

Test report CAP M2 17E/19/23/25T [PCS 1900] F-AC-F1

Designation:	CAP M2 17E/19/23/25T [PCS 1900] F-AC-F1
Manufacturer:	Commscope
Serial No(s):	FICMBA2338001
ID No.	7856326-1010 Rev: 00
FCC ID	XS5-CAPM217192325
Test Specification(s):	ANSI 63.26:2015 FCC Rules and Regulations as listed in 47 CFR, Part 20 and Part 24:2023-10-13
Test Plan:	"Infoblatt_für_CAP M2 17E_19_21_25T_ID7856326-1010 " from customer.
Test Result:	Passed

Date of issue:	2024-01-31		Signature:

1 APPLIED STANDARDS AND TEST SUMMARY

1.1 APPLIED STANDARDS

Type of Authorization

Certification for an Industrial Signal Booster.

Applicable FCC Rules

Prepared in accordance with the requirements of FCC Rules and Regulations as listed in 47 CFR Ch.1 Parts 2 and 20 and 24. The following subparts are applicable to the results in this test report.

Part 2, Subpart J - Equipment Authorization Procedures, Certification

Part 20, Commercial Mobile Services

§ 20.21 Signal Boosters

Part 24, Subpart E – Broadband PCS

§ 24.232 – Power and antenna height limits

§ 24.235 – Frequency stability

§ 24.238 – Emission limitations for broadband PCS equipment

The tests were selected and performed with reference to:

- FCC Public Notice 935210 applying "Signal Boosters Basic Certification Requirements" 935210 D02, 2019-15-04.
- FCC Public Notice 935210 applying "Measurement guidance for industrial and non-consumer signal booster, repeater and amplifier devices" 935210 D05, 2019-04-03.
- FCC Public Notice 971168 applying "Measurement guidance for certification of licensed digital transmitters" 971168 D01, 2019-04-09.
- ANSI C63.26: 2015

Summary Test Results:

The EUT complies with all performed tests as listed in chapter 1.3 Measurement Summary/Signatures.

1.2 FCC REFERENCE TABLE

Measurement	FCC reference
Effective radiated power, mean output power and zone enhancer gain	§ 2.1046 § 24.232 KDB 935210 D05 v01r04: 3.5
Peak to Average Ratio	§ 24.232
Occupied bandwidth Input-versus-output spectrum	§ 2.1049 KDB 935210 D05 v01r04: 3.4
Conducted spurious Emission at Antenna Terminal	§ 2.1051 § 24.238 KDB 935210 D05 v01r04: 3.6
Out-of-band emissions limits	§ 2.1051 § 24.238 KDB 935210 D05 v01r04: 3.6
Frequency stability	§ 2.1055 § 24.235
Field strength of spurious radiation	§ 2.1053 § 24.236
Out-of-band rejection	KDB 935210 D05 v01r04: 3.3
All measurements	ANSI 63.26

1.3 MEASUREMENT SUMMARY/SIGNATURES

47 CFR CHAPTER I FCC PART 24 Subpart E [Base § 2.1046, § 24.232 Stations/Repeater]

Effective Radiated Power, mean output power and zone enhancer gain
The measurement was performed according to ANSI C63.26, KDB
935210 D05 v01r04: 3.5

Final Result

OP-Mode

Frequency Band, Direction, Input Power, Signal Type

PCS 1900, RF downlink, 0.3 dB < AGC, Wideband	Passed
PCS 1900, RF downlink, 3 dB > AGC, Wideband	Passed
PCS 1900, RF downlink, 0.3 dB < AGC, Narrowband	Passed
PCS 1900, RF downlink, 3 dB > AGC, Narrowband	Passed
PCS 1900, RF downlink, 0.3 dB < AGC, Wideband 5G	Passed
PCS 1900, RF downlink, 3 dB > AGC, Wideband 5G	Passed

47 CFR CHAPTER I FCC PART 24 Subpart E [Base § 24.232 Stations/Repeater]

Peak to Average Ratio

The measurement was performed according to ANSI C63.26

Final Result

PCS 1900, RF downlink, 0.3 dB < AGC, Wideband	Passed
PCS 1900, RF downlink, 3 dB > AGC, Wideband	Passed
PCS 1900, RF downlink, 0.3 dB < AGC, Narrowband	Passed

3 TEST OBJECT DATA

3.1 GENERAL EUT DESCRIPTION

Kind of Device product description	Cellular Repeater
Product name	Cellular Repeater
Type	CAP M2 17E/19/23/25T F-AC-F1
Declared EUT data by the supplier	
General Product Description	The EUT is an industrial signal booster supporting the following: Band 25/PCS 1900:1930 – 1995 MHz A RF operation is only supported for the downlink.
Booster Type	Industrial Signal Booster
Voltage Type	AC
Voltage Level	100 to 240 V
Maximum Output Donor Port [Uplink]	-
Nominal Output Server Port [Downlink]	33 dBm
Nominal Gain [Uplink]	-
Nominal Gain [Downlink]	38 dB

The main components of the EUT are listed and described in chapter 3.2 EUT Main components.

