TEST RESULT

The requirements of the tests performed as shown in the overview (clause 4) were fulfilled by the equipment under test.

The complete test results are presented in the following.

Test engineer:	Thomas KÜHN		11/23/2015
	Name	Signature	Date
Authorized reviewer:	Bernd STEINER		11/23/2015
	Name	Signature	Date

This test report is only valid in its original form.

Any reproduction of its contents in extracts without written permission of the accredited test laboratory PHOENIX TESTLAB GmbH is prohibited.

The test results herein refer only to the tested sample. PHOENIX TESTLAB GmbH is not responsible for any generalisations or conclusions drawn from these test results concerning further samples. Any modification of the tested samples is prohibited and leads to the invalidity of this test report. Each page necessarily contains the PHOENIX TESTLAB Logo and the TEST REPORT NUMBER.

Manufacturer represented during the test by the following person:	-

1.3 Test laboratory

The tests were carried out at: **PHOENIX TESTLAB GmbH**
Königswinkel 10
32825 Blomberg
Germany

accredited by Deutsche Gesellschaft Akkreditierungsstelle GmbH (DAkkS) in compliance with DIN EN ISO/IEC 17025 under Reg. No. D-PL-17186-01-02, FCC Test site registration number 90877 and Industry Canada Test site registration IC3469A-1.

1.4 EUT (Equipment Under Test)

Test object: *	UHF RFID read/write device
Model name / HVIN: *	RFU650-10101
FCC ID:*	WRMRFU650
IC: *	10066A-RFU650
Serial number: *	PT2
PCB identifier: *	EK-Frontend 2080083/EK-Digital 2078517/EK-Koppler FCC 2080082
Hardware version: *	Prototype
Software version / FVIN: *	T1.60P07
Lowest internal frequency	12 MHz

1.5 Technical data of equipment

Channel 1	RX:	902.75 MHz	TX:	902.75 MHz
Channel 25	RX:	914.75 MHz	TX:	914.75 MHz
Channel 50	RX:	927.25 MHz	TX:	927.25 MHz

Rated RF output power: *	30 dBm (conducted, combined)				
Antenna type: *	Internal				
Antenna gain: *	4.8 dBi (array gain)				
Antenna connector: *	Yes (internal only)				
Adaptive frequency agility: *	No				
Modulation: *	FHSS (PR-ASK / DSB-ASK)				
Supply Voltage: *	U _{nom} =	24.0 V DC	U _{min} =	12.0 V DC	U _{max} = 30.0 V DC
Temperature range: *	-30 °C to +60 °C				
Ancillary used for test:	A switchbox typ CDB620-001S02, serial number 1204 was used to connect the EUT to the power supply. Furthermore an external power supply type Mini-PS-100-240AC/24DC/1 was used during conducted emission measurement on power supply line.				

* declared by the applicant.

The following external I/O cables were used:

Identification	Connector		Length *
	EUT	Ancillary	
Ethernet	4-pin M12-connector	-	2.0 m
Power / RS422 and external Sensor	17-pin M12-connector	SubD 15pin (CDB620-001)	2.0 m

*: Length during the test if no other specified.

1.6 Dates

Date of receipt of test sample:	06/30/2015
Start of test:	07/09/2015
End of test:	11/20/2015

2 Operational states

All tests were carried out with an unmodified sample.

During all tests the RFU650-10101 was powered by an external power supply with 24.0 V DC.

The operation mode could be chosen with the help of a laptop computer with a test-software, communicates with the EUT via the Ethernet line.

The conducted measurements were carried out at the internal antenna connectors of the EUT combined with a suitable combiner.

The EUT supports several link profiles which have no measurable influence to the measurement result. So the link profile "Robust/Industrial" was used to reach the documented results.

For all measurements the output power of the EUT was set to 27 dBm. As declared by the applicant that the antennas have an array gain of 4.8 dB.

The following test modes were adjusted during the tests:

Test items	Operation	Operation mode
20 dB bandwidth	Transmit with normal modulation on channel 1, 25 or 50	1, 2, 3
Carrier frequency separation	Transmit with normal modulation on channel 1, 25 or 50	1, 2, 3
Number of hopping channels	Transmit with normal modulation, hopping on all channels	4
Dwell time	Transmit with normal modulation on channel 25	2
Maximum peak output power	Transmit with normal modulation on channel 1, 25 or 50	1, 2, 3
Radiated emissions (transmitter)	Transmit with normal modulation on channel 1, 25 or 50	1, 2, 3
Conducted emissions on supply line	Transmit with normal modulation, hopping on all channels	4

Physical boundary of the EUT

3 Additional information

During the tests the EUT was not labelled as required by FCC / IC.

