6 Conducted Spurious Emissions / Band Edge

6.1 Test Result

Test Description	Test Specification		Test Result
Conducted Spurious Emissions	15.247(d)	RSS-247 S5.5	Compliant

6.2 Test Method

Spurious emissions in non-restricted frequency bands were recorded using the methods defined in ANSI C63.10: 2013 clause 11.11 and KDB 558074 D01 15.247 Meas Guidance v05r02.

Limit

Because the maximum conducted average output power was used to determine compliance with the output power limits, the limit in any 100 kHz band outside of the authorized band is 30 dB below the maximum in-band peak level.

Note: Duty Cycle Correction Factor (DCCF) is used in accordance with ANSI C63.10 clause 11.12.2.5.2 and KDB 558074 D01 15.247 Meas Guidance v05r02 Clause 11 Answer 3 measurement technique c. Tests were performed using a maximum achievable duty cycle of 95.2% for which a correction factor of 0.21dB was added to get to the levels that would have been measured had the tests been performed using 100% duty cycle. Then, based on FCC 15.35(c), a correction factor of -28.1dB was applied to the RMS average measurements to account for the 3.93% protocol limited duty cycle of normal BLE operation. KDB 558074 D01 15.247 Meas Guidance v05r02 Clause 11 Answer 3 allows for the use of this adjustment provided the following conditions are met:

- 1) the spurious emission falls in restricted bands,
- 2) the emissions are temporally related to the fundamental,
- 3) the maximum duty cycle used in determining the reduction factor is “hardwired” such that under no condition can it be changed or modified by either the device or the end user,
- 4) a documented justification for use of Section 15.35(c) including the measurements used to determine the worst-case duty cycle must be included in the test report, and
- 5) the duty cycle correction factor is the worst-case operational duty cycle based on the maximum transmission time in any 100 msec period.

These conditions are all met. Duty cycle measurements are located in Appendix A.

8.2 Test Method

Field strength measurements were performed at the restricted band edges of 2390MHz and 2483.5MHz. Measurements were made using the conducted methods defined in ANSI C63.10: 2013 clause 11.12.

Offset Calculations:

Offset calculations so that conducted measurements on the spectrum analyzer in dBμV represent field strength measurements in dBμV/m.

$$\text{Offset} = -20\log(D) + 104.8 - 107 + \text{CL} + \text{DC} + \text{AG}$$

$$\text{Offset}_{3m} = -11.7 + \text{CL} + \text{DC} + \text{AG}$$

D = 3m Distance
CL = 0.64 dB Cable Loss
DC = 0.21 dB (95.2%) Duty Cycle Correction Factor
AG = 7 dB Antenna Gain

$$\text{Offset} = -3.85 \text{ dB}$$

9.2 Test Method

With the receiver's resolution bandwidth set to 9 kHz, exploratory scans were performed over the measuring frequency range (0.15 MHz to 30 MHz) using a max hold mode incorporating a Peak detector and Average detector and using the TILE! software. The final test data was measured using a Quasi-Peak detector and Average detector and compared against the limits indicated in the table below. The FCC 15.207 and RSS-GEN S8.8 limits are the same as the Class B limits shown below.

Appendix A: Duty-Cycle Calculations

The client states that in normal operation the Bluetooth LE radio will transmit at a maximum duty cycle equal to the combined duty cycles of the three advertising channels of the test sample they sent. Shown below is a sample measurement of the duty cycle of one of these advertising channels.

Date: 18.JAN.2019 17:51:19

Data analysis of several 100ms trace captures such as the one shown above reveals the following worst-case results: 1.31ms of total on-time and 98.69ms of off-time. This on-time is multiplied by three to get 3.93ms of total on-time in a 100ms period for the combination of the three advertising channels. This results in a total maximum duty cycle of 3.93%. So the duty cycle correction factor (DCCF) to be applied to the field strength measurements would be $20 \cdot \log_{10}(0.0393) = -28.1\text{dB}$.