**EMC Test Report No.: 23-0221**

EMC tests on Andrew CAP M2 17E/19/23/25T [PCS 1900] F-AC-F1

3.2 EUT MAIN COMPONENTS

Sample Parameter	Value
Serial Number	FICMBA2338001
HW Version	7856326-1010 Rev: 00
SW Version	V5.0.0.196
Comment	-----

NOTE: The short description is used to simplify the identification of the EUT in this test report.

3.3 ANCILLARY EQUIPMENT

For the purposes of this test report, ancillary equipment is defined as equipment which is used in conjunction with the EUT to provide operational and control features to the EUT. It is necessary to configure the system in a typical fashion, as a customer would normally use it. But nevertheless Ancillary Equipment can influence the test results.

Device	Details (Manufacturer, Type Model, OUT Code)	Description
-	-	-

3.4 AUXILIARY EQUIPMENT

For the purposes of this test report, auxiliary equipment is defined as equipment which is used temporarily to enable operational and control features especially used for the tests of the EUT which is not used during normal operation or equipment that is used during the tests in combination with the EUT but is not subject of this test report. It is necessary to configure the system in a typical fashion, as a customer would normally use it. But nevertheless Auxiliary Equipment can influence the test results.

Device	Details (Manufacturer, Type, S/N)	Description
AUX1	Commscope, ION-E PSU Shelf AC, DC18596	Power supply rack
	GE Power Electronisc Inc., CAR1212FPBC-Z, DC17936	Power plug-in module
AUX2	Commscope, ION-E WCS-2, SZAEA11819A0005	Module rack
	Commscope, ION-E OPT, SZBEAD2012A0115	Optical plug-in module
	Commscope, RFD HB, SZBEAQ2140A0006	RF card plug-in module
	Commscope, RFD HB, SZBEAG2210A0008	RF card plug-in module
	Commscope, ION-E RFD, SZBEAG1825A0018	RF card plug-in module
	Commscope, ION-E RFD, SZBEAP2103A0457	RF card plug-in module

EMC Test Report No.: 23-0221

EMC tests on Andrew CAP M2 17E/19/23/25T [PCS 1900] F-AC-F1

3.5 EUT SETUPS

This chapter describes the combination of EUTs and equipment used for testing. The rationale for selecting the EUTs, ancillary and auxiliary equipment and interconnecting cables, is to test a representative configuration meeting the requirements of the referenced standards.

Setup	Combination of EUTs	Description and Rationale
	,	Setup for all tests

EMC Test Report No.: 23-0221

EMC tests on Andrew CAP M2 17E/19/23/25T [PCS 1900] F-AC-F1

3.6 OPERATING MODES

This chapter describes the operating modes of the EUT used for testing.

3.6.1 TEST CHANNELS

Band	Direction	Lower Frequency Band Edge [MHz]	Upper Frequency Band Edge [MHz]	Center Frequency [MHz]	Port
25, PCS 1900	Downlink	1930.00	1995.00	1962.50	Donor

