

Analysis Report

The Equipment Under Test (EUT), is a portable BLE 2.4GHz Transceiver (Plane Unit) for a RC Plane. The sample supplied operated on 40 channels, normally at 2402 - 2480MHz. The channels are separated with 2MHz spacing.

The EUT is powered by 1 x 3.7V rechargeable battery. After switching on the EUT, the plane will be moved forward or backward and turned left and right based on the switches pressed in the mobile controller app.

Antenna Type: External, Integral antenna

Antenna Gain: 0dBi

Nominal rated field strength is 99.3dBμV/m at 3m (Peak), 63.1dBμV/m at 3m (Average)

Maximum allowed production tolerance: +/- 3dB

According to the KDB 447498:

Based on the maximum average field strength of production tolerance was 66.1dBμV/m at 3m in frequency 2.402GHz.

Thus, it below calculated field strength according to minimum SAR exclusion threshold level as follows:

The worst case of SAR Exclusion Threshold Level:

= $3.0 * (\text{min. test separation distance, mm}) / \sqrt{\text{freq. in GHz}}$

= $3.0 * 5 / \sqrt{(2.483.5) \text{ mW}}$

= 9.52 mW

According to the KDB 412172 D01:

EIRP = $[(FS*D)^2 * 1000 / 30]$

Calculated Field Strength for 9.52mW is 105dBuV/m @3m

Since maximum average field strength plus production tolerance < = 105dBuV/m @3m and antenna gain is > = 0.0dBi, it is concluded that maximum Conducted Power and Field Strength are well below the SAR Exclusion threshold level, so the EUT is considered to comply with SAR requirement without testing.
