

# TEST REPORT

Report No.: BCTC2607122212E

Applicant: S.Q.M CO., LTD.

Product Name: Remote Control

Test Model: DL-8102T

Tested Date: 2026-07-07 to 2026-07-13

Issued Date: 2026-07-21

**Shenzhen BCTC Technology Co., Ltd.**

**FCC ID:Y7ZDL8102T**

Product Name: Remote Control

Trademark: NA

Model/Type Reference: DL-8102T

Prepared For: S.Q.M CO., LTD.

Address: NO. 1599 GUANGXING RD. TAIPING CITY, TAICHUNG COUNTY, TAIWAN 41149

Manufacturer: S.Q.M CO., LTD.

Address: NO. 1599 GUANGXING RD. TAIPING CITY, TAICHUNG COUNTY, TAIWAN 41149

Prepared By: Shenzhen BCTC Technology Co., Ltd.

Address: Room 101M, Unit 1, Building1, Pengyuan, No.18, Lilang Road, Shanglilang, Nanwan Subdistrict, Longgang District, Shenzhen, Guangdong, China.

Sample Received Date: 2026-07-07

Sample tested Date: 2026-07-07 to 2026-07-13

Report No.: BCTC2607122212E

Test Standards: 47 CFR Part 15 Subpart C (clause 15.231(a))  
ANSI C63.10-2020

Test Results: PASS

## 2. Test Summary

The Product has been tested according to the following specifications:

| No. | Test Parameter                                       | Clause No.      | Results |
|-----|------------------------------------------------------|-----------------|---------|
| 1   | Conducted Emission                                   | §15.207         | N/A*    |
| 2   | Fundamental & Radiated Spurious Emission Measurement | 15.209, 15.231b | PASS*   |
| 3   | Occupy Bandwidth                                     | 15.231c         | PASS*   |
| 4   | Transmission Deactivate Time                         | 15.231a         | PASS*   |
| 5   | Antenna Requirement                                  | 15.203          | PASS    |

NOTE1: N/A (Not Applicable)

NOTE2: "\*" indicates that the test results are determined based on 47 CFR Part 15 Subpart C (clause 15.231(a)). And the test results are taken into account measurement uncertainty (see section 3 for measurement uncertainty information)

### 3. Measurement Uncertainty

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the Product as specified in CISPR 16-4-2:2011/AMD2:2018. This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of k=2.

| No. | Item                                               | Uncertainty |
|-----|----------------------------------------------------|-------------|
| 1   | 3m chamber Radiated spurious emission(9kHz-30MHz)  | U=3.7dB     |
| 2   | 3m chamber Radiated spurious emission(30MHz-1GHz)  | U=4.8dB     |
| 3   | 3m chamber Radiated spurious emission(1GHz-18GHz)  | U=5.5dB     |
| 4   | 3m chamber Radiated spurious emission(18GHz-40GHz) | U=5.0dB     |
| 5   | Conducted Emission(150kHz-30MHz)                   | U=3.0dB     |
| 6   | Power Spectral Density                             | U=3.46dB    |
| 7   | Peak Power                                         | U=0.31dB    |
| 8   | Occupied Bandwidth/Frequency Range                 | U=3.46%     |
| 9   | Conducted output power uncertainty                 | U=0.55dB    |
| 10  | Frequency Error                                    | U= 53.50 Hz |
| 11  | Frequency Drift                                    | U=0.64 KHz  |
| 12  | Temperature                                        | U= 0.59 °C  |
| 13  | Humidity                                           | U= 5.3 %    |

## 4. Product Information and Test Setup

### 4.1 Product Information

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## 4.3 Support Equipment

| No. | Device Type    | Brand | Model    | Series No. | Note |
|-----|----------------|-------|----------|------------|------|
| E-1 | Remote Control | N/A   | DL-8102T | N/A        | EUT  |

| Item | Shielded Type | Ferrite Core | Length | Note |
|------|---------------|--------------|--------|------|
| C-1  | N/A           | N/A          | N/A    | N/A  |

Notes:

1. All the equipment/cables were placed in the worst-case configuration to maximize the emission during the test.
2. Grounding was established in accordance with the manufacturer's requirements and conditions for the intended use.