3.6.2 DEFINITION OF USED FREQUENCY BANDS

Narrowband: representation by a GSM signal

Wideband : representation by an AWGN signal with 4.1 MHz

Wideband 5G: representation by an AWGN signal with 43.6 MHz

3.6.3 AUTOMATIC GAIN CONTROL LEVEL

AGC Levels							
Band	Direction	Signal Type	AGC Start Pin [dBm]	AGC Start Pin -0.3 dB [dBm]	AGC Start Pin +3 dB [dBm]	Frequency [MHz]	Frequency
25	Downlink	Narrowband	-3.4	-3.7	-0.7	1963.50	Mid
25	Downlink	Wideband	-3.4	-3.7	-0.7	1962.50	
25	Downlink	Wideband 5G	-4.1	-4.3	-1.1	1962.50	
25	Downlink	Narrowband	-1.6	-1.9	1.4	1930.20	Low
25	Downlink	Wideband	-2.0	-2.3	1.0	1932.50	
25	Downlink	Wideband 5G	-2.9	-2.6	0.4	1952.50	
25	Downlink	Narrowband	-3.6	-3.9	-0.6	1994.80	High
25	Downlink	Wideband	-3.8	-4.1	-0.8	1992.50	
25	Downlink	Wideband 5G	-4.2	-4.4	-1.4	1972.50	
25	Downlink	Narrowband	-5.3	-5.6	-2.3	1977.70	Max.Power
25	Downlink	Wideband	-5.1	-5.5	-2.1	1977.70	
25	Downlink	Wideband 5G	-4.1	-4.3	-1.1	1962.50	

Remark:

If the measured frequency f_0 for the max power has a too low distance to the band edges, because in the tests modulated signals must be used: The next possible frequency to the according band edge is used.

For example for minimum distances to the band edges:

GSM-Signal (narrowband): 0.2 MHz

AWGN-signal (wideband): 2.5 MHz

AWGN-signal (wideband 5G): 22.5 MHz

**BUREAU
VERITAS**

EMC Test Report No.: 23-0221

EMC tests on Andrew CAP M2 17E/19/23/25T [PCS 1900] F-AC-F1

3.6.4 REMARKS TO THE MEASUREMENTS

Cause of an inappropriate control mode in the transmission of the narrowband signal (GSM signal) at f_{mid} , f_{mid} is increased by 1 MHz, Hereby the abbreviations are:

f_{mid} for wideband signals (AWGN signals)

f_{mid+1} for narrowband signals (GSM signals)

In the real use of the repeater narrowband signals aren't used.

3.7 PRODUCT LABELLING

3.7.1 FCC ID LABEL

Please refer to the documentation of the applicant.

3.7.2 LOCATION OF THE LABEL ON THE EUT

Please refer to the documentation of the applicant.

4 TEST RESULTS

4.1 EFFECTIVE RADIATED POWER, MEAN OUTPUT POWER AND ZONE ENHANCER GAIN

Standard FCC PART 24, § 24.232

The test was performed according to:

ANSI C63.26, KDB 935210 D05 v01r04: 3.5

Test date: 2023-10-30 to 2023-10-31

Environmental conditions: 23 °C ± 5 K; 40 % r. F. ± 20 % r. F.

Test engineer: Thomas Hufnagel

4.1.1 TEST DESCRIPTION

This test case is intended to demonstrate compliance to the signal booster power and gain limits and requirements for industrial signal boosters.

The EUT was connected to the test setup according to the following diagram:

The attenuation of the measuring and stimulus path are known for each measured frequency and are considered.

The Spectrum Analyzer settings can be directly found in the measurement diagrams.

4.1.2 TEST REQUIREMENTS/LIMITS: ABSTRACTS FROM STANDARDS

Part 24; Personal Communication Services

Subpart E – Broadband PCS

§ 24.232

Abstract § 24.232 from FCC:

§ 24.232 Power and antenna height limits.

(a)(1) Base stations with an emission bandwidth of 1 MHz or less are limited to 1640 watts equivalent isotropically radiated power (EIRP) with an antenna height up to 300 meters HAAT, except as described in paragraph (b) below.

(2) Base stations with an emission bandwidth greater than 1 MHz are limited to 1640 watts/MHz equivalent isotropically radiated power (EIRP) with an antenna height up to 300 meters HAAT, except as described in paragraph (b) below.

(3) Base station antenna heights may exceed 300 meters HAAT with a corresponding reduction in power; see Tables 1 and 2 of this section.

(4) The service area boundary limit and microwave protection criteria specified in §§24.236 and 24.237 apply.

TABLE 1—REDUCED POWER FOR BASE STATION ANTENNA HEIGHTS OVER 300 METERS, WITH EMISSION BANDWIDTH OF 1 MHz OR LESS

HAAT in meters	Maximum EIRP watts
≤300	1640
≤500	1070
≤1000	490
≤1500	270
≤2000	160

TABLE 2—REDUCED POWER FOR BASE STATION ANTENNA HEIGHTS OVER 300 METERS, WITH EMISSION BANDWIDTH GREATER THAN 1 MHz

HAAT in meters	Maximum EIRP watts/MHz
≤300	1640
≤500	1070
≤1000	490
≤1500	270
≤2000	160

