ENGINEERING STATEMENT

The measurements shown in this report were made in accordance with the procedures described on test pages. All reported testing was carried out on a sample equipment to demonstrate limited compliance with FCC 47 CFR Part 90, FCC 47 CFR Part 2, Industry Canada RSS-119 and ISED RSS-GEN. The sample tested was found to comply with the requirements defined in the applied rules.

EXECUTIVE SUMMARY

A sample of this product was tested and found to be compliant with FCC 47 CFR Part 90: 2023, FCC 47 CFR Part 2: 2023, Industry Canada RSS-119: Issue 12 (05-2015) and ISED RSS-GEN: Issue 5 (04-2018) + A2 (02-2021) for the tests detailed in section 1.3.

DISCLAIMER AND COPYRIGHT

This non-binding report has been prepared by TÜV SÜD with all reasonable skill and care. The document is confidential to the potential Client and TÜV SÜD. No part of this document may be reproduced without the prior written approval of TÜV SÜD. © 2024 TÜV SÜD. This report relates only to the actual item/items tested.

ACCREDITATION

Our UKAS Accreditation does not cover opinions and interpretations and any expressed are outside the scope of our UKAS Accreditation. Results of tests not covered by our UKAS Accreditation Schedule are marked NUA (Not UKAS Accredited). Results of tests covered by our Flexible UKAS Accreditation Schedule are marked FS (Flexible Scope).

Top Frequency (MHz)	174	2480	2480	2462	2462	2462

Table 4

Two antenna gains are given:

1. The maximum free space dBi for the specified frequency range of antennas used in a handheld system using the top antenna connector.
2. The maximum dBi provided by the antenna manufacturer for antennas used in a vehicle system using the rear connector.

Un-intentional Radiators

Highest frequency generated or used in the device or on which the device operates or tunes	2480 MHz
Lowest frequency generated or used in the device or on which the device operates or tunes	32.768 kHz
Class A Digital Device (Use in commercial, industrial or business environment) ☒	
Class B Digital Device (Use in residential environment only) ☐

Antenna Characteristics

Antenna connector ☐ for TETRA			State impedance	50	Ohm
Temporary antenna connector ☐			State impedance		Ohm
Integral antenna ☒ for BT and WLAN	Type:	Inverted F	Gain	2.5	dBi
External antenna ☒	Type:	300-02070 helical (handheld system)	Gain	-6.9	dBi
External antenna ☒	Type:	300-02071 helical (handheld system)	Gain	-6.24	dBi
External antenna ☒	Type:	300-02072 helical (handheld system)	Gain	-6.93	dBi
External antenna ☒	Type:	300-02073 helical (handheld system)	Gain	-14.6	dBi
External antenna ☒	Type:	AVGHB-H4 ½ Wave (vehicle system)	Gain	5	dBi
External antenna ☒	Type:	AVGHB-H5 ½ Wave (vehicle system)	Gain	5	dBi
External antenna ☒	Type:	AVGHB-H6 ½ Wave (vehicle system)	Gain	5	dBi
External antenna ☒	Type:	AVGHB-H7 ½ Wave (vehicle system)	Gain	5	dBi
For external antenna only: Standard Antenna Jack ☒ If yes, describe how user is prohibited from changing antenna (if not professional installed): Equipment is only ever professionally installed ☒ Non-standard Antenna Jack ☐ All part 15 applications will need to show how the antenna gain was derived either from a manufacturer data sheet or a measurement. Where the gain of the antenna is inherently accounted for as a result of the measurement, such as field strength measurements on a part 15.249 or 15.231 device, so the gain does not necessarily need to be verified. However, enough information regarding the construction of the antenna shall be provided. Such information maybe photographs, length of wire antenna etc.

1.5 Product Information

1.5.1 Technical Description

The SC2021 is a portable TETRA radio with GNSS, Bluetooth and WLAN functionality. It has a TETRA frequency range of 136-174 MHz.

1.6 Deviations from the Standard

No deviations from the applicable test standard were made during testing.

1.7 EUT Modification Record

The table below details modifications made to the EUT during the test programme.

The modifications incorporated during each test are recorded on the appropriate test pages.

