# Contents

**PART 1: Setup and Troubleshooting . . . . . 128**

**Chapter 1: CLI Navigation Commands . . . . . 129**

Introduction . . . . . 129
configure terminal . . . . . 130
disable (Privileged Exec mode) . . . . . 131
do . . . . . 132
enable (Privileged Exec mode) . . . . . 133
end . . . . . 135
exit . . . . . 136
help . . . . . 137
logout . . . . . 138
show history . . . . . 139

**Chapter 2: Device GUI and Vista Manager EX Commands . . . . . 140**

Introduction . . . . . 140
atmf topology-gui enable . . . . . 141
http log webapi-requests . . . . . 142
http port . . . . . 143
http secure-port . . . . . 144
http trustpoint . . . . . 145
log event-host . . . . . 147
service http . . . . . 148
show http . . . . . 149
update webgui now . . . . . 150

**Chapter 3: File and Configuration Management Commands . . . . . 151**

Introduction . . . . . 151
autoboot enable . . . . . 155
boot config-file . . . . . 156
boot config-file backup . . . . . 158
boot system . . . . . 159
boot system backup . . . . . 161

cd . . . . . 162
copy (filename) . . . . . 163
copy debug . . . . . 165
copy running-config . . . . . 166
copy startup-config . . . . . 167
copy zmodem . . . . . 168
create autoboot . . . . . 169
delete . . . . . 170
delete debug . . . . . 171
dir . . . . . 172
edit . . . . . 174
edit (filename) . . . . . 175
erase factory-default . . . . . 176
erase startup-config . . . . . 177
ip tftp source-interface . . . . . 178
ipv6 tftp source-interface . . . . . 179
mkdir . . . . . 180
move . . . . . 181
move debug . . . . . 182
pwd . . . . . 183
rmdir . . . . . 184
show autoboot . . . . . 185
show boot . . . . . 186
show file . . . . . 188
show file systems . . . . . 189
show running-config . . . . . 191
show running-config interface . . . . . 194
show startup-config . . . . . 197
show version . . . . . 198
unmount . . . . . 199
write file . . . . . 200
write memory . . . . . 201
write terminal . . . . . 202

**Chapter 4: User Access Commands . . . . . 203**

Introduction . . . . . 203
aaa authentication enable default local . . . . . 205
aaa local authentication attempts lockout-time . . . . . 206
aaa local authentication attempts max-fail . . . . . 207
aaa login fail-delay . . . . . 208
clear aaa local user lockout . . . . . 209
clear line console . . . . . 210
clear line vty . . . . . 211
enable password . . . . . 212
enable secret (deprecated) . . . . . 215
exec-timeout . . . . . 216
flowcontrol hardware (asyn/console) . . . . . 218
length (asyn) . . . . . 220
line . . . . . 221
privilege level . . . . . 223
security-password history . . . . . 224
security-password forced-change . . . . . 225
security-password lifetime . . . . . 226

security-password min-lifetime-enforce . . . . . 227
security-password minimum-categories . . . . . 228
security-password minimum-length . . . . . 229
security-password reject-expired-pwd . . . . . 230
security-password warning . . . . . 231
service advanced-vty . . . . . 232
service password-encryption . . . . . 233
service telnet . . . . . 234
service terminal-length (deleted) . . . . . 235
show aaa local user locked . . . . . 236
show privilege . . . . . 237
show security-password configuration . . . . . 238
show security-password user . . . . . 239
show telnet . . . . . 240
show users . . . . . 241
telnet . . . . . 242
telnet server . . . . . 243
terminal length . . . . . 244
terminal resize . . . . . 245
username . . . . . 246

**Chapter 5: Subscription Licensing Commands . . . . . 248**
Introduction . . . . . 248
license update file . . . . . 249
license update online . . . . . 250
show license external . . . . . 252

**Chapter 6: Update Manager Commands . . . . . 253**
Introduction . . . . . 253
show resource . . . . . 254
update now . . . . . 256
update webgui now . . . . . 258

**Chapter 7: Web Redirect Commands . . . . . 259**
Introduction . . . . . 259
browser-only (web-redirect) . . . . . 260
enable (web-redirect) . . . . . 261
exclude app . . . . . 262
exclude ip . . . . . 264
exclude mac . . . . . 265
exclude url . . . . . 266
idle-time (web-redirect) . . . . . 268
mode (web-redirect) . . . . . 270
proxy-host (web-redirect) . . . . . 272
repeat-time (web-redirect) . . . . . 274
server-url (web-redirect) . . . . . 275
show running-config web-redirect . . . . . 276
show web-redirect . . . . . 277
web-redirect . . . . . 278

**Chapter 8: System Configuration and Monitoring Commands . . . . . 279**
Introduction . . . . . 279

banner display external-manager . . . . . 281
banner exec . . . . . 282
banner external-manager . . . . . 284
banner login (system) . . . . . 286
banner motd . . . . . 288
clock set . . . . . 290
clock summer-time date . . . . . 291
clock summer-time recurring . . . . . 293
clock timezone . . . . . 295
debug core-file . . . . . 296
hostname . . . . . 297
max-fib-routes . . . . . 299
max-static-routes . . . . . 301
no debug all . . . . . 302
reboot . . . . . 304
receive-packet-scheduler . . . . . 305
reload . . . . . 307
show banner external-manager . . . . . 308
show clock . . . . . 309
show cpu . . . . . 311
show cpu history . . . . . 314
show debugging . . . . . 316
show interface memory . . . . . 317
show memory . . . . . 319
show memory allocations . . . . . 321
show memory history . . . . . 323
show memory pools . . . . . 324
show memory shared . . . . . 325
show process . . . . . 326
show reboot history . . . . . 328
show router-id . . . . . 329
show system . . . . . 330
show system environment . . . . . 331
show system environment counters . . . . . 332
show system interrupts . . . . . 334
show system mac . . . . . 335
show system pci device . . . . . 336
show system pci tree . . . . . 337
show system serialnumber . . . . . 338
show tech-support . . . . . 339
speed (asyn) . . . . . 341
terminal monitor . . . . . 343
undebug all . . . . . 344

**Chapter 9: Pluggables and Cabling Commands . . . . . 345**

Introduction . . . . . 345
clear fiber-monitoring interface . . . . . 346
debug fiber-monitoring . . . . . 347
fiber-monitoring action . . . . . 349
fiber-monitoring baseline . . . . . 351
fiber-monitoring enable . . . . . 353
fiber-monitoring interval . . . . . 354
fiber-monitoring sensitivity . . . . . 355

show system fiber-monitoring . . . . . 357
show system pluggable . . . . . 360
show system pluggable detail . . . . . 362
show system pluggable diagnostics . . . . . 365

**Chapter 10: Logging Commands . . . . . 367**
Introduction . . . . . 367
clear exception log . . . . . 370
clear log . . . . . 371
clear log buffered . . . . . 372
clear log external . . . . . 373
clear log permanent . . . . . 374
connection-log events . . . . . 375
copy buffered-log . . . . . 376
copy permanent-log . . . . . 377
default log buffered . . . . . 378
default log console . . . . . 379
default log email . . . . . 380
default log external . . . . . 381
default log host . . . . . 382
default log monitor . . . . . 383
default log permanent . . . . . 384
log buffered . . . . . 385
log buffered (filter) . . . . . 386
log buffered exclude . . . . . 389
log buffered size . . . . . 392
log console . . . . . 393
log console (filter) . . . . . 394
log console exclude . . . . . 397
log date-format . . . . . 400
log email . . . . . 401
log email (filter) . . . . . 402
log email exclude . . . . . 405
log email time . . . . . 408
log external . . . . . 410
log external (filter) . . . . . 412
log external exclude . . . . . 415
log external rotate . . . . . 418
log external size . . . . . 420
log facility . . . . . 421
log host . . . . . 423
log host (filter) . . . . . 425
log host exclude . . . . . 428
log host source . . . . . 431
log host startup-delay . . . . . 432
log host time . . . . . 434
log monitor (filter) . . . . . 436
log monitor exclude . . . . . 439
log permanent . . . . . 442
log permanent (filter) . . . . . 443
log permanent exclude . . . . . 446
log permanent size . . . . . 449
log-rate-limit nsm . . . . . 450

log trustpoint . . . . . 451
log url-requests . . . . . 452
show connection-log events . . . . . 453
show counter log . . . . . 454
show exception log . . . . . 455
show log . . . . . 456
show log config . . . . . 458
show log external . . . . . 460
show log permanent . . . . . 461
show running-config log . . . . . 462
unmount . . . . . 463

**Chapter 11: Scripting Commands . . . . . 464**
Introduction . . . . . 464
activate . . . . . 465
echo . . . . . 466
wait . . . . . 467

**Chapter 12: Interface Commands . . . . . 468**
Introduction . . . . . 468
description (interface) . . . . . 469
interface (to configure) . . . . . 470
ip tcp adjust-mss . . . . . 472
ipv6 tcp adjust-mss . . . . . 474
mru jumbo . . . . . 476
mtu . . . . . 477
service statistics interfaces counter . . . . . 479
show interface . . . . . 480
show interface brief . . . . . 484
show interface memory . . . . . 485
show interface status . . . . . 487
shutdown . . . . . 489

**Chapter 13: USB Cellular Modem Commands . . . . . 490**
Introduction . . . . . 490
apn . . . . . 491
chat-script . . . . . 493
cid . . . . . 494
encapsulation ppp . . . . . 495
show cellular . . . . . 497
show system usb . . . . . 500
usb mode-switch . . . . . 502

**Chapter 14: Port Mirroring Commands . . . . . 504**
Introduction . . . . . 504
mirror interface . . . . . 505
show mirror . . . . . 507
show mirror interface . . . . . 508

**Chapter 15: Container Services Commands . . . . . 509**
Introduction . . . . . 509

compute . . . 511
container-services . . . 513
enable (container-services) . . . 515
image . . . 516
image-check-interval . . . 518
instance (container-services) . . . 520
ip (container-services-inst-network) . . . 522
ip name-server (container-services-inst) . . . 524
limit cpus . . . 526
limit memory . . . 528
mac-address (container-services-inst-network) . . . 530
network (container-services-inst) . . . 532
restore . . . 534
shared-interface . . . 536
show container-services . . . 538
show container-services debug . . . 541
show running-config container-services . . . 542
start . . . 544
storage size . . . 545
vlan-id . . . 547

**PART 2: Interfaces and Layer 2 . . . 549**

**Chapter 16: Switching Commands . . . 550**
Introduction . . . 550
backpressure . . . 552
clear mac address-table dynamic . . . 554
clear mac address-table static . . . 555
clear port counter . . . 556
debug platform packet . . . 557
duplex . . . 559
flowcontrol (switch port) . . . 560
linkflap action . . . 562
mac address-table acquire . . . 563
mac address-table ageing-time . . . 564
mac address-table static . . . 565
platform multicast-ratelimit . . . 566
polarity . . . 567
show debugging platform packet . . . 568
show flowcontrol interface . . . 569
show interface err-disabled . . . 570
show interface switchport . . . 571
show mac address-table . . . 572
show platform . . . 574
show platform port . . . 576
show storm-control . . . 578
speed . . . 579
storm-control level . . . 581
undebug platform packet . . . 582

**Chapter 17: Bridging Commands . . . 583**
Introduction . . . 583

ageing-time . . . . . 585
bridge . . . . . 586
bridge-group . . . . . 587
clear mac-filter counter . . . . . 589
default-action . . . . . 590
default-protocol-action . . . . . 592
l3-filtering enable . . . . . 593
mac-filter-group egress . . . . . 594
mac-filter . . . . . 595
mac-filter-group . . . . . 596
mac-learning . . . . . 597
protocol ethii (macfilter) . . . . . 598
protocol novell (macfilter) . . . . . 600
protocol sap (macfilter) . . . . . 602
protocol snap (macfilter) . . . . . 604
rule (macfilter) . . . . . 606
rule ip (macfilter) . . . . . 608
rule ipv6 (macfilter) . . . . . 610
show bridge . . . . . 612
show bridge macaddr . . . . . 614
show mac-filter . . . . . 615

**Chapter 18: VLAN Commands . . . . . 617**
Introduction . . . . . 617
show vlan . . . . . 618
switchport access vlan . . . . . 619
switchport mode access . . . . . 620
switchport mode trunk . . . . . 621
switchport trunk allowed vlan . . . . . 622
switchport trunk native vlan . . . . . 625
switchport voice dscp . . . . . 626
switchport voice vlan . . . . . 627
switchport voice vlan priority . . . . . 629
vlan . . . . . 630
vlan database . . . . . 632

**Chapter 19: Spanning Tree Commands . . . . . 633**
Introduction . . . . . 633
clear spanning-tree statistics . . . . . 635
clear spanning-tree detected protocols (RSTP and MSTP) . . . . . 636
debug mstp (RSTP and STP) . . . . . 637
instance priority (MSTP) . . . . . 641
instance vlan (MSTP) . . . . . 643
region (MSTP) . . . . . 645
revision (MSTP) . . . . . 646
show debugging mstp . . . . . 647
show spanning-tree . . . . . 648
show spanning-tree brief . . . . . 651
show spanning-tree mst . . . . . 652
show spanning-tree mst config . . . . . 653
show spanning-tree mst detail . . . . . 654
show spanning-tree mst detail interface . . . . . 656

show spanning-tree mst instance . . . . . 658
show spanning-tree mst instance interface . . . . . 659
show spanning-tree mst interface . . . . . 660
show spanning-tree statistics . . . . . 661
show spanning-tree statistics instance . . . . . 663
show spanning-tree statistics instance interface . . . . . 664
show spanning-tree statistics interface . . . . . 666
show spanning-tree vlan range-index . . . . . 668
spanning-tree autoedge (RSTP and MSTP) . . . . . 669
spanning-tree cisco-interoperability (MSTP) . . . . . 670
spanning-tree edgeport (RSTP and MSTP) . . . . . 671
spanning-tree enable . . . . . 672
spanning-tree errdisable-timeout enable . . . . . 674
spanning-tree errdisable-timeout interval . . . . . 675
spanning-tree force-version . . . . . 676
spanning-tree forward-time . . . . . 677
spanning-tree guard root . . . . . 678
spanning-tree hello-time . . . . . 679
spanning-tree link-type . . . . . 680
spanning-tree max-age . . . . . 681
spanning-tree max-hops (MSTP) . . . . . 682
spanning-tree mode . . . . . 683
spanning-tree mst configuration . . . . . 684
spanning-tree mst instance . . . . . 685
spanning-tree mst instance path-cost . . . . . 686
spanning-tree mst instance priority . . . . . 688
spanning-tree mst instance restricted-role . . . . . 689
spanning-tree mst instance restricted-tcn . . . . . 691
spanning-tree path-cost . . . . . 692
spanning-tree portfast (STP) . . . . . 693
spanning-tree portfast bpdu-filter . . . . . 695
spanning-tree portfast bpdu-guard . . . . . 697
spanning-tree priority (bridge priority) . . . . . 699
spanning-tree priority (port priority) . . . . . 700
spanning-tree restricted-role . . . . . 701
spanning-tree restricted-tcn . . . . . 702
spanning-tree transmit-holdcount . . . . . 703
undebug mstp . . . . . 704

**Chapter 20: Link Aggregation Commands . . . . . 705**

Introduction . . . . . 705
channel-group . . . . . 707
clear lacp counters . . . . . 709
debug lacp . . . . . 710
lacp global-passive-mode enable . . . . . 711
lacp port-priority . . . . . 712
lacp system-priority . . . . . 713
lacp timeout . . . . . 714
show debugging lacp . . . . . 716
show diagnostic channel-group . . . . . 717
show etherchannel . . . . . 718
show etherchannel detail . . . . . 719
show etherchannel summary . . . . . 720

show lacp sys-id . . . . . 721
show lacp-counter . . . . . 722
show port etherchannel . . . . . 723
show static-channel-group . . . . . 724
static-channel-group . . . . . 725
undebug lacp . . . . . 727

**Chapter 21: 802.1Q Encapsulation Commands . . . . . 728**
Introduction . . . . . 728
encapsulation dot1q . . . . . 729

**Chapter 22: PPP Commands . . . . . 731**
Introduction . . . . . 731
debug ppp . . . . . 733
encapsulation ppp . . . . . 736
interface (PPP) . . . . . 738
ip address negotiated . . . . . 739
ip tcp adjust-mss . . . . . 741
ip unnumbered . . . . . 743
ipv6 tcp adjust-mss . . . . . 745
keepalive (PPP) . . . . . 747
mtu (PPP) . . . . . 749
peer default ip address . . . . . 750
peer neighbor-route . . . . . 752
ppp authentication . . . . . 754
ppp authentication refuse . . . . . 756
ppp hostname . . . . . 758
ppp ipcp dns . . . . . 760
ppp ipcp dns suffix-list . . . . . 762
ppp ipcp ip-override . . . . . 764
ppp password . . . . . 765
ppp service-name (PPPoE) . . . . . 766
ppp timeout idle . . . . . 767
ppp username . . . . . 768
show debugging ppp . . . . . 769
show interface (PPP) . . . . . 770
undebug ppp . . . . . 774

**Chapter 23: PPP over Ethernet (PPPoE) Commands . . . . . 775**
Introduction . . . . . 775
clear pppoe-ac statistics . . . . . 777
client (pppoe-relay) . . . . . 778
debug pppoe-ac . . . . . 779
destination l2tp . . . . . 780
l2tp peer-address dns-lookup . . . . . 781
l2tp peer-address radius-lookup group . . . . . 783
l2tp peer-address static . . . . . 784
l2tp profile . . . . . 786
max-sessions . . . . . 788
ppp-auth-protocol . . . . . 789
pppoe-ac . . . . . 790
pppoe-ac-service . . . . . 791

pppoe-relay . . . . . 792
proxy-auth . . . . . 793
server (pppoe-relay) . . . . . 794
service-name . . . . . 795
show debugging pppoe ac . . . . . 797
show pppoe-ac config-check . . . . . 798
show pppoe-ac connections . . . . . 800
show pppoe-ac statistics . . . . . 802
show running-config pppoe-ac . . . . . 805
show running-config pppoe-relay . . . . . 806
timeout (pppoe-relay) . . . . . 807

**PART 3: Routing . . . . . 808**

**Chapter 24: IP Addressing and Protocol Commands . . . . . 809**
Introduction . . . . . 809
arp-aging-timeout . . . . . 811
arp . . . . . 812
arp log . . . . . 814
arp opportunistic-nd . . . . . 817
arp-reply-bc-dmac . . . . . 819
clear arp-cache . . . . . 820
debug ip packet interface . . . . . 822
ip address (IP Addressing and Protocol) . . . . . 824
ip directed-broadcast . . . . . 826
ip forwarding . . . . . 828
ip forward-protocol udp . . . . . 829
ip gratuitous-arp-link . . . . . 831
ip helper-address . . . . . 833
ip icmp error-interval . . . . . 835
ip limited-local-proxy-arp . . . . . 836
ip local-proxy-arp . . . . . 838
ip proxy-arp . . . . . 839
ip redirects . . . . . 840
ip tcp synack-retries . . . . . 841
ip tcp timeout established . . . . . 842
ip unreachables . . . . . 843
local-proxy-arp . . . . . 845
optimistic-nd . . . . . 846
ping . . . . . 847
show arp . . . . . 849
show debugging ip packet . . . . . 851
show ip flooding-nexthops . . . . . 852
show ip forwarding . . . . . 853
show ip interface . . . . . 854
show ip interface vrf . . . . . 855
show ip sockets . . . . . 857
show ip traffic . . . . . 860
tcpdump . . . . . 862
traceroute . . . . . 863
undebug ip packet interface . . . . . 864

**Chapter 25: Domain Name Service (DNS) Commands . . . . . 865**
Introduction . . . . . 865
accept-invalid-sslcert . . . . . 868
clear ip dns forwarding cache . . . . . 869
custom-failure . . . . . 870
custom-success . . . . . 871
ddns enable . . . . . 872
ddns-update-method . . . . . 873
ddns-update now . . . . . 875
debug ddns . . . . . 876
debug ip dns forwarding . . . . . 877
description (domain-list) . . . . . 878
domain . . . . . 879
expect-html-response . . . . . 880
follow-redirects . . . . . 881
get-before-submit . . . . . 882
get-params . . . . . 883
host-name (ddns-update-method) . . . . . 884
ip ddns-update-method . . . . . 885
ip dns forwarding . . . . . 886
ip dns forwarding cache . . . . . 887
ip dns forwarding dead-time . . . . . 889
ip dns forwarding domain-list . . . . . 890
ip dns forwarding retry . . . . . 891
ip dns forwarding source-interface . . . . . 892
ip dns forwarding timeout . . . . . 893
ip domain-list . . . . . 894
ip domain-lookup . . . . . 895
ip domain-name . . . . . 897
ip name-server . . . . . 898
ip name-server preferred-order . . . . . 900
ipv6 ddns-update-method . . . . . 901
obey-form . . . . . 902
password (ddns-update-method) . . . . . 903
ppp ipcp dns . . . . . 904
ppp ipcp dns suffix-list . . . . . 906
retry-interval . . . . . 908
show ddns-update-method status . . . . . 909
show debugging ip dns forwarding . . . . . 910
show hosts . . . . . 911
show ip dns forwarding . . . . . 912
show ip dns forwarding cache . . . . . 913
show ip dns forwarding server . . . . . 915
show ip domain-list . . . . . 917
show ip domain-name . . . . . 918
show ip name-server . . . . . 919
suppress-ipv4-updates . . . . . 921
undebug ddns . . . . . 922
update-interval (ddns-update-method) . . . . . 923
update-url (ddns-update-method) . . . . . 924
use-ipv4-for-ipv6-updates . . . . . 927
username (ddns-update-method) . . . . . 928

**Chapter 26: IPv6 Commands . . . . . 929**
Introduction . . . . . 929
clear ipv6 neighbors . . . . . 931
ipv6 address . . . . . 932
ipv6 address autoconfig . . . . . 934
ipv6 address suffix . . . . . 936
ipv6 enable . . . . . 937
ipv6 eui64-linklocal . . . . . 939
ipv6 forwarding . . . . . 940
ipv6 icmp error-interval . . . . . 941
ipv6 multicast forward-slow-path-packet . . . . . 942
ipv6 multihoming . . . . . 943
ipv6 nd accept-ra-default-routes . . . . . 944
ipv6 nd accept-ra-pinfo . . . . . 945
ipv6 nd current-hoplimit . . . . . 946
ipv6 nd dns search-list . . . . . 948
ipv6 nd dns-server . . . . . 949
ipv6 nd managed-config-flag . . . . . 951
ipv6 nd minimum-ra-interval . . . . . 952
ipv6 nd other-config-flag . . . . . 954
ipv6 nd prefix . . . . . 955
ipv6 nd proxy interface . . . . . 957
ipv6 nd ra-interval . . . . . 959
ipv6 nd ra-lifetime . . . . . 960
ipv6 nd reachable-time . . . . . 962
ipv6 nd retransmission-time . . . . . 964
ipv6 nd route-information . . . . . 966
ipv6 nd router-preference . . . . . 967
ipv6 nd suppress-ra . . . . . 968
ipv6 neighbor . . . . . 969
ipv6 opportunistic-nd . . . . . 970
ipv6 route . . . . . 971
ipv6 unreachables . . . . . 973
optimistic-nd . . . . . 974
ping ipv6 . . . . . 975
show ipv6 forwarding . . . . . 977
show ipv6 interface . . . . . 978
show ipv6 neighbors . . . . . 980
show ipv6 route . . . . . 981
show ipv6 route summary . . . . . 983
traceroute ipv6 . . . . . 984

**Chapter 27: Routing Commands . . . . . 985**
Introduction . . . . . 985
ip route . . . . . 986
ipv6 route . . . . . 989
max-fib-routes . . . . . 991
max-static-routes . . . . . 993
maximum-paths . . . . . 994
show ip route . . . . . 995
show ip route database . . . . . 998
show ip route summary . . . . . 1001

show ipv6 route . . . . . 1003
show ipv6 route summary . . . . . 1005

**Chapter 28: RIP Commands . . . . . 1006**
Introduction . . . . . 1006
accept-lifetime . . . . . 1008
address-family ipv4 (RIP) . . . . . 1010
alliedware-behavior . . . . . 1011
cisco-metric-behavior (RIP) . . . . . 1013
clear ip rip route . . . . . 1014
debug rip . . . . . 1016
default-information originate (RIP) . . . . . 1017
default-metric (RIP) . . . . . 1018
distance (RIP) . . . . . 1019
distribute-list (RIP) . . . . . 1020
fullupdate (RIP) . . . . . 1021
ip summary-address rip . . . . . 1022
ip prefix-list . . . . . 1023
ip rip authentication key-chain . . . . . 1025
ip rip authentication mode . . . . . 1027
ip rip authentication string . . . . . 1029
ip rip receive-packet . . . . . 1031
ip rip receive version . . . . . 1032
ip rip send-packet . . . . . 1033
ip rip send version . . . . . 1034
ip rip send version 1-compatible . . . . . 1036
ip rip split-horizon . . . . . 1037

host (network) . . . 3471
icmp-code . . . 3473
icmp-type . . . 3475

ip address (host) . . . 3477
ip subnet . . . 3479
ipv6 address (host) . . . 3481
ipv6 subnet . . . 3483
network (zone) . . . 3485
protocol . . . 3487
show application . . . 3488
show application detail . . . 3489
show entity . . . 3492
sport . . . 3495
zone . . . 3497

**Chapter 68: NAT Commands . . . 3499**
Introduction . . . 3499
enable (nat) . . . 3501
ip limited-local-proxy-arp . . . 3502
local-proxy-arp . . . 3504
move rule (nat) . . . 3505
nat . . . 3506
rule (nat) . . . 3507
show nat . . . 3511
show nat rule . . . 3512
show nat rule config-check . . . 3514
show running-config nat . . . 3515

**PART 9: Advanced Network Protection . . . 3516**

**Chapter 69: IPS Commands . . . 3517**
Introduction . . . 3517
alert-thresholding . . . 3518
category action (IPS) . . . 3519
ips . . . 3520
protect (IPS) . . . 3521
show ips . . . 3522
show ips categories . . . 3523
show running-config ips . . . 3525

**Chapter 70: Malware Protection Commands . . . 3526**
Introduction . . . 3526
malware-protection . . . 3527
protect (malware) . . . 3528
provider kaspersky (malware) . . . 3529
show malware-protection . . . 3530
show running-config malware-protection . . . 3531
update-interval (malware) . . . 3532

**Chapter 71: Antivirus Commands . . . 3534**
Introduction . . . 3534
action (antivirus) . . . 3536
antivirus . . . 3538
debug antivirus . . . 3539

protect (antivirus) . . . 3540
provider kaspersky (antivirus) . . . 3541
show antivirus . . . 3542
show antivirus statistics . . . 3543
show debugging antivirus . . . 3544
show running-config antivirus . . . 3545
update-interval (antivirus) . . . 3546

**Chapter 72: URL Filtering Commands . . . 3548**
Introduction . . . 3548
blacklist . . . 3550
log url-requests . . . 3552
protect (url-filter) . . . 3553
provider kaspersky (url-filter) . . . 3554
show running-config url-filter . . . 3555
show url-filter . . . 3556
update-interval (url-filter) . . . 3557
url-filter reload custom-lists . . . 3559
url-filter . . . 3560
whitelist (url-filter) . . . 3561

**Chapter 73: Web Control Commands . . . 3563**
Introduction . . . 3563
action (web-control) . . . 3565
bypass-web-control entity . . . 3566
category (web-control) . . . 3568
debug web-control . . . 3570
match (web-control) . . . 3571
move rule (web-control) . . . 3573
protect (web-control) . . . 3574
provider digitalarts (web-control) . . . 3575
rule (web-control) . . . 3576
show debugging web-control . . . 3579
show running-config web-control . . . 3580
show web-control . . . 3581
show web-control bypass . . . 3583
show web-control categories . . . 3584
show web-control rules . . . 3586
web-control . . . 3587
web-control categorize . . . 3589

**Chapter 74: Application Awareness Commands . . . 3590**
Introduction . . . 3590
counters detailed . . . 3591
dpi . . . 3592
enable (dpi) . . . 3593
provider (dpi) . . . 3595
show dpi . . . 3596
show dpi statistics . . . 3598
show running-config dpi . . . 3600
update-interval (dpi) . . . 3601

**Chapter 75: IP Reputation Commands . . . . . 3602**
Introduction . . . . . 3602
category action (IP Reputation) . . . . . 3604
ip-reputation . . . . . 3606
protect (IP Reputation) . . . . . 3607
provider proofpoint (IP Reputation) . . . . . 3608
show ip-reputation . . . . . 3609
show ip-reputation categories . . . . . 3610
show running-config ip-reputation . . . . . 3612
update-interval (IP Reputation) . . . . . 3613
whitelist (IP Reputation) . . . . . 3615

**Chapter 76: Unified Threat Management (UTM) Offload Commands . . . . . 3616**
Introduction . . . . . 3616
show resource . . . . . 3617
show utm-offload . . . . . 3619
utm-offload interface subnet . . . . . 3620
utm-offload update-interval . . . . . 3622

**Chapter 77: URL Offload Commands . . . . . 3623**
Introduction . . . . . 3623
endpoint-source . . . . . 3625
entry (endpoint-manual) . . . . . 3627
exclude-entry (endpoint-manual) . . . . . 3629
exclude-entry (endpoint-office365) . . . . . 3631
filter-endpoint . . . . . 3633
filter-endpoint include all . . . . . 3636
filter-entry exclude . . . . . 3638
filter-entry exclude type . . . . . 3640
pac-file http-server port . . . . . 3642
pac-file proxy-address . . . . . 3644
pac-file template . . . . . 3645
parser-updates enable . . . . . 3647
parser-updates interval . . . . . 3648
service url-offload . . . . . 3649
show running-config url-offload . . . . . 3650
show url-offload endpoint-source . . . . . 3651
show url-offload endpoint-source manual entries . . . . . 3652
show url-offload endpoint-source office365 entries . . . . . 3654
show url-offload endpoint-source office365 raw-data . . . . . 3657
show url-offload pac-file . . . . . 3660
show url-offload pac-file template . . . . . 3664
update-interval (endpoint-office365) . . . . . 3666
url (endpoint office365) . . . . . 3667
url-offload . . . . . 3668
url-offload update-now . . . . . 3669

**PART 10: Virtual Private Networks (VPNs) . . . . . 3670**

**Chapter 78: IPsec Commands . . . . . 3671**
Introduction . . . . . 3671
clear isakmp sa . . . . . 3673

crypto ipsec profile . . . 3674
crypto isakmp key . . . 3676
crypto isakmp peer . . . 3679
crypto isakmp profile . . . 3681
debug isakmp . . . 3683
dpd-interval . . . 3685
dpd-timeout . . . 3686
interface tunnel (IPsec) . . . 3687
lifetime (IPsec Profile) . . . 3688
lifetime (ISAKMP Profile) . . . 3689
no debug isakmp . . . 3690
pfs . . . 3691
rekey . . . 3693
show debugging isakmp . . . 3694
show interface tunnel (IPsec) . . . 3695
show ipsec counters . . . 3696
show ipsec peer . . . 3697
show ipsec policy . . . 3698
show ipsec profile . . . 3699
show ipsec sa . . . 3701
show isakmp counters . . . 3702
show isakmp key (IPsec) . . . 3703
show isakmp peer . . . 3704
show isakmp profile . . . 3705
show isakmp sa . . . 3707
transform (IPsec Profile) . . . 3708
transform (ISAKMP Profile) . . . 3709
tunnel destination (IPsec) . . . 3711
tunnel local name (IPsec) . . . 3713
tunnel local selector . . . 3714
tunnel mode ipsec . . . 3716
tunnel oper-status-control . . . 3717
tunnel protection ipsec (IPsec) . . . 3720
tunnel remote name (IPsec) . . . 3721
tunnel remote selector . . . 3722
tunnel security-reprocessing . . . 3724
tunnel selector paired . . . 3725
tunnel source (IPsec) . . . 3726
undebug isakmp . . . 3728
version (ISAKMP) . . . 3729

**Chapter 79: GRE Tunneling Commands . . . 3730**

Introduction . . . 3730
interface tunnel (GRE) . . . 3731
local authentication . . . 3732
remote authentication . . . 3734
show interface tunnel (GRE) . . . 3736
tunnel checksum . . . 3737
tunnel dscp . . . 3738
tunnel destination (GRE) . . . 3739
tunnel endpoint . . . 3741
tunnel local name (GRE) . . . 3743
tunnel mode gre . . . 3744

tunnel mode gre multipoint . . . 3745
tunnel protection ipsec (GRE) . . . 3746
tunnel remote name (GRE) . . . 3747
tunnel security-reprocessing . . . 3748
tunnel source (GRE) . . . 3749
tunnel ttl . . . 3751

**Chapter 80: OpenVPN Commands . . . 3752**
Introduction . . . 3752
ip tcp adjust-mss . . . 3754
ipv6 tcp adjust-mss . . . 3756
show interface tunnel (OpenVPN) . . . 3758
show openvpn connections . . . 3759
show openvpn connections detail . . . 3760
tunnel openvpn tls-version-min . . . 3761
tunnel openvpn authentication . . . 3762
tunnel openvpn cipher . . . 3763
tunnel mode openvpn tap . . . 3765
tunnel mode openvpn tun . . . 3766
tunnel openvpn expiry-bytes . . . 3767
tunnel openvpn expiry-seconds . . . 3768
tunnel openvpn port . . . 3769
tunnel openvpn tagging . . . 3770
tunnel security-reprocessing . . . 3771

**Chapter 81: L2TPv2 PPP Commands . . . 3772**
Introduction . . . 3772
debug l2tp . . . 3774
destination . . . 3775
encapsulation ppp . . . 3776
ip-version . . . 3778
l2tp tunnel . . . 3779
l2tp unmanaged port . . . 3781
l2tp-profile . . . 3782
local-subaddress . . . 3783
protection ipsec . . . 3784
protection local-name . . . 3785
protection profile . . . 3787
protection remote-name . . . 3788
remote-subaddress . . . 3790
shared-secret . . . 3791
show debugging l2tp . . . 3792
show l2tp session . . . 3793
show l2tp tunnel . . . 3795
show l2tp tunnel config-check . . . 3799
show running-config l2tp-profile . . . 3801
show running-config l2tp-tunnel . . . 3802
source . . . 3803
version . . . 3804

**Chapter 82: L2TPv3 Ethernet Pseudowire Commands . . . 3805**
Introduction . . . 3805

interface tunnel (L2TPv3) . . . 3806
l2tp unmanaged port . . . 3807
show interface tunnel (L2TPv3) . . . 3808
tunnel destination (L2TPv3) . . . 3809
tunnel df . . . 3811
tunnel local id . . . 3812
tunnel mode l2tp v3 . . . 3813
tunnel protection ipsec . . . 3814
tunnel remote id . . . 3815
tunnel security-reprocessing . . . 3816
tunnel source (L2TPv3) . . . 3817

**Chapter 83: Transitioning IPv4 to IPv6 Commands . . . 3819**
Introduction . . . 3819
br-address (softwire) . . . 3821
mesh-mode . . . 3822
method (softwire) . . . 3823
rule (softwire) . . . 3824
show running-config softwire-configuration . . . 3826
show softwire-configuration . . . 3827
softwire-configuration . . . 3829
tunnel security-reprocessing . . . 3830
tunnel destination (DS-Lite) . . . 3831
tunnel mode ds-lite . . . 3832
tunnel mode lw4o6 . . . 3833
tunnel mode map-e . . . 3834
tunnel softwire . . . 3835
upstream-interface . . . 3836

**Chapter 84: IPv6 Tunneling Commands . . . 3837**
Introduction . . . 3837
interface tunnel (IPv6) . . . 3838
ip address (IP Addressing and Protocol) . . . 3839
ip tcp adjust-mss . . . 3841
ipv6 address . . . 3843
ipv6 tcp adjust-mss . . . 3845
mtu . . . 3847
show interface tunnel (IPv6) . . . 3849
tunnel destination (IPv6) . . . 3850
tunnel dscp . . . 3852
tunnel mode (IPv6) . . . 3853
tunnel source (IPv6) . . . 3854
tunnel ttl . . . 3856

# List of Commands

# Part 1: Setup and Troubleshooting

# 1 CLI Navigation Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for the commands used to navigate between different modes. This chapter also provides a reference for the help and show commands used to help navigate within the CLI.

**Command List**

- "configure terminal" on page 130
- "disable (Privileged Exec mode)" on page 131
- "do" on page 132
- "enable (Privileged Exec mode)" on page 133
- "end" on page 135
- "exit" on page 136
- "help" on page 137
- "logout" on page 138
- "show history" on page 139

# configure terminal

**Overview** This command enters the Global Configuration command mode.

**Syntax**

```
configure terminal
```

**Mode** Privileged Exec

**Example** To enter the Global Configuration command mode (note the change in the command prompt), enter the command:

```
awplus# configure terminal
awplus(config)#
```

# disable (Privileged Exec mode)

**Overview** This command exits the Privileged Exec mode, returning the prompt to the User Exec mode. To end a session, use the exit command.

**Syntax**

```
disable
```

**Mode** Privileged Exec

**Example** To exit the Privileged Exec mode, enter the command:

```
awplus# disable
awplus>
```

**Related commands** enable (Privileged Exec mode)

end

exit

# do

**Overview** This command lets you to run User Exec and Privileged Exec mode commands when you are in any configuration mode.

**Syntax**

```
do <command>
```

| Parameter | Description |
|---|---|
| *<command>* | Specify the command and its parameters. |

**Mode** Any configuration mode

**Example**

```
awplus# configure terminal
awplus(config)# do ping 192.0.2.23
```

# enable (Privileged Exec mode)

**Overview** This command enters the Privileged Exec mode and optionally changes the privilege level for a session. If a privilege level is not specified then the maximum privilege level (15) is applied to the session. If the optional privilege level is omitted then only users with the maximum privilege level can access Privileged Exec mode without providing the password as specified by the enable password or enable secret (deprecated) commands. If no password is specified then only users with the maximum privilege level set with the username command can assess Privileged Exec mode.

**Syntax**

```
enable [<privilege-level>]
```

| Parameter | Description |
|---|---|
| *<privilege-level>* | Specify the privilege level for a CLI session in the range <1-15>, where 15 is the maximum privilege level, 7 is the intermediate privilege level and 1 is the minimum privilege level. The privilege level for a user must match or exceed the privilege level set for the CLI session for the user to access Privileged Exec mode. Privilege level for a user is configured by username. |

**Mode** User Exec

**Usage notes** Many commands are available from the Privileged Exec mode that configure operating parameters for the device, so you should apply password protection to the Privileged Exec mode to prevent unauthorized use. Passwords can be encrypted but then cannot be recovered. Note that non-encrypted passwords are shown in plain text in configurations.

The username command sets the privilege level for the user. After login, users are given access to privilege level 1. Users access higher privilege levels with the enable (Privileged Exec mode) command. If the privilege level specified is higher than the users configured privilege level specified by the username command, then the user is prompted for the password for that level.

Note that a separate password can be configured for each privilege level using the enable password and the enable secret (deprecated) commands from the Global Configuration mode. The service password-encryption command encrypts passwords configured by the enable password and the enable secret (deprecated) commands, so passwords are not shown in plain text in configurations.

**Example** The following example shows the use of the **enable** command to enter the Privileged Exec mode (note the change in the command prompt).

```
awplus> enable
awplus#
```

The following example shows the **enable** command enabling access the Privileged Exec mode for users with a privilege level of 7 or greater. Users with a privilege level of 7 or greater do not need to enter a password to access Privileged

Exec mode. Users with a privilege level 6 or less need to enter a password to access Privilege Exec mode. Use the enable password command or the enable secret (deprecated) commands to set the password to enable access to Privileged Exec mode.

```
awplus> enable 7
awplus#
```

**Related commands**

disable (Privileged Exec mode)

enable password

enable secret (deprecated)

exit

service password-encryption

username

# end

**Overview** This command returns the prompt to the Privileged Exec command mode, from any advanced command mode.

**Syntax**

```
end
```

**Mode** All advanced command modes, including Global Configuration and Interface Configuration modes.

**Example** The following example shows how to use the **end** command to return to the Privileged Exec mode directly from Interface Configuration mode.

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# end
awplus#
```

**Related commands**

disable (Privileged Exec mode)

enable (Privileged Exec mode)

exit

# exit

**Overview** This command exits the current mode, and returns the prompt to the mode at the previous level. When used in User Exec mode, the **exit** command terminates the session.

**Syntax**

```
exit
```

**Mode** All command modes, including Interface Configuration and Global Configuration modes.

**Example** The following example shows the use of the **exit** command to exit Interface Configuration mode and return to Global Configuration mode.

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# exit
awplus(config)#
```

**Related commands**

disable (Privileged Exec mode)

enable (Privileged Exec mode)

end

# help

**Overview** This command displays a description of the AlliedWare Plus™ OS help system.

**Syntax**

```
help
```

**Mode** All command modes

**Example** To display a description on how to use the system help, use the command:

```
awplus# help
```

**Output** Figure 1-1: Example output from the **help** command

```
When you need help at the command line, press '?'.

If nothing matches, the help list will be empty. Delete
characters until entering a '?' shows the available options.

Enter '?' after a complete parameter to show remaining valid
command parameters (e.g. 'show ?').

Enter '?' after part of a parameter to show parameters that
complete the typed letters (e.g. 'show ip?').
```

# logout

**Overview** This command exits the User Exec or Privileged Exec modes and ends the session.

**Syntax**

```
logout
```

**Mode** User Exec and Privileged Exec

**Example** To exit the User Exec mode, use the command:

```
awplus# logout
```

# show history

**Overview** This command lists the commands entered in the current session. The history buffer is cleared automatically upon reboot.

The output lists all command line entries, including commands that returned an error.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show history
```

**Mode** User Exec and Privileged Exec

**Example** To display the commands entered during the current session, use the command:

```
awplus# show history
```

**Output** Figure 1-2: Example output from the **show history** command

```
    1 en
    2 show ru
    3 conf t
    4 route-map er deny 3
    5 exit
    6 ex
    7 di
```

# 2 Device GUI and Vista Manager EX Commands

## Introduction

**Overview**

This chapter provides an alphabetical reference of commands used to configure the Device GUI. They also allow your device to be monitored and managed by Vista Manager EX™.

For more information, see Getting Started with the Device GUI on UTM Firewalls.

**Command List**

- "atmf topology-gui enable" on page 141
- "http log webapi-requests" on page 142
- "http port" on page 143
- "http secure-port" on page 144
- "http trustpoint" on page 145
- "log event-host" on page 147
- "service http" on page 148
- "show http" on page 149
- "update webgui now" on page 150

# atmf topology-gui enable

**Overview** Use this command to enable the operation of Vista Manager EX on the Master device.

Vista Manager EX delivers state-of-the-art monitoring and management for your Autonomous Management Framework™ (AMF) network, by automatically creating a complete topology map of switches, firewalls and wireless access points (APs). An expanded view includes third-party devices such as security cameras.

Use the **no** variant of this command to disable operation of Vista Manager EX.

**Syntax**

```
atmf topology-gui enable
no atmf topology-gui enable
```

**Default** Disabled by default on AMF Master and member nodes. Enabled by default on Controllers.

**Mode** Global Configuration mode

**Usage notes** To use Vista Manager EX, you must also enable the HTTP service on all AMF nodes, including all AMF masters and controllers. The HTTP service is enabled by default on AlliedWare Plus switches and disabled by default on AR-Series firewalls. To enable it, use the commands:

```
Node1# configure terminal
Node1(config)# service http
```

On one master in each AMF area in your network, you also need to configure the master to send event notifications to Vista Manager EX. To do this, use the commands:

```
Node1# configure terminal
Node1(config)# log event-host <ip-address> atmf-topology-event
```

**Examples** To enable Vista Manager EX on Node1, use the commands:

```
Node1# configure terminal
Node1(config)# atmf topology-gui enable
```

To disable Vista Manager EX on Node1, use the commands:

```
Node1# configure terminal
Node1(config)# no atmf topology-gui enable
```

**Related commands** atmf enable

log event-host

service http

# http log webapi-requests

**Overview** Use this command to log authenticated web API requests. These logs allow you to monitor and debug Vista Manager EX or Device GUI interactions with your device.

See the Logging Feature Overview and Configuration Guide for more information about the different types of logging and how to filter log messages.

Use the **no** variant of this command to disable authenticated web API request logging.

**Syntax**

```
http log webapi-requests {configuration|all}
no http log webapi-requests
```

| Parameter | Description |
|---|---|
| `configuration` | Log PUT, POST, and DELETE requests. |
| `all` | Log PUT, POST, DELETE, and GET requests. |

**Default** Web API request logging is disabled.

**Mode** Global Configuration

**Example** To enable logging of all authenticated web API requests, use the following commands:

```
awplus# configure terminal
awplus(config)# http log webapi-requests all
```

To disable logging of authenticated web API requests, use the following commands:

```
awplus# configure terminal
awplus(config)# no http log webapi-requests
```

**Related commands**

http port

service http

show log

**Command changes** Version 5.4.8-1.1: command added

# http port

**Overview** Use this command to change the HTTP port used to access the web-based device GUI, or to disable HTTP management.

Use the **no** variant of this command to return to using the default port, which is 80.

**Syntax**

```
http port {<1-65535>|none}
no http port
```

| Parameter | Description |
|---|---|
| *<1-65535>* | The HTTP port number |
| `none` | Disable HTTP management. You may want to do this if you need to use port 80 for a different service or you do not need to use HTTP at all. |

**Default** The default port for accessing the GUI is port 80.

**Mode** Global Configuration

**Usage notes** Do not configure the HTTP port to be the same as the HTTPS port.

Note that the device will redirect from HTTP to HTTPS unless you have disabled HTTPS access, which we do not recommend doing.

**Example** To set the port to 8080, use the commands:

```
awplus# configure terminal
awplus(config)# http port 8080
```

To return to using the default port of 80, use the commands:

```
awplus# configure terminal
awplus(config)# no http port
```

To stop users from accessing the GUI via HTTP, use the commands:

```
awplus# configure terminal
awplus(config)# http port none
```

**Related commands**

http secure-port

service http

show http

**Command changes** Version 5.4.7-2.4: command added on AR-Series devices

Version 5.4.8-0.2: command added on AlliedWare Plus switches

# http secure-port

**Overview** Use this command to change the HTTPS port used to access the web-based device GUI, or to disable HTTPS management.

Use the **no** variant of this command to return to using the default port, which is 443.

**Syntax**

```
http secure-port {<1-65535>|none}
no http secure-port
```

| Parameter | Description |
|---|---|
| *<1-65535>* | The HTTPS port number |
| `none` | Disable HTTPS management. Do not do this if you want to use Vista Manager EX or the GUI. |

**Default** The default port for accessing the GUI is port 443.

**Mode** Global Configuration

**Usage notes** Do not configure the HTTPS port to be the same as the HTTP port.

Note that if you are using Vista Manager EX and need to change the HTTPS port, you must use certificate-based authorization in Vista Manager EX. See the Vista Manager EX Installation Guide for instructions.

**Example** To set the port to 8443, use the commands:

```
awplus# configure terminal
awplus(config)# http secure-port 8443
```

To return to using the default port of 443, use the commands:

```
awplus# configure terminal
awplus(config)# no http secure-port
```

To stop users from accessing the GUI via HTTPS, use the commands:

```
awplus# configure terminal
awplus(config)# http secure-port none
```

**Related commands**

http port

service http

show http

**Command changes**

Version 5.4.7-1.1: command added on AR-Series devices

Version 5.4.7-2.4: **none** parameter added

Version 5.4.8-0.2: command added on AlliedWare Plus switches

# http trustpoint

**Overview** Use this command to set the PKI trustpoint to use for secure HTTP communication to an AlliedWare Plus device.

Use the **no** variant of this command to revert to using the default trustpoint 'default-selfsigned'.

**Syntax**

```
http trustpoint <trustpoint-name>
no http trustpoint
```

| Parameter | Description |
|---|---|
| *<trustpoint-name>* | Name of trustpoint |

**Default** By default, HTTP uses the 'default-selfsigned' trustpoint.

**Mode** Global Configuration

**Usage notes** Before using the **http trustpoint** command you will need to establish a trustpoint. For example, you can create a local self-signed trustpoint using the procedure outlined below.

Create a self-signed trustpoint called 'vista' with keypair 'vista_key':

```
awplus# configure terminal
awplus(config)# crypto pki trustpoint vista
awplus(ca-trustpoint)# enrollment selfsigned
awplus(ca-trustpoint)# rsakeypair vista_key
awplus(ca-trustpoint)# exit
awplus(config)# exit
```

Create the root and server certificates for this trustpoint:

```
awplus# crypto pki authenticate vista
awplus# crypto pki enroll vista
```

For more information about the AlliedWare Plus implementation of Public Key Infrastructure (PKI), see the Public Key Infrastructure (PKI) Feature Overview and Configuration Guide

**Example** To configure HTTP to use the trustpoint 'vista', use the commands:

```
awplus# configure terminal
awplus(config)# http trustpoint vista
```

To configure HTTP to use the default trustpoint 'default-selfsigned', use the commands:

```
awplus# configure terminal
awplus(config)# no http trustpoint
```

**Related commands**

crypto pki trustpoint

show crypto pki certificates

show crypto pki trustpoint

Version 5.5.1-2.1: command added

# log event-host

**Overview** Use this command to set up an external host to log AMF topology events through Vista Manager. This command is run on the Master device.

Use the **no** variant of this command to disable log events through Vista Manager.

**Syntax**

```
log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event
no log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event
```

| Parameter | Description |
|---|---|
| *<ipv4-addr>* | ipv4 address of the event host |
| *<ipv6-addr>* | ipv6 address of the event host |

**Default** Log events are disabled by default.

**Mode** Global Configuration

**Usage notes** Event hosts are set so syslog sends the messages out as they come.

Note that there is a difference between log event and log host messages:

- Log event messages are sent out as they come by syslog
- Log host messages are set to wait for a number of messages (20) to send them out together for traffic optimization.

**Example** To enable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
Node1(config)# log event-host 192.0.2.31 atmf-topology-event
```

To disable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
Node1(config)# no log event-host 192.0.2.31 atmf-topology-event
```

**Related commands** atmf topology-gui enable

# service http

**Overview** Use this command to enable the HTTP (Hypertext Transfer Protocol) service.

This service is required to support Vista Manager EX™ and the Device GUI.

Use the **no** variant of this command to disable the HTTP feature.

**Syntax**

```
service http
no service http
```

**Default** Enabled if your device came from the factory with the Device GUI pre-installed. Otherwise disabled.

**Mode** Global Configuration

**Example** To enable the HTTP service, use the following commands:

```
awplus# configure terminal
awplus(config)# service http
```

To disable the HTTP service, use the following commands:

```
awplus# configure terminal
awplus(config)# no service http
```

**Related commands**

http port

http secure-port

show http

# show http

**Overview** This command shows the HTTP server settings.

**Syntax**

```
show http
```

**Mode** User Exec and Privileged Exec

**Example** To show the HTTP server settings, use the command:

```
awplus# show http
```

**Output** Figure 2-1: Example output from the **show http** command

```
awplus#show http

# update webgui now

**Overview** Use this command to check whether you have the latest version of the device's GUI and update it if a newer version is available.

**Syntax**

```
update webgui now
```

**Mode** Privileged Exec

**Usage notes** If you have previously used the **copy** command to copy GUI files onto your device, these files need to be deleted before running **update webgui now**. To delete all GUI files, use the command:

```
awplus# del *gui_*.tar.gz
```

**Examples** To check for GUI updates, use the following command:

```
awplus# update webgui now
```

**Related commands** show resource

**Command changes** Version 5.4.9-2.1: command added to SBx908 GEN2

# 3 File and Configuration Management Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of AlliedWare Plus™ OS file and configuration management commands.

**Filename Syntax and Keyword Usage** Many of the commands in this chapter use the placeholder 'filename' to represent the name and location of the file that you want to act on. The following table explains the syntax of the filename for each different type of file location.

| When you copy a file... | Use this syntax: | Example: |
|---|---|---|
| Copying in local flash memory | `flash:[/][<directory>/]<filename>` | To specify a file in the configs directory in flash: flash:configs/example.cfg |
| Copying to or from an SD (or SDHC) card | `card:[/][<directory>/]<filename>` | To specify a file in the top-level directory of the SD card: card:example.cfg |
| Copying to or from a USB storage device | `usb:[/][<directory>/]<filename>` | To specify a file in the top-level directory of the USB stick: usb:example.cfg |
| Copying with HTTP | `http://[[<username>:<password>]@]{<hostname>\|<host-ip>}[/<filepath>]/<filename>` | To specify a file in the configs directory on the server: http://www.company.com/configs/example.cfg |
| Copying with TFTP | `tftp://[[<location>]/<directory>]/<filename>` | To specify a file in the top-level directory of the server: tftp://172.1.1.1/example.cfg |

| When you copy a file... | Use this syntax: | Example: |
|---|---|---|
| Copying with SCP | `scp://<username>@<location>[/<directory>][/<filename>]` | To specify a file in the configs directory on the server, logging on as user 'bob': e.g. scp://bob@10.10.0.12/configs/example.cfg |
| Copying with SFTP | `sftp://[[<location>]/<directory>]/<filename>` | To specify a file in the top-level directory of the server: sftp://10.0.0.5/example.cfg |

**Valid characters**

The filename and path can include characters from up to four categories. The categories are:

1) uppercase letters: A to Z
2) lowercase letters: a to z
3) digits: 0 to 9
4) special symbols: most printable ASCII characters not included in the previous three categories, including the following characters:
   - -
   - /
   - .
   - _
   - @
   - "
   - '
   - *
   - :
   - ~
   - ?

Do not use spaces, parentheses or the + symbol within filenames. Use hyphens or underscores instead.

**Syntax for directory listings**

A leading slash (/) indicates the root of the current file system location.

In commands where you need to specify the local file system's flash base directory, you may use **flash** or **flash:** or **flash:/**. For example, these commands are all the same:

- `dir flash`
- `dir flash:`
- `dir flash:/`

Similarly, you can specify the SD (or SDHC) card base directory with **card** or **card:** or **card:/**

Similarly, you can specify the USB storage device base directory with **usb** or **usb:** or **usb:/**

You cannot name a directory or subdirectory **flash**, **nvs**, **usb**, **card**, **tftp**, **scp**, **sftp** or **http.** These keywords are reserved for tab completion when using various file commands.

**Command List**

- "autoboot enable" on page 155
- "boot config-file" on page 156
- "boot config-file backup" on page 158
- "boot system" on page 159
- "boot system backup" on page 161
- "cd" on page 162
- "copy (filename)" on page 163
- "copy debug" on page 165
- "copy running-config" on page 166
- "copy startup-config" on page 167
- "copy zmodem" on page 168
- "create autoboot" on page 169
- "delete" on page 170
- "delete debug" on page 171
- "dir" on page 172
- "edit" on page 174
- "edit (filename)" on page 175
- "erase factory-default" on page 176
- "erase startup-config" on page 177
- "ip tftp source-interface" on page 178
- "ipv6 tftp source-interface" on page 179
- "mkdir" on page 180
- "move" on page 181
- "move debug" on page 182
- "pwd" on page 183
- "rmdir" on page 184
- "show autoboot" on page 185
- "show boot" on page 186
- "show file" on page 188

- "show file systems" on page 189
- "show running-config" on page 191
- "show running-config interface" on page 194
- "show startup-config" on page 197
- "show version" on page 198
- "unmount" on page 199
- "write file" on page 200
- "write memory" on page 201
- "write terminal" on page 202

# autoboot enable

**Overview** This command enables the device to restore a release file and/or a configuration file from an SD card or USB storage device.

When the Autoboot feature is enabled, the device looks for a special file called autoboot.txt on the external media. If this file exists, the device will check the key and values in the file and recover the device with a new release file and/or configuration file from the external media. An example of a valid autoboot.txt file is shown in the following figure.

Figure 3-1: Example autoboot.txt file

```
[AlliedWare Plus]
Copy_from_external_media_enabled=yes
Boot_Release=AR4050S-5.5.1-2.1.rel
Boot_Config=network1.cfg
```

Use the **no** variant of this command to disable the Autoboot feature.

**Syntax**

```
autoboot enable
no autoboot enable
```

**Default** The Autoboot feature operates the first time the device is powered up in the field, after which the feature is disabled by default.

**Mode** Global Configuration

**Example** To enable the Autoboot feature, use the command:

```
awplus# configure terminal
awplus(config)# autoboot enable
```

**Related commands**

create autoboot

show autoboot

show boot

# boot config-file

**Overview** Use this command to set the configuration file to use during the next boot cycle.

Use the **no** variant of this command to remove the configuration file.

**Syntax**

```
boot config-file <filepath-filename>
no boot config-file
```

| Parameter | Description |
|---|---|
| *<filepath-filename>* | Filepath and name of a configuration file.<br>The specified configuration file must exist in the specified filesystem.<br>Valid configuration files must have a **.cfg** extension. |

**Mode** Global Configuration

**Usage notes** You can only specify that the configuration file is on external memory (an SD card or USB storage device) if there is a backup configuration file already specified in flash. If you attempt to set the configuration file on external memory and a backup configuration file is not specified in flash, the following error message is displayed:

```
% Backup configuration files must be stored in the flash
filesystem
```

In addition, you can only specify that the configuration file is on an SD card if the card is writable.

For an explanation of the configuration fallback order, see the File Management Feature Overview and Configuration Guide.

**Examples** To run the configuration file “branch.cfg” the next time the device boots up, when “branch.cfg” is stored on the device’s flash filesystem, use the commands:

```
awplus# configure terminal
awplus(config)# boot config-file flash:/branch.cfg
```

To stop running the configuration file “branch.cfg” when the device boots up, when “branch.cfg” is stored on the device’s flash filesystem, use the commands:

```
awplus# configure terminal
awplus(config)# no boot config-file flash:/branch.cfg
```

To run the configuration file “branch.cfg” the next time the device boots up, when “branch.cfg” is stored on an SD card, use the commands:

```
awplus# configure terminal
awplus(config)# boot config-file card:/branch.cfg
```

To stop running the configuration file “branch.cfg” when the device boots up, when “branch.cfg” is stored on an SD card, use the commands:

```
awplus# configure terminal
awplus(config)# no boot config-file card:/branch.cfg
```

To run the configuration file “branch.cfg” the next time the device boots up, when “branch.cfg” is stored on a USB storage device, use the commands:

```
awplus# configure terminal
awplus(config)# boot config-file usb:/branch.cfg
```

To stop running the configuration file “branch.cfg” when the device boots up, when “branch.cfg” is stored on a USB storage device, use the commands:

```
awplus# configure terminal
awplus(config)# no boot config-file usb:/branch.cfg
```

**Related commands**

boot config-file backup

boot system

boot system backup

show boot

# boot config-file backup

**Overview** Use this command to set a backup configuration file to use if the main configuration file cannot be accessed.

Use the **no** variant of this command to remove the backup configuration file.

**Syntax**

```
boot config-file backup <filepath-filename>
no boot config-file backup
```

| Parameter | Description |
|---|---|
| *<filepath-filename>* | Filepath and name of a backup configuration file. Backup configuration files must be in the flash filesystem. Valid backup configuration files must have a **.cfg** extension. |
| `backup` | The specified file is a backup configuration file. |

**Mode** Global Configuration

**Usage notes** For an explRSanation of the configuration fallback order, see the File Management Feature Overview and Configuration Guide.

**Examples** To set the configuration file backup.cfg as the backup to the main configuration file, use the commands:

```
awplus# configure terminal
awplus(config)# boot config-file backup flash:/backup.cfg
```

To remove the configuration file backup.cfg as the backup to the main configuration file, use the commands:

```
awplus# configure terminal
awplus(config)# no boot config-file backup flash:/backup.cfg
```

**Related commands**

boot config-file

boot system

boot system backup

show boot

# boot system

**Overview** Use this command to set the release file to load during the next boot cycle.

Use the **no** variant of this command to stop specifying a primary release file to boot from. If the device boots up with no release file set, it will use autoboot or the backup release file if either of those are configured. You can also use the boot menu to select a release file source. To access the boot menu, type Ctrl-B at bootup.

**Syntax**

```
boot system <filepath-filename>
no boot system
```

| Parameter | Description |
|---|---|
| *<filepath-filename>* | Filepath and name of a release file.<br>The specified release file must exist and must be stored in the root directory of the specified filesystem.<br>Valid release files must have a **.rel** extension. |

**Mode** Global Configuration

**Usage notes** You can only specify that the release file is on external memory (an SD card or USB storage device) if there is a backup release file already specified in flash. If you attempt to set the release file on external memory and a backup release file is not specified in flash, an error message like the following one is displayed:

```
% A backup boot image must be set before setting a current boot
image on card
```

In addition, you can only specify that the configuration file is on an SD card if the card is writable.

**Examples** To boot up with the release file AR4050S-5.5.1-2.1.rel the next time the device boots up, when the release file is stored on the device's flash filesystem, use the commands:

```
awplus# configure terminal
awplus(config)# boot system flash:/AR4050S-5.5.1-2.1.rel
```

To run the release file AR4050S-5.5.1-2.1.rel the next time the device boots up, when the release file is stored on an SD card, use the commands:

```
awplus# configure terminal
awplus(config)# boot system card:/AR4050S-5.5.1-2.1.rel
```

To run the release file AR4050S-5.5.1-2.1.rel the next time the device boots up, when the release file is stored on a USB storage device, use the commands:

```
awplus# configure terminal
awplus(config)# boot system usb:/AR4050S-5.5.1-2.1.rel
```

**Related commands**

boot config-file

boot config-file backup

boot system backup

show boot

# boot system backup

**Overview** Use this command to set a backup release file to load if the main release file cannot be loaded.

Use the **no** variant of this command to stop specifying a backup release file.

**Syntax**

```
boot system backup <filepath-filename>
no boot system backup
```

| Parameter | Description |
|---|---|
| *<filepath-filename>* | Filepath and name of a backup release file.<br>Backup release files must be in the Flash filesystem.<br>Valid release files must have a **.rel** extension. |
| backup | The specified file is a backup release file. |

**Mode** Global Configuration

**Examples** To specify the file AR4050S-5.5.1-1.1.rel as the backup to the main release file, use the commands:

```
awplus# configure terminal
awplus(config)# boot system backup flash:/AR4050S-5.5.1-1.1.rel
```

To stop specifying a backup to the main release file, use the commands:

```
awplus# configure terminal
awplus(config)# no boot system backup
```

**Related commands**

boot config-file

boot config-file backup

boot system

show boot

# cd

**Overview** This command changes the current working directory.

**Syntax**

```
cd <directory-name>
```

| Parameter | Description |
|---|---|
| *<directory-name>* | Name and path of the directory. |

**Mode** Privileged Exec

**Example** To change to the directory called `images`, use the command:

```
awplus# cd images
```

**Related commands**

dir

pwd

show file systems

# copy (filename)

**Overview** This command copies a file. This allows you to:

- copy files from your device to a remote device
- copy files from a remote device to your device
- copy files stored on Flash memory to or from a different memory type, such as an SD card
- copy files stored on Flash memory to or from a different memory type, such as a USB storage device
- create two copies of the same file on your device

**Syntax**

```
copy [force] <source-name> <destination-name>
```

| Parameter | Description |
|---|---|
| `force` | This parameter forces the copy command to overwrite the destination file, if it already exists, without prompting the user for confirmation. |
| *<source-name>* | The filename and path of the source file. See Introduction on page 151 for valid syntax. |
| *<destination-name>* | The filename and path for the destination file. See Introduction on page 151 for valid syntax. |

**Mode** Privileged Exec

**Examples** To use TFTP to copy the file “bob.key” into the current directory from the remote server at 10.0.0.1, use the command:

```
awplus# copy tftp://10.0.0.1/bob.key bob.key
```

To use SFTP to copy the file “new.cfg” into the current directory from a remote server at 10.0.1.2, use the command:

```
awplus# copy sftp://10.0.1.2/new.cfg bob.key
```

To use SCP with the username “beth” to copy the file old.cfg into the directory config_files on a remote server that is listening on TCP port 2000, use the command:

```
awplus# copy scp://beth@serv:2000/config_files/old.cfg old.cfg
```

To copy the file “newconfig.cfg” onto your device’s Flash from an SD (or SDHC) Card, use the command:

```
awplus# copy card:/newconfig.cfg flash:/newconfig.cfg
```

To copy the file “newconfig.cfg” to an SD (or SDHC) Card from your device’s Flash, use the command:

```
awplus# copy flash:/newconfig.cfg card:/newconfig.cfg
```

To copy the file “config.cfg” into the current directory from an SD (or SDHC) Card, and rename it to “configtest.cfg”, use the command:

```
awplus# copy card:/config.cfg configtest.cfg
```

To copy the file “newconfig.cfg” onto your device’s Flash from a USB storage device, use the command:

```
awplus# copy usb:/newconfig.cfg flash:/newconfig.cfg
```

To copy the file “newconfig.cfg” to a USB storage device from your device’s Flash, use the command:

```
awplus# copy flash:/newconfig.cfg usb:/newconfig.cfg
```

To copy the file “config.cfg” into the current directory from a USB storage device, and rename it to “configtest.cfg”, use the command:

```
awplus# copy usb:/config.cfg configtest.cfg
```

To copy the file “config.cfg” into the current directory from a remote file server, and rename it to “configtest.cfg”, use the command:

```
awplus# copy fserver:/config.cfg configtest.cfg
```

On an AMF network, to copy the device GUI file from the AMF master to the Flash memory of ‘node_1’, use the command:

```
master# copy awplus-gui_549_13.gui node_1.atmf/flash:
```

**Related commands**

copy zmodem

copy buffered-log

copy permanent-log

edit (filename)

show file systems

# copy debug

**Overview** This command copies a specified debug file to a destination file.

**Syntax**

```
copy debug
{<destination-name>|card|debug|flash|nvs|scp|tftp|usb}
{<source-name>|card|debug|flash|nvs|scp|tftp|usb}
```

| Parameter | Description |
|---|---|
| *<destination-name>* | The filename and path where you would like the debug output saved. See Introduction on page 151 for valid syntax. |
| *<source-name>* | The filename and path where the debug output originates. See the Introduction to this chapter for valid syntax. |

**Mode** Privileged Exec

**Example** To copy debug output to a file on flash called “my-debug”, use the following command:

```
awplus# copy debug flash:my-debug
```

To copy debug output to an SD (or SDHC) card with a filename “my-debug”, use the following command:

```
awplus# copy debug card:my-debug
```

To copy debug output to a USB storage device with a filename “my-debug”, use the following command:

```
awplus# copy debug usb:my-debug
```

**Output** Figure 3-2: CLI prompt after entering the **copy debug** command

```
Enter source file name []:
```

**Related commands**

delete debug

move debug

# copy running-config

**Overview** This command copies the running-config to a destination file, or copies a source file into the running-config. Commands entered in the running-config do not survive a device reboot unless they are saved in a configuration file.

**Syntax**

```
copy <source-name> running-config
copy running-config [<destination-name>]
copy running-config startup-config
```

| Parameter | Description |
|---|---|
| *<source-name>* | The filename and path of a configuration file. This must be a valid configuration file with a **.cfg** filename extension. Specify this when you want the script in the file to become the new running-config. See Introduction on page 151 for valid syntax. |
| *<destination-name>* | The filename and path where you would like the current running-config saved. This command creates a file if no file exists with the specified filename. If a file already exists, then the CLI prompts you before overwriting the file. See Introduction on page 151 for valid syntax. If you do not specify a file name, the device saves the running-config to a file called default.cfg. |
| `startup-config` | Copies the running-config into the file set as the current startup-config file. |

**Mode** Privileged Exec

**Examples** To copy the running-config into the startup-config, use the command:

```
awplus# copy running-config startup-config
```

To copy the file 'layer3.cfg' into the running-config, use the command:

```
awplus# copy layer3.cfg running-config
```

To use SCP to copy the running-config as 'current.cfg' to the remote server listening on TCP port 2000, use the command:

```
awplus# copy running-config
scp://user@server:2000/config_files/current.cfg
```

**Related commands**

copy startup-config

write file

write memory

# copy startup-config

**Overview** This command copies the startup-config script into a destination file, or alternatively copies a configuration script from a source file into the startup-config file.

**Syntax**

```
copy <source-name> startup-config
copy startup-config <destination-name>
```

| Parameter | Description |
|---|---|
| *<source-name>* | The filename and path of a configuration file. This must be a valid configuration file with a **.cfg** filename extension. Specify this to copy the script in the file into the startup-config file. Note that this does not make the copied file the new startup file, so any further changes made in the configuration file are not added to the startup-config file unless you reuse this command. See Introduction on page 151 for valid syntax. |
| *<destination-name>* | The destination and filename that you are saving the startup- config as. This command creates a file if no file exists with the specified filename. If a file already exists, then the CLI prompts you before overwriting the file. See Introduction on page 151 for valid syntax. |

**Mode** Privileged Exec

**Examples** To copy the file 'Layer3.cfg' to the startup-config, use the command:

```
awplus# copy Layer3.cfg startup-config
```

To copy the startup-config as the file 'oldconfig.cfg' in the current directory, use the command:

```
awplus# copy startup-config oldconfig.cfg
```

**Related commands** copy running-config

# copy zmodem

**Overview** This command allows you to copy files using ZMODEM using Minicom. ZMODEM works over a serial connection and does not need any interfaces configured to do a file transfer.

**Syntax**

```
copy <source-name> zmodem
copy zmodem
```

| Parameter | Description |
|---|---|
| *<source-name>* | The filename and path of the source file. See Introduction on page 151 for valid syntax. |

**Mode** Privileged Exec

**Example** To copy the local file 'asuka.key' using ZMODEM, use the command:

```
awplus# copy asuka.key zmodem
```

**Related commands** copy (filename)

show file systems

# create autoboot

**Overview** Use this command to create an autoboot.txt file on an external storage device. This command will automatically ensure that the keys and values that are expected in this file are correct. After the file is created the **create autoboot** command will copy the current release and configuration files across to the external storage device. The external storage device is then available to restore a release file and/or a configuration file to the device.

**Syntax**

```
create autoboot card
create autoboot usb
```

**Mode** Privileged Exec

**Example** To create an autoboot.txt file on an SD card, use the command:

```
awplus# create autoboot card
```

To create an autoboot.txt file on a USB storage device, use the command:

```
awplus# create autoboot usb
```

**Related commands**

autoboot enable

show autoboot

show boot

# delete

**Overview** This command deletes files or directories.

**Syntax** `delete [force] [recursive] <filename>`

| Parameter | Description |
|---|---|
| `force` | Ignore nonexistent filenames and never prompt before deletion. |
| `recursive` | Remove the contents of directories recursively. |
| `<filename>` | The filename and path of the file to delete. See Introduction on page 151 for valid syntax. |

**Mode** Privileged Exec

**Examples** To delete the file `temp.cfg` from the current directory, use the command:

```
awplus# delete temp.cfg
```

To delete the read-only file `one.cfg` from the current directory, use the command:

```
awplus# delete force one.cfg
```

To delete the directory `old_configs`, which is not empty, use the command:

```
awplus# delete recursive old_configs
```

To delete the directory `new_configs`, which is not empty, without prompting if any read-only files are being deleted, use the command:

```
awplus# delete force recursive new_configs
```

**Related commands** erase startup-config

rmdir

# delete debug

**Overview** Use this command to delete a specified debug output file.

**Syntax**

```
delete debug <source-name>
```

| Parameter | Description |
|---|---|
| *<source-name>* | The filename and path where the debug output originates. See Introduction on page 151 for valid URL syntax. |

**Mode** Privileged Exec

**Example** To delete debug output, use the following command:

```
awplus# delete debug
```

**Output** Figure 3-3: CLI prompt after entering the **delete debug** command

```
Enter source file name []:
```

**Related commands**

copy debug

move debug

# dir

**Overview** This command lists the files on a filesystem. If you don't specify a directory or file, then this command lists the files in the current directory.

**Syntax**
```
dir [all] [recursive] [sort [reverse] [name|size|time]]
[<filename>|card|debug|flash|nvs|usb]
```

| Parameter | Description |
|---|---|
| `all` | List all files. |
| `recursive` | List the contents of directories recursively. |
| `sort` | Sort directory listing. |
| `reverse` | Sort using reverse order. |
| `name` | Sort by name. |
| `size` | Sort by size. |
| `time` | Sort by modification time (default). |
| *<filename>* | The name of the directory or file. If you don't specify a directory or file, then this command lists the files in the current directory. |
| `card` | SD (or SDHC) card root directory |
| `debug` | Debug root directory |
| `flash` | Flash memory root directory |
| `nvs` | NVS memory root directory |
| `usb` | USB storage device root directory |

**Mode** Privileged Exec

**Examples** To list the files in the current working directory, use the command:

```
awplus# dir
```

To list the non-hidden files in the root of the Flash filesystem, use the command:

```
awplus# dir flash
```

To list all the files in the root of the Flash filesystem, use the command:

```
awplus# dir all flash:
```

To list recursively the files in the Flash filesystem, use the command:

```
awplus# dir recursive flash:
```

To list the files in alphabetical order, use the command:

```
awplus# dir sort name
```

To list the files by size, smallest to largest, use the command:

```
awplus# dir sort reverse size
```

To sort the files by modification time, oldest to newest, use the command:

```
awplus# dir sort reverse time
```

**Output** Figure 3-4: Example output from the **dir** command

```
awplus#dir
       630 -rw- May 19 2016 23:36:31  example.cfg
  23652123 -rw- May 17 2016 03:41:18
       149 -rw- Feb  9 2016 00:40:35  exception.log
```

**Related commands**

cd

pwd

# edit

**Overview** This command opens a text file in the AlliedWare Plus™ text editor. Once opened you can use the editor to alter to the file.

If a filename is specified and it already exists, then the editor opens it in the text editor.

If no filename is specified, the editor prompts you for one when you exit it.

Before starting the editor make sure your terminal, terminal emulation program, or Telnet client is 100% compatible with a VT100 terminal. The editor uses VT100 control sequences to display text on the terminal.

For more information about using the editor, including control sequences, see the File Management Feature Overview and Configuration Guide.

**Syntax**

```
edit [<filename>]
```

| Parameter | Description |
|---|---|
| *<filename>* | Name of a file in the local Flash filesystem. |

**Mode** Privileged Exec

**Examples** To create and edit a new text file, use the command:

```
awplus# edit
```

To edit the existing configuration file `myconfig.cfg` stored on your device's Flash memory, use the command:

```
awplus# edit myconfig.cfg
```

**Related commands** edit (filename)

show file

# edit (filename)

**Overview** This command opens a remote text file as read-only in the AlliedWare Plus™ text editor.

Before starting the editor make sure your terminal, terminal emulation program, or Telnet client is 100% compatible with a VT100 terminal. The editor uses VT100 control sequences to display text on the terminal.

**Syntax**

```
edit <filename>
```

| Parameter | Description |
|---|---|
| *<filename>* | The filename and path of the remote file. See Introduction on page 151 for valid syntax. |

**Mode** Privileged Exec

**Example** To view the file `bob.key` stored in the security directory of a TFTP server, use the command:

```
awplus# edit tftp://security/bob.key
```

**Related commands**

copy (filename)

edit

show file

# erase factory-default

**Overview** This command erases all data from NVS and all data from flash **except** the following:

- the boot release file (a .rel file) and its release setting file
- all license files
- the latest GUI release file

The device is then rebooted and returned to its factory default condition. The device can then be used for AMF automatic node recovery.

**Syntax**

```
erase factory-default
```

**Mode** Privileged Exec

**Usage notes** This command is an alias to the atmf cleanup command.

**Example** To erase data, use the command:

```
Node_1# erase factory-default
```

```
This command will erase all NVS, all flash contents except for
the boot release, a GUI resource file, and any license files,
and then reboot the switch. Continue? (y/n):y
```

**Related commands** atmf cleanup

# erase startup-config

**Overview** This command deletes the file that is set as the startup-config file, which is the configuration file that the system runs when it boots up.

At the next restart, the device loads the default configuration file, default.cfg. If default.cfg no longer exists, then the device loads with the factory default configuration. This provides a mechanism for you to return the device to the factory default settings.

**Syntax**

```
erase startup-config
```

**Mode** Privileged Exec

**Example** To delete the file currently set as the startup-config, use the command:

```
awplus# erase startup-config
```

**Related commands**

boot config-file backup

copy running-config

copy startup-config

show boot

# ip tftp source-interface

**Overview** Use this command to manually specify the IP address that all TFTP requests originate from. This is useful in network configurations where TFTP servers only accept requests from certain devices, or where the server cannot dynamically determine the source of the request.

Use the **no** variant of this command to stop specifying a source.

**Syntax**

```
ip tftp source-interface [<interface>|<ip-add>]
no ip tftp source-interface
```

| Parameter | Description |
|---|---|
| *<interface>* | The interface that TFTP requests originate from. The device will use the IP address of this interface as its source IP address. You can specify any interface that can have an IP address attached to it (e.g. a VLAN, PPP or Eth interface). |
| *<ip-add>* | The IP address that TFTP requests originate from, in dotted decimal format. |

**Default** There is no default source specified.

**Mode** Global Configuration

**Usage** This command is helpful in network configurations where TFTP traffic needs to traverse point-to-point links or subnets within your network, and you do not want to propagate those point-to-point links through your routing tables.

In those circumstances, the TFTP server cannot dynamically determine the source of the TFTP request, and therefore cannot send the requested data to the correct device. Specifying a source interface or address enables the TFTP server to send the data correctly.

**Example** To specify that TFTP requests originate from the IP address 192.0.2.1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip tftp source-interface 192.0.2.1
```

**Related commands** copy (filename)

# ipv6 tftp source-interface

**Overview** Use this command to manually specify the IPv6 address that all TFTP requests originate from. This is useful in network configurations where TFTP servers only accept requests from certain devices, or where the server cannot dynamically determine the source of the request.

Use the **no** variant of this command to stop specifying a source.

**Syntax**

```
ipv6 tftp source-interface [<interface>|<ipv6-add>]
no ipv6 tftp source-interface
```

| Parameter | Description |
|---|---|
| *<interface>* | The interface that TFTP requests originate from. The device will use the IPv6 address of this interface as its source IPv6 address. You can specify any interface that can have an IPv6 address attached to it (e.g. a VLAN, PPP or Eth interface). |
| *<ipv6-add>* | The IPv6 address that TFTP requests originate from, in the format x:x::x:x, for example, 2001:db8::8a2e:7334. |

**Default** There is no default source specified.

**Mode** Global Configuration

**Usage** This command is helpful in network configurations where TFTP traffic needs to traverse point-to-point links or subnets within your network, and you do not want to propagate those point-to-point links through your routing tables.

In those circumstances, the TFTP server cannot dynamically determine the source of the TFTP request, and therefore cannot send the requested data to the correct device. Specifying a source interface or address enables the TFTP server to send the data correctly.

**Example** To specify that TFTP requests originate from the IPv6 address 2001:db8::8a2e:7334, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 tftp source-interface 2001:db8::8a2e:7334
```

**Related commands** copy (filename)

# mkdir

**Overview** This command makes a new directory.

**Syntax**

```
mkdir <name>
```

| Parameter | Description |
|---|---|
| *<name>* | The name and path of the directory that you are creating. |

**Mode** Privileged Exec

**Usage** You cannot name a directory or subdirectory **flash**, **nvs**, **usb**, **card**, **tftp**, **scp**, **sftp** or **http.** These keywords are reserved for tab completion when using various file commands.

**Example** To make a new directory called `images` in the current directory, use the command:

```
awplus# mkdir images
```

**Related commands**

cd

dir

pwd

# move

**Overview** This command renames or moves a file.

**Syntax**

```
move <source-name> <destination-name>
```

| Parameter | Description |
|---|---|
| *<source-name>* | The filename and path of the source file. See Introduction on page 151 for valid syntax. |
| *<destination-name>* | The filename and path of the destination file. See Introduction on page 151 for valid syntax. |

**Mode** Privileged Exec

**Examples** To rename the file `temp.cfg` to `startup.cfg`, use the command:

```
awplus# move temp.cfg startup.cfg
```

To move the file `temp.cfg` from the root of the Flash filesystem to the directory `myconfigs`, use the command:

```
awplus# move temp.cfg myconfigs/temp.cfg
```

**Related commands**

delete

edit

show file

show file systems

# move debug

**Overview** This command moves a specified debug file to a destination debug file.

**Syntax**

```
move debug {<destination-name>|card|debug|nvs|flash|usb}
```

| Parameter | Description |
|---|---|
| *<destination-name>* | The filename and path where you would like the debug output moved to. See Introduction on page 151 for valid syntax. |

**Mode** Privileged Exec

**Example** To move debug output into Flash memory with a filename “my-debug”, use the following command:

```
awplus# move debug flash:my-debug
```

To move debug output onto an SD (or SDHC) card with a filename “my-debug”, use the following command:

```
awplus# move debug card:my-debug
```

To move debug output onto a USB storage device with a filename “my-debug”, use the following command:

```
awplus# move debug usb:my-debug
```

**Output** Figure 3-5: CLI prompt after entering the **move debug** command

```
Enter source file name []:
```

**Related commands**

copy debug

delete debug

# pwd

**Overview** This command prints the current working directory.

**Syntax**

```
pwd
```

**Mode** Privileged Exec

**Example** To print the current working directory, use the command:

```
awplus# pwd
```

**Related commands** cd

# rmdir

**Overview** This command removes a directory. This command only works on empty directories, unless you specify the optional **force** keyword.

**Syntax**

```
rmdir [force] <name>
```

| Parameter | Description |
|---|---|
| `force` | Optional keyword that allows you to delete directories that are not empty and contain files or subdirectories. |
| *<name>* | The name and path of the directory. |

**Mode** Privileged Exec

**Usage notes** You can use the CLI to access filesystems on a specific external memory device. See the Introduction on page 151 for syntax details.

**Examples** To remove the directory "images" from the top level of the Flash filesystem, use the command:

```
awplus# rmdir flash:/images
```

To create a directory called "level1" containing a subdirectory called "level2", and then force the removal of both directories, use the commands:

```
awplus# mkdir level1
awplus# mkdir level1/level2
awplus# rmdir force level1
```

**Related commands**

cd

dir

mkdir

pwd

# show autoboot

**Overview** This command displays the Autoboot configuration and status.

**Syntax**

```
show autoboot
```

**Mode** Privileged Exec

**Example** To show the Autoboot configuration and status, use the command:

```
awplus# show autoboot
```

**Output** Figure 3-6: Example output from the **show autoboot** command

```
awplus#show autoboot
Autoboot configuration
------------------------------------------------------------------------------
Autoboot status                  : enabled
USB file autoboot.txt exists     : yes

Restore information on USB
Autoboot enable in autoboot.txt  : yes
Restore release file             : AR4050S-5.5.1-2.1.rel (file exists)
Restore configuration file       : network_1.cfg (file exists)
```

Figure 3-7: Example output from the **show autoboot** command when an external media source is not present

```
awplus#show autoboot
Autoboot configuration
------------------------------------------------------------------------------
Autoboot status                        : disabled
External media source                  : media not found.
```

**Related commands**

autoboot enable

create autoboot

show boot

# show boot

**Overview** This command displays the current boot configuration.

We recommend that the currently running release is set as the current boot image.

**Syntax**

```
show boot
```

**Mode** Privileged Exec

**Example** To show the current boot configuration, use the command:

```
awplus# show boot
```

**Output** Figure 3-8: Example output from **show boot**

```
awplus#show boot
Boot configuration
-----------------------------------------------------------------
Current software   : AR4050S-5.5.1-2.1.rel
Current boot image : flash:/AR4050S-5.5.1-2.1.rel
Backup  boot image : flash:/AR4050S-5.5.1-1.1.rel
Default boot config: flash:/default.cfg
Current boot config: flash:/my.cfg (file exists)
Backup  boot config: flash:/backup.cfg (file not found)
Autoboot status    : disabled
```

Table 3-1: Parameters in the output from **show boot**

| Parameter | Description |
|---|---|
| Current software | The current software release that the device is using. |
| Current boot image | The boot image currently configured for use during the next boot cycle. |
| Backup boot image | The boot image to use during the next boot cycle if the device cannot load the main image. |
| Default boot config | The default startup configuration file. The device loads this configuration script if no file is set as the startup-config file. |
| Current boot config | The configuration file currently configured as the startup-config file. The device loads this configuration file during the next boot cycle if this file exists. |
| Backup boot config | The configuration file to use during the next boot cycle if the main configuration file cannot be loaded. |
| Autoboot status | The status of the Autoboot feature; either enabled or disabled. |

**Related commands**

autoboot enable

boot config-file backup

boot system backup

show autoboot

# show file

**Overview** This command displays the contents of a specified file.

**Syntax**

```
show file <filename>
```

| Parameter | Description |
|---|---|
| *<filename>* | Name of a file on the local Flash filesystem, or name and directory path of a file. |

**Mode** Privileged Exec

**Example** To display the contents of the file `oldconfig.cfg`, which is in the current directory, use the command:

```
awplus# show file oldconfig.cfg
```

**Related commands**

edit

edit (filename)

show file systems

# show file systems

**Overview** This command lists the file systems and their utilization information where appropriate.

**Syntax**

```
show file systems
```

**Mode** Privileged Exec

**Examples** To display the file systems, use the command:

```
awplus# show file systems
```

**Output** Figure 3-9: Example output from the **show file systems** command

```
awplus#show file systems
 Size(b)   Free(b)   Type   Flags  Prefixes   S/D/V   Lcl/Ntwk  Avail
-----------------------------------------------------------------------
  63.0M     28.5M   flash     rw  flash:     static  local      Y
      -         -   system    rw  system:    virtual local      -
  10.0M      9.8M   debug     rw  debug:     static  local      Y
 499.0K    431.0K   nvs       rw  nvs:       static  local      Y
      -         -   tftp      rw  tftp:      -       network    -
      -         -   scp       rw  scp:       -       network    -
      -         -   sftp      ro  sftp:      -       network    -
      -         -   http      ro  http:      -       network    -
      -         -   rsync     rw  rsync:     -       network    -
```

**Table 4:** Parameters in the output of the **show file systems** command

| Parameter | Description |
|---|---|
| `Size (b)` | The total memory available to this file system. The units are given after the value and are M for Megabytes or k for kilobytes. |
| `Free (b)` | The total memory free within this file system. The units are given after the value and are M for Megabytes or K for kilobytes. |
| `Type` | The memory type used for this file system, such as:<br>flash<br>system<br>sdcard<br>usbstick<br>tftp<br>scp<br>sftp<br>http. |
| `Flags` | The file setting options: rw (read write), ro (read only). |

**Table 4:** Parameters in the output of the **show file systems** command (cont.)

| Parameter | Description |
|---|---|
| `Prefixes` | The prefixes used when entering commands to access the file systems, such as:<br>flash<br>system<br>card<br>usb<br>tftp<br>scp<br>sftp<br>http. |
| `S/D/V` | The memory type: Static, Dynamic, Virtual. |
| `Lcl / Ntwk` | Whether the memory is located locally or via a network connection. |
| `Avail` | Whether the memory is accessible: Y (yes), N (no), - (not applicable) |

**Related commands**

edit

edit (filename)

show file

# show running-config

**Overview** This command displays the current configuration of your device. Its output includes all non-default configuration. The default settings are not displayed.

***NOTE:*** *You can control the output by entering | or > at the end of the command:*

- To display only lines that contain a particular word, enter:

```
| include <word>
```

- To start the display at the first line that contains a particular word, enter:

```
| begin <word>
```

- To save the output to a file, enter:

```
> <filename>
```

**Syntax**

```
show running-config [full|<feature>]
```

| Parameter | Description | |
|---|---|---|
| `full` | Display the running-config for all features. This is the default setting, so it is the same as entering **show running-config**. | |
| *<feature>* | Display only the configuration for a single feature. The features available depend on your device and will be some of the following list: | |
| | access-list | ACL configuration |
| | antivirus | Antivirus configuration |
| | application | Application configuration |
| | as-path | Autonomous system path filter configuration |
| | as-path access-list | Configuration of ACLs for AS path filtering |
| | atmf | Allied Telesis Management Framework configuration |
| | bgp | Border Gateway Protocol (BGP) configuration |
| | community-list | Community-list configuration |
| | crypto | Security-specific configuration |
| | dhcp | DHCP configuration |
| | dpi | Deep Packet Inspection configuration |
| | entity | Entity configuration |
| | firewall | Firewall configuration |
| | interface | Interface configuration. See show running-config interface for further options. |

| Parameter | Description | |
|---|---|---|
| | ip | Internet Protocol (IP) configuration |
| | ip pim dense-mode | PIM-DM configuration |
| | ip pim sparse-mode | PIM-SM configuration |
| | ip route | IP static route configuration |
| | ip-reputation | IP Reputation configuration |
| | ips | IPS configuration |
| | ipsec | Internet Protocol Security (IPsec) configuration |
| | ipv6 | Internet Protocol version 6 (IPv6) configuration |
| | ipv6 access-list | IPv6 ACL configuration |
| | ipv6 mroute | IPv6 multicast route configuration |
| | ipv6 prefix-list | IPv6 prefix list configuration |
| | ipv6 route | IPv6 static route configuration |
| | isakmp | Internet Security Association Key Management Protocol (ISAKMP) configuration |
| | key chain | Authentication key management configuration |
| | l2tp-profile | L2TP tunnel profile configuration |
| | lldp | LLDP configuration |
| | log | Logging utility configuration |
| | malware-protection | Malware protection configuration |
| | nat | Network Address Translation configuration |
| | power-inline | Power over Ethernet (PoE) configuration |
| | policy-based-routing | Policy-based routing (PBR) configuration |
| | pppoe-ac | PPPoE access concentrator configuration |
| | prefix-list | Prefix-list configuration |
| | route-map | Route-map configuration |
| | router | Router configuration |
| | router-id | Configuration of the router identifier for this system |
| | security-password | Strong password security configuration |
| | snmp | SNMP configuration |
| | ssh | Secure Shell configuration |

| Parameter | Description | |
|---|---|---|
| | switch | Switch configuration |
| | web-control | Web Control configuration |

**Mode** Privileged Exec and Global Configuration

**Example** To display the current configuration of your device, use the command:

```
awplus# show running-config
```

**Output** Figure 3-10: Example output from **show running-config**

```
awplus#show running-config
!
service password-encryption
!
no banner motd
!
username manager privilege 15 password 8 $1$bJoVec4D$JwOJGPr7YqoExA0GVasdE0
!
service ssh
!
no service telnet
!
service http
!
no clock timezone

...

line con 0
line vty 0 4
!
end
```

**Related commands** copy running-config

show running-config interface

# show running-config interface

**Overview** This command displays the current configuration of one or more interfaces on the device.

You can optionally limit the command output to display only information for a given protocol or feature. The features available depend on your device and will be a subset of the features listed in the table below.

**Syntax**

```
show running-config interface
show running-config interface <interface-list>
show running-config interface <interface-list> <feature>
show running-config interface <interface-list> ip <feature>
show running-config interface <interface-list> ipv6 <feature>
```

| Parameter | Description |
|---|---|
| *<interface-list>* | The interfaces or ports to display information about. An interface-list can be:<br>• a PPP interface (e.g. ppp0)<br>• an Eth interface (e.g. eth1)<br>• an 802.1Q Ethernet sub-interface (e.g. eth1.10, where '10' is the VLAN ID specified by the **encapsulation dot1q** command)<br>• a VLAN (e.g. vlan2)<br>• a switchport (e.g. port1.0.4)<br>• a static channel group (e.g. sa2)<br>• a dynamic (LACP) channel group (e.g. po2)<br>• a bridge interface (e.g. br0)<br>• a tunnel interface (e.g. tunnel0)<br>• a 3G cellular interface (e.g. cellular0)<br>• a WWAN interface (e.g wwan0)<br>• the loopback interface (lo)<br>• a continuous range of interfaces, separated by a hyphen (e.g. ppp2-4)<br>• a comma-separated list (e.g. ppp0,ppp2-4). Do not mix interface types in a list.<br>The specified interfaces must exist. |
| `cfm` | Displays running configuration for CFM (Connectivity Fault Management) for the specified interfaces. |
| `dot1x` | Displays running configuration for 802.1X port authentication for the specified interfaces. |
| `lacp` | Displays running configuration for LACP (Link Aggregation Control Protocol) for the specified interfaces. |

| Parameter | Description |
|---|---|
| `ip igmp` | Displays running configuration for IGMP (Internet Group Management Protocol) for the specified interfaces. |
| `ip multicast` | Displays running configuration for general multicast settings for the specified interfaces. |
| `ip pim sparse-mode` | Displays running configuration for PIM-SM (Protocol Independent Multicast - Sparse Mode) for the specified interfaces. |
| `ip pim dense-mode` | Displays running configuration for PIM-DM (Protocol Independent Multicasting - Dense Mode) for the specified interfaces. |
| `mstp` | Displays running configuration for MSTP (Multiple Spanning Tree Protocol) for the specified interfaces. |
| `ospf` | Displays running configuration for OSPF (Open Shortest Path First) for the specified interfaces. |
| `rip` | Displays running configuration for RIP (Routing Information Protocol) for the specified interfaces. |
| `ipv6 rip` | Displays running configuration for RIPng (RIP for IPv6) for the specified interfaces. |
| `ipv6 ospf` | Displays running configuration for IPv6 OSPF (Open Shortest Path First) for the specified interfaces. |
| `ipv6 pim sparse-mode` | Displays running configuration for PIM-SM (Protocol Independent Multicast - Sparse Mode) for the specified interfaces. |
| `rstp` | Displays running configuration for RSTP (Rapid Spanning Tree Protocol) for the specified interfaces. |
| `stp` | Displays running configuration for STP (Spanning Tree Protocol) for the specified interfaces. |

**Mode** Privileged Exec and Global Configuration

**Default** Displays information for all protocols on all interfaces

**Examples** To display the current running configuration of your device for eth1, use the command:

```
awplus# show running-config interface eth1
```

To display the current running configuration of a device for vlan2, use the command:

```
awplus# show running-config interface vlan2
```

To display the current OSPF configuration of your device for ports 1 to 4, use the command:

```
awplus# show running-config interface port1.0.1-port1.0.4 ospf
```

**Output** Figure 3-11: Example output from a **show running-config interface ppp0** command

```
awplus#show running-config interface ppp0
!
interface ppp0
 ipv6 address 2001:db9::a3/64
 ipv6 enable
 snmp trap link-status
!
```

**Related commands**

copy running-config

show running-config

# show startup-config

**Overview** This command displays the contents of the start-up configuration file, which is the file that the device runs on start-up.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**
```
show startup-config
```

**Mode** Privileged Exec

**Example** To display the contents of the current start-up configuration file, use the command:

```
awplus# show startup-config
```

**Output** Figure 3-12: Example output from the **show startup-config** command

```
awplus#show startup-config
!
service password-encryption
!
no banner motd
!
username manager privilege 15 password 8 $1$bJoVec4D$JwOJGPr7YqoExA0GVasdE0
!
service ssh
!
no service telnet
!
service http
!
no clock timezone

...

line con 0
line vty 0 4
!
end
```

**Related commands**
- boot config-file backup
- copy running-config
- copy startup-config
- erase startup-config
- show boot

# show version

**Overview** This command displays the version number and copyright details of the current AlliedWare Plus™ OS your device is running.

**Syntax**

```
show version
```

**Mode** User Exec and Privileged Exec

**Example** To display the version details of your currently installed software, use the command:

```
awplus# show version
```

**Related commands** boot system backup

show boot

# unmount

**Overview** Use this command to unmount an external storage device. We recommend you unmount storage devices before removing them, to avoid file corruption. This is especially important if files may be automatically written to the storage device, such as external log files or AMF backup files.

**Syntax**

```
unmount card
unmount usb
```

| Parameter | Description |
|---|---|
| `card` | Unmount the SD card. |
| `usb` | Unmount the USB storage device. |

**Mode** Privileged Exec

**Example** To unmount an SD card and safely remove it from the device, use the command:

```
awplus# unmount card
```

To unmount a USB storage device and safely remove it from the device, use the command:

```
awplus# unmount usb
```

**Related commands**

clear log external

log external

show file systems

show log config

show log external

**Command changes** Version 5.4.7-1.1: command added

# write file

**Overview** This command copies the running-config into the file that is set as the current startup-config file. This command is a synonym of the **write memory** and **copy running-config startup-config** commands.

**Syntax**

```
write [file]
```

**Mode** Privileged Exec

**Example** To write configuration data to the start-up configuration file, use the command:

```
awplus# write file
```

**Related commands**

copy running-config

write memory

show running-config

# write memory

**Overview** This command copies the running-config into the file that is set as the current startup-config file. This command is a synonym of the **write file** and **copy running-config startup-config** commands.

**Syntax**

```
write [memory]
```

**Mode** Privileged Exec

**Example** To write configuration data to the start-up configuration file, use the command:

```
awplus# write memory
```

**Related commands**

copy running-config

write file

show running-config

# write terminal

**Overview** This command displays the current configuration of the device. This command is a synonym of the show running-config command.

**Syntax**

```
write terminal
```

**Mode** Privileged Exec

**Example** To display the current configuration of your device, use the command:

```
awplus# write terminal
```

**Related commands** show running-config

# 4 User Access Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure user access.

**Command List**

- "aaa authentication enable default local" on page 205
- "aaa local authentication attempts lockout-time" on page 206
- "aaa local authentication attempts max-fail" on page 207
- "aaa login fail-delay" on page 208
- "clear aaa local user lockout" on page 209
- "clear line console" on page 210
- "clear line vty" on page 211
- "enable password" on page 212
- "enable secret (deprecated)" on page 215
- "exec-timeout" on page 216
- "flowcontrol hardware (asyn/console)" on page 218
- "length (asyn)" on page 220
- "line" on page 221
- "privilege level" on page 223
- "security-password history" on page 224
- "security-password forced-change" on page 225
- "security-password lifetime" on page 226
- "security-password min-lifetime-enforce" on page 227
- "security-password minimum-categories" on page 228
- "security-password minimum-length" on page 229

- "security-password reject-expired-pwd" on page 230
- "security-password warning" on page 231
- "service advanced-vty" on page 232
- "service password-encryption" on page 233
- "service telnet" on page 234
- "service terminal-length (deleted)" on page 235
- "show aaa local user locked" on page 236
- "show privilege" on page 237
- "show security-password configuration" on page 238
- "show security-password user" on page 239
- "show telnet" on page 240
- "show users" on page 241
- "telnet" on page 242
- "telnet server" on page 243
- "terminal length" on page 244
- "terminal resize" on page 245
- "username" on page 246

# aaa authentication enable default local

**Overview** This command enables local privilege level authentication.

Use the **no** variant of this command to disable local privilege level authentication.

**Syntax**

```
aaa authentication enable default local
no aaa authentication enable default
```

**Default** Local privilege level authentication is enabled by default.

**Mode** Global Configuration

**Usage notes** The privilege level configured for a particular user in the local user database is the privilege threshold above which the user is prompted for an enable (Privileged Exec mode) command.

**Examples** To enable local privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default local
```

To disable local privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication enable default
```

**Related commands**

aaa authentication login

enable (Privileged Exec mode)

enable password

enable secret (deprecated)

# aaa local authentication attempts lockout-time

**Overview** This command configures the duration of the user lockout period.

Use the **no** variant of this command to restore the duration of the user lockout period to its default of 300 seconds (5 minutes).

**Syntax**

```
aaa local authentication attempts lockout-time <lockout-time>
no aaa local authentication attempts lockout-time
```

| Parameter | Description |
|---|---|
| *<lockout-time>* | <0-10000>. Time in seconds to lockout the user. |

**Mode** Global Configuration

**Default** The default for the lockout-time is 300 seconds (5 minutes).

**Usage notes** While locked out all attempts to login with the locked account will fail. The lockout can be manually cleared by another privileged account using the clear aaa local user lockout command.

**Examples** To configure the lockout period to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts lockout-time
600
```

To restore the default lockout period of 5 minutes (300 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts
lockout-time
```

**Related commands** aaa local authentication attempts max-fail

# aaa local authentication attempts max-fail

**Overview** This command configures the maximum number of failed login attempts before a user account is locked out. Every time a login attempt fails the failed login counter is incremented.

Use the **no** variant of this command to restore the maximum number of failed login attempts to the default setting (five failed login attempts).

**Syntax**

```
aaa local authentication attempts max-fail <failed-logins>
no aaa local authentication attempts max-fail
```

| Parameter | Description |
|---|---|
| *<failed-logins>* | <1-32>. Number of login failures allowed before locking out a user. |

**Mode** Global Configuration

**Default** The default for the maximum number of failed login attempts is five failed login attempts.

**Usage** When the failed login counter reaches the limit configured by this command that user account is locked out for a specified duration configured by the aaa local authentication attempts lockout-time command.

When a successful login occurs the failed login counter is reset to 0. When a user account is locked out all attempts to login using that user account will fail.

**Examples** To configure the number of login failures that will lock out a user account to two login attempts, use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts max-fail 2
```

To restore the number of login failures that will lock out a user account to the default number of login attempts (five login attempts), use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts max-fail
```

**Related commands** aaa local authentication attempts lockout-time

clear aaa local user lockout

# aaa login fail-delay

**Overview** Use this command to configure the minimum time period between failed login attempts. This setting applies to login attempts via the console, SSH and Telnet.

Use the **no** variant of this command to reset the minimum time period to its default value.

**Syntax**

```
aaa login fail-delay <1-10>
no aaa login fail-delay
```

| Parameter | Description |
|---|---|
| *<1-10>* | The minimum number of seconds required between login attempts |

**Default** 1 second

**Mode** Global configuration

**Example** To apply a delay of at least 5 seconds between login attempts, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa login fail-delay 5
```

**Related commands**

aaa authentication login

aaa local authentication attempts lockout-time

clear aaa local user lockout

# clear aaa local user lockout

**Overview** Use this command to clear the lockout on a specific user account or all user accounts.

**Syntax**

```
clear aaa local user lockout {username <username>|all}
```

| Parameter | Description |
|---|---|
| `username` | Clear lockout for the specified user. |
| *`<username>`* | Specifies the user account. |
| `all` | Clear lockout for all user accounts. |

**Mode** Privileged Exec

**Examples** To unlock the user account '`bob`' use the following command:

```
awplus# clear aaa local user lockout username bob
```

To unlock all user accounts use the following command:

```
awplus# clear aaa local user lockout all
```

**Related commands** aaa local authentication attempts lockout-time

# clear line console

**Overview** This command resets a console line. If a terminal session exists on the line then the terminal session is terminated. If console line settings have changed then the new settings are applied.

**Syntax**

```
clear line console 0
```

**Mode** Privileged Exec

**Example** To reset the console line (asyn), use the command:

```
awplus# clear line console 0
% The new settings for console line 0 have been applied
```

**Related commands**

clear line vty

flowcontrol hardware (asyn/console)

line

show users

# clear line vty

**Overview** This command resets a VTY line. If a session exists on the line then it is closed.

**Syntax**

```
clear line vty <0-32>
```

| Parameter | Description |
|---|---|
| *<0-32>* | Line number |

**Mode** Privileged Exec

**Example** To reset the first VTY line, use the command:

```
awplus# clear line vty 1
```

**Related commands**

privilege level

line

show telnet

show users

# enable password

**Overview** Use this command to set a local password to control access to elevated privilege levels.

Use the **no** version of the command to remove the password.

Note that the enable secret (deprecated) command is an outdated alias for the **enable password** command.

**Syntax**

```
enable password <password>
enable password level <1-15> <password>]
enable password 8 <encrypted-password>
enable password 8 level <1-15> 8 <encrypted-password>
no enable password [level <1-15>]
```

| Parameter | Description |
|---|---|
| *<password>* | Specifies the unencrypted password. |
| 8 | Specifies that an encrypted password will follow. |
| *<encrypted-password>* | Specifies the encrypted password. |
| level | Privilege level <1-15>. Level for which the password applies. You can specify up to 16 privilege levels, using numbers 1 through 15. Level 1 is normal EXEC-mode user privileges for User Exec mode. If this argument is not specified in the command or the **no** variant of the command, the privilege level defaults to 15 (enable mode privileges) for Privileged Exec mode. A privilege level of 7 can be set for intermediate CLI security. |

**Default** Level 15

**Mode** Global Configuration

**Usage notes** This command enables the Network Administrator to set a password for entering the Privileged Exec mode when using the enable (Privileged Exec mode) command. There are three methods to enable a password. In the examples below, for each method, note that the configuration is different and the configuration file output is different, but the password string to be used to enter the Privileged Exec mode with the **enable** command is the same (in this example, **mypasswd**).

A user can have an intermediate CLI security level set with this command for privilege level 7 to access all the show commands in Privileged Exec mode and all the commands in User Exec mode, but not any configuration commands in Privileged Exec mode.

**Entering plaintext passwords**

The plaintext password is a clear text string that appears in the configuration file as configured. For example:

```
awplus# configure terminal
awplus(config)# enable password mypasswd
awplus(config)# end
```

This results in the following show output, with the password shown in plaintext:

```
awplus#show run
Current configuration:
...
hostname awplus
enable password mypasswd
...
```

**Entering encrypted passwords**

You can configure an encrypted password using the service password-encryption command. First, use the **enable password**command to specify the string that you want to use as a password (in this example, **mypasswd**). Then, use the service password-encryption command to encrypt the specified string (**mypasswd**). The advantage of using an encrypted password is that the configuration file does not show **mypasswd**; it will only show the encrypted string **fU7zHzuutY2SA**.

For example:

```
awplus# configure terminal
awplus(config)# enable password mypasswd
awplus(config)# service password-encryption
awplus(config)# end
```

This results in the following show output:

```
awplus#show run
Current configuration:
...
hostname awplus
enable password 8 fU7zHzuutY2SA
service password-encryption
...
```

**Entering pre-encrypted passwords**

You can configure an encrypted password using the **<encrypted-password>** parameter (**8**). Use this method if you already know the encrypted string corresponding to the plaintext string that you want to use as a password. You do not have to use the service password-encryption command with this method. The output in the configuration file will show only the encrypted string, and not the text string. For example:

```
awplus# configure terminal
awplus(config)# enable password 8 fU7zHzuutY2SA
awplus(config)# end
```

This results in the following show output:

```
awplus#show run
Current configuration:
...
hostname awplus
enable password 8 fU7zHzuutY2SA
...
```

**Related commands**

enable (Privileged Exec mode)

enable secret (deprecated)

service password-encryption

privilege level

show privilege

username

show running-config

# enable secret (deprecated)

**Overview** This command has been deprecated. It has been replaced by the enable password command.

# exec-timeout

**Overview** This command sets the interval your device waits for user input from either a console or VTY connection. Once the timeout interval is reached, the connection is dropped. This command sets the time limit when the console or VTY connection automatically logs off after no activity.

The **no** variant of this command removes a specified timeout and resets to the default timeout (10 minutes).

**Syntax**

```
exec-timeout {<minutes>} [<seconds>]
no exec-timeout
```

| Parameter | Description |
|---|---|
| *<minutes>* | <0-35791> Required integer timeout value in minutes |
| *<seconds>* | <0-2147483> Optional integer timeout value in seconds |

**Default** The default for the **exec-timeout** command is 10 minutes and 0 seconds (**exec-timeout 10 0**).

**Mode** Line Configuration

**Usage notes** This command is used set the time the telnet session waits for an idle VTY session, before it times out. An **exec-timeout 0 0** setting will cause the telnet session to wait indefinitely. The command **exec-timeout 0 0** is useful while configuring a device, but reduces device security.

If no input is detected during the interval then the current connection resumes. If no connections exist then the terminal returns to an idle state and disconnects incoming sessions.

**Examples** To set VTY connections to timeout after 2 minutes, 30 seconds if there is no response from the user, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# exec-timeout 2 30
```

To reset the console connection to the default timeout of 10 minutes 0 seconds if there is no response from the user, use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no exec-timeout
```

**Related commands**

line

service telnet

show running-config

# flowcontrol hardware (asyn/console)

**Overview** Use this command to enable RTS/CTS (Ready To Send/Clear To Send) hardware flow control on a terminal console line (asyn port) between the DTE (Data Terminal Equipment) and the DCE (Data Communications Equipment).

**Syntax**

```
flowcontrol hardware
no flowcontrol hardware
```

**Mode** Line Configuration

**Default** Hardware flow control is disabled by default.

**Usage notes** Hardware flow control makes use of the RTS and CTS control signals between the DTE and DCE where the rate of transmitted data is faster than the rate of received data. Flow control is a technique for ensuring that a transmitting entity does not overwhelm a receiving entity with data. When the buffers on the receiving device are full, a message is sent to the sending device to suspend the transmission until the data in the buffers has been processed.

Hardware flow control can be configured on terminal console lines (e.g. asyn0). For Reverse Telnet connections, hardware flow control must be configured to match on both the Access Server and the Remote Device. For terminal console sessions, hardware flow control must be configured to match on both the DTE and the DCE. Settings are saved in the running configuration. Changes are applied after reboot, clear line console, or after closing the session.

Use **show running-config** and **show startup-config** commands to view hardware flow control settings that take effect after reboot for a terminal console line. See the **show running-config** command output:

```
awplus#show running-config
!
line con 1
  speed 9600
  mode out 2001
  flowcontrol hardware
!
```

Note that line configuration commands do not take effect immediately. Line configuration commands take effect after one of the following commands or events:

- issuing a clear line console command
- issuing a reboot command
- logging out of the current session

**Examples**

To enable hardware flow control on terminal console line asyn0, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# flowcontrol hardware
```

To disable hardware flow control on terminal console line asyn0, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no flowcontrol hardware
```

**Related commands**

clear line console

show running-config

speed (asyn)

# length (asyn)

**Overview** Use this command to specify the number of rows of output that the device will display before pausing, for the console or VTY line that you are configuring.

The **no** variant of this command restores the length of a line (terminal session) attached to a console port or to a VTY to its default length of 22 rows.

**Syntax**

```
length <0-512>
no length
```

| Parameter | Description |
|---|---|
| *<0-512>* | Number of lines on screen. Specify 0 for no pausing. |

**Mode** Line Configuration

**Default** The length of a terminal session is 22 rows. The **no length** command restores the default.

**Usage notes** If the output from a command is longer than the length of the line the output will be paused and the '–More–' prompt allows you to move to the next screen full of data.

A length of 0 will turn off pausing and data will be displayed to the console as long as there is data to display.

**Examples** To set the terminal session length on the console to 10 rows, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# length 10
```

To reset the terminal session length on the console to the default (22 rows), use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no length
```

To display output to the console continuously, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# length 0
```

**Related commands** terminal resize

terminal length

# line

**Overview** Use this command to enter line configuration mode for the specified VTYs or the console. The command prompt changes to show that the device is in Line Configuration mode.

**Syntax**

```
line vty <first-line> [<last-line>]
line console 0
```

| Parameter | Description |
|---|---|
| *<first-line>* | *<0-32>* Specify the first line number. |
| *<last-line>* | *<0-32>* Specify the last line number. |
| console | The console terminal line(s) for local access. |
| vty | Virtual terminal for remote console access. |

**Mode** Global Configuration

**Usage notes** This command puts you into Line Configuration mode. Once in Line Configuration mode, you can configure console and virtual terminal settings, including setting speed (asyn), length (asyn), privilege level, and authentication (login authentication) or accounting (accounting login) method lists.

To change the console (asyn) port speed, use this **line** command to enter Line Configuration mode before using the speed (asyn)command. Set the console speed (Baud rate) to match the transmission rate of the device connected to the console (asyn) port on your device.

Note that line configuration commands do not take effect immediately. Line configuration commands take effect after one of the following commands or events:

- issuing a clear line console command
- issuing a reboot command
- logging out of the current session

**Examples** To enter Line Configuration mode in order to configure all VTYs, use the commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)#
```

To enter Line Configuration mode to configure the console (asyn 0) port terminal line, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)#
```

**Related commands**

accounting login

clear line console

clear line vty

flowcontrol hardware (asyn/console)

length (asyn)

login authentication

privilege level

speed (asyn)

# privilege level

**Overview** This command sets a privilege level for VTY or console connections. The configured privilege level from this command overrides a specific user's initial privilege level at the console login.

**Syntax**

```
privilege level <1-15>
```

**Mode** Line Configuration

**Usage notes** You can set an intermediate CLI security level for a console user with this command by applying privilege level 7 to access all show commands in Privileged Exec and all User Exec commands. However, intermediate CLI security will not show configuration commands in Privileged Exec.

**Examples** To set the console connection to have the maximum privilege level, use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# privilege level 15
```

To set all VTY connections to have the minimum privilege level, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# privilege level 1
```

To set all VTY connections to have an intermediate CLI security level, to access all show commands, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# privilege level 7
```

**Related commands**

enable password

line

show privilege

username

# security-password history

**Overview** This command specifies the number of previous passwords that are unable to be reused. A new password is invalid if it matches a password retained in the password history.

The **no** variant of the command disables this feature.

**Syntax**

```
security-password history <0-15>
no security-password history
```

| Parameter | Description |
|---|---|
| *<0-15>* | The allowable range of previous passwords to match against. A value of *0* will disable the history functionality and is equivalent to the **no security-password history** command. If the history functionality is disabled, all users' password history is reset and all password history is lost. |

**Default** The default history value is `0`, which will disable the history functionality.

**Mode** Global Configuration

**Examples** To restrict reuse of the three most recent passwords, use the command:

```
awplus# configure terminal
awplus(config)# security-password history 3
```

To allow the reuse of recent passwords, use the command:

```
awplus# configure terminal
awplus(config)# no security-password history
```

**Related commands**

security-password forced-change

security-password lifetime

security-password min-lifetime-enforce

security-password minimum-categories

security-password minimum-length

security-password reject-expired-pwd

security-password warning

show running-config security-password

show security-password configuration

show security-password user

# security-password forced-change

**Overview** This command specifies whether or not a user is forced to change an expired password at the next login. If this feature is enabled, users whose passwords have expired are forced to change to a password that must comply with the current password security rules at the next login.

Note that to use this command, the lifetime feature must be enabled with the security-password lifetime command and the reject-expired-pwd feature must be disabled with the security-password reject-expired-pwd command.

The **no** variant of the command disables this feature.

**Syntax**

```
security-password forced-change
no security-password forced-change
```

**Default** The forced-change feature is disabled by default.

**Mode** Global Configuration

**Example** To force a user to change their expired password at the next login, use the command:

```
awplus# configure terminal
awplus(config)# security-password forced-change
```

**Related commands**

security-password history

security-password lifetime

security-password min-lifetime-enforce

security-password minimum-categories

security-password minimum-length

security-password reject-expired-pwd

security-password warning

show running-config security-password

show security-password configuration

show security-password user

# security-password lifetime

**Overview** This command enables password expiry by specifying a password lifetime in days.

Note that when the password lifetime feature is disabled, it also disables the security-password forced-change command and the security-password warning command.

The **no** variant of the command disables this feature.

**Syntax**

```
security-password lifetime <0-1000>
no security-password lifetime
```

| Parameter | Description |
|---|---|
| *<0-1000>* | Password lifetime specified in days. A value of *0* will disable lifetime functionality and the password will never expire. This is equivalent to the **no security-password lifetime** command. |

**Default** The default password lifetime is `0`, which will disable the lifetime functionality.

**Mode** Global Configuration

**Example** To configure the password lifetime to 10 days, use the command:

```
awplus# configure terminal
awplus(config)# security-password lifetime 10
```

**Related commands**

security-password forced-change

security-password history

security-password min-lifetime-enforce

security-password minimum-categories

security-password minimum-length

security-password reject-expired-pwd

security-password warning

show running-config security-password

show security-password configuration

show security-password user

# security-password min-lifetime-enforce

**Overview** Use this command to configure a minimum number of days before a password can be changed by a user. With this feature enabled, once a user sets the password, the user cannot change it again until the minimum lifetime has passed.

Use the **no** variant of this command to remove the minimum lifetime.

**Syntax**

```
security-password min-lifetime-enforce <0-1000>
no security-password min-lifetime-enforce
```

| Parameter | Description |
|---|---|
| *<0-1000>* | The minimum number of days before a password can be changed |

**Default** By default, no minimum lifetime is enforced.

**Mode** Global Configuration

**Usage notes** The minimum lifetime is helpful in conjunction with a security policy that prevents people from re-using old passwords. For example, if you do not allow people to re-use any of their last 5 passwords, a person can bypass that restriction by changing their password 5 times in quick succession and then re-setting it to their previous password. The minimum lifetime prevents that by preventing people from changing their password in quick succession.

**Example** To force users to wait at least 2 days between changing passwords, use the command:

```
awplus(config)# security-password min-lifetime-enforce 2
```

**Related commands**

security-password forced-change

security-password history

security-password lifetime

show running-config security-password

show security-password configuration

show security-password user

**Command changes** Version 5.4.7-0.2: command added

# security-password minimum-categories

**Overview** This command specifies the minimum number of categories that the password must contain in order to be considered valid. The password categories are:

- uppercase letters: A to Z
- lowercase letters: a to z
- digits: 0 to 9
- special symbols: all printable ASCII characters not included in the previous three categories. The question mark (?) cannot be used as it is reserved for help functionality.

Note that to ensure password security, the minimum number of categories should align with the lifetime selected, i.e. the fewer categories specified the shorter the lifetime specified.

**Syntax**

```
security-password minimum-categories <1-4>
```

| Parameter | Description |
|---|---|
| *<1-4>* | Number of categories the password must satisfy, in the range 1 to 4. |

**Default** The default number of categories that the password must satisfy is `1`.

**Mode** Global Configuration

**Example** To configure the required minimum number of character categories to be `3`, use the command:

```
awplus# configure terminal
awplus(config)# security-password minimum-categories 3
```

**Related commands**

# security-password minimum-length

**Overview** This command specifies the minimum allowable password length. This value is checked against when there is a password change or a user account is created.

**Syntax**

```
security-password minimum-length <1-23>
```

| Parameter | Description |
|---|---|
| *<1-23>* | Minimum password length in the range from 1 to 23. |

**Default** The default minimum password length is `1`.

**Mode** Global Configuration

**Example** To configure the required minimum password length as `8`, use the command:

```
awplus# configure terminal
awplus(config)# security-password minimum-length 8
```

**Related commands**

show security-password user

# security-password reject-expired-pwd

**Overview** This command specifies whether or not a user is allowed to login with an expired password. Users with expired passwords are rejected at login if this functionality is enabled. Users then have to contact the Network Administrator to change their password.

***CAUTION:*** *Once all users' passwords are expired you are unable to login to the device again if the security-password reject-expired-pwd command has been executed. You will have to reboot the device with a default configuration file, or load an earlier software version that does not have the security password feature.*

*We recommend you never have the command line "security-password reject-expired-pwd" in a default config file.*

Note that when the reject-expired-pwd functionality is disabled and a user logs on with an expired password, if the forced-change feature is enabled with security-password forced-change command, a user may have to change the password during login depending on the password lifetime specified by the security-password lifetime command.

The **no** variant of the command disables this feature.

**Syntax**

```
security-password reject-expired-pwd
no security-password reject-expired-pwd
```

**Default** The reject-expired-pwd feature is disabled by default.

**Mode** Global Configuration

**Example** To configure the system to reject users with an expired password, use the command:

```
awplus# configure terminal
awplus(config)# security-password reject-expired-pwd
```

**Related commands**

security-password forced-change

security-password history

security-password lifetime

security-password min-lifetime-enforce

security-password minimum-length

security-password warning

show running-config security-password

show security-password configuration

show security-password user

# security-password warning

**Overview** This command specifies the number of days before the password expires that the user will receive a warning message specifying the remaining lifetime of the password.

Note that the warning period cannot be set unless the lifetime feature is enabled with the security-password lifetime command.

The **no** variant of the command disables this feature.

**Syntax**

```
security-password warning <0-1000>
no security-password warning
```

| Parameter | Description |
|---|---|
| *<0-1000>* | Warning period in the range from *0* to *1000* days. A value *0* disables the warning functionality and no warning message is displayed for expiring passwords. This is equivalent to the **no security-password warning** command. The warning period must be less than, or equal to, the password lifetime set with the security-password lifetime command. |

**Default** The default warning period is 0, which disables warning functionality.

**Mode** Global Configuration

**Example** To configure a warning period of three days, use the command:

```
awplus# configure terminal
awplus(config)# security-password warning 3
```

**Related commands**

security-password forced-change

security-password history

security-password lifetime

security-password min-lifetime-enforce

# service advanced-vty

**Overview** This command enables the advanced-vty help feature. This allows you to use TAB completion for commands. Where multiple options are possible, the help feature displays the possible options.

The **no service advanced-vty** command disables the advanced-vty help feature.

**Syntax**

```
service advanced-vty
no service advanced-vty
```

**Default** The advanced-vty help feature is enabled by default.

**Mode** Global Configuration

**Examples** To disable the advanced-vty help feature, use the command:

```
awplus# configure terminal
awplus(config)# no service advanced-vty
```

To re-enable the advanced-vty help feature after it has been disabled, use the following commands:

```
awplus# configure terminal
awplus(config)# service advanced-vty
```

# service password-encryption

**Overview** Use this command to enable password encryption. This is enabled by default. When password encryption is enabled, the device displays passwords in the running config in encrypted form instead of in plain text.

Use the **no service password-encryption** command to stop the device from displaying newly-entered passwords in encrypted form. This does not change the display of existing passwords.

**Syntax**

```
service password-encryption
no service password-encryption
```

**Mode** Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# service password-encryption
```

**Validation Commands** show running-config

**Related commands** enable password

# service telnet

**Overview** Use this command to enable the telnet server. The server is enabled by default. Enabling the telnet server starts the device listening for incoming telnet sessions on the configured port.

The server listens on port 23, unless you have changed the port by using the privilege level command.

Use the **no** variant of this command to disable the telnet server. Disabling the telnet server will stop the device listening for new incoming telnet sessions. However, existing telnet sessions will still be active.

**Syntax**

```
service telnet [ip|ipv6]
no service telnet [ip|ipv6]
```

**Default** The IPv4 and IPv6 telnet servers are enabled by default.

The configured telnet port is TCP port 23 by default.

**Mode** Global Configuration

**Examples** To enable both the IPv4 and IPv6 telnet servers, use the following commands:

```
awplus# configure terminal
awplus(config)# service telnet
```

To enable the IPv6 telnet server only, use the following commands:

```
awplus# configure terminal
awplus(config)# service telnet ipv6
```

To disable both the IPv4 and IPv6 telnet servers, use the following commands:

```
awplus# configure terminal
awplus(config)# no service telnet
```

To disable the IPv6 telnet server only, use the following commands:

```
awplus# configure terminal
awplus(config)# no service telnet ipv6
```

**Related commands** clear line vty

show telnet

telnet server

# service terminal-length (deleted)

**Overview** This command has been deleted in Software Version 5.4.5-0.1 and later.

# show aaa local user locked

**Overview** This command displays the current number of failed attempts, last failure time and location against each user account attempting to log into the device.

Note that once the lockout count has been manually cleared by another privileged account using the clear aaa local user lockout command or a locked account successfully logs into the system after waiting for the lockout time, this command will display nothing for that particular account.

**Syntax**

```
show aaa local user locked
```

**Mode** User Exec and Privileged Exec

**Example** To display the current failed attempts for local users, use the command:

```
awplus# show aaa local user locked
```

**Output** Figure 4-1: Example output from the **show aaa local user locked** command

```
awplus# show aaa local user locked
Login           Failures Latest failure     From
bob                  3    05/23/14 16:21:37  ttyS0
manager              5    05/23/14 16:31:44  192.168.1.200
```

**Related commands**

aaa local authentication attempts lockout-time

aaa local authentication attempts max-fail

clear aaa local user lockout

# show privilege

**Overview** This command displays the current user privilege level, which can be any privilege level in the range <1-15>. Privilege levels <1-6> allow limited user access (all User Exec commands), privilege levels <7-14> allow restricted user access (all User Exec commands plus Privileged Exec show commands). Privilege level 15 gives full user access to all Privileged Exec commands.

**Syntax**

```
show privilege
```

**Mode** User Exec and Privileged Exec

**Usage notes** A user can have an intermediate CLI security level set with this command for privilege levels <7-14> to access all show commands in Privileged Exec mode and all commands in User Exec mode, but no configuration commands in Privileged Exec mode.

**Example** To show the current privilege level of the user, use the command:

```
awplus# show privilege
```

**Output** Figure 4-2: Example output from the **show privilege** command

```
awplus#show privilege
Current privilege level is 15
awplus#disable
awplus>show privilege
Current privilege level is 1
```

**Related commands** privilege level

# show security-password configuration

**Overview** This command displays the configuration settings for the various security password rules.

**Syntax**

```
show security-password configuration
```

**Mode** Privileged Exec

**Example** To display the current security-password rule configuration settings, use the command:

```
awplus# show security-password configuration
```

**Output** Figure 4-3: Example output from the **show security-password configuration** command

```
Security Password Configuration
Minimum password length ........................... 8
Minimum password character categories to match ..... 3
Number of previously used passwords to restrict..... 4
Password lifetime ................................. 30 day(s)
  Warning period before password expires ........... 3 day(s)
Reject expired password at login ................... Disabled
  Force changing expired password at login ......... Enabled
```

# show security-password user

**Overview** This command displays user account and password information for all users.

**Syntax**

```
show security-password user
```

**Mode** Privileged Exec

**Example** To display the system users' remaining lifetime or last password change, use the command:

```
awplus# show security-password user
```

**Output** Figure 4-4: Example output from the **show security-password** user command

```
User account and password information

UserName          Privilege Last-PWD-Change   Remaining-lifetime
------------------------------------------------------------------
manager           15          4625 day(s) ago   No Expiry
bob15             15             0 day(s) ago   30 days
ted7              7              0 day(s) ago   No Expiry

# show telnet

**Overview** This command shows the Telnet server settings.

**Syntax**

```
show telnet
```

**Mode** User Exec and Privileged Exec

**Example** To show the Telnet server settings, use the command:

```
awplus# show telnet
```

**Output** Figure 4-5: Example output from the **show telnet** command

```
Telnet Server Configuration
-------------------------------------------------------------
Telnet server               : Enabled
Protocol                    : IPv4,IPv6
Port                        : 23
```

**Related commands**

clear line vty

service telnet

show users

telnet server

# show users

**Overview** This command shows information about the users who are currently logged into the device.

**Syntax**

```
show users
```

**Mode** User Exec and Privileged Exec

**Example** To show the users currently connected to the device, use the command:

```
awplus# show users
```

**Output** Figure 4-6: Example output from the **show users** command

```
Line     User             Host(s)  Idle      Location        Priv Idletime Timeout
con 0    manager          idle     00:00:00  ttyS0           15   10       N/A
vty 0    bob              idle     00:00:03  172.16.11.3     1    0        5
```

**Table 1:** Parameters in the output of the **show users** command

| Parameter | Description |
|---|---|
| Line | Console port user is connected to. |
| User | Login name of user. |
| Host(s) | Status of the host the user is connected to. |
| Idle | How long the host has been idle. |
| Location | URL location of user. |
| Priv | The privilege level in the range 1 to 15, with 15 being the highest. |
| Idletime | The time interval the device waits for user input from either a console or VTY connection. |
| Timeout | The time interval before a server is considered unreachable. |

# telnet

**Overview** Use this command to open a telnet session to a remote device.

**Syntax**

```
telnet {<hostname>|[ip] <ipv4-addr>|[ipv6] <ipv6-addr>}
[<port>]
```

**Syntax (VRF-lite)**

```
telnet [vrf <vrf-name>] {<hostname>|[ip] <ipv4-addr>|[ipv6]
<ipv6-addr>} [<port>]
```

| Parameter | Description |
|---|---|
| `vrf` | Apply this command to a VRF instance. |
| *<vrf-name>* | The name of the VRF instance. |
| *<hostname>* | The host name of the remote system. |
| `ip` | Keyword used to specify the IPv4 address or host name of a remote system. |
| *<ipv4-addr>* | An IPv4 address of the remote system. |
| `ipv6` | Keyword used to specify the IPv6 address of a remote system |
| *<ipv6-addr>* | Placeholder for an IPv6 address in the format `x:x::x:x`, for example, `2001:db8::8a2e:7334` |
| *<port>* | Specify a TCP port number (well known ports are in the range 1-1023, registered ports are 1024-49151, and private ports are 49152-65535). |

**Mode** User Exec and Privileged Exec

**Examples** To connect to TCP port 2602 on the device at 10.2.2.2, use the command:

```
awplus# telnet 10.2.2.2 2602
```

To connect to the telnet server `host.example`, use the command:

```
awplus# telnet host.example
```

To connect to the telnet server `host.example` on TCP port `100`, use the command:

```
awplus# telnet host.example 100
```

**Example (VRF-lite)** To open a telnet session to a remote host `192.168.0.1` associated with VRF instance `red`, use the command:

```
awplus# telnet vrf red ip 192.168.0.1
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# telnet server

**Overview** This command enables the telnet server on the specified TCP port. If the server is already enabled then it will be restarted on the new port. Changing the port number does not affect the port used by existing sessions.

**Syntax**

```
telnet server {<1-65535>|default}
```

| Parameter | Description |
|---|---|
| *<1-65535>* | The TCP port to listen on. |
| `default` | Use the default TCP port number 23. |

**Mode** Global Configuration

**Example** To enable the telnet server on TCP port 2323, use the following commands:

```
awplus# configure terminal
awplus(config)# telnet server 2323
```

**Related commands** show telnet

# terminal length

**Overview** Use the **terminal length** command to specify the number of rows of output that the device will display before pausing, for the currently-active terminal only.

Use the **terminal no length** command to remove the length specified by this command. The default length will apply unless you have changed the length for some or all lines by using the length (asyn) command.

**Syntax**

```
terminal length <length>
terminal no length [<length>]
```

| Parameter | Description |
|---|---|
| *<length>* | <0-512> Number of rows that the device will display on the currently-active terminal before pausing. |

**Mode** User Exec and Privileged Exec

**Examples** The following example sets the number of lines to 15:

```
awplus# terminal length 15
```

The following example removes terminal length set previously:

```
awplus# terminal no length
```

**Related commands** terminal resize

length (asyn)

# terminal resize

**Overview** Use this command to automatically adjust the number of rows of output on the console, which the device will display before pausing, to the number of rows configured on the user's terminal.

**Syntax**

```
terminal resize
```

**Mode** User Exec and Privileged Exec

**Usage notes** When the user's terminal size is changed, then a remote session via SSH or TELNET adjusts the terminal size automatically. However, this cannot normally be done automatically for a serial or console port. This command automatically adjusts the terminal size for a serial or console port.

**Examples** The following example automatically adjusts the number of rows shown on the console:

```
awplus# terminal resize
```

**Related commands** length (asyn)

terminal length

# username

**Overview** This command creates or modifies a user to assign a privilege level and a password.

***NOTE:*** *The default username privilege level of 1 is not shown in running-config output. Any username privilege level that has been modified from the default is shown.*

**Syntax**

```
username <name> privilege <1-15> [password [8] <password>]
username <name> password [8] <password>
no username <name>
```

| Parameter | Description | |
|---|---|---|
| *<name>* | The login name for the user. Do not use punctuation marks such as single quotes (‘ ‘), double quotes (“ “), or colons ( : ) with the user login name. | |
| `privilege` | The user’s privilege level. Use the privilege levels to set the access rights for each user. | |
| | *<1-15>* | A privilege level: either 1-14 (limited access) or 15 (full access). A user with privilege level 1-14 can only access higher privilege levels if an enable password has been configured for the level the user tries to access and the user enters that password.<br>A user at privilege level 1 can access the majority of show commands. A user at privilege level 7 can access the majority of show commands including platform show commands. Privilege Level 15 (to access the Privileged Exec command mode) is required to access configuration commands as well as show commands in Privileged Exec. |
| `password` | A password that the user must enter when logging in. | |
| | `8` | Specifies that you are entering a password as a string that has already been encrypted, instead of entering a plain-text password. The running-config displays the new password as an encrypted string even if password encryption is turned off.<br>Note that the user enters the plain-text version of the password when logging in. |
| | *<password>* | The user’s password. The password can be up to 32 characters in length and include characters from up to four categories. The password categories are:<br>• uppercase letters: A to Z<br>• lowercase letters: a to z<br>• digits: 0 to 9<br>• special symbols: all printable ASCII characters not included in the previous three categories. The question mark ? cannot be used as it is reserved for help functionality. |

**Mode** Global Configuration

**Default** The privilege level is 1 by default. Note the default is not shown in running-config output.

**Usage notes**

An intermediate CLI security level (privilege level 7 to privilege level 14) allows a CLI user access to the majority of show commands, including the platform show commands that are available at privilege level 1 to privilege level 6. Note that some show commands, such as **show running-configuration** and **show startup-configuration**, are only available at privilege level 15.

**Examples**

To create the user "bob" with a privilege level of 15, for all show commands including show running-configuration and show startup-configuration and to access configuration commands in Privileged Exec command mode, and the password "bobs_secret", use the commands:

```
awplus# configure terminal
awplus(config)# username bob privilege 15 password bobs_secret
```

To create a user "junior_admin" with a privilege level of 7, which will have intermediate CLI security level access for most show commands, and the password "show_only", use the commands:

```
awplus# configure terminal
awplus(config)# username junior_admin privilege 7 password
show_only
```

**Related commands**

enable password

security-password minimum-categories

security-password minimum-length

# 5 Subscription Licensing Commands

## Introduction

**Overview**

This chapter provides an alphabetical reference for each of the Subscription Licensing commands.

Subscription Licensing enables you to use the advanced threat protection features on your UTM firewall. To see the advanced threat protection subscriptions for your device, see the Datasheet.

Subscription Licensing enables you to use Allied Telesis Management Framework (AMF). You need to purchase an AMF subscription for each AMF master or controller node in your AMF network. To see the AMF subscriptions for your device, see the AlliedWare Plus Datasheet.

For step-by-step instructions about how to license AlliedWare Plus devices, see the Licensing Feature Overview and Configuration Guide.

**Command List**

- "license update file" on page 249
- "license update online" on page 250
- "show license external" on page 252

# license update file

**Overview** Use this command to load a license, after you have manually copied the license file onto the device.

Only use this command if you cannot directly access the Allied Telesis Download Center from this device. Otherwise, use the command license update online instead.

**Syntax**

```
license update file <filename>
```

| Parameter | Description |
|---|---|
| *<filename>* | Name and path of the license file on the device. |

**Mode** Privileged Exec

**Usage notes** You can download subscription licenses from the Allied Telesis Download Center, in order to copy them onto the device.

**Examples** To load a license onto a device from a file called “license_file.bin” that is stored at the top level of Flash memory, use the following command:

```
awplus# license update file license_file.bin
```

**Related commands** license update online

show license external

**Command changes** Version 5.4.6-2.1: usage changed by introduction of license update online

# license update online

**Overview** Use this command to add or update subscription licenses from the Allied Telesis Download Center, to subscribe to features such as advanced threat management and AMF master.

When you enter this command, the device will:

1) Connect to the Download Center

2) Check if new or changed licenses are available for the device, keyed to the device's serial number

3) For each such license it finds, download and install the license.

**Syntax**

```
license update online
```

**Default** AlliedWare Plus devices do not automatically connect to the Download Center and check whether licenses are available. They only check when you run the **license update online** command.

**Mode** User Exec/Privileged Exec

**Usage notes**

**Firewall rule**

AR-series firewalls block all traffic by default, so you need to configure a firewall rule to allow the licensing connection attempt to pass through the firewall. The following figure shows a recommended example configuration, when the WAN interface to the Internet is configured as a ppp0 interface:

```
zone public
 network wan
  ip subnet 0.0.0.0/0 interface ppp0
  host ppp0
   ip address dynamic interface ppp0

firewall
 rule 10 permit dns from public.wan.ppp0 to public.wan
 rule 20 permit https from public.wan.ppp0 to public.wan
 protect
```

This rule permits DNS and HTTPS packets to any destination IP address, if:

- the source IP address of the packets is the IP address of the ppp0 interface, and
- the packets are egressing the firewall through interface ppp0.

DNS packets are permitted so that the device can look up the address of the Download Center. HTTPS packets are permitted so the secure communication session with the Download Center can proceed.

The rule uses a subnet of 0.0.0.0/0 to match on any destination IP address.

The "from" part of the rule uses "public.wan.ppp0" because the firewall itself is originating the connection to the Download Center, rather than allowing traffic to flow through it, as is the case for most firewall rules. Hence, the traffic that is involved in the connection to the Download Center originates from the IP address of the PPP interface.

**Verifying the update**

The update process normally takes approximately 5 seconds.

If the console does not respond for 10 or more seconds after typing the command, a network, routing or firewall configuration error is probably preventing the connection from establishing. If this happens, you can abort the command by pressing Ctrl-C, or wait for the command to time out after 30 seconds.

If the connection to the Download Centers fails and times out, an error message will be generated on the CLI to indicate the problem. If you abort the command, no error message is displayed.

If the update is successful, the device will produce log messages to say which features have had their licensing state updated (activated, deactivated, number of items changed, or expiry date changed). If the command completes successfully but there are no licenses available for the device, or no change in the licenses already on the device, no log messages will be produced.

You should also use the show license external command to confirm which licenses are active on the device after the update has been applied.

**Example** To add a subscription license, use the command:

```
awplus# license update online
```

**Related commands** show license external

**Command changes** Version 5.4.6-2.1: command added

# show license external

**Overview** Use this command to show information about subscription (external) licenses.

**Syntax**

```
show license external
```

**Mode** Privileged Exec

**Examples** To show information about what subscription features the device is licensed for, use the following command:

```
awplus#show license external
```

**Output** Figure 5-1: Example output from **show license external**

```
awplus#show license external
Licensed features:

Application Control (Procera)
Start date                    : 24-Feb-2015 12:00AM
Expiry date                   : 24-Feb-2016 11:59PM

Web Control (Digital Arts)
Start date                    : 24-Feb-2015 12:00AM
Expiry date                   : 24-Feb-2016 11:59PM
```

**Related commands** license update online

# 6 Update Manager Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to update a resource. For more information, see the Update Manager Feature Overview and Configuration_Guide.

**Command List**

- "show resource" on page 254
- "update now" on page 256
- "update webgui now" on page 258

# show resource

**Overview** Use this command to show information about resources used by enabled features running either locally or offloaded.

**Syntax**

```
show resource [<resource-name>]
```

| Parameter | Description |
|---|---|
| *<resource-name>* | Specific resource to show |

**Mode** Privileged Exec

**Examples** To show information about the resources of features that have been enabled, use the following command:

```
awplus# show resource
```

**Output** Figure 6-1: Example output for **show resource**

```
awplus#show resource
-------------------------------------------------------------------------------
Resource Name          Status       Version    Interval  Last Download

```

The parameters in the example output are explained in the following table.

| Parameter | Description |
|---|---|
| Resource Name | Name of the updatable resource |
| Status | Resource status. There are five types of status: Sleeping, Checking, Starting, Downloading, Stopping. |
| Version | Current version of the resource |
| Interval | Configured update check interval for the resource |

| Parameter | Description |
|---|---|
| Last Download | Time stamp of last resource downloaded |
| Next Download Check | Time stamp of next download check for the resource |

**Related commands**

update-interval (antivirus)

update-interval (dpi)

update-interval (IP Reputation)

update-interval (malware)

update now

update webgui now

show utm-offload

**Command changes**

Version 5.4.9-2.1: command added to SBx908 GEN2

# update now

**Overview** Use this command to immediately perform a resource update check and update the specified resource if a newer version is available.

**Syntax**

```
update {<resource-name>|all} now
```

| Parameter | Description |
|---|---|
| `<resource-name>` | Specific resource to update. You will get an error message if the resource does not exist. |
| `all` | Update all resources |

**Mode** Privileged Exec

**Usage notes** The default update interval for a resource is 1 hour. Users can initiate an immediate update check for a resource at any time without affecting any configured update check schedule. The Update Manager will perform an update check for a resource when triggered to do so. The Update Manager will request the current version number of the resource from the Update Server, then compare it with the current local version. If they are different, the Update Manager will initiate an update of the local resource.

Note that if a feature is disabled, regular and manual update checks for its resources are also disabled.

Also note that an update check for a resource will not proceed if an update of that resource is already in progress.

The Update Manager will retry upon failure to download a resource file because of DNS resolution error, bad checksum and so on.

**Examples** To do an update check and update all available resources, use the following command:

```
awplus# update all now
```

To do an update check and update the IP Reputation feature, use the following command:

```
awplus# update iprep_et_rules now
```

To do an update check and update the device's GUI, use the following command:

```
awplus# update webgui now
```

**Related commands**

show resource

update-interval (antivirus)

update-interval (dpi)

update-interval (IP Reputation)

update-interval (malware)

update webgui now

**Command changes** Version 5.4.9-2.1: command added to SBx908 GEN2

# update webgui now

**Overview** Use this command to check whether you have the latest version of the device's GUI and update it if a newer version is available.

**Syntax**

```
update webgui now
```

**Mode** Privileged Exec

**Usage notes** If you have previously used the **copy** command to copy GUI files onto your device, these files need to be deleted before running **update webgui now**. To delete all GUI files, use the command:

```
awplus# del *gui_*.tar.gz
```

**Examples** To check for GUI updates, use the following command:

```
awplus# update webgui now
```

**Related commands** show resource

**Command changes** Version 5.4.9-2.1: command added to SBx908 GEN2

# 7 Web Redirect Commands

## Introduction

**Overview**

This chapter provides an alphabetical reference of commands used to configure Web Redirect.

The Web Redirect feature monitors HTTP requests passing through a device, intercepts the request, and replies with an HTTP Redirect message instructing the client to go to a specified URL.

For more information, see the Web Redirect Feature Overview and Configuration Guide.

**Command List**

- "browser-only (web-redirect)" on page 260
- "enable (web-redirect)" on page 261
- "exclude app" on page 262
- "exclude ip" on page 264
- "exclude mac" on page 265
- "exclude url" on page 266
- "idle-time (web-redirect)" on page 268
- "mode (web-redirect)" on page 270
- "proxy-host (web-redirect)" on page 272
- "repeat-time (web-redirect)" on page 274
- "server-url (web-redirect)" on page 275
- "show running-config web-redirect" on page 276
- "show web-redirect" on page 277
- "web-redirect" on page 278

# browser-only (web-redirect)

**Overview** Use this command to redirect only the HTTP requests sent by a web browser.

Use the **no** variant of this command to redirect all HTTP requests.

**Syntax**

```
browser-only
no browser-only
```

**Default** Disabled.

**Mode** Web Redirect Configuration

**Usage notes** Hosts may be using HTTP to request automatic software updates but it may be inappropriate for these requests to be redirected.

The **browser-only** option identifies browser requests by the "Mozilla" string in the User-Agent field of the HTTP request. If the string is not present the request is not redirected. All common browsers include "Mozilla" in their User-Agent field.

**Example** To redirect only web browser HTTP clients, use the following commands:

```
awplus# configure terminal
awplus(config)# web-redirect
awplus(config-web-redirect)# browser-only
```

To redirect all HTTP clients, use the following commands:

```
awplus# configure terminal
awplus(config)# web-redirect
awplus(config-web-redirect)# no browser-only
```

**Related commands** web-redirect

**Command changes** Version 5.4.8-1.1: command added

# enable (web-redirect)

**Overview** Use this command to enable web redirection on a device.

Use the **no** variant of this command to disable web redirection without losing any existing web redirection configuration.

**Syntax**

```
enable
no enable
```

**Default** Disabled.

**Mode** Web Redirect Configuration

**Usage notes** The web redirect feature monitors HTTP requests passing through a device, intercepts the request, and replies with an HTTP Redirect message instructing the client to go to a specified URL.

**Example** To enable web redirection, use the following commands:

```
awplus# configure terminal
awplus(config)# web-redirect
awplus(config-web-redirect)# enable
```

To disable web redirection, use the following commands:

```
awplus# configure terminal
awplus(config)# web-redirect
awplus(config-web-redirect)# no enable
```

**Related commands** web-redirect

**Command changes** Version 5.4.8-1.1: command added

# exclude app

**Overview** Use this command to exclude an application from having web-redirection applied to it.

Use the **no** variant of this command to remove the exclusion.

**Syntax**

```
exclude app <application-name>
no exclude app <application-name>
```

| Parameter | Description |
|---|---|
| *<application-name>* | The application name. |

**Default** Disabled

**Mode** Web Redirect Configuration

**Usage notes** You can use this command to exempt low security risk traffic from additional security processing and send it directly to the Internet, reducing the load on the proxy server.

**Example** To exclude the office365 application from having web-redirection applied, first set the **mode** to **proxy**:

```
awplus# configure terminal
awplus(config)# web-redirect
awplus(config-web-redirect)# mode proxy
```

Then configure the **proxy-host** server address and port:

```
awplus(config-web-redirect)# proxy-host 192.168.1.1 port 80
```

Finally use the **exclude app** command:

```
awplus(config-web-redirect)# exclude app office365
```

To remove the exclusion for the office365 application, use the command:

```
awplus(config-web-redirect)# no exclude app office365
```

**Related commands**

web-redirect

repeat-time (web-redirect)

idle-time (web-redirect)

server-url (web-redirect)

browser-only (web-redirect)

show running-config web-redirect

exclude ip

exclude mac

show web-redirect

mode (web-redirect)

proxy-host (web-redirect)

**Command changes** Version 5.5.0-2.3: command added

# exclude ip

**Overview** Use this command to exclude an IP address (or subnet) from being web redirected.

Use the **no** variant of this command to remove an excluded IP address (or subnet) from web redirection.

**Syntax**

```
exclude ip {<ip-address>|<ip-subnet>}
no exclude ip {<ip-address>|<ip-subnet>}
```

| Parameter | Description |
|---|---|
| *<ip-address>* | Exclude a specific client IP address from web redirection |
| *<ip-subnet>* | Exclude a client subnet from web redirection |

**Mode** Web Redirect Configuration

**Example** To exclude the subnet 192.0.2.0/24 from being redirected, use the commands:

```
awplus# configure terminal
awplus(config)# web-redirect
awplus(config-web-redirect)# exclude ip 192.0.2.0/24
```

To remove the subnet 192.0.2.0/24 from exclusion, use the commands:

```
awplus# configure terminal
awplus(config)# web-redirect
awplus(config-web-redirect)# no exclude ip 192.0.2.0/24
```

**Related commands** web-redirect

show running-config web-redirect

**Command changes** Version 5.4.8-1.1: command added

# exclude mac

**Overview** Use this command to exclude an entire group of MAC addresses from being redirected.

Use the **no** variant of this command to remove a MAC address exclusion.

**Syntax**

```
exclude mac <oui>
no exclude mac <oui>
```

| Parameter | Description |
|---|---|
| *<oui>* | The OUI (Organizational Unique Identifier) for the MAC address to be excluded. This is the vendor component of the MAC address, the first 24 bits that uniquely identify the vendor. |

**Mode** Web Redirect Configuration

**Example** To exclude Allied Telesis devices from being redirected, use the commands:

```
awplus# configure terminal
awplus(config)# web-redirect
awplus(config-web-redirect)# exclude mac 00:00:cd
```

To remove the exclusion of Allied Telesis devices, use the commands:

```
awplus# configure terminal
awplus(config)# web-redirect
awplus(config-web-redirect)# no exclude mac 00:00:cd
```

**Related commands** web-redirect

**Command changes** Version 5.4.8-1.1: command added

# exclude url

**Overview** Use this command to exclude a URL from having web-redirection applied to it.

Use the **no** variant of this command to remove the exclusion.

**Syntax**

```
exclude url <regexp>
no exclude url <regexp>
```

| Parameter | Description |
|---|---|
| *<regexp>* | A case sensitive regular expression used to check a URL for a match. If the URL matches the regular expression it is excluded from web redirection. |

**Default** Disabled

**Mode** Web Redirect Configuration

**Usage notes** Web Redirect (in **proxy** mode) forwards all HTTP/HTTPS traffic to an upstream proxy server.

You can use this command to exempt low risk traffic from web redirection and send it directly to the Internet, reducing the load on the proxy server.

**Example** To exclude all URLs containing 'example.com' from having web-redirection applied, first set the **mode** to proxy:

```
awplus# configure terminal
awplus(config)# web-redirect
awplus(config-web-redirect)# mode proxy
```

Then configure the **proxy-host** server address and port:

```
awplus(config-web-redirect)# proxy-host 192.168.1.1 port 80
```

Finally use the **exclude url** command:

```
awplus(config-web-redirect)# exclude url example.com
```

To remove the exclusion for all URLs ending with 'example.com', use the command:

```
awplus(config-web-redirect)# no exclude url example.com
```

**Other examples** To exclude all URLs that contain the word 'mail', use the following regular expression:

```
awplus(config-web-redirect)# exclude url mail
```

To exclude all URLs that start with 'https://', use the following regular expression:

```
awplus(config-web-redirect)# exclude url ^https://
```

To exclude a specific URL, use the following regular expression:

```
awplus(config-web-redirect)# exclude url
^https://www.example.com/Doc/FAQ/$
```

**Related commands**

web-redirect

repeat-time (web-redirect)

idle-time (web-redirect)

server-url (web-redirect)

browser-only (web-redirect)

show running-config web-redirect

exclude ip

exclude mac

exclude app

show web-redirect

mode (web-redirect)

proxy-host (web-redirect)

**Command changes**

Version 5.5.0-2.3: command added

# idle-time (web-redirect)

**Overview** Use this command to set the time the client must have been idle before it can be redirected once the repeat-time has expired.

This command improves your web browsing experience. For example, if you were busy browsing a web site and loading new content, then it is undesirable to be immediately redirected after the expiry of the repeat time interval. To ensure an ideal user experience, it is better to wait for an additional period of time to ensure current web site content is fully downloaded, and for the browser to have been idle before being redirected.

Use the **no** variant of this command to revert to the default value of 0.

**Syntax**

```
idle-time <0-86400>
no idle-time
```

| Parameter | Description |
|---|---|
| *<0-86400>* | Idle time after repeat time before redirecting a client, in seconds. |

**Default** 0 seconds.

**Mode** Web Redirect Configuration

**Usage notes** Sets the interval, following the repeat time, for which a client must be idle before it will be redirected again. This interval makes it likely that it will be a web page request that is redirected, rather than some sub-component of the page. This ensures the page that the user is being redirected to is displayed as a full page, rather than a sub-component of the current page being browsed to.

***NOTE:*** *The time when the client is idle can include the time leading up to the expiry of the **repeat-time**. So, if the idle time was 60sec and the client had been idle for the 60sec prior to the repeat-time expiring, the client could be redirected straight away. Or, if it had been idle for 30sec prior to the repeat-time expiring, it would need to be idle for a further 30sec afterwards, before being redirected.*

**Example** To configure the time after repeat time before redirecting a client to 1 hour (3600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# web-redirect
awplus(config-web-redirect)# idle-time 3600
```

To restore the default idle time, which is 0 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# web-redirect
awplus(config-web-redirect)# no idle-time
```

**Related commands**

web-redirect

repeat-time (web-redirect)

**Command changes**

Version 5.4.8-1.1: command added

# mode (web-redirect)

**Overview** Use this command to set the Web Redirection mode.

Use the **no** variant of this command to revert to the default mode of HTTP redirection.

**Syntax**

```
mode {http|proxy}
no mode
```

| Parameter | Description |
|---|---|
| `http` | HTTP and HTTPS redirection. This provides a way for HTTP and HTTPS client requests to be redirected to a specified URL. |
| `proxy` | Proxy chaining redirection. In proxy chaining mode, Web Redirect forwards all HTTP/HTTPS traffic to a particular upstream explicit proxy server. |

**Default** HTTP.

**Mode** Web Redirect Configuration

**Example** To set the web redirection to proxy chaining mode, use the commands:

```
awplus# configure terminal
awplus(config)# web-redirect
awplus(config-web-redirect)# mode proxy
```

To set the web redirection to HTTP mode, use the commands:

```
awplus# configure terminal
awplus(config)# web-redirect
awplus(config-web-redirect)# mode http
```

To restore the default web redirection, use the commands:

```
awplus# configure terminal
awplus(config)# web-redirect
awplus(config-web-redirect)# no mode
```

**Related commands**

web-redirect

repeat-time (web-redirect)

idle-time (web-redirect)

server-url (web-redirect)

browser-only (web-redirect)

show running-config web-redirect

exclude ip

exclude mac

exclude app

show web-redirect

**Command changes** Version 5.5.0-2.3: command added

# proxy-host (web-redirect)

**Overview** Use this command to configure the proxy server host and port for Web Redirect in proxy chaining mode.

In proxy chaining mode, Web Redirect forwards all HTTP/HTTPS traffic to the specified upstream proxy server.

Use the **no** variant of this command to remove a configured proxy server host and port.

**Syntax**

```
proxy-host {<ipv4-address>|<ipv6-address>|<host-name>} port
<0-65535>
no proxy-host
```

| Parameter | Description |
|---|---|
| *<ipv4-address>* | IPv4 address in dotted decimal format, for example, 192.0.2.2. |
| *<ipv6-address>* | IPv6 address in the format x:x::x:x for example, 2001:db8::8a2e:7334. |
| *<host-name>* | The host name. You can use all alphanumeric ASCII characters, and the dash (-) and underscore (_) characters. The name can be 1 to 64 characters in long. |
| port | The port number in the range of 0-65535. |

**Default** Disabled.

**Mode** Web Redirect Configuration

**Example** To configure a proxy server host of IP address 10.1.1.1 and port number 1234, use the commands:

```
awplus# configure terminal
awplus(config)# web-redirect
awplus(config-web-redirect)# proxy-host 10.1.1.1 port 1234
```

To remove the configuration, use the commands:

```
awplus# configure terminal
awplus(config)# web-redirect
awplus(config-web-redirect)# no proxy-host
```

**Related commands**

web-redirect

repeat-time (web-redirect)

idle-time (web-redirect)

server-url (web-redirect)

browser-only (web-redirect)

show running-config web-redirect

exclude ip

exclude mac

exclude app

show web-redirect

mode (web-redirect)

exclude url

**Command changes** Version 5.5.0-2.3: command added

# repeat-time (web-redirect)

**Overview** Use this command to configure the interval time between redirects for a client.

Use the **no** variant of this command to revert to the default interval time.

**Syntax**

```
repeat-time <1-31536000>
no repeat-time
```

| Parameter | Description |
|---|---|
| *<1-31536000>* | The interval between redirects for a client in seconds. |

**Default** 0 seconds.

**Mode** Web Redirect Configuration

**Usage notes** Sets the interval (in seconds) between redirects for a client. After the specified interval the client will be ***eligible*** to be redirected again. If no "repeat-time" is specified every client request will be eligible for a redirect immediately. Whether or not an eligible client is immediately redirected at the expiry of the repeat time depends on the **idle-time**.

**Example** To set the interval time between redirects to every hour (3600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# web-redirect
awplus(config-web-redirect)# repeat-time 3600
```

To restore the default repeat time interval time between re-directs (0 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# web-redirect
awplus(config-web-redirect)# no repeat-time
```

**Related commands** idle-time (web-redirect)

web-redirect

**Command changes** Version 5.4.8-1.1: command added

# server-url (web-redirect)

**Overview** Use this command to configure the URL of the server to which the HTTP connection will be redirected.

Use the **no** variant of this command to remove the configured server redirect URL.

**Syntax**

```
server-url <url>
no server-url
```

| Parameter | Description |
|---|---|
| *<url>* | URL (host name or dotted IP notation) |

**Mode** Web Redirect Configuration

**Example** To redirect the HTTP connection to http://redirectexample.com, use the commands:

```
awplus# configure terminal
awplus(config)# web-redirect
awplus(config-web-redirect)# server-url
http://redirectexample.com
```

To unset the server redirect URL, use the commands:

```
awplus# configure terminal
awplus(config)# web-redirect
awplus(config-web-redirect)# no server-url
```

**Related commands** web-redirect

**Command changes** Version 5.4.8-1.1: command added

# show running-config web-redirect

**Overview** Use this command to display the running configuration for web redirection.

**Syntax**

```
show running-config web-redirect
```

**Mode** Privileged Exec

**Example** To display the running configuration for web redirection, use the following commands:

```
awplus# show running-config web-redirect
```

**Output** Figure 7-1: Example output from **show running-config web-redirect**

```
awplus#show running-config web-redirect
web-redirect
 server-url http://redirectexample.com
 repeat-time 3600
 idle-time 360
 enable!
```

**Related commands** web-redirect

**Command changes** Version 5.4.8-1.1: command added.

# show web-redirect

**Overview** Use this command to display information about the status of web redirect, the total number of redirected hosts being tracked, and information about when each host (by IP) was last redirected and when it will next be eligible for redirection.

**Syntax**

```
show web-redirect
```

**Mode** Privileged Exec

**Example** To show the state of web redirection, use the following command:

```
awplus# show web-redirect
```

**Output** Figure 7-2: Example output from **show web-redirect**

```
awplus#show web-redirect
Mode:       HTTP redirection
Status:     Enabled
Total number of redirected clients: 5
Clients:
Address                   Last Redirection           Next redirection after
-------------------------------------------------------------------------------
192.0.2.0.2               Tue 22 Jun 2021 11:03:50   Wed 23 Jun 2021 11:03:50
192.0.2.0.17              Tue 22 Jun 2021 10:51:11   Wed 23 Jun 2021 10:51:11

2001:db8::1:ab6d          Tue 22 Jun 2021 01:18:39   Wed 23 Jun 2021 01:18:39
```

**Related commands** web-redirect

**Command changes** Version 5.4.8-1.1: command added

# web-redirect

**Overview** Use this command to enter the web redirection mode so you can configure web redirection.

Use the **no** variant of this command to remove all web redirection configuration.

**Syntax**

```
web-redirect
no web-redirect
```

**Default** Disabled.

**Mode** Global Configuration

**Example** To configure the web redirection settings, use the commands:

```
awplus# configure terminal
awplus(config)# web-redirect
awplus(config-web-redirect)#
```

To remove all web redirection configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no web-redirect
```

**Related commands**

enable (web-redirect)

repeat-time (web-redirect))

idle-time (web-redirect))

server-url (web-redirect)

browser-only (web-redirect)

show running-config web-redirect

exclude ip

exclude mac

show web-redirect

# 8 System Configuration and Monitoring Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands for configuring and monitoring the system.

**Command List**

- "banner display external-manager" on page 281
- "banner exec" on page 282
- "banner external-manager" on page 284
- "banner login (system)" on page 286
- "banner motd" on page 288
- "clock set" on page 290
- "clock summer-time date" on page 291
- "clock summer-time recurring" on page 293
- "clock timezone" on page 295
- "debug core-file" on page 296
- "hostname" on page 297
- "max-fib-routes" on page 299
- "max-static-routes" on page 301
- "no debug all" on page 302
- "reboot" on page 304
- "receive-packet-scheduler" on page 305
- "reload" on page 307
- "show banner external-manager" on page 308
- "show clock" on page 309
- "show cpu" on page 311

- "show cpu history" on page 314
- "show debugging" on page 316
- "show interface memory" on page 317
- "show memory" on page 319
- "show memory allocations" on page 321
- "show memory history" on page 323
- "show memory pools" on page 324
- "show memory shared" on page 325
- "show process" on page 326
- "show reboot history" on page 328
- "show router-id" on page 329
- "show system" on page 330
- "show system environment" on page 331
- "show system environment counters" on page 332
- "show system interrupts" on page 334
- "show system mac" on page 335
- "show system pci device" on page 336
- "show system pci tree" on page 337
- "show system serialnumber" on page 338
- "show tech-support" on page 339
- "speed (asyn)" on page 341
- "terminal monitor" on page 343
- "undebug all" on page 344

# banner display external-manager

**Overview** Use this command to display the external-manager banner. The external-manager banner warns you that certain features are being managed by an external management system. For example, if you are using Vista Manager EX to manage your network, you will see a notification banner telling you what features are being managed after you enter Global Configuration Mode.

Use the **no** variant of this command to hide the external-manager banner.

**Syntax**

```
banner display external-manager
no banner display external-manager
```

**Default** The external-manager banner is displayed by default.

**Mode** User Exec

**Usage notes** The external-manager banner is displayed by default. In some instances it is desirable to hide it for the current session. You do this by using the **no** variant of this command. The banner will remain hidden until you either re-enable it, or log out and then log back in.

**Example** To hide the external-manager banner, use the command:

```
awplus> no banner display external-manager
```

To display the external-manager banner, use the command:

```
awplus> banner display external-manager
```

**Related commands** banner external-manager

show banner external-manager

**Command changes** Version 5.5.1-1.1: command added

# banner exec

**Overview** This command configures the User Exec mode banner that is displayed on the console after you login. The **banner exec default** command restores the User Exec banner to the default banner. Use the **no banner exec** command to disable the User Exec banner and remove the default User Exec banner.

**Syntax**

```
banner exec <banner-text>
banner exec default
no banner exec
```

**Default** By default, the AlliedWare Plus™ version and build date is displayed at console login, such as:

```
AlliedWare Plus (TM) 5.5.1 04/05/21 12:00:00
```

**Mode** Global Configuration

**Examples** To configure a User Exec mode banner after login (in this example, to tell people to use the **enable** command to move to Privileged Exec mode), enter the following commands:

```
awplus#configure terminal
awplus(config)#banner exec Use enable to move to Priv Exec mode
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

Use enable to move to Priv Exec mode

awplus>
```

To restore the default User Exec mode banner after login, enter the following commands:

```
awplus#configure terminal
awplus(config)#banner exec default
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

AlliedWare Plus (TM) 5.5.1 04/05/21 12:00:00

awplus>
```

To remove the User Exec mode banner after login, enter the following commands:

```
awplus#configure terminal
awplus(config)#no banner exec
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

awplus>
```

**Related commands**

banner login (system)

banner motd

# banner external-manager

**Overview** Use this command to add an entry to the external-manager banner. The external-manager banner warns you that certain features are being managed by an external management system. For example, if you are using Vista Manager EX to manage your network, you will see a notification banner telling you what features are being managed after you enter Global Configuration Mode.

Use the **no** variant to remove an entry from the external-manager banner.

**Syntax**

```
banner external-manager <manager-name> feature <feature-name>
note <feature-note>
```

```
no banner external-manager <manager-name> [feature
<feature-name> note <feature-note>]
```

| Parameter | Description |
|---|---|
| *<manager-name>* | A string that describes the management system. |
| *<feature-name>* | A string that describes the feature being managed. |
| *<feature-note>* | A note for the feature. |

**Default** No external-manager banner entries are configured by default.

**Mode** Global Configuration

**Usage notes** When you run this command:

- if no entry exists for an external manager, the external manager, feature and note are added.
- if an entry already exists for an external manager, the feature and note are added to the existing manager.
- if the feature already exists for that manager, then the note is added to the existing feature.

The **no** variant of this command removes the specified note from the feature of the specified external manager.

- If there are no other notes for the feature, then the feature is removed.
- If the feature is removed and there are no other features for the external manager, then the external manager is removed.

Use the **no** variant with just the external manager name to remove an external manager and all its features and notes.

**Example**

To add an external manager note for 'Vista Manager' for the feature 'traffic-control' with the note 'Dynamic Traffic Management', use the commands:

```
awplus# configure terminal
awplus(config)# banner external-manager "Vista Manager" feature "traffic-control" note "Dynamic Traffic Management"
```

To remove the external manager note 'Dynamic Traffic Management' from the feature 'traffic-control' of the external manager 'Vista Manager', use the commands:

```
awplus# configure terminal
awplus(config)# no banner external-manager "Vista Manager" feature "traffic-control" note "Dynamic Traffic Management"
```

To remove all external manager features and notes for 'Vista Manager', use the commands:

```
awplus# configure terminal
awplus(config)# no banner external-manager "Vista Manager"
```

**Related commands**

banner display external-manager

show banner external-manager

**Command changes**

Version 5.5.1-1.1: command added

# banner login (system)

**Overview** This command configures the login banner that is displayed on the console when you login. The login banner is displayed on all connected terminals. The login banner is displayed after the MOTD (Message-of-the-Day) banner and before the login username and password prompts.

Use the **no banner login** command to disable the login banner.

**Syntax**

```
banner login
no banner login
```

**Default** By default, no login banner is displayed at console login.

**Mode** Global Configuration

**Examples** To configure a login banner of "Authorised users only" to be displayed when you login, enter the following commands:

```
awplus#configure terminal
awplus(config)#banner login
Type CNTL/D to finish.

