Description of Test Item

LCX or LCU (Lock Case Unit) (door lock – LCX7301) and proximity:

- I. LCX/LCU sends data over RF (906MHz) only in case when a person who has access to the cabin is in proximity of it (probably around 1.5m).
- II. Proximity function works all the time and it turns on GREEN LED if s person has access to the cabin and touched a door handle or RED if a person doesn't have access to the cabin and touch a door handle.
- III. It is important to know that LCX must receive 'permission' to active RF and this permission comes from Master. In our system Master is a Panel which hangs on the wall. The distance between Panel and door is approximately 1 meter.

Theory of Operation

When a person comes into the proximity of the Master/Panel then it sends command to the LCX to be ready to open a door. When that person touches the door handle then LCX opens the door and then sends preamble which is 10ms long plus some data (data contains information about lock case status, dead bolt, door switch etc.).

If a person comes out from the 'proximity' of the Master/ Panel then the LCX does not send any data and goes into sleep mode. It is just listening for 'permission' signal from the Master/Panel.

1.7 Worst-Case Configuration and Mode

Radiated Emissions was performed with the EUT set to transmit at the channel with the highest output power as worst-case scenario.

1.8 Comments

All measurements were done with the EUT powered by a fully charged battery.

All ports were populated during spurious emission measurements, i.e. with host device.

2 TEST REPORT SUMMARY

2.1 General

All measurements are traceable to national standards.

The tests were conducted for demonstrating compliance with FCC CFR 47 Part 15, paragraph 15.249 and Industry Canada RSS-210 Issue 9.

Tests were performed in accordance with ANSI C63.4-2014 and ANSI C63.10-2013.

Radiated tests were made in a semi-anechoic chamber at measuring distances of 1m, 3m and 10m.

A description of the test facility is on file with the FCC and Industry Canada.

Conducted Power (mWatts)	0.95
Field Strength (dBμV/m)	95.84

Average field strength calculated with duty cycle correction:

	906 MHz
Duty cycle correction (dB)	20.18
AV Field Strength (dBμV/m)	75.66
ERP, Calculated (mWatts)	0.01

Duty Cycle Correction Factor Calculation:

Duty Cycle = ON time / ON + OFF time = (9.8 ms / 100 ms) * 100 = 9.8%

Duty Cycle Correction factor = $-20 \times \log(0.098) = -20.18 \text{ dB}$

Maximum Duty Cycle Correction Factor according to Para 15.35 (b): 20 dB

Measured with 100%.

Antenna gain = $10 \times \log(\text{ERP} / \text{Conducted power}) \text{ dBi}$

EIRP is calculated from measured field strength by the formulas in KDB 412172 D01 Determining ERP and EIRP v01r01.

See attached plots.

Requirements:

(e) As shown in §15.35(b), for frequencies above 1000 MHz, the field strength limits in paragraphs (a)

The maximum average output power shall be $\leq 94 \text{ dB}\mu\text{V/m}$

and (b) of this section are based on average limits. However, the peak field strength of any emission shall not exceed the maximum permitted average limits specified above by more than 20 dB under any condition of modulation.
