Commscope
Via Mengolina, 20
Faenza -RA- , ITALY

Dear Giuliano Pompignoli,

Enclosed is the EMC Wireless test report for compliance testing of the Commscope, CAP M 7E/80-85/17E/19-F-DC 7820478-0001 and 7820478-0002 as tested to the requirements of the FCC Certification rules under Title 47 of the CFR Part 22 Subpart H for Cellular Devices and FCC Part 24 Subpart E for Broadband PCS Devices.

Thank you for using the services of MET Laboratories, Inc. If you have any questions regarding these results or if MET can be of further service to you, please contact me.

Sincerely yours,
MET LABORATORIES, INC.

Joel Huna
Documentation Department

Electromagnetic Compatibility Criteria Test Report

for the

Commscope

CAP M 7E/80-85/17E/19-F-DC 7820478-0001 and 7820478-0002

Tested under

FCC Certification Rules

Title 47 of the CFR,

Part 22 Subpart H for Cellular Devices

&

Part 24 Subpart E for Broadband PCS Devices

MET Report: EMC100116-FCC22_24 REV. 3

December 5, 2018

Prepared For:

Commscope

Via Mengolina, 20

Faenza –RA- , ITALY

Prepared By:

MET Laboratories, Inc.

Baltimore, MD 21230

Electromagnetic Compatibility Criteria Test Report

for the

Commscope
CAP M 7E/80-85/17E/19-F-DC 7820478-0001 and 7820478-0002

Tested Under
FCC Certification Rules
Title 47 of the CFR,
Part 22 Subpart H for Cellular Devices
&
Part 24 Subpart E for Broadband PCS Devices

Bradley Jones
Project Engineer, Electromagnetic Compatibility Lab

Joel Huna
Documentation Department

Engineering Statement: The measurements shown in this report were made in accordance with the procedures indicated, and the emissions from this equipment were found to be within the limits applicable. I assume full responsibility for the accuracy and completeness of these measurements, and for the qualifications of all persons taking them. It is further stated that upon the basis of the measurements made, the equipment tested is capable of operation in accordance with the requirements of Part 22 Subpart H and Part 24 Subpart E of the FCC Rules under normal use and maintenance.

John Mason,
Director, Electromagnetic Compatibility Lab

Report Status Sheet

Revision	Report Date	Reason for Revision
Ø	October 30, 2018	Initial Issue.
1	November 13, 2018	Engineer corrections
2	November 15, 2018	Engineer corrections.
3	December 5, 2018	TCB Corrections.

Table of Contents

I.	Executive Summary	1
	A. Purpose of Test	2
	B. Executive Summary	2
II.	Equipment Configuration	3
	A. Overview.....	4
	B. References.....	5
	C. Test Site	5
	D. Measurement Uncertainty	5
	E. Description of Test Sample.....	5
	F. Equipment Configuration.....	9
	G. Support Equipment	9
	H. Ports and Cabling Information.....	9
	I. Mode of Operation.....	10
	J. Method of Monitoring EUT Operation	10
	K. Modifications	10
	Modifications to EUT	10
	Modifications to Test Standard.....	10
	L. Disposition of EUT	10
III.	Electromagnetic Compatibility Criteria for Intentional Radiators.....	11
	§ 2.1046 RF Power Output	12
	§ 2.1049 Occupied Bandwidth	31
	§ 2.1053 Radiated Spurious Emissions	48
	§ 2.1051 Spurious Emissions at Antenna Terminals	66
	§ 2.1049 Frequency Stability	86
	Intermodulation	90
	Filter Response	103
IV.	Test Equipment	106

PRF	Pulse Repetition Frequency
RF	Radio Frequency
RMS	Root-Mean-Square
TWT	Traveling Wave Tube
V/m	Volts per meter
VCP	Vertical Coupling Plane

I. Executive Summary

A. Purpose of Test

An EMC evaluation was performed to determine compliance of the Commscope CAP M 7E/80-85/17E/19-F-DC 7820478-0001 and 7820478-0002, with the requirements of Part 22 Subpart H and Part 24 Subpart E. All references are to the most current version of Title 47 of the Code of Federal Regulations in effect. In accordance with §2.1033, the following data is presented in support of the Certification of the CAP M 7E/80-85/17E/19-F-DC 7820478-0001 and 7820478-0002. Commscope should retain a copy of this document which should be kept on file for at least two years after the manufacturing of the CAP M 7E/80-85/17E/19-F-DC 7820478-0001 and 7820478-0002, has been **permanently** discontinued.

