## Laboratories Introduction

SIEMIC, headquartered in the heart of Silicon Valley, with superior facilities in US and Asia, is one of the leading independent testing and certification facilities providing customers with one-stop shop services for Compliance Testing and Global Certifications.

In addition to testing and certification, SIEMIC provides initial design reviews and compliance management throughout a project. Our extensive experience with China, Asia Pacific, North America, European, and International compliance requirements, assures the fastest, most cost effective way to attain regulatory compliance for the global markets.

### Accreditations for Conformity Assessment

| Country/Region | Scope                              |
|----------------|------------------------------------|
| USA            | EMC, RF/Wireless, SAR, Telecom     |
| Canada         | EMC, RF/Wireless, SAR, Telecom     |
| Taiwan         | EMC, RF, Telecom, SAR, Safety      |
| Hong Kong      | RF/Wireless, SAR, Telecom          |
| Australia      | EMC, RF, Telecom, SAR, Safety      |
| Korea          | EMI, EMS, RF, SAR, Telecom, Safety |
| Japan          | EMI, RF/Wireless, SAR, Telecom     |
| Singapore      | EMC, RF, SAR, Telecom              |
| Europe         | EMC, RF, SAR, Telecom, Safety      |

#### 4. Equipment Under Test (EUT) Information

Description of EUT: Magic Series Legic Reader

Main Model: LE322-8K

Serial Model: LE322-8N

Date EUT received: November 11, 2016

Test Date(s): November 21 to November 22, 2016

Antenna Gain: 13.56MHz: 6dBi

Type of Modulation: ASK

RF Operating Frequency (ies): 13.56MHz

Number of Channels: 1 CH

Input Power: DC 12V

Trade Name : N/A

FCC ID: X3A-LE322

Note: the difference between these models please refer to **ANNEX E. DECLARATION OF SIMILARITY.**

## 5. Test Summary

The product was tested in accordance with the following specifications.  
All testing has been performed according to below product classification:

| FCC Rules          | Description of Test         | Result     |
|--------------------|-----------------------------|------------|
| §15.203            | Antenna Requirement         | Compliance |
| §15.207(a)         | Conducted Emissions Voltage | Compliance |
| §15.225(a)         | Fundamental Field Strength  | Compliance |
| §15.225(b)         | Fundamental Field Strength  | Compliance |
| §15.225(c)         | Fundamental Field Strength  | Compliance |
| §15.225(d), 15.209 | Radiated Emissions          | Compliance |
| §15.225(e)         | Frequency Stability         | Compliance |
| §15.215(c)         | Occupied Bandwidth          | Compliance |

### Measurement Uncertainty

| Emissions                                         |                                                                                                                                                 |                   |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| Test Item                                         | Description                                                                                                                                     | Uncertainty       |
| Conducted Emissions & Radiated Spurious Emissions | Confidence level of approximately 95% (in the case where distributions are normal), with a coverage factor of 2 (for EUTs < 0.5m X 0.5m X 0.5m) | 1.634dB / 3.952dB |

## **6. Measurements, Examination And Derived Results**

### **6.1 Antenna Requirement**

#### **Applicable Standard**

**Requirement(s):** 47 CFR §15.203

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device.

Antenna requirement must meet at least one of the following:

- a) Antenna must be permanently attached to the device.
- b) Antenna must use a unique type of connector to attach to the device.
- c) Device must be professionally installed. Installer shall be responsible for ensuring that the correct antenna is employed with the device.

The antenna is permanently attached to the device which meets the requirement.

**Result:** Compliance.

## 6.2 Conducted Emissions Voltage

|                      |                   |
|----------------------|-------------------|
| Temperature          | 25°C              |
| Relative Humidity    | 50%               |
| Atmospheric Pressure | 1019mbar          |
| Test date :          | November 21, 2016 |
| Tested By :          | Louise Tu         |

### Conducted Emission Limit

| Frequency ranges (MHz) | Limit (dBμV) |         |
|------------------------|--------------|---------|
|                        | QP           | Average |
| 0.15 ~ 0.5             | 66 – 56      | 56 – 46 |
| 0.5 ~ 5                | 56           | 46      |
| 5 ~ 30                 | 60           | 50      |

| Spec                        | Item                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Requirement                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Applicable                          |

### Data sample

#### Data sample

| No. | Frequency<br>(MHz) | Reading<br>(dBμV) | Detector | Lisn/Isn<br>(dB) | Ps_Lmt<br>(dB) | Cab_L<br>(dB) | Result<br>(dBμV) | Limit<br>(dBμV) | Margin<br>(dB) |
|-----|--------------------|-------------------|----------|------------------|----------------|---------------|------------------|-----------------|----------------|
|-----|--------------------|-------------------|----------|------------------|----------------|---------------|------------------|-----------------|----------------|

Frequency (MHz) = Emission frequency in MHz

Reading (dBμV) = Receiver Reading Value

Detector=Quasi Peak Detector or Average Detector

Lisn/Isn= Insertion loss of LISN

Ps\_Lmt= Insertion loss of transient limiter (The transient limiter included 10dB attenuation)

Cab\_L= cable loss

Result (dBμV) = Reading Value + Corrected Value

Limit (dBμV) = Limit stated in standard

#### **Calculation Formula:**

Margin (dB) = Result (dBμV) – limit (dBμV)

