

Tissue Simulating Liquids

For SAR measurement of the field distribution inside the phantom, the phantom must be filled with homogeneous tissue simulating liquid to a depth of at least 15 cm. For head SAR testing, the liquid height from the ear reference point (ERP) of the phantom to the liquid top surface is larger than 15 cm. For body SAR testing, the liquid height from the center of the flat phantom to the liquid top surface is larger than 15 cm. The nominal dielectric values of the tissue simulating liquids in the phantom and the tolerance of 5% are listed.

Figure 10: Photo of Liquid Height for Head Position & Photo of Liquid Height for Body Position

The dielectric properties of the head tissue simulating liquids are defined in IEEE 1528, and KDB 865664 D01 Appendix A. For the body tissue simulating liquids, the dielectric properties are defined in KDB 865664 D01 Appendix A. The dielectric properties of the tissue simulating liquids were verified prior to the SAR evaluation using a dielectric assessment kit(DAK) and a network analyzer.

SAR System Verification

The system check verifies that the system operates within its specifications. It is performed daily or before every SAR measurement. The system check uses normal SAR measurements in the flat section of the phantom with a matched dipole at a specified distance. The system verification setup is shown as below.

Figure 11: System Verification Setup

The validation dipole is placed beneath the flat phantom with the specific spacer in place. The distance spacer is touch the phantom surface with a light pressure at the reference marking and be oriented parallel to the long side of the phantom. The spectrum analyzer measures the forward power at the location of the system check dipole connector. The signal generator is adjusted for the desired forward power (250 mW is used for 700 MHz to 3 GHz, 100 mW is used for 3.5 GHz to 6 GHz) at the dipole connector and the power meter is read at that level. After connecting the cable to the dipole, the signal generator is readjusted for the same reading at power meter.

After system check testing, the SAR result will be normalized to 1W forward input power and compared with the reference SAR value derived from validation dipole certificate report. The deviation of system check should be within 10 %.

9 SAR Measurement Procedure

According to the SAR test standard, the recommended procedure for assessing the peak spatial-average SAR value consists of the following steps:

- (a) Power reference measurement
- (b) Area scan
- (c) Zoom scan
- (d) Power drift measurement

The SAR measurement procedures for each of test conditions are as follows:

- (a) Make EUT to transmit maximum output power
- (b) Measure conducted output power through RF cable
- (c) Place the EUT in the specific position of phantom
- (d) Perform SAR testing steps on the DASY system
- (e) Record the SAR value

9.1 Area & Zoom Scan Procedure

First Area Scan is used to locate the approximate location(s) of the local peak SAR value(s). The measurement grid within an Area Scan is defined by the grid extent, grid step size and grid offset. Next, in order to determine the EM field distribution in a three-dimensional spatial extension, Zoom Scan is required. The Zoom Scan is performed around the highest E-field value to determine the averaged SAR-distribution over 10 g. According to KDB 865664 D01, the resolution for Area and Zoom scan is specified in the table below.

Items	<= 2 GHz	2-3 GHz	3-4 GHz	4-5 GHz	5-6 GHz
Area Scan ($\Delta x, \Delta y$)	<= 15 mm	<= 12 mm	<= 12 mm	<= 10 mm	<= 10 mm
Zoom Scan ($\Delta x, \Delta y$)	<= 8 mm	<= 5 mm	<= 5 mm	<= 4 mm	<= 4 mm
Zoom Scan (Δz)	<= 5 mm	<= 5 mm	<= 4 mm	<= 3 mm	<= 2 mm
Zoom Scan Volume	>= 30 mm	>= 30 mm	>= 28 mm	>= 25 mm	>= 22 mm

Note:

When zoom scan is required and report SAR is <= 1.4 W/kg, the zoom scan resolution of $\Delta x / \Delta y$ (2-3GHz: <= 8 mm, 3-4GHz: <= 7 mm, 4-6GHz: <= 5 mm) may be applied.

9.2 Volume Scan Procedure

Volume Scans are 3D scans used to assess the peak spatial SAR values within an averaging volume containing 1g and 10g of simulated tissue. It is compatible with any phantom. For regular phantoms, the measurement grid is generated by projecting a plane onto the phantom surface as for Area and Zoom scans. For specific phantoms, the measurement grid is generated by a conformal offset to the phantom surface at the desired distances. The grid extents can be set by the end user to cover the DUT dimensions or the whole measurable area of the phantom.

9.3 Power Drift Monitoring

All SAR testing is under the EUT install full charged battery and transmit maximum output power. In DASY measurement software, the power reference measurement and power drift measurement procedures are used for monitoring the power drift of EUT during SAR test. Both these procedures measure the field at a specified reference position before and after the SAR testing. The software will calculate the field difference in dB. If the power drift more than 5%, the SAR will be retested.