B. Executive Summary

The following tests were conducted on a sample of the equipment for the purpose of demonstrating compliance with Part 22 Subpart H and Part 24 Subpart E, in accordance with Commscope, purchase order number 8002554399.

FCC Reference	Description	Compliance
§2.1046; §22.913; §24.232	RF Power Output	Compliant
§2.1047	Modulation Characteristics	Not Applicable
§2.1049; §22.917; §24.232(d)	Occupied Bandwidth	Compliant
§2.1051; §22.917, §24.238	Conducted Spurious Emissions at Antenna Terminals and Band Edge	Compliant
§2.1053; §22.917, §24.238	Radiated Spurious Emissions from the Cabinet	Compliant
§2.1049, §24.238	Frequency stability	Compliant
Section 3.62 FCC KDB 935210 and section 7.2.2.5.2 ANSI C63.26	Intermodulation Products	Compliant
Section 3.3 FCC KDB 935210 and section 7.2.2.2 ANSI C63.26	Filter Response	Compliant
N/A	RF Exposure	Not Applicable

Table 1. Executive Summary of EMC Compliance Testing

II. Equipment Configuration

A. Overview

MET Laboratories, Inc. was contracted by Commscope to perform testing on the CAP M 7E/80-85/17E/19-F-DC 7820478-0001 and 7820478-0002, under Commscope's purchase order number 8002554399.

This document describes the test setups, test methods, required test equipment, and the test limit criteria used to perform compliance testing of the Commscope, CAP M 7E/80-85/17E/19-F-DC 7820478-0001 and 7820478-0002.

The results obtained relate only to the item(s) tested.

Model(s) Tested:	CAP M 7E/80-85/17E/19-F-DC 7820478-0001 and 7820478-0002		
Model(s) Covered:	CAP M 7E/80-85/17E/19-F-DC 7820478-0001 and 7820478-0002		
Filing Status:	Original		
EUT Specifications:	Primary Power: 110VAC for EUT1 and 48VDC for EUT2		
	FCC ID: XS5-CAPM7E817E19		
	Type of Modulations:	LTE, GSM, CDMA, WCDMA	
	Equipment Code:	B2I	
	RF Power Output	32.1 dBm Conducted	
	GSM		
	CDMA	33.73 dBm Conducted	
	WCDMA	33.14 dBm Conducted	
	EUT Frequency Ranges (MHz):	CDMA : 869-894MHz, 1930-1995MHz, 2110-2180 MHz GSM : 869-894 MHz, 1930-1990 MHz WCDMA : 869-894MHz, 1930-1995MHz, 2110-2180 MHz	
Analysis:	The results obtained relate only to the item(s) tested.		
Environmental Test Conditions:	Temperature: 15-35° C		
	Relative Humidity: 30-60%		
	Barometric Pressure: 860-1060 mbar		
Evaluated by:	Bradley Jones		
Date(s):	December 5, 2018

C. Test Site

All testing was performed at MET Laboratories, Inc., 914 West Patapsco Avenue, Baltimore, MD 21230. All equipment used in making physical determinations is accurate and bears recent traceability to the National Institute of Standards and Technology.

Radiated Emissions measurements were performed in a 3 meter semi-anechoic chamber (equivalent to an Open Area Test Site). In accordance with §2.948(a)(3), a complete site description is contained at MET Laboratories.

D. Measurement Uncertainty

Test Method	Typical Expanded Uncertainty	K	Confidence Level
RF Frequencies	±4.52 Hz	2	95%
RF Power Conducted Emissions	±2.32 dB	2	95%
RF Power Conducted Spurious Emissions	±2.25 dB	2	95%
RF Power Radiated Emissions	±3.01 dB	2	95%

Table 2. Uncertainty Calculations Summary

E. Description of Test Sample

The CAP M 7E/80-85/17E/19-F-DC 7820478-0001 and 7820478-0002, Equipment Under Test (EUT), is DAS (Distributed Antenna System) Remote. It does not operate in a stand-alone mode.

