Command	Description
ap enet-link-profile	This command configures an AP Ethernet link profile.

Command History

Version	Modification
AOS-W 8.3.0.0	A new row 802.3bz displays if the standard is enabled or disabled for an AP.
AOS-W 8.0.0.0	Command introduced

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable mode on Mobility Master.

show ap essid

```
show ap essid
```

Description

Show a Extended Service Set Identifier (ESSID) summary for the Switch, including the numbers of APs and clients associated with each ESSID.

Examples

The output of the command in the example below shows statistics for four configured ESSIDs.

```
(host) [mynode] #show ap essid
ESSID Summary
-------------
ESSID             APs  Clients  VLAN(s)  Encryption
-----             ---  -------  -------  ----------
vocera  21   0         66       WPA2 PSK AES
voip    23   52        66,64    WPA2 8021X AES
guest             49   6        63       Open
wpa2    26   88        65,64    WPA2 8021X AES
Num ESSID:4
```

The output of this command includes the following information:

Column	Description
ESSID	An Extended Service Set Identifier (ESSID) is the identifying name of an 802.11 wireless network.
APs	Number of APs associated with the ESSID.
VLAN(s)	VLAN IDs of the VLANs for the ESSID.
Encryption	The layer-2 authentication and encryption used on this ESSID to protect access and ensure the privacy of the data transmitted to and from the network.

show ap general-profile

```
show ap general-profile
```

Description

This command shows the general profile of an AP.

Syntax

No parameters.

Usage Guidelines

This command shows the general profile of an AP.

Example

The following example shows the general profile of an AP:

```
(host) [mynode] #show ap general-profile

ap general-profile
------------------
Parameter                                                  Value      Set
---------                                                  -----      ---
Enable AP State Periodic Sync                              Enabled
AP State sync interval in minutes (5 - 1440 mins(24 hours))  5 minutes
```

show ap global acl-table

```
show ap global acl-table
```

Description

This command shows the ACL table of STM.

Syntax

No parameters.

Usage Guidelines

This command shows the ACL table of STM.

Example

The following example shows the ACL table of STM:

```
(host) [mynode] #show ap global acl-table

STM ACL Table
-------------
ACL  Type     ACE Index  Ace Count  Name
---  ----     ---------  ---------  ----

Related Commands

Command	Description
ap system-profile	This command configures an AP system profile.

Command History

Version	Description
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable mode on Mobility Master.

show ap greenap

```
show ap greenap
amon pending-ap {all | ip-addr <ip-addr> | ip6-addr <ip6-addr>}
counters{ap-name <ap-name> | ip-addr <ip-addr> | ip6-addr <ip6-addr> | wired-mac <wired-mac>}
request pending-ap {all | ip-addr <ip-addr> | ip6-addr <ip6-addr>}
```

Description

This command displays all the pending APs in the per-md list, sends the AP_INFO AMON message for a particular AP, and track Green AP related counters.

Syntax

Parameter	Description
`amon`	AMON message.
`pending-ap`	Displays the pending AP list.
`all`	Displays the pending AP list for the managed device.
`ip-addr`	Displays the pending AP list for a particular IP address of the managed device.
`ip6-addr`	Displays the pending AP list for a particular IPv6 address of the managed device.
`counters`	Displays all the counters for Green AP.
`ap-name`	Displays the counters for a particular AP name.
`ip-addr`	Displays the counters for a particular IP address of the managed device.
`ip6-addr`	Displays the counters for a particular IPv6 address of the managed device.
`request`	Displays the power-save or wakeup requests for a Green AP.

Usage Guidelines

AMON

When AP is in deep-sleep mode, the managed device sends the AP_INFO AMON message for a particular AP.

The amon command can only be run in the managed device.

Counters

This command is used to track green AP related counters, for example, how many deep-sleep or wake-up requests are received from Netinsight and how many requests are dropped, and so on.

Request

This command is used to display all the pending APs in the per-md list.

Example

The following command helps in debugging and tracking all the requests using counters:

show ap greenap counters ap-name <ap-name>

```
Counters for greenap

show ap he-rates

```
show ap he-rates bssid <bssid>
```

Description

This command display high-efficiency rate information for a basic service set (BSS).

Syntax

Parameter	Description
`bssid <bssid>`	Show data for a specific Basic Service Set Identifier (BSSID) on an AP. An AP's BSSID is usually the AP's MAC address.

Examples

The output of this command shows high-efficiency rates for each supported MCS value.

```
(host) [mynode] #show ap he-rates bssid 00:12:6d:03:1c:f1
```

Command History

show ap ht-rates

```
show ap ht-rates bssid <bssid>
```

Description

Show high-throughput rate information for a basic service set (BSS).

Syntax

Parameter	Description
`bssid <bssid>`	Show data for a specific Basic Service Set Identifier (BSSID) on an AP. An AP's BSSID is usually the AP's MAC address.

Examples

The output of this command shows high-throughput rates for each supported MCS value. These values are applicable to high-throughput (802.11n-capable) APs only.

```
(host) [mynode] #show ap ht-rates bssid 00:1a:1e:1e:5a:10

AP "AL12" Radio 0 BSSID 00:1a:1e:1e:5a:10 High-throughput Rates (Mbps)
-----------------------------------------------------------------------
MCS  Streams  20 MHz  40 MHz  40 MHz SGI

  5    1        52.0   108.0   120.0
  6    1        58.5   121.5   135.0
  7    1        65.0   135.0   150.0
  8    2        13.0    27.0    30.0
  9    2        26.0    54.0    60.0
 10    2        39.0    81.0    90.0
 11    2        52.0   108.0   120.0
 12    2        78.0   162.0   180.0
 13    2       104.0   216.0   240.0
 14    2       117.0   243.0   270.0
 15    2       130.0   270.0   300.0
```

The output of this command includes the following information:

Column	Description
`MCS`	A Modulation Coding Scheme (MCS) values supported on this high-throughput SSID.
`Streams`	Number of spatial streams used by the MCS index value.
`20 MHz`	802.11n data rates for the MCS for 20 Mhz transmissions.
`40 MHz`	802.11n data rates for the MCS for 40 Mhz transmissions.
`40 MHz SGI`	802.11n data rates for the MCS for 40 Mhz transmissions using a short guard interval.

Related Commands

show ap image-preload status

```
show ap image-preload status
   all
   list
   summary
```

Description

Display the list of APs that will preload a new version of software from a Switch with the AP preload feature activated.

Syntax

Parameter	Description
`all`	Display the complete status of AP image preload operation.
`list`	Displays the list of APs and their image preload statuses.
`summary`	Summarizes the status of AP image preload operation.

Usage Guidelines

Issue this command to display a list of APs in the AP image preload list, and monitor the download status of each AP.

Example

The example below shows the current status of APs downloading a new image using the AP image preload feature.

(host) #show ap image-preload status `all`

```

The output of this command includes the following information:

Column	Description
AP Image Preload Parameters	Shows if this feature has been enabled (has an active status) or is disabled (has an inactive status).
AP Image Preload AP Status Summary	These two columns list the different possible preload states for APs eligible to preload a new software image, and the total number of APs in each state. ■ **Preloaded**: Number of APs that have finished preloaded a new software image. ■ **Preloading**: Number of APs that are currently downloading the new image. ■ **Waiting**: Number of APs that are waiting to start preloading the new image from the Switch.
`AP Image Preload AP Status`	This section displays the following details for each preload attempt.
`AP Name`	Name of an AP eligible to preload a new software image.
`AP Group`	AP group of an AP eligible to preload a new software image.
`AP IP`	IP address of the AP.

Column	Description
AP Type	AP model type.
Preload State	Current state of the AP's preload attempt ■ **Preloaded**: The AP is finished preloading a new software image. ■ **Preloading**: The AP is currently downloading the new image. ■ **Waiting**: The AP is waiting to start preloading the new image from the Switch.
Start Time	Time the AP starting preloading an image.
End Time	Time the AP completed the image preload.
Failure Count	Number of times that the AP failed to preload the new image.
Failure Reason	In the event of an image preload failure, this column will display the reason that the image download failed.

Syntax

Parameter	Description
`ap-name <ap-name>`	View image version information for an AP with a specific name.
`ip-addr <ip-addr>`	View image version information for an AP with a specific IP address. Enter the address of the AP in dotted-decimal format.

Usage Guidelines

By default, this command displays image version information for all APs associated with the Switch. To view image version information for a single AP, specify an AP using the **ap-name** or **ip-addr** parameters

Example

The output in the example below shows the current running image version as well as the image version stored in the Switch's flash memory.

```
(host) [mynode] #show ap image version ip-addr 192.0.2.45
Access Points Image Version
---------------------------
AP                              Running Image Version String
--                              ----------------------------
192.0.2.45                      6.4.0.0 Wed Nov 27 10:46:42 PDT 2013

Flash Image Version String            Matches    Num Matches
--------------------------            -------    -----------
6.4.0.0 Wed Nov 27 10:46:42 PDT 2013  Yes        3

Num Mismatches    Bad Checksums    Image Load Status
--------------    -------------    -----------------
0                                  Done
```

The output of this command includes the following information:

Column	Description
`AP`	Name or IP address of an AP
`Running Image Version String`	String identifying the number of the image version currently running on the AP, as well as the date on which that version was created.
`Flash Image Version String`	String identifying the number of the image version in the AP's flash memory, as well as the date on which that version was created.
`Matches`	If **yes**, the running image version matches the image version currently in the AP's flash memory. If **no**, the two image versions do not match.

Column	Description
`Num Matches`	Number of times the running image version matched the flash image version after a reboot.
`Num Mismatches`	Number of times the running image version did not match the flash image version after a reboot. If the images do not match, the AP will upgrade to the flash image.
`Bad Checksums`	Number of bad checksum calculations due to an invalid or corrupted image file.
`Image Load Status`	Current status of the AP following an upgrade. **Done**: This status indicates that the Switch reset after the upgrade was performed, or the upgrade was performed after the AP first registered with the Switch. **Completed**: The AP was updated after it was registered to the Switch, and after the Switch's last reset. If AP shows a status of **completed**, it will also display the time it took it update that AP. **In progress:** The AP is currently updating its image.

Related Commands

Command	Description
show ap image-preload status	This command displays the list of APs that will preload a new version of software from a Switch with the AP preload feature activated.

Command History

show ap ip health-check

```
show ap ip health-check {ap-name <ap-name> | ip-addr <ip-addr> | ip6-addr <ip6-addr>}
```

Description

This command shows health of an access point.

Syntax

Parameter	Description	Range	Default
`ap-name <ap-name>`	Shows health of an access point specified by AP name.	—	—
`ip-addr <ip-addr>`	Shows health of an access point specified by IP address.	—	—
`ip6-addr <ip6-addr>`	Shows health of an access point specified by IPv6 address.	—	—

Usage Guidelines

This command shows health of an access point. For the remaining parameters, see the command syntax.

Example

Access the CLI and use the following command to show health of an access point with IP address 192.0.2.1:

```
(host) [mynode] #show ap ip health-check ip-addr 192.0.2.1

AP Health-Check Status
----------------------
Interval  Probe IP  Avg RTT(in ms)  Total_TX_Probes  Total_RX_Probes  Total_Packet Loss
--------  --------  --------------  ---------------  ---------------  -----------------
```

show ap-lacp-striping-ip

```
show ap-lacp-striping-ip
```

Description

Profile to enable/disable AP LACP feature and to specify GRE striping IP to LMS IP mapping.

Syntax

No parameters

Usage Guidelines

Example

```
(host) [mynode] #show ap-lacp-striping-ip
AP LACP LMS map information
---------------------------
Parameter            Value
---------            -----
AP LACP Striping IP  Enabled
GRE Striping IP      2.2.2.2 LMS 3.3.3.3
GRE Striping IP      4.4.4.4 LMS 5.5.5.5
GRE Striping IP      10.65.30.50 LMS 10.65.30.60
```

Related Commands

show ap license-usage

```
show ap license-usage
```

Description

Show AP license usage information.

Examples

The output of the command below shows that Switch has 13 associated campus APs using licenses, with 3 unused campus AP licenses remaining.

```
(host) [mynode] #show ap license-usage

AP Licenses
-----------
Type                        Number
----                        ------
AP Licenses                 512
MM Licenses                 500
MC-VA Licenses              0
Controller License          True
Overall AP License Limit    0
AP Usage [Note: THIS CONTROLLER DOES NOT TERMINATE ANY AP]
-----------------------------------------------------------
Type              Count
----              -----
Active CAPs       0
Active RAPs       0
Remote-node APs   0
Tunneled nodes    0
Total APs         0
Remaining AP Capacity
---------------------
Type  Number
----  ------
CAPs  0
RAPs  0
```

The output of this command includes the following information:

Parameter	Description
AP Licenses	Number of AP licenses currently available on the managed device.
RF Protect Licenses	Number of RF Protect licenses currently available on the managed device.
PEF Licenses	Number of Policy Enforcement Firewall (PEF) licenses currently available on the managed device.
Overall AP Licenses	Total number of APs supported by licenses on the managed device.
CAPs	Number of campus APs currently using a license on the managed device.
RAPs	Number of remote APs currently using a license on the managed device.
Remote-Node APs	Number of APs currently using a license on the managed device.

Parameter	Description
`Tunneled Nodes`	Number of tunneled nodes currently using a license on the managed device.
`CAPs`	Number of unused campus APs licenses remaining on the managed device.
`RAPs`	Number of unused remote APs licenses remaining on the managed device.

show ap lldp

```
show ap lldp [<profile>]
```

Description

Display a list of LLDP-MED Network Policy profiles, or display the current configuration settings of an individual profile.

Syntax

Parameter	Description
`<profile>`	Specify a LLDP profile name to view configuration settings for that profile.

Examples

The following example lists all LLDP profile profiles. The References column lists the number of other profiles with references to that LLDP-MED Network policy profile profile, and the ProfileStatus column indicates whether the profile is predefined.

The output of the command below shows that the Switch has two LLDP profiles.

```
(host) #show ap lldp med-network-policy-profile
AP LLDP Profile List
---------------------------------------
Name     References  Profile Status
----     ----------  --------------
default  0
video    2
Total:2
```

The following command displays configuration details for the LLDP profile named default.

```
(host) [mynode] #show ap lldp med-network-policy-profile video
AP LLDP Profile "new"
---------------------
Parameter                       Value
---------                       -----
PDU transmission                Enabled
Reception of LLDP PDUs          Enabled
Transmit interval (seconds)     30
Transmit hold multiplier        4
Optional TLVs                   port-description system-description system-name capabilities
management-address
802.1 TLVs                      port-vlan vlan-name
802.3 TLVs                      mac link-aggregation mfs power
LLDP-MED TLVs
LLDP-MED network policy profile  N/A
```

The output of this command includes the following information:

Parameter	Description
`PDU transmission`	Shows if LLDP PDU transmission is enabled on the AP.
`Reception of LLDP PDUs`	Shows if LLDP PDU reception is enabled on the AP.

Parameter	Description
`Transmit interval (seconds)`	The interval between LLDP TLV transmission seconds. The supported range is 1-3600 seconds and the default value is 30 seconds.
`Transmit hold multiplier`	This value is multiplied by the transmit interval to determine the number of seconds to cache learned LLDP information before that information is cleared. If the transmit-hold value is at the default value of 4, and the transmit interval is at its default value of 30 seconds, then learned LLDP information will be cached for 4 x 30 seconds, or 120 seconds.
`Optional TLVs`	The AP sends the listed optional TLVs in LLDP PDUs.
`802.1 TLVs`	The AP sends the listed 802.1 TLVs in LLDP PDUs. By default, the AP will send all 802.1 TLVs.
`802.3 TLVs`	The AP sends the listed 802.3 TLVs in LLDP PDUs. By default, the AP will send all 802.3 TLVs.
`LLDP-MED TLVs`	Lists the LLDP-MED TLVs the AP will send in LLDP PDUs. By default, the AP will not send any LLDP-MED TLVs
`LLDP-MED network policy profile`	Specifies the LLDP MED Network Policy profile to be associated with this LLDP profile.

Related Commands

show ap lldp counters

```
show ap lldp counters
   ap-name  <ap-name>
   ip-addr <ip-addr>
   ip6-addr (ipv6-addr>
```

Description

Show LLDP counters for a specific AP, or all APs sending or receiving LLDP Protocol Data Units (PDUs).

Syntax

Parameter	Description
`ap-name <ap-name>`	Show counter statistics for an AP with a specific name.
`ip-addr <ip-addr>`	View counter statistics for an AP with a specific IP address. Enter the IP address of the AP in dotted-decimal format.
`ip6-addr <ip-addr>`	View counter statistics for an AP with a specific IPv6 address.

Examples

The output of the command below shows LLDP counter information for two interfaces.

```
(host) [mynode] #show ap lldp counters
AP LLDP Counters (Updated every 60 seconds)
-------------------------------------------
AP                Interface  Received  Unknown TLVs  Malformed  Overflow  Transmitted
--                ---------  --------  ------------  ---------  --------  -----------
00:1a:1e:ce:fb:bf  bond0      0         0             0          0         68159
00:24:6c:c0:00:86  bond0      0         0             0          0         68153
```

The output of this command includes the following information:

Parameter	Description
`AP`	Name of the AP sending or receiving LLDP PDUs.
`Interface`	Name of the AP interface sending or re ce vi ng LLDP PDUs.
`Received`	Number of packets received on the specified interface.
`Unknown TLVs`	Number of LLDP Protocol Data Units (PDUs) with an unknown type-length-value (TLV).
`Number of Malformed packets`	Number of malformed packets received on that interface
`Overflow`	Number of times that an LLDP neighbor could not be added to the neighbor table (there is a limit of 8 per port)
`Transmitted`	Number of packets transmitted from that interface

show ap lldp med-network-policy-profile

```
show ap lldp med-network-policy-profile [<profile>]
```

Description

Display a list of LLDP-MED Network Policy profiles, or display the current configuration settings of an individual profile.

Syntax

Parameter	Description
`<profile>`	Specify a LLDP-MED Network Policy profile name to view configuration settings for that profile.

Usage Guidelines

The LLDP-MED Network policy profile allows you to configure an extension to LLDP that supports interoperability between VoIP devices and other networking clients. LLDP-MED network policy discovery lets end-points and network devices advertise their VLAN IDs (e.g. voice VLAN), priority levels, and DSCP values.allows you to define a set of provisioning parameters to an AP group.

Issue this command without the **<profile-name>** option to display the entire LLDP-MED Network policy profile list, including profile status and the number of references to each profile. Include a profile name to display the configuration settings for that profile.

Examples

The following example lists all LLDP-MED Network policy profile profiles. The **References** column lists the number of other profiles with references to that LLDP-MED Network policy profile, and the **ProfileStatus** column indicates whether the profile is predefined.

The output of the command below shows that the Switch has three LLDP-MED network profiles.

(host) [mynode] #show ap lldp med-network-policy-profile

```
AP LLDP-MED Network Policy Profile List
---------------------------------------
Name     References  Profile Status
----     ----------  --------------
default  0
video    2
voice    1
Total:2
The following command displays configuration details for the LLDP-MED Network Policy profile
named video.

(host) #show ap lldp med-network-policy-profile video
AP LLDP-MED Network Policy Profile "default"
--------------------------------------------
Parameter                                          Value
---------                                          -----
LLDP-MED application type                          streaming-video
LLDP-MED application VLAN                          16
LLDP-MED application VLAN tagging                  Tagged
LLDP-MED application Layer-2 priority              0
LLDP-MED application Differentiated Services Code Point  0
```

The output of this command includes the following information:

Parameter	Description
LLDP-MED application type	Type of application that this profile manages. This profile supports the following options: ■ **guest-voice** : The AP services a separate voice network for guest users and visitors. ■ **guest-voice-signaling** : The AP is part of a network that requires a different policy for guest voice signaling than for guest voice media. Do not use this application type if both the same network policies apply to both guest voice and guest voice signaling traffic. ■ **softphone-voice** : The AP supports voice services using softphone software applications on devices such as PCs or laptops. ■ **streaming-video** : T The AP supports broadcast or multicast video or other streaming video services that require specific network policy treatment. This application type is not recommended for video applications that rely on TCP with buffering. ■ **video-conferencing** : T The AP supports video conferencing equipment that provides real-time, interactive video/audio services. ■ **video-signaling** : T The AP is part of a network that requires a different policy for video signaling than for the video media. Do not use this application type if both the same network policies apply to both video and video signaling traffic. ■ **voice** : T he AP services IP telephones and other appliances that support interactive voice services. This is the default application type. ■ **voice-signaling** : T The AP is part of a network that requires a different policy for voice signaling than for the voice media. Do not use this application type if both the same network policies apply to both voice and voice signaling traffic.

Parameter	Description
`LLDP-MED application VLAN`	Indicates the VLAN ID (0-4094) or VLAN name of the VLAN used by the application.
`LLDP-MED application VLAN tagging`	Indicates if the policy applies to a to a VLAN that is tagged with a VLAN ID or untagged. The default value is untagged. **NOTE:** When an LLDP-MED network policy is defined for use with an untagged VLAN, then the L2 priority field is ignored and only the DSCP value is used.
`LLDP-MED application Layer-2 priority`	Displays a configured 802.1p priority level for the specified application type, where 0 is the lowest priority level and 7 is the highest priority.
`LLDP-MED application Differentiated Services Code Point`	Displays a configured Differentiated Services Code Point (DSCP) priority value for the specified application type, where 0 is the lowest priority level and 63 is the highest priority.

Related Commands

Command	Description
ap lldp med-network-policy-profile	This command defines an LLDP MED network policy profile that defines DSCP values and L2 priority levels for a voice or video application.

show ap lldp neighbors

```
show ap lldp neighbors
   ap-name  <ap-name>
   ip-addr <ip-addr>
   ip6-addr (ipv6-addr>
```

Description

Show LLDP neighbors for a specific AP, or all APs sending or receiving LLDP Protocol Data Units (PDUs).

Syntax

Parameter	Description
`ap-name <ap-name>`	Show LLDP neighbor statistics for an AP with a specific name.
`ip-addr <ip-addr>`	View LLDP neighbor statistics for an AP with a specific IP address. Enter the IP address of the AP in dotted-decimal format.
`ip6-addr <ip-addr>`	View LLDP neighbor statistics for an AP with a specific IPv6 address.

Usage Guidelines

The LLDP protocol allows switches, routers, and WLAN access points to advertise information about themselves such as identity, capabilities, and neighbors to other nodes on the network. Use this command to display information about the AP's LLDP peers.

By default, this command displays LLDP neighbors for the entire list of LLDP interfaces. Include a the name of IP address of an AP to display neighbor information only for that one device.

Examples

The output of the command below shows the LLDP neighbor list for an AP named **ap12**.

```
(host) [mynode] #show ap lldp neighbors ap-name ap12
AP LLDP Neighbors (Updated every 60 seconds)
-------------------------------------------
AP  Interface  Neighbor  Chassis Name/ID    Port Name/ID  Mgmt. Address  Capabilities
--  ---------  --------  ---------------    ------------  -------------  ------------
uc  bond0      0         d8:c7:c8:c4:4f:4e  bond0         10.3.44.193
Capability codes: (R)Router, (B)Bridge, (A)Access Point, (P)Phone, (O)Other
```

The output of this command includes the following information:

Parameter	Description
`AP`	Name of the LLDP neighbor
`Interface`	Interface on the AP sending or receiving LLDP PDUs.
`Neighbor`	LLDP neighbor number
`Chassis Name/ID`	The name of the LLDP neighbor AP
`Port Name/ID`	Port name or ID if the interface sending LLDP PDUs.

Parameter	Description
`Mgmt. Address`	Management address of the LLDP neighbor
`Capabilities`	This data column can list any of the following data codes to indicate LLDP neighbor capabilities. ■ R: Router ■ B: Bridge ■ A: Access Point ■ P: Phone ■ O: Other

```

The output of this command includes the following information:

Column	Description
BSS	The Basic Service Set (BSS) Identifier for the AP. This is usually the APs MAC address.
ESS	The Extended Service Set (ESS) Identifier is the user-defined name of an 802.11 wireless network.
s/p	The Switch slot and port used by the AP, in the format <slot>/<module>/<port>.
ip	IP address of the AP.
phy	One of the following 802.11 types ■ a ■ a-HT (high-throughput) ■ g ■ g-HT (high-throughput)
chan	Channel number for the AP 802.11a/802.11n physical layer. The available channels depend on the AP's regulatory domain (country).
cur-cl	Current number of clients on the AP.
util (kbps)	Current bandwidth utilization, in kbps.

show ap mesh active

```
show ap mesh active [<mesh-cluster>|{page <page>}|{start <start>}]
```

Description

Show active mesh cluster APs currently registered on this Mobility Master.

Syntax

Parameter	Description
`<mesh-cluster>`	Name of a mesh cluster profile.
`page <page>`	Limit the output of this command to a specific number of entries by entering the number of entries you want to display.
`start <start>`	Start displaying the index of mesh APs at a chosen index number by entering the index number of the AP at which command output should start.

Examples

The output of this command displays a list of all active mesh points and mesh portals.

```
(host)[mynode] #show ap mesh active
Mesh Cluster Name: meshprofile1
------------------------------
Name  Group   IP Address    BSSID             Band/Ch/EIRP/MaxEIRP  MTU   Enet 0/1
Mesh Role

Portal

Parent  #Children  AP Type  Uptime
 ------  ---------  -------  ------
 mp3     0          125      13d:2h:25m:19s
 mpp     1          125      14d:21h:23m:49s
 mp2     1          125      14d:21h:14m:55s
 -       1          125      14d:19h:5m:3s
```

The output of this command includes the following information:

Column	Description
`Name`	Name of an AP.
`Group`	AP group which includes the specified AP.
`IP Address`	IP address of the AP.
`BSSID`	BSSID for the AP. This is usually the AP's MAC address.

Column	Description
`Band/Ch/EIRP/MaxEIRP`	The RF band in which the AP should operate (**a** or **g**) or Radio channel used by the AP, or Current EIRP /maximum EIRP
`MTU`	MTU size, in bytes. This value describes the greatest amount of data that can be transferred in one physical frame.
`Enet 0/1`	Shows the current mode of each wired interface. ■ **Bridge**: 802.11 frames are bridged into the local Ethernet LAN. ■ **Tunnel**: 802.11 frames are tunneled to the Mobility Master using GRE. ■ **Split-tunnel**: 802.11 frames are either bridged into the local Ethernet LAN or tunneled to the Mobility Master, depending upon their destination. ■ **Off**: Interface is not available for serving clients. If an AP has only one wired interface, the output of this command will display a dash (-) for the unavailable port.
`Mesh Role`	An AP operating as a mesh node can have one of two roles: mesh portal or mesh point.
`Parent`	If the AP is operating as a mesh point, this parameter displays the name of its parent mesh portal. Mesh portals will display a dash (-).
`#Children`	If the AP is operating as a mesh portal, this parameter shows the number of mesh point children associated with that mesh portal.
`AP type`	The AP model type.
`Uptime`	Number of hours, minutes and seconds since the last Mobility Master reboot or bootstrap, in the format *hours:minutes:seconds*.

ap mesh-radio-profile	This command configures a mesh radio profile used by mesh nodes.

Command History

Version	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	This show command is available in the base operating system. Commands to configure the secure enterprise mesh solution for outdoor APs require the Outdoor Mesh license.	Enable or Config mode on managed devices.

show ap mesh debug counters

```
show ap mesh debug counters {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>}
```

Description

Show counters statistics for a mesh node.

Syntax

Parameter	Description
`ap-name <ap-name>`	Show counter statistics for an AP with a specific name.
`bssid <bssid>`	Show counter statistics for a specific Basic Service Set Identifier (BSSID) on an AP. An AP's BSSID is usually the AP's MAC address.
`ip-addr <ip-addr>`	View counter statistics for an AP with a specific IP address. Enter the IP address of the AP in dotted-decimal format.

Example

The example below shows the Mesh Packet Counters table for an AP named meshpoint1. The **Probe Resp**, **Assoc Req**, and **Assoc Resp** data columns show both the total number of counters and, in parenthesis, the number of requests or responses with high-throughput information elements (HE IEs).

```
(host) [mynode] #show ap mesh debug counters ap-name meshpoint1
Mesh Packet Counters
--------------------
Interface  Echo Sent  Echo Recv  Probe Req  Probe Resp  Assoc Req  Assoc Resp  Assoc Fail  ---
---------  ---------  ---------  ---------  ----------  ---------  ----------  ----------

Link up/down  Resel.  Switch  Other
------------  ------  ------  ------
Parent      68865      68755      24          8(8 HT)      3(1 HT)     3(1 HT)      1
1              -       -       0
Child       68913      67373      6           8            2
1              2       0       2618886

Received Packet Statistics: Total 2890717, Mgmt 2618946 (dropped non-mesh 0), Data 271771
(dropped unassociated 1)HT: pns=8 ans=1 pnr=0 ars=0 arr=1 anr=0

Recovery Profile Usage Counters
-------------------------------
Item                          Value
----                          -----
Enter recovery mode           0
Exit recovery mode            0
Total connections to switch   0

Mesh loop-prevention Sequence No.:1256947
Mesh timer ticks:68930
```

The output of this command includes the following information:

Column	Description
`Interface`	Indicates whether the mesh interface connects to a **Parent** AP or a **Child** AP. Each row of data in the *Mesh Packet Counters* table shows counter values for an individual interface.
`Echo Sent`	Number of echo packets sent.
`Echo Recv`	Number of echo packets received.
`Probe Req`	Number of probe request packets sent from the interface specified in the **Mesh-IF** parameter.
`Probe Resp`	Number of probe response packets sent to the interface specified in the **Interface** parameter.
`Assoc Req`	Number of association request packets from the interface specified in the **Interface** parameter.
`Assoc Resp`	Number of association response packets from the interface specified in the **Interface** parameter. This number includes valid responses and fail responses.
`Assoc Fail`	Number of fail responses received from the interface specified in the **Interface** parameter.
`Link up/down`	Number of times the link up or link down state has changed.
`Resel.`	Number of times a mesh point attempted to reselect a different mesh portal.
`Switch`	Number of times a mesh point successfully switched to a different mesh portal.
`Other Mgmt`	Management frames of any type other than association and probe frames, either received on child interface, or sent on parent interface.

show ap mesh debug current-cluster

```
show ap mesh debug current-cluster
   ap-name <ap-name>
   bssid <bssid>
   ip-addr <ip-addr>
```

Description

This command shows the AP mesh debug information for the mesh cluster currently used by a mesh point or mesh portal.

Syntax

Parameter	Description
`ap-name <ap-name>`	Shows AP mesh debug information for the specified AP name.
`bssid <bssid>`	Shows AP mesh debug information for the specified BSSID. A BSSID is usually the MAC address of an AP.
`ip-addr <ip-addr>`	Shows AP mesh debug information for the specified IP address.

Examples

The example shows the AP mesh debug information of an AP named **mp2**.

```
(host) [mynode] #show ap mesh debug current-cluster ap-name mp2

AP "mp2" Current Cluster Profile: default
-----------------------------------------
Item            Value
----            -----
Cluster Name    smettu-mesh
RF Band         a
Encryption      opensystem
WPA Hexkey      N/A
WPA Passphrase  ********
```

The output of this command includes the following information:

Column	Description
`Cluster Name`	Name of the mesh cluster using this profile
`RF band`	The RF band in which the mesh point or mesh portal operates: ■ **g** = 2.4 GHz ■ **a** = 5 GHz
`Encryption`	Data encryption setting for the mesh cluster profile. ■ **opensystem**—No authentication and encryption. ■ **wpa2-psk-aes**—WPA2 with AES encryption using a preshared key.
`WPA Hexkey`	The WPA pre-shared key (only for mesh cluster profiles using WPA2 with AES encryption).
`WPA Passphrase`	The WPA password that generates the preshared key (only for mesh cluster profiles using WPA2 with AES encryption).

show ap mesh debug forwarding-table

```
show ap mesh forwarding-table [ap-name <ap-name>|bssid <bssid>|ip-addr <ip-addr>]
```

Description

This command displays the forwarding table for a remote mesh point or remote mesh portal.

Syntax

Parameter	Description
`ap-name <ap-name>`	Show data for a remote mesh node with a specific name.
`bssid <bssid>`	Show data for a specific Basic Service Set Identifier (BSSID) on an AP. BSSID is usually the AP's MAC address.
`ip-addr <ip-addr>`	Show data for a remote mesh node with a specific IP address by entering its IP address in dotted-decimal format.

Usage Guidelines

This is an internal technical support command. Alcatel-Lucent technical support may request that you issue this command to help analyze and troubleshoot problems with your mesh network.

show ap mesh debug link-table

```
show ap mesh debug link-table [ap-name <ap-name>|bssid <bssid>|ip-addr <ip-addr>]
```

Description

This command displays the mesh link table for a remote mesh point or remote mesh portal.

Syntax

Parameter	Description
`ap-name <ap-name>`	Show data for a remote mesh node with a specific name.
`bssid <bssid>`	Show data for a specific Basic Service Set Identifier (BSSID) on an AP. BSSID is usually the AP's MAC address.
`ip-addr <ip-addr>`	Show data for a remote mesh node with a specific IP address by entering its IP address in dotted-decimal format.

show ap mesh debug hostapd-log

```
show ap mesh debug hostapd-log
   ap-name <ap-name>
   bssid <bssid>
   ip-addr <ip-addr>
```

Description

This command shows the AP mesh debug log messages for the **hostapd** process.

Syntax

Parameter	Description
`ap-name <ap-name>`	Shows AP mesh debug log messages for the specified AP name.
`bssid <bssid>`	Shows AP mesh debug log messages for the specified BSSID. A BSSID is usually the MAC address of an AP.
`ip-addr <ip-addr>`	Shows AP mesh debug log messages for the specified IP address.

Usage Guidelines

This is an internal technical support command. Alcatel-Lucent technical support may request that you issue this command to help analyze and troubleshoot problems with the **hostapd** process or your mesh network.

show ap mesh debug meshd-log

```
show ap mesh debug meshd-log {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>} [<page>]
```

Description

Show the debug log messages for the **meshd** process.

Syntax

Parameter	Description
`ap-name <ap-name>`	Show data for an AP with a specific name.
`bssid <bssid>`	Show data for a specific Basic Service Set Identifier (BSSID) on an AP. The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
`ip-addr <ip-addr>`	Show data for an AP with a specific IP address by entering an IP address in dotted-decimal format.
`<page>`	Display page number 0, 1 or 2, where page 0 has the newest information and page 2 has the oldest. If this parameter is omitted, this command will display all meshd log information, oldest first.

Usage Guidelines

This is an internal technical support command. Alcatel-Lucent technical support may request that you issue this command to help analyze and troubleshoot problems with the **meshd** process or your mesh network.

show ap mesh debug provisioned-clusters

```
show ap mesh debug provisioned-clusters
   ap-name <ap-name>
   bssid <bssid>
   ip-addr <ip-addr>
```

Description

This command shows the cluster profiles provisioned on a mesh portal or mesh point.

Syntax

Parameter	Description
`ap-name <ap-name>`	Shows AP mesh debug log messages for the specified AP name.
`bssid <bssid>`	Shows AP mesh debug log messages for the specified BSSID. A BSSID is usually the MAC address of an AP.
`ip-addr <ip-addr>`	Shows AP mesh debug log messages for the specified IP address.

Example

The example shows the statistics for the APs mesh cluster profile and recovery cluster profile on an AP mesh point named portal2.

```
(host) [mynode] #show ap mesh debug provisioned-clusters ap-name portal2

AP Portal Cluster Profile: mesh-cluster-profile
-----------------------------------------------
Parameter       Value
---------       -----
Cluster Name    sw-ad-GB32
RF Band         a
Encryption      opensystem
WPA Hexkey      N/A
WPA Passphrase  ********

AP "Portal" Cluster Profile: Recovery Cluster Profile
-----------------------------------------------------
Item            Value
----            -----
Cluster Name    Recovery-ZF-xAPl5z-g15VN
RF Band         a
Encryption      pa2-psk-aes
WPA Hexkey      ********
WPA Passphrase  N/A
```

The output of this command displays the following information for the AP's mesh cluster profile and recovery cluster profiles:

Column	Description
`Cluster Name`	Name of the mesh cluster using this profile

Column	Description
`RF band`	The RF band in which the AP should operate: ■ **g** = 2.4 GHz ■ **a** = 5 GHz
`Encryption`	Data encryption setting for the mesh cluster profile. ■ **opensystem**—No authentication and encryption. ■ **wpa2-psk-aes**—WPA2 with AES encryption using a preshared key.
`WPA Hexkey`	The WPA pre-shared key (only for mesh cluster profiles using WPA2 with AES encryption).
`WPA Passphrase`	The WPA password that generates the preshared key (only for mesh cluster profiles using WPA2 with AES encryption).

show ap mesh neighbors

```
show ap mesh neighbors {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>} [names]
```

Description

Show all mesh neighbors for an AP.

Syntax

Parameter	Description
`ap-name <ap-name>`	Show mesh neighbors for an AP with a specific name.
`bssid <bssid>`	Show mesh neighbors for a specific Basic Service Set Identifier (BSSID) on an AP. The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
`ip-addr <ip-addr>`	Show mesh neighbors for an AP with a specific IP address by entering its IP address in dotted-decimal format.
`names`	If you include this optional parameter, the **Portal** column in the output of this command will translate the BSSIDs of mesh parent and child APs to AP names (where available).

Example

In the example below, the output has been split into two tables to better fit on the page. In the actual CLI, the output appears in a single, wide table. The **Flags** column the output of this command indicates the high-throughput (HT) properties of the mesh node. In the example below, the string "HT-40MHzsgi-2ss" indicates that the node uses a 40MHz channel with a short guard interval (sgi) and sends 2 spatial streams (ss).

```
(host) [mynode] #show ap mesh neighbors ap-name portal

```
Relation: P = Parent; C = Child; N = Neighbor; B = Blacklisted-neighbor
Flags: R = Recovery-mode; S = Sub-threshold link; D = Reselection backoff; F = Auth-failure; H
= High Throughput; L = Legacy allowed
```

The output of this command includes the following information:

Column	Description
MAC	MAC address of the mesh node.
Portal	By default, this column displays the BSSID of the mesh point. If you include the optional **names** parameter, this column will display AP names, if available. The AP names will include **[p]** (parent), or **[c]** (child) suffixes to indicate the role of the mesh BSSID.
Channel	Number of a radio channel used by the AP.
Age	Number of seconds elapsed since the AP heard from the neighbor.
Hops	Indicates the number of hops it takes traffic from the mesh node to get to the mesh portal. The mesh portal advertises a hop count of 0, while all other mesh nodes advertise a cumulative count based on the parent mesh node
Cost	A relative measure of the quality of the path from the AP to the Switch. A lower number indicates a better quality path, where a higher number indicates a less favorable path (e.g, a path which may be longer or more congested than a path with a lower value.) For a mesh point, the path cost is the sum of the (parent path cost) + (the parent node cost) + (the link cost).
Relation	Shows the relationship between the specified AP and the AP on the neighbor list and the amount of time that relationship has existed. ■ **P** = Parent ■ **C** = Child ■ **N** = Neighbor ■ **B** = Blacklisted-neighbor
Flags	This parameter shows additional information about the mesh neighbor. The key describing each flag appears at the bottom of the neighbor list.
RSSI	The Receive Signal Strength Indicator (RSSI) value displayed in the output of this command represents signal strength as a signal to noise ratio. For example, a value of 30 would indicate that the power of the received signal is 30 dBm above the signal noise threshold.
Rate Tx/Rx	The rate, in Mbps, that a neighbor transmits data to or receives data from the mesh-node specified by the command.
A-Req	Number of association requests from clients
A-Resp	Number of association responses from the mesh node
A-Fail	Number of association failures
Cluster	Name of the Mesh cluster that includes the specified AP or BSSID.

show ap mesh tech-support

```
show ap mesh tech-support ap-name <ap-name> <filename>
```

Description

Display all information for an AP, and save that information in a file on the Switch.

Syntax

Parameter	Description
`<ap-name>`	Name of an AP for which you want to create a report.
`<filename>`	Filename for the report created by this command. The file can only be saved in the flash directory. If desired, you can use FTP or TFTP to copy the file to another destination.

Usage Guidelines

This command displays the output of the multiple mesh and debug CLI commands, then saves that data into a report file on the Switch's flash drive, where it can be analyzed for debugging purposes. The information in this report includes the output of the following commands:

- show ap mesh neighbors
- show ap mesh debug current-cluster
- show ap mesh debug provisioned-clusters
- show ap mesh debug counters
- show ap mesh debug forwarding-table
- show ap mesh debug meshd-log
- show ap mesh debug hostapd-log

show ap mesh topology

```
show ap mesh topology [long] [page <page>] [start <start>]
```

Description

Show the mesh topology tree.

Syntax

Parameter	Description
`long`	Include the names of a mesh portal's children in the output of this command.
`page <page>`	Limit the output of this command to a specific number of entries by entering the number of entries you want to display.
`start <start>`	Start displaying the mesh topology tree at a chosen index number by entering the index number of the AP at which command output should start.

Example

An **(N)** in the **Mesh Role** column indicates the node is 11N capable. An **(N)** beside the parent name in the **Parent** column indicates that the mesh node's the parent is also 11N capable.

(host) [mynode] #show ap mesh topology

Mesh Cluster Name: sw-ad-GB32

```
------------------------------
Name Mesh Role   Parent  Path Cost  Node Cost  Link Cost  Hop Count  RSSI  Rate Tx/Rx
---- ---------  ------ --------- --------- --------- --------- ---- ---------- Last Update   Uplink Age   #Children
---------- ---------- ---------

ad-ap Point (N)   mp3    2        0        0        1        61    300/270    6m:12s      3h:8m:7s    0

msc-1 Point       mp3    2        0 0        1        64    54/54      6m:36s      2h:48m:12s  0
```

Total APs :2
(R): Recovery AP. (N): 11N Enabled. For Portals 'Uplink Age' equals uptime.

The output of this command includes the following information:

Column	Description
`Name`	Name of the mesh node.
`Mesh Role`	An AP operating as a mesh node can have one of two roles: mesh portal or mesh point.
`Parent`	If the AP is operating as a mesh point, this parameter displays the name of its parent mesh portal.
`Path Cost`	A relative measure of the quality of the path from the AP to the Switch. A lower number indicates a better quality path, where a higher number indicates a less favorable path (e.g, a path which may be longer or more congested than a path with a lower value.)

Column	Description
	For a mesh point, the path cost is the sum of the (parent path cost) + (the parent node cost) + (the link cost).
`Node Cost`	A relative measure of the quality of the node, where a lower number of is more favorable than a higher number. This cost is related to the number of children on the specified node.
`Link Cost`	A relative measure of the quality of the link. For example, a more congested link will have a higher link cost than a similar, less-congested link.
`Hop Count`	Number of hops to the mesh portal.
`RSSI`	The Receive Signal Strength Indicator (RSSI) value displayed in the output of this command represents signal strength as a signal to noise ratio. For example, a value of 30 would indicate that the power of the received signal is 30 dBm above the signal noise threshold.
`Rate Tx/Rx`	The rate, in Mbps, that a mesh point transmits and receives at on its uplink. Note that the rate information is only as current as indicated in the **Last Update** column.
`Last Update`	Time elapsed since the mesh node last updated its statistics.
`Uplink Age`	Time elapsed since the mesh node became active in the mesh topology.
`#Children`	Number of children associated with a parent mesh point.

show ap mesh-cluster-profile

```
show ap mesh-cluster-profile [<profile>]
```

Description

Show configuration settings for a mesh cluster profile.

Syntax

Parameter	Description
`<profile>`	Name of a mesh cluster profile

Usage Guidelines

The command **show ap mesh-cluster-profile** displays a list of all mesh cluster profiles configured on the Mobility Master, including the number of references to each profile and each profile's status. Include the optional <profile> parameter to show detailed settings for an individual mesh cluster profile.

Examples

The example below shows the configuration settings for the mesh cluster profile "meshcluster2".

```
(host)[mynode] #show ap mesh-cluster-profile meshcluster2

Mesh Cluster profile "meshcluster2"
-----------------------------
Parameter       Value
---------       -----
Cluster Name    company-mesh
RF Band         a
Encryption      opensystem
WPA Hexkey      N/A
WPA Passphrase  N/A
```

The output of this command includes the following information:

Parameter	Description
`Cluster Name`	Name of the mesh cluster using this profile
`RF band`	The RF band in which the AP should operate: ■ **g** = 2.4 GHz ■ **a** = 5 GHz
`Encryption`	Data encryption setting for the mesh cluster profile. ■ **opensystem**—No authentication and encryption. ■ **wpa2-psk-aes**—WPA2 with AES encryption using a preshared key.
`WPA Hexkey`	The WPA PSK (only for mesh cluster profiles using WPA2 with AES encryption).
`WPA Passphrase`	The WPA password that generates the preshared key (only for mesh cluster profiles using WPA2 with AES encryption).

show ap mesh-ht-ssid-profile

```
show ap mesh-ht-ssid-profile [<profile>]
```

Description

Show configuration settings for a mesh high-throughput Service Set Identifier (SSID) profile.

Syntax

Parameter	Description
`<profile>`	Name of a mesh high-throughput SSID profile.

Usage Guidelines

High-throughput APs support additional settings not available in legacy APs. A mesh high-throughput SSID profile can enable or disable high-throughput (802.11n) features and 40 Mhz channel usage, and define values for aggregated MAC protocol data units (MDPUs) and Modulation and Coding Scheme (MCS) ranges.

The command **show ap mesh-ht-ssid-profile** displays a list of all mesh high-throughput SSID profiles configured on the Mobility Master, including the number of references to each profile and each profile's status. Include the optional **<profile>** parameter to show detailed settings for an individual mesh high-throughput SSID profile.

Examples

The example below shows the configuration settings for the mesh high-throughput radio profile "default".

```
(host) [mynode] #show ap mesh-ht-ssid-profile default

Mesh High-throughput SSID profile "default"
-------------------------------------------
Parameter                                                    Value
---------                                                    -----
40 MHz channel usage                                         Enabled
BA AMSDU Enable                                              Enabled
Temporal Diversity Enable                                    Disabled
High throughput enable (SSID)                                Enabled
Legacy stations                                              Allowed
Low-density Parity Check                                     Enabled
Maximum number of spatial streams usable for STBC reception  1
Maximum number of spatial streams usable for STBC transmission  1
MPDU Aggregation                                             Enabled
Max received A-MPDU size                                     65535 bytes
Max transmitted A-MPDU size                                  65535 bytes
Min MPDU start spacing                                       8 usec
Short guard interval in 20 MHz mode                          Enabled
Short guard interval in 40 MHz mode                          Enabled
Supported MCS set                                            0-23
```

The output of this command includes the following information:

Column	Description
40 MHz channel usage	This parameter shows if the profile enables or disables the use of 40 MHz channels.
BA AMSDU Enable	Shows of the AP has enabled or disabled the ability to receive AMSDU in BA negotiation.
Temporal Diversity Enable	Shows if temporal diversity has been enabled or disabled. When this feature is enabled and the client is not responding to 802.11 packets, the AP will launch two hardware retries; if the hardware retries are not successful then it attempts software retries.
High throughput enable (SSID)	Shows if 802.11n high-throughput features are enabled or disabled for this profile. By default, high-throughput features are enabled.
Legacy stations	Allow or disallow associations from legacy (non-HT) stations. By default, this parameter is enabled (legacy stations are allowed).
Low-density Parity Check	If enabled, the AP will advertise Low-density Parity Check (LDPC) support. LDPC improves data transmission over radio channels with high levels of background noise.
Maximum number of spatial streams usable for STBC reception	Shows the maximum number of spatial streams usable for STBC reception. 0 disables STBC reception, 1 uses STBC for MCS 0-7. Higher MCS values are not supported. (Supported on the OAW-AP130 Series, OAW-AP 170 Series, and OAW-AP105 only. The configured value will be adjusted based on AP capabilities.) **NOTE:** If transmit beamforming is enabled, STBC will be disabled for beamformed frames.
Maximum number of spatial streams usable for STBC transmission	Shows the maximum number of spatial streams usable for STBC transmission. 0 disables STBC transmission, 1 uses STBC for MCS 0-7. Higher MCS values are not supported. (Supported on OAW-AP 170 Series, OAW-AP130 Series, and OAW-AP105 only. The configured value will be adjusted based on AP capabilities.) **NOTE:** If transmit beamforming is enabled, STBC will be disabled for beamformed frames.
MPDU Aggregation	Shows if the profile enables or disables MAC protocol data unit (MPDU) aggregation.
Max received A-MPDU size	Configured maximum size of a received aggregate MPDU, in bytes.
Max transmitted A-MPDU size	Configured maximum size of a transmitted aggregate MPDU, in bytes.
Min MPDU start spacing	Configured minimum time between the start of adjacent MPDUs within an aggregate MPDU, in microseconds.

Column	Description
`Supported MCS set`	Displays a list of Modulation Coding Scheme (MCS) values or ranges of values to be supported on this SSID. The MCS you choose determines the channel width (20MHz vs. 40MHz) and the number of spatial streams used by the mesh node.
`Short guard interval in 20 MHz mode`	Shows if the profile enables or disables use of short (400ns) guard interval in 20 MHz mode.
`Short guard interval in 20 MHz mode`	Shows if the profile enables or disables use of short (400ns) guard interval in 40 MHz mode.
Explicit Transmit Beamforming	Shows if Explicit Transmit Beamforming is enabled or disabled for OAW-AP130 Series APs. **NOTE:** If this parameter is disabled, the other transmit beamforming configuration settings have no effect.
Transmit Beamforming Compressed Steering	When enabled, the AP can use explicit compressed feedback from clients to obtain a steering matrix. (For OAW-AP130 Series APs only.)
Transmit Beamforming non Compressed Steering	When enabled, the AP can use explicit noncompressed feedback from clients to obtain a steering matrix. (For OAW-AP130 Series only)
Transmit Beamforming delayed feedback support	Shows if the AP has enabled or disabled delayed feedback/report support in Transmit Beamforming. (For OAW-AP130 Series only)
Transmit Beamforming immediate feedback support	Shows if the AP has enabled or disabled immediate feedback/report support in Transmit Beamforming. (For OAW-AP130 Series only)
Transmit Beamforming Sounding Interval	Time interval in seconds between updates of Transmit Beamforming channel estimation. (For OAW-AP130 Series only)

show ap mesh-radio-profile

```
show ap mesh-radio-profile [<profile>]
```

Description

Show configuration settings for a mesh radio profile.

Syntax

Parameter	Description
`<profile>`	Name of a mesh radio profile.

Usage Guidelines

The radio profile determines the radio frequency/channel used only by mesh nodes to establish mesh links. Mesh nodes operating in different cluster profiles can share the same radio profile. Conversely, mesh portals using the same cluster profile can be assigned different mesh radio profiles to achieve frequency separation.

The command **show ap mesh-radio-profile** displays a list of all mesh radio profiles configured on the Switch, including the number of references to each profile and each profile's status. Include the optional *<profile>* parameter to show detailed settings for an individual mesh radio profile.

Example

The example below shows the configuration settings for the mesh cluster profile "default".

```
(host) [mynode] #show ap mesh-radio-profile default
Mesh Radio profile "default"
----------------------------
Parameter                                                    Value
---------                                                    -----
802.11a Transmit Rates                                       6 9 12 18 24 36 48 54
802.11g Transmit Rates                                       1 2 5 6 9 11 12 18 24 36 48 54
Allowed VLANs on mesh link                                   1-4094
BC/MC Rate Optimization                                      Enabled
Heartbeat threshold                                          10
Link Threshold                                               12
Maximum Children                                             64
Maximum Hop Count                                            8
Mesh Private Vlan                                            0
Mesh High-throughput SSID Profile                            default
Mesh Survivability                                           Disabled
Metric algorithm                                             distributed-tree-rssi
Rate Optimization for delivering EAPOL frames and mesh echoes Disabled
Reselection mode                                             startup-subthreshold
Retry Limit                                                  8
RTS Threshold                                                2333 bytes
```

The output of this command includes the following information:

Parameter	Description
802.11a Transmit Rates	Indicates the transmit rates for the 802.11a radio. The AP attempts to use the highest transmission rate to establish a mesh link. If a rate is unavailable, the AP goes through the list and uses the next highest rate.
802.11g Transmit Rates	Indicates the transmit rates for the 802.11g radio. The AP attempts to use the highest transmission rate to establish a mesh link. If a rate is unavailable, the AP goes through the list and uses the next highest rate.
Allowed VLANs on mesh link	Specify a list of VLAN IDs that can be used by a mesh link on APs associated with this mesh radio profile
BC/MC Rate Optimization	If enabled, the mesh node will use the slowest associated mesh-point rate for broadcast/multicast data (rather than minimum).
Heartbeat Threshold	Indicates the maximum number of heartbeat messages that can be lost between neighboring mesh nodes before the mesh node is considered inactive and is dropped as a mesh neighbor.
Link Threshold	Indicates the threshold for the lowest acceptable Receive Signal Strength Indicator (RSSI) value. Links that drop below this threshold will have an increased link cost. Default: 12.
Maximum Children	The maximum number of children a mesh portal can accept.
Maximum Hop Count	The maximum number of hops allowed between a mesh point and a mesh portal.
Mesh Private Vlan	This parameter is experimental and reserved for future use.
Mesh High-throughput SSID Profile	The High-throughput SSID Profile associated with this mesh radio profile.
Mesh Survivability	This parameter shows if mesh points and portals can become active even if the Switch cannot be reached by bridging LAN traffic. This is a beta feature that is disabled by default; it should not be enabled unless you are instructed to do so by Alcatel-Lucent technical support.
Metric algorithm	Algorithm used by a mesh node to select its parent.
Rate Optimization for delivering EAPOL frames and mesh echoes	If this option is enabled, mesh APs will use a more conservative rate for more reliable delivery of EAPOL frames.
Reselection Mode	Specifies the one of the following methods used to find a better mesh link. ■ **startup-sub-threshold**: When bringing up the mesh network, mesh nodes have 3 minutes to find a better uplink. After that time, each mesh node evaluates alternative links only if the existing uplink falls below the configured threshold level (the link becomes a sub-threshold link). The reselection process is canceled if the average RSSI rises on the existing uplink rises above the configured link threshold. ■ **reselect-any-time:** Connected mesh nodes evaluate alternative mesh links every 30 seconds. If a mesh node finds a better uplink, the mesh node connects to the new parent to create an improved path to the mesh portal. ■ **reselect-never**: Connected mesh nodes do not evaluate other mesh links to create an improved path to the mesh portal. ■ **subthreshold-only**: Connected mesh nodes evaluate alternative

Parameter	Description
	links only if the existing uplink becomes a sub-threshold link.
`Retry Limit`	Maximum number of times a mesh node can re-send a packet.
`RTS Threshold`	The packet size sent by mesh nodes. Mesh nodes transmitting frames larger than this threshold must issue request to send (RTS) and wait for other mesh nodes to respond with clear to send (CTS) to begin transmission. This helps prevent mid-air collisions.

Description

Show information for Alcatel-Lucent Air Monitors.

Syntax

Parameter	Description
`active-laser-beams`	Show active laser beam generators. The output of this command shows a list of all APs that are actively performing policy enforcement containment such as rogue containment. This command can tell us which AP is sending out deauthorization frames, although it does not specify which AP is being contained.
`ap-list`	Show list of APs being monitored.
`arp-cache`	Show ARP Cache of learned IP to MAC binding
`channel`	Show state and stats of a specific channel.
`client-list`	Show list of client being monitored.
`containment-info`	Show containment events and counters triggered by the wired containment and wireless containment features configured in the ids general-profile. The output of this command shows device and target data for wired containment activity, a well as data for the following counters. Wireless Containment Counters: ■ Last Deauth Timer Tick ■ Deauth frames to AP ■ Deauth frames to Client ■ Last Tarpit Timer Tick

Parameter	Description
	■ Tarpit Frames: Probe Response ■ Tarpit Frames: Association Response ■ Tarpit Frames: Authentication ■ Tarpit Frames: Data from AP ■ Tarpit Frames: Data from Client ■ Last Enhanced Adhoc Containment Timer Tick ■ Enhanced Adhoc Containment: Frames To Data Sender ■ Enhanced Adhoc Containment: Frames To Data Receiver ■ Enhanced Adhoc Containment: Response to Request ■ Enhanced Adhoc Containment: Replay Response Wired Containment Counters: ■ Last Wired Containment Timer Tick ■ Last Tagged Wired Containment Timer Tick ■ Spoof frames sent ■ Spoof frames sent on tagged VLAN
`debug`	Show the Air Monitor debugging information.
`counters`	Shows the maximum classification delay that was observed in monitored APs and clients, the number of Unclassified Device messages that were sent to the WMS, and the number of monitored APs/clients that were present in those messages. This parameter also shows the number of monitored APs/clients that were created and removed by the AP. This information is captured on an hourly basis for the last 24 hours. **NOTE:** The maximum delay for clients is not displayed if the **unclass_sta_update** parameter is not enabled.
`profile-config`	Shows the configuration received by the AP for each profile.
`status`	Shows general AP status information and the maximum classification delay that was observed in monitored APs and clients, in the **WLAN Interface** option. **NOTE:** The maximum delay for clients is not displayed if the **unclass_sta_update** parameter is not enabled.
`ids-state`	Show IDS State.
`ap-name`	Name of Access Point.
`bssid`	BSSID of Access Point.
`ip-addr`	IP Address of Access Point.
`ip6-addr`	IPv6 Address of Access Point.
`mesh-list`	Show list of Mesh APs being monitored.
`pot-ap-list`	Display the Potential AP table. The Potential AP table shows the following data: ■ **bssid**: the AP's Basic Service Set Identifier. ■ **channel**: The AP's current radio channel ■ **phy type**: The radio's PHY type. Possible values are 802.11a, 802.11a-HT-40, 802.11b/g, 802.11b/g-HT-20. ■ **num-beacons**: Number of beacons seen during a 10-second scan ■ **tot-beacons**: Total number of beacons seen since the last reset. ■ **num-frames**: Total number of frames seen since the last rest. ■ **mt**: Monitor time; the number of timer ticks elapsed since the

Parameter	Description
	Switch first recognized the AP. ■ **at**: Active time, in timer ticks. ■ **ibss**: Shows if adhoc BSS is enabled or disabled. It will be enabled if the bssid has detected an adhoc BSS (an ibss bit in an 802.11 frame). ■ **rssi**: The Receive Signal Strength Indicator (RSSI) value displayed in the output of this command represents signal strength as a signal to noise ratio. For example, a value of 30 would indicate that the power of the received signal is 30 dBm above the signal noise threshold.
`pot-client-list`	Display the Potential client table. The Potential Client table shows the following values: ■ **last-bssid**: the Last BSSID to which the client associated. ■ **from-bssid** ■ **to-bssid** ■ **mt:** monitor time - the number of timer ticks elapsed since the Switch first recognized the client. ■ **it:** client idle time - expressed as a number of timer ticks.
`routers`	Show Router MAC Addresses learned. The output of this command includes the router's MAC address, IP address and uptime.
`scan-info`	Show AP scanning information.
`stats`	Shows statistics for an AP or a client.
`mac <mac>`	MAC address of an AP or a client
`duration <duration>`	Duration to compute average signal strength in minutes. Default is 1 minute.
`verbose`	Shows statistics in verbose mode.
`stats advanced`	Shows advanced statistics for an AP or a client.
`client-mac <client-mac>`	MAC address of client
`wired-mac`	Show Wired MAC Addresses learned.
`ap-name <ap-name>`	Show data for an AP with a specific name.
`bssid <bssid>`	Show data for a specific Basic Service Set Identifier (BSSID) on an AP. The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
`ip-addr <ip-addr>`	Show data for an AP with a specific IP address by entering its IP address in dotted-decimal format.
`ip6-addr <ip6-addr>`	Show data for an AP with a specific IPv6 address by entering its IPv6 address in dotted-decimal format.
`ap-bssid <ap-bssid>`	Include the optional **ap-bssid <ap-bssid>** parameters to show how the AP is monitoring information for another AP with a specific BSSID.
`enet-mac <enet-mac>`	Include the optional e**net-mac <enet-mac>** parameters to show how the AP is monitoring information for an interface with a specific Ethernet MAC address.

Examples

The output of the command displays the Monitored AP table, which lists all the APs monitored by a specified AP or BSSID.

```
(host) #show ap monitor ap-list ap-name al12

Monitored AP Table
------------------

     false            false
```

The output of this command includes the following information:

Parameter	Description
bssid	Basic Service Set Identifier for (bssid) an AP. This is usually the AP's MAC address.
essid	Extended service set identifier that names a wireless network.
chan	Radio channel used by the BSSID.
ap-type	Shows classification of the AP.
phy-type	Radio phy type. Possible types include: ■ 802.11a ■ 802.11a-HT-40 ■ 802.11b/g ■ 802.11b/g-HT-20
dos	Shows if the feature to contain DoS attacks has been enabled or disabled.
dt/mt	**dt**—Detected time: the number of timer ticks since the AP was last detected. **mt**—Monitor time; the number of elapsed timer ticks since the AP first recognized the monitored AP.
ut/it	**ut**—Unseen time: the number elapsed timer ticks the monitored AP was not seen when scanning a channel of the device. **it**—AP idle time, the number of timer ticks since the AP last saw any frames from the monitored AP.
encr	Shows the encryption type of the BSSID. If there are multiple encryption types, this command shows the lowest encryption type.

Parameter	Description
`ntsas`	Shows the number of stations connected to the AP (as seen by the monitoring AP).
`avg-snr`	Shows the average Signal to Noise Ratio (SNR).
`curr-snr`	Shows the current Signal to Noise Ratio (SNR).
`avg-rssi`	Shows the average RSSI (Received Signal Strength) for the device. **NOTE:** RSSI is an indication of the power level being received by the antenna. Therefore, the higher the RSSI number, the stronger the signal.
`curr-rssi`	Shows the current RSSI for the device.
`wmacs`	Shows the number of unique wireless MAC addresses seen on the Wi-Fi network from the AP's BSSID.
`ibss`	Shows all the monitored APs (BSSIDs).
`cl-delay`	Shows the delay in classification of each device. **NOTE:** The maximum delay for clients is not displayed if the **unclass_sta_update** parameter is not enabled.
`bss-color`	Shows the bss color selected. Range: 1-63
`partial bss color`	Shows if it is partial bss enabled.
`bss color disabled`	Shows if the bss color configuration is disabled.

show ap monitor association

```
show ap monitor association {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>} <ap-bssid>
```

Description

Show the association table for an Air Monitor (AM).

Syntax

Parameter	Description
`ap-name <ap-name>`	Show data for an AM with a specific name.
`bssid <bssid>`	Show data for an AM with a specific Basic Service Set Identifier (BSSID). The Basic Service Set Identifier (BSSID) is usually the AM's MAC address.
`ip-addr <ip-addr>`	Show data for an AM with a specific IP address by entering its IP address in dotted-decimal format.
`<ap-bssid>`	BSSID of an AP.

Examples

The output of the command lists the MAC addresses associated with the Air Monitor BSSID.

```
(host) #show ap monitor association ap-name ap9 00:1a:1e:11:74:a1
Association Table

```

The output of this command includes the following information:

Column	Description
`mac`	MAC address associated with the Air Monitor BSSID
`rsta-type`	Rogue station type: ■ **interfering**: Interfering station. ■ **valid**: Station is not a rogue station. ■ **DoS**: Station may have attempted a DoS attack.
`auth`	Displays a **yes** if the client has been authenticated.
`phy-type`	The RF band in which the AP should operate: **802.11g** = 2.4 GHz **802.11a** = 5 GHz

Related Commands

Command	Description
am	The **scan** sub-command enables channel scanning for the specified air monitor. In addition, the **test** sub-command enables the client to test an air monitor..

Description

Show information for an Air Monitor's current status, message counters, or profile settings.

Syntax

Parameter	Description
`counters`	Show Air Monitor (AM) message counters.
`status`	Show the status of an Air Monitor.
`ap-name <ap-name>`	Show data for an AM with a specific name.
`bssid <bssid>`	Show data for an AM with a specific Basic Service Set Identifier (BSSID). The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
`ip-addr <ip-addr>`	Show data for an AM with a specific IP address by entering its IPv4 address in dotted-decimal format.
`ip6-addr <ip6-addr>`	Show data for an AM with a specific IP address by entering its IPv6 address in dotted-decimal format.
`profile-config`	Show an Air Monitor profile configuration.
`am-scan`	Show Air Monitor active scanning configuration.
`ap-radio`	Show the Air Monitor radio configuration parameters, as defined in the AM's 802.11a, 802.11b, or high-throughput radio profiles.
`ap-system`	Show an Air Monitor's system configuration settings, as defined in it's AP System profile.
`arm`	Show an Air Monitor's Adaptive Radio Management (ARM) settings, as defined in its current ARM profile
`event-thresholds`	Show an Air Monitor Event Thresholds settings, as defined in its current RF Event Thresholds profile
`ids-dos`	Show an Air Monitor IDS DoS settings, as defined in its current IDS DoS profile.
`ids-general`	Show an Air Monitor IDS General Configuration settings, as defined in its IDS General profile.
`ids-impersonation`	Show an Air Monitor IDS Impersonation Configuration settings, as defined in its IDS Impersonation profile.

Parameter	Description
ids-signature-matching	Show an Air Monitor IDS Signature Matching configuration settings, as defined in its IDS Signature Matching profile
ids-unauthorized-device	Show an Air Monitor IDS Unauthorized Device configuration settings, as defined in its IDS Unauthorized Device profile.
interference	Show an Air Monitor's interference configuration settings, as defined in its current RF Optimization profile.
regulatory-domain	Show an Air Monitor's Regulatory Domain configuration settings, as defined in its Regulatory Domain profile.
rf-behavior	Show an Air Monitor RF Behavior Configuration

Examples

The output of the following command includes the *WLAN Interface*, *Data Structures*, *WLAN InterfaceSwitch Status* and *RTLS Configuration* tables for the specified AP.

```
(host) #show ap monitor debug status ap-name ap12

The output of this command includes the following information:

Column	Description
bssid	The Basic Service Set Identifier (BSSID) for the AP. This is usually the AP's MAC address.
scan	Indicates whether or not if active scanning is enabled on this AP.
monitor	Indicates whether the AP radio is currently enabled or disabled.
probe-type	This parameter displays one of the following options to show the AP is configured. ■ **sap**: Default AP setting. ■ **am**: AP is configured as an Air Monitor. ■ **m-portal**: AP is configured as a Mesh portal. ■ **m-point**: AP is configured as a Mesh point.
task	This parameter displays one of the following options to show the radio's current task: ■ **scan**: AP is scanning other channels. ■ **tuned**: AP is tuned on one channel. ■ **locate**: AP has been asked to locate a specific AP or client. ■ **pcap**: The AP is enabled with the Packet Capture feature.
channel	The radio channel currently used by an AP's WLAN interface.
pkts	Number of packets seen on the interface.
mac	MAC address for the AP's wired interface.
ip	The AP's IP address.
gw-ip	IP address for the AP's gateway.
gw-mac	MAC address for the AP's gateway.
status	Shows if the interface is currently enabled or disabled.
pkts	Number of packets seen on the AP's wired interface.
macs	Number of MAC addresses in the Wired MAC table for that interface.
gw-macs	Number of MAC addresses in the Wired MAC table for that interface.
tagged-pkts	Number VLAN-tagged packets sent to that interface.
vlan	The VLAN ID for the packets sent to that interface.
Packets read	Number of packets read by the AP since it was last reset.
Bytes read	Number of bytes read by the AP since it was last reset.
Num Intercepts	Number of interrupts from the AP's driver.

Column	Description
Num Buffer Overflows	Number of times excessive traffic has filled the AP's buffers.
Max PPS	Maximum throughput rate seen on the interface, in packets per second.
Cur PPS	Current throughput rate seen on the interface, in packets per second.
Max PPI	Maximum interrupt rate seen on the interface, in interrupts per second.
Cur PPI	Current interrupt rate seen on the interface, in interrupts per second.
Uptime	Number of seconds since the AP was last reset.
LMS IP	IP address of the AP's managed device
Master IP	IP address of the AP's Mobility Master.
AP type	AP model type.
Country Code	The AP's country code. Valid radio channels for your wireless network are based on your country code. If you change the AP's country code, the valid channels will be reset to the defaults for the new country.
ap	Number of other APs monitored by this AP.
sta	Number of clients and APs seen by this AP.
pap	Number of potential APs; APs which have transmitted a beacon, but have not yet been registered.
psta	Number of potential stations; AP has seen a MAC address from the station but hasn't yet received traffic from it.
ch	Number of channel entries in the channel table.
msg-hash	Number of different message types seen on the interface.
ap-l	(For internal use only)
WMS on Master	Indicates if the AP communicates to the wms process on Mobility Master or a managed device. **enabled**: Communicates with Mobility Master. **disabled**: Communicates with a managed device only.
Stats Update Interval	If the AP is collecting statistics, this value is the interval in seconds in which the AP sends statistics to the WMS process.
Poll Interval	Interval, in milliseconds, that the AP sends RSSI updates to the WMS process.
Num Switches	Number of Switches to which this AP has access. If the value is 1, the AP has access to Mobility Master *or* a managed device. If the value is 2, the AP has access to Mobility Master *and* a managed device.
Collect Stats	If enabled, the AP will collect statistics to send to the WMS process.
Bssid	BSSID of the radio.
Type	Indicates whether the Switch type is **master** (Mobility Master) or **local** (managed device).

Column	Description
Status	If **up**, the AP can reach the managed device. If **down**, the AP cannot reach the managed device.
Last-reg	The time the AP last registered with the WMS process.
N-reg	Number of times the AP has registered with the WMS process.
Last-update	The last timer tick time the AP updated the WMS process.
Next-update	Interval between the last update and the next scheduled update.
N-updates	Number of updates sent to the WMS process.
Last-ack	Number of timer ticks since the AP received an acknowledgement from the WMS process.
Type	Type of RTLS server used by the AP, such as MMS or Aeroscout.
Server IP	IP address of the RTLS server.
Port	Port used by the RTLS server.
Frequency	Rate, in seconds, at which RTLS messages are sent to the server.
Active	Indicates if the server is active on the AP.
Rpt-Tags	Displays whether tag reporting is enabled or not.
Tag-Mcast-Addr	Displays MAC OUI of the tags that are forwarded to the server.
Tags-Sent	Displays the cumulative count of the tag reports sent to server.
Rpt-Sta	Displays whether station reporting is enabled or not.
Incl-Unassoc-Sta	Displays whether unassociated stations are included in station reporting or not.
Sta-Sent	Displays cumulative count of station reports sent to server.
Cmpd-Msgs-Sent	Displays cumulative count of compound messages containing station reports sent to server.

Command	Description
	■ The output of the **show ap monitor debug status** command displays both IPv4 and IPv6 addresses. ■ The output of the **show ap monitor debug status** command includes the new counters to differentiate the distribution of DATA, MGMT, CTRL, and AGGR packets.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable or Config mode on Mobility Master.

show ap monitor stats

```
show ap monitor stats advanced {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>}|{ip6-addr <ip6-addr>} client-mac <client-mac>

show ap monitor stats {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>}||{ip6-addr <ip6-addr>} mac <mac> <verbose>
```

Description

Show packet, signal and channel statistics for an AP or a client.

Syntax

Parameter	Description
`advanced`	Show advanced statistics for an AP or client.
`ap-name <ap-name>`	Show statistics for an AP with a specific name.
`bssid <bssid>`	Show data for a specific Basic Service Set Identifier (BSSID) on an AP. The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
`ip-addr <ip-addr>`	Show data for an AP with a specific IP address by entering its IP address in dotted-decimal format.
`ip6-addr <ip6-addr>`	Show data for an AP with a specific IPv6 address by entering its IPv6 address in dotted-decimal format.
`mac <mac>`	Show data for a specific MAC address by entering the MAC address of a client or AP.
`client-mac <client-mac>`	Show data for a specific client MAC address by entering the MAC address of a client.
`verbose`	Enable verbose mode to display the statistics of an AP.

Example

The output of the following command shows monitoring statistics for the AP ap305, and a client with the MAC address d8:6c:02:99:bc:7a.

```
(host) #show ap monitor stats ap-name ap305 mac d8:6c:02:99:bc:7a verbose

```

The output of this command includes the following information:

Column	Description
retry	Percent of 802.11 retry frames sent because a client failed to send an ACK.
Low-speed	Percent of frames sent at a data rate of 18 Mbps or slower.
non-unicast	Percent of non-unicast frames
recev-error	Percent of error frames of all frames seen in the last second.
frag	Rate of fragmented packets, in frames per second
bwth	Current bandwidth, in bps.
avg-signal	Average signal-to-noise ratio over the interval since the AP's last reset.
Low-signal	Lowest signal-to-noise ratio over the interval since the AP's last reset.

Column	Description
high-signal	Highest signal-to-noise ratio over the interval since the AP's last reset.
count	Number of packets seen on the AP over the interval since the AP's last reset.
Duration	Time over which the AP has measured RSSI values.
tx	The total number of deauthorization frames sent to this MAC address for containment in the interval from the AP's last reset until the current timer tick.
old-tx	The total number of deauthorization frames sent to this MAC address for containment until the previous timer tick.
rx	The total number of deauthorization frames spoofing the MAC address in the interval from the AP's last reset until the current timer tick.
old-rx	The total number of deauthorization frames sent to this MAC address for containment until the previous timer tick.
FRR	Frame retry rate, in frames per second.
FRER	Frame error retry rate, in frames per second.
rssi-index	This value indicates the number of consecutive timer ticks over which the value of the Receive Signal Strength Indicator (RSSI) of the client has reduced by more than 3 units. **NOTE:** This value is updated only if 'handoff-assist' is enabled in the AP's RF Optimization profile.
cur-signal	The Receive Signal Strength Indicator (RSSI) of the most recent frame received from the specified MAC address.
old-cur-signal	The most recent Receive Signal Strength Indicator (RSSI) of the MAC which is 3 lower or 5 higher than the current RSSI. **NOTE:** This value is updated only if 'handoff-assist' is enabled in the AP's RF Optimization profile
ht-type	This parameter indicates support for the following HT types: **no**: No support for high-throughput. **HT-20**: Support for 20 Mhz high-throughput only. **HT-40**: Support for 40 Mhz high-throughput.
primary-channel	Primary radio channel.
sec-channel	Secondary radio channel
gf-supported	If **1**, this AP supports greenfield mode. If **0**, greenfield is not supported.
40mhz-intolerance	Indicates whether the specified MAC address is 40 Mhz intolerant.

AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on managed devices.

show ap packet capture

```
show ap pcap status {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>}
```

Description

Show the status of outstanding packet capture (pcap) sessions.

Syntax

Parameter	Description
`ap-name <ap-name>`	Show data for an AP with a specific name.
`bssid <bssid>`	Show data for a specific Basic Service Set Identifier (BSSID) on an AP. The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
`ip-addr <ip-addr>`	Show data for an AP with a specific IP address by entering its IP address in dotted-decimal format.

Usage Guidelines

The Packet Capture (pcap) feature copies control path packets from the Alcatel-Lucent Control Processor, providing visibility for packets to or from the Switch. This provides a useful troubleshooting tool for diagnosing communication problems with elements such as a Radius server. You can retrieve these packets by issuing the command **tar logs**, and then viewing the file filter.pcap on the Switch's flash drive.

Example

The example below shows the Packet Capture Sessions table for an AP named AP16.

```
(host) #show ap pcap status ap-name AP16
Packet Capture Sessions
-----------------------
pcap-id  filter  type  intf              channel max-pkt-size  num-pkts  status       url
target
-------  ------  ----  ----              ------- ------------  --------  ------       ---  --
----
1                raw   00:1a:1e:82:ab:b0  161
                                       in-progress       10.3.9.225/5555
```

The output of this command includes the following information:

Column	Description
`pcap-id`	ID number of the packet capture session.
`filter`	Packet Capture filter specification.
`type`	A **raw** packet capture type indicates that the Switch is streaming raw packets to an external viewer.
`intf`	BSSID of the interface for the PCAP session.
`channel`	Channel used by AP to capture packets.

Column	Description
`max-pkt-size`	Maximum size of all captured packets.
`num-pkts`	Number of packets captured during the session.
`status`	Shows the current status of the packet-capture session.
`url`	Packet capture data can be downloaded to this URL.
`target`	IP address of the client station running Wildpacket's AiroPeek monitoring application.

Related Commands

Command	Description
packet-capture	Use this command to enable or disable packet capturing and set packet capturing options for a single packet capture session.

show ap papi-err

```
show ap papi-err {ap-name <ap-name>|bssid <bssid>|ip-addr <ip-addr>|ip6-addr <ip6-addr>}
```

Description

Show PAPI error messages.

Syntax

Parameter	Description
`ap-name <ap-name>`	Show data for an AP with a specific name.
`bssid <bssid>`	Show data for a specific Basic Service Set Identifier (BSSID) on an AP. The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
`ip-addr <ip-addr>`	Show data for an AP with a specific IP address by entering its IP address in dotted-decimal format.
`ip6-addr <ip6-addr>`	Show data for an AP with a specific IPv6 address by entering its IPv6 address in dotted-decimal format.

Examples

The output of the command displays the status.

```
(host) #show ap papi-err
STM SAP PAPI Send Error
-----------------------
Name  bssid  ip  Tunnel Add  Tunnel Remove  Arp Req  Vlan Req  Sta Req  Mcast Req
----  -----  --  ----------  -------------  -------  --------  -------  ---------
```

Related Commands

show ap port status

```
ap-name <ap-name>
bssid <bssid>
ip-addr <ip-addr>
ip6-addr <ip6-addr>
wired-mac <wired-mac>
```

Description

Shows the status of the AP's wired ports. The status is updated every 60 seconds.

Syntax

Parameter	Description
`ap-name <ap-name>`	Name of the AP.
`bssid <bssid>`	BSSID of the AP.
`ip-addr <ip-addr>`	IP address of the AP.
`ip6-addr <ip6-addr>`	IPv6 address of the AP.
`wired-mac <wired-mac>`	MAC address of the AP.

Examples

The output of the command displays the wired port status of an AP named **LocalAP1**. In this example, the output is divided into multiple sections to fit better on the pages of this document. In the actual CLI, it appears in a single long table.

```
(host) #show ap port status ap-name LocalAP1

AP "LocalAP1" Port Status (updated every 60 seconds)

show ap power-mgmt-statistics

```
show ap power-mgmt-statistics {ap-name <ap-name> | ip-addr <ip-addr> | ip6-addr <ip6-addr>}
```

Description

This command shows the power status statistics of an AP connected to a Managed Device.

Syntax

Parameter	Description
`ap-name <ap-name>`	Shows the statistics of the specified AP name.
`ip-addr <ip-addr>`	Shows the specified IP address.
`ip6-addr <ip6-addr>`	Shows the specified IPv6 address.

Usage Guidelines

Issue this command to get power status statistics of an AP connected to a managed device.

Example

The following is an example for executing the **show ap power-mgmt-statistics** command.

```
(host) #show ap power-mgmt-statistics ap-name 00:4e:35:c4:47:06
AP Power Mgmt Status, Last update at 2019-09-26 16:43:13

530 Series and 550 Series access points	Base operating system.	Enable or Config mode on the managed device or Switch where the AP terminates.

show ap profile-usage

```
show ap profile-usage {ap-name <ap-name>|bssid <bssid>|ip-addr <ip-addr>}
```

Description

Show a complete list of all profiles referenced by an individual AP or an AP BSSID.

Syntax

Parameter	Description
`ap-name <ap-name>`	Show data for an AP with a specific name.
`bssid <bssid>`	Show data for a specific Basic Service Set Identifier (BSSID) on an AP. The Basic Service Set Identifier (BSSID) is usually the AP's MAC address.
`ip-addr <ip-addr>`	Show data for an AP with a specific IP address by entering its IP address in dotted-decimal format.

Usage Guidelines

Use this command to monitor the configuration profiles in use by an AP or a specific BSSID. The output of this command shows the name of each profile type that is associated with the AP or BSSID, as well as the source that associates the profile with the AP.

Related Commands

show ap provisioning

```
show ap provisioning {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>}
```

Description

Show provisioning parameters currently used by an AP.

Syntax

Parameter	Description
`ap-name <ap-name>`	Show data for an AP with a specific name.
`bssid <bssid>`	Show data for a specific Basic Service Set Identifier (BSSID) on an AP. An AP's BSSID is usually the AP's MAC address.
`ip-addr <ip-addr>`	Show data for an AP with a specific IP address.

Example

```
The output of this command shows that the AP named AP8 has mostly default parameters. These
appear with the value N/A.
(host) #show ap provisioning ap-name AP8

```

The output of this command includes the following information:

Column	Description
AP Name	Name of the AP.
AP Group	AP group to which the AP belongs.
Location name	Fully-qualified location name (FQLN) for the AP.
SNMP sysLocation	User-defined description of the location of the AP, as defined with the command provision-ap syslocation.
Master	Name or IP address for Mobility Master.
Gateway	IP address of the default gateway for the AP.
Netmask	Netmask for the AP's IP address.
IP Addr	IP address for the AP.
IPv6	The static IP6 address of the AP.6
IPv6 Prefix	The prefix of static IPv6 address of the AP.
Dns IP	IP address of the DNS server.
DNS IPv6	The prefix of static IPv6 address of the AP.
Domain Name	Domain name used by the AP.
Server Name	DNS name of the managed device from which the AP boots.
Server IP	IP address of the managed device from which the AP boots
Antenna gain for 802.11a	Antenna gain for 802.11a (5GHz) antenna.
Antenna gain for 802.11g	Antenna gain for 802.11g (2.4GHz) antenna.
Antenna for 802.11a	Antenna use for 5 GHz (802.11a) frequency band. ■ **1**: AP uses antenna 1 ■ **2**: AP uses antenna 2 ■ **both**: AP uses both antennas
Antenna for 802.11g	Antenna use for 2.4 GHz (802.11g) frequency band. ■ **1**: AP uses antenna 1 ■ **2**: AP uses antenna 2 ■ **both**: AP uses both antennas

Column	Description
Single chain mode for Radio 0	If this parameter is set to 1 for an 802.11n-capable radio, the radio will operate in single-chain mode, and will transmit and receive data using only legacy rates and single-stream HT rates up to MCS 7. This parameter is set to 0 (disabled) by default.
Single chain mode for Radio 1	If this parameter is set to 1 for an 802.11n-capable radio, the radio will operate in single-chain mode, and will transmit and receive data using only legacy rates and single-stream HT rates up to MCS 7. This parameter is set to 0 (disabled) by default.
IKE PSK	IKE PSK The IKE pre-shared key.
PAP password	Password Authentication Protocol (PAP) password for the AP.
PAP User Name	PAP username for the AP.
PPPOE User Name	Point-to-Point Protocol over Ethernet (PPPoE) user name for the AP.
PPPOE Password	PPPoE password for the AP.
PPPOE Service Name	PPPoE service name for the AP.
PPPOE CHAP secret	PPPoE CHAP secret key for the AP.
USB User Name	The PPP username provided by the cellular service provider
USB Password	A PPP password, if provided by the cellular service provider
USB Type	The USB driver type.
USB Device Identifier	The USB device identifier.
USB Dial String	The dial string for the USB modem. This parameter only needs to be specified if the default string is not correct.
USB Initialization String	The initialization string for the USB modem. This parameter only needs to be specified if the default string is not correct.
USB TTY device data path	The TTY device path for the USB modem. This parameter only needs to be specified if the default path is not correct.
USB TTY device control path	The TTY device control path for the USB modem. This parameter only needs to be specified if the default path is not correct.
Uplink VLAN	If you configured an uplink VLAN on an AP connected to a port in trunk mode, the AP sends and receives frames tagged with this VLAN on its Ethernet uplink. By default, an AP has an uplink vlan of 0, which disables this feature.
Link Priority Ethernet	Set the priority of the wired uplink, from 0-255. Each uplink type has an associated priority; wired ports having the highest priority by default.
Link Priority Cellular	The priority of the cellular uplink, from 0-255. By default, the cellular uplink is a lower priority than the wired uplink; making the wired link the primary link and the cellular link the secondary or backup link.

Column	Description
`Mesh Role`	If the mesh role is “none,” the AP is operating as a thin AP. An AP operating as a mesh node can have one of two roles: mesh portal or mesh point.
`Installation`	Indicates the type of installation (**indoor** or **outdoor**). The **default** parameter indicates that the installation mode is determined by the AP model type.
`Latitude`	Latitude coordinates of the AP, in the format *Degrees Minutes Seconds* (DMS).
`Longitude`	Longitude coordinates of the AP, in the format *Degrees Minutes Seconds* (DMS).
`Altitude`	Altitude, in meters, of the AP. This parameter is supported on outdoor APs only.
`Antenna bearing for 802.11a`	Horizontal coverage distance of the 802.11a (5GHz) antenna from true north, from 0-360 degrees. **NOTE:** This parameter is supported on outdoor APs only. The horizontal coverage pattern does not consider the elevation or vertical antenna pattern.
`Antenna bearing for 802.11g`	Horizontal coverage distance of the 802.11g (2.4GHz) antenna from true north, from 0-360 degrees. **NOTE:** This parameter is supported on outdoor APs only. The horizontal coverage pattern does not consider the elevation or vertical antenna pattern.
`Antenna tilt angle for 802.11a`	The angle of the 802.11a (5GHz) antenna. This parameter can range from between -90 degrees and 0 degrees for downtilt, and between +90 degrees and 0 degrees for uptilt.
`Antenna tilt angle for 802.11g`	The angle of the 802.11g (2.4GHz) antenna. This parameter can range from between -90 degrees and 0 degrees for downtilt, and between +90 degrees and 0 degrees for uptilt.
`Mesh SAE`	Shows if the AP has enabled or disabled Secure Attribute Exchange (SAE) on a mesh network.

Related Commands

Command	Description
provision-ap	Change provisioning parameters for an individual AP. This command does not save the provisioning parameters settings in a reusable profile.
ap provisioning-profile	This command defines a provisioning profile for an AP or group of APs.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable or Config mode on Mobility Master.

show ap provisioning-profile

```
show ap provisioning-profile [<profile-name>]
```

Description

This command shows information for AP provisioning profiles.

Syntax

Parameter	Description
`<profile-name>`	The name of an existing AP provisioning profile.

Usage Guidelines

The AP provisioning profile allows you to define a set of provisioning parameters to an AP group. These settings can be saved or assigned to an AP group via the command **ap-group <group> provisioning-profile <profile>**.

Issue this command without the **<profile-name>** option to display the entire AP provisioning profile list, including profile status and the number of references to each profile. Include a profile name to display the authorization group defined for that profile.

Examples

The following example lists all AP provisioning profiles. The **References** column lists the number of other profiles with references to that provisioning profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined AP provisioning profiles will not have an entry in the **Profile Status** column.

```
(host) [mynode] #show ap provisioning-profile

Provisioning profile List
-------------------------
Name     References  Profile Status
----     ----------  --------------
default  12
outdoor  3
```

To display the configuration settings for an individual profile, include the <profile> parameter. The example below shows the profile details for the AP provisioning profile **Default**.

```
(host) [mynode] #show ap provisioning-profile default

Provisioning profile "default"
------------------------------
Parameter                                                    Value
---------                                                    -----
Remote-AP                                                    No
Master IP/FQDN                                               N/A
PPPOE User Name                                              N/A
PPPOE Password                                               N/A
PPPOE Service Name                                           N/A
USB User Name                                                N/A
USB Password                                                 N/A
USB Device Type                                              none
USB Device Identifier                                        N/A
USB Dial String                                              N/A
USB Initialization String                                    N/A

```

Description

This command defines a provisioning profile for an AP or group of APs.

Syntax

Parameter	Description
`Remote-AP`	Indicates that the profile is associated with a remote AP using certificates.
`Master IP/FQDN`	The FQDN or IP address for Mobility Master.
`PPPOE User Name`	PPPoE username for the AP.
`PPPOE Password`	Point-to-Point Protocol over Ethernet (PPPoE) password for the AP.
`PPPOE Service Name`	PPPoE service name for the AP.
`USB User Name`	The PPP username provided by the cellular service provider
`USB Password`	A PPP password, if provided by the cellular service provider
`USB Device Type`	The USB driver type.
`USB Device Identifier`	The USB device identifier.
`USB Dial String`	The dial string for the USB modem. This parameter only needs to be specified if the default string is not correct.
`USB Initialization String`	The initialization string for the USB modem. This parameter only needs to be specified if the default string is not correct.

Parameter	Description
USB TTY device data path	The TTY device path for the USB modem. This parameter only needs to be specified if the default path is not correct.
USB TTY device control path	The TTY device control path for the USB modem. This parameter only needs to be specified if the default path is not correct.
USB modeswitch parameters	All the parameters that is required to be passed to the USB mode switch utility.
Link Priority Ethernet	Set the priority of the wired uplink, from 0-255. Each uplink type has an associated priority; wired ports having the highest priority by default.
Link Priority Cellular	The priority of the cellular uplink, from 0-255. By default, the cellular uplink is a lower priority than the wired uplink; making the wired link the primary link and the cellular link the secondary or backup link.
Cellular modem network preference	Multi-mode cellular modem network preference type.
Username of AP so that AP can authenticate to 802.1X using PEAP	If your AP uses PEAP authentication, this field displays the AP username.
Password of AP so that AP can authenticate to 802.1X using PEAP	If your AP uses PEAP authentication, this field displays the AP password.
Enable AP to 802.1x using EAP-TLS	Enables AP to perform 802.1x authentication using EAP-TLS.
Enable AP to use factory certificates when doing 802.1x EAP-TLS	Enables AP to use the factory certificates to perform 802.1x EAP-TLS authentication.
AP dot1x EAP-TLS username suffix	Enables AP to use EAP-TLS username suffix.
AP dot1x EAP-TLS username suffix domain	Sets the suffix domain for AP dot1x EAP-TLS username. If defined, use EAP-TLS username as suffix, else use **aruba.ap.**
Uplink VLAN	If you configured an uplink VLAN on an AP connected to a port in trunk mode, the AP sends and receives frames tagged with this VLAN on its Ethernet uplink.

Parameter	Description
	By default, an AP has an uplink vlan of 0, which disables this feature.
`USB power mode`	The USB power mode to control the power to the USB port.
`AP POE Power optimization`	Displays the AP POE power optimization status.

Usage Guidelines

The AP provisioning profile allows you to define a set of provisioning parameters to an AP group. These settings can be saved or assigned to an AP group via the command **ap-group <group> provisioning-profile <profile>**.

Related Commands

Command	Description
provision-ap	Change provisioning parameters for an individual AP. This command does not save the provisioning parameters settings in a reusable profile.

Command History

Version	Modification
AOS-W 8.4.0.0	The output of the show ap-provisioning profile was modified to include the following parameters: ■ **AP dot1x EAP-TLS username suffix** ■ **AP dot1x EAP-TLS username suffix domain** ■ **USB power mode**
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable mode on Mobility Master.

show ap provisioning-rule

```
show ap provisioning-rule [<profile-name>]
```

Description

This command displays information for an AP provisioning rule.

Syntax

Parameter	Description
`<profile-name>`	The name of an existing AP provisioning rule.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Examples

The following example shows the details of the conditions and actions for the AP provisioning rule: **test**.

```
(host) [mm] (config) #show ap provisioning-rule test

ap provisioning rule "test"
---------------------------
Parameter                                                  Value
---------                                                  -----
ip range                                                   N/A
network                                                    3.3.3.3/1
any AP                                                     false
AP Type                                                    AP-UNKNOWN
ap group                                                   N/A
Antenna gain for 802.11g                                   N/A
Antenna gain for 802.11a                                   N/A
Radio 0 5GHz Antenna gain for APs support Dual 5GHz mode   N/A
Radio 1 5GHz Antenna gain for APs support Dual 5GHz mode   N/A
```

The output of this command includes the following information:

Parameter	Description
`ip range`	Indicates the IPv4 or IPv6 address range to check if the IP address of the AP is within this range.
`network`	Specifies the IPv4 or IPv6 network address to check if the IP address of the AP is within this network address.
`any AP`	Indicates if you want to apply the provisioning rule's condition to any AP.
`AP Type`	Indicates the AP model to apply the rule to this particular AP.

Parameter	Description
`ap group`	Indicates the AP group that you want to assign to the AP.
`Antenna gain for 802.11g`	Indicates the antenna gain for 802.11g (2.4 GHz) antenna.
`Antenna gain for 802.11a`	Indicates the antenna gain for 802.11a (5 GHz) antenna.
`Radio 0 5GHz Antenna gain for APs support Dual 5GHz mode`	Antenna gain for radio 0 (5 GHz) antenna. This parameter is only displayed for APs that support dual 5 GHz mode.
`Radio 1 5GHz Antenna gain for APs support Dual 5GHz mode`	Antenna gain for radio 1 (5 GHz) antenna. This parameter is only displayed for APs that support dual 5 GHz mode.

Related Commands

Command	Description
ap provisioning-rule	This command defines the conditions to select a group of APs and the subsequent actions to provision the APs.

show ap provisioning-rules

```
show ap provisioning-rules
```

Description

This command shows information for the priority level of AP provisioning rules.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The following example shows the details of the conditions and actions for the AP provisioning rules:

```
(host) [mm] (config) #show ap provisioning-rules
ap provisioning rules
---------------------
Parameter              Value
---------              -----
Provisioning Rule      ap324 priority 1
Provisioning Rule      ip36 priority 3
Provisioning Rule      network priority 5
Provisioning Rule      ip46 priority 7
```

Related Commands

Command	Description
ap provisioning-rules	This command defines the priority of the provisioning rules that are actively used to auto-provision the APs.

Command History

show ap radio-database

```
show ap radio-database [band a|g] [group <group>] [mode access-point|air-
monitor|disabled|ht|ht-40mhz|legacy|sap-monitor] [sort-by ap-group|ap-ip|ap-name|ap-
type|switch-ip] [sort-direction ascending|descending] [start <start>] [switch <switch-ip-
addr>]
```

Description

Show radio information for Access Points visible to this Switch.

Syntax

Parameter	Description
band	Show only APs with a radio operating in the specified band.
a	Show only APs with a radio operating in the 802.11a band (5 GHz).
g	Show only APs with a radio operating in the 802.11g band (2.4 GHz).
group <group>	Show only APs associated with the specified AP group.
mode	Show only APs with a radio operating in the specified mode.
access-point	Show only APs operating as access points.
air-monitor	Show only APs operating as air monitors.
disabled	Show only disabled APs.
ht	Show only high-throughput APs.
ht-40mhz	Show only 40 Mhz high-throughput APs.
legacy	Show only legacy (not high-throughput) APs.
sap-monitor	Show only APs operating as SAP monitors.
sort-by	Sort the output of this command by a specific data column.
ap-group	Sort the output of this command by AP group name.
ap-ip	Sort the output of this command by AP IP address.
ap-name	Sort the output of this command by AP name.
ap-type	Sort the output of this command by AP model type.
switch-ip	Sort the output of this command by Switch ip address.
sort-direction	Select a sort direction for the output of this command.
ascending	Sort the output in ascending order.
descending	Sort the output in descending order.

Parameter	Description
`start`	Start displaying the output of this command at a chosen index number by entering the index number of the AP at which command output should start.
`switch <switch-ip-addr>`	Display information for APs associated with a specific Switch by entering the IP address of that Switch.

Example

The output of the command shows that the AP is aware of five other access points, three of which are active.

```
(host) #show ap radio-database
AP Radio Database
-----------------
Name            Group    AP Type  IP Address   Status          Flags  Switch IP
----            -----    -------  ----------   ------          -----  ---------
Radio 0 Band Ch/EIRP/MaxEIRP/Clients  Radio 1 Band Ch/EIRP/MaxEIRP/Clients
------------------------------------  ------------------------------------
Radio 2 Band Ch/EIRP/MaxEIRP/Clients
------------------------------------

Flags: 1 = 802.1x authenticated AP use EAP-PEAP; 1+ = 802.1x use EST; 1- = 802.1x use factory
cert; 2 = Using IKE version 2
B = Built-in AP; C = Cellular RAP; D = Dirty or no config
E = Regulatory Domain Mismatch; F = AP failed 802.1x authentication
G = No such group; I = Inactive; J = USB cert at AP; L = Unlicensed
M = Mesh node
N = Duplicate name; P = PPPoe AP; R = Remote AP; R- = Remote AP requires Auth;
S = Standby-mode AP; U = Unprovisioned; X = Maintenance Mode
Y = Mesh Recovery
c = CERT-based RAP; e = Custom EST cert; f = No Spectrum FFT support
i = Indoor; o = Outdoor; s = LACP striping; u = Custom-Cert RAP; z = Datazone AP
p = In deep-sleep status
4 = WiFi Uplink
r = Power Restricted; T = Thermal ShutDown
"Spectrum" followed by "^" indicates Local Spectrum Override in effect.
```

The output of this command includes the following information:

Column	Description
`Name`	Name of the AP.
`Group`	AP group to which the AP is associated.
`AP Type`	AP model type.
`IP address`	IP address of the AP.
`Status`	Current AP status. If the AP is currently up, this data column also shows the amount of time for which the AP has been active.
`Flags`	This column displays a letter that corresponds to some type of additional information for the AP. The key to the list of possible flags appears at the bottom of the output of this command.

Column	Description
`Switch IP`	IP address of the AP's Switch.
`Radio 0 Band Ch/EIRP/MaxEIRP/Clients`	Radio ID, channel, EIRP, Maximum EIRP, and the number of clients using Radio 0.
`Radio 1 Band Ch/EIRP/MaxEIRP/Clients`	Radio ID, channel, EIRP, Maximum EIRP, and the number of clients using Radio 1.
`Radio 2 Band Ch/EIRP/MaxEIRP/Clients`	Radio ID, channel, EIRP, Maximum EIRP, and the number of clients using Radio 2.

Command History

Command	Description
AOS-W 8.6.0.0	A new output parameter **Radio 2 Band Ch/EIRP/MaxEIRP/Clients** was introduced for AP-555 access points.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable or Config mode on Mobility Master.

show ap radio-summary

```
show ap radio-summary
   ap-group <ap-group>
   ap-name <ap-name>
   dot11a
   dot11g
   ip-addr <ip-addr>
   ip6-addr <ip6-addr>
```

Description

Show AP radios registered to this Switch.

Syntax

Parameter	Description
`ap-group`	Allows you to filter radio information by AP group.
`ap-name <ap-name>`	Allows you to filter radio information by AP name.
`dot11a`	Allows you to filter 802.11a radio information.
`dot11g`	Allows you to filter 802.11g radio information.
`ip-addr <ip-addr>`	Allows you to filter radio information by IP address.
`ip6-addr <ip-addr>`	Allows you to filter radio information by IPv6 address.

Example

The output of the command in the example below displays statistics for the AP's radio, as well as statistics for transmitted and received frames.

In the actual CLI, it will appear in a single, long table.

```
(host) [mynode] #show ap radio-summary
APs Radios information
----------------------
Name              Group               AP Type  IP Address     Band  Mode
----              -----               -------  ----------     ----  ----
172.17.153-7      172.17.153          104      55.55.57.44    2.4   AP:1
172.17.150-5      172.17.150          104      55.55.57.42    2.4   AP:6
172.17.153-13     172.17.153          104      55.55.57.35    2.4   AP:6
172.17.151-42     172.17.151          104      55.55.57.34    2.4   AP:11
172.17.151-34     172.17.151          104      55.55.57.33    2.4   AP:11
172.17.155-26     172.17.155          104      55.55.57.22    2.4   AP:1

EIRP/MaxEIRP  NF/U/I        TD                 TM                 TC

NF: Noise Floor(dBm); U: Utilization(%); I: Interference(%)
```

```
TD: Time used by data frames (%); TM: time used by mgnt frames(%); time used by ctrl frames
(%)
Total Radios:6
```

The output of this command includes the following information:

Parameter	Description
`Name`	Name of the AP.
`Group`	Group to which AP radio is assigned.
`AP Type`	AP model.
`IP Address`	Radio IP address.
`Band`	Band on which radio is operating on (2.4 or 5 GHz).
`Mode`	Mode on which radio is operating; AP: AP Mode; AM: Air Monitor Mode, Spectrum: Spectrum Monitor Mode. Optionally, you can also specify the channel number.
`EIRP/Max EIRP`	Current EIRP output and maximum EIRP allowed for this radio (dBm).
`NF/U/I`	Noise Floor (dBm) / Utilization (%) / Interference (%).
`TD`	Time used by data frames (%).
`TM`	Time used by mgmt frames(%).
`TC`	Time used by ctrl frames (%).

Command History

Version	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable mode on Mobility Master.

show ap regulatory

```
show ap regulatory
```

Description

Shows the currently active Regulatory Cert.

Syntax

None.

Usage Guidelines

Issue this command to view the currently active Regulatory Cert

Examples

The example below shows the version of Regulatory Cert currently active on the Switch.

```
(host) [mynode] #show ap regulatory
Regulatory Version :1.0_43859
```

Related Commands

Command	Description
ap regulatory-domain-profile	This command configures an AP regulatory domain profile.

Command History

Version	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable mode on Mobility Master.

show ap regulatory-domain-profile

```
show ap regulatory-domain-profile [<profile-name>]
```

Description

Show the list of regulatory domain profiles, or the settings in an individual regulatory domain profile

Syntax

Parameter	Description
<profile-name>	Show data for a specific regulatory domain profile.

Usage Guidelines

Issue this command without the **<profile>**parameter to display the entire regulatory domain profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the Switch has three regulatory domain profiles. The **References** column lists the number of other profiles with references to the regulatory domain profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column

```
(host) [mynode] # show ap regulatory-domain-profile
Regulatory Domain profile List
------------------------------
Name                            References  Profile Status
----                            ----------  --------------
corp-channel-profile            8
default                         10
channel-test                           1.
```

This example displays the configuration settings for the profile **corp-channel-profile**. The output of this command shows the profile's country code and the valid channel and channel pairs for that profile.

```
host) #show ap regulatory-domain-profile corp-channel-profile
Regulatory Domain profile "corp-channel-profile"
------------------------------------------------
Parameter                       Value
---------                       -----
Country Code                    US
Valid 802.11g channel           1
Valid 802.11g channel           6
Valid 802.11a channel           36
Valid 802.11a channel           40
Valid 802.11a channel           44
Valid 802.11a channel           48
Valid 802.11a channel           149
Valid 802.11a channel           153
Valid 802.11g 40MHz channel pair  N/A
Valid 802.11a 40MHz channel pair  36-40
Valid 802.11a 40MHz channel pair  44-48
Valid 802.11a 40MHz channel pair  149-153
Valid 802.11a 80MHz channel group 36-48
```

```
Valid 802.11a 80MHz channel group 52-64
Valid 802.11a 80MHz channel group 100-112
Valid 802.11a 80MHz channel group 116-128
Valid 802.11a 80MHz channel group 132-144
Valid 802.11a 80MHz channel group 149-161
```

The output of this command includes the following information:

Column	Description
`Country Code`	Code that represents the country in which the APs will operate. The country code determines the 802.11 wireless transmission spectrum.
`Valid 802.11g channel`	Selected 802.11b/g channel available for use by an AP using the specified regulatory domain profile. These channels are limited to those valid for the profile's country code.
`Valid 802.11a channel`	Selected 802.11a channel available for use by an AP using the specified regulatory domain profile. These channels are limited to those valid for the country code.
`Valid 802.11g 40MHz channel pair`	Selected 802.11b/g 40 MHz channel pair available for use by an AP using the specified domain profile. These channels are limited to those valid for the profile's country code.
`Valid 802.11a 40MHz channel pair`	Selected 802.11a 40 MHz channel pair available for use by an AP using the specified domain profile. These channels are limited to those valid for the profile's country code.
`Valid 802.11a 80MHz channel group`	Selected 802.11a 80 MHz channel group available for use by an AP using the specified domain profile. These channels are limited to those valid for the profile's country code.

Related Commands

All platforms	Base operating system.	Enable mode on Mobility Master.

show ap remote auth-trace-buf

```
show ap remote auth-trace-buf {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>}|{ip6-addr <ip6-addr>}
```

Description

This command shows authentication trace buffer on an AP.

Syntax

Parameter	Description
`ap-name <ap-name>`	Shows authentication trace buffer on an AP for specified AP name.
`bssid <bssid>`	Shows authentication trace buffer on an AP for specified BSSID.
`ip-addr <ip-addr>`	Shows authentication trace buffer on an AP for specified IP address.
`ip6-addr <ip6-addr>`	Shows authentication trace buffer on an AP for specified IPv6 address.

Usage Guidelines

This command shows authentication trace buffer on an AP. For the remaining parameters, see the command syntax.

Example

The following example shows authentication trace buffer on an AP named ap-205:

```
(host) [mynode] #show ap remote auth-trace-buf ap-name ap-205

Auth Trace Buffer
-----------------
```

Related Commands

Command	Description
aaa auth-trace	This command sets parameters for debug tracing in AUTH (light weight tracing).

Command History

show ap remote blacklist-clients

```
show ap remote blacklist-clients [ap-name <ap-name>] [bssid <bssid>] [ip-addr <ip-addr>]
```

Description

This command shows all clients blacklisted.

Syntax

Parameter	Description	Range	Default
`ap-name <ap-name>`	Shows all blacklisted clients filtered by AP name.	—	—
`bssid <bssid>`	Shows all blacklisted clients filtered by BSSID.	—	—
`ip-addr <ip-addr`	Shows all blacklisted clients filtered by IP address.	—	—

Usage Guidelines

This command shows all blacklisted clients. For the remaining parameters, see the command syntax.

Example

The following example shows all blacklisted clients:

```
(host) [mynode] #show ap remote blacklist-clients ap-name ap-205

Blacklisted Clients
-------------------
STA  reason  block-time(sec)  remaining time(sec)  Flags
---  ------  ---------------  -------------------  -----

Flags: R: reject associations
```

Related Commands

Command	Description
stm add-blacklist-client	Manually add clients from a blacklist.

show ap remote blacklist-clients-driver

```
show ap remote blacklist-clients-driver [ap-name <ap-name>] [bssid <bssid>] [ip-addr <ip-addr>] [ip6-addr <ip6-addr>]
```

Description

This command shows all clients blacklisted in the driver.

Syntax

Parameter	Description	Range	Default
`ap-name <ap-name>`	Shows all clients blacklisted in the driver filtered by AP name.	—	—
`bssid <bssid>`	Shows all clients blacklisted in the driver filtered by BSSID.	—	—
`ip-addr <ip-addr`	Shows all clients blacklisted in the driver filtered by IP address.	—	—
`ip6-addr <ip6-addr`	Shows all clients blacklisted in the driver filtered by IPv6 address.	—	—

Usage Guidelines

This command shows all clients blacklisted in the driver. For the remaining parameters, see the command syntax.

Example

The following example shows all clients blacklisted in the driver:

```
(host) [mynode] #show ap remote blacklist-clients-driver ap-name ap-205

Clients Blacklisted in Driver
-----------------------------
STA
---
```

Related Commands

Command	Description
stm	This command is used to manually disconnect a client from an AP or control the blacklisting of clients.

Command History

Release	Modification

show ap remote bss-table

```
show ap remote bss-table [ap-name <ap-name>] [bssid <bssid>] [ip-addr <ip-addr>] [ip6-addr
<ip6-addr>]
```

Description

This command shows BSSIDs of all APs registered on the managed device.

Syntax

Parameter	Description	Range	Default
`ap-name <ap-name>`	Shows BSSIDs of all APs registered on the managed device filtered by AP name.	—	—
`bssid <bssid>`	Shows BSSIDs of all APs registered on the managed device filtered by BSSID.	—	—
`ip-addr <ip-addr`	Shows BSSIDs of all APs registered on the managed device filtered by IP address.	—	—
`ip6-addr <ip6-addr>`	Shows BSSIDs of all APs registered on the managed device filtered by IPv6 address.	—	—

Usage Guidelines

This command shows BSSIDs of all APs registered on the managed device. For the remaining parameters, see the command syntax.

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The following example shows BSSIDs of all APs registered on the managed device:

```
(host) [mynode] #show ap remote bss-table ap-name ap-205

Aruba AP BSS Table
------------------
bss                ess            port  ip               phy

show ap remote client status

```
show ap remote client status [ap-name <ap-name>] [bssid <bssid>] [ip-addr <ip-addr>] [ip6-addr <ip6-addr>] <client-mac>
```

Description

This command shows association state of clients.

Syntax

Parameter	Description	Range	Default
`ap-name <ap-name>`	Shows association state of clients filtered by AP name.	—	—
`bssid <bssid>`	Shows association state of clients filtered by BSSID.	—	—
`ip-addr <ip-addr`	Shows association state of clients filtered by IP address.	—	—
`ip6-addr <ip6-addr`	Shows association state of clients filtered by IPv6 address.	—	—
`<client-mac>`	MAC address of client.	—	—

Usage Guidelines

This command shows association state of clients. For the remaining parameters, see the command syntax.

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The following example shows association state of clients:

```
(host) [mynode] #show ap remote client status ap-name ap-205 00:1a:1e:aa:bb:cc
```

Command History

Release	Modification
AOS-W 8.2.0.0	The **ip6-addr** parameter was added.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable mode on Mobility Master.

show ap remote counters

```
show ap remote counters {ap-name <ap-name>}|{bssid <bssid>}|{ip-addr <ip-addr>}
```

Description

Show the numbers of message counters for Remote APs.

Syntax

Parameter	Description
`ap-name <ap-name>`	Show data for an AP with a specific name.
`bssid <bssid>`	Show data for a specific Basic Service Set Identifier (BSSID) on an AP. You must specify an AP's BSSID, which is usually the AP's MAC address.
`ip-addr <ip-addr>`	Show data for an AP with a specific IP address.

Examples

Use this command to determine the number of message counters recorded for each counter type seen by the remote AP. The output of the command in the example below shows counters for Remote AP State and VoIP CAC State Announcements.

```
(host) #show ap remote counters ap-name al22

Counters
--------
Name                          Value
----                          -----
Remote AP State               62851
VoIP CAC State Announcement   13605
```

The output of this command includes the following information:

Column	Description
`Name`	Name of the counter type.
`Value`	Number of counters recorded since the AP was last reset.

Command History

Command	Description
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable or Config mode on Mobility Master.

show ap remote debug anul-sta-entries

```
show ap remote debug anul-sta-entries {ap-name <ap-name>|ip-addr <ip-addr>|ip6-addr <ip6-addr>}
```

Description

Displays a list of VAPs and stations stored in the AP's datapath.

Syntax

Parameter	Description
`ap-name <ap-name>`	Show LACP information for an AP with a specific name.
`radio <radio>`	Shows the radio ID. Valid values are 0 and 1.
`ip-addr <ip-addr>`	Show LACP information for an AP with a specific IPv4 address.
`ip6-addr <ip6-addr>`	Show LACP information for an AP with a specific IPv6 address.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example 1

Using the following example, for OAW-AP320 Series check LAG columns to see if any packets are dropped.

```
#show ap remote  debug anul-sta-entries ap-name ap325
ANUL BSS Table for Radio 0
--------------------------
bssid              num_stas  data ready drops
-----              --------  ----------------
AC:A3:1E:53:5C:F0  2         0
ANUL STA State
--------------
mac                bssid              aid  data ready  bss  Drops  LAG  LAG drops
---                -----              ---  ----------  ---  -----  ---  ---------
3C:A9:F4:24:B2:54  AC:A3:1E:53:5C:F0  2    Yes         B    0      Yes  0
78:31:C1:BC:D6:12  AC:A3:1E:53:5C:F0  1    Yes         B    0      Yes  0
```

The following parameters appear in the output of the **show ap remote debug anul-sta-entries** command, and are useful for debugging purposes.

Parameter	Description
`bssid`	The BSS Id of the VAP.
`num_stas`	Indicates the number of stations associated to a VAP.
`data ready drops`	Indicates the total packets received and dropped before clients were ready to receive data packets.

Parameter	Description
ANUL STA State	
mac	The MAC address of a client.
bssid	The BSS Id of the VAP that the client is associated to.
aid	The association ID of the station.
data ready	Indicates if the client has completed authentication.
bss	Indicates if a client is associated to a BSS or not. The **B** flag indicates that the client is associated to a BSS. The **F** flag indicates that the entry is free and not attached to any BSS.
Drops	Indicates the number of data packets received and dropped before data ready is set to yes.
LAG	Indicates if link aggregation is used to achieve HT by transmitting the packets on both Ethernet ports, for a given station. This field is displayed only in OAW-AP320 Series access points.
LAG drops	Indicates the number of packets dropped by the AP due to packets reordered in the network by link aggregation. This field is displayed only in OAW-AP320 Series access points.

Command History

Version	Modification
AOS-W 8.2.0.0	The **ip6-addr** parameter was added.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable mode on managed devices.

show ap remote debug association

```
show ap remote debug association
   {ap-name <ap-name>|bssid <bssid>|ip-addr <ip-addr>|ip6-addr <ip6-addr>}[uac <uac>]
```

Description

This command shows the association table of the AP to identify the clients associated to each AP.

Syntax

Parameter	Description
`ap-name <ap-name>`	Shows client associations for the specified AP name.
`bssid <bssid>`	Show client associations for an specific BSSID. A BSSID is usually the MAC address of an AP.
`ip-addr <ip-addr>`	Shows client associations for the specified IP address.
`ip6-addr <ip6-addr>`	Shows client associations for the specified IPv6 address.

Usage Guidelines

Use this command to verify if a remote user is connected to an AP and to validate the AP to which is connected.

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The output of this command displays information about the remote clients associated with an AP with the IP address 192.0.2.32.

```
(host) [mynode] #show ap remote debug association ip-addr 192.0.2.32

Flags: W: WMM client, A: Active, R: RRM client

PHY Details: HT: High throughput; 20: 20MHz; 40: 40MHz
             <n>ss: <n> spatial streams

Association Table
-----------------
Name  bssid              mac               auth  assoc  aid  l-int  essid
----  -----              ---               ----  -----  ---  -----  -----
AP71  00:0a:23:c1:d4:11  00:16:6d:08:1s:f1  y     y      1    10     t-lab

vlan-id  tunnel-id  phy  assoc. time  num assoc  Flags
-------  ---------  ---  -----------  ---------  -----
111      0x108e     a    23s          1          A

Num Clients:1
```

The output of this command includes the following information:

Column	Description
Name	Name of an AP.
bssid	The AP BSSID.
mac	MAC address of the client.
auth	This column displays a **y** if the AP has been configured for 802.11 authorization frame types. Otherwise, it displays an **n**.
assoc	This column displays a **y** if the AP has been configured for 802.11 association frame types. Otherwise, it displays an **n**.
aid	802.11 association ID. A client receives a unique 802.11 association ID when it associates to an AP.
1-int	Number of beacons in the 802.11 listen interval. There are ten beacons sent per second, so a ten-beacon listen interval indicates a listen interval time of 1 second.
essid	Name that uniquely identifies the AP's ESSID.
vlan-id	Identification number of the AP's VLAN.
tunnel-id	Identification number of the AP's tunnel.
phy	The RF band in which the AP operates: **a** = 5 GHz **b**, **g** = 2.4 GHz
assoc. time	Amount of time the client has associated with the AP, in the format hours:minutes:seconds.
num assoc	Number of clients associated with the AP.
flags	This column displays any flags for this AP. The list of flag abbreviations is included in the output of the **show ap association** command.

Command History:

Release	Modification
AOS-W 8.2.0.0	The **ip6-addr** parameter was added.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Configuration mode on managed devices.

show ap remote debug association-failure

```
show ap remote debug association-failure
   {ap-name <ap-name>|bssid <bssid>|ip-addr <ip-addr>|ip6-addr <ip6-addr>}[client-mac <client-
   mac>|essid <essid>]
```

Description

This command shows the association failure information.

Syntax

Parameter	Description
`ap-name <ap-name>`	Shows AP association failure for the specified AP name. You may include the **client-mac** or **essid** to filter the output.
`bssid <bssid>`	Shows AP associations for the specified BSSID. A BSSID is usually the MAC address of an AP.
`ip-addr <ip-addr>`	Shows AP associations for the specified IP address. You may include the **client-mac** or **essid** to filter the output.
`ip6-addr <ip6-addr>`	Shows AP associations for the specified IPv6 address. You may include the **client-mac** or **essid** to filter the output.

Usage Guidelines

Use this command to see association failure information.

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The output of this command displays information about the association failure for an AP named **ap-205**:

```
(host) [mynode] #show ap remote debug association-failure ap-name ap-205

Association Failure Table
-------------------------
MAC Address  AP Name  BSSID  ESSID  State  Radio  Idle Time  Reason
-----------  -------  -----  -----  -----  -----  ---------  ------
Num Association Failures:0
```

Command History:

Release	Modification
AOS-W 8.2.0.0	The **ip6-addr** parameter was added.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Configuration mode on managed devices.

show ap remote debug association-failure

```
show ap remote debug association-failure [{ap-name <ap-name>}|{bssid <bssid>}{essid <essid>}]
```

Description

Display association failure information that can be used to troubleshoot problems on an AP.

Syntax

Parameter	Description
`ap-name <ap-name>`	Filter the Association Failure Table by AP name.
`bssid <bssid>`	Filter the Association Failure Table by BSSID. The BSSID is usually the AP's MAC address.
`essid <essid>`	Filter the Association Failure Table by ESSID of an AP.

Usage Guidelines

Use this command to determine whether the client is associated, and identify the last AP to which it was connected.

Example

The output of the command show ap remote debug association-failure displays the Association Failure Table show below. If the **Idle time** column in the output of this command is a low value, **reason** column will describe why association failed.

```
(host)#show ap remote debug association-failure ap-name AP-65-port3
Association Failure Table
-------------------------
MAC Address         AP Name  BSSID              ESSID  State  Radio    Idle Time    Reason
-----------         -------  -----              -----  -----  -----    ---------    ------
00:16:6f:09:54:3e   AL29     00:1a:1e:11:6f:00  guest          802.11g  20h:39m:33s  Denied; AP
Going Down
00:16:6f:09:54:3e   AL33     00:1a:1e:11:6e:60  guest  auth    802.11g             20h:39m:33s
Unspecified Failure
00:16:6f:09:54:3e   AL40     00:1a:1e:8d:5b:20  guest          802.11g  20h:39m:33s  Denied;
Ageout
Num Association Failures:3
```

The output of this command includes the following parameters:

Column	Description
`MAC address`	MAC address of the client that failed to associate with an AP.
`AP Name`	Name of an AP to which the client attempted to associate.
`BSSID`	BSSID of an AP.
`ESSID`	ESSID of an AP.

Column	Description
`State`	This data column shows if the client is currently authorized or both authorized and ESSID associated with an AP.
`Radio`	The AP radio type.
`Idle Time`	Amount of time that the client has been idle, in the format *hours:minutes:seconds*.
`Reason`	A brief description of the reason why the client failed to associate.

Command History

Command	Description
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable or Config mode on Mobility Master.

show ap remote debug bss-config

```
show ap remote debug bss-config {ap-name <ap-name>|bssid <bssid>|ip-addr <ip-addr>|ip6-addr
<ip6-addr>}
```

Description

Show the configuration for each BSSID of an AP. This information can be used to troubleshoot problems on an AP.

Syntax

Parameter	Description
`ap-name <ap-name>`	Filter the AP Config Table by AP name.
`bssid <bssid>`	Shows AP associations for the specified BSSID. A BSSID is usually the MAC address of an AP.
`ip-addr <ip-addr>`	Filter the AP Config Table by IP address by entering an IP address in dotted-decimal format.
`ip6-addr <ip6-addr>`	Filter the AP Config Table by IPv6 address by entering an IPv6 address in dotted-decimal format.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Examples

The output of this command shows the AP configuration table for a specific BSSID.

```
host) #show ap remote debug bss-config ap-name ap93-3
Alcatel-Lucent AP Config Table

bss                ess    vlan  ip            phy   type  fw-mode   max-cl  rates tx-rates  preamble  mtu

enable  enable
```

The output of this command includes the following information:

Column	Description
bss	BSS identifier, which is usually the AP's MAC address.
ess	ESS identifier; a user-defined name for a wireless network.
vlan	The BSSID VLAN number.
IP	The AP IP address.
phy	One of the following 802.11 types ■ a ■ a-HT ■ g ■ g-HT
type	This column shows if the BSSID is for an AP or an AM.
fw-mode	The configured forward mode for the AP's virtual AP profile. ■ **bridge**: Bridge locally ■ **split-tunnel**: Tunnel to Switch or NAT locally ■ **tunnel**: Tunnel to Switch
max-cl	The maximum number of clients allowed for this BSSID.
preamble	Shows if short preambles are enabled for 802.11b or 802.11g radios. Network performance may be higher when short preamble is enabled. In mixed radio environments, some 802.11b wireless client stations may experience difficulty associating with the AP using a short preamble.
MTU	MTU size, in bytes. This value describes the greatest amount of data that can be transferred in one physical frame.
status	Shows if this BSSID is enabled or disabled.
wmm	Shows if the BSSID has enabled or disabled WMM, also known as IEEE 802.11e Enhanced Distribution Coordination Function (EDCF) WMM provides prioritization of specific traffic relative to other traffic in the network.

Command History

Release	Modification
AOS-W 8.2.0.0	The **ip6-addr** parameter was added.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on managed devices.

show ap remote debug bucketmap datapath

```
show ap remote debug bucketmap datapath {ap-name <ap-name> | ip-addr <ip-addr> | ip6-addr
<ip6-addr>} essid <essid>
```

Description

This command shows bucket maps in AP datapath.

Syntax

Parameter	Description
`ap-name <ap-name> essid <essid>`	Shows bucket maps filtered by specified AP name and ESSID.
`ip-addr <ip-addr> essid <essid>`	Shows bucket maps filtered by specified IP address of an AP and ESSID.
`ip6-addr <ip6-addr> essid <essid>`	Shows bucket maps filtered by specified IPv6 address of an AP and ESSID.

Usage Guidelines

This command shows bucket maps in AP datapath. For the remaining parameters, see the command syntax.

Example

Access the CLI and use the following command to show bucket maps in AP datapath filtered by the AP **test** and ESSID **default**:

```
(host) [mynode] #show ap remote debug bucketmap datapath ap-name test essid default

Essid default radio=0 zone=1 - Num UACs 4

show ap remote debug bucketmap sapd

```
show ap remote debug bucketmap sapd {ap-name <ap-name> | ip-addr <ip-addr> | ip6-addr <ip6-addr>} essid <essid>
```

Description

This command shows bucket map received from cluster by SAPD process.

Syntax

Parameter	Description
`ap-name <ap-name> essid <essid>`	Shows bucket maps received from cluster by SAPD filtered by specified AP name and ESSID.
`ip-addr <ip-addr> essid <essid>`	Shows bucket maps received from cluster by SAPD filtered by specified IP address of an AP and ESSID.
`ip6-addr <ip6-addr> essid <essid>`	Shows bucket maps received from cluster by SAPD filtered by specified IPv6 address of an AP and ESSID.

Usage Guidelines

This command shows bucket map received from cluster by SAPD process. For the remaining parameters, see the command syntax.

Example

Access the CLI and use the following command to show bucket map received from cluster by SAPD process filtered by AP **test** and ESSID **default**:

```
(host) [mynode] #show ap remote debug bucketmap sapd ap-name test essid default

show ap remote debug bucketmap stm

```
show ap remote debug bucketmap stm {ap-name <ap-name> | ip-addr <ip-addr> | ip6-addr <ip6-addr>} [essid <essid>]
```

Description

This command shows bucket map received from cluster by AP STM.

Syntax

Parameter	Description
`ap-name <ap-name> essid <essid>`	Shows bucket map received from cluster by AP STM filtered by specified AP name and ESSID.
`ip-addr <ip-addr> essid <essid>`	Shows bucket map received from cluster by AP STM filtered by specified IP address of an AP and ESSID.
`ip6-addr <ip6-addr> essid <essid>`	Shows bucket map received from cluster by AP STM filtered by specified IPv6 address of an AP and ESSID.

Usage Guidelines

This command shows bucket map received from cluster by AP STM. For the remaining parameters, see the command syntax.

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

Access the CLI and use the following command to show bucket map received from cluster by AP STM filtered by AP **test** and ESSID **default**:

```
(host) [mynode] #show ap remote debug bucketmap stm ap-name test essid default

show ap remote debug bucketmap-counters

```
show ap remote debug bucketmap-counters {ap-name <ap-name> | ip-addr <ip-addr> | ip6-addr
<ip6-addr>}
```

Description

This command shows bucket map counters.

Syntax

Parameter	Description
`ap-name <ap-name>`	Shows bucket map counters filtered by specified AP name.
`ip-addr <ip-addr>`	Shows bucket map counters filtered by specified IP address of an AP.

Usage Guidelines

This command shows bucket map counters. For the remaining parameters, see the command syntax.

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

Access the CLI and use the following command to bucket map counters filtered by the AP name **test**:

```
(host) [mynode] #show ap remote debug bucketmap-couters ap-name test

Bucketmap Counters
------------------
Name                                                Value
----                                                -----
Bucketmap Updates, trunc errors                     0 0
AP Bucketmap Updates Without Initialization         0
AP Bucketmap Lookup Failed                          0
AP Bucketmap Allocation Failed                      0
On AP STA Lookup UAC Failed                         0
UAC Up/Down Events                                  4 0
UAC Changed in Bmaps                                0
Deauth dropped from non-UAC                         0
Deauths : New Bmap, Node Down not L2, node down no UAC  0, 0, 0
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode

show ap remote debug client-mgmt-counters

```
show ap remote debug client-mgmt-counters {ap-name <ap-name> | bssid <bssid> | ip-addr <ip-addr> | ip6-addr <ip6-addr>}
```

Description

Shows the number of each type of message from the clients of an AP. This information can be used to troubleshoot problems on an AP.

Syntax

Parameter	Description
`show ap remote debug client-mgmt-counters`	Use this command to display message counters.
`ap-name <ap-name>`	To show message counters by AP name.
`bssid <bssid>`	To show message counters by MAC address of AP.
`ip-addr <ip-addr>`	To show message counters by IP address of AP.
`ip6-addr <ip6-addr>`	To show message counters by IPv6 address of AP.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Examples

The output of this command shows client management counters for the specified AP.

```
(host)#show ap remote debug client-mgmt-counters ap-name ap120-3
Counters
--------
Name                          Value

STA Deauthenticate            707
Stat Update V3                441447
Remote AP State               371330
AP Message Response           164
assoc-req                     4358
```

```
assoc-resp                      4358
reassoc-req                     950
reassoc-resp                    950
disassoc                        452
deauth                          5117
sapcp                           351131
```

The output of this command includes the following information:

Parameter	Description
`Validate Client`	Number of times a client was validated.
`AP Stats Update Message`	Number of times an AP updated its statistics with the managed device.
`ARM Update`	Number of times an AP has changed its ARM settings.
`STA On Call Message`	Number of counters indicating that a station has an active phone call.
`STA SIP authenticate Message`	Number of messages indicating that a telephone has completed SIP registration and authentication.
`STA Deauthenticate`	Number of times a station sent a message to an AP to deauthenticate a client.
`assoc-req`	Number of 802.11 association request management frames from the Switch.
`assoc-resp`	Number of 802.11 association responses to the Switch.
`reassoc-req`	Number of 802.11 reassociation requests to the Switch.
`reassoc-resp`	Number of 802.11 reassociation responses from the Switch.
`disassoc`	Number of 802.11 disassociation messages to the Switch.
`deauth`	Number of 802.11 deauthorization messages from the Switch.

Command History

Release	Modification
AOS-W 8.2.0.0	The **ip6-addr** parameter was added.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on the managed device or Switch where the AP terminates.

show ap remote debug flash-config

```
show ap remote debug flash-config {ap-name <ap-name>|bssid <bssid>|ip-addr <ip-addr>|ip6-addr
<ip6-addr>} acls | vap <vap> | vaps
```

Description

Show the remote AP configuration stored in flash memory.

Syntax

Parameter	Description
`ap-name <ap-name>`	Shows debugging data for an AP with a specific name.
`bssid <bssid>`	Shows data for a specific BSSID on an AP. The BSSID is usually the MAC address of the AP.
`ip-addr <ip-addr>`	Shows data for an AP with a specific IP address by entering its IP address in dotted-decimal format.
`ip6-addr <ip6-addr>`	Shows data for an AP with a specific IP6 address by entering its IP6 address in dotted-decimal format.
`acls`	Displays ACLs of offline virtual APs.
`vap <vap>`	Displays the configuration of a specific offline virtual AP by entering the name of a virtual AP.
`vaps`	Displays the current number of offline virtual APs.

Example

The output of this command can be used to debug problems with a remote AP. The command below shows statistics for an AP with the IP address `192.0.2.64`.

```
(host) [mynode] #show ap remote debug flash-config ip-addr 192.0.2.64
   acls
Offline ACLs
------------
Item                     Value
----                     -----
Native VLAN              1
DHCP VLAN                N/A
DHCP ADDR                192.168.11.1
DHCP POOL NETMASK        255.255.255.0

DHCP LEASE               0
Session ACL              N/A
Session ACL Name         N/A
Session ACL Count        N/A
Session Aces             N/A
ACL 1                    1
ACL 1 Name               logon
ACL 1 Count              21
```

```
Aces 1                  16 1 4294
...
```

The output of this command includes the following information:

Column	Description
Native VLAN	VLAN ID of the native VLAN.
DHCP VLAN	VLAN ID of Remote AP DHCP server used when the Switch is unreachable.
DHCP ADDR	IP Address used as DHCP Server Identifier.
DHCP POOL NETMASK	Netmask of the DHCP server pool.
DHCP POOL START	IP Address used as the start of a range of addresses for a DHCP pool.
DHCP POOL END	IP Address used as the end of a range of addresses for a DHCP pool.
DHCP DNS SERVER	IP Address for the DHCP DNS server.
DHCP ROUTER	IP Address for the DHCP default router.
DHCP DNS DOMAIN	Domain name for the DHCP DNS server.
DHCP LEASE	Length of DHCP DNS leases in days. If this parameter displays a zero (0) the DHCP lease is has no defined end.
Session ACL	Name of the ACL applied to the user session.
Session ACL name	Name of the ACL applied to the user session.
Session ACL count	Number of rules in the applied to the user session.
Session Aces	A list of the individual rules in the session ACL.
ACL 1	This parameter shows the position of an individual ACL.
ACL1 Name	Name of the ACL in the first position.
ACL1 Count	Number of rules in the specified ACL.
ACL1 Aces	A list of the individual rules in the specified ACL.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on the managed device or Switch where the AP terminates.

show ap remote debug-mcast-forwarder

```
show ap remote debug-mcast-forwarder {ap-name <ap-name> | ip-addr <ip-addr>
```

Description

This command displays the Mcast forwarder status for the selected AP.

Syntax

Parameter	Description
`ap-name <ap-name>`	Shows debugging information for a specific AP.
`ip-addr <ip-addr>`	Shows debugging information for an AP with a specific IP address by entering its IP address in dotted-decimal format.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Examples

Use this command to display the mcast forwarder status for an AP.

```
(host) [mynode] #show ap remote debug-mcast-forwarder ip-addr 191.191.191.323
Status (0): OFF, VLANs: 1
Mcast Aggregation Forwarder election status:
-------------------------------------------
VLAN  Forwarder  TX  RX
----  ---------  --  --
1     itself     0   0
Forwarder:mcast packets forwarder on the VLAN
TX:output announcement number for forwarder election on the VLAN
RX:input announcement number for forwarder election on the VLAN
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on the managed device or Switch where the AP terminates.

show ap remote debug mgmt-frames

```
show ap remote debug mgmt-frames {ap-name <ap-name>}|{ip-addr <ip-addr>}|{ip6-addr <ip6-addr>}
[client-mac <client-mac>] [count <count>]
```

Description

This command shows traced 802.11 management frames for a remote AP.

Syntax

Parameter	Description	Range
`ap-name <ap-name>`	Show debugging information for a specific AP.	—
`ip-addr <ip-addr>`	Show debugging information for an AP with a specific IP address by entering its IP address in dotted-decimal format.	—
`ip6-addr <ip6-addr>`	Show debugging information for an AP with a specific IPv6 address by entering its IPv6 address in dotted-decimal format.	—
`client-mac <client-mac>`	Show the AP associations for a specific MAC address by entering the MAC address of the client.	—
`count <count>`	Limit the amount of information displayed by specifying number of frames to appear in the output of this command.	1–128

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Examples

Use this command to debug 802.1 authentication on a remote AP. The example below shows that a client successfully associated with the remote AP, then was later deauthenticated.

```
(host) [mynode] #show ap remote debug mgmt-frames ap-name AP32
```

The output of this command includes the following information:

Column	Description
`Timestamp`	The time the management frame was sent.
`stype`	One of the following 802.11 frame types: auth: Authorization frame

Column	Description
	deauth: Deauthorization frame assoc-resp: Association response assoc-req: Association request
SA	Source MAC address.
DA	Destination MAC address.
BSS	BSSID of the AP.
signal	Signal strength as a signal to noise ratio. For example, a value of 30 would indicate that the power of the received signal is 30 dBm above the signal noise threshold.
Misc	Additional information describing the client's action. In the case of deauthentication, a reason associated with the event will be displayed in this column.

Command History

Release	Modification
AOS-W 8.2.0.0	The **ip6-addr** parameter was added.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on the managed device or Switch where the AP terminates.

show ap remote debug nodelist history

```
show ap remote debug nodelist history {ap-name <ap-name>|ip-addr <ip-addr>|ip6-addr <ip6-addr>}
```

Description

This command shows cluster node history for a remote AP.

Syntax

Parameter	Description	Range
`ap-name <ap-name>`	Show debugging information for a specific AP.	—
`ip-addr <ip-addr>`	Show debugging information for an AP with a specific IP address by entering its IP address in dotted-decimal format.	—
`ip6-addr <ip6-addr>`	Show debugging information for an AP with a specific IPv6 address by entering its IPv6 address in dotted-decimal format.	—

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The following is an example for executing this command:

```
(host) [mynode] #show ap remote debug nodelist history ap-name ap-205
```

Command History

Release	Modification
AOS-W 8.2.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on the managed device or Switch where the AP terminates.

show ap remote debug redun-state history

```
show ap remote debug redun-state history {ap-name <ap-name>|ip-addr <ip-addr>|ip6-addr <ip6-addr>}
```

Description

This command shows cluster node history for a remote AP.

Syntax

Parameter	Description	Range
`ap-name <ap-name>`	Show debugging information for a specific AP.	—
`ip-addr <ip-addr>`	Show debugging information for an AP with a specific IP address by entering its IP address in dotted-decimal format.	—
`ip6-addr <ip6-addr>`	Show debugging information for an AP with a specific IPv6 address by entering its IPv6 address in dotted-decimal format.	—

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The following is an example for executing this command:

```
(host) [mynode] #show ap remote debug redun-state history ap-name ap-205
```

Command History

Release	Modification
AOS-W 8.2.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on the managed device or Switch where the AP terminates.

show ap remote debug sapd

```
show ap remote debug sapd cluster-nodestate
   ap-name
   ip-addr
   ip6-addr
```

Description

This command displays the state of cluster node in the SAPD process.

Syntax

Parameter	Description
`ap-name`	Shows state of cluster node for specified AP name.
`ip-addr`	Shows state of cluster node for specified IP address.
`ip6-addr`	Shows state of cluster node for specified IP6 address.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config mode in managed devices.

show ap remote debug stale_sta

```
show ap remote debug stale_sta {ap-name <ap-name> | bssid <bssid>| ip-addr <ip-addr> | ip6-addr <ip6-addr>}
```

Description

This command shows information for debugging an AP.

Syntax

Parameter	Description
`show ap remote debug stale_sta`	Shows stale station entries stored on the AP.
`ap-name <ap-name>`	Shows stale stations based on the AP name filter.
`bssid <bssid>`	Shows stale stations based on the AP MAC address filter.
`ip-addr <ip-addr>`	Shows stale stations based on the IP address filter of the AP.
`ip6-addr <ip6-addr>`	Shows stale stations based on the IPv6 address filter of the AP.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The following is an example for executing this command:

```
(host) [mynode] #show ap remote debug stale_sta ap-name ap-205
```

Command History

Release	Modification
AOS-W 8.2.0.0	The **ip6-addr** parameter was added.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on the managed device or Switch where the AP terminates.

show ap remote debug sta-msg-sta-down-entries

```
show ap remote debug sta-msg-sta-down-entries {ap-name <ap-name> | ip-addr <ip-addr> | ip6-addr <ip6-addr>}
```

Description

This command shows STA message for STA Down list.

Syntax

Parameter	Description
`ap-name <ap-name>`	Shows STA message for STA Down list of the specified AP.
`ip-addr <ip-addr>`	Shows STA message for Down list of the specified IP address.
`ip6-addr <ip6-addr>`	Shows STA message for Down list of the specified IPv6 address.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The execution of the following command displays the STA Down list.

```
(host) [mynode] #show ap remote debug sta-msg-sta-down-entries ap-name ap-205
```

Command History:

Release	Modification
AOS-W 8.2.0.0	The **ip6-addr** parameter was added.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on the managed device or Switch where the AP terminates.

show ap remote debug sta-msg-stats

```
show ap remote debug sta-msg-stats {ap-name <ap-name> | ip-addr <ip-addr> | ip6-addr <ip6-addr>}
```

Description

This command shows statistics of messages between AP and AC relating to STA associations on the AP.

Syntax

Parameter	Description
`ap-name <ap-name>`	Shows statistics of messages between AP and AC relating to STA associations for specified AP name.
`ip-addr <ip-addr>`	Shows statistics of messages between AP and AC relating to STA associations for specified IP address.
`ip6-addr <ip6-addr>`	Shows statistics of messages between AP and AC relating to STA associations for specified IPv6 address.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The following example shows an example for executing this command:

```
(host) [mynode] #show ap remote debug sta-msg-stats ap-name ap-205
```

Command History:

Release	Modification
AOS-W 8.2.0.0	The **ip6-addr** parameter was added.
AOS-W 8.0.0.0	Command introduced.

show ap remote debug stm cluster-nodestate

```
show ap remote debug stm cluster-nodestate {ap-name <ap-name> | ip-addr <ip-addr> | ip6-addr <ip6-addr>}
```

Description

This command shows the cluster node state in AP.

Syntax

Parameter	Description
`ap-name <ap-name>`	Shows the cluster node state for specified AP name.
`ip-addr <ip-addr>`	Shows the cluster node state for specified IP address.
`ip6-addr <ip6-addr>`	Shows the cluster node state for specified IPv6 address.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The following is an example for executing this command:

```
(host) [mynode] #show ap remote debug stm cluster-nodestate ap-name ap-205
```

Command History

show ap remote debug stm trace-files

```
show ap remote debug stm trace-files {ap-name <ap-name> | ip-addr <ip-addr> | ip6-addr <ip6-addr>}
```

Description

This command shows STM trace files for an AP.

Syntax

Parameter	Description
`ap-name <ap-name>`	Shows the STM trace files for specified AP name.
`ip-addr <ip-addr>`	Shows the STM trace files for specified IP address.
`ip6-addr <ip6-addr>`	Shows the STM trace files for specified IP6 address.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The following is an example for executing this command:

```
(host) [mynode] #show ap remote debug stm trace-files ap-name ap-205
```

show ap remote debug uac-list

```
show ap remote debug uac-list {ap-name <ap-name> | ip-addr <ip-addr> | ip6-addr <ip6-addr>}
```

Description

This command shows user anchor Switch (UAC) list in AP datapath.

Syntax

Parameter	Description
`ap-name <ap-name>`	Shows the UAC list in AP datapath for the specified AP name.
`ip-addr <ip-addr>`	Shows the UAC list in AP datapath for the specified IP address.
`ip6-addr <ip6-addr>`	Shows the UAC list in AP datapath for the specified IP6 address.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The following is an example for executing this command:

```
(host) [mynode] #show ap remote debug uac-list ap-name ap-205
```

show ap remote essid

```
show ap remote essid {ap-name <ap-name> | bssid <bssid> | ip-addr <ip-addr> | ip6-addr <ip6-addr>}
```

Description

Show an ESSID summary for the Managed Device, including the numbers of APs and clients connected to a managed device.

Syntax

Parameter	Description
`ap-name <ap-name>`	Shows the ESSID summary for the specified AP name.
`bssid <bssid>`	Shows the ESSID summary for the specified MAC address.
`ip-addr <ip-addr>`	Shows the ESSID summary for the specified IP address.
`ip6-addr <ip6-addr>`	Shows the ESSID summary for the specified IPv6 address.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Examples

The following is an example for executing the **show ap remote essid** command:

```
(host) [mynode] #show ap remote essid ap-name ap-205
```

Command History

show ap remote wmm-flow

```
show ap remote wmm-flow {ap-name <ap-name> | bssid <bssid> | ip-addr <ip-addr> | ip6-addr
<ip6-addr>}
```

Description

This command shows the Wireless Multimedia (WMM) flows that are active on an AP connected to a Managed Device.

Syntax

Parameter	Description
`ap-name <ap-name>`	Shows the WMM flows that are active for a specified AP name.
`bssid <bssid>`	Shows the WMM flows that are active for a specified MAC address.
`ip-addr <ip-addr>`	Shows the WMM flows that are active for a specified IP address.
`ip6-addr <ip6-addr>`	Shows the WMM flows that are active for a specified IPv6 address.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The following is an example for executing the **show ap remote wmm-flow** command.

```
(host) #show ap remote wmm-flow ap-name ap-205
```

show ap sapd-debug log

```
show ap sapd-debug log {ap-name <ap-name> | ip-addr <ip-addr> | ip6-addr <ip6-addr>} | <page>
```

Description

This command displays the SAPD debug log for an AP.

Syntax

Parameter	Description
`ap-name <ap-name>`	Shows the SAPD debug log for the specified AP name.
`ip-addr <ip-addr>`	Shows the SAPD debug log for the specified IP address.
`ip6-addr <ip6-addr>`	Shows the SAPD debug log for the specified IP6 address.
`<page>`	Displays the specified page of the SAPD debug log information.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The following is an example for executing the **show ap sapd-debug log** command.

```
(host) #show ap sapd-debug log ap-name ap-205
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

show ap snmp

```
show ap snmp
   wlsxSwitchStationMgmtTable
   wlsxSwitchStationStatsTable
   wlsxWlanAPBssidTable
   wlsxWlanAPTable
   wlsxWlanESSIDTable
   wlsxWlanRadioTable
```

Description

This command displays the AP-related SNMP tables.

Syntax

Parameter	Description
`wlsxSwitchStationMgmtTable`	Display user tree.
`wlsxSwitchStationStatsTable`	Display user statistics tree.
`wlsxWlanAPBssidTable`	Display BSSID SNMP tree.
`wlsxWlanAPTable`	Display SNMP tree.
`wlsxWlanESSIDTable`	Displays ESSID SNMP tree.
`wlsxWlanRadioTable`	Display radio table SNMP tree.

Example

Access the Mobility Master's CLI and use the following command to display BSSID SNMP tree:

```
(host)[mynode] #show ap snmp wlsxWlanAPBssidTable

SNMP - AP BSSID Table
---------------------
AP MAC             Radio  BSSID              Phy Type  Status  Channel
------             -----  -----              --------  ------  -------
00:24:6c:c3:d6:82  1      00:24:6c:bd:68:30  1         1       149
00:24:6c:c3:d6:82  2      00:24:6c:bd:68:20  2         1       11

Num BSSIDs:2
```

Related Commands

show ap spectrum ap-list

```
show ap spectrum ap-list {ap-name <ap-name> | ip-addr <ip-addr> | ip6-addr <ip6-addr>}
[channel <channel> | essid <essid> | freq-band {2.4ghz | 5ghz} | limit <limit> | or | page
<page> |  sort <sort> | start <start>]
```

Description

This command shows spectrum data seen by an access point that has been converted to a spectrum monitor.

Syntax

Parameter	Description
`ap-name <ap-name>`	Name of the spectrum monitor for which you want to view spectrum information.
`ip-addr <ip-addr>`	IP address of the spectrum monitor for which you want to view spectrum information.
`ip6-addr <ip6-addr>`	IPv6 address of the spectrum monitor for which you want to view spectrum information.
`channel <channel>`	View spectrum information for a specific radio channel.
`essid <essid>`	View spectrum information for a specific ESSID.
`freq-band {2.4ghz | 5ghz}`	View information for a specific radio type, either 2.4 GHz or 5 GHz.
`limit <limit>`	Limit the displayed output to the specified number of entries
`or`	Use this parameter to display information that meets either of two criteria, such as a specified ESSID or channel.
`page <page>`	Enter a number from 10–100 (inclusive) to specify the number of entries that should appear in each page of the output for this command. For example, if the output of this command has 100 entries and you select a page value of 20, the output will appear in 5 pages each with 20 entries. If you selected a page value of 10, the output would appear in 10 pages with 10 entries.
`sort <sort>`	Sort the output by the specified data column.
`start <start>`	Start displaying the output at specific spectrum index value.

Usage Guidelines

The Spectrum Analysis feature provides visibility into RF coverage, allowing you to troubleshoot RF interference and identify 802.11 devices on the network. Issue this command to display and sort APs seen by a specific spectrum monitor.

Examples

The output of this example shows spectrum data seen by spectrum monitor ap123. The output in the example below has been divided into two tables to better fit this document. In the AOS-W CLI, the output appears as a single, long table.

```
(host) [mynode]# show ap spectrum ap-list ap-name ap123
```

```
Spectrum AP Table

```

The output of this command includes the following information:

Column	Description
bssid	Basic Service Set Identifier for an AP. This is usually the MAC address of the AP.
essid	Extended service set identifier that names a wireless network.
spectrum-id	Identifier assigned to the device by the spectrum monitor.
chan	Radio channel used by the BSSID.
freq-band	Radio phy type. Possible types include: ■ 2.4 GHz ■ 5 GHz
signal (dBm)	Strength of the signal received by the device, in dBm.
avg-rssi	The average signal-to-noise ratio seen by the AP.
curr-rssi	Most recent signal-to-noise ratio seen by the AP.
ibss	Shows if ad hoc BSS is enabled or disabled. It will be enabled if the bssid has detected an ad hoc BSS (an ibss bit in an 802.11 frame).
add-time	Time when the AP was first detected by the spectrum monitor.
last-seen	Time when the AP was last seen by the spectrum monitor.

Related Commands

show ap spectrum channel-metrics

```
show ap spectrum channel-metrics {ap-name <ap-name>|ip-addr <ip-addr> | ip6-addr <ip6-addr>}
[freq-band {2.4ghz | 5ghz}]
```

Description

This command shows channel quality, availability, and utilization metrics as seen by a spectrum monitor.

Syntax

Parameter	Description
`ap-name <ap-name>`	Name of the spectrum monitor for which you want to view spectrum information.
`ip-addr <ip-addr>`	IP address of the spectrum monitor.
`ip6-addr <ip6-addr>`	IPv6 address of the spectrum monitor.
`freq-band {2.4ghz | 5ghz}`	View information for a specific radio type, either 2.4 GHz or 5 GHz.

Usage Guideline

This chart displays channel utilization data, showing the percentage of each channel that is currently being used by Wi-Fi devices, and the percentage of each channel being used by non-Wi-Fi devices and 802.11 adjacent channel interference (ACI).

ACI refers to the interference on a channel created by a transmitter operating in an adjacent channel. A transmitter on a nonadjacent or partially overlapping channel may also cause interference, depending on the transmit power of the interfering transmitter and/or the distance between the devices. In general, ACI may be caused by a Wi-Fi transmitter or a non-Wi-Fi interferer. However, whenever the term ACI appears in Spectrum Analysis graphs, it refers to the ACI caused by Wi-Fi transmitters. The channel utilization option in the Channel Metrics Chart shows the percentage of the channel utilization due to both ACI and non-Wi-Fi interfering devices. Unlike the ACI shown in the show ap spectrum interference-power output, the ACI shown in this graph indicates the percentage of channel time that is occupied by ACI or unavailable for Wi-Fi communication due to ACI.

The Channel Metrics table can also show channel availability, the percentage of each channel that is available for use, or display the current relative quality of selected channels in the 2.4 GHz or 5 GHz radio bands. In the spectrum analysis feature, channel quality is a relative measure that indicates the ability of the channel to support reliable Wi-Fi communication. Channel quality, which is represented as a percentage in this chart, is a weighted metric derived from key parameters that can affect the communication quality of a wireless channel, including noise, non-Wi-Fi (interferer) utilization and duty-cycles, and certain types of retries. Note that channel quality is not directly related to Wi-Fi channel utilization, as a higher quality channel may or may not be highly utilized.

A hybrid AP on a 20 MHz channel will see 40 MHz Wi-Fi data as non-Wi-Fi data.

Examples

The output of this example shows part of the channel metrics table for channels seen by the spectrum monitor ap123.

```
(host) [mynode] #show ap spectrum channel-metrics ap-name ap123 freq-band 2.4ghz

Channel Metrics Table
---------------------
Channel  Quality(%)  Availability(%)  Utilization(%)  WiFi Util(%)  Interference Util(%)
-------  ----------  ---------------  --------------  ------------  --------------------
1        97          57               43              40            3

```

The output of this command includes the following information:

Column	Description
`channel`	An 802.11a or 82.11g radio channel.
`Quality(%)`	Current relative quality of selected channels in the 802.11a or 802.11g radio bands, as determined by the percentage of packet retries, the current noise floor, and the duty cycle for non-Wi-Fi devices on that channel.
`Availability(%)`	The percentage of the channel currently available for use.
`Utilization(%)`	The percentage of the channel being used.
`WiFi Util(%)`	The percentage of the channel currently being used by Wi-Fi devices.
`Interference Util(%)`	The percentage of the channel currently being used by non-Wi-Fi interference + Wi-Fi ACI (Adjacent Channel Interference)

Related Commands

show ap spectrum channel-summary

```
show ap spectrum channel-summary {ap-name <ap-name> | ip-addr <ip-addr> | ip6-addr <ip6-addr>}
[freq-band {2.4ghz | 5ghz}]
```

Description

This command displays a summary of the 802.11a or 802.11g channels seen by a spectrum monitor.

Syntax

Parameter	Description
`ap-name <ap-name>`	Name of the spectrum monitor for which you want to view spectrum information.
`ip-addr <ip-addr>`	IP address of the spectrum monitor for which you want to view spectrum information.
`ip6-addr <ip6-addr>`	IPv6 address of the spectrum monitor for which you want to view spectrum information.
`freq-band {2.4ghz | 5ghz}`	View information for a specific radio type, either **2.4 GHz** or **5 GHz**.

Usage Guidelines

This table can display data aggregate data for each channel seen by the spectrum monitor radio, including the maximum AP power, interference and the signal-to-noise-and-interference Ratio (SNIR).

SNIR is the ratio of signal strength to the combined levels of interference and noise on that channel. This value is calculated by determining the maximum noise-floor and interference-signal levels, and then calculating how strong the desired signal is above this maximum.

A hybrid AP on a 20 MHz channel will see 40 MHz Wi-Fi data as non-Wi-Fi data.

Examples

The output of the example below shows information for 802.11a radio channels seen by the spectrum monitor **ap999**.

```
(host) [mynode] #show ap spectrum channel-summary ap-name ap999 freq-band 5ghz

Channel Summary Table
---------------------
Channel   KnownAPs   UnknownAPs   Util(%)   MaxAPSignal(dBm)   MaxInterference(dBm)   SNIR(dB)
-------   --------   ----------   -------   ----------------   --------------------   -------
149       69         0            5         -39                -69                    30
153       20         0            100       -42                -60                    18
157       56         0            6         -53                -59                    6
161       54         0            4         -43                -71                    28
165       32         0            3         -27                -70                    43
149+      69         0            100       -39                -60                    21
157+      20         0            6         -43                -59                    16
```

The output of this command includes the following information:

Column	Description
`Channel`	An 802.11a or 802.11g radio channel.
`Known APs`	Number of valid APs identified on the radio channel.
`UnKnown APs`	Number of invalid or rogue APs identified on the radio channel.
`Channel Util (%)`	Percentage of the channel currently in use.
`Max AP Signal (dBm)`	Signal strength of the AP that has the maximum signal strength on a channel.
`Max Interference(dBm)`	Signal strength of the non-Wi-Fi device that has the highest signal strength.
`SNIR (db)`	The ratio of signal strength to the combined levels of interference and noise on that channel. This value is calculated by determining the maximum noise-floor and interference-signal levels, and then calculating how strong the desired signal is above this maximum.

show ap spectrum client-list

```
show ap spectrum client-list {ap-name <ap-name> | ip-addr <ip-addr> | ip6-addr <ip6-addr>}
[ap-bssid <ap-bssid> | channel <channel> | essid <essid> | freq-band {2.4ghz | 5ghz} | limit
<limit> | mac <mac> | or  | page <page> | sort <sort> | start <start>]
```

Description

This command shows details for clients seen by a specified spectrum monitor.

Syntax

Parameter	Description
`ap-name <ap-name>`	Name of the spectrum monitor for which you want to view spectrum information.
`ip-addr <ip-addr>`	IP address of the spectrum monitor for which you want to view spectrum information.
`ip6-addr <ip6-addr>`	IPv6 address of the spectrum monitor for which you want to view spectrum information.
`ap-bssid <ap-bssid>`	View information for a client with a specific BSSID.
`channel <channel>`	view information for clients on a specific radio channel.
`essid <essid>`	View information for clients using a specific ESSID.
`mac <mac>`	View information for a client with a specific MAC address.
`or`	Use this parameter to display information that meets either or two criteria, such as a specified ESSID or channel.
`page <page>`	Enter a number from 10–100 (inclusive) to specify the number of entries that should appear in each page of the output for this command. For example, if the output of this command has 100 entries and you select a page value of 20, the output will appear in 5 pages each with 20 entries. If you selected a page value of 10, the output would appear in 10 pages with 10 entries.
`sort <sort>`	Sort the output by the specified data column.
`start <start>`	Start displaying the output at specific spectrum index value.

Usage Guidelines

Use this command to view channel and signal information for wireless clients seen by the spectrum monitor.

Examples

The example shows that the spectrum monitor **ap999** sees eight different clients on channel 149. The output in the example below has been divided into two tables to better fit this document. In the AOS-W CLI, the output appears as a single, long table.