## 4.4 Channel List

| CH | Frequency (MHz) |
|----|-----------------|
| 1  | 304             |

#### 4.5 Test Mode

To investigate the maximum EMI emission characteristics generates from EUT, the test system was pre-scanning tested base on the consideration of following EUT operation mode or test configuration mode which possible have effect on EMI emission level. Each of these EUT operation mode(s) or test configuration mode(s) mentioned above was evaluated respectively.

| Final Test Mode | Description |
|-----------------|-------------|
| Mode 1          | TX Mode     |

Note:

- (1) The measurements are performed at the 1 channel.
- (2) Fully battery is used during the test

## 5. Test Facility and test Instrument Used

### 5.1 Test Facility

All measurement facilities used to collect the measurement data are located at Shenzhen BCTC Technology Co., Ltd.

Address: Room 101M, Unit 1, Building1, Pengyuan, No.18, Lilang Road, Shanglilang, Nanwan Subdistrict, Longgang District, Shenzhen, Guangdong, China.

The site and apparatus are constructed in conformance with the requirements of ANSI C63.4a-2017 and CISPR 16-1-1:2019 other equivalent standards.

FCC Test Firm Registration Number: 754702

ANAB certificate registration number is: CN3479

### 5.2 Test Instrument Used

## 6. Conducted Emissions

### 6.1 Block Diagram Of Test Setup

### 6.2 Limit

| Frequency (MHz) | Limit (dBuV) |           |
|-----------------|--------------|-----------|
|                 | Quas-peak    | Average   |
| 0.15 -0.5       | 66 - 56 *    | 56 - 46 * |
| 0.50 -5.0       | 56.00        | 46.00     |
| 5.0 -30.0       | 60.00        | 50.00     |

Notes:

- \*Decreasing linearly with logarithm of frequency.
- The lower limit shall apply at the transition frequencies.

### 6.3 Test procedure

| Receiver Parameters | Setting  |
|---------------------|----------|
| Attenuation         | 10 dB    |
| Start Frequency     | 0.15 MHz |
| Stop Frequency      | 30 MHz   |
| IF Bandwidth        | 9 kHz    |

- The Product was placed on a nonconductive table 0.8 m above the horizontal ground reference plane, and 0.4 m from the vertical ground reference plane, and connected to the main through Line Impedance Stability Network (L.I.S.N).
- The RBW of the receiver was set at 9 kHz in 150 kHz ~ 30MHz with Peak and AVG detector in Max Hold mode. Run the receiver's pre-scan to record the maximum disturbance generated from Product in all power lines in the full band.
- For each frequency whose maximum record was higher or close to limit, measure its QP and AVG values and record.

### 6.4 EUT operating Conditions

The EUT was configured for testing in a typical fashion (as a customer would normally use it). The EUT has been programmed to continuously transmit during test. This operating condition was tested and used to collect the included data.

## 6.5 Test Result

ETU Not Applicable

SHENZHEN

## 7. Radiated Emissions

### 7.1 Block Diagram Of Test Setup

(A) Radiated Emission Test-Up Frequency Below 30MHz

(B) Radiated Emission Test-Up Frequency 30MHz~1GHz

## (C) Radiated Emission Test-Up Frequency Above 1GHz

## 7.2 Limit

Intentional radiators may operate at a periodic rate exceeding that specified in paragraph (a) of this section and may be employed for any type of operation, including operation prohibited in paragraph (a) of this section, provided the intentional radiator complies with the provisions of paragraphs (b) through (d) of this section, except the field strength table in paragraph (b) of this section is replaced by the following:

According to FCC Part 15.231 the field strength limited

| Frequencies (MHz) | Field strength of fundamental @3m |                      | Effective limit for 304MHz |              |
|-------------------|-----------------------------------|----------------------|----------------------------|--------------|
|                   | (uV/m)                            | dB(uV/m)             | (uV/m)                     | dB(uV/m)     |
| 40.66-40.70       | 2250                              | 67                   |                            |              |
| 70-130            | 1250                              | 62                   |                            |              |
| 130-174           | 1250 to 3750*                     | 62 to 71.5*          |                            |              |
| 174-260           | 3750                              | 71.5                 |                            |              |
| <b>260-470</b>    | <b>3750 to 12500*</b>             | <b>71.5 to 81.9*</b> | <b>5583.33</b>             | <b>74.93</b> |
| Above 470         | 12500                             | 81.9                 |                            |              |

\* Linear interpolation

| <b>260-470</b>    | <b>375 to 1250*</b>                      | <b>51.5 to 61.9*</b> | <b>558.33</b>              | <b>54.93</b> |
| Above 470         | 1250                                     | 61.9                 |                            |              |

\* Linear interpolation

The field intensity in micro-volts per meter can then be determined by the following equation:  $FI(V/m) = 10FI(dBV/m) / 20$  The FCC specified emission limits were calculated according to the EUT operating frequency and obtained by following linear interpolation equations:

