NOTICE:

- (1) This Report must not be used to claim product endorsement, by ANAB, ilac-MRA, NIST, the FCC or any other Agency. This report also does not warrant certification by ANAB or NIST.
- (2) This report shall not be reproduced except in full, without the written approval of Nemko USA, Inc.
- (3) The significance of this report is dependent on the representative character of the test sample submitted for evaluation and the results apply only in reference to the sample tested. The manufacturer must continuously implement the changes shown herein to attain and maintain the required degree of compliance.

Compliance Certificate

FCC MRA Designation Number: US3166
ANAB Accreditation Number: AT-3165.01

Applicant	Device & Test Identification
FlexRadio Systems 4616 W. Howard Lane, Suite 8-860 Austin, TX 78728	Model(s): C5K-PA FCC ID: ZD8C5K-PA Laboratory Project ID: 22343-15

The device named above was tested utilizing the following standards and found to be in compliance with the required criteria:

Test Requirements:

Requirement	Reference	Test Description
FCC 47 CFR Part 2 and Part 87 C	2.1046 (b)(3),(c) and 87.131	RF Output Power
	87.139 (c)(1)/(2)/(3)	Emission Limitations
	2.1051 and 87.139 (c)(3)	Conducted Spurious Emissions
	2.1053 and 87.139 (c)(3)	Field Strength of Radiated Spurious Emissions

I, Shakil Murad, for Nemko USA, Inc., being familiar with the above requirements and test procedures have reviewed the test setup, measured data, and this report. I believe them to be true and accurate.

Shakil Murad
Wireless Engineer

This report has been reviewed and accepted by the Applicant. The undersigned is responsible for ensuring that this device will continue to comply with the requirements listed above.

Representative of Applicant

1.0 Introduction

1.1 Scope

This report describes the extent to which the equipment under test (EUT) conformed to the intentional radiator requirements of the United States and Canada.

Nemko USA, Inc., follows the guidelines of National Institute of Standards and Technology (NIST) for all uncertainty calculations, estimates, and expressions thereof for electromagnetic compatibility testing.

1.2 EUT Description

Manufacturer / Model	Serial #	Description
FlexRadio Systems Model: C5K-PA	5021-0011-0000-6812	Skyline 5000-watt RF Power Amplifier

1.3 Support Equipment

Manufacturer	Model #	Description
Bird Electronic Corp.	4273-020	5000 Watt RF Sampler
N/A	LP-500	Power Meter
Bird Electronic Corp.	8931-115	10000 Watt Load Resistor

EUT Essential Specifications	
Power Output to Antenna	Approximately 5000 Watt
Frequency Range	2.7 MHz to 23 MHz
Channel Bandwidths Supported (kHz)	N/A
Modulation Methods Supported	N/A
Antenna	N/A
Operating Voltage and Power Required	208 VAC 60 Hz
Environment	Indoor

1.4 EUT Test Configuration

The EUT was exercised in a manner consistent with normal operations.

1.5 Modifications to Equipment

None

1.6 Test Site

Measurements were made at the Nemko USA, Inc. semi-anechoic facility designated Site 45 (FCC 905409, IC 3036B-1) in Austin, Texas. The site is registered with the FCC under Section 2.948 and Industry Canada per RSS-GEN, and is subsequently confirmed by laboratory accreditation (ANAB). The test site is located at 11400 Burnet Road, Austin, Texas 78758, while the main office is located at 1601 North A.W. Grimes Boulevard, Suite B, Round Rock, Texas, 78665. CAB Identifier: US 0123.

1.7 Measurement Corrections

Parameter	From Sums Of
Radiated Field Strength	Raw Measured Level + Antenna Factor + Cable Losses – Amplifier Gain
Conducted Antenna Port	Raw Measured Level + Attenuator Factor + Cable Losses
Conducted Mains Port	Raw Measured Level + LISN Factor + Cable/Filter/Limiter Losses

Additionally, measurement distance extrapolation factors (such as $1/d$ above 30 MHz) are applied and documented where used.

1.8 Applicable Documents

Document	Title
ANSI C63.26-2015	American National Standard for Compliance Testing of Transmitters Used in Licensed Radio Services
47 CFR	FCC Part 87 – Subpart D – Technical requirements FCC Part 2 – Subpart J – Equipment authorization procedures

2.0 RF Output Power - 87.139 (c)(1)/(2)/(3)

2.1 Test Procedure

The EUT was connected directly to the spectrum analyzer with directional coupler and attenuator for the measurements. Low, mid, and high channel were measured. ANSI C63.26-2015, section 5.2, procedure is used for the measurements. J3E modulation used for power measurements.

2.2 Test Criteria

Class of Station	Frequency Band/Frequency	Authorized Emission(s)	Maximum Power
Aeronautical enroute and aeronautical fixed	HF	R3E, H3E, J3E, J7B, H2B, J2D HF	6 kW

2.3 Test Results

Peak Output Power - Conducted Test Data											
Project Number:	22343-15				Test Date(s):	4/25/2023

Bottom Channel (2.75MHz), J3E Modulation

Middle Channel (16MHz), J3E Modulation

Top Channel (23MHz), J3E Modulation

3.0 Conducted Spurious Emissions - 2.1051 and 87.139 (c)(3)

3.1 Test Procedure

The EUT was connected directly to the spectrum analyzer with directional coupler and attenuator for the measurements.

