Fortress Technologies  
2 Technology Park Drive  
Westford, MA 01886

Dear John Pacheco,

Enclosed is the EMC Wireless test report for compliance testing of the Fortress Technologies, ES210 as tested to the requirements of Title 47 of the CFR, Ch. 1 (10-1-06 ed.), Title 47 of the CFR, Part 15.407 and Industry Canada RSS-210, Annex 9, Issue 7, June 2007 for Intentional Radiators.

Thank you for using the services of MET Laboratories, Inc. If you have any questions regarding these results or if MET can be of further service to you, please feel free to contact me.

Sincerely yours,  
MET LABORATORIES, INC.

Jennifer Sanchez  
Documentation Department

### **Electromagnetic Compatibility Criteria Test Report**

for the

**Fortress Technologies  
Model ES210**

**Tested under**  
the Certification Rules  
contained in  
Title 47 of the CFR, Part 15.407  
and  
Industry Canada RSS-210, Annex 9  
for Intentional Radiators

**MET Report: EMC27866-FCC407**

October 19, 2009

**Prepared For:**

**Fortress Technologies  
2 Technology Park Drive  
Westford, MA 01886**

**Prepared By:**  
**MET Laboratories, Inc.**

Baltimore, MD 21230

## Electromagnetic Compatibility Criteria Test Report

for the

### Fortress Technologies Model ES210

the Certification Rules  
contained in  
Title 47 of the CFR, Part 15.407  
and  
Industry Canada RSS-210, Annex 9  
for Intentional Radiators

Dusmantha Tennakoon, Project Engineer  
Electromagnetic Compatibility Lab

Jennifer Sanchez  
Documentation Department

**Engineering Statement:** The measurements shown in this report were made in accordance with the procedures indicated, and the emissions from this equipment were found to be within the limits applicable. I assume full responsibility for the accuracy and completeness of these measurements, and for the qualifications of all persons taking them. It is further stated that upon the basis of the measurements made, the equipment tested is capable of operation in accordance with the requirements of Part 15.407, of the FCC Rules and RSS-210 Annex 9 of the Industry Canada Rules under normal use and maintenance.

Shawn McMillen, Wireless Manager  
Electromagnetic Compatibility Lab

## Report Status Sheet

| Revision | Report Date      | Reason for Revision |
|----------|------------------|---------------------|
| Ø        | October 15, 2009 | Initial Issue.      |
| 1        | October 19, 2009 | Final Issue         |

# I. Executive Summary

## A. Purpose of Test

An EMC evaluation was performed to determine compliance of the Fortress Technologies ES210, with the requirements of FCC Part §15.407 and Industry Canada RSS-210 Annex 9. All references are to the most current version of Title 47 of the Code of Federal Regulations in effect. In accordance with §2.1033, the following data is presented in support of the Certification of the ES210. Fortress Technologies should retain a copy of this document which should be kept on file for at least two years after the manufacturing of the ES210, has been **permanently** discontinued.

## B. Executive Summary

The following tests were conducted on a sample of the equipment for the purpose of demonstrating compliance with FCC Part §15.407 and Industry Canada RSS-210, Annex 9, in accordance with Fortress Technologies, quote number 1FOR2809R4. All tests were conducted using measurement procedure ANSI C63.4-2003.

**Table 1. Executive Summary of EMC Part 15.407 & RSS-210 Annex 9 Compliance Testing**

## II. Equipment Configuration

## A. Overview

MET Laboratories, Inc. was contracted by Fortress Technologies to perform testing on the ES210, under Fortress Technologies' quote number 1FOR2809R4.

This document describes the test setups, test methods, required test equipment, and the test limit criteria used to perform compliance testing of the Fortress Technologies ES210.

The results obtained relate only to the item(s) tested.

**Table 3. References**

## C. Test Site

All testing was performed at MET Laboratories, Inc., 914 W. Patapsco Ave, Baltimore, MD 21230. All equipment used in making physical determinations is accurate and bears recent traceability to the National Institute of Standards and Technology.

Radiated Emissions measurements were performed in a 3 meter semi-anechoic chamber (equivalent to an Open Area Test Site). In accordance with §2.948(a)(3), a complete site description is contained at MET Laboratories.

## D. Description of Test Sample

The Fortress Technologies ES210, is a single radio access point/bridge. It embeds a COTS high power radio and two Ethernet ports in a ruggedized enclosure. The radio operates in accordance to the 802.11a, 802.11b, and 802.11g standards.

