

Prediction of MPE limit at a given distance

Equation from page 18 of OET Bulletin 65, Edition 97-01

$$S = \frac{PG}{4\pi R^2}$$

where: S = power density
P = power input to the antenna
G = power gain of the antenna in the direction of interest relative to isotropic radiator
R = distance to the center of radiation of the antenna

PWR in dBm	Maximum peak output power at antenna input terminal:	61.8	dBm
	Maximum peak output power at antenna input terminal:	1499684.8	mW
	Ant. gain in dBi	0	dBi
	Antenna gain(maximum):	1.0	numeric
Use the duty cycle from test report or 100%	Time Averaging:	100	%
Separation distance from antenna to user in cm.	Prediction distance:	800	cm
Freq. in MHz	Prediction frequency:	1.8	MHz
	Power density at prediction frequency:	0.19	mW/cm ²
	This equates to:	1.86	W/m ²
