Power requirements	7.4 V _{DC} Lithium battery
Antenna information	2.54 dBi The EUT uses a unique antenna coupling/ non-detachable antenna to the intentional radiator.

3.4 Product description and theory of operation

The Ziosk is a wireless, battery operated touch screen device with a 7" LCD display, used for pay-at-the-table applications in casual dining restaurants. The device can display menu items, specials, entertainment and local area information; it can also process credit card payments and print receipts.

3.5 EUT exercise details

EUT was connected to Laptop via internal (not user accessible) USB connector and Android shell commands were used to control channel, modulation and data rate settings.

3.6 EUT setup diagram

Figure 3.6-1: Setup diagram

Section 4. Engineering considerations

4.1 Modifications incorporated in the EUT

There were no modifications performed to the EUT during this assessment.

4.2 Technical judgment

None

4.3 Deviations from laboratory tests procedures

No deviations were made from laboratory procedures.

Section 5. Test conditions

5.1 Atmospheric conditions

Temperature	15–30 °C
Relative humidity	20–75 %
Air pressure	860–1060 mbar

When it is impracticable to carry out tests under these conditions, a note to this effect stating the ambient temperature and relative humidity during the tests shall be recorded and stated.

5.2 Power supply range

The normal test voltage for equipment to be connected to the mains shall be the nominal mains voltage. For the purpose of the present document, the nominal voltage shall be the declared voltage, or any of the declared voltages $\pm 5\%$, for which the equipment was designed.

Section 6. Measurement uncertainty

6.1 Uncertainty of measurement

Nemko Canada Inc. has calculated measurement uncertainty and is documented in EMC/MUC/001 "Uncertainty in EMC measurements." Measurement uncertainty was calculated using the methods described in CISPR 16-4 Specification for radio disturbance and immunity measuring apparatus and methods – Part 4: Uncertainty in EMC measurements; as well as described in UKAS LAB34: The expression of Uncertainty in EMC Testing. Measurement uncertainty calculations assume a coverage factor of $K=2$ with 95% certainty.

Section 8. Testing data

8.1 FCC 15.403(i) Emission bandwidth

8.1.1 Definitions and limits

For purposes of this subpart the emission bandwidth shall be determined by measuring the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, that are 26 dB down relative to the maximum level of the modulated carrier. Determination of the emissions bandwidth is based on the use of measurement instrumentation employing a peak detector function with an instrument resolution bandwidth approximately equal to 1.0 percent of the emission bandwidth of the device under measurement.

8.2 FCC 15.407(a)(1) 5.15–5.25 GHz band output power, EIRP and spectral density limits

8.2.1 Definitions and limits

- (3) (ii) For an indoor access point operating in the band 5.15–5.25 GHz, the maximum conducted output power over the frequency band of operation shall not exceed 1 W provided the maximum antenna gain does not exceed 6 dBi. In addition, the maximum power spectral density shall not exceed 17 dBm in any 1 megahertz band. If transmitting antennas of directional gain greater than 6 dBi are used, both the maximum conducted output power and the maximum power spectral density shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.
- (4) The maximum conducted output power must be measured over any interval of continuous transmission using instrumentation calibrated in terms of an rms-equivalent voltage.
- (5) The maximum power spectral density is measured as a conducted emission by direct connection of a calibrated test instrument to the equipment under test. If the device cannot be connected directly, alternative techniques acceptable to the Commission may be used. Measurements in the 5.15–5.25 GHz, 5.25–5.35 GHz, and the 5.47–5.725 GHz bands are made over a bandwidth of 1 MHz or the 26 dB emission bandwidth of the device, whichever is less. A narrower resolution bandwidth can be used, provided that the measured power is integrated over the full reference bandwidth.

8.3 FCC 15.407(b) Spurious (out-of-band) emissions

8.3.1 Definitions and limits

- (1) For transmitters operating in the 5.15–5.25 GHz band: all emissions outside of the 5.15–5.35 GHz band shall not exceed an EIRP of –27 dBm/MHz.
(5) The emission measurements shall be performed using a minimum resolution bandwidth of 1 MHz. A lower resolution bandwidth may be employed near the band edge, when necessary, provided the measured energy is integrated to show the total power over 1 MHz.
(6) Unwanted emissions below 1 GHz must comply with the general field strength limits set forth in § 15.209.
(7) The provisions of § 15.205 apply to intentional radiators operating under this section.
(8) When measuring the emission limits, the nominal carrier frequency shall be adjusted as close to the upper and lower frequency block edges as the design of the equipment permits.

