EXECUTIVE SUMMARY

A sample of this product was tested and found to be in compliance with FCC Part 15.247 Subpart C/ ICES 003 Issue 6 and RSS-247 Issue 2.

1 Report Summary

Report Modification Record

Alterations and additions to this report will be issued to the holders of each copy in the form of a complete document.

Issue	Description of Change	Date of Issue
1	First Issue	March 23 rd , 2020

Table 1 – Modification Records

Acronyms & Definitions

The following definitions and acronyms are applicable in this report. See also ANSI C63.14.

Acronyms

AM	Amplitude Modulation
DTS	Digital Transmission System
EIRP	Equivalent Isotropical Radiated Power
ETSI	European Telecommunications Standards Institute
EUT	Equipment Under Test
FVIN	Firmware Version Identification Number
HVIN	Hardware Version Identification Number(s)
OOB	Out of Band
PKPSD	Peak Power Spectrum Density
RBW	Resolution Bandwidth
RF	Radio Frequency of oscillation rate of electromagnetic fields (e.g. radio waves: 9kHz to 300GHz)
RMS	Root mean square, i.e., $V_p / \sqrt{2}$
Rx	Referred as antennae for receiving RF signals
SD	Spurious Domain
TR	Technical Report
Tx	Referred as antenna for transmitting RF signals
VBW	Video Bandwidth
Vp	Peak Voltage

EMC – Electro-Magnetic Compatibility. The ability of an equipment or system to function satisfactorily in its electromagnetic environment without introducing intolerable electromagnetic disturbances to anything in that environment.

EMI – Electro-Magnetic Immunity. The ability to maintain a specified performance when the equipment is subjected to disturbance (unwanted) signals of specified levels.

EUT – Equipment Under Test. A device or system being evaluated for compliance that is representative of a product to be marketed.

2 Introduction

Applicant:	Verdant Environmental Technologies, Inc.
Manufacturer:	Verdant Environmental Technologies, Inc.
Number of Samples Tested:	1
Test Specification/Issue/Date:	RSS-247 Issue 2 : February 2017 FCC Part 15 Subpart C.247 2016 ICES 003 Issue 6:2019
Test Plan/Issue/Date:	N/A
Project Number:	7169007677
Date:	2019-02-26
Date of Receipt of EUT:	2019-02-10
Start of Test:	2019-02-26
Finish of Test:	2019-02-26
Name of Tester(s):	Abdoulaye Ndiaye Jose Martinez-Ortega
Related Documents:	ANSI C63.10:2013 FCC 15. Subpart 15 Subpart C/RSS-247

Brief Summary of Results

A brief summary of the tests carried out in accordance with RSS-247 Issue 2, FCC Part 15 Subpart 15.247, FCC Part 15 Subpart 15.207 & FCC Part 15 Subpart 15.209 is summarized in Table 2.

Report Section	FCC Rule	IC Rule	Description	Class/Limit	Result
<u>6</u>	15.247(a)(1)	RSS-GEN.6.7	99% Bandwidth DTS+FHSS	Refer to RSS GEN.6.7	Pass
	15.247(a)(1)(i)	RSS-247.5.1	99% Bandwidth Hopping System	≤500kHz	Pass
<u>7</u>	15.247(a)(2)	RSS-247.5.2(a)	6 dB Bandwidth	>500kHz	Pass
<u>8</u>	15.247(a)(1)(i)	RSS 247 5.1 (c)	Hopping Channels	≥50	Pass
<u>9</u>	15.247(a)(1)	RSS 247 5.1 (2)	Channel Separation	> 25 kHz or 20 dB BW	Pass
<u>10</u>	15.247(a)(1)(i)	RSS 247 5.1 (c)	Time of occupancy	<0.4 s in 20s period	Pass
<u>11</u>	§15.247(b)(3)	RSS-247.5.4(d)	Maximum Peak Output Power (DTS)	< 1W	Pass
	15.247(b)(2)	RSS-247.5.4(a)	Maximum Peak Output Power (FHSS)	< 1W	
<u>12</u>	15.247(f)	RSS-247 5.2(b)	Power Spectral Density	<8dBm in any 3kHz Band	Pass
<u>13</u>	§15.247(d)	RSS-247 5.5	Band-Edge Spurious Conducted Emission	≤ 20dBc	Pass