The ES210 is intended to provide outdoor connectivity in a secure manner both wired and wirelessly. It can operate with either AC power or by a battery.

Photograph 1. Fortress Technologies ES210

Figure 1. Block Diagram of Test Configuration

**E. Equipment Configuration**

All cards, racks, etc., incorporated as part of the EUT is included in the following list.

| Ref. ID | Name / Description           | Model Number | Serial Number |
|---------|------------------------------|--------------|---------------|
| 1       | Fortress Secure Access Point | ES210        | 109160002     |

**Table 4. Equipment Configuration****F. Support Equipment**

The EUT did not require any support equipment for operation or monitoring.

**G. Ports and Cabling Information**

| Port name on EUT | Cable Description or reason for no cable | Qty. | Termination Box ID & Port ID |
|------------------|------------------------------------------|------|------------------------------|
| Enet 1           | Wired Ethernet 10/100                    | 1    | N/A                          |
| Enet 2           | Wired Ethernet 10/100                    | 1    | N/A                          |
| Ant              | Antenna                                  | 1    | Spectrum Analyzer            |
| AC Pwr           | 2-wire                                   | 1    | External AC Charger          |

**Table 5. Ports and Cabling Information****H. Mode of Operation**

Test modes were entered by using ART, the Atheros Radio Test tool. This is a standard tool provide by Atheros for directly manipulating and configuring their chips during testing and manufacturing.

**I. Method of Monitoring EUT Operation**

A Spectrum Analyzer and a Power Meter was use to monitor the EUT's transmitter channel and power output.

**J. Modifications**

- a) **Modifications to EUT**  
No modifications were made to the EUT.
- b) **Modifications to Test Standard**  
No modifications were made to the test standard.

**K. Disposition of EUT**

The test sample including all support equipment submitted to the Electro-Magnetic Compatibility Lab for testing was returned to Fortress Technologies upon completion of testing.

### **III. Electromagnetic Compatibility Criteria for Intentional Radiators**

## Electromagnetic Compatibility Criteria for Intentional Radiators

### § 15.203 Antenna Requirement

**Test Requirement:** § 15.203: An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited.

The structure and application of the EUT were analyzed to determine compliance with Section 15.203 of the Rules. Section 15.203 states that the subject device must meet at least one of the following criteria:

- a.) Antenna must be permanently attached to the unit.
- b.) Antenna must use a unique type of connector to attach to the EUT.
- c.) Unit must be professionally installed. Installer shall be responsible for verifying that the correct antenna is employed with the unit.

**Results:** The unit is professionally installed. Therefore, the EUT as tested is compliant with the criteria of §15.203.

| Gain | Type | Model   | Manufacturer |
|------|------|---------|--------------|
| 5dBi | Omni | WAE-5AG | Air Live     |

**Test Engineer(s):** Dusmantha Tennakoon

**Test Date(s):** 10/08/09

**Electromagnetic Compatibility Criteria for Intentional Radiators****§ 15.207 Conducted Emissions Limits**

**Test Requirement(s):** § 15.207 (a): For an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies, within the band 150 kHz to 30MHz, shall not exceed the limits in the following table, as measured using a 50  $\mu$ H/50  $\Omega$  line impedance stabilization network (LISN). Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between the frequency ranges.

| Frequency range<br>(MHz) | § 15.207(a), Conducted Limit (dB $\mu$ V) |         |
|--------------------------|-------------------------------------------|---------|
|                          | Quasi-Peak                                | Average |
| * 0.15- 0.45             | 66 - 56                                   | 56 - 46 |
| 0.45 - 0.5               | 56                                        | 46      |
| 0.5 - 30                 | 60                                        | 50      |

**Table 6. Conducted Limits for Intentional Radiators from FCC Part 15 § 15.207(a)**

**Test Procedure:** The EUT was placed on a non-metallic table, 80 cm above the ground plane inside a semi-anechoic chamber. The EUT was situated such that the back of the EUT was 0.4 m from one wall of the vertical ground plane, and the remaining sides of the EUT were no closer than 0.8 m from any other conductive surface. The EUT was powered from a 50  $\Omega$ /50  $\mu$ H Line Impedance Stabilization Network (LISN). The EMC receiver scanned the frequency range from 150 kHz to 30 MHz. Conducted Emissions measurements were made in accordance with ANSI C63.4-1992 "Methods and Measurements of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9kHz to 40 GHz". The measurements were performed over the frequency range of 0.15 MHz to 30 MHz using a 50  $\Omega$ /50  $\mu$ H LISN as the input transducer to an EMC/field intensity meter.

