Test Result

The requirements of the tests performed as shown in the overview (clause 4) were fulfilled by the equipment under test. The complete test results are presented in the following.
“Passed” indicates that the equipment under test conforms with the relevant limits of the testing standard without taking any measurement uncertainty into account as stated in clause 1.4 of ANSI C63.10 (2020). However, the measurement uncertainty is calculated and shown in this test report.

1.3 Test Laboratory

The tests were carried out by:

PHOENIX TESTLAB GmbH
Königswinkel 10
32825 Blomberg
Germany

Accredited by Deutsche Akkreditierungsstelle GmbH (DAkkS) in compliance with DIN EN ISO/IEC 17025 under Reg. No. D-PL-17186-01-05 and D-PL-17186-01-06, FCC Test Firm Designation Number DE0004, FCC Test Firm Registration Number 469623, CAB Identifier DE0003 and ISED# 3469A.

1.4 EUT (Equipment under Test)

Test object: *	NEARFI data coupler Base
Model name / PMN: *	NEARFI 2000 B
PCB identifier: *	ADMV9613 (Radio module from Analog Devices), 30007761 (Interface-PCB), 1184502 (Data-PCB)
Serial No.	2023000067
Hardware version / HVIN: *	1433041
Software version / FVIN: *	N/A
FCC ID: *	YG32000B
IC:	4720B-2000B
Lowest / highest internal frequency: *	12 MHz / 63 GHz

*: Declared by the applicant.

Note: PHOENIX TESTLAB GmbH does not take samples. The samples used for tests are provided exclusively by the applicant.

1.5 Technical Data of Equipment

Ethernet communication part			
Operating frequency band: *	57000 MHz to 71000 MHz		
Number of channels: *	1		
Nominal channel bandwidth(s): *	N/A (one channel equipment)		
Antenna type: *	Internal patch antenna		
Antenna connector: *	None		
Antenna gain:	12 dBi gain and ±20 ° half power beamwidth typical		
Data rate: *	62.5 Mbit/s		
Type of modulation: *	OOK		
Power supply: *	DC		
Supply voltage: *	U_{nom} = 24 V_{DC}	U_{min} = 19 V_{DC}	U_{max} = 30 V_{DC}
Temperature range: *	-20 °C to +65 °C		

*: Declared by the applicant.

Ports/Connectors			
Identification	Connector		Length
	EUT	Ancillary	
Power in	5 pole M12 connector	4 mm laboratory plug	3.0 m
Ethernet	5 pole M12 connector	RJ45	3.0 m

*: Length during the test

Equipment used for testing	
AC/DC adaptor from PHOENIX CONTACT, type MINI-PS-100-240AC/24DC/1.3	For power line conducted tests
-	-

*1 Provided by the applicant
*2 Provided by the laboratory

1.6 Dates

Date of receipt of test sample:	22.11.2023
Start of test:	17.01.2024
End of test:	14.02.2024

2 Operational States

The EUT is intended to transmit and receive real time Ethernet data contact-less over an air gap of a few millimetres.

All measurements were carried out with an unmodified sample, supplied with 24 V_{DC}, operating in normal operation mode after powered up. As pre-tests have shown, the modulation behaviour of the EUT is independent of an Ethernet connection, therefore all measurements were carried out with the Ethernet port of the EUT left open.

3 Additional Information

The antenna requirements were not tested. The required antenna data will be provided by the applicant.

The type-plate label of the tested sample is not the latest version.

4 Overview

Application	Frequency range [MHz]	FCC 47 CFR Part 15 section [2]	RSS-210 [3] / RSS-Gen [4]	Status
Fundamental emission bandwidth	57000 - 71000	15.255 (e (2))	J.4 (c) [3], 6.7 [4]	Passed
Fundamental emission	57000 - 71000	15.255 (c) (1) (i), 15.255 (e)	J.2.2 (b), J.4 [3]	Passed
Frequency stability	57000 - 71000	15.255 (f)	J.6 [3], 6.11 [4]	Passed
Radiated emissions	0.009 – 200000	15.255 (d), 15.209	J.3 [3], 6.13 [4]	Passed
Conducted emissions on supply line	0.15 – 30	15.207	8.8 [4]	Passed

5 Results

5.1 Test setups

5.1.1 Radiated: 9 kHz to 30 MHz

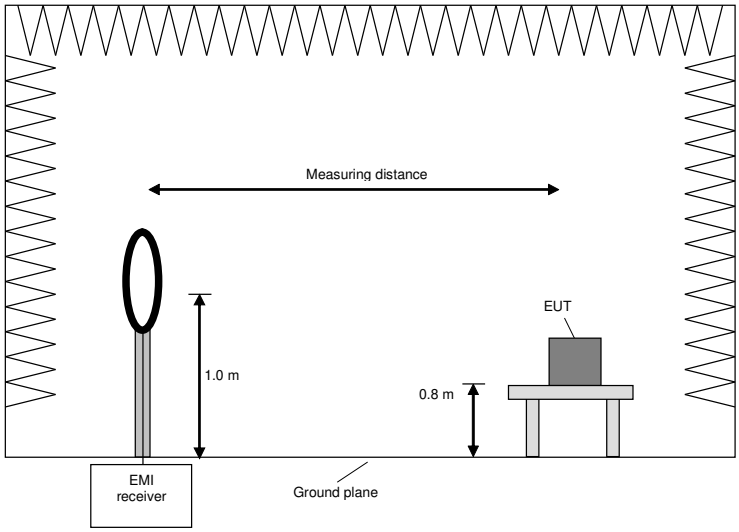
5.1.1.1 Preliminary measurement 9 kHz to 30 MHz

