REPORT SUMMARY

Radio Testing of the
Telkonet Inc.
EcoSmart VRF Controller

1.1 INTRODUCTION

The information contained in this report is intended to show verification of the Telkonet EcoInsight to the requirements of FCC Part 15 Subpart C § 15.247, RSS-Gen, Issue 4, November 2014 and RSS 247 Issue 2, February 2017.

Objective	To perform Radio Testing to determine the Equipment Under Test's (EUT's) compliance with the Test Specification, for the series of tests carried out.
Manufacturer	Telkonet Inc.
Model Number(s)	EcoSmart VRF Controller
FCC ID Number	XV6SS6600
IC Number	22341-SS6600
Serial Number(s)	None
Number of Samples Tested	1
Test Specification/Issue/Date	• FCC Part 15 Subpart C § 15.247 • RSS 247 Issue 2, February 2017 Digital Transmission Systems (DTSs), Frequency Hopping Systems (FHSs) and Licence-Exempt Local Area Network (LE-LAN) Devices. • RSS-Gen, Issue 4, November 2014 General Requirements for Compliance of Radio Apparatus. • 558074 D01 DTS Meas Guidance v03r03, (June 09, 2015) Guidance for Performing Compliance Measurements on Digital Transmission Systems (DTS) Operating Under §15.247.
Start of Test	14. December 2016
Finish of Test	16. December 2016
Name of Engineer(s)	David Foerstner
Related Document(s)	None. Supporting documents for EUT certification are separate exhibits.

1.2 BRIEF SUMMARY OF RESULTS

A brief summary of the tests carried out in accordance with FCC Part 15 Subpart C § 15.247 with cross-reference to the corresponding IC RSS standard is shown below.

1.3 PRODUCT INFORMATION

1.3.1 Technical Description

The Equipment Under Test (EUT) was an EcoSmart VRF Controller, a wireless energy management device used as an HVAC controller.

1.3.2 EUT General Description

EUT Description	An energy management thermostat with a built-in occupancy sensor and ZigBee® capability
Model Name	EcoSmart VRF Controller
Model Number(s)	none
Rated Voltage	12 VDC
Mode Verified	Zigbee
Capability	Zigbee
Primary Unit (EUT)	☐ Production ☒ Pre-Production ☐ Engineering
Antenna Manufacturer	Telkonet
Antenna Part Number	None
Antenna Type	PC Etch
Antenna Gain	3.3 dBi
Host Brand	NA
Host Model Name	NA
Host Model Number	NA

1.3.3 Maximum Conducted Output Power (Peak)

1.4 EUT TEST CONFIGURATION

1.4.1 Test Configuration Description

Test Configuration	Description
A	Radiated emissions test configuration. EUT transmitting through the integral antenna.

1.4.2 EUT Exercise Software

The manufacturer provided the following instructions: The port configuration is 9600 N81. To enable the command line interface, use a TAB-ENTER key sequence. This sequence must be executed each time the unit boots. At this point you should get the prompt "\$".

To configure the RF channel, use the command "zb -c <channel>". Channel is the 802.15.4 channel number. Valid channel numbers are from 11 to 26.

To enable/disable radio transmissions (one packet per 100ms), use the command "mfg -f <0,1>" where 1 is enable and 0 is disable.

The radio transmit power is fixed at the maximum level.

1.4.3 Support Equipment and I/O cables

Manufacturer	Equipment/Cable	Description
Lenovo	Support Laptop for programming EUT	B570

1.4.4 Worst Case Configuration

EUT verified on all three (3) orthogonal axes. Only worst case axis presented (X).

1.4.5 Simplified Test Configuration Diagram

Radiated Emission Test Setup

Configuration not presented is when the EUT is installed inside a representative host. Radiated emissions were performed on the host while the EUT is in Rx and TX mode (worst case).

1.5 DEVIATIONS FROM THE STANDARD

No deviations from the applicable test standards or test plan were made during testing.

1.6 MODIFICATION RECORD

Description of Modification	Modification Fitted By	Date Modification Fitted
Serial Number		
N/A		

The table above details modifications made to the EUT during the test programme. The modifications incorporated during each test (if relevant) are recorded on the appropriate test pages.

1.7 TEST METHODOLOGY

All measurements contained in this report were conducted with ANSI C63.10-2013, American National Standard of Procedures for Compliance Testing of Unlicensed Wireless Devices.

For conducted and radiated emissions the equipment under test (EUT) was configured to measure its highest possible emission level. The test modes were adapted according to the Operating Instructions provided by the manufacturer/client.