**Test Results:** The EUT was compliant with the Class A requirement(s) of this section. Pre-scans revealed that emissions profiles and amplitudes of emissions were similar when the EUT was transmitting on low, mid and high channels. Therefore, final measurements were taken when the EUT was transmitting on high channel (i.e. 5805 MHz)

**Test Engineer(s):** Dusmantha Tennakoon

**Test Date(s):** 10/06/09

## Electromagnetic Compatibility Criteria for Intentional Radiators

### § 15. 403(c) 26dB Bandwidth

**Test Requirements:** § 15.403 (i): For purposes of this subpart the emission bandwidth shall be determined by measuring the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, that are 26 dB down relative to the maximum level of the modulated carrier. Determination of the emissions bandwidth is based on the use of measurement instrumentation employing a peak detector function with an instrument resolution bandwidth approximately equal to 1.0 percent of the emission bandwidth of the device under measurement.

**Test Procedure:** The transmitter was set to low, mid and high operating frequencies at the highest output power and connected to the spectrum analyzer through an attenuator. The bandwidth of the fundamental frequency was measured with the spectrum analyzer using a RBW approximately equal to 1% of the total emission bandwidth, VBW > RBW. The 26 dB Bandwidth was measured and recorded.

**Test Results** The 26 dB Bandwidth was compliant with the requirements of this section and was determined from the plots on the following pages.

| Frequency (MHz) | 99% Bandwidth (MHz) | 26 dB Bandwidth (MHz) |
|-----------------|---------------------|-----------------------|
| 5745            | 16.74               | 23.05                 |
| 5785            | 16.62               | 22.26                 |
| 5805            | 16.55               | 21.48                 |

### § 15. 407(a)(3) RF Power Output

**Test Requirements:** §15.407(a) (3): The maximum output power of the intentional radiator shall not exceed the following:

| Digital Transmission Systems<br>(MHz) | Output Limit |
|---------------------------------------|--------------|
| 5150-5250                             | 50mW         |
| 5250-5350                             | 250mW        |
| 5470-5725                             | 250mW        |
| 5725-5825                             | 1W           |

**Table 10. Output Power Requirements from §15.407**

**§15.407(a) (3):** For the band 5.725–5.825 GHz, the maximum conducted output power over the frequency band of operation shall not exceed the lesser of 1 W or 17 dBm + 10 log B, where B is the 26-dB emission bandwidth in MHz.

**Test Procedure:** The EUT was connected to a Spectrum Analyzer. The power was measured on three channels.

**Test Results:** Equipment was compliant with the Peak Power Output limits of § 15.401(a)(2).

**Test Engineer(s):** Dusmantha Tennakoon

**Test Date(s):** 10/06/09

| Frequency<br>(MHz) | Conducted Power<br>(dBm) | Conducted Power<br>(mW) | Limit<br>(W) |
|--------------------|--------------------------|-------------------------|--------------|
| 5745               | 14.64                    | 29.1                    | 1            |

### § 15.407(a)(3) Peak Power Spectral Density

**Test Requirements:** § 15.407(a)(3): The peak power spectral density shall not exceed 17 dBm in any 1-MHz band. If transmitting antennas of directional gain greater than 6 dBi are used, both the maximum conducted output power and the peak power spectral density shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi. However, fixed point-to-point U-NII devices operating in this band may employ transmitting antennas with directional gain up to 23dBi without any corresponding reduction in the transmitter peak output power or peak power spectral density. For fixed, point-to-point U-NII transmitters that employ a directional antenna gain greater than 23 dBi, a 1 dB reduction in peak transmitter power and peak power spectral density for each 1 dB of antenna gain in excess of 23 dBi would be required. Fixed, point-to-point operations exclude the use of point-to-multipoint systems, Omni directional applications, and multiple collocated transmitters transmitting the same information. The operator of the U-NII device, or if the equipment is professionally installed, the installer, is responsible for ensuring that systems employing high gain directional antennas are used exclusively for fixed, point-to-point operations.

