4. RADIATED EMISSIONS §15.209

In the following table you can find the limits established by the reference standard:

FREQUENCY RANGE (MHz)	<i>Field Strenght</i> <i>QUASI-PEAK LIMITS</i> [dB (μV/m)]
0.009 to 0.490	128.5 to 93.8
0.490 to 1.705	73.8 to 63.0
1.705 to 30	69.5
30 ÷ 88	40
88 ÷ 216	43,5
216 ÷ 960	46
Above 960	54

Extrapolation below 30 MHz is calculated at 40 dB/decade

Notes

Azimuth position EUT-Antenna corresponding to 0° identifies the rotating table orientation (TT) in which the instrument to be tested shows the front part turned towards the antenna. Positive grades individuate clockwise rotations of TT when this one is observed from the top. For negative degrees, TT rotation is anticlockwise.

Antenna height respect to the mass plane is conventionally individuated with: MA=XXX where XXX indicates the height (always positive for e>100) expressed in cm.

Antenna horizontal polarisation is indicated by POL=H.

Antenna vertical polarisation is indicated by POL=V.

EUT was tested in the three ortogonal planes.
