1 General Information

1.1 General Description

The equipment under test (EUT) model EM-101R2, EM-103MDR2, EM-103SDR2 and EM-104R2 are a wireless transmitter. It operates at frequency 390MHz for transmitter. The oscillation of radio control is generated by a 26MHz crystal for RF transmitter. The EUT is powered by one 3V CR2032 button cell. The EUT contains one key, 3 keys and 4 keys for model EM-101R2, EM-103MDR2, EM-103SDR2 and EM-104R2 respectively. The key(s) is/are used to control the corresponding receiver .

The PCB antenna is used in EUT and the radio output power is unable to adjust.

EM-101R2, EM-103MDR2, EM-103SDR2 and EM-104R2 are same PCB and circuitry and only difference on the number of switch used and coding used. Therefore, EM-103MDR2 is selected as test model for radiated emission and bandwidth test and all models are selected for timing test and average factor test.

Model:	EM-101R2	EM-103MDR2	EM-103SDR2	EM-104R2

2 Description of the radiated emission test

2.1 Test Procedure

Radiated emissions measurements are investigated and taken pursuant to the procedures of ANSI C63.10 – 2013.

A non-conductive turntable with dimensions of 1.5m x 0.4m x 0.8m (L x W x H) placed above the reference ground plane. The equipment under test (EUT) was placed at 0.8m height for below 1GHz measurement and 1.5m height for above 1GHz measurement. The test distance is 3m between EUT and receiving antenna. A broadband antenna mounting on the mast received the signal strength. The turntable was rotated to maximize the emission level. The antenna was moving along the mast from 1m up to 4m until no more higher value was found. Both horizontal and vertical polarization of the antenna were placed and investigated. Additional absorbing material will be placed between the EUT and receiving antenna for above 1GHz measurement.

For below 30MHz, a loop antenna with its vertical plane is placed 3m from the EUT and rotated about its vertical axis for maximum response at each azimuth about the EUT. And the centre of the loop shall be 1 m above the ground.

The device was rotated through three orthogonal axes to determine which attitude and configuration produce the highest emission during measurement.

2.3 Test Result

Peak Detector data was measured unless otherwise stated.

The radiated emissions are measured from 9kHz to 4GHz (the tenth harmonics)

The worst case configuration is shown on the worst case configuration of test setup photo.

“#” means emissions appearing within the restricted bands of 47 CFR Part 15 section 15.205 and “*” means emission appearing within the restricted band of RSS-GEN section 8.10.

The frequencies from fundamental up to tenth harmonics were investigated, and emissions more 20dB below limit were not reported. Thus, those highest emissions were presented in next pages.

The EUT has been tested in Transmission mode.

It was found that the EUT meet the FCC and RSS requirement.

4.1 Bandwidth

Appendices A1 is shown the fundamental emission is confined in the specified band. The 20dB bandwidth is 6.174kHz and 99% bandwidth is 17.63kHz. The bandwidth requirement is 0.25% of 390MHz = 975kHz . It also shows that the EUT met the FCC Part 15.231(c) and RSS-210 Annex A1.3 bandwidth requirement and frequency stability requirement.

4.2 Average Factor

All keys of four models are tested and found that the lowest key of EM-103MDR2 is the worst case of average factor.

Note: Where the pulse train exceeds 0.1 seconds, the measured field strength shall be determined from the average absolute voltage during a 0.1 second interval.

$$\text{Duty Cycle} = \frac{4.05 + 1.37 * 18 + 4.05 + 0.70 * 26}{100} = 0.5096$$

Therefore, the average factor is found by $20 \log_{10} 0.5096 = -5.9 \text{ dB}$
