If the measured frequency f_0 for the max power has a too low distance to the band edges, because in the tests modulated signals must be used: The next possible frequency to the according band edge is used.

For example for minimum distances to the band edges:

GSM signal (narrowband): 0.2 MHz

AWGN signal (wideband): 2.5 MHz

AWGN signal (wideband 5G): Here only measurements at the mid frequency are possible, because the signal band has the same bandwidth as the used channel.

3.6.4 REMARKS TO THE MEASUREMENTS

Cause of an inappropriate control mode in the transmission of the narrowband signal (GSM signal) at f_{mid} , f_{mid} is increased by 1 MHz, Hereby the abbreviations are:

f_{mid} for wideband signals (AWGN signals)
 f_{mid+1} for narrowband signals (GSM signals)

In the real use of the repeater narrowband signals aren't used.

The attenuation of the measuring and stimulus path are known for each measured frequency and are considered.

The Spectrum Analyzer settings can be directly found in the measurement diagrams.

4.1.2 TEST REQUIREMENTS/LIMITS

Part 27; Miscellaneous Wireless Communication Services

Subpart C – Technical standards

§ 27.50

Band 41:

(h) The following power limits shall apply in the BRS and EBS:

(1) *Main, booster and base stations.* (i) The maximum EIRP of a main, booster or base station shall not exceed $33 \text{ dBW} + 10\log(X/Y) \text{ dBW}$, where X is the actual channel width in MHz and Y is either 6 MHz if prior to transition or the station is in the MBS following transition or 5.5 MHz if the station is in the LBS and UBS following transition, except as provided in paragraph (h)(1)(ii) of this section.

(ii) If a main or booster station sectorizes or otherwise uses one or more transmitting antennas with a non-omnidirectional horizontal plane radiation pattern, the maximum EIRP in dBW in a given direction shall be determined by the following formula: $\text{EIRP} = 33 \text{ dBW} + 10 \log(X/Y) \text{ dBW} + 10 \log(360/\text{beamwidth}) \text{ dBW}$, where X is the actual channel width in MHz, Y is either (i) 6 MHz if prior to transition or the station is in the MBS following transition or (ii) 5.5 MHz if the station is in the LBS and UBS following transition, and beamwidth is the total horizontal plane beamwidth of the individual transmitting antenna for the station or any sector measured at the half-power points.

Remark: Please see next sub-clause for the measurement plots.

Maximum output power at the worst case consideration

The highest power level in the tables above is:

$p_{\text{highest}} = 31.5 \text{ dBm}$ at the channel which has the most output power of all channels.

Hereby at an antenna gain of $G_{\text{dB}} = 15 \text{ dBi}$ the highest effective radiated output power EIRP $p_{\text{EIRP 1CH}}$ of one channel is:

$$p_{\text{EIRP 1CH}} = p_{\text{highest}} + G_{\text{dB}}$$

This results are:

$$p_{\text{EIRP 1CH}} = 33.1 \text{ dBm} + 15 \text{ dB} = 48.1 \text{ dBm}$$

Hereby the channel bandwidth is 5 MHz and it is used in the LBS band.

Therefore the maximum allowed power p_{EIRP} is calculated according the given formula:

$$p_{\text{EIRP 1CH}} [\text{dBm}] = p_{\text{EIRP 1CH}} [\text{dBW}] + 10 * \log \left(\frac{\text{channel bandwidth}}{5.5 \text{ MHz}} \right) + 30 \text{ dB}$$

This results dBm are:

$$p_{\text{EIRP 1CH}} [\text{dBm}] = 33 [\text{dBW}] + 10 * \log \left(\frac{5 \text{ MHz}}{5.5 \text{ MHz}} \right) + 30 \text{ dB} = 62.6 \text{ dBm}$$

Supposed all two antenna ports are working together in MIMO operation the worst case of the highest output power $p_{\text{EIRP 2CH}}$ is:

$$p_{\text{EIRP 2CH}} = p_{\text{EIRP 1CH}} + 3 \text{ dB}$$

Hereby the result is:

$$p_{\text{EIRP 2CH}} = 48.1 \text{ dBm} + 3 \text{ dB} = 51.1 \text{ dBm}$$

The final comparison of this consideration is:

$$p_{\text{EIRP 4CH}} = 51.1 \text{ dBm} < 62.6 \text{ dBm}, \text{ hereby } 62.6 \text{ dBm} \text{ is the highest allowed limit in this band.}$$

The DUT doesn't exceed the limit.

4.3.1 TEST DESCRIPTION

This test case is intended to demonstrate compliance to the applicable conducted spurious emission limits per FCC §2.1049

The EUT was connected to the test setups according to the following diagram:

The attenuation of the measuring and stimulus path are known for each measured frequency and are considered.

The Spectrum Analyzer settings can be directly found in the measurement diagrams.

4.3.2 TEST REQUIREMENTS/LIMITS

FCC Part 2.1049; Occupied Bandwidth:

The occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission shall be measured under the following conditions as applicable:

(h) Transmitters employing digital modulation techniques—when modulated by an input signal such that its amplitude and symbol rate represent the maximum rated conditions under which the equipment will be operated. The signal shall be applied through any filter networks, pseudo-random generators or other devices required in normal service. Additionally, the occupied bandwidth shall be shown for operation with any devices used for modifying the spectrum when such devices are optional at the discretion of the user.

(i) Transmitters designed for other types of modulation—when modulated by an appropriate signal of sufficient amplitude to be representative of the type of service in which used. A description of the input signal should be supplied.
