Overview Use this command to display the state of IGMP Proxy services for a specified interface or for all interfaces.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ip igmp proxy
```

Mode User Exec and Privileged Exec

Example To display the state of IGMP Proxy services for all interfaces, enter the command:

```
awplus# show ip igmp proxy
```

Output Figure 34-3: Example output from **show ip igmp proxy**

```
awplus#show ip igmp proxy
Interface vlan40 (Index 340)
Administrative status: enabled
Operational status: up
Upstream interface is vlan30
Number of multicast groups: 1
```

Related commands ip igmp proxy-service

show ip igmp proxy groups

Overview Use this command to display multicast groups with receivers directly connected to the router, learned through IGMP, which use a proxy service. You can also use a filter to specify a multicast group IP address and /or interface.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ip igmp proxy groups [detail]
show ip igmp proxy groups <multicast-group> [detail]
show ip igmp proxy groups <vlan> [detail]
show ip igmp proxy groups <vlan> <multicast-group> [detail]
```

Parameter	Description
`groups`	Specify IGMP proxy group membership information.
`detail`	Specify detailed IGMPv3 source information.
<vlan>	Specify the name of a single VLAN interface, for example **vlan1**.
<multicast-group>	Specify the IPv4 address in of the multicast group, in the format A.B.C.D.

Mode User Exec

Example To display local membership information for IGMP proxy service interfaces, use the command:

```
awplus# show ip igmp proxy groups
```

Output Figure 34-4: Example output from **show ip igmp proxy groups**

```
awplus#show ip igmp proxy groups
IGMP Connected Proxy Group Membership
Group Address    Interface            Member state
224.9.10.11      vlan10               Delay
```

Example To display local membership information for IGMP proxy service interfaces, use the command:

```
awplus# show ip igmp proxy groups detail
```

Output Figure 34-5: Example output from **show ip igmp proxy groups detail**

```
awplus#show ip igmp proxy groups detail
Interface:      vlan10
Group:          224.9.10.11
Group mode:     Exclude
Member state:   Delay
Source list is empty

Summary :
IGMP Connected Proxy Group Membership
Group Address    Interface            Member state
224.9.10.11      vlan10               DelayDetail :
Interface:       vlan10
Group:           224.9.10.11
Group mode:      Exclude
Member state:    Delay
Source list is empty
```

Table 34-2: Parameters in the output of **show ip igmp proxy groups**

Parameter	Description
`Interface`	The interface that received the IGMP report.
`Group`	The multicast group address that has been requested by the IGMP report.
`Group mode`	**Include**mode indicates that the multicast receiver has sent an IGMPv3 report for a group with a list of addresses that it wants to receive traffic from. **Exclude** mode indicates that the multicast receiver has sent an IGMPv3 report for a group with a list of addresses that it does not want to receive traffic from.
`Member state`	**Delay** indicates that no group or source query timers are running for the specified group, otherwise the member state is shown as **Idle**.

Related commands show ip igmp proxy

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip igmp snooping mrouter

Overview Use this command to display the multicast router ports, both static and dynamic, in a VLAN.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ip igmp snooping mrouter [interface <interface>]
```

Parameter	Description
`interface`	A specific interface.
`<interface>`	The name of the VLAN interface.

Mode User Exec and Privileged Exec

Example To show all multicast router interfaces, use the command:

```
awplus# show ip igmp snooping mrouter
```

To show the multicast router interfaces in `vlan1`, use the command:

```
awplus# show ip igmp snooping mrouter interface vlan1
```

Output Figure 34-6: Example output from **show ip igmp snooping mrouter**

```
VLAN    Interface   Static/Dynamic
1       port1.0.1   Statically configured
200     port1.0.2   Statically configured
```

Figure 34-7: Example output from **show ip igmp snooping mrouter interface vlan1**

```
VLAN    Interface   Static/Dynamic
1       port1.0.1   Statically configured
```

Related commands ip igmp snooping mrouter

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip igmp snooping routermode

Overview Use this command to display the current router mode and the list of IP addresses set as router multicast addresses from the ip igmp snooping routermode command.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ip igmp snooping routermode
```

Mode User Exec and Privileged Exec

Example To show the router mode and the list of router multicast addresses, use the command:

```
awplus# show ip igmp snooping routermode
```

Output Figure 34-8: Example output from **show ip igmp snooping routermode**

```
awplus#show ip igmp snooping routermode
Router mode.............Def
Reserved multicast address

        224.0.0.1
        224.0.0.2
        224.0.0.4
        224.0.0.5
        224.0.0.6
        224.0.0.9
        224.0.0.13
        224.0.0.15
        224.0.0.24
```

Related commands ip igmp snooping routermode

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip igmp snooping source-timeout

Overview Use this command to display the configured IGMP snooping source timeouts for a specified VLAN or VLAN range.

Syntax
```
show ip igmp snooping source-timeout [interface|
<interface-range>]
```

Parameter	Description
<interface-range>	The name of the VLAN interface or VLAN range

Mode Privileged Exec

Example To display the configured IGMP snooping source timeouts for all VLANs, use the command:

```
awplus# show ip igmp snooping source-timeout
```

Output Figure 34-9: Example output from **show ip igmp snooping source-timeout**

```
awplus#show ip igmp snooping source-timeout
Global IGMP snooping source-timeout is enabled (60 secs)

vlan1           enabled (300 secs)
vlan2           inherits global setting
vlan1000        inherits global settingawplus#show ip igmp
snooping source-timeout int vlan1
Global IGMP snooping source-timeout is enabled (60 secs)vlan1
enabled (300 secs)
```

Related commands ip igmp snooping source-timeout

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip igmp snooping statistics

Overview Use this command to display IGMP Snooping statistics data.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ip igmp snooping statistics interface <interface-range>
[group [<ip-address>]]
```

Parameter	Description
<ip-address>	Optionally specify the address of the multicast group, entered in the form A.B.C.D.
<interface>	Specify the name of the interface or interface range. If you specify a port number, the output displays the number of groups the port belongs to, and the port's group membership limit, if a limit has been set (with the command ip igmp maximum-groups)

Mode Privileged Exec

Example To display IGMP statistical information for **vlan1** and **vlan2**, use the command:

```
awplus# show ip igmp snooping statistics interface vlan1-vlan2
```

Output Figure 34-10: Example output from the **show ip igmp snooping statistics** command for VLANs

```
awplus#show ip igmp interface vlan1-vlan2
IGMP Snooping statistics for vlan1
Interface:      port1.0.1
Group:          224.1.1.1
Uptime:         00:00:09
Group mode:     Exclude (Expires: 00:04:10)
Last reporter:  10.4.4.5
Source list is empty
IGMP Snooping statistics for vlan2
Interface:      port1.0.2
Group:          224.1.1.2
Uptime:         00:00:19
Group mode:     Exclude (Expires: 00:05:10)
Last reporter:  10.4.4.6
Source list is empty
```

Figure 34-11: Example output from the **show ip igmp snooping statistics** command for a switch port

```
awplus#show ip igmp interface port1.0.1
IGMP information for port1.0.1
    Maximum groups limit set: 10
    Number of groups port belongs to: 0
```

Command changes

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

undebug igmp

Overview This command applies the functionality of the no debug igmp command.

35 MLD and MLD Snooping Commands

Introduction

Overview

This chapter provides an alphabetical reference of configuration, clear, and show commands related to MLD and MLD Snooping.

The Multicast Listener Discovery (MLD) module includes the MLD Proxy service and MLD Snooping functionality. Some of the following commands may have commonalities and restrictions; these are described under the Usage section for each command.

MLD and MLD Snooping commands only apply to switch ports, not Ethernet interfaces.

Before using PIM-SMv6:

- IPv6 must be enabled on an interface (ipv6 enable),
- IPv6 forwarding must be enabled globally for routing IPv6 (ipv6 forwarding), and
- IPv6 multicasting must be enabled globally (ipv6 multicast-routing).

Command List

- "clear ipv6 mld" on page 1770
- "clear ipv6 mld group" on page 1771
- "clear ipv6 mld interface" on page 1772
- "debug mld" on page 1773
- "ipv6 mld" on page 1774
- "ipv6 mld last-member-query-count" on page 1775
- "ipv6 mld last-member-query-interval" on page 1776
- "ipv6 mld querier-timeout" on page 1777
- "ipv6 mld query-interval" on page 1778
- "ipv6 mld query-max-response-time" on page 1779
- "ipv6 mld robustness-variable" on page 1780

- "ipv6 mld snooping" on page 1781
- "ipv6 mld snooping fast-leave" on page 1783
- "ipv6 mld snooping mrouter" on page 1784
- "ipv6 mld snooping querier" on page 1786
- "ipv6 mld snooping report-suppression" on page 1787
- "ipv6 mld ssm-map enable" on page 1789
- "ipv6 mld static-group" on page 1790
- "ipv6 mld version" on page 1792
- "show debugging mld" on page 1793
- "show ipv6 mld groups" on page 1794
- "show ipv6 mld interface" on page 1795
- "show ipv6 mld snooping mrouter" on page 1796
- "show ipv6 mld snooping statistics" on page 1797

clear ipv6 mld

Overview Use this command to clear all MLD local memberships on all interfaces.

Syntax
```
clear ipv6 mld
```

Mode Privileged Exec

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

Example
```
awplus# clear ipv6 mld
```

Related commands clear ipv6 mld group

clear ipv6 mld interface

clear ipv6 mld group

Overview Use this command to clear MLD specific local-membership(s) on all interfaces, for a particular group.

Syntax
```
clear ipv6 mld group {*|<ipv6-address>}
```

Parameter	Description
*	Clears all groups on all interfaces. This is an alias to the clear ipv6 mld command.
<*ipv6-address*>	Specify the group address for which MLD local-memberships are to be cleared from all interfaces. Specify the IPv6 multicast group address in the format in the format X:X::X:X.

Mode Privileged Exec

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

Example
```
awplus# clear ipv6 mld group *
```

Related commands clear ipv6 mld

clear ipv6 mld interface

clear ipv6 mld interface

Overview Use this command to clear MLD interface entries.

Syntax
```
clear ipv6 mld interface <interface>
```

Parameter	Description
<interface>	Specifies name of the interface; all groups learned from this interface are deleted.

Mode Privileged Exec

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols and learned by MLD Snooping.

Example
```
awplus# clear ipv6 mld interface vlan2
```

Related commands clear ipv6 mld

clear ipv6 mld group

debug mld

Overview Use this command to enable all MLD debugging modes, or a specific MLD debugging mode.

Use the **no** variant of this command to disable all MLD debugging modes, or a specific MLD debugging mode.

Syntax

```
debug mld {all|decode|encode|events|fsm|tib}
no debug mld {all|decode|encode|events|fsm|tib}
```

Parameter	Description
`all`	Debug all MLD.
`decode`	Debug MLD decoding.
`encode`	Debug MLD encoding.
`events`	Debug MLD events.
`fsm`	Debug MLD Finite State Machine (FSM).
`tib`	Debug MLD Tree Information Base (TIB).

Mode Privileged Exec and Global Configuration

Usage notes This command applies to interfaces configured for MLD Layer 3 multicast protocols and learned by MLD Snooping.

Examples

```
awplus# configure terminal
awplus(config)# debug mld all
awplus# configure terminal
awplus(config)# debug mld decode
awplus# configure terminal
awplus(config)# debug mld encode
awplus# configure terminal
awplus(config)# debug mld events
```

Related commands show debugging mld

ipv6 mld

Overview Use this command to enable the MLD protocol operation on an interface. This command enables MLD protocol operation in stand-alone mode, and can be used to learn local-membership information prior to enabling a multicast routing protocol on the interface.

Use the **no** variant of this command to return all MLD related configuration to the default (including MLD Snooping).

Syntax

```
ipv6 mld
no ipv6 mld
```

Default MLD is disabled by default.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage notes MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld
```

ipv6 mld last-member-query-count

Overview Use this command to set the last-member query-count value.

Use the **no** variant of this command to return to the default on an interface.

Syntax

```
ipv6 mld last-member-query-count <value>
no ipv6 mld last-member-query-count
```

Parameter	Description
<value>	Count value. Valid values are from `2 to 7`.

Default The default last-member query-count value is 2.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld last-member-query-count 3
```

ipv6 mld last-member-query-interval

Overview Use this command to configure the interval at which the router sends MLD group-specific host query messages.

Use the **no** variant of this command to set this frequency to the default.

Syntax

```
ipv6 mld last-member-query-interval <milliseconds>
no ipv6 mld last-member-query-interval
```

Parameter	Description
<milliseconds>	The time delay between successive query messages (in milliseconds). Valid values are from 1000 to 25500 milliseconds.

Default 1000 milliseconds

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld last-member-query-interval 2000
```

ipv6 mld querier-timeout

Overview Use this command to configure the timeout period before the router takes over as the querier for the interface after the previous querier has stopped querying.

Use the **no** variant of this command to restore the default.

Syntax

```
ipv6 mld querier-timeout <seconds>
no ipv6 mld querier-timeout
```

Parameter	Description
<seconds>	Number of seconds that the router waits after the previous querier has stopped querying before it takes over as the querier. Valid values are from 2 to 65535 seconds.

Default 255 seconds

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage notes This command applies to interfaces configured for MLD Layer-3 multicast protocols.

Example The following example configures the router to wait 120 seconds from the time it received the last query before it takes over as the querier for the interface:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld querier-timeout 120
```

Related commands ipv6 mld query-interval

ipv6 mld query-interval

Overview Use this command to configure the frequency of sending MLD host query messages.

Use the **no** variant of this command to return to the default frequency.

Syntax

```
ipv6 mld query-interval <seconds>
no ipv6 mld query-interval
```

Parameter	Description
<seconds>	Variable that specifies the time delay between successive MLD host query messages (in seconds). Valid values are from `1 to 18000 seconds`.

Default The default query interval is 125 seconds.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols.

Example The following example changes the frequency of sending MLD host-query messages to 2 minutes:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld query-interval 120
```

Related commands ipv6 mld querier-timeout

ipv6 mld query-max-response-time

Overview Use this command to configure the maximum response time advertised in MLD queries.

Use the **no** variant of with this command to restore the default.

Syntax

```
ipv6 mld query-max-response-time <seconds>
no ipv6 mld query-max-response-time
```

Parameter	Description
<seconds>	Maximum response time (in seconds) advertised in MLD queries. Valid values are from 1 to 240 seconds.

Default 10 seconds

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols.

Example The following example configures a maximum response time of 8 seconds:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld query-max-response-time 8
```

ipv6 mld robustness-variable

Overview Use this command to change the robustness variable value on an interface.

Use the **no** variant of this command to return to the default on an interface.

Syntax

```
ipv6 mld robustness-variable <value>
no ipv6 mld robustness-variable
```

Default The default robustness variable value is 2.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This command applies to interfaces configured for MLD Layer-3 multicast protocols.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld robustness-variable 3
```

ipv6 mld snooping

Overview Use this command to enable MLD Snooping. When this command is issued in the Global Configuration mode, MLD Snooping is enabled globally for the device. When this command is issued in Interface mode for a VLAN then MLD Snooping is enabled for the specified VLAN. Note that MLD Snooping is enabled on the VLAN only if it is enabled globally and on the VLAN.

Use the **no** variant of this command to globally disable MLD Snooping in Global Configuration mode, or for the specified VLAN interface in Interface mode.

Syntax

```
ipv6 mld snooping
no ipv6 mld snooping
```

Default By default, MLD Snooping is enabled both globally and on all VLANs.

Mode Global Configuration and Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage notes For MLD Snooping to operate on particular VLAN interfaces, it must be enabled both globally by using this command in Global Configuration mode, and on individual VLAN interfaces by using this command in Interface Configuration mode (both are enabled by default).

MLD requires memory for storing data structures, as well as the hardware tables to implement hardware routing. As the number of ports, VLANs, static and dynamic groups increases then more memory is consumed. You can track the memory used for MLD with the command:

```
awplus# show memory pools nsm | grep MLD
```

Static and dynamic groups (LACP), ports and VLANs are not limited for MLD. For VLANs, this allows you to configure MLD across more VLANs with fewer ports per VLAN, or fewer VLANs with more ports per VLAN. For LACPs, you can configure MLD across more LACP groups with fewer ports per LACP, or fewer LACP groups with more ports per LACP.

Examples To configure MLD Snooping on the VLAN interfaces `vlan2-vlan4`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping
```

To disable MLD Snooping for the VLAN interfaces `vlan2-vlan4`, enter the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config)# no ipv6 mld snooping
```

To configure MLD Snooping globally for the device, enter the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 mld snooping
```

To disable MLD Snooping globally for the device, enter the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 mld snooping
```

ipv6 mld snooping fast-leave

Overview Use this command to enable MLD Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing; the MLD group-membership is removed as soon as an MLD leave group message is received, without sending out a group-specific query.

Use the **no** variant of this command to disable fast-leave processing.

Syntax

```
ipv6 mld snooping fast-leave
no ipv6 mld snooping fast-leave
```

Default MLD Snooping fast-leave processing is disabled.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage notes This MLD Snooping command can only be configured on VLAN interfaces.

Examples This example shows how to enable fast-leave processing on the VLAN interface vlan2.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping fast-leave
```

This example shows how to enable fast-leave processing on the VLAN interface vlan2-vlan4.

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping fast-leave
```

ipv6 mld snooping mrouter

Overview Use this command to statically configure the specified port as a Multicast Router interface for MLD Snooping within the specified VLAN.

See detailed usage notes below to configure static multicast router ports when using static IPv6 multicast routes with EPSR, and the destination VLAN is an EPSR data VLAN.

Use the **no** variant of this command to remove the static configuration of the interface as a Multicast Router interface.

Syntax

```
ipv6 mld snooping mrouter interface <port>
no ipv6 mld snooping mrouter interface <port>
```

Parameter	Description
<port>	Specify the name of the port.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage notes This MLD Snooping command statically configures a switch port as a Multicast Router interface.

Note that if static IPv6 multicast routing is being used with EPSR and the destination VLAN is an EPSR data VLAN, then multicast router (mrouter) ports must be statically configured. This minimizes disruption for multicast traffic in the event of ring failure or restoration.

When configuring the EPSR data VLAN, statically configure mrouter ports so that the multicast router can be reached in either direction around the EPSR ring.

For example, if port1.0.1 and port1.0.6 are ports on an EPSR data VLAN vlan101, which is the destination for a static IPv6 multicast route, then configure both ports as multicast router (mrouter) ports as shown in the example commands listed below:

Figure 35-1: Example **ipv6 mld snooping mrouter** commands when static IPv6 multicast routing is being used and the destination VLAN is an EPSR data VLAN:

```
awplus>enable
awplus#configure terminal
awplus(config)#interface vlan101
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.1
awplus(config-if)#ipv6 mld snooping mrouter interface port1.0.6
```

Examples

This example shows how to specify the next-hop interface to the multicast router for VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping mrouter interface
port1.0.5
```

This example shows how to specify the next-hop interface to the multicast router for VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping mrouter interface
port1.0.5
```

Related commands

ipv6 multicast route

ipv6 mld snooping querier

Overview Use this command to enable MLD querier operation on a subnet (VLAN) when no multicast routing protocol is configured in the subnet (VLAN). When enabled, the MLD Snooping querier sends out periodic MLD queries for all interfaces on that VLAN.

Use the **no** variant of this command to disable MLD querier configuration.

Syntax
```
ipv6 mld snooping querier
no ipv6 mld snooping querier
```

Mode Interface Configuration for a specified VLAN interface.

Usage This command can only be configured on a single VLAN interface - not on multiple VLANs.

The MLD Snooping querier uses the 0.0.0.0 Source IP address because it only masquerades as an MLD querier for faster network convergence.

The MLD Snooping querier does not start, or automatically cease, the MLD Querier operation if it detects query message(s) from a multicast router. It restarts as an MLD Snooping querier if no queries are seen within the other querier interval.

Do not enable MLD Snooping querier if you have already enabled MLD on your device.

Do not enable MLD Snooping querier on your device and then enable MLD afterwards.

Example
```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping querier
```

ipv6 mld snooping report-suppression

Overview Use this command to enable report suppression from hosts for Multicast Listener Discovery version 1 (MLDv1) on a VLAN in Interface Configuration mode.

Use the **no** variant of this command to disable report suppression on a VLAN in Interface Configuration mode.

Syntax

```
ipv6 mld snooping report-suppression
no ipv6 mld snooping report-suppression
```

Default Report suppression does not apply to MLDv2, and is turned on by default for MLDv1 reports.

Mode Interface Configuration for a specified VLAN interface or a range of VLAN interfaces.

Usage This MLD Snooping command can only be configured on VLAN interfaces.

MLDv1 Snooping maybe configured to suppress reports from hosts. When a querier sends a query, only the first report for particular set of group(s) from a host will be forwarded to the querier by the MLD Snooping device. Similar reports (to the same set of groups) from other hosts, which would not change group memberships in the querier, will be suppressed by the MLD Snooping device to prevent 'flooding' of query responses.

Examples This example shows how to enable report suppression for MLD reports on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld snooping report-suppression
```

This example shows how to disable report suppression for MLD reports on VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 mld snooping report-suppression
```

This example shows how to enable report suppression for MLD reports on VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# ipv6 mld snooping report-suppression
```

This example shows how to disable report suppression for MLD reports on VLAN interfaces `vlan2-vlan4`:

```
awplus# configure terminal
awplus(config)# interface vlan2-vlan4
awplus(config-if)# no ipv6 mld snooping report-suppression
```

ipv6 mld ssm-map enable

Overview Use this command to enable the Source Specific Multicast (SSM) mapping feature on the device.

Use the **no** variant of this command to disable the SSM mapping feature on the device.

Syntax

```
ipv6 mld ssm-map enable
no ipv6 mld ssm-map enable
```

Mode Global Configuration

Usage notes This command enables the SSM mapping feature for group members in the defined SSM range.

Example This example shows how to enable the MLD SSM mapping feature on the device.