(a) For fundamental frequency:

$$f_{EUT} : \text{EUT Operating Frequency Emission Limit (V/m)} \\ = [f_{EUT}(\text{MHz}) - 260(\text{MHz})] \times \frac{12500(\text{V/m}) - 3750(\text{V/m})}{470(\text{MHz}) - 260(\text{MHz})} + 3750(\text{V/m})$$

(b) For spurious frequencies:

$$f_{EUT} : \text{EUT Operating Frequency Emission Limit (V/m)} \\ = [f_{EUT}(\text{MHz}) - 260(\text{MHz})] \times \frac{1250(\text{V/m}) - 375(\text{V/m})}{470(\text{MHz}) - 260(\text{MHz})} + 375(\text{V/m})$$

Other emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 20 dB below the level of the fundamental or comply with the radiated emissions limits specified in section 15.209(a) limit in the table below has to be followed.

Note:

(1) The tighter limit applies at the band edges.

(2) Emission level (dBuV/m)=20log Emission level (uV/m).

| FCC Part15 (15.231) , Subpart C |                                |                                      |
|---------------------------------|--------------------------------|--------------------------------------|
| Fundamental Frequency           | Field Strength Of Fundamental  | Field Strength of Spurious Emissions |

According to FCC Part15.205, the level of any transmitter spurious emission in Restricted bands shall not exceed the level of the emission specified in the following table

20dBc in any 100 kHz bandwidth outside the operating frequency band. In case the emission fall within the restricted band specified on 15.205(a), then the 15.209(a) limit in the table below has to be followed.

| Frequency     | Field Strength | Distance | Field Strength Limit at 3m Distance |                                |
|---------------|----------------|----------|-------------------------------------|--------------------------------|
| (MHz)         | uV/m           | (m)      | uV/m                                | dBuV/m                         |
| 0.009 ~ 0.490 | 2400/F(kHz)    | 300      | 10000 * 2400/F(kHz)                 | $20\log^{(2400/F(kHz))} + 80$  |
| 0.490 ~ 1.705 | 24000/F(kHz)   | 30       | 100 * 24000/F(kHz)                  | $20\log^{(24000/F(kHz))} + 40$ |
| 1.705 ~ 30    | 30             | 30       | 100 * 30                            | $20\log^{(30)} + 40$           |
| 30 ~ 88       | 100            | 3        | 100                                 | $20\log^{(100)}$               |
| 88 ~ 216      | 150            | 3        | 150                                 | $20\log^{(150)}$               |
| 216 ~ 960     | 200            | 3        | 200                                 | $20\log^{(200)}$               |
| Above 960     | 500            | 3        | 500                                 | $20\log^{(500)}$               |

#### Limits Of Radiated Emission Measurement (Above 1000MHz)

| Frequency (MHz) | Limit (dBuV/m) (at 3M) |         |
|-----------------|------------------------|---------|
|                 | Peak                   | Average |
| Above 1000      | 74                     | 54      |

#### Notes:

- (1)The limit for radiated test was performed according to FCC PART 15C.
- (2)The tighter limit applies at the band edges.
- (3) Emission level (dBuV/m)=20log Emission level (uV/m).

#### Frequency Range Of Radiated Measurement

(a) For an intentional radiator the spectrum shall be investigated from the lowest radio frequency signal generated in the device, without going below 9 kHz, up to at least the frequency shown in this paragraph:

- (1) If the intentional radiator operates below 10 GHz: to the tenth harmonic of the highest fundamental frequency or to 40 GHz, whichever is lower.
- (2) If the intentional radiator operates at or above 10 GHz and below 30 GHz: to the fifth harmonic of the highest fundamental frequency or to 100 GHz, whichever is lower.
- (3) If the intentional radiator operates at or above 30 GHz: to the fifth harmonic of the highest fundamental frequency or to 200 GHz, whichever is lower, unless specified otherwise elsewhere in the rules.
- (4) If the intentional radiator operates at or above 95 GHz: To the third harmonic of the highest fundamental frequency or to 750 GHz, whichever is lower, unless specified otherwise elsewhere in the rules.
- (5) If the intentional radiator contains a digital device, regardless of whether this digital device controls the functions of the intentional radiator or the digital device is used for additional control or function purposes other than to enable the operation of the intentional radiator, the frequency range shall be investigated up to the range specified in paragraphs (a) (1)through (4) of this section or the range applicable to the digital device, as shown in paragraph (b)(1) of this section, whichever is the higher frequency range of investigation.

