Note:

The product scope is extended with a new AC adaptor and two models of external Mat Antenna (125kHz antenna).

- There is no AC Adaptor in the previous scope of product.
- There is only one Internal 125kHz antenna in the previous scope of product. The extended scope

covers two additional External 125kHz antenna models (53003805 and 53003804) which would be used with the Bed Beacon product. The internal and external 125kHz antenna models are switchable by manual buttons on the Bed Beacon product. Only one 125kHz antenna can be turned on at a time.

There is no change on the main unit as in the previous version, hence, only 125kHz transmitter was tested and related new antenna specification were submitted in this application.

6.1 Antenna Requirement

6.1.1 Test Requirement:

47 CFR Part 15, Subpart C 15.203

6.1.2 Conclusion

Standard Requirement:

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of an antenna that uses a unique coupling to the intentional radiator, the manufacturer may design the unit permanently attached antenna or of an so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited.

EUT Antenna:

The antenna is integrated on the main PCB and no consideration of replacement.

Antenna 1: (53003804, Rubber-backed floor Antenna)

Antenna 2: (53003805, Adhesive-backed Floor Antenna)

7 Radio Spectrum Matter Test Results

7.1 Conducted Emissions at AC Power Line (150kHz-30MHz)

Test Requirement 47 CFR Part 15 Subpart C 15.207, RSS-Gen Section 8.8

Test Method: ANSI C63.10 (2013) Section 6.2

Limit:

Frequency of emission(MHz)	Conducted limit(dBμV)

7.1.1 E.U.T. Operation

Operating Environment:

Temperature: 22.0 C Humidity: 50.0 % RH

Test mode c: TX_Keep the EUT transmitted the continuous modulation test signal at the specific channel(s).

7.1.2 Test Setup Diagram

7.1.3 Measurement Procedure and Data

- 1) The mains terminal disturbance voltage test was conducted in a shielded room.
- 2) The EUT was connected to AC power source through a LISN 1 (Line Impedance Stabilization Network) which provides a 50ohm/50μH + 5ohm linear impedance. The power cables of all other units of the EUT were connected to a second LISN 2, which was bonded to the ground reference plane in the same way as the LISN 1 for the unit being measured. A multiple socket outlet strip was used to connect multiple power cables to a single LISN provided the rating of the LISN was not exceeded.
- 3) The tabletop EUT was placed upon a non-metallic table 0.8m above the ground reference plane. And for floor-standing arrangement, the EUT was placed on the horizontal ground reference plane,
- 4) The test was performed with a vertical ground reference plane. The rear of the EUT shall be 0.4 m from the vertical ground reference plane. The vertical ground reference plane was bonded to the horizontal ground reference plane. The LISN 1 was placed 0.8 m from the boundary of the unit under test and bonded to a ground reference plane for LISNs mounted on top of the ground reference plane. This distance was between the closest points of the LISN 1 and the EUT. All other units of the EUT and associated equipment was at least 0.8 m from the LISN 2.
- 5) In order to find the maximum emission, the relative positions of equipment and all of the interface cables must be changed according to ANSI C63.10 on conducted measurement.

7.4.3 Measurement Procedure and Data

- The EUT was placed on the top of a rotating table 0.8 meters above the ground for below 1GHz at a 3 meter semi-anechoic chamber. The table was rotated 360 degrees to determine the position of the highest radiation.
- The EUT was set 3 meters away from the interference-receiving antenna, which was mounted on the top of a variable-height antenna tower.
- The antenna height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
- For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters (for the test frequency of below 30MHz, the antenna was tuned to heights 1 meter) and the rotatable table was turned from 0 degrees to 360 degrees to find the maximum reading.
- The test-receiver system was set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.
- If the emission level of the EUT in peak mode was 10dB lower than the limit specified, then testing could be stopped and the peak values of the EUT would be reported. Otherwise the emissions that did not have 10dB margin would be re-tested one by one using peak, quasi-peak or average method as specified and then reported in a data sheet.
- Test the EUT in the lowest channel, the middle channel, the Highest channel
- The radiation measurements are performed in X, Y, Z axis positioning for Transmitting mode, And found the X axis positioning which it is worse case.
- Repeat above procedures until all frequencies measured was complete.

Remark: Level (dB $\mu V/m$) = Read Level (dB μV) + Cable Loss (dB) + Antenna Factor (dB/m) - Preamp Factor (dB)

Measurement data:

Antenna 1:

Date: 10.NOV.2022 08:27:38

Frequency (MHz)	Emission Level (dBμV/m) @3m	Distance factor (dB)	Emission Level (dBμV/m) @300m	Limit (dBμV/m) @300m	Margin (dB)
0.125	77.5	80.0	-2.5	25.6	28.1

Antenna 2:

Frequency (MHz)	Emission Level (dBμV/m) @3m	Distance factor (dB)	Emission Level (dBμV/m) @300m	Limit (dBμV/m) @300m	Margin (dB)
0.125	59.3	80.0	-20.7	25.6	46.3

Remark: The test was performed at 3m test distance, i.e. the distance between measuring antenna and EUT boundary. The results were extrapolated by using the square of an inverse linear distance factor DF:

DF (distance factor) = $40 \log (D1/D2) = 80 \text{ dB}$, where
D1 is the 300m specified measurement distance,
D2 is the 3m test measurement distance.

For 125kHz frequency the calculated level is:

Level (dBμV/m) @300m = Level (dBμV/m) @3m - DF (dB) = 59.3 dBμV/m - 80 dB = -20.7 dBμV/m

7.5.3 Measurement Procedure and Data

For testing performed with the loop antenna, the center of the loop was positioned 1 m above the ground and positioned with its plane vertical at the specified distance from the EUT. During testing the loop was rotated about its vertical axis for maximum response at each azimuth and also investigated with the loop positioned in the horizontal plane. Only the worst position of vertical was shown in the report.