1.1.1 CAP M Base Unit Overview

The CAP M serves as a remote unit in an ION-E DAS. The CAP M interfaces with the CAN/TEN via an optical link. The CAP M also can be cascaded to a second unit using the same transport mechanism, and/or an auxiliary PoE (Class 3) Ethernet device such as a wireless access point. On the DL, the CAP M converts some or all the data arriving at the CAP M to analog signals and sends them to the antenna ports. On the UL, received signals are digitized and serialized into data streams which are sent back to the CAN. Each unit contains up to four transceiver paths for RF coverage. Each path is dedicated to a fixed band (set at the factory). Physically, the CAP M base unit consists of 3 major PCBAs, the Main board and 2 separate RF boards for optimization of the dissipation. A cavity Duplexer and Power supply module.

1.1.2 Main Board

The Main Board contains the FPGA, reference clocks, and power supplies for the unit. Main Board provides the interface to the ERA head end (CAN or TEN) by optical connection. The Main Board also provides the interfaces for a cascaded CAP M and/or auxiliary Ethernet port.

Additional connections to the “outside world” from the Main Board include status & alarm indicator bi-color LED, and the fan kit connector (optional). Internally, the board contains the A/D and D/A converters as well as the IF and frequency-translating components for the RF transceivers. For the initial release, the main board transceiver paths are frequency-agnostic, so that only the RF board must be changed to cover a different set of frequency bands.

1.1.3 RF Boards

The RF boards contain the PAs, LNAs, filters, and combiners for each coverage band. These bands are combined in the cavity Duplexer, 1 ANT port for SISO version and 2 ANT ports for MIMO version. The RF Boards is where all of the frequency-specific devices reside, so generally the bands supported by a CAP M unit are determined by which RF Board variant and different cavity DPX.

1.2 PowerSupply

CAP M EU version is powered via the AC connection only. AC power comes from local AC supply. For US version DC power is available, DC can come from a local DC supply or via hybrid fiber (and a hybrid fiber junction box) from the CAN/TEN.

1.3 Optical Interface

The CAP M Optical unit interface with the CAN/TEN via optical fiber, and the conversion of signals from optical to electrical takes place in the SFP+ module(s) in the OCTIS connector(s). The appropriate SFP+ units must be specified: these vary depending upon the length of fiber used and the type of fiber used (single mode, multimode). These SFP+ options can be changed in the field. Optical transport is over single mode (SM) or multimode (MM) fiber. The appropriate SFP+ is chosen by the customer during the ordering process and is installed in the OCTIS SFP connector. See ERA system for further requirements / limitations.

1.4 List Operation bands

BAND	DL (MHz)	UL (MHz)	Standard
12	729-746	699-716	LTE
13	746-756	777-787	LTE
5	869-894	824-849	LTE, UMTS, CDMA, GSM
66	2110-2180	1710-7180	LTE, UMTS, CDMA
25	1930-1995	1850-1915	LTE, UMTS, CDMA, GSM

1.5 Description of power down function for CAP-M remote unit

a) Over temperature:

Internal temperatures of the major components (PAs, FPGA, and PHY) are continuously monitored by the system controller. Over-temperature alarms are raised if any of these temperatures exceed 80°C (75° for the FPGA). If nothing is done to remedy the situation when the alarm is raised and temperatures continue to rise; the unit will shut down when any one of the temperature measurements reach 85°C (or 80°C for the FPGA).

b) Over power:

If the input power of the PA exceeds continuously the limit that will result in the maximum output power, an input power limiter (ALC = Automatic Level Control) will be active. It will actively limit the input power to a value that will result in the maximum specified output power.

c) Over power:

Output power overdrive due to fast input power peaks will trigger a gain reduction algorithm so that the output power level is restricted to the intended maximum

d) Over current:

An electronic device turns OFF the PA when its current exceeds defined current threshold which roughly corresponds to about 4/5dB the nominal output power.