In the first stage a preliminary measurement is performed in a semi-anechoic chamber at a measuring distance of 3 meters. Table-top devices are set up on a non-conducting support with a size of 1 m by 1.5 m and a height of 80 cm. Floor-standing devices are placed directly on the turntable / ground plane. The setup of the equipment under test is in accordance with [1].

The frequency range 9 kHz to 30 MHz is monitored with an EMI receiver while the system and its cables are manipulated to find out the configuration with the maximum emission levels if applicable. The EMI receiver is set to MAX hold mode. The EUT and the measuring antenna are rotated around their vertical axis to find the maximum emission levels.

The resolution bandwidth of the EMI receiver is set to the following values:

Frequency range	Resolution bandwidth
9 kHz to 150 kHz	200 Hz
150 kHz to 30 MHz	10 kHz



Procedure preliminary measurement:

Pre-scans are performed in the frequency range 9 kHz to 150 kHz and 150 kHz to 30 MHz.
The following procedure is used:

1) Monitor the frequency range with the measuring antenna facing the EUT and an EUT / turntable azimuth of 0 °.
2) Manipulate the system cables to produce the maximum levels of emissions.
3) Rotate the EUT by 360 ° to maximize the detected signals.
4) Measure the frequencies of the highest detected emissions with a lower span and resolution bandwidth to increase the accuracy and note the frequency values.
5) If the EUT is portable or ceiling mounted, repeat steps 1 to 4 with other orientations (x,y,z) of the EUT.
6) Rotate the measuring antenna and repeat steps 1 to 5.

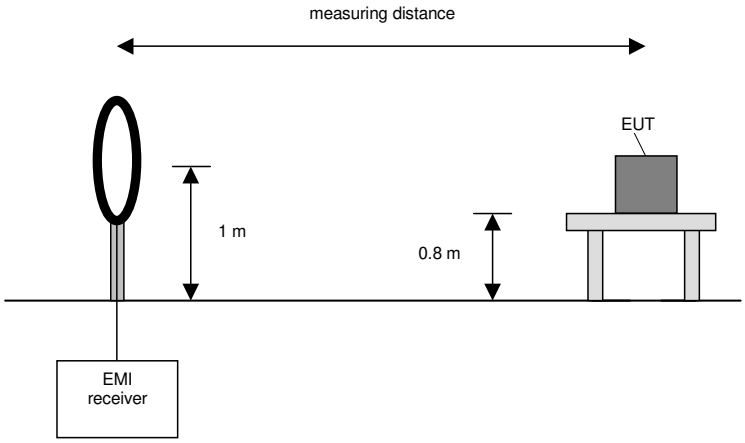
5.1.1.2 Final measurement 9 kHz to 30 MHz

In the second stage a final measurement is performed on an open area test site with no conducting ground plane at a measuring distance of 3 m, 10 m, or 30 m. If the standard requires larger measuring distances for a given frequency, the results are extrapolated according to section 15.31 (f) (2) [2]. The final measurement is performed with an EMI receiver set to Quasi-Peak detector, except for the frequency bands 9 kHz to 90 kHz and 110 kHz to 490 kHz where an Average detector is used according to section 15.209 (d) [2].

At the frequencies, which were detected during the preliminary measurements, the final measurement is performed while rotating the EUT and the measuring antenna in the range of 0 ° to 360 ° around their vertical axis until the maximum level value is found.

The resolution bandwidth of the EMI receiver is set to the following values:

Frequency range	Resolution bandwidth	Measuring time
9 kHz to 150 kHz	200 Hz	1 s
150 kHz to 30 MHz	9 kHz	1 s



Procedure final measurement:

The following procedure is used:

1) Monitor the selected frequencies from the preliminary measurement with the measuring antenna facing the EUT and an EUT azimuth of 0 °.
2) Rotate the EUT by 360 ° to maximize the detected signals.
3) Rotate the measuring antenna and repeat steps 1 to 2 until the maximum value is found and note it.
4) If the EUT is portable or ceiling mounted, repeat steps 1 to 3 with other orientations (x,y,z) of the EUT.