EMC tests on Andrew CAP M2 17E/19/23/25T [PCS 1900] F-AC-F1

- (b)(1) Base stations that are located in counties with population densities of 100 persons or fewer per square mile, based upon the most recently available population statistics from the Bureau of the Census, with an emission bandwidth of 1 MHz or less are limited to 3280 watts equivalent isotropically radiated power (EIRP) with an antenna height up to 300 meters HAAT.
- (2) Base stations that are located in counties with population densities of 100 persons or fewer per square mile, based upon the most recently available population statistics from the Bureau of the Census, with an emission bandwidth greater than 1 MHz are limited to 3280 watts/MHz equivalent isotropically radiated power (EIRP) with an antenna height up to 300 meters HAAT.
- (3) Base station antenna heights may exceed 300 meters HAAT with a corresponding reduction in power; see Tables 3 and 4 of this section.
- (4) The service area boundary limit and microwave protection criteria specified in §§24.236 and 24.237 apply.

TABLE 3—REDUCED POWER FOR BASE STATION ANTENNA HEIGHTS OVER 300 METERS, WITH EMISSION BANDWIDTH OF 1 MHz OR LESS

HAAT in meters	Maximum EIRP watts
≤300	3280
≤500	2140

4.1.3 TEST PROTOCOL

Band 25, downlink							
Signal Type	Input Power	Frequency [MHz]	Input Power [dBm]	Maximum Average Output Power [dBm]	Limit Average Output Power [dBm]	Margin to Limit [dB]	Gain [dB]
Wideband	0.3 dB < AGC	1977.70	-5.5	32.9	52.0	19.1	38.4
Wideband	3 dB > AGC	1977.70	-2.2	32.9	52.0	19.1	35.1
Narrowband	0.3 dB < AGC	1977.70	-5.6	32.9	52.0	19.1	38.5
Narrowband	3 dB > AGC	1977.70	-2.3	32.9	52.0	19.1	35.2
Wideband 5G	0.3 dB < AGC	1962.50	-4.3	33.1	52.0	18.9	37.4
Wideband 5G	3 dB > AGC	1962.50	-1.1	33.1	52.0	19.0	34.2

For the output power limit the lowest value of the FCC table from § 24.232 is taken. This is 160 watts which equates 52.0 dBm according the given formula:

$$p_{\text{dBm}} = 10 \log \frac{160 \text{ W}}{0.001 \text{ W}} = 52.0 \text{ dBm}$$

Remarks: Please see next sub-clause for the measurement plot.

EMC Test Report No.: 23-0221

EMC tests on Andrew CAP M2 17E/19/23/25T [PCS 1900] F-AC-F1

Maximum output power at the worst case consideration

The highest power level in the tables above is

$p_{\text{highest}} = 33.1 \text{ dBm}$ at the channel which has the most output power of all channels.

Hereby at an antenna gain of $G_{\text{dB}} = 15 \text{ dBi}$ the highest effective radiated output power EIRP $p_{\text{EIRP 1CH}}$ of one channel is:

$$p_{\text{EIRP 1CH}} = p_{\text{highest}} + G_{\text{dB}}$$

This results in:

$$p_{\text{EIRP 1CH}} = 33.1 \text{ dBm} + 15 \text{ dB} = 48.1 \text{ dBm}$$

The equivalent power P is according the given formula:

$$p_{\text{EIRP 1CH}} =$$

$$P_{\text{EIRP 1CH}} [\text{W}] = 10^{\text{EXP}(p_{\text{EIRP 1CH}} [\text{dBm}] / 10)} * 0.001 [\text{W}]$$

This results in:

$$P_{\text{EIRP 1CH}} [\text{W}] = 10^{\text{EXP}(48.1 [\text{dBm}] / 10)} * 0.001 [\text{W}] = 64.57 \text{ W}$$

Supposed all four antenna ports are working together in MIMO operation the worst case of the highest output power $p_{\text{EIRP 2CH}}$ is:

$$p_{\text{EIRP 2CH}} = 2 * p_{\text{EIRP 1CH}}$$

This results in:

$$p_{\text{EIRP 4CH}} = 2 * 64.57 \text{ W} = 129.14 \text{ W}$$

Final result of this consideration:

$p_{\text{EIRP 4CH}} = 129.14 \text{ W} < 160 \text{ W}$, hereby 160 W is the highest allowed limit in this band at worst case consideration.

The DUT doesn't exceed the limit.