```
(host) [mynode] #show ap spectrum client-list ap-name ap999 channel 149

Spectrum Client Table
---------------------
mac                bssid              essid              spectrum-id  channel  phy-type
```

The output of this command includes the following information:

Column	Description
mac	MAC address of the client.
bssid	Basic Service Set Identifier for a client. This is usually the device's MAC address.
essid	Extended service set identifier that names a wireless network.
spectrum-id	Identifier assigned to the client by the spectrum monitor.
chan	Radio channel used by the BSSID.
phy-type	Radio phy type. Possible types include: ■ 802.11a ■ 802.11a-HT-40 ■ 802.11b/g ■ 802.11b/g-HT-20
signal(dBm)	Client signal strength, in dBm.
add-time	Time when the client was first detected by the spectrum monitor.
last-seen	Time when the spectrum monitor last detected that the client was active.

Related Commands

Command	Description
ap spectrum local-override	Converts an AP or AM into a spectrum monitor by adding it to the spectrum local-override list.
rf dot11a-radio-profilemodespectrum-mode	Sets an 802.11a radio so that the device operates as a spectrum monitor, and can send spectrum analysis data to a desktop or laptop client.
rf dot11g-radio-profilemodespectrum-mode	Sets an 802.11g radio so that the device operates as a spectrum monitor, and can send spectrum analysis data to a desktop or laptop client.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on the managed device or Switch where the AP terminates.

show ap spectrum debug

```
show ap spectrum debug {channel-info | channel-quality | classify |classify-device | classify-
fft | device-details | device-info | devices-seen} {ap-name <ap-name> | ip-addr <ip-addr> |
ip6-addr <ip6-addr>}  freq-band {2.4ghz | 5ghz} radio {0 | 1 | 2} [<count>]
```

Description

This command saves spectrum analysis channel information to a file on the spectrum monitor.

Syntax

Parameter	Description
`channel-info`	Save channel information for later analysis.
`channel-quality`	Save channel quality information for later analysis
`classify`	Save information on classification for later analysis.
`classify-device`	Save information on classification-related debugging with device-type for later analysis
`classify-fft`	Save information on classification and FFT data for later analysis.
`device-details`	Save device details for later analysis.
`device-info`	Save device information for later analysis.
`devices-seen`	Save information on devices seen by the spectrum monitor.
`ap-name <ap-name>`	Name of the spectrum monitor for which you want to view spectrum information.
`ip-addr <ip-addr>`	IP address of the spectrum monitor for which you want to view spectrum information.
`ip6-addr <ip6-addr>`	IP6 address of the spectrum monitor for which you want to view spectrum information.
`freq-band {2.4ghz | 5ghz}`	Save information for a specific radio type, either **2.4 GHz** or **5 GHz**.
`radio {0 | 1 | 2}`	Save information for a specific radio type, either **0, 1 or 2.** Radio 0, 1 or 2 is supported only on AP-555 access points.
`<count>`	Specify the number of samples to save.

Usage Guidelines

Use this command under the supervision of your Alcatel-Lucent technical support representative to troubleshoot spectrum analysis issues or errors. If a dump-server is defined in the AP system profile of the AP, the file created by this command will be sent from the AP to the dump-server using TFTP.

Example

The following is an example for executing this command:

```
(host) [mynode] #show ap spectrum debug channel-info ap-name ap-205 freq-band 2.4ghz 22
```

Related Commands

Command	Description

show ap spectrum debug fft

```
show ap spectrum debug fft {ap-name <ap-name> | ip-addr <ip-addr>} | ip-6 addr <ipg-addr>}
freq-band {2.4ghz | 5ghz} [avg | duty-cycle |fft-to-controller | max | normalized | raw | raw-
normalized] [<count>]
```

Description

This command helps you save Fast Fourier Transform (FFT) power data to a file on the spectrum monitor.

Syntax

Parameter	Description
`ap-name <ap-name>`	Name of the spectrum monitor for which you want to view spectrum information.
`ip-addr <ip-addr>`	IP address of the spectrum monitor.
`ip6-addr <ip6-addr>`	IPv6 address of the spectrum monitor.
`freq-band {2.4ghz | 5ghz}`	Save information for a specific radio type, either **2.4 GHz** or **5 GHz**.
`avg`	Save FFT average information.
`duty-cycle`	Save FFT duty-cycle data.
`fft-to-Switch`	Save the FFT max, average and duty-cycle data.
`max`	Save the maximum FFT power measured for all samples taken over the last second.
`normalized`	Save normalized FFT information.
`raw`	Save the raw FFT information received from driver.
`raw-normalized`	Save FFT information received from driver and its normalized FFT.
`count`	Save a specific number of samples.

Usage Guidelines

Use this command under the guidance of your Alcatel-Lucent technical support representative to troubleshoot FFT power issues.

Example

The following is an example for executing this command:

```
(host) [mynode] #show ap spectrum debug fft ap-name ap-205 freq-band 5ghz avg 20
```

show ap spectrum debug status

```
show ap spectrum debug status {ap-name <ap-name> | ip-addr <ip-addr>
| ip6-addr <ip6-addr>} [freq-band {2.4ghz | 5ghz}]
```

Description

This command shows detailed status and statistics for a spectrum monitor or hybrid AP.

Syntax

Parameter	Description
`ap-name <ap-name>`	Name of the spectrum device for which you want to view status information.
`ip-addr <ip-addr>`	IP address of the spectrum device for which you want to view status information.
`ip6-addr <ip6-addr>`	IPv6 address of the spectrum device for which you want to view status information.
`freq-band 2.4ghz|5ghz`	View information for a specific radio type, either 2.4 GHz or 5 GHz.

Usage Guidelines

Use this command under the guidance of an Alcatel-Lucent technical support representative to troubleshoot spectrum analysis errors.

Example

The following is an example for executing this command:

```
(host) [mynode] #show ap spectrum debug status ap-name ap-205 freq-band 5ghz
```

Related Commands

Command	Description
ap spectrum local-override	Converts an AP or AM into a spectrum monitor by adding it to the spectrum local-override list.
rf dot11a-radio-profilemodespectrum-mode	Sets an 802.11a radio so that the device operates as a spectrum monitor, and can send spectrum analysis data to a desktop or laptop client.
rf dot11g-radio-profilemodespectrum-mode	Set an 802.11g radio so that the device operates as a spectrum monitor, and can send spectrum analysis data to a desktop or laptop client.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on the managed device or Switch where the AP terminates.

show ap spectrum device-duty-cycle

```
show ap spectrum device-duty-cycle {ap-name <ap-name>| ip-addr <ip-addr> | ip6-addr <ip6-addr>} [freq-band {2.4ghz | 5ghz}] radio {0 | 1 | 2}
```

Description

This command shows the current duty cycle for devices on all channels being monitored by the spectrum monitor or hybrid AP radio.

Syntax

Parameter	Description
`ap-name <ap-name>`	Name of the spectrum device for which you want to view spectrum information.
`ip-addr <ip-addr>`	IP address of the spectrum device for which you want to view spectrum information.
`ip6-addr <ip6-addr>`	IPv6 address of the spectrum device for which you want to view spectrum information.
`freq-band 2.4ghz|5ghz`	View information for a specific radio type, either 2.4 GHz or 5 GHz.
`radio {0 | 1 | 2}`	View information for a specific radio type, either 0, 1 or 2. Radio 0, 1 or 2 is supported only on AP-555 access points.

Usage Guidelines

The FFT Duty Cycle table in the output of this command shows the duty cycle for each radio channel. The duty cycle is the percentage of time each device type operates or transmits on that channel. For additional details about non-Wi-Fi device types shown in this table, see Non-Wi-Fi Interferers on page 1676.

Examples

The output of this command shows that video devices sent a signal on channels 153 and 157 during 99% of the last sample interval.

```
Device Duty Cycle Table (in %)
------------------------------
Device Type           149  153  157  161  165  149+  157+
-----------           ---  ---  ---  ---  ---  ----  ----
Generic Interferer    0    0    0    0    0    0     0
WIFI                  5    0    5    12   8    0     12
Microwave             0    0    0    0    0    0     0

```
show ap spectrum device-history {ap-name <ap-name> | ip-addr <ip-addr> | ip6-addr <ip6-addr>}
[freq-band {2.4ghz | 5ghz}] [type {audio | bluetooth | cordless-ff-phone | cordless-fh-base |
cordless-fh-network | generic-ff | generic-fh | generic-interferer | microwave | microwave-
inverter   |video | xbox}]
```

Description

This command shows the history of the last 256 non-Wi-Fi devices.

Syntax

Parameter	Description
`ap-name <ap-name>`	Name of the spectrum monitor or hybrid AP for which you want to view spectrum information.
`ip-addr <ip-addr>`	IP address of the spectrum monitor or hybrid AP for which you want to view spectrum information.
`ip6-addr <ip6-addr>`	IPv6 address of the spectrum monitor or hybrid AP for which you want to view spectrum information.
`freq-band {2.4ghz | 5ghz}`	View information for a specific radio type, either 2.4 GHz or 5 GHz.
`type`	Show information for one type of device only by specifying a non-Wi-Fi device.
`audio`	View information for audio devices seen by the spectrum device.
`bluetooth`	View information for bluetooth devices seen by the spectrum device. **NOTE:** This option is available only for 2.4 GHz spectrum devices.
`cordless-ff-phone`	View information for frequency-hopping cordless phones seen by the spectrum device.
`cordless-fh-base`	View information for frequency-hopping cordless phone bases seen by the spectrum device.
`cordless-fh-network`	View information for frequency-hopping cordless network devices seen by the spectrum device.
`generic-ff`	View information for generic fixed-frequency devices seen by the spectrum device.
`generic-fh`	View information for generic frequency-hopping devices seen by the spectrum device.
`generic-interferer`	Show only generic interfering devices.
`microwave`	View information for microwave-emitting devices seen by the spectrum device. **NOTE:** This option is available only for 2.4 GHz spectrum devices.
`microwave-inverter`	View information for inverter microwave devices seen by the spectrum device. **NOTE:** This option is available only for 2.4 GHz spectrum devices.

Parameter	Description
`video`	View information for video devices seen by the spectrum device.
`xbox`	View information for Xbox devices seen by the spectrum device. **NOTE:** This option is available only for 2.4 GHz spectrum devices.

Usage Guidelines

Use this command to view channel, signal, and duty-cycle information as well as addor delete times for the last 256 devices seen by a spectrum monitor or hybrid AP.

Non-Wi-Fi Interferers

The following table describes each type of of non-Wi-Fi interferer detected by a spectrum monitor or hybrid AP. Note also that a hybrid AP on a 20 MHz channel will see 40 MHz Wi-Fi data as non-Wi-Fi data.

Non-Wi-Fi Interferer Type	Description
Bluetooth	Any device that uses the Bluetooth protocol to communicate in the 2.4 GHz band is classified as a *Bluetooth* device. Bluetooth uses a frequency hopping protocol.
Fixed Frequency (Audio)	Some audio devices such as wireless speakers and microphones also use fixed frequency to continuously transmit audio. These devices are classified as *Fixed Frequency (Audio)*.
Fixed Frequency (Cordless Phones)	Some cordless phones use a fixed frequency to transmit data (much like the fixed frequency video devices). These devices are classified as *Fixed Frequency (Cordless Phones)*.
Fixed Frequency (Video)	Video transmitters that continuously transmit video on a single frequency are classified as *Fixed Frequency (Video*). These devices typically have close to a 100% duty cycle. These types of devices may be used for video surveillance, TV or other video distribution, and similar applications.
Fixed Frequency (Other)	All other fixed frequency devices that do not fall into one of the above categories are classified as *Fixed Frequency (Other*). Note that the RF signatures of the fixed frequency audio, video and cordless phone devices are very similar and that some of these devices may be occasionally classified as Fixed Frequency (Other).
Frequency Hopper (Cordless Base)	Frequency hopping cordless phone base units transmit periodic beacon-like frames at all times. When the handsets are not transmitting (i.e., no active phone calls), the cordless base is classified as *Frequency Hopper (Cordless Base*).
Frequency Hopper (Cordless Network)	When there is an active phone call and one or more handsets are part of the phone conversation, the device is classified as *Frequency Hopper (Cordless Network*). Cordless phones may operate in 2.4 GHz or 5 GHz bands. Some phones use both 2.4 GHz and 5 GHz bands (for example, 5 GHz for Base-to-handset and 2.4 GHz for Handset-to-base). These phones may be classified as unique Frequency Hopper devices on both bands.
Frequency Hopper (Xbox)	The Microsoft Xbox device uses a frequency hopping protocol in the 2.4 GHz band. These devices are classified as *Frequency Hopper (Xbox*).

Non-Wi-Fi Interferer Type	Description
Frequency Hopper (Other)	When the classifier detects a frequency hopper that does not fall into one of the above categories, it is classified as Frequency Hopper (Other). Some examples include IEEE 802.11 FHSS devices, game consoles and cordless or hands-free devices that do not use one of the known cordless phone protocols.
Microwave	Common residential microwave ovens with a single magnetron are classified as a *Microwave*. These types of microwave ovens may be used in cafeterias, break rooms, dormitories and similar environments. Some industrial, healthcare or manufacturing environments may also have other equipment that behave like a microwave and may also be classified as a Microwave device.
Microwave (Inverter)	Some newer-model microwave ovens have the inverter technology to control the power output and these microwave ovens may have a duty cycle close to 100%. These microwave ovens are classified as *Microwave (Inverter)*. Dual-magnetron industrial microwave ovens with higher duty cycle may also be classified as Microwave (Inverter). As in the Microwave category described above, there may be other equipment that behave like inverter microwaves in some industrial, healthcare or manufacturing environments. Those devices may also be classified as Microwave (Inverter).
Generic Interferer	Any non-frequency hopping device that does not fall into one of the other categories described in this table is classified as a *Generic Interferer*. For example a Microwave-like device that does not operate in the known operating frequencies used by the Microwave ovens may be classified as a Generic Interferer. Similarly wide-band interfering devices may be classified as Generic Interferers.

Example

The following is an example for executing this command:

```
(host) [mynode] #show ap spectrum device-history ap-name ap-205 type audio
```

The output of this example shows details for fixed-frequency video devices seen by a spectrum monitor or hybrid AP radio.

```
host) [mynode] #show ap spectrum device-history ap-name ap123 freq-band 5ghz type video

The output of this command includes the following information:

Column	Description
`Type`	Device type. This parameter can be any of the following: ■ audio FF (fixed frequency) ■ bluetooth ■ cordless base FH (frequency hopper) ■ cordless phone FF (fixed frequency ■ cordless network FH (frequency hopper) ■ generic FF (fixed frequency ■ generic FH (frequency hopper) ■ generic interferer ■ microwave ■ microwave inverter ■ video ■ xbox **NOTE:** For additional details about non-Wi-Fi device types shown in this table, see Non-Wi-Fi Interferers on page 1676.
`ID`	ID number assigned to the device by the spectrum monitor or hybrid AP radio. Spectrum monitors and hybrid APs assign a unique spectrum ID per device type.
`Cfreq`	Center frequency of the signal sent from the device.
`Bandwidth`	Channel bandwidth used by the device, in KHz.
`Channels-affected`	Radio channels affected by the wireless device, in KHz.
`Signal-strength`	Strength of the signal sent from the device, in dBm.
`Duty-cycle`	Device duty cycle. This value represents the percent of time the device broadcasts on the specified channel or frequency.
`Add-time`	Time at which the device was first detected.
`Delete-time`	Time at which the device was aged out.

inverter   |video | xbox}]
```

Description

Show a device summary table and channel information for non-Wi-Fi devices currently seen by a spectrum monitor or hybrid AP radio.

Syntax

Parameter	Description
`ap-name <ap-name>`	Name of the spectrum monitor or hybrid AP for which you want to view spectrum information.
`ip-addr <ip-addr>`	IP address of the spectrum monitor or hybrid AP for which you want to view spectrum information.
`ip6-addr <ip-addr>`	IPv6 address of the spectrum monitor or hybrid AP for which you want to view spectrum information.
`freq-band {2.4ghz | 5ghz}`	View information for a specific radio type, either 2.4 GHz or 5 GHz.
`type`	Show data for a specific device type only.
`audio`	Show only audio fixed frequency devices.
`bluetooth`	Show only bluetooth devices. **NOTE:** This option is available only for 2.4 GHz spectrum devices.
`cordless-ff-phone`	View information for frequency-hopping cordless phones seen by the spectrum device.
`cordless-fh-base`	View information for frequency-hopping cordless phone bases seen by the spectrum device.
`cordless-fh-network`	View information for frequency-hopping cordless network devices seen by the spectrum device.
`generic-ff`	View information for generic fixed-frequency devices seen by the spectrum device.
`generic-fh`	View information for generic frequency-hopping devices seen by the spectrum device.
`generic-interferer`	Show only generic interfering devices.
`microwave`	Show only microwave devices. **NOTE:** This option is available only for 2.4 GHz spectrum devices.
`microwave-inverter`	Show only microwave inverter devices. **NOTE:** This option is available only for 2.4 GHz spectrum devices.

Parameter	Description
`video`	Show only video fixed frequency devices.
`xbox`	Show only xbox frequency hopper devices. **NOTE:** This option is available only for 2.4 GHz spectrum devices.

Usage Guidelines

Issue this command to view detailed information about currently active non-Wi-Fi devices on the network. Use the optional **type** parameter to display data for one specific device type only. For additional details about non-Wi-Fi device types shown in this table, see Non-Wi-Fi Interferers on page 1676.

A hybrid AP on a 20 MHz channel will see 40 MHz Wi-Fi data as non-Wi-Fi data.

Examples

The output of this example shows that the spectrum monitor **ap123** is able to see data for a single non-Wi-Fi device on its 802.11a radio. Note that the output below is divided into two sections to better fit on the page of this document. In the AOS-W CLI, this information is displayed in a single long table.

```
(host) [mynode] #show ap spectrum device-list ap-name ap123 freq-band 5ghz

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on the managed device or Switch where the AP terminates.

show ap spectrum device-log

```
show ap spectrum device-log {ap-name <ap-name> | ip-addr <ip-addr> | ip6-addr <ip6-addr>}
[freq-band {2.4ghz | 5ghz} [type {audio | bluetooth | cordless-ff-phone | cordless-fh-base |
cordless-fh-network | generic-ff | generic-fh | generic-interferer | microwave | microwave-
inverter   |video | xbox}]
```

Description

This command shows a time log of add and delete events for non-Wi-Fi devices.

Syntax

Parameter	Description
`ap-name <ap-name>`	Name of the spectrum monitor for hybrid AP or which you want to view spectrum information.
`ip-addr <ip-addr>`	IP address of the spectrum monitor or hybrid AP for which you want to view spectrum information.
`ip6-addr <ip6-addr>`	IP address of the spectrum monitor or hybrid AP for which you want to view spectrum information.
`freq-band 2.4ghz|5ghz`	View information for a specific radio type, either 2.4 GHz or 5 GHz.
`type`	Show data for a specific device type only.
`audio`	Show only audio fixed frequency devices.
`bluetooth`	Show only bluetooth devices. **NOTE:** This option is available only for 2.4 GHz spectrum device radios.
`cordless-ff-phone`	View information for frequency-hopping cordless phones seen by the spectrum device.
`cordless-fh-base`	View information for frequency-hopping cordless phone bases seen by the spectrum device.
`cordless-fh-network`	View information for frequency-hopping cordless network devices seen by the spectrum device.
`generic-ff`	View information for generic fixed-frequency devices seen by the spectrum device.
`generic-fh`	View information for generic frequency-hopping devices seen by the spectrum device.
`generic-interferer`	Show only generic interfering devices.
`microwave`	Show only microwave devices. **NOTE:** This option is available only for 2.4 GHz spectrum device radios.
`microwave-inverter`	Show only microwave inverter devices. **NOTE:** This option is available only for 2.4 GHz spectrum device radios.
`video`	Show only video fixed frequency devices.

Parameter	Description
`xbox`	Show only xbox frequency hopper devices. **NOTE:** This option is available only for 2.4 GHz spectrum device radios.

Usage Guidelines

Use this table to show a time log of when non-Wi-Fi devices were added to and deleted from the Wi-fi Device log table. For additional details about non-Wi-Fi device types shown in this table, see Non-Wi-Fi Interferers on page 1676.

A hybrid AP on a 20 MHz channel will see 40 MHz Wi-Fi data as non-Wi-Fi data.

Examples

The output of this example shows that the spectrum monitor **ap123** logged data for four frequency-hopping cordless base devices seen by its 802.11g radio. Note that the output below is divided into two sections to better fit on the page of this document. In the AOS-W CLI, this information is displayed in a single long table.

```
(host) [mynode] #show ap spectrum device-log ap-name ap123 freq-band 5ghz type cordless-fh-
base

The output of this command includes the following information:

Column	Description
`Device Type`	Type of non-Wi-Fi device detected by the spectrum monitor or hybrid AP
`ID`	The spectrum ID number assigned to that device. Spectrum monitors and hybrid APs assign a unique spectrum ID per device type.

Column	Description
Added/Deleted	The non-Wi-Fi Device Log table can show signal data for a device when that device was added or removed from the log table.
Signal Strength	Strength of the signal sent by the device.
Duty Cycle	Device duty cycle. This value represents the percent of time a signal is broadcast on a specific channel or frequency.
Center Freq	Center frequency of the signal sent by the device.
Start Freq	Lowest signal frequency sent by the device.
End Freq	Highest signal frequency sent by the device.
Channels affected	Radio channels affected by the device signal.
Bandwidth	Amount of signal bandwidth used by the device, in kilohertz.

AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on the managed device or Switch where the AP terminates.

show ap spectrum device-summary

```
show ap spectrum device-summary {ap-name <ap-name> | ip-addr <ip-addr> | ip6-addr <ip6-addr>}
[freq-band {2.4 ghz | 5ghz}]
```

Description

This command shows the numbers of Wi-Fi and non-Wi-Fi device types on each channel monitored by a spectrum monitor or hybrid AP.

Syntax

Parameter	Description
`ap-name <ap-name>`	Name of the spectrum monitor or hybrid AP for which you want to view spectrum information.
`ip-addr <ip-addr>`	IP address of the spectrum monitor or hybrid AP for which you want to view spectrum information.
`ip6-addr <ip6-addr>`	IPv6 address of the spectrum monitor or hybrid AP for which you want to view spectrum information.
`freq-band {2.4ghz | 5ghz}`	View information for a specific radio type, either 2.4 GHz or 5 GHz.

Usage Guidelines

Use this command to show the types of devices that the spectrum device can detect on each channel it monitors. For additional details about non-Wi-Fi device types shown in this table, see Non-Wi-Fi Interferers on page 1676.

Examples

The output of this example shows that the spectrum monitor **ap123** is able to detect 61 Wi-Fi devices on channel 149.

```
(host) [mynode] #show ap spectrum device-summary ap-name ap123 freq-band 5ghz

Device Summary Table
--------------------
Device                149  153  157  161  165
-------               ---  ---  ---  ---  ---

show ap spectrum interference-power

```
show ap spectrum interference-power {ap-name <ap-name>}|{ip-addr <ip-addr>} [freq-band {2.4
ghz | 5ghz}]
```

Description

This command shows the interference power detected by a 802.11a or 802.11g radio on a spectrum monitor or hybrid AP.

Syntax

Parameter	Description
`ap-name <ap-name>`	Name of the spectrum monitor or hybrid AP for which you want to view spectrum information.
`ip-addr <ip-addr>`	IP address of the spectrum monitor or hybrid AP for which you want to view spectrum information.
`ip6-addr <ip6-addr>`	IPv6 address of the spectrum monitor or hybrid AP for which you want to view spectrum information.
`freq-band {2.4ghz | 5ghz}`	View information for a specific radio type, either 2.4 GHz or 5 GHz.

Usage Guidelines

This table displays information about AP power levels, channel noise, and adjacent channel interference seen on each channel by a spectrum monitor or hybrid AP radio.

The output of this command displays the noise floor of each selected channel in dBm. The noise floor of a channel depends on the noise figure of the RF components used in the radio, temperature, presence of certain types of interferers or noise, and the width of the channel. For example, in a clean environment, the noise floor of a 20 MHz channel will be around -95 dBm and that of a 40 MHz channel will be around -92 dBm. Certain types of fixed frequency continuous transmitters such as video bridges, fixed frequency phones, and wireless cameras typically elevate the noise floor as seen by the Wi-Fi radio. Other interferers such as the frequency hopping phones, Bluetooth, and Xbox devices may not affect the noise floor of the radio. A Wi-Fi radio can only reliably decode Wi-Fi signals that are a certain dB above the noise floor and therefore estimating and understanding the actual noise floor of the radio is critical to understanding the reliability of the RF environment.

The ACI column displayed in the Interference Power Chart displays adjacent-channel interference (ACI) power levels based on the signal strength(s) of the Wi-Fi APs on adjacent channels. A higher ACI value in Interference Power Chart does not necessarily mean higher interference since the AP that is contributing to the maximum ACI may or may not be very actively transmitting data to other clients at all times. The ACI power levels are derived from the signal strength of the beacons.

Examples

The output of this example shows interference power levels for each channel seen by the spectrum monitor **ap123**.

```

The output of this command includes the following information:

Column	Description
Channel	An 802.11a or 802.11g radio channel.
Noise Floor (dBm)	Current noise floor recorded on the channel.
Max AP Signal (dBm)	Power level of the AP on the channel with the highest signal power.
Max AP SSID	SSID of the AP on the channel with the highest signal power.
Max AP BSSID	BSSID of the AP on the channel with the highest signal power.
ACI (dBm)	Adjacent channel interference level detected by the spectrum device.
Max Interference Power (dBm)	Signal strength of the non-Wi-Fi device that has the highest signal strength.

show ap spectrum-load-balancing

```
show ap spectrum-load-balancing [group <group>]
```

Description

This command shows spectrum load balancing information for an AP with this feature enabled.

Syntax

Parameter	Description
`group <group>`	Filter this information to show only data for the specified spectrum load balancing domain.

Examples

The output of the command below shows the APs currently using the spectrum load-balancing domain **default-1**.

```
(host)[mynode] #show ap spectrum-load-balancing group default-1

Spectrum Load Balancing Group
-----------------------------
Name     IP Address       Domain     Assignment  Clients
----     ----------       ------     ----------  -------
ap121-1  192.168.151.253  default-1  149/21      3
ap124-1  192.168.151.254  default-1  48/15       3
ap125-1  192.168.151.251  default-1  44/15       2
```

The output of this command includes the following information:

Column	Description
`Name`	Name of an AP.
`IP address`	IP address of the AP.
`Domain`	Name of the spectrum load balancing domain assigned to the AP.
`Assignment`	Current channel and power assignment for the AP.
`Clients`	Number of clients currently using the AP.

Related Commands

show ap spectrum local-override

```
show ap spectrum local-override
```

Description

This command shows a list of AP radios currently converted to spectrum monitors through the spectrum local-override list.

Syntax

No parameters

Examples

The output of this example shows that three APs each have two radios defined as spectrum monitors.

```
(host)[mynode] #show ap spectrum local-override
Spectrum Local Override Profile
-------------------------------
Parameter       Value
---------       -----
Override Entry  AP ap125 band 2ghz
Override Entry  AP ap125 band 5ghz
Override Entry  AP ap105 band 2ghz
Override Entry  AP ap105 band 5ghz
Override Entry  AP apcorp1 band 2ghz
Override Entry  AP APcorp1 band 5ghz
```

The Value column in the output of this command includes the following information:

Parameter	Description
`Override Entry`	Indicates that an AP radio has been added to the local override list.
`Value`	Radio that has been added to the override list, and the band used by that radio.

Related Commands

Command	Description
ap spectrum local-override	Converts an AP or AM into a spectrum monitor by adding it to the spectrum local-override list.
rf dot11a-radio-profilemode spectrum-mode	Sets an 802.11a radio so that the device operates as a spectrum monitor, and can send spectrum analysis data to a desktop or laptop client.
rf dot11g-radio-profilemode spectrum-mode	Sets an 802.11g radio so that the device operates as a spectrum monitor, and can send spectrum analysis data to a desktop or laptop client.

show ap spectrum monitors

```
show ap spectrum monitors {ap-group <ap-group>|ap-name <ap-name>|ap-type <ap-type>|channel
<channel>|freq-band <freq-band>|ip-addr <ip-addr>|ip6-addr <ip6-addr>|or [page <page>|sort
<sort>]}
```

Description

This command shows a list of APs terminating on the Switch that are currently configured as spectrum monitors or hybrid APs.

Syntax

Parameter	Description
`ap-group <ap-group>`	Specify the spectrum device's AP group.
`ap-name <ap-name>`	Specify the AP name configured as a spectrum monitor or hybrid AP.
`ap-type <ap-type>`	Specify the AP type.
`channel <channel>`	Specify the channel of hybrid monitor.
`freq-band <freq-band>`	Specify the frequency band.
`ip-addr <ip-addr>`	Specify the IP address of spectrum monitor
`ip6-addr <ip6-addr>`	Specify the IPv6 address of spectrum monitor
`or`	Show spectrum monitors that satisfy any of the given conditions:
`page <page>`	Enter a value greater than 1 for Page Number. The number of Spectrum Monitors displayed per page is 50.
`sort <sort>`	Sort criteria based on pairs of column name and order, e.g. ap-name,asc,channel,desc, and so on.

Examples

The output of this example shows that the 802.11a radio on a spectrum monitor named **ap123** is sending spectrum analysis data to a client with the IP address 10.240.16.177.

```
(host)#show ap spectrum monitors

 2011-01-21
07:18:22 AM
```

The output of this command includes the following information:

Column	Description
AP name	Name of an AP configured as a spectrum monitor or hybrid AP.
Group	Name of the spectrum device's AP group.
Ap Type	The AP model number .
Phy	The radio's PHY type. Possible values are **A** for 802.11a and **G** for 802.11b/g,
Band	Spectrum band that the spectrum monitor or hybrid AP radio is currently monitoring.
Mode	This column shows whether the device is an access point configured as a hybrid AP, or a spectrum monitor.
Client IP	IP address of the client to which the spectrum monitor or hybrid AP is sending data.
Subscribe time	Time at which the spectrum monitor or hybrid AP was connected to the client.

Related Commands

Command	Description
ap spectrum local-override	Converts an AP or AM into a spectrum monitor by adding it to the spectrum local-override list.
rf dot11a-radio-profilemodespectrum-mode	Sets an 802.11a radio so that the device operates as a spectrum monitor, and can send spectrum analysis data to a desktop or laptop client.

All platforms	Base operating system.	Enable or Config mode on the managed device or Switch where the AP terminates.

show ap spectrum tech-support

```
show ap spectrum tech-support ap-name <ap-name> [<filename>]
```

Description

Save spectrum data for later analysis by technical support.

Syntax

Parameter	Description
`ap-name <ap-name>`	Save technical support information for a specific spectrum monitor.
`<filename>`	Name of the file to which this data should be saved. This file does not have to already exist on the Switch, the **show ap spectrum technical-support** command will create this file.

Usage Guidelines

Use this command under the supervision of your Alcatel-Lucent technical support representative to troubleshoot spectrum analysis issues or errors.

Related Commands

Command	Description

show ap standby

```
show ap {ap-name <ap-name> | bssid <bssid> | details |ip-addr <ip-addr> | ip6-addr <ip6-addr>}
```

Description

Show all APs in standby mode currently registered to a managed device.

Syntax

Parameter	Description
`ap-name <ap-name>`	View data for an AP with a specified name.
`bssid <bssid>`	View data for a specific BSSID.
`details`	View AP data detailed columns.
`ip-addr <ip-addr>`	View data for an AP with a specified IP address by entering an IP address in dotted-decimal format.
`ip6-addr <ip6-addr>`	View data for an AP with a specified IPv6 address.

Usage Guidelines

This command displays details for all APs connected to a Switch in standby mode.

Example

Execute the following command to view AP data detailed columns:

```
(host) [mynode] #show ap standby

Standby AP Table
---------------
Name     Group     IP Address     AP Type  Flags  Uptime         Outer IP  Cluster Role
----     -----     ----------     -------  -----  ------         --------  ------------
Radio 0 Band Ch/EIRP/MaxEIRP/Clients  Radio 1 Band Ch/EIRP/MaxEIRP/Clients
------------------------------------  ------------------------------------
Radio 2 Band Ch/EIRP/MaxEIRP/Clients
------------------------------------
Flags: 1 = 802.1x authenticated AP; 2 = Using IKE version 2;
A = Enet1 in active/standby mode;  B = Battery Boost On; C = Cellular;
D = Disconn. Extra Calls On; E = Wired AP enabled; F = AP failed 802.1x authentication;
H = Hotspot Enabled; K = 802.11K Enabled; L = Client Balancing Enabled; M = Mesh;
N = 802.11b protection disabled; P = PPPOE; R = Remote AP;
S = AP connected as standby; X = Maintenance Mode;
a = Reduce ARP packets in the air; d = Drop Mcast/Bcast On; u = Custom-Cert RAP;
i = Provisioned as Indoor; o = Provisioned as Outdoor;
p = Restriction mode in POE-AF/AT;r = 802.11r Enabled; f = No Spectrum FFT support;
Q = DFS CAC timer running; T = Flex Radio Mode is 2.4GHz+5GHz; t = Tri-Radio Mode Enabled;
U = Flex Radio Mode is 5GHz; V = Flex Radio Mode is 2.4GHz; e = custom EST cert; W = Dual 5GHz
Mode Enabled; 4 = Using WiFi Uplink
Channel followed by "*" indicates channel selected due to unsupported configured channel.
"Spectrum" followed by "^" indicates Local Spectrum Override in effect.
Channel flags: +/- = 40 MHz, E = 80 MHz, S = 160 MHz, E+E = 80 + 80 MHz (i.e. 36E+149E)
Cluster Role: U = UAC, A = AAC, SU = Standby UAC , SA = Standby AAC
Num APs:0

Dump collection profile                                                         default
```

The output of this command includes the following information:

Column	Description
RF Band	For dual-band radios, this parameter displays the RF band in which the AP should operate: ■ **g** = 2.4 GHz ■ **a** = 5 GHz

Column	Description
Recovery Mode	Displays the AP behavior when a firmware assert is detected.
RF Band for AM mode scanning	Scanning band for multiple RF radios. ■ **g** = 2.4 GHz ■ **a** = 5 GHz ■ **all** = Radio scans both bands. This is the default setting.
Native VLAN ID	Native VLAN for bridge mode virtual APs (frames on the native VLAN are not tagged with 802.1q tags).
WIDS AMPDU Optimization	Displays if the WIDS aggregate MPDU optimization is enabled or disabled.
Tunnel Heartbeat Interval	Interval between heartbeat messages between a remote or campus AP and its associated managed device. An increase in the heartbeat interval increases the time it will take for an AP to detect the loss in connectivity to the managed device, but can reduce internet bandwidth consumed by a remote AP.
Session ACL	This parameter shows the ACL applied on the uplink of a remote AP.
Corporate DNS Domain	DNS name used by the corporate network.
SNMP sysContact	SNMP system contact information.
LED operating mode	Displays the LED operating mode for indoor 802.11n APs. LEDs display as usual in the default **normal** operating mode, but are all turned off in **off** mode.
LED override	When enabled, LED auto-turn-off function does not work. This is applicable only for APs with a single LEDs, that include OAW-AP228, OAW-AP274, OAW-AP275, OAW-AP277, OAW-AP365, OAW-AP367, AP-318, AP-374, AP-375, AP-377, and AP-387 access points.
Driver log level	Level of Driver log prints sent to syslog server.
Console log level	Level of Driver log prints sent to AP console.
SAP MTU	Maximum Transmission Unit (MTU) size, in bytes. This value describes the greatest amount of data that can be transferred in one physical frame.
RAP MTU	
LMS IP	The IP address of the local management switch (LMS)—the Alcatel-Lucent managed device which is responsible for terminating user traffic from the APs, and processing and forwarding the traffic to the wired network. **NOTE:** If the LMS-IP is blank, the access point will remain on the managed device that it finds using methods like DNS or DHCP. If an IP address is configured for the LMS IP parameter, the AP will be immediately redirected to the managed device at that address.

Column	Description
`Backup LMS IP`	For networks with multiple managed devices, this parameter displays the IP address of a backup to the IP address specified with the lms-ip parameter.
`LMS IPv6`	For IPv6 networks with multiple managed devices, this parameter specifies the IPv6 address of the local management switch (LMS)—the Alcatel-Lucent managed device—which is responsible for terminating user traffic from the APs, and processing and forwarding the traffic to the wired network. This can be the IP address of the managed device or Mobility Master.
`Backup LMS IPv6`	In multi-Switch ipv6 networks, this parameter specifies the IPv6 address of a backup to the IPv6 address specified with the **LMS IPv6** setting.
`LMS Preemption`	When this parameter is enabled, the local management switch automatically reverts to the primary LMS IP address when it becomes available.
`LMS Hold-down Period`	Time, in seconds, that the primary LMS must be available before an AP returns to that LMS after failover. The `rap-dhcp-server-vlan` VLAN ID of the remote AP DHCP server is used if the managed device is unavailable. This VLAN enables the DHCP server on the AP (also known as the remote AP DHCP server VLAN). If you enter the native VLAN ID, the DHCP server is unavailable.
`LMS ping interval`	The interval at which an application level ping is sent to a primary controller to check the reachability. Applicable only for RAPs. **NOTE:** If this parameter is changed, the UDP session timeout should be set accordingly on an intermediate router. The preferred timeout value is **lms-ping-interval** plus 30 seconds.
`Remote-AP DHCP Server VLAN`	VLAN ID of the remote AP DHCP server used if the managed device is unavailable. This VLAN enables the DHCP server on the AP (also known as the remote AP DHCP server VLAN).
`Remote-AP DHCP Server ID`	IP address used as the DHCP server identifier.
`Remote-AP DNS Server`	IP address of the DNS server.
`Remote-AP DHCP Default Router`	IP address for the default DHCP router.
`Remote-AP DHCP Pool Start`	This parameter defines the starting IP address in the DHCP pool for remote APs.
`Remote-AP DHCP Pool End`	This parameter defines the last IP address in the DHCP pool for remote APs.
`Remote-AP DHCP Pool Netmask`	Configures a DHCP pool for remote APs. This is the netmask used for the DHCP pool.

Column	Description
`Remote-AP uplink total bandwidth`	This is the total reserved uplink bandwidth (in kilobits per second).

`Remote-AP bw reservation 1`
`Remote-AP bw reservation 2`
`Remote-AP bw reservation 3`
	Session ACLs with uplink bandwidth reservation in kilobits per second. You can specify up to three session ACLs to reserve uplink bandwidth. The sum of the three uplink bandwidths should not exceed the `rap-bw-total` value.

`Remote-AP Local Network Access`	Shows if Remote-AP Local Network Access is enabled or disabled. By enabling this option, the clients that are connected to a remote AP can communicate. **NOTE:** By default, the Remote-AP Local Network Access will be disabled.
`Flex Radio Mode`	The mode for flexible radio.
`Dual 5GHz Mode`	The mode for dual 5 GHz APs.
`Split-5GSHz Mode`	The mode for split 5 GHz APs.
`IPM activation`	Displays the activation status of the Intelligent Power Monitoring (IPM) system.
`Bootstrap threshold`	Number of consecutive missed heartbeats on a GRE tunnel (heartbeats are sent once per second on each tunnel) before an AP rebootstraps. On the managed device, the GRE tunnel timeout is 1.5 x bootstrap-threshold; the tunnel is torn down after this number of seconds of inactivity on the tunnel.
`Double Encrypt`	This parameter applies only to remote APs. Double encryption is used for traffic to and from a wireless client that is connected to a tunneled SSID. When enabled, all traffic is re-encrypted in the IPsec tunnel. When disabled, the wireless frame is only encapsulated inside the IPsec tunnel.
`Dump Server`	(For debugging purposes.) Displays the server to receive the core dump generated if an AP process crashes.
`Heartbeat DSCP`	DSCP value of AP heartbeats (0–63).
`Maintenance Mode`	Shows if Maintenance mode is enabled or disabled. If enabled, APs stop flooding unnecessary traps and syslog messages to the NMS or network operations centers when deploying, maintaining, or upgrading the network. The managed device still generates debug syslog messages if debug logging is enabled.
`Maximum Request Retries`	Maximum number of times to retry AP-generated requests, including keepalive messages. After the maximum number of retries, the AP either tries the IP address specified by the bkup-lms-ip (if configured) or reboots.

Column	Description
`Request Retry Interval`	Interval, in seconds, between the first and second retries of AP-generated requests. If the configured interval is less than 30 seconds, the interval for subsequent retries is increased up to 30 seconds.
`Number of IPSEC retries`	The number of times the AP will attempt to recreate an IPsec tunnel with Mobility Master before the AP will reboot. A value of 0 disables the reboot.
`AeroScout RTLS Server`	This parameter contains the following information, separated by colons: ■ IPv4 or IPv6 address of an AeroScout real-time asset location (RTLS) server to which locations report are sent ■ Port number: Port number on the AeroScout server to which location reports are sent ■ include-unassoc-sta - Specifies whether to include unassociated stations when sending station reports. Unassociated stations are stations that are not associated to any AP Default: disabled
`RTLS Server configuration`	This parameter contains the following information, separated by colons. ■ IPv4 or IPv6 address of the RTLS server to which the AP sends RFID tag information. ■ Number of the RTLS server port to which the AP sends RFID tag information ■ Shared secret key for the server ■ Frequency at which packets are sent to the server, in seconds
`AP USB Power mode`	Displays the status of USB port on various AP platforms that have external USB ports. Listed below are the power modes: ■ **auto**- Detect USB power mode automatically ■ **disable**- Disable USB power ■ **enable**- Enable USB power **NOTE:** This parameter can be configured only on OAW-AP214, OAW-AP215, OAW-AP224, OAW-AP225, OAW-AP205H, OAW-AP303H, OAW-AP304, OAW-AP305, OAW-AP314, OAW-AP315, OAW-APAP-324, OAW-AP325, OAW-AP334, OAW-AP335, AP-344, AP-345, OAW-AP203R, and OAW-AP203RP access points only.
`Telnet`	Reports whether telnet access the AP is enabled or disabled.
`RF Band for Backup`	If the system profile is enabled AP console access using a backup ESSID, this parameter
`Operation for Backup`	This parameter allows AP console access using a backup ESSID, allowing users to access an AP console after the AP has disconnected from the managed device. When the AP advertises a backup ESSID in either static or dynamic mode, a user is able to access and debug the AP remotely through a virtual AP. This feature is disabled by default.

Column	Description
BLE Endpoint URL	Displays the URL of the Meridian server to which the Bluetooth Low Energy (BLE) sends monitoring data.
BLE Auth Token	Displays the BLE endpoint authorization token. This token is unique for each deployment.
BLE Operation Mode	Displays the BLE operation mode of the AP.

Starting from AOS-W 8.2.0.0, the output of the **show ap system-profile <profile-name> | include IPM** command is modified to display a new output parameter, **IPM Steps delete all**.

```
(host) [mynode]  #show ap system-profile default | include IPM
IPM activation                              Disabled
IPM power reduction steps with priorities  N/A
IPM Steps delete all                        No
```

Starting from AOS-W 8.4.0.0, the output of the **show ap system-profile <profile-name> | include USB** command is modified to display a new output parameter, **AP USB Power mode**.

```
(host) [mynode]  #show ap system-profile default | include USB
AP USB Power mode                          auto
```

Related Commands

Command	Description
ap system-profile	This command configures an AP system profile.

Command History

Release	Modification
AOS-W 8.4.0.0	The following changes were introduced: ■ The output of the **show ap system-profile <profile-name> | include USB** command displays the **AP USB Power mode** parameter. ■ The **AeroScout RTLS Server** and **RTLS Server configuration** output parameter of the **show ap system-profile <profile-name> | include RTLS** command displays IPv6 address.
AOS-W 8.2.0.0	A new output parameter, **IPM Steps delete all**, was included in the output of the **show ap system-profile <profile-name> | include IPM** command.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on the managed device or Switch where the AP terminates.

show ap tech-support

```
show ap tech-support ap-name <ap-name> [<filename>]
```

Description

This command displays all information for an AP, or save that information to a file on the Switch. This information can be used by Alcatel-Lucent technical support to diagnose a problem with an AP.

Syntax

Parameter	Description
`<ap-name>`	Name of the AP for which you want to view tech support data.
`<filename>`	Save the output of this command to a file on the Switch with the specified filename.

Usage Guidelines

This is an internal technical support command. Alcatel-Lucent technical support may request that you issue this command to help analyze and troubleshoot problems with an AP or your wireless network.

Related Commands

Command	Description
show tech-support	This command displays all information about the Switch required for technical support purposes.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on the managed device or Switch where the AP terminates.

show ap uac-database

```
show ap uac-database
```

Description

This command shows user anchor Switch (UAC) AP database for cluster.

Syntax

No parameters

Examples

Execute the following command to show the UAC AP database for cluster:

```
(host) [mynode] #show ap uac-database
UAC AP Database
---------------
AP Name  MAC Address  IP Address  AP Group  AP Type  Status  Radio 0 BSSID  Radi

o 1 BSSID  Radio 2 BSSID
-------  -----------  ----------  --------  -------  ------  -------------  ----

---------  -------------
Total APs:0
```

Command History

Command	Modification
AOS-W 8.6.0.0	The output parameter **Radio 2 BSSID** was introduced.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on the managed device or Switch where the AP terminates.

show ap vht-rates

```
show ap vht-rates bssid <bssid>
```

Description

Show very-high-throughput (VHT) rates for an AP that supports 802.11ac.

Syntax

Parameter	Description
`bssid <bssid>`	Show VHT rates for a specific Basic Service Set Identifier (BSSID) on an 802.11ac-capable AP. The Basic Service Set Identifier (BSSID) is usually the MAC address of the AP radio.

Examples

The output of the command below shows very-high-throughput rates for 20 Mhz, 40 Mhz and 80 Mhz data streams with and without a short guard interval (SGI).

```
(host) [mynode] #show ap vht-rates bssid 6c:f3:7f:e7:51:f0
AP "Corp-ac" Radio 0 BSSID 6c:f3:7f:e7:51:f0 Very-high-throughput Rates (Mbps)
--------------------------------------------------------------------------------
MCS  Streams  20 MHz  20 MHz SGI  40 MHz  40 MHz SGI  80 MHz   80 MHz SGI
---  -------  ------  ----------  ------  ----------  ------   ----------
0    1          6.5     7.2        13.5    15.0        29.3     32.5
1    1         13.0    14.4        27.0    30.0        58.5     65.0
2    1         19.5    21.7        40.5    45.0        87.8     97.5

Range for 20 MHz:   6.5 - 288.9 Mbps
Range for 40 MHz:  13.5 - 600.0 Mbps
```

```
Range for 80 MHz:  29.3 - 1300.0 Mbps
```

The output of this command includes the following information:

Column	Description
MCS	A Modulation Coding Scheme (MCS) values supported on this high-throughput SSID.
Streams	Number of spatial streams used by the MCS index value.
20 MHz	802.11n data rates for the MCS for 20 MHz transmissions.
20 MHz SGI	802.11n data rates for the MCS for 20 MHz transmissions using a short guard interval.
40 MHz	802.11n data rates for the MCS for 40 MHz transmissions.
40 MHz SGI	802.11n data rates for the MCS for 40 MHz transmissions using a short guard interval.
80 MHz	802.11n data rates for the MCS for 80 MHz transmissions.
80 MHz SGI	802.11n data rates for the MCS for 80 MHz transmissions using a short guard interval.

Related Commands

Command	Description
show ap ht-rates	Show high-throughput rate information for a basic service set (BSS).

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
This command will only show rate information for 802.11ac-capable APs	Base operating system.	Enable or Config mode on the managed device or Switch where the AP terminates.

show ap virtual-beacon-report

```
show ap virtual-beacon-report {all | ap-name <ap-name> | client-mac <client-mac> | ip-addr
<ip-addr> | ip6-addr <ipv6-addr>}
```

Description

If the Client Match feature is enabled, the output of this command displays the virtual beacon report for an AP or a client with a specific IP or MAC address.

Syntax

Parameter	Description
`all`	Virtual beacon report for all clients on the Switch.
`ap-name <ap-name>`	Name of the AP for which you want to view a virtual beacon report.
`client-mac <client-mac>`	MAC address of a client for which you want to view a virtual beacon report.
`ip-addr <ip-addr>`	IPv4 address of an AP for which you want to view a virtual beacon report.
`ip6-addr <ipv6-addr>`	IPv6 address of an AP for which you want to view a virtual beacon report.

Usage Guidelines

Use this command to display the client RSSI from the APs in its RF neighborhood, the channel used by each AP radio, and the number of clients associated to each radio.

Example

The example below displays the virtual beacon report for a client with MAC address 24:77:03:d1:24:b8.

```
(host) [mynode] #show ap virtual-beacon-report client-mac 24:77:03:d1:24:b8

Client MAC :24:77:03:d1:24:b8
Current association :1260-205 (9c:1c:12:fe:0f:d0)
Steer attempts/Success :2/1
Consecutive (Fails/BTM Rej/BTM Timeouts) :0/0/0
Bandsteer window (Steers/Start time/Expiry time) :0/0/0
Client Device Type :Win 7
Current state :Steerable
Client Supported Channels :{36,4}{52,4}{100,11}{149,4}{165,1}
Current Time :Oct 29 15:56:06 2014

VBR Flags *-Associated S-Stale U-Unsupported Channel
```

The output of this command includes the following parameters:

Parameter	Description
`Client MAC`	MAC address of the client.
`Current association`	MAC address of the AP radio to which the client is currently associated.
`Steer attempts/Success`	Number of steer attempts, and the number of successful steers.
`Consecutive (Fails/BTM Rej/BTM Timeouts)`	Consecutive number of failed steer attempts, rejected BSS Transition Management Requests, and BSS Transition Management timeouts.
`Bandsteer window (Steers/Start time/Expiry time)`	Number of band steers, the start time of the band steer, and the expiry time of band the steer.
`Client Device Type`	Type of device used by the client (for example, Windows).
`Current State`	Indicates whether the client is currently steerable.
`Client Supported Channels`	Lists the channels that support client use.
`Current Time`	Timestamp showing the current date and time.

Parameter	Description
AP	Name of the AP from which the client can detect a signal.
IP address	IP address of the AP from which the client can detect a signal.
Radio	MAC address of the AP radio from which the client can detect a signal.
ESSID	Identifying name of the wireless network for each AP.
Signal (dBm)	Signal strength, in dBm, from the AP radio.
Last Update	Time that the virtual beacon report last updated information for the AP radio.
Add Time	Date and time the client is successfully steered and added to the AP.
Channel/EIRP/Clients	Channel used by the AP radio, the amount of power transmitted from the AP antennae, and the number of clients associated to it.
Flag	The output of this column shows the following values: ■ *: Flag indicating that the client is currently associated to this AP ■ S: Flag indicating a stale entry, with the last client update from this radio produced 120+ seconds ago ■ U: Flag indicating that the client does not support the channel the radio is currently operating on

The following example displays a virtual beacon report for all clients in the network.

```
(host) [mynode] #show ap virtual-beacon-report all

show ap arm client-match restriction-table	Displays additional statistics for the Client Match feature.

Command History

Release	Description
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on the managed device or Switch where the AP terminates.

show ap vlan-mcast

```
show ap vlan-mcast [{ap-name <ap-name> | bssid <bssid> | ip-addr <ip-addr> | ip6-addr <ip6-addr}]
```

Description

This command shows the user count in each VLAN and timestamps for tunnel to join or leave vlan-mcast group.

Syntax

Parameter	Description
`ap-name <ap-name>`	Show user count VLAN data for a specific AP name.
`bssid <bssid>`	Show user count VLAN data for a specific MAC address.
`ip-addr <ip-addr>`	Show user count VLAN data for a specific IP address.
`ip6-addr <ip6-addr>`	Show user count VLAN data for a specific IPv6 address.

Examples

Execute the following command to show the user count in each VLAN:

```
(host)[mynode] #show ap vlan-mcast
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on the managed device or Switch where the AP terminates.

show ap vlan-usage

```
show ap vlan-usage [{ap-name <ap-name> | bssid <bssid> | essid <essid> | ip-addr <ip-addr> |
ip6-addr <ip6-addr> | virtual-ap <virtual-ap}
```

Description

Show the numbers of clients on each VLAN.

Syntax

Parameter	Description
`ap-name <ap-name>`	Show VLAN data for an AP with a specific name.
`bssid <bssid>`	Show VLAN data for a specific Basic Service Set Identifier (BSSID) on an AP. The Basic Service Set Identifier (BSSID) is usually the MAC address of the AP.
`essid <essid>`	Show VLAN data for a specific Extended Service Set Identifier (ESSID). An Extended Service Set Identifier (ESSID) is a alphanumeric name that uniquely identifies a wireless network. If the name includes spaces, you must enclose the ESSID in quotation marks.
`ip-addr <ip-addr>`	Show VLAN data for an AP with a specific IP address by entering an IP address in dotted-decimal format.
`ip6-addr <ip6-addr>`	Show VLAN data for an AP with a specific IPv6 address by entering an IP address in dotted-decimal format.
`virtual-ap <virtual-ap>`	Show VLAN pool allocation by VAP name.

Examples

The output of this command displays the **VLAN Usage** table.

```
(host) [mynode] #show ap vlan-usage
VLAN Usage Table
----------------
VLAN ID  Clients
-------  -------
64       1
65       32
66       44
```

The output of this command includes the following information:

Parameter	Description
`VLAN ID`	ID number of the wireless VLAN.
`Clients`	Number of clients currently using the specified VLAN.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on the managed device or Switch where the AP terminates.

show ap wifi-uplink blacklist

```
show ap wifi-uplink blacklist {ap-name <ap-name> | bssid <bssid> | ip-addr <ip-addr>}
```

Description

Show a list of Wi-Fi uplink APs that have been denied access.

Syntax

Parameter	Description	Default
`ap-name <ap-name>`	Name of the AP that has been blacklisted.	default
`bssid <bssid>`	Name of the required BSSID of the AP.	—
`ip-addr <ip-addr>`	IP address of the blacklisted AP.	—

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

```
(host) [md] #show ap wifi-uplink blacklist ip-addr 10.65.43.247

WiFi uplink candidates
----------------------
essid  bssid  channel  rssi  encryption  phy  block-time  remaining-time(sec)  reason
-----  -----  -------  ----  ----------  ---  ----------  -------------------  ------
Total blacklist:0;  Current time: 2019-02-27 19:51:45
```

show ap wifi-uplink candidates

```
show ap wifi-uplink candidates {ap-name <ap-name> | bssid <bssid> | ip-addr <ip-addr>}
```

Description

Show a list of Wi-Fi uplink candidate APs.

Syntax

Parameter	Description	Default
`ap-name <ap-name>`	Name of the candidate AP for Wi-Fi client.	default
`bssid <bssid>`	Name of the required BSSID of the AP.	—
`ip-addr <ip-addr>`	IP address of the candidate AP for Wi-Fi client.	—

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

```
(host) [mynode] ##show ap wifi-uplink candidates ip-addr 10.65.43.247

gran-uplink  ac:a3:1e:d2:19:d0  36       51    WPA2-psk    VHT-3ss  0/0/0/0  8h:40m:20s  2019-
02-28 04:15:11(551440)
Total candidates:1;  Current time: 2019-02-28 04:15:11
```

The output of this command includes the following information:

Column	Description
`essid`	Name of the required ESSID to which the client is associated.
`bssid`	Name of the required BSSID to which the client is associated.
`channel`	The radio channel used by the AP.
`rssi`	The Received Signal Strength Indicator (RSSI) of the AP radio.
`encryption`	The encryption type used on the AP.
`phy`	The AP association for the specified PHY radio type (802.11a or 802.11g)

Column	Description
`rank`	The rank details of the AP.
`up time`	Number of hours, minutes and seconds since the discovered AP starts the BSS service or advertises the beacon, in the format hours:minutes:seconds.
`last update (total updates)`	Date and time stamp of the last AP update.

show ap wifi-uplink connection-history

```
show ap wifi-uplink connection-history {ap-name <ap-name> | bssid <bssid> | ip-addr <ip-addr>}
```

Description

Show the connection history of APs with Wi-Fi uplink.

Syntax

Parameter	Description	Default
`ap-name <ap-name>`	Name of the AP with Wi-Fi client.	default
`bssid <bssid>`	Name of the required BSSID of the AP.	—
`ip-addr <ip-addr>`	IP address of the AP with Wi-Fi client.	—

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

```
(host) [mynode] ##show ap wifi-uplink candidates ip-addr 10.65.43.247
WiFi uplink connection history
------------------------------
timestamp            essid        bssid              channel  rssi  result
---------            -----        -----              -------  ----  ------
2019-02-27 19:37:41  gran-uplink  ac:a3:1e:d2:19:d0  36       51    SUCCESS
2019-02-28 05:01:12  gran-uplink  ac:a3:1e:d2:19:d0  149      52    SUCCESS
Total connection times:2;  Current time: 2019-02-28 12:51:35
```

The output of this command includes the following information:

Parameter	Description
`timestamp`	The date and time when the entry was created.
`essid`	Name of the required ESSID to which the client is associated.
`bssid`	Name of the required BSSID to which the client is associated.
`channel`	The radio channel used by the AP.
`rssi`	The Received Signal Strength Indicator (RSSI) of the AP radio.
`result`	The success or failure status of the connection.

ap wifi-uplink profile "gran-uplink" priority 1
-----------------------------------------------
Item                    Value
----                    -----
ESSID                   gran-uplink
BSSID                   ac:a3:1e:d2:19:d0
Allowed band            a
Encryption              personal
WEP Key 1               ********
WEP Key 2               ********
WEP Key 3               ********
WEP Key 4               ********
WEP Transmit Key Index  1
WPA Hexkey              ********
WPA Passphrase          ********
```

The output of this command includes the following information:

Parameter	Description
`ESSID`	Name of this instance of the profile.
`BSSID`	Name of the required BSSID to which the client is associated.
`Allowed band`	The radio band(s) on which the Wi-Fi uplink is used: ■ a: 802.11a band only (5 Ghz) ■ g: 802.11g band only (2.4 Ghz) ■ all: Both 802.11a and 802.11g bands (5 GHz and 2.4 GHz)

Parameter	Description
`Encryption`	Name of the required BSSID to which the client is associated.
`WEP Key 1`	The first static WEP key associated with the key index. Can be 10 or 26 hex characters in length.
`WEP Key 2`	The second static WEP key associated with the key index. Can be 10 or 26 hex characters in length.
`WEP Key 3`	The third static WEP key associated with the key index. Can be 10 or 26 hex characters in length.
`WEP Key 4`	The fourth static WEP key associated with the key index. Can be 10 or 26 hex characters in length.
`WEP Transmit Key Index`	The key index to specify which static WEP key is to be used. Can be 1, 2, 3, or 4.
`WPA Hexkey`	The WPA Pre-Shared Key (PSK).
`WPA Passphrase`	The WPA password that generates the PSK.

show ap wifi-uplink debug

```
show ap wifi-uplink debug
   mat-table {ap-name <ap-name> | bssid <bssid> | ip-addr <ip-addr>}
   supplicant-log {ap-name <ap-name> | bssid <bssid> | ip-addr <ip-addr>}
   wcd-debug-log {ap-name <ap-name> | bssid <bssid> | ip-addr <ip-addr>}
   wcd-error-log {ap-name <ap-name> | bssid <bssid> | ip-addr <ip-addr>}
```

Description

Show debug information of APs with Wi-Fi uplink.

Syntax

Parameter	Description	Default
`mat-table`	MAC address translation table of WiFi uplink. This parameter has the following sub-parameters: ■ **ap-name <ap-name>**- Name of the AP with Wi-Fi client. ■ **bssid <bssid>**- Name of the required BSSID of the AP. ■ **ip-addr <ip-addr>**- IP address of the AP with Wi-Fi client.	—
`supplicant-log`	Supplicant log information. This parameter has the following sub-parameters: ■ **ap-name <ap-name>**- Name of the AP with Wi-Fi client. ■ **bssid <bssid>**- Name of the required BSSID of the AP. ■ **ip-addr <ip-addr>**- IP address of the AP with Wi-Fi client.	—
`wcd-debug-log`	Debug log information of wcd process. This parameter has the following sub-parameters: ■ **ap-name <ap-name>**- Name of the AP with Wi-Fi client. ■ **bssid <bssid>**- Name of the required BSSID of the AP. ■ **ip-addr <ip-addr>**- IP address of the AP with Wi-Fi client.	—
`wcd-error-log`	Error log information of wcd process. This parameter has the following sub-parameters: ■ **ap-name <ap-name>**- Name of the AP with Wi-Fi client. ■ **bssid <bssid>**- Name of the required BSSID of the AP. ■ **ip-addr <ip-addr>**- IP address of the AP with Wi-Fi client.	—

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The following command displays the debug log of wcd process for an AP with Wi-Fi uplink:

```
(host) [mynode] #show ap wifi-uplink debug wcd-error-log ip-addr 10.65.45.61

Command History

Command	Description
AOS-W 8.5.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable or Config mode on Mobility Master.

show ap wifi-uplink-profile

```
show ap wifi-uplink-profile [<profile-name>]
```

Description

Show a list of all Wi-Fi uplink profiles, or display the configuration parameters in a specific Wi-Fi uplink profile.

Syntax

Parameter	Description	Default
`<profile-name>`	Name of a Wi-Fi uplink profile.	default

Usage Guidelines

The **show ap wifi-uplink-profile** command displays a list of all Wi-Fi uplink profiles, including the number of references to each profile and the profile status. If you include the optional **<profile-name>** parameter, the command displays detailed information for that one profile.

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The output of this command shows the configuration parameters for the Wi-Fi uplink profile “default”.

```
(host) [mynode] #show ap wifi-uplink-profile default

WiFi uplink profile "default"
-----------------------------
Parameter               Value
---------               -----
ESSID                   aruba-ap
BSSID                   N/A
Allowed band            all
Encryption              opensystem
WEP Key 1               N/A
WEP Key 2               N/A
WEP Key 3               N/A
WEP Key 4               N/A
WEP Transmit Key Index  1
WPA Hexkey              N/A
WPA Passphrase          ********
```

The output of this command includes the following information:

Column	Description
`ESSID`	Name of the required ESSID to which the client is associated.
`BSSID`	Name of the required BSSID to which the client is associated.
`Allowed band`	The radio band(s) on which the Wi-Fi uplink is used. ■ **a:** 802.11a band only (5 Ghz) ■ **g:** 802.11g band only (2.4 Ghz)

Column	Description
	■ **all:** Both 802.11a and 802.11g bands (5 GHz and 2.4 GHz)
`Encryption`	Name of the data encryption mode. ■ **opensystem—** No authentication or encryption. ■ **personal—** A wildcard mode that matches several PSK mode key management suites and cipher suites, including WPA-PSK-TKIP, WPA-PSK-AES, WPA2-PSK-TKIP and WPA2-PSK-AES. ■ **static-wep—** WEP with static keys.
`WEP Key 1`	The first static WEP key associated with this key index.
`WEP Key 2`	The second static WEP key associated with this key index.
`WEP Key 3`	The third static WEP key associated with this key index.
`WEP Key 4`	The fourth static WEP key associated with this key index.
`WEP Transmit Key Index`	The key index to specify which static WEP key is to be used. Can be 1, 2, 3, or 4.
`WPA Hexkey`	A WPA Pre-Shared Key (PSK).
`WPA Passphrase`	The WPA password that generates the PSK.

WPA Passphrase          ********
```

The output of this command includes the following information:

Parameter	Description
`ESSID`	Name of this instance of the profile.
`BSSID`	Name of the required BSSID to which the client is associated.
`Allowed band`	The radio band(s) on which the Wi-Fi uplink is used: ■ a: 802.11a band only (5 Ghz)

Parameter	Description
	■ g: 802.11g band only (2.4 Ghz) ■ all: Both 802.11a and 802.11g bands (5 GHz and 2.4 GHz)
`Encryption`	Name of the required BSSID to which the client is associated.
`WEP Key 1`	The first static WEP key associated with the key index. Can be 10 or 26 hex characters in length.
`WEP Key 2`	The second static WEP key associated with the key index. Can be 10 or 26 hex characters in length.
`WEP Key 3`	The third static WEP key associated with the key index. Can be 10 or 26 hex characters in length.
`WEP Key 4`	The fourth static WEP key associated with the key index. Can be 10 or 26 hex characters in length.
`WEP Transmit Key Index`	The key index to specify which static WEP key is to be used. Can be 1, 2, 3, or 4.
`WPA Hexkey`	The WPA Pre-Shared Key (PSK).
`WPA Passphrase`	The WPA password that generates the PSK.

show ap wifi-uplink stats

```
show ap wifi-uplink stats {ap-name <ap-name> | ip-addr <ip-addr>}
```

Description

Show the statistics of APs with Wi-Fi uplink.

Syntax

Parameter	Description	Default
`ap-name <ap-name>`	Name of the AP with Wi-Fi client.	default
`ip-addr <ip-addr>`	IP address of the AP with Wi-Fi client.	—

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The following example displays the statistics of the counters for the AP with Wi-Fi uplink profile:

```
(host) [mynode]  #show ap wifi-uplink stats ip-addr 10.65.43.247

WiFi uplink stats
-----------------
Counter                          Value
-------                          -----
--------------------             General
--------------------             Transmit

show ap wifi-uplink status

```
show ap wifi-uplink status {ap-name <ap-name> | bssid <bssid> | ip-addr <ip-addr>}
```

Description

Show the status of APs with Wi-Fi uplink.

Syntax

Parameter	Description	Default
`ap-name <ap-name>`	Name of the AP with Wi-Fi client.	default
`bssid <bssid>`	Name of the required BSSID of the AP.	—
`ip-addr <ip-addr>`	IP address of the AP with Wi-Fi client.	—

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The following example displays the status of the AP with Wi-Fi uplink profile:

```
(host) [mynode] #show ap wifi-uplink status ip-addr 10.65.43.247

WiFi uplink status
------------------

SSID                            gran-uplink
BSSID                           ac:a3:1e:d2:19:d0

show ap wired-ap-profile

```
show ap wired-ap-profile [<profile-name>]
```

Description

Show a list of all wired AP profiles, or display the configuration parameters in a specific wired AP profile.

Syntax

Parameter	Description	Default
`<profile-name>`	Name of a wired AP profile.	default

Usage Guidelines

The command `show ap wired-ap-profile` displays a list of all wired AP profiles, including the number of references to each profile and the profile status. If you include the optional `<profile-name>` parameter, the command will display detailed information for that one profile.

Example

The output of this command shows the configuration parameters for the wired AP profile “default”.

```
(host) [mynode] #show ap wired-ap-profile default

Wired AP profile "default"
--------------------------
Parameter                 Value
---------                 -----
Wired AP enable           Disabled
Trusted                   not trusted
Forward mode              tunnel
Switchport mode           access
Access mode VLAN          1
Trunk mode native VLAN    1
Trunk mode allowed VLANs  1-4094
Broadcast                 Broadcast
```

The output of this command includes the following information:

Column	Description
`Wired AP enable`	Indicates whether the wired AP profile is **enabled** or **disabled**.
`Forward mode`	The configured forward mode for the profile. ■ **bridge**: Bridge locally ■ **split-tunnel**: Tunnel to Switch or NAT locally ■ **tunnel**: Tunnel to Switch
`Switchport mode`	The profile’s switching mode. ■ **access**: Set access mode characteristics of the interface. ■ **mode**: Set trunking mode of the interface. ■ **trunk**: Set trunk mode characteristics of the interface.
`Access mode VLAN`	VLAN ID of the access mode VLAN.

Column	Description
`Trunk mode native VLAN`	VLAN ID of the native VLAN.
`Trunk mode allowed VLANs`	Range of allowed VLAN IDs for the native VLAN.
`Trusted`	Shows if the wired port on an AP using this profile is a trusted port. Possible values are **Trusted** or **Not Trusted**.
`Broadcast`	If set to **broadcast**, the wired AP port will forward broadcast traffic. If the parameter displays **Do Not Broadcast**, broadcast traffic will not be forwarded.

show ap wired-port-profile

```
show ap wired-port-profile [<profile-name>]
```

Description

Shows all AP wired port profiles and their status.

Syntax

Parameter	Description	Default
`<profile-name>`	Name of a wired AP profile.	default

Example

The example below shows that the Switch has three wired port profiles. The **References** column lists the number of other profiles with references to the wired port profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host) [mynode] #show ap  wired-port-profile

AP wired port profile List
--------------------------
Name              References  Profile Status
----              ----------  --------------
default           3
NoAuthWiredPort   4           Predefined (editable)
shutdown          3           Predefined
Total:3
```

The following command displays information for an individual wired port profile:

```
(host)[mynode] #show ap wired-port-profile default

AP wired port profile "default"
-------------------------------
Parameter                                   Value
---------                                   -----
Wired AP profile                            default
Ethernet interface link profile             default
AP LLDP profile                             default
Shut down                                   No
Remote-AP Backup                            Enabled
AAA Profile                                 N/A
Time to wait for authentication to succeed  20 sec
Loop Protect Enable                         Disabled
Loop Detection Interval                     1
Loop Protect Auto Recovery Enable           Disabled
Loop Protect Auto Recovery Interval         300
Storm Control Broadcast                     Disabled
Storm Control Broadcast Threshold           2000
```

The output of this command includes the following information:

Parameter	Description
`Wired AP profile`	Name of a wired AP profile to be used by devices connecting the AP's wired port. The wired AP profile defines the forwarding mode and switchport values used by the port.
`Ethernet interface link profile`	An Ethernet Link profile to be used by devices connecting to the AP's wired port profile. This profile defines the duplex value and speed to be used by the port.
`AP LLDP Profile`	Name of an LLDP Profile associated with this wired port.
`Shut Down?`	Shows if the wired AP port is enabled (no) or disabled (yes).
`Remote AP Backup`	Use the rap-backup parameter to use the wired port on a Remote AP for local connectivity and troubleshooting when the AP cannot reach the Switch. If the AP is not connected to the Switch, no firewall policies will be applied when this option is enabled. (The AAA profile will be applied when the AP is connected to Switch).
`AAA Profile`	Name of a AAA profile to be used by devices connecting to the wired port of the AP.
`Time to wait for authentication to succeed`	Authentication timeout value, in seconds, for devices connecting the AP's wired port. The supported range is 1–65535 seconds, and the default value is 20 seconds.
`Loop Protect Enable`	Shows if loop protection is enabled or disabled.
`Loop Detection Interval`	Shows time in seconds after which a loop detection packet is transmitted on the AP port.
`Loop Protect Auto Recovery Enable`	Show if automatic recovery of the port in the AP that is shut down because of loop protection is enabled or disabled.
`Loop Protect Auto Recovery Interval`	Shows time in seconds after which automatic recovery of the port in the AP that is shut down because of loop protection is attempted.
`Storm Control Broadcast`	Shows if broadcast storm control is enabled or disabled.
`Storm Control Broadcast Threshold`	Shows broadcast packets per second on each Ethernet port of an AP before the Ethernet port is shut down.

show ap wired stats

```
show ap wired stats {ap-name <ap-name> | ip-addr <ip-addr>} [client-ip <client-ip> | client-mac <client-mac>]
```

Description

This command shows statistics for campus and remote AP wired clients.

Syntax

Parameter	Description
`ap-name <ap-name>`	Show wired AP statistics for a specified AP name.
`ip-addr <ip-addr>`	Show wired AP statistics for a specified AP by entering an IP address in dotted-decimal format.
`client-ip <client-ip>`	Show wired AP statistics for a specified client IP address.
`client-mac <client-mac>`	Show wired AP statistics for a specified client MAC address.

Example

```
(host) [mynode] # show ap wired stats ap-name rap5wn client-mac 00:14:d1:19:3c:0b

AP Wired User Statistics
------------------------
Counter               Value
-------               -----
Slot                  0
Port                  1
VLAN                  1
TX Packets            78
TX Bytes              7894
RX Packets            37
RX Bytes              5352
TX Broadcast Packets  36
TX Broadcast Bytes    4410
TX Multicast Packets  22
TX Multicast Bytes    1990
```

The output of this command includes the following information:

Parameter	Description
`Slot`	Slot number
`Port`	Port number
`VLAN`	Associated VLAN number
`TX Packets`	Number of packets sent
`TX Bytes`	Number of bytes sent
`RX Packets`	Number of packets received

Parameter	Description
`RX Bytes`	Number of bytes received
`TX Broadcast Packets`	Number of broadcast packets sent
`TX Broadcast Bytes`	Number of broadcast bytes sent
`TX Multicast Packets`	Number of multicast packets sent
`TX Multicast Bytes`	Number of multicast bytes sent

show ap wmm-flow

```
show ap wmm-flow [ap-name <ap-name> | bssid <bssid> |  dotlla | dotllg | essid <essid> | ip-addr <ip-addr> | ip6-addr <ip6-addr>]
```

Description

This command shows the Wireless Multimedia (WMM) flow table.

Syntax

Parameter	Description
`ap-name <ap-name>`	View an AP with a specified name.
`bssid <bssid>`	View data for an AP with a specific BSSID (Basic Service Set Identifier). The Basic Service Set Identifier (BSSID) is usually the MAC address of the AP.
`dot11a`	Show the WMM flow table for a 802.11a radio.
`dot11g`	Show the WMM flow table for a 802.11g radio.
`essid <essid>`	View data for a specific ESSID (Extended Service Set Identifier). An Extended Service Set Identifier (ESSID) is a alphanumeric name that uniquely identifies a wireless network. If the name includes spaces, you must enclose the ESSID in quotation marks.
`ip-addr <ip-addr>`	View an AP with a specified IP address by entering an IP address in dotted-decimal format.
`ip6-addr <ip6-addr>`	View an AP with a specified IPv6 address by entering an IPv6 address in dotted-decimal format.

Usage Guidelines

WMM, or Wireless Multimedia Extensions, are a subset of the 802.11e standard. WMM provides for four different types of traffic classification: voice, video, best effort, and background, with voice having the highest priority and background the lowest. Issue the **show ap wmm-flow** command to view WMM flow data for all APs. Include any of the optional parameters described in the table above to filter the table by a specific AP, radio channel (a or g), or both AP and radio type.

Example

Some samples of executing this command with various options are as follows:

```
(host) [mynode] #show ap wmm-flow ap-name ap105
(host) [mynode] #show ap wmm-flow ap-name ap105 dot11g
(host) [mynode] #show ap wmm-flow dot11a
```

The following example shows WMM flow data for all APs.

```
(host)[mynode] #show ap wmm-flow

WMM Flow Table
--------------
AP Name    ESSID  Client             Description
-------    -----  ------             -----------
AP125-srk  NOE    00:90:7a:06:1f:5b  tsid 6:prio 6:inactivity 2157352960
us:bidir:apsd:normalack:tclas prio 6 ip DIP-192.168.101.194 DP-32514 DSCP-48:one-match
```

```
AP125-srk  NOE    00:90:7a:06:1f:5b  tsid 0:prio 0:inactivity 100000000
us:bidir:apsd:normalack:no-match
Num Flows:0
```

The output of this command includes the following parameters:

Parameter	Description
`AP name`	Name of an AP with recorded WMM flows.
`ESSID`	Extended Service Set Identifier (ESSID) of a wireless network.
`Client`	MAC address of the client.
`Description`	The description is a long string that includes the following information. **TSID:** Traffic Stream Identifier. The TSID should match the priority level for each flow. **Priority**: One of the following IEEE 802.1p priority values: ■ 0,3 = Best Effort ■ 1,2 = Background ■ 4-5 = Video ■ 6-7 = Voice **Inactivity**: Tspec inactivity threshold, in microseconds. **<country code>**: AP country code, e.g., US. **bdir**: flow is bidirectional. **apsd**: flow has enabled auto power save delivery. **<ack>**: Displays the ack policy negotiated for the flow. Possible values are: ■ normalack ■ noack ■ blockack ■ resack (reserved ack) **Tclas**: traffic classification element. Tclas information includes one of the following classification types, the 802.1p priority and IP version (version 4 or version 6) ■ **type0**: Classification based on Ethernet parameters ■ **type1**: Classification based on TCP/UDP or IP parameters (IPv4 or IPv6) ■ **type2**: Classification based on based on IEEE802.1Q **DIP**: Destination IP address for the flow. **DP**: Destination IP Port specified in the TCLAS for flow negotiation. **DCSP**: The Differentiated Services Code Point (DSCP) priority value that matches the flows 802.1p priority.

show ap-crash-transfer

```
show ap-crash-transfer
```

Description

This command displays info for the AP crash transfer feature, which transfers AP coredump files to the Switch flash memory if no dumpserver is configured.

Syntax

No Parameters

Usage Guidelines

The command **ap system-profile <profile> dump-server <server>** specifies a server to receive a core dump generated when an AP process crashes. If no dump server is configured, issue the **ap-crash-transfer** command to save dump files to the Switch flash memory.

If you define a dump server and issue the ap-crash-server command, the dump server configuration takes precedence, and coredump files are sent to the dump server.

Example

```
(host)) #show ap-crash-transfer
AP Crash Transfer:enabled
AP Crash folder limit:50 MB (non-editable)
```

Related Commands

Command	Description

show arp

```
show arp [counters | vlan <vlanid>
```

Description

This command show Address Resolution Protocol (ARP) entries for the Switch.

Syntax

Parameter	Description	Range
`counters`	Shows ARP information on ARP counters.	—
`vlan <vlanid>`	Shows ARP information for a VLAN Interface Number.	1–4094

Example

This example shows configured static ARP entries for the Switch.

```
(host) [mynode] #show arp
Protocol        Address         Hardware Address        Interface
Internet        10.3.129.98     00:1A:1E:C0:80:28       vlan1
Internet        10.3.129.253    00:0B:86:42:35:80       vlan1
Internet        10.3.129.250    00:1A:92:45:DB:00       vlan1
Internet        10.3.129.99     00:1A:1E:C0:1C:60       vlan65
Internet        10.3.129.96     00:1A:1E:C0:80:1E       vlan65
Internet        10.3.129.254    00:0B:86:02:EE:00       vlan1
```

The output of this command includes the following parameters:

Parameter	Description
`Protocol`	Protocol using ARP. Although the Switch will most often use ARP to translate IP addresses to Ethernet MAC addresses, ARP may also be used for other protocols, such as Token Ring, FDDI, or IEEE 802.11, and for IP over ATM.
`Address`	IP address of the device.
`Hardware Address`	MAC address of the device.
`Interface`	Interface used to send ARP requests and replies.

show audit-trail

```
show audit-trail [history | login <number>| <number>]
```

Description

Show the Switch's audit trail log.

Syntax

Parameter	Description	Range
`history`	Shows audit trail history log.	—
`login <number>`	Starts displaying the log output from the specified number of lines from the end of the login or logout log.	1–65535
`<number>`	Starts displaying the log output from the specified number of lines from the end of the log.	1–65535

Example

By default, the audit trail feature is enabled for all commands in configuration mode. The example below shows the most recent ten audit log entries for the managed device.

```
(host) [mynode] #show audit-trail 10
Feb  5 06:13:17  cli[1239]: USER: admin has logged in from 10.240.16.118.
Feb  5 06:20:13  cli[1239]: USER: admin connected from 10.240.16.118 has logged out.
Feb  5 06:24:37  cli[1239]: USER: admin has logged in from 10.240.16.118.

show auth-tracebuf

```
show auth-tracebuf [count <1-250] | [failures] | mac <address>]
```

Description

This command shows the trace buffer for authentication events.

Syntax

Parameter	Description	Range
`count <number>`	Limits the output of the command to the specified number of packets.	1–250
`failures`	Filters the output of this command to display only authentication failures	—
`mac <address>`	Filters the output of this command to display only information for a specified MAC address.	—

Usage Guidelines

Use the output of this command to troubleshoot 802.1X authentication errors. Include the **<address>** parameter to filter data by the MAC address of the client which is experiencing errors. This command can tell you, for example, when 802.1X authentication completed and when keys were plumbed correctly.

Example

The example below shows the most recent ten trace buffer entries for the Switch. Each row includes the following information:

```
(host) [mynode] # show auth-tracebuf count 10
Auth Trace Buffer
-----------------
Feb  5 08:08:29  wpa2-key2            ->  00:09:ef:05:1e:b2  00:1a:1e:97:e5:42  -   119  mic
failure
Feb  5 08:08:30  wpa2-key1            <-  00:09:ef:05:1e:b2  00:1a:1e:97:e5:42  -   117

failure
Feb  5 08:08:35  wpa2-key1            <-  00:09:ef:05:1e:b2  00:1a:1e:97:e5:42  -   117
```

```
Feb  5 08:08:35  station-down           *  00:09:ef:05:1e:b2  00:1a:1e:97:e5:42  -   -
Feb  5 08:08:35  station-up             *  00:09:ef:05:1e:b2  00:1a:1e:97:e5:42  -   -    wpa2
psk aes
Feb  5 08:08:35  station-data-ready     *  00:09:ef:05:1e:b2  00:00:00:00:00:00  66  -
```

Each row in the output of this table may include some or all of the following information:

- A timestamp that indicates when the entry was created
- The type of exchange that was made
- The direction the packet was sen
- The source MAC address
- The destination MAC address
- BSSID/Server Name
- The packet number
- The packet length
- Additional information (if available); for example, username, encryption and WPA type, or reason for failure

show banner

```
show banner
show bannervia
```

Description

This command shows the current login banner.

Syntax

Parameter	Description
`banner`	Displays the Message of the Day banner.
`bannervia`	Displays the VIA login banner message.

Usage Guidelines

Issue this command to review the banner message that appears when you first log in to the Switch's command-line or browser interfaces.

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

```
(host) [mynode]# show banner
This testlab Switch is scheduled for maintenance starting Saturday night at 11 p.m.
```

show ble_relay disp-attr

```
show ble relay disp-attr all
```

Description

This command shows the BLE relay attributes.

Syntax

Parameter	Description	Range	Default
`all`	Displays all the attributes.	—	—

Example

The following example displays the BLE relay attributes:

```
(host) [mynode] #show ble_relay disp-attr all
=============================================================
WebSocket Connect Request               : Yes
Tag Logging                             : Off
LogLevel                                : 31
Note: Loglevel List: Error (0x1), Warn (0x2), Notice (0x4), Info (0x8),
Debug (0x10), Parser (0x20), Header (0x40), Ext (0x80), Client (0x100), Latency (0x200).
```

show bocmgr

```
show bocmgr instance
   instance {device <device-id>}{interface tunnel|vlan {intf-id <intfid>}|<nodepath>| {pool
   dhcp|tunnel|vlan {pool-name <pool-name>}|<nodepath>}
   pool {dhcp|intf|tunnel|vlan {pool-name <pool-name>}|<nodepath>}|{intf tunnel|vlan {intf-id
   <intfid>}|<nodepath>}
```

Description

Show details about dynamic VLAN, tunnel and DHCP pools.

Syntax

Parameter	Description
`device <device-id>`	Show pools information for a device with the specified MAC address (device ID).
`interface tunnel|vlan`	Show pool information for a specific tunnel or vlan
`intf-id <intfid>`	Show pool information for the specified tunnel or interface ID
`<nodepath>`	Show pool information for a configuration node at the specified path. (For example, /md/west/sunnyvale.)
`pool dhcp|tunnel|vlan`	Show pool information for the specified pool type.
`pool-name <pool-name>`	Show a list of devices using the specified pool.
`<nodepath>`	Show pool information for a configuration node at the specified path. (For example, /md/west/sunnyvale.)
`pool dhcp|{[intf]tunnel|vlan}`	Show pool information for the specified interface or pool type.
`pool-name <pool-name>`	Show details about a pool with the specified pool name
`intf-id <intfid>`	Display pool details info for the specified tunnel or interface ID
`<nodepath>`	Display pool details info for a configuration node at the specified path. (For example, /md/west/sunnyvale.)

Usage Guidelines

Command	Description
ip dhcp pool	Configures DHCP.
ip tunnel pool	Configures tunnel.
ip vlan pool	Configures VLAN pools.

Example

The following command shows the DHCP pool used by the configuration /md/east.

```
(host) [md])#show bocmgr instance pool dhcp /md/east
```

```
DHCP Instance(s)
----------------
Device Name        Pool Name   Net         Mask             Vlan Id  Vlan IP
-----------        ---------   ---         ----             -------  -------
00:0b:86:99:88:17  testpool    4.1.0.0     255.255.255.192  2        4.1.0.1

show bulkedit

```
show bulkedit {headers | status}
```

Description

This command shows the bulkedit information such as the list of supported bulkedit headers or the status of the last bulkedit transaction.

Syntax

Parameter	Description
`headers`	Show list of supported bulkedit headers.
`status`	Show status of last bulkedit transaction.

Example

The following are examples of executing the **show bulkedit** command:

```
(host) [mynode] #show bulkedit headers
(host) [mynode] #show bulkedit status
```

Related Commands

Command	Description
bulkedit import csv	Use the **bulkedit import csv** command to import data from a .csv file.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

show ccm-debug memory-usage

```
show ccm-debug memory-usage {non-profile | profile}
```

Description

This command shows the memory usage information.

Syntax

Parameter	Description
`show ccm-debug memory-usage`	Shows memory usage information.
`non-profile`	Shows memory usage - non-profile command.
`profile`	Shows memory usage - profile command.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The following is an example for executing this command:

```
(host) [mynode] #show ccm-debug memory-usage profile
```

Related Commands

Command	Description
ccm-debug	**ccm-debug config-rollback**—Rolls back the configuration of a node to the previous version. **ccm-debug full config sync**—Request a full configuration sync.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode

show clock

```
show clock [cli-timestamp|timezone]
```

Description

This command shows the configuration for the system clock, summer daylight savings configuration, timezone configuration, and gives details if the CLI-timestamp is enabled or disabled.

Syntax

Parameter	Description
`cli-timestamp`	Shows if clock cli-timestamp is enabled or disabled.
`summer-time`	Shows summer (daylight savings) time settings.
`timezone`	Show the configured timezone for the managed device.

Usage Guidelines

Include the optional summer-time parameter to display configured daylight savings time settings. The timezone parameter shows the current timezone, with its time offset from Greenwich Mean Time.

Example

The output below shows the current zone time on the managed device clock.

```
(host) [mynode] #show clock timezone
   clock timezone PST -8
```

Related Commands

Command	Description
clock summer-time recurring	Configures daylight savings /summer time settings
clock timezone	Configures the timezone for the managed device.

Command History

Release	Modification

show cluster-config

```
show cluster-config
```

Description

This command show the cluster configuration for the control plane security feature.

Syntax

No parameter.

Usage Guidelines

When you issue this command from the cluster *root*, the output of this command shows the cluster role of the managed device, and the IP address of each member node in the cluster.

When you issue this command from a cluster *member*, the output of this command shows the cluster role of the managed device, and the IP address of the cluster root.

Example

In the example below, the **Cluster Role** section in the output of this command shows that the managed device on which the command was issued is the cluster root. The **Cluster IPSEC Switches** section of the output shows the IP address of each cluster member.

```
(host) [mynode] (config) #show cluster-config

Cluster Role
------------
Root
----

Cluster IPSEC Switches
--------------------------
Switch IP address of Cluster-Members  Key
-----------------------------------  ---
172.21.18.18    ********
172.21.18.19    ********
```

Related Commands

Command	Description
control-plane-security	Configures the control plane security profile.
cluster-member-ip	Sets the Switch as a control plane security cluster root, and specifies the IPsec key for a cluster member.
cluster-root-ip	Sets the Switch as a control plane security cluster member, and defines the IPsec key for communication between the cluster member and the Switch's cluster root.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable mode on cluster member or cluster root Switches.

show cluster-switches

```
show cluster-switches
```

Description

Execute this command on a Mobility Master using control plane security in a multi-master environment to show other managed devices to which it is connected.

Syntax

No parameters

Usage Guidelines

When you issue this command from the cluster root, the output of this command displays the IP address of the VLAN used by the cluster member to connect to the cluster root.

If you issue this command from a cluster member ,the output of this command displays the IP address of the VLAN used by the cluster root to connect to the cluster member.

Example

In the example below, the **show cluster-switches** command was issued on a cluster member. The **Switch-IP** section of the output shows the IP address of a VLAN on cluster root, indicating that the cluster member can currently communicate with the cluster root. If the managed device cannot communicate with the cluster root, this table will be blank.

```
(host) [mynode] (config) #show cluster-switches

SWITCH-IP         CLUSTER-ROLE
-----------------------------
172.21.18.18      ROOT
```

In this example, the **show cluster-switches** command was issued on a cluster root. The **Switch-IP** section of the output shows the IP address of a VLAN on each cluster member that can currently communicate with the cluster root.

```
(host) [mynode] (config) #show cluster-switches

SWITCH-IP         CLUSTER-ROLE
-----------------------------
172.21.18.18     MEMBER
172.21.18.19     MEMBER
```

Related Commands

Command	Description
control-plane-security	Configures the control plane security profile.
cluster-member-ip	Sets the Switch as a control plane security cluster root, and specifies the IPsec key for a cluster member.
cluster-root-ip	Sets the Switch as a control plane security cluster member, and defines the IPsec key for communication between the cluster member and the Switch's cluster root.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on Mobility Master.

show cluster-tech-support

```
show cluster-tech-support <filename>
```

Description

Displays cluster-related information in relation to the managed device.

Syntax

Parameter	Description
`<filename>`	Specifies the file name where the command output will be stored. Maximum length of filename is 127 characters.

Example

The following command is used to store the logged cluster data:

```
show cluster-tech-support <filename>
```

Related Commands

Command	Description
show ap cluster-tech-support	This command shows cluster information of an AP.

All platforms	Base operating system.	Config or Enable on the Mobility Master.

show command-details

```
show command-details <COMMAND>
```

Description

This command displays the command debugging details for a command executed in the CLI session.

Syntax

Parameter	Description
<COMMAND>	Enter the command that is executed in the CLI session and for which you need the command details. The command text must be within quotation marks

Usage Guidelines

Use this command to display the command details for a command executed in the CLI session. The following example shows the output for this command.

```
(host) [mynode] #show command-details "show cellular profile"
Command Details:
----------------
APP Name: Layer2/3 , Object:5126 , OperationType: Async
Objname/Container: /CHK_PARENT, MajorVer: 8 , MinorVer: 1 , Instance: NULL
Local Command: 0 , Remote Command: 0 , Remote IpAddr: NULL
Current config Node: /mm/mynode
Command Key Values:
-------------------
Key       Value     Instance Key
---       -----     ------------
CELLULAR  CELLULAR  FALSE
PROFILE   PROFILE   FALSE
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Platforms	License	Command Mode
All platforms	Base operating system.	Available in Enable and Config modes on Mobility Master and managed devices.

show command-history

```
show command-history
```

Description

This command displays the command history for the CLI session.

Syntax

No parameter.

Usage Guidelines

Use this command to display a list of commands that you have executed in the CLI session. The following example shows the output for this command.

```
(host) [mynode] #show command-history
CLI session history
-------------------
show cellular profile
show cellular profile factory
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Available in Enable and Config modes on Mobility Master and managed devices.

show configuration

```
show configuration [committed <node-path> | counters platform-capability | datastore
{[committed | default | detail | inherited | json | local | node-hierarchy | non-default |
object | pending | stats | system | user]} | devices | diff | effective | failure | filtered |
node-hierarchy | partial | pending | profile-committed | received | setup-dialog <macaddr>
| similar | state | system-commands | unsaved-nodes]
```

Description

This command shows the saved configuration on the Switch.

Syntax

Parameter	Description
`committed [<node-path>]`	Shows committed configuration of the configuration node.
`counters platform-capability`	Shows internal counters at the node and platform capability-based information.
`datastore [committed | default | detail |inherited | json | local | node-hierarchy | non-default | object <objname> [detail | json | <node-path>] | pending | stats | system |user] [<node-path>]`	Shows datastore configuration.
`devices [debug | <node-path>]`	Shows devices list and nodes mapped to it.
`diff <conf1> <conf2> [context | json]`	Shows the difference between two configuration items. New commands are prefixed with a plus, deleted commands are prefixed with a minus.
`effective [detail | <node-path>]`	Shows effective configuration of devices connected to the node.
`failure [all | migration {[config-node | device]}| replace-config | <A.B.C.D>]`	Shows the configuration errors.
`filtered`	Show configuration downgraded to other versions.
`node-hierarchy [debug]`	Shows the configuration node hierarchy.
`partial [<node-path>]`	Shows incremental configuration changes between last two commits.
`pending [<node-path>]`	Shows pending configuration of the configuration node.
`profile-committed [<node-path>]`	Shows committed configuration of profiles at this node.

Parameter	Description
`received`	Shows the received configuration from Mobility Master.
`setup-dialog <macaddr>`	Shows the setup-dialog configuration of the device.
`similar <conf1> conf2> [json]`	Shows the common configuration between two configuration items.
`state pending [<node-path>]`	Shows the configuration state information.
`system-commands {committed | pending} [<node-path>]`	Shows system or hidden commands at the configuration node.
`unsaved-nodes`	Shows the list of unsaved configuration nodes.

Usage Guidelines

Execute this command to view the entire configuration saved on the Switch, including all profiles, ACLs, and interface settings.

Example

The following example shows part of the output for this command.

```
(host) [mynode] #show configuration
version 8.0
country US
logging level warnings security subcat ids
logging level warnings security subcat ids-ap
wms
general poll-interval 60000
general poll-retries 3
general stat-update enable
general ap-ageout-interval 30
general sta-ageout-interval 30
general learn-ap disable
general persistent-known-interfering enable
!
adp discovery
adp igmp-join
adp igmp-vlan 0
.
.
.
```

show controller-ip

```
show controller-ip
```

Description

Show the country and domain upgrade trail of the managed device.

Syntax

No parameters.

Example

The output of this command shows the IP address and VLAN interface ID of the managed device.

```
(host) # show controller-ip

Switch IP Address: 10.17.24.19
Switch IP is configured to be Vlan Interface: 1501
Switch IPv6 Address: 2001::1
Switch IPv6 address is configured to be Vlan Interface: 1501
```

Related Commands

Command	Description
controller-ip	Sets the IP address of the to the loopback interface address or a specific VLAN interface address.

show controller-ipv6

```
show controller-ipv6
```

Description

Shows the IPv6 address and VLAN interface ID of the Switch.

Syntax

No parameters.

Example

```
(host) [mynode] # show controller-ipv6
Switch IPv6 Address: 2001::1
Switch IPv6 address is configured to be Vlan Interface: 1501
```

The output of this command shows the IPv6 address and VLAN interface ID of the Switch.

Related Commands

Command	Description
controller-ipv6	sets the default IPv6 address of the to the IPv6 loopback interface address or a specific VLAN interface address.

AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show control-plane-security

```
show control-plane-security
```

Description

Show the current configuration of the control plane security profile.

Syntax

No parameters.

Usage Guidelines

The control plane security profile enables and disables the control plane security feature and identifies campus APs to receive security certificates. Issue this command to view current control plane security settings.

Example

The following command shows the control plane security and auto certificate provisioning features are enabled in the control plane security profile, and that the Switch will send certificates to a range of IP addresses:

```
(host)(config) #show control-plane-security
Control Plane Security Profile
------------------------------
Parameter                        Value
---------                        -----
Control Plane Security           Enabled
Auto Cert Provisioning           Disabled
Auto Cert Allow All              Enabled
Expiry timer(dd:hh)              00:02
Auto Cert Allowed Addresses      N/A
Auto Cert Allowed IPv6 Addresses N/A
```

Related Commands

Command	Description

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show country

```
show country [trail]
```

Description

Show the country and domain upgrade trail of the Switch.

Syntax

Parameter	Description
`trail`	Display the record showing how the switch was reconfigured for its current country domain when the Switch hardware was upgraded.

Usage Guidelines

A Switch's country code sets the regulatory domain for the radio frequencies that the APs use. This value is typically set during the Switch's initial setup procedure. Use this command to determine the country code specified during setup.

Example

The output of this command shows the Switch's country, model and hardware types.

```
(host) # show country
Country:US
Model:Alcatel-LucentOAW-4750-US
Hardware:Restricted US
```

Command History

show cp-bwcontracts

```
show cp-bwcontract
```

Description

Displays a list of Control Processor (CP) bandwidth contracts for whitelist ACLs.

Syntax

No parameters.

Example

The *CP bw contracts* table lists the contract names, the ID number assigned to each contract, and its defined traffic rate in packets per second.

```
(host) #show cp-bwcontracts

CP bw contracts
---------------
Contract                  Id     Rate (packets/second)
--------                  --     ---------------------
cpbwc-ipv4                15785  2000
cpbwc-ipv6                15798  2000
cp-rate                   15809  20
```

Related Commands

Command	Description
firewall cp	This command creates a new whitelist ACL and can associate a bandwidth contract with that ACL.
cp-bandwidth-contract	This command configures a bandwidth contract traffic rate, which can then be associated with a whitelist session ACL.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

show cp-stats

```
show cp-stats
```

Description

This command shows the control plane (CP) queue statistics.

Syntax

No parameters.

Example

Execute the following command to view the control plane queue statistics.

```
(host) [mynode] #show cp-stats
```

Related Commands

Command	Description
control-plane-security	This command configures the control plane security profile by identifying APs to receive security certificates.

show cpuload

```
show cpuload [current | per-cpu]
```

Description

The **show cpuload** command displays the Switch CPU load for application and system processes. The CPU load stats for a Switch can be viewed by using the **current** parameter, or displayed per-processor by using the **per-cpu** command.

Syntax

Parameter	Description
`current`	Include this optional parameter at the request of Alcatel-Lucent technical support to display additional CPU troubleshooting statistics.
`per-cpu`	Displays the CPU load stats for a Switch by individual processor.

Example

This example shows that the majority of the Switch's CPU resources are not being used by either application (user) or system processes.

```
(host)[mynode] #show cpuload
user 6.9%, system 7.7%, idle 85.4%
```

The output of this command includes the following parameters:

Parameter	Description
`user`	Percentage of Switch CPU resources used by application processes.
`system`	Percentage of Switch CPU resources used by system processes.
`idle`	Percentage of unused Switch CPU resources.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

show crashinfo

```
show crashinfo
```

Description

This command shows the list of crashes in the system.

Syntax

No parameter.

Usage Guidelines

You can use this command to know the list of crashes that has happened in the system.

Example

The following is an example for executing this command:

```
(host) [mynode] #show crashinfo
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode

show crypto-local ipsec-map

```
show crypto-local ipsec [tag <ipsec-map-name>]
```

Description

Displays the current IPsec map configuration on the Switch.

Syntax

Parameter	Description
`tag <ipsec-map-name>`	Display a specific IPsec map.

Usage Guidelines

The command **show crypto-local ipsec** displays the current IPsec configuration on the Switch.

Examples

The command **show crypto-local ipsec-map** shows the default map configuration along with any specific IPsec map configurations.

```
(host) #show crypto-local ipsec-map
Crypto Map Template "sample" 5
IKE Version: 2
IKEv2 Policy: 20
Security association lifetime seconds : 300
Security association lifetime kilobytes: N/A
PFS (Y/N): N
Transform sets={ default-transform }
Peer gateway: gateway.example.com
Interface: VLAN 0
Source network: 10.4.215.10/255.255.255.255
Destination network: 10.3.75.15/255.255.255.255
Pre-Connect (Y/N): Y
Tunnel Trusted (Y/N): Y
Forced NAT-T (Y/N): N
Uplink Failover (Y/N):N
IP Compression (Y/N):N
```

Related Commands

Command	Description
crypto-local ipsec-map	Use this command to configure IPsec mapping for site-to-site VPN.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on Mobility Master.

show crypto dp

```
show crypto dp [peer <source-ip>]
```

Descriptions

Displays crypto data packets.

Syntax

Parameter	Description
`dp`	Shows crypto latest datapath packets. The output is sent to crypto logs.
`peer <source-ip>`	Show crypto latest datapath packets for this peer—that is, shows crypto ISAKMP state for this IP.

Usage Guidelines

Use this command to send crypto data packet information to the Switch log files, or to clear a crypto ISAKMP state associated with a specific IP address.

Examples

The command show crypto dp sends debug information to CRYTPO logs.

```
(host) [mynode] #show crypto dp
Datapath debug output sent to CRYPTO logs.
```

Related Commands

Command	Description
crypto isakmp	Use this command to configure Internet Key Exchange (IKE) parameters for the Internet Security Association and Key Management Protocol (ISAKMP).

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on Mobility Master.

show crypto dynamic-map

```
show crypto dynamic-map [tag <dynamic-map-name>]
```

Descriptions

This command displays IPsec dynamic map configurations.

Syntax

Parameter	Description
`dynamic-map`	IPsec dynamic map configuration.
`tag <dynamic-map-name>`	A specific dynamic map.

Usage Guidelines

Dynamic maps enable IPsec SA negotiations from dynamically addressed IPsec peers. Once you have defined a dynamic map, you can associate that map with the default global map using the command crypto map global-map.

Examples

The command show crypto dynamic-map shows IPsec dynamic map configuration.

```
(host) [mynode] #show crypto dynamic-map
Crypto Map Template"default-dynamicmap" 10000
IKE Version: 1
IKEv1 Policy: All
Security association lifetime seconds : [300 -86400]
Security association lifetime kilobytes: N/A
PFS (Y/N): N
Transform sets={ default-transform, default-aes }
```

Related Commands

Command	Description
crypto dynamic-map	Use this command to configure a dynamic map.

AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on Mobility Master.

show crypto ipsec

```
show crypto ipsec {ipsec-map-id | mtu | sa [peer v6 <peer-ipv6> | peer <peer-ip>] | transform-set [tag <transform-set-name>]}
```

Descriptions

Displays the current IPsec configuration on the managed device.

Syntax

Parameter	Description
`ipsec-map-id`	Shows IPsec MAP to ID mapping.
`mtu`	Shows IPSec max mtu.
`sa`	Shows security associations (SAs).
`peer ip6 <peer-ipv6>`	Shows IPsec SAs for an IPv6 peer.
`peer <peer-ip>`	Shows IPsec SAs for this IP.
`transform-set`	Shows IPsec transform sets.
`tag <transform-set-name>`	Shows a specific transform set.

Usage Guidelines

Execute the **show crypto ipsec** command to view the Maximum Transmission Unit (MTU) size allowed for network transmissions using IPsec security. It also displays the transform sets that define a specific encryption and authentication type.

Examples

The **show crypto ipsec transform-set** command displays the settings for both preconfigured and manually configured transform sets.

```
(host) [mynode] #show crypto ipsec transform-set
Transform set default-transform: { esp-3des esp-sha-hmac }
         will negotiate = { Transport, Tunnel }
Transform set default-ml-transform: { esp-3des esp-sha-hmac }
         will negotiate = { Transport, Tunnel }
Transform set default-boc-bm-transform: { esp-3des esp-sha-hmac }
         will negotiate = { Transport, Tunnel }
Transform set default-cluster-transform: { esp-aes256 esp-sha-hmac }
         will negotiate = { Transport, Tunnel }
Transform set default-1st-ikev2-transform: { esp-aes256 esp-sha-hmac }
         will negotiate = { Transport, Tunnel }
Transform set default-3rd-ikev2-transform: { esp-aes128 esp-sha-hmac }
         will negotiate = { Transport, Tunnel }
Transform set default-gcm256: { esp-aes256-gcm esp-null-hmac }
         will negotiate = { Transport, Tunnel }
Transform set default-gcm128: { esp-aes128-gcm esp-null-hmac }
         will negotiate = { Transport, Tunnel }
Transform set default-rap-transform: { esp-aes256 esp-sha-hmac }
         will negotiate = { Transport, Tunnel }
Transform set default-remote-node-bm-transform: { esp-3des esp-sha-hmac }
```

```
         will negotiate = { Transport, Tunnel }
Transform set default-aes: { esp-aes256 esp-sha-hmac }
         will negotiate = { Transport, Tunnel }
Transform set newset: { esp-3des esp-sha-hmac }
         will negotiate = { Transport, Tunnel }
Transform set name: { esp-aes256-gcm esp-sha-hmac }
         will negotiate = { Transport, Tunnel }
```

Use the **peer** parameter to view details about an IPsec connection.

```
(host) [mynode] #show crypto ipsec sa peer 80.254.65.210
Initiator IP: 80.254.65.210

show crypto isakmp

```
show crypto isakmp
   block-aruba-ca
   cluster IPAssignPendingRaps
   clusterIP
   clusterMAC
   eap-passthrough
   groupname
   ipsecSPI
   key
   lc-members
   log ap <macaddr>
   packet-dump
   policy <policy-number>
   sa
   stats
   timers
   transports
   udpencap-behind-natdevice
```

Descriptions

This command displays Internet Key Exchange (IKE) parameters for the Internet Security Association and Key Management Protocol (ISAKMP).

Syntax

Parameter	Description
`block-aruba-ca`	Shows the Configuration if Alcatel-Lucent-certified clients are blocked.
`cluster IPAssignPendingRaps`	Shows cluster configuration.
`clusterIP`	Show clusterIP hash table entries
`clusterMAC`	Show clusterMAC hash table entries
`eap-passthrough`	Displays configured IKEv2 EAP pass-through methods.
`groupname`	Shows the IKE Aggressive group name.
`ipsecSPI`	Shows IPsec SPI hash table entries.
`key`	Shows the IKE pre-shared keys.
`lc-members`	Shows cluster members.
`log ap <macaddr>`	Shows debugging log.
`packet-dump`	Shows the packet dump configuration.
`policy <policy-number>`	Shows the following information for predefined and manually configured IKE policies: ■ IKE version ■ encryption and hash algorithms

Parameter	Description
	■ authentication method ■ PRF methods, ■ DH group ■ lifetime settings
sa	Shows the security associations.
[peer v6 <peer-ipv6> | peer <peer-ip>]	Shows crypto ISAKMP security associations for this IP.
stats	Shows detailed IKE statistics. This information can be very useful for troubleshooting problems with ISAKMP.
timers	Shows IKEv1 timers.
transports	Shows IKE Transports.
udpencap-behind-natdevice	Shows the Configuration if NAT-T is enabled if managed device is behind a NAT device .

Usage Guidelines

Use the show crypto isakmp command to view ISAKMP settings, statistics and policies.

Examples

The **show crypto isakmp stats** command shows the IKE statistics.

```
(host) [mynode] #show crypto isakmp stats
Default protection suite 10001
         Version 1
         encryption algorithm: 3DES - Triple Data Encryption Standard (168 bit keys)
         hash algorithm: Secure Hash Algorithm 160
         authentication method: Pre-Shared Key
         Diffie-Hellman Group: #2 (1024 bit)
         lifetime: [300 - 86400] seconds, no volume limit
Default RAP Certificate protection suite 10002
         Version 1
         encryption algorithm: AES - Advanced Encryption Standard (256 bit keys)
         hash algorithm: Secure Hash Algorithm 160
         authentication method: Rivest-Shamir-Adelman Signature
         Diffie-Hellman Group: #2 (1024 bit)
         lifetime: [300 - 86400] seconds, no volume limit
Default RAP PSK protection suite 10003
         Version 1
         encryption algorithm: AES - Advanced Encryption Standard (256 bit keys)
         hash algorithm: Secure Hash Algorithm 160
         authentication method: Pre-Shared Key
         Diffie-Hellman Group: #2 (1024 bit)
         lifetime: [300 - 86400] seconds, no volume limit
```

The **show crypto isakmp sa** command shows the IKE security associations.

```
(host) [mynode] #show crypto isakmp sa

show crypto-local isakmp

```
show crypto-local isakmp
   allow-via-subnet-routes
   ca-certificate
   certificate-group
   disable-aggressive-mode
   disable-ipcomp
   dpd
   key [peer <peer-ip> | fqdn <ike-id-fqdn>]
   server-certificate
   xauth
```

Descriptions

This command displays Internet Key Exchange (IKE) parameters for the Internet Security Association and Key Management Protocol (ISAKMP).

Syntax

Parameter	Description
`allow-via-subnet-routes`	Shows if the Mobility Master is configured to accept subnet routes from VIA clients.
`ca-certificate`	Shows all the Certificate Authority (CA) certificates associated with VPN clients.
`certificate-group`	Shows the existing certificate groups by server certificate name and CA certificate.
`disable-aggressive-mode`	Shows if aggressive-mode is enabled or disabled.
`disable-ipcomp`	Shows IP compression configuration.
`dpd`	Shows the IKE Dead Peer Detection (DPD) configuration on the managed device.
`key [fqdn <ike-id-fqdn> | peer <peer-ip>]`	Shows the IKE pre-shared key on the managed device for site-to-site VPN. This includes keys configured by Fully Qualified Domain Name (FQDN) and local and global keys configured by IP address.
`server-certificate`	Shows all the IKE server certificates used to authenticate the managed device for VPN clients.
`xauth`	Shows the IKE XAuth configuration for VPN clients.

Usage Guidelines

Use the **show crypto-local isakmp** command to view IKE parameters.

Examples

The examples here show sample output for the **show crypto-local isakmp ca-certificate**, **show crypto-local isakmp certificate-group**, **show crypto-local isakmp dpd**, **show crypto-local isakmp key**, **show crypto-local isakmp server-certificate**and **show crypto-local isakmp xauth** commands:

```

```

Related Commands

Command	Description
crypto-local isakmp allow-via-subnet-routes	Use this command to push subnet routes to the Mobility Masterand managed device.
crypto-local isakmp ca-certificate	Use this command to assign the Certificate Authority (CA) certificate used to authenticate VPN clients.
crypto-local isakmp certificate-group	Use this command to assign a certificate group so you can access multiple types of certificates on the same managed device.
crypto-local isakmp disable-aggressive-mode	Use this command to disable the IKEv1 aggressive mode.
crypto-local isakmp dpd	Use this command to configure IKE Dead Peer Detection (DPD) on the managed device.
crypto-local isakmp key	Use this command to configure the IKE preshared key on the managed device for site-to-site VPN.
crypto-local isakmp server-certificate	Use this command to assign the server certificate used to authenticate the managed device for VPN clients.
crypto-local isakmp xauth	Use this command to enable the IKE XAuth for VPN clients.

Command History

Release	Modification
AOS-W 8.0.1.0	The **allow-via-subnet-routes** subcommand was introduced.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable and Config mode on Mobility Master.

show crypto-local pki

```
show crypto-local pki

      subject]]
   service-ocsp-responder [stats]
```

Descriptions

Execute this command to show local certificate, OCSP signer or responder certificate, and CRL data and statistics.

Syntax

Parameter	Description
`CRL`	Shows the name, original filename, reference count and expiration status of all CRLs on this Switch.
`<name> ALL`	Shows the version, signature algorithm, issuer, last update, next update, and CRL extensions and all other attributes of this CRL.
`<name> crlnumber`	Shows the number of this CRL.
`<name> fingerprint`	Shows the fingerprint of this CRL.
`<name> hash`	Shows the hash number of this CRL.
`<name> issuer`	Shows the issuer of this CRL.
`<name> lastupdate`	Shows the last update (date and time) at which the returned status is known to be correct.

Parameter	Description
<name> nextupdate	Shows the next date and time (date and time) where the responder retrieves updated status information for this certificate. If this information is not present, then the responder always holds up to date status information.
crl-stats	Shows the CRL request statistics.
IntermediateCA	Shows the name, original filename, reference count and expiration status of this certificate. **NOTE:** IntermediateCA has the identical sub-parameters as those listed under the TrustedCA parameter in this table.
ocsp-client-stats	Shows the OCSP client statistics.
OSCPResponderCert	Shows the name, original filename, reference count and expiration status of all OCSPResponderCert certificates on this Switch. **NOTE:** OCSPResponderCert has the identical sub-parameters as those listed under the TrustedCA parameter in this table.
OCSPSignerCert	Shows the OCSP Signer certificate. **NOTE:** OCSPSignerCert has the identical sub-parameters as those listed under the TrustedCA parameter in this table.
PublicCert	Shows Public key information of a certificate. This certificate allows an application to identify an exact certificate. **NOTE:** PublicCert has the identical sub-parameters as those listed under the TrustedCA parameter in this table.
rcp	Shows the revocation check point.
ServerCert	Shows Server certificate information. This certificate must contain both a public and a private key (the public and private keys must match). You can import a server certificate in either PKCS12 or X.509 PEM format; the certificate is stored in X.509 PEM DES encrypted format on the Switch. **NOTE:** ServerCert has the identical sub-parameters as those listed under the TrustedCA parameter in this table.
TrustedCA	Shows trusted CA certificate information. This certificate can be either a root CA or intermediate CA. Alcatel-Lucent encourages (but does not require) the signing CA of the an intermediate CA to be the Switch itself.
<name> ALL	Shows the version, signature algorithm, issuer, last update, next update, and CRL extensions and all other attributes of this certificate.
<name> alias	Shows this certificate's alias, if it exists.
<name> dates	Shows the dates for which this certificate is valid.
<name> fingerprint	Shows the certificate's fingerprint.
<name> hash	Shows the hash number of this certificate.
<name> issuer	Shows the certificate issuer.
<name> modulus	Shows the modulus which is part of the public key of the certificate.

Parameter	Description
`<name> purpose`	Shows the certificate's purposes such as if this is an SSL server, SSL server CA and so on.
`<name> serial`	Shows the certificate's serial number.
`<name> subject`	Shows the certificate's subject identification number.
`service-ocsp-responder [stats]`	Shows if OCSP responder service is enabled and shows statistics.

Usage Guidelines

Use the **show crypto-local pki** command to view all CRL and certificate status, OCSP client and OCSP responder status and statistics.

Example

This example displays a list of all OCSP responder certificates on this Switch.

```
(host) [mynode] #show crypto-local pki OCSPResponderCert

Certificates
------------
Name                         Original Filename          Reference Count  Expired
--------------               -----------------          ---------------  -------
ocspJan28                    ocspresp-jan28.cer         0                No
ocspresp-standalone-feb21    ocspresp-feb21.cer         0                No
ocspRespFeb02                ocspresp-feb2.cer          1                No
OCSPresponder1               ocspresponder-new1.cer     0                No
ocspresponder2               subsubCA-ocsp-res-2.cer    0                No
OCSPresponderlatest          ocspresponder-latest.cer   0                No
```

The output of this command includes the following parameters:

Parameter	Description
`Name`	Name of the OCSP responder certificate.
`Original Filename`	Name of the original certificate when it was added to the Switch.
`Reference Count`	Number of RCPs that reference this OCSP responder certificate, signer certificate or CRL.
`Expired`	Shows whether the Switch has enabled or disabled client remediation with Sygate-on-demand-agent.

This example shows the dates for which this OCSP responder certificate is valid.

```
(host) [mynode] #show crypto-local pki OCSPResponderCert ocspJan28 dates
notBefore=Jan 21 02:37:47 2011 GMT
notAfter=Jan 20 02:37:47 2013 GMT
```

This example displays the certificate's hash number.

```
(host) [mynode] #show crypto-local pki OCSPResponderCert ocspJan28 hash 91dcb1b3
```

This example shows the purpose and information about this certificate.

```
(host) [mynode] #show crypto-local pki OCSPResponderCert ocspJan28 purpose
Certificate purposes:For validation
SSL client : No
```

```
SSL client CA : No
SSL server : No
SSL server CA : No
Netscape SSL server : No
Netscape SSL server CA : No
S/MIME signing : No
S/MIME signing CA : No
S/MIME encryption : No
S/MIME encryption CA : No
CRL signing : No
CRL signing CA : No
Any Purpose : Yes
Any Purpose CA : Yes
OCSP helper : Yes
OCSP helper CA : No
```

This example displays the certificate's subject.

```
(host) [mynode] #show crypto-local pki OCSPResponderCert ocspJan28 subject

subject= /CN=WIN-T1BQQFMVDED.security1.qa.mycorp.com
```

Related Commands

Command	Description
crypto-local pki	This command is saved in the configuration file and verifies the presence of the certificate in the Switch's internal directory structure.
crypto-local pki rcp <name>	Specifies the certificates that are used to sign OCSP responses for this revocation check point

Command History

show crypto map

```
show crypto map
```

Descriptions

This command displays the IPsec map configurations.

Syntax

Parameter	Description
`map`	Shows the IPsec map configurations.

Usage Guidelines

Use the **show crypto map** command to view configuration for global, dynamic, and default map configurations.

Examples

The output of the **show crypto map** command shows statistics for the global, dynamic, and default maps.

```
(host) [mynode] #show crypto map
Crypto Map "GLOBAL-IKEV2-MAP" 10000 ipsec-isakmp
Crypto Map Template"default-rap-ipsecmap" 10001
IKE Version: 2
IKEv2 Policy: DEFAULT
Security association lifetime seconds : [300 -86400]
Security association lifetime kilobytes: N/A
PFS (Y/N): N
Transform sets={ default-gcm256, default-gcm128, default-rap-transform }
Crypto Map "GLOBAL-MAP" 10000 ipsec-isakmp
Crypto Map Template"default-dynamicmap" 10000
IKE Version: 1
IKEv1 Policy: All
Security association lifetime seconds : [300 -86400]
Security association lifetime kilobytes: N/A
PFS (Y/N): N
Transform sets={ default-transform, default-aes }
```

Related Commands

show crypto pki

```
show crypto pki csr
```

Descriptions

This command displays the certificate signing request (CSR) for the captive portal feature.

Syntax

Parameter	Description
`csr`	Shows the certificate signing request for the captive portal feature.

Usage Guidelines

Use the **show crypto pki** command to view the CSR output.

Examples

The output of the **crypto pki csr** command.

```
(host) [mynode] #show crypto pki csr

show database

```
show database synchronize
```

Description

This command displays database synchronization status.

Syntax

Parameter	Description
`synchronize`	Shows Multiple Master Switches redundancy status (Master-Master communication).

Example

The following example displays a database synchronization status.

```
(host) [mm] (config) #show database synchronize

Last L2 synchronization time: Tue Oct 1 05:38:25 2019
Last L3 synchronization time: Tue Oct 1 04:26:09 2019
To Master Switch at 192.168.228.4: succeeded
To Secondary Master Switch at 2002:192:168:229::19: succeeded
WMS Database backup file size: 147035 bytes
Upgrademgr Database backup file size: 3397 bytes
Cluster upgrademgr Database backup file size: 3893 bytes
Local User Database backup file size: 37733 bytes
Global AP Database backup file size: 63738 bytes
IAP Database backup file size: 3778 bytes
Airgroup Database backup file size: 3076 bytes
License Database backup file size: 15419 bytes
CPSec Database backup file size: 3224 bytes
Bocmgr Database backup file size: 6062 bytes
Total size of Captive Portal Custom data: 0 bytes, 0 files
Total size of Captive Portal Custom data last synced: 0 bytes, 0 files
L2 Synchronization took 4 second
L3 Synchronization took 11 second
1289 L2 synchronization attempted
15 L2 synchronization have failed

10 L3 synchronization attempted
0 L3 synchronization have failed

L2 Periodic synchronization is enabled and runs every 1 minute

L3 Periodic synchronization is enabled and runs every 120 minutes

Synchronization includes Captive Portal Custom data
```

Description

Displays system statistics for the managed device.

Syntax

Parameter	Description
`acl`	Displays datapath ACL entries.
`ap-name <ap-name>`	Specify the name of the AP.
`id <id-name> [verbose]`	Displays datapath statistics associated with a specified ACL. The ACL index is found in the **show rights** command.

Parameter	Description
	The allowed range is 1–2703.
ip-addr <ip-addr>	Specify the IP address of the AP.
name <acl-name>	Specify the name of ACL.
type <acl-type>	Specify the ACL Type. 0 - session-based; 1- role-based
amsdu tx	Shows datapath AMSDU TX queue statistics
application	Shows datapath application statistics. By default, it provides combined statistics of all CPUs.
<id>	Shows datapath application statistics by specified CPU id. Valid platform CPU range may vary.
all	Shows datapath application statistics for all CPUs, one by one.
ap-name <ap-name>	Specify the name of the AP.
counters	Shows application counters and errors generated by applications running on a particular AP. These include stateful firewall application layer statistics.
ip-addr <ip-addr>	Specify the IP address of the AP.
verbose	Shows datapath application statistics in detail.
bridge	Shows bridge table entry statistics including MAC address, VLAN, assigned VLAN, Destination, and flag information for an AP.
ap-name <ap-name>	Specify the name of the AP. Shows MAC address, VLAN, assigned VLANs, destination and flags information.
counters	Shows datapath bridge table statistics such as current entries, high water mark, maximum entries, total entries, allocation failures, and max link length.
devices	Shows datapath bridge devices.
ip-addr <ip-addr>	Specify the IP address of the AP. Shows MAC address, VLAN, assigned VLANs, destination and flags information.
table <macaddr>	Displays the current high, maximum, and total number of bridge table entries for the Alcatel-Lucent Switch.
verbose	Displays datapath bridge details in a tabular format.
bwm	Displays the following bandwidth management table entry statistics: ■ **Type:** Indicates whether the contract is a control plane DoS contract (0), a contract configured through the bandwidth management WebUI or CLI

Parameter	Description
	Interfaces (1), or a contract for multicast traffic generated by the Switch(2). ■ **Cont ID:** An ID number unique to each contract. ■ **Rate:** Contract traffic rate, in 256-byte packets per second. ■ **Policed:** The number of packets dropped because the policy was applied. ■ **Avail Credits:** This value is the (contract rate) per 32, and is used for internal debugging purposes. ■ **Queued Pkts/ Bytes:** Number of bytes or packets currently being queued. ■ **Flags:** Flags applied to the contract. ■ **CPU:** A value in this column indicates that the traffic passed through the slowpath CPU, and is used for internal debugging purposes. ■ **Status:** Indicates if the bandwidth contract is successfully applied.
`ap-name <ap-name>`	View a bandwidth contract for a specific AP.
`ip-addr <ip-addr>`	View a bandwidth contract for an AP with the specified IP address.
`table`	Displays a table of all configured bandwidth contracts.
`type <type-id>`	Displays only bandwidth contracts of a specific type (0,1 or 2).
`contract <contract-id>`	Displays the bandwidth contracts for the specified contract id.
`compression`	Displays datapath compression statistics. By default, the combined statistics of all CPUs are shown.
`<id>`	Shows datapath compression statistics by specified CPU id. Valid platform CPU range may vary.
`all`	Shows datapath compression statistics for all CPUs, one by one.
`counters`	Shows datapath compression counters or statistics.
`verbose`	Shows datapath compression statistics in detail.
`cp-bwm`	Displays the data path CP bandwidth management table information.
`table`	Displays the datapath CP bandwidth management table entries.
`crypto`	Displays crypto parameter statistics including crypto, IPsec, PPTP, WEP, TKIP, AESCCM encryption and decryptions, WEP CRC, crypto hardware, XSEC, 802.1X, and L2TP information.
`<id>`	Shows datapath crypto statistics by specified CPU id. Valid platform CPU range may vary.

Parameter	Description
all	Shows datapath crypto statistics for all CPUs, one by one.
counters	Shows datapath crypto counters or statistics.
verbose	Shows datapath crypto statistics in detail.
debug	Displays datapath debug details. These are low-level datapath details.
dma [counters]	DMA statistics are displayed.
eap [counters]	EAP termination statistics are displayed.
eth1info	Displays IPv4 fragment table statistics.
memory	Displays SOS memory statistics.
memory-usage	Displays datapath memory used.
opcode	Displays datapath debugging information. **NOTE:** Use this command only under the supervision of Alcatel-Lucent technical support.
performance	Displays datapath debug performance statistics including the SUM or CPU, addr, and description.
<id>	Displays datapath performance counters by specified CPU ID.
all	Displays datapath debug performance for all CPUs.
counters	Displays datapath performance counters.
event-guide	Displays the following events: ■ COP0 ■ L3 Cache ■ NAE-RX ■ NAE-TX events (by register index 0-4)
verbose	Displays debug performance statistics including: SUM or CPU, address, description, value, and difference from last show.
pkttrace-buffer [log {<number> | all}]	Shows the datapath packet trace buffer from log file, either as number of lines from the end or as complete packet trace log.
table-limits	Displays the datapath table upper limits.
tnl-stats [<id> | all | counters | verbose]	Displays the Wi-Fi Tunnel Stats Exported to CP debug.
trace-buffer [lines <lines>]	Shows the datapath trace buffer, by number of lines from the end of log.
trace-route	Shows datapath route or cache tracing.

Parameter	Description
`dhcp vm-mac`	Shows datapath DHCP-related information; datapath VM to host client MAC mapping
`dns-cache [counters]`	Displays DNS cache statistics.

`dpdk`
`mempool-stats`
`ring-stats`
	Data Plane Development Kit.
	■ mempool-stats—Shows datapath DPDK memory pool statistics.
	■ ring-stats—Shows datapath DPDK ring statistics.

`dpi`
`app-category <appcatid>`
`application <appid>`
	Displays the DPI application default ports. Specify the application Group ID or the application ID.

`energy-efficiency`	Displays the energy efficiency statistics.
`error`	Displays datapath error statistics or counters.
`counters`	Show datapath errors including SUM, CPU, Address, and description information. The output counters include, but not limited to, the following: ■ BPDUs Received ■ VOQ retries ■ Invalid IP headers Received ■ IKE Throttle ■ VOQ retries ■ Ipv4 Firewall Denied Frames ■ Ipv6 Firewall Denied Frames ■ IP Reassembly Failures ■ Invalid IP headers Received ■ Dot1Q Discards ■ Dot1d Discards ■ Drop cache frames ■ AESCCM Encryption Station Not Ready ■ AESCCM Decryption Failures ■ AESCCM Decryption Invalid Replay Co
`esi [table]`	Displays the contents of the datapath ESI server table entries including server, IP, MAC, destination, VLAN, type, session and flag information.
`exthdr`	Displays the datapath default IPv6 Extended Header Map.
`firewall-agg-sess`	Displays the datapath firewall aggregated sessions table.
`counters`	Displays the datapath aggregate session statistics.
`fqdn`	Displays datapath FQDN entries.
`frame`	Displays frame statistics that are received and transmitted from the data path of the Switch. Several output fields include the following descriptions: ■ **Descr failures:** This is the number of times a packet descriptor was not available and the packet dropped.

Parameter	Description
	■ **Dot1QDiscards:** The number of packets received on a trunk port where the VLAN presented did not match any configured on the Switch and the packet dropped. ■ **Dot1d Discards:** Spanning tree is disabled and each BPDU frame is counted and dropped. ■ **Denied Frames:** Frames that are denied by the data path of the ACL for theSwitch. See the **Example** section for a complete list of output.
`<id>`	Displays datapath frame statistics by specified CPU ID. Valid platform CPU range may vary.
`all`	Displays datapath frame statistics for all cpus, one by one.
`ap-name <ap-name> [counters]`	Name of the AP. The *counters* parameter is optional.
`counters`	Displays datapath frame statistics
`ip-addr <ip-addr> [counters]`	IP address of the AP. The *counters* parameter is optional.
`slot`	Displays datapath combined frame statistics of all CPUs, including slot specific section.
`verbose`	Displays datapath frame statistics in detail.
`hardware`	Displays datapath hardware counters or hardware packet statistics information.
`counters`	Displays hardware counters.
`statistics`	Displays Hardware packet statistics.
`heartbeat stats`	Displays Sibyte heartbeat packet stats.
`internal`	Displays Internal details .
`dir <dir-name>`	Specify the hardware directory.
`file <file-name>`	Specify the file in the directory.
`ip-fragment-table`	Displays ip-fragment statistics including CPU, current entries, high water mark, max , total, and aged entries.
`ipv4`	Displays IPv4 fragment statistics.
`ipv6`	Displays IPv6 fragment statistics.
`ip-geolocation`	Datapath IP geolocation table entries.
`counters`	Displays IP geolocation statistics.
`ip-mcast`	Displays the Datapath IP Multicast Entries table statistics.

Parameter	Description
client <client-mac>	Datapath Layer 3 groups for specified client.
destination	Datapath tunnel and port membership.
group	Datapath Layer 3 groups.
station	Datapath station membership.
ip-reassembly	Displays the contents of the IP Reassembly statistics tables.
counters	IP reassembly counters.
ipv4	Displays the IPv4 contents of the IP Reassembly statistics table.
ipv6	Displays the IPv6 contents of the IP Reassembly statistics table.
ip-reputation	Datapath IP reputation table entries.
counters	Displays IP reputation statistics.
rtc	Displays IP reputation real time cache.
ipfix statistics	Displays datapath IPFIX collection statistics.
ipsec-map	Displays datapath IPsec map details.
ipv6-mcast	Displays the datapath IP multicast table statistics.
destination	Displays the IPv6 tunnel and port membership.
group	Displays the IPv6 multicast group.
station	Displays the IPv6 station membership.
l3-interface	Displays datapath Layer 3 interface table.
lag table	Displays contents of the datapath LAG or port channel table.
maintenance [counters]	Displays datapath maintenance statistics.
message-queue [counters]	Displays statistics of messages received by a CPU from other datapath CPUs (only CPUs that receive messages and non-zero statistics are shown). The datapath SOS message queue statistics by CPU IDs and Opcode is displayed.
mobility	Displays datapath IP mobility information.
discovery-table	Displays the discovery count table that is used to keep track of per client home agent discovery.
home-agent-table	Displays the datapath HA table information.

Parameter	Description
`mcast-table`	Displays the mobility multicast-group table that is used to flood the multicast RA traffic to the roamed clients.
`stats`	Displays the statistics of the datapath mobility.
`nat`	Displays the contents of the datapath NAT entries table. It displays NAT pools as configured in the datapath. Statistics include pool, SITP start, SIP end and DIP.
`ap-name <ap-name> [table]`	Specify the name of AP.
`ip-addr <ip-addr> [table]`	Specify the IP address of the AP.
`table`	Shows the datapath NAT table entries.

`netdest-id`
`ap-name <ap-name>`
`ip-addr <ip-addr>`
`<id>`
	Shows the datapath ACL netdestination table.
	for AP name, IP address of AP, or ID.

`network {egress | ingress}`	Displays egress or ingress queue counters. The network engress output includes, but not limited to, the following fields: ■ CPU ■ DP High Prio ■ Network High Prio The network ingress output includes, but not limited to, the following fields: ■ LIFO Queue ■ Threshold count ■ Empty Count ■ Threshold Recovery ■ Empty Recovery
`nexthop-list [ipv4 | ipv6]`	Displays information about the datapath for packets routed to next-hop devices. The output contains the following parameters: ■ Dest ■ Version ■ Nexthop ■ Nexthop Dest ■ Nexthop Index ■ Nexthop Version ■ Nexthop VLAN ■ Nexthop Priority
`openflow`	Displays the datapath OpenFlow information.
`acl`	Displays the datapath OpenFlow ACL table and actions.
`acl-action-table`	Displays the OpenFlow ACL action table.
`auxiliary`	Displays the datapath OpenFlow auxiliary channel information.

Parameter	Description
`session [<A.B.C.D>]`	Displays the datapath OpenFlow session table and actions. You can optionally filter the sessions based on the IP address.
`statistics`	Displays the OpenFlow statistics in datapath.
`papi`	Displays the datapath PAPI statistics.
`counters`	Displays datapath PAPI counters including: SUM or CPU, addr, description, and value.
`remote-device-table [ipv6]`	Displays the remote device table maintained in the datapath that contains PAPI entries for IPv6 devices.
`port`	Displays the datapath port table information. This includes the port number, PVID, Ingress ACL, Egress ACL, Session ACL, and the following flags: ■ B: Blocked by the Spanning Tree protocol ■ L: LSG ■ M: Tunneled node ■ Q: Trunk ■ T: Trusted ■ X: xSec ■ Z: QinQ
`ap-name <ap-name> [table]`	Specify the name of the AP. Shows the datapath port table entries for the specified AP.
`ip-addr <ip-addr> [table]`	Specify the IP address of the AP. Shows the datapath port table entries for the specified IP.
`untrusted-vlan <slot>/<module>/<port>`	Shows if there are untrusted vlan entries for the indicated slot, module, and port.
`vlan-table <slot>/<module>/<port>`	Shows datapath port-vlan table session entries for the specified slot, module, and port.

`rap-bw-resv`
`ap-name <ap-name> [advanced]`
`ip-addr <ip-addr> [advanced]`
	Displays the remote AP uplink BW reservation statistics of the Remote AP only. Specify the AP or IP address with the *advanced* parameter for Advanced Debugging Options.

`rap-pkt-trace`
`ap-name <ap-name>`
`ip-addr <ip-addr>`
	Specify the name of the Remote AP. Displays the remote AP packet-trace statistics of only the specified Remote AP.

`rap-stats`
`ap-name <ap-name>`
`ip-addr <ip-addr>`
	Specify the name of the Remote AP. Displays the remote AP statistics of only the specified Remote AP.

`remote-user table`	Displays the remote user table.
`ipv4`	Displays the IPv4 entries of the remote user table.
`ipv6`	Displays the IPv6 entries of the remote user table.
`route`	Displays datapath route table statistics.

Parameter	Description
	The output of the command includes the following fields: **Route table entries** ■ IP ■ Mask ■ Gateway ■ Cost ■ VLAN ■ Flags **IPv6 Route table entries** ■ Prefix ■ Gateway ■ Cost ■ VLAN ■ Flags
`ap-name <ap-name> [counters | table | verbose]`	Specify the name of the AP.
`counters`	Displays route table statistics such as current entries, high water mark, maximum entries, total entries, allocation failures and max link length.
`ip-addr <ip-addr> [counters | table | verbose]`	Specify the IP address of the AP.
`ipv4`	Displays datapath IPv4 routing table.
`ipv6`	Displays datapath IPv6 routing table.
`table`	Displays route table entries such as IP, mask, gateway, cost, VLAN and flags.
`verbose`	Displays all detailed route table entries including IP, mask, gateway, cost, VLAN, flags, Internal VerNum Index.
`route-cache`	Displays datapath route cache table statistics.
`ap-name <ap-name> [counters | table | verbose]`	Specify the name of the AP.
`counters`	Displays route cache table statistics such as current entries, high water mark, maximum entries, total entries, allocation failures and max link length.
`ip-addr <ip-addr> [counters | table | verbose]`	Specify the IP address.
`ipv4`	Displays datapath IPv4 route cache.
`ipv6`	Displays datapath IPv6 route cache.
`table`	Displays route cache table entries such as IP, mask, gateway, cost, VLAN and flags.

Parameter	Description
`verbose`	Displays all detailed route cache table entries including IP, mask, gateway, cost, VLAN, flags, Internal VerNum Index.

`scheduler`
`interface <slot/module/port>`
`table`
	Displays the datapath scheduler table. Specify interface for scheduler output in the slot or module or port format.

`services`	Displays the datapath services table statistics including protocol, port and service.
`session`	Displays datapath session statistics. The command output includes, but not limited to, the following fields: ■ Source IP ■ Destination IP ■ SPort ■ DPort ■ Prio ■ ToS ■ Age ■ Destination ■ TAge ■ Packets ■ Bytes ■ NhlIdx ■ NhIdx ■ NhlNhVer
`ap-name <ap-name>` `[counters | table [<A.B.C.D>]]`	Specify the name of the AP. Counters and table are optional parameters
`counters`	Displays counters statistics including current entries, high water mark, maximum entries, total entries, current maximum link length, maximum link length, stale entries, aged entries, and pending delete entries.
`dhcp-perf`	Displays the performance details of datapath DHCP sessions.

`dpi`
`[counters`
`[all | top | uplink-vlan <uplinkvlan>]]`
	Displays Deep Packet Information for this session. The counters parameter is optional.
	The output includes, but not limited to, the following fields:
	■ **AclVersion:** This is used to store the current version number of the ACL that is used at session creation time and is used for troubleshooting purposes.
	■ **PktsDpi:** The number of packets sent to the DPI engine for a given session.
	■ **AceIdx:** The Index of the Access List entry (in a given ACL) that triggered a match during session creation.
	■ **DpiTIdx:** This is an index to the DPI engine Tbl and is only used for troubleshooting purposes.

`high-value`	Shows high- value sessions statistics.

Parameter	Description
`ip-addr <ip-addr> [counters | table [<A.B.C.D>]]`	Specify the IP address of the AP. The counters and table parameters are optional.
`ip-classification`	IP reputation or geolocation information for session.
`ipv6 counters | dhcp-perf | dpi [counters [top] | high-value | perf | table [<X:X:X:X::X>] | appid <app-id>] table <X:X:X:X::X> verbose | web-cc [counters | dpi]`	Displays datapath IPv6 session entries and statistics including current entries, high water mark, maximum entries, total entries, allocation failures, duplicate entries, cross linked entries, number of reverse entries and maximum link length.
`perf`	Displays the performance monitored for each datapath session.
`session-id <sid> [dpi]`	Displays datapath session FIB for a given session index. The optional **dpi** parameter displays the deep packet information for session.
`table [<A.B.C.D>]`	Displays all the IP flows of a wireless device or Alcatel-Lucent AP. Statistics include table entries including source IP, destination IP, protocol, SPort, DPort, Cntr, priority, ToS, age, destination, TAge and flags.
`uplink`	Displays statistics of datapath session with uplink VLAN.
`verbose`	Displays additional information about the session that can be used by technical support for debugging purposes. The command output includes, but not limited to, the following additional fields: ■ SIDX ■ SRTI ■ SRCI ■ UsrIdx ■ UsrVer ■ AclVer ■ NhIdx ■ NhVer
`web-cc`	Displays web-content category information about the session. The output of this command includes but not limited to the following data columns: ■ **WebCCRep**: Reputation score (integer). To see the reputation type associated with that particular score, issue the command **show web-cc reputation**. ■ **WebCCID**: Web content category ID. To see the name of the category associated with that category ID, issue the command **show web-cc category**. ■ **WebCCURL**: URL for that session entry.
`station`	Displays datapath station association table statistics.

Parameter	Description
`<id>`	Shows datapath station statistics by specified CPU id. Valid platform CPU range may vary.
`all`	Shows datapath station for all CPUs, one by one.
`counters`	Display the current and high water mark amount of 802.11 associated wireless devices on a Switch. Values output from this command represent the water-marks since the last boot of the Switch. This is the same value obtainable from the Num Associations output from the **show stm connectivity** command.
`crypto-counters`	Displays datapath station crypto counters or statistics.
`mac <macaddr>`	Specify the hardware address, in hexadecimal format (48-bit, station's MAC address). Shows the datapath station association with a specific MAC.
`standby`	Shows datapath station associated as standby.
`table`	Shows datapath station associations.
`verbose`	Shows the datapath station detail.
`tcp`	Displays contents of the tcp tunnel table. This command displays all TCP tunnels that are terminated by the Switch.
`app <app> [counters]`	Specify the name of the application.
`counters`	Displays the TCP tunnel statistics.
`tunnel table`	Displays the TCP tunnel table entries. This command displays the Datapath Station Table Statistics details. Display all associated wireless devices on the Switch with their corresponding AP BSSID and VLAN ID. Displays the wireless device is associated with the correct encryption type (if the device is associated to an AP BSSID that has encryption enabled and verifies whether the Switch is having a problem in decrypting the wireless device's frames.
`tunnel`	Displays contents of the datapath tunnel table. This command displays all the tunnels that are terminated by the Switch, including the GRE tunnels of Alcatel-Lucent AP. For example, a GRE tunnel is created and terminated on the Alcatel-Lucent Switch for every SSID or BSSID configured on the Alcatel-Lucent AP. The output of the command includes, but not limited to, the following fields: ■ Source ■ Destination ■ Port ■ Type ■ MTY ■ VLAN ■ ACLs

Parameter	Description
	■ BSSID ■ Decaps ■ Encaps ■ Heartbeats ■ Flags ■ Encap Bytes ■ Decap Bytes
`counters`	Shows tunnel counters or statistics.
`encaps`	Shows datapath encapsulation statistics verbose.
`heartbeat`	Displays the datapath heartbeat tunnel details.
`ipv4`	Displays the TCP tunnel table filtered on IPv4 entries.
`ipv6 [encaps | verbose]`	Displays the TCP tunnel table filtered on IPv6 entries. The encaps or verbose parameter is optional.
`station-list`	Displays the list of stations on the tunnel.
`table`	Tunnel table statistics.
`tunnel-id <tid> [trusted-vlan | untrusted-vlan]`	Displays datapath tunnel FIB for given tunnel index. Displays the list of trusted and untrusted VLANs.
`verbose`	Shows datapath tunnel internal detail.
`tunnel-group`	Displays the tunnel group, active status and members.
`user`	Displays datapath user statistics such as current entries, pending deletes, high water mark, maximum entries, total entries, allocation failures, invalid users and maximum link length.
`<id>`	Shows datapath user statistics by specified CPU id. Valid platform CPU range may vary.
`all`	Shows datapath user table for all CPUs.
`ap-name <ap-name> [counters | table]`	Specify the name of the AP.
`counters`	User counters.
`ip-addr <ip-addr> [counters | table]`	Specify the IP address of the AP.
`ipv4`	Displays datapath IPv4 user entries and statistics such as current entries, pending deletes, high water mark, maximum entries, total entries, allocation failures, invalid users, and maximum link length.
`ipv6`	Displays datapath IPv6 user entries and statistics such as current entries, pending deletes, high water mark, maximum entries, total entries, allocation failures, invalid users, and maximum link length.
`table`	User table statistics.

Parameter	Description
verbose	Shows datapath user table detail.
utilization	Displays the current CPU utilization of datapath CPUs by CPU ID. The output of the command includes CPU ID and CPU utilization during the past 1 sec, 4 sec, and 64 sec.
vlan	Displays VLAN table information such as VLAN memberships inside the datapath including Layer 2 tunnels which tunnel L2 traffic. The output fields of the command are as follows: ■ VLAN ■ Flags ■ Ingress RACL ■ Ports
ap-name <ap-name> [table]	Specify the name of the AP. Shows the datapath VLAN details.
ip-addr <ip-address> [table]	Specify the IP address of the AP. Shows the datapath VLAN details
pvst	Displays the datapath VLAN table entries.
table	Displays VLAN number, flag, port and datapath VLAN multicast entries.
vlan-mcast	Displays the datapath VLAN multicast table. The output of this command displays the datapath VLAN Multicast entries for the following fields: ■ VLAN ■ Destinations
ap-name <ap-name> [table]	Specify the name of the AP. Displays the datapath VLAN multicast table for the specific AP.
ip-addr <ip-addr> [table]	Specify the IP address of the AP. Displays the datapath VLAN multicast table for the specific IP address.
table	Displays datapath VLAN Multicast table entries.
wan-hc	Displays datapath WAN health check statistics. By default, combined statistics of all CPUs is shown.
<id>	Displays datapath WAN health check statistics by specified CPU ID. Valid platform CPU range may vary.
all	Displays datapath WAN health check statistics for all CPUs.
counters	Displays datapath WAN health check counters or statistics.
verbose	Displays datapath WAN health check detail.
web-cc [counters]	Displays web content classification table information. The output of this command includes but not limited to the following data columns:

Parameter	Description
	■ Rep ■ ContentID ■ TTL ■ Age Include the optional **counters** parameter to display the maximum number of entries allowed in the web content category table.
`wifi-reassembly`	Displays Wi-Fi reassembly counters including CPU, current entries, high water-mark, maximum entries, total entries, and allocation failures.
`<id>`	Displays Wi-Fi reassembly statistics by specified CPU ID. Valid platform CPU range may vary.
`all`	Displays Wi-Fi reassembly statistics for all CPUs, one by one.
`counters`	Displays Wi-Fi reassembly counters or statistics.
`verbose`	Displays Wi-Fi reassembly detail.
`wmm [counters]`	Displays VOIP statistics, including the number of uplink and downlink resets.

Usage Guidelines

Use the **show datapath** command to display various datapath statistics for debugging purposes.

MTU guidelines

- Since MTU discovery is not enforced between an AP and standby Switch in a HA setup, the value of the MTU to be passed through the tunnel is not updated.
- The size of the MTU can be set to 9000, depending on the network link and AP configuration.
- In case of a heartbeat tunnel, unanswered larger frames for MTU discovery are counted as heartbeat misses.

Example

The following example displays information on network specific ingress-queue counters:

```
+-----+-----+---------------------------------+---------+---------+-----+---------+---------+
|     |     |                                 |         |         |     |         |         |
|NAE  |LIFO | Description                     |Packets  |Threshold|Empty|Threshold|Empty    |
|Block|Queue|                                 |Received |count    |Count|Recovery |Recovery|
|     |     |                                 |         |         |     |         |         |
+-----+-----+---------------------------------+---------+---------+-----+---------+---------+
|    0|    0|ARP, HTTP(CAP), DHCP,DNS,NTP,SNMP|    61221|        0|    0|        0|        0|
|    0|    1|Default queue                    |   432106|        0|    0|        0|        0|

```

The output parameters of the **show datapath network ingress** command are explained in the following table:

Output Parameter	Description
LIFO Queue	The number of the queue. **NOTE:** Packets ingressing the Switch toward the NAE pass through one of 9 queues. Each queue holds a maximum 1000 packets at any one time which are taken from the queue by the NAE for forwarding. **NOTE:** The number of packets that each LIFO queue can hold is platform-specific and different for each queue. For example, 780 for Default queue 1 on OAW-40xx Series Switches and 1580 on OAW-4x50 Series Switches.
Description	The type of traffic assigned to the queue.
Packets received	The aggregate number of packets received since clearing the queues or restarting the controller.
Threshold Count	The number of times the input queue is below the built-in threshold value. Threshold counts are caused by Input queue congestion where the queue is depleted below the threshold value.
Empty Count	The number of times the Input queue is empty. Empty queue counts are caused by Input queue congestion where the queue is empty without any free descriptors.
Threshold Recovery	The number of times the Input queue is below the built-in threshold value, but recovered to a number above the threshold value. **NOTE:** In a stable system, the Threshold Recovery and Threshold Count will match.
Empty Recovery	The number of times the Input queue has recovered from empty to a normal condition to a built-in low threshold. In a stable system, the Empty Recovery and Empty Count will match.

The following example displays the discovery count table that keeps track of per client home agent discovery:

```
(host) [mynode] #show datapath mobility discovery-table
Datapath Mobility Discovery Count Table
-----------------------------------------------
Index     Valid    Version   Retry#    No-Response    Ack      Mac                Vlan
-------   ------   -------   ------    -----------    ------   --------------     -----
1         1         2        1         a              0        10:78:D2:FA:7D:38  74
```

The following example displays the datapath HA table information:

```
(host) [mynode] #show datapath mobility home-agent-table
Datapath Mobility Home Agent Table
----------------------------------
Switch IP
---------------
10.16.19.14
10.16.19.140
```

The execution of the following command displays the mobility multicast-group table that floods the multicast RA traffic to the roaming clients:

```
(host) [mynode] #show datapath mobility mcast-table
```

The following example displays the statistics of the datapath mobility:

```
(host) [mynode] #show datapath mobility stats
Datapath Mobility Stats
Mcast group entry alloc errors           : 0
```

```
Frames flooded over MMG (@HA)            : 0
Frames subjected to MMG (@FA)            : 0
Frames sent to roamed clients            : 0
HA Discovery failure to notify NACK      : 0
HA Discovery invalid DCT                 : 0
HA Discovery DCT allocation failed       : 0
HA Discovery Probes sent                 : 0
HA Discovery NULL bridge entry in DCT    : 0
HA Discovery failed to start             : 0
HA Discovery successfully started        : 0
HAT insert failure                       : 0
HAT insert success                       : 0
HAT delete failure                       : 0
HAT delete success                       : 0
```

The following example displays the mobility multicast VLAN table information:

```
(host) [mynode] #show ip mobile multicast-vlan-table
Mobility Multicast Vlan Table
-----------------------------
Client MAC           Home vlan  Current vlan
----------           ---------  ------------
40:2C:F4:36:16:07   501        501
```

The following example displays a list of tunnels.

```
(host) [mynode] #show datapath tunnel
+----+-------+-----------------------------------------------------+
|SUM/|       |                                     |               |

+----+------+-------------------------------------------------+
```

The output parameters of the **show datapath tunnel counters** command are explained in the following table:

Output Parameter	Description
`Current Entries`	Number of tunnels that are active in the system.
`Pending Deletes`	Number of tunnel entries that are marked to be deleted.
`High Water Mark`	Maximum number of active entries recorded under Current Entries.
`Maximum Entries`	Maximum number of tunnel entries that can be supported by the platform.
`Total Entries`	Total number of tunnel entries in the system.
`Allocation Failures`	Total number of tunnel entry allocation failures.

Output Parameter	Description
Max Link Length	Indicates the length of the linked list that has the maximum length in the hash table.
Current Tunnel FIB	Number of tunnel FIB entries that are recomputed and have a valid session entry and route cache entry.
Tunnel FIB Recompute	Number of invalid tunnel FIB entries for which tunnel FIB is recomputed.
Tunnel FIB forwarded	Number of packets that are forwarded through tunnel.
Tunnel FIB Egress Not Unicast	Number of packets whose bridge entry is not found or whose egress destination is not unicast.
GRE Encap drop	Number of packets that are dropped due to various reasons such as destination is not a tunnel, tunnel is not valid, packet length exceeded the allowed MTU, and so on.
GRE Encap fallback to session	Number of packets that are not permitted to be directly forwarded using tunnel FIB, but rather have to fall back to the session-route processing in the pipeline.
Tunnel FIB stale	Number of tunnel FIB entries that are invalid due to invalid session or tunnel version number not matching the session version number.

The following example displays a partial list of crypto parameter statistics.

```
(host) [mynode] #show datapath crypto counters
+----+-------+-------------------------------------------------------+
|SUM/|       |                                       |               |
|CPU |  Addr | Description                                     Value |
+----+-------+-------------------------------------------------------+

+----+-------+-------------------------------------------------------+
```

The following parameters appear in the output of the **show datapath crypto counters** command, and are useful for debugging purposes.

Parameter	Description
Crypto BadNPlus	Indicates a queue overrun in the output of the encryption circuit.
Crypto SendNPlusFailed	Indicates a queue overrun in the input of the encryption circuit.
IPSec Frag Failures	This counter increments when the AP detects a failure to fragment a frame before or after IPsec encryption.

Parameter	Description
IPSec Invalid Length	The inbound IPsec frame length is verified before and after decryption. If the frame length is found to be incorrect , this counter is incremented.
IKE Rate	When the managed device firewall receives a UDP packet, it determines if the packet is destined for an IKE (500) or IPsec_NATT (4500) port. This counter increments when the AP receives an initial IKE packet that has an 8-byte responder cookie defined all 0s.

The following example displays the output of the **show datapath frame** and **show datapath frame counters** commands.

```
(host) [mynode] #show datapath frame
+----+------+-------------------------------------------------------+
|SUM/|      |                                       |               |
|CPU | Addr | Description                                     Value |

+----+------+-------------------------------------------------------+
```

The following table provides description for some important output parameters of **show datapath frame** and **show datapath frame counters** commands:

Output Parameter	Description
Allocated Frames	Statically pre-allocated frames (for handling data-traffic) and dynamically allocated frames (for internal control-traffic).
Max Allocated Frames	Max watermark of Allocated Frames.
TX Underrun	Hardware counter if MAC was fetching packet data while packet is being transmitted.
TX Max Collision-Late Abort	Hardware counter if packet transmission was aborted due to maximum collision count exceeded (10 or 100 modes only) or a late abort.

Output Parameter	Description
Frame Denied L2-GRE Loop	Packets where Ingress and Egress are same (Enabled for Mobility feature only).
Unknown Unicast	Unknown dest-mac counter.
IPv6 Unknown Unicast	Unknown Unicast for IPv6 ethtype.
IP Datagrams Fragmented	IP datagrams fragmented when packet-length is greater than Tunnel MTU (Tunnel can be between Switches or Switch and AP).
WIFI AMSDU	Wi-Fi A-MSDU frames received from Wi-Fi clients.
WIFI AMSDU Aggregated	A-MSDU frames sent by Switch to Wi-Fi clients.
Runts Received	Packet length is less than minimum header length.
Station Not Data Ready	Packets received by a Switch from the APs or Stations before they got provisioned.
Station Inactive	Packets received by a Switch from the APs or Stations after they were inactive.
Association Throttle	Drops of APs or Stations Associate coming at high rate (e.g., during failover).
IKE Throttle	Drops of IKE packets coming at high rate.
IPv6 NA Spoofs	IPv6 Network Advertisement spoofs.
IPv6 NS Spoofs	IPv6 Network Solicitation spoofs.
EOP zero frames	Zero length frames.
CP Policed Frames	Packets bound to Control plane from Data plane dropped.
Seqno request failure	Wi-Fi Sequence no. request failed.
Heartbeats sent to SP	Tunnel Heartbeats punted to Slowpath (due to route-cache miss, etc.)
Heartbeats dropped by FP	Tunnel Heartbeats dropped in data plane.
POE descriptor freed	Internal counter
CP Enqueue Buffer Alloc Failure	Buffer allocation failures while sending packets to Control plane.
VOQ retries	Virtual Output Queues are packet exchanges between any two entities (CPU or Hardware offload engines) that have failed due to there not being any available credits. Packets are scheduled to be retried at a later point in time.
Seqno responses sent	The sequence number sent in response to sequence number requests used in Wi-Fi frames.
Dot1Q Discards	The Dot1Q discard counter may increase as a result of the following: 1. An incoming frame's VLAN does not match a port's configured VLAN. 2. A trunk port is not a member of the received frames's VLAN and the

Output Parameter	Description
	received frame is not an STP BPDU, CISCO BPDU or an LACP PDU. 3. A received frame has three or more stacked (QnQ tagged) VLANs. 4. A received frame contains more than one VLAN tag, however the expected number of VLAN tags is one. 5. An untagged access port is not a member of the VLAN in the received frame. 6. A station has sent a tagged VLAN frame. 7. A received LLDP frame has no multicast destination. 8. A received frame has no multicast destination in the VLAN group.
Dot1D Discards	The Dot1d discard counter may increase as a result of the following: 1. If a port is in STP blocking state, then received frames are dropped. 2. The tagged frame received on untagged port and dropped. 3. Received frame length is less than (Ethernet + VLAN) header length. 4. Frames that have been dropped due to bridge filtering. 5. Port has MUX flag set but NULL egress destination. 6. Frame drop either if destined for non-tunnel or to port channel or destination tunnel with no multicast configured. 7. Dropped frames addressed to BPDU MACs but not configured in the bridge table. 8. Dropped unexpected frames.

When the counter value is zero, the output parameter line is not displayed.

Some of the other output parameters that could be part of the **show datapath frame** command are as follows:

- IP Fragmentation Failures
- IP Jumbo Fragmentation Failures
- IP Jumbo IPSec Encrption Failures
- IP Reassembled Datagrams
- IP Reassembly overlaps
- IP Reassembly PAPI Failures
- IP Reassembly PAPI
- IP Reassembly Failures
- IPv6 Datagrams Fragmented
- IPv6 Fragmentation Failures
- IPv6 Reassembled Datagrams
- IPv6 Reassembly overlaps
- Invalid IP headers Received
- Invalid IPv6 headers Received
- Too Many IPv6 Ext. Hdrs Received
- xSec Frames Re-Assembled
- xSec Re-Assembly Failures
- Flood Frames
- Flood Frames Peak Value
- ARP Request Spoofs
- ARP Reply Spoofs
- Gratuitous ARP Spoofs
- IP spoofs
- CPU based seqno resp
- Frame Length Failure
- Packet send failed and will be retried later
- Invalid Tail Room DDMO
- Invalid mcast entry
- Jumbo Wi-Fi Frames
- Invalid ingress frames
- Invalid egress frames
- Invalid opcode
- Invalid Port
- Invalid Slot
- Invalid ACL
- Jumbo discards
- Jumbo recvd
- Jumbo xmits
- Jumbo drops
- Jumbo wire to wireless drops
- Jumbo xmits Failures
- Jumbo drops [Non Jumbo Port]
- Jumbo drops [Wireless client]
- Flooded Jumbo Frames
- Buffer Alloc Failure
- NAE Transmit Failure
- Total queued BWM packets
- Excessive ARP Requests
- Drops - DPI enforcement
- Drops - WEB CC enforcement
- IPv6 Vlan Discards
- Drops - Wireless client garps

The following is an example of the **show datapath compression** command output:

```
+----+------+-----------------------------------------------------+
|SUM/|      |                                     |               |
|CPU | Addr | Description                                   Value |
+----+------+-----------------------------------------------------+
```

```
|     | [00] | Compression Engine Present                          True |

```

If the policed counter is a non-zero value, it means excessive traffic of that type that has been dropped to avoid saturating the Control Plane, resulting in potential DoS.