Authorised users only

awplus(config)#exit
awplus#exit

Authorised users only

awplus login: manager
Password:

AlliedWare Plus (TM) 5.5.1 04/05/21 12:00:00

awplus>
```

To remove the login banner, enter the following commands:

```
awplus#configure terminal
awplus(config)#no banner login
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

AlliedWare Plus (TM) 5.5.1 04/05/21 12:00:00

awplus>
```

**Related commands**

banner exec

banner motd

# banner motd

**Overview** Use this command to create or edit the text MotD (Message-of-the-Day) banner displayed before login. The MotD banner is displayed on all connected terminals. The MotD banner is useful for sending messages that affect all network users, for example, any imminent system shutdowns.

Use the **no** variant of this command to delete the MotD banner.

**Syntax**

```
banner motd <motd-text>
no banner motd
```

| Parameter | Description |
|---|---|
| *<motd-text>* | The text to appear in the Message of the Day banner. |

**Default** By default, the device displays the AlliedWare Plus™ OS version and build date when you login.

**Mode** Global Configuration

**Examples** To configure a MotD banner of "System shutdown at 6pm today" to be displayed when you log in, enter the following commands:

```
awplus>enable
awplus#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
awplus(config)#banner motd System shutdown at 6pm today
awplus(config)#exit
awplus#exit

System shutdown at 6pm today
awplus login: manager
Password:

AlliedWare Plus (TM) 5.5.1 04/05/21 12:00:00

awplus>
```

To delete the login banner, enter the following commands:

```
awplus>enable
awplus#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
awplus(config)#no banner motd
awplus(config)#exit
awplus#exit

awplus login: manager
Password:

AlliedWare Plus (TM) 5.5.1 04/05/21 12:00:00

awplus>
```

**Related commands**

banner exec

banner login (system)

# clock set

**Overview** This command sets the time and date for the system clock.

**Syntax**

```
clock set <hh:mm:ss> <day> <month> <year>
```

| Parameter | Description |
|---|---|
| *<hh:mm:ss>* | Local time in 24-hour format |
| *<day>* | Day of the current month, from 1 to 31 |
| *<month>* | The first three letters of the current month |
| *<year>* | Current year, from 2000 to 2035 |

**Mode** Privileged Exec

**Usage notes** Configure the timezone before setting the local time. Otherwise, when you change the timezone, the device applies the new offset to the local time.

***NOTE:*** *If Network Time Protocol (NTP) is enabled, then you cannot change the time or date using this command. NTP maintains the clock automatically using an external time source. If you wish to manually alter the time or date, you must first disable NTP.*

**Example** To set the time and date on your system to 2pm on the 2nd of October 2016, use the command:

```
awplus# clock set 14:00:00 2 oct 2016
```

**Related commands** clock timezone

# clock summer-time date

**Overview** This command defines the start and end of summertime for a specific year only, and specifies summertime's offset value to Standard Time for that year.

The **no** variant of this command removes the device's summertime setting. This clears both specific summertime dates and recurring dates (set with the clock summer-time recurring command).

By default, the device has no summertime definitions set.

**Syntax**

```
clock summer-time <timezone-name> date <start-day>
<start-month> <start-year> <start-time> <end-day> <end-month>
<end-year> <end-time> <1-180>
```

```
no clock summer-time
```

| Parameter | Description |
|---|---|
| *<timezone-name>* | A description of the summertime zone, up to 6 characters long. |
| `date` | Specifies that this is a date-based summertime setting for just the specified year. |
| *<start-day>* | Day that the summertime starts, from 1 to 31. |
| *<start-month>* | First three letters of the name of the month that the summertime starts. |
| *<start-year>* | Year that summertime starts, from 2000 to 2035. |
| *<start-time>* | Time of the day that summertime starts, in the 24-hour time format HH:MM. |
| *<end-day>* | Day that summertime ends, from 1 to 31. |
| *<end-month>* | First three letters of the name of the month that the summertime ends. |
| *<end-year>* | Year that summertime ends, from 2000 to 2035. |
| *<end-time>* | Time of the day that summertime ends, in the 24-hour time format HH:MM. |
| *<1-180>* | The offset in minutes. |

**Mode** Global Configuration

**Examples** To set a summertime definition for New Zealand using NZST (UTC+12:00) as the standard time, and NZDT (UTC+13:00) as summertime, with the summertime set to begin on the 25th of September 2016 and end on the 2nd of April 2017:

```
awplus(config)# clock summer-time NZDT date 25 sep 2:00 2016 2
apr 2:00 2017 60
```

To remove any summertime settings on the system, use the command:

```
awplus(config)# no clock summer-time
```

**Related commands**

clock summer-time recurring

clock timezone

# clock summer-time recurring

**Overview** This command defines the start and end of summertime for every year, and specifies summertime's offset value to Standard Time.

The **no** variant of this command removes the device's summertime setting. This clears both specific summertime dates (set with the clock summer-time date command) and recurring dates.

By default, the device has no summertime definitions set.

**Syntax**

```
clock summer-time <timezone-name> recurring <start-week>
<start-day> <start-month> <start-time> <end-week> <end-day>
<end-month> <end-time> <1-180>
```

```
no clock summer-time
```

| Parameter | Description |
|---|---|
| *<timezone-name>* | A description of the summertime zone, up to 6 characters long. |
| `recurring` | Specifies that this summertime setting applies every year from now on. |
| *<start-week>* | Week of the month when summertime starts, in the range 1-5. The value 5 indicates the last week that has the specified day in it for the specified month. For example, to start summertime on the last Sunday of the month, enter 5 for <*start-week*> and sun for <*start-day*>. |
| *<start-day>* | Day of the week when summertime starts. Valid values are mon, tue, wed, thu, fri, sat or sun. |
| *<start-month>* | First three letters of the name of the month that summertime starts. |
| *<start-time>* | Time of the day that summertime starts, in the 24-hour time format HH:MM. |
| *<end-week>* | Week of the month when summertime ends, in the range 1-5. The value 5 indicates the last week that has the specified day in it for the specified month. For example, to end summertime on the last Sunday of the month, enter 5 for <*end-week*> and sun for <*end-day*>. |
| *<end-day>* | Day of the week when summertime ends. Valid values are mon, tue, wed, thu, fri, sat or sun. |
| *<end-month>* | First three letters of the name of the month that summertime ends. |
| *<end-time>* | Time of the day that summertime ends, in the 24-hour time format HH:MM. |
| *<1-180>* | The offset in minutes. |

**Mode** Global Configuration

**Examples** To set a summertime definition for New Zealand using NZST (UTC+12:00) as the standard time, and NZDT (UTC+13:00) as summertime, with summertime set to start on the last Sunday in September, and end on the 1st Sunday in April, use the command:

```
awplus(config)# clock summer-time NZDT recurring 5 sun sep 2:00
1 sun apr 2:00 60
```

To remove any summertime settings on the system, use the command:

```
awplus(config)# no clock summer-time
```

**Related commands** clock summer-time date

clock timezone

# clock timezone

**Overview** This command defines the device's clock timezone. The timezone is set as a offset to the UTC.

The **no** variant of this command resets the system time to UTC.

By default, the system time is set to UTC.

**Syntax**

```
clock timezone <timezone-name> {minus|plus}
[<0-13>|<0-12>:<00-59>]
```

```
no clock timezone
```

| Parameter | Description |
|---|---|
| *<timezone-name>* | A description of the timezone, up to 6 characters long. |
| minusorplus | The direction of offset from UTC. The **minus** option indicates that the timezone is behind UTC. The **plus** option indicates that the timezone is ahead of UTC. |
| *<0-13>* | The offset in hours or from UTC. |
| *<0-12>:<00-59>* | The offset in hours or from UTC. |

**Mode** Global Configuration

**Usage notes** Configure the timezone before setting the local time. Otherwise, when you change the timezone, the device applies the new offset to the local time.

**Examples** To set the timezone to New Zealand Standard Time with an offset from UTC of +12 hours, use the command:

```
awplus(config)# clock timezone NZST plus 12
```

To set the timezone to Indian Standard Time with an offset from UTC of +5:30 hours, use the command:

```
awplus(config)# clock timezone IST plus 5:30
```

To set the timezone back to UTC with no offsets, use the command:

```
awplus(config)# no clock timezone
```

**Related commands**

clock set

clock summer-time date

clock summer-time recurring

# debug core-file

**Overview** Use this command to enable the generation of crash core files.

Use the **no** variant of this command to disable the generation of crash core files.

**Syntax**

```
debug core-file
no debug core-file
```

**Default** Enabled.

**Mode** Global Configuration

**Usage notes** Core files may contain raw memory content. This may not be acceptable in a security certified network. Use the **no debug core-file** command to prevent such core files from being generated.

**Example** To prevent the generation of core files, use the commands:

```
awplus# configure terminal
awplus(config)# no debug core-file
```

**Related commands** show system

**Command changes** Version 5.4.9-1.0: command added

# hostname

**Overview** This command sets the name applied to the device as shown at the prompt. The hostname is:

- displayed in the output of the show system command
- displayed in the CLI prompt so you know which device you are configuring
- stored in the MIB object sysName

Use the **no** variant of this command to revert the hostname setting to its default. For devices that are not part of an AMF network, the default is "awplus".

**Syntax**

```
hostname <hostname>
no hostname [<hostname>]
```

| Parameter | Description |
|---|---|
| *<hostname>* | Specifies the name given to a specific device. |

**Default** `awplus`

**Mode** Global Configuration

**Usage notes** Within an AMF network, any device without a user-defined hostname will automatically be assigned a name based on its MAC address.

To efficiently manage your network using AMF, we strongly advise that you devise a naming convention for your network devices and apply an appropriate hostname to each device.

The name must also follow the rules for ARPANET host names. The name must start with a letter, end with a letter or digit, and use only letters, digits, and hyphens. Refer to RFC 1035.

**Example** To set the system name to `HQ-Sales`, use the command:

```
awplus# configure terminal
awplus(config)# hostname HQ-Sales
```

This changes the prompt to:

```
HQ-Sales(config)#
```

To revert to the default hostname `awplus`, use the command:

```
HQ-Sales(config)# no hostname
```

This changes the prompt to:

```
awplus(config)#
```

***NOTE:*** *When AMF is configured, running the* ***no hostname*** *command will apply a hostname that is based on the MAC address of the device node, for example,* ***node_0000_5e00_5301****.*

**Related commands** show system

# max-fib-routes

**Overview** This command enables you to control the maximum number of FIB routes configured. It operates by providing parameters that enable you to configure preset maximums and warning message thresholds.

***NOTE:*** *When using VRF-lite, this command applies to the Global VRF instance; to set the max-fib-routes for a user-defined VRF instance use the max-fib-routes (VRF) command. For static routes use the max-static-routes command for the Global VRF instance and the max-static-routes (VRF) command for a user-defined VRF instance.*

Use the **no** variant of this command to set the maximum number of FIB routes to the default of 4294967294 FIB routes.

**Syntax**

```
max-fib-routes <1-4294967294> [<1-100>|warning-only]
no max-fib-routes
```

| Parameter | Description |
|---|---|
| `max-fib-routes` | This is the maximum number of routes that can be stored in the device's Forwarding Information dataBase. In practice, other practical system limits would prevent this maximum being reached. |
| *<1-4294967294>* | The allowable configurable range for setting the maximum number of FIB-routes. |
| *<1-100>* | This parameter enables you to optionally apply a percentage value. This percentage will be based on the maximum number of FIB routes you have specified. This will cause a warning message to appear when your routes reach your specified percentage value. Routes can continue to be added until your configured maximum value is reached. |
| `warning-only` | This parameter enables you to optionally apply a warning message. If you set this option a warning message will appear if your maximum configured value is reached. Routes can continue to be added until your device reaches either the maximum capacity value of 4294967294, or a practical system limit. |

**Default** The default number of FIB routes is the maximum number of FIB routes (4294967294).

**Mode** Global Configuration

**Examples** To set the maximum number of dynamic routes to 2000 and warning threshold of 75%, use the following commands:

```
awplus# config terminal
awplus(config)# max-fib-routes 2000 75
```

**Related commands** max-fib-routes (VRF)

# max-static-routes

**Overview** Use this command to set the maximum number of static routes, excluding FIB (Forwarding Information Base) routes.

***NOTE:*** *For FIB routes use the max-fib-routes command.*

Use the **no** variant of this command to set the maximum number of static routes to the default of 1024 static routes.

**Syntax**

```
max-static-routes <1-1024>
no max-static-routes
```

**Default** The default number of static routes is the maximum number of static routes (1024).

**Mode** Global Configuration

**Example** To reset the maximum number of static routes to the default maximum, use the command:

```
awplus# configure terminal
awplus(config)# no max-static-routes
```

***NOTE:*** *Static routes are applied before adding routes to the RIB (Routing Information Base). Therefore, rejected static routes will not appear in the running config.*

**Related commands** max-fib-routes

# no debug all

**Overview** This command disables the debugging facility for all features on your device. This stops the device from generating any diagnostic debugging messages.

You can optionally disable the debugging facility for only the given protocol or feature. The features available depend on your device and will be a subset of the features listed in the Syntax section below.

**Syntax**

```
no debug all [bgp|ipv6 ospf|ipv6 rip|dot1x|nsm|ospf|pim
dense-mode|pim sparse-mode|rip|vrrp]
```

| Parameter | Description |
|---|---|
| `bgp` | Turns off all debugging for BGP (Border Gateway Protocol). |
| `dot1x` | Turns off all debugging for IEEE 802.1X port-based network access- control. |
| `ipv6 ospf` | Turns off all debugging for IPv6 OSPF (Open Shortest Path First). |
| `ipv6 rip` | Turns off all debugging for IPv6 RIP (Routing Information Protocol). |
| `nsm` | Turns off all debugging for the NSM (Network Services Module). |
| `ospf` | Turns off all debugging for OSPF (Open Shortest Path First). |
| `pim dense-mode` | Turns off all debugging for PIM (Protocol Independent Multicast) Dense Mode. |
| `pim sparse-mode` | Turns off all debugging for PIM (Protocol Independent Multicast) Sparse Mode. |
| `rip` | Turns off all debugging for RIP (Routing Information Protocol). |
| `vrrp` | Turns off all debugging for VRRP (Virtual Router Redundancy Protocol). |

**Default** Disabled

**Mode** Global Configuration and Privileged Exec

**Example** To disable debugging for all features, use the command:

```
awplus# no debug all
```

To disable all BGP debugging, use the command:

```
awplus# no debug all bgp
```

To disable all NSM debugging, use the command:

```
awplus# no debug all nsm
```

To disable all OSPF debugging, use the command:

```
awplus# no debug all ospf
```

To disable all PIM Sparse Mode debugging, use the command:

```
awplus# no debug all pim sparse-mode
```

To disable all RIP debugging, use the command:

```
awplus# no debug all rip
```

To disable all VRRP debugging, use the command:

```
awplus# no debug all vrrp
```

**Related commands** undebug all

**Command changes** Version 5.4.7-1.1: **pim dense-mode**, **pim sparse-mode**, and **rip** parameters added

# reboot

**Overview** This command halts the device and performs a cold restart (also known as reload). It displays a confirmation request before restarting.

**Syntax**

```
reboot
reload
```

**Mode** Privileged Exec

**Usage notes** The **reboot** and **reload** commands perform the same action.

**Examples** To restart the device, use the command:

```
awplus# reboot
reboot system? (y/n): y
```

# receive-packet-scheduler

**Overview** Use this command to configure a scheduling scheme that distributes packets to individual cores in a multi-core CPU.

Receive Packet Scheduling is the mechanism by which packets requiring software forwarding are distributed to individual cores in multi-core CPUs.

Use the **no** variant of this command to set the scheduling scheme back to the default of hash.

**Syntax**

```
receive-packet-scheduler {hash|balanced|split}
no receive-packet-scheduler
```

| Parameter | Description |
|---|---|
| `hash` | Hardware 5-Tuple flow hash-based packet core scheduling. This is the most suitable scheduling scheme for all scenarios. |
| `balanced` | Packets are balanced across cores as efficiently as possible providing the best performance for single flow scenarios. |
| `split` | Half of the CPU cores in a multi-core device are reserved for packet processing. These cores process packets using the default hash-based scheme. The other half of the processing cores are reserved for the IPsec encryption/decryption process. |

**Default** Hash.

**Mode** Global Configuration

**Usage notes** Receive Packet Scheduling is the mechanism by which packets requiring software forwarding are distributed to individual cores in multi-core CPUs.

AlliedWare Plus uses a flow hash based scheme to ensure packets from the same flow are processed in order on the same core. This is generally accepted as the best compromise between efficiency and stability for most network traffic.

There are however a few scenarios where a different mechanism may be required. Use this command to configure alternative packet scheduling algorithms to suit your traffic patterns.

***NOTE:*** *It is very unlikely that there would be any need to change from the default receive-packet-scheduling scheme (hash) as it is the most suitable mechanism for real network traffic.*

***CAUTION:*** *Changing the receive packet scheduling may require IPsec SA's to be processed on a different CPU core. Hence if there are active IPsec SA's when the scheme is changed they may no longer operate correctly. All active SA's can be reset using the* ***clear isakmp sa*** *command.*

**Example** To configure the receive packet scheduling scheme to **split**, use the following commands:

```
awplus# configure terminal
awplus(config)# receive-packet-scheduler split
```

To set the receive packet scheduling back to the default of **hash**, use the following commands:

```
awplus# configure terminal
awplus(config)# no receive-packet-scheduler
```

**Related commands** show running-config

**Command changes** Version 5.4.8-2.1: command added

# reload

**Overview** This command performs the same function as the reboot command.

# show banner external-manager

**Overview** Use this command to show the current external-manager banner. The external-manager banner warns you that certain features are being managed by an external management system. For example, if you are using Vista Manager EX to manage your network, you will see a notification banner telling you which features are being managed after you enter Global Configuration Mode.

**Syntax**

```
show banner external-manager
```

**Mode** User Exec

**Example** To show the external-manager banner, use the command:

```
awplus# show banner external-manager
```

**Output** Figure 8-1: Example output from **show banner external-manager**

```
awplus#show banner external-manager
The following features are being managed by external systems.
Configuring these features may have unintended consequences.
Manager: Network Manager
  Feature: ACLs
    Filters

Manager: Vista Manager
  Feature: Traffic control
    Application Priority
    Dynamic Traffic Management
  Feature: Web control
    all features
```

**Related commands** banner display external-manager

banner external-manager

**Command changes** Version 5.5.1-1.1: command added

# show clock

**Overview** This command displays the system's current configured local time and date. It also displays other clock related information such as timezone and summertime configuration.

**Syntax**

```
show clock
```

**Mode** User Exec and Privileged Exec

**Example** To display the system's current local time, use the command:

```
awplus# show clock
```

**Output** Figure 8-2: Example output from the **show clock** command for a device using New Zealand time

```
Local Time: Mon,  17 Oct 2016 13:56:06 +1200
UTC Time:   Mon,  17 Oct 2016 01:56:06 +0000
Timezone: NZST
Timezone Offset: +12:00
Summer time zone: NZDT
Summer time starts: Last Sunday in September at 02:00:00
Summer time ends: First Sunday in April at 02:00:00
Summer time offset: 60 mins
Summer time recurring: Yes
```

**Table 1:** Parameters in the output of the **show clock** command

| Parameter | Description |
|---|---|
| Local Time | Current local time. |
| UTC Time | Current UTC time. |
| Timezone | The current configured timezone name. |
| Timezone Offset | Number of hours offset to UTC. |
| Summer time zone | The current configured summertime zone name. |
| Summer time starts | Date and time set as the start of summer time. |
| Summer time ends | Date and time set as the end of summer time. |
| Summer time offset | Number of minutes that summer time is offset from the system's timezone. |
| Summer time recurring | Whether the device will apply the summer time settings every year or only once. |

**Related commands**

# show cpu

**Overview** This command displays a list of running processes with their CPU utilization.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show cpu [sort {thrds|pri|sleep|runtime}]
```

| Parameter | Description | |
|---|---|---|
| `sort` | Changes the sorting order using the following fields. If you do not specify a field, then the list is sorted by percentage CPU utilization. | |
| | `thrds` | Sort by the number of threads. |
| | `pri` | Sort by the process priority. |
| | `sleep` | Sort by the average time sleeping. |
| | `runtime` | Sort by the runtime of the process. |

**Mode** User Exec and Privileged Exec

**Examples** To show the CPU utilization of current processes, sorting them by the number of threads the processes are using, use the command:

```
awplus# show cpu sort thrds
```

**Output** Figure 8-3: Example output from **show cpu**

```
awplus#show cpu
CPU averages:
 1 second: 0%, 20 seconds: 0%, 60 seconds: 0%
System load averages:
 1 minute: 0.16, 5 minutes: 0.13, 15 minutes: 0.13
Current CPU load:
 userspace: 2%, kernel: 6%, interrupts: 0% iowaits: 0%

**Table 2:** Parameters in the output of the **show cpu** command

| Parameter | Description |
|---|---|
| `CPU averages` | Average CPU utilization for the periods stated. |
| `System load averages` | The average number of processes waiting for CPU time for the periods stated. |
| `Current CPU load` | Current CPU utilization specified by load types. |
| `pid` | Identifier number of the process. |
| `name` | A shortened name for the process |
| `thrds` | Number of threads in the process. |
| `cpu%` | Percentage of CPU utilization that this process is consuming. |
| `pri` | Process priority state. |
| `state` | Process state; one of "run", "sleep", "zombie", and "dead". |
| `sleep%` | Percentage of time that the process is in the sleep state. |
| `runtime` | The time that the process has been running for, measured in jiffies. A jiffy is the duration of one tick of the system timer interrupt. |

# show cpu history

**Overview** This command prints a graph showing the historical CPU utilization.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show cpu history
```

**Mode** User Exec and Privileged Exec

**Usage notes** This command's output displays three graphs of the percentage CPU utilization:

- per second for the last minute, then
- per minute for the last hour, then
- per 30 minutes for the last 30 hours.

**Examples** To display a graph showing the historical CPU utilization of the device, use the command:

```
awplus# show cpu history
```

**Output** Figure 8-4: Example output from the **show cpu history** command

# show interface memory

**Overview** This command displays the shared memory used by either all interfaces, or the specified interface or interfaces. The output is useful for diagnostic purposes by Allied Telesis authorized service personnel.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show interface memory
show interface <port-list> memory
```

| Parameter | Description |
|---|---|
| *<port-list>* | Display information about only the specified port or ports. The port list can be:<br>• an Eth port (e.g. eth1)<br>• an 802.1Q Ethernet sub-interface (e.g. eth1.10, where '10' is the VLAN ID specified by the **encapsulation dot1q** command)<br>• a switchport (e.g. port1.0.4)<br>• a static channel group (e.g. sa2)<br>• a dynamic (LACP) channel group (e.g. po2)<br>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)<br>• a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list. |

**Mode** User Exec and Privileged Exec

**Example** To display the shared memory used by all interfaces, use the command:

```
awplus# show interface memory
```

To display the shared memory used by port1.0.1 and port1.0.3 to port1.0.4, use the command:

```
awplus# show interface port1.0.1,port1.0.3-port1.0.4 memory
```

**Output** Figure 8-6: Example output from the **show interface memory** command

```
awplus#show interface memory

# show memory

**Overview** This command displays the memory used by each process that is currently running.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show memory [sort {size|peak|stk}]
```

| Parameter | Description | |
|---|---|---|
| `sort` | Changes the sorting order for the list of processes. If you do not specify this, then the list is sorted by percentage memory utilization. | |
| | `size` | Sort by the amount of memory the process is currently using. |
| | `peak` | Sort by the amount of memory the process is currently using. |
| | `stk` | Sort by the stack size of the process. |

**Mode** User Exec and Privileged Exec

**Example** To display the memory used by the current running processes, use the command:

```
awplus# show memory
```

**Output** Figure 8-8: Example output from **show memory**

```
awplus#show memory

# show memory shared

**Overview** This command displays shared memory allocation information. The output is useful for diagnostic purposes by Allied Telesis authorized service personnel.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show memory shared
```

**Mode** User Exec and Privileged Exec

**Example** To display information about the shared memory allocation used on the device, use the command:

```
awplus# show memory shared
```

**Output** Figure 8-12: Example output from the **show memory shared** command

```
awplus#show memory shared
Shared Memory Status
--------------------------
Segment allocated  = 39
Pages allocated    = 39
Pages resident     = 11

Shared Memory Limits
--------------------------
Maximum number of segments          = 4096
Maximum segment size (kbytes)       = 32768
Maximum total shared memory (pages) = 2097152
Minimum segment size (bytes)        = 1
```

**Related commands**

show memory allocations

show memory history

show memory

# show process

**Overview** This command lists a summary of the current running processes.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show process [sort {cpu|mem}]
```

| Parameter | Description | |
|---|---|---|
| sort | Changes the sorting order for the list of processes. | |
| | cpu | Sorts the list by the percentage of CPU utilization. |
| | mem | Sorts the list by the percentage of memory utilization. |

**Mode** User Exec and Privileged Exec

**Usage notes** This command displays a snapshot of currently-running processes. If you want to see CPU or memory utilization history instead, use the commands show cpu history or show memory history.

**Example** To display a summary of the current running processes, use the command:

```
awplus# show process
```

**Output** Figure 8-13: Example output from the **show process** command

```
CPU averages:
 1 second: 8%, 20 seconds: 5%, 60 seconds: 5%
System load averages:
 1 minute: 0.04, 5 minutes: 0.08, 15 minutes: 0.12
Current CPU load:
 userspace: 9%, kernel: 9%, interrupts: 0% iowaits: 0%
RAM total: 514920 kB; free: 382600 kB; buffers: 16368 kB

user processes
==============
pid name          thrds  cpu%  mem%   pri  state  sleep%
962 pss             12     0     6    25  sleep       5
1   init             1     0     0    25  sleep       0
797 syslog-ng        1     0     0    16  sleep      88
...
kernel threads
==============

71  aio/0         0     20   sleep  0
3   events/0      0     10   sleep  98
...
```

**Table 4:** Parameters in the output from the **show process** command

| Parameter | Description |
|---|---|
| `CPU averages` | Average CPU utilization for the periods stated. |
| `System load averages` | The average number of processes waiting for CPU time for the periods stated. |
| `Current CPU load` | Current CPU utilization specified by load types |
| `RAM total` | Total memory size. |
| `free` | Available memory. |
| `buffers` | Memory allocated to kernel buffers. |
| `pid` | Identifier for the process. |
| `name` | Short name to describe the process. |
| `thrds` | Number of threads in the process. |
| `cpu%` | Percentage of CPU utilization that this process is consuming. |
| `mem%` | Percentage of memory utilization that this process is consuming. |
| `pri` | Process priority. |
| `state` | Process state; one of “run”, “sleep”, “stop”, “zombie”, or “dead”. |
| `sleep%` | Percentage of time the process is in the sleep state. |

**Related commands**

show cpu

show cpu history

# show reboot history

**Overview** Use this command to display the device's reboot history.

**Syntax**

```
show reboot history
```

**Mode** User Exec and Privileged Exec

**Example** To show the reboot history, use the command:

```
awplus# show reboot history
```

**Output** Figure 8-14: Example output from the **show reboot history** command

```
awplus#show reboot history

<date>     <time>    <type>      <description>
-----------------------------------------------
2016-10-10 01:42:04  Expected    User Request
2016-10-10 01:35:31  Expected    User Request
2016-10-10 01:16:25  Unexpected  Rebooting due to critical process (network/nsm)
failure!
2016-10-10 01:11:04  Unexpected  Rebooting due to critical process (network/nsm)
failure!
2016-10-09 19:56:16  Expected    User Request
2016-10-09 19:51:20  Expected    User Request
```

**Table 5:** Parameters in the output from the **show reboot history** command

| Parameter | Description |
|---|---|
| Unexpected | A non-intended reboot. |
| Expected | A planned or user-triggered reboot. |
| User request | User initiated reboot via the CLI. |

**Related commands** show tech-support

# show router-id

**Overview** Use this command to show the Router ID of the current system.

**Syntax**

```
show router-id
```

**Mode** User Exec and Privileged Exec

**Example** To display the Router ID of the current system, use the command:

```
awplus# show router-id
```

**Output** Figure 8-15: Example output from the **show router-id** command

```
awplus>show router-id
Router ID: 10.55.0.2 (automatic)
```

# show system

**Overview** This command displays general system information about the device, including the hardware, memory usage, and software version. It also displays location and contact details when these have been set.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show system
```

**Mode** User Exec and Privileged Exec

**Example** To display configuration information, use the command:

```
awplus# show system
```

**Output** Figure 8-16: Example output from **show system**

```

**Related commands** show system environment

# show system environment

**Overview** This command displays the current environmental status of your device and any attached PSU, XEM, or other expansion option. The environmental status covers information about temperatures, fans, and voltage.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show system environment
```

**Mode** User Exec and Privileged Exec

**Example** To display the system's environmental status, use the command:

```
awplus# show system environment
```

**Output** Figure 8-17: Example output from **show system environment**

Table 8-1: Parameters in the output from **show system environment counters**

| Parameter | Description |
|---|---|
| Value readings | Number of times that the value of this sensor has been read. |
| Threshold readings | Number of times that a threshold value related to this sensor has been read. |
| Checked readings | Number of times that this sensor has gone outside a threshold and has been re-read to confirm this is a genuine error. |
| Read errors | Number of times that there was an error returned when reading this sensor or one of its threshold values. |
| Alarm asserted | Number of times that this sensor has entered the fault state. |
| Alarm cleared | Number of times that this sensor has left the fault state. |

Version 5.5.0-0.1: command added

# show system interrupts

**Overview** Use this command to display the number of interrupts for each IRQ (Interrupt Request) used to interrupt input lines on a PIC (Programmable Interrupt Controller) on your device.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show system interrupts
```

**Mode** User Exec and Privileged Exec

**Example** To display information about the number of interrupts for each IRQ in your device, use the command:

```
awplus# show system interrupts
```

**Output** Figure 8-19: Example output from the **show system interrupts** command

```
awplus#show system interrupts

**Related commands** show system environment

# show system mac

**Overview** This command displays the physical MAC address of the device.

**Syntax**

```
show system mac
```

**Mode** User Exec and Privileged Exec

**Example** To display the physical MAC address enter the following command:

```
awplus# show system mac
```

**Output** Figure 8-20: Example output from the **show system mac** command

```
awplus#show system mac
0200.0034.5682 (eth1)
0200.0034.5683 (eth2)
0200.0034.5684 (system)
```

# show system pci device

**Overview** Use this command to display the PCI devices on your device.

**Syntax**

```
show system pci device
```

**Mode** User Exec and Privileged Exec

**Example** To display information about the PCI devices on your device, use the command:

```
awplus# show system pci device
```

**Output**

```
awplus#show system pci device
00:0c.0 Class 0200: 11ab:00d1 (rev 01)
        Flags: bus master, 66Mhz, medium devsel, latency 128, IRQ 113
        Memory at 5ffff000 (32-bit, non-prefetchable) [size=4K]
        Memory at 58000000 (32-bit, non-prefetchable) [size=64M]

00:0d.0 Class 0200: 11ab:00d1 (rev 01)
        Flags: bus master, 66Mhz, medium devsel, latency 128, IRQ 116
        Memory at 57fff000 (32-bit, non-prefetchable) [size=4K]
        Memory at 50000000 (32-bit, non-prefetchable) [size=64M]
```

**Related commands** show system environment

show system pci tree

# show system pci tree

**Overview** Use this command to display the PCI tree on your device.

**Syntax**

```
show system pci tree
```

**Mode** User Exec and Privileged Exec

**Example** To display information about the PCI tree on your device, use the command:

```
awplus# show system pci tree
```

**Related commands**

show system environment

show system pci device

# show system serialnumber

**Overview** This command shows the serial number information for the device.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show system serialnumber
```

**Mode** User Exec and Privileged Exec

**Example** To display the serial number information for the device, use the command:

```
awplus# show system serialnumber
```

**Output** Figure 8-21: Example output from the **show system serialnumber** command

```
awplus#show system serialnumber
45AX5300X
```

# show tech-support

**Overview** This command generates system and debugging information for the device and saves it to a file.

This command is useful for collecting a large amount of information so that it can then be analyzed for troubleshooting purposes. The output of this command can be provided to technical support staff when reporting a problem.

You can optionally limit the command output to display only information for a given protocol or feature. The features available depend on your device and will be a subset of the features listed in the table below.

**Syntax**

```
show tech-support
{[all|atmf|auth|bgp|card|dhcpsn|epsr|firewall|igmp|ip|ipv6|mld
|openflow|ospf|ospf6|pim|rip|ripng|stack|stp|system|tacacs+|
update]} [outfile <filename>]
```

| Parameter | Description |
|---|---|
| `all` | Display full information |
| `atmf` | Display ATMF-specific information |
| `auth` | Display authentication-related information |
| `bgp` | Display BGP-related information |
| `card` | Display Chassis Card specific information |
| `dhcpsn` | Display DHCP Snooping specific information |
| `epsr` | Display EPSR specific information |
| `firewall` | Display firewall specific information |
| `igmp` | Display IGMP specific information |
| `ip` | Display IP specific information |
| `ipv6` | Display IPv6 specific information |
| `mld` | Display MLD specific information |
| `openflow` | Display information related to OpenFlow |
| `ospf` | Display OSPF related information |
| `ospf6` | Display OSPF6 specific information |
| `pim` | Display PIM related information |
| `rip` | RIP related information |
| `ripng` | Display RIPNG specific information |
| `stack` | Display stacking device information |
| `stp` | Display STP specific information |
| `system` | Display general system information |

| Parameter | Description |
|---|---|
| `tacacs+` | Display TACACS+ information |
| `update` | Display resource update specific information |
| `\|` | Output modifier |
| `>` | Output redirection |
| `>>` | Output redirection (append) |
| `outfile` | Output file name |
| `<filename>` | Specifies a name for the output file. If no name is specified, this file will be saved as: tech-support.txt.gz. |

**Default** Captures **all** information for the device.

By default the output is saved to the file 'tech-support.txt.gz' in the current directory. If this file already exists in the current directory then a new file is generated with the time stamp appended to the file name, for example 'tech-support20161009.txt.gz', so the previous file is retained.

**Usage notes** The command generates a large amount of output, which is saved to a file in compressed format. The output file name can be specified by outfile option. If the output file already exists, a new file name is generated with the current time stamp. If the output filename does not end with ".gz", then ".gz" is appended to the filename. Since output files may be too large for Flash on the device we recommend saving files to external memory or a TFTP server whenever possible to avoid device lockup. This method is not likely to be appropriate when running the working set option of AMF across a range of physically separated devices.

**Mode** Privileged Exec

**Examples** To produce the output needed by technical support staff, use the command:

```
awplus# show tech-support
```

# speed (asyn)

**Overview** This command changes the console speed from the device. Note that a change in console speed is applied for subsequent console sessions. Exit the current session to enable the console speed change using the clear line console command.

**Syntax**

```
speed <console-speed-in-bps>
```

| Parameter | Description | |
|---|---|---|
| *<console-speed-in-bps>* | Console speed Baud rate in bps (bits per second). | |
| | 1200 | 1200 Baud |
| | 2400 | 2400 Baud |
| | 9600 | 9600 Baud |
| | 19200 | 19200 Baud |
| | 38400 | 38400 Baud |
| | 57600 | 57600 Baud |
| | 115200 | 115200 Baud |

**Default** The default console speed baud rate is 9600 bps.

**Mode** Line Configuration

**Usage notes** This command is used to change the console (asyn) port speed. Set the console speed to match the transmission rate of the device connected to the console (asyn) port on your device.

**Example** To set the terminal console (asyn0) port speed from the device to 57600 bps, then exit the session, use the commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# speed 57600
awplus(config-line)# exit
awplus(config)# exit
awplus# exit
```

Then log in again to enable the change:

```
awplus login:
Password:
awplus>
```

**Related commands**

clear line console

line

show running-config

show startup-config

speed

# terminal monitor

**Overview** Use this command to display debugging output on a terminal.

To display the cursor after a line of debugging output, press the Enter key.

Use the command **terminal no monitor** or **no terminal monitor** to stop displaying debugging output on the terminal. Alternatively, you can use the timeout option to stop displaying debugging output on the terminal after a set time.

**Syntax**

```
terminal monitor [<1-60>]
terminal no monitor
no terminal monitor
```

| Parameter | Description |
|---|---|
| *<1-60>* | Set a timeout between 1 and 60 seconds for terminal output. |

**Default** Disabled

**Mode** User Exec and Privileged Exec

**Examples** To display debugging output on a terminal, enter the command:

```
awplus# terminal monitor
```

To display debugging on the terminal for 60 seconds, enter the command:

```
awplus# terminal monitor 60
```

To stop displaying debugging output on the terminal, use the command:

```
awplus# no terminal monitor
```

**Related commands** All debug commands

**Command changes** Version 5.4.8-0.2: **no terminal monitor** added as an alias for **terminal no monitor**

# undebug all

**Overview** This command applies the functionality of the no debug all command.

# 9 Pluggables and Cabling Commands

## Introduction

**Overview**

This chapter provides an alphabetical reference of commands used to configure and monitor Pluggables and Cabling, including:

- Optical Digital Diagnostic Monitoring (DDM) to help find fiber issues when links go down
- Active Fiber Monitoring for detecting changes in optical power received over fiber cables.

For more information, see the Pluggables and Cabling Feature Overview and Configuration Guide.

**Command List**

- "clear fiber-monitoring interface" on page 346
- "debug fiber-monitoring" on page 347
- "fiber-monitoring action" on page 349
- "fiber-monitoring baseline" on page 351
- "fiber-monitoring enable" on page 353
- "fiber-monitoring interval" on page 354
- "fiber-monitoring sensitivity" on page 355
- "show system fiber-monitoring" on page 357
- "show system pluggable" on page 360
- "show system pluggable detail" on page 362
- "show system pluggable diagnostics" on page 365

# clear fiber-monitoring interface

**Overview** Use this command to clear the Active Fiber Monitoring state of a port. It clears the alarm, baseline and history and starts monitoring from the beginning. It does not change the configuration.

**Syntax**

```
clear fiber-monitoring interface <port>
```

| Parameter | Description |
|---|---|
| *<port>* | The name of the port to reset Active Fiber Monitoring on. |

**Default** n/a

**Mode** Privileged Exec

**Usage notes** Normally, you do not need to clear the Active Fiber Monitoring state of a port. If the issue resolves itself and the monitored optical power returns to the baseline, the alarm clears automatically.

However, you may need to clear the Active Fiber Monitoring state if the optical power level reduces for a known reason, causing the port to be stuck in the alarm state. In this situation, the alarm will not clear automatically, because Active Fiber Monitoring does not update the baseline when the port is in the alarm state, for security reasons.

**Example** To clear the Active Fiber Monitoring state for interface eth1, use the command:

```
awplus# clear fiber-monitoring interface eth1
```

**Related commands** show system fiber-monitoring

**Command changes** Version 5.4.8-0.2: command added

# debug fiber-monitoring

**Overview** Use this command to enable debugging of active fiber monitoring on the specified ports.

Use the **no** variant of this command to disable debugging on all ports or the specified ports.

**Syntax**

```
debug fiber-monitoring interface <port-list>
no debug fiber-monitoring [interface <port-list>]
```

| Parameter | Description |
|---|---|
| *<port-list>* | The list of fiber ports to enable or disable debugging for, as a single port, a comma separated list or a hyphenated range. |

**Default** Debugging of active fiber monitoring is disabled by default.

**Mode** User Exec/Privileged Exec

**Usage** While debugging is enabled by this command for a port, all the optical power readings for the port are sent to the console.

**Example** To enable debugging messages for active fiber monitoring of eth1 to be sent to the console, use the commands:

```
awplus# debug fiber-monitoring interface eth1
awplus# terminal monitor
```

To disable debugging messages for active fiber monitoring on eth1, use the command:

```
awplus# no debug fiber-monitoring interface eth1
```

To disable all debugging messages for active fiber monitoring, use the command:

```
awplus# no debug fiber-monitoring
```

**Output** Figure 9-1: Example output from **debug fiber-monitoring**

```
awplus#debug fiber-monitoring interface eth1
awplus#terminal monitor
% Warning: Console logging enabled

```

**Related commands** show system fiber-monitoring

# fiber-monitoring action

**Overview** Use this command to specify an action to be taken if the optical power received on the port changes from the baseline by the amount specified in the **fiber-monitoring sensitivity** command.

Use the **no** variant of this command to remove the specified action or all actions from the port.

**Syntax**

```
fiber-monitoring action [trap] [shutdown] [continuous]
no fiber-monitoring action [trap|shutdown]
```

| Parameter | Description |
|---|---|
| `trap` | Send an SNMP notification. |
| `shutdown` | Shutdown the port. |
| `continuous` | Make the action or actions happen continuously (every polling interval) while the sensor is in the alarm state. Otherwise, the action only happens when the alarm is triggered or cleared. |

**Default** By default a log message is generated, but no additional action is performed.

**Mode** Interface Configuration mode for a fiber port.

**Usage** If fiber monitoring is enabled and this command is not used to set an action, a change in received power on a fiber port only generates a log message.

**Example** To set the device to send an SNMP trap when eth1 or eth2 receive reduced power and when that reduced-power alarm is cleared, use the commands:

```
awplus(config)# interface eth1-eth2
awplus(config-if)# fiber-monitoring action trap
```

To set the device to send an SNMP trap when eth1 or eth2 receive reduced power, and every polling interval after that until the alarm is cleared, use the commands:

```
awplus(config)# interface eth1-eth2
awplus(config-if)# fiber-monitoring action trap continuous
```

To set the device to send an SNMP trap and to shut down the port when eth1 or eth2 receive reduced power, use the commands:

```
awplus(config)# interface eth1-eth2
awplus(config-if)# fiber-monitoring action trap shutdown
```

To set the device to stop shutting down the port if eth1 or eth2 receive reduced power, use the commands:

```
awplus(config)# interface eth1-eth2
awplus(config-if)# no fiber-monitoring action shutdown
```

If the device is set to send an SNMP trap for those ports, it will continue to do so.

To set the device not to perform any action when it receives reduced power on eth1 or eth2, except sending a log message, use the commands:

```
awplus(config)# interface eth1-eth2
awplus(config-if)# no fiber-monitoring action
```

fiber-monitoring sensitivity

show system fiber-monitoring

**Command changes**

Version 5.4.8-0.2: **continuous** parameter added

# fiber-monitoring baseline

**Overview** Use this command to configure how the baseline value for comparison is calculated for active fiber monitoring on the port.

Note that alarm generation will not commence until the link has been up for a full averaging period.

Use the **no** variant of this command to set the fiber-monitoring baseline to its default value.

**Syntax**

```
fiber-monitoring baseline average <12-150> [interval <2-86400>]
fiber-monitoring baseline fixed <1-65535>
no fiber-monitoring baseline
```

| Parameter | Description |
|---|---|
| `average <12-150>` | Set the baseline optical power received to be based on the moving average of the specified number of most recent (non-zero) values. Default is to use this setting and 12 values. |
| `interval <2-86400>` | Optionally, specify the optical power polling interval for determining the baseline, in seconds. By default, the baseline polling interval is the same as the monitoring polling interval, which is 5 seconds by default.<br>If specified, this baseline interval should be larger than the monitoring interval.<br>Even if you specify a baseline interval, Active Fiber Monitoring will use the monitoring interval to calculate the initial baseline average. This means the first x baseline readings will be taken at the monitoring interval, where x is the number of readings specified in the **average** parameter.<br>See Usage below for more information. |
| `fixed <1-65535>` | Set the baseline to a fixed level of received optical power in 0.0001mW. Not recommended—see Usage below. |

**Default** The default is a moving average of the last 12 values, taken at the same interval as the monitoring interval. The monitoring interval is set using the **fiber-monitoring interval** command. If the monitoring interval is set to its default of 5 seconds, the **fiber-monitoring baseline** default will be the average over the last minute.

**Mode** Interface Configuration for a fiber port

**Usage notes** There are two ways to configure the baseline. The first is to choose a number of readings to average. This is the default and recommended method. The second is to set a fixed value in units of x0.0001mW.

If a fixed value is required, the easiest way to choose a value is to enable fiber monitoring on the port and use the **show system fiber-monitoring** command to see what readings you can expect.

***CAUTION:*** *We do not recommend setting a fixed value because gradual change over time caused by temperature fluctuations, etc. could lead to unnecessary alarms.*

If you use the averaging method, you can optionally specify how often Active Fiber Monitoring polls the cable to determine the baseline. This allows Active Fiber Monitoring to update the baseline less often than it polls the device for monitoring.

In order to prevent the theoretical possibility of slow clamping, you can set the baseline interval to a large value, so that the baseline average is only updated with the current reading (for example) once per day or once per hour.

As fiber attenuation can be affected by ambient temperature, take care if changing the baseline interval in environments with large daily temperature fluctuations.

**Example** To set the baseline optical power to a moving average of the last 30 monitoring readings on eth1 and eth2, use the command:

```
awplus(config)# interface eth1-eth2
awplus(config-if)# fiber-monitoring baseline average 30
```

To calculate the baseline based on 12 values taken 24 hours (86400 seconds) apart, instead of using the monitoring interval, use the command:

```
awplus(config)# interface eth1-eth2
awplus(config-if)# fiber-monitoring baseline average 12
interval 86400
```

To set the baseline to its default, averaging the last 12 readings, use the command:

```
awplus(config)# interface eth1-eth2
awplus(config-if)# no fiber-monitoring baseline
```

**Related commands** fiber-monitoring interval

fiber-monitoring sensitivity

**Command changes** Version 5.4.8-0.2: **interval** parameter added

# fiber-monitoring enable

**Overview** Use this command to enable active fiber monitoring on a fiber port. If the port can support fiber monitoring but does not have the correct SFP or fiber type installed, the configuration will be saved, and monitoring will commence when a supported SFP is inserted. Disabling and re-enabling fiber monitoring on a port resets the baseline calculation.

Use the **no** variants of this command to disable active fiber monitoring on the interface, or to remove all the configuration and state for the ports, respectively.

**Syntax**

```
fiber-monitoring enable
no fiber-monitoring enable
no fiber-monitoring
```

**Default** Active fiber monitoring is disabled by default.

**Mode** Interface Configuration mode for a fiber port

**Examples** To enable active fiber monitoring on eth1 and eth2, use the commands:

```
awplus(config)# interface eth1-eth2
awplus(config-if)# fiber-monitoring enable
```

To disable fiber monitoring on the ports, use the commands:

```
awplus(config)# interface eth1-eth2
awplus(config-if)# no fiber-monitoring enable
```

To remove all fiber-monitoring configuration and state for the ports, use the commands:

```
awplus(config)# interface eth1-eth2
awplus(config-if)# no fiber-monitoring
```

**Related commands**

fiber-monitoring action

fiber-monitoring sensitivity

show system fiber-monitoring

# fiber-monitoring interval

**Overview** Use this command to configure the fiber monitoring polling interval in seconds for the port. The optical power will be read every <interval> seconds and compared against the calculated threshold values to see if a log message or other action is required.

Use the **no** variant of this command to reset the polling interval to the default (5 seconds).

**Syntax**

```
fiber-monitoring interval <2-60>
no fiber-monitoring interval
```

| Parameter | Description |
|---|---|
| *<2-60>* | Optical power polling interval in seconds. |

**Default** The interval is set to 5 seconds by default.

**Mode** Interface configuration mode for a fiber port.

**Example** To set the fiber monitoring polling interval for eth1 to 30 seconds, use the commands:

```
awplus(config)# interface eth1
awplus(config-if)# fiber-monitoring interval 30
```

To reset the fiber monitoring polling interval back to the default (5s), use the commands:

```
awplus(config)# interface eth1
awplus(config-if)# no fiber-monitoring interval
```

**Related commands** fiber-monitoring baseline

show system fiber-monitoring

# fiber-monitoring sensitivity

**Overview** Use this command to configure the sensitivity of the alarm thresholds on the port for active fiber monitoring.

Use the **no** variant of this command to reset the sensitivity to the default.

**Syntax**

```
fiber-monitoring sensitivity (low|medium|high|highest|fixed
<25-65535>)|relative <0.01-10.0>
```

```
no fiber-monitoring sensitivity
```

| Parameter | Description |
|---|---|
| `low` | Low sensitivity (+/-2 dB) |
| `medium` | Medium sensitivity (1 dB) (default) |
| `high` | High sensitivity (the greater of 0.5 dB and 0.0025 mW) |
| `highest` | The highest sensitivity available: 0.0025mW |
| `fixed <25-65535>` | Fixed sensitivity at the specified level in 0.0001 mW. |
| `relative <0.01-10.0>` | Relative sensitivity at the specified level in dB. |

**Default** Medium sensitivity.

**Mode** User Exec/Privileged Exec

**Usage** A log message is generated and configured actions are taken if the received optical power drops below the baseline value by the sensitivity configured with this command.

The sensitivity can be configured to one of four pre-defined levels in decibels or to a fixed absolute delta in units of 0.0001mW. The alarm thresholds can be seen in the **show system fiber-monitoring** output. The maximum absolute sensitivity configurable is 0.0025 mW. Note that 0.0025 mW equates to a reduction of approximately 1dB at the maximum attenuation of an AT-SPLX10/1.

**Example** To set the fiber monitoring sensitivity for eth1 to a relative sensitivity of 0.1 dB, use the commands:

```
awplus(config)# interface eth1
awplus(config-if)# fiber-monitoring sensitivity relative 0.1
```

To reset the fiber monitoring sensitivity to the default (medium), use the commands:

```
awplus(config)# interface eth1
awplus(config-if)# no fiber-monitoring sensitivity
```

**Related commands** fiber-monitoring action

fiber-monitoring baseline

## show system fiber-monitoring

# show system fiber-monitoring

**Overview** Use this command to display settings and current status for Active Fiber Monitoring.

**Syntax**

```
show system fiber-monitoring
```

**Mode** User Exec and Privileged Exec

**Example** To display configuration and status for active fiber monitoring on ports, use the command:

```
awplus# show system fiber-monitoring
```

**Output** Figure 9-2: Example output from **show system fiber-monitoring**

```
awplus#show sys fiber-monitoring
Fiber Monitoring Status
  Reading units 0.0001mW

Interface eth1
Status:           enabled

 Alarm threshold:  0
 Alarm:            no
 Last 12 Readings: 0 0 0 0 0 0 0 0 0 0 0 0
 Minimum reading: 0
 Maximum reading: 0
```

Table 9-1: Parameters in the output from **show system fiber-monitoring**

| Parameter | Description |
|---|---|
| `Reading units` | The units for optical power readings in the rest of the display, e.g. 0.0001mW. |
| `Status` | Whether active fiber monitoring is enabled or disabled for this port. |
| `Supported` | Whether the pluggable inserted in this port supports active fiber monitoring. |
| `Debugging` | Whether debugging of active fiber monitoring is enabled or disabled for this port. |
| `Interval` | The configured interval between readings of optical power on this port. |
| `Sensitivity` | The configured sensitivity threshold for optical power changes on this port. |
| `Baseline type` | How the baseline optical power level is calculated: either the average of the specified number of previous readings or a specified fixed value in 0.0001mW. |
| `Status` | Current values for the following parameters. |
| `Baseline value` | The baseline value, calculated according to the configured baseline method, in 0.0001mW. |
| `Alarm threshold` | The current threshold for a change in optical power, calculated according to the configured sensitivity method, that will result in action. |
| `Alarm` | Whether the optical power at the most recent reading fallen below the threshold. |
| `Last 12 readings` | The last 12 optical power values measured, in 0.0001mW, with oldest value first. |
| `Minimum reading` | The lowest optical power reading since the fiber pluggable was last inserted, or since active fiber monitoring was last enabled on the port. |
| `Maximum reading` | The highest optical power reading since the fiber pluggable was last inserted, or since active fiber monitoring was last enabled on the port. |

# show system pluggable

**Overview** This command displays **brief** pluggable transceiver information showing the pluggable type, the pluggable serial number, and the pluggable port on the device. Different types of pluggable transceivers are supported in different models of device. See your Allied Telesis dealer for more information about the models of pluggables that your device supports.

**Syntax**

```
show system pluggable [<port-list>]
```

| Parameter | Description |
|---|---|
| *<port-list>* | The ports to display information about. The port list can be:<br>• a switch port (e.g. eth1)<br>• a continuous range of ports separated by a hyphen (e.g. porteth1-eth2)<br>• a comma-separated list of ports and port ranges (e.g. eth1,eth2) |

**Mode** User Exec and Privileged Exec

**Example** To display brief information about all installed pluggable transceivers, use the command:

```
awplus# show system pluggable
```

**Output** Figure 9-3: Example output from **show system pluggable**

```
awplus#show system pluggable
System Pluggable Information

Port    Vendor           Device           Serial Number    Datecode Type
-------------------------------------------------------------------------------
eth1  ATI              AT-SPSX          A03240R151300867 15032801 1000BASE-SX
eth2  ATI              AT-SPSX          A03240R111800076 15032801 1000BASE-SX
-------------------------------------------------------------------------------
```

**Table 10:** Parameters in the output from the **show system pluggable** command

| Parameter | Description |
|---|---|
| Port | Specifies the port number for the installed pluggable transceiver. |
| Vendor | Specifies the vendor's name for the installed pluggable transceiver. |
| Device | Specifies the device name for the installed pluggable transceiver. |

**Table 10:** Parameters in the output from the **show system pluggable** command (cont.)

| Parameter | Description |
|---|---|
| `Serial Number` | Specifies the serial number for the installed pluggable transceiver. |
| `Datecode` | Specifies the manufacturing datecode for the installed pluggable transceiver. Checking the manufacturing datecode with the vendor may be useful when determining Laser Diode aging issues. For more information, see "Troubleshooting Fiber and Pluggable Issues" in the "Pluggables and Cabling" Feature Overview and Configuration Guide. |
| `Type` | Specifies the device type for the installed pluggable transceiver. |

**Related commands**

show system environment

show system pluggable detail

show system pluggable diagnostics

# show system pluggable detail

**Overview** This command displays detailed pluggable transceiver information showing the pluggable type, the pluggable serial number, and the pluggable port on the device. Different types of pluggable transceivers are supported in different models of device. See your Allied Telesis dealer for more information about the models of pluggables that your device supports.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show system pluggable [<port-list>] detail
```

| Parameter | Description |
|---|---|
| *<port-list>* | The ports to display information about. The port list can be:<br>• a switch port (e.g. eth1)<br>• a continuous range of ports separated by a hyphen (e.g. porteth1-eth2)<br>• a comma-separated list of ports and port ranges (e.g. eth1,eth2) |

**Mode** User Exec and Privileged Exec

**Usage notes** In addition to the information about pluggable transceivers displayed using the show system pluggable command (port, manufacturer, serial number, manufacturing datecode, and type information), the **show system pluggable detail** command displays the following information:

- **SFP Laser Wavelength**: Specifies the laser wavelength of the installed pluggable transceiver
- **Single mode Fiber**: Specifies the link length supported by the pluggable transceiver using single mode fiber
- **OM1 (62.5µ m) Fiber**: Specifies the link length, in meters (m) or kilometers (km) supported by the pluggable transceiver using 62.5 micron multi-mode fiber.
- **OM2 (50µ m) Fiber**: Specifies the link length (in meters or kilometers) supported by the pluggable transceiver using 50 micron multi-mode fiber.
- **Diagnostic Calibration**: Specifies whether the pluggable transceiver supports DDM or DOM Internal or External Calibration.
  - **Internal** is displayed if the pluggable transceiver supports DDM or DOM Internal Calibration.
  - **External** is displayed if the pluggable transceiver supports DDM or DOM External Calibration.
  - a dash (-) is displayed if neither Internal Calibration or External Calibration is supported.

- **Power Monitoring**: Displays the received power measurement type, which can be either **OMA**(Optical Module Amplitude) or **Avg**(Average Power) measured in µW.

***NOTE:*** *For parameters that are not supported or not specified, a hyphen is displayed instead.*

**Example** To display detailed information about the pluggable transceivers installed in a particular port on the device, use a command like:

```
awplus# show system pluggable eth1 detail
```

To display detailed information about all the pluggable transceivers installed on the device, use the command:

```
awplus# show system pluggable detail
```

**Output** Figure 9-4: Example output from **show system pluggable detail** for a port

```
awplus#show system pluggable eth1 detail
System Pluggable Information Detail
eth1
==========
Vendor Name:              ATI
Device Name:        AT-SPSX
Device Revision:          A
Device Type:              1000BASE-SX
Serial Number:            A02420N0607J0023
Manufacturing Datecode:   060704
SFP Laser Wavelength:     850nm
Link Length Supported
  Single Mode Fiber :     -
  OM1 (62.5um) Fiber:     150m
  OM2 (50um) Fiber  :     300m
  OM3 (50um) Fiber  :     -
Diagnostic Calibration:   External
Power Monitoring:         Average
```

Table 9-1: Parameters in the output from **show system pluggable detail**

| Parameter | Description |
|---|---|
| Port | Specifies the port the pluggable transceiver is installed in. |
| Vendor Name | Specifies the vendor's name for the installed pluggable transceiver. |
| Device Name | Specifies the device name for the installed pluggable transceiver. |
| Device Revision | Specifies the hardware revision code for the pluggable transceiver. This may be useful for troubleshooting because different devices may support different pluggable transceiver revisions. |

Table 9-1: Parameters in the output from **show system pluggable detail** (cont.)

| Parameter | Description |
|---|---|
| `Device Type` | Specifies the device type for the installed pluggable transceiver. |
| `Serial Number` | Specifies the serial number for the installed pluggable transceiver. |
| `Manufacturing Datecode` | Specifies the manufacturing datecode for the installed pluggable transceiver. Checking the manufacturing datecode with the vendor may be useful when determining Laser Diode aging issues. For more information, see "Troubleshooting Fiber and Pluggable Issues" in the "Pluggables and Cabling" Feature Overview and Configuration Guide. |
| `SFP Laser Wavelength` | Specifies the laser wavelength of the installed pluggable transceiver. |
| `Single Mode Fiber` | Specifies the link length supported by the pluggable transceiver using single mode fiber. |
| `OM1 (62.5um) Fiber` | Specifies the link length (in µm - micron) supported by the pluggable transceiver using 62.5 micron multi-mode fiber. |
| `OM2 (50um) Fiber` | Specifies the link length (in µm - micron) supported by the pluggable transceiver using 50 micron multi-mode fiber. |
| `Diagnostic Calibration` | Specifies whether the pluggable transceiver supports DDM or DOM Internal or External Calibration:<br>**Internal** is displayed if the pluggable transceiver supports DDM or DOM Internal Calibration.<br>**External** is displayed if the pluggable transceiver supports DDM or DOM External Calibration.<br>**-** is displayed if neither Internal Calibration or External Calibration is supported. |
| `Power Monitoring` | Displays the received power measurement type, which can be either **OMA** (Optical Module Amplitude) or **Avg** (Average Power) measured in µW. |

**Related commands**

show system environment

show system pluggable

show system pluggable diagnostics

# show system pluggable diagnostics

**Overview** This command displays diagnostic information about pluggable transceivers that support Digital Diagnostic Monitoring (DDM).

Different types of pluggable transceivers are supported in different models of device. See your device's Datasheet for more information about the models of pluggables that your device supports.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show system pluggable [<port-list>] diagnostics
```

| Parameter | Description |
|---|---|
| *<port-list>* | The ports to display information about. The port list can be:<br>• a switch port (e.g. eth1)<br>• a continuous range of ports separated by a hyphen (e.g. porteth1-eth2)<br>• a comma-separated list of ports and port ranges (e.g. eth1,eth2) |

**Mode** User Exec and Privileged Exec

**Usage notes** Diagnostic monitoring features allow you to monitor real-time parameters of the pluggable transceiver, such as optical output power, optical input power, temperature, laser bias current, and transceiver supply voltage. Additionally, RX LOS (Loss of Signal) is shown when the received optical level is below a preset threshold. Monitor these parameters to check on the health of all transceivers, selected transceivers or a specific transceiver installed in a device.

**Examples** To display detailed information about all pluggable transceivers installed on a standalone device, use the command:

```
awplus# show system pluggable diagnostics
```

**Output** Figure 9-5: Example output from the **show system pluggable diagnostics** command on a device

```
awplus#show system pluggable diagnostics

# 10 Logging Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure logging. See the Logging Feature Overview and Configuration Guide for more information about the different types of log and how to filter log messages.

**Command List**

- "clear exception log" on page 370
- "clear log" on page 371
- "clear log buffered" on page 372
- "clear log external" on page 373
- "clear log permanent" on page 374
- "connection-log events" on page 375
- "copy buffered-log" on page 376
- "copy permanent-log" on page 377
- "default log buffered" on page 378
- "default log console" on page 379
- "default log email" on page 380
- "default log external" on page 381
- "default log host" on page 382
- "default log monitor" on page 383
- "default log permanent" on page 384
- "log buffered" on page 385
- "log buffered (filter)" on page 386
- "log buffered exclude" on page 389
- "log buffered size" on page 392

- "log console" on page 393
- "log console (filter)" on page 394
- "log console exclude" on page 397
- "log date-format" on page 400
- "log email" on page 401
- "log email (filter)" on page 402
- "log email exclude" on page 405
- "log email time" on page 408

# clear exception log

**Overview** This command resets the contents of the exception log, but does not remove the associated core files.

**Syntax**
```
clear exception log
```

**Mode** Privileged Exec

**Example**
```
awplus# clear exception log
```

# clear log

**Overview** This command removes the contents of the buffered and permanent logs.

**Syntax**

```
clear log
```

**Mode** Privileged Exec

**Example** To delete the contents of the buffered and permanent log use the command:

```
awplus# clear log
```

**Related commands**

clear log buffered

clear log permanent

show log

# clear log buffered

**Overview** This command removes the contents of the buffered log.

**Syntax**

```
clear log buffered
```

**Mode** Privileged Exec

**Example** To delete the contents of the buffered log use the following commands:

```
awplus# clear log buffered
```

**Related commands**

default log buffered

log buffered

log buffered (filter)

log buffered size

log buffered exclude

show log

show log config

# clear log external

**Overview** Use this command to delete the external log file from the SD card or USB storage device it is stored on.

If the external log is rotating between multiple files, this command deletes all those files, not just the most recent one.

**Syntax**

```
clear log external
```

**Mode** Privileged Exec

**Example** To delete the external log file, use the command:

```
awplus# clear log external
```

**Related commands**

default log external

log external

log external (filter)

log external exclude

log external rotate

log external size

show log config

show log external

unmount

**Command changes** Version 5.4.7-1.1: command added

# clear log permanent

**Overview** This command removes the contents of the permanent log.

**Syntax**

```
clear log permanent
```

**Mode** Privileged Exec

**Example** To delete the contents of the permanent log use the following commands:

```
awplus# clear log permanent
```

**Related commands**

default log permanent

log permanent

log permanent (filter)

log permanent exclude

log permanent size

show log config

show log permanent

# connection-log events

**Overview** Use this command to enable extra logging for indicating the start and the end of connections passing through the firewall.

Use the **no** variant of this command to turn off the extra logging of connections passing through the firewall.

**Syntax**

```
connection-log events [new|end|all]
no connection-log events [new|end|all]
```

| Parameter | Description |
|---|---|
| `new` | New connection |
| `end` | Connections closed |
| `all` | All new connections and connections closed. Default. |

**Default** Connection logging is not enabled by default.

**Mode** Global Configuration.

**Usage notes** There are two types of messages you can log: new connections and connections that ended. You can control the amount of messages you log by choosing to log either type of message or all of the message types.

Messages contain the following information:

- time
- source and destination addresses (NATed and unNATed)
- protocol
- source and destination ports (NATed and unNATed)
- bytes and packets passed (found in the connection end message)

**Example** To log all of the new connections and all of the closed connections, use the commands:

```
awplus# configure terminal
awplus(config)# connection-log events all
```

**Related commands** show connection-log events

**Command changes** Version 5.4.7-1.1: command added.

# copy buffered-log

**Overview** Use this command to copy the buffered log to an internal or external destination.

**Syntax**

```
copy buffered-log <destination-name>
```

| Parameter | Description |
|---|---|
| *<destination-name>* | The filename and path for the destination file. See Introduction on page 151 for valid syntax. |

**Mode** Privileged Exec

**Example** To copy the buffered log file into a folder in Flash named “buffered-log” and name the file “buffered-log.log”, use the command:

```
awplus# copy buffered-log flash:/buffered-log/buffered-log.log
```

To copy the buffered log file onto an SD card and name the file “buffered-log.log”, use the command:

```
awplus# copy buffered-log card:/buffered-log.log
```

To copy the buffered log file onto a USB storage device and name the file “buffered-log.log”, use the command:

```
awplus# copy buffered-log usb:/buffered-log.log
```

**Related commands**

log buffered

show file systems

show log

**Command changes** Version 5.4.7-1.1: command added

# copy permanent-log

**Overview** Use this command to copy the permanent log to an internal or external destination.

**Syntax**

```
copy permanent-log <destination-name>
```

| Parameter | Description |
|---|---|
| *<destination-name>* | The filename and path for the destination file. See Introduction on page 151 for valid syntax. |

**Mode** Privileged Exec

**Example** To copy the permanent log file into a folder in Flash named "perm-log" and name the file "permanent-log.log", use the command:

```
awplus# copy permanent-log flash:/perm-log/permanent-log.log
```

To copy the permanent log file onto an SD card and name the file "permanent-log.log", use the command:

```
awplus# copy permanent-log card:/permanent-log.log
```

To copy the permanent log file onto a USB storage device and name the file "permanent-log.log", use the command:

```
awplus# copy permanent-log usb:/permanent-log.log
```

**Related commands**

log permanent

show file systems

show log permanent

**Command changes** Version 5.4.7-1.1: command added

# default log buffered

**Overview** This command restores the default settings for the buffered log stored in RAM. By default the size of the buffered log is 50 kB and it accepts messages with the severity level of “warnings” and above.

**Syntax**

```
default log buffered
```

**Default** The buffered log is enabled by default.

**Mode** Global Configuration

**Example** To restore the buffered log to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log buffered
```

**Related commands**

clear log buffered

log buffered

log buffered (filter)

log buffered size

log buffered exclude

show log

show log config

# default log console

**Overview** This command restores the default settings for log messages sent to the terminal when a log console command is issued. By default all messages are sent to the console when a **log console** command is issued.

**Syntax**

```
default log console
```

**Mode** Global Configuration

**Example** To restore the log console to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log console
```

**Related commands**

log console

log console (filter)

log console exclude

show log config

# default log email

**Overview** This command restores the default settings for log messages sent to an email address. By default no filters are defined for email addresses. Filters must be defined before messages will be sent. This command also restores the remote syslog server time offset value to local (no offset).

**Syntax**

```
default log email <email-address>
```

| Parameter | Description |
|---|---|
| *<email-address>* | The email address to send log messages to |

**Mode** Global Configuration

**Example** To restore the default settings for log messages sent to the email address `admin@alliedtelesis.com` use the following commands:

```
awplus# configure terminal
awplus(config)# default log email admin@alliedtelesis.com
```

**Related commands**

log email

log email (filter)

log email exclude

log email time

show log config

# default log external

**Overview** Use this command to restore the default settings for the external log. By default, the size of the external log is 50 kB, it rotates through 1 additional file, and it accepts messages with a severity level of notices and above.

Note that this command does not clear the configured filename for the external log.

**Syntax**
```
default log external
```

**Mode** Global Configuration

**Example** To restore the default settings for the external log, use the commands:

```
awplus# configure terminal
awplus(config)# default log external
```

**Related commands**
- clear log external
- log external
- log external (filter)
- log external exclude
- log external rotate
- log external size
- show log config
- show log external
- unmount

**Command changes** Version 5.4.7-1.1: command added

# default log host

**Overview** This command restores the default settings for log sent to a remote syslog server. By default no filters are defined for remote syslog servers. Filters must be defined before messages will be sent. This command also restores the remote syslog server time offset value to local (no offset).

**Syntax**

```
default log host <ip-addr>
```

| Parameter | Description |
|---|---|
| *<ip-addr>* | The IP address of a remote syslog server |

**Mode** Global Configuration

**Example** To restore the default settings for messages sent to the remote syslog server with IP address `10.32.16.21` use the following commands:

```
awplus# configure terminal
awplus(config)# default log host 10.32.16.21
```

**Related commands**

log host

log host (filter)

log host exclude

log host source

log host time

show log config

# default log monitor

**Overview** This command restores the default settings for log messages sent to the terminal when a terminal monitor command is used.

**Syntax**

```
default log monitor
```

**Default** All messages are sent to the terminal when a terminal monitor command is used.

**Mode** Global Configuration

**Example** To restore the log monitor to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log monitor
```

**Related commands**

log monitor (filter)

log monitor exclude

show log config

terminal monitor

# default log permanent

**Overview** This command restores the default settings for the permanent log stored in NVS. By default, the size of the permanent log is 50 kB and it accepts messages with the severity level of `warnings` and above.

**Syntax**
```
default log permanent
```

**Default** The permanent log is enabled by default.

**Mode** Global Configuration

**Example** To restore the permanent log to its default settings use the following commands:

```
awplus# configure terminal
awplus(config)# default log permanent
```

**Related commands**
clear log permanent
log permanent
log permanent (filter)
log permanent exclude
log permanent size
show log config
show log permanent

# log buffered

**Overview** This command configures the device to store log messages in RAM. Messages stored in RAM are not retained on the device over a restart. Once the buffered log reaches its configured maximum allowable size old messages will be deleted to make way for new ones.

**Syntax**

```
log buffered
no log buffered
```

**Default** The buffered log is configured by default.

**Mode** Global Configuration

**Examples** To configured the device to store log messages in RAM use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered
```

To configure the device to not store log messages in a RAM buffer use the following commands:

```
awplus# configure terminal
awplus(config)# no log buffered
```

**Related commands**

clear log buffered

copy buffered-log

default log buffered

log buffered (filter)

log buffered size

log buffered exclude

show log

show log config

# log buffered (filter)

**Overview** Use this command to create a filter to select messages to be sent to the buffered log. Selection can be based on the priority/ severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

The **no** variant of this command removes the corresponding filter, so that the specified messages are no longer sent to the buffered log.

**Syntax**

```
log buffered [level <level>] [program <program-name>] [facility
<facility>] [msgtext <text-string>]

no log buffered [level <level>] [program <program-name>]
[facility <facility>] [msgtext <text-string>]
```

| Parameter | Description | |
|---|---|---|
| `level` | Filter messages to the buffered log by severity level. | |
| *<level>* | The minimum severity of message to send to the buffered log. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: | |
| | `0\|emergencies` | System is unusable |
| | `1\|alerts` | Action must be taken immediately |
| | `2\|critical` | Critical conditions |
| | `3\|errors` | Error conditions |
| | `4\|warnings` | Warning conditions |
| | `5\|notices` | Normal, but significant, conditions |
| | `6\|informational` | Informational messages |
| | `7\|debugging` | Debug-level messages |
| `program` | Filter messages to the buffered log by program. Include messages from a specified program in the buffered log. | |
| *<program-name>* | The name of a program to log messages from. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. | |
| | `rip` | Routing Information Protocol (RIP) |
| | `ripng` | Routing Information Protocol - next generation (RIPng) |
| | `ospf` | Open Shortest Path First (OSPF) |
| | `ospfv3` | Open Shortest Path First (OSPF) version 3 (OSPFv3) |
| | `bgp` | Border Gateway Protocol (BGP) |
| | `rsvp` | Resource Reservation Protocol (RSVP) |
| | `pim-dm` | Protocol Independent Multicast - Dense Mode (PIM-DM) |

| Parameter | Description | |
|---|---|---|
| | `pim-sm` | Protocol Independent Multicast - Sparse Mode (PIM-SM) |
| | `pim-smv6` | PIM-SM version 6 (PIM-SMv6) |
| | `dot1x` | IEEE 802.1X Port-Based Access Control |
| | `lacp` | Link Aggregation Control Protocol (LACP) |
| | `stp` | Spanning Tree Protocol (STP) |
| | `rstp` | Rapid Spanning Tree Protocol (RSTP) |
| | `mstp` | Multiple Spanning Tree Protocol (MSTP) |
| | `imi` | Integrated Management Interface (IMI) |
| | `imish` | Integrated Management Interface Shell (IMISH) |
| | `epsr` | Ethernet Protection Switched Rings (EPSR) |
| | `irdp` | ICMP Router Discovery Protocol (IRDP) |
| | `rmon` | Remote Monitoring |
| | `loopprot` | Loop Protection |
| | `poe` | Power-inline (Power over Ethernet) |
| | `dhcpsn` | DHCP snooping (DHCPSN) |
| `facility` | Filter messages to the buffered log by syslog facility. | |
| *<facility>* | Specify one of the following syslog facilities to include messages from in the buffered log: | |
| | `kern` | Kernel messages |
| | `user` | Random user-level messages |
| | `mail` | Mail system |
| | `daemon` | System daemons |
| | `auth` | Security/authorization messages |
| | `syslog` | Messages generated internally by syslogd |
| | `lpr` | Line printer subsystem |
| | `news` | Network news subsystem |
| | `uucp` | UUCP subsystem |
| | `cron` | Clock daemon |
| | `authpriv` | Security/authorization messages (private) |
| | `ftp` | FTP daemon |
| `msgtext` | Select messages containing a certain text string. | |
| *<text-string>* | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. | |

**Default** By default the buffered log has a filter to select messages whose severity level is "notices (5)" or higher. This filter may be removed using the **no** variant of this command.

**Mode** Global Configuration

**Examples** To add a filter to send all messages containing the text "Bridging initialization" to the buffered log, use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered msgtext Bridging initialization
```

To remove a filter that sends all messages containing the text "Bridging initialization" to the buffered log, use the following commands:

```
awplus# configure terminal
awplus(config)# no log buffered msgtext Bridging initialization
```

**Related commands**

clear log buffered

default log buffered

log buffered

log buffered size

log buffered exclude

show log

show log config

# log buffered exclude

**Overview** Use this command to exclude specified log messages from the buffered log. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax**

```
log buffered exclude [level <level>] [program <program-name>]
[facility <facility>] [msgtext <text-string>]
```

```
no log buffered exclude [level <level>] [program
<program-name>] [facility <facility>] [msgtext <text-string>]
```

| Parameter | Description | |
|---|---|---|
| `level` | Exclude messages of the specified severity level. | |
| *<level>* | The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: | |
| | `0\|emergencies` | System is unusable |
| | `1\|alerts` | Action must be taken immediately |
| | `2\|critical` | Critical conditions |
| | `3\|errors` | Error conditions |
| | `4\|warnings` | Warning conditions |
| | `5\|notices` | Normal, but significant, conditions |
| | `6\|informational` | Informational messages |
| | `7\|debugging` | Debug-level messages |
| `program` | Exclude messages from a specified program. | |
| *<program-name>* | The name of a program. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. | |
| | `rip` | Routing Information Protocol (RIP) |
| | `ripng` | Routing Information Protocol - next generation (RIPng) |
| | `ospf` | Open Shortest Path First (OSPF) |
| | `ospfv3` | Open Shortest Path First (OSPF) version 3 (OSPFv3) |
| | `bgp` | Border Gateway Protocol (BGP) |

| Parameter | Description | |
|---|---|---|
| | `rsvp` | Resource Reservation Protocol (RSVP) |
| | `pim-dm` | Protocol Independent Multicast - Dense Mode (PIM-DM) |
| | `pim-sm` | Protocol Independent Multicast - Sparse Mode (PIM-SM) |
| | `pim-smv6` | PIM-SM version 6 (PIM-SMv6) |
| | `dot1x` | IEEE 802.1X Port-Based Access Control |
| | `lacp` | Link Aggregation Control Protocol (LACP) |
| | `stp` | Spanning Tree Protocol (STP) |
| | `rstp` | Rapid Spanning Tree Protocol (RSTP) |
| | `mstp` | Multiple Spanning Tree Protocol (MSTP) |
| | `imi` | Integrated Management Interface (IMI) |
| | `imish` | Integrated Management Interface Shell (IMISH) |

| | `loopprot` | Loop Protection |
| | `poe` | Power-inline (Power over Ethernet) |
| | `dhcpsn` | DHCP snooping (DHCPSN) |
| `facility` | Exclude messages from a syslog facility. | |
| *<facility>* | Specify one of the following syslog facilities to exclude messages from: | |
| | `kern` | Kernel messages |
| | `user` | Random user-level messages |
| | `mail` | Mail system |
| | `daemon` | System daemons |
| | `auth` | Security/authorization messages |
| | `syslog` | Messages generated internally by syslogd |
| | `lpr` | Line printer subsystem |
| | `news` | Network news subsystem |
| | `uucp` | UUCP subsystem |
| | `cron` | Clock daemon |
| | `authpriv` | Security/authorization messages (private) |
| | `ftp` | FTP daemon |
| `msgtext` | Exclude messages containing a certain text string. | |
| *<text-string>* | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. | |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
awplus(config)# log buffered exclude msgtext example of
irrelevant message
```

**Related commands**

clear log buffered

default log buffered

log buffered

log buffered (filter)

log buffered size

show log

show log config

# log buffered size

**Overview** This command configures the amount of memory that the buffered log is permitted to use. Once this memory allocation has been filled old messages will be deleted to make room for new messages.

Use the **no** variant of this command to return to the default.

**Syntax**

```
log buffered size <50-250>
no log buffered size
```

| Parameter | Description |
|---|---|
| *<50-250>* | Size of the RAM log in kilobytes |

**Default** 50 kilobytes

**Mode** Global Configuration

**Example** To allow the buffered log to use up to 100 kilobytes of RAM, use the commands:

```
awplus# configure terminal
awplus(config)# log buffered size 100
```

To return to the default value, use the commands:

```
awplus# configure terminal
awplus(config)# no log buffered size
```

show log config

# log console

**Overview** This command configures the device to send log messages to consoles. The console log is configured by default to send messages to the device's main console port.

Use the **no** variant of this command to configure the device not to send log messages to consoles.

**Syntax**

```
log console
no log console
```

**Mode** Global Configuration

**Examples** To configure the device to send log messages use the following commands:

```
awplus# configure terminal
awplus(config)# log console
```

To configure the device not to send log messages in all consoles use the following commands:

```
awplus# configure terminal
awplus(config)# no log console
```

**Related commands**

default log console

log console (filter)

log console exclude

show log config

# log console (filter)

**Overview** This command creates a filter to select messages to be sent to all consoles when the **log console** command is given. Selection can be based on the priority/severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

**Syntax**

```
log console [level <level>] [program <program-name>] [facility
<facility>] [msgtext <text-string>]

no log console [level <level>] [program <program-name>]
[facility <facility>] [msgtext <text-string>]
```

| Parameter | Description | |
|---|---|---|
| `level` | Filter messages by severity level. | |
| *<level>* | The minimum severity of message to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: | |
| | `0\|emergencies` | System is unusable |
| | `1\|alerts` | Action must be taken immediately |
| | `2\|critical` | Critical conditions |
| | `3\|errors` | Error conditions |
| | `4\|warnings` | Warning conditions |
| | `5\|notices` | Normal, but significant, conditions |
| | `6\|informational` | Informational messages |
| | `7\|debugging` | Debug-level messages |
| `program` | Filter messages by program. Include messages from a specified program. | |
| *<program-name>* | The name of a program to log messages from. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. | |
| | `rip` | Routing Information Protocol (RIP) |
| | `ripng` | Routing Information Protocol - next generation (RIPng) |
| | `ospf` | Open Shortest Path First (OSPF) |
| | `ospfv3` | Open Shortest Path First (OSPF) version 3 (OSPFv3) |
| | `bgp` | Border Gateway Protocol (BGP) |
| | `rsvp` | Resource Reservation Protocol (RSVP) |
| | `pim-dm` | Protocol Independent Multicast - Dense Mode (PIM-DM) |
| | `pim-sm` | Protocol Independent Multicast - Sparse Mode (PIM-SM) |
| | `pim-smv6` | PIM-SM version 6 (PIM-SMv6) |

| Parameter | Description | |
|---|---|---|
| | `dot1x` | IEEE 802.1X Port-Based Access Control |
| | `lacp` | Link Aggregation Control Protocol (LACP) |
| | `stp` | Spanning Tree Protocol (STP) |
| | `rstp` | Rapid Spanning Tree Protocol (RSTP) |
| | `mstp` | Multiple Spanning Tree Protocol (MSTP) |
| | `imi` | Integrated Management Interface (IMI) |
| | `imish` | Integrated Management Interface Shell (IMISH) |
| | `epsr` | Ethernet Protection Switched Rings (EPSR) |
| | `irdp` | ICMP Router Discovery Protocol (IRDP) |
| | `rmon` | Remote Monitoring |
| | `loopprot` | Loop Protection |
| | `poe` | Power-inline (Power over Ethernet) |
| | `dhcpsn` | DHCP snooping (DHCPSN) |
| `facility` | Filter messages by syslog facility. | |
| *<facility>* | Specify one of the following syslog facilities to include messages from: | |
| | `kern` | Kernel messages |
| | `user` | Random user-level messages |
| | `mail` | Mail system |
| | `daemon` | System daemons |
| | `auth` | Security/authorization messages |
| | `syslog` | Messages generated internally by syslogd |
| | `lpr` | Line printer subsystem |
| | `news` | Network news subsystem |
| | `uucp` | UUCP subsystem |
| | `cron` | Clock daemon |
| | `authpriv` | Security/authorization messages (private) |
| | `ftp` | FTP daemon |
| `msgtext` | Select messages containing a certain text string. | |
| *<text-string>* | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. | |

**Default** By default the console log has a filter to select messages whose severity level is `critical` or higher. This filter may be removed using the **no** variant of this command. This filter may be removed and replaced by filters that are more selective.

**Mode** Global Configuration

**Examples** To create a filter to send all messages containing the text “Bridging initialization” to console instances where the **log console** command has been entered, use the following commands:

```
awplus# configure terminal
awplus(config)# log console msgtext "Bridging initialization"
```

To remove a default filter that includes sending **critical**, **alert** and **emergency** level messages to the console, use the following commands:

```
awplus# configure terminal
awplus(config)# no log console level critical
```

**Related commands**

default log console

log console

log console exclude

show log config

# log console exclude

**Overview** Use this command to prevent specified log messages from being sent to the console, when console logging is turned on. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax**

```
log console exclude [level <level>] [program <program-name>]
[facility <facility>] [msgtext <text-string>]
```

```
no log console exclude [level <level>] [program <program-name>]
[facility <facility>] [msgtext <text-string>]
```

| Parameter | Description | |
|---|---|---|
| `level` | Exclude messages of the specified severity level. | |
| *<level>* | The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: | |
| | `0\|emergencies` | System is unusable |
| | `1\|alerts` | Action must be taken immediately |
| | `2\|critical` | Critical conditions |
| | `3\|errors` | Error conditions |
| | `4\|warnings` | Warning conditions |
| | `5\|notices` | Normal, but significant, conditions |
| | `6\|informational` | Informational messages |
| | `7\|debugging` | Debug-level messages |
| `program` | Exclude messages from a specified program. | |
| *<program-name>* | The name of a program. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. | |
| | `rip` | Routing Information Protocol (RIP) |
| | `ripng` | Routing Information Protocol - next generation (RIPng) |
| | `ospf` | Open Shortest Path First (OSPF) |
| | `ospfv3` | Open Shortest Path First (OSPF) version 3 (OSPFv3) |

| Parameter | Description | |
|---|---|---|
| | bgp | Border Gateway Protocol (BGP) |
| | rsvp | Resource Reservation Protocol (RSVP) |
| | pim-dm | Protocol Independent Multicast - Dense Mode (PIM-DM) |
| | pim-sm | Protocol Independent Multicast - Sparse Mode (PIM-SM) |
| | pim-smv6 | PIM-SM version 6 (PIM-SMv6) |
| | dot1x | IEEE 802.1X Port-Based Access Control |
| | lacp | Link Aggregation Control Protocol (LACP) |
| | stp | Spanning Tree Protocol (STP) |
| | rstp | Rapid Spanning Tree Protocol (RSTP) |
| | mstp | Multiple Spanning Tree Protocol (MSTP) |
| | imi | Integrated Management Interface (IMI) |
| | imish | Integrated Management Interface Shell (IMISH) |
| | epsr | Ethernet Protection Switched Rings (EPSR) |
| | irdp | ICMP Router Discovery Protocol (IRDP) |
| | rmon | Remote Monitoring |
| | loopprot | Loop Protection |
| | poe | Power-inline (Power over Ethernet) |
| | dhcpsn | DHCP snooping (DHCPSN) |
| facility | Exclude messages from a syslog facility. | |
| *<facility>* | Specify one of the following syslog facilities to exclude messages from: | |
| | kern | Kernel messages |
| | user | Random user-level messages |
| | mail | Mail system |
| | daemon | System daemons |
| | auth | Security/authorization messages |
| | syslog | Messages generated internally by syslogd |
| | lpr | Line printer subsystem |
| | news | Network news subsystem |
| | uucp | UUCP subsystem |
| | cron | Clock daemon |
| | authpriv | Security/authorization messages (private) |
| | ftp | FTP daemon |

| Parameter | Description |
|---|---|
| `msgtext` | Exclude messages containing a certain text string. |
| *<text-string>* | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
awplus(config)# log console exclude msgtext example of
irrelevant message
```

**Related commands**

default log console

log console

log console (filter)

show log config

# log date-format

**Overview** Use this command to change the date format for log messages to an ISO 8601 compliant format, or to return to the default date format.

**Syntax**

```
log date-format {iso|default}
```

| Parameter | Description |
|---|---|
| `iso` | Display the date and time in the ISO 8601 compliant format of: YYYY-MM-DDThh:mm:ssTZD |
| `default` | Display the date and time in the default date format of YYYY MMM DD HH:MM:SS |

**Default** The default option of YYYY MMM DD HH:MM:SS (except when using terminal monitor, when it is HH:MM:SS)

**Mode** Global Configuration

**Usage notes** In the ISO 8601 compliant format, a T separates the date from the time, and the time is followed by the timezone offset from UTC time. For example, this is a log message with an ISO 8601 compliant date:

```
2016-09-29T08:55:43+13:00 user.notice Gateway IMISH[1983]:
[manager@ttyS0]show run
```

This is a log message with the default date format:

```
2016 Sep 29 08:55:43 user.notice Gateway IMISH[1983]:
[manager@ttyS0]show run
```

The date format setting affects all log messages, no matter where the messages are stored or displayed.

**Examples** To set the date format to the ISO 8601 compliant format, use the commands:

```
awplus# configure terminal
awplus(config)# log date-format iso
```

To return to the default date format of YYYY MMM DD HH:MM:SS, use the commands:

```
awplus# configure terminal
awplus(config)# log date-format default
```

# log email

**Overview** This command configures the device to send log messages to an email address. The email address is specified in this command.

**Syntax**

```
log email <email-address>
```

| Parameter | Description |
|---|---|
| *<email-address>* | The email address to send log messages to |

**Default** By default no filters are defined for email log targets. Filters must be defined before messages will be sent.

**Mode** Global Configuration

**Example** To have log messages emailed to the email address `admin@alliedtelesis.com` use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@alliedtelesis.com
```

**Related commands**

default log email

log email (filter)

log email exclude

log email time

show log config

# log email (filter)

**Overview** This command creates a filter to select messages to be sent to an email address. Selection can be based on the priority/ severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

The **no** variant of this command configures the device to no longer send log messages to a specified email address. All configuration relating to this log target will be removed.

**Syntax**

```
log email <email-address> [level <level>] [program
<program-name>] [facility <facility>] [msgtext <text-string>]
```

```
no log email <email-address> [level <level>] [program
<program-name>] [facility <facility>] [msgtext <text-string>]
```

| Parameter | Description | |
|---|---|---|
| *<email-address>* | The email address to send logging messages to | |
| `level` | Filter messages by severity level. | |
| *<level>* | The minimum severity of message to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: | |
| | `0\|emergencies` | System is unusable |
| | `1\|alerts` | Action must be taken immediately |
| | `2\|critical` | Critical conditions |
| | `3\|errors` | Error conditions |
| | `4\|warnings` | Warning conditions |
| | `5\|notices` | Normal, but significant, conditions |
| | `6\|informational` | Informational messages |
| | `7\|debugging` | Debug-level messages |
| `program` | Filter messages by program. Include messages from a specified program. | |
| *<program-name>* | The name of a program to log messages from. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. | |
| | `rip` | Routing Information Protocol (RIP) |
| | `ripng` | Routing Information Protocol - next generation (RIPng) |
| | `ospf` | Open Shortest Path First (OSPF) |
| | `ospfv3` | Open Shortest Path First (OSPF) version 3 (OSPFv3) |
| | `bgp` | Border Gateway Protocol (BGP) |

| Parameter | Description | |
|---|---|---|
| | `rsvp` | Resource Reservation Protocol (RSVP) |
| | `pim-dm` | Protocol Independent Multicast - Dense Mode (PIM-DM) |
| | `pim-sm` | Protocol Independent Multicast - Sparse Mode (PIM-SM) |
| | `pim-smv6` | PIM-SM version 6 (PIM-SMv6) |
| | `dot1x` | IEEE 802.1X Port-Based Access Control |
| | `lacp` | Link Aggregation Control Protocol (LACP) |
| | `stp` | Spanning Tree Protocol (STP) |
| | `rstp` | Rapid Spanning Tree Protocol (RSTP) |
| | `mstp` | Multiple Spanning Tree Protocol (MSTP) |
| | `imi` | Integrated Management Interface (IMI) |
| | `imish` | Integrated Management Interface Shell (IMISH) |
| | `epsr` | Ethernet Protection Switched Rings (EPSR) |
| | `irdp` | ICMP Router Discovery Protocol (IRDP) |
| | `rmon` | Remote Monitoring |
| | `loopprot` | Loop Protection |
| | `poe` | Power-inline (Power over Ethernet) |
| | `dhcpsn` | DHCP snooping (DHCPSN) |
| `facility` | Filter messages by syslog facility. | |
| *<facility>* | Specify one of the following syslog facilities to include messages from: | |
| | `kern` | Kernel messages |
| | `user` | Random user-level messages |
| | `mail` | Mail system |
| | `daemon` | System daemons |
| | `auth` | Security/authorization messages |
| | `syslog` | Messages generated internally by syslogd |
| | `lpr` | Line printer subsystem |
| | `news` | Network news subsystem |
| | `uucp` | UUCP subsystem |
| | `cron` | Clock daemon |
| | `authpriv` | Security/authorization messages (private) |
| | `ftp` | FTP daemon |
| `msgtext` | Select messages containing a certain text string. | |
| *<text-string>* | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. | |

**Mode** Global Configuration

**Examples** To create a filter to send all messages containing the text “Bridging initialization”, to the email address admin@homebase.com, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@homebase.com msgtext "Bridging initialization"
```

To create a filter to send messages with a severity level of **informational** and above to the email address admin@alliedtelesis.com, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@alliedtelesis.com level informational
```

To stop the device emailing log messages emailed to the email address admin@alliedtelesis.com, use the following commands:

```
awplus# configure terminal
awplus(config)# no log email admin@homebase.com
```

To remove a filter that sends messages with a severity level of **informational** and above to the email address admin@alliedtelesis.com, use the following commands:

```
awplus# configure terminal
awplus(config)# no log email admin@alliedtelesis.com level informational
```

**Related commands**

default log email

log email

log email exclude

log email time

show log config

# log email exclude

**Overview** Use this command to prevent specified log messages from being emailed, when the device is configured to send log messages to an email address. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax**

```
log email exclude [level <level>] [program <program-name>]
[facility <facility>] [msgtext <text-string>]
```

```
no log email exclude [level <level>] [program <program-name>]
[facility <facility>] [msgtext <text-string>]
```

| Parameter | Description | |
|---|---|---|
| `level` | Exclude messages of the specified severity level. | |
| *<level>* | The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: | |
| | `0\|emergencies` | System is unusable |
| | `1\|alerts` | Action must be taken immediately |
| | `2\|critical` | Critical conditions |
| | `3\|errors` | Error conditions |
| | `4\|warnings` | Warning conditions |
| | `5\|notices` | Normal, but significant, conditions |
| | `6\|informational` | Informational messages |
| | `7\|debugging` | Debug-level messages |
| `program` | Exclude messages from a specified program. | |
| *<program-name>* | The name of a program. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. | |
| | `rip` | Routing Information Protocol (RIP) |
| | `ripng` | Routing Information Protocol - next generation (RIPng) |
| | `ospf` | Open Shortest Path First (OSPF) |
| | `ospfv3` | Open Shortest Path First (OSPF) version 3 (OSPFv3) |

| Parameter | Description | |
|---|---|---|
| | bgp | Border Gateway Protocol (BGP) |
| | rsvp | Resource Reservation Protocol (RSVP) |
| | pim-dm | Protocol Independent Multicast - Dense Mode (PIM-DM) |
| | pim-sm | Protocol Independent Multicast - Sparse Mode (PIM-SM) |
| | pim-smv6 | PIM-SM version 6 (PIM-SMv6) |
| | dot1x | IEEE 802.1X Port-Based Access Control |
| | lacp | Link Aggregation Control Protocol (LACP) |
| | stp | Spanning Tree Protocol (STP) |
| | rstp | Rapid Spanning Tree Protocol (RSTP) |
| | mstp | Multiple Spanning Tree Protocol (MSTP) |
| | imi | Integrated Management Interface (IMI) |
| | imish | Integrated Management Interface Shell (IMISH) |
| | epsr | Ethernet Protection Switched Rings (EPSR) |
| | irdp | ICMP Router Discovery Protocol (IRDP) |
| | rmon | Remote Monitoring |
| | loopprot | Loop Protection |
| | poe | Power-inline (Power over Ethernet) |
| | dhcpsn | DHCP snooping (DHCPSN) |
| facility | Exclude messages from a syslog facility. | |
| <*facility*> | Specify one of the following syslog facilities to exclude messages from: | |
| | kern | Kernel messages |
| | user | Random user-level messages |
| | mail | Mail system |
| | daemon | System daemons |
| | auth | Security/authorization messages |
| | syslog | Messages generated internally by syslogd |
| | lpr | Line printer subsystem |
| | news | Network news subsystem |
| | uucp | UUCP subsystem |
| | cron | Clock daemon |
| | authpriv | Security/authorization messages (private) |
| | ftp | FTP daemon |

| Parameter | Description |
|---|---|
| `msgtext` | Exclude messages containing a certain text string. |
| *<text-string>* | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
awplus(config)# log email exclude msgtext example of irrelevant message
```

**Related commands**

default log email

log email

log email (filter)

log email time

show log config

# log email time

**Overview** This command configures the time used in messages sent to an email address. If the syslog server is in a different time zone to your device then the time offset can be configured using either the **utc-offset** parameter option keyword or the **local-offset** parameter option keyword, where **utc-offset** is the time difference from UTC (Universal Time, Coordinated) and **local-offset** is the difference from local time.

**Syntax**

```
log email <email-address> time {local|local-offset|utc-offset
{plus|minus}<0-24>}
```

| Parameter | Description |
|---|---|
| *<email-address>* | The email address to send log messages to |
| `time` | Specify the time difference between the email recipient and the device you are configuring. |
| `local` | The device is in the same time zone as the email recipient |
| `local-offset` | The device is in a different time zone to the email recipient. Use the **plus** or **minus** keywords and specify the difference (offset) from local time of the device to the email recipient in hours. |
| `utc-offset` | The device is in a different time zone to the email recipient. Use the **plus** or **minus** keywords and specify the difference (offset) from UTC time of the device to the email recipient in hours. |
| `plus` | Negative offset (difference) from the device to the email recipient. |
| `minus` | Positive offset (difference) from the device to the email recipient. |
| *<0-24>* | World Time zone offset in hours |

**Default** The default is **local** time.

**Mode** Global Configuration

**Usage notes** Use the **local** option if the email recipient is in the same time zone as this device. Messages will display the time as on the local device when the message was generated.

Use the **offset** option if the email recipient is in a different time zone to this device. Specify the time offset of the email recipient in hours. Messages will display the time they were generated on this device but converted to the time zone of the email recipient.

**Examples**

To send messages to the email address `test@home.com` in the same time zone as the device's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@base.com time local 0
```

To send messages to the email address `admin@base.com` with the time information converted to the time zone of the email recipient, which is 3 hours ahead of the device's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log email admin@base.com time local-offset plus
3
```

To send messages to the email address `user@remote.com` with the time information converted to the time zone of the email recipient, which is 3 hours behind the device's UTC time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log email user@remote.com time utc-offset minus
3
```

# log external

**Overview** Use this command to enable external logging. External logging sends syslog messages to a file on an SD card or USB storage device.

If the file does not already exist on the storage device, it (and any specified subdirectory) will be automatically created. If the file already exists, messages are appended to it.

Use the **no** variant of this command to disable external logging.

**Syntax**

```
log external <filename>
no log external
```

| Parameter | Description |
|---|---|
| *<filename>* | The file and optionally directory path to store the log messages in. See Introduction on page 151 for valid syntax. |

**Default** External logging is disabled by default.

**Mode** Global Configuration

**Usage notes** We strongly recommend using ext3 or ext4 as the file system on the external storage device. These file systems have a lower risk of file corruption occurring if the switch or firewall loses power.

You should also unmount the storage device before removing it from the switch or firewall, to avoid corrupting the log file. To unmount the device, use the **unmount** command.

**Example** To save messages to a file called "messages.log" in a directory called "log" on an SD card, use the command:

```
awplus# configure terminal
awplus(config)# log external card:/log/messages.log
```

To save messages to a file called "messages.log" in a directory called "log" on a USB storage device, use the command:

```
awplus# configure terminal
awplus(config)# log external usb:/log/messages.log
```

**Related commands**

**Command changes** Version 5.4.7-1.1: command added

# log external (filter)

**Overview** Use this command to create a filter to select messages to be sent to the external log. You can include messages based on:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

The **no** variant of this command removes the corresponding filter, so that the specified messages are no longer sent to the external log.

**Syntax**

```
log external [level <level>] [program <program-name>] [facility
<facility>] [msgtext <text-string>]

no log external [level <level>] [program <program-name>]
[facility <facility>] [msgtext <text-string>]
```

| Parameter | Description | |
|---|---|---|
| `level` | Filter messages to the external log by severity level. | |
| *<level>* | The minimum severity of message to send to the external log. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: | |
| | `0\|emergencies` | System is unusable |
| | `1\|alerts` | Action must be taken immediately |
| | `2\|critical` | Critical conditions |
| | `3\|errors` | Error conditions |
| | `4\|warnings` | Warning conditions |
| | `5\|notices` | Normal, but significant, conditions |
| | `6\|informational` | Informational messages |
| | `7\|debugging` | Debug-level messages |
| `program` | Filter messages to the external log by program. Include messages from a specified program in the external log. | |
| *<program-name>* | The name of a program to log messages from. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. | |
| | `rip` | Routing Information Protocol (RIP) |
| | `ripng` | Routing Information Protocol - next generation (RIPng) |
| | `ospf` | Open Shortest Path First (OSPF) |

| Parameter | Description | |
|---|---|---|
| | `ospfv3` | Open Shortest Path First (OSPF) version 3 (OSPFv3) |
| | `bgp` | Border Gateway Protocol (BGP) |
| | `rsvp` | Resource Reservation Protocol (RSVP) |
| | `pim-dm` | Protocol Independent Multicast - Dense Mode (PIM-DM) |
| | `pim-sm` | Protocol Independent Multicast - Sparse Mode (PIM-SM) |
| | `pim-smv6` | PIM-SM version 6 (PIM-SMv6) |

| | `rmon` | Remote Monitoring |
| | `loopprot` | Loop Protection |
| | `poe` | Power-inline (Power over Ethernet) |
| | `dhcpsn` | DHCP snooping (DHCPSN) |
| `facility` | Filter messages to the external log by syslog facility. | |
| *<facility>* | Specify one of the following syslog facilities to include messages from in the log: | |
| | `kern` | Kernel messages |
| | `user` | Random user-level messages |
| | `mail` | Mail system |
| | `daemon` | System daemons |
| | `auth` | Security/authorization messages |
| | `syslog` | Messages generated internally by syslogd |
| | `lpr` | Line printer subsystem |
| | `news` | Network news subsystem |
| | `uucp` | UUCP subsystem |
| | `cron` | Clock daemon |
| | `authpriv` | Security/authorization messages (private) |
| | `ftp` | FTP daemon |

| Parameter | Description |
|---|---|
| `msgtext` | Select messages containing a certain text string. |
| *<text-string>* | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** By default the external log has a filter to select messages whose severity level is "notices (5)" or higher. This filter may be removed using the **no** variant of this command.

**Mode** Global Configuration

**Examples** To add a filter to send all messages containing the text "Bridging initialization" to the external log, use the following commands:

```
awplus# configure terminal
awplus(config)# log external msgtext Bridging initialization
```

To remove a filter that sends all messages containing the text "Bridging initialization" to the external log, use the following commands:

```
awplus# configure terminal
awplus(config)# no log external msgtext Bridging initialization
```

**Command changes** Version 5.4.7-1.1: command added

# log external exclude

**Overview** Use this command to exclude specified log messages from the external log. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax**

```
log external exclude [level <level>] [program <program-name>]
[facility <facility>] [msgtext <text-string>]

no log external exclude [level <level>] [program
<program-name>] [facility <facility>] [msgtext <text-string>]
```

| Parameter | Description | |
|---|---|---|
| `level` | Exclude messages of the specified severity level. | |
| *<level>* | The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: | |
| | `0\|emergencies` | System is unusable |
| | `1\|alerts` | Action must be taken immediately |
| | `2\|critical` | Critical conditions |
| | `3\|errors` | Error conditions |
| | `4\|warnings` | Warning conditions |
| | `5\|notices` | Normal, but significant, conditions |
| | `6\|informational` | Informational messages |
| | `7\|debugging` | Debug-level messages |
| `program` | Exclude messages from a specified program. | |
| *<program-name>* | The name of a program. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. | |
| | `rip` | Routing Information Protocol (RIP) |

| | `lpr` | Line printer subsystem |
| | `news` | Network news subsystem |
| | `uucp` | UUCP subsystem |
| | `cron` | Clock daemon |
| | `authpriv` | Security/authorization messages (private) |
| | `ftp` | FTP daemon |
| `msgtext` | Exclude messages containing a certain text string. | |
| *<text-string>* | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. | |

**Default** No log messages are excluded

**Mode** Global Configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
awplus(config)# log external exclude msgtext example of
irrelevant message
```

**Related commands**

clear log external

default log external

log external

log external (filter)

log external rotate

log external size

show log config

show log external

unmount

**Command changes** Version 5.4.7-1.1: command added

# log external rotate

**Overview** Use this command to configure the number of files that the external log can rotate through.

Use the **no** variant of this command to return to the default.

**Syntax**

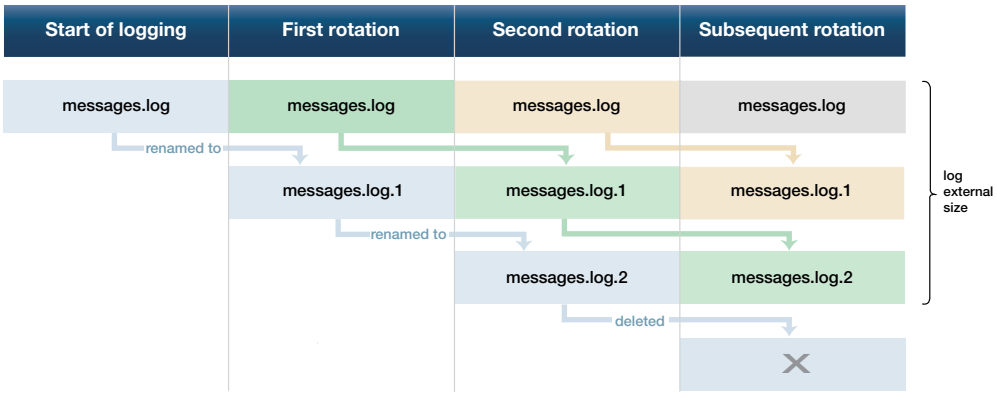
```
log external rotate <0-255>
no log external rotate
```

| Parameter | Description |
|---|---|
| *<0-255>* | The number of additional files to rotate through. Note that the device rotates between the initial file and the number of additional files specified by this value - see the Usage section below. |

**Default** The default is 1, which rotates between the initial file and 1 additional file (for example, rotates between messages.log and messages.log.1)

**Mode** Global Configuration

**Usage notes** The device rotates between the initial file and the number of additional files specified by this command. For example, the diagram below shows how setting rotate to 2 makes the device rotate through 3 files.



Note that if you set rotate to 0, and the external log file becomes full, then the device deletes the full log file and creates a new (empty) file of the same name to save messages into. For this reason, we recommend setting rotate to at least 1.

**Example** To set the rotation value to 2, and therefore rotate between 3 files, use the commands:

```
awplus# configure terminal
awplus(config)# log external rotate 2
```

**Related commands** clear log external

default log external

log external

log external (filter)

log external exclude

log external size

show log config

show log external

unmount

**Command changes** Version 5.4.7-1.1: command added

# log external size

**Overview** Use this command to configure the total amount of size that the external log is permitted to use, in kilobytes. The maximum possible depends on the storage device's file system.

Note that if you are rotating between multiple files, this is the maximum size of all files, not of each individual file. For example, if you are rotating between 2 files (**log external rotate 1**), each file will have a maximum size of 25 kBytes by default.

Use the **no** variant of this command to return to the default size.

**Syntax**

```
log external size [<50-4194304>]
no log external size
```

| Parameter | Description |
|---|---|
| *<50-4194304>* | The total amount of size that the external log is permitted to use, in kilobytes. |

**Default** 50 kBytes

**Mode** Global Configuration

**Example** To configure a total log size of 100 kBytes, use the commands:

```
awplus# configure terminal
awplus(config)# log external size 100
```

**Related commands**

clear log external

default log external

log external

log external (filter)

log external exclude

log external rotate

log external size

show log config

show log external

unmount

**Command changes** Version 5.4.7-1.1: command added

# log facility

**Overview** Use this command to assign a facility to all log messages generated on this device. This facility overrides any facility that is automatically generated as part of the log message.

Use the **no** variant of this command to remove the configured facility.

**Syntax**

```
log facility {kern|user|mail|daemon|auth|syslog|lpr|news|uucp|
cron|authpriv|ftp|local0|local1|local2|local3|local4|local5|
local6|local7}
```

```
no log facility
```

**Default** None. The outgoing syslog facility depends on the log message.

**Mode** Global Configuration

**Usage notes** Specifying different facilities for log messages generated on different devices can allow messages from multiple devices sent to a common server to be distinguished from each other.

Ordinarily, the facility values generated in log messages have meanings as shown in the following table. Using this command will override these meanings, and the new meanings will depend on the use you put them to.

Table 10-1: Ordinary meanings of the facility parameter in log messages

| Facility | Description |
|---|---|
| kern | Kernel messages |
| user | User-level messages |
| mail | Mail system |
| daemon | System daemons |
| auth | Security/authorization messages |
| syslog | Messages generated internally by the syslog daemon |
| lpr | Line printer subsystem |
| news | Network news subsystem |
| uucp | UNIX-to-UNIX Copy Program subsystem |
| cron | Clock daemon |
| authpriv | Security/authorization (private) messages |

Table 10-1: Ordinary meanings of the facility parameter in log messages (cont.)

| Facility | Description |
|---|---|
| ftp | FTP daemon |
| local<0..7> | The facility labels above have specific meanings, while the local facility labels are intended to be put to local use. In AlliedWare Plus, some of these local facility labels are used in log messages. In particular, local5 is assigned to log messages generated by UTM Firewall security features. |

**Example** To specify a facility of local6, use the following commands:

```
awplus# configure terminal
awplus(config)# log facility local6
```

**Related commands** show log config

# log host

**Overview** This command configures the device to send log messages to a remote syslog server via UDP port 514. The IP address of the remote server must be specified. By default no filters are defined for remote syslog servers. Filters must be defined before messages will be sent.

Use the **no** variant of this command to stop sending log messages to the remote syslog server.

**Syntax**

```
log host <ipv4-addr> [secure]
log host <ipv6-addr>
no log host <ipv4-addr>|<ipv6-addr>
```

| Parameter | Description |
|---|---|
| *<ipv4-addr>* | Specify the source IPv4 address, in dotted decimal notation (A.B.C.D). |
| *<ipv6-addr>* | Specify the source IPv6 address, in X:X::X:X notation. |
| secure | Optional value to create a secure log destination. This option is only valid for IPv4 hosts. |

**Mode** Global Configuration

**Usage notes** Use the optional **secure** parameter to configure a secure IPv4 syslog host. For secure hosts, syslog over TLS is used to encrypt the logs. The certificate received from the remote log server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

The remote server may also request that a certificate is transmitted from the local device. In this situation the first trustpoint added to the syslog application will be transmitted to the remote server.

For detailed information about securing syslog, see the PKI Feature Overview_and Configuration_Guide.

**Examples** To configure the device to send log messages to a remote secure syslog server with IP address 10.32.16.99, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.99 secure
```

To stop the device from sending log messages to the remote syslog server with IP address 10.32.16.99, use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.99
```

**Related commands** default log host

log host (filter)

log host exclude

log host source

log host startup-delay

log host time

log trustpoint

show log config

# log host (filter)

**Overview** This command creates a filter to select messages to be sent to a remote syslog server. Selection can be based on the priority/severity of the message, the program that generated the message, the logging facility used, a substring within the message or a combination of some or all of these.

The **no** variant of this command configures the device to no longer send log messages to a remote syslog server. The IP address of the syslog server must be specified. All configuration relating to this log target will be removed.

**Syntax**

```
log host <ip-addr> [level <level>] [program <program-name>]
[facility <facility>] [msgtext <text-string>]

no log host <ip-addr> [level <level>] [program <program-name>]
[facility <facility>] [msgtext <text-string>]
```

| Parameter | Description | |
|---|---|---|
| *<ip-addr>* | The IP address of a remote syslog server. | |
| `level` | Filter messages by severity level. | |
| *<level>* | The minimum severity of message to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: | |
| | `0\|emergencies` | System is unusable |
| | `1\|alerts` | Action must be taken immediately |
| | `2\|critical` | Critical conditions |
| | `3\|errors` | Error conditions |
| | `4\|warnings` | Warning conditions |
| | `5\|notices` | Normal, but significant, conditions |
| | `6\|informational` | Informational messages |
| | `7\|debugging` | Debug-level messages |
| `program` | Filter messages by program. Include messages from a specified program. | |
| *<program-name>* | The name of a program to log messages from. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. | |
| | `rip` | Routing Information Protocol (RIP) |
| | `ripng` | Routing Information Protocol - next generation (RIPng) |
| | `ospf` | Open Shortest Path First (OSPF) |
| | `ospfv3` | Open Shortest Path First (OSPF) version 3 (OSPFv3) |
| | `bgp` | Border Gateway Protocol (BGP) |
| | `rsvp` | Resource Reservation Protocol (RSVP) |

| Parameter | Description | |
|---|---|---|
| | `pim-dm` | Protocol Independent Multicast - Dense Mode (PIM-DM) |
| | `pim-sm` | Protocol Independent Multicast - Sparse Mode (PIM-SM) |
| | `pim-smv6` | PIM-SM version 6 (PIM-SMv6) |
| | `dot1x` | IEEE 802.1X Port-Based Access Control |
| | `lacp` | Link Aggregation Control Protocol (LACP) |
| | `stp` | Spanning Tree Protocol (STP) |
| | `rstp` | Rapid Spanning Tree Protocol (RSTP) |
| | `mstp` | Multiple Spanning Tree Protocol (MSTP) |
| | `imi` | Integrated Management Interface (IMI) |
| | `imish` | Integrated Management Interface Shell (IMISH) |
| | `epsr` | Ethernet Protection Switched Rings (EPSR) |
| | `irdp` | ICMP Router Discovery Protocol (IRDP) |
| | `rmon` | Remote Monitoring |
| | `loopprot` | Loop Protection |
| | `poe` | Power-inline (Power over Ethernet) |
| | `dhcpsn` | DHCP snooping (DHCPSN) |
| `facility` | Filter messages by syslog facility. | |
| *<facility>* | Specify one of the following syslog facilities to include messages from: | |
| | `kern` | Kernel messages |
| | `user` | Random user-level messages |
| | `mail` | Mail system |
| | `daemon` | System daemons |
| | `auth` | Security/authorization messages |
| | `syslog` | Messages generated internally by syslogd |
| | `lpr` | Line printer subsystem |
| | `news` | Network news subsystem |
| | `uucp` | UUCP subsystem |
| | `cron` | Clock daemon |
| | `authpriv` | Security/authorization messages (private) |
| | `ftp` | FTP daemon |
| `msgtext` | Select messages containing a certain text string. | |
| *<text-string>* | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. | |

**Mode** Global Configuration

**Examples** To create a filter to send all messages containing the text “Bridging initialization”, to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 msgtext "Bridging
initialization"
```

To create a filter to send messages with a severity level of **informational** and above to the syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 level informational
```

To remove a filter that sends all messages containing the text “Bridging initialization”, to a remote syslog server with IP address 10.32.16.21, use the following commands:

```
awplus# configure terminal
awplus(config)# no log host 10.32.16.21 msgtext "Bridging
initialization"
```

To remove a filter that sends messages with a severity level of **informational** and above to the syslog server with IP address 10.32.16.21, use the following commands:

```
awplusawpluls# configure terminal
awplus(config)# no log host 10.32.16.21 level informational
```

**Related commands**

default log host

log host

log host exclude

log host source

log host time

show log config

# log host exclude

**Overview** Use this command to prevent specified log messages from being sent to the remote syslog server, when log host is enabled. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax**

```
log host {<hostname>|<ipv4-addr>|<ipv6-addr>} exclude [level
<level>] [program <program-name>] [facility <facility>]
[msgtext <text-string>]
```

```
no log host {<hostname>|<ipv4-addr>|<ipv6-addr>} exclude [level
<level>] [program <program-name>] [facility <facility>]
[msgtext <text-string>]
```

| Parameter | Description | |
|---|---|---|
| *<hostname>* | The host name of a remote syslog server. | |
| *<ipv4-addr>* | The IPv4 address of a remote syslog server, in A.B.C.D format. | |
| *<ipv6-addr>* | The IPv6 address of a remote syslog server, in X:X::X:X format. | |
| `level` | Exclude messages of the specified severity level. | |
| *<level>* | The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: | |
| | `0\|emergencies` | System is unusable |
| | `1\|alerts` | Action must be taken immediately |
| | `2\|critical` | Critical conditions |
| | `3\|errors` | Error conditions |
| | `4\|warnings` | Warning conditions |
| | `5\|notices` | Normal, but significant, conditions |
| | `6\|informational` | Informational messages |
| | `7\|debugging` | Debug-level messages |
| `program` | Exclude messages from a specified program. | |
| *<program-name>* | The name of a program. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. | |

| Parameter | Description | |
|---|---|---|
| | `rip` | Routing Information Protocol (RIP) |
| | `ripng` | Routing Information Protocol - next generation (RIPng) |
| | `ospf` | Open Shortest Path First (OSPF) |
| | `ospfv3` | Open Shortest Path First (OSPF) version 3 (OSPFv3) |
| | `bgp` | Border Gateway Protocol (BGP) |
| | `rsvp` | Resource Reservation Protocol (RSVP) |
| | `pim-dm` | Protocol Independent Multicast - Dense Mode (PIM-DM) |
| | `pim-sm` | Protocol Independent Multicast - Sparse Mode (PIM-SM) |
| | `pim-smv6` | PIM-SM version 6 (PIM-SMv6) |
| | `dot1x` | IEEE 802.1X Port-Based Access Control |
| | `lacp` | Link Aggregation Control Protocol (LACP) |
| | `stp` | Spanning Tree Protocol (STP) |
| | `rstp` | Rapid Spanning Tree Protocol (RSTP) |
| | `mstp` | Multiple Spanning Tree Protocol (MSTP) |
| | `imi` | Integrated Management Interface (IMI) |
| | `imish` | Integrated Management Interface Shell (IMISH) |
| | `epsr` | Ethernet Protection Switched Rings (EPSR) |
| | `irdp` | ICMP Router Discovery Protocol (IRDP) |
| | `rmon` | Remote Monitoring |
| | `loopprot` | Loop Protection |
| | `poe` | Power-inline (Power over Ethernet) |
| | `dhcpsn` | DHCP snooping (DHCPSN) |
| `facility` | Exclude messages from a syslog facility. | |
| *<facility>* | Specify one of the following syslog facilities to exclude messages from: | |
| | `kern` | Kernel messages |
| | `user` | Random user-level messages |
| | `mail` | Mail system |
| | `daemon` | System daemons |
| | `auth` | Security/authorization messages |
| | `syslog` | Messages generated internally by syslogd |
| | `lpr` | Line printer subsystem |
| | `news` | Network news subsystem |
| | `uucp` | UUCP subsystem |
| | `cron` | Clock daemon |

| Parameter | Description | |
|---|---|---|
| | `authpriv` | Security/authorization messages (private) |
| | `ftp` | FTP daemon |
| `msgtext` | Exclude messages containing a certain text string. | |
| *`<text-string>`* | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. | |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To exclude messages that contain the string 'example of irrelevant message' being sent to the remote syslog server 10.10.10.100, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.10.10.100 exclude msgtext example
of irrelevant message
```

**Related commands**

default log host

log host

log host (filter)

log host source

log host time

show log config

# log host source

**Overview** Use this command to specify a source interface or IP address for the device to send syslog messages from. You can specify any one of an interface name, an IPv4 address or an IPv6 address.

This is useful if the device can reach the syslog server via multiple interfaces or addresses and you want to control which interface/address the device uses.

Note that AlliedWare Plus does not support source interface settings on secure log hosts (which are hosts configured using "log host <ip-address> secure").

Use the **no** variant of this command to stop specifying a source interface or address.

**Syntax**

```
log host source {<interface-name>|<ipv4-addr>|<ipv6-addr>}
no log host source
```

| Parameter | Description |
|---|---|
| *<interface-name>* | Specify the source interface name. You can enter a VLAN, eth interface or loopback interface. |
| *<ipv4-addr>* | Specify the source IPv4 address, in dotted decimal notation (A.B.C.D). |
| *<ipv6-addr>* | Specify the source IPv6 address, in X:X::X:X notation. |

**Default** None (no source is configured)

**Mode** Global Configuration

**Example** To send syslog messages from 192.168.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# log host source 192.168.1.1
```

**Related commands**

default log host

log host

log host (filter)

log host exclude

log host time

show log config

# log host startup-delay

**Overview** Use this command to set the delay between the device booting up and it attempting to connect to remote log hosts. This is to allow time for network connectivity to the remote host to be established. During this period, the device buffers log messages and sends them once it has connected to the remote host.

The startup delay begins when the message "syslog-ng starting up" appears in the log.

If the default startup delay is not long enough for the boot and configuration process to complete and the links to come up, you may see logging failure messages on startup. In these cases, you can use the command to increase the startup delay.

Use the **no** variant of this command to return to the default delay values.

**Syntax**

```
log host startup-delay [delay <1-600>] [messages <1-5000>]
no log host startup-delay
```

| Parameter | Description |
|---|---|
| `delay <1-600>` | The time, in seconds, from when syslog starts before the device attempts to filter and transmit the buffered messages to remote hosts. |
| `messages <1-5000>` | The maximum number of messages that the device will buffer during the delay period. |

**Default** By default the system will buffer up to 2000 messages and wait 120 seconds from when syslog starts before attempting to filter and transmit the buffered messages to remote hosts.

**Mode** Global Configuration

**Example** To increase the delay to 180 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# log host startup-delay delay 180
```

**Related commands**

default log host

log host (filter)

log host exclude

log host source

log host time

log trustpoint

show log config

**Command changes** Version 5.4.8-0.2: defaults changed

# log host time

**Overview** This command configures the time used in messages sent to a remote syslog server. If the syslog server is in a different time zone to your device then the time offset can be configured using either the **utc-offset** parameter option keyword or the **local-offset** parameter option keyword, where **utc-offset** is the time difference from UTC (Universal Time, Coordinated) and **local-offset** is the difference from local time.

**Syntax**

```
log host {<hostname>|<ipv4-addr>|<ipv6-addr>} time
{local|local-offset|utc-offset {plus|minus} <0-24>}
```

| Parameter | Description |
|---|---|
| *<hostname>* | The host name of a remote syslog server. |
| *<ipv4-addr>* | The IPv4 address of a remote syslog server, in A.B.C.D format. |
| *<ipv6-addr>* | The IPv6 address of a remote syslog server, in X:X::X:X format. |
| *<email-address>* | The email address to send log messages to |
| `time` | Specify the time difference between the email recipient and the device you are configuring. |
| `local` | The device is in the same time zone as the email recipient |
| `local-offset` | The device is in a different time zone to the email recipient. Use the **plus** or **minus** keywords and specify the difference (offset) from local time of the device to the email recipient in hours. |
| `utc-offset` | The device is in a different time zone to the email recipient. Use the **plus** or **minus** keywords and specify the difference (offset) from UTC time of the device to the email recipient in hours. |
| `plus` | Negative offset (difference) from the device to the syslog server. |
| `minus` | Positive offset (difference) from the device to the syslog server. |
| *<0-24>* | World Time zone offset in hours |

**Default** The default is **local** time.

**Mode** Global Configuration

**Usage notes** Use the **local** option if the remote syslog server is in the same time zone as the device. Messages will display the time as on the local device when the message was generated.

Use the **offset** option if the email recipient is in a different time zone to this device. Specify the time offset of the remote syslog server in hours. Messages will display the time they were generated on this device but converted to the time zone of the remote syslog server.

**Examples**

To send messages to the remote syslog server with the IP address 10.32.16.21 in the same time zone as the device's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.21 time local 0
```

To send messages to the remote syslog server with the IP address 10.32.16.12 with the time information converted to the time zone of the remote syslog server, which is 3 hours ahead of the device's local time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.12 time local-offset plus 3
```

To send messages to the remote syslog server with the IP address 10.32.16.02 with the time information converted to the time zone of the email recipient, which is 3 hours behind the device's UTC time zone, use the following commands:

```
awplus# configure terminal
awplus(config)# log host 10.32.16.02 time utc-offset minus 3
```

**Related commands**

default log host

log host

log host (filter)

log host exclude

log host source

show log config

# log monitor (filter)

**Overview** This command creates a filter to select messages to be sent to the terminal when the terminal monitor command is given. Selection can be based on the priority/severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

**Syntax**

```
log monitor [level <level>] [program <program-name>] [facility
<facility>] [msgtext <text-string>]

no log monitor [level <level>] [program <program-name>]
[facility <facility>] [msgtext <text-string>]
```

| Parameter | Description | |
|---|---|---|
| `level` | Filter messages by severity level. | |
| *<level>* | The minimum severity of message to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: | |
| | `0\|emergencies` | System is unusable |
| | `1\|alerts` | Action must be taken immediately |
| | `2\|critical` | Critical conditions |
| | `3\|errors` | Error conditions |
| | `4\|warnings` | Warning conditions |
| | `5\|notices` | Normal, but significant, conditions |
| | `6\|informational` | Informational messages |
| | `7\|debugging` | Debug-level messages |
| `program` | Filter messages by program. Include messages from a specified program. | |
| *<program-name>* | The name of a program to log messages from. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. | |
| | `rip` | Routing Information Protocol (RIP) |
| | `ripng` | Routing Information Protocol - next generation (RIPng) |
| | `ospf` | Open Shortest Path First (OSPF) |
| | `ospfv3` | Open Shortest Path First (OSPF) version 3 (OSPFv3) |
| | `bgp` | Border Gateway Protocol (BGP) |
| | `rsvp` | Resource Reservation Protocol (RSVP) |
| | `pim-dm` | Protocol Independent Multicast - Dense Mode (PIM-DM) |
| | `pim-sm` | Protocol Independent Multicast - Sparse Mode (PIM-SM) |
| | `pim-smv6` | PIM-SM version 6 (PIM-SMv6) |

| Parameter | Description | |
|---|---|---|
| | dot1x | IEEE 802.1X Port-Based Access Control |
| | lacp | Link Aggregation Control Protocol (LACP) |
| | stp | Spanning Tree Protocol (STP) |
| | rstp | Rapid Spanning Tree Protocol (RSTP) |
| | mstp | Multiple Spanning Tree Protocol (MSTP) |
| | imi | Integrated Management Interface (IMI) |
| | imish | Integrated Management Interface Shell (IMISH) |
| | epsr | Ethernet Protection Switched Rings (EPSR) |
| | irdp | ICMP Router Discovery Protocol (IRDP) |
| | rmon | Remote Monitoring |
| | loopprot | Loop Protection |
| | poe | Power-inline (Power over Ethernet) |
| | dhcpsn | DHCP snooping (DHCPSN) |
| facility | Filter messages by syslog facility. | |
| <*facility*> | Specify one of the following syslog facilities to include messages from: | |
| | kern | Kernel messages |
| | user | Random user-level messages |
| | mail | Mail system |
| | daemon | System daemons |
| | auth | Security/authorization messages |
| | syslog | Messages generated internally by syslogd |
| | lpr | Line printer subsystem |
| | news | Network news subsystem |
| | uucp | UUCP subsystem |
| | cron | Clock daemon |
| | authpriv | Security/authorization messages (private) |
| | ftp | FTP daemon |
| msgtext | Select messages containing a certain text string. | |
| <*text-string*> | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. | |

**Default** By default there is a filter to select all messages. This filter may be removed and replaced by filters that are more selective.

**Mode** Global Configuration

**Examples**

To create a filter to send all messages that are generated by authentication and have a severity of **info** or higher to terminal instances where the terminal monitor command has been given, use the following commands:

```
awplus# configure terminal
awplus(config)# log monitor level info program auth
```

To remove a default filter that includes sending everything to the terminal, use the following commands:

```
awplus# configure terminal
awplus(config)# no log monitor level debugging
```

**Related commands**

default log monitor

log monitor exclude

show log config

terminal monitor

# log monitor exclude

**Overview** Use this command to prevent specified log messages from being displayed on a terminal, when terminal monitor is enabled. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax**

```
log console exclude [level <level>] [program <program-name>]
[facility <facility>] [msgtext <text-string>]
```

```
no log console exclude [level <level>] [program <program-name>]
[facility <facility>] [msgtext <text-string>]
```

| Parameter | Description | |
|---|---|---|
| `level` | Exclude messages of the specified severity level. | |
| *<level>* | The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: | |
| | `0\|emergencies` | System is unusable |
| | `1\|alerts` | Action must be taken immediately |
| | `2\|critical` | Critical conditions |
| | `3\|errors` | Error conditions |
| | `4\|warnings` | Warning conditions |
| | `5\|notices` | Normal, but significant, conditions |
| | `6\|informational` | Informational messages |
| | `7\|debugging` | Debug-level messages |
| `program` | Exclude messages from a specified program. | |
| *<program-name>* | The name of a program. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. | |
| | `rip` | Routing Information Protocol (RIP) |
| | `ripng` | Routing Information Protocol - next generation (RIPng) |
| | `ospf` | Open Shortest Path First (OSPF) |
| | `ospfv3` | Open Shortest Path First (OSPF) version 3 (OSPFv3) |

| Parameter | Description | |
|---|---|---|
| | bgp | Border Gateway Protocol (BGP) |
| | rsvp | Resource Reservation Protocol (RSVP) |
| | pim-dm | Protocol Independent Multicast - Dense Mode (PIM-DM) |
| | pim-sm | Protocol Independent Multicast - Sparse Mode (PIM-SM) |
| | pim-smv6 | PIM-SM version 6 (PIM-SMv6) |
| | dot1x | IEEE 802.1X Port-Based Access Control |
| | lacp | Link Aggregation Control Protocol (LACP) |
| | stp | Spanning Tree Protocol (STP) |
| | rstp | Rapid Spanning Tree Protocol (RSTP) |
| | mstp | Multiple Spanning Tree Protocol (MSTP) |
| | imi | Integrated Management Interface (IMI) |
| | imish | Integrated Management Interface Shell (IMISH) |
| | epsr | Ethernet Protection Switched Rings (EPSR) |
| | irdp | ICMP Router Discovery Protocol (IRDP) |
| | rmon | Remote Monitoring |
| | loopprot | Loop Protection |
| | poe | Power-inline (Power over Ethernet) |
| | dhcpsn | DHCP snooping (DHCPSN) |
| facility | Exclude messages from a syslog facility. | |
| *<facility>* | Specify one of the following syslog facilities to exclude messages from: | |
| | kern | Kernel messages |
| | user | Random user-level messages |
| | mail | Mail system |
| | daemon | System daemons |
| | auth | Security/authorization messages |
| | syslog | Messages generated internally by syslogd |
| | lpr | Line printer subsystem |
| | news | Network news subsystem |
| | uucp | UUCP subsystem |
| | cron | Clock daemon |
| | authpriv | Security/authorization messages (private) |
| | ftp | FTP daemon |

| Parameter | Description |
|---|---|
| `msgtext` | Exclude messages containing a certain text string. |
| *<text-string>* | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. |

**Default** No log messages are excluded

**Mode** Global configuration

**Example** To remove messages that contain the string “example of irrelevant message”, use the following commands:

```
awplus# configure terminal
awplus(config)# log monitor exclude msgtext example of
irrelevant message
```

**Related commands**

default log monitor

log monitor (filter)

show log config

terminal monitor

# log permanent

**Overview** This command configures the device to send permanent log messages to non-volatile storage (NVS) on the device. The content of the permanent log is retained over a reboot. Once the permanent log reaches its configured maximum allowable size old messages will be deleted to make way for new messages.

The **no** variant of this command configures the device not to send any messages to the permanent log. Log messages will not be retained over a restart.

**Syntax**

```
log permanent
no log permanent
```

**Mode** Global Configuration

**Examples** To enable permanent logging use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent
```

To disable permanent logging use the following commands:

```
awplus# configure terminal
awplus(config)# no log permanent
```

**Related commands**

clear log permanent

copy permanent-log

default log permanent

log permanent (filter)

log permanent exclude

log permanent size

show log config

show log permanent

# log permanent (filter)

**Overview** This command creates a filter to select messages to be sent to the permanent log. Selection can be based on the priority/ severity of the message, the program that generated the message, the logging facility used, a sub-string within the message or a combination of some or all of these.

The **no** variant of this command removes the corresponding filter, so that the specified messages are no longer sent to the permanent log.

**Syntax**

```
log permanent [level <level>] [program <program-name>]
[facility <facility>] [msgtext <text-string>]
```

```
no log permanent [level <level>] [program <program-name>]
[facility <facility>] [msgtext <text-string>]
```

| Parameter | Description | |
|---|---|---|
| `level` | Filter messages sent to the permanent log by severity level. | |
| *<level>* | The minimum severity of message to send. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: | |
| | `0\|emergencies` | System is unusable |
| | `1\|alerts` | Action must be taken immediately |
| | `2\|critical` | Critical conditions |
| | `3\|errors` | Error conditions |
| | `4\|warnings` | Warning conditions |
| | `5\|notices` | Normal, but significant, conditions |
| | `6\|informational` | Informational messages |
| | `7\|debugging` | Debug-level messages |
| `program` | Filter messages by program. Include messages from a specified program. | |
| *<program-name>* | The name of a program to log messages from. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. | |
| | `rip` | Routing Information Protocol (RIP) |
| | `ripng` | Routing Information Protocol - next generation (RIPng) |
| | `ospf` | Open Shortest Path First (OSPF) |
| | `ospfv3` | Open Shortest Path First (OSPF) version 3 (OSPFv3) |
| | `bgp` | Border Gateway Protocol (BGP) |
| | `rsvp` | Resource Reservation Protocol (RSVP) |
| | `pim-dm` | Protocol Independent Multicast - Dense Mode (PIM-DM) |
| | `pim-sm` | Protocol Independent Multicast - Sparse Mode (PIM-SM) |

| Parameter | Description | |
|---|---|---|
| | `pim-smv6` | PIM-SM version 6 (PIM-SMv6) |
| | `dot1x` | IEEE 802.1X Port-Based Access Control |
| | `lacp` | Link Aggregation Control Protocol (LACP) |
| | `stp` | Spanning Tree Protocol (STP) |
| | `rstp` | Rapid Spanning Tree Protocol (RSTP) |
| | `mstp` | Multiple Spanning Tree Protocol (MSTP) |
| | `imi` | Integrated Management Interface (IMI) |
| | `imish` | Integrated Management Interface Shell (IMISH) |
| | `epsr` | Ethernet Protection Switched Rings (EPSR) |
| | `irdp` | ICMP Router Discovery Protocol (IRDP) |
| | `rmon` | Remote Monitoring |
| | `loopprot` | Loop Protection |
| | `poe` | Power-inline (Power over Ethernet) |
| | `dhcpsn` | DHCP snooping (DHCPSN) |
| `facility` | Filter messages by syslog facility. | |
| *<facility>* | Specify one of the following syslog facilities to include messages from: | |
| | `kern` | Kernel messages |
| | `user` | Random user-level messages |
| | `mail` | Mail system |
| | `daemon` | System daemons |
| | `auth` | Security/authorization messages |
| | `syslog` | Messages generated internally by syslogd |
| | `lpr` | Line printer subsystem |
| | `news` | Network news subsystem |
| | `uucp` | UUCP subsystem |
| | `cron` | Clock daemon |
| | `authpriv` | Security/authorization messages (private) |
| | `ftp` | FTP daemon |
| `msgtext` | Select messages containing a certain text string. | |
| *<text-string>* | A text string to match (maximum 128 characters). This is case sensitive, and must be the last text on the command line. | |

**Default** By default the buffered log has a filter to select messages whose severity level is `notices (5)` or higher. This filter may be removed using the **no** variant of this command.

**Mode** Global Configuration

**Examples** To create a filter to send all messages containing the text "`Bridging initialization`", to the permanent log use the following commands:

```
awplus# configure terminal
awplus(config)# log permanent msgtext Bridging initialization
```

**Related commands**

clear log permanent

default log permanent

log permanent

log permanent exclude

log permanent size

show log permanent

# log permanent exclude

**Overview** Use this command to prevent specified log messages from being sent to the permanent log. You can exclude messages on the basis of:

- the priority/severity of the message
- the program that generated the message
- the logging facility used
- a sub-string within the message, or
- a combination of some or all of these.

Use the **no** variant of this command to stop excluding the specified messages.

**Syntax**

```
log permanent exclude [level <level>] [program <program-name>]
[facility <facility>] [msgtext <text-string>]
```

```
no log permanent exclude [level <level>] [program
<program-name>] [facility <facility>] [msgtext <text-string>]
```

| Parameter | Description | |
|---|---|---|
| `level` | Exclude messages of the specified severity level. | |
| *<level>* | The severity level to exclude. The level can be specified as one of the following numbers or level names, where 0 is the highest severity and 7 is the lowest severity: | |
| | `0\|emergencies` | System is unusable |
| | `1\|alerts` | Action must be taken immediately |
| | `2\|critical` | Critical conditions |
| | `3\|errors` | Error conditions |
| | `4\|warnings` | Warning conditions |
| | `5\|notices` | Normal, but significant, conditions |
| | `6\|informational` | Informational messages |
| | `7\|debugging` | Debug-level messages |
| `program` | Exclude messages from a specified program. | |
| *<program-name>* | The name of a program. You can enter either one of the following predefined program names (depending on your device model), or another program name that you find in the log output. The pre-defined names are not case sensitive but other program names from the log output are. | |
| | `rip` | Routing Information Protocol (RIP) |
| | `ripng` | Routing Information Protocol - next generation (RIPng) |
| | `ospf` | Open Shortest Path First (OSPF) |
| | `ospfv3` | Open Shortest Path First (OSPF) version 3 (OSPFv3) |
| | `bgp` | Border Gateway Protocol (BGP) |

| Parameter | Description | |
|---|---|---|
| | `rsvp` | Resource Reservation Protocol (RSVP) |
| | `pim-dm` | Protocol Independent Multicast - Dense Mode (PIM-DM) |
| | `pim-sm` | Protocol Independent Multicast - Sparse Mode (PIM-SM) |

log permanent (filter)

log permanent size

show log config

show log permanent

# log permanent size

**Overview** This command configures the amount of memory that the permanent log is permitted to use. Once this memory allocation has been filled old messages will be deleted to make room for new messages.

Use the **no** variant of this command to return to the default.

**Syntax**

```
log permanent size <50-250>
no log permanent size
```

| Parameter | Description |
|---|---|
| *<50-250>* | Size of the permanent log in kilobytes |

**Default** 50 kilobytes

**Mode** Global Configuration

**Example** To allow the permanent log to use up to 100 kilobytes of NVS, use the commands:

```
awplus# configure terminal
awplus(config)# log permanent size 100
```

To return to the default value, use the commands:

```
awplus# configure terminal
awplus(config)# no log permanent size
```

# log-rate-limit nsm

**Overview** This command limits the number of log messages generated by the device for a specified time interval.

Use the **no** variant of this command to revert to the default number of log messages, which is up to 200 log messages per second.

**Syntax**

```
log-rate-limit nsm messages <message-limit> interval
<time-interval>
```

```
no log-rate-limit nsm
```

| Parameter | Description |
|---|---|
| *<message-limit>* | <1-65535><br>The number of log messages generated by the device. |
| *<time-interval>* | <0-65535><br>The time period for log message generation in 1/100 seconds. If an interval of 0 is specified then no log message rate limiting is applied. |

**Default** By default, the device will allow 200 log messages to be generated per second.

**Mode** Global Configuration

**Usage notes** This command limits the rate that log messages are generated. Limiting log messages protects the device from running out of memory in extreme conditions, such as during a broadcast storm.

Once the specified number of log messages per interval is exceeded, any excess log messages are dropped. When this occurs a summary log message is generated at the end of the interval. This summary message includes the number of log messages dropped.

If you expect a lot of dropped log messages, we recommend setting the time interval to no less than 100. This limits the number of summary messages to one per second, which prevents the log from filling up with these summary messages.

**Examples** To allow the device to generate a maximum of 300 log messages per second, use the following commands:

```
awplus# configure terminal
awplus(config)# log-rate-limit nsm messages 300 interval 100
```

To return the device to the default setting, use the following commands:

```
awplus# configure terminal
awplus(config)# no log-rate-limit nsm
```

# log trustpoint

**Overview** This command adds one or more trustpoints to be used with the syslog application. Multiple trustpoints may be specified, or the command may be executed multiple times, to add multiple trustpoints to the application.

The **no** version of this command removes one or more trustpoints from the list of trustpoints associated with the application.

**Syntax**

```
log trustpoint [<trustpoint-list>]
no log trustpoint [<trustpoint-list>]
```

| Parameter | Description |
|---|---|
| *<trustpoint-list>* | Specify one or more trustpoints to be added or deleted. |

**Default** No trustpoints are created by default.

**Mode** Global Configuration

**Usage notes** The device certificate associated with first trustpoint added to the application will be transmitted to remote servers. The certificate received from the remote server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

If no trustpoints are specified in the command, the trustpoint list will be unchanged.

If **no log trustpoint** is issued without specifying any trustpoints, then all trustpoints will be disassociated from the application.

**Example** You can add multiple trustpoints by executing the command multiple times:

```
awplus# configure terminal
awplus(config)# log trustpoint trustpoint_1
awplus(config)# log trustpoint trustpoint_2
```

Alternatively, add multiple trustpoints with a single command:

```
awplus(config)# log trustpoint trustpoint_2 trustpoint_3
```

Disassociate all trustpoints from the syslog application using the command:

```
awplus(config)# log trustpoint trustpoint_2 trustpoint_3
```

**Related commands** log host

show log config

# log url-requests

**Overview** If URL Filtering is enabled, then by default, black list hits and issues with match criteria and list files are logged.

Use this command to enable logging of all HTTP and HTTPS URL requests (both permitted and denied) passing through the firewall.

Use the **no** variant of this command to disable extra logging of HTTP and HTTPS URL requests passing through the firewall.

**Syntax**

```
log url-requests
no log url-requests
```

**Default** Disabled by default.

**Mode** URL Filter Configuration

**Usage notes** When enabled, additional log messages for HTTP and HTTPS URL requests passing through the firewall contain the:

- URL being accessed
- IP address of the user that requested the URL

**Example** To configure logging of all HTTP and HTTPS URL requests passing through the firewall (permitted as well as denied), use the following commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# log url-requests
```

**Related commands** url-filter

**Command changes** Version 5.4.7-1.1: command added

# show connection-log events

**Overview** This command displays the configuration state (enabled or disabled) for the logging of connections passing through the firewall, as configured by the connection-log events command.

**Syntax**
```
show connection-log events
```

**Mode** User Exec

**Example** To show the logging configuration state for the connections passing through the firewall, use the command:

```
awplus# show connection-log events
```

**Output** Figure 10-1: Example output from **show connection-log events**

```
awplus#show connection-log events
Log new connection events:    Disabled
Log connection end events:    Enabled
```

**Related commands** connection-log events

**Command changes** Version 5.4.7-1.1: command added.

# show counter log

**Overview** This command displays log counter information.

**Syntax**

```
show counter log
```

**Mode** User Exec and Privileged Exec

**Example** To display the log counter information, use the command:

```
awplus# show counter log
```

**Output** Figure 10-2: Example output from the **show counter log** command

```
Log counters
Total Received        ......... 2328
Total Received P0     ......... 0
Total Received P1     ......... 0
Total Received P2     ......... 1
Total Received P3     ......... 9
Total Received P4     ......... 32
Total Received P5     ......... 312
Total Received P6     ......... 1602
Total Received P7     ......... 372
```

**Table 11:** Parameters in output of the **show counter log** command

| Parameter | Description |
|---|---|
| Total Received | Total number of messages received by the log |
| Total Received P0 | Total number of Priority 0 (Emergency) messages received |
| Total Received P1 | Total number of Priority 1 (Alert) messages received |
| Total Received P2 | Total number of Priority 2 (Critical) messages received |
| Total Received P3 | Total number of Priority 3 (Error) messages received |
| Total Received P4 | Total number of Priority 4 (Warning) messages received |
| Total Received P5 | Total number of Priority 5 (Notice) messages received |
| Total Received P6 | Total number of Priority 6 (Info) messages received |
| Total Received P7 | Total number of Priority 7 (Debug) messages received |

**Related commands** show log config

# show exception log

**Overview** This command displays the contents of the exception log. If the device has unexpectedly restarted and has produced a core dump file, the output of this command shows the name and location of the file.

**Syntax**

```
show exception log
```

**Mode** User Exec and Privileged Exec

**Example** To display the exception log, use the command:

```
awplus# show exception log
```

**Output** Figure 10-3: Example output from the **show exception log** command on a device that has never had an exception occur

```
awplus#show exception log
<date> <time> <facility>.<severity> <program[<pid>]>: <message>
------------------------------------------------------------------------
None
------------------------------------------------------------------------
awplus#
```

# show log

**Overview** This command displays the contents of the buffered log.

For information on filtering and saving command output, see the "Getting Started with AlliedWare_Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show log [tail [<10-250>]]
```

| Parameter | Description |
|---|---|
| `tail` | Display only the latest log entries. |
| *<10-250>* | Specify the number of log entries to display. |

**Default** By default the entire contents of the buffered log is displayed.

**Mode** User Exec, Privileged Exec and Global Configuration

**Usage notes** If the optional **tail** parameter is specified, only the latest 10 messages in the buffered log are displayed. A numerical value can be specified after the **tail** parameter to select how many of the latest messages should be displayed.

The **show log** command is only available to users at privilege level 7 and above. To set a user's privilege level, use the command:

```
awplus(config)# username <name> privilege <1-15>
```

**Examples** To display the contents of the buffered log use the command:

```
awplus# show log
```

To display the 10 latest entries in the buffered log use the command:

```
awplus# show log tail 10
```

**Output** Figure 10-4: Example output from **show log**

```
awplus#show log

<date> <time> <facility>.<severity> <program[<pid>]>: <message>

```

In the above example the '*' next to filter 1 in the buffered log configuration indicates that this is the default filter. The permanent log has had its default filter removed, so none of the filters are marked with '*'.

**NOTE:** *Terminal log and console log cannot be set at the same time. If console logging is enabled then the terminal logging is turned off.*

**Related commands**

show counter log

show log

show log permanent

# show log external

**Overview** Use this command to display the contents of the external log, which is stored on an SD card or USB storage device.

**Syntax**

```
show log external [tail [<10-250>]]
```

| Parameter | Description |
|---|---|
| `tail` | Display only the latest log entries. |
| *<10-250>* | Specify the number of log entries to display. |

**Mode** Global Configuration

Privileged Exec

User Exec

**Usage notes** If the optional **tail** parameter is specified, only the latest 10 messages in the permanent log are displayed. A numerical value can be specified after the **tail** parameter to change how many of the latest messages should be displayed.

**Example** To display the last 5 entries in the external log, use the command:

```
awplus# show log external tail 5
```

**Overview** This command displays the contents of the permanent log.

**Syntax**

```
show log permanent [tail [<10-250>]]
```

| Parameter | Description |
|---|---|
| `tail` | Display only the latest log entries. |
| *<10-250>* | Specify the number of log entries to display. |

**Usage notes** If the optional **tail** parameter is specified, only the latest 10 messages in the permanent log are displayed. A numerical value can be specified after the **tail** parameter to change how many of the latest messages should be displayed.

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the permanent log, use the command:

```
awplus# show log permanent
```

**Output** Figure 10-6: Example output from **show log permanent**

```
awplus#show log permanent

show log config

# show running-config log

**Overview** This command displays the current running configuration of the Log utility.

**Syntax**

```
show running-config log
```

**Mode** Privileged Exec and Global Configuration

**Example** To display the current configuration of the log utility, use the command:

```
awplus# show running-config log
```

**Related commands** show log

show log config

# unmount

**Overview** Use this command to unmount an external storage device. We recommend you unmount storage devices before removing them, to avoid file corruption. This is especially important if files may be automatically written to the storage device, such as external log files or AMF backup files.

**Syntax**

```
unmount card
unmount usb
```

| Parameter | Description |
|---|---|
| `card` | Unmount the SD card. |
| `usb` | Unmount the USB storage device. |

**Mode** Privileged Exec

**Example** To unmount an SD card and safely remove it from the device, use the command:

```
awplus# unmount card
```

To unmount a USB storage device and safely remove it from the device, use the command:

```
awplus# unmount usb
```

# 11 Scripting Commands

## Introduction

**Overview** This chapter provides commands used for command scripts.

**Command List**

- "activate" on page 465
- "echo" on page 466
- "wait" on page 467

# activate

**Overview** This command activates a script file.

**Syntax**

```
activate [background] <script>
```

| Parameter | Description |
|---|---|
| `background` | Activate a script to run in the background. A process that is running in the background will operate as a separate task, and will not interrupt foreground processing. Generally, we recommend running short, interactive scripts in the foreground and longer scripts in the background. The default is to run the script in the foreground. |
| *<script>* | The file name of the script to activate. The script is a command script consisting of commands documented in this software reference. Note that you must use either a **. scp** or a **. sh** filename extension for a valid script text file, as described below in the usage section for this command. |

**Mode** Privileged Exec

**Usage notes** When a script is activated, the privilege level is set to 1 enabling User Exec commands to run in the script. If you need to run Privileged Exec commands in your script you need to add an enable (Privileged Exec mode) command to the start of your script. If you need to run Global Configuration commands in your script you need to add a configure terminal command after the **enable** command at the start of your script.

The **activate** command executes the script in a new shell. A terminal length shell command, such as **terminal length 0** may also be required to disable a delay that would pause the display.

A script must be a text file with a filename extension of either **. sh** or **. scp** only for the AlliedWare Plus™ CLI to activate the script file. The **. sh** filename extension indicates the file is an ASH script, and the **. scp** filename extension indicates the file is an AlliedWare Plus™ script.

**Examples** To activate a command script to run as a background process, use the command:

```
awplus# activate background test.scp
```

**Related commands**

configure terminal

echo

enable (Privileged Exec mode)

wait

# echo

**Overview** This command echoes a string to the terminal, followed by a blank line.

**Syntax**

```
echo <line>
```

| Parameter | Description |
|---|---|
| *<line>* | The string to echo |

**Mode** User Exec and Privileged Exec

**Usage** This command may be useful in CLI scripts, to make the script print user-visible comments.

**Example** To echo the string `Hello World` to the console, use the command:

```
awplus# echo Hello World
```

**Output**

```
Hello World
```

**Related commands** activate

wait

# wait

**Overview** This command pauses execution of the active script for the specified period of time.

**Syntax**

```
wait <delay>
```

| Parameter | Description |
|---|---|
| *<delay>* | <1-65535> Specify the time delay in seconds |

**Default** No wait delay is specified by default.

**Mode** Privileged Exec (when executed from a script not directly from the command line)

**Usage notes** Use this command to pause script execution in an **.scp** (AlliedWare Plus™ script) or an **.sh** (ASH script) file executed by the activate command. The script must contain an **enable** command, because the **wait** command is only executed in the Privileged Exec mode.

**Example** See an **.scp** script file extract below that will show port counters for interface port1.0.2 over a 10 second interval:

```
enable

show interface port1.0.2

wait 10

show interface port1.0.2
```

**Related commands**

activate

echo

enable (Privileged Exec mode)

# 12 Interface Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure and display interfaces.

**Command List**

- "description (interface)" on page 469
- "interface (to configure)" on page 470
- "ip tcp adjust-mss" on page 472
- "ipv6 tcp adjust-mss" on page 474
- "mru jumbo" on page 476
- "mtu" on page 477
- "service statistics interfaces counter" on page 479
- "show interface" on page 480
- "show interface brief" on page 484
- "show interface memory" on page 485
- "show interface status" on page 487
- "shutdown" on page 489

# description (interface)

**Overview** Use this command to add a description to a specific port or interface.

**Syntax**

```
description <description>
```

| Parameter | Description |
|---|---|
| *<description>* | Text describing the specific interface. Descriptions can contain any printable ASCII characters (ASCII 32-126). |

**Mode** Interface Configuration

**Example** The following example uses this command to describe the device that an interface is connected to.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# description Boardroom PC
```

**Command changes** Version 5.4.7-1.1: valid character set changed to printable ASCII characters

# interface (to configure)

**Overview** Use this command to select one or more interfaces to configure.

**Syntax** `interface <interface-list>`

| Parameter | Description |
|---|---|
| *<interface-list>* | The interfaces to configure. An interface-list can be:<br>• a PPP interface (e.g. ppp0)<br>• an Eth interface (e.g. eth1)<br>• an 802.1Q Ethernet sub-interface (e.g. eth1.10, where '10' is the VLAN ID specified by the **encapsulation dot1q** command)<br>• a VLAN (e.g. vlan2)<br>• a switchport (e.g. port1.0.4)<br>• a static channel group (e.g. sa2)<br>• a dynamic (LACP) channel group (e.g. po2)<br>• a bridge interface (e.g. br0)<br>• a tunnel interface (e.g. tunnel0)<br>• a 3G cellular interface (e.g. cellular0)<br>• a WWAN interface (e.g wwan0)<br>• the loopback interface (lo)<br>• a continuous range of interfaces, separated by a hyphen (e.g. ppp2-4)<br>• a comma-separated list (e.g. ppp0,ppp2-4). Do not mix interface types in a list.<br>The specified interfaces must exist. |

**Usage notes** A local loopback interface is one that is always available for higher layer protocols to use and advertise to the network. Although a local loopback interface is assigned an IP address, it does not have the usual requirement of connecting to a lower layer physical entity. This lack of physical attachment creates the perception of a local loopback interface always being accessible via the network.

Local loopback interfaces can be utilized by a number of protocols for various purposes. They can be used to improve access to the device and also increase its reliability, security, scalability and protection. In addition, local loopback interfaces can add flexibility and simplify management, information gathering and filtering.

One example of this increased reliability is for OSPF to advertise a local loopback interface as an interface-route into the network irrespective of the physical links that may be 'up' or 'down' at the time. This provides a higher probability that the routing traffic will be received and subsequently forwarded.

**Mode** Global Configuration

**Examples**

The following example shows how to enter Interface mode to configure VLAN interface vlan1. Note how the prompt changes.

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)#
```

The following example shows how to enter Interface mode to configure the PPP interface ppp0.

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)#
```

The following example shows how to enter Interface mode to configure the local loopback interface.

```
awplus# configure terminal
awplus(config)# interface lo
awplus(config-if)#
```

The following example shows how to enter Interface mode to configure bridge br2.

```
awplus# configure terminal
awplus(config)# interface br2
awplus(config-if)#
```

**Related commands**

ip address (IP Addressing and Protocol)

show interface

show interface brief

# ip tcp adjust-mss

**Overview** Use this command to set the Maximum Segment Size (MSS) size for an interface, where MSS is the maximum TCP data packet size that the interface can transmit before fragmentation.

Use the **no** variant of this command to remove a previously specified MSS size for a PPP interface, and restore the default MSS size.

**Syntax**

```
ip tcp adjust-mss {<mss-size>|pmtu}
no ip tcp adjust-mss
```

| Parameter | Description |
|---|---|
| *<mss-size>* | <64-1460> Specifies the MSS size in bytes. |
| pmtu | Adjust TCP MSS automatically with respect to the MTU on the interface. |

**Default** The default setting allows a TCP server or a TCP client to set the MSS value for itself.

**Mode** Interface Configuration

**Usage notes** When a host initiates a TCP session with a server it negotiates the IP segment size by using the MSS option field in the TCP packet. The value of the MSS option field is determined by the Maximum Transmission Unit (MTU) configuration on the host.

You can set a feasible MSS value on the following interfaces:

- PPP
- Ethernet
- Tunnel
- VLAN

**Examples** To configure an MSS size of 1452 bytes on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip tcp adjust-mss 1452
```

To configure an MSS size of 1452 bytes on Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip tcp adjust-mss 1452
```

To configure an MSS size of 1452 bytes on interface tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# ip tcp adjust-mss 1452
```

To restore the MSS size to the default size on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip tcp adjust-mss
```

**Related commands**

mtu (PPP)

show interface

show interface (PPP)

show interface tunnel (GRE)

**Command changes**

Version 5.4.8-2.1: interface tunnel example added

# ipv6 tcp adjust-mss

**Overview** Use this command to set the IPv6 Maximum Segment Size (MSS) size for an interface, where MSS is the maximum TCP data packet size that the interface can transmit before fragmentation.

Use the **no** variant of this command to remove a previously specified MSS size for a PPP interface, and restore the default MSS size.

**Syntax**

```
ipv6 tcp adjust-mss {<mss-size>|pmtu}
no ipv6 tcp adjust-mss
```

| Parameter | Description |
|---|---|
| *<mss-size>* | <64-1460> Specifies the MSS size in bytes. |
| pmtu | Adjust TCP MSS automatically with respect to the MTU on the interface. |

**Default** The default setting allows a TCP server or a TCP client to set the MSS value for itself.

**Mode** Interface Configuration

**Usage notes** When a host initiates a TCP session with a server it negotiates the IP segment size by using the MSS option field in the TCP packet. The value of the MSS option field is determined by the Maximum Transmission Unit (MTU) configuration on the host.

You can set a feasible MSS value on the following interfaces:

- PPP
- Ethernet
- Tunnel
- VLAN

**Examples** To configure an IPv6 MSS size of 1452 bytes on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ipv6 tcp adjust-mss 1452
```

To configure an IPv6 MSS size of 1452 bytes on Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 tcp adjust-mss 1452
```

To adjust IPv6 TCP MSS automatically with respect to the MTU on interface tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# ipv6 tcp adjust-mss pmtu
```

To restore the MSS size to the default size on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 tcp adjust-mss
```

**Related commands**

mtu (PPP)

show interface

show interface (PPP)

show interface tunnel (GRE)

**Command changes**

Version 5.4.8-2.1: interface tunnel example added

# mru jumbo

**Overview** Use this command to enable the device to forward jumbo frames. For more information, see the Switching Feature Overview and Configuration Guide.

When jumbo frame support is enabled, the maximum size of packets that the device can forward is 9688 bytes of payload.

Use the **no** variant of this command to remove jumbo frame support, and restore the default MRU size (1500 bytes) for switch ports.

***NOTE:*** *The number above specifies the payload only. For an IEEE 802.1q frame, provision is made (internally) for the following additional components:*

- Source and Destination addresses
- EtherType field
- Priority and VLAN tag fields
- FCS

*These additional components increase the frame size (to 1522 bytes in the default case).*

**Syntax**

```
mru jumbo
no mru
```

**Default** By default, jumbo frame support is not enabled.

**Mode** Interface Configuration for switch ports.

**Usage notes** Note that show interface output will only show MRU size for switch ports.

We recommend limiting the number of ports with jumbo frames support enabled to two.

**Examples** To enable the device to forward jumbo frames on port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# mru jumbo
```

To remove the jumbo frame support, and therefore restore the MRU size of 1500 bytes on port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no mru
```

**Related commands** show interface

# mtu

**Overview** Use this command to set the Maximum Transmission Unit (MTU) size for interfaces, where MTU is the maximum packet size that interfaces can transmit. The MTU size setting is applied to both IPv4 and IPv6 packet transmission.

Use the **no** variant of this command to remove a previously specified Maximum Transmission Unit (MTU) size, and restore the default MTU size. For example, the VLAN interface default is 1500 bytes.

**Syntax**

```
mtu <68-1582>
no mtu
```

| Parameter | Description |
|---|---|
| *<68-1582>* | The Maximum Transmission size in bytes. |

**Default** The default MTU size, for example 1500 bytes for VLAN interfaces.

**Mode** Interface Configuration

**Usage notes** If a device receives an IPv4 packet for Layer 3 switching to another interface with an MTU size smaller than the packet size, and if the packet has the '**don't fragment**' bit set, then the device will send an ICMP '**destination unreachable**' (3) packet type and a '**fragmentation needed and DF set**' (4) code back to the source. For IPv6 packets bigger than the MTU size of the transmitting interface, an ICMP '**packet too big**' (ICMP type 2 code 0) message is sent to the source.

You can set an MTU value on the following interfaces:

- PPP
- Ethernet
- Tunnel
- VLAN

Note that you cannot configure MTU on bridge interfaces. The MTU of the bridge interface is determined by the member interface of the bridge which has the lowest MTU. For example, if you attach eth1 with MTU 1200, ppp1 with MTU 1400, and vlan1 with MTU 1500 to a bridge interface, the MTU for that interface will be 1200.

Note that show interface output will only show MTU size for VLAN interfaces.

**Examples** To configure an MTU size of 1555 bytes on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# mtu 1555
```

To configure an MTU size of 1555 bytes for tunnel 'tunnel2', use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# mtu 1555
```

To restore the MTU size to the default MTU size of 1500 bytes on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no mtu
```

**Related commands**

show interface

**Command changes**

Version 5.4.7-1.1: Behavior change when MTU set to less than 1500 on FS980M and GS980M.

Version 5.5.1-0.1: Layer 3 jumbo frames supported on SBx908 GEN2 and x950.

Version 5.5.1-1.2: Layer 3 jumbo frames supported on x530 and GS980MX.

# service statistics interfaces counter

**Overview** Use this command to enable the interface statistics counter.

Use the **no** variant of this command to disable the interface statistics counter.