```
awplus# configure terminal
awplus(config)# ipv6 mld ssm-map enable
```

ipv6 mld static-group

Overview Use this command to statically configure IPv6 group membership entries on an interface. To statically add only a group membership, do not specify any parameters.

Use the **no** variant of this command to delete static group membership entries.

Syntax

```
ipv6 mld static-group <ipv6-group-address> [source
<ipv6-source-address>] [interface <port>]
```

```
no ipv6 mld static-group <ipv6-group-address> [source
<ipv6-source-address>] [interface <port>]
```

Parameter	Description
<ipv6-group-address>	Specify a standard IPv6 Multicast group address to be configured as a static group member. The IPv6 address uses the format X:X::X:X.
<ipv6-source-address>	Optional. Specify a standard IPv6 source address to be configured as a static source from where multicast packets originate. The IPv6 address uses the format X:X::X:X.
<port>	Optional. Physical interface. This parameter specifies a physical port. If this parameter is used, the static configuration is applied to just to that physical interface. If this parameter is not used, the static configuration is applied on all ports in the VLAN.

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to MLD Snooping on a VLAN interface to statically add groups and/or source records.

Examples To add a static group record, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10
```

To add a static group and source record, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 source
fe80::2fd:6cff:fe1c:b
```

To add a static group record on a specific port on vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 mld static-group ff1e::10 interface
port1.0.4
```

ipv6 mld version

Overview Use this command to set the current MLD protocol version on an interface.

Use the **no** variant of this command to return to the default version on an interface.

Syntax

```
ipv6 mld version <version>
no ipv6 mld version
```

Parameter	Description
<version>	MLD protocol version number. Valid version numbers are 1 and 2

Default The default MLD protocol version number is 2.

Mode Interface Configuration for a VLAN interface.

Usage notes This command applies to interfaces configured for MLD Layer-3 multicast protocols and MLD Snooping. Note this command is intended for use where there is another querier (when there is another device with MLD enabled) on the same link that can only operate with MLD version 1. Otherwise, the default MLD version 2 is recommended for performance.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 mld version 1
```

show debugging mld

Overview Use this command to see what debugging is turned on for MLD. MLD debugging modes are enabled with the debug mld command.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax
```
show debugging mld
```

Mode Privileged Exec

Example
```
awplus# show debugging mld
```

Output
```
show debugging mld
MLD Debugging status:
  MLD Decoder debugging is on
  MLD Encoder debugging is on
  MLD Events debugging is on
  MLD FSM debugging is on
  MLD Tree-Info-Base (TIB) debugging is on
```

Related commands debug mld

show ipv6 mld groups

Overview Use this command to display the multicast groups that have receivers directly connected to the router and learned through MLD.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax `show ipv6 mld groups [<ipv6-address>|<interface>] [detail]`

Parameter	Description
<ipv6-address>	Optional. Specify Address of the multicast group in format X:X::X:X.
<interface>	Optional. Specify the Interface name for which to display local information.

Mode User Exec and Privileged Exec

Examples The following command displays local-membership information for all interfaces:

```
awplus# show ipv6 mld groups
```

Output Figure 35-2: Example output for **show ipv6 mld groups**

```
awplus#show ipv6 mld groups
MLD Connected Group Membership
Group Address                           Interface            Uptime   Expires
                  Last Reporter
ff08::1                                 vlan10 (port1.0.1)   00:07:27 00:03:10
                  fe80::200:1ff:fe20:b5ac
```

The following command displays local-membership information for all interfaces:

```
awplus# show ipv6 mld groups detail
```

show ipv6 mld interface

Overview Use this command to display the state of MLD and MLD Snooping for a specified interface, or all interfaces.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ipv6 mld interface [<interface>]
```

Parameter	Description
<interface>	Interface name.

Mode User Exec and Privileged Exec

Example The following command displays MLD interface status on all interfaces enabled for MLD:

```
awplus# show ipv6 mld interface
```

Output

```
awplus#show ipv6 mld interface

Interface vlan1 (Index 301)
 MLD Enabled, Active, Querier, Version 2 (default)
 Internet address is fe80::215:77ff:fec9:7468
 MLD interface has 0 group-record states
 MLD activity: 0 joins, 0 leaves
 MLD robustness variable is 2
 MLD last member query count is 2
 MLD query interval is 125 seconds
 MLD querier timeout is 255 seconds
 MLD max query response time is 10 seconds
 Last member query response interval is 1000 milliseconds
 Group Membership interval is 260 seconds
 MLD Snooping is globally enabled
 MLD Snooping is enabled on this interface
 MLD Snooping fast-leave is not enabled
 MLD Snooping querier is enabled
 MLD Snooping report suppression is enabled
```

show ipv6 mld snooping mrouter

Overview Use this command to display the multicast router interfaces, both configured and learned, in a VLAN. If you do not specify a VLAN interface then all the VLAN interfaces are displayed.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show ipv6 mld snooping mrouter [<interface>]
```

Parameter	Description
<interface>	Optional. Specify the name of the VLAN interface. Note: If you do not specify a single VLAN interface, then all VLAN interfaces are shown.

Mode User Exec and Privileged Exec

Examples The following command displays the multicast router interfaces in `vlan2`:

```
awplus# show ipv6 mld snooping mrouter vlan2
```

Output

```
awplus#show ipv6 mld snooping mrouter vlan2
VLAN    Interface    Static/Dynamic
2       port1.0.2    Dynamically Learned
2       port1.0.3    Dynamically Learned
```

The following command displays the multicast router interfaces for all VLAN interfaces:

```
awplus# show ipv6 mld snooping mrouter
```

Output

```
awplus#show ipv6 mld snooping mrouter
VLAN    Interface    Static/Dynamic
2       port1.0.2    Dynamically Learned
2       port1.0.3    Dynamically Learned
3       port1.0.4    Statically Assigned
3       port1.0.5    Statically Assigned
```

show ipv6 mld snooping statistics

Overview Use this command to display MLD Snooping statistics data.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus"_Feature Overview and Configuration Guide.

Syntax

```
show ipv6 mld snooping statistics interface <interface>
```

Parameter	Description
<interface>	The name of the VLAN interface.

Mode User Exec and Privileged Exec

Example The following command displays MLDv2 statistical information for `vlan1`:

```
awplus# show ipv6 mld snooping statistics interface vlan1
```

Output

```
awplus#show ipv6 mld snooping statistics interface vlan1
MLD Snooping statistics for vlan1
Interface:      port1.0.1
Group:          ff08::1
Uptime:         00:02:18
Group mode:     Include ()
Last reporter:  fe80::eecd:6dff:fe6b:4783
Group source list: (R - Remote, M - SSM Mapping, S - Static )
  Source Address       Uptime    v2 Exp    Fwd  Flags
  2001:db8::1          00:02:18  00:02:02  Yes  R
  2001:db8::3          00:02:18  00:02:02  Yes  R
```

36 Multicast Commands

Introduction

Overview This chapter provides an alphabetical reference of multicast commands for configuring:

- IPv4 and IPv6 multicast forwarding
- IPv4 and IPv6 static multicast routes
- mroutes (routes back to a multicast source)

For commands for other multicast protocols, see:

- IGMP and IGMP Snooping Commands
- MLD and MLD Snooping Commands
- PIM-SM Commands
- PIM-SMv6 Commands

NOTE: *Before using PIM-SMv6 commands, IPv6 must be enabled on an interface with the ipv6 enable command, IPv6 forwarding must be enabled globally for routing IPv6 with the ipv6 forwarding command, and IPv6 multicasting must be enabled globally with the ipv6 multicast-routing command.*

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the clear ipv6 mroute command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.

The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306. The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96.

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

- "platform multicast-ratelimit" on page 1821
- "show debugging nsm mcast" on page 1822
- "show ip mroute" on page 1823
- "show ip mvif" on page 1826
- "show ip rpf" on page 1827
- "show ipv6 mroute" on page 1828
- "show ipv6 multicast forwarding" on page 1830
- "show ipv6 mif" on page 1831

clear ip mroute

Overview Use this command to delete entries from the IPv4 multicast routing table.

NOTE: *If you use this command, you should also use the clear ip igmp group command to clear IGMP group membership records.*

Syntax

```
clear ip mroute {*|<ipv4-group-address>
[<ipv4-source-address>]} [pim sparse-mode]
```

Parameter	Description
*	Deletes all multicast routes.
<ipv4-group-address>	Group IPv4 address, in dotted decimal notation in the format A.B.C.D.
<ipv4-source-address>	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.
pim sparse-mode	Clear specified IPv4 multicast route(s) for PIM Sparse Mode only.

Mode Privileged Exec

Usage notes When this command is used, the Multicast Routing Information Base (MRIB) clears the IPv4 multicast route entries in its IPv4 multicast route table, and removes the entries from the multicast forwarder. The MRIB sends a “clear” message to the multicast protocols. Each multicast protocol has its own “clear” multicast route command. The protocol-specific “clear” command clears multicast routes from PIM Sparse Mode, and also clears the routes from the MRIB.

Examples

```
awplus# clear ip mroute 225.1.1.1 192.168.3.3
awplus# clear ip mroute *
```

Related commands ip multicast route

show ip mroute

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

clear ip mroute statistics

Overview Use this command to delete multicast route statistics entries from the IP multicast routing table.

Syntax
```
clear ip mroute statistics {*|<ipv4-group-addr>
[<ipv4-source-addr>]}
```

Parameter	Description
*	All multicast route entries.
<ipv4-group-addr>	Group IPv4 address, in dotted decimal notation in the format A.B.C.D.
<ipv4-source-addr>	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.

Mode Privileged Exec

Example
```
awplus# clear ip mroute statistics 225.1.1.2 192.168.4.4
awplus# clear ip mroute statistics *
```

clear ipv6 mroute

Overview Use this command to delete one or more dynamically-added route entries from the IPv6 multicast routing table.

You need to do this, for example, if you want to create a static route instead of an existing dynamic route.

Syntax

```
clear ipv6 mroute {*|<ipv6-group-address>
[<ipv6-source-address>]}
```

Parameter	Description
*	Deletes all dynamically-learned IPv6 multicast routes.
<ipv6-group-address>	Group IPv6 address, in hexadecimal notation in the format X.X::X.X.
<ipv6-source-address>	Source IPv6 address, in hexadecimal notation in the format X.X::X.X.

Mode Privileged Exec

Usage notes When this command is used, the Multicast Routing Information Base (MRIB) clears the relevant IPv6 multicast route entries in its IPv6 multicast route table, and removes the entries from the multicast forwarder. The MRIB sends a "clear" message to the multicast protocols. Each multicast protocol has its own "clear" multicast route command.

This command does not remove static routes from the routing table or the configuration. To remove static routes, use the **no** parameter of the command ipv6 multicast route.

Example

```
awplus# clear ipv6 mroute 2001::2 ff08::1
```

Related commands ipv6 multicast route

show ipv6 mroute

clear ipv6 mroute statistics

Overview Use this command to delete multicast route statistics entries from the IPv6 multicast routing table.

NOTE: *Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the clear ipv6 mroute command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.*

Syntax

```
clear ipv6 mroute statistics {*|<ipv6-group-address>
[<ipv6-source-address>]}
```

Parameter	Description
*	All multicast route entries.
<*ipv6-group-addr*>	Group IPv6 address, in hexadecimal notation in the format X.X::X.X.
<*ipv6-source-addr*>	Source IPv6 address, in hexadecimal notation in the format X.X::X.X.

Mode Privileged Exec

Examples

```
awplus# clear ipv6 mroute statistics 2001::2 ff08::1
awplus# clear ipv6 mroute statistics *
```

debug nsm

Overview This command specifies a set of debug options for use by Allied Telesis authorized service personnel only.

Use the **no** variant of this command to remove debug options.

Syntax

```
debug nsm [all|events|ha|kernel]
no debug nsm [all|events|ha|kernel]
```

Parameter	Description
`all`	Enables all the nsm debugging options
`events`	Enables the nsm events debugging options
`ha`	Enables the nsm high availability debugging options
`kernel`	Enables the nsm kernel debugging options

Mode Global Configuration, Privileged Exec

Usage notes This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

Related commands show debugging nsm mcast

Command changes Version 5.4.7-2.1 command added.

debug nsm mcast

Overview Use this command to debug IPv4 events in the Multicast Routing Information Base (MRIB).

This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

Syntax

```
debug nsm mcast
{all|fib-msg|mrt|mtrace|mtrace-detail|register|stats|vif}
```

Parameter	Description
`all`	All IPv4 multicast debugging.
`fib-msg`	Forwarding Information Base (FIB) messages.
`mrt`	Multicast routes.
`mtrace`	Multicast traceroute.
`mtrace-detail`	Multicast traceroute detailed debugging.
`register`	Multicast PIM register messages.
`stats`	Multicast statistics.
`vif`	Multicast interface.

Mode Privileged Exec and Global Configuration

Examples To enable debugging of all multicast route events, use the commands:

```
awplus# configure terminal
awplus(config)# debug nsm mcast all
```

To enable debugging of PIM register entries, use the commands:

```
awplus# configure terminal
awplus(config)# debug nsm mcast register
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

debug nsm mcast6

Overview Use this command to debug IPv6 events in the Multicast Routing Information Base (MRIB).

This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

Syntax

```
debug nsm mcast6 {all|fib-msg|mrt|register|stats|vif}
no debug nsm mcast6 {all|fib-msg|mrt|register|stats|vif}
```

Parameter	Description
`all`	All IPv6 multicast route debugging.
`fib-msg`	Forwarding Information Base (FIB) messages.
`mrt`	Multicast routes.
`register`	Multicast PIM register messages.
`stats`	Multicast statistics.
`vif`	Multicast interfaces.

Mode Privileged Exec and Global Configuration

Examples To enable debugging of all multicast route events, use the commands:

```
awplus# configure terminal
awplus(config)# debug nsm mcast6 all
```

To enable debugging of PIM register entries, use the commands:

```
awplus# configure terminal
awplus(config)# debug nsm mcast6 register
```

ip mroute

Overview Use this command to inform multicast of the RPF (Reverse Path Forwarding) route to a given IPv4 multicast source.

Use the **no** variant of this command to delete a route to an IPv4 multicast source.

Syntax

```
ip mroute <ipv4-source-address/mask-length>
[bgp|ospf|rip|static] <rpf-address> [<admin-distance>]
```

```
no ip mroute <ipv4-source-address/mask-length>
[bgp|ospf|rip|static]
```

Parameter	Description
<ipv4-source-address/mask-length>	A multicast source IPv4 address and mask length, in dotted decimal notation in the format A.B.C.D/M.
`bgp`	BGP unicast routing protocol.
`ospf`	OSPF unicast routing protocol.
`rip`	RIP unicast routing protocol.
`static`	Specifies a static route.
<rpf-address>	A.B.C.D The closest known address on the multicast route back to the specified source. This host IPv4 address can be within a directly connected subnet or within a remote subnet. In the case that the address is in a remote subnet, a lookup is done from the unicast route table to find the next hop address on the path to this host.
<admin-distance>	The administrative distance. Use this to determine whether the RPF lookup selects the unicast or multicast route. Lower distances have preference. If the multicast static route has the same distance as the other RPF sources, the multicast static route takes precedence. The default is 0 and the range available is 0-255.

Mode Global Configuration

Usage notes Typically, when a Layer 3 multicast routing protocol is determining the RPF (Reverse Path Forwarding) interface for the path to an IPv4 multicast source, it uses the unicast route table to find the best path to the source. However, in some networks a deliberate choice is made to send multicast via different paths to those used for unicast. In this case, the interface via which a multicast stream from a given source enters a router may not be the same as the interface that connects to the best unicast route to that source.

This command enables the user to statically configure the device with “multicast routes” back to given sources. When performing the RPF check on a stream from a given IPv4 source, the multicast routing protocol will look at these static entries as well as looking into the unicast routing table. The route with the lowest

administrative distance - whether a static “multicast route” or a route from the unicast route table - will be chosen as the RPF route to the source.

Note that in this context the term “multicast route” does not imply a route via which the current router will forward multicast; instead it refers to the route the multicast will have traversed in order to arrive at the current router.

Examples

The following example creates a static multicast IPv4 route back to the sources in the 10.10.3.0/24 subnet. The multicast route is via the host 192.168.2.3, and has an administrative distance of 2:

```
awplus# configure terminal
awplus(config)# ip mroute 10.10.3.0/24 static 2 192.168.2.3 2
```

The following example creates a static multicast IPv4 route back to the sources in the 192.168.3.0/24 subnet. The multicast route is via the host 10.10.10.50. The administrative distance on this route has the default value of 0:

```
awplus# configure terminal
awplus(config)# ip mroute 192.168.3.0/24 10.10.10.50
```

Validation Commands

show ip rpf

ip multicast route

Overview Use this command to add an IPv4 static multicast route for a specific multicast source and group IPv4 address to the multicast Routing Information Base (RIB). This IPv4 multicast route is used to forward multicast traffic from a specific source and group ingressing on an upstream VLAN to a single or range of downstream VLANs.

Use the **no** variant of this command to either remove an IPv4 static multicast route set with this command or to remove a specific downstream VLAN interface from an IPv4 static multicast route for a specific multicast source and group IPv4 address.

Syntax

```
ip multicast route <ipv4-source-addr> <ipv4-group-addr>
<upstream-vlan-id> [<downstream-vlan-id>]
```

```
no ip multicast route <ipv4-source-addr> <ipv4-group-addr>
[<upstream-vlan-id> <downstream-vlan-id>]
```

Parameter	Description
<ipv4-source-addr>	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.
<ipv4-group-addr>	Group IPv4 address, in dotted decimal notation in the format A.B.C.D.
<upstream-vlan-id>	Upstream VLAN interface on which the multicast packets ingress.
<downstream-vlan-id>	Downstream VLAN interface or range of VLAN interfaces to which the multicast packets are sent.

Default By default, this feature is disabled.

Mode Global Configuration

Usage notes Only one multicast route entry per IPv4 address and multicast group can be specified. Therefore, if one entry for a static multicast route is configured, PIM will not be able to update this multicast route in any way.

If a dynamic multicast route exists you cannot create a static multicast route with same source IPv4 address, group IPv4 address, upstream VLAN and downstream VLANs. An error message is displayed and logged. To add a new static multicast route, either wait for the dynamic multicast route to timeout or clear the dynamic multicast route with the clear ip mroute command.

To update an existing static multicast route entry with more or a new set of downstream VLANs, you must firstly remove the existing static multicast route and then add the new static multicast route with all downstream VLANs specified. If you attempt to update an existing static multicast route entry with an additional VLAN or VLANs an error message is displayed and logged.

To create a blackhole or null route where packets from a specified source and group address coming from an upstream VLAN are dropped rather than

forwarded, do not specify the optional <*downstream-vlan-id*> parameter when entering this command.

To remove a specific downstream VLAN from an existing static multicast route entry, specify the VLAN you want to remove with the <`downstream-vlan-id`> parameter when entering the **no** variant of this command.

Examples To create a static multicast route for the multicast source IPv4 address `2.2.2.2` and group IPv4 address `224.9.10.11`, specifying the upstream VLAN interface as `vlan10` and the downstream VLAN interface as `vlan20`, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10 vlan20
```

To create a blackhole route for the multicast source IPv4 address `2.2.2.2` and group IPv4 address `224.9.10.11`, specifying the upstream VLAN interface as `vlan10`, use the following commands:

To create an IPv4 static multicast route for the multicast source IPv4 address `2.2.2.2` and group IP address `224.9.10.11`, specifying the upstream VLAN interface as `vlan10` and the downstream VLAN range as `vlan20-25`, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast route 2.2.2.2 224.9.10.11 vlan10 vlan20-25
```

To remove the downstream VLAN 23 from the IPv4 static multicast route created with the above command, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast route 2.2.2.2 224.9.10.11 vlan10 vlan23
```

To delete an IPv4 static multicast route for the multicast source IP address `2.2.2.2` and group IP address `224.9.10.11`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast route 2.2.2.2 224.9.10.11
```

Related commands clear ip mroute

show ip mroute

ip multicast route-limit

Overview Use this command to limit the number of multicast routes that can be added to an IPv4 multicast routing table.

Use the **no** variant of this command to return the IPv4 route limit to the default.

Syntax

```
ip multicast route-limit <limit> [<threshold>]
no ip multicast route-limit
```

Parameter	Description
<limit>	*<1-2147483647>* Number of routes.
<threshold>	*<1-2147483647>* Threshold above which to generate a warning message. The mroute warning threshold must not exceed the mroute limit.

Default The default limit and threshold value is 2147483647.

Mode Global Configuration

Usage notes This command limits the number of multicast IPv4 routes (mroutes) that can be added to a router, and generates an error message when the limit is exceeded. If the threshold parameter is set, a threshold warning message is generated when this threshold is exceeded, and the message continues to occur until the number of mroutes reaches the limit set by the limit argument.