**Test Procedure:** The transmitter was connected directly to a Spectrum Analyzer through an attenuator. The power level was set to the maximum level on the EUT. The RBW was set to 1MHz and the VBW was set to 3MHz. The method of measurement #2 from the FCC Public Notice DA 02-2138 was used.

**Test Results:** Equipment was compliant with the peak power spectral density limits of § 15.407 (a)(2). The peak power spectral density was determined from plots on the following page(s).

**Test Engineer(s):** Dusmantha Tennakoon

**Test Date(s):** 10/06/09

| Frequency (MHz) | PSD (dBm) |
|-----------------|-----------|
| 5745            | 12.99     |
| 5785            | 12.1      |
| 5805            | 12.01     |

### § 15.407(a)(6) Peak Excursion Ratio

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Test Requirements:</b> | <b>§ 15.407(a)(6):</b> The ratio of the peak excursion of the modulation envelope (measured using a peak hold function) to the maximum conducted output power (measured as specified above) shall not exceed 13 dB across any 1 MHz bandwidth or the emission bandwidth whichever is less.                                                                                                                      |
| <b>Test Procedure:</b>    | The EUT was connected directly to the spectrum analyzer through cabling and attenuation. The 1 <sup>st</sup> trace on the spectrum analyzer was set to RBW=1MHz, VBW=3MHz. The peak detector mode was used and the trace max held. The 2 <sup>nd</sup> trace on the spectrum analyzer was set according to measurement method #1 from the FCC Public Notice DA 02-2138 for making conducted power measurements. |
| <b>Test Results:</b>      | Equipment was compliant with the peak excursion ratio limits of <b>§ 15.407(a)(6)</b> . The peak excursion ratio was determined from plots on the following page(s).                                                                                                                                                                                                                                            |
| <b>Test Engineer(s):</b>  | Dusmantha Tennakoon                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Test Date(s):</b>      | 10/06/09                                                                                                                                                                                                                                                                                                                                                                                                        |

## Electromagnetic Compatibility Criteria for Intentional Radiators

### § 15.407(b) Undesirable Emissions

**Test Requirements:** § 15.407(b)(4), (b)(6), (b)(7), §15.205: Emissions outside the frequency band.

**§ 15.407(b)(4):** For transmitters operating in the 5.725–5.825 GHz band: all emissions within the frequency range from the band edge to 10 MHz above or below the band edge shall not exceed an EIRP of –17 dBm/MHz; for frequencies 10 MHz or greater above or below the band edge, emissions shall not exceed an EIRP of –27 dBm/MHz.

**§ 15.407(b)(6):** Unwanted emissions below 1 GHz must comply with the general field strength limits set forth in Section 15.209. Further, any U-NII devices using an AC power line are required to comply also with the conducted limits set forth in Section 15.207.

**§ 15.407(b)(7):** The provisions of Section 15.205 of this part apply to intentional radiators operating under this section.

**Test Procedure:** The transmitter was placed on an acrylic stand inside in a semi-anechoic chamber. Measurements were performed with the EUT rotated 360 degrees and varying the adjustable antenna mast height to determine worst case orientation for maximum emissions.

For frequencies from 30 MHz to 1 GHz, measurements were made using a quasi-peak detector with a 120 kHz bandwidth.

For measurements above 1 GHz, measurements were made with a Peak detector with 1 MHz resolution bandwidth. Where the spurious emissions fell into a restricted band, measurements were also made with an average detector to make sure they complied with 15.209 limits. Emissions were explored up to 40 GHz.

The equation,  $EIRP = E + 20 \log D - 104.8$  was used to convert an EIRP limit to a field strength limit.

E = field strength (dBV/m)

D = Reference measurement distance

**Test Results:** The EUT was compliant with the Radiated Emission limits for Intentional Radiators. See following pages for detailed test results.

