2479.4	98.85	Average	2483.88	36.7	62.1(**)	54.0	11.9

The band edge readings were performed with a peak detector and with the E.U.T. set in a constant 100 % transmit state.

* According to step 2 of Marker-Delta Method DA 00-705.

** The limit is 54 dBμV/m for average emissions. According to 15.35 (c): when the radiated emission limits are expressed in terms of the average value of the emission, and pulsed operation is employed, the measurement field strength shall be determined by averaging over one complete pulse train, including blanking intervals, as long as the pulse train does not exceed 0.1 seconds. For a 10 % duty cycle, the power measured would be reduced by $20 \log (0.1) = -20$ dB. According to the declared duty cycle, therefore, the emissions observed are below the limit after averaging for pulse rate.

Band-edge curves are given in annex 5.

9. UNINTENTIONAL RADIATED EMISSIONS AND TRANSMITTER UNWANTED EMISSION IN THE BAND 9 KHz – 25 GHz

The E.U.T. is blocked in continuous transmission.

** The limit is 54 dBμV/m for average emissions. According to 15.35 (c): when the radiated emission limits are expressed in terms of the average value of the emission, and pulsed operation is employed, the measurement field strength shall be determined by averaging over one complete pulse train, including blanking intervals, as long as the pulse train does not exceed 0.1 seconds. For a 10 % duty cycle, the power measured would be reduced by $20 \log (0.1) = -20 \text{ dB}$. According to the declared duty cycle, therefore, the emissions observed are below the limit after averaging for pulse rate.

Test conclusion:

The equipment complies with the requirements of the standard.