The following table provides description for the contract IDs 1-10 as well as the corresponding firewall parameters:

Contract ID	Contract Description	Firewall Parameter
1	Rate limit Control-Plane-bound untrusted unicast packets. It is used to limit Web CC traffic to CP.	untrusted-ucast
2	Rate limit Control-Plane-bound untrusted multicast packets. It limits ACL logging, packet capture traffic.	untrusted-mcast
3	Rate limit Control-Plane-bound trusted unicast packets.	trusted-ucast
4	Rate limit Control-Plane-bound trusted multicast packets.	trusted-mcast

Contract ID	Contract Description	Firewall Parameter
5	Rate limit Control-Plane-bound routed packets.	route
6	Rate limit Control-Plane-bound GRE control-plane session mirrored packets.	sessmir
7	Rate limit Control-Plane-bound authentication-related packets.	auth
8	Rate limit Control-Plane-bound VRRP protocol packets.	vrrp
9	Rate limit Control-Plane-bound ARP protocol packets	arp-traffic
10	Rate limit Control-Plane-bound other Layer-2 or bridging packets - Non-ARP traffic.	l2-other

The following example displays the IPv6 route table entries of AP datapath in Spit-Tunnel forwarding mode for Remote APs:

```
(host)[mynode] #show datapath route ap-name ap303 ipv6
IPv6 Route Table Entries
------------------------

Flags: L - Local, P - Permanent,  T - Tunnel, I - IPsec, M - Mobile, A - ARP, D - Drop

```

Related Commands

Command	Description
datapath	This command configures datapath options.

Command History

Release	Modification
AOS-W 8.6.0.0	The following changes were introduced: ■ The **remote-user table** parameter was added. ■ The **ipv6** option was added to the **nexthop-list** sub-parameter. ■ The output of the **show datapath session ipv6** command was modified to display the next-hop list details, and includes the **NhlIdx**, **NhIdx**, and **NhlNhVer** columns. ■ The output of the **show datapath ipsec-map** command was modified to display **v6** value under **IP ver** column.
AOS-W 8.4.0.0	The following changes were introduced: ■ The output of the #show datapath tunnel ipv6 command was modified to include **B**, **G**, and **Y** flags. ■ The output of the **show datapath route ap-name <ap-name> ipv6** and **show datapath route-cache ap-name <ap-name> ipv6** commands was modified to display IPv6 route entries. ■ The **web-cc** and **counters** sub-parameters were added to **ipv6** parameter. ■ The output of the **show datapath session ipv6 web-cc** command was modified to display WebCC related entries for IPv6 sessions. ■ The **trusted-vlan** and **untrusted-vlan** sub-parameters were introduced in the **show datapath tunnel tunnel-id <id>** command.
AOS-W 8.2.0.0	The **netdest-id**, and **remote-device-table** parameters were added.
AOS-W 8.0.0.0	Command introduced.

show dds debug

```
show dds debug
global_object_db [peer <A.B.C.D> [rkey <rkey-id>]|peerv6 <X:X:X:X::X>]
message-stats
peers
rkey
replicaton <sources>
stats
```

Description

This command shows the dds debug information.

Syntax

Parameter	Description
`global_object_db`	DDS global object database.
`peer <A.B.C.D>`	Peer for the global object database.
`rkey <rkey-id>`	Replication key for the global object database.
`peerv6 <X:X:X:X::X>`	Set peer ipv6 address.
`message-stats`	Message statistics.
`peers`	Remote peers.
`replication`	Object replication.
`rkey <rkey-id>`	Replication keys
`stats`	Statistics of the DDS log

The output of this command includes the following parameters:

Parameter	Description
AP ■ Sync Request ■ Sync Response ■ Up ■ Down ■ Resps ■ Acl	■ Number of sync requests sent ■ Number of sync responses sent ■ Number of times an AP has come up ■ Number of times an has gone down ■ Number of response messages sent to the AP due to an AP up message ■ Number of ACLs
Station ■ Sync Request ■ Sync Response ■ Up ■ Down ■ Unknown	■ Number of sync requests sent to find all APs and stations that are connected ■ Number of sync responses received ■ Number of times a station (any station) connected to the AP ■ Number of times a station (any station) disconnected from the AP ■ Number of times a station attempted to start an EAP exchange before associating to an AP. In other words, the number of times the auth module saw the start of an EAP exchange before auth was notified that a station has associated an AP
EAP ■ RX Pkts ■ Dropped Pkts ■ TX Pkts	■ Number of EAP packets received ■ Number of EAP packets dropped (ignored) for any reason, such as bad packet, length, EAP ID mismatch, etc. ■ Number of EAP packets sent
WPA ■ Message-1 ■ Message-2 ■ Message-3 ■ Message-4 ■ Group Message-1 ■ Group Message-2 ■ Rx Failed ■ IE Mismatches ■ Key Exchange Failures	■ Number of WPA message-1s sent ■ Number of WPA message-2s sent ■ Number of WPA message-3s sent ■ Number of WPA message-4s sent ■ Number of WPA group message-1s sent ■ Number of WPA group message-2s sent ■ Number of WPA related EAP packets dropped for any reason ■ Number of WPA related EAP packets dropped because the station and Switch have a different perception of what the connection details are ■ Number of key exchange failures
WPA2 ■ Message-1 ■ Message-2 ■ Message-3 ■ Message-4 ■ Rx Failed ■ IE Mismatches ■ Key Exchange Failures	■ Number of WPA2 message-1s sent ■ Number of WPA2 message-2s sent ■ Number of WPA2 message-3s sent ■ Number of WPA2 message-4s sent ■ Number of WPA2 related EAP packets dropped for any reason ■ Number of WPA2 related EAP packets dropped because the station and Switch have a different perception of what the connection details are ■ Number of key exchange failures
Radius Accept	Number of RADIUS accepts
Station Deauths	Number of stations deaths

```

The output of this command includes the following parameters:

Parameter	Description
`Name`	Supplicant name.

Parameter	Description
MAC Address	Supplicant MAC address.
AP MAC Address	AP MAC address.
Status	Supplicant's status.
Unicast Cipher	Supplicant's unicast cipher.
Multicast Cipher	Supplicant's multicast cipher.
EAP-Type	Supplicant's EAP-Type.
EAPOL Starts	Number of EAPOL starts.
EAP ID Requests	Number of EAP ID requests.
EAP ID Responses	Number of EAP ID responses.
EAPOL Logoffs from station	Number of EAPOL logoffs from the station.
EAP pkts to the station	Number of EAP packets sent to the station.
EAP pkts from station	Number of EAP packets sent from the station.
Unknown EAP pkts from station	Number of unknown EAP packets sent from the station.
EAP Successes sent	Number of EAP successes sent.
EAP Failures sent	Number of EAP failures sent.
Station failed to respond	Number of times the station failed to respond.
Station NAKs	Number of station negative-acknowledgement characters.
Radius pkts to the server	Number of RADIUS packets set to the server.
Radius pkts from the server	Number of RADIUS packets sent from the server.
Server failed to respond	Number of times the server failed to respond.
Server rejects	Number of times ac connection was rejected by the server.
WPA/WPA2-Key Message1	Number of WPA message-1s sent
WPA/WPA2-Key Message2	Number of WPA message-2s sent.
WPA/WPA2-Key Message3	Number of WPA message-3s sent.
WPA/WPA2-Key Message4	Number of WPA message-4s sent.
WPA-GKey Message1	Number of WPA group message-1s sent.
WPA-GKey Message2	Number of WPA group message-2s sent.
ID of the last EAP request	The ID of the last EAP request.
Length of the last EAP request	The length of the last EAP request.

Parameter	Description
`ID of the last EAP response`	The ID of the last EAP response.
`Length of the last EAP response`	The length of the last EAP response.
`ID of the last radius request`	The ID of the last RADIUS request.
`Length of the last radius request`	The length of the last RADIUS request.
`ID of the last radius response`	The ID of the last RADIUS response.
`Length of the last radius response`	The length of the last RADIUS response.

show dot1x supplicant-info statistics

```
show dot1x supplicant-info statistics
```

Description

Shows the 802.1X statistics of the users.

Syntax

No parameters.

Example

Issue this command to display the 802.1X statistics of the users.

```
802.1X Statistics
-----------------
Mac                 Name    AP                  Auth-Succs  Auth-Fails  Auth-Tmout  Re-Auths
Supp-Naks  UKeyRotations  MKeyRotations
---                 ----    --                  ----------  ----------  ----------  --------  ---
------  -------------  -------------
00:15:00:26:f8:f5  user1   00:0b:86:8b:68:68  1           0           0           0         0
       0              0
Total:                                         2           0           0           0         0
       0              0

Station Entries: 1
```

The output of this command includes the following parameters:

Parameter	Description
MAC	Supplicant MAC address.
Name	Supplicant name.
AP	AP MAC address.
Auth-Succs	Number of successful authentications.
Auth-Fails	Number of authentication failures.
Auth-Tmout	Number of authentication timeouts.
Re-Auths	Number of reauthentications.
Supp-Naks	Number of negative-acknowledgement characters sent by the supplicant.
UKeyRotations	Number of unicast key rotations.
MKeyRotations	Number of multicast key rotations.

show dot1x watermark

```
crypto-local
show dot1x watermark
   history
   table {active|pending}
```

Description

Use this command under the guidance of Alcatel-Lucent support to view information about the table that contains 802.1X sessions being processed.

Syntax

Parameter	Description	Range	Default
`history`	Displays all historical sessions in the 802.1X session queue.	—	—
`table {active|pending}`	Table types: ■ **active**: Displays all current active sessions in the 802.1X queue and the corresponding user-age. ■ **pending**: Displays all pending sessions in the 802.1X queue, the duration for which the user is pending in the queue, and the corresponding user-age.	—	—

show dpi

```
show dpi
application
   name
   all
   category <name>
   custom-app <name>
global-bandwidth-contract
   all
   category <name>
   custom-app <name>
custom-app
   all
   string
```

Description

Shows applications and application categories that are configured for DPI. It also shows DPI global bandwidth contracts by application or application category.

Syntax

Parameter	Description
`name`	Name of the application.
`all`	Shows all applications.
`category <name>`	Shows all applications within a category.
`custom-app <name>`	Shows all custom applications.
`global-bandwidth-contract`	Shows the DPI global bandwidth contracts.
`all`	Shows all bandwidth contracts.
`app <name>`	Shows bandwidth contracts by application name.
`appcategory <name>`	Shows bandwidth contracts by application category name.
`custom-app`	Show custom applications.
`all`	Show all applications.
`string`	Name of the application to show.

Example

The output of the following command shows custom applications by name, ID, application category, and default ports that are configured for DPI.

```
(host) (config) #show dpi application all
Applications
------------
Name               App ID  App Category         Default Ports              Applied
----               ------  ------------         -------------              -------
01net              948     web                  tcp 80                     0
```

```
050plus             1123    audio-video         tcp 80 443              0

show esi groups

```
show esi groups [{group-name <groupname>|{ping-name <ping-name>}]
```

Description

Show ESI group information.

Syntax

Parameter	Description
group-name <groupname>	View the facility used when logging messages into the remote syslog server.
ping-name <ping-name>	Enter the name of a set of ping values to how the names of ESI groups using that set of ping attributes. Define a set of ESI ping values using the command esi ping.

Usage Guidelines

The ESI parser is a mechanism for interpreting syslog messages from third party appliances such as anti-virus gateways. Use this command to view configured ESI server groups.

Example

This example below displays the name of each configured ESI group, including its ping definitions and ESI server.

```
(host) #show esi groups

ESI Group Table
---------------
Name        Tunnel ID  Ping       Flags  Servers
----        ---------  ----       -----  -------
anything    0x1042     pingset_1 C       0
cupertino   0x1043     -          C       0
Flags:
  C:Datapath Download complete
```

show esi parser

```
show esi parser domains|rules|stats
```

Description

Show ESI parser information.

Syntax

Parameter	Description
`domains`	Show ESI parser domain information.
`rules`	Show ESI parser rule information.
`stats`	Show ESI parser rule stats.

Usage Guidelines

The ESI parser is a generic syslog parser on the Switch that accepts syslog messages from external third-party appliances such as anti-virus gateways, content filters, and IDS. It processes syslog messages according to user-defined rules and takes configurable actions on the corresponding system users.

ESI servers are configured into domains to which ESI syslog parser rules are applied.

Use the **`show esi parser domains`** command to show ESI parser domain information.

Example

The ESI Parser Domain table in the example below shows that the Switch has two ESI domains and two ESI servers.

```
(host) [mynode] (config) #show esi parser domains

ESI Parser Domain Table
-----------------------
Domain          ESI Servers    Peer Switches
------          -----------    -----------------
corp_domain     172.21.5.50    10.3.132.14
remote_domain   192.84.66.30

Total number of servers configured: 2
```

show esi ping

```
show esi ping [ping-name <ping-name>]
```

Description

Show settings for ESI ping health check attributes.

Syntax

Parameter	Description
`ping-name <ping-name>`	Include the optional **ping-name <ping-name>** parameters to display settings for one specified set of ping settings.

Example

This example below shows that the Switch has three defined sets of ping attributes.

```
(host) #show esi groups

ESI Ping Table
--------------
Name         Frequency (sec)  Timeout (sec)  Retry Count  ID  Num Groups
----         ---------------  -------------  -----------  --  ----------
ping_att1                         5                2             2            0   1
ESIping                                  5                2              2            1   0
ESIping2                                 50000            2              2            2   2
```

The output of this command includes the following information:

Column	Description
`Name`	Name of a group of ping settings.
`frequency`	Specifies the ping frequency in seconds.
`timeout`	Specifies the ping timeout in seconds.
`retry-count`	Specifies the ping retry count
`ID`	ID number assigned to the ping attributes when that set of attributes was defined.
`Num Groups`	Number of ESI groups to which this set of ping attributes is assigned.

Related Commands

Platforms	Licensing

show esi servers

```
show esi servers [{group-name <groupname>|{server-name <server-name>}]
```

Description

Show configuration information for ESI servers.

Syntax

Parameter	Description
group-name <groupname>	Include this optional parameter to display information for all ESI servers assigned to a specific ESI group.
server-name <server-name>	Specify an ESI server name to view configuration information for just that server.

Usage Guidelines

By default, this command displays configuration settings for all ESI servers. You can include the name of an ESI group to view servers assigned to just that group, or specify a server name to view information for that server only.

Example

This example below displays configuration details for the ESI server name **forti_1**.

```
(host) #show esi servers server-name forti_1

ESI Server Table
----------------
Name     Trusted IP    Untrusted IP  Trusted Port Untrusted Port Group  Mode   NAT Port  ID
----     ----------    ------------  ------------ -------------- -----  ----   --------  --
forti_1  10.168.173.2  10.168.171.3  -/-/-          -/-/-        default route  0         4

Flags
-----
U

Flags:
  C :Datapath Download complete
  U :Server Up
  D :Server Down
  PT:Trusted Ping response outstanding
  PU:Untrusted Ping response outstanding
  HT:Health Check Trusted IP
  HU:Health Check Untrusted IP
  FT:Trusted Ping failed
  FU:Untrusted Ping failed
```

The output of this command includes the following information:

Column	Description
Name	Name of the ESI server.
Trusted IP	Displays the server IP address on the trusted network. As an option, you can also enable a health check on the specified address
Untrusted IP	Displays the server IP address on the untrusted network. As an option, you can also enable a health check on the specified address
Trusted Port	Shows the slot and port connected to the trusted side of the ESI server in the format <slot>/<module>/<port>.
Untrusted Port	Shows the slot and port connected to the untrusted side of the ESI server in the format <slot>/<module>/<port>.
Group	Name of the ESI group to which this server is assigned. If the server has not yet been assigned to a group, this column will be blank.
Mode	Specifies the ESI server mode of operation: bridge, nat, or route
Nat Port	Displays the NAT destination TCP or UDP port.
ID	ID number assigned to the server when it was first defined.
Flags	This data column displays any flags associated with this server. The flag key appears below the ESI Server Table.

show est profile

```
show est profile {default|<profile-name>}
```

Description

Displays the information of the activated EST profiles on the device.

Syntax

Parameter	Description
<profile-name>	Name of this instance of the profile.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The output of this command shows the default EST profile of a single managed device:

```
(host) [mynode] # show est profile default
EST Profile "default"
---------------------
Parameter              Value
---------              -----
Server Host                  N/A
Server Port                  443
Challenge password           N/A
Arbitrary label              N/A
Server's CA Cert Name        N/A
Organizational Unit Name     N/A
Arbitrary enrollment label   /ca:7
Arbitrary reenrollment label /ca:7
Username                     N/A
Password                     N/A
```

Related Commands

show est status

```
show est status [all]
```

Description

Displays the information of the activated EST profiles along with the current status of the EST information on the device.

Syntax

Parameter	Description
`all`	Displays the activated EST profiles and the current status of the EST related information of the all switches.

Usage Guidelines

show est status—Use this command to view the current status of the EST related information on the device.

show est status all—Use this command to view the current status of the EST related information of all the switches.

Example

The output of this command shows the current EST status of a single managed device:

```
(host) [mynode] # show est status
EST STATUS
----------
Profile Name       : ssetty26_new
Server Host        : 10.20.21.26
Server Port        : 8443
Enrollment status  : Re-enrolled
Arbitrary label enrollment : /ca:7
Arbitrary label reenrollment : /ca:7
Expiry status      : EXPIRING SOON
Valid from         : 2017-08-01 06:02:30
Valid till         : 2017-08-02 06:02:30
Re-enrollment due  : 2017-08-02 00:02:30
```

The output of this command shows the current EST status of all the switches:

```
(host) [mynode] # show est status all
EST Status for All Switches
---------------------------

show faults

```
show fault [history]
```

Description

Display a list of faults, which are any problematic conditions of the AOS-W software or hardware.

Syntax

Parameter	Description
history	Include this parameter to display a history of faults cleared by the managed device or the operator.

Usage Guidelines

A managed device can maintain a list of up to 100 faults. Once 100 faults have been logged, any faults arising after that are dropped. The managed device maintains a history of the last 100 faults that have cleared. Every time a new fault clears clear, the oldest fault in the fault history is purged from the list.

Example

This example below shows all active faults the managed device, including the time the fault occurred, the fault ID number, and a description of the problem.

```
(host) [mynode] (config) #show faults

Active Faults

Related Commands

Command	Description
clear	Manually clear a single fault by specifying the fault ID number, or clear all faults by including the **all** parameter.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable and Config mode on managed devices.

show file syncing profile

```
show file syncing profile
```

Description

This command displays the configuration the file syncing profile.

Syntax

None.

Usage Guidelines

Execute this command to view the file syncing profile.

Example

The following example shows the output of **show file syncing profile**.

```
(host) [mynode] (config) #show file syncing profile
File syncing profile
--------------------
Parameter      Value
---------      -----
File syncing   Enabled
sync time      30
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licenses	Command Mode
All platforms	Base operating system.	Enable mode on Mobility Master.

show fips

```
show fips
```

This command applies only to the FIPS version of AOS-W.

Description

Displays FIPS mode of operation status as enabled or disabled.

Syntax

No parameters.

Example

The output of this command shows that the FIPS mode of operation is currently enabled.

```
(host) [mynode] (config) # show fips

FIPS Settings:
--------------
Mode  Enabled
```

Related Commands

Command	Description
fips	This command enables and disables the FIPS mode of operation.

show firewall

```
show firewall [debug-route][dns-names]
```

Description

Display a list of global firewall policies and policy details.

Syntax

Parameter	Description
`debug-route`	Show global route debug settings, including the route protocol (IPv4/IPv6) and IP address.
`dns-names`	Display a list of DNS names and IP addresses used in firewall commands.

Examples

Include the optional **dns-names** parameter to list the DNS names used in firewall policies currently configured on the Switch.

```
(host) [mynode] #show firewall dns-names
FW DNS names
------------

Rate limit CP trusted ucast traffic         Enabled           65535 ps
Rate limit CP trusted mcast traffic         Enabled           1953 pps
Rate limit CP route traffic                 Enabled           976 pps
Rate limit CP session mirror traffic        Enabled           976 pps
Rate limit CP auth process traffic          Enabled           976 pps
Deny inter user traffic                     Disabled
Prohibit ARP Spoofing                       Disabled
Enforce bw contracts for broadcast traffic  Disabled
Multicast automatic shaping                 Disabled
Stall Detection                             Enabled
Enforce TCP Sequence numbers                Disabled
AMSDU Rx                                    Enabled
Jumbo Frames                                Disabled
Session-tunnel FIB                          Enabled
Prevent DHCP exhaustion                     Disabled
Deny source routing                         Disabled
Immediate Freeback                          Disabled
DPI Classification                          Enabled [Cfg: enabled, PEF license: installed]
Web Content Classification                  Enabled
Web Content Cache Miss Drop                 Disabled
Optimize Duplicate Address Detection frames Enabled
```

The output of this command includes the following information:

Parameter	Description
`Enforce TCP handshake before allowing data`	If enabled, this feature prevents data from passing between two clients until the three-way TCP handshake has been performed. This option should be disabled when you have mobile clients on the network as enabling this option will cause mobility to fail. You can enable this option if there are no mobile clients on the network.
`Prohibit RST replay attack`	If enabled, this setting closes a TCP connection in both directions if a TCP RST is received from either direction.
`Deny all IP Fragments`	If enabled, all IP fragments are dropped.
`Prohibit IP Spoofing`	When this option is enabled, source and destination IP and MAC addresses are checked; possible IP spoofing attacks are logged and an SNMP trap is sent.

Parameter	Description
Monitor ping attack	If enabled, the Switch monitors the number of ICMP pings per second. If this value exceeds the maximum configured rate, the Switch will register a denial of service attack.
Monitor TCP SYN attack	If enabled, the Switch monitors the number of TCP SYN messages per second. If this value exceeds the maximum configured rate, the Switch will register a denial of service attack.
Monitor IP sessions attack	If enabled, the Switch monitors the number of TCP sessions requests per second. If this value exceeds the maximum configured rate, the Switch will register a denial of service attack sessions.
Deny inter user bridging	If enabled this setting prevents the forwarding of Layer-2 traffic between wired or wireless users. You can configure user role policies that prevent Layer-3 traffic between users or networks but this does not block Layer-2 traffic.
Log all received ICMP errors	Shows if the Switch will log received ICMP errors.
Per-packet logging	If active, and logging is enabled for the corresponding session rule, this feature logs every packet.
Blacklist Grat ARP attack client	If enabled, blacklist clients exceeding the Gratuitous ARP attack rate.
Allow tri-session with DNAT	Shows if the Switch allows three-way session when performing destination NAT.
Disable FTP server	If active, this feature disables the FTP server on the Switch.
Blacklist ARP attack client	If enabled, blacklist clients exceeding the ARP attack rate.
Monitor ARP attack	Shows the status of the ARP attack monitor.
Monitor Gratuitous ARP attack	Shows the status of the Gratuitous ARP attack monitor.
GRE call id processing	If active the Switch creates a unique state for each PPTP tunnel.
Session Idle Timeout	Shows if a session idle timeout interval has been defined.
WMM content enforcement	If traffic to or from the user is inconsistent with the associated QoS policy for voice, this feature reclassifies traffic to best effort and data path counters are incremented.
Session VOIP Timeout	If enabled, a idle session timeout is defined for sessions that are marked as voice sessions.

Parameter	Description
Only allow local subnets in user table	If enabled, the Switch only adds IP addresses which belong to a local subnet to the user table.
Monitor/police CP attacks	If enabled, the Switch monitors a misbehaving user's inbound traffic rate. If this rate is exceeded, the Switch can register a denial of service attack.
Rate limit CP untrusted ucast traffic	Shows the inbound traffic rate
Rate limit CP untrusted mcast traffic	Displays the untrusted multicast traffic rate limit.
Rate limit CP trusted ucast traffic	Displays the trusted unicast traffic rate limit.
Rate limit CP trusted mcast traffic	Displays the trusted multicast traffic rate limit.
Rate limit CP route traffic	Displays the traffic rate limit for traffic that needs generated ARP requests.
Rate limit CP session mirror traffic	Displays the traffic rate limit for session mirrored traffic forwarded to the Switch.
Rate limit CP auth process traffic	Displays the traffic rate limit for traffic forwarded to the authentication process.
Deny inter user traffic	If enabled, this setting disables traffic between all untrused users. You can configure user role policies that prevent Layer-3 traffic between users or networks but this does not block Layer-2 traffic.
Prohibit ARP Spoofing	When this option is enabled, possible arp spoofing attacks are logged and an SNMP trap is sent.
Enforce bw contracts for broadcast traffic	If enabled, bw contracts are applied ot local subnet broadcast traffic.
Multicast automatic shaping	If enabled, enables multicast optimization and provides excellent streaming quality regardless of the amount of VLANs or IP IGMP groups that are used.
Stall Detection	If enabled, triggers datapath crash on stall detection. Applies to the to OAW-4x50 SeriesSwitches only.
Enforce TCP Sequence numbers	If enabled, prevents data from passing between two clients until the three-way TCP handshake has been performed.
AMSDU Rx	AMSDU packets are dropped if this option is enabled.
Jumbo Frames	If enabled, supports up to 9216 bytes of payload on the Switch.
Session-tunnel FIB	Enables session tunnel based forwarding.

Parameter	Description
`Prevent DHCP Exhaustion`	If enabled, this option checks for DHCP client hardware address against the packet source MAC address. This command checks the frame's source-MAC against the DHCPv4 client hardware address and drops the packet if it does not match. This feature prevents a client from submitting multiple DHCP requests with different hardware addresses, thereby preventing DHCP pool depletion.
`Deny Source Routing`	If enabled, forwarding of IP frames with source routing with the source routing options set is disallowed.
`Immediate Freeback`	If enabled, immediately frees buffers on OAW-4x50 Series Switches. Do not enable this option unless instructed to do so by a technical support representative.
`DPI Classification`	If enabled, performs deep packet inspection.
`Web Content Classification`	If enabled, allows web content classification for all HTTP traffic. Default: disabled
`Web Content Cache Miss Drop`	If enabled, allows the Switch to drop any packets that do not match any web content category or reputation levels in the Switch's internal web content cache. Default: disabled
`Optimize Duplicate Address Detection frames`	Reduce flooding of IPv4 Gratuitous ARPs/IPv6 Duplicate Address Detection frames onto wireless clients. Default: enabled

    no           -        -         down notification
```

The output of this command includes the following information:

Parameter	Description
IP	The IP address of the managed device
Master Cookie	The cookie information on Mobility Master that is used to communicate with the LMS.
Master Seq	The sequence number used by Mobility Master to sync up with the LMS. This tracks the number of times Mobility Master has communicated with the LMS.
LMS Cookies	The cookie information on the LMS that is used to communicate with Mobility Master.
LMS Seq	The sequence number used by the LMS to sync up with Mobility Master.This tracks the number of times the LMS has communicated with Mobility Master.

Parameter	Description
`Activity`	The time at which the last activity happened on the LMS.
`Status`	Indicates if the status of the LMS is up or down.
`Msg in Prog`	Indicates if an active communication is happening between the LMS andMobility Master. It can be Yes or No. If it is yes, then the Msg Len and Attempt fields are set.
`Msg Len`	The length of the message that Mobility Master is syncing with the LMS.
`Attempts`	Number of times Mobility Master has attempted to sync with the LMS.
`Last Reset Reason`	Indicates the reason for last reset.

Related Commands

Command	Description
ap gap-db ___	Resynchronize an AP status on a managed device and Mobility Master.

show global-user-table

```
show global-user-table count|list
```

Description

This command displays a count of global user based on the specified criteria or displays the list of users matching the given criteria.

Syntax

Parameter	Description
`count`	Show the number of users matching the given criteria
`current-switch`	Match IP address of the switch where the user is currently associated
`authentication-method`	Count users matching the specified authentication method
`role`	Count users matching the specified role
`bssid`	Count users matching the specified BSSID
`essid`	Count users matching the specified ESSID. If the ESSID includes spaces, you must enclose it in quotation marks.
`ap-name`	Count users matching the specified AP name
`phy-type`	Count users matching the specified Phy type
`age`	Count users matching the specified age
`list`	Show users matching the given criteria
`ap-name`	Lists users matching the specified AP name
`authentication-method`	Lists the users matching the specified authentication method
`bssid`	Lists the users matching the specified BSSID
`current-switch`	Match IP address of the switch where the user is currently associated
`devtype`	Lists the users matching device type
`essid`	Lists the users matching the specified ESSID. If the ESSID includes spaces, you must enclose it in quotation marks.
`ip`	Match IP address
`mac-addr`	Match MAC address
`name`	Match name
`not`	Show users that do not satisfy the given criteria
`or`	Show users that satisfy any of the given condition

Parameter	Description
`phy-type`	Match PHY type
`role`	Match role
`rows`	Show certain rows
`start`	Show user table starting from the specific row

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode

show gsm channel-matrix

```
show gsm channel-matrix
```

Description

Displays the channels with Publisher and Subscriber Information.

Example

The following is a sample output of this command:

```
(host) [mynode] (config) #show gsm channel-matrix
GSM Channel Matrix
------------------
Channel              Publishers                    Subscribers

Description

This command displays status, event ring channel information, and trace events for channel and assignment related features like cluster, LLDP, tunneled nodes, UCC, and so on.

Syntax

Parameter	Description
`Channel`	Channel Name
`ag_user`	AirGroup User Channel
`ale_sta`	Analytics and Location Engine Data
`all`	All GSM Channels
`amon_registration`	AMON messages Registration Data
`ap`	AP Channel
`application_status`	Application Status Data
`blacklist`	Blacklist Channel
`bss`	BSS Channel
`bucket_map`	STA Hash Bucket to UAC map
`cac_usage`	Call Admission Control Usage Data
`cluster`	Switch Cluster Info
`cluster_aac`	Cluster AAC Assignment Data
`cluster_ap`	Cluster AP Data
`cluster_bss`	Cluster BSS Data
`cluster_sta`	Cluster STA Data
`cluster_tunneled_node`	Cluster Tunneled Node Channel.
`dds_peer`	DDS Peer Info
`dev_id_cache`	Device Id Cache Channel
`device_config`	Device Config
`device_lclist`	Device Lclist
`ha_info`	HA Info Channel
`ip_probe`	MIP Proxy Info
`ip_user`	IP User Channel

Parameter	Description
ipsec_tunnel_info	ipsec_tunnel_info Channel
key_cache	Key Cache Channel
license_keys	License Keys Channel
lldp_chassis_info	LLDP Chassis Info Channel
lldp_info	LLDP Info Channel
mac_user	Layer 2 MAC user Channel
mip_proxy	MIP Proxy Info
mip_tunnel	Mobileip tunnel control information.
named_vlan_info	Named vlans information.
pmk_cache	PMK Cache Channel
port_info	Port Info Channel
radio	Radio Channel
rap_whitelist	RAP Whitelist Channel
remote_ip_user	Remote IP User Data
rep_key	Replication Key Channel
sectun	Secured Tunnel Channel
service_ctrl_info	Service Control Info
sta	STA Channel
sys_racl	sys_racl Data
tunneled_node	Tunneled Node Channel.
tunneled_user	Tunneled User Channel.
ucc_client	UCC Client Channel
ucc_session	UCC Session Channel
user	User Channel
v4_dhcp_pool	v4 DHCP Pool Info
via_user	VIA VPN users information
vlan_info	VLAN Info Channel
web_cc_info	Web content classification Info Channel
wired_ap	Wired AP Channel

Parameter	Description
`rkey`	replication key
`assignment`	current Replication Key assignment
`rap_public_ip`	Displays the public IP address of the Remote AP cluster configured behind NAT

Example

You can use the following show command to check the status of the tunneled node:

```
(host) [mynode] #show gsm debug channel tunneled_node status
  GSM Channel status for Channel:TUNNELED_NODE
  CSM:: Key = 0X1BB7, Size = 357612 B
  DSM:: Base Key = 0X1BB8, Size = 524288 B Max number of segments = 1 Segments created = 1
  DSM:: In current segment: free_slots = 3040
  Object Size = 165 B, Key Size = 6 B
  Max number of Objects = 2048
  Number of Allocated Objects = 0
  Number of Objects in use = 0
  Producers of TUNNELED_NODE channel are
  tunneled_node_mgr
  Subscribers of TUNNELED_NODE channel are ---
  stm
  cluster_mgr
```

Description

This command displays status, event ring channel information, and trace events for specific channel and assignment related features like cluster, LLDP, tunneled nodes, UCC, and so on.

Syntax

Parameter	Description
`Channel`	Channel Name
`ag_user`	AirGroup User Channel
`ale_sta`	Analytics and Location Engine Data
`amon_registration`	AMON messages Registration Data
`ap`	AP Channel
`application_status`	Application Status Data
`blacklist`	Blacklist Channel
`bss`	BSS Channel
`bucket_map`	STA Hash Bucket to UAC map
`ccm_state`	Centralized Configuration Module state
`cluster`	Switch Cluster Info
`cluster_aac`	Cluster AAC Assignment Data
`cluster_ap`	Cluster AP Data
`cluster_bss`	Cluster BSS Data
`cluster_sta`	Cluster STA Data
`cluster_tunneled_node`	Cluster Tunneled Node Channel.
`dds_peer`	DDS Peer Info
`dev_id_cache`	Device Id Cache Channel
`device_config`	Device Config
`device_lclist`	Device LC list
`device_unprov`	Unprovisioned device
`ha_info`	HA Info Channel
`ip_probe`	MIP Proxy Info
`ip_user`	IP User Channel

Parameter	Description
ipsec_tunnel_info	ipsec_tunnel_info Channel
key_cache	Key Cache Channel
license_keys	License Keys Channel
lldp_chassis_info	LLDP Chassis Info Channel
lldp_info	LLDP Info Channel
mac_user	Layer 2 MAC user Channel
mip_proxy	MIP Proxy Info
mip_tunnel	Mobileip tunnel control information.
named_vlan_info	Named vlans information.
ofa_port	OpenFlow Port Channel
pmk_cache	PMK Cache Channel
port_info	Port Info Channel
radio	Radio Channel
rap_whitelist	RAP Whitelist Channel
rep_key	Replication Key Channel
sectun	Secured Tunnel Channel
service_ctrl_info	Service Control Info
split_tunnel	Split Tunnel
sta	STA Channel
sys_racl	sys_racl Data
tunneled_node	Tunneled Node Channel.
tunneled_user	Tunneled User Channel.
ucc_client	UCC Client Channel
ucc_session	UCC Session Channel
user	User Channel
vlan_info	VLAN Info Channel
vrrp_info	Virtual Router Redundancy Protocol Information
web_cc_info	Web content classification Info Channel
wired_ap	Wired AP Channel

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

show guest-access-email

```
show guest-access-email
```

Description

This command shows a guest access email profile configuration. The guest access email process sends email to either the guest or the sponsor whenever a guest user account is created or when the Guest Provisioning user manually sends email from the GPP.

Syntax

No parameters.

Usage Guidelines

Issue this command to show the current guest access email profile parameters. The Parameter and **Value** columns show the configured SMTP server and SMTP ports. that process guest email.

```
(host) [mynode] (config) #show guest-access-email

Guest-access Email Profile
--------------------------
Parameter    Value
---------    -----
SMTP Server  10.1.1.4
SMTP Port    25
```

show ha ap

```
show ha ap
   information {ip-addr <ip-addr>|ip6-addr <ip6-addr>}
   table
```

Description

This command displays information about APs using the HA feature.

Syntax

Parameter	Description

`information`
`ip-addr <ip-addr>`
`ip6-addr <ip6-addr>`
	Issue this command under the supervision of Alcatel-Lucent support to troubleshoot the HA feature.

`table`	Display the HA AP table to view information about APs configured to use the HA feature.

Usage Guidelines

The HA features work across Layer-3 networks, so there is no need for a direct Layer-2 connection between in a high-availability group When the AP first connects to its active , the active provides the IP address of a standby , and the AP attempts to establish a tunnel to the standby to the standby . If an AP fails to connect to the first standby , the active will select a new standby for that AP, and the AP will attempt to connect to that standby .

An AP will failover to its backup if it fails to contact its active through regular heartbeats and keepalive messages, or if the user manually triggers a failover using the WebUI or CLI.

Examples

The following command displays the HA table for the HA group **default**.

```
(host) [mynode] (config) #show ha ap table
HA AP Table
-----------
AP           IP-Address    MAC-Address         AP-flags  HA-flags
--           ----------    -----------         --------  --------
ard          10.3.31.245   6c:f3:7f:c6:72:c0   LU
arr          10.3.31.222   d8:c7:c8:c0:02:7c   LU
kalap105-2   10.3.31.253   00:24:6c:c0:22:6b   LU        S
Total Num APs::3
Active APs::2
Standby APs::1
AP Flags: R=RAP; S=Standby; s=Bridge Split VAP L=Licensed; M=Mesh, U=Up
HA Flags: S=Standby, C=Standby connected, L=LMS, F=Sent Failover Request to AP,
H=AP flagged for Inter Controller Heartbeat
```

show ha group

```
show ha
   group-membership
   group-profile [<profile>]}
```

Description

This command displays HA profile settings and shows the HA group to which the managed device is currently assigned.

Syntax

Parameter	Description
`group-membership <profile>`	Name of the HA group to which the managed device should be a member.
`group-profile [<profile>]`	Display a list of all HA groups, or include the optional <profile> parameter to display configuration settings for the specified profile.

Usage Guidelines

The HA feature supports redundancy models with an active managed device pair, or an active or standby deployment model with one backup managed device supporting one or more active managed device. Each of these clusters of active and backup managed device comprises a HA group. Note that all active and backup managed device within a single HA group must be deployed in a single Mobility Master - managed device topology. The HA feature works across Layer-3 networks, so there is no need for a direct Layer-2 connection between managed device in a HA group.

Examples

The following command shows that the managed device from which the command was issued is a member of the HA group ha-group2.

```
(host) [mynode] (config) #show ha-group-member
Member of HA group :ha-group2
```

The example below shows that the managed device has two configured HA group profiles. The **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
HA group information List
-------------------------
Name      Profile Status
----      --------------
default
new
Total:2
```

show ha heartbeat counters

```
show ha heartbeat counters
```

Description

This command displays statistics for the HA extended managed device capacity feature.

Syntax

No parameters.

Usage Guidelines

The HA inter-managed device heartbeat feature allows for faster AP failover from an active managed device to a standby managed device, especially in situations where the active managed device reboots or loses connectivity to the network.

The inter-managed device heartbeat feature works independently from the AP mechanism that sends heartbeats from the AP to the managed device. If enabled, the inter-managed device heartbeat feature supersedes the AP's heartbeat to its managed device. As a result, if a standby managed device detects missed inter-managed device heartbeats from the active managed device, it triggers its standby APs to failover to the standby managed device, *even if those APs have not detected any missed heartbeats between the APs and their active managed device*. Use this feature with caution in deployments where the active and standby managed device are separated over high-latency WAN links.

When this feature is enabled, the standby managed device starts sending regular heartbeats to an AP's active managed device as soon as the AP has an UP status on the standby managed device. By default, the standby managed device sends heartbeat messages every 100ms. If the active managed device becomes unreachable for the number of heartbeats defined by the heartbeat threshold (by default, 5 missed heartbeats), the standby managed device immediately detects this error, and informs the APs using the standby managed device to fail over from the active managed device to the standby managed device .

This feature is disabled by default. It can be used in conjunction with the HA state synchronization feature only in topologies that use a single active and standby managed device, or a pair dual-mode active managed device that act as standby managed device for each other. HA inter-managed device heartbeats can be enabled and configured in the HA group profile using the WebUI or CLI.

Examples

The following command displays HA heartbeat statistics for the HA group **default**.

```
(host) [mynode] (HA group information "default") #show ha heartbeat counters

Heartbeat stats
---------------
Controller IP  Active Reference Count    Total Heartbeat Sent   Total Heartbeat Received
-------------  ----------------------    --------------------   ------------------------
172.14.0.2     1                         101                    101

Last Missed Heartbeat (Count) Time
----------------------------------
0
```

The output of this command includes the following parameters:

Parameter	Description
`IP`	IP address of the managed device from which this command was issued.
`Active Reference Count`	Number of APs that are using that standby managed device as their active managed device.
`Total HeartBeat Sent`	Total number of heartbeats sent by the managed device.
`Total Heartbeat REceived`	Total number of heartbeats received by the managed device.
`Last Missed Heartbeat (count) time`	Timestamp showing when the last heartbeat sent was not received, as well as the number of heartbeats that failed to be sent.

show ha oversubscription statistics

```
show ha oversubscription statistics
```

Description

This command displays statistics for the HA extended managed device capacity feature

Syntax

No parameters.

Usage Guidelines

A managed device acting as a standby managed device can oversubscribe to standby APs by up to four times that managed device's rated AP capacity, as long as the tunnels consumed the standby APs do not exceed the maximum tunnel capacity for that standby managed device.

Feature Requirements

All managed device using this feature must be deployed in a master-local topology where centralized licensing is enabled on the active and standby managed device. If centralized licensing is disabled, the standby AP oversubscription feature are disabled also. Standby managed device oversubscription and the HA state synchronization features are mutually incompatible cannot be be enabled simultaneously. If your deployment uses the state synchronization feature, you must disable it before you enable standby managed device oversubscription.

Standby managed device Capacity

The following table describes the AP oversubscription capacity maximum supported tunnels and for managed device that support this feature.

Switch Model	Standby AP Capacity	Maximum Tunnels Supported
OAW-4550	4x rated AP capacity	16384 tunnels
OAW-4650	4x rated AP capacity	32768 tunnels
OAW-4750	4x rated AP capacity	65536 tunnels

To determine the number of standby tunnels consumed by APs on each active managed device, multiply the number of APs on the active managed device by the number of BSSIDs per AP. As an example, consider a deployment with four active OAW-4550 managed device that each have 512 APs with 8 BSSIDs. The APs on each active managed device consume (512 * 8) tunnels, for a combined total of 16,384 tunnels. A single OAW-4550 managed device using the standby managed device oversubscription feature can act as the standby managed device for all four active managed device in this example, because this topology is within the 4x rated AP capacity limit and maximum tunnel limit for the an OAW-4550 managed device model.

If the network administrator later changed all the APs in this deployment to support 10 BSSIDs, each active managed device would use (512 * 10) tunnels, for a combined total of 20,480 tunnels on the four active managed device. The tunnels required by the APs on the active managed device would then exceed the

maximum tunnel limit for the standby managed device, so the standby managed device can no longer support all APs on the active managed device.

AP Failover

If a standby managed device reaches its AP oversubscription capacity or exceeds its maximum BSSID limit, the standby managed device drops any subsequent standby AP connections. A dropped AP attempts to reconnect to the standby managed device, but after it exceeds the maximum number of request retries, the AP informs the active managed device that it is unable to connect to the standby managed device. The active managed device then prompts the AP to create a standby tunnel to another standby managed device, if one is configured.

If an active managed device fails, the APs on the active managed device fail over to the standby managed device. Once the standby managed device has reached its capacity for active APs,it terminates tunnels to any standby APs that Switch can no longer serve. When these APs detect that there is no longer a heartbeat between the AP and the standby managed device, they notify their active managed device that they can no longer connect to the standby. The active managed device then prompts the APs to establish standby tunnels to another standby managed device, if one is configured.

Examples

The following command displays oversubscription statistics for APs and tunnels

```
(host) [mynode] (config) #show ha oversubscription statistics
Platform oversubscription factor :          4
APs Limits
------------------
APs                      Number
----                     ------
Platform Limit           512
Current Active           2
Current Standby          694
Active remaining         0
Standby remaining        1
Maximum allowed Standby  697

BSS Limits
--------------------
Tunnels                Limits
-------                ------
Maximum BSS tunnels    16384
Average BSS/AP         23
BSS tunnels in use     16360
BSS tunnels available  24
```

The output of this command includes the following parameters:

Parameter	Description
`Platform limit`	Maximum number of APs supported by the managed device platform.
`Current Active`	Number of active APs currently associated to the managed device.
`Current Standby`	Number of APs that are currently using the managed device as a standby managed device.
`Active Remaining`	Number of APs that can connect to this managed device in Active mode.

Parameter	Description
`Standby Remaining`	Number of APs that can connect to this managed device in Standby mode.
`Maximum allowed Standby`	Maximum number of Standby APs supported by the managed device.
`Maximum BSS tunnels`	The maximum number of BSS tunnels supported by the managed device.
`Average BSS/AP`	The average number of BSS tunnels per AP using the managed device as a standby managed device.
`BSS tunnels in use`	Number of BSS tunnels currently in use by the managed device.
`BSS tunnels available`	Number of BSS tunnels not currently in use by the managed device.

show iap detailed-table

```
show iap detailed-table
   branch-key <brkey>
   long
```

Description

Displays the details of all the branches terminating at the managed device.

Syntax

Parameter	Description
`branch-key <brkey>`	Key for the branch, which is unique to each branch.
`long`	Displays the branches connected to the managed device in detailed view.

Example

This example shows the details of the branches connected to the Switch:

```
(host) [mynode] (config) #show iap detailed-table long

Name              VC MAC Address     Status   Inner IP   Key
----              --------------     ------   --------   ------------------------------------
Instant-C0:8C:08 d8:c7:c8:c4:73:53  UP       1.1.1.1    2d15576901190269568c3d9837fc1b414e1b06
                                                         523282805aaa
Instant-C0:8C:08 d8:c7:c8:c4:73:53  UP       1.1.1.1    2d15576901190269568c3d9837fc1b414e1b06
                                                         523282805aaa
Instant-C0:8C:08 d8:c7:c8:c4:73:53  UP       1.1.1.1    2d15576901190269568c3d9837fc1b414e1b06
                                                         523282805aaa

Flags    Branch (Subnet / Vlan)    BID    IP Address Range      Client Count
-----    ----------------------    ---    ----------------      ------------
PD2      52                        0      52.1.1.2-52.1.1.100   5
PD3      53.1.1.8/29               0      53.1.1.1-53.1.1.100   5
PC2      51                        0

Flags: P = Primary Tunnel; B = Backup Tunnel; C = Centralized; U = Unassigned;
       D = Distributed; L = Local; 3 = Routed(L3); 2 = Bridged(L2);
```

The output of this command includes the following parameters:

Parameter	Description
`Name`	Name of the branch
`VC MAC Address`	MAC address of the Virtual managed device of the branch
`Status`	Current status of the branch (UP or DOWN)
`Inner IP`	Internal VPN IP of the branch
`Key`	Key for the branch, which is unique to each branch

Parameter	Description
Flags	This column displays any flags for the branch subnet ■ P = Primary Tunnel ■ B = Backup Tunnel ■ C = Centralized ■ D = Distributed ■ L = Local ■ U = Unassigned ■ 3 = Routed(L3) ■ 2 = Bridged(L2)
`Branch (Subnet/Vlan)`	Subnet mask or VLAN assigned to the branch
`BID`	Branch ID
IP Address Range	Allocated branch subnet IP address range
`Client Count`	Number of client terminating on this managed device

Related Commands

Command	Description
hostname	This command changes the hostname of the Mobility Master, standby Switch, or managed device.
iap trusted-branch-db	This command is used to configure an Instant AP (IAP)-VPN branch as trusted.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system, except for noted parameters.	Enable or Configuration mode on managed devices.

show iap subnet

```
show iap subnet <subnet-name>
```

Description

Displays the details of specific IAP subnet information.

Syntax

Parameter	Description
`subnet <subnet-name>`	Displays specific subnet information for an IAP.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The following command displays a subnet details:

```
(host) [mynode] (config) #show iap subnet test
```

Related Commands

Command	Description
hostname	This command changes the hostname of the Mobility Master, standby Switch, or managed device.

All platforms	Base operating system, except for noted parameters.	Enable or Configuration mode on managed devices.

show iap table

```
show iap table
   branch-key <brkey>
   long
   summary
```

Description

Displays the branch details connected to the managed device.

Syntax

Parameter	Description
`branch-key <brkey>`	Key for the branch, which is unique to each branch.
`long`	Displays the branches connected to the managed device in detailed view.
`summary`	Displays the summary of the IAP table.

Example

This example shows the details of the branches connected to the managed device:

```
(host) [mynode] (config) #show iap table long

IAP Branch Table
----------------
Name             VC MAC Address     Status   Inner IP       Assigned Subnet  Assigned Vlan

Delhi            6c:f3:7f:cc:42:ca  DOWN     0.0.0.0
Singapore        6c:f3:7f:cc:42:cb  UP       10.15.207.122  10.15.206.120/29 2

Key        Bid(Subnet Name)
---        ----------------
b3c65c...
b3c65c...
b3c65c...  2(10.15.205.0-10.15.205.250,5),1(10.15.206.1-10.15.206.252,5)
a2a65c...  0
b3c65c...  7(10.15.205.0-10.15.205.250,5),8(10.15.206.1-10.15.206.252,5)
b3c65c...
b3c65c...  1(10.15.205.0-10.15.205.250,5),2(10.15.206.1-10.15.206.252,5)
b3c65c...  14(10.15.205.0-10.15.205.250,5),15(10.15.206.1-10.15.206.252,5)
```

The output of this command includes the following parameters:

Parameter	Description
`Name`	Name of the branch.

Parameter	Description
`VC MAC Address`	MAC address of the Virtual managed device of the branch.
`Status`	Current status of the branch (UP or DOWN).
`Inner IP`	Internal VPN IP of the branch.
`Assigned Subnet`	Subnet mask assigned to the branch.
`Assigned Vlan`	VLAN ID assigned to the branch.
`Key`	Key for the branch, which is unique to each branch.
`Bid(Subnet Name)`	Branch ID (BID) of the subnet. ■ In the example above, the managed device displays bid-per-subnet-per-branch i.e., for "LA" branch, BID "2" for the ip-range "10.15.205.0-10.15.205.250" with client count per branch "5"). If a branch has multiple subnets, it can have multiple BIDs. ■ Branches that are in **UP** state and do not have a **Bid(Subnet Name)** means that the IAP is connected to a managed device which did not assign any bid for any subnet. In the above example, "Paris-CB:D3:16" branch is **UP** and does not have a **Bid(Subnet Name)** information. This means that either the IAP is connected to a backup managed device or connected to a primary managed device without any distributed L2 or L3 subnets. For more information on bid-per-subnet-per-branch and distributed L2 and L3 subnets, see the *DHCP Configuration* chapter of the Alcatel-Lucent *Instant Access Point 6.2.1.0-3.3 User Guide*.

Related Commands

Command	Description
hostname	This command changes the hostname of the Mobility Master, standby Switch, or managed device.
iap trusted-branch-db	This command is used to configure an Instant AP (IAP)-VPN branch as trusted.

Command History

AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system, except for noted parameters.	Enable or Configuration mode on managed devices.

show iap trusted-branch-db

```
show iap trusted-branch-db
```

Description

Displays the details of IAP trusted branch database information.

Syntax

None

Example

This example shows the details of IAP trusted branch database information:

```
(host) [mynode] (config) #show iap trusted-branch-db

Trusted Branch Validation: Enabled
IAP Trusted Branch Table
------------------------
Branch MAC
----------
01:01:0e:3e:4c:33
```

Another example:

```
(host) #show iap trusted-branch-db

Trusted Branch Validation: Disabled
IAP Trusted Branch Table
------------------------
Branch MAC
----------
(allow all as trusted branch)
```

The output of this command includes the following parameters:

Parameter	Description
`Branch MAC`	MAC address of the trusted IAP branch

Related Commands

Command	Description
hostname	This command changes the hostname of the Mobility Master, standby Switch, or managed device.
iap trusted-branch-db	This command is used to configure an Instant AP (IAP)-VPN branch as trusted.

Command History

show ids ap-classification-rule

```
id-classification-rule <rule-name>
```

Description

Display the IDS AP classification rule profile.

Syntax

Parameter	Description
`<rule-name>`	Enter the AP classification rule profile name.

Usage Guidelines

Issue this command without the **<rule-name>**option to view the AP Classification Rule Profile list. Add the rule name option to display values for the rule.

Example

Below is the show command *without* the rule name option:

```
(host) [mynode] (config) #show ids ap-classification-rule
IDS AP Classification Rule Profile List
---------------------------------------
Name               References  Profile Status
----               ----------  --------------
exclude-ssid-rule  1
rule1              1
rule2              1
Total:3
```

In the example above, the **Reference** column indicates the number of references to the rule named in the **Name** column. The **Profile Status** column is blank unless the rule is predefined. Optionally, you can enter a rule name to view the parameters for that rule. For example:

```
(host) (config) # show ids ap-classification-rule rule1
IDS AP Classification Rule Profile "rule1"
------------------------------------------
Parameter                    Value
---------                    -----
SSID                         Alcatel-Lucent-ap
Match SSIDs                  true
Min SNR value                0
Max SNR value                255
Discovered APs count         2
Check for Min Discovered APs  true
Classify To AP Type          suspected-rogue
Confidence level increase    5
```

show ids ap-rule-matching

Description

Display the IDS active AP rules profile.

Example

```
(host) [mynode] (config) #show ids ap-rule-matching

IDS Active AP Rules Profile
---------------------------
Parameter     Value
---------     -----
AP Rule name  snr0
AP Rule name  rule1
AP Rule name  rule2
AP Rule name  exclude-ssid-rule
```

In the above example, the rule names in the *Value* column have been activated by the **ids ap-rule-matching** command.

Related Commands

Command	Description

show ids dos-profile

```
show ids dos-profile <profile-name>
```

Description

Show an IDS DoS Profile.

Syntax

Parameter	Description
`<profile-name>`	Name of an IDS DoS profile.

Usage Guidelines

Issue this command without the **<profile-name>**parameter to display an IDS DoS profile.

Examples

The example below shows that the Switch has four configured DoS profiles.

(host) [mynode] (config) #show ids dos-profile

IDS Denial Of Service Profile List

Name References Profile Status
---- ---------- --------------
default 4
test 0
test1 1
Wizard-test 1
Wizard-test2 1

Total:5

In the example above, the **Reference** column indicates the number of references to the profile named in the **Name** column. The **Profile Status** column is blank unless the rule is predefined.

The example below displays a partial output for the profile “test1”.

```
(host) (config) #show ids dos-profile test1
Parameter                                       Value
---------                                       -----

show ids general-profile

```
show ids general-profile <profile-name>
```

Description

Display an IDS General profile.

Syntax

Parameter	Description
`<profile-name>`	Name of an IDS General profile.

Usage Guidelines

Issue this command without the **<profile-name>** parameter to display the IDS General profile list. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the managed device has four configured General profiles.

```
(host) [mynode] (config) # show ids general-profile
IDS General Profile List
------------------------
Name           References  Profile Status
----           ----------  --------------
default        2
helen          0
wired-lb       1
Wizard-test2   1
Total:4
```

In the example above, the **Reference** column indicates the number of references to the profile named in the **Name** column. The **Profile Status** column is blank unless the rule is predefined.

The example below displays the settings for the profile **Michael**.

```
(host) (config) #show ids general-profile Michael

IDS General Profile "Michael"
-----------------------------
Parameter                                 Value

```

The output of this command includes the following parameters:

Parameter	Description
Adhoc AP Max Unseen Timeout	Ageout time in seconds since ad hoc (IBSS) AP was last seen.
Adhoc (IBSS) AP Inactivity Timeout	Ad hoc (IBSS) AP inactivity timeout in number of scans.
AP Inactivity Timeout	Time, in seconds, after which an AP is aged out.
AP Max Unseen Timeout	Ageout time, in seconds, since AP was last seen.
Frame Types for RSSI calculation	Frame types used in AM RSSI calculation.
IDS Event Generation on AP	Enable or disable IDS event generation from the AP. Event generation from the AP can be enabled for syslogs, traps, or both. This does not affect generation of IDS correlated events on the switch.
Max Monitored Stations	Maximum number of monitored stations.
Max Unassociated Stations	Maximum number of unassociated stations.
Min Potential AP Beacon Rate	Minimum beacon rate acceptable from a potential AP, in percentage of the advertised beacon interval.
Min Potential AP Monitor Time	Minimum time, in seconds, a potential AP has to be up before it is classified as a real AP.
Mobility Manager RTLS	Shows if RTLS communication with the configured mobility-manager is enabled or disabled.
Monitored Device Stats Update Interval	Time interval, in seconds, for AP to update the switch with stats for monitored devices. Minimum is 60.
Packet SNR Threshold	The packet Signal to Noise Ratio (SNR) threshold. All packets with SNR below this threshold is dropped from IDS and ARM processing. No packets are dropped if the threshold is set to 0.
Send Adhoc Info to Controller	Enable or disable sending ad hoc information to the managed device from the AP.
Signature Quiet Time	After a signature match is detected, the time to wait, in seconds, to resume checking.
STA Inactivity Timeout	Time, in seconds, after which a station is aged out.

Parameter	Description
`STA Max Unseen Timeout`	Time, in seconds, after which an AP is aged out.
`Stats Update Interval`	Interval, in seconds, for the AP to update the managed device with statistics. This setting takes effect only if the Alcatel-Lucent Mobility Manager is configured. Otherwise, statistics update to the managed device is disabled.
`Wired Containment`	Shows if the profile has enabled or disabled containment from the wired side.
`Wired Containment of AP's Adj MACs`	Shows if the profile has enabled or disabled wired containment of MACs offset by one from APs BSSID.
`Wired Containment of Suspected L3 Rogue`	Shows if the profile has enabled or disabled the feature to identify and contain an AP with a preset wired MAC address that is completely different from the AP's BSSID. where the MAC address that the AP provides to wireless clients as a 'gateway MAC' is offset by one character from its wired MAC address.
`Wireless Containment`	Shows if the profile has enabled or disabled containment from the wireless side.
`Debug Wireless Containment`	Shows if the profile has enabled or disable debugging of containment from the wireless side.
`Wired Containment of AP's Adj MACs`	Enable or disable wired containment of MACs offset by one from APs BSSID.

Related Commands

show ids impersonation-profile

```
show ids impersonation-profile <profile-name>
```

Description

Display an IDS Impersonation Profile.

Syntax

Parameter	Description
`<profile-name>`	Name of an IDS Impersonation profile.

Usage Guidelines

Issue this command without the **<profile-name>** parameter to display the IDS Impersonation profile list. Include a profile name to display detailed configuration information for that profile.

Examples

The example below displays that the Mobility Master has five configured Impersonation profiles.

```
(host) [mynode] (config) #show ids impersonation-profile

IDS Impersonation Profile List
------------------------------
Name           References  Profile Status
----           ----------  --------------
default        4
test           0
test1          1
Wizard-test    1
Wizard-test2   1

Total:5
```

In the example above, the **Reference** column indicates the number of references to the profile named in the **Name** column. The **Profile Status** column is blank unless the rule is predefined.

The example below displays the configuration settings for the profile **test1**.

```
(host) (config) #show ids impersonation-profile test1

IDS Impersonation Profile "test1"
---------------------------------
Parameter                                 Value
---------                                 -----
Detect AP Impersonation                   false
Protect from AP Impersonation             false
Beacon Diff Threshold                     50 %
Beacon Increase Wait Time                 3 sec
Detect AP Spoofing                        true
Detect Beacon Wrong Channel               false
Beacon Wrong Channel Detection Quiet Time 900 sec
Detect Hotspotter Attack                  true
Hotspotter Quiet Time                     900 sec
```

The output of this command includes the following parameters:

Parameter	Description
`Detect AP Impersonation`	Shows of the profile has enabled or disabled detection of AP impersonation.
`Protect from AP Impersonation`	Shows if AP impersonation is enabled or disabled for the profile. When AP impersonation is detected, both the legitimate and impersonating AP are disabled using a DoS attack.
`Beacon Diff Threshold`	Percentage increase in beacon rates that triggers an AP impersonation event.
`Beacon Increase Wait Time`	Time, in seconds, after the beacon difference threshold is crossed before an AP impersonation event is generated.
`Detect AP Spoofing`	AP Spoofing detection is enabled
`Detect Beacon Wrong Channel`	Disable detection of beacons advertising the incorrect channel
`Beacon Wrong Channel Detection Quiet Time`	Wait 90 seconds after detecting a beacon with the wrong channel after which the check can be resumed.
`Detect Hotspotter Attack`	Enable detection of the Hotspotter attack to lure away valid clients.
`Hotspotter Quiet Time`	Wait 90 seconds after detecting an attempt to Use the Hotspotter tool against clients.

show ids management-profile

Description

Displays the management event correlation for IDS event traps and sylogs (logs).

Example

The following example displays the current management status.

```
(host) [mynode] (config) #show ids management-profile

IDS Management Profile
----------------------
Parameter                Value
---------                -----
IDS Event Correlation    logs-and-traps
Event Correlation Quiet Time  900 sec
```

The display output of the above command includes:

Parameter	Description
`IDS Event Correlation`	Management profile is set for logs-and-traps.
`Event Correlation Quiet Time`	The time to wait, 900 seconds, before the event can be raised again.

show ids profile

```
show ids profile <profile-name>
```

Description

Display all ids profiles or display a specific profile name.

Syntax

Parameter	Description
`<profile-name>`	Name of an IDS profile.

Usage Guidelines

Issue this command without the **<profile-name>**parameter to display the list of IDS profiles. Include a profile name to display detailed information for that profile.

Examples

The example below shows that the Switch has seven configured IDS Profiles.

```
(host) [mynode] (config) #show ids profile

IDS Profile List
----------------
Name            References  Profile Status
----            ----------  --------------
default         5
test            0
test-tarpit     1
test-wired-lb   0
test1           0
Wizard-test     0
Wizard-test2    0

Total:7
```

In the example above, the **Reference** column indicates the number of references to the profile named in the **Name** column. The **Profile Status** column is blank unless the rule is predefined.

This example displays the configuration settings for the profile **test1**.

(host) [mynode] (config) `#show ids profile test1`

```
IDS Profile "test1"
-------------------
Parameter                       Value
---------                       -----
IDS General profile             test1
IDS Signature Matching profile  test1
IDS DOS profile                 test1
IDS Impersonation profile       test1
IDS Unauthorized Device profile test1
```

The output of this command includes the following parameters:

Parameter	Description
`IDS General profile`	Name of a IDS General profile to be applied to an AP or AP group.
`IDS Signature Matching profile`	Name of a IDS Signature Matching profile to be applied to an AP or AP group.
`IDS DOS profile`	Name of a IDS DoS profile to be applied to an AP or AP group.
`IDS Impersonation profile`	Name of a IDS Impersonation profile to be applied to an AP or AP group.
`IDS Unauthorized Device profile`	Name of a IDS Unauthorized Device profile to be applied to an AP or AP group.

```
show ids rate-thresholds-profile <profile-name>
```

Description

Show an IDS Rate Thresholds profile.

Syntax

Parameter	Description
`<profile-name>`	Name of an IDS Rate Threshold profile.

Usage Guidelines

Issue this command without the **<profile-name>** parameter to display the IDS Rate Threshold profile list. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the Switch has three configured IDS Rate Threshold profiles.

```
(host) [mynode] (config) #show ids rate-thresholds-profile

IDS Rate Thresholds Profile List
--------------------------------
Name                               References  Profile Status
----                               ----------  --------------
default                            20
probe-request-response-thresholds  10          Predefined
test                               0

Total:3
```

In the example above, the **Reference** column indicates the number of references to the profile named in the **Name** column. The **Profile Status** column is blank unless the rule is predefined.

This example displays the configuration settings for the profile **test**. \

```
(host) [mynode] (config) #show ids rate-thresholds-profile test

IDS Rate Thresholds Profile "test"
----------------------------------
Parameter              Value
---------              -----
Channel Increase Time  15 sec
Channel Quiet Time     900 sec
Channel Threshold      300
Node Time Interval     15 sec
Node Quiet Time        900 sec
Node Threshold         200
```

The output of this command includes the following parameters:.

Parameter	Description
`Channel Increase Time`	Time, in seconds, in which the threshold must be

Parameter	Description
	exceeded in order to trigger an alarm.
`Channel Quiet Time`	The time that must elapse after a channel rate alarm before another identical alarm may be triggered. This option prevents excessive messages in the log file.
`Channel Threshold`	Number of a specific type of frame that must be exceeded within a specific interval in an entire channel to trigger an alarm.
`Node Time Interval`	Time, in seconds, in which the threshold must be exceeded in order to trigger an alarm.
`Node Quiet Time`	The time that must elapse after a node rate alarm before another identical alarm may be triggered. This option prevents excessive messages in the log file.
`Node Threshold`	Number of a specific type of frame that must be exceeded within a specific interval for a particular client MAC address to trigger an alarm.

show ids signature-matching-profile

```
show ids signature-matching-profile <profile-name>
```

Description

Show an IDS Signature Matching profile.

Syntax

Parameter	Description
`<profile-name>`	Name of an IDS Signature Matching profile.

Usage Guidelines

Issue this command without the **<profile-name>**parameter to display the entire IDS Signature Matching profile list. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the Mobility Master has four configured Signature Matching profiles.

```
(host) [mynode] (config) #show ids signature-matching-profile

IDS Signature Matching Profile List
-----------------------------------
Name           References  Profile Status
----           ----------  --------------
default        4
test1          1
Wizard-test    1
Wizard-test2   1

Total:4
```

In the example above, the **Reference** column indicates the number of references to the profile named in the **Name** column. The **Profile Status** column is blank unless the rule is predefined.

This example displays the configuration settings for the profile **test1**.

```
(host) [mynode] (config) #show ids signature-matching-profile test1

IDS Signature Matching Profile "test1"
--------------------------------------
Parameter      Value
---------      -----
IDS Signature  Deauth-Broadcast
IDS Signature  Disassoc-Broadcast
```

The output of this command includes the following parameters:

Parameter	Value
`IDS Signature`	Broadcast is not authorized.
`IDS Signature`	Disassociate broadcast.

Related Commands

show ids signature-profile

```
show ids signature-profile <profile-name>
```

Description

Show an IDS signature profile.

Syntax

Parameter	Description
`<profile-name>`	Name of an IDS Signature profile.

Usage Guidelines

Issue this command without the **<profile>**parameter to display the entire IDS Signature profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the Switch has eight configured Signature profiles.

```
(host) [mynode] (config) #show ids signature-profile

IDS Signature Profile List
--------------------------
Name                        References  Profile Status
----                        ----------  --------------
AirJack                     1           Predefined
ASLEAP                      1           Predefined
Deauth-Broadcast            1           Predefined
default                     1
Netstumbler Generic         1           Predefined
Netstumbler Version 3.3.0x  1           Predefined
Null-Probe-Response         1           Predefined
sample                      0

Total:8
```

This example displays the configuration settings for the profile **AirJack**.

```
(host) [mynode] (config) # show ids signature-profile
IDS Signature Profile "AirJack" (predefined)
--------------------------------------------
Parameter   Value
---------   -----
Frame Type  beacon SSID = AirJack
```

The output of this command includes the following parameters:

Parameter	Description
`Frame Type`	Type of 802.11 frame. For each type of frame, further parameters may be included to filter and detect only the required frames. ■ **assoc**: Association frame type. ■ **auth**: Authentication frame type. ■ **beacon**: Beacon frame type. ■ **control**: All control frames. ■ **data**: All data frames. ■ **deauth**: Deauthentication frame type. ■ **disassoc**: Disassociation frame type. ■ **mgmt**: Management frame type. ■ **probe-request**: Probe request frame type. ■ **probe-response:** Probe response frame type. ■ **ssid**: For beacon, probe-request, and probe-response frame types, the SSID as either a string or hex pattern. ■ **ssid-length**: For beacon, probe-request, and probe-response frame types, the length, in bytes, of the SSID.
`payload`	Pattern at a fixed offset in the payload of an 802.11 frame.
`sequence number`	Sequence number of the frame.
`src- mac`	Source MAC address in the 802.11 frame header.
`dst- mac`	Source MAC address in the 802.11 frame header.
`bssid`	BSSID field in the 802.11 frame header.

Protect Valid Stations                                  false
Valid Wired MACs                                        N/A
Detect Windows Bridge                                   true
Protect Windows Bridge                                  false
Detect Wireless Bridge                                  false
Wireless Bridge detection Quiet Time                    900 sec
Detect Wireless Hosted Network                          true
Wireless Hosted Network Quiet Time                      900 sec
Protect From Wireless Hosted Networks                   false
```

The output of this command includes the following parameters:

Parameter	Description
`Protect 802.11n High Throughput Devices`	Shows if the profile enables or disables protection of HT (802.11n) devices.
`Protect 40MHz 802.11n High Throughput Devices`	Shows if the profile enables or disables protection of HT (802.11n) devices operating in 40 MHz mode.
`Detect Active 802.11n Greenfield Mode`	Shows if the profile enables or disables detection of HT devices advertising greenfield preamble capability.
`Detect AdHoc Networks`	Shows if the profile has enabled or disabled detection of ad hoc networks.
`Protect from Adhoc Networks`	Shows if the profile has enabled or disabled protection from WPA or WPA2 ad hoc networks.
`Protect from Adhoc Networks-Enhanced`	Shows if the profile has enabled or disabled protection from WEP or Open ad hoc networks.
`Detect Valid SSID Misuse`	Shows if the detect valid SSID minuse is enabled (true) or disabled (false).

Parameter	Description
Adhoc Network Using Valid SSID Quiet Time	Shows time to wait, in seconds, after detecting an ad hoc network using a valid SSID, after which the check can be resumed.
Allow Well Known MAC	Shows if the profile allows devices with known MAC addresses to classify rogue APs.
Detect Devices with an Invalid MAC OUI	Shows if the profile has enabled or disabled checking of the first three bytes of a MAC address, known as the OUI, assigned by the IEEE to known manufacturers.
MAC OUI detection Quiet Time	Time, in seconds, that must elapse after an invalid MAC OUI alarm has been triggered before another identical alarm may be triggered.
Detect Misconfigured AP	Shows if the profile has enabled or disabled detection of misconfigured APs.
Protect Misconfigured AP	Shows if the profile has enabled or disabled protection of misconfigured APs.
Detect Bad WEP	Shows if the profile has enabled or disabled detection of WEP initialization vectors that are known to be weak or repeating.
Privacy	Shows if the profile has enabled or disabled encryption as a valid AP configuration.
Require WPA	Shows if the Mobility Master will flag any valid AP not using WPA as a misconfigured AP.
Valid 802.11g channel for policy enforcement	A list of valid 802.1b or 802.1g channels that third-party APs are allowed to use.
Valid 802.11a channel for policy enforcement	A list of valid 802.11a channels that third-party APs are allowed to use.
Valid and Protected SSIDs	A list of valid and protected SSIDs.
Valid MAC OUIs	A list of valid MAC OUIs.
Rogue AP Classification	Shows if the profile has enabled or disabled rogue AP classification.
Overlay Rogue AP Classification	Shows if the Mobility Master allows APs that are plugged into the wired side of the network to be classified as “suspected rogue” instead of “rogue”.
OUI-based Rogue AP Classification	Shows if OUI-based rogue AP classification is enabled or disabled.

Parameter	Description
Propagated Wired MAC based Rogue AP Classification	Shows if rogue AP classification through propagated wired MACs is enabled or disabled.
Rogue Containment	Shows if the Mobility Master will automatically shut down rogue APs.
Suspected Rogue Containment	Shows if the Mobility Master will automatically treat suspected rogue APs as interfering APs.
Suspected Rogue Containment Confidence Level	Confidence level of suspected Rogue AP to trigger containment, expressed as a percentage.
Detect Station Association To Rogue AP	Shows if the profile has been configured to detect station association to a rogue AP.
Detect Unencrypted Valid Clients	Shows if the profile has enabled or disabled detection of unencrypted valid clients.
Unencrypted Valid Client Detection Quiet Time	Shows the time to wait, in seconds, after detecting an unencrypted valid client after which the check can be resumed.
Detect Valid Client Misassociation	Shows if the profile has enabled or disabled detection of a misassociation between a valid client and an unsafe AP.
Detect Valid SSID Misuse	Shows if the profile has enabled or disabled detection of Interfering or Neighbor APs using valid or protected SSIDs.
Protect SSID	Shows if the profile has enabled or disabled use of SSID by valid APs only.
Protect Valid Stations	Shows if the Mobility Master will allow valid stations to connect to a non-valid AP.
Valid Wired MACs	List of valid and protected SSIDs.
Detect Windows Bridge	Shows if the profile has enabled or disabled detection of Windows station bridging.
Protect Windows Bridge	Shows if the profile has enabled or disabled protection of Windows station bridging.
Detect Wireless Bridge	Shows if the profile has enabled or disabled detection of wireless bridging.
Wireless Bridge detection Quiet Time	Time, in seconds, that must elapse after a wireless bridge alarm has been triggered before another identical alarm may be triggered.

Parameter	Description
`Protect From Wireless Hosted Networks`	Shows if the profile has enabled or disabled detection of a wireless hosted network.
`Wireless Hosted Network Quiet Time`	The wireless hosted network detection feature sends a log message and trap when a wireless hosted network is detected. The quiet time displayed in this field displays the amount of time, in seconds, that must elapse after a wireless hosted network log message or trap has been triggered before an identical log message or trap can be sent again.
`Protect From Wireless Hosted Networks`	Shows if the profile has enabled or disabled containment on a wireless hosted network by launching a DoS attack to disrupt associations between a Windows 7 software-enabled Access Point (softAP) and a client, and disrupt associations between the client that is hosting the softAP and any access point to which the host connects.

show ids wms-general-profile

```
show ids wms-general-profile
```

Description

Display general statistics for the wms configuration.

Syntax

No parameters.

Example

```
This example shows per-channel statistics for all monitored APs.

(host) [mynode] (config) #show ids wms-general-profile

IDS WMS General Profile
-----------------------
Parameter                                   Value
---------                                   -----
AP poll interval                            60000 msec
AP poll retries                             3
AP ageout interval                          0 minutes
Adhoc AP ageout interval                    31 minutes
Station ageout interval                     100 minutes
Statistics update                           true
Persistent Neighbor APs                     true
Persistent Valid STAs                       false
AP learning                                 false
Propagate Wired Macs                        true
Collect Stats for Monitored APs and Clients false
Learn System Wired Macs                     false
```

The output of this command includes the following information:

Column	Description
AP poll interval	Interval, in milliseconds, for communication between the Switch and AMs. The Switch contacts the AM at this interval to download AP to station associations, update policy configuration changes, and download AP and station statistics.
AP poll retries	Maximum number of failed polling attempts before the polled AM is considered to be down.
AP ageout interval	Time, in minutes, that an AP must remain unseen by any probes before it is deleted from the database.
Adhoc AP ageout interval	Time, in minutes, that an ad hoc (IBSS) AP remains unseen before it is deleted (ageout) from the database.
Station ageout interval	Time, in minutes, that an client must unseen by any probes before it is deleted from the database.

Column	Description
`Statistics update`	Shows the status of the statistics updates in the database.
`Persistent Neighbor APs`	Shows the status of known AP neighbors.
`Persistent Valid STAs`	Shows the status of known AP neighbors.
`AP learning`	Shows the status of “learning” of non-Alcatel-Lucent APs.
`Propagate Wired Macs`	Shows if the Switch has enabled or disabled the propagation of the gateway wired MACs.
`Collect Stats for Monitored APs and Clients`	Shows if the master Switch will collect up to 25,000 statistic entries for monitored APs and clients.
`Learn System Wired Macs`	Shows the status of “learning” of wired MACs at the Switch.

show ids wms-local-system-profile

```
ids wms-local-system-profile
   max-ap-threshold <max-ap-threshold>
```

Description

Display statistics for the WMS local system profile settings.

Syntax

No Parameters

Usage Guidelines

The configuration parameters in IDS WMS local system profile enables local termination of the WMS service, sets maximum thresholds for the maximum number of managed APs and stations, and defines the intervals at which valid AP, rogue AP and station data is sent to the managed device. Issue this command to view the local WMS service profile settings .

Example

The following commands first set the interval time for repopulating the MAC table to 10 minutes and then sets the maximimum number of APs to 100.

```
(host) (config) #show ids wms-local-system-profile
   IDS WMS Local System Profile
   ----------------------------
   Parameter                          Value        Set
   ---------                          -----        ---
   Max AP Threshold                   100
   Max STA Threshold                  0
   Max RBTree Entries                 3
   Max System Wired MACs              1000
   Override Service Termination       false
   Periodic AP Snapshot Interval      180 minutes
   Periodic Rogue AP Snapshot Interval  30 minutes
   Periodic STA Snapshot Interval     180 minutes
   System Wired MAC Update Interval   8
```

The output of this command includes the following information:

Table 10: *IDS WMS Local System Profile Settings*

Parameter	Description
Max AP Threshold	The max threshold for the total number of APs
Max STA Threshold	The max threshold for the total number of stations.
Max RBTree Entries	The max threshold for the total number of AP and station RBTree entries.
Max System Wired MACs	The max number of system wired MAC table entries learned by the managed device.
Override Service Termination	If enabled, this feature overrides the system-determined termination mode, and terminates WMS service at the managed device to which the AP is associated.

Parameter	Description
Periodic AP Snapshot Interval	The interval in minutes at which to generate a periodic snapshot of monitored APs. The (AMON) messages comprising the snapshot will be spread over this interval.
Periodic Rogue AP Snapshot Interval	The interval in minutes at which to generate a periodic snapshot of monitored Rogue APs. The (AMON) messages comprising the snapshot will be spread over this interval.
Periodic STA Snapshot Interval	The interval in minutes at which to generate a periodic snapshot of monitored clients. The (AMON) messages comprising the snapshot will be spread over this interval.
System Wired MAC Update Interval	The interval, in minutes, for repopulating the system wired MAC table at the managed device.

show ifmap

```
show ifmap
   cppm
   state cppm
   statistics cppm
```

Descriptions

Issue this command to show the ClearPass Policy Manager IF-MAP configuration profile and the IP-MAP connection state.

Syntax

Parameter	Description
`cppm`	Shows the ClearPass Policy Manager IF-MAP profile parameters and their values.
`state cppm`	Shows the ClearPass Policy Manager IF-MAP connection state including if it is enabled, and the servers and their state.
`statistics cppm`	Shows the statistics data.

Example

To configure this feature using the CLI:

```
(host) [mynode] (config) #ifmap
(host) [mynode] (config) #ifmap cppm
(host) [mynode] (CPPM IF-MAP Profile) #server host <host>
(host) [mynode] (CPPM IF-MAP Profile) #port <port>
(host) [mynode] (CPPM IF-MAP Profile) #passwd <psswd>
(host) [mynode] (CPPM IF-MAP Profile) #enable
```

This show command show if the CCPM interface is enable and the ClearPass Policy Manager server IP address, username and password.

```
(host)[mynode] (CPPM IF-MAP Profile) #show ifmap cppm
CPPM IF-MAP Profile
-------------------
Parameter              Value
---------              -----
CPPM IF-MAP Interface  Enabled
CPPM IF-MAP Server     10.10.10.10:443 admin/********
```

This show command shows if state of all enabled ClearPass Policy Manager servers.

```
(host)[mynode] (CPPM IF-MAP Profile) #show ifmap state cppm
CPPM IF-MAP Connection State [Interface: Enabled]
-------------------------------------------------
Server           State
------           -----
10.4.191.32:443  UP
```

Related Commands

Command	Description
ifmap	This command is used in conjunction with ClearPass Policy Manager. It sends HTTP User Agent Strings and mDNS broadcast information to ClearPass so that it can make more accurate decisions about what types of devices are connecting to the network

All platforms	Base operating system.	Enable mode

show image version

```
show image version
type
```

Description

Display the current system image version on both partition 0 and 1.

Syntax

Parameter	Description
`type`	Displays the System image type.

Example

The following example shows that the managed device is running AOS-W 8.0 and booting off partition 0:1.

```
(host)[mynode] #show image version
---------------------------------
Partition               : 0:0 (/mnt/disk1)
Software Version        : ArubaOS 8.0.0.0-svcs-ctrl (Digitally Signed - Developer/Internal
Build)
Build number            : 0000
Label                   : ssetty@ss_sc_new-ENG.0000
Built on                : Wed Jun 8 14:46:22 IST 2016
---------------------------------
Partition               : 0:1 (/mnt/disk2) **Default boot**
Software Version        : ArubaOS 8.0.0.0-svcs-ctrl (Digitally Signed - Developer/Internal
Build)
Build number            : 0000
Label                   : ssetty@ss_sc_new-ENG.0000
Built on                : Thu Jun 16 12:53:57 IST 2016
```

The output of this command includes the following parameters:

Parameter	Description
`Partition`	Partition number and name. The default boot partition will display a **Default boot** notice by the partition name.
`Software Version`	Version of AOS-W software running on the partition.
`Build number`	Build number for the software version.
`Label`	The label parameter can display additional information for the build. By default, this value is the software build number.
`Built on`	Date the software build was created.

Following is an example of **show image version type** command:

```
(host) [mynode] #show image version type

This image is development build
```

Related Commands

show interface counters

```
show interface counters
```

Description

Displays a table of L2 interfaces counters.

Syntax

No parameters

Example

The example below shows the output of the **show interface counters** command.

```
(host) [mynode] #show interface counters
Port            InOctets         InUcastPkts       InMcastPkts     InBcastPkts
GE0/0/0         87071474           45349             590754          112566
Port            OutOctets        OutUcastPkts      OutMcastPkts    OutBcastPkts
GE0/0/0         10646801           18727             581               2
```

The output of this command includes the following parameters:

Parameter	Description
`Port`	Port number.
`InOctets`	Number of octets received through the port.
`InUcastPkts`	Number of unicast packets received through the port.
`InMcastPkts`	Number of multicast packets received through the port.
`InBcastPkts`	Number of broadcast packets received through the port.
`OutOctets`	Number of octets sent through the port.
`OutUcastPkts`	Number of unicast packets sent through the port.
`OutMcastPkts`	Number of multicast packets sent through the port.
`OutBcastPkts`	Number of broadcast packets sent through the port.

show interface gigabitethernet

```
show interface gigabitethernet <slot/module/port>
```

Description

Displays information about a specified Gigabit Ethernet port.

Syntax

Parameter	Description
`access-group`	Displays the Access Groups configured on this interface.
`counters`	Displays L2 interface counters for the specified interface.
`switchport`	Displays L2 interface information.
`transceiver`	Displays the transceiver serial ID information.
`trusted-vlan`	Displays port member vlan trusted status.
`untrusted-vlan`	Displays port member vlan untrusted status.
`xsec`	Displays xsec configuration.

Examples

The example below shows the output of **show interface gigabitethernet 0/0/0**.

```
(host)[mynode] (config) #show interface gigabitethernet 0/0/0
GE 0/0/0 is up, line protocol is up
Hardware is 10 Gigabit Ethernet, address is 00:0C:29:37:AB:82 (bia 00:0C:29:37:AB:82)
Description: GE0/0/0
Encapsulation ARPA, loopback not set
speed (10 Gbps)
MTU 1500 bytes, BW is 10000 Mbit
Last clearing of "show interface" counters 5 day 4 hr 57 min 41 sec
link status last changed 5 day 4 hr 55 min 22 sec
1560452 packets input, 498781462 bytes
Received 240098 broadcasts, 0 runts, 0 giants, 0 throttles
0 input error bytes, 0 CRC, 0 frame
240098 multicast, 1320354 unicast
1149614 packets output, 158075706 bytes
0 output errors bytes, 0 deferred
0 collisions, 0 late collisions, 0 throttles
This port is TRUSTED
```

The output of this command includes the following parameters:

Parameter	Description
`GE 0/0/0 is...`	Displays the status of the specified port.

Parameter	Description
line protocol is...	Displays the status of the line protocol on the specified port.
Hardware is....	Describes the hardware interface type.
address is...	Displays the MAC address of the hardware interface.
Description	The port type, name, and connector type.
Encapsulation	Encapsulation method assigned to this port.
loopback...	Displays whether or not loopback is set.
Configured	Configured transfer operation and speed.
Jumbo support...	Jumbo frame support is enabled.
Negotiated	Negotiated transfer operation and speed.
MTU bytes	MTU size of the specified port in bytes.
BW is...	Bandwidth of the link.
Last clearing of "show interface counters"	Time since "show interface counters" was cleared.
link status last changed...	Time since "show interface counters" was cleared. Below the time, all current counters related to the specified port are listed.
This port is...	Whether or not this port is trusted.
POE status of the port is...	The POE status of the specified port.
BW-Contract List/ Application Exception List/ Application BW-Contract list	Information about the bandwidth contract applied to the interface. For details, see interface gigabitethernet.

(host)[mynode] (config) #show interface gigabitethernet 0/0/0 counters

```
Port            InOctets          InUcastPkts       InMcastPkts      InBcastPkts
GE0/0/0         498972448         1321416           240316                0
Port            OutOctets         OutUcastPkts      OutMcastPkts     OutBcastPkts
GE0/0/0         158234051         1150823                0                0
```

The output of this command includes the following parameters:

Parameter	Description
Port	Port number.
InOctets	Number of octets received through the port.
InUcastPkts	Number of unicast packets received through the port.

Parameter	Description
InMcastPkts	Number of multicast packets received through the port.
InBcastPkts	Number of broadcast packets received through the port.
OutOctets	Number of octets sent through the port.
OutUcastPkts	Number of unicast packets sent through the port.
OutMcastPkts	Number of multicast packets sent through the port.
OutBcastPkts	Number of broadcast packets sent through the port.

(host)[mynode] (config)#show interface gigabitethernet 0/0/0 switchport

```
Name:  GE0/0/0
Switchport:  Enabled
Administrative mode:  static access
Operational mode:  static access
Administrative Trunking Encapsulation:  dot1q
Operational Trunking Encapsulation:  dot1q
Access Mode VLAN: 1 (Default)
Trunking Native Mode VLAN: 1 (Default)
Trunking Vlans Enabled: NONE
Trunking Vlans Active: NONE
```

The output of this command includes the following parameters:

Parameter	Description
Name	Port name.
Switchport	Whether or not switchport is enabled.
Administrative mode	Administrative mode .
Operational mode	Operational mode.
Administrative Trunking Encapsulation	Encapsulation method used for administrative trunking.
Operational Trunking Encapsulation	Encapsulation method used for operational trunking.
Access Mode VLAN	The access mode VLAN for the specified port.
Trunking Native Mode VLAN	The trunking native mode VLAN for the specified port.
Trunking Vlans Enabled	Number of trunking VLANs currently enabled.
Trunking Vlans Active	Number of trunking VLANs currently active.

(host) [mynode] (config)#show interface gigabitethernet 0/0/0 untrusted-vlan

Name: GE1/0
Untrusted Vlan(s)

The output of this command includes the following parameters:

Parameter	Description
`Name`	Name of the specified port.
`Untrusted Vlan(s)`	List of untrusted VLANs.

(host) [mynode] (config)# show interface gigabitethernet 0/0/1 xsec
xsec vlan 7 is ACTIVE

The output of this command includes the following parameters:

Parameter	Description
`xsec vlan 7 is ACTIVE`	This states that xsec is active on the specified port as well as the associated VLAN.

show interface loopback

```
show interface loopback
```

Description

Displays information about the loopback IP interface.

Syntax

No parameters

Example

The example below shows the output of the **show interface loopback** command.

```
(host) [mynode] #show interface loopback

loopback interface is up line protocol is up
Hardware is Ethernet, address is 00:0C:29:37:AB:81
IPv6 link-local address is fe80::c:290f:ff37:ab81/64
```

The output of this command includes the following parameters:

Parameter	Description
`loopback interface is...`	Status of the loopback interface.
`line protocol is...`	Status of the line protocol on the specified port.
`Hardware is...`	Hardware interface type.
`address is...`	MAC address of the loopback interface.
`IPv6 link-local address`	IP address and subnet mask of the loopback interface.

Related Commands

Command	Description

show interface mgmt

```
show interface mgmt
```

Description

Displays information about management Ethernet IP interfaces.

Syntax

No parameters

Example

The example below shows the output of show interface mgmt:

```
(host) [mynode] (config)# show interface mgmt

  mgmt is up line protocol is up
  Hardware is Ethernet, address is 00:0C:29:37:AB:77
```

The output of this command includes the following parameters:

Parameter	Description
`mgmt is...`	Status of the mgmt interface.
`line protocol is...`	Status of the line protocol on the specified port.
`Hardware is...`	Describes the hardware interface type.
`address is...`	Interface's MAC address.

Related Commands

Command	Description
interface mgmt	This command configures the out-of-band Ethernet management port on Switch.
interface range	This command configures a range of GigabitEthernet interfaces on the managed device.

show interface port-channel

```
show interface port-channel <id>
   access-group
   counters
   switchport
   trusted-vlan
   untusted-vlan
   xsec
      xsec point-to-point
```

Description

Displays information about a specified port-channel interface.

Syntax

Parameter	Description
`access-group`	Displays access groups configured on this interface.
`counters`	Displays L2 interface counters for the specified interface.
`switchport`	Displays L2 interface information for the specified interface.
`trusted-vlan`	Displays port member vlan trusted status.
`untrusted-vlan`	Displays port member vlan untrusted status.
`xsec`	Displays xsec configuration.
`xsec point-to-point`	Displays the point-to-point xsec tunnels for the specified interface.

Example

The example below shows the output of **show interface port-channel 7** on a managed device.

```
(host) [mynode] (config) #show interface port-channel 7
   Port-Channel 7 is administratively up, Link is up, Line protocol is down
   Hardware is Port-Channel, address is 00:0C:29:37:AB:81 (bia 00:0C:29:37:AB:81)
   Description: Link Aggregate
   Spanning Tree is Discarding
   Switchport priority: 0
   Member port(s):
   Speed :0 Mbps
   Interface index: 8200
   MTU: 1500 bytes
   Last clearing of "show interface" counters 0 day 8 hr 48 min 3 sec
   link status last changed 0 day 8 hr 48 min 3 sec
   0 packets input, 0 bytes
   Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
   0 input error bytes, 0 CRC, 0 frame
   0 multicast, 0 unicast
   0 packets output, 0 bytes
   0 output errors bytes, 0 deferred
   0 collisions, 0 late collisions, 0 throttles
   Port-Channel 7 is NOT TRUSTED
```

The output of this command includes the following parameters:

Parameter	Description
Port-Channel 7 is...	Status of the specified port.
line protocol is...	Status of the line protocol on the specified port.
Hardware is....	Hardware interface type.
address is...	MAC address of the hardware interface.
Description	The port type, name, and connector type. If the LAG is created by LACP, it is indicated as shown in the display output above. If the LAG is created by LACP, you can not statically add or delete any ports under that port channel. All other commands are allowed. If LACP is not shown, then the LAG is created by static configuration.
Spanning Tree is...	Spanning tree status on the specified port-channel.
VLAN membership	Number of VLANs the specified port-channel is associated with.
Switchport priority	Switchport priority of the specified port-channel.
Jumbo Support is...	Displays the status of jumbo frame on a port channel.
Last clearing of "show interface counters"	Time since "show interface counters" was cleared. Below the time, all current counters related to the specified port are listed.
Port-channel 7 is...	Whether or not this port-channel is trusted.

```
#show interface port-channel 7 access-group

Port-Channel 7:

Port-Vlan Session ACL
---------------------
SessionACL            Vlan     Status
----------          ----     ------
```

The output of this command includes the following parameters:

Parameter	Description
SessionACL	Session ACL name.
Vlan	VLAN number.
Status	ACL status.

```
#show interface port-channel 7 counters
Port          InOctets     InUcastPkts     InMcastPkts     InBcastPkts
PC 0:                0               0               0               0
Port         OutOctets    OutUcastPkts    OutMcastPkts    OutBcastPkts
PC 0:                0               0               0               0
```

The output of this command includes the following parameters:

Parameter	Description
PC	Port number.
InOctets	Number of octets received through the port.
InUcastPkts	Number of unicast packets received through the port.
InMcastPkts	Number of multicast packets received through the port.
InBcastPkts	Number of broadcast packets received through the port.
OutOctets	Number of octets sent through the port.
OutUcastPkts	Number of unicast packets sent through the port.
OutMcastPkts	Number of multicast packets sent through the port.
OutBcastPkts	Number of broadcast packets sent through the port.

```
#show interface port-channel 7 trusted-vlan

Name:  Port-channel 7
Switchport:  Enabled
Administrative mode:  static access
Operational mode:  static access
Administrative Trunking Encapsulation:  dot1q
Operational Trunking Encapsulation:  dot1q
Access Mode VLAN: 1 (Default)
Trunking Native Mode VLAN: 1 (Default)
Trunking Vlans Enabled: NONE
Trunking Vlans Active: NONE
```

The output of this command includes the following parameters:

Parameter	Description
Name	Port name.
Switchport	Whether or not switchport is enabled.
Administrative mode	Administrative mode .
Operational mode	Operational mode.
Administrative Trunking Encapsulation	Encapsulation method used for administrative trunking.
Operational Trunking Encapsulation	Encapsulation method used for operational trunking.
Access Mode VLAN	The access mode VLAN for the specified port.
Trunking Native Mode VLAN	The trunking native mode VLAN for the specified port.
Trunking Vlans Enabled	Number of trunking VLANs currently enabled.
Trunking Vlans Active	Number of trunking VLANs currently active.

```
#show interface port-channel 7 trusted-vlan

Name:  Port-Channel7
Trusted Vlan(s)
```

The output of this command includes the following parameters:

Parameter	Description
`Name`	Name of the specified port.
`trusted Vlan(s)`	List of trusted VLANs.

```
#show interface port-channel 7 untrusted-vlan

Name:  FE1/0
Untrusted Vlan(s)
```

The output of this command includes the following parameters:

Parameter	Description
`Name`	Name of the specified port.
`Untrusted Vlan(s)`	List of untrusted VLANs.

```
#show interface port-channel 7 xsec

xsec vlan 7 is ACTIVE
```

The output of this command includes the following parameters:

Parameter	Description
xsec vlan 7 is ACTIVE	This states that xsec is active on the specified port as well as the associated VLAN.

Related Commands

Command	Description
interface mgmt	This command configures the out-of-band Ethernet management port on Switch.
interface port-channel	This command configures an Ethernet port channel.
interface range	This command configures a range of GigabitEthernet interfaces on the managed device.
interface tunnel	This command configures a Layer-2 or Layer-3 GRE tunnel between a managed device and another GRE-capable device.
interface vlan	This command configures a VLAN interface.

Command	Description
interface vlan ip igmp	This command enables IGMP or IGMP snooping on this interface, or configures a VLAN interface for uninterrupted streaming of multicast traffic.

show interface-profile voip-profile

```
show interface-profile voip-profile <profile-name>
```

Description

This command displays the specified VoIP profile configuration information.

Syntax

Parameter	Description
`<profile-name>`	Name of the VoIP profile.

Examples

The following example shows configuration details for the VoIP profile:

```
(host) #show interface-profile voip-profile profile1
VOIP profile "profile1"
-----------------------
Parameter  Value
---------  -----
VOIP VLAN  1
DSCP       0
802.1 UP   0
VOIP Mode  auto-discover
```

The output of this command includes the following information:

Parameter	Description
`VOIP VLAN`	The Voice VLAN ID.
`DSCP`	The DSCP value for the voice VLAN.
`802.1 UP`	The 802.11p priority level.
`VOIP Mode`	The mode of VoIP operation. It can be auto-discover or static.

show interface tunnel

```
show interface tunnel <id> {trusted-vlan | untrusted-vlan}
```

Description

Displays information about tunnel interfaces.

Syntax

Parameter	Description
`id`	Tunnel interface number.
`trusted-vlan`	Displays trusted VLAN list.
`untrusted-vlan`	Displays untrusted VLAN list.

Example

The example below shows the output of **show interface tunnel** for IPv4.

```
(host) [mynode] #show interface tunnel 2000
Tunnel 2000 is up line protocol is down
Description: Tunnel Interface
Source  10.16.33.208 (Vlan 33)
Destination 1.1.1.200
Tunnel mtu is set to 1100
Tunnel is a Layer2 GRE TUNNEL
Tunnel is Trusted
Inter Tunnel Flooding is enabled
Tunnel keepalive is enabled
Keepalive type is Default
Tunnel keepalive interval is 1 seconds, retries 1
Heartbeats sent 1992, Heartbeats lost 1991
Tunnel is down 2 times
Trusted vlans:350-850
tunnel vlan 300-900
```

The example below shows the output of **show interface tunnel** for IPv6.

```
(host) [mynode] #show interface tunnel 20
Tunnel 20 is up line protocol is up
Description: Tunnel Interface
Source  2001:10:16:32::54 (Vlan 32)
Destination 2001:10:16:32::53
Tunnel mtu is set to 1500
Tunnel is a Layer2 GRE TUNNEL
Tunnel is Trusted
Inter Tunnel Flooding is enabled
Tunnel keepalive is disabled
Keepalive type is Default
Tunnel keepalive interval is 0 seconds, retries 0
Trusted vlan 300-350
tunnel vlan 100,200,300-350
```

The example below shows the output of **show interface tunnel** for trusted vlan.

```
(host) [mynode] #show interface tunnel 30 trusted-vlan
Trusted Vlan(s):300-350
```

The example below shows the output of **show interface tunnel** for untrusted vlan.

```
(host) [mynode] #show interface tunnel 40 untrusted-vlan
Untrusted Vlan(s):1-299,351-4094
```

The output of this command includes the following parameters:

Parameter	Description
`Tunnel 2000 is up line protocol is down`	Displays the status of the specified interface tunnel and its line protocol.
`Description`	Displays the description of the specified interface tunnel.
`Source`	Displays the IP address of the source of the specified interface tunnel.
`Destination`	Displays the IP address of the destination of the specified interface tunnel.
`Tunnel mtu is set to 1100`	Displays the MTU size of the specified interface tunnel.
`Tunnel is a Layer2 GRE TUNNEL`	Displays the layer 2 or layer 3 status of the specified interface tunnel.
`Tunnel is trusted`	Displays whether or not the specified interface tunnel is trusted.
`Inter tunnel flooding is enabled`	Displays whether or not the inter tunnel flooding of the specified interface tunnel is enabled.
`Tunnel keepalive is disabled`	Displays whether or not the tunnel keepalive of the specified interface tunnel is enabled.
`Keepalive type is Default`	Displays the type of the keepalive of the specified interface tunnel.
`Tunnel keepalive interval is 1 seconds, retries 1`	Displays the keepalive interval and number of retries configured on the specified interface tunnel.
`Heartbeats sent 1992, Heartbeats lost 1991`	Displays the number of heartbeats sent and lost on the specified interface tunnel.
`Tunnel is down 2 times`	Displays the number of times the tunnel was down on the specified interface tunnel.
`Trusted vlans:350-850`	Displays the VLAN IDs that are trusted on the specified interface tunnel.
`tunnel vlan 300-900`	Displays the VLAN IDs that are part of the tunnel in the specified interface tunnel.

Related Commands

Command History

Release	Modification
AOS-W 8.4.0.0	The **trusted-vlan** and **untrusted-vlan** sub-parameters was introduced in the following command. ■ **show interface tunnel <id>**
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on Mobility Master.

show interface vlan

```
show interface vlan <id> [access-group]
```

Description

Displays information about a specified VLAN interface.

Syntax

Parameter	Description
`<id>`	VLAN interface number.
`access-group`	Session ACL configured on this interface.

Example

The following example displays information about VLAN 90:

```
(host) [mynode] #show interface vlan 20

VLAN20 is up line protocol is up
Hardware is CPU Interface, Interface address is 00:0C:29:3C:F7:D3 (bia 00:0C:29:3C:F7:D3)
Description: 802.1Q VLAN
IPv6 is enabled, link-local address is fe80::c:2900:143c:f7d3
Global unicast address(es):
2017::1, subnet is 2017::/64
IPv6 Router Advertisements are disabled
Routing interface is enable, Forwarding mode is enable
Directed broadcast is disabled, BCMC Optimization disabled ProxyARP disabled Suppress ARP
enable
Encapsulation 802, loopback not set
MTU 1500 bytes
Last clearing of "show interface" counters 1 day 2 hr 55 min 37 sec
link status last changed 1 day 0 hr 37 min 24 sec
Proxy Arp is disabled for the Interface
IPv6 Helper Addresses Configured on this Interface:
2017::2 with source ::
```

The output of this command includes the following parameters:

Parameter	Description
`VLAN1 is...`	Status of the specified VLAN.
`line protocol is...`	Displays the status of the line protocol on the specified port.
`Hardware is...`	Describes the hardware interface type.
`Interface address is...`	Displays the MAC address of the hardware interface.
`Description`	Description of the specified VLAN.
`Internet address is...`	IP address and subnet mask of the specified VLAN.

Parameter	Description
`IPv6 Router Advertisements...`	Status of IPv6 RA.
`Routing interface is...`	Status of the routing interface.
`Forwarding mode is...`	Status of the forwarding mode.
`Directed broadcast is...`	Displays whether or not directed broadcast is enabled.
`BCMC Optimization...`	Status of broadcast-multicast optimization.
`ProxyARP...`	Status of proxy ARP. Proxy ARP is a technique by which a device on a given network answers the ARP queries for a network address that is not on that network.
`Supress ARP...`	Status of suppressed ARP. If enabled, the managed device prevents flooding of ARP broadcasts on all the untrusted interfaces.
`Encapsulation`	Encapsulation type.
`loopback...`	Loopback status.
`MTU`	MTU size of the specified port in bytes.
`Last clearing of "show interface counters"`	Time since **show interface counters** was cleared.
`link status last changed`	Time since link status last changed.
`Proxy ARP is...`	Status of proxy ARP on the specified interface.
`IPv6 Helper Addresses...`	Helper address configured for a vlan.

show inventory

```
show inventory
```

Description

This command displays the hardware inventory of Mobility Master or the managed device.

Syntax

No parameters.

Example

Execute this command to display the hardware component inventory of Mobility Master.

```
(host) [mynode] #show inventory

Mgmt Port HW MAC Addr           : 00:0C:29:71:10:0B
HW MAC Addr                     : 00:0C:29:71:10:15

show iostat

```
show iostat
```

Description

Displays Input/Output statistics information. This command reports Central Processing Unit (CPU) statistics and Input/Output statistics for devices and partitions.

Syntax

No parameters.

Example

Execute this command to display the IO statistics.

```
(host) [mynode] #show iostat

The output includes the following parameters:

Parameter	Description
`cpu`	The number of jiffies (1/100th of a second) that the system spent in user mode, user mode with low priority, system mode, and the idle task, respectively.
`page`	The number of pages the system paged in and the number that were paged out (from disk).
`swap`	The number of swap pages that have been brought in an out.
`intr`	The number of interrupts received from the system boot.
`disk_io`	(x,y) is (major, minor):(xx, xx, xxxx, x, x) is (noinfo, read_io_ops, blks_read, write_ io_ops, blks_written).
`ctxt`	The number of context switches that the system underwent.

Parameter	Description
`btime`	The boot time, in seconds.
`processes`	The number of forks since boot.

show iot radio-profile

```
show iot radio-profile [<profile-name>]
```

Description

This command displays the list of IoT radio profiles and the context and status of the IoT radio profiles.

Example

The following example shows the list and context of IoT transport profiles.

```
(host) [mynode] #show iot radio-profile

IoT Radio Profile List
----------------------
Name            References  Profile Status
----            ----------  --------------
Sample-Ble      0
Sample-Zigbee   0

Total:2
```

The following example shows the status of an IoT radio profile.

```
(host) [mynode] #show iot transportProfile Sample-Zigbee

IoT Data Profile "Sample-Zigbee"
------------------------
Parameter                       Value
---------                       -----
Radio Instance                  internal
Radio Mode                      zigbee
Radio Enable                    Enabled
ZipBee Opmode                   coordinator
ZipBee Channel                  auto
ZipBee Permit Joining           on
ZipBee Permit Joining Duration  300
ZipBee PAN ID Type              auto
ZipBee PAN ID                   0000
```

show iot-manager

```
debug db-dump-status
debug db-optimize-status
log level
```

Description

This command shows the status of the IoT manager.

Syntax

Parameter	Description
`debug db-dumb-status`	This parameter shows the database dump status information.
`debug db-optimize-status`	This parameter shows the database optimization status information.
`log`	This parameter shows the logs from IoT manager process.

Usage Guidelines

Use this command to show the status of the IoT manager.

Example

Access the CLI and use the following command to show the status of the IoT manager:

```
(host) [mynode] #show iot-manager debug db-dump-status

IM DB dump status
-----------------
Field          Value
-----          -----
Status:        Success
Filename:      im_db_dump.tgz
Begin Time:    2019-04-30 06:47:48
End Time:      2019-04-30 06:47:48
```

show ip access-group

```
show ip access-group
```

Description

Displays ACLs configured for each port on Mobility Master.

Syntax

No parameters.

Examples

The example below shows part of the output of this command. If a port does not have a defined session ACL, the *Port-Vlan Session ACL* table will be blank.

```
(host) [mynode] #show ip access-group

FE 1/0:
Rx access list 200 is applied
session access list User14 is applied

Port-Vlan Session ACL
---------------------
SessionACL            Vlan     Status
----------            ----     ------
coltrane              22       configured
```

The output of this command includes the following parameters:

Parameter	Description
`Session ACL`	Name of the ACL applied to the interface.
`VLAN`	If the ACL was applied to a VLAN associated with this port, this column will show the VLAN ID.
`Status`	Shows whether or not the session ACL is configured.

Related Commands

Command	Description
ip access-group	Configures an access group for an interface.

show ip access-list

```
show ip access-list
   brief [ipv4|ipv6]
   <string>
```

Description

This command displays a table of all configured ACLs, or show details for a specific ACL.

Syntax

Parameter	Description
`brief`	Display a table of information for all ACLs.
`<string>`	Specify the name of a single ACL to display detailed information on that ACL.

Examples

The example below shows general information for all ACLs in the Access List table.

```
(host) [mynode] #show ip access-list brief

Access list table (4 - IPv4, 6 - IPv6)
--------------------------------------
Name                          Type          Use Count  Roles
----                          ----          ---------  -----
allow-diskservices            session(4)
allow-printservices           session(4)
allowall                      session(46)   3          default-via-role default-vpn-role
authenticated
ap-acl                        session(4)    1          ap-role
ap-uplink-acl                 session(4)
apprf-authenticated-sacl      session       1          authenticated
apprf-default-via-role-sacl   session       1          default-via-role
apprf-default-vpn-role-sacl   session       1          default-vpn-role
apprf-guest-sacl              session       1          guest
apprf-stateful-dot1x-sacl     session       1          stateful-dot1x
apprf-voice-sacl              session       1          voice
captiveportal                 session(4)    2          guest-logon logon
captiveportal6                session(6)    2          guest-logon logon
```

The output of this command includes the following parameters:

Parameter	Description
`Name`	Name of an ACL.
`Type`	Shows that the ACL is one of the following ACL policy types: ■ Ethertype ■ Standard ■ Session ■ MAC ■ Extended

Parameter	Description
`Use Count`	Number of rules defined in the ACL.
`Roles`	Names of user roles associated with the ACL.

Include the name of a specific ACL to show detailed configuration information for that ACL. The output in the example below has been divided into two sections to better fit int this document. The output in the CLI will appear in a single, long table.

```
(host) [mynode] # show ip access-list captiveportal6

ip access-list session captiveportal6
captiveportal6
----------
Priority  Source  Destination  Service       Application    Action   NextHopList TimeRange

           Low                                                          6
           Low                                                          6
           Low                                                          6
           Low                                                          6
           Low                                                          6
           Low                                                          6
```

The output of the **show ip access-list** command may include some or all of the following parameters:

Parameter	Description
`Priority`	Name of an access-control list (ACL).
`Source`	The traffic source, which can be one of the following: ■ **alias**: The network resource (use the netdestination command to configure aliases; use the show netdestination command to see configured aliases) ■ **any**: Matches any traffic. ■ **host**: A single host IP address. ■ **network**: The IP address and netmask. ■ **user**: The IP address of the user. ■ **localip**: The set of all local IP addresses on the system, on which the ACL is applied.
`Destination`	The traffic destination, which can be one of the following: ■ **alias**: The network resource (use the netdestination command to configure aliases;

Parameter	Description
	use the show netdestination command to see configured aliases) ■ **any**: Matches any traffic. ■ **host**: A single host IP address. ■ **network**: An IP address and netmask. ■ **user**: The IP address of the user. ■ **localip**: The set of all local IP addresses on the system, on which the ACL is applied**.**
`Service`	Network service, which can be one of the following: ■ An IP protocol number (0-255). ■ The name of a network service (use the show netservice command to see configured services). ■ **any**: Matches any traffic. ■ **tcp**: A TCP port number (0-65535). ■ **destination port number**: specify the TCP port number (0-65535) ■ **source**: TCP or UDP source port number ■ **udp**: A UDP port number (0-65535).
`Application`	Name of the application to which the ACL is applied. (For a complete list of supported applications, issue the command **show dpi application all**.)
`Action`	Action if rule is applied, which can be one of the following: **deny**: Reject packets. **dst-nat**: Perform destination NAT on packets. **dual-nat**: Perform both source and destination NAT on packets. **permit:** Forward packets. **redirect**: Specify the location to which packets are redirected, which can be one of the following: ■ Datapath destination ID (**0-65535**). ■ **esi-group**: Specify the ESI server group configured with the esi group command ■ **opcode**: Specify the datapath destination ID (0x33, 0x34, or 0x82). Do not use this parameter without proper guidance from Alcatel-Lucent. **tunnel:** Specify the ID of the tunnel configured with the interface tunnel command. **src-nat**: Perform source NAT on packets.
`IpsecMap`	Packets can be redirected over a VPN tunnel by specifying the name of an IPsec map in the ACL. This column specifies the name of an IPsec map used by a router ACL. For more information on IPsec maps, see crypto-local ipsec-map.
`Timerange`	Any defined time range for this rule.
`NextHopList`	If the access rule uses PBR to forwards packets to a nexthop device, then this column displays the next-hop list associated with the rule. For more information on next-hop lists, see ip nexthop-list on page 668.
`Tunnel`	Packets can be redirected over an L3 GRE tunnel. If the ACL routes packets over a tunnel, this column specifies the tunnel used by the ACL.
`TunnelGroup`	Packets can be redirected over an L3 GRE tunnel group. If the ACL routes packets over a tunnel in a tunnel group, this column specifies the tunnel group used by the ACL. For more information on tunnel groups, see tunnel-group.
`Log`	Shows if the rule was configured to generate a log message when the rule is applied.
`Expired`	Shows if the rule has expired.
`Queue`	Shows if the rule assigns a matching flow to a priority queue (high or low).

Parameter	Description
`8021.p`	802.11p priority level applied by the rule (0-7).
`Blacklist`	Shows if the rule should blacklist any matching user.
`Mirror`	Shows if the rule was configured to mirror all session packets to datapath or remote destination.
`DisScan`	Shows if the rule was configured to pause ARM scanning while traffic is present.
`IPv4/6`	Shows the IP version.
`Contract`	Shows the bandwidth contract status.

show ip dhcp

```
show ip dhcp
  binding
  database
  relay statistics
  statistics
```

Description

This command displays the DHCP server binding, database setting, relay and pool statistics.

Syntax

Parameter	Description
`binding`	Show DHCP server bindings.
`database`	Show DHCP server settings.
`relay statistics`	Show DHCP relay statistics.
`statistics`	Show DHCP pool statistics.

Examples

The example below shows DHCP statistics for two configured networks.

```
(host) [mynode] #show ip dhcp statistics

DHCPv4 enabled; DHCPv6 enabled
DHCP Pools
----------
Network Name  Type  Active  Configured leases  Active leases  Free leases  Expired leases
Abandoned leases
------------  ----  ------  -----------------  -------------  -----------  --------------  ---
-------------
2-2-2-nw      v4    Yes     242                0              242          0               0
3-2-2-nw      v4    Yes     254                0              254          0               0
test          v4    Yes     254                0              254          0               0
2011          v6    No      5                  -              -            -               -
2012          v6    No      5                  -              -            -               -
Current leases          750
Total leases            512
```

Starting from AOS-W 8.2.0.0, if the DHCP lease limit is configured to exceed the user limit, a warning is displayed in the command output.

```
host) (config) #show ip dhcp statistics
DHCPv4 disabled; DHCPv6 disabled
DHCP Pools
----------
Network Name  Type  Active  Configured leases  Active leases  Free leases  Expired leases
------------  ----  ------  -----------------  -------------  -----------  --------------
Abandoned leases
---------- ------
Current leases          0
Total leases            2048
```

WARNING: DHCP lease limit increased beyond user limit. Some of the controller's services may be impacted

```
NOTE: To make a DHCPv6 pool active, ensure that the pool name is added in vlan interface.
```

The output of this command includes the following parameters:

Parameter	Description
`Network Name`	Range of addresses that the DHCP server may assign to clients.
`Type`	Indicates the IP version of the DHCP server. It can be v4 or v6.
`Active`	Indicates if the DHCP server is active or not.
`Configured leases`	Number of leases configured on the DHCP server.
`Active leases`	Number of active DHCP leases.
`Free leases`	Number of available DHCP leases.
`Expired leases`	Number of leases that have expired because they have extended past their valid lease period.
`Abandoned leases`	Number of abandoned leases. Abandoned leases will not be reassigned unless there are no free leases available.

show ip domain-name

```
show ip domain-name
```

Description

This command displays the full domain name and server.

Syntax

No parameters.

Examples

The following example displays that the IP domain lookup feature is enabled, and the DNS server is configured on the managed device.

```
(host) [mynode] #show ip domain-name

IP domain lookup:                Enabled
IPv6 domain lookup:              Enabled
IP Host.Domain name:             SP-VMC.
IP Domain Redirect:              Enabled
DNS servers
===========
10.13.6.110
10.13.5.200
2020::abcd:abcd

Redirect DNS servers
====================
xyzcorp.com.............         192.168.11.2

show ip-flow-export

```
show ip-flow-export
   collector [<ipaddr>]
   gsm-cache
```

Description

This command shows information for IP flow collector and the GSM cache.

Syntax

Parameter	Description
`collector [<ipaddr>]`	Specify the IP address of the collector.
`gsm-cache`	Shows GSM cache.

Example

The following command displays information about the IP flow collector.

```
(host) [mynode] #ip-flow-export collector

Observation Domain: 168096376 (Controller IP)
Collector IP Not Configured, protocol udp, port 4739, not enabled, not connected
Upload template always, upload all sessions every 15 minute(s), no upload flow cache snapshot
15000 flow cache size, 0 flows exported, next sequence 0, 0 packets, 0 bytes
Last template send: Never, last dispatch: Never
0 Connect errors, 0 connection resets, 0 send errors, 0 flows dropped, 0 blocked sends
(RJ_LC120) #show ip-flow-export collector 1.1.1.1
Observation Domain: 168096376 (Controller IP)
Collector IP 1.1.1.1, protocol udp, port 4739, not enabled, not connected
Upload template always, upload all sessions every 15 minute(s), no upload flow cache snapshot
15000 flow cache size, 0 flows exported, next sequence 0, 0 packets, 0 bytes
Last template send: Never, last dispatch: Never
0 Connect errors, 0 connection resets, 0 send errors, 0 flows dropped, 0 blocked sends
No flows
```

show ip health-check

```
show ip health-check <probe-ip> <src_intf>
```

Description

This command displays the health-check status of the uplink interfaces of a branch office managed device.

Syntax

Parameter	Description
`<probe-ip>`	IP address of Mobility Master.
`<src_intf>`	Source interface VLAN.

Usage Guidelines

This command should be executed from the branch office managed device.

Example

The following example displays the status of two uplinks on a branch office managed device.

```
(host-md) #show ip health-check

IP Health-Check Entries
-----------------------
Probe IP        Src Interface   State    Probe Profile   Avg RTT(ms)
--------        -------------   ------   --------------  ----------
10.10.10.254    vlan 1          UP       Default         20.4
10.10.10.254    Cellular        DOWN     Default         0
```

The output of this command includes the following data columns.

Parameter	Description
`Probe IP`	IP address of Mobility Master.
`Src Interface`	IP address of the uplink gateway interface through which the probes were sent.
`State`	Shows if the uplink is in an UP or DOWN state.
`Probe-Profile`	A branch of managed device supports only the **default** IP probe profile. For information on configuring an IP probe profile, see **ip probe default**
`Avt RTT (in ms)`	The average round trip time, in milliseconds. If the round trip time is less than 1 millisecond, the average round trip time will appear as 0.

Related Commands

Command	Description

show ip igmp

```
show ip igmp
   cluster
   config
   counters
   group maddr <maddr> [mac <mac-addr>|source <addr>]
   interface [vlan <vlan>]
   proxy-group [vlan <vlan>]
   proxy-mobility-group maddr <maddr>
   proxy-mobiity-stats
   proxy-stats
```

Description

This command displays IGMP timers and counters.

Syntax

Parameter	Description
`cluster`	See show ip igmp cluster.
`config`	Show the current IGMP configuration
`counters`	Display a list counters for the following IGMP queries: ■ received-total ■ received-queries ■ received-v1-reports ■ received-v2-reports ■ received-leaves ■ received-unknown-types ■ len-errors ■ checksum-errors ■ not-vlan-dr ■ transmitted-queries ■ forwarded
`group maddr <maddr>`	Displays the following IGMP group information: ■ mac: Specify MAC address of the specific member. ■ source: Specify the source address of the specific SSM group.
`interface vlan <vlan>`	Show IGMP interface information
`proxy-group vlan <vlan>`	Show IGMP proxy group information for a specific interface.
`proxy-mobility-group maddr <maddr>`	Display the IGMP proxy group information stored for mobile clients which are away from the managed device.
`proxy-mobiity-stats`	Display the most important messages exchanged between the mobility process and the IGMP proxy.
`proxy-stats`	Display the number of messages transmitted and received by the IGMP proxy on the upstream interface

Examples

The following example displays the IGMP interface table for all VLANs on Mobility Master.

```
(host) [mynode] #show ip igmp interface vlan 2

IGMP Interface Table
--------------------
VLAN  Addr        Netmask        MAC Address        IGMP      Snooping  Querier
Destination IGMP Proxy
----  ----        -------        -----------        ----      --------  -------     ----------
- -----------
64    10.6.4.252  255.255.255.0  00:0b:86:01:99:00  disabled  disabled  10.6.4.252  CP
disabled
65    10.6.5.252  255.255.255.0  00:0b:86:01:99:00  disabled  disabled  10.6.5.252  CP
disabled
1     10.6.2.252  255.255.255.0  00:0b:86:01:99:00  disabled  disabled  10.6.2.252  CP
disabled
66    10.6.6.252  255.255.255.0  00:0b:86:01:99:00  disabled  disabled  10.6.6.252  CP
disabled
63    10.6.3.252  255.255.255.0  00:0b:86:01:99:00  disabled  disabled  10.6.3.252  CP
disabled
```

The output of this command includes the following parameters:

Parameter	Description
`VLAN`	A VLAN ID number.
`Addr`	IP address of a VLAN router.
`Netmask`	Subnet mask for the IP address.
`MAC Address`	MAC destination address.
`IGMP`	Indicates if IGMP is enabled (or disabled) on the interface.
`Snooping`	Indicates if IGMP snooping is enabled (or disabled).
`Querier`	IP address of an IGMP querier.
`Destination`	Traffic destination.
`IGMP Proxy`	Indicates if IGMP proxy is enabled (or disabled).

The following example displays the current IGMP configuration settings for Mobility Master.

```
(host) [mynode] #show ip igmp config

IGMP Config
-----------
Name                              Value
----                              -----
robustness-variable               2
query-interval                    30
query-response-interval           100
startup-query-interval            31
startup-query-count               2
last-member-query-interval        10
last-member-query-count           2
version-1-router-present-timeout  400
```

```
version-2-router-present-timeout  400
max-members-per-group             300
quick-client-convergence          enabled
ssm-range                         IANA standard range. 232.0.0.0/8
```

The output of this command includes the following parameters:

Parameter	Description
robustness-variable	This variable is increased from its default level of 2 to allow for expected packet loss on a subnetwork.
query-interval	Interval, in seconds, at which Mobility Master sends host-query messages to the multicast group address 224.0.0.1 to solicit group membership information.
query-response-interval	Maximum time, in .1 second intervals, that can elapse between when Mobility Master sends a host-query message and when it receives a response. This must be less than the **query-interval**.
startup-query-count	Number of queries that Mobility Master sends out on startup, separated by startup-query-interval. The default setting is the value of the **robustness-variable** parameter.
startup-query-interval	Interval, in seconds, at which Mobility Master sends general queries on startup. The default value of this parameter is 1/4 of the **query-interva**l.
last-member-query-count	Number of group-specific queries that Mobility Master sends before assuming that there are no local group members.
last-member-query-interval	Maximum time, in seconds, that can elapse between group-specific query messages.
version-1-router-present-timeout	Timeout, in seconds, if Mobility Master detects a version 1 IGM router.
version-2-router-present-timeout	Timeout, in seconds, if Mobility Master detects a version 2 IGM router.

The following examples displays the information on IGMP groups:

```
(host) [mynode] #show ip igmp group

IGMP Group Table
----------------
(Source,Group)           Members
--------------           -------
(172.12.2.2, 232.0.0.2)  2
(172.12.2.2, 232.0.0.1)  2
(*, 224.0.0.252)         2
(*, 239.255.255.250)     2

Total Groups: 4

(host) [mynode] #show ip igmp group maddr 232.0.0.1 source 172.12.2.2

IGMP Group (172.12.2.2, 232.0.0.1) Table
----------------------------------------
Member          MAC               Vlan  Destination  Version  Age

```
show ip igmp cluster
   aac-info
   bss-info
   client-info
   dmo-off-info
   info
   proxy-group
   stats
```

Description

Display IGMP related cluster information.

Syntax

Parameter	Description
`aac-info`	Show Cluster AAC information of APs.
`bss-info`	Show IGMP BSS information.
`client-info`	Show IGMP cluster client information.
`dmo-off-info`	Show list of (S,G,BSS) where DMO threshold is hit.
`info`	Show Cluster information.
`proxy-group`	Show IGMP cluster proxy database group information.
`stats`	Show cluster statistics.

show ip interface brief

```
show ip interface brief
```

Description

This command displays the IP-related information on all interfaces in summary format.

Syntax

No parameters.

Example

```
(host) #show  ip interface brief

Interface                   IP Address / IP Netmask        Admin    Protocol     VRRP-IP
vlan 1                   172.16.0.254 / 255.255.255.0      up       up
vlan 2                      10.4.62.9 / 255.255.255.0      up       up
loopback                  unassigned / unassigned          up       up
mgmt                      unassigned / unassigned          down     down
```

The following table details the columns and content in the show command.

Column	Description
`Interface`	List the interface and interface identification, where applicable.
`IP Address /IP Netmask`	List the IP address and netmask for the interface, if configured.
`Admin`	States the administrative status of the interface. Enabled—up Disabled—down
`Protocol`	Status of the IP on the interface. Enabled—up Disabled—down
`VRRP-IP`	VRRP IP address associated to the interface.

Command History

Version	Modification
AOS-W 8.0.0.0	Command introduced.

show ip mobile

```
show ip mobile
   act
   active-domains
   binding [<host-ip>|<host-ipv6>|<host-macaddr>|brief]
   domain [<name>]
   global
   hat
   host [<host-ip>|<host-ipv6>|<host-macaddr>|brief]
   multicast-vlan-table [client-macaddr]
   packet-trace [<count>]
   remote <host-ip>|<host-ipv6>|<host-macaddr>
   trace <host-ip>|<host-ipv6>|<mac-addr>|{force <host-ip>|<host-ipv6>|<mac-addr>}
   traffic dropped|foreign-agent|home-agent|proxy
   trail <host-ip>|<host-ipv6><host-macaddr>
   tunnel
   visitor [<host-ip>|<host-ipv6>|<host-macaddr>|brief]
```

Description

This command displays statistics and configuration information for the mobile protocol.

Syntax

Parameter	Description
`act`	Active anchor managed device table; subnets to another managed device map.
`active domains`	IP mobility domains active on this switch
`binding`	Display a list of Home Agent Bindings
`[<host-ip>]`	Filter the Home Agent Bindings list to display data for a specific host IPv4 address.
`[<host-ipv6>]`	Filter the Home Agent Bindings list to display data for a specific host IPv6 address.
`[<host-macaddr>]`	Filter the Home Agent Bindings list to display data for a specific host MAC address.
`[brief]`	Limit the output of this command to show just two lines of data.
`domain [<name>]`	Display subnet, VLAN, and home agent information for all mobility domains, or specify a mobility domain name to view data for that domain only.
`global`	View the current Mobility Agents global configuration
`hat`	Display the active Home Agent table
`host`	Display a list of Mobile IP hosts.

Parameter	Description
[<host-ip>]	Filter the Mobile Host List to display data for a specific host IPv4 address.
[<host-ipv6>]	Filter the Mobile Host List to display data for a specific host IPv6 address.
[<host-macaddr>]	Filter the Mobile Host List to display data for a specific host MAC address.
[brief]	Limit the output of this command to show just two lines of data.
multicast-vlan-table	Displays mobility multicast VLAN table information.
mac	MAC address of the client.
packet-trace [<count>]	The output of this command shows when packets of different types were sent between a source IP or MAC address and a destination IP or MAC address.
remote <host-ip>| <host-ipv6>|<host-macaddr>	This is a debug command can be used to identify the managed device associated with the specified client IPv4 or IPv6 address or MAC address. The output of this command shows the home agent (HA) and foreign agent (FA) for a mobile client, as well as the client's roaming status.
trace	Show if the Mobile IP feature will poll remote managed device for mobility status of station.
<host-ip>	Host IPv4 address.
<host-ipv6>	Host IPv6 address.
<mac-addr>	Host MAC address
force <host-ip>| <host-ipv6>|<mac-addr>	Show if the Mobile IP feature will poll remote managed device for mobility status of station.
traffic	Display mobile IP protocol statistics for: ■ Proxy Mobile IP ■ Home Agent Registrations ■ Foreign Agent Registrations ■ Registration Revocations
dropped	Show only counters for dropped mobility traffic.
foreign-agent	Show only mobile IP foreign agent statistics. A foreign agent is the managed device which handles all mobile IP communication with a home agent on behalf of a roaming client.
home-agent	Show only mobile IP home agent statistics. A home agent for a mobile client is the managed device where the client first appears when it joins the mobility domain.
proxy	Show only counters for mobile IP proxy traffic.
trail <host-ip>| <host-ipv6>|<host-macaddr>	Show the mobile IP roaming trail by entering a host's IP (IPv4 or IPv6)or MAC address.

Parameter	Description
`tunnel`	Show the Mobile Tunnel Table for IPIP tunnels.
`visitor`	Display a list of mobile nodes visiting a foreign agent.
`[<host-ip>]`	Filter the Foreign Agent Visitor list to display data for a specific host IPv4 address.
`[<host-ipv6>]`	Filter the Foreign Agent Visitor list to display data for a specific host IPv6 address.
`[<host-macaddr>]`	Filter the Foreign Agent Visitor list to display data for a specific host MAC address.
`[brief]`	Limit the output of this command to show just two lines of data.

Examples

The example below lists mobility domains configured on the managed device, and shows information for any subnets defined on these domains.

```
(host) [mynode] #show ip mobile domain

Mobility Domains:, 2 domain(s)
------------------------------

Domain name default
   Home Agent Table, 0 subnet(s)

Domain name newdomain
   Home Agent Table, 2 subnet(s)
        subnet          mask            VlanId Home Agent         Description
        --------------- --------------- ------ ---------------    -----------------------
        10.2.124.76     255.255.255.255 1      10.4.62.2          Corporate mobility entry
        172.21.5.50     255.255.255.255 1      10.4.62.2          Reserved entries
```

The output of this command includes the following parameters:

Parameter	Description
`Home Agent`	IP address of the home agent or mobility agent.
`Description`	Description of the HAT entry.

Use the **show ip mobile host** command to track mobile users.

```
(host) [mynode] #show ip mobile host

Mobile Host List, 1 host(s)
---------------------------
9c:b7:0d:3f:a6:dd  10.16.23.219  mob1
IPv4: 10.16.23.219
IPv6: fe80::826:aa9a:fe35:53e0
2004:deed::34
Roaming Status: Home Switch/Home VLAN, Service time 0 days 01:34:19
Home VLAN 623 on network 10.16.23.0/24
DHCP lease for PC at Sun Dec 23 20:32:00 2012 for 86400 secs from 10.16.28.1
```

The output of this command includes the following parameters:

Parameter	Description
`<mac-addr> <ip-addr>`	MAC and IP addresses of the host
`Roaming Status`	Displays how long the host has used its current managed device and VLAN.
`Home VLAN`	VLAN ID, IP address and subnet of the home VLAN.
`DHCP lease`	Displays the amount of time the station has had its current DHCP lease.

Related Commands

show ip nat pool

```
show ip nat pool
```

Description

This command displays a pool of IP addresses for NAT.

Syntax

No parameters.

Examples

The example below shows the current NAT pool configuration on Mobility Master.

```
(host) [mynode]# show ip nat pools

NAT Pools
---------
Name  Start IP     End IP       DNAT IP         Flags
----  --------     ---------    -------         -----
2net  192.0.2.2    192.0.2.48   192.0.2.222
```

The output of this command includes the following parameters:

Parameter	Description
`Name`	Name of the NAT pool.
`Start IP`	IP address that defines the beginning of the range of source NAT addresses in the pool.
`End IP`	IP address that defines the end of the range of source NAT addresses in the pool.
`DNAT IP`	Destination NAT IP address, if defined.
`Flags`	NAT pool flags, if any.

show ip nexthop-list

```
show ip nexthop-list
   details STRING
   STRING
```

Description

This command displays the next hop list settings for policy-based routing.

Syntax

Parameter	Description
`details`	Displays detailed next hop settings for policy-based routing.
`STRING`	Displays the next hop settings based on the next hop list name.

Usage Guidelines

A next hop IP is the IP address of a adjacent router or device with layer-2 connectivity to managed device. The next hop list provides redundancy for the next hop devices by forwarding the traffic to a backup next hop device in case of failures. If active next hop device on the list becomes unreachable, traffic matching a policy-based routing ACL is forwarded using the highest-priority active next hop on the list. For more information on this feature, see ip nexthop-list on page 668.

Example

The following command displays the configuration settings for the one configured next hop list.

```
(host) [mynode] #show ip nexthop-list

Nexthop-List Entries
--------------------
Name                    Type            Dest  Preemptive Failover  Nexthop
----                    ----            ----  -------------------  -------
load-balance-gateways   Active-Active         Enabled
load-balance-ipsecs     Active-Active         Enabled
traditional-ipsecs      Active-Standby        Enabled

Nexthop Dest  Nexthop Priority
------------  ----------------
              10.18.2.254(2), 10.10.10.254(1)
```

The output of this command displays the following information

Parameter	Description
`Name`	Name of the next hop list
`Type`	Type of next hop.
`Dest`	Destination prefix address.
`Preemptive Failover`	This column indicates whether preemptive failover is enabled or disabled.

Parameter	Description
	If preemption is enabled and a higher priority next hop becomes reachable again, packets are again forwarded to the higher priority next hop.
`Nexthop`	Next hop IP address.
`Nexthop Dest`	Next hop destination prefix address.
`Nexthop Priority`	List of the IP addresses of all next hop IPs, including the priority assigned to each device when the list was configured.

Related Commands

Command	Description
ip route	This command configures a static route on Mobility Master. (These routes can use a next hop list.)
ip nexthop-list	Configure next hop list settings for policy-based routing.

Command History

show ip ospf

```
show ip ospf
   database area <area-id>
   debug route
   interface [tunnel|vlan] <id>
   neighbor
   rapng-vpn aggregate-routes <ip-addr> <mask>
   redistribute
   subnet
```

Description

Display statistics and configuration information for the OSPF routing protocol.

Syntax

Parameter	Description
`database area <area-id>`	Show database information for the OSPF protocol.
`debug route`	Show debugging information for OSPF routes.
`interface [tunnel|vlan] <id>`	Display the status of OSPF on an individual interface by specifying a tunnel or VLAN ID number. The tunnel ID range is 1-16777215.
`neighbor`	Display data for OSPF neighboring routers.
`rapng-vpn`	Display IAP-VPN information.
`aggregate-routes <ip-addr> <mask>`	Display IAP-VPN aggregate route information.
`redistribute`	Display OSPF route distribution information.
`subnet`	Display the subnets manually added to the Subnet Exclude List via the router ospfsubnet exclude <addr> <mask> command.

Example

If you issue this command without any of the optional parameters described in the table above, the **show ip ospf** command will display general router and area settings for the OSPF.

```
(host) [mynode] #show ip ospf

OSPF is currently running with Router ID 123.45.110.200
Number of areas in this router is 1
Area 10.1.1.0
        Number of interfaces in this area is 2
        Area is totally stub area
        SPF algorithm executed 0 times
```

The output of this command includes the following parameters.

Parameter	Description
`OSPF Router ID`	Verifies that OSPF is running and the router ID that OSPF is running on.
`Number of areas`	List the number of areas configured in the router.
`Area`	Displays the Area ID followed by: ■ number of interfaces in the area ■ indicates if the area is a totally stub area ■ number of times the SPF algorithm has been executed

To display OSPF settings for an individual interface, you must specify a VLAN or tunnel ID number. The example below displays part of the output of the **show ip ospf interface vlan** command.

```
(host) [mynode] #show ip ospf interface vlan 1

Vlan 1 is up, line protocol is up
Internet Address 170.1.0.1, Mask 255.255.255.0, Area 2.0.1.1
Router ID 16.1.0.2, Network Type BROADCAST, Cost: 1
Transmit Delay is 1 sec, State DROTHER, Priority 0
Designated Router id 0.0.0.0, Interface Address 170.1.0.1
Backup designated Router id 0.0.0.0, Interface Address 170.1.0.1
Timer intervals configured, Hello 10, Dead 40, Retransmit 5
Neighbor Count is 0
Tx Stat: Hellos 7 DbDescr 0 LsReq 0 LsUpdate 0 LsAck 0 Pkts 7
Tx Err:  BufNull 0 BufCorrupt 0 NoMem 0 SendFail 0
Rx Stat: Hellos 0 DbDescr 0 LsReq 0 LsUpdate 0 LsAck 0 Pkts 0
LoopSend 0 RxVirtualLink 0
Rx Err:  DisCd 0 BadVer 0 BadNet 0 BadArea 0 BadDstAdr 0 BadAuType 0
BadAuth 0 BadNeigh 0 BadPckType 0 BadVirtLink 0
IntfDown 0 MySource 0 Legal 0
```

...

The output may include some or all of the following parameters.

Parameter	Description
`Vlan <number>`	Identifies that the interface type and ID are up and functional.
`Internet Address`	Internet address, network mask, and area assigned to the interface.
`Router ID`	Displays the router ID, that the network type is Broadcast, and the cost value.
`Transmit Delay`	Details of the transmit delay, state, and priority.
`Designated Router`	Details of the designated router ID and interface address.
`Backup Designated Router ID`	Details of the backup router ID and interface address.
`Timer intervals configured`	Details of elapse time intervals for Hello, Dead, Transmit (wait), and retransmit.
`Neighbor Count`	Details the number of neighbors and adjacent neighbors.
`Tx Stat`	Counters and statistics for transmitted data. ■ **Hellos**: Number of transmitted hello packets. These packets are sent every hello interval.

Parameter	Description
	■ **DbDescr**: Number of transmitted database description packets. ■ **LsReq**: Number of transmitted link state request packets. ■ **LsUpdate**: Number of transmitted link state update packets. ■ **LsAck**: Number of transmitted link state acknowledgment packets ■ **Pkts**: Total number of transmitted packets.
`Tx Err`	Counters and statistics for received data. ■ **Hellos**: Number of received hello packets. These packets are sent every hello interval. ■ **DbDescr**: Number of received database description packets. ■ **LsReq**: Number of received link state request packets. ■ **LsUpdate**: Number of received link state update packets. ■ **LsAck**: Number of received link state acknowledgment packets ■ **Pkts**: Total number of received packets.
`Rx Stat`	Counters and statistics for received data. ■ **Hellos**: Number of received hello packets. These packets are sent every hello interval. ■ **DbDescr**: Number of received database description packets. ■ **LsReq**: Number of received link state request packets. ■ **LsUpdate**: Number of received link state update packets. ■ **LsAck**: Number of received link state acknowledgment packets ■ **Pkts**: Total number of received packets.
`Rx Err`	Counters and statistics for received data. ■ **Hellos**: Number of received hello packets. These packets are sent every hello interval. ■ **DbDescr**: Number of received database description packets. ■ **LsReq**: Number of received link state request packets. ■ **LsUpdate**: Number of received link state update packets. ■ **LsAck**: Number of received link state acknowledgment packets ■ **Pkts**: Total number of received packets.
`DisCd`	Number of received packets that are discarded.
`BadVer`	Number of received packets that have bad OSPF version number.
`BadNet`	Number of received packets that belong to different network than the local interface.
`BadArea`	Number of received packets that belong to different area than the local interface.
`BadDstAdr`	Number of received packets that have wrong destination address.
`BadAuType`	Number of received packets that have different authentication type than the local interface.
`BadAuth`	Number of received packets where authentication failed.
`BadNeigh`	Number of received packets which didn't have a valid neighbor.

show ip pppoe-info

```
show ip pppoe-info
```

Description

This command displays the configuration settings for PPPoE.

Syntax

No parameters.

Examples

The following example displays the current PPPoE configuration.

```
(host) [mynode] #show ip pppoe-info

PPPoE username: rudolph123
PPPoE password: <HIDDEN>
PPPoE service name: ppp2056
PPPoE VLAN: 22
Gateway NAT: Enabled     IP: 10.1.1.1
PPPoE is UP
Server IP: 9.0.0.3
Gateway IP: 9.0.0.3
Primary DNS: <NONE> Secondary DNS: <NONE>
```

The output of this command includes the following parameters:

Parameter	Description
`PPPoE username`	PAP username configured on the PPPoE access concentrator.
`PPPoE password`	If this parameter displays the word **<HIDDEN>**, a PAP password is configured on the PPPoE access concentrator. If this parameter is **<NONE>**, there is no PPPoE password configured.
`PPPoE service name`	PPPoE service name.
`PPPoE VLAN`	VLAN configured to use PPPoE to obtain an IP address via the command **interface vlan <id> ip address pppoe.**

show ip probe

```
show ip probe
```

Description

This command displays the **health-check** profile settings for measuring WAN reachability and latency on a managed device uplink, and the **default** probe profile settings for PBR using next-hop lists.

Syntax

No parameters.

Usage Guidelines

The health-check feature uses ping or UDP probes for measuring WAN reachability and latency. PBR routing uses ping probes to determine the reachability of devices on a next-hop list. This command should be executed from the managed device only.

Examples

The following command displays the current IP probe settings for the **default** and **health-check** IP probe profiles.

```
(host-md) #show ip probe

IP Probe Entries
----------------
Name          Probe Mode  Frequency(in sec)  Retries  Burst size
----          ----------  -----------------  -------  ----------
default       Ping        10                 19       3
health-check  Ping        10                 3        5
```

The output of this command contains the following information:

Column	Description
Name	Name of the ip probe profile, which is either **default** or **health-check**.
Probe Mode	Indicates whether the probes are sent as ping or UDP packets.
Frequency	Probe interval, in seconds. The managed device sends the number of probes in the **Burst Size** column during each frequency interval.
Retries	Number of times the managed device attempts to resend a probe.
Burst size	Number of probes sent during the probe frequency interval that appears in the **Frequency** column.

Related Commands

Command	Description

show ip radius

```
show ip radius
   nas-ip
   source-interface
```

Description

This command displays global parameters for configured RADIUS servers.

Syntax

Command	Description
`nas-ip`	Show the Network Access Server (NAS) IP address attribute sent in outgoing RADIUS requests.
`source-interface`	Show the source interface address of outgoing RADIUS requests.

Examples

The following example displays the RADIUS client NAS IP address:

```
(host) [mynode] #show ip radius nas-ip
RADIUS client NAS IP address = 10.168.254.221
RADIUS client NAS IPv6 address = ::1
```

The following example displays the RADIUS client source interface address of the outgoing RADIUS requests:

```
(host) [mynode] #show ip radius source-interface
Global radius client source IP address = 12.0.2.26, vlan 3
Global radius client source IPv6 address = ::, vlan 0
Per-server client source IPv4/6 addresses:
```

Related Commands

Command	Description

show ip route

```
show ip route
   counters
   static
   stats
```

Description

This command displays the Mobility Master routing table.

Syntax

Command	Description
`counters`	Displays the number of routes present, categorized by type.
`static`	Include this optional parameter to display only static routes.
`stats`	Displays route statistics.

Usage Guidelines

This command displays static routes configured on the Mobility Master using the ip route command. Use the ip default-gateway command to set the default gateway to the IP address of the interface on the upstream router or switch to which you connect Mobility Master.

Examples

The following example displays the IP address of routers and the VLANs to which they are connected:

```
(host) [mynode]#show ip route
M - mgmt, U - route usable, * - candidate default, V - RAPNG VPN/Branch
Gateway of last resort is Imported from DHCP to network 0.0.0.0 at cost 10
Gateway of last resort is Imported from CELL to network 0.0.0.0 at cost 10
Gateway of last resort is Imported from PPPOE to network 0.0.0.0 at cost 10
Gateway of last resort is 10.7.73.77 to network 0.0.0.0 at cost 1
S*    0.0.0.0/0  [1/0] via 10.7.73.77*
S    172.0.0.0/8  [1/0] via 172.16.1.253*
```

Related Commands

show ip tacacs

```
show ip tacacs
   source-interface
```

Description

This command displays global parameters for configured TACACS servers.

Syntax

Command	Description
`source-interface`	Shows the source interface address of outgoing TACACS requests.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Examples

The following example displays the TACACS client source interface address of the outgoing TACACS requests:

```
(host) [mynode] #show ip tacacs source-interface
Global tacacs client source IP address = 0.0.0.0, vlan 0
Global tacacs client source IPv6 address = ::, vlan 0
Per-server client source IPv4/6 addresses:
```

Related Commands

show ipc statistics app-ap

```
show ipc statistics app-ap {am|ap-stm|ofald|sapd}
   ap-name <ap-name>
   bssid <bssid>
   ip-addr <ip-addr>
```

Description

This command displays the Inter Process Communication (IPC) statistics for a specific AP or BSSID.

Syntax

Parameter	Description
`am`	Show IPC statistics for an air monitor.
`ap-stm`	Show IPC statistics for AP station management communication.
`ofald`	OpenFlow Agent Lite Daemon. Show OpenFlow Agent statistics running on the AP.
`sapd`	Show IPC statistics for the AP management process on the AP.
`ap-name <ap-name>`	Show IPC statistics for an AP with a specific name.
`bssid <bssid>`	Show IPC statistics for a specific Basic Service Set Identifier (BSSID). An AP's BSSID is usually the AP's MAC address.
`ip-addr <ip-addr>`	Show IPC statistics for an AP with a specific IP address. Enter the IP address in dotted-decimal format.

Usage Guidelines

Execute this command under the supervision of Alcatel-Lucent TAC to troubleshoot application errors. This command should be executed on a standby Switch or managed device where the APs terminate.

Example

The following example shows IPC statistics for the station management process on an AP named **corp-AP-115**.

```
(host-md) #show ipc statistics app-ap ap-stm ap-name corp-AP-115
IP: 168778491, IP_STR: 10.15.90.251

14302                    0        0        0        0        0        1        0        0
  1        0
Allocated Buffers   1
Static Buffers      4
```

```
Static Buffer Size  1400
```

The output of this command includes the following data columns:

Parameter	Description
`Tx Msg`	Number of transmitted messages.
`Tx Blk`	Number of blocking messages transmitted.
`Tx Ret`	Number of transmitted messages that were returned.
`Tx Fail`	Number of failure messages that were transmitted.
`Rx Ack`	Number of received acknowledgments.
`Rx Msg`	Number of received messages.
`Rx Drop`	Number of received messages that were dropped.
`Rx Err`	Number of received messages with errors.
`Tx Ack`	Number of transmitted acknowledgments.
`Allocated Buffers`	Number of allocated buffers for IPC messages.
`Static Buffers`	Number of static buffers for IPC messages.
`Static Buffer Size`	Size of the static buffer.

show ipc statistics app-id

```
show ipc statistics app-id <app-id>
```

Description

This command displays the Inter Process Communication (IPC) statistics for a specific AP or BSSID.

Syntax

Parameter	Description
`<app-id>`	Application ID number. This number must be obtained from Alcatel-Lucent TAC.

Usage Guidelines

Execute this command under the supervision of Alcatel-Lucent TAC to troubleshoot application errors.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable mode on Mobility Master or Managed Device.

show ipc statistics app-name

```
show ipc statistics app-name <name>
```

Description

Display Inter Process Communication (IPC) statistics for a specific application.

Syntax

Parameter	Description	
`<name>`	One of the following application names: ■ **aaa**: Administrator Authentication ■ **ads**: Anomaly Detection ■ **auth-resp**: Authentication Response ■ **authmgr**: User Authentication ■ **certmgr**: Certificate Manager ■ **cfgm**: Config Manager ■ **cluster_mgr**: Cluster Manager ■ **cpsec**: Control-Plane Security Manager ■ **cts**: Transport Service ■ **dbsync**: Database Synchronization ■ **dds**: Distributed data store ■ **dhcp**: DHCP Server ■ **esi**: Server Load Balancing ■ **extifmgr**: External Interface Manager ■ **fpapps**: Layer 2,3 control ■ **gsmmgr**: GSM manager ■ **ha_mgr**: HA manager ■ **httpd**: HTTPD ■ **ike**: IKE Daemon ■ **l2tp**: L2TP ■ **lagm**: LAGM ■ **licensemgr**: License Manager ■ **mdns**: AirGroup mdns ■ **mobileip**: Mobile IP	■ **ntp**: NTP Daemon ■ **ofa**: OpenFlow Agent ■ **ospf**: OSPF ■ **phonehome**: PhoneHome ■ **pim**: Protocol Independent Multicast ■ **pktfilter**: Packet Filter ■ **pptp**: PPTP ■ **profmgr**: Profile Manager ■ **publisher**: Publish subscribe service ■ **resolver**: Resolver ■ **sapm**: SAPM ■ **sapm-resp**: SAPM Response ■ **snmp**: SNMP agent ■ **stm**: Station Management ■ **stm-lopri**: Station Management Low Priority ■ **syslogd**: Syslog Manager ■ **ucm**: Unified Communication Manager ■ **userdb**: User Database Server ■ **vrrp**: VRRP ■ **web_cc**: Web Content Classification ■ **wms**: Wireless Management

Usage Guidelines

Execute this command under the supervision of Alcatel-Lucent TAC to troubleshoot application errors.

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The following example shows IPC statistics for the **sapm** process.

To view the statistics of transmitted, received, and denied messages, three additional output parameters are introduced in the **show ipc statistics** command output.

- Tx Sign—the number of messages which were signed before transmitting

- Rx Sign—the number of messages validated through digest validation
- Rx Denied—the number of messages denied due to incorrect digest

```
(host) [mynode] #show ipc statistics app-name sapm

Allocated Buffers   4
Static Buffers      0
Static Buffer Size  1476
```

The output of this command includes the following data columns:

Parameter	Description
Tx Msg	Number of transmitted messages.
Tx Blk	Number of blocking messages transmitted.
Tx Ret	Number of transmitted messages that were returned.
Tx Fail	Number of failure messages that were transmitted.
Rx Ack	Number of received acknowledgments.
Rx Msg	Number of received messages.
Rx Drop	Number of received messages that were dropped.

Parameter	Description
`Rx Err`	Number of received messages with errors.
`Tx Ack`	Number of transmitted acknowledgments.
`Tx Sign`	Number of messages which were signed before transmitting.
`Rx Sign`	Number of messages validated through digest validation.
`Rx Denied`	Number of messages denied due to incorrect digest.
`Rx Silent Drops`	Number of received messages that are categorized as silent drops.
`Allocated Buffers`	Number of allocated buffers for IPC messages.
`Static Buffers`	Number of static buffers for IPC messages.
`Static Buffer Size`	Size of the static buffer.

Command History

Release	Modification
AOS-W 8.2.0.0	The **lagm** and **vrrp** parameters were added.
AOS-W 8.0.1.0	**Tx Sign**, **Rx Sign**, and **Rx Denied** columns are added to the command output.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable mode on Mobility Master or Managed Device.

show ipstm

```
show ipstm debug stats
```

Description

This command displays the debug messages for the IPsec tunnel manager.

Syntax

No parameters.

Description

This command displays the IPv4 user table entries. You can filter the output based on various parameters described in the following table.

Syntax

Parameter	Description
`ap-group <ap-group>`	Filter the output of this command by showing users connected to APs that belong to the specified AP group.
`ap-name <ap-name>`	Filter the output of this command by showing users connected to an AP with the specified AP name.
`authentication-method`	Filter the output of this command by the authentication method used for the device:
`dot1x`	Filer the output of this command by showing data for devices using the 802.1X authentication.
`mac`	Filer the output of this command by showing data for devices using the MAC authentication.
`opensystem`	Filer the output of this command by showing data for devices using the open (no) authentication.
`psk`	Filer the output of this command by showing data for devices that do not use authentication but use a PSK for encryption.
`stateful-dot1x`	Filer the output of this command by showing data for devices using stateful 802.1X authentication.
`via-vpn`	Filer the output of this command by showing data for devices that authenticate using VIA.
`vpn`	Filer the output of this command by showing data for devices using VPN authentication.
`web`	Filer the output of this command by showing data for devices using the Captive Portal authentication.
`bssid`	Filer the output of this command by showing users connected to the specified BSSID.
`debug`	Filer the output of this command by showing entries in the IPv4 user-table that are in debug mode.
`essid`	Filer the output of this command by showing entries in the IPv4 user table that are associated to the specified ESSID. If the ESSID includes spaces, you must enclose it in quotation marks.
`internal`	Filer the output of this command by showing internal IPv4 users.
`ip <A.B.C.D>`	Filer the output of this command by showing IPv4 users that match the specified IPv4 address.
`log`	Filer the output of this command by showing the log information for the specified IPv4 client.
`mac`	Filer the output of this command by showing users with the specified MAC address.

Parameter	Description
mobile	Filer the output of this command by showing a list of mobile users in the IPv4 user table. The following filters are available for this parameter: ■ **bindings**—List of users that have moved away from the current managed device. ■ **rows**—Displays entries that match the specified row number. ■ **unique**—Displays unique entries in the IPv6 user-table. ■ **visitors**—Displays users that have associated with the current managed device.
name	Filer the output of this command by showing IPv4 user table entries that match the specified name.
phy-type	Filer the output of this command by showing IPv4 user table entries that match **a** or **b** phy-type.
role	Filer the output of this command by showing IPv4 user table entries that match the specified role.
rows	Filer the output of this command by showing specific rows in the IPv4 user table. Enter the starting row number and the number of rows to be displayed.
station	Filer the output of this command by showing the station table information for the IPv4 user table entries.
verbose	Filer the output of this command by showing the complete IPv4 user table with all details.

Usage Guidelines

This command should be executed from the managed device only where the APs and client terminate.

Example

The following example displays a list of internal IPv4 user entries:

```
(host-md) #show ipv4 user-table

IP                MAC               Name      Role              Age(d:h:m)  Auth
----------       ------------       ------    ----              ----------  ----
192.168.201.234  00:10:18:a9:38:e1  uccsol10  ucc-dot1x-voice   00:22:14    802.1X
192.168.201.230  5c:c5:d4:7d:c0:80  uccsol23  ucc-dot1x-voice   00:02:59    802.1X
192.168.201.252  48:51:b7:19:40:88  uccsol19  ucc-dot1x-voice   00:22:14    802.1X
192.168.201.241  5c:c5:d4:7d:c2:b5  uccsol24  ucc-dot1x-voice   00:02:59    802.1X
192.168.201.233  5c:c5:d4:7d:c0:b7  uccsol22  ucc-dot1x-voice   00:02:29    802.1X

          325-1     Wireless  UCC-DOT1X/ac:a3:1e:57:6d:90/a-VHT  UCC-DOT1X  dtunnel

Type  Host Name
----  ---------

User Entries: 5/5
```

The output of this command includes the following parameters:

Parameter	Description
IP	IP address of the client in that row that authenticating using 802.1X authentication.
MAC	MAC address of the client.
Name	Name of the client.
Role	The role assigned to the client.
Age (d:h:m)	Total time that client is connected to managed device.
Auth	Authentication type of the client.
VPN link	Clients using VPN authentication.
AP name	Name of the AP associated with the client.
Roaming	Current roaming status of the client.
Essid/Bssid/Phy	ESSID, BSSID, and Phy to which the client is associated.
Profile	The AAA profile to which the client is associated.
Forward Mode	The client traffic forwarding mode.

Related Commands

Command	Description
show user-table	Displays detailed information about the Switch's connection to a user device, in regards to mobility state and statistics, authentication statistics, VLAN assignment method, AP datapath tunnel info, radius accounting statistics, user name, user-role derivation method, datapath session flow entries, and 802.11 association state and statistics.

Command History

show ipv6 dhcp

show ipv6 dhcp
    binding
    database [pool<pool_name>]

Description

Shows DHCPv6 server settings.

Syntax

Parameter	Description
`binding`	Show DHCPv6 server bindings.
`database`	Show DHCPv6 server settings.

Examples

The example below shows the DHCPv6 database:

```
(host) [mynode] #show ipv6 dhcp database
DHCPv6 enabled
# 2001-feed-64-nw
subnet6 2001:feed::/120 {
        option vendor-class-identifier  "ArubaAP";
        option dhcp6.vendor-opts  "2001:feed::235";
        range6 2001:feed::1 2001:feed::234;
        range6 2001:feed::236 2001:feed::ffff:ffff:ffff:fffe;
}
# 2003-feed-64-nw
subnet6 2003:feed::/120 {
        option vendor-class-identifier  "ArubaAP";
        option dhcp6.vendor-opts  "2001:feed::235";
        range6 2003:feed::1 2003:feed::234;
        range6 2003:feed::236 2003:feed::ffff:ffff:ffff:fffe;
}
# DHCPv6
subnet6 2001:470:faca:4::/120 {
        default-lease-time 43200;
        max-lease-time 43200;
        option dhcp6.domain-search "test.org";
        option vendor-class-identifier  "ArubaAP";
        option dhcp6.vendor-opts  "2001:feed::235";
        option dhcp6.name-servers 2001:470:20::2;
        option dhcp6.preference 25;
        option dhcp6.usr-opt-24-DHCPv6 "Domain Search List";
        range6 2001:470:20::1 2001:470:faca:4::1;
        range6 2001:470:20::3 2001:470:faca:4:ffff:ffff:ffff:fffe;
}
```

The example below shows the DHCPv6 database for a specific pool:

```
(host) [mynode] #show ipv6 dhcp database [pool <pool-name>]
(host) [mynode] #show ipv6 dhcp database pool DHCPv6

# DHCPv6
subnet6 2001:470:faca:4::/120 {
        default-lease-time 43200;
```

```
        max-lease-time 43200;
        option dhcp6.domain-search "test.org";
        option vendor-class-identifier  "ArubaAP";
        option dhcp6.vendor-opts  "2001:feed::235";
        option dhcp6.name-servers 2001:470:20::2;
        option dhcp6.preference 25;
        option dhcp6.usr-opt-24-DHCPv6 "Domain Search List";
        range6 2001:470:20::1 2001:470:faca:4::1;
        range6 2001:470:20::3 2001:470:faca:4:ffff:ffff:ffff:fffe;
}
```

The example below shows the DHCPv6 binding information:

```
(host) [mynode] # show ipv6 dhcp binding
# Client: fe80::1cf:2e1:cd13:356b; IA ID 0x13001f3c
ia-na "\023\000\037<\000\001\000\001\030\223\211\242\000%\263J\372\364" {
cltt epoch 1364206514; # Mon Mar 25 15:45:14 2013
iaaddr 2001:470:faca:4:21a:1eff:fe00:9e6 {
binding state expired;
preferred-life 187;
max-life 300;
ends epoch 1364206814; # Mon Mar 25 15:50:14 2013
}
```

The example below shows the DHCPv6 active pools:

```
(host) [mynode] #show ipv6 dhcp active-pools
DHCPv6 Active Pools
-------------------
Vlan Pool Name
---- ---------
10   DHCPv6
```

Related Commands

Command	Description
ipv6 dhcp pool	This command configures a DHCPv6 pool on the managed device.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on Mobility Master.

show ipv6 firewall

```
show ipv6 firewall
```

Example

This example displays the status of all firewall configurations.

```
(host) [mynode] #show ipv6 firewall

Global IPv6 firewall policies
-----------------------------
Policy                                      Action    Rate       Port
------                                      ------    ----       ----
Monitor ping attack                         Disabled
Monitor TCP SYN attack                      Disabled
Monitor IPv6 sessions attack                Disabled
Deny inter user bridging                    Disabled
Drop all IPv6 fragments                     Disabled
Per-packet logging                          Disabled
Enforce TCP handshake before allowing data  Disabled
Prohibit RST replay attack                  Disabled
Session Idle Timeout                        Disabled
Prohibit IPv6 Spoofing                      Disabled
Extension header parse length               Enabled   100 bytes
Stateful ICMP Processing                    Disabled
```

The output of this command includes the following parameters:

Parameter	Description
`Monitor ping attack`	If enabled, the managed device monitors the number of ICMP pings per second. If this value exceeds the maximum configured rate, the managed device will register a DoS attack.
`Monitor TCP SYN attack`	If enabled, the managed device monitors the number of TCP SYN messages per second. If this value exceeds the maximum configured rate, the managed device will register a DoS attack.
`Monitor IPv6 sessions attack`	If enabled, the managed device monitors the number of TCP session requests per second. If this value exceeds the maximum configured rate, the managed device will register a DoS attack sessions.
`Deny inter user bridging`	If enabled this setting prevents the forwarding of Layer-2 traffic between wired or wireless users. You can configure user role policies that prevent Layer-3 traffic between users or networks but this does not block Layer-2 traffic.
`Drop all IPv6 fragments`	If enabled, all IPv6 fragments are dropped.
`Per-packet logging`	If active, and logging is enabled for the corresponding session rule, this feature logs every packet.