Conducted antenna port emissions are measured with the EUT transmitting on Low, Mid, and High channels. ANSI C63.26-2015, section 5.7, procedure is used for the measurements.

3.2 Test Criteria

When the frequency is removed from the assigned frequency by more than 250 percent of the authorized bandwidth of 3.0 kHz for aircraft transmitters the attenuation must be at least 43 dB. For aeronautical station transmitters with transmitter power up to and including 50 watts the attenuation must be at least $43 + 10 \log_{10} pX$ dB and with transmitter power more than 50 watts the attenuation must be at least 60 dB.

3.3 Test Results

Three channels were tested. EUT was transmitting continuously using J3E modulation.

The top, middle, and bottom channels were tested. Testing was conducted with 9 kHz RBW.

There were no emissions observed within 60 dBc of the transmitter rated output power.

The EUT satisfied the requirements. Test plots are presented on the following page.

3.3.1 Test data

Bottom Channel (2.75MHz), J3E Modulation

Middle Channel (16MHz), J3E Modulation**Top Channel (23MHz), J3E Modulation**

4.0 Emission Limitations - 2.1051 and 87.139 (c)(3)

4.1 Test Procedure

The EUT was connected directly to the spectrum analyzer with directional coupler and attenuator for the measurements.

Conducted antenna port emissions are measured with the EUT transmitting on Low, Mid, and High channels. ANSI C63.26-2015, section 5.7, procedure is used for the measurements.

4.2 Test Criteria

When the frequency is removed from the assigned frequency by more than 250 percent of the authorized bandwidth of 3.0 kHz for aircraft transmitters the attenuation must be at least 43 dB. For aeronautical station transmitters with transmitter power up to and including 50 watts the attenuation must be at least $43 + 10 \log_{10} pX$ dB and with transmitter power more than 50 watts the attenuation must be at least 60 dB.

4.3 Test Results

Three channels were tested. EUT was transmitting continuously using H3E and J3E modulation.

The top, middle, and bottom channels were tested. Testing was conducted with 100 Hz RBW with Emission Mask Limits.

The EUT satisfied the requirements. Test plots are presented below.

4.3.1 Test data

Bottom Channel (2.75MHz), J3E Modulation

Middle Channel (16MHz), J3E Modulation

Top Channel (23MHz), J3E Modulation

Bottom Channel (2.75MHz), H3E Modulation

Middle Channel (16MHz), H3E Modulation

Top Channel (23MHz), H3E Modulation

5.0 Field Strength of Radiated Spurious Emissions - 2.1053 and 87.139 (c)(3)

5.1 Test Procedure

Radiated emissions are measured with the EUT in normal operation transmitting on normal hopping channels. ANSI C63.26-2015, section 5.7, procedure is used for the measurements.

Table 5.1.1: Test Distance, Table Height, and Detection Method

30 MHz to 1 GHz	1 GHz to 18 GHz	18 GHz to 26.5 GHz
10 m, 80 cm	3 m, 1.5 m	1 m, 1.5 m
Quasi-peak	Peak & Average	Peak & Average

5.2 Test Criteria

When the frequency is removed from the assigned frequency by more than 250 percent of the authorized bandwidth of 3.0 kHz for aircraft transmitters the attenuation must be at least 43 dB. For aeronautical station transmitters with transmitter power up to and including 50 watts the attenuation must be at least $43 + 10 \log_{10} p_X$ dB and with transmitter power more than 50 watts the attenuation must be at least 60 dB.

5.3 Test Results

EUT was tested in normal operation and transmitting continuously unmodulated. Device tested in normal operational orientation.

There were no emissions observed within 60 dBc of the transmitter rated output power.

The EUT satisfied the requirement. Test plots and tabular data are presented on the following page.

5.3.1 Test data

Bottom Channel

9kHz – 30MHz Parallel Orientation Emissions Data

Note: FCC part 15.209 limit used in this range is for reference only at 3 meters distance. There were no emissions observed within 60 dBc of the transmitter rated output power.

9kHz – 30MHz Perpendicular Orientation Emissions Data

Frequency (MHz)	EUT Direction (Degrees)	Antenna Height (cm)	Quasi-peak Reading (dBμV)	Quasi-peak Limit (dBμV)	Quasi-peak Results	Average Reading (dBμV)	Average Limit (dBμV)	Average Results
0.058	79	100				70.924	112.39	PASS
0.115	115	100				57.623	106.40	PASS
8.254	246	100	44.925	69.54	PASS			
16.500	83	100	61.424	69.54	PASS			
27.501	256	100	63.715	69.54	PASS			

Note: FCC part 15.209 limit used in this range is for reference only at 3 meters distance. There were no emissions observed within 60 dBc of the transmitter rated output power.