**Syntax**

```
service statistics interfaces counter
no service statistics interfaces counter
```

**Default** The interface statistics counter is enabled by default.

**Mode** Global Configuration

**Example** To enable the interface statistics counter, use the following commands:

```
awplus# configure terminal
awplus(config)# service statistics interfaces counter
```

To disable the interface statistics counter, use the following commands:

```
awplus# configure terminal
awplus(config)# no service statistics interfaces counter
```

**Command changes** Version 5.4.7-2.1: command added

# show interface

**Overview** Use this command to display interface configuration and status.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show interface [<interface-list>]
```

| Parameter | Description |
|---|---|
| *<interface-list>* | The interfaces or ports to display. An interface-list can be:<br>• a PPP interface (e.g. ppp0)<br>• an Eth interface (e.g. eth1)<br>• an 802.1Q Ethernet sub-interface (e.g. eth1.10, where '10' is the VLAN ID specified by the **encapsulation dot1q** command)<br>• a VLAN (e.g. vlan2)<br>• a switchport (e.g. port1.0.4)<br>• a static channel group (e.g. sa2)<br>• a dynamic (LACP) channel group (e.g. po2)<br>• a bridge interface (e.g. br0)<br>• a tunnel interface (e.g. tunnel0)<br>• a 3G cellular interface (e.g. cellular0)<br>• a WWAN interface (e.g wwan0)<br>• the loopback interface (lo)<br>• a continuous range of interfaces, separated by a hyphen (e.g. ppp2-4)<br>• a comma-separated list (e.g. ppp0,ppp2-4). Do not mix interface types in a list.<br>The specified interfaces must exist. |

**Mode** User Exec and Privileged Exec

**Usage notes** Note that the output displayed with this command will show MTU (Maximum Transmission Unit) size for VLAN interfaces, and MRU (Maximum Received Unit) size for switch ports.

**Example** To display configuration and status information for all interfaces, use the command:

```
awplus# show interface
```

Figure 12-1: Example output from the **show interface** command:

```
awplus#show interface
Interface port1.0.1
  Link is UP, administrative state is UP
  Hardware is Ethernet, address is 0000.cd38.026c
  index 5001 metric 1 mru 1500
  current duplex full, current speed 1000, current polarity mdix
  configured duplex auto, configured speed auto, configured polarity auto
  <UP,BROADCAST,RUNNING,MULTICAST>
  SNMP link-status traps: Disabled
    input packets 2927667, bytes 224929311, dropped 0, multicast packets 1242629
    output packets 378084, bytes 54372424, multicast packets 1, broadcast packets 10
    input average rate : 30 seconds 5.19 Kbps, 5 minutes 8.16 Kbps
    output average rate: 30 seconds 6.04 Kbps, 5 minutes 73.89 Kbps
    input peak rate 268.60 Kbps at 2018/04/10 17:46:43
    output peak rate 6.81 Mbps at 2018/04/10 18:15:44
  Time since last state change: 7 days 01:58:10
...
```

To display configuration and status information for the loopback interface lo, use the command:

```
awplus# show interface lo
```

Figure 12-2: Example output from the **show interface lo** command:

```
awplus#show interface lo
Interface lo
  Link is UP, administrative state is UP
  Hardware is Loopback
  index 1 metric 1
  <UP,LOOPBACK,RUNNING>
  VRF Binding: Not bound
  SNMP link-status traps: Disabled
  Router Advertisement is disabled
  Router Advertisement default routes are accepted
  Router Advertisement prefix info is accepted
  Time since last state change: 8 days 19:41:47
```

To display configuration and status information for interface vlan1, use the command:

```
awplus# show interface vlan1
```

Figure 12-3: Example output from the **show interface vlan1** command:

```
awplus#show interface vlan1
Interface vlan1
  Link is UP, administrative state is UP
  Hardware is VLAN, address is 0000.cd38.026c
  IPv4 address 192.168.1.1/24 broadcast 192.168.1.255
  index 301 metric 1 mtu 1500
  arp ageing timeout 300
  <UP,BROADCAST,RUNNING,MULTICAST>
  VRF Binding: Not bound
  SNMP link-status traps: Disabled
  Router Advertisement is disabled
  Router Advertisement default routes are accepted
  Router Advertisement prefix info is accepted
    input packets 0, bytes 0, dropped 0, multicast packets 0
    output packets 9, bytes 612, multicast packets 0, broadcast packets 0
    input average rate : 30 seconds 0 bps, 5 minutes 0 bps
    output average rate: 30 seconds 0 bps, 5 minutes 0 bps
    output peak rate 140 bps at 2018/04/10 16:40:56
  Time since last state change: 8 days 19:09:19
```

To display configuration and status information for br1, use the command:

```
awplus# show interface br1
```

```
awplus#show interface br1
Interface br1
  Link is UP, administrative state is UP
  Hardware is Bridge
  IPv6 address fe80::200:cdff:fe38:f7/64
  index 33555969 metric 1
  MAC ageing time 300
  <UP,BROADCAST,RUNNING,MULTICAST>
  SNMP link-status traps: Disabled
    input packets 1328, bytes 143605, dropped 0, multicast packets 0
    output packets 1847, bytes 218999, multicast packets 1 broadcast packets 3
    input average rate : 30 seconds 3.00 Kbps, 5 minutes 1.02 Kbps
    output average rate: 30 seconds 5.32 Kbps, 5 minutes 2.06 Kbps
    input peak rate 8.19 Kbps at 2017/11/13 05:09:59
    output peak rate 17.05 Kbps at 2017/11/13 05:11:23
  Time since last state change: 0 days 00:00:09
```

To display configuration and status information for eth1, use the command:

```
awplus# show interface eth1
```

Figure 12-4: Example output from the **show interface eth1** command:

```
awplus#show interface eth1
Interface eth1
  Link is DOWN, administrative state is UP
  Hardware is Ethernet, address is 0000.cd38.026a
  index 12 metric 1 mtu 1500
  configured duplex auto, configured speed auto, configured polarity auto
  <UP,BROADCAST,MULTICAST>
  VRF Binding: Not bound
  SNMP link-status traps: Disabled
  Bandwidth 1g
  Router Advertisement is disabled
  Router Advertisement default routes are accepted
  Router Advertisement prefix info is accepted
    input packets 0, bytes 0, dropped 0, multicast packets 0
    output packets 11, bytes 5848
    input average rate : 30 seconds 0 bps, 5 minutes 0 bps
    output average rate: 30 seconds 0 bps, 5 minutes 0 bps
    output peak rate 2.48 Kbps at 2018/04/10 18:22:14
  Time since last state change: 7 days 22:56:59
```

# show interface brief

**Overview** Use this command to display brief interface, configuration, and status information, including provisioning information.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show interface brief
```

**Mode** User Exec and Privileged Exec

**Output** Figure 12-5: Example output from **show interface brief**

```
awplus#show interface brief
Interface              Status          Protocol
port1.0.1              admin up        down
port1.0.2              admin up        down
port1.0.3              admin up        down
port1.0.4              admin up        down
...
eth1                   admin up        down
lo                     admin up        running
vlan1                  admin up        down
ppp1                   admin up        down
```

Table 12-1: Parameters in the output of **show interface brief**

| Parameter | Description |
|---|---|
| `Interface` | The name or type of interface. |
| `Status` | The administrative state. This can be either **admin up** or **admin down**. |
| `Protocol` | The link state. This can be either **down**, **running**, or **provisioned**. |

**Related commands**

show interface

show interface status

show interface memory

# show interface memory

**Overview** This command displays the shared memory used by either all interfaces, or the specified interface or interfaces. The output is useful for diagnostic purposes by Allied Telesis authorized service personnel.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show interface memory
show interface <port-list> memory
```

| Parameter | Description |
|---|---|
| *<port-list>* | Display information about only the specified port or ports. The port list can be:<br>• an Eth port (e.g. eth1)<br>• an 802.1Q Ethernet sub-interface (e.g. eth1.10, where '10' is the VLAN ID specified by the **encapsulation dot1q** command)<br>• a switchport (e.g. port1.0.4)<br>• a static channel group (e.g. sa2)<br>• a dynamic (LACP) channel group (e.g. po2)<br>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)<br>• a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list. |

**Mode** User Exec and Privileged Exec

**Example** To display the shared memory used by all interfaces, use the command:

```
awplus# show interface memory
```

To display the shared memory used by port1.0.1 and port1.0.3 to port1.0.4, use the command:

```
awplus# show interface port1.0.1,port1.0.3-port1.0.4 memory
```

**Output** Figure 12-6: Example output from the **show interface memory** command

```
awplus#show interface memory
Vlan blocking state shared memory usage
---------------------------------------------
Interface    shmid        Bytes Used     nattch     Status
port1.0.1    294921       512            1
port1.0.2    491535       512            1
port1.0.3    458766       512            1
...
eth1         393228       512            1
lo           360459       512            1
```

Figure 12-7: Example output from **show interface <port-list> memory** for a list of interfaces

```
awplus#show interface port1.0.1,port1.0.3-port1.0.4 memory
Vlan blocking state shared memory usage
---------------------------------------------
Interface    shmid        Bytes Used     nattch     Status
port1.0.1    589842       512            1
port1.0.3    688149       512            1
port1.0.4    327690       512            1
```

**Related commands**

show interface brief

show interface status

show interface switchport

# show interface status

**Overview** Use this command to display the status of the specified interface or interfaces. Note that when no interface or interfaces are specified then the status of all interfaces on the device are shown.

**Syntax**

```
show interface [<port-list>] status
```

| Parameter | Description |
|---|---|
| *<port-list>* | The ports to display information about. The port list can be:<br>• an Eth port (e.g. eth1)<br>• an 802.1Q Ethernet sub-interface (e.g. eth1.10, where '10' is the VLAN ID specified by the **encapsulation dot1q** command)<br>• a switchport (e.g. port1.0.4)<br>• a static channel group (e.g. sa2)<br>• a dynamic (LACP) channel group (e.g. po2)<br>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)<br>• a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list. |

**Examples** To display the status of port1.0.1 to port1.0.3, use the command:

```
awplus# show interface port1.0.1-port1.0.3 status
```

**Table 13:** Example output from the **show interface <port-list> status** command

```
awplus#show interface port1.0.1-port1.0.3 status
Port       Name               Status            Vlan Duplex   Speed Type
port1.0.1                     notconnect           1 auto      auto 1000BASE-T
port1.0.2                     notconnect           1 auto      auto 1000BASE-T
port1.0.3                     notconnect           1 auto      auto 1000BASE-T
```

To display the status of all ports, use the command:

```
awplus# show interface status
```

**Table 14:** Example output from the **show interface status** command

```
awplus#show interface status
Port      Name               Status             Vlan Duplex   Speed Type
port1.0.1 Trunk_Net          connected         trunk a-full  a-1000 1000BaseTX
port1.0.2 Access_Net1        connected             1 full      1000 1000BaseTX
port1.0.3 Access_Net1        disabled              1 auto      auto 1000BaseTX
...
```

**Table 15:** Parameters in the output from the **show interface status** command

| Parameter | Description |
|---|---|
| `Port` | Name/Type of the interface. |
| `Name` | Description of the interface. |
| `Status` | The administrative and operational status of the interface; one of:<br>• disabled: the interface is administratively down.<br>• connect: the interface is operationally up.<br>• notconnect: the interface is operationally down. |
| `Vlan` | VLAN type or VLAN IDs associated with the port:<br>• When the VLAN mode is trunk, it displays **trunk** (it does not display the VLAN IDs).<br>• When the VLAN mode is access, it displays the VLAN ID.<br>• When the port is an Eth port, it displays **none**: there is no VLAN associated with it. |
| `Duplex` | The actual duplex mode of the interface, preceded by **a-** if it has autonegotiated this duplex mode. If the port is disabled or not connected, it displays the configured duplex setting. |
| `Speed` | The actual link speed of the interface, preceded by **a-** if it has autonegotiated this speed. If the port is disabled or not connected, it displays the configured speed setting. |
| `Type` | The type of interface, e.g. 1000BaseTX. For SFP bays, it displays **Unknown** if it does not recognize the type of SFP installed, or **Not present** if an SFP is not installed or is faulty. |

**Related commands**

show interface

show interface brief

show interface memory

# shutdown

**Overview** This command shuts down the selected interface. This administratively disables the link and takes the link down at the physical (electrical) layer.

Use the **no** variant of this command to disable this function and bring the link back up again.

**Syntax**

```
shutdown
no shutdown
```

**Mode** Interface Configuration

**Usage notes** If you shutdown an aggregator, the device shows the admin status of the aggregator and its component ports as “admin down”. While the aggregator is down, the device accepts **shutdown** and **no shutdown** commands on component ports, but these have no effect on port status. Ports will not come up again while the aggregator is down.

**Example** To shut down port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# shutdown
```

To bring up port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no shutdown
```

To shut down vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# shutdown
```

To bring up vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no shutdown
```

# 13 USB Cellular Modem Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure USB Cellular Modems.

For more information, see the USB Cellular Modem Feature Overview and Configuration Guide.

**Command List**

- "apn" on page 491
- "chat-script" on page 493
- "cid" on page 494
- "encapsulation ppp" on page 495
- "show cellular" on page 497
- "show system usb" on page 500
- "usb mode-switch" on page 502

# apn

**Overview** Use this command to set the Access Point Name (APN) to use to connect to a 3G serial cellular network.

Use the **no** variant of this command to unset the APN.

**Syntax**

```
apn <access-point-name>
no apn
```

| Parameter | Description |
|---|---|
| *<access-point-name>* | The APN to use to connect to a cellular network (for example, www.example.com). |

**Default** No APN is set

**Mode** Interface Configuration (Cellular)

**Usage notes** The APN has to be set in order to initiate the cellular network connection. Some mobile network operators do not require a specific APN to be specified, in this case any APN can be used.

**Examples** To set the APN to www.example.com for a cellular interface, use the commands:

```
awplus# configure terminal
awplus(config)# int cellular0
awplus(config-if)# apn www.example.com
```

**Output** Figure 13-1: Example output from the **apn** command

```
awplus#configure terminal
awplus(config)#int cellular0
awplus(config-if)#apn www.example.com
```

To unset the APN, use the commands:

```
awplus# configure terminal
awplus(config)# int cellular0
awplus(config-if)# no apn
```

**Output** Figure 13-2: Example output from the **no apn** command

```
awplus#configure terminal
awplus(config)#int cellular0
awplus(config-if)#no apn
```

**Related commands** chat-script

show cellular

show system usb

usb mode-switch

# chat-script

**Overview** Use this command to set a chat-script, instead of the default chat-script, to connect to a 3G serial cellular network.

Use the **no** variant of this command to set the chat-script back to the default.

**Syntax**

```
chat-script <file-name>
no chat-script
```

| Parameter | Description |
|---|---|
| *<file-name>* | The path to the chat-script file (this file has to have a ".chat" extension). |

**Default** The default chat-script is a built-in chat-script that in most cases is sufficient for connecting to a cellular network.

**Mode** Interface Configuration (Cellular)

**Usage notes** The chat-script file must have the file extension ".chat". The chat-script consists of a sequence of expect-send pairs of strings. The send strings are AT (Hayes) commands. Any occurrence of the string $APN in the chat-script will be substituted with the Access Point Name (APN) configured on a cellular interface.

**Examples** To use a non-default chat-script, "connect.chat", use the commands:

```
awplus# configure terminal
awplus(config)# interface cellular0
awplus(config-if)# #chat-script connect.chat
```

To use the default chat-script, use the commands:

```
awplus# configure terminal
awplus(config)# interface cellular0
awplus(config-if)# #no chat-script
```

**Related commands**

apn

cid

show cellular

show system usb

usb mode-switch

# cid

**Overview** Use this command to set the PDP Context-ID (CID). The customer information in the CID is used to connect to a 3G cellular network.

Use the **no** variant of this command to set the CID back to the default value of 1.

**Syntax**

```
cid <context-id>
no cid
```

| Parameter | Description |
|---|---|
| `cid` | Context ID (CID) includes identifying information about the mobile customer.<br>For example, the PDP Contexts include the Context-ID that contains the following information:<br>Type, APN, Address, Header Compression, and Status. |
| *<context-id>* | The Context-ID is a number from the range 1 to 10. |

**Default** Context-ID is set to1

**Mode** Interface Configuration (cellular)

**Usage notes** Some cellular modems may have elements of the CID that are read-only.

Use this command to change the CID instead of using a custom chat-script.

**Examples** To set the Context ID to 2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface cellular0
awplus(config-if)# cid 2
```

To set the Context ID back to the default value of 1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface cellular0
awplus(config-if)# no cid
```

**Related commands**

apn

chat-script

show cellular

**Command changes** Version 5.4.9-2.1: command added

# encapsulation ppp

**Overview** Use this command to enable PPP encapsulation and create one or more PPP interfaces over Ethernet, a cellular interface, or an L2TPv2 managed VPN.

Use the **no** variant of this command to disable PPP encapsulation and remove the specified PPP interface.

**Syntax**

```
encapsulation ppp <index>
no encapsulation ppp <index>
```

| Parameter | Description |
|---|---|
| *<index>* | The PPP interface index number in the range from 0 to 255. |

**Default** No PPP encapsulation or interfaces are configured by default.

**Mode** Interface Configuration mode for an Ethernet interface (e.g. **interface eth1**), or an Ethernet sub-interface (e.g. **interface eth1.1**), or a cellular interface (e.g. **interface cellular0**).

L2TP Tunnel Configuration mode for an L2TP tunnel (e.g. **l2tp tunnel tunnel0**).

**Examples** To configure a PPP interface with index 0 for Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# encapsulation ppp 0
```

To shut down the ppp0 interface and remove it from Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# shutdown
awplus(config-if)# interface eth1
awplus(config-if)# no encapsulation ppp 0
```

To set the L2TP tunnel tunnel1 to encapsulate the PPP interface with index 1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# encapsulation ppp 1
```

To remove the PPP interface with index 1 from L2TP tunnel tunnel1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no encapsulation ppp 1
```

**Related commands**

l2tp tunnel

ppp service-name (PPPoE)

show interface (PPP)

# show cellular

**Overview** Use this command to display status information about 3G serial USB cellular modems currently plugged into your AR-Series Firewall.

**Syntax** `show cellular <cellular-interface-name>`

| Parameter | Description |
|---|---|
| *<cellular-interface-name>* | Specify the name of a cellular interface. This option displays status information for the cellular modem associated with that interface. |

**Default** None

**Mode** Privileged Exec

**Usage notes** If a cellular interface is specified, then the command only shows information for the cellular modem associated with that interface. Different vendors, and models of cellular modems often provide different sets of information:

- Vendor-specific information will not be displayed if the information is unable to be obtained from the cellular modem.
- For information that is common to most cellular modems, "(unknown)" will be displayed if the information was not obtained successfully.

**Examples** To show status information about all cellular modems, use the command:

```
awplus# show cellular
```

**Output** Figure 13-3: Example output from **show cellular**

```
awplus#show cellular
Interface cellular0
  Manufacturer: huawei
  Model ID: E1762
  Revision ID: 11.126.10.00.74
  Serial ID: 351553036840711

    Parity: Space
```

```
  Terminal Equipment Character Set: IRA
  Cable interface DTE-DCE local flow control:
    To DTE: RTS
    To DCE: CTS
  System Time: 1980/01/06,03:37:39
  GPRS Network Registration Status: Registered, home network
  PIN Request Status: READY
  Functionality Level: Full functionality (power-saving disabled)
  Facility Lock Status:
    SIM card lock: Not active
    SIM fixed dialling memory feature: Not active
    Network personalization: Not active
    Network subset personalization: Not active
    Service provider personalization: Not active
    Corporate personalization: Not active
    Lock phone to first SIM card: Not active
  Call Mode: Single mode
  Wireless Data Service: 3GPP systems (GERAN, UTRAN and E-UTRAN)
  GPRS Service Status: Mobile station is attached to a GPRS service
  Dialling Number Type: National
  Bearer Service Type:
    Autobauding: Enabled
    Service: Data circuit asynchronous (UDI or 3.1 kHz modem)
    Connection Element: Non-transparent
  Automatic time and time zone update via NITS: Not enabled
  PPP support between TE and MT: Supported
  Last Error Report: No cause information available
  PLMN selection method: User controlled PLMN selected from Access Technology
PDP Contexts:
  Context ID: 1
    Type: IP
    APN: www.vodafone.net.nz
    Address: 0.0.0.0
    Header Compression: Off
    Status: Not active
  Primary DNS: 0.0.0.0
  Secondary DNS: 0.0.0.0
  Diagnostic mode baud rate: 115200
  TE-DCE baud rate: 115200
  Tolerance to long delays in PDP call setup: Enabled
  Hardware Version: CD25TCPV
  System Info:
    System Service State: Valid service
    System Service Domain: CS and PS service
    Roaming Status: Not roaming
    System Mode: WCDMA mode
    SIM card state: Valid USIM card state
    System Sub-mode: WCDMA mode
  System Config:
    Supported System Mode: Auto-select
    Network Acquisition Order: WCDMA, then GSM
    Service Domain Support: CS and PS
 Card-Lock:
    Lock Status: Unlock code does not need to be provided
    Remaining Unlock Attempts: 10
    PLMN ID of the operator who has locked this device: None

      PUK: 10
      PIN: 3
      PUK2: 10
      PIN2: 3
```

To show status information about the cellular modem associated with interface ‘cellular0’ only, use the command:

```
awplus# show cellular cellular0
```

**Related commands**

apn

chat-script

show system usb

usb mode-switch

# show system usb

**Overview** Use this command to display technical information about connected USB devices.

**Syntax**

```
show system usb [detail]
```

| Parameter | Description |
|---|---|
| detail | This option provides greater detail about the USB device, such as descriptors for the device, configuration and Interface. |

**Default** None

**Mode** Privileged Exec

**Examples** To show information about USB devices connected to your AR-Series Firewall, use the command:

```
awplus# show system usb
```

**Output** Figure 13-4: Example output from **show system usb**

```
awplus#show system usb
Bus 001 Device 003: ID 12d1:140c Huawei Technologies Co., Ltd. E180v modem
```

To show greater detail of information about USB devices connected to your AR-Series Firewall, use the command:

```
awplus# show system usb detail
```

**Output** Figure 13-5: Example output from **show system usb detail**

```
awplus#show system usb detail

apn

chat-script

show cellular

usb mode-switch

# usb mode-switch

**Overview** Use this command to map a specific USB device to a mode-switch configuration file.

The **no** variant of this command removes the configuration corresponding to a specific ID.

**Syntax**

```
usb mode-switch id <1-16> vendor-id <vendor-id> product-id
<product-id> [manufacturer <manufacturer>|product
<product>|serial <serial>|vendor <vendor>|model
<model>|revision <revision>] file <file-name>
```

```
no usb mode-switch id <1-16>
```

| Parameter | Description |
|---|---|
| id | mode switch configuration ID. |
| *<1-16>* | Configuration ID number (from 1 through 16). |
| vendor-id | Specify the USB device's vendor ID. |
| *<vendor-id>* | 4 digit hexadecimal value representing the device's vendor ID. |
| product-id | Specify the USB device's product ID. |
| *<product-id>* | 4 digit hexadecimal value representing the device's product ID. |
| manufacturer | Specify the USB manufacturer descriptor. |
| *<manufacturer>* | All or part of the USB manufacturer string descriptor (with spaces replaced by underscores). |
| product | Specify the USB product descriptor. |
| *<product>* | All or part of the USB product string descriptor (with spaces replaced by underscores). |
| serial | Specify the USB serial descriptor. |
| *<serial>* | All or part of the USB serial string descriptor (with spaces replaced by underscores). |
| vendor | Specify the SCSI vendor descriptor. |
| *<vendor>* | All or part of the SCSI model descriptor (with spaces replaced by underscores). |
| model | Specify the SCSI model descriptor. |
| *<model>* | All or part of the SCSI revision descriptor (with spaces replaced by underscores). |
| revision | Specify the SCSI revision descriptor. |
| *<revision>* | All or part of the SCSI revision descriptor (with spaces replaced by underscores). |

| Parameter | Description |
|---|---|
| `file` | Specify the mode switch config file to be used instead of the default when the target device is inserted. |
| *<file>* | Mode switch configuration file URL with extension .conf. |

**Default** Some USB devices will use a default mode switch configuration file if one is not specified.

**Mode** Global Configuration

**Usage notes** Some USB devices must be explicitly told to switch to a compatible mode. The **usb mode-switch** command does this by matching on a target device by its USB vendor and product IDs, and executing a specified configuration file.

Additional parameters can be defined which specify other USB and SCSI descriptors. These are useful if there are multiple devices that have the same product and vendor IDs, but differ in the other parameters. The mode switch configuration files must have the extension ".conf".

**Examples** To add a mode switch configuration for a USB device, use the commands:

```
awplus# configure terminal
awplus(config)# usb mode-switch id 1 vendor-id 12d1 product-id 140c manufacturer HUAWEI file switch.conf
```

To remove a mode switch configuration for a USB device, use the commands:

```
awplus# configure terminal
awplus(config)# no usb mode-switch id 1

# 14 Port Mirroring Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Port Mirroring.

For more information, see the Mirroring Feature Overview and Configuration Guide.

**Command List**

- "mirror interface" on page 505
- "show mirror" on page 507
- "show mirror interface" on page 508

# mirror interface

**Overview** Use this command to define a mirror port and mirrored (monitored) ports and direction of traffic to be mirrored. The port for which you enter interface mode will be the mirror port.

The destination port is removed from all VLANs, and no longer participates in other switching.

Use the **no** variant of this command to disable port mirroring by the destination port on the specified source port.

**Syntax**

```
mirror interface <source-port-list> direction
{both|receive|transmit}
```

```
no mirror interface <source-port-list>
```

| Parameter | Description |
|---|---|
| *<source-port-list>* | The source switch ports to mirror. A port-list can be:<br>• a port (e.g. port1.0.2)<br>• a continuous range of ports separated by a hyphen, e.g. port1.0.1-port1.0.3<br>• a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.2-port1.0.4<br>The source port list cannot include dynamic or static channel groups (link aggregators). |
| `direction` | Specifies whether to mirror traffic that the source port receives, transmits, or both. |
| `both` | Mirroring traffic both received and transmitted by the source port. |
| `receive` | Mirroring traffic received by the source port. |
| `transmit` | Mirroring traffic transmitted by the source port. |

**Mode** Interface Configuration

**Usage notes** Use this command to send traffic to another device connected to the mirror port for monitoring.

For more information, see the Mirroring Feature Overview and Configuration Guide.

A mirror port cannot be associated with a VLAN. If a switch port is configured to be a mirror port, it is automatically removed from any VLAN it was associated with.

This command can only be applied to a single mirror (destination) port, not to a range of ports, nor to a static or dynamic channel group. Do not apply multiple interfaces with an interface command before issuing the mirror interface command. One interface may have multiple mirror interfaces.

**Example** To mirror traffic received and transmitted on port1.0.1 to destination port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# mirror interface port1.0.1 direction both
```

# show mirror

**Overview** Use this command to display the status of all mirrored ports.

**Syntax**

```
show mirror
```

**Mode** User Exec and Privileged Exec

**Example** To display the status of all mirrored ports, use the following command:

```
awplus# show mirror
```

**Output** Figure 14-1: Example output from the **show mirror** command

```
Mirror Test Port Name: port1.0.1
Mirror option: Enabled
Mirror direction: both
Monitored Port Name: port1.0.2
```

# show mirror interface

**Overview** Use this command to display port mirroring configuration for a mirrored (monitored) switch port.

**Syntax**

```
show mirror interface <port>
```

| Parameter | Description |
|---|---|
| *<port>* | The monitored switch port to display information about. |

**Mode** User Exec, Privileged Exec and Interface Configuration

**Example** To display port mirroring configuration for port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# show mirror interface port1.0.2
```

**Output** Figure 14-2: Example output from the **show mirror interface** command

```
Mirror Test Port Name: port1.0.1
Mirror option: Enabled
Mirror direction: both
Monitored Port Name: port1.0.2
```

# 15 Container Services Commands

## Introduction

**Overview**

This chapter provides an alphabetical reference of commands used to configure container services.

The container services feature allows the device to host available Allied Telesis applications.

The device may generate container services commands automatically when you use the Device GUI to configure a hosted Allied Telesis application such as AMF Security mini. We recommend using the GUI to configure the applications rather than using these commands.

For more information, see Getting Started with the Device GUI on UTM Firewalls and documentation for the particular Allied Telesis application to be hosted.

**Command List**

- "compute" on page 511
- "container-services" on page 513
- "enable (container-services)" on page 515
- "image" on page 516
- "image-check-interval" on page 518
- "instance (container-services)" on page 520
- "ip (container-services-inst-network)" on page 522
- "ip name-server (container-services-inst)" on page 524
- "limit cpus" on page 526
- "limit memory" on page 528
- "mac-address (container-services-inst-network)" on page 530
- "network (container-services-inst)" on page 532
- "restore" on page 534
- "shared-interface" on page 536

- "show container-services" on page 538
- "show container-services debug" on page 541
- "show running-config container-services" on page 542
- "start" on page 544
- "storage size" on page 545
- "vlan-id" on page 547

# compute

**Overview** Use this command to configure the node (device) that the configured container services instance will run on. The compute node must be set before the container instance and application can start.

The device may generate container services commands automatically when you use the Device GUI to configure a hosted Allied Telesis application such as AMF Security mini. We recommend using the GUI to configure the applications rather than using these commands.

The **no** variant of this command removes the configured compute node from the instance configuration.

**Syntax**

```
compute {local|<compute-node>}
no compute
```

| Parameter | Description |
|---|---|
| `local` | The local device—the device on which container services is configured. |
| *<compute-node>* | The serial number or name of the device on which the container instance is to run. |

**Default** By default no compute node is configured for a container instance.

**Mode** Container Services Instance Configuration

**Example** To configure the compute node for the application instance AMF-SEC-mini to be the local device (the device currently being used), use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# instance AMF-SEC-mini
awplus(config-container-services-inst)# compute local
```

To specify the compute node for the instance as its serial number, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# instance AMF-SEC-mini
awplus(config-container-services-inst)# compute
A99999B999999999
```

To remove the compute node setting for the instance, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# instance AMF-SEC-mini
awplus(config-container-services-inst)# no compute
```

**Related commands**

**Command changes**

Version 5.5.0-0.1: command added

# container-services

**Overview** This command enters Container Services Configuration mode. This allows container services to be configured for hosting Allied Telesis applications.

The device may generate container services commands automatically when you use the Device GUI to configure a hosted Allied Telesis application such as AMF Security mini. We recommend using the GUI to configure the applications rather than using these commands.

The **no** variant of this command removes all container services configuration and application instances.

**Syntax**

```
container-services
no container-services
```

**Default** No container services

**Mode** Global Configuration

**Usage** To configure a hosted application in container services:

- Ensure the application image file is either stored in flash memory on the device or available from the Allied Telesis Update Service. To use the Allied Telesis Update Service, configure the device's IP name server with the address of the update server (ip name-server) in Global Configuration mode.
- Turn on the container services feature (this **container-services** command) and enable it (enable (container-services)).
- Create and configure an application instance (instance (container-services)), including specifying the required host device (compute), how much storage space to allocate it (storage size), and the application image file and version (image), and other optional parameters.
- Add and configure network interfaces (network (container-services-inst))
- Save the running configuration.
- Start the application instance (start).

To disable or enable the container services feature while leaving the configuration intact, use the enable (container-services) command.

**Example** To turn on the container services feature and enter Container Services Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)#
```

To turn off the container services feature and remove all configuration and resources relating to container services, use the commands:

```
awplus# configure terminal
awplus(config)# no container-services
All container configuration
and instances will be removed. Proceed? (y/n): y
```

**Related commands**

**Command changes**

Version 5.5.0-0.1: command added

# enable (container-services)

**Overview** This command enables container services. This allows application instances to be created, configured, started and stopped.

The device may generate container services commands automatically when you use the Device GUI to configure a hosted Allied Telesis application such as AMF Security mini. We recommend using the GUI to configure the applications rather than using these commands.

The **no** variant of this command disables the container services feature. It keeps the container services configuration intact.

**Syntax**

```
enable
no enable
```

**Default** Disabled

**Mode** Container Services Configuration

**Example** To enable container services, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# enable
```

To disable container services and keep the container services configuration, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# no enable
```

**Command changes** Version 5.5.0-0.1: command added

# image

**Overview** This command specifies the application image from which the application instance is created. The image must already be downloaded to the device's flash memory or be available to download via the Allied Telesis Update Service.

This command is required for the application instance to start.

The device may generate container services commands automatically when you use the Device GUI to configure a hosted Allied Telesis application such as AMF Security mini. We recommend using the GUI to configure the applications rather than using these commands.

The **no** variant of this command removes the configured application image name and version.

**Syntax**

```
image <image-name> version <image-version>
no image
```

| Parameter | Description |
|---|---|
| *<image-name>* | The name of the application image. Allied Telesis applications that can be hosted with container services have predefined image names. |
| `version` *<image-version>* | The application image version, in the format x.y.z. |

**Default** No image by default

**Mode** Container Services Instance Configuration

**Usage** The application image file must be either stored in flash memory on the device or available from the Allied Telesis Update Service. To use the Allied Telesis Update Service, configure the device's IP name server with the address of the update server (ip name-server) in Global Configuration mode.

To see which images and versions are available for Container Services, use the show container-services command.

**Example** To set the application image 'sesc' and version 1.7.0 for application instance AMF-SEC-mini, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# instance AMF-SEC-mini
awplus(config-container-services-inst)# image sesc version
1.7.0
```

To remove the configured image and version, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# instance AMF-SEC-mini
awplus(config-container-services-inst)# no image
```

**Related commands**

storage size

**Command changes**

Version 5.5.0-0.1: command added

# image-check-interval

**Overview** This command sets the interval at which the device will check the Allied Telesis Update Server for new versions of application images that are available for installation on this device.

The device may generate container services commands automatically when you use the Device GUI to configure a hosted Allied Telesis application such as AMF Security mini. We recommend using the GUI to configure the applications rather than using these commands.

Use the **no** variant of this command to disable image availability checking.

**Syntax**

```
image-check-interval {minutes <1-525600>| hours <1-8760>| days <1-365> | weeks <1-52>}
no image-check-interval
```

| Parameter | Description |
|---|---|
| `minutes` | Set the number of minutes, from 1 to 525600. |
| `hours` | Set the number of hours, from 1 to 8760. |
| `days` | Set the number of days, from 1 to 365. |
| `weeks` | Set the number of weeks, from 1 to 52. |

**Default** Disabled—no image checking

**Mode** Container Services Configuration

**Usage notes** The application image file must be either stored in flash memory on the device or available from the Allied Telesis Update Service. To use the Allied Telesis Update Service, configure the device's IP name server with the address of the update server (ip name-server) in Global Configuration mode.

**Example** To set the image check interval to 1 day, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# image-check-interval days 1
```

To disable image checking, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# no image-check-interval
```

**Related commands** container-services

**Command changes** Version 5.5.0-0.1: command added

# instance (container-services)

**Overview** This command creates a new application instance with the specified name and enters Container Services Instance Configuration mode.

The device may generate container services commands automatically when you use the Device GUI to configure a hosted Allied Telesis application such as AMF Security mini. We recommend using the GUI to configure the applications rather than using these commands.

The **no** variant of this command removes all configuration for the specified application instance.

**Syntax**

```
instance <instance-name>
no instance <instance-name>
```

| Parameter | Description |
|---|---|
| *<instance-name>* | The name of the application instance. When the Device GUI is used to configure container services to run a particular application, the instance name may be a predefined string for the specific application. |

**Default** No application instance exists by default

**Mode** Container Services Configuration

**Example** To create a new application instance called AMF-SEC-mini and enter Container Services Instance Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# instance AMF-SEC-mini
awplus(config-container-services-inst)#
```

To remove the instance and its configuration, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# no instance AMF-SEC-mini
```

**Related commands**

storage size

**Command changes** Version 5.5.0-0.1: command added

# ip (container-services-inst-network)

**Overview** This command configures an IP address and/or an IP gateway address for a specific network interface for an application instance.

The device may generate container services commands automatically when you use the Device GUI to configure a hosted Allied Telesis application such as AMF Security mini. We recommend using the GUI to configure the applications rather than using these commands.

The **no** variants of this command remove a configured IP address or gateway.

**Syntax**

```
ip address <ip-address>
ip address dhcp
ip gateway <gateway-address>
```

| Parameter | Description |
|---|---|
| `address` | Add an IP address for the network interface. |
| `dhcp` | Configure the IP address to be set by DHCP. DHCP will typically also provide the gateway address. |
| *`<ip-address>`* | The fixed IP address in dotted decimal format (A.B.C.D/M). |
| `gateway` | Add a gateway address for the network interface. |
| *`<gateway-address>`* | The gateway address in dotted decimal format (A.B.C.D). |

**Default** By default, if no IP address or gateway is specified and DHCP is not used, there will be no IP address or gateway on the interface.

**Mode** Container Services Instance Network Configuration

**Example** To configure network 1 of the application instance with a dynamic IP address and gateway provided by DHCP, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# instance AMF-SEC-mini
awplus(config-container-services-inst)# network 1
awplus(config-container-services-inst-network)# ip address
dhcp
```

To configure network 1 with a static IP address and gateway, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# instance AMF-SEC-mini
awplus(config-container-services-inst)# network 1
awplus(config-container-services-inst-network)# ip address
192.168.1.1/24
awplus(config-container-services-inst-network)# ip gateway
192.168.1.100
```

To remove a configured IP address and gateway from network 1, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# instance AMF-SEC-mini
awplus(config-container-services-inst)# network 1
awplus(config-container-services-inst-network)# no ip address
192.168.1.1/24
awplus(config-container-services-inst-network)# no ip gateway
192.168.1.100
```

**Related commands**

container-services

instance (container-services)

mac-address (container-services-inst-network)

network (container-services-inst)

shared-interface

show running-config container-services

vlan-id

**Command changes**

Version 5.5.0-0.1: command added

# ip name-server (container-services-inst)

**Overview** This command adds a name server (DNS server) to an application instance. You can add multiple name-servers by using this command for each one.

The name servers are added; they don't replace name servers previously configured by this command or by DHCP.

The device may generate container services commands automatically when you use the Device GUI to configure a hosted Allied Telesis application such as AMF Security mini. We recommend using the GUI to configure the applications rather than using these commands.

The **no** variant of this command removes a name server from the application instance.

**Syntax**

```
ip name-server <name-server-addr>
no ip name-server <name-server-addr>
```

| Parameter | Description |
|---|---|
| *<name-server-addr>* | The IP address of the DNS name server in dotted decimal format (A.B.C.D). |

**Default** No name servers by default

**Mode** Container Services Instance Configuration

**Usage** This command adds a name server to the application instance. To add a name server to the device itself, use the ip name-server command in Global Configuration mode.

**Example** To add a name server to the application instance AMF-SEC-mini, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# instance AMF-SEC-mini
awplus(config-container-services-inst)# ip name-server
192.168.1.2
```

To remove a name server from instance AMF-SEC-mini, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# instance AMF-SEC-mini
awplus(config-container-services-inst)# no ip name-server
192.168.1.2
```

storage size

**Command changes**

Version 5.5.0-0.1: command added

# limit cpus

**Overview** This command specifies which CPU cores can be used for the application instance.

The device may generate container services commands automatically when you use the Device GUI to configure a hosted Allied Telesis application such as AMF Security mini. We recommend using the GUI to configure the applications rather than using these commands.

Use the **no** variant of this command to remove configured CPU limits.

**Syntax**

```
limit cpus <cpu-limit>
no limit cpus
```

| Parameter | Description |
|---|---|
| *<cpu-limit>* | The CPU cores to restrict the application instance to, as a comma-separated list, for instance, 0,2,4.<br>By default the device can run on all the compute node's CPU cores. |

**Default** No limit—all CPU cores

**Mode** Container Services Instance Configuration

**Usage notes** In general, we recommend leaving the CPU limit unset unless you have a particular reason to restrict it. To see how many CPU cores are present on this compute node, see the output of the show container-services command.

**Example** To limit the application instance to CPU cores 0, 1 and 2, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(container-services)# instance AMF-SEC-mini
awplus(container-services-inst)# limit cpus 0,1,2
```

To remove the limit on CPU cores for the instance and reset it to the default, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(container-services)# instance AMF-SEC-mini
awplus(container-services-inst)# no limit cpus
```

**Related commands**

**Command changes** Version 5.5.0-0.1: command added

# limit memory

**Overview** This command sets the upper limit for the amount of memory the configured application instance can use.

The device may generate container services commands automatically when you use the Device GUI to configure a hosted Allied Telesis application such as AMF Security mini. We recommend using the GUI to configure the applications rather than using these commands.

Use the **no** variant of this command to remove the configured limit.

**Syntax**

```
limit memory <memory-limit>
no limit memory
```

| Parameter | Description |
|---|---|
| *<memory-limit>* | The maximum memory in MB to be used by the application instance, in the range 1-4294967295. |

**Default** No memory limit—the maximum memory available on the device is available to the application instance.

**Mode** Container Services Instance Configuration

**Usage notes** To see the total, free and used memory on the compute node, and the memory allocated to and used by the application instance, see the output of the show container-services command.

**Example** To configure a memory limit for the application instance AMF-SEC-mini, use the commands:

```
awplus# configure terminal
awplus(config)# container services
awplus(config-container)# instance AMF-SEC-mini
awplus(config-container-inst)# limit memory 4096
```

To remove the memory limit and restore the default, use the commands:

```
awplus# configure terminal
awplus(config)# container services
awplus(config-container)# instance AMF-SEC-mini
awplus(config-container-inst)# no limit memory
```

**Related commands**

**Command changes** Version 5.5.0-0.1: command added

# mac-address (container-services-inst-network)

**Overview** This command assigns a MAC address to a network interface for an application instance.

The device may generate container services commands automatically when you use the Device GUI to configure a hosted Allied Telesis application such as AMF Security mini. We recommend using the GUI to configure the applications rather than using these commands.

The **no** variant of this command removes a configured MAC address from the specified network interface.

If no MAC address is manually specified, one will be randomly generated when the application instance is started.

**Syntax**

```
mac-address <mac-address>
no mac-address
```

| Parameter | Description |
|---|---|
| *<mac-address>* | The MAC address for the network interface, in the format of 6 hexadecimal numbers (XX:XX:XX:XX:XX:XX). The first byte of the MAC address should be an even number. If this command is used, the MAC address must not duplicate any other MAC address on the same Ethernet collision domain. |

**Default** By default, if no MAC address is configured, a unicast and locally administered MAC address will be assigned to the network interface.

**Mode** Container Services Instance Network Configuration

**Example** To assign MAC address 02:AA:BB:CC:11:22 to network 1, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# instance AMF-SEC-mini
awplus(config-container-services-inst)# network 1
awplus(config-container-services-inst-network)# mac address
02:AA:BB:CC:11:22
```

To remove the configured MAC address from network 1, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# instance AMF-SEC-mini
awplus(config-container-services-inst)# network 1
awplus(config-container-services-inst-network)# no mac address
```

**Related commands**

container-services

vlan-id

**Command changes**

Version 5.5.0-0.1: command added

# network (container-services-inst)

**Overview** This command creates a new network for the application instance, assigns it a unique network ID, and enters Container Services Instance Network Configuration mode for the network.

The device may generate container services commands automatically when you use the Device GUI to configure a hosted Allied Telesis application such as AMF Security mini. We recommend using the GUI to configure the applications rather than using these commands.

The **no** variant of this command removes all configuration for the selected network.

**Syntax**

```
network <network-id>
no network <network-id>
```

| Parameter | Description |
|---|---|
| *<network-id>* | A unique ID for the network, from 0 to 255. |

**Default** No network by default

**Mode** Container Services Instance Configuration

**Example** To add a new network ID 1 to the application instance AMF-SEC-mini and enter Container Services Instance Network Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# instance AMF-SEC-mini
awplus(config-container-services-inst)# network 1
awplus(config-container-services-inst-network)#
```

To remove network ID 1 and all its configuration from instance AMF-SEC-mini, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# instance AMF-SEC-mini
awplus(config-container-services-inst)# no network 1
```

**Related commands**

mac-address (container-services-inst-network)

shared-interface

vlan-id

show running-config container-services

**Command changes** Version 5.5.0-0.1: command added

# restore

**Overview** Use this command to restore a previously configured application instance to the running configuration.

The device may generate container services commands automatically when you use the Device GUI to configure a hosted Allied Telesis application such as AMF Security mini. We recommend using the GUI to configure the applications rather than using these commands.

**Syntax**

```
restore <instance-name>
```

| Parameter | Description |
|---|---|
| *<instance-name>* | The name of the application instance to restore. |

**Mode** Container Services Configuration

**Usage** We recommend saving the running configuration after configuring an application instance. However, if the following conditions apply, an instance may be restored to the running configuration by using the Device GUI or this **restore** command, even if it has not been saved:

- the application instance has been configured
- the instance has been started and run at least once
- the configuration that created the instance has not been saved
- the device is rebooted.

This reconstructs the configuration for the application instance from information in the container.

After using this command to restore the instance, save the running configuration.

**Example** If application instance AMF-SEC-mini has been configured and started, and then the device reboots before the running configuration is saved, you can restore it by using the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# restore AMF-SEC-mini
```

**Related commands**

container-services

enable (container-services)

instance (container-services)

show container-services

show running-config container-services

start

**Command changes** Version 5.5.0-0.1: command added

# shared-interface

**Overview** This command specifies the network interface (VLAN) for the application instance to share with the host device (the compute node).

The host device (compute node) and the container instance share the physical interface; however, they both have a unique MAC address.

The device may generate container services commands automatically when you use the Device GUI to configure a hosted Allied Telesis application such as AMF Security mini. We recommend using the GUI to configure the applications rather than using these commands.

The **no** variant of this command removes a configured shared interface.

**Syntax**

```
shared-interface <interface>
no shared-interface
```

| Parameter | Description |
|---|---|
| *<interface>* | The name of the VLAN interface to share with the host device, e.g. vlan1. |

**Default** No shared interface by default

**Mode** Container Services Instance Network Configuration

**Example** To configure network 1 to share interface vlan1 with the host device, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# instance AMF-SEC-mini
awplus(config-container-services-inst)# network 1
awplus(config-container-services-inst-network)#
shared-interface vlan1
```

To remove a configured shared interface, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# instance AMF-SEC-mini
awplus(config-container-services-inst)# network 1
awplus(config-container-services-inst-network)# no
shared-interface
```

**Related commands** container-services

vlan-id

**Command changes** Version 5.5.0-0.1: command added

# show container-services

**Overview** Use this command to display information about container services, including available application images, the status of the compute node, and the state and configuration of application instances.

**Syntax**

```
show container-services
```

**Mode** User Exec and Privileged Exec

**Example** To display information about container services configuration, use the command:

```
awplus# show container-services
```

**Output** Figure 15-1: Example output from **show container-services**

```
awplus#show container-services

Compute ID    : A05049G143600028

Table 15-1: Parameters in the output from **show container-services**

| Parameter | Description |
|---|---|
| Compute ID | The compute node, as specified by the compute command. |
| Architecture | The architecture of the compute node. The image file must match the architecture of the compute node model. The architecture is mips64. |
| **Image** | Information about each application image that is available in the device's flash memory or from the Allied Telesis Update Service, beginning with the image name. |
| Version | The version of the application image. This version is associated with the application features. |
| Contract Version | The ACS image contract version that this image conforms to. The ACS image contract version must supported by the compute node, as shown below. |
| Image Info | Information about the application in the image file. |
| Signed | Whether or not the image file is signed. The signature provides assurance that the file is provided by Allied Telesis. Images used in container services must be signed ('Yes'). |
| **Status** | Status information for this compute node. |
| State | The state of the compute node; Alive, Dead, Sleeping or Waking. |
| Contract version | The ACS image contract version that is currently supported by this compute node. |
| CPUs allocated | The number of CPU cores on this compute node. |
| CPU load | The total CPU load on the compute node. |
| Memory | The total, free and used memory on the compute node. |
| Storage | The total, free and used storage on the compute node. |
| **Application Instance** | Information about the application instance, beginning with its name, as specified by the instance (container-services) command. |
| URL | The web address or IP address of the application instance, based on an IP address from a network interface configured for the application instance with the network (container-services-inst) and ip (container-services-inst-network) commands. |

Table 15-1: Parameters in the output from **show container-services** (cont.)

| Parameter | Description |
|---|---|
| State | The running state of the application instance; Offline, Downloading, Extracting, Creating, Stopping, Stopped, Running, Destroying or Error. |
| **Resources** | Current state of the application instance's resources. |
| CPUs allocated | The CPU cores allocated for the application instance to use (limit cpus). |
| CPU load | The current CPU load on allocated cores for this application instance. |
| Memory allocated | The amount of memory allocated, and how much is available for and used by the application. |
| Storage allocated | The amount of storage allocated, and how much is available for and used by the application. |
| Image | The application image and application image version for this application instance, as set by the image command. |
| CPUs | The CPU cores allocated to this application instance by the limit cpus command, or blank if unset. |
| Storage size | The amount of storage space allocated to this application instance by the storage size command. |
| Memory limit | The upper limit of memory allocated to this application instance by the limit memory command. |

**Related commands**

**Command changes**

Version 5.5.0-0.1: command added

# show container-services debug

**Overview** This command displays debugging information for container services and all application instances, or for the specified instance.

The device may generate container services commands automatically when you use the Device GUI to configure a hosted Allied Telesis application such as AMF Security mini. We recommend using the GUI to configure the applications rather than using these commands.

**Syntax**

```
show container-services debug [instance <instance-name>]
```

| Parameter | Description |
|---|---|
| *<instance-name>* | The name of the application instance to display debugging messages for. |

**Mode** Privileged Exec

**Example** To display debugging messages for container services, use the command:

```
awplus# show container-services debug
```

To display debugging messages for application instance AMF-SEC-mini, use the command:

```
awplus# show container-services debug instance AMF-SEC-mini
```

**Related commands** show container-services

show running-config container-services

**Command changes** Version 5.5.0-0.1: command added

# show running-config container-services

**Overview** Use this command to display container services configuration.

The device may generate container services commands automatically when you use the Device GUI to configure a hosted Allied Telesis application such as AMF Security mini. We recommend using the GUI to configure the applications rather than using these commands.

**Syntax**

```
show running-config container-services
```

**Mode** Privileged Exec

**Example** To display container services configuration, use the command:

```
awplus# show running-config container-services
```

**Output** Figure 15-2: Example output from **show running-config container-services**

```
awplus#show running-config container-services

container-services
 instance AMF-SEC-mini
  compute A05049G143600028
  image sesc version 1.7.0
  storage size 512
  limit memory 512
  start
 enable
!
```

vlan-id

**Command changes** Version 5.5.0-0.1: command added

# start

**Overview** This command starts a fully-configured application instance.

The device may generate container services commands automatically when you use the Device GUI to configure a hosted Allied Telesis application such as AMF Security mini. We recommend using the GUI to configure the applications rather than using these commands.

The **no** variant of this command stops an application instance.

**Syntax**

```
start
no start
```

**Default** Not started

**Mode** Container Services Instance Configuration

**Usage notes** Before starting an application instance, it must be configured using the instance (container-services), compute, storage size and image (with version) commands.

**Example** To start the application instance AMF-SEC-mini, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# instance AMF-SEC-mini
awplus(config-container-services-inst)# start
```

To stop the instance AMF-SEC-mini, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# instance AMF-SEC-mini
awplus(config-container-services-inst)# stop
```

**Related commands**

compute

container-services

enable (container-services)

image

instance (container-services)

show container-services

storage size

**Command changes** Version 5.5.0-0.1: command added

# storage size

**Overview** This command allocates the amount of storage available for the application instance.

An instance must have storage allocated before it can start.

The device may generate container services commands automatically when you use the Device GUI to configure a hosted Allied Telesis application such as AMF Security mini. We recommend using the GUI to configure the applications rather than using these commands.

Use the **no** variant of this command to remove the configured storage allocation. This resets the storage allocation to the default of 0 (zero).

**Syntax**

```
storage size <size>
no storage size
```

| Parameter | Description |
|---|---|
| *<size>* | The amount of storage in MB to allocate for the application instance in the file system. The value must be in the range of 1 to the maximum storage available on the device. |

**Default** No storage allocated (0 MB)

**Mode** Container Services Instance Configuration

**Example** To allocate 512 MB storage for the application instance AMF-SEC-mini, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# instance AMF-SEC-mini
awplus(config-container-services-inst)# storage size 512
```

To remove the storage allocation and reset it to the default of 0 MB, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# instance AMF-SEC-mini
awplus(config-container-services-inst)# no storage size
```

**Related commands**

**Command changes** Version 5.5.0-0.1: command added

# vlan-id

**Overview** This command specifies the VLAN ID for the VLAN that the network interface for the instance is attached to.

This command is required for a network interface.

The device may generate container services commands automatically when you use the Device GUI to configure a hosted Allied Telesis application such as AMF Security mini. We recommend using the GUI to configure the applications rather than using these commands.

The **no** variant of this command removes a configured VLAN ID from the network interface.

**Syntax**

```
vlan-id <1-4094>
no vlan-id
```

| Parameter | Description |
|---|---|
| `vlan-id <1-4094>` | The VLAN ID of the VLAN the network is attached to. |

**Default** No VLAN ID is set for the network by default

**Mode** Container Services Instance Network Configuration

**Example** To set vlan1 as the VLAN for network 1 of the application instance, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# instance AMF-SEC-mini
awplus(config-container-services-inst)# network 1
awplus(config-container-services-inst-network)# vlan-id 1
```

To remove the VLAN ID for the network, use the commands:

```
awplus# configure terminal
awplus(config)# container-services
awplus(config-container-services)# instance AMF-SEC-mini
awplus(config-container-services-inst)# network 1
awplus(config-container-services-inst-network)# no vlan-id
```

# Part 2: Interfaces and Layer 2

# 16 Switching Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure switching.

For more information, see the Switching Feature Overview and Configuration Guide.

**Command List**

- "backpressure" on page 552
- "clear mac address-table dynamic" on page 554
- "clear mac address-table static" on page 555
- "clear port counter" on page 556
- "debug platform packet" on page 557
- "duplex" on page 559
- "flowcontrol (switch port)" on page 560
- "linkflap action" on page 562
- "mac address-table acquire" on page 563
- "mac address-table ageing-time" on page 564
- "mac address-table static" on page 565
- "platform multicast-ratelimit" on page 566
- "polarity" on page 567
- "show debugging platform packet" on page 568
- "show flowcontrol interface" on page 569
- "show interface err-disabled" on page 570
- "show interface switchport" on page 571
- "show mac address-table" on page 572

- "show platform" on page 574
- "show platform port" on page 576
- "show storm-control" on page 578
- "speed" on page 579
- "storm-control level" on page 581
- "undebug platform packet" on page 582

# backpressure

**Overview** This command provides a method of applying flow control to ports running in half duplex mode. The setting will only apply when the link is in the half-duplex state.

You can disable backpressure on an interface using the **off** parameter or the **no** variant of this command.

**Syntax**

```
backpressure {on|off}
no backpressure
```

| Parameters | Description |
|---|---|
| `on` | Enables half-duplex flow control. |
| `off` | Disables half-duplex flow control. |

**Default** Backpressure is turned off by default. You can determine whether an interface has backpressure enabled by viewing the running-config output; **backpressure on** is shown for interfaces if this feature is enabled.

**Mode** Interface Configuration

**Usage notes** The backpressure feature enables half duplex Ethernet ports to control traffic flow during congestion by preventing further packets arriving. Backpressure utilizes a pre-802.3x mechanism in order to apply Ethernet flow control to switch ports that are configured in the half duplex mode.

The flow control applied by the flowcontrol (switch port) command operates only on full-duplex links, whereas backpressure operates only on half-duplex links.

If a port has insufficient capacity to receive further frames, the device will simulate a collision by transmitting a CSMACD jamming signal from this port until the buffer empties. The jamming signal causes the sending device to stop transmitting and wait a random period of time, before retransmitting its data, thus providing time for the buffer to clear. Although this command is only valid for switch ports operating in half-duplex mode the remote device (the one sending the data) can be operating in the full duplex mode.

To see the currently-negotiated duplex mode for ports whose links are up, use the command show interface. To see the configured duplex mode (when different from the default), use the command show running-config.

**Examples** To enable backpressure flow control on port1.0.2, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# backpressure on
```

To disable backpressure flow control on interface port1.0.2, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# backpressure off
```

**Related commands**

duplex

show interface

show running-config

# clear mac address-table dynamic

**Overview** Use this command to clear the filtering database of all entries learned for a selected MAC address, a switch port interface, or a VLAN interface.

**Syntax**
```
clear mac address-table dynamic
[address <mac-address>|interface <port>|vlan <vid>]
```

| Parameter | Description |
|---|---|
| `address <mac-address>` | Specify a MAC (Media Access Control) address to be cleared from the filtering database, in the format HHHH.HHHH.HHHH. |
| `interface <port>` | Specify a switch port to be cleared from the filtering database. The port can be:<br>• a switchport (e.g. port1.0.4)<br>• a static channel group (e.g. sa2)<br>• a dynamic (LACP) channel group (e.g. po2) |
| `vlan <vid>` | Specify a VID (VLAN ID) in the range 1 to 4094 to be cleared from the filtering database. |

**Mode** Privileged Exec

**Usage notes** Use this command with options to clear the filtering database of all entries learned for a given MAC address, interface or VLAN. Use this command without options to clear any learned entries.

**Examples** This example shows how to clear all dynamically learned filtering database entries.

```
awplus# clear mac address-table dynamic
```

This example shows how to clear all dynamically learned filtering database entries when learned through device operation for the MAC address 0000.5E00.5302.

```
awplus# clear mac address-table dynamic address 0000.5E00.5302
```

**Related commands** clear mac address-table static

show mac address-table

# clear mac address-table static

**Overview** Use this command to clear the filtering database of all statically configured entries for a selected MAC address, interface, or VLAN.

**Syntax**

```
clear mac address-table static [address <mac-address>|interface
<port>|vlan <vid>]
```

| Parameter | Description |
|---|---|
| `address <mac-address>` | Specify a MAC (Media Access Control) address to be cleared from the filtering database, in the format HHHH.HHHH.HHHH. |
| `interface <port>` | Specify the port from which statically configured entries are to be cleared. The port can be<br>• a switchport (e.g. port1.0.4)<br>• a static channel group (e.g. sa2)<br>• a dynamic (LACP) channel group (e.g. po2) |
| `vlan <vid>` | Specify a VID (VLAN ID) in the range 1 to 4094 to be cleared from the filtering database. |

**Mode** Privileged Exec

**Usage notes** Use this command with options to clear the filtering database of all entries made from the CLI for a given MAC address, interface or VLAN. Use this command without options to clear any entries made from the CLI.

Compare this usage with clear mac address-table dynamic command.

**Examples** This example shows how to clear all filtering database entries configured through the CLI.

```
awplus# clear mac address-table static
```

This example shows how to clear all filtering database entries for a specific interface configured through the CLI.

```
awplus# clear mac address-table static interface port1.0.3
```

This example shows how to clear filtering database entries configured through the CLI for the MAC address 0000.5E00.5302.

```
awplus# clear mac address-table static address 0000.5E00.5302
```

**Related commands**

clear mac address-table dynamic

mac address-table static

show mac address-table

# clear port counter

**Overview** Use this command to clear the packet counters of the port.

**Syntax**

```
clear port counter [<port>]
```

| Parameter | Description |
|---|---|
| *<port>* | The port number or range |

**Mode** Privileged Exec

**Example** To clear the packet counter for port1.0.1, use the command:

```
awplus#  clear port counter port1.0.1
```

**Related commands** show platform port

# debug platform packet

**Overview** This command enables platform to CPU level packet debug functionality on the device.

Use the **no** variant of this command to disable platform to CPU level packet debug. If the result means both send and receive packet debug are disabled, then any active timeout will be canceled.

**Syntax**

```
debug platform packet [recv] [send] [timeout <timeout>] [vlan <vid>|all]
no debug platform packet [recv] [send]
```

| Parameter | Description |
|---|---|
| `recv` | Debug packets received. |
| `send` | Debug packets sent. |
| `timeout <timeout>` | Stop debug after a specified time. Specify the time in seconds. |
| `vlan <vid>` | Specify a VID (VLAN ID) in the range 1 to 4094 to limit debug to that VLAN. |
| `all` | Debug all VLANs (default setting). |

**Default** A 5 minute timeout is configured by default if no other timeout duration is specified.

**Mode** Privileged Exec and Global Configuration

**Usage notes** This command can be used to trace packets sent and received by the CPU. If a timeout is not specified, then a default 5 minute timeout will be applied.

If a timeout of 0 is specified, packet debug will be generated until the **no** variant of this command is used or another timeout value is specified. The timeout value applies to both send and receive debug and is updated whenever the **debug platform packet** command is used.

**Examples** To enable both receive and send packet debug for the default timeout of 5 minutes, enter:

```
awplus# debug platform packet
```

To enable receive packet debug for 10 seconds, enter:

```
awplus# debug platform packet recv timeout 10
```

To enable send packet debug with no timeout, enter:

```
awplus# debug platform packet send timeout 0
```

To enable VLAN packet debug for VLAN 1 with a timeout duration of 3 minutes, enter:

```
awplus# debug platform packet vlan 1 timeout 180
```

To disable receive packet debug, enter:

```
awplus# no debug platform packet recv
```

**Related commands**

show debugging platform packet

undebug platform packet

# duplex

**Overview** This command changes the duplex mode for the specified port.

To see the currently-negotiated duplex mode for ports whose links are up, use the command show interface. To see the configured duplex mode (when different from the default), use the command show running-config.

**Syntax**

```
duplex {auto|full|half}
```

| Parameter | Description |
|---|---|
| `auto` | Auto-negotiate duplex mode. |
| `full` | Operate in full duplex mode only. |
| `half` | Operate in half duplex mode only. |

**Default** By default, ports auto-negotiate duplex mode.

**Mode** Interface Configuration

**Usage notes** Switch ports in a static or dynamic (LACP) channel group must have the same port speed and be in full duplex mode. Once switch ports have been aggregated into a channel group, you can set the duplex mode of all the switch ports in the channel group by applying this command to the channel group.

**Examples** To specify full duplex for port1.0.4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# duplex full
```

To specify half duplex for port1.0.4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# duplex half
```

To auto-negotiate duplex mode for port1.0.4, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# duplex auto
```

**Related commands**

polarity

speed

show interface

# flowcontrol (switch port)

## Overview

Use this command to enable flow control, and configure the flow control mode for the switch port.

Use the **no** variant of this command to disable flow control for the specified switch port.

## Syntax

```
flowcontrol both
flowcontrol {receive|send} {off|on}
no flowcontrol
```

| Parameter | Description |
|---|---|
| `both` | Use this parameter to specify send and receive flow control for the port. |
| `receive` | When the port receives pause frames, it temporarily stops (pauses) sending traffic. |
| `send` | When the port is congested (receiving too much traffic), it sends pause frames to request the other end to temporarily stop (pause) sending traffic. |
| `on` | Enable the specified flow control. |
| `off` | Disable the specified flow control. |

## Default

By default, flow control is disabled.

## Mode

Interface Configuration

## Usage notes

The flow control mechanism specified by 802.3x is only for full duplex links. It operates by sending PAUSE frames to the link partner to temporarily suspend transmission on the link.

Flow control enables connected Ethernet ports to control traffic rates during congestion by allowing congested nodes to pause link operation at the other end. If one port experiences congestion, and cannot receive any more traffic, it notifies the other port to stop sending until the condition clears. When the local device detects congestion at its end, it notifies the remote device by sending a pause frame. On receiving a pause frame, the remote device stops sending data packets, which prevents loss of data packets during the congestion period.

For half-duplex links, an older form of flow control known as backpressure is supported. See the related backpressure command.

For flow control on async serial (console) ports, see the flowcontrol hardware (asyn/console) command.

**Examples**

To enable flow control on port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# flowcontrol both
```

To disable flow control on port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no flowcontrol
```

To enable flow control on port1.0.2 (receive only), use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# flowcontrol receive on
```

To enable flow control on port1.0.2 (send only), use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# flowcontrol send on
```

To disable flow control on port1.0.2 (receive only), use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# flowcontrol receive off
```

To disable flow control on port1.0.2 (send only), use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# flowcontrol send off
```

**Related commands**

backpressure

show running-config

# linkflap action

**Overview** Use this command to detect flapping on all ports. If more than 15 flaps occur in less than 15 seconds the flapping port will shut down.

Use the **no** variant of this command to disable flapping detection at this rate.

**Syntax**

```
linkflap action [shutdown]
no linkflap action
```

| Parameter | Description |
|---|---|
| `linkflap` | Global setting for link flapping. |
| `action` | Specify the action for port. |
| `shutdown` | Shutdown the port. |

**Default** Linkflap action is disabled by default.

**Mode** Global Configuration

**Example** To enable the linkflap action command on the device, use the following commands:

```
awplus# configure terminal
awplus(config)# linkflap action shutdown
```

# mac address-table acquire

**Overview** Use this command to enable MAC address learning on the device.

Use the **no** variant of this command to disable learning.

**Syntax**
```
mac address-table acquire
no mac address-table acquire
```

**Default** Learning is enabled by default for all instances.

**Mode** Global Configuration

**Example**
```
awplus# configure terminal
awplus(config)# mac address-table acquire
```

# mac address-table ageing-time

**Overview** Use this command to specify an ageing-out time for a learned MAC address. The learned MAC address will persist for at least the specified time.

The **no** variant of this command will reset the ageing-out time back to the default of 300 seconds (5 minutes).

**Syntax**

```
mac address-table ageing-time <ageing-timer> none
no mac address-table ageing-time
```

| Parameter | Description |
|---|---|
| *<ageing-timer>* | *<10-1000000>* The number of seconds of persistence. |
| none | Disable learned MAC address timeout. |

**Default** The default ageing time is 300 seconds.

**Mode** Global Configuration

**Examples** The following commands specify various ageing timeouts on the device:

```
awplus# configure terminal
awplus(config)# mac address-table ageing-time 1000
awplus# configure terminal
awplus(config)# mac address-table ageing-time none
awplus# configure terminal
awplus(config)# no mac address-table ageing-time
```

# mac address-table static

**Overview** Use this command to statically configure the MAC address-table to forward or discard frames with a matching destination MAC address.

**Syntax**

```
mac address-table static <mac-addr> {forward|discard} interface
<port> [vlan <vid>]
```

```
no mac address-table static <mac-addr> {forward|discard}
interface <port> [vlan <vid>]
```

| Parameter | Description |
|---|---|
| *<mac-addr>* | The destination MAC address in `HHHH.HHHH.HHHH` format. |
| `interface` *<port>* | Specify a switch port to be cleared from the filtering database. The port can be:<br>• a switchport (e.g. port1.0.4)<br>• a static channel group (e.g. sa2)<br>• a dynamic (LACP) channel group (e.g. po2) |
| `vlan` *<vid>* | The ID of a VLAN to apply the command to, in the range 1 to 4094. If you do not specify a VLAN, the command applies to VLAN1. |

**Mode** Global Configuration

**Usage notes** The **mac address-table static** command is only applicable to Layer 2 switched traffic within a single VLAN. Do not apply the **mac address-table static** command to Layer 3 switched traffic passing from one VLAN to another VLAN. Frames will not be discarded across VLANs because packets are routed across VLANs. This command only works on Layer 2 traffic.

**Example**

```
awplus# configure terminal
```

```
awplus(config)# mac address-table static 2222.2222.2222 forward
interface port1.0.4 vlan 3
```

**Related commands** clear mac address-table static

show mac address-table

# platform multicast-ratelimit

**Overview** Use this command to set the maximum number of multicast packets to be forwarded to the CPU (in packets per second). Setting the value to zero disables rate limiting.

This command should be used with care. Increasing or removing the limit could make the device less responsive under heavy multicast load.

Use the **no** variant of this command to return the limit to its default.

**Syntax**

```
platform multicast-ratelimit <0-1000>
no platform multicast-ratelimit
```

**Default** 10 packets per second (pps)

**Mode** Global Configuration

**Usage notes** If you find that the CPU load on your device from multicast traffic is higher than desired, reducing this rate may reduce the CPU load.

If you need the device to process a large amount of multicast traffic, increasing this rate may improve performance.

**Example** To set the rate to 30pps, use the commands:

```
awplus# configure terminal
awplus(config)# platform multicast-ratelimit 30
```

**Command changes** Version 5.4.8-1.1: default changed to 100pps on SBx908 GEN2, SBx8100, and x930 Series switches.

# polarity

**Overview** This command sets the MDI/MDIX polarity on a copper-based switch port.

**Syntax**

```
polarity {auto|mdi|mdix}
```

| Parameter | Description |
|---|---|
| `mdi` | Sets the polarity to MDI (medium dependent interface). |
| `mdix` | Sets the polarity to MDI-X (medium dependent interface crossover). |
| `auto` | The switch port sets the polarity automatically. This is the default option. |

**Default** By default, switch ports set the polarity automatically (**auto**).

**Mode** Interface Configuration

**Usage notes** We recommend the default **auto** setting for MDI/MDIX polarity. Polarity applies to copper 10BASE-T, 100BASE-T, and 1000BASE-T switch ports; it does not apply to fiber ports. See the "MDI/MDIX Connection Modes" section in the Switching Feature Overview and Configuration Guide for more information.

**Example** To set the polarity for port1.0.4 to fixed MDI mode, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# polarity mdi
```

# show debugging platform packet

**Overview** This command shows platform to CPU level packet debugging information.

**Syntax**

```
show debugging platform packet
```

**Mode** User Exec and Privileged Exec

**Example** To display the platform packet debugging information, use the command:

```
awplus# show debugging platform packet
```

**Related commands** debug platform packet

undebug platform packet

# show flowcontrol interface

**Overview** Use this command to display flow control information.

**Syntax**

```
show flowcontrol interface <port>
```

| Parameter | Description |
|---|---|
| *<port>* | Specifies the name of the port to be displayed. |

**Mode** User Exec and Privileged Exec

**Example** To display the flow control for port1.0.3, use the command:

```
awplus# show flowcontrol interface port1.0.3
```

**Output** Figure 16-1: Example output from the **show flowcontrol interface** command for a specific interface

```
Port      Send  FlowControl    Receive  FlowControl  RxPause TxPause
          admin    oper         admin    oper
-----     ------- --------     ------- --------     ------- -------
port1.0.3 on       on           on       on           0       0
```

# show interface err-disabled

**Overview** Use this command to show the ports which have been dynamically shut down by protocols running on the device and the protocols responsible for the shutdown.

**Syntax**

```
show interface [<interface-range> err-disabled]
```

| Parameter | Description |
|---|---|
| *<interface-range>* | Interface range |
| `err-disabled` | Brief summary of interfaces shut down by protocols |

**Mode** User Exec and Privileged Exec

**Example** To show which protocols have shut down ports, use the commands:

```
awplus# show interface err-disabled
```

# show interface switchport

**Overview** Use this command to show VLAN information about each switch port.

**Syntax**

```
show interface switchport
```

**Mode** User Exec and Privileged Exec

**Example** To display VLAN information about each switch port, enter the command:

```
awplus# show interface switchport
```

**Output** Figure 16-2: Example output from the **show interface switchport** command

```
 Interface name          : port1.0.1
 Switchport mode         : access
 Ingress filter          : enable
 Acceptable frame types  : all
 Default Vlan            : 1
 Configured Vlans        : 2
 Dynamic Vlans           :

 Interface name          : port1.0.2
 Switchport mode         : trunk

```

**Related commands**

show interface memory

show vlan

# show mac address-table

**Overview** Use this command to display the MAC address-table for all configured VLANs.

**Syntax**

```
show mac address-table
```

**Mode** User Exec and Privileged Exec

**Usage notes** The **show mac address-table** command is only applicable to view a MAC address-table for Layer 2 switched traffic within VLANs.

**Example** To display the MAC address-table, use the following command:

```
awplus# show mac address-table
```

**Output** See the following sample output captured when there was no traffic being switched:

```
awplus#show mac address-table

VLAN port         mac              type
1    unknown      0000.cd28.0752   forward   static
ARP  -            0000.cd00.0000   forward   static
```

See the sample output captured when packets were switched and MAC addresses were learned:

```
awplus#show mac address-table

VLAN port         mac              type
1    unknown      0000.cd28.0752   forward   static
1    port1.0.2    0030.846e.9bf4   forward   dynamic
1    port1.0.3    0030.846e.bac7   forward   dynamic
ARP  -            0000.cd00.0000   forward   static
```

Note the new MAC addresses learned for port1.0.2 and port1.0.3 added as dynamic entries.

Note the first column of the output below shows VLAN IDs if multiple VLANs are configured:

```
awplus#show mac address-table

VLAN port         mac              type
1    unknown      0000.cd28.0752   forward   static
1    port1.0.2    0030.846e.bac7   forward   dynamic
2    unknown      0000.cd28.0752   forward   static
2    port1.0.3    0030.846e.9bf4   forward   dynamic
ARP  -            0000.cd00.0000   forward   static
```

Also note if manually configured static MAC addresses exist, this is shown to the right of the type column:

```
awplus(config)#mac address-table static 0000.1111.2222 for int
port1.0.3 vlan 1
awplus(config)#end
awplus#
awplus#show mac address-table

VLAN port         mac              type
1    unknown      0000.cd28.0752   forward   static
1    port1.0.2    0030.846e.bac7   forward   dynamic
1    port1.0.3    0000.1111.2222   forward   static
...
```

**Related commands**

mac address-table static

# show platform

**Overview** This command displays the settings configured by using the **platform** commands.

**Syntax**

```
show platform
```

**Mode** Privileged Exec

**Usage notes** This command displays the settings in the running config. For changes in some of these settings to take effect, the device must be rebooted with the new settings in the startup config.

**Example** To check the settings configured with **platform** commands on the device, use the following command:

```
awplus# show platform
```

**Output** Figure 16-3: Example output from the **show platform** command:

```
awplus#show platform
MAC vlan hashing algorithm    unknown
```

**Table 1:** Parameters in the output of the **show platform** command. Note that the parameters displayed depend on your device, and that not all displayed parameters can be modified on all devices.

| Parameter | Description |
|---|---|
| Routing Ratio | Whether all memory is allocated to IPv4 address table entries only, or whether it is allocated evenly to both IPv4 and IPv6 addresses (set with the **platform routingratio** command). |
| Route Weighting | The split between multicast and unicast route entries (set with the **platform routingratio** command). |
| MAC vlan hashing algorithm | The MAC VLAN hash-key-generating algorithm (set with the **platform mac-vlan-hashing-algorithm** command). The default algorithm is crc32l. The algorithm may need to be changed in rare circumstances in which hash collisions occur. |
| L3 hashing algorithm | The L3 VLAN hash-key-generating algorithm (set with the **platform l3-vlan-hashing-algorithm** command). The default algorithm is crc32l. The algorithm may need to be changed in rare circumstances in which hash collisions occur. |
| Load Balancing | Which packet fields are used in the channel load balancing algorithm (set with the **platform load-balancing** command). |
| Control-plane-prioritization | Maximum traffic rate on the CPU port (set with the **platform control-plane-prioritization rate** command). |

**Table 1:** Parameters in the output of the **show platform** command. Note that the parameters displayed depend on your device, and that not all displayed parameters can be modified on all devices. (cont.)

| Parameter | Description |
|---|---|
| Fdb-chain-length | The length of the FDB hash chain (set with the **platform fdb-chain-length** command). FDB entries are hashed and indexed using a hash. In rare circumstances it may be useful to reduce the chain length. |
| L2MC overlapped group check | Whether Layer 2 multicast entries are checked before deletion (set with the **platform l2mc-overlap** command). |
| silicon-profile | The silicon profile setting (set with the **platform silicon-profile** command) for the switch hardware; one of:<br>• profile 1<br>• profile 2<br>• profile 3<br>• None (default) |
| fdb-l3-hosts mode | Whether Host Mode is turned on or not. Host Mode increases the number of host entries and is available for systems containing SBx81CFC960 controller cards and SBx81XLEM line cards. See **platform silicon-profile** and **platform fdb-l3-hosts** for details. |
| Jumboframe support | Whether the jumbo frames setting is enabled or disabled (set with the **platform jumboframe** command). |
| Traffic Manager | A test setting that is disabled by default. |
| stop-unreg-mc-flooding | Whether the stop-unreg-mc-flooding feature is on or off (set with the **platform stop-unreg-mc-flooding** command). This feature prevents flooding of unregistered multicast packets in the occasional situations in which IGMP snooping does not prevent it. |
| Port Mode | Whether each port on the AT-StackQS is configured as one 40Gbps port or four 10Gbps ports, if they are operating as network ports (set with the **platform portmode interface** command). |
| Vlan-stacking TPID | The value of the TPID set in the Ethernet type field when a frame has a double VLAN tag (set with the **platform vlan-stacking-tpid** command). |
| PBR enabled | Whether policy-based routing is globally enabled or not (set with the **platform pbr-enable** command). |
| Hardware Filter Size | Whether hardware ACLs can filter on IPv6 addresses (ipv4-full-ipv6) or not (ipv4-limited-ipv6). This is set with the **platform hwfilter-size** command. |
| Vlan Ingress Filter Hard Drop | The Bridge Vlan Ingress Filtering drops traffic if the VID assigned to the packet does not match with the port's VLAN membership.<br>There are two ways the traffic is dropped by the Ingress Filtering mechanism:<br>• HARD DROP - Traffic is dropped by the Bridge Engine and not forwarded or trapped.<br>• SOFT DROP - Traffic may be mirrored or trapped by the Bridge Engine. |

# show platform port

**Overview** This command displays the various port registers or platform counters for specified switchports.

**Syntax**

```
show platform port [<port-list>] [counters]
```

| Parameter | Description |
|---|---|
| *<port-list>* | The ports to display information about. A port-list can be:<br>• a switchport (e.g. port1.0.4)<br>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)<br>• a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). |
| `counters` | Show the platform counters. |

**Mode** Privileged Exec

**Examples** To display port registers for port1.0.1 to port1.0.4, use the command:

```
awplus# show platform port port1.0.1-port1.0.4
```

To display platform counters for port1.0.1 to port1.0.4, use the command:

```
awplus# show platform port port1.0.1-port1.0.4 counters
```

**Output** Figure 16-4: Example output from the **show platform port** command

```
awplus#show platform port port1.0.1
Phy register value for port1.0.1 (ifindex: 5001)

```

# show storm-control

**Overview** Use this command to display storm-control information for all interfaces or a particular interface.

**Syntax**

```
show storm-control [<port>]
```

| Parameter | Description |
|---|---|
| *<port>* | The port to display information about. The port may be:<br>• a switchport (e.g. port1.0.4)<br>• a static channel group (e.g. sa2)<br>• a dynamic (LACP) channel group (e.g. po2) |

**Mode** User Exec and Privileged Exec

**Example** To display storm-control information for port1.0.2, use the following command:

```
awplus# show storm-control port1.0.2
```

**Output** Figure 16-5: Example output from the **show storm-control** command for port1.0.2

```
Port       BcastLevel  McastLevel  DlfLevel
port1.0.2      40. 0%     100. 0%   100. 0%
```

**Related commands** storm-control level

# speed

**Overview** This command changes the speed of the specified port. You can optionally specify the speed or speeds that get autonegotiated, so autonegotiation is only attempted at the specified speeds.

To see the currently-negotiated speed for ports whose links are up, use the show interface command. To see the configured speed (when different from the default), use the show running-config command.

Depending on your switch model and the SFP or SFP+ modules you use, a subset of the following speed options will be available.

**Syntax**

```
speed {10|100|1000|2500|5000|10000|40000|100000}
```

```
speed auto [10] [100] [1000] [2500] [5000] [10000] [40000]
[100000]
```

The following table shows the speed options for each type of port, depending on the model.

| Port type | Speed Options (units are Mbps) |
|---|---|
| RJ.5 copper ports | `auto` (default)<br>`10`<br>`100`<br>`1000` |
| RJ-45 copper ports | `auto` (default)<br>`10`<br>`100`<br>`1000`<br>`2500`<br>`5000`<br>`10000` |
| tri-speed copper SFPs | `auto` (default)<br>`10`<br>`100`<br>`1000` |
| 100 Mbps fiber SFPs | `100` |
| 1000 Mbps fiber SFPs | `auto` (default)<br>`1000` |
| 1000 Mbps copper SFPs | `auto` (default)<br>`1000` |
| 1000 Mbps fiber CSFPs (Compact SFPs) | `auto` (default)<br>`1000` |
| Multi-speed copper SFP+ | `auto` (default)<br>`1000`<br>`2500`<br>`5000`<br>`10000` |

| Port type | Speed Options (units are Mbps) |
|---|---|
| 10000 Mbps fiber SFP+ | `auto` (default)<br>`10000` |
| 10000 Mbps copper SFP+ | `auto` (default)<br>`10000` |
| 10000 Mbps Direct Attach Cable (DAC) | `auto` (default)<br>`10000` |
| 40000 Mbps QSFP+ | `auto` (default)<br>`40000` |
| 40000 Mbps Direct Attach Cable (DAC) | `auto` (default)<br>`40000` |
| Breakout DACs for 4 x 10G connections | `auto` (default)<br>`10000` |
| 100000 Mbps QSFP28 | `auto` (default)<br>`100000` |

**Mode** Interface Configuration

**Default** By default, ports autonegotiate speed.

**Usage notes** We recommend having autonegotiation enabled for link speeds of 1000 Mbps and above. For example, to apply a fixed speed of 1000 Mbps use the command **speed auto 1000**.

If multiple speeds are specified after the auto option to autonegotiate speeds, then the device only attempts autonegotiation at those specified speeds.

Switch ports in a static or dynamic (LACP) channel group must have the same port speed and be in full duplex mode. Once switch ports have been aggregated into a channel group, you can set the speed of all the switch ports in the channel group by applying this command to the channel group.

**Examples**

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# speed auto 1000
```

To return the port to auto-negotiating its speed, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# speed auto
```

duplex

polarity

show interface

speed (asyn)

# storm-control level

**Overview** Use this command to specify the speed limiting level for broadcast, multicast, or dlf (destination lookup failure) traffic for the port. Storm-control limits the selected traffic type to the specified percentage of the maximum port speed.

Use the **no** variant of this command to disable storm-control for broadcast, multicast or dlf traffic.

**Syntax**

```
storm-control {broadcast|multicast|dlf} level <level>
no storm-control {broadcast|multicast|dlf} level
```

| Parameter | Description |
|---|---|
| *<level>* | <0-100> Specifies the percentage of the maximum port speed allowed for broadcast, multicast or destination lookup failure traffic. |
| broadcast | Applies the storm-control to broadcast frames. |
| multicast | Applies the storm-control to multicast frames. |
| dlf | Applies the storm-control to destination lookup failure traffic. |

**Default** Disabled

**Mode** Interface Configuration

**Usage notes** Flooding techniques are used to block the forwarding of unnecessary flooded traffic. A packet storm occurs when a large number of broadcast packets are received on a port. Forwarding these packets can cause the network to slow down or time out.

More than one limit type can be set at a time. For example, you can configure both broadcast and multicast levels on the same port, at the same time.

**Example** To limit broadcast traffic on port1.0.2 to 30% of the maximum port speed, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# storm-control broadcast level 30
```

**Related commands** show storm-control

**Command changes** Version 5.4.9-1.3: Multiple limit types available on x530 series

Version 5.5.0-2.1: Multiple limit types available on x220 and GS980M series

# undebug platform packet

**Overview** This command applies the functionality of the no debug platform packet command.

# 17 Bridging Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure bridging. For more information, see the Bridging Feature Overview and Configuration Guide.

**Command List**

- "ageing-time" on page 585
- "bridge" on page 586
- "bridge-group" on page 587
- "clear mac-filter counter" on page 589
- "default-action" on page 590
- "default-protocol-action" on page 592
- "l3-filtering enable" on page 593
- "mac-filter-group egress" on page 594
- "mac-filter" on page 595
- "mac-filter-group" on page 596
- "mac-learning" on page 597
- "protocol ethii (macfilter)" on page 598
- "protocol novell (macfilter)" on page 600
- "protocol sap (macfilter)" on page 602
- "protocol snap (macfilter)" on page 604
- "rule (macfilter)" on page 606
- "rule ip (macfilter)" on page 608
- "rule ipv6 (macfilter)" on page 610
- "show bridge" on page 612

- "show bridge macaddr" on page 614
- "show mac-filter" on page 615

# ageing-time

**Overview** This command specifies the time period that a learned MAC address will remain defined within the bridge's MAC address table.

Use the **no** variant of this command to set the ageing out time back to the default.

**Syntax**

```
ageing-time <10-1000000>
no ageing-time
```

| Parameter | Description |
|---|---|
| *<10-1000000>* | The number of seconds that the MAC addresses will remain in the table. |

**Default** 300 seconds (5 minutes)

**Mode** Interface Configuration

**Examples** To change the ageing time on br2 to 60 seconds (1 minute), use the following commands:

```
awplus#configure terminal
awplus(config)#interface br2
awplus(config-if)#ageing-time 60
```

To reset the ageing time back to its default, use the following commands:

```
awplus#configure terminal
awplus(config-if)#no ageing-time
```

To reset the ageing time back to its default, you can also use the following commands:

```
awplus#configure terminal
awplus(config-if)#ageing-time 300
```

**Output** None

**Related commands**

bridge

bridge-group

show bridge

show bridge macaddr

# bridge

**Overview** Use this command to create a software bridge.

Use the **no** variant of this command to remove the specified bridge.

**Syntax**

```
bridge <bridge-id>
no bridge <bridge-id>
```

| Parameter | Description |
|---|---|
| *<bridge-id>* | The bridge ID (from 1 to 255). This is made up of the bridge priority and the bridge's MAC address. |

**Default** No configured bridges

**Mode** Global Configuration

**Usage notes** The bridge interface name will be prefixed with 'br' followed by the bridge ID.

*If interfaces exist on a bridge, then the bridge cannot be removed. For example if interface eth1 exists on bridge 2, then the* ***no bridge 2*** *command will give you the following message:*

```
% failed to remove interface br2, there are still configured
sub-interfaces.
```

**Example** To create a bridge with the ID of 2, use the following commands:

```
awplus#configure terminal
awplus(config)#bridge 2
```

To remove the bridge with the ID of 2, use the following commands:

```
awplus#configure terminal
awplus(config)##no bridge 2
```

**Related commands**

ageing-time

bridge-group

show bridge

show bridge macaddr

# bridge-group

**Overview** Use this command to add an interface to a bridge. Interfaces that have been added to a bridge will lose their L3 properties.

Use the **no** variant of this command to remove an interface from a bridge.

**Syntax**

```
bridge-group <0-255> [port-protected]
no bridge-group
```

| Parameter | Description |
|---|---|
| *<0-255>* | The ID of the bridge that you are adding the interface to. Interface ID 0 is a VLAN-aware bridge.<br>For container services, allocate an interface ID of 0.<br>For more information about the VLAN-aware bridge, see the Bridging Feature Overview and Configuration Guide. |
| port-protected | Interfaces added to a bridge can be added in "protected" mode. Interfaces in this mode that are part of the same bridge-group will be unable to bridge to each other, but communication with unprotected interfaces will be unimpeded. Omitting this option from the command will add the interface in unprotected mode. |

**Default** An interface is not part of any bridge by default

**Mode** Interface Configuration

**Usage notes** Interfaces can only be part of one bridge, so when removing the bridge no parameters are required.

Interfaces that have been added to a bridge will lose their Layer 3 properties. The bridge will act as the Layer 3 interface. The bridge will provide Layer 2 connectivity between interfaces that are a part of the same bridge-group.

You can attach interfaces such as Ethernet, VLAN, VTI (Tunnel) to your bridge.

**Examples** To add eth1 to bridge 2 in unprotected mode, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# bridge-group 2
```

To add eth1 to bridge 2 in protected mode, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# bridge-group 2 port-protected
```

To remove eth1 from bridge 2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no bridge-group
```

**Related commands**

ageing-time

show bridge

show bridge macaddr

# clear mac-filter counter

**Overview** This command clears all the mac-filter counters on a bridge interface.

**Syntax**

```
clear mac-filter counter
clear mac-filter counter ingress
clear mac-filter counter egress
clear mac-filter counter {ingress|egress} <interface-name>
```

| Parameter | Description |
|---|---|
| `ingress` | Clear only the ingress counters |
| `egress` | Clear only the egress counters |
| *<interface-name>* | Clear counters on the specified interface |

**Default** None

**Mode** Privileged Exec

**Examples** To clear all ingress counters on eth1, use the following command:

```
awplus#clear mac-filter counter ingress eth1
```

To clear all ingress counters, use the following command:

```
awplus#clear mac-filter counter ingress
```

To clear all mac-filter counters, use the following command:

```
awplus#clear mac-filter counter
```

**Related commands**

mac-filter

mac-filter-group

show mac-filter

rule (macfilter)

**Command changes** Version 5.4.8-0.2: command updated

# default-action

**Overview** Use this command to set the default action for packets not hitting a particular mac-filter.

Use the **no** variant of this command to remove the configured default action. See the third example below for more information.

**Syntax**

```
default-action [permit|deny|none]
no default-action
```

| Parameter | Description |
|---|---|
| `permit` | Accept the traffic which didn't match any rule in the mac-filter. This means the traffic will not pass through any other mac-filters. |
| `deny` | Drop the traffic which didn't hit any rule in the mac-filter. |
| `none` | Allow the traffic (which didn't hit any rule in the mac-filter) to traverse the next mac-filter, if any are configured. |

**Default** Deny.

**Mode** MAC Filter Configuration

**Example1** To set the default action to **none** for the mac-filter named: filter1, use the following commands:

```
awplus# configure terminal
awplus(config)# mac-filter filter1
awplus(config-macfilter)# default-action none
```

This means that if this filter is set on ingress traffic for eth1 and that traffic doesn't hit any rules in the filter, then the traffic will progress to any other filters present. For example, there could be a filter on bridge1 that eth1 is a part of. If bridge1 also has mac filters, then those filters have a chance to examine that traffic ingressing eth1.

**Example 2** To set the default action to **permit** for the mac-filter named: filter1, use the following commands:

```
awplus# configure terminal
awplus(config)# mac-filter filter1
awplus(config-macfilter)# default-action permit
```

This means that if this filter is set on ingress traffic for eth1 and that traffic doesn't hit any rules in the filter, then the traffic will not progress to any other filters present, and will not undergo any more filtering.

**Example 3** To set the default action to **deny** for the mac-filter named: filter1, use the following commands:

```
awplus# configure terminal
awplus(config)# mac-filter filter1
awplus(config-macfilter)# default-action deny
```

This means that if this filter is set on ingress traffic for eth1 and that traffic doesn't hit any rules in the filter, then the traffic will be dropped. This is the same as setting the command **no default-action**.

**Related commands** mac-filter

**Command changes** Version 5.4.7-2.1: command added

# default-protocol-action

**Overview** Use this command to set the default behavior (permit or deny) when a packet does not match any configured protocol filter. Permit means to continue to the rules (if rules exist). If there are no rules or no rules match, then continue to the default action.

Use the **no** variant of this command to revert to the default filtering action of 'permit'.

**Syntax**

```
default-protocol-action {permit|deny}
no default-protocol-action
```

| Parameter | Description |
|---|---|
| `permit` | Allow the packet |
| `deny` | Drop the packet |

**Default** Permit.

**Mode** MAC Filter Configuration

**Example** To designate ATL-router1 to deny all packets that do not match the configured protocol filters, use the following commands:

```
awplus# configure terminal
awplus(config)# mac-filter ATL-router1
awplus(config-macfilter)# default-protocol-action deny
```

**Related commands**

protocol ethii (macfilter)

protocol novell (macfilter)

protocol sap (macfilter)

protocol snap (macfilter)

**Command changes** Version 5.4.8-0.2: command added

# l3-filtering enable

**Overview** Use this command to enable traffic control for bridged traffic on a bridge interface.

Use the **no** variant of this command to disable traffic control for bridged traffic on a bridge interface.

**Syntax**

```
l3-filtering enable
no l3-filtering enable
```

**Default** Traffic control is disabled by default for bridged traffic.

**Mode** Interface mode for a bridge interface

**Usage notes** We do not recommend shaping bridged traffic on firewalls that are running Unified Threat Management (UTM) features, because both Traffic Control and UTM require significant CPU resources.

**Example** To enable traffic control for bridged traffic on br1, use the commands:

```
awplus# configure terminal
awplus(config)# interface br1
awplus(config-if)# l3-filtering enable
```

**Related commands** traffic-control

**Command changes** Version 5.4.7-0.1: command added. Previously, traffic control was enabled by default on all bridge interfaces.

# mac-filter-group egress

**Overview** Use this command to apply an egress MAC-filter to a bridge interface, bridge port, or potential bridge port.

Use the **no** variant of this command to remove an egress MAC-filter on a specific bridge interface or bridge port.

**Syntax**

```
mac-filter-group egress <mac-filter-name>
no mac-filter-group egress
```

| Parameter | Description |
|---|---|
| *<mac-filter-name>* | The name of the MAC-filter that is applied to the bridge interface or bridge port on egress. |

**Default** No mac-filter.

**Mode** Interface Configuration

**Example** To configure MAC-filter 'filter1' to operate on traffic egressing tunnel2, use the following commands:

```
awplus# configure terminal
awplus(config)# int tunnel2
awplus(config-if)# mac-filter-group egress filter1
```

To remove that same filter, use the following commands:

```
awplus# configure terminal
awplus(config)# int tunnel2
awplus(config-if)# no mac-filter-group egress
```

**Related commands** mac-filter

show mac-filter

clear mac-filter counter

**Command changes** Version 5.4.8-0.2 command updated.

# mac-filter

**Overview** This command creates a Layer 2 MAC filter that can be applied on a bridge.

Use the **no** variant of this command to remove the MAC filter.

**Syntax**

```
mac-filter [<mac-filter-name>]
no mac-filter [<mac-filter-name>]
```

| Parameter | Description |
|---|---|
| *<mac-filter-name>* | The name of the mac-filter (maximum of 16 characters). |

**Default** None

**Mode** Interface Configuration

**Usage notes** You can only create one MAC filter at one time.

**Examples** To create a mac-filter with the name of ATL-router1,use the following commands:

```
awplus#configure terminal
awplus(config)#mac-filter ATL-router1
```

To delete a mac-filter, use the following commands:

```
awplus#configure terminal
awplus(config)#no mac-filter ATL-router1
```

**Output** None

**Related commands** clear mac-filter counter

mac-filter-group

show mac-filter

# mac-filter-group

**Overview** This command applies a Layer two MAC filter on a bridge.

Use the **no** variant of this command to remove the mac-filter on a bridge.

**Syntax**

```
mac-filter-group [<mac-filter-name>]
no mac-filter-group
```

| Parameter | Description |
|---|---|
| *<mac-filter-name>* | The name of the mac-filter (maximum 16 characters). |

**Default** None

**Mode** Interface Configuration

**Usage notes** You can only apply one MAC filter at one time.

**Examples** To apply a mac-filter with the name of ATL-router1 on bridge interface br1,use the following commands:

```
awplus#configure terminal
awplus(config)#interface br1
awplus(config-if)#mac-filter-group ATL-router1
```

To remove the mac-filter on a bridge, use the following commands:

```
awplus#configure terminal
awplus(config)#interface br1
awplus(config-if)#no mac-filter-group
```

**Output** Figure 17-1: Example output from the **mac-filter-group** command displaying information about all bridges:

```
mac-filter "ATL-router1" will be applied to the bridge interface
br1
```

**Related commands**

clear mac-filter counter

mac-filter

show mac-filter

# mac-learning

**Overview** Use this command to enable FDB MAC address learning on a bridge interface. In some circumstances, FDB MAC address learning on a software-based router bridge is not useful, and it is better to flood the traffic within interfaces associated with the bridge instance, to ensure the traffic reaches its destination.

Use the **no** variant of this command to disable or enable FDB MAC address learning on a bridge.

**Syntax**

```
mac-learning
no mac-learning
```

**Default** Learning is enabled by default.

**Mode** Interface mode for a bridge interface

**Example** To turn off learning on bridge 2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface br2
awplus(config-if)# no mac-learning
```

To turn learning on bridge 2 back on, use the following commands:

```
awplus# configure terminal
awplus(config)# interface br2
awplus(config-if)# mac-learning
```

**Command changes** Version 5.4.7-0.1: command added

# protocol ethii (macfilter)

**Overview** Use this command to add a bridge protocol filter for Ethernet II packets. If ether-type is not specified, then all Ethernet II packets match the rule.

If ether-type is specified, then only packets having the specified ether-type matches the rule.

Use the **no** variant of this command to remove the protocol filter.

**Syntax**

```
protocol <filter-name> {permit|deny} ethii
protocol <filter-name> {permit|deny} ethii ether-type
<ether-type>
protocol <filter-name> {permit|deny} ethii {after|before}
protocol <filter-name>
protocol <filter-name> {permit|deny} ethii ether-type
<ether-type> {after|before} protocol <filter-name>
no protocol <filter-name>
```

| Parameter | Description | |
|---|---|---|
| *<filter-name>* | Protocol filter name. | |
| permit | Allow the matched frame | |
| deny | Drop the matched frame | |
| ethii | Ethernet type II frame | |
| ether-type | Ethertype of Ethernet II frame | |
| *<ether-type>* | Ethertype (2 bytes in hexadecimal, e.g. 0800) or any of the well-known names.. | |
| | arp | ARP (Address Resolution Protocol), 0806 |
| | atmf | ATMF (Allied Telesis Management Framework), fbae |
| | atmf-agent | ATMF Agent, fbaf |
| | ip | IPv4 (Internet Protocol version 4), 0800 |
| | ipv6 | IPv6 (Internet Protocol version 6), 86dd |
| | loop | Loopback (Ethernet Configuration Testing Protocol), 9000 |
| | ppp | PPP (Point-to-Point Protocol), 880b |
| | pppoe-disc | PPPoE Discovery, 8863 |
| | pppoe-sess | PPPoE Session, 8864 |
| after | Add after the following protocol filter name | |
| before | Add before the following protocol filter name. | |

**Default** The default action is permit.

**Mode** MAC Filter Configuration

**Usage notes** This command adds or deletes a protocol filter for bridged traffic in Mac filter mode.

By default all protocols are permitted, but this can be changed by using the command: **default-protocol-action**.

This command, examines packets for each protocol filter in the configured order.

- If a denied protocol filter is matched, then the packet is immediately dropped without examining the rest of protocol filters and rules
- If a permitted protocol filter is matched, then the packet skips the rest of protocol filters and continues to examine rules.

**Example** To allow all IPv4 packets, use the commands:

```
awplus# configure terminal
awplus(config)# mac-filter ATL-router1
awplus(config-macfilter)# protocol 1 permit ethii ether-type ip
```

**Related commands**

**Command changes** Version 5.4.8-0.2: command added

# protocol novell (macfilter)

**Overview** Use this command to add a bridge protocol filter for Novell raw IEEE 802.3 packets..

Use the **no** variant of this command to remove the protocol filter.

**Syntax**

```
protocol <filter-name> {permit|deny} novell
protocol <filter-name> {permit|deny} novell {after|before}
protocol <filter-name>
no protocol <filter-name>
```

| Parameter | Description |
|---|---|
| *<filter-name>* | Protocol filter name. |
| permit | Allow the matched frame |
| deny | Drop the matched frame |
| novell | Novell raw IEEE 802.3 |
| after | Add after the following protocol filter name |
| before | Add before the following protocol filter name. |

**Default** The default action is permit.

**Mode** MAC Filter Configuration

**Usage notes** This command adds or deletes a protocol filter for bridged traffic in Mac filter mode.

By default all protocols are permitted, but this can be changed by using the command: **default-protocol-action**.

This command, examines packets for each protocol filter in the configured order.

- If a denied protocol filter is matched, then the packet is immediately dropped without examining the rest of protocol filters and rules
- If a permitted protocol filter is matched, then the packet skips the rest of protocol filters and continues to examine rules.

**Example** To allow all Novell IEEE 802.3 packets, use the commands:

```
awplus# configure terminal
awplus(config)# mac-filter ATL-router1
awplus(config-macfilter)# protocol 1 permit novell
```

**Related commands**

rule ipv6 (macfilter)

default-protocol-action

show mac-filter

clear mac-filter counter

**Command changes** Version 5.4.8-0.2: command added

# protocol sap (macfilter)

**Overview** Use this command to add a bridge protocol filter for IEEE 802.3 packets. If sap-type is not specified, then all IEEE 802.3 packets (including Novell raw IEEE 802.3, IEEE 802.3 with 802.2 LLC and IEEE 802.3 with 802.2 SNAP) match the rule.

If sap-type is specified, then only packets having the specified sap-type matches the rule.

Use the **no** variant of this command to remove the protocol filter.

**Syntax**

```
protocol <filter-name> {permit|deny} sap
protocol <filter-name> {permit|deny} sap sap-type <sap-type>
protocol <filter-name> {permit|deny} sap {after|before}
protocol <filter-name>
protocol <filter-name> {permit|deny} sap sap-type <sap-type>
{after|before} protocol <filter-name>
no protocol <filter-name>
```

| Parameter | Description |
|---|---|
| *<filter-name>* | Protocol filter name. |
| permit | Allow the matched frame |
| deny | Drop the matched frame |
| sap | SAP (IEEE 802.3) |
| sap-type | SAP type |
| *<sap-type>* | SAP type value (1 byte in hexadecimal, e.g. e0) |
| after | Add after the following protocol filter name |
| before | Add before the following protocol filter name. |

**Default** The default action is permit. You can change the default by using the command: **default-protocol-action**.

**Mode** MAC Filter Configuration

**Usage notes** This command adds or deletes a protocol filter for bridged traffic in Mac filter mode.

This command, examines packets for each protocol filter in the configured order.

- If a denied protocol filter is matched, then the packet is immediately dropped without examining the rest of protocol filters and rules
- If a permitted protocol filter is matched, then the packet skips the rest of protocol filters and continues to examine rules.

**Example** To allow Novell Netware SAP type of 802.2 packets, use the commands:

```
awplus# configure terminal
awplus(config)# mac-filter ATL-router1
awplus(config-macfilter)# protocol 2 permit sap sap-type e0
```

**Command changes** Version 5.4.8-0.2: command added

# protocol snap (macfilter)

**Overview** Use this command to add a bridge protocol filter for SNAP (IEEE 802.3 with 802.2 SNAP) packets. If snap-type is not specified, then all snap packets match the rule.

If snap-type is specified, then only packets having the specified snap-type matches the rule.

Use the **no** variant of this command to remove the protocol filter.

**Syntax**

```
protocol <filter-name> {permit|deny} snap
protocol <filter-name> {permit|deny} snap-type <snap-type>
protocol <filter-name> {permit|deny} snap {after|before}
protocol <filter-name>
protocol <filter-name> {permit|deny} snap snap-type <snap-type>
{after|before} protocol <filter-name>
no protocol <filter-name>
```

| Parameter | Description |
|---|---|
| *<filter-name>* | Protocol filter name. |
| permit | Allow the matched frame |
| deny | Drop the matched frame |
| snap | IEEE 802.2 SNAP |
| snap-type | SNAP type |
| *<snap-type>* | SNAP protocol ID (2 bytes in hexadecimal, e.g. 0800) |
| after | Add after the following protocol filter name |
| before | Add before the following protocol filter name. |

**Default** The default action is permit.

**Mode** MAC Filter Configuration

**Usage notes** This command adds or deletes a protocol filter for bridged traffic in Mac filter mode.

By default all protocols are permitted, but this can be changed by using the command: **default-protocol-action**.

This command, examines packets for each protocol filter in the configured order.

- If a denied protocol filter is matched, then the packet is immediately dropped without examining the rest of protocol filters and rules
- If a permitted protocol filter is matched, then the packet skips the rest of protocol filters and continues to examine rules.

**Example** To allow all SNAP packets, use the commands:

```
awplus# configure terminal
awplus(config)# mac-filter ATL-router1
awplus(config-macfilter)# protocol 3 permit snap
```

**Related commands**

rule (macfilter)

rule ip (macfilter)

rule ipv6 (macfilter)

default-protocol-action

show mac-filter

clear mac-filter counter

**Command changes** Version 5.4.8-0.2: command added

# rule (macfilter)

**Overview** Use this command to add a filter rule to a specified mac-filter. The filter rule can also be configured to run after or before the specified rule.

Use the **no** variant of this command to remove a filter rule.

**Syntax**

```
rule <rule-name> {deny|permit} [dmac {<mac-addr>|any}] [smac
{<mac-addr>|any}] [proto {<ether-type>|any}] [offset <0-1499>
hex-string <match-string>] [{after|before} rule <rule-name>]

no rule <rule-name>
```

| Parameter | Description |
|---|---|
| *<rule-name>* | The name of the rule (maximum of 16 characters) |
| deny | Drop the matched frame |
| permit | Allow the matched frame |
| dmac | Destination MAC address |
| smac | Source MAC address |
| *<mac-addr>* | MAC address in HHHH.HHHH.HHHH format |
| *<ether-type>* | Ethernet protocol type |
| offset | Offset of Ethernet data to match |
| *<0-1499>* | Offset value (0 is the beginning of the Ethernet data) |
| hex-string | Match with the specified hexadecimal string |
| *<match-string>* | String to match in hexadecimal (e.g. 01ab) |
| after | Add after the following rule name |
| before | Add before the following rule name |
| rule <rule-name> | Mac Filter rule |

**Mode** MAC Filter Configuration

**Usage notes** The filter rule can specify any combination of the following:

- destination MAC address
- source MAC address
- Ethernet protocol type
- string match from a specific offset of Ethernet data

**Example** To configure a bridge filter rule (RULE1) that permits any destination MAC address with the source address of 00c4.6d20.c0f4 with any protocol, use the following commands:

```
awplus# configure terminal
awplus(config)# mac-filter ATL-router1
awplus(config-macfilter)# rule RULE1 permit dmac any smac
00c4.6d20.c0f4 proto any
```

**Example** To configure a bridge filter rule (RULE2) that permits any broadcast traffic with 0xF2 at the offset of 28 (29th byte) in the Ethernet data, use the following commands:

```
awplus# configure terminal
awplus(config)# mac-filter ATL-router1
awplus(config-macfilter)# rule RULE2 permit dmac ffff.ffff.ffff
offset 28 hex-string f2
```

**Related commands**

show mac-filter

clear mac-filter counter

rule ip (macfilter)

rule ipv6 (macfilter)

**Command changes** Version 5.4.8-0.2: command added

# rule ip (macfilter)

**Overview** Use this command to add a bridge filter rule based on the IP protocol.

Use the **no** variant of this command to remove a bridge IP protocol filter.

**Syntax**

```
rule <name> {deny|permit} ip [src {<ip-addr>|<ip-subnet>}]
[dst {<ip-addr>|<ip-subnet>}] [proto <1-255>] [{after|before}
rule <name>]
```

```
rule <name> {deny|permit} ip [src {<ip-addr>|<ip-subnet>}]
[dst {<ip-addr>|<ip-subnet>}] [proto {tcp|udp} [sport
<1-65535>] [dport <1-65535>]] [{after|before} rule <name>]
```

```
no rule <name>
```

| Parameter | Description |
|---|---|
| *<name>* | Rule name |
| deny | Drop the matched frame |
| permit | Permit the matched frame |
| src *<ip-addr>* | Source IP address |
| src *<ip-subnet>* | Source IP address with subnet prefix length |
| dst *<ip-addr>* | Destination IP address |
| dst *<ip-subnet>* | Destination IP address with subnet prefix length |
| proto *<1-255>* | IP protocol number |
| proto tcp | TCP protocol |
| proto udp | UDP protocol |
| sport *<1-65535>* | TCP or UDP source port number |
| dport *<1-65535>* | TCP or UDP destination port number |
| after | Add after the following rule name |
| before | Add before the following rule name |
| rule *<name>* | MAC Filter rule name |

**Mode** MAC Filter Configuration

**Example** To add a bridge filter rule that permits IP packets with a source address of 192.168.1.1 and a destination address of 10.0.0.0/8 using the TCP protocol to destination port 23, use the following commands:

```
awplus# configure terminal
```

```
awplus(config)# mac-filter ATL-router1
```

```
awplus(config-macfilter)# rule 1 permit ip scr 192.168.1.1 dst
10.0.0.0/8 proto tcp dport 23
```

**Related commands**

Version 5.4.8-0.2: command added

# rule ipv6 (macfilter)

**Overview** Use this command to add a bridge filter rule based on the IPv6 protocol.

Use the **no** variant of this command to remove a bridge IPv6 protocol filter.

**Syntax**

```
rule <name> {deny|permit} ipv6 [src
{<ipv6-addr>|<ipv6-addr/prefix-length>}]
[dst {<ipv6-addr>|<ipv6-addr/prefix-length>}] [proto <1-255>]
[{after|before} rule <name>]
```

```
rule <name> {deny|permit} ipv6 [src
{<ipv6-addr>|<ipv6-addr/prefix-length>}]
[dst {<ipv6-addr>|<ipv6-addr/prefix-length>}] [proto {tcp|udp}
[sport <1-65535>] [dport <1-65535>]] [{after|before} rule
<name>]
```

```
no rule <name>
```

| Parameter | Description |
|---|---|
| *<name>* | Rule name |
| deny | Drop the matched frame |
| permit | Permit the matched frame |
| src *<ipv6-addr>* | Source IPv6 address |
| src *<ipv6-addr/prefix-length>* | Source IPv6 address with subnet prefix length |
| dst *<ipv6-addr>* | Destination IPv6 address |
| dst *<ipv6-addr/prefix-length>* | Destination IPv6 address with subnet prefix length |
| proto *<1-255>* | IPv6 protocol number |
| proto tcp | TCP protocol |
| proto udp | UDP protocol |
| sport *<1-65535>* | TCP or UDP source port number |
| dport *<1-65535>* | TCP or UDP destination port number |
| after | Add after the following rule name |
| before | Add before the following rule name |
| rule *<name>* | MAC Filter rule name |

**Mode** MAC Filter Configuration

**Example** To add a bridge filter rule that permits IPv6 packets with a source address of 2001::1 and a destination address of 3001::/64 using the TCP protocol to destination port 23, use the following commands:

```
awplus# configure terminal
awplus(config)# mac-filter ATL-router1
awplus(config-macfilter)# rule 1 permit ipv6 scr 2001::1 dst 3001::/64 proto tcp dport 23
```

**Related commands** show mac-filter

rule (macfilter)

protocol sap (macfilter)

**Command changes** Version 5.4.8-0.2: command added

# show bridge

**Syntax** Use this command to display detailed information about your bridge(s).

**Syntax** `show bridge [<bridge-list>]`

| Parameter | Description |
|---|---|
| *<bridge-list>* | The bridge/s to display the information about.<br>The <*bridge-list*> can be:<br>• a single bridge(e.g. br2)<br>• a continuous range of bridges (e.g. br1-3)<br>• a comma separated list of bridges and/or ranges (e.g. br1,br2,br3-br5) |

**Default** Displays detailed information about all bridges, if no <*bridge-list*> is specified.

**Mode** Privileged Exec

**Examples** To display information about all bridges, use the following command:

```
awplus#show bridge
```

To display information about bridge 2, use the following command:

```
awplus#show bridge br2
```

To display information about bridge in the range 1 to 3, use the following command:

```
awplus#show bridge br1-3
```

To display information about bridges 1, and from 3 to 5, use the following command:

```
awplus#show bridge br1,br3-5
```

**Output** Figure 17-2: Example output from the **show bridge** command displaying information about all bridges:

```
awplus#show bridge
Bridge Name     Aging Timer     Interfaces
----------------------------------------
br1             300             eth1
br3             300
br4             300
br5             300
```

Figure 17-3: Example output from the **show bridge** command displaying information about bridge 1.

```
awplus#show bridge br1
Bridge Name     Aging Timer     Interfaces
----------------------------------------
br1             300             eth1
```

**Related commands**

ageing-time

bridge

bridge-group

show bridge macaddr

# show bridge macaddr

**Overview** Use this command to display the MAC entries learned in the MAC table for your bridge.

**Syntax**

```
show bridge macaddr <bridge-list>
```

| Parameter | Description |
|---|---|
| *<bridge-list>* | The bridge interfaces to display the information about. The *<bridge-list>* can be:<br>• a single bridge (e.g. br2)<br>• a continuous range of bridges (e.g. br1-3)<br>• a comma separated list of bridges and/or ranges (e.g. br1,br2,br3-br5) |

**Mode** Global Configuration

**Example** To display the learned MAC entries for bridge 2, use the following commands:

```
awplus# configure terminal
awplus(config)# show bridge macaddr br2
```

**Output** Figure 17-4: Example output from the **show bridge macaddr** command displaying information about bridge 2:

```
awplus#show bridge macaddr br2
Bridge Name    Interface    mac addr              is local?  ageing
-----------------------------------------------------------------
br2            vlan1        ec:cd:6d:20:c0:fb     no          41
br2            vlan1        00:c4:6d:20:c0:e6     no           0
br2            vlan1        ec:cd:6d:20:c0:bd     yes          0
...
```

**Related commands**

ageing-time

bridge

bridge-group

show bridge

# show mac-filter

**Overview** This command displays configured protocol filters and rules along with packet and byte counts on a bridge or an interface that is a member of a bridge.

**Syntax**

```
show mac-filter [<interface-name>]
```

| Parameter | Description |
|---|---|
| *<interface-name>* | The interface name. Mac-filters applied to this interface will be displayed. |

**Default** Displays all MAC filters, rules, and counters for all interfaces on a bridge.

**Mode** Privileged Exec

**Examples** To display all MAC filters, rules, and counters for all interfaces on a bridge, use the following command:

```
awplus#show mac-filter
```

**Output** Figure 17-5: Example output from **show mac-filter**

```
awplus#show mac-filter
Iface            Rule         Options                                Pkt Count
                 Dir / Action                                       Byte Count
-------------------------------------------------------------------------------

# 18 VLAN Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure VLANs. For more information see the VLAN Feature Overview and Configuration Guide.

**Command List**

- "show vlan" on page 618
- "switchport access vlan" on page 619
- "switchport mode access" on page 620
- "switchport mode trunk" on page 621
- "switchport trunk allowed vlan" on page 622
- "switchport trunk native vlan" on page 625
- "switchport voice dscp" on page 626
- "switchport voice vlan" on page 627
- "switchport voice vlan priority" on page 629
- "vlan" on page 630
- "vlan database" on page 632

# show vlan

**Overview** Use this command to display information about a particular VLAN by specifying its VLAN ID. Selecting **all** will display information for all the VLANs configured.

**Syntax**

```
show vlan
{all|brief|dynamic|static|auto|static-ports|<1-4094>}
```

| Parameter | Description |
|---|---|
| *<1-4094>* | Display information about the VLAN specified by the VLAN ID. |
| `all` | Display information about all VLANs on the device. |
| `brief` | Display information about all VLANs on the device. |
| `dynamic` | Display information about all VLANs learned dynamically. |
| `static` | Display information about all statically configured VLANs. |
| `auto` | Display information about all auto-configured VLANs. |
| `static-ports` | Display static egress/forbidden ports. |

**Mode** User Exec and Privileged Exec

**Example** To display information about VLAN 2, use the command:

```
awplus# show vlan 2
```

**Output** Figure 18-1: Example output from the **show vlan** command

```
VLAN ID  Name            Type    State   Member ports
                                         (u)-Untagged, (t)-Tagged
======= ================ ======= ======= ====================================
2       VLAN0002         STATIC  ACTIVE  port1.0.3(u) port1.0.4(u) port1.0.5(u)
                                         port1.0.6(u)
...
```

**Related commands** vlan

**Command changes** Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V

# switchport access vlan

**Overview** Use this command to change the port-based VLAN of the current port.

Use the **no** variant of this command to change the port-based VLAN of this port to the default VLAN, VLAN 1.

**Syntax**

```
switchport access vlan <vlan-id>
no switchport access vlan
```

| Parameter | Description |
|---|---|
| *<vlan-id>* | <1-4094> The port-based VLAN ID for the port. |

**Default** VLAN 1

**Mode** Interface Configuration

**Usage notes** Any untagged frame received on this port will be associated with the specified VLAN.

**Examples** To change the port-based VLAN to VLAN 3 for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport access vlan 3
```

To reset the port-based VLAN to the default VLAN 1 for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport access vlan
```

**Related commands** show interface switchport

show vlan

**Command changes** Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V

# switchport mode access

**Overview** Use this command to set the switching characteristics of the port to access mode. Received frames are classified based on the VLAN characteristics, then accepted or discarded based on the specified filtering criteria.

**Syntax**

```
switchport mode access [ingress-filter {enable|disable}]
```

| Parameter | Description |
|---|---|
| `ingress-filter` | Set the ingress filtering for the received frames. |
| `enable` | Turn on ingress filtering for received frames. This is the default. |
| `disable` | Turn off ingress filtering to accept frames that do not meet the classification criteria. |

**Default** By default, ports are in access mode with ingress filtering on.

**Usage notes** Use access mode to send untagged frames only.

**Mode** Interface Configuration

**Example**

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access ingress-filter enable
```

**Related Commands** show interface switchport

**Command changes** Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V

# switchport mode trunk

**Overview** Use this command to set the switching characteristics of the port to trunk. Received frames are classified based on the VLAN characteristics, then accepted or discarded based on the specified filtering criteria.

**Syntax**

```
switchport mode trunk [ingress-filter {enable|disable}]
```

| Parameter | Description |
|---|---|
| `ingress-filter` | Set the ingress filtering for the frames received. |
| `enable` | Turn on ingress filtering for received frames. This is the default. |
| `disable` | Turn off ingress filtering to accept frames that do not meet the classification criteria. |

**Default** By default, ports are in access mode, are untagged members of the default VLAN (VLAN 1), and have ingress filtering on.

**Mode** Interface Configuration

**Usage notes** A port in trunk mode can be a tagged member of multiple VLANs, and an untagged member of one native VLAN.

To configure which VLANs this port will trunk for, use the switchport trunk allowed vlan command.

**Example**

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# switchport mode trunk ingress-filter enable
```

**Related Commands** show interface switchport

**Command changes** Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V

# switchport trunk allowed vlan

**Overview** Use this command to add VLANs to be trunked over this switch port. Traffic for these VLANs can be sent and received on the port.

Use the **no** variant of this command to reset switching characteristics of a specified interface to negate a trunked configuration specified with **switchport trunk allowed vlan** command.

**Syntax**

```
switchport trunk allowed vlan all
switchport trunk allowed vlan none
switchport trunk allowed vlan add <vid-list>
switchport trunk allowed vlan remove <vid-list>
switchport trunk allowed vlan except <vid-list>
no switchport trunk
```

| Parameter | Description |
|---|---|
| `all` | Allow all VLANs to transmit and receive through the port. |
| `none` | Allow no VLANs to transmit and receive through the port. |
| `add` | Add a VLAN to the list of VLANs that are allowed to transmit and receive through the port. Only use this parameter if a list of VLANs is already configured on a port. |
| `remove` | Remove a VLAN from the list of VLANs that are allowed to transmit and receive through the port. Only use this parameter if a list of VLANs is already configured on a port.<br>If you are removing VLAN port membership for a large number of switchports and VLANs, note that this command may take a number of minutes to run. |
| `except` | All VLANs, except the VLAN for which the VID is specified, are part of its port member set. Only use this parameter to remove VLANs after either this parameter or the **all** parameter have added VLANs to a port. |
| *<vid-list>* | <2-4094> The ID of the VLAN or VLANs that will be added to, or removed from, the port. A single VLAN, VLAN range, or comma-separated VLAN list can be set.<br>For a VLAN range, specify two VLAN numbers: lowest, then highest number in the range, separated by a hyphen.<br>For a VLAN list, specify the VLAN numbers separated by commas.<br>Do not enter spaces between hyphens or commas when setting parameters for VLAN ranges or lists. |

**Default** By default, ports are untagged members of the default VLAN (VLAN 1).

**Mode** Interface Configuration

**Usage notes**

The **all** parameter sets the port to be a tagged member of all the VLANs configured on the device. The **none** parameter removes all VLANs from the port's tagged member set. The **add** and **remove** parameters will add and remove VLANs to and from the port's member set. The **except** parameter creates an exception to the list.

If you use the **all** parameter, and then you want to remove VLANs from the port's member list, you must use the **except** parameter to remove the unwanted VLANs. Similarly, if you use the **except** parameter to remove a list of VLANs, and you want to change that list, you must use the **except** parameter to make that change (not the **add** and **remove** parameters).

For example, if you want to remove VLAN3-5 from a port and the port's configuration is currently **switchport trunk allowed vlan all**, then you should remove VLAN3-5 by entering the **except** parameter, instead of using the **remove** parameter. This means using the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.6
awplus(config-if)# switchport trunk allowed vlan except 3-5
```

If you do this, then the configuration changes to:

```
awplus#show running-config
interface port1.0.6
switchport
switchport mode trunk
switchport trunk allowed vlan except 3-5
```

For example, if you want to add VLAN4 back in again, and the port configuration is currently **switchport trunk allowed vlan except 3-5**, then you should add VLAN4 by re-entering the **except** parameter with the list of VLANs to remove, instead of using the **add** parameter. This means using the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.6
awplus(config-if)# switchport trunk allowed vlan except 3,5
```

If you do this, then the configuration changes to:

```
awplus#show running-config
interface port1.0.6
switchport
switchport mode trunk
switchport trunk allowed vlan except 3,5
```

**Examples**

The following shows adding a single VLAN to a port's member set.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk allowed vlan add 2
```

The following shows adding a range of VLANs to a port's member set.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk allowed vlan add 2-4
```

The following shows adding a list of VLANs to a port's member set.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk allowed vlan add 2,3,4
```

**Command changes**

Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V

# switchport trunk native vlan

**Overview** Use this command to configure the native VLAN for this port. The native VLAN is used for classifying the incoming untagged packets. Use the **none** parameter with this command to remove the native VLAN from the port and set the acceptable frame types to VLAN-tagged only.

Use the **no** variant of this command to reset the native VLAN to the default VLAN ID 1 and remove tagged VLANs from the port.

**Syntax**

```
switchport trunk native vlan {<vid>|none}
no switchport trunk native vlan
```

| Parameter | Description |
|---|---|
| *<vid>* | The ID of the VLAN that will be used to classify the incoming untagged packets, in the range 2-2094. The VLAN ID must be a part of the VLAN member set of the port. |
| none | No native VLAN specified. This option removes the native VLAN from the port and sets the acceptable frame types to vlan-tagged only. Note: Use the **no** variant of this command to revert to the default VLAN 1 as the native VLAN for the specified interface switchport - not **none**. |

**Default** VLAN 1 (the default VLAN), which is reverted to using the **no** form of this command.

**Mode** Interface Configuration

**Examples** To set the native VLAN on interface port1.0.2 to VLAN 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk native vlan 2
```

To remove the native VLAN from interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport trunk native vlan none
```

To reset the native VLAN on interface port1.0.2 to the default VLAN 1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no switchport trunk native vlan
```

**Command changes** Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V

# switchport voice dscp

**Overview** Use this command for a specific port to configure the Layer 3 DSCP value advertised when the transmission of LLDP-MED Network Policy TLVs for voice devices is enabled. When LLDP-MED capable IP phones receive this network policy information, they transmit voice data with the specified DSCP value.

Use the **no** variant of this command to reset the DSCP value to the default, 0.

**Syntax**

```
switchport voice dscp <0-63>
no switchport voice dscp
```

| Parameter | Description |
|---|---|
| `dscp` | Specify a DSCP value for voice data. |
| *<0-63>* | DSCP value. |

**Default** A DSCP value of 0 will be advertised.

**Mode** Interface Configuration

**Usage notes** LLDP-MED advertisements including Network Policy TLVs are transmitted via a port if:

- LLDP is enabled (lldp run command)
- Voice VLAN is configured for the port (switchport voice vlan command)
- The port is configured to transmit LLDP advertisements—enabled by default (lldp transmit receive command)
- The port is configured to transmit Network Policy TLVs—enabled by default (lldp med-tlv-select command)
- There is an LLDP-MED device connected to the port

**Example** To tell IP phones connected to port1.0.2 to send voice data with DSCP value 27, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport voice dscp 27
```

**Related commands**

lldp med-tlv-select

show lldp

switchport voice vlan

# switchport voice vlan

**Overview** Use this command to configure the Voice VLAN tagging advertised when the transmission of LLDP-MED Network Policy TLVs for voice endpoint devices is enabled. When LLDP-MED capable IP phones receive this network policy information, they transmit voice data with the specified tagging. This command also sets the ports to be spanning tree edge ports, that is, it enables spanning tree portfast on the ports.

Use the **no** variant of this command to remove LLDP-MED network policy configuration for voice devices connected to these ports. This does not change the spanning tree edge port status.

**Syntax**

```
switchport voice vlan [<vid>|dot1p|dynamic|untagged]
no switchport voice vlan
```

| Parameter | Description |
|---|---|
| `dot1p` | The IP phone should send User Priority tagged packets, that is, packets in which the tag contains a User Priority value, and a VID of 0. (The User Priority tag is also known as the 802.1p priority tag, or the Class of Service (CoS) tag.) |
| `dynamic` | The VLAN ID with which the IP phone should send tagged packets will be assigned by RADIUS authentication. |
| `untagged` | The IP phone should send untagged packets. |

**Default** By default, no Voice VLAN is configured, and therefore no network policy is advertised for voice devices.

**Mode** Interface Configuration

**Usage notes** LLDP-MED advertisements including Network Policy TLVs are transmitted via a port if:

- LLDP is enabled (lldp run command)
- Voice VLAN is configured for the port using this command (switchport voice vlan)
- The port is configured to transmit LLDP advertisements—enabled by default (lldp transmit receive command)
- The port is configured to transmit Network Policy TLVs—enabled by default (lldp med-tlv-select command)
- There is an LLDP-MED device connected to the port.

To set the priority value to be advertised for tagged frames, use the switchport voice vlan priority command.

If the Voice VLAN details are to be assigned by RADIUS, then the RADIUS server must be configured to send the attribute “Egress-VLANID (56)” or

"Egress-VLAN-Name (58)" in the RADIUS Accept message when authenticating a phone attached to this port.

**Examples**

To tell IP phones connected to port1.0.4 to send voice data tagged for VLAN 10, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# switchport voice vlan 10
```

To tell IP phones connected to port1.0.2-port1.0.8 to send priority tagged packets (802.1p priority tagged with VID 0, so that they will be assigned to the port VLAN) use the following commands. The priority value is 5 by default, but can be configured with the switchport voice vlan priority command.

```
awplus# configure terminal
awplus(config)# interface port1.0.2-port1.0.8
awplus(config-if)# switchport voice vlan dot1p
```

To dynamically configure the VLAN ID advertised to IP phones connected to port1.0.1 based on the VLAN assigned by RADIUS authentication (with RADIUS attribute "Egress- VLANID" or "Egress-VLAN-Name" in the RADIUS accept packet), use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport voice vlan dynamic
```

To remove the Voice VLAN, and therefore disable the transmission of LLDP-MED network policy information for voice devices on port1.0.8, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.8
awplus(config-if)# no switchport voice vlan
```

**Related commands**

switchport voice dscp

switchport voice vlan priority

# switchport voice vlan priority

**Overview** Use this command to configure the Layer 2 user priority advertised when the transmission of LLDP-MED Network Policy TLVs for voice devices is enabled. This is the priority in the User Priority field of the IEEE 802.1Q VLAN tag, also known as the Class of Service (CoS), or 802.1p priority. When LLDP-MED capable IP phones receive this network policy information, they transmit voice data with the specified priority.

**Syntax**

```
switchport voice vlan priority <0-7>
no switchport voice vlan priority
```

| Parameter | Description |
|---|---|
| `priority` | Specify a user priority value for voice data. |
| *<0-7>* | Priority value. |

# vlan

**Overview** This command creates VLANs, assigns names to them, and enables or disables them. Disabling the VLAN causes all forwarding over the specified VLAN ID to cease. Enabling the VLAN allows forwarding of frames on the specified VLAN.

You can create a management-only VLAN that contains only one member port and may be used as a remote management port. Management-only VLANs process packets in the CPU rather than in hardware. See the parameter table below for more detail.

The **no** variant of this command destroys the specified VLANs or returns their MTU to the default.

**Syntax**

```
vlan <vid> [name <vlan-name>] [state
{enable|disable|management-only}]
vlan <vid-range> [state {enable|disable|management-only}]
vlan {<vid>|<vlan-name>} [mtu <mtu-value>]
no vlan {<vid>|<vid-range>} [mtu]
```

| Parameter | Description |
|---|---|
| *<vid>* | The VID of the VLAN to enable or disable, in the range 1-4094. |
| *<vlan-name>* | The ASCII name of the VLAN. Maximum length: 32 characters. |
| *<vid-range>* | Specifies a range of VLAN identifiers. |
| *<mtu-value>* | Specifies the Maximum Transmission Unit (MTU) size in bytes, in the range 68 to 1500 bytes, for the VLAN. |
| `enable` | Puts the VLAN into an enabled state. |
| `disable` | Puts the VLAN into a disabled state. |
| `management-only` | Management-only VLANs are VLANs which:<br>• have one and only one access port (no aggregators, trunk port etc.)<br>• do not route to/from other interfaces.<br>• process packets in the CPU, rather than in hardware.<br>• cannot be converted to a normal VLAN, nor can a normal VLAN be converted to a management-only VLAN. Delete and re-create the VLAN to convert a normal VLAN to/from a management-only VLAN. |

**Default** By default, VLANs are enabled when they are created.

**Mode** VLAN Configuration

**Examples**

To enable VLAN 45, use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 45 name accounts state enable
```

To destroy VLAN 45, use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no vlan 45
```

To create a management-only VLAN with VID 100, use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 100 state management-only
```

**Related commands**

mtu

vlan database

show vlan

**Command changes**

Version 5.4.9-2.1: Parameter **management-only** added

Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V

# vlan database

**Overview** Use this command to enter the VLAN Configuration mode. You can then add or delete a VLAN, or modify its values.

**Syntax**

```
vlan database
```

**Mode** Global Configuration

**Example** In the following example, note the change to VLAN Configuration mode from Global Configuration mode:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)#
```

**Related commands** vlan

**Command changes** Version 5.5.0-1.3: Support for up to 5 VLANs added to AR1050V

# 19 Spanning Tree Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure RSTP, STP or MSTP. For information about spanning trees, including configuration procedures, see the STP Feature Overview and Configuration Guide.

**Command List**

- "clear spanning-tree statistics" on page 635
- "clear spanning-tree detected protocols (RSTP and MSTP)" on page 636
- "debug mstp (RSTP and STP)" on page 637
- "instance priority (MSTP)" on page 641

- "spanning-tree priority (port priority)" on page 700
- "spanning-tree restricted-role" on page 701
- "spanning-tree restricted-tcn" on page 702
- "spanning-tree transmit-holdcount" on page 703
- "undebug mstp" on page 704

# clear spanning-tree statistics

**Overview** Use this command to clear all the STP BPDU (Bridge Protocol Data Unit) statistics.

**Syntax**

```
clear spanning-tree statistics
clear spanning-tree statistics [instance <mstp-instance>]
clear spanning-tree statistics [interface <port> [instance
<mstp-instance>]]
```

| Parameter | Description |
|---|---|
| *<port>* | The port to clear STP BPDU statistics for. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa2`), or a dynamic (LACP) channel group (e.g. `po2`). |
| *<mstp-instance>* | The MSTP instance (MSTI - Multiple Spanning Tree Instance) to clear MSTP BPDU statistics. |

**Mode** User Exec and Privileged Exec

**Usage notes** Use this command with the **instance** parameter in MSTP mode. Specifying this command with the **interface** parameter only not the instance parameter will work in STP and RSTP mode.

**Examples**

```
awplus# clear spanning-tree statistics
awplus# clear spanning-tree statistics instance 1
awplus# clear spanning-tree statistics interface port1.0.2
awplus# clear spanning-tree statistics interface port1.0.2
instance 1
```

# clear spanning-tree detected protocols (RSTP and MSTP)

**Overview** Use this command to clear the detected protocols for a specific port, or all ports.

Use this command in RSTP or MSTP mode only.

**Syntax**

```
clear spanning-tree detected protocols [interface <port>]
```

| Parameter | Description |
|---|---|
| *<port>* | The port to clear detected protocols for. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa2`), or a dynamic (LACP) channel group (e.g. `po2`). |

**Mode** Privileged Exec

**Example**

```
awplus# clear spanning-tree detected protocols
```

# debug mstp (RSTP and STP)

**Overview** Use this command to enable debugging for the configured spanning tree mode, and echo data to the console, at various levels. Note that although this command uses the keyword **mstp** it displays debugging output for RSTP and STP protocols as well the MSTP protocol.

Use the **no** variant of this command to disable spanning tree debugging.

**Syntax**

```
debug mstp {all|cli|protocol [detail]|timer [detail]}
debug mstp {packet {rx|tx} [decode] [interface <interface>]}
debug mstp {topology-change [interface <interface>]}
no debug mstp {all|cli|protocol [detail]|timer [detail]}
no debug mstp {packet {rx|tx} [decode] [interface <interface>]}
no debug mstp {topology-change [interface <interface>]}
```

| Parameter | Description |
|---|---|
| `all` | Echoes all spanning tree debugging levels to the console. |
| `cli` | Echoes spanning tree commands to the console. |
| `packet` | Echoes spanning tree packets to the console. |
| `rx` | Received packets. |
| `tx` | Transmitted packets. |
| `protocol` | Echoes protocol changes to the console. |
| `timer` | Echoes timer information to the console. |
| `detail` | Detailed output. |
| `decode` | Interprets packet contents |
| `topology-change` | Interprets topology change messages |
| `interface` | Keyword before <interface> placeholder to specify an interface to debug |
| *<interface>* | Placeholder used to specify the name of the interface to debug. |

**Mode** Privileged Exec and Global Configuration mode

**Usage 1** Use the **debug mstp topology-change interface** command to generate debugging messages when the device receives an indication of a topology change in a BPDU from another device. The debugging can be activated on a per-port basis. Although this command uses the keyword **mstp**, it displays debugging output for RSTP and STP protocols as well as the MSTP protocol.

Due to the likely volume of output, these debug messages are best viewed using the terminal monitor command before issuing the relevant **debug mstp**

command. The default terminal monitor filter will select and display these messages. Alternatively, the messages can be directed to any of the other log outputs by adding a filter for the MSTP application using log buffered (filter) command:

```
awplus# configure terminal
awplus(config)# log buffered program mstp
```

**Output 1**

```
awplus#terminal monitor
awplus#debug mstp topology-change interface port1.0.4
10:09:09 awplus MSTP[1409]: Topology change rcvd on port1.0.4 (internal)
10:09:09 awplus MSTP[1409]: Topology change rcvd on MSTI 1 port1.0.4
awplus#debug mstp topology-change interface port1.0.6
10:09:29 awplus MSTP[1409]: Topology change rcvd on port1.0.6 (external)
10:09:29 awplus MSTP[1409]: Topology change rcvd on MSTI 1 port1.0.6
```

**Usage 2** Use the **debug mstp packet rx|tx decode interface** command to generate debugging messages containing the entire contents of a BPDU displayed in readable text for transmitted and received xSTP BPDUs. The debugging can be activated on a per-port basis and transmit and receive debugging is controlled independently. Although this command uses the keyword **mstp**, it displays debugging output for RSTP and STP protocols as well as the MSTP protocol.

Due to the likely volume of output, these debug messages are best viewed using the terminal monitor command before issuing the relevant **debug mstp** command. The default terminal monitor filter will select and display these messages. Alternatively, the messages can be directed to any of the other log outputs by adding a filter for the MSTP application using the log buffered (filter) command:

```
awplus(config)# log buffered program mstp
```

**Output 2** In MSTP mode - an MSTP BPDU with 1 MSTI:

```
awplus#terminal monitor
awplus#debug mstp packet rx decode interface port1.0.4
17:23:42 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - start
17:23:42 awplus MSTP[1417]: Protocol version: MSTP, BPDU type: RST
17:23:42 awplus MSTP[1417]: CIST Flags:  Agree Forward Learn role=Desig
17:23:42 awplus MSTP[1417]: CIST root id      : 0000:0000cd1000fe
17:23:42 awplus MSTP[1417]: CIST ext pathcost : 0
17:23:42 awplus MSTP[1417]: CIST reg root id  : 0000:0000cd1000fe
17:23:42 awplus MSTP[1417]: CIST port id      : 8001 (128:1)
17:23:42 awplus MSTP[1417]: msg age: 0 max age: 20 hellotime: 2 fwd delay: 15
17:23:42 awplus MSTP[1417]: Version 3 length : 80
17:23:42 awplus MSTP[1417]: Format id      : 0
17:23:42 awplus MSTP[1417]: Config name    : test
17:23:42 awplus MSTP[1417]: Revision level : 0
17:23:42 awplus MSTP[1417]: Config digest  : 3ab68794d602fdf43b21c0b37ac3bca8
17:23:42 awplus MSTP[1417]: CIST int pathcost : 0
17:23:42 awplus MSTP[1417]: CIST bridge id    : 0000:0000cd1000fe
17:23:42 awplus MSTP[1417]: CIST hops remaining : 20
17:23:42 awplus MSTP[1417]: MSTI flags           : Agree Forward Learn role=Desig
17:23:42 awplus MSTP[1417]: MSTI reg root id     : 8001:0000cd1000fe
17:23:42 awplus MSTP[1417]: MSTI pathcost        : 0
17:23:42 awplus MSTP[1417]: MSTI bridge priority : 32768 port priority : 128
17:23:42 awplus MSTP[1417]: MSTI hops remaining  : 20
17:23:42 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - finish
```

In STP mode transmitting a TCN BPDU:

```
awplus#terminal monitor
awplus#debug mstp packet tx decode interface port1.0.4
17:28:09 awplus MSTP[1417]: port1.0.4 xSTP BPDU tx - start
17:28:09 awplus MSTP[1417]: Protocol version: STP, BPDU type: TCN
17:28:09 awplus MSTP[1417]: port1.0.4 xSTP BPDU tx - finish
```

In STP mode receiving an STP BPDU:

```
awplus#terminal monitor
awplus#debug mstp packet rx decode interface port1.0.4
17:31:36 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - start
17:31:36 awplus MSTP[1417]: Protocol version: STP, BPDU type: Config
17:31:36 awplus MSTP[1417]: Flags:  role=none
17:31:36 awplus MSTP[1417]: Root id      : 8000:0000cd1000fe
17:31:36 awplus MSTP[1417]: Root pathcost : 0
17:31:36 awplus MSTP[1417]: Bridge id  : 8000:0000cd1000fe
17:31:36 awplus MSTP[1417]: Port id      : 8001 (128:1)
17:31:36 awplus MSTP[1417]: msg age: 0 max age: 20 hellotime: 2 fwd delay: 15
17:31:36 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - finish
```

In RSTP mode receiving an RSTP BPDU:

```
awplus#terminal monitor
awplus#debug mstp packet rx decode interface port1.0.4
awplus#17:30:17 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - start
17:30:17 awplus MSTP[1417]: Protocol version: RSTP, BPDU type: RST
17:30:17 awplus MSTP[1417]: CIST Flags:  Forward Learn role=Desig
17:30:17 awplus MSTP[1417]: CIST root id      : 8000:0000cd1000fe
17:30:17 awplus MSTP[1417]: CIST ext pathcost : 0
17:30:17 awplus MSTP[1417]: CIST reg root id  : 8000:0000cd1000fe
17:30:17 awplus MSTP[1417]: CIST port id      : 8001 (128:1)
17:30:17 awplus MSTP[1417]: msg age: 0 max age: 20 hellotime: 2 fwd delay: 15
17:30:17 awplus MSTP[1417]: port1.0.4 xSTP BPDU rx - finish
```

**Examples**

```
awplus# debug mstp all
awplus# debug mstp cli
awplus# debug mstp packet rx
awplus# debug mstp protocol detail
awplus# debug mstp timer
awplus# debug mstp packet rx decode interface port1.0.2
awplus# debug mstp packet tx decode interface port1.0.6
```

**Related commands**

log buffered (filter)

show debugging mstp

terminal monitor

undebug mstp

# instance priority (MSTP)

**Overview** Use this command to set the priority for this device to become the root bridge for the specified MSTI (Multiple Spanning Tree Instance).

Use this command for MSTP only.

Use the **no** variant of this command to restore the root bridge priority of the device for the instance to the default.

**Syntax**

```
instance <instance-id> priority <priority>
no instance <instance-id> priority
```

| Parameter | Description |
|---|---|
| *<instance-id>* | Specify an MSTP instance in the range 1-5. |
| *<priority>* | Specify the root bridge priority for the device for the MSTI in the range <0-61440>. Note that a lower priority number indicates a greater likelihood of the device becoming the root bridge. The priority values can be set only in increments of 4096. If you specify a number that is not a multiple of 4096, it will be rounded down. The default priority is 32768. |

**Default** The default priority value for all instances is 32768.

**Mode** MST Configuration

**Usage notes** MSTP lets you distribute traffic more efficiently across a network by blocking different links for different VLANs. You do this by making different devices into the root bridge for each MSTP instance, so that each instance blocks a different link.

If all devices have the same root bridge priority for the instance, MSTP selects the device with the lowest MAC address to be the root bridge. Give the device a higher priority for becoming the root bridge for a particular instance by assigning it a lower priority number, or vice versa.

**Examples** To set the root bridge priority for MSTP instance 2 to be the highest (0), so that it will be the root bridge for this instance when available, use the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# instance 2 priority 0
```

To reset the root bridge priority for instance 2 to the default (32768), use the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# no instance 2 priority
```

**Related commands**

region (MSTP)

revision (MSTP)

show spanning-tree mst config

spanning-tree mst instance

spanning-tree mst instance priority

# instance vlan (MSTP)

**Overview** Use this command to create an MST Instance (MSTI), and associate the specified VLANs with it. An MSTI is a spanning tree instance that exists within an MST region (MSTR).

When a VLAN is associated with an MSTI the member ports of the VLAN are automatically configured to send and receive spanning-tree information for the associated MSTI. You can disable this automatic configuration of member ports of the VLAN to the associated MSTI by using a **no spanning-tree mst instance** command to remove the member port from the MSTI.

Use the **instance vlan** command for MSTP only.

Use the **no** variant of this command to remove the specified VLANs from the MSTI.

**Syntax**

```
instance <instance-id> vlan <vid-list>
no instance <instance-id> vlan <vid-list>
```

| Parameter | Description |
|---|---|
| *<instance-id>* | Specify an MSTP instance in the range 1-5. |
| *<vid-list>* | Specify one or more VLAN identifiers (VID) to be associated with the MSTI specified. This can be a single VID in the range 1-4094, or a hyphen-separated range or a comma-separated list of VLAN IDs. |

**Mode** MST Configuration

**Usage notes** The VLANs must be created before being associated with an MST instance (MSTI). If the VLAN range is not specified, the MSTI will not be created.

This command removes the specified VLANs from the CIST and adds them to the specified MSTI. If you use the **no** variant of this command to remove the VLAN from the MSTI, it returns it to the CIST. To move a VLAN from one MSTI to another, you must first use the **no** variant of this command to return it to the CIST.

Ports in these VLANs will remain in the control of the CIST until you associate the ports with the MSTI using the spanning-tree mst instance command.

**Example** To associate VLAN 30 with MSTI 2, use the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mode mstp
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# instance 2 vlan 30
```

**Related commands**

region (MSTP)

revision (MSTP)

show spanning-tree mst config

spanning-tree mst instance

vlan

# region (MSTP)

**Overview** Use this command to assign a name to the device's MST Region. MST Instances (MSTI) of a region form different spanning trees for different VLANs.

Use this command for MSTP only.

Use the **no** variant of this command to remove this region name and reset it to the default.

**Syntax**

```
region <region-name>
no region
```

| Parameter | Description |
|---|---|
| *<region-name>* | Specify the name of the region, up to 32 characters. Valid characters are upper-case, lower-case, digits, underscore. |

**Default** By default, the region name is My Name.

**Mode** MST Configuration

**Usage** The region name, the revision number, and the digest of the VLAN to MSTI configuration table must be the same on all devices that are intended to be in the same MST region.

**Example**

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# region ATL
```

**Related commands** revision (MSTP)

show spanning-tree mst config

# revision (MSTP)

**Overview** Use this command to specify the MST revision number to be used in the configuration identifier.

Use this command for MSTP only.

**Syntax**

```
revision <revision-number>
```

| Parameter | Description |
|---|---|
| *<revision-number>* | <0-65535> Revision number. |

**Default** The default of revision number is 0.

**Mode** MST Configuration

**Usage** The region name, the revision number, and the digest of the VLAN to MSTI configuration table must be the same on all devices that are intended to be in the same MST region.

**Example**

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)# revision 25
```

**Related commands**

region (MSTP)

show spanning-tree mst config

instance vlan (MSTP)

# show debugging mstp

**Overview** Use this command to see what debugging is turned on for MSTP.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show debugging mstp
```

**Mode** User Exec and Privileged Exec

**Example** To display the MSTP debugging options set, enter the command:

```
awplus# show debugging mstp
```

**Output** Figure 19-1: Example output from **show debugging mstp**

```
MSTP debugging status:
  MSTP receiving packet debugging is on
```

**Related commands** debug mstp (RSTP and STP)

# show spanning-tree

**Overview** Use this command to display detailed spanning tree information on the specified port or on all ports. Use this command for RSTP, MSTP or STP.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show spanning-tree [interface <port-list>]
```

| Parameter | Description |
|---|---|
| `interface` | Display information about the following port only. |
| *<port-list>* | The ports to display information about. A port-list can be:<br>• a switch port (e.g. port1.0.6) a static channel group (e.g. sa2) or a dynamic (LACP) channel group (e.g. po2)<br>• a continuous range of ports separated by a hyphen, e.g. port1.0.1-1.0.4, or sa1-2, or po1-2<br>• a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.4-1.0.6. Do not mix switch ports, static channel groups, and dynamic (LACP) channel groups in the same list |

**Mode** User Exec and Privileged Exec

**Usage notes** Note that any list of interfaces specified must not span any interfaces that are not installed.

A topology change counter has been included for RSTP and MSTP. You can see the topology change counter for RSTP by using the **show spanning-tree** command. You can see the topology change counter for MSTP by using the **show spanning-tree mst instance** command.

**Example** To display spanning tree information about port1.0.3, use the command:

```
awplus# show spanning-tree interface port1.0.3
```

**Output** Figure 19-2: Example output from **show spanning-tree** in RSTP mode

```
awplus#show spanning-tree
% 1: Bridge up - Spanning Tree Enabled

# show spanning-tree brief

**Overview** Use this command to display a summary of spanning tree status information on all ports. Use this command for RSTP, MSTP or STP.

**Syntax**

```
show spanning-tree brief
```

| Parameter | Description |
|---|---|
| `brief` | A brief summary of spanning tree information. |

**Mode** User Exec and Privileged Exec

**Usage notes** Note that any list of interfaces specified must not span any interfaces that are not installed.

A topology change counter has been included for RSTP and MSTP. You can see the topology change counter for RSTP by using the **show spanning-tree** command. You can see the topology change counter for MSTP by using the **show spanning-tree mst instance** command.

**Example** To display a summary of spanning tree status information, use the command:

```
awplus# show spanning-tree brief
```

**Output** Figure 19-4: Example output from **show spanning-tree brief**

```
Default: Bridge up - Spanning Tree Enabled
Default: Root Path Cost 40000 - Root Port 4501 -  Bridge Priority 32768
Default: Root Id 8000:0000cd250001
Default: Bridge Id 8000:0000cd296eb1

Port            Designated Bridge    Port Id    Role          State
sa1             8000:001577c9744b    8195       Rootport      Forwarding
po1             8000:0000cd296eb1    81f9       Designated    Forwarding
port1.0.1       8000:0000cd296eb1    8389       Disabled      Discarding
port1.0.2       8000:0000cd296eb1    838a       Disabled      Discarding
port1.0.3       8000:0000cd296eb1    838b       Disabled      Discarding
...
```

**Related commands** show spanning-tree

# show spanning-tree mst

**Overview** This command displays bridge-level information about the CIST and VLAN to MSTI mappings.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show spanning-tree mst
```

**Mode** User Exec, Privileged Exec and Interface Configuration

**Example** To display bridge-level information about the CIST and VLAN to MSTI mappings, enter the command:

```
awplus# show spanning-tree mst
```

**Output** Figure 19-5: Example output from **show spanning-tree mst**

```
% 1: Bridge up - Spanning Tree Enabled
% 1: CIST Root Path Cost 0 - CIST Root Port 0 - CIST Bridge
Priority 32768
% 1: Forward Delay 15 - Hello Time 2 - Max Age 20 - Max-hops 20
% 1: CIST Root Id 8000000475e93ffe

%   2:              4
```

**Related commands** show spanning-tree mst interface

# show spanning-tree mst config

**Overview** Use this command to display MSTP configuration identifier for the device.

**Syntax**

```
show spanning-tree mst config
```

**Mode** User Exec, Privileged Exec and Interface Configuration

**Usage notes** The region name, the revision number, and the digest of the VLAN to MSTI configuration table must be the same on all devices that are intended to be in the same MST region.

**Example** To display MSTP configuration identifier information, enter the command:

```
awplus# show spanning-tree mst config
```

**Output** Figure 19-6: Example output from **show spanning-tree mst config**

```
awplus#show spanning-tree mst config
%
%  MSTP Configuration Information:
%--------------------------------------------------------
%  Format Id      : 0
%  Name           : My Name
%  Revision Level : 0
%  Digest         : 0x80DEE46DA92A98CF21C603291B22880A
%--------------------------------------------------------
```

# show spanning-tree mst detail interface

**Overview** This command displays detailed information about the specified switch port, and the MST instances associated with it.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show spanning-tree mst detail interface <port>
```

| Parameter | Description |
|---|---|
| *<port>* | The port to display information about. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa2`), or a dynamic (LACP) channel group (e.g. `po2`). |

**Mode** User Exec, Privileged Exec and Interface Configuration

**Example** To display detailed information about port1.0.3 and the instances associated with it, enter the command:

```
awplus# show spanning-tree mst detail interface port1.0.3
```

**Output** Figure 19-8: Example output from **show spanning-tree mst detail interface**

# show spanning-tree mst instance

**Overview** This command displays detailed information for the specified instance, and all switch ports associated with that instance.

A topology change counter has been included for RSTP and MSTP. You can see the topology change counter for RSTP by using the show spanning-tree command. You can see the topology change counter for MSTP by using the **show spanning-tree mst instance** command.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show spanning-tree mst instance <instance-id>
```

| Parameter | Description |
|---|---|
| *<instance-id>* | Specify an MSTP instance in the range 1-5. |

**Mode** User Exec, Privileged Exec, and Interface Configuration

**Example** To display detailed information for **instance 2**, and all switch ports associated with that instance, use the command:

```
awplus# show spanning-tree mst instance 2
```

**Output** Figure 19-9: Example output from **show spanning-tree mst instance**

```
% 1: MSTI Root Path Cost 0 - MSTI Root Port 0 - MSTI Bridge Priority 32768

# show spanning-tree mst instance interface

**Overview** This command displays detailed information for the specified MST (Multiple Spanning Tree) instance, and the specified switch port associated with that MST instance.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show spanning-tree mst instance <instance-id> interface <port>
```

| Parameter | Description |
|---|---|
| *<instance-id>* | Specify an MSTP instance in the range 1-5. |
| *<port>* | The port to display information about. The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2). |

**Mode** User Exec, Privileged Exec, and Interface Configuration

**Example** To display detailed information for instance 2, interface port1.0.2, use the command:

```
awplus# show spanning-tree mst instance 2 interface port1.0.2
```

**Output** Figure 19-10: Example output from **show spanning-tree mst instance**

```
% 1: MSTI Root Path Cost 0 - MSTI Root Port 0 - MSTI Bridge Priority 32768
% 1: MSTI Root Id 80020000cd24ff2d
% 1: MSTI Bridge Id 80020000cd24ff2d

%   port1.0.2: Designated Root 80020000cd24ff2d
%   port1.0.2: Designated Bridge 80020000cd24ff2d
%   port1.0.2: Message Age 0 - Max Age 0
%   port1.0.2: Hello Time 2 - Forward Delay 15
%   port1.0.2: Forward Timer 0 - Msg Age Timer 0 - Hello Timer 0
%
```

# show spanning-tree mst interface

**Overview** This command displays the number of instances created, and VLANs associated with it for the specified switch port.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show spanning-tree mst interface <port>
```

| Parameter | Description |
|---|---|
| *<port>* | The port to display information about. The port may be a switch port (e.g. `port1.0.4`), a static channel group (e.g. `sa2`), or a dynamic (LACP) channel group (e.g. `po2`). |

**Mode** User Exec, Privileged Exec, and Interface Configuration

**Example** To display detailed information about each instance, and all interfaces associated with them, for port1.0.4, use the command:

```
awplus# show spanning-tree mst interface port1.0.4
```

**Output** Figure 19-11: Example output from **show spanning-tree mst interface**

```
% 1: Bridge up - Spanning Tree Enabled
% 1: CIST Root Path Cost 0 - CIST Root Port 0 - CIST Bridge Priority 32768

# show spanning-tree statistics

**Overview** This command displays BPDU (Bridge Protocol Data Unit) statistics for all spanning-tree instances, and all switch ports associated with all spanning-tree instances.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show spanning-tree statistics
```

**Mode** Privileged Exec

**Usage notes** To display BPDU statistics for all spanning-tree instances, and all switch ports associated with all spanning-tree instances, use the command:

```
awplus# show spanning-tree statistics
```

**Output** Figure 19-12: Example output from **show spanning-tree statistics**

```

# show spanning-tree statistics instance

**Overview** This command displays BPDU (Bridge Protocol Data Unit) statistics for the specified MST (Multiple Spanning Tree) instance, and all switch ports associated with that MST instance.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show spanning-tree statistics instance <instance-id>
```

| Parameter | Description |
|---|---|
| *<instance-id>* | Specify an MSTP instance in the range 1-5. |

**Mode** Privileged Exec

**Example** To display BPDU statistics information for MST instance 2, and all switch ports associated with that MST instance, use the command:

```
awplus# show spanning-tree statistics instance 2
```

**Output** Figure 19-13: Example output from **show spanning-tree statistics instance**

```
% % INST_PORT port1.0.3 Information & Statistics
% ----------------------------------------
% Config Bpdu's xmitted (port/inst)    : (0/0)
% Config Bpdu's received (port/inst)   : (0/0)
% TCN Bpdu's xmitted (port/inst)       : (0/0)
% TCN Bpdu's received (port/inst)      : (0/0)
% Message Age(port/Inst)               : (0/0)
% port1.0.3: Forward Transitions                : 0
% Next State                           : Learning
% Topology Change Time                 : 0
...
```

**Related commands** show spanning-tree statistics

# show spanning-tree statistics instance interface

**Overview** This command displays BPDU (Bridge Protocol Data Unit) statistics for the specified MST (Multiple Spanning Tree) instance and the specified switch port associated with that MST instance.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show spanning-tree statistics instance <instance-id> interface
<port>
```

| Parameter | Description |
|---|---|
| *<instance-id>* | Specify an MSTP instance in the range 1-5. |
| *<port>* | The port to display information about. The port may be a switch port (e.g. port1.0.4), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2). |

**Mode** Privileged Exec

**Example** To display BPDU statistics for MST instance 2, interface port1.0.2, use the command:

```
awplus# show spanning-tree statistics instance 2 interface
port1.0.2
```

**Output** Figure 19-14: Example output from **show spanning-tree statistics instance interface**

```
awplus#sh spanning-tree statistics interface port1.0.2 instance 1
        Spanning Tree Enabled for Instance : 1

**Related commands** show spanning-tree statistics

# show spanning-tree statistics interface

**Overview** This command displays BPDU (Bridge Protocol Data Unit) statistics for the specified switch port, and all MST instances associated with that switch port.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show spanning-tree statistics interface <port>
```

| Parameter | Description |
|---|---|
| *<port>* | The port to display information about. The port may be a switch port (e.g. port1.0.2), a static channel group (e.g. sa2), or a dynamic (LACP) channel group (e.g. po2). |

**Mode** Privileged Exec

**Example** To display BPDU statistics about each MST instance for port1.0.2, use the command:

```
awplus# show spanning-tree statistics interface port1.0.2
```

**Output** Figure 19-15: Example output from **show spanning-tree statistics interface**

```
awplus#show spanning-tree statistics interface port1.0.2

              Port number = 906 Interface = port1.0.2

**Related commands** show spanning-tree statistics

# show spanning-tree vlan range-index

**Overview** Use this command to display information about MST (Multiple Spanning Tree) instances and the VLANs associated with them including the VLAN range-index value for the device.

**Syntax**

```
show spanning-tree vlan range-index
```

**Mode** Privileged Exec

**Example** To display information about MST instances and the VLANs associated with them for the device, including the VLAN range-index value, use the following command:

```
awplus# show spanning-tree vlan range-index
```

**Output** Figure 19-16: Example output from **show spanning-tree vlan range-index**

```
awplus#show spanning-tree vlan range-index
% MST Instance  VLAN       RangeIdx
%      1        1          1%
```

**Related commands** show spanning-tree statistics

# spanning-tree autoedge (RSTP and MSTP)

**Overview** Use this command to enable the autoedge feature on the port.

The autoedge feature allows the port to automatically detect that it is an edge port. If it does not receive any BPDUs in the first three seconds after linkup, enabling, or entering RSTP or MSTP mode, it sets itself to be an edgeport and enters the forwarding state.

Use this command for RSTP or MSTP.

Use the **no** variant of this command to disable this feature.

**Syntax**

```
spanning-tree autoedge
no spanning-tree autoedge
```

**Default** Disabled

**Mode** Interface Configuration

**Example**

```
awplus# configure terminal
awplus(config)# interface port1.0.3
awplus(config-if)# spanning-tree autoedge
```

**Related commands** spanning-tree edgeport (RSTP and MSTP)

# spanning-tree cisco-interoperability (MSTP)

**Overview** Use this command to enable/disable Cisco-interoperability for MSTP.

Use this command for MSTP only.

**Syntax**

```
spanning-tree cisco-interoperability {enable|disable}
```

| Parameter | Description |
|---|---|
| `enable` | Enable Cisco interoperability for MSTP. |
| `disable` | Disable Cisco interoperability for MSTP. |

**Default** If this command is not used, Cisco interoperability is disabled.

**Mode** Global Configuration

**Usage** For compatibility with certain Cisco devices, all devices in the switched LAN running the AlliedWare Plus™ Operating System must have Cisco-interoperability enabled. When the AlliedWare Plus Operating System is interoperating with Cisco, the only criteria used to classify a region are the region name and revision level. VLAN to instance mapping is not used to classify regions when interoperating with Cisco.

**Examples** To enable Cisco interoperability on a Layer 2 device:

```
awplus# configure terminal
awplus(config)# spanning-tree cisco-interoperability enable
```

To disable Cisco interoperability on a Layer 2 device:

```
awplus# configure terminal
awplus(config)# spanning-tree cisco-interoperability disable
```

# spanning-tree edgeport (RSTP and MSTP)

**Overview** Use this command to set a port as an edge-port.

Use this command for RSTP or MSTP.

This command has the same effect as the spanning-tree portfast (STP) command, but the configuration displays differently in the output of some show commands.

Use the **no** variant of this command to set a port to its default state (not an edge-port).

**Syntax**

```
spanning-tree edgeport
no spanning-tree edgeport
```

**Default** Not an edge port.

**Mode** Interface Configuration

**Usage notes** Use this command on a switch port connected to a LAN that has no other bridges attached. If a BPDU is received on the port that indicates that another bridge is connected to the LAN, then the port is no longer treated as an edge port.

**Example**

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree edgeport
```

**Related commands** spanning-tree autoedge (RSTP and MSTP)

# spanning-tree enable

**Overview** Use this command in Global Configuration mode to enable the specified spanning tree protocol for all switch ports. Note that this must be the spanning tree protocol that is configured on the device by the spanning-tree mode command.

Use the **no** variant of this command to disable the configured spanning tree protocol. This places all switch ports in the forwarding state.

**Syntax**

```
spanning-tree {mstp|rstp|stp} enable
no spanning-tree {mstp|rstp|stp} enable
```

| Parameter | Description |
|---|---|
| `mstp` | Enables or disables MSTP (Multiple Spanning Tree Protocol). |
| `rstp` | Enables or disables RSTP (Rapid Spanning Tree Protocol). |
| `stp` | Enables or disables STP (Spanning Tree Protocol). |

**Default** RSTP is enabled by default for all switch ports.

**Mode** Global Configuration

**Usage** With no configuration, spanning tree is enabled, and the spanning tree mode is set to RSTP. To change the mode, see spanning-tree mode command.

**Examples** To enable STP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree stp enable
```

To disable STP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree stp enable
```

To enable MSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mstp enable
```

To disable MSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree mstp enable
```

To enable RSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree rstp enable
```

To disable RSTP in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# no spanning-tree rstp enable
```

**Related commands** spanning-tree mode

# spanning-tree errdisable-timeout enable

**Overview** Use this command to enable the errdisable-timeout facility, which sets a timeout for ports that are disabled due to the BPDU guard feature.

Use this command for RSTP or MSTP.

Use the **no** variant of this command to disable the errdisable-timeout facility.

**Syntax**
```
spanning-tree errdisable-timeout enable
no spanning-tree errdisable-timeout enable
```

**Default** By default, the errdisable-timeout is disabled.

**Mode** Global Configuration

**Usage** The BPDU guard feature shuts down the port on receiving a BPDU on a BPDU-guard enabled port. This command associates a timer with the feature such that the port is re- enabled without manual intervention after a set interval. This interval can be configured by the user using the spanning-tree errdisable-timeout interval command.

**Example**
```
awplus# configure terminal
awplus(config)# spanning-tree errdisable-timeout enable
```

**Related commands**
show spanning-tree

spanning-tree errdisable-timeout interval

spanning-tree portfast bpdu-guard

# spanning-tree errdisable-timeout interval

**Overview** Use this command to specify the time interval after which a port is brought back up when it has been disabled by the BPDU guard feature.

Use this command for RSTP or MSTP.

**Syntax**

```
spanning-tree errdisable-timeout interval <10-1000000>
no spanning-tree errdisable-timeout interval
```

| Parameter | Description |
|---|---|
| *<10-1000000>* | Specify the errdisable-timeout interval in seconds. |

**Default** By default, the port is re-enabled after 300 seconds.

**Mode** Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# spanning-tree errdisable-timeout interval 34
```

**Related commands**

show spanning-tree

spanning-tree errdisable-timeout enable

spanning-tree portfast bpdu-guard

# spanning-tree force-version

**Overview** Use this command in Interface Configuration mode for a switch port interface only to force the protocol version for the switch port. Use this command for RSTP or MSTP only.

**Syntax**

```
spanning-tree force-version <version>
no spanning-tree force-version
```

| Parameter | Description | |
|---|---|---|
| *<version>* | <0-3> | Version identifier. |
| | 0 | Forces the port to operate in STP mode. |
| | 1 | Not supported. |
| | 2 | Forces the port to operate in RSTP mode. If it receives STP BPDUs, it can automatically revert to STP mode. |
| | 3 | Forces the port to operate in MSTP mode (this option is only available if MSTP mode is configured). If it receives RSTP or STP BPDUs, it can automatically revert to RSTP or STP mode. |

**Default** By default, no version is forced for the port. The port is in the spanning tree mode configured for the device, or a lower version if it automatically detects one.

**Mode** Interface Configuration mode for a switch port interface only.

**Examples** Set the value to enforce the spanning tree protocol (STP):

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree force-version 0
```

Set the default protocol version:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree force-version
```

**Related commands** show spanning-tree

# spanning-tree forward-time

**Overview** Use this command to set the forward delay value. Use the **no** variant of this command to reset the forward delay value to the default setting of 15 seconds.

The **forward delay** sets the time (in seconds) to control how fast a port changes its spanning tree state when moving towards the forwarding state. If the mode is set to STP, the value determines how long the port stays in each of the listening and learning states which precede the forwarding state. If the mode is set to RSTP or MSTP, this value determines the maximum time taken to transition from discarding to learning and from learning to forwarding.

This value is used only when the device is acting as the root bridge. Devices not acting as the Root Bridge use a dynamic value for the **forward delay** set by the root bridge. The **forward delay**, **max-age**, and **hello time** parameters are interrelated.

**Syntax**

```
spanning-tree forward-time <forward-delay>
no spanning-tree forward-time
```

| Parameter | Description |
|---|---|
| *<forward-delay>* | <4-30> The forwarding time delay in seconds. |

**Default** The default is 15 seconds.

**Mode** Global Configuration

**Usage notes** The allowable range for forward-time is 4-30 seconds.

The **forward delay**, **max-age**, and **hello time** parameters should be set according to the following formula, as specified in IEEE Standard 802.1d:

2 x (forward delay - 1.0 seconds) >= max-age

max-age >= 2 x (hello time + 1.0 seconds)

**Example**

```
awplus# configure terminal
awplus(config)# spanning-tree forward-time 6
```

**Related commands**

show spanning-tree

spanning-tree forward-time

spanning-tree hello-time

spanning-tree mode

# spanning-tree guard root

**Overview** Use this command in Interface Configuration mode for a switch port only to enable the Root Guard feature for the switch port. The root guard feature disables reception of superior BPDUs. You can use this command for RSTP, STP or MSTP.

Use the **no** variant of this command to disable the root guard feature for the port.

**Syntax**

```
spanning-tree guard root
no spanning-tree guard root
```

**Mode** Interface Configuration mode for a switch port interface only.

**Usage notes** The Root Guard feature makes sure that the port on which it is enabled is a designated port. If the Root Guard enabled port receives a superior BPDU, it goes to a Listening state (for STP) or discarding state (for RSTP and MSTP).

**Example**

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree guard root
```

# spanning-tree hello-time

**Overview** Use this command to set the hello-time. This sets the time in seconds between the transmission of device spanning tree configuration information when the device is the Root Bridge of the spanning tree or is trying to become the Root Bridge.

Use this command for RSTP, STP or MSTP.

Use the **no** variant of this command to restore the default of the hello time.

**Syntax**

```
spanning-tree hello-time <hello-time>
no spanning-tree hello-time
```

| Parameter | Description |
|---|---|
| *<hello-time>* | <1-10> The hello BPDU interval in seconds. |

**Default** Default is 2 seconds.

**Mode** Global Configuration and Interface Configuration for switch ports.

**Usage notes** The allowable range of values is 1-10 seconds.

The forward delay, max-age, and hello time parameters should be set according to the following formula, as specified in IEEE Standard 802.1d:

2 x (forward delay - 1.0 seconds) >= max-age

max-age>= 2 x (hello time + 1.0 seconds)

**Example**

```
awplus# configure terminal
awplus(config)# spanning-tree hello-time 3
```

**Related commands**

spanning-tree forward-time

spanning-tree max-age

show spanning-tree

# spanning-tree link-type

**Overview** Use this command in Interface Configuration mode for a switch port interface only to enable or disable point-to-point or shared link types on the switch port.

Use this command for RSTP or MSTP only.

Use the **no** variant of this command to return the port to the default link type.

**Syntax**

```
spanning-tree link-type {point-to-point|shared}
no spanning-tree link-type
```

| Parameter | Description |
|---|---|
| `shared` | Disable rapid transition. |
| `point-to-point` | Enable rapid transition. |

**Default** The default link type is point-to-point.

**Mode** Interface Configuration mode for a switch port interface only.

**Usage notes** You may want to set link type to shared if the port is connected to a hub with multiple devices connected to it.