**Test Engineer(s):** Dusmantha Tennakoon

**Test Date(s):** 10/06/09

## Electromagnetic Compatibility Criteria for Intentional Radiators

### § 15.407(b)(4): Harmonic and Spurious Emissions Requirements – Radiated

| Channel (MHz) | Frequency (GHz) | Measured value (corrected) @ 1m dBμV/m | Limit @ 1m | Margin | Remark |
|---------------|-----------------|----------------------------------------|------------|--------|--------|
| 5745          | 5.3             | 76.03                                  | 77.8       | -1.77  | Peak   |
|               | 5.4452          | 46.06                                  | 63.5       | -17.44 | Avg    |
|               | 5.35            | 65.49                                  | 83.5       | -18.01 | Peak   |
|               | 6.7209          | 76.05                                  | 77.8       | -1.75  | Peak   |
|               | 17.9725         | 65.09                                  | 77.8       | -12.71 | Peak   |
| 5785          | 5.5124          | 74.81                                  | 77.8       | -2.99  | Peak   |
|               | 5.4501          | 46.18                                  | 63.5       | -17.32 | Avg    |
|               | 5.4454          | 58.69                                  | 83.5       | -24.81 | Peak   |
|               | 6.7239          | 75.55                                  | 77.8       | -2.25  | Peak   |
|               | 17.9175         | 65.35                                  | 77.8       | -12.45 | Peak   |
| 5805          | 5.5714          | 74.9                                   | 77.8       | -2.9   | Peak   |
|               | 5.4592          | 46.13                                  | 63.5       | -17.37 | Avg    |
|               | 5.4353          | 57.9                                   | 83.5       | -25.6  | Peak   |
|               | 6.7466          | 76.18                                  | 77.8       | -1.62  | Peak   |
|               | 17.945          | 65.45                                  | 77.8       | -12.35 | Peak   |

**Table 13. Radiated Spurs, Test Results**

Note: All other emissions were measured at the noise floor of the spectrum analyzer.

Limit Calculations:

-27 dBm/MHz

$$\text{EIRP} = E0 + 20\log(D) - 104.8$$

$$E0 = -27 + 104.8 \text{ (measurements made at 1m)}$$

$$E0 = 77.8 \text{ dBuV/m}$$

-17 dBm/MHz:

$$\text{EIRP} = E0 + 20\log(D) - 104.8$$

$$E0 = -17 + 104.8$$

$$E0 = 87.8 \text{ dBuV/m}$$

## Electromagnetic Compatibility Criteria for Intentional Radiators

### § 15.407(f) RF Exposure

**RF Exposure Requirements:** §1.1307(b)(1) and §1.1307(b)(2): Systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy levels in excess of the Commission's guidelines.

**RF Radiation Exposure Limit:** §1.1310: As specified in this section, the Maximum Permissible Exposure (MPE) Limit shall be used to evaluate the environmental impact of human exposure to radiofrequency (RF) radiation as specified in Sec. 1.1307(b), except in the case of portable devices which shall be evaluated according to the provisions of Sec. 2.1093 of this chapter.

MPE Limit Calculation: EUT's operating frequency is 5745MHz and 5805 MHz;. Highest conducted power = 29.1mW (i.e. 14.64dBm). Therefore, **Limit for Uncontrolled exposure: 1 mW/cm<sup>2</sup>**.

Equation from page 18 of OET 65, Edition 97-01

$$S = P G / 4\pi R^2$$

S = Power Density mW/m<sup>2</sup>

P = Power (mW)

R = Distance to the center of radiation of the antenna

G = Maximum antenna gain

Maximum antenna gain for EUT = 5 dBi = 3.16

P = 29.1 mW

R = 20 cm

G = 3.16

$$S = 29.1 * 3.16 / 4(3.1416)(20)^2$$

$$S = 0.0183 \text{ mW/cm}^2$$

Therefore, EUT meets the Uncontrolled Exposure limit at 20cm.

## Electromagnetic Compatibility Criteria for Intentional Radiators

### § 15.407(g) Frequency Stability

**Test Requirements:** § 15.407(g): Manufacturers of U-NII devices are responsible for ensuring frequency stability such that an emission is maintained within the band of operation under all conditions of normal operation as specified in the users manual.

**Test Procedure:** The EUT was connected directly to a spectrum analyzer through a attenuator. The resolution band width of the spectrum analyzer was set to 10 KHz. The 1<sup>st</sup> trace of the Spectrum Analyzer was used as a reference at 23°C. A 2<sup>nd</sup> trace was used to show the drift of the carrier at extreme conditions. A delta marker was used to find the drift at a given extreme condition. The two frequencies (i.e. 5300 MHz and 5550 MHz) are derived from one oscillator. Therefore, only one channel was investigated for frequency stability.