Examples

```
awplus# configure terminal
awplus(config)# ip multicast route-limit 34 24
awplus# configure terminal
awplus(config)# no ip multicast route-limit
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip multicast wrong-vif-suppression

Overview Use this command to prevent unwanted multicast packets received on an unexpected VLAN being trapped to the CPU.

Use the no variant of this command to disable wrong VIF suppression.

Syntax

```
ip ip multicast wrong-vif-suppression
no ip multicast wrong-vif-suppression
```

Default By default, this feature is disabled.

Mode Global Configuration

Usage notes Use this command if there is excessive CPU load and multicast traffic is enabled. To confirm that VIF messages are being sent to the CPU use the debug nsm mcast6 command.

Examples To enable the suppression of wrong VIF packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip multicast wrong-vif-suppression
```

To disable the suppression of wrong VIF packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip multicast wrong-vif-suppression
```

ip multicast-routing

Overview Use this command to turn on/off IPv4 multicast routing on the router; when turned off the device does not perform multicast functions.

Use the **no** variant of this command to disable IPv4 multicast routing after enabling it. Note the default stated below.

Syntax

```
ip multicast-routing
no ip multicast-routing
```

Default By default, IPv4 multicast routing is off.

Mode Global Configuration

Usage notes When the **no** variant of this command is used, the Multicast Routing Information Base (MRIB) cleans up Multicast Routing Tables (MRT), stops IGMP operation, and stops relaying multicast forwarder events to multicast protocols.

When multicast routing is enabled, the MRIB starts processing any MRT addition/deletion requests, and any multicast forwarding events.

You must enable multicast routing before issuing other multicast commands.

Example

```
awplus# configure terminal
awplus(config)# ip multicast-routing
```

Validation Commands show running-config

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ipv6 mroute

Overview Use this command to inform multicast of the RPF (Reverse Path Forwarding) route to a given IPv6 multicast source.

Use the **no** variant of this command to delete a route to an IPv6 multicast source.

Syntax

```
ipv6 mroute <ipv6-source-address/mask-length> [rip|static]
<rpf-address> [<admin-distance>]
no ipv6 mroute <ipv6-source-address/mask-length> [rip|static]
```

Parameter	Description
<ipv6-source-address/mask-length>	A multicast source IPv6 address and mask length, in hexadecimal notation in the format X.X::X.X/M.
`rip`	RIPng IPv6 unicast routing protocol.
`static`	Specifies a static route.
<rpf-address>	X.X::X:X The closest known address on the IPv6 multicast route back to the specified source. This host IPv6 address can be within a directly connected subnet or within a remote subnet. In the case that the address is in a remote subnet, a lookup is done from the unicast route table to find the nexthop address on the path to this host.
<admin-distance>	The administrative distance. Use this to determine whether the RPF lookup selects the unicast or multicast route. Lower distances have preference. If the multicast static route has the same distance as the other RPF sources, the multicast static route takes precedence. The default is `0` and the range available is `0-255`.

Mode Global Configuration

Usage notes Typically, when a Layer 3 multicast routing protocol is determining the RPF (Reverse Path Forwarding) interface for the path to a multicast source, it uses the unicast IPv6 route table to find the best path to the source. However, in some networks a deliberate choice is made to send multicast via different paths to those used for unicast. In this case, the interface via which a multicast stream from a given source enters a router may not be the same as the interface that connects to the best unicast route to that source.

This command enables the user to statically configure the switch with “multicast routes” back to given sources. When performing the RPF check on a stream from a given IPv6 source, the multicast routing protocol will look at these static entries as well as looking into the unicast routing table. The route with the lowest administrative distance - whether a static “multicast route” or a route from the unicast route table - will be chosen as the RPF route to the source.

Note that in this context the term “multicast route” does not imply a route via which the current router will forward multicast; instead it refers to the route the multicast will have traversed in order to arrive at the current router.

Examples

The following example creates a static multicast route back to the sources in the `2001::1/64` subnet. The multicast route is via the host `2002::2`, and has an administrative distance of 2:

```
awplus# configure terminal
awplus(config)# ipv6 mroute 2001::1/64 static 2 2002::2
```

The following example creates a static multicast route back to the sources in the 2002::2/64subnet. The multicast route is via the host 2001::1. The administrative distance on this route has the default value of `0`:

```
awplus# configure terminal
awplus(config)# ipv6 mroute 2002::2/64 2001::1
```

Validation Commands

show ipv6 mroute

ipv6 multicast route

Overview Use this command to add an IPv6 static multicast route for a specific multicast source and group IPv6 address to the multicast Routing Information Base (RIB). This IPv6 multicast route is used to forward IPv6 multicast traffic from a specific source and group ingressing on an upstream VLAN to a single or range of downstream VLANs.

See detailed usage notes below to configure static multicast router ports when using static IPv6 multicast routes with EPSR, and the destination VLAN is an EPSR data VLAN.

Use the **no** variant of this command to either remove an IPv6 static multicast route set with this command or to remove a specific downstream VLAN interface from an IPv6 static multicast route for a specific IPv6 multicast source and group address.

Syntax

```
ipv6 multicast route <ipv6-source-addr> <ipv6-group-addr>
<upstream-vlan-id> [<downstream-vlan-id>]
```

```
no ipv6 multicast route <ipv6-source-addr> <ipv6-group-addr>
[<upstream-vlan-id> <downstream-vlan-id>]
```

Parameter	Description
<ipv6-group-addr>	Source IPv6 address, in dotted decimal notation in the format X.X::X.X.
<ipv6-group-addr>	Group IP address, in dotted decimal notation in the format X.X::X.X.
<upstream-vlan-id>	Upstream VLAN interface on which the multicast packets ingress.
<downstream-vlan-id>	Downstream VLAN interface or range of VLAN interfaces to which the multicast packets are sent.

Default By default, no static routes exist.

Mode Global Configuration

Usage notes Only one multicast route entry per IPv6 address and multicast group can be specified. Therefore, if one entry for an IPv6 static multicast route is configured, PIM will not be able to update this multicast route in any way.

If a dynamic multicast route exists, you cannot create a static multicast route with the same source IPv6 address and group IPv6 address. An error message is displayed and logged. To add a new static multicast route, either wait for the dynamic multicast route to time out or clear the dynamic multicast route with the clear ipv6 mroute command.

To update an existing IPv6 static multicast route entry with new or additional downstream VLANs, you must firstly remove the existing static multicast route and then add the new static multicast route with all downstream VLANs specified. If

you attempt to update an existing static multicast route entry with an additional VLAN or VLANs an error message is displayed and logged.

To remove a specific downstream VLAN from an existing static multicast route entry, specify the VLAN you want to remove with the <downstream-vlan-id> parameter when entering the **no** variant of this command.

Note that if static IPv6 multicast routing is being used with EPSR and the destination VLAN is an EPSR data VLAN, then multicast router (mrouter) ports must be statically configured. This minimizes disruption for multicast traffic in the event of ring failure or restoration.

When configuring the EPSR data VLAN, statically configure mrouter ports so that the multicast router can be reached in either direction around the EPSR ring.

See ipv6 mld snooping mrouter for a command description and command examples.

Examples

To create an IPv6 static multicast route for the multicast source IPv6 address 2001::1 and group IPv6 address ff08::1, specifying the upstream VLAN interface as vlan10 and the downstream VLAN interface as vlan20, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
vlan20
```

To create a blackhole route for the IPv6 multicast source IP address 2001::1 and group IP address ff08::1, specifying the upstream VLAN interface as vlan10, use the following commands:

To create an IPv6 static multicast route for the multicast source IPv6 address 2001::1 and group IPv6 address ff08::1, specifying the upstream VLAN interface as vlan10 and the downstream VLAN range as vlan20-25, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 multicast route 2001::1 ff08::1 vlan10
vlan20-25
```

To remove the downstream VLAN 23 from the IPv6 static multicast route created with the above command, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast route 2001::1 ff08::1 vlan10
vlan23
```

To delete an IPv6 static multicast route for the multicast source IPv6 address 2001::1 and group IPv6 address ff08::1, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 multicast route 2001::1 ff08::1
```

show ipv6 mroute

ipv6 multicast route-limit

Overview Use this command to limit the number of multicast routes that can be added to an IPv6 multicast routing table.

Use the no variant of this command to return the IPv6 route limit to the default.

Syntax

```
ipv6 multicast route-limit <limit> [<threshold>]
no ipv6 multicast route-limit
```

Parameter	Description
<limit>	*<1-2147483647>* Number of routes.
<threshold>	*<1-2147483647>* Threshold above which to generate a warning message. The mroute warning threshold must not exceed the mroute limit.

Default The default limit and threshold value is 2147483647.

Mode Global Configuration

Usage notes This command limits the number of multicast IPv6 routes (mroutes) that can be added to a router, and generates an error message when the limit is exceeded. If the threshold parameter is set, a threshold warning message is generated when this threshold is exceeded, and the message continues to occur until the number of mroutes reaches the limit set by the limit argument.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 multicast route-limit 34 24
awplus# configure terminal
awplus(config)# no ipv6 multicast route-limit
```

ipv6 multicast-routing

Overview Use this command to turn on/off IPv6 multicast routing on the router; when turned off the device does not perform multicast functions.

Use the **no** variant of this command to disable IPv6 multicast routing after enabling it. Note the default stated below.

Syntax
```
ipv6 multicast-routing
no ipv6 multicast-routing
```

Default By default, IPv6 multicast routing is off.

Mode Global Configuration

Usage When the **no** variant of this command is used, the Multicast Routing Information Base (MRIB) cleans up Multicast Routing Tables (MRT, and stops relaying multicast forwarder events to multicast protocols.

When multicast routing is enabled, the MRIB starts processing any MRT addition/deletion requests, and any multicast forwarding events.

You must enable multicast routing before issuing other multicast commands.

Examples
```
awplus# configure terminal
awplus(config)# ipv6 multicast-routing
awplus# configure terminal
awplus(config)# no ipv6 multicast-routing
```

Validation Commands show running-config

multicast

Overview Use this command to enable a device port to route multicast packets that ingress the port.

Use the **no** variant of this command to stop the device port from routing multicast packets that ingress the port. Note that this does not affect Layer 2 forwarding of multicast packets. If you enter **no multicast** on a port, multicast packets received on that port will not be forwarded to other VLANs, but ports in the same VLANs as the receiving port will still receive the multicast packets.

CAUTION: *We do not recommend disabling multicast routing in a live network. Some non-multicast protocols use multicast packets and will not function correctly if you disable it.*

Syntax

```
multicast
no multicast
```

Default By default, all device ports route multicast packets.

Mode Interface Configuration

Examples To disable routing of multicast packets on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no multicast
```

To re-enable routing of multicast packets on a port, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# multicast
```

Validation Commands show running-config

platform multicast-ratelimit

Overview Use this command to set the maximum number of multicast packets to be forwarded to the CPU (in packets per second). Setting the value to zero disables rate limiting.

This command should be used with care. Increasing or removing the limit could make the device less responsive under heavy multicast load.

Use the **no** variant of this command to return the limit to its default.

Syntax

```
platform multicast-ratelimit <0-1000>
no platform multicast-ratelimit
```

Default 10 packets per second (pps)

Mode Global Configuration

Usage notes If you find that the CPU load on your device from multicast traffic is higher than desired, reducing this rate may reduce the CPU load.

If you need the device to process a large amount of multicast traffic, increasing this rate may improve performance.

Example To set the rate to 30pps, use the commands:

```
awplus# configure terminal
awplus(config)# platform multicast-ratelimit 30
```

Command changes Version 5.4.8-1.1: default changed to 100pps on SBx908 GEN2, SBx8100, and x930 Series switches.

show debugging nsm mcast

Overview Use this command to show the status of the NSM multicast debugging.

Syntax

```
show debugging nsm mcast
```

Parameter	Description
<vrf-name>	VRF instance name

Mode Privileged Exec

Usage notes This command is intended for use by Allied Telesis authorized service personnel for diagnostic purposes.

Example To show debugging for NSM multicast, use the following command:

```
awplus# show debug nsm mcast
```

Output Figure 36-1: Example output from **show debug nsm mcast**

```
awplus# show debugging nsm mcast
Debugging status:
  NSM multicast vif debugging is on
  NSM multicast route debugging is on
  NSM multicast route statistics debugging is on
  NSM multicast FIB message debugging is on
  NSM multicast PIM Register message debugging is on
  NSM multicast traceroute debugging is on
  NSM multicast traceroute detailed debugging is on
```

Related commands debug nsm mcast

Command changes Version 5.4.7-2.1: command added

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2

show ip mroute

Overview Use this command to display the contents of the IPv4 multicast routing (mroute) table.

Syntax
```
show ip mroute [<ipv4-group-addr>] [<ipv4-source-addr>]
[dense|sparse] [count|summary]
```

Parameter	Description
<ipv4-group-addr>	Group IPv4 address, in dotted decimal notation in the format A.B.C.D.
<ipv4-source-addr>	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.
`dense`	Display dense IPv4 multicast routes.
`sparse`	Display sparse IPv4 multicast routes.
`count`	Display the route and packet count from the IPv4 multicast routing (mroute) table.
`summary`	Display the contents of the IPv4 multicast routing (mroute) table in an abbreviated form.

Mode User Exec and Privileged Exec

Examples
```
awplus# show ip mroute 10.10.3.34 224.1.4.3
awplus# show ip mroute 10.10.5.24 225.2.2.2 count
awplus# show ip mroute 10.10.1.34 summary
```

Output The following is a sample output of this command displaying the IPv4 multicast routing table, with and without specifying the group and source IPv4 address:

Figure 36-2: Example output from the **show ip mroute** command

```
awplus# show ip mroute
IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry
Interface State: Interface (TTL)

```

Command changes

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip mvif

Overview Use this command to display the contents of the IPv4 Multicast Routing Information Base (MRIB) VIF table.

Syntax `show ip mvif <interface>`

Parameter	Description
<interface>	The interface to display information about.

Mode User Exec and Privileged Exec

Example `awplus# show ip mvif vlan2`

Output Figure 36-6: Example output from the **show ip mvif** command

```
Interface    Vif   Owner    TTL  Local           Remote        Uptime
             Idx   Module        Address         Address
vlan2        0     PIM-SM   1    192.168.1.53    0.0.0.0       00:04:26
Register     1               1    192.168.1.53    0.0.0.0       00:04:26
vlan3        2     PIM-SM   1    192.168.10.53   0.0.0.0       00:04:25
```

Figure 36-7: Example output from the **show ip mvif** command with the interface parameter **vlan2** specified

```
Interface   Vif   Owner    TTL  Local           Remote          Uptime
            Idx   Module        Address         Address
vlan2       0     PIM-SM   1    192.168.1.53    0.0.0.0         00:05:17
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip rpf

Overview Use this command to display Reverse Path Forwarding (RPF) information for the specified IPv4 source address.

Syntax

```
show ip rpf <source-addr>
```

Parameter	Description
<source-addr>	Source IPv4 address, in dotted decimal notation in the format A.B.C.D.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip rpf 10.10.10.50
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ipv6 mroute

Overview Use this command to display the contents of the IPv6 multicast routing (mroute) table.

Syntax
```
show ipv6 mroute [<ipv6-group-addr>] [<ipv6-source-addr>]
[{count|summary}]
```

Parameter	Description
<ipv6-group-addr>	Group IPv6 address, in hexadecimal notation in the format X.X::X.X.
<ipv6-source-addr>	Source IPv6 address, in hexadecimal notation in the format X.X::X.X.
`count`	Display the route and packet count from the IPv6 multicast routing (mroute) table.
`summary`	Display the contents of the IPv6 multicast routing (mroute) table in an abbreviated form.

Mode User Exec and Privileged Exec

Examples
```
awplus# show ipv6 mroute
awplus# show ipv6 mroute count
awplus# show ipv6 mroute summary
awplus# show ipv6 mroute 2001::2 ff08::1 count
awplus# show ipv6 mroute 2001::2 ff08::1
awplus# show ipv6 mroute 2001::2 summary
```

Output The following is a sample output of this command displaying the IPv6 multicast routing table for a single static IPv6 Multicast route:

Figure 36-8: Example output from the **show ipv6 mroute** command

```
awplus#show ipv6 mroute
IPv6 Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder
installed
Timers: Uptime/Stat Expiry

show ipv6 multicast forwarding

Overview Use this command to view the status of multicast forwarding slow-path-packet setting.

Syntax

```
show ipv6 multicast forwarding
```

Mode User Exec

Example To show the status of the multicast forwarding, slow-path-packet setting, use the following command:

```
awplus# show ipv6 multicast forwarding
```

Output Figure 36-11: Example output from the **show ipv6 multicast forwarding** command:

```
ipv6 multicast forwarding is disabled
```

Related commands ipv6 multicast forward-slow-path-packet

show ipv6 mif

Overview Use this command to display the contents of the IPv6 Multicast Routing Information Base (MRIB) MIF table.

Syntax `show ipv6 mif [<interface>]`

Parameter	Description
<interface>	The interface to display information about.

Mode User Exec and Privileged Exec

Example
```
awplus# show ipv6 mif
awplus# show ipv6 mif vlan2
```

Output Figure 36-12: Example output from the **show ipv6 mif** command

```
awplus#show ipv6 mif
Interface    Mif   Owner            Uptime
             Idx   Module
vlan3        0     MLD/MLD Proxy-Service 03:28:48
vlan2        1     MLD/MLD Proxy-Service 03:28:48
vlan1        2     MLD/MLD Proxy-Service 03:28:48
```

Figure 36-13: Example output from the **show ipv6 mif** command with the interface parameter **vlan2** specified

```
Interface    Mif   Owner    TTL   Remote           Uptime
             Idx   Module         Address
vlan2        0     PIM-SMv6   1    0.0.0.0         00:05:17
```

37 PIM-SM Commands

Introduction

Overview This chapter provides an alphabetical reference of PIM-SM commands. For commands common to PIM-SM and PIM-DM, see the Multicast Commands chapter.

Command List

- "clear ip pim sparse-mode bsr rp-set *" on page 1834
- "clear ip pim sparse-mode packet statistics" on page 1835
- "clear ip mroute pim sparse-mode" on page 1836
- "debug pim sparse-mode" on page 1837
- "debug pim sparse-mode timer" on page 1838
- "ip pim anycast-rp" on page 1840
- "ip pim bsr-border" on page 1841
- "ip pim bsr-candidate" on page 1842
- "ip pim cisco-register-checksum" on page 1843
- "ip pim crp-cisco-prefix" on page 1844
- "ip pim dr-priority" on page 1845
- "ip pim exclude-genid" on page 1846
- "ip pim ext-srcs-directly-connected" on page 1847
- "ip pim hello-holdtime (PIM-SM)" on page 1848
- "ip pim hello-interval (PIM-SM)" on page 1849
- "ip pim ignore-rp-set-priority" on page 1850
- "ip pim jp-timer" on page 1851
- "ip pim register-rate-limit" on page 1852
- "ip pim register-rp-reachability" on page 1853

- "ip pim register-source" on page 1854
- "ip pim register-suppression" on page 1855
- "ip pim rp-address" on page 1856
- "ip pim rp-candidate" on page 1858
- "ip pim rp-register-kat" on page 1859
- "ip pim sparse-mode" on page 1860
- "ip pim sparse-mode join-prune-batching" on page 1861
- "ip pim sparse-mode passive" on page 1863
- "ip pim sparse-mode wrong-vif-suppression" on page 1864
- "ip pim spt-threshold" on page 1866
- "ip pim ssm" on page 1867
- "service pim" on page 1868
- "show debugging pim sparse-mode" on page 1869
- "show ip pim sparse-mode bsr-router" on page 1870
- "show ip pim sparse-mode interface" on page 1871
- "show ip pim sparse-mode interface detail" on page 1873
- "show ip pim sparse-mode local-members" on page 1874
- "show ip pim sparse-mode mroute" on page 1875
- "show ip pim sparse-mode mroute detail" on page 1877
- "show ip pim sparse-mode neighbor" on page 1879
- "show ip pim sparse-mode nexthop" on page 1880
- "show ip pim sparse-mode packet statistics" on page 1881
- "show ip pim sparse-mode rp-hash" on page 1882
- "show ip pim sparse-mode rp mapping" on page 1883
- "undebug all pim sparse-mode" on page 1884

clear ip pim sparse-mode bsr rp-set *

Overview Use this command to clear all Rendezvous Point (RP) sets learned through the PIMv2 Bootstrap Router (BSR).

Syntax

```
clear ip pim sparse-mode bsr rp-set *
```

Parameter	Description
*	Clears all RP sets.

Mode Privileged Exec

Usage notes For multicast clients, note that one router will be automatically or statically designated as the RP, and all routers must explicitly join through the RP. A Designated Router (DR) sends periodic Join/Prune messages toward a group-specific RP for each group that it has active members.

For multicast sources, note that the Designated Router (DR) unicasts Register messages to the RP encapsulating the data packets from the multicast source. The RP forwards decapsulated data packets toward group members.

Example

```
awplus# clear ip pim sparse-mode bsr rp-set *
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

clear ip pim sparse-mode packet statistics

Overview Use this command to clear the PIM sparse mode packet statistics counter.

Syntax
```
clear ip pim sparse-mode packet statistics
```

Mode Privileged Exec

Example The following command clears the current packet receive counts for PIM sparse-mode:

```
awplus# configure terminal
awplus(config)# clear ip pim sparse-mode statistics
```

Output Figure 37-1: Example output from **clear ip pim sparse-mode statistics**

```
awplus(config)#clear ip pim sparse-mode statistics
PIM-SM Receive Packet Statistics :
All PIM-SM    :   Total : 0   Valid : 0
Hello         :   Total : 0   Valid : 0
Register      :   Total : 0   Valid : 0
Register Stop :   Total : 0   Valid : 0
Join/Prune    :   Total : 0   Valid : 0
Bootstrap     :   Total : 0   Valid : 0
Assert        :   Total : 0   Valid : 0
Candidate-RP  :   Total : 0   Valid : 0
```

Related commands show ip pim sparse-mode packet statistics

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

clear ip mroute pim sparse-mode

Overview Use this command to clear all multicast route table entries learned through PIM-SM for a specified multicast group address, and optionally a specified multicast source address.

Syntax

```
clear ip mroute <Group-IP-address> pim sparse-mode
clear ip mroute <Group-IP-address> <Source-IP-address> pim sparse-mode
```

Parameter	Description
<Group-IP-address>	Specify a multicast group IPv6 address, entered in the form A.B.C.D.
<Source-IP-address>	Specify a source group IP address, entered in the form A.B.C.D.

Mode Privileged Exec

Example

```
awplus# clear ip mroute  pim sparse-mode 224.0.0.0
awplus# clear ip mroute  192.168.7.1 pim sparse-mode 224.0.0.0
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

debug pim sparse-mode

Overview Use this command to turn on some or all PIM-SM debugging.