4.2 PEAK TO AVERAGE RATIO

Standard FCC PART 24, § 24.232

The test was performed according to:

ANSI C63.26

Test date: 2023-10-30 to 2023-10-31**Environmental conditions:** 23 °C ± 5 K; 40 % r. F. ± 20 % r. F.**Test engineer:** Thomas Hufnagel

4.2.1 TEST DESCRIPTION

This test case is intended to demonstrate compliance to the signal booster power and gain limits and requirements for industrial signal boosters.

The EUT was connected to the test setup according to the following diagram:

FCC Part 22/24/27/90 Industrial signal booster – Test Setup; RF Output Power / Gain

The attenuation of the measuring and stimulus path are known for each measured frequency and are considered.

The Spectrum Analyzer settings can be directly found in the measurement diagrams.

4.2.2 TEST REQUIREMENTS/LIMITS

Part 24; Personal Communication Services

Subpart E – Broadband PCS

§ 24.232

Abstract § 24.232 from FCC:

(d) Power measurements for transmissions by stations authorized under this section may be made either in accordance with a Commission-approved average power technique or in compliance with paragraph (e) of this section. In both instances, equipment employed must be authorized in accordance with the provisions of §24.51. In measuring transmissions in this band using an average power technique, the peak-to-average ratio (PAR) of the transmission may not exceed 13 dB.

4.3 OCCUPIED BANDWIDTH/INPUT-VERSUS-OUTPUT SPECTRUM

Standard FCC Part 2.1049; Occupied Bandwidth

The test was performed according to:

ANSI C63.26, KDB 935210 D05 v01r04: 3.4

Test date: 2023-10-30 to 2023-10-31

Environmental conditions: 23 °C ± 5 K; 40 % r. F. ± 20 % r. F.

Test engineer: Thomas Hufnagel

4.3.1 TEST DESCRIPTION

This test case is intended to demonstrate compliance to the applicable conducted spurious emission limits.

The EUT was connected to the test setups according to the following diagram:

The attenuation of the measuring and stimulus path are known for each measured frequency and are considered.

The Spectrum Analyzer settings can be directly found in the measurement diagrams.

4.3.2 TEST REQUIREMENTS/LIMITS

Abstract § 2.1049 from FCC:

FCC Part 2.1049; Occupied Bandwidth:

The occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.3 percent of the total mean power radiated by a given emission shall be measured under the following conditions as applicable:

(h) Transmitters employing digital modulation techniques—when modulated by an input signal such that its amplitude and symbol rate represent the maximum rated conditions under which the equipment will be operated. The signal shall be applied through any filter networks, pseudo-random generators or other devices required in normal service. Additionally, the occupied bandwidth shall be shown for operation with any devices used for modifying the spectrum when such devices are optional at the discretion of the user.

(i) Transmitters designed for other types of modulation—when modulated by an appropriate signal of sufficient amplitude to be representative of the type of service in which used. A description of the input signal should be supplied.

4.4 CONDUCTED SPURIOUS EMISSIONS AT ANTENNA TERMINALS

Standard FCC Part § 2.1051; § 24.238

The test was performed according to:

ANSI C63.26, KDB 935210 D05 v01r04: 3.6

Test date: 2023-12-14**Environmental conditions:** 23 °C ± 5 K; 40 % r. F. ± 20 % r. F.**Test engineer:** Thomas Hufnagel

4.4.1 TEST DESCRIPTION

This test case is intended to demonstrate compliance to the signal booster power and gain limits and requirements for industrial signal boosters.

The EUT was connected to the test setup according to the following diagram:

FCC Part 22/24/27/90 Industrial signal booster – Test Setup; RF Output Power / Gain

The attenuation of the measuring and stimulus path are known for each measured frequency and are considered.

The Spectrum Analyzer settings can be directly found in the measurement diagrams.

4.4.2 TEST REQUIREMENTS/LIMITS

Abstract § 2.1051 from FCC:

FCC Part 2.1051; Measurement required: Spurious emissions at antenna terminal:

The radio frequency voltage or powers generated within the equipment and appearing on a spurious frequency shall be checked at the equipment output terminals when properly loaded with a suitable artificial antenna. Curves or equivalent data shall show the magnitude of each harmonic and other spurious emission that can be detected when the equipment is operated under the conditions specified in § 2.1049 as appropriate. The magnitude of spurious emissions which are attenuated more than 20 dB below the permissible value need not be specified.

Part 24, Subpart E – Cellular Radiotelephone Service

Abstract § 24.238 FCC:

§ 24.238 Emission limitations for cellular equipment.