Modification State	Description of Modification still fitted to EUT	Modification Fitted By	Date Modification Fitted
Model: SC2021, Serial Number: 1PR002417GKZ793			
0	As supplied by the customer	Not Applicable	Not Applicable
Model: SC2021, Serial Number: 1PR002417GKZ790

2 Test Details

2.1 Radiated Spurious Emissions

2.1.1 Specification Reference

FCC 47 CFR Part 90, Clause 90.210
FCC 47 CFR Part 2, Clause 2.1053
Industry Canada RSS-119, Clause 5.8
ISED RSS-GEN, Clause 6.13

2.1.2 Equipment Under Test and Modification State

SC2021, S/N: 1PR002417GKZ790 - Modification State 0

2.1.3 Date of Test

31-July-2024

2.1.4 Test Method

A preliminary profile of the Radiated Spurious Emissions was obtained up to the 10th harmonic by operating the EUT on a remotely controlled turntable within a semi-anechoic chamber. Measurements of emissions from the EUT were obtained with the Measurement Antenna in both Horizontal and Vertical Polarisations. The profiling produced a list of the worst-case emissions together with the EUT azimuth and antenna polarisation.

The EUT was powered by a rechargeable 7.4V, 8.6Wh Lithium polymer battery supplied by the manufacturer for the duration of test.

Testing was performed in accordance with ANSI C63.26, Clause 5.5.

Prescans and final measurements were performed using the direct field strength method.

Field strength measurements were performed and then converted to Equivalent Power Measurements in accordance with ANSI C63.26, Clause 5.2.7 equation c)

Example calculation:

$E \text{ (dBuV/m)} + 20\log(d) - 104.8 = \text{EIRP (dBm)}$ where (d) is the measurement distance.

$82.2 \text{ (dBuV/m)} + 20\log(3) - 104.8 = \text{EIRP (dBm)}$

$-13.0 = \text{EIRP (dBm)}$

2.2.3 Date of Test

21-August-2024

2.2.4 Test Method

The test was applied in accordance with the test method requirements of FCC 47 CFR Part 90, Industry Canada RSS-119, and ISED RSS-GEN with reference to ANSI C63.26, clause 5.2.4.3.1.

The EUT was configured to transmit on maximum power on the bottom and top channel in continuous mode. Additionally, the middle channel was tested where required by ANSI C63.26 table 2.

The EUT was connected to a spectrum analyser via a cable and 50 dB of attenuation.

The path loss was measured using a calibrated signal generator connected to the wanted signal path and entered as a reference level offset in the spectrum analyser.

The RBW of the spectrum analyser was set to 22 kHz and the video bandwidth to 68 kHz with the trace set to average using an RMS detector over 1001 samples and the result was recorded.

The EUT was powered by a 7.4V, lithium polymer battery supplied by the manufacturer for the duration of test.

2.3.3 Date of Test

22-August-2024

2.3.4 Test Method

The test was applied in accordance with the test method requirements of FCC 47 CFR Part 90, Industry Canada RSS-119, and ISED RSS-GEN with reference to ANSI C63.26, Clause 5.4.

The EUT was configured to transmit on maximum power on the bottom and top channel in continuous mode. Additionally, the middle channel was tested where required by ANSI C63.26 table 2.

The EUT was connected to a spectrum analyser via a cable and 50 dB of attenuation. The path loss was measured using a network analyser and entered as a reference level offset in the spectrum analyser including the manufacturers declared maximum antenna gain. The RBW of the spectrum analyser was set to 300 Hz and the video bandwidth to 1 kHz with the trace set to max hold using a peak detector and the result was recorded.

The EUT was powered by a 7.4V, lithium polymer battery supplied by the manufacturer for the duration of test

2.4.3 Date of Test

22-August-2024

2.4.4 Test Method

For emissions where the frequency is removed less than 250 % of the authorised bandwidth measurements were performed conducted as follows:

The EUT was connected to a spectrum analyser via a cable and attenuator. The path loss between the EUT and analyser was calibrated using a network analyser and entered into the spectrum analyser as a reference level offset. The reference level for the mask was established with an RBW approximately 2 or 3 times the emission bandwidth. The RBW was then reduced to at least 1 % of the emission bandwidth, with a VBW of 3 times RBW. The mask as per FCC 47 CFR Part 90.210 (b) was applied.

For emissions where the frequency is removed more than 250 % of the authorized bandwidth measurements were performed both conducted and radiated as follows:

Conducted: A network analyser was used to measure the path loss and the worst case was entered as a reference level offset in to the spectrum analyser. The EUT was connected to a spectrum analyser via an attenuator, filter and cable. Between 300 MHz and 2 GHz a 300 MHz high pass filter was used. The spectrum analyser was configured with an RBW of 1 kHz between 9kHz and 150 kHz, an RBW of 10kHz was used between 150 kHz and 30 MHz, and an RBW of 100kHz was used between 30 MHz and 1 GHz. The RBW was set to 1 MHz for frequencies greater than 1 GHz with the trace set to max hold using a peak detector.

Radiated:- see section 2.1

The EUT was powered by a 7.4V, lithium polymer battery supplied by the manufacturer for the duration of test

2.5.3 Date of Test

30-August-2024

2.5.4 Test Method

This test was performed in accordance with ANSI C63.26, Clause 5.6. and the requirements of FCC 47 CFR Part 2, Clause 2.1055 (a)(1).