**Examples**

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree link-type point-to-point
```

# spanning-tree max-age

**Overview** Use this command to set the max-age. This sets the maximum age, in seconds, that dynamic spanning tree configuration information is stored in the device before it is discarded.

Use this command for RSTP, STP or MSTP.

Use the **no** variant of this command to restore the default of max-age.

**Syntax**

```
spanning-tree max-age <max-age>
no spanning-tree max-age
```

| Parameter | Description |
|---|---|
| *<max-age>* | <6-40> The maximum time, in seconds. |

**Default** The default of spanning-tree max-age is 20 seconds.

**Mode** Global Configuration

**Usage** Max-age is the maximum time in seconds for which a message is considered valid.

Configure this value sufficiently high, so that a frame generated by the root bridge can be propagated to the leaf nodes without exceeding the max-age.

The **forward delay**, **max-age**, and **hello time** parameters should be set according to the following formula, as specified in IEEE Standard 802.1d:

2 x (forward delay - 1.0 seconds) >= max-age

max-age >= 2 x (hello time + 1.0 seconds)

**Example**

```
awplus# configure terminal
awplus(config)# spanning-tree max-age 12
```

**Related commands**

show spanning-tree

spanning-tree forward-time

spanning-tree hello-time

# spanning-tree max-hops (MSTP)

**Overview** Use this command to specify the maximum allowed hops for a BPDU in an MST region. This parameter is used by all the instances of the MST region.

Use the **no** variant of this command to restore the default.

Use this command for MSTP only.

**Syntax**

```
spanning-tree max-hops <hop-count>
no spanning-tree max-hops <hop-count>
```

| Parameter | Description |
|---|---|
| *<hop-count>* | Specify the maximum hops the BPDU will be valid for in the range <1-40>. |

**Default** The default max-hops in a MST region is 20.

**Mode** Global Configuration

**Usage** Specifying the max hops for a BPDU prevents the messages from looping indefinitely in the network. The hop count is decremented by each receiving port. When a device receives an MST BPDU that has a hop count of zero, it discards the BPDU.

**Examples**

```
awplus# configure terminal
awplus(config)# spanning-tree max-hops 25
awplus# configure terminal
awplus(config)# no spanning-tree max-hops
```

# spanning-tree mode

**Overview** Use this command to change the spanning tree protocol mode on the device. The spanning tree protocol mode on the device can be configured to either STP, RSTP or MSTP.

**Syntax**

```
spanning-tree mode {stp|rstp|mstp}
```

**Default** The default spanning tree protocol mode on the device is RSTP.

**Mode** Global Configuration

**Usage** With no configuration, the device will have spanning tree enabled, and the spanning tree mode will be set to RSTP. Use this command to change the spanning tree protocol mode on the device. MSTP is VLAN aware, but RSTP and STP are not VLAN aware. To enable or disable spanning tree operation, see the spanning-tree enable command.

**Examples** To change the spanning tree mode from the default of RSTP to MSTP, use the following commands:

```
awplus# configure terminal
awplus(config)# spanning-tree mode mstp
```

**Related commands** spanning-tree enable

# spanning-tree mst configuration

**Overview** Use this command to enter the MST Configuration mode to configure the Multiple Spanning-Tree Protocol.

**Syntax**

```
spanning-tree mst configuration
```

**Mode** Global Configuration

**Examples** The following example uses this command to enter MST Configuration mode. Note the change in the command prompt.

```
awplus# configure terminal
awplus(config)# spanning-tree mst configuration
awplus(config-mst)#
```

# spanning-tree mst instance

**Overview** Use this command to assign a Multiple Spanning Tree instance (MSTI) to a switch port or channel group.

Note that ports are automatically configured to send and receive spanning-tree information for the associated MSTI when VLANs are assigned to MSTIs using the instance vlan (MSTP) command.

Use the **no** variant of this command in Interface Configuration mode to remove the MSTI from the specified switch port or channel group.

**Syntax**

```
spanning-tree mst instance <instance-id>
no spanning-tree mst instance <instance-id>
```

| Parameter | Description |
|---|---|
| *<instance-id>* | Specify an MSTP instance in the range 1-5. The MST instance must have already been created using the instance vlan (MSTP) command. |

**Default** A port automatically becomes a member of an MSTI when it is assigned to a VLAN.

**Mode** Interface Configuration mode for a switch port or channel group.

**Usage notes** You can disable automatic configuration of member ports of a VLAN to an associated MSTI by using a **no spanning-tree mst instance** command to remove the member port from the MSTI. Use the **spanning-tree mst instance** command to add a VLAN member port back to the MSTI.

**Examples** To assign instance 3 to a switch port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3
```

To remove instance 3 from a switch port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3
```

**Related commands**

instance vlan (MSTP)

spanning-tree mst instance path-cost

spanning-tree mst instance priority

spanning-tree mst instance restricted-role

spanning-tree mst instance restricted-tcn

# spanning-tree mst instance path-cost

**Overview** Use this command to set the cost of a path associated with a switch port, for the specified MSTI.

This specifies the switch port's contribution to the cost of a path to the MSTI regional root via that port. This applies when the port is the root port for the MSTI.

Use the **no** variant of this command to restore the default cost value of the path.

**Syntax**

```
spanning-tree mst instance <instance-id> path-cost <path-cost>
no spanning-tree mst instance <instance-id> path-cost
```

| Parameter | Description |
|---|---|
| *<instance-id>* | Specify an MSTP instance in the range 1-5. |
| *<path-cost>* | Specify the cost of path in the range of <1-200000000>, where a lower path-cost indicates a greater likelihood of the specific interface becoming a root. |

**Default** The default path cost values and the range of recommended path cost values depend on the port speed, as shown in the following table from the IEEE 802.1q-2003 standard.

| Port speed | Default path cost | Recommended path cost range |
|---|---|---|
| Less than 100 Kb/s | 200,000,000 | 20,000,000-200,000,000 |
| 1Mbps | 20,000,000 | 2,000,000-20,000,000 |
| 10Mbps | 2,000,000 | 200,000-2,000,000 |
| 100 Mbps | 200,000 | 20,000-200,000 |
| 1 Gbps | 20,000 | 2,000-20,000 |
| 10 Gbps | 2,000 | 200-2,000 |
| 100 Gbps | 200 | 20-200 |
| 1Tbps | 20 | 2-200 |
| 10 Tbps | 2 | 2-20 |

**Mode** Interface Configuration mode for a switch port interface only.

**Usage notes** Before you can use this command to set a path-cost in a VLAN configuration, you must explicitly add an MST instance to a port using the spanning-tree mst instance command.

**Examples** To set a path cost of 1000 on instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3 path-cost 1000
```

To return the path cost to its default value on instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3 path-cost
```

**Related commands**

instance vlan (MSTP)

spanning-tree mst instance

spanning-tree mst instance priority

spanning-tree mst instance restricted-role

spanning-tree mst instance restricted-tcn

# spanning-tree mst instance priority

**Overview** Use this command in Interface Configuration mode for a switch port interface only to set the port priority for an MST instance (MSTI).

Use the **no** variant of this command to restore the default priority value (128).

**Syntax**

```
spanning-tree mst instance <instance-id> priority <priority>
no spanning-tree mst instance <instance-id> [priority]
```

| Parameter | Description |
|---|---|
| *<instance-id>* | Specify an MSTP instance in the range 1-5. |
| *<priority>* | This must be a multiple of 16 and within the range <0-240>. A lower priority indicates greater likelihood of the port becoming the root port. |

**Default** The default is 128.

**Mode** Interface Configuration mode for a switch port interface.

**Usage notes** This command sets the value of the priority field contained in the port identifier. The MST algorithm uses the port priority when determining the root port for the switch in the MSTI. The port with the lowest value has the highest priority, so it will be chosen as root port over a port that is equivalent in all other aspects but with a higher priority value.

**Examples** To set the priority to 112 on instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3 priority 112
```

To return the priority to its default value of 128 on instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3 priority
```

**Related commands**

instance vlan (MSTP)

spanning-tree priority (port priority)

spanning-tree mst instance

spanning-tree mst instance path-cost

spanning-tree mst instance restricted-role

spanning-tree mst instance restricted-tcn

# spanning-tree mst instance restricted-role

**Overview** Use this command in Interface Configuration mode for a switch port interface only to enable the restricted role for an MSTI (Multiple Spanning Tree Instance) on a switch port. Configuring the restricted role for an MSTI on a switch port prevents the switch port from becoming the root port in a spanning tree topology.

Use the **no** variant of this command to disable the restricted role for an MSTI on a switch port. Removing the restricted role for an MSTI on a switch port allows the switch port to become the root port in a spanning tree topology.

**Syntax**

```
spanning-tree mst instance <instance-id> restricted-role
no spanning-tree mst instance <instance-id> restricted-role
```

| Parameter | Description |
|---|---|
| *<instance-id>* | Specify an MSTP instance in the range 1-5. The MST instance must have already been created using the instance vlan (MSTP) command. |

**Default** The restricted role for an MSTI instance on a switch port is disabled by default.

**Mode** Interface Configuration mode for a switch port interface only.

**Usage notes** The root port is the port providing the best path from the bridge to the root bridge. Use this command to disable a port from becoming a root port. Use the **no** variant of this command to enable a port to become a root port. See the STP Feature Overview and Configuration Guide for root port information.

**Examples** To prevent a switch port from becoming the root port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3 restricted-role
```

To stop preventing the switch port from becoming the root port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3
restricted-role
```

**Related commands**

instance vlan (MSTP)

spanning-tree priority (port priority)

spanning-tree mst instance

spanning-tree mst instance path-cost

spanning-tree mst instance restricted-tcn

# spanning-tree mst instance restricted-tcn

**Overview** Use this command to prevent a switch port from propagating received topology change notifications and topology changes to other switch ports. This is named restricted TCN (Topology Change Notification). A TCN is a simple Bridge Protocol Data Unit (BPDU) that a bridge sends out to its root port to signal a topology change.

Use the **no** variant of this command to stop preventing the switch port from propagating received topology change notifications and topology changes to other switch ports for the specified MSTI (Multiple Spanning Tree Instance).

The restricted TCN setting applies only to the specified MSTI (Multiple Spanning Tree Instance).

**Syntax**

```
spanning-tree mst instance <instance-id> restricted-tcn
no spanning-tree mst instance <instance-id> restricted-tcn
```

| Parameter | Description |
|---|---|
| *<instance-id>* | Specify an MSTP instance in the range 1-5. The MST instance must have already been created using the instance vlan (MSTP) command. |

**Default** Disabled. By default, switch ports propagate TCNs.

**Mode** Interface Configuration mode for a switch port interface only.

**Examples** To prevent a switch port from propagating received topology change notifications and topology changes to other switch ports, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree mst instance 3 restricted-tcn
```

To stop preventing a switch port from propagating received topology change notifications and topology changes to other switch ports, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no spanning-tree mst instance 3
restricted-tcn
```

**Related commands**

instance vlan (MSTP)

spanning-tree priority (port priority)

spanning-tree mst instance

spanning-tree mst instance path-cost

spanning-tree mst instance restricted-role

# spanning-tree path-cost

**Overview** Use this command in Interface Configuration mode for a switch port interface only to set the cost of a path for the specified port. This value then combines with others along the path to the root bridge in order to determine the total cost path value from the particular port, to the root bridge. The lower the numeric value, the higher the priority of the path. This applies when the port is the root port.

Use this command for RSTP, STP or MSTP. When MSTP mode is configured, this will apply to the port's path cost for the CIST.

**Syntax**

```
spanning-tree path-cost <pathcost>
no spanning-tree path-cost
```

| Parameter | Description |
|---|---|
| *<pathcost>* | <1-200000000> The cost to be assigned to the port. |

**Default** The default path cost values and the range of recommended path cost values depend on the port speed, as shown in the following table from the IEEE 802.1q-2003 and IEEE 802.1d-2004 standards.

| Port speed | Default path cost | Recommended path cost range |
|---|---|---|
| Less than 100 Kb/s | 200,000,000 | 20,000,000-200,000,000 |
| 1Mbps | 20,000,000 | 2,000,000-20,000,000 |
| 10Mbps | 2,000,000 | 200,000-2,000,000 |
| 100 Mbps | 200,000 | 20,000-200,000 |
| 1 Gbps | 20,000 | 2,000-20,000 |
| 10 Gbps | 2,000 | 200-2, 000 |
| 100 Gbps | 200 | 20-200 |
| 1Tbps | 20 | 2-200 |
| 10 Tbps | 2 | 2-20 |

**Mode** Interface Configuration mode for switch port interface only.

**Example**

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree path-cost 123
```

# spanning-tree portfast (STP)

**Overview** Use this command in Interface Configuration mode for a switch port interface only to set a port as an edge-port. The portfast feature enables a port to rapidly move to the forwarding state, without having first to pass through the intermediate spanning tree states. This command has the same effect as the spanning-tree edgeport (RSTP and MSTP) command, but the configuration displays differently in the output of some show commands.

***NOTE:*** *You can run either of two additional parameters with this command. To simplify the syntax these are documented as separate commands. See the following additional portfast commands:*

- spanning-tree portfast bpdu-filter command
- spanning-tree portfast bpdu-guard command.

You can obtain the same effect by running the spanning-tree edgeport (RSTP and MSTP) command. However, the configuration output may display differently in some show commands.

Use the **no** variant of this command to set a port to its default state (not an edge-port).

**Syntax**

```
spanning-tree portfast
no spanning-tree portfast
```

**Default** Not an edge port.

**Mode** Interface Configuration mode for a switch port interface only.

**Usage notes** Portfast makes a port move from a blocking state to a forwarding state, bypassing both listening and learning states. The portfast feature is meant to be used for ports connected to end-user devices. Enabling portfast on ports that are connected to a workstation or server allows devices to connect to the network without waiting for spanning-tree to converge.

For example, you may need hosts to receive a DHCP address quickly and waiting for STP to converge would cause the DHCP request to time out. Ensure you do not use portfast on any ports connected to another device to avoid creating a spanning-tree loop on the network.

Use this command on a switch port that connects to a LAN with no other bridges attached. An edge port should never receive BPDUs. Therefore if an edge port receives a BPDU, the portfast feature takes one of three actions.

- Cease to act as an edge port and pass BPDUs as a member of a spanning tree network (spanning-tree portfast (STP) command disabled).
- Filter out the BPDUs and pass only the data and continue to act as a edge port (spanning-tree portfast bpdu-filter command enabled).
- Block the port to all BPDUs and data (spanning-tree portfast bpdu-guard command enabled).

**Example**

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree portfast
```

**Related commands**

spanning-tree edgeport (RSTP and MSTP)

show spanning-tree

spanning-tree portfast bpdu-filter

spanning-tree portfast bpdu-guard

# spanning-tree portfast bpdu-filter

**Overview** This command sets the bpdu-filter feature and applies a filter to any BPDUs (Bridge Protocol Data Units) received. Enabling this feature ensures that configured ports will not transmit any BPDUs and will ignore (filter out) any BPDUs received. BPDU Filter is not enabled on a port by default.

Using the **no** variant of this command to turn off the bpdu-filter, but retain the port's status as an enabled port. If the port then receives a BPDU it will change its role from an **edge-port** to a **non edge-port**.

**Syntax (Global Configuration)**

```
spanning-tree portfast bpdu-filter
no spanning-tree portfast bpdu-filter
```

**Syntax (Interface Configuration)**

```
spanning-tree portfast bpdu-filter
{default|disable|enable}
no spanning-tree portfast bpdu-filter
```

| Parameter | Description | |
|---|---|---|
| `bpdu-filter` | A port that has bpdu-filter enabled will not transmit any BPDUs and will ignore any BPDUs received. This port type has one of the following parameters (in Interface Configuration mode): | |
| | `default` | Takes the setting that has been configured for the whole device, i.e. the setting made from the Global configuration mode. |
| | `disable` | Turns off BPDU filter. |
| | `enable` | Turns on BPDU filter. |

**Default** BPDU Filter is not enabled on any ports by default.

**Mode** Global Configuration and Interface Configuration

**Usage notes** This command filters the BPDUs and passes only data to continue to act as an edge port. Using this command in Global Configuration mode applies the portfast bpdu-filter feature to all ports on the device. Using it in Interface mode applies the feature to a specific port, or range of ports.The command will operate in both RSTP and MSTP networks.

Use the show spanning-tree command to display status of the bpdu-filter parameter for the switch ports.

**Example** To enable STP BPDU filtering in Global Configuration mode, enter the commands:

```
awplus# configure terminal
awplus(config)# spanning-tree portfast bpdu-filter
```

To enable STP BPDU filtering in Interface Configuration mode, enter the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree portfast bpdu-filter enable
```

**Related commands**

spanning-tree edgeport (RSTP and MSTP)

show spanning-tree

spanning-tree portfast (STP)

spanning-tree portfast bpdu-guard

# spanning-tree portfast bpdu-guard

**Overview**

The AR3050S and AR4050S devices don't support BPDU protection in 5.4.5-0.1 release.

This command applies a BPDU (Bridge Protocol Data Unit) guard to the port. A port with the bpdu-guard feature enabled will block all traffic (BPDUs and user data), if it starts receiving BPDUs.

Use this command in Global Configuration mode to apply BPDU guard to all ports on the device. Use this command in Interface mode for an individual interface or a range of interfaces specified. BPDU Guard is not enabled on a port by default.

Use the **no** variant of this command to disable the BPDU Guard feature on a device in Global Configuration mode or to disable the BPDU Guard feature on a port in Interface mode.

**Syntax (Global Configuration)**

```
spanning-tree portfast bpdu-guard
no spanning-tree portfast bpdu-guard
```

**Syntax (Interface Configuration)**

```
spanning-tree portfast bpdu-guard
{default|disable|enable}
no spanning-tree portfast bpdu-guard
```

| Parameter | Description | |
|---|---|---|
| `bpdu-guard` | A port that has bpdu-guard turned on will enter the STP blocking state if it receives a BPDU. This port type has one of the following parameters (in Interface Configuration mode): | |
| | `default` | Takes the setting that has been configured for the whole device, i.e. the setting made from the Global configuration mode. |
| | `disable` | Turns off BPDU guard. |
| | `enable` | Turns on BPDU guard and will also set the port as an edge port. |

**Default**

BPDU Guard is not enabled on any ports by default.

**Mode**

Global Configuration or Interface Configuration

**Usage notes**

This command blocks the port(s) to all devices and data when enabled. BPDU Guard is a port-security feature that changes how a portfast-enabled port behaves if it receives a BPDU. When **bpdu-guard** is set, then the port shuts down if it receives a BPDU. It does not process the BPDU as it is considered suspicious. When **bpdu-guard** is not set, then the port will negotiate spanning-tree with the device sending the BPDUs. By default, bpdu- guard is not enabled on a port.

You can configure a port disabled by the bpdu-guard to re-enable itself after a specific time interval. This interval is set with the spanning-tree errdisable-timeout

interval command. If you do not use the **errdisable-timeout** feature, then you will need to manually re-enable the port by using the **no shutdown** command.

Use the show spanning-tree command to display the device and port configurations for the BPDU Guard feature. It shows both the administratively configured and currently running values of bpdu-guard.

**Example** To enable STP BPDU guard in Global Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# spanning-tree portfast bpdu-guard
```

To enable STP BPDU guard in Interface Configuration mode, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree portfast bpdu-guard enable
```

**Related commands**

spanning-tree edgeport (RSTP and MSTP)

show spanning-tree

spanning-tree portfast (STP)

spanning-tree portfast bpdu-filter

# spanning-tree priority (bridge priority)

**Overview** Use this command to set the bridge priority for the device. A lower priority value indicates a greater likelihood of the device becoming the root bridge.

Use this command for RSTP, STP or MSTP. When MSTP mode is configured, this will apply to the CIST.

Use the **no** variant of this command to reset it to the default.

**Syntax**

```
spanning-tree priority <priority>
no spanning-tree priority
```

| Parameter | Description |
|---|---|
| *<priority>* | <0-61440> The bridge priority, which will be rounded to a multiple of 4096. |

**Default** The default priority is 32678.

**Mode** Global Configuration

**Usage** To force a particular device to become the root bridge use a lower value than other devices in the spanning tree.

**Example**

```
awplus# configure terminal
awplus(config)# spanning-tree priority 4096
```

**Related commands**

spanning-tree mst instance priority

show spanning-tree

# spanning-tree priority (port priority)

**Overview** Use this command in Interface Configuration mode for a switch port interface only to set the port priority for port. A lower priority value indicates a greater likelihood of the port becoming part of the active topology.

Use this command for RSTP, STP, or MSTP. When the device is in MSTP mode, this will apply to the CIST.

Use the **no** variant of this command to reset it to the default.

**Syntax**

```
spanning-tree priority <priority>
no spanning-tree priority
```

| Parameter | Description |
|---|---|
| *<priority>* | <0-240>, in increments of 16. The port priority, which will be rounded down to a multiple of 16. |

**Default** The default priority is 128.

**Mode** Interface Configuration mode for a switch port interface only.

**Usage notes** To force a port to be part of the active topology (for instance, become the root port or a designated port) use a lower value than other ports on the device. (This behavior is subject to network topology, and more significant factors, such as bridge ID.)

**Example**

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree priority 16
```

**Related commands**

spanning-tree mst instance priority

spanning-tree priority (bridge priority)

show spanning-tree

# spanning-tree restricted-role

**Overview** Use this command in Interface Configuration mode for a switch port interface only to restrict the port from becoming a root port.

Use the **no** variant of this command to disable the restricted role functionality.

**Syntax**
```
spanning-tree restricted-role
no spanning-tree restricted-role
```

**Default** The restricted role is disabled.

**Mode** Interface Configuration mode for a switch port interface only.

**Example**
```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree restricted-role
```

# spanning-tree restricted-tcn

**Overview** Use this command in Interface Configuration mode for a switch port interface only to prevent TCN (Topology Change Notification) BPDUs (Bridge Protocol Data Units) from being sent on a port. If this command is enabled, after a topology change a bridge is prevented from sending a TCN to its designated bridge.

Use the **no** variant of this command to disable the restricted TCN functionality.

**Syntax**

```
spanning-tree restricted-tcn
no spanning-tree restricted-tcn
```

**Default** The restricted TCN is disabled.

**Mode** Interface Configuration mode for a switch port interface only.

**Example**

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# spanning-tree restricted-tcn
```

# spanning-tree transmit-holdcount

**Overview** Use this command to set the maximum number of BPDU transmissions that are held back.

Use the **no** variant of this command to restore the default transmit hold-count value.

**Syntax**

```
spanning-tree transmit-holdcount
no spanning-tree transmit-holdcount
```

**Default** Transmit hold-count default is 3.

**Mode** Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# spanning-tree transmit-holdcount
```

# undebug mstp

**Overview** This command applies the functionality of the no debug mstp (RSTP and STP) command.

# 20 Link Aggregation Commands

## Introduction

**Overview**

This chapter provides an alphabetical reference of commands used to configure a static channel group (static aggregator) and dynamic channel group (LACP channel group, etherchannel or LACP aggregator). Link aggregation is also sometimes referred to as channeling.

***NOTE:*** *AlliedWare Plus™ supports IEEE 802.3ad link aggregation and uses the Link Aggregation Control Protocol (LACP). LACP does not interoperate with devices that use Port Aggregation Protocol (PAgP).*

*Link aggregation does not necessarily achieve exact load balancing across the links. The load sharing algorithm is designed to ensure that any given data flow always goes down the same link. It also aims to spread data flows across the links as evenly as possible.*

*For example, for a 2 Gbps LAG that is a combination of two 1 Gbps ports, any one flow of traffic can only ever reach a maximum throughput of 1 Gbps. However, the hashing algorithm should spread the flows across the links so that when many flows are operating, the full 2 Gbps can be utilized.*

For a description of static and dynamic link aggregation (LACP), and configuration examples, see the Link Aggregation Feature Overview and Configuration Guide.

**Command List**

- "channel-group" on page 707
- "clear lacp counters" on page 709
- "debug lacp" on page 710
- "lacp global-passive-mode enable" on page 711
- "lacp port-priority" on page 712
- "lacp system-priority" on page 713
- "lacp timeout" on page 714
- "show debugging lacp" on page 716
- "show diagnostic channel-group" on page 717

- "show etherchannel" on page 718
- "show etherchannel detail" on page 719
- "show etherchannel summary" on page 720
- "show lacp sys-id" on page 721
- "show lacp-counter" on page 722
- "show port etherchannel" on page 723
- "show static-channel-group" on page 724
- "static-channel-group" on page 725
- "undebug lacp" on page 727

# channel-group

**Overview** Use this command to create a dynamic channel group, or to add a port to an existing dynamic channel group.

You can create up to 2 channel groups, in any combination of static and dynamic (LACP) groups. This means you can create up to 2 dynamic channel groups, if you have no static channel groups.

Use the **no** variant of this command to turn off link aggregation on the device port. You will be returned to Global Configuration mode from Interface Configuration mode.

**Syntax**

```
channel-group <dynamic-channel-group-number> mode
{active|passive}
```

```
no channel-group
```

| Parameter | Description |
|---|---|
| *<dynamic-channel-group-number>* | <1-248> Dynamic channel group number for an LACP link. You can create up to 2 dynamic channel groups, numbered in the range 1-248. |
| `active` | Enables initiation of LACP negotiation on a port. The port will transmit LACP dialogue messages whether or not it receives them from the partner device. |
| `passive` | Disables initiation of LACP negotiation on a port. The port will only transmit LACP dialogue messages if the partner device is transmitting them, i.e., the partner is in the active mode. |

**Mode** Interface Configuration

**Usage notes** All the device ports in a channel-group must belong to the same VLANs, have the same tagging status, and can only be operated on as a group. All device ports within a channel group must have the same port speed and be in full duplex mode.

Once the LACP channel group has been created, it is treated as a device port. You can specify it in other commands. If you are specifying it in:

- an LACP command, then use the channel-group number on its own. For example, use the command **show etherchannel 2** to show details about channel group 2.
- a non-LACP command, then use **po** followed by the channel-group number. For example, use the command **show interface po2** to show details about channel group 2's interface.

For more information about LACP, see the Link Aggregation Feature Overview and Configuration Guide which is available on our website at alliedtelesis.com.

**Examples**

To add device port1.0.2 to a newly created LACP channel group 2, in active mode, use the commands below:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# channel-group 2 mode active
```

To remove device port1.0.2 from any created LACP channel groups, use the command below:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no channel-group
```

To reference channel group 2 as an interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface po2
awplus(config-if)#
```

**Related commands**

show etherchannel

show etherchannel detail

show etherchannel summary

show port etherchannel

**Command changes**

Version 5.4.9-0.1: Ability added to create up to 2 groups as any combination of static and dynamic channel groups. Also, numbering changed to 1-248.

# clear lacp counters

**Overview** Use this command to clear all counters of all present LACP aggregators (channel groups) or a given LACP aggregator.

**Syntax**

```
clear lacp [<1-248>] counters
```

| Parameter | Description |
|---|---|
| *<1-248>* | Channel-group number. |

**Mode** Privileged Exec

**Example**

```
awplus# clear lacp 2 counters
```

# debug lacp

**Overview** Use this command to enable all LACP troubleshooting functions.

Use the **no** variant of this command to disable this function.

**Syntax**

```
debug lacp {all|cli|event|ha|packet|sync|timer[detail]}
no debug lacp {all|cli|event|ha|packet|sync|timer[detail]}
```

| Parameter | Description |
|---|---|
| `all` | Turn on all debugging for LACP. |
| `cli` | Specifies debugging for CLI messages.<br>Echoes commands to the console. |
| `event` | Specifies debugging for LACP events.<br>Echoes events to the console. |
| `ha` | Specifies debugging for HA (High Availability) events.<br>Echoes High Availability events to the console. |
| `packet` | Specifies debugging for LACP packets.<br>Echoes packet contents to the console. |
| `sync` | Specified debugging for LACP synchronization.<br>Echoes synchronization to the console. |
| `timer` | Specifies debugging for LACP timer.<br>Echoes timer expiry to the console. |
| `detail` | Optional parameter for LACP timer-detail.<br>Echoes timer start/stop details to the console. |

**Mode** Privileged Exec and Global Configuration

**Examples**

```
awplus# debug lacp timer detail
awplus# debug lacp all
```

**Related commands** show debugging lacp

undebug lacp

# lacp global-passive-mode enable

**Overview** Use this command to enable LACP channel-groups to dynamically self-configure when they are connected to another device that has LACP channel-groups configured with Active Mode.

**Syntax**

```
lacp global-passive-mode enable
no lacp global-passive-mode enable
```

**Default** Enabled

**Mode** Global Configuration

**Usage notes** Do not mix LACP configurations (manual and dynamic). When LACP global passive mode is turned on (by using the **lacp global-passive-mode enable** command), we do not recommend using a mixed configuration in a LACP channel-group; i.e. some links are manually configured (by the **channel-group** command) and others are dynamically learned in the same channel-group.

**Example** To enable global passive mode for LACP channel groups, use the command:

```
awplus(config)# lacp global-passive-mode enable
```

To disable global passive mode for LACP channel groups, use the command:

```
awplus(config)# no lacp global-passive-mode enable
```

**Related commands** show etherchannel

show etherchannel detail

# lacp port-priority

**Overview** Use this command to set the priority of a device port. Ports are selected for aggregation based on their priority, with the higher priority (numerically lower) ports selected first.

Use the **no** variant of this command to reset the priority of port to the default.

**Syntax**

```
lacp port-priority <1-65535>
no lacp port-priority
```

| Parameter | Description |
|---|---|
| *<1-65535>* | Specify the LACP port priority. |

**Default** The default is 32768.

**Mode** Interface Configuration

**Example**

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# lacp port-priority 34
```

# lacp system-priority

**Overview** Use this command to set the system priority of a local system. This is used in determining the system responsible for resolving conflicts in the choice of aggregation groups.

Use the **no** variant of this command to reset the system priority of the local system to the default.

**Syntax**

```
lacp system-priority <1-65535>
no lacp system-priority
```

| Parameter | Description |
|---|---|
| *<1-65535>* | LACP system priority. Lower numerical values have higher priorities. |

**Default** The default is 32768.

**Mode** Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# lacp system-priority 6700
```

# lacp timeout

**Overview** Use this command to set the short or long timeout on a port. Ports will time out of the aggregation if three consecutive updates are lost.

**Syntax**

```
lacp timeout {short|long}
```

| Parameter | Description |
|---|---|
| `timeout` | Number of seconds before invalidating a received LACP data unit (DU). |
| `short` | LACP short timeout. The **short** timeout value is **1** second. |
| `long` | LACP long timeout. The **long** timeout value is **30** seconds. |

**Default** The default is **long** timeout (30 seconds).

**Mode** Interface Configuration

**Usage notes** This command enables the device to indicate the rate at which it expects to receive LACPDUs from its neighbor.

If the timeout is set to **long**, then the device expects to receive an update every **30** seconds, and this will time a port out of the aggregation if no updates are seen for 90 seconds (i.e. 3 consecutive updates are lost).

If the timeout is set to **short**, then the device expects to receive an update every second, and this will time a port a port out of the aggregation if no updates are seen for 3 seconds (i.e. 3 consecutive updates are lost).

The device indicates its preference by means of the Timeout field in the Actor section of its LACPDUs. If the Timeout field is set to 1, then the device has set the **short** timeout. If the Timeout field is set to 0, then the device has set the **long** timeout.

Setting the **short** timeout enables the device to be more responsive to communication failure on a link, and does not add too much processing overhead to the device (1 packet per second).

***NOTE:*** *It is not possible to configure the rate that the device sends LACPDUs; the device must send at the rate which the neighbor indicates it expects to receive LACPDUs.*

**Examples** The following commands set the LACP long timeout period for 30 seconds on port1.0.2.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# lacp timeout long
```

The following commands set the LACP short timeout for 1 second on port1.0.2.

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# lacp timeout short
```

# show debugging lacp

**Overview** Use this command to see what debugging is turned on for LACP management.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show debugging lacp
```

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show debugging lacp
```

**Output** Figure 20-1: Example output from the **show debugging lacp** command

```
LACP debugging status:
 LACP timer debugging is on
 LACP timer-detail debugging is on
 LACP cli debugging is on
 LACP packet debugging is on
 LACP event debugging is on
 LACP sync debugging is on
```

**Related commands** debug lacp

# show diagnostic channel-group

**Overview** This command displays dynamic and static channel group interface status information. The output of this command is useful for Allied Telesis authorized service personnel for diagnostic purposes.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**
```
show diagnostic channel-group
```

**Mode** User Exec and Privileged Exec

**Example**
```
awplus# show diagnostic channel-group
```

**Output** Figure 20-2: Example output from the **show diagnostic channel-group** command

```
awplus# show diagnostic channel-group

  Link: port1.0.3 (IfIndex: 11007) synchronized
```

# show lacp sys-id

**Overview** Use this command to display the LACP system ID and priority.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide, which is available on our website at alliedtelesis.com.

**Syntax**

```
show lacp sys-id
```

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show lacp sys-id
```

**Output** Example output from **show lacp sys-id**

```
System Priority: 0x8000 (32768)
MAC Address: 0200.0034.5684
```

# show lacp-counter

**Overview** Use this command to display the packet traffic on all ports of all present LACP aggregators, or a given LACP aggregator.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide, which is available on our website at alliedtelesis.com.

**Syntax**

```
show lacp-counter [<1-248>]
```

| Parameter | Description |
|---|---|
| *<1-248>* | Channel-group number. |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show lacp-counter 2
```

**Output** Example output from **show lacp-counter**

```

```

# show static-channel-group

**Overview** Use this command to display all configured static channel groups and their corresponding member ports. Note that a static channel group is the same as a static aggregator.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide, which is available on our website at alliedtelesis.com.

**Syntax**
```
show static-channel-group
```

**Mode** User Exec and Privileged Exec

**Example**
```
awplus# show static-channel-group
```

**Output** Example output from **show static-channel-group**

```
% LAG Maximum        : 2
% LAG Static  Count  : 2
% LAG Dynamic Count  : 0
% LAG Total   Count  : 2
% Static Aggregator: sa2
% Member:
   port1.0.1
port1.0.2
% Static Aggregator: sa3
% Member:
   port1.0.3
port1.0.4
```

**Related commands** static-channel-group

# static-channel-group

**Overview** Use this command to create a static channel group, or to add a port to an existing static channel group. Static channel groups are also known as static aggregators.

You can create up to 2 channel groups, in any combination of static and dynamic (LACP) groups. This means you can create up to 2 static channel groups, if you have no dynamic channel groups.

Use the **no** variant of this command to remove the device port from the static channel group.

**Syntax**

```
static-channel-group <static-channel-group-number>
no static-channel-group
```

| Parameter | Description |
|---|---|
| *<static-channel-group-number>* | <1-248> Static channel group number.<br>You can create up to 2 static channel groups, numbered in the range 1-248. |

**Mode** Interface Configuration

**Usage notes** This command adds the device port to the static channel group with the specified channel group number. If the channel group does not exist, it is created, and the port is added to it. The **no** prefix detaches the port from the static channel group. If the port is the last member to be removed, the static channel group is deleted.

All the ports in a channel group must have the same VLAN configuration: they must belong to the same VLANs and have the same tagging status, and can only be operated on as a group.

Once the static channel group has been created, it is treated as a device port. You can specify it in other commands by using **sa** followed by the channel-group number. For example, use the command **show interface sa2** to show details about channel group 2's interface:

**Examples** To define static channel group 2 on port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# static-channel-group 2
```

To reference static channel group 2 as an interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface sa2
awplus(config-if)#
```

**Related commands** show static-channel-group

**Command changes** Version 5.4.9-0.1: Ability added to create up to 2 groups as any combination of static and dynamic channel groups. Also, numbering changed to 1-248.

# undebug lacp

**Overview** This command applies the functionality of the no debug lacp command.

# 21 802.1Q Encapsulation Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure 802.1Q Encapsulation. For more information, see the Interface Feature Overview and Configuration Guide.

**Command List**

- "encapsulation dot1q" on page 729

# encapsulation dot1q

**Overview** Use this command to enable 802.1Q encapsulation on Ethernet interfaces, L2 tunnel interfaces (e.g. OpenVPN or L2TPv3 Ethernet pseudowire), or the VLAN-aware bridge 0.

Use the **no** variant of this command to disable 802.1Q encapsulation for the VLAN identified by the VLAN ID (VID).

**Syntax**

```
encapsulation dot1q <vid>
no encapsulation dot1q <vid>
```

| Parameter | Description |
|---|---|
| *<vid>* | Enter a VLAN ID in the range from 1 through 4094. The VLAN ID identifies the VLAN to which the frames belong. It also identifies the index of the subinterface of the Ethernet interface or Layer 2 tunnel interface. |

**Default** 802.1Q encapsulation is disabled by default on all Ethernet interfaces, Layer 2 tunnel interfaces, and bridge interfaces.

**Mode** Interface Configuration

**Usage notes** You should enter the Ethernet interface or tunnel interface configuration mode to enable 802.1Q encapsulation and configure the VID first. Then you can use the VID to configure the sub-interface associated with the Ethernet interface or tunnel interface. Sub-interfaces are logical interfaces. The sub interface index must be the same as the VID. For example, if you configure VID 1 for eth1, then the sub-interface for eth1 is eth1.1. If you configure VID 2 for tunnel20, then the sub-interface for tunnel20 is tunnel20.2.

**Examples** To enable 802.1Q encapsulation on Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awuplus(config)# interface eth1
awplus(config-if)# encapsulation dot1q 1
```

To enable 802.1Q encapsulation on tunnel interface tunnel20, use the commands:

```
awplus# configure terminal
awuplus(config)# interface tunnel20
awplus(config-if)# encapsulation dot1q 2
```

To enable multiple 802.1Q encapsulation on Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awuplus(config)# interface eth1
awplus(config-if)# encapsulation dot1q 1
awplus(config-if)# encapsulation dot1q 2
awplus(config-if)# encapsulation dot1q 3
```

To disable 802.1Q encapsulation on eth1, use the commands:

```
awplus# configure terminal
awuplus(config)# interface eth1
awuplus(config-if)# no encapsulation dot1q 1
```

# 22 PPP Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure and validate the PPP (Point-To-Point) protocol. For more information about PPP, see the Point-to-Point Protocol (PPP) Feature Overview and_Configuration Guide.

**Command List**

- "debug ppp" on page 733
- "encapsulation ppp" on page 736
- "interface (PPP)" on page 738
- "ip address negotiated" on page 739
- "ip tcp adjust-mss" on page 741
- "ip unnumbered" on page 743
- "ipv6 tcp adjust-mss" on page 745
- "keepalive (PPP)" on page 747
- "mtu (PPP)" on page 749
- "peer default ip address" on page 750
- "peer neighbor-route" on page 752
- "ppp authentication" on page 754
- "ppp authentication refuse" on page 756
- "ppp hostname" on page 758
- "ppp ipcp dns" on page 760
- "ppp ipcp dns suffix-list" on page 762
- "ppp ipcp ip-override" on page 764
- "ppp password" on page 765
- "ppp service-name (PPPoE)" on page 766

- "ppp timeout idle" on page 767
- "ppp username" on page 768
- "show debugging ppp" on page 769
- "show interface (PPP)" on page 770
- "undebug ppp" on page 774

# debug ppp

**Overview** Use this command to enable PPP protocol debugging on an optionally specified PPP interface or range of PPP interfaces to analyze PPP behavior when diagnosing PPP connectivity issues. If no interface is specified then debugging for all PPP interfaces is enabled.

Use the **no** variant of this command to disable PPP protocol debugging on the specified PPP interface. If no PPP interface is specified then PPP debugging for all PPP interfaces is disabled.

**Syntax**

```
debug ppp [interface <ppp-interface-list>]
no debug ppp [interface <ppp-interface-list>]
```

| Parameter | Description |
|---|---|
| *<ppp-interface- list>* | Specify a PPP interface or a range of PPP interfaces in the range ppp<0-255>. Use a hyphen between PPP interfaces to include all PPP interfaces in a given range, or use commas between PPP interfaces to specify non-contiguous PPP interfaces. |

**Default** No diagnostic messages are enabled for PPP debugging. PPP debugging is disabled by default.

**Mode** Global Configuration and Privileged Exec

**Usage notes** Debugging messages are sent to the logging system and can be viewed in log output, filtered in permanent or buffered logs, and viewed on the terminal using the terminal monitor command. See the status of PPP debugging with the show debugging ppp command.

Note that debugging output for PPP shows packet debugging and events debugging, see output below.

Note that disabling all debugging with the no debug all or the undebug all commands also disables PPP debugging configured with this command.

Note that the negated form of this command is an alias of the undebug ppp command.

**Examples** To enable PPP debugging on all PPP interfaces and send diagnostic messages to the system log, use the below command:

```
awplus# debug ppp
```

To enable PPP debugging on PPP interfaces `ppp0` through `ppp2` and display them on the console, use the below commands:

```
awplus# terminal monitor
awplus# debug ppp interface ppp0-ppp2
```

**Output of packet debugging**

Figure 22-1: Example output from the **debug ppp** command on the console

```
awplus#terminal monitor
awplus#debug ppp

192.168.1.2, remote-IP:
192.168.1.1]
05:35:46 awplus PPP: IPCP [ppp0]: add IP interface [IP-addr:
192.168.1.2, mask: ]
05:35:46 awplus PPP: IPCP [ppp0]: add host route [peer-IP:
192.168.1.1]
05:35:47 awplus PPP: IPCP [ppp0]: add domain name server [DNS:
1.1.1.1]
05:35:47 awplus PPP: IPCP [ppp0]: add domain name server [DNS:
2.2.2.2]
```

To record messages relating to PPP packets in the buffered log, first configure a buffered log filter to select the messages using the commands:

```
awplus# configure terminal
awplus(config)# log buffered level debug program pppd
awplus(config)# end
```

Then configure PPP debugging, using the below command:

```
awplus# debug ppp
```

To disable PPP debugging for all PPP interfaces, use the below command:

```
awplus# no debug ppp
```

ppp authentication

show debugging ppp

show interface (PPP)

undebug all

# encapsulation ppp

**Overview** Use this command to enable PPP encapsulation and create one or more PPP interfaces over Ethernet, a cellular interface, or an L2TPv2 managed VPN.

Use the **no** variant of this command to disable PPP encapsulation and remove the specified PPP interface.

**Syntax**

```
encapsulation ppp <index>
no encapsulation ppp <index>
```

| Parameter | Description |
|---|---|
| *<index>* | The PPP interface index number in the range from 0 to 255. |

**Default** No PPP encapsulation or interfaces are configured by default.

**Mode** Interface Configuration mode for an Ethernet interface (e.g. **interface eth1**), or an Ethernet sub-interface (e.g. **interface eth1.1**), or a cellular interface (e.g. **interface cellular0**).

L2TP Tunnel Configuration mode for an L2TP tunnel (e.g. **l2tp tunnel tunnel0**).

**Examples** To configure a PPP interface with index 0 for Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# encapsulation ppp 0
```

To shut down the ppp0 interface and remove it from Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# shutdown
awplus(config-if)# interface eth1
awplus(config-if)# no encapsulation ppp 0
```

To set the L2TP tunnel tunnel1 to encapsulate the PPP interface with index 1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# encapsulation ppp 1
```

To remove the PPP interface with index 1 from L2TP tunnel tunnel1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no encapsulation ppp 1
```

**Related commands**

l2tp tunnel

ppp service-name (PPPoE)

show interface (PPP)

# interface (PPP)

**Overview** Use this command to select a PPP interface to configure.

You need to use the encapsulation ppp command to enable PPP encapsulation and create PPP interfaces first.

**Syntax**

```
interface <PPP-interface-list>
```

| Parameter | Description |
|---|---|
| *<PPP-interface-list>* | The PPP interfaces or ports to configure. An interface-list can be:<br>• a PPP interface (e.g. ppp0)<br>• a continuous range of PPP interfaces, separated by a hyphen (e.g. `ppp0-ppp2`)<br>• a comma-separated non-continuous list of PPP interfaces (e.g. `ppp0,ppp2`)<br>The specified interfaces must exist. |

**Mode** Global Configuration

**Example** The following example shows how to enter Interface mode to configure a PPP interface.

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)#
```

**Related commands**

ip address (IP Addressing and Protocol)

show interface

show interface brief

# ip address negotiated

**Overview** Use this command to obtain an IP address with the peer for a PPP interface via IPCP (Internet Protocol Control Protocol) address negotiation when configuring a PPP link for IP traffic.

Use the **no** variant of this command to remove IP address negotiation settings.

**Syntax**

```
ip address negotiated [<default-ip-address>]
no ip address negotiated
```

| Parameter | Description |
|---|---|
| *<default-ip-addr>* | Specify an optional default IP address for use instead of an IP address assigned from the peer that is otherwise configured for a PPP interface. |

**Default** No IP address negotiation with the peer is configured by default.

**Mode** Interface Configuration for a PPP interface

**Usage notes** Use this command to enable the device to automatically negotiate an IP address for a PPP interface, and to enable all remote hosts to access the device using this IP address. When the peer does not send an IP address via IPCP negotiation, the specified default IP address will be used.

**Examples** To configure the PPP interface ppp0 to use IPCP to negotiate an IP address for itself, use the below commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip address negotiated
```

To configure the PPP interface ppp0 to a default IP address of 10.9.9.2, for use when the peer does not send an IP address via IPCP negotiation, use the below commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip address negotiated 10.9.9.2
```

To stop the PPP interface ppp0 from using IPCP to negotiate an IP address for itself, use the below commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip address negotiated
```

**Output** To verify IPCP address negotiation is configured on PPP interface ppp0, use the following command:

```
awplus# show running-config interface ppp0
```

Figure 22-3: Example output from **show running-config interface ppp0** to verify IPCP configuration:

```
!
interface ppp0
 ip address negotiated
!
```

show ip interface

encapsulation ppp

peer default ip address

show running-config interface

# ip tcp adjust-mss

**Overview** Use this command to set the Maximum Segment Size (MSS) size for an interface, where MSS is the maximum TCP data packet size that the interface can transmit before fragmentation.

Use the **no** variant of this command to remove a previously specified MSS size for a PPP interface, and restore the default MSS size.

**Syntax**

```
ip tcp adjust-mss {<mss-size>|pmtu}
no ip tcp adjust-mss
```

| Parameter | Description |
|---|---|
| *<mss-size>* | <64-1460> Specifies the MSS size in bytes. |
| pmtu | Adjust TCP MSS automatically with respect to the MTU on the interface. |

**Default** The default setting allows a TCP server or a TCP client to set the MSS value for itself.

**Mode** Interface Configuration

**Usage notes** When a host initiates a TCP session with a server it negotiates the IP segment size by using the MSS option field in the TCP packet. The value of the MSS option field is determined by the Maximum Transmission Unit (MTU) configuration on the host.

You can set a feasible MSS value on the following interfaces:

- PPP
- Ethernet
- Tunnel
- VLAN

**Examples** To configure an MSS size of 1452 bytes on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip tcp adjust-mss 1452
```

To configure an MSS size of 1452 bytes on Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip tcp adjust-mss 1452
```

To configure an MSS size of 1452 bytes on interface tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# ip tcp adjust-mss 1452
```

To restore the MSS size to the default size on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip tcp adjust-mss
```

# ip unnumbered

**Overview** Use this command to borrow an IP address from the specified interface, on an unnumbered PPP interface.

Use the **no** variant of this command to remove the borrowed IP address.

**Syntax**

```
ip unnumbered <interface-name>
no ip unnumbered
```

| Parameter | Description |
|---|---|
| *<interface-name>* | Name of the interface from which the IP address is to be borrowed. Valid interface types from which the IP address can be borrowed are VLAN, Ethernet, loopback, and bridge. |

**Default** IP unnumbered is disabled by default.

**Mode** Interface Configuration for a PPP interface

**Usage notes** An unnumbered PPP interface can process IP packets without explicitly assigning an IP address. This is achieved by borrowing the primary IP address from the specified VLAN, Ethernet, loopback, or bridge interface.

**Examples** To borrow an IP address on unnumbered PPP from vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip address 6.6.6.6/24
awplus(config-if)# exit
awplus(config)# interface ppp0
awplus(config-if)# ip unnumbered vlan2
```

To remove the borrowed IP address, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip unnumbered
```

To verify borrowed address is configured on PPP interface ppp0, use the following command:

```
awplus# show interface ppp0
```

Figure 22-4: Example output from a **show interface** ppp0 to verify PPP IP borrowing configuration:

```
awplus#show interface ppp0
Interface ppp0
  Link is UP, administrative state is UP
  Hardware is PPP
  Interface is unnumbered. Using IPv4 address of vlan2 (2.2.2.2)

show ip interface

show interface tunnel (L2TPv3)

show running-config interface

# ipv6 tcp adjust-mss

**Overview** Use this command to set the IPv6 Maximum Segment Size (MSS) size for an interface, where MSS is the maximum TCP data packet size that the interface can transmit before fragmentation.

Use the **no** variant of this command to remove a previously specified MSS size for a PPP interface, and restore the default MSS size.

**Syntax**

```
ipv6 tcp adjust-mss {<mss-size>|pmtu}
no ipv6 tcp adjust-mss
```

| Parameter | Description |
|---|---|
| *<mss-size>* | <64-1460> Specifies the MSS size in bytes. |
| pmtu | Adjust TCP MSS automatically with respect to the MTU on the interface. |

**Default** The default setting allows a TCP server or a TCP client to set the MSS value for itself.

**Mode** Interface Configuration

**Usage notes** When a host initiates a TCP session with a server it negotiates the IP segment size by using the MSS option field in the TCP packet. The value of the MSS option field is determined by the Maximum Transmission Unit (MTU) configuration on the host.

You can set a feasible MSS value on the following interfaces:

- PPP
- Ethernet
- Tunnel
- VLAN

**Examples** To configure an IPv6 MSS size of 1452 bytes on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ipv6 tcp adjust-mss 1452
```

To configure an IPv6 MSS size of 1452 bytes on Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 tcp adjust-mss 1452
```

To adjust IPv6 TCP MSS automatically with respect to the MTU on interface tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# ipv6 tcp adjust-mss pmtu
```

To restore the MSS size to the default size on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 tcp adjust-mss
```

Version 5.4.8-2.1: interface tunnel example added

# keepalive (PPP)

**Overview** Use this command to enable LCP (Link Control Protocol) Echo keepalive request messages and change LCP echo parameters on a given PPP interface in Interface Configuration mode.

Use the **no** variant of this command to disable LCP Echo keepalive request messages on a given PPP interface in Interface Configuration mode. Note that disabling the sending of LCP Echo keepalive request messages does not stop a device responding to LCP Echo requests.

**Syntax**

```
keepalive [[interval <interval>] [attempts
<attempt-limit>]]no keepalive
```

| Parameter | Description |
|---|---|
| *<interval>* | Specify the interval in seconds in the range <1-600> seconds between LCP Echo keepalive request messages, for a PPP interface.<br>Default: 10 |
| *<attempt-limit>* | Specify the number of missing LCP Echo keepalive response messages, in the range <1-10> for a PPP interface, before the link is considered as being link down and link renegotiation starts to reestablish the link.<br>Default: 3 |

**Default** The sending of LCP Echo keepalive messages on a PPP interface is disabled by default. If no optional **interval** is specified then the default interval duration is configured to 10 seconds. If no optional **attempts** are specified then the default attempt limit is configured to 3 attempts.

**Mode** Interface Configuration for a PPP interface

**Example** To enable the device to send LCP Echo keepalive messages on the PPP interface ppp0with the default 10 second interval when no interval is specified and the default 3 attempts when no attempt is specified, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# keepalive
```

To enable the device to send LCP Echo keepalive messages on the PPP interface ppp0 with double the default values for a 20 second interval and 6 attempts, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# keepalive interval 20 attempts 6
```

To disable the device from sending LCP Echo keepalive messages on the PPP interface `ppp0`, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no keepalive
```

**Related commands** show running-config interface

# mtu (PPP)

**Overview** Use this command to set the Maximum Transmission Unit (MTU) size for a PPP interface, where MTU is the maximum packet size that PPP interfaces can transmit.

Use the **no** variant of this command to remove a previously specified MTU size for a PPP interface, and restore the default MTU size (1492 bytes) for PPP interfaces.

**Syntax**

```
mtu <mtu-size>
no mtu
```

| Parameter | Description |
|---|---|
| *<mtu-size>* | <68-1492> Specifies the Maximum Transmission Unit (MTU) size in bytes, where 1492 bytes is the default MTU size for a PPPoE interface and 1500 bytes for PPP via other lower layer interface types. This allows for the 8-byte PPPoE header that is added to make up the total of a 1582 byte packet that matches the default MTU size for the Ethernet link.. |

***NOTE:*** *For PPPoE the minimum MTU value is 128.*

**Default** The default MTU size is 1492 bytes for PPPoE interfaces. The MTU should be greater than, or equal to, the MSS.

**Mode** Interface Configuration for PPP interfaces.

**Usage notes** If a router receives an IPv4 packet for another PPP interface with an MTU size smaller than the packet size, and if the packet has the ' **don't fragment**' bit set, then the switch will send an ICMP ' **destination unreachable**' (3) packet type and a ' **fragmentation needed and DF set**' (4) code back to the source.

See the ip tcp adjust-mss command to set the Maximum Segment Size (MSS) after first setting the MTU size.

**Examples** To configure an MTU size of 1492 bytes on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# mtu 1492
```

To restore the MTU size to the default MTU size of 1492 bytes on PPP interface ppp0, use the commands

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no mtu
```

**Related commands** ip tcp adjust-mss

show interface (PPP)

# peer default ip address

**Overview** Use this command to set the default IP address assigned to the peer if required for a given PPP interface.

Use the optional **required** keyword with this command to specify that the peer must use this address for a given PPP interface, or drop the connection.

Use the **no** variant of this command to remove the previously specified peer default IP address for a given PPP interface.

**Syntax**

```
peer default ip address <default-ip-address> [required]
no peer default ip address
```

| Parameter | Description |
|---|---|
| *<default-ip-address>* | Specify the IPv4 address to be assigned to the peer upon request. |
| `required` | Optionally specify the peer to acknowledge the default IP address, which requires the peer to use the address or drop the connection. |

**Default** No default IP address is configured to be assigned to the peer.

**Mode** Interface Configuration for a PPP interface

**Examples** To configure the PPP interface `ppp0` to assign the IP address of `192.168.0.1` to its peer upon request, use the below commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# peer default ip address 192.168.0.1
```

To configure the PPP interface `ppp0` to have the default peer IP address of `192.168.0.1`, and be required to use it or drop the connection, use the below commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# peer default ip address 192.168.0.1
required
```

To remove the default peer IP address of `192.168.0.1` from the PPP interface `ppp0`, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no peer default ip address
```

To verify the required peer default IP address `192.168.0.1` is configured on PPP interface `ppp0`, use the following command:

```
awplus# show running-config interface ppp0
```

## Output

**Table 1:** Example output from the **show running-config interface** ppp0 command

```
awplus# show running-config interface ppp0
!
interface ppp0
 peer default ip address 192.168.0.1 required
!
```

## Related commands

ip address negotiated

show running-config interface

# peer neighbor-route

**Overview** Use this command in Interface Configuration mode for a PPP interface to re-enable the creation of peer neighbor routes after the default behavior has been disabled.

Use the **no** form of this command in Interface Configuration mode for a PPP interface to disable the default behavior of creating a neighbor route for the peer.

**Syntax**

```
peer neighbor-route
no peer neighbor-route
```

**Default** A 32-bit host route (with a /32 mask) is created to the peer address on a PPP interface after PPP IPCP negotiation finishes.

**Usage notes** Use the **no** form of this command if the default behavior creates issues within your network. Use the show ip route command to validate the route behavior after issuing this command.

**Mode** Interface Configuration for a PPP interface

**Examples** To re-enable the default behavior for the PPP interface `ppp1`, where a 32-bit host route (with a /32 mask) is created to the peer address on a PPP interface after PPP IPCP negotiation finishes, enter the commands:

```
awplus# configure terminal
awplus(config)# interface ppp1
awplus(config-if)# peer neighbor-route
```

To disable the default behavior for the PPP interface `ppp0`, to prevent a 32-bit host route being added to the IP router table, enter the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no peer neighbor-route
```

**Related commands** show interface (PPP)

show ip route

# ppp authentication

**Overview** Use this command in Interface Configuration mode for a PPP interface to configure PAP (Password Authentication Protocol), CHAP (Challenge Authentication Protocol), or EAP (Extensible Authentication Protocol).

Use the **no** form of this command in Interface Configuration mode for a PPP interface to disable all PAP, CHAP, and EAP authentication for a specified PPP interface.

**Syntax**

```
ppp authentication {eap|chap|pap}
no ppp authentication
```

| Parameter | Description |
|---|---|
| eap | Specify this parameter to enable EAP on a PPP interface |
| chap | Specify this parameter to enable CHAP on a PPP interface. |
| pap | Specify this parameter to enable PAP on a PPP interface. |

**Default** There is no PPP authentication protocol defined or configured to a PPP interface by default.

**Mode** Interface Configuration for a PPP interface

**Examples** To enable PPP PAP authentication on the PPP interface ppp0, enter the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ppp authentication pap
```

To enable PPP CHAP authentication on the PPP interface ppp0, enter the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ppp authentication chap
```

To enable PPP EAP authentication on the PPP interface ppp0, enter the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ppp authentication eap
```

To attempt PPP EAP authentication, then fall back to PPP CHAP authentication if the attempt to enable PPP EAP authentication fails on the PPP interface `ppp0`, enter the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ppp authentication eap chap
```

To attempt PPP CHAP authentication, then fall back to PPP PAP authentication if the attempt to enable PPP CHAP authentication fails on the PPP interface `ppp0`, enter the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ppp authentication chap pap
```

To disable all PPP authentication on the PPP interface `ppp0`, enter the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ppp authentication
```

**Related commands**

ppp authentication refuse

ppp hostname

ppp password

ppp username

# ppp authentication refuse

**Overview** Use this command in Interface Configuration mode for a PPP interface to refuse EAP, CHAP (Challenge Handshake Authentication Protocol) or PAP (Password Authentication Protocol) authentication from peers requesting it.

Use the **no** form of this command in Interface Configuration mode for a PPP interface to allow authentication from peers requesting it.

**Syntax**

```
ppp authentication refuse {eap|chap|pap}
no ppp authentication refuse
```

| Parameter | Description |
|---|---|
| `eap` | Use this parameter to specify the router will refuse LCP configuration requests containing the authentication protocol option with EAP received on this PPP interface. |
| `chap` | Use this parameter to specify the router will refuse LCP configuration requests containing the authentication protocol option with CHAP received on this PPP interface. |
| `pap` | Use this parameter to specify the router will refuse LCP configuration requests containing the authentication protocol option with PAP on this PPP interface. |

**Mode** Interface Configuration for a PPP interface

**Usage notes** This command specifies that EAP, CHAP or PAP authentication is disabled, so all requests by the peer for the user to authenticate using EAP, CHAP or PAP are refused.

**Examples** To refuse the use of PAP authentication if a peer requests PAP authentication, enter the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ppp authentication refuse pap
```

To refuse the use of CHAP authentication if a peer requests CHAP authentication, enter the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ppp authentication refuse chap
```

To refuse the use of EAP authentication if a peer requests EAP authentication, enter the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ppp authentication refuse eap
```

To allow the use of EAP, CHAP or PAP authentication if a peer requests EAP, CHAP or PAP authentication, enter the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ppp authentication refuse
```

**Related commands** ppp authentication

# ppp hostname

**Overview** Use this command in Interface Configuration mode for a PPP interface to configure a unique identifier for that PPP authenticator. This is used by the authenticator to fill the Name field in a CHAP challenge packet, or is used to fill the Server Name field in an EAP SRP-SHA1 (Subtype 1 Request) packet. The hostname sent with PPP packet exchanges is normally the hostname of the router, as configured with the hostname command.

Use the **no** form of this command in Interface Configuration mode for a PPP interface to disable a configured alternate hostname and revert to using the hostname, as configured with the hostname command.

See the Usage section below for information about when you may want to specify another hostname, instead of the system hostname configured from the hostname command, using this command.

**Syntax**

```
ppp hostname <hostname>
no ppp hostname <hostname>
```

| Parameter | Description |
|---|---|
| *<hostname>* | Specify this parameter to use an alternate hostname for PPP EAP and CHAP authentication instead of the hostname specified by the hostname command. The name can contain up to 255 characters. The name can contain any printable ASCII characters (ASCII 32-126). If the name contains the special characters backslash, double-quote or space, those characters should be escaped with a backslash. |

**Default** The default PPP hostname is the system hostname as specified with the hostname command.

**Mode** Interface Configuration for a PPP interface

**Usage notes** This command allows the PPP username that is sent to be independent of the router hostname for a specific PPP interface.

**Examples** To enable the use of the alternate hostname `remote_router` for PPP authentication, enter the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ppp hostname remote_router
```

To disable the use of the alternate hostname `remote_router` for PPP authentication, enter the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ppp hostname remote_router
```

**Related commands**

hostname

ppp authentication

# ppp ipcp dns

**Overview** Use this command to configure the primary and secondary DNS (Domain Name System) IP addresses for IPCP (Internet Protocol Control Protocol) on a given PPP interface.

Use the **no** variant of this command to remove the primary and secondary DNS IP addresses for IPCP on a given PPP interface, and remove any optional parameters configured for DNS.

**Syntax**

```
ppp ipcp dns [<primary> [<secondary>]][required|reject|request]
no ppp ipcp dns
```

| Parameter | Description |
|---|---|
| *<primary>* | Specify the primary DNS address for a given PPP interface to the peer. |
| *<secondary>* | Specify the secondary DNS address for a given PPP interface to the peer. |
| `required` | Request DNS addresses from the peer, and close the link if none is given. |
| `reject` | Reject negotiations with the peer (default). |
| `request` | Request DNS addresses from the peer. |

**Default** By default no IPCP DNS server request is sent to the peer.

**Mode** Interface Configuration

**Usage notes** Use the optional parameters to configure PPP IPCP DNS options for accepting, rejecting or requesting DNS addresses from the peer. Use the optional primary and secondary or primary only DNS server address placeholders to specify DNS server addresses to the peer.

The no variant of this command also stops IPCP DNS request messages being sent to the peer.

**Examples** To configure the PPP interface `ppp0` to require a DNS IP address from the peer, and close the link if a DNS IP address is not given, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ppp ipcp dns required
```

To configure the PPP interface ppp0 to require a DNS IP address from the peer, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ppp ipcp dns request
```

To configure the PPP interface ppp0 to reject a DNS IP address from the peer, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ppp ipcp dns reject
```

To configure the PPP interface ppp0 to supply primary and secondary DNS server addresses to the peer, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ppp ipcp dns 10.1.1.2 10.1.1.3
```

To configure the PPP interface ppp0 to supply a primary but not a secondary DNS server address to the peer, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ppp ipcp dns 10.1.1.2
```

**Related commands**

ip address negotiated

peer default ip address

peer neighbor-route

show running-config interface

# ppp ipcp dns suffix-list

**Overview** Use this command to configure a suffix-list to be associated with DNS name-servers learned over the PPP connection.

Use the **no** variant of this command to remove the suffix-list.

**Syntax**

```
ppp ipcp dns suffix-list <domain-list-name>
no ppp ipcp dns suffix-list
```

| Parameter | Description |
|---|---|
| *<domain-list-name>* | The name of the DNS domain-list |

**Mode** Interface Configuration

**Usage notes** A PPP connection can be configured to learn DNS servers from the remote peer by using the command ppp ipcp dns command.

This command allows a user to associate a domain-list to be used to match against the suffixes of incoming DNS requests. For example, a customer branch office may have a router that is used to give remote-access to their head office, over which they learn the IP address of the head office's DNS server. A domain list can be created that contains a suffix used for services internal to that company, for example, "example.lc". This domain-list is associated as a suffix-list to the PPP connection. So when the PPP connection is completed with the head office, users at the branch office that browse to "intranet.example.lc" will have the DNS request forwarded to the DNS server learned over the PPP connection. Without having the suffix-list configured, the DNS request for "intranet.example.lc" would instead be sent to the primary DNS server, which is likely to be the branch office's ISP, and they will simply respond with a negative reply, because .example.lc is not a globally routable domain.

**Examples** At a branch office, to direct DNS lookups for domains with suffixes of "engineering.acme" or "intranet.acme" to an internal corporate name-server run at head-office that was learned over a PPP connection, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding domain-list corporatedomains
host(config-domain-list)# description Our internal network
domains; do not send DNS requests to internet
host(config-domain-list)# domain engineering.acme
host(config-domain-list)# domain intranet.acme
awplus(config)# interface ppp0
awplus(config-if)# ppp ipcp dns required
awplus(config-if)# ppp ipcp dns suffix-list corporatedomains
```

**Related commands**

ip dns forwarding domain-list

ppp ipcp dns

# ppp ipcp ip-override

**Overview** Use this command to override the IP address negotiated via IPCP with peer and use the statically configured address on a given PPP interface.

Use the **no** variant of this command to use any address negotiated with the peer via IPCP on a given PPP interface.

**Syntax**

```
ppp ipcp ip-override
no ppp ipcp ip-override
```

**Default** By default the address is negotiated with the peer via IPCP.

**Mode** Interface Configuration

**Examples** To override the IP address negotiated with the peer via IPCP and use statically configured address on interface ppp0, use the commands below:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip address 192.168.1.100/24
awplus(config-if)# ppp ipcp ip-override
```

**Related commands** show running-config interface

# ppp password

**Overview** Use this command in Interface Configuration mode for a PPP interface to configure a PPP secret password to be used in response to a challenge from an unknown remote peer.

Use the **no** form of this command in Interface Configuration mode for a PPP interface to disable a configured PPP secret password.

**Syntax**

```
ppp password <password>
no ppp password
```

| Parameter | Description |
|---|---|
| *<password>* | Specify this parameter to configure a PPP secret password to be used in response to an unknown remote peer. You can use any printable characters, including spaces. A password can contain up to 255 printable characters. |

**Default** There is no PPP password defined or configured to a PPP interface by default.

**Mode** Interface Configuration for a PPP interface

**Examples** To enable the use of the PPP secret password `bobs_secret` for PPP authentication, enter the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ppp password bobs_secret
```

To disable the use of the PPP secret password `bobs_secret` for PPP authentication, enter the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ppp password
```

**Related commands** ppp authentication

ppp username

# ppp service-name (PPPoE)

**Overview** This command configures the PPPoE service name used to select a service from an access concentrator. This can only be applied when the PPP interface has been configured over an underlying eth interface.

Use the **no** variant of this command to set the service name for the connection back to the default (unset).

**Syntax**

```
ppp service-name <service-name>
no ppp service-name
```

| Parameter | Description |
|---|---|
| *<service-name>* | Specifies the PPPoE service name to select from an access concentrator. The service-name is 1 to 18 characters long, is case-sensitive, and for a PPPoE client is usually supplied by the ISP.<br>The name can contain any printable ASCII characters (ASCII 32-126). If the name contains the special characters backslash, double-quote or space, those characters should be escaped with a backslash.<br>The default is no service name. |

**Default** The default option is not to specify a service name. This results in a connection to the default service specified by the access concentrator.

**Mode** Interface Configuration for a PPP interface

**Usage notes** You can only apply a single service name to each PPPoE interface.

**Examples** To connect to a service called “Internet”, use the command:

```
awplus(config)# interface ppp0
awplus(config-if)# ppp service-name Internet
```

**Related commands**

encapsulation ppp

show interface (PPP)

# ppp timeout idle

**Overview** Use this command to specify an idle time when a PPP connection is disconnected.

Use the **no** variant of this command to reset the idle time to the default of 60 seconds.

**Syntax**

```
ppp timeout idle <0-99999>
no ppp timeout idle
```

| Parameter | Description |
|---|---|
| *<0-99999>* | The time in seconds before the idle timeout disconnects. If this is not specified the default value of 60 seconds is used. |

**Default** PPP timeout idle is not set and the PPP Dial on Demand feature is disabled. If no idle time is set, the default value of 60 seconds is used.

**Mode** Interface Configuration

**Usage notes** This command allows an idle timer to disconnect a PPP connection after a specified time. The timer is reset upon either ingress or regress user traffic. Non-user traffic such as Link Control Protocol (LCP) keepalives and Network Control Protocol (NCP) negotiation packets do not reset the idle timer.

**Examples** To set the idle time to 30 seconds, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ppp timeout idle
30
```

To disable the use of the timer and disable the PPP Dial on Demand feature, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ppp timeout
idle 30
```

**Validation Commands** show running-config interface

# ppp username

**Overview** This command creates or modifies a username for a PPP user on a configured PPP interface.

**Syntax**

```
ppp username <username>
no ppp username
```

| Parameter | Description |
|---|---|
| *<username>* | Specify a login name for the user. The name can contain up to 255 characters.<br>The name can contain any printable ASCII characters (ASCII 32-126). If the name contains the special characters backslash, double-quote or space, those characters should be escaped with a backslash. |

**Default** There is no default PPP username defined or configured to a PPP interface.

**Mode** Interface Configuration for a PPP interface.

**Examples** To create the PPP username `bob`, for the PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ppp username bob
```

To remove the PPP username `bob`, for the PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ppp username
```

**Related commands**

ppp authentication

ppp password

# show debugging ppp

**Overview** Use this command to display PPP debug settings for optionally specified PPP interfaces. If no PPP interfaces are specified then PPP debug settings are shown for all available PPP interfaces.

**Syntax**

```
show debugging ppp [interface <0-255>]
```

| Parameter | Description |
|---|---|
| *<0-255>* | Specify a PPP interface or a range of PPP interfaces in the range ppp<0-255>. Use a hyphen between PPP interfaces to include all PPP interfaces in a given range, or use commas between PPP interfaces to specify non-contiguous PPP interfaces. |

**Mode** Privileged Exec

**Examples** The following example shows how to display PPP debug information for PPP interface ppp0:

```
awplus# show debugging ppp interface ppp0
```

The following example shows how to display PPP debug information for PPP interface ppp0 through ppp2:

```
awplus# show debugging ppp interface ppp0-ppp2
```

The following example shows how to display PPP debug information for PPP interface ppp0 and ppp2:

```
awplus# show debugging ppp interface ppp0,ppp2
```

The following example shows how to display PPP debug information for all available PPP interfaces:

```
awplus# show debugging ppp
```

Figure 22-6: Example output from the **show debugging ppp** command

```
awplus# show debugging ppp
PPP debugging status:
  PPP debug on interface ppp0: enabled
  PPP debug on interface ppp1: disabled
```

**Related commands**

debug ppp

no debug all

undebug all

show interface (PPP)

# show interface (PPP)

**Overview** Use this command to display configuration and status information for a configured PPP (Point-to-Point) interface.

**Syntax**

```
show interface ppp<ppp_index>
```

| Parameter | Description |
|---|---|
| *<ppp_index>* | Display configuration and status information for the specified and configured PPP interface (0 to 255). |

**Mode** User Exec and Privileged Exec

**Usage notes** See the show interface brief command for brief interface, configuration and status information.

Note the negotiated options, including those for DNS addresses, are shown in console output:

- `Local DNS addresses` as displayed in console output are provided from the peer.
- `Peer DNS addresses` as displayed in console output are provided to the peer.
- Only `Peer DNS addresses` or `Local DNS addresses` are shown, but not both.
- `Echo Request Timer` value as displayed in console output is the local setting.

**Example** The following example shows how to display the configuration and status information for a configured PPP interface named `ppp0`.

```
awplus# show interface ppp0
```

Figure 22-7: Example output from the **show interface** command for a PPPoE interface

```
awplus#show interface ppp0

Interface ppp0
  Scope: both
  Link is UP, administrative state is UP
  Hardware is PPP
  IPv4 address 10.1.0.2/32
  IPv6 address fe80::200:cdff:fe28:8a1/10
  index 16778440 metric 1
  <UP,POINTOPOINT,RUNNING,NOARP,MULTICAST>
  VRF Binding: Not bound
  PPP is running over interface eth0
  PPPoE is using the default service
  SNMP link-status traps: Disabled

encapsulation ppp

ppp service-name (PPPoE)

show interface

show interface brief

# undebug ppp

**Overview** Use this command to disable PPP protocol debugging on the specified PPP interface or interfaces. If no PPP interface is specified then PPP debugging for all PPP interfaces is disabled.

This command has the same functionality as the **no** variant of the debug ppp command.

**Syntax**

```
undebug ppp [interface <ppp-interface-list>]
```

| Parameter | Description |
|---|---|
| *<ppp-interface-list>* | Specify a PPP interface or a range of PPP interfaces in the range ppp<0-255>. Use a hyphen between PPP interfaces to include all PPP interfaces in a given range, or use commas between PPP interfaces to specify non-contiguous PPP interfaces. |

**Default** No diagnostic messages are enabled for PPP debugging. PPP debugging is disabled by default.

**Mode** Privileged Exec

**Usage notes** Note that this command is an alias of the negated form of the debug ppp command.

**Examples** To disable PPP debugging for all PPP interfaces, enter the below command:

```
awplus# undebug ppp
```

To disable PPP debugging for PPP interfaces ppp0, enter the below command:

```
awplus# undebug ppp interface ppp0
```

To disable PPP debugging for PPP interfaces ppp0 through ppp2, enter the below command:

```
awplus# undebug ppp interface ppp0-ppp2
```

To disable PPP debugging for PPP interfaces ppp0 and ppp2, enter the below command:

```
awplus# undebug ppp interface ppp0,ppp2
```

# 23 PPP over Ethernet (PPPoE) Commands

## Introduction

**Overview**

This chapter provides an alphabetical reference of commands used to configure Point to Point Protocol over Ethernet (PPPoE) related features. This includes PPPoE Client, PPPoE Access Concentrator, and PPPoE Relay.

For more information, see the PPP Feature Overview and Configuration Guide and the L2TPv2 Tunneling of PPP Feature Overview and Configuration Guide.

**Command List**

- "clear pppoe-ac statistics" on page 777
- "client (pppoe-relay)" on page 778
- "debug pppoe-ac" on page 779
- "destination l2tp" on page 780
- "l2tp peer-address dns-lookup" on page 781
- "l2tp peer-address radius-lookup group" on page 783
- "l2tp peer-address static" on page 784
- "l2tp profile" on page 786
- "max-sessions" on page 788
- "ppp-auth-protocol" on page 789
- "pppoe-ac" on page 790
- "pppoe-ac-service" on page 791
- "pppoe-relay" on page 792
- "proxy-auth" on page 793
- "server (pppoe-relay)" on page 794
- "service-name" on page 795
- "show debugging pppoe ac" on page 797
- "show pppoe-ac config-check" on page 798

- "show pppoe-ac connections" on page 800
- "show pppoe-ac statistics" on page 802
- "show running-config pppoe-ac" on page 805
- "show running-config pppoe-relay" on page 806
- "timeout (pppoe-relay)" on page 807

# clear pppoe-ac statistics

**Overview** Use this command to zero all the PPPoE Access Concentrator statistics counters, and restart the counters incrementing from zero.

To see the affected counter values, use the command show pppoe-ac statistics.

**Syntax**
```
clear pppoe-ac statistics
```

**Default** n/a

**Mode** Privileged Exec

**Example** To set all the PPPoE Access Concentrator statistics counters to zero, use the command:

```
awplus# clear pppoe-ac statistics
```

**Related commands** show pppoe-ac statistics

# client (pppoe-relay)

**Overview** Use this command to configure a PPPoE relay client interface.

Use the **no** variant of this command to remove a PPPoE relay client interface.

**Syntax**

```
client <client-interface>
no client <client-interface>
```

| Parameter | Description |
|---|---|
| *<client-interface>* | The PPPoE relay client interface.<br>The valid interface types are: eth and vlan. |

**Default** None.

**Mode** PPPoE Relay Configuration

**Example** To configure eth1 as the client interface on PPPoE relay instance 'Telco1', use the commands:

```
awplus# pppoe-relay Telco1
awplus(config-pppoe-relay)# client eth1
```

To remove the eth1 client interface configured on PPPoE relay instance 'Telco1', use the commands:

```
awplus# pppoe-relay Telco1
awplus(config-pppoe-relay)# no client eth1
```

**Related commands**

pppoe-relay

show running-config pppoe-relay

**Command changes** Version 5.5.0-1.3: command added

# debug pppoe-ac

**Overview** Use this command to enable debugging of the PPPoE Access Concentrator.

Use the **no** variant of this command to disable debugging of the PPPoE Access Concentrator.

**Syntax**

```
debug pppoe-ac
no debug pppoe-ac
```

| Parameter | Description |
|---|---|
| *<varname>* | Description of varname |

**Default** PPPoE Access Concentrator debugging is disabled by default.

**Mode** Privileged Exec

**Example** To enable PPPoE AC debugging, use the commands:

```
awplus# debug pppoe-ac
awplus# terminal monitor
% Warning: Console logging enabled
```

**Related commands** debug l2tp

show debugging pppoe ac

# destination l2tp

**Overview** Use this command to set the destination to forward all PPPoE packets to the peer over L2TP.

Use the **no** variant of this command to unset the destination for PPPoE packets.

**Syntax**

```
destination l2tp
no destination
```

**Default** This command is not configured by default.

**Mode** PPPoE Access Concentrator Configuration

**Example** To sets the destination to forward all PPPoE packets for the service 'ISP-service' to the peer over L2TP, use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-ac ISP-service
awplus(config-pppoe-ac)# destination l2tp
```

To unset the destination for PPPoE packets for the service 'ISP-service', use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-ac ISP-service
awplus(config-pppoe-ac)# no destination
```

# l2tp peer-address dns-lookup

**Overview** Use this command to set the LNS address to use via a DNS lookup from the username email domain for this PPPoE Access Concentrator service.

Use the **no** variant of this command to remove the DNS lookup setting for this PPPoE AC service.

**Syntax**

```
l2tp peer-address dns-lookup [prefix <prefix>|]
no l2tp peer-address
```

| Parameter | Description |
|---|---|
| *<prefix>* | A string to prepend to the domain name portion of the username. |

**Default** This command is not set by default.

**Mode** PPPoE Access Concentrator Configuration

**Example** To set the LNS address to use via a DNS lookup for the PPPoE AC service 'ISP-service', use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-ac ISP-service
awplus(config-pppoe-ac)# l2tp peer-address dns-lookup
```

To set the LNS address to use via a DNS lookup and prepend "lns" to the domain name portion of the username, use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-ac ISP-service
awplus(config-pppoe-ac)# l2tp peer-address dns-lookup prefix
lns
```

To remove the DNS lookup setting for the PPPoE AC service 'ISP-service', use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-ac ISP-service
awplus(config-pppoe-ac)# no l2tp peer-address
```

# l2tp peer-address radius-lookup group

**Overview** Use this command to set this PPPoE Access Concentrator (AC) service to get the LNS address by a RADIUS lookup.

Use the **no** variant of this command to remove the L2TP peer address setting.

**Syntax**

```
l2tp peer-address radius-lookup group <radius-group-name>
no l2tp peer-address
```

| Parameter | Description |
|---|---|
| *<radius-group-name>* | The name of the RADIUS group to lookup. |

**Default** No L2TP peer address is set by default.

**Mode** PPPoE Access Concentrator Configuration

**Example** To find peer address via RADIUS lookup from Radius server group called "GROUP1", use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-ac ISP-service
awplus(config-pppoe-ac)# l2tp peer-address radius-lookup group GROUP1
```

To remove the RADIUS lookup setting for the PPPoE AC service 'ISP-service', use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-ac ISP-service
awplus(config-pppoe-ac)# no l2tp peer-address
```

**Related commands**

# l2tp peer-address static

**Overview** Use this command to set the IP address or fully qualified domain name of the L2TP peer (LNS) to which the L2TP tunnel should be established for this PPPoE Access Concentrator route.

Use the **no** variant of this command to remove the configured L2TP peer (LNS) address.

**Syntax**

```
l2tp peer-address static
{<l2tp-peer-ip-address>|<l2tp-peer-domain-name>}
```

```
no l2tp peer-address
```

| Parameter | Description |
|---|---|
| *<l2tp-peer-ip-address>* | The IPv4 address of the L2TP peer (LNS) for this PPPoE AC route, in dotted-decimal format. |
| *<l2tp-peer-domain-name>* | The fully-qualified domain name of the L2TP peer (LNS) for this PPPoE AC route. |

**Default** No L2TP peer address is configured by default.

**Mode** PPPoe Access Concentrator Configuration

**Example** To configure L2TP to tunnel all users to the LNS located at IP address 192.168.11.2, use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-ac ISP-service
awplus(cinfig-pppoe-ac)# l2tp peer-address static 192.168.11.2
```

To configure L2TP to tunnel all users to the LNS located at domain foo.mydomain.org, use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-ac ISP-service
awplus(config-pppoe-ac)# l2tp peer-address static
foo.mydomain.org
```

To remove the configured peer (LNS) address, use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-ac ISP-service
awplus(cinfig-pppoe-ac)# no l2tp peer-address
```

# l2tp profile

**Overview** Use this command to set the profile to use for L2TP traffic for this PPPoE Access Concentrator (AC).

Use the **no** variant of this command to remove L2TP profile setting from this PPPoE AC.

**Syntax**

```
l2tp profile <l2tp-profile-name>
no l2tp profile <l2tp-profile-name>
```

| Parameter | Description |
|---|---|
| *<l2tp-profile-name>* | The name of the L2TP profile that the PPPoE AC is to use. to use. |

**Default** This command is not configured by default.

**Mode** PPPoE Access Concentrator Configuration

**Usage** The L2TP profile name used in this command is created by the **l2tp-profile** command.

**Example** To allow AC service "ISP-service" to use the L2TP profile called "PUBLIC", use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-ac ISP-service
awplus(config-pppoe-ac)# l2tp profile PUBLIC
```

To unset the L2TP profile for the AC service "ISP-service", use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-ac ISP-service
awplus(config-pppoe-ac)# no l2tp profile PUBLIC
```

## show running-config pppoe-ac

# max-sessions

**Overview** Use this command to configure the maximum concurrent sessions for a PPPoE relay instance.

Use the **no** variant of this command to set a PPPoE relay maximum concurrent sessions to the default value.

**Syntax**

```
max-sessions <1-65534>
no max-sessions
```

| Parameter | Description |
|---|---|
| *<1-65534>* | The maximum number of concurrent sessions per PPPoE relay instance. |

**Default** 5000

**Mode** PPPoE Relay Configuration

**Example** To set the PPPoE relay maximum concurrent sessions to 50, use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-relay Telco1
awplus(config-pppoe-relay)# max-sessions 50
```

To set the PPPoE relay maximum concurrent sessions to the default, use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-relay Telco1
awplus(config-pppoe-relay)# no max-sessions
```

# ppp-auth-protocol

**Overview** Use this command to set the authentication protocol to be used for this PPPoE Access Concentrator (AC) service.

Use the **no** variant of this command to reset the authentication protocol to the default.

**Syntax**

```
ppp-auth-protocol {chap|pap|eap}
no ppp-auth-protocol
```

| Parameter | Description |
|---|---|
| chap | Set the PPP authentication protocol to Challenge Handshake Authentication Protocol (default). |
| pap | Set the PPP authentication protocol to Password Authentication Protocol. |
| eap | Set the PPP authentication protocol to Extensible Authentication Protocol. |

**Default** Default PPP authentication protocol is CHAP.

**Mode** PPPoE Access Concentrator Configuration

**Example** To set PPP authentication for the PPPoE AC service 'ISP-service' to use PAP, use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-ac ISP-service
awplus(config-pppoe-ac)# ppp-auth-protocol pap
```

To set PPP authentication to use the default (CHAP), use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-ac ISP-service
awplus(config-pppoe-ac)# no ppp-auth-protocol
```

# pppoe-ac

**Overview** Use this command to create a PPPoE Access Concentrator (AC) and put the device into PPPoE Access Concentrator Configuration mode, in which subsequent commands can be entered.

Use the **no** variant of this command to remove the PPPoE AC and all its configuration.

**Syntax**

```
pppoe-ac <label>
no pppoe-ac <label>
```

| Parameter | Description |
|---|---|
| *<label>* | A unique label for the PPPoE AC service. |

**Default** No PPPoE AC services are configured by default.

**Mode** Global Configuration

**Example** To configure a PPPoE AC called "ISP-service", use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-ac ISP-service
awplus(config-pppoe-ac)#
```

To remove a PPPoE AC called "ISP-service" and its configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no pppoe-ac ISP-service
```

show running-config pppoe-ac

# pppoe-ac-service

**Overview** Use this command to attach the specified PPPoE Access Concentrator (AC) service to the interface. An AC service can be offered on several interfaces. Up to six PPPoE AC services can be set for one interface. Only ETH and VLAN interfaces accept this command.

Use the **no** variant of this command to remove the AC service from the interface.

**Syntax**

```
pppoe-ac-service <label>
no pppoe-ac-service <label>
```

| Parameter | Description |
|---|---|
| *<label>* | The name (label) of the PPPoE AC service to be attached to the interface. |

**Default** No PPPoE AC service is attached to an interface by default.

**Mode** Interface Configuration

**Usage notes** The label of the PPPoE AC service specified in this command is created by the **pppoe-ac** command.

**Example** To provide a PPPoE AC service labeled 'ISP-service' for client requests received on interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# pppoe-ac-service ISP-service
```

To remove the PPPoE AC service 'isp1' from interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no pppoe-ac-service isp1
```

**Related commands** pppoe-ac

# pppoe-relay

**Overview** Use this command to create a PPPoE relay instance and put the device into PPPoE Relay Configuration mode, in which subsequent commands can be entered.

Use the **no** variant of this command to remove the PPPoE relay instance and all its configuration.

**Syntax**

```
pppoe-relay <relay-name>
no pppoe-relay <relay-name>
```

| Parameter | Description |
|---|---|
| *<relay-name>* | Name of the PPPoE relay instance |

**Default** None.

**Mode** Global Configuration

**Usage notes** PPPoE relay tracks state information for multiple Layer 2 PPPoE sessions, and allows multiple PPPoE client connections to be relayed between one or more client LANs and a WAN.

This allows the PPPoE client connections to have access to one or more service provider PPPoE Access Concentrators - whilst at the same time allowing Layer 3 IP traffic routing from the internal LAN(s) to the Internet.

Use this command to first create a PPPoE relay instance, then add a client and server interface to the instance.

**Example** To configure a PPPoE relay instance, use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-relay test
awplus(config-pppoe-relay)#
```

**Related commands**

client (pppoe-relay)

server (pppoe-relay)

max-sessions

show running-config pppoe-relay

**Command changes** Version 5.5.0-1.3: command added

# proxy-auth

**Overview** Use this command to enable the proxy authentication to allow PPP authentication data to be collected and sent to an L2TP peer in additional L2TP AVPs when the L2TP session is established.

Use the **no** variant of this command to disable the proxy authentication.

**Syntax**

```
proxy-auth
no proxy-auth
```

**Default** Proxy authentication is enabled by default.

**Mode** PPPoE Access Concentrator Configuration

**Example** To enable proxy authentication for the PPPoE AC service "ISP-service", use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-ac ISP-service
awplus(config-pppoe-ac)# proxy-auth
```

Disable proxy authentication for PPPoE AC service "ISP-service:

```
awplus# configure terminal
awplus(config)# pppoe-ac ISP-service
awplus(config-pppoe-ac)# no proxy-auth
```

# server (pppoe-relay)

**Overview** Use this command to configure a PPPoE relay server interface.

Use the **no** variant of this command to remove a PPPoE relay server interface.

**Syntax**

```
server <server-interface>
no server <server-interface>
```

| Parameter | Description |
|---|---|
| *<server-interface>* | The PPPoE relay server interface.<br>The valid interface types are: eth and vlan. |

**Default** None.

**Mode** PPPoE Relay Configuration

**Example** To configure eth1 as the server interface on PPPoE relay instance 'Telco2', use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-relay Telco2
awplus(config-pppoe-relay)# server eth1
```

To remove the eth1 server interface configured on PPPoE relay instance 'Telco2', use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-relay Telco2
awplus(config-pppoe-relay)# no server eth1
```

**Command changes** Version 5.5.0-1.3: command added

# service-name

**Overview** Use this command to configure the PPPoE service name offered by the Access Concentrator (AC).

Use the **no** variant of this command to remove the service offered by the AC.

**Syntax**

```
service-name {any|<service-name> [advertised]}
no service-name {any|<service-name>}
```

| Parameter | Description |
|---|---|
| *<service-name>* | The name of the service to be offered. |
| any | The service should be provided to any client requesting it, regardless of the service name they request. |
| advertised | Whether the service is advertised to other clients. |

**Default** No PPPoE service is configured by default.

**Mode** PPPoE Access Concentrator Configuration

**Example** To set the PPPoE AC labelled 'ISP-service' to provide service to any client requesting it, regardless of the service name they request, use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-ac ISP-service
awplus(config-pppoe-ac# service-name any
```

To offer a private (unadvertised) PPPoE service "internet" and an advertised PPPoE service "remote-office" to a client, use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-ac ISP-service
awplus(config-pppoe-ac)# service-name internet
awplus(config-pppoe-ac)# service-name remote-office advertised
```

To remove the non-matching (any) PPPoE service so that it is no longer offered to a client, use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-ac ISP-service
awplus(config-pppoe-ac)# no service-name any
```

To remove the private PPPoE service "internet" and advertised service "remote-office", so they are no longer offered to a client, use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-ac ISP-service
awplus(config-pppoe-ac)# no service-name internet
awplus(config-pppoe-ac)# no service-name remote-office
```

# show debugging pppoe ac

**Overview** Use this command to display the status of the PPPoE AC debugging.

**Syntax**

```
show debugging pppoe ac
```

**Mode** Privileged Exec

**Usage notes** Enable PPPoE AC debugging with the **debug pppoe-ac** command.

**Example** To display the status of PPPoE AC debugging, use the command:

```
awplus# show debugging pppoe ac
```

**Output** Figure 23-1: Example output from **show debugging pppoe ac**

```
awplus#show debugging pppoe ac
PPPoE-AC Debugging is on
```

**Related commands** debug pppoe-ac

# show pppoe-ac config-check

**Overview** Use this command to display information about the validity of the configurations for PPPoE AC routes.

**Syntax**

```
show pppoe-ac [<label>] config-check
```

| Parameter | Description |
|---|---|
| *<label>* | The label for the PPPoE AC service. |

**Mode** Privileged Exec

**Example** To display the validity of the configurations for all PPPoE AC services, use the command:

```
awplus# show pppoe-ac config-check
```

To display the validity of the configurations for the PPPoE AC labelled "ac1" only, use the command:

```
awplus# show pppoe-ac ac1 config-check
```

**Output** Figure 23-2: Example output from **show pppoe-ac config-check**

```
awplus#sh pppoe-ac config-check

PPPoE Access Concentrator ac:
  Incomplete Configuration
  Required: add pppoe-ac-service to one or more interfaces
  Required: destination
  Required: service-name
  Required: l2tp peer-address
  Required: l2tp profile

PPPoE Access Concentrator ac1:
  Incomplete Configuration
  Required: add pppoe-ac-service to one or more interfaces

PPPoE Access Concentrator pppoeservice:
  Complete Configuration
```

Table 23-1: Parameters in the output from **show pppoe-ac config-check**

| Parameter | Description |
|---|---|
| `Incomplete configuration` | Further configuration is required to create a valid PPPoE AC service. |

Table 23-1: Parameters in the output from **show pppoe-ac config-check** (cont.)

| Parameter | Description |
|---|---|
| `Complete configuration` | There is sufficient configuration of this PPPoE AC service to be valid. |
| `Required` | Parameters that still need to be configured for this PPPoE AC service. |

**Related commands**

pppoe-ac

show running-config pppoe-ac

# show pppoe-ac connections

**Overview** Use this command to display information about current routes for the specified PPPoE Access Concentrator (AC) service or for all PPPoE AC services.

**Syntax**

```
show pppoe-ac [<label>] connections
```

| Parameter | Description |
|---|---|
| *<label>* | The label for the PPPoE AC service. |

**Mode** User Exec and Privileged Exec

**Example** To display current routes information for all PPPoE AC services, use the command:

```
awplus# show pppoe-ac connections
```

To display information about connected routes for the PPPoE AC service 'pppoeservice' only, use the command:

```
awplus# show pppoe-ac pppoeservice connections
```

**Output** Figure 23-3: Example output from **show pppoe-ac connections**

```
awplus#show pppoe-ac connections
PPPoE Access Concentrator Connection Status

------------------------------------------------------------------
Route Name: pppoeservice-eth1
Route ID: 29785
Source Information
  Interface: eth1
  Session ID: 14204
  Service Name: test
  State: Open
  Peer MAC: 00:00:cd:38:01:4f
Destination Information
  Type: L2TP
  Tunnel ID: 11223
  Session ID: 57309
```

Table 23-2: Parameters in the output from **show pppoe-ac connections**

| Parameter | Description |
|---|---|
| Route Name | The name of the route. |
| Route ID | The ID of the route. |
| Source Information | Information about the source of the PPPoE route. |

Table 23-2: Parameters in the output from **show pppoe-ac connections** (cont.)

| Parameter | Description |
|---|---|
| `Interface` | The incoming interface name. |
| `Session ID` | The PPPoE session ID. |
| `Service Name` | The service name that this PPPoE AC is offering. This is the service name assigned by the **service-name** command. |
| `State` | The state of the PPPoE connection; e.g. open. |
| `Peer MAC` | The MAC address of the LNS. |
| `Destination Information` | Information about the destination for this PPPoE route. |
| `Type` | The type of destination of this PPPoE connection, for example, L2TP. |
| `Tunnel ID` | The ID of the L2TP tunnel. |
| `Session ID` | The ID of the PPPoE session. |

**Related commands** pppoe-ac

# show pppoe-ac statistics

**Overview** Use this command to displays the statistics for the PPPoE Access Concentrator (AC).

**Syntax**

```
show pppoe-ac statistics
```

**Mode** Privileged Exec

**Example** To display statistics for PPPoE AC, use the command:

```
awplus# show pppoe-ac statistics
```

**Output** Figure 23-4: Example output from **show pppoe-ac statistics**

```
awplus#sh pppoe-ac statistics
PPPoE Access Concentrator Statistics

# show running-config pppoe-relay

**Overview** Use this command to display the running configuration for PPPoE relay.

**Syntax**

```
show running-config pppoe-relay [<relay-name>]
```

| Parameter | Description |
|---|---|
| *<relay-name>* | Name of the PPPoE relay instance. |

**Default** None.

**Mode** Privileged Exec

**Example** To show all PPPoE relay configurations, use the command:

```
awplus# show running-config pppoe-relay
```

To show the PPPoE relay configuration for Telco1, use the command:

```
awplus# show running-config pppoe-relay Telco1
```

**Output** Figure 23-6: Example output from **show running-config pppoe-relay**

```
awplus#show running-config pppoe-relay

# timeout (pppoe-relay)

**Overview** Use this command to configure the PPPoE relay idle session timeout.

Use the **no** variant of this command to set the PPPoE relay idle session timeout to the default value.

**Syntax**

```
timeout {0|<30-86400>}
no timeout
```

| Parameter | Description |
|---|---|
| 0 | Sets the idle session timeout to never terminate PPPoE relay sessions. |
| *<30-86400>* | The PPPoE relay idle session timeout in seconds. |

**Default** 600 seconds.

**Mode** PPPoE Relay Configuration

**Example** To set the PPPoE relay idle session timeout to 30 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-relay Telco1
awplus(config-pppoe-relay)# timeout 1800
```

To set the PPPoE relay idle session timeout to never timeout, use the commands:

```
awplus# configure terminal
awplus(config)# pppoe-relay Telco1
awplus(config-pppoe-relay)# timeout 0
```

To set the PPPoE relay idle session timeout to the default value, use the commands:

```
awplus# configure terminal

# Part 3: Routing

# 24 IP Addressing and Protocol Commands

## Introduction

**Overview**

This chapter provides an alphabetical reference of commands used to configure various IP features, including the following protocols:

- Address Resolution Protocol (ARP)

For more information, see the IP Feature Overview and Configuration Guide.

**Command List**

- "arp-aging-timeout" on page 811
- "arp" on page 812
- "arp log" on page 814
- "arp opportunistic-nd" on page 817
- "arp-reply-bc-dmac" on page 819
- "clear arp-cache" on page 820
- "debug ip packet interface" on page 822
- "ip address (IP Addressing and Protocol)" on page 824
- "ip directed-broadcast" on page 826
- "ip forwarding" on page 828
- "ip forward-protocol udp" on page 829
- "ip gratuitous-arp-link" on page 831
- "ip helper-address" on page 833
- "ip icmp error-interval" on page 835
- "ip limited-local-proxy-arp" on page 836
- "ip local-proxy-arp" on page 838
- "ip proxy-arp" on page 839
- "ip redirects" on page 840

- "ip tcp synack-retries" on page 841
- "ip tcp timeout established" on page 842
- "ip unreachables" on page 843
- "local-proxy-arp" on page 845
- "optimistic-nd" on page 846
- "ping" on page 847
- "show arp" on page 849
- "show debugging ip packet" on page 851
- "show ip flooding-nexthops" on page 852
- "show ip forwarding" on page 853
- "show ip interface" on page 854
- "show ip interface vrf" on page 855
- "show ip sockets" on page 857
- "show ip traffic" on page 860
- "tcpdump" on page 862
- "traceroute" on page 863
- "undebug ip packet interface" on page 864

# arp-aging-timeout

**Overview** This command sets a timeout period on dynamic ARP entries associated with a specific interface. If your device stops receiving traffic for the host specified in a dynamic ARP entry, it deletes the ARP entry from the ARP cache after this timeout is reached.

Your device times out dynamic ARP entries to ensure that the cache does not fill with entries for hosts that are no longer active. Static ARP entries are not aged or automatically deleted.

By default the time limit for dynamic ARP entries is 300 seconds on all interfaces.

The **no** variant of this command sets the time limit to the default of 300 seconds.

**Syntax**

```
arp-aging-timeout <0-432000>
no arp-aging timeout
```

| Parameter | Description |
|---|---|
| *<0-432000>* | The timeout period in seconds. |

**Default** 300 seconds (5 minutes)

**Mode** Interface Configuration for a VLAN interface.

**Example** To set the ARP entries on interface vlan2 to time out after two minutes, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# arp-aging-timeout 120
```

**Related commands**

clear arp-cache

show arp

# arp

**Overview** This command adds a static ARP entry to the ARP cache. This is typically used to add entries for hosts that do not support ARP or to speed up the address resolution function for a host. The ARP entry must not already exist. Use the **alias** parameter to allow your device to respond to ARP requests for this IP address.

If VRF-lite is configured, you can add ARP entries to either the global cache or for a specific VRF instance.

The **no** variant of this command removes the static ARP entry. Use the clear arp-cache command to remove the dynamic ARP entries in the ARP cache.

**Syntax**

```
arp <ip-addr> <mac-address> [alias]
no arp <ip-addr>
```

**Syntax (VRF-lite)**

```
arp [vrf <vrf-name>] <ip-addr> <mac-address> [<port-number>]
[alias]
no arp [vrf <vrf-name>] <ip-addr>
```

| Parameter | Description |
|---|---|
| *<ip-addr>* | The IPv4 address of the device you are adding as a static ARP entry. |
| *<mac-address>* | The MAC address of the device you are adding as a static ARP entry, in hexadecimal notation with the format HHHH.HHHH.HHHH. |
| alias | Allows your device to respond to ARP requests for the IP address. Proxy ARP must be enabled on the interface before using this parameter. |
| vrf | Apply this command to a VRF instance. |
| *<vrf-name>* | The name of the VRF instance. |

**Mode** Global Configuration

**Examples** To add the IP address 10.10.10.9 with the MAC address 0010.2533.4566 into the ARP cache, and have your device respond to ARP requests for this address, use the commands:

```
awplus# configure terminal
awplus(config)# arp 10.10.10.9 0010.2533.4566 alias
```

**Example (VRF-lite)** To apply the above example within a VRF instance called `red` use the following commands:

```
awplus# configure terminal
awplus(config)# arp vrf red 10.10.10.9 0010.2533.4566 alias
```

**Related commands**

clear arp-cache

ip proxy-arp

show arp

**Command changes**

Version 5.4.6-2.1: VRF-lite support added.

# arp log

**Overview** This command enables the logging of dynamic and static ARP entries in the ARP cache. The ARP cache contains mappings of device ports, VLAN IDs, and IP addresses to physical MAC addresses for hosts.

This command can display the MAC addresses in the ARP log either using the notation HHHH.HHHH.HHHH, or using the IEEE standard hexadecimal notation (HH-HH-HH-HH-HH-HH).

Use the **no** variant of this command to disable the logging of ARP entries.

**Syntax**

```
arp log [mac-address-format ieee]
no arp log [mac-address-format ieee]
```

| Parameter | Description |
|---|---|
| `mac-address-format ieee` | Display the MAC address in the standard IEEE format (HH-HH-HH-HH-HH-HH), instead of displaying the MAC address with the format HHHH.HHHH.HHHH. |

**Default** The ARP logging feature is disabled by default.

**Mode** Global Configuration

**Usage notes** You have the option to change how the MAC address is displayed in the ARP log message. The output can either use the notation HHHH.HHHH.HHHH or HH-HH-HH-HH-HH-HH.

Enter **arp log** to use HHHH.HHHH.HHHH notation.

Enter **arp log mac-address-format ieee** to use HH-HH-HH-HH-HH-HH notation.

Enter **no arp log mac-address-format ieee** to revert from HH-HH-HH-HH-HH-HH to HHHH.HHHH.HHHH.

Enter **no arp log** to disable ARP logging.

To display ARP log messages use the command **show log | include ARP_LOG**.

**Examples** To enable ARP logging and specify that the MAC address in the log message is displayed in HHHH.HHHH.HHHH notation, use the following commands:

```
awplus# configure terminal
awplus(config)# arp log
```

To disable ARP logging on the device, use the following commands:

```
awplus# configure terminal
awplus(config)# no arp log
```

To enable ARP logging and specify that the MAC address in the log message is displayed in the standard IEEE format hexadecimal notation (HH-HH-HH-HH-HH-HH), use the following commands:

```
awplus# configure terminal
awplus(config)# arp log mac-address-format ieee
```

To leave ARP logging enabled, but stop using HH-HH-HH-HH-HH-HH format and use HHHH.HHHH.HHHH format instead, use the following commands:

```
awplus# configure terminal
awplus(config)# no arp log mac-address-format ieee
```

To display ARP log messages, use the following command:

```
awplus# show log | include ARP_LOG
```

**Output** Figure 24-1: Output from **show log | include ARP_LOG** after enabling ARP logging using **arp log**. Note that this output uses HHHH.HHHH.HHHH format.

```
awplus#configure terminal
awplus(config)#arp log
awplus(config)#exit
awplus#show log | include ARP_LOG

00-03-37-6b-a6-a5 (192.168.2.10)
2022 Mar 6 06:28:14 user.notice awplus IMISH[1830]: show log | include ARP_LOG
```

The following table lists the parameters shown in the output of the **show log | include ARP_LOG** command. The ARP log message format is:

```
<date> <time> <severity> <hostname> <program-name>
ARP_LOG <port-number> <vid> <operation> <MAC> <IP>
```

Table 24-1: Parameters in the output from **show log | include ARP_LOG**

| Parameter | Description |
|---|---|
| ARP_LOG | Indicates that ARP log entry information follows. |
| *<operation>* | Indicates "add" if the ARP log entry displays an ARP addition. Indicates "del" if the ARP log entry displays an ARP deletion. |
| *<MAC>* | Indicates the MAC address for the ARP log entry, either in the default hexadecimal notation (HHHH.HHHH.HHHH) or in the IEEE standard format hexadecimal notation (HH-HH-HH-HH-HH-HH) as specified with the **arp log** or the **arp log mac-address-format ieee** command. |
| *<IP>* | Indicates the IP address for the ARP log entry. |

**Related commands**

show log

show running-config

# arp opportunistic-nd

**Overview** Use this command to enable opportunistic neighbor discovery for the global ARP cache. This command changes the behavior for unsolicited ARP packet forwarding on the device.

***CAUTION:*** *Opportunistic neighbor discovery can make your device more vulnerable to ARP/ND cache poisoning attacks. We recommend disabling it unless necessary.*

When using VRF-lite, you can use this command to enable opportunistic neighbor discovery for a named VRF instance.

Use the **no** variant of this command to disable opportunistic neighbor discovery for the global ARP cache.

**Syntax**

```
arp opportunistic-nd
no arp opportunistic-nd
```

**Syntax (VRF-lite)**

```
arp opportunistic-nd [vrf <vrf-name>]
no arp opportunistic-nd [vrf <vrf-name>]
```

| Parameter | Description |
|---|---|
| `vrf` | Apply this command to a VRF instance. |
| `<vrf-name>` | The name of the VRF instance. |

**Default** Opportunistic neighbor discovery is disabled by default.

**Mode** Global Configuration

**Usage notes** When opportunistic neighbor discovery is enabled, the device will reply to any received unsolicited ARP packets (but not gratuitous ARP packets). The source MAC address for the unsolicited ARP packet is added to the ARP cache, so the device forwards the ARP packet. When opportunistic neighbor discovery is disabled, the source MAC address for the ARP packet is not added to the ARP cache, so the ARP packet is not forwarded by the device.

Note this command enables or disables opportunistic neighbor discovery for a VRF instance if the **vrf** parameter and an instance name are applied. If a VRF instance is not specified, then opportunistic neighbor discovery is enabled or disabled for device ports configured for IPv4.

**Examples** To enable opportunistic neighbor discovery for the global ARP cache, enter:

```
awplus# configure terminal
awplus(config)# arp opportunistic-nd
```

To disable opportunistic neighbor discovery for the global ARP cache, enter:

```
awplus# configure terminal
awplus(config)# no arp opportunistic-nd
```

**Example (VRF-lite)**

To enable opportunistic neighbor discovery for the VRF instance 'blue', enter:

```
awplus# configure terminal
awplus(config)# arp opportunistic-nd vrf blue
```

To disable opportunistic neighbor discovery for the VRF instance 'blue', enter:

```
awplus# configure terminal
awplus(config)# no arp opportunistic-nd vrf blue
```

**Related commands**

ipv6 opportunistic-nd

show arp

show running-config interface

**Command changes**

Version 5.4.6-2.1: VRF-lite support added.

# arp-reply-bc-dmac

**Overview** Use this command to allow processing of ARP replies that arrive with a broadcast destination MAC (ffff.ffff.ffff). This makes neighbors reachable if they send ARP responses that contain a broadcast destination MAC.

Use the **no** variant of this command to turn off processing of ARP replies that arrive with a broadcast destination MAC.

**Syntax**

```
arp-reply-bc-dmac
no arp-reply-bc-dmac
```

**Default** By default, this functionality is disabled.

**Mode** Interface Configuration for VLAN, Eth, WWAN, L2TP tunnel, Multipoint VPN GRE, and bridge interfaces and 802.1Q sub-interfaces.

**Example** To allow processing of ARP replies that arrive on vlan2 with a broadcast destination MAC, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# arp-reply-bc-dmac
```

**Related commands** clear arp-cache

show arp

# clear arp-cache

**Overview** This command deletes dynamic ARP entries from the ARP cache. You can optionally specify the IPv4 address of an ARP entry to be cleared from the ARP cache.

When running VRF-lite, this command deletes dynamic ARP entries either from the ARP cache of a specific VRF instance, or from the ARP cache of the Global VRF instance. To delete all ARP entries from both the Global VRF instance and all VRF instances, use the command with no parameters. You can optionally specify the IPv4 address for the VRF instance to clear an ARP entry from the ARP cache.

**Syntax**
```
clear arp-cache [<ip-address>]
```

**Syntax (VRF-lite)**
```
clear arp-cache [vrf <vrf-name>|global] [<ip-address>]
```

| Parameter | Description |
|---|---|
| *<ip-address>* | Specifies a specific IPv4 address for a VRF instance whose entries are to be cleared from the ARP cache. |
| `global` | When VRF-lite is configured, apply this command to the global routing and forwarding table. |
| `vrf` | Apply this command to the specified VRF instance. |
| *<vrf-name>* | The VRF instance name |

**Mode** Privileged Exec

**Usage notes** To display the entries in the ARP cache, use the show arp command. To remove static ARP entries, use the no variant of the arp command.

**Example** To clear all dynamic ARP entries, use the command:

```
awplus# clear arp-cache
```

To clear all dynamic ARP entries associated with the IPv4 address 192.168.1.1, use the command:

```
awplus# clear arp-cache 192.168.1.1
```

**Example (VRF-lite)** To clear the dynamic ARP entries from the VRF instance named blue, use the commands:

```
awplus# clear arp-cache vrf blue
```

To clear the dynamic ARP entries from the VRF instance named blue with the IPv4 address 192.168.1.1, use the commands:

```
awplus# clear arp-cache vrf blue 192.168.1.1
```

When running VRF-lite, to clear the dynamic ARP entries from the global VRF-lite and all VRF instances, use the command:

```
awplus# clear arp-cache
```

**Related commands**

arp

show arp

# debug ip packet interface

**Overview** The **debug ip packet interface** command enables IP packet debug and is controlled by the **terminal monitor** command.

If the optional **icmp** keyword is specified then ICMP packets are shown in the output.

The **no** variant of this command disables the **debug ip packet interface** command.

**Syntax**

```
debug ip packet interface {<interface-name>|all} [address
<ip-address>|verbose|hex|arp|udp|tcp|icmp]
```

```
no debug ip packet interface [<interface-name>]
```

| Parameter | Description |
|---|---|
| *<interface-name>* | Specify a single Layer 3 interface name (not a range of interfaces)<br>This keyword can be specified as either all or as a single Layer 3 interface to show debugging for either all interfaces or a single interface. |
| `all` | Specify all Layer 3 interfaces on the device. |
| *<ip-address>* | Specify an IPv4 address.<br>If this keyword is specified, then only packets with the specified IP address as specified in the ip-address placeholder are shown in the output. |
| `verbose` | Specify **verbose** to output more of the IP packet.<br>If this keyword is specified then more of the packet is shown in the output. |
| `hex` | Specify **hex** to output the IP packet in hexadecimal.<br>If this keyword is specified, then the output for the packet is shown in hex. |
| `arp` | Specify **arp** to output ARP protocol packets.<br>If this keyword is specified, then ARP packets are shown in the output. |
| `udp` | Specify **udp** to output UDP protocol packets.<br>If this keyword is specified then UDP packets are shown in the output. |
| `tcp` | Specify **tcp** to output TCP protocol packets.<br>If this keyword is specified, then TCP packets are shown in the output. |
| `icmp` | Specify **icmp** to output ICMP protocol packets.<br>If this keyword is specified, then ICMP packets are shown in the output. |

**Mode** Privileged Exec and Global Configuration

**Examples**

To turn on ARP packet debugging on vlan2, use the command:

```
awplus# debug ip packet interface vlan2 arp
```

To turn off IP packet interface debugging on interface vlan2, use the command:

```
awplus# no debug ip packet interface vlan2
```

To turn on all packet debugging on all interfaces on the device, use the command:

```
awplus# debug ip packet interface all
```

To turn off IP packet interface debugging on all interfaces, use the command:

```
awplus# no debug ip packet interface
```

To turn on TCP packet debugging on vlan2 and IP address 192.168.2.4, use the command:

```
awplus# debug ip packet interface vlan2 address 192.168.2.4 tcp
```

**Related commands**

no debug all

show debugging ip dns forwarding

tcpdump

terminal monitor

undebug ip packet interface

# ip address (IP Addressing and Protocol)

**Overview** This command sets a static IP address on an interface.

The **no** variant of this command removes the IP address from the interface.

You cannot remove the primary address when a secondary address is present.

**Syntax**

```
ip address <ip-addr/prefix-length> [secondary] [label <label>]
no ip address [<ip-addr/prefix-length>] [secondary]
```

| Parameter | Description |
|---|---|
| *<ip-addr/prefix-length>* | The IPv4 address and prefix length you are assigning to the interface. |
| `secondary` | Secondary IP address. |
| `label` | Adds a user-defined description of the secondary IP address. |
| *<label>* | A user-defined description of the secondary IP address. Valid characters are any printable character and spaces. |

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** To set the primary IP address on the interface, specify only **ip address** *<ip-addr/prefix-length>*. This overwrites any configured primary IP address. To add additional IP addresses on this interface, use the **secondary** parameter. You must configure a primary address on the interface before configuring a secondary address.

***NOTE:*** *Use **show running-config interface**, instead of **show ip interface brief**, when you need to view a secondary address configured on an interface. **show ip interface brief** will only show the primary address, not a secondary address for an interface.*

**Examples** To add the IP address 10.10.10.50/24 to the interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip address 10.10.10.50/24
```

To add the secondary IP address 10.10.11.50/24 to the same interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip address 10.10.11.50/24 secondary
```

To add the IP address 10.10.11.50/24 to the local loopback interface lo, use the following commands:

```
awplus# configure terminal
awplus(config)# interface lo
awplus(config-if)# ip address 10.10.11.50/24
```

To add the IP address 10.10.11.50/24 to the PPP interface ppp0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip address 10.10.11.50/24
```

To add the IP address 10.10.11.50/24 to the tunnel tunnel0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# ip address 10.10.11.50/24
```

**Related commands**

interface (to configure)

show ip interface

show running-config interface

# ip directed-broadcast

**Overview** Use this command to enable flooding of directed broadcast packets into a directly connected subnet. If this command is configured on an interface, then directed broadcasts received on other interfaces, destined for the subnet on this interface, will be flooded to the subnet broadcast address of this interface.

Use the **no** variant of this command to disable **ip directed-broadcast**. When this feature is disabled using the **no** variant of this command, directed broadcasts are not forwarded.

**Syntax**

```
ip directed-broadcast
no ip directed-broadcast
```

**Default** The **ip directed-broadcast** command is disabled by default.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** IP directed-broadcast is enabled and disabled per interface. When enabled a directed broadcast packet is forwarded to an enabled interface if received on another subnet.

An IP directed broadcast is an IP packet whose destination address is a broadcast address for some IP subnet, but originates from a node that is not itself part of that destination subnet. When a directed broadcast packet reaches a device that is directly connected to its destination subnet, that packet is flooded as a broadcast on the destination subnet.

The **ip directed-broadcast** command controls the flooding of directed broadcasts when they reach target subnets. The command affects the final transmission of the directed broadcast on its destination subnet. It does not affect the transit unicast routing of IP directed broadcasts. If directed broadcast is enabled for an interface, incoming directed broadcast IP packets intended for the subnet assigned to the interface will be flooded as broadcasts on that subnet.

If the **no ip directed-broadcast** command is configured for an interface, directed broadcasts destined for the subnet where the interface is attached will be dropped instead of broadcast.

**Examples** To enable the flooding of broadcast packets via the interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip directed-broadcast
```

To disable the flooding of broadcast packets via the interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ip directed-broadcast
```

**Related commands**

ip forward-protocol udp

ip helper-address

show running-config

# ip forwarding

**Overview** This command enables IP forwarding on your device. When enabled, your device routes IP packets.

The **no** variant of this command disables IP forwarding on your device. Even when IP forwarding is not enabled, the device can still work as an IP host; in particular, it can be managed by IP-based applications, such as SNMP, Telnet and SSH.

**Syntax**

```
ip forwarding
no ip forwarding
```

**Default** IP forwarding is enabled by default.

**Mode** Global Configuration

**Examples** To enable your device to route IP packets, use the commands:

```
awplus# configure terminal
awplus(config)# ip forwarding
```

To stop your device from routing IP packets, use the commands

```
awplus# configure terminal
awplus(config)# no ip forwarding
```

**Related commands** show ip forwarding

# ip forward-protocol udp

**Overview** This command enables you to control which UDP broadcasts will be forwarded to the helper address(es). A UDP broadcast will only be forwarded if the destination UDP port number in the packet matches one of the port numbers specified using this command.

Refer to the IANA site (www.iana.org) for a list of assigned UDP port numbers for protocols to forward using **ip forward-protocol udp**.

Use the **no** variant of this command to remove a port number from the list of destination port numbers that are used as the criterion for deciding if a given UDP broadcast should be forwarded to the IP helper address(es).

**Syntax**

```
ip forward-protocol udp <port>
no ip forward-protocol udp <port>
```

| Parameter | Description |
|---|---|
| *<port>* | UDP Port Number. |

**Default** The **ip forward-protocol udp** command is not enabled by default.

**Mode** Global Configuration

**Usage notes** Combined with the ip helper-address command in interface mode, the **ip forward-protocol udp** command in Global Configuration mode allows control of which protocols (destination port numbers) are forwarded. The **ip forward-protocol udp** command configures protocols for forwarding, and the **ip helper-address** command configures the destination address(es).

***NOTE:***

*The types of UDP broadcast packets that the device will forward are ONLY those specified by the **ip forward-protocol** command(s). There are no other UDP packet types that the IP helper process forwards by default.*

**Examples** To configure forwarding of packets on a UDP port, use the following commands:

```
awplus# configure terminal
awplus(config)# ip forward-protocol udp <port>
```

To delete a UDP port from the UDP ports that the device forwards, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip forward-protocol udp <port>
```

**Related commands**

ip helper-address

ip directed-broadcast

show running-config

# ip gratuitous-arp-link

**Overview** This command sets the Gratuitous ARP time limit for all interfaces. The time limit restricts the sending of Gratuitous ARP packets to one Gratuitous ARP packet within the time in seconds.

The **no** variant of the command sets the Gratuitous ARP time limit to the default.

***NOTE:*** *This command specifies time between sequences of Gratuitous ARP packets, and time between individual Gratuitous ARP packets occurring in a sequence, to allow legacy support for older devices and inter-operation between other devices that are not ready to receive and forward data until several seconds after linkup.*

*Additionally, jitter has been applied to the delay following linkup, so Gratuitous ARP packets applicable to a given port are spread over a period of 1 second so are not all sent at once. Remaining Gratuitous ARP packets in the sequence occur after a fixed delay from the first one.*

**Syntax**

```
ip gratuitous-arp-link <0-300>
no ip gratuitous-arp-link
```

| Parameter | Description |
|---|---|
| *<0-300>* | Specify the minimum time between sequences of Gratuitous ARPs and the fixed time between Gratuitous ARPs occurring in a sequence, in seconds.<br>0 disables the sending of Gratuitous ARP packets.<br>The default is 8 seconds. |

**Default** The default Gratuitous ARP time limit for all interfaces is 8 seconds.

**Mode** Global Configuration

**Usage** Every switchport will send a sequence of 3 Gratuitous ARP packets to each VLAN that the switchport is a member of, whenever the switchport moves to the forwarding state. The first Gratuitous ARP packet is sent 1 second after the switchport becomes a forwarding switchport. The second and third Gratuitous ARP packets are each sent after the time period specified by the Gratuitous ARP time limit.

Additionally, the Gratuitous ARP time limit specifies the minimum time between the end of one Gratuitous ARP sequence and the start of another Gratuitous ARP sequence. When a link is flapping, the switchport's state is set to forwarding several times. The Gratuitous ARP time limit is imposed to prevent Gratuitous ARP packets from being sent undesirably often.

**Examples** To disable the sending of Gratuitous ARP packets, use the commands :

```
awplus# configure terminal
awplus(config)# ip gratuitous-arp-link 0
```

To restrict the sending of Gratuitous ARP packets to one every 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip gratuitous-arp-link 20
```

**Related Commands** show running-config

# ip helper-address

**Overview** Use this command to add a forwarding destination address for IP Helper to enable forwarding of User Datagram Protocol (UDP) broadcasts on an interface.

Use the **no** variant of this command to disable the forwarding of broadcast packets to specific addresses.

**Syntax**

```
ip helper-address <ip-addr>
no ip helper-address <ip-addr>
```

| Parameter | Description |
|---|---|
| *<ip-addr>* | Forwarding destination IP address for IP Helper. |

**Default** The destination address for the **ip helper-address** command is not configured by default.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** Combined with the ip forward-protocol udp command in global configuration mode, the **ip helper-address** command in interface mode allows control of which protocols (destination port numbers) are forwarded. The **ip forward-protocol udp** command configures protocols for forwarding, and the **ip helper-address** command configures the destination address(es).

The destination address can be a unicast address or a subnet broadcast address. The UDP destination port is configured separately with the **ip forward-protocol udp** command. If multiple destination addresses are registered then UDP packets are forwarded to each IP address added to an IP Helper. Up to 32 destination addresses may be added using IP Helper.

The device will only forward the types of UDP broadcast packets that are specified by the **ip forward-protocol** command(s). The device does not forward any other UDP packet types by default.

The **ip helper-address** command does not support BOOTP / DHCP Relay. The service dhcp-relay command must be used instead. For this reason, you may not configure UDP ports 67 and 68 with the **ip forward-protocol** command.

See the IP Feature Overview and Configuration Guide for more information about DHCP Relay.

**Examples** The following example defines IPv4 address 192.168.1.100 as an IP Helper destination address to which to forward UDP broadcasts received on eth1:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip helper-address 192.168.1.100
```

The following example removes IPv4 address 192.168.1.100 as an IP Helper destination address to which to forward UDP broadcasts received on eth1:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ip helper-address 192.168.1.100
```

**Related commands**

ip forward-protocol udp

ip directed-broadcast

show running-config

# ip icmp error-interval

**Overview** Use this command to limit how often IPv4 ICMP error messages are sent. The maximum frequency of messages is specified in milliseconds.

Use the **no** variant of this command to reset the frequency to the default.

**Syntax**

```
ip icmp error-interval <interval>
no ip icmp error-interval
```

| Parameter | Description |
|---|---|
| *<interval>* | 0-2147483647, interval in milliseconds. |

**Default** 1000

**Mode** Global Configuration

**Example** To configure the rate to be at most one packet every 10 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip icmp error-interval 10000
```

To reset the rate to the default of one packet every second, use the commands:

```
awplus# configure terminal
awplus(config)# no ip icmp error-interval
```

**Related commands** ipv6 icmp error-interval

# ip limited-local-proxy-arp

**Overview** Use this command to enable local proxy ARP, but only for a specified set of IP addresses. This makes the device respond to ARP requests for those IP addresses when the addresses are reachable via the interface you are configuring.

To specify the IP addresses, use the command local-proxy-arp.

Use the **no** variant of this command to disable limited local proxy ARP. This stops your device from intercepting and responding to ARP requests for the specified hosts. This allows the hosts to use MAC address resolution to communicate directly with one another.

**Syntax**

```
ip limited-local-proxy-arp
no ip limited-local-proxy-arp
```

**Default** Limited local proxy ARP is disabled by default.

**Mode** Interface Configuration for VLAN, Eth, WWAN, L2TP tunnel, Multipoint VPN GRE, and bridge interfaces and 802.1Q sub-interfaces.

**Usage** Limited local proxy ARP supports Static NAT configurations in which the NAT configuration's public address is different to the Ethernet interface's address.

On such Ethernet interfaces, the device needs to respond to ARP requests for the public address so that it will receive packets targeted at that address.

Limited local proxy ARP makes this possible. It is especially useful when you have a number of 1-1 NAT configurations and each public address falls within the public interface's subnet. If you enable limited local proxy ARP on the public interface and specify suitable addresses, the device will respond to ARP requests for those addresses, as long as the addresses are routed out the interface the ARP requests are received on. The device responds with its own MAC address.

**Example** The following configuration snippet shows how to use limited local proxy ARP, if you are using NAT for an HTTP server with an address of 172.22.0.3 connected via eth1, and eth1 has an address of 172.22.0.1:

```
! Create a private zone for the HTTP server with address 172.22.200.3:
zone private
network vlan1
ip subnet 172.22.200.0/24
host http_server
ip address 172.22.200.3
!
! Create a public zone for the HTTP server with address 172.22.0.3:
zone public
network eth1
ip subnet 0.0.0.0/0 interface eth1
host http_server
ip address 172.22.0.3
!
! Create a NAT rule to map from the public to the private zone:
nat
rule 10 portfwd http from public.eth1 to public.eth1.http_server with dst
private.vlan1.http_server
enable
!
! Configure eth1. It has a different public address than the HTTP server:
interface eth1
ip limited local-proxy-arp
ip address 172.22.0.1/24
!
! Configure vlan1:
interface vlan1
ip address 172.22.200.5/24
!
! Tell the device to respond to ARPs for the HTTP server public address:
local-proxy-arp 172.22.0.3/32
```

**Related commands** ip local-proxy-arp

local-proxy-arp

# ip local-proxy-arp

**Overview** This command allows you to stop MAC address resolution between hosts within a subnet. Local Proxy ARP works by intercepting ARP requests between hosts within a subnet and responding with your device's own MAC address details instead of the destination host's details. This stops hosts from learning the MAC address of other hosts within its subnet through ARP requests.

Local Proxy ARP ensures that devices within a subnet cannot send traffic that bypasses Layer 3 routing on your device. This lets you monitor and filter traffic between hosts in the same subnet, and enables you to have control over which hosts may communicate with one another.

When Local Proxy ARP is operating on an interface, your device does not generate or forward any ICMP-Redirect messages on that interface. This command does not enable proxy ARP on the interface; see the ip proxy-arp command for more information on enabling proxy ARP.

The **no** variant of this command disables Local Proxy ARP to stop your device from intercepting and responding to ARP requests between hosts within a subnet. This allows the hosts to use MAC address resolution to communicate directly with one another. Local Proxy ARP is disabled by default.

**Syntax**

```
ip local-proxy-arp
no ip local-proxy-arp
```

**Default** Local Proxy ARP is disabled by default.

**Mode** Interface Configuration for VLAN, Eth, WWAN, L2TP tunnel, Multipoint VPN GRE, and bridge interfaces and 802.1Q sub-interfaces.

**Examples** To enable your device to apply Local Proxy ARP on the interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip local-proxy-arp
```

To stop your device from doing Local Proxy ARP on the interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip local-proxy-arp
```

**Related commands** ip proxy-arp

show arp

show running-config

# ip proxy-arp

**Overview** This command enables Proxy ARP responses to ARP requests on an interface. When enabled, your device intercepts ARP broadcast packets and substitutes its own physical address for that of the remote host. By responding to the ARP request, your device ensures that subsequent packets from the local host are directed to its physical address, and it can then forward these to the remote host.

Your device responds only when it has a specific route to the address being requested, excluding the interface route that the ARP request arrived from. It ignores all other ARP requests. See the ip local-proxy-arp command about enabling your device to respond to other ARP messages.

The **no** variant of this command disables Proxy ARP responses on an interface. Proxy ARP is disabled by default.

**Syntax**

```
ip proxy-arp
no ip proxy-arp
```

**Default** Proxy ARP is disabled by default.

**Mode** Interface Configuration for VLAN, Eth, WWAN, L2TP tunnel, Multipoint VPN GRE, and bridge interfaces and 802.1Q sub-interfaces.

**Examples** To enable your device to do Proxy ARP on the interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip proxy-arp
```

To stop your device from doing Proxy ARP on the interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip proxy-arp
```

**Related commands**

arp

ip local-proxy-arp

show arp

show running-config

# ip redirects

**Overview** This command enables the device to send ICMP redirects.

Use the **no** variant of this command to stop the device from sending ICMP redirects.

**Syntax**

```
ip redirects
no ip redirects
```

**Default** ICMP redirects are disabled by default.

**Mode** Global Configuration.

**Usage notes** ICMP redirect messages are used to notify hosts that a better route is available to a destination.

ICMP redirects are used when a packet is routed into the device on the same interface that the packet is routed out of the device. ICMP redirects are only sent to packet sources that are directly connected to the device.

**Examples** To enable the switch to send ICMP redirects, use the following commands:

```
awplus# configure terminal
awplus(config)# ip redirects
```

To stop the switch from sending ICMP redirects, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip redirects
```

# ip tcp synack-retries

**Overview** Use this command to specify how many times the switch will retry sending a SYN ACK for a TCP connection for which it has received a SYN but not an ACK. Such connections are called half-open TCP connections. This command allows you to influence how long half-open TCP connections take to time out.

Use the **no** variant of this command to return to the default setting of 5 retries.

**Syntax**

```
ip tcp synack-retries <0-255>
no ip tcp synack-retries
```

| Parameter | Description |
|---|---|
| *<0-255>* | Number of times to retry sending the SYN ACK |

**Default** 5 retries

**Mode** Global Configuration

**Usage notes** The following table shows the approximate correlation between the number of retries and the time half-open TCP connections take to time out.

| Number of retries | Approximate lower bound for the timeout |
|---|---|
| 0 retries | 1 second |
| 1 retry | 3 seconds |
| 2 retries | 7 seconds |
| 3 retries | 15 seconds |
| 4 retries | 31 seconds |
| 5 retries | 63 seconds |

**Example** To retry twice, which leads to a timeout of approximately 7 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip tcp synack-retries 2
```

**Related commands** show running-config

**Command changes** Version 5.4.7-0.2: command added

# ip tcp timeout established

**Overview** Use this command to set the idle timeout for all established TCP connections.

Use the **no** variant of this command to set the idle timeout back to the default of 3600 seconds.

**Syntax**

```
ip tcp timeout established <1-31536000>
no ip tcp timeout established
```

| Parameter | Description |
|---|---|
| *<1-31536000>* | Idle timeout for established TCP connections in seconds from 1 to 3153600. |

**Default** 3600 seconds (1 hour)

**Mode** Global Configuration

**Usage notes** By default, when a TCP session is successfully established through the firewall, when the session goes idle, it automatically times out of the firewall connection tracking table after 3600 seconds. In some situations it may be beneficial to time out unused established TCP sessions earlier.

For example, in a busy environment where there is an excessive number of sessions being established, the firewall connection tracking table could become oversubscribed, with new connections being blocked until older sessions are timed out.

**Example** To set a non-default TCP session timeout for established idle sessions of 1800 seconds (30 minutes), use the commands:

```
awplus# configure terminal
awplus(config)# ip tcp timeout established 1800
```

**Example** To set the TCP session timeout for established idle sessions back to the default setting of 3600 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip tcp timeout established
```

**Related commands** show running-config

**Command changes** Version 5.4.6-1.1: command added

# ip unreachables

**Overview** Use this command to enable ICMP (Internet Control Message Protocol) type 3, destination unreachable, messages.

Use the **no** variant of this command to disable destination unreachable messages. This prevents an attacker from using these messages to discover the topology of a network.

**Syntax**

```
ip unreachables
no ip unreachables
```

**Default** Destination unreachable messages are enabled by default.

**Mode** Global Configuration

**Usage notes** When a device receives a packet for a destination that is unreachable it returns an ICMP type 3 message, this message includes a reason code, as per the table below. An attacker can use these messages to obtain information regarding the topology of a network. Disabling destination unreachable messages, using the **no ip unreachables** command, secures your network against this type of probing.

***NOTE:*** *Disabling ICMP destination unreachable messages breaks applications such as traceroute and Path MTU Discovery (PMTUD), which depend on these messages to operate correctly.*

Table 24-2: ICMP type 3 reason codes and description

| Code | Description [RFC] |
|---|---|
| 0 | Network unreachable [RFC792] |
| 1 | Host unreachable [RFC792] |
| 2 | Protocol unreachable [RFC792] |
| 3 | Port unreachable [RFC792] |
| 4 | Fragmentation required, and DF flag set [RFC792] |
| 5 | Source route failed [RFC792] |
| 6 | Destination network unknown [RFC1122] |
| 7 | Destination host unknown [RFC1122] |
| 8 | Source host isolated [RFC1122] |
| 9 | Network administratively prohibited [RFC768] |
| 10 | Host administratively prohibited [RFC869] |
| 11 | Network unreachable for Type of Service [RFC908] |
| 12 | Host unreachable for Type of Service [RFC938] |
| 13 | Communication administratively prohibited [RFC905] |

Table 24-2: ICMP type 3 reason codes and description (cont.)

| Code | Description [RFC] |
|---|---|
| 14 | Host Precedence Violation [RFC1812] |
| 15 | Precedence cutoff in effect [RFC1812] |

**Example** To disable destination unreachable messages, use the commands

```
awplus# configure terminal
awplus(config)# no ip unreachables
```

To enable destination unreachable messages, use the commands

```
awplus# configure terminal
awplus(config)# ip unreachables
```

# local-proxy-arp

**Overview** Use this command to specify an IP subnet for use with limited local proxy ARP. When limited local proxy ARP is enabled with the command ip limited-local-proxy-arp, the device will respond to ARP requests for addresses in that subnet.

Use the **no** variant of this command to stop specifying a subnet for use with limited local proxy ARP.

**Syntax**

```
local-proxy-arp [<ip-add/mask>]
no local-proxy-arp [<ip-add/mask>]
```

| Parameter | Description |
|---|---|
| *<ip-add/mask>* | The IP subnet to use with limited local proxy ARP, in dotted decimal format (A.B.C.D/M). To specify a single IP address, use a 32-bit mask. |

**Default** No subnets are specified for use with limited local proxy ARP.

**Mode** Global Configuration

**Example** To specify limited local proxy ARP for the address 172.22.0.3, use the following commands:

```
awplus# configure terminal
awplus(config)# local-proxy-arp 172.22.0.3/32
```

This is part of a configuration snippet that shows how to use limited local proxy ARP with static NAT. See the command ip limited-local-proxy-arp for the whole example.

**Related commands** ip limited-local-proxy-arp

# optimistic-nd

**Overview** Use this command to enable the optimistic neighbor discovery feature for both IPv4 and IPv6.

Use the **no** variant of this command to disable the optimistic neighbor discovery feature.

**Syntax**

```
optimistic-nd
no optimistic-nd
```

**Default** The optimistic neighbor discovery feature is enabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** The optimistic neighbor discovery feature allows the device, after learning an IPv4 or IPv6 neighbor, to refresh the neighbor before it is deleted from the ARP or neighbor tables. The optimistic neighbor discovery feature enables the device to sustain L3 traffic switching to a neighbor without interruption.

If a neighbor receiving optimistic neighbor solicitations does not answer optimistic neighbor solicitations with neighbor advertisements, then the device puts the neighbor entry into the 'stale' state, and subsequently deletes it from the L3 switching tables.

**Examples** To enable the optimistic neighbor discovery feature on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# optimistic-nd
```

To disable the optimistic neighbor discovery feature on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no optimistic-nd
```

**Related commands** show running-config

# ping

**Overview** This command sends a query to another IPv4 host (send Echo Request messages).

**Syntax**

```
ping [ip] <host> [broadcast] [df-bit {yes|no}] [interval
<0-128>] [pattern <hex-data-pattern>] [repeat
{<1-2147483647>|continuous}] [size <36-18024>] [source
<ip-addr>] [timeout <1-65535>] [tos <0-255>]
```

**Syntax (VRF-lite)**

```
ping [vrf <vrf-name>] [ip] <host> [broadcast] [df-bit {yes|no}]
[interval <0-128>] [pattern <hex-data-pattern>] [repeat
{<1-2147483647>|continuous}] [size <36-18024>] [source
<ip-addr>] [timeout <1-65535>] [tos <0-255>]
```

| Parameter | Description |
|---|---|
| *<host>* | The destination IP address or hostname. |
| broadcast | Allow pinging of a broadcast address. |
| df-bit | Enable or disable the do-not-fragment bit in the IP header. |
| interval *<0-128>* | Specify the time interval in seconds between sending ping packets. The default is 1. You can use decimal places to specify fractions of a second. For example, to ping every millisecond, set the interval to 0.001. |
| pattern *<hex-data-pattern>* | Specify the hex data pattern. |
| repeat | Specify the number of ping packets to send. |
| *<1-2147483647>* | Specify repeat count. The default is 5. |
| continuous | Continuous ping |
| size *<36-18024>* | The number of data bytes to send, excluding the 8 byte ICMP header. The default is 56 (64 ICMP data bytes). |
| source *<ip-addr>* | The IP address of a configured IP interface to use as the source in the IP header of the ping packet. |
| timeout *<1-65535>* | The time in seconds to wait for echo replies if the ARP entry is present, before reporting that no reply was received. If no ARP entry is present, it does not wait. |
| tos *<0-255>* | The value of the type of service in the IP header. |
| vrf | Apply the command to the specified VRF instance. |
| *<vrf-name>* | The name of the VRF instance. |

**Mode** User Exec and Privileged Exec

**Example** To ping the IP address 10.10.0.5 use the following command:

```
awplus# ping 10.10.0.5
```

**Example (VRF-lite)**

To ping the IP address 10.10.0.5 from VRF instance 'red', use the following command:

```
awplus# ping vrf red 10.10.0.5
```

***NOTE:*** *Unless a cross-domain static or leaked route exists to the destination IP address, you must run this command from within the same routing domain as the address being pinged.*

**Command changes**

Version 5.4.6-2.1: VRF-lite support added.

# show arp

**Overview** Use this command to display entries in the ARP routing and forwarding table—the ARP cache contains mappings of IP addresses to physical addresses for hosts. To have a dynamic entry in the ARP cache, a host must have used the ARP protocol to access another host.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show arp
```

**Syntax (VRF-lite)**

```
show arp [global|vrf <vrf-name>]
```

| Parameter | Description |
|---|---|
| `global` | When VRF-lite is configured, apply this command to the global routing and forwarding table |
| `vrf` | Apply this command to the specified VRF instance. |
| *<vrf-name>* | The VRF instance name |

**Mode** User Exec and Privileged Exec

**Usage notes** Running this command with no additional parameters will display all entries in the ARP routing and forwarding table.

With VRF-lite configured, and no additional parameters entered, the command output displays all entries, listed by their VRF instance. By adding either a specific VRF instance or global parameter entry, you can selectively list ARP entries by their membership of a specific VRF instance.

**Example** To display all ARP entries in the ARP cache, use the following command:

```
awplus# show arp
```

**Output** Figure 24-3: Example output from the **show arp** command

```
awplus#show arp
IP Address      LL Address       Interface  Port         Type
192.168.27.10   192.168.4.1      vlan1      port1.0.1    dynamic
192.168.27.100  0000.daaf.cd24   vlan1      port1.0.2    dynamic
...
```

**Example (VRF-lite)** To display the dynamic ARP entries in the global routing instance, use the command:

```
awplus# show arp global
```

**Output** Figure 24-4: Example output from the **show arp global** command

```
awplus#show arp global
IP Address      LL Address      Interface    Port        Type
192.168.10.2    0015.77ad.fad8  vlan1        port1.0.1   dynamic
192.168.20.2    0015.77ad.fa48  vlan2        port1.0.2   dynamic
192.168.1.100   00d0.6b04.2a42  vlan2        port1.0.3   static
```

**Example (VRF-lite)** To display the dynamic ARP entries for a VRF instance 'red', use the command:

```
awplus# show arp vrf red
```

**Output** Figure 24-5: Example output from the **show arp vrf red** command

```
awplus# show arp vrf red
[VRF: red]
  IP Address      LL Address      Interface    Port        Type
  192.168.10.2    0015.77ad.fad8  vlan1        port1.0.1   dynamic
```

**Table 25:** Parameters in the output of the **show arp** command

| Parameter | Meaning |
|---|---|
| IP Address | IP address of the network device this entry maps to. |
| LL Address | Hardware address of the network device. |
| Interface | Interface over which the network device is accessed. |
| Port | Physical port that the network device is attached to. |
| Type | Whether the entry is a static or dynamic entry. Static entries are added using the arp command. Dynamic entries are learned from ARP request/reply message exchanges. |
| VRF | The name of the VRF instance. The VRF-lite components only display when VRF-lite is configured. |

**Related commands**

arp

clear arp-cache

ip vrf

**Command changes**

Version 5.4.6-2.1: VRF-lite support added.

Version 5.4.9-0.1: Link layer addresses now shown as the hardware address (MAC Address output parameter has been renamed to LL Address).

# show debugging ip packet

**Overview** Use this command to see what debugging is turned on for IP interfaces. IP interface debugging is set using the **debug ip packet interface** command.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show debugging ip packet
```

**Mode** User Exec and Privileged Exec

**Example** To display the IP interface debugging status when the terminal monitor is off, use the commands:

```
awplus# terminal no monitor
awplus# show debugging ip packet
```

**Output** Figure 24-6: Example output from the **show debugging ip packet** command with **terminal monitor** off

```
awplus#terminal no monitor
awplus#show debugging ip packet
IP debugging status:
interface all tcp (stopped)
...
```

**Example** To display the IP interface debugging status when the terminal monitor is on, use the commands:

```
awplus# terminal monitor
awplus# show debugging ip packet
```

**Output** Figure 24-7: Example output from the **show debugging ip packet** command with **terminal monitor** on

```
awplus#terminal monitor
awplus#show debugging ip packet
IP debugging status:
interface all tcp (running)
...
```

**Related commands** debug ip packet interface

terminal monitor

# show ip flooding-nexthops

**Overview** Use this command to display the static and dynamic ARP entries in the ARP cache that flood packets to multiple ports.

When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax**
```
show ip flooding-nexthops
```

**Syntax (VRF-lite)**
```
show ip flooding-nexthops [vrf <vrf-name>|global]
```

| Parameter | Description |
|---|---|
| `vrf <vrf-name>` | VRF instance |
| `global` | Global Routing/Forwarding table |

**Mode** User Exec and Privileged Exec

**Usage notes** To display the flooding nexthop entries associated with a VRF instance, use the **show ip flooding-nexthops vrf** command in User Exec and Privileged Exec mode.

To display the entries in the global ARP table only, use the **show ip flooding-nexthop global** command.

**Example** To display all of the flooding nexthop entries in the ARP cache, use the command:

```
awplus# show ip flooding-nexthops
```

**Output** Figure 24-8: Example output from **show ip flooding-nexthops**

```
awplus#show ip flooding-nexthops
IP Address      MAC Address     Interface         Flooding Mode    Type
11.11.11.10     0300.0000.0011  vlan1             port-group       static
[VRF: test]
IP Address      MAC Address     Interface         Flooding Mode    Type
10.10.10.10     0100.0000.0000  vlan2             port-group       static
```

**Related commands** show arp

**Command changes** Version 5.4.8-2.1: command added

# show ip forwarding

**Overview** Use this command to display the IP forwarding status.

**Syntax**

```
show ip forwarding
```

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip forwarding
```

**Output** Figure 24-9: Example output from the **show ip forwarding** command

```
awplus#show ip forwarding
IP forwarding is on
```

**Related commands** ip forwarding

# show ip interface

**Overview** Use this command to display information about interfaces and the IP addresses assigned to them. To display information about a specific interface, specify the interface name with the command.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip interface [<interface-list>] [brief]
```

| Parameter | Description |
|---|---|
| *<interface-list>* | The interfaces to display information about. An interface-list can be:<br>• a PPP interface (e.g. ppp0)<br>• an Eth interface (e.g. eth1)<br>• an 802.1Q Ethernet sub-interface (e.g. eth1.10, where '10' is the VLAN ID specified by the **encapsulation dot1q** command)<br>• a VLAN (e.g. vlan2)<br>• a bridge interface (e.g. br0)<br>• a tunnel interface (e.g. tunnel0)<br>• a WWAN interface (e.g wwan0)<br>• the loopback interface (lo)<br>• a continuous range of interfaces, separated by a hyphen (e.g. ppp2-4)<br>• a comma-separated list (e.g. ppp0,ppp2-4). Do not mix interface types in a list.<br>The specified interfaces must exist. |

**Mode** User Exec and Privileged Exec

**Examples** To show the IP addresses assigned to ppp0, use the command:

```
awplus# show ip interface ppp0 brief
```

**Output** Figure 24-10: Example output from the **show ip interface brief** command

```
Interface               IP-Address      Status          Protocol
port1.0.1               unassigned      admin up        down
...
vlan1                   192.168.1.1     admin up        running
...
```

# show ip interface vrf

**Overview** Use this command to display protocol and status information about configured interfaces and their assigned IP addresses in VRF instances.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip interface [vrf <vrf-name>|global]
```

| Parameter | Description |
|---|---|
| `vrf` | A VRF instance. |
| *`<vrf-name>`* | The name of a specific VRF instance. |
| `global` | The global routing and forwarding table. |

**Mode** User Exec and Privileged Exec

**Examples** To display all interfaces and IP addresses associated with a VRF instance 'red', use the command:

```
awplus# show ip interface vrf red
```

**Output** Figure 24-11: Example output from **show ip interface vrf red**

```
[VRF: red]
Interface            IP-Address         Status       Protocol
lo1                  unassigned         admin up     running
vlan1                192.168.10.1/24    admin up     running
```

**Example** To display all interfaces and IP addresses associated with all VRF instances, use the command:

```
awplus# show ip interface
```

**Output** Figure 24-12: Example output from the **show ip interface** with VRF-lite configured

```
Interface               IP-Address          Status          Protocol
eth0                    unassigned          admin up        down
lo                      unassigned          admin up        running
vlan1                   192.168.1.1/24      admin up        running
vlan4                   172.30.4.43/24      admin up        down

[VRF: red]
Interface               IP-Address          Status
Protocol
lo1                     unassigned          admin up        running

[VRF: blue]
Interface               IP-Address          Status
Protocol
lo2                     unassigned          admin up        running
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip sockets

**Overview** Use this command to display information about the IP or TCP sockets that are present on the device. It includes TCP and UDP listen sockets, and displays the associated IP address and port.

The information displayed for established TCP sessions includes the remote IP address, port, and session state. Raw IP protocol listen socket information is also displayed for protocols such as VRRP and ICMP6, which are configured to receive IP packets with the associated protocol number.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip sockets
```

**Mode** Privileged Exec

**Usage notes** Use this command to verify that the socket being used is opening correctly. If there is a local and remote endpoint, a connection is established with the ports indicated.

Note that this command does not display sockets that are used internally for exchanging data between the various processes that exist on the device and are involved in its operation and management. It only displays sockets that are present for the purposes of communicating with other external devices.

**Example** To display IP sockets currently present on the device, use the command:

```
awplus# show ip sockets
```

**Output** Figure 24-13: Example output from **show ip sockets**

```
Socket information

Not showing 40 local connections
Not showing 7 local listening ports

Typ Local Address           Remote Address          State
tcp 0.0.0.0:111             0.0.0.0:*               LISTEN
tcp 0.0.0.0:80              0.0.0.0:*               LISTEN
tcp 0.0.0.0:23              0.0.0.0:*               LISTEN
tcp 0.0.0.0:443             0.0.0.0:*               LISTEN
tcp 0.0.0.0:4743            0.0.0.0:*               LISTEN
tcp 0.0.0.0:873             0.0.0.0:*               LISTEN
tcp :::23                   :::*                    LISTEN
udp 0.0.0.0:111             0.0.0.0:*
udp 226.94.1.1:5405         0.0.0.0:*

udp :::161                  :::*
raw 0.0.0.0:112             0.0.0.0:*               112
raw :::58                   :::*                    58
raw :::112                  :::*                    112
```

Table 24-1: Parameters in the output from **show ip sockets**

| Parameter | Description |
|---|---|
| `Not showing <number> local connections` | This field refers to established sessions between processes internal to the device, that are used in its operation and management. These sessions are not displayed as they are not useful to the user. <number> is some positive integer. |
| `Not showing <number> local listening ports` | This field refers to listening sockets belonging to processes internal to the device, that are used in its operation and management. They are not available to receive data from other devices. These sessions are not displayed as they are not useful to the user. <number> is some positive integer. |
| `Typ` | This column displays the type of the socket. Possible values for this column are:<br>`tcp` : IP Protocol 6<br>`udp` : IP Protocol 17<br>`raw` : Indicates that socket is for a non port-orientated protocol (i.e. a protocol other than TCP or UDP) where all packets of a specified IP protocol type are accepted. For raw socket entries the protocol type is indicated in subsequent columns. |
| `Local Address` | For TCP and UDP listening sockets this shows the destination IP address and destination TCP or UDP port number for which the socket will receive packets. The address and port are separated by ':'. If the socket will accept packets addressed to any of the device's IP addresses, the IP address will be 0.0.0.0 for IPv4 or :: for IPv6. For active TCP sessions the IP address will display which of the devices addresses the session was established with. For raw sockets this displays the IP address and IP protocol for which the socket will accept IP packets. The address and protocol are separated by ':'. If the socket will accept packets addressed to any of the device's IP addresses, the IP address will be 0.0.0.0 for IPv4 and :: for IPv6. IP Protocol assignments are described at:www.iana.org/assignments/protocol-numbers |

Table 24-1: Parameters in the output from **show ip sockets** (cont.)

| Parameter | Description |
|---|---|
| `Remote Address` | For TCP and UDP listening sockets this shows the source IP address (either IPv4 or IPv6) and source TCP or UDP port number for which the socket will accept packets. The address and port are separated by ':'. If the socket will accept packets addressed from any IP address, the IP address will be 0.0.0.0 for IPv4 . This is the usual case for a listening socket. Normally for a listen socket any source port will be accepted. This is indicated by ". For active TCP sessions the IP address will display the remote address and port the session was established with. For raw sockets the entry in this column will be 0.0.0.0: for IPv4 . |
| `State` | This column shows the state of the socket. For TCP sockets this shows the state of the TCP state machine. For UDP sockets this column is blank. For raw sockets it contains the IP protocol number. The possible TCP states are:<br>`LISTEN`<br>`SYN-SENT`<br>`SYN-RECEIVED`<br>`ESTABLISHED`<br>`FIN-WAIT-1`<br>`FIN-WAIT-2`<br>`CLOSE-WAIT`<br>`CLOSING`<br>`LAST-ACK`<br>`TIME-WAIT`<br>`CLOSED`<br>RFC793 contains the TCP state machine diagram with Section 3.2 describing each of the states. |

# show ip traffic

**Overview** Use this command to display statistics regarding IP traffic sent and received by all interfaces on the device, showing totals for IP and IPv6 and then broken down into sub-categories such as TCP, UDP, ICMP and their IPv6 equivalents when appropriate.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip traffic
```

**Mode** Privileged Exec

**Example** To display IP traffic statistics, use the command:

```
awplus# show ip traffic
```

**Output** Figure 24-14: Example output from the **show ip traffic** command

```
awplus#show ip traffic
IP:
    168475 packets received
    168475 delivered
    208099 sent
    35 dropped due to missing route
    22646409 bytes received
    126783216 bytes sent
    InCsumErrors 0
    InNoECTPkts 168475
    InECT1Pkts 0
    InECT0Pkts 0
    InCEPkts 0
    In107 Destination Unreachable
    Out11 Destination Unreachable
IPv6:
    14 packets received
    14 received packets delivered
    18 packets transmitted
...
ICMP6:
    4 messages sent
...
UDP6:
    Udp6RcvbufErrors 0
...
UDPLite6:
    UdpLite6RcvbufErrors 0
...
```

```
TCP:
    8 remote connections established
...
UDP:
    79797 datagrams received
...
UDPLite:
    InCsumErrors 0
...
```

# tcpdump

**Overview** Use this command to start a tcpdump, which gives the same output as the Unix-like **tcpdump** command to display TCP/IP traffic. Press `<ctrl> + c` to stop a running tcpdump.

**Syntax**
```
tcpdump <line>
```

**Syntax (VRF-lite)**
```
tcpdump [vrf <vrf-name>] <line>
```

| Parameter | Description |
|---|---|
| *<line>* | Specify the dump options. For more information on the options for this placeholder see http://www.tcpdump.org/tcpdump_man.html |
| `vrf` | Apply the command to the specified VRF instance. |
| *<vrf-name>* | The name of the VRF instance. |

**Mode** Privileged Exec

**Example** To start a tcpdump running to capture IP packets, enter the command:

```
awplus# tcpdump ip
```

**Example (VRF-lite)** To start a tcpdump on interface vlan2 associated with a VRF instance red, enter the command:

```
awplus# tcpdump vrf red vlan2
```

**Output** Figure 24-15: Example output from the **tcpdump** command

```
03:40:33.221337 IP 192.168.1.1 > 224.0.0.13: PIMv2, Hello,
length: 34
1 packets captured
2 packets received by filter
0 packets dropped by kernel
```

**Related commands** debug ip packet interface

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# traceroute

**Overview** Use this command to trace the route to the specified IPv4 host.

**Syntax**
```
traceroute {<ip-addr>|<hostname>}
```

**Syntax (VRF-lite)**
```
traceroute [vrf <vrf-name>] {<ip-addr>|<hostname>}
```

| Parameter | Description |
|---|---|
| *<ip-addr>* | The destination IPv4 address. The IPv4 address uses the format A.B.C.D. |
| *<hostname>* | The destination hostname. |
| `vrf` | Apply the command to the specified VRF instance. |
| *<vrf-name>* | The name of the VRF instance. |

**Mode** User Exec and Privileged Exec

**Example**
```
awplus# traceroute 10.10.0.5
```

**Example (VRF-lite)**
```
awplus# traceroute vrf red 192.168.0.1
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# undebug ip packet interface

**Overview** This command applies the functionality of the no debug ip packet interface command.

# 25 Domain Name Service (DNS) Commands

## Introduction

**Overview**

This chapter provides an alphabetical reference of commands used to configure Domain Name Service (DNS) features, including the following:

- DNS client
- DNS forwarding (DNS relay)
- Domain lists
- DDNS (Dynamic Domain Name System)

For more information about DNS and DDNS for AR-Series Firewalls, see the Domain Name System (DNS) for AlliedWare Plus AR-Series Firewalls Feature Overview and Configuration Guide.

**Command List**

- "accept-invalid-sslcert" on page 868
- "clear ip dns forwarding cache" on page 869
- "custom-failure" on page 870
- "custom-success" on page 871
- "ddns enable" on page 872
- "ddns-update-method" on page 873
- "ddns-update now" on page 875
- "debug ddns" on page 876
- "debug ip dns forwarding" on page 877
- "description (domain-list)" on page 878
- "domain" on page 879
- "expect-html-response" on page 880
- "follow-redirects" on page 881
- "get-before-submit" on page 882

- "get-params" on page 883
- "host-name (ddns-update-method)" on page 884
- "ip ddns-update-method" on page 885
- "ip dns forwarding" on page 886
- "ip dns forwarding cache" on page 887
- "ip dns forwarding dead-time" on page 889
- "ip dns forwarding domain-list" on page 890
- "ip dns forwarding retry" on page 891
- "ip dns forwarding source-interface" on page 892
- "ip dns forwarding timeout" on page 893
- "ip domain-list" on page 894
- "ip domain-lookup" on page 895
- "ip domain-name" on page 897
- "ip name-server" on page 898
- "ip name-server preferred-order" on page 900
- "ipv6 ddns-update-method" on page 901
- "obey-form" on page 902
- "password (ddns-update-method)" on page 903
- "ppp ipcp dns" on page 904
- "ppp ipcp dns suffix-list" on page 906
- "retry-interval" on page 908
- "show ddns-update-method status" on page 909
- "show debugging ip dns forwarding" on page 910
- "show hosts" on page 911
- "show ip dns forwarding" on page 912
- "show ip dns forwarding cache" on page 913
- "show ip dns forwarding server" on page 915
- "show ip domain-list" on page 917
- "show ip domain-name" on page 918
- "show ip name-server" on page 919
- "suppress-ipv4-updates" on page 921
- "undebug ddns" on page 922
- "update-interval (ddns-update-method)" on page 923
- "update-url (ddns-update-method)" on page 924
- "use-ipv4-for-ipv6-updates" on page 927

- "username (ddns-update-method)" on page 928

# accept-invalid-sslcert

**Overview** Use this command to tell the dynamic DNS client to connect to an HTTPS server even if the server is producing an invalid SSL certificate (because it is self-signed, for a different host, expired, etc.).

Use the **no** variant of this command to return to the default.

**Syntax**

```
accept-invalid-sslcert
no accept-invalid-sslcert
```

**Default** Not set

**Mode** Dynamic DNS Update Method Configuration

**Example** If the HTTPS server you are using for the dynamic DNS configuration "test" does not have a valid SSL certificate, then use the following commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method test
awplus(config-ddns-update-method)# accept-invalid-sslcert
```

**Command changes** Version 5.5.0-0.1: command added

# clear ip dns forwarding cache

**Overview** Use this command to clear the DNS Relay name resolver cache.

When using VRF-lite, use this command to clear the DNS Relay name resolver cache for either the whole device or for a specific VRF instance.

**Syntax**
```
clear ip dns forwarding cache
```

**Syntax (VRF-lite)**
```
clear ip dns [vrf <name>|global] forwarding cache
```

| Parameter | Description |
|---|---|
| `vrf` | Apply this command to the specified VRF instance. |
| *<name>* | The name of the specific VRF instance |
| `global` | When VRF-lite is configured, apply this command to the global routing and forwarding table. |

**Mode** Privileged Exec

**Examples** To clear all cached data, use the command:

```
awplus# clear ip dns forwarding cache
```

**Example (VRF-lite)** To clear the cached data for VRF instance red, use the command:

```
awplus# clear ip dns vrf red forwarding cache
```

To clear the cached data for the default global VRF instance only, use the command:

```
awplus# clear ip dns global forwarding cache
```

**Related commands** ip dns forwarding cache

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# custom-failure

**Overview** Use this command to specify the update server's failure message for Dynamic DNS. You only need to do this if the failure message is different to the ones in DDNS's built-in list.

Use the **no** variant of this command to remove the customized failure message.

**Syntax**

```
custom-failure <failure-word>
no custom-failure
```

| Parameter | Description |
|---|---|
| *<failure-word>* | A word that the update server sends to indicate a failed update. |

**Default** No customized failure message

**Mode** Dynamic DNS Update Method Configuration

**Example** If the update server sends a message of 'AllBad' to indicate a failed update, use the commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method test
awplus(config-ddns-update-method)# custom-failure AllBad
```

**Related commands**

custom-success

ddns-update-method

show ddns-update-method status

**Command changes** Version 5.5.1-1.1: command added

# custom-success

**Overview** Use this command to specify the update server's success message for Dynamic DNS. You only need to do this if the success message is different to the ones in DDNS's built-in list.

Use the **no** variant of this command to remove the customized success message.

**Syntax**

```
custom-success <success-word>
no custom-success
```

| Parameter | Description |
|---|---|
| *<success-word>* | A word that the update server sends to indicate a successful update. |

**Default** No customized success message

**Mode** Dynamic DNS Update Method Configuration

**Example** If the update server sends a message of 'AllGood' to indicate a successful update, use the commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method test
awplus(config-ddns-update-method)# custom-success AllGood
```

**Related commands**

custom-failure

ddns-update-method

show ddns-update-method status

**Command changes** Version 5.5.1-1.1: command added

# ddns enable

**Overview** Use this command to globally enable or disable DDNS updates. DDNS updates are disabled by default. DDNS configuration will remain when the updates are disabled and DDNS will still be configurable when updates are disabled.

Use the **no** variant of this command to disable DDNS updates.

**Syntax**

```
ddns enable
no ddns enable
```

**Default** Disabled

**Mode** Global Configuration

**Example** To globally enable DDNS updates, use the commands:

```
awplus# configure terminal
awplus(config)# ddns enable
```

To globally disable DDNS updates, use the commands:

```
awplus# configure terminal
awplus(config)# no ddns enable
```

**Related commands** ddns-update-method

**Command changes** Version 5.4.7-0.1: command added

# ddns-update-method

**Overview** Use this command to create a new DDNS update method and enter DDNS Update Method Configuration mode.

Use the **no** variant of this command to remove a DDNS update method.

**Syntax**

```
ddns-update-method <method-name>
no ddns-update-method <method-name>
```

| Parameter | Description |
|---|---|
| *<method-name>* | The name of the DDNS method. |

**Default** None

**Mode** Global Configuration

**Example** To create a method named “dyndns”, use the commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method dyndns
awplus(config-ddns-update-method)#
```

**Related commands**

custom-failure

custom-success

ddns enable

ddns-update now

debug ddns

expect-html-response

host-name (ddns-update-method)

ip ddns-update-method

ipv6 ddns-update-method

password (ddns-update-method)

retry-interval

show ddns-update-method status

suppress-ipv4-updates

update-interval (ddns-update-method)

update-url (ddns-update-method)

use-ipv4-for-ipv6-updates

username (ddns-update-method)

**Command changes** Version 5.4.7-0.1: command added

# ddns-update now

**Overview** Use this command to manually update DDNS methods.

**Syntax**

```
ddns-update now
ddns-update method <method-name> now
```

| Parameter | Description |
|---|---|
| *<method-name>* | The DDNS update method name to use for the manual update. |

**Default** None

**Mode** Privileged Exec

**Usage notes** When no method name is entered, all DDNS update methods are updated. If a method name is specified, then only that method will update.

**Example** To manually update all DDNS update methods, use the command:

```
awplus# ddns-update now
```

To manually update the method “dyndns”, use the command:

```
awplus# ddns-update method dyndns now
```

**Related commands** ddns-update-method

**Command changes** Version 5.4.7-0.1: command added

# debug ddns

**Overview** Use this command to enable debugging for the DDNS process.

Use the **no** variant of this command to disable debugging for the DDNS process.

**Syntax**

```
debug ddns
no debug ddns
```

**Default** Disabled

**Mode** Privileged Exec

**Example** To enable debugging for the DDNS process, use the command:

```
awplus# debug ddns
```

To disable debugging for the DDNS process, use the command:

```
awplus# no debug ddns
```

**Related commands** ddns-update-method

undebug ddns

**Command changes** Version 5.4.7-0.1: command added

# debug ip dns forwarding

**Overview** Use this command to enable DNS Relay debugging.

Use the **no** variant of this command to disable DNS Relay debugging.

**Syntax**

```
debug ip dns forwarding
no debug ip dns forwarding
```

**Default** DNS Relay debugging is disabled by default.

**Mode** Privileged Exec

**Examples** To enable DNS forwarding debugging, use the commands:

```
awplus# debug ip dns forwarding
```

To disable DNS forwarding debugging, use the commands:

```
awplus# no debug ip dns forwarding
```

**Related commands** ip dns forwarding

show debugging ip dns forwarding

# description (domain-list)

**Overview** Use this command to give a description to a domain-list.

Use the **no** variant of this command to delete the description.

**Syntax**

```
description <text>
no description
```

| Parameter | Description |
|---|---|
| *<text>* | Description string, 128 characters maximum. The string may contain spaces. |

**Mode** Domain List

**Usage notes** When creating a domain-list, it is helpful to write a short description of what the list is to be used for.

**Examples** To add a description to a domain list, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding domain-list mydomains
awplus(config-domain-list)# description This is a useful
description of my domain list
```

To delete the description, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding domain-list mydomains
awplus(config-domain-list)# no description
```

**Related commands** ip dns forwarding domain-list

# domain

**Overview** Use this command to add a domain to a domain list.

Use the **no** variant of this command to delete the domain.

**Syntax**

```
domain <domain-string>
no domain <domain-string>
```

| Parameter | Description |
|---|---|
| *<domain-string>* | • A domain name must only contain a-z, A-Z, 0-9, '-' (en-dash) and '.' (period) characters.<br>• Each sub-section of the domain must not start or end with the '-' character.<br>• Each sub-section must have no more than 64 characters including the '.'.<br>• The last section must not have a '.' at the end.<br>• The whole domain must be less than 254 characters long. |

**Mode** Domain List

**Usage notes** Domain lists are objects that contain unsorted lists of domain names. After a domain list has been created, you can use this command to add domains to the domain list. There is no limit on the number of domains that can be added to a domain list.

**Examples** To add the domain "acme-solutions.com" to a domain list, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding domain-list acme-corporation
awplus(config-domain-list)# domain acme-solutions.com
```

To delete the domain, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding domain-list acme-corporation
awplus(config-domain-list)# no domain acme-solutions.com
```

**Related commands** ip dns forwarding domain-list

# expect-html-response

**Overview** Use this command to allow Dynamic DNS to accept HTML formatted responses from the update server (and reject non-HTML responses). You need this if the update server sends HTML responses instead of plain text responses.

Use the **no** variant of this command to stop Dynamic DNS from accepting HTML responses.

**Syntax**
```
expect-html-response
no expect-html-response
```

**Default** Disabled (HTML responses are rejected)

**Mode** Dynamic DNS Update Method Configuration

**Example** To configure DDNS to only accept an HTML response, use the commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method test
awplus(config-ddns-update-method)# expect-html-response
```

**Related commands** ddns-update-method

show ddns-update-method status

**Command changes** Version 5.5.1-1.1: command added

# follow-redirects

**Overview** Use this command to accept redirects during the initial GET request and during the update. See the command **get-before-submit**. The behavior without this command is to treat redirects as a failure.

