Antenna Parameters with Head TSL

Impedance, transformed to feed point	$51.7 \Omega + 2.1 j\Omega$
Return Loss	- 31.6 dB

Antenna Parameters with Body TSL

Impedance, transformed to feed point	$49.4 \Omega + 2.5 j\Omega$
Return Loss	- 31.8 dB

General Antenna Parameters and Design

Electrical Delay (one direction)	1.157 ns
----------------------------------	----------

After long term use with 100W radiated power, only a slight warming of the dipole near the feedpoint can be measured.

The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals. On some of the dipoles, small end caps are added to the dipole arms in order to improve matching when loaded according to the position as explained in the "Measurement Conditions" paragraph. The SAR data are not affected by this change. The overall dipole length is still according to the Standard.

No excessive force must be applied to the dipole arms, because they might bend or the soldered connections near the feedpoint may be damaged.

ANNEX E

SC2021 WLAN TEST REPORT

Sepura Limited confirmed that the SC2021 TETRA hand portable's user interfaces and accessories remain unchanged from the previously assessed SC2021 series TETRA hand portables. The updated SC2021 represented within this report is representative of the previous SC2021 and has the same WLAN module.

On the updated SC2021, one SAR spot check was done on the test configuration that resulted in the highest SAR in the previously assessed SC2021 WLAN DEKRA 73291RAN.003s SAR report. Referencing the previously assessed SC2021 DEKRA SAR test report supplied by the customer we carried out spot check measurements for Head, Body, and Front of Face positions and found that the results are within an acceptable measurement variation.

For SC2021 WLAN testing, Wireless-LAN modes, channels, tune-ups and conducted power measurements are given by the customer please refer down the Table 38 for these details.

For SC2021 WLAN test details and test equipment used, please refer to the sections 2 and 3 of this report and for EUT identification refer to section 1.3.

Table 38

The following information was taken from the DEKRA report reference 73291RAN.003s.

Bluetooth: According to ISED RSS-102 Issue 6 (2023-12) – Radio Frequency Exposure Compliance of Radiocommunication Apparatus (All Frequency Bands), paragraph 6.3 Exemption Limits for Routine Evaluation – SAR Evaluation, if the device operates below the applicable output power level (adjusted for tune-up tolerance), for the specified separation distance defined in Table 11, SAR evaluation is not required. Output power level shall be the higher of the maximum conducted or equivalent isotropically radiated power (e.i.r.p.) source-based, time-averaged output power.

Output power level (e.i.r.p.) < Occupational Exemption limit at 2450MHz frequency, 5 mm distance.

The DUT has an antenna with a gain of 2.5 dBi, so the isotropically radiated power (e.i.r.p.) source-based, time averaged output power is 11.5 dBm $\diamond$ 14.12 mW:

Output power level (e.i.r.p.) = 14.12 mW

Occupational Exemption limit at 2450MHz frequency, 5 mm distance = 15.00 mW

$14.12 \text{ mW} < 15.00 \text{ mW}$

Therefore, SAR testing is not needed according to ISED RSS-102 Issue 6 (2023-12).

As the device supports simultaneous transmission using this technology, the estimate SAR value must be calculated according to Notice 2016-DRS001, based the following equation:

(maximum power level including tune-up tolerance for transmitter A / maximum power level of exemption at the same frequency and distance) * 0.4W/kg

Bluetooth Estimated SAR = $(14.12 \text{ mW} / 15.00 \text{ mW}) * 0.4 \text{ W/kg} = 0.376 \text{ W/kg}$

SC2321 TEST REPORT

Sepura Limited. confirmed that the SC2321 TETRA hand portable radio is the same as the SC2021 series with a depopulated PCB that has TETRA only and without BT/WLAN and reduced keypad features.

On the SC2321, one SAR spot check on each antenna and band configuration that resulted in the highest SAR from this SC2021 SAR test report has been performed and found that SC2321 test results are within an acceptable measurement variation.

For SC2321 testing, tune-ups and conducted power measurements are taken from SC2021 model D tests, please refer to sections 1.6 and 1.7 of this report for these details.

For head, body, and front of face, one SAR spot check test was done on each antenna and band configuration, please refer to section 1.5 of this report for spot check selection.

For SC2321 test details and test equipment used, please refer to sections 2 and 3 of this report and for EUT identification refer to section 1.3.