5.1.2 Radiated: 30 MHz to 1 GHz

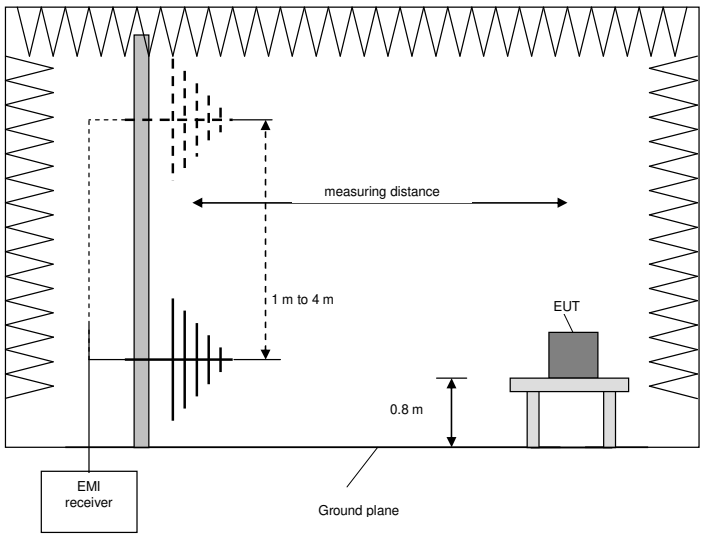
5.1.2.1 Preliminary and final measurement 30 MHz to 1 GHz

The preliminary and final measurements are performed in a semi-anechoic chamber with a metal ground plane at a measuring distance of 3 meters. Table-top devices are set up on a non-conducting support with a size of 1 m by 1.5 m and a height of 80 cm. Floor-standing devices are placed directly on the turntable / ground plane. The setup of the equipment under test is in accordance with [1].

During the tests the EUT is rotated in the range of 0 ° to 360 °, the measuring antenna is set to horizontal and vertical polarization and raised and lowered in the range from 1 m to 4 m to find the maximum level of emissions.

The resolution bandwidth of the EMI receiver is set to the following values:

Test	Frequency range	Step-size	Resolution bandwidth	Measuring time	Detector
Preliminary measurement	30 MHz to 1 GHz	30 kHz	120 kHz	-	Peak Average
Frequency peak search	± 120 kHz	10 kHz	120 kHz	1 s	Peak
Final measurement	30 MHz to 960 MHz	-	120 kHz	1 s	QuasiPeak
Final measurement	960 MHz to 1 GHz	-	120 kHz	1 s	RMS average



Procedure preliminary measurement:

The following procedure is used:

1) Set the measuring antenna to 1 m height.
2) Monitor the frequency range at horizontal polarization of the measuring antenna and an EUT / turntable azimuth of 0 °.
3) Rotate the EUT by 360° to maximize the detected signals.
4) Repeat steps 2 to 3 with the vertical polarization of the measuring antenna.
5) Increase the height of the measuring antenna for 0.5 m and repeat steps 2 to 4 until the final height of 4 m is reached.
6) The highest values for each frequency are saved by the software, including the measuring antenna height and polarization and the turntable azimuth for that value.

Procedure final measurement:

The following procedure is used:

1) Select the highest frequency peaks (lowest margin to the limit) for the final measurement.
2) The software determines the exact peak frequencies by doing a partial scan with reduced step size of the pre-scan of the selected peaks.
3) If the EUT is portable or ceiling mounted, find the worst-case EUT orientation (x,y,z) for the final test.
4) The worst-case measuring antenna height is found via varying the height by +/- 0.5 m from the value obtained in the preliminary measurement while monitoring the emission level.
5) The worst-case turntable position is found via varying the turntable azimuth by +/- 30° from the value obtained in the preliminary measurement while monitoring the emission level.
6) The final measurement is performed at the worst-case measuring antenna height and the worst-case turntable azimuth.
7) Steps 2 to 6 are repeated for each frequency peak selected in step 1.

5.1.3 Radiated: 1 GHz to 40 GHz

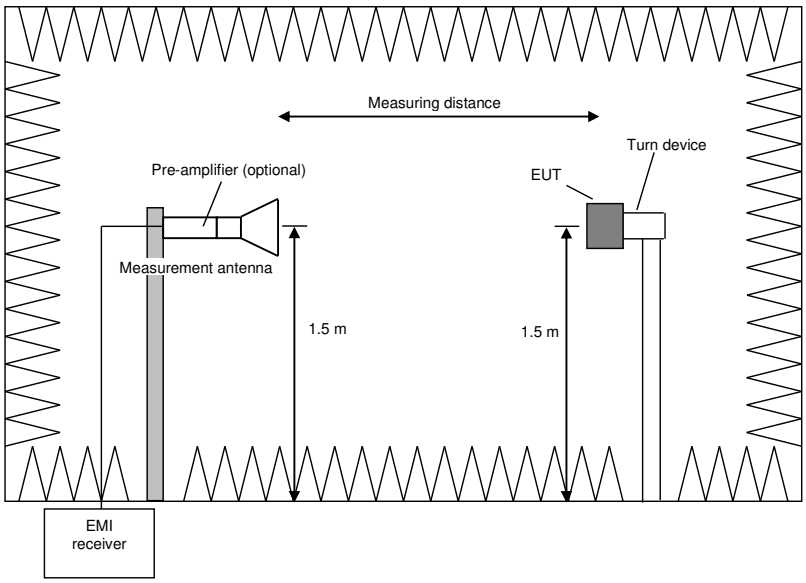
5.1.3.1 Preliminary and final measurement 1 GHz to 40 GHz

The preliminary and final measurements are performed in a fully anechoic chamber at a measuring distance of 1 or 3 meters (depending on the frequency range). Table-top devices are set up on a non-conducting turn device at the height of 1.5 m. The setup of the equipment under test is in accordance with [1].

