PRODUCT DESCRIPTION

Equipment Under Test:

EUT	Head Mounted Display system for sports eyewear
Functional Description	RI-JET-009 is a Head Mounted Display system for sports eyewear. It measures the athlete's performance using an onboard GPS receiver and multiple motion sensors, displays the sensor data in real-time on a small LCD, and records sensor data in non-volatile memory for post processing.
Operational Description	A Bluetooth (BT), a Bluetooth Low Energy (BLE) as well as WiFi technology is implemented in JET to receive control signals from a Recon Remote and communicate with various computer programs. The BLE & WiFi transceiver inside the JET was programmed to transmit the maximum output power at the low, mid and high channels of the Bluetooth (2402, 2441 and 2480 MHz) and Wi-Fi band (2412, 2442, and 2477 MHz) respectively). In order to set the eyewear in a continuous transmission mode a Laptop PC was used to the send the various commands.

TESTING METHODOLOGY

The tests documented in this report were performed in accordance with ANSI C63.4-2009, ANSI C63.10-2009, ANSI C63.10-2013, FCC CFR 47 Part 2, FCC CFR 47 Part 15, and RSS-Gen, Issue 4 and RSS-210, Issue 8. The FCC testing was also done using the FCC KDB 558074 D01 DTS Measurement Guidance v03r02 for the Wi-Fi and BLE transmitters and the FCC Public Notice DA 00-705 Filing and Measurement Guidelines for Frequency Hopping Spread Spectrum Systems

EUT TESTING CONFIGURATION

For the purpose of compliance testing, the EUT was powered using the +5.0Vdc power supply since the battery would not have enough power to complete the testing. The transmitter was set for continuous operation on various frequencies in modulated modes of operation.

WORST TEST CASE

The worst-case channel is determined as the channel with the highest output power. The highest measured output power was at 2441 MHz for the Wi-Fi 802.11b mode.

TEST SETUP

For conducted tests the EUT is installed in a test fixture connected to An EMI receiver and Spectrum Analyzer as well as a host laptop computer during the tests. Test software exercised the radio card. A separate EUT connected to an AC power adapter was used for the radiated tests.

GENERAL TEST PROCEDURES

RF Conducted Emissions

The EUT is placed on a test bench connected directly to an EMI Receive and Spectrum Analyzer. Conducted emissions are measured in the frequency range 10kHz to 25GHz using CISPR Peak, Quasi-Peak and Average detectors.

AC Mains Conducted Emissions

The EUT is placed on the turntable 0.8m above a ground plane. Conducted emissions are measured in the frequency range 0.15 – 30MHz using CISPR quasi-peak and average detector.

Radiated Emissions

The EUT is placed on the turntable 0.8m above a ground plane 3m away from a receiving antenna. Height of receiving antenna varied from 1m to 4m, its polarity changes from vertical to horizontal. Turntable rotates 360 degrees. Motion of turntable and receiving antenna allows determining position of maximum emission level. Quasi-peak detector applies for measurements of emissions with frequency range of 30 to 1000MHz. and average/peak detector otherwise.

RESTRICTED BANDS OF OPERATION

(a) Except as shown in paragraph (d) of this section, only spurious emissions are permitted in any of the frequency bands listed below:

(b) Except as provided in paragraphs (d) and (e) of this section, the field strength of emissions appearing within these frequency bands shall not exceed the limits shown in § 15.209. At frequencies equal to or less than 1000 MHz, compliance with the limits in § 15.209 shall be demonstrated using measurement instrumentation employing a CISPR quasi-peak detector. Above 1000 MHz, compliance with the emission limits in § 15.209 shall be demonstrated based on the average value of the measured emissions. The provisions in § 15.35 apply to these measurements.

Part 1 - Antenna Requirements

DATE: Dec-01-2014

TEST STANDARD: FCC 47 CFR Part 15.203 and IC Rss-Gen Issue 4 Section 7.1.2

APPLICABLE REGULATIONS: - "An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this Section. The manufacturer may design the unit so that the user can replace a broken antenna, but the use of a standard antenna jack or electrical connector is prohibited."... "the installer shall be responsible for ensuring that the proper antenna is employed so that the limits in this Part are not exceeded."