(a) Out of band emissions. The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log(P)$ dB.

(b) Measurement procedure. Compliance with these rules is based on the use of measurement instrumentation employing a resolution bandwidth of 1 MHz or greater. However, in the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. A narrower resolution bandwidth is permitted in all cases to improve measurement accuracy provided the measured power is integrated over the full required measurement bandwidth (i.e. 1 MHz or 1 percent of emission bandwidth, as specified). The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

EMC tests on Andrew CAP M2 17E/19/23/25T [PCS 1900] F-AC-F1

General considerations concerning the limits:

The measuring bandwidth of 1 MHz is chosen for the wideband 1 and the narrowband. The limit here is at $p = -13$ dBm

For the wideband 2 a bandwidth of 100 kHz is necessary. Therefore the limit here is -23 dBm, according the given formula:

$$p_{RBWreduced} [dBm] = 10 * \log \left(RBWreduced [kHz] - 1000 \text{ kHz} \right) + p_{RBW 1000 \text{ kHz}} [dBm]$$

Hereby "p" are the limit lines' values.

4.5 OUT-OF-BAND EMISSION LIMITS

Standard FCC Part § 2.1051, § 24.238

The test was performed according to:

ANSI C63.26, KDB 935210 D05 v01r04: 3.6

Test date: 2023-10-30 to 2023-10-31**Environmental conditions:** 23 °C ± 5 K; 40 % r. F. ± 20 % r. F.**Test engineer:** Thomas Hufnagel

4.5.1 TEST DESCRIPTION

This test case is intended to demonstrate compliance to the out-of-band emission limit for industrial signal boosters. The limits itself come from the applicable rule part for each operating band.

The EUT was connected to the test setup according to the following diagram:

The attenuation of the measuring and stimulus path are known for each measured frequency and are considered.

The Spectrum Analyser settings can be directly found in the measurement diagrams.

4.5.2 TEST REQUIREMENTS/LIMITS

Abstract § 2.1051 from FCC:

FCC Part 2.1051; Measurement required: Spurious emissions at antenna terminal:

The radio frequency voltage or powers generated within the equipment and appearing on a spurious frequency shall be checked at the equipment output terminals when properly loaded with a suitable artificial antenna. Curves or equivalent data shall show the magnitude of each harmonic and other spurious emission that can be detected when the equipment is operated under the conditions specified in § 2.1049 as appropriate. The magnitude of spurious emissions which are attenuated more than 20 dB below the permissible value need not be specified.

Part 24, Subpart E – Cellular Radiotelephone Service

Abstract § 24.238 FCC:

§ 24.238 Emission limitations for cellular equipment.

(a) Out of band emissions. The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log(P)$ dB.

(b) Measurement procedure. Compliance with these rules is based on the use of measurement instrumentation employing a resolution bandwidth of 1 MHz or greater. However, in the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. A narrower resolution bandwidth is permitted in all cases to improve measurement accuracy provided the measured power is integrated over the full required measurement bandwidth (i.e. 1 MHz or 1 percent of emission bandwidth, as specified). The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

4.7 FREQUENCY STABILITY

The frequency stability test case was not carried out, as any frequency errors are eliminated by the given system architecture. This is achieved by generating the LOs in the head-end station and the LOs in the remote unit with a common reference clock. This reference clock is transmitted from the head-end station to the remote unit and regenerated there. This means that the same reference frequency is used for all signal conversions (up- and down-conversion as well as analog-to-digital and digital-to-analog conversion) and any frequency error in the reference clock is compensated therefore. This is already clear from the measurement markings for the occupied bandwidth (26 dB bandwidth). It can be seen that the DUT has no influence on the frequency (comparison between input and output signal). In addition, it is operationally necessary for the frequency deviation to be significantly smaller than the spectral distance between the transmission bandwidth edge and the channel bandwidth edge in order to meet the signal quality requirement (signal purity) and such ensure that the fundamental emissions remain within the authorized bands of operation.

EMC Test Report No.: 23-0221

EMC tests on Andrew CAP M2 17E/19/23/25T [PCS 1900] F-AC-F1

4.8 FIELD STRENGTH OF SPURIOUS RADIATION

Standard FCC Part § 2.1053, § 24.236

The test was performed according to:
ANSI C63.26**Test date:** 2023-11-02 to 2023-11-03**Environmental conditions:** 23 °C ± 5 K; 40 % r. F. ± 20 % r. F.**Test engineer:** Thomas Hufnagel

4.8.1 TEST DESCRIPTION

This test case is intended to demonstrate compliance to the applicable radiated spurious emission measurements.