H. Ports and Cabling Information

Ref. ID	Port name on EUT	Cable Description or reason for no cable	Qty	Length as tested (m)	Max Length (m)	Shielded? (Y/N)	Termination Box ID & Port Name
1	Fiber Input Cable	Customer supplied Fiber Cable	1	10		Yes	EUT Input
2	48VDC Input	DC power Cable	1	3,2		No	EUT Power Supply
3	VAC Input	AC power Cable	1	3,2		No	EUT Power Supply
4	ANT 1	Test Equipment	1	2		No	Antenna Port

Table 5. Ports and Cabling Information

I. Mode of Operation

The EUT will operate in a continuous emission mode. The unit will be tested to address FCC Part 15 B (Class B) – Unintentional Radiator Conducted and Radiated Emissions.

The EUT will also be operated in a continuous emission mode on downlink bands only addressing FCC 22H/24E & RSS-131, RSS-132, RSS-133 intentional Radiator mode for Frequency:

GSM-850UL (824-849 MHz) / DL (869-894MHz)

GSM-1900 UL(1850-1910MHz) / DL(1930-1990MHz)

WCDMA Band 25 UL(1850-1915 MHz) / DL(1930 – 1995 MHz)

WCDMA Band 66 UL(1710-1780 MHz) / DL(2110-2180 MHz)

WCDMA Band 5 UL(824-849 MHz) / DL(869-894 MHz)

CDMA Band 25 UL(1850-1915 MHz) / DL(1930-1995 MHz)

CDMA Band 66 UL(1710-1780 MHz) / DL(2110-2180MHz)

CDMA Band 5 UL (824-849 MHz) / DL(869-894MHz)

J. Method of Monitoring EUT Operation

The LED on the unit will be solid green if the unit is powered on and operational. If the unit is powered on and the LED on the unit is a solid red, the unit is not operational. It will be identified as a major hardware issue and an alarm will be raised on the GUI.

K. Modifications

a) Modifications to EUT

No modifications were made to the EUT.

b) Modifications to Test Standard

No modifications were made to the test standard.

L. Disposition of EUT

The test sample including all support equipment submitted to the Electro-Magnetic Compatibility Lab for testing was returned to CommScope upon completion of testing.

III. Electromagnetic Compatibility Criteria for Intentional Radiators

Electromagnetic Compatibility Criteria for Intentional Radiators

§ 2.1046 RF Power Output

Test Requirements: § 2.1046 Measurements required: RF power output:

§ 2.1046 (a) For transmitters other than single sideband, independent sideband and controlled carrier radiotelephone, power output shall be measured at the RF output terminals when the transmitter is adjusted in accordance with the tune-up procedure to give the values of current and voltage on the circuit elements specified in § 2.1033(c)(8). The electrical characteristics of the radio frequency load attached to the output terminals when this test is made shall be stated.

§ 2.1046 (b) For single sideband, independent sideband, and single channel, controlled carrier radiotelephone transmitters, the procedure specified in paragraph (a) of this section shall be employed and, in addition, the transmitter shall be modulated during the test as specified and as applicable in § 2.1046 (b) (1-5). In all tests, the input level of the modulating signal shall be such as to develop rated peak envelope power or carrier power, as appropriate, for the transmitter.

§ 2.1046 (c) For measurements conducted pursuant to paragraphs (a) and (b) of this section, all calculations and methods used by the applicant for determining carrier power or peak envelope power, as appropriate, on the basis of measured power in the radio frequency load attached to the transmitter output terminals shall be shown. Under the test conditions specified, no components of the emission spectrum shall exceed the limits specified in the applicable rule parts as necessary for meeting occupied bandwidth or emission limitations.

§ 22.913(5): The ERP of mobile transmitters and auxiliary test transmitters must not exceed 7 watts

§ 24.232 (c): Mobile and portable stations are limited to 2 watts EIRP and the equipment must employ a means for limiting power to the minimum necessary for successful communications

Test Procedures: The EUT was tested according to the average power integration procedures of ANSI C63.26 5.2.4.4.1. The power measurement function of spectrum analyzer was used and configured in the following manner.