1.8 TEST FACILITY LOCATION

1.8.1 TÜV SÜD America Inc. (Tampa)

1.9 TEST FACILITY REGISTRATION

1.9.1 FCC – Registration No

The TUV SUD America Inc. (Tampa), test facility has been registered with the Federal Communication Commission as an ISO/IEC 17025 accredited test laboratory and assigned the designation number US1063.

1.9.2 Innovation, Science and Economic Development Canada Registration

The TUV SUD America Inc. (Tampa), test facility has been registered with Innovation, Science and Economic Development Canada and assigned the site number 2087A-2.

TEST DETAILS

Radio Testing of the
Telkonet Inc.
EcoSmart VRF Controller

2.1 PEAK OUTPUT POWER

2.1.1 Specification Reference

Part 15 Subpart C §15.247(b)(3)

2.1.2 Standard Applicable

(3) For systems using digital modulation in the 902–928 MHz, 2400–2483.5 MHz, and 5725–5850 MHz bands: 1 Watt. As an alternative to a peak power measurement, compliance with the one Watt limit can be based on a measurement of the maximum conducted output power. Maximum Conducted Output Power is defined as the total transmit power delivered to all antennas and antenna elements averaged across all symbols in the signaling alphabet when the transmitter is operating at its maximum power control level. Power must be summed across all antennas and antenna elements. The average must not include any time intervals during which the transmitter is off or is transmitting at a reduced power level. If multiple modes of operation are possible (e.g., alternative modulation methods), the maximum conducted output power is the highest total transmit power occurring in any mode.

2.1.3 Equipment Under Test and Modification State

Serial No: none / Test Configuration A

2.1.4 Date of Test/Initial of test personnel who performed the test

14. December 2016 / DF

2.1.5 Test Equipment Used

The major items of test equipment used for the above tests are identified in Section 3.1.

2.1.6 Environmental Conditions

Test performed at TÜV SÜD America Inc. Tampa facility

Ambient Temperature	24 - 26 °C
Relative Humidity	30 - 32 %

2.1.7 Additional Observations

- This is a radiated test (Maximum Peak Output Power) using a spectrum analyzer.
- Test methodology is per Clause 9.2.2.6 of KDB 558074 D01 (DTS Meas Guidance v03r05, April 08, 2016). All conditions under this Clause were satisfied.

2.2 CONDUCTED EMISSIONS

2.2.1 Specification Reference

Part 15 Subpart C §15.207(a)

2.2.2 Standard Applicable

An intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies, within the band 150 kHz to 30 MHz, shall not exceed the limits in the following table, as measured using a 50 μ H/50 ohms line impedance stabilization network (LISN).

Frequency of emission (MHz)	Conducted limit (dB μ V)	
	Quasi-peak	Average
0.15–0.5	66 to 56*	56 to 46*
0.5–5	56	46
5–30	60	50

*Decreases with the logarithm of the frequency.

2.2.9 Test Results

The conducted emissions tests was not applicable since the EUT was powered by 12 VDC; did not connect to a public utility ac line.

2.3 99% Emission Bandwidth

2.3.1 Specification Reference

RSS-Gen Clause 6.6

2.3.2 Standard Applicable

The emission bandwidth (x dB) is defined as the frequency range between two points, one above and one below the carrier frequency, at which the spectral density of the emission is attenuated x dB below the maximum in-band spectral density of the modulated signal. Spectral density (power per unit bandwidth) is to be measured with a detector of resolution bandwidth in the range of 1% to 5% of the anticipated emission bandwidth, and a video bandwidth at least 3x the resolution bandwidth.

When the occupied bandwidth limit is not stated in the applicable RSS or reference measurement method, the transmitted signal bandwidth shall be reported as the 99% emission bandwidth, as calculated or measured.

- The transmitter shall be operated at its maximum carrier power measured under normal test conditions.
- • The span of the analyzer shall be set to capture all products of the modulation process, including the emission skirts.
- • The resolution bandwidth (RBW) shall be in the range of 1% to 5% of the occupied bandwidth (OBW) and video bandwidth (VBW) shall be approximately 3x RBW.

Note: Video averaging is not permitted.

A peak, or peak hold, may be used in place of the sampling detector as this may produce a wider bandwidth than the actual bandwidth (worst-case measurement). Use of a peak hold may be necessary to determine the occupied bandwidth if the device is not transmitting continuously.