**Test Results:** The EUT was compliant with the requirements of §15.407(g).

## **V. Certification & User's Manual Information**

## Certification & User's Manual Information

### A. Certification Information

The following is extracted from Title 47 of the Code of Federal Regulations, Part 2, Subpart I — Marketing of Radio frequency devices:

#### § 2.801 Radio-frequency device defined.

As used in this part, a radio-frequency device is any device which in its operation is capable of Emitting radio-frequency energy by radiation, conduction, or other means. Radio- frequency devices include, but are not limited to:

- (a) The various types of radio communication transmitting devices described throughout this chapter.
- (b) *The incidental, unintentional and intentional radiators defined in Part 15 of this chapter.*
- (c) The industrial, scientific, and medical equipment described in Part 18 of this chapter.
- (d) Any part or component thereof which in use emits radio-frequency energy by radiation, conduction, or other means.

#### § 2.803 Marketing of radio frequency devices prior to equipment authorization.

- (a) Except as provided elsewhere in this chapter, no person shall sell or lease, or offer for sale or lease (including advertising for sale or lease), or import, ship or distribute for the purpose of selling or leasing or offering for sale or lease, any radio frequency device unless:
  - (1) In the case of a device subject to certification, such device has been authorized by the Commission in accordance with the rules in this chapter and is properly identified and labeled as required by §2.925 and other relevant sections in this chapter; or
  - (2) In the case of a device that is not required to have a grant of equipment authorization issued by the Commission, but which must comply with the specified technical standards prior to use, such device also complies with all applicable administrative (including verification of the equipment or authorization under a Declaration of Conformity, where required), technical, labeling and identification requirements specified in this chapter.
- (d) Notwithstanding the provisions of paragraph (a) of this section, the offer for sale solely to business, commercial, industrial, scientific or medical users (but not an offer for sale to other parties or to end users located in a residential environment) of a radio frequency device that is in the conceptual, developmental, design or pre-production stage is permitted prior to equipment authorization or, for devices not subject to the equipment authorization requirements, prior to a determination of compliance with the applicable technical requirements *provided* that the prospective buyer is advised in writing at the time of the offer for sale that the equipment is subject to the FCC rules and that the equipment will comply with the appropriate rules before delivery to the buyer or to centers of distribution.

- (e)(1) Notwithstanding the provisions of paragraph (a) of this section, prior to equipment authorization or determination of compliance with the applicable technical requirements any radio frequency device may be operated, but not marketed, for the following purposes and under the following conditions:
- (i) *Compliance testing*;
  - (ii) Demonstrations at a trade show provided the notice contained in paragraph (c) of this section is displayed in a conspicuous location on, or immediately adjacent to, the device;
  - (iii) Demonstrations at an exhibition conducted at a business, commercial, industrial, scientific or medical location, but excluding locations in a residential environment, provided the notice contained in paragraphs (c) or (d) of this section, as appropriate, is displayed in a conspicuous location on, or immediately adjacent to, the device;
  - (iv) Evaluation of product performance and determination of customer acceptability, provided such operation takes place at the manufacturer's facilities during developmental, design or pre-production states; or
  - (v) Evaluation of product performance and determination of customer acceptability where customer acceptability of a radio frequency device cannot be determined at the manufacturer's facilities because of size or unique capability of the device, provided the device is operated at a business, commercial, industrial, scientific or medical user's site, but not at a residential site, during the development, design or pre-production stages.
- (e)(2) For the purpose of paragraphs (e)(1)(iv) and (e)(1)(v) of this section, the term *manufacturer's facilities* includes the facilities of the party responsible for compliance with the regulations and the manufacturer's premises, as well as the facilities of other entities working under the authorization of the responsible party in connection with the development and manufacture, but not the marketing, of the equipment.
- (f) For radio frequency devices subject to verification and sold solely to business, commercial, industrial, scientific and medical users (excluding products sold to other parties or for operation in a residential environment), parties responsible for verification of the devices shall have the option of ensuring compliance with the applicable technical specifications of this chapter at each end user's location after installation, provided that the purchase or lease agreement includes a proviso that such a determination of compliance be made and is the responsibility of the party responsible for verification of the equipment.

## Certification & User's Manual Information

The following is extracted from Title 47 of the Code of Federal Regulations, Part 2, Subpart J — Equipment Authorization Procedures:

### § 2.901 Basis and Purpose

- (a) In order to carry out its responsibilities under the Communications Act and the various treaties and international regulations, and in order to promote efficient use of the radio spectrum, the Commission has developed technical standards for radio frequency equipment and parts or components thereof. The technical standards applicable to individual types of equipment are found in that part of the rules governing the service wherein the equipment is to be operated.<sup>1</sup> *In addition to the technical standards provided, the rules governing the service may require that such equipment be verified by the manufacturer or importer, be authorized under a Declaration of Conformity, or receive an equipment authorization from the Commission by one of the following procedures: certification or registration.*
- (b) The following sections describe the verification procedure, the procedure for a Declaration of Conformity, and the procedures to be followed in obtaining certification from the Commission and the conditions attendant to such a grant.