Product Service

ZX Wired Thermostat

14	§15.209(a)	RSS-247 5.5	Tx Spurious Radiated Emission	Quasi-Peak Average	Pass
15	15.207(a)	RSS GEN 8.8	Conducted Emission	Quasi-Peak Average	Pass
-	15.247(h)	RSS 247 5.1	FHSS Intelligence	Note 3	Pass
-	15.247 (i)	RSS-102	RF Exposure	Note 4	Pass
-	15.247(b)(4)	RSS 247 5.4 (3)	Antenna Gain	<6dBi <Note 2>	Pass
-	15.203 & 15.247(b)	RSS-210	Antenna Requirement	Note 1	Not Applicable
Note 1: Manufacture uses a SMA antenna connector for unique coupling to the intentional radiator Note 2: For the Antenna requirement specified in FCC 15.203 (RSS-247 section 5.5), the unit uses a trace antenna with a gain of less than 6 dBi. Note 3: The EUT does not coordinate transmission with any other FHSS to avoid simultaneous occupation of hopping frequencies Note 4: For maximum permissible exposure, this device operates at less than 1 Watt at 902 - 928MHz and at 2.4GHz – 2.48GHz. It is designed to operate less than 20 cm from any personnel during normal operation. No testing is required; however, it complies with SAR exemption evaluation as determined the RF Exposure exhibits					

Table 2 – Test Summary Table

Declaration of Build Status

This report addresses the EMC verification testing and test results of the ZX Wired Thermostat as herein referred to as EUT (Equipment Under Test). The EUT was tested for compliance against the following standards:

RSS-247 Issue 2:2017

FCC Part 15 Subpart C 15.247:2016

ICES 003 Issue 6: 2019

Test procedures, results, justifications, and engineering considerations, if any, follow later in this report.

This report does not imply product endorsement by any government, accreditation agency, or TÜV SÜD Canada Inc.

Opinions or interpretations expressed in this report, if any, are outside the scope of TÜV SÜD Canada Inc accreditations. Any opinions expressed do not necessarily reflect the opinions of TÜV SÜD Canada Inc, unless otherwise stated.

For a more detailed list of the standards and the revision used, see the "Applicable Standards, Specifications and Methods" section of this report.

Notes, Justification

The following notes, justifications for tests not performed or deviations from the above listed specifications apply:

For the Antenna requirement specified in FCC 15.203 (RSS-247 section 5.5), the unit uses a trace antenna with a gain of less than 6 dBi

For the Restricted Bands of operation, the EUT is designed to only operate between 902 – 907.6 MHz and 2.402 – 2.48GHz.

The EUT does not coordinate transmission with any other FHSS to avoid simultaneous occupation of hopping frequencies.

For maximum permissible exposure, this device operates at less than 1 Watt at 902 - 928MHz and 2.4GHz – 2.48GHz. It is designed to operate less than 20 cm from any personnel during normal operation. No testing is required; however, it complies with SAR exemption evaluation as determined the RF Exposure exhibits.

For the scope of this test report, the EUT was mounted in three orthogonal axes to maximize emissions. Worst case results are presented

3.2 Modes of Operation

The ZX WIRED THERMOSTAT is operating in the 2.4 GHz and 915 MHz bands. For operation, wireless was configured to transmit at maximum possible duty cycle

The transmitter was provided in 2 different settings:

- A configuration with special test firmware was installed on the EUT to control hopping through its pseudo random sequence and single channel
- A configuration with low, medium and high channels transmitting continuously at a 100% duty cycle.

3.3 Setup Diagram

During the EUT was exercised by powering to the rated voltage and connecting according to Figure 1.

Figure 1: EUT Setup Diagram – ZX WIRED THERMOSTAT – Spurious emissions

4 Deviations from the Standard

No deviations from the applicable test standard were made during testing.

5 Measurement Uncertainty

The expanded measurement uncertainty is calculated in accordance with CISPR 16-4-2. For instance, for the range of 0.15MHz-30MHz, 30MHz – 1GHz and 1GHz – 18GHz is ± 3.3 dB, ± 4.25 dB and ± 4.93 dB, respectively with a 'k=2' coverage factor and a 95% confidence level.