Because the antenna of the EUT is glued the internal photographs with respect to the antennas were supplied by the applicant.

4 Overview

Application	Frequency range [MHz]	FCC 47 CFR Part 15 section [2]	RSS 247, Issue 1 [3] or RSS-Gen, Issue 4 [4]	Status	Refer page
20 dB bandwidth	General	15.247 (a) (1) (i)	5.1 (1) [3]	Passed	8 et seq.
Carrier frequency separation	General	15.247 (a) (1) (i)	5.1 (2) [3]	Passed	11 et seq.
Number of hopping channels	902.0 – 928.0	15.247 (a) (1) (i)	5.1 (3) [3]	Passed	14 et seq.
Dwell time	902.0 – 928.0	15.247 (a) (1) (i)	5.1 (3) [3]	Passed	16 et seq.
Maximum peak output power	902.0 – 928.0	15.247 (b) (2)	5.4 (1) [3]	Passed	19 et seq.
Radiated emissions (transmitter)	0.009 - 10,000	15.247 (d) 15.205 (a) 15.209 (a)	5.5 [3] 8.9 [4]	Passed	24 et seq.
Conducted emissions on supply line	0.15 - 30	15.207 (a)	8.8 [4]	Passed	45 et seq.
Radiated emissions (receiver)	30 - 5,000	15.109 (a)	6.1 [4]	N. a. *	-
Antenna requirement	-	15.203 [2]	-	Passed**	-

*: No measurement of the receiver spurious emissions was carried out, because of a continuously operating co-located transmitter.

** : Integrated antennas only, requirement fulfilled.

5 Test results

5.1 20 dB bandwidth

5.1.1 Method of measurement (20 dB bandwidth)

The calibration of the spectrum analyser has to be checked with the help of a known signal from a signal generator. The EUT has to be connected to the spectrum analyser via a low loss cable. If the EUT is not equipped with an antenna connector, a temporary antenna connector has to be installed. The EUT has to be switched on and the hopping function has to be disabled, the transmitter shall work with its maximum data rate.

The following spectrum analyser settings according to [1] shall be used:

- Span: App. 2 to 5 times the 20 dB bandwidth, centred on the actual hopping channel.
- Resolution bandwidth: 1 % to 5 % of the 20 dB bandwidth.
- Video bandwidth: three times the resolution bandwidth.
- Set the reference level of the instrument as required, keeping the signal from exceeding the maximum input mixer level for linear operation. In general, the peak of the spectral envelope shall be more than $[10 \log (OBW/RBW)]$ below the reference level.
- Sweep: Auto.
- Detector function: peak.
- Trace mode: Max hold.

After trace stabilisation the marker shall be set on the signal peak. The first display line has to be set on this value. The second display line has to be set 20 dB below the first line (or the peak marker). The frequency lines shall be set on the intersection points between the second display line and the measured curve.

The measurement will be performed at the upper, the lower end and the middle of the assigned frequency band.

Test set-up:

5.1.2 Test results (20 dB bandwidth)

Ambient temperature	22 °C	Relative humidity	40 %
---------------------	-------	-------------------	------

152541_120.wmf: 20 dB bandwidth at the lower end of the assigned frequency band:

152541_121.wmf: 20 dB bandwidth at the middle of the assigned frequency band:

152541_122.wmf: 20 dB bandwidth at the upper end of the assigned frequency band:

Channel number	Channel frequency [MHz]	20 dB bandwidth [kHz]
1	902.750	82.692 kHz
25	914.750	82.692 kHz
50	927.250	82.692 kHz
Measurement uncertainty		+0.66 dB / -0.72 dB

Test equipment used (see chapter 6):

31, 54, 84

5.2 Carrier frequency separation

5.2.1 Method of measurement (carrier frequency separation)

The calibration of the spectrum analyser has to be checked with the help of a known signal from a signal generator. The EUT has to be connected to the spectrum analyser via a low loss cable. If the EUT is not equipped with an antenna connector, a temporary antenna connector has to be installed. The EUT has to be switched on and the hopping function has to be enabled.

The following spectrum analyser settings according to [1] shall be used:

- Span: Wide enough to capture the peaks of two adjacent channels.
- Resolution bandwidth: Start with the Resolution bandwidth set to approximately 30% of the channel spacing; adjust as necessary to best identify the center of each individual channel.
- Video bandwidth $\geq$ Resolution bandwidth.
- Sweep: Auto.
- Detector function: peak.
- Trace mode: Max hold.

After trace stabilisation the marker and the delta marker function will be used to determine the separation between the peaks of two adjacent channel signals.

The measurement will be performed at the upper, the lower end and the middle of the assigned frequency band.

