

Troubleshooting

This chapter contains the following sections:

- [Verifying Data Call Setup](#) , on page 1
- [Checking Signal Strength](#), on page 2
- [Verifying Service Availability](#), on page 2
- [Sample Command Output](#), on page 5

Verifying Data Call Setup

To verify the data call setup, follow these steps:

1. After you create a modem data profile using the cellular profile create command and configuring DDR on the cellular interface, send a ping from the router to a host across the wireless network.
2. If the ping fails, capture the following show commands:
 - show version
 - show cellular 0/x/0 all
 - show controller cellular 0/x/0 all
 - show interface cellular 0/x/0
 - show dialer
 - show ip route
 - show running-config
3. For more detailed troubleshooting, capture traces from debug commands:
 - debug cellular all — All debugging
 - debug cellular async — Cellular async debugging
 - debug cellular callback — Cellular data callback debugging
 - debug cellular callcontrol — Cellular Direct IP call control debugging
 - debug cellular data — Data path debugging

- debug cellular dm— DM debugging
- debug cellular dualsim — Cellular dual SIM debugging
- debug cellular fota — Cellular Fota debugging
- debug cellular fw — Cellular modem firmware upgrade debugging
- debug cellular gps — Cellular gps debugging
- debug cellular ipc — Cellular IPC debugging
- debug cellular linkrecovery — Cellular Link Recovery debugging
- debug cellular management — Mgmt path debugging
- debug cellular mobile-app — Cellular mobile app debugging
- debug cellular nas — Cellular NAS log debugging
- debug cellular nmea — GPS NMEA messages debugging
- debug cellular sms — SMS messages debugging
- debug cellular snmp — Cellular snmp debugging

Checking Signal Strength

If the Received Signal Strength Indication (RSSI) level is very low (for example, if it is less than -110 dBm), follow these steps:

1. Ensure at least one antenna is connected to the 'MAIN' RF port on the 4G module. Preferably both MAIN and DIV RF ports should be connected to antenna for better RF signal. Check to ensure the antenna are threaded and tightened.
2. If you are using a remote antenna, move the antenna cradle and check if the RSSI has improved.
3. Contact your wireless service provider to verify if there is service availability in your area.

Verifying Service Availability

The following is a sample output for the **show cellular slot all** command.

```
Router# show cellular x/x/x all