### 7.3 Test procedure

| Receiver Parameter | Setting           |
|--------------------|-------------------|
| Attenuation        | Auto              |
| 9kHz~150kHz        | RBW 200Hz for QP  |
| 150kHz~30MHz       | RBW 9kHz for QP   |
| 30MHz~1000MHz      | RBW 120kHz for QP |

| Spectrum Parameter | Setting                                                            |
|--------------------|--------------------------------------------------------------------|
| 1-6GHz             | RBW 1 MHz /VBW 1 MHz for Peak,<br>RBW 1 MHz / VBW 10Hz for Average |

Below 1GHz test procedure as below:

- The EUT was placed on the top of a rotating table 0.8 meters above the ground at a 3 meter semi-anechoic camber. The table was rotated 360 degrees to determine the position of the highest radiation.
- The EUT was set 3 meters away from the interference-receiving antenna, which was mounted on the top of a variable-height antenna tower.
- The antenna height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
- For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters (for the test frequency of below 30MHz, the antenna was tuned to heights 1 meter) and the rotatable table was turned from 0 degrees to 360 degrees to find the maximum reading.
- The test-receiver system was set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.
- If the emission level of the EUT in peak mode was 10dB lower than the limit specified, then testing could be stopped and the peak values of the EUT would be reported. Otherwise the emissions that did not have 10dB margin would be re-tested one by one using peak, quasi-peak or average method as specified and then reported in a data sheet.

Above 1GHz test procedure as below:

- The EUT was placed on the top of a rotating table 1.5 meters above the ground at a 3 meter camber. The table was rotated 360 degrees to determine the position of the highest radiation.
- The EUT was set 3 meters away from the interference-receiving antenna, which was mounted on the top of a variable-height antenna tower.
- The antenna height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
- For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters and the rota table was turned from 0 degrees to 360 degrees to find the maximum reading.

e. The test-receiver system was set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.

f. If the emission level of the EUT in peak mode was 10dB lower than the limit specified, then testing could be stopped and the peak values of the EUT would be reported. Otherwise the emissions that did not have 10dB margin would be re-tested one by one using peak, quasi-peak or average method as specified and then reported in a data sheet.

g. Test the EUT has only one channel.

Note:

Both horizontal and vertical antenna polarities were tested and performed pretest to three orthogonal axis. The worst case emissions were reported.

## 7.4 EUT operating Conditions

The EUT was configured for testing in a typical fashion (as a customer would normally use it). The EUT has been programmed to continuously transmit during test. This operating condition was tested and used to collect the included data.

## 7.5 Test Result

Below 30MHz

|              |         |                    |       |
|--------------|---------|--------------------|-------|
| Temperature: | 25.7℃   | Relative Humidity: | 54%   |
| Pressure:    | 101 kPa | Test Voltage:      | DC 3V |
| Test Mode:   | Mode 1  | Polarization:      | --    |

| Freq. | Reading  | Limit    | Margin | State |
|-------|----------|----------|--------|-------|
| (MHz) | (dBuV/m) | (dBuV/m) | (dB)   | P/F   |
| --    | --       | --       | --     | PASS  |
| --    | --       | --       | --     | PASS  |

Note:

The amplitude of spurious emissions which are attenuated by more than 20dB below the permissible value has no need to be reported.

Distance extrapolation factor =  $40 \log (\text{specific distance}/\text{test distance})$ (dB);

Limit line = specific limits(dBuV) + distance extrapolation factor.

Between 30MHz – 1GHz

|              |         |                    |            |
|--------------|---------|--------------------|------------|
| Temperature: | 25.7 °C | Relative Humidity: | 54%        |

## 8. Bandwidth Test

### 8.1 Block Diagram Of Test Setup

### 8.2 Limit

According to FCC 15.231(c) requirement:

The bandwidth of the emission shall be no wider than 0.25% of the center frequency for devices operating between 70 MHz to 900 MHz. Those devices operating above 900 MHz, the emission spurious shall be no wider than 0.5% of the center frequency. Bandwidth is determined at the points 20 dB down from the modulated carrier.

$$\text{B.W (20dBc) Limit} = 0.25\% * f(\text{MHz}) = 0.25\% * 304\text{MHz} = 0.76\text{MHz}$$

| Spectrum Parameter | Setting                                       |
|--------------------|-----------------------------------------------|
| Attenuation        | Auto                                          |
| Span Frequency     | > Measurement Bandwidth or Channel Separation |
| RB                 | 1 % to 5 % of the OBW                         |
| VB                 | $\geq \text{RBW}$                             |
| Detector           | Peak                                          |
| Trace              | Max Hold                                      |
| Sweep Time         | Auto                                          |

### 8.3 Test procedure

- The EUT was directly connected to the spectrum analyzer and antenna output port as show in the block diagram below,
- Spectrum Setting : RBW= 1 % to 5 % of the OBW, VBW $\geq$  RBW, Sweep time = Auto.