Test set-up:

5.2.2 Test results (carrier frequency separation)

Ambient temperature	22 °C	Relative humidity	40 %
---------------------	-------	-------------------	------

152541_123.wmf: Channel separation at the lower end of the assigned frequency band:

152541_124_020.wmf: Channel separation at the middle of the assigned frequency band:

152541_125.wmf: Channel separation at the upper end of the assigned frequency band:

Remark: A smaller Resolution bandwidth was used in order to reach a better optical identification of the signal peaks.

Channel number	Channel frequency [MHz]	Channel separation [kHz]	Minimum limit [kHz]
1	902.750	500.000 kHz	81.961538 kHz (the 20 dB bandwidth)
25	914.750	500.000 kHz	81.730769 kHz (the 20 dB bandwidth)
50	927.250	500.000 kHz	82.371795 kHz (the 20 dB bandwidth)
Measurement uncertainty			$<10^{-7}$

Test: Passed

Test equipment used (see chapter 6):

31, 54, 84

5.3 Number of hopping frequencies

5.3.1 Method of measurement (number of hopping frequencies)

The calibration of the spectrum analyser has to be checked with the help of a known signal from a signal generator. The EUT has to be connected to the spectrum analyser via a low loss cable. If the EUT is not equipped with an antenna connector, a temporary antenna connector has to be installed. The EUT has to be switched on and the hopping function has to be enabled.

The following spectrum analyser settings according to [1] shall be used:

- Span: The frequency band of operation. Depending on the number of channels the device supports, it may be necessary to divide the frequency range of operation across multiple spans, to allow the individual channels to be clearly seen.
- Resolution bandwidth: To identify clearly the individual channels, set the Resolution bandwidth to less than 30% of the channel spacing or the 20 dB bandwidth, whichever is smaller.
- Video bandwidth: $\geq$ the resolution bandwidth.
- Sweep: Auto.
- Detector function: Peak.
- Trace mode: Max hold.

After trace stabilisation the number of hopping channels could be counted. It might be possible to divide the span into some sub ranges in order to clearly show all hopping frequencies.

Test set-up:

5.3.2 Test results (number of hopping frequencies)

Ambient temperature	22 °C
---------------------	-------

Relative humidity	40 %
-------------------	------

152541_126.wmf: Number of hopping channels:

Remark: The Resolution bandwidth was set close to the 20 dB bandwidth.

Number of hopping channels	Limit
Operation mode 4	
50	At least 50

Test: Passed

Test equipment used (see chapter 6):

31, 54, 84

5.4 Dwell time

5.4.1 Method of measurement (dwell time)

The calibration of the spectrum analyser has to be checked with the help of a known signal from a signal generator. The EUT has to be connected to the spectrum analyser via a low loss cable. If the EUT is not equipped with an antenna connector, a temporary antenna connector has to be installed. The EUT has to be switched on and the hopping function has to be enabled.

The following spectrum analyser settings according to [1] shall be used:

- Span: Zero, centred on a hopping channel.
- Resolution bandwidth shall be $\leq$ channel spacing and where possible Resolution bandwidth should be set $\gg 1 / T$, where T is the expected dwell time per channel.
- Video bandwidth: $\geq$ the resolution bandwidth.
- Sweep: As necessary to capture the entire dwell time per hopping channel; where possible use a video trigger and trigger delay so that the transmitted signal starts a little to the right of the start of the plot. The trigger level might need slight adjustment to prevent triggering when the system hops on an adjacent channel; a second plot might be needed with a longer sweep time to show two successive hops on a channel.
- Detector function: peak.
- Trace mode: Max hold.

The marker and delta marker function of the spectrum analyser will be used to determine the dwell time.

The measurement will be performed at the middle of the assigned frequency band.

Repeat the measurement using a longer sweep time to determine the number of hops over the period specified in the requirements. The sweep time shall be equal to, or less than, the period specified in the requirements. Determine the number of hops over the sweep time and calculate the total number of hops in the period specified in the requirements, using the following equation:

$$\begin{aligned} & \text{(Number of hops in the period specified in the requirements)} = \\ & \text{(number of hops on spectrum analyzer)} \times (\text{period specified in the requirements} / \text{analyzer sweep time}) \end{aligned}$$

The average time of occupancy is calculated from the transmit time per hop multiplied by the number of hops in the period specified in the requirements. If the number of hops in a specific time varies with different modes of operation (data rate, modulation format, number of hopping channels, etc.), then repeat this test for each variation.

The measured transmit time and time between hops shall be consistent with the values described in the operational description for the EUT.

