Test Requirement

e-CFR Title 47 Chapter I Subchapter A Part 15 Subpart C §15.247 (d)

Test equipment and test set up:

Test equipment used for conducted measurements as given in clause 10 Test equipment of this report.

Test setup used for conducted measurements as given in clause 11 Test setups of this report.

Description

The band edge is measured at an amplitude level reduced from the reference level by a specified ratio. The reference level is the level of the highest amplitude signal observed from the transmitter at the fundamental frequency.

Detector function selection and bandwidth

For the measurement, an EMI test receiver that have CISPR peak and average detector was used.

Frequency range:

See measurement graph

Bandwidth

RBW: 100 kHz

VBW: 300 kHz

Limit:

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power. Emissions which fall in the restricted bands, as defined in §15.205 Restricted Bands of operation, must also comply with the radiated emission limits specified in §15.209 Radiated emission limits; general requirements.