Parameter	Description
`Enforce TCP handshake before allowing data`	If enabled, this feature prevents data from passing between two clients until the three-way TCP handshake has been performed. Enabling this option causes mobility to fail. So, disable this option if you have mobile clients on the network as.
`Prohibit RST replay attack`	If enabled, this setting closes a TCP connection in both directions if a TCP RST is received from either direction.
`Session Idle Timeout`	Shows if a session idle timeout interval has been defined.
`Prohibit IPv6 Spoofing`	Status on IPv6 spoofing. When this option is enabled, IP and MAC addresses are checked; possible IP spoofing attacks are logged and an SNMP trap is sent.
`Extension header parse length`	Shows the extension header parse length, with a maximum value of 100 bytes.
`Stateful ICMP Processing`	If enabled, stateful ICMP processing is enabled.

show ipv6 interface

```
show ipv6 interface [brief]
```

Description

View IPv6-related information on all interfaces.

Syntax

Parameter	Description
`brief`	Optional parameter. If specified, displays the IPv6-related information on all the interfaces in a summary format.

Example

```
(host) [mynode] #show IPv6 interface
VLAN1 is up line protocol is down
IPv6 Router Advertisements are disabled
IPv6 is disabled
VLAN46 is up line protocol is up
IPv6 is enabled, link-local address is fe80::1a:1e00:2e00:9f0
Global unicast address(es):
2046:eab::25, subnet is 2046:eab::/64
IPv6 Router Advertisements are disabled
VLAN50 is up line protocol is up
IPv6 Router Advertisements are disabled
IPv6 is disabled
VLAN10 is up line protocol is up
IPv6 is enabled, link-local address is fe80::1a:1e00:a00:9f0
Global unicast address(es):
2010:eab::1, subnet is 2010:eab::/64
fc01:eab::1, subnet is fc01:eab::/64
IPv6 Router Advertisements are enabled
loopback is up line protocol is up
IPv6 is enabled, link-local address is fe80::1a:1e0f:ff00:9f0
Global unicast address:
2046:eab::2, subnet is 2046:eab::2/128
TUNNEL2 is up line protocol is up
tunnel mode is Layer2 IPv6 GRE, tunnel vlan 10
tunnel source ipv6 address is 2046:eab::25
tunnel destination ipv6 address is 2047:eab::25

(host) [mynode] #show ipv6 interface brief

show ipv6 mld cluster

```
show ipv6 mld cluster
   aac-info
   bss-info
   client-info
   dmo-off-info
   info
   proxy-group
   stats
```

Description

Display MLD configuration details for a cluster.

Syntax

Parameter	Description
`aac-info`	Show cluster AAC information of APs.
`bss-info`	Show IGMP BSS information.
`client-info`	Show IGMP cluster client information.
`dmo-off-info`	Show list of (S,G,BSS) where DMO threshold is hit.
`info`	Show cluster information.
`proxy-group`	Show IGMP cluster proxy database group information.
`stats`	Show cluster statistics.

Related Commands

Command	Description
ipv6 mld	This command configures the IPv6 MLD (Multi-listener discovery) parameters.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Available in Config or Enable mode on managed device.

show ipv6 mld config

```
show ipv6 mld config
```

Description

Displays MLD configuration details.

Example

This example displays the current MLD configuration values.

```
(host) [mynode] #show ipv6 mld config

MLD Config
----------
Name                      Value
----                      -----
robustness-variable       2
query-interval            125
query-response-interval   100
ssm-range                 FF3X::4000:1 - FF3X::FFFF:FFFF
```

The output of this command includes the following parameters:

Parameter	Description
`robustness-variable`	Denotes the value that is used to calculate the timeout value of an MLD client.
`query-interval`	Denotes the time interval at which the MLD query is sent.
`query-response-interval`	Denotes the time interval at which the MLD query response should be received.
`ssm-range`	Denotes the source specific multicast range. When you enter the SSM Range ensure that the upstream router has the same range, else the multicast stream would be dropped. **NOTE:** Only SSM enabled clients can subscribe to the multicast stream in the multicast range. The default ssm-range in case of IPv6 is FF3X::4000:1 - FF3X::FFFF:FFFF, this range is configurable. If MLDv1 or a non SSM client sends a report on a specified SSM range, it is rejected by the managed device.

show ipv6 mld counters

```
show ipv6 mld counters
```

Description

Displays the statistics of MLD.

Example

This example displays the MLD statistics for the following values.

```
(host) [mynode] #show ipv6 mld counters

MLD Statistics
--------------
Name                    Value
----                    -----
received-total          0
received-queries        0
received-v1-reports     0
received-v1-leaves      0
received-v2-reports     0
received-unknown-types  0
len-errors              0
checksum-errors         0
not-vlan-dr             0
transmitted-queries     0
forwarded               0
non-conforming-mld      0
```

The output of this command includes the following parameters:

Parameter	Description
`received-total`	The total number of MLD messages.
`received-queries`	The total number of MLD queries.
`received-v1-reports`	The total number of MLD v1 reports received.
`received-v1-leaves`	The total number of MLD v1 leave messages received.
`received-v2-reports`	The total number of MLD v2 reports received.
`received-unknown-types`	The total number of unrecognized messages received.
`len-errors`	The total number of error message where the length check has failed.
`checksum-errors`	The total number of error message where the checksum has failed.
`not-vlan-dr`	The number of messages received for which the current managed device is not the designated router.
`transmitted-queries`	The total number of transmitted MLD queries.
`forwarded`	The total number of MLD messages forwarded.
`non-conforming-mld`	The total number of non confirming MLD messages.

show ipv6 mld group

```
show ipv6 mld group
```

Example

This example displays MLD group details.

```
(host) [mynode] #show ipv6 mld group

MLD Group Table
---------------
Group               Members  Mode     Age
-----               -------  ----     ---
ff02::1:ff00:0      2        Exclude  4
ff02::1:ff00:1900   2        Exclude  1
ff1e::2             2        Include  0
ff02::1:3           4        Exclude  1
ff02::202           2        Exclude  4
ff02::2             3        Exclude  1
ff02::1:ff20:d6e2   2        Exclude  4
ff02::c             4        Exclude  2
ff02::1:ffab:4027   2        Exclude  6
ff02::d             2        Exclude  1
ff02::1:ff00:12     2        Exclude  4
ff02::1:ffd6:4d41   1        Exclude  7
ff02::16            2        Exclude  1
ff02::1:ffd6:4d40   1        Exclude  1
ff02::1:ff8a:4951   2        Exclude  4
ff02::1:ff5b:aac4   2        Exclude  11
ff02::1:ff9f:df01   2        Exclude  3
Total Groups: 17
```

The output of this command includes the following parameters:

Parameter	Description
`Group`	Name of MLD groups.
`Members`	Number of members in an MLD group.
`Mode`	Managed device supports two IPv6 multicast source filtering modes - Include and Exclude. In Include mode, the reception of packets sent to a specified multicast address is enabled only from the source addresses listed in the source list. In Exclude mode, the reception of packets sent to a specific multicast address is enabled from all source addresses (MLDv1 mode).
`Age`	This parameter specifies the aging time.

This example displays MLD group address details.

```
(host) [mynode] #show ipv6 mld group maddr ff1e::2 mac 9c:b7:0d:3f:a8:fc

MLD member 9c:b7:0d:3f:a8:fc Table
----------------------------------
Source        Age
------        ---
2001:feed::2  26
```

The output of the `show ipv6 mld group` command includes the following parameters:

Parameter	Description
`Source`	IP address of the multicast source.
`Age`	This parameter specifies the aging time.

show ipv6 mld interface

```
show ipv6 mld interface
```

Example

This example displays MLD status on VLANs. To view details for a specific VLAN, you can specify the VLAN ID.

```
(host) [mynode] #show ipv6 mld interface

MLD Interface Table
-------------------
VLAN  Link local address  Snooping  Proxy     Querier  Querier-dest  Upstream querier
Upstream port
----  ------------------  --------  -----     -------  ------------  ----------------  -------
------
1     ::                  disabled  disabled  ::       unknown       ::                -
160   ::                  disabled  disabled  ::       unknown       ::                -
```

The output of this command includes the following parameters:

Parameter	Description
VLAN	Denotes the VLAN ID.
Link local address	IP address of the VLAN interface.
Snooping	Status of MLD snooping.
Proxy	Status of MLD proxy configuration.
Querier	IPv6 address of the MLD querier for the VLAN.
Querier-dest	Denotes the destination of MLD querier on VLAN.
Upstream querier	Denotes the address of upstream MLD querier on VLAN.
Upstream port	Denotes the destination of upstream MLD querier on VLAN.

show ipv6 mld proxy-group

```
show ipv6 mld proxy-group [vlan <vlan>]
```

Example

This example displays MLD proxy-group details.

```
(host) [mynode] #show ipv6 mld proxy-group
MLD Proxy Group Table
---------------------
VLAN  Addr                    Group              Num Members
----  ----                    -----              -----------
10    fe80::b:8600:a61:cc5c   ff1e::5            2
10    fe80::b:8600:a61:cc5c   ff02::1:ff9e:dc4c  1
10    fe80::b:8600:a61:cc5c   ff02::1:3          2
10    fe80::b:8600:a61:cc5c   ff02::1:ff83:d718  1
10    fe80::b:8600:a61:cc5c   ff02::1:ff13:356b  1
10    fe80::b:8600:a61:cc5c   ff02::c            2
Total displayed proxy groups: 6
```

The output of this command includes the following parameters:

Parameter	Description
VLAN	Denotes the VLAN ID.
Addr	IP address of the VLAN interface.
Group	Name of MLD group.
Num Members	Number of members in an MLD group.

show ipv6 neighbors

```
show ipv6 neighbors
```

Description

Displays the IPv6 neighbors configured on a VLAN interface.

Usage Guidelines

This command displays the IPv6 neighbors configured on a VLAN interface via the ipv6 neighbor command.

Examples

The example below shows the ipv6 neighbors configured on VLAN 1 .

```
(host) [mynode] #show ipv6 neighbors vlan 1

IPv6 Neighbors
--------------
IPv6 Address           Age  Link-layer Addr    State      Interface
------------           ---  ---------------    -----      ---------
2cce:205:160:100::fe   -    00:0b:86:61:13:28  PERMANENT  vlan 1
```

Related Commands

Command	Description

All platforms	Base operating system.	Available in Config or Enable mode on Mobility Master.

show ipv6 nexthop-list

```
show ipv6 nexthop-list
   details STRING
   STRING
```

Description

This command displays the next hop list settings for policy-based routing in IPv6 address.

Syntax

Parameter	Description
`details`	Displays detailed next-hop settings for policy-based routing.
`STRING`	Displays the next-hop settings based on the next-hop list name.

Usage Guidelines

A next hop IP is the IPv4 or IPv6 address of a adjacent router or device with layer-2 connectivity to managed device. The next hop list provides redundancy for the next hop devices by forwarding the traffic to a backup next hop device in case of failures. If active next hop device on the list becomes unreachable, traffic matching a policy-based routing ACL is forwarded using the highest-priority active next hop on the list. For more information on this feature, see ip nexthop-list on page 668.

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The following command displays the configuration settings for the one configured next hop list.

```
(host) [mynode] #show ipv6 nexthop-list

IPv6 Nexthop-List Entries
-------------------------
Name      Dest   Preemptive Failover  Nexthop              Nexthop Dest  Nexthop Priority
----      ----   -------------------  -------              ------------  ---------------
test      0x4402       Enabled       2032:1202:4072::2111  0x4421             1
test2     0x4403       Enabled       2006::3               0x4422             128
```

The output of this command displays the following information

Parameter	Description
`Name`	Name of the next hop list.
`Dest`	Destination prefix address.
`Preemptive Failover`	This column indicates whether preemptive failover is enabled or disabled. If preemption is enabled and a higher priority next hop becomes reachable again, packets are again forwarded to the higher priority next hop.
`Nexthop`	Next hop IPv6 address.
`Nexthop Dest`	Next hop destination prefix address.
`Nexthop Priority`	List of the IPv6 addresses of all next hop IPs, including the priority assigned to each device when the list was configured.

Related Commands

show ipv6 pd status

```
show ipv6 pd status
```

Description

Displays the prefix obtained by the PD client on uplink.

Example

The following example displays the status of the IPv6 prefix deligation.

```
(host)[mynode] #show ipv6 pd status
DHCPv6 PD Client is enabled
Uplink VLAN     : 100
Label           : site1
Prefix          : 2001:0:3::/48
65536 unique /64 prefixes are derivable from the acquired IA PD lease
Preferred lifetime 604800s, Valid lifetime 2592000s
Last request/renewal for the lease done at Thu Apr 14 04:46:15 2016
Lease expires at Sat May 14 04:46:15 2016
Downlink VLANs
--------------
VlanId  Prefix
------  ------
101      2001:0:3:12:1:2:3:4/64
```

Related Commands

show ipv6 ra

```
show ipv6 ra [proxy | status]
```

Description

Displays the RA proxy server information and IPv6 RA.

Examples

The example below shows the IPv6 RA status on the VLAN interfaces .

```
(host) [mynode] #show ipv6 ra status

IPv6 RA Status
--------------
VlanId  State    Prefix(es)
------  -----    ----------
1       enabled  2001:abcd:1234:dead::/64
220     enabled  2200:eab:feed:12::/64
230     enabled  2300:eab:feed::/64
7       enabled  2001:470:faca:2::/64
                 2001:470:faca:3::/64
                 2001:470:faca:4::/64
```

The example below shows the status of the IPv6 proxy RA:

```
(host) #show ipv6 ra proxy
IPv6 RA Proxy status: enabled
IPv6 RA Proxy interval: 600
```

Related Commands

Command	Description

show ipv6 route

```
show ipv6 route [counters | static]
```

Description

Displays the IPv6 routing table.

Syntax

Command	Description
`counters`	Displays the number of routes present, categorized by type.
`static`	Include this optional parameter to display only static IPv6 routes.

Usage Guidelines

This command displays static IPv6 routes configured on the managed device via the ipv6 route command. Use the ipv6 default-gateway command to set the default gateway to the IPv6 address of the interface on the upstream router or switch to which you connect the managed device.

Examples

The examples below show the ipv6 address of routers and the VLANs to which they are connected.

```
(host) [mynode] #show ipv6 route
Codes: C - connected, O - OSPF, R - RIP, S - static
       M - mgmt, U - route usable, * - candidate default

Gateway of last resort is 2001::3 to network ::/128 at cost 1
S*    ::/0 [1/0] via 2001::3*
C    2001::/64 is directly connected, VLAN1
C    2010:abcd:1234:dead::/64 is directly connected, VLAN10

(host) [mynode] #show ipv6 route static
Gateway of last resort is 2001::3 to network ::/128 at cost 1
S*    ::/0 [1/0] via 2001::3*
```

Related Commands

show ipv6 user-table

```
show ipv6 user-table
   ap-group <ap-group>
   ap-name <ap-name>
   authentication-method <dot1x|mac|opensystem|psk|stateful-dot1x|via-vpn|vpn|web>
   bssid <A:B:C:D:E:F>
   debug
   essid <STRING>
   internal
   ip <A.B.C.D> [log]
   mac <A:B:C:D:E:F>
   mobile {[bindings][visitors]}
   name <STRING>
   phy-type {[a]|[b]}
   role <STRING>
   rows <NUMBER> <NUMBER>
   station <rows|unique>
   verbose <rows|unique>
```

Description

Displays IPv6 user table entries. You can filter the output based on various parameters are described in table.

Syntax

Parameter	Description
`ap-group <ap-group>`	Filter the output of this command by showing users connected to APs that belong to the specified AP group.
`ap-name <ap-name>`	Filter the output of this command by showing users connected to an AP with the specified AP name.
`authentication-method`	Filter the output of this command by the authentication method used for the device:
`dot1x`	Show data for devices using 802.1X authentication.
`mac`	Show data for devices using MAC authentication.
`opensystem`	Show data for devices using open (no) authentication.
`psk`	Show data for devices that do not use authentication but use a PSK for encryption.
`stateful-dot1x`	Show data for devices using stateful 802.1X authentication.
`via-vpn`	Show data for devices that authenticate using Alcatel-Lucent VIA.
`vpn`	Show data for devices using VPN authentication.
`web`	Show data for devices using captive portal authentication.
`bssid`	Displays entries in the IPv6 user-table that are associated to the specified BSSID.
`debug`	Displays entries in the IPv6 user-table that are in debug mode.

Parameter	Description
essid	Displays entries in the IPv6 user-table that are associated to the specified ESSID. If the ESSID includes spaces, you must enclose it in quotation marks.
internal	Displays internal IPv6 users.
ip <A.B.C.D>	Displays IPv6 users that match the specified IPv6 IP address.
log	Displays the log information for the specified IPv6 client.
mac	Displays users with the specified MAC address.
mobile	Displays list of mobile users in the IPv6 user table. The following filters are available for this parameter: ■ **bindings**—list of users that have moved away from the current Switch. ■ **rows**—displays entries that match the specified row number. ■ **unique**—displays unique entries in the IPv6 user-table. ■ **visitors**—displays users that have associated with the current Switch.
name	Displays IPv6 user table entries that match the specified name.
phy-type	Displays IPv6 user table entries that match **a** or **b** phy-type.
role	Displays IPv6 user table entries that match the specified role.
rows	Displays specific rows in the IPv6 user table. Enter the starting row number and the number of rows to be displayed.
station	Displays the station table information for the IPv6 user table entries.
verbose <rows|unique>	Displays the complete IPv6 user table with all details.

Example

This example displays a list of users.

```
(host) [mynode] #show ipv6 user-table
Users
-----
IP                                MAC                Name     Role      Age(d:h:m)  Auth    VPN
link  AP name  Roaming  Essid/Bssid/Phy                      Profile  Forward mode  Type

```

The output of this command includes the following parameters:

Parameter	Description
`IP`	IP address of the client in that row that authenticating using 802.1X
`MAC`	MAC address of the client.
`Name`	Name of the client.
`Role`	The role assigned to the client.
`Age(d:h:m)`	Total time that client is connected to Switch.
`Auth`	Authentication type.
`AP name`	Name of the AP associated with the client.
`Roaming`	Current roaming status of the client.
`Essid/Bssid/Phy`	ESSID or BSSID or Phy to which the client is associated.
`Profile`	Displays the AAA profile.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on Mobility Master.

show jitter

```
show jitter <probe_ip> <src_intf>
```

Description

This command displays the debug messages for the IPsec tunnel manager.

Syntax

Command	Description
`<probe_ip>`	IP address of a remote host to which the managed device is connected.
`<src_intf>`	Source interface VLAN of a remote host to which the managed device is connected.

Usage Guidelines

This command should be executed from the managed device only.

Related Commands

Command	Description
ip probe health-check	This command configures WAN health-check ping-probes for measuring WAN availability and latency on managed device up-links.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable mode on Managed Device.

show keys

```
show keys [all]
```

Description

This command displays if optional keys and features are enabled or disabled on Mobility Master.

Syntax

Parameter	Description
`all`	Include this optional parameter to display the status of all optional keys and features. If this parameter is omitted, the output displays the status of the most commonly used features and keys.

Example

The following example displays the status of the most commonly used keys and features on Mobility Master:

```
(host) [mynode] #show keys all

Related Commands

Command	Description
show license	View the license usage database (including the license key strings).

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable or Config mode on Mobility Master.

show lacp

```
show lacp
   sys-id
   <id> {counters|internal|neighbor}
```

Description

This command displays the Link Aggregation Control Protocol (LACP) configuration status.

Syntax

Parameter	Description
`sys-id`	LACP system ID.
`<id>`	Group ID. Range is 0-7.
`counters`	Enter the keyword **counters** to view the LACP traffic.
`internal`	Enter the keyword **internal** to view the LACP internal information.
`neighbor`	Enter the keyword **neighbor** to view the LACP neighbor information.

Example

This command returns the port priority and the MAC address (comma separated). In the example below, the port priority is the default value 32768 followed by the MAC address 00:0B:86:40:37:C0.

```
(host) [mynode] #show lacp sys-id
32768,00:0B:86:40:37:C0
```

The port uses the group number +1 as its “actor admin key”. By default, all the ports use the long timeout value (90 seconds).

```
(host) [mynode] #show lacp 0 neighbor

Flags:  S - Device is requesting Slow LACPDUs
        F - Device is requesting fast LACPDUs
        A - Device is in active mode P - Device is in passive mode

Partner's information
---------------------
Port    Flags  Pri  OperKey  State Num  Dev Id
----    -----  ---- -------  ----- ---- ----------------
FE 1/1  SA     1    0x10     0x45  0x5  00:0b:86:51:1e:70
FE 1/2  SA     1    0x10     0x45  0x6  00:0b:86:51:1e:70
```

When a port, in a LAG, is disconnected (that is, the partner device is different than the other ports or the neighbor times out or can not exchange LACPDUs with the partner), the port status is displayed as **DOWN**. See the following example.

```
(host) [mynode] #show lacp 0 internal

Flags:  S - Device is requesting Slow LACPDUs
        F - Device is requesting fast LACPDUs
        A - Device is in active mode P - Device is in passive mode

Port    Flags  Pri  AdminKey  OperKey  State Num  Status
----    -----  ---- --------  -------- ----- ---- -------
```

```
FE 1/1   SA      1     0x1        0x1        0x45   0x2   DOWN
FE 1/2   SA      1     0x1        0x1        0x45   0x3   UP
```

The “counters” option allows you to view LACP received (Rx) traffic, transmitting (Tx) traffic, data units (DU) received and transmitted by port.

```
(host) [mynode] #show lacp 0 counters

Port     LACPDUTx   LACPDURx   MarkrTx   MarkrRx   MrkrRspTx MrkrRspRx
----     --------   --------   -------   --------  --------- ---------
FE 1/1   10         10         0         0         0         0
FE 1/2   12         12         0         0         0         0
```

Related Commands

Command	Description

show lc-cluster

```
show lc-cluster
   exclude-vlan
   group-membership
   group-profile
   gsm counters
   heartbeat counters
   load distribution
   papi counters
   upgrade
   scheduled-upgrades
   vlan-probe
   <profile> {ap|controller|upgrade}
```

Description

Displays information related to vlan, membership, profile, heartbeat, and so on for a cluster.

Syntax

Parameter	Description
`exclude-vlan`	Displays a list containing vlans excluded from L2 Probing
`group-membership`	Displays the active cluster member of cluster profile
`group-profile`	Displays the cluster profile
`gsm counters`	Displays the counters pertaining to various GSM events
`heartbeat counters`	Displays the cluster node health parameters such as heartbeat related counters, last time of node disconnect, critical process crash count and other information.
`load distribution`	Displays the current load distribution
`ap`	Displays the current load distribution on the AP
`client`	Displays the current load distribution on the client
`papi`	Displays the cluster messaging related counters.
`vlan-probe`	Displays the Cluster VLAN Probe information.
`<profile>`	Displays the name of the cluster profile.
`ap {details}`	Displays the details of the APs in the cluster.
`controller {details|ip|ipv6}`	Displays the Switches details in the cluster. Use one of the following parameters: ■ **details**: Displays the details of the Switches in the cluster. ■ **ip <ipv4_addr> [active {ap [details]}]**: Displays the IP address details of the Switches in the cluster. ■ **ipv6 <ipv6_addr> [active {ap [details]}**: Displays the IPv6 address details of the Switches in the cluster.

Parameter	Description
upgrade	Displays the upgrade details of controllers and APs in the cluster. Use one of the following parameters: ■ **stats**: Displays the statistics of the cluster upgrade. ■ **status**: Displays the upgrade status of each Switch and AP.
rap-public-ip	Displays the public IP address of the Remote AP cluster configured behind NAT.
scheduled-upgrades	Displays the status of all the clusters scheduled for an upgrade.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

An example output of the **show lc-cluster group-membership** command.

lc-cluster group-profile	This command is used to configure the cluster group profile in the Mobility Master.
lc-cluster group-membership	This command configures the group-membership in each node. This command is used to enable the cluster membership on the managed devices.

Command History

Release	Modification
AOS-W 8.5.0.0	The load balance thresholds were updated in the output and the **Starting VRRP ID** and **VRRP Passphrase** fields are added in the output.
AOS-W 8.4.0.0	The parameter **scheduled-upgrades** and **rap-public-ip** were added.
AOS-W 8.2.0.0	The parameter details of **<profile>** were added.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config mode or enable mode in the managed device.

show lc-rap-pool

```
show lc-rap-pool <pool_name>
```

Description

This command displays the remote AP inner IP pool for cluster deployment.

Syntax

Parameter	Description
`pool_name`	Name of the local IP pool to show.

Example

The output of the example below displays the remote AP inner IP pool that can be used for cluster deployment.

```
(host) [mynode] (config) #show lc-rap-pool rap-cluster
IP addresses used in pool rap-cluster
3.1.1.3-3.1.1.10
Total:-
8 IPs used - 51134 IPs free - 51142 IPs configured
LC RAP Pool Total Allocs/Deallocs/Reserves : 8/0/0
LC RAP Pool Allocs/Deallocs/Reserves(succ/fail) : 8/0/(0/0)
```

Related Commands

show license

```
show license [limits]|[passphrase]
```

Description

Displays the license table or Mobility Master passphrase.

Syntax

Parameter	Description
`limits`	Enter the keyword **limit** to display the current license limits.
`passphrase`	Issue the **show license passphrase** command to identify the Mobility Master passphrase. This passphrase is used in the licensing website to generate a Mobility Master (MM) license, or to generate a sharable license that can be added to Mobility Master license pools.

Example

An example output of the **show license** command.

```
(host)[node] # show license

License Table

```

The output of this command includes the following data columns:

Parameter	Description
`Key`	The license key.
`Installed`	The license installation date and time.
`Expires`	The date that your evaluation license expires is listed in this column. Permanent license will always have a “Never” in this column. Expired evaluation licenses will also be indicated in this column.
`Flags`	This column displays some status about your license. The legend for this column appears at the bottom of the display output. They are: **A**: The license is auto-generated. **E**: The license if fully enabled. **R**: You must reboot your Switch to fully enable this license. **M**: The license is activated using Master Token Key.
`Service Type`	The license name (feature).

show license aggregate

```
show license aggregate
```

Description

Display the total number of licenses of each license type in all Mobility Master licensing pools.

Syntax

No Parameters.

Usage Guidelines

Execute this command from any configuration node in the Mobility Master CLI to view the licenses in the global licensing pool and any local license pools, as well as the number of clients using each pool.

Example

The following example displays output of the **show license aggregate** command.

```
Aggregate License Table for pool /
----------------------------------
Hostname     IP Address  Mac addr  AP   PEF  RF Protect  xSec Module  ACR  WebCC
--------     ----------  --------  ---  ---  ----------  -----------  ---  -----

Total no. of clients: 91
```

The output of this command includes the following data columns:

Parameter	Description
Hostname	Name of the device that supplied the licensing information. If this command is executed on a Mobility Master, the hostname field displays the value **from server**.
IP Address	IPv4 or IPv6 address of the device that supplied the licensing information. If this command is executed on a Mobility Master, the IP address field remains blank.
AP	Total number of AP licenses in the licensing pool.
PEF	Total number of Policy Enforcement Firewall (PEF) licenses in the licensing pool.
RF Protect	Total number of RFprotect licenses in the licensing pool.
xSec Module	Total number of Extreme Security (xSec) licenses in the licensing pool.
ACR	Total number of advanced Cryptography (ACR) licenses in the licensing pool.
Last update (secs. ago	Time, in seconds, that has elapsed since the licensing table on Mobility Master was updated.
Total mumber of clients	This value indicates the total number of clients using licenses from the licensing pool.

Related Commands

Command	Description
show license key	Display information about a specific license key.
show license keys	Display information about all installed license keys.
show license_box	Display the device-specific licenses used by a managed device.

Command History

show license box

```
show license box remote remote-ip-addr <ip-addr>
```

Description

Display the device-specific licenses used by a remote managed device.

Syntax

Parameter	Description
`remote remote-ip-addr <ip-addr>`	IP address of the managed device.

Usage Guidelines

Execute this command from the CLI of a managed device to view license limits applied to that managed device from its licensing pool

Example

The following example displays output of the **show license box remote remote-ip-addr <ip-addr>** command.

```
Box Licenses Table
------------------
Key                           Feature                                 Expiration  Status
---                           -------                                 ----------  ------
cvK33n5l-MeXuHi7N-gRyIa4As-Gh  X86 VM SKU Activate                     Never       E/Active
V3rBYtzd-hOtVXuKi-WZeEYJUl-9k  Policy Enforcement Firewall for VPN users  Never       E/Active
```

The output of this command includes the following data columns:

Parameter	Description
`Key`	License key on the managed device
`Feature`	Licensing feature enabled by the license key
`Expiration`	This field displays the expiration date for evaluation or subscription licenses.
`Status`	Current status of the license.

Related Commands

MC-VA-IL             499           0            0          0               enabled
MC-VA-JP             499           0            0          0               enabled
MC-VA-US             499           0            0          0               enabled
VIA                  499           0            0          0               enabled
```

The output of this command includes the following data columns:

Parameter	Description
`Service Type`	Type of license on the managed device.
`System Limit`	The maximum number of licenses supported by the man platform.
`Server Lic.`	Number of licenses available for use by the licensing client. **NOTE:** This number is limited by the total license capacity of the managed device platform. A managed device cannot use more licenses than is supported by that managed device platform, even if additional license are available.
`Used Lic.`	Total number of licenses of each license type used by the managed device.
`Remaining Lic.`	Total number of remaining licenses available in the licensing pool

Parameter	Description
`Feature Bit`	This column indicates whether these license features are enabled or disabled. For more information about enabling a sharable license, see license-pool-profile-root.

show license debug

```
show license debug
```

Description

Displays a summary of Mobility Master's licensing role and IP address.

Syntax

No parameters

Example

The following example shows the output of the **show license debug** command.

```
(host)[node] # show license debug

Summary of licensing state
Centralized Licensing: Enabled
Switch Role: Master
License Role: License Client
Master IP: 10.9.217.71
Master IPv6: 2002::1
Switch IP: 10.16.16.160
Switch IPv6: 2002::2
License Server IP: 10.9.217.71 (or 2002::1 as configured)
```

The output of this command includes the following data columns:

Parameter	Description
`Centralized licensing`	Shows if centralized licensing is enable or disabled.
`Switch Role`	Role of the device using the configuration on which this command is run.
`License Role`	Licensing role of the Switch on which this command is run. Mobility Master can be a licensing client or a licensing server. Managed devices can be licensing clients only.
`Master IP`	IPv4 address used by Mobility Master. If a Mobility Master redundant pair is using VRRP, this parameter displays the VRRP virtual IP address.
`Master IPv6`	IPv6 address used by Mobility Master.
`Switch IP`	IPv4 address assigned to the device using the configuration on which this command is run.
`Switch IPv6`	IPv6 address assigned to the device using the configuration on which this command is run.
`License Server IP`	Mobility Master IP address.

Related Commands

All platforms	Base operating system	Enable and config mode on Mobility Master and managed devices.

show license heartbeat stats

```
show license heartbeat stats
```

Description

Display the license heartbeat statistics between the centralized licensing server and the license client.

Syntax

No Parameters.

Usage Guidelines

If your deployment uses the centralized licensing feature, issue this command from the CLI of a centralized licensing server to view heartbeat requests to and responses from each licensing client associated to that licensing server. If you issue this command from a licensing client, the output displays information for that one client only.

Example

The following example displays output of the **show license heartbeat stats** command issued from the licensing server.

```
(host)[node] #show license heartbeat stats
License Heartbeat Table
-----------------------
IP Address      HB Req  HB Resp         Total Missed    Last Update
10.3.17.130     233     233             0               18
10.3.17.120     233     233             0               19
10.3.17.190     234     234             0               9
2002::3         233     233             0               7
```

The output of this command includes the following data columns:

Parameter	Description
`IP address`	IPv4 or IPv6 address of the licensing client.
`HB Req`	Heartbeat requests sent from the licensing client.
`HB Resp`	Heartbeat responses received from the license server.
`Total Missed`	Total number of heartbeats that were not received by the licensing client.
`Last Update`	Number of seconds elapsed since the licensing client last sent a heartbeat request.

Related Commands

Parameter	Description

AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable mode on centralized licensing master or licensing client Switches.

show license key

```
show license key <key>
```

Description

Display information about a specific evaluation or subscription license key.

Syntax

Parameter	Description
`<key>`	License key

Usage Guidelines

Issue this command from the Mobility Master CLI to view the status of an installed evaluation or subscription license key.

Example

The following example displays output for the **show license key** command. In this example, the output has been modified to appear in two separate sections. In the actual CLI, this output appears in a single, long row.

```
(host)[node] #show license key eLNB35l-2lF-3WE

Key Attributes:
---------------
Feature  Type       Expiration           GraceExpiration      TotalCount
-------  ----       ----------           ---------------      ----------
WebCC    Subscript  2017-05-03 10:36:54  2017-08-31 10:36:54  10

AvailableForAllocation  Status
----------------------  ------
10                      E/Active
Flags: E - enabled; R - reboot/activation key required to activate; D - Not enabled on Local
Controller
```

The output of this command includes the following data columns:

Parameter	Description
`Key`	License key
`Feature`	Feature type supported by the license key
`Type`	AOS-W supports the **permanent**, **evaluation** or **subscription** license types, but this command displays information about evaluation and subscription licenses only.
`Expiration`	The expiration date for the subscription or evaluation license key.
`GraceExpiration`	The grace period for which a subscription remains fully active after the subscription key expiration date.
`TotalCount`	The total number of licenses supported by the license key.

Parameter	Description
`AvailableforAllocation`	The total number of licenses that are still available for allocation
`Status`	This column shows the current status of the license, including whether it is active or expired, and whether that licensing feature is enabled on Mobility Master or the stand-alone Switch.

Related Commands

Command	Description
show license aggregate	Display the total number of licenses of each license type in all Mobility Master licensing pools.
show license keys	Display information about all installed license keys.
show license box	Display the device-specific licenses used by a managed device.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

All platforms	Base operating system.	Enable and config mode on Mobility Master.

show license keys

```
show license keys
   [feature-type acr|ap|mc-va-eg|mc-va-il|mc-va-jp|mc-va-rw|mc-va-us|pefng|rfp|acr|xsc|
   [webc|mm]
   [license-type perm|eval|subscript|non-perm]
```

Description

Display information about all license keys installed on Mobility Master.

Syntax

Parameter	Description
`Feature-type`	View a list of license keys for the specified feature type.
`acr`	View Advanced Cryptography (ACR) licenses.
`ap`	View AP licenses.
`mc-va-eg`	View MC-VA-EG license type information for Egypt.
`mc-va-il`	View MC-VA-IL license type information for Israel.
`mc-va-jp`	View MC-VA-JP license type information for Japan.
`mc-va-rw`	View MC-VA-RW license type information for rest of the world (all other countries)
`mc-va-us`	View MC-VA-US license type information for United States.
`mm`	View MM licenses for Mobility Master.
`pef`	View Policy Enforcement Firewall (PEF) licenses.
`rfp`	View RF Protect licenses.
`xsc`	View xSec licenses.
`License-type`	View a list of license keys of the specified license type.
`perm`	Display a list of permanent licenses.
`eval`	Display a list of evaluation licenses.
`subscript`	Display a list of subscription licenses .
`non-perm`	Display a list of non-permanent licenses (evaluation and subscription).

Usage Guidelines

Issue this command from the Mobility Master CLI to view the status of an installed license keys.

Example

The following example displays output for the **show license keys** command. In this example, the output has been modified to appear in two separate sections. In the actual CLI, this output appears in a single, long row.

Example

```
(host)[node]#show license keys
License Keys info
-----------------
Key      Feature  Type       Expiration           GraceExpiration      TotalCount
---      -------  ----       ----------           ---------------      ----------
7eWKHB6 PEFNG    Perm       Never                N/A                  500
Ryw+Sau AP       Perm       Never                N/A                  500

eLNBA35 WebCC    Subscript  2017-05-03 10:36:54  2017-08-31 10:36:54  10

AvailableForAllocation  Status
----------------------  ------
450                     E/Active
450                     E/Active
64                      E/Expires in 29 days
10                      E/Active
```

Related Commands

Command	Description
show license aggregate	Display the total number of licenses of each license type in all Mobility Master licensing pools.
show license key	Display information about a specific license key.
show license_box	Display the device-specific licenses used by a managed device.

Command History

Release	Modification
AOS-W 8.2.0.0	The following parameters under **feature-type** were added: ■ **mc-va-eg** ■ **mc-va-il** ■ **mc-va-jp** ■ **mc-va-rw** ■ **mc-va-us**
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable and config mode on Mobility Master.

show license passphrase

```
show license passphrase
```

Description

Display the Mobility Master passphrase used to generate licenses for a Mobility Master deployment.

Syntax

No Parameters.

Usage Guidelines

Issue this command for a network where the Mobility Master software is installed on a VM. This command is not supported on stand-alone Switches, the Mobility Master appliance or managed devices.

Example

```
(host)[node] #show license passphrase
5I0N3bI6-exkTWLkq-P05tfofQ-d6NvLJR91
```

Related Commands

Command	Description
show inventory	Display the Mobility Master serial number used to generate licenses for a Mobility Master deployment.
product serial-number	This command configures the product serial-number for a managed device on a Virtual Machine (VM).

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable and config mode on Mobility Master.

show license platform-limits

```
show license passphrase
```

Description

Display the licensing limits for Mobility Master or the Switch platform upon which this command is issued.

Syntax

No Parameters.

Usage Guidelines

To view licensing limits for Mobility Master managed devices, you must access the CLI of that specific node.

The output of this command displays limits for currently supported licenses, as well as limits for deprecated license types no longer supported by this software version.

Example

The output of the following command displays platform limits for all licenses supported by Mobility Master.

```
(host)[node] #show license platform-limits
License Platform Limits
-----------------------

License Platform Limits
-----------------------
Limit   Value
-----   -----
999999  Access Points
999999  Remote Access Points
999999  Ortronics Access Points
999999  Outdoor Mesh Access Points
999999  Wireless Intrusion Protection Module
999999  VPN Service Module
4096    xSec Users
999999  Indoor Mesh Access Points
999999  120abg Upgrade
999999  121abg Upgrade
999999  124abg Upgrade
999999  125abg Upgrade
999999  Policy Enforcement Firewall Module
999999  Advanced Cryptography
0       SAP
999999  WebCC
999999  Beta AP
```

The following example displays platform limits for all licenses supported by a OAW-4005 Switch.

```
(host)[node] #show license platform-limits
License Platform Limits
-----------------------
Limit  Value
-----  -----
16     Access Points
16     Remote Access Points
16     Ortronics Access Points
32     Outdoor Mesh Access Points
16     Wireless Intrusion Protection Module
```

```
4096    VPN Service Module
4096    xSec Users
32      Indoor Mesh Access Points
16      120abg Upgrade
16      121abg Upgrade
16      124abg Upgrade
16      125abg Upgrade
16      Policy Enforcement Firewall Module
4096    Advanced Cryptography
0       SAP
16      WebCC
16      Beta AP
```

Related Commands

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable and config mode on Mobility Master.

show license-pool-profile

```
show license-pool-profile [<profile>]
```

Description

Use this command to display a list of license pools, or display the licenses allocated for a specific pool.

Syntax

Parameter	Description
`<profile>`	(Optional) The name of the profile for which you are creating a local license pool, for example, **Northwest**. The profile name is limited to 63 characters. **NOTE:** In AOS-W 8.0.x releases, the licensing pool profile name was required to be the license pool configuration path. Starting in AOS-W 8.1, the **license-pool-path** parameter is introduced to configure the license pool path, and the profile name can be any string of 63 characters or less.

Usage Guidelines

All managed devices associated to the same Mobility Master can share a pool of licenses, comprised of all the sharable licenses added to the Mobility Master. However, AOS-W also allows you to create individual licensing pools at a configuration node, allowing managed devices below that node to share licenses amongst themselves but not with other managed devices.

Starting in AOS-W 8.1, the license-pool-path parameter displays the license pool path for the profile, up to 255 characters, for example, /USA/northwest.

NOTE: If you upgrade a legacy AOS-W deployment to AOS-W 8.1 or later, the license-pool-path parameter is automatically derived from the license-pool-profile <profile> name.

You must use the **license add** command to add license keys to the Mobility Master before you can allocate sharable licenses to a license pool, or associate a non-sharable license with an individual managed device, then issue the **license-pool-profile-root** command to enable licensing features on Mobility Master.

Examples

```
(host)[node] (config) #show license-pool-profile v6cluster

License pool profile "v6cluster"
--------------------------------
Parameter                                 Value
---------                                 -----
License pool path                         /md/v6cluster-1
AP permanent licenses                     600
AP expiry licenses                        N/A
PEFNG permanent licenses                  600
PEFNG expiry licenses                     N/A
RFP permanent licenses                    N/A
RFP expiry licenses                       N/A
ACR permanent licenses                    N/A
ACR expiry licenses                       N/A
WebCC expiry licenses                     N/A
WebCC subscription licenses               N/A
VIA permanent licenses                    N/A
VIA expiry licenses                       N/A
```

```
MM permanent licenses                          600
MM expiry licenses                             N/A
MC-VA Egypt permanent licenses                 N/A
MC-VA Egypt expiry licenses                    N/A
MC-VA Israel permanent licenses                N/A
MC-VA Israel expiry licenses                   N/A
MC-VA Japan permanent licenses                 N/A
MC-VA Japan expiry licenses                    N/A
MC-VA USA permanent licenses                   N/A
MC-VA USA expiry licenses                      N/A
MC-VA Rest of the world permanent licenses     N/A
MC-VA Rest of the World expiry licenses        N/A
```

Syntax

Parameter	Description
`license-pool-path <license-pool-path>`	The name of the profile , for example, Northwest. The profile name is limited to 63 characters. **NOTE:** In AOS-W 8.0.x releases, the licensing pool profile name was required to be the license pool configuration path. Starting in AOS-W 8.1, the **license-pool-path** parameter is introduced to configure the license pool path, and the profile name can be any string of 63 characters or less. **NOTE:** name.
`AP Permanent Licenses` `AP Expiry License`	These two fields show the numbers of permanent and temporary AP licenses.
`PEFNG Permanent Licenses` `PEFNG Expiry License`	These two fields show the numbers of permanent and temporary Next Generation Policy Enforcement Firewall (PEFNG) licenses.
`RFP Permanent Licenses` `RFP Expiry License`	These two fields show the numbers of permanent and temporary RF Protect (RFP) licenses.
`ACR Permanent Licenses` `ACR Expiry License`	These two fields show the numbers of permanent and temporary AOS-W Advanced Cryptography (ACR) licenses .
`WebCC Permanent Licenses` `WebCC Expiry License`	These two fields show the numbers of permanent and temporary Web Content Classification (WebCC) licenses.
`VIA Permanent Licenses` `VIA Expiry License`	These two fields show the numbers of permanent and temporary Virtual Intranet Access (VIA) licenses.
`MM Permanent Licenses` `MM Expiry License`	These two fields show the numbers of permanent and temporary Mobility Master licenses in pool.
`via-licenses`	VIA licenses suport Virtual Intranet Access (VIA) or 3rd party VPN client . VIA licenses are not consumed for site-to-site VPNs. If a managed device or standalone Switch has a PEFV license, that device will not consume VIA licenses from a licensing pool, as a single PEFV license supports all VIA and 3rd party VPN clients, up to the full user capacity for that device.
`webcc-licenses`	Add WebCC licenses to the selected pool. The Web Content Classification (WebCC) license is a subscription-based, per-AP license.

Parameter	Description
`eval`	(Optional) Include this keyword to add an evaluation license.
`<num>`	Number of licenses supported by the license key.

show license-pool-profile root

```
show license-pool-profile root
```

Description

Use this command to determine the license types that are enabled and sharable via the root licensing profile

Syntax

No parameters

Usage Guidelines

All managed devices associated to the same Mobility Master can share a pool of licenses, comprised of all the sharable licenses added to the Mobility Master. However, AOS-W also allows you to create individual licensing pools at a configuration node, allowing managed devices below that node to share licenses amongst themselves but not with other managed devices.

You must use the **license add** command to add license keys to the Mobility Master before you can allocate sharable licenses to a license pool, or associate a non-sharable license with an individual managed device, then issue the **license-pool-profile-root** command to enable licensing features on Mobility Master.

Examples

```
(host) ^[mynode] (config) #show license-pool-profile-root
License root(/) pool profile
----------------------------
Parameter              Value    Set
---------              -----    ---
enable PEFNG feature   Enabled
enable RFP feature     Enabled
enable XSEC feature    true
enable ACR feature     true
enable WebCC feature   true
```

show license server-table

```
show license server-table
```

Description

Display the license server table for each licensing pool as it appears on the centralized licensing server.

Syntax

No Parameters.

Usage Guidelines

If your deployment uses the centralized licensing feature, issue this command from the CLI of a centralized licensing server to view to view licensing counts for each supported license type.

Example

The following example displays part of the output of the **show license server-table** command issued from a licensing server. The complete output displays a separate table for each licensing pool.

```
(host) [node] #show license server-table
License Server Table for pool /
-------------------------------
Service Type            PoolSize  ExpiredLic  ActualPoolSize  UsedLic  RemainingLic  Warnings
                        FeatureBit
------------            --------  ----------  --------------  -------  ------------  --------
                        ----------

                        enabled
MC-VA-RW                0         0           0               0        0             None
                        enabled
MC-VA-EG                0         0           0               0        0             None
                        enabled
MC-VA-IL                0         0           0               0        0             None
                        enabled
MC-VA-JP                0         0           0               0        0             None
                        enabled
MC-VA-US                0         0           0               0        0             None
                        enabled
VIA                     0         0           0               0        0             None
                        enabled
```

The output of this command includes the following data columns:

Parameter	Description
`ServiceType`	Type of license on the licensing server.
`PoolSize`	The total number of licenses assigned to that licensing pool. This number includes both expired and active licenses.
`ExpiredLic`	Number of expired licenses for each license type,
`ActualPoolSize`	The total number of active licenses currently available for devices and users in the selected license pool. The **ActualPoolSize** value is the total number of licenses in the pool (**PoolSize**) value minus the expired licenses (**ExpiredLic**).
`UsedLic.`	Total number of licenses of each license type reported as used by the licensing clients or licensing server.
`RemainingLic.`	Total number of remaining licensing available in the licensing table.
`Warnings`	This column displays warnings if licenses have exired, or if licenses used on a per-session basis are no longer sufficient to support the client demand.
`FeatureBit`	This column indicates whether these license features are enabled or disabled. For more information about enabling a sharable license, see license-pool-profile-root.

```

When you issue the **show license-usage client** command from the CLI of a Switch configured as a centralized licensing server, the output displays license usage statistics for each licensing client associated to that server. Include the **verbose** parameter to display license statistics for individual configuration nodes and the devices in those nodes. The output in the example below is separated into multiple tables to better fit in this document. In the AOS-W CLI, the output appears in a single wide table.

```
(MM)[mynode] #show license-usage client verbose
License Clients License Usage for pool /

The output of the show license-usage client command includes the following data columns:

Parameter	Description
Hostname	Name of the licensing client Switch.
IP Address	IPv4 or IPv6 address of the licensing client Switch.
AP	Total number of AP licenses used by a licensing client associated with this Switch.
PEF	Total number of Policy Enforcement Firewall (PEF) licenses used by a licensing client associated with this Switch.
RF Protect	Total number of RFprotect licenses used by a licensing client associated with this Switch.
ACR	Total number of advanced Cryptography (ACR) licenses used by a licensing client associated with this Switch.
WebCC	Total number of Web Content Classification (WebCC) licenses used by a licensing client associated with this Switch.
MM	Total number of Mobility Master (MM) licenses used by a licensing client associated with this Switch.
MC-VA-RW MC-VA-EG MC-VA-IL MC-VA-JP MC-VA-US	Total number of regional licenses required to terminate APs on a virtual Switch. Different MC-VA-XX license types enable APs to support regional channels for the following countries: ■ MC-VA-US: United states ■ MC-VA-JP: Japan ■ MC-VA-IL: Israel ■ MC-VA-EG: Egypt ■ MC-VA-RW: Rest of the world (all other countries)
Last update (secs. ago)	Time, in seconds, that has elapsed since the licensing table on the licensing client was updated.

Related Commands

show lldp interface

```
show lldp interface gigabitethernet <slot/module/port>
```

Description

This command displays the LLDP interfaces information.

Syntax

Parameter	Description
`gigabitethernet <slot/module/port>`	Displays LLDP information on a gigabitethernet interface.

Example

The example shows two commands. The output of the **show lldp interface** command displays information for all LLDP interfaces.

```
(host) #show lldp interface
LLDP Interfaces Information
---------------------------
Interface LLDP TX LLDP RX LLDP-MED TX interval Hold Timer
--------- ------- ------- -------- ----------- ----------
GE1/3     Enabled Enabled Enabled 30 120
```

The following example only shows information for the GE1/3 interface.

```
(host)[node] #show lldp interface gigabitethernet 0/0/3
Interface: gigabitethernet 0/0/3
LLDP Tx: Enabled, LLDP Rx: Enabled
LLDP-MED: Enabled
Transmit interval: 30, Hold timer: 120
```

Parameter	Description
`Interface`	Name of an LLDP interface.
`LLDP TX`	Shows if LLDP Protocol Data Unit (PDU) transmission is enabled or disabled.
`LLDP RX`	Shows if the managed device has enabled or disabled processing of received LLDP PDUs.
`LLDP-MED`	Shows if LLDP MED protocol is enabled or disabled.
`TX interval`	The LLDP transmit interval, in seconds.
`Hold Timer`	The LLDP transmit hold multiplier.

Related Commands

Command	Description
ap lldp profile	Define an LLDP profile that specifies the TLV elements to be sent in LLDP PDUs.

show lldp neighbor

```
show lldp neighbor interfaces gigabitethernet <slot/module/port> [detail]
```

Description

This command displays information about LLDP peers.

Syntax

Parameter	Description
`gigabitethernet <slot/module/port>`	Displays LLDP information on a gigabitethernet interface.
`detail`	Include details.

Example

The command in the first example below shows that the ports GE0/0/1 and GE0/0/2 recognize each other as an LLDP peers.

```
(host)#show lldp neighbor
Capability codes: (R)Router, (B)Bridge, (A)Access Point, (P)Phone, (O)Other
LLDP Neighbor Information
-------------------------
Local Intf Chassis ID Capability Remote Intf Expiry-Time (Secs)

MAC: 9c:b7:0d:7d:0b:72: Blacklist
MAC: 7c:d1:c3:d1:02:c8: Blacklist
```

The output of the **`show lldp neighbor`** command includes the following information:

Parameter	Description
Local Intf	Slot and port number.
Chassis ID	MAC address of the LLDP Peer.
Capability	Shows the capabilities of the peer to operate as a router, bridge, access point, phone or other network device.
Remote Intf	Remote interface.
Expiry-time	Expiry time.
System Name	Name of the peer system, as supplied by the peer.

The output of the **show lldp neighbor interface gigabitethernet <slot/module/port> detail** command varies, depending upon the type of LLDP peer detected. The output in the example above contains the following information:

Parameter	Description
Interface	Name of the port for which you are viewing LLDP neighbor information.
Number of Neighbors	Number of LLDP neighbors seen by the port.
Chassis id	MAC address of the neighbor device.
Management address	MAC address of the neighbor's management port.
Interface description	Description of the LLDP neighbor interface.
ID	Interface ID of the LLDP neighbor interface.
MTU	Maximum Transmission Unit size allowed by the neighbor device in bytes.
Device MAC	Shows the MAC address of the IAP connected to the MAS port.
Last Update	Date and time the neighbor device's status changed.
Time to live	Time, in seconds, for which this information is valid.
Expires in	Time, in seconds, before this information is considered invalid.
System capabilities	This column shows the capabilities of the peer to operate as a router, bridge, access point, phone or other network device.
Enabled capabilities	This column if the peer has been actively configured to operate as a router, bridge, access point, phone or other network device.
System name	Name of the peer system, as supplied by the peer.
System description	Description of the peer system, as supplied by the peer.
Auto negotiation	Shows if link auto-negotiation is enabled for the peer interface.

Parameter	Description
`Media attached unit type`	This parameter displays additional details about an LLDP-MED device attached to the interface. The specific details depend upon the capabilities of the device.
`VLAN`	VLAN ID assigned to the peer interface.
`pvid`	Indicates if the VLAN ID is assigned to the peer access port.
`MAC`	Shows the MAC address of the rogue AP detected by the Instant AP(IAP), which is blacklisted by the MAS.
`LLDP-MED`	Shows details for LLDP-MED (Media Endpoint Discovery), if applicable.
`Device Type`	Type of LLDP-MED device connected to the peer interface.
`Capability`	Capabilities of the LLDP-MED device connected to the peer interface.

Related Commands

show lldp statistics

```
show lldp statistics  gigabitethernet <slot/module/port>
```

Description

This command displays the LLDP statistics information.

Syntax

Parameter	Description
`gigabitethernet <slot/module/port>`	Displays LLDP information on a gigabitethernet interface.

Usage Guidelines

By default, this command displays LLDP statistics for the entire list of LLDP interfaces. Include a slot/module/port number to display statistics only for that one interface.

Example

The example command below shows LLDP statistics for the Gigabit Ethernet interface **0/0/0**.

```
(host) #show lldp statistics interface gigabitethernet 0/0/0

LLDP Statistics
---------------
Interface             Received  Unknow TLVs  Malformed  Transmitted
---------             --------  -----------  ---------  -----------
gigabitethernet0/0  1249      0            0          1249
```

The output of this command includes the following information:

Parameter	Description
`Interface`	Name of an LLDP interface.
`Received`	Number of packets received on that interface.
`Unknown TLVs`	Number of LLDP Protocol Data Units (PDUs) with an unknown type-length-value (TLV).
`Number of Malformed packets`	Number of malformed packets received on that interface.
`Transmitted`	Number of packets transmitted from that interface.

Related Commands

Command	Description
ap lldp profile	Define an LLDP profile that specifies the TLV elements to be sent in LLDP PDUs.

Command History

Release	Modification
AOS-W 8.0.0.0	Command Introduced.

Command Information

Platforms	Licensing	Command Mode

show local-cert-mac

```
show local-cert-mac
   tag <mac>
```

Description

Display the IP, MAC address and certificate configuration of a managed device in a Mobility Master/managed device configuration.

Syntax

Parameter	Description
`tag <tag>`	IP address of the managed device or MAC address of the managed device.

Usage Guidelines

By default the output of this command shows each managed device's IP and MAC address and the type of certificate used by those managed devices (Custom or Factory). Use the optional **tag** parameter to display information for a managed device only.

Example

The output of this command shows that two managed devices have a custom certificate installed.

```
(host)[node] # show local-cert-mac
Local Switches configured by Local Certificate
-----------------------------------------------
Switch IP of the Local  MAC address of the Local  Cert-Type  CA cert
----------------------  ------------------------  ---------  -------
10.4.62.3               0B:86:F0:12:AC:15         Custom     CAcert
10.4.62.5               00:0B:86:F0:05:60         Custom     Undefined
```

The output of this command includes the following information:

Column	Description
Switch IP of the Local	IP address of the managed device.
MAC address of the Local	MAC address of a managed device with a local certificate.
Cert-Type	Type of certificate used by the local managed device. ■ Custom: User-installed, custom certificate ■ Factory: Factory-installed certificate
CA Cert	Name of the Certificate Authority (CA) certificate.

Related Commands

Command	Description
local-factory-cert	This command configures the factory-installed certificate for secure communication between a managed device and Mobility Master.

Command	Description
local-custom-cert	This command configures a custom certificate for secure communication between a managed device and Mobility Master.

Command History

Version	Description
AOS-W 8.0.0.0	Command introduced.

Command Information

show localip

```
show localip
```

Description

Displays the IP address and VPN shared key between master and local.

Syntax

No parameters.

Example

The output of this command shows the managed device's IP address and shared key between Mobility Master and managed devices.

```
(host)[node] # show localip

Local Switches configured by Local Switch IP
--------------------------------------------
Switch IP address of the Local  Key
------------------------------  ---
0.0.0.0                         ********
```

Related Commands

Command	Description

show localipv6

```
show localipv6
```

Description

Shows the IP address and preshared key for the managed device on a Mobility Master.

Syntax

Parameter	Description
`<tag>`	Show VPN configuration of a specific Local Switch or Output Modifiers.

Example

This example shows the IPv4 and IPv6 addresses configured .

```
(host) [mynode] (config) #show localipv6
Local Switches configured by Local Switch IPv6
----------------------------------------------
Switch IPv6 address of the Local  Corres IPv4 address of the Local  Key
------------------------------  ------------------------------  ---
2002::1                         1.1.1.1                         ********
```

Related Commands

Command	Description

show local-peer-mac

```
show local-peer-mac tag <local-mac-addr>
```

Description

This command is used to display the MAC address used for secure communication based between Mobility Master and managed devices.

Syntax

Parameter	Description
`tag <local-mac-addr>`	The managed device's MAC address.

Example

Include the optional tag<local-mac-addr>

```
(host) [mynode] (config) #local-peer-mac 00:0c:29:00:00:00 ipsec 123456
```

Related Commands

Command	Description

show local-userdb

```
show local-userdb
   maximum-expiration
   start <offset>
   page <page-size>
   username <username>
   verbose
```

Description

Shows information about user's accounts in the local user database.

Syntax

Parameter	Description
`maximum-expiration`	How long the account is valid, in minutes, in the internal database.
`start <offset>`	Display records starting at a specific database record number defined by the <offset> parameter.
`page <page-size>`	Number of user entries to display .
`username <username>`	Show data for a specific user.
`verbose`	Display the following additional details for each database entry. ■ Full-Name ■ Company ■ Phone ■ Comments ■ Start-Date ■ Creation-Date ■ Sponsor-Fullname ■ Sponsor-Email ■ Sponsor-Dept ■ Opt-Field-1 ■ Opt-Field-2 ■ Opt-Field-3 ■ Opt-Field-4 ■ Grantor-Role ■ VLAN ■ NASIP

Usage Guidelines

Issue this command without any parameters to display a general overview of user's accounts in the database. Use the **maximum-expiration** parameter to show how long the account is valid for in minutes. Use the **start <offset> page <page_size>** parameters to control which user account records in the database display initially and the number of account records displayed on a page.

Example

This example shows the basic summary of user accounts in the database.

```
(host)[node] #show local-userdb maximum-expiration start 5 page 4
```

```
local-userdb maximum-expiration 90

User Summary
------------
Name           Password  Role   E-Mail  Enabled  Expiry  Status  Sponsor-Name  Grantor-Name
----           --------  ----   ------  -------  ------  ------  ------------  ------------
guest-0657984  ********  guest          Yes              Active                admin
guest-8330301  ********  guest          Yes              Active                admin

guest-3469360  ********  guest          Yes              Active                admin

User Entries: 11
```

The output of this command includes the following parameters:

Parameter	Description
`Name`	Name of the user.
`Password`	The user's password.
`Role`	Role for the user. This role takes effect when the internal database is specified in a server group profile with a server derivation rule. If there is no server derivation rule configured, then the user is assigned the default role for the authentication method.
`E-mail`	Shows the email address of the user account.
`Enabled`	Shows whether the account is enabled or disabled.
`Expiry`	Shows the expiration date for the user account. If this is not set, the account does not expire.
`Status`	Shows whether the profile has enabled or disabled the ability to use the HTTP protocol to redirect users to the captive portal page.
`Sponsor-Name`	Shows the sponsor's name.
`Grantor-Name`	Shows the grantor's name.
`User Entries`	Shows the number of user accounts in the database.

Related Commands

show local-userdb-guest

```
show local-userdb-guest
   maximum-expiration
   start <offset>
   page <page-size>
   username <username>
   verbose
```

Description

Shows information about guest accounts in the local user database.

Syntax

Parameter	Description
`maximum-expiration`	How long the account is valid, in minutes, in the internal database.
`start <offset>`	Display records starting at a specific database record number defined by the <offset> parameter.
`page <page-size>`	Number of user entries to display .
`username <username>`	Show data for a specific user.
`verbose`	Display the following additional details for each database entry. ■ Full-Name ■ Company ■ Phone ■ Comments ■ Start-Date ■ Creation-Date ■ Sponsor-Fullname ■ Sponsor-Email ■ Sponsor-Dept ■ Opt-Field-1 ■ Opt-Field-2 ■ Opt-Field-3 ■ Opt-Field-4 ■ Grantor-Role ■ VLAN ■ NASIP

Usage Guidelines

Issue this command without any parameters to display a general overview of guest accounts in the database. Use the **maximum-expiration** parameter to show how long the account is valid for in minutes. Use the **start <offset> page <page_size>** parameters to control which guest account records in the database display initially and the number of account records displayed on a page.

Example

This example shows the basic summary of guest user accounts in the database.

```
(host)[node] #show local-userdb-guest maximum-expiration start 5 page 4
```

```
local-userdb-guest maximum-expiration 90

Guest UserSummary
-----------------
Name           Password  Role    E-Mail  Enabled  Expiry  Status  Sponsor-Name  Grantor-Name

   page <page-size>
   username <username>
   verbose
```

Description

Shows information about public-access user accounts in the local user database.

Syntax

Parameter	Description
`maximum-expiration`	How long the account is valid, in minutes, in the internal database.
`start <offset>`	Display records starting at a specific database record number defined by the <offset> parameter.
`page <page-size>`	Number of user entries to display .
`username <username>`	Show data for a specific user.
`verbose`	Display the following additional details for each database entry. ■ Full-Name ■ Company ■ Phone ■ Comments ■ Start-Date ■ Creation-Date ■ Sponsor-Fullname ■ Sponsor-Email ■ Sponsor-Dept ■ Opt-Field-1 ■ Opt-Field-2 ■ Opt-Field-3 ■ Opt-Field-4 ■ Grantor-Role ■ VLAN ■ NASIP

Usage Guidelines

Issue this command without any parameters to display a general overview of guest accounts in the database. Use the **maximum-expiration** parameter to show how long the account is valid for in minutes. Use the **start <offset> page <page_size>** parameters to control which account records in the database display initially and the number of account records displayed on a page.

Example

This example shows the basic summary of public access user accounts in the database.

```
(host)[node] #show local-userdb-guest maximum-expiration start 5 page 4
local-userdb-guest maximum-expiration 90
```

```
Guest UserSummary
-----------------
Name           Password  Role   E-Mail  Enabled  Expiry  Status  Sponsor-Name  Grantor-Name
----           --------  ----   ------  -------  ------  ------  ------------  ------------
guest-0657984  ********  guest          Yes              Active                admin
guest-8330301  ********  guest          Yes              Active                admin
guest-5433352  ********  guest          Yes              Active                admin
guest-3469360  ********  guest          Yes              Active                admin

User Entries: 11
```

The output of this command includes the following parameters:

Parameter	Description
`Name`	Name of the user.
`Password`	The user's password.
`Role`	Role for the user. This role takes effect when the internal database is specified in a server group profile with a server derivation rule. If there is no server derivation rule configured, then the user is assigned the default role for the authentication method.
`E-mail`	Shows the email address of the user account.
`Enabled`	Shows whether the account is enabled or disabled.
`Expiry`	Shows the expiration date for the user account. If this is not set, the account does not expire.
`Status`	Shows whether the profile has enabled or disabled the ability to use the HTTP protocol to redirect users to the captive portal page.
`Sponsor-Name`	Shows the sponsor's name.
`Grantor-Name`	Shows the grantor's name.
`User Entries`	Shows the number of user accounts in the database.

Related Commands

show localip

```
show localip
```

Description

Displays the IP address and VPN shared key between master and local.

Syntax

No parameters.

Example

The output of this command shows the managed device's IP address and shared key between Mobility Master and managed devices.

```
(host)[node] # show localip

Local Switches configured by Local Switch IP
--------------------------------------------
Switch IP address of the Local  Key
------------------------------  ---
0.0.0.0                         ********
```

Related Commands

Command	Description
localip	This command configures the IP address and preshared key for the managed device on a Mobility Master.

show log all

```
show log all|ap-debug|arm|arm-user-debug|errorlog|network|security|system|user|user-
debug|wireless  [<number>]
```

Description

Show the log files on Mobility Master or a managed device.

Syntax

Parameter	Description
`all`	Issue the command **show log all** to display all log files. Include this parameter after one of the log file types (for example, **show log security all**) to display all log files of the selected type.
`ap-debug`	Display AP debug log files.
`arm`	Display ARM log files.
`arm-user-debug`	Display ARM user debug log files.
`errorlog`	Display error log files.
`network`	Display network log files.
`<number>`	Include this parameter at the end of the show log command to start displaying the log output from the specified number of lines from the end of the log.
`security`	Display security log files.
`system`	Display system log files.
`user`	Display user log files.
`user-debug`	Display user debug log files.
`wireless`	Display wireless log files.

Example

This example shows the most ten recent security log entries for the Switch.

```
(host)[node] (config) #show log security 5

show log user

```
show log user{[<number>][all]}
```

Description

Show the Switch's user logs.

Syntax

Parameter	Description
`<number>`	Start displaying the log output from the specified number of lines from the end of the log.
`all`	Shows all the user logs for the Switch.

Example

This example shows the Switch's last ten user logs.

```
(host)[node] #show log user 10

show logging

```
show logging facility|server|{level [verbose]}
```

Description

the IP address of the remote logging server, as well as facility log types and their associated facility levels.

Syntax

Parameter	Description
`facility`	View the facility used when logging messages into the remote syslog server.
`server`	Show the IP address of a remote logging server.
`level [verbose]`	Show logging levels at which the messages are logged. Include the optional verbose parameter to display additional data for logging subcategories and processes.

Usage Guidelines

The AOS-W logging levels follow syslog convention:

- level 7: Emergency
- level 6: Alert
- level 5: Critical
- level 4: Errors.
- level 3: Warning
- level 2:Notices
- level 1:Informational
- level 0: Debug

The default logging level is **leve1 1**. You can change this setting via the **logging** command.

Example

This example below displays defined logging levels for each logging facility.

```
(host)[node] #show logging level

LOGGING LEVELS
--------------
Facility  Level
--------  -----
network   warnings
security  warnings
system    warnings
user      warnings
wireless  warnings
```

This example below displays the IP address of a remote log server. If a remote log server has not yet been defined, this command will not display any output.

```
(host)[node] #show logging server
```

```
Remote Server: 1.1.1.1

FACILITY MAPPING TABLE
----------------------
local-facility  severity   remote-facility
--------------  --------   ---------------
user            debugging  local1
```

show loginsessions

```
show loginsessions
```

Description

Displays the current administrator login sessions statistics.

Syntax

No parameters.

Example

Issue this command to display the admin login session statistics.

```
Session Table
-------------
ID  User Name  User Role  Connection From  Idle Time  Session Time
--  ---------  ---------  ---------------  ---------  ------------
1   admin      root       10.100.102.43    00:00:00   00:27:59
```

The output includes the following parameters:

Parameter	Description
`ID`	Sessions identification number
`User Name`	Administrator's user name
`User Role`	Administrator's role
`Connection From`	The IP address from which the administrator is connecting
`Idle Time`	Amount of time the user has been idle
`Session Time`	Total time the session has been open

show mac-address-table

```
show mac-address-table
```

Description

Displays a MAC forwarding table.

Syntax

No parameters.

Example

Issue this command to display the MAC forwarding table.

```
Dynamic Address Count:           0
Static Address (User-defined) Count:             0
System Self Address Count:               0
Total MAC  Addresses :           6
Maximum MAC addresses :                  6
MAC Address Table
------------------
Destination Address  Address Type  VLAN  Destination Port
-------------------  ------------  ----  ----------------
00:0b:86:00:00:00    Mgmt          1     vlan 1
00:0b:86:f0:05:60    Mgmt          1     vlan 1
00:0b:86:00:00:00    Mgmt          62    vlan 62
00:0b:86:f0:05:60    Mgmt          62    vlan 62
00:0b:86:00:00:00    Mgmt          4095  vlan 4095
00:0b:86:f0:05:60    Mgmt          4095  vlan 4095
```

The output includes the following parameters:

Parameter	Description
`Dynamic Address Count`	Count of dynamic addresses currently associated with the managed device.
`Static Address (User-defined) Count`	Count of static, user-defined addresses associated with the managed device.
`System Self Address Count`	Number of self system addresses.
`Total MAC Addresses`	Total number of MAC addresses associated with the managed device.
`Maximum MAC Addresses`	Maximum number of MAC addresses.
`Destination Address`	Destination MAC address.
`Address Type`	Destination address type.
`VLAN`	Associated VLAN.
`Destination Port`	Destination port.

show master-local stats

```
show master-local stats [<ip-addr>] [<page>]
```

Description

Display statistics for communication between Mobility Master and managed devices.

Syntax

Parameter	Description
`<ip-addr>`	Include the IP address of a managed device to display statistics that managed device only.
`<page>`	Start displaying the output of this command at the specified page number.

Usage Guidelines

By default, Mobility Master and managed devices exchange heartbeat messages every 10 seconds. These Heartbeats include a configuration timestamp. If a Mobility Master has later timestamp than the managed device, the state of the managed device changes from 'Update Successful' to 'Update Required'.

Example

This example below shows statistics for all communications between the Mobility Master and the managed devices.

```
(host) [mynode] #show master-local stats

Missed -> HB Resp from Master
-----------------------------
IP Address  HB Req      HB Resp     Total Missed  Last Sent Missed  Peer Reset  Cfg Terminate
Last Synced
----------  ------      -------     ------------  ----------------  ----------  -------------
-----------
10.6.2.252  194721      194208      926           0                 105         1
Thu Feb 26 21:12:04 2009
```

The output of this command includes the following data columns:

Parameter	Description
`IP Address`	IP address of the managed device.
`HB Req`	Heartbeat requests sent from the managed device.
`HB Resp`	Heartbeat responses sent from the Mobility Master.
`Total Missed`	Total number of heartbeats that were not received by the managed device.
`Last Sent Missed`	This counter will increment if the managed device misses the last heartbeat from the peer managed device. This counter will keep on incrementing until the heartbeat message is received from peer.

Parameter	Description
`Peer Reset`	The number of times the connection to peer is been reset. The connection could reset due to network connectivity problems or when the peer switch reboots.
`Cfg Terminate`	Number of times the managed device has failed to upgrade to a new configuration
`Last Synced`	Timestamp showing the last time the managed device synched its configuration from the Mobility Master.

Command History

Version	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable and Config mode on Mobility Master.

show master-l3redundancy

```
show master-l3redundancy {config-sync|status}
```

Description

Displays the Layer-3 configuration and database sync status as well as the current status of Layer-3-domain Mobility Master redundancy.

Syntax

Parameter	Description
`config-sync <status>`	Displays Layer-3 configuration and database sync status.
`status`	Displays current status of L3-domain master redundancy.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Examples

The example below executed on the managed device displays the health of primary and secondary data centers.

```
(host) #show master-l3redundancy status
L3 Redundancy Status

--------------------

Role IP Address Status

---- ---------- ------

Master 10.9.196.151 Down

Secondary Master 10.9.196.152 Up
```

The example below executed on the managed device displays Layer-3 redundancy configuration.

```
(host) #show master-l3redundancy

L3 Sync Role:Primary

L3 Redundant Peer IP:10.9.196.154

IKE PSK: 16c591a3789da6eef4420a5fe45967c3f1cf1bc457464244
```

The example below executed on the managed device displays the L3 configuration and database sync status.

```
(host)# show master-l3redundancy config-sync state

(host)# show database synchronize
```

Description

This command displays the availability of used and available memory on Mobility Master, or include a process name to show memory information for a process on the AP or Mobility Master.

Syntax

Parameter	Description
`aaa`	Displays memory information for the AAA process.
`amon_recvr`	Displays the memory information for the **amon_recvr** process.
`amon_sender`	Displays the memory information for the **amon_sender** process
`ap`	Displays memory information for a process running on a specific AP or BSSID. ■ **ble_daemon**: Displays the memory information for the ble_daemon process. ■ **lldpd**: Displays the memory information for the LLDP process. ■ **meshd**: Displays the memory information for the meshd process. ■ **ofald**: Displays the memory information for the OpenFlow Agent Lite Daemon process. ■ **rapper**: Displays the memory information for the rapper process. ■ **rfd**: Displays the memory information for the rfd process. ■ **sapd**: Displays the memory information for the sapd process. ■ **stm**: Displays the memory information for the AP stm process. ■ **wcd**: Displays the memory information for the AP wcd process.
`apprf`	Displays the memory information for the AppRF process.
`arci-cli-helper`	Displays the memory information for the arci-cli-helper process.
`arm`	Displays the memory information for the ARM process.
`auth`	Displays the memory information for the authentication process.
`ble_relay`	Displays the memory information for the ble relay process.
`certmgr`	Displays the memory information for the certmgr process.
`cfgdist`	Displays the memory information for the cfgdist process.
`cfgm`	Displays the memory information for the cfgm process.
`cli`	Displays the memory information for the cli process.
`cluster_mgr`	Displays the memory information for the cluster_mgr process.
`cpsec`	Displays the memory information for the cpsec process.
`ctrlmgmt`	Displays the memory information for the ctrlmgmt process.
`dbsync`	Displays the memory information for the dbsync process.
`dds`	Displays the memory information for dds process.
`debug`	Displays detailed memory information to debug memory errors.

Parameter	Description
dhcpd	Displays the memory information for the DHCP process.
dhcpdwrap	Displays the memory information for the dhcpdwrap process.
ecc	Displays the DRAM ecc counters.
fpapps	Displays the memory information for the fpapps process.
fw_visibility	Displays the memory information for the fw_visibility process.
gsmmgr	Displays the memory information for gthe smmgr process.
ha_mgr	Displays the memory information for the HA_MGR process.
ip_flow_export	Displays the memory information for the ip flow export process.
isakmpd	Displays the memory information for the isakmpd process.
l2tpd	Displays the memory information for the l2tpd process.
lagm	Displays the memory information for the lagm process.
licensemgr	Displays the memory information for the licensemgr process.
lldpd	Displays the memory information for the lldpd process.
mdns	Displays the memory information for the mDNS process.
mobileip	Displays the memory information for the mobileip process.
mon_serv	Displays the memory information for the mon_serv process.
ofa	Displays the memory information for the OpenFlow Agent process.
ospf	Displays the memory information for the OSPF process.
phonehome	Displays the memory information for the phonehome process.
pim	Displays the memory information for the pim process.
pptpd	Displays the memory information for the pptpd process.
profmgr	Displays the memory information for the profmgr process.
rtpa	Displays the memory information for the rtpa process.
slb	Displays the memory information for the slb process.
snmpd	Displays the memory information for the snmpd process.
stm	Displays the memory information for the stm process.
syslogdwrap	Displays the memory information for the syslogdwrap process.
ucm	Displays the memory information for the UCM process.
udbserver	Displays the memory information for the udbserver process.

Parameter	Description
upgrademgr	Displays the memory information for the upgrademgr process.
vrrp	Displays the memory information for the vrrp process.
web_cc	Displays the memory information for the WebCC process.
wms	Displays the memory information for the WMS process.

Usage Guidelines

Include the name of a process to show memory information for that process. Use this command under the supervision of Alcatel-Lucent technical support to help debug process errors.

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The command **show memory** displays, in Kilobytes, the total memory on Mobility Master, the amount of memory currently being used, and the amount of free memory.

```
(host) [mynode] #show memory

Memory (Kb): total: 256128, used: 162757, free: 93371
```

Include the name of a process to show memory statistics for that process. The example below shows memory statistics for **mobileip**.

```
(host) [mynode] #show memory mobileip

Type            Num Allocs     Size Allocs      Peak Allocs      Peak Size

0x4358ac              2            272
0x4369f1              3            120
0x436a64              9            288
0x437f3a              3            168
0x45ba3a              3             72
0x45c277              4            288

total                                  336545                          336698
```

The output of this command includes the following columns:

Column	Description
`Type`	The **show memory** command only shows information for predefined processes, so this column always displays the parameter **default**.
`Num Alloc`	Current number of memory allocations.
`Size Allocs`	Total size of all memory allocations, in bytes.
`Peak Allocs`	Maximum number of allocations used throughout in the life of the process.
`Peak Size`	Maximum size of allocations used throughout in the life of the process, in bytes.
`PC`	Program counter: the address of a memory allocation. (For internal use only)
`Allocs`	Number of memory allocations at that program counter. (For internal use only)
`Size`	Size of all memory allocations at that program counter. (For internal use only)

Command History

Release	Modification
AOS-W 8.5.0.0	The **wcd** sub-parameter was added.
AOS-W 8.2.0.0	The **lagm** and **vrrp** parameters were added.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on Mobility Master.

show mgmt-role

```
show mgmt-role
```

Description

This command allows the user to view a list of management role configurations.

Syntax

No parameters.

Example

Issue this command to display a list of management user roles.

```
Management User Roles
---------------------
ROLE                 DESCRIPTION
----                 -----------
root                 Super user role
read-only            Read only commands
network-operations   network-operations
guest-provisioning   guest-provisioning
location-api-mgmt    location-api-mgmt
no-access            Default role, no commands are accessible for this role
location-api-mgmt    location-api-mgmt
```

The output includes the following parameters:

Parameter	Description
`Role`	Name of the management user role
`Description`	Description of the management user role

Related Commands

Command	Description

show mgmt-server

```
show mgmt-server
   message-counters process {arm|auth|dhcp|fpapps|fw_visibility|hwmon|mdns|resolver|spectrum
   stm|ucm|wms}
   profile <profile-name>
```

Description

Displays the message counter information of management server.

Syntax

Parameter	Description
`message-counters`	Message counter in the recent past.
`process {arm|auth|dhcp|fw_visibility|mdns |resolver|spectrum|stm|ucm|wms}`	Switch processes: ■ **arm**: Advanced Radio Management (ARM) ■ **auth**: Authentication ■ **dhcp**: DHCP ■ **fpapps**: Layer 2,3 control ■ **fw_visibility**: Firewall Visibility ■ **hwmon**: Hardware monitor ■ **mdns**: AirGroup ■ **resolver**: Resolver ■ **spectrum**: Spectrum Analysis ■ **stm**: Station Management ■ **ucm**: Unified Communication Manager ■ **wms**: WLAN Management System
`profile <profile-name>`	Displays the list of configuration profiles and the details of the specified configuration profiles for the management server.

Example

The output of this command shows the message counter information of the WLAN Management System process in the Switch.

```
(host)[node] (config) #show mgmt-server message-counters process wms

Message Counter History
-----------------------
Message Number  Time                      Packets  Monitored AP Info  Monitored AP Stats
Monitored STA Info  Monitored STA Stats
--------------  ----                      -------  -----------------  ------------------  -----
-------------  -------------------
82              Tue Apr 2 14:56:43 2013   1        0                  0                   3
               3
81              Tue Apr 2 14:56:13 2013   1        14                 218                 2
               67
80              Tue Apr 2 14:55:43 2013   1        0                  0                   0
               2
79              Tue Apr 2 14:55:13 2013   1        0                  0                   0
               2
```

The output of the following command displays the details of the default-amp management configuration profile:

```
            (host)[node] #show mgmt-server profile default-amp
Mgmt Config profile "default-amp" (Predefined (editable))
---------------------------------------------------------
Parameter         Value
---------         -----

show mgmt-servers

```
show mgmt-servers
```

Description

Displays list of management servers that receive Advanced Monitoring (AMON) messages from the Switch.

Syntax

Parameter	Description
`mgmt-servers`	Management Servers. This could be OmniVista 3600 Air Manager Management Server or any other server that receive messages from the Switch using AMON protocol.

Example

The output of this command shows list of management servers.

```
(host)(mynode) #show mgmt-servers
List of Management Servers
--------------------------
Primary Server  Profile      Transport-method
--------------  -------      ----------------
2001::2         default-amp  secure-udp
40.40.40.1      default-amp  secure-udp
10.1.1.11       default-amp  udp
20.16.11.1      default-ale  udp
Num Rows:4
```

Related Commands

Command	Description
mgmt-user	This command configures an administrative user.
mgmt-server	This command configures the management server profile.

Command History

show mgmt-users

```
show mgmt-users [ <username> |
   audit-info <username>
   console <username>
   local-authentication-mode <username>
   ssh-pubkey <username>
   webui-cacert <username>
   <username>
```

Description

Displays a list of management users on the Switch and details of each management user.

Syntax

Parameter	Description
`audit-info`	To view audit information related to a specific management user.
`console`	To view serial console status of management user.
`local-authentication-mode`	Status of local-authentication mode.
`ssh-pubkey`	Number of management users using the ssh-pubkey.
`webui-cacert`	Number of management users using web CA certificates.
`username`	To view details of a specific management user.

Example

The output of this command shows the client certificate name, username, user role, and revocation checkpoint for management users using the ssh-pubkey in the Switch.

```
#show mgmt-user ssh-pubkey

SSH Public Key Management User Table
------------------------------------
CLIENT-CERT           USER             ROLE        STATUS   REVOCATION CHECKPOINT  Max-
concurrent-sessions
-----------           ----             ----        ------   ---------------------  -----------
------------
pub1                  public1          root        ACTIVE   none                   N/A
master-ssh-pub-cert   seamless-logon   read-only   ACTIVE   none                   32
```

The output of this command displays the maximum number of concurrent sessions for a management user.

```
(host) [mynode] #show mgmt-user <username>
Management User Table
---------------------
USER    PASSWD  ROLE   STATUS   PATH  Max-concurrent-sessions
----    ------  ----   ------   ----  -----------------------
admin   *****   root   ACTIVE   /     N/A
luke    *****   root   ACTIVE   /     N/A
```

Related Commands

show mon-serv

```
show mon-serv
   ap-microboot-stats
   device-count
   function-stats
   max-q-stats
   message-stats
   mon-device-operation-stats
   queue-stats
   radio-microboot-stats
   sta-microboot-stats
   vap-microboot-stats
```

Description

This command shows the detailed statistics of monitoring server.

Syntax

Parameter	Description
`ap-microboot-stats`	Displays the AP micro-bootstrapping statistics.
`device-count`	Displays the count of devices that are added or deleted.
`function-stats`	Displays the summary of monitoring server activities.
`max-q-stats`	Displays the details of maximum queue statistics.
`message-stats`	Displays the AMON and monitoring server message statistics.
`mon-device-operation-stats`	Displays the device operation statistics.
`queue-stats`	Displays the current queue statistics.
`radio-microboot-stats`	Displays the micro-bootstrapping statistics of AP radios.
`sta-microboot-stats`	Displays the STA micro-bootstrapping statistics.
`vap-microboot-stats`	Displays the VAP micro-bootstrapping statustics.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The following example shows the device operation statistics on the monitoring server.

```
(host) [mynode] #show mon-serv mon-device-operation-stats

Device Type: 0 [MON_DEVICE_TYPE_NETWORK]

Add Count          : 7
Delete Count       : 0
```

```

```
show mon-serv-lc-table
   airgroup
   bootstrap-stats <ip-addr>
   dev-del-stats <ip-addr>
   microboot-stats <ip-addr>
```

Description

This command shows the status and counters of monitoring server.

Syntax

Parameter	Description
`airgroup`	Shows AirGroup counters.
`bootstrap-stats <ip-addr>`	Shows bootstrap statistics for an lc-cluster.
`dev-del-stats <ip-addr>`	Shows (STM) device delete reason statistics for an lc-cluster.
`microboot-stats <ip-addr>`	Shows micro-bootstrapping statistics and threshold counts for an lc-cluster.

Usage Guidelines

This command shows the status and counters of monitoring server. For the remaining parameters, see the command syntax.

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The following example shows the configuration status of all branch config groups on the Switch.

```
(host) [mynode] #show mon-serv-lc-table airgroup

MON_SERV Airgroup Table
-----------------------
LC IP  Servers  Users  Server Usage  User Usage  Server Ip Entries
-----  -------  -----  ------------  ----------  ------------------

User Ip Entries  Ag sessions
---------------  -----------
```

Related Commands

Command	Description

All platforms	Base operating system.	Enable mode on Mobility Master.

show neighbor-devices

```
show neighbor-devices
```

Description

Show neighbor device information

Syntax

No Parameters

Example

The command in the first example below shows that the managed device recognizes two neihbor devices.

```
[host] (node) # show neighbor devices
Interface objtype is 7
Capability codes: (R)Router, (B)Bridge, (A)Access Point, (P)Phone, (S)Station
(r)Repeater, (O)Other
Neighbor Devices Information
-------------------------
Local Intf      Chassis ID          Capability   Remote Intf   Expiry-Time (Secs)  System
---------       -----------         -----------  -----------   ------------------ -----------
0/0/1           00:0b:86:6a:25:40   B:R          0/0/17        105                 Alcatel-Lucent OAW-
0/0/2           00:0b:86:6a:25:40   B:R          0/0/18        105                 Alcatel-Lucent OAW-
```

Parameter	Description
`Local Intf`	Slot and port number of the local interface that detected the neighbor devices.
`Chassis ID`	MAC address of the neighbor device.
`Capability`	Shows the capabilities of the neighbor deviceto operate as a router, bridge, access point, phone or other network device.
`Remote Intf`	Slot and port number of the remote interface on the neighbor device
`Expiry-time`	Expiry time.
`System Name`	Name of the neighbor device, as supplied by the neighbor.

Command History

Release	Modification
AOS-W 8.0.0.0	Command Introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable mode on managed devices. This command is not supported on Mobility Master.

show netdestination

```
show netdestination {ipv4 | ipv6 | <netdestination name>} [verbose]
```

Description

Displays IPv4 and IPv6 network destination information.

Syntax

Parameter	Description
`ipv4`	Displays IPv4 network destinations.
`ipv6`	Displays IPv6 network destinations.
`<netdestination name>`	Displays the name or IP addresses.
`verbose`	Prints the netdestination table entries.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

Issue this command to display all netdestination configured on this managed device. The output below displays information for all configured IPv4 and IPv6 netdestinations. To display additional detailed information for an individual netdestinations, include the name of the netdestination at the end of the command.

```
(host) [mynode] #show netdestination
Name: sep23-ipv4
Destination ID: 34
Position  Type  IP addr   Mask-Len/Range
--------  ----  -------   --------------
1         host  1.1.1.1   32
2         name  0.0.0.8   google.com
```

The output includes the following parameters:

Parameter	Description
`Name`	Network destination name.
`Destination ID`	Network destination ID.
`Position`	Network destination position.
`Type`	Network destination type.
`IP addr`	IP address of the network destination.

Parameter	Description
`Mask-Len/Range`	Network destination subnet mask and range. If the netdestination object has a defined domain or host name, that value will appear in the mask-Len or Range column.

Related commands

Command	Description
netdestination	This command configures an alias for an IPv4 network host, subnetwork, or range of addresses.
netdestination6	This command configures an alias for an IPv6 network host, subnetwork, or range of addresses.

Command History

Version	Modification
AOS-W 8.2.1.0	The **Destination ID** parameter was added to the output.
AOS-W 8.2.0.0	The **ipv4** and **ipv6** parameters were added.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	You must have a PEFNG license to configure or view a netdestination.	Enable or Config mode on Mobility Master.

show netexthdr

```
show netexthdr <alias-name>
```

Description

This command displays the IPv6 extension header (EH) types that are denied.

Syntax

Parameter	Description
`<alias-name>`	Specify the EH alias name.

Usage Guidelines

Example

The following command displays the denied extended header types in the default EH:

```
(host)[mynode] #show netexthdr default

Extended Header type(s) Denied
------------------------------
51,
```

Related Commands

Command	Description
netexthdr	This command allows you to edit the packet filter options in the extension header (EH).

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable or Config mode on Mobility Master.

show netservice

```
show netservice [<string>]
```

Description

Show network services

Syntax

Parameter	Description
`<string>`	Name of a network service.

Usage guidelines

Issue this command without the optional **<string>** parameter to view a complete table of network services on the Switch. Include the **<string>** parameter to display settings for a single network service only.

Example

The following example shows the protocol type, ports and application-level gateway (ALG) for the DHCP service.

```
(host)[mynode] #show netservice svc-dhcp
Services
--------
Name      Protocol  Ports  ALG
----      --------  -----  ---
svc-dhcp  udp       67                          68
```

Related Commands

Command	Description

show netstat

```
show netstat
ip dst|src <ip-addr>
port dst|exclude|src <port>
raw
stats
tcp
udp
unix
```

Description

Show network statistics for current active network connections, filtered by protocol type.

Syntax

Parameter	Description
`ip dst|src <ip-addr>`	Displays network statistics filtered based on the source or destination IP address
`port dst|exclude|src <port>`	Displays network statistics filtered based on the source or destination port number. Use the **exclude** parameter to exclude a part from the output of this command.
`raw`	Show netstat raw socket statistics
`stats`	Show a network statistics summary
`tcp`	Displays network statistics for TCP sockets.
`udp`	Displays network statistics for UDP sockets.
`unix`	Displays network statistics for UNIX sockets.

Usage guidelines

Issue the **show netstat stats** command to display aggregate statistics, or protocol type, port or IP address to filter the statistics displayed in the output of this command.

Example

The following example shows incoming and outgoing packet statistics for the Switch.

```
(host)[node](config) #show netstat stats
Total: 1128 (kernel 1200)
TCP:   147 (estab 82, closed 22, orphaned 0, synrecv 0, timewait 13/0), ports 0
Transport Total     IP        IPv6
*         1200      -         -
RAW       1         1         0
UDP       240       43        197
TCP       125       107       18
INET      366       151       215
FRAG      0         0         0
```

Related Commands

Parameter	Description
netservice	Configures an alias for network protocols.

Command History

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable and Config mode.

show ntp authentication-keys

```
show ntp authentication-keys
```

Description

Show information for the NTP authentication key.

Syntax

No parameters.

Example

The following example shows values for the NTP authentication keys—Key ID, Key Type, and the Secret.

```
(host) [mynode] # show ntp authentication-keys
Key Id Key Type Secret
------ -------- ------
41       sha1     ********
```

The output of this command includes the following parameters:

Parameter	Description
`Key ID`	The key identifier used when you configured the NTP authentication key.
`Key Type`	The key type that you used when you configured the NTP authentication key—md5 or sha1.
`Secret`	The key value for the MD5/SHA1 hash used when you configured the NTP authentication key.

Related Commands

Command	Description
ntp	Helps configure NTP authentication keys.

Command History

Release	Modification
AOS-W 8.2.1.0	The output was modified to show the SHA1 key type and secret (in encoded format), when SHA1 authentication is configured.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Available in Enable and Config modes on Mobility Master and managed devices.

show ntp peer

```
show ntp peer <IPv4/IPv6 Address>
```

Description

Show NTP peer information.

Syntax

Parameter	Description
`<IPv4/IPv6 Address>`	IPv4/IPv6 Address of the peer.

Example

The output of this commands shows IPv4 and IPv6 address of the peer.

```
(host)[mynode]#show ntp peer 2008::2

remote 2008::2, local 2008::1

flags:     config, bclient, iburst
```

Usage guidelines

The **show ntp peer** command is used for NTP server troubleshooting, and should only be used under the supervision of Alcatel-Lucent technical support. Issue the show ntp servers command to view basic settings for currently configured NTP servers.

Related Commands

Command	Description
ntp	This command configures a Network Time Protocol (NTP) server.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable and Config mode on Mobility Master.

show ntp servers

```
show ntp servers [brief]
```

Description

Show information for Network Time Protocol (NTP) servers.

Syntax

Parameter	Description
`brief`	Display the IP address of the defined NTP servers, iburst and key settings.

Examples

The following example shows values for the primary and backup NTP servers. The primary server is marked with an asterisk (*****) and the backup server is marked with an equals sign (**=**). Note that a backup server will not display delay, offset or dispersion data, as it is not currently in use.

```
(host) (config) #show ntp server
NTP Server Table Entries
------------------------
Flags:     * Selected for synchronization
+ Included in the final selection set
# Selected for synchronization but distance exceeds maximum
- Discarded by the clustering algorithm
= mode is client
remote                          local         st   poll   reach    delay     offset      disp
================================================================================================
===
*2012::d63d:7eff:fe46:7309       2012::40       3 1024     377    0.00169    -0.001367
0.13815
```

The output of this command includes the following parameters:

Parameter	Description
`flags`	The flags indicate the status of the server.
remote	IP address of the remote NTP server defined using the CLI command ntp.
local	IP address of the local clock.
st	NTP uses hierarchical levels of clock sources, or strata, and assigns each layer a number starting with zero at the root. The **st** column in the output of this command represents the number of servers between the configured NTP server and the root reference clock.
poll	Interval, in seconds, between the local NTP server's attempt to poll the remote NTP server.
reach	An index that measures whether or not the remote NTP server could be reached at eight most recent polling intervals. If the NTP server has just been configured and hasn't yet been polled successfully, the value will be zero (0). A value of 377 indicates that the last eight poll queries were successful.

Parameter	Description
delay	Delay, in seconds, between the time that the local clock polls the NTP server and the NTP server returns a reply.
offset	The difference in time, in seconds, between the local clock and the NTP server.
disp	Dispersion represents the maximum error of the local clock relative to the reference clock, and is a measurement of the time server and network quality. Lower dispersion values are preferred over higher dispersion values.

The following example shows the **ntp servers** configuration. The NTP server IP address, key ID and iburst status are shown when the **ntp servers brief** command is used.

The following output is for IPv4:

```
(host) (config) #show ntp servers brief
server 1.1.1.1  key 1234
server 10.1.1.245 iburst key 12345
```

The following output is for IPv6:

```
(host) (config) #show ntp servers brief
server 2012::d63d:7eff:fe46:7309
```

Related Commands

show ntp status

```
show ntp status
```

Description

Show information for a NTP server.

Syntax

No parameters.

Example

The following example shows values for the primary NTP server.

```
(host) #show ntp status

Authentication:          enabled
time since restart:      2347
time since reset:        7594
packets received:        4
packets processed:       0
current version:         0
previous version:        0
declined:                0
access denied:           0
bad length or format:    0
bad authentication:      0
rate exceeded:           0
system peer:             10.1.1.250
system peer mode:        client
leap indicator:          00
stratum:                 3
precision:               -18
root distance:           0.03236 s
root dispersion:         0.06728 s
reference ID:            [10.1.1.250]
reference time:          cd45b701.bcbc05d5  Tue, Feb 17 2009 14:21:53.737
system flags:            auth monitor ntp kernel stats
jitter:                  0.005020 s
stability:               0.866 ppm
broadcastdelay:          0.003998 s
authdelay:               0.000000 s
```

The output of this command includes the following parameters:

Parameter	Description
`authentication`	Indicates if authentication is enabled for the NTP server.
`time since restart`	Time in hours since the system was last rebooted.
time since reset	The number of seconds since the last time the local NTP server was restarted.
`packets received`	Total number of packets received.

Parameter	Description
packets processed	Number of packets received in response to previous packets sent.
current version	Number of packets matching the current NTP version.
previous version	Number of packets matching the previous NTP version.
declined	Number of packets declined.
access denied	Number of packets for which access has been denied.
bad length or format	Number of packets with invalid length, format or port number.
packets received	Total number of packets received.
bad authentication	Number of NTP packets that failed to be authenticated.
rate exceeded	Number of packets discarded due to rate limitation.
system peer	The IP address of the peer NTP server.
system peer mode	The peer mode of this remote association: ■ Symmetric Active ■ Symmetric Passive ■ Client ■ Server ■ Broadcast
leap indicator	This parameter indicates whether or not a leap-second should be inserted or removed at the end of the last day of the current month. ■ 00 no warning ■ 01 +1 second (following minute has 61 seconds) ■ 10 -1 second (following minute has 59 seconds)
stratum	The stratum level of the peer
precision	The advertised precision of the switch. This value can range from -4 and -20, inclusive.
root distance	Total round trip delay to the stratum 1 reference clock.
root dispersion	Total dispersion to the stratum 1 reference clock. This value is a cumulative measure of all errors associated with the network hops and servers between the NTP server and its stratum 1 server.
reference ID	IPv4/IPv6 address of the remote NTP server. Note: When NTP server is reachable through IPv4 address, use the address as is. If done through IPv6 address, the Reference ID is calculated instead of directly taking the IPV6 address on the NTP Server. The Switch performs a MD5 checksum and the last 4 bytes are considered as the reference ID.
reference time	Time when the local system clock was last set or corrected, in NTP timestamp format.
system flags	This parameter displays any flags configured for this NTP entity.
jitter	The average magnitude of jitter between several time queries.

Parameter	Description
stability	The average magnitude of offset between several time queries
broadcastdelay	The broadcast delay of this NTP server association, in seconds.
authdelay	The authentication delay of this NTP server association, in seconds.

show openflow

```
show openflow
   capabilities
   controller
   debug
   flow-table
   flows
   ports
   statistics
```

Description

The command displays the information such as flows, flow tables, system capabilities, and statistics related to OpenFlow on the managed device where OpenFlow is enabled.

Syntax

Parameter	Description
`capabilities`	Displays the OpenFlow system capability information.
`controller`	Displays the OpenFlow Controller information.
`debug {ap-client|event|flows| ports}`	Displays the debug information for the OpenFlow AP clients, events, flows and ports.
`flow-table`	Displays the flow table information.
`flows`	Displays the flow information of the OpenFlow agent.
`ports`	Displays all the ports configured for OpenFlow.
`statistics`	Displays the OpenFlow statistics information.

Example

The following command displays the OpenFlow capabilities on the managed device:

```
(host-md) #show openflow capabilities

Match Fields:
In Port
Ethernet Destination Address
Ethernet Source Address
Ethernet Frame Type
802.1Q Vlan ID
IP Protocol
IPv4 Source Address
IPv4 Destination Address
TCP Source Port
TCP Destination Port
UDP Source Port
UDP Destination Port
IPv6 Source Address
IPv6 Destination Address
Actions:
Output to Port
Set 802.1Q Vlan ID
```

```
Set 802.1Q Vlan Priority
Strip 802.1Q Vlan
Set Ethernet Source Address
Set Ethernet Destination Address
Set IPv4 Source Address
Set IPv4 Destination Address
Set DSCP Bits
Set TCP/UDP Source Port
Set TCP/UDP Destination Port
```

The following command displays the OpenFlow Controller information from the managed device:

```
(host-md) #show openflow controller

Controller IP Address: 10.4.131.169  Port: 6633
Connection: UP
State: ACTIVE

show openflow-controller

```
show openflow-controller
   flow-table [app-name|dpid|sorted-by-dpid]
   flows [app-name <name>|dpid <dp-id>]
   hosts [dpid <dp-id>|ip-address <ip>|mac-address <mac>]
   links [dpid <dp-id>]
   ports [dpid <dp-id>]
   resource
   statistics [process-name <name>]
   summary [dpid <dp-id>]
   switches [details]
```

Description

The command displays the OpenFlow Controller configuration information on . In addition, you can view information such as flows, flow tables, hosts, and statistics related to OpenFlow Controller on Mobility Master.

Syntax

Parameter	Description
`flow-table [app-name|dpid|sorted-by-dpid]`	Displays the flow table information on Mobility Master. You can also filter the view based on the application name that installed the flow, or by datapath ID of the OpenFlow instance.
`flows [app-name <name>|dpid <dp-id>]`	Displays the flow information of the OpenFlow Controller on Mobility Master.
`hosts [dpid <dp-id>|ip-address <ip>|mac-address <mac>]`	Displays the OpenFlow host configuration information on Mobility Master. You can also filter the view by datapath ID, IP address or MAC address of the host.
`links [dpid <dp-id>]`	Displays the OpenFlow links on Mobility Master. You can also filter the output based on the datapath ID of the OpenFlow instance.
`ports [dpid <dp-id>]`	Displays the OpenFlow ports configured on Mobility Master. You can also filter the output based datapath ID of the OpenFlow instance.
`resource`	Displays the OpenFlow resource usage information on Mobility Master.
`statistics [process-name <name>]`	Displays the OpenFlow statistics information. You can also filter the output based on any of the following process names: ■ flow_manager

Parameter	Description
	■ topology ■ topology_discovery ■ routing_switch ■ switch_manager ■ packetin_dispatcher ■ event_dispatcher
summary [dpid <dp-id>]	Displays the OpenFlow summary information on Mobility Master. You can also filter the output based datapath ID of the OpenFlow instance.
switches [details]	Displays the details of the OpenFlow switches on Mobility Master.

Example

The following command displays the OpenFlow Controller configuration details on Mobility Master:

```
(host) [mynode] #show openflow-controller
openflow-controller
-------------------
Parameter                   Value     Set
---------                   -----     ---
ofc state                   Enabled
ofc host-ageout-time        300
ofc mode                    passive
ofc certificate-file        none
ofc key-file                none
ofc ca-certificate-file     none
ofc tls                     Disabled
ofc port                    6633
ofc topology-discovery      Disabled
ofc auxiliary-channel-port  6633
```

The following command displays the OpenFlow Controller switches details on Mobility Master:

```
(host) [mynode] #show openflow-controller switches

show openflow-profile

```
show openflow-profile
```

Description

The command displays the OpenFlow profile information configured on the managed device.

Syntax

No parameters.

Example

The following command displays the OpenFlow profile information on the managed device. Execute the following commands to verify OpenFlow profile configuration on managed devices:

```
(host) [md] #show openflow-profile

Openflow-profile "default"
--------------------------
Parameter                                   Value
---------                                   -----
State                                       Enabled
Openflow mode                               passive
Openflow version                            v1.3
controller-ip                               10.16.125.115:6633
VLAN ID or range(s) of VLAN IDs             1,124,400,600
openflow tls                                Disabled
certificate-file                            none
key-file                                    none
ca-certificate-file                         none
```

show packages

```
show packages [supported|upgrade-history]
```

Description

This command displays information about the downloaded and active Loadable Service Module (LSM) service packages.

Syntax

Parameter	Description
`supported`	Displays all packages supported by Mobility Master.
`upgrade-history`	Displays package installation logs.

Usage Guidelines

The following command lists all packages downloaded on a given Mobility Master:

```
(host) [mynode] #show packages

Packages
--------

show packet-capture

```
show packet-capture
   controlpath-pcap [hex]
   datapath-pcap [hex]
```

Description

Displays packet capture status on the Switch.

Syntax

Parameter	Description
`controlpath-pcap [hex]`	Displays controlpath packets captured in the local-filesystem.
`datapath-pcap [hex]`	Displays datapath packets captured in the local-filesystem.

Example

The output of this command shows the packet capture configuration details.

```
(host)[mynode] #show packet-capture
Active Capture Destination
--------------------------
Destination    IP         1.2.3.4
Active Capture (Controlpath)
----------------------------
Interprocess   Disabled
Sysmsg         Disabled
TCP            Enabled    Ports: 2
UDP            Enabled    Ports: 5
Other          Enabled
Active Capture (Datapath)
-------------------------
Wifi-Client    Enabled    Mac: 00:0b:86:6d:47:6c   Filter: Decrypted
Ipsec          Enabled    Peer: 10.1.1.1
(host) (config) #show packet-capture-defaults
Default Capture Destination
---------------------------
Destination    Local-Filesystem
Default Capture (Controlpath)
-----------------------------
Interprocess   Disabled
Sysmsg         Disabled
TCP            Enabled    Ports: 80 8080
UDP            Enabled    Ports: All
Other          Disabled
Default Capture (Datapath)
--------------------------
Wifi-Client    Enabled    Mac: 00:0b:86:6d:47:6c   Filter: Encrypted
Ipsec          Disabled
```

Command	Description
packet-capture	This command enables or disables packet capturing and sets packet capturing options for a single packet capture session.
packet-capture-defaults	This command enables or disables packet capturing and defines a set of default packet capturing options on the control path for debugging purposes.
ap packet-capture	These commands manage WiFi packet capture (PCAP) on Alcatel-Lucent APs. The WiFi packets are encapsulated in a UDP header and sent to a client running a packet analyzer like Wildpacket's Airopeek, Omnipeek, or Wireshark.
no packet-capture	This command disables packet capturing for debugging.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show packet-capture-defaults

```
show packet-capture-defaults
```

Description

Displays the status of default packet capture options.

Syntax

No parameters.

Example

The output of this command shows packet capture status.

```
(host) # show packet-capture-defaults

Current Active Packet Capture Actions(current switch)
=====================================================
Packet filtering for TCP ports disabled.
Packet filtering for UDP ports disabled.
Packet filtering for internal messaging opcodes disabled.
Packet filtering for all other packets disabled.

Packet Capture Defaults(across switches and reboots if saved)
=============================================================
Packet filtering for TCP ports disabled.
Packet filtering for UDP ports disabled.
Packet filtering for internal messaging opcodes disabled.
Packet filtering for all other packets disabled.
```

show pan active-profile

```
show pan active-profile
```

Description

This command shows the active PAN firewall profile at the managed device level.

Syntax

No syntax.

Usage Guidelines

Issue this command to show the current active PAN firewall profile running on the managed device.

```
(host)[node]#show pan active-profile
Palo Alto Networks Active Profile
---------------------------------
Parameter                          Value
---------                          -----
Active Palo Alto Networks profile  PAN-Group-1
```

show pan-options

```
show pan-options
```

Description

This command displays configured settings for integrating a branch Switch with a Palo Alto Networks (PAN) firewall.

Syntax

No syntax.

Usage Guidelines

Issue this command to see the connection status of the PAN firewalls associated with the Switch.

```
(host)[node]#show pan profile PAN-Group-1

Palo Alto Networks Servers Profile "PAN-Group-1"
------------------------------------------------
Parameter                                  Value
---------                                  -----

show pan statistics

```
show pan statistics
```

Description

This command shows PAN firewall interface statistics.

Syntax

No syntax.

Usage Guidelines

Issue this command to see PAN firewall interface statistics.

```
(host)[node](config) #show pan statistics
Palo Alto Networks Interface Statistics Summary
-----------------------------------------------
Login Reqts  Logout Reqts  Refresh Reqts
-----------  ------------  -------------
0            0             0
Per-PAN server Statistics Summary
---------------------------------
PAN Server       User-ID Reqts  Sent  Skipped  Success  Failure  Last Error
----------       -------------  ----  -------  -------  -------  ----------
1.2.3.4:443  0              0     0        0        0
```

Parameter	Description
Palo Alto Networks Interface Statistics Summary	
Login Reqts	Total number of login requests.
Logout Reqts	Total number of logout requests.
Refresh Reqts	Total number of refresh requests.
Per-PAN server Statistics Summary	
PAN Server	The PAN Server IP address.
User-ID Reqts	Total number of login, logout, and refresh requests.
Sent	Number of requests sent.
Skipped	Number of requests skipped.
Success	Number of requests successfully handled.
Failure	Number of requests that were not successfully received.
Last Error	The last failure error received.

show papi-security

```
show papi-security
```

Description

This command shows a configured papi-security profile.

Syntax

Parameter	Description	Range	Default
`PAPI Key`	The key string. The key authenticates the messages between systems.	Range: 10–64 characters	—
`Enhanced security mode`	Indicates if the enhanced security mode is enabled or disabled. This mode causes the system to reject messages when an incorrect key is used.	—	disabled

Usage Guidelines

Execute this command to show the selected papi-security profile configuration. The **papi-security** command is used to enforce advanced security options and provides an enhanced level of security.

The **Parameter** column displays the PAPI Key and Enhanced security mode parameters. The **Value** column displays a Papi key value (encrypted) and indicates whether the Enhanced security mode is enabled or disabled.

```
(host)[mynode] #show papi-security

PAPI Security Profile
---------------------
Parameter               Value
---------               -----
PAPI Key                ********
Enhanced security mode  Enabled
```

show perf-test reports

```
show perf-test reports
   ap {ap-name <ap-name>}|{ip-addr <ip>}|{ip6-addr <ip6>}
   controller
```

Description

Use this command under the guidance of Alcatel-Lucent technical support to view the results of an Iperf throughput test launched from an AP or Switch.

Syntax

Parameter	Description
ap	Display the results of an Iperf throughput test launched from an AP.
`ap-name <ap-name>`	Name of the AP.
`ip-addr <ip-addr>`	IPv4 address of the AP.
`ip6-addr <ip6-addr>`	IPv6 address of the AP.
`controller`	Display the results of an Iperf throughput test launched from a Switch.

Usage Guidelines

Issue this command to view a report file of test data from a client-mode Iperf throughput test launched from an AP or Switch. Tests launched in server mode do not generate reports. Only OAW-AP130 Series, OAW-AP 220 Series, and OAW-AP105 access points connected to an OAW-4x50 Series Switch support this feature.

Related Commands

Command	Description

Platforms	Licensing	Command Mode
OAW-4x50 Series Switches	Base operating system.	Enable mode on Mobility Master.

show poe

```
show poe [<slot/module/port>]
```

Description

Displays the PoE status of all or a specific port on the Switch.

Syntax

No parameters.

Example

The output of this command shows the PoE status of the specified slot, module and port.

```
(host)[mynode] # show poe 0/0/2

PoE Status
----------
Port      Status  Voltage(mV)  Current(mA)  Power (mW)
----      ------  -----------  -----------  ----------
GE 0/0/2  Off      N/A           N/A          N/A
```

```

The output of this command includes the following parameters:

Parameter	Description
`Port`	Displays the physical port on the Switch.
`PacketIn`	Indicates the total number of incoming packets to the port.
`PacketOut`	Indicates the total number of outgoing packets from the port.
`BytesIn`	Indicates the total number of incoming data (in bytes) to the port.
`BytesOut`	Indicates the total number of outgoing data (in bytes) from the port.
`InputErrorBytes`	Indicates input error bytes on the port.
`OutputErrorBytes`	Indicates the output error bytes on the port.
`CRCErrors`	Indicates the Cyclic Redundancy Check (CRC) errors on the port.

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable mode on Mobility Master.

show port status

```
show port status [<slot/module/port>]
```

Description

Displays the status of all ports on the Switch.

Syntax

Parameter	Description
`<slot/module/port>]`	Physical port in **<slot>/<module>/<port>** format.

Example

The output of this command shows the status of all ports in the Switch.

```
(host)[mynode]# show port status

Port Status
-----------
Slot-Port  PortType  AdminState  OperState  PoE  Trusted  SpanningTree  PortMode
---------  --------  ----------  ---------  ---  -------  ------------  --------
0/0/0      GE        Enabled     Up         N/A  Yes      Forwarding    Access
0/0/1      GE        Enabled     Down       N/A  Yes      Disabled      Access
0/0/2      GE        Enabled     Down       N/A  Yes      Disabled      Access
0/0/3      GE        Enabled     Down       N/A  Yes      Disabled      Access
0/0/4      GE        Enabled     Down       N/A  Yes      Disabled      Access
0/0/5      GE        Enabled     Down       N/A  Yes      Disabled      Access

Speed   Duplex
-----   ------
1 Gbps   Full
Auto     Auto
Auto     Auto
Auto     Auto
Auto     Auto
Auto     Auto
```

The output of this command includes the following parameters:

Parameter	Description
`Slot-Port`	Physical port in **<slot>/<module>/<port>** format.
`PortType`	Displays the type of physical port. ■ **FE**: Fast Ethernet ■ **GE**: Gigabit Ethernet ■ **PC**: Port Channel
`AdminState`	Indicates if the physical port is enabled or disabled.
`OperState`	Indicates if the current status of the physical port is up or down.

Parameter	Description
PoE	Indicates if the physical port is Power over Ethernet (PoE) enabled.
Trusted	Indicates if the physical port is trusted.
SpanningTree	Indicates the state of spanning tree.
PortMode	Indicates the port mode of the physical port.
Speed	Indicates the port speed.
Duplex	Indicates the direction of traffic.

Related Commands

Command	Description
show port stats	This command displays the activity statistics on each of the port on the Switch.
show port link-event	This command displays the link status on each of the port on the Switch.
show port trusted	This command displays the list of ports configured with trusted profiles.
show port xsec	This command displays the list of xSec enabled ports.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show port trusted

```
show port trusted
```

Description

Displays the list of ports configured with trusted profiles.

Syntax

No parameters.

Example

The output of this command shows the list of ports with trusted profile.

```
(host)[mynode]# show port trusted

FE 1/0
FE 1/1
FE 1/2
FE 1/3
FE 1/4
FE 1/5
FE 1/6
FE 1/7
FE 1/8
FE 1/9
FE 1/10
FE 1/11
FE 1/12
FE 1/13
FE 1/14
FE 1/15
FE 1/16
FE 1/17
FE 1/18
FE 1/19
FE 1/20
FE 1/21
FE 1/22
FE 1/23
GE 1/24
GE 1/25
```

Related Commands

Command	Description
show port stats	This command displays the activity statistics on each of the port on the Switch.
show port link-event	This command displays the link status on each of the port on the Switch.
show port xsec	This command displays the list of xSec enabled ports.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show port tunneled-node

```
show port tunneled-node
```

Description

This command shows the tunneled node ports.

Syntax

No parameter

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master and Managed Device.

show port untrusted-vlan

```
show port untrusted-vlan
```

Description

This command shows untrusted port VLANs.

Syntax

No parameter.

Example

The following command shows untrusted port VLANs,

```
(host)[mynode) #show port untrusted-vlan
Port Untrusted Vlan Table
-------------------------
Name: Pc 0
Vlan(s): 1-4094
Name: Pc 1
Vlan(s): 1-4094
Name: Pc 2
Vlan(s): 1-4094
```

Related Commands

Command	Description
show datapath	This command displays system statistics for a managed device.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Managed Device.

show port xsec

```
show port xsec
```

Description

Displays the list of xSec enabled ports.

Syntax

No parameters.

Example

The output of this command shows the list of xSec enabled ports.

```
(host)[mynode] #show port xsec

Xsec Ports
----------
Interface  xsec vlan  state

--------- --------- -----
```

Related Commands

Command	Description
show port stats	This command displays the activity statistics on each of the port on the Switch.
show port link-event	This command displays the link status on each of the port on the Switch.
show port trusted	This command displays the list of ports configured with trusted profiles.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show priority-map

```
show priority-map
```

Description

Displays the list of priority maps on a interface.

Syntax

No parameters.

Example

The output of this command shows the priority maps configured on all interfaces.

```
(host)[node] # show priority-map

Priority Map
------------
ID  Name     DSCP-TOS   DOT1P-COS
--  ----     --------   ---------
1   my-map   4-20,60       4-7
```

Related Commands

Command	Description
priority-map	This command configures the ToS and CoS values used to map traffic into high priority queues.
interface gigabitethernet	This command configures a GigabitEthernet interface.

Command History

	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show processes

```
show processes [sort-by {cpu | memory}]
```

Description

Displays the list of all system process running on the managed device. You can sort the list either by CPU intensive or memory intensive processes.

Syntax

Parameter	Description
`sort-by`	Add a sort filter to the output
`cpu`	This will sort output based on CPU usage.
`memory`	This will sort output based on memory usage.

Example

The output of this command shows list of system processes sorted by CPU usage.

```
(host) [mynode] (config) # show priority-map

%CPU S   PID  PPID   VSZ  RSS   F  NI START     TIME      EIP CMD

show processes monitor stats

```
show processes monitor statistics
```

Description

Displays the current status of all the processes running under the process monitor watchdog.

Syntax

No parameters.

Example

A partial example of the output of this command is shown below:

```
(host) [mynode] (config) #show process monitor statistics

   Process Monitor Statistics
   --------------------------
   Name                          State            Restarts  Timeout Value  Timeout
                                                                 Chances
   ----                          -----            --------  -------------  ---------------
   /mswitch/bin/arci-cli-helper  PROCESS_RUNNING  0         120            3
   /mswitch/bin/fpcli            PROCESS_RUNNING  0         120            3

   /mswitch/bin/pim              PROCESS_RUNNING  0         120            3
   /mswitch/bin/lic
```

Related Commands

Command	Description
process restart	This command restarts a process and optionally creates a core file.
process monitor	The process monitor validates the integrity of processes every 120 seconds. If a process does not respond during three consecutive 120-second timeout intervals, that process is flagged as nonresponsive and the process monitor will create a log message, restart the process or reboot the managed device.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show profile-errors

```
show profile-errors
```

Description

Displays the list of invalid user-created profiles.

Syntax

No parameters.

Example

The output of this command shows list of profiles that are invalid and also displays the error in those profiles. In this example, the VLAN 1000 that is mapped to a virtual-ap that does not exist.

```
(host)[node] #show profile-errors

Invalid Profiles
----------------
Profile                      Error
-------                      -----
wlan virtual-ap "test-vap"  VLAN 1000 does not exist
```

The following are the list of some profile errors:

Error	Description
Named VLAN [named_VLAN] is removed	These errors are displayed if a virtual AP profile is configure with a VLAN that does not exist.
Named VLAN [named_VLAN] is not mapped	
Named VLAN [named_VLAN] is invalid	
VLAN [x] does not exist	
Server group is invalid	This error is displayed if an AAA profile is configured an invalid server group.
User derivation rule is invalid	This error is displayed if a user role in an AAA profile is invalid.
User role is invalid	
Switch country code is undefined	These errors are displayed, if your Switch is not set to the correct country code or if the country code specified in a WLAN profile does not match the Switch's country code.
Country [country_name] does not match Switch country [country_name]	
Opmode requires WPA key	This message is displayed if a SSID profile is configured without a WPA key.
WARNING: if weptxkey = [x], wepkey[x] must be set in order to use static WEP	This message is displayed if a SSID profile is configured to use a static WEP and the WEP is not configured.

Command History

	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system	Config or Enable mode on Mobility Master.

show profile-hierarchy

```
show profile-hierarchy
```

Description

Displays the profile hierarchy template.

Syntax

No parameters.

Usage Guidelines

The output of this command shows how profiles relate to each other, and how some higher-level profiles reference other lower-level profiles. The output of this command will vary, depending upon Switch configuration and licenses.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Available in Enable and Config modes on Mobility Master and managed devices.

show profile-list aaa

```
show profile-list aaa [{alias-group [page | start]} | {authentication [captive-portal | dot1x
| mac | stateful-ntlm | wispr]} |{authentication-server [ldap | radius | tacacs | windows]} |
{profile} | {rfc-3576-server} | {server-group} | {xml-api}]
```

Description

Displays the list of AAA profiles.

Syntax

Parameter	Description
`alias-group`	Lists all alias-groups.
`page`	Specify the number of items to display
`start`	Specify the first item to display
`authentication`	List of aaa authentication profiles.
`captive-portal`	Captive portal authentication profiles.
`dot1x`	802.1X authentication profiles.
`mac`	MAC authentication profiles.
`stateful-ntlm`	Stateful-NTLM authentication profiles.
`wispr`	WISPr authentication profiles.
`authentication-server`	List of aaa authentication servers
`ldap`	List of servers using LDAP for AAA authentication.
`radius`	List of servers using RADIUS for AAA authentication.
`tacacs`	List of servers using TACACS+ for AAA authentication.
`windows`	List of Windows servers used for AAA authentication.
`profile`	Displays the AAA profile details.
`rfc-3576-server`	Displays IP address of RADIUS servers that use RFC 3576 specification to exchange authorization messages.
`server-group`	List of server group used for RADIUS accounting.
`xml-api`	List of servers configured in an external XML API server.

Example

The output of this command shows list of AAA profiles that use captive-portal authentication.

```
(host)[node] # show profile-list aaa authentication captive-portal

Captive Portal Authentication Profile List
------------------------------------------
```

```
Name      References  Profile Status
----      ----------  --------------
default   1
```

Related Commands

show profile-list airgroupprofile

```
show profile-list airgroupprofile {cppm|domain|ipv6|page|service|start} [page | start]
```

Description

Displays the list of configured AirGroup profiles.

Syntax

Parameter	Description
`cppm`	Displays all AirGroup ClearPass Policy Manager profiles.
`domain`	Displays all AirGroup domain profiles.
`ipv6`	Displays all AirGroup IPv6 profiles.
`service`	Displays all AirGroup service profiles.
`page`	Specify the number of items to display.
`start`	Specify the first item to display.

Example

The output of this command shows a list of AirGroup profiles.

```
(host)[node] (config) # show profile-list airgroupprofile
AirGroup Profile List
---------------------
Name     References  Profile Status
----     ----------  --------------
default  1
```

Related Commands

Command	Description
airgroupprofile	Configures an AirGroup profile.

Command History

	Modification

show profile-list ap

```
show profile-list ap [ enet-link-profile | mesh-cluster-profile |
   mesh-ht-ssid-profile | mesh-radio-profile | regulatory-domain-profile |
   snmp-profile | snmp-user-profile | system-profile | wired-ap-profile ]
```

Description

Displays the list of AP profiles.

Syntax

Parameter	Description
`enet-link-profile`	Display a list of AP Ethernet link profiles.
`mesh-cluster-profile`	Display a list of mesh cluster profiles used by mesh nodes.
`mesh-ht-ssid-profile`	Display a list of mesh high-throughput SSID profiles used by mesh nodes.
`mesh-radio-profile`	Display a list of mesh radio profiles used by mesh nodes.
`multizone-profile`	Display a list of all AP MultiZone profile.
`regulatory-domain-profile`	Display a list of AP regulatory profiles.
`snmp-profile`	Display a list of SNMP profiles.
`snmp-user-profile`	Display a list of SNMPv3 user profiles.
`system-profile`	Display a list of AP system profiles.
`wired-ap-profile`	Display a list of wired AP profiles.

Example

The output of this command shows list of profiles that are invalid and also displays the error in those profiles.

```
(host)[mynode] # show profile-list aaa authentication captive-portal

Captive Portal Authentication Profile List
------------------------------------------
Name     References  Profile Status
----     ----------  --------------
default  1
```

Related Commands

Command	Description
ap system-profile	This command configures an AP system profile.

show profile-list ap-group

```
show profile-list ap-group
```

Description

Displays the status of AP groups profiles in the Switch.

Syntax

No parameters.

Example

The output of this command shows the status of AP group profiles in the Switch.

```
(host)[node] # show profile-list ap-group

AP group List
-------------
Name      Profile Status
----      --------------
default

Total:1
```

Related Commands

Command	Description

show profile-list dump-collection-profile

```
show profile-list dump-collection-profile [page<number> start<number>]
```

Description

This command is used to display the list of all dump collection profiles.

Syntax

Parameter	Description
`page <number>`	Include this parameter to limit output of this command to the specified number of items.
`start <number>`	Include this parameter to start displaying the output of this command at the specified index number.

Example

The output of this command shows a list of all dump collection profiles,

```
(host)[mynode] #show profile-list dump-collection-profile
Dump collection profile List
----------------------------
Name      References  Profile Status
----      ----------  --------------
default   3
Total:1
```

Command	Description
ap system-profile	This command configures an AP system profile.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show profile-list est

```
show profile-list est profile [page | start]
```

Description

Displays the list of EST profiles.

Syntax

Parameter	Description
`profile`	Displays all EST profiles.
`page`	Specify the number of items to display.
`start`	Specify the first item to display.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The output of this command shows a list of EST profiles.

```
(host)[node] (config) # #show profile-list est profile

EST Profile List
----------------
Name      References  Profile Status
----      ----------  --------------
default   0

Total:1
```

Related Commands

Command	Description
est	This command configures an EST profile on the Switch. This configuration is then pushed to the AP on successful enrollment.

Command History

Release	Modification
AOS-W 8.2.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show profile-list iot

```
show profile-list iot radio-profile [page <number>] [start <number>]| transport-profile [page <number>] [start <number>]
```

Description

This command is used to display the list of IOT profiles.

Syntax

Parameter	Description
`radio-profile`	Displays IoT radio profiles.
`transport-profile`	Displays IoT transport profiles.
`page <number>`	Include this parameter to limit output of this command to the specified number of items.
`start <number>`	Include this parameter to start displaying the output of this command at the specified index number.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The output of this command shows a list of IoT radio profiles,

```
(host)[mynode] #show profile-list iot radio-profile
IoT Radio Profile List
----------------------
Name  References  Profile Status
----  ----------  --------------
Total:0
```

Related Commands

Command	Description
iot radio-profile	This command configures an IoT radio profile.
iot Transportprofile	This command configures an IoT transport profile.

Command History

Release	Modification
AOS-W 8.4.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show profile-list ha

```
show profile-list ha
   group-profile [page | start]
```

Description

Displays the list of HA profiles.

Syntax

Parameter	Description
`group-profile`	Lists all HA group information.
`page`	Specify the number of items to display
`start`	Specify the first item to display

Example

The output of this command shows list of HA group profile information.

```
(host)[node] # show profile-list ha group-profile

HA group information List
-------------------------
Name  Profile Status
----  --------------
Total:0
```

Related Commands

Command	Description
ha	This command configures the High Availability:Fast Failover feature by assigning a managed device or standby Switch to a high-availability group, and defining the deployment role for each Switch.

Command History

	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show profile-list ids

```
show profile-list ids [dos-profile | general-profile | impersonation-profile |
   profile | rate-thresholds-profile | signature-matching-profile |
   signature-profile | unauthorized-device-profile ]
```

Description

Displays the status of all IDS profiles in the Switch.

Syntax

Parameter	Description
`dos-profile`	Display a list of IDS DoS profiles.
`general-profile`	Display a list of IDS generate profiles.
`impersonation-profile`	Display a list IDS impersonation profile.
`profile`	Display a list of IDS profiles.
`rate-thresholds-profile`	Display a list of IDS rate threshold profiles.
`signature-matching-profile`	Display a list of IDS signature-matching profiles.
`signature-profile`	Display a list of IDS signature profiles.
`unauthorized-device-profile`	Display a list of IDS unauthorized device profiles.

Example

The output of this command shows a list of all IDS DoS profiles.

```
(host)[node] # show profile-list ids dos-profile

IDS Denial Of Service Profile List
----------------------------------
Name                    References  Profile Status
----                    ----------  --------------
default                 1
ids-dos-disabled        1           Predefined
ids-dos-high-setting    1           Predefined
ids-dos-low-setting     1           Predefined
ids-dos-medium-setting  1           Predefined

Total:5
```

Related Commands

Command	Description
ids general-profile	This command configures an IDS general profile.

Command History

	Modification
AOS-W 8.0.0.0	Command introduced.

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show profile-list lc-cluster

```
show profile-list lc-cluster
   group-profile [page | start]
```

Description

Displays the list of classic Switch cluster profiles .

Syntax

Parameter	Description
`group-profile`	Lists all Switch cluster profiles.
`page`	Specify the number of items to display.
`start`	Specify the first item to display.

Example

The output of this command shows a list of all Switch cluster profiles.

```
(host)[node]# show profile-list lc-cluster group-profile

Classsic Switch Cluster Profile List
------------------------
Name    Profile Status
----    --------------
LC-west
Total:1
```

Related Commands

Command	Description
lc-cluster group-profile	This command is used to configure the cluster group profile in the Mobility Master.
lc-cluster group-membership	Configure the group-membership in each node. This command is used to enable the cluster membership on the managed devices.

Command History

	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show profile-list license-pool-profile

```
show profile-list license-pool-profile [page | start]
```

Description

Displays the list of license pool profiles .

Syntax

Parameter	Description
page	Specify the number of items to display.
start	Specify the first item to display.

Example

The output of this command shows a list of all licensing pools.

```
(host)[node] (config) #show profile-list license-pool-profile
License pool profile List
-------------------------
Name            References  Profile Status
----            ----------  --------------
/md/dev         2
/md/Sunnyvale   1
/md/testpool    0
/md/Testpool2   0
```

Related Commands

Command	Description
license-pool-profile	Use this command to create a local licensing pool and allocate licenses for that licensing pool.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show profile-list mgmt-server

```
show profile-list mgmt-server {profile <profile_name>} [page <number>] [start <number>]
```

Description

Displays all the Mgmt Config profiles in the Switch.

Syntax

Parameter	Description
`mgmt-server {profile <profile_name>`	Specifies the name of the management server profile.
`page <number>`	Include this optional parameter to limit output of this command to the specified number of items.
`start <number>`	Include this optional parameter to start displaying the output of this command at the specified index number.

Example

The output of this command shows the management server profiles in the Switch.

```
(host) (config) #show profile-list mgmt-server profile
Mgmt Config profile List
------------------------
Name          References  Profile Status
----          ----------  --------------
default-ale   0           Predefined (editable)
default-amp   0           Predefined (editable)
Total:2
```

Related Commands

Command	Description

All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show profile-list pan profile

```
show profile-list pan profile
```

Description

This command is used to display the list of all Palo Alto Networks servers profiles.

Syntax

No parameter

Example

The output of this command shows a list of all time range profiles,

```
[host](mynode) #show profile-list pan profile
Palo Alto Networks Servers Profile List
---------------------------------------
Name     References  Profile Status
----     ----------  --------------
default  1
Total:1
```

Related Commands

Command	Description

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show profile-list rf

```
show profile-list rf [ arm-profile | dot11a-radio-profile | dot11g-radio-profile |
   event-thresholds-profile | ht-radio-profile | optimization-profile ]
```

Description

Displays the status of all radio profiles.

Syntax

Parameter	Description
`arm-profile`	Details of Adaptive Radio Management (ARM) Profile.
`dot11a-radio-profile`	Details of AP radio settings for the 5GHz frequency band, including the ARM profile and the high-throughput (802.11n) radio profile.
`dot11g-radio-profile`	Details of AP radio settings for the 2.4 GHz frequency band, including the ARM profile and the high-throughput (802.11n) radio profile.
`event-thresholds-profile`	Details of events thresholds profile.
`ht-radio-profile`	Details of high-throughput AP radio settings
`optimization-profile`	Details of the RF optimization profile

Example

The output of this command shows status of ARM profile.

```
(host) # show profile-list rf arm-profile

Adaptive Radio Management (ARM) profile List
--------------------------------------------
Name     References  Profile Status
----     ----------  --------------
default  2

Total:1
```

Related Commands

Command	Description

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show profile-list scheduler-profile

```
show profile-list scheduler-profile [page | start]
```

Description

Displays the list of scheduler profiles.

Syntax

Parameter	Description
`page`	Specify the number of items to display
`start`	Specify the first item to display

Example

The output of this command shows a list of scheduler profiles.

```
(host)[node] (config) # show profile-list scheduler-profile
scheduler profile List
----------------------
Name     References  Profile Status
----     ----------  --------------
default  2
Total:1
```

Related Commands

Command	Description
scheduler-profile	Define a schedule profile that associates priorities to four uplink queues.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show profile-list sso idp-profile

```
show profile-list sso idp-profile
```

Description

This command is used to display the list of all SSO profiles.

Syntax

No parameter

Example

The output of this command shows a list of all SSO profiles,

```
(host)[mynode] #show profile-list sso idp-profile
SSO Profile List
----------------
Name  References  Profile Status
----  ----------  --------------
Total:0
```

Related Commands

Command	Description
sso idp-profile	This command configures an IDP-SSO profile.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show profile-list wlan

```
show profile-list wlan
   anyspot-profile
   bcn-rpt-req-profile
   client-wlan-profile
   dotllk-profile
   dot11r-profile
   edca-parameters-profile
   hotspot
   ht-ssid-profile
   rrm-ie-profile
   ssid-profile
   traffic-management-profile
   tsm-req-profile
   virtual-ap
   wmm-traffic-management-profile]
```

Description

Displays the status of WLAN profiles on the Switch.

Syntax

Parameter	Description
`anyspot-profile`	Shows a list of all anyspot profiles
`bcn-rpt-req-profile`	Shows a list of all Beacon Report Request profiles
`client-wlan-profile`	Shows a list of all client WLAN profiles
`dot11r-profile`	Shows a list of all 802.11r profiles
`dot11k-profile`	Show a list of all 802.11K profiles
`edca-parameters-profile`	Show a list of all enhanced distributed channel access (EDCA) profile for APs or for clients (stations)
`hotspot`	Hotspot/Passpoint configuration settings
`advertisement-profile`	Shows a list of all Advertisement profile
`angp-3gpp-nwk-profile`	Shows a list of all ANQP 3GPP Cellular Network profiles
`anqp-domain-name-profile`	Shows a list of all ANQP Domain Name profiles
`anqp-ip-addr-avail-profile`	Shows a list of all ANQP IP Address Availability profiles
`anqp-nai-realm-profile`	Shows a list of all ANQP NAI Realm profiles
`anqp-nwk-auth-profile`	Shows a list of all ANQP Network Authentication profiles
`anqp-roam-cons-profile`	Shows a list of all ANQP Roaming Consortium profiles

Parameter	Description
anqp-venue-name-profile	Shows a list of all ANQP Venue Name profiles
h2qp-conn-capability-profile	Shows a list of all H2QP Connection Capability profiles
h2qp-op-cl-profile	Shows a list of all H2QP Operating Class Indication profiles
h2qp-operator-friendly-profile	Shows a list of all H2QP Operator Friendly Name profiles
h2qp-wan-metrics-profile	Shows a list of all H2QP WAN Metrics profiles
hs2-profile	Shows a list of all Hotspot 2.0 profiles
ht-ssid-profile	Show a list of all high-throughput SSID profiles
rrm-ie-profile	Shows a list of all Radio Resource Management Information Element (RRM IE) profiles
traffic-management-profile	Show a list of all traffic management profiles
tsm-req-profile	Show a list of all Transmit Stream/Category Measurement (TSM) request profiles
virtual-ap	Show a list of all the virtual AP profiles
wmm-traffic-management-profile	Show a list of all WMM traffic management profiles

Example

The output of this command shows that the Switch has a single ARM profile, “default”.

```
(host)[mynode] # show profile-list rf arm-profile

Adaptive Radio Management (ARM) profile List
--------------------------------------------
Name     References  Profile Status
----     ----------  --------------
default  2

Total:1
```

Related Commands

Command	Description
wlan ssid-profile	This command configures an SSID profile.

Command History

Release	Modification

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show provisioning-ap-list

```
show provisioning-ap-list
```

Description

Displays the list of all APs that are in queue to be provisioned by the admin.

Syntax

No parameters.

Example

```
(host) [mynode]# show provisioning-ap-list
Access Points Provisioning List
-------------------------------
Current IP       AP Name  AP Group  Location name  SNMP sysLocation  AP Type  Serial #   AP
State
----------       -------  --------  -------------  ----------------  -------  --------   -----
---
191.191.191.253  ap-215   default   N/A            N/A               215      CK0223282  -
Total APs:1
```

Related Commands

Command	Description

provision-ap	This command provisions or reprovisions an AP.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on the Mobility Master.

show provisioning-params

```
show provisioning-params
```

Description

Displays the list of parameters and the values used to provision the APs.

Syntax

No parameters.

Example

The output of this command shows list of all provisioning parameters and their values.

```
(host) [mynode]# show provisioning-params
AP provisioning
---------------
Parameter                                                    Value

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show provisioning-rule-info

```
show provisioning-rule-info [record <rule-name>|summary]
```

Description

This command displays detailed information about the AP auto-provisioning rules.

Syntax

Parameter	Description
`record <rule-name>`	Display information about the MAC address of the AP that the auto-provisioning rule is applied to, along with the provisioning time, LMS IP of the AP, and auto-provisioning state of the AP.
`summary`	Display information about the auto-provision rule of each AP in ascending order of the rule-priority, the hit times of that rule, as well as the success and failure count of the rules.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Examples

The following example displays the summary of the auto-provisioning rules.

```
(host) [mm] #show provisioning-rule-info summary

Auto provision Rule Info
------------------------
Rule Name  Priority  Hit times  Success count
---------  --------  ---------  -------------
ap324          1       0               0
ip36           3       0               0
network        5       0               0
ip46           7       0               0
```

The following example displays information on each auto-provisoning rule and the associated AP.

```
(host) [mm] #show provisioning-rule-info record ap324
Auto provision Rule Info
------------------------
Rule Name Priority Hit times Success count
--------- -------- --------- -------------
ap324         1        1          1

Auto provision Rule Record
--------------------------
AP MAC             Provision Time        LMS
------             --------------        ---
40:e3:d6:cd:82:34  2018-07-01 13:55:06   10.65.46.203
```

The output of this command includes the following information:

Parameter	Description
`Rule Name`	Indicates the name of the auto-provisioning rule that is applied to the AP.
`Priority`	Indicates the priority level of the auto-provisioning rule. The rules are listed in ascending order of the priority level.
`Hit times`	Indicates the hit times of the auto-provisioning rule.
`Success count`	Indicates the success count of the auto-provisioning rule.
`AP MAC`	Indicates the MAC address of the AP that the auto-provisioning rule is applied to.
`Provision Time`	Indicates the date and time when the auto-provisioning rule is applied to the AP.
`LMS`	Indicates the LMS IP of the AP that the auto-provisioning rule is applied to.

Related Commands

show rap-wml

```
show rap-wml [cache <server-name> | servers | wired-mac <bssid>]
```

Description

Displays the name and attributes of a MySQL database or a MySQL server.

Syntax

Parameter	Description
`cache <server-name>`	Displays the cache of all look-ups for a database server.
`servers`	Displays the database server state.
`wired-mac <bssid>`	Displays the wired MAC discovered on traffic through the AP.

Example

The output of this command shows status of all database servers.

```
(host) [mynode] #show rap-wml servers

WML DB Servers
--------------
name  ip  type  user  password  db-name  cache  ageout(sec)  in-service
----  --  ----  ----  --------  -------  -----  -----------  ----------
WML DB Tables
-------------
server  db  table  column  timestamp-column  lookup-time(sec)  delimiter  query-count
------  --  -----  ------  ----------------  ----------------  ---------  -----------
Mesh SAE                        sae-default
```

show references aaa alias-group

```
show references aaa
   alias-group <ag_name>
   [page <page>] [start <start>]
```

Description

Shows AAA profile references to an alias group.

Syntax

Parameter	Description
`alias-group <ag_name>`	Shows the references to an Alias group.
`page <page>`	Include this optional parameter to limit output of this command to the specified number of items.
`start <start>`	Include this optional parameter to start displaying the output of this command at the specified index number.

Example

Use this command to show the references to an alias group.

```
(host)[mynode] #show references aaa alias-group alias1
```

Related Commands

Command	Description
aaa alias-group	Configures an AAA alias with set of VLAN derivation rules that could speed up user rule derivation processing for deployments with a very large number of user derivation rules.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

show references aaa authentication

```
show references aaa authentication
   captive-portal {default | <profile-name>}
   dot1x {default | <profile-name>}
   mac {default | <profile-name>}
   mgmt
   stateful-dot1x
   stateful-kerberos {default | <profile-name>}
   stateful-ntlm {default | <profile-name>}
   via
      auth-profile {default | <profile-name>}
      connection-profile {default | <profile-name>}
      global-config
      web-auth <default>
   vpn {default | <profile-name>}
   wired
   wispr {default | <profile-name>}
   [page <page>] [start <start>]
```

Description

This command shows AAA profile references.

Syntax

Parameter	Description	Default
`captive-portal <profile-name>`	Shows the number of references to a captive-portal profile.	default
`dot1x <profile-name>`	Shows the number of references to a 802.1X authentication profile.	default
`mac <profile-name>`	Shows the number of references to a MAC authentication profile.	default
`mgmt`	Shows the number of references to a management authentication profile.	
`stateful-dot1x <profile-name>`	Shows the number of references to the stateful 802.1X authentication profile.	default
`stateful-kerberos <profile-name>`	Shows references to a Stateful Kerberos authentication profile.	default
`stateful-ntlm <profile-name>`	Shows the number of references to the specified stateful NTLM authentication profile.	default

Parameter	Description	Default
`via`	Shows the number of references to VIA.	
`auth-profile <profile-name>}`	Shows references to a VIA authentication profile.	default
`connection-profile <profile-name>`	Shows references to a VIA connection profile.	default
`global-config`	Shows references to the VIA global configuration.	
`web-auth <default>`	Shows references to a VIA web authentication.	default
`vpn <profile-name>`	Shows the number of references to VPN authentication.	default
`wired`	Shows the number of references to wired authentication.	
`wispr <profile-name>`	Shows the number of references to the specified WISPr authentication profile.	default
`page <page>`	Include this optional parameter to limit output of this command to the specified number of items.	
`start <start>`	Include this optional parameter to start displaying the output of this command at the specified index number.	

Example

Use this command to show where a specified AAA profile has been applied. The output of the example shown here indicates that the aaa profile **default-dot1x** contains a single reference to the 802.1X authentication profile **default**.

```
(host)[mynode] #show references aaa authentication dot1x default

References to 802.1X Authentication Profile "default"
-----------------------------------------------------
Referrer                                          Count
--------                                          -----
aaa profile "default-dot1x" authentication-dot1x  1
Total References:1
```

Related Commands

Command	Description
aaa authentication captive-portal	Configures a Captive Portal authentication profile.
aaa authentication dot1x	Configures the 802.1X authentication profile.
aaa authentication mac	Configures the MAC authentication profile.
aaa authentication mgmt	Configures authentication for administrative users.
aaa authentication stateful-dot1x	Configures 802.1X authentication for clients on non-Alcatel-Lucent APs.
aaa authentication stateful-kerberos	Configures stateful Kerberos authentication.
aaa authentication stateful-ntlm	Configures stateful NT LAN Manager (NTLM) authentication.
aaa authentication via auth-profile	Configures the VIA authentication profile.
aaa authentication via connection-profile	Configures the VIA connection profile.
aaa authentication via global-config	Allows you to enable SSL fallback mode.
aaa authentication via web-auth	Creates a VIA web authentication profile.
aaa authentication vpn	This command configures VPN authentication settings.
aaa authentication wired	Configures authentication for a client device that is directly connected to a port on the managed device.
aaa authentication wispr	Configures WISPr authentication with WISPr RADIUS server of an ISP.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode

show references aaa authentication-server

```
show references aaa authentication-server
   ldap <ldap_server_name>
   radius <rad_server_name>
   tacacs <tacacs_server_name>
   windows <windows_server_name>
   [page <page>] [start <start>]
```

Description

This command displays information about AAA authentication servers.

Syntax

Parameter	Description
`ldap <ldap-server-name>`	Show the number of server groups that include references to the specified LDAP server.
`radius <rad_server_name>`	Show the number of server groups that include references to the specified RADIUS server.
`tacacs <tacacs_server_name>`	Show the number of server groups that include references to the specified TACACS server.
`windows <windows_server_name>`	Show the number of server groups that include references to the specified Windows server.
`page <page>`	Include this parameter to limit output of this command to the specified number of items.
`start <start>`	Include this parameter to start displaying the output of this command at the specified index number.

Example

Issue this command to show the AAA server groups that include references to the specified server. The example below shows that two server groups, **default** and **rad,** each include a single reference to the RADIUS server **rad01**.

```
(host)[mynode] #show references aaa authentication-server radius rad01

References to RADIUS Server "rad01"
-----------------------------------
Referrer                                Count
--------                                -----
aaa server-group "default" server_group  1
aaa server-group "rad" server_group      1
Total References:2
```

Related Commands

Command	Description
aaa authentication-server ldap	Configures an LDAP server.
aaa authentication-server radius	Configures a RADIUS server.
aaa authentication-server tacacs	Configures a TACACS+ server.

show references aaa password-policy

```
show references aaa password-policy mgmt
```

Description

This command shows the password policy for locally configured management users.

Syntax

Parameter	Description
`mgmt`	Shows references to the Management Password Policy.

Example

Execute the following command to show the password policy for locally configured management users.

```
(host)[mynode] #show references aaa password-policy mgmt
```

Related Commands

Command	Description
aaa password-policy mgmt	Defines a policy for creating management user passwords.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show references aaa profile

```
show references aaa profile <profile-name>
```

Description

This command shows references to an AAA Profile.

Syntax

Parameter	Description
`profile <profile-name>`	Name of an AAA profile for which you want to view references.

Example

Issue this command to show the wlan virtual AP profiles that include references to the specified AAA profile. The example below shows that seven different virtual AP profiles include a single reference to the AAA profile **default**.

```
(host)[mynode] #References to AAA Profile "default"
-----------------------------------
Referrer                                                Count
--------                                                -----
wlan virtual-ap "1.0.0_corporateHQ-wpa2" aaa-profile    1
wlan virtual-ap "110.0.corporateHQ-wpa2" aaa-profile    1
wlan virtual-ap "default" aaa-profile                   1
wlan virtual-ap "corporateHQ-vocera" aaa-profile        1
wlan virtual-ap "corporateHQ-voip-wpa2" aaa-profile     1
wlan virtual-ap "Test123" aaa-profile                   1
wlan virtual-ap "branch12" aaa-profile                  1
Total References:7
```

Related Commands

show references aaa radius

```
show references aaa
   radius modifier <rad_modifier_name>
   [page <page>] [start <start>]
```

Description

This command shows information about the configuration profiles that reference a specific RADIUS modifier profile.

Syntax

Parameter	Description
`radius modifier <rad_modifier_name>`	Shows references to a RADIUS modifier profile.
`page <page>`	Include this parameter to limit output of this command to the specified number of items.
`start <start>`	Include this parameter to start displaying the output of this command at the specified index number

Example

The following is an example to execute the **show references aaa radius modifier** command:

```
(host) [mynode] #show references aaa radius modifier RADIUSProfile1
```

Related Commands

Command	Description
aaa radius modifier	Configures the RADIUS modifier profile to customize the attributes that are included, excluded, and modified in the RADIUS request before it is sent to the authentication server.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show references aaa radius-attributes

```
show references aaa
   radius-attributes <node-path>
```

Description

This command shows information about the configuration profiles that reference a specific RADIUS modifier profile.

Syntax

Parameter	Description
`radius-attributes`	Displays references to RADIUS attributes.
`<node-path>`	Displays the path of the configuration node.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The following is an example to execute the **show references aaa radius-attributes** command:

```
(host) [mynode] #show references aaa radius-attributes HW-Cluster-1
```

Related Commands

Command	Description
aaa radius-attributes	Configures the RADIUS attributes to statically configure values to be included in RADIUS Access- Requests and Accounting-Requests.

show references aaa rfc-3576-server

```
show references aaa
   rfc-3576-server <server_ip>
   [page <page>] [start <start>]
```

Description

This command shows information about the configuration profiles that reference a specific RFC 3576 server.

Syntax

Parameter	Description
`rfc-3576-server <server_ip>`	IP address of an RFC-3576 server.
`page <page>`	Include this parameter to limit output of this command to the specified number of items.
`start <start>`	Include this parameter to start displaying the output of this command at the specified index number

Example

This first example shows that the **default** AAA profile and the AirGroup ClearPass Policy Manager-server AAA profile reference an RFC 3567 Server with the IP address 10.1.1.41.

```
(host)[mynode] #show references aaa rfc-3576-server 10.1.1.41
References to RFC 3576 Server "10.1.1.41"
-----------------------------------------
Referrer                                  Count
--------                                  -----
aaa profile "default" rfc-3576-server     1
airgroup cppm-server aaa rfc-3576-server  1
Total References:2
```

Related Commands

Command	Description

show references aaa server-group

```
show references aaa server-group
   <sg_name>
   [page <page>][start <start>]
```

Description

This command shows references to a server group.

Syntax

Parameter	Description
`<sg_name>`	Name of the server group for which you want to show references
`page <number>`	Include this parameter to limit output of this command to the specified number of items.
`start <start>`	Include this parameter to start displaying the output of this command at the specified index number.

Example

Issue this command to display a list of AAA profiles that include references to the specified server group.

```
(host)[mynode] #show references aaa server-group default

References to Server Group "default"
-----------------------------------
Referrer                                                Count
--------                                                -----
aaa profile "aircorp-office-ssid" mac-server-group      1
aaa profile "amigopod-guest" mac-server-group           1

show references activate

```
show references activate
   [page <page>] [start <start>]
```

Description

This command displays Activate service whitelist profile references.

Syntax

Parameter	Description
`activate`	Name of the activate profile for which you want to show references.
`page <page>`	Include this parameter to limit output of this command to the specified number of items.
`start <start>`	Include this parameter to start displaying the output of this command at the specified index number.

Example

Execute this command to display a list of profiles that include references to the activate profile.

```
(host) [mynode] #show references activate
References to activate
----------------------------------------
Referrer  Count
--------  -----
Total References:0
```

Related Commands

Command	Description

All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show references airgroup

```
show references airgroup
   cppm-server aaa
   [page <page>] [start <start>]
```

Description

This command displays information about AAA authentication servers.

Syntax

Parameter	Description
`cppm-server`	Specifies the ClearPass Policy Server information.
`aaa`	Specifies the AAA parameters for AirGroup.
`page <page>`	Include this optional parameter to limit output of this command to the specified number of items.
`start <start>`	Include this optional parameter to start displaying the output of this command at the specified index number.

Example

Use this command to show the AAA server groups that include references to the AirGroup.

```
(host)[mynode] #show reference airgroup
References to Airgroup AAA profile
----------------------------------
Referrer  Count
--------  -----
Total References:0
```

Related Commands

Command	Description
airgroup	configures AirGroup settings.

Command History

show references airgroupprofile

```
show references airgroupprofile
   activate
   cppm <airgroup-cppm-name>
   domain <airgroup-domain-name>
   ipv6 <ipv6-profile-name>
   service <service-name>
   [page <page>] [start <start>]
```

Description

This command shows the references to the AirGroup profile information.

Syntax

Parameter	Description
`activate`	Displays references to the active AirGroup profile.
`cppm <airgroup-cppm-name>`	Displays references to the AirGroup ClearPass Policy Manager profile.
`domain <airgroup-domain-name>`	Displays references to an AirGroup domain profile.
`ipv6 <ipv6-profile-name>`	Displays references to the AirGroup IPv6 profile.
`service <service-name>`	Displays references to the AirGroup service profile. By default, the following services are available: ■ default-airplay ■ default-airprint ■ default-allowall ■ default-amazontv ■ default-dial ■ default-dlna-media ■ default-dlna-print ■ default-googlecast ■ default-itunes ■ default-remotemgmt ■ default-sharing
`<profile-name>`	Configures an AirGroup profile.
`page <page>`	Include this optional parameter to limit output of this command to the specified number of items.
`start <start>`	Include this optional parameter to start displaying the output of this command at the specified index number.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

Use this command to show the AirGroup domain profiles.

```
(host)[mynode] ##show references airgroupprofile cppm test
```

Related Commands

show references airmatch

```
show references airmatch
   profile
   [page <page>] [start <start>]
```

Description

The show references profile command displays profile references. No other profiles reference the AirMatch profile, so the output of this always displays a reference count of 0.

Syntax

Parameter	Description
`profile`	Shows references to the AirMatch profile
`page <page>`	Include this parameter to limit output of the **show references** command to the specified number of items.
`start <start>`	Include this parameter to start displaying the output of the **show references** command at the specified index number.

Example

The **show references <profile>** command displays a list of profiles that include references to the selected profile. No other profiles reference the AirMatch profile, so this table always displays a reference count of 0.

```
(host) [mynode] #show references airmatch profile
References to AirMatch
---------------------------------------
Referrer  Count
--------  -----
Total References:0
```

Related Commands

Command	Description

```

Description

This command shows the number of references to a specific AP profile.

Syntax

Parameter	Description	Default
`am-filter-profile <profile-name>`	Shows references to an AM filter.	default
`authorization-profile <profile-name>`	Shows references to an AP Authorization profile.	default
`deploy-profile`	Show references to the AP deploy-profile.	
`enet-link-profile <profile-name>`	Shows AP groups that include a references to this Ethernet link profile.	default
`general-profile`	Shows references to the ap general-profile.	
`lldp`	Shows references to the Link-layer Discovery Protocol profile.	
`med-network-policy-profile <profile-name>`	Shows references to LLDP-MED Network Policy profile of an AP.	
`profile`	Shows references to an AP LLDP profile.	
`mesh-cluster-profile <profile-name>`	Shows AP groups that include a references to this mesh cluster profile.	default

Parameter	Description	Default
`mesh-ht-ssid-profile <profile-name>`	Shows AP groups that include a references to this mesh high-throughput SSID profile.	default
`mesh-radio-profile <profile-name>`	Shows AP groups that include a references to this mesh radio profile.	default
`multizone <profile-name>`	Shows references to an AP MultiZone profile.	default
`provisioning-profile <profile-name>`	Shows references to a Provisioning profile.	default
`regulatory-domain-profile <profile-name>`	Shows AP groups that include a references to this regulatory domain profile.	default
`spectrum local-override`	Shows references to the Spectrum Local Override Profile.	
`system-profile <profile-name>`	Shows AP groups that include a references to this system profile.	default
`wired-ap-profile <profile-name>`	Shows AP groups that include a references to this wired AP profile.	default
`wired-port-profile <profile-name>`	Shows references to an AP wired port profile	default
`page <page>`	Include this optional parameter to limit output of this command to the specified number of items.	
`start <start>`	Include this optional parameter to start displaying the output of this command at the specified index number.	