- (a) Frequency = channel cf
- (b) Span = 2-3 x the OBW
- (c) RBW = 1-5 % of the OBW
- (d) VBW 1-3 x the RBW
- (e) Sweep Time = Auto
- (f) Detector = Average

Test Results: The EUT was found compliant with the requirements of this section.

Test Engineer(s): Bradley Jones

Test Date(s): August 31, 2018

§ 2.1049 Occupied Bandwidth

Test Requirement(s): § 2.1049 **Measurements required: Occupied bandwidth:** The occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission shall be measured under the specified conditions of § 2.1049 (a) through (i) as applicable.

§22.917 (1) The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

§24.238 (b) The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

Test Procedures: The EUT was tested according to relative measurement procedure of ANSI C63.26 5.4.3. The OBW measurement function of the spectrum analyzer was used and configured in the following manner.

- (a) Frequency = channel cf
- (b) Span = 2-5 x the OBW
- (c) RBW = 1-5 % of the OBW
- (d) VBW 1-3 x the RBW
- (e) Sweep Time = Auto
- (f) Detector = peak
- (g) -X dB = 26

Test Results: The equipment was found compliant with FCC requirements.

Test Engineer(s): Bradley Jones

Test Date(s): August 30, 2018

Electromagnetic Compatibility Criteria for Intentional Radiators

§ 2.1053 Radiated Spurious Emissions

Test Requirement(s): § 2.1053 Measurements required: Field strength of spurious radiation.

§ 2.1053 (a) Measurements shall be made to detect spurious emissions that may be radiated directly from the cabinet, control circuits, power leads, or intermediate circuit elements under normal conditions of installation and operation. Curves or equivalent data shall be supplied showing the magnitude of each harmonic and other spurious emission. For this test, single sideband, independent sideband, and controlled carrier transmitters shall be modulated under the conditions specified in paragraph (c) of § 2.1049, as appropriate. For equipment operating on frequencies below 890 MHz, an open field test is normally required with the measuring instrument antenna located in the far-field at all test frequencies. In the event it is either impractical or impossible to make open field measurements (e.g. a broadcast transmitter installed in a building) measurements will be accepted of the equipment as installed. Such measurements must be accompanied by a description of the site where the measurements were made showing the location of any possible source of reflections which might distort the field strength measurements. Information submitted shall include the relative radiated power of each spurious emission with reference to the rated power output of the transmitter, assuming all emissions are radiated from half-wave dipole antennas.

§ 2.1053 (b): The measurements specified in paragraph (a) of this section shall be made for the following equipment:

- (1) Those in which the spurious emissions are required to be 60 dB or more below the mean power of the transmitter.
- (2) All equipment operating on frequencies higher than 25 MHz.
- (3) All equipment where the antenna is an integral part of, and attached directly to the transmitter.
- (4) Other types of equipment as required, when deemed necessary by the Commission.

§ 22.917 Emission limitations Cellular equipment: The rules in this section govern the spectral characteristics of emissions in the Cellular Radiotelephone Service.

§ 22.917 (a): Out of band emissions. The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log(P)$.

§24.238 (a) Out of band emissions. The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log(P)$ dB.

Test Procedures: The EUT was tested according to field strength method of ANSI C63.26 5.5.4. The spectrum analyzer was used and configured in the following manner:

- (a) Frequency Range = Lowest Generated – 10th Harmonic
- (b) RBW = 1MHz
- (c) VBW 1-3 x the RBW
- (d) Detector = Average

Radiated emission measurements were performed inside a 3 meter chamber that satisfies the site requirements of ANSI C63.4-2014. The EUT was placed on an rf transparent 80 cm table for measurements below 1GHz and an rf transparent 1.5 meter table for measurements above 1GHz. The EUT's RF ports were terminated to 50ohm load. The EUT was tested using all modulations and at the low, mid, and high channels. The EUT was rotated about 360° and the receiving antenna scanned from 1-4m in order to capture the maximum emission. The plots are corrected for cable loss, antenna correction factor, and distance correction. The field strength was mathematically corrected to an E.I.R.P.