### § 2.907 Certification.

- (a) Certification is an equipment authorization issued by the Commission, based on representation and test data submitted by the applicant.
- (b) Certification attaches to all units subsequently marketed by the grantee which are identical (see Section 2.908) to the sample tested except for permissive changes or other variations authorized by the Commission pursuant to Section 2.1043.

---

<sup>1</sup> In this case, the equipment is subject to the rules of Part 15. More specifically, the equipment falls under Subpart B (of Part 15), which deals with unintentional radiators.

## Certification & User's Manual Information

### § 2.948 Description of measurement facilities.

- (a) Each party making measurements of equipment that is subject to an equipment authorization under Part 15 or Part 18 of this chapter, regardless of whether the measurements are filed with the Commission or kept on file by the party responsible for compliance of equipment marketed within the U.S. or its possessions, shall compile a description of the measurement facilities employed.
  - (1) If the measured equipment is subject to the verification procedure, the description of the measurement facilities shall be retained by the party responsible for verification of the equipment.
    - (i) *If the equipment is verified through measurements performed by an independent laboratory, it is acceptable for the party responsible for verification of the equipment to rely upon the description of the measurement facilities retained by or placed on file with the Commission by that laboratory. In this situation, the party responsible for the verification of the equipment is not required to retain a duplicate copy of the description of the measurement facilities.*
    - (ii) If the equipment is verified based on measurements performed at the installation site of the equipment, no specific site calibration data is required. It is acceptable to retain the description of the measurement facilities at the site at which the measurements were performed.
  - (2) If the equipment is to be authorized by the Commission under the certification procedure, the description of the measurement facilities shall be filed with the Commission's Laboratory in Columbia, Maryland. The data describing the measurement facilities need only be filed once but must be updated as changes are made to the measurement facilities or as otherwise described in this section. At least every three years, the organization responsible for filing the data with the Commission shall certify that the data on file is current.

## Certification & User's Manual Information

### Label and User's Manual Information

The following is extracted from Title 47 of the Code of Federal Regulations, Part 15, Subpart A — General:

#### § 15.19 Labeling requirements.

(a) *In addition to the requirements in Part 2 of this chapter, a device subject to certification or verification shall be labeled as follows:*

- (1) Receivers associated with the operation of a licensed radio service, e.g., FM broadcast under Part 73 of this chapter, land mobile operation under Part 90, etc., shall bear the following statement in a conspicuous location on the device:

This device complies with Part 15 of the FCC Rules. Operation is subject to the condition that this device does not cause harmful interference.

- (2) A stand-alone cable input selector switch, shall bear the following statement in a conspicuous location on the device:

This device is verified to comply with Part 15 of the FCC Rules for use with cable television service.

- (3) All other devices shall bear the following statement in a conspicuous location on the device:

*This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.*

- (4) Where a device is constructed in two or more sections connected by wires and marketed together, the statement specified under paragraph (a) of this section is required to be affixed only to the main control unit.

- (5) When the device is so small or for such use that it is not practicable to place the statement specified under paragraph (a) of this section on it, the information required by this paragraph shall be placed in a prominent location in the instruction manual or pamphlet supplied to the user or, alternatively, shall be placed on the container in which the device is marketed. However, the FCC identifier or the unique identifier, as appropriate, must be displayed on the device.

#### § 15.21 Information to user.

The users manual or instruction manual for an intentional or unintentional radiator shall caution the user that changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

## Verification & User's Manual Information

The following is extracted from Title 47 of the Code of Federal Regulations, Part 15, Subpart B — Unintentional Radiators:

### § 15.105 Information to the user.

- (a) For a Class A digital device or peripheral, the instructions furnished the user shall include the following or similar statement, placed in a prominent location in the text of the manual:

Note: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at own expense.

- (b) For a Class B digital device or peripheral, the instructions furnished the user shall include the following or similar statement, placed in a prominent location in the text of the manual:

Note: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a residential environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.