Example

The example below shows that 10 different AP groups include links to the AP Ethernet link profile **Default**. These 10 AP groups reference the **Default** Ethernet link profile for both their Ethernet 0 and Ethernet 1 interfaces, for a total of 20 references altogether.

```
(host)[mynode] #show references ap enet-link-profile default

References to AP Ethernet Link profile "default"
------------------------------------------------
Referrer                                    Count
--------                                    -----
ap-group "10.0.0" enet0-profile             1
ap-group "10.0.0" enet1-profile             1
ap-group "corp" enet0-profile               1
ap-group "corp" enet1-profile               1
ap-group "Corp_AM_Ch1" enet0-profile        1
ap-group "Corp_AM_Ch1" enet1-profile        1
ap-group "Corp_AM_Ch6" enet0-profile        1
ap-group "Corp_AM_Ch6" enet1-profile        1
ap-group "corpTest" enet0-profile           1
ap-group "corpTest" enet1-profile           1
ap-group "default" enet0-profile            1
ap-group "default" enet1-profile            1
ap-group "India_Local" enet0-profile        1
```

```
ap-group "India_Local" enet1-profile        1
ap-group "ops" enet0-profile                1
ap-group "ops" enet1-profile                1
ap-group "voip-test" enet0-profile          1
ap-group "voip-test" enet1-profile          1
ap-group "voip-test-nokia" enet0-profile    1
ap-group "voip-test-nokia" enet1-profile    1
Total References:20
```

Related Commands

Command	Description
ap am-filter-profile	Configures an AM filter.
ap authorization-profile	Defines a temporary configuration profile for remote APs that are not yet authorized on the network.
ap deploy-profile	Configures an AP deployment profile.
ap enet-link-profile	Configures an AP Ethernet link profile.
ap general-profile	Configures the general profile of an AP.
ap lldp profile	Defines an LLDP profile that specifies the type-length-value (TLV) elements to be sent in LLDP PDUs.
ap lldp med-network-policy-profile	Defines an LLDP MED network policy profile that defines DSCP values and L2 priority levels for a voice or video application.
ap mesh-cluster-profile	Configures a mesh cluster profile used by mesh nodes.
ap mesh-ht-ssid-profile	Configures a mesh high-throughput SSID profile used by mesh nodes.
ap mesh-radio-profile	Configures a mesh radio profile used by mesh nodes.
ap multizone-profile	Attaches the profile to ap-group or ap-name.
ap provisioning-profile	Defines a provisioning profile for an AP or group of APs.
ap regulatory-domain-profile	Configures an AP regulatory domain profile.
ap spectrum local-override	Converts an AP or AM into a spectrum monitor by adding it to the spectrum local-override list.
ap system-profile	Configures an AP system profile.
ap wired-ap-profile	Configures a wired AP profile.
ap wired-port-profile	Configures a wired port profile.

Command History

Release	Modification
AOS-W 8.2.0.0	The **ap deploy-profile** parameter was added.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show references ap-group

```
show references
   ap-group {default | <profile-name>}
   [page <page>] [start <start>]
```

Description

This command shows the number of references to a specific AP-group profile.

Syntax

Parameter	Description	Default
`ap-group <profile-name>`	Shows references to an AP-group profile.	default

Example

The following is an example for execution of the **show references ap-group** command:

```
(host) [mynode] #show references ap-group LeftWing
```

Related Commands

Command	Description
ap-group	Configures an AP group.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system	Config or Enable mode on Mobility Master

show references ap-lacp-striping-ip

```
show references
   ap-lacp-striping-ip
   [page <page>] [start <start>]
```

Description

This command shows the references to the AP LACP LMS map information.

Syntax

Parameter	Description
`ap-lacp-striping-ip`	Shows references to AP LACP LMS map information.

Example

The following is an example for execution of the **show references ap-lacp-striping-ip** command:

```
(host) [mynode] #show references ap-lacp-striping-ip
```

Related Commands

Command	Description
ap-lacp-striping-ip	Configures the AP LACP LMS map information.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show references ap-name

```
show references
   ap-name <profile-name>
   [page <page>] [start <start>]
```

Description

This command shows the number of references to a specific AP-group profile.

Syntax

Parameter	Description
`ap-name <profile-name>`	Shows references to an AP name profile.

Example

The following is an example for execution of the **show references ap-name** command:

```
(host) [mynode] #show references ap-name ap228
```

Related Commands

Command	Description
ap-name	Configures a specific AP.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show references aruba-central

```
show references
   aruba-central
   [page <page>] [start <start>]
```

Description

This command shows the number of references to Alcatel-Lucent-Central.

Syntax

Parameter	Description
`aruba-central`	Shows references to Alcatel-Lucent-Central.

Example

The following is an example for execution of the **show references aruba-central** command:

```
(host) [mynode] #show references aruba-central
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show references bw-contract

```
show references
   bw-contract <name> [revert_cmd]
   [page <page>] [start <start>]
```

Description

This command shows the number of references to bandwidth contract.

Syntax

Parameter	Description
`bw-contract <name>`	Shows references to bandwidth contract. Specify the bandwidth contract name.
`[revert_cmd]`	List of no commands to change the value.

Example

The following is an example for execution of the **show references bw-contract** command:

```
(host) [mynode] #show references bw-contract bwcontract1
```

Related Commands

Command	Description
aaa bandwidth-contract	This command configures a bandwidth contract.
cp-bandwidth-contract	This command configures a bandwidth contract traffic rate, which can then be associated with a whitelist session ACL.
firewall cp-bandwidth-contract	This command configures bandwidth contract traffic rate limits, in packets per second, to prevent denial of service attacks.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show references control-plane-security

```
show references
   control-plane-security
   [page <page>] [start <start>]
```

Description

This command shows the number of references to bandwidth contract.

Syntax

Parameter	Description
`control-plane-security`	Shows references to the Control Plane Security Profile.

Example

The following is an example for execution of the **show references control-plane-security** command:

```
(host) [mynode] #show references control-plane-security
```

Related Commands

Command	Description
control-plane-security	Configures the control plane security profile by identifying APs to receive security certificates.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show references dump-collection-profile

```
show references dump-collection-profile {default | <profile-name>}
   [page <number>][start <number>]
```

Description

This command shows references to a dump collection profile.

Syntax

Parameter	Description
`{default | <profile-name>}`	Specify the profile for collecting core dump when an AP process crashes.
`page <number>`	Include this parameter to limit output of this command to the specified number of items.
`start <number>`	Include this parameter to start displaying the output of this command at the specified index number.

Example

The following is an example of the command that shows references to a dump collection profile,

```
(host)[mynode] #show references dump-collection-profile default

References to Dump collection profile "default"
-----------------------------------------------
Referrer                                                    Count
--------                                                    -----
ap system-profile "default" dump-collection-profile         1
ap system-profile "NoAuthApSystem" dump-collection-profile  1
Total References:2
```

Related Commands

Related Command	Description
ap system-profile	This command configures the AP system profile.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show references est profile

```
show references
   est profile {default | <profile-name>}
   [page <page>] [start <start>]
```

Description

This command shows the number of references to bandwidth contract.

Syntax

Parameter	Description
`est profile <profile-name>`	Show references to an EST Profile.

Example

The following is an example for execution of the **show references est profile** command:

```
(host) [mynode] #show references est profile default
```

Related Commands

Related Command	Description
est	This command configures an EST profile on the Switch. This configuration is then pushed to the AP on successful enrollment.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show references file syncing profile

```
show references
   file syncing profile
   [page <page>] [start <start>]
```

Description

This command shows references to the file syncing profile.

Syntax

Parameter	Description
`file syncing profile`	Shows references to the file syncing profile.

Example

The following is an example for execution of the **show references file syncing profile** command:

```
(host) [mynode] #show references file syncing profile
```

Related Commands

Command	Description
file syncing profile	Allows the user to configure the file syncing profile.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show references guest-access-email

```
show references
   guest-access-email
   [page <page>] [start <start>]
```

Description

This command shows references to the global guest access email profile.

Syntax

Parameter	Description
`guest-access-email`	Shows references to the guest-access email profile.
`page <number>`	Include this optional parameter to limit output of this command to the specified number of items.
`start <number>`	Include this optional parameter to start displaying the output of this command at the specified index number.

Example

```
(host)[mynode]#show references guest-access-email

References to Guest-access Email Profile
----------------------------------------
Referrer  Count
--------  -----
Total References:0
```

Related Commands

Command	Description
guest-access-email	Configures the SMTP server which is used to send guest email.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show references ha

```
show references
   ha group-profile <profile-name>
   [page <page>] [start <start>]
```

Description

This command displays HA group profile references.

Syntax

Parameter	Description
`group-profile <profile-anme>`	Name of the HA group profile for which you want to show references.
`page <page>`	Include this parameter to limit output of this command to the specified number of items.
`start <page>`	Include this parameter to start displaying the output of this command at the specified index number.

Example

Execute this command to display a list of references for a specific HA group profile.

```
(host)[mynode](config) #show references ha group-profile newgroup
References to HA group information "newgroup"
-----------------------------------------
Referrer  Count
--------  -----
Total References:0
```

Related Commands

Command	Description
ha	Creates a new high availability group, or define settings for an existing group.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show references ids

```
show references ids
   ap-classification-rule <rule-name>
   ap-rule-matching
   dos-profile {default | <profile-name>}
   general-profile {default | <profile-name>}
   impersonation-profile {default | <profile-name>}
   management-profile
   profile {default | <profile-name>}
   rap-wml-server-profile <server-name>
   rap-wml-table-profile <table-name>
   rate-thresholds-profile {default | <profile-name>}
   signature-matching-profile {default | <profile-name>}
   signature-profile <profile-name>
   unauthorized-device-profile {default | <profile-name>}
   wms-general-profile
   wms-local-system-profile
```

Description

This command displays IDS profile references.

Syntax

Parameter	Description	Default
`ap-classification-rule <rule-name>`	Shows references to an IDS AP classification rule profile.	
`ap-rule-matching`	Shows references to the IDS Active AP Rules Profile.	
`dos-profile <profile-name>`	Shows references to an IDS Denial of Service (DoS) profile.	default
`general-profile <profile-name>`	Shows references to an IDS general profile.	default
`impersonation-profile <profile-name>`	Shows references to an IDS impersonation profile.	default
`management-profile`	Shows references to the IDS WMS management profile.	
`profile <profile-name>`	Shows references to an IDS profile.	default
`rap-wml-server-profile <server-name>`	Shows references to an IDS remote AP WML server profile.	

Parameter	Description	Default
`rap-wml-table-profile <table-name>`	Shows references to an IDS remote AP WML table profile	
`rate-thresholds-profile <profile-name>`	Shows references to an IDS rate thresholds profile.	default
`signature-matching-profile <profile-name>`	Shows references to an IDS signature matching profile.	default
`signature-profile <profile-name>`	Shows references to an IDS signature profile.	default
`unauthorized-device-profile <profile-name>`	Shows references to an unauthorized device profile.	default
`wms-general-profile`	Shows references to the IDS WMS general profile.	
`wms-local-system-profile`	Shows references to the IDS WMS local system profile.	

Example

Execute the following command to display a list of references for the default IDS profile.

```
(host) [mynode] #show references ids profile default
References to IDS Profile "default"
-----------------------------------
Referrer                              Count
--------                              -----
ap-group "default" ids-profile        1
ap-group "NoAuthApGroup" ids-profile  1
Total References:2
```

Related Commands

Command	Description
ids ap-classification-rule	Configures the IDS AP classification rule profile.
ids ap-rule-matching	Configures the IDS active AP rules profile by enabling an AP classification rule.
ids dos-profile	Configures traffic anomalies for denial of service (DoS) attacks.
ids general-profile	Configures an IDS general profile.
ids impersonation-profile	Configures anomalies for impersonation attacks.
ids management-profile	Configures the IDS WMS management profile.
ids profile	Defines a set of IDS profiles.

Command	Description
ids rate-thresholds-profile	Configures an IDS rate thresholds profile.
ids signature-matching-profile	Configures an IDS signature matching profile.
ids signature-profile	Configures signatures for wireless intrusion detection.
ids unauthorized-device-profile	Configures detection of unauthorized devices, as well as rogue AP detection and containment.
ids wms-general-profile	configures the IDS WLAN management system (WMS) general profile.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show references ifmap cppm

```
show references
   ifmap cppm
   [page <page>] [start <start>]
```

Description

This command displays the ClearPass Policy Manager IF-MAP references.

Syntax

Parameter	Description
`ifmap cppm`	Shows references to the ClearPass Policy Manager IF-MAP profile.
`page <page>`	Include this parameter to limit output of this command to the specified number of items.
`start <start>`	Include this parameter to start displaying the output of this command at the specified index number.

Example

Execute this command to display a list of references for the ClearPass Policy Manager IF-MAP profile.

```
(host) [mynode] #show references ifmap cppm
References to CPPM IF-MAP Profile
---------------------------------
Referrer  Count
--------  -----
Total References:0
```

Related Commands

Command	Description
ifmap	Sends HTTP User Agent Strings and mDNS broadcast information to ClearPass Policy Manager so that it can make more accurate decisions about what types of devices are connecting to the network.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show references ip-flow-export-profile

```
show references
   ip-flow-export-profile
   [page <page>] [start <start>]
```

Description

This command shows references to the IP flow collector Profile.

Syntax

Parameter	Description
`ip-flow-export-profile`	Shows references to the IP flow collector profile.
`page <page>`	Include this optional parameter to limit output of this command to the specified number of items.
`start <start>`	Include this optional parameter to start displaying the output of this command at the specified index number.

Example

Execute this command to display a list of references for the IP flow export profile:

```
(host) [mynode] #show references ip-flow-export-profile
```

Related Commands

Command	Description
ip-flow-export-profile	Configures the IP flow collector profile.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show references lc-cluster

```
show references lc-cluster group-profile <profile-name> {page<page> start<start>}
```

Description

Displays Switch Cluster Profile references.

Syntax

Parameter	Description
`group-profile <profile-anme>`	Name of the lc-cluster group profile for which you want to show references.
`page <number>`	Include this parameter to limit output of this command to the specified number of items.
`start <number>`	Include this parameter to start displaying the output of this command at the specified index number.

Related Commands

Command	Description
lc-cluster group-profile	This command is used to configure the cluster group profile in the Mobility Master.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Managed device.

show references lcd-menu

```
show references lcd-menu {page<number> start<number>}
```

Description

This command shows references to lcd-menu.

Syntax

Parameter	Description
`page <number>`	Include this parameter to limit output of this command to the specified number of items.
`start <number>`	Include this parameter to start displaying the output of this command at the specified index number.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output. This command can be executed only on **/md subtree.** This command is not supported on OmniAccess Mobility Controller - Virtual Appliance platform.

Related Commands

Related Command	Description
lcd-menu	This command allows you to enable or disable the LCD menu either completely or for specific operations.

Command History

Release	Modification

show references license-pool-profile

```
show references
   license-pool-profile
   [page <page>] [start <start>]
```

Description

This command displays references to a License pool profile.

Syntax

Parameter	Description
`license-pool-profile`	Shows references to the license-pool profile.
`page <page>`	Include this parameter to limit output of this command to the specified number of items.
`start <start>`	Include this parameter to start displaying the output of this command at the specified index number.

Example

Execute this command to display a list of references for the license-pool profile.

```
(host)[node] #show references license-pool-profile
```

Related Commands

Related Command	Description
license-pool-profile	Creates a local licensing pool and allocate licenses for that licensing pool.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show references mgmt-server profile

```
show references mgmt-server profile <profile_name>
```

Description

Shows the management server configuration profiles.

Syntax

Parameter	Description
`mgmt-server profile`	Specifies the management profile name.
`page <number>`	Include this optional parameter to limit output of this command to the specified number of items.
`start <number>`	Include this optional parameter to start displaying the output of this command at the specified index number.

Example

```
(host)[mynode] #show references mgmt-server profile default
References to Mgmt Config profile "default"
---------------------------------------
Referrer  Count
--------  -----
Total References:0
```

Related Commands

Related Command	Description
mgmt-server	This command configures the management server profile.

Command History

Release	Modification

Command Information

Platform	License	Command Mode
All platforms	Base operating system.	Config mode on Mobility Master.

show references openflow-controller

```
show references openflow-controller {page<number> start<number>}
```

Description

This command shows references to openflow controller.

Syntax

Parameter	Description
`page <number>`	Include this parameter to limit output of this command to the specified number of items.
`start <number>`	Include this parameter to start displaying the output of this command at the specified index number.

Example

The following command show references to openflow controller,

```
(host)[mm] #show references openflow-controller
References to Openflow-controller
---------------------------------
Referrer  Count
--------  -----
Total References:0
```

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show references openflow-profile

```
show references openflow-profile {page<number> start<number>}
```

Description

This command shows references to openflow-profile.

Syntax

Parameter	Description
`page <number>`	Include this parameter to limit output of this command to the specified number of items.
`start <number>`	Include this parameter to start displaying the output of this command at the specified index number.

Example

The following command show references to openflow-profile,

```
(host)[mm] #show references openflow-profile
References to Openflow-profile
------------------------------
Referrer  Count
--------  -----
Total References:0
```

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

show references pan

```
show references pan {active-profile [page<number> start<number>]} | {profile <default|profile-name> [page<number> start<number>]}
```

Description

This command shows references to Palo Alto Networks configuration.

Syntax

Parameter	Description
`active-profile`	Shows references to the Palo Alto Networks Active Profile.
`profile <default|profile-name>`	Shows references to the Palo Alto Networks Servers Profile.
`page <number>`	Include this parameter to limit output of this command to the specified number of items.
`start <number>`	Include this parameter to start displaying the output of this command at the specified index number.

Example

The following command show references to Palo Alto Networks configuration,

```
(host)[mm] #show references pan active-profile
References to Palo Alto Networks Active Profile
-----------------------------------------------
Referrer  Count
--------  -----
Total References:0
```

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Related Commands

Related Command	Description
pan-active-profile	This command makes a Palo Alto Network profile active from a set of profiles.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master and Managed Device.

show references pan-options

```
show references pan-options [page<number> start<number>]
```

Description

This command shows references to configure Palo Alto Networks options.

Syntax

Parameter	Description
`page <number>`	Include this parameter to limit output of this command to the specified number of items.
`start <number>`	Include this parameter to start displaying the output of this command at the specified index number.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output. This command can be executed only on **/md subtree**.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Managed Device.

show references papi-security

```
show references papi-security [page <number>] [start <number>]
```

Description

Show references to a PAPI security profile.

Syntax

Parameter	Description
`page <number>`	Include this optional parameter to limit output of this command to the specified number of items.
`start <number>`	Include this optional parameter to start displaying the output of this command at the specified index number.

Example

```
            (host)[node]#show references papi-security

References to PAPI Security Profile
-----------------------------------
Referrer  Count
--------  -----
Total References:0
```

Related Commands

Related Command	Description
papi-security	The papi-security command enforces advanced security options and provides an enhanced level of security. It allows to enable or disable the PAPI Enhanced Security configuration and to configure a new security key if required.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platform	License	Command Mode
All platforms	Base operating system.	Config mode on Mobility Master.

show references rf

```
show references rf
   dot11a-radio-profile <profile-name>
   dot11g-radio-profile <profile-name>
   event-thresholds-prof <profile-name>
   ht-radio-profile <profile-name>
   optimization-profile <profile-name>
```

Description

Show RF profile references.

Syntax

Parameter	Description
`dot11a-radio-profile`	Show references to a 802.11a radio profile.
`dot11g-radio-profile`	Show references to a 802.11g radio profile.
`event-thresholds-prof`	Show references to an RF Event Thresholds Profile.
`ht-radio-profile`	Show references to a High-throughput radio profile.
`optimization-profile`	Show references to an RF Optimization Profile.

Related Commands

Related Command	Description
rf arm-profile	This command configures the Adaptive Radio Management (ARM) profile.

Command History

	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show references scheduler-profile

```
show references scheduler-profile {default | <map-name> } [page<number> start<number>]
```

Description

This command shows references to a scheduler profile.

Syntax

Parameter	Description
`default | <map-name>`	Shows references to the default profile or to a specific profile.
`page <number>`	Include this parameter to limit output of this command to the specified number of items.
`start <number>`	Include this parameter to start displaying the output of this command at the specified index number.

Example

The following command shows references to a scheduler profile,

```
(host)[mm] #show references scheduler-profile default
References to scheduler profile "default"
----------------------------------------
Referrer  Count
--------  -----
Total References:0
```

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Related Commands

Related Command	Description
scheduler-profile	Define a schedule profile that associates priorities to four uplink queues.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master and Managed Device.

show references sdwan-profile

```
show references sdwan-profile [page<number> start<number>]
```

Description

This command shows references of the SD-WAN profile.

Syntax

Parameter	Description
`page <number>`	Include this parameter to limit output of this command to the specified number of items.
`start <number>`	Include this parameter to start displaying the output of this command at the specified index number.

Example

The following command shows references of the SD-WAN profile,

```
(host)[mm] #show references sdwan-profile
References to sdwan-profile
---------------------------
Referrer  Count
--------  -----
Total References:0
```

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Related Commands

show references sso idp-profile

```
show references sso idp-profile <sso_prof_name> [page<number> start<number>]
```

Description

This command shows references to an SSO profile.

Syntax

Parameter	Description
`idp-profile <sso_prof_name>`	Name of the SSO profile.
`page <number>`	Include this parameter to limit output of this command to the specified number of items.
`start <number>`	Include this parameter to start displaying the output of this command at the specified index number.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Related Commands

Command	Description

show references time-range-profile

```
show references time-range-profile <profile-name>  [page<number> start<number>]
```

Description

This command shows references to a time range profile.

Syntax

Parameter	Description
`<profile-name>`	Name of the profile.
`page <number>`	Include this parameter to limit output of this command to the specified number of items.
`start <number>`	Include this parameter to start displaying the output of this command at the specified index number.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

show references ucc

```
show references ucc
   facetime
   h323
   ich
   jabber
   noe
   rtpa-config
   sccp
   session-idle-timeout
   sip
   skype4b
   vocera
   wificalling
      page <page>
      start <start>
```

Description

This command displays the UCC ALG references to a profile.

Syntax

Parameter	Description
`facetime`	Show references to the Apple FaceTime ALG configuration.
`h323`	Show references to the H.323 ALG configuration.
`ich`	Show references to the Intelligent Call Handling configuration.
`jabber`	Show references to the Cisco Jabber ALG configuration.
`noe`	Show references to the Alcatel-Lucent New Office Environment (NOE) ALG configuration.
`rtpa-config`	Show references to the Real-Time Analysis configuration.
`sccp`	Show references to the Cisco SCCP ALG configuration.
`session-idle-timeout`	Show references to the UCC Session Idle Timeout configuration.
`sip`	Show references to the SIP ALG configuration.
`skype4b`	Show references to the Microsoft Skype for Business ALG configuration.
`vocera`	Show references to the Vocera ALG configuration.
`wificalling`	Show references to the Wi-Fi Calling configuration.
`page <number>`	Include this optional parameter to limit output of this command to the specified number of items.
`start <number>`	Include this optional parameter to start displaying the output of this command at the specified index number.

Example

```
(host)[mynode]#show references u skype4b

References to Skype4B ALG Configuration
---------------------------------------
Referrer  Count
--------  -----
Total References:0
```

Related Commands

Related Command	Description

show references upgrade-profile

```
crypto-local
show references upgrade-profile {page<page> start<start>}
```

Description

Displays the upgrade profile references.

Syntax

Parameter	Description
`upgrade-profile`	Shows references to the upgrade profile.
`page <number>`	Include this parameter to limit output of this command to the specified number of items.
`start <number>`	Include this parameter to start displaying the output of this command at the specified index number.

Example

Issue this command to display a list of references for the upgrade profile.

```
(host)[mynode]#show references upgrade-profile
References to Upgrade Profile
-----------------------------
Referrer  Count
--------  -----
Total References:0
```

show references user-role

```
show references user-role <role_name>
```

Description

Show access rights for user role.

Syntax

Parameter	Description
`<role_name>`	The role name assigned to a user.

Example

```
(host)[mynode] #show references user-role guest

References to User Role "guest"
-------------------------------
aaa profile "airwave-office-ssid" mac-default-role
aaa profile "amigopod-guest" mac-default-role
aaa profile "corp1344-voip" mac-default-role
aaa profile "default" mac-default-role
aaa profile "default-airwave-office" mac-default-role
aaa profile "default-corp1344" mac-default-role
aaa profile "default-corp1344-no-okc" mac-default-role
aaa profile "default-corp1344-okc" mac-default-role
aaa profile "default-dot1x" mac-default-role
aaa profile "default-dot1x-psk" mac-default-role
aaa profile "default-dot1x-psk" dot1x-default-role
aaa profile "default-India" mac-default-role
aaa profile "default-india-hotel" mac-default-role
```

show references websocket clearpass

```
show references websocket clearpass [page<number> start<number>]
```

Description

This command shows references to the ClearPass WebSocket profile.

Syntax

Parameter	Description
`page <number>`	Include this parameter to limit output of this command to the specified number of items.
`start <number>`	Include this parameter to start displaying the output of this command at the specified index number.

Example

The following command shows references to the valid equipment OUI profile,

```
(host)[mm] #show references websocket clearpass
References to ClearPass WebSocket Profile
----------------------------------------
Referrer  Count
--------  -----
Total References:0
```

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

show references web-server

```
show references web-server [page <number>] [start <number>]
```

Description

Show the Web server configuration references.

Syntax

Parameter	Description
`page <number>`	Include this optional parameter to limit output of this command to the specified number of items.
`start <number>`	Include this optional parameter to start displaying the output of this command at the specified index number.

Example

```
(host)[mynode]#show references web-server

References to Web Server Configuration
--------------------------------------
Referrer  Count
--------  -----
Total References:0
```

Related Commands

show references wlan

```
show references wlan
   bcn-rpt-req-profile
   client-wlan-profile
   dot11k-profile <profile-name>
   dot11r-profile <profile-name>
   edca-parameters-profile <profile-name>
   hotspot
      advertisement-profile
      anqp-3gpp-nwk-profile <profile-name>
      anqp-domain-name-profile <profile-name>
      anqp-ip-addr-avail-profile <profile-name>
      anqp-nai-realm-profile <profile-name>
      anqp-nwk-auth-profile <profile-name>
      anqp-roam-cons-profile <profile-name>
      anqp-venue-name-profile <profile-name>
      h2qp-conn-capability-profile <profile-name>
      h2qp-op-cl-profile <profile-name>
      h2qp-operator-friendly-name-profile <profile-name>
      h2qp-wan-metrics-profile <profile-name>
      hs2-profile <profile-name>
   ht-ssid-profile
   rrm-ie-profile
   ssid-profile <profile-name>
   traffic-management-pr <profile-name>
   tsm-req-profile
   virtual-ap <profile-name>
   wmm-traffic-management
```

Description

Show information about the different configuration profiles that reference a specific WLAN profile.

Syntax

Parameter	Description
`bcn-rpt-req-profile`	Shows references to a Beacon Report Request profile.
`client-wlan-profile`	Shows references for the Client WLAN profile.
`dot11k-profile <profile-name>`	Shows references to a 802.11k profile.
`dot11r-profile <profile-name>`	Shows references to a 802.11r profile.
`edca-parameters-profile <profile-name>`	Shows references to an EDCA parameters profile.
`hotspot`	Shows references to one of the following hotspot profile types: ■ advertisement-profile ■ anqp-3gpp-nwk-profile ■ anqp-domain-name-profile ■ anqp-ip-addr-avail-profile ■ anqp-nai-realm-profile ■ anqp-nwk-auth-profile ■ anqp-roam-cons-profile

Parameter	Description
	■ anqp-venue-name-profile ■ h2qp-conn-capability-profile ■ h2qp-op-cl-profile ■ h2qp-operator-friendly-name-profile ■ h2qp-wan-metrics-profile ■ hs2-profile
`ht-ssid-profile <profile-name>`	Shows references to a high-throughput SSID profile.
`rrm-ie-profile`	Shows references to an RRM IE profile.
`ssid-profile <profile-name>`	Shows references to an SSID management profile.
`traffic-management-pr <profile-name>`	Shows references to a traffic management profile.
`virtual-ap <profile-name>`	Shows references to a virtual AP profile.
`tsm-req-profile`	Show references to a TSM Report Request profile.
`wmm-traffic-management`	Shows references to a WMM Traffic management profile.

Example

The following example shows that two different WLAN hotspot 2.0 profiles reference the **default** WLAN hotspot advertisement profile.

```
(host) [mynode] #show references wlan hotspot advertisement-profile default

References to Advertisement Profile "default"
---------------------------------------------
Referrer                                                    Count
--------                                                    -----
wlan hotspot hs2-profile "deploytest" advertisement-profile  1
wlan hotspot hs2-profile "default" advertisement-profile     1

Total References:2
```

Related Commands

Related Command	Description
wlan ssid-profile	This command configures an SSID profile.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platform	License	Command Mode
All platforms	Base operating system.	Config mode on Mobility Master.

show rf am-scan-profile

```
show rf am-scan-profile [<profile-name>]
```

Description

Display the AM scanning profile list. Optionally display parameter and values of a specified Air Monitor profile.

Syntax

Parameter	Description
<profile-name>	Name of this instance of the profile.

Usage Guidelines

Enter the basic show command to view a list of profiles, the number of profiles and the profile status. For example:

```
(host) [mynode]#show rf am-scan-profile

AM Scanning profile List
------------------------
Name      References  Profile Status
----      ----------  --------------
default   9
north     0

Total:2
```

Example

In the example above, their are two profile names; default and north. The Reference column indicates the number of references to this profile name. The Profile Status column is blank unless the profile is predefined.

Optionally, you can enter a profile name to view the parameters for that profile. For example:

```
(host) [mynode]#show rf am-scan-profile default

AM Scanning profile "default"
-----------------------------
Parameter                                 Value
---------                                 -----
Scan Mode                                 all-reg-domain
Dwell time: Active channels               500
Dwell time: Regulatory Domain channels    250
Dwell time: non-Regulatory Domain channels  200
Dwell time: Rare channels                 100
```

The explanation of the display output is described in the table below.

Parameter	Description
Scan-mode	The scanning mode for the radio
all-reg-domain	Scan channels in all regulatory domain

Parameter	Description
rare	Scan all channels (all regulatory domains and rare channels)
reg-domain	Scan channels in the APs regulatory domain
Dwell time: Active channels	Dwell time (in ms) for channels where there is wireless activity
Dwell time: Regulatory Domain channels	Dwell time (in ms) for AP's Regulatory domain channels
Dwell time: non-Regulatory Domain channels	Dwell time (in ms) for channels not in the APs regulatory domain
Dwell time: Rare channels	Dwell time (in ms) for rare channels

Related Commands

Related Command	Description
rf am-scan-profile	This command configures an Air Monitor (AM) scanning profile.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config mode on Mobility Master.

show rf arm-rf-domain-profile

```
show rf arm-rf-domain profile
```

Description

This profile contains a non-editable key defined by Mobility Master, and used to sign over-the air (OTA) ARM updates exchanged between APs.

Syntax

No parameters

Example

The output of this command displays the OTA key defined by Mobility Master.

```
(host)[mynode] #show rf arm-rf-domain-profile

ARM RF domain
-------------
Parameter          Value
---------          -----
ARM RF domain key  27f71ad66f28c374a8904b4a82177e2c
```

Related Commands

Related Command	Description
rf arm-rf-domain-profile	This profile holds a non-editable key defined by Mobility Master, and used to sign over-the air (OTA) ARM updates exchanged between APs.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platform	License	Command Mode
All platforms	Base operating system.	Config mode on Mobility Master.

show rf arm-profile

```
show rf arm-profile [<profile>]
```

Description

Show an ARM profile.

Syntax

Parameter	Description
`<profile>`	Name of an ARM profile.

Usage Guidelines

Issue this command without the **<profile>** parameter to display the entire ARM profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the Switch has five configured ARM profiles. The **References** column lists the number of other profiles with references to the ARM profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host)[node] # show rf arm-profile
Adaptive Radio Management (ARM) profile List
-------------------------------------------
Name                    References  Profile Status
----                    ----------  --------------
airwave                 2
default                 4
default-AP85            2
no-scanning             1
Wireless-rf-profile                     1

Total:5.
```

This example displays the configuration settings for the profile **Wireless_rf_profile.**

```
(host)[node] #show rf arm-profile default
Adaptive Radio Management (ARM) profile "Wireless_rf_profile"
-------------------------------------------------------------------------------------------------
----
Parameter                                                                        Value
---------                                                                        -----
Assignment                                                                       single-band
Allowed bands for 40MHz channels                                                 a-only
80MHz support                                                                    Enabled
160MHz-support                                                                   None
Client Aware                                                                     Enabled
Max Tx EIRP                                                                      127 dBm
Min Tx EIRP                                                                      9 dBm
Rogue AP Aware                                                                   Disabled
Scan Interval                                                                    10 sec
Aggressive scanning                                                              true
Active Scan                                                                      Disabled

```

```
Scanning                                                                    Enabled
Multi Band Scan                                                             Enabled
VoIP Aware Scan                                                             Enabled
Power Save Aware Scan                                                       Disabled
Video Aware Scan                                                            Enabled
Ideal Coverage Index                                                        10
Acceptable Coverage Index                                                   4
Free Channel Index                                                          25
Interfering AP Weight                                                       25 %
Backoff Time                                                                240 sec
Error Rate Threshold                                                        50 %
Error Rate Wait Time                                                        30 sec
Channel Quality Aware Arm                                                   Disabled
Channel Quality Threshold                                                   70 %
Channel Quality Wait Time                                                   120 sec
Minimum Scan Time                                                           8
Load aware Scan Threshold                                                   1250000 Bps
Mode Aware Arm                                                              Disabled
Scan Mode                                                                   all-reg-domain
Client Match                                                                Enabled
Client Match report interval (sec)                                          30
Allows Client Match to Automatically Clear Unsteerable Clients after Ageout Enabled
Client Match Unsteerable Client Ageout Interval                             2 Days 0 Hours
Client Match Band Steering G Max Signal (-dBm)                              45
Client Match Band Steering A Min Signal (-dBm)                              75
Client Match Sticky Client Check Interval (sec)                             3
Client Match Sticky Client Check SNR (dB)                                   25
Client Match SNR Delta Bound(dB)                                            10
Client Match Sticky Min Signal                                              70
Client Match Steering Timeout (sec)                                         10
Client Match Load Balancing Threshold (%)                                   20
Client Match IOS Steering Backoff Interval (sec)                            300
Client Match VBR Stale Entry Age (sec)                                      120
Client Match Max Steering Failures                                          2
Client Match Load Balancing Client Threshold                                10
Client Match Load Balancing SNR Threshold (dB)                              77
Client Match Load Balancing Signal Delta Bound (dB)                         5
Client Match 802.11v BSS Transition Management                              Enabled
Dynamic Bandwidth Switch                                                    Enabled
Dynamic Bandwidth Switch Wait Time (sec)                                    30
Dynamic Bandwidth Switch Triggering Indicator CCA ibss Threshold (%)        10
Dynamic Bandwidth Switch Triggering Indicator Beacon Failed Threshold       30
Dynamic Bandwidth Switch Triggering Indicator CCA intf Threshold (%)        30
Dynamic Bandwidth Switch Clear Time (min)                                   30
```

The output of this command includes the following parameters:

Parameter	Description
Assignment	Displays the current ARM channel/power assignment mode.
Allowed bands for 40MHz channels	Shows if 40 MHz mode of operation is allowed on the 5 GHz (802.11a) or 2.4 GHz (802.11b/g) frequency band only, on all frequency bands, or on neither frequency band.
Client Aware	Shows if the client aware feature is enabled or disabled. When enabled, the AP does not change channels when there are active clients.

Parameter	Description
Max Tx Power	The highest transmit power levels for the AP, from 0-30 dBm in 3 dBm increments. Higher power level settings may be constrained by local regulatory requirements and AP capabilities. In the event that an AP is configured for a Max Tx Power setting it cannot support, this value will be reduced to the highest supported power setting.
Min Tx Power	The lowest transmit power levels for the AP, from 0-30 dBm, in 3 dBm increments. Note that power settings will not change if the Assignment option is set to disabled or maintain.
Multi Band Scan	If enabled, single-radio APs will try to scan across bands for rogue AP detection.
Rogue AP Aware	If enabled, Alcatel-Lucent APs may change channels to contain off-channel rogue APs with active clients. This security features allows APs to change channels even if the Client Aware setting is disabled. This setting is disabled by default, and should only be enabled in high-security environments where security requirements are allowed to consume higher levels of network resources. You may prefer to receive Rogue AP alerts via SNMP traps or syslog events.
Scan Interval	If Scanning is enabled, the Scan Interval defines how often the AP will leave its current channel to scan other channels in the band. Off-channel scanning can impact client performance. Typically, the shorter the scan interval, the higher the impact on performance. If you are deploying a large number of new APs on the network, you may want to lower the Scan Interval to help those APs find their optimal settings more quickly. Raise the Scan Interval back to its default setting after the APs are functioning as desired.
Aggressive Scanning	When the aggressive scanning feature is enabled, an AP radio with no clients will scan channels every second.
Active Scan	If enabled, the AP initiates active scanning via probe request. This option elicits more information from nearby APs, but also creates additional management traffic on the network. Active Scan is disabled by default, and should not be enabled except under the direct supervision of Alcatel-Lucent Support.
Scanning	Shows if the AP has enabled or disabled AP scanning of other channels.
VoIP Aware Scan	Shows if Alcatel-Lucent's VoIP Intelligent Call Handling prevents any single AP from becoming congested with voice calls. If Intelligent Call Handling is enabled, you should also enable VoIP Aware Scan in the ARM profile, so the AP will not attempt to scan a different channel if one of its clients has an active VoIP call.
Power Save Aware Scan	When enabled, the AP will not scan if Power Save is active.
Video Aware Scan	If Video Aware Scan is enabled in the ARM profile, the AP will not attempt to scan a different channel if one of its clients has an active video session.
Ideal Coverage Index	The coverage that the AP should try to achieve on its channel. The denser the AP deployment, the lower this value should be.
Acceptable Coverage Index	The minimal coverage that the AP should try to achieve on its channel. The denser the AP deployment, the lower this value should be.

Parameter	Description
Free Channel Index	The difference in the interference index between the new channel and current channel must exceed this value for the AP to move to a new channel. The higher this value, the lower the chance an AP will move to the new channel.
Backoff Time	Time, in seconds, an AP backs off after requesting a new channel or power level.
Error Rate Threshold	The percentage of errors in the channel that triggers a channel change.
Error Rate Wait Time	Time, in seconds, that the error rate has to maintain or surpass the error rate threshold before it triggers a channel change.
Channel Quality Aware Arm	Shows if ARM changes are based upon an internally calculated channel quality metric. When this feature is disabled, ARM initiates channel changes based on thresholds defined in this profile, and chooses the channel based on the calculated interference index value.
Channel Quality Threshold	Displays the channel quality percentage below which ARM initiates a channel change.
Channel Quality Wait Time	If channel quality is below the specified channel quality threshold for this wait time period, ARM initiates a channel change.
Minimum Scan Time	Time, in seconds, that a channel must be scanned before it is considered for assignment.
Load aware Scan Threshold	The traffic throughput level an AP must reach before it stops scanning, in bytes/second. A value of 0 to disables this feature.
Mode Aware Arm	If enabled, ARM will turn APs into AMs if it detects higher coverage levels than necessary. This helps avoid higher levels of interference on the WLAN. Although this setting is disabled by default, you may want to enable this feature if your APs are deployed in close proximity (e.g. less than 60 feet apart).
Scan Mode	This parameter defines the scan mode for the AP. ■ all-reg-domain: The AP scans channels within all regulatory domains. This is the default setting. ■ reg-domain:Limit the AP scans to just the regulatory domain for that AP.
Client Match	The client match feature helps optimize network resources by balancing clients across channels, regardless of whether the AP or the Switch is responding to the wireless clients' probe requests. If enabled, the Switch compares whether or not an AP has more clients than its neighboring APs on other channels. If an AP's client load is at or over a predetermined threshold as compared to its immediate neighbors, or if a neighboring Alcatel-Lucent AP on another channel does not have any clients, load balancing will be enabled on that AP. This feature is enabled by default
Client Match report interval (sec)	This interval defines how often an AP sends an updated client probe report to the Switch. Each client probe report contains a list of MAC addresses for clients that have been active in the last two minutes, and the AP radio SNR values seen by those clients.
Client Match Unsteerable Client Ageout Interval	The client entries in an unsteerable client list remain in effect for the interval defined by this parameter before they age out.

Parameter	Description
Client Match Unsteerable Client Ageout	When client match and the client match unsteerable client ageout feature are enabled, the Switch periodically sends APs that are not a desired AP match for a client in a list of unsteerable clients. These lists contain a list of MAC addresses for up to 128 clients that should not be steered to that AP.
Client Match Sticky Client Check Interval (sec)	Frequency at which the AP checks for client's received SNR values. If the SNR value drops below the threshold defined by the **cm-sticky-snr** parameter for three consecutive check intervals, that client may be moved to an different AP.
Client Match Sticky Client Check SNR (dB)	If the client's received signal strength indicator (RSSI) is above this signal-to-noise ratio (SNR) threshold, that client will be allowed to stay associated to its current AP. If the client's received signal strength is below this threshold, it may be moved to a different AP.
Client Match SNR threshold(dB)	A client triggered to move to a different AP may consider an AP radio a better match if the client detects that the signal from the AP radio is stronger than its current radio by the dB level defined by the cm-sticky-snr-thresh parameter, and the candidate radio also has a minimum signal level defined by the cm-sticky-min-signal parameter.
Client Match Sticky Min Signal	A client triggered to move to a different AP may consider an AP radio a better match if the client detects that the signal from the candidate AP radio is at or higher than the minimum signal level defined by this parameter*and* the candidate radio has a higher signal strength than the radio to which the client is currently associated. (The required improvement in signal strength can be defined using the **cm-sticky-snr-delta** command.)
Client Match Restriction timeout (sec)	When a client is steered from one AP to a more desirable AP, the steer timeout feature helps facilitate the move by defining the amount of time that any APs to which the client should NOT associate will not respond to the AP.
Client Match Load Balancing threshold (%)	When the client match feature is enabled, clients may be steered from a highly utilized channel on an AP to a channel with fewer clients. If a channel on an AP radio has this percentage fewer clients than another channel supported by the client, the client match feature may move clients from the busier channel to the channel with fewer clients.
Client Match VBR Stale Entry Age (sec)	The Switch can maintains client match data for the maximum number of supported clients for that Switch platform, showing the detected SNR values for up to 16 candidate APs per client. This table is periodically updated as APs send client probe reports to the Switch. This parameter defines the amount of time that the Switch should retain client match data from each client probe report.
Client Match Max Steer Failures	The Switch keeps track of the number of times the client match feature failed to steer a client to a different radio, and the reason that each steer attempt was triggered. If the client match feature attempts to steer a client to a new radio multiple consecutive times for the same reason but client steering fails each time, the Switch notifies the AP to mark the client as unsteerable for that specific trigger. This parameter defines the maximum allowed number of client match steering fails with the same trigger before the client is marked as unsteerable for that trigger.
Client Match Load Balancing Client Threshold	If an AP radio has fewer clients than the client match load balancing threshold defined by this parameter, the AP will not participate in load balancing.

Parameter	Description
Client Match Load Balancing SNR Threshold (dB)	Clients must detect a SNR from an underutilized AP radio at or above this threshold before the client match feature considers load balancing a client to that radio.
Dynamic Bandwidth Switch	ARM dynamic 80MHz/40MHz bandwidth switch when 80MHz assignment is enabled.
Dynamic Bandwidth Switch Wait Time (sec)	Minimum time in seconds during which dynamic bandwidth switch indicators have to be true to trigger a 80MHz to 40MHz bandwidth change.
Dynamic Bandwidth Switch Triggering Indicator CCA ibss Threshold (%)	Dynamic Bandwidth Switch wait time window starts when load aware scan rejects increases and CCA ibss is below the threshold.
Dynamic Bandwidth Switch Triggering Indicator Beacon Failed Threshold	Dynamic Bandwidth Switch beacon failed indicator is true if beacon failed num is no less than this threshold during the wait time window.
Dynamic Bandwidth Switch Triggering Indicator CCA intf Threshold (%)	Dynamic Bandwidth Switch CCA intf indicator is true if CCA intf is no less than this threshold during the wait time window.
Dynamic Bandwidth Switch Clear Time (min)	Dynamic Bandwidth Switch back to 80MHz channel after the clear time in minutes if currently there is no high volume of traffic.

Related Commands

Related Command	Description

show rf dot11a-radio-profile

```
show rf dot11a-radio-profile [<profile>]
```

Description

Show an 802.11a radio profile.

Syntax

Parameter	Description
<profile>	Name of an 802.11a profile.

Usage Guidelines

Issue this command without the **<profile>** parameter to display the entire 802.11a Radio profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the Switch has three configured 802.11a Radio profiles. The **References** column lists the number of other profiles with references to the 802.11a Radio profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host)[mynode]# show rf dot11a-radio-profile
802.11a radio profile List
--------------------------
Name          References  Profile Status
----          ----------  --------------
default       18
default-AP85  1
test          1

Total:3.
```

This example displays the configuration settings for the profile default.

```
(host) # show rf dot11a-radio-profile default
802.11a radio profile "default"
Parameter                                   Value
---------                                   -----
Radio enable                                Enabled
Mode                                        ap-mode

EIRP Offset                                    0 dBm
deploy-hour                                    N/A
```

The output of this command includes the following parameters:

Parameter	Description
Radio enable	Shows if the AP has enabled or disabled transmissions on this radio band.
Mode	Access Point operating mode. Available options are: ■ am-mode: Air Monitor mode ■ ap-mode: Access Point mode ■ apm-mode: Access Point Monitor mode ■ sensor-mode: RFprotect sensor mode
High throughput enable (radio)	Shows if high-throughput (802.11n) is enabled on the radio. A high-throughput profile manages 40 Mhz tolerance settings, and controls whether or not APs using this profile will advertise intolerance of 40 MHz operation. (This option is disabled by default, allowing 40 MHz operation.) A high-throughput profile also determines whether an AP radio using the profile will stop using the 40 MHz channels surrounding APs or stations advertise 40 Mhz intolerance. This option is enabled by default.
Very high throughput enable (radio)	Enable or disable support for Very High Throughput (802.11ac) on the radio. This option is enabled by default.
Channel	Channel number for the AP 802.11a, 802.11n, or 802.11ac physical layer.
Transmit EIRP	Maximum transmit power (EIRP) in dBm from 0 to 51 in .5 dBm increments. Further limited by regulatory domain constraints and AP capabilities.

Parameter	Description
Non-Wi-Fi Interference Immunity	Sets a value for 802.11 Interference Immunity. The default setting for this parameter is level 2. When performance drops due to interference from non-802.11 interferers (such as DECT or Bluetooth devices), the level can be increased up to level 5 for improved performance. However, increasing the level makes the AP slightly "deaf" to its surroundings, causing the AP to lose a small amount of range. The levels for this parameter are: ■ Level-0: no ANI adaptation. ■ Level-1: noise immunity only. ■ Level-2: noise and spur immunity. This is the default setting ■ Level-3: level 2 and weak OFDM immunity. ■ Level-4: level 3 and FIR immunity.
Spur Immunity	Displays the spur immunity value for 802.11a radio. **NOTE:** This parameter is applicable for OAW-AP130 Series access points only. The Switch ignores this parameter if configured for non-OAW-AP130 Series access points.
Enable CSA	Shows if CSAs are enabled or disabled. CSAs, as defined by IEEE 802.11h, enable an AP to announce that it is switching to a new channel before it begins transmitting on that channel. This allows clients that support CSA to transition to the new channel with minimal downtime.
CSA Count	Number of channel switch announcements that must be sent prior to switching to a new channel. The default CSA count is 4 announcements.
Spectrum Monitoring	If enabled, the AP operates as a hybrid AP that can simultaneously serve clients and monitor a single channel for spectrum analysis data.
Spectrum Monitoring Profile	The spectrum monitoring profile referenced by APs using this 802.11a radio profile. For details, see rf spectrum-profile on page 936
Advertise 802.11d and 802.11h Capabilities	If enabled, the radio advertises its 802.11d (Country Information) and 802.11h (Transmit Power Control) capabilities.
Spectrum load balancing	The Spectrum load balancing feature helps optimize network resources by balancing clients across channels, regardless of whether the AP or the Switch is responding to the wireless clients' probe requests. If enabled, the Switch compares whether or not an AP has more clients than its neighboring APs on other channels. If an AP's client load is at or over a predetermined threshold as compared to its immediate neighbors, or if a neighboring Alcatel-Lucent AP on another channel does not have any clients, load balancing will be enabled on that AP. This feature is disabled by default.
Spectrum load balancing mode	SLB Mode allows control over how to balance clients. Channel-based load-balancing balances clients across channels. Radio-based load-balancing distributes clients across radios on the same band, independent of channels.
Spectrum load balancing mode update interval	This parameter specifies how often spectrum load balancing calculations are made (in seconds). The default value is 30 seconds.

Parameter	Description
Spectrum load balancing threshold	If the spectrum load balancing feature is enabled, this parameter controls the percentage difference between number of clients on a channel channel that triggers load balancing. The default value is 20%, meaning that spectrum load balancing is activated when there are 20% more clients on one channel than on another channel used by the AP radio.
Spectrum load balancing domain	Define a spectrum load balancing domain to manually create RF neighborhoods. Use this option to create RF neighborhood information for networks that have disabled ARM scanning and channel assignment. ■ If spectrum load balancing is enabled in a 802.11a radio profile but the spectrum load balancing domain is *not* defined, AOS-W uses ARM to calculate RF neighborhoods. ■ If spectrum load balancing is enabled in a 802.11a radio profile and a spectrum load balancing domain *isalso* defined, AP radios belonging to the same spectrum load balancing domain will be considered part of the same RF neighborhood for load balancing, and will not recognize RF neighborhoods defined by ARM.
Beacon Period	Time, in milliseconds, between successive beacon transmissions. The beacon advertises the AP's presence, identity, and radio characteristics to wireless clients.
Beacon Regulate	If enabled, this option introduces randomness in the beacon generation so that multiple APs on the same channel do not send beacons at the same time, which causes collisions over the air. This option is disabled by default.
Advertised Regulatory Max EIRP	Shows if the radio is configured to work around a known issue on Cisco 7921G telephones by capping for a radio's maximum EIRP. When you enable this parameter, even if the regulatory approved maximum for a given channel is higher than this EIRP cap, the AP radio using this profile will advertise only this capped maximum EIRP in its radio beacons. The supported value is1–31 dBm.
ARM/WIDS Override	If enabled, this option disables ARM and Wireless IDS functions and slightly increases packet processing performance. If a radio is configured to operate in Air Monitor mode, then the ARM/WIDS override functions are always enabled, regardless of whether or not this check box is selected.
Reduce Cell Size (Rx Sensitivity)	The cell size reduction feature allows you manage dense deployments and to increase overall system performance and capacity by shrinking an AP's receive coverage area, thereby minimizing co-channel interference and optimizing channel reuse. The possible range of values for this feature is 0-55 dB. The default 0 dB reduction allows the radio to retain its current default Rx sensitivity value.
Energy Detect Threshold Offset	This parameter can modify the energy detect threshold used by the radio in making transmit decisions. The energy detect threshold is a negative value, and the value specified for this parameter (1-12) is the offset from the base value of -59 dBm. For example a value of 1 = -60 dBm, and a value of 10: = -69 dBm. A value of 0 indicates the AP is using the default energy detect threshold for this radio. (This value may vary by AP model)

Parameter	Description
Management Frame Throttle Interval	Averaging interval for rate limiting mgmt frames from this radio, in seconds. A management frame throttle interval of 0 seconds disables rate limiting.
Management Frame Throttle Limit	Maximum number of management frames that can come in from this radio in each throttle interval.
Maximum Distance	Maximum distance between a client and an AP or between a mesh point and a mesh portal, in meters. This value is used to derive ACK and CTS timeout times. A value of 0 specifies default settings for this parameter, where timeouts are only modified for outdoor mesh radios which use a distance of 16km..
RX Sensitivity Threshold	If the Rx Sensitivity Tuning Based Channel reuse feature is set to static mode, this parameter manually sets the AP's Rx sensitivity threshold (-dBm). The AP will filter out and ignore weak signals that are below the channel threshold signal strength. For example, if the RX sensitivity threshold was set to -65 dBm, the AP would ignore signals with a strength from -1 dBM to -64 dBm. If the value is set to zero, the feature will automatically determine an appropriate threshold.
RX Sensitivity Tuning Based Channel Reuse	Shows if the channel reuse feature's current operating mode, static, dynamic or disable. ■ **Static**: This mode of operation is a coverage-based adaptation of the CCA thresholds. In the static mode of operation, the CCA is adjusted according to the configured transmission power level on the AP, so as the AP transmit power decreases as the CCA threshold increases, and vice versa. ■ **Dynamic**: In this mode, the CCA thresholds are based on channel loads, and take into account the location of the associated clients. When you set the Channel Reuse This feature is automatically enabled when the wireless medium around the AP is busy greater than half the time. When this mode is enabled, the CCA threshold adjusts to accommodate transmissions between the AP its most distant associated client. ■ **Disable**: This mode does not support the tuning of the CCA Detect Threshold.
Set to Radar Test Mode	For internal use only.
Adaptive Radio Management (ARM) Profile	Name of an ARM profile associated with this 802.11a profile.
High-throughput Radio Profile	Name of a High Throughput Radio profile associated with this 802.11a profile.
AM Scanning Profile	The AM scanning profile referenced by APs using this 802.11a radio profile. For details, seerf am-scan-profile on page 881
Max Channel Bandwidth	Sets the maximum channel bandwidth for APs associated to Mobility Master managed devices.
Min Channel Bandwidth	Sets the minimum channel bandwidth for APs associated to Mobility Master managed devices.

Parameter	Description
Max EIRP	The maximum transmission power level from 3 to 33 dBm. You may also specify a special value of 127 dBm for regulatory maximum to disable power adjustments for environments such as outdoor mesh links.
Min EIRP	The minimum transmission power level (in dBm) to be assigned to the AP radio(s).
EIRP Offset	This parameter is used to manually adjust EIRP levels selected by the AirMatch algorithm by specifying a value from -6 to 6 dBm.
deploy-hour	Specify a number from 0-23 to select the hour during which AirMatch updates are sent to the APs (in 24-hour format). If the managed device to which the AP is associated is in a different time zone than Mobility Master, the AirMatch solution will be deployed according to the time zone of the managed device. **NOTE:** If this parameter is set in both the AirMatch profile and radio profile, the setting in the radio profile will take precedence.

Related Commands

Related Command	Description
rf dot11a-radio-profile	This command configures AP radio settings for the 5 GHz frequency band, including the Adaptive Radio Management (ARM) profile for standalone Switches and the high-throughput (802.11n) radio profile.

Command History

Release	Modification
AOS-W 8.1.0.0	The **deploy-hour**, **eirp-offset, Energy Detect Threshold Offset,** and **Min Channel Bandwidth** parameters are introduced.
AOS-W 8.0.0.0	Command introduced.

All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show rf dot11g-radio-profile

```
show rf dot11g-radio-profile [<profile>]
```

Description

Show an 802.11g Radio profile.

Syntax

Parameter	Description
<profile>	Name of a 802.11g profile.

Usage Guidelines

Issue this command without the **<profile>**parameter to display the entire 802.11g profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the Switch has four configured 802.11g profiles. The **References** column lists the number of other profiles with references to the 802.11g profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column

```
(host)[mynode] # show rf arm-profile
Adaptive Radio Management (ARM) profile List
-----------------------------------------
Name                    References  Profile Status
----                    ----------  --------------
airwave                 4
default                 4
no-scanning             1
nokia-rf-profile        1

Total:4.
```

This example displays the configuration settings for the profile **default**.

```
(host)[mynode]# show rf dot11g-radio-profile default
802.11g radio profile "default"
-------------------------------
Parameter                                   Value       Set

deploy-hour                                     N/A
```

The output of this command includes the following parameters:

Parameter	Description
Radio enable	Shows if the AP has enabled or disabled transmissions on this radio band.
Mode	Access Point operating mode. Available options are: ■ am-mode: Air Monitor mode ■ ap-mode: Access Point mode ■ apm-mode: Access Point Monitor mode ■ sensor-mode: RFprotect sensor mode
High throughput enable (radio)	Shows if high-throughput (802.11n) is enabled on the radio. A high-throughput profile manages 40 Mhz tolerance settings, and controls whether or not APs using this profile will advertise intolerance of 40 MHz operation. (This option is disabled by default, allowing 40 MHz operation.) A high-throughput profile also determines whether an AP radio using the profile will stop using the 40 MHz channels surrounding APs or stations advertise 40 Mhz intolerance. This option is enabled by default.
Very High Throughput Rates Enable	Enable or disable support for Very High Throughput (802.11ac) on the radio. This option is enabled by default.
Channel	Channel number for the AP 802.11a, 802.11n, or 802.11ac physical layer.
Transmit EIRP	Maximum transmit power (EIRP) in dBm from 0 to 51 in .5 dBm increments. Further limited by regulatory domain constraints and AP capabilities.

Parameter	Description
Non-Wi-Fi Interference Immunity	Sets a value for 802.11 Interference Immunity. The default setting for this parameter is level 2. When performance drops due to interference from non-802.11 interferers (such as DECT or Bluetooth devices), the level can be increased up to level 5 for improved performance. However, increasing the level makes the AP slightly "deaf" to its surroundings, causing the AP to lose a small amount of range. The levels for this parameter are: ■ Level-0: no ANI adaptation. ■ Level-1: noise immunity only. ■ Level-2: noise and spur immunity. This is the default setting ■ Level-3: level 2 and weak OFDM immunity. ■ Level-4: level 3 and FIR immunity.
Enable CSA	Shows if CSAs are enabled or disabled. CSAs, as defined by IEEE 802.11h, enable an AP to announce that it is switching to a new channel before it begins transmitting on that channel. This allows clients that support CSA to transition to the new channel with minimal downtime.
CSA Count	Number of channel switch announcements that must be sent prior to switching to a new channel. The default CSA count is 4 announcements.
Spectrum Monitoring	If enabled, the AP operates as a hybrid AP that can simultaneously serve clients and monitor a single channel for spectrum analysis data.
Spectrum Monitoring Profile	The spectrum monitoring profile referenced by APs using this 802.11a radio profile. For details, see rf spectrum-profile on page 936
Advertise 802.11d and 802.11h Capabilities	If enabled, the radio advertises its 802.11d (Country Information) and 802.11h (Transmit Power Control) capabilities.
Spectrum load balancing	The Spectrum load balancing feature helps optimize network resources by balancing clients across channels, regardless of whether the AP or the Switch is responding to the wireless clients' probe requests. If enabled, the Switch compares whether or not an AP has more clients than its neighboring APs on other channels. If an AP's client load is at or over a predetermined threshold as compared to its immediate neighbors, or if a neighboring Alcatel-Lucent AP on another channel does not have any clients, load balancing will be enabled on that AP. This feature is disabled by default.
Spectrum load balancing mode	SLB Mode allows control over how to balance clients. Channel-based load-balancing balances clients across channels. Radio-based load-balancing distributes clients across radios on the same band, independent of channels.
Spectrum load balancing mode update interval	This parameter specifies how often spectrum load balancing calculations are made (in seconds). The default value is 30 seconds.

Parameter	Description
Spectrum load balancing threshold	If the spectrum load balancing feature is enabled, this parameter controls the percentage difference between number of clients on a channel channel that triggers load balancing. The default value is 20%, meaning that spectrum load balancing is activated when there are 20% more clients on one channel than on another channel used by the AP radio.
Spectrum load balancing domain	Define a spectrum load balancing domain to manually create RF neighborhoods. Use this option to create RF neighborhood information for networks that have disabled ARM scanning and channel assignment. ■ If spectrum load balancing is enabled in a 802.11a radio profile but the spectrum load balancing domain is *not* defined, AOS-W uses ARM to calculate RF neighborhoods. ■ If spectrum load balancing is enabled in a 802.11a radio profile and a spectrum load balancing domain *isalso* defined, AP radios belonging to the same spectrum load balancing domain will be considered part of the same RF neighborhood for load balancing, and will not recognize RF neighborhoods defined by ARM.
Beacon Period	Time, in milliseconds, between successive beacon transmissions. The beacon advertises the AP's presence, identity, and radio characteristics to wireless clients.
Beacon Regulate	If enabled, this option introduces randomness in the beacon generation so that multiple APs on the same channel do not send beacons at the same time, which causes collisions over the air. This option is disabled by default.
Advertised Regulatory Max EIRP	Shows if the radio is configured to work around a known issue on Cisco 7921G telephones by capping for a radio's maximum EIRP. When you enable this parameter, even if the regulatory approved maximum for a given channel is higher than this EIRP cap, the AP radio using this profile will advertise only this capped maximum EIRP in its radio beacons. The supported value is1–31 dBm.
ARM/WIDS Override	If enabled, this option disables ARM and Wireless IDS functions and slightly increases packet processing performance. If a radio is configured to operate in Air Monitor mode, then the ARM/WIDS override functions are always enabled, regardless of whether or not this check box is selected.
Reduce Cell Size (Rx Sensitivity)	The cell size reduction feature allows you manage dense deployments and to increase overall system performance and capacity by shrinking an AP's receive coverage area, thereby minimizing co-channel interference and optimizing channel reuse. The possible range of values for this feature is 0-55 dB. The default 0 dB reduction allows the radio to retain its current default Rx sensitivity value.
Energy Detect Threshold Offset	This parameter can modify the energy detect threshold used by the radio in making transmit decisions. The energy detect threshold is a negative value, and the value specified for this parameter (1-12) is the offset from the base value of -59 dBm. For example a value of 1 = -60 dBm, and a value of 10: = -69 dBm. A value of 0 indicates the AP is using the default energy detect threshold for this radio. (This value may vary by AP model).

Parameter	Description
Management Frame Throttle Interval	Averaging interval for rate limiting mgmt frames from this radio, in seconds. A management frame throttle interval of 0 seconds disables rate limiting.
Management Frame Throttle Limit	Maximum number of management frames that can come in from this radio in each throttle interval.
Maximum Distance	Maximum distance between a client and an AP or between a mesh point and a mesh portal, in meters. This value is used to derive ACK and CTS timeout times. A value of 0 specifies default settings for this parameter, where timeouts are only modified for outdoor mesh radios which use a distance of 16km..
RX Sensitivity Threshold	If the Rx Sensitivity Tuning Based Channel reuse feature is set to static mode, this parameter manually sets the AP's Rx sensitivity threshold (-dBm). The AP will filter out and ignore weak signals that are below the channel threshold signal strength. For example, if the RX sensitivity threshold was set to -65 dBm, the AP would ignore signals with a strength from -1 dBM to -64 dBm. If the value is set to zero, the feature will automatically determine an appropriate threshold.
RX Sensitivity Tuning Based Channel Reuse	Shows if the channel reuse feature's current operating mode, static, dynamic or disable. ■ **Static**: This mode of operation is a coverage-based adaptation of the CCA thresholds. In the static mode of operation, the CCA is adjusted according to the configured transmission power level on the AP, so as the AP transmit power decreases as the CCA threshold increases, and vice versa. ■ **Dynamic**: In this mode, the CCA thresholds are based on channel loads, and take into account the location of the associated clients. When you set the Channel Reuse This feature is automatically enabled when the wireless medium around the AP is busy greater than half the time. When this mode is enabled, the CCA threshold adjusts to accommodate transmissions between the AP its most distant associated client. ■ **Disable**: This mode does not support the tuning of the CCA Detect Threshold.
Protection for 802.11b Clients	Shows if the profile has enabled or disabled protection for 802.11b clients.
Adaptive Radio Management (ARM) Profile	Name of an Adaptive Radio Management profile associated with this 802.11a profile.
High-throughput Radio Profile	Name of a High Throughput Radio profile associated with this 802.11a profile.
AM Scanning Profile	The AM scanning profile referenced by APs using this 802.11a radio profile. For details, seerf am-scan-profile on page 881
Max Channel Bandwidth	Sets the maximum channel bandwidth for APs associated to Mobility Mastermanaged devices.
Min Channel Bandwidth	Sets the minimum channel bandwidth for APs associated to Mobility Mastermanaged devices.

Parameter	Description
Max EIRP	Maximum EIRP from 3 to 33 dBm. You may also specify a special value of 127 dBm for regulatory maximum to disable power adjustments for environments such as outdoor mesh links.
Min EIRP	The minimum transmission power level (in dBm) to be assigned to the AP radio(s).
EIRP Offset	This parameter is used to manually adjust EIRP levels selected by the AirMatch algorithm by specifying a value from -6 to 6 dBm.
deploy-hour	The hour during which AirMatch updates are sent to APs (in 24-hour format). If the managed device to which the AP is associated is in a different time zone than Mobility Master, the AirMatch solution will be deployed according to the time zone of the managed device. **NOTE:** If this parameter is set in both the AirMatch profile and the 802.11a radio profile, the setting in the 802.11a radio profile will take precedence.

show rf dot11-60GHz-radio-profile

```
show rf dot11-60GHz-radio-profile [<profile>]
```

Description

This command displays an 802.11 60 GHz radio profile.

Syntax

Parameter	Description
`<profile>`	Name of a 802.11 60 GHz profile.

Usage Guidelines

Execute this command to display the 802.11 profile list including a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the Switch has configured 802.11 for the profile "default".

```
(host)[mynode] # show rf dot11-60GHz-radio-profile default
802.11 60GHz radio profile "default"
-----------------------------------
Parameter  Value
---------  -----
Channel    2
```

show rf event-thresholds-profile

```
show rf event-thresholds-profile [<profile>]
```

Description

Show an Event Thresholds profile.

Syntax

Parameter	Description
`<profile>`	name of an Event Thresholds profile

Usage Guidelines

Issue this command without the **<profile>** parameter to display the entire Event Thresholds profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the Switch has two configured Event Thresholds profiles. The **References** column lists the number of other profiles with references to the Event Thresholds profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column

```
(host)[mynode]# show rf event-thresholds-profile

RF Event Thresholds Profile List
--------------------------------
Name     References  Profile Status
----     ----------  --------------
default  6
event1           2

Total: 2.
```

This example displays the configuration settings for the profile **default**.

```
(host)[mynode]# show rf event-thresholds-profile default
RF Event Thresholds Profile "default"
-------------------------------------
Parameter                                Value
---------                                -----
Detect Frame Rate Anomalies              Disabled
Bandwidth Rate High Watermark            0 %
Bandwidth Rate Low Watermark             0 %
Frame Error Rate High Watermark          0 %
Frame Error Rate Low Watermark           0 %
Frame Fragmentation Rate High Watermark  16 %
Frame Fragmentation Rate Low Watermark   8 %
Frame Low Speed Rate High Watermark      16 %
Frame Low Speed Rate Low Watermark       8 %
Frame Non Unicast Rate High Watermark    0 %
Frame Non Unicast Rate Low Watermark     0 %
Frame Receive Error Rate High Watermark  16 %
Frame Receive Error Rate Low Watermark   8 %
Frame Retry Rate High Watermark          16 %
```

```
Frame Retry Rate Low Watermark          8 %
```

The output of this command includes the following parameters:

Parameter	Description
Detect Frame Rate Anomalies	Shows of the profile enables or disables detection of frame rate anomalies.
Bandwidth Rate High Watermark	If bandwidth in an AP exceeds this value, it triggers a **bandwidth exceeded condition**. The value represents the percentage of maximum for a given radio. (For 802.11b, the maximum bandwidth is 7 Mbps. For 802.11 a and g, the maximum is 30 Mbps.) The recommended value is 85%.
Bandwidth Rate Low Watermark	If an AP triggers a **bandwidth exceeded** condition, the condition persists until bandwidth drops below this value.
Frame Error Rate High Watermark	If the frame error rate (as a percentage of total frames in an AP) exceeds this value, it triggers a **frame error rate exceeded** condition.
Frame Error Rate Low Watermark	If an AP triggers a **frame error rate exceeded** condition, the condition persists until the frame error rate drops below this value.
Frame Fragmentation Rate High Watermark	If the frame fragmentation rate (as a percentage of total frames in an AP) exceeds this value, it triggers a **frame fragmentation rate exceeded** condition.
Frame Fragmentation Rate Low Watermark	If an AP triggers a **frame fragmentation rate exceeded** condition, the condition persists until the frame fragmentation rate drops below this value.
Frame Low Speed Rate High Watermark	If the rate of low-speed frames (as a percentage of total frames in an AP) exceeds this value, it triggers a **low-speed rate exceeded** condition.
Frame Low Speed Rate Low Watermark	After a **low-speed rate exceeded condition** exists, the condition persists until the percentage of low-speed frames drops below this value.
Frame Non Unicast Rate High Watermark	If the non-unicast rate (as a percentage of total frames in an AP) exceeds this value, it triggers a **non-unicast rate exceeded** condition. This value depends upon the applications used on the network.
Frame Non Unicast Rate Low Watermark	If an AP triggers a **non-unicast rate exceeded** condition, the condition persists until the non-unicast rate drops below this value.
Frame Receive Error Rate High Watermark	If the frame receive error rate (as a percentage of total frames in an AP) exceeds this value, it triggers a **frame receive error rate exceeded** condition.
Frame Receive Error Rate Low Watermark	If an AP triggers a **frame receive error rate exceeded** condition, the condition persists until the frame receive error rate drops below this value.
Frame Retry Rate High Watermark	If the frame retry rate (as a percentage of total frames in an AP) exceeds this value, it triggers a **frame retry rate exceeded** condition.
Frame Retry Rate Low Watermark	If an AP triggers a **frame retry rate exceeded** condition exists, the condition persists until the frame retry rate drops below this value.

show rf ht-radio-profile

```
show rf ht-radio-profile [<profile>]
```

Description

Show a High-throughput Radio profile.

Syntax

Parameter	Description
`<profile>`	Name of a High-throughput Radio profile.

Usage Guidelines

Issue this command without the **<profile>**parameter to display the entire High-throughput Radio profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the Switch has five configured High-throughput Radio profiles. The **References** column lists the number of other profiles with references to the High-throughput Radio profile, and the **Profile Status** column indicates whether the profile is predefined and editable, and if that predefined profile has been changed from its default settings. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host)[mynode]# show rf ht-radio-profile
High-throughput radio profile List
----------------------------------
Name            References  Profile Status
----            ----------  --------------
default         0
default-a       8           Predefined (editable)
default-g       3           Predefined (changed)
legacystation   1
test            1

Total:5
```

This example displays the configuration settings for the predefined profile **default-a**.

```
(host) *[mynode] #show rf ht-radio-profile default-a
High-throughput radio profile "default-a" (Predefined (changed))
-----------------------------------------------------------------
Parameter                                       Value
---------                                       -----
40 MHz intolerance                              Disabled
Honor 40 MHz intolerance                        Enabled
CSD override                                    Disabled
VHT Bandwidth Signaling                         Disabled
VHT - Transmit Beamforming Sounding Interval    0 msec
BSS Color                           5
BSS Color Switch Count                  10
```

The output of this command includes the following parameters:

Parameter	Description
40 MHz intolerance	Shows whether or not APs using this radio profile will advertise intolerance of 40 MHz operation. By default, 40 MHz operation is allowed.
Honor 40 MHz intolerance	If this parameter is enabled, the radio will stop using the 40 MHz channels if the 40 MHz intolerance indication is received from another AP or station.
Diversity Spreading Workaround	When this feature is enabled, all legacy transmissions will be sent using a single antenna. This enables interoperability for legacy or high-throughput stations that cannot decode 802.11n cyclic shift diversity data. This feature is disabled by default and should be kept disabled unless necessary.
BSS Color	Displays the bss color code.
BSS Color Switch Count	Displays the number of times the BSS color switch announcements are sent before switching to a new color.

show rf optimization-profile

```
show rf optimization-profile [<profile>]
```

Description

Show an Optimization profile.

Syntax

Parameter	Description
<profile>	name of an ARM profile

Usage Guidelines

Issue this command without the **<profile>**parameter to display the entire Optimization profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the Switch has two configured Optimization profiles. The **References** column lists the number of other profiles with references to the Optimization profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host)[mynode]# show rf optimization-profile
RF Optimization Profile List
----------------------------
Name     References  Profile Status
----     ----------  --------------
default  6
profile2 1

Total:2
```

This example displays the configuration settings for the profile **profile2**.

```
(host)[mynode]#show rf optimization-profile profile2
RF Optimization Profile "profile2"
----------------------------------
Parameter                           Value
---------                           -----
Station Handoff Assist              Disabled
Detect Association Failure          Disabled
Coverage Hole Detection             Disabled
Hole Good RSSI Threshold            20
Hole Good Station Ageout            30 sec
Hole Detection Interval             180 sec
Hole Idle Station Ageout            90 sec
Hole Poor RSSI Threshold            10
Detect interference                 Disabled
Interference Threshold              90 %
Interference Threshold Exceed Time  25 sec
Interference Baseline Time          25 sec
RSSI Falloff Wait Time              4
Low RSSI Threshold                  10
RSSI Check Frequency                3 sec
```

The output of this command includes the following parameters:

Parameter	Description
Station Handoff Assist	If enabled, this parameter allows the Switch to force a client off an AP when the RSSI drops below a defined minimum threshold.
Detect Association Failure	Shows if the profile enables or disables STA association failure detection.
Coverage Hole Detection	Shows if the profile enables or disables coverage hole detection.
Hole Good RSSI Threshold	Time, in seconds, after a coverage hole is detected until a coverage hole event notification is generated. This parameter requires the RF Protect license.
Hole Good Station Ageout	Stations with signal strength above this value are considered to have good coverage. This parameter requires the RF Protect license.
Hole Detection Interval	Time, in seconds, after which a station with good coverage is aged out. This parameter requires the RF Protect license.
Hole Idle Station Ageout	Time, in seconds, after which a station in a poor coverage area is aged out. This parameter requires the RF Protect license.
Hole Poor RSSI Threshold	Stations with signal strength below this value will trigger detection of a coverage hole. This parameter requires the RF Protect license.
Detect interference	Enables or disables interference detection.
Interference Threshold	Percentage increase in the frame retry rate or frame receive error rate before interference monitoring begins on a given channel.
Interference Threshold Exceed Time	Time, in seconds, the FRR or FRER exceeds the threshold before interference is reported.
Interference Baseline Time	Time, in seconds, the air monitor should learn the state of the link between the AP and client to create frame retry rate and frame receive error rate baselines.
RSSI Falloff Wait Time	Number of times the detected client RSSI level must fall below the minimum RSSI threshold the before the AP sends a deauthorization message to the client. The maximum value is 8 times.
Low RSSI Threshold	Minimum RSSI above which deauthorization messages should never be sent.
RSSI Check Frequency	Interval, in seconds, to sample RSSI.

show rf spectrum-profile

```
rf spectrum-profile <profile-name>
```

Description

Show a spectrum profile used by the spectrum analysis feature.

Syntax

Parameter	Description
`<profile>`	Name of a spectrum profile.

Usage Guidelines

Issue this command without the **<profile>**parameter to display the entire spectrum profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the Switch has three configured spectrum profiles. The **References** column lists the number of other profiles with references to the spectrum profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host)[mynode]#show rf spectrum-profile

Spectrum profile List
---------------------
Name        References  Profile Status
----        ----------  --------------
spectrum1   1
default-a   2           Predefined (editable)
default-g   2           Predefined (editable)
```

This example displays the configuration settings for the profile spectrum1.

```
(host)[mynode]#show rf spectrum-profile default

Spectrum profile "default"
--------------------------
Parameter                                  Value
---------                                  -----
Age Out: WIFI                              600 sec
Age Out: Generic Interferer                30 sec
Age Out: Microwave                         15 sec
Age Out: Microwave (Inverter type)         15 sec
Age Out: Video Device                      60 sec
Age Out: Audio Device                      10 sec
Age Out: Cordless Phone Fixed Frequency    10 sec
Age Out: Generic Fixed Frequency           10 sec
Age Out: Bluetooth                         25 sec
Age Out: Xbox                              25 sec
Age Out: Cordless Network Frequency Hopper 60 sec
Age Out: Cordless Base Frequency Hopper    240 sec
Age Out: Generic Frequency Hopper          25 sec
```

The output of this command includes the following information:

Parameter	Description
`Age Out: WIFI`	The number of seconds for which a wifi device must stop sending a signal before the spectrum monitor considers that device no longer active on the network. The default value is 600 seconds.
`Age Out: Generic Interferer`	The number of seconds for which an unknown device must stop sending a signal before the spectrum monitor considers that device no longer active on the network. The default value is 30 seconds.
`Age Out: Microwave`	The number of seconds for which a microwave device must stop sending a signal before the spectrum monitor considers that device no longer active on the network. The default value is 15 seconds. Note that this parameter is applicable to 2.4GHz spectrum monitor radios only.
`Age Out: Microwave (inverter type)`	The number of seconds for which an inverter microwave must stop sending a signal before the spectrum monitor considers that device no longer active on the network. The default value is 15 seconds. Note that this parameter is applicable to 2.4GHz spectrum monitor radios only.
`Age Out: Video Device`	The number of seconds for which a video device must stop sending a signal before the spectrum monitor considers that device no longer active on the network. The default value is 60 seconds.
`Age Out: Audio Device`	The number of seconds for which an audio device must stop sending a signal before the spectrum monitor considers that device no longer active on the network. The default value is 10 seconds.
`Age Out: Cordless Phone Fixed Frequency`	The number of seconds for which a fixed frequency cordless phone must stop sending a signal before the spectrum monitor considers that device no longer active on the network. The default value is 10 seconds.
`Age Out: Generic Fixed Frequency`	The number of seconds for which a generic fixed frequency device must stop sending a signal before the spectrum monitor considers that device no longer active on the network. The default value is 10 seconds.
`Age Out: Xbox`	The number of seconds for which an Xbox device must stop sending a signal before the spectrum monitor considers that device no longer active on the network. The default value is 25 seconds. Note that this parameter is applicable to 2.4GHz spectrum monitor radios only.

Parameter	Description
`Age Out: Bluetooth`	The number of seconds for which a bluetooth device must stop sending a signal before the spectrum monitor considers that device no longer active on the network. The default value is 25 seconds. Note that this parameter is applicable to 2.4GHz spectrum monitor radios only.
`Age Out: Cordless Network Frequency Hopper`	The number of seconds for which a frequency-hopping cordless network device must stop sending a signal before the spectrum monitor considers that device no longer active on the network. The default value is 60 seconds.
`Age Out: Cordless Base Frequency Hopper`	The number of seconds for which a frequency-hopping cordless phone base must stop sending a signal before the spectrum monitor considers that device no longer active on the network. The default value is 240 seconds.
`Age Out: Generic Frequency Hopper`	The number of seconds for which a generic frequency-hopping device must stop sending a signal before the spectrum monitor considers that device no longer active on the network. The default value is 25 seconds.

show rft profile

```
show rft profile {all|ht-link-quality|link-quality|raw}
```

Description

Show parameters for the predefined RF test profiles.

Syntax

Parameter	Description
`all`	Show all predefined profiles.
`ht-link-quality`	Show configured parameters for the predefined **HT Link Quality** test profile.
`link-quality`	Show configured parameters for the predefined **Link Quality** test profile.
`raw`	Show configured parameters for the predefined **RAW** test profile.

Usage guidelines

The rft command is used for RF troubleshooting, and should only be used under the supervision of Alcatel-Lucent technical support. Issue the **show rft profile** command to view the profiles used for these RF tests.

Example

The following example shows the testing parameters for the predefined link-quality RF test profile.

```
(host) #show rft profile link-quality

Profile LinkQuality: Built-in profile
-------------------------------------
Parameter    Value
---------    -----
Antenna      1 and/or 2
Frame Type   Null Data
Num Packets  100 for each data-rate
Packet Size  1500
Num Retries  0
Data Rate    All rates are tried
```

Related Commands

Command	Description
show rft result	Shows the results of an RF test.

show rft result

```
show rft result all|{trans-id <trans-id>}
```

Description

Show the results of an RF test.

Syntax

Parameter	Description
`all`	Show the most recent test result for each test type (antenna-connectivity, link-quality or raw).
`trans-id <trans-id>`	Each RF test is assigned a transaction ID. Include the **trans-id <trans-id>** parameters to show the test result for a specific transaction ID.

Usage guidelines

The rft command is used for RF troubleshooting, and should only be used under the supervision of Alcatel-Lucent technical support.

show rft transactions

```
show rft transactions
```

Description

Show transaction IDs of RF tests.

Syntax

No parameters.

Usage guidelines

The rft command is used for RF troubleshooting, and should only be used under the supervision of Alcatel-Lucent technical support. Issue the **show rft transaction** command to view the transaction IDs for the most recent test of each test type.

Example

The following example shows the transaction IDs for the latest RAW, link-quality and antenna-connectivity tests.

```
(host) [mynode] #show rft transactions

RF troubleshooting transactions
-------------------------------
Profile              Transaction ID
-------              --------------
RAW                  2001
LinkQuality          2101
AntennaConnectivity  1801
```

show rights

```
show rights [<name-of-a-role>]
```

Description

Displays the list of user roles in the roles table with high level details of role policies. To view role policies of a specific role specify the role name.

Syntax

Parameter	Description
`name-of-a-role`	Enter the role name to view its policy details.

Example

The output of this command shows the list of roles in the role table.

```
(host) [mynode]# show rights

RoleTable
---------
Name              ACL  Bandwidth                 ACL List                                Type
----              ---  ---------                 --------                                ----
ap-role           4    Up: No Limit,Dn: No Limit  control/,ap-acl/                       System
authenticated     39   Up: No Limit,Dn: No Limit  allowall/,v6-allowall/                 User
default-vpn-role  37   Up: No Limit,Dn: No Limit  allowall/,v6-allowall/                 User
guest             3    Up: No Limit,Dn: No Limit  http-acl/,https-acl/,dhcp-acl/         User
guest-logon       6    Up: No Limit,Dn: No Limit  logon-control/,captiveportal/          User
logon             1    Up: No Limit,Dn: No Limit  logon-control/,captiveportal/          User
stateful-dot1x    5    Up: No Limit,Dn: No Limit                                         System
voice             38   Up: No Limit,Dn: No Limit  sip-acl/,noe-acl/,svp-acl/,vocera-acl/  User
```

The following output displays the ACE entries of role based ACL in IPv6 Split-Tunnel forwarding mode in Remote APs:

```
(host) [mynode] #show rights split
split
-----
Priority  Source    Destination Service    Application Action       TimeRange Log

show route-access-list

```
show route-access-list
```

Description

This command displays information about ACLs for PBR.

Syntax

No parameters.

Usage Guidelines

Policy-based routing is an optional feature that allows packets to be routed based on ACLs configured by the administrator. By default, when a managed device receives a packet for routing, it looks up the destination IP in the routing table and forwards the packet to the next hop router. If policy-based routing is configured, the next hop device can be chosen based on a defined access control list.

In a typical deployment scenario with multiple uplinks, the default route only uses one of the uplink next-hops for forwarding packets. If a next hop becomes unreachable, the packets will not reach their destination. If your deployment uses policy-based routing based on a next hop list, any of the uplink next hops could be used for forwarding traffic. This requires a valid ARP entry (Route-cache) in the system for all the policy-based routing next hops.

Example

The following command displays a list of configured routing access lists.

```
(host) [mynode] #show route-access-list

Router Access list table
------------------------
Name       Use Count  Roles
----       ---------  -----
attempt1   0
pbr        0
name       1          test
Tuesday    0
```

The output of this command includes the following parameters:

Parameter	Description
`Name`	Name of the access list.
`Use Count`	Number of VLANs associated with this routing access list.
`Roles`	User role associated with the routing access list.

Related Commands

   bssid <bssid-of-an-ap> | ip-addr <ip-address-of-an-ap> | ip6-addr <ip-addr> | essid
   <essid>]
```

Description

Displays the channel information gathered by the AP. You can either specify an ap-name, bssid or ip-address of an AP to see more details.

Syntax

Parameter	Description
`ap-name`	Enter the name of the AP.
`bssid`	Enter the BSSID address of the AP.
`ip-addr`	Enter the IP address of the AP.
`ip6-addr`	Enter the IPv6 address of the AP
`essid`	Entries in the IPv4 user-table that are associated to the specified ESSID. If the ESSID includes spaces, you must enclose it in quotation marks.

Example

The output of this command shows the channel information for r-wing-94:94.

```
(host) [mynode]# show rrm dot11k ap-channel-report ap-name r-wing-94

show rrm dot11k neighbor-report

```
show rrm dot11k neighbor-report [ap-name |
   bssid <bssid-of-an-ap> | ip-addr <ip-address-of-an-ap>]
```

Description

Displays the neighbor information for a particular AP. If the AP name or the AP's IP address is specified, the user should specify the ESSID to get the neighbor information. If the ESSID is not specified, the command will display the neighbor information for all the Virtual AP's configured on the AP.

Syntax

Parameter	Description
ap-name	Identify the AP for which you want to view information.
<name-of-an-ap>	Name of an AP.
<essid>	ESSID of the AP. If the ESSID includes spaces, you must enclose it in quotation marks.
bssid	Enter the BSSID address of the AP.
ip-addr	Enter the IP address of the AP.

Example

The output of this command shows the neighbor information for r-wing-94.

```
(host) [mynode]# show rrm dot11k neighbor-report ap-name r-wing-94

Related Commands

Related Command	Description
wlan rrm-ie-profile	This command configures a radio resource management (RRM) IE profile to define the information elements advertised by an AP with 802.11k support enabled.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Available in Enable and Config modes on Mobility Master and managed devices.

show rrm dot11k transmit-stream-report station-mac

```
show rrm dot11k transmit-stream-report station-mac <mac-addr>
```

Description

This is a diagnostic option for quick verification of received transmit stream measurement reports. Displays the contents of the transmit stream measurement reports received from a client.

Syntax

Parameter	Description
`mac-addr`	MAC address of the client.

Related Commands

Related Command	Description
wlan rrm-ie-profile	This command configures a radio resource management (RRM) IE profile to define the information elements advertised by an AP with 802.11k support enabled.

show rrm handover-trigger

```
show rrm handover-trigger station-mac <station-mac>
```

Description

This command shows handover trigger information of a station.

Syntax

Parameter	Description
`<station-mac>`	Mac address of the station.

Command History

Version	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable and Config mode on Mobility Master.

show running-config

```
show running-config
```

Description

Displays the current Mobility Master configuration, including all pending changes that are yet to be saved.

Syntax

No parameters.

Usage Guidelines

Use this command to see the complete running and pending configuration on the Mobility Master.

Example

The output of this command shows the running configuration on the Switch.

```
(host) [mynode] #show running-config
Building Configuration...

version 8.0
hostname "host"
clock timezone PST -8
!
location "Building1.floor1"
controller config 59
crypto-local pki ServerCert default-self-signed default-self-signed
crypto-local pki PublicCert master-ssh-pub-cert master-ssh-pub-cert
ip NAT pool dynamic-srcnat 0.0.0.0 0.0.0.0
ip access-list eth name2
!
ip access-list mac name
!
ip access-list eth etherypte
deny 0x0
!
ip access-list eth validuserethacl
permit any
...
...
...
snmp-server enable trap
snmp-server trap source 0.0.0.0

process monitor log
nbapi_publish
end
```

The output of this command shows the running configuration of the management server profiles.

```
(host) [mynode] #show running-config | include mgmt
Building Configuration...
interface mgmt
mgmt-server  primary-server 40.40.40.1 profile default-amp transport udp  secure
mgmt-server  primary-server 2001::2 profile default-amp transport udp  secure
mgmt-server  primary-server 10.1.1.11 profile default-amp transport udp
mgmt-server  primary-server 20.16.11.1 profile default-ale transport udp
```

Command History

Version	Modification
AOS-W 8.1.0.0	Listed primary servers with IPv6 address.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable or Config mode on Mobility Master.

show sapm-bucketmap

```
show sapm-bucketmap [essid <essid>]
```

Description

Displays the bucketmap information of the AP.

Syntax

Parameter	Description
essid	Enter the ESSID of the AP.

Example

The output of this command shows bucketmap information of the AP on the Mobility Master.

```
(host)[mynode](config) #show sapm-bucketmap essid Zone1TestEssid
SAPM Bucketmap

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Available in Enable and Config modes on managed devices.

show sapm cluster nodestate

```
show sapm cluster nodestate [verbose]
```

Description

Displays the state of the cluster nodes.

Syntax

No parameters.

Example

The output of this command shows slot details on the managed device.

```
(host)(cluster) (config)# show sapm cluster nodestate

Cluster Nodelist (Gen Num 124)
------------------------------
Index  Node IP address Public IP address
-----  --------------- ---------------
1      10.17.65.35     192.168.10.249
2      10.17.65.34     192.168.10.248
```

Related Commands

Related Command	Description
cluster-debug	This command sets are used to change the bucketmap entries and to reassign the standby AAC.

Command History

Release	Modification
AOS-W 8.4.0.0	The **Public IP address** output column was added.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on managed devices.

show scheduler-profile

```
show scheduler-profile <map-name>
```

Description

Displays details of the scheduler profile that associates priorities to four uplink queues.

Syntax

Command	Description
`map-name`	Displays the scheduler map name.

Examples

The following example displays the priority map of the default scheduler profile.

```
(host) [mynode] #show scheduler-profile default
scheduler profile "default"
---------------------------
Queue     Weight   Priority-map
-----     ------   ------------
Queue 0   0        6 7
Queue 1   0        4 5
Queue 2   0        2 3
Queue 3   0        0 1
```

Related Commands

Related Command	Description
scheduler-profile	This command defines a schedule profile that associates priorities to four uplink queues.

AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Available in Config or Enable mode on Mobility Master.

show scp

```
show scp
```

Description

Execute this command to view the status of the SCP server functionality of the Switch or managed device.

Syntax

No parameters

Example

To view if the SCP server functionality on the Switch or managed device is enabled or not, execute the following command:

```
(host) [mynode] #show scp
```

Related Commands

Command	Description
service	Use this command to enable the SCP server functionality on the Switch or managed device.

Command History

Release	Modification
AOS-W 8.2.0.0	Command introduced.

Command Information

All platforms	Base operating system.	Configuration mode on Switch or managed device.

show sdwan-profile

```
show sdwan-profile
```

Description

This command shows if the SD-WAN profile is enabled or disabled.

Syntax

No parameters.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

```
(host)[mynode] #show sdwan-profile
sdwan-profile
-------------
Parameter  Value
---------  -----
State      Disabled
```

Related Commands

Command	Description
sdwan-profile	This command enables or disables an SD-WAN profile.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show serial console redirect

```
show serial console redirect
```

Description

Displays the status of Serial Console Redirect.

Examples

The following example displays the status of the serial console redirect.

```
(host) [mynode] #show serial console redirect
Serial Console Redirect : Enabled
```

Related Commands

Related Command	Description
serial console redirect	This command configures redirect to serial console.

Command History

Version	Description

show session-acl-list

```
show session-acl-list
```

Description

Displays the list of configured session ACLs in the Switch.

Syntax

No parameters.

Example

The output of this command shows the session ACLs in the Switch.

```
(host)[mynode] # show session-access-list
v6-icmp-acl
allow-diskservices
control
validuser
v6-https-acl
vocera-acl
icmp-acl
v6-dhcp-acl
captiveportal
v6-dns-acl
allowall
test
sip-acl
https-acl
...

show slots

```
show slots
```

Description

Displays the list of slots in the managed device, including the status and card type.

Syntax

No parameters.

Example

The output of this command shows slot details on the managed device.

```
(host)[mynode] # show slots

Slots
------
Slot  Status   Card Type
----  ------   ---------
1     Present  A2400
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

show snmp community

```
show snmp community
```

Description

Displays the SNMP community string details.

Syntax

No parameters.

Example

The output of this command shows slot details on the Switch.

```
(host) # show snmp community

SNMP COMMUNITIES
----------------
COMMUNITY  ACCESS     VERSION
---------  ------     -------
 public    READ_ONLY  V1, V2c
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

show snmp engine-id

```
show snmp engine-id
```

Description

This command displays the SNMP engine ID.

Syntax

No parameters.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

```
(host)[mynode] #show snmp engine-id
SNMP engine ID: 000039e7000000a10a11a029 (Factory Default)
```

All platforms	Base operating system.	Available in Enable and Config modes on Mobility Master and managed devices.

show snmp user-table

```
show snmp user-table [user <username> auth-prot [sha | md5] <value> priv-prot [aes | des]
<value>]
```

Description

Displays the list of SNMP user profile for a specified username.

Syntax

Parameter	Description
`auth-prot`	Authentication protocol for the user, either HMAC-MD5-98 Digest Authentication Protocol (MD5) or HMAC-SHA-98 Digest Authentication Protocol (SHA), and the password for use with the designated protocol.
`priv-prot`	Privacy protocol for the user, either AES or CBC-DES, and the password for use with the designated protocol.

Example

The output of this command shows the list of SNMP traps sent to host.

```
(host) # show snmp user-table

SNMP USER TABLE
---------------
USER     AUTHPROTOCOL   PRIVACYPROTOCOL   FLAGS
----     ------------   ---------------   -----
 Sam     SHA            AES
 fire    SHA            AES
```

Command History

show spanning-tree

```
show spanning-tree
   <interface [gigabitethernet <slot/module/port> | port-channel id]
   <vlan vlan-id>
```

Description

View the RSTP and PVST+ configuration.

Syntax

Parameter	Description
interface	Enter the keyword **interface** followed by the interface and slot/module/port or port-channel id: ■ For Gigabit Ethernet enter the keyword **gigabitethernet** followed by the <slot/module/port> ■ For Port Channel enter the keyword **port-channel** followed by an id number Range: 0 to 7
vlan	Enter the keyword **vlan** follow by the VLAN ID. Range: 1 to 4094 Default: 1

Example—show spanning-tree

```
(host) # show spanning-tree

Spanning tree instance for vlan 10
Spanning Tree is executing the IEEE compatible Rapid Spanning Tree protocol
Bridge Identifier has priority 32768, address 00:0b:86:f0:20:00
Configured hello time 2, max age 20, forward delay 15
We are the root of the spanning tree
Topology change flag is not set, detected flag not set, changes 1
Times: hold 1, topology change 35 hello 2, max age 20, forward delay 15
Timers: hello 0, notification 0
Last topology change: 2 days, 0 hours, 31 mins, 21 secs

Spanning tree instance for vlan 20
Spanning Tree is executing the IEEE compatible Rapid Spanning Tree protocol
Bridge Identifier has priority 32768, address 00:0b:86:f0:20:00
Configured hello time 2, max age 20, forward delay 15
We are the root of the spanning tree
Topology change flag is not set, detected flag not set, changes 1
Times: hold 1, topology change 3 hello 2, max age 20, forward delay 15
Timers: hello 0, notification 0
Last topology change: 1 days, 0 hours, 3 mins, 2 secs
```

Example—show spanning-tree vlan

```
(host) # show spanning-tree vlan 2
Spanning Tree is executing the IEEE compatible Rapid Spanning Tree protocol
Bridge Identifier has priority 32768, address 00:0b:86:f0:20:00
Configured hello time 2, max age 20, forward delay 15
We are the root of the spanning tree
Topology change flag is not set, detected flag not set, changes 1
Times: hold 1, topology change 35 hello 2, max age 20, forward delay 15
```

```
Timers: hello 0, notification 0
Last topology change: 2 days, 0 hours, 31 mins, 21 secs
```

Example—show spanning-tree interface gigabitethernet

```
(host) (config-if)#show spanning-tree interface gigabitethernet 0/0/1

Interface FE 1/1 (port 2) in Spanning tree is FORWARDING
Port path cost 19, Port priority 128 Role DISNIGNATED
PortFast DISABLED P-to-P ENABLED
Designated root has priority 0 address 00:01:e8:d5:a3:6d

show spantree

```
show spantree
   <blocking> | <enable> | <forwarding> | <off> | <vlan>
```

Description

View the global RSTP and PVST+ topology.

Syntax

Parameter	Description
blocking	View the spanning tree ports in the Blocking state.
enable	View the spanning tree ports in the Enable state.
forwarding	View the spanning tree ports in the Forwarding state.
off	View the ports with spanning tree disabled
vlan	View the spanning tree instance for the VLAN.

Example

```
(host) # show spantree

Spanning tree instance    vlan 1
Designated Root MAC       00:0b:86:6b:57:80
Designated Root Priority  32768
Root Cost                 20000

show station-table

```
show station-table [mac <mac_address> | verbose ]
```

Description

Displays the internal station table entries and also details of a station table entry.

Syntax

Parameter	Description
`mac <mac_address>`	Displays the details of the AP that matches the specified MAC address.
`verbose`	Displays the details of all the APs in a table format.

Example

The output of this command shows details of an entry in the station table.

```
(host) # show station-table mac 00:1f:6c:7a:d4:fd

show stm

```
show stm
   aruba-deauth-reasons
   mon-update-queue {stats | threshold}
```

Description

This command is used to display the deauthentication reasons and the monitoring update queue information from the station management module.

Syntax

Parameter	Description
`aruba-deauth-reasons`	Displays the Aruba deauthentication reasons.
`mon-update-queue`	Displays the STM monitoring update queue information.
`stats`	Displays the STM update queue statistics.
`threshold`	Displays the STM monitoring update queue threshold.

Example

The following command displays the STM deauthentication reasons:

```
(host) [mynode] #show stm aruba-deauth-reasons
   Aruba Deauth Reasons
   --------------------
   Code  Reason
   ----  ------
   1     Unspecified Failure
   2     Prior authentication is not valid
   3     STA has left and is deauthenticated
   4     Inactive Timer expired and STA was disassociated
   5     Disassociated due to insufficient resources at AP
   6     Class 2 frames from non authenticated STA
   7     Class 3 frames from non associated STA
   8     STA has left and is disassociated
   9     STA Requesting Association without authentication
   ...
   ...
   ..
```

The following command displays the STM monitoring queue update statistics:

```
(host) [mynode] #show stm mon-update-queue stats
   (host) [mynode] #show stm mon-update-queue stats
   Stm mon update queue statistics
   Mon queue size:0
   AP Devices Queued
   -----------------
   Add  Info Update  Delete  Stats Update
   ---  -----------  ------  ------------
   0    0            0       0
   AP Devices Dropped
   ------------------
   Add  Info Update  Delete  Stats Update
   ---  -----------  ------  ------------
```

```
0    0            0       0
RADIO Devices Queued
--------------------
Add  Info Update  Delete  Stats Update
---  -----------  ------  ------------
0    0            0       0
...
...
```

The following command displays the monitoring update queue threshold value:

```
(host) [mynode] #show stm mon-update-queue threshold
  Stm mon udpate queue limit:83328
```

All platforms	Base operating system.	Config or Enable mode on Mobility Master.

show storage

```
show storage
```

Description

Displays the storage information on the Switch.

Syntax

No parameters.

Example

The output of this command shows the storage details on the Switch.

```
(host) # show storage
Filesystem                Size      Used Available Use% Mounted on
/dev/root                57.0M     54.6M      2.3M  96% /
none                     70.0M      2.0M     68.0M   3% /tmp
/dev/hda3               149.7M      9.3M    132.6M   7% /flash
/dev/usb/flash3           1.5G    168.6M      1.3G  12% /flash
/dev/usbdisk/2            3.5G     71.4M      3.2G   2% /mnt/usbdisk/2
/dev/usbdisk/1            3.9G    131.0M      3.8G   3% /mnt/usbdisk/1
```

The number at the end of the USB device's name is the partition. Unlike the Switch's flash, the USB device has more than two partitions; not just 0 and 1. When copying a file from a USB device, you must know which partition the target file is on.

show switches

```
show switches [all | regulatory | state {complete | incomplete | inprogress | required} |
summary ]
```

Description

Displays the details of managed device connected to the Mobility Master, including the Mobility Master itself.

Syntax

Parameter	Description
`all`	List of all managed devices.
`regulatory`	Displays information about the currently active regulatory file.
`state`	Configuration status of all managed devices.
`summary`	Status of all managed devices connected to the Mobility Master.

Example

The output of this command shows that there is a single managed device connected to the Mobility Master.

```
(host) # show switches all
All Switches
------------
IP Address  Name         Location          Type    Version        Status  Configuration State
Config Sync Time (sec)
----------  ----         --------          ----    -------        ------  -------------------
----------------------
10.16.12.1  r-wing-94    Building1.floor1  master  6.0.0.0_13782  up      UPDATE SUCCESSFUL
0192.0.2.12  CorpA2400    Building1.floor1  master  6.0.0.0_13782  up      UPDATE SUCCESSFUL
 0
```

Execute the **show switches regulatory** command to check if the regulatory file is active on the managed device.

```
(host) #show switches regulatory

All Switches

show threshold

show threshold
all | controlpath-cpu | controlpath-memory | datapath-cpu |
no-of-aps | no-of-locals | total-tunnel-capacity | user-capacity |

Description

This command shows managed device capacity thresholds which, when exceeded, will trigger alerts.

Syntax

Parameter	Description
`all`	Display all alert thresholds.
`controlpath-cpu`	Display the alert threshold for controlpath CPU capacity. The output of this command shows the percentage of the total controlpath CPU capacity that must be exceeded before the alert is sent. The default threshold for this parameter is 45%.
`controlpath-memory`	Display the alert threshold for controlpath memory consumption. The output of this command shows the percentage of the total memory capacity that must be exceeded before the alert is sent. The default threshold for this parameter is 85%.
`datapath-cpu`	Display the alert threshold for datapath CPU capacity. The output of this command shows the percentage of the total datapath CPU capacity that must be exceeded before the alert is sent. The default threshold for this parameter is 30%.
`no-of-APs`	The maximum number of APs that can be connected to a managed device is determined by that managed device's model type and installed licenses. This threshold triggers an alert when the number of APs currently connected to the managed device exceeds a specific percentage of its total AP capacity. The default threshold for this parameter is 80%.
`no-of-locals`	Display the alert threshold for Mobility Master's capacity to support managed devices. Mobility Master can support a combined total of 256 managed devices. The output of this command shows the percentage of the total Mobility Master capacity that must be exceeded before the alert is sent. The default threshold for this parameter is 80%.
`total-tunnel-capacity`	Display the alert threshold for the managed device's tunnel capacity. The output of this command shows the percentage of the managed device's total tunnel capacity that must be exceeded before the alert is sent. The default threshold for this parameter is 80%
`user-capacity`	Display the alert threshold for the managed device's user capacity. The output of this command shows the percentage of the total resource capacity that must be exceeded before the alert is sent. The default threshold for this parameter is 80%.

Usage Guidelines

The managed device will send a *wlsxThresholdAbove* SNMP trap and a syslog error message when the managed device has exceeded a set percentage of the total capacity for that resource. A *wlsxThresholdBelow* SNMP trap

and error message will be triggered if the resource usage drops below the threshold once again.

Example

```
(host) (config) #show threshold all
Switch Capacity Threshold Values
------------------------------------
RESOURCE                THRESHOLD(%)
--------                ------------
Datapath-Cpu            30 %
Controlpath-Cpu         80 %
Controlpath-Memory      85 %
Total-Tunnel-Capacity   80 %
Ap-Tunnel-Capacity      80 %
User-Capacity           80 %
No-of-APs               80 %
No-of-locals            80 %
```

show threshold-limits

show threshold-limits
controlpath-memory|fan-speed|no-of-aps|no-of-locals|no-of-vaps|total-tunnel-capacity|user-capacity

Description

This command shows current values of the different resources monitored by the managed device.

Syntax

Parameter	Description
controlpath-memory	The output of this command displays the default memory threshold which, when exceeded, will trigger an alert, the current configured threshold, the total memory (in MB) and the currently available memory (in MB).
fan-speed	The output of this command displays the fan alert threshold. This parameter is only available for managed devices with fans, such as the OAW-4x50 Series.
no-of-aps	The output of this command displays the following values: ■ The default threshold for the number of APs, which, when exceeded, will trigger an alert ■ The current configured threshold. ■ The maximum number of APs supported by the managed device, ■ The number of available licenses for campus and remote APs, ■ The total number of APs, and the current number of campus, remote and virtual APs.
no-of-locals	The output of this command displays the default threshold for the number of managed devices which, when exceeded, will trigger an alert, and the current configured threshold. The output also displays the maximum number of managed devices that can be connected to this Mobility Master, and the number of managed devices currently connected.
no-of-vaps	The output of this command displays the following values: ■ The default threshold for the number of Virtual APs, which, when exceeded, will trigger an alert ■ The current configured threshold. ■ The maximum number of Virtual APs supported by the managed device, ■ The total number of current Virtual APs.
total-tunnel-capacity	The output of this command displays the default tunnel capacity threshold which, when exceeded, will trigger an alert, as well as the current configured tunnel threshold. The output also includes the maximum number of tunnels supported by the managed device, as well as the number of tunnels currently used by the managed device.
user-capacity	The output of this command displays the default user capacity threshold which, when exceeded, will trigger an alert, as well as the current configured user threshold. The output also includes the maximum number of users supported by the managed device, as well as the number of users currently associated with the managed device.

Usage Guidelines

The managed device will send a *wlsxThresholdAbove* SNMP trap and a syslog error message when the managed device has exceeded a set percentage of the total capacity for that resource. A *wlsxThresholdBelow* SNMP trap

and error message will be triggered if the resource usage drops below the threshold once again.

Example

The following command shows the current alert thresholds for controlpath memory resources:

```
[host](node)(config) #show threshold-limits controlpath-memory

Threshold Values For Controlpath Memory
---------------------------------------
Default(%)  Current(%)  Total Memory (MB)  Available Memory (MB)
----------  ----------  -----------------  ---------------------
85                  77                679                    225
```

show time-range

```
show time-range [<name>|summary]
```

Description

Displays the list of time range configured in the system and rules affected by the time range.

Syntax

No parameters.

Example

The output of this command shows the absolute time range details.

```
(host) # show time-range

Time-Range monitoring, Absolute
-------------------------------
StartDate   Start-time  EndDate    End-time  Applied
---------   ----------  -------    --------  -------
4/29/2009   23:00       4/30/2009  12:00     No
```

show timer debug statistics app-name

```
show ipc statistics app-name <name>
```

Description

Displaytimer debugging statistics for a specific application.

Syntax

Parameter	Description	
`<name>`	One of the following application names: ■ **aaa**: Administrator Authentication ■ **ads**: Anomaly Detection ■ **authmgr**: User Authentication ■ **certmgr**: Certificate Manager ■ **cfgm**: Config Manager ■ **cpsec**: Control-Plane Security Manager ■ **cts**: Transport Service ■ **dbsync**: Database Synchronization ■ **dhcp**: DHCP Server ■ **esi**: Server Load Balancing ■ **fpapps**: Layer 2,3 control ■ **ha_mgr**: HA manager ■ **httpd**: HTTPD ■ **ike**: IKE Daemon ■ **l2tp**: L2TP ■ **licensemgr**: License Manager ■ **mdns**: AirGroup mdns ■ **mobileip**: Mobile IP	■ **ntp**: NTP Daemon ■ **ospf**: OSPF ■ **pim**: Protocol Independent Multicast ■ **pktfilter**: Packet Filter ■ **pptp**: PPTP ■ **profmgr**: Profile Manager ■ **publisher**: Publish subscribe service ■ **resolver**: Resolver ■ **snmp**: SNMP agent ■ **stm**: Station Management ■ **syslogd**: Syslog Manager ■ **userdb**: User Database Server ■ **wms**: Wireless Management

Example

The following example shows IPC statistics for the **STM** process.

```
(host) #show timer debug statistics app-name stm

show tpm

```
show tpm
   cert-info
   errorlog
```

Description

Displays the TPM and factory certificate information and error log.

Syntax

No parameters.

Usage Guidelines

Use this command to verify that TPM and factory certificates are installed as expected.

Example

In the example below, the TPM and certificates are installed.

```
(host) [mynode] #show tpm cert-info

subject= /CN=AF0000168::00:0b:86:f0:33:e0
issuer= /DC=com/DC=arubanetworks/DC=ca/CN=DEVICE-CA2
serial=1F023F05000000015087
notBefore=Jan 30 01:38:57 2009 GMT
notAfter=Jan 25 01:38:57 2029 GMT
```

In the example below, the Switch is unable to verify the TPM or factory certificate information.

```
(host) [mynode] #show tpm cert-info

Cannot get TPM and Factory Certificate Info
TPM and/or Factory Certificates might be missing.
```

In the example below, the TPM initialization errors are displayed.

```
(host) [mynode] #show tpm errorlog

show tunnel-group

```
show tunnel-group <tunnel-group-name>
```

Description

Displays the operational status of the tunnel-groups configured on the Switch.

Syntax

Parameter	Description
`<tunnel-group-name>`	Displays the operational status of the specified tunnel-group.

Example

The output of this command shows the status of the configured tunnel-groups:

```
(host) #show tunnel-group

Tunnel-Group Table Entries
--------------------------
Tunnel Group Type Tunnel Group Id Preemptive Failover  Active Tunnel Id Tunnel Members
------------ ---- --------------- -------------------- ---------------- --------------
tgroup1      L3   16385           enabled              10               10 20
tgroup2      L2   16387           enabled              10               10 20 40
```

The output of the following command shows the status of the specified tunnel-group:

```
(host) #show tunnel-group tgroup1

Tunnel-Group Table Entries
--------------------------
Tunnel Group Type Tunnel Group Id Preemptive Failover  Active Tunnel Id Tunnel Members
------------ ---- --------------- -------------------- ---------------- --------------
tgroup1      L3   16385           enabled              10               10 20
```

The output of the following command shows the datapath Tunnel-Group table entries:

```
(host) #show datapath tunnel-group

Datapath Tunnel-Group Table Entries
-----------------------------------
Tunnel-Group Active Tunnel Members
------------ ------------- ---------
16385        10            10 20
```

show tunneled-node

```
show tunneled-node {config|state|database}
```

Description

Displays the wired tunneled node configuration details, the state of the tunneled node, and lists all the tunneled nodes in the database.

Syntax

Parameter	Description
`config`	Displays the wired tunneled node configuration details.
`state`	Displays the state of the tunneled node.
`database`	Displays all the tunneled nodes in the database.

Example

The output of this command shows the tunneled node state.

```
(host) [mynode]# show tunneled-node state

Tunneled Node State
---------
IP MAC s/p state vlan tunnel inactive-time
-- --- --- ----- ---- ------ -------------
192.168.123.14 00:0b:86:40:32:40 1/23 complete 10 9 1
192.168.123.14 00:0b:86:40:32:40 1/22 complete 10 10 1
192.168.123.14 00:0b:86:40:32:40 1/20 complete 10 11 1
```

On the tunneled node client:

```
(host) #show tunneled-node state
Tunneled Node State
-------------------
IP              MAC               s/p   state     vlan  tunnel  inactive-time
--              ---               ---   -----     ----  ------  -------------
192.168.123.16  00:0b:86:40:32:40  1/23  complete  10    21      0
192.168.123.16  00:0b:86:40:32:40  1/22  complete  10    9       0
```

show tunneled-node-mgr

```
show tunneled-node-mgr
```

Description

Displays the tunneled node configuration details, the state of the tunneled node, and lists all the tunneled nodes in the database.

Syntax

Parameter	Description
`cluster-bucket-map`	Displays the cluster bucket map details.
`cluster-node-list`	Displays the cluster node list information.
`gsm-counters`	Displays the GSM counters details.
`mcast-tunnel-table`	Information on multicast tunnel.
`mcast-vlan-user-map`	Information on the user count on each multicast tunnel VLAN pair.
`node-heartbeat-table`	Displays node heartbeat table related information.
`stats`	Displays the tunneled node manager statistics.
`trace-buf`	Displays contents of trace buffer.
`tunnel-vlan-user-map`	Displays Information on user count on each Tunnel VLAN pair.
`tunneled-nodes`	Displays all the information on tunneled nodes.
`tunneled-users`	Displays all the information on tunneled users.
`user-tunnel-table`	Displays information on user tunnel tables.

Example

You can use the following show command to check if the per-user tunnel node is configured and is working as expected

```
(host) [mynode]# show tunneled-node-mgr stats

Related Commands

Command	Description
tunnel-group	This command creates a tunnel-group to group a set of tunnels.

Command History

Release	Modification
AOS-W 8.4.0.0	New parameters **mcast-tunnel-table** and **mcast-vlan-user-map** were added.
AOS-W 8.1.0.0	Command introduced.

Command Information

Platform	License	Command Mode
All platforms	Base operating system.	Enable and Config modes on managed devices.

show uap-blacklist

```
show uap-blacklist [mac-address|page|start]
```

Description

This command configures a UAP blacklist database entry. You can add, delete, or modify AP MAC addresses and description to the blacklist database. If you enable the blacklist policy in the AP deploy profile, the policy is applied to the APs included in this list.

Syntax

Parameter	Description
`mac-address <name>`	Shows MAC address of the AP.
`page`	Shows specific page (50 records per page).
`start`	Shows <start> records into the database

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The following commands lists all the AP MAC addresses in the UAP blacklist table:

```
(host) [mynode] #show uap-blacklist
UAP Blacklist Details
---------------------
MAC-Address         Description
-----------         -----------
11:11:11:11:11:11   AP-test2
11:11:11:11:11:12   Ap-test1
11:11:11:11:11:01   AP-test3
```

Related Commands

Command	Description
uap-blacklist	This command allows you to create or purges the UAP blacklist database by adding, deleting, or modifying AP MAC address entries.

Command History

Release	Modification
AOS-W 8.2.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config mode on master Mobility Master.

show ucc call-info cdrs

```
show ucc call-info cdrs
   ap <ap_name>
      [app [facetime | h323 | jabber | noe | sccp | sip | skype4b | svp | vocera | WiFi-
     Calling]]
   app
      {h323 [detail] | jabber [detail] | noe [detail] | sccp [detail] | sip [detail] | skype4b
      [detail] | svp [detail] | vocera [detail] | WiFi-Calling [detail]}
   cid <cid>
   detail
```

Description

This command displays the Call Detailed Records (CDR) statistics for Unified Communication and Collaboration (UCC).

When VoIP calls are prioritized using media classification, the **UCC Call ID**, **Client Name**, **Called to**, **Dir** (direction of the call), **End-to-End Delay(ms)/Jitter(ms)/PktLoss(%)**, **Codec**, **MOS**, and **MOS-Band** values are not available.

Syntax

Parameter	Description
`ap <ap_name>`	Displays the CDR statistics of an AP for a specific Application Layer Gateway (ALG).
`app`	Displays the CDR statistics based on a specific ALG.
`cid <cid>`	Displays CDR statistics for a specific CDR-ID.
`detail`	Displays detailed CDR statistics.

Example

The following command displays the CDR statistics:

```
(host) [mynode] #show ucc call-info cdrs

The output of this command includes the following information:

Column	Description
CDR ID	Displays the Call Detail Record ID of a particular voice and video calls, desktop sharing, or file transfer session.
UCC Call ID	Displays the unique identifier for all call legs of a particular voice and video calls, desktop sharing, or file transfer session. **NOTE:** This column is not populated for WiFi-Calling ALG.
Client IP	Displays the IP address of the VoIP client.
Client MAC	Displays the MAC address of the VoIP client.
Client Name	Displays the username of the VoIP client. **NOTE:** This column is not populated for WiFi-Calling ALG.
ALG	Displays the VoIP protocol used by the VoIP client.
Dir	Displays the direction of the call. Possible values are: ■ **OG**—Outgoing ■ **IC**—Incoming **NOTE:** This column is not populated for WiFi-Calling ALG.
Called to	Displays the username of the VoIP client being called. **NOTE:** This column is not populated for WiFi-Calling ALG.
Dur(sec)	Displays the duration of the VoIP call in seconds.
Orig Time	Displays the time at which the VoIP call originated.
Status	Displays the status of the VoIP call. Possible values are: ■ **SUCCESS** ■ **FAILED** ■ **ABORTED** ■ **BLOCKED** ■ **FORWARDED** ■ **ALERTING** ■ **HOLD** ■ **ACTIVE**
Reason	Displays the reason code for call termination. Possible values are: ■ **NA** ■ **Capacity Reached** ■ **401 unauthorized** ■ **487 request timeout** ■ **Request timeout** ■ **Request canceled** ■ **Request terminated** ■ **Session timeout** ■ **Session timer expired** ■ **Session expired - request timeout** ■ **Aborted** ■ **Terminated**

Column	Description
	■ **Forwarded** ■ **Transferred** ■ **Inactivity** ■ **Wrong number** ■ **Peer reset** ■ **Client reset** ■ **No answer** ■ **Missed** ■ **Parked** ■ **Invalid number** ■ **Tunnel down** ■ **Moved temporarily** ■ **4xx error** ■ **5xx error** ■ **Call leg does not exist** ■ **DELTS request** ■ **TCLAS flow deleted** ■ **No reason**
`Call Type`	Displays the type of VoIP call or session. Possible values are: ■ **Not Available** ■ **Voice** ■ **Video** ■ **Desktop Sharing** ■ **File Transfer** ■ **Voice/Conf Call** ■ **Video/Conf Call** ■ **Desktop-Sharing/Conf Call** ■ **File-Transfer/Conf Call**
`Client Health`	Displays the ratio of ideal air time required for transmitting a packet from an AP to a client to the actual air time taken for the packet transmission in percentage. Ideal air time assumes highest data rate without any retransmission.
`UCC Score[C]`	Displays the UCC score based on the quality of the voice call. This is the metric calculated at the managed device. **NOTE:** This column is not populated for WiFi-Calling ALG.
`UCC Score[A]`	Displays the UCC score based on the quality of the voice call or desktop sharing session. This is the metric calculated at the AP. **NOTE:** This column is not populated for WiFi-Calling ALG.
`MOS`	Displays the Mean Opinion Score (MOS) of the VoIP call. **NOTE:** This column is not populated for WiFi-Calling ALG.
`Server(IP)`	Displays the name of the service provider for WiFi-calling ALG

The following command displays the CDR statistics for an AP.

```
(host) [mynode] #show ucc call-info cdrs ap AP225-1

The output of this command includes the following information:

Column	Description
CDR ID	Displays the Call Detail Record ID of a particular voice and video calls, desktop sharing, or file transfer session.
UCC Call ID	Displays the unique identifier for all call legs of a particular voice and video calls, desktop sharing, or file transfer session. **NOTE:** This column is not populated for WiFi-Calling ALG
AP Name	Displays the name that uniquely identifies the AP.
Re-Assoc	Displays the number of times the client re-associated while on an active call.
ICH-Denied	Displays the status of the Intelligent Call Handling (ICH). Possible values are: ■ **Yes**—Call prioritized ■ **No**—Call not prioritized
Utilization(%)	Displays the channel utilization of the AP during the call.
Codec	Displays the compression protocol used for voice and video calls, desktop sharing, or file transfer session. **NOTE:** This column is not populated for WiFi-Calling ALG
Quality	Displays the quality of the VoIP call based on the UCC score. Possible values are: ■ **Good** ■ **Fair** ■ **Poor** ■ **NA** **NOTE:** This column is not populated for WiFi-Calling ALG.
Delay(msec)	Displays the average delay in milliseconds. **NOTE:** This column is not populated for WiFi-Calling ALG.
Jitter(msec)	Displays the average jitter in milliseconds. **NOTE:** This column is not populated for WiFi-Calling ALG.
Packet Loss(%)	Displays the loss of packet in percentage. **NOTE:** This column is not populated for WiFi-Calling ALG.
Orig WMM-AC	Displays the original client value of the Wi-Fi Multimedia Access Category.

The following command displays detailed CDR statistics.

```

The output of this command includes the following information:

Column	Description
CDR ID	Displays the Call Detail Record ID of a particular voice and video calls, desktop sharing, or file transfer session.
UCC Call ID	Displays the unique identifier for all call legs of a particular voice and video calls, desktop sharing, or file transfer session. **NOTE:** This column is not populated for WiFi-Calling ALG.
AP Name	Displays the name that uniquely identifies the AP.
Re-Assoc	Displays the number of times the client re-associated while on an active call.
UCC Score[C]	Displays the UCC score based on the quality of the voice call. This is the metric calculated at the managed device.
D(ms)/J(ms)/PL(%)[C]	Displays the WLAN delay (in milliseconds), jitter (in milliseconds), and packet loss (in percentage). This is the metric calculated at the managed device.
UCC Score[A]	Displays the UCC score based on the quality of the voice call or desktop sharing. This is the metric calculated at the AP. **NOTE:** This column is not populated for WiFi-Calling ALG.
D(ms)/J(ms)/PL(%)[A]	Displays the WLAN delay (in milliseconds), jitter (in milliseconds), and packet loss (in percentage). This is the metric calculated at the AP.
SNR	Displays the Signal-to-noise (SNR) ratio. SNR is the power ratio between an information signal and the level of background noise.

Column	Description
`Avg Tx Rate(Mbps)`	Displays the average transmission rate in Mbps.
`Tx Drop(%)`	Displays the transmission packet drop in percentage.
`Tx Retry(%)`	Displays the transmission retry in percentage.
`Avg Rx Rate(Mbps)`	Displays the average receive rate in Mbps.
`Rx Retry(%)`	Displays the receive retry in percentage.
`MOS`	Displays the MOS value of the VoIP call. This is an end-to-end score (wired and wireless) of the VoIP call. **NOTE:** This column is not populated for WiFi-Calling ALG.
`D(ms)/J(ms)/PL(%)[E`	Displays the end-to-end delay (in milliseconds), jitter (in milliseconds), and packet loss (in percentage). This field takes the wired and wireless network QoS parameters into consideration.
`Controller-IP`	Displays the IP address of the managed device.

```

Description

This command displays the UCC client status and CDR statistics.

When VoIP calls are prioritized using media classification, the **Client Name** value is not available.

Syntax

Parameter	Description
`app`	Displays the UCC client status and CDR statistics based on a specific ALG.
`detail`	Displays UCC client status details.
`sta <mac>`	Displays the detailed record for a specific client based on its MAC address.

Example

The following command displays the UCC client status and record:

```
(host) [mynode] #show ucc client-info

Client Status:
--------------
Client IP     Client MAC         Client Name  ALG      Server(IP)  Registration State  Call

```

The output of this command includes the following information:

Column	Description
Client IP	Displays the IP address of the VoIP client.
Client MAC	Displays the MAC address of the VoIP client.
Client Name	Displays the username of the VoIP client.
ALG	Displays the Application Layer Gateway protocol used by the VoIP client.
Server(IP)	Displays the IP address of call server the client is registered to.
Registration State	Displays the registration status of the VoIP call. Possible values are: ■ **Challenged** ■ **Registered** ■ **Registering** ■ **Unregistered** ■ **Rejected** ■ **Unknown**
Call Status	Displays the VoIP call status of the client. Possible values are: ■ **Idle** ■ **In-Call**
AP Name	Displays the name of the AP to which the VoIP client is associated.
Flags	Displays if the client is a visitor, away, wired, remote, or external.
Device Type	Displays the device type identification of the client.
Home Agent	Displays the IP address of the managed device to which the client is connected or the home agent of the client if mobile IP is enabled.
Foreign Agent	Displayed if the client has roamed to another managed device when mobile IP is enabled.

The following command displays the UCC client status details:

```
(host) [mynode] #show ucc client-info detail

```

The output of this command includes the following information:

Column	Description
Station Report	
Client IP	Displays the IP address of the VoIP client.
Client MAC	Displays the MAC address of the VoIP client.
Client Name	Displays the username of the VoIP client.
AP-Name	Displays the name of the AP handling the VoIP call.
SNR	Displays the Signal-to-noise (SNR) ratio. SNR is the power ratio between an information signal and the level of background noise.
Avg Tx Rate(Mbps)	Displays the average transmission rate in Mbps.
Tx Drop(%)	Displays the transmission packet drop in percentage.
Tx Retry(%)	Displays the transmission retry in percentage.
Avg Rx Rate(Mbps)	Displays the average receive rate in Mbps.
Rx Retry(%)	Displays the receive retry in percentage.
Un-steerable (reason)	Displays the reason for steering/not steering the client to another band. Possible values are: ■ **Sticky** ■ **Load Balance** ■ **Band Steer** ■ **Band Balance** ■ **Administrator Added** ■ **(IOS)** ■ **NA**

Column	Description
Active Calls	
CDR ID	Displays the Call Detail Record ID of a particular voice and video calls, desktop sharing, or file transfer session.
UCC Call ID	Displays the unique identifier for all call legs of a particular voice and video calls, desktop sharing, or file transfer session.
Client IP	Displays the IP address of the VoIP client.
Client Name	Displays the username of the VoIP client.
ALG	Displays the Application Layer Gateway protocol used by the VoIP client.
Dir	Displays the direction of the call. Possible values are: ■ **OG**—Outgoing ■ **IG**—Incoming
Called To	Displays the username of the VoIP client being called.
Dur(sec)	Displays the duration of the VoIP call in seconds.
Orig-Time	Displays the time at which the VoIP call originated.
Status	Displays the status of the VoIP call. Possible values are: ■ **SUCCESS** ■ **FAILED** ■ **ABORTED** ■ **BLOCKED** ■ **FORWARDED** ■ **ALERTING** ■ **HOLD** ■ **ACTIVE**
Call Type	Displays the type of VoIP call or session. Possible values are: ■ **Not Available** ■ **Voice** ■ **Video** ■ **Desktop Sharing** ■ **File Transfer** ■ **Voice/Conf Call** ■ **Video/Conf Call** ■ **Desktop-Sharing/Conf Call** ■ **File-Transfer/Conf Call**
Client Health	Displays the ratio of ideal air time required for transmitting a packet from an AP to a client to the actual air time taken for the packet transmission in percentage. Ideal air time assumes highest data rate without any retransmission.
UCC Score[C]	Displays the UCC score based on the quality of the voice call. This is the metric calculated at the managed device.
UCC Score[A]	Displays the UCC score based on the quality of the voice call or desktop sharing session. This is the metric calculated at the AP.
MOS	Displays the Mean Opinion Score of the VoIP call.

Column	Description
Call History	
Reason	Displays the reason code for call termination. Possible values are: ■ **NA** ■ **Capacity Reached** ■ **401 unauthorized** ■ **487 request timeout** ■ **Request timeout** ■ **Request canceled** ■ **Request terminated** ■ **Session timeout** ■ **Session timer expired** ■ **Session expired - request timeout** ■ **Aborted** ■ **Terminated** ■ **Forwarded** ■ **Transferred** ■ **Inactivity** ■ **Wrong number** ■ **Peer reset** ■ **Client reset** ■ **No answer** ■ **Missed** ■ **Parked** ■ **Invalid number** ■ **Tunnel down** ■ **Moved temporarily** ■ **4xx error** ■ **5xx error** ■ **Call leg does not exist** ■ **DELTS request** ■ **TCLAS flow deleted** ■ **No reason**
NOTE: For information on additional field descriptions, refer the field descriptions under the **Active Calls** heading.

-------  -------  ---------  ---------  ---------  ------  ------
0        0        0          3          0          0       0
```

```
0          0          0          3          0          0          0
0          2          0          0          0          0          6
0          0          0          0          0          0          2

WMM (VI, VO, BK, BE):total calls with received priority
```

The output of this command includes the following information:

Column	Description
`Client IP`	Displays the IP address of the VoIP client.
`Client MAC`	Displays the MAC address of the VoIP client.
`Call Originated`	Displays the number of times a call originated from the VoIP client.
`Call Terminated`	Displays the number of times a call terminated on the VoIP client.
`Active`	Displays the number of active calls on the VoIP client.
`Success`	Displays the number of successful calls.
`Failed`	Displays the number of failed call setup calls.
`Blocked`	Displays the number of blocked calls due to CAC.
`Aborted`	Displays the number of terminated calls due to inactivity.
`Forwarded`	Displays the number of times a call is forwarded for a VoIP client.
`WMM AC-VI`	Displays the number of calls where the client sent RTP with WMM AC set to Video (VI).
`WMM AC-VO`	Displays the number of calls where the client sent RTP with WMM AC set to Voice (VO).
`WMM-BK`	Displays the number of calls where the client sent RTP with WMM AC set to Background (BK).
`WMM-BE`	Displays the number of calls where the client sent RTP with WMM AC set to Best Effort (BE).

Related Commands

Command	Description

show ucc trace-buffer

```
show ucc trace-buffer
   jabber [count <0-65535>]
   sccp [count <0-65535>]
   sip [count <0-65535>]
   skype4b[count <0-65535>]
```

Description

This command displays the UCC call message trace buffer for Cisco Jabber, Cisco SCCP, SIP, and Microsoft Skype for Business ALGs. Call signaling events such as establishing voice, video, desktop sharing, and file transfer are recorded.

Syntax

Parameter	Description
`jabber [count <0-65535>]`	Displays the Jabber call message trace buffer.
`sccp [count <0-65535>]`	Displays the SCCP call message trace buffer.
`sip [count <0-65535>]`	Displays the SIP call message trace buffer.
`skype4b [count <0-65535>]`	Displays the Skype4b call message trace buffer.

Example

The following command displays Skype4b call message trace buffer:

```
(host) #show ucc trace-buffer skype4b

Ken        Voice        OAW-AP225   50026        50038        Call Quality Update

Num of Rows:3
```

The output of this command includes the following information:

Column	Description
`Client IP`	Displays the IP address of the VoIP client.
`Client MAC`	Displays the MAC address of the VoIP client.

Column	Description
Client Name	Displays the user name of the VoIP client.
Direction	Displays the call direction. ■ **OG** — Outgoing ■ **IC** — Incoming
Event Time	Displays the time stamp when the VoIP call originated.
BSSID	Displays the BSSID of the AP to which the VoIP client is connected.
Called To	Displays the user name of the VoIP client being called.
Media Type	Displays the type of Skype4b call. This can be one of the following: ■ **Desktop-sharing** ■ **File-transfer** ■ **Video** ■ **Voice**
AP Name	Displays the name of the access point receiving calls.
Src Port	Displays the source port for the media session.
Dest Port	Displays the destination port of the particular media session.
Call Status	Displays if the Skype4b client is in any one of the following call status: ■ **Start of call** ■ **End of call** ■ **Before call update** ■ **Call Quality Update** ■ **InCallQuality Update** ■ **After call update**

show upgrade internal

```
show upgrade internal managed-devices status
      copy list <mac-list>
      reboot list <mac-list>
      summary list <mac-list>
```

Description

This command displays the status of the upgrade of the managed devices.

Syntax

Parameter	Description
`copy list <mac-list>`	Copy status of managed devices based on MAC address. Specify multiple MAC addresses separated by commas.
`reboot list <mac-list>`	Reboot status of managed devices based on MAC address. Specify multiple MAC addresses separated by commas.
`summary list <mac-list>`	Status summary of managed devices based on MAC address. Specify multiple MAC addresses separated by commas.

Example

```
(host) [mynode] #show upgrade internal managed-devices status summary list 00:0b:23:b0:81:d0

upgrade managed-node status summary
-----------------------------------
LC MAC  Config Path  Host Name  IP Addr  LC Model  Current Ver  Last Cmd  Last Cmd Status
------  -----------  ---------  -------  --------  -----------  --------  ---------------
00:0b:23:b0:81:d0  /md/IND/70XXS  A7010-HA2-FIFTEEN  192.168.5.15  A7010  8.0.0.0-svcs-ctrl_
55616  Not initialized  Not initialized
```

The output of this command includes the following information:

Parameter	Description
`LC MAC`	MAC address of the managed device.
`Config Path`	Config node path of the managed device.
`Host Name`	Name of the Mobility Master.
`IP Addr`	IP address of the managed device.
`LC Model`	Model number of the managed device.
`Current Ver`	Version of AOS-W currently running on the managed device.
`Last Cmd`	Last command issued on the managed device.
`Last Cmd Status`	Status of the last command issued on the managed device.

Related Commands

Command	Description
upgrade internal	This command upgrades the managed devices with the respective options provided in the input, like using different protocol options as well as loading at different node levels and paths, and also can upgrade the single managed device based on the MAC address of the device. This command is internal or hidden.

show upgrade managed-devices

```
show upgrade managed-devices status
      copy
         all
         path <node-path>
         single <mac-addr>
      reboot
         all
         path <node-path>
         single <mac-addr>
      summary
         all
         path <node-path>
         single <mac-addr>
```

Description

This command displays the status of the upgrade of the managed devices.

Syntax

Parameter	Description
copy	Copy status of managed device.
all	Copy status of all managed devices under the respective node path.
path <node-path>	Copy status of all managed devices under the specific node path.
copy single <mac-addr>	Copy status of a specific managed device based on MAC address.
reboot	Reboot status of managed device.
all	Reboot status of all managed devices under the respective node path.
path	Reboot status of all managed devices under a specific node path.
single	Reboot status of a specific managed device based on MAC address.
Summary	Status summary of the managed device .
all	Status summary of all managed device under the respective node path.
path	Status summary ofl managed devices under a specific node path.
single	Status Summary of a specific managed device based on MAC address.

Example

```
(host) [mynode] #show upgrade managed-devices status summary single 00:0b:23:b0:81:d0
-----------------------------------
LC MAC  Config Path  Host Name  IP Addr  LC Model  Current Ver  Last Cmd  Last Cmd Status
------  -----------  ---------  -------  --------  -----------  --------  ---------------
00:0b:23:b0:81:d0  /md/IND/IPV6-NODES  A7005-BKLMS_TWENTY  2002:dead:face:5::20  A7005
8.0.0.0-svcs-ctrl_55616  Not initialized  Not initialized
```

The output of this command includes the following information:

Parameter	Description
LC MAC	MAC address of the managed device.
Config Path	Config node path of the managed device.
Host Name	Name of the Mobility Master.
IP Addr	IP address of the managed device.
LC Model	Model number of the managed device.
Current Ver	Version of AOS-W currently running on the managed device.
Last Cmd	Last command issued on the managed device.
Last Cmd Status	Status of the last command issued on the managed device.

All platforms	Base operating system.	Config mode on Mobility Master.

show upgrade-profile

Description

The settings in the centralized image upgrade profile uses AOS-W images to upgrade the managed devices with the AOS-W images hosted on an image server. When an upgrade action command is executed on the Mobility Master, the **upgrademgr** process running on Mobility Master sends an upgrade request to **upgrademgr** process running on corresponding managed devices. The managed devices then connect to the image server and download the appropriate image file after verifying the validity of the image file, before upgrading to the downloaded image file.

Syntax

No parameters.

Usage Guidelines

The centralized image upgrade feature is enabled and configured on managed devices only, and supports up to 100 simultaneous image downloads.

Example

```
(host) (config) # show upgrade-profile

Upgrade Profile
---------------
Parameter                Value
---------                 -----
Server IP address         N/A
Server IPv4/IPv6 address  2000:192:168:28::59
Username                  root
Password                  ********
Protocol                  scp
File path                 Builds
```

The output of this command includes the following information:

Parameter	Description	Range	Default
`serverip`	The IPv4 address of the image server. This parameter is only used by managed devices running versions prior to AOS-W 8.2 and accepts only IPv4 address. **NOTE:** For FTP or SCP protocol, specify the username and password.	-	-
`serveraddr`	The IPv4 or IPv6 address of the image server. This parameter is only used by managed devices running AOS-W 8.2. **NOTE:** For FTP or SCP protocol, specify the username and password.	-	-
`Username`	If the **protocol** parameter is set to **FTP** or **SCP**, this parameter displays the user name that AOS-W uses to connect to the image server.	-	-

Parameter	Description	Range	Default
`Password`	If the **protocol** parameter is set to **FTP** or **SCP**, this parameter displays the password that AOS-W will use to connect to the image server.	-	-
`Protocol`	Specify the protocol used to send the software to the managed device. ■ TFTP ■ FTP ■ SCP	-	TFTP
`File path`	File path to the location on the image server where the image file(s) reside.	-	-

Related Commands

Command	Description
upgrade-profile	This command is used to configure the upgrade profile.

Command History

All platforms	Base operating system.	Available in Enable and Config modes on Mobility Master and managed devices.

show uplink

```
show uplink [config|{connection <link_id>}|signal|{stats <link_id}]
```

Description

Displays uplink manager configuration details.

Syntax

Parameter	Description
`config`	Enter the keyword **config** to display the uplink manager, the default wired priority and default cellular priority
`connection`	Enter the keyword **connection** followed by the uplink ID number to display the connection details.
`signal`	Enter the keyword **signal** to display the cellular uplink signal strength.
`stats`	Enter the keyword **stats** followed by the uplink ID number to display the statistical information on the designated uplink.

Example

The output of this command displays the managed device uplink status . For a managed device, the health status of these uplink connections is also displayed in the **Status** section of the **Dashboard>WAN** page of the managed device WebUI.

```
(host) #show uplink
Uplink Manager: Disabled
Uplink Health-check: Enabled
Uplink Health-check IP/FQDN: 192.0.2.14
Uplink Management Table
-----------------------
Id  Uplink Type  Properties     Priority  State      Status      Reachability
--  -----------  ----------     --------  -----      ------      ------------
1   Wired        vlan 4094      200       Connected  Active      Reachable
2   Cellular     Novatel_U727   100       Standby    Ready       Reachable
```

Related Commands

Command	Description
ip probe default	This command configures WAN health-check ping-probes for measuring WAN availability and latency on managed device uplinks.
uplink	Manage and configure the uplink network connection.

Command History

Release	Modification

show usb

```
show usb
   cellular
   ports [<address>]
   test <address>
   usb-modeswitch
   verbose
```

Description

Display detailed USB device information on a stand-alone Switch or managed device.

Syntax

Parameter	Description
`cellular`	Enter the keyword **cellular** to display cellular devices.
`ports`	Enter the keyword **ports** to display detailed TTY port information such as signal strength.
`test`	Enter the keyword **test** to test the USB TTY ports. **NOTE:** Testing an invalid modem port may cause the stand-alone Switch or managed device to “hang”. To resolve this, unplug and re-plug the modem.
`usb-modeswitch`	USB mode switch utility log.
`verbose`	Enter the keyword **verbose** to display detailed USB information including serial number and USB type.

Usage Guideline

This command should be executed from the managed device only.

Examples

The USB Device table, in the example below, displays the USB port is in the 'Device Ready' state, meaning that the port has passed the diagnostic test and is ready to send and receive data.

```
(host-md) #show usb

USB Device Table
----------------
Address  Product                Vendor  ProdID  Serial           Type      Profile    State
Bus
-------  -------                ------  ------  ------           ----      -------    -----
--
18       Novatel Wireless CDMA  1410    4100    091087843891000  Cellular  new_modem  Device
ready
```

Below is an example of the **show usb verbose** display output (partial).

```
(host-md) #show usb verbose

show user

```
show user
   ap-group <ap-group>
   ap-name <ap-name>
   authentication-method dot1x|mac|opensystem|psk|stateful-dot1x|via-vpn|vpn|web
   bssid <A:B:C:D:E:F>
   devtype <device>
   essid <STRING>
   internal
   ip <A.B.C.D> [log]
   location b.f.l
   mac <A:B:C:D:E:F> [log]
   mobile {[bindings][visitors]}
   name <STRING>
   phy-type {[a]|[b]}
   role <STRING>
   rows <NUMBER> <NUMBER>
```

Description

Displays detailed information about user in terms of AP group, authentication method, role and so on.

Syntax

Parameter	Description
`ap-group <ap-group>`	Filter the output of this command by showing users connected to APs that belong to the specified AP group.
`ap-name <ap-name>`	Filter the output of this command by showing users connected to an AP with the specified AP name.
`authentication-method`	Filter the output of this command by the authentication method used for the device:
`dot1x`	Show data for devices using 802.1X authentication.
`mac`	Show data for devices using MAC authentication.
`opensystem`	Show data for devices using open (no) authentication.
`psk`	Show data for devices that do not use authentication but use a pre-shared key for encryption.
`stateful-dot1x`	Show data for devices using stateful 802.1X authentication.
`via-vpn`	Show data for devices that authenticate using Alcatel-Lucent VIA.
`vpn`	Show data for devices using VPN authentication.
`web`	Show data for devices using captive portal authentication.
`bssid <A:B:C:D:E:F>`	Show user data for a specific device BSSID.
`devtype <device>`	Show output for a specified device type, if identified. If the device name includes spaces, you must enclose it in quotation marks.

Parameter	Description
essid <STRING>	Show user data for a specific ESSID. If the ESSID includes spaces, you must enclose it in quotation marks.
internal	Display internal user entries only. Include the **rows** options to filter the output of this command by specifying the number of rows from the end of the output and the total number of rows to display/
ip <A.B.C.D>	Show user data for a specific IP address .
log	If per-user logging is enabled using the aaa log command, include the optional **log** parameter to display authentication log files for a user with the specified MAC address.
mac <A:B:C:D:E:F>	Show user data for a specific MAC address
log	If per-user logging is enabled using the aaa log command, include the optional **log** parameter to display authentication log files for a user with the specified MAC address.
mobile	Filter the output of this command to show data for Mobile users.
bindings	Show data for users that have moved away from their home network.
visitors	Show data for mobility users that are visiting the network.
name <STRING>	User's name.
phy-type	801.11 type
a	Matches PHY type a.
g	Matches PHY type b or g.
role <STRING>	User role such as employee, visitor and so on.
rows <NUMBER> <NUMBER>	Filter the output of the show user command by specifying the number of rows from the end of the output and the total number of rows to display/

Usage Guidelines

Use the **show user** command to show detailed user statistics and roles.

Example

```
(host) #show user
Users
-----
IP           MAC       Name    Role  Age(d:h:m)  Auth  VPN link  AP name  Roaming
Essid/Bssid/Phy  Profile  Forward mode  Type  Host Name
---------  -----------  ------  ----  ----------  ----  --------  -------  -------  --------
-------  -------  -----------  ----  ---------
User Entries: 0/0
Curr/Cum Alloc:0/0 Free:0/0 Dyn:0 AllocErr:0 FreeErr:0
```

Related Commands

show user-table

```
show user-table
   ap-group <ap-group>
   ap-name <ap-name>
   authentication-method dot1x|mac|opensystem|psk|stateful-dot1x|via-vpn|vpn|web
   bssid <A:B:C:D:E:F>
   devtype <device>
   debug
   essid <STRING>
   internal
   ip <A.B.C.D> [log]|[detail]
   mac <A:B:C:D:E:F> [log]
   mobile {[bindings][visitors]}
   name <STRING>
   phy-type {[a]|[b]}
   role <STRING>
   rows <NUMBER> <NUMBER>
   standby [ipv4]|[ipv6]|[log]|[mac]
   station
   summary
   unique
   verbose
```

Description

Displays detailed information about the Switch's connection to a user device, in regards to mobility state and statistics, authentication statistics, VLAN assignment method, AP datapath tunnel info, radius accounting statistics, user name, user-role derivation method, datapath session flow entries, and 802.11 association state and statistics. The **show user** command allows you to filter specific information by parameter.

Syntax

Parameter	Description
`ap-group <ap-group>`	Filter the output of this command by showing users connected to APs that belong to the specified AP group.
`ap-name <ap-name>`	Filter the output of this command by showing users connected to an AP with the specified AP name.
`authentication-method`	Filter the output of this command by the authentication method used for the device:
`dot1x`	Show data for devices using 802.1X authentication.
`mac`	Show data for devices using MAC authentication.
`opensystem`	Show data for devices using open (no) authentication.
`psk`	Show data for devices that do not use authentication but use a pre-shared key for encryption.
`stateful-dot1x`	Show data for devices using stateful 802.1X authentication.
`via-vpn`	Show data for devices that authenticate using Alcatel-Lucent VIA.

Parameter	Description
vpn	Show data for devices using VPN authentication.
web	Show data for devices using captive portal authentication.
bssid <A:B:C:D:E:F>	Show user data for a specific device BSSID.
debug	Show all user data for debugging purposes.
devtype <device>	Show output for a specified device type, if identified. If the device name includes spaces, you must enclose it in quotation marks.
essid <STRING>	Show user data for a specific ESSID. If the ESSID includes spaces, you must enclose it in quotation marks.
internal	Display internal user entries only. Include the **rows** options to filter the output of this command by specifying the number of rows from the end of the output and the total number of rows to display/
ip <A.B.C.D>	Show user data for a specific IP address .
log	If per-user logging is enabled using the aaa log command, include the optional **log** parameter to display authentication log files for a user with the specified MAC address.
detail	Show detailed user data for a specific IP address including role-derivation.
mac <A:B:C:D:E:F>	Show user data for a specific MAC address
log	If per-user logging is enabled using the aaa log command, include the optional **log** parameter to display authentication log files for a user with the specified MAC address.
mobile	Filter the output of this command to show data for Mobile users.
bindings	Show data for users that have moved away from their home network.
visitors	Show data for mobility users that are visiting the network.
name <STRING>	User's name.
phy-type	801.11 type
a	Matches PHY type a.
g	Matches PHY type b or g.
role <STRING>	User role such as employee, visitor and so on.
rows <NUMBER> <NUMBER>	Filter the output of the show user command by specifying the number of rows from the end of the output and the total number of rows to display/
standby	User standby entries
ipv4	User standby entires for the IPv4 address specified.
ipv6	User standby entires for the IPv6 address specified.

Parameter	Description
log	Debug log of the specified user.
mac	User standby entires for the MAC address specified.
station	For internal use only.
summary	Shows the authentication and encryption type used by wired or wireless clients.
unique	Displays only information for users with a valid IP address.
verbose	Displays all information about the user table.

Usage Guidelines

Use the **show user-table** command to show detailed user statistics which includes the entire output of the user-table, mobility state and statics, authentication statistics, VLAN assignment method, AP datapath tunnel information, radius accounting statistics, user-role derivation method, datapath session flow entries and 802.11 association state and statistics.

Examples

This example displays users currently in the **employee** role. The output of this command is split into two tables in this document, however it appears in one table in the CLI.

```
(host) [mynode] (config) show user role employee
Users
-----
    IP              MAC            Name           Role      Age(d:h:m)  Auth    VPN link  AP

The **role-how** and **vlan-how** parameters in the output of this command display a code that corresponds to the following values:

Role Derivation Code	Description
1	AAA profile default role
2	Role derived from user rules
3	Role derived from UDR
4	Default role for authentication type
5	Role derived from server rules
6	Alcatel-Lucent vendor-specific attribute (VSA)
7	Dot1X profile role
8	Dot1X server derived role
9	Dot1X role derived from Alcatel-Lucent VSA
10	Dot1X role derived from ClearPass Policy Manager VSA
11	Role derived from DHCP option
12	Change of authorization role
13	Forced role set by ESI

Role Derivation Code	Description
14	Role derived from mobility
15	Role assigned by external/internal captive portal
16	Role assigned by SIP
17	SDR derived role during L3 authentication
18	VSA derived role during L3 authentication
19	ClearPass Policy Manager VSA derived role during L3 authentication
20	Authentication type VPN role (VIA, VPN, or Transport VPN)
21	Authentication type role (BTLM, Kerb, GIS, or so on)
22	System assigned AP role

VLAN Derivation Code	Description
1	Default VLAN
2	Initial role contained
3	User rule role contained
4	Matched user rule
5	DHCP Option 77 role contained
6	Matched DHCP Option 77
7	MBA role contained
8	MBA server rule role contained
9	MBA server rule

show util_proc

```
show util_proc guest-email counters
```

Description

Show counters for the guest email process.

Syntax

No parameters.

Usage Guidelines

As part of guest provisioning, the guest access email feature allows you to define the SMTP port and server that processes guest provisioning email. This server sends email to the guest or the sponsor when a guest user manually sends email from the Guest Provisioning page, or when a user creates a guest account.

Example

The output of this command shows the numbers of guest emails received, sent and dropped since the Switch was last reset

```
(host) #show util_proc guest-email counters

Guest Email Counters
--------------------
Name             Value
----             -----
Email Received   14
Email Sent       3
Email Dropped    0.
```

show valid-network-oui-profile

```
show valid-network-oui-profile
```

Description

This command displays the Valid Equipment OUI Profile table

Syntax

No parameters

Usage Guidelines

If you used the valid-networkoui-profile to add a new OUI to the Switch, issue the show valid-network-oui-profile command to see a list of current OUIs.

Example

```
(Host) (config) #show valid-network-oui-profile

Valid Equipment OUI profile
---------------------------
Parameter  Value
---------  -----
OUI        00:1A:1E
```

Related Commands

Command	Description
valid-network-oui-profile	This command allows you to add a new OUI to the managed device.

show version

```
show version
```

Description

Show the system software version.

Syntax

No parameters.

Example

```
host) #show version
Alcatel-Lucent Operating System-Wireless.
AOS-W (MODEL: OAW-4504-US), Version 6.0.0.0
Website: http://www.alcatel.com/enterprise
All Rights Reserved (c) 2005-2010, Alcatel-Lucent.
Compiled on 2008-12-17 at 22:52:36 PST (build 20263) by p4build

ROM: System Bootstrap, Version CPBoot 1.2.11 (Sep 13 2005 - 17:39:11)

Switch uptime is 41 days 8 hours 57 minutes 18 seconds
Reboot Cause: User reboot.
Supervisor Card
Processor  16.20 (pvr 8081 1014) with 256M bytes of memory.
32K bytes of non-volatile configuration memory.
256M bytes of Supervisor Card System flash (model=CF 256MB).
```

The output of this command includes the following information

Parameter	Description
Model	Switch model type.
Version	Version of AOS-W software.
ROM	System bootstrap version.
Switch Uptime	Switch uptime (time elapsed since the last Switch reset.
Reboot Cause	Reason the Switch was last rebooted.
Supervisor Card	Details for the Switch's internal supervisor card.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable and Config mode on Mobility Master.

show via

```
show via
   version
   websessions
   lastlogin
```

Description

Displays VIA version and web session details.

Syntax

Parameter	Description	Range	Default
`version`	Displays the version of VIA client available on the Switch.	—	—
`websessions`	Displays the list of users connected to the VIA Switch using the VIA client.	—	—
`lastlogin`	Displays the time that the VIA user last logged in.	—	—

Example

The following example displays the version of VIA client available on the Switch.

```
(host) # show via version(host) (VIA Client WLAN Profile "example") #show  via version
Default VIA Installer:
----------------------
<aruba>
        <via>
                <platform>win32</platform>
                <version>1.0.0.23373</version>
        </via>
</aruba>
```

The following example displays the time that the VIA user last logged in.

```
(host) [mm] #show via-lastlogin
VIA users login Details
-----------------------
User Name  Last Login Time (GMT)
---------  --------------------
vpatil123  Wed Jun 20 16:41:19 2018
abc123     Fri Jun 22 05:40:48 2018
smidha     Fri Jun 22 06:55:59 2018
vpatil     Fri Jun 22 09:30:13 2018
Total Entries: 4
```

Command History

Release	Modification
AOS-W 8.4.0.0	The **lastlogin** parameter was introduced.

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable and Config mode on Mobility Master.

show vlan

```
show vlan <id>
```

Description

This command shows a configured VLAN interface number, description and associated ports.

Syntax

Parameter	Description	Range	Default
<id>	Identification number for the VLAN.	1-4094	1

Usage Guidelines

Issue this command to show the selected VLAN configuration. The **VLAN** column lists the VLAN ID. The **Description** column provides the VLAN name or number and the **Ports** column shows the VLAN's associated ports. The **AAA Profile column** shows if a wired AAA profile has been assigned to a VLAN, enabling role-based access for wired clients connected to an untrusted VLAN or port on the Switch.

```
(host) #show vlan

VLAN CONFIGURATION
------------------
VLAN  Description     Ports                          AAA Profile
----  -----------     -----                          -----------
1     Default         GE0/3-7 GE0/9 XG0/10-11 Pc0-7  N/A
10    VLAN0010        GE0/8                          N/A
20    RAP_VLAN                                       N/A
25    VLAN0025        GE0/0                          mac-auth-aaa-prof
30    VLAN0030                                       N/A
56    VLAN0056                                       default
57    VLAN0057                                       default
58    VLAN0058                                       default
```

show vlan-assignment-auth

```
show vlan-assignment-auth
```

Description

This command shows the VLAN usage in the user authentication module.

Syntax

No parameters.

Usage Guidelines

Issue this command to view all the VLAN IDs that are configured along with the current client count that uses that VLAN ID.

```
(host) #show vlan-assignment-auth

Vlan usage in AUTH
------------------
VLAN ID  Usage
-------  -----
10       0
```

Related Commands

Command	Description

show vlan mapping

```
show vlan mapping
```

Description

This command shows a configured VLAN name, its pool status, assignment type and the VLAN IDs assigned to the pool.

Syntax

Parameter	Description	Range	Default
<id>	Identification number for the VLAN.	1-4094	1

Usage Guidelines

Issue this command to show the selected VLAN configuration. The **VLAN Name** column displays the name of the VLAN pool. The **VLAN IDs** column lists the VLANs that are part of the pool.

```
(host) #show vlan mapping

Vlan Mapping Table
------------------
VLAN Name         Assignment Type  VLAN IDs
---------         ---------------  --------
mygroup           Hash             62,94
newpoolgroup      Even
vlannametest      Even             62,1511
yourvlan          N/A              62
```

show vlan status

```
show vlan status <id>
```

Description

This command shows the current status of all VLANs on the Switch.

Syntax

No parameters.

Usage Guidelines

Issue this command to show the status of VLANs on the Switch. The **VLANID** column displays the VLAN ID name or number. The **IP Address** column provides the VLAN's IP address. The **Adminstate** column indicates if the VLAN is enabled or disabled. The **Operstate** column indicates if the VLAN is currently up and running. The **PortCount** column shows how many ports are associated with the VLAN. The **Nat Inside** column displays whether source Nat is enabled for the VLAN interface. If Nat is enabled, all the traffic passing through this VLAN interface is the source natted to the outgoing interface's IP address.

```
(host) #show vlan status

Vlan Status
-----------
VlanId  IPAddress                    Adminstate  Operstate  PortCount  Nat Inside  Mode

show vlan-bwcontract-explist

```
show vlan-bwcontract-explist [internal]
```

Description

Show entries in the VLAN bandwidth contracts MAC exception lists.

Syntax

Parameter	Description
`internal`	Include the optional **internal** parameter to display the MAC addresses in the internal, preconfigured VLAN bandwidth contracts MAC exception list.

Example

The following command displays the MAC addresses in the internal MAC exception list.

```
(host) (config) #show vlan-bwcontract-explist internal

VLAN BW Contracts Internal MAC Exception List
-----------------------------------------
MAC address
-----------
01:80:C2:00:00:00
01:00:0C:CC:CC:CD
01:80:C2:00:00:02
01:00:5E:00:82:11
```

vpn-dialer	This command configures the VPN dialer.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable and Config mode on Mobility Master and managed devices.

show vrrp

```
show vrrp {{<vrid>[statistics]}|ipv6{<vrid>|stats[all]}|stats[all]|summary}
```

Description

Displays the list of all VRRP configuration on the managed device. To view a specific VRRP configuration, specify the VRID number.

Syntax

Parameter	Description	Range	Default
`<vrid>`	Displays the Virtual Router Id.	1-255	—
`ipv6`	Display VRRP information for IPv6 address.	—	—
`stats`	Displays the operational statistics of the VRRP.	—	—
`summary`	Displays the number of vrrp instances for IPv4 and IPv6.	—	—

Example

The output of the following command shows the VRRP IPv4 instance with vrid 1.

```
(host) [mynode] #show vrrp
Virtual Router 1:
Description
Admin State UP, VR State BACKUP
IP Address 0.0.0.0, MAC Address 00:00:5e:00:01:01, vlan 99
Priority 100, Advertisement 1 sec, Preemption Disable Delay 0
Hold time 45 sec
Auth type NONE ********
tracking is not enabled
```

The output of the following command shows the statistics for IPv4 vrrp instance with vrid 10.

```
(host) [mynode] # show vrrp 10 statistics
Virtual Router 10:
Admin State UP, VR State MASTER

show web-cc

```
show web-cc
   categories
   reputation
   md
      stats
   mm
      stats
   stats
   status
   global-bandwidth-contract all|{web-cc-category <category>}|{web-cc-reputation <reputation>}
```

Description

Display information about web content (web-cc) classification settings, category and reputation types, classification statistics and bandwidth contracts.