Use the **no** variant of this command to turn off some or all PIM-SM debugging.

Syntax

```
debug pim sparse-mode [all] [events] [mfc] [mib] [nexthop] [nsm]
[packet] [state] [mtrace]
```

```
no debug pim sparse-mode [all] [events] [mfc] [mib] [nexthop]
[nsm] [packet] [state] [mtrace]
```

Parameter	Description
`all`	Activates/deactivates all PIM-SM debugging.
`events`	Activates debug printing of events.
`mfc`	Activates debug printing of MFC (Multicast Forwarding Cache in kernel) add/delete/updates.
`mib`	Activates debug printing of PIM-SM MIBs.
`nexthop`	Activates debug printing of PIM-SM next hop communications.
`nsm`	Activates debugging of PIM-SM Network Services Module communications.
`packet`	Activates debug printing of incoming and/or outgoing packets.
`state`	Activates debug printing of state transition on all PIM-SM FSMs.
`mtrace`	Activates debug printing of multicast traceroute.

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# debug pim sparse-mode all
```

Related commands show debugging pim sparse-mode

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

debug pim sparse-mode timer

Overview Use this command to enable debugging for the specified PIM-SM timers.

Use the **no** variants of this command to disable debugging for the specified PIM-SM timers.

Syntax

```
debug pim sparse-mode timer assert [at]
no debug pim sparse-mode timer assert [at]
debug pim sparse-mode timer bsr [bst|crp]
no debug pim sparse-mode timer bsr [bst|crp]
debug pim sparse-mode timer hello [ht|nlt|tht]
no debug pim sparse-mode timer hello [ht|nlt|tht]
debug pim sparse-mode timer joinprune [jt|et|ppt|kat|ot]
no debug pim sparse-mode timer joinprune [jt|et|ppt|kat|ot]
debug pim sparse-mode timer register [rst]
no debug pim sparse-mode timer register [rst]
```

Parameter	Description
`assert`	Enable or disable debugging for the Assert timers.
`at`	Enable or disable debugging for the Assert Timer.
`bsr`	Enable or disable debugging for the specified Bootstrap Router timer, or all Bootstrap Router timers.
`bst`	Enable or disable debugging for the Bootstrap Router: Bootstrap Timer.
`crp`	Enable or disable debugging for the Bootstrap Router: Candidate-RP Timer.
`hello`	Enable or disable debugging for the specified Hello timer, or all Hello timers.
`ht`	Enable or disable debugging for the Hello timer: Hello Timer.
`nlt`	Enable or disable debugging for the Hello timer: Neighbor Liveness Timer.
`tht`	Enable or disable debugging for the Hello timer: Triggered Hello Timer.
`joinprune`	Enable or disable debugging for the specified JoinPrune timer, or all JoinPrune timers.
`jt`	Enable or disable debugging for the JoinPrune timer: upstream Join Timer.
`et`	Enable or disable debugging for the JoinPrune timer: Expiry Timer.
`ppt`	Enable or disable debugging for the JoinPrune timer: PrunePending Timer.

Parameter	Description
`kat`	Enable or disable debugging for the JoinPrune timer: KeepAlive Timer.
`ot`	Enable or disable debugging for the JoinPrune timer: Upstream Override Timer.
`register`	Enable or disable debugging for the Register timers.
`rst`	Enable or disable debugging for the Register timer: Register Stop Timer.

Default By default, all debugging is disabled.

Mode Privileged Exec and Global Configuration

Examples To enable debugging for the PIM-SM Bootstrap Router bootstrap timer, use the commands:

```
awplus(config)# debug pim sparse-mode timer bsr bst
```

To enable debugging for the PIM-SM Hello: neighbor liveness timer, use the command:

```
awplus(config)# debug pim sparse-mode timer hello ht
```

To enable debugging for the PIM-SM Joinprune expiry timer, use the command:

```
awplus# debug pim sparse-mode timer joinprune et
```

To disable debugging for the PIM-SM Register timer, use the command:

```
awplus# no debug pim sparse-mode timer register
```

Related commands show debugging pim sparse-mode

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim anycast-rp

Overview Use this command to configure Anycast RP (Rendezvous Point) in a RP set.

Use the **no** variant of this command to remove the configuration.

Syntax

```
ip pim anycast-rp <anycast-rp-address> <member-rp-address>
no ip pim anycast-rp <anycast-rp-address> [<member-rp-address>]
```

Parameter	Description
<anycast-rp-address>	<A.B.C.D> Specify an anycast IP address to configure an Anycast RP (Rendezvous Point) in a RP set.
<member-rp-address>	<A.B.C.D> Specify an Anycast RP (Rendezvous Point) address to configure an Anycast RP in a RP set.

Mode Global Configuration

Usage notes Anycast is a network addressing and routing scheme where data is routed to the nearest or best destination as viewed by the routing topology. Compared to unicast with a one-to- one association between network address and network endpoint, and multicast with a one-to-many association between network address and network endpoint; anycast has a one-to-many association between network address and network endpoint. For anycast, each destination address identifies a set of receiver endpoints, from which only one receiver endpoint is chosen.

Anycast is often implemented using BGP to simultaneously advertise the same destination IP address range from many sources, resulting in packets address to destination addresses in this range being routed to the nearest source announcing the given destination IP address.

Use this command to specify the Anycast RP configuration in the Anycast RP set. Use the **no** variant of this command to remove the Anycast RP configuration. Note that the member RP address is optional when using the **no** parameter to remove the Anycast RP configuration. removing the anycast RP address also removes the member RP address.

Examples The following example shows how to configure the Anycast RP address with **ip pim anycast-rp**:

```
awplus# configure terminal
awplus(config)# ip pim anycast-rp 1.1.1.1 10.10.10.10
```

The following example shows how to remove the Anycast RP in the RP set specifying only the anycast RP address with **no ip pim anycast-rp**, but not specifying the member RP address:

```
awplus# configure terminal
awplus(config)# no ip pim anycast-rp 1.1.1.1
```

ip pim bsr-border

Overview Use the **ip pim bsr-border** command to prevent Bootstrap Router (BSR) messages from being sent or received through a VLAN interface. The BSR border is the border of the PIM domain.

Use the **no** variant of this command to disable the configuration set with **ip pim bsr-border**.

Syntax

```
ip pim bsr-border
no ip pim bsr-border
```

Mode Interface Configuration for a VLAN interface or a PPP interface.

Usage notes When this command is configured on a VLAN interface, no PIM version 2 BSR messages will be sent or received through the interface. Configure an interface bordering another PIM domain with this command to avoid BSR messages from being exchanged between the two PIM domains.

BSR messages should not be exchanged between different domains, because devices in one domain may elect Rendezvous Points (RPs) in the other domain, resulting in loss of isolation between the two PIM domains that would stop the PIM protocol from working as intended.

Examples The following example configures the VLAN interface vlan2 to be the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim bsr-border
```

The following example removes the VLAN interface vlan2 from the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim bsr-border
```

The following example configures the PPP interface ppp0 to be the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim bsr-border
```

The following example removes the PPP interface ppp0 from the PIM domain border:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip pim bsr-border
```

ip pim bsr-candidate

Overview Use this command to give the device the candidate BSR (Bootstrap Router) status using the specified IP address mask of the interface.

Use the **no** variant of this command to withdraw the address of the interface from being offered as a BSR candidate.

Syntax

```
ip pim bsr-candidate <interface> [<hash>] [<priority>]
no ip pim bsr-candidate [<interface>]
```

Parameter	Description
<interface>	The interface. For instance, vlan2.
<hash>	<0-32> configure hash mask length for RP selection. The default hash value if you do not configure this parameter is 10.
<priority>	<0-255> configure priority for a BSR candidate. Note that you must also specify the *<hash>* (mask length) when specifying the *<priority>*. The default priority if you do not configure this parameter is 64.

Mode Global Configuration

Default The default hash parameter value is 10 and the default priority parameter value is 64.

Examples To set the BSR candidate to the VLAN interface vlan2, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ip pim bsr-candidate vlan2 20 30
```

To withdraw the address of vlan2 from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ip pim bsr-candidate vlan2
```

To set the BSR candidate to the PPP interface ppp0, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ip pim bsr-candidate ppp0 20 30
```

To withdraw the address of ppp0 from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ip pim bsr-candidate ppp0
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim cisco-register-checksum

Overview Use this command to configure the option to calculate the Register checksum over the whole packet. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this option.

Syntax
```
ip pim cisco-register-checksum
no ip pim cisco-register-checksum
```

Default This command is disabled by default. By default, Register Checksum is calculated only over the header.

Mode Global Configuration

Example
```
awplus# configure terminal
awplus(config)# ip pim cisco-register-checksum
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim crp-cisco-prefix

Overview Use this command to interoperate with Cisco devices that conform to an earlier draft standard. Some Cisco devices might not accept candidate RPs with a group prefix number of zero. Note that the latest BSR specification prohibits sending RP advertisements with prefix 0. RP advertisements for the default IPv4 multicast group range 224/4 are sent with a prefix of 1.

Use the **no** variant of this command to revert to the default settings.

Syntax

```
ip pim crp-cisco-prefix
no ip pim crp-cisco-prefix
```

Mode Global Configuration

Usage notes Cisco's BSR code does not conform to the latest BSR draft. It does not accept candidate RPs with a group prefix number of zero. To make the candidate RP work with a Cisco BSR, use the **ip pim crp-cisco-prefix** command when interoperating with older versions of Cisco IOS.

Example

```
awplus# configure terminal
awplus(config)# ip pim crp-cisco-prefix
awplus# configure terminal
awplus(config)# no ip pim crp-cisco-prefix
```

Related commands ip pim rp-candidate

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim dr-priority

Overview Use this command to set the Designated Router priority value.

Use the **no** variant of this command to disable this function.

Syntax

```
ip pim dr-priority  <priority>
no ip pim dr-priority [<priority>]
```

Parameter	Description
<priority>	<0-4294967294> The Designated Router priority value. A higher value has a higher preference.

Default The default is 1. The negated form of this command restores the value to the default.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Examples To set the Designated Router priority value to 11234 for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim dr-priority 11234
```

To disable the Designated Router priority value for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim dr-priority
```

To set the Designated Router priority value to 11234 for the PPP interface ppp0, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim dr-priority 11234
```

To disable the Designated Router priority value for the PPP interface ppp0, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip pim dr-priority
```

Related commands ip pim ignore-rp-set-priority

ip pim exclude-genid

Overview Use this command to exclude the GenID option from Hello packets sent out by the PIM module on a particular interface.This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

Syntax
```
ip pim exclude-genid
no ip pim exclude-genid
```

Default By default, this command is disabled; the GenID option is included.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Example
```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim exclude-genid
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim exclude-genid
```

ip pim ext-srcs-directly-connected

Overview Use this command to configure PIM to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM to treat only directly connected sources as directly connected.

Syntax

```
ip pim ext-srcs-directly-connected
no ip pim ext-srcs-directly-connected
```

Default The **no** variant of this command is the default behavior.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Example To configure PIM to treat all sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim ext-srcs-directly-connected
```

To configure PIM to treat only directly connected sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim ext-srcs-directly-connected
```

To configure PIM to treat all sources as directly connected for PPP interface ppp0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim ext-srcs-directly-connected
```

To configure PIM to treat only directly connected sources as directly connected for PPP interface ppp0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip pim ext-srcs-directly-connected
```

ip pim hello-holdtime (PIM-SM)

Overview This command configures a hello-holdtime value. You cannot configure a hello-holdtime value that is less than the current hello-interval.

Use the **no** variant of this command to return it to its default of 3.5 * the current hello-interval.

Syntax

```
ip pim hello-holdtime <holdtime>
no ip pim hello-holdtime
```

Parameter	Description
<holdtime>	<1-65535> The holdtime value in seconds (no fractional seconds are accepted).

Default The default hello-holdtime value is 3.5 * the current hello-interval. The default hello- holdtime is restored using the negated form of this command.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Usage Each time the hello interval is updated, the hello holdtime is also updated, according to the following rules:

If the hello holdtime is not configured; or if the hello holdtime is configured and less than the current hello-interval value, it is modified to the (3.5 * hello interval). Otherwise, it retains the configured value.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-holdtime 123
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim hello-holdtime 123
```

ip pim hello-interval (PIM-SM)

Overview This command configures a hello-interval value.

Use the **no** variant of this command to reset the hello-interval to the default.

Syntax

```
ip pim hello-interval <interval>
no ip pim hello-interval
```

Parameter	Description
<interval>	<1-65535> The value in seconds (no fractional seconds accepted).

Default The default hello-interval value is 30 seconds. The default is restored using the negated form of this command.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Usage When the hello interval is configured, and the hello holdtime is not configured, or when the configured hello-holdtime value is less than the new hello-interval value; the holdtime value is modified to the (3.5 * hello interval). Otherwise, the hello-holdtime value is the configured value.

Example

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim hello-interval 123
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim hello-interval 123
```

ip pim ignore-rp-set-priority

Overview Use this command to ignore the RP-SET priority value, and use only the hashing mechanism for RP selection.

This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this setting.

Syntax

```
ip pim ignore-rp-set-priority
no ip pim ignore-rp-set-priority
```

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim ignore-rp-set-priority
```

ip pim jp-timer

Overview Use this command to set the PIM-SM join/prune timer. Note that the value the device puts into the holdtime field of the join/prune packets it sends to its neighbors is 3.5 times the join/prune timer value set using this command.

Use the **no** variant of this command to return the PIM-SM join/prune timer to its default value of 60 seconds, which corresponds to a join/prune packet holdtime of 210 seconds.

Syntax

```
ip pim jp-timer <1-65535>
no ip pim jp-timer [<1-65535>]
```

Parameter	Description
<1-65535>	Specifies the join/prune timer value. The default value is 60 seconds.

Default The default join/prune timer value is 60 seconds.

Mode Global Configuration

Example To set the join/prune timer value to 300 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim jp-timer 300
```

To return the join/prune timer to its default value of 60 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim jp-timer
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim register-rate-limit

Overview Use this command to configure the rate of register packets sent by this DR, in units of packets per second.

Use the **no** variant of this command to remove the limit.

Syntax

```
ip pim register-rate-limit <1-65535>
no ip pim register-rate-limit
```

Parameter	Description
<1-65535>	Specifies the maximum number of packets that can be sent per second.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim register-rate-limit 3444
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim register-rp-reachability

Overview Use this command to enable the RP reachability check for PIM Register processing at the DR. The default setting is no checking for RP-reachability.

Use the **no** variant of this command to disable this processing.

Syntax
```
ip pim register-rp-reachability
no ip pim register-rp-reachability
```

Default This command is disabled; by default, there is no checking for RP-reachability.

Mode Global Configuration

Example
```
awplus# configure terminal
awplus(config)# ip pim register-rp-reachability
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim register-source

Overview Use this command to configure the source address of register packets sent by this DR, overriding the default source address, which is the address of the RPF interface toward the source host.

Use the **no** variant of this command to un-configure the source address of Register packets sent by this DR, reverting back to use the default source address that is the address of the RPF interface toward the source host.

Syntax

```
ip pim register-source [<source-address>|<interface>]
no ip pim register-source
```

Parameter	Description
<source-address>	The IP address, entered in the form A.B.C.D, to be used as the source of the register packets.
<interface>	The name of the interface to be used as the source of the register packets.

Usage notes The configured address must be a reachable address to be used by the RP to send corresponding Register-Stop messages in response. It is normally the local loopback interface address, but can also be a physical address. This address must be advertised by unicast routing protocols on the DR. The configured interface does not have to be PIM enabled.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ip pim register-source 10.10.1.3
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim register-suppression

Overview Use this command to configure the register-suppression time, in seconds, overriding the default of 60 seconds. Configuring this value modifies register-suppression time at the DR. Configuring this value at the RP modifies the RP-keepalive-period value if the ip pim rp-register-kat command is not used.

Use the **no** variant of this command to reset the value to its default of 60 seconds.

Syntax
```
ip pim register-suppression <1-65535>
no ip pim register-suppression
```

Mode Global Configuration

Example
```
awplus# configure terminal
awplus(config)# ip pim register-suppression 192
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim rp-address

Overview Use this command to statically configure the RP (Rendezvous Point) address for multicast groups.

Use the **no** variant of this command to remove a statically configured RP address for multicast groups.

Syntax

```
ip pim rp-address <ip-address> group-list <group-prefix>
[override]
```

```
no ip pim rp-address <ip-address> group-list <group-prefix>
[override]
```

Parameter	Description
<ip-address>	IP address of RP, entered in the form A.B.C.D.
<group-prefix>	Multicast group IP prefix address of RP, entered in the form A.B.C.D/M
override	Enables statically defined RPs to override dynamically learned RPs.

Mode Global Configuration

Usage notes The AlliedWare Plus PIM-SM implementation supports multiple static RPs. It also supports usage of static RP and the BSR (Bootstrap Router) mechanism simultaneously. The **ip pim rp-address** command is used to statically configure the RP address for multicast groups.

You need to understand the following information before using this command.

If the RP address configured by the BSR, and the statically configured RP address are both available for a group range, then the RP address configured through the BSR is chosen over the statically configured RP address, unless the 'override' parameter is specified, in which case, the static RP will be chosen.

After configuration, the RP address is inserted into a static RP group tree based on the configured group ranges. For each group range, multiple static RPs are maintained in a linked list. This list is sorted in a descending order of IP addresses. When selecting static RPs for a group range, the first element (which is the static RP with highest IP address) is chosen.

RP address deletion is handled by removing the static RP from all the existing group ranges and recalculating the RPs for existing TIB states if required.

NOTE: *A unique RP address may only be specified once as a static RP.*

Example

```
awplus# configure terminal
```

```
awplus(config)# ip pim rp-address 192.0.2.10 group-list
233.252.0.0/24 override
```

Figure 37-2: Output from the **show ip pim sparse-mode rp mapping** command

```
awplus#show ip pim sp rp mapping
PIM Group-to-RP Mappings
Group(s): 233.252.0.0/24, Static
    RP: 192.0.2.10
         Uptime: 00:00:17
```

Command changes

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-0.5: Replaced <acl> parameter with <group-list> parameter.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim rp-candidate

Overview Use this command to make the router an RP (Rendezvous Point) candidate, using the IP address of the specified interface.

Use the **no** variant of this command to remove the RP status set using the **ip pim rp-candidate** command.

Syntax

```
ip pim rp-candidate <interface> [priority <priority> | interval
<interval> ]
no ip pim rp-candidate [<interface>]
```

Parameter	Description
<interface>	Interface name
<priority>	<0-255> configure priority for an RP candidate.
<interval>	advertisement interval specified in the range <1-16383> (in seconds).

Default The priority value for a candidate RP is 0 by default until specified using the **priority** parameter.

Mode Global Configuration

Usage notes Note that issuing the command **ip pim rp-candidate** <*interface*> without optional **priority**, **interval**, or **grouplist** parameters will configure the candidate RP with a priority value of 0.

Examples To specify a priority of 3, use the following commands:

```
awplus# configure terminal
awplus(config)# ip pim rp-candidate vlan2 priority 3
```

To stop the device from being an RP candidate on vlan2 , use the following commands:

```
awplus# configure terminal
awplus(config)# no ip pim rp-candidate vlan2
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim rp-register-kat

Overview Use this command to configure the Keep Alive Time (KAT) for (S,G) states at the RP (Rendezvous Point) to monitor PIM-SM Register packets.

Use the **no** variant of this command to return the PIM-SM KAT timer to its default value of 210 seconds.

Syntax

```
ip pim rp-register-kat <1-65535>
no ip pim rp-register-kat
```

Parameter	Description
<1-65535>	Specify the KAT timer in seconds. The default value is 210 seconds.

Mode Global Configuration

Default The default PIM-SM KAT timer value is 210 seconds.

Examples

```
awplus# configure terminal
awplus(config)# ip pim rp-register-kat 3454
awplus# configure terminal
awplus(config)# no ip pim rp-register-kat
```

Related commands ip pim rp-address

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim sparse-mode

Overview Use this command to enable PIM-SM on the VLAN interface.

Use the **no** variant of this command to disable PIM-SM on the VLAN interface.

Syntax

```
ip pim sparse-mode
no ip pim sparse-mode
```

Mode Interface Configuration for a VLAN interface or a PPP interface.

Examples

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim sparse-mode
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim sparse-mode
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim sparse-mode
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip pim sparse-mode
```

ip pim sparse-mode join-prune-batching

Overview Use this command to enable batching of Join and Prune messages in PIM-SM. This functionality reduces the number of PIM packets that must be sent to maintain a large number of groups

When using VRF-lite, you can use this command to enable Join and Prune batching in PIM-SM for a named VRF instance.

Use the **no** variant of this command to disable batching of Join and Prune messages in PIM-SM.

Syntax

```
ip pim sparse-mode join-prune-batching
no ip pim sparse-mode join-prune-batching
```

Syntax (VRF-lite)

```
ip pim [vrf <vrf-name>]sparse-mode join-prune-batching
no ip pim [vrf <vrf-name>]sparse-mode join-prune-batching
```

Parameter	Description
`vrf`	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.

Default Disabled.

Mode Global Configuration

Examples To enable Join/Prune batching for PIM-SM, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim sparse-mode join-prune-batching
```

To disable Join/Prune batching for PIM-SM, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim sparse-mode join-prune-batching
```

Example (VRF-lite) To enable Join/Prune batching for the VRF instance 'red', use the commands:

```
awplus# configure terminal
awplus(config)# ip pim vrf red sparse-mode join-prune-batching
```

To disable Join/Prune batching for the VRF instance 'red', use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim vrf red sparse-mode
join-prune-batching
```

Related commands ip pim sparse-mode wrong-vif-suppression

Command changes Version 5.4.8-2.3: command added.

ip pim sparse-mode passive

Overview Use this command to enable and disable passive mode operation for local members on the VLAN interface.

Use the **no** variant of this command to disable passive mode operation for local members on the VLAN interface.