The trace data points are recovered and are directly summed in linear power level terms. The recovered amplitude data points, beginning at the lowest frequency, are placed in a running sum until 0.5% of the total is reached and that frequency recorded. The process is repeated for the highest frequency data points (starting at the highest frequency, at the right side of the span, and going down in frequency). This frequency is then recorded.

The difference between the two recorded frequencies is the 99% occupied bandwidth.

2.3.3 Equipment Under Test and Modification State

Serial No: none / Test Configuration A

2.3.4 Date of Test/Initial of test personnel who performed the test

14. December 2016 / DF

2.3.5 Test Equipment Used

The major items of test equipment used for the above tests are identified in Section 3.1.

2.3.6 Environmental Conditions

Test performed at TÜV SÜD America Inc. Tampa facility.

Ambient Temperature 24 - 26 °C
 Relative Humidity 30 - 32 %

2.3.7 Additional Observations

- This is a radiated test. EUT on normal test mode.
- Span is wide enough to capture the channel transmission.
- RBW is 1% to 5% of the span.
- VBW is 3X RBW.
- Sweep is auto.
- Detector is peak.

2.4.6 Environmental Conditions

Test performed at TÜV SÜD America Inc. Tampa facility

Ambient Temperature	24 - 26 °C
Relative Humidity	30 - 32 %

2.4.7 Additional Observations

- This is a radiated test.
- Span is wide enough to capture the channel transmission.
- RBW is set to 100 kHz.
- VBW is $\geq 3X$ RBW.
- Sweep is auto.
- Detector is peak.
- The “n” dB down marker function of the spectrum analyzer was used for this test.

2.5 OUT-OF-BAND EMISSIONS - CONDUCTED

2.5.1 Specification Reference

Part 15 Subpart C §15.247(d)

2.5.2 Standard Applicable

(d) In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

2.6.7 Additional Observations

- This is a radiated test.
- RBW is 100kHz.VBW is 3X RBW.
- Sweep is auto. Detector is peak. Trace is max hold.
- Trace was centred on the band-edge frequency.
- Span was set to encompass the band-edge frequency and the peak of the emission.
- Using Marker function, peak of the emission was determined and the delta to the band-edge frequency measured.
- Band-edges were verified ≤ 30 dBc.

2.7.6 Environmental Conditions

Test performed at TÜV SÜD America Inc. Tampa facility

Ambient Temperature	24 - 26 °C
Relative Humidity	30 - 32 %

2.7.7 Additional Observations

- This is a radiated test. The spectrum was searched from 30MHz to the 10th harmonic.
- There are no emissions found that do not comply to the restricted bands defined in FCC Part 15 Subpart C, 15.205 or Part 15.247(d).
- Only noise floor measurements observed above 18GHz.
- Measurement was done using EMC32 automated software. Reported level is the actual level with all the correction factors factored in. Correction Factor column is for informational purposes only. See Section 2.6.8 for sample computation.

Test Notes: No significant emissions observed above 12GHz. Measurements above 12GHz were noise floor figures.

2.8 POWER SPECTRAL DENSITY

2.8.1 Specification Reference

Part 15 Subpart C §15.247(e)

2.8.2 Standard Applicable

(e) For digitally modulated systems, the power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission. This power spectral density shall be determined in accordance with the provisions of paragraph (b) of this section. The same method of determining the conducted output power shall be used to determine the power spectral density.

2.8.3 Equipment Under Test and Modification State

Serial No: none / Test Configuration A

2.8.4 Date of Test/Initial of test personnel who performed the test

14. December 2016 / DF

2.8.5 Test Equipment Used

The major items of test equipment used for the above tests are identified in Section 3.1.

2.8.6 Environmental Conditions

Test performed at TÜV SÜD America Inc. Tampa facility.

Ambient Temperature	24 - 26 °C
Relative Humidity	30 - 32 %

2.8.7 Additional Observations

- This is a radiated test.
- Test procedure is per Section 10.8 of KDB 558074 v03r05, (April 08, 2016).
- Detector is Peak.
- Trace Mode is Max hold.
- Sweep time is Auto Couple.
- EUT complies with 3 kHz RBW.

2.8.8 Test Results Summary (PKPSD Method)

Channel	Marker Reading using 3 kHz RBW (dBuV/m)	PSD (dBm)	PSD Limit (dBm)	Compliance
2405 MHz	102.0	6.8	8	Complies
2440 MHz	100.7	5.5	8	Complies
2480 MHz	101.8	6.6	8	Complies

2.8.9 Test Results Plots

Convert Field Strength to dBm
 $EIRP = FS + (20 \log D) - 104.7$
 $EIRP = FS - 95.2$