During the tests the EUT is rotated in the range of 0 ° to 360 ° and the measuring antenna is set to horizontal and vertical polarization to find the maximum level of emissions.

The resolution bandwidth of the EMI receiver is set to the following values:

Test	Frequency range	Step-size	Resolution bandwidth	Measuring time	Detector
Preliminary measurement	1 GHz - 40 GHz	-	1 MHz	-	Peak
Final measurement	1 GHz - 40 GHz	-	1 MHz	1 ms per sweep point	Peak and average



Procedure preliminary measurement:

The following procedure is used:

1) Monitor the frequency range at horizontal polarisation of the measuring antenna and an EUT / turntable azimuth of 0 °.
2) Rotate the EUT by 360° to maximize the detected signals.
3) Repeat steps 1 to 2 with the vertical polarisation of the measuring antenna.
4) Repeat steps 1 to 3 with the EUT reorientated by an angle of 30° (60°, 90°, 120° and 150°), according to 6.6.5.4 in [1].
5) The highest values for each frequency are saved by the software, including the measuring antenna polarization, the turntable azimuth and the turn device elevation for that value.

Procedure final measurement:

The following procedure is used:

1) Set the turntable and the turn device to the position which leads to the highest emission for the first frequency identified in the preliminary measurements.
2) Set the measurement antenna to the polarisation which leads to the highest emission for the first frequency identified in the preliminary measurements.
3) Set the spectrum analyser to EMI mode with Peak and Average detector activated.
4) The worst-case turntable position is found via varying the turntable azimuth by +/- 30° from the value obtained in the preliminary measurement while monitoring the emission level.
5) The final measurement is performed at the worst-case turntable azimuth.
6) Repeat steps 1 to 5 for each frequency detected during the preliminary measurements.

5.1.4 Radiated: 40 GHz to 200 GHz

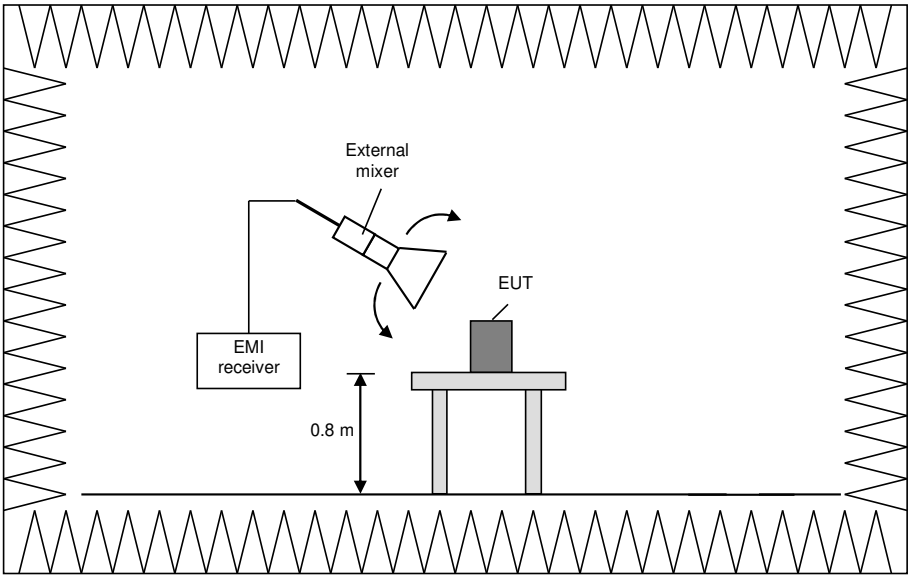
5.1.4.1 Preliminary and final measurement 40 GHz to 200 GHz

The frequency range will be divided into different sub ranges depending on the frequency range of the used horn antennas and frequency mixers. The spectrum analyser set to MAX Hold mode and a resolution bandwidth of 1 MHz. The measurement will be performed in horizontal and vertical polarisation of the measuring antenna, the antenna close to the EUT and while moving the antenna over all sides of the EUT. With the spectrum analyser in CLEAR / WRITE mode the cone of the emission should be found. After that the measuring distance will be set to the final measurement distance with the receiving antenna moving in this cone of emission. At this position the final measurement will be carried out with using the Auto ID functionality of the analyser. The used measuring distance for the used antenna has to be above the minimum measuring distance calculated for accreditation.