Test set-up:

5.4.2 Test results (dwell time)

Ambient temperature	22 °C	Relative humidity	40 %
---------------------	-------	-------------------	------

152541_134.wmf: Dwell time at the middle of the assigned frequency band (single hop):

152541_135.wmf: Dwell time at the middle of the assigned frequency band (required period):

Channel number	Channel frequency [MHz]	t _{pulse} [ms]	Number of pulses	Dwell time [ms]	Limit [ms]
24	914.750	397.436	1	397.436	400.000
Measurement uncertainty				<10 ⁻⁷	

Test: Passed

Test equipment used (see chapter 6):

31, 54, 84

5.5 Maximum peak output power

5.5.1 Method of measurement (maximum peak output power)

The calibration of the spectrum analyser has to be checked with the help of a known signal from a signal generator. The EUT has to be connected to the spectrum analyser via a low loss cable. If the EUT is not equipped with an antenna connector, a temporary antenna connector has to be installed. The EUT has to be switched on and the hopping function has to be disabled.

The following spectrum analyser settings according to [1] shall be used:

- Span: Approx. 5 times the 20 dB bandwidth, centred on a hopping channel.
- Resolution bandwidth: > the 20 dB bandwidth of the emission being measured.
- Video bandwidth: $\geq$ the resolution bandwidth.
- Sweep: Auto.
- Detector function: peak.
- Trace mode: Max hold.

After trace stabilisation the marker shall be set on the signal peak. The indicated level is the peak output power, which has to be corrected with the value of the cable loss and an external attenuation (if necessary).

The measurement will be performed at the upper and lower end and the middle of the assigned frequency band.

Test set-up:

5.5.2 Test results (maximum peak output power)

Ambient temperature	22 °C
---------------------	-------

Relative humidity	40 %
-------------------	------

152541_128.wmf: Maximum peak output power at the lower end of the assigned frequency band, port 1:

152541_129.wmf: Maximum peak output power at the middle of the assigned frequency band, port 1:

152541_130.wmf: Maximum peak output power at the upper end of the assigned frequency band, port 1:

152541_131.wmf: Maximum peak output power at the lower end of the assigned frequency band, port 2:

152541_132.wmf: Maximum peak output power at the middle of the assigned frequency band, port 2:

152541_133.wmf: Maximum peak output power at the upper end of the assigned frequency band, port 2:

Remark: Because the EUT is equipped with two internal antenna ports, the peak output power was measured at port 1 during the port 2 was terminated with 50 Ω . The measurement was repeated with measuring on port 2 and with termination on port 1. The peak power of both measurements was summed up and shown in the table below.
For the measurement the original antenna connection cable was used, so no additional cable attenuation was taken into account.

Operation mode	Channel number	Channel frequency [MHz]	Maximum peak output power						Antenna gain [dBi] *	Peak power limit [dBm]
			Port 1		Port 2		Sum of Port 1 + 2			
			[dBm]	[W]	[dBm]	[W]	[W]	[dBm]		
1	1	902.750	27.0	0.5	27.0	0.5	1.0	30.0	4.8	30.0
2	25	914.750	27.0	0.5	27.0	0.5	1.0	30.0	4.8	30.0
3	50	927.250	27.0	0.5	26.9	0.490	0.990	30.0	4.8	30.0
Measurement uncertainty									+0.66 dB / -0.72 dB	

*: Antenna array gain

Test: Passed

Test equipment used (see chapter 6):

31, 54, 84

5.6 Radiated emissions

5.6.1 General method of measurement (radiated emissions)

The radiated emission measurement is subdivided into five stages.

- A preliminary measurement carried out in a fully anechoic chamber with a fixed antenna height in the frequency range 9 kHz to 1 GHz.
- A final measurement carried out on an outdoor test site without reflecting ground plane and a fixed antenna height in the frequency range 9 kHz to 30 MHz.
- A final measurement carried out on an open area test site with reflecting ground plane and various antenna height in the frequency range 30 MHz to 1 GHz.
- A preliminary measurement carried out in a fully anechoic chamber with a variable antenna distance and height in the frequency range 1 GHz to 25 / 40 GHz.
- A final measurement carried out in a fully anechoic chamber with a fixed antenna height in the frequency range 1 GHz to 40 GHz.

Preliminary measurement (9 kHz to 30 MHz):

In the first stage a preliminary measurement will be performed in a shielded room with a measuring distance of 3 meters. Table-top devices will set up on a non-conducting support with a size of 1 m by 1.5 m and a height of 80 cm. Floor-standing devices will be placed directly on the turntable/ground plane. The set up of the Equipment under test will be in accordance to [1].