Use the **no** variant of this command to disable following redirects.

**Syntax**

```
follow-redirects
no follow-redirects
```

**Default** disabled

**Mode** Dynamic DNS Update Method Configuration

**Example** To configure DDNS to accept redirects, use the commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method dyndns
awplus(config-ddns-update-method)# follow-redirects
```

**Related commands**

ddns-update-method

get-before-submit

obey-form

**Command changes** Version 5.5.1-0.1: command added

# get-before-submit

**Overview** Use this command to make DDNS perform a GET request for the page without any parameters before making the DDNS update submission.

Use the **no** variant of this command to disable this process.

**Syntax**

```
get-before-submit
no get-before-submit
```

**Default** Disabled

**Mode** Dynamic DNS Update Method Configuration

**Usage notes** This command may be required if the service you are using either:

- follows a series of redirects before accepting the update submission (see the command **follow-redirects**).

  or

- if the update submission is normally submitted by the browser and contains either a CSRF token or Session ID (see the command **get-params**).

***NOTE:*** *Cookies from this GET request are used during the update submission.*

**Example** To configure DDNS to perform a GET request for the page without any parameters before making the DDNS update submission, use the commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method dyndns
awplus(config-ddns-update-method)# get-before-submit
```

**Related commands**

ddns-update-method

follow-redirects

get-params

obey-form

**Command changes** Version 5.5.1-0.1: command added

# get-params

**Overview** Use this command to support update services that use CSRF and other session tracking. This command picks up the required input fields and adds them to the request when it is sent.

Use the **no** variant of this command to remove parameters.

**Syntax**

```
get-params <parameter-name>
no get-params
```

| Parameter | Description |
|---|---|
| *<parameter-name>* | A comma separated list of input fields to include the values in the update. |

**Default** No parameters are set

**Mode** Dynamic DNS Update Method Configuration

**Usage notes** During the **get-before-submit** stage, the HTML of the page is interpreted, and any input fields that match any of the names in the list are included as extra parameters when the update is submitted.

**Example** To configure the support update services that use CSRF, use the commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method dyndns
awplus(config-ddns-update-method)# get-before-submit
awplus(config-ddns-update-method)# get-params session,csrf
```

**Related commands** ddns-update-method

get-before-submit

**Command changes** Version 5.5.1-0.1: command added

# host-name (ddns-update-method)

**Overview** Use this command to add a host name for the current DDNS update method.

***NOTE:*** *A DDNS update method can only have one host name.*

Use the **no** variant of this command to remove the host name from the current DDNS update method.

**Syntax**

```
host-name <host-name>
no host-name
```

| Parameter | Description |
|---|---|
| *<host-name>* | The name of the host to be configured in conjunction with the user name and password. |

**Default** None

**Mode** Dynamic DNS Update Method Configuration

**Example** To add the host name “test.dyndns.org” for the DDNS update method “dyndns”, use the commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method dyndns
awplus(config-ddns-update-method)# host-name test.dyndns.org
```

To remove the host name “test.dyndns.org” from the DDNS update method “dyndns”, use the commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method dyndns
awplus(config-ddns-update-method)# no host-name
```

**Related commands** ddns-update-method

**Command changes** Version 5.4.7-0.1: command added

# ip ddns-update-method

**Overview** Use this command to enable an IPv4 interface to update DDNS with the specified DDNS update method.

Use the **no** variant of this command to disable an IPv4 interface to update DDNS with the specified DDNS update method.

**Syntax**

```
ip ddns-update-method <method-name>
no ip ddns-update-method <method-name>
```

| Parameter | Description |
|---|---|
| *<method-name>* | A name given to a DDNS update method. |

**Default** None

**Mode** Interface Configuration

**Usage notes** A DDNS update method cannot be attached to multiple interfaces, however multiple DDNS update methods can be assigned to the same interface.

**Example** To enable IPv4 DDNS updates for a DDNS update method named “dyndns” using interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip ddns-update-method dyndns
```

To disable IPv4 DDNS updates for a DDNS update method named “dyndns” using interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ip ddns-update-method dyndns
```

**Related commands** ddns-update-method

**Command changes** Version 5.4.7-0.1: command added

# ip dns forwarding

**Overview** Use this command to enable DNS Relay, the forwarding of incoming DNS queries for IP hostname-to-address translation.

Use the **no** variant of this command to disable the forwarding of incoming DNS queries for IP hostname-to-address translation.

**Syntax**

```
ip dns forwarding
no ip dns forwarding
```

**Default** The forwarding of incoming DNS query packets is disabled by default.

**Mode** Global Configuration

**Usage notes** DNS Relay is independent of the configuration of ip domain-lookup (which is enabled by default). If ip domain-lookup is disabled, but DNS Relay is enabled, the router will continue to forward DNS queries by hosts in the network to its configured name-servers.

See the ip dns forwarding dead-time command used with this command.

***NOTE:*** *When running VRF-lite, the DNS Relay functions will apply separately within each VRF instance.*

**Examples** To enable the forwarding of incoming DNS query packets, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding
```

To disable the forwarding of incoming DNS query packets, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding
```

show ip dns forwarding cache

show ip dns forwarding server

# ip dns forwarding cache

**Overview** Use this command to set the DNS Relay name resolver cache size and cache entry lifetime period. The DNS Relay name resolver cache stores the mappings between domain names and IP addresses.

Use the **no** variant of this command to set the default DNS Relay name resolver cache size and cache entry lifetime period.

Note that the lifetime period of the cache entry can be overwritten by the time-out period of the DNS reply from the DNS server if the time-out period of the DNS reply from the DNS server is smaller than the configured time-out period. The time-out period of the cache entry will only be used when the time-out period of the DNS reply from the DNS server is bigger than the time-out period configured on the device.

**Syntax**

```
ip dns forwarding cache [size <0-10000>] [timeout <60-3600>]
no ip dns forwarding cache [size|timeout]
```

| Parameter | Description |
|---|---|
| *<0-10000>* | Number of entries in the DNS Relay name resolver cache. |
| *<60-3600>* | Timeout value in seconds.<br>Note that when running VRF-lite the number of entries configured will apply to each VRF instance. |

**Default** The default cache size is 0 (no entries) and the default lifetime is 1800 seconds.

**Mode** Global Configuration

**Examples** To set the cache size to `10` entries and the lifetime to `500` seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding cache size 10 time 500
```

To set the cache size to the default, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding cache size
```

**Related commands**

clear ip dns forwarding cache

debug ip dns forwarding

ip dns forwarding

show ip dns forwarding

show ip dns forwarding cache

**Command changes** Version 5.4.8-1.1: maximum cache limit increased to 10000

# ip dns forwarding dead-time

**Overview** Use this command to set the time period in seconds when the device stops sending any DNS requests to an unresponsive server and all retries set using ip dns forwarding retry are used. This time period is the DNS forwarding dead-time. The device stops sending DNS requests at the DNS forwarding dead-time configured and when all of the retries are used.

Use the **no** variant of this command to restore the default DNS forwarding dead-time value of 3600 seconds.

**Syntax**

```
ip dns forwarding dead-time <60-43200>
no ip dns forwarding retry
```

**Default** The default time to stop sending DNS requests to an unresponsive server is 3600 seconds.

**Mode** Global Configuration

**Usage notes** See the ip dns forwarding retry command used with this command.

**Examples** To set the DNS forwarding retry count to 50 and to set the DNS forwarding dead-time to 1800 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding dead-time 1800
awplus(config)# ip dns forwarding retry 50
```

To reset the DNS retry count to the default of 2 and the DNS forwarding dead-time to the default of 3600, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding dead-time
awplus(config)# no ip dns forwarding retry
```

**Related commands**

debug ip dns forwarding

ip dns forwarding

ip dns forwarding retry

show ip dns forwarding

show ip dns forwarding server

# ip dns forwarding domain-list

**Overview** Use this command to create a domain-list that can be used as a suffix-list for DNS lookups. This command puts the device into a new mode where subsequent commands can be entered. The new mode is "Domain List Configuration" mode.

Use the **no** variant of this command to delete the domain-list.

**Syntax**

```
ip dns forwarding domain-list <domain-list-name>
no ip dns forwarding domain-list <domain-list-name>
```

| Parameter | Description |
|---|---|
| *<domain-list-name>* | Name of the list. |

**Mode** Global Configuration

**Usage notes** The domain list can be used by features that need to match against domains. A domain list by itself does nothing; it must be attached to another feature to have functionality (like a prefix-list).For example, the domain list can be used as a suffix list on an DNS name-server. The DNS server can be either statically configured, or learned over a PPP connection.

Note that this command is separate from the **ip domain-list** command, which is used by DNS client to append a domain on to the end of a partial hostname to form a fully-qualified domain.

**Examples** To create a domain list to include domains that are internal to the company such as "engineering.acme" or "intranet.acme", use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding domain-list corporatedomains
awplus(config-domain-list)# description internal network domain
awplus(config-domain-list)# domain engineering.acme
awplus(config-domain-list)# domain intranet.acme
```

To delete the domain list, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding domain-list
corporatedomains
```

**Related commands** description (domain-list)

domain

# ip dns forwarding retry

**Overview** Use this command to set the number of times DNS Relay will retry to forward DNS queries. The device stops sending DNS requests to an unresponsive server at the time set using the ip dns forwarding dead-time command and when all of the retries are used.

Use the **no** variant of this command to set the number of retries to the default of 2.

**Syntax**

```
ip dns forwarding retry <0-100>
no ip dns forwarding retry
```

**Default** The default number of retries is 2 DNS requests to an unresponsive server.

**Mode** Global Configuration

**Usage notes** See the ip dns forwarding dead-time command used with this command.

**Examples** To set the DNS forwarding retry count to `50` and to set the DNS forwarding dead-time to `1800` seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding retry 50
awplus(config)# ip dns forwarding dead-time 1800
```

To reset the DNS retry count to the default of `2` and the DNS forwarding dead-time to the default of `3600` seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding retry
awplus(config)# no ip dns forwarding dead-time
```

**Related commands**

debug ip dns forwarding

ip dns forwarding

ip dns forwarding dead-time

show ip dns forwarding

# ip dns forwarding source-interface

**Overview** Use this command to set the interface to use for forwarding and receiving DNS queries.

Use the **no** variant of this command to unset the interface used for forwarding and receiving DNS queries.

**Syntax**

```
ip dns forwarding source-interface <interface-name>
no ip dns forwarding source-interface
```

| Parameter | Description |
|---|---|
| *<interface-name>* | An alphanumeric string that is the interface name. |

**Default** The default is that no interface is set and the device selects the appropriate source IP address automatically.

**Mode** Global Configuration

**Examples** To set eth1.2 as the source interface for relayed DNS queries, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding source-interface eth1.2
```

To clear the source interface for relayed DNS queries, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding source-interface
```

**Related commands**

debug ip dns forwarding

ip dns forwarding

show ip dns forwarding

# ip dns forwarding timeout

**Overview** Use this command to set the time period for the DNS Relay to wait for a DNS response.

Use the **no** variant of this command to set the time period to wait for a DNS response to the default of 3 seconds.

**Syntax**

```
ip dns forwarding timeout <0-3600>
no ip dns forwarding timeout
```

**Default** The default timeout value is 3 seconds.

**Mode** Global Configuration

**Examples** To set the timeout value to `12` seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding timeout 12
```

To set the timeout value to the default of `3` seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dns forwarding timeout
```

**Related commands**

debug ip dns forwarding

ip dns forwarding

show ip dns forwarding

# ip domain-list

**Overview** This command adds a domain to the DNS list. Domains are appended to incomplete host names in DNS requests. Each domain in this list is tried in turn in DNS lookups. This list is ordered so that the first entry you create is checked first.

The **no** variant of this command deletes a domain from the list.

**Syntax**

```
ip domain-list <domain-name>
no ip domain-list <domain-name>
```

| Parameter | Description |
|---|---|
| *<domain-name>* | Domain string, for example “company.com”. |

**Mode** Global Configuration

**Usage notes** If there are no domains in the DNS list, then your device uses the domain specified with the ip domain-name command. If any domain exists in the DNS list, then the device does not use the domain set using the **ip domain-name** command.

**Example** To add the domain `example.net` to the DNS list, use the following commands:

```
awplus# configure terminal
awplus(config)# ip domain-list example.net
```

**Related commands**

ip domain-lookup

ip domain-name

show ip domain-list

# ip domain-lookup

**Overview** This command enables the DNS client on your device. This allows you to use domain names instead of IP addresses in commands. The DNS client resolves the domain name into an IP address by sending a DNS inquiry to a DNS server, specified with the ip name-server command.

It is possible to configure the DNS client to use the DNS relay to resolve domain lookups originating from the device itself. This configuration may be preferred, as the DNS relay provides additional functionality that is not available in the DNS client, such as caching, a configurable timeout length, and other options.

The **no** variant of this command disables the DNS client. The client will not attempt to resolve domain names. You must use IP addresses to specify hosts in commands.

**Syntax**

```
ip domain-lookup [via-relay]
no ip domain-lookup
```

| Parameter | Description |
|---|---|
| via-relay | Perform resolution via DNS relay |

**Mode** Global Configuration

**Usage notes** The client is enabled by default. However, it does not attempt DNS inquiries unless there is a DNS server configured.

**Examples** To enable the DNS client on your device, use the following commands:

```
awplus# configure terminal
awplus(config)# ip domain-lookup
```

To configure the DNS client to perform resolution via the DNS relay, use the following commands:

```
awplus# configure terminal
awplus(config)# ip domain-lookup via-relay
awplus(config)# ip dns forwarding
```

To disable the DNS client on your device, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip domain-lookup
```

**Related commands**

ip domain-list

ip domain-name

ip name-server

show hosts

show ip name-server

**Command changes**

Version 5.4.8-1.1: via-relay parameter added

# ip domain-name

**Overview** This command sets a default domain for the DNS. The DNS client appends this domain to incomplete host-names in DNS requests.

The **no** variant of this command removes the domain-name previously set by this command.

**Syntax**

```
ip domain-name <domain-name>
no ip domain-name <domain-name>
```

**Mode** Global Configuration

**Usage notes** If there are no domains in the DNS list (created using the ip domain-list command) then your device uses the domain specified with this command. If any domain exists in the DNS list, then the device does not use the domain configured with this command.

When your device is using its DHCP client for an interface, it can receive Option 15 from the DHCP server. This option replaces the domain name set with this command.

**Example** To configure the domain name, enter the following commands:

```
awplus# configure terminal
awplus(config)# ip domain-name company.com
```

**Related commands**

ip domain-list

show ip domain-list

show ip domain-name

# ip name-server

**Overview** Use this command to add IPv4 or IPv6 DNS server addresses. The DNS client on your device sends DNS queries to IP addresses in this list when trying to resolve a host name. Host names cannot be resolved until you have added at least one server to this list. A maximum of three name servers can be added to this list.

If you are running VRF-lite, you can add IPv4 or IPv6 DNS server addresses for either the global VRF instance or for a specific VRF instance. Host names cannot be resolved from within a VRF instance until you have added at least one name-server to that VRF instance.

The **no** variant of this command removes the specified DNS name-server address.

**Syntax**

```
ip name-server <ip-addr> [suffix-list <domain-list>]
no ip name-server <ip-addr> [suffix-list]
```

**Syntax (VRF-lite)**

```
ip name-server [vrf <name>] <ip-addr>
no ip name-server [vrf <name>] <ip-addr>
```

| Parameter | Description |
|---|---|
| *<ip-addr>* | The IP address of the DNS server that is being added to the name server list. The address is entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X:X for an IPv6 address.<br>The order that you enter the servers in, is the order in which they will be used. |
| `vrf` | Apply this command to the specified VRF instance. |
| *<name>* | The name of the specific VRF instance |
| `suffix-list` | Specify domain suffixes that should be directed to this name server |
| *<domain-list>* | The name of the DNS domain-list |

**Mode** Global Configuration

**Usage notes** To allow the device to operate as a DNS proxy, your device must have learned about a DNS name-server to forward requests to. Name-servers can be learned through the following means:

- Manual configuration, using the **ip name-server** command
- Learned from DHCP server with Option 6
- Learned over a PPP tunnel if the neighbor advertises the DNS server

Use this command to statically configure a DNS name-server for the device to use.

The order that you enter the servers in, is the order in which they will be used.

For more information about PPP and DNS, see the PPP Feature Overview and Configuration Guide.

**Examples**

To allow a device to send DNS queries to a DNS server with the IPv4 address 10.10.10.5, use the commands:

```
awplus# configure terminal
awplus(config)# ip name-server 10.10.10.5
```

To enable your device to send DNS queries to a DNS server with the IPv6 address 2001:0db8:010d::1, use the commands:

```
awplus# configure terminal
awplus(config)# ip name-server 2001:0db8:010d::1
```

For DNS relay, to direct DNS lookups for domains with suffixes of "engineering.acme" or "intranet.acme" to an internal corporate name-server, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding domain-list corporatedomains
awplus(config-domain-list)# description Our internal network
domains; do not send DNS requests to internet
awplus(config-domain-list)# domain engineering.acme
awplus(config-domain-list)# domain intranet.acme
awplus(config-domain-list)# exit
awplus(config)# ip name-server 172.16.0.1 suffix-list
corporatedomains
```

**Example (VRF-lite)**

To enable your switch to send DNS queries (on VRF instance RED) to a DNS server with the IPv4 address 10.10.10.5 use the commands:

```
awplus# configure terminal
awplus(config)# ip name-server vrf RED 10.10.10.5
```

**Related commands**

ip domain-list

ip domain-lookup

ip domain-name

show ip dns forwarding cache

show ip name-server

**Command changes**

Version 5.4.6-2.1: VRF-lite support added to AR-series devices.

# ip name-server preferred-order

**Overview** Use this command to choose between using statically-configured DNS servers or dynamically-learned DNS servers.

Use the **no** variant of this command to set the DNS servers back to the default setting of dynamic.

**Syntax**

```
ip name-server preferred-order {dynamic|static}
no ip name-server preferred-order
```

| Parameter | Description |
|---|---|
| `dynamic` | Use dynamically learned DNS servers first. |
| `static` | Use statically configured DNS servers first. |

**Default** dynamic

**Mode** Global Configuration

**Usage notes** This command is used to choose which DNS server set to use first. Select either the **dynamic** or **static** parameter.

**Examples** To configure the preference to use static servers first, use the commands:

```
awplus# configure terminal
awplus(config)# ip name-server preferred-order static
```

To configure the preference to use dynamically-learned servers first, use the commands:

```
awplus# configure terminal
awplus(config)# ip name-server preferred-order dynamic
```

or

```
awplus# configure terminal
awplus(config)# no ip name-server preferred-order
```

# ipv6 ddns-update-method

**Overview** Use this command to enable an IPv6 interface to update DDNS with the specified DDNS update method.

Use the **no** variant of this command to disable an IPv6 interface to update DDNS with the specified DDNS update method.

**Syntax**

```
ipv6 ddns-update-method <method-name>
no ipv6 ddns-update-method <method-name>
```

| Parameter | Description |
|---|---|
| *<method-name>* | A name given to a DDNS update method. |

**Default** None

**Mode** Interface Configuration

**Usage notes** A DDNS update method cannot be attached to multiple interfaces, however multiple DDNS update methods can be assigned to the same interface.

**Example** To enable IPv6 DDNS updates for a DDNS update method named “dyndns” using interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 ddns-update-method dyndns
```

To disable IPv6 DDNS updates for a DDNS update method named “dyndns” using interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ipv6 ddns-update-method dyndns
```

**Related commands** ddns-update-method

**Command changes** Version 5.4.7-0.1: command added

# obey-form

**Overview** Use this command to read the action URL from the form and submit to that URL instead of the current page's URL. This is needed for forms that don't submit to the current page's URL.

Use the **no** variant of this command to disable form submission.

**Syntax**

```
obey-form
no obey-form
```

**Default** Disabled

**Mode** Dynamic DNS Update Method Configuration

**Usage notes** This command applies after the **follow-redirects** and **get-before-submit** commands are applied.

**Example** To turn on obey-form, use the commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method dyndns
awplus(config-ddns-update-method)# get-before-submit
awplus(config-ddns-update-method)# obey-form
```

**Related commands**

ddns-update-method

get-before-submit

follow-redirects

**Command changes** Version 5.5.0.1: command added

# password (ddns-update-method)

**Overview** Use this command to add a password to the current DDNS update method.

Use the **no** variant of this command to remove a password from the current DDNS update method.

**Syntax**

```
password <password>
no password
```

| Parameter | Description |
|---|---|
| *<password>* | The password to be configured in conjunction with the user name and host name. |

**Default** None

**Mode** Dynamic DNS Update Method Configuration

**Example** To configure the password “test” for the method “dyndns”, use the following commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method dyndns
awplus(config-ddns-update-method)# password test
```

To remove the password “test” from the method “dyndns”, use the following commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method dyndns
awplus(config-ddns-update-method)# no password
```

**Related commands** ddns-update-method

**Command changes** Version 5.4.7-0.1: command added

# ppp ipcp dns

**Overview** Use this command to configure the primary and secondary DNS (Domain Name System) IP addresses for IPCP (Internet Protocol Control Protocol) on a given PPP interface.

Use the **no** variant of this command to remove the primary and secondary DNS IP addresses for IPCP on a given PPP interface, and remove any optional parameters configured for DNS.

**Syntax**

```
ppp ipcp dns [<primary> [<secondary>]][required|reject|request]
no ppp ipcp dns
```

| Parameter | Description |
|---|---|
| *<primary>* | Specify the primary DNS address for a given PPP interface to the peer. |
| *<secondary>* | Specify the secondary DNS address for a given PPP interface to the peer. |
| `required` | Request DNS addresses from the peer, and close the link if none is given. |
| `reject` | Reject negotiations with the peer (default). |
| `request` | Request DNS addresses from the peer. |

**Default** By default no IPCP DNS server request is sent to the peer.

**Mode** Interface Configuration

**Usage notes** Use the optional parameters to configure PPP IPCP DNS options for accepting, rejecting or requesting DNS addresses from the peer. Use the optional primary and secondary or primary only DNS server address placeholders to specify DNS server addresses to the peer.

The no variant of this command also stops IPCP DNS request messages being sent to the peer.

**Examples** To configure the PPP interface `ppp0` to require a DNS IP address from the peer, and close the link if a DNS IP address is not given, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ppp ipcp dns required
```

To configure the PPP interface ppp0 to require a DNS IP address from the peer, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ppp ipcp dns request
```

To configure the PPP interface ppp0 to reject a DNS IP address from the peer, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ppp ipcp dns reject
```

To configure the PPP interface ppp0 to supply primary and secondary DNS server addresses to the peer, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ppp ipcp dns 10.1.1.2 10.1.1.3
```

To configure the PPP interface ppp0 to supply a primary but not a secondary DNS server address to the peer, enter the below commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ppp ipcp dns 10.1.1.2
```

# ppp ipcp dns suffix-list

**Overview** Use this command to configure a suffix-list to be associated with DNS name-servers learned over the PPP connection.

Use the **no** variant of this command to remove the suffix-list.

**Syntax**

```
ppp ipcp dns suffix-list <domain-list-name>
no ppp ipcp dns suffix-list
```

| Parameter | Description |
|---|---|
| *<domain-list-name>* | The name of the DNS domain-list |

**Mode** Interface Configuration

**Usage notes** A PPP connection can be configured to learn DNS servers from the remote peer by using the command ppp ipcp dns command.

This command allows a user to associate a domain-list to be used to match against the suffixes of incoming DNS requests. For example, a customer branch office may have a router that is used to give remote-access to their head office, over which they learn the IP address of the head office's DNS server. A domain list can be created that contains a suffix used for services internal to that company, for example, "example.lc". This domain-list is associated as a suffix-list to the PPP connection. So when the PPP connection is completed with the head office, users at the branch office that browse to "intranet.example.lc" will have the DNS request forwarded to the DNS server learned over the PPP connection. Without having the suffix-list configured, the DNS request for "intranet.example.lc" would instead be sent to the primary DNS server, which is likely to be the branch office's ISP, and they will simply respond with a negative reply, because .example.lc is not a globally routable domain.

**Examples** At a branch office, to direct DNS lookups for domains with suffixes of "engineering.acme" or "intranet.acme" to an internal corporate name-server run at head-office that was learned over a PPP connection, use the commands:

```
awplus# configure terminal
awplus(config)# ip dns forwarding domain-list corporatedomains
host(config-domain-list)# description Our internal network
domains; do not send DNS requests to internet
host(config-domain-list)# domain engineering.acme
host(config-domain-list)# domain intranet.acme
awplus(config)# interface ppp0
awplus(config-if)# ppp ipcp dns required
awplus(config-if)# ppp ipcp dns suffix-list corporatedomains
```

**Related commands**

ip dns forwarding domain-list

ppp ipcp dns

# retry-interval

**Overview** Use this command to enable DDNS update retries. Retries are attempted after a DDNS update fails after the specified interval. If the DDNS update keeps failing, then no more than the specified maximum retries are attempted.

***NOTE:*** *The retry interval is used for one DDNS update at one time, so if an update is not complete within the specified interval, an update will not begin until it has completed.*

Use the **no** variant of this command to disable DDNS update retires.

**Syntax**

```
retry-interval <1-3888000> maximum-retries <1-100>
no retry-interval
```

| Parameter | Description |
|---|---|
| *<1-3888000>* | The retry interval in seconds (from 1 second to 4.5 days), after which a failed DDNS update will be retried. |
| *<1-100>* | The maximum number of times a retry is allowed. |

**Default** Disabled

**Mode** Dynamic DNS Update Method Configuration

**Usage notes** If an update is triggered by another source, such as an IP address change or a manual update, then the retry counter will start again from the beginning.

**Example** To enable DDNS update retry attempts every hour up to 5 times for the method “dyndns”, use the commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method dyndns
awplus(config-ddns-update-method)# retry-interval 3600
maximum-retries 5
```

To disable DDNS update retry attempts for the method “dyndns”, use the commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method dyndns
awplus(config-ddns-update-method)# no retry-interval
```

**Related commands** ddns-update-method

**Command changes** Version 5.4.7-0.1: command added

# show ddns-update-method status

**Overview** Use this command to show the status of the configured DDNS update methods.

**Syntax**

```
show ddns-update-method status
```

**Mode** User Exec and Privileged Exec

**Example** To display the status of DDNS update methods currently configured on your device, use the command:

```
awplus# show ddns-update-method status
```

**Output** Figure 25-1: Example output from **show ddns-update-method status**

```
awplus#show ddns-update-method status

Dynamic DNS updates are enabled

------------------------------------------------------------------
Update Method Name    test

# show debugging ip dns forwarding

**Overview** Use this command to see what debugging is turned on for DNS Relay. DNS Relay debugging is set using the **debug ip dns forwarding** command.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

**Syntax**

```
show debugging ip dns forwarding
```

**Mode** User Exec and Privileged Exec

**Example** To display the DNS Relay debugging status, use the command:

```
awplus# show debugging ip dns forwarding
```

**Output** Figure 25-2: Example output from the **show debugging ip dns forwarding** command:

```
awplus#show debugging ip dns forwarding

DNS Relay debugging status:
  debugging is on
```

**Related commands** debug ip dns forwarding

# show hosts

**Overview** This command shows the default domain, domain list, and name servers configured on your device.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show hosts
```

**Mode** User Exec and Privileged Exec

**Example** To display the default domain, use the command:

```
awplus# show hosts
```

**Output** Figure 25-3: Example output from the **show hosts** command when **no ip domain-lookup** is configured

```
awplus#show hosts

Default domain is not set
Name/address lookup is disabled
```

Figure 25-4: Example output from the **show hosts** command when **ip domain-lookup** is configured

```
awplus#show hosts

Default domain is mycompany.com
Domain list: company.com
Name/address lookup uses domain service
Name servers are 10.10.0.2 10.10.0.88
```

Figure 25-5: Example output from the **show hosts** command when **ip domain-lookup via-relay** is configured

```
awplus#show hosts

Default domain is mycompany.com
Domain list: company.com
Name/address lookup uses domain relay service
Name servers are 10.10.0.2 10.10.0.88
```

# show ip dns forwarding

**Overview** Use this command to display the DNS Relay status.

**Syntax**

```
show ip dns forwarding
```

**Mode** User Exec and Privileged Exec

**Examples** To display the DNS Relay status, use the command:

```
awplus# show ip dns forwarding
```

**Output** Figure 25-6: Example output from the **show ip dns forwarding** command

```
awplus#show ip dns forwarding

Max-Retry       : 2
Timeout         : 3 second(s)
Dead-Time       : 3600 second(s)
Source-Interface: not specified
DNS Cache       : disabled
```

**Related commands** ip dns forwarding

# show ip dns forwarding cache

**Overview** Use this command to display the DNS Relay name resolver cache.

**Syntax**

```
show ip dns forwarding cache
```

**Syntax (VRF-lite)**

```
show ip dns [vrf <name>|global] forwarding cache
```

| Parameter | Description |
|---|---|
| `vrf` | Apply this command to the specified VRF instance. |
| *<name>* | The name of the specific VRF instance |
| `global` | When VRF-lite is configured, apply this command to the global routing and forwarding table. |

**Mode** User Exec and Privileged Exec

**Example** To display the DNS Relay name resolver cache, use the command:

```
awplus# show ip dns forwarding cache
```

**Output** Figure 25-7: Example output from the **show ip dns forwarding cache** command

```
awplus#show ip dns forwarding cache
IPv4 addresses in cache:     3
IPv6 addresses in cache:     0
Cache size: 1000
Host                                    Address                 Expires Flags
www.example.com                         172.16.1.1.                 180
mail.example.com                        www.example.com             180 CNAME
www.example.com                         172.16.1.1.                 180 REVERSE
mail.example.com                        172.16.1.5.                 180
```

**Example (VRF-lite)** To display the DNS Relay name resolver cache with output for VRF instance RED, use the command:

```
awplus# show ip dns vrf RED forwarding cache
```

**Output** Figure 25-8: Example output from the **show ip dns forwarding cache** command that includes output for VRF instance RED.

```
awplus#show ip dns vrf RED forwarding cache
IPv4 addresses in cache:     3
IPv6 addresses in cache:     0
Cache size: 1000
Host                                    Address                 Expires Flags
www.example.com                         172.16.1.1.                 180
mail.example.com                        www.example.com             180 CNAME
www.example.com                         172.16.1.1.                 180 REVERSE
mail.example.com                        172.16.1.5.                 180

[VRF: RED]
www.example2.com                         10.25.1.1.                 180
mail.example2.com                        www.example2.com           180 CNAME
www.example2.com                         10.25.1.1.                 180 REVERSE
mail.example2.com                        10.25.1.6.                 180
```

**Related commands**
ip dns forwarding cache
ip name-server

**Command changes**
Version 5.4.6-2.1: VRF-lite support added.
Version 5.4.8-1.1: additional cache counters added to output.

# show ip dns forwarding server

**Overview** Use this command to display the status of DNS forwarding name servers.

If you are running VRF, you can also use this command to display the status for DNS forwarding name servers operating on a specific VRF instance.

**Syntax**
```
show ip dns forwarding server
```

**Syntax (VRF-lite)**
```
show ip dns [vrf <name>|global] forwarding server
```

| Parameter | Description |
|---|---|
| `vrf` | Apply this command to the specified VRF instance. |
| *<name>* | The name of the specific VRF instance |
| `global` | When VRF-lite is configured, apply this command to the global routing and forwarding table. |
| `forwarding server` | Display information about the DNS forwarding name servers for either the switch (when not using VRF-lite) or for a specific VRF instance (when using VRF-lite). |

**Mode** User Exec and Privileged Exec

**Examples** To display the status of DNS Relay name servers, use the command:

```
awplus# show ip dns forwarding server
```

**Output** Figure 25-9: Example output from the **show ip dns forwarding server** command

```
awplus#show ip dns forwarding server

Servers           Forwards      Fails    Dead-Time
172.16.1.1              12          0       active
172.16.1.2               6          3         3900
```

**Example (VRF-lite)** To display the status of DNS Relay name-servers for VRF-lite instance red, use the command:

```
awplus# show ip dns vrf red forwarding server
```

**Output** Figure 25-10: Example output from the **show ip dns forwarding** server command

```
awplus#show ip dns forwarding server

[VRF: red]
Servers           Forwards      Fails    Dead-Time
172.16.1.1              12          0       active
172.16.1.2               6          3         3900
```

**Related commands**

ip dns forwarding

ip dns forwarding dead-time

**Command changes**

Version 5.4.6-2.1: VRF-lite support added.

# show ip domain-list

**Overview** This command shows the domains configured in the domain list. The DNS client uses the domains in this list to append incomplete hostnames when sending a DNS inquiry to a DNS server.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip domain-list
```

**Mode** User Exec and Privileged Exec

**Example** To display the list of domains in the domain list, use the command:

```
awplus# show ip domain-list
```

**Output** Figure 25-11: Example output from the **show ip domain-list** command

```
awplus#show ip domain-list
alliedtelesis.com
mycompany.com
```

**Related commands**

ip domain-list

ip domain-lookup

# show ip domain-name

**Overview** This command shows the default domain configured on your device. When there are no entries in the DNS list, the DNS client appends this domain to incomplete hostnames when sending a DNS inquiry to a DNS server.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip domain-name
```

**Mode** User Exec and Privileged Exec

**Example** To display the default domain configured on your device, use the command:

```
awplus# show ip domain-name
```

**Output** Figure 25-12: Example output from the **show ip domain-name** command

```
awplus#show ip domain-name
alliedtelesis.com
```

**Related commands** ip domain-name

ip domain-lookup

# show ip name-server

**Overview** This command displays a list of IPv4 and IPv6 DNS server addresses that your device will send DNS requests to. This is a static list configured using the ip name-server command.

The command will also show any domain-list that has been associated as suffix-list with the DNS server, and the domains that will be preferentially directed to that DNS server.

When running VRF-lite, this command displays a list of IPv4 and IPv6 addresses of DNS servers that your device will send DNS requests to for either the global VRF instance or a selected VRF instance.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**
```
show ip name-server
```

**Syntax (VRF-lite)**
```
show ip name-server [vrf <name>|global]
```

| Parameter | Description |
|---|---|
| `vrf` | A VRF instance |
| *`<name>`* | The name of the specific VRF instance |
| `global` | The global VRF instance |

**Mode** User Exec and Privileged Exec

**Example** To display the list of DNS servers that your device sends DNS requests to, use the command:

```
awplus# show ip name-server
```

**Output** Figure 25-13: Example output from the **show ip name-server** command

```
awplus# show ip name-server
 10.10.0.123
 10.10.0.124
 2001:0db8:010d::1
```

**Example** To display the list of DNS servers that your device sends DNS requests to, use the command:

```
awplus# show ip name-server
```

**Output** Figure 25-14: Example output from the **show ip name-server** command

```
awplus#show ip name-server
Currently learned name-servers
10.36.200.165 dynamic (ppp0)
10.35.12.20 dynamic (ppp1), using suffix-list mysuffixlist:
        test.com
        intranet.interslice.com
10.37.84.97 static
130.37.84.97 static
```

**Output (VRF-lite)** Figure 25-15: Example output from the **show ip name-server** command for the VRF instance "red"

```
awplus# show ip name-server vrf red

[VRF: red]
 10.10.0.123
 10.10.0.124
 2001:0db8:010d::1
```

**Related commands**

ip domain-lookup

ip name-server

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# suppress-ipv4-updates

**Overview** Use this command to suppress IPv4 updates from being sent.

Use the **no** variant of this command to stop suppressing IPv4 updates from being sent.

**Syntax**

```
suppress-ipv4-updates
no suppress-ipv4-updates
```

**Default** Disabled

**Mode** Dynamic DNS Update Method Configuration

**Usage notes** This command is used in conjunction with the **use-ipv4-for-ipv6-updates** command. IPv4 DDNS updates are suppressed so that only IPv6 updates are sent.

***NOTE:*** *The IPv4 DNS entry may be updated using the source IPv4 address used.*

**Example** To suppress IPv4 updates and send IPv6 updates instead for the method “dyndns”, use the commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method-dyndns
awplus(config-ddns-update-method)# use-ipv4-for-ipv6-updates
awplus(config-ddns-update-method)# suppress-ipv4-updates
```

**Related commands** ddns-update-method

use-ipv4-for-ipv6-updates

**Command changes** Version 5.4.7-0.1: command added

# undebug ddns

**Overview** Use this command to disable debugging for the DDNS process.

**Syntax**

```
undebug ddns
```

**Default** Disabled

**Mode** Privileged Exec

**Example** To disable debugging for the DDNS process, use the command:

```
awplus# undebug ddns
```

**Related commands** ddns-update-method

debug ddns

**Command changes** Version 5.4.7-0.1: command added

# update-interval (ddns-update-method)

**Overview** Use this command to specify the time interval between periodic DDNS updates.

Use the **no** variant of this command to disable periodic DDNS updates.

**Syntax**

```
update-interval <1-64800>
no update-interval
```

| Parameter | Description |
|---|---|
| *<1-64800>* | Update interval time in minutes (from 1 minute to 45 days). |

**Default** Disabled

**Mode** Dynamic DNS Update Method Configuration

**Examples** To enable periodic DDNS updates every day for the method “dyndns”, use the commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method dyndns
awplus(config-ddns-update-method)# update-interval 1440
```

To enable periodic DDNS updates every 28 days for the method “dyndns”, use the commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method dyndns
awplus(config-ddns-update-method)# update-interval 40320
```

To disable periodic DDNS updates for the method “dyndns”, use the commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method dyndns
awplus(config-ddns-update-method)# no update-interval
```

**Related commands** ddns-update-method

**Command changes** Version 5.4.7-0.1: command added

# update-url (ddns-update-method)

**Overview** Use this command to configure a URL for DDNS updates for the current DDNS update method.

Use the **no** variant of this command to remove an update URL from a DDNS update method.

**Syntax**

```
update-url <url-name>
no update-url <url-name>
```

| Parameter | Description |
|---|---|
| *<url-name>* | The update URL is provided by the DDNS provider and can be configured with the following placeholder tokens:<br>• <USERNAME><br>• <PASSWORD><br>• <HOST-NAME><br>• <IPADDRESS><br>To specify the values for <USERNAME>, <PASSWORD> and <HOST-NAME>, use the commands **username, password** and **hostname**. The value for <IPADDRESS> is populated automatically from the interface IP settings. |

**Default** None

**Mode** Dynamic DNS Update Method Configuration

**Usage notes** The update URL (provided by the DDNS provider) can include a user name, password, host name and/or IP address. These user values are optional because they may vary depending on the DDNS provider's update URLs. AlliedWare Plus requires you to enter the required parameters for the update URL using the following placeholder tokens:

- for the user name enter "<USERNAME>"
- for the password enter "<PASSWORD>"
- for the host name enter "<HOST-NAME>"
- for the IP address enter "<IPADDRESS>"

For example, for DynDNS the following update URL can be used:

```
http://username:password@members.dyndns.org/nic/update?
SYSTEM=dyndns&hostname=<h>&myip=<a>
```

To configure this URL, use the following command including the placeholder tokens as written here:

```
awplus(config-ddns-update-method)# update-url
http://<USERNAME>:<PASSWORD>@members.dyndns.org/nic/update?
SYSTEM=dyndns&hostname=<HOST-NAME>&myip=<IPADDRESS>
```

DynDNS also has the following update URL that can be used instead:

```
http://<USERNAME>:<PASSWORD>@members.dyndns.org/v3/update?
hostname=<HOST-NAME>&myip=<IPADDRESS>
```

***NOTE:*** *URLs that contain the character "?" activate help from the command line. To stop the help from activating enter the "?" in the command line, then press Ctrl+v.*

For more information and examples, see the Domain Name System (DNS) for AlliedWare Plus AR-Series Firewalls Feature Overview and Configuration Guide.

**Examples** To use members.dyndns.org/nic/update as the update URL for the provider DynDNS, with the method called "dyndns" that uses HTTP, use the following commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method dyndns
awplus(config-ddns-update-method)# update-url
http://<USERNAME>:<PASWORD>@members.dyndns.org/nic/update?
SYSTEM=dyndns&hostname=<HOST-NAME>&myip=<IPADDRESS>
```

To use members.dyndns.org/v3/update as the update URL for the provider DynDNS, with the method called "dyndns" that uses HTTP, use the following commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method dyndns
awplus(config-ddns-update-method)# update-url
http://<USERNAME>:<PASSWORD>@members.dyndns.org/v3/update?
hostname=<HOST-NAME>&myip=<IPADDRESS>
```

To use members.dyndns.org/v3/update as the update URL for the provider DynDNS, with the method called "dyndns" that uses HTTPS/SSL, use the following commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method dyndns
awplus(config-ddns-update-method)# update-url
https://<USERNAME>:<PASSWORD>@members.dyndns.org/v3/update?
hostname=<HOST-NAME>&myip=<IPADDRESS>
```

To use members.dyndns.org/v3/update as the update URL for the provider DynDNS, with the method called "dyndns" that uses HTTP on port 8245, use the following commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method dyndns
awplus(config-ddns-update-method)# update-url
http://<USERNAME>:<PASSWORD>@members.dyndns.org:8245/v3/
update?hostname=<HOST-NAME>&myip=<IPADDRESS>
```

To remove the update URL from the method called “dyndns”, use the following commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method dyndns
awplus(config-ddns-update-method)# no update-url
```

**Related commands** ddns-update-method

**Command changes** Version 5.4.7-0.1: command added

# use-ipv4-for-ipv6-updates

**Overview** Use this command to send IPv6 updates using IPv4.

Use the **no** variant of this command to stop sending IPv6 updates using IPv4.

**Syntax**

```
use-ipv4-for-ipv6-updates
no use-ipv4-for-ipv6-updates
```

**Default** Disabled

**Mode** Dynamic DNS Update Method Configuration

**Usage notes** If your DDNS provider supports IPv6 but does not support sending updates in IPv6 then this command is used so IPv6 updates can be sent using IPv4 instead. The **suppress-ipv4-updates** command is used in conjunction with this command to suppress IPv4 updates and send only IPv6 updates instead.

**example** To send IPv6 updates using IPv4 for the method “dyndns” and to suppress IPv4 updates, use the commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method dyndns
awplus(config-ddns-update-method)# use-ipv4-for-ipv6-updates
awplus(config-ddns-update-method)# suppress-ipv4-updates
```

**Related commands** ddns-update-method

suppress-ipv4-updates

**Command changes** Version 5.4.7-0.1: command added

# username (ddns-update-method)

**Overview** Use this command to add a user name to the current DDNS update method.

Use the **no** variant of this command to remove a user name from the current DDNS update method.

**Syntax**

```
username <user-name>
no username
```

| Parameter | Description |
|---|---|
| *<user-name>* | The name of the user to be configured in conjunction with the password and host name. |

**Default** None

**Mode** Dynamic DNS Update Method Configuration

**Example** To configure the username “atlnz” for the method “dyndns”, use the following commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method dyndns
awplus(config-ddns-update-method)# username atlnz
```

To remove the username “atlnz” from the method “dyndns”, use the following commands:

```
awplus# configure terminal
awplus(config)# ddns-update-method dyndns
awplus(config-ddns-update-method)# no username
```

**Related commands** ddns-update-method

**Command changes** Version 5.4.7-0.1: command added

# 26 IPv6 Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure IPv6. For more information, see the IPv6 Feature Overview and Configuration Guide.

**Command List**

- "clear ipv6 neighbors" on page 931
- "ipv6 address" on page 932
- "ipv6 address autoconfig" on page 934
- "ipv6 address suffix" on page 936
- "ipv6 enable" on page 937
- "ipv6 eui64-linklocal" on page 939
- "ipv6 forwarding" on page 940
- "ipv6 icmp error-interval" on page 941
- "ipv6 multicast forward-slow-path-packet" on page 942
- "ipv6 multihoming" on page 943
- "ipv6 nd accept-ra-default-routes" on page 944
- "ipv6 nd accept-ra-pinfo" on page 945
- "ipv6 nd current-hoplimit" on page 946
- "ipv6 nd dns search-list" on page 948
- "ipv6 nd dns-server" on page 949
- "ipv6 nd managed-config-flag" on page 951
- "ipv6 nd minimum-ra-interval" on page 952
- "ipv6 nd other-config-flag" on page 954
- "ipv6 nd prefix" on page 955

- "ipv6 nd proxy interface" on page 957
- "ipv6 nd ra-interval" on page 959
- "ipv6 nd ra-lifetime" on page 960
- "ipv6 nd reachable-time" on page 962
- "ipv6 nd retransmission-time" on page 964
- "ipv6 nd route-information" on page 966
- "ipv6 nd router-preference" on page 967
- "ipv6 nd suppress-ra" on page 968
- "ipv6 neighbor" on page 969
- "ipv6 opportunistic-nd" on page 970
- "ipv6 route" on page 971
- "ipv6 unreachables" on page 973
- "optimistic-nd" on page 974
- "ping ipv6" on page 975
- "show ipv6 forwarding" on page 977
- "show ipv6 interface" on page 978
- "show ipv6 neighbors" on page 980
- "show ipv6 route" on page 981
- "show ipv6 route summary" on page 983
- "traceroute ipv6" on page 984

# clear ipv6 neighbors

**Overview** Use this command to clear all dynamic IPv6 neighbor entries.

**Syntax**
```
clear ipv6 neighbors
```

**Mode** Privileged Exec

**Example**
```
awplus# clear ipv6 neighbors
```

**Related commands** ipv6 neighbor

show ipv6 neighbors

# ipv6 address

**Overview** Use this command to set the IPv6 address of an interface. The command also enables IPv6 on the interface, which creates an EUI-64 link-local address as well as enabling RA processing and SLAAC.

To stop the device from processing prefix information (routes and addresses from the received Router Advertisements) use the command **no ipv6 nd accept-ra-pinfo**.

To remove the EUI-64 link-local address, use the command **no ipv6 eui64-linklocal**.

Use the **no** variant of this command to remove the IPv6 address assigned and disable IPv6. Note that if no global addresses are left after removing the IPv6 address then IPv6 is disabled.

**Syntax**

```
ipv6 address <ipv6-addr/prefix-length>
no ipv6 address <ipv6-addr/prefix-length>
```

| Parameter | Description |
|---|---|
| *<ipv6-addr/prefix-length>* | Specifies the IPv6 address to be set. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. |

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** Note that the device keeps link-local addresses until you remove them with the **no** variant of the command that established them. See the ipv6 enable command for more information.

Also note that the device keeps the link-local address if the global address is removed using a command other than the command that was used to establish the link-local address. For example, if a link local address is established with the ipv6 enable command then it will not be removed using a **no ipv6 address** command.

**Examples** To assign the IPv6 address 2001:0db8::a2/64 to eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 address 2001:0db8::a2/64
```

To remove the IPv6 address 2001:0db8::a2/64 from eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ipv6 address 2001:0db8::a2/64
```

To assign the IPv6 address to the PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ipv6 address 2001:0db8::a2/64
```

To assign the IPv6 address to the tunnel tunnel0, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# ipv6 address 2001:0db8::a2/64
```

To remove the IPv6 address 2001:0db8::a2/64 from the PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 address 2001:0db8::a2/64
```

**Related commands**

ipv6 address autoconfig

ipv6 address dhcp

ipv6 dhcp server

ipv6 enable

ipv6 eui64-linklocal

show running-config

show ipv6 interface

show ipv6 route

# ipv6 address autoconfig

**Overview** Use this command to enable IPv6 stateless address autoconfiguration (SLAAC) for an interface. This configures an IPv6 address on an interface derived from the MAC address on the interface.

Use the **no** variant of this command to disable IPv6 SLAAC on an interface. Note that if no global addresses are left after removing all IPv6 autoconfigured addresses then IPv6 is disabled.

**Syntax**

```
ipv6 address autoconfig
no ipv6 address autoconfig
```

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** Use this command to enable automatic configuration of IPv6 addresses using stateless autoconfiguration on an interface, and enable IPv6.

IPv6 hosts can configure themselves when connected to an IPv6 network using ICMPv6 (Internet Control Message Protocol version 6) router discovery messages. Configured routers respond with a Router Advertisement (RA) containing configuration parameters for IPv6 hosts.

The SLAAC process derives the interface identifier of the IPv6 address from the MAC address of the interface.

When applying SLAAC to an interface, note that the MAC address of the default VLAN is applied to the interface if the interface does not have its own MAC address.

If SLAAC is not suitable then a network can use stateful configuration with DHCPv6 (Dynamic Host Configuration Protocol version 6) Relay, or hosts can be configured statically. See ip dhcp-relay server-address for the DHCPv6 Relay server command description and examples. See the IP Feature Overview and Configuration Guide for more information about DNS Relay.

Note that the device keeps link-local addresses until you remove them with the **no** variant of the command that established them. See the ipv6 enable command for more information.

Also note that the device keeps the link-local address if the global address is removed using a command other than the command that was used to establish the link-local address. For example, if a link local address is established with the ipv6 enable command then it will not be removed using a **no ipv6 address** command.

**Examples** To enable SLAAC on eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 address autoconfig
```

To disable SLAAC on eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ipv6 address autoconfig
```

**Related commands**

ipv6 address

ipv6 enable

show ipv6 interface

show running-config

# ipv6 address suffix

**Overview** Use this command to configure the suffix to use when generating an address from prefix information. Any addresses that were created with the EUI-64 suffix will be removed, and new addresses will be added after the next Router Advertisement.

Use the **no** variant of this command to set it back to the default of disabled or set to :: for the same result as the **no** variant.

**Syntax**

```
ipv6 address suffix <ipv6-addr-suffix>
no ipv6 address suffix
```

| Parameter | Description |
|---|---|
| *<ipv6-addr-suffix>* | In the format of ::X:X:X:X, for example ::a2d8:0fd8 |

**Default** Disabled

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Example** To configure the suffix to use when generating an address from prefix information on eth1, use the command:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 address suffix ::a2d8:0fd8
```

**Related commands** ipv6 nd accept-ra-pinfo

show running-config interface

**Command changes** Version 5.4.8-2.1: command added

# ipv6 enable

**Overview** Use this command to enable automatic configuration of a link-local IPv6 address on an interface using Stateless Automatic Address Configuration (SLAAC). By default, the EUI-64 method is used to generate the link-local address.

Use the **no** variant of this command to disable IPv6 on an interface without a global address. Note, to stop EUI-64 from generating the automatic link-local address, use the command **no ipv6 eui64-linklocal**.

**Syntax**

```
ipv6 enable
no ipv6 enable
```

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** The **ipv6 enable** command automatically configures an IPv6 link-local address on the interface and enables the interface for IPv6 processing.

A link-local address is an IP (Internet Protocol) address that is only used for communications in the local network, or for a point-to-point connection. Routing does not forward packets with link-local addresses. IPv6 requires that a link-local address is assigned to each interface that has the IPv6 protocol enabled, and when addresses are assigned to interfaces for routing IPv6 packets.

Note that the device keeps link-local addresses until you remove them with the **no** variant of the command that established them.

Also note that the device keeps the link-local address if the global address is removed using a command other than the command that was used to establish the link-local address. For example, if a link local address is established with the ipv6 enable command then it will not be removed using a **no ipv6 address** command.

**Default** All interfaces default to IPv6-down with no address.

**Examples** To enable IPv6 with only a link-local IPv6 address on eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 enable
```

To disable IPv6 with only a link-local IPv6 address on eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ipv6 enable
```

To enable IPv6 with only a link-local IPv6 address on the PPP interface ppp0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
```

To disable IPv6 with only a link-local IPv6 address on the PPP interface ppp0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 enable
```

**Related commands**

ipv6 address

ipv6 address autoconfig

ipv6 address dhcp

ipv6 address (DHCPv6 PD)

ipv6 dhcp client pd

ipv6 nd prefix

show ipv6 interface

show ipv6 route

show running-config

# ipv6 eui64-linklocal

**Overview** When IPv6 is enabled on an interface, an EUI link-local address is generated and installed on the interface. In other words, **ipv6 eui64-linklocal** is enabled by default on any IPv6 enabled interface.

Use the **no** variant of this command to disallow the automatic generation of the EUI-64 link-local address on an IPv6 enabled interface.

**Syntax**

```
ipv6 eui64-linklocal
no ipv6 eui64-linklocal
```

**Default** The command **ipv6 eui64-linklocal** is enabled by default on any IPv6 enabled interface.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Example** To enable IPv6 on an interface eth1, and use the link-local address of fe80::1/10 instead of the EUI-64 link-local that is automatically generated, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 enable
awplus(config-if)# no ipv6 eui64-linklocal
awplus(config-if)# ipv6 address fe80::1/10
```

**Related commands**

ipv6 address

ipv6 address autoconfig

ipv6 enable

**Command changes** Version 5.4.7-0.1: command added

# ipv6 forwarding

**Overview** Use this command to turn on IPv6 unicast routing for IPv6 packet forwarding.

Use this command globally on your device before using the ipv6 enable command on individual interfaces.

Use the **no** variant of this command to turn off IPv6 unicast routing. Note IPv6 unicast routing is disabled by default.

**Syntax**

```
ipv6 forwarding
no ipv6 forwarding
```

**Mode** Global Configuration

**Default** IPv6 unicast forwarding is disabled by default.

**Usage notes** Enable IPv6 unicast forwarding globally for all interfaces on your device with this command. Use the **no** variant of this command to disable IPv6 unicast forwarding globally for all interfaces on your device.

IPv6 unicast forwarding allows devices to communicate with devices that are more than one hop away, providing that there is a route to the destination address. If IPv6 forwarding is not enabled then pings to addresses on devices that are more than one hop away will fail, even if there is a route to the destination address.

**Examples** To enable IPv6 unicast routing, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
```

To disable IPv6 unicast routing, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 forwarding
```

**Related commands** ipv6 enable

ipv6 multicast-routing

# ipv6 icmp error-interval

**Overview** Use this command to limit how often IPv6 ICMP error messages are sent. The maximum frequency of messages is specified in milliseconds.

Use the **no** variant of this command to reset the frequency to the default

**Syntax**

```
ipv6 icmp error-interval <interval>
no ipv6 icmp error-interval
```

| Parameter | Description |
|---|---|
| *<interval>* | 0-2147483647, interval in milliseconds. |

**Default** 1000

**Mode** Global Configuration

**Example** To configure the rate to be at most one packet every 10 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 icmp error-interval 10000
```

To reset the rate to the default of one packet every second, use the commands:

```
awplus# configure terminal
awplus(config)# no ipv6 icmp error-interval
```

**Related commands** ip icmp error-interval

# ipv6 multicast forward-slow-path-packet

**Overview** Use this command to enable multicast packets to be forwarded to the CPU. Enabling this command will ensure that the layer L3 MTU is set correctly for each IP multicast group and will apply the value of the smallest MTU among the outgoing interfaces for the multicast group.

It will also ensure that a received packet that is larger than the MTU value will result in the generation of an ICMP Too Big message.

Use the **no** variant of this command to disable the above functionality.

**Syntax**

```
ipv6 multicast forward-slow-path-packet
no ipv6 multicast forward-slow-path-packet
```

**Default** Disabled.

**Mode** Privileged Exec

**Example** To enable the ipv6 multicast forward-slow-path-packet function, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast forward-slow-path-packet
```

**Related commands** show ipv6 forwarding

# ipv6 multihoming

**Overview** Use this command to enable IPv6 multihoming. IPv6 multihoming dynamically adds IPv6 routes, with source prefixes, based on Neighbor Discovery Protocol (NDP) utilizing the Router Advertisements (RAs).

This allows segregation of traffic between multiple gateways, which is useful for sending traffic to multiple ISPs for increased redundancy and load balancing.

Use the **no** variant of this command to disable IPv6 multihoming.

**Syntax**

```
ipv6 multihoming
no ipv6 multihoming
```

**Default** Disabled

**Mode** Interface Configuration

**Usage notes** Note that static IPv6 source address dependent routes do not require this feature.

**Examples** To configure IPv6 multihoming, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 multihoming
```

To disable IPv6 multihoming, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ipv6 multihoming
```

**Related commands** ipv6 route

**Command changes** Version 5.5.0-0.3: command added

# ipv6 nd accept-ra-default-routes

**Overview** Use this command to allow accepting and installing of default routes based on a received RA (Router Advertisement). The default route's destination is set to the source address of the received RA.

Use the **no** variant of this command to disable accepting RA-based default routes.

**Syntax**

```
ipv6 nd accept-ra-default-routes
no ipv6 nd accept-ra-default-routes
```

**Default** RA-based default routes are accepted by default.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Example** To enable RA-based default routes on eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 nd accept-ra-default-routes
```

**Related commands**

ipv6 address

ipv6 address autoconfig

ipv6 enable

# ipv6 nd accept-ra-pinfo

**Overview** Use this command to allow the processing of the prefix information included in a received RA (Router Advertisement) on an IPv6 enabled interface.

Use the **no** variant of this command to disable an IPv6 interface from using the prefix information within a received RA.

**Syntax**

```
ipv6 nd accept-ra-pinfo
no ipv6 nd accept-ra-pinfo
```

**Default** The command **ipv6 nd accept-ra-pinfo** is enabled by default on any IPv6 interface.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** By default, when IPv6 is enabled on an interface, SLAAC is also enabled. SLAAC addressing along with the EUI-64 process, uses the prefix information included in a received RA to generate an automatic link-local address on the IPv6 interface.

Note: an AlliedWare Plus device will, by default, add a prefix for the connected interface IPv6 address(es) to the RA it transmits. However, this behavior can be changed by using the command **no ipv6 nd prefix auto-advertise**, so there is no guarantee that an RA will contain a prefix.

**Example** To enable IPv6 on eth1 without installing a SLAAC address on the interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 enable
awplus(config-if)# no ipv6 nd accept-ra-pinfo
```

**Related commands**

ipv6 address

ipv6 address autoconfig

ipv6 enable

**Command changes** Version 5.4.7-0.1: command added

# ipv6 nd current-hoplimit

**Overview** Use this command to specify the advertised current hop limit used between IPv6 Routers.

Use the **no** variant of this command to reset the current advertised hop limit to the default of 0, which means no advertised current hop limit is specified.

**Syntax**

```
ipv6 nd current-hoplimit <hoplimit>
no ipv6 nd current-hoplimit
```

| Parameter | Description |
|---|---|
| *<hoplimit>* | Specifies the advertised current hop limit value. Valid values are from 0 to 255 hops. |

**Default** 0 (No advertised current hop limit specified)

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Examples** To set the advertised current hop limit to 2 between IPv6 Routers on eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 nd current-hoplimit 2
```

To reset the advertised current hop limit to the default 0 on eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ipv6 nd current-hoplimit
```

To set the advertised current hop limit to 2 between IPv6 Routers on ppp0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ipv6 nd current-hoplimit 2
```

To reset the advertised current hop limit to the default 0 on ppp0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 nd current-hoplimit
```

**Related commands**

ipv6 nd managed-config-flag

ipv6 nd prefix

ipv6 nd suppress-ra

# ipv6 nd dns search-list

**Overview** Use this command to specify a DNS Search List (DNSSL) to be included in the Router Advertisment for a given IPv6 interface.

Use the **no** variant of this command to remove a specified domain name. If no domain name is specified, then all domain names previously added will be deleted.

**Syntax**

```
ipv6 nd dns search-list <domain-name>
no ipv6 nd dns search-list [<domain-name>]
```

| Parameter | Description |
|---|---|
| *<domain-name>* | A string specifying the domain name to be added to the search list. For example, myexample.com |

**Default** No domain search list is included in router advertisements from any interface.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Example** To add the domain name 'myexample.com' to the search list for vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 nd dns search-list myexample.com
```

To delete all domain names added previously, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd dns search-list
```

**Related commands** ipv6 nd suppress-ra

**Command changes** Version 5.5.0-2.5: command added

# ipv6 nd dns-server

**Overview** Use this command to advertise (in Router Advertisement messages) a DNS server for downstream devices to use.

You can specify either a static IPv6 address or the lowest address from an interface.

Use the **no** variant of this command to delete one or all DNS server addresses.

**Syntax**

```
ipv6 nd dns-server {<int>|<ip-add>}
no ipv6 nd dns-server [<int>|<ip-add>]
```

| Parameter | Description |
|---|---|
| *<int>* | Advertise the lowest IPv6 address on the selected interface as a DNS server for downstream devices. |
| *<ip-add>* | Advertise a particular IPv6 address as a DNS server for downstream devices. |

**Default** No DNS servers are advertised.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Example** To configure eth1 to send RAs and advertise itself as a DNS server, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ipv6 nd suppress-ra
awplus(config-if)# no ipv6 nd accept-ra-pinfo
awplus(config-if)# ipv6 address 2001:DB8::1/64
awplus(config-if)# ipv6 nd dns-server eth1
```

To configure eth1 to send RAs and advertise 2001:DB8::2 as a DNS server, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ipv6 nd suppress-ra
awplus(config-if)# no ipv6 nd accept-ra-pinfo
awplus(config-if)# ipv6 address 2001:DB8::1/64
awplus(config-if)# ipv6 nd dns-server 2001:DB8::2
```

To stop advertising any DNS servers on the selected interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ipv6 nd dns-server
```

**Related commands**

ipv6 nd accept-ra-pinfo

ipv6 nd suppress-ra

show ipv6 interface

# ipv6 nd managed-config-flag

**Overview** Use this command to set the managed address configuration flag, contained within the router advertisement field.

Setting this flag indicates the operation of a stateful autoconfiguration protocol such as DHCPv6 for address autoconfiguration, and that address information (i.e. the network prefix) and other (non-address) information can be requested from the device.

An unset flag enables hosts receiving the advertisements to use a stateless autoconfiguration mechanism to establish their IPv6 addresses. The default is flag unset.

Use the **no** variant of this command to reset this command to its default of having the flag unset.

**Syntax**

```
ipv6 nd managed-config-flag
no ipv6 nd managed-config-flag
```

**Default** Unset

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** To enable the transmission of router advertisements, you must apply the **no** version of the ipv6 nd suppress-ra command. This step is included in the example below.

**Example** To set the managed address configuration flag on eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 nd managed-config-flag
awplus(config-if)# no ipv6 nd suppress-ra
```

To set the managed address configuration flag on the PPP interface ppp0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ipv6 nd managed-config-flag
awplus(config-if)# no ipv6 nd suppress-ra
```

**Related commands**

ipv6 nd suppress-ra

ipv6 nd prefix

ipv6 nd other-config-flag

# ipv6 nd minimum-ra-interval

**Overview** Use this command in Interface Configuration mode to set a minimum Router Advertisement (RA) interval for an interface.

Use the **no** variant of this command in Interface Configuration mode to remove the minimum RA interval for an interface.

**Syntax**

```
ipv6 nd minimum-ra-interval <seconds>
no ipv6 nd minimum-ra-interval
```

| Parameter | Description |
|---|---|
| *<seconds>* | Specifies the number of seconds between IPv6 Router Advertisements (RAs). Valid values are from 3 to 1350 seconds. |

**Default** The RA interval for an interface is unset by default.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Examples** To set the minimum RA interval for eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 nd minimum-ra-interval 60
```

To remove the minimum RA interval for eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ipv6 nd minimum-ra-interval
```

To set the minimum RA interval for the PPP interface ppp0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ipv6 nd minimum-ra-interval 60
```

To remove the minimum RA interval for the PPP interface ppp0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 nd minimum-ra-interval
```

**Related commands**

ipv6 nd ra-interval

ipv6 nd suppress-ra

ipv6 nd prefix

ipv6 nd other-config-flag

# ipv6 nd other-config-flag

**Overview** Use this command to set the **other** stateful configuration flag (contained within the router advertisement field) to be used for IPv6 address auto-configuration. This flag is used to request the router to provide information in addition to providing addresses.

Setting the ipv6 nd managed-config-flag command implies that the ipv6 nd other-config-flag will also be set.

Use **no** variant of this command to reset the value to the default.

**Syntax**

```
ipv6 nd other-config-flag
no ipv6 nd other-config-flag
```

**Default** Unset

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** To enable the transmission of router advertisements, you must apply the **no** version of the ipv6 nd suppress-ra command. This step is included in the example below.

**Example** To set the IPv6 other-config-flag on eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 nd other-config-flag
awplus(config-if)# no ipv6 nd suppress-ra
```

To set the IPv6 other-config-flag on the PPP interface ppp0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ipv6 nd other-config-flag
awplus(config-if)# no ipv6 nd suppress-ra
```

**Related commands**

ipv6 nd suppress-ra

ipv6 nd prefix

ipv6 nd managed-config-flag

# ipv6 nd prefix

**Overview** Use this command in Interface Configuration mode to specify the IPv6 prefix information that is advertised by the router advertisement for IPv6 address auto-configuration.

Use the **no** parameter with this command to reset the IPv6 prefix for an interface in Interface Configuration mode.

**Syntax**

```
ipv6 nd prefix <ipv6-prefix/length>
ipv6 nd prefix <ipv6-prefix/length> <valid-lifetime>
ipv6 nd prefix <ipv6-prefix/length> <valid-lifetime>
<preferred-lifetime> [no-autoconfig]
ipv6 nd prefix <ipv6-prefix/length> <valid-lifetime>
<preferred-lifetime> off-link [no-autoconfig]
no ipv6 nd prefix [<ipv6-addr/prefix-length>|all]
```

| Parameter | Description |
|---|---|
| *<ipv6-prefix/length>* | The prefix to be advertised by the router advertisement message.<br>The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64. The default is X:X::/64. |
| *<valid-lifetime>* | The the period during which the specified IPv6 address prefix is valid. This can be set to a value between 0 and 4294967295 seconds. The default is 2592000 (30 days). Note that this period should be set to a value greater than that set for the prefix preferred-lifetime. |
| *<preferred-lifetime>* | Specifies the IPv6 prefix preferred lifetime. This is the period during which the IPv6 address prefix is considered a current (undeprecated) value. After this period, the command is still valid but should not be used in new communications. Set to a value between 0 and 4294967295 seconds. The default is 604800 seconds (7 days).<br>Note that this period should be set to a value less than that set for the prefix valid-lifetime. |
| `off-link` | Specify the IPv6 prefix off-link flag. The default is flag set. |
| `no-autoconfig` | Specify the IPv6 prefix no autoconfiguration flag. Setting this flag indicates that the prefix is not to be used for autoconfiguration. The default is flag set. |
| `all` | Specify all IPv6 prefixes associated with the interface. |

**Default** Valid-lifetime default is 2592000 seconds (30 days). Preferred-lifetime default is 604800 seconds (7 days).

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** This command specifies the IPv6 prefix flags that are advertised by the router advertisement message.

**Examples** To configure the device to issue router advertisements on eth1, and advertise the address prefix of 2001:0db8::/64, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 nd prefix 2001:0db8::/64
```

To configure the device to issue router advertisements on eth1, and advertise the address prefix of 2001:0db8::/64 with a valid lifetime of 10 days and a preferred lifetime of 5 days, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 nd prefix 2001:0db8::/64 864000 432000
```

To configure the device to issue router advertisements on eth1 and advertise the address prefix of 2001:0db8::/64 with a valid lifetime of 10 days, a preferred lifetime of 5 days, and no prefix used for autoconfiguration, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 nd prefix 2001:0db8::/64 864000 432000
no-autoconfig
```

To reset router advertisements on eth1, so the address prefix of 2001:0db8::/64 is not advertised from the device, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ipv6 nd prefix 2001:0db8::/64
```

To reset all router advertisements on eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ipv6 nd prefix all
```

**Related commands** ipv6 nd suppress-ra

# ipv6 nd proxy interface

**Overview** Use this command to enable the neighbor discovery proxy that forwards Neighbor Solicitations (NS) and Neighbor Advertisements (NA) between two interfaces.

Use the **no** variant of this command to disable the neighbor discovery proxy.

**Syntax**

```
ipv6 nd proxy interface <interface-name>
no ipv6 nd proxy
```

| Parameter | Description |
|---|---|
| *<interface-name>* | The name of the VLAN, Ethernet or Bridge interface to proxy NS and NA from/to. For example *vlan1, eth1 or br1*. |

**Default** No ND proxy is enabled

**Mode** Interface Configuration for VLAN, Eth, WWAN, and bridge interfaces and 802.1Q sub-interfaces.

**Examples** To enable neighbor discovery proxy on eth1, and forward NS and NA to vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 nd proxy interface vlan1
```

To disable neighbor discovery proxy on eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ipv6 nd proxy
```

Example running configuration output to enable neighbor discovery proxy between eth1 and br1:

```
!
bridge 1
!
int vlan1
 bridge-group 1
!
int vlan2
 bridge-group 1
!
interface eth1
 ipv6 enable
 ipv6 nd proxy interface br1
!
interface br1
 ipv6 enable
 ipv6 nd proxy interface eth1
 ipv6 address autoconfig eth1
!
```

**Related commands** show running-config

**Command changes** Version 5.4.8-1.1: command added

# ipv6 nd ra-interval

**Overview** Use this command to specify the interval between IPv6 Router Advertisements (RA) transmissions.

Use **no** parameter with this command to reset the value to the default value (600 seconds).

**Syntax**

```
ipv6 nd ra-interval <seconds>
no ipv6 nd ra-interval
```

| Parameter | Description |
|---|---|
| *<seconds>* | Specifies the number of seconds between IPv6 Router Advertisements (RAs). Valid values are from 4 to 1800 seconds. |

**Default** 600 seconds.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** To enable the transmission of router advertisements, you must apply the **no** version of the ipv6 nd suppress-ra command. This step is included in the example below.

**Example** To set the advertisements interval on eth1 to be 60 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 nd ra-interval 60
awplus(config-if)# no ipv6 nd suppress-ra
```

To reset the advertisements interval on eth1 to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ipv6 nd ra-interval
```

**Related commands**

ipv6 nd minimum-ra-interval

ipv6 nd suppress-ra

ipv6 nd prefix

# ipv6 nd ra-lifetime

**Overview** Use this command to specify the time period that this router can usefully act as a default gateway for the network. Each router advertisement resets this time period.

Use **no** parameter with this command to reset the value to default.

**Syntax**

```
ipv6 nd ra-lifetime <seconds>
no ipv6 nd ra-lifetime
```

| Parameter | Description |
|---|---|
| *<seconds>* | Time period in seconds. Valid values are from 0 to 9000. Note that you should set this time period to a value greater than the value you have set using the ipv6 nd ra-interval command. |

**Default** 1800 seconds

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** This command specifies the lifetime of the current router to be announced in IPv6 Router Advertisements.

To enable the transmission of router advertisements, you must apply the **no** version of the ipv6 nd suppress-ra command. This step is included in the example below.

**Examples** To set the advertisement lifetime of 8000 seconds on eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 nd ra-lifetime 8000
awplus(config-if)# no ipv6 nd suppress-ra
```

To reset the advertisement lifetime to the default on eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ipv6 nd ra-lifetime
```

To set the advertisement lifetime of 8000 seconds on the PPP interface ppp0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ipv6 nd ra-lifetime 8000
awplus(config-if)# no ipv6 nd suppress-ra
```

**Related commands**

ipv6 nd suppress-ra

ipv6 nd prefix

# ipv6 nd reachable-time

**Overview** Use this command to specify the reachable time in the router advertisement to be used for detecting reachability of the IPv6 neighbor.

Use the **no** variant of this command to reset the value to default.

**Syntax**

```
ipv6 nd reachable-time <milliseconds>
no ipv6 nd reachable-time
```

| Parameter | Description |
|---|---|
| *<milliseconds>* | Time period in milliseconds. Valid values are from 1000 to 3600000.<br>Setting this value to 0 indicates an unspecified reachable-time. |

**Default** 0 milliseconds

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** This command specifies the reachable time of the current router to be announced in IPv6 Router Advertisements.

To enable the transmission of router advertisements, you must apply the **no ipv6 nd suppress-ra** command. This instruction is included in the example shown below.

**Example** To set the reachable-time in router advertisements on eth1 to be 1800000 milliseconds, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 nd reachable-time 1800000
awplus(config-if)# no ipv6 nd suppress-ra
```

To reset the reachable-time in router advertisements on eth1 to an unspecified reachable-time (0 milliseconds), enter the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ipv6 nd reachable-time
```

To set the reachable-time in router advertisements on the PPP interface ppp0 to be 1800000 milliseconds, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ipv6 nd reachable-time 1800000
awplus(config-if)# no ipv6 nd suppress-ra
```

To reset the reachable-time in router advertisements on the PPP interface ppp0 to an unspecified reachable-time (0 milliseconds), enter the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 nd reachable-time
```

**Related commands**

ipv6 nd suppress-ra

ipv6 nd prefix

# ipv6 nd retransmission-time

**Overview** Use this command to specify the advertised retransmission interval for Neighbor Solicitation in milliseconds between IPv6 Routers.

Use the **no** variant of this command to reset the retransmission time to the default (1 second).

**Syntax**

```
ipv6 nd retransmission-time <milliseconds>
no ipv6 nd retransmission-time
```

| Parameter | Description |
|---|---|
| *<milliseconds>* | Time period in milliseconds. Valid values are from 1000 to 3600000. |

**Default** 1000 milliseconds (1 second)

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Examples** To set the retransmission-time of Neighbor Solicitation on eth1 to be 800000 milliseconds, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 nd retransmission-time 800000
```

To reset the retransmission-time of Neighbor Solicitation on eth1 to the default 1000 milliseconds (1 second), enter the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ipv6 nd retransmission-time
```

To set the retransmission-time of Neighbor Solicitation on the PPP interface ppp0 to be 800000 milliseconds, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ipv6 nd retransmission-time 800000
```

To reset the retransmission-time of Neighbor Solicitation on the PPP interface ppp0 to the default 1000 milliseconds (1 second), enter the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 nd retransmission-time
```

**Related commands**

ipv6 nd suppress-ra

ipv6 nd prefix

# ipv6 nd route-information

**Overview** Use this command to supply more specific route information to be included in the RA (Router Advertisement) the device sends to downstream devices on the same link/LAN.

Use the **no** variant of this command to remove some or all route information.

**Syntax**

```
ipv6 nd route-information <ipv6-prefix/length>
[<0-4294967295>|infinity|default] [low|medium|high]
ipv6 nd route-information <ipv6-prefix/length>
no ipv6 nd route-information <ipv6-prefix/length>
no ipv6 nd route-information all
```

| Parameter | Description |
|---|---|
| *<ipv6-prefix/length>* | The IPv6 network prefix and prefix length entered in dotted decimal format for the IPv6 network prefix, then slash notation for the IPv6 prefix length in the format X:X::X:X/ M, e.g. 2001:db8::/64 |
| *<0-4294967295>*\|infinity\|default | The length of time in seconds (relative to the time the packet is sent) that the prefix is valid for route determination.<br>• infinity - specifies that the route advertisement has an infinite lifetime.<br>• default - is 3 * MaxRtrAdvInterval |
| low\|medium\|high | The preference value for the route information |

**Default** No route information option is included in router advertisement on any interface.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Example** To configure a route of 2001:DB8:1::/48 on vlan2, with a lifetime of 6000 seconds and a high preference, use the commands:

```
awplus# configure terminal
awplus(config)# int vlan2
awplus(config-if)# ipv6 nd route-information 2001:DB8:1::/48
6000 high
```

**Related commands** ipv6 nd suppress-ra

**Command changes** Version 5.5.0-2.4: command added

# ipv6 nd router-preference

**Overview** Use this command to set the default router preference in the router advertisements sent on a particular interface. You can use this setting to decide whether devices will use this router instead of an alternative router, by giving this router and the alternative router different values.

Use the **no** variant of this command to return the router preference to its default value.

**Syntax**

```
ipv6 nd router-preference {low|medium|high}
no ipv6 nd router-preference
```

| Parameter | Description |
|---|---|
| `low` | (0b11)<br>Preference for this router on this interface is low. |
| `medium` | (0b00)<br>Preference for this router on this interface is medium. |
| `high` | (0b01)<br>Preference for this router on this interface is high. |

**Default** Medium

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Example** To set the router preference to high on eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 nd router-preference high
```

**Related commands** ipv6 nd suppress-ra

show ipv6 interface

**Command changes** Version 5.5.1-0.1: command added

# ipv6 nd suppress-ra

**Overview** Use this command to inhibit IPv6 Router Advertisement (RA) transmission for the current interface. Router advertisements are used when applying IPv6 stateless auto-configuration.

Use the **no** parameter with this command to enable Router Advertisement transmission.

**Syntax**

```
ipv6 nd suppress-ra
no ipv6 nd suppress-ra
```

**Default** Router Advertisement (RA) transmission is suppressed by default.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

**Example** To enable the transmission of router advertisements from vlan2 on the device, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd suppress-ra
```

To enable the transmission of router advertisements from ppp0 on the router, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 nd suppress-ra
```

**Related commands**

ipv6 nd ra-interval

ipv6 nd router-preference

ipv6 nd prefix

# ipv6 neighbor

**Overview** Use this command to add a static IPv6 neighbor entry.

Use the **no** variant of this command to remove a specific IPv6 neighbor entry.

**Syntax**

```
ipv6 neighbor <ipv6-address> <vlan-name> <mac-address>
<port-list>
```

```
no ipv6 neighbor <ipv6-address> <vlan-name> <port-list>
```

| Parameter | Description |
|---|---|
| *<ipv6-address>* | Specify the neighbor's IPv6 address in the format X:X::X:X. |
| *<vlan-name>* | Specify the neighbor's VLAN name. |
| *<mac-address>* | Specify the MAC hardware address in hexadecimal notation in the format HHHH.HHHH.HHHH. |
| *<port-list>* | Specify the port number, or port range. |

**Mode** Global Configuration

**Usage notes** Use this command to clear a specific IPv6 neighbor entry. To clear all dynamic address entries, use the clear ipv6 neighbors command.

**Example** To create a static neighbor entry for IPv6 address 2001:0db8::a2, on vlan2, with MAC address 0000.cd28.0880, on port1.0.1, use the command:

```
awplus# configure terminal
```

```
awplus(config)# ipv6 neighbor 2001:0db8::a2 vlan2
0000.cd28.0880 port1.0.1
```

**Related commands** clear ipv6 neighbors

show ipv6 neighbors

# ipv6 opportunistic-nd

**Overview** Use this command to enable opportunistic neighbor discovery for the global IPv6 ND cache. Opportunistic neighbor discovery changes the behavior for unsolicited ICMPv6 ND packet forwarding on the device.

Use the **no** variant of this command to disable opportunistic neighbor discovery for the global IPv6 ND cache.

**Syntax**

```
ipv6 opportunistic-nd
no ipv6 opportunistic-nd
```

**Default** Opportunistic neighbor discovery is disabled by default.

**Mode** Global Configuration

**Usage notes** When opportunistic neighbor discovery is enabled, the device will reply to any received unsolicited ICMPv6 ND packets. The source MAC address for the unsolicited ICMPv6 ND packet is added to the IPv6 ND cache, so the device forwards the ICMPv6 ND packet. When opportunistic neighbor discovery is disabled, the source MAC address for the ICMPv6 packet is not added to the IPv6 ND cache, so the ICMPv6 ND packet is not forwarded by the device.

**Examples** To enable opportunistic neighbor discovery for the IPv6 ND cache, enter:

```
awplus# configure terminal
awplus(config)# ipv6 opportunistic-nd
```

To disable opportunistic neighbor discovery for the IPv6 ND cache, enter:

```
awplus# configure terminal
awplus(config)# no ipv6 opportunistic-nd
```

**Related commands**

arp opportunistic-nd

show ipv6 neighbors

show running-config interface

# ipv6 route

**Overview** This command adds a static IPv6 route to the Routing Information Base (RIB). If this route is the best route for the destination, then your device adds it to the Forwarding Information Base (FIB). Your device uses the FIB to forward packets and to advertise routes to neighbors.

The **no** variant of this command removes the static route.

**Syntax**

```
ipv6 route <dest-prefix/length> {<gateway-ip>|<gateway-name>}
[<src-prefix/length>] [<distvalue>] [description
<description>]
```

```
no ipv6 route <dest-prefix/length>
{<gateway-ip>|<gateway-name>} [<src-prefix/length>]
[<distvalue>]
```

| Parameter | Description |
|---|---|
| *<dest-prefix/length>* | Specifies the destination prefix.<br>The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64. |
| *<gateway-ip>* | Specifies the address of the gateway (or next hop). The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. |
| *<gateway-name>* | Specifies the name of the interface for the gateway (or next hop). |
| *<src-prefix/length>* | Specifies the source prefix. This is used for SADR - see the Usage notes.<br>The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64. |
| *<distvalue>* | Specifies the administrative distance for the route. Valid values are from 1 to 255. You can use administrative distance to determine which routes take priority over other routes. The route with the lowest distance value is used. |
| description *<description>* | A description to record the route's purpose. It can be up to 80 printable ASCII characters long, including spaces. The description does not affect routing or forwarding decisions made by the device. To see the description, use the command **show running-configuration**. |

**Mode** Global Configuration

**Usage notes** You can configure IPv6 static routes for Source Address Dependent Routing (SADR) by providing a source prefix. In 'normal' routing, when the device searches

routes for a next hop to forward a packet to, the device chooses the next hop based only on the destination address of the packet. When you provide SADR information for a route, the device also inspects the source address and ensures it fits within the source prefix range you provided for this route.

Versions of AlliedWare Plus earlier than 5.5.1-2.1 do not support descriptions on static routes, so a start-up configuration that contains descriptions will be rejected by these older versions. If you add descriptions, be careful if you downgrade to an older AlliedWare Plus version.

**Example**

To create a route with administrative distance of 32 to send packets to 2001:0db8::1/128 via eth1.1, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 route 2001:0db8::1/128 eth1.1 32
```

To use SADR to create a route for packets from 2001::/64 to 2223::/64, with a next hop of 2001::1, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 route 2223::/64 2001::1 2001::/64
```

To give a route a description of 'test' when creating it, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 route 2001:0db8::1/128 eth1.1 description
test
```

To remove the description from a route, re-enter the route without specifying the **description** parameter:

```
awplus# configure terminal
awplus(config)# ipv6 route 2001:0db8::1/128 eth1.1
```

**Related Commands**

ipv6 multihoming

show running-config

show ipv6 route

**Command changes**

Version 5.5.1-2.1: **description** parameter added

Version 5.5.0-0.3: **src-prefix** parameter added

# ipv6 unreachables

**Overview** Use this command to enable ICMPv6 (Internet Control Message Protocol version 6) type 1, destination unreachable, messages.

Use the **no** variant of this command to disable destination unreachable messages. This prevents an attacker from using these messages to discover the topology of a network.

**Syntax**

```
ipv6 unreachables
no ipv6 unreachables
```

**Default** Destination unreachable messages are enabled by default.

**Mode** Global Configuration

**Usage notes** When a device receives a packet for a destination that is unreachable it returns an ICMPv6 type 1 message. This message includes a reason code, as per the table below. An attacker can use these messages to obtain information regarding the topology of a network. Disabling destination unreachable messages, using the **no ipv6 unreachables** command, secures your network against this type of probing.

***NOTE:*** *Disabling ICMPv6 destination unreachable messages breaks applications such as traceroute, which depend on these messages to operate correctly.*

Table 26-1: ICMPv6 type 1 reason codes and description

| Code | Description [RFC] |
|---|---|
| 0 | No route to destination [RFC4443] |
| 1 | Communication with destination administratively prohibited [RFC4443] |
| 2 | Beyond scope of source address [RFC4443] |
| 3 | Address unreachable [RF4443] |
| 4 | Port unreachable [RFC4443] |
| 5 | Source address failed ingress/egress policy [RFC4443] |
| 6 | Reject route to destination [RFC4443 |
| 7 | Error in Source Routing Header [RFC6554] |

**Example** To disable destination unreachable messages, use the commands

```
awplus# configure terminal
awplus(config)# no ipv6 unreachables
```

To enable destination unreachable messages, use the commands

```
awplus# configure terminal
awplus(config)# ipv6 unreachables
```

# optimistic-nd

**Overview** Use this command to enable the optimistic neighbor discovery feature for both IPv4 and IPv6.

Use the **no** variant of this command to disable the optimistic neighbor discovery feature.

**Syntax**

```
optimistic-nd
no optimistic-nd
```

**Default** The optimistic neighbor discovery feature is enabled by default.

**Mode** Interface Configuration for a VLAN interface.

**Usage notes** The optimistic neighbor discovery feature allows the device, after learning an IPv4 or IPv6 neighbor, to refresh the neighbor before it is deleted from the ARP or neighbor tables. The optimistic neighbor discovery feature enables the device to sustain L3 traffic switching to a neighbor without interruption.

If a neighbor receiving optimistic neighbor solicitations does not answer optimistic neighbor solicitations with neighbor advertisements, then the device puts the neighbor entry into the 'stale' state, and subsequently deletes it from the L3 switching tables.

**Examples** To enable the optimistic neighbor discovery feature on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# optimistic-nd
```

To disable the optimistic neighbor discovery feature on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no optimistic-nd
```

**Related commands** show running-config

# ping ipv6

**Overview** This command sends a query to another IPv6 host (send Echo Request messages).

**Syntax**

```
ping ipv6 {<host>|<ipv6-address>} [repeat
{<1-2147483647>|continuous}] [size <10-1452>] [interface
<interface-list>] [timeout <1-65535>]
```

| Parameter | Description |
|---|---|
| *<ipv6-addr>* | The destination IPv6 address. The IPv6 address uses the format X:X::X:X. |
| *<hostname>* | The destination hostname. |
| repeat | Specify the number of ping packets to send. |
| *<1-2147483647>* | Specify repeat count. The default is 5. |
| size *<10-1452>* | The number of data bytes to send, excluding the 8 byte ICMP header. The default is 56 (64 ICMP data bytes). |
| interface *<interface-list>* | The interface or range of configured IP interfaces to use as the source in the IP header of the ping packet. The interface can be one of:<br>• a PPP interface (e.g. ppp0)<br>• an Eth interface (e.g. eth1)<br>• an 802.1Q Ethernet sub-interface (e.g. eth1.10, where '10' is the VLAN ID specified by the **encapsulation dot1q** command)<br>• a VLAN (e.g. vlan2)<br>• a bridge interface (e.g. br0)<br>• a tunnel interface (e.g. tunnel0)<br>• a WWAN interface (e.g wwan0)<br>• the loopback interface (lo)<br>• a continuous range of interfaces, separated by a hyphen (e.g. ppp2-4)<br>• a comma-separated list (e.g. ppp0,ppp2-4). Do not mix interface types in a list.<br>You can only specify the interface when pinging a link local address. |
| timeout *<1-65535>* | The time in seconds to wait for echo replies if the ARP entry is present, before reporting that no reply was received. If no ARP entry is present, it does not wait. |
| repeat | Specify the number of ping packets to send. |
| *<1-2147483647>* | Specify repeat count. The default is 5. |
| continuous | Continuous ping. |

| Parameter | Description |
|---|---|
| `size <10-1452>` | The number of data bytes to send, excluding the 8 byte ICMP header. The default is 56 (64 ICMP data bytes). |
| `timeout <1-65535>` | The time in seconds to wait for echo replies if the ARP entry is present, before reporting that no reply was received. If no ARP entry is present, it does not wait. |

**Mode** User Exec and Privileged Exec

**Example**
```
awplus# ping ipv6 2001:0db8::a2
```

**Related commands** traceroute ipv6

# show ipv6 forwarding

**Overview** Use this command to display IPv6 forwarding status.

**Syntax**

```
show ipv6 forwarding
```

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ipv6 forwarding
```

**Output** Figure 26-1: Example output from the **show ipv6 forwarding** command

```
awplus#show ipv6 forwarding
ipv6 forwarding is on
```

# show ipv6 interface

**Overview** Use this command to display brief information about interfaces and the IPv6 address assigned to them.

**Syntax** `show ipv6 interface [brief|<interface-list>] [nd]`

| Parameter | Description |
|---|---|
| `brief` | Specify this optional parameter to display brief IPv6 interface information. |
| *<interface-list>* | The interfaces to display information about. An interface-list can be:<br>• a PPP interface (e.g. ppp0)<br>• an Eth interface (e.g. eth1)<br>• an 802.1Q Ethernet sub-interface (e.g. eth1.10, where '10' is the VLAN ID specified by the **encapsulation dot1q** command)<br>• a VLAN (e.g. vlan2)<br>• a bridge interface (e.g. br0)<br>• a tunnel interface (e.g. tunnel0)<br>• a WWAN interface (e.g wwan0)<br>• the loopback interface (lo)<br>• a continuous range of interfaces, separated by a hyphen (e.g. ppp2-4)<br>• a comma-separated list (e.g. ppp0,ppp2-4). Do not mix interface types in a list.<br>The specified interfaces must exist. |
| `nd` | Specify this optional parameter for Neighbor Discovery configurations. |

**Mode** User Exec and Privileged Exec

**Examples** To display a brief list of all interfaces on a device, use the following command:

```
awplus# show ipv6 interface brief
```

**Output** Figure 26-2: Example output from the **show ipv6 interface brief** command

```
awplus#show ipv6 interface brief
Interface     IPv6-Address                                Status      Protocol
eth1          unassigned                                  admin up    running
eth1.1        2001:db8::1/48                              admin up    down
              fe80::215:77ff:fee9:5c50/64
lo            unassigned                                  admin up    running
```

**Related commands**

ipv6 nd router-preference

show interface brief

# show ipv6 neighbors

**Overview** Use this command to display all IPv6 neighbors.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

**Syntax**

```
show ipv6 neighbors
```

**Mode** User Exec and Privileged Exec

**Example** To display a device's IPv6 neighbors, use the following command:

```
awplus# show ipv6 neighbors
```

**Output** Figure 26-3: Example output of the **show ipv6 neighbors** command

```
IPv6 Address                    MAC Address    Interface          Port     Type
fe80::290:bff:fe3e:44dc         0090.0b3e.44dc eth1               -        dynamic
fd32:b1f0:dff7:ab03::1          0090.0b3e.44dc eth1               -        dynamic
...
```

**Related commands** clear ipv6 neighbors

ipv6 neighbor

# show ipv6 route

**Overview** Use this command to display the IPv6 routing table for a protocol or from a particular table.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ipv6 route
[bgp|connected|database|ospf|rip|static|summary|<ipv6-address>
|<ipv6-prefix/prefix-length>]
```

| Parameter | Description |
|---|---|
| `bgp` | Displays only the routes learned from BGP. |
| `connected` | Displays only the routes learned from connected interfaces. |
| `database` | Displays only the IPv6 routing information extracted from the database. |
| `ospf` | Displays only the routes learned from OSPFv3. |
| `rip` | Displays only the routes learned from RIPng. |
| `static` | Displays only the IPv6 static routes you have configured. |
| `summary` | Displays summary information from the IPv6 routing table. |
| *`<ipv6-address>`* | Displays the routes for the specified address in the IPv6 routing table. |
| *`<ipv6-prefix>/<prefix-length>`* | Displays only the routes for the specified IPv6 prefix. |

**Mode** User Exec and Privileged Exec

**Example** To display all IPv6 routes with all parameters turned on, use the following command:

```
awplus# show ipv6 route
```

To display all database entries for all IPv6 routes, use the following command:

```
awplus# show ipv6 route database
```

**Output** Figure 26-4: Example output of the **show ipv6 route** command

```
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPF, B - BGP
S   ::/0 [1/0] via 2001::a:0:0:c0a8:a6, eth1
C   2001:db8::a:0:0:0:0/64 via ::, eth1
...
```

**Output** Figure 26-5: Example output of the **show ipv6 route database** command

```
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPF, B - BGP
> - selected route, * - FIB route, p - stale info
Timers: Uptime

S   ::/0 [1/0] via 2001::a:0:0:c0a8:a01 inactive, 6d22h12m
         [1/0] via 2001::fa:0:0:c0a8:fa01 inactive, 6d22h12m
```

# show ipv6 route summary

**Overview** Use this command to display the summary of the current NSM RIB entries.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ipv6 route summary
```

**Mode** User Exec and Privileged Exec

**Example** To display IP route summary, use the following command:

```
awplus# show ipv6 route summary
```

**Output** Figure 26-6: Example output from the **show ipv6 route summary** command

```
IPv6 routing table name is Default-IPv6-Routing-Table(0)
IPv6 routing table maximum-paths is 4
RouteSource     Networks
connected       4
rip             5
Total           9
FIB             5
```

**Related commands** show ip route database

# traceroute ipv6

**Overview** Use this command to trace the route to the specified IPv6 host.

**Syntax**

```
traceroute ipv6 {<ipv6-addr>|<hostname>}
```

| Parameter | Description |
|---|---|
| *<ipv6-addr>* | The destination IPv6 address. The IPv6 address uses the format X:X::X:X. |
| *<hostname>* | The destination hostname. |

**Mode** User Exec and Privileged Exec

**Example** To run a traceroute for the IPv6 address 2001:0db8::a2, use the following command:

```
awplus# traceroute ipv6 2001:0db8::a2
```

**Related commands** ping ipv6

# 27 Routing Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of routing commands that are common across the routing IP protocols. For more information, see the Route Selection Feature Overview and Configuration Guide.

**Command List**

- "ip route" on page 986
- "ipv6 route" on page 989
- "max-fib-routes" on page 991
- "max-static-routes" on page 993
- "maximum-paths" on page 994
- "show ip route" on page 995
- "show ip route database" on page 998
- "show ip route summary" on page 1001
- "show ipv6 route" on page 1003
- "show ipv6 route summary" on page 1005

# ip route

**Overview** This command adds a static route to the Routing Information Base (RIB). If this route is the best route for the destination, then your device adds it to the Forwarding Information Base (FIB). Your device uses the FIB to advertise routes to neighbors and forward packets.

The **no** variant of this command removes the static route from the RIB and FIB.

**Syntax**

```
ip route <subnet&mask> {<gateway-ip>|<interface>} [<distance>]
[weight <1-255>] [description <description>]
```

```
no ip route <subnet&mask> {<gateway-ip>|<interface>}
[<distance>] [weight <1-255>]
```

| Parameter | Description |
|---|---|
| *<subnet&mask>* | The IPv4 address of the destination subnet defined using either a prefix length or a separate mask specified in one of the following formats:<br>• The IPv4 subnet address in dotted decimal notation followed by the subnet mask, also in dotted decimal notation.<br>• The IPv4 subnet address in dotted decimal notation, followed by a forward slash, then the prefix length. |
| *<gateway-ip>* | The IPv4 address of the gateway device. |
| *<interface>* | The interface that connects your device to the network. For a VLAN, enter the name of the VLAN or its VID.<br>You can also enter 'null' as an interface. Specify a 'null' interface to add a null or blackhole route to the switch.<br>The gateway IP address or the interface is required if VRF-lite is not configured.<br>If VRF-lite is configured: When adding a static intra-VRF route, you must specify either the gateway IP address or the interface.<br>When adding a static inter-VRF route, you must specify both the gateway IP address and the interface. |
| *<distance>* | The administrative distance for the static route in the range 1 to 255. Static routes by default have an administrative distance of 1, which gives them the highest priority possible. |
| weight *<1-255>* | Weight is used for the Weighted Lottery Load Balancing mode. See the Usage notes section for more information. |
| description *<description>* | A description to record the route's purpose. It can be up to 80 printable ASCII characters long, including spaces. The description does not affect routing or forwarding decisions made by the device. To see the description, use the command **show running-configuration**. |

**Mode** Global Configuration

**Default** The default administrative distance for a static route is 1.

**Usage notes**

You can use administrative distance to determine which routes take priority over other routes.

Specify a 'Null' interface to add a null or blackhole route to the switch. A null or blackhole route is a routing table entry that does not forward packets, so any packets sent to it are dropped.

Versions of AlliedWare Plus earlier than 5.5.1-2.1 do not support descriptions on static routes, so a start-up configuration that contains descriptions will be rejected by these older versions. If you add descriptions, be careful if you downgrade to an older AlliedWare Plus version.

The **weight** parameter lets you assign a weight to the interface. AlliedWare Plus distributes the work load based on the number of sessions that are connected through the interfaces. It uses the weight that you assign to each interface to calculate a percentage of the total sessions that are allowed to connect through each interface. It then distributes the number of sessions between the interfaces accordingly.

**Examples**

To add the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at 10.10.0.2 with the default administrative distance, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.3.0 255.255.255.0 10.10.0.2
```

To remove the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at 10.10.0.2 with the default administrative distance, use the commands:

```
awplus# configure terminal
awplus(config)# no ip route 192.168.3.0 255.255.255.0 10.10.0.2
```

To specify a null or blackhole route 192.168.4.0/24, so packets forwarded to this route are dropped, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.4.0/24 null
```

To add the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at 10.10.0.2 with an administrative distance of 128, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.3.0 255.255.255.0 10.10.0.2
128
```

To add the destination 192.168.3.0 with the mask 255.255.255.0 as a static route available through the device at 10.10.0.2 with the default administrative distance, and a weight of 7, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.3.0 255.255.255.0 10.10.0.2
weight 7
```

To give a route a description of 'test' when creating it, use the commands:

```
awplus# configure terminal
awplus(config)# ip route 192.168.3.0/24 10.10.0.2 description
test
```

To remove the description from a route, re-enter the route without specifying the **description** parameter:

```
awplus# configure terminal
awplus(config)# ip route 192.168.3.0/24 10.10.0.2
```

**Related commands**

ip route vrf

show ip route

show ip route database

**Command changes**

Version 5.5.1-2.1: **weight** and **description** parameters added.

# ipv6 route

**Overview** This command adds a static IPv6 route to the Routing Information Base (RIB). If this route is the best route for the destination, then your device adds it to the Forwarding Information Base (FIB). Your device uses the FIB to forward packets and to advertise routes to neighbors.

The **no** variant of this command removes the static route.

**Syntax**

```
ipv6 route <dest-prefix/length> {<gateway-ip>|<gateway-name>}
[<src-prefix/length>] [<distvalue>] [description
<description>]
```

```
no ipv6 route <dest-prefix/length>
{<gateway-ip>|<gateway-name>} [<src-prefix/length>]
[<distvalue>]
```

| Parameter | Description |
|---|---|
| *<dest-prefix/length>* | Specifies the destination prefix.<br>The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64. |
| *<gateway-ip>* | Specifies the address of the gateway (or next hop). The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. |
| *<gateway-name>* | Specifies the name of the interface for the gateway (or next hop). |
| *<src-prefix/length>* | Specifies the source prefix. This is used for SADR - see the Usage notes.<br>The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64. |
| *<distvalue>* | Specifies the administrative distance for the route. Valid values are from 1 to 255. You can use administrative distance to determine which routes take priority over other routes. The route with the lowest distance value is used. |
| description *<description>* | A description to record the route's purpose. It can be up to 80 printable ASCII characters long, including spaces. The description does not affect routing or forwarding decisions made by the device. To see the description, use the command **show running-configuration**. |

**Mode** Global Configuration

**Usage notes** You can configure IPv6 static routes for Source Address Dependent Routing (SADR) by providing a source prefix. In 'normal' routing, when the device searches

routes for a next hop to forward a packet to, the device chooses the next hop based only on the destination address of the packet. When you provide SADR information for a route, the device also inspects the source address and ensures it fits within the source prefix range you provided for this route.

Versions of AlliedWare Plus earlier than 5.5.1-2.1 do not support descriptions on static routes, so a start-up configuration that contains descriptions will be rejected by these older versions. If you add descriptions, be careful if you downgrade to an older AlliedWare Plus version.

**Example** To create a route with administrative distance of 32 to send packets to 2001:0db8::1/128 via eth1.1, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 route 2001:0db8::1/128 eth1.1 32
```

To use SADR to create a route for packets from 2001::/64 to 2223::/64, with a next hop of 2001::1, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 route 2223::/64 2001::1 2001::/64
```

To give a route a description of 'test' when creating it, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 route 2001:0db8::1/128 eth1.1 description
test
```

To remove the description from a route, re-enter the route without specifying the **description** parameter:

```
awplus# configure terminal
awplus(config)# ipv6 route 2001:0db8::1/128 eth1.1
```

**Related Commands**

ipv6 multihoming

show running-config

show ipv6 route

**Command changes**

Version 5.5.1-2.1: **description** parameter added

Version 5.5.0-0.3: **src-prefix** parameter added

# max-fib-routes

**Overview** This command enables you to control the maximum number of FIB routes configured. It operates by providing parameters that enable you to configure preset maximums and warning message thresholds.

***NOTE:*** *When using VRF-lite, this command applies to the Global VRF instance; to set the max-fib-routes for a user-defined VRF instance use the max-fib-routes (VRF) command. For static routes use the max-static-routes command for the Global VRF instance and the max-static-routes (VRF) command for a user-defined VRF instance.*

Use the **no** variant of this command to set the maximum number of FIB routes to the default of 4294967294 FIB routes.

**Syntax**

```
max-fib-routes <1-4294967294> [<1-100>|warning-only]
no max-fib-routes
```

| Parameter | Description |
|---|---|
| `max-fib-routes` | This is the maximum number of routes that can be stored in the device's Forwarding Information dataBase. In practice, other practical system limits would prevent this maximum being reached. |
| *<1-4294967294>* | The allowable configurable range for setting the maximum number of FIB-routes. |
| *<1-100>* | This parameter enables you to optionally apply a percentage value. This percentage will be based on the maximum number of FIB routes you have specified. This will cause a warning message to appear when your routes reach your specified percentage value. Routes can continue to be added until your configured maximum value is reached. |
| `warning-only` | This parameter enables you to optionally apply a warning message. If you set this option a warning message will appear if your maximum configured value is reached. Routes can continue to be added until your device reaches either the maximum capacity value of 4294967294, or a practical system limit. |

**Default** The default number of FIB routes is the maximum number of FIB routes (4294967294).

**Mode** Global Configuration

**Examples** To set the maximum number of dynamic routes to 2000 and warning threshold of 75%, use the following commands:

```
awplus# config terminal
awplus(config)# max-fib-routes 2000 75
```

**Related commands** max-fib-routes (VRF)

# max-static-routes

**Overview** Use this command to set the maximum number of static routes, excluding FIB (Forwarding Information Base) routes.

***NOTE:*** *For FIB routes use the max-fib-routes command.*

Use the **no** variant of this command to set the maximum number of static routes to the default of 1024 static routes.

**Syntax**

```
max-static-routes <1-1024>
no max-static-routes
```

**Default** The default number of static routes is the maximum number of static routes (1024).

**Mode** Global Configuration

**Example** To reset the maximum number of static routes to the default maximum, use the command:

```
awplus# configure terminal
awplus(config)# no max-static-routes
```

***NOTE:*** *Static routes are applied before adding routes to the RIB (Routing Information Base). Therefore, rejected static routes will not appear in the running config.*

**Related commands** max-fib-routes

# maximum-paths

**Overview** This command enables ECMP on your device, and sets the maximum number of paths that each route has in the Forwarding Information Base (FIB). ECMP is enabled by default.

The **no** variant of this command sets the maximum paths to the default of 4.

ECMP path calculations are flow-based. This means that packets from the same flow will always be sent on the same path.

**Syntax**

```
maximum-paths <1-8>
no maximum-paths
```

| Parameter | Description |
|---|---|
| *<1-8>* | The maximum number of paths that a route can have in the FIB. |

**Default** By default the maximum number of paths is 4.

**Mode** Global Configuration

**Examples** To set the maximum number of paths for each route in the FIB to 5, use the command:

```
awplus# configure terminal
awplus(config)# maximum-paths 5
```

To set the maximum paths for a route to the default of 4, use the command:

```
awplus# configure terminal
awplus(config)# no maximum-paths
```

# show ip route

**Overview** Use this command to display routing entries in the FIB (Forwarding Information Base). The FIB contains the best routes to a destination, and your device uses these routes when forwarding traffic. You can display a subset of the entries in the FIB based on protocol.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

**VRF-lite** If VRF-lite is configured, you can display routing entries in the FIB associated with either the global routing domain or a named VRF.

**Syntax**
```
show ip route [bgp|connected|ospf|rip|static|
<ip-addr>|<ip-addr/prefix-length>]
```

**Syntax (VRF-lite)**
```
show ip route {vrf <vrf-name>|global}
[bgp|connected|ospf|rip|static]
```

| Parameter | Description |
|---|---|
| `global` | If VRF-lite is configured, apply the command to the global routing and forwarding table. |
| `vrf` | Apply the command to the specified VRF instance. |
| *`<vrf-name>`* | The name of the VRF instance. |
| `bgp` | Displays only the routes learned from BGP. |
| `connected` | Displays only the routes learned from connected interfaces. |
| `ospf` | Displays only the routes learned from OSPF. |
| `rip` | Displays only the routes learned from RIP. |
| `static` | Displays only the static routes you have configured. |
| *`<ip-addr>`* | Displays the routes for the specified address. Enter an IPv4 address. |
| *`<ip-addr/prefix-length>`* | Displays the routes for the specified network. Enter an IPv4 address and prefix length. |

**Mode** User Exec and Privileged Exec

**Examples** To display the static routes in the FIB, use the command:

```
awplus# show ip route static
```

To display the OSPF routes in the FIB, use the command:

```
awplus# show ip route ospf
```

**Example (VRF-lite)** To display all routing entries in the FIB associated with a VRF instance `red`, use the command:

```
awplus# show ip route vrf red
```

**Output** Each entry in the output from this command has a code preceding it, indicating the source of the routing entry. For example, O indicates OSPF as the origin of the route. The first few lines of the output list the possible codes that may be seen with the route entries.

Typically, route entries are composed of the following elements:

- code
- a second label indicating the sub-type of the route
- network or host IP address
- administrative distance and metric
- next hop IP address
- outgoing interface name
- time since route entry was added

Figure 27-1: Example output from the **show ip route** command

```
Codes: C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       * - candidate default

O       10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:20:54
C       3.3.3.0/24 is directly connected, vlan1
C       10.10.31.0/24 is directly connected, vlan2
C       10.70.0.0/24 is directly connected, vlan4
O E2    14.5.1.0/24 [110/20] via 10.10.31.16, vlan2, 00:18:56
C       33.33.33.33/32 is directly connected, lo
```

**Connected Route** An example of a connected route entry consists of:

```
C       10.10.31.0/24 is directly connected, eth1
```

This route entry denotes:

- Route entries for network 10.10.31.0/24 are derived from the IP address of local interface eth1.
- These routes are marked as Connected routes (C) and always preferred over routes for the same network learned from other routing protocols.

**OSPF Route** An example of an OSPF route entry consists of:

```
O       10.10.37.0/24 [110/11] via 10.10.31.16, eth1, 00:20:54
```

This route entry denotes:

- This route in the network 10.10.37.0/24 was added by OSPF.
- This route has an administrative distance of 110 and metric/cost of 11.
- This route is reachable via next hop 10.10.31.16.
- The outgoing local interface for this route is eth1.
- This route was added 20 minutes and 54 seconds ago.

**OSPF External Route**

An example of an OSPF external route entry consists of:

```
O E2    14.5.1.0/24 [110/20] via 10.10.31.16, eth1, 00:18:56
```

This route entry denotes that this route is the same as the other OSPF route explained above; the main difference is that it is a Type 2 External OSPF route.

**Weight for Static Route**

If the **weight** parameter has been set using the **ip route** command, it will be shown in the output:

```
S       10.10.37.0/24 [110/11] via 10.10.31.16, vlan2 weight 5
                               via 10.10.31.32, vlan2 weight 1
```

AlliedWare Plus distributes the work load based on the number of sessions that are connected through the interfaces. It uses the weight that you assign to each interface to calculate a percentage of the total sessions that are allowed to connect through each interface. It then distributes the number of sessions between the interfaces accordingly.

**Related commands**

ip route

ip route vrf

maximum-paths

show ip route database

**Command changes**

Version 5.4.6-2.1: VRF-lite support added.

# show ip route database

**Overview** This command displays the routing entries in the RIB (Routing Information Base).

When multiple entries are available for the same prefix, RIB uses the routes' administrative distances to choose the best route. All best routes are entered into the FIB (Forwarding Information Base). To view the routes in the FIB, use the show ip route command.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > (output redirection token).

**Syntax**
```
show ip route database [bgp|connected|ospf|rip|static]
```

**Syntax (VRF-lite)**
```
show ip route [vrf <vrf-name>|global] database
[bgp|connected|ospf|rip|static]
```

| Parameter | Description |
|---|---|
| `global` | If VRF-lite is configured, apply the command to the global routing and forwarding table. |
| `vrf` | Apply the command to the specified VRF instance. |
| *`<vrf-name>`* | The name of the VRF instance. |
| `bgp` | Displays only the routes learned from BGP. |
| `connected` | Displays only the routes learned from connected interfaces. |
| `ospf` | Displays only the routes learned from OSPF. |
| `rip` | Displays only the routes learned from RIP. |
| `static` | Displays only the static routes you have configured. |

**Mode** User Exec and Privileged Exec

**Example** To display the static routes in the RIB, use the command:

```
awplus# show ip route database static
```

**Output** Figure 27-2: Example output from the **show ip route database** command:

```
Codes: C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
              > - selected route, * - FIB route, p - stale info

O    *> 9.9.9.9/32 [110/31] via 10.10.31.16, vlan2, 00:19:21
O       10.10.31.0/24 [110/1] is directly connected, vlan2, 00:28:20
C    *> 10.10.31.0/24 is directly connected, vlan2
S    *> 10.10.34.0/24 [1/0] via 10.10.31.16, vlan2
O       10.10.34.0/24 [110/31] via 10.10.31.16, vlan2, 00:21:19
O    *> 10.10.37.0/24 [110/11] via 10.10.31.16, vlan2, 00:21:19
C    *> 10.30.0.0/24 is directly connected, vlan6
S    *> 11.22.11.0/24 [1/0] via 10.10.31.16, vlan2
O E2 *> 14.5.1.0/24 [110/20] via 10.10.31.16,vlan2, 00:19:21
O       16.16.16.16/32 [110/11] via 10.10.31.16, vlan2, 00:21:19
S    *> 16.16.16.16/32 [1/0] via 10.10.31.16, vlan2
O    *> 17.17.17.17/32 [110/31] via 10.10.31.16, vlan2, 00:21:19
C    *> 45.45.45.45/32 is directly connected, lo
O    *> 55.55.55.55/32 [110/21] via 10.10.31.16, vlan2, 00:21:19
C    *> 127.0.0.0/8 is directly connected, lo
```

**Example (VRF-lite)** To display all routing entries in the RIB associated with a VRF instance `red`, use the command:

```
awplus# show ip route vrf red database
```

**Output** Figure 27-3: Example output from the **show ip route vrf red database** command

```
[VRF: red]
Codes: C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
              > - selected route, * - FIB route, p - stale info

O       192.168.10.0/24 [110/1] is directly connected, vlan1, 06:45:51
C    *> 192.168.10.0/24 is directly connected, vlan1
B     > 192.168.33.0/24 [20/0] via 192.168.30.3, 06:45:52
O E2 *> 192.168.110.0/24 [110/20] via 192.168.10.2, vlan1, 06:45:00
O E2 *> 192.168.111.0/24 [110/20] via 192.168.10.2, vlan1, 06:45:00
```

The routes added to the FIB are marked with a `*`. When multiple routes are available for the same prefix, the best route is indicated with the > symbol. All unselected routes have neither the `*` nor the > symbol.

```
S    *> 10.10.34.0/24 [1/0] via 10.10.31.16, vlan2
O       10.10.34.0/24 [110/31] via 10.10.31.16, vlan2, 00:21:19
```

These route entries denote:

- The same prefix was learned from OSPF and from static route configuration.

- Since this static route has a lower administrative distance than the OSPF route (110), the static route (1) is selected and installed in the FIB.

If the static route becomes unavailable, then the device automatically selects the OSPF route and installs it in the FIB.

**Related commands**

maximum-paths

show ip route

**Command changes**

Version 5.4.6-2.1: VRF-lite support added.

# show ip route summary

**Overview** This command displays a summary of the current RIB (Routing Information Base) entries.

To modify the lines displayed, use the | (output modifier token); to save the output to a file, use the > output redirection token.

**Syntax**
```
show ip route summary
```

**Syntax (VRF-lite)**
```
show ip route summary [vrf <vrf-name>|global]
```

| Parameter | Description |
|---|---|
| `vrf` | Specific VRF instance. |
| *`<vrf-name>`* | The name of the VRF instance. |
| `global` | The global routing and forwarding table. |

**Mode** User Exec and Privileged Exec

**Example** To display a summary of the current RIB entries, use the command:

```
awplus# show ip route summary
```

**Output** Figure 27-4: Example output from the **show ip route summary** command

```
IP routing table name is Default-IP-Routing-Table(0)
IP routing table maximum-paths is 4
Route Source    Networks
connected       5
ospf            2
Total           8
```

**Example (VRF-lite)** To display a summary of the current RIB entries associated with a VRF instance red, use the command:

```
awplus# show ip route summary vrf red
```

**Output** Figure 27-5: Example output from the **show ip route summary vrf red** command

```
IP routing table name is Default-IP-Routing-Table(0)
IP routing table maximum-paths is 4
Route Source    Networks
connected       1
Total           1
FIB             0

[VRF: red]
Route Source    Networks
connected       1
ospf            2
Total           3
```

show ip route database

**Command changes**

Version 5.4.6-2.1: VRF-lite support added.

# show ipv6 route

**Overview** Use this command to display the IPv6 routing table for a protocol or from a particular table.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ipv6 route
[bgp|connected|database|ospf|rip|static|summary|<ipv6-address>
|<ipv6-prefix/prefix-length>]
```

| Parameter | Description |
|---|---|
| `bgp` | Displays only the routes learned from BGP. |
| `connected` | Displays only the routes learned from connected interfaces. |
| `database` | Displays only the IPv6 routing information extracted from the database. |
| `ospf` | Displays only the routes learned from OSPFv3. |
| `rip` | Displays only the routes learned from RIPng. |
| `static` | Displays only the IPv6 static routes you have configured. |
| `summary` | Displays summary information from the IPv6 routing table. |
| *`<ipv6-address>`* | Displays the routes for the specified address in the IPv6 routing table. |
| *`<ipv6-prefix>/<prefix-length>`* | Displays only the routes for the specified IPv6 prefix. |

**Mode** User Exec and Privileged Exec

**Example** To display all IPv6 routes with all parameters turned on, use the following command:

```
awplus# show ipv6 route
```

To display all database entries for all IPv6 routes, use the following command:

```
awplus# show ipv6 route database
```

**Output** Figure 27-6: Example output of the **show ipv6 route** command

```
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPF, B - BGP
S   ::/0 [1/0] via 2001::a:0:0:c0a8:a6, eth1
C   2001:db8::a:0:0:0:0/64 via ::, eth1
...
```

**Output** Figure 27-7: Example output of the **show ipv6 route database** command

```
IPv6 Routing Table
Codes: C - connected, S - static, R - RIP, O - OSPF, B - BGP
> - selected route, * - FIB route, p - stale info
Timers: Uptime

S   ::/0 [1/0] via 2001::a:0:0:c0a8:a01 inactive, 6d22h12m
         [1/0] via 2001::fa:0:0:c0a8:fa01 inactive, 6d22h12m
```

# show ipv6 route summary

**Overview** Use this command to display the summary of the current NSM RIB entries.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ipv6 route summary
```

**Mode** User Exec and Privileged Exec

**Example** To display IP route summary, use the following command:

```
awplus# show ipv6 route summary
```

**Output** Figure 27-8: Example output from the **show ipv6 route summary** command

```
IPv6 routing table name is Default-IPv6-Routing-Table(0)
IPv6 routing table maximum-paths is 4
RouteSource     Networks
connected       4
rip             5
Total           9
FIB             5
```

# 28 RIP Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure RIP.

For information about configuring RIP, see the RIP Feature Overview and Configuration Guide.

**Command List**

- "accept-lifetime" on page 1008
- "address-family ipv4 (RIP)" on page 1010
- "alliedware-behavior" on page 1011
- "cisco-metric-behavior (RIP)" on page 1013
- "clear ip rip route" on page 1014
- "debug rip" on page 1016
- "default-information originate (RIP)" on page 1017
- "default-metric (RIP)" on page 1018
- "distance (RIP)" on page 1019
- "distribute-list (RIP)" on page 1020
- "fullupdate (RIP)" on page 1021
- "ip summary-address rip" on page 1022
- "ip prefix-list" on page 1023
- "ip rip authentication key-chain" on page 1025
- "ip rip authentication mode" on page 1027
- "ip rip authentication string" on page 1029
- "ip rip receive-packet" on page 1031
- "ip rip receive version" on page 1032

- "ip rip send-packet" on page 1033
- "ip rip send version" on page 1034
- "ip rip send version 1-compatible" on page 1036
- "ip rip split-horizon" on page 1037
- "key" on page 1038
- "key chain" on page 1039
- "key-string" on page 1040
- "maximum-prefix" on page 1041
- "neighbor (RIP)" on page 1042
- "network (RIP)" on page 1043
- "passive-interface (RIP)" on page 1045
- "recv-buffer-size (RIP)" on page 1046
- "redistribute (RIP)" on page 1047
- "restart rip graceful" on page 1049
- "rip restart grace-period" on page 1050
- "route (RIP)" on page 1051
- "router rip" on page 1052
- "send-lifetime" on page 1053
- "show debugging rip" on page 1055
- "show ip prefix-list" on page 1056
- "show ip protocols rip" on page 1057
- "show ip rip" on page 1058
- "show ip rip database" on page 1059
- "show ip rip interface" on page 1060
- "show ip rip vrf database" on page 1061
- "show ip rip vrf interface" on page 1062
- "timers (RIP)" on page 1063
- "undebug rip" on page 1065
- "version (RIP)" on page 1066

# accept-lifetime

**Overview** Use this command to specify the time period during which the authentication key on a key chain is received as valid.

Use the **no** variant of this command to remove a specified time period for an authentication key on a key chain as set previously with the **accept-lifetime** command.

**Syntax**

```
accept-lifetime <start-date> {<end-date>|
duration <seconds>|infinite}
```

```
no accept-lifetime
```

| Parameter | Description | |
|---|---|---|
| *<start-date>* | Specifies the start time and date in the format:<br>*<hh:mm:ss> <day> <month> <year>* or<br>*<hh:mm:ss> <month> <day> <year>*, where: | |
| | *<hh:mm:ss>* | The time of the day, in hours, minutes and seconds |
| | *<day>* | <1-31> The day of the month |
| | *<month>* | The month of the year (the first three letters of the month, for example, Jan) |
| | *<year>* | <1993-2035> The year |
| *<end-date>* | Specifies the end time and date in the format:<br>*<hh:mm:ss> <day> <month> <year>* or<br>*<hh:mm:ss> <month> <day> <year>*, where: | |
| | *<hh:mm:ss>* | The time of the day, in hours, minutes and seconds |
| | *<day>* | <1-31> The day of the month |
| | *<month>* | The month of the year (the first three letters of the month, for example, Jan) |
| | *<year>* | <1993-2035> The year |
| *<seconds>* | <1-2147483646> Duration of the key in seconds. | |
| infinite | Never expires. | |

**Mode** Keychain-key Configuration

**Examples** The following examples show the setting of accept-lifetime for key 1 on the key chain named “mychain”.

```
awplus# configure terminal
```

```
awplus(config)# key chain mychain
```

```
awplus(config-keychain)# key 1
```

```
awplus(config-keychain-key)# accept-lifetime 03:03:01 Sep 3
2016 04:04:02 Oct 6 2016
```

or:

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# accept-lifetime 03:03:01 3 Sep
2016 04:04:02 6 Oct 2016
```

**Related commands**

key-string

key chain

send-lifetime

# address-family ipv4 (RIP)

**Overview** This command enters the IPv4 address-family command mode. In this mode you can configure address-family specific parameters for a specific VRF (RIP) instance.

**Syntax**

```
address-family ipv4 vrf <vrf-name>
no address-family ipv4 vrf <vrf-name>
```

| Parameter | Description |
|---|---|
| `ipv4` | Configure parameters relating to the RIP exchange of IPv4 prefixes. |
| `vrf` | Apply this command to a VRF instance. |
| *<vrf-name>* | The name of the VRF instance. |

**Mode** Router Configuration

**Usage** To leave Address Family mode and return to Router Configuration mode, use the exit-address-family command.

**Example** In this example the address family "green" is entered, and then exited by using the exit-address-family command.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf green
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

**Related commands** exit-address-family

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# alliedware-behavior

**Overview** This command configures your device to exhibit AlliedWare behavior when sending RIPv1 response/update messages. Configuring for this behavior may be necessary if you are replacing an AlliedWare device with an AlliedWare Plus device and wish to ensure consistent RIPv1 behavior.

Use the **no** variant of this command to implement AlliedWare Plus behavior.

This command has no impact on devices running RIPv2. Reception and transmission can be independently altered to conform to AlliedWare standard.

**Syntax**

```
alliedware-behavior {rip1-send|rip1-recv}
no alliedware-behavior {rip1-send|rip1-recv}
```

| Parameter | Description |
|---|---|
| `rip1-send` | Configures the router to behave in AlliedWare mode when **sending** update messages. |
| `rip1-recv` | Configures the router to behave in AlliedWare mode when **receiving** update messages. |

**Default** By default when sending out RIPv1 updates on an interface, if the prefix (learned through RIPv2 or otherwise redistributed into RIP) being advertised does not match the subnetting used on the outgoing RIPv1 interface it will be filtered. The **alliedware-behavior** command returns your router's RIPv1 behavior to the AlliedWare format, where the prefix will be advertised as-is.

For example, if a RIPv1 update is being sent over interface 192.168.1.4/26, by default the prefix 192.168.1.64/26 will be advertised, but the prefix 192.168.1.144/28 will be filtered because the mask /28 does not match the interface's mask of /26. If **alliedware-behavior rip1-send** is configured, 192.168.1.144 would be sent as-is.

**Mode** Router Configuration

**Examples** To configure your device for **AlliedWare**-like behavior when sending and receiving RIPv1 update messages, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# alliedware-behavior rip1-send
awplus(config-router)# alliedware-behavior rip1-recv
```

To return your device to **AlliedWare Plus**-like behavior when sending and receiving RIPv1 update messages, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no alliedware-behavior rip1-send
awplus(config-router)# no alliedware-behavior rip1-recv
```

**Validation Commands**

show ip protocols rip

show running-config

**Related commands**

fullupdate (RIP)

# cisco-metric-behavior (RIP)

**Overview** Use this command to enable or disable the RIP routing metric update to conform to Cisco's implementation. This command is provided to allow inter-operation with older Cisco devices that do not conform to the RFC standard for RIP route metrics.

Use the **no** variant of this command to disable this feature.

**Syntax**

```
cisco-metric-behavior {enable|disable}
no cisco-metric-behavior
```

| Parameter | Description |
|---|---|
| `enable` | Enables updating the metric consistent with Cisco. |
| `disable` | Disables updating the metric consistent with Cisco. |

**Default** By default, the Cisco metric-behavior is disabled.

**Mode** Router Configuration

**Examples** To enable the routing metric update to behave as per the Cisco implementation, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# cisco-metric-behavior enable
```

To disable the routing metric update to behave as per the default setting, enter the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no cisco-metric-behavior
```

**Validation Commands** show running-config

# clear ip rip route

**Overview** Use this command to clear specific data from the RIP routing table.

**Syntax**

```
clear ip rip route <ip-dest-network/prefix-length>
clear ip rip route
{static|connected|rip|ospf|bgp|invalid-routes|all}
```

**Syntax (VRF-lite)**

```
clear ip rip [vrf <vrf-name>] route
<ip-dest-network/prefix-length>
clear ip rip [vrf <vrf-name>] route
{static|connected|rip|ospf|bgp|invalid-routes|all}
```

| Parameter | Description |
|---|---|
| `vrf` | Apply this command to a VRF instance. |
| *<vrf-name>* | The name of the VRF instance. |
| *<ip-dest-network/ prefix-length>* | Removes entries which exactly match this destination address from RIP routing table. Enter the IP address and prefix length of the destination network. |
| `static` | Removes static entries from the RIP routing table. |
| `connected` | Removes entries for connected routes from the RIP routing table. |
| `rip` | Removes only RIP routes from the RIP routing table. |
| `ospf` | Removes only OSPF routes from the RIP routing table. |
| `bgp` | Removes only BGP routes from the RIP routing table. |
| `invalid-routes` | Removes routes with metric 16 immediately. Otherwise, these routes are not removed until RIP times out the route after 2 minutes. |
| `all` | Clears the entire RIP routing table. |

**Mode** Privileged Exec

**Usage notes** Using this command with the **all** parameter clears the RIP table of all the routes.

**Examples** To clear the route 10.0.0.0/8 from the RIP routing table, use the following command:

```
awplus# clear ip rip route 10.0.0.0/8
```

**Examples (VRF-lite)** To clear RIP routes associated with the VRF instance ‘red’ for OSPF routes, use the following command:

```
awplus# clear ip rip vrf red route ospf
```

To clear the route 10.0.0.0/8 from the RIP routing table for the VRF instance 'red', use the following command:

```
awplus# clear ip rip vrf red route 10.0.0.0/8
```

**Command changes**

Version 5.4.6-2.1: VRF-lite support added.

# debug rip

**Overview** Use this command to specify the options for the displayed debugging information for RIP events and RIP packets.

Use the **no** variant of this command to disable the specified debug option.

**Syntax**

```
debug rip {events|nsm|<packet>|all}
no debug rip {events|nsm|<packet>|all}
```

| Parameter | Description |
|---|---|
| `events` | RIP events debug information is displayed. |
| `nsm` | RIP and NSM communication is displayed. |
| `<packet>` | `packet [recv\|send] [detail]` Specifies RIP packets only. |
| `recv` | Specifies that information for received packets be displayed. |
| `send` | Specifies that information for sent packets be displayed. |
| `detail` | Displays detailed information for the sent or received packet. |
| `all` | Displays all RIP debug information. |

**Default** Disabled

**Mode** Privileged Exec and Global Configuration

**Example** The following example displays information about the RIP packets that are received and sent out from the device.

```
awplus# debug rip packet
```

**Related commands** undebug rip

# default-information originate (RIP)

**Overview** Use this command to generate a default route into the Routing Information Protocol (RIP).

Use the **no** variant of this command to disable this feature.

**Syntax**
```
default-information originate
no default-information originate
```

**Default** Disabled

**Mode** Router Configuration

**Usage** If routes are being redistributed into RIP and the router's route table contains a default route, within one of the route categories that are being redistributed, the RIP protocol will advertise this default route, irrespective of whether the **default-information originate** command has been configured or not. However, if the router has not redistributed any default route into RIP, but you want RIP to advertise a default route anyway, then use this command.

This will cause RIP to create a default route entry in the RIP database. The entry will be of type RS (Rip Static). Unless actively filtered out, this default route will be advertised out every interface that is sending RIP. Split horizon does not apply to this route, as it is internally generated. This operates quite similarly to the OSPF **default-information originate always** command.

**Example**
```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# default-information originate
```

# default-metric (RIP)

**Overview** Use this command to specify the metrics to be assigned to redistributed RIP routes.

Use the **no** variant of this command to reset the RIP metric back to its default (1).

**Syntax**

```
default-metric <metric>
no default-metric [<metric>]
```

| Parameter | Description |
|---|---|
| *<metric>* | <1-16> Specifies the value of the default metric. |

**Default** By default, the RIP metric value is set to 1.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage notes** This command is used with the redistribute (RIP) command to make the routing protocol use the specified metric value for all redistributed routes, regardless of the original protocol that the route has been redistributed from.

**Examples** This example assigns the cost of 10 to the routes that are redistributed into RIP.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# default-metric 10
awplus(config-router)# redistribute ospf
awplus(config-router)# redistribute connected
```

**Example (VRF-lite)** This example assigns the cost of 10 to the routes which are redistributed into RIP for the VRF instance blue.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address family ipv4 vrf blue
awplus(config-router-af)# default-metric 10
awplus(config-router-af)# redistribute ospf
awplus(config-router-af)# redistribute connected
```

**Related commands** redistribute (RIP)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# distance (RIP)

**Overview** This command sets the administrative distance for RIP routes. Your device uses this value to select between two or more routes to the same destination obtained from two different routing protocols. The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). For more information, see the Route Selection Feature Overview and Configuration Guide.

The **no** variant of this command sets the administrative distance for the RIP route to the default of 120.

**Syntax**

```
distance <1-255> [<ip-addr/prefix-length>]
no distance [<1-255>] [<ip-addr/prefix-length>]
```

| Parameter | Description |
|---|---|
| *<1-255>* | The administrative distance value you are setting for this RIP route. |
| *<ip-addr/prefix-length>* | The network IP address and prefix-length that you are changing the administrative distance for. |

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Examples** To set the administrative distance to 8 for the RIP routes within the 10.0.0.0/8 network, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distance 8 10.0.0.0/8
```

To set the administrative distance to the default of 120 for the RIP routes within the 10.0.0.0/8 network, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no distance 8 10.0.0.0/8
```

**Example (VRF-lite)** This example assigns a cost of 10 to the routes for the VRF instance blue, when redistributed into RIP.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address family ipv4 blue
awplus(config-router-af)# distance 10
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# distribute-list (RIP)

**Overview** Use this command to filter incoming or outgoing route updates using the prefix-list.

When running VRF-lite, this command can be applied to a specific VRF instance.

Use the **no** variant of this command to disable this feature.

**Syntax**

```
distribute-list prefix <prefix-list> {in|out} [<interface>]
no distribute-list prefix <prefix-list> {in|out} [<interface>]
```

| Parameter | Description |
|---|---|
| `prefix` | Filter prefixes in routing updates. |
| *<prefix-list>* | Specifies the name of the IPv4 prefix-list to use. |
| `in` | Filter incoming routing updates. |
| `out` | Filter outgoing routing updates. |
| *<interface>* | The interface on which the filtering applies. |

**Default** Disabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage notes** Filter out incoming or outgoing route updates using a prefix-list. If you do not specify the name of the interface, the filter will be applied to all interfaces.

**Examples** To apply a prefix list called 'myfilter' to filter incoming routing updates on eth1, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distribute-list prefix myfilter in eth1
```

**Example (VRF-lite)** This example applies the commands of the previous prefix-list example, but to a specific VRF named blue:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# distribute-list prefix myfilter in
vlan2
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# fullupdate (RIP)

**Overview** Use this command to specify which routes RIP should advertise when performing a triggered update. By default, when a triggered update is sent, RIP will only advertise those routes that have changed since the last update. When **fullupdate** is configured, the device advertises the full RIP route table in outgoing triggered updates, including routes that have not changed. This enables faster convergence times, or allows inter-operation with legacy network equipment, but at the expense of larger update messages.

Use the **no** variant of this command to disable this feature.

**Syntax**

```
fullupdate
no fullupdate
```

**Default** By default this feature is disabled.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage (VRF-lite)** If VRF-lite is configured, you can apply this command for either the global routing environment, or to a specific VRF instance.

**Example** To enable the fullupdate (RIP) function, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# fullupdate
```

**Example (VRF-lite)** To enable the full update (RIP) function on the VRF instance named 'blue', use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# fullupdate
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# ip summary-address rip

**Overview** Use this command to configure a summary IP address on a RIPv2 interface.

Use the **no** variant of this command to remove a summary IP address from a selected RIPv2 interface.

**Syntax**

```
ip summary-address rip {<ip-address/prefix-length>}
no ip summary-address rip {<ip-address/prefix-length>}
```

| Parameter | Description |
|---|---|
| *<ip-address/prefix-length>* | The summary IPv4 address to be advertised |

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** Route summarization is a technique that helps network administrators reduce the size of the routing tables by advertising a single super-network that covers a range of subnets.

You statically configure an IP summary address on a router interface. The router then advertises the summary address downstream through this interface. This means that:

- all the routers that are downstream from the configured interface will receive only the summary route, and none of the child routes via the RIP advertisement.
- As long as at least one of the child routes is valid, the router will propagate the summary route. But when the last child that is part of the summarized range disappears, then the router will stop advertising the summary route through the interface.

This command will be rejected if there is no IP address configured on the interface.

***NOTE:*** *Manual route summarization is not supported when the interface/router is running in RIPv1.*

**Example** The subnets 10.4.1.0/24, 10.4.2.128/25 and 10.4.3.0/24 can be summarized and advertised as 10.4.0.0/16 on eth1 using the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip summary-address rip 10.4.0.0/16
```

**Related commands**

show ip rip database

show ip protocols rip

**Command changes** Version 5.4.8-0.2 command added

# ip prefix-list

**Overview** Use this command to create an entry for an IPv4 prefix list.

Use the **no** variant of this command to delete the IPv4 prefix-list entry.

**Syntax**

```
ip prefix-list <list-name> [seq <1-429496725>] {deny|permit}
{any|<ip-prefix>} [ge <0-32>] [le <0-32>]
ip prefix-list <list-name> description <text>
ip prefix-list sequence-number
no ip prefix-list <list-name> [seq <1-429496725>]
no ip prefix-list <list-name> [description <text>]
no ip prefix-list sequence-number
```

| Parameter | Description |
|---|---|
| *<list-name>* | Specifies the name of a prefix list. |
| seq *<1-429496725>* | Sequence number of the prefix list entry. |
| deny | Specifies that the prefixes are excluded from the list. |
| permit | Specifies that the prefixes are included in the list. |
| *<ip-prefix>* | Specifies the IPv4 address and length of the network mask in dotted decimal in the format A.B.C.D/M. |
| any | Any prefix match. Same as **0.0.0.0/0 le 32**. |
| ge*<0-32>* | Specifies the minimum prefix length to be matched. |
| le*<0-32>* | Specifies the maximum prefix length to be matched. |
| *<text>* | Text description of the prefix list. |
| sequence-number | Specify sequence numbers included or excluded in prefix list. |

**Mode** Global Configuration

**Usage notes** When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. When setting these parameters, set the **le** value to be less than 32, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

**Example** In the following sample configuration, the last **ip prefix-list** command in the below list matches all, and the first **ip prefix-list** command denies the IP network 76.2.2.0:

```
awplus(config)# router bgp 100
awplus(config-router)# network 172.1.1.0
awplus(config-router)# network 172.1.2.0
awplus(config-router)# neighbor 10.6.5.3 remote-as 300
awplus(config-router)# neighbor 10.6.5.3 prefix-list mylist out
awplus(config-router)# exit
awplus(config)# ip prefix-list mylist seq 5 deny 76.2.2.0/24
awplus(config)# ip prefix-list mylist seq 100 permit any
```

To deny the IP addresses between 10.0.0.0/14 (10.0.0.0 255.252.0.0) and 10.0.0.0/22 (10.0.0.0 255.255.252.0) within the 10.0.0.0/8 (10.0.0.0 255.0.0.0) addressing range, enter the following commands:

```
awplus# configure terminal
awplus(config)# ip prefix-list mylist seq 12345 deny 10.0.0.0/8
ge 14 le 22
```

**Related commands**

neighbor prefix-list

clear ip prefix-list

show ip prefix-list

# ip rip authentication key-chain

**Overview** Use this command to enable RIPv2 authentication on an interface and specify the name of the key chain to be used.

Use the **no** variant of this command to disable this function.

**Syntax**

```
ip rip authentication key-chain <key-chain-name>
no ip rip authentication key-chain
```

| Parameter | Description |
|---|---|
| *<key-chain-name>* | Specify the name of the key chain. This is an alpha-numeric string, but it cannot include spaces. |

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** Use this command to perform authentication on the interface. Not configuring the key chain results in no authentication at all.

The AlliedWare Plus™ implementation provides the choice of configuring authentication for single key or multiple keys at different times. Use the ip rip authentication string command for single key authentication. Use the ip rip authentication key-chain command for multiple keys authentication. See the RIP Feature Overview and Configuration Guide for illustrated RIP configuration examples.

For multiple key authentication, use the following steps to configure a route to enable RIPv2 authentication using multiple keys at different times:

1) Define a key chain with a key chain name, using the following commands:

```
awplus# configure terminal
awplus(config)# key chain <key-chain-name>
```

2) Define a key on this key chain, using the following command:

```
awplus(config-keychain)# key <keyid>
```

3) Define the password used by the key, using the following command:

```
awplus(config-keychain-key)# key-string <key-password>
```

4) Enable authentication on the desired interface and specify the key chain to be used, using the following commands:

```
awplus# configure terminal
awplus(config)# interface <id>
awplus(config-if)# ip rip authentication key-chain
<key-chain-name>
```

5) Specify the mode of authentication for the given interface (text or MD5), using the following command:

```
awplus(config-if)# ip rip authentication mode {md5|text}
```

**Example 1** To use the key chain named 'mykey' on the interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip rip authentication key-chain mykey
```

**Example 2** In the following example of a configuration for multiple keys authentication, a password 'toyota' is set for key 1 in key chain 'cars'. Authentication is enabled on eth1 and the authentication mode is set to MD5:

```
awplus# configure terminal
awplus(config)# key chain cars
awplus(config-keychain)# key 1
awplus(config-keychain-key)# key-string toyota
awplus(config-keychain-key)# accept-lifetime 10:00:00 Oct 08
2021 duration 43200
awplus(config-keychain-key)# send-lifetime 10:00:00 Oct 08 2021
duration 43200
awplus(config-keychain-key)# exit
awplus(config-keychain)# exit
awplus(config)# interface eth1
awplus(config-if)# ip rip authentication key-chain cars
awplus(config-if)# ip rip authentication mode md5
```

**Related commands**

accept-lifetime

send-lifetime

ip rip authentication mode

ip rip authentication string

key

key chain

# ip rip authentication mode

**Overview** Use this command to specify the type of authentication mode used for RIP v2 packets.

Use the **no** variant of this command to restore clear text authentication.

**Syntax**

```
ip rip authentication mode {md5|text}
no ip rip authentication mode
```

| Parameter | Description |
|---|---|
| `md5` | Uses the keyed MD5 authentication algorithm. |
| `text` | Specifies clear text or simple password authentication. |

**Default** Text authentication is enabled

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** The AlliedWare Plus™ implementation provides the choice of configuring authentication for single key or multiple keys at different times. Use the ip rip authentication string command for single key authentication. Use the ip rip authentication key-chain command for multiple keys authentication. See the RIP Feature Overview and Configuration Guide for illustrated RIP configuration examples.

**Usage: single key** Use the following steps to configure a route to enable RIPv2 authentication using a single key or password:

1) Define the authentication string or password used by the key for the desired interface, using the following commands:

```
awplus# configure terminal
awplus(config)# interface <id>
awplus(config-if)# ip rip authentication string <auth-string>
```

2) Specify the mode of authentication for the given interface (text or MD5), using the following commands:

```
awplus# configure terminal
awplus(config)# interface <id>
awplus(config-if)# ip rip authentication mode {md5|text}
```

**Usage: multiple key**

For multiple keys authentication, use the following steps to configure a route to enable RIPv2 authentication using multiple keys at different times:

1) Define a key chain with a key chain name, using the following commands:

```
awplus# configure terminal
awplus(config)# key chain <key-chain-name>
```

2) Define a key on this key chain using the following command:

```
awplus(config-keychain)# key <keyid>
```

3) Define the password used by the key, using the following command:

```
awplus(config-keychain-key)# key-string <key-password>
```

4) Enable authentication on the desired interface and specify the key chain to be used, using the following commands:

```
awplus(config-if)# ip rip authentication key-chain
<key-chain-name>
```

5) Specify the mode of authentication for the given interface (text or MD5), using the following commands:

```
awplus(config-if)# ip rip authentication mode {md5|text}
```

**Example 1**

To use MD5 authentication on the interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip rip authentication mode md5
```

**Example 2**

In the following example of a configuration for multiple keys authentication, a password 'toyota' is set for key 1 in key chain 'cars'. Authentication is enabled on eth1 and the authentication mode is set to MD5:

```
awplus# configure terminal
awplus(config)# key chain cars
awplus(config-keychain)# key 1
awplus(config-keychain-key)# key-string toyota
awplus(config-keychain-key)# accept-lifetime 10:00:00 Oct 08
2016 duration 43200
awplus(config-keychain-key)# send-lifetime 10:00:00 Oct 08 2016
duration 43200
awplus(config-keychain-key)# exit
awplus(config-keychain)# exit
awplus(config)# interface eth1
awplus(config-if)# ip rip authentication key-chain cars
awplus(config-if)# ip rip authentication mode md5
```

**Related commands**

ip rip authentication string

ip rip authentication key-chain

# ip rip authentication string

**Overview** Use this command to specify the authentication string or password used by a key.

Use the **no** variant of this command to remove the authentication string.

**Syntax**

```
ip rip authentication string <auth-string>
no ip rip authentication string
```

| Parameter | Description |
|---|---|
| *<auth-string>* | The authentication string or password used by a key. It is an alpha-numeric string and can include spaces. |

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** The AlliedWare Plus™ implementation provides the choice of configuring authentication for single key or multiple keys at different times. Use this command to specify the password for a single key on an interface. Use the ip rip authentication key-chain command for multiple keys authentication. For information about configuring RIP, see the RIP Feature Overview and Configuration Guide.

Use the following steps to configure a route to enable RIPv2 authentication using a single key or password:

1) Define the authentication string or password used by the key for the desired interface, using the following commands:

```
awplus# configure terminal
awplus(config)# interface <id>
```

2) Specify the mode of authentication for the given interface (text or MD5), using the following commands:

```
awplus# configure terminal
awplus(config-if)# ip rip authentication string <auth-string>
awplus(config)# interface <id>
awplus(config-if)# ip rip authentication mode {md5|text}
```

**Example** To specify 'mykey' as the authentication string and use MD5 authentication for the interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip rip authentication string mykey
awplus(config-if)# ip rip authentication mode md5
```

Any RIP packet received on that interface should have the same string as its password.

**Related commands**

ip rip authentication key-chain

ip rip authentication mode

# ip rip receive-packet

**Overview** Use this command to configure the interface to enable the reception of RIP packets.

Use the **no** variant of this command to disable this feature.

**Syntax**

```
ip rip receive-packet
no ip rip receive-packet
```

**Default** Enabled

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Example** To turn on packet receiving on the interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip rip receive-packet
```

**Related commands** ip rip send-packet

# ip rip receive version

**Overview** Use this command to specify the version of RIP packets accepted on an interface and override the setting of the version command.

Use the **no** variant of this command to use the setting specified by the version (RIP) command.

**Syntax**

```
ip rip receive version [1] [2]
no ip rip receive version
```

| Parameter | Description |
|---|---|
| 1 | Specifies acceptance of RIP version 1 packets on the interface. |
| 2 | Specifies acceptance of RIP version 2 packets on the interface. |

**Default** Version 2

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** This command applies to a specific interface and overrides the version specified by the version (RIP) command.

RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

**Example** To set the interface eth1 to receive both RIP version 1 and 2 packets, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip rip receive version 1 2
```

**Related commands** version (RIP)

# ip rip send-packet

**Overview** Use this command to enable sending RIP packets through the current interface.

Use the **no** variant of this command to disable this feature.

**Syntax**

```
ip rip send-packet
no ip rip send-packet
```

**Default** Enabled

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Example** To turn on packet sending on the interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip rip send-packet
```

**Related commands** ip rip receive-packet

# ip rip send version

**Overview** Use this command in Interface Configuration mode to specify the version of RIP packets sent on an interface and override the setting of the version (RIP) command. This mechanism causes RIP version 2 interfaces to send multicast packets instead of broadcasting packets.

Use the **no** variant of this command to use the setting specified by the version (RIP) command.

**Syntax**

```
ip rip send version {1|2|1 2|2 1}
no ip rip send version
```

| Parameter | Description |
|---|---|
| 1 | Specifies the sending of RIP version 1 packets out of an interface. |
| 2 | Specifies the sending of RIP version 2 packets out of an interface. |
| 1 2 | Specifies the sending of both RIP version 1 and RIP version 2 packets out of an interface. |
| 2 1 | Specifies the sending of both RIP version 2 and RIP version 1 packets out of an interface. |

**Default** Version 2

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** This command applies to a specific interface and overrides the version specified by the version (RIP) command.

RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces. Selecting version parameters 1 2 or 2 1 sends RIP version 1 and 2 packets.

Use the ip rip send version 1-compatible command in an environment where you cannot send multicast packets. For example, in environments where multicast is not enabled and where hosts do not listen to multicast.

**Examples** To set the interface eth1 to send both RIP version 1 and 2 packets, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip rip send version 1 2
```

To set the interface eth1 to use the RIP version specified by the version (RIP) command, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ip rip send version
```

**Related commands**

ip rip send version 1-compatible

version (RIP)

# ip rip send version 1-compatible

**Overview** Use this command in Interface Configuration mode to send RIP version 1 compatible packets from a RIP version 2 interface to other RIP Interfaces. This mechanism causes RIP version 2 interfaces to send broadcast packets instead of multicasting packets, and is used in environments where multicast is not enabled or where hosts do not listen to multicast.

Use the **no** variant of this command to use the setting specified by the version (RIP) command, and disable the broadcast of RIP version 2 packets that are sent as broadcast packets.

**Syntax**

```
ip rip send version 1-compatible
no ip rip send version
```

| Parameter | Description |
|---|---|
| `1-compatible` | Specify this parameter to send RIP version 1 compatible packets from a version 2 RIP interface to other RIP interfaces.<br>This mechanism causes version 2 RIP interfaces to broadcast packets instead of multicasting packets. |

**Default** RIP version 2 is enabled by default.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** This command applies to a specific interface and overrides the version specified by the version (RIP) command.

RIP can be run in version 1 compatible mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

Use the ip rip send version command in an environment where you can send multicast packets, for example, in environments where multicast is enabled and where hosts listen to multicast.

**Example** To set the interface eth1 to send RIP version 1- compatible packets, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip rip send version 1-compatible
```

**Related commands**

ip rip send version

version (RIP)

# ip rip split-horizon

**Overview** Use this command to turn on the split-horizon mechanism on the interface.

Use the **no** variant of this command to disable this mechanism.

**Syntax**

```
ip rip split-horizon [poisoned]
no ip rip split-horizon
```

| Parameter | Description |
|---|---|
| `poisoned` | Performs split-horizon with poison-reverse. See "Usage" below for more information. |

**Default** Split horizon poisoned

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** Use this command to avoid including routes in updates sent to the same gateway from which they were learned. Without the **poisoned** parameter, using this command causes routes learned from a neighbor to be omitted from updates sent to that neighbor. With the **poisoned** parameter, using this command causes such routes to be included in updates, but sets their metrics to infinity. This advertises that these routes are not reachable.

**Example** To turn on split horizon poisoned on eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip rip split-horizon poisoned
```

# key

**Overview** Use this command to manage, add and delete authentication keys in a key-chain.

Use the **no** variant of this command to delete the authentication key.

**Syntax**

```
key <keyid>
no key <keyid>
```

| Parameter | Description |
|---|---|
| *<keyid>* | <0-2147483647> Key identifier number. |

**Mode** Keychain Configuration

**Usage** This command allows you to enter the keychain-key mode where a password can be set for the key.

**Example** The following example configures a key number 1 and shows the change into a **keychain- key** command mode prompt.

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)#
```

**Related commands**

key chain

key-string

accept-lifetime

send-lifetime

# key chain

**Overview** Use this command to enter the key chain management mode and to configure a key chain with a key chain name.

Use the **no** variant of this command to remove the key chain and all configured keys.

**Syntax**

```
key chain <key-chain-name>
no key chain <key-chain-name>
```

| Parameter | Description |
|---|---|
| *<key-chain-name>* | Specify the name of the key chain to manage. |

**Mode** Global Configuration

**Usage** This command allows you to enter the keychain mode from which you can specify keys on this key chain.

**Example** The following example shows the creation of a key chain named `mychain` and the change into **keychain** mode prompt.

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)#
```

**Related commands**

key

key-string

accept-lifetime

send-lifetime

# key-string

**Overview** Use this command to define the password to be used by a key.

Use the **no** variant of this command to remove a password.

**Syntax**

```
key-string <key-password>
no key-string
```

| Parameter | Description |
|---|---|
| *<key-password>* | A string of characters to be used as a password by the key. |

**Mode** Keychain-key Configuration

**Usage** Use this command to specify passwords for different keys.

**Examples** In the following example, the password for `key1` in the key chain named `mychain` is set to password **prime**:

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# key-string prime
```

In the following example, the password for `key1` in the key chain named `mychain` is removed:

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# no key-string
```

**Related commands**

key

key chain

accept-lifetime

send-lifetime

# maximum-prefix

**Overview** Use this command to configure the maximum number of RIP routes stored by the device.

Use the **no** variant of this command to disable all limiting of the number of RIP routes stored by the device.

**Syntax**

```
maximum-prefix <maxprefix> [<threshold>]
no maximum-prefix
```

| Parameter | Description |
|---|---|
| *<maxprefix>* | <1-65535> The maximum number of RIP routes allowed. |
| *<threshold>* | <1-100> Percentage of maximum routes to generate a warning. The default threshold is 75%. |

**Mode** Router Configuration

**Example** To configure the maximum number of RIP routes to 150, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# maximum-prefix 150
```

# neighbor (RIP)

**Overview** Use this command to specify a neighbor router. It is used for each router to which you wish to send unicast RIP updates.

Use the **no** variant of this command to stop sending unicast updates to the specific router.

**Syntax**

```
neighbor <ip-address>
no neighbor <ip-address>
```

| Parameter | Description |
|---|---|
| *<ip-address>* | The IP address of a neighboring router with which the routing information will be exchanged. |

**Default** Disabled

**Mode** Router Configuration

**Usage** Use this command to exchange nonbroadcast routing information. It can be used multiple times for additional neighbors.

The passive-interface (RIP) command disables sending routing updates on an interface. If you want to send routing updates only to specific neighbors, use the passive-interface (RIP) command and this **neighbor** command together.

**Example** To specify the neighbor router to 1.1.1.1, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# passive-interface vlan1
awplus(config-router)# neighbor 1.1.1.1
```

**Related commands** passive-interface (RIP)

# network (RIP)

**Overview** Use this command to activate the transmission of RIP routing information on the defined network.

Use the **no** variant of this command to remove the specified network or interface as one that runs RIP.

**Syntax**

```
network {<network-address>[/<subnet-mask>]|<interface>}
no network {<network-address>[/<subnet-mask>]|<interface>}
```

| Parameter | Description |
|---|---|
| *<network-address>* *[/<subnet-mask>]* | Specifies the network address to run RIP. Entering a subnet mask (or prefix length) for the network address is optional. Where no mask is entered, the device will attempt to apply a mask that is appropriate to the class (A, B, or C) of the address entered, e.g. an IP address of 10.0.0.0 will have a prefix length of 8 applied to it. |
| *<interface>* | Specify an interface to run RIP. |

**Default** Disabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage notes** Use this command to specify networks, by IP address or interface, to which routing updates will be sent and received. The connected routes corresponding to the specified network will be automatically advertised in RIP updates. RIP updates will be sent and received within the specified network.

When running VRF-lite, this command can be applied to a VRF instance.

**Example** Use the following commands to activate RIP routing updates on network 172.16.20.0/24:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# network 172.16.20.0/24
```

**Example (VRF-lite)** To activate RIP routing updates on vlan3 for VRF instance 'blue'.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# network vlan3
```

**Related commands**

show ip rip

show running-config

clear ip rip route

**Command changes**

Version 5.4.6-2.1: VRF-lite support added.

# passive-interface (RIP)

**Overview** Use this command to block RIP broadcasts on the interface.

Use the **no** variant of this command to disable this function.

**Syntax**

```
passive-interface <interface>
no passive-interface <interface>
```

| Parameter | Description |
|---|---|
| *<interface>* | Specifies the interface name. |

**Default** Disabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Example** Use the following commands to block RIP broadcasts on eth1:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# passive-interface eth1
```

**Example (VRF-lite)** To apply the example above to a specific VRF instance named 'green', use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf green
awplus(config-router-af)# passive-interface eth1
```

**Related commands** show ip rip

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# recv-buffer-size (RIP)

**Overview** Use this command to run-time configure the RIP UDP (User Datagram Protocol) receive-buffer size to improve UDP reliability by avoiding UDP receive buffer overrun.

Use the **no** variant of this command to reset the configured RIP UDP receive-buffer size to the system default (196608 bits).

**Syntax**

```
recv-buffer-size <8192-2147483647>
no recv-buffer-size [<8192-2147483647>]
```

| Parameter | Description |
|---|---|
| *<8192-2147483647>* | Specify the RIP UDP (User Datagram Protocol) buffer size value in bits. |

**Default** 196608 bits is the system default when reset using the **no** variant of this command.

**Mode** Router Configuration

**Examples** To run-time configure the RIP UDP, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# recv-buffer-size 23456789
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no recv-buffer-size 23456789
```

# redistribute (RIP)

**Overview** Use this command to redistribute information from other routing protocols into RIP.

When using VRF-lite, you can apply this command to a specific VRF instance.

Use the **no** variant of this command to disable the specified redistribution. The parameters **metric** and **routemap** may be used with the **no** variant, but have no effect.

**Syntax**

```
redistribute {connected|static|ospf|bgp} [metric <0-16>]
[routemap <routemap>]
```

```
no redistribute {connected|static|ospf|bgp} [metric] [routemap]
```

| Parameter | Description |
|---|---|
| `routemap` | Optional. Specifies route-map that controls how routes are redistributed. |
| `<routemap>` | Optional. The name of the route map. |
| `connected` | Redistribute from connected routes. |
| `static` | Redistribute from static routes. |
| `ospf` | Redistribute from Open Shortest Path First (OSPF). |
| `bgp` | Redistribute from Border Gateway Protocol (BGP). |
| `metric <0-16>` | Optional. Sets the value of the metric that will be applied to routes redistributed into RIP from other protocols. If a value is not specified, and no value is specified using the default-metric (RIP) command, the default is one. |

**Default** By default, the RIP metric value is set to 1.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Example** To apply the metric value 15 to static routes being redistributed into RIP, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# redistribute static metric 15
```

**Example (VRF-lite)**

To apply the metric value 15 to static routes in address-family ipv4 VRF instance `blue` being redistributed into RIP, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# redistribute static metric 15
```

**Related commands**

default-metric (RIP)

**Command changes**

Version 5.4.6-2.1: VRF-lite support added.

# restart rip graceful

**Overview** Use this command to force the RIP process to restart, and optionally set the grace-period.

**Syntax**
```
restart rip graceful [grace-period <1-65535>]
```

**Mode** Privileged Exec

**Default** The default RIP grace-period is 60 seconds.

**Usage notes** After this command is executed, the RIP process immediately shuts down. It notifies the system that RIP has performed a graceful shutdown. Routes that have been installed into the route table by RIP are preserved until the specified grace-period expires.

When a **restart rip graceful** command is issued, the RIP configuration is reloaded from the last saved configuration. Ensure you first enter the command copy running-config startup-config.

**Example** To apply a restart rip graceful setting, grace-period to 100 seconds use the following commands:

```
awplus# copy running-config startup-config
awplus# restart rip graceful grace-period 100
```

# rip restart grace-period

**Overview** Use this command to change the grace period of RIP graceful restart.

Use the **no** variant of this command to disable this function.

**Syntax**

```
rip restart grace-period <1-65535>
no rip restart grace-period <1-65535>
```

**Mode** Global Configuration

**Default** The default RIP grace-period is 60 seconds.

**Usage notes** Use this command to enable the **Graceful Restart** feature on the RIP process. Entering this command configures a grace period for RIP.

**Example**

```
awplus# configure terminal
awplus(config)# rip restart grace-period 200
```

# route (RIP)

**Overview** Use this command to add a static RIP route.

Use the **no** variant of this command to remove a static RIP route.

**Syntax**

```
route <ip-addr/prefix-length>
no route <ip-addr/prefix-length>
```

| Parameter | Description |
|---|---|
| *<ip-addr/prefix-length>* | The IPv4 address and prefix length. |

**Default** No static RIP route is added by default.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage notes** Use this command to add a static RIP route. After adding the RIP route, the route can be checked in the RIP routing table.

**Example** To create a static RIP route to IP subnet 192.168.1.0/24, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# route 192.168.1.0/24
```

**Example (VRF-lite)** To create a static RIP route to IP subnet `192.168.1.0/24`, for the VRF instance `red`, use the following commands

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# route 192.168.1.0/24
```

**Related commands** show ip rip

clear ip rip route

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# router rip

**Overview** Use this global command to enter Router Configuration mode to enable the RIP routing process.

Use the **no** variant of this command to disable the RIP routing process.

**Syntax**

```
router rip
no router rip
```

**Mode** Global Configuration

**Example** This command is used to begin the RIP routing process:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# version 1
awplus(config-router)# network 10.10.10.0/24
awplus(config-router)# network 10.10.11.0/24
awplus(config-router)# neighbor 10.10.10.10
```

**Related commands** network (RIP)

version (RIP)

# send-lifetime

**Overview** Use this command to specify the time period during which the authentication key on a key chain can be sent.

**Syntax**

```
send-lifetime <start-date> {<end-date>|
duration <seconds>|infinite}
```

```
no send-lifetime
```

| Parameter | Description | |
|---|---|---|
| *<start-date>* | Specifies the start time and date in the format: *<hh:mm:ss> <day> <month> <year>* or *<hh:mm:ss> <month> <day> <year>*, where: | |
| | *<hh:mm:ss>* | The time of the day, in hours, minutes and seconds |
| | *<day>* | <1-31> The day of the month |
| | *<month>* | The month of the year (the first three letters of the month, for example, Jan) |
| | *<year>* | <1993-2035> The year |
| *<end-date>* | Specifies the end time and date in the format: *<hh:mm:ss> <day> <month> <year>* or *<hh:mm:ss> <month> <day> <year>*, where: | |
| | *<hh:mm:ss>* | The time of the day, in hours, minutes and seconds |
| | *<day>* | <1-31> The day of the month |
| | *<month>* | The month of the year (the first three letters of the month, for example, Jan) |
| | *<year>* | <1993-2035> The year |
| *<seconds>* | <1-2147483646> Duration of the key in seconds. | |
| infinite | Never expires. | |

**Mode** Keychain-key Configuration

**Example** The following example shows the setting of send-lifetime for key 1 on the key chain named “mychain”.

```
awplus# configure terminal
awplus(config)# key chain mychain
awplus(config-keychain)# key 1
awplus(config-keychain-key)# send-lifetime 03:03:01 Jan 3 2016
04:04:02 Dec 6 2016
```

**Related commands**

key

key-string

key chain

accept-lifetime

# show debugging rip

**Overview** Use this command to display the RIP debugging status for these debugging options: nsm debugging, RIP event debugging, RIP packet debugging and RIP nsm debugging.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

**Syntax**
```
show debugging rip
```

**Mode** User Exec and Privileged Exec

**Usage notes** Use this command to display the debug status of RIP.

**Example**
```
awplus# show debugging rip
```

# show ip prefix-list

**Overview** Use this command to display the IPv4 prefix-list entries.

Note that this command is valid for RIP and BGP routing protocols only.

**Syntax**

```
show ip prefix-list [<name>|detail|summary]
```

| Parameter | Description |
|---|---|
| *<name>* | Specify the name of a prefix list in this placeholder. |
| `detail` | Specify this parameter to show detailed output for all IPv4 prefix lists. |
| `summary` | Specify this parameter to show summary output for all IPv4 prefix lists. |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip prefix-list
awplus# show ip prefix-list 10.10.0.98/8
awplus# show ip prefix-list detail
```

**Related commands** ip prefix-list

# show ip protocols rip

**Overview** Use this command to display RIP process parameters and statistics.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

**Syntax**

```
show ip protocols rip
```

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip protocols rip
```

**Output** Figure 28-1: Example output from the **show ip protocols rip** command

```
Routing Protocol is "rip"
Sending updates every 30 seconds with +/-50%, next due in 12
seconds
Timeout after 180 seconds, garbage collect after 120 seconds
Outgoing update filter list for all interface is not set
Incoming update filter list for all interface is not set
Default redistribution metric is 1
Redistributing: connected static
Default version control: send version 2, receive version 2
Interface        Send  Recv   Key-chain
   vlan25          2     2
Routing for Networks:
  10.10.0.0/24
Routing Information Sources:
  Gateway          BadPackets BadRoutes  Distance Last Update
Distance: (default is 120
```

# show ip rip

**Overview** Use this command to show RIP routes.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip rip
```

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip rip
```

**Output** Figure 28-2: Example output from the **show ip rip** command

```
awplus#show ip rip
Codes: R - RIP, Rc - RIP connected, Rs - RIP static
       C - Connected, S - Static, O - OSPF, B - BGP
Network         Next Hop Metric From If    Time
C 10.0.1.0/24             1      eth1
S 10.10.10.0/24           1      eth1
C 10.10.11.0/24           1      eth1
S 192.168.101.0/24        1      eth1
R 192.192.192.0/24        1      --
```

**Related commands**

route (RIP)

network (RIP)

clear ip rip route

show ip rip vrf interface

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip rip database

**Overview** Use this command to display information about the RIP database.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

**Syntax**

```
show ip rip database [full]
```

| Parameter | Description |
|---|---|
| `full` | Specify the full RIP database including sub-optimal RIP routes. |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip rip database
awplus# show ip rip database full
```

**Related commands** show ip rip

# show ip rip interface

**Overview** Use this command to display information about the RIP interfaces. You can specify an interface name to display information about a specific interface.

**Syntax**

```
show ip rip interface [<interface>]
```

| Parameter | Description |
|---|---|
| *<interface>* | The interface to display information about. |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip rip interface
```

# show ip rip vrf database

**Overview** Use this command to display information about the RIP database that is associated with a specific VRF instance.

Entering this command with the **full** option included, will display information about the full RIP database (including sub-optimal routes) associated with a specific VRF instance.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip rip {vrf <vrf-name>|global} database [full]
```

| Parameter | Description |
|---|---|
| `vrf` | Specific VRF instance. |
| *`<vrf-name>`* | The name of the VRF instance. |
| `global` | The global routing and forwarding table. |
| `full` | Specify the full RIP database including sub-optimal RIP routes. |

**Mode** User Exec and Privileged Exec

**Example** To display information about the RIP database associated with a VRF instance 'blue', use the command:

```
awplus# show ip rip vrf blue database
```

**Output** Figure 28-3: Example output from the **show ip rip vrf blue database** command

```
Codes: R - RIP, Rc - RIP connected, Rs - RIP static
       C - Connected, S - Static, O - OSPF, B - BGP

   Network            Next Hop         Metric From            If       Time
Rc 192.168.30.0/24                         1                  vlan3
R  192.168.45.0/24    192.168.30.1         2 192.168.30.1     vlan3    02:46
```

**Related commands** show ip rip

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# show ip rip vrf interface

**Overview** Use this command to display information about the RIP interfaces that are associated with a specific VRF instance.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip rip {vrf <vrf-name>|global} interface
[<interface-name>]
```

| Parameter | Description |
|---|---|
| `vrf` | Specific VRF instance. |
| *`<vrf-name>`* | The name of the VRF instance. |
| `global` | The global routing and forwarding table. |
| *`<interface-name>`* | The IP RIP interface (VLAN). |

**Mode** User Exec and Privileged Exec

**Example** To display information about the RIP database associated with a VRF instance 'blue', use the command:

```
awplus# show ip rip vrf blue interface
```

**Output** Figure 28-4: Example output from **show ip rip vrf blue interface vlan3**

```
Codes: R - RIP, Rc - RIP connected, Rs - RIP static
       C - Connected, S - Static, O - OSPF, B - BGP

   Network            Next Hop         Metric From            If       Time
Rc 192.168.30.0/24                          1                 vlan3
R  192.168.45.0/24    192.168.30.1 2    192.168.30.1          vlan3    02:46
```

***NOTE:*** *The Time parameter operates as follows:*

- RIP updates occur approximately every 30 seconds.
- Each update resets a count-down timer to 180 seconds (3 minutes).
- The Time parameter displays the count-down from the last reset.