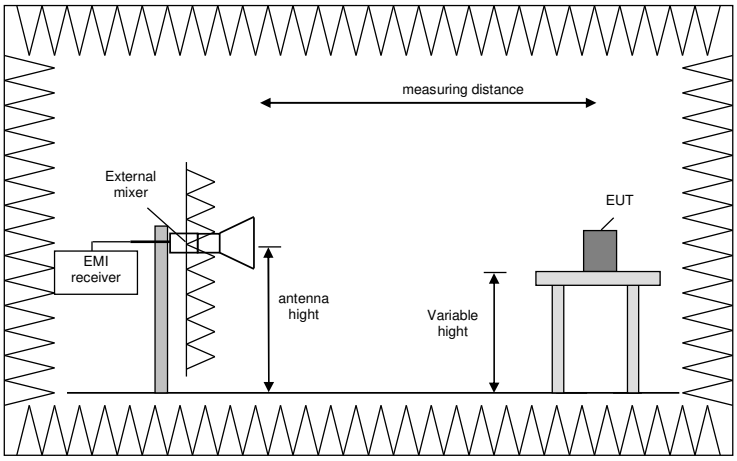
The resolution bandwidth of the EMI Receiver will be set to the following values:

Test	Frequency range	Resolution bandwidth	Measuring time	Detector
Preliminary measurement	40 GHz - 200 GHz	1 MHz	-	Peak
Final measurement	40 GHz - 200 GHz	1 MHz	1 ms per sweep point	Peak and average

Set up preliminary measurement:



Set up final measurement:



Procedure of measurement:

The measurements were performed in the frequency range 40 GHz to 55 GHz, 55 GHz to 75 GHz, 75 GHz to 90 GHz, 90GHz to 110 GHz, 110 GHz to 140 GHz, 140 GHz to 170 GHz and 170 GHz to 200 GHz.
The following procedure will be used:

1) Monitor the frequency range at horizontal polarisation and move the antenna over all sides of the EUT (if necessary) move the EUT to another orthogonal axis).
2) Change the antenna polarisation and repeat 1) with vertical polarisation.
3) Make a hardcopy of the spectrum.
4) Measure the frequency of the detected emissions with a lower span and resolution bandwidth to increase the accuracy and note the frequency value.
5) Change the analyser mode to Clear / Write and found the cone of emission.
6) Rotate and move the EUT, so that the measuring distance can be enlarged to the final measurement distance and the antenna will be still inside the cone of emission.
7) Measure the level of the detected frequency with the correct resolution bandwidth, with the antenna polarisation and azimuth and the peak and average detector, which causes the maximum emission.
8) Repeat steps 1) to 7) for the next antenna spot if the EUT is larger than the antenna beamwidth.

Step 1) to 6) are defined as preliminary measurement.

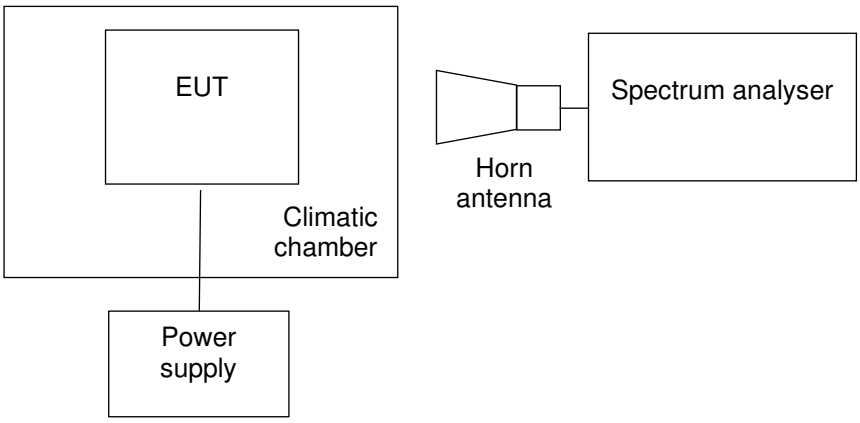
5.1.5 Frequency stability

5.1.5.1 Method of measurement (frequency stability)

The following procedure will be used:

1) Place the EUT in the climatic chamber.
2) Switch on the EUT and check the correct function and the settings of the spectrum analyser.
3) Switch off the EUT and tune the climatic chamber to a temperature of 50 °C or the highest temperature specified for the EUT. Wait until the thermal balance is obtained.
4) Switch the EUT on with nominal supply voltage and record the frequencies according to the procedure described under clause 4.1 of this test report within 1 minute after start-up. Switch the EUT off and wait for ten minutes.
5) Only at 20 ° C: Switch the EUT on with minimum supply voltage (85 %) and record the frequencies according to the procedure described under clause 4.1 of this test report within 1 minute after start-up. Switch the EUT off and wait for ten minutes.
6) Only at 20 ° C: Switch the EUT on with maximum supply voltage (115 %) and record the frequencies according to the procedure described under clause 4.1 of this test report within 1 minute after start-up.
7) Switch off the EUT and tune the climatic chamber to a temperature range of 50 °C (or the highest temperature specified for the EUT) to –20 °C (or the lowest temperature specified for the EUT) in ten-degree steps. Wait until the thermal balance is obtained for every step and repeat step 4) to 7) with the next temperature step until –20 °C or the lowest temperature specified for the EUT were reached.