The frequency range 9 kHz to 30 MHz will be monitored with a spectrum analyser while the system and its cables will be manipulated to find out the configuration with the maximum emission levels if applicable. The EMI Receiver will be set to MAX Hold mode. The EUT and the measuring antenna will be rotated around their vertical axis to found the maximum emissions.

The resolution bandwidth of the spectrum analyser will be set to the following values:

Frequency range	Resolution bandwidth
9 kHz to 150 kHz	200 Hz
150 kHz to 30 MHz	10 kHz

Preliminary measurement procedure:

Prescans were performed in the frequency range 9 kHz to 150 kHz and 150 kHz to 30 MHz.

The following procedure will be used:

- 1) Monitor the frequency range at horizontal polarisation and a EUT azimuth of 0 °.
- 2) Manipulate the system cables within the range to produce the maximum level of emission.
- 3) Rotate the EUT by 360 ° to maximize the detected signals.
- 4) Make a hardcopy of the spectrum.
- 5) Measure the frequencies of highest detected emission with a lower span and resolution bandwidth to increase the accuracy and note the frequency value.
- 6) Repeat steps 1) to 5) with the other orthogonal axes of the EUT (because of EUT is a module and might be used in a handheld equipment application).
- 7) Rotate the measuring antenna and repeat steps 1) to 5).

Final measurement (9 kHz to 30 MHz):

In the second stage a final measurement will be performed on an open area test site with no conducting ground plane in a measuring distances of 3 m, 10 m and 30 m. In the case where larger measuring distances are required the results will be extrapolated based on the values measured on the closer distances according to Section 15.31 (f) (2) [2]. The final measurement will be performed with a EMI Receiver set to Quasi Peak detector except for the frequency bands 9 kHz to 90 kHz and 110 kHz to 490 kHz where an average detector will be used according Section 15.209 (d) [2].

On the frequencies, which were detected during the preliminary measurements, the final measurement will be performed while rotating the EUT and the measuring antenna in the range of 0 ° to 360 ° around their vertical axis until the maximum value is found.

The resolution bandwidth of the EMI Receiver will be set to the following values:

Frequency range	Resolution bandwidth
9 kHz to 150 kHz	200 Hz
150 kHz to 30 MHz	9 kHz

Final measurement procedure:

The following procedure will be used:

- 1) Monitor the frequency range with the measuring antenna at vertical orientation parallel to the EUT at an azimuth of 0 °.
- 2) Rotate the EUT by 360 ° to maximize the detected signals and note the azimuth and orientation.
- 3) Rotate the measuring antenna to find the maximum and note the value.
- 4) Rotate the measuring antenna and repeat steps 1) to 3) until the maximum value is found.
- 5) Repeat steps 1) to 4) with the other orthogonal axes of the EUT (if the EUT is a module and might be used in a handheld equipment application).

Preliminary measurement (30 MHz to 1 GHz)

In the first stage a preliminary measurement will be performed in a fully anechoic chamber with a measuring distance of 3 meter. Table top devices will set up on a non-conducting turn device on the height of 1.5 m. Floor-standing devices will be placed directly on the turntable/ground plane. The set up of the Equipment under test will be in accordance to [1].

The frequency range 30 MHz to 1 GHz will be measured with an EMI Receiver set to MAX Hold mode and a resolution bandwidth of 100 kHz. The measurement will be performed in horizontal and vertical polarisation of the measuring antenna and while rotating the EUT in its vertical axis in the range of 0 ° to 360 °. This measurement is repeated after raising the EUT in 30 ° steps according 6.6.5.4 in [1].

The resolution bandwidth of the EMI Receiver will be set to the following values:

Frequency range	Resolution bandwidth
30 MHz to 230 MHz	100 kHz
230 MHz to 1 GHz	100 kHz

Procedure preliminary measurement:

Prescans were performed in the frequency range 30 MHz to 230 MHz and 230 MHz to 1 GHz.

The following procedure will be used:

1. Monitor the frequency range at horizontal polarisation and a EUT azimuth of 0 °.
2. Manipulate the system cables within the range to produce the maximum level of emission.
3. Rotate the EUT by 360 ° to maximize the detected signals.
4. Repeat 1) to 3) with the vertical polarisation of the measuring antenna.
5. Make a hardcopy of the spectrum.
6. Repeat 1) to 5) with the EUT raised by an angle of 30 ° (60 °, 90 °, 120 ° and 150 °) according to 6.6.5.4 in [1].
7. Measure the frequency of the detected emissions with a lower span and resolution bandwidth to increase the accuracy and note the frequency value.