This test was performed on the bottom and top channel. Additionally, the middle channel was tested where required by ANSI C63.26 table 2.

The EUT was set to transmit on maximum power with an unmodulated carrier.

The EUT was connected to a spectrum analyser using an external 10 MHz frequency reference. The difference between the frequency of the fundamental and the frequency of the assigned channel in accordance with the manufacturer's documentation was recorded. In accordance with FCC 47 CFR, Clause 2.1055, the temperature was varied from -30 °C to +50 °C in 10 ° steps, with the EUT being supplied nominal voltage via a 7.4V, 8.6Wh lithium polymer battery supplied by the manufacturer. At nominal temperature, voltage was varied with the use of a DC PSU supplied to the EUT through a dummy battery.

2.6.3 Date of Test

28-August-2024

2.6.4 Test Method

This test was performed on the bottom and top channel. Additionally, the middle channel was tested where required by ANSI C63.26 table 2.

Testing was performed using an unmodulated carrier output from the EUT and measured on a spectrum analyser in accordance with TIA Standard 603 (Referenced in Industry Canada RSS-119, Clause 5.9).

The EUT configuration application used to transmit an unmodulated signal was 2.25 kHz higher than the nominal centre frequency of the channel. Therefore, the trace plots recorded were centred on 2.25 kHz higher than the bottom, middle and top nominal centre frequencies.

The EUT was powered by a 7.4V lithium polymer battery, supplied by the manufacturer, for the duration of the test.

2.7.3 Date of Test

28-August-2024

2.7.4 Test Method

The duty cycle and burst length of the EUT were measured in accordance with the procedures in ANSI C63.26, clause 5.2.4.3.4 b). In addition to this, a spectral plot of the intentional transmission was produced.

The EUT was configured to transmit on maximum power on the middle channel in burst mode. The EUT was connected to a spectrum analyser via a cable and 40 dB of attenuation.

The path loss was measured using a calibrated signal generator connected to the wanted signal path and entered as a reference level offset in the spectrum analyser.

The EUT was powered by a 7.4V, lithium polymer battery supplied by the manufacturer for the duration of test.

2.7.5 Environmental Conditions

Ambient Temperature	17.0 °C
Relative Humidity	58.3 %

FCC 47 CFR Part 90, Limit Clause 90.207

As per FCC Part 90.207 (b) through (n).

FCC 47 CFR Part 2, Limit Clause 2.1047

Voice modulated communication equipment. A curve or equivalent data showing the frequency response of the audio modulating circuit over a range of 100 to 5000 Hz shall be submitted. For equipment required to have an audio low-pass filter, a curve showing the frequency response of the filter, or of all circuitry installed between the modulation limiter and the modulated stage shall be submitted.

Equipment which employs modulation limiting. A curve or family of curves showing the percentage of modulation versus the modulation input voltage shall be supplied. The information submitted shall be sufficient to show modulation limiting capability throughout the range of modulating frequencies and input modulating signal levels employed.

Industry Canada RSS-119, Limit Clause 5.3

Equipment that operates in the bands 768-776 MHz and 798-806 MHz shall use digital modulation. Mobile and portable transmitters that operate in these bands may have analogue modulation capability only as a secondary mode in addition to their primary digital mode. However, mobile and portable transmitters that operate only on the low-power channels as defined in SRSP-511 may employ any type of modulation.

2.7.7 Test Location and Test Equipment Used

This test was carried out in EMC Chamber 5.

4 Measurement Uncertainty

For a 95% confidence level, the measurement uncertainties for defined systems are:

Test Name	Measurement Uncertainty
Maximum Conducted Output Power	± 3.2 dB
Bandwidth Limitations	± 58.05 Hz
Spurious Emissions at Antenna Terminals	± 3.45 dB
Frequency Stability	± 11 Hz
Transient Frequency Behaviour	± 0.2 Hz
Types of Emissions	-
Radiated Spurious Emissions	30 MHz to 1 GHz: ± 5.2 dB 1 GHz to 18 GHz: ± 6.3 dB

Table 56

Measurement Uncertainty Decision Rule – Accuracy Method

Determination of conformity with the specification limits is based on the decision rule according to IEC Guide 115:2021, Clause 4.4.3 (Procedure 2). The measurement results are directly compared with the test limit to determine conformance with the requirements of the standard.

Risk: The uncertainty of measurement about the measured result is negligible with regard to the final pass/fail decision. The measurement result can be directly compared with the test limit to determine conformance with the requirement (compare IEC Guide 115). The level of risk to falsely accept and falsely reject items is further described in ILAC-G8.
