1.3 Equipment Under Test [EUT]

Description of Sample

Product Description:	EMPRESS 2.4GHz WIRELESS ACTIVE RFID READER
Model No:	HKRAR-EM02
FCCID:	XNO-HKRAR-EM02
Rating:	AC/DC Adaptor Model: KSAS0120500200HK Input: 100-240VAC, 50/60Hz Output: 5.0 VDC, 2A
Accessories and Auxiliary Equipment:	AC/DC power adaptor, ThinkPad Notebook
EUT Exercising Software:	None

Description of EUT

The Equipment Under Test (EUT) is a RFID Reader.

As per Client Declaration, the circuit design, PCB Layout, shielding and interfaces of HKRAR-EM02-SP are identical for HKRAR-EM02-ETH, HKRAR-EM02-POE, only the Power Source Connection and grouping are different. So we use the HKRAR-EM02-SP as a representative model.

1.4 Equipment Modification

No modification was conducted on the tested sample by TÜV SÜD Hong Kong Ltd.

1.5 Related Submittal(s) Grants

This is a signal application subject to Certificate Authorization.

Perform ElectroMagnetic Interference measurement in accordance with FCC 47CFR [Codes of Federal Regulations] Part 15 and ANSI C63.4: 2009.

2.2 Test Standards and Results Summary Tables

3.0 Test Methodology

3.1 Radiated Emission

The sample was placed 0.8m above the ground plane on a standard emission test site *. Measurements in both horizontal and vertical polarities were performed. During the test, each emission was maximized by: having the EUT continuously working, investigated all operating modes, rotated about all 3 axis (X, Y & Z) and considered typical configuration to obtain worst position, manipulating interconnecting cables, rotating turntable, varying antenna height from 1m to 4m in both horizontal and vertical polarizations. The emissions worst-case are shown in Test Results of the following pages.

3.2 Field Strength Calculation

The field strength at 3 m was established by adding the meter reading of the spectrum analyzer to the factors associated with antenna correction factor, cable loss, preamplifiers and filter attenuation.

The equation is expressed as follow:

$FS = R + \text{System Factor}$

$\text{System Factor} = AF + CF + FA - PA$

Where FS = Net Field Strength in dBuV/m at 3 meters.

R = Reading of Spectrum Analyzer / Test Receiver in dBuV.

AF = Antenna Factor in dB.

CF = Cable Attenuation Factor in dB.

FA = Filter Attenuation Factor in dB.

PA = Preamplifier Factor in dB.

FA and PA are only be used for the measuring frequency above 1 GHz.

3.3 Conducted Emissions

The EUT was placed on a non-metallic table 0.8m above the horizontal metal reference plane and 0.4m from a vertical ground plane which is connected to the horizontal metal ground plane. Meanwhile, the AC main of EUT was connected to the distance of 0.8m line impedance stabilization network (LISN) during measurement.

Initial measurements were performed in quasi-peak and average detection modes by the test receiver, any emissions recorded within 30dB of the relevant limit lines were re-measured using quasi-peak and average detection on the live and neutral lines with the worst case recorded in the table of results.