**Related commands** show ip rip

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# timers (RIP)

**Overview** Use this command to adjust routing network timers.

Use the **no** variant of this command to restore the defaults.

**Syntax**

```
timers basic <update> <timeout> <garbage>
no timers basic
```

| Parameter | Description |
|---|---|
| *<update>* | <5-2147483647><br>Specifies the period at which RIP route update packets are transmitted. The default is 30 seconds. |
| *<timeout>* | <5-2147483647><br>Specifies the routing information timeout timer in seconds. The default is 180 seconds. After this interval has elapsed and no updates for a route are received, the route is declared invalid. |
| *<garbage>* | <5-2147483647><br>Specifies the routing garbage collection timer in seconds. The default is 120 seconds. |

**Default** Enabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage notes** This command adjusts the RIP timing parameters.

The update timer is the time between sending out updates, that contain the complete routing table, to every neighboring router.

If an update for a given route has not been seen for the time specified by the timeout parameter, that route is no longer valid. However, it is retained in the routing table for a short time, with metric 16, so that neighbors are notified that the route has been dropped.

When the time specified by the garbage parameter expires the metric 16 route is finally removed from the routing table. Until the garbage time expires, the route is included in all updates sent by the router.

All the routers in the network must have the same timers to ensure the smooth operation of RIP throughout the network.

**Examples** To set the update timer to 30, the routing information timeout timer to 180, and the routing garbage collection timer to 120, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# timers basic 30 180 120
```

To set the update timer to 30, the routing information timeout timer to 180, and the routing garbage collection timer to 120 with VRF, use the following command:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# timers basic 30 180 120
```

**Command changes**

Version 5.4.6-2.1: VRF-lite support added.

# undebug rip

**Overview** Use this command to disable the options set for debugging information of RIP events, packets and communication between RIP and NSM.

This command has the same effect as the **no debug rip** command.

**Syntax** `undebug rip {all|events|nsm|<packet>}`

| Parameter | Description |
|---|---|
| `all` | Disables all RIP debugging. |
| `events` | Disables the logging of RIP events. |
| `nsm` | Disables the logging of RIP and NSM communication. |
| *<packet>* | `packet [recv\|send] [detail]`<br>Disables the debugging of RIP packets. |
| `recv` | Disables the logging of received packet information. |
| `send` | Disables the logging of sent packet information. |
| `detail` | Disables the logging of sent or received RIP packets. |

**Mode** Privileged Exec

**Example** To disable the options set for debugging RIP information events, use the following command:

```
awplus# undebug rip packet
```

**Related commands** debug rip

# version (RIP)

**Overview** Use this command to specify a RIP version used globally by the router.

If VRF-lite is configured, you can specify a RIP version either globally, or for a particular VRF instance.

Use the **no** variant of this command to restore the default version.

**Syntax**

```
version {1|2}
no version
```

| Parameter | Description |
|---|---|
| 1\|2 | Specifies the version of RIP processing. |

**Default** Version 2

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage notes** RIP can be run in version 1 or version 2 mode. Version 2 has more features than version 1; in particular RIP version 2 supports authentication and classless routing. Once the RIP version is set, RIP packets of that version will be received and sent on all the RIP-enabled interfaces.

Setting the version command has no impact on receiving updates, only on sending them. The ip rip send version command overrides the value set by the version (RIP) command on an interface-specific basis. The ip rip receive version command allows you to configure a specific interface to accept only packets of the specified RIP version. The ip rip receive version command and the ip rip send version command override the value set by this command.

**Examples** To specify a RIP version, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# version 1
```

To specify a RIP version with VRF, use the following commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# version 1
```

**Related commands**

ip rip receive version

ip rip send version

show running-config

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# 29 RIPng for IPv6 Commands

## Introduction

**Overview** This chapter contains RIPng commands. RIPng (Routing Information Protocol next generation) is an extension of RIPv2 to support IPv6. RFC 2080 specifies RIPng. The differences between RIPv2 and RIPng are:

- RIPng does not support RIP updates authentication
- RIPng does not allow the attachment of arbitrary tags to routes
- RIPng requires the encoding of the next-hop for a set of routes

For more information, see the RIPng Feature Overview and Configuration Guide.

**Command List**

- "aggregate-address (IPv6 RIPng)" on page 1070
- "clear ipv6 rip route" on page 1071
- "debug ipv6 rip" on page 1072
- "default-information originate (IPv6 RIPng)" on page 1073
- "default-metric (IPv6 RIPng)" on page 1074
- "distribute-list (IPv6 RIPng)" on page 1075
- "ipv6 prefix-list" on page 1076
- "ipv6 rip metric-offset" on page 1078
- "ipv6 rip split-horizon" on page 1080
- "ipv6 router rip" on page 1081
- "neighbor (IPv6 RIPng)" on page 1082
- "passive-interface (IPv6 RIPng)" on page 1083
- "recv-buffer-size (IPv6 RIPng)" on page 1084
- "redistribute (IPv6 RIPng)" on page 1085
- "route (IPv6 RIPng)" on page 1086

- "router ipv6 rip" on page 1087
- "show debugging ipv6 rip" on page 1088
- "show ipv6 prefix-list" on page 1089
- "show ipv6 protocols rip" on page 1090
- "show ipv6 rip" on page 1091
- "show ipv6 rip database" on page 1092
- "show ipv6 rip interface" on page 1093
- "timers (IPv6 RIPng)" on page 1094
- "undebug ipv6 rip" on page 1095

# aggregate-address (IPv6 RIPng)

**Overview** Use this command to add an aggregate route to RIPng.

Use the **no** variant of this command to remove the aggregate route from RIPng.

**Syntax**

```
aggregate-address <ipv6-addr/prefix-length>
no aggregate-address <ipv6-addr/prefix-length>
```

| Parameter | Description |
|---|---|
| *<ipv6-addr/prefix-length>* | Specify the IPv6 Address in the format *X:X::X:X/Prefix-Length*. The prefix-length is a decimal integer between 1 and 128. |

**Mode** Router Configuration

**Usage notes** The route will not be added to the RIPng database unless the database contains at least one route which is contained within the address range covered by the aggregate route. As soon as there are any such component routes in the RIPng database, then the following occurs:

- the aggregate route is added to the RIPng database
- all the component routes that are within the address range covered by the aggregate route are retained in the RIPng database, but are marked as suppressed routes. The aggregate route will be advertised in RIPng updates, and the component route will no longer be advertised.

Note that simply having a component route in the IPv6 route database is not a sufficient condition for the aggregate route to be included into the RIPng database. The component route(s) must be in the RIPng database before the aggregate route will be included in the RIPng database. There is no restriction on the method by which the component routes have arrived into the RIPng database, it can be by being connected RIP interfaces, by redistribution or by direct inclusion using the **route** command in router IPv6 RIP configuration mode.

**Example**

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# aggregate-address 2001:db8::/32
```

# clear ipv6 rip route

**Overview** Use this command to clear specific data from the RIPng routing table.

**Syntax**
```
clear ipv6 rip route
{<ipv6-addr/prefix-length>|all|connected|rip|static|ospf}
```

| Parameter | Description |
|---|---|
| *<ipv6-addr/prefix-length>* | Specify the IPv6 Address in format *X:X::X:X/Prefix-Length*. The prefix-length is a decimal integer between 1 and 128. Removes entries which exactly match this destination address from the RIPng routing table. |
| `connected` | Removes redistributed connected entries from RIPng routing table. |
| `static` | Removes redistributed static entries from the RIPng routing table. |
| `rip` | Removes RIPng routes from the RIPng routing table. |
| `ospf` | Removes redistributed OSPFv3 routes from the RIPng routing table. |
| `all` | Clears the entire RIPng routing table. |

**Mode** Privileged Exec

**Example**
```
awplus# clear ipv6 rip route all
awplus# clear ipv6 rip route 2001:db8::/32
```

# debug ipv6 rip

**Overview** Use this command to enable RIPng debugging and specify debugging for RIPng events, RIPng packets, or RIPng communication with NSM processes.

Use the **no** variant of this command to disable RIPng debugging.

**Syntax**

```
debug ipv6 rip [all|events|nsm|packet [detail]|recv
[detail]|send [detail]]
```

```
no debug ipv6 rip [all|events|nsm|packet [detail]|recv
[detail]|send [detail]]
```

| Parameter | Description |
|---|---|
| `all` | Displays all RIPng debugging showing RIPng events debug information, RIPng received packets information, and RIPng sent packets information. |
| `events` | Displays RIPng events debug information. |
| `nsm` | Displays RIPng and NSM communication. |
| `packet` | Displays RIPng packets only. |
| `recv` | Displays information for received packets. |
| `send` | Displays information for sent packets. |
| `detail` | Displays detailed information for the sent or received packet. |

**Default** RIPng debugging is disabled by default.

**Mode** Privileged Exec and Global Configuration

**Example**

```
awplus# debug ipv6 rip events
awplus# debug ipv6 rip packet send detail
awplus# debug ipv6 rip nsm
```

**Related commands** undebug ipv6 rip

# default-information originate (IPv6 RIPng)

**Overview** Use this command to generate a default route into RIPng.

Use the **no** variant of this command to disable this feature.

**Syntax**

```
default-information originate
no default-information originate
```

**Default** Disabled

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# default-information originate
```

# default-metric (IPv6 RIPng)

**Overview** Use this command to specify the metrics to be assigned to redistributed RIPng routes.

Use the **no** variant of this command to reset the RIPng metric back to its default (1).

**Syntax**

```
default-metric <1-16>
no default-metric [<1-16>]
```

| Parameter | Description |
|---|---|
| *<1-16>* | Metric value. |

**Default** By default, the RIPng metric value is set to 1.

**Mode** Router Configuration

**Usage** This command is used with the redistribute (IPv6 RIPng) command to make the routing protocol use the specified metric value for all redistributed RIPng routes, regardless of the original protocol that the route has been redistributed from.

Note, this metric is not applied to routes that are brought into RIPng by using the **route** command in router IPv6 RIP configuration mode. This metric is, though, applied to any RIPng aggregate routes that have been brought into the RIPng database due to the presence of a component route that was redistributed into RIPng.

Also note that the default-metric is applied to routes redistributed into RIPng with no metric assignment in the routemap associated with redistribution.

**Example**

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# default-metric 8
```

**Related commands** ipv6 rip metric-offset

redistribute (IPv6 RIPng)

# distribute-list (IPv6 RIPng)

**Overview** Use this command to filter incoming or outgoing route updates using the prefix-list.

Use the **no** variant of this command to disable this feature.

**Syntax**

```
distribute-list [prefix <prefix-list-name>] [in|out]
[<interface>]
```

```
no distribute-list [prefix <prefix-list-name>] [in|out]
[<interface>]
```

| Parameter | Description |
|---|---|
| *<prefix-list-name>* | Filter prefixes in routing updates.<br>Specify the name of the IPv6 prefix-list to use. |
| *<interface>* | The interface for which distribute-list applies. |
| `in` | Filter incoming routing updates. |
| `out` | Filter outgoing routing updates. |

**Default** Disabled

**Mode** Router Configuration

**Usage notes** Filter out incoming or outgoing route updates using the prefix-list. If you do not specify the name of the interface, the filter is applied to all the interfaces.

**Example** To filter incoming or outgoing route updates, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# distribute-list prefix myfilter in eth1
```

**Related commands** ipv6 nd prefix

# ipv6 prefix-list

**Overview** Use this command to create an IPv6 prefix list or an entry in an existing prefix list.

Use the **no** variant of this command to delete a whole prefix list, a prefix list entry, or a description.

**Syntax**

```
ipv6 prefix-list <list-name> [seq <1-429496725>] {deny|permit}
{any|<ipv6-prefix>} [ge <0-128>] [le <0-128>]
ipv6 prefix-list <list-name> description <text>
no ipv6 prefix-list <list-name> [seq <1-429496725>]
no ipv6 prefix-list <list-name> [description <text>]
```

| Parameter | Description |
|---|---|
| `<list-name>` | Specifies the name of a prefix list. |
| `seq <1-429496725>` | Sequence number of the prefix list entry. |
| `deny` | Specifies that the prefixes are excluded from the list. |
| `permit` | Specifies that the prefixes are included in the list. |
| `<ipv6-prefix>` | Specifies the IPv6 prefix and prefix length in hexadecimal in the format X:X::X:X/M. |
| `any` | Any prefix match. Same as ::0/0 le 128. |
| `ge <0-128>` | Specifies the minimum prefix length to be matched. |
| `le <0-128>` | Specifies the maximum prefix length to be matched. |
| `description` | Prefix list specific description. |
| `<text>` | Up to 80 characters of text description of the prefix list. |

**Mode** Global Configuration

**Usage notes** When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. The parameters **ge** and **le** are only used if an ip-prefix is stated. When setting these parameters, set the **le** value to be less than 128, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

**Example** To check the first 32 bits of the prefix 2001:db8:: and that the subnet mask must be greater than or equal to 34 and less than or equal to 40, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 prefix-list mylist seq 12345 permit
2001:db8::/32 ge 34 le 40
```

**Related commands**

match ipv6 address

show ipv6 prefix-list

show running-config ipv6 prefix-list

# ipv6 rip metric-offset

**Overview** Use this command to increment the metric value on incoming routes for a specified interface. This command can be used to artificially inflate the metric value for routes learned on the specified interface. Routes learned on the specified interface are only used if the routes to the same destination with a lower metric value in the routing table are down.

Use the **no** variant of this command to reset the metric value on incoming routes to the default value (1). You can set the metric value for redistributed routes with default-metric (IPv6 RIPng) and redistribute (IPv6 RIPng) commands in Router Configuration mode.

**Syntax**

```
ipv6 rip metric-offset <1-16>
no ipv6 rip metric-offset <1-16>
```

| Parameter | Description |
|---|---|
| *<1-16>* | Specify an increment to the metric value on an incoming route. The metric value for RIPng routes is the hop count for the route. |

**Default** The default RIPng metric value is 1.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** When a RIPng route is received on an interface, the metric value for the interface set by this command is added to the metric value of the route in the routing table. Note this command only increments the metric for incoming routes on a specified interface. Increasing the metric value for an interface increases the metric value of routes received on that interface. This changes the route selected from the routing table.

The RIPng metric is the hop count. At regular intervals of the routing update timer (which has a default value of 30 seconds), and at the time of change in the topology, the RIPng router sends update messages to other routers. The listening routers update their route table with the new route, and increase the metric value of the path by one (referred to as a hop count). The router recognizes the IPv6 address advertising router as the next hop, then sends the routing updates to other routers. A maximum allowable hop count is 15. If a router reaches a metric value of 16 or more, the destination is identified as unreachable.

For information about how AlliedWare Plus adds routes, see the "Route Selection" Feature Overview and Configuration Guide. See also the default-metric (IPv6 RIPng)and redistribute (IPv6 RIPng) commands to specify the metric for redistributed RIPng routes.

**Examples**

To increment the metric-offset on the PPP interface ppp0, enter the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# exit
awplus(config)# interface ppp0
awplus(config-if)# ipv6 rip metric-offset
```

To reset the metric-offset on the PPP interface ppp0 to the default value, enter the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 router rip
```

**Related commands**

default-metric (IPv6 RIPng)

show running-config

# ipv6 rip split-horizon

**Overview** Use this command to perform the split-horizon action on the interface. The default is split-horizon with poisoned reverse.

Use the **no** variant of this command to disable this function.

**Syntax**

```
ipv6 rip split-horizon [poisoned]
no ipv6 rip split-horizon
```

| Parameter | Description |
|---|---|
| `split-horizon` | Perform split-horizon without poisoned reverse |
| `poisoned` | Performs split-horizon with poisoned reverse. |

**Default** Split-horizon with poisoned reverse is the default.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** Use this command to avoid including routes in updates sent to the same gateway from which they were learned. Using the **split horizon** command omits routes learned from one neighbor, in updates sent to that neighbor. Using the **poisoned** parameter with this command includes such routes in updates, but sets their metrics to infinity. Thus, advertising that these routes are not reachable.

**Examples** To perform split-horizon with poisoned reverse on the PPP interface ppp0, enter the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# exit
awplus(config)# interface ppp0
awplus(config-if)# ipv6 rip split-horizon poisoned
```

To disable split-horizon on the PPP interface ppp0, enter the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 rip split-horizon
```

**Related Commands** show running-config

# ipv6 router rip

**Overview** Use this command to enable RIPng routing on an interface.

Use the **no** variant of this command to disable RIPng routing on an interface.

**Syntax**

```
ipv6 router rip
no ipv6 router rip
```

**Default** RIPng routing is disabled by default.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Examples** To enable RIPng routing on the PPP interface ppp0, enter the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# exit
awplus(config)# interface ppp0
awplus(config-if)# ipv6 router rip
```

To disable RIPng routing on the PPP interface ppp0, enter the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 router rip
```

# neighbor (IPv6 RIPng)

**Overview** Use this command to specify a neighbor router.

Use the **no** variant of this command to disable the specific router.

**Syntax**

```
neighbor <ipv6-link-local-addr> <interface>
no neighbor <ipv6-link-local-addr> <interface>
```

| Parameter | Description |
|---|---|
| *<ipv6-link-local-addr>* | Specify the link-local IPv6 address (in the format *X:X::X:X*) of a neighboring router to exchange routing information with. |
| *<interface>* | The interface to exchange routing information over. |

**Mode** Router Configuration

**Usage** Use this command to exchange non broadcast routing information. It can be used multiple times for additional neighbors.

The passive-interface (IPv6 RIPng) command disables sending routing updates on an interface. If you want to send routing updates only to specific neighbors, use the passive-interface (IPv6 RIPng) command and this **neighbor** command together.

**Examples** To set 2001:db8:1::1 as a neighbor via interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# neighbor 2001:db8:1::1 eth1
```

To stop having 2001:db8:1::1 as a neighbor via interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no neighbor 2001:db8:1::1 eth1
```

**Related commands** passive-interface (IPv6 RIPng)

# passive-interface (IPv6 RIPng)

**Overview** Use this command to enable suppression of routing updates on an interface.

Use the **no** variant of this command to disable this function.

**Syntax**

```
passive-interface <interface>
no passive-interface <interface>
```

| Parameter | Description |
|---|---|
| *<interface>* | The interface to suppress routing updates on. |

**Default** Disabled

**Mode** Router Configuration

**Examples** To suppress routing updates on eth1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# passive-interface eth1
```

To stop suppressing routing updates on eth1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no passive-interface eth1
```

# recv-buffer-size (IPv6 RIPng)

**Overview** Use this command to configure the RIPng UDP (User Datagram Protocol) receive-buffer size. This should improve UDP reliability by avoiding UDP receive buffer overruns.

Use the **no** variant of this command to unset the configured RIPng UDP receive-buffer size and set it back to the system default of 196608 bits.

**Syntax**

```
recv-buffer-size <8192-2147483647>
no recv-buffer-size [<8192-2147483647>]
```

**Default** The RIPng UDP receive-buffer-size is 196608 bits by default, and is reset to the default using the **no** variant of this command.

**Mode** Router Configuration

**Examples** To configure the RIPng UPD, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# recv-buffer-size 23456789
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no recv-buffer-size 23456789
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# no recv-buffer-size
```

# redistribute (IPv6 RIPng)

**Overview** Use this command to redistribute information from other routing protocols into RIPng.

Use the **no** variant of this command to disable the specified redistribution. The parameters **metric** and **routemap** may be used on this command, but have no effect.

**Syntax**

```
redistribute {connected|static|ospf} [metric <0-16>] [route-map
<route-map>]
```

```
no redistribute {connected|static|ospf} [metric <0-16>]
[route-map <route-map>]
```

| Parameter | Description |
|---|---|
| *<0-16>* | Optional. Specifies the metric value to be used when redistributing information. If a value is not specified, and no value is specified using the default-metric (IPv6 RIPng) command, the default is one. |
| *<route-map>* | Optional. Specifies route-map to be used to redistribute information. |
| `connected` | Redistribute from connected routes. |
| `static` | Redistribute from static routes. |
| `ospf` | Redistribute from Open Shortest Path First (OSPF). |

**Default** By default, the RIPng metric value is set to 1.

**Mode** Router Configuration

**Example** To redistribute information from other routing protocols into RIPng, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# redistribute static route-map mymap
awplus(config-router)# redistribute static metric 8
```

**Related commands** default-metric (IPv6 RIPng)

# route (IPv6 RIPng)

**Overview** Use this command to configure static RIPng routes.

Use the **no** variant of this command to disable this function.

**Syntax**

```
route <ipv6-addr/prefix-length>
no route <ipv6-addr/prefix-length>
```

| Parameter | Description |
|---|---|
| *<ipv6-addr/prefix-length>* | Specify the IPv6 Address in format *X:X::X:X/Prefix-Length*. The prefix-length is a decimal integer between 1 and 128. |

**Mode** Router Configuration

**Usage notes** Use this command to add a static RIPng route. After adding the RIPng route, the route can be checked in the RIPng routing table.

**Example** To configure static RIPng routes, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# route 2001:db8::1/64
```

**Related commands** show ipv6 rip

clear ipv6 rip route

# router ipv6 rip

**Overview** Use this global command to enter Router Configuration mode to enable a RIPng routing process.

Use the **no** variant of this command to disable the RIPng routing process.

**Syntax**

```
router ipv6 rip
no router ipv6 rip
```

**Mode** Global Configuration

**Example** To enable a RIPng routing process, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)#
```

# show debugging ipv6 rip

**Overview** Use this command to see what debugging is turned on for RIPng options such as: nsm debugging, RIPng event debugging, RIPng packet debugging, and RIPng nsm debugging.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

**Syntax**

```
show debugging ipv6 rip
```

**Mode** User Exec and Privileged Exec

**Usage notes** Use this command to display the debug status of RIPng.

**Example** To display the RIPng debugging status, use the following command:

```
awplus# show debugging ipv6 rip
```

# show ipv6 prefix-list

**Overview** Use this command to display the prefix-list entries.

Note that this command is valid for RIPng and BGP4+ routing protocols only.

**Syntax**

```
show ipv6 prefix-list [<name>|detail|summary]
```

| Parameter | Description |
|---|---|
| *<name>* | Specify the name of an individual IPv6 prefix list. |
| `detail` | Specify this parameter to show detailed output for all IPv6 prefix lists. |
| `summary` | Specify this parameter to show summary output for all IPv6 prefix lists. |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ipv6 prefix-list
awplus# show ipv6 prefix-list 10.10.0.98/8
awplus# show ipv6 prefix-list detail
```

**Related commands** ipv6 prefix-list

# show ipv6 protocols rip

**Overview** Use this command to display RIPng process parameters and statistics.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ipv6 protocols rip
```

**Mode** User Exec and Privileged Exec

**Example** To display RIPng process parameters and statistics, use the following command:

```
awplus# show ipv6 protocols rip
```

**Output** Figure 29-1: Example output from the **show ipv6 protocols rip** command

```
awplus#show ipv6 protocols rip
Routing Protocol is "RIPng"
  Sending updates every 30 seconds with +/-5 seconds, next due
in 6 seconds
  Timeout after 180 seconds, garbage collect after 120 seconds
  Outgoing update filter list for all interface is not set
  Incoming update filter list for all interface is not set
  Default redistribute metric is 1
  Redistributing:
  Interface
    eth1
  Routing for Networks:
    fe80::200:cdff:fe27:c086 vlan1
```

# show ipv6 rip

**Overview** Use this command to show RIPng routes.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ipv6 rip
```

**Mode** User Exec and Privileged Exec

**Example** To display RIPng routes, use the following command:

```
awplus# show ipv6 rip
```

**Output** Figure 29-2: Example output from the **show ipv6 rip** command

```
awplus#show ipv6 rip
Codes: R - RIP, Rc - RIP connected, Rs - RIP static, Ra - RIP
aggregated, Rcx - RIP connect suppressed, Rsx - RIP static
suppressed, C - Connected, S - Static, O - OSPF, B - BGP

   Network           Next Hop         If     Met Tag   Time

R  2001:db8:1::/48   2001:db8:2::/48  eth1   3   0    02:28
C  2001:db8:3::/48   ::               eth1   1   0
Ra 2001:db8:4::/48                    --     1   0
...
```

**Related commands** show ipv6 rip database

# show ipv6 rip database

**Overview** Use this command to display information about the RIPng database.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ipv6 rip database [full]
```

| Parameter | Description |
|---|---|
| `full` | Display all IPv6 RIPng full database entries including sub-optimal routes. |

**Mode** User Exec and Privileged Exec

**Example** To display information about the RIPng database, use the following command:

```
awplus# show ipv6 rip database
```

**Output** Figure 29-3: Example output from the **show ipv6 rip database** command

```
Codes: R - RIP, Rc - RIP connected, Rs - RIP static, Ra - RIP
aggregated, Rcx - RIP connect suppressed, Rsx - RIP static
suppressed, C - Connected, S - Static, O - OSPF, B - BGP

   Network           Next Hop         If     Met Tag   Time

R  2001:db8:1::/48   2001:db8:2::/48  eth1    3   0    02:28
C  2001:db8:3::/48   ::               eth1    1   0
Ra 2001:db8:4::/48                    --      1   0
...
```

**Related commands** show ipv6 rip

# show ipv6 rip interface

**Overview** Use this command to display information about the RIPng interfaces. You can specify an interface name to display information about a specific interface.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

**Syntax**

```
show ipv6 rip interface [<interface>]
```

| Parameter | Description |
|---|---|
| *<interface>* | The interface to display information about. |

**Mode** User Exec and Privileged Exec

**Example** To display RIPng interface information, use the following command:

```
awplus# show ipv6 rip interface
```

**Output** Figure 29-4: Example output from the **show ipv6 rip interface** command

```
lo is up, line protocol is up
RIPng is not enabled on this interface
eth1 is up, line protocol is up
Routing Protocol: RIPng
Passive interface: Disabled
Split horizon: Enabled with Poisoned Reversed
IP interface address:
2001:db8:1::1/64
2001:db8:1::2/64
...
```

# timers (IPv6 RIPng)

**Overview** Use this command to adjust the RIPng routing network timers.

Use the **no** variant of this command to restore the defaults.

**Syntax**

```
timers basic <update> <timeout> <garbage>
no timers basic
```

| Parameter | Description |
|---|---|
| *<update>* | <5-2147483647> Specifies the RIPng routing table update timer in seconds. The default is 30 seconds. |
| *<timeout>* | <5-2147483647> Specifies the RIPng routing information timeout timer in seconds. The default is 180 seconds. After this interval has elapsed and no updates for a route are received, the route is declared invalid. |
| *<garbage>* | <5-2147483647> Specifies the RIPng routing garbage collection timer in seconds. The default is 120 seconds. |

**Default** The default RIPng routing table update timer default is 30 seconds, the default RIPng routing information timeout timer is 180 seconds, and the default RIPng routing garbage collection timer is 120 seconds. The **no** variant of this command restores the default RIPng routing timers.

**Mode** Router Configuration

**Example** To adjust the RIPng routing network timers, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 rip
awplus(config-router)# timers basic 30 180 120
```

# undebug ipv6 rip

**Overview** Use this command to disable debugging options of RIPng events, RIPng packets, and communication between RIPng and NSM processes.

**Syntax**

```
undebug ipv6 rip [all|events|nsm|packet [recv|send][detail]]
```

| Parameter | Description |
|---|---|
| `all` | Disables all RIPng debugging. |
| `events` | Disable the display of RIPng events information. |
| `nsm` | Disable the display of RIPng and NSM communication. |
| `packet` | Disable debugging of specified RIPng packets only. |
| `recv` | Disable the display of information for received packets. |
| `send` | Disable the display of information for sent packets. |
| `detail` | Disable the display of detailed information for sent or received packets. |

**Mode** Privileged Exec and Global Configuration

**Example** To disable debugging options, use the following command:

```
awplus# undebug ipv6 rip events
awplus# undebug ipv6 rip all
awplus# undebug ipv6 rip packet send
awplus# undebug ipv6 rip packet recv detail
```

**Related commands** debug ipv6 rip

# 30 OSPF Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure OSPF. For more information, see the OSPF Feature Overview and Configuration Guide.

- "undebug ospf route" on page 1202

# area default-cost

**Overview** This command specifies a cost for the default summary route sent into a stub or NSSA area.

The **no** variant of this command removes the assigned default-route cost.

**Syntax**

```
area <area-id> default-cost <0-16777215>
no area <area-id> default-cost
```

| Parameter | Description | |
|---|---|---|
| *<area-id>* | The OSPF area that you are specifying the default summary route cost for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. | |
| | *<ip-addr>* | OSPF Area ID expressed in IPv4 address format A.B.C.D. |
| | *<0-4294967295>* | OSPF Area ID expressed as a decimal number within the range shown. |
| | For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID. | |
| *default-cost* | Indicates the cost for the default summary route used for a stub or NSSA area.<br>Default: **1** | |

**Mode** Router Configuration

**Usage** The default-cost option provides the metric for the summary default route, generated by the area border router, into the NSSA or stub area. Use this option only on an area border router that is attached to the NSSA or stub area. Refer to the RFC 3101 for information on NSSA.

**Example** To set the default cost to 10 in area 1 for the OSPF instance 100, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 default-cost 10
```

**Related commands**

area nssa

area stub

# area authentication

**Overview** Use this command to enable authentication for an OSPF area. Specifying the area authentication sets the authentication to Type 1 authentication or the Simple Text password authentication (details in RFC 2328).

The **no** variant of this command removes the authentication specification for an area.

**Syntax**

```
area <area-id> authentication [message-digest]
no area <area-id> authentication
```

| Parameter | Description | |
|---|---|---|
| *<area-id>* | The OSPF area that you are enabling authentication for. This can be entered in either dotted decimal format or normal decimal format. | |
| | *<ip-addr>* | OSPF Area ID expressed in IPv4 address, entered in the form A.B.C.D. |
| | *<0-4294967295>* | OSPF Area ID expressed as a decimal number within the range shown. |
| | For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area OSPF Area ID. | |
| *message-digest* | Enables MD5 authentication in the OSPF area. | |

**Default** By default, no authentication occurs.

**Mode** Router Configuration

**Usage** All OSPF packets transmitted in this **area** must have the same password in their OSPF header. This ensures that only routers that have the correct password may join the routing domain.

Give all routers that are to communicate with each other through OSPF the same authentication password.

Use the ip ospf authentication-key command to specify a Simple Text password. Use the ip ospf message-digest-key command to specify MD5 password.

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 authentication
```

**Related commands** ip ospf authentication

ip ospf message-digest-key

# area filter-list

**Overview** This command configures filters to advertise summary routes on Area Border Routers (ABR).

This command is used to suppress particular intra-area routes from/to an area to/from the other areas. You can use this command in conjunction with the prefix-list command.

The **no** variant of this command removes the filter configuration.

**Syntax**

```
area <area-id> filter-list prefix <prefix-list> {in|out}
no area <area-id> filter-list prefix <prefix-list> {in|out}
```

| Parameter | Description | |
|---|---|---|
| *<area-id>* | The OSPF area that you are configuring the filter for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. | |
| | *<ip-addr>* | OSPF Area ID expressed in IPv4 address format A.B.C.D. |
| | *<0-4294967295>* | OSPF Area ID expressed as a decimal number within the range shown. |
| | For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID. | |
| `prefix` | Use prefix-list to filter summary. | |
| *<prefix-list>* | Name of a prefix-list. | |
| `in` | Filter routes from the other areas to this area. | |
| `out` | Filter routes from this area to the other areas. | |

**Mode** Router Configuration

# area nssa

**Overview** This command sets an area as a Not-So-Stubby-Area (NSSA). By default, no NSSA area is defined.

Use this command to simplify administration if you are connecting a central site using OSPF to a remote site that is using a different routing protocol. You can extend OSPF to cover the remote connection by defining the area between the central router and the remote router as an NSSA.

There are no external routes in an OSPF stub area, so you cannot redistribute from another protocol into a stub area. A NSSA allows external routes to be flooded within the area. These routes are then leaked into other areas. Although, the external routes from other areas still do not enter the NSSA. You can either configure an area to be a stub area or an NSSA, not both.

The **no** variant of this command removes this designation.

**Syntax**

```
area <area-id> nssa [default-information-originate <metric> |
no-redistribution | no-summary | translator-role <role> ]
```

```
no area <area-id> nssa [default-information-originate |
no-redistribution | no-summary | translator-role ]
```

| Parameter | Description | |
|---|---|---|
| *<area-id>* | The OSPF area that you are configuring as an NSSA. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. | |
| | *<ip-addr>* | OSPF Area ID expressed in IPv4 address format A.B.C.D. |
| | *<0-4294967295>* | OSPF Area ID expressed as a decimal number within the range shown. |
| | For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID. | |
| `default-information-originate` | Originate Type-7 default LSA into NSSA. | |
| *<metric>* | The external or internal metric. Specify the following: | |
| | `metric`*<0-16777214>* | The metric value. |
| | `metric-type`*<1-2>* | External metric type. |
| `no-redistribution` | Do not redistribute external route into NSSA. | |
| `no-summary` | Do not inject inter-area route into NSSA. | |
| `translator-role` | Specify NSSA-ABR translator-role. | |

| Parameter | Description | |
|---|---|---|
| *<role>* | The role type. Specify one of the following keywords: | |
| | `always` | Router always translate NSSA-LSA to Type-5 LSA. |
| | `candidate` | Router may translate NSSA-LSA to Type-5 LSA if it is elected. |
| | `never` | Router never translate NSSA-LSA. |

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 0.0.0.51 nssa
awplus(config-router)# area 3 nssa translator-role candidate
no-redistribution default-information-originate metric 34
metric-type 2
```

**Related commands** area default-cost

# area range

**Overview** Use this command to summarize OSPF routes at an area boundary, configuring an IPv4 address range which consolidates OSPF routes. By default, this feature is not enabled.

A summary route created by this command is then advertised to other areas by the Area Border Routers (ABRs). In this way, routing information is condensed at area boundaries and outside the area so that routes are exchanged between areas in an efficient manner.

If the network numbers in an area are arranged into sets of contiguous routes, the ABRs can be configured to advertise a summary route that covers all the individual networks within the area that fall into the specified range.

Use the cost parameter to specify a metric that will be advertised in the summary Link State Advertisement (LSA), rather than relying on the standard method to calculate the metric for the LSA.

The **no** variant of this command disables this function and restores default behavior.

**Syntax**

```
area <area-id> range <ip-addr/prefix-length> [advertise] [cost <0-16777215>]
area <area-id> range <ip-addr/prefix-length> not-advertise
no area <area-id> range <ip-addr/prefix-length>
```

| Parameter | Description | |
|---|---|---|
| *<area-id>* | The OSPF area that you summarizing the routes for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. | |
| | *<ip-addr>* | OSPF Area ID expressed in IPv4 address format A.B.C.D. |
| | *<0-4294967295>* | OSPF Area ID expressed as a decimal number within the range shown. |
| | For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID. | |
| *<ip-addr/prefix-length>* | The area range prefix and length. | |
| advertise | Advertise this range as a summary route into other areas. | |

| Parameter | Description |
|---|---|
| `not-advertise` | Does not advertise this range. |
| `cost` | Optionally override the metric that would normally be calculated for this summary with a user-defined cost to be advertised for this summary LSA. Specify the metric to be advertised for this route in the range 0-16777215. |

**Default** The area range is not configured by default. The area range is advertised if it is configured.

**Mode** Router Configuration

**Usage notes** You can configure multiple ranges on a single area with multiple instances of this command, so OSPF summarizes addresses for different sets of IPv4 address ranges.

Ensure OSPF IPv4 routes exist in the area range for advertisement before using this command.

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 range 192.16.0.0/16
awplus(config-router)# area 1 range 203.18.0.0/16 cost 70
```

To remove a cost configured on an area range, re-enter the area range without the optional cost parameter. This will set the metric calculation back to the default algorithm.

```
awplus(config-router)# area 1 range 207.14.0.0/16 cost 35
awplus(config-router)# area 1 range 207.14.0.0/16
```

**Command changes** Version 5.5.0-0.1: parameter **cost** added

# area stub

**Overview** This command defines an OSPF area as a stub area. By default, no stub area is defined.

Use this command when routers in the area do not require learning about summary LSAs from other areas. You can define the area as a totally stubby area by configuring the Area Border Router of that area using the **area stub no-summary** command.

There are two stub area router configuration commands: the **area stub** and **area default-cost** commands. In all routers attached to the stub area, configure the area by using the **area stub** command. For an area border router (ABR) attached to the stub area, also use the **area default-cost** command.

The **no** variant of this command removes this definition.

**Syntax**

```
area <area-id>  stub [no-summary]
no area <area-id> stub [no-summary]
```

| Parameter | Description | |
|---|---|---|
| *<area-id>* | The OSPF area that you are configuring as a stub area. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID. | |
| | *<ip-addr>* | OSPF Area ID expressed in IPv4 address in the format A.B.C.D. |
| | *<0-4294967295>* | OSPF Area ID expressed as a decimal number within the range shown. |
| | For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID. | |
| no-summary | Stops an ABR from sending summary link advertisements into the stub area. | |

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 stub
```

**Related commands** area default-cost

# area virtual-link

**Overview** This command configures a link between two backbone areas that are physically separated through other non-backbone areas.

In OSPF, all non-backbone areas must be connected to a backbone area. If the connection to the backbone is lost, the virtual link repairs the connection.

The **no** variant of this command removes the virtual link.

**Syntax**

```
area <area-id> virtual-link <ip-addr> [<auth-key>|<msg-key>]

no area <area-id>  virtual-link <ip-addr>[<auth-key>|<msg-key>]

area <area-id>  virtual-link <ip-addr> authentication
[message-digest|null] [<auth-key>|<msg-key>]

no area <area-id>  virtual-link <ip-addr> authentication
[message-digest|null] [<auth-key>|<msg-key>]

area <area-id>  virtual-link <ip-addr> [authentication]
[dead-interval <1-65535>] [hello-interval <1-65535>]
[retransmit-interval <1-3600>] [transmit-delay <1-3600>]

no area <area-id>  virtual-link <ip-addr>[authentication]
[dead-interval] [hello-interval] [retransmit-interval]
[transmit-delay]
```

| Parameter | Description | |
|---|---|---|
| *<area-id>* | The area ID of the transit area that the virtual link passes through. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. | |
| | *<ip-addr>* | OSPF Area ID expressed in IPv4 address format A.B.C.D. |
| | *<0-4294967295>* | OSPF Area ID expressed as a decimal number within the range shown. |
| | For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area ID. | |
| *<ip-address>* | The OSPF router ID of the virtual link neighbor. | |
| *<auth-key>* | Specifies the password used for this virtual link. Use the format: **authentication-key***<pswd-short>* | |
| | *<pswd-short>* | An 8 character password. |
| *<msg-key>* | Specifies a message digest key using the MD5 encryption algorithm. Use the following format: **message-digest-key***<1-255>* md5 *<pswd-long>* | |
| | *<1-255>* | The key ID. |
| | *<pswd-long>* | Authentication password of 16 characters. |
| `authentication` | Enables authentication on this virtual link. | |

| Parameter | Description | |
|---|---|---|
| `message-digest` | Use message-digest authentication. | |
| `null` | Use null authentication to override password or message digest. | |
| `dead-interval` | If no packets are received from a particular neighbor for dead-interval seconds, the router considers that neighboring router as being off-line.<br>Default: 40 seconds | |
| | *<1-65535>* | The number of seconds in the interval. |
| `hello-interval` | The interval the router waits before it sends a hello packet.<br>Default: 10 seconds | |
| | *<1-65535>* | The number of seconds in the interval. |
| `retransmit-interval` | The interval the router waits before it retransmits a packet.<br>Default: 5 seconds | |
| | *<1-3600>* | The number of seconds in the interval. |
| `transmit-delay` | The interval the router waits before it transmits a packet.<br>Default: 1 seconds | |
| | *<1-3600>* | The number of seconds in the interval. |

**Mode** Router Configuration

**Usage notes** You can configure virtual links between any two backbone routers that have an interface to a common non-backbone area. The protocol treats these two routers, joined by a virtual link, as if they were connected by an unnumbered point-to-point network. To configure a virtual link, you require:

- The transit area ID, i.e. the area ID of the non backbone area that the two backbone routers are both connected to.
- The corresponding virtual link neighbor's router ID. To see the router ID use the show ip ospf command.

Configure the **hello-interval** to be the same for all routers attached to a common network. A short **hello-interval** results in the router detecting topological changes faster but also an increase in the routing traffic.

The **retransmit-interval** is the expected round-trip delay between any two routers in a network. Set the value to be greater than the expected round-trip delay to avoid needless retransmissions.

The **transmit-delay** is the time taken to transmit a link state update packet on the interface. Before transmission, the link state advertisements in the update packet, are incremented by this amount. Set the **transmit-delay** to be greater than zero. Also, take into account the transmission and propagation delays for the interface.

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# area 1 virtual-link 10.10.11.50 hello 5
dead 10
```

**Related commands**

area authentication

show ip ospf

show ip ospf virtual-links

# auto-cost reference bandwidth

**Overview** This command controls how OSPF calculates default metrics for the interface.

Use the **no** variant of this command to assign cost based only on the interface bandwidth.

**Syntax**

```
auto-cost reference-bandwidth <1-4294967>
no auto-cost reference-bandwidth
```

| Parameter | Description |
|---|---|
| *<1-4294967>* | The reference bandwidth in terms of Mbits per second (Mbps). |

**Default** 1000 Mbps

**Usage notes** By default, OSPF calculates the OSPF metric for an interface by dividing the reference bandwidth by the interface bandwidth. The default for the reference bandwidth is 1000 Mbps. As a result, if this default is used, there is very little difference between the metrics applied to interfaces of increasing bandwidth beyond 1000 Mbps.

The auto-cost command is used to alter this reference bandwidth in order to give a real difference between the metrics of high bandwidth links of differing bandwidths. In a network that has multiple links with high bandwidths, specify a larger reference bandwidth value to differentiate the costs on those links.

Cost is calculated by dividing the reference bandwidth (Mbps) by the layer 3 interface (Switched Virtual Interface (SVI), Loopback or Ethernet interface) bandwidth. Interface bandwidth may be altered by using the bandwidth command as the SVI does not auto detect the bandwidth based on the speed of associated switch ports.

When the reference bandwidth calculation results in a cost integer greater than 1 but contains a fractional value (value after the decimal point), the result rounds down to the nearest integer. The following example shows how the cost is calculated.

The reference bandwidth is 1000 Mbps and the interface bandwidth is 7 Mbps.

Calculation = 1000/7

Calculation result = 142.85 (integer of 142, fractional value of 0.85)

Result after rounding down to the nearest integer = 142 (Interface cost is 142)

When the reference bandwidth calculation results in a cost less than 1, it is rounded up to the nearest integer which is 1. The following example shows how the cost is calculated.

The reference bandwidth is 1000 Mbps and the interface bandwidth is 10000 Mbps.

Calculation = 1000/10000

Calculation result = 0.1

Result after rounding up to the nearest integer = 1 (Interface cost is 1)

The auto-cost reference bandwidth value should be consistent across all OSPF routers in the OSPF process.

Note that using the ip ospf cost command on a layer 3 interface will override the cost calculated by this command.

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# auto-cost reference-bandwidth 1000
```

**Related commands** ip ospf cost

# bandwidth

**Overview** Use this command to specify the maximum bandwidth to be used for each interface. The bandwidth value is in bits per second. OSPF uses this to calculate metrics for the interface.

The **no** variant of this command removes any applied bandwidth value.

**Syntax**

```
bandwidth <bandwidth-setting>
no bandwidth
```

| Parameter | Description |
|---|---|
| *<bandwidth-setting>* | Sets the bandwidth for the interface. Enter a value in the range 1 to 10000000000 bits per second. Note that to avoid entering many zeros, you can add k, m, or g to internally add 3, 6 or 9 zeros to the number entered. For example entering 1k is the same as entering 1000. |

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Example** To set the bandwidth on VLAN2 to be 10 Mbps, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# bandwidth 10000000
```

or

```
awplus(config-if)# bandwidth 10m
```

**Related commands** show interface

# capability opaque

**Overview** This command enables opaque-LSAs. Opaque-LSAs are Type 9, 10 and 11 LSAs that deliver information used by external applications.

Use the **no** variant of this command to disable opaque-LSAs.

**Syntax**

```
capability opaque
no capability opaque
```

**Default** By default, opaque-LSAs are enabled.

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no capability opaque
```

# capability restart

**Overview** This command enables OSPF Graceful Restart or restart signaling features. By default, this is enabled.

Use the **no** variant of this command to disable OSPF Graceful Restart and restart signaling features.

**Syntax**

```
capability restart [graceful|signaling]
no capability restart
```

| Parameter | Description |
|---|---|
| `graceful` | Enable graceful OSPF restart. |
| `signaling` | Enable OSPF restart signaling. |

**Default** Graceful restart

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# capability restart graceful
```

# clear ip ospf process

**Overview** This command clears and restarts the OSPF routing process. Specify the Process ID to clear one particular OSPF process. When no Process ID is specified, this command clears all running OSPF processes.

**Syntax**

```
clear ip ospf [<0-65535>] process
```

| Parameter | Description |
|---|---|
| *<0-65535>* | The Routing Process ID. |

**Mode** Privileged Exec

**Example**

```
awplus# clear ip ospf process
```

# compatible rfc1583

**Overview** This command changes the method used to calculate summary route to the that specified in RFC 1583. By default, OSPF uses the method specified in RFC 2328.

RFC 1583 specifies a method for calculating the metric for summary routes based on the minimum metric of the component paths available. RFC 2328 specifies a method for calculating metrics based on maximum cost.

It is possible that some ABRs in an area might conform to RFC 1583 and others support RFC 2328, which could lead to incompatibility in their interoperation. This command addresses this issue by allowing you to selectively disable compatibility with RFC 2328.

Use the **no** variant of this command to disable RFC 1583 compatibility.

**Syntax**

```
compatible rfc1583
no compatible rfc1583
```

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# compatible rfc1583
```

# debug ospf events

**Overview** This command enables OSPF debugging for OSPF event troubleshooting.

To enable all debugging options, specify **debug ospf event** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF debugging. Use this command without parameters to disable all the options.

**Syntax**

```
debug ospf events [abr] [asbr] [lsa] [nssa] [os] [router]
[vlink]
```

```
no debug ospf events [abr] [asbr] [lsa] [nssa] [os] [router]
[vlink]
```

| Parameter | Description |
|---|---|
| `abr` | Shows ABR events. |
| `asbr` | Shows ASBR events. |
| `lsa` | Shows LSA events. |
| `nssa` | Shows NSSA events. |
| `os` | Shows OS interaction events. |
| `router` | Shows other router events. |
| `vlink` | Shows virtual link events. |

**Mode** Privileged Exec and Global Configuration

**Example**

```
awplus# debug ospf events asbr lsa
```

**Related commands** terminal monitor

undebug ospf events

# debug ospf ifsm

**Overview** This command specifies debugging options for OSPF Interface Finite State Machine (IFSM) troubleshooting.

To enable all debugging options, specify **debug ospf ifsm** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF IFSM debugging. Use this command without parameters to disable all the options.

**Syntax**

```
debug ospf ifsm [status] [events] [timers]
no debug ospf ifsm [status] [events] [timers]
```

| Parameter | Description |
|---|---|
| `events` | Displays IFSM event information. |
| `status` | Displays IFSM status information. |
| `timers` | Displays IFSM timer information. |

**Mode** Privileged Exec and Global Configuration

**Example**

```
awplus# no debug ospf ifsm events status
awplus# debug ospf ifsm status
awplus# debug ospf ifsm timers
```

**Related commands** terminal monitor

undebug ospf ifsm

# debug ospf lsa

**Overview** This command enables debugging options for OSPF Link State Advertisements (LSA) troubleshooting. This displays information related to internal operations of LSAs.

To enable all debugging options, specify **debug ospf lsa** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF LSA debugging. Use this command without parameters to disable all the options.

**Syntax**

```
debug ospf lsa [flooding] [generate] [install] [maxage]
[refresh]
```

```
no debug ospf lsa [flooding] [generate] [install] [maxage]
[refresh]
```

| Parameter | Description |
|---|---|
| `flooding` | Displays LSA flooding. |
| `generate` | Displays LSA generation. |
| `install` | Show LSA installation. |
| `maxage` | Shows maximum age of the LSA in seconds. |
| `refresh` | Displays LSA refresh. |

**Mode** Privileged Exec and Global Configuration

**Examples**

```
awplus# undebug ospf lsa refresh
```

**Output** Figure 30-1: Example output from the **debug ospf lsa** command

```
2002/05/09 14:08:11 OSPF: LSA[10.10.10.10:10.10.10.70]: instance(0x8139cd0)
created with Link State Update
2002/05/09 14:08:11 OSPF: RECV[LS-Upd]: From 10.10.10.70 via vlan5:10.10.10.50
(10.10.10.10 -> 224.0.0.5)
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: Begin send queue
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: # of LSAs 1, destination 224.0.0.5
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: End send queue
2002/05/09 14:12:33 OSPF: SEND[LS-Upd]: To 224.0.0.5 via vlan5:10.10.10.50
```

**Related commands** terminal monitor

undebug ospf lsa

# debug ospf nfsm

**Overview** This command enables debugging options for OSPF Neighbor Finite State Machines (NFSMs).

To enable all debugging options, specify **debug ospf nfsm** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF NFSM debugging. Use this command without parameters to disable all the options.

**Syntax**

```
debug ospf nfsm [events] [status] [timers]
no debug ospf nfsm [events] [status] [timers]
```

| Parameter | Description |
|---|---|
| `events` | Displays NFSM event information. |
| `status` | Displays NSFM status information. |
| `timers` | Displays NFSM timer information. |

**Mode** Privileged Exec and Global Configuration

**Examples**

```
awplus# debug ospf nfsm events
awplus# no debug ospf nfsm timers
awplus# undebug ospf nfsm events
```

**Related commands** terminal monitor

undebug ospf nfsm

# debug ospf nsm

**Overview** This command enables debugging options for the OSPF Network Service Module.

To enable both debugging options, specify **debug ospf nsm** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF NSM debugging. Use this command without parameters to disable both options.

**Syntax**

```
debug ospf nsm [interface] [redistribute]
no debug ospf nsm [interface] [redistribute]
```

| Parameter | Description |
|---|---|
| `interface` | Specify NSM interface information. |
| `redistribute` | Specify NSM redistribute information. |

**Mode** Priviledged Exec and Global Configuration

**Examples**

```
awplus# debug ospf nsm interface
awplus# no debug ospf nsm redistribute
awplus# undebug ospf nsm interface
```

**Related commands** terminal monitor

undebug ospf nsm

# debug ospf packet

**Overview** This command enables debugging options for OSPF packets.

To enable all debugging options, specify **debug ospf packet** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF packet debugging. Use this command without parameters to disable all options.

**Syntax**

```
debug ospf packet [dd] [detail] [hello] [ls-ack] [ls-request]
[ls-update] [recv] [send]
```

```
no debug ospf packet [dd] [detail] [hello] [ls-ack] [ls-request]
[ls-update] [recv] [send]
```

| Parameter | Description |
|---|---|
| `dd` | Specifies debugging for OSPF database descriptions. |
| `detail` | Sets the debug option to detailed information. |
| `hello` | Specifies debugging for OSPF hello packets. |
| `ls-ack` | Specifies debugging for OSPF link state acknowledgments. |
| `ls-request` | Specifies debugging for OSPF link state requests. |
| `ls-update` | Specifies debugging for OSPF link state updates. |
| `recv` | Specifies the debug option set for received packets. |
| `send` | Specifies the debug option set for sent packets. |

**Mode** Privileged Exec and Global Configuration

**Examples**

```
awplus# debug ospf packet detail
awplus# debug ospf packet dd send detail
awplus# no debug ospf packet ls-request recv detail
awplus# undebug ospf packet ls-request recv detail
```

**Related commands** terminal monitor

undebug ospf packet

# debug ospf route

**Overview** This command enables debugging of route calculation. Use this command without parameters to turn on all the options.

To enable all debugging options, specify **debug ospf route** with no additional parameters.

The **no** and **undebug** variant of this command disable OSPF route debugging. Use this command without parameters to disable all options.

**Syntax**

```
debug ospf route [ase] [ia] [install] [spf]
no debug ospf route [ase] [ia] [install] [spf]
```

| Parameter | Description |
|---|---|
| `ia` | Specifies the debugging of Inter-Area route calculation. |
| `ase` | Specifies the debugging of external route calculation. |
| `install` | Specifies the debugging of route installation. |
| `spf` | Specifies the debugging of SPF calculation. |

**Mode** Privileged Exec and Global Configuration

**Examples**

```
awplus# debug ospf route
awplus# no debug ospf route ia
awplus# debug ospf route install
awplus# undebug ospf route install
```

**Related commands** terminal monitor

undebug ospf route

# default-information originate

**Overview** This command creates a default external route into an OSPF routing domain.

When you use the **default-information originate** command to redistribute routes into an OSPF routing domain, then the system acts like an Autonomous System Boundary Router (ASBR). By default, an ASBR does not generate a default route into the OSPF routing domain.

When using this command, also specify the **route-map** <*route-map*> option to avoid a dependency on the default network in the routing table.

The **metric-type** is an external link type associated with the default route advertised into the OSPF routing domain. The value of the external route could be either Type 1 or 2. The default is Type 2.

The **no** variant of this command disables this feature.

**Syntax**

```
default-information originate [always] [metric <metric>]
[metric-type <1-2>] [route-map <route-map>]
```

```
no default-information originate [always] [metric]
[metric-type] [route-map]
```

| Parameter | Description |
|---|---|
| `always` | Used to advertise the default route regardless of whether there is a default route. |
| *<metric>* | The metric value used in creating the default route. Enter a value in the range 0 to 16777214.<br>The default metric value is 10. The value used is specific to the protocol. |
| *<1-2>* | External metric type for default routes, either OSPF External Type 1 or Type 2 metrics. Enter the value 1 or 2. |
| `route-map` | Specifies to use a specific route-map. |
| *<route-map>* | The route-map name. It is a string comprised of any characters, numbers or symbols. |

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# default-information originate always
metric 23 metric-type 2 route-map myinfo
```

**Related commands** route-map

# default-metric (OSPF)

**Overview** This command sets default metric values for the OSPF routing protocol.

The **no** variant of this command returns OSPF to using built-in, automatic metric translations, as appropriate for each routing protocol.

**Syntax**

```
default-metric <1-16777214>
no default-metric [<1-16777214>]
```

| Parameter | Description |
|---|---|
| *<1-16777214>* | Default metric value appropriate for the specified routing protocol. |

**Mode** Router Configuration

**Usage notes** A default metric facilitates redistributing routes even with incompatible metrics. If the metrics do not convert, the default metric provides an alternative and enables the redistribution to continue. The effect of this command is that OSPF will use the same metric value for **all** redistributed routes. Use this command in conjunction with the redistribute (OSPF) command.

**Examples**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# default-metric 100
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no default-metric
```

**Related commands** redistribute (OSPF)

# distance (OSPF)

**Overview** This command sets the administrative distance for OSPF routes based on the route type. Your device uses this value to select between two or more routes to the same destination from two different routing protocols. The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). See the Route_Selection Feature Overview and Configuration Guide for more information.

Use the command **distance ospf** to set the distance for an entire category of OSPF routes, rather than the specific routes that pass an access list.

Use the command **distance <1-255>**, with no other parameter, to set the same distance for all OSPF route types.

The **no** variant of this command sets the administrative distance for all OSPF routes to the default of 110.

**Syntax**

```
distance <1-255>
distance ospf {external <1-255>|inter-area <1-255>|intra-area <1-255>}
no distance {ospf|<1-255>}
```

| Parameter | Description |
|---|---|
| *<1-255>* | Specify the Administrative Distance value for OSPF routes. |
| `external` | Sets the distance for routes from other routing domains, learned by redistribution. Specify an OSPF external distance in the range *<1-255>*. |
| `inter-area` | Sets the distance for all routes from one area to another area. Specify an OSPF inter-area distance in the range *<1-255>*. |
| `intra-area` | Sets the distance for all routes within an area. Specify an OSPF intra-area distance in the range *<1-255>*. |

**Default** The default OSPF administrative distance is 110. The default Administrative Distance for each type of route (intra, inter, or external) is 110.

**Mode** Router Configuration

**Usage notes** The administrative distance rates the trustworthiness of a routing information source. The distance could be any integer from 0 to 255. A higher distance value indicates a lower trust rating. For example, an administrative distance of 255 indicates that the routing information source cannot be trusted and should be ignored.

Use this command to set the distance for an entire group of routes, rather than a specific route that passes an access list.

**Examples** To set the following administrative distances for route types in OSPF 100:

- 20 for inter-area routes

- 10 for intra-area routes
- 40 for external routes

use the commands:

```
awplus(config)# router ospf 100
awplus(config-router)# distance ospf inter-area 20 intra-area
10 external 40
```

To set the administrative distance for all routes in OSPF 100 back to the default of 110, use the commands:

```
awplus(config)# router ospf 100
awplus(config-router)# no distance ospf
```

# distribute-list (OSPF)

**Overview** Use this command to apply filtering to the transfer of routing information between OSPF and the IP route table. You can apply filtering from OSPF to the IP route table using an **in** distribute-list.

The effect of an **in** filter is that some route information that OSPF has learned from LSA updates will not be installed into the IP route table.

The entities that are used to perform filtering are route-maps, which match on certain attributes in the routes that are being transferred.

For information about route maps, see the Routemaps Feature Overview and Configuration Guide.

The **no** variant of this command removes the configured distribute-list command entry.

**Syntax**

```
distribute-list route-map <route-map-name> in
no distribute-list route-map <route-map-name> in
```

| Parameter | Description |
|---|---|
| *<route-map-name>* | The name of the route-map. |
| in | Indicates that this applies to incoming advertised routes. |

**Mode** Router Configuration

**Usage notes** The **in** distribute-lists carry out the following route filtering activities:

- The **in** distribute list is applied to the process of installing OSPF routes into the IP route table. The SPF calculations generate a set of routes calculated from the LSA database. By default, all of these routes become OSPF's candidate routes for inclusion into the IP route table.
- An **in** distribute-list can be used to control whether or not certain routes generated by the SPF calculation are included into the set of candidates for inclusion into the IP route table. Those routes that match **deny** entries in the distribute-list will not be considered for inclusion into the IP route table.

**Examples** The following example shows the installation of OSPF routes into the IP route table with route map "mymap1" applied, which will process routes that have been tagged 100:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match tag 100
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# distribute-list route-map mymap1 in
```

Use the following commands to configure a route-map to specifically prevent OSPF from offering 192.168.1.0/24 as a candidate for inclusion into the IP route table:

```
awplus# configure terminal
awplus(config)# ip prefix-list 100 seq 5 permit 192.168.1.0/24
awplus(config)# route-map 100 deny 10
awplus(config-route-map)# match ip address prefix-list 100
awplus(config-route-map)# exit
awplus(config)# route-map 100 permit 20
awplus(config-router)# router ospf 1
awplus(config-router)# distribute-list route-map 100 in
```

**Related commands**

match interface

redistribute (OSPF)

route-map

# enable db-summary-opt

**Overview** This command enables OSPF database summary list optimization.

The **no** variant of this command disables database summary list optimization.

**Syntax**

```
enable db-summary-opt
no enable db-summary-opt
```

**Default** The default setting is disabled.

**Mode** Router Configuration

**Usage** When this feature is enabled, the database exchange process is optimized by removing the LSA from the database summary list for the neighbor, if the LSA instance in the database summary list is the same as, or less recent than, the listed LSA in the database description packet received from the neighbor.

**Examples** To enable OSPF database summary list optimization, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf
awplus(config-router)# enable db-summary-opt
```

To disable OSPF database summary list optimization, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf
awplus(config-router)# no enable db-summary-opt
```

**Validation Commands** show running-config

# host area

**Overview** This command configures a stub host entry belonging to a particular area. You can use this command to advertise specific host routes in the router-LSA as stub link. Since stub host belongs to the specified router, specifying cost is optional.

The **no** variant of this command removes the host area configuration.

**Syntax**

```
host <ip-address> area <area-id> [cost <0-65535>]
no host <ip-address> area <area-id> [cost <0-65535>]
```

| Parameter | Description |
|---|---|
| *<ip-address>* | The IPv4 address of the host, in dotted decimal notation. |
| *<area-id>* | The OSPF area ID of the transit area that configuring the stub host entry for. Use one of the following formats:<br>• dotted decimal format, e.g. 0.0.1.2.<br>• normal decimal format in the range <0-4294967295>, e.g. 258. |
| `cost <0-65535>` | The cost for the stub host entry. |

**Default** By default, no host entry is configured.

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# host 172.16.10.100 area 1
awplus(config-router)# host 172.16.10.101 area 2 cost 10
```

# ip ospf authentication

**Overview** This command sets the authentication method used when sending and receiving OSPF packets on the current interface. The default is to use no authentication. If no authentication method is specified in this command, then plain text authentication will be used.

The **no** variant of this command disables the authentication.

**Syntax**

```
ip ospf [<ip-address>] authentication [message-digest|null]
no ip ospf [<ip-address>] authentication
```

| Parameter | Description |
|---|---|
| *<ip-address>* | The IP address of the interface. |
| `message-digest` | Use the message digest authentication. |
| `null` | Use no authentication. This overrides the password or message digest authentication of the interface. |

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** Use the ip ospf authentication-key command to specify a simple text password. Use the ip ospf message-digest-key command to specify an MD5 key.

**Example** To configure PPP interface ppp0 to have no authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip ospf authentication null
```

This will override any text or MD5 authentication configured on this interface.

**Related commands**

ip ospf authentication-key

area authentication

ip ospf message-digest-key

# ip ospf authentication-key

**Overview** This command specifies an OSPF authentication password for the neighboring routers.

The **no** variant of this command removes the OSPF authentication password.

**Syntax**

```
ip ospf [<ip-address>] authentication-key <pswd-long>
no ip ospf [<ip-address>] authentication-key
```

| Parameter | Description |
|---|---|
| *<ip-address>* | The IPv4 address of the interface, in dotted decimal notation. |
| *<pswd-long>* | The authentication password.<br>The string you enter at the end of the command line will be used. |

**Default** No password specified

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** This command creates a password (key) that is inserted into the OSPF header when AlliedWare Plus™ software originates routing protocol packets. Assign a separate password to each network for different interfaces. All neighboring routers on the same network with the same password exchange OSPF routing data.

The key can be used only when authentication is enabled for an area. Use the **area authentication** command to enable authentication.

Simple password authentication allows a password to be configured for each area. Configure the routers in the same routing domain with the same password.

**Example** To turn on authentication in area 0 and then create an authentication key named ‘very secure password’ on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# network 10.10.10.0/24 area 0
awplus(config-router)# area 0 authentication
awplus(config-router)# exit
awplus(config)# interface ppp0
awplus(config-if)# ip ospf 3.3.3.3 authentication-key very
secure password
```

**Related commands**

area authentication

ip ospf authentication

# ip ospf cost

**Overview** This command explicitly specifies the cost of the link-state metric in a router-LSA.

The **no** variant of this command resets the interface cost to the default.

**Syntax**

```
ip ospf [<ip-address>] cost <1-65535>
no ip ospf [<ip-address>] cost
```

| Parameter | Description |
|---|---|
| *<ip-address>* | The IPv4 address of the interface, in dotted decimal notation. |
| *<1-65535>* | The link-state metric. |

**Default** No static value. The OSPF cost is automatically calculated by using the auto-cost reference bandwidth command.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** This command explicitly sets a user specified cost of sending packets out the interface. Using this command overrides the cost value calculated automatically with the auto-cost reference bandwidth feature.

The interface cost indicates the overhead required to send packets across a certain interface. This cost is stated in the Router-LSA's link. Typically, the cost is inversely proportional to the bandwidth of an interface. By default, the cost of an interface is calculated according to the following formula:

- reference bandwidth/interface bandwidth

Use the **ip ospf cost** command to set the interface cost manually.

**Example** To set the OSPF cost to 10 on the PPP interface ppp0 for IP address 10.10.10.50, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip ospf 10.10.10.50 cost 10
```

**Related commands** show ip ospf interface

auto-cost reference bandwidth

# ip ospf database-filter

**Overview** This command turns on the LSA database-filter for a particular interface.

The **no** variant of this command turns off the LSA database-filter.

**Syntax**

```
ip ospf [<ip-address>] database-filter all out
no ip ospf [<ip-address>] database-filter
```

| Parameter | Description |
|---|---|
| *<ip-address>* | The IPv4 address of the interface, in dotted decimal notation. |

**Default** All outgoing LSAs are flooded to the interface.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** OSPF floods new LSAs over all interfaces in an area, except the interface on which the LSA arrives. This redundancy ensures robust flooding. However, too much redundancy can waste bandwidth and might lead to excessive link and CPU usage in certain topologies, resulting in destabilizing the network. To avoid this, use the **ip ospf database-filter** command to block flooding of LSAs over specified interfaces.

**Example** To stop flooding new LSAs on the PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if# ip ospf database-filter all out
```

# ip ospf dead-interval

**Overview** This command sets the interval during which no hello packets are received and after which a neighbor is declared dead.

The dead-interval is the amount of time that OSPF waits to receive an OSPF hello packet from the neighbor before declaring the neighbor is down. This value is advertised in the router's hello packets. It must be a multiple of the hello-interval and be the same for all routers on a specific network.

The **no** variant of this command returns the interval to the default of 40 seconds. If you have configured this command specifying the IP address of the interface and want to remove the configuration, specify the IP address ( **no ip ospf**<*ip-address*> **dead-interval**).

**Syntax**

```
ip ospf [<ip-address>] dead-interval <1-65535>
no ip ospf [<ip-address>] dead-interval
```

| Parameter | Description |
|---|---|
| *<ip-address>* | The IPv4 address of the interface, in dotted decimal notation. |
| *<1-65535>* | The interval in seconds.<br>Default: 40 |

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Example** To set the dead-interval to 10 seconds on the PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip ospf dead-interval 10
```

**Related commands**

ip ospf hello-interval

show ip ospf interface

# ip ospf disable all

**Overview** This command completely disables OSPF packet processing on an interface. It overrides the network area command and disables the processing of packets on the specific interface.

Use the **no** variant of this command to restore OSPF packet processing on a selected interface.

**Syntax**

```
ip ospf disable all
no ip ospf disable all
```

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Example** To disable OSPF packet processing on the PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip ospf disable all
```

# ip ospf hello-interval

**Overview** This command specifies the interval between hello packets.

The hello-interval is advertised in the hello packets. Configure the same hello-interval for all routers on a specific network. A shorter hello interval ensures faster detection of topological changes, but results in more routing traffic.

The **no** variant of this command returns the interval to the default of 10 seconds.

**Syntax**

```
ip ospf [<ip-address>] hello-interval <1-65535>
no ip ospf [<ip-address>] hello-interval
```

| Parameter | Description |
|---|---|
| *<ip-address>* | The IP address of the interface, in dotted decimal notation. |
| *<1-65535>* | The interval in seconds.<br>Default: 10 |

**Default** 10 seconds

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Example** To set the hello-interval to 3 seconds on the PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip ospf hello-interval 3
```

**Related commands**

ip ospf dead-interval

show ip ospf interface

# ip ospf message-digest-key

**Overview** This command registers an MD5 key for OSPF MD5 authentication.

Message Digest Authentication is a cryptographic authentication. A key (password) and key-id are configured on each router. The router uses an algorithm based on the OSPF packet, the key, and the key-id to generate a message digest that gets appended to the packet.

The **no** variant of this command removes the MD5 key.

**Syntax**

```
ip ospf [<ip-address>] message-digest-key <key-id> md5
<pswd-long>
```

```
no ip ospf [<ip-address>] message-digest-key <key-id>
```

| Parameter | Description |
|---|---|
| *<ip-address>* | The IPv4 address of the interface, in dotted decimal notation. |
| *<key-id>* | A key ID number specified as an integer between 1 and 255. |
| `md5` | Use the MD5 algorithm. |
| *<pswd-long>* | The OSPF password. This is a string of 1 to 16 characters including spaces. |

**Default** No MD5 key registered

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** Use this command for uninterrupted transitions between passwords. It allows you to add a new key without having to delete the existing key. While multiple keys exist, all OSPF packets will be transmitted in duplicate; one copy of the packet will be transmitted for each of the current keys. This is helpful for administrators who want to change the OSPF password without disrupting communication. The system begins a rollover process until all the neighbors have adopted the new password. This allows neighboring routers to continue communication while the network administrator is updating them with a new password. The router will stop sending duplicate packets once it detects that all of its neighbors have adopted the new password.

Maintain only one password per interface, removing the old password whenever you add a new one. This will prevent the local system from continuing to communicate with the system that is using the old password. Removing the old password also reduces overhead during rollover. All neighboring routers on the same network must have the same password value to enable exchange of OSPF routing data.

**Examples** To configure OSPF authentication on the PPP interface ppp0, with a key of 'yourpass', use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip ospf authentication message-digest
awplus(config-if)# ip ospf message-digest-key 1 md5 yourpass
```

# ip ospf mtu

**Overview** This command sets the MTU size for OSPF. Whenever OSPF constructs packets, it uses the interface MTU size as Maximum IP packet size. This command forces OSPF to use the specified value, instead of the actual interface MTU size.

Use the **no** variant of this command to return the MTU size to the default.

**Syntax**

```
ip ospf mtu <mtu-size>
no ip ospf mtu
```

| Parameter | Description |
|---|---|
| *<mtu-size>* | <576-65535> The MTU size in bytes. |

**Default** OSPF uses the interface MTU derived from the interface

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** This command allows an administrator to configure the MTU size recognized by the OSPF protocol. It does not configure the MTU settings on the interface.

This command can be useful to ensure the OSPF neighbor relationship can fully establish via a network link, where the neighboring devices may have mismatched interface MTUs.

**Example** To change the OSPF MTU to 1446 on the PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip ospf mtu 1446
```

# ip ospf mtu-ignore

**Overview** Use this command to configure OSPF so that OSPF does not check the MTU size during DD (Database Description) exchange.

Use the **no** variant of this command to make sure that OSPF checks the MTU size during DD exchange.

**Syntax**

```
ip ospf [<ip-address>] mtu-ignore
no ip ospf [<ip-address>] mtu-ignore
```

| Parameter | Description |
|---|---|
| *<ip-address>* | The IPv4 address of the interface, in dotted decimal notation. |

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** By default, during the DD exchange process, OSPF checks the MTU size described in the DD packets received from the neighbor. If the MTU size does not match the interface MTU, the neighbor adjacency is not established. Using this command makes OSPF ignore this check and allows establishing of adjacency regardless of MTU size in the DD packet.

**Example** To stop OSPF from checking the MTU size during DD exchange on the PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip ospf mtu-ignore
```

# ip ospf network

**Overview** This command configures the OSPF network type to a type different from the default for the particular interface.

The **no** variant of this command returns the network type to the default for the particular interface.

**Syntax**

```
ip ospf network {broadcast|non-broadcast|point-to-point|
point-to-multipoint}
```

```
no ip ospf network
```

| Parameter | Description |
|---|---|
| `broadcast` | Sets the network type to broadcast. |
| `non-broadcast` | Sets the network type to NBMA. |
| `point-to-multipoint` | Sets the network type to point-to-multipoint. |
| `point-to-point` | Sets the network type to point-to-point. |

**Default** The default is the default type for the interface, e.g broadcast for VLANs.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** This command forces the interface network type to be the specified type. Depending on the network type, OSPF changes the behavior of the packet transmission and the link description in LSAs.

**Example** The following example shows setting the network type to point-to-point on the interface eth1:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip ospf network point-to-point
```

# ip ospf priority

**Overview** This command sets the router priority, which is a parameter used in the election of the designated router for the network.

The **no** variant of this command returns the router priority to the default of 1.

**Syntax**

```
ip ospf [<ip-address>] priority <priority>
no ip ospf [<ip-address>] priority
```

| Parameter | Description |
|---|---|
| *<ip-address>* | The IP address of the interface. |
| *<priority>* | *<0-255>* The Router Priority of the interface. |

**Default** 1

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** Set the priority to help determine the OSPF Designated Router (DR) for a network. If two routers attempt to become the DR, the router with the higher router priority becomes the DR. If the router priority is the same for two routers, the router with the higher router ID takes precedence.

Only routers with nonzero router priority values are eligible to become the designated or backup designated router.

Configure router priority for multi-access networks only and not for point-to-point networks.

**Example** To set the OSPF priority value to 3 on the PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip ospf priority 3
```

**Related commands** ip ospf network

# ip ospf resync-timeout

**Overview** Use this command to set the interval after which adjacency is reset if out-of-band resynchronization has not occurred. The interval period starts from the time a restart signal is received from a neighbor.

Use the **no** variant of this command to return to the default.

**Syntax**

```
ip ospf [<ip-address>] resync-timeout <1-65535>
no ip ospf [<ip-address>] resync-timeout
```

| Parameter | Description |
|---|---|
| *<ip-address>* | The IP address of the interface. |
| *<1-65535>* | The resynchronization timeout value of the interface in seconds. |

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Example** To set the OSPF resynchronization timeout value to 65 seconds on the PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip ospf resync-timeout 65
```

# ip ospf retransmit-interval

**Overview** Use this command to specify the time between link-state advertisement (LSA) retransmissions for adjacencies belonging to the interface.

Use the **no** variant of this command to return to the default of 5 seconds.

**Syntax**

```
ip ospf [<ip-address>] retransmit-interval <1-65535>
no ip ospf [<ip-address>] retransmit-interval
```

| Parameter | Description |
|---|---|
| *<ip-address>* | The IP address of the interface. |
| *<1-65535>* | The interval in seconds. |

**Default** 5 seconds

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** After sending an LSA to a neighbor, the router keeps the LSA until it receives an acknowledgment. In case the router does not receive an acknowledgment during the set time (the retransmit interval value) it retransmits the LSA. Set the retransmission interval value conservatively to avoid needless retransmission. The interval should be greater than the expected round-trip delay between two routers.

**Example** To set the retransmit interval to 6 seconds on the PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip ospf retransmit-interval 6
```

# ip ospf transmit-delay

**Overview** Use this command to set the estimated time it takes to transmit a link-state-update packet on the interface.

Use the **no** variant of this command to return to the default of 1 second.

**Syntax**

```
ip ospf [<ip-address>] transmit-delay <1-65535>
no ip ospf [<ip-address>] transmit-delay
```

| Parameter | Description |
|---|---|
| *<ip-address>* | The IP address of the interface. |
| *<1-65535>* | The time, in seconds, to transmit a link-state update. |

**Default** 1 second

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** The transmit delay value adds a specified time to the age field of an update. If the delay is not added, the time in which the LSA transmits over the link is not considered. This command is especially useful for low speed links. Add transmission and propagation delays when setting the transmit delay value.

**Example** To set the OSPF transmit delay time to 3 seconds on the PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip ospf transmit-delay 3
```

# max-concurrent-dd

**Overview** Use this command to set the limit for the number of Database Descriptors (DD) that can be processed concurrently.

Use the **no** variant of this command to reset the limit for the number of Database Descriptors (DD) that can be processed concurrently.

**Syntax**

```
max-concurrent-dd <1-65535>
no max-concurrent-dd
```

| Parameter | Description |
|---|---|
| *<1-65535>* | Specify the number of DD processes. |

**Mode** Router Configuration

**Usage** This command is useful when a router's performance is affected from simultaneously bringing up several OSPF adjacencies. This command limits the maximum number of DD exchanges that can occur concurrently per OSPF instance, thus allowing for all of the adjacencies to come up.

**Example** The following example sets the max-concurrent-dd value to 4, so that only 4 DD exchanges will be processed at a time.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router# max-concurrent-dd 4
```

# maximum-area

**Overview** Use this command to set the maximum number of OSPF areas.

Use the **no** variant of this command to set the maximum number of OSPF areas to the default.

**Syntax**

```
maximum-area <1-4294967294>
no maximum-area
```

| Parameter | Description |
|---|---|
| *<1-4294967294>* | Specify the maximum number of OSPF areas. |

**Default** The default for the maximum number of OSPF areas is 4294967294.

**Mode** Router Configuration

**Usage notes** Use this command in router OSPF mode to specify the maximum number of OSPF areas.

**Examples** The following example sets the maximum number of OSPF areas to 2:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# maximum-area 2
```

The following example removes the maximum number of OSPF areas and resets to default:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no maximum-area
```

# neighbor (OSPF)

**Overview** Use this command to inform the router of other neighboring routers that are connected to the same NBMA network.

Use the **no** variant of this command to remove a configuration.

**Syntax**

```
neighbor <ip-address> [<cost>]{<priority>|<poll-interval>}
no neighbor <ip-address> [<cost>]{<priority>|<poll-interval>}
```

| Parameter | Description |
|---|---|
| *<ip-address>* | Specifies the interface IP address of the neighbor. |
| *<priority>* | *priority <0-255>*<br>Specifies the router priority value of the non-broadcast neighbor associated with the specified IP address. The default is 0. This keyword does not apply to point-to-multipoint interfaces. |
| *<poll-interval>* | *poll-interval <1-2147483647>*<br>Dead neighbor polling interval in seconds. It is recommended to set this value much higher than the hello interval. The default is 120 seconds. |
| *<cost>* | *cost <1-65535>*<br>Specifies the link-state metric to this neighbor. |

**Mode** Router Configuration

**Usage** To configure a neighbor on an NBMA network manually, use the `neighbor` command and include one neighbor entry for each known nonbroadcast network neighbor. The IP address used in this command is the neighbor's primary IP address on the interface where that neighbor connects to the NBMA network.

The poll interval is the reduced rate at which routers continue to send hello packets, when a neighboring router has become inactive. Set the poll interval to be much larger than hello interval.

**Examples** This example shows a neighbor configured with a priority value, poll interval time, and cost.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# neighbor 1.2.3.4 priority 1
poll-interval 90
awplus(config-router)# neighbor 1.2.3.4 cost 15
```

# network area

**Overview** Use this command to enable OSPF routing with a specified Area ID on any interfaces with IP addresses that match the specified network address.

Use the **no** variant of this command to disable OSPF routing on the interfaces.

**Syntax**

```
network <network-address> area <area-id>
no network <network-address> area <area-id>
```

| Parameter | | Description |
|---|---|---|
| *<network-address>* | | *{<ip-network/m>\|<ip-addr> <reverse-mask>}* |
| | *<ip-network/m>* | IP address of the network, entered in the form A.B.C.D/M. Dotted decimal notation followed by a forward slash, and then the subnet mask length. |
| | *<ip-addr> <reverse-mask>* | IPv4 network address, entered in the form A.B.C.D, followed by the mask. Enter the mask as a wildcard, or reverse, mask (e.g. 0.0.0.255). Note that the device displays the mask as a subnet mask in the running configuration. |
| *<area-id>* | | *{<ip-addr>\|<0-4294967295>}* |
| | *<ip-addr>* | OSPF Area ID in IPv4 address format, in the form A.B.C.D. |
| | *<0-4294967295>* | OSPF Area ID as 4 octets unsigned integer value. |

**Default** No **network area** is configured by default.

**Mode** Router Configuration

**Usage notes** OSPF routing can be enabled per IPv4 subnet. The network address can be defined using either the prefix length or a wild card mask. A wild card mask is comprised of consecutive `0's` as network bits and consecutive `1's` as host bits.

**Examples** The following commands show the use of the **network area** command with OSPF multiple instance support disabled:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# network 10.0.0.0/8 area 3
awplus(config-router)# network 10.0.0.0/8 area 1.1.1.1
```

The following commands disable OSPF routing with Area ID 3 on all interfaces:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no network 10.0.0.0/8 area3
```

# ospf abr-type

**Overview** Use this command to set an OSPF Area Border Router (ABR) type.

Use the **no** variant of this command to revert the ABR type to the default setting (Cisco).

**Syntax**

```
ospf abr-type {cisco|ibm|standard}
no ospf abr-type {cisco|ibm|standard}
```

| Parameter | Description |
|---|---|
| `cisco` | Specifies an alternative ABR using Cisco implementation (RFC 3509). This is the default ABR type. |
| `ibm` | Specifies an alternative ABR using IBM implementation (RFC 3509). |
| `standard` | Specifies a standard behavior ABR (RFC 2328). |

**Default** ABR type `Cisco`

**Mode** Router Configuration

**Usage** Specifying the ABR type allows better interoperation between different implementations. This command is specially useful in a multi-vendor environment. The different ABR types are:

- Cisco ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and one of them is the backbone area.
- IBM ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and the backbone area is configured. In this case the configured backbone need not be actively connected.
- Standard ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached to it.

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# ospf abr-type ibm
```

# ospf restart grace-period

**Overview** Use this command to configure the grace-period for restarting OSPF routing.

Use the **no** variant of this command to revert to the default grace-period.

**Syntax**

```
ospf restart grace-period <1-1800>
no ospf restart grace-period
```

| Parameter | Description |
|---|---|
| *<1-1800>* | Specifies the grace period in seconds. |

**Default** In the AlliedWare Plus™ OSPF implementation, the default OSPF grace-period is 180 seconds.

**Mode** Global Configuration

**Usage notes** Use this command to enable the OSPF Graceful Restart feature and set the restart grace-period. Changes from the default restart grace-period are displayed in the running- config. The restart grace-period is not displayed in the running-config if it has been reset to the default using the **no** variant of this command.

**Example** To set the OSPF restart grace-period to 250 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ospf restart grace-period 250
```

To reset the OSPF restart grace-period to the default (180 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no ospf restart grace-period
```

**Validation Commands** show running-config

**Related commands** ospf restart helper

restart ospf graceful

# ospf restart helper

**Overview** Use this command to configure the **helper** behavior for the OSPF Graceful Restart feature.

Use the **no** variant of this command to revert to the default grace-period.

**Syntax**

```
ospf restart helper {max-grace-period <grace-period>|only-reload|only-upgrade}
ospf restart helper {never router-id <router-id>}
no ospf restart helper [max-grace-period]
```

| Parameter | Description |
|---|---|
| `max-grace-period` | Specify help if received grace-period is less than a specified value. |
| *<grace-period>* | Maximum grace period accepted in seconds in range *<1-1800>*. |
| `never` | Specify the local policy to never to act as a helper for this feature. |
| `only-reload` | Specify help only on software reloads not software upgrades. |
| `only-upgrade` | Specify help only on software upgrades not software reloads. |
| `router-id` | Enter the router-id keyword to specify the OSPF Router ID that is never to act as a helper for the OSPF Graceful Restart feature. |
| *<router-id>* | *<A.B.C.D>*<br>Specify the OSPF Router ID in dotted decimal format A.B.C.D |

**Default** In the AlliedWare Plus™ OSPF implementation, the default OSPF grace-period is 180 seconds.

**Mode** Global Configuration

**Usage** The **ospf restart helper** command requires at least one parameter, but you may use more than one in the same command (excluding parameter **never**).

The **no** version of this command turns off the OSPF restart helper, while the **no ospf restart helper max-grace-period** command resets the max-grace-period, rather than the helper policy itself.

**Example**

```
awplus# configure terminal
awplus(config)# ospf restart helper only-reload
awplus# configure terminal
awplus(config)# ospf restart helper never router-id 10.10.10.1
awplus# configure terminal
awplus(config)# no ospf restart helper max-grace-period
```

**Related commands**

ospf restart grace-period

restart ospf graceful

# ospf router-id

**Overview** Use this command to specify a router ID for the OSPF process.

Use the **no** variant of this command to disable this function.

**Syntax**

```
ospf router-id <ip-address>
no ospf router-id
```

| Parameter | Description |
|---|---|
| *<ip-address>* | Specifies the router ID in IPv4 address format. |

**Mode** Router Configuration

**Usage** Configure each router with a unique router-id. In an OSPF router process that has active neighbors, a new router-id takes effect at the next reload or when you restart OSPF manually.

**Example** The following example shows a specified router ID 2.3.4.5.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# ospf router-id 2.3.4.5
```

**Related commands** show ip ospf

# overflow database

**Overview** Use this command to limit the maximum number of Link State Advertisements (LSAs) that can be supported by the current OSPF instance.

Use the **no** variant of this command to have no limit on the maximum number of LSAs.

**Syntax**

```
overflow database <0-4294967294> {hard|soft}
no overflow database
```

| Parameter | Description |
|---|---|
| *<0-4294967294>* | The maximum number of LSAs. |
| `hard` | Shutdown occurs if the number of LSAs exceeds the specified value. |
| `soft` | Warning message appears if the number of LSAs exceeds the specified value. |

**Mode** Router Configuration

**Usage** Use **hard** with this command if a shutdown is required if the number of LSAs exceeds the specified number. Use **soft** with this command if a shutdown is not required, but a warning message is required, if the number of LSAs exceeds the specified number.

**Example** The following example shows setting the database overflow to 500, and a shutdown to occur, if the number of LSAs exceeds 500.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# overflow database 500 hard
```

# overflow database external

**Overview** Use this command to configure the size of the external database and the time the router waits before it tries to exit the overflow state.

Use the **no** variant of this command to revert to default.

**Syntax**

```
overflow database external <max-lsas> <recover-time>
no overflow database external
```

| Parameter | Description |
|---|---|
| *<max-lsas>* | *<0-2147483647>* The maximum number of Link State Advertisements (LSAs). Note that this value should be the same on all routers in the AS. |
| *<recover-time>* | *<0-65535>* the number of seconds the router waits before trying to exit the database overflow state. If this parameter is 0, router exits the overflow state only after an explicit administrator command. |

**Mode** Router Configuration

**Usage** Use this command to limit the number of AS-external-LSAs a router can receive, once it is in the wait state. It takes the number of seconds specified as the *<recover-time>* to recover from this state.

**Example** The following example shows setting the maximum number of LSAs to 5 and the time to recover from overflow state to be 3:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# overflow database external 50 3
```

# passive-interface (OSPF)

**Overview** Use this command to suppress the sending of Hello packets on all interfaces, or on a specified interface. If you use the **passive-interface** command without the optional parameters then all interfaces are put into passive mode.

Use the **no** variant of this command to allow the sending of Hello packets on all interfaces, or on the specified interface. If you use the **no** variant of this command without the optional parameters then all interfaces are removed from passive mode.

**Syntax**

```
passive-interface [<interface>] [<ip-address>]
no passive-interface [<interface>] [<ip-address>]
```

| Parameter | Description |
|---|---|
| *<interface>* | The name of the interface. |
| *<ip-address>* | IP address of the interface, entered in the form A.B.C.D. |

**Mode** Router Configuration

**Usage notes** Configure an interface to be passive if you wish its connected route to be treated as an OSPF route (rather than an AS-external route), but do not wish to actually exchange any OSPF packets via this interface.

**Examples** To configure passive interface mode on all interfaces, enter the following commands:

```
awplus(config)# router ospf 100
awplus(config-router)# passive-interface
```

To configure passive interface mode on the local loopback interface, enter the following commands:

```
awplus(config)# router ospf 100
awplus(config-router)# passive-interface lo
```

To remove passive interface mode on all interfaces, enter the following commands:

```
awplus(config)# router ospf 100
awplus(config-router)# no passive-interface
```

# redistribute (OSPF)

**Overview** Use this command to redistribute routes from other routing protocols, static routes and connected routes into an OSPF routing table.

Use the **no** variant of this command to disable this function.

**Syntax**

```
redistribute {bgp|connected|rip|static} {metric
<0-16777214>|metric-type {1|2}|route-map <name>|tag
<0-4294967295>}
```

```
no redistribute {bgp|connected|rip|static} {metric
<0-16777214>|metric-type {1|2}|route-map <name>|tag
<0-4294967295>}
```

| Parameter | Description |
|---|---|
| `bgp` | Specifies that this applies to the redistribution of BGP routes. |
| `connected` | Specifies that this applies to the redistribution of connected routes. |
| `rip` | Specifies that this applies to the redistribution of RIP routes. |
| `static` | Specifies that this applies to the redistribution of static routes. |
| `metric` | Specifies the external metric. |
| `metric-type` | Specifies the external metric-type. |
| `route-map` | Specifies name of the route-map. |
| `tag` | Specifies the external route tag. |

**Default** The default metric value for routes redistributed into OSPF is 20. The metric can also be defined using the set metric command for a route map. Note that a metric defined using the set metric command for a route map overrides a metric defined with this command.

**Mode** Router Configuration

**Usage notes** You use this command to inject routes, learned from other routing protocols, into the OSPF domain to generate AS-external-LSAs. If a route-map is configured by this command, then that route-map is used to control which routes are redistributed and can set metric and tag values on particular routes.

The metric, metric-type, and tag values specified on this command are applied to any redistributed routes that are not explicitly given a different metric, metric-type, or tag value by the route map.

See the OSPF Feature Overview and Configuration Guide for more information about metrics, and about behavior when configured in route maps.

Note that this command does not redistribute the default route. To redistribute the default route, use the default-information originate command.

**Example** The following example shows redistribution of BGP routes into OSPF routing table 100, with metric 12.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# redistribute bgp metric 12
```

The following example shows the configuration of a route-map named 'rmap2', which is then applied using the **redistribute route-map** command, so routes learned via a specified interface can be redistributed as type-1 external LSAs:

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 3
awplus(config-route-map)# match interface eth1
awplus(config-route-map)# set metric-type 1
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# redistribute rip route-map rmap2
```

Note that configuring a route-map and applying it with the **redistribute route-map** command allows you to filter which routes are distributed from another routing protocol (such as RIP). A route-map can also set the metric, tag, and metric-type of the redistributed routes.

**Related commands**

match interface

route-map

show ip ospf database external

# restart ospf graceful

**Overview** Use this command to force the OSPF process to restart, and optionally set the grace-period.

**Syntax**

```
restart ospf graceful [grace-period <1-1800>]
```

| Parameter | Description |
|---|---|
| `grace-period` | Specify the grace period. |
| *<1-1800>* | The grace period in seconds. |

**Default** In the AlliedWare Plus™ OSPF implementation, the default OSPF grace-period is 180 seconds.

**Mode** Privileged Exec

**Usage notes** After this command is executed, the OSPF process immediately shuts down. It notifies the system that OSPF has performed a graceful shutdown. Routes installed by OSPF are preserved until the grace-period expires.

When a **restart ospf graceful** command is issued, the OSPF configuration is reloaded from the last saved configuration. Ensure you first enter the command copy running-config startup-config.

**Example**

```
awplus# copy running-config startup-config
awplus# restart ospf graceful grace-period 200
```

**Related commands** ospf restart grace-period

ospf restart helper

# router ospf

**Overview** Use this command to enter Router Configuration mode to configure an OSPF routing process. You must specify the process ID with this command for multiple OSPF routing processes on the device.

Use the **no** variant of this command to terminate an OSPF routing process.

Use the **no** parameter with the **process-id** parameter, to terminate and delete a specific OSPF routing process. If no **process-id** is specified on the **no** variant of this command, then all OSPF routing processes are terminated, and all OSPF configuration is removed.

**Syntax**

```
router ospf [<process-id>]
no router ospf [<process-id>]
```

**Syntax (VRF-lite)**

```
router ospf [<process-id>] [<vrf-instance>]
no router ospf [<process-id>]
```

| Parameter | Description |
|---|---|
| *<process-id>* | A positive number from 1 to 65535, that is used to define a routing process. |
| *<vrf-instance>* | The VRF instance to be associated with the OSPF routing process. |

**Default** No routing process is defined by default.

**Mode** Global Configuration

**Usage notes** The process ID of OSPF is an optional parameter for the **no** variant of this command only. When removing all instances of OSPF, you do not need to specify each Process ID, but when removing particular instances of OSPF you must specify each Process ID to be removed.

When using VRF-lite, this command can be used to associate a process-id with a VRF instance that has been created using the ip vrf command.

**Example** To enter Router Configuration mode to configure an existing OSPF routing process `100`, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)#
```

**Example (VRF-lite)**

To enter Router Configuration mode to configure an existing OSPF routing process `100` for VRF instance `red`, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100 red
awplus(config-router)#
```

**Command changes**

Version 5.4.6-2.1: VRF-lite support added.

# router-id

**Overview** Use this command to specify a router ID for the OSPF process.

Use the **no** variant of this command to force OSPF to use the previous OSPF router-id behavior.

**Syntax**

```
router-id <ip-address>
no router-id
```

| Parameter | Description |
|---|---|
| *<ip-address>* | Specifies the router ID in IPv4 address format. |

**Mode** Router Configuration

**Usage** Configure each router with a unique router-id. In an OSPF router process that has active neighbors, a new router-id is used at the next reload or when you restart OSPF manually.

**Example** The following example shows a fixed router ID 10.10.10.60

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# router-id 10.10.10.60
```

**Related commands** show ip ospf

# show debugging ospf

**Overview** Use this command to see what debugging is turned on for OSPF.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

**Syntax**

```
show debugging ospf
```

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show debugging ospf
```

**Output** Figure 30-2: Example output from the **show debugging ospf** command

```
OSPF debugging status:
  OSPF packet Link State Update debugging is on
  OSPF all events debugging is on
```

# show ip ospf

**Overview** Use this command to display general information about all OSPF routing processes. Include the process ID parameter with this command to display information about specified instances.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip ospf
show ip ospf <process-id>
```

| Parameter | Description |
|---|---|
| *<process-id>* | *<0-65535>* The ID of the router process for which information will be displayed. If this parameter is included, only the information for the specified routing process is displayed. |

**Mode** User Exec and Privileged Exec

**Examples** To display general information about all OSPF routing processes, use the command:

```
awplus# show ip ospf
```

To display general information about OSPF routing process `100`, use the command:

```
awplus# show ip ospf 100
```

**Table 1:** Example output from the **show ip ospf** command

```
Route Licence: Route : Limit=0, Allocated=0, Visible=0, Internal=0
Route Licence: Breach: Current=0, Watermark=0
Routing Process "ospf 10" with ID 192.168.1.1
Process uptime is 10 hours 24 minutes
Process bound to VRF default
Conforms to RFC2328, and RFC1583 Compatibility flag is disabled
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Graceful Restart
SPF schedule delay min 0.500 secs, SPF schedule delay max 50.0 secs
Refresh timer 10 secs
Number of incomming current DD exchange neighbors 0/5
Number of outgoing current DD exchange neighbors 0/5
Number of external LSA 0. Checksum 0x000000
Number of opaque AS LSA 0. Checksum 0x000000
Number of non-default external LSA 0
```

**Table 1:** Example output from the **show ip ospf** command (cont.)

```
External LSA database is unlimited.
Number of LSA originated 0
Number of LSA received 0
Number of areas attached to this router: 2
   Area 0 (BACKBONE) (Inactive)
       Number of interfaces in this area is 0(0)
       Number of fully adjacent neighbors in this area is 0
       Area has no authentication
       SPF algorithm executed 0 times
       Number of LSA 0. Checksum 0x000000

   Area 1 (Inactive)
       Number of interfaces in this area is 0(0)
       Number of fully adjacent neighbors in this area is 0
       Number of fully adjacent virtual neighbors through this area is 0
       Area has no authentication
       SPF algorithm executed 0 times
       Number of LSA 0. Checksum 0x000000
```

**Table 2:** Example output from the **show ip ospf <process-id>** command

```
Routing Process "ospf 100" with ID 10.10.11.146
Process uptime is 0 minute
Conforms to RFC2328, and RFC1583Compatibility flag is disabled
Supports only single TOS(TOS0) routes
Supports opaque LSA
SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
Refresh timer 10 secs
Number of external LSA 0. Checksum Sum 0x0
Number of non-default external LSA 0
External LSA database is unlimited.
Number of areas attached to this router: 1
   Area 1
       Number of interfaces in this area is 1(1)
       Number of fully adjacent neighbors in this area is 0
       Number of fully adjacent virtual neighbors through this area is 0
       Area has no authentication
       SPF algorithm executed 0 times
       Number of LSA 1. Checksum Sum 0x00e3e2
```

**Table 3:** Parameters in the output of the **show ip ospf** command

| Output Parameter | | Meaning |
|---|---|---|
| `Route Licence: Route:` | `Limit` | The maximum number of OSPF routes which may be used for forwarding. |
| | `Allocated` | The current total number of OSPF routes allocated in the OSPF module. |
| | `Visible` | The current number of OSPF routes which may be used for forwarding. |
| | `Internal` | The number of OSPF internal routes used for calculating paths to ASBRs. |
| `Number of external LSA` | | The number of external link-state advertisements |
| `Number of opaque AS LSA` | | Number of opaque link-state advertisements |

**Related commands** router ospf

# show ip ospf border-routers

**Overview** Use this command to display the ABRs and ASBRs for all OSPF instances. Include the process ID parameter with this command to view data about specified instances.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip ospf border-routers
show ip ospf <process-id> border-routers
```

| Parameter | Description |
|---|---|
| *<process-id>* | *<0-65535>* The ID of the router process for which information will be displayed. |

**Mode** User Exec and Privileged Exec

**Examples** To display the ABRs and ASBRs for all OSPF instances, use the following command:

```
awplus# show ip ospf border-routers
```

**Output** Figure 30-3: Example output from the **show ip ospf border-routers** command

```
OSPF process 1 internal Routing Table
Codes: i - Intra-area route, I - Inter-area route
i 10.15.0.1 [10] via 10.10.0.1, eth1, ASBR, Area 0.0.0.0
...
```

# show ip ospf database

**Overview** Use this command to display a database summary for OSPF information. Include the process ID parameter with this command to display information about specified instances.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip ospf [<process-id>] database
[self-originate|max-age|adv router <adv-router-id>]
```

| Parameter | Description |
|---|---|
| *<process-id>* | *<0-65535>* The ID of the router process for which information will be displayed. |
| `self-originate` | Displays self-originated link states. |
| `max-age` | Displays LSAs in MaxAge list. It maintains the list of the all LSAs in the database which have reached the max-age which is 3600 seconds. |
| `adv-router` | Advertising Router LSA. |
| *<adv-router-id>* | The Advertising Router ID (usually entered in IPv4 address format A.B.C.D).<br>Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format. |

**Mode** User Exec and Privileged Exec

**Examples** To display the ABRs and ASBRs for all OSPF instances, use the command:

```
awplus# show ip ospf border-routers
```

To display the ABRs and ASBRs for the specific OSPF instance `721`, use the command:

```
awplus# show ip ospf 721 border-routers
```

**Output** Figure 30-4: Example output from the **show ip ospf database** command

```
       OSPF Router process 1 with ID (10.10.11.60)
                Router Link States (Area 0.0.0.1)
Link ID         ADV Router      Age  Seq#       CkSum  Link
count
10.10.11.60     10.10.11.60       32 0x80000002 0x472b 1
       OSPF Router process 100 with ID (10.10.11.60)
                Router Link States (Area 0.0.0.0)

```

# show ip ospf database asbr-summary

**Overview** Use this command to display information about the Autonomous System Boundary Router (ASBR) summary LSAs.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus"_Feature Overview and Configuration Guide.

**Syntax**

```
show ip ospf database asbr-summary [<ip-addr>]
[self-originate|adv-router <advrouter-ip-addr>]
```

| Parameter | Description |
|---|---|
| *<ip-addr>* | A link state ID, as an IP address. |
| `self-originate` | Displays self-originated link states. |
| *adv-router <advrouter-ip-addr>* | Displays all the LSAs of the specified router. |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip ospf database asbr-summary 1.2.3.4
self-originate
```

```
awplus# show ip ospf database asbr-summary self-originate
```

```
awplus# show ip ospf database asbr-summary 1.2.3.4 adv-router
2.3.4.5
```

# show ip ospf database external

**Overview** Use this command to display information about the external LSAs.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**
```
show ip ospf database external adv-router[<adv-router-id>]
[self-originate|adv-router<adv-router-id>]
```

| Parameter | Description |
|---|---|
| `adv-router` | Displays all the LSAs of the specified router. |
| `self-originate` | Displays self-originated link states. |
| *`<adv-router- id>`* | The Advertising Router ID (usually entered in IPv4 address format A.B.C.D).<br>Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format. |

**Mode** User Exec and Privileged Exec

**Examples**
```
awplus# show ip ospf database external 1.2.3.4 self-originate
awplus# show ip ospf database external self-originate
awplus# show ip ospf database external 1.2.3.4 adv-router
2.3.4.5
```

**Output** Figure 30-6: Example output from the **show ip ospf database external self-originate** command

```
      OSPF Router process 100 with ID (10.10.11.50)
                AS External Link States
  LS age: 298
  Options: 0x2 (*|-|-|-|-|-|E|-)
  LS Type: AS-external-LSA
  Link State ID: 10.10.100.0 (External Network Number)
  Advertising Router: 10.10.11.50
  LS Seq Number: 80000001
  Checksum: 0x7033
  Length: 36
  Network Mask: /24
        Metric Type: 2 (Larger than any link state path)
        TOS: 0
        Metric: 20
        Forward Address: 10.10.11.50
        External Route Tag: 0
```

**Output** Figure 30-7: Example output from the **show ip ospf database external adv-router** command

```
awplus#show ip ospf database external adv-router 1.1.1.1

                 AS External Link States
LS age: 273
Options: 0x2 (-|-|-|-|-|-|E|-)
LS Type: AS-external-LSA
Link State ID: 172.16.0.0 (External Network Number)
Advertising Router: 1.1.1.1
LS Seq Number: 80000004
Checksum: 0x02f8
Length: 36
Network Mask: /24
      Metric Type: 2 (Larger than any link state path)
      TOS: 0
      Metric: 20
      Forward Address: 0.0.0.0
      External Route Tag: 0
```

# show ip ospf database network

**Overview** Use this command to display information about the network LSAs.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip ospf database network [<adv-router-id>]
[self-originate|<adv-router-id>]
```

| Parameter | Description |
|---|---|
| *<adv-router-id>* | The router ID of the advertising router, in IPv4 address format. Note however, that this no longer represents a real address. |
| `self-originate` | Displays self-originated link states. |
| `adv-router` | Displays all the LSAs of the specified router. |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip ospf database network 1.2.3.4 self-originate
awplus# show ip ospf database network self-originate
awplus# show ip ospf database network 1.2.3.4 adv-router 2.3.4.5
```

**Output** Figure 30-8: Example output from the **show ip ospf database network** command

```
      OSPF Router process 200 with ID (192.30.30.2)
                Net Link States (Area 0.0.0.0)
  LS age: 1387
  Options: 0x2 (*|-|-|-|-|-|E|-)
  LS Type: network-LSA
  Link State ID: 192.10.10.9 (address of Designated Router)
  Advertising Router: 192.30.30.3

  Checksum: 0xe1b0
  Length: 32
  Network Mask: /24
        Attached Router: 192.20.20.1
        Attached Router: 192.30.30.3
      OSPF Router process 200 with ID (192.30.30.2)
                Net Link States (Area 0.0.0.0)
...
```

# show ip ospf database nssa-external

**Overview** Use this command to display information about the NSSA external LSAs.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip ospf database nssa-external [<ip-address>]
[self-originate|<advrouter>]
```

| Parameter | Description |
|---|---|
| *<advrouter>* | adv-router <ip-address> |
| adv-router | Displays all the LSAs of the specified router. |
| *<ip-address>* | A link state ID, as an IP address. |
| self-originate | Displays self-originated link states. |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip ospf database nssa-external 1.2.3.4
self-originate
```

```
awplus# show ip ospf database nssa-external self-originate
```

```
awplus# show ip ospf database nssa-external 1.2.3.4 adv-router
2.3.4.5
```

**Output** Figure 30-9: Example output from the **show ip ospf database nssa-external adv-router** command

```
      OSPF Router process 100 with ID (10.10.11.50)

        Metric Type: 2 (Larger than any link state path)
        TOS: 0
        Metric: 1
        NSSA: Forward Address: 0.0.0.0
        External Route Tag: 0
                 NSSA-external Link States (Area 0.0.0.1 [NSSA])
```

# show ip ospf database opaque-area

**Overview** Use this command to display information about the area-local (link state type 10) scope LSAs. Type-10 Opaque LSAs are not flooded beyond the borders of their associated area.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip ospf database opaque-area [<ip-address>]
[self-originate|<advrouter>]
```

| Parameter | Description |
|---|---|
| *<advrouter>* | adv-router <ip-address> |
| adv-router | Displays all the LSAs of the specified router. |
| *<ip-address>* | A link state ID, as an IP address. |
| self-originate | Displays self-originated link states. |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip ospf database opaque-area 1.2.3.4
self-originate
```

```
awplus# show ip ospf database opaque-area self-originate
```

```
awplus# show ip ospf database opaque-area 1.2.3.4 adv-router
2.3.4.5
```

**Output** Figure 30-10: Example output from the **show ip ospf database opaque-area** command

```
       OSPF Router process 100 with ID (10.10.11.50)
                Area-Local Opaque-LSA (Area 0.0.0.0)
  LS age: 262
  Options: 0x2 (*|-|-|-|-|-|E|-)
  LS Type: Area-Local Opaque-LSA
  Link State ID: 10.0.25.176 (Area-Local Opaque-Type/ID)
  Opaque Type: 10
  Opaque ID: 6576
  Advertising Router: 10.10.11.50
  LS Seq Number: 80000001
  Checksum: 0xb413
  Length: 26
```

# show ip ospf database opaque-as

**Overview** Use this command to display information about the link-state type 11 LSAs. This type of link-state denotes that the LSA is flooded throughout the Autonomous System (AS).

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip ospf database opaque-as [<ip-address>]
[self-originate|<advrouter>]
```

| Parameter | Description |
|---|---|
| *<advrouter>* | adv-router <ip-address> |
| adv-router | Displays all the LSAs of the specified router. |
| *<ip-address>* | A link state ID, as an IP address. |
| self-originate | Displays self-originated link states. |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip ospf database opaque-as 1.2.3.4 self-originate
awplus# show ip ospf database opaque-as self-originate
awplus# show ip ospf database opaque-as 1.2.3.4 adv-router
2.3.4.5
```

**Output** Figure 30-11: Example output from the **show ip ospf database opaque-as** command

```
       OSPF Router process 100 with ID (10.10.11.50)
                AS-Global Opaque-LSA
  LS age: 325
  Options: 0x2 (*|-|-|-|-|-|E|-)
  LS Type: AS-external Opaque-LSA
  Link State ID: 11.10.9.23 (AS-external Opaque-Type/ID)
  Opaque Type: 11
  Opaque ID: 657687
  Advertising Router: 10.10.11.50
  LS Seq Number: 80000001
  Checksum: 0xb018
  Length: 25
```

# show ip ospf database opaque-link

**Overview** Use this command to display information about the link-state type 9 LSAs. This type denotes a link-local scope. The LSAs are not flooded beyond the local network.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip ospf database opaque-link [<ip-address>]
[self-originate|<advrouter>]
```

| Parameter | Description |
|---|---|
| *<advrouter>* | adv-router <ip-address> |
| adv-router | Displays all the LSAs of the specified router. |
| *<ip-address>* | A link state ID, as an IP address. |
| self-originate | Displays self-originated link states. |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip ospf database opaque-link 1.2.3.4
self-originate
```

```
awplus# show ip ospf database opaque-link self-originate
```

```
awplus# show ip ospf database opaque-link 1.2.3.4 adv-router
2.3.4.5
```

**Output** Figure 30-12: Example output from the **show ip ospf database opaque-link** command

```
       OSPF Router process 100 with ID (10.10.11.50)
                Link-Local Opaque-LSA (Link hme0:10.10.10.50)
  LS age: 276
  Options: 0x2 (*|-|-|-|-|-|E|-)
  LS Type: Link-Local Opaque-LSA
  Link State ID: 10.0.220.247 (Link-Local Opaque-Type/ID)
  Opaque Type: 10
  Opaque ID: 56567
  Advertising Router: 10.10.11.50
  LS Seq Number: 80000001
  Checksum: 0x744e
  Length: 26
                Link-Local Opaque-LSA (Link hme1:10.10.11.50)
```

# show ip ospf database router

**Overview** Use this command to display information only about the router LSAs.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip ospf database router [<adv-router-id>
self-originate|<adv-router-id>]
```

| Parameter | Description |
|---|---|
| `adv-router` | Displays all the LSAs of the specified router. |
| `self-originate` | Displays self-originated link states. |
| *`<adv-router- id>`* | The router ID of the advertising router, in IPv4 address format. Note however, that this no longer represents a real address. |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip ospf database router 1.2.3.4 self-originate
awplus# show ip ospf database router self-originate
awplus# show ip ospf database router 1.2.3.4 adv-router 2.3.4.5
```

**Output** Figure 30-13: Example output from the **show ip ospf database router** command

```
       OSPF Router process 100 with ID (10.10.11.50)
                Router Link States (Area 0.0.0.0)
  LS age: 878
  Options: 0x2 (*|-|-|-|-|-|E|-)
  Flags: 0x3 : ABR ASBR
  LS Type: router-LSA
  Link State ID: 10.10.11.50
  Advertising Router: 10.10.11.50
  LS Seq Number: 80000004
  Checksum: 0xe39e

      Number of TOS metrics: 0
       TOS 0 Metric: 10
```

# show ip ospf database summary

**Overview** Use this command to display information about the summary LSAs.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip ospf database summary [<ip-address>]
[self-originate|<advrouter>]
```

| Parameter | Description |
|---|---|
| *<advrouter>* | adv-router <ip-address> |
| adv-router | Displays all the LSAs of the specified router. |
| *<ip-address>* | A link state ID, as an IP address. |
| self-originate | Displays self-originated link states. |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip ospf database summary 1.2.3.4 self-originate
awplus# show ip ospf database summary self-originate
awplus# show ip ospf database summary 1.2.3.4 adv-router 2.3.4.5
```

**Output** Figure 30-14: Example output from the **show ip ospf database summary** command

# show ip ospf interface

**Overview** Use this command to display interface information for OSPF.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

**Syntax**

```
show ip ospf interface [<interface-list>]
```

| Parameter | Description |
|---|---|
| *<interface-list>* | The interfaces to display information about. An interface-list can be:<br>• a PPP interface (e.g. ppp0)<br>• an Eth interface (e.g. eth1)<br>• an 802.1Q Ethernet sub-interface (e.g. eth1.10, where '10' is the VLAN ID specified by the **encapsulation dot1q** command)<br>• a VLAN (e.g. vlan2)<br>• a bridge interface (e.g. br0)<br>• a tunnel interface (e.g. tunnel0)<br>• a WWAN interface (e.g wwan0)<br>• the loopback interface (lo)<br>• a continuous range of interfaces, separated by a hyphen (e.g. ppp2-4)<br>• a comma-separated list (e.g. ppp0,ppp2-4). Do not mix interface types in a list. |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip ospf interface tunnel14
```

**Output** Figure 30-17: Example output from the **show ip ospf interface** command

```
awplus#show ip ospf interface
tunnel14 is up, line protocol is up
  Internet Address 192.168.100.5/30, Area 0.0.0.200, MTU 1438
  Interface state Point-To-Point
  Process ID 200, Router ID 10.255.255.1, Network Type POINTOPOINT, Cost: 1
  Transmit Delay is 1 sec, State Point-To-Point
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
    Hello due in 00:00:06
  Neighbor Count is 1, Adjacent neighbor count is 0
  Crypt Sequence Number is 237068
  Hello received 1211 sent 1259, DD received 9 sent 20
  LS-Req received 3 sent 2, LS-Upd received 19 sent 231
  LS-Ack received 218 sent 17, Discarded 0
```

# show ip ospf neighbor

**Overview** Use this command to display information on OSPF neighbors. Include the **ospf-id** parameter with this command to display information about specified instances.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip ospf [<ospf-id>] neighbor <neighbor-ip-addr> [detail]
show ip ospf [<ospf-id>] neighbor detail [all]
show ip ospf [<ospf-id>] neighbor [all]
show ip ospf [<ospf-id>] neighbor interface <ip-addr>
```

| Parameter | Description |
|---|---|
| *<ospf-id>* | <0-65535> The ID of the router process for which information will be displayed. |
| *<neighbor-ip-addr>* | The Neighbor ID, entered as an IP address. |
| `all` | Include downstatus neighbor. |
| `detail` | Detail of all neighbors. |
| *<ip-addr>* | IP address of the interface. |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip ospf neighbor detail
awplus# show ip ospf neighbor 1.2.3.4
awplus# show ip ospf neighbor interface 10.10.10.50 detail all
```

**Output** Note that before a device enters OSPF Graceful Restart it first informs its OSPF neighbors. In the **show** output, an * symbol beside the **Dead Time** parameter indicates that the device has been notified of a neighbor entering the graceful restart state.

Figure 30-18: Example output from the **show ip ospf neighbor** command

```
awplus#show ip ospf neighbor

OSPF process 200:
Neighbor ID     Pri   State           Dead Time   Address         Interface
192.168.100.22    1   Full/ -         00:00:32    192.168.100.18  tunnel16
...
```

Figure 30-19: Example output from the **show ip ospf <ospf-id> neighbor** command

```

OSPF process 200:
Neighbor ID     Pri   State           Dead Time   Address         Interface
192.168.100.22    1   Full/ -         00:00:32    192.168.100.18  tunnel16
```

Figure 30-20: Example output from the **show ip ospf neighbor detail** command

```
awplus#show ip ospf neighbor detail
 Neighbor 192.168.100.22, interface address 192.168.100.18
    In the area 0.0.0.200 via interface tunnel116
    Neighbor priority is 1, State is Full, 5 state changes
    DR is 0.0.0.0, BDR is 0.0.0.0
    Options is 0x42 (-|O|-|-|-|-|E|-)
    Dead timer due in 00:00:34
    Neighbor is up for 02:08:06
    Database Summary List 0
    Link State Request List 0
    Link State Retransmission List 0
    Crypt Sequence Number is 0
    Thread Inactivity Timer on
    Thread Database Description Retransmission off
    Thread Link State Request Retransmission off
    Thread Link State Update Retransmission off
```

# show ip ospf route

**Overview** Use this command to display the OSPF routing table. Include the **ospf-id** parameter with this command to display the OSPF routing table for specified instances.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip ospf [<ospf-id>] route
```

| Parameter | Description |
|---|---|
| *<ospf-id>* | <0-65535> The ID of the router process for which information will be displayed. If this parameter is included, only the information for this specified routing process is displayed. |

**Mode** User Exec and Privileged Exec

**Examples** To display the OSPF routing table, use the command:

```
awplus# show ip ospf route
```

**Output** Figure 30-21: Example output from the **show ip ospf route** command for a specific process

```
awplus#show ip ospf route

OSPF process 200:
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2

O  172.30.1.64/26 [2] via 192.168.100.6, tunnel104, Area 0.0.0.200
O  172.30.2.64/26 [2] via 192.168.100.18, tunnel116, Area 0.0.0.200
O  172.30.4.0/24 [2] via 192.168.100.6, tunnel104, Area 0.0.0.200
C  192.168.100.4/30 [1] is directly connected, tunnel104, Area 0.0.0.200
C  192.168.100.16/30 [1] is directly connected, tunnel116, Area 0.0.0.200
```

# show ip ospf virtual-links

**Overview** Use this command to display virtual link information.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip ospf virtual-links
```

**Mode** User Exec and Privileged Exec

**Examples** To display virtual link information, use the command:

```
awplus# show ip ospf virtual-links
```

**Output** Figure 30-22: Example output from the **show ip ospf virtual-links** command

```
awplus#show ip ospf virtual-links
Virtual Link VLINK0 to router 10.10.0.9 is up
  Transit area 0.0.0.1 via interface eth1
  Transmit Delay is 1 sec, State Point-To-Point,
  Timer intervals configured, Hello 10, Dead 40, Wait 40,
Retransmit 5
    Hello due in 00:00:02
    Adjacency state Full
Virtual Link VLINK1 to router 10.10.0.123 is down
  Transit area 0.0.0.1 via interface *
  Transmit Delay is 1 sec, State Down,
  Timer intervals configured, Hello 10, Dead 40, Wait 40,
Retransmit 5
    Hello due in inactive
    Adjacency state Down
```

# show ip protocols ospf

**Overview** Use this command to display OSPF process parameters and statistics.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip protocols ospf
```

**Mode** User Exec and Privileged Exec

**Examples** To display OSPF process parameters and statistics, use the command:

```
awplus# show ip protocols ospf
```

**Output** Figure 30-23: Example output from the **show ip protocols ospf** command

```
Routing Protocol is "ospf 200"
  Invalid after 0 seconds, hold down 0, flushed after 0
  Outgoing update filter list for all interfaces is
    Redistributed kernel filtered by filter1
  Incoming update filter list for all interfaces is
  Redistributing: kernel
  Routing for Networks:
    192.30.30.0/24
    192.40.40.0/24
  Routing Information Sources:
    Gateway         Distance      Last Update
  Distance: (default is 110)
    Address         Mask            Distance List
```

# summary-address

**Overview** Use this command to summarize, or possibly suppress, external routes that have the specified address range.

Use the **no** variant of this command to stop summarizing, or suppressing, external routes that have the specified address range.

**Syntax**

```
summary-address <ip-addr/prefix-length> [not-advertise] [tag <0-4294967295>]
```

```
no summary-address <ip-addr/prefix-length> [not-advertise] [tag <0-4294967295>]
```

| Parameter | Description |
|---|---|
| *<ip-addr/prefix-length>* | Specifies the base IP address of the summary address.The range of addresses given as IPv4 starting address and a prefix length. |
| `not-advertise` | Set the **not-advertise** option if you do not want OSPF to advertise either the summary address or the individual networks within the range of the summary address. |
| `tag <0-4294967295>` | The tag parameter specifies the tag value that OSPF places in the AS external LSAs created as a result of redistributing the summary route. The tag overrides tags set by the original route. |

**Default** The default tag value for a summary address is 0.

**Mode** Router Configuration

**Usage notes** An address range is a pairing of an address and a mask that is almost the same as IP network number. For example, if the specified address range is 192.168.0.0/255.255.240.0, it matches: 192.168.1.0/24, 192.168.4.0/22, 192.168.8.128/25 and so on.

Redistributing routes from other protocols into OSPF requires the router to advertise each route individually in an external LSA. Use the **summary address** command to advertise one summary route for all redistributed routes covered by a specified network address and mask. This helps decrease the size of the OSPF link state database.

Ensure OSPF routes exist in the summary address range for advertisement before using this command.

**Example** The following example uses the **summary-address** command to aggregate external LSAs that match the network 172.16.0.0/16 and assign a Tag value of 3.

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# summary-address 172.16.0.0/16 tag 3
```

# timers spf exp

**Overview** Use this command to adjust route calculation timers using exponential back-off delays.

Use **no** form of this command to return to the default exponential back-off timer values.

**Syntax**

```
timers spf exp <min-holdtime> <max-holdtime>
no timers spf exp
```

| Parameter | Description |
|---|---|
| *<min-holdtime>* | *<0-2147483647>*<br>Specifies the minimum delay between receiving a change to the SPF calculation in milliseconds. The default SPF min-holdtime value is 50 milliseconds. |
| *<max-holdtime>* | *<0-2147483647>*<br>Specifies the maximum delay between receiving a change to the SPF calculation in milliseconds. The default SPF max-holdtime value is 50 seconds. |

**Mode** Router Configuration

**Default** The default SPF min-holdtime is 50 milliseconds. The default SPF max-holdtime is 40 seconds.

**Usage** This command configures the minimum and maximum delay time between the receipt of a topology change and the calculation of the Shortest Path First (SPF).

**Examples** To set the minimum delay time to 5 milliseconds and maximum delay time to 10 milliseconds, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# timers spf exp 5 10
```

To reset the minimum and maximum delay times to the default values, use the commands:

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# no timers spf exp
```

**Related commands** timers spf exp

# undebug ospf events

**Overview** This command applies the functionality of the no debug ospf events command.

# undebug ospf ifsm

**Overview** This command applies the functionality of the no debug ospf ifsm command.

# undebug ospf lsa

**Overview** This command applies the functionality of the no debug ospf lsa command.

# undebug ospf nfsm

**Overview** This command applies the functionality of the no debug ospf nfsm command.

# undebug ospf nsm

**Overview** This command applies the functionality of the no debug ospf nsm command.

# undebug ospf packet

**Overview** This command applies the functionality of the no debug ospf packet command.

# undebug ospf route

**Overview** This command applies the functionality of the no debug ospf route command.

# 31 OSPFv3 for IPv6 Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure OSPFv3 for IPv6. See the OSPFv3 Feature Overview and Configuration Guide for more information and examples.

**Command List**

- "abr-type" on page 1206
- "area authentication ipsec spi" on page 1207
- "area default-cost (IPv6 OSPF)" on page 1209
- "area encryption ipsec spi esp" on page 1210
- "area range (IPv6 OSPF)" on page 1213
- "area stub (IPv6 OSPF)" on page 1215
- "area virtual-link (IPv6 OSPF)" on page 1216
- "area virtual-link authentication ipsec spi" on page 1218
- "area virtual-link encryption ipsec spi" on page 1220
- "auto-cost reference bandwidth (IPv6 OSPF)" on page 1223
- "bandwidth" on page 1225
- "clear ipv6 ospf process" on page 1226
- "debug ipv6 ospf events" on page 1227
- "debug ipv6 ospf ifsm" on page 1228
- "debug ipv6 ospf lsa" on page 1229
- "debug ipv6 ospf nfsm" on page 1230
- "debug ipv6 ospf packet" on page 1231
- "debug ipv6 ospf route" on page 1232
- "default-information originate" on page 1233

- "default-metric (IPv6 OSPF)" on page 1234
- "distance (IPv6 OSPF)" on page 1235
- "ipv6 ospf authentication spi" on page 1237
- "ipv6 ospf cost" on page 1239
- "ipv6 ospf dead-interval" on page 1240
- "ipv6 ospf display route single-line" on page 1241
- "ipv6 ospf encryption spi esp" on page 1242
- "ipv6 ospf hello-interval" on page 1245
- "ipv6 ospf neighbor" on page 1246
- "ipv6 ospf network" on page 1248
- "ipv6 ospf priority" on page 1249
- "ipv6 ospf retransmit-interval" on page 1250
- "ipv6 ospf transmit-delay" on page 1251
- "ipv6 router ospf area" on page 1252
- "max-concurrent-dd (IPv6 OSPF)" on page 1254
- "passive-interface (IPv6 OSPF)" on page 1255
- "redistribute (IPv6 OSPF)" on page 1256
- "restart ipv6 ospf graceful" on page 1258
- "router ipv6 ospf" on page 1259
- "router-id (IPv6 OSPF)" on page 1260
- "show debugging ipv6 ospf" on page 1261
- "show ipv6 ospf" on page 1262
- "show ipv6 ospf database" on page 1264
- "show ipv6 ospf database external" on page 1265
- "show ipv6 ospf database grace" on page 1266
- "show ipv6 ospf database inter-prefix" on page 1267
- "show ipv6 ospf database inter-router" on page 1268
- "show ipv6 ospf database intra-prefix" on page 1269
- "show ipv6 ospf database link" on page 1270
- "show ipv6 ospf database network" on page 1271
- "show ipv6 ospf database router" on page 1273
- "show ipv6 ospf interface" on page 1278
- "show ipv6 ospf neighbor" on page 1279
- "show ipv6 ospf route" on page 1280
- "show ipv6 ospf virtual-links" on page 1281

- "summary-address (IPv6 OSPF)" on page 1282
- "timers spf exp (IPv6 OSPF)" on page 1284
- "undebug ipv6 ospf events" on page 1285
- "undebug ipv6 ospf ifsm" on page 1286
- "undebug ipv6 ospf lsa" on page 1287
- "undebug ipv6 ospf nfsm" on page 1288
- "undebug ipv6 ospf packet" on page 1289
- "undebug ipv6 ospf route" on page 1290

# abr-type

**Overview** Use this command to set an OSPF Area Border Router (ABR) type.

Use the **no** variant of this command to revert the ABR type to the default setting (cisco).

**Syntax**

```
abr-type {cisco|ibm|standard}
no abr-type {cisco|ibm|standard}
```

| Parameter | Description |
|---|---|
| `cisco` | Specifies an alternative ABR using Cisco implementation (RFC 3509). This is the default ABR type. |
| `ibm` | Specifies an alternative ABR using IBM implementation (RFC 3509). |
| `standard` | Specifies a standard behavior ABR (RFC 2328). |

**Default** ABR type cisco

**Mode** Router Configuration

**Usage notes** Specifying the ABR type allows better interoperation between different implementations. This command is specially useful in a multi-vendor environment. The different ABR types are:

- Cisco ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and one of them is the backbone area.
- IBM ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached and the backbone area is configured. In this case the configured backbone need not be actively connected.
- Standard ABR Type: By this definition, a router is considered an ABR if it has more than one area actively attached to it.

**Example** To set the ABR type to “ibm” use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# abr-type ibm
```

# area authentication ipsec spi

**Overview** Use this command in Router Configuration mode to enable either MD5 (Message-Digest 5) or SHA1 (Secure Hash Algorithm 1) authentication for a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable the authentication configured for a specified OSPF area.

**Syntax**

```
area <area-id> authentication ipsec spi <256-4294967295> {md5 <MD5-key>|sha1 <SHA1-key>}
no area <area-id> authentication ipsec spi <256-4294967295>
```

| Parameter | Description | |
|---|---|---|
| *<area-id>* | The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats: | |
| | *<ip-addr>* | OSPF area-ID expressed in IPv4 address format A.B.C.D. |
| | *<0-4294967295>* | OSPF area-ID expressed as a decimal number within the range shown. |
| | For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID. | |
| *<256-4294967295>* | Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer. | |
| md5 | Specify the MD5 (Message-Digest 5) hashing algorithm. | |
| *<MD5-key>* | Enter an MD5 key containing up to 32 hexadecimal characters. | |
| sha1 | Specify the SHA-1 (Secure Hash Algorithm 1) hashing algorithm. | |
| *<SHA1-key>* | Enter an SHA-1 key containing up to 40 hexadecimal characters. | |

**Mode** Router Configuration

**Usage notes** Use this command on an OSPFv3 area; use the area virtual-link authentication ipsec spi command on an OSPFv3 area virtual link. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the OSPFv3 Feature Overview and Configuration Guide for more information and examples.

***NOTE:*** *You can configure an authentication security policy (SPI) on an OSPFv3 area with this command, or on an interface with the ipv6 ospf authentication spi command.*

*When you configure authentication for an area, the security policy is applied to all interfaces in the area. However, we recommend a different authentication security policy is applied to each interface for higher security.*

*If you apply the* ***ipv6 ospf authentication null*** *command, this affects authentication configured on both the interface and the OSPFv3 area.*

*This is due to OSPFv3 hello messages ingressing interfaces, which are part of area authentication, not being authenticated. So neighbors time out.*

**Example** To enable MD5 authentication with a 32 hexadecimal character key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 authentication ipsec spi 1000 md5
1234567890ABCDEF1234567890ABCDEF
```

To enable SHA-1 authentication with a 40 hexadecimal character key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 authentication ipsec spi 1000
sha1 1234567890ABCDEF1234567890ABCDEF12345678
```

To disable authentication for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 authentication ipsec spi 1000
```

**Related commands**

area encryption ipsec spi esp

area virtual-link authentication ipsec spi

area virtual-link encryption ipsec spi

ipv6 ospf authentication spi

ipv6 ospf encryption spi esp

show ipv6 ospf

# area default-cost (IPv6 OSPF)

**Overview** This command specifies a cost for the default summary route sent into a stub area.

The **no** variant of this command removes the assigned default-route cost.

**Syntax**

```
area <area-id> default-cost <0-16777215>
no area <area-id> default-cost
```

| Parameter | Description | |
|---|---|---|
| *<area-id>* | The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats: | |
| | *<ip-addr>* | OSPF area-ID expressed in IPv4 address format A.B.C.D. |
| | *<0-4294967295>* | OSPF area-ID expressed as a decimal number within the range shown. |
| | For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID. | |
| `default-cost` | Indicates the cost for the default summary route used for a stub area.<br>Default: **1** | |

**Mode** Router Configuration

**Usage** The default-cost option provides the metric for the summary default route, generated by the area border router, into the stub area. Use this option only on an area border router that is attached to the stub area.

**Example** To set the default cost to 10 in area 1 for the OSPF process P2, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf P2
awplus(config-router)# area 1 default-cost 10
```

**Related commands** area stub (IPv6 OSPF)

# area encryption ipsec spi esp

**Overview** Use this command in Router Configuration mode to enable either AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) or 3DES (Triple Data Encryption Standard) ESP (Encapsulating Security Payload) encryption for a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable the encryption configured for a specified OSPF area.

**Syntax**

```
area <area-id> encryption ipsec spi <256-4294967295> esp
{aes-cbc <AES-CBC-key>|3des <3DES-key>|null}{md5
<MD5-key>|sha1 <SHA1-key>}
```

```
no area <area-id> encryption ipsec spi <256-4294967295>
```

| Parameter | Description | |
|---|---|---|
| *<area-id>* | The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats: | |
| | *<ip-addr>* | OSPF area-ID expressed in IPv4 address format A.B.C.D. |
| | *<0-4294967295>* | OSPF area-ID expressed as a decimal number within the range shown. |
| | For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID. | |
| *<256-4294967295>* | Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer. | |
| esp | Specify the esp keyword (Encapsulating Security Payload) to then apply either AES-CBC or 3DES encryption. | |
| aes-cbc | Specify this keyword to enable AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) encryption. | |
| *<AES-CBC-key>* | Enter an AES-CBC key containing either 32, 48, or 64 hexadecimal characters. | |
| 3des | Specify 3DES (Triple Data Encryption Standard) encryption. | |
| *<3DES-key>* | Enter a 3DES key containing 48 hexadecimal characters. | |
| null | Specify ESP without AES-CBC or 3DES encryption applied. | |
| md5 | Specify the MD5 (Message-Digest 5) encryption algorithm. | |
| *<MD5-key>* | Enter an MD5 key containing 32 hexadecimal characters. | |
| sha1 | Specify the SHA-1 (Secure Hash Algorithm 1) encryption algorithm. | |
| *<SHA1-key>* | Enter an SHA-1 key containing 40 hexadecimal characters. | |

**Mode** Router Configuration

**Usage notes**

When you issue this command, authentication and encryption are both enabled.

Use this command on an OSPFv3 area, use the area virtual-link encryption ipsec spi command on an OSPFv3 area virtual link. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Security is achieved using the IPv6 ESP extension header. The IPv6 ESP extension header is used to provide confidentiality, integrity, authentication, and confidentiality. Authentication fields are removed from OSPF for IPv6 packet headers, so applying IPv6 ESP extension headers are required for integrity, authentication, and confidentiality.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the OSPFv3 Feature Overview and Configuration Guide for more information and examples.

***NOTE:*** *You can configure an encryption security policy (SPI) on an OSPFv3 area with this command, or on an interface with the ipv6 ospf encryption spi esp command.*

*When you configure encryption for an area, the security policy is applied to all interfaces in the area. However, we recommend a different encryption security policy is applied to each interface for higher security.*

*If you apply the **ipv6 ospf encryption null** command, this affects encryption configured on both the interface and the OSPFv3 area.*

*This is due to OSPFv3 hello messages ingressing interfaces, which are part of area encryption, not being encrypted. So neighbors time out.*

**Example**

To enable ESP encryption, but not apply an AES-CBC key or an 3DES key, and MD5 authentication with a 32 hexadecimal character key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp null
md5 1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption, but not apply an AES-CBC key or an 3DES key, and SHA-1 authentication with a 40 hexadecimal character key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp null
sha1 1234567890ABCDEF1234567890ABCDEF12345678
```

To enable ESP encryption with a 48 hexadecimal character 3DES key and a 32 hexadecimal character MD5 authentication for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp 3des
1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF md5
1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption with a 32 hexadecimal character AES-CBC key, and a 40 hexadecimal character SHA-1 authentication key for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 encryption ipsec spi 1000 esp
aes-cbc 1234567890ABCDEF1234567890ABCDEF sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To disable ESP encryption for OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 encryption ipsec spi 1000
```

**Related commands**

area virtual-link authentication ipsec spi

area virtual-link encryption ipsec spi

ipv6 ospf authentication spi

ipv6 ospf encryption spi esp

show ipv6 ospf

# area range (IPv6 OSPF)

**Overview** Use this command to summarize OSPFv3 routes at an area boundary, configuring an IPv6 address range which consolidates OSPFv3 routes. By default, this feature is not enabled.

A summary route created by this command is then advertised to other areas by the Area Border Routers (ABRs). In this way, routing information is condensed at area boundaries and outside the area so that routes are exchanged between areas in an efficient manner.

If the network numbers in an area are arranged into sets of contiguous routes, the ABRs can be configured to advertise a summary route that covers all the individual networks within the area that fall into the specified range.

The **no** variant of this command disables this function and restores default behavior.

**Syntax**

```
area <area-id> range <ipv6address/prefix-length>
[advertise|not-advertise]

no area <area-id> range <ipv6address/prefix-length>
```

| Parameter | Description | |
|---|---|---|
| *<area-id>* | The OSPFv3 area that you summarizing the routes for. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. | |
| | *<A.B.C.D>* | OSPF area-ID expressed in IPv4 address format A.B.C.D. |
| | *<0-4294967295>* | OSPF area-ID expressed as a decimal number within the range shown. |
| | For example the values 0.0.1.2 and decimal 258 would both define the same area-ID. | |
| *<ip-addr/prefix-length>* | The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. | |
| `advertise` | Advertise this range as a summary route into other areas. | |
| `not-advertise` | Do not advertise this range. | |

**Default** The area range is not configured by default. The area range is advertised if it is configured.

**Mode** Router Configuration

**Usage notes** You can configure multiple ranges on a single area with multiple instances of this command, so OSPFv3 summarizes addresses for different sets of IPv6 address ranges.

Ensure OSPFv3 IPv6 routes exist in the area range for advertisement before using this command.

**Example**

```
awplus# configure terminal
awplus(config)# router ipv6 ospf P2
awplus(config-router)# area 1 range 2000::/3
```

# area stub (IPv6 OSPF)

**Overview** This command defines an OSPF area as a stub area. By default, no stub area is defined.

Use this command when routers in the area do not require learning about external LSAs. You can define the area as a totally stubby area by configuring the Area Border Router of that area using the **area stub no-summary** command.

The **no** variant of this command removes this definition.

**Syntax**

```
area <area-id> stub [no-summary]
no area <area-id> stub [no-summary]
```

| Parameter | Description | |
|---|---|---|
| *<area-id>* | The OSPF area that you are configuring as a stub area. Use one of the following formats: This can be entered in either dotted decimal format or normal decimal format. For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area-ID. | |
| | *<A.B.C.D>* | OSPF area-ID, expressed in the IPv4 address format *<A.B.C.D>*. |
| | *<0-4294967295>* | OSPF area-ID expressed as a decimal number within the range shown. |
| | For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area-ID. | |
| no-summary | Stops an ABR from sending summary link advertisements into the stub area. | |

**Mode** Router Configuration

**Usage** There are two stub area router configuration commands: the **area stub** and **area default- cost** commands. In all routers attached to the stub area, configure the area by using the **area stub** command. For an area border router (ABR) attached to the stub area, also use the **area default-cost** command.

**Example**

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# area 100 stub
```

**Related commands** area default-cost (IPv6 OSPF)

# area virtual-link (IPv6 OSPF)

## Overview

This command configures a link between a non-backbone area and the backbone, through other non-backbone areas.

In OSPF, all non-backbone areas must be connected to a backbone area. If the connection to the backbone is lost, the virtual link repairs the connection.

The **no** variant of this command removes the virtual link.

## Syntax

```
area <area-id> virtual-link <router-id>

no area <area-id>  virtual-link <router-id>

area <area-id>  virtual-link <router-id>

no area <area-id>  virtual-link <router-id>

area <area-id>  virtual-link <router-id> [hello-interval
<1-65535>]  [retransmit-interval <1-65535>] [transmit-delay
<1-65535>]

no area <area-id>  virtual-link <router-id> [hello-interval]
[retransmit-interval] [transmit-delay]
```

| Parameter | Description | |
|---|---|---|
| *<area-id>* | The area-ID of the transit area that the virtual link passes through. This can be entered in either dotted decimal format or normal decimal format as shown below. | |
| | *<A.B.C.D>* | OSPF area-ID, expressed in the IPv4 address format *<A.B.C.D>*. |
| | *<0-4294967295>* | OSPF area-ID expressed as a decimal number within the range shown. |
| | For example the values dotted decimal 0.0.1.2 and decimal 258 would both define the same area-ID. | |
| *<router-id>* | The OSPF router ID of the virtual link neighbor. | |
| dead-interval | If no packets are received from a particular neighbor for dead-interval seconds, the router considers the neighbor router to be off-line.<br>Default: 40 seconds | |
| | *<1-65535>* | The number of seconds in the interval. |
| hello-interval | The interval the router waits before it sends a hello packet.<br>Default: 10 seconds | |
| | *<1-65535>* | The number of seconds in the interval. |
| retransmit-interval | The interval the router waits before it retransmits a packet.<br>Default: 5 seconds | |
| | *<1-65535>* | The number of seconds in the interval. |

| Parameter | Description | |
|---|---|---|
| `transmit-delay` | The interval the router waits before it transmits a packet. Default: 1 seconds | |
| | *<1-65535>* | The number of seconds in the interval. |

**Mode** Router Configuration

**Usage** You can configure virtual links between any two backbone routers that have an interface to a common non-backbone area. The protocol treats these two routers, joined by a virtual link, as if they were connected by an unnumbered point-to-point network. To configure a virtual link, you require:

- The transit area-ID, i.e. the area-ID of the non-backbone area that the two backbone routers are both connected to.
- The corresponding virtual link neighbor's router ID. To see the router ID use the show ipv6 ospf command.

Configure the **hello-interval** to be the same for all routers attached to a common network. A short **hello-interval** results in the router detecting topological changes faster but also an increase in the routing traffic.

The **retransmit-interval** is the expected round-trip delay between any two routers in a network. Set the value to be greater than the expected round-trip delay to avoid needless retransmissions.

The **transmit-delay** is the time taken to transmit a link state update packet on the interface. Before transmission, the link state advertisements in the update packet, are incremented by this amount. Set the **transmit-delay** to be greater than zero. Also, take into account the transmission and propagation delays for the interface.

**Example** To configure a virtual link through area 1to the router with router-ID 10.10.11.50, use the following commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# area 1 virtual-link 10.10.11.50 hello 5
dead 10
```

**Related commands** show ipv6 ospf

# area virtual-link authentication ipsec spi

**Overview** Use this command in Router Configuration mode to enable authentication for virtual links in a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable authentication for virtual links in a specified OSPF area.

**Syntax**

```
area <area-id> virtual-link <router-ID> authentication ipsec
spi <256-4294967295> {md5 <MD5-key>|sha1 <SHA1-key>}
```

```
no area <area-id> virtual-link <router-ID> authentication ipsec
spi <256-4294967295>
```

| Parameter | Description | |
|---|---|---|
| *<area-id>* | The OSPF area that you are specifying the summary route default-cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats: | |
| | *<ip-addr>* | OSPF area-ID expressed in IPv4 address format A.B.C.D. |
| | *<0-4294967295>* | OSPF area-ID expressed as a decimal number within the range shown. |
| | For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID. | |
| `virtual-link` | Specify a virtual link and its parameters. | |
| *<router-ID>* | Enter a router ID associated with a virtual link neighbor in IPv4 address format A.B.C.D. | |
| `authentication` | Specify this keyword to enable authentication. | |
| `ipsec` | Specify this keyword to use IPsec authentication. | |
| `spi` | Specify this keyword to set the SPI (Security Parameters Index). | |
| *<256-4294967295>* | Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer. | |
| `md5` | Specify the MD5 (Message-Digest 5) encryption algorithm. | |
| *<MD5-key>* | Enter an MD5 key containing 32 hexadecimal characters. | |
| `sha1` | Specify the SHA-1 (Secure Hash Algorithm 1) encryption algorithm. | |
| *<SHA1-key>* | Enter an SHA-1 key containing 40 hexadecimal characters. | |

**Mode** Router Configuration

**Usage notes** Use this command on an OSPFv3 area virtual link, use the area authentication ipsec spi command on an OSPFv3 area. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by

link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

OSPFv3 areas are connected to a backbone area. Virtual links can be configured to repair lost connections to a backbone area for OSPFv3 areas. To configure an OSPFv3 virtual link, use a router ID instead of the IPv6 prefix of the router.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the OSPFv3 Feature Overview and Configuration Guide for more information and examples.

**Example** To enable MD5 authentication with a 32 hexadecimal character key for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1
authentication ipsec spi 1000 md5
1234567890ABCDEF1234567890ABCDEF
```

To enable SHA-1 authentication with a 40 hexadecimal character key for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1
authentication ipsec spi 1000 sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To disable authentication for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 virtual-link ipsec spi 1000
```

**Related commands**

area authentication ipsec spi

area encryption ipsec spi esp

area virtual-link encryption ipsec spi

show ipv6 ospf virtual-links

# area virtual-link encryption ipsec spi

**Overview** Use this command in Router Configuration mode to enable either AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) or 3DES (Triple Data Encryption Standard) ESP (Encapsulating Security Payload) encryption for virtual links in a specified OSPF area.

Use the **no** variant of this command in Router Configuration mode to disable encryption configured for virtual links in a specified OSPF area.

**Syntax**

```
area <area-id> virtual-link <router-ID> encryption ipsec spi
<256-4294967295> esp {aes-cbc <AES-CBC-key>|3des
<3DES-key>|null}{md5 <MD5-key>|sha1 <SHA1-key>}

no area <area-id> encryption ipsec spi <256-4294967295>
```

| Parameter | Description | |
|---|---|---|
| *<area-id>* | The OSPF area that you are specifying the summary route default- cost for. This can be entered in either dotted decimal format or normal decimal format. Use one of the following formats: | |
| | *<ip-addr>* | OSPF area-ID expressed in IPv4 address format A.B.C.D. |
| | *<0-4294967295>* | OSPF area-ID expressed as a decimal number within the range shown. |
| | For example, the values 0.0.1.2 and decimal 258 would both define the same area-ID. | |
| `virtual-link` | Specify a virtual link and its parameters. | |
| *<router-ID>* | Enter a router ID associated with a virtual link neighbor in IPv4 address format A.B.C.D. | |
| `encryption` | Specify this keyword to enable encryption. | |
| `ipsec` | Specify this keyword to use IPsec authentication. | |
| `spi` | Specify this keyword to set the SPI (Security Parameters Index). | |
| *<256-4294967295>* | Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer. | |
| `esp` | Specify the esp keyword (Encapsulating Security Payload) to then apply either AES-CBC or 3DES encryption. | |
| `aes-cbc` | Specify this keyword to enable AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) encryption. | |
| *<AES-CBC-key>* | Enter an AES-CBC key containing either 32, 48, or 64 hexadecimal characters. | |
| `3des` | Specify 3DES (Triple Data Encryption Standard) encryption. | |
| *<3DES-key>* | Enter a 3DES key containing 48 hexadecimal characters. | |

| Parameter | Description |
|---|---|
| `null` | Specify ESP without AES-CBC or 3DES encryption applied. |
| `md5` | Specify the MD5 (Message-Digest 5) encryption algorithm. |
| *<MD5-key>* | Enter an MD5 key containing 32 hexadecimal characters. |
| `sha1` | Specify the SHA-1 (Secure Hash Algorithm 1) encryption algorithm. |
| *<SHA1-key>* | Enter an SHA-1 key containing 40 hexadecimal characters. |

**Mode** Router Configuration

**Usage notes** When you issue this command, authentication and encryption are both enabled.

Use this command on an OSPFv3 area virtual link, use the area encryption ipsec spi esp command on an OSPFv3 area. Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Security is achieved using the IPv6 ESP extension header. ESP is used to provide confidentiality, integrity, authentication, and confidentiality. Authentication fields are removed from OSPF for IPv6 packet headers. The IPv6 ESP extension header is required for integrity, authentication, and confidentiality.

Note that interface configuration takes priority over area configuration. If an interface configuration is removed then an area configuration is applied to an interface instead.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the OSPFv3 Feature Overview and Configuration Guide for more information and examples.

**Example** To enable ESP encryption, but not apply an AES-CBC key or a 3DES key, and MD5 authentication with a 32 hexadecimal character key for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp null md5 1234567890ABCDEF1234567890ABCDEF
```

To enable ESP encryption, but not apply an AES-CBC key or a 3DES key, and SHA-1 authentication with a 40 hexadecimal character key for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp null sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To enable ESP encryption with a 32 hexadecimal character AES-CBC key and a 40 hexadecimal character SHA-1 authentication key for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp aes-cbc 1234567890ABCDEF1234567890ABCDEF
sha1 1234567890ABCDEF1234567890ABCDEF12345678
```

To enable ESP encryption with a 48 hexadecimal character 3DES key and a 40 hexadecimal character SHA-1 authentication key for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# area 1 virtual-link 10.0.0.1 encryption
ipsec spi 1000 esp 3des
1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To disable authentication for virtual links in OPSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no area 1 virtual-link 10.0.0.1
authentication ipsec spi 1000
```

**Related commands**

area authentication ipsec spi

area encryption ipsec spi esp

area virtual-link authentication ipsec spi

show ipv6 ospf virtual-links

# auto-cost reference bandwidth (IPv6 OSPF)

**Overview** This command controls how OSPF calculates default metrics for the interface.

Use the **no** variant of this command to assign cost based only on the interface bandwidth.

**Syntax**

```
auto-cost reference-bandwidth <1-4294967>
no auto-cost reference-bandwidth
```

| Parameter | Description |
|---|---|
| *<1-4294967>* | The reference bandwidth, measured in Mbits per second (Mbps). |

**Default** 1000 Mbps

**Usage notes** By default, OSPF calculates the OSPF metric for an interface by dividing the reference bandwidth by the interface bandwidth. The default for the reference bandwidth is 1000 Mbps. As a result, if this default is used, there is very little difference between the metrics applied to interfaces of increasing bandwidth beyond 1000 Mbps.

The auto-cost command is used to alter this reference bandwidth in order to give a real difference between the metrics of high bandwidth links of differing bandwidths. In a network that has multiple links with high bandwidths, specify a larger reference bandwidth value to differentiate the costs on those links.

Cost is calculated by dividing the reference bandwidth (Mbps) by the layer 3 interface (Switched Virtual Interface (SVI), Loopback or Ethernet interface) bandwidth. Interface bandwidth may be altered by using the bandwidth command as the SVI does not auto-detect the bandwidth based on the speed of associated device ports.

When the reference bandwidth calculation results in a cost integer greater than 1 but contains a fractional value (the value after the decimal point), the result rounds down to the nearest integer. The following example shows how the cost is calculated.

The reference bandwidth is 1000 Mbps and the interface bandwidth is 7 Mbps.

Calculation = 1000/7

Calculation result = 142.85 (integer of 142, fractional value of 0.85)

Result after rounding down to the nearest integer = 142 (Interface cost is 142)

When the reference bandwidth calculation results in a cost less than 1, it is rounded up to the nearest integer which is 1. The following example shows how the cost is calculated.

The reference bandwidth is 1000 Mbps and the interface bandwidth is 10000 Mbps.

Calculation = 1000/10000

Calculation result = 0.1

Result after rounding up to the nearest integer = 1 (Interface cost is 1)

The auto-cost reference bandwidth value should be consistent across all OSPF routers in the OSPF process.

Note that using the ipv6 ospf cost command on a layer 3 interface will override the cost calculated by this command.

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 20
awplus(config-router)# auto-cost reference-bandwidth 1000
```

**Related commands** ipv6 ospf cost

# bandwidth

**Overview** Use this command to specify the maximum bandwidth to be used for each interface. The bandwidth value is in bits per second. OSPF uses this to calculate metrics for the interface.

The **no** variant of this command removes any applied bandwidth value.

**Syntax**

```
bandwidth <bandwidth-setting>
no bandwidth
```

| Parameter | Description |
|---|---|
| *<bandwidth-setting>* | Sets the bandwidth for the interface. Enter a value in the range 1 to 10000000000 bits per second. Note that to avoid entering many zeros, you can add k, m, or g to internally add 3, 6 or 9 zeros to the number entered. For example entering 1k is the same as entering 1000. |

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Example** To set the bandwidth on VLAN2 to be 10 Mbps, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# bandwidth 10000000
```

or

```
awplus(config-if)# bandwidth 10m
```

**Related commands** show interface

# clear ipv6 ospf process

**Overview** This command clears and restarts the IPv6 OSPF routing process. Specify the Process ID to clear one particular OSPF process. When no Process ID is specified, this command clears all running OSPF processes.

**Syntax**

```
clear ipv6 ospf [<0-65535>] process
```

| Parameter | Description |
|---|---|
| *<0-65535>* | The routing process ID. |

**Mode** Privileged Exec

**Example**

```
awplus# clear ipv6 ospf process
```

# debug ipv6 ospf events

**Overview** This command enables IPv6 OSPF debugging for event troubleshooting.

To enable all debugging options, specify **debug ipv6 ospf event** with no additional parameters.

The **no** and **undebug** variants of this command disable OSPF debugging. Using this command with no parameters entered, will disable debugging for all parameter options.

**Syntax**

```
debug ipv6 ospf events [abr] [asbr] [os][router] [vlink]
no debug ipv6 ospf events [abr] [asbr] [os] [router] [vlink]
```

| Parameter | Description |
|---|---|
| `abr` | Shows ABR events. |
| `asbr` | Shows ASBR events. |
| `router` | Shows other router events. |
| `os` | Shows OS events. |
| `vlink` | Shows virtual link events. |

**Mode** Privileged Exec and Global Configuration

**Example** To enable IPv6 event debugging and show ABR events, use the following command:

```
awplus# debug ipv6 ospf events asbr
```

# debug ipv6 ospf ifsm

**Overview** This command specifies debugging options for IPv6 OSPF Interface Finite State Machine (IFSM) troubleshooting.

To enable all debugging options, specify **debug ipv6 ospf ifsm** with no additional parameters.

The **no** and **undebug** variants of this command disable IPv6 OSPF IFSM debugging. Use these commands without parameters to disable all the options.

**Syntax**

```
debug ipv6 ospf ifsm [events] [status] [timers]
no debug ipv6 ospf ifsm [events] [status] [timers]
```

| Parameter | Description |
|---|---|
| `events` | Displays IFSM event information. |
| `status` | Displays IFSM status information. |
| `timers` | Displays IFSM timer information. |

**Mode** Privileged Exec and Global Configuration

**Example** To specify IPv6 OSPF debugging options to display IPv6 OSPF IFSM events information, use the following commands:

```
awplus# debug ipv6 ospf ifsm events
```

**Related commands** terminal monitor

undebug ipv6 ospf ifsm

# debug ipv6 ospf lsa

**Overview** This command enables debugging options for IPv6 OSPF Link State Advertisements (LSA) troubleshooting. This displays information related to internal operations of LSAs.

To enable all debugging options, specify **debug ipv6 ospf lsa** with no additional parameters.

The **no** and **undebug** variants of this command disable IPv6 OSPF LSA debugging. Use this command without parameters to disable all the options.

**Syntax**

```
debug ipv6 ospf lsa [flooding] [generate] [install] [maxage]
[refresh]
```

```
no debug ipv6 ospf lsa [flooding] [generate] [install] [maxage]
[refresh]
```

| Parameter | Description |
|---|---|
| `flooding` | Displays LSA flooding. |
| `generate` | Displays LSA generation. |
| `install` | Show LSA installation. |
| `maxage` | Shows maximum age of the LSA in seconds. |
| `refresh` | Displays LSA refresh. |

**Mode** Privileged Exec and Global Configuration

**Examples** To enable debugging for IPv6 OSPF refresh LSA, use the following commands:

```
awplus# debug ipv6 ospf lsa refresh
```

**Related commands** terminal monitor

undebug ipv6 ospf lsa

# debug ipv6 ospf nfsm

**Overview** This command enables debugging options for IPv6 OSPF Neighbor Finite State Machines (NFSMs).

To enable all debugging options, specify **debug ipv6 ospf nfsm** with no additional parameters.

The **no** and **undebug** variants of this command disable IPv6 OSPF NFSM debugging. Use this command without parameters to disable all the options.

**Syntax**

```
debug ipv6 ospf nfsm [events] [status] [timers]
no debug ipv6 ospf nfsm [events] [status] [timers]
```

| Parameter | Description |
|---|---|
| `events` | Displays NFSM event information. |
| `status` | Displays NSFM status information. |
| `timers` | Displays NFSM timer information. |

**Mode** Privileged Exec and Global Configuration

**Examples** To enable IPv6 debugging option to display timer information, use the following command:

```
awplus# debug ipv6 ospf nfsm timers
```

**Related commands** terminal monitor

undebug ipv6 ospf nfsm

# debug ipv6 ospf packet

**Overview** This command enables debugging options for IPv6 OSPF packets.

To enable all debugging options, specify **debug ipv6 ospf packet** with no additional parameters.

The **no** and **undebug** variants of this command disable IPv6 OSPF packet debugging. Use this command without parameters to disable all options.

**Syntax**

```
debug ipv6 ospf packet [dd] [detail] [hello] [ls-ack]
[ls-request] [ls-update] [recv] [send]
```

```
no debug ipv6 ospf packet [dd] [detail] [hello] [ls-ack]
[ls-request] [ls-update] [recv] [send]
```

| Parameter | Description |
|---|---|
| `dd` | Specifies debugging for IPv6 OSPF database descriptions. |
| `detail` | Sets the debug option to detailed information. |
| `hello` | Specifies debugging for IPv6 OSPF hello packets. |
| `ls-ack` | Specifies debugging for IPv6 OSPF link state acknowledgments. |
| `ls-request` | Specifies debugging for IPv6 OSPF link state requests. |
| `ls-update` | Specifies debugging for IPv6 OSPF link state updates. |
| `recv` | Specifies the debug option set for received packets. |
| `send` | Specifies the debug option set for sent packets. |

**Mode** Privileged Exec and Global Configuration

**Examples** To enable debugging for hello packets, use the following command:

```
awplus# debug ipv6 ospf packet hello
```

**Related commands** terminal monitor

undebug ipv6 ospf packet

# debug ipv6 ospf route

**Overview** This command enables debugging of route calculation. Use this command without parameters to turn on all the options.

The **no** and **undebug** variants of this command disable IPv6 OSPF route debugging. Use this command without parameters to disable all options.

**Syntax**

```
debug ipv6 ospf route [ase] [ia] [install] [spf]
no debug ipv6 ospf route [ase] [ia] [install] [spf]
```

| Parameter | Description |
|---|---|
| `ase` | Specifies the debugging of external route calculation. |
| `ia` | Specifies the debugging of inter-area route calculation. |
| `install` | Specifies the debugging of route installation. |
| `spf` | Specifies the debugging of SPF calculation. |

**Mode** Privileged Exec and Global Configuration

**Examples** To enable IPv6 route debugging of inter-area route calculations, use the following command:

```
awplus# debug ipv6 ospf route ia
```

**Related commands** terminal monitor

undebug ipv6 ospf route

# default-information originate

**Overview** This command creates a default external route into an OSPF routing domain.

When you use the **default-information originate** command to redistribute routes into an OSPF routing domain, then the system acts like an Autonomous System Boundary Router (ASBR). By default, an ASBR does not generate a default route into the OSPF routing domain.

When using this command, also specify the **route-map** <*route-map*> option to avoid a dependency on the default network in the routing table.

The **metric-type** is an external link type associated with the default route advertised into the OSPF routing domain. The value of the external route could be either Type 1 or 2. The default is Type 2.

The **no** variant of this command disables this feature.

**Syntax**

```
default-information originate [always] [metric <metric>]
[metric-type <1-2>] [route-map <route-map>]
```

```
no default-information originate [always] [metric]
[metric-type] [route-map]
```

| Parameter | Description |
|---|---|
| `always` | Used to advertise the default route regardless of whether there is a default route. |
| *<metric>* | The metric value used in creating the default route. Enter a value in the range 0 to 16777214.<br>The default metric value is 10. The value used is specific to the protocol. |
| *<1-2>* | External metric type for default routes, either OSPF External Type 1 or Type 2 metrics. Enter the value 1 or 2. |
| `route-map` | Specifies to use a specific route-map. |
| *<route-map>* | The route-map name. It is a string comprised of any characters, numbers or symbols. |

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router ospf 100
awplus(config-router)# default-information originate always
metric 23 metric-type 2 route-map myinfo
```

**Related commands** route-map

# default-metric (IPv6 OSPF)

**Overview** This command sets default metric value for routes redistributed into the IPv6 OSPF routing protocol.

The **no** variant of this command returns IPv6 OSPF to using built-in, automatic metric translations, as appropriate for each routing protocol.

**Syntax**

```
default-metric <0-16777214>
no default-metric [<0-16777214>]
```

| Parameter | Description |
|---|---|
| *<1-16777214>* | Default metric value appropriate for the specified routing protocol. |

**Mode** Router Configuration

**Usage notes** A default metric facilitates redistributing routes even with incompatible metrics. If the metrics do not convert, the default metric provides an alternative and enables the redistribution to continue. The effect of this command is that IPv6 OSPF will use the same metric value for **all** redistributed routes. Use this command in conjunction with the redistribute (IPv6 OSPF) command.

**Examples**

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# default-metric 100
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# no default-metric
```

**Related commands** redistribute (IPv6 OSPF)

# distance (IPv6 OSPF)

**Overview** This command sets the administrative distance for OSPFv3 routes based on the route type. Your device uses this value to select between two or more routes to the same destination from two different routing protocols. The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). See the OSPFv3 Feature Overview and Configuration Guide for more information.

Use the command **distance ospfv3** to set the distance for an entire category of OSPFv3 routes, rather than the specific routes that pass an access list.

Use the command **distance <1-254>**, with no other parameter, to set the same distance for all OSPFv3 route types.

The **no** variant of this command sets the administrative distance for OSPFv3 routes to the default of 110.

**Syntax**

```
distance <1-254>
distance ospfv3 {external <1-254>|inter-area <1-254>|intra-area <1-254>}
no distance {ospfv3|<1-254>}
```

| Parameter | Description |
|---|---|
| *<1-254>* | Specify the Administrative Distance value for OSPFv3 routes. |
| `external` | Sets the distance for routes from other routing domains, learned by redistribution.<br>Specify an OSPFv3 external distance in the range *<1-254>*. |
| `inter-area` | Sets the distance for all routes from one area to another area.<br>Specify an OSPFv3 inter-area distance in the range*<1-254>*. |
| `intra-area` | Sets the distance for all routes within an area.<br>Specify an OSPFv3 intra-area distance in the range *<1-254>*. |

**Default** The default OSPFv3 administrative distance is 110. The default Administrative Distance for each type of route (intra, inter, or external) is 110.

**Mode** Router Configuration

**Usage notes** The administrative distance rates the trustworthiness of a routing information source. The distance could be any integer from 0 to 254. A higher distance value indicates a lower trust rating. For example, an administrative distance of 254 indicates that the routing information source cannot be trusted and should be ignored.

Use this command to set the distance for an entire group of routes, rather than a specific route that passes an access list.

**Examples** To set the following administrative distances for route types in OSPF 100:

- 20 for inter-area routes

- 10 for intra-area routes
- 40 for external routes

use the commands:

```
awplus(config)# router ipv6 ospf 100
awplus(config-router)# distance ospfv3 inter-area 20 intra-area
10 external 40
```

To set the administrative distance for all routes in OSPFv3 100 back to the default of 110, use the commands:

```
awplus(config)# router ipv6 ospf 100
awplus(config-router)# no distance ospfv3
```

# ipv6 ospf authentication spi

**Overview** Use this command in Interface Configuration mode to enable either MD5 (Message-Digest 5) or SHA1 (Secure Hash Algorithm 1) authentication for a specified interface.

Use the **no** variant of this command in Interface Configuration mode to disable the authentication configured for a specified interface.

**Syntax**

```
ipv6 ospf authentication ipsec spi <256-4294967295> {md5 <MD5-key>|sha1 <SHA1-key>}
ipv6 ospf authentication null
no ipv6 ospf authentication ipsec spi <256-4294967295>
```

| Parameter | Description |
|---|---|
| `authentication` | Specify this keyword to enable authentication. |
| `ipsec` | Specify this keyword to use IPsec authentication. |
| `spi` | Specify this keyword to set the SPI (Security Parameters Index). |
| *<256-4294967295>* | Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer. |
| `md5` | Specify the MD5 (Message-Digest 5) hashing algorithm. |
| *<MD5-key>* | Enter an MD5 key containing up to 32 hexadecimal characters. |
| `sha1` | Specify the SHA-1 (Secure Hash Algorithm 1) hashing algorithm. |
| *<SHA1-key>* | Enter an SHA-1 key containing up to 40 hexadecimal characters. |
| `null` | Specify no authentication is applied when no other parameters are applied after this keyword (`ipv6 ospf authentication null`). Note this overrides any existing area authentication configured. |

**Default** Authentication is not configured on an interface by default.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** Configure the same SPI (Security Parameters Index) value on all interfaces that connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

Use the **null** keyword to override existing area authentication. Apply the **null** keyword if area authentication is already configured to configure authentication on an interface.

See the OSPFv3 Feature Overview and Configuration Guide for more information and examples.

***NOTE:*** *You can configure an authentication security policy (SPI) on an interface with this command, or an OSPFv3 area with the area authentication ipsec spi command.*

*When you configure authentication for an area, the security policy is applied to all interfaces in the area. Allied Telesis recommends a different authentication security policy is applied to each interface for higher security.*

*If you apply the **ipv6 ospf authentication null** command, this affects authentication configured on both the interface and the OSPFv3 area.*

*This is due to OSPFv3 hello messages ingressing interfaces, which are part of area authentication, not being authenticated. So neighbors time out.*

**Example** To enable SHA-1 authentication with a 40 hexadecimal character key for interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 ospf authentication ipsec spi 1000 sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To specify no authentication is applied to interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 ospf authentication null
```

To disable authentication for interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ipv6 ospf authentication ipsec spi 1000
```

**Related commands**

area authentication ipsec spi

area encryption ipsec spi esp

ipv6 ospf encryption spi esp

show ipv6 ospf interface

# ipv6 ospf cost

**Overview** This command explicitly specifies the cost of the link-state metric in a router-LSA.

The interface cost indicates the overhead required to send packets across a certain interface. Use this command to set the interface cost manually.

The **no** variant of this command resets the interface cost to the default.

**Syntax**

```
ipv6 ospf cost <1-65535>
no ipv6 ospf cost
```

| Parameter | Description |
|---|---|
| *<1-65535>* | The link-state metric. |

**Default** By default there is no static value set and the OSPF cost is automatically calculated by using the command auto-cost reference bandwidth (IPv6 OSPF).

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** This command explicitly sets a user specified cost of sending packets out the interface. Using this command overrides the cost value calculated automatically with the auto-cost reference bandwidth (IPv6 OSPF) feature.

The link-state metric cost is stated in the Router-LSA's link. Typically, the cost is inversely proportional to the bandwidth of an interface. By default, the cost of an interface is calculated according to the following formula:

reference bandwidth / interface bandwidth

The reference bandwidth is set by default at 1000000 kbps (or 1000 Mbps), but can be changed by the command auto-cost reference bandwidth (IPv6 OSPF).

The interface bandwidth is set by default to 1000000 kbps (or 1000 Mbps), but can be changed by the bandwidth command.

**Example** To set the IPv6 OSPF cost to 10 on the interface ppp0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ipv6 ospf cost 10
```

**Related commands**

show ipv6 ospf interface

auto-cost reference bandwidth (IPv6 OSPF)

bandwidth

# ipv6 ospf dead-interval

**Overview** This command sets the interval during which no hello packets are received and after which a neighbor is declared dead.