Final measurement (30 MHz to 1 GHz)

A final measurement on an open area test site will be performed on selected frequencies found in the preliminary measurement. During this test the EUT will be rotated in the range of 0 ° to 360 °, the measuring antenna will be set to horizontal and vertical polarisation and raised and lowered in the range from 1 m to 4 m to find the maximum level of emissions.

The resolution bandwidth of the EMI Receiver will be set to the following values:

Frequency range	Resolution bandwidth
30 MHz to 1 GHz	120 kHz

Procedure final measurement:

The following procedure will be used:

- 1) Measure on the selected frequencies at an antenna height of 1 m and a EUT azimuth of 23 °.
- 2) Move the antenna from 1 m to 4 m and note the maximum value at each frequency.
- 3) Rotate the EUT by 45 ° and repeat 2) until an azimuth of 337 ° is reached.
- 4) Repeat 1) to 3) for the other orthogonal antenna polarization.
- 5) Move the antenna and the turntable to the position where the maximum value is detected.
- 6) Measure while moving the antenna slowly +/- 1 m.
- 7) Set the antenna to the position where the maximum value is found.
- 8) Measure while moving the turntable +/- 45 °.
- 9) Set the turntable to the azimuth where the maximum value is found.
- 10) Measure with Final detector (QP and AV) and note the value.
- 11) Repeat 5) to 10) for each frequency.
- 12) Repeat 1) to 11) for each orthogonal axes of the EUT (because of EUT is a module and might be used in a handheld equipment application).

Preliminary and final measurement (1 GHz to 40 GHz)

This measurement will be performed in a fully anechoic chamber. Table top devices will set up on a non-conducting turn device on the height of 1.5 m. The set-up of the Equipment under test will be in accordance to [1].

Preliminary measurement (1 GHz to 40 GHz)

The frequency range will be divided into different sub ranges depending of the frequency range of the used horn antenna. The spectrum analyser set to MAX Hold mode and a resolution bandwidth of 100 kHz. The measurement will be performed in horizontal and vertical polarisation of the measuring antenna and while rotating the EUT in its vertical axis in the range of 0 ° to 360 °. This measurement is repeated after raising the EUT in 30 ° steps according 6.6.5.4 in [1].

The resolution bandwidth of the EMI Receiver will be set to the following values:

Frequency range	Resolution bandwidth
1 GHz to 4 GHz	100 kHz
4 GHz to 12 GHz	100 kHz
12 GHz to 18 GHz	100 kHz
18 GHz to 25 / 26.5 GHz	100 kHz
26.5 GHz to 40 GHz	100 kHz

Procedure preliminary measurement:

Prescans were performed in the frequency range 1 to 40 GHz.

The following procedure will be used:

1. Monitor the frequency range at horizontal polarisation and a EUT azimuth of 0 °.
2. Rotate the EUT by 360° to maximize the detected signals.
3. Repeat 1) to 2) with the vertical polarisation of the measuring antenna.
4. Make a hardcopy of the spectrum.
5. Repeat 1) to 4) with the EUT raised by an angle of 30° (60°, 90°, 120° and 150°) according to 6.6.5.4 in [1].
6. Measure the frequency of the detected emissions with a lower span and resolution bandwidth to increase the accuracy and note the frequency value.
7. The measurement antenna polarisation, with the according EUT position (Turntable and Turn device) which produces the highest emission for each frequency will be used for the final measurement. The six closest values to the applicable limit will be used for the final measurement.

Final measurement (1 GHz to 40 GHz)

The frequency range will be divided into different sub ranges depending of the frequency range of the used horn antenna. The EMI Receiver set to peak and average mode and a resolution bandwidth of 1 MHz. The measurement will be performed by rotating the turntable through 0 to 360° in the worst-case EUT orientation which was obtained during the preliminary measurements.

The resolution bandwidth of the EMI Receiver will be set to the following values:

Frequency range	Resolution bandwidth
1 GHz to 4 GHz	1 MHz
4 GHz to 12 GHz	1 MHz
12 GHz to 18 GHz	1 MHz
18 GHz to 25 / 26.5 GHz	1 MHz
26.5 GHz to 40 GHz	1 MHz

Procedure of measurement:

The measurements were performed in the frequency ranges 1 GHz to 4 GHz, 4 GHz to 12 GHz, 12 GHz to 18 GHz, 18 GHz to 25 /26.5 GHz and 26.5 GHz to 40 GHz.

The following procedure will be used:

- 1) Set the turntable and the turn device to obtain the worst-case emission for the first frequency identified in the preliminary measurements.
- 2) Set the measurement antenna polarisation to the orientation with the highest emission for the first frequency identified in the preliminary measurements.
- 3) Set the spectrum analyser to EMI mode with peak and average detector activated.
- 4) Rotate the turntable from 0° to 360° to find the EUT angle that produces the highest emissions.
- 5) Note the highest displayed peak and average values
- 6) Repeat the steps 1) to 5) for each frequency detected during the preliminary measurements.