Table 8.3-1: FCC §15.209 – Radiated emission limits

8.3.2 Test summary

Test date	September 24, 2014	Temperature	22 °C
Test engineer	Andrey Adelberg	Air pressure	1004 mbar
Verdict	Pass	Relative humidity	30 %

8.3.3 Observations, settings and special notes

The spectrum was searched from 30 MHz to 40 GHz.
Cabinet radiation measurements were performed at a distance of 3 m while antenna connector was terminated with 50 Ω load.

Spectrum analyser for peak conducted measurements within restricted bands below 1 GHz:

Resolution bandwidth	100 kHz
Video bandwidth	300 kHz
Detector mode	Peak
Trace mode	Max Hold

Average limit line was set as follows: $54 \text{ dB}\mu\text{V/m} - 95.23 \text{ dB} - 2.54 \text{ dBi} - 4.7 \text{ dB} = -48.47 \text{ dBm}$

Spectrum analyser for peak conducted measurements within restricted bands above 1 GHz:

Resolution bandwidth	1 MHz
Video bandwidth	3 MHz
Detector mode	Peak
Trace mode	Max Hold

Average limit line was set as follows: $54 \text{ dB}\mu\text{V/m} - 95.23 \text{ dB} - 2.54 \text{ dBi} = -43.77 \text{ dBm/MHz}$

Spectrum analyser for average conducted measurements within restricted bands above 1 GHz for frequencies where peak results were above the average limit:

Resolution bandwidth	1 MHz
Video bandwidth	10 MHz
Detector mode	RMS
Trace mode	Power average
Number of averaging traces	100

Peak limit is 20 dB higher than the average limit: $-43.77 \text{ dBm/MHz} + 20 \text{ dB} = -23.77 \text{ dBm/MHz}$

Spectrum analyser for peak conducted measurements outside restricted bands:

Resolution bandwidth	1 MHz
Video bandwidth	3 MHz
Detector mode	Peak
Trace mode	Max Hold

The limit was adjusted to include antenna directional gain of 3 dBi: $-27 \text{ dBm/MHz} - 2.54 \text{ dBi} = -29.54 \text{ dBm/MHz}$

As per **789033 D02 General UNII Test Procedures New Rule sv01**: If an out-of-band emission complies with both the peak and average limits of §15.209 it is not required to satisfy the -27 dBm/MHz or -17 dBm/MHz maximum emission limit.

As per **644545 D03 Guidance for IEEE 802 11ac New Rules v01**, section II) E) 3) Although the peak limit of $74 \text{ dB}\mu\text{V/m}$ (20 dB above $54 \text{ dB}\mu\text{V/m}$) in the restricted band appears to be higher than $68 \text{ dB}\mu\text{V/m}$, the lower average limit of $54 \text{ dB}\mu\text{V/m}$ in the restricted bands needs to be complied to.

All limit lines on the plots are lower by 0.46 dB than the ones calculated above, due to wrong initial antenna gain.
Every margin depicted on the plots is 0.46 dB higher.

* 99 % OBW lies completely within 5.15–5.25 GHz (U-NII-1) band (see plot below) but -26 dBc (26 dB BW) at upper band edge straddles into U-NII-2A band.

As per 644545 D03 Guidance for IEEE 802 11ac New Rules v01, section II) B) 1) b):

§15.407(b)(1) specifies an exception permitting the out-of-band limits to be exceeded the U-NII-2A band when transmitting in the U-NII-1 band.

NOTE: In that case, if the 26 dB bandwidth of the transmitted signal extends into the U-NII-2A band, the device shall be considered to be operating in both the U-NII-1 and U-NII-2A bands, and will therefore require implementation of Dynamic Frequency Selection and Transmit Power Control in accordance with §15.407(h) within U-NII-2A band (5.25–5.35 GHz).

For DFS and TPC compliance please refer to test report covering U-NII-2a band (5.25–5.35 GHz).