Syntax
```
ip pim sparse-mode passive
no ip pim sparse-mode passive
```

Mode Interface Configuration for a VLAN interface or a PPP interface.

Usage Passive mode essentially stops PIM transactions on the interface, allowing only IGMP mechanism to be active. To turn off passive mode, use the **no ip pim sparse-mode passive** or the ip pim sparse-mode command. To turn off PIM activities on the VLAN interface, use the **no ip pim sparse-mode** command.

Examples
```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip pim sparse-mode passive
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip pim sparse-mode passive
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip pim sparse-mode passive
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip pim sparse-mode passive
```

ip pim sparse-mode wrong-vif-suppression

Overview Use this command to permit or block multicast packets that arrive on the wrong VLAN Interface (VIF).

When using VRF-lite, you can use this command to enable wrong VIF suppression for a named VRF instance.

Use the **no** variant of this command to disable wrong VIF suppression.

Syntax

```
ip pim sparse-mode wrong-vif-suppression
no ip pim sparse-mode wrong-vif-suppression
```

Syntax (VRF-lite)

```
ip pim [vrf <vrf-name>]sparse-mode wrong-vif-suppression
no ip pim [vrf <vrf-name>]sparse-mode wrong-vif-suppression
```

Parameter	Description
`vrf`	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.

Default Disabled.

Mode Global Configuration

Usage notes This command enables wrong VIF suppression for PIM sparse-mode. Wrong VIF suppression prevents multicast packets received on the wrong upstream interface from being copied to the CPU.

Examples To enable wrong VIF suppression, use the commands:

```
awplus# configure terminal
awplus(config)# ip pim sparse-mode wrong-vif-suppression
```

To disable wrong VIF suppression, use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim sparse-mode wrong-vif-suppression
```

Example (VRF-lite) To enable wrong VIF suppression for the VRF instance 'green', use the commands:

```
awplus# configure terminal
awplus(config)# ip pim vrf green sparse-mode
wrong-vif-suppression
```

To disable wrong VIF suppression for the VRF instance 'green', use the commands:

```
awplus# configure terminal
awplus(config)# no ip pim vrf green sparse-mode
wrong-vif-suppression
```

Related commands ip pim sparse-mode join-prune-batching

Command changes Version 5.4.8-2.3: command added.

ip pim spt-threshold

Overview This command turns on the ability for the last-hop PIM router to switch to SPT (shortest-path tree).

The **no** variant of this command turns off the ability for the last-hop PIM router to switch to SPT.

NOTE: *The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.*

Syntax

```
ip pim spt-threshold
no ip pim spt-threshold
```

Mode Global Configuration

Examples To enable the last-hop PIM-SM router to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# ip pim spt-threshold
```

To stop the last-hop PIM-SM router from being able to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip pim spt-threshold
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

ip pim ssm

Overview Use this command to define the Source Specific Multicast (SSM) range of IP multicast addresses. The default keyword defines the SSM range as 232/8.

Use the **no** variant of this command to disable the SSM range.

Syntax

```
ip pim ssm default
no ip pim ssm
```

Default By default, the command is disabled.

Mode Global Configuration

Usage When an SSM range of IP multicast addresses is defined by the ip pim ssm command, the no (*,G) or (S,G,rpt) state will be initiated for groups in the SSM range.

The messages corresponding to these states will not be accepted or originated in the SSM range.

Examples The following commands show how to set PIM-SSM as default:

```
awplus# configure terminal
awplus(config)# ip pim ssm default
```

The following commands show how to disable PIM-SSM:

```
awplus# configure terminal
awplus(config)# no ip pim ssm
```

service pim

Overview Use this command to enable PIM sparse mode services.

Use the **no** version of the command to disable unused PIM sparse mode services.

Syntax

```
service pim
no service pim
```

Default Enabled

Mode Global Configuration

Usage notes Sometimes it may be desirable to disable unused services, in order to reduce memory use.

Disabling the PIM services will only take effect after you save the configuration and restart the device.

Example To disable the PIM sparse mode service, use the commands:

```
awplus# configure terminal
awplus(config)# no service pim
```

Output Figure 37-3: Example output from **no service pim**

```
awplus(config)#no service pim
% Save the config and restart the device for this change to take
effect
```

Command changes Version 5.5.0-0.1: command added

show debugging pim sparse-mode

Overview This command displays the status of the debugging of the system.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show debugging pim sparse-mode
```

Mode User Exec and Privileged Exec

Example To display PIM-SM debugging settings, use the command:

```
awplus# show debugging pim sparse-mode
```

Figure 37-4: Output from **show debugging pim sparse-mode**

```
Debugging status:
  PIM event debugging is on
  PIM Hello THT timer debugging is on
  PIM event debugging is on
  PIM MFC debugging is on
  PIM state debugging is on
  PIM packet debugging is on
  PIM incoming packet debugging is on
  PIM outgoing packet debugging is on
```

Related commands debug pim sparse-mode

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode bsr-router

Overview Use this command to show the Bootstrap Router (BSR) (v2) address.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ip pim sparse-mode bsr-router
```

Mode User Exec and Privileged Exec

Output Figure 37-5: Output from the **show ip pim sparse-mode bsr-router** command

```
PIMv2 Bootstrap information
  BSR address: 10.10.11.35 (?)
  Uptime:      00:00:38, BSR Priority: 0, Hash mask length: 10
  Expires:     00:01:32
  Role: Non-candidate BSR
  State: Accept Preferred
```

192.168.1.53    vlan2     0        v2/S   2      2       192.168.1.53
192.168.10.53   vlan3     2        v2/S   0      2       192.168.10.53

... Note that this screen has been edited to remove any additional interfaces.
```

Table 1: Parameters in the output from the **show ip pim sparse-mode interface** command

Parameters	Description
`Total configured interfaces`	The number of configured PIM Sparse Mode interfaces.
`Maximum allowed`	The maximum number of PIM Sparse Mode interfaces that can be configured.
`Total active interfaces`	The number of active PIM Sparse Mode interfaces.
`Address`	Primary PIM-SM address.
`Interface`	Name of the PIM-SM interface.
`VIF Index`	The Virtual Interface index of the VLAN.
`Ver/Mode`	PIM version/Sparse mode.
`Nbr Count`	Neighbor count of the PIM-SM interface.

Table 1: Parameters in the output from the **show ip pim sparse-mode interface** command (cont.)

Parameters	Description
`DR Priority`	Designated Router priority.
DR	The IP address of the Designated Router.

show ip pim sparse-mode interface detail

Overview Use this command to show detailed information on a PIM-SM interface.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ip pim sparse-mode interface detail
```

Mode User Exec and Privileged Exec

Output Figure 37-7: Example output from the **show ip pim sparse-mode interface detail** command

```
vlan3 (vif 3):
  Address 192.168.1.149, DR 192.168.1.149
  Hello period 30 seconds, Next Hello in 15 seconds
  Triggered Hello period 5 seconds
  Neighbors:
   192.168.1.22

vlan2 (vif 0):
  Address 10.10.11.149, DR 10.10.11.149
  Hello period 30 seconds, Next Hello in 18 seconds
  Triggered Hello period 5 seconds
  Neighbors:
   10.10.11.4
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode local-members

Overview Use this command to show detailed local member information on a VLAN interface configured for PIM-SM. If you do not specify a VLAN interface then detailed local member information is shown for all VLAN interfaces configured for PIM-SM.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ip pim sparse-mode local-members [<interface>]
```

Parameter	Description
<interface>	Optional. Specify the interface. For instance, VLAN interface `vlan2`.

Mode User Exec and Privileged Exec

Example To show detailed PIM-SM information for all PIM-SM configured VLAN interfaces, use the command:

```
awplus# show ip pim sparse-mode local-members
```

Output Figure 37-8: Example output from the **show ip pim sparse-mode local-members** command

```
awplus#show ip pim sparse-mode local-members
PIM Local membership information

vlan1:
    (*, 224.0.0.4) : Include

vlan203:
    (*, 223.0.0.3) : Include
```

Example To show detailed PIM-SM information for the PIM-SM configured interface vlan1, use the command:

```
awplus# show ip pim sparse-mode local-members vlan1
```

Output Figure 37-9: Example output from the **show ip pim sparse-mode local-members vlan1** command

```
awplus#show ip pim sparse-mode local-members vlan1
PIM Local membership information

vlan1:
    (*, 224.0.0.4) : Include
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode mroute

Overview Use this command to display the IP multicast routing table or the IP multicast routing table based on a specific address or addresses.

Syntax

```
show ip pim sparse-mode mroute brief
show ip pim sparse-mode mroute
show ip pim sparse-mode mroute <group-address>
show ip pim sparse-mode mroute <source-address>
show ip pim sparse-mode mroute <source-address> <group-address>
```

Parameter	Description
`brief`	Shows only a summary of the number of each type of multicast entry and the cache.
<group-address>	Group IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that group.
<source-address>	Source IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that source.

Mode Privileged Exec

Usage notes Note that when a feature license is enabled, the output for the **show ip pim sparse-mode mroute** command will only show 32 interfaces because of the terminal display width limit. Use the **show ip pim sparse-mode mroute detail** command to display detailed entries of the IP multicast routing table.

Example To display the IP multicast routing table for the address 40.40.40.11, enter the command:

```
awplus# show ip pim sparse-mode mroute 40.40.40.11
```

Output Figure 37-10: Example output from **show ip pim sparse-mode mroute brief**

```
awplus#show ip pim sparse-mode mroute brief

Related commands show ip pim sparse-mode mroute detail

Command changes Version 5.4.7-1.1: VRF-lite support added to SBx8100.

Version 5.4.8-1.1: VRF-lite support added to x930, SBx908 GEN2.

Version 5.4.8-2.1: **brief** parameter added.

show ip pim sparse-mode mroute detail

Overview This command displays detailed entries of the IP multicast routing table, or detailed entries of the IP multicast routing table based on the specified address or addresses.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ip pim sparse-mode mroute [<group-address>] detail
show ip pim sparse-mode mroute [<source-address>] detail
show ip pim sparse-mode mroute [<group-address>
<source-address>] detail
show ip pim sparse-mode mroute [<source-address>
<group-address>] detail
```

Parameter	Description
<group-address>	Group IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that group.
<source-address>	Source IP address, entered in the form A.B.C.D. Output is all multicast entries belonging to that source.
`detail`	Show detailed information.

Usage notes Based on the group and source address, the output is the selected route if present in the multicast route tree.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ip pim sparse-mode mroute detail
awplus# show ip pim sparse-mode mroute 40.40.40.11 detail
awplus# show ip pim sparse-mode mroute 224.1.1.1 detail
awplus# show ip pim sparse-mode mroute 224.1.1.1 40.40.40.11
detail

```

Command changes

Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode neighbor

Overview Use this command to show the PIM-SM neighbor information.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ip pim sparse-mode neighbor [<interface>] [<ip-address>]
[detail]
```

Parameter	Description
<interface>	Interface name (e.g. vlan2). Show neighbors on an interface.
<ip-address>	Show neighbors with a particular address on an interface. The IP address entered in the form A.B.C.D.
detail	Show detailed information.

Mode Privileged Exec

Examples

```
awplus# show ip pim sparse-mode neighbor
awplus# show ip pim sparse-mode neighbor vlan5 detail
```

Figure 37-13: Example output from the **show ip pim sparse-mode neighbor** command

```
Neighbor         Interface   Uptime/Expires    Ver   DR
Address                                              Priority/
Mode
10.10.0.9        vlan2       00:55:33/00:01:44 v2    1 /
10.10.0.136      vlan2       00:55:20/00:01:25 v2    1 /
10.10.0.172      vlan2       00:55:33/00:01:32 v2    1 / DR
192.168.0.100    vlan3       00:55:30/00:01:20 v2    N / DR
```

Figure 37-14: Example output from the **show ip pim sparse-mode neighbor interface detail** command

```
Nbr 10.10.3.180 (vlan5), DR
 Expires in 55 seconds, uptime 00:00:15
 Holdtime: 70 secs, T-bit: off, Lan delay: 1, Override interval:
3
 DR priority: 100, Gen ID: 625159467,
 Secondary addresses:
  192.168.30.1
```

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode nexthop

Overview Use this command to see the next hop information as used by PIM-SM.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide

Syntax

```
show ip pim sparse-mode nexthop
```

Mode User Exec and Privileged Exec

Example

```
awplus# show ip pim sparse-mode nexthop
```

Figure 37-15: Example output from the **show ip pim sparse-mode nexthop** command

```
Flags: N = New, R = RP, S = Source, U = Unreachable
Destination Type Nexthop Nexthop Nexthop      Nexthop    Metric Pref  Refcnt
                 Num     Addr                 Ifindex    Name
-------------------------------------------------------------------------
10.10.0.9   .RS.  1      0.0.0.0  4           0           0       1
```

Table 2: Parameters in output of the **show ip pim sparse-mode nexthop** command

Parameter	Description
Destination	The destination address for which PIM-SM requires next hop information.
Type	The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable.
Nexthop Num	The number of next hops to the destination. PIM-SM always uses only 1 next hop.
Nexthop Addr	The address of the primary next hop gateway.
Nexthop IfIndex	The interface on which the next hop gateway can be reached.
Nexthop Name	The name of next hop interface.
Metric	The metric of the route towards the destination.
Preference	The preference of the route towards destination.
Refcnt	Only used for debugging.

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode packet statistics

Overview Use this command to display the current packet receive counts for PIM sparse-mode.

Syntax
```
show ip pim sparse-mode packet statistics
```

Mode Privileged Exec

Example The following command displays the current packet receive counts for PIM sparse-mode:

```
awplus# configure terminal
awplus(config)# show ip pim sparse-mode statistics
```

Output Figure 37-16: Example output from **show ip pim sparse-mode statistics**

```
awplus(config)#show ip pim sparse-mode statistics
PIM-SM Receive Packet Statistics :
All PIM-SM    :   Total : 25   Valid : 25
Hello         :   Total : 14   Valid : 14
Register      :   Total : 5   Valid : 5
Register Stop :   Total : 0   Valid : 0
Join/Prune    :   Total : 0   Valid : 0
Bootstrap     :   Total : 6   Valid : 6
Assert        :   Total : 0   Valid : 0
Candidate-RP  :   Total : 0   Valid : 0
```

Related commands clear ip pim sparse-mode packet statistics

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode rp-hash

Overview Use this command to display the Rendezvous Point (RP) to be chosen based on the group selected.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ip pim sparse-mode rp-hash <group-addr>
```

Parameter	Description
<group-addr>	The group address for which to find the RP, entered in the form A.B.C.D.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip pim sparse-mode rp-hash 224.0.1.3
```

Figure 37-17: Output from the **show ip pim sparse-mode rp-hash** command

```
RP: 10.10.11.35
Info source: 10.10.11.35, via bootstrap
```

Related commands show ip pim sparse-mode rp mapping

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

show ip pim sparse-mode rp mapping

Overview Use this command to show group-to-RP (Rendezvous Point) mappings, and the RP set.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ip pim sparse-mode rp mapping
```

Mode Privileged Exec

Example

```
awplus# show ip pim sparse-mode rp mapping
```

Figure 37-18: Output from the **show ip pim sparse-mode rp mapping** command

```
PIM Group-to-RP Mappings
Group(s): 224.0.0.0/4
  RP: 10.10.0.9
    Info source: 10.10.0.9, via bootstrap, priority 192
         Uptime: 16:52:39, expires: 00:02:50
```

Related commands show ip pim sparse-mode rp-hash

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

undebug all pim sparse-mode

Overview Use this command to disable all PIM-SM debugging.

Syntax
```
undebug all pim sparse-mode
```

Mode Privileged Exec

Example
```
awplus# undebug all pim sparse-mode
```

Related commands debug pim sparse-mode

Command changes Version 5.4.7-1.1: VRF-lite support added SBx8100.

Version 5.4.8-1.1: VRF-lite support added x930, SBx908 GEN2.

38 PIM-SMv6 Commands

Introduction

Overview

This chapter provides an alphabetical reference of PIM-SMv6 commands. For IPv6 Multicast commands, see Multicast Commands. For an overview of PIM-SMv6, see the PIM-SMv6 Feature Overview and Configuration Guide.

IPv6 must be enabled on an interface with the ipv6 enable command, IPv6 forwarding must be enabled globally for routing IPv6 with the ipv6 forwarding command, and IPv6 multicasting must be enabled globally with the ipv6 multicast-routing command before using PIM-SMv6 commands.

Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the clear ipv6 mroute command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous IPv6 static multicast routes.

NOTE: *The IPv6 Multicast addresses shown can be derived from IPv6 unicast prefixes as per RFC 3306.The IPv6 unicast prefix reserved for documentation is 2001:0db8::/32 as per RFC 3849. Using the base /32 prefix the IPv6 multicast prefix for 2001:0db8::/32 is ff3x:20:2001:0db8::/64. Where an RP address is 2001:0db8::1 the embedded RP multicast prefix is ff7x:120:2001:0db8::/96. For ASM (Any-Source Multicast) the IPV6 multicast addresses allocated for documentation purposes are ff0x::0db8:0:0/96 as per RFC 6676. This is a /96 prefix so that it can be used with group IDs as per RFC 3307. These addresses should not be used for practical networks (other than for testing purposes), nor should they appear in any public network.*

The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.

clear ipv6 mroute pim

Overview Use this command to clear all Multicast Forwarding Cache (MFC) entries in PIM-SMv6.

NOTE: *Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the clear ipv6 mroute command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.*

Syntax

```
clear ipv6 mroute [*] pim sparse-mode
```

Parameter	Description
*	Clears all PIM-SMv6 multicast routes. Using this command without this optional operator only deletes the multicast router table entries.

Mode Privileged Exec

Example

```
awplus# clear ipv6 mroute pim sparse-mode
awplus# clear ipv6 mroute * pim sparse-mode
```

clear ipv6 mroute pim sparse-mode

Overview Use this command to clear all multicast route table entries learned through PIM-SMv6 for a specified multicast group address, and optionally a specified multicast source address.

NOTE: *Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the clear ipv6 mroute command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.*

Syntax

```
clear ipv6 mroute <Group-IPv6-add> pim sparse-mode
clear ipv6 mroute <Group-IPv6-add> <Source-IPv6-add> pim sparse-mode
```

Parameter	Description
<Group-IPv6-add>	Specify a multicast group IPv6 address, entered in the form X:X::X:X.
<Source-IPv6-add>	Specify a source group IPv6 address, entered in the form X:X::X:X.

Mode Privileged Exec

Example

```
awplus# clear ipv6 mroute 2001:db8:: pim sparse-mode
awplus# clear ipv6 mroute 2001:db8:: 2002:db8:: pim sparse-mode
```

clear ipv6 pim sparse-mode bsr rp-set *

Overview Use this command to clear all Rendezvous Point (RP) sets learned through the PIM-SMv6 Bootstrap Router (BSR).

NOTE: *Static IPv6 multicast routes take priority over dynamic IPv6 multicast routes. Use the clear ipv6 mroute command to clear static IPv6 multicast routes and ensure dynamic IPv6 multicast routes can take over from previous static IPv6 multicast routes.*

Syntax

```
clear ipv6 pim sparse-mode bsr rp-set *
```

Parameter	Description
*	Clears all RP sets.

Mode Privileged Exec

Usage For multicast clients, note that one router will be automatically or statically designated as the RP, and all routers must explicitly join through the RP. A Designated Router (DR) sends periodic Join/Prune messages toward a group-specific RP for each group that it has active members.

For multicast sources, note that the Designated Router (DR) unicasts Register messages to the RP encapsulating the data packets from the multicast source. The RP forwards decapsulated data packets toward group members.

Example

```
awplus# clear ipv6 pim sparse-mode bsr rp-set *
```

debug ipv6 pim sparse-mode

Overview Use this command to activate PIM-SMv6 debugging.

Use the no variant of this command to deactivate PIMv6 debugging. Note that the undebug ipv6 pim sparse-mode command is an alias of the no variant of this command.

Syntax

```
debug ipv6 pim sparse-mode [all] [events] [mfc] [mib] [nexthop]
[nsm] [state] [timer]
```

```
no debug ipv6 pim sparse-mode [all] [events] [mfc] [mib]
[nexthop] [nsm] [state] [timer]
```

Parameter	Description
`all`	Activates/deactivates all PIM-SMv6 debugging.
`events`	Activates debug printing of PIM-SMv6 events.
`mfc`	Activates debug printing of MFC (Multicast Forwarding Cache).
`mib`	Activates debug printing of PIM-SMv6 MIBs.
`nexthop`	Activates debug printing of PIM-SMv6 next hop communications.
`nsm`	Activates debugging of PIM-SMv6 NSM (Network Services Module) communications.
`state`	Activates debug printing of state transition on all PIM-SMv6 FSMs.
`timer`	Activates debug printing of PIM-SMv6 timers.