The dead-interval is the amount of time that OSPF waits to receive an OSPF hello packet from the neighbor before declaring the neighbor is down. This value is advertised in the router's hello packets. It must be a multiple of the hello-interval and be the same for all routers on a specific network.

The **no** variant of this command returns the interval to the default of 40 seconds.

**Syntax**

```
ipv6 ospf dead-interval <1-65535> [<inst-id>]
no ipv6 ospf  dead-interval
```

| Parameter | Description |
|---|---|
| *<1-65535>* | The interval in seconds.<br>Default: 40 |
| *<inst-id>* | The instance ID<br>Default: 0 |

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Default** 40 seconds.

**Example** The following example shows configuring the dead-interval to 10 seconds on the interface eth1:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 ospf dead-interval 10
```

**Related commands**

ipv6 ospf hello-interval

show ipv6 ospf interface

# ipv6 ospf display route single-line

**Overview** Use this command to change the result of the **show ipv6 route** command to display each route entry on a single line.

**Syntax**

```
ipv6 ospf display route single-line
no ipv6 ospf display route single-line
```

**Mode** Global Configuration

**Example** To display each route entry on a single line.

```
awplus# configure terminal
awplus(config)# ipv6 ospf display route single-line
```

**Related commands** show ipv6 ospf route

# ipv6 ospf encryption spi esp

**Overview** Use this command in Interface Configuration mode to enable either AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) or 3DES (Triple Data Encryption Standard) ESP (Encapsulating Security Payload) encryption for a specified interface.

Use the **no** variant of this command in Interface Configuration mode to disable the encryption configured for a specified interface.

**Syntax**

```
ipv6 ospf encryption ipsec spi <256-4294967295> esp {aes-cbc
<AES-CBC-key>|3des <3DES-key>|null} {md5 <MD5-key>|sha1
<SHA1-key>}
```

```
ipv6 ospf encryption null
```

```
no ipv6 ospf encryption ipsec spi <256-4294967295>
```

| Parameter | Description |
|---|---|
| *<256-4294967295>* | Specify an SPI (Security Parameters Index) value in the range 256 to 4294967295, entered as a decimal integer. |
| `esp` | Specify the esp keyword (Encapsulating Security Payload) to then apply either AES-CBC or 3DES encryption. |
| `aes-cbc` | Specify this keyword to enable AES-CBC (Advanced Encryption Standard-Cipher Block Chaining) encryption. |
| *<AES-CBC-key>* | Enter an AES-CBC key containing either 32, 48, or 64 hexadecimal characters. |
| `3des` | Specify 3DES (Triple Data Encryption Standard) encryption. |
| *<3DES-key>* | Enter a 3DES key containing 48 hexadecimal characters. |
| `null` | Specify ESP without AES-CBC or 3DES encryption applied. |
| `md5` | Specify the MD5 (Message-Digest 5) encryption algorithm. |
| *<MD5-key>* | Enter an MD5 key containing 32 hexadecimal characters. |
| `sha1` | Specify the SHA-1 (Secure Hash Algorithm 1) encryption algorithm. |
| *<SHA1-key>* | Enter an SHA-1 key containing 40 hexadecimal characters. |
| `null` | Specify no encryption is applied when no other parameters are applied after this keyword (`ipv6 ospf encryption null`). |

**Default** Authentication is not configured on an interface by default.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** When you issue this command, authentication and encryption are both enabled. Configure the same SPI (Security Parameters Index) value on all interfaces that

connect to the same link. SPI values are used by link interfaces. Use a different SPI value for a different link interface when using OSPFv3 with link interfaces.

Security is achieved using the IPv6 ESP extension header. The IPv6 ESP extension header is used to provide confidentiality, integrity, authentication, and confidentiality. Authentication fields are removed from OSPF for IPv6 packet headers, so applying IPv6 ESP extension headers are required for integrity, authentication, and confidentiality.

Use the **null** keyword to override existing area encryption. Apply the **null** keyword if area encryption is already configured to then configure encryption on an interface instead.

Use the **sha1** keyword to choose SHA-1 authentication instead of entering the **md5** keyword to use MD5 authentication. The SHA-1 algorithm is more secure than the MD5 algorithm. SHA-1 uses a 40 hexadecimal character key instead of a 32 hexadecimal character key as used for MD5 authentication.

See the OSPFv3 Feature Overview and Configuration Guide for more information and examples.

***NOTE:*** *You can configure an encryption security policy (SPI) on an interface with this command, or an OSPFv3 area with the area encryption ipsec spi esp command.*

*When you configure encryption for an area, the security policy is applied to all interfaces in the area. Allied Telesis recommends a different encryption security policy is applied for each interface for higher security.*

*If you apply the **ipv6 ospf encryption null** command this affects encryption configured on both the interface and the OSPFv3 area.*

*This is due to OSPFv3 hello messages ingressing interfaces, which are part of area encryption, not being encrypted. So neighbors time out.*

**Example** To enable ESP encryption but not apply an AES-CBC key or a 3DES key, for interface eth1 and SHA-1 authentication with a 40 hexadecimal character key, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 ospf encryption ipsec spi 1000 esp null
sha1 1234567890ABCDEF1234567890ABCDEF12345678
```

To enable ESP encryption with an AES-CBC key with a 32 hexadecimal character key and SHA-1 authentication with a 40 hexadecimal character key for interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 ospf encryption ipsec spi 1000 esp
aes-cbc 1234567890ABCDEF1234567890ABCDEF sha1
1234567890ABCDEF1234567890ABCDEF12345678
```

To specify no ESP encryption is applied to interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 ospf encryption null
```

To disable ESP encryption for interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ipv6 ospf encryption ipsec spi 1000
```

**Related commands**

area authentication ipsec spi

area encryption ipsec spi esp

ipv6 ospf authentication spi

show ipv6 ospf interface

# ipv6 ospf hello-interval

**Overview** This command specifies the interval between hello packets.

The hello-interval is advertised in the hello packets. Configure the same hello-interval for all routers on a specific network. A shorter interval ensures faster detection of topological changes, but results in more routing traffic.

The **no** variant of this command returns the interval to the default of 10 seconds.

**Syntax**

```
ipv6 ospf hello-interval <1-65535>
no ipv6 ospf hello-interval
```

| Parameter | Description |
|---|---|
| *<1-65535>* | The hello-interval in seconds.<br>Default: `10` |

**Default** The default interval is 10 seconds.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Example** The following example shows setting the hello-interval to 3 seconds on the interface eth1:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 ospf hello-interval 3
```

**Related commands**

ipv6 ospf dead-interval

show ipv6 ospf interface

# ipv6 ospf neighbor

**Overview** Use this command to configure static OSPFv3 IPv6 neighbors when using the OSPFv3 "non-broadcast" (NBMA) and "point-to-multipoint non-broadcast" (P2MP NBMA) network types. OSPFv3 messages exchanged between the neighbors are unicast only.

Use the **no** variant of this command to remove a configuration.

**Syntax**

```
ipv6 ospf neighbor <ipv6-address>
[<cost>|<instance-id>|<poll-interval>|<priority>]

no ipv6 ospf neighbor <ipv6-address>
[<cost>|<instacne-id>|<poll-interval>|<priority>]
```

| Parameter | Description |
|---|---|
| *<ipv6-address>* | Specifies the interface IPv6 address of the neighbor. |
| *<cost>* | *cost <1-65535>*<br>OSPF cost for point-to-multipoint neighbor. |
| *<instance-id>* | *instance-id <0-255>*<br>Interface instance ID. |
| *<poll-interval>* | *poll-interval <0-4294967295>*<br>Dead neighbor polling interval in seconds. It is recommended to set this value much higher than the hello interval. The default is 120 seconds. |
| *<priority>* | *priority <0-255>*<br>Specifies the router priority value of the non-broadcast neighbor associated with the specified IP address. The default is 0. This keyword does not apply to point-to-multipoint interfaces. |

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** To configure a neighbor on an NBMA network manually, use the **ipv6 ospf neighbor** command and include one neighbor entry for each known non-broadcast network neighbor. The IPv6 address used in this command is the neighbor's primary IPv6 address on the interface where that neighbor connects to the NBMA network.

The poll interval is the reduced rate at which routers continue to send hello packets, when a neighboring router has become inactive. Set the poll interval to be much larger than the hello interval.

**Examples** To configure a neighbor with a priority value, poll interval time, and cost, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 ospf neighbor fe80::c:20:0:1 priority 1
poll-interval 90
awplus(config-router)# ipv6 ospf neighbor fe80::c:20:0:1 cost
15
```

**Related commands** show ipv6 ospf neighbor

# ipv6 ospf network

**Overview** This command configures the OSPF network type to a type different from the default for the particular interface.

The **no** variant of this command returns the network type to the default for the particular interface.

**Syntax**

```
ipv6 ospf network {broadcast|non-broadcast|point-to-point|
point-to-multipoint}
```

```
no ipv6 ospf network
```

| Parameter | Description |
|---|---|
| `broadcast` | Sets the network type to broadcast. |
| `non-broadcast` | Sets the network type to NBMA. |
| `point-to-multipoint` | Sets the network type to point-to-multipoint. |
| `point-to-point` | Sets the network type to point-to-point. |

**Default** The default is the default type for the interface, e.g broadcast for VLANs.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** This command forces the interface network type to be the specified type. Depending on the network type, OSPF changes the behavior of the packet transmission and the link description in LSAs.

**Example** The following example shows setting the network type to point-to-point on the interface eth1:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 ospf network point-to-point
```

# ipv6 ospf priority

**Overview** This command sets the router priority, which is a parameter used in the election of the designated router for the link.

The **no** variant of this command returns the router priority to the default of 1.

**Syntax**

```
ipv6 ospf priority <priority>
no ipv6 ospf priority
```

| Parameter | Description |
|---|---|
| *<priority>* | *<0-255>*<br>Specifies the router priority of the interface. The larger the value, the greater the priority level. The value 0 defines that the device cannot become either the DR, or backup DR for the link. |

**Default** The default priority is 1.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage** Set the priority to help determine the OSPF Designated Router (DR) for a link. If two routers attempt to become the DR, the router with the higher router priority becomes the DR. If the router priority is the same for two routers, the router with the higher router ID takes precedence.

Routers with zero router priority values cannot become the designated or backup designated router.

**Example** The following example shows setting the OSPFv3 priority value to 3 on the interface eth1:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 ospf priority 3
```

# ipv6 ospf retransmit-interval

**Overview** Use this command to specify the time between link-state advertisement (LSA) retransmissions for adjacencies belonging to the interface.

Use the **no** variant of this command to return to the default of 5 seconds.

**Syntax**

```
ipv6 ospf retransmit-interval <1-65535>
no ipv6 ospf retransmit-interval
```

| Parameter | Description |
|---|---|
| *<1-65535>* | Specifies the interval in seconds. |

**Default** The default interval is 5 seconds.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage** After sending an LSA to a neighbor, the router keeps the LSA until it receives an acknowledgment. In case the router does not receive an acknowledgment during the set time (the retransmit interval value) it retransmits the LSA. Set the retransmission interval value conservatively to avoid needless retransmission. The interval should be greater than the expected round-trip delay between two routers.

**Example** The following example shows setting the OSPF retransmit interval to 6 seconds on the interface eth1:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 ospf retransmit-interval 6
```

# ipv6 ospf transmit-delay

**Overview** Use this command to set the estimated time it takes to transmit a link-state-update packet on the interface.

Use the **no** variant of this command to return to the default of 1 second.

**Syntax**

```
ipv6 ospf transmit-delay <1-65535>
no ipv6 ospf transmit-delay
```

| Parameter | Description |
|---|---|
| *<1-65535>* | Specifies the time, in seconds, to transmit a link-state update. |

**Default** The default interval is 1 second.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage** The transmit delay value adds a specified time to the age field of an update. If the delay is not added, the time in which the LSA transmits over the link is not considered. This command is especially useful for low speed links. Add transmission and propagation delays when setting the transmit delay value.

**Example** To set the IPv6 OSPF transmit delay time to 3 seconds on the interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 ospf transmit-delay 3
```

# ipv6 router ospf area

**Overview** Use this command to enable IPv6 OSPF routing on an interface.

Use the **no** variant of this command to disable IPv6 OSPF routing on an interface.

**Syntax**

```
ipv6 router ospf area <area-id> [tag <process-id>] [instance <instance-id>]
no ipv6 router ospf area <area-id>
```

| Parameter | Description |
|---|---|
| *<area-id>* | The ID of the IPv6 OSPF routing area. Can be entered as either an IPv4 A.B.C.D address format, or as an unsigned integer in the range, 0 to 4294967295. Use either of the following forms when entering an area-ID:<br>• `area-id` *<A.B.C.D>* where A.B.C.D is a number entered in IPv4 address format.<br>• `area-id` <0 to 4294967295>. |
| *<process-id>* | The process tag denotes a separate router process. It can comprise any string of alphanumeric characters.<br>Note that this tag is local to the router on which it is set and does not appear in any OSPF packets or LSA. |
| *<instance-id>* | The OSPF instance ID, entered as an integer between 0 and 255. This is the value that will appear in the instance field of the IPv6 OSPF hello packet. |

**Defaults** IPv6 OSPF routing is disabled by default.

When enabling IPv6 OSPF routing:

- the process-tag will default to a null value if not set.
- the Instance ID defaults to 0 if not set.

**Mode** Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a PPP interface, a bridge, or a tunnel.

**Usage notes** When enabling IPv6 OSPF routing on an interface, specifying the area-ID is mandatory, but the Process tag and Instance are optional.

See the OSPFv3 Feature Overview and Configuration Guide for more information and examples.

**Examples** To enable IPv6 OSPF on interface eth1 in OSPF area 1, with a tag of 'PT2', and instance 2, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 router ospf area 1 tag PT2 instance-id 2
```

To disable IPv6 OSPF on interface eth1 and OSPF area 1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no ipv6 router ospf area 1
```

# max-concurrent-dd (IPv6 OSPF)

**Overview** Use this command to limit the number of neighbors that can be concurrently processed in the database exchange. The specified value limits the number of neighbors from all interfaces, not per interface.

Use the **no** variant of this command to have no limit on the maximum number of LSAs.

**Syntax**

```
max-concurrent-dd <max-neighbors>
no max-concurrent-dd
```

| Parameter | Description |
|---|---|
| *<max-neighbors>* | <1-65535> The maximum number of neighbors. |

**Mode** Router Configuration

**Usage notes** This command is useful where bringing up several adjacencies on a router is affecting performance. In this situation, you can often enhance the system performance by limiting the number of neighbors that can be processed concurrently.

**Example** The following example sets the max-concurrent-dd value to allow only 4 neighbors to be processed at a time.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# max-concurrent-dd 4
```

**Related commands** router ipv6 ospf

# passive-interface (IPv6 OSPF)

**Overview** Use this command to suppress the sending of Hello packets on a specified interface. If you use the **passive-interface** command without the optional parameters then all interfaces are put into passive mode.

Use the **no** variant of this command to allow the sending of Hello packets on all interfaces, or on the specified interface. If you use the **no** variant of this command without the optional parameters then all interfaces are removed from passive mode.

**Syntax**

```
passive-interface [<interface>]
no passive-interface [<interface>]
```

| Parameter | Description |
|---|---|
| *<interface>* | The name of the interface. |

**Mode** Router Configuration

**Usage** Configure an interface to be passive if you wish its connected route to be treated as an OSPF route (rather than an AS-external route), but do not wish to actually exchange any OSPF packets via this interface.

**Examples** To configure passive interface mode on all interfaces, enter the following commands:

```
awplus(config)# router ipv6 ospf
awplus(config-router)# passive-interface
```

To configure passive interface mode on the local loopback interface, enter the following commands:

```
awplus(config)# router ipv6 ospf
awplus(config-router)# passive-interface lo
```

To remove passive interface mode from all interfaces, enter the following commands:

```
awplus(config)# router ipv6 ospf
awplus(config-router)# no passive-interface
```

# redistribute (IPv6 OSPF)

**Overview** Use this command to redistribute routes from other routing protocols, static routes and connected routes into an IPv6 OSPF routing table.

Use the **no** variant of this command to disable this function.

**Syntax**

```
redistribute <protocol>} [metric <0-16777214>] [metric-type
{1|2}] [route-map <route-map-entry>]
no redistribute <protocol>
```

| Parameter | Description | |
|---|---|---|
| *<protocol>* | The routing protocol to be redistributed, can be one of: | |
| | `connected` | Connected routes |
| | `rip` | Routing Internet Protocol |
| | `static` | Static Routes |
| `metric` | Specifies the external metric. | |
| `metric-type` | Specifies the external metric-type, either type 1 or type 2.<br>• **For Metric Type 1:** The best route is based on the external redistributed path cost plus the internal path cost presented by the native routing protocol.<br>• **For Metric Type 2:** The best route is based only on the external redistributed path cost. The internal path cost is only used to break a "tie" situation between two identical external path costs. | |
| `route-map` | The name of the specific route-map. | |

**Default** The default metric value for routes redistributed into OSPFv3 is 20. The metric can also be defined using the set metric command for a route map. Note that a metric defined using the set metric command for a route map overrides a metric defined with this command.

**Mode** Router Configuration

**Usage notes** You use this command to inject routes, learned from other routing protocols, into the OSPF domain to generate AS-external-LSAs. If a route-map is configured by this command, then that route-map is used to control which routes are redistributed and can set metric and tag values on particular routes.

The metric, metric-type, and tag values specified on this command are applied to any redistributed routes that are not explicitly given a different metric, metric-type, or tag value by the route map.

See the OSPFv3 Feature Overview and Configuration Guide for more information about metrics, and about behavior when configured in route maps.

Note that this command does not redistribute the default route. To redistribute the default route, use the default-information originate command.

**Example** The following example shows the redistribution of RIP routes into the IPv6 OSPF routing table, with a metric of 10 and a metric type of 1.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# redistribute rip metric 10 metric-type 1
```

# restart ipv6 ospf graceful

**Overview** Use this command to force the OSPFv3 process to restart. You may optionally specify a grace-period value. If a grace-period is not specified then a default value of 120 seconds is applied.

You should specify a grace-period value of 120 seconds or more. Low grace-period values may cause the graceful restart process on neighboring routers to terminate with routes missing.

**Syntax**

```
restart ipv6 ospf graceful [grace-period <1-1800>]
```

| Parameter | Description |
|---|---|
| `grace-period` | Specify the grace period. |
| *<1-1800>* | The grace period in seconds. |

**Default** The default OSPF grace-period is 120 seconds.

**Mode** Privileged Exec

**Usage notes** After this command is executed, the OSPFv3 process immediately shuts down. It notifies the system that OSPF has performed a graceful shutdown. Routes installed by OSPF are preserved until the grace-period expires.

When a **restart ospf graceful** command is issued, the OSPF configuration is reloaded from the last saved configuration. Ensure you first enter the copy running-config startup- config command.

**Example** To restart OSPFv3, use the following commands:

```
awplus# copy running-config startup-config
awplus# restart ipv6 ospf graceful grace-period 200
```

To apply the default grace-period (120 seconds), use the following commands:

```
awplus# copy running-config startup-config
awplus# restart ipv6 ospf graceful
```

# router ipv6 ospf

**Overview** Use this command to create or remove an IPv6 OSPF routing process, or to enter the Router Configuration mode to configure a specific IPv6 OSPF routing process. Use the **no** variant of this command to terminate an IPv6 OSPF routing process.

Use the **no** parameter with the **process-id** parameter, to terminate and delete a specific IPv6 OSPF routing process.

**Syntax**

```
router ipv6 ospf [<process-id>]
no router ipv6 ospf [<process-id>]
```

| Parameter | Description |
|---|---|
| *<process-id>* | A character string that identifies a routing process.<br>If you do not specify the process-id a "null" process ID will be applied.<br>Note that this will appear in show output as *null* However you cannot select the null process by using the character string *null* as command entry characters. |

**Default** No routing process is defined by default.

**Mode** Global Configuration

**Usage notes** The process ID enables you to run more than one OSPF session within the same router, then configure each session to a different router port. Note that this function is internal to the router, and other routers (neighbors) have no knowledge of these different processes. The hello and LSAs issued from each process will appear as if coming from a separate physical router.

To a large extent the requirement for multiple processes has been replaced by the ability within IPv6 OSPF of running simultaneous router instances.

The process ID of IPv6 OSPF is an optional parameter for the **no** variant of this command only. When removing all IPv6 OSPF processes on the device, you do not need to specify each Process ID, but when removing particular IPv6 OSPF processes, you must specify each Process ID to be removed.

For a description of processes and instances and their configuration relationships, see the OSPFv3 Feature Overview and Configuration Guide.

**Example** This example shows the use of this command to enter Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf P100
awplus(config-router)#
```

# router-id (IPv6 OSPF)

**Overview** Use this command to specify a router ID for the IPv6 OSPF process.

Use the **no** variant of this command to disable this function.

**Syntax**

```
router-id <router-id>
no router-id
```

| Parameter | Description |
|---|---|
| *<router-id>* | Specifies the router ID in IPv4 address format. |

**Mode** Router Configuration

**Usage** Configure each router with a unique router-id. In an IPv6 OSPF router process that has active neighbors, a new router-id takes effect at the next reload or when you restart OSPF manually.

**Example** The following example shows a specified router ID 0.0.4.5.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# router-id 0.0.4.5
```

**Related commands** show ipv6 ospf

# show debugging ipv6 ospf

**Overview** Use this command to see what debugging is turned on for OSPFv3.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

**Syntax**

```
show debugging ipv6 ospf
```

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show debugging ipv6 ospf
```

**Output** Figure 31-1: Example output from the **show debugging ipv6 ospf** command

```
OSPFv3 debugging status:
  OSPFv3 all packet detail debugging is on
  OSPFv3 all IFSM debugging is on
  OSPFv3 all NFSM debugging is on
  OSPFv3 all LSA debugging is on
  OSPFv3 all NSM debugging is on
  OSPFv3 all route calculation debugging is on
  OSPFv3 all event debugging is on
```

# show ipv6 ospf

**Overview** Use this command in User Exec or Privileged Exec modes to display general information about all IPv6 OSPF routing processes, including OSPFv3 Authentication configuration and status information.

Include the process ID parameter with this command to display information about specified processes.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ipv6 ospf
show ipv6 ospf <process-id>
```

| Parameter | Description |
|---|---|
| *<process-id>* | *<0-65535>*<br>The ID of the router process for which information will be displayed. If this parameter is included, only the information for the specified routing process is displayed. |

**Mode** User Exec and Privileged Exec

**Examples** To display general information about all IPv6 OSPF routing processes, use the command:

```
awplus# show ipv6 ospf
```

To display general information about IPv6 OSPF (OSPFv3) routing process `P10`, use the command:

```
awplus# show ipv6 ospf P10
```

**Output** Figure 31-2: Example output from the **show ipv6 ospf** command for process P10, showing OSPFv3 Authentication configuration information highlighted in bold

```
 awplus#show ipv6 ospf
  Routing Process "OSPFv3 (10)" with ID 192.168.1.2
  Route Licence: Route : Limit=Unlimited, Allocated=0, Visible=0,
Internal=0
  Route Licence: Breach: Current=0, Watermark=0
  Process uptime is 6 minutes
  Current grace period is 120 secs (default)
  SPF schedule delay min 0.500 secs, SPF schedule delay max 50.0
secs
  Minimum LSA interval 5 secs, Minimum LSA arrival 1 secs
  Number of incoming current DD exchange neighbors 0/5
  Number of outgoing current DD exchange neighbors 0/5
  Number of external LSA 0. Checksum Sum 0x0000
  Number of AS-Scoped Unknown LSA 0
  Number of LSA originated 4
  Number of LSA received 10
  Number of areas in this router is 1
     Area BACKBONE(0)
         Number of interfaces in this area is 1(1)
         MD5 Authentication SPI 1000
         NULL Encryption SHA-1 Auth, SPI 1001
         SPF algorithm executed 9 times
         Number of LSA 3.  Checksum Sum 0xF9CC
         Number of Unknown LSA 0
```

# show ipv6 ospf database

**Overview** Use this command in User Exec or Privileged Exec modes to display a database summary for IPv6 OSPF information. Include the process ID parameter with this command to display information about specified processes.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ipv6 ospf <process-id> database
[self-originate|max-age|adv router <adv-router-id>]
```

| Parameter | Description |
|---|---|
| *<process-id>* | *<0-65535>*<br>The ID of the router process for which information will be displayed. |
| `self-originate` | Displays self-originated link states. |
| `max-age` | Displays LSAs in MaxAge list. It maintains the list of the all LSAs in the database which have reached the max-age which is 3600 seconds. |
| `adv-router` | Advertising Router LSA. |
| *<adv-router-id>* | The Advertising Router ID<br>(usually entered in IPv4 address format A.B.C.D).<br>Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format. |

**Mode** User Exec and Privileged Exec

**Example** To display the database summary for IPv6 OSPF information on process `P10`, use the command:

```
awplus# show ipv6 ospf P10 database
```

**Output** Figure 31-3: Example output from the **show ipv6 ospf P10 database** command

```
OSPFv3 Router with ID (0.0.1.1) (Process P10)

                Link-LSA (Interface eth1)

Link State ID   ADV Router      Age  Seq#       CkSum  Prefix
0.0.0.202       0.0.1.1          46 0x800000c3 0x5f50      1
0.0.0.202       0.0.1.2           8 0x800000c3 0x4ca0      1
...
```

# show ipv6 ospf database external

**Overview** Use this command in User Exec or Privileged Exec modes to display information about the external LSAs.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ipv6 ospf database external <adv-router-id>
[self-originate|adv-router <adv-router-id>]
```

| Parameter | Description |
|---|---|
| *<adv-router-id>* | The Advertising Router ID<br>(usually entered in IPv4 address format A.B.C.D).<br>Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format. |
| `self-originate` | Self-originated link states. |
| `adv-router` | Displays all the LSAs of the specified router. |

**Mode** User Exec and Privileged Exec

**Examples** To display information about the external LSAs, use the following command:

```
awplus# show ipv6 ospf database external adv-router 10.10.10.1
```

**Output** Figure 31-4: Example output from the **show ipv6 ospf database external** command

```
LS age: 1087
  LS Type: AS-External-LSA
  Link State ID: 0.0.0.13
  Advertising Router: 0.0.1.1
  LS Seq Number: 0x8000000C
  Checksum: 0xCE9D
  Length: 52
    Metric Type: 2 (Larger than any link state path)
    Metric: 20
    Prefix: 2010:2222::/64
    Prefix Options: 0 (-|-|-|-)
    Forwarding Address: 2003:1111::1
...
```

# show ipv6 ospf database grace

**Overview** Use this command in User Exec or Privileged Exec modes to display information about the grace LSAs.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ipv6 ospf database grace <adv-router-id>
[self-originate|adv-router <adv-router-id>]
```

| Parameter | Description |
|---|---|
| *<adv-router-id>* | The Advertising Router ID<br>(usually entered in IPv4 address format A.B.C.D).<br>Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format. |
| adv-router | Displays all the LSAs of the specified router. |
| self-originate | Self-originated link states. |

**Mode** User Exec and Privileged Exec

**Examples** To display information about the grace LSAs, use the following command:

```
awplus# show ipv6 ospf database grace adv-router 10.10.10.1
```

**Output** Figure 31-5: Example output from the **show ipv6 ospf database grace** command

```
LS age: 1087
  LS Type: AS-External-LSA
  Link State ID: 0.0.0.13
  Advertising Router: 0.0.1.1
  LS Seq Number: 0x8000000C
  Checksum: 0xCE9D
  Length: 52
    Metric Type: 2 (Larger than any link state path)
    Metric: 20
    Prefix: 2010:2222::/64
    Prefix Options: 0 (-|-|-|-)
    Forwarding Address: 2003:1111::1
```

# show ipv6 ospf database inter-prefix

**Overview** Use this command in User Exec or Privileged Exec modes to display information about the inter-prefix LSAs.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ipv6 ospf database inter-prefix <adv-router-id>
[self-originate|adv-router <adv-router-id>]
```

| Parameter | Description |
|---|---|
| *<adv-router-id>* | The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format. |
| `adv-router` | Displays all the LSAs of the specified router. |
| `self-originate` | Self-originated link states. |

**Mode** User Exec and Privileged Exec

**Examples** To display information about the inter-prefix LSAs, use the following command:

```
awplus# show ipv6 ospf database external adv-router 10.10.10.1
```

**Output** Figure 31-6: Example output from the **show ipv6 ospf database inter-prefix** command

```
LS age: 1087
  LS Type: AS-External-LSA
  Link State ID: 0.0.0.13
  Advertising Router: 0.0.1.1
  LS Seq Number: 0x8000000C
  Checksum: 0xCE9D
  Length: 52
    Metric Type: 2 (Larger than any link state path)
    Metric: 20
    Prefix: 2010:2222::/64
    Prefix Options: 0 (-|-|-|-)
    Forwarding Address: 2003:1111::1
...
```

# show ipv6 ospf database inter-router

**Overview** Use this command in User Exec or Privileged Exec modes to display information about the inter-router LSAs.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ipv6 ospf database inter-router <adv-router-id>
[self-originate| adv-router <adv-router-id>]
```

| Parameter | Description |
|---|---|
| *<adv-router-id>* | The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format. |
| adv-router | Displays all the LSAs of the specified router. |
| self-originate | Self-originated link states. |

**Mode** User Exec and Privileged Exec

**Examples** To display information about the inter-router LSAs, use the following command:

```
awplus# show ipv6 ospf database inter-router adv-router
10.10.10.1
```

**Output** Figure 31-7: Example output from the **show ipv6 ospf database inter-router** command

```
LS age: 1087
  LS Type: AS-External-LSA
  Link State ID: 0.0.0.13
  Advertising Router: 0.0.1.1
  LS Seq Number: 0x8000000C
  Checksum: 0xCE9D
  Length: 52
    Metric Type: 2 (Larger than any link state path)
    Metric: 20
    Prefix: 2010:2222::/64
    Prefix Options: 0 (-|-|-|-)
    Forwarding Address: 2003:1111::1
...
```

# show ipv6 ospf database intra-prefix

**Overview** Use this command in User Exec or Privileged Exec modes to display information about the intra-prefix LSAs.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ipv6 ospf database intra-prefix <adv-router-id>
[self-originate|adv-router <adv-router-id>]
```

| Parameter | Description |
|---|---|
| *<adv-router-id>* | The Advertising Router ID (usually entered in IPv4 address format A.B.C.D). Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format. |
| adv-router | Displays all the LSAs of the specified router. |
| self-originate | Self-originated link states. |

**Mode** User Exec and Privileged Exec

**Examples** To display information about the intra-prefix LSAs, use the following command:

```
awplus# show ipv6 ospf database intra-prefix adv-router
10.10.10.1
```

**Output** Figure 31-8: Example output from the **show ipv6 ospf database intra-prefix** command

```
LS age: 1087
  LS Type: AS-External-LSA
  Link State ID: 0.0.0.13
  Advertising Router: 0.0.1.1
  LS Seq Number: 0x8000000C
  Checksum: 0xCE9D
  Length: 52
    Metric Type: 2 (Larger than any link state path)
    Metric: 20
    Prefix: 2010:2222::/64
    Prefix Options: 0 (-|-|-|-)
    Forwarding Address: 2003:1111::1
...
```

# show ipv6 ospf database link

**Overview** Use this command in User Exec or Privileged Exec modes to display information about the link LSAs.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ipv6 ospf database link <adv-router-id>
[self-originate|adv-router <adv-router-id>]
```

| Parameter | Description |
|---|---|
| *<adv-router-id>* | The Advertising Router ID<br>(usually entered in IPv4 address format A.B.C.D).<br>Note that this ID component no longer represents an address; it is simply a character string that has an IPv4 address format. |
| adv-router | Displays all the LSAs of the specified router. |
| self-originate | Self-originated link states. |

**Mode** User Exec and Privileged Exec

**Examples** To display information about the link LSAs, use the following command:

```
awplus# show ipv6 ospf database link adv-router 10.10.10.1
```

**Output** Figure 31-9: Example output from the s**how ipv6 ospf database link** command

```
LS age: 1087
  LS Type: AS-External-LSA
  Link State ID: 0.0.0.13
  Advertising Router: 0.0.1.1
  LS Seq Number: 0x8000000C
  Checksum: 0xCE9D
  Length: 52
    Metric Type: 2 (Larger than any link state path)
    Metric: 20
    Prefix: 2010:2222::/64
    Prefix Options: 0 (-|-|-|-)
    Forwarding Address: 2003:1111::1
...
```

# show ipv6 ospf database network

**Overview** Use this command in User Exec or Privileged Exec modes to display information about the network LSAs.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ipv6 ospf database network <adv-router-id>
[self-originate|adv-router <adv-router-id>]
```

| Parameter | Description |
|---|---|
| *<adv-router-id>* | The router ID of the advertising router, in IPv4 address format. Note, however, that this no longer represents a real address. |
| `self-originate` | Self-originated link states. |
| `adv-router` | The advertising router selected. |

**Mode** User Exec and Privileged Exec

**Examples** To display information about the OSPFv3 network LSAs, use the following command:

```
awplus# show ipv6 ospf database network
```

**Output** Figure 31-10: Example output from the **show ipv6 ospf database network** command

```
OSPFv3 Router with ID (0.0.1.1) (Process P10)

                Network-LSA (Area 0.0.0.0)

# show ipv6 ospf database router

**Overview** Use this command in User Exec or Privileged Exec modes to display information only about the router LSAs.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ipv6 ospf database router <adv-router-id>
[self-originate|adv-router <adv-router-id>]
```

| Parameter | Description |
|---|---|
| *<adv-router-id>* | The router ID of the advertising router, in IPv4 address format. Note, however, that this no longer represents a real address. |
| `self-originate` | Self-originated link states. |
| `adv-router` | The advertising router selected. |

**Mode** User Exec and Privileged Exec

**Examples** To display information about the OSPFv3 router LSAs, use the following command:

```
awplus# show ipv6 ospf database router
```

**Output** Figure 31-11: Example output from the **show ipv6 ospf database router** command

```

# show ipv6 ospf interface

**Overview** Use this command in User Exec or Privileged Exec modes to display interface information for OSPF for all interfaces or a specified interface, including OSPFv3 Authentication status for all interfaces or for a specified interface.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ipv6 ospf interface [<interface-name>]
```

| Parameter | Description |
|---|---|
| *<interface-name>* | An alphanumeric string that is the interface name. Omit the optional interface to display information for all interfaces. |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ipv6 ospf interface
```

**Output** Figure 31-12: Example output from the **show ipv6 ospf interface** command showing OSPFv3 Authentication configuration information highlighted in bold

```
awplus#show ipv6 ospf interface
 eth1 is up, line protocol is up
   Interface ID 302
   IPv6 Prefixes
     fe80::215:77ff:fead:f87e/64 (Link-Local Address)

# show ipv6 ospf neighbor

**Overview** Use this command in User Exec or Privileged Exec modes to display information on OSPF neighbors. Include the process ID parameter with this command to display information about specified processes.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ipv6 ospf [<process-id>] neighbor <neighbor-id>
show ipv6 ospf [<process-id>] neighbor detail
show ipv6 ospf [<process-id>] neighbor <interface> [detail]
```

| Parameter | Description |
|---|---|
| *<process-id>* | *<character string>*<br>The ID of the OSPF process for which information will be displayed. |
| *<neighbor-id>* | The Neighbor ID, entered in IP address (A.B.C.D) format. |
| detail | Detail of all neighbors. |
| *<interface>* | IP address of the interface. |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ipv6 ospf neighbor
```

**Output** Figure 31-13: Example output from **show ipv6 ospf neighbor**

```
awplus#show ipv6 ospf P1 neighbor 2.2.2.2
OSPFv3 Process (P1)
Neighbor ID     Pri       State                 Dead Time   Interface Instance ID
2.2.2.2         5         2-Way/DROther         00:00:33    eth1              0
```

Figure 31-14: Example output from **show ipv6 ospf neighbor detail**

```
awplus#show ipv6 ospf neighbor detail
Neighbor 0.0.1.2, interface address fe80::215:77ff:fec9:7472
   In the area 0.0.0.0 via interface eth1
   Neighbor priority is 1, State is Full, 6 state changes
   DR is 0.0.1.2     BDR is 0.0.1.1
   Options is 0x000013 (-|R|-|-|E|V6)
   Dead timer due in 00:00:33
   Database Summary List 0
   Link State Request List 0
   Link State Retransmission List 0
```

# show ipv6 ospf route

**Overview** Use this command in User Exec or Privileged Exec modes to display the OSPF routing table. Include the process ID parameter with this command to display the OSPF routing table for specified processes.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ipv6 ospf [<process-id>] route
```

| Parameter | Description |
|---|---|
| *<process-id>* | A character string that specifies the router process. If this parameter is included, only the information for this specified routing process is displayed. |

**Mode** User Exec and Privileged Exec

**Examples** To display the whole OSPF routing table, use the command:

```
awplus# show ipv6 ospf route
```

**Output** Figure 31-15: Example output from the **show ipv6 ospf P1 route** command for a specific process

```
OSPFv3 Process (P1)
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
E1 - OSPF external type 1, E2 - OSPF external type 2

Destination Metric
Next-hop
O  2002:1111::/64  2
via fe80::200:cdff:fe24:daae, eth1, Area 0.0.0.0
...
```

# show ipv6 ospf virtual-links

**Overview** Use this command in User Exec or Privileged Exec modes to display virtual link information, including OSPFv3 Authentication status for virtual links.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ipv6 ospf virtual-links
```

**Mode** User Exec and Privileged Exec

**Usage notes** See the OSPFv3 Feature Overview and Configuration Guide for more information and examples.

**Examples** To display virtual link information, use the command:

```
awplus# show ipv6 ospf virtual-links
```

**Output** Figure 31-16: Example output from the **show ipv6 ospf virtual-links** command showing OSPFv3 Authentication configuration information highlighted in bold

```
awplus#show ipv6 ospf virtual-links
 Virtual Link VLINK1 to router 192.168.1.10 is down
   Transit area 0.0.0.1 via interface *, instance ID 0
   Local address
   Remote address
   MD5 Authentication SPI 1000
   NULL encryption SHA-1 auth SPI 1001
   Transmit Delay is 1 sec, State Down,
   Timer intervals configured, Hello 10, Dead 40, Wait 40,
Retransmit 5
     Hello due in inactive
     Adjacency state Down
```

# summary-address (IPv6 OSPF)

**Overview** Use this command in Router Configuration mode to summarize, or possibly suppress, external redistributed OSPFv3 routes within the specified address range.

Use the **no** variant of this command in Router Configuration mode to stop summarizing, or suppressing, external redistributed OSPFv3 routes within the specified address range.

**Syntax**

```
summary-address <ipv6-addr/prefix-length> [not-advertise] [tag
<0-4294967295>]
```

```
no summary-address <ipv6-addr/prefix-length> [not-advertise]
[tag <0-4294967295>]
```

| Parameter | Description |
|---|---|
| *<ipv6-addr/prefix-length>* | Specifies the base IPv6 address of the IPv6 summary address. The range of addresses given as IPv6 starting address and an IPv6 prefix length. |
| `not-advertise` | Set the **not-advertise** option if you do not want OSPFv3 to advertise either the summary address or the individual networks within the range of the summary address. |
| `tag <0-4294967295>` | The tag parameter specifies the tag value that OSPFv3 places in the AS external LSAs created as a result of redistributing the summary route. The tag overrides tags set by the original route. |

**Default** The default tag value for a summary address is 0.

**Mode** Router Configuration

**Usage** An address range is a pairing of an address and a prefix length. Redistributing routes from other protocols into OSPFv3 requires the router to advertise each route individually in an external LSA. Use this command to advertise one summary route for all redistributed routes covered by a specified prefix to decrease the size of the OSPFv3 link state database.

For example, if the specified address range is 2001:0db8:44::/48, then summary-address functionality will match 2001:0db8:4400:0000::1/128 through 2001:0db8:44ff:ffff::1/128.

Ensure OSPFv3 routes exist in the summary address range for advertisement before using this command.

**Example** The following example uses the `summary-address` command to aggregate external LSAs that match the IPv6 prefix `2001:0db8::/32` and assigns a tag value of `3`.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# summary-address 2001:0db8::/32 tag 3
```

The following example uses the `no summary-address` command to stop summarizing IPv6 addresses in the address range covered within the IPv6 prefix `2001:0db8::/32`.

```
awplus# configure terminal
awplus(config)# router ipv6 ospf
awplus(config-router)# no summary-address 2001:0db8::/32
```

# timers spf exp (IPv6 OSPF)

**Overview** Use this command to adjust route calculation timers using exponential back-off delays.

Use **no** form of this command to return to the default exponential back-off timer values.

**Syntax**

```
timers spf exp <min-holdtime> <max-holdtime>
no timers spf exp <min-holdtime> <max-holdtime>
```

| Parameter | Description |
|---|---|
| *<min-holdtime>* | Specifies the minimum delay between receiving a change to the SPF calculation in milliseconds. The range is 0-2147483647. The default SPF min-holdtime value is 50 milliseconds. |
| *<max-holdtime>* | Specifies the maximum delay between receiving a change to the SPF calculation in milliseconds. The range is 0-2147483647. The default SPF max-holdtime value is 50 seconds. |

**Mode** Router Configuration

**Usage notes** This command configures the minimum and maximum delay time between the receipt of a topology change and the calculation of the Shortest Path First (SPF).

The time between SPF runs increases if a topology change occurs (and triggers a new SPF run) before the last SPF holdtimer has finished. The time between runs may increase up to the max-holdtime value.This increase in holdtime prevents too many SPF runs from occurring if multiple OSPF topology change events occur.

**Examples** To set the minimum delay time to 5 milliseconds and maximum delay time to 2 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 ospf 100
awplus(config-router)# timers spf exp 5 2000
```

# address-family

**Overview** This command enters the IPv4 or IPv6 Address-Family Configuration command mode. In this mode you can configure address-family specific parameters.

When using VRF-lite, you can enter IPv4 Address Family Configuration mode for a specified VRF instance before configuring that instance.

**Syntax [BGP]**

```
address-family ipv4 [unicast]
no address-family ipv4 [unicast]
```

**Syntax (VRF-lite)**

```
address-family ipv4 [unicast|vrf <vrf-name>]
no address-family ipv4 [unicast|vrf <vrf-name>]
```

**Syntax [BGP4+]**

```
address-family ipv6 [unicast]
no address-family ipv6 [unicast]
```

| Parameter | Description |
|---|---|
| `ipv4` | Configure parameters relating to the exchange of IPv4 prefixes. |
| `ipv6` | Configure parameters relating to the exchange of IPv6 prefixes. |
| `unicast` | Configure parameters relating to the exchange of routes to unicast destinations. |
| `vrf` | Applies the command to the specified VRF instance. |
| *`<vrf-name>`* | The name of the VRF instance to enter IPv4 Address-Family mode for. |

**Mode [BGP]** Router Configuration

**Mode [BGP4+]** Router Configuration

**Usage notes** To leave the IPv4 or IPv6 Address Family Configuration mode, and return to the Router Configuration mode, use the exit-address-family command.

**Example [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# neighbor 192.168.0.1 remote-as 100
awplus(config-router)# address-family ipv4 vrf
green
awplus(config-router-af)# neighbor 192.168.0.1 activate
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

**Example [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 activate
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

**Related commands**

exit-address-family

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# aggregate-address

**Overview** This command adds an aggregate route that can be advertised to BGP or BGP4+ neighbors. This command creates an aggregate entry in the BGP or BGP4+ routing table if the device learns, by any means, any routes that are within the range configured by the aggregate address/mask.

When this command is used with the **summary-only** option, the more-specific routes of the aggregate are suppressed to all neighbors. Use the neighbor unsuppress-map command instead to selectively leak more-specific routes to a particular neighbor.

The **no** variant of this command removes the aggregate configured by the **aggregate-address** command.

**Syntax [BGP]**

```
aggregate-address <ip-addr/m> {summary-only|as-set}
no aggregate-address <ip-addr/m> {summary-only|as-set}
```

**Syntax [BGP4+]**

```
aggregate-address <ipv6-addr/prefix-length>
{summary-only|as-set}
no aggregate-address <ipv6-addr/prefix-length>
{summary-only|as-set}
```

| Parameter | Description |
|---|---|
| *<ip-addr/m>* | Specifies the aggregate IPv4 address and mask. |
| *<ipv6-addr/ prefix-length>* | Specifies the aggregate IPv6 address. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. |
| `summary-only` | Filters more specific routes from updates. Only the aggregate address/mask will be advertised, and none of the component addresses that fall within the range of the aggregate address/mask. |
| `as-set` | Generates AS set path information. The AS-path advertised with the aggregate is an unordered list of all the AS-numbers that appear in any of the AS-paths of the component routes, with each AS-number appearing just once in the list. |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage [BGP]** If the `summary-only` parameter is specified, then only the aggregate address/mask will be advertised, and none of the component addresses that fall within the range of the aggregate address/mask. For example, if you configure:

```
awplus# configure terminal

awplus(config)# router bgp 100

awplus(config-router)# aggregate-address 172.0.0.0/8 summary-
only
```

then the device will advertise the prefix `172.0.0.0/8`, but no component routes like `172.10.0.0/16`

The `as-set` parameter controls the AS-path attribute that is advertised with the aggregate route. If the device has learned multiple routes that are within the range of the aggregate address/mask, and the AS-paths associated with those routes contain different sets of AS-numbers, then it is not possible to create a single AS-path that accurately represents the AS-paths of all those component routes. In this case, the device will, by default, advertise a NULL AS-path with the aggregate.

**Usage [BGP4+]**

If the `summary-only` parameter is specified, then only the aggregate address/mask will be advertised, and none of the component addresses that fall within the range of the aggregate address/mask. For example, if you configure:

```
awplus# configure terminal

awplus(config)# router bgp 100

awplus(config-router)#address-family ipv6

awplus(config-router-af)# aggregate-address 2001:0db8::/64
summary-only
```

then the device will advertise the prefix 2001:0db8::/64, but no component routes like 2001:0db8:010d::1/128

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# aggregate-address 192.0.0.0/8 as-set
summary-only
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no aggregate-address 192.0.0.0/8 as-set
summary-only
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address family ipv6
awplus(config-router-af)# aggregate-address 2001:0db8::/64
as-set summary-only
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address family ipv6
awplus(config-router-af)# no aggregate-address 2001:0db8::/64
as-set summary-only
```

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# auto-summary (BGP only)

**Overview** Use this command to enable sending summarized routes by a BGP speaker to its peers in the Router Configuration mode or in the Address-Family Configuration mode. BGP uses auto-summary to advertise summarized routes.

Use the **no** variant of this command to disable BGP auto-summary.

**Syntax**

```
auto-summary
no auto-summary
```

**Default** The auto-summary function is disabled by default.

**Mode** Router Configuration and Address Family IPv4 mode

**Usage** If certain routes have already been advertised, enabling auto-summary results in non- summarized routes being withdrawn and only summarized routes are advertised. Summarized routes are advertised before non-summarized routes are withdrawn from all connected peers.

If certain routes have already been advertised, disabling auto-summary results in summarized routes being withdrawn and only non-summarized routes are advertised. Non-summarized routes are advertised before summarized routes are withdrawn from all connected peers.

**Examples** The following example enables auto-summary in Router Configuration mode:

```
awplus# configure
awplus(config)# router bgp 100
awplus(config-router)# auto-summary
```

The following example disables auto-summary in Router Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no auto-summary
```

The following example enables auto-summary in Address Family IPv4 mode:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv4
awplus(config-router-af)# auto-summary
```

The following example disables auto-summary in Address Family IPv4 mode:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no auto-summary
```

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp aggregate-nexthop-check

**Overview** This command affects the operation of the summary-only option on the aggregate-address command.

This command enables a mode whereby the summary-only option will only suppress the component routes if those component routes all have the same next hop. If the routes have different next hops, then they will continue to be advertised to peers even if the summary-only option is configured. By default this is disabled.

The **no** variant of this command disables this function.

**Syntax**

```
bgp aggregate-nexthop-check
no bgp aggregate-nexthop-check
```

**Default** Disabled by default.

**Mode** Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# bgp aggregate-nexthop-check
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp always-compare-med

**Overview** This command enables BGP to compare the Multi Exit Discriminator (MED) for paths from neighbors in different autonomous systems.

Multi Exit Discriminator (MED) is used in best path selection by BGP. MED is compared after BGP attributes weight, local preference, AS-path and origin have been compared and are equal.

By default, MED comparison is done only among routes from the same autonomous system (AS). Use the **bgp always-compare-mode** command to allow comparison of MEDs from different ASs.

A path with a lower MED value is preferred. For example, if the bgp table contains the following entries, and the **bgp always-compare-med** command has been issued to enable this feature:

- Route1: as-path 400, med 300
- Route2: as-path 200, med 200
- Route3: as-path 400, med 250

Route1 is compared to Route2. Route2 is best of the two (lower MED). Next, Route2 is compared to Route3 and Route2 is chosen best path again (lower MED). If **always-compare-med** was disabled, MED is not taken into account when Route1 and Route2 are compared, because of different ASs and MED is compared for only Route1 and Route3. In this case, Route3 would be the best path. The selected route is also affected by the **bgp deterministic-med** command. See the bgp deterministic-med command for details.

If this command is used to compare MEDs for all paths, it should be configured on every BGP router in the AS.

The **no** variant of this command disallows the comparison.

**Syntax**

```
bgp always-compare-med
no bgp always-compare-med
```

**Default** By default this feature is disabled.

**Mode** Router Configuration

**Example**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp always-compare-med
```

**Related commands**

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp bestpath as-path ignore

**Overview** This command prevents the router from considering as-path as a factor in the algorithm for choosing a route.

The **no** variant of this command allows the router to consider as-path in choosing a route.

**Syntax**
```
bgp bestpath as-path ignore
no bgp bestpath as-path ignore
```

**Mode** Router Configuration

**Example**
```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp bestpath as-path ignore
```

**Related commands**

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp bestpath compare-confed-aspath

**Overview** This command specifies that the AS confederation path length must be used, when available, in the BGP best path decision process. It is effective only when bgp bestpath as-path ignore command has not been specified.

By default, if BGP receives routes with identical eBGP paths from eBGP peers, BGP does not continue to consider any AS confederation path length attributes that may be associated with the routes.

The **no** variant of this command returns the device to the default state, where the device ignores AS confederation path length in the BGP best path selection process.

**Syntax**
```
bgp bestpath compare-confed-aspath
no bgp bestpath compare-confed-aspath
```

**Mode** Router Configuration

**Example**
```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp bestpath compare-confed-aspath
```

**Related commands** bgp bestpath as-path ignore

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp bestpath compare-routerid

**Overview** By default, when comparing similar routes from peers, BGP does not consider the router ID of neighbors advertising the routes - BGP simply selects the first received route. Use this command to include router ID in the selection process; similar routes are compared and the route with the lowest router ID is selected.

The **no** variant of this command disables this feature, and returns the device to the default state, where the device ignores the router ID in the BGP best path selection process.

**Syntax**
```
bgp bestpath compare-routerid
no bgp bestpath compare-routerid
```

**Mode** Router Configuration

**Example**
```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp bestpath compare-routerid
```

**Related commands** show ip bgp (BGP only)

show bgp ipv6 neighbors (BGP4+ only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp bestpath med

**Overview** This command controls how the Multi Exit Discriminator (MED) attribute comparison is performed.

Use the **no** variant of this command to prevent BGP from considering the MED attribute when comparing paths.

**Syntax**

```
bgp bestpath med {[confed] [missing-as-worst]}
```

| Parameter | Description |
|---|---|
| `confed` | Compares MED among confederation paths. |
| `missing-as-worst` | Treats missing MED as the least preferred one. |

**Mode** Router Configuration

**Usage** The **confed** parameter enables MED comparison among paths learned from confederation peers. The MED attributes are compared only if there is no external AS (Autonomous System), where an external AS is one that is not within the confederation. If there is an external AS in the path, then the MED comparison is not made.

For example, in the following paths the MED value is not compared with `Path3` since it is not in the confederation. MED is compared for `Path1` and `Path2` only.

- Path1 = 32000 32004, med=4
- Path2 = 32001 32004, med=2
- Path3 = 32003 1, med=1

The effect of the **missing-as-worst** parameter is to treat a missing MED attribute in a path as having a value of infinity, making the path without a MED value the least desirable path. If the **missing-as-worst** parameter is not configured, the missing MED attribute is assigned the value of 0, making the path with the missing MED attribute the best path.

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp bestpath med missing-as-worst
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp bestpath med confed
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp bestpath med confed missing-as-worst
```

# bgp bestpath med remove-recv-med

**Overview** This command removes the Multi Exit Discriminator (MED) attribute from the update messages received by the BGP speaker from its peers. However, the local BGP speaker will send MED attributes in the update messages to its peers, unless specified not to by the **bgp bestpath med remove-send-med** command.

Use the **no** variant of this command to disable this feature.

**Syntax**

```
bgp bestpath med remove-recv-med
no bgp bestpath med remove-recv-med
```

**Mode** Router Configuration

**Example** To enable the **remove-recv-med** feature on the BGP speaker belonging to the Autonomous System (AS) 100, enter the command:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp bestpath med remove-recv-med
```

**Related commands** bgp bestpath med remove-send-med

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp bestpath med remove-send-med

**Overview** This command removes the Multi Exit Discriminator (MED) attribute from the update messages sent by the BGP speaker to its peers. However, the local BGP speaker will consider the MED attribute received from other peers during the decision and route selection process, unless specified not to by the **bgp bestpath med remove-recv-med** command.

Use the **no** variant of this command to disable this feature.

**Syntax**

```
bgp bestpath med remove-send-med
no bgp bestpath med remove-send-med
```

**Mode** Router Configuration

**Example** To enable the **remove-send-med** feature on the BGP speaker belonging to the Autonomous System (AS) 100, enter the command:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp bestpath med remove-send-med
```

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp client-to-client reflection

**Overview** This command restores route reflection from a BGP route reflector to clients, and is used to configure routers as route reflectors. Route reflectors are used when all Interior Border Gateway Protocol (iBGP) speakers are not fully meshed.

If the clients are fully meshed the route reflector is not required, use the **no** variant of this command to disable the client-to-client route reflection.

When a router is configured as a route reflector, client-to-client reflection is enabled by default.

The **no** variant of this command turns off client-to-client reflection.

**Syntax**
```
bgp client-to-client reflection
no bgp client-to-client reflection
```

**Default** This command is enabled by default.

**Mode** Router Configuration

**Example**
```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no bgp client-to-client reflection
```

**Related commands**
bgp cluster-id

neighbor route-reflector-client (BGP only)

show bgp ipv6 (BGP4+ only)

show ip bgp (BGP only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp cluster-id

**Overview** This command configures the cluster-id if the BGP cluster has more than one route reflector. A cluster includes one or more route reflectors and their clients. Usually, each cluster is identified by the router-id of its single route reflector. However, to increase redundancy, a cluster may sometimes have more than one route reflector. All router reflectors in such a cluster are then identified by a cluster-id.

The **bgp cluster-id** command is used to configure the 4 byte cluster ID for clusters with more than one route reflector.

The **no** variant of this command removes the cluster ID.

**Syntax**

```
bgp cluster-id {<ip-address>|<cluster-id>}
no bgp cluster-id
```

| Parameter | Description | |
|---|---|---|
| *<cluster-id>* | <1-4294967295> | Route Reflector cluster-id as a 32 bit quantity. |
| *<ip-address>* | *A.B.C.D* | Route Reflector Cluster-id in IP address format. |

**Mode** Router Configuration

**Usage** The following configuration creates `cluster-id 5` including two route-reflector- clients.

```
awplus(config)# router bgp 200
awplus(config-router)# neighbor 2.2.2.2 remote-as 200
awplus(config-router)# neighbor 3.3.3.3 remote-as 200
awplus(config-router)# neighbor 3.3.3.3 route-reflector-client
awplus(config-router)# neighbor 5.5.5.5 remote-as 200
awplus(config-router)# neighbor 5.5.5.5 route-reflector-client
awplus(config-router)# neighbor 6.6.6.6 remote-as 200
awplus(config-router)# bgp cluster-id 5
```

**Examples** To add a **bgp cluster-id**, apply the example commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp cluster-id 10.10.1.1
```

To remove a bgp cluster-id apply the example commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no bgp cluster-id 10.10.1.1
```

**Related commands**

# bgp confederation identifier

**Overview** This command specifies a BGP confederation identifier.

The **no** variant of this command removes all BGP confederation identifiers.

**Syntax**

```
bgp confederation identifier <1-4294967295>
no bgp confederation identifier
```

| Parameter | Description |
|---|---|
| *<1-4294967295>* | Set routing domain confederation AS number. |

**Mode** Router Configuration

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp confederation identifier 1
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no bgp confederation identifier
```

**Related commands** bgp confederation peers

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp confederation peers

**Overview** This command configures the Autonomous Systems (AS) that belong to the same confederation as the current device.

A confederation allows an AS to be divided into several sub-ASs. The overall AS is given a confederation identifier. External routers view only the whole confederation as one AS, whose AS number is the confederation identifier. Each sub-AS is fully meshed within itself and is visible internally to the confederation.

Use the **bgp confederation peer** command to define the list of AS numbers of the sub-ASs in the confederation containing the current device.

The **no** variant of this command removes an autonomous system from the confederation.

**Syntax**

```
bgp confederation peers <1-4294967295>
no bgp confederation peers <1-4294967295>
```

| Parameter | Description |
|---|---|
| *<1-4294967295>* | AS numbers of eBGP peers that are under same confederation but in a different sub-AS. |

**Mode** Router Configuration

**Usage notes** In the following configuration of **Router 1** the neighbor `172.210.30.2` and `172.210.20.1` have iBGP connection within AS `100`. The neighbor `173.213.30.1` has an BGP connection, but it is within AS `200`, which is part of the same confederation. The neighbor `6.6.6.6` has an eBGP connection to external AS `500`.

In the configuration of **Router 2**, neighbor `5.5.5.4` has an eBGP connection to confederation `300`. `Router2` does not know about the ASs `100` and `200`, it only knows about confederation `300`.

**Router 1**

```
awplus(config)# router bgp 100
awplus(config-router)# bgp confederation identifier 300
awplus(config-router)# bgp confederation peers 200
awplus(config-router)# neighbor 172.210.30.2 remote-as 100
awplus(config-router)# neighbor 172.210.20.1 remote-as 100
awplus(config-router)# neighbor 173.213.30.1 remote-as 200
awplus(config-router)# neighbor 6.6.6.6 remote-as 300
```

**Router 2**

```
awplus(config)# router bgp 500
awplus(config-router)# neighbor 5.5.5.4 remote-as 300
```

**Example**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp confederation peers 1234
```

**Related commands**

bgp confederation identifier

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp config-type

**Overview** Use this command to set the BGP configuration type to either **standard** or **enhanced** types. When you configure the **enhanced** type, then BGP and BGP4+ communities are allowed to be sent and received by default. The **enhanced** type is configured by default.

Use the **no** variant of this command to restore the default BGP configuration type (**enhanced**).

**Syntax**

```
bgp config-type {standard|enhanced}
no bgp config-type
```

| Parameter | Description |
|---|---|
| `standard` | Specifies the industry standard style configuration. After setting the configuration to standard, make sure to use the neighbor send-community command to send out BGP community attributes. The synchronization command is enabled in the Global Configuration mode and is shown in the configuration. |
| `enhanced` | Specifies the enhanced style configuration. The enhanced configuration type requires no specific configuration for sending out BGP standard community and extended community attributes. The synchronization command is enabled by default in the Global Configuration mode and is not shown in configuration output. |

**Default** By default, the BGP configuration type is **enhanced**.

**Mode** Global Configuration

**Usage notes** Note that the **enhanced** type default configuration may cause issues in some networks if unauthorized BGP peers are advertising BGP communities to adjust routing decisions.

Changing modes requires you to **reload** your device for the change to take effect:

```
awplus(config)#bgp config-type standard
awplus(config)#exit
awplus#reload
reboot system? (y/n): y
```

When your device reloads, it will load with the standard BGP settings commonly used by most vendors. Apply the **standard** type configuration if you have interoperability issues.

**Examples** To specify the `standard` BGP configuration type, enter the following commands:

```
awplus# configure terminal
awplus(config)# bgp config-type standard
```

To specify the `enhanced` BGP configuration type, enter the following commands:

```
awplus# configure terminal
awplus(config)# bgp config-type enhanced
```

To restore the default BGP configuration type (`enhanced`), enter the following commands:

```
awplus# configure terminal
awplus(config)# no bgp config-type
```

**Related commands**

neighbor send-community

synchronization

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp dampening

**Overview** This command enables BGP and BGP4+ dampening and sets BGP and BGP4+ dampening parameters. BGP4+ dampening is available from the IPv6 Address Family Configuration mode. BGP dampening is available from the Router Configuration mode.

The **no** variant of this command disables BGP dampening or unsets the BGP dampening parameters.

**Syntax**

```
bgp dampening
no bgp dampening
bgp dampening <reachtime>
no bgp dampening <reachtime>
bgp dampening <reachtime> <reuse> <suppress> <maxsuppress> <unreachtime>
no bgp dampening <reachtime> <reuse> <suppress> <maxsuppress> <unreachtime>
bgp dampening route-map <routemap-name>
no bgp dampening route-map <routemap-name>
```

| Parameter | Description |
|---|---|
| *<reachtime>* | <1-45> Specifies the reachability half-life time in minutes. The time for the penalty to decrease to one-half of its current value. The default is 15 minutes. |
| *<reuse>* | <1-20000> Specifies the reuse limit value. When the penalty for a suppressed route decays below the reuse value, the routes become unsuppressed. The default reuse limit is 750 |
| *<suppress>* | <1-20000> Specifies the suppress limit value. When the penalty for a route exceeds the suppress value, the route is suppressed. The default suppress limit is 2000. |
| *<maxsuppress>* | <1-255> Specifies the max-suppress-time. Maximum time that a dampened route is suppressed. The default max-suppress value is 4 times the half-life time (60 minutes). |
| *<unreachtime>* | <1-45> Specifies the un-reachability half-life time for penalty, in minutes. |
| route-map | Route-map to specify criteria for dampening. |
| *<routemap-name>* | Specify the name of the route-map. |

**Mode [BGP]** Router Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage notes** Route dampening minimizes the instability caused by route flapping. A penalty is added for every flap in a flapping route. As soon as the total penalty reaches the **suppress** limit the advertisement of the route is suppressed. This penalty is decayed according to the configured **half time** value. Once the penalty is lower than the **reuse** limit, the route advertisement is un-suppressed.

The dampening information is purged from the router once the penalty becomes less than half of the **reuse** limit.

**Example [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# bgp dampening 20 800 2500 80 25
```

**Example [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# address-family ipv6
awplus(config-router-af)# bgp dampening 20 800 2500 80 25
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp damp-peer-oscillation (BGP only)

**Overview** Use this command to enable BGP peer oscillating connection damping.

Use the **no** variant of this command to disable BGP peer oscillating connection damping.

**Syntax**

```
bgp damp-peer-oscillations
no bgp damp-peer-oscillations
```

**Default** By default, this functionality is enabled and will not appear in the **show running-config** command output.

**Mode** Router Configuration

**Usage** BGP peers in AlliedWare Plus will automatically attempt to form connections with configured neighbors. Due to misconfiguration these connections may fail and continue to fail until such time as the misconfiguration is detected and fixed. During this time, BGP can quickly cycle through the state machine from Idle through the various Connect states, which can result in large numbers of TCP sessions being opened in a short period of time.

This command instead adds a delay after a peer enters the Idle state before it can progress to the later states. The default delay is 0 second, increasing by 1 second for each unsuccessful connection attempt, to a maximum of 5 seconds. After a successful BGP route update has been received over a connection, the delay will be reset to 0. This command implements the DampPeerOscillations FSM behavior described in section 8.1 of RFC 4271.

The command is enabled by default. When disabled, peers will transition out of the Idle state immediately. The command applies globally to all currently configured BGP peers and all future peers to be created.

**Example** To disable peer connection damping, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 1
awplus(config-router)# no bgp damp-peer-oscillations
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp default ipv4-unicast

**Overview** This command configures BGP defaults and activates IPv4-unicast for a peer by default. This affects BGP global configuration. By default, BGP exchanges IPv4 prefixes with a peer.

The **no** variant of this command disables this function. The BGP routing process will no longer exchange IPv4 addressing information with BGP neighbor routers. Note that disabling the exchange of IPv4 prefixes will also enable an IPv6 only BGP4+ network.

**Syntax**
```
bgp default ipv4-unicast
no bgp default ipv4-unicast
```

**Default** This is enabled by default.

**Mode** Router Configuration

**Usage** Use the negated form of this command to enable an IPv6 only BGP4+ network.

**Examples**
```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp default ipv4-unicast
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no bgp default ipv4-unicast
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp default local-preference (BGP only)

**Overview** This command changes the default local preference value.

The local preference indicates the preferred path when there are multiple paths to the same destination. The path with the higher preference is preferred.

Use this command to define the default local preference value that the device will advertise for the routes it sends. The preference is sent to all routers and access servers in the local autonomous system.

The **no** variant of this command reverts to the default local preference value of 100.

**Syntax**

```
bgp default local-preference <pref-value>
no bgp default local-preference [<pref-value>]
```

| Parameter | Description |
|---|---|
| *<pref-value>* | <0-4294967295> Configure default local preference value. The default local preference value is 100. |

**Default** By default the local-preference value is 100.

**Mode** Router Configuration

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp default local-preference 2345555
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no bgp default local-preference
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp deterministic-med

**Overview** Use this command to allow or disallow the device to compare the Multi Exit Discriminator (MED) variable when choosing among routes advertised by different peers in the same autonomous system (AS).

Use the **bgp deterministic-med** command to enable this feature to allow the comparison of MED variables when choosing among routes advertised by different peers in the same AS.

Use the **no** variant of this command to disable this feature to disallow the comparison of the MED variable when choosing among routes advertised by different peers in the same AS.

**Syntax**

```
bgp deterministic-med
no bgp deterministic-med
```

**Default** Disabled

**Mode** Router Configuration

**Usage** When the **bgp deterministic-med** command is enabled, routes from the same AS are grouped together and ordered according to their MED values, and the best routes of each group are compared.

The main benefit of this is that the choice of best route then does not depend on the order in which the routes happened to be received, which is rather random and arbitrary.

To see how this works, consider the following set of bgp table entries, all for the same route:

```
1: ASPATH 234, MED 120, internal, IGP metric to NEXT_HOP 40
2: ASPATH 389, MED 190, internal, IGP metric to NEXT_HOP 35
3: ASPATH 234, MED 245, external
```

If **bgp deterministic-med** is not enabled, then entry `3` will be chosen, because it is an external route.

But if BGP deterministic-MED is enabled, the entries will be grouped as follows:

```
Group 1:  1: ASPATH 234, MED 120, internal, IGP metric to NEXT_HOP 40
          3: ASPATH 234, MED 245, external
Group 2:  2: ASPATH 389, MED 190, internal, IGP metric to NEXT_HOP 35
```

***NOTE:*** *Routes from the same AS are grouped together and ordered by MED.*

Entry `1` is chosen as the best route from `Group 1`, since this route has the lowest MED value. Entry 2 has to be the best route in `Group 2`, since this is the only route in that group. These two group winners are compared against each other, and

Entry 2 is chosen as the best route because Entry 2 has the lower metric to next-hop.

All routers in an AS should have the same setting for BGP deterministic-MED. All routers in an AS should have BGP deterministic-MED enabled with **bgp deterministic-med**, or all routers in an AS should have BGP deterministic-MED disabled with **no bgp-deterministic- med**.

In the example above, the MED values were not considered when comparing the winners of the two groups (the best routes from the different ASs). To use MED in the comparison of routes from different ASs, use the bgp always-compare-med command.

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp deterministic-med
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no bgp deterministic-med
```

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp enforce-first-as

**Overview** Use this command to enforce the denying of eBGP updates in which the neighbor's AS number is not the first AS in the AS-path attribute.

Use the **no** variant of this command to disable this feature.

**Syntax**
```
bgp enforce-first-as
no bgp enforce-first-as
```

**Mode** Router Configuration

**Usage** This command specifies that any updates received from an external neighbor that do not have the neighbor's configured Autonomous System (AS) at the beginning of the AS_PATH in the received update must be denied. Enabling this feature adds to the security of the BGP network by not allowing traffic from unauthorized systems.

**Example**
```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router# bgp enforce-first-as
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp fast-external-failover

**Overview** Use this command to reset a BGP session immediately if the interface used for BGP connection goes down.

Use the **no** variant of this command to disable this feature.

**Syntax**
```
bgp fast-external-failover
no bgp fast-external-failover
```

**Default** Enabled

**Mode** Router Configuration

**Example**
```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp fast-external-failover
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp graceful-restart

**Overview** Use this command to enable BGP and BGP4+ graceful-restart capabilities for restart and stalepath times.

Use the **no** variant of this command to restore restart timers to their default settings.

**Syntax**

```
bgp graceful-restart [restart-time <delay-value>|
stalepath-time <delay-value>]
```

```
no bgp graceful-restart [restart-time|stalepath-time]
```

| Parameter | Description |
|---|---|
| `restart-time` | The maximum time needed for neighbors to restart, in seconds.<br>The default restart-time is 120 seconds. |
| `stalepath-time` | The maximum time to retain stale paths from restarting neighbors, in seconds. The default stalepath-time is 120 seconds. |
| *`<delay-value>`* | <1-3600> Maximum time in seconds. |

**Default** Graceful restart is disabled by default. If you enable it and do not specify the restart-time and stalepath-time, they default to 120 seconds.

**Mode** Router Configuration

**Usage notes** The **restart-time** parameter is used for setting the maximum time that a graceful-restart neighbor waits to come back up after a restart. This **restart-time** value is applied to neighbors unless you explicitly override it by configuring the corresponding value on the neighbor.

The **stalepath-time** parameter is used to set the maximum time to preserve stale paths from a gracefully restarted neighbor. All stalepaths, unless reinstated by the neighbor after a re-establishment, will be deleted when time, as specified by the **stalepath-time** parameter, expires.

**Examples** To enable graceful restart, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# bgp graceful-restart
```

To disable graceful restart, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no bgp graceful-restart
```

To enable graceful restart and set the restart time to 150 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# bgp graceful-restart restart-time 150
```

To return the restart-time to its default of 120 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no bgp graceful-restart restart-time
```

**Related commands**

bgp graceful-restart graceful-reset

restart bgp graceful (BGP only)

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp graceful-restart graceful-reset

**Overview** This command enables BGP and BGP4+ graceful-restart when a configuration change forces a peer restart.

Use the **no** variant of this command to restore the device to its default state.

**Syntax**

```
bgp graceful-restart graceful-reset
no bgp graceful-restart graceful-reset
```

**Default** Disabled

**Mode** Router Configuration

**Usage** The bgp graceful-restart command must be enabled before this command is enabled. All events that cause BGP peer reset, including all session reset commands, can trigger graceful-restart.

**Example** To enable the graceful-restart graceful-reset feature on the BGP or BGP4+ peer belonging to Autonomous System (AS) 10, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# bgp graceful-restart graceful-reset
```

To disable the graceful-restart graceful-reset feature on the BGP or BGP4+ peer belonging to Autonomous System (AS) 10, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no bgp graceful-restart graceful-reset
```

**Related commands** bgp graceful-restart

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp log-neighbor-changes

**Overview** Use this command to enable logging of status change messages without turning on **debug bgp** commands.

Use the **no** variant of this command to disable this feature.

**Syntax**

```
bgp log-neighbor-changes
no bgp log-neighbor-changes
```

**Default** Disabled

**Mode** Router Configuration

**Usage notes** AlliedWare Plus™ provides other kinds of logging services for neighbor status, for example, **debug bgp fsm** and **debug bgp events**.

However, these commands create a significant hit in the logging performance. If you need to log neighbor status changes only, we recommend turning off all the debug commands, and then use this command.

To see BGP neighbor changes in the log you must also set the log level to informational using the **log buffered** command.

A sample output of this log is:

```
%Protocol-Severity-Events: Message-text
```

A sample output of the log for an interface down event is:

```
%BGP-5-ADJCHANGE: neighbor 10.10.0.24 Down Interface flap
```

The **bgp log-neighbor-changes** command logs the following events:

- BGP Notification Received
- Erroneous BGP Update Received
- User reset request
- Peer time-out
- Peer Closing down the session
- Interface flap
- Router ID changed
- Neighbor deleted
- Member added to peer group
- Administrative shutdown

- Remote AS changed
- RR client configuration modification
- Soft reconfiguration modification

**Example** To enable the logging of BGP status changes without using the debug bgp command:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp log-neighbor-changes
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp memory maxallocation

**Overview** This command allocates a maximum percentage of the RAM (Random Access Memory) available on the device for BGP processes.

When this percentage is exceeded, BGP peering terminates and an **out of resources** error displays. The default setting for **bgp memory maxallocation** is 100% memory allocation.

Use the **no** variant of this command to reset memory allocation to the default.

**Syntax**

```
bgp memory maxallocation <1-100>
no bgp memory maxallocation
```

| Parameter | Description |
|---|---|
| *<1-100>* | Percentage of device memory allocated to BGP processes. Note this is RAM (Random Access Memory), not device flash memory. |

**Default** BGP processes are allocated the maximum percentage of 100% of the device's available RAM memory by default. Note only non-default BGP memory allocation values are shown in the running or startup configuration files:

```
awplus#show running-config
!
bgp memory maxallocation 50
!
```

**Mode** Global Configuration

**Examples** To limit the maximum amount of memory used by BGP processes to 65% of the total RAM memory available on the device, use the commands:

```
awplus# configure terminal
awplus(config)# bgp memory maxallocation 65
```

To return to the default 100% maximum RAM memory allocation available on the device for BGP processes, use the commands:

```
awplus# configure terminal
awplus(config)# no bgp memory maxallocation
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp nexthop-trigger-count

**Overview** Use this command to configure the display of BGP next hop tracking status.

Use the **no** variant of this command to disable this function.

**Syntax**

```
bgp nexthop-trigger-count <0-127>
no bgp nexthop-trigger-count
```

| Parameter | Description |
|---|---|
| *<0-127>* | BGP next hop tracking status. |

**Mode** Router Configuration

**Example** To enable next-hop-tracking status on the BGP peer belonging to the Autonomous System (AS) 100, enter the following commands:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp nexthop-trigger-count 10
```

To disable next-hop-tracking status, enter the following commands:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no bgp nexthop-trigger-count
```

**Related commands**

bgp nexthop-trigger delay

bgp nexthop-trigger enable

show bgp nexthop-tracking (BGP only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp nexthop-trigger delay

**Overview** Use this command to set the delay interval for next hop address tracking.

Use the **no** variant of this command to reset the timer value to the default.

**Syntax**

```
bgp nexthop-trigger delay <1-100>
no bgp nexthop-trigger delay
```

| Parameter | Description |
|---|---|
| *<1-100>* | Next hop trigger delay interval in seconds. |

**Default** The default next hop delay interval is 5 seconds.

**Mode** Global Configuration

**Usage** This command configures the delay interval between routing table waits for next hop delay tracking. The delay interval determines how long BGP waits after it receives the trigger from the system about one or more next hop changes before it walks the full BGP table to determine which prefixes are affected by the next hop changes.

**Example** To set the next hop delay interval to 6 seconds, enter the command:

```
awplus# configure terminal
awplus(config)# bgp nexthop-trigger delay 6
```

**Related commands** bgp nexthop-trigger-count

bgp nexthop-trigger enable

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp nexthop-trigger enable

**Overview** Use this command to enable next hop address tracking. If next hop address tracking is enabled and a next hop trigger delay interval has not been explicitly set with the bgp nexthop-trigger delay command, the default delay interval of 5 seconds is used.

Use the **no** variant of this command to disable this feature.

**Syntax**
```
bgp nexthop-trigger enable
no bgp nexthop-trigger enable
```

**Default** Disabled.

**Mode** Global Configuration

**Usage** Next hop address tracking is an event driven notification system that monitors the status of routes installed in the Routing Information Base (RIB) and reports next hop changes that affect internal BGP (iBGP) or external BGP (eBGP) prefixes directly to the BGP process. This improves the overall BGP convergence time, by allowing BGP to respond rapidly to next hop changes for routes installed in the RIB.

If next hop tracking is enabled after certain routes are learned, the registration of all the next hops of selected BGP routes are done immediately after the next hop tracking feature is enabled.

If next hop tracking is disabled, and if there are still some selected BGP routes, BGP deregisters the next hops of all of the selected BGP routes from the system.

If next hop tracking is disabled when next hop tracking is in the process of execution, an error appears, and next hop tracking is not disabled. However, if the next hop tracking timer is running at the time of negation, the next hop tracking timer is stopped, and next hop tracking is disabled.

**Example** To enable next hop address tracking, enter the command:

```
awplus# configure terminal
awplus(config)# bgp nexthop-trigger enable
```

**Related commands**

bgp nexthop-trigger-count

bgp nexthop-trigger delay

show bgp nexthop-tracking (BGP only)

# bgp rfc1771-path-select (BGP only)

**Overview** Use this command to set the RFC1771 compatible path selection mechanism.

Use the **no** variant of this command to revert this setting.

**Syntax**

```
bgp rfc1771-path-select
no bgp rfc1771-path-select
```

**Default** Industry standard compatible path selection mechanism.

**Mode** Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# bgp rfc1771-path-select
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp rfc1771-strict (BGP only)

**Overview** Use this command to set the Strict RFC1771 setting.

Use the **no** variant of this command to revert this setting.

**Syntax**

```
bgp rfc1771-strict
no bgp rfc1771-strict
```

**Default** Disabled

**Mode** Global Configuration

**Example**

```
awplus# configure terminal
awplus(config)# bgp rfc1771-strict
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp router-id

**Overview** Use this command to configure the router identifier. The IPv4 address specified in this command does not have to be an IPv4 address that is configured on any of the interfaces on the device. Note that you must specify an IPv4 address with this when used for BGP4+.

Use the **no** variant of this command to return the router-id to its default value (as described in Default below).

**Syntax**

```
bgp router-id <routerid>
no bgp router-id [<routerid>]
```

| Parameter | Description |
|---|---|
| *<routerid>* | Specify the IPv4 address without mask for a manually configured router ID, in the format A.B.C.D. |

**Default** If the BGP router ID is not specified, the IPv4 address of the loopback interface is used. When there is no address on the loopback interface, the highest IP address among the other interfaces is used.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage** Use the **bgp router-id** command to manually configure a fixed router ID as a BGP or BGP4+ router identifier. This router ID takes precedence over all other possible router ID sources. The order of precedence is:

1) router ID configured with this command
2) IP address of the loopback interface
3) highest IP address from the other interfaces

**Examples** To configure a router ID with an IPv4 address for a BGP or BGP4+ router identifier, enter the commands listed below:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp router-id 1.1.2.3
```

To disable the router ID for a BGP or BGP4+ router identifier enter the commands listed below:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no bgp router-id
```

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp scan-time (BGP only)

**Overview** Use this command to set the interval for BGP route next-hop scanning.

Use the **no** variant of this command to disable this function.

**Syntax**

```
bgp scan-time <time>
no bgp scan-time [<time>]
```

| Parameter | Description |
|---|---|
| *<time>* | <0-60> Scanning interval in seconds. |

**Default** The default scanning interval is 60 seconds.

**Mode** Router Configuration

**Usage** Use this command to configure scanning intervals of BGP routers. This interval is the period after which router checks the validity of the routes in its database.

To disable BGP scanning, set the scan time interval to 0 seconds.

**Example**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# bgp scan-time 10
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# bgp update-delay

**Overview** Use this command to specify the update-delay value for a graceful-restart capable router.

Use the **no** variant of this command to revert to the default update-delay value.

**Syntax**

```
bgp update-delay <1-3600>
no bgp update-delay [<1-3600>]
```

| Parameter | Description |
|---|---|
| *<1-3600>* | Delay value in seconds. |

**Default** The default update-delay value is 120 seconds.

**Mode** Router Configuration

**Usage** The update-delay value is the maximum time a graceful-restart capable router which is restarting will defer route-selection and advertisements to all its graceful-restart capable neighbors. This maximum time starts from the instance the first neighbor attains established state after restart. The restarting router prematurely terminates this timer when end-of-rib markers are received from all its graceful-restart capable neighbors.

**Example**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# bgp update-delay 345
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear bgp *

**Overview** Use this command to reset the BGP and BGP4+ connections for all peers.

**Syntax**

```
clear bgp *
clear bgp * in [prefix-filter]
clear bgp * out
clear bgp * soft [in|out]
```

| Parameter | Description |
|---|---|
| `*` | Clears all BGP and BGP4+ peers. |
| `in` | Indicates that incoming advertised routes will be cleared. |
| `prefix-filter` | Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration. |
| `out` | Indicates that outgoing advertised routes will be cleared. |
| `soft in` | Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory. |
| `soft out` | Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries. |

**Mode** Privileged Exec

**Examples**

```
awplus# clear bgp * soft in
awplus# clear bgp * in prefix-filter
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear bgp (IPv4 or IPv6 address)

**Overview** Use this command to reset the BGP and BGP4+ connections for specified peers.

When VRF-lite is configured, you can apply this command to a specific VRF instance. This command resets all BGP connections from any address family (from either IPv4 or IPv6 Address Families).

**Syntax [BGP]**

```
clear bgp <ip-addr>
clear bgp <ip-addr> in [prefix-filter]
clear bgp <ip-addr> out
clear bgp <ip-addr> soft [in|out]
```

**Syntax (VRF-lite)**

```
clear ip bgp <ip-addr> [vrf <vrf-name>] [in|out|soft [in|out]]
```

**Syntax [BGP4+]**

```
clear bgp <ipv6-addr>
clear bgp <ipv6-addr> in [prefix-filter]
clear bgp <ipv6-addr> out
clear bgp <ipv6-addr> soft [in|out]
```

| Parameter | Description |
|---|---|
| *<ip-addr>* | Specifies the IPv4 address of the neighbor whose connection is to be reset, entered in the form A.B.C.D. |
| *<ipv6-addr>* | Specifies the IPv6 address of the neighbor whose connection is to be reset, entered in hexadecimal in the format X:X::X:X. |
| `in` | Indicates that incoming advertised routes will be cleared. |
| `prefix-filter` | Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration. |
| `out` | Indicates that outgoing advertised routes will be cleared. |
| `soft in` | Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory. |
| `soft out` | Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries. |
| `vrf` | Applies the command to the specified VRF instance. |
| *<vrf-name>* | The name of the VRF instance. |

**Mode** Privileged Exec

**Examples [BGP]**

```
awplus# clear bgp 3.3.3.3 soft in prefix-filter
awplus# clear bgp 2.2.2.2 out
```

**Example (VRF-lite)** To apply the above example to clear the BGP connection to peer at IP address 192.0.2.11 for the VRF instance blue, use the following commands:

```
awplus# clear bgp 192.0.2.11 vrf blue in
```

**Examples [BGP4+]**

```
awplus# clear bgp 2001:0db8:010d::1 soft in prefix-filter
awplus# clear bgp 2001:0db8:010d::1 out
```

**Related commands** clear bgp (IPv4 or IPv6 address)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear bgp (ASN)

**Overview** Use this command to reset the BGP and BGP4+ connections for peers in the specified Autonomous System Number (ASN).

**Syntax**

```
clear bgp <asn> [in [prefix-filter]|out|soft [in|out]]
```

| Parameter | Description |
|---|---|
| *<asn>* | <1-4294967295><br>The AS Number for which all routes will be cleared. |
| in | Indicates that incoming advertised routes will be cleared. |
| prefix-filter | Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration. |
| out | Indicates that outgoing advertised routes will be cleared. |
| soft in | Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory. |
| soft out | Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries. |

**Mode** Privileged Exec

**Examples**

```
awplus# clear bgp 300 soft in prefix-filter
awplus# clear bgp 500 soft out
awplus# clear bgp 300 soft in
awplus# clear bgp 1 in prefix-filter
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear bgp external

**Overview** Use this command to reset the BGP and BGP4+ connections for all external peers.

**Syntax**

```
clear bgp external [in [prefix-filter]|out|soft [in|out]]
```

| Parameter | Description |
|---|---|
| `external` | Clears all external peers. |
| `in` | Indicates that incoming advertised routes will be cleared. |
| `prefix-filter` | Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration. |
| `out` | Indicates that outgoing advertised routes will be cleared. |
| `soft in` | Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory. |
| `soft out` | Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries. |

**Mode** Privileged Exec

**Examples**

```
awplus# clear bgp external soft in
awplus# clear bgp external in prefix-filter
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear bgp peer-group

**Overview** Use this command to reset the BGP and BGP4+ connections for all members of a peer group.

**Syntax**

```
clear bgp peer-group <peer-group> [in [prefix-filter]|out|soft [in|out]]
```

| Parameter | Description |
|---|---|
| `peer-group` | Clears all members of a peer group. |
| *<peer-group>* | Name of the BGP peer group |
| `in` | Indicates that incoming advertised routes will be cleared. |
| `prefix-filter` | Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration. |
| `out` | Indicates that outgoing advertised routes will be cleared. |
| `soft in` | Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory. |
| `soft out` | Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries. |

**Mode** Privileged Exec

**Examples**

```
awplus# clear bgp peer-group P1 soft in
awplus# clear bgp peer-group P2 in
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear bgp ipv6 (ipv6 address) (BGP4+ only)

**Overview** Use this command to reset the IPv6 BGP4+ connection to the peer specified by the IP address.

**Syntax**

```
clear bgp ipv6 <ipv6-addr> [in [prefix-filter]|out|soft
[in|out]]
```

| Parameter | Description |
|---|---|
| *<ipv6-addr>* | Specifies the IPv6 address of the neighbor whose connection is to be reset, entered in hexadecimal in the format X:X::X:X. |
| `ipv6` | Clears all IPv6 address family peers. Configure parameters relating to the BGP4+ exchange of IPv6 prefixes. |
| `in` | Indicates that incoming advertised routes will be cleared. |
| `prefix-filter` | Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration. |
| `out` | Indicates that outgoing advertised routes will be cleared. |
| `soft in` | Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory. |
| `soft out` | Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries. |

**Mode** Privileged Exec

**Examples** Use the following command to clear the BGP4+ connection to peer at IPv6 address 2001:0db8:010d::1, and clearing all incoming routes.

```
awplus# clear ip bgp 2001:0db8:010d::1 in
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear bgp ipv6 dampening (BGP4+ only)

**Overview** Use this command to clear route dampening information and unsuppress routes that have been suppressed routes.

**Syntax**

```
clear bgp ipv6 dampening
[<ipv6-addr>|<ipv6-addr/prefix-length>]
```

| Parameter | Description |
|---|---|
| *<ipv6-addr>* | Specifies the IPv6 address for which BGP4+ dampening is to be cleared, entered in hexadecimal in the format X:X::X:X. |
| *<ipv6-addr/prefix-length>* | Specifies the IPv6 address and prefix-length for which BGP4+ dampening is to be cleared. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. |

**Mode** Privileged Exec

**Examples**

```
awplus# clear bgp ipv6 dampening 2001:0db8:010d::1
awplus# clear bgp ipv6 dampening 2001:0db8::/64
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear bgp ipv6 flap-statistics (BGP4+ only)

**Overview** Use this command to clear the flap count and history duration for the specified prefixes.

**Syntax**
```
clear bgp ipv6 flap-statistics
[<ipv6-addr>|<ipv6-addr/prefix-length>]
```

| Parameter | Description |
|---|---|
| *<ipv6-addr>* | Specifies the IPv6 address for which BGP4+ flap count and history duration are to be cleared, entered in hexadecimal in the format X:X::X:X. |
| *<ipv6-addr/ prefix-length>* | Specifies the IPv6 address with prefix length for which BGP4+ flap count and history duration are to be cleared. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. |

**Mode** Privileged Exec

**Examples**
```
awplus# clear bgp ipv6 flap-statistics 2001:0db8:010d::1
awplus# clear bgp ipv6 flap-statistics 2001:0db8::/64
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear bgp ipv6 (ASN) (BGP4+ only)

**Overview** Use this command to reset the BGP4+ connections to all peers in a specified Autonomous System Number (ASN).

**Syntax**

```
clear bgp ipv6 <asn> [in [prefix-filter]|out|soft [in|out]]
clear bgp ipv6 <asn>
clear bgp ipv6 <asn> in [prefix-filter]
clear bgp ipv6 <asn> out
clear bgp ipv6 <asn> soft [in|out]
```

| Parameter | Description |
|---|---|
| *<asn>* | <1-4294967295><br>Specifies the ASN for which all routes will be cleared. |
| `in` | Indicates that incoming advertised routes will be cleared. |
| `prefix-filter` | Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration. |
| `out` | Indicates that outgoing advertised routes will be cleared. |
| `soft in` | Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory. |
| `soft out` | Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries. |

**Mode** Privileged Exec

**Examples**

```
awplus# clear bgp ipv6 100
awplus# clear bgp ipv6 100 in
awplus# clear bgp ipv6 100 in prefix-filter
awplus# clear bgp ipv6 100 out
awplus# clear bgp ipv6 100 soft out
awplus# clear bgp ipv6 100 soft in
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear bgp ipv6 external (BGP4+ only)

**Overview** Use this command to reset the BGP4+ connections to all external peers.

**Syntax**

```
clear bgp ipv6 external [in [prefix-filter]|out|soft [in|out]]
clear bgp ipv6 external
clear bgp ipv6 external in [prefix-filter]
clear bgp ipv6 external out
clear bgp ipv6 external soft [in|out]
```

| Parameter | Description |
|---|---|
| `external` | Clears all external peers. |
| `in` | Indicates that incoming advertised routes will be cleared. |
| `prefix-filter` | Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration. |
| `out` | Indicates that outgoing advertised routes will be cleared. |
| `soft in` | Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory. |
| `soft out` | Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries. |

**Mode** Privileged Exec

**Examples**

```
awplus# clear bgp ipv6 external in
awplus# clear bgp ipv6 external in prefix
awplus# clear bgp ipv6 external out
awplus# clear bgp ipv6 external soft out
awplus# clear bgp ipv6 external soft in
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear bgp ipv6 peer-group (BGP4+ only)

**Overview** Use this command to reset the BGP4+ connections to all members of a peer group.

**Syntax**

```
clear bgp ipv6 peer-group <peer-name>
clear bgp ipv6 peer-group <peer-name> in [prefix-filter]
clear bgp ipv6 peer-group <peer-name> out
clear bgp ipv6 peer-group <peer-name> soft [in|out]
```

| Parameter | Description |
|---|---|
| `peer-group` | Clears all members of a peer group. |
| *<peer-name>* | Specifies the name of the peer group for which all members will be cleared. |
| `ipv6` | Clears all IPv6 address family peers. Configure parameters relating to the BGP4+ exchange of IPv6 prefixes. |
| `in` | Indicates that incoming advertised routes will be cleared. |
| `prefix-filter` | Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration. |
| `out` | Indicates that outgoing advertised routes will be cleared. |
| `soft in` | Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory. |
| `soft out` | Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries. |

**Mode** Privileged Exec

**Example**

```
awplus# clear bgp ipv6 peer-group Peer1 out
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear ip bgp * (BGP only)

**Overview** Use this command to reset all BGP connections, either by fully resetting sessions or by performing soft resets.

If VRF-lite is configured, you can reset BGP connections for all VRF instances or for a specified VRF instance.

**Syntax**

```
clear ip bgp *
clear ip bgp * in
clear ip bgp * out
clear ip bgp * soft [in|out]
clear ip bgp * in [prefix-filter]
```

**Syntax (VRF-lite)**

```
clear ip bgp * [vrf <vrf-name>]
clear ip bgp * [vrf <vrf-name>] in
clear ip bgp * [vrf <vrf-name>] out
clear ip bgp * [vrf <vrf-name>] soft [in|out]
clear ip bgp * in [prefix-filter]
```

| Parameter | Description |
|---|---|
| `*` | Clears all BGP peers. |
| `in` | Indicates that incoming advertised routes will be cleared. |
| `prefix-filter` | Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration. |
| `out` | Indicates that outgoing advertised routes will be cleared. |
| `soft in` | Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory. |
| `soft out` | Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries. |
| `vrf` | Applies the command to the specified VRF instance. |
| *`<vrf-name>`* | The name of the VRF instance. |

**Mode** Privileged Exec

**Examples**

To clear all BGP peers, use the command:

```
awplus# clear ip bgp *
```

**Example (VRF-lite)**

To clear all BGP peers in VRF instance red, use the command:

```
awplus# clear ip bgp * vrf red
```

To clear all outbound BGP peers in VRF instance red, use the command:

```
awplus# clear ip bgp * out vrf red
```

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear ip bgp (IPv4) (BGP only)

**Overview** Use this command to reset the IPv4 BGP connection to the peer specified by the IP address. When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax [BGP]**

```
clear ip bgp <ipv4-addr> [in [prefix-filter]|out|soft [in|out]]
```

**Syntax (VRF-lite)**

```
clear ip bgp <ipv4-address> [vrf <vrf-name>] [in|out|soft
[in|out]]
```

| Parameter | Description |
|---|---|
| *<ipv4-addr>* | Specifies the IPv4 address of the neighbor whose connection is to be reset, entered in the form A.B.C.D. |
| `in` | Indicates that incoming advertised routes will be cleared. |
| `prefix-filter` | Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration. |
| `out` | Indicates that outgoing advertised routes will be cleared. |
| `soft in` | Soft inbound reset causes the neighbors to resend all their updates to the local switch, without resetting the connection or clearing the entries in the local switch. So, the local switch stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory. |
| `soft out` | Soft outbound reset causes the switch to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries. |
| `vrf` | Applies the command to the specified VRF instance. |
| *<vrf-name>* | The name of the VRF instance. |

**Mode [BGP]** Privileged Exec

**Examples [BGP]** To clear the BGP connection to the peer at IPv4 address 192.168.1.1 and clear all incoming routes, use the following command:

```
awplus# clear ip bgp 192.168.1.1 in
```

To apply the above example to clear the BGP connection to the peer at IP address 192.0.2.11 for the VRF instance blue, use the following commands:

```
awplus# clear ip bgp 192.0.2.11 vrf blue in
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear ip bgp dampening (BGP only)

**Overview** Use this command to clear route dampening information and unsuppress routes that have been suppressed.

**Syntax**

```
clear ip bgp dampening [<ip-address>|<ip-address/m>]
```

| Parameter | Description |
|---|---|
| *<ip-address>* | Specifies the IPv4 address for which BGP dampening is to be cleared, in dotted decimal format. |
| *<ip-address/m>* | Specifies the IPv4 address with mask for which BGP dampening is to be cleared, entered in the form A.B.C.D/M. Where M is the subnet mask |
| `ipv4` | Clears all IPv4 address family peers. Configure parameters relating to the BGP exchange of IPv4 prefixes. |

**Mode** Privileged Exec

**Examples**

```
awplus# clear ip bgp dampening 10.10.0.121
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear ip bgp flap-statistics (BGP only)

**Overview** Use this command to clear the flap count and history duration for the specified prefixes.

**Syntax**

```
clear ip bgp flap-statistics [<ip-address>|<ip-address/m>]
```

| Parameter | Description |
|---|---|
| *<ip-address>* | Specifies the IPv4 address for which BGP flap count and history duration are to be cleared. |
| *<ip-address/m>* | Specifies the IPv4 address with mask for which BGP flap count and history duration are to be cleared. |
| ipv4 | Clears all IPv4 address family peers. Configure parameters relating to the BGP exchange of IPv4 prefixes. |

**Mode** Privileged Exec

**Examples**

```
awplus# clear ip bgp flap-statistics 10.10.0.121
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear ip bgp (ASN) (BGP only)

**Overview** Use this command to reset the BGP connections to all peers in a specified Autonomous System Number (ASN).

**Syntax**

```
clear ip bgp <asn> [in [prefix-filter]|out|soft [in|out]]
clear ip bgp <asn> ipv4
clear ip bgp <asn> ipv4 in [prefix-filter]
clear ip bgp <asn> ipv4 out
clear ip bgp <asn> ipv4 soft [in|out]
```

| Parameter | Description |
|---|---|
| *<asn>* | <1-4294967295><br>Specifies the ASN for which all routes will be cleared. |
| ipv4 | Clears all IPv4 address family peers. Configure parameters relating to the BGP exchange of IPv4 prefixes. |
| in | Indicates that incoming advertised routes will be cleared. |
| prefix-filter | Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration. |
| out | Indicates that outgoing advertised routes will be cleared. |
| soft in | Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory. |
| soft out | Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries. |

**Mode** Privileged Exec

**Examples**

```
awplus# clear ip bgp 100
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear ip bgp external (BGP only)

**Overview** Use this command to reset the BGP connections to all external peers.

**Syntax**

```
clear ip bgp external [in [prefix-filter]|out|soft [in|out]]
clear ip bgp external
clear ip bgp external in [prefix-filter]
clear ip bgp external out
clear ip bgp external soft [in|out]
```

| Parameter | Description |
|---|---|
| `external` | Clears all external peers. |
| `ipv4` | Clears all IPv4 address family peers. Configure parameters relating to the BGP exchange of IPv4 prefixes. |
| `in` | Indicates that incoming advertised routes will be cleared. |
| `prefix-filter` | Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration. |
| `out` | Indicates that outgoing advertised routes will be cleared. |
| `soft in` | Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory. |
| `soft out` | Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries. |

**Mode** Privileged Exec

**Examples**

```
awplus# clear ip bgp external out
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear ip bgp peer-group (BGP only)

**Overview** Use this command to reset the BGP connections to all members of a peer group.

**Syntax**

```
clear ip bgp peer-group <peer-name>
clear ip bgp peer-group <peer-name> in [prefix-filter]
clear ip bgp peer-group <peer-name> out
clear ip bgp peer-group <peer-name> soft [in|out]
clear ip bgp peer-group <peer-name> out
clear ip bgp peer-group <peer-name> soft [in|out]
```

| Parameter | Description |
|---|---|
| `peer-group` | Clears all members of a peer group. |
| *<peer-name>* | Specifies the name of the peer group for which all members will be cleared. |
| `ipv4` | Clears all IPv4 address family peers. Configure parameters relating to the BGP exchange of IPv4 prefixes. |
| `in` | Indicates that incoming advertised routes will be cleared. |
| `prefix-filter` | Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration. |
| `out` | Indicates that outgoing advertised routes will be cleared. |
| `soft in` | Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory. |
| `soft out` | Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries. |

**Mode** Privileged Exec

**Examples**

```
awplus# clear ip bgp peer-group Peer1 out
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear ip prefix-list

**Overview** Use this command to reset the hit count to zero in the prefix-list entries.

**Syntax**

```
clear ip prefix-list [<list-name>] [<ip-address>/<mask>]
```

| Parameter | Description |
|---|---|
| *<list-name>* | The name of the prefix-list. |
| *<ip-address>/<mask>* | The IP prefix and length. |

**Mode** Privileged Exec

**Example** To clear a prefix-list named List1:

```
awplus# clear ip prefix-list List1
```

# debug bgp (BGP only)

**Overview** Use this command to turn on one or more BGP debug options.

Use the **no** variant of this command to disable one or more BGP debug options.

**Syntax**

```
debug bgp
[all|dampening|events|filters|fsm|keepalives|nht|nsm|updates
[in|out]]
```

```
no debug all bgp
```

```
no debug bgp
[all|dampening|events|filters|fsm|keepalives|nht|nsm|updates
[in|out]]
```

| Parameter | Description |
|---|---|
| `all` | Turns on all debugging for BGP. |
| `dampening` | Specifies debugging for BGP dampening. |
| `events` | Specifies debugging for BGP events. |
| `filters` | Specifies debugging for BGP filters. |
| `fsm` | Specifies debugging for BGP Finite State Machine (FSM). |
| `keepalives` | Specifies debugging for BGP keepalives. |
| `nht` | Specifies debugging for BGP NHT (Next Hop Tracking) messages. |
| `nsm` | Specifies debugging for NSM messages. |
| `updates` | `[in\|out]`<br>Specifies debugging for BGP updates. |
| `in` | Inbound updates. |
| `out` | Outbound updates. |

**Mode** Privileged Exec and Global Configuration

**Usage** If the command is entered with no parameters, then all debug options are enabled.

**Examples**

```
awplus# debug bgp
awplus# debug bgp events
awplus# debug bgp nht
awplus# debug bgp updates in
```

**Related commands** show debugging bgp (BGP only)

undebug bgp (BGP only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# distance (BGP and BGP4+)

**Overview** This command sets the administrative distance for BGP and BGP4+ routes. The device uses this value to select between two or more routes to the same destination from two different routing protocols. Set the administrative distance for BGP routes in the Router Configuration mode, and for BGP4+ routes in IPv6 Address Family Configuration mode.

The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). For more information, see the Route Selection Feature Overview and Configuration Guide, which is available from the above link at alliedtelesis.com.

The **no** variant of this command sets the administrative distance for the route to the default for the route type.

**Syntax**

```
distance <1-255> <ip-address/m>
distance bgp <ebgp> <ibgp> <local>
no distance <1-255> <ip-address/m>
no distance bgp <ebgp> <ibgp> <local>
```

| Parameter | Description |
|---|---|
| *<1-255>* | The administrative distance value you are setting for the route. |
| *<ip-address/m>* | The IP source prefix that you are changing the administrative distance for, entered in the form `A.B.C.D/M`. This is an IPv4 address in dotted decimal notation followed by a forward slash, and then the prefix length. |
| *<ebgp>* | Specifies the administrative distance of external BGP (eBGP) routes. These are routes learned from a neighbor out of the AS. Specify the distance as a number between 1 and 255. Default: **20** |
| *<ibgp>* | Specifies the administrative distance of internal BGP (iBGP) routes. These are routes learned from a neighbor within the same AS. Specify the distance as a number between 1 and 255. Default: **200** |
| *<local>* | Specifies the administrative distance of local BGP routes. These are routes redistributed from another protocol within your device. Specify the distance as a number between 1 and 255. Default: **200** |

**Mode [BGP]** Router Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage notes** You can use this command to set the administrative distance:

- for each BGP route type by specifying:

```
awplus(config-router)# distance <ebgp> <igbp> <local>
```

- for a specific route by specifying:

```
awplus(config-router)# distance <1-255> <ip-address/m>
[<listname>]
```

If the administrative distance is changed, it could create inconsistency in the routing table and obstruct routing.

**Example [BGP4+]**

For BGP4+ IPv6, to set BGP 100's administrative distances for eBGP routes to 34, iBGP routes to 23, and local BGP routes to 15, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# distance bgp 34 23 15
```

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# exit-address-family

**Overview** Use this command to exit either the IPv4 or the IPv6 Address Family Configuration mode.

**Syntax**
```
exit-address-family
```

**Mode [BGP]** IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Examples [BGP]** To enter and then exit IPv4 Address Family Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv4
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

**Example (VRF-lite)** To enter and then exit IPv4 Address Family Configuration mode for VRF instance red, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

**Example [BGP4+]** To enter and then exit IPv6 Address Family Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

**Related commands** address-family

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# ip community-list

**Overview** Use this command to add an entry to a standard or extended BGP community-list filter.

Use the **no** variant of this command to delete a standard or extended community list entry.

**Syntax**

```
ip community-list <listname> {deny|permit} .<community>
no ip community-list <listname> {deny|permit} .<community>
```

| Parameter | Description |
|---|---|
| *<listname>* | Specifies the community listname. |
| deny | Specifies the community to reject. |
| permit | Specifies the community to accept. |
| .*<community>* | {<AS:VAL>\|local-AS\|no-advertise\|no-export} |
| <AS:VAL> | Specifies the valid value for the community number. This format represents the 32 bit communities value, where AS is the high order 16 bits and VAL is the low order 16 bits in digit format. |
| local-AS | Specifies routes not to be advertised to external BGP peers. |
| no-advertise | Specifies routes not to be advertised to other BGP peers. |
| no-export | Specifies routes not to be advertised outside of Autonomous System boundary. |

**Mode** Global Configuration

**Usage notes** A community-list can be used as a filter to BGP updates. Use this command to define the community access list globally, then use neighbor configuration commands to apply the list to a particular neighbor.

There are two kinds of community-lists: expanded and standard. A standard community- list defines the community attributes explicitly and not via a regular expression. An expanded community-list defines the communities attributes with regular expressions.

The standard community-list is compiled into binary format and is directly compared with the BGP communities attribute in the BGP updates. The comparison is faster than the expanded community-list. Any community value that does not match the standard community value is automatically treated as expanded.

**Example**

```
awplus# configure terminal
awplus(config)# ip community-list mylist permit 7675:80 7675:90
```

**Related commands**

ip community-list standard

ip community-list expanded

show ip community-list

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.4: BGP support added for IE300 series

# ip community-list expanded

**Overview** Use this command to add an entry to an expanded BGP community-list filter.

Use the **no** variant of this command to delete the community list entry.

**Syntax**

```
ip community-list <100-199> {deny|permit} .<line>
no ip community-list <100-199> {deny|permit} .<line>
ip community-list expanded <expanded-listname> {deny|permit}
.<line>
no ip community-list expanded <expanded-listname> {deny|permit}
.<line>
```

| Parameter | Description |
|---|---|
| *<100-199>* | Expanded community list number. |
| expanded | Specifies an expanded community list. |
| *<expanded-listname>* | Expanded community list entry. |
| deny | Specifies community to reject. |
| permit | Specifies community to accept. |
| .*<line>* | Specifies community attributes with regular expressions. |

Regular expressions listed below can be used with the **ip community-list expanded** command:

| Symbol | Character | Meaning |
|---|---|---|
| ^ | Caret | Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match. |
| $ | Dollar sign | Used to match the end of the input string. |
| . | Period | Used to match a single character (white spaces included). |
| * | Asterisk | Used to match none or more sequences of a pattern. |
| + | Plus sign | Used to match one or more sequences of a pattern. |
| ? | Question mark | Used to match none or one occurrence of a pattern. |
| _ | Underscore | Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string. |
| [ ] | Brackets | Specifies a range of single-characters. |
| - | Hyphen | Separates the end points of a range. |

**Mode** Global Configuration

**Usage notes** A `community-list` can be used as a filter to BGP updates. Use this command to define the community access list globally, then use **neighbor** configuration commands to apply the list to a particular neighbor.

There are two kinds of community-lists: expanded and standard. A standard community- list defines the community attributes explicitly and not via a regular expression. An expanded community-list defines the communities attributes with regular expressions.

The standard community-list is compiled into binary format and is directly compared with the BGP communities attribute in the BGP updates. The comparison is faster than the expanded community-list. Any community value that does not match the standard community value is automatically treated as expanded.

**Examples**

```
awplus# configure terminal
awplus(config)# ip community-list 125 permit 6789906
awplus(config)# ip community-list expanded CLIST permit .*
```

**Related commands**

# ip community-list standard

**Overview** Use this command to add an entry to a standard BGP community-list filter.

Use the **no** variant of this command to delete the standard community-list entry.

**Syntax**

```
ip community-list <1-99> {deny|permit} [.<community>]
no ip community-list <1-99> {deny|permit} [.<community>]
ip community-list standard <standard-listname> {deny|permit}
[.<community>]
no ip community-list standard <standard-listname> {deny|permit}
[.<community>]
```

| Parameter | Description |
|---|---|
| *<1-99>* | Standard community list number. |
| `standard` | Specifies a standard community list. |
| *<standard-listname>* | Standard community list entry. |
| `deny` | Specifies community to reject. |
| `permit` | Specifies community to accept. |
| *<community>* | {*<AS:VAL>*\| local-AS \| no-advertise \| no-export} |
| *<AS:VAL>* | Specifies the valid value for the community number. This format represents the 32 bit communities value, where `AS` is the high order 16 bits and `VAL` is the low order 16 bits in digit format. |
| `local-AS` | Specifies routes not to be advertised to external BGP peers. |
| `no-advertise` | Specifies routes not to be advertised to other BGP peers. |
| `no-export` | Specifies routes not to be advertised outside of the Autonomous System boundary. |

**Mode** Global Configuration

**Usage notes** A community-list can be used as a filter to BGP updates. Use this command to define the community access list globally, then use neighbor configuration commands to apply the list to a particular neighbor.

There are two kinds of community-lists: expanded and standard. The standard community-list defines the community attributes as explicit values, without regular expressions. The expanded community-list defines the communities attributes with regular expressions.

The standard community-list is compiled into binary format and is directly compared with the BGP communities attribute in the BGP updates. The comparison is faster than the expanded community-list. Any community value

that does not match the standard community value is automatically treated as expanded.

**Examples**

```
awplus# configure terminal
awplus(config)# ip community-list standard CLIST permit 7675:80
7675:90 no-export
awplus(config)# ip community-list 34 permit 5675:50
no-advertise
```

# ip extcommunity-list expanded

**Overview** Use this command to create or delete an expanded extended community list.

Use the **no** variant of this command to delete the expanded extended community-list entry.

**Syntax**

```
ip extcommunity-list <100-199> {deny|permit}
{.<line>|.<AS:NN>|.<ip-address>}

no ip extcommunity-list <100-199> {deny|permit}
{.<line>|.<AS:NN>|.<ip-address>}

ip extcommunity-list expanded <expanded-listname> {deny|permit}
{.<line>|.<AS:NN>|.<ip-address>}

no ip extcommunity-list expanded <expanded-listname>
{deny|permit} {.<line>|.<AS:NN>|.<ip-address>}

no ip extcommunity-list <100-199>

no ip extcommunity-list expanded <expanded-listname>
```

| Parameter | Description |
|---|---|
| *<100-199>* | Expanded extcommunity list number. |
| expanded | Specifies an expanded extcommunity list. |
| *<expanded-listname>* | Expanded extcommunity list entry. |
| deny | Specifies the extcommunity to reject. |
| permit | Specifies the extcommunity to accept. |
| *.<line>* | Specifies extcommunity attributes with regular expression. |
| *<AS:NN>* | Specifies the valid value for an extcommunity number. This format represents the 32 bit extcommunities value, where AA is the high order 16 bits and NN is the low order 16 bits in digit format. |
| *<ip-address>* | Specifies the IP address to deny or permit. |

Regular expressions listed below are used with the **ip extcommunity-list expanded** command:

| Symbol | Character | Meaning |
|---|---|---|
| ^ | Caret | Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match. |
| $ | Dollar sign | Used to match the end of the input string. |

| Symbol | Character | Meaning |
|---|---|---|
| . | Period | Used to match a single character (white spaces included). |
| * | Asterisk | Used to match none or more sequences of a pattern. |
| + | Plus sign | Used to match one or more sequences of a pattern. |
| ? | Question mark | Used to match none or one occurrence of a pattern. |
| _ | Underscore | Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string. |
| [ ] | Brackets | Specifies a range of single-characters. |
| - | Hyphen | Separates the end points of a range. |

**Mode** Global Configuration

**Examples**

```
awplus# configure terminal
awplus(config)# ip extcommunity-list 125 permit 4567335
awplus(config)# ip extcommunity-list expanded CLIST permit .*
```

**Related commands** ip extcommunity-list standard

# ip extcommunity-list standard

**Overview** Use this command to create and delete a standard extended community list.

Use the **no** variant of this command to delete a standard extended community-list entry.

**Syntax**

```
ip extcommunity-list <1-99> {deny|permit} {rt|soo}
<community-number>
```

```
ip extcommunity-list standard <standard-listname> {deny|permit}
{rt|soo} <community-number>
```

```
no ip extcommunity-list <1-99> [{deny|permit} {rt|soo}
<community-number>]
```

```
no ip extcommunity-list standard <standard-listname>
[{deny|permit} {rt|soo} <community-number>]
```

| Parameter | Description |
|---|---|
| <1-99> | Standard extcommunity list number. |
| standard | Specifies a standard extended community list. |
| <standard-listname> | Standard extended community list entry. |
| deny | Specifies the extended community to reject. |
| permit | Specifies the extended community to accept. |
| rt | Specifies the route target of the extended community. |
| soo | Specifies the site of origin of the extended community. |
| <community-number> | Specifies the valid value for an extended community number.<br>This can be one of two formats:<br>• <ASN:NN> where *ASN* is an AS (Autonomous System) number and *NN* is a value chosen by the ASN administrator<br>• <A.B.C.D:NN> where *A.B.C.D* is an IPv4 address, and *NN* is a value chosen by the ASN administrator.<br>Note that *ASN* and *NN* are both integers from 1 to 4294967295.<br>AS numbers are assigned to the regional registries by IANA (www.iana.org) and must be obtained in your region. |

**Mode** Global Configuration

**Examples**

```
awplus# configure terminal
awplus(config)# ip extcommunity-list 36 permit rt 5675:50
awplus(config)# ip extcommunity-list standard CLIST permit soo 7645:70
awplus# configure terminal
awplus(config)# ip extcommunity-list 36 deny rt 192.168.1.1:70
awplus(config)# ip extcommunity-list standard CLIST deny soo 10.10.1.1:50
```

**Related commands**

ip extcommunity-list expanded

show ip extcommunity-list

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.4: BGP support added for IE300 series

# ip prefix-list

**Overview** Use this command to create an entry for an IPv4 prefix list.

Use the **no** variant of this command to delete the IPv4 prefix-list entry.

**Syntax**

```
ip prefix-list <list-name> [seq <1-429496725>] {deny|permit}
{any|<ip-prefix>} [ge <0-32>] [le <0-32>]
ip prefix-list <list-name> description <text>
ip prefix-list sequence-number
no ip prefix-list <list-name> [seq <1-429496725>]
no ip prefix-list <list-name> [description <text>]
no ip prefix-list sequence-number
```

| Parameter | Description |
|---|---|
| *<list-name>* | Specifies the name of a prefix list. |
| seq *<1-429496725>* | Sequence number of the prefix list entry. |
| deny | Specifies that the prefixes are excluded from the list. |
| permit | Specifies that the prefixes are included in the list. |
| *<ip-prefix>* | Specifies the IPv4 address and length of the network mask in dotted decimal in the format A.B.C.D/M. |
| any | Any prefix match. Same as **0.0.0.0/0 le 32**. |
| ge*<0-32>* | Specifies the minimum prefix length to be matched. |
| le*<0-32>* | Specifies the maximum prefix length to be matched. |
| *<text>* | Text description of the prefix list. |
| sequence-number | Specify sequence numbers included or excluded in prefix list. |

**Mode** Global Configuration

**Usage notes** When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. When setting these parameters, set the **le** value to be less than 32, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

**Example** In the following sample configuration, the last **ip prefix-list** command in the below list matches all, and the first **ip prefix-list** command denies the IP network 76.2.2.0:

```
awplus(config)# router bgp 100
awplus(config-router)# network 172.1.1.0
awplus(config-router)# network 172.1.2.0
awplus(config-router)# neighbor 10.6.5.3 remote-as 300
awplus(config-router)# neighbor 10.6.5.3 prefix-list mylist out
awplus(config-router)# exit
awplus(config)# ip prefix-list mylist seq 5 deny 76.2.2.0/24
awplus(config)# ip prefix-list mylist seq 100 permit any
```

To deny the IP addresses between 10.0.0.0/14 (10.0.0.0 255.252.0.0) and 10.0.0.0/22 (10.0.0.0 255.255.252.0) within the 10.0.0.0/8 (10.0.0.0 255.0.0.0) addressing range, enter the following commands:

```
awplus# configure terminal
awplus(config)# ip prefix-list mylist seq 12345 deny 10.0.0.0/8
ge 14 le 22
```

**Related commands**

neighbor prefix-list

clear ip prefix-list

show ip prefix-list

# ipv6 prefix-list

**Overview** Use this command to create an IPv6 prefix list or an entry in an existing prefix list.

Use the **no** variant of this command to delete a whole prefix list, a prefix list entry, or a description.

**Syntax**

```
ipv6 prefix-list <list-name> [seq <1-429496725>] {deny|permit}
{any|<ipv6-prefix>} [ge <0-128>] [le <0-128>]
ipv6 prefix-list <list-name> description <text>
no ipv6 prefix-list <list-name> [seq <1-429496725>]
no ipv6 prefix-list <list-name> [description <text>]
```

| Parameter | Description |
|---|---|
| `<list-name>` | Specifies the name of a prefix list. |
| `seq <1-429496725>` | Sequence number of the prefix list entry. |
| `deny` | Specifies that the prefixes are excluded from the list. |
| `permit` | Specifies that the prefixes are included in the list. |
| `<ipv6-prefix>` | Specifies the IPv6 prefix and prefix length in hexadecimal in the format X:X::X:X/M. |
| `any` | Any prefix match. Same as ::0/0 le 128. |
| `ge <0-128>` | Specifies the minimum prefix length to be matched. |
| `le <0-128>` | Specifies the maximum prefix length to be matched. |
| `description` | Prefix list specific description. |
| `<text>` | Up to 80 characters of text description of the prefix list. |

**Mode** Global Configuration

**Usage notes** When the device processes a prefix list, it starts to match prefixes from the top of the prefix list, and stops whenever a permit or deny occurs. To promote efficiency, use the **seq** parameter and place common permits or denials towards the top of the list. If you do not use the **seq** parameter, the sequence values are generated in a sequence of 5.

The parameters **ge** and **le** specify the range of the prefix lengths to be matched. The parameters **ge** and **le** are only used if an ip-prefix is stated. When setting these parameters, set the **le** value to be less than 128, and the **ge** value to be less than or equal to the **le** value and greater than the ip-prefix mask length.

Prefix lists implicitly exclude prefixes that are not explicitly permitted in the prefix list. This means if a prefix that is being checked against the prefix list reaches the end of the prefix list without matching a permit or deny, this prefix will be denied.

**Example** To check the first 32 bits of the prefix 2001:db8:: and that the subnet mask must be greater than or equal to 34 and less than or equal to 40, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 prefix-list mylist seq 12345 permit
2001:db8::/32 ge 34 le 40
```

**Related commands**

match ipv6 address

show ipv6 prefix-list

show running-config ipv6 prefix-list

# match as-path

**Overview** Use this command to add an autonomous system (AS) path match clause to a route map entry. Specify the AS path attribute value or values to match by specifying the name of an AS path access list.

A BGP update message matches the route map if its attributes include AS path values that match the AS path access list.

Each entry of a route map can only match against one AS path access list in one AS path match clause. If the route map entry already has an AS path match clause, entering this command replaces that match clause with the new clause.

Note that AS path access lists and route map entries both specify an action of deny or permit. The action in the AS path access list determines whether the route map checks update messages for a given AS path value. The route map action and its **set** clauses determine what the route map does with update messages that contain that AS path value.

Use the **no** variant of this command to remove the AS path match clause from a route map entry.

**Syntax**

```
match as-path <as-path-listname>
no match as-path [<as-path-listname>]
```

| Parameter | Description |
|---|---|
| *<as-path-listname>* | Specifies an AS path access list name. |

**Mode** Route-map Configuration

**Usage notes** This command is valid for BGP update messages only.

**Example** To add entry `34` to the route map called `myroute`, which will discard update messages if they contain the AS path values that are included in `myaccesslist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute deny 34
awplus(config-route-map)# match as-path myaccesslist
```

**Related commands**

route-map

set as-path

show route-map

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# match community

**Overview** Use this command to add a community match clause to a route map entry. Specify the community value or values to match by specifying a community list. To create the community list, enter Global Configuration mode and use the ip community-list command.

A BGP update message matches the route map if its attributes include community values that match the community list.

Each entry of a route map can only match against one community list in one community match clause. If the route map entry already has a community match clause, entering this command replaces that match clause with the new clause.

Note that community lists and route map entries both specify an action of deny or permit. The action in the community list determines whether the route map checks update messages for a given community value. The route map action and its **set** clauses determine what the route map does with update messages that contain that community value.

Use the **no** variant of this command to remove the community match clause from a route map.

**Syntax**

```
match community
{<community-listname>|<1-99>|<100-199>}[exact-match]
```

```
no match community
[<community-listname>|<1-99>|<100-199>|exact-match]
```

| Parameter | Description |
|---|---|
| *<community-listname>* | The community list name or number. |
| *<1-99>* | Community list number (standard range). |
| *<100-199>* | Community list number (expanded range). |
| exact-match | Exact matching of communities. |

**Mode** Route-map Configuration

**Usage notes** This command is valid for BGP update messages only.

Communities are used to group and filter routes. They are designed to provide the ability to apply policies to large numbers of routes by using match and set commands. Community lists are used to identify and filter routes by their common attributes.

**Example** To add entry `3` to the route map called `myroute`, which will process update messages if they contain the community values that are included in `mylist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# match community mylist
```

**Related commands**

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# max-paths

**Overview** Use this command to set the number of equal-cost multi-path (ECMP) routes for eBGP or iBGP. You can install multiple BGP paths to the same destination to balance the load on the forwarding path.

Use the **no** variant of this command to disable this feature.

**Syntax**

```
max-paths {ebgp|ibgp} <2-64>
no max-paths ebgp [<2-64>]
no max-paths ibgp [<2-64>]
```

| Parameter | Description |
|---|---|
| ebgp | eBGP ECMP session. |
| ibgp | iBGP ECMP session. |
| *<2-64>* | Specifies the number of routes. |

**Mode** Global Configuration

**Usage notes** This command is available for the default BGP instance and for IPV4 and IPv6 unicast addresses.

**Example**

```
awplus# configure terminal
awplus(config)# router bgp 64501
awplus(config-router)# max-paths ebgp 2
```

**Related commands** show ip route summary

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor activate

**Overview** Use this command to enable the exchange of BGP IPv4 and BGP4+ IPv6 routes with a neighboring router, and also within either an IPv4 or an IPv6 specific address-family.

Use the **no** variant of this command to disable the exchange of information with a BGP or BGP4+ neighbor, in the Router Configuration or the Address Family Configuration mode.

**Syntax**

```
neighbor <neighborid> activate
no neighbor <neighborid> activate
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>* \| *<ipv6-addr>* \| *<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage [BGP]** Use this command to enable the exchange of information to a neighbor. To exchange IPv4 or IPv6 prefixes with a BGP or a BGP4+ peer, you must configure this command for the peer or the peer group. This command only enables the exchange of information. You can establish peering without this command, but no prefixes and other information is sent until you apply this command to the neighbor.

This command triggers the device to start a BGP or BGP4+ peering relationship with the specified BGP or BGP4+ neighbor and start exchanging routes with that neighbor.

The command is required for neighbors configured in Address-Family Configuration mode, but it is not required in Router Configuration mode (that is, it does not affect the device's behavior).

**Examples [BGP]** To enable an exchange of routes with a neighboring router with the IPv4 address 10.10.10.1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 activate
```

To disable an exchange of routes with a neighboring router with the IPv4 address 10.10.10.1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 activate
```

To enable an exchange of routes in Address Family Configuration mode with a neighboring router with the IPv4 address 10.10.10.1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 activate
```

To disable an exchange of routes in Address Family Configuration mode with a neighboring router with the IPv4 address 10.10.10.1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 activate
```

To enable an exchange of routes with a neighboring router with the peer-group named group1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.63 remote-as 10
awplus(config-router)# neighbor 10.10.0.63 peer-group group1
awplus(config-router)# neighbor group1 activate
```

To disable an exchange of routes with a neighboring router with the peer-group named group1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 activate
```

**Examples [BGP4+]**

To enable an exchange of routes in IPv6 Address Family Configuration mode with a neighboring router with the IPv6 address 2001:0db8:010d::1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 activate
```

To disable an exchange of routes in IPv6 Address Family Configuration mode with a neighboring router with the IPv6 address 2001:0db8:010d::1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
activate
```

To enable an exchange of routes with a neighboring router with the peer-group named group1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 activate
```

To disable an exchange of routes with a neighboring router with the peer-group named group1, enter the commands as shown below:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 activate
```

**Related commands**

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor advertisement-interval

**Overview** Use this command to set the minimum interval between sending iBGP or eBGP routing updates for a given route. This command reduces the flapping of individual routes.

Use the **no** variant of this command to set the interval time to the default values (30 seconds for eBGP peers and 5 seconds for iBGP peers) for a given route.

**Syntax**

```
neighbor <neighborid> advertisement-interval <time>
no neighbor <neighborid> advertisement-interval [<time>]
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>* \| *<ipv6-addr>* \| *<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. Note that if you apply an advertisement-interval value to a peer group it will apply to all members in the peer group. |
| *<time>* | *<0-600>* | Advertisement -interval value in seconds. |

**Default** The default interval between sending routing updates for a given route to eBGP peers is 30 seconds, and the default interval for a given route to iBGP peers is 5 seconds.

**Mode** Router Configuration

**Usage notes** Use this command to set the minimum interval between sending iBGP or eBGP routing updates for a given route. To reduce the flapping of routes to the internet, set a minimum advertisement interval, so iBGP or eBGP routing updates are sent per interval seconds.

BGP dampening can also be used to control the effects of flapping routes. See the bgp dampening command in this chapter, and the Routing_Protocol Guide for more information.

The advertisement-interval time value is the minimum time between the advertisement of Update messages sent from a BGP speaker to report changes to

eBGP or iBGP peers. This is the minimum time between two Update messages sent to iBGP or eBGP peers.

See the neighbor as-origination-interval command to set the interval time between messages to iBGP peers, which have prefixes within the local AS. Use this command instead of the neighbor as-origination-interval command for eBGP peers with prefixes not in the same AS and updates not in a local AS.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.3
advertisement-interval 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.3
advertisement-interval
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.3 remote-as 10
awplus(config-router)# neighbor 10.10.0.3 peer-group group1
awplus(config-router)# neighbor group1 advertisement-interval
45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1
advertisement-interval
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
advertisement-interval 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
advertisement-interval
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1
advertisement-interval 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1
advertisement-interval
```

**Related commands**

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor allowas-in

**Overview** Use this command to accept an AS_PATH with the specified Autonomous System (AS) number from inbound updates for both BGP and BGP4+ routes.

This command allows BGP and BGP4+ to accept prefixes with the same ASN in the AS_PATH attribute. This command allows BGP and BGP4+ to accept up to 10 instances, configured by the <*occurrences*> placeholder, of its own AN in the AS_PATH for a prefix.

Use the **no** variant of this command to revert to default functionality (disabled by default).

**Syntax**

```
neighbor <neighborid> allowas-in <occurrences>
no neighbor <neighborid> allowas-in
```

| Parameter | Description | |
|---|---|---|
| <*neighborid*> | {<*ip-address*>\|<*ipv6-addr*>\|<*peer-group*>} | |
| | <*ip-address*> | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | <*ipv6-addr*> | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | <*peer-group*> | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| <*occurrences*> | <*1-10*> Specifies the number of occurrences of the AS number. | |

**Default** Disabled

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** Use this command to configure PE (Provider Edge) routers to allow re-advertisement of all prefixes containing duplicate Autonomous System Numbers (ASNs). In a hub and spoke configuration, a PE router re-advertises all prefixes containing duplicate ASNs. Specify the remote-as or peer-group first using the related commands. The command allows a receiving peer to accept prefixes with its own AN in the AS_PATH, up the maximum number of instances, as configured by the <*occurrences*> placeholder.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.1 allowas-in 3
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.0.1 allowas-in 3
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.1 allowas-in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.0.1 allowas-in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.1 remote-as 10
awplus(config-router)# neighbor 10.10.0.1 peer-group group1
awplus(config-router)# neighbor group1 allowas-in 3
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor group1 allowas-in 3
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
allowas-in 3
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
allowas-in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 allowas-in 3
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor group1 allowas-in 3
```

**Related commands**

neighbor route-map

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor as-origination-interval

**Overview** Use this command to adjust the sending of AS (Autonomous System) origination routing updates to a specified iBGP peer. This command adjusts the rate at which updates are sent to a specified iBGP peer (15 seconds by default). You must set a rate when you enable it.

The as-origination-interval is the minimum time set between the advertisement of Update messages sent from a BGP speaker to an iBGP peer to report changes within the local AS.

Use the **no** variant of this command to reset the timer to the default value of 15 seconds.

**Syntax [BGP]**

```
neighbor <neighbor_address> as-origination-interval <time>
no neighbor <neighbor_address> as-origination-interval [<time>]
```

**Syntax [BGP4+]**

```
neighbor <ipv6-addr> as-origination-interval <time>
no neighbor <ipv6-addr> as-origination-interval [<time>]
```

| Parameter | Description |
|---|---|
| *<neighbor_address>* | Specify a neighbor IPv4 address, in dotted decimal in the format A.B.C.D. |
| *<ipv6-addr>* | Specify an address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| *<time>* | <1-600> Time in seconds. |

**Default** The default interval between sending routing updates to iBGP peers, which include a prefix that originates from the local AS, is 15 seconds by default.

**Mode** Router Configuration

**Usage** This command is used to change the minimum interval between sending AS-origination routing updates. The update interval for iBGP peers can be set from 1 to 600 seconds.

For interoperability with other vendors' devices, we recommend using the default value. The AS origination interval timer may not be available to adjust on other vendors' devices. Applying the default of 15 seconds across the AS maintains a common timer policy.

AlliedWare Plus devices use the default 15 second AS Origination Interval timer as per RFC 4271, a 30 second keepalive timer, a 90 second hold timer, a 120 second connect timer, a 5 second iBGP peer route advertisement interval, and a 30 second eBGP peer route advertisement interval.

Cisco devices use a 60 second keepalive timer, a 180 second hold timer, and no iBGP peer route interval timer (0). Juniper devices use a 10 second AS Origination Interval timer.

The as-origination-interval time value is the minimum amount of time between the advertisement of Update messages sent from a BGP speaker to report changes within the local AS. This is the minimum time between two Update messages to iBGP peers, which contain a prefix that originates from the same AS. See the neighbor advertisement-interval command to set time between messages to eBGP peers.

Use this command instead of the neighbor advertisement-interval command for iBGP peers with prefixes in the same AS for updates only within a local AS.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# neighbor 10.10.0.1
as-origination-interval 10
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no neighbor 10.10.0.1
as-origination-interval
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# neighbor 2001:0db8:010d::1
as-origination-interval 10
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# no neighbor 2001:0db8:010d::1
as-origination-interval
```

**Validation Commands**

show bgp ipv6 neighbors (BGP4+ only)

show ip bgp neighbors (BGP only)

**Related commands**

neighbor advertisement-interval

address-family

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor attribute-unchanged

**Overview** Use this command to advertise unchanged BGP or BGP4+ attributes to the specified BGP or BGP4+ neighbor.

Use the **no** variant of this command to disable this function.

**Syntax**

```
neighbor <neighborid> attribute-unchanged
{as-path|next-hop|med}
```

```
no neighbor <neighborid> attribute-unchanged
{as-path|next-hop|med}
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>*\|*ipv6-addr*\|*<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| as-path | AS path attribute. | |
| next-hop | Next hop attribute. | |
| med | Multi Exit Discriminator. | |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage notes** Note that specifying this command with the optional **as-path** parameter has the same effect as invoking the neighbor transparent-as command.

Note this specifying this command with the optional **next-hop** parameter has the same effect as invoking the neighbor transparent-nexthop command.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.75 attribute-unchanged
as-path med
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.75
attribute-unchanged as-path med
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.0.75
attribute-unchanged as-path med
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.0.75
attribute-unchanged as-path med
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.75 remote-as 10
awplus(config-router)# neighbor 10.10.0.75 peer-group group1
awplus(config-router)# neighbor group1 attribute-unchanged
as-path med
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 attribute-unchanged
as-path med
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
attribute-unchanged as-path med
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
attribute-unchanged as-path med
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 attribute-unchanged
as-path med
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1
attribute-unchanged as-path med
```

# neighbor capability graceful-restart

**Overview** Use this command to configure the device to advertise the Graceful Restart Capability to BGP and BGP4+ neighbors.

Use the **no** variant of this command to configure the device so it does not advertise the Graceful Restart Capability to its neighbor.

**Syntax**

```
neighbor <neighborid> capability graceful-restart
no neighbor <neighborid> capability graceful-restart
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>*\|*<ipv6-addr>*\|*<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Default** Disabled

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** Use the **neighbor capability graceful-restart** command to advertise to the BGP or BGP4+ neighbor routers the capability of graceful restart. First specify the BGP or BGP4+ neighbor's **remote-as** identification number as assigned by the neighbor router.

The graceful restart capability is advertised only when the graceful restart capability has been enabled using the bgp graceful-restart command.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.50 capability
graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.50 capability
graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.50 capability
graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.50 capability
graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.50 remote-as 10
awplus(config-router)# neighbor 10.10.10.50 peer-group group1
awplus(config-router)# neighbor group1 capability
graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 capability
graceful-restart
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
capability graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
capability graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 capability
graceful-restart
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 capability
graceful-restart
```

**Related commands**

bgp graceful-restart

neighbor peer-group (add a neighbor)

neighbor route-map

restart bgp graceful (BGP only)

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor capability orf prefix-list

**Overview** Use this command to advertise ORF (Outbound Route Filters) capability to neighbors. Use this command to dynamically filter updates. The BGP speaker can advertise a prefix list with prefixes it wishes the peer to prune or filter from outgoing updates.

Use the **no** variant of this command to disable this function.

**Syntax**

```
neighbor <neighborid> capability orf prefix-list
{both|receive|send}
```

```
no neighbor <neighborid> capability orf prefix-list
{both|receive|send}
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>*\|*<ipv6-addr>*\|*<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| `orf` | Advertises ORF capability to its neighbors. | |
| `both` | Indicates that the local router can send ORF entries to its peer as well as receive ORF entries from its peer. | |
| `receive` | Indicates that the local router is willing to receive ORF entries from its peer. | |
| `send` | Indicates that the local router is willing to send ORF entries to its peer. | |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Default** Disabled

**Usage notes** Outbound Route Filters (ORFs) send and receive capabilities to lessen the number of updates exchanged between neighbors. By filtering updates, this option minimizes generating and processing of updates. The local router advertises the ORF capability in `send` mode and the remote router receives the ORF capability in

**receive** mode applying the filter as outbound policy. The two routers exchange updates to maintain the ORF for each router. Only an individual router or a peer-group can be configured to be in **receive** or **send** mode. A peer-group member cannot be configured in **receive** or **send** mode.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.5 capability orf
prefix-list both
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.5 capability orf
prefix-list both
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# neighbor 10.10.0.5 capability orf
prefix-list both
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# no neighbor 10.10.0.5 capability orf
prefix-list both
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.5 remote-as 10
awplus(config-router)# neighbor 10.10.0.5 peer-group group1
awplus(config-router)# neighbor group1 capability orf
prefix-list both
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 capability orf
prefix-list both
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router)# neighbor 2001:0db8:010d::1 capability
orf prefix-list both
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router)# no neighbor 2001:0db8:010d::1 capability
orf prefix-list both
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 capability orf
prefix-list both
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 capability orf
prefix-list both
```

**Related commands**

neighbor capability orf prefix-list

neighbor peer-group (add a neighbor)

neighbor route-map

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor capability route-refresh

**Overview** Use this command to advertise route-refresh capability to the specified BGP and BGP4+ neighbors.

Use the **no** variant of this command to disable this function

**Syntax**

```
neighbor <neighborid> capability route-refresh
no neighbor <neighborid> capability route-refresh
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>*\|*ipv6-addr*\|*<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode** Router Configuration

**Default** Enabled

**Usage** Use this command to advertise to peer about route refresh capability support. If route refresh capability is supported, then router can dynamically request that the peer readvertises its Adj-RIB-Out.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 capability
route-refresh
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 capability
route-refresh
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.1.1 remote-as 10
awplus(config-router)# neighbor 10.10.1.1 peer-group group1
awplus(config-router)# neighbor group1 capability route-refresh
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 capability
route-refresh
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 capability
route-refresh
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 capability
route-refresh
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 capability route-refresh
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 capability
route-refresh
```

**Related commands**

neighbor peer-group (add a neighbor)

neighbor route-map

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor collide-established

**Overview** Use this command to specify including a BGP or BGP4+ neighbor, already in an 'established' state, for conflict resolution when a TCP connection collision is detected.

Use the **no** variant of this command to remove a BGP or BGP4+ neighbor, already in an 'established' state, for conflict resolution when a TCP connection collision is detected.

**Syntax**

```
neighbor <neighborid> collide-established
no neighbor <neighborid> collide-established
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>*\|*<ipv6-addr>*\|*<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode** Router Configuration

**Usage notes** This command must be used only when specially required. It is not required in most network deployments.

The associated functionality of including an 'established' neighbor into TCP connection collision conflict resolution is automatically enabled when neighbor is configured for BGP graceful-restart.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 collide-established
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1
collide-established
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 collide-established
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 collide-established
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
collide-established
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
collide-established
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 collide-established
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 collide-established
```

**Related commands**

neighbor peer-group (add a neighbor)

neighbor route-map

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor default-originate

**Overview** Use this command to allow a BGP or BGP4+ local router to send the default route to a neighbor.

Use the **no** variant of this command to send no route as a default route.

**Syntax**

```
neighbor {<neighborid>} default-originate [route-map
<routemap-name>]
```

```
no neighbor {<neighborid>} default-originate [route-map
<routemap-name>]
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>* \| *<ipv6-addr>* \| *<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| route-map | If a route-map is specified, then the route table must contain at least one route that matches the permit criteria of the route map before the default route will be advertised to the specified neighbor. | |
| *<routemap-name>* | Enter the route-map name. | |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Examples [BGP]** To allow a device to originate default route to neighbor 10.10.10.1, when the device's route table contains at least one route matching the route map 'myroute', use the commands:

```
awplus# configure terminal
```

```
awplus(config)# router bgp 10
```

```
awplus(config-router)# neighbor 10.10.10.1 default-originate
route-map myroute
```

To stop a device from originating default route to neighbor 10.10.10.1, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 default-originate
route-map myroute
```

To allow a device to originate the IPv4 default route to neighbor 10.10.10.1, when the device's route table contains at least one route matching the route map 'myroute', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1
default-originate route-map myroute
```

To stop a device from originating IPv4 default route to neighbor 10.10.10.1, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1
default-originate route-map myroute
```

To allow a device to originate default route to peer group 'group1', when the device's route table contains at least one route matching the route map 'myroute', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 default-originate
route-map myroute
```

To stop a device originating default route to peer group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 default-originate
route-map myroute
```

**Examples [BGP4+]**

To allow a device to originate default route to neighbor 2001:0db8:010d::1, when the device's route table contains at least one route matching the route map 'myroute', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
default-originate route-map myroute
```

To stop a device originating default route to neighbor 2001:0db8:010d::1, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
default-originate route-map myroute
```

To allow a device to originate default route to peer group 'group1', when the device's route table contains at least one route matching the route map 'myroute', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 default-originate
route-map myroute
```

To stop a device originating default route to peer group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 default-originate
route-map myroute
```

**Related commands**

neighbor peer-group (add a neighbor)

neighbor route-map

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor description

**Overview** Use this command to associate a description with a BGP or a BGP4+ neighbor. We recommend adding descriptions to defined neighbors, so any network administrators or network engineers can see a description of connected BGP or BGP4+ peers on the device.

Use the **no** variant of this command to remove the description from a BGP or a BGP4+ neighbor.

**Syntax**

```
neighbor <neighborid> description <description>
no neighbor <neighborid> description [<description>]
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>* \| *<ipv6-addr>* \| *<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| *<description>* | Enter up to 80 characters of text describing the neighbor. | |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 description Backup
router for sales
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 description
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 description Backup
router for sales
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 description Backup
router for sales.
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 description
Backup router for sales
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
description
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 description Backup
router for sales
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 description Backup
router for sales
```

**Related commands**

neighbor peer-group (add a neighbor)

neighbor route-map

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor disallow-infinite-holdtime

**Overview** Use this command to disallow the configuration of infinite holdtime for BGP and BGP4+.

Use the **no** variant of this command to allow the configuration of infinite holdtime for BGP or BGP4+.

**Syntax [BGP]**

```
neighbor {<ip-address>} disallow-infinite-holdtime
no neighbor {<ip-address>} disallow-infinite-holdtime
```

**Syntax [BGP4+]**

```
neighbor {<ipv6-addr>} disallow-infinite-holdtime
no neighbor {<ipv6-addr>} disallow-infinite-holdtime
```

| Parameter | Description |
|---|---|
| *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |

**Mode** Router Configuration

**Usage** This command enables the local BGP or BGP4+ speaker to reject holdtime "0" seconds from the peer during exchange of open messages or the user during configuration.

The **no** variant of this command allows the BGP speaker to accept "0" holdtime from the peer or during configuration.

**Examples [BGP]** To enable the **disallow-infinite-holdtime** feature on the BGP speaker with the IP address of `10.10.10.1`, enter the command:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1
disallow-infinite-holdtime
```

To disable the **disallow-infinite-holdtime** feature on the BGP speaker with the IP address of `10.10.10.10`, enter the command:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1
disallow-infinite-holdtime
```

**Examples [BGP4+]**

To enable the **disallow-infinite-holdtime** feature on the BGP4+ speaker with the IPv6 address of `2001:0db8:010d::1`, enter the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor
disallow-infinite-holdtime2001:0db8:010d::1
```

To disable the **disallow-infinite-holdtime** feature on the BGP4+ speaker with the IPv6 address of `2001:0db8:010d::1`, enter the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor
disallow-infinite-holdtime2001:0db8:010d::1
```

**Related commands**

neighbor timers

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor dont-capability-negotiate

**Overview** Use this command to disable capability negotiation for BGP and BGP4+.

The capability negotiation is performed by default. This command is used to allow compatibility with older BGP versions that have no capability parameters used in open messages between peers.

Use the **no** variant of this command to enable capability negotiation.

**Syntax**

```
neighbor <neighborid> dont-capability-negotiate
no neighbor <neighborid> dont-capability-negotiate
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>*\|*<ipv6-addr>*\|*<peer-group>*} | |
| | *<ip-address>* | Specify the IPv4 address of the BGP neighbor in dotted decimal, in the format A.B.C.D. |
| | *<ipv6-addr>* | Specify the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) and neighbor route-map commands. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.34
dont-capability-negotiate
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.34
dont-capability-negotiate
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.34 remote-as 100
awplus(config-router)# neighbor 10.10.10.34 peer-group group1
awplus(config-router)# neighbor group1
dont-capability-negotiate
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1
dont-capability-negotiate
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
dont-capability-negotiate
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
dont-capability-negotiate
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1
dont-capability-negotiate
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1
dont-capability-negotiate
```

**Related commands**

neighbor peer-group (add a neighbor)

neighbor route-map

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor ebgp-multihop

**Overview** Use this command to accept and attempt BGP or BGP4+ connections to external peers on indirectly connected networks.

Effectively, this command sets the TTL value in the BGP or BGP4+ packets that the router sends to the neighbor, so that the packets may traverse the network route to the neighbor.

The device will not establish a connection to a multihop neighbor, if the only route to the multihop peer is a default route.

Use the **no** variant of this command to return to the default.

**Syntax**

```
neighbor <neighborid> ebgp-multihop [<count>]
no neighbor <neighborid> ebgp-multihop [<count>]
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>* \| *ipv6-addr* \| *<peer-group>*} | |
| | *<ip-addr>* | Specify the address of an IPv4 BGP neighbor, entered in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| *<count>* | *<1-255>* The Maximum hop count, that is set in the TTL field of the BGP packets. If this optional parameter is not specified with the command, then the Maximum hop count is set to 255. | |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.34 remote-as 10
awplus(config-router)# neighbor 10.10.10.34 ebgp-multihop 5
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.34 ebgp-multihop 5
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.34 remote-as 10
awplus(config-router)# neighbor 10.10.10.34 peer-group group1
awplus(config-router)# neighbor group1 ebgp-multihop 5
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 ebgp-multihop 5
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# neighbor 2001:0db8:010d::1
ebgp-multihop 5
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
ebgp-multihop 5
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 ebgp-multihop 5
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 ebgp-multihop 5
```

# neighbor enforce-multihop

**Overview** Use this command to enforce the requirement that BGP and BGP4+ neighbors form multihop connections.

Use the **no** variant of this command to turn off this feature.

**Syntax**

```
neighbor <neighborid> enforce-multihop
no neighbor <neighborid> enforce-multihop
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>*\|*<ipv6-addr>*\|*<peer-group>*} | |
| | *<ip-address>* | The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | The address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.34 remote-as 10
awplus(config-router)# neighbor 10.10.0.34 enforce-multihop
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.34 enforce-multihop
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.34 remote-as 10
awplus(config-router)# neighbor 10.10.10.34 peer-group group1
awplus(config-router)# neighbor group1 enforce-multihop
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 enforce-multihop
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# neighbor 2001:0db8:010d::1
enforce-multihop
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
enforce-multihop
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 enforce-multihop
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 enforce-multihop
```

**Related commands**

neighbor peer-group (add a neighbor)

neighbor route-map

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor filter-list

**Overview** This command creates a BGP or BGP4+ filter using an AS (Autonomous System) path list. This command specifies an AS path list, which it then applies to filter updates to and from a BGP or a BGP4+ neighbor

The **no** variant of this command removes the previously specified BGP or BGP4+ filter using access control lists.

**Syntax**

```
neighbor <neighborid> filter-list <listname> {in|out}
no neighbor <neighborid> filter-list <listname> {in|out}
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | Specify the identification method for the BGP or BGP4+ peer. Use one of the following formats: | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| *<listname>* | Specify the name of an AS (Autonomous System) path list. | |
| `in` | Indicates that incoming advertised routes will be filtered. | |
| `out` | Indicates that outgoing advertised routes will be filtered. | |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** This command specifies a filter for updates based on a BGP AS (Autonomous System) path list.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.34 filter-list list1
out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.34 filter-list list1
out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.0.34 filter-list list1
out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.0.34 filter-list
list1 out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.34 remote-as 10
awplus(config-router)# neighbor 10.10.10.34 peer-group group1
awplus(config-router)# neighbor group1 filter-list list1 out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 filter-list list1 out
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
filter-list list1 out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
filter-list list1 out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 filter-list list1 out
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 filter-list list1
out
```

**Related commands**

neighbor peer-group (add a neighbor)

neighbor route-map

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor interface

**Overview** Use this command to configure the interface name of a BGP4+ speaking neighbor.

Use the **no** variant of this command to disable this function.

**Syntax [BGP4+]**

```
neighbor {<ipv6-addr>|<ipaddress>} interface <interface>
no neighbor {<ipv6-addr>|<ipaddress>} interface <interface>
```

| Parameter | Description |
|---|---|
| *<ipaddress>* | Specifies the IPv4 address of the BGP neighbor - entered in dotted decimal notation in the format A.B.C.D. |
| *<ipv6-addr>* | Specifies the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| *<interface>* | Specifies the name of the interface to reach the BGP neighbor over. |

**Mode [BGP4+]** Router Configuration

**Usage [BGP4+]** This command is for use with BGP4+ peering. Use this command for BGP peering with IPv6 link local addresses.

**Examples [BGP4+]** To specify a neighbor of 10.10.0.72 over the interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 interface eth1
```

To remove the neighbor of 10.10.0.72 over the interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 interface eth1
```

To specify a neighbor of 2001:0db8:010d::1 over the interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 interface
eth1
```

To remove the neighbor of 2001:0db8:010d::1 over the interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 interface
eth1
```

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor local-as

**Overview** Use this command to configure a local AS number for the specified BGP or BGP4+ neighbor. This overrides the local AS number specified by the router bgp command.

Use the **no** variant of this command to remove the local AS number for the specified BGP or BGP4+ neighbor.

**Syntax**

```
neighbor <neighborid> local-as <as-number>
no neighbor <neighborid> local-as <as-number>
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>* \| *<ipv6-addr>* \| *<peer-group>*} | |
| | *<ip-address>* | The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | The address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) and neighbor route-map commands. When this parameter is used with this command, the command applies on all peers in the specified group. |
| *<as-number>* | *<1-4294967295>* Neighbor's Autonomous System (AS) number. | |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

When VRF-lite is configured, this command allows internal BGP loopback connections between named VRFs and the default global routing instance to be configured to act as eBGP connections, instead of only iBGP.

**Usage [BGP4+]** When BGP4+ is configured, this command prepends the ASN as defined by the router bgp command, and adds the ASN as defined by the neighbor local-as command in front of the actual ASN as defined by the router bgp command. This makes the peer believe it is peering with the ASN as defined by the neighbor local-as command.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.34 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.34 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.34 remote-as 10
awplus(config-router)# neighbor 10.10.10.34 peer-group group1
awplus(config-router)# neighbor group1 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 local-as 1
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 local-as 1
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 local-as 1
```

**Related commands**

neighbor peer-group (add a neighbor)

neighbor route-map

router bgp

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor maximum-prefix

**Overview** Use this command to control the number of prefixes that can be received from a BGP or a BGP4+ neighbor.

Use the **no** variant of this command to disable this function. Do not specify threshold to apply the default threshold of 75% for the maximum number of prefixes before this is applied.

**Syntax**

```
neighbor <neighborid> maximum-prefix <maximum>
no neighbor <neighborid> maximum-prefix [<maximum>]
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>*\|*<ipv6-addr>*\|*<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| *<maximum>* | *<maxprefix>*[*<threshold>*] [warning-only] | |
| *<maxprefix>* | *<1-4294967295>*<br>Specifies the maximum number of prefixes permitted. | |
| *<threshold>* | *<1-100>* Specifies the threshold value, 1 to 100 percent. 75% by default. | |
| warning-only | Only gives a warning message when the limit is exceeded. | |

**Default** The default threshold value is 75%. If the threshold value is not specified this default is applied.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** The **neighbor maximum-prefix** command allows the configuration of a specified number of prefixes that a BGP or a BGP4+ router is allowed to receive from a neighbor. When the warning-only option is not used, if any extra prefixes are received, the router ends the peering. A terminated peer, stays down until the **clear ip bgp** command is used.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 maximum-prefix 1244
warning-only
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 maximum-prefix
1244 warning-only
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.72 remote-as 10
awplus(config-router)# neighbor 10.10.10.72 peer-group group1
awplus(config-router)# neighbor group1 maximum-prefix 1244
warning-only
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 maximum-prefix 1244
warning-only
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
maximum-prefix 1244 warning-only
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
maximum-prefix 1244 warning-only
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 maximum-prefix 1244
warning-only
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 maximum-prefix
1244 warning-only
```

**Related commands**

neighbor peer-group (add a neighbor)

neighbor route-map

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor next-hop-self

**Overview** Use this command to configure the BGP or BGP4+ router as the next hop for a BGP or BGP4+ speaking neighbor or peer group.

Use the **no** variant of this command to disable this feature.

**Syntax**

```
neighbor <neighborid> next-hop-self
no neighbor <neighborid> next-hop-self
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>*\|*<ipv6-addr>*\|*<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage notes** This command allows a BGP or BGP4+ router to change the next hop information that is sent to the iBGP peer. The next hop information is set to the IP address of the interface used to communicate with the neighbor.

This command can be run for a specific VRF instance.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router)# no neighbor 10.10.0.72 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.72 remote-as 10
awplus(config-router)# neighbor 10.10.10.72 peer-group group1
awplus(config-router)# neighbor group1 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 next-hop-self
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 next-hop-self
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 next-hop-self
```

**Related commands**

neighbor peer-group (add a neighbor)

neighbor route-map

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor override-capability

**Overview** Use this command to override a capability negotiation result for BGP and BGP4+.

Use the **no** variant of with this command to disable this function.

**Syntax**

```
neighbor <neighborid> override-capability
no neighbor <neighborid> override-capability
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>*\|*<ipv6-addr>*\|*<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 override-capability
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72
override-capability
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.72 remote-as 10
awplus(config-router)# neighbor 10.10.10.72 peer-group group1
awplus(config-router)# neighbor group1 override-capability
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 override-capability
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor 2001:0db8:010d::1
override-capability
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor 2001:0db8:010d::1
override-capability
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 override-capability
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 override-capability
```

**Related commands**

neighbor peer-group (add a neighbor)

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor passive

**Overview** Use this command to configure the local BGP or BGP4+ router to be passive with regard to the specified BGP or BGP4+ neighbor. This has the effect that the BGP or BGP4+ router will not attempt to initiate connections to this BGP or BGP4+ neighbor, but will accept incoming connection attempts from the BGP or BGP4+ neighbor.

Use the **no** variant of this command to disable this function.

**Syntax**

```
neighbor <neighborid> passive
no neighbor <neighborid> passive
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>*\|*<ipv6-addr>*\|*<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.72 remote-as 10
awplus(config-router)# neighbor 10.10.10.72 peer-group group1
awplus(config-router)# neighbor group1 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 passive
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 passive
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 passive
```

**Related commands**

neighbor peer-group (add a neighbor)

neighbor route-map

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor password

**Overview** Use this command to enable MD5 authentication on a TCP connection between BGP and BGP4+ neighbors. No authentication is applied by default. To setup authentication for the session, you must first apply authentication on each connected peer for the session.

Use the **no** variant of this command to disable this function.

**Syntax [BGP]**

```
neighbor {<ip-address>|<peer-group-name>} password <password>
no neighbor {<ip-address>|<peer-group-name>} password
[<password>]
```

**Syntax [BGP4+]**

```
neighbor {<ipv6-addr>|<peer-group-name>} password <password>
no neighbor {<ipv6-addr>|<peer-group-name>} password
[<password>]
```

| Parameter | Description |
|---|---|
| *<ip-address>* | Specifies the IP address of the BGP neighbor, in A.B.C.D format. |
| *<ipv6-addr>* | Specifies the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| *<peer-group-name>* | Name of an existing peer-group. When this parameter is used with this command, the command applies on all peers in the specified group. |
| *<password>* | An alphanumeric string of characters to be used as password. |

**Default** No authentication is applied by default.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage notes** When using the *<peer-group-name>* parameter with this command (to apply this command to all peers in the group), see the related commands neighbor peer-group (add a neighbor) and neighbor route-map for information about how to create peer groups first.

**Examples [BGP]** This example specifies the encryption type and the password 'manager' for the neighbor `10.10.10.1`:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 password manager
```

This example removes the password set for the neighbor `10.10.10.1`:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 password
```

This example specifies the encryption type and the password 'manager' for the neighbor peer group named 'group1':

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 password manager
```

This example removes the password set for the neighbor peer group named `group1`:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 password
```

**Examples (VRF-lite)**

This example specifies the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# neighbor 10.10.10.1 password manager
```

This example removes the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family, VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# no neighbor 10.10.10.1 password
manager
```

This example specifies the password ('manager') for the neighbor peer group named 'group1' for an IPv4 address-family, VRF instance name 'red', and router bgp 10:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# address-family ipv4 vrf red
awplus(config-router-af)# neighbor group1 password manager
```

**Examples [BGP4+]**

This example specifies the encryption type and the password 'manager' for the neighbor `2001:0db8:010d::1`:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor password manager
2001:0db8:010d::1
```

This example removes the password set for the neighbor `2001:0db8:010d::1`:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor password 2001:0db8:010d::1
```

This example specifies the encryption type and the password 'manager' for the neighbor peer group named `group1`:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor  remote-as 102001:0db8:010d::1
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor peer-group group1
2001:0db8:010d::1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 password manager
```

This example removes the password set for the neighbor peer group named 'group1':

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 password
```

**Related commands**

neighbor peer-group (add a neighbor)

neighbor route-map

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor peer-group (add a neighbor)

**Overview** Use this command to add a BGP or a BGP4+ neighbor to an existing peer-group.

Use the **no** variant of this command to disable this function.

**Syntax [BGP]**

```
neighbor <ip-address> peer-group <peer-group>
no neighbor <ip-address> peer-group <peer-group>
```

**Syntax [BGP4+]**

```
neighbor <ipv6-addr> peer-group <peer-group>
no neighbor <ipv6-addr> peer-group <peer-group>
```

| Parameter | Description |
|---|---|
| *<ip-address>* | Specify the IPv4 address of the BGP neighbor, entered in the format A.B.C.D. |
| *<ipv6-addr>* | Specify the IPv6 address of the BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| *<peer-group>* | Enter the name of the peer-group. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** Use this command to add neighbors with the same update policies to a peer group. This facilitates the updates of various policies, such as, distribute and filter lists. The peer-group is then configured easily with many of the neighbor commands. Any changes made to the peer group affect all members.

To create a peer-group use the neighbor port command and then use this command to add neighbors to the group.

**Examples [BGP]** This example shows a new peer-group `group1` and the addition of a neighbor `10.10.0.63` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.63 peer-group group1
```

This example shows a new peer-group `group1` and the removal of a neighbor `10.10.0.63` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# no neighbor 10.10.0.63 peer-group group1
```

**Examples [BGP4+]**

This example shows a new peer-group `group1` and the addition of a neighbor `2001:0db8:010d::1` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor  peer-group
group12001:0db8:010d::1
```

This example shows a new peer-group `group1` and the removal of a neighbor `2001:0db8:010d::1` to the group.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor  peer-group
group12001:0db8:010d::1
```

**Related commands**

neighbor peer-group (create a peer-group)

neighbor port

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor peer-group (create a peer-group)

**Overview** Use this command to create a peer-group for BGP and BGP4+.

Use the **no** variant of this command to disable this function.

**Syntax**

```
neighbor <peer-group> peer-group
no neighbor <peer-group> peer-group
```

| Parameter | Description |
|---|---|
| *<peer-group>* | Enter the name of the peer-group. |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage notes** Neighbors with the same update policies are grouped into peer groups. This facilitates the updates of various policies, such as, distribute and filter lists.

The peer-group is then configured easily with many of the neighbor commands. Any changes made to the peer group affect all members.

Use this command to create a peer-group, then use the neighbor peer-group (add a neighbor) command to add neighbors to the group.

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 peer-group
```

**Related commands** neighbor peer-group (add a neighbor)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor port

**Overview** Use this command to specify the TCP port to which packets are sent to on a BGP or a BGP4+ neighbor. TCP port 179 is the default port used to connect BGP and BGP4+ peers. You can specify a different destination port for the TCP session with this command.

Use the **no** variant of this command to reset the port number back to the default value (TCP port 179).

**Syntax [BGP]**

```
neighbor <neighborid> port <portnum>
no neighbor <neighborid> port [<portnum>]
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>* \| *ipv6-addr>* \| *<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| *<portnum>* | *<0-65535>* Specifies the TCP port number. | |

**Default** TCP port 179 is the default port used to connect BGP and BGP4+ peers.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor 10.10.10.10 port 643
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor 10.10.10.10 port 643
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 port 643
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 port 643
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor  port 6432001:0db8:010d::1
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor  port 6432001:0db8:010d::1
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(awplus-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 port 643
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 port 643
```

**Related commands**

neighbor peer-group (add a neighbor)

neighbor route-map

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor prefix-list

**Overview** Use this command to distribute BGP and BGP4+ neighbor information as specified in a prefix list.

Use the **no** variant of this command to remove an entry.

**Syntax**

```
neighbor <neighborid> prefix-list <listname> {in|out}
no neighbor <neighborid> prefix-list <listname> {in|out}
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | *<ip-address>*\|*<ipv6-addr>*\|*<peer-group>* | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| *<listname>* | The name of an IP prefix list. | |
| in | Specifies that the IP prefix list applies to incoming advertisements. | |
| out | Specifies that the IP prefix list applies to outgoing advertisements. | |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage notes** Use this command to specify a prefix list for filtering BGP or BGP4+ advertisements. Filtering by prefix list matches the prefixes of routes with those listed in the prefix list. If there is a match, the route is used. An empty prefix list permits all prefixes. If a given prefix does not match any entries of a prefix list, the route is denied access.

The router begins the search at the top of the prefix list, with the sequence number 1. Once a match or deny occurs, the router does not need to go through the rest of the prefix list. For efficiency the most common matches or denies are listed at the top.

The **neighbor distribute-list** command is an alternative to the **neighbor prefix-list** command and only one of them can be used for filtering to the same neighbor in any direction.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 30.0.0.0/24
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 prefix-list list1 in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 prefix-list list1
in
awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 30.0.0.0/24
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 prefix-list list1
in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 prefix-list
list1 in
awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 30.0.0.0/24
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 prefix-list list1 in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 prefix-list list1 in
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# ipv6 prefix-list list1 deny
2001:0db8:010d::1/128
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:: prefix-list
list1 in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:: prefix-list
list1 in
awplus# configure terminal
awplus(config)# ip prefix-list list1 deny 2001:0db8:010d::1/128
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 prefix-list list1 in
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 prefix-list list1
in
```

**Related commands**

# neighbor remote-as

**Overview** Use this command to configure an internal or external BGP or BGP4+ (iBGP or eBGP) peering relationship with another router.

Use the **no** variant of this command to remove a previously configured BGP or BGP4+ peering relationship.

**Syntax**

```
neighbor <neighborid> remote-as <as-number>
no neighbor <neighborid> remote-as <as-number>
```

**Syntax (VRF- lite)**

```
neighbor <neighborid> remote-as <as-number> [global|vrf
<vrf-name>]
no neighbor <neighborid> remote-as <as-number>
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>* \| *ipv6-addr>* \| *<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| *<as-number>* | *<1-4294967295>* Neighbor's Autonomous System (AS) number. | |
| global | Specify that the remote neighbor exists locally within the device, in the global routing domain | |
| vrf | Specify that the remote neighbor exists locally within the device, in the specified VRF instance. | |
| *<vrf-name>* | The name of the VRF instance. | |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage notes** This command is used to configure iBGP and eBGP peering relationships with other BGP or BGP4+ neighbors. A peer-group support of this command is configured only after creating a specific peer-group. Use the **no** variant of this command to remove a previously configured BGP peering relationship.

The **vrf** and **global** parameters are used to create internal 'loopback' BGP connections within the device between two VRF instances. This is used to leak BGP routes between a named VRF instance and the global routing instance. This requires BGP neighbors to be configured in both the global routing instance and in the named VRF instance.

**Examples [BGP]** To configure a BGP peering relationship from the neighbor with the IPv4 address 10.10.0.73 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.73 remote-as 10
```

To remove a configured BGP peering relationship from the neighbor with the IPv4 address 10.10.0.73 from another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.73 remote-as 10
```

To configure a BGP peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 remote-as 10
```

To remove a configured BGP peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 remote-as 10
```

**Examples [BGP4+]** To configure a BGP4+ peering relationship with another router:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 345
```

To remove a configured BGP4+ peering relationship from another router:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# no neighbor 2001:0db8:010d::1 remote-as
345
```

To configure a BGP4+ peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 remote-as 10
```

To remove a configured BGP4+ peering relationship from the neighbor with the peer group named group1 with another router:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 remote-as 10
```

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor remove-private-AS (BGP only)

**Overview** Use this command to remove the private Autonomous System (AS) number from external outbound updates. Use the **no** variant of this command to revert to the default (disabled).

**Syntax**

```
neighbor <neighborid> remove-private-AS
no neighbor <neighborid> remove-private-AS
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>*\|*<tag>*} | |
| | *<ip-address>* | The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<tag>* | Name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor remote-as command. When this parameter is used with a command, the command applies on all peers in the specified group. |

**Default** This command is disabled by default.

**Mode** Router Configuration or IPv4 Address Family Configuration

**Usage notes** The private AS numbers range from <64512-65535>. Private AS numbers are not advertised to the Internet. This command is used with external BGP peers only. The router removes the AS numbers only if the update includes private AS numbers. If the update includes both private and public AS numbers, the system treats it as an error.

This command removes private AS numbers for BGP in Router Configuration mode. This command is not supported for BGP4+ in IPv6 Address Family Configuration mode. This command removes a private AS number and makes an update packet with a public AS number as the AS path attribute. So only public AS numbers are entered in Internet BGP routing tables, and private AS numbers are not entered in Internet BGP tables.

For the filtering to apply, both peering devices must be set to use either 2-byte or extended 4- byte ASN (with the same ASN type set on both peers). For example, if a device (which defaults to use a 4-byte ASN), is peered with a device that defaults to a 2-byte ASN, then the device using a 2-byte ASN device also needs to be configured with the command **bgp extended-asn-cap** for the filtering to apply.

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.63 remove-private-AS
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.63 remove-private-AS
```

**Related commands**

show ip bgp (BGP only)

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor restart-time

**Overview** Use this command to set a different restart-time other than the global restart-time configured using the **bgp graceful-restart** command for BGP and BGP4+.