RESULT : This unit meets this requirement. There are 2 antennas in this unit – GPS and Wi-Fi/Bluetooth antenna (see Antenna Description section). Antennas are soldered to the circuit board and are not accessible to the end-user.

Part 2 – RF Power Conducted

DATE: Nov-21-2014

TEST STANDARD: IC RSS-210 Annex 2 Section (A2.9)(a)
FCC Subpart C §§15.247(a) (2), 15.247(b)

TEST VOLTAGE: 5Vdc from AC Power Adapter

MINIMUM STANDARD: 1 W (30 dBm)

TEST SETUP: The antenna port of EUT was directly connected to a spectrum analyser.

MEASUREMENT METHOD: As called by the standards above. For the measurement of Wi-Fi peak power output the power meter was used so that the plots were not provided.

DEVICE DESCRIPTIONS: As described in the above EUT description and set up section.

OBSERVATIONS: The EUT performed as expected.

PERFORMANCE: Complies.

Part 3 - Radiated Spurious Emissions

DATE: Dec -12-2014

TEST STANDARD: IC RSS-210 Annex 2 Section (A2.9)(b), RSS-Gen Issue 4 Section (7.2.5);
FCC Subpart C §§15.209(a) and 15.247(c), FCC Part 15.249 (ANT+)

TEST VOLTAGE: 5Vdc from AC Power Adapter

TEST CONDITIONS: Indoor

MINIMUM STANDARD: (b) Emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general field strength limits listed in RSS-Gen, whichever is less stringent.

In measuring unwanted emissions, the spectrum shall be investigated from 30 MHz or the lowest radio frequency signal generated in the equipment, whichever is lower, without going below 9 kHz, up to at least the frequency ... if the equipment operates below 10 GHz: to the tenth harmonic of the highest fundamental frequency or to 40 GHz, whichever is lower.

Table 1: General Field Strength Limits for Transmitters at Frequencies Above 30 MHz

Frequency (MHz)	Field Strength	
	uV/m @ 3-m	Calculated dBµV/m at 3m
30 – 88	100	40.0
88 - 216	150	43.5
216 - 960	200	46.0
960 - 1000	500	54.0

TEST SETUP: The EUT was tested in our 3 m SAC and was positioned on the center of the turntable and connected to a 5Vdc power supply. The transmitter was set for continuous transmission. The lowest, middle and highest channels in the 2400-2483.5 MHz band were measured for all radiated emissions 10kHz to 18 GHz. The EUT was pre-scanned in 3 different orthogonal orientations and was found to radiate highest when placed flat on the table top as indicated in the test photos.

MEASUREMENT METHOD: Measurements were made using spectrum analyser and receiver, 200Hz RBW average detector for the frequency range 9-150KHz; 9kHz RBW average detector for the Frequency range 150kHz to 30MHz; 120kHz RBW quasi-peak detector using the appropriate antennas, amplifiers and filters.

DEVICE DESCRIPTIONS: As described in the above EUT description and setup section.

MODIFICATIONS: The EUT did not require any modifications.

PERFORMANCE: Complies with Standard

EMISSIONS DATA & PLOT:

- Note: 1) The measurements of Radiated Emissions were performed on all of operational modes of the EUT.
For the purpose of the report the plots of the worst case were added only.
- 2) Radiated Emissions were verified up to 10th harmonics of fundamental frequency. But all spurious emissions above 18GHz were at least 20dB below the limit line or were undetectable.

FCC Subpart C §15.247(e)

TEST METHOD: As called by the standards above

TEST VOLTAGE: 5Vdc from AC Power Adapter

MINIMUM STANDARD: 8 dBm in any 3 kHz band

TEST SETUP: The EUT was connected to the DUT in conducted mode likewise for output power measurements.

METHOD OF MEASUREMENT: Measurements were made using a spectrum analyser with 100 kHz resolution bandwidth, peak and detector.

DEVICE DESCRIPTIONS: As described in the equipment under test section, above.

