4. Test Set-up and Operation Modes

4.1 Principle of Configuration Selection

The equipment under test (EUT) was configured to measure its maximum emission level. The test modes were adapted accordingly in reference to the instructions for use.

4.2 Test Operation and Test Software

Setup for testing: Test samples are provided with a test software SPI interface which makes it possible to control them through a test software installed on a notebook computer.

This software was running on the laptop computer connected to the EUT. It was used to enable the operation modes listed in section 3.3 as appropriate.

The samples were used as follows:

434MHz ASK : A000990161-20
434MHz FSK : A000990161-19
315MHz ASK : A000990161-18
315MHz FSK : A000990161-17

Full test was applied on all test modes, but only worst case was shown.

4.3 Special Accessories and Auxiliary Equipment

The product has been tested together with the following additional accessories:

None.

4.4 Countermeasures to achieve EMC Compliance

The test sample which has been tested contained the noise suppression parts as described in the Constructional Data Form or the Technical Construction File. No additional measures were employed to achieve compliance.

5. Test Results

5.1 Transmitter Requirement & Test Suites

5.1.1 Antenna Requirement

RESULT:**Passed**

Standard : FCC Part 15.203 and ISSED RSS-Gen 6.8
Requirement : Manufacturer must ensure approved antenna is used

The antenna is a loop antenna with no possibility of replacement with a non-approved antenna by the end-user. Therefore, the EUT is considered to comply with this provision.

Refer to EUT photo for details.

5.1.2 Field strength of fundamental

RESULT:**Passed**

Test standard : FCC Part 15. 231(e)
ISED RSS-210 A1.4, Table A2

Basic standard : ANSI C63.10:2013

Test setup

Test Channel : 315, 434 MHz
Operation Mode : A
Test Lab : Linkou

Atmospheric pressure : 100-103 kPa

The EUT employs pulsed operation.
The pulse width is: ASK: 28.7 msec. FSK:10.435ms

The Tables below show calculated average values from the pulsed emissions measurement dataMHz, corrected with the worst case duty cycle factor over 100 msec.

The average values noted are calculated through the application of a duty cycle correction, according to part 15.35c

Duty cycle calculation:

ASK: Duty cycle correction (dB) = $20 \log (28.7 \text{ msec} / 100 \text{ msec}) = -10.84 \text{ dB}$.

FSK: Duty cycle correction (dB) = $20 \log (10.435 \text{ msec} / 100 \text{ msec}) = -19.63 \text{ dB}$.

6. Safety Human exposure

6.1 Radio Frequency Exposure Compliance

6.1.1 Electromagnetic Fields

RESULT:**Passed**

Test standard : FCC KDB Publication 447498 D01 v06
ISED RSS-102 issue 5, Table 1

FCC:

Since maximum peak output power of the transmitter is 0.000343 mW < 10mW, hence the EUT is excluded from SAR evaluation according to FCC KDB publication 447498: Mobile Portable RF Exposure

Canada:

Maxmium ERP = 72.35dBu/m +2.15 = 74.5dBuV/m (EIRP) = 0.000562mW

Since maximum output power, either EIRP or conducted, of the transmitter 0.000567mW < 4mW, hence the EUT is excluded from SAR evaluation according to Table 1 in RSS-102