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode all
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode events
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode nexthop
```

Validation output

Figure 38-1: Example output from the **show debugging ipv6 pim sparse-mode** command after issuing **multiple debug ipv6 pim sparse-mode** commands

```
awplus#debug ipv6 pim sparse-mode state
awplus#debug ipv6 pim sparse-mode events
awplus#debug ipv6 pim sparse-mode packet
awplus#show debugging ipv6 pim sparse-mode
PIM-SMv6 debugging status:
  PIM event debugging is on
  PIM MFC debugging is off
  PIM state debugging is on
  PIM packet debugging is on
  PIM Hello HT timer debugging is off
  PIM Hello NLT timer debugging is off
  PIM Hello THT timer debugging is off
  PIM Join/Prune JT timer debugging is off
  PIM Join/Prune ET timer debugging is off
  PIM Join/Prune PPT timer debugging is off
  PIM Join/Prune KAT timer debugging is off
  PIM Join/Prune OT timer debugging is off
  PIM Assert AT timer debugging is off
  PIM Register RST timer debugging is off
  PIM Bootstrap BST timer debugging is off
  PIM Bootstrap CRP timer debugging is off
  PIM mib debugging is off
  PIM nsm debugging is off
  PIM nexthop debugging is off
```

Related commands

show debugging ipv6 pim sparse-mode

undebug all ipv6 pim sparse-mode

undebug ipv6 pim sparse-mode

debug ipv6 pim sparse-mode packet

Overview Use this command to activate PIM-SMv6 packet debugging.

Use the no variant of this command to deactivate PIMv6 packet debugging.

Syntax

```
debug ipv6 pim sparse-mode packet {in|out}
no debug ipv6 pim sparse-mode packet {in|out}
```

Parameter	Description
`packet`	Activates debug printing of incoming and/or outgoing IPv6 packets.
`in`	Specify incoming packet debugging.
`out`	Specify outgoing packet debugging.

Mode Privileged Exec and Global Configuration

Example

```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode packet in
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# debug ipv6 pim sparse-mode packet out
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# no debug ipv6 pim sparse-mode packet in
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# no debug ipv6 pim sparse-mode packet out
```

Related commands

show debugging ipv6 pim sparse-mode

undebug all ipv6 pim sparse-mode

debug ipv6 pim sparse-mode timer

Overview Use this command to enable debugging for the specified PIM-SMv6 timers.

Use the **no** variants of this command to disable debugging for the specified PIM-SMv6 timers.

Syntax

```
debug ipv6 pim sparse-mode timer assert [at]
no debug ipv6 pim sparse-mode timer assert [at]
debug pim ipv6 sparse-mode timer bsr [bst|crp]
no debug pim ipv6 sparse-mode timer bsr [bst|crp]
debug pim ipv6 sparse-mode timer hello [ht|nlt|tht]
no debug pim ipv6 sparse-mode timer hello [ht|nlt|tht]
debug pim ipv6 sparse-mode timer joinprune [jt|et|ppt|kat|ot]
no debug pim ipv6 sparse-mode timer joinprune
[jt|et|ppt|kat|ot]
debug pim ipv6 sparse-mode timer register [rst]
no debug pim ipv6 sparse-mode timer register [rst]
```

Parameter	Description
`assert`	Enable or disable debugging for the Assert timers.
`at`	Enable or disable debugging for the Assert Timer.
`bsr`	Enable or disable debugging for the specified Bootstrap Router timer, or all Bootstrap Router timers.
`bst`	Enable or disable debugging for the Bootstrap Router: Bootstrap Timer.
`crp`	Enable or disable debugging for the Bootstrap Router: Candidate-RP Timer.
`hello`	Enable or disable debugging for the specified Hello timer, or all Hello timers.
`ht`	Enable or disable debugging for the Hello timer: Hello Timer.
`nlt`	Enable or disable debugging for the Hello timer: Neighbor Liveness Timer.
`tht`	Enable or disable debugging for the Hello timer: Triggered Hello Timer.
`joinprune`	Enable or disable debugging for the specified JoinPrune timer, or all JoinPrune timers.
`jt`	Enable or disable debugging for the JoinPrune timer: upstream Join Timer.
`et`	Enable or disable debugging for the JoinPrune timer: Expiry Timer.
`ppt`	Enable or disable debugging for the JoinPrune timer: PrunePending Timer.

Parameter	Description
`kat`	Enable or disable debugging for the JoinPrune timer: KeepAlive Timer.
`ot`	Enable or disable debugging for the JoinPrune timer: Upstream Override Timer.
`register`	Enable or disable debugging for the Register timers.
`rst`	Enable or disable debugging for the Register timer: Register Stop Timer.

Default By default, all debugging is disabled.

Mode Privileged Exec and Global Configuration

Examples To enable debugging for the PIM-SMv6 Bootstrap Router bootstrap timer, use the commands:

```
awplus(config)# debug ipv6 pim sparse-mode timer bsr bst
```

To enable debugging for the PIM-SMv6 Hello: neighbor liveness timer, use the command:

```
awplus(config)# debug ipv6 pim sparse-mode timer hello ht
```

To enable debugging for the PIM-SMv6 Joinprune expiry timer, use the command:

```
awplus# debug ipv6 pim sparse-mode timer joinprune et
```

To disable debugging for the PIM-SMv6 Register timer, use the command:

```
awplus# no debug ipv6 pim sparse-mode timer register
```

Related commands show debugging ipv6 pim sparse-mode

ipv6 pim anycast-rp

Overview Use this command to configure Anycast RP (Rendezvous Point) in an RP set.

Use the **no** variant of this command to remove the configuration.

Syntax

```
ipv6 pim anycast-rp <anycast-rp-address> <member-rp-address>
no ipv6 pim anycast-rp <anycast-rp-address>
[<member-rp-address>]
```

Parameter	Description
<anycast-rp-address>	<X:X::X:X> Specify an Anycast IPv6 address to configure an Anycast RP (Rendezvous Point) in a RP set.
<member-rp-address>	<A:B::C:D> Specify an Anycast RP (Rendezvous Point)IPv6 address to configure an Anycast RP in a RP set.

Mode Global Configuration

Usage notes Anycast is a network addressing and routing scheme where data is routed to the nearest or best destination as viewed by the routing topology. Compared to unicast with a one-to-one association between network address and network endpoint, and multicast with a one-to-many association between network address and network endpoint; anycast has a one-to-many association between network address and network endpoint. For anycast, each destination address identifies a set of receiver endpoints, from which only one receiver endpoint is chosen.

Anycast is often implemented using BGP to simultaneously advertise the same destination IPv6 address range from many sources, resulting in packets addressed to destination addresses in this range being routed to the nearest source announcing the given destination IPv6 address.

Use this command to specify the Anycast RP configuration in the Anycast RP set. Use the **no** variant of this command to remove the Anycast RP configuration. Note that the member RP address is optional when using the **no** parameter to remove the Anycast RP configuration. removing the anycast RP address also removes the member RP address.

Examples The following example shows how to configure the Anycast RP address with **ipv6 pim anycast-rp**:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim anycast-rp 2:2::2:2 20:20::20:20
```

The following example shows how to remove the Anycast RP in the RP set specifying only the anycast RP address with **no ipv6 pim anycast-rp**, but not specifying the member RP address:

```
awplus# configure terminal
awplus(config)# no ipv6 pim anycast-rp 2:2::2:2 20:20::20:20
```

ipv6 pim bsr-border

Overview Use the **ipv6 pim bsr-border** command to prevent Bootstrap Router (BSR) messages from being sent or received through a VLAN interface. The BSR border is the border of the PIM-SMv6 domain.

Use the **no** variant of this command to disable the configuration set with **ipv6 pim bsr-border**.

Syntax

```
ipv6 pim bsr-border
no ipv6 pim bsr-border
```

Mode Interface Configuration for a VLAN interface or a PPP interface.

Usage When this command is configured on a VLAN interface, no PIM-SMv6 BSR messages will be sent or received through the interface. Configure an interface bordering another PIM- SMv6 domain with this command to avoid BSR messages from being exchanged between the two PIM-SMv6 domains.

BSR messages should not be exchanged between different domains, because devices in one domain may elect Rendezvous Points (RPs) in the other domain, resulting in loss of isolation between the two PIM domains that would stop the PIM-SMv6 protocol from working as intended.

Examples The following example configures the VLAN interface vlan2 to be the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim bsr-border
```

The following example removes the VLAN interface vlan2 from the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim bsr-border
```

The following example configures the PPP interface ppp0 to be the PIM -SMv6 domain border:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim bsr-border
```

The following example removes the PPP interface ppp0 from the PIM-SMv6 domain border:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 pim bsr-border
```

ipv6 pim bsr-candidate

Overview Use this command to give the device the candidate BSR (Bootstrap Router) status using the specified IPv6 address mask of the interface.

Use the **no** variant of this command to withdraw the address of the interface from being offered as a BSR candidate.

Syntax

```
ipv6 pim bsr-candidate <interface> [<hash>] [<priority>]
no ipv6 pim bsr-candidate [<interface>]
```

Parameter	Description
<interface>	Specify the interface. For instance, VLAN interface `vlan2`.
<hash>	<0-128> configure the hash mask length used for RP selection. The default hash value if you do not configure this parameter is 126.
<priority>	<0-255> configure priority for a BSR candidate. Note that you must also specify the *<hash>* (mask length) when specifying the *<priority>*. The default priority if you do not configure this parameter is 64.

Mode Global Configuration

Default The default hash parameter value is 126 and the default priority parameter value is 64.

Examples To set the BSR candidate to the VLAN interface vlan2, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim bsr-candidate vlan2 20 30
```

To withdraw the address of vlan2 from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ipv6 pim bsr-candidate vlan2
```

To set the BSR candidate to the PPP interface ppp0, with the optional mask length and BSR priority parameters, enter the commands shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim bsr-candidate ppp0 20 30
```

To withdraw the address of ppp0 from being offered as a BSR candidate, enter:

```
awplus# configure terminal
awplus(config)# no ipv6 pim bsr-candidate ppp0
```

ipv6 pim cisco-register-checksum

Overview Use this command to configure the option to calculate the Register Checksum over the whole packet. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to disable this option.

Syntax
```
ipv6 pim cisco-register-checksum
no ipv6 pim cisco-register-checksum
```

Default This command is disabled by default. By default, Register Checksum is calculated only over the header.

Mode Global Configuration

Example
```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim cisco-register-checksum
awplus# configure terminal
awplus(config)# no ipv6 pim cisco-register-checksum
```

ipv6 pim crp-cisco-prefix

Overview Use this command to interoperate with Cisco devices that conform to an earlier draft standard. Some Cisco devices might not accept candidate RPs with a group prefix number of zero. Note that the latest BSR specification prohibits sending RP advertisements with prefix 0.

Use the **no** variant of this command to revert to the default settings.

Syntax

```
ipv6 pim crp-cisco-prefix
no ipv6 pim crp-cisco-prefix
```

Mode Global Configuration

Usage Cisco's BSR code does not conform to the latest BSR draft, it does not accept candidate RPs with a group prefix number of zero. To make the candidate RP work with a Cisco BSR, use the **ipv6 pim crp-cisco-prefix** command when interoperating with older versions of Cisco IOS.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim crp-cisco-prefix
awplus# configure terminal
awplus(config)# no ipv6 pim crp-cisco-prefix
```

Related commands ipv6 pim rp-candidate

ipv6 pim dr-priority

Overview Use this command to set the Designated Router priority value.

Use the **no** variant of this command to disable this function.

Syntax

```
ipv6 pim dr-priority  <priority>
no ipv6 pim dr-priority [<priority>]
```

Parameter	Description
<priority>	<0-4294967294> Specify the Designated Router priority value. Note that a higher value has a higher preference or higher priority.

Default The default value is 1. The negated form of this command restores the value to the default.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Examples To set the Designated Router priority value to 11234 for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim dr-priority 11234
```

To disable the Designated Router priority value for the VLAN interface vlan2, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim dr-priority
```

To set the Designated Router priority value to 11234 for the PPP interface ppp0, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim dr-priority 11234
```

To disable the Designated Router priority value for the PPP interface ppp0, apply the commands as shown below:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 pim dr-priority
```

Related commands ipv6 pim ignore-rp-set-priority

ipv6 pim exclude-genid

Overview Use this command to exclude the GenID option from Hello packets sent out by the PIM-SMv6 module on a particular interface. This command is used to inter-operate with older Cisco IOS versions.

Use the **no** variant of this command to revert to default settings.

Syntax

```
ipv6 pim exclude-genid
no ipv6 pim exclude-genid
```

Default By default, this command is disabled; the GenID option is included.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim exclude-genid
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim exclude-genid
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim exclude-genid
```

ipv6 pim ext-srcs-directly-connected

Overview Use this command to configure PIM-SMv6 to treat all source traffic arriving on the interface as though it was sent from a host directly connected to the interface.

Use the **no** variant of this command to configure PIM-SMv6 to treat only directly connected sources as directly connected.

Syntax
```
ipv6 pim ext-srcs-directly-connected
no ipv6 pim ext-srcs-directly-connected
```

Default The **no** variant of this command is the default behavior.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Example To configure PIM-SMv6 to treat all sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim ext-srcs-directly-connected
```

To configure PIM-SMv6 to treat only directly connected sources as directly connected for VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim ext-srcs-directly-connected
```

To configure PIM to treat all sources as directly connected for PPP interface ppp0, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim ext-srcs-directly-connected
```

To configure PIM to treat only directly connected sources as directly connected for PPP interface ppp0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 pim ext-srcs-directly-connected
```

ipv6 pim hello-holdtime

Overview This command configures a hello-holdtime value. You cannot configure a hello-holdtime value that is less than the current hello-interval.

Use the **no** variant of this command to return it to its default of 3.5 * the current hello-interval.

Syntax

```
ipv6 pim hello-holdtime <holdtime>
no ipv6 pim hello-holdtime
```

Parameter	Description
<holdtime>	<1-65535> The holdtime value in seconds (no fractional seconds are accepted).

Default The default hello-holdtime value is 3.5 * the current hello-interval. The default hello- holdtime is restored using the negated form of this command.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Usage Each time the hello interval is updated, the hello holdtime is also updated, according to the following rules:

If the hello holdtime is not configured; or if the hello holdtime is configured and less than the current hello-interval value, it is modified to the (3.5 * hello interval). Otherwise, it retains the configured value.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-holdtime 123
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-holdtime 123
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim hello-holdtime
```

ipv6 pim hello-interval

Overview This command configures a hello-interval value for PIM-SMv6.

Use the **no** variant of this command to reset the hello-interval for PIM-SMv6 to the default.

Syntax

```
ipv6 pim hello-interval <interval>
no ipv6 pim hello-interval
```

Parameter	Description
<interval>	<1-65535> The value in seconds (no fractional seconds accepted).

Default The default hello-interval value is 30 seconds. The default is restored using the negated form of this command.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Usage When the hello interval is configured, and the hello holdtime is not configured, or when the configured hello-holdtime value is less than the new hello-interval value; the holdtime value is modified to the (3.5 * hello interval). Otherwise, the hello-holdtime value is the configured value.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-interval 123
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim hello-interval 123
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim hello-interval
```

ipv6 pim ignore-rp-set-priority

Overview Use this command to ignore the RP-SET priority value, and use only the hashing mechanism for RP selection.

Use the **no** variant of this command to disable this setting.

Syntax
```
ipv6 pim ignore-rp-set-priority
no ipv6 pim ignore-rp-set-priority
```

Mode Global Configuration

Usage This command is used to inter-operate with older Cisco IOS versions.

Example
```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim ignore-rp-set-priority
awplus# configure terminal
awplus(config)# no ipv6 pim ignore-rp-set-priority
```

ipv6 pim jp-timer

Overview Use this command to set the PIM-SMv6 join/prune timer. Note that the value set by the join/prune timer is the value that the device puts into the holdtime field of the join/prune packets it sends to its neighbors.

Use the **no** variant of this command to return the PIM-SMv6 join/prune timer to its default value of 210 seconds.

Syntax

```
ipv6 pim jp-timer <1-65535>
no ipv6 pim jp-timer [<1-65535>]
```

Parameter	Description
<1-65535>	Specifies the Join/Prune timer value. The default value is 210 seconds.

Default The default PIM-SMv6 join/prune timer value is 210 seconds.

Mode Global Configuration

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim jp-timer 300
awplus# configure terminal
awplus(config)# no ipv6 pim jp-timer
```

ipv6 pim neighbor-filter

Overview The AR3050S and AR4050S devices don't support access control list in 5.4.5-0.1 release.

This command enables filtering of neighbors on the VLAN interface. When configuring a neighbor filter, PIM-SMv6 will either not establish adjacency with the neighbor, or terminate adjacency with the existing neighbors if denied by the filtering IPv6 access list.

Use the **no** variant of this command to disable this function.

Syntax

```
ipv6 pim neighbor-filter <IPv6-accesslist>
no ipv6 pim neighbor-filter <IPv6-accesslist>
```

Parameter	Description
<IPv6-accesslist>	Specify a Standard or an Extended software IPv6 access list name for the PIM-SMv6 neighbor filter.

Default By default, there is no neighbor filtering applied to an interface.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Example

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim neighbor-filter filter1
```

ipv6 pim register-rate-limit

Overview Use this command to configure the rate of register packets sent by this DR, in units of packets per second. The configured rate is per (S, G) state, and is not a system wide rate.

Use the **no** variant of this command to remove the limit and reset to the default rate limit.

Syntax

```
ipv6 pim register-rate-limit <1-65535>
no ipv6 pim register-rate-limit
```

Parameter	Description
<1-65535>	Specifies the maximum number of packets that can be sent per second.

Mode Global Configuration

Default The default is 0, as reset with the **no** variant, which also specifies an unlimited rate limit.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-rate-limit 3444
awplus# configure terminal
awplus(config)# no ipv6 pim register-rate-limit 3444
```

ipv6 pim register-rp-reachability

Overview Use this command to enable the RP reachability check for PIMv6 Register processing at the DR. The default setting is no checking for RP-reachability.

Use the **no** variant of this command to disable this processing.

Syntax
```
ipv6 pim register-rp-reachability
no ipv6 pim register-rp-reachability
```

Default This command is disabled; by default, there is no checking for RP-reachability.

Mode Global Configuration

Examples
```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-rp-reachability
awplus# configure terminal
awplus(config)# no ipv6 pim register-rp-reachability
```

ipv6 pim register-source

Overview Use this command to configure the source IPv6 address of register packets sent by this DR, overriding the default source IPv6 address, which is the IPv6 address of the RPF interface toward the source host.

Use the **no** variant of this command to remove the IPv6 source address of Register packets sent by this DR, reverting back to use the default IPv6 source address that is the address of the RPF interface toward the source host.

Syntax

```
ipv6 pim register-source [<source-IPv6-address>|<interface>]
no ipv6 pim register-source
```

Parameter	Description
<source-IPv6-address>	The IPv6 address, entered in the form X:X::X:X, to be used as the source of the register packets.
<interface>	The name of the VLAN interface to be used as the source of the register packets.

Usage The configured address must be a reachable address to be used by the RP to send corresponding Register-Stop messages in response. It is normally the local loopback IPv6 interface address, but can also be a physical IPv6 address. This IPv6 address must be advertised by unicast routing protocols on the DR. The configured interface does not have to be PIM-SMv6 enabled.

Mode Global Configuration

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-source 3ffe::24:2
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-source vlan2
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# no ipv6 pim register-source
```

ipv6 pim register-suppression

Overview Use this command to configure the register-suppression time, in seconds, overriding the default of 60 seconds.

Use the **no** variant of this command to reset the value to its default of 60 seconds.

Syntax

```
ipv6 pim register-suppression <1-65535>
no ipv6 pim register-suppression
```

Parameter	Description
<1-65535>	Register suppression on time in seconds.

Mode Global Configuration

Default The default PIM-SMv6 register suppression time is 60 seconds, and is restored with the no variant of this command.

Usage Configuring this value modifies register-suppression time at the DR. Configuring this value at the RP modifies the RP-keepalive-period value if the ipv6 pim rp-register-kat command is not used.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim register-suppression 192
awplus# configure terminal
awplus(config)# no ipv6 pim register-suppression
```

ipv6 pim rp-address

Overview The AR3050S and AR4050 devices don't support access control list in 5.4.5-0.1 release.

Use this command to statically configure RP (Rendezvous Point) address for IPv6 multicast groups.

Use the **no** variant of this command to remove a statically configured RP (Rendezvous Point) address for IPv6 multicast groups.

Syntax

```
ipv6 pimv6 rp-address <IPv6-address>
no ipv6 pim rp-address <IPv6-address>
```

Parameter	Description
<IPv6-address>	Specify the IPv6 address of the Rendezvous Point, entered in the form X:X::X:X.

Mode Global Configuration

Usage notes The AlliedWare Plus™ PIM-SMv6 implementation supports multiple static RPs. It also supports usage of static-RP and BSR mechanism simultaneously. The **ipv6 pim rp-address** command is used to statically configure the RP address for IPv6 multicast groups.

You need to understand the following information before using this command.

If the RP-address that is configured by the BSR, and the RP-address that is configured statically, are both available for a group range, then the RP-address configured through BSR is chosen over the statically configured RP-address.

If multiple static-RPs are available for a group range, then one with the highest IPv6 address is chosen.

After configuration, the RP-address is inserted into a static-RP group tree based on the configured group ranges. For each group range, multiple static-RPs are maintained in a list. This list is sorted in a descending order of IPv6 addresses. When selecting static-RPs for a group range, the first element (which is the static-RP with highest IPv6 address) is chosen.

RP-address deletion is handled by removing the static-RP from all the existing group ranges and recalculating the RPs for existing TIB states if required.

Group mode and RP address mappings learned through BSR take precedence over mappings statistically defined by the ipv6 pim rp-address command. Commands with the override keyword take precedence over dynamically learned mappings.

