3.6.4 REMARKS TO THE MEASUREMENTS

Cause of an inappropriate control mode in the transmission of the narrowband signal (GSM signal) at f_{mid} , f_{mid} is increased by 1 MHz. Hereby the abbreviations are:

f_{mid} for wideband signals (AWGN signals)

$f_{\text{mid}+1}$ for narrowband signals (GSM signals)

In the real use of the repeater narrowband signals aren't used.

The test results relate only to the tested item. The sample has been provided by the client.

4.1 EFFECTIVE RADIATED POWER, MEAN OUTPUT POWER AND ZONE ENHANCER GAIN

Standard FCC Part 27, §27.50

The test was performed according to:

ANSI C63.26, KDB KDB 935210 D05 v01r04: 3.5

Test date: 2023-09-06 – 2023-11-14

Environmental conditions: 23 ° C ± 5 K; 40 % r. F. ± 20 % r. F.

Test engineer: Thomas Hufnagel

4.1.1 TEST DESCRIPTION

This test case is intended to demonstrate compliance to the signal booster power and gain limits and requirements for industrial signal boosters.

The EUT was connected to the test setup according to the following diagram:

FCC Part 22/24/27/90 Industrial signal booster – Test Setup; RF Output Power / Gain

The attenuation of the measuring and stimulus path are known for each measured frequency and are considered.

The Spectrum Analyzer settings can be directly found in the measurement diagrams.

4.1.2 TEST REQUIREMENTS/LIMITS

Part 27; Miscellaneous Wireless Communication Services

Subpart C – Technical standards

§ 27.50

- (j) The following power requirements apply to stations transmitting in the 3700-3980 MHz band:
- (1) The power of each fixed or base station transmitting in the 3700-3980 MHz band and located in any county with population density of 100 or fewer persons per square mile, based upon the most recently available population statistics from the Bureau of the Census, is limited to an equivalent isotropically radiated power (EIRP) of 3280 Watts/MHz. This limit applies to the aggregate power of all antenna elements in any given sector of a base station.
 - (2) The power of each fixed or base station transmitting in the 3700-3980 MHz band and situated in any geographic location other than that described in paragraph (j)(1) of this section is limited to an EIRP of 1640 Watts/MHz. This limit applies to the aggregate power of all antenna elements in any given sector of a base station.
 - (3) Mobile and portable stations are limited to 1 Watt EIRP. Mobile and portable stations operating in these bands must employ a means for limiting power to the minimum necessary for successful communications.
 - (4) Equipment employed must be authorized in accordance with the provisions of § 27.51. Power measurements for transmissions by stations authorized under this section may be made either in accordance with a Commission-approved average power technique or in compliance with paragraph (j)(5) of this section. In measuring transmissions in this band using an average power technique, the peak-to-average ratio (PAR) of the transmission may not exceed 13 dB.
 - (5) Peak transmit power must be measured over any interval of continuous transmission using instrumentation calibrated in terms of an rms-equivalent voltage. The measurement results shall be properly adjusted for any instrument limitations, such as detector response times, limited resolution bandwidth capability when compared to the emission bandwidth, sensitivity, and any other relevant factors, so as to obtain a true peak measurement for the emission in question over the full bandwidth of the channel.

EMC tests on Andrew CAP M2 34T/37T/37T F-DC-F1 [37T]

Maximum output power at the worst case consideration

The highest power level in the tables above is

$p_{\text{highest}} = 34.8 \text{ dBm}$ at the channel which has the most output power of all channels.

Hereby at an antenna gain of $G_{\text{dB}} = 15 \text{ dBi}$ the highest effective radiated output power EIRP $p_{\text{EIRP 1CH}}$ of one channel is:

$$p_{\text{EIRP 1CH}} = p_{\text{highest}} + G_{\text{dB}}$$

This results in:

$$p_{\text{EIRP 1CH}} = 34.8 \text{ dBm} + 15 \text{ dB} = 49.8 \text{ dBm}$$

The equivalent power P is according the given formula:

$$P_{\text{EIRP 1CH}} =$$

$$P_{\text{EIRP 1CH}} [\text{W}] = 10 \exp \left((p_{\text{EIRP 1CH}} [\text{dBm}] - 10) * 0.001 [\text{W}] \right)$$

This results in:

$$P_{\text{EIRP 1CH}} [\text{W}] = 10 \exp \left((49.8 [\text{dBm}] - 10) * 0.001 [\text{W}] \right) = 95.5 \text{ W}$$

Supposed all four antenna ports are working together in MIMO operation the worst case of the highest output power $p_{\text{EIRP 4CH}}$ is:

$$p_{\text{EIRP 4CH}} = 4 * p_{\text{EIRP 1CH}}$$

This results in:

$$p_{\text{EIRP 4CH}} = 4 * 95.5 \text{ W} = 382 \text{ W}$$

Final result of this consideration:

$$p_{\text{EIRP 4CH}} = 382 \text{ W} < 1640 \text{ W, hereby 1640 W is the highest allowed limit in this band.}$$

The DUT doesn't exceed the limit.