The EUT was connected to the test setup according to the following diagram:

The test set-up was made in accordance to the general provisions of ANSI C63.4 in a typical installation configuration. The Equipment Under Test (EUT) was set up on a non-conductive table 1.5 x 1.5 m² in the semi-anechoic chamber, 0.8 meter above the ground or floor-standing arrangement shall be placed on the horizontal ground reference plane.. The influence of the EUT support table that is used between 30–1000 MHz was evaluated. For the initial measurements, the receiving antenna is varied from 1-4 meter height and is changed in the vertical plane from vertical to horizontal polarization at each frequency. The highest emissions between 30 MHz to 1000 MHz were analyzed in details by operating the spectrum analyzer and/or EMI receiver in quasi-peak mode to determine the precise amplitude of the emissions.

The measurement procedure is implemented into the EMI test software BAT EMC from NEXIO. Exploratory tests are performed at 3 orthogonal axes to determine the worst-case orientation of a body-worn or handheld EUT. The final test on all kind of EUTs is also performed at 3 axes. A pre-check is performed while the EUT is powered by a DC power source. ?

1. Measurement above 30 MHz and up to 1 GHz

Step 1: Preliminary scan

This is a preliminary test to identify the highest amplitudes relative to the limit.

Settings for step 1:

- Antenna distance: 10 m
- Detector: Peak-Maxhold/RMS (FFT-based)
- Frequency range: 30 – 1000 MHz
- Frequency steps: 30 kHz
- IF-Bandwidth: 120 kHz
- Measuring time/Frequency step: 5 ms
- Turntable angle range: –180° to 180°
- Turntable step size: 30°
- Height variation range: 1 – 4 m
- Height variation step size: 1 m
- Polarisation: Horizontal + Vertical

Intention of this step is, to determine the radiated EMI-profile of the EUT. Afterwards the relevant emissions for the final measurement are identified.

EMC Test Report No.: 23-0221

EMC tests on Andrew CAP M2 17E/19/23/25T [PCS 1900] F-AC-F1

Step 2: Adjustment measurement

In this step the accuracy of the turntable azimuth and antenna height will be improved. This is necessary to find out the maximum value of every frequency.

For each frequency, which was determined the turntable azimuth and antenna height will be adjusted. The turntable azimuth will slowly vary by $\pm 45^\circ$ around this value. During this action, the value of emission is continuously measured. The turntable azimuth at the highest emission will be recorded and adjusted. In this position, the antenna height will also slowly vary by ± 100 cm around the antenna height determined. During this action, the value of emission is also continuously measured. The antenna height of the highest emission will also be recorded and adjusted.

- Detector: Peak – Maxhold; RMS
- Measured frequencies: in step 1 determined frequencies
- IF – Bandwidth: 120 kHz
- Measuring time: 100 ms
- Turntable angle range: $\pm 30^\circ$ around the determined value
- Antenna Polarisation: max. value determined in step 1

Step 3: Final measurement with QP detector

With the settings determined in step 3, the final measurement will be performed:

EMI receiver settings for step 4:

- Detector: Quasi-Peak (< 1 GHz); RMS; Peak
- Measured frequencies: in step 1 determined frequencies
- IF – Bandwidth: 120 kHz
- Measuring time: 1 s

After the measurement a plot will be generated which contains a diagram with the results of the preliminary scan and a chart with the frequencies and values of the results of the final measurement.

3. Measurement above 1 GHz

The following modifications apply to the measurement procedure for the frequency range above 1 GHz:

Step 1:

The Equipment Under Test (EUT) was set up on a non-conductive support at 1.5 m height in the semi-anechoic chamber. Absorbers are placed around and between the turn table and the antenna tower.

All steps were performed with one height (1.5 m) of the receiving antenna only.

The EUT is turned during the preliminary measurement across the elevation axis, with a step size of 30° .

The turn table step size (azimuth angle) for the preliminary measurement is 15° .

Step 2:

The maximum RFI field strength was determined during the measurement by rotating the turntable (± 180 degrees) and varying the height of the receive antenna ($h = 1 \dots 4$ m) with a additional tilt function of the antenna. The turn table azimuth will slowly vary by $\pm 15^\circ$.

