TEST DATA

Note:

1. Maximum PSD = Measured PSD + Duty Factor
2. "Measure and add $10 \log(N_{ANT})$ dB, where N_{ANT} is the number of outputs" was used for measuring in-band Total PSD.
Total PSD = Chain 3 PSD + duty factor + $10 \log(N_{ANT})$
3. For CDD transmission, directional gain is. **8.02 dBi**
For MIMO transmission, directional gain is **5.01 dBi**.
Directional gain was calculated according to KDB662911 D01 Multiple Transmitter Output v02r01.
For power spectral density (PSD) measurements on all devices employing CDD, directional gain is as follows,
Directional gain = G_{ANT} + Array Gain = 2 dBi + 6.02 dB = 8.02 dBi
Array Gain = $10 \log(N_{ANT}/N_{SS})$ dB = $10 \log(4/1)$ = 6.02 dB.
where N_{SS} = the number of independent spatial streams of data and G_{ANT} is the antenna gain in dBi.
For CDD mode of this device, $N_{SS}=1$.
For power spectral density (PSD) measurements on all devices employing MIMO, directional gain is as follows,
Directional gain = G_{ANT} + $10 \log(N_{ANT}/N_{SS})$ dBi = 2 dBi + $10 \log(4/2)$ dB = 5.01 dBi.
where N_{SS} = the number of independent spatial streams of data and G_{ANT} is the antenna gain in dBi
For this device, MIMO mode means SM-MIMO(Spatial Multiplexing) transmission and the lowest $N_{SS}=2$ with beamforming.
4. For FCC PSD Limit, If transmitting antennas of directional gain greater than 6 dBi was used, maximum power spectral density was reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.
5. Power Spectral Density(PSD) was measured by same method with conducted output power according to II.F.1 in KDB 789033 D02 General UNII Test Procedures New Rules v02r01.
6. The following equation was used for spectrum offset:
Spectrum offset (dB) = Attenuator (dB) + Cable Loss (dB) + SMA Type Connector Loss (dB)