Emissions below 30MHz and above 18GHz were more than 20dB below the limit. The worse-case configurations are reported.

Test Results: The EUT was found compliant with the requirements of this section.

Measurements were made in each configuration. Data is presented for the worse case configuration.

Test Engineer: Bradley Jones

Electromagnetic Compatibility Criteria for Intentional Radiators

§ 2.1051 Spurious Emissions at Antenna Terminals

Test Requirement(s): § 2.1051 **Measurements required: Spurious emissions at antenna terminals:** The radio frequency voltage or powers generated within the equipment and appearing on a spurious frequency shall be checked at the equipment output terminals when properly loaded with a suitable artificial antenna. Curves or equivalent data shall show the magnitude of each harmonic and other spurious emission that can be detected when the equipment is operated under the conditions specified in § 2.1049 as appropriate.

§ 22.917 The rules in this section govern the spectral characteristics of emissions in the Cellular Radiotelephone Service.

§ 22.917 (a) **Out of band emissions.** The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log(P)$ dB.

§24.238 **Emission limitations for Broadband PCS equipment:** The rules in this section govern the spectral characteristics of emissions in the Broadband Personal Communications Service.

§ 24.238 (a) **Out of band emissions.** The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log(P)$ dB.

Test Procedures: The EUT was tested according to the unwanted emissions procedures of ANSI C63.26 5.7.3. The spectrum analyzer was used and configured in the following manner:

- (e) Frequency Range = 30MHz – 10th Harmonic
- (f) RBW = 1% of the OBW, or greater
- (g) VBW 1-3 x the RBW
- (h) Detector = Peak
- (i) Sweet Time = Auto

Test Results: The equipment was found compliant with the requirements of this section.

For out of band emissions, the low, mid, and high channels for each test mode were evaluated, data is presented for the worse case/ highest output channel.

For band edge emissions, each bandwidth mode was evaluated. Data is presented for the worse case configurations.

Electromagnetic Compatibility Criteria for Intentional Radiators

§2.1049 Frequency Stability

Test Requirement(s): §2.1055 (a) The frequency stability shall be measured with variation of ambient temperature.
(d) The frequency stability shall be measured with variation of primary supply voltage.

§24.235 The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block.

Test Procedures: The EUT was placed inside a temperature chamber and Frequency measurements were made at the extremes of the specified temperature range and at intervals of 10° centigrade through the range. The operating voltage is varied to +/- 15 % of the nominal voltage at normal temperature.

Test Results: Equipment was found compliant with the requirements of this section.

Table 11. Frequency Stability, 746 - 756 MHz, Test Results

Electromagnetic Compatibility Criteria for Intentional Radiators

Intermodulation

Test Requirement(s):	Spurious emissions shall be measured using a single test signal sequentially tuned to the low, middle, and high channels or frequencies within each authorized frequency band of operation. Out-of-band/out-of-block emissions (including intermodulation products) shall be measured under each of the following two stimulus conditions: a) two adjacent test signals sequentially tuned to the lower and upper frequency band/block edges; b) a single test signal, sequentially tuned to the lowest and highest frequencies or channels within the frequency band/block under examination.
Test Procedures:	Test was performed using the procedure specified in Section 3.6.2 of the KDB 935210 D05 v01r02.
Test Results:	Equipment was found compliant with the requirements of this section.
Test Engineer(s):	Deepak Giri
Test Date(s):	September 19, 2018

Electromagnetic Compatibility Criteria for Intentional Radiators

Filter Response

Test Procedures: Test was performed according to section 3.3 of the FCC KDB 935210 D05 v01r02.

Test Results: Equipment was found compliant with the requirements of this section.

Test Engineer(s): Bradley Jones

Test Date(s): September 19, 2018

IV. Test Equipment

Test Equipment

Calibrated test equipment utilized during testing was maintained in a current state of calibration per the requirements of ISO/IEC 17025:2005.

MET Asset #	Equipment	Manufacturer	Model	Last Cal Date	Cal Due Date