EMI receiver settings (for all steps):

- Detector: Peak, Average
- IF Bandwidth = 1 MHz

EMC tests on Andrew CAP M2 17E/19/23/25T [PCS 1900] F-AC-F1

Step 3:

Spectrum analyser settings for step 3:

- Detector: Peak/Average
- Measured frequencies: in step 1 determined frequencies
- IF – Bandwidth: 1 MHz
- Measuring time: 1 s

4.8.2 TEST REQUIREMENTS/LIMITS

Abstract from FCC Part § 2.1053:

FCC Part 2.1053; Measurement required: Field strength of spurious radiation:

Measurements shall be made to detect spurious emissions that may be radiated directly from the cabinet, control circuits, power leads, or intermediate circuit elements under normal conditions of installation and operation. Curves or equivalent data shall be supplied showing the magnitude of each harmonic and other spurious emission. For this test, single sideband, independent sideband, and controlled carrier transmitters shall be modulated under the conditions specified in paragraph (c) of § 2.1049, as appropriate.

EMC Test Report No.: 23-0221EMC tests on Andrew CAP M2 17E/19/23/25T [PCS 1900] F-AC-F1

4.8.3 TEST PROTOCOL

General considerations concerning the limits:

The measuring bandwidth of 1 MHz was chosen according the test requirements except at the bands from 30 MHz to 1 GHz: At these bands reducing of measurement bandwidth was done.
Also outside the downlink frequency band at lower frequencies the measurement bandwidths were reduced to have the possibility to record the spurious emissions at these lower frequencies.

At frequencies where measuring bandwidths were reduced also the limit lines were reduced according the given formula:

$$p_{RBWreduced} [dBm] = 10 * \log \left(RBWreduced [kHz] - 1000 kHz \right) + p_{RBW 1000 kHz} [dBm]$$

Hereby "p" are the limit lines' values.

Considerations to MIMO operation:

At this test the two output ports ANT 1 and ANT 2 are together in function according KDB 935210 D02 v04r02 chapter II (o) (2).

Measurement tables (showing the highest value. "worst case") with one antenna

At this tables the highest peak value of spurious radiation per frequency test band is shown.

Band 25, PCS 1900, downlink						
Spurious Freq. [MHz]	Spurious Level [dBm]	Pin [dBm]	Detector	RBW [kHz]	Limit [dBm]	Margin to Limit [dB]
273.2/hor..	-63.5	-3.7	RMS	100	-23.0	40.5
270.9/vert.	-64.6	-3.7	RMS	100	-23.0	41.6
17755.8/hor.	-23.1	-3.7	RMS	1000	-13.0	10.1
16290.9/ver.	-23.6	-3.7	RMS	1000	-13.0	10.6
26646.0/hor.	-65.5	-3.7	RMS	1000	-13.0	52.5
26655.9/vert.	-65.3	-3.7	RMS	1000	-13.0	52.3

Measurement tables (showing the highest value. "worst case") with two antennas (MIMO)

At this tables the highest peak value of spurious radiation per frequency test band is shown.

Band 25, PCS 1900, downlink						
Spurious Freq. [MHz]	Spurious Level [dBm]	Pin [dBm]	Detector	RBW [kHz]	Limit [dBm]	Margin to Limit [dB]
273.2/hor..	-63.5	-3.7	RMS	100	-23.0	40.5
270.9/vert.	-64.6	-3.7	RMS	100	-23.0	41.6

4.8.6 FIELD STRENGTH CALCULATIONS

$$\mathbf{FS} = \mathbf{SA} + \mathbf{AF} + \mathbf{CL} + \mathbf{PA}$$

Where as:

- FS** = Field strength
- SA** = EMC test receiver reading
- AF** = Antenna factor
- CL** = Cable loss
- PA** = Preamplifier

4.8.7 TEST EQUIPMENT USED

- Radiated Emissions

1000	21.6	4.9	2.23	0.61	1.71	0.30	0.0	3	3

Sample calculation

$$E \text{ (dB } \mu\text{V/m)} = U \text{ (dB } \mu\text{V)} + AF \text{ (dB 1/m)} + Corr. \text{ (dB)}$$

U = Receiver reading

AF = Antenna factor

Corr. = sum of single correction factors of used cables, switch unit, distance correction, amplifier (if applicable)

distance correction = $-20 * \text{LOG} (d_{\text{Limit}} / d_{\text{used}})$

Linear interpolation will be used for frequencies in between the values in the table.

Tables show an extract of values.

6.2 ANTENNA ROHDE & SCHWARZ HL 025 (1 GHZ – 18 GHZ)

Frequency	AF	Corr.