**Test Mode:** Transmitting Mode

| Test Setup | <p>The diagram illustrates the test setup. On the left, the 'EUT &amp; Support Units' are placed on a 'Turn Table' which is 80cm high. A horizontal distance of 3m separates the turn table from the 'Ant. Tower'. The antenna tower has a '1-4m Variable' antenna. A 'Test Receiver' is connected to the antenna and sits on the 'Ground Plane'.</p> |

| Test Procedure | <ol style="list-style-type: none"> <li>The EUT was switched on and allowed to warm up to its normal operating condition.</li> <li>The test was carried out at the selected frequency points obtained from the EUT characterisation. Maximization of the emissions, was carried out by rotating the EUT, changing the antenna polarization, and adjusting the antenna height in the following manner: <ol style="list-style-type: none"> <li>Vertical or horizontal polarisation (whichever gave the higher emission level over a full rotation of the EUT) was chosen.</li> <li>The EUT was then rotated to the direction that gave the maximum emission.</li> <li>Finally, the antenna height was adjusted to the height that gave the maximum emission.</li> </ol> </li> <li>A peak measurement was then made for that frequency point.</li> <li>Steps 2 and 3 were repeated for the next frequency point, until all selected frequency points were measured.</li> </ol> |

| Procedure              | <div><div><div>1.</div><div>2.</div><div>3.</div><div>4.</div></div><div><div>The EUT was switched on and allowed to warm up to its normal operating condition.</div><div>The test was carried out at the selected frequency points obtained from the EUT characterisation. Maximization of the emissions, was carried out by rotating the EUT, changing the antenna polarization, and adjusting the antenna height in the following manner:<div><div>a.</div><div>b.</div><div>c.</div></div></div><div>A Quasi-peak measurement was then made for that frequency point.</div><div>Steps 2 and 3 were repeated for the next frequency point, until all selected frequency points were measured.</div></div></div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                |                                   |                                   |                               |             |             |     |             |              |    |            |    |    |       |       |   |        |       |   |         |       |   |           |     |   |
| Remark                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                |                                   |                                   |                               |             |             |     |             |              |    |            |    |    |       |       |   |        |       |   |         |       |   |           |     |   |

Test Plot ☒ Yes ☐ N/A

#### Data sample

| No. | Frequency | Reading  | Detector | Ant_F  | PA_G | Cab_L | Result   | Limit    | Margin | Height | Degree |
|-----|-----------|----------|----------|--------|------|-------|----------|----------|--------|--------|--------|
|     | (MHz)     | (dBμV/m) |          | (dB/m) | (dB) | (dB)  | (dBμV/m) | (dBμV/m) | (dB)   | (cm)   | (°)    |

Frequency (MHz) = Emission frequency in MHz

Reading (dBμV/m) = Receiver Reading Value

Detector= Peak Detector or Quasi Peak Detector

Ant\_F=Antenna Factor

PA\_G=Pre-Amplifier Gain

Cab\_L=Cable Loss

Result (dBμV/m) = Reading Value + Corrected Value

Limit (dBμV/m) = Limit stated in standard

Height (cm) = Height of Receiver antenna

Degree = Turn table degree

#### Calculation Formula:

Margin (dB) = Result (dBμV/m) – limit (dBμV/m)

| Test Procedure | <ol style="list-style-type: none"> <li>1&gt; Place the de-energized EUT in an environmental temperature test chamber. Supply the EUT with nominal ac voltage, or install a new or fully charged battery in the EUT. An antenna should be connected to the antenna output connector of the EUT if possible. Use of a dummy load could affect the output frequency of the EUT. If the EUT is equipped with or uses an adjustable-length antenna, it should be fully extended.</li> <li>2&gt; Turn the EUT on, and couple its output to a frequency counter or other frequency-measuring device of sufficient accuracy, considering the frequency tolerance with which the EUT shall comply.</li> <li>3&gt; Turn the EUT off, and place it inside an environmental chamber set to the highest temperature specified by the procuring or regulatory agency. For devices that are normally operated continuously, the EUT may be energized while inside the test chamber. For devices that have oscillator heaters, energize only the heater circuit while the EUT is inside the chamber.</li> <li>4&gt; Allow sufficient time (approximately 30 minutes) for the temperature of the chamber to stabilize. While maintaining a constant temperature inside the environmental chamber, turn the EUT on and measure the EUT operating frequency at startup, and two, five, and ten minutes after startup. Four measurements in total are made.</li> <li>5&gt; If 13.1.1 requires measurements on only one operating frequency, proceed to step f); otherwise, successively tune the EUT to each of the additional operating frequencies specified in 13.1.1 and repeat step d).</li> <li>6&gt; Repeat step d) and step e) with the temperature chamber set to the lowest temperature specified by the procuring or regulatory agency. Be sure to allow the environmental chamber temperature to stabilize before performing these measurements.</li> </ol> |

| §15.215(c)     | a)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Intentional radiators operating under the alternative provisions to the general emission limits, as contained in §§ 15.217 through 15.257 and in Subpart E of this part, must be designed to ensure that the 20 dB bandwidth of the emission, or whatever bandwidth may otherwise be specified in the specific rule section under which the equipment operates, is contained within the frequency band designated in the rule section under which the equipment is operated. The requirement to contain the designated bandwidth of the emission within the specified frequency band includes the effects from frequency sweeping, frequency hopping and other modulation techniques that may be employed as well as the frequency stability of the transmitter over expected variations in temperature and supply voltage. If a frequency stability is not specified in the regulations, it is recommended that the fundamental emission be kept within at least the central 80% of the permitted band in order to minimize the possibility of out-of-band operation. | <input checked="" type="checkbox"/> |

## Declaration letter

Dear Sir/Madam:

For our business issue and marketing requirement, we would like to list different models numbers on the CE certificates and reports, as following:

Model No: LE322-8K

LE322-8N

The two models have the same Circuits, components and color.

Apart from the different model name, the two models differ from each other by:

LE322-8K has the button function, but LE322-8 has no button function.

Thank you!