Syntax

Parameter	Description
`categories`	Display the category index number and the category name for each category type.
`md stats`	Display web content classification table statistics for the managed device. This command must be issued on the managed device.
`mm stats`	Display web content classification table statistics for Mobility Master.
`reputation`	Display the different reputation levels, and the range of reputation scores associated with each level.
`stats`	Display counters for web content traffic and web content classification table statistics
`status`	Display information about the current operational status of the web content classification feature.
`global-bandwidth-contract`	Display settings for global bandwidth contracts assigned to web content classification category types and reputation levels.
`all`	Show all bandwidth contracts
`web-cc-category <category>`	Display information for the specified web-cc category bandwidth contract.
`web-cc-reputation <reputation>`	Display information for the specified web-cc reputation bandwidth contract.

Usage Guidelines

The web content classification feature classifies all (HTTP/HTTPS) web traffic on the network. The output of the **show web-cc** command displays information about Webroot classification categories and risk reputation levels, bandwidth contracts, and the web content classification cache and database.

Examples

To see if the WebCC feature is able to send queries from Mobility Master to the WebRoot server in the cloud, issue the command **show web-cc status**.

```
(host)[mynode](config) #show web-cc status
Web Content Classification Status
---------------------------------
Service Status
------- ------
Web Content Classification enabled :    Yes
DNS/Name Server configured :            Yes
URL Cloud lookup server reachable :     Yes
Cloud lookup/update available :         Yes
Webroot Server Connection Type :        ipv6
Mode:                                   MM
```

The following command shows the global bandwidth contracts applied to upstream and downstream traffic matching the **music** content category.

```
(host)[mynode](config) #show web-cc global-bandwidth-contract web-cc-category music
Web-cc Global Bandwidth Contract
--------------------------------
Web-cc Category/Reputation  Direction   Rate (bits/second)  Contract    Id
--------------------------  ---------   ------------------  --------    --
web-cc-category music       Upstream    55000000            music-2126  2
web-cc-category music       Downstream  20000000            music-745c  1
```

The output of the **show web-cc** command varies, depending upon the parameters specified. The following table describes the information displayed in the output of this command when that parameter is included.

Parameter	Description
`categories`	Include this parameter to display the following information categories in the command output: ■ **Name**: names of the available web content classification categories ■ **Web Category ID**: ID number associated with a category name
`reputation`	Include this parameter to display the following information categories in the command output: ■ **RiskLevel**: names of the available web content classification risk levels ■ **Score**: Range of risk scores associated with a risk level
`Stats`	Include this parameter to display the following information categories in the command output: ■ **URL miss from sos**: number of times a URL was not found in the internal web content classification cache. ■ **Database hit:** number of times a URL was not found in the interal web content classification cache, but was found by the local web content classification database. ■ **Cloud lookup**: number of times a URL was not found by the local web content classification database, and was sent to the cloud for identification. ■ **Cloud response**: number of times the cloud responded to a cloud lookup request. ■ **RTU updates**: Number of times that the internal web content classification cache was udpated ■ **DB Entries**: Maximum number of entries allowed in the local web

Parameter	Description
	content classification database. This value varies by Switch type.
`Status`	Include this parameter to display the following information categories in the command output: ■ **Web Content Classification enabled**: Displays if the web content classification feature is enabled or disabled. ■ **DNS/Name Server configured**: Displays if DNS is configured on the Switch. The web content classification feature uses DNS to identify the URL cloud server, so DNS must be configured on the Switch for this feature to work. ■ **Cloud lookup/update available**: A status of **Yes** indicates that license pool for that configuration node has a sufficient number of unexpired Web Content Classification licenses. A status of **No** indicates that licenses have expired, or that there are not enough licenses for the managed devices in that pool. ■ **URL Cloud lookup server reachable**: Indicates if the Switch is able to contact the URL cloud server. ■ **Webroot Server Connection Type**: Displays if the connection to the Webroot server to look-up or download the URL database is by using IPv4 or IPv6 addresses. ■ **Mode**: Indicates operational mode for the WebCC feature. If the managed device is in centralized mode, the Mobility Master (MM) contacts the WebRoot server for URL queries. If the managed device is in distributed mode, the managed device contacts the WebRoot server directly.
`global-bandwidth-contract`	Include this parameter to display the following information categories in the command output: ■ **Web-cc Category/Reputation**: Name of the web content classification category or reputation level. ■ **Direction:** indicates whether the contract applies to upstream or downstream traffic. ■ **Rate (bits/second) :** bandwidth contract rate, in bits/second. ■ **Contract:** unique name assigned to the web-cc global bandwidth contract. ■ **Id:** identification number assigned to the web-cc global bandwidth contract.

The following output displays the current operational status of web content classification feature when the managed device is in the default centralized WebCC mode or in distributed mode:

```
MD : Webcc mode: Centralized
---------
(Aruba7210) #show web-cc status

Web Content Classification Status
---------------------------------
Service                                Status
-------                                ------
Web Content Classification enabled :   Yes
DNS/Name Server configured :           Yes
URL Cloud lookup server reachable :    Yes
Cloud lookup/update available :        Yes
Webroot Server Connection Type :       ipv6
Mode :                                 MD - Centralized
MM IP address :                        10.15.60.251

MD : Webcc mode: Distributed
---------------
```

```
(Aruba7210) #show web-cc status

Web Content Classification Status
---------------------------------
Service                                 Status
-------                                 ------

Switch Certificate                               default-self-signed
Captive Portal Certificate                       default
IDP Certificate                                  default-self-signed
Management user's WebUI access method            username/password
User absolute session timeout <30-3600> (seconds)  0
User session timeout <30-3600> (seconds)         900
Maximum supported concurrent clients <25-320>    25
Enable WebUI access on HTTPS port (443)          false
Enable bypass captive portal landing page        false
Exclude Security Headers from HTTP Response      false
```

The output of this command displays the web-server statistics.

```
(host) #show web-server statistics

Web Server Statistics:
----------------------
Current Request Rate:            1 Req/Sec
Current Traffic Rate:            0 KB/Sec
Busy Connection Slots:           1
Available Connection Slots:      24
Total Requests Since Up Time:    16854
Total Traffic Since Up Time:     199580 KB
Avg. Request Rate Since Up Time: 0 Req/Sec
Avg. Traffic Rate Since Up Time: 321 Bytes/Sec
Server Scoreboard ____________W____________

Scoreboard Key: _ - Waiting for Connection, s - Starting up
                R - Reading Request, W - Sending Reply
```

```
K - Keepalive, D - DNS Lookup
C - Closing connection, L - Logging
G - Gracefully finishing, I - Idle cleanup of worker
. - Open slot with no current process
```

The output of the **show web-server statistics** command includes the following parameters.

Parameter	Description
`Current Request Rate`	HTTP/HTTPS request rate measured immediately within the last one second.
`Current Traffic Rate`	HTTP/HTTPS data transfer rate measured immediately within the last one second.
`Busy Connection Slots`	Number of simultaneous HTTP/HTTPS sessions currently being served. Each session occupy one slot from the total available slot configured under the **web-max-clients <web-max-client>** parameter.
`Available Connection Slots`	Number of simultaneous HTTP/HTTPS sessions which can be served more than what is being served currently.
`Total Requests Since Up Time`	Total number of HTTP/HTTPS requests received by the web server since the server was up.
`Total Traffic Since Up Time`	Total number of HTTP/HTTPS traffic handled by the web server since the server was up.
`Avg. Request Rate Since Up Time`	Lifetime average of HTTP/HTTPS request rate. This is calculated by dividing the total number of requests received with the web server up-time.
`Avg. Traffic Rate Since Up Time`	Lifetime average of HTTP/HTTPS traffic rate. This is calculated by dividing the total of HTTP/HTTPS traffic with the web server up-time.
`Server Scoreboard`	Displays information of each worker thread of web server.

2                   1
```

The output of the following command displays the current connection state of the ClearPass WebSocket interface that is configured.

```
(host) [mynode] #show websocket state clearpass

ClearPass Web-Socket Connection State [Interface: Enabled]
----------------------------------------------------------
Server                          State
------                          -----
Primary:    SECIRTY67.ACMECOMPANY.COM:443  DOWN
Secondary:  10.17.5.210:443               UP[08/22/16 13:38:50]Established
```

The output of this command includes the following parameters.

Parameter	Description
Server	Displays the primary and secondary ClearPass Insight server.
State	Displays the state of the primary and secondary ClearPass Insight server, which is either UP or DOWN.

The output of the following command displays the current statistics of ClearPass WebSocket interface.

```
(host) [mynode] #show websocket statistics clearpass

ClearPass WebSocket Interface Statistics Summary
------------------------------------------------
DevId Replayed  DevId Created  DevId Deleted  SUB Item Sent  SUB Msg Sent  UNSUB Item Sent
UNSUB Msg Sent  PUB Item Received  PUB Item Posted
--------------  -------------  -------------  -------------  ------------  ---------------  --
------------  -----------------  ---------------
0               10             0              10             1             0                0
              0                  0
```

The output of this command includes the following parameters.

Parameter	Description
DevId Replayed	Counter to track the number of device Ids replayed.
DevId Created	Counter to track the number of device Ids created.
DevId Deleted	Counter to track the number of device Ids deleted.
SUB Item Sent	When an interface is established, the existing device Ids are re-played and sent as sub items to ClearPass.
SUB Msg Sent	Counter to track the sub items that are consolidated and sent to ClearPass as sub messages.
UNSUB Item Sent	Counter to track the sub items sent to ClearPass, when ever a device Id is deleted.
UNSUB Msg Sent	Counter to track the deleted sub items consolidated as a sub message and sent to ClearPass.
PUB Item Received	When a subscribed profile for a specific station is updated in the ClearPass Insight server, a PUB message with the station's device profile information is sent back to the Switch through the WebSocket connection. This event is mapped to the AOS-W device type data.
PUB Item Posted	Counter to track the items successfully posted.

show whitelist-db cpsec

```
show whitelist-db cpsec
   cert-type {factory-cert|switch-cert}
   mac-address <name>
   page <num>
   start <offset>
   state {approved-ready-for-cert|certified-factory-cert|unapproved-factory-cert|unapproved-
   no-cert}
```

Description

Display the campus AP whitelist for campus APs using the control plane security feature.

Syntax

Parameter	Description
`cert-type factory-cert|switch-cert`	■ **factory-cert**: Use this parameter if AP is using a factory certificate. ■ **switch-cert**: Use this parameter if AP is using a certificate signed by the switch
`mac-address <name>`	MAC address of the campus AP you want to enter into the CPsec whitelist database.
`page <num>`	AOS-W CLI displays 50 whitelist database entries per page. Filter the output of this command by displaying information starting at the specified page number.
`start <offset>`	Start displaying the table at the specified record in the database
`state approved-ready-for-cert certified-factory-cert unapproved-factory-cert unapproved-no-cert`	■ **approved-ready-for-cert**: AP in Approved state and is ready to receive a certificate. ■ **certified-factory-cert**: AP in Certified state and has a factory certificate. ■ **unapproved-factory-cert**: AP in Unapproved state and has a factory certificate. ■ **unapproved-no-cert**: AP in Unapproved state and has no or unknown certificate.

Usage Guidelines

Use this command to display the contents of the control plane security whitelist. To view information for a single AP, use the command **show whitelist-db cpsec mac-address <mac-address>**. To view a list of all secure APs on your Switch, use the command **show whitelist-db cpsec**. If your deployment includes both Mobility Master and managed devices, then the campus AP whitelist on every managed device contains an entry for every secure AP on the network, regardless of the managed device to which it is connected.

Example

The output of the following command shows the campus AP whitelist entry for an AP with the MAC address 00:16:CF:AF:3E:E1:

```
(host) #show whitelist-db cpsec mac-address 00:16:CF:AF:3E:E1

Control-Plane Security Whitelist-entry Details
----------------------------------------------
MAC-Address        AP-Group     AP-Name         Enable    State
-----------        --------     -------         ------    -----
```

```
00:16:CF:AF:3E:E1  employee     ap-office1      Enabled   cert-cont-cert

Cert-Type    Description  Revoke Text  Last Updated
---------    -----------  -----------  ------------
switch-cert                            Fri Oct 16 01:21:09 2009

Whitelist Entries: 1
```

The output of this command includes the following parameters:

Parameter	Description
`MAC-Address`	MAC address of the campus AP.
`Enable`	Shows whether the campus AP has been enabled or disabled.
`State`	Shows the current state of the campus AP. ■ **unapproved-no-cert**: AP has no certificate and is not approved. ■ **unapproved-factory-cert:** AP has a preinstalled certificate that was not approved. ■ **approved-ready-for-cert**: AP is valid, but is waiting to receive a certificate. ■ **certified-factory-cert**: AP has an approved factory-installed certificate ■ **certified-controller-cert**: AP has an approved certificate from the managed device. ■ **certified-hold-factory-cert**: An AP is put in this state when the managed device thinks the AP has been certified with a factory certificate yet the AP requests to be certified again. Since this is not a normal condition, the AP will not be reapproved as a secure AP until a network administrator manually changes the status of the AP to verify that it is not compromised. ■ **certified-hold-controller-cert**: An AP is put in this state when the managed device thinks the AP has been certified with a managed device certificate yet the AP requests to be certified again. Since this is not a normal condition, the AP will not be reapproved as a secure AP until a network administrator manually changes the status of the AP to verify that it is not compromised.
`Cert-Type`	Type of certificate used by the AP. ■ **switch-cert**: AP received a certificate from the managed device ■ **factory-cert**: AP has a factory-installed certificate
`Description`	If you included an optional description when you added the AP to the campus AP whitelist, that description will appear here.
`Revoke Text`	If you included an optional revoke description when you manually revoked the AP, that description will appear here.
`Last Updated`	Date and time that the AP record was last updated in the database.

show whitelist-db cpsec-local-switch-list

```
show whitelist-db cpsec-local-switch-list [mac-address <mac-address>]
```

Description

Display the list of managed devices with APs using the control plane security feature.

Syntax

Parameter	Description
`mac-address <mac-address>`	MAC address of the managed device whose data you want to view.

Usage Guidelines

When you use the control plane feature on a network with Mobility Master and managed devices, Mobility Master maintains a whitelist of managed devices with APs using control plane security. When you change a campus AP whitelist on any managed device, that managed device contacts Mobility Master to check the local switch whitelist, then contacts every other managed device on the local managed device whitelist to notify it of the change. This allows an AP to move between managed devices and still stay connected to the secure network.

To view information for a single managed device, use the command **show whitelist-db cpsec-local-switch-list mac-address <mac-address>**. To view a list of all managed devices, use the command **show whitelist-db cpsec-local-switch-list**.

Example

The following command shows information for all managed devices in the managed device whitelist:

```
(host) #show whitelist-db cpsec-local-switch-list
Registered Local Switch Details
-----------------------------------
MAC-Address        IP-Address  Sequence Number  Remote Sequence Number  NULL Update Count
-----------        ----------  ---------------  ----------------------  -----------------
00:0b:86:51:a5:4c 10.3.53.2               3    1
0
00:A0:C9:14:C8:29 10.3.53.4               3    0
0
Local Purge  Remote Purge  Remote Last-Seq  Last Update Sent           Last Update Received
-----------  ------------  ---------------  ----------------           --------------------
0            0              2                Mon May 4 13:33:29 2013   Mon May 4 13:33:18 2013
0            0              2                Mon May 4 13:32:55 2013   Mon May 4 13:32:19 2013

Whitelist Entries: 2
```

The output of this command includes the following information:

Parameter	Description
`MAC-Address`	MAC address of the managed device.
`IP-Address`	IP address of the managed device.

Parameter	Description
`Sequence Number`	The number of times the managed device in the whitelist received and acknowledged a campus AP whitelist change from Mobility Master. In the example above, both managed devices received and acknowledged three campus AP whitelist changes sent from Mobility Master.
`Remote Sequence Number`	The number of times that Mobility Master has received and acknowledged a campus AP whitelist change from the managed device in the whitelist. In the example above, Mobility Master received and acknowledged a single campus AP whitelist change from the managed device with the MAC address 00:0b:86:51:a5:4c.
`Null Update Count`	The number of times the managed device has checked its control plane security whitelist and found nothing to synchronize with the remote managed device. By default, the managed device compares its control plane security whitelist against whitelists on other managed devices every minute. If the null update count reaches 5, the managed device will send an “empty sync” heartbeat to the remote managed device to ensure the sequence numbers on both managed devices are the same, then reset the null update count to zero.

Related Commands

show whitelist-db cpsec-master-switch-list

```
show whitelist-db cpsec-master-switch-list [mac-address <mac-address>]
```

Description

Display the master switch list whitelist on managed devices with APs using the control plane security feature.

Syntax

Parameter	Description
`mac-address <mac-address>`	MAC address of Mobility Master.

Usage Guidelines

When you use the control plane feature on a network with both Mobility Master and managed devices, each managed device has a master switch whitelist which contains the IP and MAC addresses of Mobility Master. If your network has a redundant Mobility Master, then this whitelist will contain more than one entry.

To view information for a single Mobility Master, use the command **show whitelist-db cpsec-master-switch-list mac-address <mac-address>**. To view a list of all Mobility Masters, use the command **show whitelist-db cpsec-master-switch-list**.

Example

The following command shows that the managed devices have a single Mobility Master with the IP address 10.3.53.3:

```
(host) #show whitelist-db cpsec-master-list
Registered Master Switch Details
--------------------------------
Active  MAC-Address        IP-Address  Sequence Number  Remote Sequence Number  NULL Update
Count
------  -----------        ----------  ---------------  ----------------------  --------------
---
1       00:0b:86:61:ed:6c  10.3.53.11  1                3                       1
Local Purge  Remote Purge  Remote Last-Seq  Last Update Sent          Last Update Received
-----------  ------------  ---------------  ----------------          --------------------
0            0             1                Tue Aug  2 13:33:29 2012  Tue Aug  2 13:33:18 2012
```

The output of this command includes

Syntax

Parameter	Description
`MAC-Address`	MAC address of Mobility Master.
`IP-Address`	IP address of Mobility Master.

Parameter	Description
`Sequence Number`	The number of times Mobility Master in the whitelist received and acknowledged a campus AP whitelist change from the managed device. In the example above, Mobility Master received and acknowledged one campus AP whitelist change from the managed device.
`Remote Sequence Number`	The number of times that the managed device has received and acknowledged a campus AP whitelist change from the Mobility Master in the whitelist. In the example above, the managed device received and acknowledged three campus AP whitelist updates from Mobility Master.
`Null Update Count`	The number of times the managed device has checked its control plane security whitelist and found nothing to synchronize with Mobility Master. By default, the managed device compares its control plane security whitelist against whitelists on other managed devices every minute. If the null update count reaches 5, the managed device will send an “empty sync” heartbeat to the remote managed device to ensure the sequence numbers on both managed devices are the same, then reset the null update count to zero.

show whitelist-db cpsec-seq

```
show whitelist-db cpsec-seq
```

Description

Display the current sequence number for the Mobility Master or managed device whitelists.

Syntax

No Parameters

Usage Guidelines

The current sequence number in the **Sequence Number Details** table shows the number of changes to the campus AP whitelist made on this managed device.

Each managed device compares its campus AP whitelist against whitelists on other managed devices every two minutes. If a managed device detects a difference, it will send its changes to the other managed devices on the network. If all other managed devices on the network have successfully received and acknowledged all whitelist changes made on this managed device, every entry in the **sequence number** column in the managed device whitelist will have the same value as the number displayed in the **Sequence Number Details** table. If a managed device in the Mobility Master or managed device whitelist has a lower sequence number, that managed device may still be waiting to complete its update, or its update acknowledgement may not have yet been received.

Example

The output of the first command below shows that the campus AP whitelist has been updated 3 times on Mobility Master. The second command shows the managed device list on Mobility Master, and verifies that both managed devices have received and acknowledged all three of these changes.

```
(host) #show whitelist-db cpsec-seq
Sequence Number Details
-----------------------
Table Name       Current Seq Number
----------       ------------------
cpsec_whitelist  3

Whitelist Entries: 97

(host) # show whitelist-db cpsec-local-list

show whitelist-db cpsec-status

```
show whitelist-db cpsec-status
   [lms-list]
```

Description

Display aggregate status information APs in the campus AP whitelist.

Syntax

Parameter	Description
`lms-list`	Displays a list of LMS IP addresses.

Example

The output of the following command shows current status information for all APs in the campus AP whitelist:

```
(host) #show whitelist-db cpsec-status

My Mac-Address                00:1a:1e:00:89:b8
My IP-Address                 192.0.2.1
Master IP-Address             192.0.2.1
Switch-Role                   Master
Whitelist-sync is enabled

Entries in Whitelist database

Total entries:                41
Approved entries:              0
Unapproved entries:            0
Certified entries:            40
Certified hold entries:        0

show whitelist-db cpsec-stats

```
show whitelist-db cpsec-stats {mac-addr <mac-addr>}
```

Description

This command displays the statistics of CPSEC whitelist in an AP.

Syntax

Parameter	Description
`mac-addr <mac-addr>`	Displays whitelist entry of a specific AP.

Example

The output of the command displays the statistics of CPSEC whitelist,

```
(host)[mynode] #show whitelist-db cpsec-stats
Whitelist Statistics:
LNotS = Local sent notify seq num;        MNotR = Master recv notify seq num;          LNotR =

show whitelist-db rap

```
show whitelist-db rap
   apgroup <ap-group>
   apname <ap-name>
   export-css <filename>
   fullname <full-name>
   long
   mac-address <address>
   page <num>
   start <offset>
```

Description

View detailed information for the remote AP whitelist database.

Syntax

Parameter	Description
`apgroup <ap-group>`	Display specific AP-entries for this AP-group.
`apname <ap-name>`	Display specific AP-entry for this AP-name.
`export-css`	Export the remote AP white list to a file in the managed device's /flash/config/ folder. This file can be given to a content security provider to manage the remote AP database.
`fullname <full-name>`	Display specific AP-entry for this full-name in the RAP whitelist database.
`long`	Display additional debugging information about an entry in the RAP whitelist, including when it was last updated, the sequence number for the update, and any flags for the entry.
`mac-address <mac-addr>`	Display a whitelist entry for the specified RAP MAC address.
`page`	AOS-W CLI displays 50 whitelist database entries per page. Filter the output of this command by displaying information starting at the specified page number.
`start <offset>`	Start displaying the table at the specified record in the database

Example

In the example below, the command output has been divided into two tables to fit on a single page of this document. In the CLI, this output would appear in a single, wide table.

```
(host) #show whitelist-db rap

AP Entries: 5
```

The output of this command includes the following information:

Parameter	Description
`Name`	MAC address of the remote AP.
`AP-Group`	Name of the AP group to which th remotee AP has been assigned.
`AP-name`	Name of the remote AP. If no name has been specified, this column will display the remote AP's MAC address
`Full-name`	Text string used to identify the remote AP. This field often describes the AP's user, and corresponds to the **User Name** field in the RAP whitelist in the WebUI.
`Authen-Username`	User name of the user who authenticated the remote AP. This parameter holds the user name of the user who authenticated the remote AP. This is related to the zero touch authentication feature, as a user needs authenticate an AP before it gets its complete configuration. Before the AP is authenticated, it is given a restricted configuration to allow users to perform captive portal authorization via the remote AP's ENET ports to authenticate the remote AP. The username used during captive portal authentication will be stored in this field. This cannot be added manually when creating a local-userdb-ap entry.
`Revoke-Text`	The command **whitelist-db rap revoke** includes an optional **revoke-comment** parameter that allows network administrators to explain why the remote AP was revoked. If a remote AP is revoked, and a revoke comment entered, this text appears in the **revoke-text** column in the **show whitelist-db rap**command. When a local DB entry is reenabled via the command **whitelist-db rap modify mac-addr mode enable**, this field is cleared.
`AP_ Authenticated`	This column indicates the authorization status of the RAP. A RAP can either be **Authenticated** or **Provisioned**. Remote APs that *do not* support certificated-based provisioning will always display a **Provisioned** status. Remote APs that support certificated-based provisioning can display either a **Authenticated** or **Provisioned** status, depending on their configuration and authentication status. ■ If the remote AP has a defined AP authorization profile, the remote AP will be in a "Provisioned" state with a limited configuration until it is authenticated. After it the remote AP has been authenticated, it will be in an "Authenticated" state. ■ If the remote AP does not have a defined AP authorization profile, the remote AP will be in a "Provisioned" state, but will still receive the full configuration assigned to that AP and its AP group.
`Description`	A text string used to further identify the remote AP.
`Date-Added`	Date and time that the AP was added to the local user database

Parameter	Description

`Enabled`	This column shows if the entry in the database is enabled or disabled. Database entries can be enabled or disabled using the CLI commands:
	`whitelist-db rap {add|modify} mac-address <mac-addr> mode {enable|disable}`
	and
	`whitelist-db rap revoke mac-address <mac-addr>`

```

Description

Display the remote AP whitelist local switch list on Mobility Master.

Syntax

Parameter	Description
`mac-address <mac-address>`	MAC address of the managed device whose data you want to view.

Usage Guidelines

When you have remote APs on a network with both master and managed devices, Mobility Master maintains a whitelist of managed devices with remote APs. When you change a remote AP whitelist on any managed device, that managed device contacts Mobility Master to check the local switch whitelist, then contacts every other managed device on the local managed device whitelist to notify it of the change. This allows a remote AP to move between managed devices and still stay connected to the secure network.

To view information for a single managed device, use the command **show whitelist-db rap-local-switch-list mac-address <mac-address>**. To view a list of all managed devices, use the command **show whitelist-db rap-local-switch-list**.

Example

The following command shows information for all managed devices in the managed device whitelist. The output in the example below has been divided into sections to better fit on the pages of this document. In the AOS-W CLI, the output appears in a single, long table.

```
(host) #show whitelist-db rap-local-switch-list

Active   MAC-Address        IP-Address          Sequence Number         Remote Sequence Number
-------  -----------        ----------          ---------------         ----------------------
1         00:0b:86:51:a5:4c 10.3.53.2   3                      1
1         00:A0:C9:14:C8:29 10.3.53.4   3                      0

NULL Update Count       Local Purge  Remote Purge  Remote Last-Seq  Last Update Sent
-----------------       -----------  ------------  ---------------  ----------------
0                       0            0              2                Mon May 4 13:33:29 2013
0                       0            0              2                Mon May 4 13:32:55 2013

Last Update Received
--------------------
Mon May 4 13:33:18 2013
Mon May 4 13:32:19 2013W

Whitelist Entries: 2
```

The output of this command includes the following information:

Parameter	Description
`Active`	Shows if the managed device is active on the network. ■ 1: Active ■ 0: Inactive
`MAC-Address`	MAC address of the managed device.
`IP-Address`	IP address of the managed device.
`Sequence Number`	The number of times the managed device in the whitelist received and acknowledged a remote AP whitelist change from Mobility Master. In the example above, both managed devices received and acknowledged three remote AP whitelist changes sent from Mobility Master.
`Remote Sequence Number`	The number of times that Mobility Master has received and acknowledged a remote AP whitelist change from the managed device in the whitelist. In the example above, Mobility Master received and acknowledged a single remote AP whitelist change from the managed device with the MAC address 00:0b:86:51:a5:4c.
`Null Update Count`	The number of times the managed device has checked its remote AP whitelist and found nothing to synchronize with the remote managed device. By default, the managed device compares its remote AP whitelist against whitelists on other managed devices every minute. If the null update count reaches 5, the managed device will send an “empty sync” heartbeat to the remote managed device to ensure the sequence numbers on both managed devices are the same, then reset the null update count to zero.

Related Commands

show whitelist-db rap-master-switch-list

```
show whitelist-db rap-local-switch-list [mac-address <mac-address>]
```

Description

Display the remote AP whitelist master switch list on managed devices with remote APs

Syntax

Parameter	Description
`mac-address <mac-address>`	MAC address of the managed device whose data you want to view.

Usage Guidelines

When your network has with both master and managed devices, each managed device with associated remote APs has a master switch whitelist which contains the IP and MAC addresses of Mobility Master. If your network has a redundant Mobility Master, then this whitelist will contain more than one entry.

To view information for a single Mobility Master, use the command **show whitelist-db rap-master-switch-list mac-address <mac-address>**. To view a list of all Mobility Masters, use the command **show whitelist-db rap-master-switch-list**.

Example

The following command shows that the managed devices have a single Mobility Master with the IP address 192.0.2.143. The output in the example below has been divided into sections to better fit on the pages of this document. In the AOS-W CLI, the output appears in a single, long table.

```
Active   MAC-Address           IP-Address       Sequence Number         Remote Sequence
                                                                         Number
-------  -----------           ----------       ---------------         ---------------
1         00:0b:86:51:a5:4c   192.0.2.14        2                       2

show whitelist-db rap-status

```
show whitelist-db rap-status
```

Description

Display aggregate status information APs in the remote AP whitelist.

Syntax

No parameters.

Example

The output of the following command shows current status information for all APs in the remote AP whitelist:

```
(host) #show whitelist-db rap-status
Entries in Whitelist database

Total entries:                41
Revoked entries:               1
Marked for deletion entries:   0
```

The output of this command includes

Syntax

Parameter	Description
`Total entries`	Total number of entries in the remote AP whitelist
`Revoked entries`	Number of remote APs whose entries have been revoked
`Marked for deletion entries`	Number of remote APs whose entries have been marked for deletion. An entry will not be permanently deleted until all other managed devices on the network acknowledge the deletion.

show wired-blacklist-clients

```
show wired-blacklist-clients
```

Description

This command shows wired clients that are blacklisted.

Usage Guidelines

Issue this command to list the blacklisted wired clients.

Examples

```
(host) [mynode] (config)#show wired-blacklist-clients
```

The output of this command is as follows:

```
Wired user Blacklist table
--------------------------
MAC   AP name   Slot/Port   Reason   Blacklist Time (Sec)
---   -------   ---------   ------   --------------------
b4:b5:2f:8d:cc:96   ac:a3:1e:cd:36:84   0/1         session-blacklist   258
```

show wlan anyspot-profile

```
show wlan anyspot-profile [<profile-name>]
```

Description

The output of this command displays configuration settings for a WLAN anyspot profile.

Syntax

Parameter	Description
<profile>	Name of an anyspot profile.

Usage Guidelines

The anyspot client probe suppression feature decreases network traffic by suppressing probe requests from clients attempting to locate and connect to other known networks. Issue this command without the **<profile>** parameter to display the entire anyspot profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Example

The following command displays configuration information for an active (enabled) anyspot profile with two excluded ESSIDs, and one preset ESSID.

```
Anyspot profile "default"
-------------------------
Parameter                                 Value
---------                                 -----
Enable Anyspot                            true
Exclude ESSID(s) (exact match)            corp_dev_1
Exclude ESSID(s) (exact match)            corp_voip_1
Exclude ESSID(s) (containing string(s))   N/A
Preset ESSID(s)                           corpGuest
```

Parameter	Description
enable-anyspot	Indicates if the anyspot feature is enabled or disabled.
exclude-essid <exclude-essid>	An anyspot-enabled radio will not respond to client probe requests using an ESSID in the **Exclude ESSID** lists. ESSIDs from neighboring APs will automatically appear in this list as long as the anyspot-enabled AP can detect that ESSID.
exclude-wildcard <exclude-wildcard>	An anyspot-enabled radio will not respond to client probe requests using an ESSID that matches a string in the **Exclude ESSID (containing string) list.**
preset-essid <preset-essid>	If a client sends a probe request without an ESSID (that is, the probe request is not looking for a specific network) then the anyspot-enabled AP will respond to the probe request with an ESSID from this list.

show wlan bcn-rpt-req-profile

```
show wlan bcn-rpt-req-profile <profile-name>
```

Description

Shows configuration and other information about the parameters for the Beacon Report Request frames.

Syntax

Parameter	Description
<profile>	Name of a WLAN beacon report request profile.

Usage Guidelines

Issue this command without the <profile> parameter to display the entire Beacon Report Request profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

For this profile to take effect, the 802.11K feature needs to be enabled.

Examples

```
(host) #show wlan bcn-rpt-req-profile
Beacon Report Request Profile List
----------------------------------
Name     References  Profile Status
----     ----------  --------------
default  1
test     0
Total:2
(host) #
(host) #show wlan bcn-rpt-req-profile default

Beacon Report Request Profile "default"
---------------------------------------
Parameter                           Value
---------                           -----
Interface                           1
Regulatory Class                    12
Channel                             9
Randomization Interval              100
Measurement Duration                100
Measurement Mode for Beacon Reports active-all-ch
Reporting Condition                 2
ESSID Name                          aruba-ap
Reporting Detail                    Disabled
Measurement Duration Mandatory      Disabled
Request Information values          0/21/22
```

The output of this command includes the following parameters:

Parameter	Description
`Interface`	Specifies the Radio interface for transmitting the Beacon Report Request frame. It can have a value of either 0 or 1.
`Regulatory Class`	Specifies the Regulatory Class field in the Beacon Report Request frame.
`Channel`	Specifies the Channel field in the Beacon Report Request frame.
`Randomization Interval`	Specifies the Randomization Interval field in the Beacon Report Request frame. The Randomization Interval is used to specify the desired maximum random delay in the measurement start time. It is expressed in units of TUs (Time Units).
`Measurement Duration`	Specifies the Measurement Duration field in the Beacon Report Request frame. The Measurement Duration is set to the duration of the requested measurement. It is expressed in units of TUs.
`Measuremement Mode for Beacon Reports`	Specifies the mode used for the measurement. The valid measurement modes are: ■ active-all-ch ■ active-ch-rpt ■ beacon-table ■ passive
`Reporting Condition`	Specifies the value for the "Reporting Condition" field in the Beacon Reporting Information sub-element present in the Beacon Report Request frame.
`ESSID Name`	Specifies the value for the "SSID" field in the Beacon Report Request frame.
`Reporting Detail`	Indicates the value for the "Detail" field in the Reporting Detail sub-element present in the Beacon Report Request frame.
`Measurement Duration Mandatory`	Specifies the "Duration Mandatory" bit of the Measurement Request Mode field of the Beacon Report Request frame.
`Request Information values`	Indicates the contents of the Request Information IE that could be present in the Beacon Report Request frame. The Request Information IE is present for all Measurement Modes except the 'Beacon Table' mode. It consists of a list of Element IDs that should be included by the client in the response frame.

show wlan dot11k-profile

```
show wlan dot11k-profile [<profile>]
```

Description

Show a list of all 802.11k profiles, or display detailed configuration information for a specific 802.11k profile.

Syntax

Parameter	Description
<profile>	Name of an 802.11k profile.

Usage Guidelines

Issue this command without the <profile> parameter to display the 802.11k profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the Switch has two configured 802.11k profiles. The **References** column lists the number of other profiles with references to the 802.11k profile, and the **Profile Status** column indicates whether the profile is predefined. (User-defined profiles will not have an entry in the Profile Status column.)

```
(host) #show wlan dot11k-profile

802.11K Profile List
--------------------
Name                            References  Profile Status
----                            ----------  --------------
default                         8
11kprofile2             1
Total: 2
```

The following example shows configuration settings defined for the profile **default**.

```
(host) #show wlan dot11k-profile default

802.11K Profile "default"
-------------------------
Parameter                                                       Value
---------                                                       -----
Advertise 802.11K Capability                                    Disabled
Forcefully disassociate on-hook voice clients                   Disabled
Measurement Mode for Beacon Reports                             beacon-table
Configure specific channel for Beacon Requests                  Disabled
Channel requested for Beacon Reports in 'A' band                36
Channel requested for Beacon Reports in 'BG' band               1
Time duration between consecutive Beacon Requests               60 sec
Time duration between consecutive Link Measurement Requests     60 sec
Time duration between consecutive Transmit Stream Measurement Requests  90 sec
```

The output of this command includes the following data columns:

Parameter	Description
Advertise 802.11K Capability	Shows if the profile has enabled or disabled the 802.11K feature.
Forcefully disassociate on-hook voice clients	If enabled, the AP may forcefully disassociate clients that reach the maximum CAC peak capacity or call handoff reservation.
Measurement Mode for Beacon Reports	Shows the profile's beacon measurement mode: ■ **active**: In this mode, the client sends a probe request to the broadcast destination address on all supported channels, sets a measurement duration timer, and, at the end of the measurement duration, compiles all received beacons or probe response with the requested SSID and BSSID into a measurement report. ■ **beacon-table**: In this mode, the client measures beacons and returns a report with stored beacon information for any supported channel with the requested SSID and BSSID. The client does not perform any additional measurements. This is the default beacon measurement mode. ■ **passive**: In this mode, the client sets a measurement duration timer, and, at the end of the measurement duration, compiles all received beacons or probe response with the requested SSID and BSSID into a measurement report.

--------------------
Name              References  Profile Status
----              ----------  --------------
default           8
voice-enterprise  1

Total: 2
```

The following example shows configuration settings defined for the profile **default**.

```
(host) #show wlan dot11r-profile default
802.11r Profile "default"
-------------------------
Parameter                    Value
---------                    -----
Advertise 802.11r Capability  Disabled
802.11r Mobility Domain ID    1
802.11r R1 Key Duration       3600
802.11r R1 Key Assignment     dynamic
```

The output of this command includes the following data columns:

Parameter	Description
Advertise 802.11r Capability	Shows if the profile has enabled or disabled the 802.11r feature.
802.11r Mobility Domain ID	Shows the unique ID that identifies the mobility domain.

Parameter	Description
802.11r R1 Key Duration	Shows the r1 key timeout value in seconds for decrypt-tunnel or bridge mode.
`802.11r R1 Key Assignment`	Shows if the r1 key assignment is static or dynamic.

show wlan edca-parameters-profile

```
show wlan edca-parameters-profile ap|station [<profile>]
```

Description

Display an EDCA profile for APs or for clients (stations). EDCA profiles are specific either to APs or clients.

Syntax

Parameter	Description
<profile>	Name of a EDCA Parameters profile.

Usage Guidelines

Issue this command without the <profile> parameter to display a EDCA Parameters profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the Switch has three EDCA Parameters profiles configured for stations. The **References** column lists the number of other profiles with references to the EDCA Parameters profile, and the **Profile Status** column indicates whether the profile is predefined. (User-defined profiles will not have an entry in the Profile Status column.)

```
(host) #show wlan edca-parameters-profile station
EDCA Parameters profile (Station) List
----------------------------------
Name            References  Profile Status
----            ----------  --------------
station-corp1   3
station-corp2   1
testprofile     0

Total:3
```

The following example shows configuration settings defined for the profile **station-corp1**.

```
(host) #show wlan edca-parameters-profile ap station-corp1
EDCA Parameters
---------------
AC            ECWmin   ECWmax   AIFSN   TXOP   ACM
--            ------   ------   -----   ----   ---
Best-effort   4        6        3       0      0
Background    4        10       7       0      0
Video         3        4        1       94     0
Voice         2        3        1       47     0
```

The output of this command includes the following data columns:

Parameter	Description
AC	Name of an Access channel queue (**Best-effort**, **Background**, **Video** or **Voice**).

Parameter	Description
ECWmin	The exponential (n) value of the minimum contention window size, as expressed by 2^n-1. A value of 4 computes to 2^4-1 = 15.
ECWmax	The exponential (n) value of the maximum contention window size, as expressed by 2^n-1. A value of 4 computes to 2^4-1 = 15.
AIFSN	Arbitrary inter-frame space number.
TXOP	Transmission opportunity, in units of 32 microseconds.
ACM	If this column displays a 1, the profile has enabled mandatory admission control. If this column displays a 0, the profile has disabled this feature.

Syntax

Parameter	Description
<profile>	Name of a wlan hotspot advertisement profile.

Usage Guidelines

ANQP profiles and H2QP profiles define the 802.11u IEs to be broadcast by an 802.11u-capable AP. Use this command to view the ANQP and H2QP profiles to be associated with the advertisement profile.

Issue this command without the **<profile>** parameter to display the entire ANQP advertisement profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the Switch has two configured advertisement profiles. The **References** column lists the number of other profiles with references to the advertisement profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column

```
(host) # show wlan hotspot advertisement-profile
Advertisement Profile List
--------------------------
Name           References  Profile Status
----           ----------  --------------
default        1
Westgate_Mall  2
Total:2.
```

This example displays the configuration settings for the profile **Wireless_rf_profile.**

```
(host) (config) #show wlan hotspot advertisement-profile Wireless_rf_profile
Advertisement Profile "default"
------------------------------
Parameter                              Value
---------                              -----
ANQP Venue Name Profile                venue_mall
ANQP Network Authentication Profile    auth1
ANQP Roaming Consortium Profile        default
ANQP NAI Realm Profile                 Realm2
ANQP 3GPP Cellular Network Profile     default
ANQP IP Address Availability Profile   ipv4_Profile
H2QP WAN Metrics Profile        default
H2QP Operator Friendly Name Profile    default
H2QP Connection Capability Profile     default
H2QP Operating Class Indication Profile default
ANQP Domain Name Profile               corp_domain
```

The output of this command includes the following parameters:

Parameter	Description
ANQP Venue Name Profile	Name of the ANQP Venue Name profile associated with this WLAN advertisement profile.
ANQP Network Authentication Profile	Name of the ANQP Network Authentication profile associated with this WLAN advertisement profile.
ANQP Roaming Consortium Profile	Name of the ANQP Roaming Consortium profile associated with this WLAN advertisement profile.
ANQP NAI Realm Profile	Name of the ANQP NAI Realm profile associated with this WLAN advertisement profile.
ANQP 3GPP Profile	Name of the ANQP 3GPP Cellular Network profile associated with this WLAN advertisement profile.
ANQP IP Address Availability Profile	Name of the ANQP IP Address Availability profile associated with this WLAN advertisement profile.
H2QP WAN Metrics Profile	Name of the H2QPWAN Metrics profile associated with this WLAN advertisement profile.
H2QP Operator Friendly Name Profile	Name of the H2QP Operator Friendly Name profile associated with this WLAN advertisement profile.
H2QP Connection Capability Profile	Name of the H2QP Connection Capability profile associated with this WLAN advertisement profile.
H2QP Operating Class Indication Profile	Name of the H2QP Operating Class Indication profile associated with this WLAN advertisement profile.
ANQP Domain Name Profile	Name of the ANQP domain name profile associated with this WLAN advertisement profile.

show wlan hotspot anqp-3gpp-nwk-profile

```
show wlan hotspot anqp-3gpp-nwk-profile [<profile-name>]
```

Description

This profile shows the configuration settings for for a 3GPP Cellular Network profile.

Syntax

Parameter	Description
<profile>	Name of a 3GPP Cellular Network profile.

Usage Guidelines

ANQP profiles define the 802.11u IEs to be broadcast by an 802.11u-capable AP. Issue this command without the **<profile>**parameter to display the entire list of 3GPP profiles, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the Switch has two configured 3GPP profiles. The **References** column lists the number of other profiles with references to the advertisement profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column

```
(host) (config)# show wlan hotspot anqp-3gpp-nwk-profile
ANQP 3GPP Cellular Network Profile List
---------------------------
Name            References  Profile Status
----            ----------  --------------
default         1
Updated_PLMN    2
Total:2.
```

This example displays the configuration settings for the profile **Updated_PLMN.**

```
(host) (config)# show wlan hotspot anqp-3gpp-nwk-profile Updated_PLMN
ANQP 3GPP Cellular Network Profile "Updated_PLMN"
-----------------------------------------
Parameter                       Value
---------                       -----
ANQP 3GPP network profile enable  Enabled
3GPP PLMN1                      310026
3GPP PLMN2                      208000
3GPP PLMN3                      208001
3GPP PLMN4                      N/A
3GPP PLMN5                      N/A
3GPP PLMN6                      N/A
```

The output of this command includes the following parameters:

Parameter	Description
`ANQP 3GPP network profile enable`	Shows if this profile has been enabled ANQP 3GPP Cellular Network profiles are disabled by default.
`3gpp PLMN1`	The Public Land Mobile Networks (PLMN) value of the highest-priority network. The PLMN is comprised of a 12-bit Mobile Country Code (MCC) and the 12-bit Mobile Network Code (MNC).
`3gpp PLMN2`	The Public Land Mobile Networks (PLMN) value of the second-highest priority network. The PLMN is comprised of a 12-bit Mobile Country Code (MCC) and the 12-bit Mobile Network Code (MNC).
`3gpp PLMN3`	The Public Land Mobile Networks (PLMN) value of the third-highest priority network. The PLMN is comprised of a 12-bit Mobile Country Code (MCC) and the 12-bit Mobile Network Code (MNC).
`3gpp PLMN4`	The Public Land Mobile Networks (PLMN) value of the fourth-highest priority network. The PLMN is comprised of a 12-bit Mobile Country Code (MCC) and the 12-bit Mobile Network Code (MNC).
`3gpp PLMN5`	The Public Land Mobile Networks (PLMN) value of the fifth-highest priority network. The PLMN is comprised of a 12-bit Mobile Country Code (MCC) and the 12-bit Mobile Network Code (MNC).
`3gpp PLMN6`	The Public Land Mobile Networks (PLMN) value of the sixth-highest priority network. The PLMN is comprised of a 12-bit Mobile Country Code (MCC) and the 12-bit Mobile Network Code (MNC).

Usage Guidelines

The 3GPP Cellular Network Profile defines an ANQP IE to be sent in a GAS query response from an AP in a hotspot with a roaming relationship with a cellular operator. The 3GPP mobile country code and the 12-bit Mobile Network Code data in the IE can help the client select a 3GPP network.

Values configured in this profile will not be sent to clients unless you:

1. Associate the 3GPP Cellular Network profile with an ANQP advertisement profile. (`wlan hotspot advertisement profile <profile-name> anqp-3gpp-nwk-profile <profile-name>`)
2. Associate the ANQP advertisement profile with a Hotspot profile. (`wlan hotspot h2-profile advertisement-profile <profile-name>`)
3. Enable the hotspot feature within that Hotspot profile. (`wlan hotspot h2-profile <profile-name>hotspot-enable`)

show wlan hotspot anqp-domain-name-profile

show wlan hotspot anqp-domain-name-profile [<profile-name>]

Description

The output of this command displays settings for a WLAN ANQP Domain Name profile.

Syntax

Parameter	Description
`<profile>`	Name of a Domain Name profile.

Usage Guidelines

ANQP profiles define the 802.11u IEs to be broadcast by an 802.11u-capable AP. Use this command to select one of each type of ANQP profile to be associated with the advertisement profile.

Issue this command without the **<profile>** parameter to display the entire ANQP Domain Name profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Values configured in this profile will not be sent to clients unless you:

1. Associate the ANQP Domain Name profile an ANQP advertisement profile. (wlan hotspot advertisement-profile <profile-name> anqp-domain-name-profile)
2. Associate the ANQP advertisement profile with a Hotspot profile. (wlan hotspot h2-profile advertisement-profile <profile-name>)
3. Enable the hotspot feature within that Hotspot profile. (wlan hotspot h2-profile <profile-name>hotspot-enable)

Examples

The example below shows that the Switch has two configuredDomain Name profiles. The **References** column lists the number of other profiles with references to the Domain Name profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column

```
(host) # show wlan hotspot anqp-domain-name
ANQP Domain Name Profile List
-----------------------------
Name        References  Profile Status
----        ----------  --------------
corp_domain  2
default     1
Total:2.
```

This example displays the configuration settings for the profile **corp_domain.**

```
(host) #show wlan hotspot anqp-domain-name-profile corp_domain
ANQP Domain Name Profile "corp_domain"
--------------------------------------
Parameter    Value
---------    -----
Domain Name  example.com
```

The output of this command includes the following parameters:

Parameter	Description
Domain Name	Domain name of the hotspot operator.

show wlan hotspot anqp-ip-addr-avail-profile

```
show wlan hotspot anqp-ip-addr-avail-profile [<profile-name>]
```

Description

The output of this command displays settings for a WLAN ANQP IP Address Availability profile.

Syntax

Parameter	Description
`<profile>`	Name of an IP Address Availability profile.

Usage Guidelines

ANQP profiles define the 802.11u IEs to be broadcast by an 802.11u-capable AP. Use this command to select one of each type of ANQP profile to be associated with the advertisement profile.

Issue this command without the **<profile>** parameter to display the entire ANQP IP Address Availability profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Values configured in this profile will not be sent to clients unless you:

1. Associate the ANQP IP Address Availability profile an ANQP advertisement profile.(`wlan hotspot advertisement profile <profile-name> anqp-ip-addr-avail-profile <profile-name>`)
2. Associate the ANQP advertisement profile with a Hotspot profile. (`wlan hotspot h2-profile advertisement-profile <profile-name>`)
3. Enable the hotspot feature within that Hotspot profile. (`wlan hotspot h2-profile <profile-name>hotspot-enable`)

Examples

The example below shows that the Switch has three configured IP Address Availability profiles. The **References** column lists the number of other profiles with references to the IP Address Availability profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column

```
(host) # show wlan hotspot anqp-ip-addr-avail-profile
ANQP IP Address Availability Profile List
-----------------------------------------
Name          References  Profile Status
----          ----------  --------------
default       0
ipv4_Profile  2
ipv6_profile  1
Total:3.
```

This example displays the configuration settings for the profile **ipv4_Profile.**

```
(host) #show rf anqp-ip-addr-avail-profile ipv4_Profile
ANQP IP Address Availability Profile "ipv4_Profile"
-----------------------------------------------
Parameter                      Value
---------                      -----
IPv4 Address Availability Type  public
```

```
IPv6 Address Availability Type  not-available
The output of this command includes the following parameters:
```

Parameter	Description
IPv4 Address Availability Type	Indicates the availability of an IPv4 network. This parameter can display any of the following values: ■ availability-unknown: Network availability cannot be determined. ■ not-available : Network is not available. ■ port-restricted : Network has some ports restricted (for example, the network blocks port 110 to retrict POP mail). ■ port-restricted-double-nated : Network has some ports restricted and multiple routers performing network address translation. ■ port-restricted-single-nated : Network has some ports restricted and a single router performing network address translation. ■ private-double-nated : Network is a private network with multiple routers doing network address translation. ■ private-single-nated : Network is a private network a single router doing network address translation. ■ public : Network is a public network
IPv6 Address Availability Type	Indicates the availability of an IPv6 network. This parameter can display any of the following values: ■ available : An IPv6 network is available. ■ availability-unknown: Network availability cannot be determined. ■ not-available : Network is not available.

show wlan hotspot anqp-nai-realm-profile

```
show wlan hotspot anqp-nai-realm-profile [<profile-name>]
```

Description

The output of this command displays settings for a WLAN ANQP Network Access Identifier (NAI) Realm profile.

Syntax

Parameter	Description
`<profile>`	Name of an NAI Realm profile.

Usage Guidelines

ANQP profiles define the 802.11u IEs to be broadcast by an 802.11u-capable AP. Use this command to select one of each type of ANQP profile to be associated with the advertisement profile.

Issue this command without the **<profile>** parameter to display the entire ANQP NAI Realm profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Values configured in this profile will not be sent to clients unless you:

1. Associate the ANQP NAI Realm profile an ANQP advertisement profile. (`wlan hotspot advertisement profile <profile-name> anqp-nai-realm-profile <profile-name>`)
2. Associate the ANQP advertisement profile with a Hotspot profile. (`wlan hotspot h2-profile advertisement-profile <profile-name>`)
3. Enable the hotspot feature within that Hotspot profile. (`wlan hotspot h2-profile <profile-name>hotspot-enable`)

Examples

The example below shows that the Switch has three configured NAI Realm profiles. The References column lists the number of other profiles with references to the NAI Realm profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column

```
(host) # show wlan hotspot anqp-nai-realm-profile

ANQP NAI Realm Profile List
---------------------------
Name     References  Profile Status
----     ----------  --------------
default  0
Realm1   2Realm2   2

Total:3.
```

This example displays the configuration settings for the profile **Realm2.**

```
(host) #show wlan hotspot anqp-nai-realm-profile Realm2
ANQP NAI Realm Profile "Realm2"
-------------------------------
Parameter                              Value
---------                              -----
NAI Realm name                         example.com
NAI Realm EAP Method                   eap-ttls
```

```
NAI Realm Authentication Parameter Type  expanded-eap
```

The output of this command includes the following parameters:

Parameter	Description
NAI Realm name	Name of the NAI realm. The realm name is often the domain name of the service provider.
NAI Realm EAP Method	The NAI Realm Authentication types sent as an ANQP IE in an GAS response
NAI Realm Authentication Parameter Type	The EAP authentication method supported by the hotspot realm.

show wlan hotspot anqp-nwk-auth-profile

```
show wlan hotspot anqp-nwk-auth-profile [<profile-name>]
```

Description

The output of this command displays settings for a WLAN ANQP network authentication profile.

Syntax

Parameter	Description
<profile>	Name of an ANQP Network Authentication profile.

Usage Guidelines

ANQP profiles define the 802.11u IEs to be broadcast by an 802.11u-capable AP. Use this command to select one of each type of ANQP profile to be associated with the advertisement profile.

Issue this command without the **<profile>** parameter to display the entire ANQP network authentication profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the Switch has two configured network authentication profiles. The **References** column lists the number of other profiles with references to the network authentication profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host) # show wlan hotspot anqp-nwk-auth-profile

ANQP Network Authentication Profile List
----------------------------------------
Name         References  Profile Status
----         ----------  --------------
auth1        0
default      0

Total:2.
```

The following example displays the configuration settings for the profile **default.**

```
(host) #show wlan hotspot anqp-nwk-auth-profile default

ANQP Network Authentication Profile "default"
---------------------------------------------
Parameter                      Value
---------                      -----
Type of Network Authentication  acceptance
Redirect URL                   N/A
```

The output of this command includes the following parameters:

Parameter	Description
Type of Network Authentication	Network Authentication Type being used by the hotspot network. This parameter can be any of the following values: ■ acceptance: Network requires the user to accept terms and conditions. ■ dns-redirection: Additional information on the network is provided through DNS redirection. ■ http-https-redirection : Additional information on the network is provided through HTTP/HTTPS redirection. ■ online-enroll : Network supports online enrollment.
Redirect URL	If information on the network is provided through DNS redirection, this parameter displays the redirection URL.

show wlan hotspot anqp-roam-cons-profile

```
show wlan hotspot anqp-roam-cons-profile [<profile-name>]
```

Description

The output of this command displays settings for a WLAN ANQP Roaming Consortium profile.

Syntax

Parameter	Description
<profile>	Name of an ANQP Roaming Consortium profile.

Usage Guidelines

ANQP profiles define the 802.11u IEs to be broadcast by an 802.11u-capable AP. Use this command to select one of each type of ANQP profile to be associated with the advertisement profile.

Issue this command without the <profile>parameter to display the entire ANQP Roaming Consortiumprofile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Values configured in this profile will not be sent to clients unless you:

1. Associate the ANQP Roaming Consortium profile an ANQP advertisement profile. (`wlan hotspot advertisement profile <profile-name> anqp-roam-cons-profile <profile-name>`)
2. Associate the ANQP advertisement profile with a Hotspot profile. (`wlan hotspot h2-profile advertisement-profile <profile-name>`)
3. Enable the hotspot feature within that Hotspot profile. (`wlan hotspot h2-profile <profile-name>hotspot-enable`)

Examples

The example below shows that the Switch has two configured Roaming Consortium profiles. The **References** column lists the number of other profiles with references to the Roaming Consortium profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host) # show wlan hotspot anqp-roam-cons-profile
ANQP Roaming Consortium Profile List
------------------------------------
Name      References  Profile Status
----      ----------  --------------
default   1
Roam_OI2  1
Total:2.
```

This example displays the configuration settings for the profile **Roam_OI2.**

```
(host) #show wlan hotspot anqp-roam-cons-profile Roam_OI2
ANQP Roaming Consortium Profile "Roam_OI2"
------------------------------------------
Parameter                 Value
---------                 -----
Roaming consortium OI Len  3
Roaming consortium OI Len b32af0
```

The output of this command includes the following parameters:

Parameter	Description
`Roaming consortium OI Len`	Length of the OI. The roaming consortium OI length parameter is based upon the number of octets of the Roaming consortium OI. This parameter can have the following values: ■ **0**: 0 Octets in the OI (Null) ■ **3**: OI length is 24-bit (3 Octets) ■ **5**: OI length is 36-bit (5 Octets)
`Roaming Consortium OI`	The roaming consortium OI sent in a GAS query response.

show wlan hotspot anqp-venue-name-profile

```
show wlan hotspot anqp-venue-name-profile [<profile-name>]
```

Description

The output of this command displays settings for a WLAN ANQP Venue Name profile.

Syntax

Parameter	Description
<profile>	Name of an ANQP Venue Name profile.

Usage Guidelines

ANQP profiles define the 802.11u IEs to be broadcast by an 802.11u-capable AP. Use this command to select one of each type of ANQP profile to be associated with the advertisement profile.

Issue this command without the <profile>parameter to display the entire ANQP Venue Name profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Values configured in this profile will not be sent to clients unless you:

1. Associate the ANQP Venue Name profile an ANQP advertisement profile. (`wlan hotspot advertisement profile <profile-name> anqp-venue-name-profile <profile-name>`)
2. Associate the ANQP advertisement profile with a Hotspot profile. (`wlan hotspot h2-profile advertisement-profile <profile-name>`)
3. Enable the hotspot feature within that Hotspot profile. (`wlan hotspot h2-profile <profile-name>hotspot-enable`)

Examples

The example below shows that the Switch has two configured Venue Name profiles. The **References** column lists the number of other profiles with references to the Venue Name profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host) # show wlan hotspot anqp-venue-name-profile
ANQP Venue Name Profile List
----------------------------
Name         References  Profile Status
----         ----------  --------------
default      0
venue_mall   0
Total:2.
```

This example displays the configuration settings for the profile venue_mall.

```
(host) #show wlan hotspot anqp-venue-name-profile venue_mall
ANQP Venue Name Profile "venue_mall"
------------------------------------
Parameter      Value
---------      -----
Venue Group    mercantile
Type of Venue  mercantile-shopping-mall
Venue Name     Westfield_Mall
```

The output of this command includes the following parameters:

Parameter	Description
Venue Group	The venue group to be advertised in the ANQP IEs from APs associated with this profile. This parameter can have any of the following values: ■ assembly ■ business ■ educational ■ factory-or-industrial ■ institutional ■ mercantile ■ outdoor ■ reserved ■ residential ■ storage ■ unspecified ■ Utility-Misc ■ Vehicular
Type of Venue	The venue type to be advertised in the IEs from APs associated with this hotspot profile. The complete list of supported venue types is described in Venue Types on page 2875.
Venue Name	The venue name to be advertised in the ANQP IEs from APs associated with this profile.

show wlan hotspot hs2-profile

```
show wlan hotspot hs2-profile [<profile-name>]
```

Description

The output of this command displays settings for a Hotspot 2.0 profile.

Syntax

Parameter	Description
`<profile-name>`	Name of a Hotspot 2.0 profile.

Usage Guidelines

Organization Identifiers (OIs) are assigned to service providers when they register with the IEEE registration authority The Roaming Consortium IEs contain information identifying the network and service provider, whose security credentials can then be used to authenticate with the AP transmitting this element.

The OI for the service provider is defined in the ANQP Roaming Consortium profile using the wlan hotspot anqp-roam-cons-profile command. This Hotspot profile allows you to define and send up to three additional OIs to a client. The configurable values for each additional OI include the Organization Identifier itself, the OI length, and the venue group and venue type associated with those OIs.

Issue this command without the **<profile-name>** parameter to display the entire ANQP advertisement profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the Switch has two configured Hotspot profiles. The **References** column lists the number of other profiles with references to the Hotspot profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host) [mynode] # show wlan hotspot hs2-profile

Hotspot 2.0 Profile List
------------------------
Name           References  Profile Status
----           ----------  --------------
default        1
Hotspot_1      2
Total:2
```

The following example shows configuration settings defined for the profile **Hotspot1**:

```
(host) [mynode] #show wlan hotspot hs2-profile Hotspot1

Hotspot 2.0 Profile "default"
-----------------------------
Parameter                                                    Value
---------                                                    -----
Advertise Hotspot 2.0 Capability                             Enabled
Additional Steps required for Access Enabled                 Enabled
Network Internet Access                                      Enabled
Length of Query Response                                     255 octets

```

The output of this command includes the following data columns:

Parameter	Description
`Advertise Hotspot 2.0 Capability`	Shows if this profile has been enabled.
`Additional Steps required for Access Enabled`	If this parameter is enabled, the AP will send the following IEs (IEs) in response to the client's the ANQP query. ■ Venue Name ■ Domain Name List ■ Network Authentication Type ■ Roaming Consortium List ■ NAI Realm List **NOTE:** If **asra** is enabled, the advertisement profile for this hotspot must reference an enabled network authentication type profile. For more information on enabling an network authentication type profile, see wlan hotspot anqp-nwk-auth-profile on page 2870.
`Network Internet Access`	If enabled, the AP sends an Information Element (IE) indicating that the network allows internet access. By default, a hotspot profile does not advertise network internet access.
`Length of Query Response`	The maximum length of the GAS query response, in octets. The supported range is 1-255 octets.
`Access network Type`	The 802.11u network type. The default setting is *public-chargeable.* ■ emergency-services: emergency services only network ■ personal-device: personal device network ■ private: private network ■ private-guest: private network with guest access ■ public-chargeable: public chargeable network ■ public-free: free public network ■ test: test network ■ wildcard: wildcard network
`Roaming Consortium Len Entry 1`	Length of the OI. This value is based upon the number of octets in the **Roaming Consortium OI Entry 1** field. ■ **0**: Zero Octets in the OI (Null) ■ **3**: OI length is 24-bit (3 Octets) ■ **5**: OI length is 36-bit (5 Octets)

Parameter	Description
`Roaming Consortium OI Entry 1`	Roaming consortium OI assigned to one of the service provider's top three roaming partners. This additional OI will only be sent to a client if the **Additional Roaming Consortium OI's (displayed in Advertisement Profile)** parameter is set to 1 or higher.
`Roaming Consortium Len Entry 2`	Length of the OI. This value is based upon the number of octets in the **Roaming Consortium OI Entry 2** field. ■ **0**: Zero Octets in the OI (Null) ■ **3**: OI length is 24-bit (3 Octets) ■ **5**: OI length is 36-bit (5 Octets)
`Roaming Consortium OI Entry 2`	Roaming consortium OI assigned to one of the service provider's top three roaming partners. This additional OI will only be sent to a client if the **Additional Roaming Consortium OI's (displayed in Advertisement Profile)** parameter is set to 2 or higher.
`Roaming Consortium Len Entry 3`	Length of the OI. This value is based upon the number of octets in the **Roaming Consortium OI Entry 3** field. ■ **0**: Zero Octets in the OI (Null) ■ **3**: OI length is 24-bit (3 Octets) ■ **5**: OI length is 36-bit (5 Octets)
`Roaming Consortium OI Entry 3`	Roaming consortium OI assigned to one of the service provider's top three roaming partners. This additional OI will only be sent to a client if the **Additional Roaming Consortium OI's (displayed in Advertisement Profile)** parameter is set to 3 or higher.
`Additional Roaming Consortium OI's (displayed in Advertisement Profile)`	Number of additional roaming consortium Organization Identifiers (OIs) advertised by the AP.
`Venue Group Type`	The venue groups to be advertised in the IEs from APs associated with this hotspot profile. The default setting is **unspecified**.
`Venue Type`	Venue type to be advertised in the IEs from APs associated with this hotspot profile.
`Type of Hotspot 2.0 Indication Element`	Advertisement protocol types to be used by the AP. ■ **anqp**: Access Network Query Protocol ■ **emergency**: Emergency Alert System ■ **mih-cmd-event**: Media Independent Handover (MIH) Command and Event Services Capability Discovery ■ **mih-info**: Media Independent Handover (MIH) Information Service. This option allows handovers between differing kinds of wireless access protocols and technologies, allowing access points on different IP subnets to communicate with each other at the link level while maintaining session continuity.

Parameter	Description
`Advertisement Profile`	Advertisement profile associated with this hotspot profile.

show wlan hotspot h2qp-conn-capability-profile

```
show wlan hotspot h2qp-conn-capability-profile [<profile>]
```

Description

The output of this command displays settings for a WLAN H2QP connection capability profile.

Syntax

Parameter	Description
`<profile>`	Name of H2QP connection capability profile

Usage Guidelines

The values configured in this profile can be sent in an ANQP IE to provide hotspot clients information about the IP protocols and associated port numbers that are available and open for communication.

Values configured in this profile will not be sent to clients unless you:

1. Associate the H2QP profile with an ANQP advertisement profile. (`wlan hotspot advertisement profile <profile-name> h2qp-conn-cap-profile <profile-name>`)
2. Associate the ANQP advertisement profile with a Hotspot profile. (`wlan hotspot h2-profile advertisement-profile <profile-name>`)
3. Enable the hotspot feature within that Hotspot profile. (`wlan hotspot h2-profile <profile-name> hotspot-enable`)

Examples

Issue this command without the optional <profile> parameter to display a list of all configured connection capability profiles. Include the <profile> parameter to display details for a specific profile.

The example below shows that the Switch has four configured connection capability profiles. The **References** column lists the number of other profiles with references to the connection capability profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
H2QP Connection Capability Profile List
---------------------------------------
Name              References  Profile Status
----              ----------  --------------
branch-hotspot-1  6
branch-hotspot-2  5
default           1
downtown-hotspot  1
Total:4
```

The following example displays the current configuration settings for the default H2QP connection capability profile.

```
(host) (config) #show wlan hotspot h2qp-conn-capability-profile  default
H2QP Connection Capability Profile "default"
--------------------------------------------
Parameter                                                  Value
---------                                                  -----
H2QP Connection Capability ICMP port                       Disabled
H2QP Connection Capability FTP port(TCP Protocol)          Disabled
```

```
H2QP Connection Capability SSH port(TCP Protocol)                    Disabled
H2QP Connection Capability HTTP port(TCP Protocol)                   Disabled
H2QP Connection Capability TLS VPN port(TCP Protocol)                Disabled
H2QP Connection Capability PPTP VPN port(TCP Protocol)               Disabled
H2QP Connection Capability VOIP port(TCP Protocol)                   Disabled
H2QP Connection Capability VOIP port(UDP Protocol)                   Disabled
H2QP Connection Capability IKEv2 port for IPSec VPN                  Disabled
H2QP Connection Capability May be used by IKEv2 port for IPSec VPN   Disabled
H2QP Connection Capability ESP port(Used by IPSec VPN)               Disabled
```

The output of this command includes the following information:

Parameter	Description
`H2QP Connection Capability ICMP port`	Shows if the ICMP port is enabled and available. (port 0)
`H2QP Connection Capability FTP port`	Shows if the FTP port is enabled and available. (port 20)
`H2QP Connection Capability SSH port`	Shows if the SSH port is enabled and available. (port 22)
`H2QP Connection Capability HTTP port`	Shows if the HTTP port is enabled and available. (port 80)
`H2QP Connection Capability TLS VPN port`	Shows if the TCP TLS port used VPNs is enabled and available. (port 80)
`H2QP Connection Capability PPTP VPN port`	Shows if the PPTP port used by IPsec VPNs is enabled and available. (port 1723)
`H2QP Connection Capability VoIP port (UDP)`	Shows if the UDP VoIP port is enabled and available. (port 5060)
`H2QP Connection Capability VoIP port (TCP)`	Shows if the TCP VoIP port is enabled and available. (port 5060)
`H2QP Connection Capability IKEv2 port for IPSec VPN`	Shows if the IKEv2 port 4500 is enabled and available
`H2QP Connection Capability May be used by IKEv2 port for IPSec VPN`	Shows if the IKEv2 port 500 is enabled and available
`H2QP Connection Capability ESP port (Used by IPSec VPN)`	Shows if the ESP port used by IPsec VPNs is enabled and available. (port 0)

show wlan hotspot h2qp-op-cl-profile

```
show wlan hotspot h2qp-op-cl-profile [<profile>]
```

Description

The output of this command displays settings for a WLAN H2QP operating class profile.

Syntax

Parameter	Description
`<profile>`	Name of H2QP operating class profile

Usage Guidelines

The values configured in this H2QP Operating Class profile list the channels on which the hotspot is capable of operating. It may be useful where, for instance, a mobile device discovers a hotspot in the 2.4 GHz band but finds it is dual-band and prefers the 5 GHz band.

Examples

Issue this command without the optional <profile> parameter to display a list of all configured connection capability profiles. Include the <profile> parameter to display details for a specific profile.

The example below shows that the Switch has two configured operating class profiles. The **References** column lists the number of other profiles with references to the operating class profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host)(H2QP Connection Capability Profile "default") #show wlan hotspot h2qp-op-cl-profile
H2QP Operating Class Indication Profile List
-----------------------------------------
Name     References  Profile Status
----     ----------  --------------
default  0
newopcl  1
Total:2
```

The following example displays the current configuration setting for the default H2QP operating class profile.

```
(host)(H2QP Connection Capability Profile "default") #show wlan hotspot h2qp-op-cl-profile
default
H2QP Operating Class Indication Profile "default"
-------------------------------------------------
Parameter                                 Value
---------                                 -----
H2QP Operating Class(Valid Values 1-255)  1
```

The output of this command includes the following information:

Parameter	Description
`H2QP Operating Class (Valid Values 1-255)`	Displays the current operating class for the devices' BSS. The supported range for this field is 1-255, and the default value is 1.

show wlan hotspot h2qp-operator-friendly-name-profile

```
show wlan hotspot h2qp-operator-friendly-name-profile [<profile>]
```

Description

The output of this command displays settings for a H2QP operator-friendly name profile.

Syntax

Parameter	Description
<profile>	Name of H2QP operator-friendly name profile.

Usage Guidelines

The operator-friendly name defined in this profile is a free-form text field that can identify the operator and also something about the location.Issue this command without the **<profile>** parameter to display the entire operator-friendly name profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the Switch has two configured operator-friendly name profiles. The **References** column lists the number of other profiles with references to the operator-friendly name profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host)(config)# show wlan hotspot h2qp-operator-friendly-name-profile
H2QP Operator Friendly Name Profile List
----------------------------------------
Name       References  Profile Status
----       ----------  --------------
default    0
operator1  8
Total:2
```

The following example displays the configuration settings for the profile **operator1.**

```
(host) (H2QP Operator Friendly Name Profile "operator1") #show wlan hotspot h2qp-operator-
friendly-name-profile operator1
H2QP Operator Friendly Name Profile "operator1"
-----------------------------------------------
Parameter                              Value
---------                              -----
Operator Friendly Name Language Code   eng
Operator Friendly Name                 CoffeeHouseGuest
```

The output of this command includes the following parameters:

Parameter	Description
Operator Friendly Name Language Code	An ISO 639 language code that identifies the language used in the Operator Friendly Name field.

Parameter	Description
Operator Friendly Name	An operator-friendly name sent by devices using this profile. The name can be up to 64 alphanumeric characters, and can include special characters and spaces. If the name includes quotation marks (“), you must include a backslash character (\) before each quotation mark. (e.g. \"example\")

show wlan hotspot h2qp-osu-prov-list-profile

```
show wlan hotspot h2qp-osu-prov-list-profile <profile-name>
```

Description

This command displays settings for a H2QP OSU providers list profile.

Syntax

Parameter	Description
`<profile-name>`	Name of the H2QP OSU providers list profile.

Usage Guidelines

The name defined in this profile is a free-form text field that can identify the OSU providers list. Issue this command without the **<profile-name>** parameter to display the entire OSU providers profile list. Include a profile name to display detailed configuration information for that profile.

Related Commands

show wlan hotspot h2qp-wan-metrics-profile

```
show wlan hotspot h2qp-wan-metrics-profile [<profile-name>]
```

Description

The output of this command displays settings for a H2QP WAN metrics profile.

Syntax

Parameter	Description
<profile-name>	Name of H2QP WAN metrics profile.

Usage Guidelines

The values configured in this profile can be sent in an ANQP IE to provide hotspot clients information about access network characteristics such as link status and the capacity and speed of the WAN link to the Internet. Issue this command without the **<profile-name>** parameter to display the entire WAN metrics profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the managed device has two configured WAN metrics profiles. The **References** column lists the number of other profiles with references to the WAN metrics profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host) [mynode] (H2QP Connection Capability Profile "default") #show wlan hotspot h2qp-wan-
metrics-profile

H2QP WAN Metrics Profile List
-----------------------------
Name     References  Profile Status
----     ----------  --------------
default  0
fastwan  6
Total:2
```

The following example shows the current configuration settings for the profile 'fastwan':

```
(host) [mynode] #show wlan hotspot h2qp-wan-metrics-profile fastwan

H2QP WAN Metrics Profile "fastwan"
----------------------------------
Parameter                              Value
---------                              -----
H2QP WAN metrics link status           link_up
H2QP WAN metrics symmetric WAN link    Disabled
H2QP WAN metrics link at capacity      Disabled
WAN Metrics uplink speed               1000
WAN Metrics downlink speed             1000
WAN Metrics uplink load                100
WAN Metrics downlink load              100
WAN Metrics load measurement duration  100
```

The output of this command includes the following information:

Parameter	Description
`H2QP WAN metrics link status`	Indicates the status of the WAN Link by displaying one of the following values. The default link status is **reserved**, which indicates that the link status is unknown or unspecified. ■ link_down ■ link_test ■ link_up ■ reserved
H2QP WAN metrics symmetric WAN link	This parameter indicates if the WAN Link has same speed in both the uplink and downlink directions.
`H2QP WAN metrics link at capacity`	This parameter indicates if the WAN Link has reached its maximum capacity. If this parameter is enabled, no additional mobile devices will be permitted to associate to the hotspot AP.
`WAN Metrics uplink speed`	This parameter indicates the current WAN backhaul uplink speed in Kbps. If no value is set, this parameter will show a default value of 0 to indicate that the uplink speed is unknown or unspecified.
`WAN Metrics down link speed`	This parameter indicates the current WAN backhaul downlink speed in Kbps. If no value is set, this parameter will show a default value of 0 to indicate that the downlink speed is unknown or unspecified.
WAN Metrics uplink load	The percentage of the WAN uplink that is currently utilized. If no value is set, this parameter will show a default value of 0 to indicate that the downlink speed is unknown or unspecified.
`WAN Metrics downlink load`	The percentage of the WAN downlink that is currently utilized. If no value is set, this parameter will show a default value of 0 to indicate that the downlink speed is unknown or unspecified.
`WAN Metrics load measurement duration`	Duration over which the downlink load is measured, in tenths of a second.

show wlan ht-ssid-profile

```
show wlan ht-ssid-profile [<profile-name>]
```

Description

This command displays the list of all high-throughput SSID profiles, or detailed configuration information for a specific high-throughput SSID profile.

Syntax

Parameter	Description
`<profile-name>`	Name of a high-throughput SSID profile.

Usage Guidelines

Issue this command without the **<profile-name>** parameter to display the entire high-throughput SSID profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the managed device has two configured high-throughput SSID profiles. The **References** column lists the number of other profiles with references to the high-throughput SSID profile, and the **Profile Status** column indicates whether the profile is predefined. (User-defined profiles will not have an entry in the **Profile Status** column.)

```
(host) [mynode] #show wlan ht-ssid-profile

High-throughput SSID profile List
---------------------------------
Name                          References  Profile Status
----                          ----------  --------------
default                       2
dot1X_CP-htssid_prof          1
ade-sloan-htssid_prof         1

Total:3
```

The following example shows configuration settings defined for the profile **default**:

```
(host) #show wlan ht-ssid-profile default

High-throughput SSID profile "default"
--------------------------------------
Parameter                                                    Value
---------                                                    -----
High throughput enable (SSID)                                Enabled
40 MHz channel usage                                         Enabled
Very High throughput enable (SSID)                           Enabled
80 MHz channel usage (VHT)                                   Enabled
BA AMSDU Enable                                              Enabled

Maximum VHT MPDU size                                     11454 bytes
Maximum number of MSDUs in an A-MSDU on best-effort AC    2 MSDUs
Maximum number of MSDUs in an A-MSDU on background AC     2 MSDUs
Maximum number of MSDUs in an A-MSDU on video AC          2 MSDUs
Maximum number of MSDUs in an A-MSDU on voice AC          0 MSDUs
```

The output of this command includes the following data columns:

Parameter	Description
`High throughput enable (SSID)`	Displays if the high-throughput (802.11n) feature is enabled or disabled on the SSID. Default: Enabled.
`40 MHz channel usage`	Shows if the profile enables or disables the use of 40 MHz channels. Default: Enabled.
`Very High throughput enable (SSID)`	Displays if the very high-throughput (802.11ac) feature is enabled or disabled on the SSID. Default: Enabled.
`80 MHz channel usage (VHT)`	Displays the status of the 80 MHz channel for very high-throughput is enabled or disabled. Default: Enabled.
`BA AMSDU Enable`	Displays if the AP has enabled or disabled the ability to receive Aggregated-MAC Service Data Unit (A-MSDU) in Block ACK (BA) negotiation. Default: Enabled.
`Temporal Diversity Enable`	Displays if temporal diversity has been enabled or disabled. When this feature is enabled and the client is not responding to 802.11 packets, the AP will launch two hardware retries; if the hardware retries are not successful then it attempts software retries. Default: Disabled.
`Legacy stations`	Allows or disallows associations from legacy (non-HT) stations. By default, this parameter is enabled (legacy stations are allowed).
`Low-density Parity Check`	If enabled, the AP will advertise Low-density Parity Check (LDPC) support. LDPC improves data transmission over radio channels with high levels of background noise. Default: Enabled.

Parameter	Description
Maximum number of spatial streams usable for STBC reception	Displays the maximum number of spatial streams usable for Space-Time Block Code (STBC) reception. 0 disables STBC reception, 1 uses STBC for MCS 0-7. Higher MCS values are not supported. (Supported on the OAW-AP105, OAW-AP130 Series, and OAW-AP 170 Series only. The configured value will be adjusted based on AP capabilities.) **NOTE:** If transmit beamforming is enabled, STBC will be disabled for beamformed frames.
Maximum number of spatial streams usable for STBC transmission	Displays the maximum number of spatial streams usable for STBC transmission. 0 disables STBC transmission, 1 uses STBC for MCS 0-7. Higher MCS values are not supported. (Supported on OAW-AP105, OAW-AP130 Series, and OAW-AP 170 Series only. The configured value will be adjusted based on AP capabilities.) **NOTE:** If transmit beamforming is enabled, STBC will be disabled for beamformed frames.
MPDU Aggregation	Displays if the profile enables or disables MAC Protocol Data Unit (MPDU) aggregation. Default: Enabled.
Max received A-MPDU size	Displays the configured maximum size of a received aggregate MPDU, in bytes.
Max transmitted A-MPDU size	Displays the configured maximum size of a transmitted aggregate MPDU, in bytes.
Min MPDU start spacing	Displays the configured minimum time between the start of adjacent MPDUs within an aggregate MPDU, in microseconds.
Short guard interval in 20 MHz mode	Displays if the profile enables or disables use of short (400 ns) guard interval in 20 MHz mode. Default: Enabled.
Short guard interval in 40 MHz mode	Displays if the profile enables or disables use of short (400 ns) guard interval in 40 MHz mode. Default: Enabled.
Short guard interval in 80 MHz mode	Displays if the profile enables or disables use of short (400 ns) guard interval in 80 MHz mode. Default: Enabled.
Supported MCS set	Displays a list of Modulation Coding Scheme (MCS) values or ranges of values to be supported on this SSID. The MCS you choose determines the channel width (20 MHz vs. 40 MHz vs. 80 MHz) and the number of spatial streams used by the mesh node. Default: 0-31 ■ MCS value of 16-23 are supported on OAW-AP130 Series, OAW-RAP155, and 11ac APs only. ■ MCS value of 24-31 are supported on OAW-AP320 Series APs only.

Parameter	Description
VHT - Supported MCS map	Displays a list of supported MCS map for very high throughput SSID. Comma separated list of maximum supported MCS for spatial streams 1 through 4. Valid values for maximum MCS are 7, 8, 9, and '-' (if spatial stream is not supported). Maximum MCS of a spatial stream cannot be higher than the previous streams. If an MCS is not valid for a particular combination of bandwidth and number of spatial streams, it will not be used for Tx and Rx. Default: 9,9,9,9.
VHT - Explicit Transmit Beamforming	Displays if VHT Explicit Transmit Beamforming status is enabled or disabled for the 802.11ac-capable APs. When this feature is enabled, the AP requests information about the MIMO channel and uses that information to transmit data over multiple transmit streams using a calculated steering matrix. The result is higher throughput due to improved signal at the beamformee (the receiving client). If this parameter is disabled, all other transmit beamforming settings will not take effect. Default: Enabled.
VHT - Transmit Beamforming Sounding Interval	Displays the time interval in milliseconds between updates of VHT Transmit Beamforming channel estimation. (802.11ac-capable APs only) **NOTE:** This is applicable for 802.11ac-capable APs only. Default: 25 milliseconds.
VHT - Multi User Transmit Beamforming	Displays if the VHT Multi-User Transmit Beamforming is enabled or disabled. If this parameter is disabled, all other Multi-User Transmit Beamforming configuration parameters have no effect. **NOTE:** This parameter is applicable for OAW-AP320 Series APs only. Default: Enabled.
Maximum VHT MPDU size	Displays the maximum size of a VHT MPDU. Default: 11454 bytes.
Maximum number of MSDUs in an A-MSDU on best-effort AC	Displays the maximum number of MSDUs in a TX A-MSDU on best-effort Access Category (AC). Default: 2. **NOTE:** In tunnel and decrypt-tunnel forwarding mode, TX A-MSDU is disabled if the value is set to 0. If the value is set to non-zero, TX A-MSDU is enabled and set to this value.
Maximum number of MSDUs in an A-MSDU on background AC	Displays the maximum number of MSDUs in a TX A-MSDU on background AC. Default: 2. **NOTE:** TX A-MSDU is disabled if the value is set to 0. In decrypt-tunnel forwarding mode, TX A-MSDU on background AC is disabled and assigning any value has no effect.
Maximum number of MSDUs in an A-MSDU on video AC	Displays the maximum number of MSDUs in a TX A-MSDU on video AC. Default: 2. **NOTE:** TX A-MSDU is disabled if the value is set to 0. In decrypt-tunnel forwarding mode, TX A-MSDU on video AC is disabled and assigning any value has no effect.

Parameter	Description
`Maximum number of MSDUs in an A-MSDU on voice AC`	Displays the maximum number of MSDUs in a TX A-MSDU on voice AC. Default: 0. **NOTE:** TX A-MSDU is disabled if the value is set to 0. In decrypt-tunnel forwarding mode, TX A-MSDU on voice AC is disabled and assigning any value has no effect.

Related Commands

Command	Description
wlan ht-ssid-profile	This command configures a high-throughput SSID profile.

Command History

Version	Description
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable or Config mode on Mobility Master.

show wlan mu-edca-parameters-profile

```
show wlan mu-edca-parameters-profile <profile-name>
```

Description

This command displays the MU EDCA parameters profiles.

Syntax

Parameter	Description
`<profile>`	Name of the profile.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output

Examples

```
(host)[mynode] #show wlan mu-edca-parameters-profile
MU EDCA Parameters profile List
-------------------------------
Name     References  Profile Status
----     ----------  --------------
default  0
Total:1
```

show wlan rrm-ie-profile

```
show wlan rrm-ie-profile [<profile-name>]
```

Description

This command displays the list of all radio resource management information element (RRM IE) profiles, or the detailed configuration information for a specific RRM IE profile.

Syntax

Parameter	Description
`<profile-name>`	Name of an RRM IE profile.

Usage Guidelines

Issue this command without the **<profile-name>** parameter to display the entire RRM IE profile list. Include a profile name to display detailed configuration information for that profile.

Examples

The following example displays the configuration information for the "default" RRM IE profile:

```
(host) [mynode] #show wlan rrm-ie-profile default

RRM IE Profile "default"
------------------------
Parameter                          Value    Set
---------                          -----    ---
Advertise Enabled Capabilities IE  Enabled
Advertise Country IE               Enabled
Advertise Power Constraint IE      Enabled
Advertise TPC Report IE            Enabled
Advertise QBSS Load IE             Enabled
Advertise BSS AAC IE               Enabled
Advertise Quiet IE                 Enabled
```

show wlan ssid-profile

```
show wlan ssid-profile [<profile-name>]
```

Description

This command displays the list of all SSID profiles, or detailed configuration information for a specific SSID profile.

Syntax

Parameter	Description
`<profile-name>`	Name of an SSID profile.

Usage Guidelines

Issue this command without the **<profile-name>** parameter to display the entire SSID profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the managed device has six configured SSID profiles. The **References** column lists the number of other profiles with references to the SSIDs profile, and the **Profile Status** column indicates whether the profile is predefined. (User-defined profiles will not have an entry in the **Profile Status** column.)

```
(host) [mynode] #show wlan ssid-profile

SSID Profile List
-----------------
Name                              References  Profile Status
----                              ----------  --------------
coltrane-ssid-profile             1
corp1   -ssid-profile                                  3
Remote                            1
Secure-Profile2                   0

Advertise QBSS Load IE                              Disabled
Advertise Location Info                             Enabled
Advertise AP Name                                   Disabled
802.11r Profile                                     N/A
Enforce user vlan for open stations                 Enabled
Enable OKC                                          Enabled
```

The output of this command includes the following data columns:

Parameter	Description
SSID	Shows if the profile has enabled or disabled this SSID.
ESSID	Name that uniquely identifies a wireless network. If the ESSID includes spaces, you must enclose it in quotation marks.
Encryption	The layer-2 authentication and encryption type used on this ESSID.

Parameter	Description
Enable Management Frame Protection	Enables management frame protection.
Require Management Frame Protection	If enabled, requires management frame protection.
DTIM Interval	The interval, in milliseconds, between the sending of Delivery Traffic Indication Messages (DTIMs) in the beacon.
802.11a Basic Rates	List of supported 802.11a rates, in Mbps, that are advertised in beacon frames and probe responses.
802.11a Transmit Rates	Set of 802.11a rates at which the AP is allowed to send data.
802.11g Basic Rates	List of supported 802.11b/g rates, in Mbps, that are advertised in beacon frames and probe responses.
802.11g Transmit Rates	Set of 802.11b/g rates at which the AP is allowed to send data.
Station Ageout Time	Time, in seconds, that a client is allowed to remain idle before being aged out.
Station Refresh Direction	The refresh direction of WLAN SSID profile.
Max Transmit Attempts	Maximum transmission failures allowed before the client gives up.
RTS Threshold	Wireless clients transmitting frames larger than this defined threshold must issue Request to Send (RTS) and wait for the AP to respond with Clear to Send (CTS).
Short Preamble	Shows if the profile enables or disables short preamble for 802.11b/g radios
Max Associations	Maximum number of wireless clients for the AP
Wireless Multimedia (WMM)	Shows if the profile enables or disables WMM, also known as IEEE 802.11e Enhanced Distribution Coordination Function (EDCF)
Wireless Multimedia U-APSD (WMM-UAPSD) Powersave	Shows if the profile enables or disables Wireless Multimedia (WMM) UAPSD powersave.
WMM TSPEC Min Inactivity Interval	Specifies the minimum inactivity time-out threshold of WMM traffic.
DSCP mapping for WMM voice AC	DSCP value used to map WMM voice traffic.
DSCP mapping for WMM video AC	DSCP value used to map WMM video traffic.
DSCP mapping for WMM best-effort AC	DSCP value used to map WMM best-effort traffic.

Parameter	Description
DSCP mapping for WMM background AC	DSCP value used to map WMM background traffic.
902il Compatibility Mode	(For clients using NTT DoCoMo 902iL phones only) When enabled, the managed device does not drop packets from the client if a small or old initialization vector value is received.
Hide SSID	Shows if the profile enables or disables hiding of the SSID name in beacon frames.
Deny_Broadcast Probes	When a client sends a broadcast probe request frame to search for all available SSIDs, this option controls whether or not the system responds for this SSID. When enabled, no response is sent and clients have to know the SSID in order to associate to the SSID. When disabled, a probe response frame is sent for this SSID.
Local Probe Response	Shows if the profile enables or disables local probe response on the AP. If this option is enabled, the AP is responsible for sending 802.11 probe responses to wireless clients' probe requests. If this option is disabled, then the managed device sends the 802.11 probe responses.
Auth Request Threshold (dB)	Displays the SNR threshold below which incoming authentication requests are ignored.
Disable Probe Retry	Shows if the profile enables or disables battery MAC level retries for probe response frames.
Battery Boost	If enabled, this feature converts multicast traffic to unicast before delivery to the client, thus allowing you to set a longer DTIM interval.
WEP Key 1	Displays the Static WEP key associated with this key index.
WEP Key 2	Displays the Static WEP key associated with this key index.
WEP Key 3	Displays the Static WEP key associated with this key index.
WEP Key 4	Displays the Static WEP key associated with this key index.
WEP Transmit Key Index	Shows the key index that specifies which static WEP key is to be used.
WPA Hexkey	WPA pre-shared key (PSK).
WPA Passphrase	WPA passphrase used to generate a pre-shared key (PSK).

Parameter	Description
Maximum Transmit Failures	Maximum transmission failures allowed before the client gives up.
EDCA Parameters Station profile	Name of the enhanced distributed channel access (EDCA) Station profile that applies to this SSID.
EDCA Parameters AP profile	Name of the enhanced distributed channel access (EDCA) AP profile that applies to this SSID.
BC/MC Rate Optimization	Shows if the profile enables or disables scanning of all active stations currently associated to an AP to select the lowest transmission rate for broadcast and multicast frames. This option only applies to broadcast and multicast data frames; 802.11 management frames are transmitted at the lowest configured rate.
Rate Optimization for delivering EAPOL frames	If this option is enabled, APs using this profile will use a more conservative rate for more reliable delivery of EAPOL frames.
Strict Spectralink Voice Protocol (SVP)	Shows if the profile enables or disables strict Spectralink Voice Protocol (SVP).
High-throughput SSID Profile	Name of the high-throughput SSID profile associated with this SSID profile.
802.11g Beacon Rate	The beacon rate for 802.11g (use for Distributed Antenna System (DAS) only). Using this parameter in normal operation may cause connectivity problems.
802.11a Beacon Rate	The beacon rate for 802.11a (use for Distributed Antenna System (DAS) only). Using this parameter in normal operation may cause connectivity problems.
Video Multicast Rate Optimization	The rate for video multicast frames.
Advertise QBSS Load IE	Enables the AP to advertise the QBSS load element. The element includes the following parameters that provide information on the traffic situation: ■ **Station count**: The total number of stations associated to the QBSS. ■ **Channel utilization**: The percentage of time (normalized to 255) the channel is sensed to be busy. The access point uses either the physical or the virtual carrier sense mechanism to sense a busy channel. ■ **Available admission capacity**: The remaining amount of medium time (measured as number of 32us/s) available for a station via explicit admission control. The QAP uses these parameters to decide whether to accept an admission control request. A wireless station uses these parameters to choose the appropriate access points.

Parameter	Description
`Advertise Location Info`	APs that are part of this VAP will broadcast their GPS coordinates in the beacons and probe response frames as part of a vendor-specific Information Element.
`Advertise AP Name`	If this parameter enabled, APs will broadcast the AP name configured by the **ap-name** command. This option is disabled by default.
`802.11r Profile`	The associated **dot11r-profile** with the SSID profile.
`Enforce user vlan for open stations`	Shows the strict enforcement of data traffic only in user's assigned vlan (Open stations only).
`Enable OKC`	The status of the Opportunistic Key Caching. Opportunistic Key Caching (OKC) is a similar technique, not defined by 802.11i, available for authentication between multiple APs in a network where those APs are under common administrative control. An Alcatel-Lucent deployment with multiple APs under the control of a single Switch is one such example. Using OKC, a station roaming to any AP in the network will not have to complete a full authentication exchange, but will instead just perform the 4-way handshake to establish transient encryption keys.

Related Commands

Command	Description

show wlan traffic-management-profile

```
show wlan traffic-management-profile [<profile-name>]
```

Description

This command displays the list of all traffic management profiles, or detailed configuration information for a specific traffic management profile.

Syntax

Parameter	Description
`<profile-name>`	Name of a traffic management profile.

Usage Guidelines

Issue this command without the **<profile-name>** parameter to display the entire traffic management profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the managed device has three configured traffic management profiles. The **References** column lists the number of other profiles with references to the traffic management profile, and the **Profile Status** column indicates whether the profile is predefined. (User-defined profiles will not have an entry in the **Profile Status** column.)

```
(host) [mynode] #show wlan traffic-management-profile

Traffic management profile List
-------------------------------
Name     References  Profile Status
----     ----------  --------------
mgmt1    3
mgmt2    2
Total:2
```

The following example shows configuration settings defined for the profile **mgmt1**:

```
(host) [mynode] #show wlan traffic-management-profile mgmt1

Traffic management profile "default"
------------------------------------
Parameter                   Value
---------                   -----
Proportional BW Allocation  N/A
Report interval             5 min
Station Shaping Policy      default-access
```

The output of this command includes the following data columns:

Parameter	Description
`Proportional BW Allocation`	Minimum bandwidth, as a percentage of available bandwidth, allocated to an SSID when there is congestion on the wireless network. An SSID can use all available bandwidth if no other SSIDs are active.
`Report interval`	Number of minutes between bandwidth usage reports.
`Station Shaping Policy`	Shows which of three possible Station Shaping policies is configured on the profile. ■ **default-access**: Traffic shaping is disabled, and client performance is dependent on MAC contention resolution. This is the default traffic shaping setting. ■ **fair-access**: Each client gets the same airtime, regardless of client capability and capacity. This option is useful in environments like a training facility or exam hall, where a mix of 802.11a/g, 802.11g and 802.11n clients need equal to network resources, regardless of their capabilities. The **bw-alloc** parameter of a traffic management profile allows you to set a minimum bandwidth to be allocated to a virtual AP profile when there is congestion on the wireless network.You must set traffic shaping to f**air-access** to use this bandwidth allocation value for an individual virtual AP. ■ **preferred-access**: High-throughput (802.11n) clients do not get penalized because of slower 802.11a/g or 802.11b transmissions that take more air time due to lower rates. Similarly, faster 802.11a/g clients get more access than 802.11b clients.

show wlan tsm-req-profile

```
show wlan tsm-req-profile [<profile-name>]
```

Description

This command displays configuration and other information about the parameters for the Transmit Stream and Category Measurement (TSM) Request frames.

Syntax

Parameter	Description
`<profile-name>`	Name of this profile. Name must be 1-63 characters.

Usage Guidelines

Issue this command without the **<profile-name>** parameter to display the entire TSM Request profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

For this profile to take effect, the 802.11K feature needs to be enabled.

Examples

```
(host) [mynode] #show wlan tsm-req-profile default

TSM Report Request Profile "default"
------------------------------------
Parameter                           Value
---------                           -----
Request Mode for TSM Report Request  normal
Number of repetitions                65535
Duration Mandatory                   Enabled
Randomization Interval               0
Measurement Duration                 25
Traffic ID                           96
Bin 0 Range                          200
```

The output of this command includes the following information:

Parameter	Description
`Request mode for TSM Report Request`	Shows the request mode for the Transmit Stream and Category Measurement Request frame.
`Number of repe-titions`	Shows the "Number of Repetitions" field in the Transmit Stream and Category Measurement Request frame.
`Duration Mandatory`	Shows the "Duration Mandatory" part of the **Measurement Request Mode** field of the Transmit Stream and Category Measurement Request frame.
`Randomization Inter-val`	Shows the **Randomization Interval** field in the Transmit Stream and Category Measurement Request frame.

Parameter	Description
`Measurement Duration`	Shows the **Measurement Duration** field in the Transmit Stream and Category Measurement Request frame.
`Traffic ID`	Shows the **Traffic Identifier** field in the Transmit Stream and Category Measurement Request frame.
`Bin 0 Range`	Shows the **'Bin 0 Range'** field in the Transmit Stream and Category Measurement Request frame.

show wlan virtual-ap

```
show wlan virtual-ap [<profile-name>]
```

Description

Displays the list of all Virtual AP profiles, or detailed configuration information for a specific Virtual AP profile.

Syntax

Parameter	Description
`<profile-name>`	Name of a Virtual AP profile

Usage Guidelines

Issue this command without the **<profile-name>** parameter to display the entire Virtual AP profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the managed device has six configured Virtual AP profiles. The **References** column lists the number of other profiles with references to the Virtual AP profile, and the **Profile Status** column indicates whether the profile is predefined. (User-defined profiles will not have an entry in the **Profile Status** column.)

```
(host) [mynode] #show wlan virtual-ap

Virtual AP profile List
-----------------------
Name                              References  Profile Status
----                              ----------  --------------
coltrane-vap-profile              1
default
MegTest
Remote                            1
test-vap-profile                  1
wizardtest-vap-profile            1
Total: 6
```

The following example shows configuration settings defined for the profile **wizardtest-vap-profile**:

```
(host) [mynode] #show wlan virtual-ap test-vap-profile

Virtual AP profile "wizardtest-vap-profile"
---------------------------
Parameter                                       Value
---------                                       -----
AAA Profile                                     default
802.11K Profile                                 default
SSID Profile                                    default
Virtual AP enable                               Enabled
VLAN                                            N/A
Forward mode                                    tunnel
Allowed band                                    all
Band Steering                                   Disabled
Fine Timing Measurement(802.11mc Responder Mode Disabled
Steering Mode                                   prefer-5ghz
```

```
Dynamic Multicast Optimization (DMO)            Enabled
Dynamic Multicast Optimization (DMO)            Threshold  6
Drop Broadcast and Multicast                     Disabled
Convert Broadcast ARP requests to unicast        Enabled
Authentication Failure Blacklist Time            3600 sec
Blacklist Time                                   3600 sec

Deny time range                                  N/A
DoS Prevention                                   Disabled
HA Discovery on-association                      Disabled
Mobile IP                                        Enabled
Preserve Client VLAN                             Disabled
Remote-AP Operation                              standard
Station Blacklisting                             Enabled
Strict Compliance                                Disabled
VLAN Mobility                                    Disabled
FDB Update on Assoc                              Disabled
WMM Traffic Management Profile                   N/A
Anyspot Profile                                  N/A
```

The output of this command includes the following data columns:

Parameter	Description
AAA Profile	Name of the AAA profile associated with this virtual AP.
802.11K Profile	Name of an 802.11k profile associated with this virtual AP.
SSID Profile	Name of an SSID profile associated with this virtual AP.
Virtual AP enable	Shows if the profile enables or disables the virtual AP.
VLAN	The VLAN(s) into which users are placed in order to obtain an IP address.
Forward mode	Forwarding mode defined on the profile: ■ tunnel mode ■ bridge mode ■ split-tunnel mode ■ decrypt-tunnel mode The forwarding mode controls whether data is tunneled to the managed device using generic routing encapsulation (GRE), bridged into the local Ethernet LAN (for remote APs), or a combination thereof depending on the destination (corporate traffic goes to the managed device, and Internet access remains local).

Parameter	Description
	When an AP is configured to use the decrypt-tunnel forwarding mode, that AP decrypts and decapsulates all 802.11 frames from a client and sends the 802.3 frames through the GRE tunnel to the managed device, which then applies firewall policies to the user traffic. When the managed device sends traffic to a client, the managed device sends 802.3 traffic through the GRE tunnel to the AP, which then converts it to encrypted 802.11 and forwards to the client.
`Allowed band`	The band(s) on which to use the virtual AP: ■ **a**—802.11a band only (5 GHz) ■ **g**—802.11b/g band only (2.4 GHz) ■ **all**—both 802.11a and 802.11b/g bands (5 GHz and 2.4 GHz)
`Band Steering`	If enabled, ARM's band steering feature encourages dual-band capable clients to stay on the 5GHz band on dual-band APs. This frees up resources on the 2.4 GHz band for single band clients like VoIP phones.
`Steering Mode`	Band steering supports three different band steering modes: ■ **Force-5GHz**: When the AP is configured in **force-5GHz** band steering mode, the AP will try to force 5 Ghz-capable APs to use that radio band. ■ **Prefer-5GHz** (Default): If you configure the AP to use **prefer-5GHz** band steering mode, the AP will try to steer the client to 5G band (if the client is 5G capable) but will let the client connect on the 2.4G band if the client persists in 2.4G association attempts. ■ **Balance-bands**: In this band steering mode, the AP tries to balance the clients across the two radios in order to best utilize the available 2.4G bandwidth. This feature takes into account the fact that the 5Ghz band has more channels than the 2.4 GHz band, and that the 5 GHz channels operate in 40 MHz while the 2.5 GHz band operates in 20 MHz. **NOTE:** Steering modes do not take effect until the band steering feature has been enabled. The band steering feature in AOS-W versions 3.3.2-5.0 does not support multiple band-steering modes. The band-steering feature in these versions of AOS-W functions the same way as the default **prefer-5GHz** steering mode available in AOS-W 6.0 and later.
`Dynamic Multicast Optimization (DMO)`	If enabled DMO techniques will be used to reliably transmit video data.
`Dynamic Multicast Optimization (DMO) Threshold`	Maximum number of high-throughput stations in a multicast group beyond which dynamic multicast optimization stops.

Parameter	Description
Drop Broadcast and Multicast	If enabled, the virtual AP will filter out broadcast and multicast traffic in the air.
Convert Broadcast ARP requests to unicast	If enabled, all broadcast ARP requests are converted to unicast and sent directly to the client.
Authentication Failure Blacklist Time	Time, in seconds, a client is blocked if it fails repeated authentication. An authentication failure blacklist time of 0 blocks failed users indefinitely.
Blacklist Time	Number of seconds that a client is quarantined from the network after being blacklisted.
Deny Inter User Traffic	This option, when enabled, denies traffic between the clients using this virtual AP profile. The **firewall** comand includes an option to deny all inter-user traffic, regardless of the Virtual AP profile used by those clients. If the global setting to deny inter-user traffic is enabled, all inter-user traffic between clients will be denied, regardless of the settings configured in the virtual AP profiles. If the setting to deny inter-user traffic is disabled globally but enabled on an individual virtual ap, only the traffic between un-trusted users and the clients on that particular virtual AP will be blocked.
Deny time range	Time range for which the AP will deny access.
DoS Prevention	If enabled, APs ignore deauthentication frames from clients. This prevents a successful deauth attack from being carried out against the AP. This does not affect third-party APs.
HA Discovery on-association	If enabled, home agent discovery is triggered on client association instead of home agent discovery based on traffic from client. Mobility on association can speed up roaming and improve connectivity for clients that do not send many uplink packets to trigger mobility (VoIP clients). Best practices is to leave this parameter disabled as it increases IP mobility control traffic between Switches in the same mobility domain. Enable this parameter only when voice issues are observed in VoIP clients. **NOTE: ha-disc-onassoc** parameter works only when IP mobility is enabled and configured on the Switch.
Mobile IP	Shows if the profile has enabled or disabled IP mobility.

Parameter	Description
Preserve Client VLAN	This parameter allows clients to retain their previous VLAN assignment if the client disassociates from an AP and then immediately re-associates either with same AP or another AP on same Switch.
Remote-AP Operation	Shows when the virtual AP operates on a remote AP: ■ **always**—Permanently enables the virtual AP (Bridge Mode only). This option can be used for non-802.1X bridge VAPs. ■ **backup**—Enables the virtual AP if the remote AP cannot connect to the Switch (Bridge Mode only). This option can be used for non-802.1X bridge VAPs. ■ **persistent**—Permanently enables the virtual AP after the remote AP initially **connects** to the Switch (Bridge Mode only). This option can be used for any (Open/PSK/802.1X) bridge VAPs. ■ **standard**—Enables the virtual AP when the remote AP connects to the Switch. This option can be used for any (bridge/split-tunnel/tunnel/d-tunnel) VAPs.
Station Blacklisting	Shows if the profile has enabled or disabled detection of denial of service (DoS) attacks, such as ping or SYN floods, that are not spoofed deauth attacks.
Strict Compliance	If enabled, the AP denies client association requests if the AP and client station have no common rates defined. Some legacy client stations which are not fully 802.11-compliant may not include their configured rates in their association requests. Such non-compliant stations may have difficulty associating with APs unless strict compliance is disabled.
Multi Association	If enabled, this feature allows a station to be associated to multiple APs. If this feature is disabled, when a station moves to new AP it will be de authorized by the AP to which it was previously connected, deleting station context and flushing key caching information
Fast Roaming	Shows if the AP has enabled or disabled fast roaming.
VLAN Mobility	Shows if the AP has enabled or disabled VLAN (Layer-2) mobility.
WMM Traffic Management Profile	WMM Traffic Management Profile associated with this Virtual AP Profile
Anyspot profile	Anyspot Profile associated with this Virtual AP Profile
Fine Timing Measurement (802.11mc) Responder Mode	Shows if 802.11mc Fine Timing Measurement (Responder Mode) is enabled for 510 Series access points.

show wlan wmm-traffic-management-profile

```
show wlan wmm-traffic-management-profile [<profile-name>]
```

Description

This command displays the list of all WMM traffic management profiles, or detailed configuration information for a specific WMM traffic management profile.

Syntax

Parameter	Description
`<profile-name>`	Name of the WMM traffic management profile.

Usage Guidelines

Issue this command without the **<profile-name>** parameter to display the entire WMM traffic management profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that the managed device has two configured WMM traffic management profiles. The **References** column lists the number of other profiles with references to the WMM traffic management profile, and the **Profile Status** column indicates whether the profile is predefined. (User-defined profiles will not have an entry in the **Profile Status** column.)

```
(host) [mynode] #show wlan wmm-traffic-management-profile

WMM Traffic management profile List
-------------------------------
Name     References  Profile Status
----     ----------  --------------
default  3
test     2

Total:2
```

The following example shows configuration settings defined for the profile **test**:

```
(host) [mynode] #show wlan traffic-management-profile test

WMM Traffic management profile "test"
-----------------------------------
Parameter              Value
---------              -----
Enable Shaping Policy  true
Voice Share            40 %
Video Share            43 %
Best-effort Share      10 %
Background Share       7 %
```

The output of this command includes the following data columns:

Parameter	Description
`Enable Shaping Policy`	Displays if WMM based traffic shaping is enabled on the managed device.
`Voice Share`	Displays the bandwidth allocation in percentage (%) for voice access traffic category.
`Viceo Share`	Displays the bandwidth allocation in percentage (%) for video access traffic category.
`Best-effort Share`	Displays the bandwidth allocation in percentage (%) for best effort access traffic category.
`Background Share`	Displays the bandwidth allocation in percentage (%) for background access traffic category.

show wmm tspec-statistics

```
show wmm tspec-statistics
```

Description

A WMM client can send a Traffic Specification (TSPEC) signaling request to the AP before sending traffic of a specific AC type, such as voice. This command displays TSPEC statistics information.

Syntax

No parameters.

Example

The following command displays TSPEC statistics information:

```
(host) [mynode] #show wmm tspec-statistics

TSPEC Enforcement statistics
----------------------------
Name                                          Value
----                                          -----
TSPEC ADDTS Request                           0
TSPEC accepted                                0
TSPEC denied due to CAC                       0
TSPEC enforcement timer events                0
Calls established within enforcement period   0
TSPEC deleted after enforcement period        0
```

Related Commands

show wms ap

```
show wms ap {<bssid>|list|stats [mon-mac <mon-mac> bssid <bssid>]|tree}
```

Description

This command displays information for APs currently monitored by the Wireless Management System (WMS).

Syntax

Parameter	Description
`<bssid>`	Enter the AP's BSSID number in hexadecimal format (XX:XX:XX:XX:XX:XX).
`list`	Shows the list of all APs monitored by WMS.
`stats`	Shows the **AP Statistics** table for all APs.
`mon-mac <mon-mac>`	Shows the **AP Tree** table for an AP with the specified MAC address.
`bssid <bssid>`	Shows the **AP Tree** table for an AP with the specified BSSID.
`tree`	Show the APs seen by each monitoring probe in the WMS.

Usage Guidelines

The WMS feature periodically sends statistics that it has collected for APs and Probes to the WMS process. When WMS receives an event message from an AM, it will save the event information along with the BSSID of the AP that generated the event in the WMS database. When WMS receives statistics from the AM, it updates its state, and the database.

Examples

The **show wms ap <bssid>** command displays a list of AP MAC addresses and the BSSIDs seen by each AP.

```
(host) [mynode] #show wms ap 00:0d:67:20:db:4b

AP Info
-------
BSSID              SSID            Channel  Type        RAP_Type     Status  Ageout  HT-Type

HT-Sec-Chan
-----------
 0
Probe Info
----------
MAC                IP               Name    Type     Status  AP Type
---                --               ----    ----     ------  -------
40:e3:d6:76:19:70  191.191.191.252  ap-205  soft-ap  up      205
40:e3:d6:8d:ca:f0  191.191.191.253  ap-215  soft-ap  up      215
```

The output of this command includes the following information:

Column	Description
BSSID	Basic Service Set Identifier (BSSID) for the AP. This is usually the AP's MAC address.
SSID	The Service Set Identifier (SSID) that identifies a wireless network.
Channel	Channel used by the AP radio.
Type	A WMS AP type can be one of the following: ■ **soft-ap**: An Alcatel-Lucent Access Point (AP). ■ **air-monitor**: An Alcatel-Lucent Air Monitor (AM).
RAP_Type	Indicates one of the following Rogue AP types: ■ Valid (not a rogue AP) ■ Interfering ■ Rogue ■ Suspected Rogue ■ Disabled Rogue ■ Unclassified ■ Known Interfering
Status	If up, the AP is active. If down (or no information is shown) the AP is inactive.
Ageout	An ageout time is the time, in minutes, that the client must remain unseen by any probes before it is eliminated from the database. If this column displays a -1, the client has not yet aged out. Any other number indicates the number of minutes since the client has passed its ageout interval.
HT-type	The type of high-throughput traffic sent by the AP: ■ **HT-20mhz**: The AP radio uses a single 20 MHz channel ■ **HT-40mhz**: The AP radio uses a 40 MHz channel pair comprised of two adjacent 20 MHz channels.
HT-Sec-Chan	Secondary channel used for 40 MHz high-throughput transmissions.
MAC	MAC address of a probe that can see the specified AP.
IP	IP address of a probe that can see the specified AP.
Name	Name of the probe.
Type	Displays the probe type: A WMS probe can be one of the following: ■ **soft-ap**: An Alcatel-Lucent Access Point (AP). ■ **air-monitor**: An Alcatel-Lucent Air Monitor (AM).
Status	If up, the AP is active. If down (or no information is shown) the AP is inactive.
AP Type	AP model type.

The example below shows received and transmitted data statistics for each BSSID seen by a monitoring AP.

```
(host)# show wms ap stats

```

Column	Description
`Monitor-MAC`	MAC address of an AP.

Column	Description
`Channel`	802.11 radio channel.
`NumAP`	Number of other APs seen on the specified channel.
`NumSta`	Number stations seen on the specified channel.
`TotalPkt`	Number of received packets.
`TotalByte`	Number of received bytes.
`Noise`	Current noise level.

Related Commands

Command	Description
wms client	This command allows you to classify a wireless client into one of several categories.

Command History

show wms client

```
show wms client {list|<mac>|probe <mac>|stats [mon-mac <mon-mac> mac <mac>]|valid-exempt}
```

Description

This command displays the list of client information for the clients that can be seen by monitoring APs.

Syntax

Parameter	Description
`list`	Show statistics for all monitored clients.
`<mac>`	Show statistics for a client with the specified MAC address, including the BSSID of the AP to which that client is currently associated, and the MAC addresses of other monitoring APs that can see that client.
`probe <mac>`	Specify a client's MAC address to show the BSSIDs of all probes that can see that client.
`stats`	Show the STA stats table, which displays data for all clients seen by each monitoring AP.
`mon-mac <mon-mac> mac <mac>`	Enter a monitoring AP's MAC address (<mon-mac>) and the MAC address of a client (<mac>) to show data for traffic received from and sent to a specific client as seen by a specific AP.
`valid-exempt`	Shows a list of valid-exempt clients.

Example

The **AP Info** table in the example below shows that the client is associated to an AP with the BSSID **00:0b:86:cd:86:a0**. The **Probe info** table shows the MAC addresses of three other APs that can see the client.

```
(host) #show wms client 00:0e:35:29:9b:28

STA Info
--------
MAC                Type   Status  Ageout  HT-Type
---                ----   ------  ------  -------
00:0e:35:29:9b:28  valid  up      -1      HT-40mhz

AP Info
-------
BSSID              SSID    Channel  Type     RAP_Type  Status  Ageout       HT-Type   HT-Sec-
Chan
-----              ----    -------  ----     --------  ------  ------       -------   --------
---
00:0b:86:cd:86:a0  MySSiD  11       soft-ap  valid     up      -1           HT-40mhz  153
```

Column	Description
`MAC`	MAC address of the client
`Type`	Station type (**valid**, **interfering**, or **disabled rogue client**)

Column	Description
Status	If **up**, the client is active. If **down** (or no information is shown) the client is inactive.
Ageout	An ageout time is the time, in minutes, that the client must remain unseen by any probes before it is eliminated from the database. If this column displays a **-1**, the client has not yet aged out. Any other number indicates the number of minutes since the client has passed its ageout interval.
HT-Type	Type of high-throughput traffic sent by the client.
BSSID	BSSID of the AP to which the client is associated.
SSID	Extended service set identifier (ESSID) of the BSSID.
RAP_Type	Indicates one of the following Rogue AP types: ■ Valid (not a rogue AP) ■ Interfering ■ Rogue ■ Disabled Rogue ■ Suspected Rogue ■ Unclassified ■ Known Interfering
Status	If **up**, the AP is active. If **down** (or no information is shown) the AP is inactive.
Ageout	An ageout time is the time, in minutes, that the client must remain unseen by any probes before it is eliminated from the database. If this column displays a **-1**, the client has not yet aged out. Any other number indicates the number of minutes since the client has passed its ageout interval.
HT-Type	Type of high-throughput traffic sent by the AP.
HT-Sec-Chan	Secondary channel used for high-throughput transmissions.

show wms counters

```
show wms counters [debug|events]
```

Description

This command displays WMS events and debug counters. If you omit the optional **debug** and **events** parameters, the **show wms counters** command displays the frequently used (general) counters in a single table.

Syntax

Parameter	Description
`debug`	Displays debug counters only.
`events`	Displays events counters only.

Usage Guidelines

This command displays counters for database entries, messages, and data structures. The counters displayed vary for each managed device; if the managed device does not have an entry for a particular counter type, it does not appear in the output of this command

Example

The following example shows output for the **show wms counters** command:

```
(host) [mynode] #show wms counters

Counters
--------
Name                        Value
----                        -----
DB Reads                    288268
DB Writes                   350870
Probe Table DB Reads        2477
Probe Table DB Writes       952
AP Table DB Reads           143992
AP Table DB Writes          138867
STA Table DB Reads          40404
STA Table DB Writes         99687
Probe STA Table DB Reads    101352
Probe STA Table DB Writes   117566
Probe Register              2476
Probe State Update          37077
Set RAP Type                42552
Set RAP Type Conf Level     152
Valid Exempt Station Macs   10
...
```

show wms forwarding-stats

```
show wms forwarding-stats
```

Description

This command displays message forwarding statistics between the WLAN Management System (WMS) and Alcatel-Lucent Air Monitor.

Syntax

No parameters.

Example

The following command displays forwarding statistics between the WMS and Air Monitor:

```
(host) [mynode] #show wms forwarding-stats

WMS Forwarding Stats
--------------------
Item                                    Value
----                                    -----
Messages Forwarded                      10
Messages Dropped                        1
Messages Diverted to Local Processing   0
```

show wms general

```
show wms general [debug]
```

Description

This command displays general configuration information for the Alcatel-Lucent WLAN Management System (WMS).

Syntax

Parameter	Description
`debug`	Displays general debugging information for WMS.

Example

The following command displays general configuration information for WMS:

```
(host) [mynode] #show wms general

General Attributes
------------------

show wms monitor-summary

```
show wms monitor-summary
```

Description

This command displays the number of different AP and client types monitored over the last 5 minutes, 1 hour, and since the managed device was last reset.

Syntax

No parameters.

Usage Guidelines

The WLAN management system (WMS) monitors wireless traffic to detect any new AP or wireless client stations that attempt to connect to the network. When an AP or wireless client is detected, it is classified and its classification is used to determine the security policies which should be enforced on the AP or client. Use the **show wms monitor-summary** command to view a quick summary of each classified AP and client type currently on the network.

If AP learning is enabled (with the wms general command), non-Alcatel-Lucent APs connected on the same wired network as Alcatel-Lucent APs are classified as valid APs. If AP learning is disabled, a non-Alcatel-Lucent AP is classified as an unsecure or suspect-unsecure AP.

Example

The following example displays a summary of monitored APs and clients on a managed device:

```
(host) [mynode] #show wms monitor-summary

WMS Monitor Summary
-------------------
                          Last 5 Min  Last Hour  All
-                         ----------  ---------  ---
Valid APs                 1           1          1
Interfering APs           57          57         60
Rogue APs                 3           3          3
Manually Contained APs    0           0          0
Unclassified APs          0           0          0
Neighbor APs              0           0          0
Suspected Rogue APs       138         138        139
Valid Clients             0           0          0
Interfering Clients       1           1          1
Manually Contained Clients 0          0          0
```

show wms probe

```
show wms probe
```

Description

This command displays detailed information on WMS probes.

Syntax

No parameters.

Example

This example shows the Probe List table for WMS probes. The output below has been split into two tables to better fit in this document. In the actual CLI, this information appears in a single, long table.

```
(host) [mynode] #show wms probe

Probe List
----------
Monitor Eth MAC    BSSID              PHY Type         IP               LMS IP         Scan
Status  Updates  Reqs/Fails  Stats  Type

Up      6924     1/0         0      soft-ap
40:e3:d6:c0:dc:ae  40:e3:d6:8d:ca:f0  80211AVHT-80mhz  191.191.191.253  192.192.189.1  No
Up      6909     0/0         0      soft-ap
Total:4
```

Column	Description
`Monitor Eth MAC`	Ethernet MAC address of a probe.
`BSSID`	Probe Radio BSSID.
`PHY Type`	Radio PHY type: ■ 802.11A ■ 802.11AHT-40Mbps ■ 802.11AHT-20Mbps ■ 802.11G ■ 802,11GHT-20Mbps
`IP`	IP address of the AP.
`LMS IP`	IP address of the AP's managed device.
`Scan`	Shows if the Air Monitor is performing scanning.
`Status`	If the scan column displays a status of Up, the AP or AM is active
`Updates`	Number of updates the AP or AM sent to the WMS database since the managed device was last reset.

Column	Description
Reqs/Fails	Number of database update requests that have not yet been added into the database. and the number of failed database requests.
Stats	Total number of statistics updates sent to the database.
Type	A WMS AP type can be one of the following: ■ **soft-ap**: An Alcatel-Lucent Access Point (AP). ■ **air-monitor**: An Alcatel-Lucent Air Monitor (AM).

Related Commands

show wms rogue-ap

```
show wms rogue-ap <bssid> [list]
```

Description

This command displays statistics for APs classified as rogues APs.

Syntax

Parameter	Description
`<bssid>`	BSSID of a rogue AP.
`list`	Shows Rogue AP list.

Usage Guidelines

The optional output modifiers | begin , | exclude, and | include help you display those lines that begin, include, exclude, respectively, the line expression given in the CLI command. The | redirect-output modifier helps you redirect the command output.

Example

The output of this command shows statistics for a suspected rogue AP:

```
(host) [mynode] #show wms rogue-ap 00:0b:86:d4:ca:12

Suspect Rogue AP Info
---------------------
Key                Value
---                -----
BSSID              00:0b:86:89:c6:20
SSID               aruba-ap
Channel            1
Type               generic-ap
RAP Type           suspected-rogue
Status             up
Match Type         AP-Rule
Match MAC          00:0b:86:61:8a:d0
Match IP           0.0.0.0
Match AM           ssahoo-155
Match Method       Exact-Match
Match Time         Sun Sep 19 19:11:40 2010
```

The output of this command includes the following information:

Column	Description
`BSSID`	BSSID of the suspected rogue AP.
`SSID`	The rogue AP's Extended service set identifier.
`Channel`	Channel used by a radio on the rogue AP.

Column	Description
Type	Indicates if the AP is an Alcatel-Lucent AP, a Cisco AP, or an AP from any other manufacturer (generic AP).
RAP Type	Type of rogue AP, ■ **Suspect-unsecure**: AP has not been confirmed as a rogue AP. ■ **unsecure**: AP has been confirmed as a rogue AP
Status	Shows if the AP is active (**up**) or inactive (**down**).
Match Type	Describes how the AP was classified as a rogue. ■ **Eth-Wired-MAC**: An Alcatel-Lucent AP or AM detected that a single MAC address was in both the Ethernet Wired-Mac table and a non-valid AP wired-Mac table. ■ **AP-Wired-MAC**: An interfering AP is marked as rogue when the Alcatel-Lucent AP finds a MAC address in one of its valid AP wired-mac table and in an interfering AP wired-mac table. You can enable or disable the AP-Wired-MAC matching method using the CLI command **ids unauthorized-device-profile overlay-classification**. ■ **Config-Wired-MAC**: This type of classification occurs when an Alcatel-Lucent AP or AM detects a match between a wired MAC table and a pre-defined MAC address that has manually defined via the command ids unauthorized-device-profile . ■ **External-Wired-MAC**: This type of classification occurs when an Alcatel-Lucent AP or AM detects a match between a wired MAC table entry and a pre-defined MAC address manually defined in the ids rap-wml-server-profile table. ■ **Base-BSSID-Override**: If an Alcatel-Lucent AP is detected as rogue, then all virtual APs on the particular rogue are marked as rogue using Base-BSSID-Override match type. ■ **Manual**: An AP is manually defined as a rogue by via the command wms ap <bssid> mode rogue. ■ **EMS**: An AP is manually defined as a rogue by via the Element Management System.
Match MAC	MAC address of a wired device that helped identify the AP as a rogue. If the AP has not been identified as a rogue, this column will display the MAC address 00:00:00:00:00:00.
Match IP	IP address of a wired device that helped identify the AP as a rogue.
Match AM	Alcatel-Lucent Air Monitor that reported seeing the rogue AP.
Match Method	This variable indicates the type of match.
Match Time	Time the AP was identified as a rogue AP.

show wms rogue-ap list

```
show wms rogue-ap list
```

Description

This command displays the information on the rogue APs in the network.

Syntax

No parameter.

Usage Guidelines

When an AM classifies an interfering AP as a Rogue AP it sends that classification to the WMS process.

Use this command to list all known Rogue APs that may be potential security threats.

Examples

The **show wms rogue-ap list** command displays a list of rogue APs detected in the network.

```
(host)[mynode] #show wms rogue-ap list
AP List
-------
BSSID             ESSID        Class   PHY Type AP-name Encryp       IBSS   Last Mon Eth MAC
-----             -----         -----  -------- ------- ------       ----  ----------------
ac:a3:1e:53:72:94 arturo04      rogue  80211A           wpa2-psk-aes   no    ac:a3:1e:cd:35:5a
84:d4:7e:64:1c:72 hpeguest      rogue  80211A           open           no    ac:a3:1e:cd:35:5a
00:62:ec:26:2e:2f smtcwireless  rogue  80211A           wpa-8021x-tkip no    c8:b5:ad:c3:ac:fc
Total: 3
```

The output of this command includes the following information:

Column	Description
BSSID	Basic Service Set Identifier (BSSID) for the AP. This is usually the AP's MAC address.
ESSID	The Extended Service Set Identifier (SSID) that identifies a wireless network.
Class	AP classification: will always be set to 'rogue'. A rogue AP that is unauthorized and is plugged into the wired side of the network. You can configure automatic shutdown of rogue APs in the IDS unauthorized device detection profile.
PHY Type	Shows one of the following 802.11 types: ■ 802.11a ■ 802.11b ■ 802..11g ■ 802.11 ag
AP-name	Name of the rogue AP.
Encryp	Encryption type used on each listed rogue AP.

Column	Description
IBSS	Shows if ad hoc BSS is enabled or disabled on each listed rogue AP.
Last Mon Eth MAC	Shows the last monitored MAC address seen on the wired network for this rogue AP.

show wms routers

```
show wms routers [<mac>]
```

Description

This command displays learned router MAC information for WMS APs.

Syntax

Parameter	Description
<mac>	MAC address of a probe that can see the router.

Usage Guidelines

This command displays the MAC addresses of devices that have been determined to be routers by the listed APs. This output of this command will be blank if there is not any broadcast or multicast activity in an AP's subnet.

Example

In the example below, a single WMS AP has learned MAC information for four different routers.

```
(host) [mynode] #show wms routers

Router Mac 00:08:00:00:11:12 is Seen by APs
-------------------------------------------
AP-Name
-------
AP32
Router Mac 00:08:00:00:11:29 is Seen by APs
-------------------------------------------
AP-Name
-------
AP32
Router Mac 00:08:00:00:11:57 is Seen by APs
-------------------------------------------
AP-Name
-------
AP32
Router Mac 00:08:00:00:11:6e is Seen by APs
-------------------------------------------
AP-Name
-------
AP32
```

show wms rules

```
show wms rules
   config
   state
   summary
```

Description

This command displays the internal state and matching information of rules created using the ids ap-classification-rule command.

Syntax

Parameter	Description
`config`	Displays the following information for each AP classification rule: ■ name ■ ids ■ match-ssid ■ min-snr ■ max-snr ■ min-prcnt ■ max-prcnt ■ ssids ■ enabled ■ classify ■ conf-incr ■ flags ■ match-cnt
`state`	Displays the following information for each AP classification rule: ■ SSID Match Table ■ SSID Exclude Table ■ SNR Table ■ Probe Count Table
`summary`	Displays a summary of AP classification rules.

Usage Guidelines

Issue this command to view existing AP classification rules. AP classification rule configuration can only be performed on a Mobility Master. If AMP is enabled via the mobility-manager command, then processing of the AP classification rules is disabled on Mobility Master. A rule is identified by its ASCII character string name (32 characters maximum). The AP classification rules have one of the following specifications:

- SSID of the AP
- SNR of the AP
- Discovered-AP-Count or the number of APs that can see the AP

Example

The output in the example below shows that although two rules have been defined, neither have been enabled using the **ids ap-rule-matching rule-name <name>** command.

```
(host) [mynode] #show wms rules summary
```

```
AP Classification Rules Summary
-------------------------------
Parameter               Value
---------               -----
Num Rules               2
Num Active-Rules        0
Num SSID-to-match       0
Num SSID-to-exclude     0
Num SNR-bounds          0
Num Probe-Count-bounds  0
```

show wms wired-mac

```
show wms wired-mac {gw-mac [<mac>]|monitored-ap-wm [<mac>]|prop-eth-mac [<mac>]|reg-ap-oui
[<mac>]|summary|system-gw-mac [<mac>]|system-wired-mac [<mac>]|wireless-device [<mac>]}
```

Description

This command displays a summary table of WLAN Management System (WMS) wired MAC information. This command can display a list of APs aware of a specific gateway MAC address, or list the wired MAC addresses known to a single AP.

Syntax

Column	Description
`gw-mac`	Shows gateway wired MAC information collected from the APs.
`<mac>`	Displays information for a single MAC address.
`monitored-ap-wm`	Shows monitored AP wired MAC information collected from the APs.
`<mac>`	Displays information for a single MAC address.
`prop-eth-mac`	Shows wired mac information collected from the APs.
`<mac>`	Displays information for a single MAC address.
`reg-ap-oui`	Shows registered AP OUI information collected from the APs, including each registered OUI, and the time that OUI was last seen.
`<mac>`	Displays information for a single MAC address.
`summary`	Display a wired MAC summary that includes the number of each of the following MAC types: ■ Registered AP OUIs ■ Propagated Ethernet MACs. ■ Potential Wireless Device MACs ■ Monitored AP Wired MACs ■ System Wired MACs ■ System Gateway MACs
`system-gw-mac`	Shows system gateway MAC information learned at the managed device, including the age of each MAC address.
`<mac>`	Displays information for a single MAC address.
`system-wired-mac`	Shows system wired MAC information learned at the managed device.
`<mac>`	Displays information for a single MAC address.
`wireless-device`	Show routers or potential wireless devices information, including the MAC address of the device, and the MAC address of the AP or managed device that saw the device.
`<mac>`	Displays information for a single MAC address.

Example

The following example shows the wired MAC summary:

```
(host) [mynode] #show wms wired-mac summary

Wired MAC Summary
-----------------
Type                            Count
----                            -----
Gateway MACs                    1
Registered AP OUIs              16
Propagated Ethernet MACs        0
Potential Wireless Device MACs  0
Monitored AP Wired MACs         0
System Wired MACs               0
System Gateway MACs             0
```

Related Commands

show wnm-dot11v bss-tm-response

```
show wnm-dot11v bss-tm-response station-mac <mac>
```

Description

This command displays the BSS transition management response for a given client.

Syntax

Column	Description
<mac>	MAC address of the client.

Example

The following example shows the BSS transition management response for a client:

```
(host) [mynode] #show wnm-dot11v bss-tm-response station-mac 58:94:6b:31:d0:f0
VLAN Assignment
---------------
VLAN   #CLIENTS
----   --------
1      0
192    1
```

show ip interface brief

```
show ip interface brief
```

Description

This command displays the IP-related information on all interfaces in summary format.

Syntax

No parameters.

Example

```
(host) #show  ip interface brief

Interface                   IP Address / IP Netmask        Admin    Protocol     VRRP-IP
vlan 1                   172.16.0.254 / 255.255.255.0      up       up
vlan 2                      10.4.62.9 / 255.255.255.0      up       up
loopback                  unassigned / unassigned          up       up
mgmt                      unassigned / unassigned          down     down
```

The following table details the columns and content in the show command.

Column	Description
`Interface`	List the interface and interface identification, where applicable.
`IP Address /IP Netmask`	List the IP address and netmask for the interface, if configured.
`Admin`	States the administrative status of the interface. Enabled—up Disabled—down
`Protocol`	Status of the IP on the interface. Enabled—up Disabled—down
`VRRP-IP`	VRRP IP address associated to the interface.

snmp-server

```
snmp-server
   community <string>
   enable
   engine-id
                  host IPv4/IPv6 Address|version {1 <name> udp-port <port>}|2c|{3 <name>}
      [inform] [interval <seconds>] [retrycount <number>] [udp-port <port>]}
   inform queue-length <size>
   source controller-ip
   stats
   trap {source [IPv4|IPv6 Address]|<name>}
   user
        <word>
        [auth-prot [md5|sha] <string>]
        [priv-prot {AES|DES} <string>]
```

Description

This command configures SNMP parameters.

Syntax

Parameter	Description	Range	Default
`community`	Sets the read-only community string.	—	—
`enable`	Enables sending of SNMP traps to the configured host.	—	disabled
`engine-id`	Sets the SNMP server engine ID as a hexadecimal number.	24 characters maximum	—
`host`	Configures the IPv4/IPv6 Address address of the host to which SNMP traps are sent. This host needs to be running a trap receiver to receive and interpret the traps sent by the Switch.	—	—
`version`	Configures the SNMP version and security string for notification messages.	—	—
`inform`	Sends SNMP inform messages to the configured host.	—	disabled
`inform`	Specifies the length for the SNMP inform queue.	100-350	250

Parameter	Description	Range	Default
`stats`	Allows file-based statistics collection. The Mobility Master generates a file that contains statistics data to display information in chart and graph formats. File-based statistics collection is transparent to the user and increases the efficiency of transferring information.		enabled
`trap {source [IPv4|IPv6 Address]|<name>}`	Configures source IPv4 or IPv6 address or name of SNMP traps.	—	disabled
`user`	Configures an SNMPv3 user profile.	—	—
`<word>`	USM security model user name		
`[auth-prot [md5|sha] <string>]`	Authentication protocol of the user and the password to use with the protocol.	MD5/SHA	SHA
`[priv-prot {AES|DES} <string>]`	Privacy protocol of the user and the password to use with the protocol.	AES/DES	DES

Usage Guidelines

This command configures SNMP parameters. You configure SNMP-related information for APs in an SNMP profile which you apply to an AP group or to a specific AP.

Example

The following command configures an SNMP user:

```
(host) [mynode] (config) #snmp-server user temp auth-prot md5 temp12 priv-prot aes temp34
```

Command History:

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config mode on Mobility Master.

spanning-tree

```
spanning-tree
   forward-time <value>
   hello-time <value>
   max-age <value>
   mode <rapid> | <rapid-pvst>
   priority <value>
   vlan range {<word>|[remove <word> {forward-time|hello-time|max-age|priority}]}
```

RSTP is backward compatible with STP and is enabled by default. For ease of use, this command uses the spanning tree keyword.

Description

This command configures global settings for the Rapid Spanning Tree Protocol (RSTP) and Per VLAN Spanning Tree (PVST+). Refer to interface gigabitethernet for details on enabling and configuring spanning tree for an individual interface.

Syntax

Parameter	Description	Range	Default
`forward-time`	Specifies the time, in seconds, the port spends in the listening and learning state. During this time, the port waits to forward data packets.	4-30	15 seconds
`hello-time`	Specifies the time, in seconds, between each bridge protocol data unit (BPDU) transmitted by the root bridge.	1-10	2 seconds
`max-age`	Specifies the time, in seconds, the root bridge waits to receive a hello packet before changing the STP topology.	6-40	20 seconds
`mode`	Set the spanning tree mode to either Rapid Spanning Tree (802.1w) or PVST+ (Per VLAN Spanning Tree)	N/A	N/A
`<rapid>`	Set the spanning tree mode to RSTP (Rapid Spanning Tree Protocol).	N/A	N/A
`<rapid-pvst>`	Set the spanning tree mode to PVST+ (Per VLAN Spanning Tree protocol)	N/A	N/A
`priority`	Set the priority of a bridge to make it more or less likely to become the root bridge. The bridge with the lowest value has the highest priority. When configuring the priority, remember the following: The highest priority bridge is the root bridge. The highest priority value is 0 (zero).	0-65535	32768

Parameter	Description	Range	Default
`vlan range <WORD>`	Enter the keywords **vlan range** followed by the range of VLAN ID's. Separate the VLAN IDs with a hyphen, comma or both to indicate the range. For example: 2-3 or 2,4,6 or 2-6,11	–	–
`remove <word>`	Removes range of VLAN IDs.	–	–
`remove <word> forward-time`	Removes the spanning tree forward interval.	–	–
`remove <word> hello-time`	Removed the spanning tree hello interval.	–	–
`remove <word> max-age`	Removes the spanning tree maximum age interval.	–	–
`remove <word> priority`	Removes the spanning tree priority interval.	–	–

Usage Guidelines

This command configures the global RSTP settings and is backward compatible with past versions of AOS-W using STP.

By default, all interfaces and ports run RSTP as specified in 802.1w and 802.1D. The default RSTP values can be used for most implementations.

Use the `no spanning-tree` command to disable RSTP.

Examples

The following command sets the time a port spends in the listening and learning state to 3 seconds:

```
(host) [mynode] #spanning-tree forward-time 3
```

The following command sets the time the root bridge waits to transmit BPDUs to 4 seconds:

```
(host) [mynode] #spanning-tree hello-time 4
```

The following command sets the time the root bridge waits to receive a hello packet to 30 seconds:

```
(host) [mynode] #spanning-tree max-age 30
```

The following command sets the bridge priority to 10, making it more likely to become the root bridge:

```
(host) [mynode] #spanning-tree priority 10
```

The follow command sets a spanning-tree VLAN range

```
(host) [mynode] #spanning-tree vlan range 2-8,11
```

Command History:

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Configuration mode on Mobility Master.

ssh

```
ssh
   disable-ciphers {aes-cbc | aes-ctr}
   disable-mac hmac-sha1-96
   disable_dsa
   mgmt-auth {public-key [username/password]|username/password [public-key]}
   <username> <ip_addr>
```

Description

This command configures SSH access to a Mobility Master.

Syntax

Parameter	Description	Default
`disable-ciphers`	Disables cipher authentication for SSH. Specify the cipher to be disabled.	—
`aes-cbc`	Disables AES-CBC authentication for SSH. This parameter enables the **`aes-ctr`** encryption.	—
`aes-ctr`	Disables AES-CTR authentication for SSH. This parameter enables the **`aes-cbc`** encryption.	—
`disable-mac`	Disables Message Authentication Code algorithm for SSH authentication.	hmac-sha1-96
`hmac-sha1-96`	Disables HMAC-SHA1-96 authentication for SSH.	
`disable_dsa`	Disables DSA authentication for SSH. Only RSA authentication is used.	—
`mgmt-auth`	Configures the authentication method for the management user. You can specify a username and password only, public key only, or both username and password and public key.	username and password
`<username>`	Username for SSH login.	—
`<ip_addr>`	IPv4 or IPv6 address of the remote machine.	—

Usage Guidelines

Public key authentication is supported using a X.509 certificate issued to the management client. If you specify public-key authentication, you need to load the client X.509 certificate into Mobility Master and configure certificate authentication for the management user with the **mgmt-user ssh-pubkey** command.

Example

The following command configures SSH access using public key authentication only:

```
(host) [mynode] (config) #ssh mgmt-auth public-key
   mgmt-user ssh-pubkey client-cert ssh-pubkey cli-admin root
```

The following command enables **AES-CBC** and disables **AES-CTR** on the SSH server:

```
(host) [md] (config) #ssh disable-ciphers aes-ctr
```

The following command enables both the cipher encryptions on the SSH server:

```
(host) [md] (config) #no ssh disable-ciphers
```

The following command disables **HMAC-SHA1-96** on the SSH server:

```
(host) [md] (config) #ssh disable-mac hmac-sha1-96
```

Related Commands

sso idp-profile

```
sso idp-profile <sso_prof_name>
   clone <source>
   idp <string> <url>
   no
```

Description

This command configures an SSO Identity Provider profile for use with application SSO with L2 Authentication.

Syntax

Parameter	Description
`<sso_prof_name>`	Name of the L2SSO profile.
`clone <source>`	Copies data from another SSO IDP profile.
`idp <string> <url>`	Configures the name and URL of Mobility Master's IDP server.
`no`	Deletes the command.

Usage Guidelines

This command is used to configure an SSO IDP profile, which establishes the name and URL of the IDP server that Mobility Master uses for application SSO.

ClearPass Policy Manager is the only device that can act as an IDP server for application SSO with an Alcatel-Lucent managed device.

Example

```
(host) [mynode] (config) #sso idp-profile profile1
   idp url1 cppm128.arubanetworks.com/idp.login
```

Related Commands

Command	Description
show sso idp-profile	Displays all SSO IDP profiles.

Command History

stm

```
stm
   add-blacklist-client <macaddr>
   disable-timing-stats
   enable-timing-stats
   kick-off-sta <macaddr> <bssid>
   purge-blacklist-clients
   remove-blacklist-client <macaddr>
   start-trace <macaddr>
   stop-trace <macaddr>
   mon-update-queue <threshold>
```

Description

This command is used to manually disconnect a client from an AP or control the blacklisting of clients.

Syntax

Parameter	Description
`add-blacklist-client`	MAC address of the client to be added to the denial of service list.
`disable-timing-stats`	Disables performance monitoring in STM.
`enable-timing-stats`	Enables performance monitoring in STM.
`kick-off-sta`	When you use the kick-off-sta feature specify a client's MAC address and BSSID, the AP sends deauthorization frames to the station to disconnect it.
`<macaddr>`	MAC address of client to be disconnected.
`<bssid>`	The associated BSSID of the client to be disconnected.
`purge-blacklist-client`	Clear the entire client blacklist.
`remove-blacklist-client <macaddr>`	Specify the MAC address of a client to remove it from the denial of service list.
`start-trace <macaddr>`	Starts tracing probe requests and probe responses from the specified client.
`stop-trace <macaddr>`	Stops tracing probe requests and probe response from the specified client.
`mon-update-queue <threshold>`	Configures the maximum queue size for the STM monitoring updates. **NOTE:** This parameter is available only in Config mode on Mobility Master.

Usage Guidelines

When you blacklist a client, the client is not allowed to associate with any AP in the network. If the client is connected to the network when you blacklist it, a deauthentication message is sent to force the client to disconnect. The blacklisted client is blacklisted for the duration specified in the virtual AP profile. The client blacklist supports up to 4,000 individual client entries.

The managed device retains the client blacklist in the user database, so the information is not lost if the managed device reboots. When you import or export the managed device's user database, the client blacklist will be exported or imported as well.

Example

The following command blacklists a client:

```
(host) #stm add-blacklist-client 00:01:6C:CC:8A:6D
```

Related Commands

Command	Description
show stm	This command is used to display the deauthentication reasons and the monitoring update queue information from the station management module.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable mode on Mobility Master.

syscontact

```
syscontact <syscontact>
```

Description

This command configures the name of the system contact for the managed device.

Syntax

Parameter	Description
`<syscontact>`	An alphanumeric string that specifies the name of the system contact.

Usage Guidelines

Use this command to enter the name of the person who acts as the system contact or administrator for the managed device. You can use a combination of numbers, letters, characters, and spaces to create the name. To include a space in the name, use quotation marks to enclose the alphanumeric string. For example, to create the system contact name Lab Technician 1, enter "Lab Technician 1" at the prompt.

To change the existing name, enter the command with a different string. The new name takes affect immediately. To unconfigure the name, enter "" at the prompt.

Example

The following command defines **LabTechnician** as the system contact name:

```
(host) [mynode] (config) #syscontact LabTechnician
```

Related Commands

Command	Description
show syscontact	Displays the system contact information.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config mode on managed devices.

syslocation

```
syslocation <syslocation>
```

Description

This command configures the name of the system location for the managed device.

Syntax

Parameter	Description
`<syslocation>`	An alphanumeric string that specifies the name of the system location.

Usage Guidelines

Use this command to indicate the location of the managed device. You can use a combination of numbers, letters, characters, and spaces to create the name. To include a space in the name, use quotation marks to enclose the text string.

To change the existing name, enter the command with a different string. To unconfigure the location, enter "" at the prompt.

Example

The following command defines **SalesLab** as the system location:

```
(host) [mynode] (config) #syslocation "Building 10, second floor, room 21E"
syscontact LabTechnician
```

Related Commands

Command	Description
show syslocation	Displays the system location information.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config mode on managed devices.

tar

```
tar clean {crash|flash|logs}| crash [kernel] | flash | logs [tech-support {no-controllerip
 | user <mac-address>}]
```

Description

This command archives a directory.

Syntax

Parameter	Description
`clean`	Removes a tar file
`crash`	Removes crash.tar
`flash`	Removes flash.tar.gz
`logs`	Removes logs.tar
`crash`	Archives the crash directory to crash.tar. A crash directory must exist.
`kernel`	Archives the kernel crash directory to kernel_crash.tar.
`flash`	Archives and compresses the /flash directory to flash.tar.gz.
`logs`	Archives the logs directory to log.tar.
`tech-support {no-controllerip | user <mac-address>}`	Optionally, technical support information can be included for a specific user.

Usage Guidelines

This command creates archive files in Unix tar file format.

Example

The following command creates the log.tar file with technical support information:

```
(host) [mynode] (config) #tar logs tech-support
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	This command is available in the base operating system. The **ipaccess-group** parameter requires the PEFNG license. The **xsec** parameter requires the xSec license.	Enable or config mode on Mobility Master.

telnet

```
telnet <host> [port <port_num>]
   cli
   soe
```

Description

This command enables telnet to Mobility Master or to an AP through Mobility Master.

Syntax

Parameter	Description	Default
`host`	IP address of the host Mobility Master	—
`port`	Port number in the host	—
`cli`	Enable telnet using the CLI.	Disabled
`soe`	Enable telnet using Serial over Ethernet (SoE).	Disabled

Usage Guidelines

Use the host and port to specify the host IP address and the port to enable telnet. This command is available only in **Enable** mode.

Use the **cli** option to enable telnet to Mobility Master.

Use the **soe** option to enable telnet using the SoE protocol. This allows you to remotely manage an AP directly connected to Mobility Master.

Example

The following example enables telnet to Mobility Master using the CLI:

```
(host) [mynode] (config) #telnet cli
```

Related Commands

Command	Description
show telnet	Displays the telnet access status.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

threshold

```
threshold
   controlpath-cpu <value>
   controlpath-memory <value>
   datapath-cpu <value>
   no-of-APs <value>
   no-of-locals <value>
   no-of-vaps <value>
   total-tunnel-capacity <value>
   user-capacity <value>
   no
```

Description

This command configures managed device capacity thresholds which, when exceeded, trigger alerts.

Syntax

Parameter	Description	Range	Default
`controlpath-cpu <value>`	Sets an alert threshold, in percentage, for the control path CPU capacity that must be exceeded before the alert is sent.	0-100%	80%
`controlpath-memory <value>`	Sets an alert threshold, in percentage, for the control path memory consumption that must be exceeded before the alert is sent.	0-100%	85%
`datapath-cpu <value>`	Sets an alert threshold, in percentage, for the datapath CPU capacity that must be exceeded before the alert is sent.	0-100%	30%
`no-of-APs <value>`	The maximum number of APs that can be connected to a managed device is determined by that managed device's model type and installed licenses. Use this command to trigger an alert when the number of APs currently connected to the managed device exceeds a specific percentage of its total AP capacity.	0-100%	80%
`no-of-locals <value>`	Sets an alert threshold, in percentage, for the Mobility Master's capacity to support managed devices that must be exceeded before the alert is sent.	0-100%	80%
`no-of-vaps <value>`	The maximum number of Virtual APs that can be connected to a managed device is determined by that managed device's model type and installed licenses. Use this command to trigger an alert when the number of Virtual APs currently connected to the managed device exceeds a specific percentage of its total AP capacity.	0-100%	80%
`total-tunnel-capacity <value>`	Sets an alert threshold, in percentage, for the managed device's tunnel capacity that must be exceeded before the alert is sent.	0-100%	80%

Parameter	Description	Range	Default
`user-capacity <value>`	Sets an alert threshold, in percentage, for the managed device's user capacity that must be exceeded before the alert is sent.	0-100%	80%

Usage Guidelines

The managed device sends a *wlsxThresholdExceeded* SNMP trap and a syslog error message when the managed device has exceeded a set percentage of the total capacity for that resource. A *wlsxThresholdCleared* SNMP trap and error message will be triggered if the resource usage drops below the threshold once again.

Example

The following command configures a new alert threshold for controlpath memory consumption:

```
(host) [mynode] (config) #threshold datapath-cpu 90
```

If this threshold is exceeded then subsequently drops below the 90% threshold, the managed device would send the following two syslog error messages.

```
Mar 10 13:13:58  nanny[1393]: <399816> <ERRS> |nanny|  Resource 'Control-Path Memory' has gone
above  90%  threshold, value : 93
Mar 10 13:16:58  nanny[1393]: <399816> <ERRS> |nanny|  Resource 'Control-Path Memory' has come
below  90%  threshold, value : 87
```

Related Commands

Command	Description
show threshold	Displays the managed device capacity thresholds which, when exceeded, triggers alerts.

Command History

Release	Modification
AOS-W 8.6.0.0	The **no-of-vaps<value>** parameter was introduced.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config mode on Mobility Master.

time-range

```
time-range
   absolute <name> [end <mm/dd/yyyy> <hh:mm>][start <mm/dd/yyyy> <hh:mm>]
   no
   periodic <name>
      Daily <hh:mm> to <hh:mm>
      Friday <hh:mm> to <hh:mm>
      Monday <hh:mm> to <hh:mm>
      Saturday <hh:mm> to <hh:mm>
      Sunday <hh:mm> to <hh:mm>
      Thursday <hh:mm> to <hh:mm>
      Tuesday <hh:mm> to <hh:mm>
      Wednesday <hh:mm> to <hh:mm>
      Weekday <hh:mm> to <hh:mm>
      Weekend <hh:mm> to <hh:mm>
```

Description

This command configures time ranges.

Syntax

Parameter	Description
`absolute <name>`	Specifies an absolute time range, with a specific start time, end time, and date.
`end <mm/dd/yyyy> <hh:mm>`	Specifies the end time of the time range.
`start <mm/dd/yyyy> <hh:mm>`	Specifies the start time of the time range.
`no`	Negates any configured parameter.
`periodic <name>`	Specifies a recurring time range. Select the day of the week occurrence, the start time (hh:mm), and the end time (hh:mm).

Usage Guidelines

You can use time ranges when configuring session ACLs. Once you configure a time range, you can use it in multiple session ACLs.

Example

The following command configures a time range for daytime working hours:

```
(host) [mynode] (config) #time-range periodic working-hours
   weekday 7:30 to 18:00
```

Related Commands

Command	Description
show time-range	Displays the configured time ranges.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platform	License	Command Mode
All platforms	Next Generation Policy Enforcement Firewall (PEFNG) license.	Enable and Config modes on Mobility Master and managed devices.

time-range-profile

```
time-range-profile <profile-name>
   absolute [start-date <abs_sdate> start-time <abs_stime>][end-date <abs_edate> end-time
   <abs_etime>]
   mode {absolute|periodic}
   no
```

Description

This command configures time range profiles.

Syntax

Parameter	Description
`<profile-name>`	Name of the time range profile.
`absolute`	Specifies an absolute time range profile, with a specific start date, start time, end date, and end time.
`start-date <abs_sdate>`	Start date for the time range profile (mm/dd/yyyy).
`start-time <abs_stime>`	Start time for the time range profile (hh:mm).
`end-date <abs_edate>`	End date for the time range profile (mm/dd/yyyy).
`end-time <abs_etime>`	End time for the time range profile (hh:mm).
`mode`	Time range profile mode: ■ Absolute ■ Periodic
`no`	Negates any configured parameter.

Usage Guidelines

You can use time range profiles when configuring session ACLs. After you configure a time range profile, you can use it in multiple session ACLs.

Example

The following command configures a time range profile for a training class that takes place between 8:30AM and 6:00PM:

```
(host) [node] (config) #time-range-profile training absolute
   start-date <06/19/2016>
   start-time <08:30>
   end-date <06/19/2016>
   end-time <18:00>
```

Related Commands

Command	Description
show time-range	Displays the configured time ranges.

```

Description

This command configures the traceoptions to monitor and log traffic flows.

Syntax

Parameter	Description
`chassis-manager flags`	Configures the chassis manager trace options: ■ **all**—Enables all chassis manager debug tracing. ■ **association**—Enables stack membership and association tracing. ■ **debug**—Enables generic chassis manager debug tracing. ■ **environment-monitoring**—Enables environment monitor debug tracing. ■ **fru**— Enables FRU reporting and management tracing. ■ **interface**—Enables interface debug tracing. ■ **interface-statistics**—Enables packet statistics on interface tracing. ■ **ipc**—Enables inter-process message exchange tracing. ■ **poe-configuration**—Enables power-over-ethernet configuration tracing. ■ **poe-statistics**—Enables power-over-ethernet statistics tracing. ■ **statistics-sync**—Enables statistics tracing. ■ **system-statistics**—Enables chassis system statistics tracing.
`igmp flags`	Configures the IGMP trace options: ■ **all**—Enables tracing on all IGMP modules. ■ **debug**—Enables internal state tracing for IGMP modules. ■ **leave**—Enables IGMP leave processing tracing. ■ **query**—Enables IGMP query processing tracing. ■ **report**—Enables IGMP report processing tracing.

Parameter	Description
`igmp-snooping flags`	Configures the IGMP snooping trace options: ■ **all**—Enables tracing on all igmp-snooping modules. ■ **config**—Enables igmp-snooping configuration tracing. ■ **errors**— Enables igmp-snooping error tracing. ■ **receive**—Enables igmp-snooping PDU received (RX) tracing. ■ **transmit**—Enables igmp-snooping PDU transmit (TX) tracing.
`interface-manager {flags|level}`	Configures the interface manager trace flags: ■ **all**—Enables all interface manager debug message tracing. ■ **configuration**—Enables configuration debug tracing. ■ **dhcp-client**—Enables dhcp client debug tracing. ■ **ethernet**—Enables ethernet interface debug tracing. ■ **infrastructure**—Enables infrastructure debug tracing. ■ **lacp**—Enables LACP debug tracing. ■ **loopback**—Enables loopback interface debug tracing. ■ **mgmt**—Enables management interface debug tracing. ■ **oam**—Enables OAM debug tracing. ■ **port-channel**—Enables port-channel debug tracing. ■ **port-mirroring**—Enables port mirroring debug tracing. ■ **system-information**—Enables system debug messages tracing. ■ **tunnel**—Enables tunnel interface debug tracing. ■ **vlan**—Enables vlan interface debug tracing. Configures the level for interface manager tracing: ■ **debug**—Debug messages ■ **error**—Error messages ■ **verbose**—Verbose debug messages
`layer2-forwarding {flags|level|size}`	Configures the layer2 forwarding trace flags: ■ **all**—Enables tracing on all switching modules. ■ **config**—Enables config module tracing. ■ **fdb**—Enables forwarding database module tracing. ■ **hsl**—Enables HSL module tracing. ■ **interface**—Enables interface module tracing. ■ **ipc**—Enables IPC tracing. ■ **learning**—Enables learning module tracing. ■ **nexthop**—Enables nexthop module tracing. ■ **port-loop**—Enables Port loop protect Protocol tracing. ■ **sysinfo**—Enables sysinfo module tracing. ■ **task**—Enables task tracing. ■ **timer**—Enables task timer tracing. ■ **tunneled-node**—Enables tunneled-node module tracing. ■ **vlan**—Enables vlan module tracing. ■ **vlan-assignment**—Enables VLAN assignment module tracing. ■ **vlan-port**—Enables VLAN port module tracing. Configures the layer2 forwarding tracing levels: ■ **debug**—Debug messages ■ **error**—Error messages ■ **informational**—Informational messages Configures the maximum size for layer2 forwarding trace file in MB.
`lldp flags`	Configures the LLDP trace options: ■ **all**—Enables tracing on all lldp modules. ■ **errors**—Enables lldp error tracing. ■ **receive**—Enables lldp PDU receive (RX) tracing. ■ **system-state**—Enables lldp system-state tracing. ■ **transmit**—Enables lldp PDU transmit (TX) tracing.
`mstp {flags|port}`	Configures the MSTP trace flags and trace port:

Parameter	Description
	■ **all**—Enables tracing on all mstp modules ■ **config**—Enables mstp config tracing. ■ **debug**—Enables mstp debug tracing. ■ **port-information**—Enables mstp port information tracing. ■ **received-bpdu-al**—Enables mstp received bpdu tracing. ■ **role-selection**—Enables mstp role selection tracing. ■ **sent-bpdu-all**—Enables mstp sent bpdu tracing. ■ **state-machine-changes**—Enables mstp state machine change tracing. ■ **system**—Enables mstp system tracing. ■ **topology-change**—Enables mstp topology change tracing.
`ospf flags`	Configures the OSPF trace options: ■ **all**—Enables tracing for all ospf events. ■ **cnf**—Enables configuration events tracing. ■ **db**—Enables database operations tracing. ■ **dd**—Enables database description packets tracing. ■ **debug**—Enables internal debug tracing. ■ **dr-elect**—Enables designated router election tracing. ■ **flood**—Enables linkstate flooding tracing. ■ **hello**—Enables tracing for hello packets. ■ **lsa**—Enables link state advertisement packets tracing. ■ **lsr**—Enables link state request packets tracing. ■ **lsu**—Enables link state update packets tracing. ■ **msm**—Enables msm events tracing. ■ **pkt-all**—Enables tracing for all packets. ■ **spf**—Enables SPF operations tracing. ■ **state**—Enables interface, neighbor, area changes tracing.
`pim flags`	Configures PIM sparse mode trace options: ■ **adjacency**—Enables pim sparse mode adjacency tracing. ■ **all**—Enables tracing on all pim sparse mode modules. ■ **debug**—Enables internal state tracing for pim sparse mode modules. ■ **jp-asserts**—Enables pim sparse mode join-prune/assert tracing. ■ **register**—Enables pim sparse mode register tracing. ■ **route**—Enables pim sparse mode route tracing. ■ **state**—Enables pim sparse mode state tracing.
`rmon {flag-s|level|size}`	Configures the RMON trace flags: ■ **alarm**—Enables rmon alarm module debug tracing. ■ **all**—Enables rmon all module debug tracing. ■ **cli**—Enables rmon CLI module debug tracing. ■ **event**—Enables rmon event debug tracing. ■ **history**—Enables rmon history module debug tracing. ■ **ifstat**—Enables rmon interface statistics debug tracing. ■ **log**—Enables rmon log debug tracing. ■ **snmp**—Enables rmon SNMP module debug tracing. Configures the RMON tracing levels: ■ **alert**—Alert messages ■ **critical**—Critical messages ■ **debugging**—Debug messages ■ **emergency**—Emergency messages ■ **errors**—Error messages ■ **informational**—Informational messages ■ **notice**—Notification messages ■ **warning**—Warning messages Configures the maximum size for RMON trace file in MB.
`routing flags`	Configures the layer3 manager trace options:

Parameter	Description
	■ **all**—Enables tracing on all layer3 manager events. ■ **arp**—Enables arp module tracing. ■ **configuration**—Enables layer3 configuration processing tracing. ■ **event**—Enables layer3 manager system events tracing. ■ **interface**—Enables layer3 manager interface events tracing. ■ **route**—Enables route table updates tracing.
`stack-manager {flags|level}`	Configures the stack manager trace flags: ■ **adjacency**—Enables stack-manager adjacency tracing. ■ **all**—Enables tracing for all stack-manager modules. ■ **asp**—Enables aruba stacking protocol tracing. ■ **configuration**—Enables tracing for configuration of stack-manager. ■ **primary-election**—Enables tracing for primary election. ■ **route**—Enables stack-manager route calculations tracing. ■ **system**—Enables tracing for stack-manager interaction with other components. ■ **webui**—Enables tracing for stack-manager interaction with WebUI. Configures the stack manager tracing level: ■ **alert**—Alert messages ■ **critical**—Critical messages ■ **debugging**—Debug messages ■ **emergency**—Emergency messages ■ **errors**—Error messages ■ **informational**—Informational messages ■ **notice**—Notification messages ■ **warning**—Warning messages

Example

The following command enables tracing on all IGMP modules:

```
(host) [mynode] (config) #traceoptions igmp flags all
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config mode on Mobility Master.

tracepath

```
tracepath <global-address>
```

Description

Traces the path of an IPv6 host.

Syntax

Parameter	Description
`<global-address>`	The IPv6 global address of the host.

Usage Guidelines

Use this command to identify points of failure in your IPv6 network.

Example

The following command traces the path of the specified IPv6 host.