PERFORMANCE: Complies with Standard

Part 5 – AC Mains Conducted Emissions

DATE: Dec-10-2014

TEST STANDARD: RSS-210, Issue 8; FCC Subpart C §15.207(a)

TEST METHOD: RSS-Gen Issue 4 (7.1.4); CAN/USA – IEC CISPR 22; FCC Subpart C §15.207(a)

TEST VOLTAGE: 5Vdc from AC Power Adapter

MINIMUM STANDARD: Class B Limit:

Frequency (MHz)	Conducted Limit (dBμV)	
	Quasi-Peak	Average
0.15 - 0.50	66 to 56	56 to 46
0.5 – 5	56	46
5 – 30	60	50
Note 1 The lower limit shall apply at the transition frequencies		
Note 2 The limit decreases linearly with the logarithm of the frequency in the 0.15 to 0.50 MHz..		

TEST SETUP: The EUT was connected to the conducted emissions LISN apparatus. The equipment was operated and tested at 120Vac 60Hz while in continuous mode of operation.

METHOD OF MEASUREMENT: Measurements were made using a test receiver with 9 kHz bandwidth, quasi-peak and average detector.

DEVICE DESCRIPTIONS: As described in the equipment test section above.

PERFORMANCE: Complies with Standard

DATA & PLOT: Pre-testings were performed to find out the worst case which is Wi-Fi transmitter on

Part 6 - 6 dB Occupied Bandwidth

DATE: Dec-01-2014

TEST STANDARD: RSS-210, §15.247(a)(2)

TEST VOLTAGE: 5Vdc from AC Power Adapter

MINIMUM STANDARD: The minimum 6 dB bandwidth shall be at least 500 kHz.

TEST SETUP: The EUT was directly connected to a spectrum analyser. The transmitter was set for continuous transmission..

MEASUREMENT METHOD: Measurements were made using an spectrum analyser 100kHz RBW peak detector set on maximum hold using the appropriate antennas, amplifiers and filters.

DEVICE DESCRIPTIONS: As described in the above EUT description and setup section.

DATA:

DATE: Nov-26-2014

TEST STANDARD: RSS-210 §A8.2(1), RSS-Gen Issue 4 § (4.6.1); §15.247(a)(2)

TEST VOLTAGE: 5Vdc from AC Power Adapter

MINIMUM STANDARD: When an occupied bandwidth value is not specified in the applicable RSS, the transmitted signal bandwidth to be reported.

TEST SETUP: The EUT was directly connected to a spectrum analyser.

MEASUREMENT METHOD: Measurements were made using spectrum analyser with 100 kHz RBW, peak detector set on maximum hold using the appropriate antennas, amplifiers and filters.

DEVICE DESCRIPTIONS: As described in the above EUT description and setup section.

Part 8 – Band Edge

DATE: Dec-02-2014

TEST STANDARD: RSS-210, FCC Subpart C §§15.209(d) and 15.247(c);

TEST VOLTAGE: 5Vdc

MINIMUM STANDARD:(d) Emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general radiated emission limits in § 15.209, whichever is the lesser attenuation.
(e) As shown in § 15.35(b), for frequencies above 1000 MHz, the field strength limits in paragraphs (a) and (b) of this section are based on average limits. However, the peak field strength of any emission shall not exceed the maximum permitted average limits specified above by more than 20dB under any condition of modulation.

15.209 General Field Strength Limits

Frequency (MHz)	Field Strength	
	uV/m @ 3-m	Calculated dBµV/m at 3m
30 - 88	100	40.0
88 - 216	150	43.5
16 - 960	200	46.0
960 - 1000	500	54.0

TEST SETUP: The EUT was directly connected to a spectrum analyser. The transmitter was set for continuous transmission.

MEASUREMENT METHOD: Measurements were made using a spectrum analyser with 300 kHz RBW peak detector using the appropriate antennas, amplifiers and filters.

DEVICE DESCRIPTIONS: As described in the above EUT description and setup section.

OBSERVATIONS: The EUT performed as expected.

PERFORMANCE: Complies.

Part 9 – Conducted Spurious Emissions

DATE: Dec-01-2014

TEST STANDARD: IC RSS-210 Annex 2 Section (A2.9)(b); FCC Subpart C §15.247(c)
RSS-Gen Issue 4 Section (7.2.5)

TEST VOLTAGE: 5Vdc from AC Power Adapter

TEST CONDITIONS: Indoor

MINIMUM STANDARD: (b) Emissions emitted outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general field strength limits listed in RSS-Gen, whichever is less stringent.