5.6.2 Test results (radiated emissions)

5.6.2.1 Preliminary radiated emission measurement (10 MHz to 10 GHz)

Ambient temperature	22 °C	Relative humidity	46 %
---------------------	-------	-------------------	------

Position of EUT:	The EUT was set-up on a non-conducting table of a height of 0.8 m and 1.5 m. The distance between EUT and antenna was 3 m.
Cable guide:	For detail information of test set-up and the cable guide refer to the pictures in annex A of this test report.
Test record:	All results are shown in the following.
Supply voltage:	During all measurements the EUT was supplied with 24 V DC by an external power supply.
Frequency range:	The preliminary measurement was carried out in the frequency range 10 MHz to 10 GHz according to [2].
Remark:	As pre-tests have shown, the emissions in the frequency range 10 MHz to 30 MHz are not depending on the transmitter operation mode. Therefore the emissions in this frequency range were measured only with the transmitter operates in operation mode 2.

Transmitter operates at the lower end of the assigned frequency band (operation mode 1)

152541_115.wmf: Spurious emissions from 30 MHz to 200 MHz (operation mode 1):

152541_116.wmf: Spurious emissions from 200 MHz to 1 GHz (operation mode 1, carrier notched):

The following frequencies were found outside the restricted bands during the preliminary radiated emission test:

- 700.000 MHz, 869.500 MHz, 881.500 MHz, 902.750 MHz, 920.000 MHz

No frequencies were found inside the restricted bands during the preliminary radiated emission test.

These frequencies have to be measured on the open area test site. The result is presented in the following.

152541_108.wmf: Spurious emissions from 1 GHz to 4 GHz (operation mode 1):

152541_112.wmf: Spurious emissions from 4 GHz to 10 GHz (operation mode 1):

The following frequencies were found inside the restricted bands during the preliminary radiated emission test:

- 1000.000 MHz, 2708.250 MHz, 3611.000 MHz, 4513.750 MHz and 5416.500 MHz.

The following frequency was found outside the restricted bands during the preliminary radiated emission test:

- 1805.500 MHz and 6319.250 MHz.

These frequencies have to be measured in a final measurement. The results were presented in the following.

Transmitter operates on the middle of the assigned frequency band (operation mode 2)

152541_119.wmf: Spurious emissions from 10 MHz to 30 MHz (operation mode 2):

No significant frequencies above the noise floor of the system (max. 33 dBμV/m (measured with peak detector) at 3 m distance) were found during the preliminary radiated emission test, so no measurements were carried out on the outdoor test site.

152541_113.wmf: Spurious emissions from 30 MHz to 200 MHz (operation mode 2):

152541_114.wmf: Spurious emissions from 200 MHz to 1 GHz (operation mode 2, carrier notched):

The following frequencies were found outside the restricted bands during the preliminary radiated emission test:

- 700.00 MHz, 900.000 MHz, 914.750 and 936.000 MHz

No frequencies were found inside the restricted bands during the preliminary radiated emission test.

These frequencies have to be measured on the open area test site. The result is presented in the following.

152541_107.wmf: Spurious emissions from 1 GHz to 4 GHz (operation mode 2):

152541_111.wmf: Spurious emissions from 4 GHz to 10 GHz (operation mode 2):

The following frequencies were found inside the restricted bands during the preliminary radiated emission test:

- 1000.000 MHz, 3659.000 MHz and 4573.750 MHz.

The following frequency was found outside the restricted bands during the preliminary radiated emission test:

- 1829.500 MHz, 5488.500 MHz and 6403.250 MHz.

These frequencies have to be measured in a final measurement. The results were presented in the following.

Transmitter operates on the upper end of the assigned frequency (operation mode 3)

152541_117.wmf: Spurious emissions from 30 MHz to 200 MHz (operation mode 3):

152541_118.wmf: Spurious emissions from 200 MHz to 1 GHz (operation mode 3, carrier notched):

The following frequencies were found outside the restricted bands during the preliminary radiated emission test:

- 700.000 MHz, 900.000 MHz, 912.000 MHz, 927.250 MHz, 942.500 MHz and 954.500 MHz

No frequencies were found inside the restricted bands during the preliminary radiated emission test.

These frequencies have to be measured on the open area test site. The result is presented in the following.