```
(host) [mynode] (config) #tracepath 2005:d81f:f9f0:1001::14
```

Command History

Version	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config mode on Mobility Master.

traceroute

```
traceroute <ipaddr>
   source
```

Description

Trace the route to the specified IP address.

Syntax

Parameter	Description
`<ipaddr>`	The destination IP address.
`source <ipaddr>`	Sets the source IP address through which packets are sent for tracing route.

Usage Guidelines

Use this command to identify points of failure in your network.

Example

The following command traces the route to the device identified by the IP address 10.1.2.3.

```
(host) [mynode] (config) #traceroute 10.1.2.3
```

Command History

Version	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config mode on Mobility Master.

tunnel-group

```
tunnel-group <tungrpname>
   mode {l2|l3)
   no
   preemptive-failover
   tunnel <tunnel-id>
```

Description

This command creates a tunnel-group to group a set of tunnels.

Syntax

Parameter	Description	Default
`mode {l2|l3}`	Set the type of tunnel-group.	l3
`no`	Negates any parameter configured.	—
`preemptive-failover`	When enabled, this option automatically redirects the traffic upon detecting an active tunnel with a higher precedence in the tunnel-group. When disabled, the traffic gets redirected to a higher precedence tunnel only when the tunnel carrying the traffic fails.	enabled
`tunnel <tunnel-id>`	Adds the specified tunnel ID to the tunnel group. The range is 1-16777215.	—

Usage Guidelines

Use this command to provide redundancy for L3 GRE tunnels. This feature enables automatic redirection of the user traffic to a standby tunnel when the primary tunnel goes down.

To enable L3 GRE tunnel group, you must:

- configure a tunnel-group to group a set of tunnels.
- enable tunnel keepalives on all the tunnel interfaces assigned to the tunnel-group, and
- configure the session ACL with the tunnel-group as the redirect destination.

To enable L2 GRE tunnel group, you must:

- configure the member tunnel and add them to the appropriate VLAN.
- enable tunnel keepalives on the tunnel interface.
- configure the tunnel-group and set the group type to L2, and
- add the member tunnel to the group

You can configure up to 32 tunnel-groups on a managed device with a maximum of 5 tunnels in each tunnel-group.

Example

The following set of commands create a tunnel-group with tunnel IDs 10 and 20 as the members:

```
(host) [mynode] (config) #tunnel-group tgroup1
(host) [mynode] (config-tunnel-group)# mode l3
```

```
(host) [mynode] (config-tunnel-group)# tunnel 10
(host) [mynode] (config-tunnel-group)# tunnel 20
(host) [mynode] (config-tunnel-group)#preemptive-failover
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable and Config mode on Mobility Master.

tunnel-loop-prevention

`tunnel-loop-prevention`

Description

This command prevents prevent forwarding loops between tunneled nodes on the managed device.

Syntax

No parameters.

Usage Guidelines

This command prevents forwarding loops between tunnels from the tunneled nodes on the managed device.

To allow a tunneled node-connected machine to communicate with another managed device that is a connected client on the same subnet, you must enable **broadcast-filter-arp**.

Example

The following command prevents tunneled node forwarding:

```
(host) [mynode] (config) #tunnel-loop-prevention
```

Related Commands

Related Commands

Command	Description
show tunneled-node	Displays the wired tunneled node configuration details, the state of the tunneled node, and lists all the tunneled nodes in the database.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Requires the PEFNG license.	Config mode on Mobility Master.

tunneled-node-address

```
tunneled-node-address <ipaddr>
```

Description

This command configures the IP address of a tunneled node server.

Syntax

Parameter	Description
`tunneled-node-address`	IP address of the managed device. This is the loopback or IP address of the managed device acting as a tunneled node managed device.

Usage Guidelines

A Alcatel-Lucent managed device can operate as a Wi-Fi managed device, terminating GRE tunnels from tunneled node switches. As a Wi-Fi managed device, the managed device does not perform full Wi-Fi switching functions. Instead, it accepts traffic from ports designated as tunneled node ports, packages this traffic inside a GRE tunnel, and forwards the traffic back to a central managed device for processing.

Example

The following command configures the address of a managed device for tunneled nodes:

```
(host)[mynode] (config) #tunneled-node-address 192.168.1.245
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config mode on Mobility Master.

tunnel-node-mtu

```
tunnel-node-mtu <mtu>
```

Description

This command configures the MTU of a tunneled node.

Syntax

Parameter	Description
`tnode-mtu`	Value of the MTU for the tunneled nodes Range: 1024 to 9216

Usage Guidelines

An Alcatel-Lucent managed device can operate as a Wi-Fi managed device, terminating GRE tunnels from tunneled node switches. As a Wi-Fi managed device, the managed device does not perform full Wi-Fi switching functions. Instead, it accepts traffic from ports designated as tunneled node ports, packages this traffic inside a GRE tunnel, and forwards the traffic back to a central managed device for processing.

This command does not take effect when the tunnel node client is an AOS-W switch.

Example

The following command configures the MTU of a managed device for tunneled nodes:

```
(host) [mynode] (config) #tunnel-node-mtu 1030
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config mode on Mobility Master.

uap-blacklist

```
uap-blacklist
   add mac-address <address> description <description>
   del mac-address <address>
   modify mac-address <address> description <description>
   purge
```

Description

This command configures a Unified AP (UAP) blacklist database entry. You can add, delete, or modify AP MAC addresses and description to the blacklist database. If you enable the blacklist policy in the AP deploy profile, the policy is applied to the APs included in this list. You can also purge the UAP blacklist database from the device.

Syntax

Parameter	Description
`add mac-address <address> description <description>`	Adds the specified AP MAC address to the blacklist database.
`del mac-address <address>`	Deletes the specified AP MAC address from the blacklist database.
`modify mac-address <address> description <description>`	Modifies the details of an existing MAC address entry in the blacklist database.
`purge`	Purges the blacklist database.

Example

The following command adds the 11:11:11:11:11:11 MAC address entry to the UAP blacklist database:

```
(host) [mynode] #uap-blacklist add mac-address 11:11:11:11:11:11 description AP-203H
```

The following command modifies the description of the 11:11:11:11:11:11 MAC address entry from **AP-203H** to **AP-203R** in the UAP blacklist database:

```
(host) [mynode] #uap-blacklist add mac-address 11:11:11:11:11:11 description AP-203R
```

The following command deletes the 11:11:11:11:11:11 MAC address entry from the UAP blacklist database:

```
(host) [mynode] #uap-blacklist del mac-address 11:11:11:11:11:11
```

The following command purges the UAP blacklist database from the device:

```
(host) [mynode] #uap-blacklist purge
```

Related Commands

Description

This command configures the various UCC Application Layer Gateways (ALGs).

Syntax

Parameter	Description	Range	Default
`custom-sip`	Configures the custom SIP ALG. The ALG is enabled by default. This parameter has the following sub-parameters: ■ **app-name** – Configure an application name.	priority voice: 0-63	—

Parameter	Description	Range	Default
	■ **custom_sip_port** – Configure the custom SIP port number. ■ **enable** – Enable the custom SIP ALG. ■ **key** – Configure the user-agent key-name. ■ **no** – Remove or negate a parameter. ■ **priority**– Configure the DSCP value for the video or voice session.	priority video: 0-63	
`facetime`	Configures the Apple® FaceTime ALG. The ALG is enabled by default. The DSCP value for the video session is 34 by default. This parameter has the following sub-parameters: ■ **enable**– Enable the Apple Facetime ALG on the Mobility Master. ■ **no–** Remove or negate a parameter. ■ **priority**– The DSCP value for the video session.	priority video: 0-63	priority video: 34
`h323`	Configures the H.323 ALG. The ALG is enabled by default. The DSCP value for the voice session is 46 by default. This parameter has the following sub-parameters: ■ **enable**– Enable the H.323 ALG on the Mobility Master. ■ **no–** Remove or negate a parameter. ■ **priority**– The DSCP value for the voice session.	priority voice: 0-63	priority voice: 46
`ich`	Configures the intelligent call handling. The setting is enabled by default. The Channel Utilization Threshold is 90 by default. This parameter has the following sub-parameters: ■ **channel-utilization-threshold**–The maximum limit for the channel utilization. ■ **enable**–Enable intelligent call handling on the Mobility Master. ■ **no**–Remove or negate a parameter.	channel-utilization-threshold: 50-95	channel-utilization-threshold: 90
`jabber`	Configures the Cisco® Jabber ALG. The ALG is enabled by default. Enter the Cisco Unified Communication Manager IM & Presence server IP. The DSCP values for the voice, video, and app-sharing sessions are 46, 34, and 34, respectively, by default. This parameter has the following sub-parameters: ■ **enable**–Enable Jabber ALG on the Mobility Master. ■ **no**–Remove or negate a parameter. ■ **priority**–The DSCP value for voice, video, and app-sharing sessions. ■ **server-ip**–Jabber server IP.	app-sharing, video, and voice: 0-63	app-sharing: 34 video: 34 voice: 46
`noe`	Configures the Alcatel-Lucent® New Office Environment (NOE) ALG. The ALG is enabled by default. The DSCP value for the voice session is 46 by default. This parameter has the following sub-parameters: ■ **enable**– Enable the NOE ALG on the Mobility Master. ■ **no–** Remove or negate a parameter. ■ **priority**– The DSCP value for the voice session.	priority voice: 0-63	priority voice: 46

Parameter	Description	Range	Default
`rtpa-config`	Configures the real-time analysis of VoIP calls including upstream real-time analysis. The setting is enabled by default. This parameter has the following sub-parameters: ■ **enable**– Enable Real-Time Analysis of VoIP calls. ■ **no–** Remove or negate a parameter. ■ **upstream**–Enable upstream Real-Time Analysis of VoIP calls.	—	—
`sccp`	Configures the Cisco Skinny Client Control Protocol (SCCP) ALG. The ALG is enabled by default. The DSCP value for the voice session is 46 by default. This parameter has the following sub-parameters: ■ **enable**– Enable the SCCP ALG on the Mobility Master. ■ **no–** Remove or negate a parameter. ■ **priority**– The DSCP value for the voice session.	priority voice: 0-63	priority voice: 46
`session-idle-timeout`	Configures the UCC session idle timeout. On configuring this parameter, if the voice session is idle for the configured period, UCM aborts the session on the managed device due to inactivity. The default value is 35. This parameter has the following sub-parameters: ■ **no–** Remove or negate a parameter. ■ **value**– Configure UCC session idle timeout in seconds.	value: 35-250	value: 35
`sip`	Configures the Session Initiation Protocol (SIP) ALG. The ALG is enabled by default. You can enable the **SIP Midcall request timeout** and **RTCP inactivity** settings. The DSCP values for the voice and video sessions are 46 and 34, respectively, by default. This parameter has the following sub-parameters: ■ **enable**–Enable SIP ALG on the Mobility Master. ■ **midcall-req-timeout**–Enable SIP Midcall request timeout. ■ **no**–Remove or negate a parameter. ■ **priority**–The DSCP value for voice and video sessions. ■ **rtcp-inactivity**–Enable Real-Time Control Protocol inactivity.	video and voice: 0-63	video: 34 voice: 46
`skype4b`	Configures the Microsoft® Lync/Skype for Business ALG. The ALG is enabled by default. You can set the Skype for Business SDN listen protocol over HTTP or HTTPS. Based on the SDN listen protocol configuration, Mobility Master accepts either HTTP or HTTPS messages from the Skype for Business SDN manager. The DSCP values for the voice, video, and app-sharing sessions are 46, 34, and 34, respectively, by default. This parameter has the following sub-parameters: ■ **enable**–Enable Skype for Business ALG on the Mobility Master. ■ **no**–Remove or negate a parameter. ■ **priority**–The DSCP value for voice, video, and app-sharing sessions. ■ **sdn**–Skype for Business SDN listen protocol.	app-sharing, video, and voice: 0-63	app-sharing: 34 video: 34 voice: 46

Parameter	Description	Range	Default
	The default Skype for Business SDN API listen port is 32000.		
`tables`	Displays the UCC client MAC and IP address table. **NOTE:** This parameter is executable from the **enable** mode.	—	—
`vocera`	Configure the Vocera ALG. The ALG is enabled by default. The DSCP value for the voice session is 46 by default. This parameter has the following sub-parameters: ■ **enable**– Enable the Vocera ALG on the Mobility Master. ■ **no–** Remove or negate a parameter. ■ **priority**– The DSCP value for the voice session.	priority voice: 0-63	priority voice: 46
`webrtc`	Configure the WebRTC ALG. The ALG is enabled by default. This parameter has the following sub-parameters: ■ **enable**– Enable the WebRTC ALG on the Mobility Master. ■ **no–** Remove or negate a parameter. ■ **priority**– The DSCP value for the video or voice session.	priority video: 0-63 priority voice: 0-63	priority voice: 46
`wificalling`	Configures the Wi-Fi Calling. Wi-Fi Calling is enabled by default. The DSCP value for the voice session is 46 by default. ■ **dns-pattern**– Configure the DNS pattern for the carrier. A maximum of 10 DNS patterns can be configured. DNS patterns for known carriers are configured by default. Default built-in patterns are: - 3 HK - wlan.three.com.hk - ATT - epdg.epc.att.net - Rogers - epdg.epc.mnc720.mcc302.pub.3gppnetwork.org - SmarTone - epdg.epc.mnc006.mcc454.pub.3gppnetwork.org - Sprint - primgw.vowifi2.spcsdns.net - T-Mobile - ss.epdg.epc.mnc260.mcc310.pub.3gppnetwork.org - Verizon - wo.vzwwo.com If the ePDG FQDN of the carrier does not match with the default patterns, use this option to configure the DNS pattern for the carrier. **NOTE:** The DNS IP address that Mobility Master learns for Wi-Fi Calling age out automatically, if there was no DNS query or response matching that IP for more than seven days. **service-provider**– Add the service provider name for enhanced visibility. ■ **enable**– Enable the Wi-Fi calling ALG on the Mobility Master. ■ **no–** Remove or negate a parameter. ■ **priority**– The DSCP value for the voice session.	priority voice: 0-62	priority voice: 46

Usage Guidelines

The UCC ALGs must be configured from the **/mm** node hierarchy of Mobility Master. All the ALGs are enabled by default.

Examples

The following commands enables Wi-Fi calling on Mobility Master:

```
(host) [mm] (config) #ucc wificalling
(host) ^[mm] (WiFiCalling Configuration) #enable
```

The following command displays the UCC client MAC and IP address table. The **ucc tables** command should be executed from the **enable** mode:

```
(host) [mynode] #ucc tables

-------------------------------------------
UCC Client MAC table
--------------------
Client(MAC)         Client(IP)     Type    ALG
-----------         ----------     ----    ---
68:17:29:9f:b6:77   10.15.88.234   Client  Jabber/xmpp/SIP
-------------------------------------------
UCC Client IP table
-------------------
Client(MAC)         Client(IP)     Type    ALG
-----------         ----------     ----    ---
00:0b:86:8f:d6:b7   10.15.16.50    Server  SIP
00:0b:86:8f:d6:b7   10.15.16.30    Server  Jabber
68:17:29:9f:b6:77   10.15.88.234   Client  Jabber/xmpp/SIP
-------------------------------------------
```

```

Description

This command upgrades the managed devices with the respective options provided in the input, like using different protocol options as well as loading at different node levels and paths, and also can upgrade the single managed device based on the MAC address of the device. This command is internal or hidden

Syntax

Parameter	Description
`copy configured-fileserver`	Copies the configured file server options like file, force-file, version, and force-version.
`copy fileserver`	Specify the file server details like, scp, ftp, tftp.
`copy-reboot configured-fileserver`	Reboots the managed devices after successful upgrade of the respective image using configured-file server options like file, force-file, version and force-version.
`copy-reboot fileserver`	Selects the type of supported servers like, ftp, scp, tftp and reboots the managed device post upgrade.
`reboot`	Reboots the managed device.
`ftp`	Used for mentioning FTP server.
`scp`	Used for mentioning SCP server.
`tftp`	Used for mentioning TFTP server.

Parameter	Description
`file`	Used for mentioning TFTP server.
`force-file`	Exact name of the image or image file.
`force-version`	Used to force the standard image name and is based on the platform type and version running on the managed device.
`version`	Image version and standard name based on platform type generated to load the image.

Command History

Release	Description
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable mode on Mobility Master.

upgrade managed-devices

```
upgrade managed-devices

      force-version <img-version-forced> {all|path <node-path>|single <mac-addr>} partition
      {0|1}
      version <img-version> {all|path <node-path>|single <mac-addr>} partition {0|1}
      schedule <year> <month> <day> <hour> <min> <sec> partition {0|1}
   reboot
      all
      path <node-path>
      single <mac-addr>
```

Description

This command upgrades the managed devices with the respective options provided in the input, like using different protocol options as well as loading at different node levels and paths, and also can upgrade the single managed device based on the MAC address of the device.

This command can only be issued on the **/md** node or a specific node. This command is ignored if issued on the **/mynode** node.

Syntax

Parameter	Description
`copy configured-fileserver`	Copies the configured file server options like file, force-file, version, and force-version.

Parameter	Description
`copy fileserver`	Specify the file server details like, scp, ftp, tftp.
`copy-reboot configured-fileserver`	Reboots the managed devices after successful upgrade of the respective image using configured-file server options like file, force-file, version and force-version.
`copy-reboot fileserver`	Selects the type of supported servers like, ftp, scp, tftp and reboots the managed device post upgrade
`reboot`	Reboots the managed device.
`all`	Copies/ upgrades image to all managed devices under the respective node path
`path`	Copies/ upgrades image under specific node path and all the managed devices under this node path target node and make them as target list.
`single`	Copies/ upgrades image to the specific managed device based on MAC address under the respective node-path.
`ftp`	Used for mentioning FTP server.
`scp`	Used for mentioning SCP server.
`tftp`	Used for mentioning TFTP server.
`file`	Exact name of the image or image file.
`force-file`	Forcing the exact image name on the file-server by ignoring the existing file or image on the managed device..
`force-version`	Used to force the standard image name and is based on the platform type and version running on the managed device.
`version`	Image version and standard name based on platform type generated to load the image.
`schedule <year> <month> <day> <hour> <min> <sec>`	Schedule the upgrade to occur at specified date and time.

Example

The following command schedules the upgrade of AOS-W image on partition 0 of a single managed device with MAC address 1a:2b:3c:4d:5e:6f under the **/md** node by using an AOS-W image from an FTP file server on the network. The upgrade is scheduled to occur at 10:30:15 AM on the 11th of December 2018.

```
(host) [md] #upgrade managed-devices copy fileserver ftp 191.1.2.3 anonymous . file ArubaOS_
70xx_8.4.0.0_68198 single 1a:2b:3c:4d:5e:6f partition 0 schedule 2018 12 11 10 30 153
```

Related Commands

Command	Description
lc-cluster schedule upgrade	Use this command to schedule upgrade of cluster.
show upgrade managed-devices	Use this command to view the status of scheduled upgrade of managed devices.

Command History

Release	Description
AOS-W 8.4.0.0	The **schedule** parameter was added.
AOS-W 8.2.0.0	The IPv6 address of the image server was added to the **imagehost** parameter.
AOS-W 8.0.0.0	Command introduced.

Command Information

All platforms	Base operating system.	Config mode on Mobility Master.

upgrade cancel-schedule

```
upgrade cancel-schedule
    <year> <month> <day> <hour> <min> <sec> {all|path <node-path>|single <mac-addr>}
```

Description

This command cancels an already scheduled upgrade of the managed devices.

Syntax

Parameter	Description
`<year>`	Specify the scheduled year in YYYY format.
`<month>`	Specify the scheduled month in MM format. Example: Specify 10 for October.
`<day>`	Specify the scheduled day of the month.
`<hour>`	Specify the scheduled hour in 24-hour format.
`<min>`	Specify the scheduled minute.
`<sec>`	Specify the scheduled second.
`all`	Cancels the scheduled upgrade on all managed devices. Target managed devices will be all managed devices under the node path.
`path`	Cancels the scheduled upgrade on all managed devices under the specified node path. Target managed devices will be the managed devices under the specified node path.
`single <mac-addr>`	Cancels the scheduled upgrade on specified managed device. Specify the MAC address of the target managed device. The managed device should be under the current node path.

Example

The following command cancels the scheduled upgrade on all managed devices:

```
(host) [mynode] #upgrade cancel-schedule 2018 12 01 23 59 59 all
```

Command History

Release	Description
AOS-W 8.4.0.0	Command introduced.

Command Information

Platform	License	Command Mode
All platforms	Base operating system.	Config mode on Mobility Master.

upgrade reschedule

```
upgrade reschedule
   from <from-year> <from-month> <from-day> <from-hour> <from-min> <from-sec> to <to-year>
   <to-month> <to-day> <to-hour> <to-min> <to-sec> {all|path <node-path>|single <mac-addr>}
```

Description

This command reschedules the existing scheduled upgrade of the managed devices.

Syntax

Parameter	Description
`from`	Specify the original schedule.
`<from-year>`	Specify the originally scheduled year in YYYY format.
`<from-month>`	Specify the originally scheduled month in MM format. Example: Specify 10 for October.
`<from-day>`	Specify the originally scheduled day of the month.
`<from-hour>`	Specify the originally scheduled hour in 24-hour format.
`<from-min>`	Specify the originally scheduled minute.
`<from-sec>`	Specify the originally scheduled second.
`to`	Specify the new schedule.
`<to-year>`	Specify the new year in YYYY format.
`<to-month>`	Specify the new month in MM format. Example: Specify 10 for October.
`<to-day>`	Specify the new day.
`<to-hour>`	Specify the new hour in 24-hour format.
`<to-min>`	Specify the new minute.
`<to-sec>`	Specify the new second.
`all`	Reschedule the scheduled upgrade on all managed devices. Target managed devices will be all managed devices under the node path.
`path`	Reschedule the scheduled upgrade on all managed devices under the specified node path. Target managed devices will be the managed devices under the specified node path.
`single <mac-addr>`	Reschedule the scheduled upgrade on specified managed device. Specify the MAC address of the target managed device. The managed device should be under the current node path.

Example

The following command reschedules the scheduled upgrade on all managed devices:

```
(host) [mynode] #upgrade reschedule from 2018 11 30 23 59 59 to 2018 12 25 12 30 00 all
```

Command History

Release	Description

upgrade-pkg

```
upgrade-pkg
   activate <packagename>
   copy
      ftp: <ftphost> <username> <filename> flash: <destfilename>
      scp: <scphost> <username> <filename> flash: <destfilename>
      tftp: <tftphost> flash: <destfilename>
   remove
```

Description

This command upgrades the service module on Mobility Master.

Syntax

Parameter	Description
`activate <packagename>`	Install and activate the service package.
`copy`	Download a service package through an FTP, SCP, or TFTP server.
`remove`	Delete a service package.

Example

This command upgrades the service module on Mobility Master.

```
(host) [mynode] #upgrade-pkg copy ftp: 192.0.2.22 anonymous ArubaOS_MM_8.0.0.0-svcs-ctrl_
appRF_55579 flash: ArubaOS_MM_8.0.0.0-svcs-ctrl_appRF_55579
(host) [mynode] #upgrade-pkg activate ArubaOS_MM_8.0.0.0-svcs-ctrl_appRF_55579
```

This command removes the service module on Mobility Master.

```
(host) [mynode] #upgrade-pkg remove ArubaOS_MM_8.0.0.0-svcs-ctrl_appRF_55579
```

Command History

upgrade-profile

```
upgrade-profile
   filepath
   no
   password
   protocol
   serverip
   username
   serverip
   serveraddr
```

Description

This command is used to configure the upgrade profile.

Syntax

Parameter	Description
`filepath`	File path to the location on the image server where the image file(s) reside.
`no`	Delete command
`password`	If you selected the FTP or SCP protocol for the Protocol type, enter the password that Mobility Master will use to connect to the image server.
`protocol`	Specify the protocol used to send the software upgrade from the image server to the managed device. ■ TFTP ■ FTP ■ SCP
`username <username>`	If you specified FTP or SCP for the **protocol** parameter field, enter the user name that Mobility Master uses to connect to the image server.
`serverip`	Specify the IPv4 address of the image server. This parameter is only used by managed devices running versions prior to AOS-W 8.2 and accepts only IPv4 address. **NOTE:** For FTP or SCP protocol, specify the username and password.
`serveraddr`	Specify the IPv4 or IPv6 address of the image server. This parameter is only used by managed devices running AOS-W 8.2. **NOTE:** For FTP or SCP protocol, specify the username and password.

Usage Guidelines

This command can be executed only from the **/md** node-hierarchy.

Example

The following command is used to upgrade managed devices:

```
(host) [md] #upgrade-profile
(host) [md] (Upgrade Profile) #serveraddr 2000:192:168:28::59
(host) [md] (Upgrade Profile) #username root
(host) [md] (Upgrade Profile) #password root123
(host) [md] (Upgrade Profile) #filepath Builds
```

```
(host) [md] (Upgrade Profile) #protocol scp
```

Command History

Release	Modification
AOS-W 8.2.0.0	The **serveraddr** parameter was added.
AOS-W 8.0.0.0	Command introduced.

uplink

```
uplink
   cellular
    apn <APN-Profile-Pid> <APN-name>
    priority <prior>
   enable
   health-check ip {<fqdn>|<ip>}
   load-balance
    media-mode
    mode {hash-based|round-robbin|session-count|uplink utilization}
    threshold-limits
    jitter <avg_jitter>
    latency <avg_latency>
    session-count-percent <sess_percent>
   wired
    priority <prior>
    vlan <id> uplink-id {link1|link2|link3|link4}
     backup-link
     max-bandwidth <max_bw_utiln>
     no {backup-link|max-bandwidth|priority|speed|weight}
     priority <wired_vlan_priority>
     speed <uplink_speed>
     weight <wired_vlan_weight>
```

Description

Manage and configure the uplink network connection.

Syntax

Parameter	Description	Range

`cellular`
`apn <APN-Profile-Pid> <APN-Name>`
`priority <prior>`
	Set the cellular uplink configuration. This parameter has two sub-parameters:
	apn: The AP name of the cellular uplink.
	<APN-Profile-Pid>: Connection ID in modem dial string (e.g. "*99***x#", where "x" is the appropriate APN-profile-id number in dial-string)
	<APN-Name>: AP Name (e.g. internet). Contact your service provider if not known.
	priority: Set the priority of the cellular uplink. By default, the cellular uplink is a lower priority than the wired uplink; making the wired link the primary link and the cellular link the secondary or backup link. Configuring the cellular link with a higher priority than your wired link priority will set your cellular link as the primary link.
		priority: 1-255

Parameter	Description	Range
`enable`	Enable the uplink manager.	—
`load-balance`	Load-balance configuration.	—
`media-mode`	Enable the **Media Mode** option to reevaluate the selected uplink for the session if it is identified as a media session. By default, all sessions use the load-balance mode specified by the **mode** parameter. When you select this option, any time a session is identified as a media session, the uplink is reassigned to the optimal uplink for media sessions, based upon a separate media load-balancing algorithm.	—
`mode hash-based|round-robbin|session-count`	Choose one of the following load balancing modes: **Hash based**: Hash-based load balancing uses information from the packets being sent, (e.g. the source IP address, destination IP address, protocol and port numbers to determine how to load balance that traffic) **Round Robin**: Traffic is equally distributed to all the active uplinks **Session Count**: Traffic is balanced between the uplink ports based on the number of sessions managed by each link. The session-distribution is guided by **uplink load-balance threshold-limits session-count <>** percentage.	—
`threshold-limits`	Define latency and session thresholds	—
`jitter <avg_jitter>`	Define the maximum latency allowed for media sessions in media mode. The supported range is 1 - 400 milliseconds, and the default is 20 ms.	1-400 ms
`latency <avg_latency>`	Optimize media sessions by defining the maximum latency allowed for media sessions in media mode. The supported range is 1 - 400 milliseconds, and the default is 20 ms.	1-400 ms
`session-count <sess_count>`	Specify the maximum percentage of total sessions that can be managed by any active uplink. The default % is equally distributed among the number of wired uplink ports present. That is:	—

Parameter	Description	Range
	■ For 4 uplink ports– 25% ■ For 3 uplink ports– 33% ■ For 2 uplink ports– 50% ■ For 1 uplink port– 100%	
media-mode	Enable load-balancing of media sessions using jitter, latency, pkt-loss of uplinks (disabled by default)	—
mode	Configure load-balancing mode. The valid values are hash-based, round-robin, and session-count.	—
threshold-limits	Set threshold limits for load balancing. The valid values are jitter, latency, and session count percentage.	—
health-check {ip {<fqdn>|<ip>}	The **health-check** parameter is introduced to monitor the availability and quality of the connection to a master managed device with the specified FQDN or IP address.	—
wired	Define the wired uplink configuration.	—
priority <prior>	Define the default priority for wired uplinks. The default wired priority is 200.	1-255
vlan <id> uplink-id {link1|link2|link3|link4}	Define the VLAN ID of the uplink VLAN. A maximum of four wired VLANs can be defined.	1-4094
priority <wired_vlan_priority>	Set the priority of the wired VLAN uplink-id. Each uplink type has an associated priority; wired ports have the highest priority by default.	1-255
weight <wired_vlan_weight>	Set a weight for the uplink VLAN, which will be used in load balancing. The default value is 10.	1-100

Usage Guidelines

A managed device that supports multiple 3G cellular uplink ports in addition to their standard wired ports provides redundancy in the event of connection failure. However, at a time, only one cellular uplink is supported irrespective of many plugged-in. Also, **uplink enable** configuration is required to failover to cellular uplink (that is, active-standby operation). So, if a managed device's wired link cannot access the internet, the managed device can fail over to a secondary cellular link and continue routing traffic.

The uplink manager is disabled by default. Issue the **uplink enable** command to enable the uplink manager.

If **uplink load-balance** is enabled (active-active operation), and the device fails-over to cellular uplink because all wired uplink ports became unusable (unreachable or interface is down) then uplink load-balancing gets disabled automatically. This is because cellular uplink never participates in load-balancing of WAN traffic. Once any wired uplink port becomes usable again, cellular is disconnected and load-balancing get enabled again.

Both **uplink enable** and **uplink health-check** configuration are required for enabling **uplink load-balance**.

To view the health status of an uplink on a services or managed device, issue the command show uplink in the managed device CLI. For a managed device, the health status of its uplink connections are also displayed in the **Status** section of the **Dashboard > WAN** page of the managed device WebUI.

```

Description

This command configures a user role.

Syntax

Parameter	Description	Range	Default
`<name>`	Role name	—	—
`access-list`	Type of ACL to be applied: **eth:** Ethertype ACL, configured with the **ip access-list eth** command. **mac:** MAC ACL, configured with the **ip access-list mac** command. **session:** Session ACL, configured with the **ip access-list session** command.	—	—
`<acl>`	Name of the configured ACL.	–	–

Parameter	Description	Range	Default
`ap-group`	(Optional) AP group to which this ACL applies.	—	—
`position`	(Optional) Position of this ACL relative to other ACLs that you can configure for the user role. 1 is the top.	—	(last)
`bandwidth-contract`	Name of a bandwidth contract or rate limiting policy configured with the **aaa bandwidth-contract** command. The bandwidth contract must be applied to either downstream or upstream traffic.	—	—
`app`	Name of the application bandwidth contract configured for the user role. The bandwidth contract must be applied to either downstream or upstream traffic. **NOTE:** For a complete list of supported applications, issue the command **show dpi application all**.	–	–
`appcategory`	Name of the application category bandwidth contract configured for the user role. The bandwidth contract must be applied to either downstream or upstream traffic. **NOTE:** For a complete list of supported applications, issue the command **show dpi application category all**.	–	–
`web-cc-category|web-cc-reputation <cc-name> <bwc-name>`	Apply a bandwidth conract to the specified web content category or reputation level. Bandwidth contracts can be applied to user-defined web content categories created using the web-cc command. The five web content reputation levels are predefined in AOS-W. **NOTE:** bandwidth	Available reputation categories are: ■ high-risk ■ low-risk ■ moderate-risk ■ suspicious ■ trustworthy	–

Parameter	Description	Range	Default
	contracts applied to a web content category or reputation will not be enforced unless web content classification is enabled using the **firewall web-content-classification** command.		
`exclude app|appcategory`	Excludes an application or application category from being configured as a bandwidth contract.	–	–
`downstream`	Applies the bandwidth contract to traffic from the Switch to the client.	—	—
`per-user`	Specifies that bandwidth contract is assigned on a per-user basis instead of a per-role basis. For example, if two users are active on the network and both are part of the same role with a 500 Kbps bandwidth contract, then each user is able to use up to 500 Kbps.	—	(per role)
`upstream`	Applies the bandwidth contract to traffic from the client to the Switch.	—	—
`captive-portal <STRING>`	Name of the captive portal profile configured with the **aaa authentication captive-portal** command.	—	—
`check-for-accounting`	If disabled, RADIUS accounting is done for an authenticated users irrespective of the captive-portal profile in the role of an authenticated user. If enabled, accounting is not done as long as the user's role has a captive portal profile on it. Accounting will start when Auth/XML-Add/CoA changes the role of an authenticated user to a role which doesn't have captive portal profile.	–	enabled

Parameter	Description	Range	Default
`dialer`	If VPN is used as an access method, name of the VPN dialer configured with the **vpn-dialer** command. The user can login using captive portal and download the dialer. The dialer is a Windows application that configures the VPN client.	—	—
`dpi`	Role specific DPI configuration.	—	—
`disable`	Disable role specific DPI configuration.	–	–
`max-sessions`	Maximum number of datapath sessions per user in this role.	0-65535	65535
`no`	Negates any configured parameter.	—	—
`openflow-enable`	Enables SDN for the user role.	—	disabled
`pool`	If VPN is used as an access method, specifies the IP address pool from which the user's IP address is assigned: l2tp: When a user negotiates an L2TP or IPsec session, specifies an address pool configured with the **ip local pool** command. pptp: When a user negotiates a PPTP session, specifies an address pool configured with the **pptp ip local pool** command.	—	—
`<name>`	Name of the L2TP or PPTP pool to be applied.	—	—
`qos-profile`	Applies a QOS profile to the user role.	—	—
`reauthentication-interval`	Interval, in minutes or seconds, after which the client is required to reauthenticate.	■ 0-4096 in minutes ■ 0-245760 in seconds	0(disabled)

Parameter	Description	Range	Default
`registration-role`	If enabled, a user is forced to do MAC-based authentication every time the user connects to the network.	—	disabled
`sso`	Applies an SSO profile to the user role.	—	—
`statefule-kerberos`	Applies a stateful Kerberos profile to the user role.	—	—
`stateful-ntlm`	Apply stateful NTLM authentication to the specified user role		
`via`	Applies a VIA connection profile to the user role.	—	—
`vlan`	Identifies the VLAN ID or VLAN name to which the user role is mapped. This parameters works only when using Layer-2 authentication such as 802.1X or MAC address, ESSID, or encryption type role mapping because these authentications occur before an IP address is assigned. If a user authenticates using a Layer-3 mechanism such as VPN or captive portal this parameter has no effect. **NOTE:** VLAN IDs and VLAN names cannot be listed together.	—	—
`voip-profile`	Applies a VOIP profile to the user role.	—	—
`web-cc disable`	Disable web content classification for this user role. User role bandwidth contracts associated with web content classification categories and reputation types will not enforced unless web content classification is enabled using the **firewall web-content-classification** command.	—	—
`wispr`	Apply WISPr authentication to the specified user role.	—	—

Usage Guidelines

Every client in a user-centric network is associated with a user role. All wireless clients start in an initial role. From the initial role, clients can be placed into other user roles as they pass authentication.

Example

The following command configures a user role:

```
(host)[md](config) #user-role new-user
   dialer default-dialer
   pool pptp-pool-1
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

valid-network-oui-profile

```
valid-network-oui-profile
   no
   oui <oui>
```

Description

This command allows you to add a new OUI to the managed device.

Syntax

Parameter	Description	Range	Default
`no`	Negates any configured parameter.	—	—
`oui <oui>`	The new OUI to be added. Use the aa:bb:cc format to input the new OUI.	—	—

Usage Guidelines

This command adds a new OUI to the managed device. The new OUI must be entered in a aa:bb:cc format.

Example

The following command adds a new OUI to the managed device.

```
(host) [mynode] (config) #valid-network-oui-profile
(host) [mynode] (Valid Equipment OUI profile) #
(host) [mynode] (Valid Equipment OUI profile) #oui 00:11:22
This should only be used when adding equipment with a new OUI.  Are you sure you
want to proceed? [y/n]: y
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
Available on all platforms	Base operating system.	Config mode on Mobility Master.

vlan-bwcontract-explist

```
vlan-bwcontract-explist mac <mac>
```

Description

Use this command to add entries to or remove entries from the MAC exception list for bandwidth contracts on broadcast or multicast traffic.

Syntax

Parameter	Description
`<mac>`	MAC address of a protocol that should be added to or removed from the exception list for bandwidth contracts.

Usage Guidelines

Bandwidth contracts on a VLAN can limit broadcast and multicast traffic. AOS-W includes an internal exception list to allow broadcast and multicast traffic using the VRRP, LACP, OSPF, PVST and STP protocols. To remove per-vlan bandwidth contract limits on an additional broadcast or multicast protocol, add the MAC address for that broadcast or multicast protocol to the Vlan Bandwidth Contracts MAC Exception List.

Example

The following command adds the MAC address for CDP and VTP to the list of protocols that are not limited by VLAN bandwidth contracts.

```
(host) [mynode] (config) #vlan-bwcontract-explist mac 01:00:0C:CC:CC:CC
```

Command History

Version	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config mode on Mobility Master.

vlan-name

```
vlan-name <name> [assignment {even|hash}]
```

Description

This command creates a named VLAN on the managed device and given an assignment type.

Syntax

Parameter	Description	Range
`<name>`	Name of the VLAN.	1–32 characters
`assignment`	Sets the assignment type. This determines how a VLAN assignment is handled by the managed device.	—
`even`	Sets the assignment type as even.The Even assignment type is based on an even distribution of VLAN pool assignments.	—
`hash`	Sets the assignment type as hash. The hash type means that the VLAN assignment is based on the station MAC address.	—

Usage Guidelines

Create a named VLAN so you can set up a VLAN pool. A VLAN pool consists of a set of VLAN IDs which are grouped together to efficiently manage multi-managed device networks from a single location.

NOTE

VLAN pooling should *not* be used with static IP addresses.

The Even VLAN assignment type maintains a dynamic latest usage level of each VLAN ID. Therefore, as users age out, the number of available addresses increases. This leads to a more even distribution of addresses.

The Even type is only supported in tunnel and decrypt tunnel forwarding modes. It is not supported in split or bridge modes and it is not allowed for VLAN pools that are configured directly under a virtual AP. It can only be used under named VLANs. If a VLAN is given an Even assignment in bridge mode, a message displays indicating that the Hash assignment is automatically used instead to retrieve the VLAN ID.

NOTE

L2 Mobility is not compatible with the existing implementation of the Even VLAN pool assignment type.

Example

The following command creates a VLAN named **mygroup** with the assignment type “even” on the managed device:

```
(host) [mynode] (config) #vlan-name mygroup assignment even
```

Related Commands

Command	Description
show vlan status	Shows the VLAN status.

All platforms	Base operating system.	Config mode on Mobility Master.

vlan

```
vlan <id> [<description>] |[<name> <vlan-ids>]|[range <range>]|[wired aaa-profile <profile>]
```

Description

This command creates a VLAN ID or a range of VLAN IDs on the managed device.

Syntax

Parameter	Description	Range	Default
`<id>`	Identification number for the VLAN.	2-4094	1
`<description>`	Description of a VLAN ID.	1-32 characters; cannot begin with a numeric character	VLAN000x, where x is the ID number.
`<name>`	(Optional) Identification name of the VLAN. The VLAN name was created using the **vlan-name** command.	1-32 characters; a name cannot begin with a numeric character	VLAN<id>
`<vlan-ids>`	(Optional) List of VLAN IDs that are associated with this VLAN. If two or more IDs are listed, the VLAN needs to specified first as a VLAN pool using the **vlan-name** command.	Existing VLAN IDs	1
`range <range>`	Create a range of multiple VLAN IDs by specifying the beginning and ending VLAN ID separated by a hyphen. For example, 55-58	2-4094	—
`remove <WORD>`	List a range of vlans to be removed and it is a comma and a '-' separated list of vlans.	—	—
wired aaa-profile <profile>	Assign an AAA profile to a VLAN to enable role-based access for wired clients connected to an untrusted VLAN or port on the managed device. This parameter applies to wired clients only. Note that this profile will only take effect if the VLAN or the port on the managed device is untrusted. If both the port and the VLAN are trusted, no AAA profile is assigned.	—	—

Usage Guidelines

Use the **`interface vlan`** command to configure the VLAN interface, including an IP address. Use the **`vlan-name`** command to create a named VLAN to set up a VLAN pool. A VLAN pool consists of a set of VLAN IDs which are grouped together to efficiently manage multi-managed device networks from a single location.

To enable role-based access for wired clients connected to an untrusted VLAN or port on the managed device, you must use the **wired aaa-profile** parameter to specify the wired AAA profile you would like to apply to that VLAN. If you do not specify a per-VLAN wired AAA profile, traffic from clients connected to an untrusted wired port or VLAN will use the global wired AAA profile, if configured.

Example

The following command creates VLAN ID 27 with the description **myvlan** on the managed device.

```
(host) [mynode] (config) #vlan 27 myvlan
```

The following command associates the VLAN IDs 5, 12 and 100 with VLAN guestvlan on the managed device.

```
vlan guestvlan 5,12,100
```

The following command creates VLAN IDs 200-300, 302, 303-400.

```
(host) [mynode] (config) #vlan range 200-300,302, 303-400
```

Related Commands

vpn-dialer

```
vpn-dialer <name>
   enable dnetclear|l2tp|pptp|securid_newpinmode|wirednowifi
   ike {authentication {pre-share <key>|rsa-sig}|encryption {3des|des}|
    group {1|2}|hash {md5|sha}|lifetime [<seconds>]}
   ipsec {encryption {esp-3des|esp-des}|hash {esp-md5-hmac|esp-sha-hmac}|
    lifetime [<seconds>]|pfs {group1|group2}}
   no {enable...|ipsec...|ppp...}
   ppp authentication {cache-securid|chap|mschap|mschapv2|pap}
```

Description

This command configures the VPN dialer.

Syntax

Parameter	Description	Range	Default
`<name>`	Name that identifies this VPN dialer configuration.	—	—
`enable`	Enables dialer operations:	—	—
`dnetclear`	Enables “split tunneling” functionality so that traffic destined for the internal network is tunneled while traffic for the Internet is not. This option is not recommended for security reasons.	—	disabled
`l2tp`	Allows the dialer to negotiate a Layer-2 Tunneling Protocol (L2TP)/IPsec tunnel with the managed device.	—	enabled
`pptp`	Allows the dialer to negotiate a Point-to-Point Tunneling Protocol (PPTP) with the managed device.	—	disabled
`securid_newpinmode`	Supports SecurID new and next pin mode.	—	disabled
`wirednowifi`	Allows the dialer to detect when a wired network connection is in use, and shuts down the wireless interface.	—	disabled
`ike`	Configures internet key exchange (IKE) protocol. This configuration must match the IKE policy configured with the **crypto isakmp policy** command on the managed device.	—	—
`authentication`	Specifies whether preshared keys or RSA signatures are used for IKE authentication.	pre-share | rsa-sig	pre-share
`encryption`	Specifies the IKE encryption protocol, either DES or 3DES.	3des | des	3des
`group`	Specifies the Diffie-Hellman group, either 1 or 2.	1 | 2	2

Parameter	Description	Range	Default
hash	Specifies the HASH algorithm, ether SHA or MD5.	md5 | sha	sha
lifetime	Specifies how long an IKE security association lasts, in seconds.	300-86400	28800 seconds
ipsec	Configures IPsec. This configuration must match the IPsec parameters configured with the **crypto dynamic-map** and **crypto ipsec** commands on the managed device.	—	—
encryption	Specifies the encryption type for IPsec, either DES or 3DES.	esp-3des | esp-des	esp-3des
hash	Specifies the hash algorithm used by IPsec, either MD5 or SHA.	esp-md5-hmac | esp-sha- hmac	esp-sha-hmac
lifetime	Specifies how long an IPsec security association lasts, in seconds.	300-86400	7200 seconds
pfs	Specifies the IPsec Perfect Forward Secrecy (PFS) mode, either group 1 or group 2.	group1 | group2	group2
no	Negates any configured parameter.	—	—
ppp authentication	Enables the protocols for PPP authentication. This list should match the L2TP or PPTP configuration configured with the **vpdn** command on the managed device.	—	—
cache-securid	The managed device caches Secure ID tokens so that the user does not need to reauthenticate each time a network connection is lost.	—	disabled
chap	Use CHAP with PPP authentication.	—	enabled
mschap	Use MSCHAP with PPP authentication.	—	enabled
mschapv2	Use MSCHAPv2 with PPP authentication.	—	enabled
pap	Use PAP with PPP authentication.	—	enabled

Usage Guidelines

A VPN dialer is a Windows application that configures a Windows client for use with the VPN services in the managed device. When VPN is used as an access method, a user can login using captive portal and download a VPN dialer. You can customize a VPN dialer for a user role configured with the **user-role** command. After the user authenticates via captive portal, a link appears to allow download of the VPN dialer if a dialer is configured for the user role.

Example

The following command configures a VPN dialer:

```
(host)[node] (config) #vpn-dialer default-dialer
  ike authentication pre-share f00xYz123BcA
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
Available on all platforms	Base operating system.	Config mode on Mobility Master.

vpdn group l2tp

```
vpdn group l2tp
   client configuration {dns|wins} <ipaddr1> [<ipaddr2>]
   disable|enable
   l2tp tunnel hello <seconds>
   no ...
   ppp authentication {CACHE-SECURID|CHAP|EAP|MSCHAP|MSCHAPv2|PAP}
   ppp securid cache <minutes>
```

Description

This command configures an L2TP or IPsec VPN connection.

Syntax

Parameter	Description	Range	Default
`client configuration`	Configures parameters for the remote clients.	—	—
`dns`	Configures a primary and optional secondary DNS server.	—	—
`wins`	Configures a primary and optional secondary WINS server.	—	—
`disable|enable`	Disables or enables termination of L2TP clients.	—	enabled
`l2tp tunnel hello`	Configures L2TP tunneling hello timeout, in seconds.	10-1440	60 seconds
`no`	Negates any configured parameter.	—	—
`ppp authentication`	Enables the protocols for PPP authentication. This list should match the L2TP configuration configured with the **vpn-dialer** command on the managed device.	—	—
`CACHE-SECURID`	The managed device caches Secure ID tokens so that the user does not need to reauthenticate each time a network connection is lost.	—	—
`CHAP`	Use CHAP with PPP authentication.	—	—
`EAP`	Use EAP-TLS with PPP authentication. Specify this protocol for Windows IPsec VPN clients that use Common Access Card (CAC) Smart Cards that contain user information and digital certificates.	—	—
`MSCHAP`	Use MSCHAP with PPP authentication.	—	—
`MSCHAPv2`	Use MSCHAPv2 with PPP authentication. This is the default for L2TP	—	—
`PAP`		—	—
`ppp securid`	If CACHE-SECURID is configured for PPP authentication, this specifies the time, in minutes, that the token is cached.	15-10080	1440 minutes

Usage Guidelines

L2TP or IPsec relies on the PPP connection process to perform user authentication and protocol configuration. You specify the protocol used for PPP authentication and whether SecureID tokens are cached on the managed device. Client addresses are assigned from a pool configured with the **ip local pool** command.

Example

The following command configures virtual private dial-in networking:

```
(host) [mynode] (coinfig) #vpdn group l2tp
  ppp authentication PAP
  client configuration dns 10.1.1.2
  client configuration wins 10.1.1.2
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config mode on Mobility Master.

vpdn group pptp

```
vpdn group pptp
   client configuration {dns|wins} <ipaddr1> [<ipaddr2>]
   disable|enable
   no ...
   ppp authentication {MSCHAP|MSCHAPv2}
   pptp echo <seconds>
```

Description

This command configures a PPTP VPN connection.

Syntax

Parameter	Description	Range	Default
`client configuration`	Configures parameters for the remote clients.	—	—
`dns`	Configures a primary and optional secondary DNS server.	—	—
`wins`	Configures a primary and optional secondary WINS server.	—	—
`disable|enable`	Disables or enables termination of PPTP clients.	—	enabled
`no`	Negates any configured parameter.	—	—
`ppp authentication`	Enables the protocols for PPP authentication. This list should match the PPTP configuration configured with the **vpn-dialer** command on the managed device.	—	—
`MSCHAP`	Use MSCHAP with PPP authentication.	—	—
`MSCHAPv2`	Use MSCHAPv2 with PPP authentication. This is the default for L2TP	—	—
`pptp echo`	Time, in seconds, that the managed device waits for a PPTP echo response from the client before considering the client to be down. The client is disconnected if it does not respond within this interval.	10-300	60 seconds

Usage Guidelines

PPTP connections require user-level authentication through a PPP authentication protocol (MSHCAPv2 is the currently-supported method.) Client addresses are assigned from a pool configured with the **pptp** command.

Example

The following command configures virtual private dial-in networking:

```
vpdn group pptp
   ppp authentication MSCHAPv2
   client configuration dns 10.1.1.2
   client configuration wins 10.1.1.2
```

Command History

vpnip

```
vpnip <vpncip>
   ipsec-custom-cert vpnc-mac-1-c <mac-addr> [vpnc-mac-2-c <mac-addr>][ca-cert <ca>|factory-
   ca-cert] [fqdn <local-fqdn>] [interface vlan <id>] [server-cert <sc>|factory-cert]| [suite-
   b gcm128 |gcm256]
   ipsec-factory-cert vpnc-mac-1 <mac-addr>
   peer-mac <peer-mac-1> ipsec <key> {[fqdn <local-fqdn>] [interface vlan <vpnvlanid>]}
```

Description

This command configures the certificate or PSK used by a managed device to create a site-to-site IPsec VPN tunnel to a Switch configured as a VPN concentrator.

Syntax

Parameter	Description
`ipsec-custom-cert`	Custom Cert-based IPsec secure communication between a VPN concentrator and a managed device.
`vpnc-mac-1-c <mac-addr>`	Specify the first VPN concentrator's MAC address.
`vpnc-mac-2-c <mac-addr>`	Specify the second VPN concentrator's MAC address.
`ca-cert <ca> | factory-cert`	The specified CA certificate will be used validate the certificate presented by the VPN concentrator. Enter a name of a CA certificate, or choose **factory-cert** to use factory-installed CA Cert chain.
`fqdn <local-fqdn>`	The managed device's FQDN (max 64 bytes) used in IKE. This is optional for a dynamically addressed device.
`interface vlan <id>`	Specify the VLAN ID of a VLAN interface that initiates the IKE tunnel. If no interface is specified, the managed device uses the switch IP.
`server-cert <sc>|factory-cert]`	The managed device will use the specified server certificate for IPsec communication to a VPN concentrator.
`suite-b gcm128|gcm256`	Specify the GCM-128 or GCM-256 Suite B Algorithm
`ipsec-factory-cert`	Factory Cert-based IPsec secure communication between the VPN concentrator and the managed device.
`vpnc-mac-1-c <mac-addr>`	Specify VPN concentrator's MAC address.
`peer-mac <peer-mac-1>`	Specify Peer MAC address for PSK-based authentication.
`ipsec <key>`	Enable IPsec secure communication between the VPN concentrator and the managed device using the specified key.
`fqdn <local-fqdn>`	The managed device's FQDN (max 64 bytes) used in IKE. This is optional for a dynamically addressed device.
`interface vlan <vpnvlanid>`	Specify the VLAN ID of a VLAN interface that initiates the IKE tunnel. If no interface is specified, the managed device uses the switch IP.

Usage Guidelines

Use the **vpnip** command to configure a managed device to communicate with a VPN concentrator in a deployment where both Mobility Master and the VPN concentrator are located within the same DMZ.

When the managed device communicates with the VPN concentrator to set up an IPsec tunnel, any uplink VLAN tag defined via the **uplink wired** command will be sent with the vendor-id during IKE negotiation. This setting can uniquely bind the tunnel from a particular uplink on a managed device to a corresponding crypto map on VPN concentrator.

Example

```
[host](mynode)(config) # vpnip 192.0.0.2 ipsec-factory-cert vpn-mac-1 01:00:5E:00:00:01
```

Related Commands

Command	Description
uplink	Manage and configure the uplink network connection on a managed device.
vpnip	Defines Internet Key Exchange (IKE) parameters used by a VPN concentrator to create secure tunnels between that VPN concentrator and a managed device.

Command History

Release	Modification
AOS-W 8.2.0.0	New sub-parameter, **vpnc-mac-2-c**, was added.
AOS-W 8.0.0.0	Command introduced.

Command Information

Available on all platforms	Base operating system.	Config mode on Mobility Master.

vpn-peer peer-mac

```
vpn-peer peer-mac <mac-addr>
   cert-auth {ca-cert <peer-ca> server-cert <peer-sc> [load-balance]}|{factory-cert [load-
   balance]}
   pre-share-key <peer-key> [load-balance]
```

Description

This command defines IKE parameters used by a VPN concentrator to create secure tunnels between that VPN concentrator and a managed device.

Syntax

Parameter	Description
`peer-mac <mac-addr>`	MAC address of the managed device. **NOTE:** If the peer device is an x86 server, then configure the MAC address of the management interface of the managed device. However, if the peer device is a hardware platform, you must provide the MAC address of the VLAN interface of the managed device.
`cert-auth`	Enable certificate authentication.
`ca-cert <peer-ca>`	<peer-ca> is a user-defined name of a trusted CA certificate installed on the VPN concentrator. This CA certificate will be used validate the certificate presented by the managed device.
`server-cert <peer-sc>`	<peer-SC> is a user-defined name of a server certificate installed on the VPN concentrator. The VPN concentrator will use the specified server certificate for IPsec communication to a managed device.
`load balance`	Enables uplink load-balancing on the primary and backup uplinks between a VPN concentrator and a managed device.
`factory-cert`	The factory-installed CA certificate on the VPN concentrator will be used validate the certificate presented by the managed device.
`pre-share-key <peer-key>`	Enable authentication using a PSK.
`load balance`	Enables uplink load-balancing on the primary and backup uplinks between a managed device and a VPN peer.

Usage Guidelines

Issue the **vpn-peer** command on Switch configured as a VPN concentrator to define a VPN between that device and another managed device. When the other managed device communicates with the VPN concentrator to set up an IPsec tunnel, any uplink VLAN tag defined via the **uplink wired** command will be sent with the vendor-id during IKE negotiation. This setting can uniquely bind the tunnel from a particular uplink on a managed device to a corresponding crypto map on VPN concentrator.

Example

The following command configures a VPN from a managed device VPN concentrator to another managed device using the factory default certificate.

```
(host)[node] (config) #vpn-peer peer-mac 01:00:5E:00:00:FF factory-cert load-balance
```

vpn-peer pass-code

```
vpn-peer pass-code <auth-pass-code>
   cert-auth {ca-cert <peer-ca> server-cert <peer-sc>}|{factory-cert}
```

Description

This command automates the process of whitelisting the branch devices to avoid extra configuration for each device at the headend. For automatic whitelisting of managed devices in the VPN Concentrator, the authentication code method is used. In this method, the whitelisting of the device is achieved through the authentication token. You must configure the same VPN peer authentication passcode on the Mobility Master as well as the VPN Concentrator to whitelist the device in the database.

Syntax

Parameter	Description
`pass-code <auth-pass-code>`	The authenticate token to be configured on Mobility Master as well as the VPN Concentrator. The Mobility Master pushes this configuration to the managed devices for automatic whitelisting on the VPN Concentrator.
`cert-auth`	Enable certificate authentication.
`ca-cert <peer-ca>`	<peer-ca> is a user-defined name of a trusted CA certificate installed on the VPN concentrator. This CA certificate is used to validate the certificate presented by the managed device.
`server-cert <peer-sc>`	<peer-SC> is a user-defined name of a server certificate installed on the VPN concentrator. The VPN concentrator uses the specified server certificate for IPsec communication to a managed device.
`factory-cert`	The factory-installed CA certificate on the VPN concentrator will be used validate the certificate presented by the managed device.

Example

The following command configures an authenticate code on the Mobility Master which is used for automatic whitelisting of managed devices on a VPN concentrator where the same authenticate code is configured.

```
(host)[mynode] (config) #vpn-peer pass-code Aruba123 cert-auth factory-cert
```

Command History

vrrp

```
ipv6 <id>
   advertise <interval>
   authentication <password>
   description <text>
   holdtime <secs>
   ipv6
   no...
   preempt
   priority <level>
   shutdown
   tracking {interface|master-up-time|vlan|vrrp-master-state}
   vlan <vlanid>
```

Description

This command configures the VRRP.

Syntax

Parameter	Description	Range	Default
`id`	Number that uniquely identifies the VRRP instance, also known as the VRID. This number should match the VRID on the other member of the redundant pair. For ease in administration, you should configure this with the same value as the VLAN ID. After you configure the VRID, the command platform enters VRRP mode. From here, you can access the remaining VRRP commands.	1-255	—
`ipv6`	Include this optional parameter to define a VRRP using an IPv6 address.	–	–
`advertise`	Specifies the time, in seconds, between successive VRRP advertisements sent by the current *master*. Best practices are to use the default value.	1-60 seconds	1 second (1s=1000ms)

Parameter	Description	Range	Default
`authentication`	Configure an optional password of up to eight characters to be used to authenticate VRRP peers in their advertisements. The password must be the same on both members of the redundant pair. The password is sent in plain-text and therefore should not be treated as a security measure. Rather, the purpose of the password is to guard against misconfigurations in the event that other VRRP devices exist on the same network. Note: This parameter is supported only for IPv4.	8 characters	—
`description`	Configure an optional text string to describe the VRRP instance.	1-80 characters	—
`holdtime <secs>`	The VRRP virtual router does not begin listening to advertisements until the holdtime expires. If your deployment includes a VRRP master with preemption disabled and an uplink switch is running RSTP, a higher value will prevent the VRRP master from regaining the master state after it reboots. **NOTE:** The holdtime is disabled by default. If enabled without mentioning a time range, the holdtime will be configured to the default value, 45 seconds.	30-120 seconds.	Disabled
`ipv6 address`	Configure the virtual IPv6 address that will be owned by the elected VRRP *master*. Use the same IPv6 address on each member of the redundant pair.	—	—

Parameter	Description	Range	Default
	This IPv6 address will be redundant - it will be active on the VRRP master, and will become active on the VRRP backup in the event that the VRRP master fails. The IPv6 address must be unique; the IPv6 address cannot be the loopback address of the Mobility Master. Only IPv6 address formats are supported. Starting from AOS-W 8.2.1.0, you can configure a unique local address as the VRRP IPv6 address on the Mobility Master and the managed devices.		
`no`	Negates all configured VRRP parameters.	—	—
`preempt`	Preempt mode allows a managed device to take over the role of master if it detects a lower priority managed device currently acting as master. Best practices are to use the default value to avoid excessive interruption to users or “flapping” if a problematic managed device is cycling up and down.	—	disabled
`delay`	Delay value in seconds. Specifying a value enables the delay timer. The timer is triggered when the VRRP state moves out of backup or init state to become a master. This is applicable only if router pre-emption is enabled.	0-60 seconds	0

Parameter	Description	Range	Default
	When the timer is triggered, it delays the router for a specified period of time before taking over the master router. In the mean time, if there is an advertisement from another VRRP master (existing master), the router stops the timer and does not transition to master.		
`priority`	Defines the priority level of the VRRP instance for the Mobility Master. This value is used in the election mechanism for the master. A higher number specifies a higher priority. The default priority setting is adequate for most networks.	100	1-255
`shutdown`	Administratively shutdown VRRP. When down, VRRP is not active, although the Mobility Master maintains the configuration information. To start the VRRP instance, use **no shutdown**.	—	enabled (VRRP is down)
`tracking`	Alter the virtual router priority value.	—	—
`interface {gigabitethernet <slot/module/port>} {sub <value>}`	Configures VRRP tracking based on Layer-2 interface state transitions. You can track a combined maximum of 16 VLAN and Layer-2 interfaces. ■ <slot/module/port> - Interface in <slot>/<module>/<port> format. ■ sub - Decreases the priority of the VRRP instance by the specified number. When the interface comes up again, the value is restored to	—	—

Parameter	Description	Range	Default
	the previous priority level. The combined priority and tracking vales cannot exceed 255. If the priority value exceeds 255, the Mobility Master displays an error message. Valid range is 0-255.		
`master-up-time <duration> add <value>`	The VLAN tracking feature monitors how long the Mobility Master has been master for the VRRP instance. ■ duration - This value configures the number of minutes that must elapse before uptime tracking takes place. Valid range is 0-1440 minutes. ■ add - Instructs the Mobility Master to add the specified value to the existing priority level. The combined priority and tracking values cannot exceed 255. Valid range is 0-255. If the priority value exceeds 255, the Mobility Master displays an error message similar to the following - Error: Vrrp 30 priority + tracking value exceeds 255.		—
`vlan <vlanid> {sub <value>}`	Configures VRRP tracking based on VLAN state transitions. You can track a combined maximum of 16 VLAN and Layer-2 interfaces.	—	—

Parameter	Description	Range	Default
	sub - Decreases the priority of the VRRP instance by the specified amount. When the VLAN comes up again, the value is restored to the previous priority level. Valid range is 0-255. The combined priority and tracking values cannot exceed 255. If the priority value exceeds 255, the Mobility Master displays an error message.		
`vrrp-master-state <vrid> add <value>`	Specifies the VRID to use for tracking the state of the VRRP Mobility Master. ■ add - Instructs the Mobility Master to add the specified value to the existing priority level. The combined priority and tracking values cannot exceed 255. Valid value is 0-255. If the priority value exceeds 255, the Mobility Master displays an error message similar to the following - Error: Vrrp 30 priority + tracking value exceeds 255	1-255	—
`vlan`	Specifies the VLAN ID of the VLAN on which VRRP will run.	1-4094	—

Usage Guidelines

Use this command to set parameters for VRRP on the Mobility Master. The default VRRP parameters can be left for most implementations.

You can use a combination of numbers, letters, and characters to create the authentication password and the VRRP description. To include a space in the password or description, enter quotation marks around the string. For example, to create the password Floor 1, enter “Floor 1” at the prompt.

To change the existing password or description, enter the command with a different string. The new password or description takes affect immediately.

To unconfigure the existing password or description, enter “” at the prompt. If you update the password on one managed device, you must update the password on the redundant member pair.

Interface Tracking

You can track multiple VRRP instances to prevent asymmetric routing and dynamically change the VRRP master to adapt to changes in the network. VRRP interface tracking can alter the priority of the VRRP instance based on the state of a particular VLAN or Layer-2 interface. The priority of the VRRP instance can increase or decrease based on the operational state of the specified interface. For example, interface transitions (up or down events) can trigger a recomputation of the VRRP priority, which can change the VRRP master depending on the resulting priority. You can track a combined maximum of 16 interfaces.

You must enable preempt mode to allow a managed device to take over the role of master if it detects a lower priority managed device currently acting as master

Example

The following command configures a priority of 105 for VRRP ID (VRID) 30:

```
(host) [mynode] (config) #vrrp 30
  priority 105
```

The following commands configure VLAN interface tracking and assumes the following:

- You have two managed device, a primary and a backup.
- The configuration highlights the parameters for interface tracking. You may have other parameters configured for VRRP.

Primary Configuration	Backup Configuration
vrrp 10 vlan 10 ip address 10.200.22.254 priority 105 preempt tracking vlan 20 sub 10 vrrp 20 vlan 20 ip address 10.200.22.254 preempt priority 105 tracking vlan 10 sub 10 vrrp 30 vlan 30 ip address 10.200.22.254 preempt priority 105 tracking vlan 20 sub 10	vrrp 10 vlan 10 ip address 10.200.22.254 priority 100 preempt tracking vlan 20 sub 10 vrrp 20 vlan 20 ip address 10.200.22.254 preempt priority 100 tracking vlan 10 sub 10 vrrp 30 vlan 30 ip address 10.200.22.254 preempt priority 100 tracking vlan 20 sub 10

If VLAN 20 goes down, VRRP 20 automatically fails over, VRRP 10 and VRRP 30 would drop their priority to 95, causing a failover to the backup Mobility Master. Once VLAN 20 comes back up, the Mobility Master restores the VRRP priority to 105 for all VRRP IDs and resumes the master VRRP role.

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config mode on Mobility Master.

webcc

```
distributed
connectiontype ipv6
```

Description

This command changes the WebCC operational mode of a managed devicefrom the default centralized mode to distributed mode. The WebCC operational mode determines whether the managed device or Mobility Master contacts the cloud WebRoot server for URL lookup queries. In the default centralized mode, the Mobility Master contacts the cloud WebRoot server for URL lookup queries, whereas in distributed mode, the managed device contacts the cloud WebRoot server for URL lookup queries.

Syntax

Parameter	Description
`distributed`	Sets the WebCC mode for the managed device to distributed mode.
`connectiontype ipv6`	Sets the WebCC connection type from IPv4 to IPv6 address. The default is IPv4.

Usage Guidelines

The WebCC license allows all web traffic to be classified and allows the managed device to apply firewall policies based on web content category and reputation. The category and reputation data for each URL is obtained from an external WebRoot Server. The WebCC feature can operate in two distinct modes, which control whether the managed device or Mobility Master performs the WebCC content lookup tasks. This command can be executed only from the **/md** subtree of the Mobility Master.

Centralized Mode

In the default **centralized** mode, only Mobility Master downloads the URL entry database from the WebRoot Server. If a URL for web traffic sent through the managed device does not appear in its datapath cache, the managed device sends a query request to Mobility Master. The Mobility Master queries the WebRoot Server, adds the response to its database and sends information about the URL back to the managed device.

WebCC license usage is calculated for each license pool, and the total count in each pool is sent to each managed device within that pool. If the WebCC licenses expire, or the available WebCC licenses are fewer than the AP licenses, then individual managed devices within that pool will no longer be able to send query requests to Mobility Master, and WebCC classification will be blocked.

If WebCC classification is blocked due to expired or insufficient licenses, individual managed devices continue to classify requested URLs currently available in the managed device datapath cache until the cache entries time out (usually over a period of 24 to 96 hours, depending upon the reputation level of the URL).

Distributed Mode

In **distributed** mode, each individual managed device downloads the complete URL entry database (approximately 22 MB) directly from the WebRoot Server. If a URL for web traffic sent through the managed device does not appear in this database, the managed device sends a query to the WebRoot Server, then adds the response to its datapath cache.

WebCC license usage is calculated for each license pool, and the total count in each pool is sent to each managed device within that pool. If the WebCC licenses expire, or the available WebCC licenses are fewer than

the AP licenses, then individual managed devices within that pool will no longer be able to send new query requests to the WebRoot server. However, the WebCC feature continue to classify requested URLs that are already in the URL entry database on the managed device.

Example

```
(host) [md] (config) #webcc distributed
(host) [md] (config) #webcc connectiontype ipv6
```

Command History

Release	Modification
AOS-W 8.4.0.0	**connectiontype ipv6** parameter was introduced.
AOS-W 8.2.0.0	Command introduced.

web-cc global-bandwidth-contract

```
web-cc global-bandwidth-contract
   web-cc-category <category-name> downstream|upstream kbits|mbits <bandwidth>
   web-cc-reputation high-risk|low-risk|moderate-risk|suspicious|trustworthy
   downstream|upstream kbits|mbits <1-2000>
```

Description

This command defines global bandwidth contracts for HTTP or HTTPS traffic matching a predefined web content category or reputation type.

Syntax

Parameter	Description	Range	Default
`web-cc-category <category-name>`	Specify a web content category to apply a bandwidth contract to that category type. To see the full list of available web content categories, issue the command **show web-cc categories**.	—	—
`downstream|upstream`	Specify **downstream** to apply the bandwidth contract to downstream traffic from the Mobility Master. Specify **upstream** to apply the contract to upstream traffic to the Mobility Master.	—	—
`kbits|mbits`	Select kbits to define the contract bandwidth in kilobits/second. Select mbits to define the contract in megabits/second.	—	—
`bandwidth`	Define the contract value, If you are defining the bandwith value in kilobits/second, the supported range is 256-2,000,000 kbits. If you are defining the bandwidth value in megabits/second, the supported range is 1-2000 mbits.	256-2,000,000 kbits 1-2000 mbits	—
`web-cc-reputation high-risk|low-risk|moderate-risk|suspicious|trustworthy`	Define a bandwidth contract for traffic associated with one of five predefined reputation types. Session ACLs can be applied to these risk categories using the ip access-list session command.	–	–

Usage Guidelines

The web content classification feature classifies all (HTTP/HTTPS) web traffic on the network. AOS-W uses the Webroot® classification categories and risk reputation levels, URL database and URL cloud look-up service to classify the web traffic. You can create firewall policies and bandwidth contracts based upon these web traffic classification and reputation types.

Example

The following example creates a 100 megabit/second bandwidth contract for a category called **music**.

```
(host) [/md] (config) #web-cc global-bandwidth-contract web-cc-category music downstream mbits
100
```

web-proxy server

```
web-proxy server <name>
   port
```

Description

This command configures the web-proxy server related information.

Syntax

Parameter	Description	Range	Default
`<name>`	Specifies the proxy server name / IP address.	—	—
`port`	Specifies the proxy server port.	—	—

Usage Guidelines

When the Mobility Master needs to access data on the cloud or the internet, and if the internet bound traffic needs to pass through a proxy, execute the **web-proxy server** command. Once the command is executed the Mobility Master routes web (HTTP/HTTPS) traffic through the proxy server.

Example

The following command configures the web-proxy server related information:

```
(host) [mynode] (config) #web-proxy server arubaproxy.com port 8080
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

   switch-cert <name>
   via-client-cert-port <via-client-cert-port>
   web-https-port-443
   web-max-clients <web-max-clients>
```

Description

This command configures the Mobility Master's web server.

Syntax

Parameter	Description	Range	Default
`absolute-session-timeout <30-3600>`	Specifies the absolute time after which the WebUI session times out post a successful authentication.	30-3600 seconds	0 (disabled)
`bypass-cp-landing-page`	If disabled, the Mobility Master uses the new redirection scheme also known as the landing page by default including the meta tag. This can reduce the CPU load on the Mobility Master. The Mobility Master falls back to the old redirection scheme if this parameter is enabled.	—	disabled
`captive-portal-cert`	Specifies the name of the server certificate associated with captive portal. Use the **show crypto-local pki ServerCert** command to see the server certificates installed in the Mobility Master.	—	default
`ciphers`	Configures the strength of the cipher suite:	high, low, medium	high

Parameter	Description	Range	Default
	■ **high**: encryption keys larger than 128 bits ■ **low**: 56 or 64 bit encryption keys ■ **medium**: 128 bit encryption keys **NOTE:** This command is not available in FIPS software images because ciphers are pre-configured only to acceptable values.		
`exclude-http-security-headers`	Excludes security headers from HTTP response.	—	—
`idp-cert`	Specifies the IDP certificate name configured in the Mobility Master.	—	—
`mgmt-auth`	Specifies the authentication method for the management user; you can choose to use either username or password or certificates, or both username or password and certificates.	username/ password, certificate	username/ password
`no`	Negates any configured parameter.	—	—
`session-timeout <session-timeout>`	Specifies the time of inactivity after which the WebUI session times out and requires login for continued access.	30-3600 seconds	900 seconds
`ssl-protocol`	Specifies the SSL or TLS protocol version used for securing communication with the web server: ■ TLS v1 ■ TLS v1.1 ■ TLS v1.2	—	tlsv1 tlsv1.1 tlsv1.2
`switch-cert`	Specifies the name of the server certificate associated with WebUI access. Use the **show crypto-local pki ServerCert** command to see the server certificates installed in the Mobility Master.	—	default

Parameter	Description	Range	Default
`via-client-cert-port <via-client-cert-port>`	Configures a port for VIA client certificate-based authentication.	—	—
`web-https-port-443`	Enables WebUI access on the HTTPS port (443). When you connect to the WebUI using https (tcp port 443), the Mobility Master continues using port 443 and no longer redirects to port 4343.	—	—
`web-max-clients <web-max-client>`	Configures the web server's maximum number of supported concurrent clients.	25-320	75

Usage Guidelines

There is a default server certificate installed in the Mobility Master, However this certificate does not guarantee security in production networks. Best practices are to replace the default certificate with a custom certificate issued for your site by a trusted CA. See the *AOS-W User Guide* for more information about how to generate a CSR to submit to a CA and how to import the signed certificate received from the CA into the Mobility Master. After importing the signed certificate into the Mobility Master, use the **web-server profile** command to specify the certificate for captive portal or WebUI access. If you need to specify a different certificate for captive portal or WebUI access, use the **no** command to revert back to the default certificate before you specify the new certificate (see the Example section).

You can use client certificates to authenticate management users. If you specify certificate authentication, you need to configure certificate authentication for the management user with the **mgmt-user webui-cacert** command.

Example

The following commands configure WebUI access with client certificates only, and specify the server certificate for the Mobility Master:

```
(host) [/md] (config) #web-server profile
(host) [/md] (Web Server Configuration) #mgmt-auth certificate
(host) [/md] (Web Server Configuration) #switch-cert ServerCert1
(host) (Web Server Configuration) #!
(host) [/md] (config) #mgmt-user webui-cacert test_string serial 1111 admin root
```

To specify a different server certificate, use the **no** command to revert back to the default certificate *before* you specify the new certificate:

```
(host) [/md] (config) #web-server profile
(host) [/md] (Web Server Configuration) #mgmt-auth certificate
(host) [/md] (Web Server Configuration) #switch-cert ServerCert1
(host) [/md] (Web Server Configuration) #no switch-cert
(host) [/md] (Web Server Configuration) #switch-cert ServerCert2
```

All platforms	The **web-server ciphers** and **web-server ssl-protocol** commands require the PEFNG license.	Config mode on Mobility Master.

websocket clearpass

```
websocket clearpass
   enable
   no
   primary host <host> port <1-65535> username <username> passwd <passwd>
   secondary host <host> port <1-65535> username <username> passwd <passwd>
```

Description

This command configures the ClearPass WebSocket profile. This command configures the primary and secondary ClearPass Insight server.

Syntax

Parameter	Description	Range	Default
`enable`	Enable ClearPass WebSocket interface.	—	—
`no`	Remove or negate a parameter.	—	—
`primary`	Configure the primary ClearPass Insight server. This parameter has the following sub-parameters: ■ **host**–The primary ClearPass Insight server IP address. ■ **port**–The port number of the ClearPass Insight server. ■ **username**– The name of the user who can perform the action on the server. ■ **passwd**– The password of the user.	port: 1-65535 username: 1-255 bytes password: 6-100 bytes	port: 443
`secondary`	Configure the secondary ClearPass Insight server. This parameter has the following sub-parameters: ■ **host**–The primary ClearPass Insight server IP address. ■ **port**–The port number of the ClearPass Insight server. ■ **username**– The name of the user who can perform the action on the server. ■ **passwd**– The password of the user.	port: 1-65535 username: 1-255 bytes password: 6-100 bytes	port: 443

Example

The following commands configures the ClearPass WebSocket interface and the primary and secondary ClearPass Insight server:

```
(host) [mynode] (config) #websocket clearpass
(host) [mynode] (ClearPass WebSocket Profile) #primary host secuirty67.acmecompany.com port
443 username admin passwd changeme
(host) [mynode] (ClearPass WebSocket Profile) #secondary host 10.17.5.210 port 443 username
aosadmin passwd changeme
(host) [mynode] (ClearPass WebSocket Profile) #enable
(host) [mynode] (ClearPass WebSocket Profile) #write memory

whitelist-db cpsec add

```
whitelist-db cpsec add mac-address <name>
    ap-group <ap_group>
    ap-name <ap_name>
    description <description>
```

Description

Add an AP entry to the campus AP whitelist.

Syntax

Parameter	Description
`mac-address <name>`	MAC address of the AP you want to enter into the campus AP whitelist database.
`ap-group <ap_group>`	(Optional) Name of the AP group. **NOTE:** If the AP group is not entered, a campus AP boots with "default" as AP group.
`ap-name <ap_name>`	(Optional) Name of the AP. **NOTE:** If the AP name is not entered, a campus AP boots with its MAC address as AP name.
`description <description>`	(Optional) Brief description of the AP. If the description includes spaces, enclose the description in quotation marks.

Usage Guidelines

You can manually add entries to the campus AP whitelist to grant valid APs secure access to the network.

Example

The following command creates a new campus AP whitelist entry for an AP with the MAC address 00:16:CF:AF:3E:E1:

```
(host) #whitelist-db cpsec add mac-address 00:16:CF:AF:3E:E1
   ap-group default
   ap-name OAW-AP225
   description "OAW-AP225 in lobby"
```

whitelist-db cpsec delete

```
whitelist-db cpsec delete mac-address <mac-address>
```

Description

Remove an individual AP entry to the campus AP whitelist.

Syntax

Parameter	Description
`mac-address <mac-address>`	MAC address of the AP you want to remove from the campus AP whitelist.

Usage Guidelines

Use this command to remove an individual whitelist entries for an AP that has been either removed from the network, or is no longer a candidate for automatic certificate provisioning. If the AP whose entry you deleted is still connected to the network and the control plane security feature is configured to send certificates to all APs (or a range of addresses that include that AP), then the managed device will send the AP another certificate, and the AP will reappear in the campus whitelist. To permanently revoke a certificate from an invalid or suspected rogue AP, use the command whitelist-db cpsec revoke.

Example

The following command removes an AP with the MAC address 10:14:CA:AF:3E:E1 from the campus AP whitelist.:

```
(host) [mynode] (config) #whitelist-db cpsec delete mac-address 10:14:CA:AF:3E:E1
```

whitelist-db cpsec-local-switch-list

```
whitelist-db cpsec-local-switch-list
   del mac-address <mac-address>
   purge
```

Description

Delete a managed device from the local switch whitelist.

Syntax

Parameter	Description
`del mac-address <mac-address>`	Remove a single managed device from the local switch whitelist.
`purge`	Clear all entries from the local switch whitelist

Usage Guidelines

If your deployment includes both Mobility Master and managed devices, then the campus AP whitelist on each managed device contains an entry for every AP on the network, regardless of the managed device to which it is connected. Mobility Master also maintains a whitelist of managed devices with APs using control plane security. When you change a campus AP whitelist on any managed device, that managed device contacts Mobility Master to check the local switch whitelist, then contacts every other managed device on the local switch whitelist to notify it of the change.

If you ever remove a managed device from the network, you must also remove the managed device from the local switch whitelist. If the local switch whitelist contains entries for managed devices no longer on the network, then a campus AP whitelist entry can be marked for deletion but will not be physically deleted, as the managed device will be waiting for an acknowledgement from another managed device no longer on the network. Any unused managed device entries in the local switch whitelist can significantly increase network traffic and reduce managed device memory resources.

Example

The following command removes a managed device from the local switch whitelist:

```
(host) (config) #whitelist-db cpsec-local-switch-list del mac-address 00:1E:33:CA:D2:51
```

Related Commands

whitelist-db cpsec-master-switch-list

```
whitelist-db cpsec-master-switch-list
   del mac-address <mac-address>
   purge
```

Description

Delete a Mobility Master from the master switch whitelist.

Syntax

Parameter	Description
`del mac-address <mac-address>`	Remove a single Mobility Master from the master switch whitelist.
`purge`	Clear all entries from the master switch whitelist

Usage Guidelines

Each managed device using the control plane security feature has a master switch whitelist which contains the IP and MAC addresses of its Mobility Master. If your network has a redundant Mobility Master, then this whitelist will contain more than one entry.

The master switch whitelist rarely needs to be purged. Although you can delete an entry from the master switch whitelist, you should do so only if you have removed a master switch from the network. Deleting a valid Mobility Master from the master switch whitelist can cause errors in your network.

Example

The following command removes a Mobility Master from the master switch whitelist

```
(host) [mynode] (config) #whitelist-db cpsec-master-switch-list del mac-address
00:1E:33:CA:D2:51
```

Related Commands

whitelist-db cpsec modify

```
whitelist-db cpsec modify mac-address <name>
   ap-group <ap_group>
   ap-name <ap_name>
   cert-type {factory-cert|switch-cert}
   description <description>
   mode {disable|enable}
   revoke-text <revoke-text>
   state {approved-ready-for-cert|certified-factory-cert}
```

Description

Modify an existing entry in the campus AP whitelist.

Syntax

Parameter	Description
`mac-address <name>`	MAC address of an AP in the campus AP whitelist database.
`ap-group <ap_group>`	(Optional) Name of the AP group to which an AP is assigned. **NOTE:** If AP group is not entered, a campus AP boots with "default" as the AP group.
`ap-name <ap_name>`	(Optional) Name of an AP. **NOTE:** If AP name is not entered, a campus AP boots with its MAC address as the AP name.
`cert-type {factory-cert|switch-cert}`	(Optional) Type of certificate used by an AP. ■ **factory-cert**: AP uses a factory-installed certificate. ■ **switch-cert**: AP uses a Switch-signed certificate.
`description <description>`	(Optional) Brief description of an AP. If the description includes spaces, enclose the description in quotation marks.
`mode {disable|enable}`	(Optional) Mode of an AP. ■ **disable**: Disables an AP in the campus AP whitelist. A disabled AP cannot contact a managed device over a secure connection. ■ **enable**: Enables a disabled AP in the campus AP whitelist.
`revoke-text <revoke-text>`	(Optional) Brief description why an AP was revoked.
`state {approved-ready-for-cert|certified-factory-cert}`	(Optional) State of an AP. ■ **approved-ready-for-cert**: AP is approved and is ready to receive a certificate. ■ **certified-factory-cert**: AP is certified and has a factory-installed certificate.

Example

The following command changes the AP group, AP name, certificate type, description, mode, revoke text, and state of an AP with MAC address 00:1E:37:CB:D4:52:

```
(host)[node] #whitelist-db cpsec modify mac-address 00:1E:37:CB:D4:52
          ap-group default
          ap-name ap-225
          cert-type factory-cert
          description "AP-225 in lobby"
```

```
mode disable
revoke-text "Maintenance"
state approved-ready-for-cert
```

whitelist-db cpsec purge

```
whitelist-db cpsec purge
```

Description

Clear the campus AP whitelist.

Syntax

No parameters.

Usage Guidelines

Use this command to clear all entries in the entire campus AP whitelist. If your network includes both Mobility Master and managed devices, then each campus AP whitelist is synchronized across all managed devices. If you purge the entire campus AP whitelist on one managed device, that action will clear the campus AP whitelist on every managed device in the network. To delete an individual entry in the campus AP whitelist, use the command whitelist-db cpsec delete.

Example

The following command remove all APs from the campus AP whitelist:

```
(host)[node] (config) #whitelist-db cpsec purge
```

whitelist-db cpsec revoke

```
whitelist-db cpsec revoke mac-address <mac-address> revoke-text <revoke-text>
```

Description

Revoke a certificate from an AP in the campus AP whitelist.

Syntax

Parameter	Description
`mac-address <mac-address>`	MAC address of the AP you want to remove from the cpsec whitelist database.
`revoke-text <revoke-text>`	A brief description why the AP's certificate was revoked, up to 64 alphanumeric characters. If this comment includes spaces, you must enclose the comment in quotation marks.

Usage Guidelines

Use this command to revoke a certificate from a invalid or suspected rogue AP.

Example

The following command revokes a certificate from an AP. This command does not delete a whitelist entry for a revoked AP, but marks its entry with the revoked state.

```
(host)[node] (config) #whitelist-db cpsec revoke mac-address 00:1E:37:CA:D4:51
   revoke-text "revoking cert from a rogue AP."
```

whitelist-db rap add

```
whitelist-db rap add mac-addr <mac-address>
   ap-group <ap-group>
   ap-name <ap-name>
   description <description>
   full-name <full-name>
   mode enable|disable
   remote-ip <ip-addr>
```

Description

Add an AP entry to the remote AP whitelist.

Syntax

Parameter	Description
`mac-address <mac-address>`	MAC address of the AP you want to enter into the remote AP whitelist database.
`ap-group <ap-group>`	AP group of the remote AP.
`ap-name <ap-name>`	Name of the Remote AP.
`description <description>`	Description of the remote AP. If the description includes spaces, it must be enclosed within quotation marks.
`full-name <full-name>`	Name of the client using the remote AP.
`remote-ip <ip-addr>`	IP address used to assign a static inner IP address for the remote AP.

Usage Guidelines

You can manually add entries to the remote AP whitelist to grant valid remote APs secure access to the network.

Example

The following command creates a new remote AP whitelist entry for an AP with the MAC address 00:16:CF:AF:3E:E1:

```
(host)[node](config) #whitelist-db rap add mac-address 00:16:CF:AF:3E:E1
```

whitelist-db rap del

```
whitelist-db rap del mac-addr <mac-address>
```

Description

Remove an AP entry from the remote AP whitelist.

Syntax

Parameter	Description
`mac-address <mac-address>`	MAC address of the AP you want to remove from the remote AP whitelist database.

Usage Guidelines

You can manually remove entries from the remote AP whitelist to revoke a remote AP's secure access to the network. If you want to temporarily revoke an AP's access without removing the entry from the whitelist, use the command whitelist-db rap revoke.

Example

The following command revokes and deletes a remote AP whitelist entry for an AP with the MAC address 00:16:CF:AF:3E:E1:

```
(host)[node] (config) #whitelist-db rap del mac-address 00:16:CF:AF:3E:E1
```

   ap-name <ap-name>
   description <description>
   full-name <full-name>
   mode enable|disable
   remote-ip <ip-addr>
```

Description

Remove an AP entry from the remote AP whitelist.

Syntax

Parameter	Description
`mac-address <mac-address>`	MAC address of the remote AP whose whitelist database entry you want to modify.
`ap-group <ap-group>`	AP group of the remote AP.
`ap-name <ap-name>`	Name of the Remote AP.
`description <description>`	Description of the remote AP. If the description includes spaces, it must be enclosed within quotation marks.
`full-name <full-name>`	Name of the client using the remote AP.
`mode enable|disable`	Enable or disable the remote AP without deleting it from the database.
`remote-ip <ip-addr>`	IP address used to assign a static inner IP address for the remote AP.

Usage Guidelines

You can manually remove entries from the remote AP whitelist to revoke a remote AP's secure access to the network.

Example

The following command modifies a remote AP whitelist entry for an AP with the MAC address 00:16:CF:AF:3E:E1:

```
(host)[node] (config) #whitelist-db rap modify mac-address 00:16:CF:AF:3E:E1

whitelist-db rap revoke

```
whitelist-db rap revoke mac-address <mac-address> revoke-comment <comment>
```

Description

Revoke a certificate from an AP in the remote AP whitelist.

Syntax

Parameter	Description
`mac-address <mac-address>`	MAC address of the AP you want to remove from the remote AP whitelist database.
`revoke-comment <comment>`	A brief description why the AP's certificate was revoked, up to 64 alphanumeric characters. If this comment includes spaces, you must enclose the comment in quotation marks.

Usage Guidelines

Use this command to revoke a certificate from a invalid or suspected rogue AP.

Example

The following command revokes a certificate from an AP. This command does not delete a whitelist entry for a revoked AP, but marks its entry with the revoked state.

```
(host) (config) #whitelist-db rap revoke mac-address 00:1E:37:CA:D4:51
   revoke-comment "revoking cert from a rogue RAP."

whitelist-db rap-master-switch-list

```
whitelist-db rap-master-switch-list
   del mac-addr <mac-address>
   purge
```

Description

Delete a Mobility Master from the master switch table used by the remote AP whitelist.

Syntax

Parameter	Description
`del mac-address <mac-address>`	Remove a single Mobility Master from the master switch whitelist.
`purge`	Clear all Mobility Masters from the Registered Master Switch table.

Usage Guidelines

Each managed device with remote APs managed through a remote AP whitelist has a master switch whitelist which contains the IP and MAC addresses of its Mobility Master. If your network has a redundant Mobility Master, then this whitelist will contain more than one entry.

The Mobility Master whitelist rarely needs to be purged. Although you can delete an entry from the master switch whitelist, you should do so only if you have removed a master switch from the network. Deleting a valid Mobility Master from the master switch whitelist can cause errors in your network.

Example

The following command removes a Mobility Master from the master switch whitelist table:

```

wlan anyspot-profile

```
wlan anyspot-profile <profile-name>
   clone <profile-name>
   enable-anyspot
   exclude-essid <exclude-essid>
   exclude-wildcard <exclude-wildcard>
   no
   preset-essid <preset-essid>
```

Description

The anyspot client probe suppression feature decreases network traffic by suppressing probe requests from clients attempting to locate and connect to other known networks.

Syntax

Parameter	Description
`clone <profile-name>`	Make a copy of an existing anyspot profile.
`enable-anyspot`	Issue this command to enable the anyspot feature. Note that you must associate the anyspot profile with a virtual AP profile for the settings to take effect.
`exclude-essid <exclude-essid>`	An anyspot-enabled radio will not respond to client probe requests using an ESSID in the **Exclude ESSID** lists. To add an ESSID to the list, enter the full name of the ESSID, then click **Add**. To remove an ESSID from the list, select it and click **Delete**. ESSIDs from neighboring APs will automatically appear in this list as long as the anyspot-enabled AP can detect that ESSID.
`exclude-wildcard <exclude-wildcard>`	An anyspot-enabled radio will not respond to client probe requests using an ESSID in the **Exclude ESSID** list. To exclude ESSIDs that partially match a text string, enter that string then click **Add**. To remove a matching string from the list, select it and click **Delete**.
`no`	Remove or negate any configured parameter.
`preset-essid <preset-essid>`	The anyspot-enabled AP will not send an ESSID in beacons, but if a client sends a probe request without an ESSIDs (that is, the probe request is not looking for a specific network) then the anyspot-enabled AP will respond to the probe request with an ESSID from this list.

Usage Guidelines

When an AP is configured to use this feature, the anyspot AP radio hides its configured ESSID in beacons, and compiles a list of other ESSIDs from detected neighboring APs. If the client sends a probe request without a specified ESSID, the anyspot AP will respond with a preconfigured ESSID.

When a client searches for a preferred network, that client sends the SSID of the preferred network in the probe request. The anyspot AP checks to see if there is a neighboring AP using that ESSID that can respond the client's request. If no matching network is found, the anyspot AP sends a response to the client using the SSID from the client request. If the client is authorized to connect to the anyspot AP, that client associates to AP.

Once connected to the anyspot AP, the client recognizes the ESSID to which it is connected as one associated with its preferred network, and does not send out any further probe requests.

Example

The following command defines a ESSID to be returned in probe requests that do not contain an ESSID, as well as two ESSIDs that should be excluded from anyspot responses, in the event that a client is probing for one of these excluded ESSIDs.

```
(host) [/md] (config) #wlan anyspot-profile anyspot1
   (host) [/md] (Anyspot profile "anyspot1") #preset SSID companyguest
   (host) [/md] (Anyspot profile "anyspot1") #exclude-ssid corp_dev_essid
   (host) [/md] (Anyspot profile "anyspot1") #exclude-ssid corp_voip_essid
```

wlan bcn-rpt-req-profile

```
wlan bcn-rpt-req-profile <profile-name>
   channel <channel>
   clone <source>
   interface <interface>
   measure-dur-mandatory
   measure-duration <measure-duration>
   measure-mode
   no
   random-interval <random-interval>
   reg-class {1|12}
   request-info <request-info>
   rpt-condition <rpt-condition>
   rpt-detail
   ssid <ssid>
```

Description

Configures a Beacon Report Request Profile to provide the parameters for the Beacon Report Request frames.

Syntax

Parameter	Description	Range	Default
`<profile-name>`	Name of this instance of the profile. The name must be 1-63 characters.	—	"default"
`channel <channel>`	This option is used to set the Channel field in the Beacon Report Request frame. The Channel value can be set to one of the following: ■ The channel of the AP (when Measurement Mode is set to either 'Passive' or 'Active-All channels') ■ 0 (when Measurement Mode is set to 'Beacon Table') ■ 255 (when Measurement Mode is set to 'Active-Channel Report')	For 802.11b/g band: 1 to 14 For 802.11a band: 36 to 165	255
`clone <source>`	Creates a copy of the Beacon Report Request Profile specified as the <source>. <source> is the name of an existing Beacon Report Request Profile from which parameter values are copied.	—	—
`interface <interface>`	This field is used to specify the radio interface for transmitting the Beacon Report Request frame.	0-1	1
`measure-dur-mandatory`	This value is used to set the Duration Mandatory bit of the Measurement Request Mode field of the Beacon Report Request frame.	—	Disabled
`measure-duration <measure-duration>`	This value is used to set the Measurement Duration field in the Beacon Report Request frame. The Measurement Duration is set to the duration of the requested measurement. It is expressed in units of TUs.	0 – 65535	0

Parameter	Description	Range	Default
`measure-mode`	Indicates the mode used for the measurement. The valid measurement modes are: ■ **active-all-ch**—Enables active beacon measurement mode. In this mode, the client sends a probe request to the broadcast destination address on all supported channels, sets a measurement duration timer, and, at the end of the measurement duration, compiles all received beacons or probe response with the requested SSID and BSSID into a measurement report. ■ **active-ch-rpt**—In this mode, the client and returns a report that contains a list of channels in a regulatory class where a client is likely to find an AP, including the AP transmitting the AP channel report. ■ **beacon-table**—Enables beacon-table beacon measurement mode. In this mode, the client measures beacons and returns a report with stored beacon information for any supported channel with the requested SSID and BSSID. The client does not perform any additional measurements. ■ **passive**—Enables passive beacon measurement mode. In this mode, the client sets a measurement duration timer, and, at the end of the measurement duration, compiles all received beacons or probe response with the requested SSID and BSSID into a measurement report. **NOTE:** If a station doesn't support the selected measurement mode, it returns a Beacon Measurement Report with the Incapable bit set in the Measurement Report Mode field. Default Mode: beacon-table	–	beacon-table
`no`	Negates any configured parameter.	—	—
`random-interval <random-interval>`	This value is used to set the Randomization Interval field in the Beacon Report Request frame. The Randomization Interval is used to specify the desired maximum random delay in the measurement start time. It is expressed in units of TUs (Time Units). A Randomization Interval of 0 in a measurement request indicates that no random delay is to be used.	0 – 65535	0
`reg-class {1|12}`	This option is used to specify the Regulatory Class field in the Beacon Report Request frame.	For 802.11b/g bands, 12. For 802.11a, use 1	—

Parameter	Description	Range	Default
`request-info <request-info>`	This option is used to indicate the contents of the Request Information IE that could be present in the Beacon Report Request frame. The Request Information IE is present for all Measurement Modes except the Beacon Table mode. It consists of a list of Element IDs that should be included by the client in the response frame.	Any valid element ID in the x/y/z format. For example, 0/21/22.	—
`rpt-condtion <rpt-condition>`	This option is used to indicate the value for the Reporting Condition field in the Beacon Reporting Information sub-element present in the Beacon Report Request frame.	0 - 255	0
`rpt-detail`	This option is used to indicate the value for the Detail field in the Reporting Detail sub-element present in the Beacon Report Request frame.	—	Disabled
`ssid <ssid>`	A unique character string (sometimes referred to as a network name), consisting of no more than 32 characters. The SSID is case-sensitive (for example, WLAN- 01).	—	—

Usage Guidelines

The Beacon Report Request profile is configured under the 802.11K profile.

Example

The following commands configure the parameters under the bcn-rpt-req-profile.

```
(host) [/md] (config) #wlan bcn-rpt-req-profile default
(host) [/md]  (Beacon Report Request Profile "default") #channel 9
(host) [/md]  (Beacon Report Request Profile "default") #interface 1
(host) [/md]  (Beacon Report Request Profile "default") #no measure-dur-mandatory
(host) [/md]  (Beacon Report Request Profile "default") #measure-duration 100
(host) [/md]  (Beacon Report Request Profile "default") #measure-mode active-all-ch
(host) [/md]  (Beacon Report Request Profile "default") #random-interval 100
(host) [/md]  (Beacon Report Request Profile "default") #reg-class 12
(host) [/md]  (Beacon Report Request Profile "default") #rpt-condition 2
(host) [/md]  (Beacon Report Request Profile "default") #no rpt-detail
(host) [/md]  (Beacon Report Request Profile "default") #request-info 0/21/22
(host) [/md]  (Beacon Report Request Profile "default") #ssid aruba-ap
```

wlan client-wlan-profile

```
wlan client-wlan-profile <profile-name>
   auth-as-computer
   auth-as-guest
   clone
   eap-cert
   eap-cert-connect-only-to
   eap-peap
   eap-peap-connect-only-to
   eap-type
   enable-8021x
   ieap-cert-connect-only
   inner-eap
   inner-eap-type
   no
   non-broadcasting-connection
   range-connect
   ssid-profile
```

Description

You can push WLAN profiles to users computers that use the Microsoft Windows Wireless Zero Config (WZC) service to configure and maintain their wireless networks. After the WLAN profiles are pushed to user computers, they are automatically displayed as an ordered list in the preferred networks.

Syntax

Parameter	Description	Default
auth-as-computer	Authenticate with domain credentials.	
auth-as-guest	Authenticate as a guest user.	
clone	Copy settings from another WLAN client profile.	
eap-cert	If you select EAP type as certificate, you can use one of the following options: ■ use-smartcard ■ simple-certificate-selection ■ use-different-name ■ validate-server-certificate	—
eap-cert-connect-only-to	Comma separated list of servers.	
eap-peap	Configure one of the following EAP-PEAP settings: ■ disconnect-if-no-crypto ■ dont-allow-user-authorize ■ enable-fast-reconnect ■ enable-quarantine-checks ■ validate-server-certificate	
eap-peap-connect-only-to	Comma separated list of servers.	

Parameter	Description	Default
eap-type	Select one of the following EAP types used by the client to connect to wireless network: ■ eap-peap - Select this option to specify EAP-PEAP as the authentication protocol. ■ eap-tls - Select this option to specify EAP-TLS as the authentication protocol.	EAP-PEAP
enable-8021x	Select this option to enable 802.1X authentication for this network.	Enabled
ieap-cert-connect-only-to	Command separated list of servers that the Inner EAP Certificates connects to.	
inner-eap	Enter the inner EAP type.	EAP-MSCHAPv2
inner-eap-type	Specify one of the following: ■ eap-gtc - Select this option to specify EAP-GenericTokenCard as the inner authentication protocol. ■ eap-mschapv2 - Select his option to specify EAP-MSCHAPV2 as the inner authentication protocol.	
no	Negate and reset all configuration settings.	
non-broadcasting-connection	Connect even if WLAN is not broadcasting.	Disabled
range-connect	Automatically connect to this WLAN if in range.	
ssid-profile	Enter the name of the SSID profile.

wlan dot11k-profile

```
wlan dotllk <profile-name>
   ap-chan-rpt-11a <ap-chan-rpt-11a>
   ap-chan-rpt-11bg <ap-chan-rpt-11bg>
   bcn-measurement-mode {active-all-ch|active-ch-rpt|beacon-table|passive}
   bcn-req-chan-11a <bcn-req-chan-11a>
   bcn-req-chan-11bg <bcn-req-chan-11bg>
   bcn-req-time <bcn-req-time>
   bcn-rpt-req-profile <profile-name>
   clone <profile-name>
   dot11k-enable
   force-disassoc
   lm-req-time <lm-req-time>
   no ...
   rrm-ie-profile <profile-name>
   tsm-req-profile <profile-name>
   tsm-req-time <tsm-req-time>
```

Description

Configure a 802.11k radio profile.

Syntax

Parameter	Description	Default
`<profile-name>`	Name of this instance of the profile. The name must be 1-63 characters.	"default"
`ap-chan-rpt-11a <ap-chan-rpt-11a>`	This value is sent in the Channel field of the AP channel reports on the 'A' radio. You can specify values in the range 34 to 165.	36
`ap-chan-rpt-11bg <ap-chan-rpt-11bg>`	This value is sent in the Channel field of the AP channel reports on the 'BG' radio. You can specify values in the range 1 to 14.	1
`bcn-measurement-mode`	Configures a beacon measurement mode for the profile. ■ **active-all-ch**—Enables active beacon measurement mode. In this mode, the client sends a probe request to the broadcast destination address on all supported channels, sets a measurement duration timer, and, at the end of the measurement duration, compiles all received beacons or probe response with the requested SSID and BSSID into a measurement report. ■ **active-ch-rpt**—In this mode, the client and returns a report that contains a list of channels in a regulatory class where a client is likely to find an AP, including the AP transmitting the AP channel report. ■ **beacon-table**—Enables beacon-table beacon measurement mode. In this mode, the client measures beacons and returns a report with stored beacon information for any supported channel with the requested SSID and BSSID. The client does not perform any additional measurements. ■ **passive**—Enables passive beacon measurement mode. In this mode, the client sets a measurement	beacon-table

Parameter	Description	Default
	duration timer, and, at the end of the measurement duration, compiles all received beacons or probe response with the requested SSID and BSSID into a measurement report. **NOTE:** If a station doesn't support the selected measurement mode, it returns a Beacon Measurement Report with the Incapable bit set in the Measurement Report Mode field. Default Mode: beacon-table	
`beacon-table`	Enables **beacon-table** beacon measurement mode. In this mode, the client measures beacons and returns a report with stored beacon information for any supported channel with the requested SSID and BSSID. The client does not perform any additional measurements. This is the default beacon measurement mode. **NOTE:** If a station doesn't support beacon-table able measurement mode, it returns a Beacon Measurement Report with the *Incapable* bit set in the *Measurement Report Mode* field.	—
`passive`	Enables **passive** beacon measurement mode. In this mode, the client sets a measurement duration timer, and, at the end of the measurement duration, compiles all received beacons or probe response with the requested SSID and BSSID into a measurement report. **NOTE:** If a station doesn't support passive measurement mode, it returns a Beacon Measurement Report with the *Incapable* bit set in the *Measurement Report Mode* field.	—
`clone` <profile-name>	Copy settings from another specified 802.11k profile.	—
`bcn-req-chan-11a <bcn-req-chan-11a>`	This value is sent in the Channel field of the beacon requests on the 'A' radio. You can specify values in the range 34 to 165.	36
`bcn-req-chan-11bg <bcn-req-chan-11bg>`	This value is sent in the Channel field of the Beacon Requests on the BG radio. You can specify values in the range 1 to 14 or 0 to 255.	1
`bcn-req-time <bcn-req-time>`	This option configures the time duration between two consecutive beacon requests sent to a802.11k client. By default, the beacon requests are sent to a802.11k client every 60 seconds. However, if a different value is required, the `bcn-req-time` option can be used. This permits values in the range from 10 seconds to 200 seconds.	60 seconds
bcn-rpt-req-profile <profile-name>	Beacon Report Request Settings for the selected profile.	—
`dot11k-enable`	Enables the 802.11K feature. This feature is disabled by default.	Disabled
`force-dissasoc`	This feature allows the AP to forcefully disassociate on-hook voice clients (clients that are not on a call) after period of inactivity.	Disabled

Parameter	Description	Default
	Without the forced disassociation feature, if an AP has reached its CAC limits and an on-hook voice client wants to start a new call, that client may be denied. If forced disassociation is enabled, those clients can associate to a neighboring AP that can fulfill their QoS requirements. **NOTE:** This feature is disabled by default.	
`lm-req-time <lm-req-time>`	This option configures the time duration between two consecutive link measurement requests sent to an 802.11k client. By default, link measurement requests are sent to a 802.11k client every 61 seconds. However, you can use the `lm-req-time` option to specify different time interval. This permits values in the range from 10 to 200 seconds.	60 seconds
`no`	Negates or removes any configured parameter.	
`rrm-ie-profile <profile-name>`	RRM IE Settings Profile.	
`tsm-req-profile <profile-name>`	TSM Report Request Settings Profile.	
`tsm-req-time <tsm-req-time>`	This option configures the time duration between two consecutive transmit stream measurement requests sent to a 802.11k client. By default, the transmit stream measurement requests are sent to a 802.11k client every 90 seconds. However, you can use the `tsm-req time` option to specify a different time interval. This permits values in the range from 10 seconds to 200 seconds.	90 seconds

Usage Guidelines

In a 802.11k network, if the AP with the strongest signal is reaches its maximum capacity, clients may connect to an under utilized AP with a weaker signal. A 802.11k profile can assigned to each virtual AP.

Example

The following command enables the 802.11k feature on the 802.11k profile and configures the beacon measurement mode and specifies the time interval for beacon, link, and transmit stream measurement requests.

```
(host) [/md] (config) #wlan dot11k-profile default
(host) [/md] (802.11K Profile "default") #dot11k-enable
(host) [/md] (802.11K Profile "default") #bcn-measurement-mode beacon-table
(host) [/md] (802.11K Profile "default") #bcn-req-time 60
(host) [/md] (802.11K Profile "default") #lm-req-time 60
(host) [/md] (802.11K Profile "default") #tsm-req-time 90
```

Related Commands

Command	Description
wlan rrm-ie-profile	Configure an radio resource management RRM IE profile to define the information elements advertised by an AP with 802.11k support enabled.

wlan dot11r-profile

```
wlan dotllr-profile <profile-name>
   clone
   dot11r
   key-duration <60-86400>
   key-assignment
   mob-domain-id <1-65535>
   no
```

Description

This command configures an 802.11r radio profile.

Syntax

Parameter	Description	Range	Default
`<profile-name>`	Name of this instance of the profile. The name must be 1-63 characters.	—	Default
`clone`	Name of an existing dot11r-profile from which the parameter values are copied.	—	—
`mob-domain-id`	An ID that uniquely identifies the mobility domain.	1-65535	1
`dot11r`	Enables the Fast BSS Transition capability.	—	Disabled
`no`	Negates or removes any configured parameter.		—
`key-duration`	The r1 key timeout value in seconds for decrypt-tunnel or bridge mode.	60-86400	3600
`key-assignment`	The list of neighbor APs for decrypt-tunnel or bridge mode. ■ static: Get neighbor AP list from ARM or VBR. ■ dynamic: Use all APs from ap-group as the neighbor list.	—	—

Usage Guidelines

You can enable and configure Fast BSS Transition on a per Virtual AP basis. You must create an 802.11r profile and associate that with the Virtual AP profile through an SSID profile.

Example

The following set of commands enable the 802.11r capability on the 802.11r profile, configures the Fast BSS mobility domain ID, and specifies the r1 key time-out value.

```
(host) [/md] (config)#wlan dot11r-profile default
(host) [/md] (802.11r Profile "default") #fastbss-transition
(host) [/md] (802.11r Profile "default") #fastbss-mob-domain-id 25
(host) [/md] (802.11r Profile "default") #r1key_validity_duration 2500
```

Configure a mobility domain ID that uniquely identifies a mobility domain using the following command:

(host) [mynode] (802.11r Profile "default") #mob-domain-id <1-65535>

The default value is 1.

Configure the r1 key timeout value in seconds for decrypt-tunnel or bridge mode using the following command:

(host) [mynode] (802.11r Profile "default") #key_duration <60-86400>

The default value is 3600 seconds.

Apply the 802.11r profile to an SSID profile using the following command:

(host) [mynode] (config) #wlan ssid-profile voice dot11r-profile voice-enterprise

You can advertise the 802.11r capability on the Virtual AP profile by applying the SSID profile. Use the following command to apply the SSID profile to the Virtual AP profile:

(host) [mynode] (config) #wlan virtual-ap voice-AP ssid-profile voice

wlan edca-parameters-profile

```
wlan edca-parameters-profile
   ap|station <profile-name>
      background [acm <0-1>]|[aifsn <1-15>]|[ecw-max <1-15>|[ecw-min <0-15>]|[txop <0-2047>]
      best-effort [acm <0-1>]|[aifsn <1-15>]|[ecw-max <1-15>|[ecw-min <0-15>]|[txop <0-2047>]
      clone <source>
      no
      video [acm <0-1>]|[aifsn <1-15>]|[ecw-max <1-15>|[ecw-min <0-15>]|[txop <0-2047>]
      voice [acm <0-1>]|[aifsn <1-15>]|[ecw-max <1-15>|[ecw-min <0-15>]|[txop <0-2047>]
```

Description

This command configures an EDCA profile for APs or for clients (stations).

Syntax

Parameter	Description	Range	Default
`<profile-name>`	Name of this instance of the profile. The name must be 1-63 characters.	—	default
`background`	Configures the background queue.	—	—
`best-effort`	Configures the best-effort queue.	—	—
`clone`	Name of an existing EDCA profile from which parameter values are copied.	—	—
`no`	Remove or negate a parameter.	—	—
`video`	Configures the video queue.	—	—
`voice`	Configures the voice queue.	—	—
`acm`	Specifies mandatory admission control. The client reserves the AC through TSPEC signaling. Enter 1 to enable, 0 to disable.	0, 1	0 (disabled)
`aifsn`	Arbitrary inter-frame space number.	1-15	0
`ecw-max`	The exponential (n) value of the maximum contention window size, as expressed by 2^n-1. A value of 4 computes to 2^4-1 = 15.	1-15	0
`ecw-min`	The exponential (n) value of the minimum contention window size, as expressed by 2^n-1. A value of 4 computes to 2^4-1 = 15.	0-15	0
`txop`	TXOP in units of 32 microseconds. Divide the desired transmission duration by 32 to determine the value to configure. For example, for a transmission duration of 3008 microseconds, enter 94 (3008/32).	0-2047	0

Usage Guidelines

EDCA profiles are specific either to APs or clients. You apply an EDCA profile to a specific SSID profile. use this command only under the guidance of your Alcatel-Lucent technical support representative.

The following are the default values configured for APs:

Access Category	ecw-min	ecw-max	aifsn	txop	acm
best-effort	4	6	3	0	No
background	4	10	7	0	No
video	3	4	1	94	No
voice	2	3	1	47	No

The following are the default values configured for clients:

Access Category	ecw-min	ecw-max	aifsn	txop	acm
best-effort	4	10	3	0	No
background	4	10	7	0	No
video	3	4	2	94	No
voice	2	3	2	47	No

Example

The following command configures an EDCA profile for APs:

```
(host) [/md] (config) #wlan edca-parameters-profile ap edca1
(host) [/md] (EDCA Parameters profile (AP) "edca1") #best-effort ecw-min 15 ecw-max 15 aifsn
15 txop 100 acm 1
```

wlan he-ssid-profile

```
wlan he-ssid-profile <profile-name>
   clone
   dynamic-fragmentation-level <dynamic-fragmentation-level>
   he-duration-based-rts <he-duration-based-rts>
   he-guard-interval
   he-mu-mimo
   he-mu-ofdma
   he-supported-mcs-map <he-supported-mcs-map>
   he-txbf
   high-efficiency-enable
   individual-twt
   no...
```

Description

This command configures a high-efficiency SSID profile.

Syntax

Parameter	Description	Range	Default
`<profile-name>`	Name of this instance of the profile. The name must be 1-63 characters.	—	default
`clone`	Name of an existing high-efficiency SSID profile from which parameter values are copied.	—	—
`dynamic-fragmentation-level`	Controls the level of dynamic fragmentation that is supported by the APs. Enter one of the following values: ■ 0: Does not support Dynamic Fragmentation ■ 1: Support for dynamic fragments that are contained within an S-MPDU. It does not support dynamic fragment within an A-MPDU that is not an S-MPDU. ■ 2: Support for dynamic fragments that are contained within an S-MPDU, and support for up to one dynamic fragment for each MSDU within an A-MPDU. ■ 3: Support for dynamic fragments that are contained within an S-MPDU, and support for up to four dynamic fragments for each MSDU within an A-MPDU.	0-3	0

Parameter	Description	Range	Default
`he-duration-based-rts`	Indicates the duration-based RTS value, in microseconds, in the HE capability. When the Transmission Opportunity (TXOP) is greater than the configured duration-based RTS value, RTS/CTS exchange value is used.	0-1023	1023
`he-guard-interval`	Sets the supported GI.	800 ns, 1600 ns, 3200 ns	800
`he-mu-mimo`	Enables or disables HE MU-OFDMA in WLAN high-efficiency SSID.	—	enabled
`he-mu-ofdma`	Enables or disables HE MU-OFDMA in WLAN high-efficiency SSID.	—	enabled
`he-supported-mcs-map`	Comma separated list of maximum supported MCS for spatial streams 1 through 8. Valid values for maximum MCS are 7, 9, 11, and '-' (if spatial stream is not supported). Maximum MCS of a spatial stream cannot be higher than the previous streams. If an MCS is not valid for a particular combination of bandwidth and number of spatial streams, it is not used for Tx and Rx.	7,9,11, -	11,11,11,11,11,11,11,11
`he-txbf`	Enables or disables Transmit Beamforming (TxBF) in HE capability.	—	enabled
`high-efficiency-enable`	Enables or disables high-efficiency (802.11ax) features in SSID.	—	enabled
`individual-twt`	Enables or disables individual TWT support.	—	enabled
`no`	Negates any configured parameter.	—	—

Usage Guidelines

The **wlan he-ssid** profile configures the high-efficiency SSID.

Example

The following command configures the dynamic fragmentation level supported by the AP for the default high-efficiency SSID:

```
(host) [md] (config) #wlan he-ssid-profile default
(host) [md] (High-efficiency SSID profile "default") #dynamic-fragmentation-level 2
```

wlan hotspot advertisement-profile

```
wlan hotspot advertisement profile <profile-name>
   anqp-3gpp-nwk-profile <profile-name>
   anqp-domain-name-profile <profile-name>
   anqp-ip-addr-avail-profile <profile-name>
   anqp-nai-realm-profile <profile-name>
   anqp-nwk-auth-profile <profile-name>
   anqp-roam-cons-profile <profile-name>
   anqp-venue-name-profile <profile-name>
   clone <profile-name>
   h2qp-conn-cap-profile <profile-name>
   h2qp-op-cl-profile <profile-name>
   h2qp-operator-friendly-profile <profile-name>
   h2qp-wan-metrics-profile <profile-name>
   no
```

Description

This command configures a WLAN advertisement profile for an 802.11u public access service provider.

Syntax

Parameter	Description
`anqp-3gpp-nwk-profile <profile-name>`	Name of the Access Network Query Protocol (ANQP) 3GPP cellular network profile to be associated with this WLAN advertisement profile. For more information on configuring this profile, refer to wlan hotspot anqp-3gpp-nwk-profile on page 2860.
`anqp-domain-name-profile <profile-name>`	Name of the ANQP domain name profile to be associated with this WLAN advertisement profile. For more information on configuring this profile, refer to wlan hotspot anqp-domain-name-profile on page 2862.
`anqp-ip-addr-avail-profile <profile-name>`	Name of the ANQP IP Address Availability profile to be associated with this WLAN advertisement profile.For more information on configuring this profile, refer to wlan hotspot anqp-ip-addr-avail-profile on page 2864.
`anqp-nai-realm-profile <profile-name>`	Name of the ANQP NAI Realm profile to be associated with this WLAN advertisement profile. For more information on configuring this profile, refer to wlan hotspot anqp-nai-realm-profile on page 2866.
`anqp-nwk-auth-profile <profile-name>`	Name of the ANQP Network Authentication profile to be associated with this WLAN advertisement profile. For more information on configuring this profile, refer to wlan hotspot anqp-nwk-auth-profile on page 2870.

Parameter	Description
`anqp-roam-cons-profile <profile-name>`	Name of the ANQP Roaming Consortium profile to be associated with this WLAN advertisement profile. For more information on configuring this profile, refer to wlan hotspot anqp-roam-cons-profile on page 2872.
`anqp-venue-name-profile <profile-name>`	Name of the ANQP Venue Name profile to be associated with this WLAN advertisement profile. For more information on configuring this profile, refer to wlan hotspot anqp-venue-name-profile on page 2874.
`clone <profile-name>`	Make a copy of an existing WLAN Advertisement profile.
`h2qp-conn-cap-profile <profile-name>`	Name of the Hotspot 2.0 Connection Capability profile to be associated with this WLAN advertisement profile. For more information on configuring this profile, refer to wlan hotspot h2qp-conn-capability-profile on page 2877.
`h2qp-op-cl-profile <profile-name>`	Name of the Hotspot 2.0 Operating Class Indication profile to be associated with this WLAN advertisement profile. For more information on configuring this profile, refer to wlan hotspot h2qp-op-cl-profile on page 2879.
`h2qp-operator-friendly-name-profile <profile-name>`	Name of the Hotspot 2.0 operator-friendly name profile to be associated with this WLAN advertisement profile. For more information on configuring this profile, refer to wlan hotspot h2qp-operator-friendly-name-profile on page 2881.
`h2qp-wan-metrics-profile <profile-name>`	Name of the Hotspot 2.0 WAN Metrics profile to be associated with this WLAN advertisement profile. For more information on configuring this profile, refer to wlan hotspot h2qp-wan-metrics-profile on page 2883.
`no`	Negate or remove any existing parameter, returning it to its default value.

Usage Guidelines

Hotspot 2.0 is a WFA specification based upon the 802.11u protocol that provides wireless clients with a streamlined mechanism to discover and authenticate to suitable networks, and allows mobile users the ability to roam between partner networks without additional authentication.

Access Network Query Protocol (ANQP) and Hotspot 2.0 Query Protocol (H2QP) profiles define the information in the 802.11u IEs to be broadcast by an 802.11u-capable AP. Use this command to select one of each type of ANQP and H2QP profile to be associated with the advertisement profile.

Values configured in the ANQP profiles will not be sent to clients unless you:

1. Associate the ANQP advertisement profile with a Hotspot profile. (`wlan hotspot h2-profile advertisement-profile <profile-name>`)
2. Enable the hotspot feature within that Hotspot profile (`wlan hotspot h2-profile <profile-name> hotspot-enable`)

Example

The following command associates the ANQP domain name profile **anqp-dom-1** to the advertisement profile **network1**:

```
(host) [mynode] (config) #wlan hotspot advertisement-profile network1
(host) [mynode] (Advertisement Profile "network1") #anqp-domain-name-profile anqp-dom-1
```

Related Commands

Use the following commands to configure the Hotspot feature:

Command	Description
wlan hotspot anqp-3gpp-nwk-profile	This profile defines information for a 3rd Generation Partnership Project (3GPP) Cellular Network for hotspots that have roaming relationships with cellular operators
wlan hotspot anqp-domain-name-profile	This command defines the domain name to be sent in an Access Network Query Protocol (ANQP) information element in a Generic Advertisement Service (GAS) query response.
wlan hotspot anqp-ip-addr-avail-profile	This command defines available IP address types to be sent in an Access network Query Protocol (ANQP) information element in a Generic Advertisement Service (GAS) query response.
wlan hotspot anqp-nai-realm-profile	This command defines a Network Access Identifier (NAI) realm whose information can be sent as an Access network Query Protocol (ANQP) information element in a Generic Advertisement Service (GAS) query response
wlan hotspot anqp-nwk-auth-profile	This command configures an ANQP Network Authentication profile to define authentication type being used by the hotspot network.
wlan hotspot anqp-roam-cons-profile	This command configures the Roaming Consortium OI information to be sent in an Access network Query Protocol (ANQP) information element in a Generic Advertisement Service (GAS) query response
wlan hotspot anqp-venue-name-profile	This command defines venue information be sent in an Access network Query Protocol (ANQP) information element in a Generic Advertisement Service (GAS) query response.
wlan hotspot h2qp-conn-capability-profile	This command defines a Hotspot 2.0 Query Protocol (H2QP) profile that advertises hotspot protocol and port capabilities.
wlan hotspot h2qp-op-cl-profile	This command defines a Hotspot 2.0 Query Protocol (H2QP) profile that defines the Operating Class to be sent in the ANQP IE.
wlan hotspot h2qp-operator-friendly-name-profile	This command defines a Hotspot 2.0 Query Protocol (H2QP) operator-friendly name profile.
wlan hotspot h2qp-wan-metrics-profile	This command creates a Hotspot 2.0 Query Protocol (H2QP) profile that specifies the hotspot WAN status and link metrics.
wlan hotspot hs2-profile	This command configures a hotspot profile for an 802.11u public access service provider.

wlan hotspot anqp-3gpp-nwk-profile

```
wlan hotspot anqp-3gpp-nwk-profile <profile-name>
   3gpp_plmn1 <3GPP-PLMN1>
   3gpp_plmn2 <3GPP-PLMN2>
   3gpp_plmn3 <3GPP-PLMN3>
   3gpp_plmn4 <3GPP-PLMN4>
   3gpp_plmn5 <3GPP-PLMN5>
   3gpp_plmn6 <3GPP-PLMN6>
   clone <source>
   no
```

Description

This profile defines information for a 3GPP Cellular Network for hotspots that have roaming relationships with cellular operators.

Syntax

Parameter	Description
`3gpp_plmn1`	The Public Land Mobile Networks (PLMN) value of the highest-priority network. The PLMN is comprised of a 12-bit Mobile Country Code (MCC) and the 12-bit Mobile Network Code (MNC).
`3gpp_plmn2`	The Public Land Mobile Networks (PLMN) value of the second-highest priority network. The PLMN is comprised of a 12-bit Mobile Country Code (MCC) and the 12-bit Mobile Network Code (MNC).
`3gpp_plmn3`	The Public Land Mobile Networks (PLMN) value of the third-highest priority network. The PLMN is comprised of a 12-bit Mobile Country Code (MCC) and the 12-bit Mobile Network Code (MNC).
`3gpp_plmn4`	The Public Land Mobile Networks (PLMN) value of the fourth-highest priority network. The PLMN is comprised of a 12-bit Mobile Country Code (MCC) and the 12-bit Mobile Network Code (MNC).
`3gpp_plmn5`	The Public Land Mobile Networks (PLMN) value of the fifth-highest priority network. The PLMN is comprised of a 12-bit Mobile Country Code (MCC) and the 12-bit Mobile Network Code (MNC).
`3gpp_plmn6`	The Public Land Mobile Networks (PLMN) value of the sixth-highest priority network. The PLMN is comprised of a 12-bit Mobile Country Code (MCC) and the 12-bit Mobile Network Code (MNC).
`clone <profile-name>`	Copies an existing 3GPP profile.
`no`	Removes an existing parameter.

Usage Guidelines

The 3GPP Cellular Network Profile defines an ANQP information element (IE) to be sent in a Generic Advertisement Service (GAS) query response from an AP in a hotspot with a roaming relationship with a cellular operator. The 3GPP Mobile Country Code (MCC) and the 12-bit Mobile Network Code data in the IE can help the client select a 3GPP network.

Values configured in this profile will not be sent to clients unless you:

1. Associate the 3GPP Cellular Network profile with an ANQP advertisement profile. (`wlan hotspot advertisement profile <profile-name> anqp-3gpp-nwk-profile <profile-name>`)
2. Associate the ANQP advertisement profile with a Hotspot profile. ("`wlan hotspot h2-profile advertisement-profile <profile-name>`)
3. Enable the hotspot feature within that Hotspot profile. (`wlan hotspot h2-profile <profile-name> hotspot-enable`)

Example

The following command defines 3GPP data for the 3GPP profile **cellcorp1**:

```
(host) [md] (config) #wlan hotspot anqp-3gpp-nwk-profile cellcorp1
(host) [md] ((ANQP 3GPP Cellular Network Profile "cellcorp1") #enable
(host) [md] ((ANQP 3GPP Cellular Network Profile "cellcorp1") #3gpp_plmn1 310026
(host) [md] ((ANQP 3GPP Cellular Network Profile "cellcorp1") #3gpp_plmn2 208000
(host) [md] ((ANQP 3GPP Cellular Network Profile "cellcorp1") #3gpp_plmn3 208001
```

wlan hotspot anqp-domain-name-profile

```
wlan hotspot anqp-domain-name-profile <profile-name>
   clone <source>
   domain-name <domain-name>
   no
```

Description

This command defines the domain name to be sent in an Access Network Query Protocol (ANQP) information element in a Generic Advertisement Service (GAS) query response.

Syntax

Parameter	Description
`<profile-name>`	ANQP domain name profile.
`clone <source>`	Copies an existing ANQP domain name profile.
`domain-name <domain-name>`	Domain name of the hotspot operator. This alphanumeric string must be 255 characters or less.
`no`	Removes an existing parameter.

Usage Guidelines

Use this command to configure a domain name in the ANQP Domain Name profile. If a client uses the Generic Advertisement Service (GAS) to post an ANQP query to an Access Point, the AP will return an ANQP Information Element with the domain name configured in this profile.

Values configured in this profile are not sent to clients unless you:

1. Associate the ANQP Domain Name profile with an ANQP advertisement profile (`wlan hotspot advertisement profile <profile-name> anqp-domain-name-profile <profile-name>`).
2. Associate the ANQP advertisement profile with a Hotspot profile (`wlan hotspot h2-profile advertisement-profile <profile-name>`).
3. Enable the hotspot feature within that Hotspot profile (`wlan hotspot h2-profile <profile-name> hotspot-enable`).

Example

The following command defines a domain name for the ANQP domain name profile domain1:

```
(host) [md] (config) #wlan hotspot anqp-domain-name-profile domain1
(host) [md] (ANQP Domain Name Profile "domain1") #domain-name example.com
```

Command History

wlan hotspot anqp-ip-addr-avail-profile

```
wlan hotspot anqp-ip-addr-avail-profile <profile-name>
   clone <profile-name>
   ipv4-addr-avail {availability-unknown|not-available|port-restricted|port-restricted-ouble-
   nated|port-restricted-single-nated|private-double-nated|private-single-nated|public}
   ipv6-addr-avail {available|availability-unknown|not-available}
   no
```

Description

This command defines available IP address types to be sent in an Access network Query Protocol (ANQP) information element in a Generic Advertisement Service (GAS) query response.

Syntax

Parameter	Description
`<profile-name>`	Name of the ANQP IP address availability profile.
`clone <source>`	Copies an existing ANQP IP Address Availability profile.
`ipv4-addr-avail`	Indicates the availability of an IPv4 network.
`availability-unknown`	Network availability cannot be determined.
`not-available`	Network is not available.
`port-restricted`	Network has some ports restricted (for example, the network blocks port 110 to restrict POP mail).
`port-restricted-double-nated`	Network has some ports restricted and multiple routers performing network address translation.
`port-restricted-single-nated`	Network has some ports restricted and a single router performing network address translation.
`private-double-nated`	Network is a private network with multiple routers doing network address translation.
`private-single-nated`	Network is a private network a single router doing network address translation.
`public`	Network is a public network.
`ipv6-addr-avail`	Indicates the availability of an IPv6 network.
`available`	An IPv6 network is available.
`availability-unknown`	Network availability cannot be determined.
`not-available`	Network is not available.
`no`	Removes an existing parameter.

Usage Guidelines

The IP Address Availability information configured using this command provides clients with information about the availability of IP address versions and types which could be allocated to those clients after they associate to the hotspot AP.

Values configured in this profile will not be sent to clients unless you:

1. Associate the ANQP IP Address Availability profile with an ANQP advertisement profile. (`wlan hotspot advertisement profile <profile-name> anqp-ip-addr-avail-profile <profile-name>`)
2. Associate the ANQP advertisement profile with a Hotspot profile. (`wlan hotspot h2-profile advertisement-profile <profile-name>`)
3. Enable the hotspot feature within that Hotspot profile. (`wlan hotspot h2-profile <profile-name> hotspot-enable`)

Example

The following command configures an AP using this profile to advertise a public IPv4 network:

```
(host) [md] (config) #wlan hotspot anqp-ip-addr-avail-profile default
(host) [md] (ANQP IP Address Availability Profile "default") #ipv4-addr-avail public
(host) [md] (ANQP IP Address Availability Profile "default") #ipv6-addr-avail not-available
```

Command History

   eap-chap|non-eap-mschap|non-eap-mschapv2|non-eap-pap|non-eap-rsvd|reserved|tun-cred-
   anon|tun-cred-cert|tun-cred-hw-token|tun-cred-nfc|tun-cred-rsvd|tun-cred-sim|tun-cred-soft-
   token|tun-cred-user-pass|tun-cred-usim|tun-cred-vendor-spec}
   nai-realm-eap-method crypto-card|eap-aka|eap-sim|eap-tls|eap-ttls|generic-token-
     card|identity|notification|one-time-password|peap|peap-mschapv2
   nai-realm-encoding <nai-realm-encoding>
   nai-realm-name <nai-realm-name>
   no
```

Description

This command defines a Network Access Identifier (NAI) realm whose information can be sent as an Access network Query Protocol (ANQP) information element in a Generic Advertisement Service (GAS) query response.

Syntax

Parameter	Description
`<profile-name>`	Name of the ANQP NAI realm profile.
`clone <source>`	Copies an existing NAI Realm profile.
`nai-home-realm`	Marks the realm in this profile as the NAI Home Realm.
`nai-realm-auth-id-1|nai-realm-auth-id-2`	Use the **nai-realm-auth-id-1** command to send the one of the following authentication methods for the primary NAI realm ID. Use the **nai-realm-auth-id-2** command to send the one of the following authentication methods for the secondary NAI realm ID.
`credential-type`	The specified authentication ID uses credential authentication.
`expanded-eap`	The specified authentication ID uses the expanded EAP authentication method.
`expanded-inner-eap`	The specified authentication ID uses the expanded inner EAP authentication method.
`inner-auth-eap`	The specified authentication ID uses inner EAP authentication type.

Parameter	Description
non-eap-inner-auth	The specified authentication ID uses non-EAP inner authentication type.
reserved	The specified authentication ID uses Reserved authentication type.
tunneled-eap-credential-type	The specified authentication ID uses the tunneled EAP credential type.
nai-realm-auth-value-1|nai-realm-auth-value-2	Use the **nai-ream-auth-value-1** command to select an authentication value for the authentication method specified by **nai-realm-auth-id-1**. Use the **nai-ream-auth-value-2** command to select the authentication value for the authentication method specified by **nai-realm-auth-id-2**.
cred-cert	Credential - Certificate.
cred-hw-token	Credential - Hardware Token.
cred-nfc	Credential - NFC.
cred-none	Credential - None.
cred-rsvd	Credential - Reserved.
cred-sim	Credential - SIM.
cred-soft-token	Credential - Soft Token.
cred-user-pass	Credential - Username and password.
cred-usim	Credential - USIM.
cred-vendor-spec	Credential - Vendor-specific.
eap-crypto-card	EAP Method - Crypto-card.
eap-generic-token-card	EAP Method - Generic-Token-Card.
eap-identity	EAP Method - Identity.
eap-method-aka	EAP Method - AKA.
eap-method-sim	EAP Method - SIM - GSM Subscriber Iden.
eap-method-tls	EAP Method - TLS - Transport Layer Sec.
eap-method-ttls	EAP Method - TTLS - Tunneled Transport Security.
eap-notification	EAP Method - Notification.
eap-one-time-password	EAP Method - One-Time-Password.
eap-peap	EAP Method - PEAP.
eap-peap-mschapv2	EAP Method - PEAP MSCHAP V2.

Parameter	Description
non-eap-chap	Non-EAP Method - CHAP.
non-eap-mschap	Non-EAP Method - MSCHAP.
non-eap-mschapv2	Non-EAP Method - MSCHAPv2.
non-eap-pap	Non-EAP Method - PAP.
non-eap-rsvd	Non-EAP Method - Reserved for future use.
reserved	Reserved for future use.
tun-cred-anon	Tunneled Credential - ANONYMOUS.
tun-cred-cert	Tunneled Credential - CERTIFICATE .
tun-cred-hw-token	Tunneled Credential - Hardware Token.
tun-cred-nfc	Tunneled Credential - NFC.
tun-cred-rsvd	Tunneled Credential - RESERVED.
tun-cred-sim	Tunneled Credential - SIM.
tun-cred-soft-token	Tunneled Credential - Soft Token.
tun-cred-user-pass	Tunneled Credential - USERNAME and PASSWORD.
tun-cred-usim	Tunneled Credential - USIM.
tun-cred-vendor-spec	Tunneled Credential - VENDOR SPECIFIC.
nai-realm-eap-method	Select one of the options below to identify the EAP authentication method supported by the hotspot realm.
crypto-card	Crypto card authentication
eap-aka	EAP for UMTS Authentication and Key Agreement
eap-sim	EAP for GSM Subscriber Identity Modules
eap-tls	EAP-Transport Layer Security
eap-ttls	EAP-Tunneled Transport Layer Security
generic-token-card	EAP Generic Token Card (EAP-GTC)
identity	EAP Identity type
notification	The hotspot realm uses EAP Notification messages for authentication.
one-time-password	Authentication with a single-use password.
peap	Protected Extensible Authentication Protocol

Parameter	Description
peap-mschapv2	Protected Extensible Authentication Protocol with Microsoft CHAP version 2
nai-realm-encoding <nai-realm-encoding>	Issue this command if the NAI realm named defined by nai-realm-name <nai-realm-name> is a UTF-8 formatted character string that is not formatted in accordance with IETF RFC 4282.
nai-realm-name <nai-realm-name>	Name of the NAI realm. The realm name is often the domain name of the service provider.
no	Negates or removes any existing parameter

Usage Guidelines

An AP's NAI Realm profile identifies and describes a NAI realm accessible using the AP, and the method that this NAI realm uses for authentication. These settings configured in this profile determine the NAI realm elements that are included as part of a GAS Response frame.

Values configured in this profile will not be sent to clients unless you:

1. Associate the ANQP NAI Realm profile with an ANQP advertisement profile. (`wlan hotspot advertisement profile <profile-name>anqp-nai-realm-profile <profile-name>`)
2. Associate the ANQP advertisement profile with a Hotspot profile. (`wlan hotspot h2-profileadvertisement-profile <profile-name>`)
3. Enable the hotspot feature within that Hotspot profile. (`wlan hotspot h2-profile <profile-name>hotspot-enable`)

Example

```
(host) [md] (config) #wlan hotspot anqp-nai-realm-profile home
(host) [md] (ANQP NAI Realm Profile "home") #enable
(host) [md] (ANQP NAI Realm Profile "home") #nai-realm-name corp-hotspot.com
(host) [md] (ANQP NAI Realm Profile "home") #nai-realm-auth-id-1 credential-type
(host) [md] (ANQP NAI Realm Profile "home") #nai-realm-auth-value-1 cred-cert
(host) [md] (ANQP NAI Realm Profile "home") #nai-home-realm
(host) [md] (config) #wlan hotspot anqp-nai-realm-profile non-home
(host) [md] (ANQP NAI Realm Profile "non-home") #nai-realm-name corp-hotspot-roam.com
(host) [md] (ANQP NAI Realm Profile "non-home") #nai-realm-eap-method eap-sim
(host) [md] (ANQP NAI Realm Profile "non-home") #nai-realm-auth credential-type
```

wlan hotspot anqp-nwk-auth-profile

```
wlan hotspot anqp-nwk-auth-profile <profile-name>
   clone <source>
   no
   nwk-auth-type {acceptance|dns-redirection|http-https-redirection|online-enroll}
   url <url>
```

Description

This command configures an ANQP Network Authentication profile to define authentication type being used by the hotspot network.

Syntax

Parameter	Description
`<profile-name>`	Name of the ANQP network authentication profile.
`clone <source>`	Copies an existing ANQP Network Authentication profile.
`no`	Negates any existing parameter.
`nwk-auth-type`	Network authentication type being used by the hotspot network.
`acceptance`	Network requires the user to accept terms and conditions. **NOTE:** This option requires you to specify a redirection URL string as an IP address, FQDN or URL.
`dns-redirection`	Additional information on the network is provided through DNS redirection. **NOTE:** This option requires you to specify a redirection URL string as an IP address, FQDN or URL.
`http-https-redirection`	Additional information on the network is provided through HTTP or HTTPS redirection.
`online-enroll`	Network supports online enrollment.
`url <url>`	URL, IP address, or FQDN used by the hotspot network for the **acceptance** or **dns-redirection** network authentication types.

Usage Guidelines

When you enable the asra option in the WLAN hotspot profile, the settings you configure in the Network Authentication profile are sent in the GAS response to the client.

Values configured in this profile will not be sent to clients unless you:

1. Associate the ANQP Network Authentication profile an ANQP advertisement profile. (`wlan hotspot advertisement profile <profile-name> anqp-nwk-auth-profile <profile-name>`)
2. Associate the ANQP advertisement profile with a Hotspot profile. (`wlan hotspot h2-profile1advertisement-profile <profile-name>`)
3. Enable the hotspot feature within that Hotspot profile. (`wlan hotspot h2-profile <profile-name> hotspot-enable`)

Example

The following command configures the default Network Authorization profile to use DNS redirection:

```
(host) [md] (config) #wlan hotspot anqp-nwk-auth-profile defaul
(host) [md] (ANQP Network Authentication Profile "default") #nwk-auth-type dns-redirection
redirect-url http://www.example.com/redirect.html
```

wlan hotspot anqp-roam-cons-profile

```
wlan hotspot anqp-roam-cons-profile <profile-name>
   clone <source>
   no
   roam-cons oi <oi>
```

Description

This command configures the Roaming Consortium OI information to be sent in an Access network Query Protocol (ANQP) information element in a Generic Advertisement Service (GAS) query response.

Syntax

Parameter	Description
`<profile-name>`	Name of the ANQP roaming consortium profile.
`clone <source>`	Copies an existing ANQP Roaming Consortium profile.
`no`	Negates any existing parameter.
`roam-cons oi <oi>`	Sends the specified roaming consortium OI in a GAS query response. The OI must be a hexadecimal value.

Usage Guidelines

Organization Identifiers (OIs) are assigned to service providers when they register with the IEEE registration authority. The Roaming Consortium IEs contain information identifying the network and service provider, whose security credentials can then be used to authenticate with the AP transmitting this element.

Use the wlan hotspot anqp-roam-cons-profile command to define the OI for the hotspot service provider in the ANQP Roaming Consortium profile. Values configured in this profile will not be sent to clients unless you:

1. Associate the ANQP Roaming Consortium profile an ANQP advertisement profile. (`wlan hotspot advertisement profile <profile-name> anqp-roam-cons-profile <profile-name>`)
2. Associate the ANQP advertisement profile with a Hotspot profile. (`wlan hotspot h2-profile advertisement-profile <profile-name>`)
3. Enable the hotspot feature within that Hotspot profile. (`wlan hotspot h2-profile <profile-name> hotspot-enable`)

To identify additional Roaming consortium OIs used by the service provider's top three roaming partners, configure the wlan hotspot hs2-profile, wlan hotspot hs2-profile or wlan hotspot hs2-profile parameters in the Hotspot Profile.

Example

The following command defines the roaming consortium OI and OI length in the ANQP roaming consortium profile:

```
(host) [md] (config) #wlan hotspot anqp-roam-cons-profile profile1
(host) [md] (ANQP Roaming Consortium Profile "profile1") #roam-cons oi 506F9A
(host) [md] (ANQP Roaming Consortium Profile "profile1") #roam-cons-oi-len 3
```

Command History

Version	Description
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Config mode on Mobility Master.

wlan hotspot anqp-venue-name-profile

```
wlan hotspot anqp-venue-name-profile <profile-name>
   clone
   no
   venue-group {outdoor|reserved|utility-misc|vehicular|assembly|business|educational|factory-
   or-industrial|institutional|mercantile|residential|storage|unspecified|utility-
   misc|vehicular}
   venue-lang-code <venue-lang-code>
   venue-name <venue-name>
   venue-type <venue-type>
```

Description

This command defines venue information be sent in an Access network Query Protocol (ANQP) information element in a Generic Advertisement Service (GAS) query response.

Syntax

Parameter	Description
`<profile-name>`	Name of the ANQP venue profile.
`clone <source>`	Copies an existing ANQP Venue Name profile.
`no`	Negates any existing parameter.
`venue-group`	Specify one of the following venue groups to be advertised in the ANQP IEs from APs associated with this profile. The default setting is unspecified. ■ assembly ■ business ■ educational ■ factory-or-industrial ■ institutional ■ mercantile ■ outdoor ■ reserved ■ residential ■ storage ■ unspecified ■ utility-misc ■ vehicular
`venue-lang-code <venue-lang-code>`	An ISO 639 language code that identifies the language used in the Venue Name field.
`venue-name <venue-name>`	Venue name to be advertised in the ANQP IEs from APs associated with this profile. If the venue name includes spaces, the name must be enclosed in quotation marks, e.g. “Midtown Shopping Center”.
`venue-type <venue-type>`	Specify a venue type to be advertised in the IEs from APs associated with this hotspot profile. The complete list of supported venue types is described in Venue Types on page 2875.

Usage Guidelines

Use this command to configure the venue group and venue type in an ANQP Venue Name profile. If a client uses the Generic Advertisement Service (GAS) to post an ANQP query to an Access Point, the AP will return ANQP Information Elements with the values configured in this profile.

Values configured in this profile will not be sent to clients unless you:

1. Associate the ANQP Venue Name profile with an ANQP Advertisement profile. (`wlan hotspot advertisement profile <profile-name> anqp-venue-name-profile <profile-name>`)
2. Associate the ANQP advertisement profile with a Hotspot profile. (`wlan hotspot h2-profile advertisement-profile <profile-name>`)
3. Enable the hotspot feature within that Hotspot profile. (`wlan hotspot h2-profile <profile-name> hotspot-enable`)

Venue Types

The following list describes the different venue types that may be configured in a hotspot profile:

- assembly-amphitheater
- assembly-amusement-park
- assembly-arena
- assembly-bar
- assembly-coffee-shop
- assembly-convention-center
- assembly-emer-coord-center
- assembly-library
- assembly-museum
- assembly-passenger-terminal
- assembly-restaurant
- assembly-stadium
- assembly-theater
- assembly-unspecified
- assembly-worship-place
- assembly-zoo
- business-attorney
- business-bank
- business-doctor
- business-fire-station
- business-police-station
- business-post-office
- business-professional-office
- business-research-and-development
- business-unspecified
- educational-primary-school
- educational-secondary-school
- educational-university
- educational-unspecified
- industrial-factory
- institutional-alcohol-or-drug-rehab
- institutional-group-home
- institutional-hospital
- institutional-prison
- institutional-terminal-care
- institutional-unspecified
- mercantile-automotive-service-station
- mercantile-gas-station
- mercantile-grocery
- mercantile-retail
- mercantile-shopping-mall
- merchantile unspecified
- outdoor-bus-stop
- outdoor-city-park
- outdoor-kiosk
- outdoor-muni-mesh-nwk
- outdoor-rest-area
- outdoor-traffic-control
- outdoor-unspecified
- residential-boarding-house
- residential-dormitory
- residential-hotel
- residential-private-residence
- residential-unspecified
- unspecified
- vehicular-airplane
- vehicular-automobile
- vehicular-bus
- vehicular-ferry
- vehicular-motor-bike
- vehicular-ship
- vehicular-train
- vehicular-unspecified

Example

The following command defines an ANQP Venue Name profile for a shopping mall:

```
(host) [md] (config) #wlan hotspot anqp-venue-name-profile Mallprofile1
(host) [md] (ANQP Venue Name Profile "Mallprofile1") #venue-group mercantile
(host) [md] (ANQP Venue Name Profile "Mallprofile1") #venue-name Westgate Shopping Center
(host) [md] (ANQP Venue Name Profile "Mallprofile1") #venue-type mercantile-shopping-mall
```

Command History

Version	Description
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode

wlan hotspot h2qp-conn-capability-profile

```
wlan hotspot h2qp-conn-capability-profile <profile-name>
   clone <source>
   esp
   icmp
   no
   tcp-ftp
   tcp-http
   tcp-pptp-vpn
   tcp-ssh
   tcp-tls-vpn
   tcp-voip
   udp-ike2-4500
   udp-ike2-500
   udp-voip
```

Description

This command defines an H2QP profile that advertises hotspot protocol and port capabilities.

Syntax

Parameter	Description
`<profile-name>`	Name of the H2QP connection capability profile.
`clone <source>`	Copies an existing hotspot connection capability profile.
`esp`	Include this parameter to enable the Encapsulating Security Payload (ESP) port used by IPsec VPNs. (port 0)
`icmp`	Indicates that the ICMP port is enabled and available. (port 0)
`no`	Negates any existing parameter, returning it to its default disabled value.
`tcp-ftp`	Include this parameter to enable the FTP port. (port 20)
`tcp-http`	Include this parameter to enable the HTTP port. (port 80)
`tcp-pptp-vpn`	Include this parameter to enable the PPTP port used by IPsec VPNs. (port 1723)
`tcp-ssh`	Include this parameter to enable the SSH port. (port 22)
`tcp-tls-vpn`	Include this parameter to enable the TCP TLS port used by VPNs. (port 80)
`tcp-voip`	Include this parameter to enable the TCP VoIP port. (port 5060)
`udp-ike2-4500`	Include this parameter to enable the IKEv2. (port 4500)
`udp-ike2-500`	Include this parameter to enable the IKEv2. (port 500)
`udp-voip`	Include this parameter to enable the UDP VoIP port. (port 5060)

Usage Guidelines

The values configured in this profile can be sent in an ANQP IE to provide hotspot clients information about the IP protocols and associated port numbers that are available and open for communication.

Values configured in this profile will not be sent to clients unless you:

1. Associate the H2QP profile with an ANQP advertisement profile. (`wlan hotspot advertisement profile <profile-name> h2qp-conn-cap-profile <profile-name>`)
2. Associate the ANQP advertisement profile with a Hotspot profile. (`wlan hotspot h2-profile advertisement-profile <profile-name>`)
3. Enable the hotspot feature within that Hotspot profile. (`wlan hotspot h2-profile <profile-name> hotspot-enable`)

Example

The following example allows the H2QP connection capability profile to advertise the availability of ICMP, HTTP, and VOIP ports:

```
(host) [md] (config) #wlan hotspot h2qp-conn-capability-profile Wan1
(host) [md] (H2QP Connection Capability Profile "Wan1") #icmp
(host) [md] (H2QP Connection Capability Profile "Wan1") #http
(host) [md] (H2QP Connection Capability Profile "Wan1") # voip
(host) [md] (H2QP Connection Capability Profile "Wan1") #enable
```

wlan hotspot h2qp-op-cl-profile

```
wlan hotspot h2qp-op-cl-profile <profile-name>
   clone <source>
   no
   op-cl <op-cl>
```

Description

This command defines an H2QP profile that defines the Operating Class to be sent in the ANQP IE.

Syntax

Parameter	Description
`<profile-name>`	Name of the H2QP operating class indication profile.
`clone <source>`	Copies an existing hotspot operating class profile.
`no`	Negates any existing parameter, returning it to its default disabled value.
`op-cl <op-cl>`	Configures the operating class for the devices' BSS. The supported range for this field is 1-255, and the default value is 1.

Usage Guidelines

The values configured in this H2QP Operating Class profile define the channels on which the hotspot is capable of operating. It may be useful where, for instance, a mobile device discovers a hotspot in the 2.4 GHz band but finds it is dual-band and prefers the 5 GHz band. For a definition of these global operating classes, refer to Table E-4 of IEEE Std 802.11-2012, Annex E.

Values configured in this profile will not be sent to clients unless you:

1. Associate the H2QP profile with an ANQP advertisement profile. (`wlan hotspot advertisement profile <profile-name> h2qp-op-cl-profile <profile-name>`)
2. Associate the ANQP advertisement profile with a Hotspot profile. (`wlan hotspot h2-profile advertisement-profile <profile-name>`)
3. Enable the hotspot feature within that Hotspot profile. (`wlan hotspot h2-profile <profile-name> hotspot-enable`)

Example

The following example configures and enables a profile with the default operating class value:

```
(host) [md] (config) #wlan hotspot h2qp-op-cl-profile profile1
(host) [md] (H2QP Operating Class Indication Profile "profile1") #op-cl 1
(host) [md] (H2QP Operating Class Indication Profile "profile1") #enable
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

wlan hotspot h2qp-operator-friendly-name-profile

```
wlan hotspot h2qp-operator-friendly-name-profile <profile-name>
   clone <source>
   no
   op-fr-name <op-fr-name>
   op-fr-name-hex <op-fr-name-hex>
   op-lang-code <op-lang-code>
```

Description

This command defines an H2QP operator-friendly name profile.

Syntax

Parameter	Description
`<profile-name>`	H2QP operator friendly name profile.
`clone <source>`	Copies an existing operator-friendly name profile.
`no`	Negates any existing parameter.
`op-fr-name <op-fr-name>`	An operator-friendly name sent by devices using this profile. The name can be up to 64 alphanumeric characters, and can include special characters and spaces. If the name includes quotation marks (“), you must include a backslash character (\) before each quotation mark. (e.g. \"example\")
`op-fr-name-hex <op-fr-name-hex>`	Operator Friendly Name in HEX.
`op-lang-code <op-lang-code>`	An ISO 639 language code that identifies the language used in the op-fr-name field.

Usage Guidelines

The operator-friendly name configured in this profile is a free-form text field that can identify the operator and also something about the location.

Values configured in this profile will not be sent to clients unless you:

1. Associate the H2QP operator-friendly name profile with an ANQP advertisement profile. (`wlan hotspot advertisement profile <profile-name>h2qp-operator-friendly-profile <profile-name>`)
2. Associate the ANQP advertisement profile with a Hotspot profile. (`wlan hotspot h2-profile advertisement-profile <profile-name>`)
3. Enable the hotspot feature within that Hotspot profile. (`wlan hotspot h2-profile <profile-name>hotspot-enable`)

Example

The example below shows that the managed device has two configured operator friendly name profiles. The **References** column lists the number of other profiles with references to the operator friendly name profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host) [md] (config) #wlan hotspot h2qp-operator-friendly-name-profile profile1
(host) [md] (H2QP Operator Friendly Name Profile "profile1") #op-fr-name my_hotspot
```

```
(host) [md] (H2QP Operator Friendly Name Profile "profile1") #op-lang-code <op-lang-code>
```

wlan hotspot h2qp-wan-metrics-profile

```
wlan hotspot h2qp-wan-metrics-profile <profile-name>
   at-capacity
   clone <source>
   downlink-load
   downlink-speed
   load-dur
   no
   symm-link
   uplink-load
   uplink-speed
   wan-metrics-link-status link_down|link_test|link_up|reserved
```

Description

This command creates an H2QP profile that specifies the hotspot WAN status and link metrics.

Syntax

Parameter	Description	Range	Default
`<profile-name>`	Name of the H2QP WAN metrics profile.	—	—
`at_capacity`	Use the **at_capacity** parameter to indicate that the WAN Link has reached its maximum capacity. If this parameter is enabled, no additional mobile devices will be permitted to associate with the hotspot AP.	enable disable	disabled
`clone <source>`	Copies an existing H2QP profile.	—	—
`downlink-load <load>`	The percentage of the WAN downlink that is currently utilized. If no value is set, this parameter will show a default value of 0 to indicate that the downlink speed is unknown or unspecified.	1-100	0 (unspecified)
`downlink-speed <speed>`	Use the `downlink_speed <speed>` parameter to indicate the current WAN backhaul downlink speed in Kbps. If no value is set, this parameter will show a default value of 0 to indicate that the downlink speed is unknown or unspecified.	0 - 2,147,483,647 Kbps	0 (unspecified)
`load-dur <load_dur>`	Duration over which the downlink load is measured, in tenths of a second.	0 and 65535	0 (unspecified)
`no`	Negates any existing parameter	—	—
symm-link	Use the **symn_link** parameter to indicate that the WAN Link has same speed in both the uplink and downlink directions.	enabled disabled	disabled

Parameter	Description	Range	Default
uplink-load <speed>	The percentage of the WAN uplink that is currently utilized. If no value is set, this parameter will show a default value of 0 to indicate that the downlink speed is unknown or unspecified.	1-100	0 (unspecified)
`uplink-speed <speed>`	Use the **uplink <speed>** parameter to indicate the current WAN backhaul uplink speed in Kbps. If no value is set, this parameter will show a default value of 0 to indicate that the uplink speed is unknown or unspecified.	0 - 2,147,483,647 kbps	0 (unspecified)
`wan-metrics-link-status`	Define the status of the WAN Link by configuring one of the following values. The default link status is **reserved**, which indicates that the link status is unknown or unspecified.	■ link_down ■ link_test ■ link_up ■ reserved	reserved
`link_down`	WAN link is down.	—	—
`link_test`	WAN link is currently in a test state.	—	—
`link_up`	WAN link is up.	—	—
`reserved`	This parameter is reserved by the Hotspot 2.0 specification, and cannot be configured. This is the default link status.	—	—

Usage Guidelines

The values configured in this profile can be sent in an ANQP IE to provide hotspot clients information about access network characteristics such as link status and the capacity and speed of the WAN link to the Internet.Issue this command without the **<profile-name>** parameter to display the entire WAN metrics profile list, including profile status and the number of references to each profile. Include a profile name to display detailed configuration information for that profile.