### 8.4 EUT operating Conditions

The EUT tested system was configured as the statements of 2.4 Unless otherwise a special operating condition is specified in the follows during the testing.

## 8.5 Test Result

|              |         |                    |       |
|--------------|---------|--------------------|-------|
| Temperature: | 23.5 °C | Relative Humidity: | 56%   |
| Pressure:    | 101kPa  | Test Voltage:      | DC 3V |
| Test Mode:   | Mode 1  |                    |       |

| Frequency | 20dB Bandwidth(kHz) | Limit(KHz) | Result |
|-----------|---------------------|------------|--------|
| 304MHz    | 9.201               | ≤760       | PASS   |

## 9. Calculation of Average Factor

The output field strengths of specification in accordance with the FCC rules specify measurements with an average detector. During the test, a spectrum analyzer incorporating a peak detector was used. Therefore, a reduction factor can be applied to the resultant peak signal level and compared to the limit for measurement instrumentation incorporating an average detector.

The duty cycle is measured in 100 ms or the repetition cycle period, whichever is a shorter time frame. The duty cycle is measured by placing the spectrum analyzer to set zero span at 100kHz resolution bandwidth.

Averaging factor in dB =  $20\log(\text{duty cycle})$

The duration of one cycle = 37.60ms

The duty cycle is simply the on-time divided the duration of one cycle

Duty Cycle =  $(0.370\text{ms} \times 14 + 0.750\text{ms} \times 11) / 37.60\text{ms}$

=  $13.430\text{ms} / 37.60\text{ms}$

= 0.36

Therefore, the averaging factor is found by  $20\log(0.36) = -8.87\text{dB}$

## 10. Transmission Deactivate Time

### 10.1 Block Diagram Of Test Setup

### 10.2 Limit

According to FCC 15.231(a) requirement:

A manually operated transmitter shall employ a switch that will automatically deactivate the transmitter within not more than 5 seconds of being released.

### 10.3 Test procedure

- a) Check the calibration of the measuring instrument using either an internal calibrator or a known signal from an external generator.
- b) Position the EUT without connection to measurement instrument. Turn on the EUT and connect its antenna terminal to measurement instrument via a low loss cable. Then set it to any one measured frequency within its operating range, and make sure the instrument is operated in its linear range.
- c) Set RBW to 100 kHz and VBW of spectrum analyzer to 300 kHz with a convenient frequency span including 100 kHz bandwidth from band edge.
- d) Measure the highest amplitude appearing on spectral display and set it as a reference level. Plot the graph with marking the highest point and edge frequency.
- e) Repeat above procedures until all measured frequencies were complete.

#### 10.4 Test Result

| Transmission Deactivate Time | Limit (second) | Result |
|------------------------------|----------------|--------|
| 340ms                        | <5s            | Pass   |

## 11. Antenna Requirement

### 11.1 Standard Requirement

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited. This requirement does not apply to carrier current devices or to devices operated under the provisions of §§ 15.211, 15.213, 15.217, 15.219, 15.221, or § 15.236. Further, this requirement does not apply to intentional radiators that must be professionally installed, such as perimeter protection systems and some field disturbance sensors, or to other intentional radiators which, in accordance with § 15.31(d), must be measured at the installation site. However, the installer shall be responsible for ensuring that the proper antenna is employed so that the limits in this part are not exceeded.

### 11.2 EUT Antenna

The EUT antenna is the PCB antenna. It complies with the standard requirement.

### Spurious Emission Test Setup (Above 1GHz)

## STATEMENT

1. The equipment lists are traceable to the International System of Units (SI)
2. The test report can not be partially copied unless prior written approval is issued from our lab.
3. The test report is invalid without the "special seal for inspection and testing".
4. The test report is invalid without the signature of the approver.
5. The test process and test result is only related to the Unit Under Test.
6. Sample information is provided by the client and the laboratory is not responsible for its authenticity.
7. The quality system of our laboratory is in accordance with ISO/IEC 17025:2017.
8. If there is any objection to this test report, the client should inform issuing laboratory within 15 days from the date of receiving test report.