Test set-up:

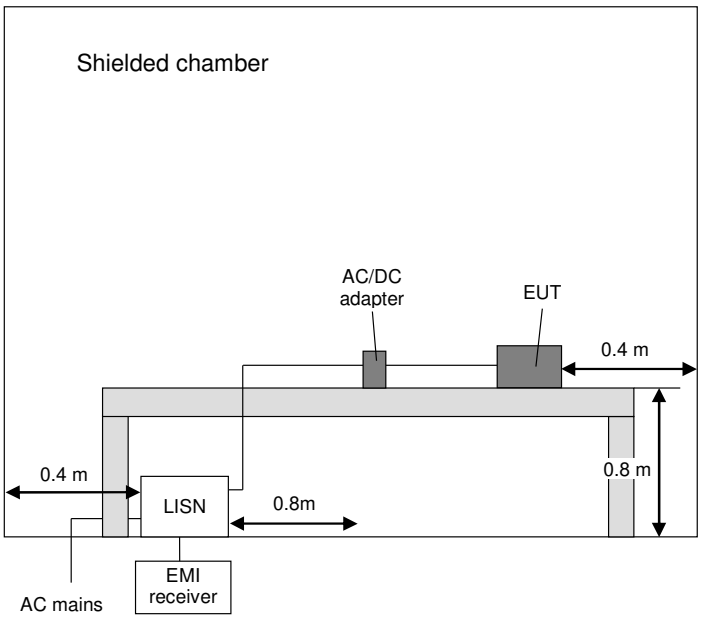


5.1.6 Conducted emission: AC power line

The test is carried out in a shielded chamber. Table-top devices are set up on a non-conducting support with a size of 1 m by 1.5 m and a height of 80 cm above the ground plane. Floor-standing devices are placed directly on the ground plane. In case of DC powered equipment, which is not exclusively powered by a battery, it is connected to the LISN via a suitable AC/DC adaptor. The setup of the equipment under test is in accordance with [1].

The frequency range 150 kHz to 30 MHz is measured with an EMI receiver set to MAX hold mode with Peak and Average detectors and a resolution bandwidth of 9 kHz. A scan is carried out on the phase and neutral line of the AC mains network. If emissions less than 10 dB below the appropriable limit are detected, these emissions are measured with an Average and Quasi-Peak detector on all lines.

Frequency range	Resolution bandwidth	Measuring time
150 kHz to 30 MHz	9 kHz	5 s



5.2 Fundamental emissions bandwidth

5.2.1 Test setup (Fundamental emission bandwidth)

Used	Setup	See sub-clause	Comment
☒	Radiated: 40 GHz to 200 GHz	5.1.4	Measured at boresight
☐	Conducted: Antenna port		EUT has no antenna connector

5.3 Fundamental emission

5.3.1 Test setup (Fundamental emission)

Used	Setup	See sub-clause	Comment
☒	Radiated: 40 GHz to 200 GHz	5.1.4	Measured at boresight
☐	Conducted: Antenna port	-	EUT has no antenna connector

5.3.2 Test method (peak emission)

Used	Sub-Clause	Name of method	Applicability	Comment
☒	5.1.4	Radiated: 40 GHz to 200 GHz	No limitations	-

5.3.3 Test results (fundamental emission)

Ambient temperature:	21 °C
Relative humidity:	28 %

Date:	17.01.2024
Tested by:	Thomas KÜHN

The plots of these measurements are shown in A.3 of annex A of this test report.

Maximum peak transmitter power (EIRP)		
Maximum peak transmitter power	Limit	Margin
1.9 dBm	43 dBm	41.1 dB

Maximum average transmitter power (EIRP) *		
Maximum average transmitter power	Limit	Margin
-6.2 dBm	40 dBm	46.2 dB

*: Because the EUT has a constant duty cycle of 100 %, the average transmitter output power was measured and not calculated over the transmission time period.

Peak power density within the 57 GHz to 71 GHz band
Peak power density (EIRP, peak)
18.2 dBm / 14 GHz

Because the EUT has no antenna connector, the maximum peak transmitter conducted output power was calculated with the following formula:

$P_{cond.} = P_{eirp} - G$

Where: $P_{cond.}$ = Maximum peak transmitter conducted output power [dBm],
P_{eirp} = Maximum peak transmitter power (EIRP) [dBm],
G = Antenna gain of the transmitting antenna [dBi].

The 6 dB bandwidth of the EUT is below 100 MHz, therefore the limit for maximum peak transmitter output power has to be calculated with the following formula:

Limit acc. 15.255 (e) (1) / RSS-210 J.4 (a): (500 mW x 6 dB bandwidth) / 100 MHz
With the 6 dB bandwidth of 7.396 MHz (refer clause 5.2.4 of this test report), the limit is calculated to 37 mW / 15.7 dBm.