152541_109.wmf: Spurious emissions from 1 GHz to 4 GHz (operation mode 3):

152541_110.wmf: Spurious emissions from 4 GHz to 10 GHz (operation mode 3):

The following frequencies were found inside the restricted bands during the preliminary radiated emission test:

- 1000.000 MHz, 3709.000 MHz and 4636.250 MHz

The following frequency was found outside the restricted bands during the preliminary radiated emission test:

- 1854.500 MHz, 5563.500 MHz, 6490.750 MHz and 9272.500 MHz.

These frequencies have to be measured in a final measurement. The results were presented in the following.

Test equipment used (refer clause 6):

29, 31 - 36, 43 - 45, 49, 55, 73, 75, 83

5.6.2.2 Final radiated emission measurement (10 MHz to 30 MHz)

No significant frequencies above the noise floor of the system (max. 33 dB μ V/m (measured with peak detector) at 3 m distance) were found during the preliminary radiated emission test, so no final measurements were carried out on the outdoor test site.

5.6.2.3 Final radiated emission measurement (30 MHz to 1 GHz)

Ambient temperature	20 °C	Relative humidity	56 %
---------------------	-------	-------------------	------

Position of EUT: The EUT was set-up on a non-conducting table of a height of 0.8 m. The distance between EUT and antenna was 3 m.

Cable guide: For detail information of test set-up and the cable guide refer to the pictures in annex A of this test report.

Test record: All results are shown in the following.

Supply voltage: During all measurements the EUT was supplied with 24 V DC by an external power supply.

Test results: The test results were calculated with the following formula:

$$\text{Result [dB}\mu\text{V/m]} = \text{reading [dB}\mu\text{V]} + \text{cable loss [dB]} + \text{antenna factor [dB/m]} + 6 \text{ dB (used attenuator)}$$

The measured points and the limit line in the following diagrams refer to the standard measurement of the emitted interference in compliance with the above-mentioned standard. The measured points marked with an x are the measured results of the standard final measurement on the open area test site.

The results of the standard subsequent measurement on the open area test site are indicated in the table below. The limits as well as the measured results (levels) refer to the above mentioned standard while taking account of the specified requirements for a 3 m measuring distance.

The measurement time with the quasi-peak measuring detector is 1 second.

Transmitter operates on the lower end of the assigned frequency (operation mode 1)

◆ Final_Result QPK

Data record name: 152541fflow

Transmitter operates on the middle of the assigned frequency (operation mode 2)

◆ Final_Result QPK

Data record name: 152541ffmid

Transmitter operates on the upper end of the assigned frequency (operation mode 3)

◆ Final_Result QPK

Data record name: 152541ffhigh

Test: Passed

Test equipment used (see chapter 6):

29, 31 - 34, 36, 44, 45, 49, 54, 73, 75, 84

5.7 Conducted emissions on power supply lines (150 kHz to 30 MHz)

5.7.1 Method of measurement

This test will be carried out in a shielded chamber. Tabletop devices will set up on a non-conducting support with a size of 1 m by 1.5 m and a height of 80 cm above the ground plane. Floor-standing devices will be placed directly on the ground plane. The setup of the Equipment under test will be in accordance to [1].

The frequency range 150 kHz to 30 MHz will be measured with an EMI Receiver set to MAX Hold mode with peak and average detector and a resolution bandwidth of 9 kHz. A scan will be carried out on the phase (or plus pole in case of DC powered devices) of the AC mains network. If levels detected 10 dB below the appropriable limit, this emission will be measured with the average and quasi-peak detector on all lines.

Frequency range	Resolution bandwidth
150 kHz to 30 MHz	9 kHz

5.7.2 Test results (conducted emissions on power supply lines)

Ambient temperature	21 °C	Relative humidity	64 %
---------------------	-------	-------------------	------

Position of EUT:	The EUT was set-up on a non-conducting table of a height of 0.8 m.
Cable guide:	The cables of the EUT were fixed on the non-conducting table. For further information of the cable guide refer to the pictures in annex A of this test report.
Test record:	All results are shown in the following.
Supply voltage:	During this test the EUT was powered with 24 V _{DC} by the Mini-PS-100-240AC/24DC/1 from PHOENIX CONTACT, which was itself supplied with 120 V _{AC} / 60 Hz.

The curves in the diagram only represent for each frequency point the maximum measured value of all preliminary measurements which were made for each power supply line. The top measured curve represents the peak measurement and the bottom measured curve the average measurement. The quasi-peak measured points are marked ◆ by and the average measured points by +.

record name: 152541ffcAC

Remark: The limits of FCC 15.207 are identical to [3]

Frequency (MHz)	QuasiPeak (dBμV)	Average (dBμV)	Limit (dBμV)	Margin (dB)	Meas. Time (ms)	Bandwidth (kHz)	Line	PE	Corr. (dB)