9.4 Spatial Peak SAR Evaluation

The procedure for spatial peak SAR evaluation has been implemented according to the IEEE 1528 standard. It can be conducted for 1 g and 10 g, as well as for user-specific masses. The algorithm to find the cube with highest averaged SAR is divided into the following stages:

- a. Extraction of the measured data (grid and values) from the Zoom Scan
- b. Calculation of the SAR value at every measurement point based on all stored data (A/D values and measurement parameters)
- c. Generation of a high-resolution mesh within the measured volume
- d. Interpolation of all measured values from the measurement grid to the high-resolution grid
- e. Extrapolation of the entire 3-D field distribution to the phantom surface over the distance from sensor to surface
- f. Calculation of the averaged SAR within masses of 1g and 10g

In DASY5 V5.2 SAR, the calculation is performed in the SEMCAD post processing engine. In cDASY6 Module SAR, the 1 g and 10 g cubes are calculated in the software itself.

9.5 SAR Averaged Methods

In DASY, the interpolation and extrapolation are both based on the modified Quadratic Shepard's method. The interpolation scheme combines a least-square fitted function method and a weighted average method which are the two basic types of computational interpolation and approximation.

Extrapolation routines are used to obtain SAR values between the lowest measurement points and the inner phantom surface. The extrapolation distance is determined by the surface detection distance and the probe sensor offset. The uncertainty increases with the extrapolation distance. To keep the uncertainty within 1% for the 1 g and 10 g cubes, the extrapolation distance should not be larger than 5 mm.

9.6 Tissue Verification

Table 10: The measuring results for tissue simulating liquid

Tissue Type	Frequency (MHz)	Liquid Temp. (°C)	Measured Conductivity (σ)	Measured Permittivity (ϵ_r)	Target Conductivity (σ)	Target Permittivity (ϵ_r)	Conductivity Deviation (%)	Permittivity Deviation (%)	Test Date
H2450	2450	23.7	1.83	38.08	1.80	39.2	1.81	-2.9	Oct. 26, 2020
H5200	5200	22.3	4.51	36.20	4.66	36.0	-3.10	0.6	Oct. 27, 2020
H5800	5800	22.5	5.27	35.30	5.27	35.3	-0.00	0.1	Oct. 27, 2020

Note:

1. The dielectric properties of the tissue simulating liquid must be measured within 24 hours before the SAR testing and within $\pm 5\%$ of the target values. Liquid temperature during the SAR testing must be within $\pm 2^\circ\text{C}$.
2. Since the maximum deviation of dielectric properties of the tissue simulating liquid is within 5%, SAR correction is evaluated in the measurement uncertainty shown on section 3.3 of this report.

9.7 System Verification

Table 11: The measuring results for system check

Frequency (MHz)	TSL	Power [dBm]	Deviation 1g [%]	Deviation 10g [%]	Deviation Peak [%]	Isotropic Error [%]	Test Date
2450	HSL	17	6.7	4.9	8.5	-2.2	Oct. 26, 2020
5200	HSL	17	-2.40	-1.1	-6.6	3.8	Oct. 27, 2020
5800	HSL	17	8.1	8.5	9.0	3.8	Oct. 27, 2020

Note:

Comparing to the reference SAR value provided by SPEAG, the validation data should be within its specification of 10 %. The result indicates the system check can meet the variation criterion and the plots can be referred to APPENDIX B: PLOTS FOR SYSTEM VERIFICATION. of this report.

NO : SAR testing is excluded, Refer clause 9.11 Guidelines Applied of this report

9.9 SAR Test Exclusion

Based on the conducted power measurement, reported under section " RF Conducted Power " of this test report and derivation of Low-Power exclusion level defined in FCC KDB 447498 D01 General RF Exposure Guidance v06 (See 4.3 a), SAR test exclusion was identified for the following frequency band

RF protocol	Measured Frequency (MHz)	Maximum measured RF output power at antenna terminal (dBm)	Tune-up tolerance (dB)	Max power Including tune-up tolerance * (mW)	Exclusion threshold ** for separation distance of 5mm	SAR Test required (Yes/No)
BLE	2480	5.08 dBm	±2	5.11	1.61	No

*Max power is rounded to two decimal place for reporting

**separation distance of 5mm is used for the calculation, where as the actual separation distance is 3.6mm

Hence RF exposure evaluation or SAR testig is not required for BLE 2.4 GHz frequency range

- Per KDB 447498 D01v06, the 1-g and 10-g SAR Test Exclusion threshold for 100MHz to 6GHz at separation distance ≤50mm are determined by

$$[(\text{max. power of channel, including tune-up tolerance, mW}) / (\text{min. test separation distance, mm})] \cdot [\sqrt{f_{\text{(GHz)}}}] \leq 3.0 \text{ for 1-g SAR, and } \leq 7.5 \text{ for 10-g extremity SAR}$$

Where

f (GHz) is the RF channel transmit frequency in GHz

9.10 Simultaneous Transmission

This device do not support Simultaneous transmission.