Peak transmitter output power (conducted)				
Peak transmitter power within the band (EIRP)	Antenna gain	Peak transmitter output power (conducted)	Limit	Margin
18.2 dBm	12.0 dBi	6.2 dBm	15.7 dBm	9.5 dB

Test result: Passed

Test equipment (please refer to chapter 6 for details)
4, 39, 40, 47 – 49, 51, 52

Tested by:	Sebastian KREHS

Position of EUT: The EUT was set-up on a non-conducting table with a height of 80 cm. The distance between EUT and antenna was 3 m. The EUT was tested in the following three orthogonal planes separately:
Position 1: the antenna of the EUT shows to the measuring antenna, connectors are showing upwards;
Position 2: the antenna of the EUT shows to the measuring antenna, connectors are showing sidewards;
Position 3: the antenna of the EUT shows upwards, connectors away from the measurement antenna.

Cable guide: For detail information of test set-up and the cable guide refer to the pictures in the annex A in the test report.

Test record: The measurement value was already corrected by 40 dB/decade as described in 47 CFR 15.31(f)(2) regarding to the measurement distance as requested in 47 CFR 15.209(a). The plot submitted in annex A.4 of this test report shows the maximum of all positions.

Frequency range	Frequencies for final measurement
9 kHz to 150 kHz	No significant frequencies above the noise floor of the system (-27.7 dBµV/m or -79.2 dBµA/m (peak) in 300 m distance, measured at 3 m and converted with 40 dB / decade correction factor) were found during the preliminary radiated emission test, so no measurements were carried out on the outdoor test site.
150 kHz to 30 MHz	No significant frequencies above the noise floor of the system (4.9 dBµV/m or -46.6 dBµA/m (peak) in 30 m distance, measured at 3 m and converted with 40 dB / decade correction factor) were found during the preliminary radiated emission test, so no measurements were carried out on the outdoor test site.

Test result: Passed

Test equipment (please refer to chapter 6 for details)
7 – 11, 14, 51, 52

5.5.3.2 Test results preliminary and final measurement 30 MHz to 1 GHz

Ambient temperature:	22 °C
Relative humidity:	35 %

Date:	06.02.2024
Tested by:	Sebastian KREHS

Position of EUT: The EUT was set-up on a non-conducting table with a height of 80 cm. The distance between EUT and antenna was 3 m. The EUT was tested in the following three orthogonal planes separately:
Position 1: the antenna of the EUT shows to the measuring antenna, connectors are showing upwards;
Position 2: the antenna of the EUT shows to the measuring antenna, connectors are showing sidewards;
Position 3: the antenna of the EUT shows upwards, connectors away from the measurement antenna.

Cable guide: For detail information of test set-up and the cable guide refer to the pictures in the annex B in the test report.

Test record: The plot submitted in annex A.4 of this test report shows the maximum of all positions.

Calculations:

The test results above 30 MHz and below 1 GHz were calculated with the following formula:

Result [dBµV/m] = Reading [dBµV] + Correction [dBµV/m]

Correction [dBµV/m] = AF [dB/m] + Cable attenuation [dB] + attenuator [dB]

Margin [dB] = Limit [dBµV/m] - Result [dBµV/m]

Result measured with the Quasi-peak detector above 30 MHz and below 1 GHz:

Frequency [MHz]	Result (QP) [dBµV/m]	Limit [dBµV/m]	Margin [dB]	Readings [dBµV]	Correction [dB/m]	Height [cm]	Azimuth [deg]	Pol. (H/V)	Position #

5.5.3.3 Test results measurement 1 GHz to 40 GHz

Ambient temperature:	22 °C
Relative humidity:	18 % + 26 %

Date:	29. + 30.01.2024
Tested by:	Thomas KÜHN

Position of EUT: The EUT was set-up on a position device at a height of 1.5 m. The distance between EUT and antenna was 3 m (1 GHz to 16.5 GHz) and 1 m (26.5 GHz to 40 GHz).

Cable guide: For detail information of test set-up and the cable guide refer to the pictures in the annex B in the test report.

Test record: The plots submitted annex A.4 of this test report showing the maximum emissions level position.

Calculation:

Result [dBµV/m] = Reading [dBµV] + Correction [dBµV/m]

Correction [dBµV/m] = Cable attenuation [dB] + preamplifier [dB] + antenna factor [1/dB] + Distance correction factor [dB] (if necessary)

Margin [dB] = Limit [dBµV/m] - Result [dBµV/m]

5.5.3.4 Test results measurement 40 GHz to 200 GHz

Ambient temperature:	21 °C
Relative humidity:	28 %

Date:	17.01.2024
Tested by:	Thomas KÜHN

Position of EUT: In this frequency range the EUT was positioned on a non-conducting support with a variable height and was tested in two orthogonal directions.

Cable guide: For detail information of test set-up and the cable guide refer to the pictures in the annex B in the test report.