Parameter	Uncertainty
Occupied channel Bandwidth	$\pm 5\%$
RF output power, conducted	± 1.5 dB
Power Spectral Density, conducted	± 3 dB
Unwanted Emission, conducted	± 3 dB
All emission, radiated	± 6 dB
Temperature	$\pm 3^{\circ}\text{C}$
Time Occupancy	$\pm 3\%$

Table 7 Acceptable Uncertainties

6 99% Bandwidth

6.1 Purpose & Methods

The Purpose & Methods of this test is to ensure that the bandwidth occupied exceeds a stated minimum. This helps ensure the utilization of the frequency allocation is sufficiently wide. This also helps prevent corruption of data by ensuring adequate data separation to distinguish the reception of the intended information. The test method is defined in ANSI C63.10.

6.2 Test Specifications

REFERENCE STANDARD	FCC 15.247(a)(1) ANSI C63.10-2013 Clause 6.9 RSS-247.5.1	
SPECIFICATIONS		
Limit – Bandwidth (kHz)	≤500	
Frequency range (MHz)	2402	902.46
	2442	915
	2480	927.52
RBW (kHz):	Set to 1% to 3% of the 99% bandwidth	
VBW (kHz)	3xRBW	
EUT		
Identification	ZX Wired Thermostat (2.4GHz) ZX Wired Thermostat (915MHz)	
Voltage Input	24Vdc	
ENVIRONMENTAL & TEST INFO		
Test Date (YYYY-MM-DD)	2019-03-22	
Temperature (°C)	23.4± 2

Atmospheric Pressure kPa (For Info Only)	109.7	
Tester	Abderrahmane Ferhat	
Client Witness	No Witness	

ZX Wired Thermostat

6.3 Test Results**ZX Wired Thermostat (2.4GHz)**

All the Channels gave a maximum of 1.0416 MHz for 99% BW. Details are depicted in Table 8.

Channel	Frequency (MHz)	99% Bandwidth (MHz)	Results
Low channel	2402	1.0416	Pass
Middle Channel	2442	1.0416	Pass
Highest Channel	2480	1.0416	Pass
Note 1: No Limit is applicable, but according to RSS GEN 5 the RBW has to be set to 1% to 3% of the 99% bandwidth			

Table 8 – 99% Bandwidth Results**ZX Wired Thermostat (900MHz)**

The Channel #0 gave a maximum of 182.7 kHz for 99% BW. Details are depicted in Table 9.

Channel	Frequency (MHz)	20 dB Bandwidth (kHz)	Limits (kHz)	Results
Low channel	902.46	182.7	≤500	Pass
Middle Channel	915	181.9	≤500	Pass
Highest Channel	927.52	181.1	≤500	Pass

6.4 Graphs

The graphs showed below show the OBW during the operation of the device. This is measured by a max hold on the spectrum analyzer and the highest resolution bandwidth that is sufficiently low to exhibit the 99% bandwidth of a channel during operation of the EUT. Max hold is performed for a duration of not less than 1 minute. No attenuator was used between the EUT and the Spectrum Analyzer.

7 6dB Bandwidth of Digitally Modulated Systems

7.1 Purpose & Methods

The Purpose & Methods of this test is to ensure that the bandwidth occupied exceeds a stated minimum. This helps ensure the utilization of the frequency allocation is sufficiently wide. This also helps prevent corruption of data by ensuring adequate data separation to distinguish the reception of the intended information. The test method is as defined in ANSI C63.10.

8 Hopping Channel

8.1 Purpose & Methods

The Purpose & Methods of this test is to ensure that the RF energy of frequency hopping systems is sufficiently spread over a spectrum and that the radio energy is not overly dense. This limit helps allow for other spread spectrum devices to co-exist in the same frequency spectrum. This also helps prevent corruption of data by ensuring adequate channel separation to distinguish the reception of the intended information. The test method is defined in ANSI C63.10.

Tester(s)	Abderrahmane Ferhat
Client Witness	No witness

8.3 Limits

The limits are as defined in 47 CFR FCC Part 15 Section 15.247(a)(1). The test method is defined in ANSI C63.10.