TEST SETUP: The EUT was directly connected to a spectrum analyser. The transmitter was set for continuous transmission. Measurements were done up to 25GHz.

MEASUREMENT METHOD: Measurements were made using a spectrum analyser with 300kHz RBW quasi-peak detector using the appropriate antennas, amplifiers and filters.

DEVICE DESCRIPTIONS: As described in the above EUT description and setup section.

Part 10 – Hopping Carrier Frequency Separation

DATE: Dec-01-2014

TEST STANDARD: IC RSS-210 Annex 2 Section (A2.9)(b), RSS-Gen Issue 4 Section (7.2.5);
FCC Subpart C §15.247(a)

TEST VOLTAGE: 5Vdc from AC Power Adapter

TEST CONDITIONS: Indoor

MINIMUM STANDARD: Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater.

TEST SETUP: The EUT is directly connected to a spectrum analyser.

MEASUREMENT METHOD: Measurements were made using spectrum analyser with RBW and VBW of 100 kHz using the appropriate antennas, amplifiers and filters.

DEVICE DESCRIPTIONS: As described in the above EUT description and setup section.

RESULTS: Compliance to standard is confirmed.

DATA & PLOT:

Date: 26.JAN.2015 22:13:24

Part 11 – Number of Hopping Frequencies

DATE:	Dec-01-2014
TEST STANDARD:	IC RSS-210 Annex 2 Section (A2.9)(b), RSS-Gen Issue 4 Section (7.2.5); FCC Subpart C §15,247(a)
TEST VOLTAGE:	5Vdc from AC Power Adapter
TEST CONDITIONS:	Indoor
MINIMUM STANDARD:	Frequency hopping systems in the 2400 – 2483.5 MHz shall use at least 15 non-overlapping channels.
TEST SETUP:	The EUT is directly connected to a spectrum analyser. The span is set to cover authorised band, in either a single sweep or in multiple contiguous sweeps. The RBW is set to 1% of the span. The analyser is set to Max Hold.
MEASUREMENT METHOD:	Measurements were made using spectrum analyser using the appropriate antennas, amplifiers and filters.
DEVICE DESCRIPTIONS:	As described in the above EUT description and setup section.
DATA:	79 channels
OBSERVATIONS:	The EUT performed as expected.
PERFORMANCE:	Complies

PLOT:

Part 12 – Time Of Occupancy (Dwell Time)

DATE: Dec-01-2014

TEST STANDARD: IC RSS-210 Annex 2 Section (A2.9)(b)
RSS-Gen Issue 4 Section (7.2.5)

TEST VOLTAGE: 5Vdc from AC Power Adapter

TEST CONDITIONS: Indoor

MINIMUM STANDARD: For frequency hopping systems average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed.

TEST SETUP: The EUT is directly connected to a spectrum analyser. The span is set to 0 Hz, centered on a single, selected hopping channel. The width of a single pulse is measured in a fast scan. The number of pulses is measured in a second scan to enable resolution of each occurrence.

The averaged time of occupancy in the specified period 31.6 seconds (79X0.4 s) is equal to 316X(# of pulses in 100 ms) X pulse width.

MEASUREMENT METHOD: Measurements were made using spectrum analyser using the appropriate antennas, amplifiers and filters.

DEVICE DESCRIPTIONS: As described in the above EUT description and setup section.

RESULTS: Compliance standard is confirmed

DATA & PLOT:

Part 13 – RF Exposure Compliance

DATE: Dec-01-2014

TEST STANDARD: IC RSS-Gen Issue 4 Section 5.6, RSS-102 Section 2.5
FCC KDB447498

TEST CONDITIONS: Indoor

MINIMUM STANDARD: RSS-102 Section 2.5
SAR evaluation is required if the separation distance between the user and the radiating element of the device is less than or equal to 20 cm, except when the device operates as follows:
above 2.2 GHz and up to 3 GHz inclusively, and with output power (i.e. the higher of the conducted or radiated (e.i.r.p.) source-based, time-averaged output power) that is less than or equal to 20 mW for general public use and 100 mW for controlled use;

KDB447498, sec. 4.3.1:

As stated in Appendix A SAR test exclusion limit for 2450 GHz with separation distance < 5mm is 10mW. The equation and threshold in section 4.3.1 must be applied to determine SAR test exclusion.

