6.10 Occupied Bandwidth

6.10.1 Applicable Standard

According to §2.1049 Measurements required: Occupied bandwidth.

This measurement is required to compare the consistency of the output signal relative to the input signal, and to satisfy the requirements of Section 2.1049.

6.10.2 Test Procedure

According to section 7.10 of KDB 935210 D03 Signal Booster Measurement v04r04:

- Connect the test equipment as shown in Figure 10 to firstly measure the characteristics of the test signals produced by the signal generator.
- Set $VBW \geq 3$ RBW.
- Set the center frequency of the spectrum analyzer to the center of the operational band. The span will be adjusted for each modulation type and OBW as necessary for accurately viewing the signals.
- Set the signal generator for power level to match the values obtained from the tests of 7.2.
- Set the signal generator modulation type for GSM with a PRBS pattern and allow the trace on the signal generator to stabilize adjusting the span as necessary.
- Set the spectrum analyzer RBW for 1% to 5% of the EBW.
- Capture the spectrum analyzer trace for inclusion in the test report.
- Repeat 7.10c) to 7.10g) for CDMA and WCDMA modulation, adjusting the span as necessary. AWGN or LTE may be used in place of WCDMA, as an option.
- Repeat 7.10c) to 7.10h) for all uplink and downlink operational bands.
- Connect the test equipment as shown in Figure 10, with the uplink output (donor) port connected to the spectrum analyzer, and the server port connected to the signal generator.
- Repeat 7.10c) to 7.10i) with this EUT uplink path test setup.
- Connect the test equipment as shown in Figure 10, with the downlink output (server) port connected to the spectrum analyzer, and the donor port connected to the signal generator.
- Repeat 7.10c) to 7.10i) with this EUT downlink path test setup.

Figure 10 – Test setup for measuring characteristics of test signals used for subsequent EUT occupied bandwidth testing

7. RADIATION SPURIOUS EMISSION

7.1 Applicable Standard

According to §2.1053 Measurements required: Field strength of spurious radiation. The power of any emission outside a licensee's frequency block shall be attenuated below the transmitter power (P) by at least $43 + 10 \log_{10}(P)$ dB. So the Conducted emissions limit = -13 dBm

7.2 Test Procedure

- According to section 7.12 of KDB 935210 D03 Signal Booster Measurement v04r04: This procedure is intended to satisfy the requirements specified in Section 2.1053. The applicable limits are those specified for mobile station emissions in the rule part appropriate to the band of operation (see Appendix A). Separate compliance requirements are applicable for any digital device circuitry that controls additional functions or capabilities and that is not used only to enable operation of the transmitter in a booster device [i.e., Section 15.3(k) digital device definition]. Separate compliance requirements are applicable for any receiver components/functions that tune within 30 MHz to 960 MHz contained in booster devices [Section 15.101(b)].
- Place the EUT on an OATS or semi-anechoic chamber turntable 3 m from the receiving antenna.
 - Connect the EUT to the test equipment as shown in Figure 11 beginning with the uplink output (donor) port.
 - Set the signal generator to produce a CW signal with the frequency set to the center of the operational band under test, and the power level set at PIN as determined from measurement results per 7.2.
 - Measure the radiated spurious emissions from the EUT from the lowest to the highest frequencies as specified in Section 2.1057. Maximize the radiated emissions by using the procedures described in ANSI C63.26.
 - Capture the peak emissions plots using a peak detector with Max-Hold for inclusion in the test report. Tabular data is acceptable in lieu of spectrum analyzer plots.
 - Repeat 7.12c) through 7.12e) for all uplink and downlink operational bands.

Figure 11 – Radiated spurious emissions test and instrumentation setup