Frequency Band	20 dB Bandwidth of the hopping channel	Hopping Number
902 - 928	$\leq 250\text{kHz}$	≥ 50 channels
	$\geq 250\text{ kHz}$	≥ 25 channels
2400 - 2483.5	$\leq 250\text{kHz}$	≥ 15 channels
	$\geq 250\text{ kHz}$	≥ 15 channels
5275 - 5850	$\leq 250\text{kHz}$	≥ 75 channels
	$\geq 250\text{ kHz}$	≥ 75 channels

8.4 Test Results

The EUT passed the requirements of the number of channels. The number of channels occupied by the EUT and 64 channels in the allocation band of 902 MHz to 928 MHz. The results are depicted in Table 13.

Channel	Range (MHz)	Number of Hopping Measured	Limits	Results
Middle Channel:	902 - 928	64	≥ 50 channels	Pass

Table 13 – Hopping Channel Results

8.5 Graphs

The graphs below show the number of occupied channels during the operation of the device. This is measured by a max hold on the spectrum analyser and the highest resolution bandwidth that is sufficiently low to exhibit the channel spacing of the signal being measured. This measurement is a peak measurement. Max hold is performed for a duration of not less than 10 minutes, or as sufficient to capture the channels occupied.

Humidity (%)	36.3 ± 5
Atmospheric Pressure kPa (For Info Only)	109.7
Tester	Abderrahmane Ferhat
Client Witness	No Witness

9.3 Limits

The limits are as defined in 47 CFR FCC Part 15 Section 15.247(a)(1). The test method is defined in ANSI C63.10 as shown in the Table below

Frequency Band	20 dB Bandwidth of the hopping channel	Limits <Note 1>
902 - 928	≤250kHz	25kHz or 20dB BW
2400 - 2483.5	≤250kHz	25kHz or 20dB BW
	≤125mW	25 kHz or 2/3 of 20 dB BW ¹
5275 - 5850	≤250kHz	25kHz or 20dB BW
Note 1: The minimum channel separation is given by the greater of 25 kHz or 20 dB BW for unconditional operation. The 20 dB BW of the system was measured to be 184.63 kHz. Thus, a channel separation limit of 182.7kHz applies.		

9.4 Test Results

The results of the EUT are detailed in Table 15. Results are depicted in Table 15.

Channel	Range (MHz)	Channel Separation Measured <kHz>	Limits < kHz>	Results
Middle Channel:	902 - 915	378	≥182.7	Pass

Table 15 – Channel Separation Results

9.5 Graphs

The graphs shown below shows the channel spacing during the operation of the device. This is measured by a max hold on the spectrum analyser and the highest resolution bandwidth that is sufficiently low to exhibit the channel spacing of the signal being measured. This measurement is a peak measurement. Max hold is performed for a duration of not less than 1 minute, as the device is stepping through its hopping table.

Date: 22.MAR.2019 10:08:04

Tester	Abderrahmane Ferhat
Client Witness	No Witness

10.3 Limits

For frequency hopping systems operating in the 902-928 MHz band: if the 20 dB bandwidth of the hopping channel is less than 250 kHz, the system shall use at least 50 hopping frequencies and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 20 second period; if the 20 dB bandwidth of the hopping channel is 250 kHz or greater, the system shall use at least 25 hopping frequencies and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 10 second period. The maximum allowed 20 dB bandwidth of the hopping channel is 500 kHz.

10.4 Test Results

The EUT cycles through its pseudo-random generated list of hopping frequencies. There are 64 channels occupied in total. The average transmit time is 4.5 ms per channel and each channel is repeated approximately every 1s. Results are depicted in Table 17.

Channel	Range (MHz)	Average Transmit Time/ Channel (ms)	Number of Hops in 20s	Average Time of Occupancy (ms)	Limit (ms)	Results
Middle Channel: #34	902 - 915	4.5	20	90	≤400	Pass

11.3 Limits

The limits are defined in 15.247(b)(2) and 15.247(b)(3). For frequency hopping systems operating in the 902-928 MHz band: 1 watt for systems employing at least 50 hopping channels; and, 0.25 watts for systems employing less than 50 hopping channels, but at least 25 hopping channels, as permitted under paragraph (a)(1)(i) of this section.

For systems using digital modulation in the 902-928 MHz, 2400-2483.5 MHz, and 5725-5850 MHz bands: 1 Watt.