Examples

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp-address 3ffe:30:30:5::153 G2
```

Related commands

ipv6 pim rp-candidate

ipv6 pim rp-register-kat

ipv6 pim rp-candidate

Overview Use this command to make the device an RP (Rendezvous Point) candidate, using the IPv6 address of the specified VLAN interface.

Use the **no** variant of this command to stop the device from being an RP candidate.

Syntax

```
ipv6 pim rp-candidate <interface> [priority <priority>|interval
<interval>|grouplist <accesslist>]
```

```
no ipv6 pim rp-candidate [<interface>]
```

Parameter	Description
<interface>	Specify a VLAN interface name.
<priority>	Specify the priority for the RP candidate in the range 0 to 255.
<interval>	Specify a candidate RP advertisement interval in the range 1 to 16383 (seconds).
<accesslist>	Specify a Standard or an Extended software IPv6 access list name.

Default The priority value for a candidate RP is 192 by default until specified using the **priority** parameter.

Mode Global Configuration

Usage notes Note that issuing the command **ipv6 pim rp-candidate** *<interface>* without optional **priority**, **interval**, or **grouplist** parameters will configure the candidate RP with a priority value of 192.

Examples To specify a priority of 3, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp-candidate vlan2 priority 3
```

To stop the device from being an RP candidate on vlan2 , use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp-candidate vlan2
```

Related commands ipv6 pim rp-address

ipv6 pim rp-register-kat

ipv6 pim rp embedded

Overview Use this command to configure and enable embedded RP (Rendezvous Point) in PIM-SMv6.

This command only applies to the embedded RP group range **ff7x::/12** and **fffx::/12**.

Use the **no** variant of this command to disable embedded RP support. Since embedded RP support is enabled by default, use the **no** variant of this command to disable the default.

Syntax

```
ipv6 pim rp embedded
no ipv6 pim rp embedded
```

Mode Global Configuration

Default Embedded RP is enabled by default in the AlliedWare Plus implementation of PIM-SMv6.

Examples The following example re-enables embedded RP support, the default state in PIM-SMv6:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp embedded
```

The following example disables embedded RP support, which is enabled by default in PIM-SMv6:

```
awplus# configure terminal
awplus(config)# no ipv6 pim rp embedded
```

ipv6 pim rp-register-kat

Overview Use this command to configure the Keep Alive Time (KAT) for (S,G) states at the RP (Rendezvous Point) to monitor PIM-SMv6 Register packets.

Use the **no** variant of this command to return the PIM-SMv6 KAT timer to its default value of 210 seconds.

Syntax

```
ipv6 pim rp-register-kat <1-65535>
no ipv6 pim rp-register-kat
```

Parameter	Description
<1-65536>	Specify the KAT timer in seconds. The default value is 210 seconds.

Mode Global Configuration

Default The default PIM-SMv6 KAT timer value is 210 seconds.

Examples

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim rp-register-kat 3454
awplus# configure terminal
awplus(config)# no ipv6 pim rp-register-kat
```

Related commands ipv6 pim rp-address

ipv6 pim rp-candidate

ipv6 pim sparse-mode

Overview Use this command to enable PIM-SMv6 on a VLAN interface or a PPP interface.

Use the **no** variant of this command to disable PIM-SMv6 on a VLAN interface or a PPP interface.

Syntax
```
ipv6 pim sparse-mode
no ipv6 pim sparse-mode
```

Mode Interface Configuration for a VLAN interface or a PPP interface.

Examples
```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim sparse-mode
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 pim sparse-mode
```

ipv6 pim sparse-mode passive

Overview Use this command to enable and disable PIM-SMv6 passive mode operation for local members on a VLAN interface or a PPP interface.

Use the **no** variant of this command to disable PIM-SMv6 passive mode operation for local members on a VLAN interface or a PPP interface.

Syntax
```
ipv6 pim sparse-mode passive
no ipv6 pim sparse-mode passive
```

Mode Interface Configuration for a VLAN interface or a PPP interface.

Usage Passive mode essentially stops PIM-SMv6 transactions on the interface, allowing only the MLD mechanism to be active.

Examples
```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode passive
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim sparse-mode passive
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface ppp0
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim sparse-mode passive
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 pim sparse-mode passive
```

ipv6 pim spt-threshold

Overview This command turns on the ability for the last-hop PIM-SMv6 router to switch to SPT (shortest-path tree).

The **no** variant of this command turns off the ability for the last-hop PIM-SMv6 router to switch to SPT.

NOTE: *The switching to SPT happens either at the receiving of the first data packet, or not at all; it is not rate-based.*

Syntax

```
ipv6 pim spt-threshold
no ipv6 pim spt-threshold
```

Mode Global Configuration

Examples To enable the last-hop PIM-SMv6 router to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# ipv6 pim spt-threshold
```

To stop the last-hop PIM-SMv6 router from being able to switch to SPT, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 pim spt-threshold
```

ipv6 pim ssm

Overview Use this command to define the Source Specific Multicast (SSM) range of IPv6 multicast addresses. PIM-SMv6 routers will only install (S,G) entries for multicast groups (addresses) residing in the SSM range.

Use the **no** variant of this command to disable the SSM range.

Syntax

```
ipv6 pim ssm [default]
no ipv6 pim ssm
```

Parameter	Description
`default`	Named Standard Access List. Use FF3x::/32 group range for SSM.

Default By default, the command is disabled.

Mode Global Configuration

Usage Any (*,G) or (S,G,rpt) joins received for multicast groups (addresses) within the range, are not installed in PIM-SMv6 mroute table.

Examples The following commands show how to set PIM-SSM as default:

```
awplus# configure terminal
awplus(config)# ipv6 pim ssm default
```

The following commands show how to disable PIM-SSM:

```
awplus# configure terminal
awplus(config)# no ipv6 pim ssm
```

ipv6 pim unicast-bsm

Overview Use this command to enable support for the sending and receiving of unicast Boot Strap Messages (BSM) on a VLAN interface.

Use the **no** variant of this command to disable the sending and receiving of unicast BSM on a VLAN interface.

Syntax
```
ipv6 pim unicast-bsm
no ipv6 pim unicast-bsm
```

Mode Interface Configuration for a VLAN interface.

Default Unicast BSM is disabled by default on an interface.

Usage This command provides backward compatibility with older versions of the Boot Strap Router (BSR) specification, which directs unicast BSM to refresh the state of new or restarting neighbors. The current BSR specification defines a No Forward BSM to achieve the same result.

Examples
```
awplus# configure terminal
awplus(config)# ipv6 forwarding
awplus(config)# ipv6 multicast-routing
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 pim unicast-bsm
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 pim unicast-bsm
```

service pim6

Overview Use this command to enable IPv6 PIM sparse mode services.

Use the **no** version of the command to disable unused IPv6 PIM sparse mode services.

Syntax

```
service pim6
no service pim6
```

Default Enabled

Mode Global Configuration

Usage notes Sometimes it may be desirable to disable unused services, in order to reduce memory use.

Disabling the PIM services will only take effect after you save the configuration and restart the device.

Example To disable the IPv6 PIM sparse mode service, use the commands:

```
awplus# configure terminal
awplus(config)# no service pim6
```

Output Figure 38-2: Example output from **no service pim6**

```
awplus(config)#no service pim6
% Save the config and restart the device for this change to take
effect
```

Command changes Version 5.5.0-0.1: command added

show debugging ipv6 pim sparse-mode

Overview Use this command to see what debugging is turned on for PIM-SMv6.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show debugging ipv6 pim sparse-mode
```

Mode User Exec and Privileged Exec

Example To display PIM-SMv6 debugging settings, use the command:

```
awplus# show debugging ipv6 pim sparse-mode
```

Figure 38-3: Example output from the **show debugging ipv6 pim sparse-mode** command

```
awplus#show debugging ipv6 pim sparse-mode
Debugging status:
  PIM event debugging is on
  PIM MFC debugging is on
  PIM state debugging is on
  PIM packet debugging is on

Related commands debug ipv6 pim sparse-mode

undebug ipv6 pim sparse-mode

show ipv6 pim sparse-mode bsr-router

Overview Use this command to show the PIM-SMv6 Bootstrap Router (BSR) IPv6 address.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax
```
show ipv6 pim sparse-mode bsr-router
```

Mode User Exec and Privileged Exec

Example To display the BSR IPv6 address, use the command:

```
awplus# show ipv6 pim sparse-mode bsr-router
```

Output Figure 38-4: Example output from the **show ipv6 pim sparse-mode bsr-router** command

```
awplus#show ipv6 pim sparse-mode bsr-router
PIM6v2 Bootstrap information
  BSR address: 2001:203::213 (?)
  Uptime:      00:36:25, BSR Priority: 64, Hash mask length: 126
  Expires:     00:01:46
  Role: Candidate BSR
  State: Candidate BSR

  Candidate RP: 2001:5::211(vlan5)
    Advertisement interval 60 seconds
    Next C-RP advertisement in 00:00:43
```

Related commands
show ipv6 pim sparse-mode rp mapping

show ipv6 pim sparse-mode neighbor

show ipv6 pim sparse-mode interface

Overview Use this command to show PIM-SMv6 interface information. Note that you can specify an individual VLAN interface with the optional parameter. Alternatively, you can display PIM-SMv6 interface information for all interfaces if you omit the optional interface parameter.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show ipv6 pim sparse-mode interface
```

Mode User Exec and Privileged Exec

Examples To display information about all PIM-SMv6 interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode interface
```

```
awplus#show ipv6 pim sparse-mode interface
Interface VIFindex Ver/   Nbr    DR
                   Mode   Count  Priority
vlan2     0        v2/S   2      1
    Address       : fe80::207:e9ff:fe02:81d
    Global Address: 3ffe:192:168:1::53
    DR            : fe80::20e:cff:fe01:facc
vlan3     2        v2/S   2      1
    Address       : fe80::207:e9ff:fe02:21a2
    Global Address: 3ffe:192:168:10::53
    DR            : this system
```

Table 1: Parameters in the output from the **show ipv6 pim sparse-mode interface** command

Parameters	Description
Address	Primary PIM-SMv6 address.
Interface	Name of the PIM-SMv6 interface.
VIF Index	The Virtual Interface index of the VLAN.
Ver/Mode	PIMv6 version/Sparse mode.
Nbr Count	Neighbor count of the PIM-SMv6 interface.
DR Priority	Designated Router priority.
DR	The IPv6 address of the Designated Router.

Related commands

ipv6 pim sparse-mode

show ipv6 pim sparse-mode rp mapping

show ipv6 pim sparse-mode neighbor

show ipv6 pim sparse-mode interface detail

Overview Use this command to show detailed PIM-SMv6 information for all PIM-SMv6 configured interfaces.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show ipv6 pim sparse-mode interface detail
```

Mode User Exec and Privileged Exec

Example To show detailed PIM-SMv6 information for all PIM-SMv6 configured interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode interface detail
```

Output Figure 38-5: Example output from the **show ipv6 pim sparse-mode interface detail** command

```
awplus#show ipv6 pim sparse-mode interface detail
vlan2 (vif 0)
  Address fe80::207:e9ff:fe02:81d, DR fe80::20e:cff:fe01:facc

  Address fe80::207:e9ff:fe02:21a2, DR fe80::207:e9ff:fe02:21a2
  Hello period 30 seconds, Next Hello in 20 seconds
  Triggered Hello period 5 seconds
  Secondary addresses:
   3ffe:192:168:10::53
  Neighbors:
```

show ipv6 pim sparse-mode local-members

Overview Use this command to show detailed local member information on a VLAN interface configured for PIM-SMv6. If you do not specify a VLAN interface then detailed local member information is shown for all VLAN interfaces configured for PIM-SMv6.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show ipv6 pim sparse-mode local-members [<interface>]
```

Parameter	Description
<interface>	Optional Specify the interface. For instance, VLAN interface `vlan2`.

Mode User Exec and Privileged Exec

Example To show detailed PIM-SMv6 information for all PIM-SMv6 configured VLAN interfaces, use the command:

```
awplus# show ipv6 pim sparse-mode local-members
```

Output Figure 38-6: Example output from the **show ipv6 pim sparse-mode local-members** command

```
awplus#show ipv6 pim sparse-mode local-members
PIM Local membership information

vlan1:

  (*, ff02::1:ff6b:4783) : Include

vlan203:

  (*, ff0e:1::4) : Include
```

Example To show detailed PIM-SMv6 information for the PIM-SMv6 configured interface vlan1, use the command:

```
awplus# show ipv6 pim sparse-mode local-members vlan1
```

Output Figure 38-7: Example output from the **show ipv6 pim sparse-mode local-members vlan1** command

```
awplus#show ipv6 pim sparse-mode local-members vlan1
PIM Local membership information

vlan1:

  (*, ff02::1:ff6b:4783) : Include
```

show ipv6 pim sparse-mode mroute

Overview This command displays the IPv6 multicast routing table, or the IPv6 multicast routing table based on the specified IPv6 address or addresses.

Two group IPv6 addresses cannot be entered simultaneously; two source IPv6 addresses cannot be entered simultaneously.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show ipv6 pim sparse-mode mroute
show ipv6 pim sparse-mode mroute <group-IPv6-address>
show ipv6 pim sparse-mode mroute <source-IPv6-address>
show ipv6 pim sparse-mode mroute <group-IPv6-address>
<source-IPv6-address>
show ipv6 pim sparse-mode mroute <source-IPv6-address>
<group-IPv6-address>
show ipv6 pim sparse-mode mroute brief
```

Parameter	Description
<group-IPv6-address>	Group IPv6 address, entered in the form X:X::X:X. Based on the group and source IPv6 address, the output is the selected route if present in the multicast route tree.
<source-IPv6-address>	Source IPv6 address, entered in the form X:X::X:X. Based on the source and group IPv6 address, the output is the selected route if present in the multicast route tree.
`brief`	Brief display

Mode User Exec and Privileged Exec

Usage notes Note that when a feature license is enabled, the output for the show ipv6 pim sparse-mode mroute command will only show 100 interfaces because of the terminal display width limit. Use the show ipv6 pim sparse-mode mroute detail command to display detailed entries of the IPv6 multicast routing table.

Examples

```
awplus# show ipv6 pim sparse-mode mroute
awplus# show ipv6 pim sparse-mode mroute 2001:db8::
awplus# show ipv6 pim sparse-mode mroute 2001:db8:: 2002:db8::
awplus# show ipv6 pim sparse-mode mroute brief
```

show ipv6 pim sparse-mode mroute detail

Overview This command displays detailed entries of the IPv6 multicast routing table, or detailed entries of the IPv6 multicast routing table based on the specified IPv6 address or addresses.

Two group IPv6 addresses cannot be used simultaneously; two IPv6 source addresses cannot be used simultaneously.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show ipv6 pim sparse-mode mroute [<source-IPv6-address>] detail
```

Parameter	Description
`<source-IPv6-address>`	Source IPv6 address, entered in the form X:X::X:X. Output is all multicast entries belonging to that source.
`detail`	Show detailed information.

Usage notes Based on the group and source IPv6 address, the output is the selected route if present in the multicast route tree.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ipv6 pim sparse-mode mroute detail
awplus# show ipv6 pim sparse-mode mroute 2001:db8:: detail
awplus# show ipv6 pim sparse-mode mroute 2001:db8:: 2002:db8:: detail
```

  FCR:
```

show ipv6 pim sparse-mode neighbor

Overview Use this command to show the PIM-SMv6 neighbor information.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show ipv6 pim sparse-mode neighbor [<interface>]
[<IPv6-address>] [detail]
```

Parameter	Description
<interface>	Interface name (e.g. vlan2). Show neighbors on an interface.
<IPv6-address>	Show neighbors with a particular address on an interface. The IPv6 address entered in the form X:X::X:X.
detail	Show detailed information.

Mode User Exec and Privileged Exec

Examples

```
awplus# show ipv6 pim sparse-mode neighbor
awplus# show ipv6 pim sparse-mode neighbor vlan5 detail
```

Figure 38-11: Example output from the **show ipv6 pim sparse-mode neighbor** command

```

show ipv6 pim sparse-mode nexthop

Overview Use this command to see the next hop information as used by PIM-SMv6.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show ipv6 pim sparse-mode nexthop
```

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 pim sparse-mode nexthop
```

Figure 38-13: Example output from the **show ipv6 pim sparse-mode nexthop** command

```
awplus#show ipv6 pim sparse-mode nexthop
Flags: N = New, R = RP, S = Source, U = Unreachable
Destination           Type  Nexthop Nexthop Nexthop  Nexthop Metric     Pref   Refcnt
                            Num     Addr    Ifindex  Name
-------------------------------------------------------------------------------------
3ffe:10:10:5::153    .RS.   1       fe80::20e:cff:fe01:facc  2     30   110    1
```

Table 2: Parameters in output of the **show ipv6 pim sparse-mode nexthop** command

Parameter	Description
`Destination`	The destination address for which PIM-SMv6 requires next hop information.
`Type`	The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable.
`Nexthop Num`	The number of next hops to the destination. PIM-SMv6 always uses only 1 next hop.
`Nexthop Addr`	The address of the primary next hop gateway.
`Nexthop IfIndex`	The interface on which the next hop gateway can be reached.
`Nexthop Name`	The name of next hop interface.
`Metric`	The metric of the route towards the destination.
`Preference`	The preference of the route towards destination.
`Refcnt`	Only used for debugging.

show ipv6 pim sparse-mode rp-hash

Overview Use this command to display the Rendezvous Point (RP) to be chosen based on the IPv6 group address selected.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ipv6 pim sparse-mode rp-hash <IPv6-group-addr>
```

Parameter	Description
<IPv6-group-addr>	The IPv6 group address used to find the RP, entered in the form X:X::X:X.

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 pim sparse-mode rp-hash ff04:10
```

Figure 38-14: Output from the **show ipv6 pim sparse-mode rp-hash** command:

```
awplus#show ipv6 pim sparse-mode rp-hash ff04::10
    RP: 3ffe:10:10:5::153
    Info source: 3ffe:10:10:5::153, via bootstrap
```

Related commands show ipv6 pim sparse-mode rp mapping

show ipv6 pim sparse-mode rp mapping

Overview Use this command to show group-to-RP (Rendezvous Point) mappings, and the RP set.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax
```
show ipv6 pim sparse-mode rp mapping
```

Mode User Exec and Privileged Exec

Example
```
awplus# show ipv6 pim sparse-mode rp mapping
```

Figure 38-15: Output from the **show ipv6 pim sparse-mode rp mapping** command

```
awplus#show ipv6 pim sparse-mode rp mapping
PIM Group-to-RP Mappings
Group(s): ff00::/8
  RP: 3ffe:10:10:5::153
    Info source: 3ffe:10:10:5::153, via bootstrap, priority 192
         Uptime: 05:36:40
```

Related commands show ipv6 pim sparse-mode rp-hash

show ipv6 pim sparse-mode rp nexthop

Overview Use this command to display the RP (Rendezvous Point) next hop information used by PIM-SMv6.

For information on filtering and saving command output, see the "Getting_Started with AlliedWare Plus" Feature Overview and Configuration_Guide.

Syntax

```
show ipv6 pim sparse-mode rp nexthop <RP-group-addr>
```

Parameter	Description
<RP-group-addr>	Specify the RP group address used to display next hop RP information, entered in the form X:X::X:X.

Mode User Exec and Privileged Exec

Example

```
awplus# show ipv6 pim sparse-mode rp nexthop 3ffe:10:10:5::153
```

Figure 38-16: Example output from the **show ipv6 pim sparse-mode rp nexthop** command

```
awplus#show ipv6 pim sparse-mode rp nexthop 3ffe:10:10:5::153
Flags: N = New, R = RP, S = Source, U = Unreachable
Destination           Type  Nexthop Nexthop Nexthop  Nexthop Metric     Pref   Refcnt
                            Num     Addr    Ifindex  Name
-------------------------------------------------------------------------------------
3ffe:10:10:5::153     .RS.  1       fe80::20e:cff:fe01:facc  2     30   110    1
```

Table 3: Parameters in output of the **show ipv6 pim sparse-mode rp nexthop** command

Parameter	Description
`Destination`	The destination address for which PIM-SMv6 requires next hop information.
`Type`	The type of destination, as indicated by the Flags description. N = New, R= RP, S = Source, U = Unreachable.
`Nexthop Num`	The number of next hops to the destination. PIM-SMv6 always uses only 1 next hop.
`Nexthop Addr`	The address of the primary next hop gateway.
`Nexthop IfIndex`	The interface on which the next hop gateway can be reached.
`Nexthop Name`	The name of next hop interface.

Table 3: Parameters in output of the **show ipv6 pim sparse-mode rp nexthop** command (cont.)

Parameter	Description
`Metric`	The metric of the route towards the destination.
`Preference`	The preference of the route towards destination.
`Refcnt`	Only used for debugging.

undebug all ipv6 pim sparse-mode

Overview Use this command to disable all PIM-SMv6 debugging.

Syntax
```
undebug all ipv6 pim sparse-mode
```

Mode Privileged Exec

Example
```
awplus# undebug all ipv6 pim sparse-mode
```

Related commands debug ipv6 pim sparse-mode

undebug ipv6 pim sparse-mode

Overview Use this command to deactivate PIM-SMv6 debugging. Note that this command is an alias of the no variant of the debug ipv6 pim sparse-mode command.

Syntax
```
undebug ipv6 pim sparse-mode [all] [events] [mfc] [mib]
[nexthop] [nsm] [state] [timer]
```

Parameter	Description
`all`	Deactivates all PIM-SMv6 debugging.
`events`	Deactivates debug printing of PIM-SMv6 events.
`mfc`	Deactivates debug printing of MFC (Multicast Forwarding Cache).
`mib`	Deactivates debug printing of PIM-SMv6 MIBs.
`nexthop`	Deactivates debug printing of PIM-SMv6 next hop communications.
`nsm`	Deactivates debugging of PIM-SMv6 NSM (Network Services Module) communications.
`state`	Deactivates debug printing of state transition on all PIM-SMv6 FSMs.
`timer`	Deactivates debug printing of PIM-SMv6 timers.