Examples

The example below shows that three WAN metrics profiles are configured. The **References** column lists the number of other profiles with references to the operator-friendly name profile, and the **Profile Status** column indicates whether the profile is predefined. User-defined profiles will not have an entry in the **Profile Status** column.

```
(host) [md] #show wlan hotspot h2qp-wan-metrics-profile
H2QP WAN Metrics Profile List
-----------------------------
Name          References  Profile Status
----          ----------  --------------
default       0
WanFastlink

Total:1
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config mode on Mobility Master.

wlan hotspot hs2-profile

```
wlan hotspot hs2-profile <profile-name>
   access-network-type {emergency-services|personal-device|private|private-guest|public-
   chargeable|public-free|test|wildcard}
   advertisement-profile <profile-name>
   advertisement-protocol {anqp|eas|mih-cmd-event|mih-info|rsvd}
   asra
   clone <source>
   comeback-mode
   gas-comeback-delay <gas-comeback-delay>
   grp-frame-block
   hessid <hessid>
   hotspot-enable
   hotspot-roam-cons-1
   hotspot-roam-cons-2
   hotspot-roam-cons-3
   internet
   no
   p2p-cross-connect
   p2p-dev-mgmt
   pame-bi
   query-response-length-limit <query-response-length-limit>
   radius-cui
   radius-loc-data
   release-number {release-1|release-2|reserved}
   time-advt-cap {no-std-ext-timesrc|timestamp-offset-utc|reserved}
   time-error <milliseconds>
   time-zone <time-zone>
   venue-group <venue-group>
   venue-type <venue-type>
```

Description

This command configures a hotspot profile for an 802.11u public access service provider.

Syntax

Parameter	Description
`<profile-name>`	Name of the hotspot profile.
`access-network-type`	Specifies the 802.11u network type. The default setting is **public-chargeable.** ■ **emergency-services**: emergency services only network ■ **personal-device**: personal device network ■ **private**: private network ■ **private-guest**: private network with guest access ■ **public-chargeable**: public chargeable network ■ **public-free**: free public network ■ **test**: test network ■ **wildcard**: wildcard network
`advertisement-profile <profile-name>`	Advertisement profile associated with this hotspot profile. If this parameter is not changed, the hotspot profile uses with the **default** advertisement profile.

Parameter	Description
`advertisement-protocol`	Select one of the following advertisement protocol types to be used by the AP. ■ **anqp** ■ **emergency**: Emergency Alert System ■ **mih-cmd-event**: Media Independent Handover Command and Event Services Capability Discovery ■ **mih-info**: Media Independent Handover Information Service. This option allows handovers between differing kinds of wireless access protocols and technologies, allowing access points on different IP subnets to communicate with each other at the link level while maintaining session continuity. ■ **rsvd**: Reserved for future use.
`asra`	Issue the Additional Steps Required for Access (ASRA) sub command if any additional steps are required for network access. If this parameter is enabled, the AP will send the following IEs in response to the client's ANQP query. ■ Venue Name ■ Domain Name List ■ Network Authentication Type ■ Roaming Consortium List ■ NAI Realm List **NOTE:** If ASRA is enabled, the advertisement profile for this hotspot must reference an enabled network authentication type profile. For more information on enabling an network authentication type profile, see wlan hotspot anqp-nwk-auth-profile on page 2870.
`clone <source>`	Makes a copy of an existing hotspot profile.
`comeback-mode`	By default, ANQP information is obtained from a GAS Request and Response. If you enable the comeback-mode option, advertisement information is obtained using a GAS Request and Response. as well as a Comeback-Request and Comeback-Response. This option is disabled by default.
`gas-comeback-delay <gas-comeback-delay>`	At the end of the GAS comeback delay interval, the client may attempt to retrieve the query response using a Comeback Request Action frame. The supported range is 100-2000 milliseconds, and the default value is 500 milliseconds.
`grp-frame-block`	This option configures the Downstream Group Addressed Forwarding Disabled Mode. If this feature is enabled, it ensures that the AP does not forward downstream group-addressed frames. It is disabled by default, allowing the AP to forward downstram group-addressed frames.
`hessid <hessid>`	This optional parameter devices an AP's homogenous ESS identifier, which is that device's MAC address in colon-separated hexadecimal format.
`hotspot-enable`	Enables or disables the hotspot. When this feature is enabled, the Information Elements (IEs) for this hotspot are included in beacons and probe responses from the AP. This setting is disabled by default.
`hotspot-roam-cons-1`	Roaming Consortium entry 1 OI value and length.

Parameter	Description
`hotspot-roam-cons-2`	Roaming Consortium entry 2 OI value and length.
`hotspot-roam-cons-3`	Roaming Consortium entry 3 OI value and length.
`internet`	If you issue the **internet** parameter, the AP sends an IE indicating that the network allows internet access. By default, a hotspot profile does not advertise network internet access.
`no`	Negates or removes any configured parameter.
`p2p-cross-connect`	Issue this command to advertise support for P2P Cross Connections. This setting is disabled by default.
`p2p-dev-mgmt`	Issue this command to advertise support for P2P device management. This setting is disabled by default.
`pame-bi`	This option enables the Pre-Association Message Exchange BSSID Independent (PAME-BI) bit, which is used by an AP to indicate whether the AP indicates that the Advertisement Server can return a query response that is independent of the BSSID used for the GAS Frame exchange.
`query-response-length-limit <query-response-length-limit>`	GAS enables advertisement services that lets clients query multiple 802.11 neworks at once, while also allowing the client to learn more about a network's 802.11 infrastructure before associating. If a client transmits a GAS Query using a GAS Initial Request frame, the responding AP will provide the query response (or information on how to receive the query response) in a GAS Initial Response frame. This parameter sets the maximum length of the GAS query response, in octets. The supported range is 1-255 octets.
`radius-cui`	Include this parameter to enable the Chargeable-User-Identity RADIUS attribute defined by RFC 4372. Home networks can use this attribute to identify a user for the roaming transactions that take place outside of that home network.
`radius-loc-data`	Include this parameter to enable the Location Data RADIUS attribute defined by RFC 5580. Enabling this parameter allows the RADIUS server to use location data.
`release number`	Hotspot 2.0 Release Number: ■ Release #1 ■ Release #2 ■ Reserved

`time-advt-cap`
`no-std-ext-timesrc`
`timestamp-offset-utc`
`reserved`
	This parameter specifies the AP's source of external time, and the current condition of its timing estimator.
	■ **no-std-ext-time-src**: The AP using this profile has no standardized external time source.
	■ **timestamp-offset-utc**: The AP has a timestamp offset based on UTC.
	■ **reserved**: This setting is reserved for future use, and should not be used.

Parameter	Description
`time-error`	The standard deviation of error in time value estimate, in milliseconds. The default value is 0 milliseconds, and the supported range is 0- 2,147,483,647 milliseconds.
`time-zone`	The time zone in which the AP is operating, in the format `<std><offset>[dst[offset][,start[/time],end [/time]]` Where the <std> string specifies the abbreviation of the time zone, **<dst>** is the abbreviation of the timezone in daylight savings time, and the **<offset>** string specifies the time value you must add to the local time to arrive at UTC. **NOTE:** For complete details on configuring the timezone format, refer to section 8.3 of IEEE Std 1003.1, 2004 Edition.
`venue-group <venue-group>`	Specify one of the following venue groups to be advertised in the IEs from APs associated with this hotspot profile. The default setting is **unspecified**. ■ assembly ■ business ■ educational ■ factory-or-industrial ■ institutional ■ mercantile ■ outdoor ■ reserved ■ residential ■ storage ■ unspecified ■ utility-misc ■ vehicular **NOTE:** This parameter only defines the venue group advertised in the IEs from hotspot APs. To define the venue group to be included in ANQP responses, use anqp-venue-name-profile <profile-name>.
`venue-type <venue-type>`	Specify a venue type to be advertised in the IEs from APs associated with this hotspot profile. The complete list of supported venue types is described in Venue Types on page 2890 **NOTE:** This parameter only defines the venue type advertised in the IEs from hotspot APs. To define the venue type to be included in ANQP responses, use anqp-venue-name-profile <profile-name>.

Usage Guidelines

Hotspot 2.0 is a WFA specification based upon the 802.11u protocol that provides wireless clients with a streamlined mechanism to discover and authenticate to suitable networks, and allows mobile users the ability to roam between partner networks without additional authentication.

Mobility Master supports Hotspot 2.0 with enhanced network discovery and selection. Clients can receive general information about the network identity, venue and type via management frames from the Alcatel-Lucent AP. Clients can also query APs for information about the network's available IP address type (IPv4 or IPv6), roaming partners, and supported authentication methods, and receive that information in Information Elements from the AP.

Generic Advertisement Service Queries

An Organization Identifier is a unique identifier assigned to a service provider when it registers with the IEEE registration authority. An AP can include its service provider OI in beacons and probe responses to clients. If a client recognizes an AP's OI, it will attempt to associate to that AP using the security credentials corresponding to that service provider.

If the client does *not* recognize the AP's OI, that client can send a GAS query to the AP to request more information more about the network before associating.

ANQP Information Elements

ANQP IEs are additional data that can be sent from the AP to the client to identify the AP's network and service provider. If a client requests this information via a GAS query, the hotspot AP then sends the ANQP Capability list in the GAS Initial Response frame indicating support for the following IEs:

- **Venue Name**: defined using the wlan hotspot anqp-venue-name-profile command.
- **Domain Name**: defined using the wlan hotspot anqp-domain-name-profile command.
- **Network Authentication Type**: defined using the wlan hotspot anqp-nwk-auth-profile command.
- **Roaming Consortium List**: defined using the wlan hotspot anqp-roam-cons-profile command.
- **NAI Realm**: defined using the wlan hotspot anqp-nai-realm-profile command.
- **Cellular Network Data**: defined using the wlan hotspot anqp-3gpp-nwk-profile command.
- **Connection Capability**: defined using the wlan hotspot h2qp-conn-capability-profile command.
- **Operator Class**: defined using the wlan hotspot h2qp-op-cl-profile command.
- **Operator Friendly Name**: defined using the wlan hotspot h2qp-operator-friendly-name-profile command.
- **WAN Metrics**: defined using the wlan hotspot h2qp-wan-metrics-profile.

Roaming Consortium OIs

Organization Identifiers (OIs) are assigned to service providers when they register with the IEEE registration authority. You can specify the OI for the hotspot's service provider in the ANQP Roaming Consortium profile using the wlan hotspot anqp-roam-cons-profile command. This Hotspot profile also allows you to define and send up to three additional roaming consortium OIs for the service provider's top three roaming partners. To send this additional data to clients, you must specify the number of roaming consortium elements a client can query using the **addtl-roam-cons-ois <1-3>** parameter, then define those elements using the following parameters:

- **roam-cons-oi-1** and **roam-cons-len 1**
- **roam-cons-oi-2** and **roam-cons-len 2**
- **roam-cons-oi-3** and **roam-cons-len 3**

The configurable values for each additional OI include the Organization Identifier itself, the OI length, and the venue group and venue type associated with those OIs.

Venue Types

The following list describes the different venue types that may be configured in a hotspot profile:

▪ assembly-amphitheatre ▪ assembly-amusement-park	▪ business-fire-station ▪ business-police-station ▪ business-post-office	▪ mercantile-shopping-mall ▪ outdoor-bus-stop ▪ outdoor-city-park

■ assembly-arena ■ assembly-bar ■ assembly-coffee-shop ■ assembly-convention-center ■ assembly-emer-coord-center ■ assembly-library ■ assembly-musuem ■ assembly-passenger-terminal ■ assembly-restaurant ■ assembly-stadium ■ assembly-theater ■ assembly-worship-place ■ assembly-zoo ■ business-attorney ■ business-bank ■ business-doctor	■ business-professional-office ■ business-research-and-development ■ educational-primary-school ■ educational-secondary-school ■ educational-university ■ industrial-factory ■ institutional-alcohol-or-drug-rehab ■ institutional-group-home ■ institutional-hospital ■ institutional-prison ■ institutional-terminal-care ■ mercantile-automotive-service-station ■ mercantile-gas-station ■ mercantile-grocery ■ mercantile-retail	■ outdoor-kiosk ■ outdoor-muni-mesh-nwk ■ outdoor-rest-area ■ outdoor-traffic-control ■ residential-boarding-house ■ residential-dormitory ■ residential-hotel ■ residential-private-residence ■ unspecified ■ vehicular-airplane ■ vehicular-automobile ■ vehicular-bus ■ vehicular-ferry ■ vehicular-motor-bike ■ vehicular-ship ■ vehicular-train

Example

The following command configures a hotspot profile with one additional roaming consortium OI for the service provider's top roaming partner:

```
(host) [md] (config) #wlan hotspot hs2-profile profile2
(host) [md] (Hotspot 2.0 Profile "profile2") #venue-group mercantile(host) [md] (Hotspot 2.0
Profile "profile2") #venue-type mercantile-shopping-mall
(host) [md] (Hotspot 2.0 Profile "profile2") #addtl-roam-cons-ois
(host) [md] (Hotspot 2.0 Profile "profile2") #roam-cons-len 3
(host) [md] (Hotspot 2.0 Profile "profile2") #roam-cons-oi1 415B8C
{host) [md] (Hotspot 2.0 Profile "profile2") #hotspot-enable
```

Related Commands

Use the following commands to configure the Hotspot feature:

Command	Description
wlan hotspot anqp-3gpp-nwk-profile	This profile defines information for a 3GPP Cellular Network for hotspots that have roaming relationships with cellular operators
wlan hotspot anqp-domain-name-profile	This command defines the domain name to be sent in an ANQP information element in a GAS query response.
wlan hotspot anqp-ip-addr-avail-profile	This command defines available IP address types to be sent in an ANQP information element in a GAS query response.

Command	Description
wlan hotspot anqp-nai-realm-profile	This command defines a Network Access Identifier realm whose information can be sent as an ANQP information element in a GAS query response
wlan hotspot anqp-nwk-auth-profile	This command configures an ANQP Network Authentication profile to define authentication type being used by the hotspot network.
wlan hotspot anqp-roam-cons-profile	This command configures the Roaming Consortium OI information to be sent in an ANQP information element in a GAS query response
wlan hotspot anqp-venue-name-profile	This command defines venue information be sent in an ANQP information element in a GAS query response.
wlan hotspot h2qp-conn-capability-profile	Defines a H2QP profile that advertises hotspot protocol and port capabilities.
wlan hotspot h2qp-op-cl-profile	Defines a H2QP profile that defines the Operating Class to be sent in the ANQP IE.
wlan hotspot h2qp-operator-friendly-name-profile	Defines a H2QP operator-friendly name profile.
wlan hotspot h2qp-wan-metrics-profile	Creates a H2QP profile that specifies the hotspot WAN status and link metrics.

Description

This command configures a high-throughput SSID profile.

Syntax

Parameter	Description	Range	Default
`<profile-name>`	Name of this instance of the profile. The name must be 1-63 characters.	—	“default”
`40MHz-enable`	Enables or disables the use of this high-throughput SSID in 40 MHz mode.	—	enabled
`80MHz-enable`	Enables or disables the use of 80 MHz channels on VHT APs.	—	enabled
`ba-amsdu-enable`	Enables or disables Receive AMSDU in Block ACK (BA) negotiation. If enabled, AP denies clients from sending AMSDU using BA agreement.	—	enabled

Parameter	Description	Range	Default
clone	Name of an existing high-throughput SSID profile from which parameter values are copied.	—	—
high-throughput-enable	Enables or disables high-throughput SSID to allow high-throughput (802.11n) stations to associate. Enabling high-throughput in an ht-ssid-profile enables WMM base features for the associated SSID.	—	enabled
ldpc	If enabled, the AP will advertise LDPC support. LDPC improves data transmission over radio channels with high levels of background noise.	—	enabled
legacy-stations	Controls whether or not legacy (non-HT) stations are allowed to associate with this SSID. By default, legacy stations are allowed to associate. This setting has no effect on a BSS in which HT support is not available.	—	enabled
max-rx-a-mpdu-size	Controls the maximum size, in bytes, of an A-MPDU that can be received on this high-throughput SSID.	8191 16383 32767 65535	65535
8191	Maximum size of 8191 bytes.	—	—
16383	Maximum size of 16383 bytes.	—	—
32767	Maximum size of 32767 bytes.	—	—
65535	Maximum size of 65535 bytes.	—	—
max-tx-a-mpdu-size	Controls the maximum size, in bytes, of an A-MPDU that can be sent on this high-throughput SSID.	1576-65535	65535
max-tx-a-masdu-count-be	Sets the maximum number of MSDUs in a TX A-MSDU on best effort AC. **NOTE:** In tunnel and decrypt-tunnel forwarding mode, TX A-MSDU is disabled if the value is set to 0. If the value is set to non-zero, TX A-MSDU is enabled and set to this value.	0-15	2
max-tx-a-masdu-count-bk	Sets the maximum number of MSDUs in a TX A-MSDU on background AC. **NOTE:** TX A-MSDU is disabled if the value is set to 0. In decrypt-tunnel forwarding mode, TX A-MSDU on background AC is disabled and assigning any value has no effect.	0-15	2
max-tx-a-masdu-count-vi	Sets the maximum number of MSDUs in a TX A-MSDU on video AC. **NOTE:** TX A-MSDU is disabled if the value is set to 0. In decrypt-tunnel forwarding mode, TX A-MSDU on video AC is disabled and	0-15	2

Parameter	Description	Range	Default
	assigning any value has no effect.		
`max-tx-a-masdu-count-vo`	Sets the maximum number of MSDUs in a TX A-MSDU on voice AC. **NOTE:** TX A-MSDU is disabled if the value is set to 0. In decrypt-tunnel forwarding mode, TX A-MSDU on voice AC is disabled and assigning any value has no effect.	0-15	0
`max-vht-mpdu-size`	Maximum size of a VHT MPDU.	3895, 7991, or 11454 bytes	11454 bytes
`min-mpdu-start-spacing`	Minimum time between the start of adjacent MDPUs within an aggregate MDPU in microseconds.	0, .25, .5, 1, 2,4, 8,16	0
`0`	No restriction on MDPU start spacing.	—	—
`.25`	Minimum time of .25 µsec.	—	—
`.5`	Minimum time of .5 µsec.	—	—
`1`	Minimum time of 1 µsec.	—	—
`2`	Minimum time of 2 µsec.	—	—
`4`	Minimum time of 4 µsec.	—	—
`8`	Minimum time of 8 µsec.	—	—
`16`	Minimum time of 16 µsec.	—	—
`mpdu-agg`	Enables or disables MAC protocol data unit (MDPU) aggregation. High-throughput APs are able to send aggregated MDPUs, which allow an AP to receive a single block acknowledgment instead of multiple ACK signals. This option, which is enabled by default, reduces network traffic overhead by effectively eliminating the need to initiate a new transfer for every MPDU.	—	enabled
`no`	Negates any configured parameter.	—	—
`short-guard-intvl-20MHz`	Enables or disables use of short guard interval (400 ns) in 20 MHz mode.	—	enabled

Parameter	Description	Range	Default
	A guard interval is a period of time between transmissions that allows reflections from the previous data transmission to settle before an AP transmits data again. An AP identifies any signal content received inside this interval as unwanted inter-symbol interference, and rejects that data. The 802.11n standard specifies two guard intervals: 400 ns (short) and 800 ns (long). Enabling a short guard interval can decrease network overhead by reducing unnecessary idle time on each AP. Some outdoor deployments, may, however require a longer guard interval. If the short guard interval does not allow enough time for reflections to settle in your mesh deployment, inter-symbol interference values may increase and degrade throughput.		
`short-guard-intvl-40MHz`	Enables or disables use of short guard interval (400 ns) in 40 MHz mode of operation.	—	enabled
`short-guard-intvl-80MHz`	Enables or disables use of short guard interval (400 ns) in 80 MHz mode of operation.	—	enabled
`stbc-rx-streams`	Control the maximum number of spatial streams usable for STBC reception. 0 disables STBC reception, 1 uses STBC for MCS 0-7. Higher MCS values are not supported. (Supported on the OAW-AP105, OAW-AP130 Series, and OAW-AP 170 Series only. The configured value will be adjusted based on AP capabilities.) **NOTE:** If transmit beamforming is enabled, STBC will be disabled for beamformed frames.	0-1	1
`stbc-tx-streams`	Control the maximum number of spatial streams usable for STBC transmission. 0 disables STBC transmission, 1 uses STBC for MCS 0-7. Higher MCS values are not supported. (Supported on OAW-AP105, OAW-AP130 Series, and OAW-AP 170 Series only. The configured value will be adjusted based on AP capabilities.) **NOTE:** If transmit beamforming is enabled, STBC will be disabled for beamformed frames.	0-1	1
`supported-mcs-set`	A list of MCS values or ranges of values to be supported on this SSID. The MCS you choose determines the channel width (20 MHz vs. 40 MHz vs. 80 MHz) and the number of spatial streams used by the mesh node. To specify a smaller range of values, enter a hyphen between the lower and upper values. To specify a series of different values, separate each value with a comma.	0-31	0-31

Parameter	Description	Range	Default
	Examples: 2–10 1,3,6,9,12 MCS value of 16-23 are supported on OAW-AP130 Series/OAW-RAP155/11ac APs only. MCS value of 24-31 are supported on OAW-AP320 Series APs only.		
`temporal-diversity`	Enable or disable temporal diversity. When this setting is enabled and the client is not responding to 802.11 packets, the AP will launch two hardware retries; if the hardware retries are not successful then it attempts software retries.	—	disabled
`very-high-throughput-enable`	Enable or disable support for VHT (802.11ac) on the SSID.	—	enabled
`vht-mu-txbf-enable`	Enable or disable VHT Multi-User Transmit Beamforming. If this parameter is disabled, all other Multi-User Transmit Beamforming configuration parameters have no effect. **NOTE:** This parameter is applicable for OAW-AP320 Series APs only.	—	enabled
`vht-supported-mcs-map`	Comma separated list of maximum supported MCS for spatial streams 1 through 4. Valid values for maximum MCS are 7, 8, 9, and '-' (if spatial stream is not supported). Maximum MCS of a spatial stream cannot be higher than the previous streams. If an MCS is not valid for a particular combination of bandwidth and number of spatial streams, it will not be used for Tx and Rx.	7, 8, 9, or -	9,9,9,9
`vht-txbf-explicit-enable`	Enable or disable VHT Explicit Transmit Beamforming for the 802.11ac-capable APs. When this feature is enabled, the AP requests information about the MIMO channel and uses that information to transmit data over multiple transmit streams using a calculated steering matrix. The result is higher throughput due to improved signal at the beamformee (the receiving client). If this parameter is disabled, all other transmit beamforming settings will not take effect.	—	Enabled
`vht-txbf-sounding-interval`	Time interval in milliseconds between channel information updates between the AP and the beamformee client. **NOTE:** This is applicable for 802.11ac-capable APs only.	1-1000 msec	25 msec

Usage Guidelines

The ht-ssid profile configures the high-throughput SSID. Stations are not allowed to use HT with TKIP stand-alone encryption, although TKIP can be provided in mixed-mode BSSIDs that support HT. HT is disabled on a BSSID if the encryption mode is stand-alone TKIP or WEP.

You can also use this profile to configure explicit transmit beamforming for OAW-AP130 Series access points. When this feature is enabled, the AP coordinates the signals sent from each antenna so the signals focus on the receiver, improving radio range and performance. The OAW-AP130 Series AP can advertise transmit beamforming capabilities in beacon, probe response and association responses in the HT capabilities IE, then use the compressed or noncompressed beamforming report from clients to form a steering matrix. The AP ensures that the steering matrix stays current by updating and recalibrating the steering matrix at regular intervals.

By default, OAW-AP130 Series access points support both compressed and non-compressed steering information from clients. If you have many clients that can send only non-compressed steering reports, best practices are to retain the default settings, allowing the AP to support both types of steering reports. If all (or nearly all) of the AP's clients are capable of sending compressed steering reports, best practices are to disable non-compressed steering in the AP's HT SSID profile.

De-aggregation of MSDUs is supported with a maximum frame transmission size of 4 KBs; however, this feature is always enabled and is not configurable. Aggregation is not currently supported.

Example

The following command configures the maximum size of a received aggregate MDPU to be 8191 bytes for the high-throughput SSID named htcorpnet:

```
(host) [md] (config) #wlan ht-ssid-profile htcorpnet
(host) [md] (High-throughput SSID profile "htcorpnet") #max-rx-a-mpdu-size 8191
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms, but only operates with 802.11n-capable APs. The following parameters are supported on 802.11ac-capable APs only: ■ **80-MHz-enable** ■ **very-high-throughput-enable** ■ **vht-supported-mcs-map** ■ **vht-txbf-explicit-enable** ■ **vht-txbf-sounding-interval**	Base operating system.	Config mode on Mobility Master.

wlan rrm-ie-profile

```
wlan rrm-ie-profile <profile-name>
   bss-aac-ie
   clone
   country-ie
   enabled-capabilities-ie
   no
   pwr-constraint-ie
   qbss-load-ie
   quiet-ie
   tpc-report-ie
```

Description

This command configures a radio resource management (RRM) IE profile to define the information elements advertised by an AP with 802.11k support enabled.

Syntax

Parameter	Description
`bss-aac-ie`	The AP will advertise in beacon and probe responses the BSS Available Admission Capacity IE, which contains information about the admission capabilities for each User Priority or AC.
`clone`	Copy the settings of an existing RRM IE profile.
`country-ie`	The AP will advertise in beacon and probe responses the device's regulatory domain.
`enabled-capabilities-ie`	The AP will advertise in beacon and probe responses support for radio measurements in a device.
`no ...`	Disables the transmission of an IE in this profile.
`pwr-constraint-ie`	The AP will advertise in beacon and probe responses the regulatory maximum transmit power for that current channel.
`qbss-load-ie`	The AP will advertise in beacon and probe responses the QBSS Load IE, which contains information on the current station count, channel utilization and available admission capacity levels in the QBSS.
`quiet-ie`	The AP will advertise in beacon and probe responses the Quiet IE, which is used to silence the channel for measurement purposes. When an AP uses a quiet IE to schedule a quiet interval, stations may not transmit on that channel during the quiet interval.
`tpc-report-ie`	The AP will advertise in beacon and probe responses information about its TCP.

Usage Guidelines

AOS-W supports RRM IEs for APs with 802.11k support enabled. All IEs are sent by default.

Example

The following command prevents the AP from advertising the country IE:

```
(host) [md] (config) #wlan rrm-ie-profile default
```

```
(host) [md] (RRM IE Profile "default") #no country-ie
```

Description

This command configures an SSID profile.

Syntax

	Description	Range	Default
`<profile-name>`	Name of this instance of the profile. The name must be 1-63 characters.	—	“default”
`a-basic-rates`	List of supported 802.11a rates, in Mbps, that are advertised in beacon frames and probe responses.	6, 9, 12, 18, 24, 36, 48, 54 Mbps	6, 12, 24 Mbps
`a-beacon-rate`	Sets the beacon rate for 802.11a (use for DAS only). Using this parameter in normal operation may cause connectivity problems.	default, 6, 9, 12, 18,24,36,48,54 Mbps	minimum valid rate
`a-tx-rates`	Set of 802.11a rates at which the AP is allowed to send data. The actual transmit rate depends on what the client is able to handle, based on information sent at the time of association and on the current error or loss rate of the client.	6, 9, 12, 18, 24, 36, 48, 54 Mbps	6, 9, 12, 18, 24, 36, 48, 54 Mbps
`advertise-ap-name`	If enabled, APs that are part of this VAP will broadcast the AP Name information in the beacons frames.	—	—
`advertise-location`	If enabled, APs that are part of this VAP will broadcast their GPS coordinates in the beacons and probe response frames as part of a vendor-specific Information Element.	—	disabled
`ageout`	Time, in seconds, that a client is allowed to remain idle before being aged out.		1000 seconds
`auth-req-thresh`	The SNR threshold below which incoming authentication requests are ignored. Use this parameter instead of the local probe request threshold parameter to filter out low SNR authentication request. **NOTE:** Use this parameter with caution. Consult technical support before configuring this parameter.	0-100 dB	0 dB
`battery-boost`	Converts multicast traffic to unicast before delivery to the client, thus allowing you to set a longer DTIM interval. The longer interval keeps associated wireless clients from activating their radios for multicast indication and delivery, leaving them in power-save mode longer and thus lengthening battery life. **NOTE:** This parameter requires the PEFNG license. This parameter should not be enabled if you plan on using the Push-To-	—	disabled

	Description	Range	Default
	Talk feature for Polycom SpectraLink devices.		
`cdc-enable`	Advertizes the Cellular Data Capability (CDC) attribute of an MBO. **NOTE:** CDC can only be enabled when MBO is enabled.	—	—
`clone`	Name of an existing SSID profile from which parameter values are copied.	—	—
`deny-bcast`	When a client sends a broadcast probe request frame to search for all available SSIDs, this option controls whether or not the system responds for this SSID. When enabled, no response is sent and clients have to know the SSID in order to associate to the SSID. When disabled, a probe response frame is sent for this SSID.	—	disabled
`disable-probe-retry`	Enables or disables battery MAC level retries for probe response frames. By default this parameter is enabled, which mean that MAC level retries for probe response frames is disabled. **NOTE:** This parameter is not supported for OAW-AP200 Series, OAW-AP210 Series, OAW-AP 220 Series, OAW-AP270 Series access points.		enabled
`dot11r-profile`	Associates the dot11r-profile with the SSID profile.	—	—
`dtim-period`	Specifies the interval, in milliseconds, between the sending of DTIMs in the beacon. This is the maximum number of beacon cycles before unacknowledged network broadcasts are flushed. When using wireless clients that employ power management features to sleep, the client must revive at least once during the DTIM period to receive broadcasts.		1
`eapol-rate-opt`	Uses a more conservative rate for more reliable delivery of EAPOL frames.	—	enabled
`edca-parameters-profile`	Name of the EDCA profile that applies to this SSID. **NOTE:** This parameter requires the PEFNG license. Configure this parameter only under the guidance of your Alcatel-Lucent representative.	—	—
`ap|station`	Assigns the specified EDCA profile to AP or station (client).	—	—
`enforce-user-vlan`	Enforces data traffic only in user's assigned vlan (Open stations only).	—	—

	Description	Range	Default
essid	Name that uniquely identifies a wireless network. The ESSID can be up to 32 characters. If the ESSID includes spaces, you must enclose it in quotation marks.	—	alcatel-ap
g-basic-rates	List of supported 802.11b/g rates that are advertised in beacon frames and probe responses.	1, 2, 5, 6, 9, 11, 12, 18, 24, 36, 48, 54 Mbps	1, 2 Mbps
g-beacon-rate	Sets the beacon rate for 802.11g (use for DAS only). Using this parameter in normal operation may cause connectivity problems.	default, 1,2,5, 6 9, 11, 12, 18, 24, 36, 48, 54 Mbps	minimum valid rate
g-tx-rates	Set of 802.11b/g rates at which the AP is allowed to send data. The actual transmit rate depends on what the client is able to handle, based on information sent at the time of association and on the current error or loss rate of the client.	1, 2, 5, 6, 9, 11, 12, 18, 24, 36, 48, 54 Mbps	1, 2, 5, 6, 9, 11, 12, 18, 24, 36, 48, 54 Mbps
hide-ssid	Enables or disables hiding of the SSID name in beacon frames. Note that hiding the SSID does very little to increase security.	—	disabled
ht-ssid-profile	Name of high-throughput SSID profile to use for configuring high-throughput support. See wlan ht-ssid-profile on page 2893.	—	“default”
local-probe-req-thresh	APs will not respond to client probe requests if the SNR value in the probe request is less than the specified threshold value.	0-100 dB	0 dB
max-clients	Maximum number of wireless clients for the AP. This parameter is limited to 255 clients per radio.	0-255	64
max-retries	Maximum number of retries allowed for the AP to send a frame.	0-15	4
max-tx-fail	The AP assumes the client has left and should be deauthorized when the AP detects this number of consecutive frames were not delivered because the **max-retries** threshold was exceeded.	0 - 2,147,483,647	0
mbo-enable	Enables the Agile Multiband Operations (MBO). Enables the mfp-capable, 802.11k and 802.11u-interworking implicitly on the AP.	—	—

	Description	Range	Default
`mcast-rate-opt`	Enables or disables scanning of all active stations currently associated to an AP to select the lowest transmission rate for broadcast and multicast frames. This option only applies to broadcast and multicast data frames; 802.11 management frames are transmitted at the lowest configured rate. **NOTE:** Do not enable this parameter unless instructed to do so by your Alcatel-Lucent technical support representative.	—	disabled
`mfp-capable`	When enabled, the SSID supports management frame protection (MFP) capable clients and traditional clients.	—	disabled
`mfp-required`	When enabled, the SSID only supports MFP capable clients.	—	disabled

`multicast-rate`	When configured, the Mobility Master chooses the rate for video multicast frames. You can configure MCS rates as well. MCS is an important setting because it provides for potentially greater throughput.
	NOTE: The following information displays the MCS rate if the **short-guard-intvl-20MHz** parameter in **ht-ssid-profile** is either enabled or disabled:
	`MCS Streams 20 MHz 20 MHz SGI`
	`--- ------- ------ --------`
	`- 0 1 6.5 7.2`
	`1 1 13.0 14.4`
	`2 1 19.5 21.7`
	`3 1 26.0 28.9`
	`4 1 39.0 43.3`
	`5 1 52.0 57.8`
	`6 1 58.5 65.0`
	`7 1 65.0 72.2`
	`8 2 13.0 14.4`
	`9 2 26.0 28.9`
	`10 2 39.0 43.3`
	`11 2 52.0 57.8`
	`12 2 78.0 86.7`
	`13 2 104.0 115.6`
	`14 2 117.0 130.0`
	`15 2 130.0 144.4`
	NOTE: The MCS rates for video multicast are supported in all 802.11n -capable APs.
		default, 6, 9, 12, 18, 24, 36, 48, 54 Mbps mcs0-mcs15	default

`multiple-tx-replay-co`	Enables Multiple Tx Replay Counters.	—	—
`no`	Negates any configured parameter.	—	—

	Description	Range	Default
okc	OKC is a similar technique, not defined by 802.11i, available for authentication between multiple APs in a network where those APs are under common administrative control. An Alcatel-Lucent deployment with multiple APs under the control of a single Switch is one such example. Using OKC, a station roaming to any AP in the network will not have to complete a full authentication exchange, but will instead just perform the 4-way handshake to establish transient encryption keys.	—	Enabled
opmode	The layer-2 authentication and encryption to be used on this ESSID to protect access and ensure the privacy of the data transmitted to and from the network.	—	opensystem
bSec-128	WPA2 with AES GCM-128 encryption and dynamic keys using 802.1X	—	—
bSec-256	WPA2 with AES GCM-256 encryption and dynamic keys using 802.1X	—	—
dynamic-wep	WEP with dynamic keys.	—	—
enhanced-open	Improved data encryption in open Wi-Fi networks and protects data from sniffing. Enhanced open replaces open system as the default opmode.	—	—
mpsk-aes	AES encryption using a pre-shared key.	—	—
opensystem	No authentication and encryption.	—	—
static-wep	WEP with static keys.	—	—
wpa-aes	WPA with AES encryption and dynamic keys using 802.1X.	—	—
wpa-psk-aes	WPA with AES encryption using a preshared key.	—	—
wpa-psk-tkip	WPA with TKIP encryption using a preshared key.	—	—
wpa-tkip	WPA with TKIP encryption and dynamic keys using 802.1X.	—	—
wpa2-aes	WPA2 with AES encryption and dynamic keys using 802.1X.	—	—
wpa2-psk-aes	WPA2 with AES encryption using a preshared key.	—	—
wpa2-psk-tkip	WPA2 with TKIP encryption using a preshared key.	—	—

	Description	Range	Default
wpa2-tkip	WPA2 with TKIP encryption and dynamic keys using 802.1X.	—	—
wpa3-aes-ccm-128	WPA3 with AES CCM-128 encryption and dynamic keys using 802.1X.	—	—
wpa3-aes-gcm-256	WPA3 with AES GCM-256 encryption.	—	—
wpa3-cnsa	WPA3 with AES GCM-256 encryption using CNSA (192 bit).	—	—
wpa3-sae-aes	WPA3 with AES encryption using Simultaneous Authentication of Equals.	—	—
xSec	Encryption and tunneling of Layer-2 traffic between the managed device and wired or wireless clients, or between managed devices. To use xSec encryption, you must use a RADIUS authentication server. For clients, you must install the Funk Odyssey client software. Requires installation of the xSec license. For xSec between managed devices, you must install an xSec license in each managed device.	—	—
opmode-transition	Enables backward compatibility for enhanced open or WPA3-SAE-AES opmodes.	—	enabled
qbss-load-enable	Enables the AP to advertise the QBSS load element. The element includes the following parameters that provide information on the traffic situation: ■ Station count: The total number of stations associated to the QBSS. ■ Channel utilization: The percentage of time (normalized to 255) the channel is sensed to be busy. The access point uses either the physical or the virtual carrier sense mechanism to sense a busy channel. ■ Available admission capacity: The remaining amount of medium time (measured as number of 32us/s) available for a station via explicit admission control. The QAP uses these parameters to decide whether to accept an admission control request. A wireless station uses these parameters to choose the appropriate access points. **NOTE:** Ensure that wmm is enabled for legacy APs to advertise the QBSS load element. For 802.11n APs, ensure that either wmm or high throughput is enabled.	—	disabled
refresh-direction	The refresh direction of WLAN SSID profile.	—	bi-dir-ectional

	Description	Range	Default
<bidirectional>	Bidirectional data frames that are used for station refresh.	—	—
<rx-only>	Received data frames that are used for station refresh. **NOTE:** The receive-only mode does not use null frames for station refresh.	—	—
<tx-only>	Transmitted data frames that are used for station refresh.	—	—
rts-threshold	Wireless clients transmitting frames larger than this threshold must issue RTS and wait for the AP to respond with CTS. This helps prevent mid-air collisions for wireless clients that are not within wireless peer range and cannot detect when other wireless clients are transmitting.		2333 bytes
short-preamble	Enables or disables short preamble for 802.11b/g radios. Network performance may be higher when short preamble is enabled. In mixed radio environments, some 802.11b wireless client stations may experience difficulty associating with the AP using short preamble. To use only long preamble, disable short preamble. Legacy client devices that use only long preamble generally can be updated to support short preamble.	—	enabled
strict-svp	Enable Strict Spectralink Voice Protocol (SVP)	—	disabled
wepkey1 - wepkey4	Static WEP key associated with the key index. Can be 10 or 26 hex characters in length.	—	—
weptxkey	Key index that specifies which static WEP key is to be used. Can be 1, 2, 3, or 4.	1, 2, 3, 4	1
wmm	Enables or disables WMM, also known as IEEE 802.11e Enhanced Distribution Coordination Function. WMM provides prioritization of specific traffic relative to other traffic in the network.	—	disabled
wmm-be-dscp	DSCP value used to map WMM best-effort traffic.	0-63	—
wmm-bk-dscp	DSCP used to map WMM background traffic.	0-63	—
wmm-ts-min-inact-int	Specifies the minimum inactivity time-out threshold of WMM traffic. This setting is useful in environments where low inactivity interval time-outs are advertised, which may cause unwanted timeouts.	0-3,600,000	0 milliseconds

	Description	Range	Default
wmm-uapsd	Enable WMM UAPSD powersave.	—	enabled
wmm-vi-dscp	DSCP used to map WMM video traffic.	0-63	—
wmm-vo-dscp	DSCP used to map WMM voice traffic.	0-63	—
wpa-hexkey	WPA PSK.	—	—
wpa-passphrase	WPA passphrase with which to generate a PSK.	—	—

Usage Guidelines

The SSID profile configures the SSID. Default WMM mappings exist for all SSIDs. After you customize an WMM mapping and apply it to the SSID, the Mobility Master overwrites the default mapping values and uses the user-configured values.

Suite-B Cryptography

The **opmode** parameters for Suite-B encryption, wpa2-aes-gcm-128 and wpa2-aes-gcm-256, require the ACR license. All OAW-40xx Series and OAW-4x50 Series support Suite-B encryption.

Multicast Rate Optimization

The Multicast Rate Optimization feature dynamically selects the rate for sending broadcast/multicast frames on any BSS. This feature determines the optimal rate for sending broadcast and multicast frames based on the lowest of the unicast rates across all associated clients.

When the Multicast Rate Optimization option (mcast-rate-opt) is enabled, the Mobility Master scans the list of all associated stations in that BSS and finds the lowest transmission rate as indicated by the rate adaptation state for each station. If there are no associated stations in the BSS, it selects the lowest configured rate as the transmission rate for broadcast and multicast frames.

This feature is disabled by default. Multicast Rate Optimization applies to broadcast and multicast frames only. 802.11 management frames are not affected by this feature and will be transmitted at the lowest configured rate.

The Multicast Rate Optimization feature should only be enabled on a BSS where all associated stations are sending or receiving unicast data. If there is no unicast data to or from a particular station, then the rate adaptation state may not accurately reflect the current sustainable transmission rate for that station. This could result in a higher packet error rate for broadcast or multicast packets at that station.

Example

The following command configures an SSID for WPA2 AES authentication:

```
(host) [md] (config) #wlan ssid-profile corpnet
(host) [md] (SSID Profile "corpnet") #essid Corpnet
(host) [md] (SSID Profile "corpnet") #opmode wpa2-aes
```

Command History

Release	Description
AOS-W 8.6.0.0	Added the **cdc-enable** and the **mbo-enable** parameters.
AOS-W 8.5.0.0	Added the **refresh-direction** parameter and the **wpa3-aes-gcm-256** sub-parameter to the **opmode** parameter.
AOS-W 8.4.0.0	Added **enhanced-open**, **mpsk-aes**, **opensystem**, **wpa3-aes-ccm-128**, **wpa3-cnsa**, and **wpa-sae-aes** sub-parameters to the **opmode** parameter and the **opmode-transition** parameter.
AOS-W 8.0.0.0	Command introduced.

wlan traffic-management-profile

```
wlan traffic-management-profile <profile-name>
   bw-alloc virtual-ap <virtual-ap> share <percent>
   clone <profile-name>
   no ...
   report-interval <minutes>
   shaping-policy default-access|fair-access|preferred-access
```

Description

This command configures a traffic management profile.

Syntax

Parameter	Description	Range	Default
`<profile-name>`	Name of this profile. The name must be 1-63 characters.	—	default
`bw-alloc`	Minimum bandwidth, as a percentage of available bandwidth, allocated to a Virtual AP when there is congestion on the wireless network. An virtual AP can use all available bandwidth if no other virtual APs are active.		
`virtual-ap <virtual-ap>`	Name of the virtual AP to which you will allocate a share of bandwidth.	—	—
`share <percent>`	Percentage of available bandwidth allocated to this virtual AP.	0-100	—
`clone <profile-name>`	Name of an existing traffic management profile from which parameter values are copied.	—	—
`no`	Negates any configured parameter.	—	—
`report-interval <minutes>`	Number of minutes between bandwidth usage reports.	1 - 999999 minutes	5 minutes
`shaping-policy`	Defines the Station Shaping Policy This feature has the following three options: ■ **default-access**: Traffic shaping is disabled, and client performance is dependent on MAC contention resolution. This is the default traffic shaping setting. ■ **fair-access**: Each client gets the same airtime, regardless of client capability and capacity. This option is useful in environments like a training facility or exam hall, where a mix of 802.11a/g, 802.11g and 802.11n clients need equal to network resources, regardless of their capabilities. The **bw-alloc** parameter of a traffic management profile allows you to set a minimum bandwidth to be allocated to a virtual AP profile when	default-access fair-access preferred-access	default-access

Parameter	Description	Range	Default
	there is congestion on the wireless network.You must set traffic shaping to f**air-access** to use this bandwidth allocation value for an individual virtual AP. ■ **preferred-access**: High-throughput (802.11n) clients do not get penalized because of slower 802.11a/g or 802.11b transmissions that take more air time due to lower rates. Similarly, faster 802.11a/g clients get more access than 802.11b clients.		

Usage Guidelines

The traffic management profile allows you to allocate bandwidth to SSIDs. When you enable the band-steering feature, an AP keeps track of all BSSIDs active on a radio, all clients connected to the BSSID, and 802.11a/g, 802.11b, or 802.11n capabilities of each client. Every sampling period, airtime is allocated to each client, giving it opportunity to get and receive traffic. The specific amount of airtime given to an individual client is determined by;

- Client capabilities (802.11a/g, 802.11b or 802.11n)
- Amount of time the client spent receiving data during the last sampling period
- Number of active clients in the last sampling period
- Activity of the current client in the last sampling period

The **bw-alloc** parameter of a traffic management profile allows you to set a minimum bandwidth to be allocated to a virtual AP profile when there is congestion on the wireless network. You must set traffic shaping to fair-access to use this bandwidth allocation value for an individual virtual AP.

Example

The following command configures a traffic management profile that allocates bandwidth to the corpnet virtual AP:

```
(host) [md] (config) #wlan traffic-management-profile best
(host) [md] (Traffic management profile "best") #bw-alloc virtual-ap corpnet share 75
```

Command History

wlan tsm-req-profile

```
wlan tsm-req-profile <profle-name>
   bin0-range <bin0-range>
   clone
   dur-mandatory
   measure-duration <measure-duration>
   no
   num-repeats <num-repeats>
   random-interval <random-interval>
   request-mode {normal | triggered}
   traffic-id <traffic-id>
```

Description

This command configures a TSM Report Request Profile.

Syntax

Parameter	Description	Range	Default
`<profile-name>`	Name of this profile. The name must be 1-63 characters.	—	default
`bin0-range <bin0-range>`	This value is used to set the 'Bin 0 Range' field in the Transmit Stream or Category Measurement Request frame. Bin 0 Range indicates the delay range of the first bin (Bin 0) of the Transmit Delay Histogram, expressed in units of TUs.	0- 255	6
`clone <source>`	Creates a copy of the Transmit Stream Measurement Request Report Request Profile. <source> is the name of an existing TSM Profile from which parameter values are copied.	—	—
`dur-mandatory`	This parameter is used to set the "Duration Mandatory" bit of the Measurement Request Mode field of the Transmit Stream or Category Measurement Request frame.	–	Enabled
`measure-duration <measure-duration>`	This parameter is used to set the Measurement Duration field in the Transmit Stream or Category Measurement Request frame. The Measurement Duration is set to the duration of the requested measurement. It is expressed in units of TUs. When the request mode for the Transmit Stream or Category Measurement Request frame is set to triggered, the Measurement Duration field should be set to 0.	0-65535	9776

Parameter	Description	Range	Default
`no`	Negates any configured parameter	—	—
`num-repeats <num-repeats>`	This parameter is used to set the Number of Repetitions field in the Transmit Stream or Category Measurement Request frame. The Number of Repetitions field contains the requested number of repetitions for all the Measurement Request elements in this frame. A value of zero in the Number of Repetitions field indicates Measurement Request elements are executed once without repetition. A value of 65535 in the Number of Repetitions field indicates Measurement Request elements are repeated until the measurement is canceled or superseded.	0-65535	65535
`random-interval <random-interval>`	This parameter is used to set the Randomization Interval field in the Transmit Stream or Category Measurement Request frame. The Randomization Interval is used to specify the desired maximum random delay in the measurement start time. It is expressed in units of TUs (Time Units). When the request mode for the Transmit Stream or Category Measurement Request frame is set to "triggered", the Randomization Interval is not used and is set to 0. A Randomization Interval of 0 in a measurement request indicates that no random delay is to be used.	0-65535	0
`request-mode {normal | triggered}`	This parameter is used to determine the request mode for the Transmit Stream or Category Measurement Request frame. There are two options for this field: ■ normal ■ triggered	–	normal
`traffic-id <traffic-id>`	The parameter is used to set the Traffic Identifier field in the Transmit Stream or Category Measurement Request frame. The Traffic Identifier field contains the TID subfield. The TID subfield indicates the TC or TS for which traffic is to be measured.	0-255	96

Usage Guidelines

The tsm-req-profile is a part of the 802.11K profile. It is used to configure the parameters for the Transmit Stream or Category Measurement frames. It takes effect only when the 802.11K feature is enabled.

Example

```
(host) [md] (config) #wlan tsm-req-profile default
(host) [md] (TSM Report Request Profile "default") #bin0-range 1
```

```
(host) [md] (TSM Report Request Profile "default") #dur-mandatory
(host) [md] (TSM Report Request Profile "default") #measure-duration 25
(host) [md] (TSM Report Request Profile "default") #num-repeats 0
(host) [md] (TSM Report Request Profile "default") #random-interval 0
(host) [md] (TSM Report Request Profile "default") #request-mode normal
(host) [md] (TSM Report Request Profile "default") #traffic-id 96
```

```

Description

This command configures a virtual AP profile.

Syntax

Parameter	Description	Range	Default
`<profile-name>`	Name of this profile. The name must be 1-63 characters.	—	“default”
`aaa-profile`	Name of the AAA profile that applies to this virtual AP.	—	“default”
`allowed-band`	The band(s) on which to use the virtual AP: **a**—802.11a band only (5 GHz) **g**—802.11b/g band only (2.4 GHz)	a, g, all	all

Parameter	Description	Range	Default
	all—both 802.11a and 802.11b/g bands (5 GHz and 2.4 GHz)		
`anyspot-profile`	Anyspot Profile associated with this Virtual AP Profile. The anyspot client probe suppression feature decreases network traffic by suppressing probe requests from clients attempting to locate and connect to other known networks.	–	–
`auth-failure-blacklist-time`	Time, in seconds, a client is blocked if it fails repeated authentication. A value of 0 blocks a client iindefinitely.	0-2,147,483,647 seconds	0
`band-steering`	ARM's band steering feature can encourage or require dual-band capable clients to stay on the 5 GHz band on dual-band APs. This frees up resources on the 2.4 GHz band for single band clients like VoIP phones. Band steering reduces co-channel interference and increases available bandwidth for dual-band clients, because there are more channels on the 5 GHz band than on the 2.4 GHz band. Dual-band 802.11n-capable clients may see even greater bandwidth improvements, because the band steering feature will automatically select between 40MHz or 20 MHz channels in 802.11n networks. This feature is disabled by default, and must be enabled in a Virtual AP profile. The band steering feature supports three steering modes, which can be configured via the steering-mode parameter: Band steering can be configured on both campus APs and remote APs that have a virtual AP profile set to tunnel, decrypt-tunnel, split-tunnel or bridge forwarding mode. Note, however, that if a campus or remote APs has virtual AP profiles configured in bridge or split-tunnel forwarding mode but no virtual AP in tunnel mode, those APs will gather information about 5G-capable clients independently and will not exchange this information with other APs that also have bridge or split-tunnel virtual APs only.	—	disabled
`blacklist`	Enables detection of DoS attacks, such as ping or SYN floods, that are not spoofed deauth attacks.	—	enabled

Parameter	Description	Range	Default
`blacklist-time`	Number of seconds that a client is quarantined from the network after being blacklisted.	0-2,147,483,647 seconds	3600 seconds (1 hour)
`broadcast-filter`	Filter out broadcast and multicast traffic in the air. ■ all **NOTE:** Do not enable this option for virtual APs configured in bridge forwarding mode. This configuration parameter is only intended for use for virtual APs in tunnel mode. In tunnel mode, all packets travel to the managed device, so the managed device is able to drop all broadcast traffic. When a virtual AP is configured to use bridge forwarding mode, most data traffic stays local to the AP, and the managed device is not able to filter out that broadcast traffic. **IMPORTANT:** If you enable this option, you must also enable the **Broadcast-Filter ARP** parameter in the stateful firewall configuration to prevent ARP requests from being dropped. Note also that although a virtual AP profile can be replicated from a Mobility Master to managed device, stateful firewall settings do not. If you select the **broadcast-filter all** option for a Virtual AP Profile on a Mobility Master, you must enable the **broadcast-filter arp** setting on each individual managed device. ■ arp If enabled, all broadcast ARP requests are converted to unicast and sent directly to the client. You can check the status of this option using the **show ap active** and the **show datapath tunnel** command. If enabled, the output will display the letter **a** in the flags column. Do not enable this option for virtual APs configured in bridge forwarding mode. This configuration parameter is only intended for use for virtual APs in tunnel mode. In tunnel mode, all packets travel to the managed device, so the managed device is able to convert ARP requests directed to the broadcast address into unicast. When a virtual AP is configured to use bridge forwarding mode, most data traffic stays local to the AP, and the managed device is not able to convert that broadcast traffic.	—	For the option **all**, the default value is disabled. For the option **arp**, the default value is enabled.

Parameter	Description	Range	Default
`cellular-handoff-assist`	When both the client match and cellular handoff assist features are enabled, the cellular handoff assist feature can help a dual-mode, 3G or 4G-capable Wi-Fi device such as an iPhone, iPad, or Android client at the edge of Wi-Fi network coverage switch from Wi-Fi to an alternate 3G or 4G radio that provides better network access. This feature is disabled by default, and is recommended only for Wi-Fi hotspot deployments.	—	disabled
`clone`	Name of an existing traffic management profile from which parameter values are copied.	—	—
`deny-inter-user-traffic`	Select this check box to deny traffic between the clients using this virtual AP profile. The **firewall** command includes an option to deny all inter-user traffic, regardless of the Virtual AP profile used by those clients. If the global setting to deny inter-user traffic is enabled, all inter-user traffic between clients will be denied, regardless of the settings configured in the virtual AP profiles. If the setting to deny inter-user traffic is disabled globally but enabled on an individual virtual ap, only the traffic between un-trusted users and the clients on that particular virtual AP will be blocked.	–	disabled
`deny-time-range`	Specify the name of the time range for which the AP will deny access. Time ranges can be defined using the CLI command time-range.	—	—
`dos-prevention`	If enabled, APs ignore deauthentication frames from clients. This prevents a successful deauth attack from being carried out against the AP. This does not affect third-party APs.	—	disabled
`dot11k-profile`	Name of an 802.11k profile to be associated with this VAP.	—	default
`dynamic-mcast-optimization`	Enable or /Disable dynamic multicast optimization. This parameter can only be enabled on a managed device with a PEFNG license.	—	disabled

Parameter	Description	Range	Default
`dynamic-mcast-optimization-threshold`	Maximum number of high-throughput stations in a multicast group beyond which dynamic multicast optimization stops.	2-255 stations	6 stations
`fdb-update-on-assoc`	This parameter enables seamless failover for silent clients, allowing them to re-associate. If you select this option, the managed device will generate a Layer 2 update on behalf of client to update forwarding tables in bridge devices. Default: Disabled	—	disabled
`forward-mode`	Controls whether 802.11 frames are tunneled to the managed device using generic routing encapsulation (GRE), bridged into the local Ethernet LAN (for remote APs), or a combination thereof depending on the destination (corporate traffic goes to the managed device, and Internet access remains local). Select one of the following forward modes: ■ **Tunnel**: When an AP is in tunnel forwarding mode, the AP handles all 802.11 association requests and responses. The AP sends all 802.11 data packets, action frames and EAPOL frames over a GRE tunnel to the managed device for processing. The managed device removes or adds the GRE headers, decrypts or encrypts 802.11 frames and applies firewall rules to the user traffic as usual. ■ **Bridge**: When an AP is in bridge mode, data is bridged onto the local Ethernet LAN. When in bridge mode, the AP handles all 802.11 association requests and responses, encryption or decryption processes, and firewall enforcement. 802.11e and 802.11k action frames are also processed by the AP, which then sends out responses as needed. An AP in bridge mode supports only the 802.1X authentication type. ■ **Split-Tunnel**: Data frames are either tunneled or bridged, depending on the destination (corporate traffic goes to the managed device, and Internet access remains local). The AP handles all 802.11 association requests and responses,	tunnel bridge split-tunnel decrypt-tunnel	tunnel

Parameter	Description	Range	Default
	encryption or decryption, and firewall enforcement. 802.11e and 802.11k action frames are also processed by the AP, which then sends out responses as needed. An AP in split-tunnel mode supports only the 802.1X authentication type. ■ **Decrypt-Tunnel:** An AP in decrypt-tunnel forwarding mode decrypts and decapsulates all 802.11 frames from a station and sends the 802.3 frames through the GRE tunnel to the managed device, which then applies firewall policies to the user traffic. This mode allows a network to utilize the encryption or decryption capacity the AP while reducing the demand for processing resources on the managed device. APs in decrypt-tunnel forwarding mode also manage all 802.11 association requests and responses, and process all 802.11e and 802.11k action frames. **NOTE:** Virtual APs in bridge or split-tunnel mode using static WEP should use key slots 2-4 on the managed device. Key slot 1 should only be used with Virtual APs in tunnel mode.		
`ftm-responder-enable`	Enables 802.11mc fine timing measurement (responder mode only). This feature is supported only on AP-514 and AP-515 access points.	—	disabled
`ha-disc-onassoc`	If enabled, home agent discovery is triggered on client association instead of home agent discovery based on traffic from client. Mobility on association can speed up roaming and improve connectivity for clients that do not send many uplink packets to trigger mobility (VoIP clients). Best practices is to leave this parameter disabled, as it increases IP mobility control traffic between managed devices in the same mobility domain. Enable this parameter only when voice issues are observed in VoIP clients. **NOTE:** `ha-disc-onassoc` parameter works only when IP mobility is enabled and configured on the managed device.	—	disabled
`hs2-profile`	Enables or disables a hotspot profile. This is enabled by default.	–	enabled

Parameter	Description	Range	Default
`mobile-ip`	Enables or disables IP mobility on a virtual AP. This is enabled by default. L3 mobility service is active on a VAP only if **router mobile** is also enabled on the managed device.	—	enabled
`no`	Negates any configured parameter.	—	—
`openflow-enable`	Enables OpenFlow on AP forwarding path.	—	—
`preserve-vlan`	This parameter allows clients to retain their previous VLAN assignment if the client disassociates from an AP and then immediately re-associates either with same AP or another AP on same managed device.		
`rap-operation`	Configures when the virtual AP operates on a remote AP: ■ **always**—Permanently enables the virtual AP (Bridge Mode only). This option can be used for non-802.1X bridge VAPs. ■ **backup**—Enables the virtual AP if the remote AP cannot connect to the managed device (Bridge Mode only). This option can be used for non-802.1X bridge VAPs. ■ **persistent**—Permanently enables the virtual AP after the remote AP initially **connects** to the managed device (Bridge Mode only). This option can be used for any (Open or PSK or 802.1X) bridge VAPs. ■ **standard**—Enables the virtual AP when the remote AP connects to the managed device. This option can be used for any (bridge or split-tunnel or tunnel or d-tunnel) VAPs.	always or backup or persistent or standard	standard
`ssid-profile`	Name of the SSID profile that applies to this virtual AP.	—	default
`steering-mode`	Band steering supports three different band steering modes. ■ **Force-5GHz**: When the AP is configured in **force-5GHz** band steering mode, the AP will try to force 5 GHz-capable APs to use that radio band. ■ **Prefer-5GHz** (Default): If you configure the AP to use **prefer-5GHz** band steering mode, the AP will try to steer the client to 5G band (if the client is 5G	Force-5 GHz prefer-5 GHz balance-bands	prefer-5 GHz

Parameter	Description	Range	Default
	capable) but will let the client connect on the 2.4G band if the client persists in 2.4G association attempts. ■ **Balance-bands**: In this band steering mode, the AP tries to balance the clients across the two radios in order to best utilize the available 2.4G bandwidth. This feature takes into account the fact that the 5 GHz band has more channels than the 2.4 GHz band, and that the 5 GHz channels operate in 40 MHz while the 2.5 GHz band operates in 20 MHz. **NOTE:** Steering modes do not take effect until the band steering feature has been enabled. The band steering feature in AOS-W versions 3.3.2-5.0 does not support multiple band-steering modes. The band-steering feature in these versions of AOS-W functions the same way as the default **prefer-5GHz** steering mode available in AOS-W 6.0 and later.		
`strict-compliance`	If enabled, the AP denies client association requests if the AP and client station have no common rates defined. Some legacy client stations which are not fully 802.11-compliant may not include their configured rates in their association requests. Such non-compliant stations may have difficulty associating with APs unless strict compliance is disabled.	—	disabled
`vap-enable`	Enable or disable the virtual AP.	—	enabled
`vlan`	The VLAN(s) into which users are placed in order to obtain an IP address. Enter VLANs as a comma-separated list of existing VLAN IDs *or* VLAN names. A mixture of names and numeric IDs are not allowed. **NOTE:** You must add an existing VLAN ID to the Virtual AP profile.		1
`vlan-mobility`	VLAN mobility retains the client VLAN on roaming irrespective of the VAP VLAN, provided the user VLANs are extended. VLAN mobility and mobile IP are mutually exclusive. VLAN mobility does not re-use user firewall sessions on roaming as the sessions will have to be recreated locally on the roamed managed device.	—	disabled

Parameter	Description	Range	Default
`wan-operation`	Specify the wan-operation to enable Virtual AP depending on the state of the WAN link.	always backup primary	always
`wmm-traffic-management-profile`	Specify the WMM Traffic Management Profile to be associated with this Virtual AP Profile.	—	—

Usage Guidelines

WLAN profiles configure WLANs in the form of virtual AP profiles. A virtual AP profile contains an SSID profile which defines the WLAN and an AAA profile which defines the authentication for the WLAN. You can configure and apply multiple instances of virtual AP profiles to an AP group or to an individual AP.

A named VLAN can be deleted although it is configured in a virtual AP profile. If this occurs the virtual AP profiles becomes invalid. If the named VLAN is added back later the virtual AP becomes valid again.

The **broadcast-filter arp** parameter is enabled by default. If your Mobility Master supports clients behind a wireless bridge or virtual clients on VMware devices, you must disable the broadcast-filter arp setting to allow those clients to obtain an IP address. In previous releases of AOS-W, the virtual AP profile included two unique broadcast filter parameters; the **broadcast-filter all** parameter, which filtered out all broadcast and multicast traffic in the air except DHCP response frames (these were converted to unicast frames and sent to the corresponding client) and the **broadcast-filter arp** parameter, which converted broadcast ARP requests to unicast messages sent directly to the client.

The **broadcast-filter arp** setting includes the additional functionality of broadcast-filter all parameter, where DHCP response frames are sent as unicast to the corresponding client. This can impact DHCP discover or requested packets for clients behind a wireless bridge and virtual clients on VMware devices. Disable the broadcast-filter arp setting using the **wlan virtual-ap <profile> no broadcast-filter arp** command to resolve this issue and allow clients behind a wireless bridge or VMware devices to receive an IP address.

If there is only one VLAN defined, then the Mobility Master will send IPv6 RAs as usual. If, however, there are multiple VLANs, then the Mobility Master will automatically convert 802.11 multicast frames to unicast. This conversion prevents RA frames from being sent with a multicast key to all clients on the BSSID, which could lead to clients having multiple IPv6 addresses.

Example

The following command configures a virtual AP:

```
(host) [md] (config) #wlan virtual-ap corpnet
(host) [md] (Virtual AP profile "corpnet") #vlan 1
(host) [md] (Virtual AP profile "corpnet") #aaa-profile corpnet
(host) [md] (Virtual AP profile "corpnet") #ftm-enable
```

Command History

Version	Modification
AOS-W 8.6.0.0	The **ftm-responder-enabl**e parameter was introduced.
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Config mode on Mobility Master.

wlan wmm-traffic-management-profile

```
wlan wmm-traffic-management-profile <profile-name>
   background <share>
   best-effort <share>
   clone <source>
   enable-shaping
   no
   video <share>
   voice <share>
```

Description

This command configures bandwidth shaping for WMM access categories.

Bandwidth shaping is only applied on the down-link traffic.

Syntax

Parameter	Description	Range	Default
`background <share>`	Bandwidth allocation, in percentage (%), for WMM background access traffic category.	0-100%	5%
`best-effort <share>`	Bandwidth allocation, in percentage (%), for WMM best effort access traffic category.	0-100%	5%
`clone <source>`	Copies the configuration from another WMM Traffic management profile.	—	—
`enable-shaping`	Enables a bandwidth shaping policy so that the allocated bandwidth share is appropriately used.	—	disabled
`no`	Negates any configured parameter.	—	—
`video <share>`	Bandwidth allocation, in percentage (%), for video access traffic category.	0-100%	55%
`voice <share>`	Bandwidth allocation, in percentage (%), for voice access traffic category.	0-100%	35%

Usage Guidelines

After you configure the WMM traffic management profile, apply it to the virtual AP profile. For WMM traffic management to take effect, you must enable **fair-access** or **preferred-access** parameter under wlan traffic-management-profile.

Example

The following command configures a WMM traffic management profile:

```
(host) [md] (config) #wlan wmm-traffic-management-profile test
(host) [md] (WMM Traffic management profile "test") #enable-shaping
(host) [md] (WMM Traffic management profile "test") #background 7
(host) [md] (WMM Traffic management profile "test") #best-effort 10
(host) [md] (WMM Traffic management profile "test") #voice 40
(host) [md] (WMM Traffic management profile "test") #video 43
```

Apply the WMM traffic management profile to the virtual AP profile.

```
(host) [md] (config) #wlan virtual-ap employee
(host) [md] (Virtual AP profile "employee") #wmm-traffic-management-profile test
```

Enable the **fair-access** or **preferred access** parameter under **wlan traffic-management-profile**.

```
(host) [md] (config) #wlan traffic-management-profile test
(host) [md] (Traffic management profile "test") #shaping-policy fair-access
```

OR

```
(host) [md] (Traffic management profile "test") #shaping-policy preferred-access
```

Apply the traffic management profile to an ap group.

```
(host) [md] (config) #ap-group default
(host) [md] (AP group "default") #dot11a-traffic-mgmt-profile test
```

Related Commands

Command	Description
show wlan wmm-traffic-management-profile	Displays the WMM traffic management profile(s) configured on the managed device.
wlan traffic-management-profile	Configures a traffic management profile.

Command History

AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	PEFNG license.	Config mode on Mobility Master.

wmm-dscp-mapping

`wmm-dscp-mapping`

Description

This command enables or disables WMM DSCP map in the upstream direction decrypt-tunnel mode.

Syntax

No parameters

Usage Guidelines

This feature is enabled by default. Use the **no** form of this command to disable.

Example

The following command enables WMM DSCP mapping:

```
(host) [mynode] (config) #wmm-dscp-mapping
```

The following command disables WMM DSCP mapping:

```
(host) [mynode] (config) #no wmm-dscp-mapping
```

wms ap

```
wms ap <bssid> mode {interfering|manually-contained|neighbor|rogue|suspected-rogue|valid}
```

Description

This command allows you to classify an AP into one of several categories.

Syntax

Parameter	Description
`<bssid>`	BSSID of the AP.
`mode`	Classify the AP into one of the following categories.
`interfering`	An AP seen in the RF environment but is not connected to the wired network.
`manually-contained`	Manually enables denial of service from this AP
`neighbor`	An neighboring AP whose BSSID is known.
`rogue`	A rogue AP that is unauthorized and is plugged into the wired side of the network. You can configure automatic shutdown of rogue APs in the IDS unauthorized device detection profile.
`suspected-rogue`	A suspected rogue AP that is plugged into the wired side of the network but may not be an unauthorized device. Automatic shutdown of rogue APs does not apply to these devices.
`valid`	An AP that is part of the enterprise providing WLAN service.

Usage Guidelines

If AP learning is enabled (with the **ids-wms-general-profile learn-ap** command), non-Alcatel-Lucent APs connected on the same wired network as Alcatel-Lucent APs are classified as valid APs. If AP learning is disabled, a non-Alcatel-Lucent AP is classified as an unsecure or suspect-unsecure AP.

Example

The following command classifies an interfering AP as a known-interfering AP:

```
(host) [mynode] #wms ap 01:00:00:00:00:00 mode known-interfering
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

wms clean-db

```
wms clean-db
```

Description

This command deletes the WMS database.

Syntax

Parameter	Description
`clean-db`	Cleans the WMS database.

Usage Guidelines

This command deletes all entries from the WMS database. Do not use this command unless instructed to do so by an Alcatel-Lucent representative.

Example

The following command cleans the WMS database:

```
(host) [mynode] #wms clean-db
   WMS Database will be deleted. Do you want to proceed with this action [y/n]:
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

All platforms	Base operating system.	Enable or Config mode on Mobility Master.

wms client

```
wms client <mac>
   mode {interfering|manually-contain|valid}
   valid-exempt {insert|remove}
```

Description

This command allows you to classify a wireless client into one of several categories.

Syntax

Parameter	Description
`<mac>`	MAC address of the client.
`mode`	Classifies the client into one of the following categories:
`interfering`	Setting the client mode to *interfering* makes it part of clients outside the enterprise
`manually-contain`	Manually enables denial of service to this client.
`valid`	A client that is part of the enterprise.
`valid-exempt`	Classifies the client under this option to exempt from Valid Station Protection and Valid Station Misassociation Detection.
`insert`	Adds the client to the valid-exempt list and exempt from Valid Station Protection and Valid Station Misassociation Detection. If the client exists in the WMS, the classification is set to valid. In case the client does not exist in the WMS, a client entry is created and then the classification is set to valid.
`remove`	Removes the client from the list of valid-exempt clients.

Usage Guidelines

AOS-W can automatically determine client classification based on client behavior, but this command allows you to explicitly classify a client. The classification of a client is used in certain policy enforcement features. For example, if **protect-valid-sta** is enabled in the IDS Unauthorized Device Profile, then clients that are classified as valid cannot connect to non-valid APs.

Example

The following command classifies a client as valid:

```
(host) [mynode] #wms client 00:00:A4:34:C9:B3 mode valid
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

wms export-class

```
wms export-class <filename>
```

Description

This command exports classification information into a file.

Syntax

Parameter	Description
`<filename>`	Name of the file into which you want to export classification information.

Usage Guidelines

This command writes classification data into comma separated values (CSV) files—one for APs and one for clients. You can import these files into the Alcatel-Lucent Mobility Manager system.

Example

The following command exports classification data into an AP and a client file:

```
(host) [mynode] #wms export-class class
Exported data to class_ap.csv and class_sta.csv
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on Mobility Master.

wms export-db

```
wms export-db <filename>
```

Description

This command exports the WMS database to a specified file.

Syntax

Parameter	Description
`<filename>`	Name of the file into which you want to export the database. The filename plus any extensions must be no longer than 32 characters and may contain only keyboard characters.

Usage Guidelines

The file is exported as an ASCII text file.

Example

The following command exports the WMS database to a file:

```
(host) [mynode] #wms export-db database
Exported WMS DB to database
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on Mobility Master.

wms import-db

```
wms import-db <filename>
```

Description

This command imports the specified file into the WMS database.

Syntax

Parameter	Description
`<filename>`	Name of the file into which you want to import into the database. The filename plus any extensions must be no longer than 32 characters and may contain only keyboard characters.

Usage Guidelines

The imported file replaces the WMS database. The imported file must be a valid WMS database file that you previously exported using the **wms export-db** command.

Example

The following command imports the WMS database from a file:

```
(host) [mynode] #wms import-db database
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on Mobility Master.

wms reinit-db

```
wms reinit-db
```

Description

This command reinitializes the WMS database to its factory default setting.

Syntax

No parameters.

Usage Guidelines

When you use this command, there is no automatic backup of the current database.

Example

The following command reinitializes the WMS database:

```
(host) [mynode] #wms reinit-db
WMS Database will be re-initialized. Do you want to proceed with this action [y/n ]:
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

wms restart-snapshot

```
wms restart-snapshot {ap|rogue-ap|sta}
```

Description

This command restarts periodic snapshot messaging by the WLAN Management System (WMS).

Syntax

Parameter	Description
`ap`	Restarts the monitored AP snapshot.
`rogue-ap`	Restarts the monitored rogue AP snapshot.
`sta`	Restarts the monitored client snapshot.

Example

The following command restarts snapshot messaging for monitored APs:

```
(host) [mynode] #wms restart-snapshot ap
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on Mobility Master.

wms test

```
wms test {busy <interval>|lc-poll-interval <interval-time>}
```

Description

This command configures WLAN Management System (WMS) test settings.

Syntax

Parameter	Description
`busy <interval>`	Sets a time interval, in seconds, that the WMS is busy.
`lc-poll-interval <interval-time>`	Sets a polling interval, in minutes, for communication between the WMS and managed devices. The time interval must be between 10-360 minutes.

Example

The following command sets a polling interval of 15 minutes:

```
(host) [mynode] (config) #wms test lc-poll-interval 15
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system	Config mode on Mobility Master.

write

```
write {erase [all]|memory|terminal}
```

Description

This command saves the running configuration to memory or displays the running configuration on the screen. This command can also be used to erase the running configuration and return Mobility Master to factory defaults.

Syntax

Parameter	Description
`erase`	Erases the running system configuration file. Rebooting Mobility Master resets it to the factory default configuration. If you specify `all`, the configuration and all data in Mobility Master databases (including the license, WMS, and internal databases) are erased.
`memory`	Saves the current system configuration to memory. Any configuration changes made during this session will be made permanent.
`terminal`	Displays the current system configuration.

Usage Guidelines

Configuration changes made using the CLI affect only the current session. You must save your changes for them to be retained across system reboots. Changes are lost if the system reboots before saving the changes. To save your configuration changes, use the **write memory** command.

If you use the **write erase** command, the license key management database on Mobility Master is not affected. If you use the **write erase all** command, all databases on Mobility Master are deleted, including the license key management database. If you reset Mobility Master to the factory default configuration, perform the Initial Setup as described in the *AOS-W Quick Start Guide*.

If you use the **write terminal** command, all of the commands used to configure Mobility Master appear on the terminal. If paging is enabled, there is a pause mechanism that stops the output from printing continuously to the terminal. To navigate through the output, use any of the commands displayed at the bottom of the output, as described in below. If paging is disabled, the output prints continuously to the terminal. For more information about the **paging** command, see paging on page 824.

Key	Description
Q	Exit the display.
U	Page up through the output.
spacebar	Page down through the output.
/	Enter a text string to search for.
N	Repeat the text string to search for.

Example

The following command saves your changes so they are retained after a reboot:

```
(host) [mynode] #write memory
```

The following command deletes the running configuration and databases and returns Mobility Master to the factory default settings:

```
(host) [mynode] #write erase
```

Command History

Release	Modification
AOS-W 8.0.0.0	Command introduced.

Command Information

Platforms	License	Command Mode
All platforms	Base operating system.	Enable or Config mode on Mobility Master.

zeroize-tpm-keys

```
zeroize-tpm-keys
```

Description

This command is used to erase the TPM content and render a Switch permanently inoperable.

Syntax

No parameters.

Usage Guidelines

Use this command to erase the TPM content and render a Switch permanently inoperable.

Example

Execute the following command to erase the TPM content and render a Switch permanently inoperable.

```
(host) [mynode] (config) #zeroize-tpm-keys
The effect of the action you are about to execute is not reversible. Are you sure you want to
implement this function? Press 'y' to proceed : [y/n]: y
This action will void the warranty on the controller and nullify the RMA. Are you still sure
you want to do this?(y/n): y
You are about to wipe the contents of the TPM and render the controller permanently
inoperable. Are you ready to go ahead?(y/n): y
TPM keys have been zeroized. Please reload the controller.
```

Command History

Release	Modification
AOS-W 8.4.0.0	Command introduced.

Command Information

Platforms	Licensing	Command Mode
All platforms	Base operating system.	Enable Mode.

The AOS-W CLI offers different levels of user access by differentiating between different command modes.

When you first log in to the CLI, you start your session in *User* mode, which provides only limited access for basic operational testing. You must enter an additional password to access *Enable* mode, which allows you to issue show commands run certain management functions. Configuration commands can only be issued in *Configuration* mode. You can access Config mode by entering **configure terminal** at the command prompt. You can exit your current command mode and return to a lower-level command mode at any time by entering **exit** at the command prompt.

The following sections describes how to access each command mode, the command prompt for each mode, and links to its available commands:

- Enable Mode on page 2943
- Config Mode on page 2943

Enable Mode

On logging onto the Mobility Master, the user mode is presented.

The command prompt for a CLI session in enable mode is a pound (**#**) symbol:

```
(host) [mynode]#
```

To view a list of commands available in enable mode, access the CLI in enable mode and enter a question mark (?):

```
(host) [mynode]#?
```

Some top-level commands have different sets of sub-commands available in Enable or Config mode. To view a list of available sub-commands in Enable mode, access the CLI in Enable mode, enter the top level command, then enter a question mark (?). For example, the following example shows which aaa commands are available in Enable mode:

```
(host) [mynode]#aaa ?
authentication          Authentication
inservice               Bring authentication server into service
ipv6                    Internet Protocol Version 6
query-user              Query User
test-server             Test authentication server
user                    User commands
```

Config Mode

To move from enable mode to config mode, enter the command **config terminal**. Users in config mode may return to enable mode at any time by entering the command **exit**.

When you are in config mode, **(config)** appears before the # prompt:

```
(host) [mynode] (config) #
```

Some top-level commands have different sets of sub-commands available in the Enable or Config mode. To view a list of available sub-commands in the Config mode, access the CLI in the Config mode, enter the top level

command, then enter a question mark (?). For example, the following example shows which **aaa** commands are available in the Config mode:

```
(host) [mynode] (config) #aaa ?
alias-group             Configure an Alias Group
auth-survivability      Configure Auth Surivability
auth-trace              Set parameters for debug tracing in AUTH (light weight tracing)
authentication          Authentication
authentication-server   Authentication Servers
bandwidth-contract      Configure bandwidth contract (256 Kbps - 2 Gbps)
derivation-rules        Configure rules to derive user role or vlan
dns-query-interval      Set DNS query interval
log                     Enable debugging on per-user basis
password-policy         Password policy for locally configured management users
profile                 Configure an AAA Profile
radius-attributes       Configure RADIUS attribute
rfc-3576-server         Configure an RFC 3576 Server
server-group            Configure a Server Group
tacacs-accounting       Configure accounting
timers                  Configure authentication timers
user                    User commands
xml-api                 External XML API server
```

Configuration Sub-modes

Some Config mode commands can enter you into a sub-mode with a limited number of available commands specific to that mode. When you are in a configuration sub-mode, the (config) that appears before the command prompt will change to indicate your current mode; e.g (config-submode).

You can exit a sub-command mode and return to the basic configuration mode at any time by entering the exit command.

Appendix 5
Glossary of Terms

The following table provides a brief description of the terminology used in this guide.

3DES

Triple Data Encryption Standard. 3DES is a symmetric-key block cipher that applies the DES cipher algorithm three times to each data block.

3G

Third Generation of Wireless Mobile Telecommunications Technology. See W-CDMA.

3GPP

Third Generation Partnership Project. 3GPP is a collaborative project aimed at developing globally acceptable specifications for third generation mobile systems.

4G

Fourth Generation of Wireless Mobile Telecommunications Technology. See LTE.

802.11

802.11 is an evolving family of specifications for wireless LANs developed by a working group of the Institute of Electrical and Electronics Engineers (IEEE). 802.11 standards use the Ethernet protocol and Carrier Sense Multiple Access with collision avoidance (CSMA/CA) for path sharing.

802.11 bSec

802.11 bSec is an alternative to 802.11i. The difference between bSec and standard 802.11i is that bSec implements Suite B algorithms wherever possible. Notably, Advanced Encryption Standard-Counter with CBC-MAC is replaced by Advanced Encryption Standard - Galois/Counter Mode, and the Key Derivation Function (KDF) of 802.11i is upgraded to support SHA-256 and SHA-384.

802.11a

802.11a provides specifications for wireless systems. Networks using 802.11a operate at radio frequencies in the 5 GHz band. The specification uses a modulation scheme known as orthogonal frequency-division multiplexing (OFDM) that is especially well suited to use in office settings. The maximum data transfer rate is 54 Mbps.

802.11ac

802.11ac is a wireless networking standard in the 802.11 family that provides high-throughput WLANs on the 5 GHz band.

802.11b

802.11b is a WLAN standard often called Wi-Fi and is backward compatible with 802.11. Instead of the Phase-Shift Keying (PSK) modulation method used in 802.11 standards, 802.11b uses Complementary Code Keying (CCK) that allows higher data speeds and makes it less susceptible to multipath-propagation interference. 802.11b operates in the 2.4 GHz band and the maximum data transfer rate is 11 Mbps.

802.11d

802.11d is a wireless network communications specification for use in countries where systems using other standards in the 802.11 family are not allowed to operate. Configuration can be fine-tuned at the Media Access Control (MAC) layer level to comply with the rules of the country or district in which the network is to be used. Rules are subject to variation and include allowed frequencies, allowed power levels, and allowed signal bandwidth. 802.11d facilitates global roaming.

802.11e

802.11e is an enhancement to the 802.11a and 802.11b specifications that enhances the 802.11 Media Access Control layer with a coordinated Time Division Multiple Access (TDMA) construct. It adds error-correcting mechanisms for delay-sensitive applications such as voice and video. The 802.11e specification provides seamless interoperability between business, home, and public environments such as airports and hotels, and offers all subscribers high-speed Internet access with full-motion video, high-fidelity audio, and VoIP.

802.11g

802.11g offers transmission over relatively short distances at up to 54 Mbps, compared with the 11 Mbps theoretical maximum of 802.11b standard. 802.11g employs Orthogonal Frequency Division Multiplexing (OFDM), the modulation scheme used in 802.11a, to obtain higher data speed. Computers or terminals set up for 802.11g can fall back to speed of 11 Mbps, so that 802.11b and 802.11g devices can be compatible within a single network.

802.11h

802.11h is intended to resolve interference issues introduced by the use of 802.11a in some locations, particularly with military Radar systems and medical devices. Dynamic Frequency Selection (DFS) detects the presence of other devices on a channel and automatically switches the network to another channel if and when such signals are detected. Transmit Power Control (TPC) reduces the radio frequency (RF) output power of each network transmitter to a level that minimizes the risk of interference.

802.11i

802.11i provides improved encryption for networks that use 802.11a, 802.11b, and 802.11g standards. It requires new encryption key protocols, known as Temporal Key Integrity Protocol (TKIP) and Advanced Encryption Standard (AES).

802.11j

802.11j is a proposed addition to the 802.11 family of standards that incorporates Japanese regulatory extensions to 802.11a; the main intent is to add channels in the radio frequency (RF) band of 4.9 GHz to 5.0 GHz.

802.11k

802.11k is an IEEE standard that enables APs and client devices to discover the best available radio resources for seamless BSS transition in a WLAN.

802.11m

802.11m is an Initiative to perform editorial maintenance, corrections, improvements, clarifications, and interpretations relevant to documentation for 802.11 family specifications.

802.11n

802.11n is a wireless networking standard to improve network throughput over the two previous standards, 802.11a and 802.11g. With 802.11n, there will be a significant increase in the maximum raw data rate from 54 Mbps to 600 Mbps with the use of four spatial streams at a channel width of 40 MHz.

802.11r

802.11r is an IEEE standard for enabling seamless BSS transitions in a WLAN. 802.11r standard is also referred to as Fast BSS transition.

802.11u

802.11u is an amendment to the IEEE 802.11 WLAN standards for connection to external networks using common wireless devices such as smartphones and tablet PCs. The 802.11u protocol provides wireless clients with a streamlined mechanism to discover and authenticate to suitable networks, and allows mobile users to roam between partner networks without additional authentication. An 802.11u-capable device supports the Passpoint technology from the Wi-Fi Alliance Hotspot 2.0 R2 Specification that simplifies and automates access to public Wi-Fi.

802.11v

802.11v is an IEEE standard that allows client devices to exchange information about the network topology and RF environment. This information is used for assigning best available radio resources for the client devices to provide seamless connectivity.

802.1Q

802.1Q is an IEEE standard that enables the use of VLANs on an Ethernet network. 802.1Q supports VLAN tagging.

802.1X

802.1X is an IEEE standard for port-based network access control designed to enhance 802.11 WLAN security. 802.1X provides an authentication framework that allows a user to be authenticated by a central authority.

802.3af

802.3af is an IEEE standard for Power over Ethernet (PoE) version that supplies up to 15.4W of DC power. See PoE.

802.3at

802.3at is an IEEE standard for PoE version that supplies up to 25.5W of DC power. See PoE+.

A-MPDU

Aggregate MAC Protocol Data Unit. A-MPDU is a method of frame aggregation, where several MPDUs are combined into a single frame for transmission.

A-MSDU

Aggregate MAC Service Data Unit. A-MSDU is a structure containing multiple MSDUs, transported within a single (unfragmented) data MAC MPDU.

AAA

Authentication, Authorization, and Accounting. AAA is a security framework to authenticate users, authorize the type of access based on user credentials, and record authentication events and information about the network access and network resource consumption.

ABR

Area Border Router. ABR is used for establishing connection between the backbone networks and the Open Shortest Path First (OSPF) areas. ABR is located near the border of one or more OSPF areas.

AC

Access Category. As per the IEEE 802.11e standards, AC refers to various levels of traffic prioritization in Enhanced Distributed Channel Access (EDCA) operation mode. The WLAN applications prioritize traffic based on the Background, Best Effort, Video, and Voice access categories. AC can also refer to Alternating Current, a form of electric energy that flows when the appliances are plugged to a wall socket.

ACC

Advanced Cellular Coexistence. The ACC feature in APs enable WLANs to perform at peak efficiency by minimizing interference from 3G/4G/LTE networks, distributed antenna systems, and commercial small cell/femtocell equipment.

Access-Accept

Response from the RADIUS server indicating successful authentication and containing authorization information.

Access-Reject

Response from RADIUS server indicating that a user is not authorized.

Access-Request

RADIUS packet sent to a RADIUS server requesting authorization.

Accounting-Request

RADIUS packet type sent to a RADIUS server containing accounting summary information.

Accounting-Response

RADIUS packet sent by the RADIUS server to acknowledge receipt of an Accounting-Request.

ACE

Access Control Entry. ACE is an element in an ACL that includes access control information.

ACI

Adjacent Channel Interference. ACI refers to interference or interruptions detected on a broadcasting channel, caused by too much power on an adjacent channel in the spectrum.

ACL

Access Control List. ACL is a common way of restricting certain types of traffic on a physical port.

Active Directory

Microsoft Active Directory. The directory server that stores information about a variety of things, such as organizations, sites, systems, users, shares, and other network objects or components. It also provides authentication and authorization mechanisms, and a framework within which related services can be deployed.

ActiveSync

Mobile data synchronization app developed by Microsoft that allows a mobile device to be synchronized with either a desktop or a server running compatible software products.

ad hoc network

An ad hoc network is a network composed of individual devices communicating with each other directly. Many ad hoc networks are Local Area Networks (LANs) where computers or other devices are enabled to send data directly to one another rather than going through a centralized access point.

ADO

Active X Data Objects is a part of Microsoft Data Access Components (MDACs) that enables client applications to access data sources through an (Object Linking and Embedding Database) OLE DB provider. ADO supports key features for building client-server and Web-based applications.

ADP

Aruba Discovery Protocol. ADP is an Aruba proprietary Layer 2 protocol. It is used by the APs to obtain the IP address of the TFTP server from which it downloads the AP boot image.

AES

Advanced Encryption Standard. AES is an encryption standard used for encrypting and protecting electronic data. The AES encrypts and decrypts data in blocks of 128 bits (16 bytes), and can use keys of 128 bits, 192 bits, and 256 bits.

AIFSN

Arbitrary Inter-frame Space Number. AIFSN is set by the AP in beacon frames and probe responses. AIFS is a method of prioritizing a particular category of traffic over the other, for example prioritizing voice or video messages over email.

AirGroup

The application that allows the end users to register their personal mobile devices on a local network and define a group of friends or associates who are allowed to share them. AirGroup is primarily designed for colleges and other institutions. AirGroup uses zero configuration networking to allow Apple mobile devices, such as the AirPrint wireless printer service and the AirPlay mirroring service, to communicate over a complex access network topology.

AirWave Management Client

AirWave Management Client is a Windows software utility that enables client devices (such as a laptop) to act as passive RF sensors and augments the AirWave RAPIDS module.

ALE

Analytics and Location Engine. ALE gives visibility into everything the wireless network knows. This enables customers and partners to gain a wealth of information about the people on their premises. This can be very important for many different verticals and use cases. ALE includes a location engine that calculates associated and unassociated device location periodically using context streams, including RSSI readings, from WLAN controllers or Instant clusters.

ALG

Application Layer Gateway. ALG is a security component that manages application layer protocols such as SIP, FTP and so on.

AM

Air Monitor. AM is a mode of operation supported on wireless APs. When an AP operates in the Air Monitor mode, it enhances the wireless networks by collecting statistics, monitoring traffic, detecting intrusions, enforcing security policies, balancing wireless traffic load, self-healing coverage gaps, and more. However, clients cannot connect to APs operating in the AM mode.

AMON

Advanced Monitoring. AMON is used in Aruba WLAN deployments for improved network management, monitoring and diagnostic capabilities.

AMP

AirWave Management Platform. AMP is a network management system for configuring, monitoring, and upgrading wired and wireless devices on your network.

ANQP

Access Network Query Protocol. ANQP is a query and a response protocol for Wi-Fi hotspot services. ANQP includes information Elements (IEs) that can be sent from the AP to the client to identify the AP network and service provider. The IEs typically include information about the domain name of the AP operator, the IP addresses available at the AP, and information about potential roaming partners accessible through the AP. If the client responds with a request for a specific IE, the AP will send a Generic Advertisement Service (GAS) response frame with the configured ANQP IE information.

ANSI

American National Standards Institute. It refers to the ANSI compliance standards for products, systems, services, and processes.

API

Application Programming Interface. Refers to a set of functions, procedures, protocols, and tools that enable users to build application software.

app

Short form for application. It generally refers to the application that is downloaded and used on mobile devices.

ARM

Adaptive Radio Management. ARM dynamically monitors and adjusts the network to ensure that all users are allowed ready access. It enables full utilization of the available spectrum to support maximum number of users by intelligently choosing the best RF channel and transmit power for APs in their current RF environment.

ARP

Address Resolution Protocol. ARP is used for mapping IP network address to the hardware MAC address of a device.

Aruba Activate

Aruba Activate is a cloud-based service that helps provision your Aruba devices and maintain your inventory. Activate automates the provisioning process, allowing a single IT technician to easily and rapidly deploy devices throughout a distributed enterprise network.

ASCII

American Standard Code for Information Interchange. An ASCII code is a numerical representation of a character or an action.

B-RAS

Broadband Remote Access Server. A B-RAS is a server that facilitates and converges traffic from multiple Internet traffic resources such as cable, DSL, Ethernet, or Broadband wireless.

band

Band refers to a specified range of frequencies of electromagnetic radiation.

BGP

Border Gateway Protocol. BGP is a routing protocol for exchanging data and information between different host gateways or autonomous systems on the Internet.

BLE

Bluetooth Low Energy. The BLE functionality is offered by Bluetooth® to enable devices to run for long durations with low power consumption.

BMC

Beacon Management Console. BMC manages and monitors beacons from the BLE devices. The BLE devices are used for location tracking and proximity detection.

BPDU

Bridge Protocol Data Unit. A BPDU is a data message transmitted across a local area network to detect loops in network topologies.

BRE

Basic Regular Expression. The BRE syntax standards designed by the IEEE provides extension to the traditional Simple Regular Expressions syntax and allows consistency between utility programs such as grep, sed, and awk.

BSS

Basic Service Set. A BSS is a set of interconnected stations that can communicate with each other. BSS can be an independent BSS or infrastructure BSS. An independent BSS is an ad hoc network that does not include APs, whereas the infrastructure BSS consists of an AP and all its associated clients.

BSSID

Basic Service Set Identifier. The BSSID identifies a particular BSS within an area. In infrastructure BSS networks, the BSSID is the MAC address of the AP. In independent BSS or ad hoc networks, the BSSID is generated randomly.

BYOD

Bring Your Own Device. BYOD refers to the use of personal mobile devices within an enterprise network infrastructure.

CA

Certificate Authority or Certification Authority. Entity in a public key infrastructure system that issues certificates to clients. A certificate signing request received by the CA is converted into a certificate when the CA adds a signature generated with a private key. See digital certificate.

CAC

Call Admission Control. CAC regulates traffic volume in voice communications. CAC can also be used to ensure or maintain a certain level of audio quality in voice communications networks.

CALEA

Communications Assistance for Law Enforcement Act. To comply with the CALEA specifications and to allow lawful interception of Internet traffic by the law enforcement and intelligence agencies, the telecommunications carriers and manufacturers of telecommunications equipment are required to modify and design their equipment, facilities, and services to ensure that they have built-in surveillance capabilities.

Campus AP

Campus APs are used in private networks where APs connect over private links (LAN, WLAN, WAN or MPLS) and terminate directly on controllers. Campus APs are deployed as part of the indoor campus solution in enterprise office buildings, warehouses, hospitals, universities, and so on.

captive portal

A captive portal is a web page that allows the users to authenticate and sign in before connecting to a public-access network. Captive portals are typically used by business centers, airports, hotel lobbies, coffee shops, and other venues that offer free Wi-Fi hotspots for the guest users.

CCA

Clear Channel Assessment. In wireless networks, the CCA method detects if a channel is occupied or clear, and determines if the channel is available for data transmission.

CDP

Cisco Discovery Protocol. CDP is a proprietary Data Link Layer protocol developed by Cisco Systems. CDP runs on Cisco devices and enables networking applications to learn about the neighboring devices directly connected to the network.

CDR

Call Detail Record. A CDR contains the details of a telephone or VoIP call, such as the origin and destination addresses of the call, the start time and end time of the call, any toll charges that were added through the network or charges for operator services, and so on.

CEF

Common Event Format. The CEF is a standard for the interoperability of event or log-generating devices and applications. The standard syntax for CEF includes a prefix and a variable extension formatted as key-value pairs.

CGI

Common Gateway Interface. CGI is a standard protocol for exchanging data between the web servers and executable programs running on a server to dynamically process web pages.

CHAP

Challenge Handshake Authentication Protocol. CHAP is an authentication scheme used by PPP servers to validate the identity of remote clients.

CIDR

Classless Inter-Domain Routing. CIDR is an IP standard for creating and allocating unique identifiers for networks and devices. The CIDR IP addressing scheme is used as a replacement for the older IP addressing scheme based on classes A, B, and C. With CIDR, a single IP address can be used to designate many unique IP addresses. A CIDR IP address ends with a slash followed by the IP network prefix, for example, 192.0.2.0/24.

ClearPass

ClearPass is an access management system for creating and enforcing policies across a network to all devices and applications. The ClearPass integrated platform includes applications such as Policy Manager, Guest, Onboard, OnGuard, Insight, Profile, QuickConnect, and so on.

ClearPass Guest

ClearPass Guest is a configurable ClearPass application for secure visitor network access management.

ClearPass Policy Manager

ClearPass Policy Manager is a baseline platform for policy management, AAA, profiling, network access control, and reporting. With ClearPass Policy Manager, the network administrators can configure and manage secure network access that accommodates requirements across multiple locations and multivendor networks, regardless of device ownership and connection method.

CLI

Command-Line Interface. A console interface with a command line shell that allows users to execute text input as commands and convert these commands to appropriate functions.

CN

Common Name. CN is the primary name used to identify a certificate.

CNA

Captive Network Assistant. CNA is a popup page shown when joining a network that has a captive portal.

CoA

Change of Authorization. The RADIUS CoA is used in the AAA service framework to allow dynamic modification of the authenticated, authorized, and active subscriber sessions.

CoS

Class of Service. CoS is used in data and voice protocols for classifying packets into different types of traffic (voice, video, or data) and setting a service priority. For example, voice traffic can be assigned a higher priority over email or HTTP traffic.

CPE

Customer Premises Equipment. It refers to any terminal or equipment located at the customer premises.

CPsec

Control Plane Security. CPsec is a secure form of communication between a controller and APs to protect the control plane communications. This is performed by means of using public-key self-signed certificates created by each master controller.

CPU

Central Processing Unit. A CPU is an electronic circuitry in a computer for processing instructions.

CRC

Cyclic Redundancy Check. CRC is a data verification method for detecting errors in digital data during transmission, storage, or retrieval.

CRL

Certificate Revocation List. CRL is a list of revoked certificates maintained by a certification authority.

cryptobinding

Short for cryptographic binding. A procedure in a tunneled EAP method that binds together the tunnel protocol and the tunneled authentication methods, ensuring the relationship between a collection of data assets. Cryptographic binding focuses on protecting the server; mutual cryptographic binding protects both peer and server.

CSA

Channel Switch Announcement. The CSA element enables an AP to advertise that it is switching to a new channel before it begins transmitting on that channel. This allows the clients, which support CSA, to transition to the new channel with minimal downtime.

CSMA/CA

Carrier Sense Multiple Access / Collision Avoidance. CSMA/CA is a protocol for carrier transmission in networks using the 802.11 standard. CSMA/CA aims to prevent collisions by listening to the broadcasting nodes, and informing devices not to transmit any data until the broadcasting channel is free.

CSR

Certificate Signing Request. In PKI systems, a CSR is a message sent from an applicant to a CA to apply for a digital identity certificate.

CSV

Comma-Separated Values. A file format that stores tabular data in the plain text format separated by commas.

CTS

Clear to Send. The CTS refers to the data transmission and protection mechanism used by the 802.11 wireless networking protocol to prevent frame collision occurrences. See RTS.

CW

Contention Window. In QoS, CW refers to a window set for access categories based on the type of traffic. Based on the type and volume of the traffic, the minimum and maximum values can be calculated to provide a wider window when necessary.

DAI

Dynamic ARP inspection. A security feature that validates ARP packets in a network.

DAS

Distributed Antenna System. DAS is a network of antenna nodes strategically placed around a geographical area or structure for additional cellular coverage.

dB

Decibel. Unit of measure for sound or noise and is the difference or ratio between two signal levels.

dBm

Decibel-Milliwatts. dBm is a logarithmic measurement (integer) that is typically used in place of mW to represent receive-power level. AMP normalizes all signals to dBm, so that it is easy to evaluate performance between various vendors.

DCB

Data Center Bridging. DCB is a collection of standards developed by IEEE for creating a converged data center network using Ethernet.

DCE

Data Communication Equipment. DCE refers to the devices that establish, maintain, and terminate communication network sessions between a data source and its destination.

DCF

Distributed Coordination Function. DCF is a protocol that uses carrier sensing along with a four-way handshake to maximize the throughput while preventing packet collisions.

DDMO

Distributed Dynamic Multicast Optimization. DDMO is similar to Dynamic Multicast Optimization (DMO) where the multicast streams are converted into unicast streams on the AP instead of the controller, to

enhance the quality and reliability of streaming videos, while preserving the bandwidth available to non-video clients.

DES

Data Encryption Standard. DES is a common standard for data encryption and a form of secret key cryptography, which uses only one key for encryption and decryption.

designated router

Designated router refers to a router interface that is elected to originate network link advertisements for networks using the OSPF protocol.

destination NAT

Destination Network Address Translation. Destination NAT is a process of translating the destination IP address of an end route packet in a network. Destination NAT is used for redirecting the traffic destined to a virtual host to the real host, where the virtual host is identified by the destination IP address and the real host is identified by the translated IP address.

DFS

Dynamic Frequency Selection. DFS is a mandate for radio systems operating in the 5 GHz band to be equipped with means to identify and avoid interference with Radar systems.

DFT

Discrete Fourier Transform. DFT converts discrete-time data sets into a discrete-frequency representation. See FFT.

DHCP

Dynamic Host Configuration Protocol. A network protocol that enables a server to automatically assign an IP address to an IP-enabled device from a defined range of numbers configured for a given network.

DHCP snooping

DHCP snooping enables the switch to monitor and control DHCP messages received from untrusted devices that are connected to the switch.

digital certificate

A digital certificate is an electronic document that uses a digital signature to bind a public key with an identity—information such as the name of a person or an organization, address, and so forth.

Digital wireless pulse

A wireless technology for transmitting large amounts of digital data over a wide spectrum of frequency bands with very low power for a short distance. Ultra Wideband radio can carry a huge amount of data over a distance up to 230 ft at very low power (less than 0.5 mW), and has the ability to carry signals through doors and other obstacles that tend to reflect signals at more limited bandwidths and a higher power.

Disconnect-Ack

Disconnect-Ack is a NAS response packet to a Disconnect-Request, which indicates that the session was disconnected.

Disconnect-Nak

Disconnect-Nak is NAS response packet to a Disconnect-Request, which indicates that the session was not disconnected.

Disconnect-Request

Disconnect-Request is a RADIUS packet type sent to a NAS requesting that a user or session be disconnected.

distribution certificate

Distribution certificate is used for digitally signing iOS mobile apps to enable enterprise app distribution. It verifies the identity of the app publisher.

DLNA

Digital Living Network Alliance. DLNA is a set of interoperability guidelines for sharing digital media among multimedia devices.

DMO

Dynamic Multicast Optimization. DMO is a process of converting multicast streams into unicast streams over a wireless link to enhance the quality and reliability of streaming videos, while preserving the bandwidth available to non-video clients.

DN

Distinguished Name. A series of fields in a digital certificate that, taken together, constitute the unique identity of the person or device that owns the digital certificate. Common fields in a DN include country, state, locality, organization, organizational unit, and the “common name”, which is the primary name used to identify the certificate.

DNS

Domain Name System. A DNS server functions as a phone book for the intranet and Internet users. It converts human-readable computer host names into IP addresses and IP addresses into host names. It stores several records for a domain name such as an address 'A' record, name server (NS), and mail exchanger (MX) records. The Address 'A' record is the most important record that is stored in a DNS server, because it provides the required IP address for a network peripheral or element.

DOCSIS

Data over Cable Service Interface Specification. A telecommunication standard for Internet access through cable modem.

DoS

Denial of Service. DoS is any type of attack where the attackers send excessive messages to flood traffic and thereby preventing the legitimate users from accessing the service.

DPD

Dead Peer Detection. A method used by the network devices to detect the availability of the peer devices.

DPI

Deep Packet Inspection. DPI is an advanced method of network packet filtering that is used for inspecting data packets exchanged between the devices and systems over a network. DPI functions at the Application layer of the Open Systems Interconnection (OSI) reference model and enables users to identify, categorize, track, reroute, or stop packets passing through a network.

DRT

Downloadable Regulatory Table. The DRT feature allows new regulatory approvals to be distributed for APs without a software upgrade or patch.

DS

Differentiated Services. The DS specification aims to provide uninterrupted quality of service by managing and controlling the network traffic, so that certain types of traffic get precedence.

DSCP

Differentiated Services Code Point. DSCP is a 6-bit packet header value used for traffic classification and priority assignment.

DSL

Digital Subscriber Line. The DSL technology allows the transmission of digital data over telephone lines. A DSL modem is a device used for connecting a computer or router to a telephone line that offers connectivity to the Internet.

DSSS

Direct-Sequence Spread Spectrum. DSSS is a modulation technique used for reducing overall signal interference. This technique multiplies the original data signal with a pseudo random noise spreading code. Spreading of this signal makes the resulting wideband channel more noisy, thereby increasing the resistance to interference. See FHSS.

DST

Daylight Saving Time. DST is also known as summer time that refers to the practice of advancing clocks, so that evenings have more daylight and mornings have less. Typically clocks are adjusted forward one hour near the start of spring and are adjusted backward in autumn.

DTE

Data Terminal Equipment. DTE refers to a device that converts user information into signals or re-converts the received signals.

DTIM

Delivery Traffic Indication Message. DTIM is a kind of traffic indication map. A DTIM interval determines when the APs must deliver broadcast and multicast frames to their associated clients in power save mode.

DTLS

Datagram Transport Layer Security. DTLS communications protocol provides communications security for datagram protocols.

dynamic authorization

Dynamic authorization refers to the ability to make changes to a visitor account's session while it is in progress. This might include disconnecting a session or updating some aspect of the authorization for the session.

dynamic NAT

Dynamic Network Address Translation. Dynamic NAT maps multiple public IP addresses and uses these addresses with an internal or private IP address. Dynamic NAT helps to secure a network by masking the internal configuration of a private network.

EAP

Extensible Authentication Protocol. An authentication protocol for wireless networks that extends the methods used by the PPP, a protocol often used when connecting a computer to the Internet. EAP can support multiple authentication mechanisms, such as token cards, smart cards, certificates, one-time passwords, and public key encryption authentication.

EAP-FAST

EAP – Flexible Authentication Secure Tunnel (tunneled).

EAP-GTC

EAP – Generic Token Card. (non-tunneled).

EAP-MD5

EAP – Method Digest 5. (non-tunneled).

EAP-MSCHAP

EAP Microsoft Challenge Handshake Authentication Protocol.

EAP-MSCHAPv2

EAP Microsoft Challenge Handshake Authentication Protocol Version 2.

EAP-PEAP

EAP–Protected EAP. A widely used protocol for securely transporting authentication data across a network (tunneled).

EAP-PWD

EAP-Password. EAP-PWD is an EAP method that uses a shared password for authentication.

EAP-TLS

EAP–Transport Layer Security. EAP-TLS is a certificate-based authentication method supporting mutual authentication, integrity-protected ciphersuite negotiation and key exchange between two endpoints. See RFC 5216.

EAP-TTLS

EAP–Tunneled Transport Layer Security. EAP-TTLS is an EAP method that encapsulates a TLS session, consisting of a handshake phase and a data phase. See RFC 5281.

EAPoL

Extensible Authentication Protocol over LAN. A network port authentication protocol used in IEEE 802.1X standards to provide a generic network sign-on to access network resources.

ECC

Elliptical Curve Cryptography or Error correcting Code memory. Elliptical Curve Cryptography is a public-key encryption technique that is based on elliptic curve theory used for creating faster, smaller, and more efficient cryptographic keys. Error Correcting Code memory is a type of computer data storage that can detect and correct the most common kinds of internal data corruption. ECC memory is used in most computers where data corruption cannot be tolerated under any circumstances, such as for scientific or financial computing.

ECDSA

Elliptic Curve Digital Signature Algorithm. ECDSA is a cryptographic algorithm that supports the use of public or private key pairs for encrypting and decrypting information.

EDCA

Enhanced Distributed Channel Access. The EDCA function in the IEEE 802.11e Quality of Service standard supports differentiated and distributed access to wireless medium based on traffic priority and Access Category types. See WMM and WME.

EIGRP

Enhanced Interior Gateway Routing Protocol. EIGRP is a routing protocol used for automating routing decisions and configuration in a network.

EIRP

Effective Isotropic Radiated Power or Equivalent Isotropic Radiated Power. EIRP refers to the output power generated when a signal is concentrated into a smaller area by the Antenna.

ESI

External Services Interface. ESI provides an open interface for integrating security solutions that solve interior network problems such as viruses, worms, spyware, and corporate compliance.

ESS

Extended Service Set. An ESS is a set of one or more interconnected BSSs that form a single sub network.

ESSID

Extended Service Set Identifier. ESSID refers to the ID used for identifying an extended service set.

Ethernet

Ethernet is a network protocol for data transmission over LAN.

EULA

End User License Agreement. EULA is a legal contract between a software application publisher or author and the users of the application.

FCC

Federal Communications Commission. FCC is a regulatory body that defines standards for the interstate and international communications by radio, television, wire, satellite, and cable.

FFT

Fast Fourier Transform. FFT is a frequency analysis mechanism that aims at faster conversion of a discrete signal in time domain into a discrete frequency domain representation. See also DFT.

FHSS

Frequency Hopping Spread Spectrum. FHSS is transmission technique that allows modulation and transmission of a data signal by rapidly switching a carrier among many frequency channels in a random but predictable sequence. See also DSSS.

FIB

Forwarding Information Base. FIB is a forwarding table that maps MAC addresses to ports. FIB is used in network bridging, routing, and similar functions to identify the appropriate interface for forwarding packets.

FIPS

Federal Information Processing Standards. FIPS refers to a set of standards that describe document processing, encryption algorithms, and other information technology standards for use within non-military government agencies, and by government contractors and vendors who work with these agencies.

firewall

Firewall is a network security system used for preventing unauthorized access to or from a private network.

FQDN

Fully Qualified Domain Name. FQDN is a complete domain name that identifies a computer or host on the Internet.

FQLN

Fully Qualified Location Name. FQLN is a device location identifier in the format: APname.Floor.Building.Campus.

frequency allocation

Use of radio frequency spectrum as regulated by governments.

FSPL

Free Space Path Loss. FSPL refers to the loss in signal strength of an electromagnetic wave that would result from a line-of-sight path through free space (usually air), with no obstacles nearby to cause reflection or diffraction.

FTP

File Transfer Protocol. A standard network protocol used for transferring files between a client and server on a computer network.

GARP

Generic Attribute Registration Protocol. GVRP is a LAN protocol that allows the network nodes to register and de-register attributes, such as network addresses, with each other.

GAS

Generic Advertisement Service. GAS is a request-response protocol, which provides Layer 2 transport mechanism between a wireless client and a server in the network prior to authentication. It helps in determining a wireless network infrastructure before associating clients, and allows clients to send queries to multiple 802.11 networks in parallel.

gateway

Gateway is a network node that allows traffic to flow in and out of the network.

Gbps

Gigabits per second.

GBps

Gigabytes per second.

GET

GET refers HTTP request method or an SNMP operation method. The GET HTTP request method submits data to be processed to a specified resource. The GET SNMP operation method obtains information from the Management Information Base (MIB).

GHz

Gigahertz.

GMT

Greenwich Mean Time. GMT refers to the mean solar time at the Royal Observatory in Greenwich, London. GMT is the same as Coordinated Universal Time (UTC) standard, written as an offset of UTC +/- 00:00.

goodput

Goodput is the application level throughput that refers to the ratio of the total bytes transmitted or received in the network to the total air time required for transmitting or receiving the bytes.

GPS

Global Positioning System. A satellite-based global navigation system.

GRE

Generic Routing Encapsulation. GRE is an IP encapsulation protocol that is used to transport packets over a network.

GTC

Generic Token Card. GTC is a protocol that can be used as an alternative to MSCHAPv2 protocol. GTC allows authentication to various authentication databases even in cases where MSCHAPv2 is not supported by the database.

GVRP

GARP VLAN Registration Protocol or Generic VLAN Registration Protocol. GARP is an IEEE 802.1Q-compliant protocol that facilitates VLAN registration and controls VLANs within a larger network.

H2QP

Hotspot 2.0 Query Protocol.

hot zone

Wireless access area created by multiple hotspots that are located in close proximity to one another. Hot zones usually combine public safety APs with public hotspots.

hotspot

Hotspot refers to a WLAN node that provides Internet connection and virtual private network (VPN) access from a given location. A business traveler, for example, with a laptop equipped for Wi-Fi can look up a local hotspot, contact it, and get connected through its network to reach the Internet.

HSPA

High-Speed Packet Access.

HT

High Throughput. IEEE 802.11n is an HT WLAN standard that aims to achieve physical data rates of close to 600 Mbps on the 2.4 GHz and 5 GHz bands.

HTTP

Hypertext Transfer Protocol. The HTTP is an application protocol to transfer data over the web. The HTTP protocol defines how messages are formatted and transmitted, and the actions that the w servers and browsers should take in response to various commands.

HTTPS

Hypertext Transfer Protocol Secure. HTTPS is a variant of the HTTP that adds a layer of security on the data in transit through a secure socket layer or transport layer security protocol connection.

IAS

Internet Authentication Service. IAS is a component of Windows Server operating systems that provides centralized user authentication, authorization, and accounting.

ICMP

Internet Control Message Protocol. ICMP is an error reporting protocol. It is used by network devices such as routers, to send error messages and operational information to the source IP address when network problems prevent delivery of IP packets.

IDS

Intrusion Detection System. IDS monitors a network or systems for malicious activity or policy violations and reports its findings to the management system deployed in the network.

IEEE

Institute of Electrical and Electronics Engineers.

IGMP

Internet Group Management Protocol. Communications protocol used by hosts and adjacent routers on IP networks to establish multicast group memberships.

IGMP snooping

IGMP snooping prevents multicast flooding on Layer 2 network by treating multicast traffic as broadcast traffic. Without IGMP snooping, all streams could be flooded to all ports on that VLAN. When multicast flooding occurs, end-hosts that happen to be in the same VLAN would receive all the streams only to be discarded without snooping.

IGP

Interior Gateway Protocol. IGP is used for exchanging routing information between gateways within an autonomous system (for example, a system of corporate local area networks).

IGRP

Interior Gateway Routing Protocol. IGRP is a distance vector interior routing protocol used by routers to exchange routing data within an autonomous system.

IKE

Internet Key Exchange. IKE is a key management protocol used with IPsec protocol to establish a secure communication channel. IKE provides additional feature, flexibility, and ease of configuration for IPsec standard.

IKEv1

Internet Key Exchange version 1. IKEv1 establishes a secure authenticated communication channel by using either the pre-shared key (shared secret), digital signatures, or public key encryption. IKEv1 operates in Main and Aggressive modes. See RFC 2409.

IKEv2

Internet Key Exchange version 2. IKEv2 uses the secure channel established in Phase 1 to negotiate Security Associations on behalf of services such as IPsec. IKEv2 uses pre-shared key and Digital Signature for authentication. See RFC 4306.

IoT

Internet of Things. IoT refers to the internetworking of devices that are embedded with electronics, software, sensors, and network connectivity features allowing data exchange over the Internet.

IPM

Intelligent Power Monitoring. IPM is a feature supported on certain APs that actively measures the power utilization of an AP and dynamically adapts to the power resources.

IPS

Intrusion Prevention System. The IPS monitors a network for malicious activities such as security threats or policy violations. The main function of an IPS is to identify suspicious activity, log the information, attempt to block the activity, and report it.

IPsec

Internet Protocol security. IPsec is a protocol suite for secure IP communications that authenticates and encrypts each IP packet in a communication session.

IPSG

Internet Protocol Source Guard. IPSG restricts IP address from untrusted interface by filtering traffic based on list of addresses in the DHCP binding database or manually configured IP source bindings. It prevents IP spoofing attacks.

IrDA

An industry-sponsored organization set up in 1993 to create international standards for the hardware and software used in infrared communication links. In this special form of radio transmission, a focused ray of light in the infrared frequency spectrum, measured in terahertz (THz), or trillions of hertz (cycles per second), is modulated with information and sent from a transmitter to a receiver over a relatively short distance.

ISAKMP

Internet Security Association and Key Management Protocol. ISAKMP is used for establishing Security Associations and cryptographic keys in an Internet environment.

ISP

Internet Service Provider. An ISP is an organization that provides services for accessing and using the Internet.

JSON

JavaScript Object Notation. JSON is an open-standard, language-independent, lightweight data-interchange format used to transmit data objects consisting of attribute–value pairs. JSON uses a "self-describing" text format that is easy for humans to read and write, and that can be used as a data format by any programming language.

Kbps

Kilobits per second.

KBps

Kilobytes per second.

keepalive

Signal sent at periodic intervals from one device to another to verify that the link between the two devices is working. If no reply is received, data will be sent by a different path until the link is restored. A keepalive can also be used to indicate that the connection should be preserved so that the receiving device does not consider it timed out and drop it.

L2TP

Layer-2 Tunneling Protocol. L2TP is a networking protocol used by the ISPs to enable VPN operations.

LACP

Link Aggregation Control Protocol. LACP is used for the collective handling of multiple physical ports that can be seen as a single channel for network traffic purposes.

LAG

Link Aggregation Group . A LAG combines a number of physical ports together to make a single high-bandwidth data path. LAGs can connect two switches to provide a higher-bandwidth connection to a public network.

LAN

Local Area Network. A LAN is a network of connected devices within a distinct geographic area such as an office or a commercial establishment and share a common communications line or wireless link to a server.

LCD

Liquid Crystal Display. LCD is the technology used for displays in notebook and other smaller computers. Like LED and gas-plasma technologies, LCDs allow displays to be much thinner than the cathode ray tube technology.

LDAP

Lightweight Directory Access Protocol. LDAP is a communication protocol that provides the ability to access and maintain distributed directory information services over a network.

LDPC

Low-Density Parity-Check. LDPC is a method of transmitting a message over a noisy transmission channel using a linear error correcting code. An LDPC is constructed using a sparse bipartite graph.

LEAP

Lightweight Extensible Authentication Protocol. LEAP is a Cisco proprietary version of EAP used in wireless networks and Point-to-Point connections.

LED

Light Emitting Diode. LED is a semiconductor light source that emits light when an electric current passes through it.

LEEF

Log Event Extended Format. LEEF is a type of customizable syslog event format. An extended log file contains a sequence of lines containing ASCII characters terminated by either the sequence LF or CRLF.

LI

Lawful Interception. LI refers to the procedure of obtaining communications network data by the Law Enforcement Agencies for the purpose of analysis or evidence.

LLDP

Link Layer Discovery Protocol. LLDP is a vendor-neutral link layer protocol in the Internet Protocol suite used by network devices for advertising their identity, capabilities, and neighbors on an IEEE 802 local area network, which is principally a wired Ethernet.

LLDP-MED

LLDP–Media Endpoint Discovery. LLDP-MED facilitates information sharing between endpoints and network infrastructure devices.

LMS

Local Management Switch. In multi-controller networks, each controller acts as an LMS and terminates user traffic from the APs, processes, and forwards the traffic to the wired network.

LNS

L2TP Network Server. LNS is an equipment that connects to a carrier and handles the sessions from broadband lines. It is also used for dial-up and mobile links. LNS handles authentication and routing of the IP addresses. It also handles the negotiation of the link with the equipment and establishes a session.

LTE

Long Term Evolution. LTE is a 4G wireless communication standard that provides high-speed wireless communication for mobile phones and data terminals. See 4G.

MAB

MAC Authentication Bypass. Endpoints such as network printers, Ethernet-based sensors, cameras, and wireless phones do not support 802.1X authentication. For such endpoints, MAC Authentication Bypass mechanism is used. In this method, the MAC address of the endpoint is used to authenticate the endpoint.

MAC

Media Access Control. A MAC address is a unique identifier assigned to network interfaces for communications on a network.

MAM

Mobile Application Management. MAM refers to software and services used to secure, manage, and distribute mobile applications used in enterprise settings on mobile devices like smartphones and tablet computers. Mobile Application Management can apply to company-owned mobile devices as well as BYOD.

Mbps

Megabits per second

MBps

Megabytes per second

MCS

Modulation and Coding Scheme. MCS is used as a parameter to determine the data rate of a wireless connection for high throughput.

MD4

Message Digest 4. MD4 is an earlier version of MD5 and is an algorithm used to verify data integrity through the creation of a 128-bit message digest from data input.

MD5

Message Digest 5. The MD5 algorithm is a widely used hash function producing a 128-bit hash value from the data input.

MDAC

Microsoft Data Access Components. MDAC is a framework of interrelated Microsoft technologies that provides a standard database for Windows OS.

MDM

Mobile Device Management. MDM is an administrative software to manage, monitor, and secure mobile devices of the employees in a network.

mDNS

Multicast Domain Name System. mDNS provides the ability to perform DNS-like operations on the local link in the absence of any conventional unicast DNS server. The mDNS protocol uses IP multicast User Datagram Protocol (UDP) packets, and is implemented by the Apple Bonjour and Linux NSS-mDNS services. mDNS works in conjunction with DNS Service Discovery (DNS-SD), a companion zero-configuration technique specified. See RFC 6763.

MFA

Multi-factor Authentication. MFA lets you require multiple factors, or proofs of identity, when authenticating a user. Policy configurations define how often multi-factor authentication will be required, or conditions that will trigger it.

MHz

Megahertz

MIB

Management Information Base. A hierarchical database used by SNMP to manage the devices being monitored.

microwave

Electromagnetic energy with a frequency higher than 1 GHz, corresponding to wavelength shorter than 30 centimeters.

MIMO

Multiple Input Multiple Output. An antenna technology for wireless communications in which multiple antennas are used at both source (transmitter) and destination (receiver). The antennas at each end of the communications circuit are combined to minimize errors and optimize data speed.

MISO

Multiple Input Single Output. An antenna technology for wireless communications in which multiple antennas are used at the source (transmitter). The antennas are combined to minimize errors and optimize data speed. The destination (receiver) has only one antenna.

MLD

Multicast Listener Discovery. A component of the IPv6 suite. It is used by IPv6 routers for discovering multicast listeners on a directly attached link.

MPDU

MAC Protocol Data Unit. MPDU is a message exchanged between MAC entities in a communication system based on the layered OSI model.

MPLS

Multiprotocol Label Switching. The MPLS protocol speeds up and shapes network traffic flows.

MPPE

Microsoft Point-to-Point Encryption. A method of encrypting data transferred across PPP-based dial-up connections or PPTP-based VPN connections.

MS-CHAP

Microsoft Challenge Handshake Authentication Protocol. MS-CHAP is Password-based, challenge-response, mutual authentication protocol that uses MD4 and DES encryption.

MS-CHAPv1

Microsoft Challenge Handshake Authentication Protocol version 1. MS-CHAPv1 extends the user authentication functionality provided on Windows networks to remote workstations. MS-CHAPv1 supports only one-way authentication.

MS-CHAPv2

Microsoft Challenge Handshake Authentication Protocol version 2. MS-CHAPv2 is an enhanced version of the MS-CHAP protocol that supports mutual authentication.

MSS

Maximum Segment Size. MSS is a parameter of the options field in the TCP header that specifies the largest amount of data, specified in bytes, that a computer or communications device can receive in a single TCP segment.

MSSID

Mesh Service Set Identifier. MSSID is the SSID used by the client to access a wireless mesh network.

MSTP

Multiple Spanning Tree Protocol. MSTP configures a separate Spanning Tree for each VLAN group and blocks all but one of the possible alternate paths within each spanning tree.

MTU

Maximum Transmission Unit. MTU is the largest size packet or frame specified in octets (eight-bit bytes) that can be sent in networks such as the Internet.

MU-MIMO

Multi-User Multiple-Input Multiple-Output. MU-MIMO is a set of multiple-input and multiple-output technologies for wireless communication, in which users or wireless terminals with one or more antennas

communicate with each other.

MVRP

Multiple VLAN Registration Protocol. MVRP is a Layer 2 network protocol used for automatic configuration of VLAN information on switches.

mW

milliWatts. mW is 1/1000 of a Watt. It is a linear measurement (always positive) that is generally used to represent transmission.

NAC

Network Access Control. NAC is a computer networking solution that uses a set of protocols to define and implement a policy that describes how devices can secure access to network nodes when they initially attempt to connect to a network.

NAD

Network Access Device. NAD is a device that automatically connects the user to the preferred network, for example, an AP or an Ethernet switch.

NAK

Negative Acknowledgement. NAK is a response indicating that a transmitted message was received with errors or it was corrupted, or that the receiving end is not ready to accept transmissions.

NAP

Network Access Protection. The NAP feature in the Windows Server allows network administrators to define specific levels of network access based on identity, groups, and policy compliance. The NAP Agent is a service that collects and manages health information for NAP client computers. If a client is not compliant, NAP provides a mechanism to automatically bring the client back into compliance and then dynamically increase its level of network access.

NAS

Network Access Server. NAS provides network access to users, such as a wireless AP, network switch, or dial-in terminal server.

NAT

Network Address Translation. NAT is a method of remapping one IP address space into another by modifying network address information in Internet Protocol (IP) datagram packet headers while they are in transit across a traffic routing device.

NetBIOS

Network Basic Input/Output System. A program that lets applications on different computers communicate within a LAN.

netmask

Netmask is a 32-bit mask used for segregating IP address into subnets. Netmask defines the class and range of IP addresses.

NFC

Near-Field Communication. NFC is a short-range wireless connectivity standard (ECMA-340, ISO/IEC 18092) that uses magnetic field induction to enable communication between devices when they touch or are brought closer (within a few centimeters of distance). The standard specifies a way for the devices to establish a peer-to-peer (P2P) network to exchange data.

NIC

Network Interface Card. NIC is a hardware component that allows a device to connect to the network.

Nmap

Network Mapper. Nmap is an open-source utility for network discovery and security auditing. Nmap uses IP packets to determine such things as the hosts available on a network and their services, operating systems and versions, types of packet filters/firewalls, and so on.

NMI

Non-Maskable Interrupt. NMI is a hardware interrupt that standard interrupt-masking techniques in the system cannot ignore. It typically occurs to signal attention for non-recoverable hardware errors.

NMS

Network Management System. NMS is a set of hardware and/or software tools that allow an IT professional to supervise the individual components of a network within a larger network management framework.

NOE

New Office Environment. NOE is a proprietary VoIP protocol designed by Alcatel-Lucent Enterprise.

NTP

Network Time Protocol. NTP is a protocol for synchronizing the clocks of computers over a network.

OAuth

Open Standard for Authorization. OAuth is a token-based authorization standard that allows websites or third-party applications to access user information, without exposing the user credentials.

OCSP

Online Certificate Status Protocol. OCSP is used for determining the current status of a digital certificate without requiring a CRL.

OFDM

Orthogonal Frequency Division Multiplexing. OFDM is a scheme for encoding digital data on multiple carrier frequencies.

OID

Object Identifier. An OID is an identifier used to name an object. The OIDs represent nodes or managed objects in a MIB hierarchy. The OIDs are designated by text strings and integer sequences and are formally defined as per the ASN.1 standard.

OKC

Opportunistic Key Caching. OKC is a technique available for authentication between multiple APs in a network where those APs are under common administrative control. Using OKC, a station roaming to any AP in the network will not have to complete a full authentication exchange, but will instead just perform the 4-way handshake to establish transient encryption keys.

onboarding

The process of preparing a device for use on an enterprise network, by creating the appropriate access credentials and setting up the network connection parameters.

OpenFlow

OpenFlow is an open communications interface between control plane and the forwarding layers of a network.

OpenFlow agent

OpenFlow agent. OpenFlow is a software module in Software-Defined Networking (SDN) that allows the abstraction of any legacy network element, so that it can be integrated and managed by the SDN controller. OpenFlow runs on network devices such as switches, routers, wireless controllers, and APs.

Optical wireless

Optical wireless is combined use of conventional radio frequency wireless and optical fiber for telecommunication. Long-range links are provided by using optical fibers; the links from the long-range endpoints to end users are accomplished by RF wireless or laser systems. RF wireless at Ultra High Frequencies and microwave frequencies can carry broadband signals to individual computers at substantial data speeds.

OSI

Open Systems Interconnection. OSI is a reference model that defines a framework for communication between the applications in a network.

OSPF

Open Shortest Path First. OSPF is a link-state routing protocol for IP networks. It uses a link-state routing algorithm and falls into the group of interior routing protocols that operates within a single Autonomous System (AS).

OSPFv2

Open Shortest Path First version 2. OSPFv2 is the version 2 of the link-state routing protocol, OSPF. See RFC 2328.

OUI

Organizationally Unique Identifier. Synonymous with company ID or vendor ID, an OUI is a 24-bit, globally unique assigned number, referenced by various standards. The first half of a MAC address is OUI.

OVA

Open Virtualization Archive. OVA contains a compressed installable version of a virtual machine.

OVF

Open Virtualization Format. OVF is a specification that describes an open-standard, secure, efficient, portable and extensible format for packaging and distributing software for virtual machines.

PAC

Protected Access Credential. PAC is distributed to clients for optimized network authentication. These credentials are used for establishing an authentication tunnel between the client and the authentication server.

PAP

Password Authentication Protocol. PAP validates users by password. PAP does not encrypt passwords for transmission and is thus considered insecure.

PAPI

Process Application Programming Interface. PAPI controls channels for ARM and Wireless Intrusion Detection System (WIDS) communication to the master controller. A separate PAPI control channel connects to the local controller where the SSID tunnels terminate.

PBR

Policy-based Routing. PBR provides a flexible mechanism for forwarding data packets based on polices configured by a network administrator.

PDU

Power Distribution Unit or Protocol Data Unit. Power Distribution Unit is a device that distributes electric power to the networking equipment located within a data center. Protocol Data Unit contains protocol control Information that is delivered as a unit among peer entities of a network.

PEAP

Protected Extensible Authentication Protocol. PEAP is a type of EAP communication that addresses security issues associated with clear text EAP transmissions by creating a secure channel encrypted and protected by TLS.

PEF

Policy Enforcement Firewall. PEF also known as PEFNG provides context-based controls to enforce application-layer security and prioritization. The customers using Aruba mobility controllers can avail PEF features and services by obtaining a PEF license. PEF for VPN users—Customers with PEF for VPN license can apply firewall policies to the user traffic routed to a controller through a VPN tunnel.

PEFNG

Policy Enforcement Firewall. PEF also known as PEFNG provides context-based controls to enforce application-layer security and prioritization. The customers using Aruba mobility controllers can avail PEF features and services by obtaining a PEF license. PEF for VPN users—Customers with PEF for VPN license can apply firewall policies to the user traffic routed to a controller through a VPN tunnel.

PEFV

Policy Enforcement Firewall. PEF also known as PEFNG provides context-based controls to enforce application-layer security and prioritization. The customers using Aruba mobility controllers can avail PEF

features and services by obtaining a PEF license. PEF for VPN users—Customers with PEF for VPN license can apply firewall policies to the user traffic routed to a controller through a VPN tunnel.

PFS

Perfect Forward Secrecy. PFS refers to the condition in which a current session key or long-term private key does not compromise the past or subsequent keys.

PHB

Per-hop behavior. PHB is a term used in DS or MPLS. It defines the policy and priority applied to a packet when traversing a hop (such as a router) in a DiffServ network.

PIM

Protocol-Independent Multicast. PIM refers to a family of multicast routing protocols for IP networks that provide one-to-many and many-to-many distribution of data over a LAN, WAN, or the Internet.

PIN

Personal Identification Number. PIN is a numeric password used to authenticate a user to a system.

PKCS#n

Public-key cryptography standard n. PKCS#n refers to a numbered standard related to topics in cryptography, including private keys (PKCS#1), digital certificates (PKCS#7), certificate signing requests (PKCS#10), and secure storage of keys and certificates (PKCS#12).

PKI

Public Key Infrastructure. PKI is a security technology based on digital certificates and the assurances provided by strong cryptography. See also certificate authority, digital certificate, public key, private key.

PLMN

Public Land Mobile Network. PLMS is a network established and operated by an administration or by a Recognized Operating Agency for the specific purpose of providing land mobile telecommunications services to the public.

PMK

Pairwise Master Key. PMK is a shared secret key that is generated after PSK or 802.1X authentication.

PoE

Power over Ethernet. PoE is a technology for wired Ethernet LANs to carry electric power required for the device in the data cables. The IEEE 802.3af PoE standard provides up to 15.4 W of power on each port.

PoE+

Power over Ethernet+. PoE+ is an IEEE 802.3at standard that provides 25.5W power on each port.

POST

Power On Self Test. An HTTP request method that requests data from a specified resource.

PPP

Point-to-Point Protocol. PPP is a data link (layer 2) protocol used to establish a direct connection between two nodes. It can provide connection authentication, transmission encryption, and compression.

PPPoE

Point-to-Point Protocol over Ethernet. PPPoE is a method of connecting to the Internet, typically used with DSL services, where the client connects to the DSL modem.

PPTP

Point-to-Point Tunneling Protocol. PPTP is a method for implementing virtual private networks. It uses a control channel over TCP and a GRE tunnel operating to encapsulate PPP packets.

private key

The part of a public-private key pair that is always kept private. The private key encrypts the signature of a message to authenticate the sender. The private key also decrypts a message that was encrypted with the public key of the sender.

PRNG

Pseudo-Random Number Generator. PRNG is an algorithm for generating a sequence of numbers whose properties approximate the properties of sequences of random numbers.

PSK

Pre-shared key. A unique shared secret that was previously shared between two parties by using a secure channel. This is used with WPA security, which requires the owner of a network to provide a passphrase to users for network access.

PSU

Power Supply Unit. PSU is a unit that supplies power to an equipment by converting mains AC to low-voltage regulated DC power.

public key

The part of a public-private key pair that is made public. The public key encrypts a message and the message is decrypted with the private key of the recipient.

PVST

Per-VLAN Spanning Tree. PVST provides load balancing of VLANs across multiple ports resulting in optimal usage of network resources.

PVST+

Per-VLAN Spanning Tree+. PVST+ is an extension of the PVST standard that uses the 802.1Q trunking technology.

QoS

Quality of Service. It refers to the capability of a network to provide better service and performance to a specific network traffic over various technologies.

RA

Router Advertisement. The RA messages are sent by the routers in the network when the hosts send multicast router solicitation to the multicast address of all routers.

Radar

Radio Detection and Ranging. Radar is an object-detection system that uses radio waves to determine the range, angle, or velocity of objects.

RADIUS

Remote Authentication Dial-In User Service. An Industry-standard network access protocol for remote authentication. It allows authentication, authorization, and accounting of remote users who want to access network resources.

RAM

Random Access Memory.

RAPIDS

Rogue Access Point identification and Detection System. An AMP module that is designed to identify and locate wireless threats by making use of all of the information available from your existing infrastructure.

RARP

Reverse Address Resolution Protocol. RARP is a protocol used by a physical machine in a local area network for determining the IP address from the ARP table or cache of the gateway server.

Regex

Regular Expression. Regex refers to a sequence of symbols and characters defining a search pattern.

Registration Authority

Type of Certificate Authority that processes certificate requests. The Registration Authority verifies that requests are valid and comply with certificate policy, and authenticates the user's identity. The Registration Authority then forwards the request to the Certificate Authority to sign and issue the certificate.

Remote AP

Remote APs extend corporate network to the users working from home or at temporary work sites. Remote APs are deplyed at branch office sites and are connected to the central network on a WAN link.

REST

Representational State Transfer. REST is a simple and stateless architecture that the web services use for providing interoperability between computer systems on the Internet. In a RESTful web service, requests made to the URI of a resource will elicit a response that may be in XML, HTML, JSON or some other defined format.

RF

Radio Frequency. RF refers to the electromagnetic wave frequencies within a range of 3 kHz to 300 GHz, including the frequencies used for communications or Radar signals.

RFC

Request For Comments. RFC is a commonly used format for the Internet standards documentss.

RFID

Radio Frequency Identification. RFID uses radio waves to automatically identify and track the information stored on a tag attached to an object.

RIP

Routing Information Protocol. RIP prevents the routing loops by limiting the number of hops allowed in a path from source to destination.

RJ45

Registered Jack 45. RJ45 is a physical connector for network cables.

RMA

Return Merchandise Authorization. RMA is a part of the product returning process that authorizes users to return a product to the manufacturer or distributor for a refund, replacement, or repair. The customers who want to return a product within its Warranty period contact the manufacturer to initiate the product returning process. The manufacturer or the seller generates an authorization number for the RMA, which is used by the customers, when returning a product to the warehouse.

RMON

Remote Monitoring. RMON provides standard information that a network administrator can use to monitor, analyze, and troubleshoot a group of distributed LANs.

RoW

Rest of World. RoW or RW is an operating country code of a device.

RSA

Rivest, Shamir, Adleman. RSA is a cryptosystem for public-key encryption, and is widely used for securing sensitive data, particularly when being sent over an insecure network such as the Internet.

RSSI

Received Signal Strength Indicator. RSSI is a mechanism by which RF energy is measured by the circuitry on a wireless NIC (0-255). The RSSI is not standard across vendors. Each vendor determines its own RSSI scale/values.

RSTP

Rapid Spanning Tree Protocol. RSTP provides significantly faster spanning tree convergence after a topology change, introducing new convergence behaviors and bridge port roles to do this.

RTCP

RTP Control Protocol. RTCP provides out-of-band statistics and control information for an Real-Time Transport Protocol session.

RTLS

Real-Time Location Systems. RTLS automatically identifies and tracks the location of objects or people in real time, usually within a building or other contained area.

RTP

Real-Time Transport Protocol. RTP is a network protocol used for delivering audio and video over IP networks.

RTS

Request to Send. RTS refers to the data transmission and protection mechanism used by the 802.11 wireless networking protocol to prevent frame collision occurrences. See CTS.

RTSP

Real Time Streaming Protocol. RTSP is a network control protocol designed for use in entertainment and communications systems to control streaming media servers.

RVI

Routed VLAN Interface. RVI is a switch interface that forwards packets between VLANs.

RW

Rest of World. RoW or RW is an operating country code of a device.

SA

Security Association. SA is the establishment of shared security attributes between two network entities to support secure communication.

SAML

Security Assertion Markup Language. SAML is an XML-based framework for communicating user authentication, entitlement, and attribute information. SAML enables single sign-on by allowing users to authenticate at an identity provider and then access service providers without additional authentication.

SCEP

Simple Certificate Enrollment Protocol. SCEP is a protocol for requesting and managing digital certificates.

SCP

Secure Copy Protocol. SCP is a network protocol that supports file transfers between hosts on a network.

SCSI

Small Computer System Interface. SCSI refers to a set of interface standards for physical connection and data transfer between a computer and the peripheral devices such as printers, disk drives, CD-ROM, and so on.

SD-WAN

Software-Defined Wide Area Network. SD-WAN is an application for applying SDN technology to WAN connections that connect enterprise networks across disparate geographical locations.

SDN

Software-Defined Networking. SDN is an umbrella term encompassing several kinds of network technology aimed at making the network as agile and flexible as the virtualized server and storage infrastructure of the modern data center.

SDR

Server Derivation Rule. An SDR refers to a role assignment model used by the controllers running ArubaOS to assign roles and VLANs to the WLAN users based on the rules defined under a server group. The SDRs override the default authentication roles and VLANs defined in the AAA and Virtual AP profiles.

SDU

Service Data Unit. SDU is a unit of data that has been passed down from an OSI layer to a lower layer and that has not yet been encapsulated into a PDU by the lower layer.

SFP

The Small Form-factor Pluggable. SFP is a compact, hot-pluggable transceiver that is used for both telecommunication and data communications applications.

SFP+

Small Form-factor Pluggable+. SFP+ supports up to data rates up to 16 Gbps.

SFTP

Secure File Transfer Protocol. SFTP is a network protocol that allows file access, file transfer, and file management functions over a secure connection.

SHA

Secure Hash Algorithm. SHA is a family of cryptographic hash functions. The SHA algorithm includes the SHA, SHA-1, SHA-2 and SHA-3 variants.

SIM

Subscriber Identity Module. SIM is an integrated circuit that is intended to securely store the International Mobile Subscriber Identity (IMSI) number and its related key, which are used for identifying and authenticating subscribers on mobile telephony devices.

SIP

Session Initiation Protocol. SIP is used for signaling and controlling multimedia communication session such as voice and video calls.

SIRT

Security Incident Response Team. SIRT is responsible for reviewing as well as responding to computer security incident reports and activity.

SKU

Stock Keeping Unit. SKU refers to the product and service identification code for the products in the inventory.

SLAAC

Stateless Address Autoconfiguration. SLAAC provides the ability to address a host based on a network prefix that is advertised from a local network router through router advertisements.

SMB

Server Message Block or Small and Medium Business. Server Message Block operates as an application-layer network protocol mainly used for providing shared access to files, printers, serial ports, and for miscellaneous communications between the nodes on a network.

SMS

Short Message Service. SMS refers to short text messages (up to 140 characters) sent and received through mobile phones.

SMTP

Simple Mail Transfer Protocol. SMTP is an Internet standard protocol for electronic mail transmission.

SNIR

Signal-to-Noise-Plus-Interference Ratio. SNIR refers to the power of a central signal of interest divided by the sum of the interference power and the power of the background noise. SINR is defined as the power of a certain signal of interest divided by the sum of the interference power (from all the other interfering signals) and the power of some background noise.

SNMP

Simple Network Management Protocol. SNMP is a TCP/IP standard protocol for managing devices on IP networks. Devices that typically support SNMP include routers, switches, servers, workstations, printers, modem racks, and more. It is used mostly in network management systems to monitor network-attached devices for conditions that warrant administrative attention.

SNMPv1

Simple Network Management Protocol version 1. SNMPv1 is a widely used network management protocol.

SNMPv2

Simple Network Management Protocol version 2. SNMPv2 is an enhanced version of SNMPv1, which includes improvements in the areas of performance, security, confidentiality, and manager-to-manager communications.

SNMPv2c

Community-Based Simple Network Management Protocol version 2. SNMPv2C uses the community-based security scheme of SNMPv1 and does not include the SNMPv2 security model.

SNMPv3

Simple Network Management Protocol version 3. SNMPv3 is an enhanced version of SNMP that includes security and remote configuration features.

SNR

Signal-to-Noise Ratio. SNR is used for comparing the level of a desired signal with the level of background noise.

SNTP

Simple Network Time Protocol. SNTP is a less complex implementation of NTP. It uses the same , but does not require the storage of state over extended periods of time.

SOAP

Simple Object Access Protocol. SOAP enables communication between the applications running on different operating systems, with different technologies and programming languages. SOAP is an XML-based messaging protocol for exchanging structured information between the systems that support web services.

SoC

System on a Chip. SoC is an Integrated Circuit that integrates all components of a computer or other electronic system into a single chip.

source NAT

Source NAT changes the source address of the packets passing through the router. Source NAT is typically used when an internal (private) host initiates a session to an external (public) host.

SSH

Secure Shell. SSH is a network protocol that provides secure access to a remote device.

SSID

Service Set Identifier. SSID is a name given to a WLAN and is used by the client to access a WLAN network.

SSL

Secure Sockets Layer. SSL is a computer networking protocol for securing connections between network application clients and servers over the Internet.

SSO

Single Sign-On. SSO is an access-control property that allows the users to log in once to access multiple related, but independent applications or systems to which they have privileges. The process authenticates the user across all allowed resources during their session, eliminating additional login prompts.

STBC

Space-Time Block Coding. STBC is a technique used in wireless communications to transmit multiple copies of a data stream across a number of antennas and to exploit the various received versions of the data to improve the reliability of data transfer.

STM

Station Management. STM is a process that handles AP management and user association.

STP

Spanning Tree Protocol. STP is a network protocol that builds a logical loop-free topology for Ethernet networks.

SU-MIMO

Single-User Multiple-Input Multiple-Output. SU-MIMO allocates the full bandwidth of the AP to a single high-speed device during the allotted time slice.

subnet

Subnet is the logical division of an IP network.

subscription

A business model where a customer pays a certain amount as subscription price to obtain access to a product or service.

SVP

SpectraLink Voice Priority. SVP is an open, straightforward QoS approach that has been adopted by most leading vendors of WLAN APs. SVP favors isochronous voice packets over asynchronous data packets when contending for the wireless medium and when transmitting packets onto the wired LAN.

SWAN

Structured Wireless-Aware Network. A technology that incorporates a Wireless Local Area Network (WLAN) into a wired Wide Area Network (WAN). SWAN technology can enable an existing wired network to serve hundreds of users, organizations, corporations, or agencies over a large geographic area. SWAN is said to be scalable, secure, and reliable.

TAC

Technical Assistance Center.

TACACS

Terminal Access Controller Access Control System. TACACS is a family of protocols that handles remote authentication and related services for network access control through a centralized server.

TACACS+

Terminal Access Controller Access Control System+. TACACS+ provides separate authentication, authorization, and accounting services. It is derived from, but not backward compatible with, TACACS.

TCP

Transmission Control Protocol. TCP is a communication protocol that defines the standards for establishing and maintaining network connection for applications to exchange data.

TCP/IP

Transmission Control Protocol/ Internet Protocol. TCP/IP is the basic communication language or protocol of the Internet.

TFTP

Trivial File Transfer Protocol. The TFTP is a software utility for transferring files from or to a remote host.

TIM

Traffic Indication Map. TIM is an information element that advertises if any associated stations have buffered unicast frames. APs periodically send the TIM within a beacon to identify the stations that are using power saving mode and the stations that have undelivered data buffered on the AP.

TKIP

Temporal Key Integrity Protocol. A part of the WPA encryption standard for wireless networks. TKIP is the next-generation Wired Equivalent Privacy (WEP) that provides per-packet key mixing to address the flaws encountered in the WEP standard.

TLS

Transport Layer Security. TLS is a cryptographic protocol that provides communication security over the Internet. TLS encrypts the segments of network connections above the Transport Layer by using asymmetric cryptography for key exchange, symmetric encryption for privacy, and message authentication codes for message integrity.

TLV

Type-length-value or Tag-Length-Value. TLV is an encoding format. It refers to the type of data being processed, the length of the value, and the value for the type of data being processed.

ToS

Type of Service. The ToS field is part of the IPv4 header, which specifies datagrams priority and requests a route for low-delay, high-throughput, or a highly reliable service.

TPC

Transmit Power Control. TPC is a part of the 802.11h amendment. It is used to regulate the power levels used by 802.11a radio cards.

TPM

Trusted Platform Module. TPM is an international standard for a secure cryptoprocessor, which is a dedicated microcontroller designed to secure hardware by integrating cryptographic keys into devices.

TSF

Timing Synchronization Function. TSF is a WLAN function that is used for synchronizing the timers for all the stations in a BSS.

TSPEC

Traffic Specification. TSPEC allows an 802.11e client or a QoS-capable wireless client to signal its traffic requirements to the AP.

TSV

Tab-Separated Values. TSV is a file format that allows the exchange of tabular data between applications that use different internal data formats.

TTL

Time to Live. TTL or hop limit is a mechanism that sets limits for data expiry in a computer or network.

TTY

TeleTypeWriter. TTY-enabled devices allow telephones to transmit text communications for people who are deaf or hard of hearing as well as transmit voice communication.

TXOP

Transmission Opportunity. TXOP is used in wireless networks supporting the IEEE 802.11e Quality of Service (QoS) standard. Used in both EDCA and HCF Controlled Channel Access modes of operation, TXOP is a bounded time interval in which stations supporting QoS are permitted to transfer a series of frames. TXOP is defined by a start time and a maximum duration.

U-APSD

Unscheduled Automatic Power Save Delivery. U-APSD is a part of 802.11e and helps considerably in increasing the battery life of VoWLAN terminals.

UAM

Universal Access Method. UAM allows subscribers to access a wireless network after they successfully log in from a web browser.

UCC

Unified Communications and Collaboration. UCC is a term used to describe the integration of various communications methods with collaboration tools such as virtual whiteboards, real-time audio and video conferencing, and enhanced call control capabilities.

UDID

Unique Device Identifier. UDID is used to identify an iOS device.

UDP

User Datagram Protocol. UDP is a part of the TCP/IP family of protocols used for data transfer. UDP is typically used for streaming media. UDP is a stateless protocol, which means it does not acknowledge that the packets being sent have been received.

UDR

User Derivation Rule. UDR is a role assignment model used by the controllers running ArubaOS to assign roles and VLANs to the WLAN users based on MAC address, BSSID, DHCP-Option, encryption type, SSID, and the location of a user. For example, for an SSID with captive portal in the initial role, a UDR can be configured for scanners to provide a role based on their MAC OUI.

UHF

Ultra high frequency. UHF refers to radio frequencies between the range of 300 MHz and 3 GHz. UHF is also known as the decimeter band as the wavelengths range from one meter to one decimeter.

UI

User Interface.

UMTS

Universal Mobile Telecommunication System. UMTS is a third generation mobile cellular system for networks. See 3G.

UPnP

Universal Plug and Play. UPnp is a set of networking protocols that permits networked devices, such as personal computers, printers, Internet gateways, Wi-Fi APs, and mobile devices to seamlessly discover each

other's presence on the network and establish functional network services for data sharing, communications, and entertainment.

URI

Uniform Resource Identifier. URI identifies the name and the location of a resource in a uniform format.

URL

Uniform Resource Locator. URL is a global address used for locating web resources on the Internet.

USB

Universal Serial Bus. USB is a connection standard that offers a common interface for communication between the external devices and a computer. USB is the most common port used in the client devices.

UTC

Coordinated Universal Time. UTC is the primary time standard by which the world regulates clocks and time.

UWB

Ultra-Wideband. UWB is a wireless technology for transmitting large amounts of digital data over a wide spectrum of frequency bands with very low power for a short distance.

VA

Virtual Appliance. VA is a pre-configured virtual machine image, ready to run on a hypervisor.

VBR

Virtual Beacon Report. VBR displays a report with the MAC address details and RSSI information of an AP.

VHT

Very High Throughput. IEEE 802.11ac is an emerging VHT WLAN standard that could achieve physical data rates of close to 7 Gbps for the 5 GHz band.

VIA

Virtual Intranet Access. VIA provides secure remote network connectivity for Android, Apple iOS, Mac OS X, and Windows mobile devices and laptops. It automatically scans and selects the best secure connection to the corporate network.

VLAN

Virtual Local Area Network. In computer networking, a single Layer 2 network may be partitioned to create multiple distinct broadcast domains, which are mutually isolated so that packets can only pass between them through one or more routers; such a domain is referred to as a Virtual Local Area Network, Virtual LAN, or VLAN.

VM

Virtual Machine. A VM is an emulation of a computer system. VMs are based on computer architectures and provide functionality of a physical computer.

VoIP

Voice over IP. VoIP allows transmission of voice and multimedia content over an IP network.

VoWLAN

Voice over WLAN. VoWLAN is a method of routing telephone calls for mobile users over the Internet using the technology specified in IEEE 802.11b. Routing mobile calls over the Internet makes them free, or at least much less expensive than they would be otherwise.

VPN

Virtual Private Network. VPN enables secure access to a corporate network when located remotely. It enables a computer to send and receive data across shared or public networks as if it were directly connected to the private network, while benefiting from the functionality, security, and management policies of the private network. This is done by establishing a virtual point-to-point connection through the use of dedicated connections, encryption, or a combination of the two.

VRD

Validated Reference Design. VRDs are guides that capture the best practices for a particular technology in field.

VRF

VisualRF. VRF is an AirWave Management Platform (AMP) module that provides a real-time, network-wide views of your entire Radio Frequency environment along with floor plan editing capabilities. VRF also includes overlays on client health to help diagnose issues related to clients, floor plan, or a specific location.

VRF Plan

VisualRF Plan. A stand-alone Windows client used for basic planning procedures such as adding a floor plan, provisioning APs, and generating a Bill of Materials report.

VRRP

Virtual Router Redundancy Protocol. VRRP is an election protocol that dynamically assigns responsibility for a virtual router to one of the VRRP routers on a LAN.

VSA

Vendor-Specific Attribute. VSA is a method for communicating vendor-specific information between NASs and RADIUS servers.

VTP

VLAN Trunking Protocol. VTP is a Cisco proprietary protocol for propagating VLANs on a LAN.

W-CDMA

Wideband Code-Division Multiple Access. W-CDMA is a third-generation (3G) mobile wireless technology that promises much higher data speeds to mobile and portable wireless devices.

walled garden

Walled garden is a feature that allows blocking of unauthorized users from accessing network resources.

WAN

Wide Area Network. WAN is a telecommunications network or computer network that extends over a large geographical distance.

WASP

Wireless Application Service Provider. WASP provides a web-based access to applications and services that would otherwise have to be stored locally and makes it possible for customers to access the service from a variety of wireless devices, such as a smartphone or Personal Digital Assistant (PDA).

WAX

Wireless abstract XML. WAX is an abstract markup language and a set of tools that is designed to help wireless application development as well as portability. Its tags perform at a higher level of abstraction than that of other wireless markup languages such as HTML, HDML, WML, XSL, and more.

web service

Web services allow businesses to share and process data programmatically. Developers who want to provide integrated applications can use the API to programmatically perform actions that would otherwise require manual operation of the user interface.

WEP

Wired Equivalent Privacy. WEP is a security protocol that is specified in 802.11b and is designed to provide a WLAN with a level of security and privacy comparable to what is usually expected of a wired LAN.

WFA

Wi-Fi Alliance. WFA is a non-profit organization that promotes Wi-Fi technology and certifies Wi-Fi products if they conform to certain standards of interoperability.

Wi-Fi

Wi-Fi is a technology that allows electronic devices to connect to a WLAN network, mainly using the 2.4 GHz and 5 GHz radio bands. Wi-Fi can apply to products that use any 802.11 standard.

WIDS

Wireless Intrusion Detection System. WIDS is an application that detects the attacks on a wireless network or wireless system.

WiMAX

Worldwide Interoperability for Microwave Access. WiMAX refers to the implementation of IEEE 802.16 family of wireless networks standards set by the WiMAX forum.

WIP

Wireless Intrusion Protection. The WIP module provides wired and wireless AP detection, classification, and containment. It detects Denial of Service (DoS) and impersonation attacks, and prevents client and network intrusions.

WIPS

Wireless Intrusion Prevention System. WIPS is a dedicated security device or integrated software application that monitors the radio spectrum of WLAN network for rogue APs and other wireless threats.

WISP

Wireless Internet Service Provider. WISP allows subscribers to connect to a server at designated hotspots using a wireless connection such as Wi-Fi. This type of ISP offers broadband service and allows subscriber computers called stations, to access the Internet and the web from anywhere within the zone of coverage provided by the server antenna, usually a region with a radius of several kilometers.

WISPr

Wireless Internet Service Provider Roaming. The WISPr framework enables the client devices to roam between the wireless hotspots using different ISPs.

WLAN

Wireless Local Area Network. WLAN is a 802.11 standards-based LAN that the users access through a wireless connection.

WME

Wireless Multimedia Extension. WME is a Wi-Fi Alliance interoperability certification, based on the IEEE 802.11e standard. It provides basic QoS features to IEEE 802.11 networks. WMM prioritizes traffic according to four ACs: voice (AC_VO), video (AC_VI), best effort (AC_BE) and background (AC_BK). See WMM.

WMI

Windows Management Instrumentation. WMI consists of a set of extensions to the Windows Driver Model that provides an operating system interface through which instrumented components provide information and notification.

WMM

Wi-Fi Multimedia. WMM is also known as WME. It refers to a Wi-Fi Alliance interoperability certification, based on the IEEE 802.11e standard. It provides basic QoS features to IEEE 802.11 networks. WMM prioritizes traffic according to four ACs: voice (AC_VO), video (AC_VI), best effort (AC_BE), and background (AC_BK).

WPA

Wi-Fi Protected Access. WPA is an interoperable wireless security specification subset of the IEEE 802.11 standard. This standard provides authentication capabilities and uses TKIP for data encryption.

WPA2

Wi-Fi Protected Access 2. WPA2 is a certification program maintained by IEEE that oversees standards for security over wireless networks. WPA2 supports IEEE 802.1X/EAP authentication or PSK technology, but includes advanced encryption mechanism using CCMP that is referred to as AES.

WSDL

Web Service Description Language. WSDL is an XML-based interface definition language used to describe the functionality provided by a web service.

WSP

Wireless Service Provider. The service provider company that offers transmission services to users of wireless devices through Radio Frequency (RF) signals rather than through end-to-end wire communication.

WWW

World Wide Web.

X.509

X.509 is a standard for a public key infrastructure for managing digital certificates and public-key encryption. It is an essential part of the Transport Layer Security protocol used to secure web and email communication.

XAuth

Extended Authentication. XAuth provides a mechanism for requesting individual authentication information from the user, and a local user database or an external authentication server. It provides a method for storing the authentication information centrally in the local network.

XML

Extensible Markup Language. XML is a markup language that defines a set of rules for encoding documents in a format that is both human-readable and machine-readable.

XML-RPC

XML Remote Procedure Call. XML-RPC is a protocol that uses XML to encode its calls and HTTP as a transport mechanism. Developers who want to provide integrated applications can use the API to programmatically perform actions that would otherwise require manual operation of the user interface.

ZTP

Zero Touch Provisioning. ZTP is a device provisioning mechanism that allows automatic and quick provisioning of devices with a minimal or at times no manual intervention.