11.4 Tests Results

ZX Wired Thermostat (2.4GHz)

The Low Channel gave a maximum Peak Power of 8.79 dBm (7.56mW). Results of the peak power measurements of channels tested are depicted in Table 19.

Channel	Frequency (MHz)	Measured Peak Power (dBm)	Peak Power (mW)	Limit (W)	Result
Low	2402	8.79	7.56	1	Pass
Middle	2442	8.61	7.26	1	Pass
High	2480	8.12	6.48	1	Pass

12 Power Spectral Density

12.1 Purpose & Methods

The Purpose & Methods of this test is to ensure that the maximum power spectral density to the radiating element does not exceed the limits specified. This ensures that the modulation is significantly wide enough, or low enough in power that it will allow for co-operation of other wireless devices operating within this frequency allocation. The method applied is the PKPSD described in ANSI C63.10-2013 in Clause 11.10.

12.3 Limits

The limits are defined in 15.247(f)

The power spectral density conducted from the intentional radiator to the antenna due to the digital modulation operation of the hybrid system, with the frequency hopping operation turned off, shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission.

12.4 Test Results

ZX Wired Thermostat (2.4GHz)

The EUT was tested on: Low, medium, and high bands. The worst-case value is the Low Channel with -7.43 dBm as measured with a 3 kHz resolution bandwidth (peak power) on the higher channel #39. The results of the peak power of channels tested are depicted in Table 22.

Channel	Frequency (MHz)	Measured PSD (dBm)	Limit (dBm)	Results
Low	2402	-7.43	<8	Pass
Middle	2442	-7.56	<8	Pass
High	2480	-8.05	<8	Pass

Attenuator 10 dB	4779-10	Narda	NCR	NCR	4096

Table 23 – Test Instrumentation – PKPS

13 Band Edge Spurious Emission (-20 dBc Requirement)

13.1 Purpose & Methods

The Purpose of this test is to ensure that the maximum power conducted to the radiating element at frequencies outside of the authorized spectrum does not exceed the limits specified. This ensures that the only the intended signal is delivered to the radiating element. The method applied is described in ANSI C63.10-2013 in Clause 11.11.1.

13.2 Test Specifications

Humidity (%)	36.3 ± 5	
Atmospheric Pressure kPa (For Info Only)	109.7	
Tester	Abderrahmane Ferhat	
Client Witness	No Witness	

13.3 Limits

The limits are defined in 15.247(d). In any 100 kHz band, the peak spurious harmonics emissions must be at least 20 dB below the fundamental. Band Edge is to be evaluated up to the 10th harmonic. This -20 dBc requirement also applies at the 'band edge' of 2.4 GHz and 2.4835 GHz.

13.4 Test Setup

The Setup for the Maximum Peak Power testing is identical to the 99% Bandwidth setup.

13.5 Test Results

ZX Wired Thermostat (2.4GHz)

The EUT was tested on: Low, medium, and high bands. The worst-case value is -28.88 dBm and on High Channel. The peak power of channels tested are depicted in Table 24.

	Middle	2402-2483.5	-30	Pass
	High	2483.5-25000	-28.88	Pass
Note 1. The highest level of the fundamental is 8.79 dBm based on RF output Power results (see Table 19)				

Table 24- Results Band Edge – 2.4GHz Band

ZX Wired Thermostat

ZX WIRED THERMOSTAT (900MHz)

The EUT was tested on: Low, medium, and high bands. The worst-case value is -34.65 dBm on Middle channel. The peak power of channels tested are depicted in Table 25.

Frequency Band (MHz)	Channel	Frequency (MHz)	Measured Spurious Conducted (dBm)	Results <Note 1>
902 – 907.6	Low	0.009-0.15	-49.94	Pass
	Low	0.15-30	-48.16	Pass
	Low	30-1000	-42.5	Pass
	Low	900-902.46	-33.73	Pass
	Middle	902 - 928	-34.65	Pass
	Hight	1000 - 10000	-38.55	Pass
Note 1. The highest level of the fundamental is 8.79 dBm based on RF output Power results (see Table 20)				

Table 25- Results – Band Edge – 900GHz Band

13.6 Graphs

The graphs shown below show the worst-case peak power output of the device during the antenna conducted measurement during transmit operation of the EUT. No attenuator was used between the EUT and the Spectrum Analyzer.