Use the **no** variant of this command to restore the device to its default state (see the default value of the **bgp graceful-restart** command).

**Syntax**

```
neighbor <neighborid> restart-time <delay-value>
no neighbor <neighborid> restart-time <delay-value>
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>*\|*<ipv6-addr>*\|*<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| *<delay-value>* | *<1-3600>* | Delay value in seconds. |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage** This command takes precedence over the restart-time value specified using the **bgp graceful-restart** command.

The restart-time value is the maximum time that a graceful-restart neighbor waits to come back up after a restart. The default is 120 seconds.

Make sure that the restart time specified using this command does not exceed the stalepath-time specified in the Router Configuration mode.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 restart-time 45
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 restart-time
45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 restart-time 45
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 restart-time 45
```

**Related commands**

neighbor peer-group (add a neighbor)

neighbor route-map

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor route-map

**Overview** Use this command to apply a route map to incoming or outgoing routes for BGP or BGP4+.

Use the **no** variant of this command to remove a route map from a BGP or BGP4+ route.

**Syntax**

```
neighbor <neighborid> route-map <mapname> {in|out}
no neighbor <neighborid> route-map <mapname> {in|out}
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>*\|*ipv6-addr*\|*<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| *<mapname>* | Specifies name of the route-map. | |
| in | Specifies that the access list applies to incoming advertisements. | |
| out | Specifies that the access list applies to outgoing advertisements. | |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage notes** Use the **neighbor route-map** command to filter updates and modify attributes. A route map is applied to inbound or outbound updates. Only the routes that pass the route map are sent or accepted in updates.

**Examples [BGP]** The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 route-map rmap2 in
```

The following example shows the removal of the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 route-map rmap2
in
```

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the IPv4 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 route-map rmap2
in
```

The following example shows the removal of the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the IPv4 address 10.10.10.1 in the IPv4 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 route-map
rmap2 in
```

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the peer group named group1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 route-map rmap2 in
```

The following example shows the removal the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the peer group named group1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 route-map rmap2 in
```

**Examples [BGP4+]**

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the IPv6 address 2001:0db8:010d::1 in the IPv6 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 route-map
rmap2 in
```

The following example shows the removal of the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the IPv6 address 2001:0db8:010d::1 in the IPv6 Address Family Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
route-map rmap2 in
```

The following example shows the configuration of the route-map name **rmap2** and then the use of this map name in the **neighbor route-map** command for the neighbor with the peer group named group1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 6
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 route-map rmap2 in
```

The following example shows the removal the route-map name **rmap2** in the **neighbor route-map** command for the neighbor with the peer group named group1 in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 route-map rmap2 in
```

**Related commands**

neighbor peer-group (add a neighbor)

route-map

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor route-reflector-client (BGP only)

**Overview** Use this command to configure the router as a BGP route reflector and configure the specified neighbor as its client.

Use the **no** variant of this command to indicate that the neighbor is not a client.

**Syntax**

```
neighbor <neighborid> route-reflector-client
no neighbor <neighborid> route-reflector-client
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>*\|*<peer-group>*} | |
| | *<ip-address>* | The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode** Router Configuration or IPv4 Address Family Configuration

**Usage notes** Route reflectors are a solution for the explosion of iBGP peering within an autonomous system. By route reflection the number of iBGP peers within an AS is reduced. Use the **neighbor route-reflector-client** command to configure the local router as the route reflector and specify neighbors as its client.

An AS can have more than one route reflector. One route reflector treats the other route reflector as another iBGP speaker.

In the following configuration, Router1 is the route reflector for clients `3.3.3.3` and `2.2.2.2`; it also has a non-client peer `6.6.6.6`:

```
Router1#
router bgp 200
neighbor 3.3.3.3 remote-as 200
neighbor 3.3.3.3 route-reflector-client
neighbor 2.2.2.2 remote-as 200
neighbor 2.2.2.2 route-reflector-client
neighbor 6.6.6.6 remote-as 200
```

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72
route-reflector-client
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72
route-reflector-client
```

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor route-server-client (BGP only)

**Overview** Use this command to specify the peer as route server client.

Use the **no** variant of this command to disable this function.

**Syntax**

```
neighbor <neighborid> route-server-client
no neighbor <neighborid> route-server-client
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>*\|*<peer-group>*} | |
| | *<ip-address>* | The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode** Router Configuration

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 route-server-client
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72
route-server-client
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor send-community

**Overview** Use this command to specify that a community attribute should be sent to a BGP or BGP4+ neighbor.

Use the **no** variant of this command to remove the entry for the community attribute.

**Syntax**

```
neighbor <neighborid> send-community {both|extended|standard}
no neighbor <neighborid> send-community
{both|extended|standard}
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>*\|*<ipv6-addr>*\|*<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| `both` | Sends Standard and Extended Community attributes. Specifying this parameter with the **no** variant of this command results in no `standard` or `extended` community attributes being sent. | |
| `extended` | Sends Extended Community attributes. Specifying this parameter with the **no** variant of this command results in no `extended` community attributes being sent. | |
| `standard` | Sends Standard Community attributes. Specifying this parameter with the **no** variant of this command results in no `standard` community attributes being sent. | |

**Default** Both **standard** and **extended** community attributes are sent to a neighbor.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration and IPv6 Address Family Configuration

**Usage notes** This command is used to specify a community attribute to be sent to a neighbor. The community attribute groups destinations in a certain community and applies routing decisions according to those communities. On receiving community attributes the router reannounces them to the neighbor. Only when the **no**

parameter is used with this command the community attributes are not reannounced to the neighbor.

By default, both **standard** and **extended** community attributes are sent to a neighbor.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 send-community
extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 send-community
extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.0.72 send-community
extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.0.72 send-community
extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 send-community extended
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1
send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 send-community extended
awplus# configure terminal
awplus(config)# bgp config-type standard
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 send-community
extended
```

**Related commands**

# neighbor shutdown

**Overview** Use this command to disable a peering relationship with a BGP or BGP4+ neighbor.

Use the **no** variant of this command to re-enable the BGP or BGP4+ neighbor.

**Syntax**

```
neighbor <neighborid> shutdown
no neighbor <neighborid> shutdown
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>*\|*<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage notes** This command shuts down any active session for the specified BGP or BGP4+ neighbor and clears all related routing data.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.72 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.72 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 shutdown
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 shutdown
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 shutdown
```

neighbor route-map

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor soft-reconfiguration inbound

**Overview** Use this command to configure the device to start storing all updates from the BGP or BGP4+ neighbor, without any consideration of any inward route filtering policy that might be applied to the connection with this BGP or BGP4+ neighbor. This is so that the full set of the neighbor's updates are available locally to be used in a soft-reconfiguration event.

You may need to apply this older method of clearing routes if the peer does not support route refresh.

Use the **no** variant of this command to disable this function for a BGP or BGP4+ neighbor.

**Syntax**

```
neighbor <neighborid> soft-reconfiguration inbound
no neighbor <neighborid> soft-reconfiguration inbound
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>*\|*<ipv6-addr>*\|*<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** Use this command to store updates for inbound soft reconfiguration. Soft-reconfiguration may be used in lieu of BGP route refresh capability. Using this command enables local storage of all the received routes and their attributes. This requires additional memory. When a soft reset (inbound) is done on this neighbor, the locally stored routes are re- processed according to the inbound policy. The BGP neighbor connection is not affected.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# neighbor 10.10.10.10
soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor 10.10.10.10
soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv4
awplus(config-router-
af)# neighbor 10.10.10.10 soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv4
awplus(config-router-
af)# no neighbor 10.10.10.10 soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 soft-reconfiguration
inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# no neighbor group1 soft-reconfiguration
inbound
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
soft-reconfiguration inbound
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 soft-reconfiguration
inbound
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv6
awplus(config-router-
af)# no neighbor group1 soft-reconfiguration inbound
```

**Related commands**

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor timers

**Overview** Use this command to set the keepalive, holdtime, and connect timers for a specific BGP or BGP4+ neighbor.

Use the **no** variant of this command to clear the timers for a specific BGP or BGP4+ neighbor.

**Syntax**

```
neighbor <neighborid> timers {<keepalive> <holdtime>|connect <connect>}
no neighbor <neighborid> timers [connect]
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>*\|*<ipv6-addr>*\|*<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| *<keepalive>* | *<0-65535>* Frequency (in seconds) at which a router sends keepalive messages to its neighbor. | |
| *<holdtime>* | *<0-65535>* Interval (in seconds) after which, on not receiving a keepalive message, the router declares a neighbor dead. | |
| *<connect>* | connect *<1-65535>* Specifies the connect timer in seconds. The default connect timer value is 120 seconds as per RFC 4271. Modify this value as needed for interoperability. | |

**Default** The keepalive timer default is 60 seconds, the holdtime timer default is 90 seconds, and the connect timer default is 120 seconds as per RFC 4271. Holdtime is keepalive * 3.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage** Keepalive messages are sent by a router to inform another router that the BGP connection between the two is still active. The keepalive interval is the period of time between each keepalive message sent by the router. The holdtime interval is the time the router waits to receive a keepalive message and if it does not receive

a message for this period it declares the neighbor dead. The holdtime value must be 3 times the value of the keepalive value.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 timers 60 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 timers
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 timers 60 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 timers
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1 timers 60 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 2001:0db8:010d::1 timers
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 timers 60 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 timers
```

# neighbor transparent-as

**Overview** Use this command to specify not to append your AS path number even if the BGP or BGP4+ peer is an eBGP peer.

Note this command has the same effect as invoking neighbor attribute-unchanged and specifying the optional **as-path** parameter.

**Syntax**

```
neighbor <neighborid> transparent-as
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>*\|*<ipv6-addr>*\|*<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 transparent-as
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 transparent-as
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
transparent-as
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 transparent-as
```

**Related commands**

neighbor attribute-unchanged

neighbor peer-group (add a neighbor)

neighbor route-map

neighbor transparent-nexthop

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor transparent-nexthop

**Overview** Use this command to keep the next hop value of the route even if the BGP or BGP4+ peer is an eBGP peer.

Note this command has the same effect as invoking neighbor attribute-unchanged and specifying the optional **next-hop** parameter.

**Syntax** `neighbor <neighborid> transparent-nexthop`

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>*\|*<ipv6-addr>*\|*<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |

**Mode** Router Configuration

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 transparent-nexthop
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 transparent-nexthop
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 2001:0db8:010d::1
transparent-nexthop
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# exit
awplus(config-router)# neighbor group1 transparent-nexthop
```

**Related commands**

neighbor attribute-unchanged

neighbor peer-group (add a neighbor)

neighbor route-map

neighbor transparent-as

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor unsuppress-map

**Overview** Use this command to selectively leak more specific routes to a particular BGP or BGP4+ neighbor.

Use the **no** variant of this command to remove selectively leaked specific routes to a particular BGP or BGP4+ neighbor.

**Syntax**

```
neighbor <neighborid> unsuppress-map <route-map-name>
no neighbor <neighborid> unsuppress-map <route-map-name>
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>* \| *<ipv6-addr>* \| *<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| *<route-map-name>* | The name of the route-map used to select routes to be unsuppressed. | |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage** When the aggregate-address command is used with the **summary-only** option, the more-specific routes of the aggregate are suppressed to all neighbors. Use this command instead to selectively leak more-specific routes to a particular neighbor.

**Examples [BGP]** To allow the device to advertise specific routes in the routemap 'mymap', which would have otherwise been aggregated to neighbor 10.10.0.73, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.0.73 unsuppress-map mymap
```

To stop the device from advertising specific routes in the routemap, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.0.73 unsuppress-map
mymap
```

To allow the device to advertise specific IPv4 routes in the routemap 'mymap', which would have otherwise been aggregated to neighbor 10.10.0.73, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 unicast
awplus(config-router-af)# neighbor 10.10.0.70 unsuppress-map
mymap
```

To stop the device from advertising specific IPv4 routes in the routemap, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4 unicast
awplus(config-router-af)# no neighbor 10.10.0.70 unsuppress-map
mymap
```

To allow the device to advertise specific routes in the routemap 'mymap', which would have otherwise been aggregated to peer group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 unsuppress-map mymap
```

To stop the device from advertising specific routes in the routemap to peer group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 unsuppress-map mymap
```

**Examples [BGP4+]**

To allow the device to advertise specific IPv6 routes in the routemap 'mymap', which would have otherwise been aggregated to neighbor 2001:0db8:010d::1, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6 unicast
awplus(config-router-af)# neighbor 2001:0db8:010d::1
unsuppress-map mymap
```

To stop the device from advertising specific IPv6 routes in the routemap, use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6 unicast
awplus(config-router-af)# no neighbor 2001:0db8:010d::1
unsuppress-map mymap
```

To allow the device to advertise specific IPv6 routes in the routemap 'mymap', which would have otherwise been aggregated topeer group 'group1', use the commands

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 unsuppress-map mymap
```

To stop the device from advertising specific IPv6 routes in the routemap to peer group 'group1', use the commands:

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 unsuppress-map
mymap
```

**Related commands**

aggregate-address

neighbor peer-group (add a neighbor)

neighbor route-map

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor update-source

**Overview** Use this command to specify the source IPv4 or IPv6 address of BGP or BGP4+ packets, which are sent to the neighbor for routing updates, as the IPv4 or IPv6 address configured on the specified interface. The specified interface is usually the local loopback (lo) interface to allow internal BGP or BGP4+ connections to stay up regardless of which interface is used to reach a neighbor.

Use the **no** variant of this command to remove the IPv4 or IPv6 address from the interface as the source IPv4 or IPv6 address of BGP or BGP4+ packets sent to the neighbor, and restores the interface assignment to the closest interface, which is also called the best local address.

**Syntax**

```
neighbor <neighborid> update-source <interface>
no neighbor <neighborid> update-source
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>* \| *<ipv6-addr>* \| *<peer-group>*} | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| *<interface>* | Specifies the local loopback interface (lo). | |

**Default** Use of this command sets a default value of 2 for the maximum hop count.

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration

**Usage** Use this command in conjunction with any specified interface on the router. The local loopback interface is the interface that is most commonly used with this command. The use of local loopback interface eliminates a dependency and BGP or BGP4+ does not have to rely on the availability of a particular interface for making BGP or BGP4+ peer relationships.

**Examples [BGP]** To source BGP connections for neighbor 10.10.0.72 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ip address 10.10.0.73/24
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# network 10.10.0.0
awplus(config-router)# neighbor 10.10.0.72 remote-as 110
awplus(config-router)# neighbor 10.10.0.72 update-source lo
```

To remove BGP connections for neighbor 10.10.0.72 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# no neighbor 10.10.0.72 update-source
```

To source BGP connections for neighbor group1 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ip address 10.10.0.73/24
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# network 10.10.0.0
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.0.72 remote-as 100
awplus(config-router)# neighbor 10.10.0.72 peer-group group1
awplus(config-router)# neighbor group1 update-source lo
```

To remove BGP connections for neighbor group1 with the IP address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# neighbor group1 update-source lo
```

**Examples [BGP4+]**

To source BGP connections for neighbor 2001:0db8:010d::1 with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ipv6 address 2001:0db8:010d::1/128
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 110
awplus(config-router)# neighbor 2001:0db8:010d::1
update-source lo
```

To remove BGP connections for neighbor 2001:0db8:010d::1 with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# no neighbor 2001:0db8:010d::1
update-source
```

To source BGP connections for neighbor group1 with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# interface lo
awplus(config-if)# ipv6 address 2001:0db8:010d::1/128
awplus(config-if)# exit
awplus(config)# router bgp 100
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 100
awplus(config-router)# address-family ipv6
awplus(config-router-
af)# neighbor 2001:0db8:010d::1 peer-group group1
awplus(config-router-
af)# exit
awplus(config-router)# neighbor group1 update-source lo
```

To remove BGP connections for neighbor group1 with the IPv6 address of the local loopback address instead of the best local address, enter the commands listed below:

```
awplus(config)# router bgp 100
awplus(config-router)# neighbor group1 update-source lo
```

**Related commands**

neighbor peer-group (add a neighbor)

neighbor route-map

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor version (BGP only)

**Overview** Use this command to configure the device to accept only a particular BGP version.

Use the **no** variant of this command to use the default BGP version (version 4).

**Syntax**

```
neighbor <neighborid> version <version>
no neighbor <neighborid> version
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | {*<ip-address>*\|*<peer-group>*} | |
| | *<ip-address>* | The address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<peer-group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| *<version>* | {4} Specifies the BGP version number. | |

**Mode** Router Configuration or IPv4 Address Family Configuration

**Usage notes** By default, the system uses BGP version 4 and on request dynamically negotiates down to version 2. Using this command disables the router's version-negotiation capability and forces the router to use only a specified version with the neighbor.

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 version 4
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 version 4
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 version
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 version
```

**Related commands**

neighbor peer-group (add a neighbor)

neighbor route-map

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# neighbor weight

**Overview** Use this command to set default weights for routes from this BGP or BGP4+ neighbor.

Use the **no** variant of this command to remove a weight assignment.

**Syntax**

```
neighbor <neighborid> weight <weight>
no neighbor <neighborid> weight [<weight>]
```

| Parameter | Description | |
|---|---|---|
| *<neighborid>* | *{<ip-address>\|<ipv6-addr>\|<peer-group>}* | |
| | *<ip-address>* | Specify the address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| | *<ipv6-addr>* | Specify the address of an IPv6 BGP4+ neighbor, entered in hexadecimal in the format X:X::X:X. |
| | *<peer- group>* | Enter the name of an existing peer-group. For information on how to create peer groups, refer to the neighbor peer-group (add a neighbor) command, and neighbor route-map command. When this parameter is used with this command, the command applies on all peers in the specified group. |
| *<weight>* | *<0-65535>* Specifies the weight this command assigns to the route. | |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage notes** Use this command to specify a weight value to all routes learned from a BGP or BGP4+ neighbor. The route with the highest weight gets preference when there are other routes on the network.

Unlike the local-preference attribute, the weight attribute is relevant only to the local router.

The weights assigned using the **set weight** command overrides the weights assigned using this command.

**Examples [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor 10.10.10.1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor 10.10.10.1 weight
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# neighbor 10.10.10.1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv4
awplus(config-router-af)# no neighbor 10.10.10.1 weight
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 10.10.10.1 remote-as 10
awplus(config-router)# neighbor 10.10.10.1 peer-group group1
awplus(config-router)# neighbor group1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no neighbor group1 weight
```

**Examples [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor 2001:0db8:010d::1 weight
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# neighbor group1 peer-group
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1
peer-group group1
awplus(config-router-af)# neighbor group1 weight 60
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# address-family ipv6
awplus(config-router-af)# no neighbor group1 weight
```

**Related commands**

neighbor peer-group (add a neighbor)

neighbor route-map

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# network (BGP and BGP4+)

**Overview** Use this command to specify particular routes to be advertised into the BGP or BGP4+ routing process. A unicast network address without a mask is accepted if it falls into the natural boundary of its class. A class-boundary mask is derived if the address matches its natural class-boundary.

Note that you can specify a prefix length for the prefix being added, and you can also specify a classful network without a prefix length and an appropriate prefix length is added. Note that specifying a non-classful prefix without a prefix length results in a /32 prefix length on an IPv4 route.

Use the **no** variant of this command to remove a network route entry.

**Syntax [BGP]**

```
network {<ip-prefix/length>|<ip-network-addr>} [mask
<network-mask>] [route-map <route-map-name>] [backdoor]
```

```
no network {<ip-prefix/length>|<ip-network-addr>} [mask
<network-mask>] [route-map <route-map-name>] [backdoor]
```

**Syntax [BGP4+]**

```
network {<ipv6-prefix/length>|<ipv6-network-addr>} [route-map
<route-map-name>]
```

```
no network {<ipv6-prefix/length>|<ipv6-network-addr>}
[route-map <route-map-name>]
```

| Parameter | Description |
|---|---|
| *<ip-prefix/length>* | IP network prefix and prefix length entered in dotted decimal format for the IP network prefix, then slash notation for the prefix length in the format A.B.C.D/M, e.g. 192.168.1.224/27 |
| *<ip-network-addr>* | IP network prefix entered in dotted decimal format A.B.C.D, e.g. 192.168.1.224 |
| *<network-mask>* | Specify a network mask in the format A.B.C.D, e.g. 255.255.255.224. |
| *<ipv6-prefix/length>* | IPv6 network prefix and prefix length entered in dotted decimal format for the IPv6 network prefix, then slash notation for the IPv6 prefix length in the format X:X::X:X/M, e.g. 2001:db8::/64 |
| *<ipv6-network-addr>* | IP network prefix entered in dotted decimal format A.B.C.D, e.g. 192.168.1.224 |
| *<route-map-name>* | Specify the name of the route map. |
| backdoor | Specify a BGP backdoor route that is not advertised. |

**Mode [BGP]** Router Configuration and IPv4 Address Family `[ipv4 unicast]` mode

**Mode [BGP4+]** IPv6 Address Family Configuration

**Usage notes**

It does not matter how the route is arranged in the IP or IPv6 routing table. The route can arrive in the IP routing table by a static route, or the route can be learned from OSPF or OSPFv3 or RIP or RIPng routing.

If you configure a route-map, then that route-map will be used in filtering the network, or the route-map will be used to modify the attributes that are advertised with the route.

**Example [BGP]**

The following example illustrates a Class-A address configured as a network route. The natural Class-A network prefix mask length of 8 will be internally derived, that is, 2.0.0.0/8.

```
awplus(config)# router bgp 100
awplus(config-router)# network 2.0.0.0
```

**Output [BGP]**

Figure 32-1: Example output from the **show running-config** command after entering **network 2.0.0.0**

```
awplus#show running-config

router bgp 100
 network 2.0.0.0/8
```

**Example [BGP]**

The following example illustrates a network address which does not fall into its natural class boundary, and hence, is perceived as a host route, that is, 192.0.2.224/27.

```
awplus(config)# router bgp 100
awplus(config-router)# network 192.0.2.224 mask 255.255.255.224
```

**Output [BGP]**

Figure 32-2: Example output from the **show running-config** command after entering **network 192.0.2.224 mask 255.255.255.224**

```
awplus#show running-config

router bgp 100
 network 192.0.2.224/27
```

**Example [BGP]**

The following example is the same as the previous example for host route 192.0.2.224/27, but is entered in prefix/length format using slash notation (instead of prefix plus mask in dotted decimal format using the **mask** keyword before the network mask in dotted decimal format):

```
awplus(config)# router bgp 100
awplus(config-router)# network 192.0.2.224/27
```

**Example [BGP4+]**

The following example is the same as the previous example for host route 2001:db8::/32:

```
awplus(config)# router bgp 100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# network 2001:db8::/32
```

**Output [BGP4+]**

Figure 32-3: Example output from the **show running-config** command after entering **network 2001:db8::/32**

```
awplus#show running-config

router bgp 100
 network 2001:db8::/32
```

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# network synchronization

**Overview** Use this command to ensure the exact same static network prefix, specified through any of the **network** commands, is local or has IGP reachability before introduction to BGP or BGP4+.

Use the **no** variant of this command to disable this function.

**Syntax**

```
network synchronization
no network synchronization
```

**Default** Network synchronization is disabled by default.

**Mode [BGP]** Router Configuration and IPv4 Address Family [ipv4 unicast] Configuration

**Mode [BGP4+]** IPv6 Address Family [ipv6 unicast] Configuration

**Examples [BGP]** The following example enables IGP synchronization of BGP static network routes in the Router Configuration mode.

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# network synchronization
```

The following example enables IGP synchronization of BGP static network routes in the IPv4-Unicast address family.

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# address-family ipv4 unicast
awplus(config-router-af)# network synchronization
```

**Example [BGP4+]** The following example enables IGP synchronization of BGP4+ static network routes in the IPv6-Unicast address family.

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# address-family ipv6 unicast
awplus(config-router-af)# network synchronization
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# redistribute (into BGP or BGP4+)

**Overview** Use this command to inject routes from one routing process into a BGP or BGP4+ routing table.

Use the **no** variant of this command to disable this function.

**Syntax**

```
redistribute {ospf|rip|connected|static} [route-map
<route-map-entry-pointer>]
```

```
no redistribute {ospf|rip|connected|static} [route-map
<route-map-entry-pointer>]
```

| Parameter | Description |
|---|---|
| `connected` | Specifies the redistribution of connected routes for both BGP and BGP4+. |
| `ospf` | Specifies the redistribution of OSPF information for BGP or OSPFv3 information for BGP4+. |
| `rip` | Specifies the redistribution of RIP information for BGP or RIPng information for BGP4+. |
| `static` | Specifies the redistribution of Static routes for both BGP and BGP4+. |
| `route-map` | Route map reference for both BGP and BGP4+. |
| *`<route-map-entry-pointer>`* | Pointer to route-map entries. |

**Mode [BGP]** Router Configuration or IPv4 Address Family Configuration

**Mode [BGP4+]** Router Configuration or IPv6 Address Family Configuration

**Usage notes** Redistribution is used by routing protocols to advertise routes that are learned by some other means, such as by another routing protocol or by static routes. Since all internal routes are dumped into BGP, careful filtering is applied to make sure that only routes to be advertised reach the internet, not everything. This command allows redistribution by injecting prefixes from one routing protocol into another routing protocol.

**Examples [BGP/ BGP+]** The following example shows the configuration of a route-map named `rmap1`, which is then applied using the **redistribute route-map** command.

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 1
awplus(config-route-map)# match origin incomplete
awplus(config-route-map)# set metric 100
awplus(config-route-map)# exit
awplus(config)# router bgp 12
awplus(config-router)# redistribute ospf route-map rmap1
```

To apply the above example to a specific VRF instance named `blue`, use the following commands:

```
awplus(config)# router bgp 12
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# redistribute ospf route-map rmap1
```

The following example shows the configuration of a route-map named `rmap2`, which is then applied using the **redistribute route-map** command.

```
awplus# configure terminal
awplus(config)# route-map rmap2 permit 3
awplus(config-route-map)# match interface eth1
awplus(config-route-map)# set metric-type 1
awplus(config-route-map)# exit
awplus(config)# router ospf 100
awplus(config-router)# redistribute bgp route-map rmap2
```

Note that configuring a route-map and applying it with the **redistribute route-map** command allows you to filter which router are distributed from another routing protocol (such as OSPF with BGP). A route-map can also set the metric, tag, and metric-type of the redistributed routes.

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# restart bgp graceful (BGP only)

**Overview** Use this command to force the device to perform a graceful BGP restart.

**Syntax**

```
restart bgp graceful
```

**Mode** Privileged Exec

**Usage** Before using this command, BGP graceful-restart capabilities must be enabled within the router BGP (bgp graceful-restart command), and each neighbor configured on the device should be set to advertise its graceful-restart capability (bgp graceful-restart graceful-reset command). The neighbor devices also need to have BGP graceful-restart capabilities enabled (bgp graceful-restart command).

This command stops the whole BGP process and makes the device retain the BGP routes and mark them as stale. Receiving BGP speakers, retain and mark as stale all BGP routes received from the restarting speaker for all the address families received in the Graceful Restart Capability exchange.

When a **restart bgp graceful** command is issued, the BGP configuration is reloaded from the last saved configuration. Ensure you first issue a **copy running-config startup-config**.

**Example**

```
awplus# restart bgp graceful
```

**Related commands**

bgp graceful-restart

bgp graceful-restart graceful-reset

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# router bgp

**Overview** Use this command to configure a BGP routing process, specifying the 32-bit Autonomous System (AS) number.

Use the **no** variant of this command to disable a BGP routing process, specifying the 32-bit AS number.

**Syntax**

```
router bgp <asn>
no router bgp <asn>
```

| Parameter | Description |
|---|---|
| *<asn>* | *<1-4294967295>* Specifies the 32-bit Autonomous System (AS) number. |

**Mode** Global Configuration

**Usage** The **router bgp** command enables a BGP routing process:

```
router bgp 1
    neighbor 10.0.0.1 remote-as 1
    neighbor 10.0.0.2 remote-as 1
     !
  router bgp 2
    neighbor 10.0.0.3 remote-as 2
    neighbor 10.0.0.4 remote-as 2
```

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 12
awplus(config-router)#
awplus# configure terminal
awplus(config)# no router bgp 12
awplus(config)#
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# route-map

**Overview** Use this command to configure a route map entry, and to specify whether the device will process or discard matching routes and BGP update messages.

The device uses a name to identify the route map, and a sequence number to identify each entry in the route map.

The **route-map** command puts you into route-map configuration mode. In this mode, you can use the following:

- one or more of the **match** commands to create match clauses. These specify what routes or update messages match the entry.
- one or more of the **set** commands to create set clauses. These change the attributes of matching routes or update messages.

Use the **no** variant of this command to delete a route map or to delete an entry from a route map.

**Syntax**

```
route-map <mapname> {deny|permit} <seq>
no route-map <mapname>
no route-map <mapname> {deny|permit} <seq>
```

| Parameter | Description |
|---|---|
| *<mapname>* | A name to identify the route map. |
| `deny` | The route map causes a routing process to discard matching routes or BGP update messages. |
| `permit` | The route map causes a routing process to use matching routes or BGP update messages. |
| *<seq>* | <1-65535> The sequence number of the entry. You can use this parameter to control the order of entries in this route map. |

**Mode** Global Configuration

**Usage notes** Route maps allow you to control and modify routing information by filtering routes and setting route attributes. You can apply route maps when the device:

- processes BGP update messages that it has received from a peer
- prepares BGP update messages to send to peers
- redistributes routes from one routing protocol into another
- redistributes static routes into routing protocols
- uses BGP route flap dampening

When a routing protocol passes a route or update message through a route map, it checks the entries in order of their sequence numbers, starting with the lowest numbered entry.

If it finds a match on a route map with an action of permit, then it applies any set clauses and accepts the route. Having found a match, the route is not compared against any further entries of the route map.

If it finds a match on a route map with an action of deny, it will discard the matching route.

If it does not find a match, it discards the route or update message. This means that route maps end with an implicit deny entry. To permit all non-matching routes or update messages, end your route map with an entry that has an action of **permit** and no match clause.

**Examples**

To enter route-map mode for entry 1 of the route map called "route1", and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 1
awplus(config-route-map)# match as-path 60
awplus(config-route-map)# set weight 70
```

To enter route-map mode for entry 2 of the route map called "route1", and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 2
awplus(config-route-map)# match interface eth1
awplus(config-route-map)# set metric 20
```

Note how the prompt changes when you go into route map configuration mode.

To make the device process non-matching routes instead of discarding them, add a command like the following one:

```
awplus(config)# route-map route1 permit 100
```

**Related commands**

For BGP:

show route-map

bgp dampening

neighbor default-originate

neighbor route-map

neighbor unsuppress-map

network (BGP and BGP4+)

redistribute (into BGP or BGP4+)

show ip bgp route-map (BGP only)

For OSPF:

default-information originate

redistribute (OSPF)

For RIP:

redistribute (RIP)

# set as-path

**Overview** Use this command to add an AS path set clause to a route map entry.

When a BGP update message matches the route map entry, the device prepends the specified Autonomous System Number (ASN) or ASNs to the update's AS path attribute.

The AS path attribute is a list of the autonomous systems through which the announcement for the prefix has passed. As prefixes pass between autonomous systems, each autonomous system adds its ASN to the beginning of the list. This means that the AS path attribute can be used to make routing decisions.

Use the **no** variant of this command to remove the set clause.

**Syntax**

```
set as-path prepend <1-65535> [<1-65535>]...
no set as-path prepend [<1-65535> [<1-65535>]...]
```

| Parameter | Description |
|---|---|
| `prepend` | Prepends the autonomous system path. |
| *<1-65535>* | The number to prepend to the AS path. If you specify multiple ASNs, separate them with spaces. |

**Mode** Route-map mode

**Usage notes** Use the **set as-path** command to specify an autonomous system path. By specifying the length of the AS-Path, the device influences the best path selection by a neighbor. Use the `prepend` parameter with this command to prepend an AS path string to routes increasing the AS path length.

This command is valid for BGP update messages only.

**Example** To use entry `3` of the route map called `myroute` to prepend ASN `8` and `24` to the AS path of matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set as-path prepend 8 24
```

**Related commands**

match as-path

route-map

show route-map

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# set community

**Overview** Use this command to add a community set clause to a route map entry.

When a BGP update message matches the route map entry, the device takes one of the following actions:

- changes the update's community attribute to the specified value or values, or
- adds the specified community value or values to the update's community attribute, if you specify the **additive** parameter after specifying another parameter. or
- removes the community attribute from the update, if you specify the **none** parameter

Use the **no** variant of this command to remove the set clause.

**Syntax**

```
set community {[<1-65535>][AA:NN] [internet] [local-AS]
[no-advertise] [no-export] [additive]}
```

```
no set community {[AA:NN] [internet] [local-AS] [no-advertise]
[no-export] [additive]}
```

```
set community none
```

```
no set community none
```

| Parameter | Description |
|---|---|
| *<1-65535>* | The AS number of the community as an integer not in AA:NN format. |
| *AA:NN* | The Autonomous System (AS) number of the community, in AA:NN format. AS numbers are assigned to the regional registries by the IANA (www.iana.org) and can be obtained from the registry in your region.<br>AA and NN are both integers from 1 to 65535.<br>AA is the AS number; NN is a value chosen by the ASN administrator. |
| `local-AS` | The community of routes that must not be advertised to external BGP peers (this includes peers in other members' Autonomous Systems inside a BGP confederation). |
| `internet` | The community of routes that can be advertised to all BGP peers. |
| `no-advertise` | The community of routes that must not be advertised to other BGP peers. |
| `no-export` | The community of routes that must not be advertised outside a BGP confederation boundary (a standalone Autonomous System that is not part of a confederation should be considered a confederation itself). |

| Parameter | Description |
|---|---|
| `none` | The device removes the community attribute from matching update messages. |
| `additive` | The device adds the specified community value to the update message's community attribute, instead of replacing the existing attribute. By default this parameter is not included, so the device replaces the existing attribute. |

**Mode** Route-map Configuration

**Usage notes** This command is valid for BGP update messages only.

**Examples** To use entry `3` of the route map called `rmap1` to put matching routes into the no-advertise community, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community no-advertise
```

To use entry `3` of the route map called `rmap1` to put matching routes into several communities, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 10:01 23:34 12:14
no-export
```

To use entry `3` of the route map called `rmap1` to put matching routes into a single AS community numbered `16384`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 16384 no-export
```

**Related commands**

match community

route-map

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 (BGP4+ only)

**Overview** Use this command to display BGP4+ network information for a specified IPv6 address.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show bgp ipv6 <ipv6-addr>
```

| Parameter | Description |
|---|---|
| *<ipv6-addr>* | Specifies the IPv6 address, entered in hexadecimal in the format X:X::X:X. |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show bgp ipv6 2001:0db8:010d::1
```

**Related commands** show bgp ipv6 longer-prefixes (BGP4+ only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 community (BGP4+ only)

**Overview** Use this command to display routes that match specified communities within an IPv6 environment. Use the show ip bgp community (BGP only) command within an IPv4 environment.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

You may use any combination and repetition of parameters listed in the *<type>* placeholder.

**Syntax**

```
show bgp ipv6 community [<type>] [exact-match]
```

| Parameter | | Description |
|---|---|---|
| *<type>* | {[*AA:NN*][local-AS][no-advertise][no-export]} | |
| | *AA:NN* | Specifies the Autonomous System (AS) community number, in AA:NN format. |
| | local-AS | Do not send outside local Autonomous Systems (well-known community). |
| | no-advertise | Do not advertise to any peer (well-known community). |
| | no-export | Do not export to next AS (well-known community). |
| exact-match | Specifies that the exact match of the communities is displayed. This optional parameter cannot be repeated. | |

**Mode** User Exec and Privileged Exec

**Examples** Note that the AS numbers shown are examples only.

```
awplus# show bgp ipv6 community 64497:64499 exact-match
```

```
awplus# show bgp ipv6 community 64497:64499 64500:64501
exact-match
```

```
awplus# show bgp ipv6 community 64497:64499 64500:64501
64510:64511no-advertise
```

```
awplus# show bgp ipv6 community no-advertise
no-advertiseno-advertise exact-match
```

```
awplus# show bgp ipv6 community no-export 64510:64511
no-advertise local-AS no-export
```

```
awplus# show bgp ipv6 community no-export 64510:64511
no-advertise 64497:64499 64500:64501 no-export
```

```
awplus# show bgp ipv6 community no-export 64497:64499
no-advertise local-AS no-export
```

**Related commands**

show ip bgp community (BGP only)

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 community-list (BGP4+ only)

**Overview** Use this command to display routes that match the given community-list within an IPv6 environment. Use the show ip bgp community-list (BGP only) command within an IPv4 environment.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show bgp ipv6 community-list <listname> [exact-match]
```

| Parameter | Description |
|---|---|
| `<listname>` | Specifies the community list name. |
| `exact-match` | Displays only routes that have exactly the same specified communities. |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show bgp ipv6 community-list mylist exact-match
```

**Related commands** show ip bgp community-list (BGP only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 dampening (BGP4+ only)

**Overview** Use this command to show dampened routes from a BGP4+ instance within an IPv6 environment. Use the show ip bgp dampening (BGP only) command to show dampened routes from a BGP instance within an IPv4 environment.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show bgp ipv6 dampening
{dampened-paths|flap-statistics|parameters}
```

| Parameter | Description |
|---|---|
| `dampened-paths` | Display paths suppressed due to dampening. |
| `flap-statistics` | Display flap statistics of routes. |
| `parameters` | Display details of configured dampening parameters. |

**Mode** User Exec and Privileged Exec

**Usage notes** Enable BGP4+ dampening to maintain dampened-path information in memory.

**Examples**

```
awplus# show bgp ipv6 dampening dampened-path
awplus# show bgp ipv6 dampening flap-statistics
awplus# show bgp ipv6 dampening parameter
```

**Related commands** show ip bgp dampening (BGP only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 filter-list (BGP4+ only)

**Overview** Use this command to display routes conforming to the filter-list within an IPv6 environment. Use the show ip bgp filter-list (BGP only) command to display routes conforming to the filter-list within an IPv4 environment.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show bgp ipv6 filter-list <listname>
```

| Parameter | Description |
|---|---|
| *<listname>* | Specifies the regular-expression access list name. |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show bgp ipv6 filter-list mylist
```

**Related commands** show ip bgp filter-list (BGP only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 inconsistent-as (BGP4+ only)

**Overview** Use this command to display routes with inconsistent AS Paths within an IPv6 environment. Use the show ip bgp inconsistent-as (BGP only) command to display routes with inconsistent AS paths within an IPv4 environment.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**
```
show bgp ipv6 inconsistent-as
```

**Mode** User Exec and Privileged Exec

**Example**
```
awplus# show bgp ipv6 inconsistent-as
```

**Related commands** show ip bgp inconsistent-as (BGP only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 longer-prefixes (BGP4+ only)

**Overview** Use this command to display the route of the local BGP4+ routing table for a specific prefix with a specific mask or for any prefix having a longer mask than the one specified.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show bgp ipv6 <ipv6-addr/prefix-length> longer-prefixes
```

| Parameter | Description |
|---|---|
| *<ipv6-addr/prefix-length>* | Specifies the IPv6 address with prefix length. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64. |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show bgp ipv6 2001:0db8::/64 longer-prefixes
```

**Related commands** show bgp ipv6 (BGP4+ only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 neighbors (BGP4+ only)

**Overview** Use this command to display detailed information on peering connections to all BGP4+ neighbors within an IPv6 environment.

Use the show ip bgp neighbors (BGP only) command to display detailed information on peering connections to all BGP neighbors within an IPv4 environment.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show bgp ipv6 neighbors [<ipv6-addr> [advertised-routes|
received prefix-filter|received-routes|routes]]
```

| Parameter | Description |
|---|---|
| *<ipv6-addr>* | Specifies the IPv6 address, entered in hexadecimal in the format X:X::X:X. |
| `advertised-routes` | Displays the routes advertised to a BGP4+ neighbor. |
| `received prefix-filter` | Displays received prefix-list filters. |
| `received-routes` | Displays the received routes from the neighbor. To display all the received routes from the neighbor, configure the BGP4+ soft reconfigure first. |
| `routes` | Displays all accepted routes learned from neighbors. |

**Mode** User Exec and Privileged Exec

**Examples [BGP4+]**

```
awplus# show bgp ipv6 neighbors 2001:0db8:010d::1
advertised-routes
```

```
awplus# show bgp ipv6 neighbors 2001:0db8:010d::1 received
prefix-filter
```

```
awplus# show bgp ipv6 neighbors 2001:0db8:010d::1
received-routes
```

```
awplus# show bgp ipv6 neighbors 2001:0db8:010d::1 routes
```

**Output** Figure 32-4: Example output from **show bgp ipv6 neighbors** 2001:db8:b::1

```
awplus#show bgp ipv6 neighbors 2001:db8:b::1
BGP neighbor is 2001:db8:b::1, remote AS 200, local AS 100, external link
  BGP version 4, remote router ID 2.2.2.1
  BGP state = Established, up for 01:03:26
  Last read 01:03:26, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    4-Octet ASN Capability: advertised and received
    Address family IPv4 Unicast: advertised and received
    Address family IPv6 Unicast: advertised and received
  Received 157 messages, 0 notifications, 0 in queue
  Sent 228 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 30 seconds
  Update source is lo
For address family: IPv4 Unicast
  BGP table version 1, neighbor version 1
  Index 2, Offset 0, Mask 0x4
  Community attribute sent to this neighbor (both)
  0 accepted prefixes
  0 announced prefixes

For address family: IPv6 Unicast
  BGP table version 66, neighbor version 66
  Index 2, Offset 0, Mask 0x4
  AF-dependant capabilities:
    Graceful restart: advertised, received

  Community attribute sent to this neighbor (both)
  Default information originate, default sent
  Inbound path policy configured
  Incoming update prefix filter list is *BGP_FILTER_LIST
  Route map for incoming advertisements is *BGP_LOCAL_PREF_MAP
  8 accepted prefixes
  8 announced prefixes

Connections established 1; dropped 0
Graceful-restart Status:
  Remote restart-time is 90 sec

  External BGP neighbor may be up to 2 hops away.
Local host: 2001:db8:a::1, Local port: 179
Foreign host: 2001:db8:b::1, Foreign port: 50672
Nexthop: 1.1.1.1
Nexthop global: 2001:db8:a::1
Nexthop local: ::
BGP connection: non shared network
```

If available the following is shown:

- Session information
  - Neighbor address, ASN information and if the link is external or internal
  - BGP version and status
  - Neighbor capabilities for the BGP session
  - Number of messages transmitted and received
- IPv6 unicast address family information
  - BGP4+ table version
  - IPv6 Address Family dependent capabilities
  - IPv6 Communities
  - IPv6 Route filters for ingress and egress updates
  - Number of announced and accepted IPv6 prefixes
- Connection information
  - Connection counters
  - Graceful restart timer
  - Hop count to the peer
  - Next hop information
  - Local and external port numbers

**Related commands** show ip bgp neighbors (BGP only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 paths (BGP4+ only)

**Overview** Use this command to display BGP4+ path information within an IPv6 environment. Use the show ip bgp paths (BGP only) command to display BGP path information within an IPv4 environment.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show bgp ipv6 paths
```

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show bgp ipv6 paths
```

**Related commands** show ip bgp paths (BGP only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 prefix-list (BGP4+ only)

**Overview** Use this command to display routes matching the prefix-list within an IPv6 environment. Use the show ip bgp prefix-list (BGP only) command to display routes matching the prefix-list within an IPv4 environment.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show bgp ipv6 prefix-list <list>
```

| Parameter | Description |
|---|---|
| *<list>* | Specifies the name of the IPv6 prefix list. |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show bgp ipv6 prefix-list mylist
```

**Related commands** show ip bgp prefix-list (BGP only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 quote-regexp (BGP4+ only)

**Overview** Use this command to display routes matching the AS path regular expression within an IPv6 environment. Use the show ip bgp quote-regexp (BGP only) command to display routes matching the AS path regular expression within an IPv4 environment.

Note that you must use quotes to enclose the regular expression with this command. Use the regular expressions listed below with the <*expression*> parameter:

| Symbol | Character | Meaning |
|---|---|---|
| ^ | Caret | Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match. |
| $ | Dollar sign | Used to match the end of the input string. |
| . | Period | Used to match a single character (white spaces included). |
| * | Asterisk | Used to match none or more sequences of a pattern. |
| + | Plus sign | Used to match one or more sequences of a pattern. |
| ? | Question mark | Used to match none or one occurrence of a pattern. |
| _ | Underscore | Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string. |
| [ ] | Brackets | Specifies a range of single-characters. |
| - | Hyphen | Separates the end points of a range. |

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**
```
show bgp ipv6 quote-regexp <expression>
```

**Mode** User Exec and Privileged Exec

**Example**
```
awplus# show bgp ipv6 quote-regexp myexpression
```

**Related commands** show ip bgp quote-regexp (BGP only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 regexp (BGP4+ only)

**Overview** Use this command to display routes matching the AS path regular expression within an IPv6 environment. Use the show ip bgp regexp (BGP only) command to display routes matching the AS path regular expression within an IPv4 environment.

Use the regular expressions listed below with the <*expression*> parameter:

| Symbol | Character | Meaning |
|---|---|---|
| ^ | Caret | Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match. |
| $ | Dollar sign | Used to match the end of the input string. |
| . | Period | Used to match a single character (white spaces included). |
| * | Asterisk | Used to match none or more sequences of a pattern. |
| + | Plus sign | Used to match one or more sequences of a pattern. |
| ? | Question mark | Used to match none or one occurrence of a pattern. |
| _ | Underscore | Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string. |
| [ ] | Brackets | Specifies a range of single-characters. |
| - | Hyphen | Separates the end points of a range. |

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show bgp ipv6 regexp <expression>
```

| Parameter | Description |
|---|---|
| <*expression*> | Specifies a regular-expression to match the BGP4+ AS paths. |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show bgp ipv6 regexp myexpression
```

**Related commands** show ip bgp regexp (BGP only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 route-map (BGP4+ only)

**Overview** Use this command to display BGP4+ routes that match the specified route-map within an IPv6 environment. Use the show ip bgp route-map (BGP only) command to display BGP routes that match the specified route-map within an IPv4 environment.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show bgp ipv6 route-map <route-map>
```

| Parameter | Description |
|---|---|
| *<route-map>* | Specifies a route-map that is matched. |

**Mode** User Exec and Privileged Exec

**Example** To show routes that match the route-map `myRouteMap`, use the command:

```
awplus# show bgp ipv6 route-map myRouteMap
```

**Related commands** show ip bgp route-map (BGP only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp ipv6 summary (BGP4+ only)

**Overview** Use this command to display a summary of a BGP4+ neighbor status within an IPv6 environment. Use the show ip bgp summary (BGP only) command to display a summary of a BGP neighbor status within an IPv4 environment.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show bgp ipv6 summary
```

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show bgp ipv6 summary
```

**Output** Figure 32-5: Example output from the **show ip bgp summary** command

```
awplus>show ip bgp summary

BGP router identifier 1.0.0.1, local AS number 65541
BGP table version is 12
4 BGP AS-PATH entries
0 BGP community entries

Neighbor           V         AS   MsgRc  MsgSnt TblVer InOutQ Up/Down   State/PfxRcd
2001:0db8:cccc::1  4      65544      20      24     11 0/0    00:07:19          1
2001:0db8:dddd::1  4      65545       0       0      0 0/0    never         Active
2001:0db8:eeee::1  4      65542      34      40      0 0/0    00:00:04      Active
2001:0db8:ffff::1  4      65543      29      32     11 0/0    00:07:03         13

Number of neighbors 4
```

The Up/Down column in this output is a timer that shows:

- "never" if the peer session has never been established
- The up time, if the peer session is currently up
- The down time, if the peer session is currently down.

In the example above, the session with 2001:0db8:eeee::1 has been down for 4 seconds, and the session with 2001:0db8:dddd::1 has never been established.

**Related commands** show ip bgp summary (BGP only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp memory maxallocation (BGP only)

**Overview** This command displays the maximum percentage of total memory that is allocated to BGP processes.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show bgp memory maxallocation
```

**Mode** User Exec and Privileged Exec

**Example** To display the maximum amount of memory allocated for BGP processes, use the command:

```
awplus# show bgp memory maxallocation
```

**Output** Figure 32-6: Example output from the **show bgp memory maxallocation** command

```
BGP maximum RAM allocation is 100%
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp nexthop-tracking (BGP only)

**Overview** Use this command to display BGP next hop tracking status.

**Syntax**

```
show bgp nexthop-tracking
```

**Mode** User Exec and Privileged Exec

**Example** To display BGP next hop tracking status, use the command:

```
awplus# show bgp nexthop-tracking
```

**Related commands**

bgp nexthop-trigger-count

show bgp nexthop-tree-details (BGP only)

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show bgp nexthop-tree-details (BGP only)

**Overview** Use this command to display BGP next hop tree details.

**Syntax**

```
show bgp nexthop-tree-details
```

**Mode** User Exec and Privileged Exec

**Example** To display BGP next hop tree details, use the command:

```
awplus# show bgp nexthop-tree-details
```

**Related commands** show bgp nexthop-tracking (BGP only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show debugging bgp (BGP only)

**Overview** Use this command to see what debugging is turned on for BGP.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show debugging bgp
```

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show debugging bgp
```

**Output** Figure 32-7: Example output from the **show debugging bgp** command

```
BGP debugging status:
  BGP debugging is on
  BGP events debugging is on
  BGP updates debugging is on
  BGP fsm debugging is on
```

**Related commands** debug bgp (BGP only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp (BGP only)

**Overview** Use this command to display BGP network information.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip bgp [<ip-addr>|<ip-addr/m>]
```

| Parameter | Description |
|---|---|
| *<ip-addr>*<br>*<ip-addr/m>* | Specifies the IPv4 address and the optional prefix mask length. |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip bgp 10.10.1.34/24
```

**Output** Figure 32-8: Example output from the **show ip bgp** command

```

# show ip bgp attribute-info (BGP only)

**Overview** Use this command to show internal attribute hash information.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip bgp attribute-info
```

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip bgp attribute-info
```

**Output** Figure 32-9: Example output from the **show ip bgp attribute-info** command

```
attr[1] nexthop 0.0.0.0
attr[1] nexthop 10.10.10.10
attr[1] nexthop 10.10.10.50
```

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp cidr-only (BGP only)

**Overview** Use this command to display routes with non-natural network masks.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**
```
show ip bgp cidr-only
```

**Syntax (VRF-lite)**
```
show ip bgp [global|vrf <vrf-name>] cidr-only
```

| Parameter | Description |
|---|---|
| `global` | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| `vrf` | Apply the command to the specified VRF instance. |
| *`<vrf-name>`* | The name of the VRF instance. |

**Mode** User Exec and Privileged Exec

**Example**
```
awplus# show ip bgp cidr-only
awplus# show ip bgp vrf red cidr-only
```

**Output** Figure 32-10: Example output from the **show ip bgp cidr-only** command

```
BGP table version is 0, local router ID is 10.10.10.50

Status codes: s suppressed, d damped, h history, p stale, *

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp community (BGP only)

**Overview** Use this command to display routes that match specified communities from a BGP instance within an IPv4 environment. Use the show bgp ipv6 community (BGP4+ only) command within an IPv6 environment.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

You may use any combination and repetition of parameters listed in the *<type>* placeholder.

**Syntax**
```
show ip bgp community [<type>] [exact-match]
```

**Syntax (VRF-lite)**
```
show ip bgp [global|vrf <vrf-name>] community  [<type>]
[exact-match]
```

| Parameter | Description | |
|---|---|---|
| `global` | When VRF-lite is configured, apply the command to the global routing and forwarding table. | |
| `vrf` | Apply the command to the specified VRF instance. | |
| *<vrf-name>* | The name of the VRF instance. | |
| *<type>* | {[*AA:NN*][local-AS][no-advertise][no-export]} | |
| | *AA:NN* | Specifies the Autonomous System (AS) community number, in AA:NN format. |
| | `local-AS` | Do not send outside local Autonomous Systems (well-known community). |
| | `no-advertise` | Do not advertise to any peer (well-known community). |
| | `no-export` | Do not export to next AS (well-known community). |
| `exact-match` | Specifies that the exact match of the communities is displayed. This optional parameter cannot be repeated. | |

**Mode** User Exec and Privileged Exec

**Examples**

Note that the AS numbers shown are examples only.

```
awplus# show ip bgp community 64497:64499 exact-match
awplus# show ip bgp community 64497:64499 64500:64501
exact-match
awplus# show ip bgp community 64497:64499 64500:64501
64510:64511no-advertise
awplus# show ip bgp community no-advertise
no-advertiseno-advertise exact-match
awplus# show ip bgp community no-export 64510:64511
no-advertise local-AS no-export
awplus# show ip bgp community no-export 64510:64511
no-advertise 64497:64499 64500:64501 no-export
awplus# show ip bgp community no-export 64497:64499
no-advertise local-AS no-export
awplus# show ip bgp vrf red no-export
awplus# show ip bgp global 65500:2 65500:3 exact-match
```

# show ip bgp community-info (BGP only)

**Overview** Use this command to list all BGP community information.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip bgp community-info
```

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip bgp community-info
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp community-list (BGP only)

**Overview** Use this command to display routes that match the given community-list from a BGP instance within an IPv4 environment. Use the show bgp ipv6 community-list (BGP4+ only) command within an IPv6 environment.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**
```
show ip bgp community-list <listname> [exact-match]
```

**Syntax (VRF-lite)**
```
show ip bgp [global|vrf <vrf-name>] community-list <listname>
[exact-match]
```

| Parameter | Description |
|---|---|
| `global` | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| `vrf` | Apply the command to the specified VRF instance. |
| *<vrf-name>* | The name of the VRF instance. |
| *<listname>* | Specifies the community list name. |
| `exact-match` | Displays only routes that have exactly the same specified communities. |

**Mode** User Exec and Privileged Exec

**Example**
```
awplus# show ip bgp community-list mylist exact-match
awplus# show ip bgp vrf red community-list myCommunity
awplus# show ip bgp global community-list myExactCommunity
exact-match
```

**Related commands** show bgp ipv6 community-list (BGP4+ only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp dampening (BGP only)

**Overview** Use this command to show dampened routes from a BGP instance within an IPv4 environment. Use the show bgp ipv6 dampening (BGP4+ only) command within an IPv6 environment.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**
```
show ip bgp dampening
{dampened-paths|flap-statistics|parameters}
```

**Syntax (VRF-lite)**
```
show ip bgp [global|vrf <vrf-name>] dampening
{dampened-paths|flap-statistics|parameters}
```

| Parameter | Description |
|---|---|
| `global` | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| `vrf` | Apply the command to the specified VRF instance. |
| *`<vrf-name>`* | The name of the VRF instance. |
| `dampened-paths` | Display paths suppressed due to dampening. |
| `flap-statistics` | Display flap statistics of routes. |
| `parameters` | Display details of configured dampening parameters. |

**Mode** User Exec and Privileged Exec

**Usage notes** Enable BGP dampening to maintain dampened-path information in memory.

**Examples**
```
awplus# show ip bgp dampening dampened-paths
awplus# show ip bgp vrf red dampening dampened-paths
awplus# show ip bgp global dampening flap-statistics
```

**Output** Figure 32-11: Example output from the **show ip bgp dampening** command

```
dampening 15 750 2000 60 15
 Reachability Half-Life time    : 15 min
 Reuse penalty                  : 750
 Suppress penalty               : 2000
 Max suppress time              : 60 min
 Un-reachability Half-Life time : 15 min
 Max penalty (ceil)             : 11999
 Min penalty (floor)            : 375
```

The following example output shows that the internal route (`i`), has flapped 3 times and is now categorized as history (`h`).

Figure 32-12: Example output from the **show ip bgp dampening flap-statistics** command

```
awplus# show ip bgp dampening flap-statistics
BGP table version is 1, local router ID is 30.30.30.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,S
Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network          From            Flaps  Duration  Reuse    Path
 hi1.1.1.0/24       10.100.0.62        3   00:01:20           i
```

The following example output shows a dampened route in the `1.1.1.0/24` network.

Figure 32-13: Example output from the **show ip bgp dampening dampened-path** command

```
awplus# show ip bgp dampening dampened-paths
BGP table version is 1, local router ID is 30.30.30.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,S
Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

     Network          From            Reuse     Path
 di 1.1.1.0/24       10.100.0.62     00:35:10     i

Total number of prefixes 1
```

**Related commands** show bgp ipv6 dampening (BGP4+ only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp filter-list (BGP only)

**Overview** Use this command to display routes conforming to the filter-list within an IPv4 environment. Use the show bgp ipv6 filter-list (BGP4+ only) command to display routes conforming to the filter-list within an IPv6 environment

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**
```
show ip bgp filter-list <listname>
```

**Syntax (VRF-lite)**
```
show ip bgp [global|vrf <vrf-name>] filter-list <listname>
```

| Parameter | Description |
|---|---|
| `global` | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| `vrf` | Apply the command to the specified VRF instance. |
| *<vrf-name>* | The name of the VRF instance. |
| *<listname>* | Specifies the regular-expression access list name. |

**Mode** User Exec and Privileged Exec

**Example**
```
awplus# show ip bgp filter-list mylist
awplus# show ip bgp vrf red filter-list mylist
```

**Related commands** show bgp ipv6 filter-list (BGP4+ only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp inconsistent-as (BGP only)

**Overview** Use this command to display routes with inconsistent AS Paths within an IPv4 environment. Use the show bgp ipv6 inconsistent-as (BGP4+ only) command to display routes with inconsistent AS paths within an IPv6 environment.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**
```
show ip bgp inconsistent-as
```

**Syntax (VRF-lite)**
```
show ip bgp [global|vrf <vrf-name>] inconsistent-as
```

| Parameter | Description |
|---|---|
| `global` | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| `vrf` | Apply the command to the specified VRF instance. |
| *`<vrf-name>`* | The name of the VRF instance. |

**Mode** User Exec and Privileged Exec

**Example**
```
awplus# show ip bgp inconsistent-as
awplus# show ip bgp global inconsistent-as
```

**Related commands** show bgp ipv6 inconsistent-as (BGP4+ only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp longer-prefixes (BGP only)

**Overview** Use this command to display the route of the local BGP routing table for a specific prefix with a specific mask, or for any prefix having a longer mask than the one specified.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**
```
show ip bgp <ip-address/m> longer-prefixes
```

**Syntax (VRF-lite)**
```
show ip bgp [global|vrf <vrf-name>] <ip-address/m>
longer-prefixes
```

| Parameter | Description |
|---|---|
| `global` | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| `vrf` | Apply the command to the specified VRF instance. |
| *`<vrf-name>`* | The name of the VRF instance. |
| *`<ip-address/m>`* | Neighbor's IP address and subnet mask, entered in the form A.B.C.D/M, where M is the subnet mask length. |

**Mode** User Exec and Privileged Exec

**Example**
```
awplus# show ip bgp 10.10.0.10/24 longer-prefixes
awplus# show ip bgp vrf red 172.16.4.0/24
awplus# show ip bgp global 172.16.0.0/16 longer-prefixes
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors (BGP only)

**Overview** Use this command to display detailed information on peering connections to all BGP neighbors within an IPv4 environment.

Use the show bgp ipv6 neighbors (BGP4+ only) command to display detailed information on peering connections to all BGP4+ neighbors within an IPv6 environment.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax [BGP]**

```
show ip bgp neighbors [<ipv4-addr> [advertised-routes|received
prefix-filter|received-routes|routes]]
```

**Syntax (VRF-lite)**

```
show ip bgp [global|vrf <vrf-name>] neighbors [<ipv4-addr>
routes]
```

| Parameter | Description |
|---|---|
| *<ipv4-addr>* | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |
| `advertised-routes` | Displays the routes advertised to a BGP neighbor. |
| `received prefix-filter` | Displays the received prefix-list filters. |
| `received-routes` | Displays the received routes from the neighbor. To display all the received routes from the neighbor, configure the BGP soft reconfigure first. |
| `routes` | Displays all accepted routes learned from neighbors. |
| `global` | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| `vrf` | Apply the command to the specified VRF instance. |
| *<vrf-name>* | The name of the VRF instance. |

**Mode [BGP]** User Exec and Privileged Exec

**Examples [BGP]**

```
awplus# show ip bgp neighbors 10.10.10.72 advertised-routes
awplus# show ip bgp neighbors 10.10.10.72 received
prefix-filter
awplus# show ip bgp neighbors 10.10.10.72 received-routes
awplus# show ip bgp neighbors 10.10.10.72 routes
```

**Output** Figure 32-14: Example output from **show ip bgp neighbors 10.10.10.72**

```
awplus#show ip bgp neighbors 10.10.10.72
BGP neighbor is 10.10.10.72, remote AS 100, local AS 100, internal
 link
 Member of peer-group group1 for session parameters
  BGP version 4, remote router ID 0.0.0.0
  BGP state = Active
  Last read         , hold time is 90, keepalive interval is 30 seconds
  Received 0 messages, 0 notifications, 0 in queue
  Sent 0 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 5 seconds
 For address family: IPv4 Unicast
  BGP table version 1, neighbor version 0
  Index 1, Offset 0, Mask 0x2
  group1 peer-group member
  NEXT_HOP is always this router
  0 accepted prefixes
  0 announced prefixes

 Connections established 0; dropped 0
Next connect timer due in 33 seconds
```

If available the following is shown:

- Session information
  - Neighbor address, ASN information and if the link is external or internal
  - BGP version and status
  - Neighbor capabilities for the BGP session
  - Number of messages transmitted and received
- IPv4 unicast address family information
  - BGP table version
  - IPv4 Address Family dependent capabilities
  - IPv4 Communities
  - IPv4 Route filters for ingress and egress updates
  - Number of announced and accepted IPv4 prefixes
- Connection information
  - Connection counters
  - Graceful restart timer
  - Hop count to the peer
  - Next hop information
  - Local and external port numbers

**Related commands**

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors connection-retrytime (BGP only)

**Overview** Use this command to display the configured connection-retrytime value of the peer at the session establishment time with the neighbor.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip bgp neighbors <ipv4-addr> connection-retrytime
```

| Parameter | Description |
|---|---|
| *<ipv4-addr>* | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip bgp neighbors 10.11.4.26 connection-retrytime
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors hold-time (BGP only)

**Overview** Use this command to display the configured holdtime value of the peer at the session establishment time with the neighbor.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip bgp neighbors <ipv4-addr> hold-time
```

| Parameter | Description |
|---|---|
| *<ipv4-addr>* | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |

**Default** The holdtime timer default is 90 seconds as per RFC 4271. Holdtime is keepalive * 3.

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip bgp neighbors 10.11.4.26 hold-time
```

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors keepalive (BGP only)

**Overview** Use this command to display the number of keepalive messages sent to the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip bgp neighbors <ipv4-addr> keepalive
```

| Parameter | Description |
|---|---|
| *<ipv4-addr>* | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip bgp neighbors 10.11.4.26 keepalive
```

**Related commands** show ip bgp neighbors keepalive-interval (BGP only)

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors keepalive-interval (BGP only)

**Overview** Use this command to display the configured keepalive-interval value of the peer at the session establishment time with the neighbor.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip bgp neighbors <ipv4-addr> keepalive-interval
```

| Parameter | Description |
|---|---|
| *<ipv4-addr>* | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |

**Default** The keepalive timer default is 60 seconds as per RFC 4271. Keepalive is holdtime / 3.

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip bgp neighbors 10.11.4.26 keepalive-interval
```

**Related commands**

# show ip bgp neighbors open (BGP only)

**Overview** Use this command to display the number of open messages sent to the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip bgp neighbors <ipv4-addr> open
```

| Parameter | Description |
|---|---|
| *<ipv4-addr>* | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip bgp neighbors 10.11.4.26 open
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors rcvd-msgs (BGP only)

**Overview** Use this command to display the number of messages received by the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip bgp neighbors <ipv4-addr> rcvd-msgs
```

| Parameter | Description |
|---|---|
| *<ipv4-addr>* | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip bgp neighbors 10.11.4.26 rcvd-msgs
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors sent-msgs (BGP only)

**Overview** Use this command to display the number of messages sent to the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip bgp neighbors <ipv4-addr> sent-msgs
```

| Parameter | Description |
|---|---|
| *<ipv4-addr>* | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip bgp neighbors 10.11.4.26 sent-msgs
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp neighbors update (BGP only)

**Overview** Use this command to display the number of update messages sent to the neighbor from the peer throughout the session.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip bgp neighbors <ipv4-addr> update
```

| Parameter | Description |
|---|---|
| *<ipv4-addr>* | The IPv4 address of an IPv4 BGP neighbor, in dotted decimal notation A.B.C.D. |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip bgp neighbors 10.11.4.26 update
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp paths (BGP only)

**Overview** Use this command to display BGP4 path information within an IPv4 environment. Use the show bgp ipv6 paths (BGP4+ only) command to display BGP4+ path information within an IPv4 environment.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip bgp paths
```

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip bgp paths
```

**Related commands** show bgp ipv6 paths (BGP4+ only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp prefix-list (BGP only)

**Overview** Use this command to display routes matching the prefix-list within an IPv4 environment. Use the show bgp ipv6 prefix-list (BGP4+ only) command to display routes matching the prefix-list within an IPv6 environment.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**
```
show ip bgp prefix-list <list>
```

**Syntax (VRF-lite)**
```
show ip bgp [global|vrf <vrf-name>] prefix-list <list>
```

| Parameter | Description |
|---|---|
| `global` | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| `vrf` | Apply the command to the specified VRF instance. |
| *<vrf-name>* | The name of the VRF instance. |
| *<list>* | Specifies the name of the IP prefix list. |

**Mode** User Exec and Privileged Exec

**Examples**
```
awplus# show ip bgp prefix-list mylist
awplus# show ip bgp vrf red prefix-list myPrefixes
```

**Related commands** show bgp ipv6 prefix-list (BGP4+ only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp quote-regexp (BGP only)

**Overview** Use this command to display routes matching the AS path regular expression within an IPv4 environment. Use the show bgp ipv6 quote-regexp (BGP4+ only) command to display routes matching the AS path regular expression within an IPv6 environment.

Note that you must use quotes to enclose the regular expression with this command. Use the regular expressions listed below with the *<expression>* parameter:

| Symbol | Character | Meaning |
|---|---|---|
| ^ | Caret | Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match. |
| $ | Dollar sign | Used to match the end of the input string. |
| . | Period | Used to match a single character (white spaces included). |
| * | Asterisk | Used to match none or more sequences of a pattern. |
| + | Plus sign | Used to match one or more sequences of a pattern. |
| ? | Question mark | Used to match none or one occurrence of a pattern. |
| _ | Underscore | Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string. |
| [ ] | Brackets | Specifies a range of single-characters. |
| - | Hyphen | Separates the end points of a range. |

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**
```
show ip bgp quote-regexp <expression>
```

**Syntax (VRF-lite)**
```
show ip bgp [global|vrf <vrf-name>] quote-regexp <expression>
```

| Parameter | Description |
|---|---|
| `global` | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| `vrf` | Apply the command to the specified VRF instance. |
| *<vrf-name>* | The name of the VRF instance. |
| *<expression>* | Specifies a regular-expression to match the BGP AS paths. |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip bgp quote-regexp myexpression
awplus# show ip bgp global quote-regexp 65550 65555
```

**Related commands**

show bgp ipv6 quote-regexp (BGP4+ only)

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp regexp (BGP only)

**Overview** Use this command to display routes matching the AS path regular expression within an IPv4 environment. Use the show bgp ipv6 regexp (BGP4+ only) command to display routes matching the AS path regular expression within an IPv6 environment.

Use the regular expressions listed below with the <*expression*> parameter:

| Symbol | Character | Meaning |
|---|---|---|
| ^ | Caret | Used to match the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match. |
| $ | Dollar sign | Used to match the end of the input string. |
| . | Period | Used to match a single character (white spaces included). |
| * | Asterisk | Used to match none or more sequences of a pattern. |
| + | Plus sign | Used to match one or more sequences of a pattern. |
| ? | Question mark | Used to match none or one occurrence of a pattern. |
| _ | Underscore | Used to match spaces, commas, braces, parenthesis, or the beginning and end of an input string. |
| [ ] | Brackets | Specifies a range of single-characters. |
| - | Hyphen | Separates the end points of a range. |

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**
```
show ip bgp regexp <expression>
```

**Syntax (VRF-lite)**
```
show ip bgp [global|vrf <vrf-name>] regexp <expression>
```

| Parameter | Description |
|---|---|
| global | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf | Apply the command to the specified VRF instance. |
| <*vrf-name*> | The name of the VRF instance. |
| <*expression*> | Specifies a regular-expression to match the BGP AS paths. |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip bgp regexp myexpression
awplus# show ip bgp vrf red regexp 65550 65555
```

**Related commands**

show bgp ipv6 regexp (BGP4+ only)

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp route-map (BGP only)

**Overview** Use this command to display BGP routes that match the specified route-map within an IPv4 environment. Use the show bgp ipv6 route-map (BGP4+ only) command to display BGP4+ routes that match the specified route-map within an IPv6 environment.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**
```
show ip bgp route-map <route-map>
```

**Syntax (VRF-lite)**
```
show ip bgp [global|vrf <vrf-name>] route-map <route-map>
```

| Parameter | Description |
|---|---|
| `global` | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| `vrf` | Apply the command to the specified VRF instance. |
| *<vrf-name>* | The name of the VRF instance. |
| *<route-map>* | Specifies a route-map that is matched. |

**Mode** User Exec and Privileged Exec

**Examples** To show routes that match the route-map `myRouteMap` for the global routing instance, use the command:

```
awplus# show ip bgp global route-map myRouteMap
```

To show routes that match the route-map `myRouteMap`, use the command:

```
awplus# show ip bgp route-map myRouteMap
```

**Related commands** show bgp ipv6 route-map (BGP4+ only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp scan (BGP only)

**Overview** Use this command to display BGP scan status.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip bgp scan
```

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip bgp scan
```

**Output** Figure 32-15: Example output from the **show ip bgp scan** command

```
BGP scan is running
BGP scan interval is 60
BGP instance : AS is 11,DEFAULT
Current BGP nexthop cache:
BGP connected route:
 10.10.10.0/24
 10.10.11.0/24
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip bgp summary (BGP only)

**Overview** Use this command to display a summary of a BGP neighbor status within an IPv4 environment. Use the show bgp ipv6 summary (BGP4+ only) command to display a summary of BGP4+ neighbors.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**
```
show ip bgp summary
```

**Syntax (VRF-lite)**
```
show ip bgp [global|vrf <vrf-name>] summary
```

| Parameter | Description |
|---|---|
| `global` | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| `vrf` | Apply the command to the specified VRF instance. |
| *`<vrf-name>`* | The name of the VRF instance. |

**Mode** User Exec and Privileged Exec

**Examples**
```
awplus# show ip bgp summary
awplus# show ip bgp vrf red summary
```

**Output** Figure 32-16: Example output from the **show ip bgp summary** command

```
awplus>show ip bgp summary

BGP router identifier 1.0.0.1, local AS number 65541
BGP table version is 12
4 BGP AS-PATH entries
0 BGP community entries

Neighbor        V         AS   MsgRc  MsgSnt TblVer InOutQ Up/Down   State/PfxRcd
192.168.3.2     4      65544      20      24     11 0/0    00:07:19          1
192.168.4.2     4      65545       0       0      0 0/0    never         Active
192.168.11.2    4      65542      34      40      0 0/0    00:00:04      Active
192.168.21.2    4      65543      29      32     11 0/0    00:07:03         13

Number of neighbors 4
```

The Up/Down column in this output is a timer that shows:

- "never" if the peer session has never been established
- The up time, if the peer session is currently up
- The down time, if the peer session is currently down.

In the example above, the session with 192.168.11.2 has been down for 4 seconds, and the session with 192.168.4.2 has never been established.

**Related commands**

show bgp ipv6 summary (BGP4+ only)

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip community-list

**Overview** Use this command to display routes that match a specified community-list name or number.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip community-list [<listnumber>|<listname>]
```

| Parameter | Description |
|---|---|
| *<listnumber>* | Specifies the community list number in the range <1-199> as specified by a previously issued **ip community-list** command. |
| *<listname>* | Specifies the community list name as specified by a previously issued ip community-list command. |

**Mode** User Exec and Privileged Exec

**Examples**

```
awplus# show ip community-list mylist
awplus# show ip community-list 99
```

**Related commands**

ip community-list

ip community-list expanded

ip community-list standard

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip extcommunity-list

**Overview** Use this command to display a configured extcommunity-list.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip extcommunity-list [<1-199>|<extcommunity-listname>]
```

| Parameter | Description |
|---|---|
| *<1-199>* | Extcommunity-list number |
| *<extcommunity-listname>* | Extcommunity-list name |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip extcommunity-list 33
```

**Related commands**

ip extcommunity-list expanded

ip extcommunity-list standard

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show ip prefix-list

**Overview** Use this command to display the IPv4 prefix-list entries.

Note that this command is valid for RIP and BGP routing protocols only.

**Syntax**

```
show ip prefix-list [<name>|detail|summary]
```

| Parameter | Description |
|---|---|
| *<name>* | Specify the name of a prefix list in this placeholder. |
| `detail` | Specify this parameter to show detailed output for all IPv4 prefix lists. |
| `summary` | Specify this parameter to show summary output for all IPv4 prefix lists. |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ip prefix-list
awplus# show ip prefix-list 10.10.0.98/8
awplus# show ip prefix-list detail
```

**Related commands** ip prefix-list

# show ipv6 prefix-list

**Overview** Use this command to display the prefix-list entries.

Note that this command is valid for RIPng and BGP4+ routing protocols only.

**Syntax**

```
show ipv6 prefix-list [<name>|detail|summary]
```

| Parameter | Description |
|---|---|
| *<name>* | Specify the name of an individual IPv6 prefix list. |
| `detail` | Specify this parameter to show detailed output for all IPv6 prefix lists. |
| `summary` | Specify this parameter to show summary output for all IPv6 prefix lists. |

**Mode** User Exec and Privileged Exec

**Example**

```
awplus# show ipv6 prefix-list
awplus# show ipv6 prefix-list 10.10.0.98/8
awplus# show ipv6 prefix-list detail
```

**Related commands** ipv6 prefix-list

# show ip protocols bgp (BGP only)

**Overview** Use this command to display BGP process parameters and statistics.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

**Syntax**

```
show ip protocols bgp
```

**Mode** User Exec and Privileged Exec

**Example** To display BGP process parameters and statistics, use the command:

```
awplus# show ip protocols bgp
```

**Output** Figure 32-17: Example output from the **show ip protocols bgp** command

```
Routing Protocol is "bgp 100"
  IGP synchronization is disabled
  Automatic route summarization is disabled
  Default local-preference applied to incoming route is 100
  Redistributing:
  Neighbor(s):
  Address AddressFamily FiltIn FiltOut DistIn DistOut RouteMapIn RouteMapOut
Weight
10.10.10.1              unicast
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# show route-map

**Overview** Use this command to display information about one or all route maps.

**Syntax**

```
show route-map <map-name>
```

| Parameter | Description |
|---|---|
| *<map-name>* | A name to identify the route map. |

**Mode** User Exec and Privileged Exec

**Example** To display information about the route-map named `example-map`, use the command:

```
awplus# show route-map example-map
```

**Output** Figure 32-18: Example output from the **show route-map** command

```
route-map example-map, permit, sequence 1
  Match clauses:
    ip address prefix-list example-pref
  Set clauses:
    metric 100
route-map example-map, permit, sequence 200
  Match clauses:
  Set clauses:
```

**Related commands** route-map

# synchronization

**Overview** Use this command in Router Configuration mode or in Address Family Configuration mode to ensure BGP does not advertise router learned from iBGP peers until they are learned locally, or are propagated throughout the AS via an IGP.

Use the **no** variant of this command to disable this function.

**Syntax**

```
synchronization
no synchronization
```

**Default** Disabled.

**Mode** Router Configuration and Address Family Configuration mode

**Usage notes** Synchronization is used when a BGP router should not advertise routes learned from iBGP neighbors, unless those routes are also present in an IGP (for example, OSPF). These routes must be in the RIB (Routing Information Base) learned locally or via an IGP.

Synchronization may be enabled when all the routers in an autonomous system do not speak BGP, and the autonomous system is a transit for other autonomous systems.

Use the **no synchronization** command when BGP router can advertise routes learned from iBGP neighbors, without waiting for IGP reachability, when routes are in the RIB.

**Example** The following example enables IGP synchronization of iBGP routes in Router Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config-router)# synchronization
```

The following example enables IGP synchronization of iBGP routes in IPv4 unicast Address Family Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config)# address-family ipv4 unicast
awplus(config-af)# synchronization
```

The following example enables IGP synchronization of iBGP routes in the IPv6 unicast Address Family Configuration mode:

```
awplus# configure terminal
awplus(config)# router bgp 11
awplus(config)# address-family ipv6 unicast
awplus(config-af)# synchronization
```

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# timers (BGP)

**Overview** Use this command sets the BGP keepalive timer and holdtime timer values.

Use the **no** variant of this command to reset timers to the default.

**Syntax**

```
timers bgp <keepalive> <holdtime>
no timers bgp [<keepalive> <holdtime>]
```

| Parameter | Description |
|---|---|
| *<keepalive>* | *<0-65535>* The frequency with which the keepalive messages are sent to the neighbors. The default is 30 seconds as per RFC 4271. Cisco IOS uses a 60 second keepalive timer default value. Adjust keepalive timers for interoperability as required. Maintain the keepalive value at the holdtime value / 3. |
| *<holdtime>* | *<0-65535>* The interval after which the neighbor is considered dead if keepalive messages are not received. The default holdtime value is 90 seconds as per RFC 4271. Cisco IOS uses a 180 second holdtime timer default value. Adjust holdtime timers for interoperability as required. Maintain the holdtime value at the keepalive value * 3. |

**Default** The keepalive timer default is 60 seconds, the holdtime timer default is 90 seconds, and the connect timer default is 120 seconds as per RFC 4271. Holdtime is keepalive * 3.

**Mode** Router Configuration

**Usage notes** This command is used globally to set or unset the keepalive and holdtime values for all the neighbors.

**Examples**

```
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# timers bgp 40 120
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no timers bgp 30 90
awplus# configure terminal
awplus(config)# router bgp 10
awplus(config-router)# no timers bgp
```

**Related commands**

neighbor timers

show ip bgp neighbors hold-time (BGP only)

show ip bgp neighbors keepalive-interval (BGP only)

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# undebug bgp (BGP only)

**Overview** Use this command to disable BGP debugging functions.

**Syntax**

```
undebug bgp
[all|dampening|events|filters|fsm|keepalives|nht|nsm|updates]
undebug all bgp
```

| Parameter | Description |
|---|---|
| `all` | Disable all debugging for BGP. |
| `dampening` | Disable debugging for BGP dampening. |
| `events` | Disable debugging for BGP events. |
| `filters` | Disable debugging for BGP filters. |
| `fsm` | Disable debugging for BGP Finite State Machine (FSM). |
| `keepalives` | Disable debugging for BGP keepalives. |
| `nht` | Disable debugging for BGP NHT (Next Hop Tracking) messages. |
| `nsm` | Disable debugging for NSM messages. |
| `updates` | Disable debugging for BGP updates. |

**Mode** Privileged Exec and Global Configuration

**Example**

```
awplus# undebug bgp events
awplus# undebug bgp nht
awplus# undebug bgp updates
```

**Related commands** debug bgp (BGP only)

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# 33 Route Map Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for route map commands. For more information, see the Routemaps Feature Overview and Configuration Guide. These commands can be divided into the following categories:

- the route-map command, which is used to create a route map and/or route map entry, and to put you into route map mode
- **match** commands, used to determine which routes or BGP update messages the route map applies to
- **set** commands, used to modify matching routes or BGP update messages

**Command List**

- "match as-path" on page 1592
- "match community" on page 1593
- "match interface" on page 1595
- "match ip address" on page 1596
- "match ip next-hop" on page 1598
- "match ipv6 address" on page 1600
- "match ipv6 next-hop" on page 1602
- "match metric" on page 1603
- "match origin" on page 1604
- "match route-type" on page 1606
- "match tag" on page 1607
- "route-map" on page 1608
- "set aggregator" on page 1611
- "set as-path" on page 1612
- "set atomic-aggregate" on page 1613

- "set comm-list delete" on page 1614
- "set community" on page 1615
- "set dampening" on page 1617
- "set extcommunity" on page 1619
- "set ip next-hop (route map)" on page 1621
- "set ipv6 next-hop" on page 1622
- "set local-preference" on page 1623

# match as-path

**Overview** Use this command to add an autonomous system (AS) path match clause to a route map entry. Specify the AS path attribute value or values to match by specifying the name of an AS path access list.

A BGP update message matches the route map if its attributes include AS path values that match the AS path access list.

Each entry of a route map can only match against one AS path access list in one AS path match clause. If the route map entry already has an AS path match clause, entering this command replaces that match clause with the new clause.

Note that AS path access lists and route map entries both specify an action of deny or permit. The action in the AS path access list determines whether the route map checks update messages for a given AS path value. The route map action and its **set** clauses determine what the route map does with update messages that contain that AS path value.

Use the **no** variant of this command to remove the AS path match clause from a route map entry.

**Syntax**

```
match as-path <as-path-listname>
no match as-path [<as-path-listname>]
```

| Parameter | Description |
|---|---|
| *<as-path-listname>* | Specifies an AS path access list name. |

**Mode** Route-map Configuration

**Usage notes** This command is valid for BGP update messages only.

**Example** To add entry `34` to the route map called `myroute`, which will discard update messages if they contain the AS path values that are included in `myaccesslist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute deny 34
awplus(config-route-map)# match as-path myaccesslist
```

**Related commands**

route-map

set as-path

show route-map

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# match community

**Overview** Use this command to add a community match clause to a route map entry. Specify the community value or values to match by specifying a community list. To create the community list, enter Global Configuration mode and use the ip community-list command.

A BGP update message matches the route map if its attributes include community values that match the community list.

Each entry of a route map can only match against one community list in one community match clause. If the route map entry already has a community match clause, entering this command replaces that match clause with the new clause.

Note that community lists and route map entries both specify an action of deny or permit. The action in the community list determines whether the route map checks update messages for a given community value. The route map action and its **set** clauses determine what the route map does with update messages that contain that community value.

Use the **no** variant of this command to remove the community match clause from a route map.

**Syntax**

```
match community
{<community-listname>|<1-99>|<100-199>}[exact-match]

no match community
[<community-listname>|<1-99>|<100-199>|exact-match]
```

| Parameter | Description |
|---|---|
| *<community-listname>* | The community list name or number. |
| *<1-99>* | Community list number (standard range). |
| *<100-199>* | Community list number (expanded range). |
| exact-match | Exact matching of communities. |

**Mode** Route-map Configuration

**Usage notes** This command is valid for BGP update messages only.

Communities are used to group and filter routes. They are designed to provide the ability to apply policies to large numbers of routes by using match and set commands. Community lists are used to identify and filter routes by their common attributes.

**Example** To add entry `3` to the route map called `myroute`, which will process update messages if they contain the community values that are included in `mylist`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# match community mylist
```

**Related commands**

ip community-list

# match interface

**Overview** Use this command to add an interface match clause to a route map entry. Specify the interface name to match.

A route matches the route map if its interface matches the interface name.

Each entry of a route map can only match against one interface in one interface match clause. If the route map entry already has an interface match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the interface match clause from the route map entry. Use the **no** variant of this command without a specified interface to remove all interfaces.

**Syntax**

```
match interface <interface>
no match interface [<interface>]
```

| Parameter | Description |
|---|---|
| *<interface>* | The interface to match. |

**Mode** Route-map Configuration

**Usage** This command is valid for RIP and OSPF routes only.

**Example** To add entry 10 to the route map called 'mymap1', which will process routes if they use the interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match interface eth1
```

To remove all interfaces from the route map called 'mymap1', use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# no match interface
```

**Related commands**

match ip address

match ip next-hop

match route-type

match tag

route-map

show route-map

# match ip address

**Overview** Use this command to add an IP address prefix match clause to a route map entry. You can specify the prefix or prefixes to match by specifying the name of the prefix list. To create the prefix list, enter Global Configuration mode and use the **ip prefix-list** command.

A route matches the route map entry if the route's prefix matches the prefix list.

Use the **no** variant of this command to remove the IP address match clause from a route map entry.

**Syntax**

```
match ip address prefix-list <prefix-listname>
no match ip address prefix-list <prefix-listname>
```

| Parameter | Description |
|---|---|
| `prefix-list` | Use an IP prefix list to specify which prefixes to match. |
| | *<prefix-listname>* The prefix list name. |

**Mode** Route-map Configuration

**Usage notes** Each entry of a route map can have at most one prefix list-based IP address match clause. If the route map entry already has one match clause, entering this command replaces that match clause with the new clause.

Note that prefix lists and route map entries both specify an action of deny or permit. The action in the prefix list determines whether the route map checks update messages and routes for a given prefix. The action in the route map, and the map's **set** clauses, determine what the device does with update messages or routes that contain that prefix.

If the **match ip address** command results in a match against the specified IP address, then the outcome is:

- If **permit** is specified, then the route is redistributed or controlled, as specified by the set action.
- If **deny** is specified, then the route is not redistributed or controlled.

If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of **permit** or **deny** specifications.

This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

**Examples**

To add entry 3 to the route map called 'rmap1', which will process routes that match the prefix list called 'mylist', use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ip address prefix-list mylist
```

**Related commands**

route-map

show route-map

# match ip next-hop

**Overview** Use this command to add a next-hop match clause to a route map entry. You can specify the next hop to match by specifying the name of a prefix list. To create the prefix list, enter Global Configuration mode and use the **ip prefix-list** command.

A route matches the route map if the route's next hop matches the prefix list.

Each entry of a route map can have at most one prefix list-based next-hop match clause. If the route map entry already has one match clause, entering this command replaces that match clause with the new clause.

Note that the lists and route map entries specify an action of deny or permit. The action in the list determines whether the route map checks update messages and routes for a given next-hop value. The route map action and its **set** clauses determine what the route map does with update messages and routes that contain that next hop.

Use the **no** variant of this command to remove the next-hop match clause from a route map entry. To remove a prefix list-based match clause you must also specify the prefix-list parameter.

**Syntax**

```
match ip next-hop prefix-list <prefix-listname>
no match ip next-hop prefix-list [<prefix-listname>]
```

| Parameter | Description |
|---|---|
| `prefix-list` | Use an IP prefix list to specify which next hops to match. |
| | *<prefix-listname>* The prefix list name. |

**Mode** Route-map Configuration

**Usage notes** This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

**Examples** To add entry 3 to the route map called 'mymap', which will process routes whose next hop matches the prefix list called 'list1', use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap permit 3
awplus(config-route-map)# match ip next-hop prefix-list list1
```

**Related commands**

ip prefix-list

route-map

show ip prefix-list

show route-map

# match ipv6 address

**Overview** Use this command to add an IPv6 address prefix match clause to a route map entry. You can specify the prefix or prefixes to match by specifying the name of the prefix list. To create the prefix list, enter Global Configuration mode and use the **ipv6 prefix-list** command.

A route matches the route map entry if the route's prefix matches the prefix list.

Use the **no** variant of this command to remove the IPv6 address match clause from a route map entry.

**Syntax**

```
match ipv6 address prefix-list <prefix-listname>
no match ipv6 address
no match ipv6 address prefix-list <prefix-listname>
```

| Parameter | Description |
|---|---|
| `prefix-list` | Use an IP prefix list to specify which prefixes to match. |
| *`<prefix-listname>`* | The prefix list name. |

**Mode** Route-map Configuration

**Usage notes** Each entry of a route map can have at most one prefix list-based IPv6 address match clause. If the route map entry already has one match clause, entering this command replaces that match clause with the new clause.

Note that prefix lists and route map entries all specify an action of deny or permit. The action in the prefix list determines whether the route map checks update messages and routes for a given prefix. The action in the route map, and the map's **set** clauses, determine what the device does with update messages or routes that contain that prefix.

If the **match ipv6 address** command results in a match against the specified IPv6 address, then the outcome is:

- If **permit** is specified, then the route is redistributed or controlled, as specified by the set action.
- If **deny** is specified, then the route is not redistributed or controlled.

If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of **permit** or **deny** specifications.

This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

**Examples** To match traffic according to the prefix list named “mylist”, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ipv6 address prefix-list mylist
```

# match ipv6 next-hop

**Overview** Use this command to specify a next-hop address to be matched by the route-map.

Use the **no** variant of this command to disable this function.

**Syntax**

```
match ipv6 next-hop <ipv6-addr>
match ipv6 next-hop prefix-list <prefix-listname>
match ipv6 next-hop [<ipv6-addr>]
match ipv6 next-hop [prefix-list <prefix-listname>]
```

| Parameter | Description |
|---|---|
| *<ipv6-addr>* | The IPv6 address of the next hop. The IPv6 address uses the format X:X::X:X. |
| *<prefix-listname>* | The name of the IPv6 prefix list that specifies criteria for the addresses to be matched. |

**Mode** Route-map Configuration

**Usage notes** The **match ipv6 next-hop** command specifies the next-hop address to be matched. If there is a match for the specified next-hop address, and permit is specified, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and deny is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of permit or deny specifications.

***NOTE:*** *This command is valid only for BGP.*

**Example**

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# match ipv6 next-hop 2001:0db8::/32
```

# match metric

**Overview** Use this command to add a metric match clause to a route map entry. Specify the metric value to match.

A route matches the route map if its metric matches the route map's metric.

A BGP update message matches the route map if its MED attribute value matches the route map's metric.

Each entry of a route map can only match against one metric value in one metric match clause. If the route map entry already has a metric match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the metric match clause from the route map entry.

**Syntax**

```
match metric <metric>
no match metric [<metric>]
```

| Parameter | Description |
|---|---|
| *<metric>* | *<0-4294967295>* Specifies the metric value. |

**Mode** Route-map Configuration

**Usage notes** This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

**Example** To stop entry 3 of the route map called "myroute" from processing routes with a metric of 888999, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# no match metric 888999
```

**Related commands**

route-map

set metric

show route-map

# match origin

**Overview** Use this command to add an origin match clause to a route map entry. Specify the origin attribute value to match.

A BGP update message matches the route map if its origin attribute value matches the route map's origin value.

Each entry of a route map can only match against one origin in one origin match clause. If the route map entry already has an origin match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the origin match clause from the route map entry.

**Syntax**

```
match origin {egp|igp|incomplete}
no match origin [egp|igp|incomplete]
```

| Parameter | Description |
|---|---|
| `egp` | Learned from an exterior gateway protocol. |
| `igp` | Learned from a local interior gateway protocol. |
| `incomplete` | Of unknown heritage, for example a static route. |

**Mode** Route-map Configuration

**Usage** The origin attribute defines the origin of the path information. The **egp** parameter is indicated as an **e** in the routing table, and it indicates that the origin of the information is learned via Exterior Gateway Protocol. The **igp** parameter is indicated as an **i** in the routing table, and it indicates the origin of the path information is interior to the originating AS. The **incomplete** parameter is indicated as a **?** in the routing table, and indicates that the origin of the path information is unknown or learned through other means. If a static route is redistributed into BGP, the origin of the route is incomplete.

The **match origin** command specifies the origin to be matched. If there is a match for the specified origin, and **permit**is specified, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and `deny` is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of **permit** or **deny** specifications.

This command is valid for BGP update messages only.

**Example** To add entry 34 to the route map called "rmap1", which will drop externally-originated routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute deny 34
awplus(config-route-map)# match origin egp
```

**Related commands**

route-map

set origin

show route-map

# match route-type

**Overview** Use this command to add an external route-type match clause to a route map entry. Specify whether to match OSPF type-1 external routes or OSPF type-2 external routes.

An OSPF route matches the route map if its route type matches the route map's route type.

Each entry of a route map can only match against one route type in one match clause. If the route map entry already has a route type match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the route type match clause from the route map entry.

**Syntax**

```
match route-type external {type-1|type-2}
no match route-type external [type-1|type-2]
```

| Parameter | Description |
|---|---|
| `type-1` | OSPF type-1 external routes. |
| `type-2` | OSPF type-2 external routes. |

**Mode** Route-map Configuration

**Usage** Use the **match route-type external**command to match specific external route types. AS- external LSA is either Type-1 or Type-2. **external type-1** matches only Type 1 external routes, and **external type-2** matches only Type 2 external routes.

This command is valid for OSPF routes only.

**Example** To add entry `10` to the route map called `mymap1`, which will process type-1 external routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match route-type external type-1
```

**Related commands**

match interface

match ip address

match ip next-hop

match tag

route-map

set metric-type

show route-map

# match tag

**Overview** Use this command to add a tag match clause to a route map entry. Specify the route tag value to match.

An OSPF route matches the route map if it has been tagged with the route map's tag value. Routes can be tagged through OSPF commands or through another route map's set clause.

Each entry of a route map can only match against one tag in one match clause. If the route map entry already has a tag match clause, entering this command replaces that match clause with the new clause.

Use the **no** variant of this command to remove the tag match clause from the route map entry.

**Syntax**

```
match tag <0-4294967295>
no match tag [<0-4294967295>]
```

**Mode** Route-map Configuration

**Usage** This command is valid for OSPF routes only.

**Example** To add entry 10 to the route map called `mymap1`, which will process routes that are tagged `100`, use the following commands:

```
awplus# configure terminal
awplus(config)# route-map mymap1 permit 10
awplus(config-route-map)# match tag 100
```

**Related commands**

match interface

match ip address

match ip next-hop

match route-type

route-map

set tag

show route-map

# route-map

**Overview** Use this command to configure a route map entry, and to specify whether the device will process or discard matching routes and BGP update messages.

The device uses a name to identify the route map, and a sequence number to identify each entry in the route map.

The **route-map** command puts you into route-map configuration mode. In this mode, you can use the following:

- one or more of the **match** commands to create match clauses. These specify what routes or update messages match the entry.
- one or more of the **set** commands to create set clauses. These change the attributes of matching routes or update messages.

Use the **no** variant of this command to delete a route map or to delete an entry from a route map.

**Syntax**

```
route-map <mapname> {deny|permit} <seq>
no route-map <mapname>
no route-map <mapname> {deny|permit} <seq>
```

| Parameter | Description |
|---|---|
| *<mapname>* | A name to identify the route map. |
| `deny` | The route map causes a routing process to discard matching routes or BGP update messages. |
| `permit` | The route map causes a routing process to use matching routes or BGP update messages. |
| *<seq>* | <1-65535> The sequence number of the entry. You can use this parameter to control the order of entries in this route map. |

**Mode** Global Configuration

**Usage notes** Route maps allow you to control and modify routing information by filtering routes and setting route attributes. You can apply route maps when the device:

- processes BGP update messages that it has received from a peer
- prepares BGP update messages to send to peers
- redistributes routes from one routing protocol into another
- redistributes static routes into routing protocols
- uses BGP route flap dampening

When a routing protocol passes a route or update message through a route map, it checks the entries in order of their sequence numbers, starting with the lowest numbered entry.

If it finds a match on a route map with an action of permit, then it applies any set clauses and accepts the route. Having found a match, the route is not compared against any further entries of the route map.

If it finds a match on a route map with an action of deny, it will discard the matching route.

If it does not find a match, it discards the route or update message. This means that route maps end with an implicit deny entry. To permit all non-matching routes or update messages, end your route map with an entry that has an action of **permit** and no match clause.

**Examples**

To enter route-map mode for entry 1 of the route map called "route1", and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 1
awplus(config-route-map)# match as-path 60
awplus(config-route-map)# set weight 70
```

To enter route-map mode for entry 2 of the route map called "route1", and then add a match and set clause to it, use the commands:

```
awplus# configure terminal
awplus(config)# route-map route1 permit 2
awplus(config-route-map)# match interface eth1
awplus(config-route-map)# set metric 20
```

Note how the prompt changes when you go into route map configuration mode.

To make the device process non-matching routes instead of discarding them, add a command like the following one:

```
awplus(config)# route-map route1 permit 100
```

**Related commands**

For BGP:

show route-map

bgp dampening

neighbor default-originate

neighbor route-map

neighbor unsuppress-map

network (BGP and BGP4+)

redistribute (into BGP or BGP4+)

show ip bgp route-map (BGP only)

For OSPF:

default-information originate

redistribute (OSPF)

For RIP:

redistribute (RIP)

# set aggregator

**Overview** Use this command to add an aggregator set clause to a route map entry.

When a BGP update message matches the route map entry, the device sets the update's aggregator attribute. The aggregator attribute specifies the AS and IP address of the device that performed the aggregation.

Use the **no** variant of this command to remove the set clause.

**Syntax**

```
set aggregator as <asnum> <ip-address>
no set aggregator as
```

| Parameter | Description |
|---|---|
| *<asnum>* | The AS number of the aggregator. |
| *<ip-address>* | The IP address of the aggregator. |

**Mode** Route-map Configuration

**Usage** An Autonomous System (AS) is a collection of networks under a common administration sharing a common routing strategy. It is subdivided by areas, and is assigned a unique 16- bit number. Use the **set aggregator** command to assign an AS number for the aggregator.

This command is valid for BGP update messages only.

**Example** To use entry `3` of the route map called `myroute` to set the aggregator attribute to `43 10.10.0.3` in matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set aggregator as 43 10.10.0.3
```

To remove all aggregator attributes for entry `3` of the route map called `myroute`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# no set aggregator as
```

**Related commands** route-map

show route-map

# set as-path

**Overview** Use this command to add an AS path set clause to a route map entry.

When a BGP update message matches the route map entry, the device prepends the specified Autonomous System Number (ASN) or ASNs to the update's AS path attribute.

The AS path attribute is a list of the autonomous systems through which the announcement for the prefix has passed. As prefixes pass between autonomous systems, each autonomous system adds its ASN to the beginning of the list. This means that the AS path attribute can be used to make routing decisions.

Use the **no** variant of this command to remove the set clause.

**Syntax**

```
set as-path prepend <1-65535> [<1-65535>]...
no set as-path prepend [<1-65535> [<1-65535>]...]
```

| Parameter | Description |
|---|---|
| `prepend` | Prepends the autonomous system path. |
| *<1-65535>* | The number to prepend to the AS path. If you specify multiple ASNs, separate them with spaces. |

**Mode** Route-map mode

**Usage notes** Use the **set as-path** command to specify an autonomous system path. By specifying the length of the AS-Path, the device influences the best path selection by a neighbor. Use the `prepend` parameter with this command to prepend an AS path string to routes increasing the AS path length.

This command is valid for BGP update messages only.

**Example** To use entry `3` of the route map called `myroute` to prepend ASN `8` and `24` to the AS path of matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set as-path prepend 8 24
```

**Related commands**

match as-path

route-map

show route-map

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# set atomic-aggregate

**Overview** Use this command to add an atomic aggregate set clause to a route map entry.

When a BGP update message matches the route map entry, the device adds the atomic aggregate attribute to the update.

Use the **no** variant of this command to remove the set clause.

**Syntax**

```
set atomic-aggregate
no set atomic-aggregate
```

**Mode** Route-map Configuration

**Usage** This command is valid for BGP update messages only.

**Example** To use entry `3` of the route map called `rmap1` to add the atomic aggregator attribute to matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set atomic-aggregate
```

**Related commands** route-map

show route-map

# set comm-list delete

**Overview** Use this command to delete one or more communities from the community attribute of a BGP update message. Specify the communities to delete by specifying a community list. To create the community list, enter Global Configuration mode and use the ip community-list command.

When a BGP update message matches the route map entry, the device deletes the specified communities from the update's community attribute.

Use the **no** variant of this command to stop deleting the communities.

**Syntax**

```
set comm-list {<1-199>|<100-199>|<word>} delete
no set comm-list {<1-199>|<100-199>|<word>} delete
```

| Parameter | Description |
|---|---|
| *<1-99>* | Standard community-list number. |
| *<100-199>* | Expanded community-list number. |
| *<word>* | Name of the Community-list. |

**Mode** Route-map Configuration

**Usage** This command is valid for BGP update messages only.

**Example** To use entry `3` of the route map called `myroute` to delete the communities in community list `34` from matching update messages, use the commands:

```
awplus# configure terminal
awplus(config)# route-map myroute permit 3
awplus(config-route-map)# set comm-list 34 delete
```

**Related commands**

ip community-list

match community

route-map

set community

show route-map

# set community

**Overview** Use this command to add a community set clause to a route map entry.

When a BGP update message matches the route map entry, the device takes one of the following actions:

- changes the update's community attribute to the specified value or values, or
- adds the specified community value or values to the update's community attribute, if you specify the **additive** parameter after specifying another parameter. or
- removes the community attribute from the update, if you specify the **none** parameter

Use the **no** variant of this command to remove the set clause.

**Syntax**

```
set community {[<1-65535>][AA:NN] [internet] [local-AS]
[no-advertise] [no-export] [additive]}
```

```
no set community {[AA:NN] [internet] [local-AS] [no-advertise]
[no-export] [additive]}
```

```
set community none
```

```
no set community none
```

| Parameter | Description |
|---|---|
| *<1-65535>* | The AS number of the community as an integer not in AA:NN format. |
| *AA:NN* | The Autonomous System (AS) number of the community, in AA:NN format. AS numbers are assigned to the regional registries by the IANA (www.iana.org) and can be obtained from the registry in your region.<br>AA and NN are both integers from 1 to 65535.<br>AA is the AS number; NN is a value chosen by the ASN administrator. |
| `local-AS` | The community of routes that must not be advertised to external BGP peers (this includes peers in other members' Autonomous Systems inside a BGP confederation). |
| `internet` | The community of routes that can be advertised to all BGP peers. |
| `no-advertise` | The community of routes that must not be advertised to other BGP peers. |
| `no-export` | The community of routes that must not be advertised outside a BGP confederation boundary (a standalone Autonomous System that is not part of a confederation should be considered a confederation itself). |

| Parameter | Description |
|---|---|
| `none` | The device removes the community attribute from matching update messages. |
| `additive` | The device adds the specified community value to the update message's community attribute, instead of replacing the existing attribute. By default this parameter is not included, so the device replaces the existing attribute. |

**Mode** Route-map Configuration

**Usage notes** This command is valid for BGP update messages only.

**Examples** To use entry `3` of the route map called `rmap1` to put matching routes into the no-advertise community, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community no-advertise
```

To use entry `3` of the route map called `rmap1` to put matching routes into several communities, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 10:01 23:34 12:14
no-export
```

To use entry `3` of the route map called `rmap1` to put matching routes into a single AS community numbered `16384`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set community 16384 no-export
```

**Related commands**

route-map

set aggregator

set comm-list delete

set extcommunity

show route-map

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# set dampening

**Overview** Use this command to add a route flap dampening set clause to a route map entry.

Also use the route map by specifying it in the command bgp dampening route-map.

When a route matches the route map entry, the device enables route flap dampening for that route. If the set clause includes dampening parameter values, the device uses those values when dampening the matching route.

Use the **no** variant of this command to remove the set clause. This disables dampening on matching routes.

**Syntax**

```
set dampening
set dampening [<reachtime>]
set dampening <reachtime> [<reuse> <suppress> <maxsuppress>] [<unreachtime>]
no set dampening
no set dampening [<reachtime>]
no set dampening <reachtime> [<reuse> <suppress> <maxsuppress>] [<unreachtime>]
```

| Parameter | Description |
|---|---|
| *<reachtime>* | *<1-45>*<br>The time it takes, in minutes, for the route's instability penalty to halve if the route remains stable. The instability penalty is called the Figure of Merit (FoM). For example, if reachtime is 15, the FoM of a stable route halves over a 15 minute period, quarters over a 30 minute period, and so on.<br>The default is 15 minutes. |
| *<reuse>* | *<1-20000>*<br>The value that the instability penalty (FoM) must reach for the device to use a suppressed route again. Once a route is suppressed, it remains suppressed until its FoM falls below this threshold. Reuse must not exceed suppress. The default is 750. |
| *<suppress>* | *<1-20000>*<br>The instability penalty (FoM) at which the route is suppressed. Suppress must be greater than or equal to reuse.<br>If suppress is less than 1000, a route is suppressed when it becomes unreachable for the first time. The default is 2000. |

| Parameter | Description |
|---|---|
| *<maxsuppress>* | *<1-255>*<br>A number that is multiplied by reachtime to give the maximum time in minutes for which a suppressed route must remain stable in order to become unsuppressed. The lowest maxsuppress value of 1 gives a maximum suppression time of 1 x reachtime, and the highest maxsuppress value of 255 gives a maximum suppression time of 255 x reachtime.<br>For example, if reachtime is 15 and maxsuppress is 4, the route is unsuppressed after 60 minutes of stability even if its FoM still exceeds reuse. The default is 4. |
| *<unreachtime>* | *<1-45>*<br>The time it takes, in minutes, for the route's instability penalty to halve if the route remains unstable. The default is 15 minutes. |

**Mode** Route-map Configuration

**Usage** The **suppress** value must be greater than or equal to the **reuse** value.

Set the unreachability half-life time to be equal to, or greater than, reachability half-life time. The suppress-limit value must be greater than or equal to the reuse limit value.

This command is valid for BGP routes only.

**Example** To use entry 24 of the route map called `R1` to enable dampening of matching routes and set the dampening parameters, use the commands:

```
configure terminal
route-map R1 permit 24
set dampening 20 333 534 30
```

**Related commands**

# set extcommunity

**Overview** Use this command to add an extended community set clause to a route map entry. A route map entry can have a route target extended community set clause, a site-of-origin extended community set clause, or both.

When a BGP update message matches the route map entry, the device sets the update's extended community attribute to the specified value or values.

Use the **no** variant of this command to remove the set clause.

**Syntax**

```
set extcommunity {rt|soo} <extcomm-number>
no set extcommunity {rt|soo} [<extcomm-number>]
```

| Parameter | Description |
|---|---|
| `rt` | Configure a route target extended community. This consists of routers that will receive matching routes. |
| `soo` | Configure a site-of-origin extended community. This consists of routers that will inject matching routes into BGP. |
| *<extcomm-number>* | The extended community number, in the format AA:NN or IPADD:N. |

**Mode** Route-map Configuration

**Usage notes** This command is valid for BGP update messages only.

**Examples** To use entry `3` of the route map called `rmap1` to set the route target extended community attribute to 06:01, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity rt 06:01
```

To instead specify the extended community number in dotted decimal notation, use the command:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity rt 0.0.0.6:01
```

To use entry `3` of the route map called `rmap1` to set the site-of-origin extended community attribute to 06:01, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity soo 06:01
```

To instead specify the extended community number in dotted decimal notation, use the command:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set extcommunity soo 0.0.0.6:01
```

**Related commands**

match community

route-map

set comm-list delete

set community

show route-map

# set ip next-hop (route map)

**Overview** Use this command to add a next-hop set clause to a route map entry.

When a route or BGP update message matches the route map entry, the device sets the route's next hop to the specified IP address.

Use the **no** variant of this command to remove the set clause.

**Syntax**

```
set ip next-hop <ip-address>
no set ip next-hop [<ip-address>]
```

| Parameter | Description |
|---|---|
| *<ip-address>* | The IP address of the next hop, entered in the form A.B.C.D. |

**Mode** Route-map Configuration

**Usage notes** Use this command to set the next-hop IP address to the routes.

This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

**Example** To use entry 3 of the route map called `mymap` to give matching routes a next hop of 10.10.0.67, use the commands:

```
awplus# configure terminal
awplus(config)# route-map mymap permit 3
awplus(config-route-map)# set ip next-hop 10.10.0.67
```

**Related commands**

match ip next-hop

route-map

show route-map

# set ipv6 next-hop

**Overview** Use this command to set a next hop-address.

Use the **no** variant of this command to delete an entry.

**Syntax**

```
set ipv6 next-hop {<ipv6-addr-global>|local <ipv6-addr>}
no set ipv6 next-hop [<ipv6-addr-global>|local [<ipv6-addr>]]
```

| Parameter | Description |
|---|---|
| *<ipv6-addr-global>* | The IPv6 global address of next hop. The IPv6 address uses the format X:X::X:X. |
| `local` | Specifies that the address is local. |
| *<ipv6-addr>* | The IPv6 local address of next hop. The IPv6 address uses the format X:X::X:X. |

**Mode** Route-map Configuration

**Usage notes** Use this command to set the next-hop IPv6 address to the routes.

This command is valid only for BGP.

**Examples**

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set ipv6 next-hop local
fe80::203:47ff:fe97:66dc
awplus(config-route-map)# no set ipv6 next-hop
```

# set local-preference

**Overview** This command changes the default local preference value.

The local preference indicates the BGP local preference path attribute when there are multiple paths to the same destination. The path with the higher preference is chosen.

Use this command to define the preference of a particular path. The preference is sent to all routers and access servers in the local autonomous system.

The **no** variant of this command reverts to the default setting.

**Syntax**

```
set local-preference <pref-value>
no set local-preference [<pref-value>]
```

| Parameter | Description |
|---|---|
| *<pref-value>* | <0-4294967295> Configure local preference value. The default local preference value is 100. |

**Mode** Route-map Configuration

**Examples**

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set local-preference 2345555
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-route-map)# no set local-preference
```

**Related commands** For related Route Map commands:

route-map

show route-map

For related BGP commands:

bgp default local-preference (BGP only)

neighbor route-map

# set metric

**Overview** Use this command to add a metric set clause to a route map entry.

When a route or BGP update message matches the route map entry, the device takes one of the following actions:

- changes the metric (or for BGP, the MED attribute value) to the specified value, or
- adds or subtracts the specified value from the metric or MED attribute, if you specify + or - before the value (for example, to increase the metric by 2, enter +2)

Use the **no** variant of this command to remove the set clause.

**Syntax**

```
set metric {+<metric-value>|-<metric-value>|<metric-value>}
no set metric [+<metric-value>|-<metric-value>|<metric-value>]
```

| Parameter | Description |
|---|---|
| + | Increase the metric or MED attribute by the specified amount. |
| – | Decrease the metric or MED attribute by the specified amount. |
| *<metric-value>* | <0-4294967295><br>The new metric or MED attribute value, or the amount by which to increase or decrease the existing value. |

**Default** The default metric value for routes redistributed into OSPF and OSPFv3 is 20.

**Mode** Route-map Configuration

**Usage notes** For BGP, if you want the device to compare MED values in update messages from peers in different ASes, also enter the command bgp always-compare-med. You do not need to enter this command if you only want the device to compare MED values in update messages from peers in the same AS, because it always does.

This command is valid for:

- OSPF routes
- routes in BGP update messages
- RIP routes.

Note that defining the OSPF metric in a route map supersedes the metric defined using a redistribute (OSPF) or a redistribute (IPv6 OSPF) command. For more information, see the OSPFv3 Feature Overview and Configuration Guide and the OSPF Feature Overview and Configuration Guide.

**Examples**

To use entry 3 of the route map called "rmap1" to give matching routes a metric of 600, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric 600
```

To use entry 3 of the route map called "rmap1" to increase the metric of matching routes by 2, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric +2
```

**Related commands**

match metric

route-map

show route-map

# set metric-type

**Overview** Use this command to add a metric-type set clause to a route map entry.

When a route matches the route map entry, the device sets its route type to the specified value.

Use the **no** variant of this command to remove the set clause.

**Syntax**

```
set metric-type {type-1|type-2}
no set metric-type [type-1|type-2]
```

| Parameter | Description |
|---|---|
| type-1 | Redistribute matching routes into OSPF as type-1 external routes. |
| type-2 | Redistribute matching routes into OSPF as type-2 external routes. |

**Mode** Route-map Configuration

**Usage notes** This command is valid for OSPF routes only.

**Example** To use entry 3 of the route map called rmap1 to redistribute matching routes into OSPF as type-1 external routes, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set metric-type 1
```

**Related commands**

default-information originate

redistribute (OSPF)

match route-type

route-map

show route-map

# set origin

**Overview** Use this command to add an origin set clause to a route map entry.

When a BGP update message matches the route map entry, the device sets its origin attribute to the specified value.

Use the **no** variant of this command to remove the set clause.

**Syntax**

```
set origin {egp|igp|incomplete}
no set origin [egp|igp|incomplete]
```

| Parameter | Description |
|---|---|
| `egp` | Learned from an exterior gateway protocol. |
| `igp` | Learned from a local interior gateway protocol. |
| `incomplete` | Of unknown heritage, for example a static route. |

**Mode** Route-map Configuration

**Usage** This command is valid for BGP update messages only.

**Example** To use entry `3` of the route map called `rmap1` to give matching update messages an origin of `egp`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set origin egp
```

**Related commands**

match origin

route-map

show route-map

# set originator-id

**Overview** Use this command to add an originator ID set clause to a route map entry.

The originator ID is the router ID of the IBGP peer that first learned this route, either via an EBGP peer or by some other means such as importing it.

When a BGP update message matches the route map entry, the device sets its originator ID attribute to the specified value.

Use the **no** variant of this command to remove the set clause.

**Syntax**

```
set originator-id <ip-address>
no set originator-id [<ip-address>]
```

| Parameter | Description |
|---|---|
| *<ip-address>* | The IP address of the originator, entered in the form A.B.C.D. |

**Mode** Route-map Configuration

**Usage** This command is valid for BGP update messages only.

**Example** To use entry `3` of the route map called `rmap1` to give matching update messages an originator ID of `1.1.1.1`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set originator-id 1.1.1.1
```

**Related commands** route-map

show route-map

# set tag

**Overview** Use this command to add a tag set clause to a route map entry.

When a route matches the route map entry, the device sets its tag to the specified value when it redistributes the route into OSPF.

Use the **no** variant of this command to remove the set clause.

**Syntax**

```
set tag <tag-value>
no set tag [<tag-value>]
```

| Parameter | Description |
|---|---|
| *<tag-value>* | <0-4294967295><br>Value to tag matching routes with. |

**Mode** Route-map Configuration

**Usage notes** This command is valid only when redistributing routes into OSPF.

**Example** To use entry 3 of the route map called `rmap1` to tag matching routes with the number 6, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set tag 6
```

**Related commands**

default-information originate

redistribute (OSPF)

match tag

route-map

show route-map

# set weight

**Overview** Use this command to add a weight set clause to a route map entry.

The weight value assists in best path selection of BGP routes. It is stored with the route in the BGP routing table, but is not advertised to peers. When there are multiple routes with a common destination, the device uses the route with the highest weight value.

When a route matches the route map entry, the device sets its weight to the specified value.

Use the **no** variant of this command to remove the set clause.

**Syntax**

```
set weight <weight>
no set weight [<weight>]
```

| Parameter | Description |
|---|---|
| *<weight>* | *<0-4294967295>*<br>The weight value. |

**Mode** Route-map Configuration

**Usage** This command is valid for BGP routes only.

**Example** To use entry `3` of the route map called `rmap1` to give matching routes a weight of `60`, use the commands:

```
awplus# configure terminal
awplus(config)# route-map rmap1 permit 3
awplus(config-route-map)# set weight 60
```

**Related commands** route-map

show route-map

# show route-map

**Overview** Use this command to display information about one or all route maps.

**Syntax**

```
show route-map <map-name>
```

| Parameter | Description |
|---|---|
| *<map-name>* | A name to identify the route map. |

**Mode** User Exec and Privileged Exec

**Example** To display information about the route-map named `example-map`, use the command:

```
awplus# show route-map example-map
```

**Output** Figure 33-1: Example output from the **show route-map** command

```
route-map example-map, permit, sequence 1
  Match clauses:
    ip address prefix-list example-pref
  Set clauses:
    metric 100
route-map example-map, permit, sequence 200
  Match clauses:
  Set clauses:

# 34 Policy-based Routing Commands

## Introduction

**Overview**

This chapter provides an alphabetical reference of commands used to configure policy-based routing.

For more information, see the Policy-based Routing (PBR) Feature Overview and Configuration Guide.

**Command List**

- "application-decision" on page 1633
- "debug policy-based-routing" on page 1635
- "ip policy-route" on page 1636
- "ipv6 policy-route" on page 1638
- "policy-based-routing" on page 1640
- "policy-based-routing enable" on page 1641
- "show ip pbr route" on page 1642
- "show ipv6 pbr route" on page 1644
- "show pbr rules" on page 1646
- "show pbr rules brief" on page 1651

# application-decision

**Overview** Use this command to select which method is used for the application decision.

**Syntax**

```
application-decision {once-only|continuous}
```

| Parameter | Description |
|---|---|
| `once-only` | When a traffic flow reaches the PBR engine for the first time, whatever application has been set on that flow will be used to match against the PBR rules and a route selected. Subsequent updates to the flow's application will be ignored by the PBR engine. |
| `continuous` | Any time a traffic flow has its application updated by the DPI engine, the PBR engine will re-process the flow against all configured PBR rules, which may result in a new match and the traffic being directed over a different route than it was previously. |

**Default** Application determination is set to **continuous**.

**Mode** Policy-based Routing Configuration

**Usage notes** When using a DPI engine, traffic flows through the device are periodically assigned an application by the DPI engine. The application assignment is then used when matching against PBR rules. The DPI engine may change its decision about a traffic flow over time, as more packets from the flow are analyzed. This command determines how the PBR engine utilizes the application decision made by DPI.

When set to **once-only**, only the initial application decision made by the DPI engine will be used when matching against PBR routes, and subsequent updates will be ignored.

When set to **continuous**, if the DPI engine re-classifies a traffic flow under a different application, the flow will be re-processed by the PBR engine, and may therefore match against a different PBR rule and take a different route than it was previously.

Once-only is intended for use with DPI learning enabled. Refer to the SD-WAN Feature Overview and Configuration Guide for examples.

**Example** To prevent the PBR engine from re-matching a traffic flow whenever the application decision is changed, use the following commands:

```
awplus(config)# policy-based-routing
awplus(config-pbr)# application-decision once-only
```

To allow the PBR engine to re-match traffic flows against PBR rules when the application decision changes, use the following commands:

```
awplus(config)# policy-based-routing
awplus(config-pbr)# application-decision continuous
```

**Related commands**

ip policy-route

ipv6 policy-route

**Command changes**

Version 5.4.8-0.2: command added

# debug policy-based-routing

**Overview** Use this command to enable policy-based routing debugging. This will cause messages containing detailed debugging information to be displayed and logged at the "debugging" level.

Use the **no** variant of this command to disable policy-based routing debugging.

**Syntax**
```
debug policy-based-routing
no debug policy-based-routing
```

**Default** Policy-based routing debugging is disabled by default.

**Mode** Privileged Exec

**Examples** To enable policy-based routing debugging, use the command:

```
awplus# debug policy-based-routing
```

To disable policy-based routing debugging, use the command:

```
awplus# no debug policy-based-routing
```

**Related commands**
ip policy-route

ipv6 policy-route

policy-based-routing

show ip pbr route

show ipv6 pbr route

# ip policy-route

**Overview** Use this command to configure IP policy routes. These routes specify how the device will route traffic from specified applications and entities. You can specify the route's next-hop by specifying the egress interface, or by specifying the next-hop device's IP address (except on dynamic interfaces such as PPPoE). You can also list alternative next-hops to use if your first choice is down.

You can also specify the pseudo interface Null. Null should be the last nexthop specified, as this will drop packets when used as the nexthop.

Use the **no** variant of this command to remove a policy route.

**Syntax**

```
ip policy-route [<1-500>] [match <application-name>] [from
<source-entity>] [to <destination-entity>] nexthop
{<interface-list>|<ip-add-list>}
```

```
no ip policy-route <1-500>
```

| Parameter | Description |
|---|---|
| *<1-500>* | The policy route ID number.<br>If you do not specify an ID number, the device assigns the new policy route the next available number, in multiples of 10. For example, if the highest numbered policy route is 81, the next policy route would be given an ID of 90.<br>Policy routes are checked in order of ID number, starting with the lowest ID number. The device applies the policy route as soon as it finds a matching route; it does not check the remaining policy routes. |
| *<application-name>* | An application name. |
| *<source-entity>* | A source entity name. |
| *<destination-entity>* | A destination entity name. |
| *<interface-list>* | The name of the egress interface or interfaces. You can list up to 8 interfaces per policy route; the device sends the traffic out the first interface in the list that is up. |
| *<ip-add-list>* | The IP address of the next-hop. You can list up to 8 next-hop addresses per policy route; the device sends the traffic to the first address in the list that is reachable. Do not use this when the next-hop is on a dynamic interface (e.g. PPPoE); specify the interface name instead. |

**Default** No policy routes

**Mode** Policy-based Routing Configuration

**Usage notes**

You must specify at least one of the **match**, **from** or **to** parameters. Packets will be routed to the specified next-hop if they match the application, come from the source entity, and are destined for the destination entity.

Before creating a policy route, you need to create the application and entities that specify the traffic you want to route. To create an application, use the application command. To create entities, use the zone, network (zone), and host (network) commands. To see existing applications and entities, use the show application and show entity commands.

**Examples**

To create a policy route to route traffic that matches an application called "voice", comes from the entity called "inside", and is destined for the entity called "outside", use the following commands:

```
awplus# configure terminal
awplus(config)# policy-based-routing
awplus(config-pbr)# policy-based-routing enable
awplus(config-pbr)# ip policy-route 10 match voice from inside
to outside nexthop 10.37.236.65
```

To delete the policy route created above, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-based-routing
awplus(config-pbr)# no ip policy-route 10
```

To route the above traffic via ppp0 if ppp0 is up, or ppp1 if ppp0 is down, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-based-routing
awplus(config-pbr)# policy-based-routing enable
awplus(config-pbr)# ip policy-route 20 match voice from inside
to outside nexthop ppp0 ppp1
```

To delete the policy route created above, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-based-routing
awplus(config-pbr)# no ip policy-route 20
```

**Related commands**

policy-based-routing

policy-based-routing enable

show application

show entity

show ip pbr route

**Command changes**

Version 5.4.8-0.2: number of routes increased, null interface added

# ipv6 policy-route

**Overview** Use this command to configure IPv6 policy routes. These routes specify how the device will route traffic from specified applications and entities. You can specify the route's next-hop by specifying the egress interface, or by specifying the next-hop device's IPv6 address (except on dynamic interfaces such as PPPoE). You can also list alternative next-hops to use if your first choice is down.

You can also specify the pseudo interface Null. Null should be the last nexthop specified, as this will drop packets when used as the nexthop.

Use the **no** variant of this command to remove a policy route.

**Syntax**

```
ipv6 policy-route [<1-500>] [match <application-name>] [from
<source-entity>] [to <destination-entity>] nexthop
{<interface-list>|<ipv6-add-list>}
```

```
no ipv6 policy-route <1-500>
```

| Parameter | Description |
|---|---|
| *<1-500>* | The policy route ID number.<br>If you do not specify an ID number, the device assigns the new policy route the next available number, in multiples of 10. For example, if the highest numbered policy route is 81, the next policy route would be given an ID of 90.<br>Policy routes are checked in order of ID number, starting with the lowest ID number. The device applies the policy route as soon as it finds a matching route; it does not check the remaining policy routes. |
| *<application-name>* | An application name. |
| *<source-entity>* | A source entity name. |
| *<destination-entity>* | A destination entity name. |
| *<interface-list>* | The name of the egress interface or interfaces. You can list up to 8 interfaces per policy route; the device sends the traffic out the first interface in the list that is up. |
| *<ipv6-add-list>* | The IPv6 address of the next-hop, specified in the form X:X::X:X. You can list up to 8 next-hop addresses per policy route; the device sends the traffic to the first address in the list that is reachable.<br>Do not use this when the next-hop is on a dynamic interface (e.g. PPPoE); specify the interface name instead. |

**Default** No policy routes

**Mode** Policy-based Routing Configuration

**Usage notes**

You must specify at least one of the **match**, **from** or **to** parameters. Packets will be routed to the specified next-hop if they match the application, come from the source entity, and are destined for the destination entity.

Before creating a policy route, you need to create the application and entities that specify the traffic you want to route. To create an application, use the application command. To create entities, use the zone, network (zone), and host (network) commands. To see existing applications and entities, use the show application and show entity commands.

**Examples**

To create a policy route to route traffic that matches an application called "voice", comes from the entity called "inside", and is destined for the entity called "outside", use the following commands:

```
awplus# configure terminal
awplus(config)# policy-based-routing
awplus(config-pbr)# policy-based-routing enable
awplus(config-pbr)# ipv6 policy-route 10 match voice from
inside to outside nexthop 2001:100::1
```

To delete the policy route created above, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-based-routing
awplus(config-pbr)# no ipv6 policy-route 10
```

To route the above traffic via ppp0 if ppp0 is up, or ppp1 if ppp0 is down, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-based-routing
awplus(config-pbr)# policy-based-routing enable
awplus(config-pbr)# ipv6 policy-route 20 match voice from
inside to outside nexthop ppp0 ppp1
```

To delete the policy route created above, use the following commands:

```
awplus# configure terminal
awplus(config)# policy-based-routing
awplus(config-pbr)# no ipv6 policy-route 20
```

**Related commands**

policy-based-routing

policy-based-routing enable

show application

show entity

show ipv6 pbr route

**Command changes**

Version 5.4.8-0.2: number of routes increased, null interface added

# policy-based-routing

**Overview** Use this command to enter Policy-based-routing mode. Policy-based routing lets you determine how the device will route traffic from specified applications and entities.

Use the **no** variant of this command to remove the whole policy-based routing configuration.

**Syntax**

```
policy-based-routing
no policy-based-routing
```

**Mode** Global configuration

**Usage** Once you have entered policy-based-routing mode, use the policy-based-routing enable command to turn on policy-based routing, and the ip policy-route or ipv6 policy-route commands to create policy routes.

**Example** To enter policy-based-routing mode, use the commands:

```
awplus# configure terminal
awplus(config)# policy-based-routing
awplus(config-pbr)#
```

**Related commands**

ip policy-route

ipv6 policy-route

policy-based-routing enable

# policy-based-routing enable

**Overview** Use this command to enable policy-based routing (PBR). Policy-based routing lets you determine how the device will route traffic from specified applications and entities.

Use the **no** variant of this command to disable policy-based routing.

**Syntax**

```
policy-based-routing enable
no policy-based-routing enable
```

**Default** Policy-based routing is disabled by default

**Mode** Policy-based Routing Configuration

**Examples** To enable policy-based routing use the following commands.

```
awplus# configure terminal
awplus(config)# policy-based-routing
awplus(config-pbr)# policy-based-routing enable
```

To disable policy-based routing use the following commands.

```
awplus# configure terminal
awplus(config)# policy-based-routing
awplus(config-pbr)# no policy-based-routing enable
```

**Related commands** ip policy-route

ipv6 policy-route

# show ip pbr route

**Overview** Use this command to display the installed IPv4 routes for policy-based routing.

**Syntax**

```
show ip pbr route [<1-500>]
```

| Parameter | Description |
|---|---|
| *<1-500>* | The policy route ID. If you specify a policy route ID, the output only lists routes for that ID. If you do not specify an ID, the output also lists the conventional static and dynamic routes, in the table called "main". |

**Mode** User Exec and Privileged Exec

**Usage notes** If you do not specify a policy routeID, the output starts by listing the ordinary static and dynamic routes, in a table called "main".

**Example** To show all the IPv4 routes, use the following command:

```
awplus# show ip pbr route
```

**Output** Figure 34-1: Example output from **show ip pbr route**

```
awplus#show ip pbr route
Route table: main
    10.33.11.0/24 via 10.37.236.65, eth1
    10.37.236.64/27 is directly connected, eth1
    172.31.0.0/17 is directly connected, vlan4092
    192.168.1.0/24 is directly connected, vlan2

Route table: policy-route 10

Route table: policy-route 20
    default via 10.37.236.65, ppp0
```

If you do not specify a policy routeID, the output starts by listing the ordinary static and dynamic routes, in the route table called "main".

Then it lists the routes for each policy route.

For each route, the output lists the route's next-hop IP address and/or the next-hop interface.

**Example** To show only the routes for policy route 20, use the following command:

```
awplus# show ip pbr route 20
```

**Output** Figure 34-2: Example output from **show ip pbr route** for a specified policy route

```
awplus#show ip pbr route 20

Route table: policy-route 20
    default via 10.37.236.65, ppp0
```

For each route, the output lists the route's next-hop IP address and/or the next-hop interface.

**Related commands** ip policy-route

policy-based-routing

**Command changes** Version 5.4.8-0.2: Policy route ID increased from 128 to 500

# show ipv6 pbr route

**Overview** Use this command to display the installed IPv6 routes for policy-based routing.

**Syntax**

```
show ipv6 pbr route [<1-128>]
```

| Parameter | Description |
|---|---|
| *<1-128>* | The policy route ID. If you specify a policy route ID, the output only lists routes for that ID. If you do not specify an ID, the output also lists the ordinary static and dynamic routes, in the table called "main". |

**Mode** User Exec and Privileged Exec

**Usage** If you do not specify a policy routeID, the output starts by listing the ordinary static and dynamic routes, in a table called "main".

**Example** To show all the IPv6 routes, use the following command:

```
awplus# show ipv6 pbr route
```

**Output** Figure 34-3: Example output from **show ipv6 pbr route**

```
awplus#show ipv6 pbr route
Route table: main
    2001:100::/64 dev eth1
    fe80::/64 dev eth1

Route table: policy-route 10

Route table: policy-route 20
    default via 2001:100::2, eth1
```

If you do not specify a policy routeID, the output starts by listing the ordinary static and dynamic routes, in the route table called "main".

Then it lists the routes for each policy route.

For each route, the output lists the route's next-hop IPv6 address and/or the next-hop interface.

**Example** To show only the routes for policy-route 20, use the following command:

```
awplus# show ip pbr route 20
```

**Output** Figure 34-4: Example output from **show ipv6 pbr route** for a specified policy route

```
awplus#show ipv6 pbr route 20

Route table: policy-route 20
    default via 2001:100::2, eth1
```

For each route, the output lists the route's next-hop IPv6 address and/or the next-hop interface.

**Related commands** ipv6 policy-route

policy-based-routing

# show pbr rules

**Overview** Use this command to display the configured IPv4 and IPv6 policy routes. It also shows the validity of the policy routes.

**Syntax**

```
show pbr rules
show pbr rules <rule-id>
show pbr rules profile <profile-name>
show pbr rules group <group-name>
```

| Parameter | Description |
|---|---|
| *<rule-id>* | The policy route ID. If you specify a policy route ID, the output only lists configuration and status for this specified rule. |
| *<profile-name>* | The Link Health Monitoring profile name. If you specify an existing Link Health Monitoring performance profile name, the output only lists profile configuration for this specified profile. |
| *<group-name>* | The Link Health Monitoring group name. If you specify an existing Link Health Monitoring group name, the output only lists group configuration for this specified profile. |

**Mode** User Exec and Privileged Exec

**Example** To show information about the policy routes, use the following command:

```
awplus# show pbr rules
```

To show information about the policy route rule with the rule ID of '1', use the following command:

```
awplus# show pbr rules 1
```

To show information about the Link Health Monitoring profile with the profile name of 'profile1', use the following command:

```
awplus# show pbr rules profile profile1
```

To show information about the Link Health Monitoring group with the profile name of 'group1', use the following command:

```
awplus# show pbr rules group group1
```

**Output** Figure 34-5: Example output from **show pbr rules**

```
awplus#show pbr rules

Table 34-1: Parameters in the output from **show pbr rules**

| Parameter | Description |
|---|---|
| `Total number of configured PBR-rules` | The number of PBR rules currently configured. This includes both conventional PBR policy-routes and Link Health Monitoring IP policy-routes, regardless of whether the rules are valid or not. |
| `PBR-Rule` | The PBR rule ID which the following statistics and configuration are associated with. |
| `Active` | Whether the rule is active or not. |
| `Match` | The name of an application. Packets will be routed to the specified next hop if they match this application, come from the source entity, and are destined for the destination entity. |
| `From` | The name of the source entity. Packets will be routed to the specified next hop if they match the application, come from this source entity, and are destined for the destination entity. |
| `To` | The name of the destination entity. Packets will be routed to the specified next hop if they match the application, come from the source entity, and are destined for this destination entity. |
| `Profile` | The name of the Link Health Monitoring profile associated with this Link Health Monitoring PBR policy-route. |
| `bad above, good below` | The configured threshold for this specific rule. There are fields for latency, jitter, and packet loss. If this field has a value of "-", then the threshold has not been configured. |
| `Group` | The name of the Link Health Monitoring group associated with this Link Health Monitoring PBR policy-route. |

Table 34-1: Parameters in the output from **show pbr rules** (cont.)

| Parameter | Description |
|---|---|
| `Member` | The ID of the Link Health Monitoring member associated with this Link Health Monitoring group. |
| `Nexthop` | The IPv4 or IPv6 address of the next-hop or the egress interface. There can be up to 8 next-hops per policy route. |
| `probe` | The Link Health Monitoring probe associated with the Link Health Monitoring group member. |
| `latency` | The latency of the probe associated with the Link Health Monitoring member. |
| `jitter` | The jitter of the probe associated with the Link Health Monitoring member. |
| `packet loss` | The packet loss of the probe associated with the Link Health Monitoring member. |
| `Current Nexthop` | The chosen nexthop for traffic matching the Link Health Monitoring PBR policy-route. |
| `Previous Nexthop` | The previously chosen nexthop prior to failover. If a failover hasn't occurred on this setup, there is no previous nexthop. This is indicated by "-". |
| `Change Time` | The time at which the current nexthop was chosen. This will change if a failover occurs, or at boot. |
| `Causes` | The event that caused the last failover. |
| `Decision` | The reason why the current nexthop was chosen. |
| `Change Count` | The number of times the chosen nexthop has changed. This counter will increment any time a link failover occurs. |

# 35 VRF-lite Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Virtual Routing and Forwarding Lite (VRF-lite). See the VRF Lite Feature Overview and Configuration Guide for more information and examples.

**Command List**

- "address-family" on page 1656
- "address-family ipv4 (RIP)" on page 1658
- "arp" on page 1659
- "arp opportunistic-nd" on page 1661
- "clear arp-cache" on page 1663
- "clear ip bgp * (BGP only)" on page 1665
- "clear ip bgp (IPv4) (BGP only)" on page 1667
- "clear ip rip route" on page 1669
- "crypto key pubkey-chain knownhosts" on page 1671
- "default-metric (RIP)" on page 1673
- "description (VRF)" on page 1674
- "distance (RIP)" on page 1675
- "distribute-list (RIP)" on page 1676
- "export map" on page 1677
- "fullupdate (RIP)" on page 1678
- "import map" on page 1679
- "ip route static inter-vrf" on page 1680
- "ip route vrf" on page 1681
- "ip vrf" on page 1684

- "ip vrf forwarding" on page 1685
- "max-fib-routes (VRF)" on page 1686
- "max-static-routes (VRF)" on page 1688
- "neighbor next-hop-self" on page 1689
- "neighbor remote-as" on page 1692
- "neighbor password" on page 1695
- "network (RIP)" on page 1699
- "passive-interface (RIP)" on page 1701
- "ping" on page 1702
- "rd (route distinguisher)" on page 1704
- "redistribute (into BGP or BGP4+)" on page 1705
- "redistribute (OSPF)" on page 1707
- "redistribute (RIP)" on page 1709
- "route (RIP)" on page 1711
- "route-target" on page 1712
- "router ospf" on page 1714
- "router-id (VRF)" on page 1716
- "show arp" on page 1717
- "show crypto key pubkey-chain knownhosts" on page 1719
- "show ip bgp cidr-only (BGP only)" on page 1721
- "show ip bgp community (BGP only)" on page 1722
- "show ip bgp community-list (BGP only)" on page 1724
- "show ip bgp dampening (BGP only)" on page 1725
- "show ip bgp filter-list (BGP only)" on page 1727
- "show ip bgp inconsistent-as (BGP only)" on page 1728
- "show ip bgp longer-prefixes (BGP only)" on page 1729
- "show ip bgp prefix-list (BGP only)" on page 1730
- "show ip bgp quote-regexp (BGP only)" on page 1731
- "show ip bgp regexp (BGP only)" on page 1733
- "show ip bgp route-map (BGP only)" on page 1735
- "show ip bgp summary (BGP only)" on page 1736
- "show ip interface vrf" on page 1738
- "show ip rip vrf database" on page 1740
- "show ip rip vrf interface" on page 1741
- "show ip route" on page 1742

- "show ip route database" on page 1745
- "show ip route summary" on page 1748
- "show ip vrf" on page 1750
- "show ip vrf detail" on page 1751
- "show ip vrf interface" on page 1752
- "show running-config vrf" on page 1753
- "ssh" on page 1754
- "tcpdump" on page 1756
- "telnet" on page 1757
- "timers (RIP)" on page 1758
- "traceroute" on page 1760
- "version (RIP)" on page 1761
- "vrf" on page 1763

# address-family

**Overview** This command enters the IPv4 or IPv6 Address-Family Configuration command mode. In this mode you can configure address-family specific parameters.

When using VRF-lite, you can enter IPv4 Address Family Configuration mode for a specified VRF instance before configuring that instance.

**Syntax [BGP]**

```
address-family ipv4 [unicast]
no address-family ipv4 [unicast]
```

**Syntax (VRF-lite)**

```
address-family ipv4 [unicast|vrf <vrf-name>]
no address-family ipv4 [unicast|vrf <vrf-name>]
```

**Syntax [BGP4+]**

```
address-family ipv6 [unicast]
no address-family ipv6 [unicast]
```

| Parameter | Description |
|---|---|
| `ipv4` | Configure parameters relating to the exchange of IPv4 prefixes. |
| `ipv6` | Configure parameters relating to the exchange of IPv6 prefixes. |
| `unicast` | Configure parameters relating to the exchange of routes to unicast destinations. |
| `vrf` | Applies the command to the specified VRF instance. |
| *`<vrf-name>`* | The name of the VRF instance to enter IPv4 Address-Family mode for. |

**Mode [BGP]** Router Configuration

**Mode [BGP4+]** Router Configuration

**Usage notes** To leave the IPv4 or IPv6 Address Family Configuration mode, and return to the Router Configuration mode, use the exit-address-family command.

**Example [BGP]**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# neighbor 192.168.0.1 remote-as 100
awplus(config-router)# address-family ipv4 vrf
green
awplus(config-router-af)# neighbor 192.168.0.1 activate
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

**Example [BGP4+]**

```
awplus# configure terminal
awplus(config)# router bgp 100
awplus(config-router)# neighbor 2001:0db8:010d::1 remote-as 100
awplus(config-router)# address-family ipv6
awplus(config-router-af)# neighbor 2001:0db8:010d::1 activate
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

**Related commands**

exit-address-family

**Command changes**

Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# address-family ipv4 (RIP)

**Overview** This command enters the IPv4 address-family command mode. In this mode you can configure address-family specific parameters for a specific VRF (RIP) instance.

**Syntax**

```
address-family ipv4 vrf <vrf-name>
no address-family ipv4 vrf <vrf-name>
```

| Parameter | Description |
|---|---|
| `ipv4` | Configure parameters relating to the RIP exchange of IPv4 prefixes. |
| `vrf` | Apply this command to a VRF instance. |
| `<vrf-name>` | The name of the VRF instance. |

**Mode** Router Configuration

**Usage** To leave Address Family mode and return to Router Configuration mode, use the exit-address-family command.

**Example** In this example the address family "green" is entered, and then exited by using the exit-address-family command.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf green
awplus(config-router-af)# exit-address-family
awplus(config-router)#
```

**Related commands** exit-address-family

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# arp

**Overview** This command adds a static ARP entry to the ARP cache. This is typically used to add entries for hosts that do not support ARP or to speed up the address resolution function for a host. The ARP entry must not already exist. Use the **alias** parameter to allow your device to respond to ARP requests for this IP address.

If VRF-lite is configured, you can add ARP entries to either the global cache or for a specific VRF instance.

The **no** variant of this command removes the static ARP entry. Use the clear arp-cache command to remove the dynamic ARP entries in the ARP cache.

**Syntax**
```
arp <ip-addr> <mac-address> [alias]
no arp <ip-addr>
```

**Syntax (VRF-lite)**
```
arp [vrf <vrf-name>] <ip-addr> <mac-address> [<port-number>]
[alias]
no arp [vrf <vrf-name>] <ip-addr>
```

| Parameter | Description |
|---|---|
| *<ip-addr>* | The IPv4 address of the device you are adding as a static ARP entry. |
| *<mac-address>* | The MAC address of the device you are adding as a static ARP entry, in hexadecimal notation with the format HHHH.HHHH.HHHH. |
| alias | Allows your device to respond to ARP requests for the IP address. Proxy ARP must be enabled on the interface before using this parameter. |
| vrf | Apply this command to a VRF instance. |
| *<vrf-name>* | The name of the VRF instance. |

**Mode** Global Configuration

**Examples** To add the IP address 10.10.10.9 with the MAC address 0010.2533.4566 into the ARP cache, and have your device respond to ARP requests for this address, use the commands:

```
awplus# configure terminal
awplus(config)# arp 10.10.10.9 0010.2533.4566 alias
```

**Example (VRF-lite)** To apply the above example within a VRF instance called `red` use the following commands:

```
awplus# configure terminal
awplus(config)# arp vrf red 10.10.10.9 0010.2533.4566 alias
```

**Related commands**

clear arp-cache

ip proxy-arp

show arp

**Command changes**

Version 5.4.6-2.1: VRF-lite support added.

# arp opportunistic-nd

**Overview** Use this command to enable opportunistic neighbor discovery for the global ARP cache. This command changes the behavior for unsolicited ARP packet forwarding on the device.

***CAUTION:*** *Opportunistic neighbor discovery can make your device more vulnerable to ARP/ND cache poisoning attacks. We recommend disabling it unless necessary.*

When using VRF-lite, you can use this command to enable opportunistic neighbor discovery for a named VRF instance.

Use the **no** variant of this command to disable opportunistic neighbor discovery for the global ARP cache.

**Syntax**

```
arp opportunistic-nd
no arp opportunistic-nd
```

**Syntax (VRF-lite)**

```
arp opportunistic-nd [vrf <vrf-name>]
no arp opportunistic-nd [vrf <vrf-name>]
```

| Parameter | Description |
|---|---|
| `vrf` | Apply this command to a VRF instance. |
| *<vrf-name>* | The name of the VRF instance. |

**Default** Opportunistic neighbor discovery is disabled by default.

**Mode** Global Configuration

**Usage notes** When opportunistic neighbor discovery is enabled, the device will reply to any received unsolicited ARP packets (but not gratuitous ARP packets). The source MAC address for the unsolicited ARP packet is added to the ARP cache, so the device forwards the ARP packet. When opportunistic neighbor discovery is disabled, the source MAC address for the ARP packet is not added to the ARP cache, so the ARP packet is not forwarded by the device.

Note this command enables or disables opportunistic neighbor discovery for a VRF instance if the **vrf** parameter and an instance name are applied. If a VRF instance is not specified, then opportunistic neighbor discovery is enabled or disabled for device ports configured for IPv4.

**Examples** To enable opportunistic neighbor discovery for the global ARP cache, enter:

```
awplus# configure terminal
awplus(config)# arp opportunistic-nd
```

To disable opportunistic neighbor discovery for the global ARP cache, enter:

```
awplus# configure terminal
awplus(config)# no arp opportunistic-nd
```

**Example (VRF-lite)**

To enable opportunistic neighbor discovery for the VRF instance 'blue', enter:

```
awplus# configure terminal
awplus(config)# arp opportunistic-nd vrf blue
```

To disable opportunistic neighbor discovery for the VRF instance 'blue', enter:

```
awplus# configure terminal
awplus(config)# no arp opportunistic-nd vrf blue
```

**Related commands**

ipv6 opportunistic-nd

show arp

show running-config interface

**Command changes**

Version 5.4.6-2.1: VRF-lite support added.

# clear arp-cache

**Overview** This command deletes dynamic ARP entries from the ARP cache. You can optionally specify the IPv4 address of an ARP entry to be cleared from the ARP cache.

When running VRF-lite, this command deletes dynamic ARP entries either from the ARP cache of a specific VRF instance, or from the ARP cache of the Global VRF instance. To delete all ARP entries from both the Global VRF instance and all VRF instances, use the command with no parameters. You can optionally specify the IPv4 address for the VRF instance to clear an ARP entry from the ARP cache.

**Syntax**
```
clear arp-cache [<ip-address>]
```

**Syntax (VRF-lite)**
```
clear arp-cache [vrf <vrf-name>|global] [<ip-address>]
```

| Parameter | Description |
|---|---|
| *<ip-address>* | Specifies a specific IPv4 address for a VRF instance whose entries are to be cleared from the ARP cache. |
| `global` | When VRF-lite is configured, apply this command to the global routing and forwarding table. |
| `vrf` | Apply this command to the specified VRF instance. |
| *<vrf-name>* | The VRF instance name |

**Mode** Privileged Exec

**Usage notes** To display the entries in the ARP cache, use the show arp command. To remove static ARP entries, use the no variant of the arp command.

**Example** To clear all dynamic ARP entries, use the command:

```
awplus# clear arp-cache
```

To clear all dynamic ARP entries associated with the IPv4 address 192.168.1.1, use the command:

```
awplus# clear arp-cache 192.168.1.1
```

**Example (VRF-lite)** To clear the dynamic ARP entries from the VRF instance named blue, use the commands:

```
awplus# clear arp-cache vrf blue
```

To clear the dynamic ARP entries from the VRF instance named blue with the IPv4 address 192.168.1.1, use the commands:

```
awplus# clear arp-cache vrf blue 192.168.1.1
```

When running VRF-lite, to clear the dynamic ARP entries from the global VRF-lite and all VRF instances, use the command:

```
awplus# clear arp-cache
```

**Related commands**

arp

show arp

# clear ip bgp * (BGP only)

**Overview** Use this command to reset all BGP connections, either by fully resetting sessions or by performing soft resets.

If VRF-lite is configured, you can reset BGP connections for all VRF instances or for a specified VRF instance.

**Syntax**

```
clear ip bgp *
clear ip bgp * in
clear ip bgp * out
clear ip bgp * soft [in|out]
clear ip bgp * in [prefix-filter]
```

**Syntax (VRF-lite)**

```
clear ip bgp * [vrf <vrf-name>]
clear ip bgp * [vrf <vrf-name>] in
clear ip bgp * [vrf <vrf-name>] out
clear ip bgp * [vrf <vrf-name>] soft [in|out]
clear ip bgp * in [prefix-filter]
```

| Parameter | Description |
|---|---|
| `*` | Clears all BGP peers. |
| `in` | Indicates that incoming advertised routes will be cleared. |
| `prefix-filter` | Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration. |
| `out` | Indicates that outgoing advertised routes will be cleared. |
| `soft in` | Soft inbound reset causes the neighbors to resend all their updates to the local device, without resetting the connection or clearing the entries in the local device. So, the local device stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory. |
| `soft out` | Soft outbound reset causes the device to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries. |
| `vrf` | Applies the command to the specified VRF instance. |
| *`<vrf-name>`* | The name of the VRF instance. |

**Mode** Privileged Exec

**Examples** To clear all BGP peers, use the command:

```
awplus# clear ip bgp *
```

**Example (VRF-lite)** To clear all BGP peers in VRF instance red, use the command:

```
awplus# clear ip bgp * vrf red
```

To clear all outbound BGP peers in VRF instance red, use the command:

```
awplus# clear ip bgp * out vrf red
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear ip bgp (IPv4) (BGP only)

**Overview** Use this command to reset the IPv4 BGP connection to the peer specified by the IP address. When VRF-lite is configured, you can apply this command to a specific VRF instance.

**Syntax [BGP]**

```
clear ip bgp <ipv4-addr> [in [prefix-filter]|out|soft [in|out]]
```

**Syntax (VRF-lite)**

```
clear ip bgp <ipv4-address> [vrf <vrf-name>] [in|out|soft
[in|out]]
```

| Parameter | Description |
|---|---|
| *<ipv4-addr>* | Specifies the IPv4 address of the neighbor whose connection is to be reset, entered in the form A.B.C.D. |
| `in` | Indicates that incoming advertised routes will be cleared. |
| `prefix-filter` | Specifies that a prefix-list will be sent, by the ORF mechanism, to those neighbors with which the ORF capability has been negotiated. The neighbors will be triggered to resend updates, which match the prefix-list filter, to the local router. The local router will then perform a soft reconfiguration. |
| `out` | Indicates that outgoing advertised routes will be cleared. |
| `soft in` | Soft inbound reset causes the neighbors to resend all their updates to the local switch, without resetting the connection or clearing the entries in the local switch. So, the local switch stores new updates, and uses them to systematically replace existing table entries. This process can use a considerable amount of memory. |
| `soft out` | Soft outbound reset causes the switch to simply resend all its updates to the specified neighbor(s), without resetting the connection, or clearing table entries. |
| `vrf` | Applies the command to the specified VRF instance. |
| *<vrf-name>* | The name of the VRF instance. |

**Mode [BGP]** Privileged Exec

**Examples [BGP]** To clear the BGP connection to the peer at IPv4 address 192.168.1.1 and clear all incoming routes, use the following command:

```
awplus# clear ip bgp 192.168.1.1 in
```

To apply the above example to clear the BGP connection to the peer at IP address 192.0.2.11 for the VRF instance blue, use the following commands:

```
awplus# clear ip bgp 192.0.2.11 vrf blue in
```

**Command changes** Added to AlliedWare Plus prior to 5.4.6-1

Version 5.4.6-2.1: VRF-lite support added to BGP for AR-series products

Version 5.4.7-2.1: BGP support added for IEx510, x550 series

Version 5.4.7-2.4: BGP support added for IE300 series

# clear ip rip route

**Overview** Use this command to clear specific data from the RIP routing table.

**Syntax**

```
clear ip rip route <ip-dest-network/prefix-length>
clear ip rip route
{static|connected|rip|ospf|bgp|invalid-routes|all}
```

**Syntax (VRF-lite)**

```
clear ip rip [vrf <vrf-name>] route
<ip-dest-network/prefix-length>
clear ip rip [vrf <vrf-name>] route
{static|connected|rip|ospf|bgp|invalid-routes|all}
```

| Parameter | Description |
|---|---|
| `vrf` | Apply this command to a VRF instance. |
| *`<vrf-name>`* | The name of the VRF instance. |
| *`<ip-dest-network/prefix-length>`* | Removes entries which exactly match this destination address from RIP routing table. Enter the IP address and prefix length of the destination network. |
| `static` | Removes static entries from the RIP routing table. |
| `connected` | Removes entries for connected routes from the RIP routing table. |
| `rip` | Removes only RIP routes from the RIP routing table. |
| `ospf` | Removes only OSPF routes from the RIP routing table. |
| `bgp` | Removes only BGP routes from the RIP routing table. |
| `invalid-routes` | Removes routes with metric 16 immediately. Otherwise, these routes are not removed until RIP times out the route after 2 minutes. |
| `all` | Clears the entire RIP routing table. |

**Mode** Privileged Exec

**Usage notes** Using this command with the **all** parameter clears the RIP table of all the routes.

**Examples** To clear the route 10.0.0.0/8 from the RIP routing table, use the following command:

```
awplus# clear ip rip route 10.0.0.0/8
```

**Examples (VRF-lite)** To clear RIP routes associated with the VRF instance 'red' for OSPF routes, use the following command:

```
awplus# clear ip rip vrf red route ospf
```

To clear the route 10.0.0.0/8 from the RIP routing table for the VRF instance 'red', use the following command:

```
awplus# clear ip rip vrf red route 10.0.0.0/8
```

**Command changes**

Version 5.4.6-2.1: VRF-lite support added.

# crypto key pubkey-chain knownhosts

**Overview** This command adds a public key of the specified SSH server to the known host database on your device. The SSH client on your device uses this public key to verify the remote SSH server.

The key is retrieved from the server. Before adding a key to this database, check that the key sent to you is correct.

If the server's key changes, or if your SSH client does not have the public key of the remote SSH server, then your SSH client will inform you that the public key of the server is unknown or altered.

The **no** variant of this command deletes the public key of the specified SSH server from the known host database on your device.

**Syntax**

```
crypto key pubkey-chain knownhosts [ip|ipv6] <hostname>
[ecdsa|rsa]
no crypto key pubkey-chain knownhosts <1-65535>
```

**Syntax (VRF-lite)**

```
crypto key pubkey-chain knownhosts [vrf <vrf-name>]
[ip|ipv6] <hostname> [ecdsa|rsa]
no crypto key pubkey-chain knownhosts [vrf <vrf-name>]
<1-65535>
```

| Parameter | Description |
|---|---|
| `vrf` | Apply this command to the specified VRF instance. |
| *<vrf-name>* | The VRF instance name |
| `ip` | Keyword used prior to specifying an IPv4 address |
| `ipv6` | Keyword used prior to specifying an IPv6 address |
| *<hostname>* | IPv4/IPv6 address or hostname of a remote server in the format `a.b.c.d` for an IPv4 address, or in the format `x:x::x:x` for an IPv6 address. |
| `ecdsa` | Specify the ECDSA public key of the server to be added to the known host database. |
| `rsa` | Specify the RSA public key of the server to be added to the known host database. |
| *<1-65535>* | Specify a key identifier when removing a key using the **no** parameter. |

**Default** If no cryptography algorithm is specified, then **rsa** is used as the default cryptography algorithm.

**Mode** Privilege Exec

**Usage notes**

This command adds a public key of the specified SSH server to the known host database on the device. The key is retrieved from the server. The remote SSH server is verified by using this public key. The user is requested to check the key is correct before adding it to the database.

If the remote server's host key is changed, or if the device does not have the public key of the remote server, then SSH clients will inform the user that the public key of the server is altered or unknown.

**Examples**

To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts 192.0.2.11
```

To delete the second entry in the known host database, use the command:

```
awplus# no crypto key pubkey-chain knownhosts 2
```

**Examples (VRF-lite)**

To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 in VRF 'red' to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts vrf red 192.0.2.11
```

To delete the second entry in the known host database in VRF 'red', use the command:

```
awplus# no crypto key pubkey-chain knownhosts vrf red 2
```

**Validation Commands**

show crypto key pubkey-chain knownhosts

**Command changes**

Version 5.4.6-2.1: VRF-lite support added.

# default-metric (RIP)

**Overview** Use this command to specify the metrics to be assigned to redistributed RIP routes.

Use the **no** variant of this command to reset the RIP metric back to its default (1).

**Syntax**

```
default-metric <metric>
no default-metric [<metric>]
```

| Parameter | Description |
|---|---|
| *<metric>* | <1-16> Specifies the value of the default metric. |

**Default** By default, the RIP metric value is set to 1.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage notes** This command is used with the redistribute (RIP) command to make the routing protocol use the specified metric value for all redistributed routes, regardless of the original protocol that the route has been redistributed from.

**Examples** This example assigns the cost of 10 to the routes that are redistributed into RIP.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# default-metric 10
awplus(config-router)# redistribute ospf
awplus(config-router)# redistribute connected
```

**Example (VRF-lite)** This example assigns the cost of 10 to the routes which are redistributed into RIP for the VRF instance blue.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address family ipv4 vrf blue
awplus(config-router-af)# default-metric 10
awplus(config-router-af)# redistribute ospf
awplus(config-router-af)# redistribute connected
```

**Related commands** redistribute (RIP)

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# description (VRF)

**Overview** Use this command to add text that describes a specific VRF instance. Descriptions can be up to 80 characters long.

The **no** variant of this command removes the description of the selected VRF instance.

**Syntax**

```
description <descriptive-text>
no description
```

| Parameter | Description |
|---|---|
| *<descriptive-text>* | A string of up to 80 characters that describes the VRF instance. |

**Mode** VRF Configuration

**Example** To add the description for a VRF instance named blue, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# description the text description of vrf
blue
```

**Related commands** show ip vrf

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# distance (RIP)

**Overview** This command sets the administrative distance for RIP routes. Your device uses this value to select between two or more routes to the same destination obtained from two different routing protocols. The route with the smallest administrative distance value is added to the Forwarding Information Base (FIB). For more information, see the Route Selection Feature Overview and Configuration Guide.

The **no** variant of this command sets the administrative distance for the RIP route to the default of 120.

**Syntax**

```
distance <1-255> [<ip-addr/prefix-length>]
no distance [<1-255>] [<ip-addr/prefix-length>]
```

| Parameter | Description |
|---|---|
| *<1-255>* | The administrative distance value you are setting for this RIP route. |
| *<ip-addr/prefix-length>* | The network IP address and prefix-length that you are changing the administrative distance for. |

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Examples** To set the administrative distance to 8 for the RIP routes within the 10.0.0.0/8 network, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distance 8 10.0.0.0/8
```

To set the administrative distance to the default of 120 for the RIP routes within the 10.0.0.0/8 network, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# no distance 8 10.0.0.0/8
```

**Example (VRF-lite)** This example assigns a cost of 10 to the routes for the VRF instance blue, when redistributed into RIP.

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address family ipv4 blue
awplus(config-router-af)# distance 10
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# distribute-list (RIP)

**Overview** Use this command to filter incoming or outgoing route updates using the prefix-list.

When running VRF-lite, this command can be applied to a specific VRF instance.

Use the **no** variant of this command to disable this feature.

**Syntax**

```
distribute-list prefix <prefix-list> {in|out} [<interface>]
no distribute-list prefix <prefix-list> {in|out} [<interface>]
```

| Parameter | Description |
|---|---|
| `prefix` | Filter prefixes in routing updates. |
| *<prefix-list>* | Specifies the name of the IPv4 prefix-list to use. |
| `in` | Filter incoming routing updates. |
| `out` | Filter outgoing routing updates. |
| *<interface>* | The interface on which the filtering applies. |

**Default** Disabled

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage notes** Filter out incoming or outgoing route updates using a prefix-list. If you do not specify the name of the interface, the filter will be applied to all interfaces.

**Examples** To apply a prefix list called 'myfilter' to filter incoming routing updates on eth1, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# distribute-list prefix myfilter in eth1
```

**Example (VRF-lite)** This example applies the commands of the previous prefix-list example, but to a specific VRF named blue:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# distribute-list prefix myfilter in
vlan2
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# export map

**Overview** This command associates a route map with a specific VRF instance. It provides a finer control over the routes that are exported out of a VRF instance by the **route-target** command. Note, however, that this command does not replace the need for a route-target export in the VRF configuration.

The **no** variant of this command disables the capability to export route map entries for a specified VRF instance.

**Syntax**

```
export map <route-map>
no export map
```

| Parameter | Description |
|---|---|
| *<route-map>* | The route-map name. |

**Mode** VRF Configuration

**Usage notes** Use this command to export route-map entries in VRF configuration mode.

**Example** To export the route map named routemap2 for the VRF instance named blue, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# export map routemap2
```

**Related commands** import map

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# fullupdate (RIP)

**Overview** Use this command to specify which routes RIP should advertise when performing a triggered update. By default, when a triggered update is sent, RIP will only advertise those routes that have changed since the last update. When **fullupdate** is configured, the device advertises the full RIP route table in outgoing triggered updates, including routes that have not changed. This enables faster convergence times, or allows inter-operation with legacy network equipment, but at the expense of larger update messages.

Use the **no** variant of this command to disable this feature.

**Syntax**

```
fullupdate
no fullupdate
```

**Default** By default this feature is disabled.

**Mode** RIP Router Configuration or RIP Router Address Family Configuration for a VRF instance.

**Usage (VRF-lite)** If VRF-lite is configured, you can apply this command for either the global routing environment, or to a specific VRF instance.

**Example** To enable the fullupdate (RIP) function, use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# fullupdate
```

**Example (VRF-lite)** To enable the full update (RIP) function on the VRF instance named 'blue', use the commands:

```
awplus# configure terminal
awplus(config)# router rip
awplus(config-router)# address-family ipv4 vrf blue
awplus(config-router-af)# fullupdate
```

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# import map

**Overview** The import map command associates a route map with a specific VRF instance. The import map command does not replace the need for a route-target import in the VRF configuration. It provides a finer control over the routes imported into a VRF instance by the **route-target** command.

The **no** variant of this command disables the capability to import route map entries for a specified VRF instance.

**Syntax**

```
import map <route-map>
no import map
```

| Parameter | Description |
|---|---|
| *<route-map>* | The route-map name. |

**Mode** VRF Configuration

**Usage notes** Use this command to import route-map entries into the specified VRF instance.

**Example** To import the route map named `routemap2` for the VRF instance named `blue`, use the following commands:

```
awplus# config terminal
awplus(config)# ip vrf blue
awplus(config-vrf)# import map routemap2
```

**Related commands** export map

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# ip route static inter-vrf

**Overview** Applying this command enables static inter-VRF routing. Note that static inter-VRF routing must be enabled before you can use the **ip route** command to create a static inter-VRF route.

The **no** variant of this command disables static inter-VRF routing.

**Syntax**

```
ip route static inter-vrf
no ip route static inter-vrf
```

**Mode** VRF Configuration

**Default** Static inter-VRF routing is enabled.

**Example** To enable static inter-VRF routing, use the following commands:

```
awplus# config terminal
awplus(config)# ip route static inter-vrf
```

**Related commands** ip route

show ip route

**Command changes** Version 5.4.6-2.1: VRF-lite support added.

# ip route vrf

**Overview** This command adds a static route to the Routing Information Base (RIB). If this route is the best route for the destination, then your device adds it to the Forwarding Information Base (FIB). Your device uses the FIB to advertise routes to neighbors and forward packets.

When using VRF (Virtual Routing and Forwarding), you can use this command to configure a static inter-VRF route to a destination network that is reachable by a remote gateway located in a different VRF instance. Note that to apply the command in this way, the ip route static inter-vrf command must be in enabled (its default condition). For more information about VRF, see the VRF Feature Overview and Configuration Guide and the VRF-lite Commands chapter.

The **no** variant of this command removes the static route from the RIB and FIB.

**Syntax**

```
ip route [vrf <vrf-name>] <subnet&mask>
{<gateway-ip>|<interface>} [<distance>] [weight <1-255>]
[description <description>]
```

```
no ip route [vrf <vrf-name>] <subnet&mask>
{<gateway-ip>|<interface>} [<distance>] [weight <1-255>]
```

| Parameter | Description |
|---|---|
| *<subnet&mask>* | The IPv4 address of the destination subnet defined using either a prefix length or a separate mask specified in one of the following formats:<br>• The IPv4 subnet address in dotted decimal notation followed by the subnet mask, also in dotted decimal notation.<br>• The IPv4 subnet address in dotted decimal notation, followed by a forward slash, then the prefix length. |
| *<gateway-ip>* | The IPv4 address of the gateway device. |
| *<interface>* | The interface that connects your device to the network. Enter the name of the VLAN or its VID. You can also enter 'null' as an interface. Specify a 'null' interface to add a null or blackhole route to the switch.<br>The gateway IP address or the interface is required if VRF-lite is not configured.<br>If VRF-lite is configured: When adding a static intra-VRF route, you must specify either the gateway IP address or the interface.<br>When adding a static inter-VRF route, you must specify both the gateway IP address and the interface. |
| *<distance>* | The administrative distance for the static route in the range 1 to 255. Static routes by default have an administrative distance of 1, which gives them the highest priority possible. |
| vrf | Applies the command to the specified VRF instance. |