9.11 Guidelines Applied

FCC KDB 248227 D01 802.11 Wi-Fi SAR v02r02

- The maximum output power specified for production units, including tune-up tolerance, are used to determine initial SAR test requirements for the 802.11 transmission modes in a frequency band.
- SAR test reduction is determined according to 802.11 transmission mode and configuration with multiple positions
- When the same maximum power is specified for multiple transmission modes in a frequency band, the largest channel bandwidth, lowest order modulation, lowest data rate and lowest order 802.11a/g/n/ac mode is used for SAR measurement, on the highest measured output power channel in the initial test configuration, for each frequency band
- The reported SAR must be scaled to the maximum transmission duty factor to determine compliance
- During SAR testing, RF transmission and EUT functionality is verified with spectrum analyzer
- When the highest reported SAR for DSSS is adjusted by the ratio of OFDM to DSSS specified maximum output power and the adjusted SAR is ≤ 1.2 W/kg, SAR testing is not required for OFDM

FCC KDB 865664 D01 SAR Measurement 100 MHz to 6 GHz v01r04

- Repeated measurement is not required when the original highest measured SAR is < 0.80 W/kg
- When the original highest measured SAR is ≥ 0.80 W/kg, repeat that measurement once
- Perform a second repeated measurement only if the ratio of largest to smallest SAR for the original and first repeated measurements is > 1.20 or when the original or repeated measurement is ≥ 1.45 W/kg (~10% from the 1-g SAR limit).
- Perform a third repeated measurement only if the original, first or second repeated measurement is ≥ 1.5 W/kg and the ratio of largest to smallest SAR for the original, first and second repeated measurements is > 1.20 .

FCC KDB 447498 D01 General RF Exposure Guidance v06

- Measured SAR is adjusted for maximum tune-up tolerance
- The test separation distances required for a device to demonstrate SAR or MPE compliance must be sufficiently conservative to support the operational separation distances required by the device and its antennas and radiating structures
- For SAR testing of WLAN signal with duty cycle $< 100\%$, the measured SAR is scaled-up by the duty cycle scaling factor (i.e. $1/\text{duty cycle}$)
- For all the applicable exposure position, testing of other required channels within the operating mode of a frequency band is not required when the reported 1-g or 10-g SAR of the mid-channel or highest output power channel is
 - ≤ 0.8 W/kg or ≤ 2 W/kg, for 1-g or 10-g respectively, when transmission band is ≤ 100 MHz
 - ≤ 0.6 W/kg or ≤ 1.5 W/kg, for 1-g or 10-g respectively, when transmission band is between 100 MHz and 200 MHz
 - ≤ 0.4 W/kg or ≤ 1 W/kg, for 1-g or 10-g respectively, when transmission band is ≥ 200 MHz

Front , Back , Edge Right , Edge Left	Limb	-	4

Table 15: SAR Testing Results (Wi-Fi 2.4 GHz)

Phantom	Position	Description	Channel	Frequency (MHz)	psSAR 1g [W/Kg]	psSAR 10g [W/Kg]	Tune up tolerance	Adjusted SAR Value (1g) W/kg	Adjusted SAR Value (10g) W/kg
Flat HSL	FRONT	IEEE 802.11b WiFi 2.4 GHz (DSSS, 1 Mbps)	6	2437	0.337	0.162	±2	0.534	0.257
Flat HSL	BACK	IEEE 802.11b WiFi 2.4 GHz (DSSS, 1 Mbps)	6	2437	0.027	0.013	±2	0.043	0.021
Flat HSL	EDGE TOP	IEEE 802.11b WiFi 2.4 GHz (DSSS, 1 Mbps)	6	2437	0.019	0.008	±2	0.030	0.013
Flat HSL	EDGE BOTTOM	IEEE 802.11b WiFi 2.4 GHz (DSSS, 1 Mbps)	6	2437	0.052	0.024	±2	0.082	0.038
Flat HSL	EDGE LEFT	IEEE 802.11b WiFi 2.4 GHz (DSSS, 1 Mbps)	6	2437	0.082	0.035	±2	0.130	0.055
Flat HSL	EDGE RIGHT	IEEE 802.11b WiFi 2.4 GHz (DSSS, 1 Mbps)	6	2437	0.103	0.047	±2	0.163	0.074
Flat HSL	FRONT	IEEE 802.11b WiFi 2.4 GHz (DSSS, 1 Mbps)	11	2462	0.323	0.145	±2	0.512	0.230
Flat HSL	FRONT	IEEE 802.11b WiFi 2.4 GHz (DSSS, 1 Mbps)	1	2412	0.463	0.21	±2	0.734	0.333

Note :

1. As the highest measured SAR is < 0.8 W/kg for lowest bandwidth channel, which is also the highest power configuration, remaining channels are optional, However these channels are measured as an additional analysis and reported in below table

2. For 2.4 GHz 802.11 g/n OFDMA mode, SAR testing is not required when the highest reported SAR for DSSS adjusted by the ratio of OFDMA to DSSS specified maximum output power and adjusted SAR is ≤ 1.2 W/kg, however this exclusion is not applied as an additional analysis, OFDMA test results are reported in the below table

3. Thresholds should be multiplied by 2.5 when 10-g extremity SAR is considered.