The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances

≤ 50 mm are determined by:

$[(\text{max. power of channel, including tune-up tolerance, mW}) / (\text{min. test separation distance, mm})] \cdot [\sqrt{f(\text{GHz})}] \leq 3.0$ for 1-g SAR and ≤ 7.5 for 10-g extremity SAR, (1) where

- $f(\text{GHz})$ is the RF channel transmit frequency in GHz
- Power and distance are rounded to the nearest mW and mm before calculation²⁶

- The result is rounded to one decimal place for comparison
- 3.0 and 7.5 are referred to as the numeric thresholds in the step 2 below

The test exclusions are applicable only when the minimum test separation distance is ≤ 50 mm and for transmission frequencies between 100 MHz and 6 GHz. When the minimum test separation distance is < 5 mm, a distance of 5 mm according to 5) in section 4.1 is applied to determine SAR test exclusion.

EUT DESIGN PARAMETERS: Minimum separation distance: 4.5mm;
Antenna gain: -4.12 dBi.

RESULT: The EUT is exempt from SAR evaluation.

Part 14 - Frequency Stability

DATE:

TEST STANDARD: FCC Part 15.215(c) and RSS-Gen Issue 4 (8.11)

MINIMUM STANDARD: Not specified.
RSS-Gen (8.8): Transmitter frequency stability for licence-exempt radio apparatus shall be measured in accordance with Section 6.11. For licence-exempt radio apparatus, the frequency stability shall be measured at temperatures of -20°C (-4°F), +20°C (+68°F) and +50°C (+122°F) instead of at the temperatures specified in Section 6.11. If the frequency stability of the licence-exempt radio apparatus is not specified in the applicable standard (RSS), measurement of the frequency stability is not required provided that the occupied bandwidth of the licence-exempt radio apparatus lies entirely outside the restricted bands and the prohibited TV bands of 54-72 MHz, 76-88 MHz, 174-216 MHz, 470-608 MHz and 614-806 MHz.
FCC (15.215(c)): The 20dB bandwidth must remain within the designated frequency band over the expected variations in temperature and voltage range

TEST SETUP: The EUT was bench tested and in our temperature chamber. Due to the outdoor location and mounting method of the EUT, the EUT voltage and temperature range was specified by the manufacturer and verified at 2.6, 3 and 5Vdc; +50 to -30° Celsius. The transmitter was set for Carrier Wave (CW) mode and the lowest and highest channel Frequency was measured at each Temperature setting, after the Transmitter stabilized at the temperature.

MEASUREMENT METHOD: Measurements were made using a Spectrum Analyzer with 120kHz RBW Average detector while directly connected to the EUT through the antenna port.

DEVICE DESCRIPTIONS: As described in the above EUT description and setup section

Part 15 – 99% Bandwidth

DATE: Dec-02-2014

TEST STANDARD: RSS-Gen Issue 4

TEST VOLTAGE: 5Vdc from AC Power Adapter

MINIMUM STANDARD: The Occupied Channel Bandwidth is the bandwidth that contains 99 % of the power of the signal.
The Occupied Channel Bandwidth shall fall completely within the range between 2,4 GHz and 2,4835 GHz.

TEST SETUP: The antenna port of EUT was directly connected to a spectrum analyser.

MODIFICATIONS: No modification is required to comply for this test.

PERFORMANCE: Complies with standard

DATA & PLOT:

99% Occupied Channel Bandwidth, Wi-Fi, 802.11b

99% Occupied Channel Bandwidth, Wi-Fi, 802.11g

99% Occupied Channel Bandwidth, Wi-Fi,802.11n

99% Occupied Channel Bandwidth, Bluetooth-GFSK

99% Occupied Channel Bandwidth, Bluetooth-EDR2

99% Occupied Channel Bandwidth, BTLE

99% Occupied Channel Bandwidth, ANT