13.7 Test Instruments

This test was carried out in Laval test location. Instrumentation used is depicted in Table 26.

Equipment	Model No.	Manufacturer	Calibration Period (months)	Calibration Due (YYY-MM-DD)	Asset No: LAVE
Spectrum Analyzer	ESU-40	Rohde & Schwarz	24	2019-04-20	4092
Attenuator 10 dB	4779-10	Narda	NCR	NCR	4096

Table 26 – Test Instrumentation – Band Edge

14 Tx Spurious Radiated Emissions

14.1 Purpose & Methods

The Purpose of this test is to ensure that the RF energy unintentionally emitted from the EUT does not exceed the limits listed below as defined in the applicable test standard, as measured from a receiving antenna. This helps protect broadcast radio services such as television, FM radio, pagers, cellular telephones, emergency services, and so on, from unwanted interference. The method is as defined in Section 12.1 of FCC KDB 558074 and ANSI C63.10.

All unintentional emissions must also meet the 'Spurious Conducted Emissions' requirements of -20 dBc or greater. See also '[Band Edge](#)' for further details. Limits are depicted in Table 27.

Frequency	Limit
0.009 MHz – 0.490 MHz	2400/F(kHz) uV/m at 300m ⁽¹⁾
0.490 MHz – 1.705 MHz	24000/F(kHz) uV/m at 30m ⁽¹⁾
1.705 MHz – 30 MHz	30 uV/m at 30m ⁽¹⁾
30 MHz – 88 MHz	100 uV/m (40.0 dBuV/m) at 3m ⁽¹⁾
88 MHz – 216 MHz	150 uV/m (43.5 dBuV/m) at 3m ⁽¹⁾
216 MHz – 960 MHz	200 uV/m (46.0 dBuV/m) at 3m ⁽¹⁾
Above 960 MHz	500 uV/m (54.0 dBuV/m) at 3m ⁽¹⁾
Above 1000 MHz	500 uV/m (54 dBuV/m) at 3m ⁽²⁾
Above 1000 MHz	500 uV/m (74 dBuV/m) at 3m ⁽³⁾
¹ Limit is with Quasi Peak detector with bandwidths as defined in CISPR-16-1-1	
² Limit is with 1 MHz measurement bandwidth and using an Average detector	
³ Limit is with 1 MHz measurement bandwidth and using a Peak detector	

Table 27 Limits – Tx Spurious

Based on ANSI C63.4 Section 4.2, if the Peak detector measurements do not exceed the Quasi-Peak limits, where defined, then the EUT is deemed to have passed the requirements.

14.3 Limits

The limits, as defined in 15.247(d) for intentional radiated emissions, apply for those emissions that fall in the restricted bands, as defined in Section 15.205(a). These emissions must comply with the radiated emission limits specified in Section 15.209(a).

14.4 Results

The EUT passed. Low, medium, and high bands were tested. The worst-case are only presented and final measurements are given in [Appendix A](#).

Channel	Frequency Range (MHz)	Frequency (MHz)	Polarization	Detector	Limit	Margin	Results <Note 2>	
Low	0.009 – 0.015	-	-	-	See Table 27	Note 1	Pass

	>1000			Average			Pass	
Note 1: No significant emission, i.e., 10dB below the limit was measured.								
Note 2: For Worst cases final measurements please refer to Appendix A : Table A1 to Table A4.								

Table 29 – Test Results for Tx Spurious Emission – Worst Cases(900MHz)

14.5 Graphs

The graphs shown below are maximized peak measurement graphs measured with a resolution bandwidth greater than or equal to the final required detector over a full 0-360°. This peaking process is done as a worst-case measurement and enables the detection of frequencies of concern for final measurement. For final measurements with the appropriate detector, where applicable, please refer to the tables under Final Measurements.

In accordance with FCC Part 15, Subpart A, Section 15.33, the device was scanned to the 10th harmonic (a minimum of 24.835 GHz).

Devices scanned may be scanned at alternate test distances and in accordance with FCC Part 15, Subpart A, Section 15.31, an extrapolation factor of 20 dB/decade was used above 30 MHz and 40 dB/decade below 30 MHz for example, for 1-meter measurements, an extrapolation factor 9.5 dB from 20 Log (1m / 3m) is applied.

Low, middle and high channels. However, the worst-case graphs are presented.