Test record: The plots submitted annex A.4 of this test report showing the maximum emissions level position.

Calculation: The limit of 90 pW/cm^2 is converted to an effective isotropic radiated power (EIRP) of -10 dBm with the following formular:

$$EIRP\ [dBm] = P_D \times 4 \times \pi \times d^2$$

Where: P_D = power density limit in W/m^2
d = distance, where the limit has to be reached (3 m)

Test result: No emissions were found in this frequency range. Therefore, the maximum noise level in each frequency range was reported in the table below.

Unwanted emissions level, measured with peak detector				
Frequency range	Max. peak emission level [dBm]	Used measurement distance [cm]	Limit [dBm]	Margin [dB]
40 GHz to 50 GHz	-28.5 *	100	-10.0	18.5
50 GHz to 57 GHz	-30.6 *	100	-10.0	20.6
71 GHz to 75 GHz	-29.7 *	100	-10.0	19.7
75 GHz to 110 GHz	-23.8 *	30	-10.0	13.8
110 GHz to 170 GHz	-20.6 *	30	-10.0	10.6
170 GHz to 200 GHz	-20.5 *	30	-10.0	10.5

*: Measured with peak detector, only, because the peak value is already below the average limit

Test result: Passed

Test equipment (please refer to chapter 6 for details)

5.6 AC power line conducted emissions

5.6.1 Test setup (AC power line conducted emissions)

Used	Setup	See sub-clause	Comment
☒	Conducted: AC power line	5.1.6	-
☐	Not applicable, because …	-	-

5.6.2 Test method (AC power line conducted emissions)

Used	Clause	Name of method	Sub-clause	Comment
☒	5.1.6	Tabletop equipment testing	5.1.6	The EUT is DC supplied, therefore, an AC / DC adaptor has to be used.

During the measurement the EUT was supplied with 24.0 V DC by an AC / DC adaptor from bel power solutions & protection type HC24-2.4-AG. The adaptor itself was supplied by an AC mains network with 120V_{AC} 60Hz.

5.6.3 Test results (Conducted emissions on power supply lines)

Ambient temperature:	22 °C
Relative humidity:	37 %

Date:	14.02.2024
Tested by:	Thomas KÜHN

The curves in the diagrams in A.5 of annex A of this test report only represent for each frequency point the maximum measured value of all preliminary measurements which were made for each power supply line. The top measured curve represents the peak measurement and the bottom measured curve the average measurement. The quasi-peak measured points are marked by ◆ and the average measured points by ▼.

Frequency [MHz]	QuasiPeak [dB(µV)]	Average [dB(µV)]	Limit [dB(µV)]	Margin [dB]	Line	PE	Corr. [dB]

7 Measurement Uncertainties

Measurement method	Standard used for calculating measurement uncertainty	Expanded measurement uncertainty (95 %) U_{lab}
Conducted measurements		
Conducted emissions from 150 kHz to 30 MHz with LISN	CISPR 16-4-2	2.8 dB
Radiated measurements		
Frequency error		
(Semi-) Anechoic chamber	ETSI TR 100 028	4.5×10^{-8}
OATS	ETSI TR 100 028	4.5×10^{-8}
Test fixture	ETSI TR 100 028	4.5×10^{-8}
Bandwidth measurements		
(Semi-) Anechoic chamber	-	9.0×10^{-8}
OATS	-	9.0×10^{-8}
Test fixture	-	9.1×10^{-8}
Radiated field strength M20		
EMCO 3115 @ 3 m		
1 – 6 GHz	CISPR 16-4-2	5.1 dB
6 – 12 GHz	CISPR 16-4-2	5.4 dB
Flann Standard Gain Horns 12 – 40 GHz	-	5.9 dB
Radiated field strength M276		
R&S HL562E @ 3 m 30 MHz – 1 GHz	CISPR 16-4-2	4.8 dB
Field strength measurements below 30 MHz on OATS without ground plane		
R&S HFH2-Z2 9 kHz – 30 MHz	-	4.4 dB
Radiated emissions above 40 GHz		
40 – 60 GHz	-	7.0 dB
50 – 75 GHz	-	7.0 dB
60 – 90 GHz	-	7.0 dB
75 – 110 GHz	-	7.0 dB
90 – 140 GHz	-	7.6 dB
110 – 170 GHz	-	6.9 dB
140 – 220 GHz	-	7.8 dB

8 Test site Verification

Test equipment	PM. No.	Frequency range	Type of validation	According to	Val. Date	Val Due
Shielded chamber M4	480088	9 kHz – 30 MHz	GND-Plane	ANSI C63.4-2014	08.11.2022	07.11.2025
Semi anechoic chamber M276	483227	30 – 1000 MHz	NSA/RSM	ANSI C63.4-2014 + ANSI C63.4a-2017	01.03.2023	28.02.2025
Fully anechoic chamber M20	480303	1 -18 GHz	SVSWR	CISPR 16-1-4 Amd. 1	17.08.2022	16.08.2024