30MHz - 1GHz Vertical Polarity Emissions Data

Frequency (MHz)	EUT Direction (Degrees)	Antenna Height (cm)	Quasi-peak Reading (dBμV)	Limit 60 dBc (dBμV)	Results
30.243	325	182	36.70	91.76	PASS
41.250	78	104	48.47	91.76	PASS
44.003	44	128	51.15	91.76	PASS
46.750	99	104	46.41	91.76	PASS
63.256	297	270	39.33	91.76	PASS
126.505	280	134	40.90	91.76	PASS

Note: FCC part 15.209 limit used in this range is for reference only at 10 meters distance. There were no emissions observed within 60 dBc of the transmitter rated output power.

30MHz - 1GHz Horizontal Polarity Emissions Data

Frequency (MHz)	EUT Direction (Degrees)	Antenna Height (cm)	Quasi-peak Reading (dBμV)	Limit 60 dBc (dBμV)	Results
30.246	315	412	40.14	91.76	PASS
46.756	23	128	36.86	91.76	PASS

6.0 Measurement Bandwidths

Radiated Emissions Spectrum Analyzer Bandwidth and Measurement Time - Peak Scan				
Frequency Band Start (MHz)	Frequency Band Stop (MHz)	6 dB Bandwidth (kHz)	Number of Ranges Used	Measurement Time per Range
0.009	0.15	0.3	2	Multiple Sweeps
0.15	30	9	6	Multiple Sweeps
30	1000	120	2	Multiple 800 mS Sweeps
1000	6000	1000	2	Multiple Sweeps
6000	18000	1000	2	Multiple Sweeps
18000	26500	1000	2	Multiple Sweeps
*Notes: 1. The settings above are specifically calculated for the E4440A series of spectrum analyzers, which have 8,000 data points per range. 2. The measurement receiver resolution bandwidth setting was 300 Hz for quasi-peak measurements from 9-150 kHz. 3. The measurement receiver resolution bandwidth setting was 9 kHz for quasi-peak measurements from 0.15-30 MHz. 4. The measurement receiver resolution bandwidth setting was 120 kHz for quasi-peak measurements from 30-1000 MHz. 5. The measurement receiver resolution bandwidth setting was 1 MHz for average measurements from 1-18 GHz.

Appendix: Policy, Rationale, and Evaluation of EMC Measurement Uncertainty

All uncertainty calculations, estimates and expressions thereof shall be in accordance with ANAB policy. Since Nemko USA, Inc. operates in accordance with ANAB Document Number AR 2250: 2021/06/16, all instrumentation having an effect on the accuracy or validity of tests shall be periodically calibrated or verified traceable to national standards by a competent calibration laboratory. The certificates of calibration or verification on this instrumentation shall include estimates of uncertainty as required by ANAB Document Number AR 2250.

1. Rationale and Summary of Expanded Uncertainty.

Each piece of instrumentation at Nemko USA that is used in making measurements for determining conformance to a standard (or limit), shall be assessed to evaluate its contribution to the overall uncertainty of the measurement in which it is used. The assessment of each item will be based on either a type A evaluation or a type B evaluation. Most of the evaluations will be type B, since they will be based on the manufacturer's statements or specifications of the calibration tolerances, or uncertainty will be stated along with a brief rationale for the type of evaluation and the resulting stated uncertainties.

The individual uncertainties included in the combined standard uncertainty for a specific test result will depend on the configuration in which the item of instrumentation is used. The combination will always be based on the law of propagation of uncertainty. Any systematic effects will be accommodated by including their uncertainties, in the calculation of the combined standard uncertainty; except that if the direction and amount of the systematic effect cannot be determined and separated from its uncertainty, the whole effect will be treated as uncertainty and combined along with the other elements of the test setup.

Type A evaluations of standard uncertainty will usually be based on calculating the standard deviation of the mean of a series of independent observations, but may be based on a least-squares curve fit or the analysis of variance for unusual situations. Type B evaluations of standard uncertainty will usually be based on manufacturer's specifications, data provided in calibration reports, and experience. The type of probability distribution used (normal, rectangular, a priori, or u-shaped) will be stated for each Type B evaluation.

In the evaluation of the uncertainty of each type of measurement, the uncertainty caused by the operator will be estimated. One notable operator contribution to measurement uncertainty is the manipulation of cables to maximize the measured values of radiated emissions. The operator contribution to measurement uncertainty is evaluated by having several operators independently repeat the same test. This results in a Type A evaluation of operator-contributed measurement uncertainty.

A summary of the expanded uncertainties of Nemko USA's measurements is shown as Table 1. These are the worst-case uncertainties considering all operative influence factors.

Table 1: Summary of Measurement Uncertainties for Site 45

Type of Measurement	Frequency Range	Meas. Dist.	Expanded Uncertainty U, dB (k=2)
Mains Conducted Emissions	150 kHz to 30 MHz	N/A	2.82
Telecom Conducted Emissions	150 kHz to 30 MHz	N/A	3.48
Radiated Emissions	30 to 1,000 MHz	10 m	3.88
	1 to 18 GHz	3 m	4.31