Mode Privileged Exec and Global Configuration

Example
```
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebug ipv6 pim sparse-mode all
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebug ipv6 pim sparse-mode events
awplus# configure terminal
awplus(config)# terminal monitor
awplus(config)# undebug ipv6 pim sparse-mode nexthop
```

Validation Output

Figure 38-17: Example output from the **show debugging ipv6 pim sparse-mode** command after issuing the **undebug ipv6 pim sparse-mode all** command

```
awplus#undebug ipv6 pim sparse-mode all
awplus#show debugging ipv6 pim sparse-mode

39 Traffic Control Commands

Introduction

Overview This chapter provides an alphabetical reference of commands used to configure traffic control. For more information, see the Traffic Control Feature Overview and Configuration Guide.

Command List

- "class (htb)" on page 1951
- "class (priority)" on page 1953
- "class (wrr)" on page 1955
- "debug traffic-control" on page 1957
- "interface (traffic-control)" on page 1958
- "l3-filtering enable" on page 1959
- "move rule (traffic-control)" on page 1960
- "policy (traffic-control)" on page 1961
- "red-curve" on page 1963
- "rule (traffic-control)" on page 1965
- "show debugging traffic-control" on page 1967
- "show running-config traffic-control" on page 1968
- "show traffic-control counters" on page 1970
- "show traffic-control interface" on page 1972
- "show traffic-control policy" on page 1974
- "show traffic-control red-curve" on page 1976
- "show traffic-control rule config-check" on page 1978
- "show traffic-control rule" on page 1979
- "show traffic-control" on page 1980

- "sub-class (htb)" on page 1981
- "sub-class (priority)" on page 1983
- "sub-class (wrr)" on page 1985
- "sub-sub-class (htb)" on page 1987
- "sub-sub-class (priority)" on page 1989
- "sub-sub-class (wrr)" on page 1991
- "traffic-control enable" on page 1993
- "traffic-control" on page 1994

class (htb)

Overview Use this command to configure a hierarchy token bucket (HTB) class within a traffic control policy.

Use the **no** variant of this command to delete an existing class under a current policy.

Syntax

```
class <class-name> [cir <committed-rate>] [pir <peak-rate>]
[bc <1-100000000>] [be <1-100000000>] [preference <0-7>]
[queue-length <2-65536>] [set-dscp <dscp-value>] [red-curve
<red-curve-name>]
```

```
class <class-name> [cir <committed-rate>] [pir <peak-rate>]
[bc <1-100000000>] [be <1-100000000>] [preference <0-7>]
sub-class-policy htb
```

```
no class <class-name>
```

Parameter	Description
<class-name>	Name of the class.
cir *<committed-rate>*	Set the Committed Information Rate (CIR) for the queue. This parameter is compulsory when creating a new class. When editing an existing class, this parameter is optional.
pir *<peak-rate>*	Set the Peak Information Rate (PIR) for the queue. This is the rate of the queue under peak conditions. Specified in kbit/mbit/gbit per second, in the range 1kbit-100gbit.
bc *<1-100000000>*	Set the Committed Burst size (BC). This is the burst allowed above the CIR sent at the PIR rate.
be *<1-100000000>*	Set the Excess Burst size (BE). This is the burst allowed above the PIR sent at the maximum rate.
preference *<0-7>*	Set the preference for a class to receive spare bandwidth. Preference for the class to receive spare bandwidth (highest is 7).
queue-length *<2-65536>*	Set the maximum queue length.
set-dscp *<dscp-value>*	Set the DSCP value to apply to the packets.
red-curve *<red-curve-name>*	Apply a random early discard template with the class (only available on leaf queues when specifying class policy). If the keyword <default> is used then the default RED curve is applied.
sub-class-policy	Specify that the class will contain sub-classes.
htb	Sub-classes will use the Hierarchy Token Bucket (HTB) queueing discipline.

Default BC and BE are assigned suitable values proportional to the CIR and PIR respectively, and are larger than the MTU. The PIR defaults to the CIR. The Preference defaults to 7 and the queue-length defaults to 1000 (if the class is a leaf). If the keyword <default> is used then the default RED curve is applied.

Mode Traffic-Control Policy for an HTB policy.

Usage If there is already a class in the same level that has the specified name, the command will replace the configuration of the existing class if it does not have any sub-classes.

If a sub-class policy is specified, this command uses the Traffic-Control Class mode to apply it.

Examples To configure a leaf class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 htb
awplus(config-tc-policy)#class c01 cir 100mbit pir 150mbit
```

To configure a class with a sub-sub-class as the leaf class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 htb
awplus(config-tc-policy)#class c01 cir 100mbit pir 150mbit
sub-class-policy htb
awplus(config-tc-class)#sub-class s01 cir 10mbit sub-sub-class
policy htb
awplus(config-tc-subclass)#sub-sub-class ss01 cir 5mbit
queue-length 200 red-curve ss01-red
```

To enter Traffic-Control Class mode for an existing class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#
```

To delete an existing class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#no class c01
```

Related commands policy (traffic-control)

sub-class (htb)

traffic-control

class (priority)

Overview Use this command to configure a priority queue class within a traffic control policy.

Use the **no** variant of this command to delete an existing priority class under a current policy.

Syntax

```
class <class-name> [priority-level <0-15>] [max <max-rate>] [queue-length <2-65536>] [set-dscp <dscp-value>] [red-curve <red-curve-name>]
```

```
class <class-name> [priority-level <0-15>] sub-class-policy {priority|wrr|htb}
```

```
no class <class-name>
```

Parameter	Description
<class-name>	Name of the class.
priority-level *<0-15>*	Set the priority level (15 is the highest). This parameter is compulsory when creating a new class. When editing an existing class, this parameter is optional.
max *<max-rate>*	Set the maximum traffic rate of the queue (in kbit/mbit/gbit per second, 1kbit-100gbit).
queue-lenth *<2-65535>*	Set the maximum queue length in packets (only available on leaf queues when specifying sub-class policy).
set-dscp *<dscp-value>*	Set the DSCP value to apply to the packets (only available on leaf queues when specifying sub-class policy).
red-curve *<red-curve-name>*	Apply a random early discard template with the class (only available on leaf queues when specifying class policy). If the keyword <default> is used then the default RED curve is applied.
sub-class-policy	Create a sub-class within the policy.
priority	Sub-classes use the Priority Queue scheduling algorithm.
wrr	Sub-classes use the Weighted Round Robin scheduling algorithm.
htb	Sub-classes use the Hierarchy Token Bucket scheduling algorithm.

Default No priority class is applied. If the keyword <default> is used then the default RED curve is applied.

Mode Traffic Control Policy for a priority policy.

Usage If there is already a class in the same level with the specified name, the command will replace the configuration of the existing class if it does not have any sub-classes.

If a sub-class policy is specified, this command uses the Traffic-Control Class mode to apply it.

Examples

To configure a leaf class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 priority
awplus(config-tc-policy)#class c01 priority-level 5
```

To configure a class with a sub-sub-class as the leaf class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 priority
awplus(config-tc-policy)#class c01 priority-level 5
sub-class-policy priority
awplus(config-tc-class)#sub-class s01 priority-level 7
sub-sub-class-policy priority
awplus(config-tc-subclass)#sub-sub-class ss01 priority-level 3
max 5mbit queue-length 200 red-curve ss01-red
```

To enter Traffic-Control Class mode for an existing class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#
```

To delete an existing policy class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#no class c01
```

Related commands

policy (traffic-control)

sub-class (htb)

sub-class (wrr)

traffic-control

class (wrr)

Overview Use this command to configure a Weighted Round-Robin (WRR) class within a traffic control policy.

Use the **no** variant of this command to delete an existing class under a current policy.

Syntax

```
class <class-name> [weight <1-100>] [queue-length <2-65536>] [set-dscp <dscp-value>] [red-curve <red-curve-name>]
class <class-name> [weight <1-100>] sub-class-policy wrr
no class <class-name>
```

Parameter	Description
<class-name>	Name of the class.
`weight` *<1-100>*	Set the weight.The relative weight is the available bandwidth divided between sibling WRR classes according to the ratio of their configured weights. This parameter is compulsory when creating a new class. When editing an existing class, this parameter is optional.
`queue-length` *<2-65536>*	Set the maximum queue length in packets.
`set-dscp` *<dscp-value>*	Set the DSCP value to apply to packets.
`red-curve` *<red-curve-name>*	Apply a random early discard template with the class (only available on leaf queues when specifying class policy). If the keyword <default> is used then the default RED curve is applied.
`sub-class-policy`	Create a sub-class within the policy.
`wrr`	Sub-classes use the Weighted Round Robin queueing algorithm.

Default A weighted round-robin class has no DSCP value or sub-class policy. The queue length is 1000 by default. If the keyword <default> is used then the default RED curve is applied.

Mode Traffic-Control Policy for a WRR policy.

Usage If there is already a class in the same level with the specified name, the command will replace the configuration of the existing class if it does not have any sub-classes.

If a sub-class policy is specified, this command uses the Traffic-Control Class mode to apply it.

Examples

To configure a leaf class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 wrr
awplus(config-tc-policy)#class c01 weight 50
```

To configure a class with a sub-sub-class as the leaf class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 wrr
awplus(config-tc-policy)#class c01 weight 50 sub-class-policy
wrr
awplus(config-tc-class)#sub-class s01 weight 30 sub-sub-class-
policy wrr
awplus(config-tc-subclass)#sub-sub-class ss01 weight 5
queue-length 200 red-curve ss01-red
```

To enter Traffic-Control Class mode for an existing class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#
```

To delete an existing class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#no class c01
```

debug traffic-control

Overview Use this command to enable traffic-control debugging. This will cause additional detailed debugging information to be logged and available using the show debugging traffic-control.

Use the **no** variant of this command to disable traffic-control debugging.

Syntax
```
debug traffic-control
no debug traffic-control
```

Default Disabled

Mode Privileged Exec

Examples To enable traffic control debugging, use the commands:

```
awplus#debug traffic-control
```

To disable traffic control debugging, use the commands:

```
awplus#no debug traffic-control
```

Related commands traffic-control

show debugging traffic-control

interface (traffic-control)

Overview Use this command to configure interface specific parameters for traffic control.

Syntax
```
interface <interface-name> {overhead
[<overhead-bytes>|ethernet]|virtual-bandwidth
<bandwidth>|system-bandwidth <system-percentage>}
```

Parameter	Description
<interface-name>	Name of interface to configure
overhead	Set overhead to add to each packet when calculating the packet size
<overhead-bytes>	Number of bytes to add to the packet for packet size calculations. The range is from 0 to 512 and the default is 0.
ethernet	Setting the overhead to 'ethernet' adds 24 bytes to the packet to account for preamble + CRC + inter-frame gap.
virtual-bandwidth	Specify the virtual-bandwidth of the interface. This is the maximum amount of traffic that traffic control will allow to be sent via the interface..
<bandwidth>	Value for the virtual bandwidth in kbit, mbit or gbits. For example 5mbit.
system-bandwidth	Specify the percentage of the interface bandwidth to reserve for system traffic. The default when a traffic control policy is applied to the interface is 5%.
<system-percentage>	Percentage of the bandwidth to reserve for system traffic in the range from 1 to 99.

Default The default overhead is 0, the default bandwidth is the interface speed if it can be read. It is recommended to always set the virtual bandwidth when using traffic control. The system bandwidth default is 5%.

Mode Traffic-Control

Usage This command allows configuring traffic control parameters specific to the traffic egress interface.

Examples To rate limit eth1 to 10mbit while taking into account the ethernet framing overhead and reserving only 1% of the bandwidth for system traffic, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#interface eth1 overhead ethernet
virtual-bandwidth 10mbit system-bandwidth 1
```

show traffic-control interface

l3-filtering enable

Overview Use this command to enable traffic control for bridged traffic on a bridge interface.

Use the **no** variant of this command to disable traffic control for bridged traffic on a bridge interface.

Syntax

```
l3-filtering enable
no l3-filtering enable
```

Default Traffic control is disabled by default for bridged traffic.

Mode Interface mode for a bridge interface

Example To enable traffic control for bridged traffic on br1, use the commands:

```
awplus# configure terminal
awplus(config)# interface br1
awplus(config-if)# l3-filtering enable
```

Related commands traffic-control

Command changes Version 5.4.7-0.1: command added. Previously, traffic control was enabled by default on all bridge interfaces.

move rule (traffic-control)

Overview Use this command to change the identification of an existing traffic control rule.

Syntax

```
move rule [<1-65535> to <1-65535>]
```

Parameter	Description
<1-65535>	Range of the rule ID to move from
<1-65535>	Range of the destination ID for the rule to move to

Default None

Mode Traffic-Control

Example To change rule ID 10 to rule ID 25, use the commands:

```
awplus#cofigure terminal
awplus(config)#traffic-control
awplus(config-tc)#move rule 10 to 25
```

Related commands

rule (traffic-control)

show traffic-control rule config-check

policy (traffic-control)

Overview Use this command to configure a traffic control policy, that can then be used with rules that have been created.

Use the **no** variant of this command to delete an existing policy.

Syntax

```
policy <policy-name> [priority|wrr|htb]
no policy <policy-name>
```

Parameter	Description
<policy_name>	The name of the policy
`priority`	Use Priority Queueing (PQ)
`wrr`	Use Weighted Round Robin (WRR)
`htb`	Use Hierarchy Token Bucket (HTB)

Default No policies are configured

Mode Traffic-Control

Usage A policy specifies a top-level queueing discipline which determines the type of classes that can be configured under the policy. This command uses the Traffic-Control Policy mode.

Examples To configure a policy, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 htb
awplus(config-tc-policy)#
```

To delete an existing policy, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#no policy p01 htb
```

red-curve

Overview Use this command to allow configuration of a RED (Random Early Discard) curve template.

Use the **no** variant of this command to set the RED curve back to the default.

Syntax

```
red-curve <red-curve-name> [limit <4-127>] [avpkt <64-1518>]
[min <3-126>] [max <4-127>] [probabilty <1-100>]
[ecn [ecn-drop]]
```

```
no red-curve [<red-curve-name>]
```

Parameter	Description
<red-curve-name>	The RED curve name.
`limit` *<4-127>*	The hard queue length limit (in packets) for the RED curve. Once the queue length reaches the limit, all packets are dropped.
`avpkt` *<64-1518>*	The average packet size to use for queue size calculations in bytes.
`min` *<3-126>*	The minimum queue length for random early discard (in packets). Between <min> and <max> the drop probability will increase linearly.
`max` *<4-127>*	The maximum queue length where packets are probabilistically dropped. At <max> the drop probability equals <probability>. Beyond <max> the drop or marking probability is 100%.
`probability` *<1-100>*	The probability of a packet being dropped when queue-length reaches <max>. The drop probability increases linearly from 0 to <probability> in between <min> and <max>.
`ecn`	Use explicit congestion notification marking instead of dropping the packet.
`ecn-drop`	When average queue size exceeds <max> drop packets instead of marking.

Default The default RED curve is **red-curve default limit 127 avpkt 576B min 10 max 32 prob 2**.

Mode Traffic-control

Usage notes The RED curve template can later be applied to a traffic control class, sub-class, or sub-sub-class.

Example To configure a RED curve with ECN dropping and the default curve shape, use the commands:

```
awplus# configure terminal
awplus(config)# traffic-control
awplus(config-tc)# red-curve red-ecn ecn
```

To configure an aggressive RED curve, use the commands:

```
awplus# configure terminal
awplus(config)# traffic-control
awplus(config-tc)# red-curve aggressive min 5 max 50
probability 70
```

sub-sub-class (priority)

sub-sub-class (wrr)

rule (traffic-control)

Overview Use this command to create a traffic-control rule.

Use the **no** variant of this command to remove a traffic-control rule

Syntax `rule [<1-65535>] match <application> from <source-entity> to <destination-entity> policy <policy>`

`no rule [<1-65535>]`

Parameter	Description
<1-65535>	The rule ID is an integer in the range from 1 to 65535. If you do not designate a rule ID, one will be automatically generated and it will be greater than the current highest rule ID. Lower IDs have higher priority.
`match`	Application traffic to match
<application>	Application name
`from`	Set the source of the entity
<source_entity>	Source entiity name. Entities represent logical grouping of subnets, hosts or interfaces.
`to`	Set the destination of the entity
<destination_entity>	Source entiity name. Entities represent logical grouping of subnets, hosts or interfaces.
`policy`	Policy to apply to matched traffic
<policy>	Traffic control policy. This consists of a top-level policy name followed by the name of a class within that policy, and sub-class (of the class) and a sub-sub-calss if applicable. Examples are: p01.c03 p01.c03.sc02 p01.c03.scc02.ssc01 P01 is the policy name, c03 is the class name,sc02 is the sub-class, and ssc01 is the sub-sub-class..

Default No rules

Mode Traffic-Control

Usage Rules are used to apply traffic-control policies to a type of traffic. When traffic control is enabled and no rules are added, a default traffic-control policy is installed on all supported interfaces.

If the application, source entity or destination entity specified in the rule is not configured correctly, the rule is not valid and is not installed.

You can change the rule order by using the move rule (traffic-control) command.

Rules are applied to destination interfaces in the order of their ID (lower IDs are applied first). If traffic matches a rule, then the rest are ignored. If traffic does not match any rule, then it is classified to the default class.

A rule can specify the system class as the policy. System traffic is high priority traffic that is allocated a fixed amount of bandwidth on an interface. Use the interface (traffic-control) command to configure system bandwidth on an interface.

Examples

To configure a rule, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#rule 10 match ftp from wan to private policy p01.c02.sc03
```

To delete a rule, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#no rule 10
```

traffic-control

show traffic-control counters

Overview Use this command to display counters related to traffic control. This command displays counters for the number of packets sent, queued or dropped by each traffic control class. The information is shown by each interface. There is an overall counter for the policy, and counters for each leaf class in the policy.

If no interface name is specified then information for all interfaces with traffic control policies applied is displayed.

Syntax

```
show traffic-control counters [<interface-name>]
```

Parameter	Description
<interface-name>	Name of Interface to display traffic control counters

Default None

Mode Privileged Exec

Examples To show the traffic control counters for all interfaces, use the commands:

```
awplus#show traffic-control counters
```

Related commands show running-config traffic-control

show traffic-control interface

Overview Use this command to display information about interfaces known to traffic control, such as the applied policy, the virtual-bandwidth configured on the interface, the bandwidth reserved for system traffic and the overhead applied to the packet size calculations. If no interface name is specified, information is shown for all interfaces known to traffic control.

Syntax

```
show traffic-control interface [<interface-name>]
```

Parameter	Description
<interface-name>	Name of interface to display information

Default None

Mode Privileged Exec

Examples To show traffic control information for all interfaces, use the command:

```
awplus#show traffic-control interface
```

Output Figure 39-4: Example output from **show traffic-control interface**

```
awplus#show traffic-control interface
Traffic Control Interface Information

eth1:

Policy:               A
Virtual bandwidth:    Not set (optional)
System bandwidth:     5%
Packet overhead:      0 Bytes

eth2:
Policy:               A
Virtual bandwidth:    2000 kbit
System bandwidth:     5%
Packet overhead       24 Bytes (Ethernet transport layer)

vlan1:
Policy:               Default policy
Virtual bandwidth:    Not set (optional)
Packet overhead:      0 Bytes
```

```
vlan10:
Policy:               Default policy
Virtual bandwidth:    Not set (optional)
Packet overhead:      0 Bytes

vlan3:
Policy:               Default policy
Virtual bandwidth:    Not set (optional)
Packet overhead:      0 Bytes

vlan4:
Policy:               Default policy
Virtual bandwidth:    Not set (optional)
Packet overhead:      0 Bytes

Policy:               Default policy
Virtual bandwidth:    Not set (optional)
Packet overhead:      0 Bytes
```

Related commands

interface (traffic-control)

show running-config traffic-control

show traffic-control policy

Overview Use this command to show information about the configured traffic control policies and classes. This command shows the configured traffic control policies and the interfaces that they are applied to. Only non-default configuration parameters are shown.

If no policy name is given, all configured policies are displayed.

Syntax `show traffic-control policy [<policy-name>]`

Parameter	Description
<policy-name>	Name of policy to display

Default None

Mode Privileged Exec

Examples To show all traffic control policies, use the command:

```
awplus#show traffic-control policy
```

Output Figure 39-5: Example output from **show traffic-control policy**

```
awplus#show traffic-control policy
Traffic Control Policies:
Policy A:
  Type:                     wrr
  Applied interfaces:       eth1 eth2
  Classes:

Related commands

show running-config

show running-config traffic-control

show traffic-control red-curve

Overview Use this command to show configured RED curve templates.

Syntax

```
show traffic-control red-curve <red-curve-name>
```

Parameter	Description
<red-curve-name>	The name of the RED curve. The default RED curve is **red-curve default limit 127 avpkt 576B min 10 max 32 prob 2.**

Default None

Mode Privileged Exec

Usage notes If you have not configured some parameters, default values will display. If no RED curve name is given, all configured RED curves are shown.

Example To show all RED curves, use the command:

```
awplus# show traffic-control red-curve
```

To show a specified red curve called “TCP_session_1”, use the command:

```
awplus# show traffic-control red-curve TCP_session_1
```

Output Figure 39-6: Example output from **show traffic-control red-curve**

```
awplus#show traffic-control red-curve
Traffic Control RED Curves:

RED curve default:
 Average packet size: 576 bytes
 Minimum: 10 packets
 Maximum: 32 packets
 Limit: 127 packets
 Drop probability: 2%
 ECN marking: disabled

RED curve TCP_session_1:
 Average packet size: 576 bytes
 Minimum: 20 packets
 Maximum: 60 packets
 Limit: 127 packets
 Drop probability: 20%
 ECN marking: disabled
```

Figure 39-7: Example output from **show traffic-control red-curve TCP_session_1**

```
awplus#show traffic-control red-curve TCP_session_1
Traffic Control RED Curves
RED curve TCP_session_1:
Average packet size: 576 bytes
Minimum: 20 packets
Maximum: 60 packets
Limit: 127 packets
Drop probability: 20%
ECN marking: disabled
```

Related commands

red-curve

show running-config

show running-config traffic-control

show traffic-control policy

show traffic-control rule config-check

Overview Use this command to show information about traffic control rule validity.

Syntax
```
show traffic-control rule config-check
```

Default None

Mode Privileged Exec

Usage An asterisk is printed before each rule that is invalid. To help determine why the rule is invalid, the show traffic-control rule config-check command will print the reasons why the rule is invalid. Information is only shown for invalid rules. If all rules are valid, a message will be printed showing all rules are valid.

Example To check if configured rules are valid, use the commands:

```
awplus#show traffic-control rule config-check
```

Output Figure 39-8: Example output from **show traffic-control rule config-check**

```
awplus#show traffic-control rule config-check

Rule 30:
  "From" entity does not exist
  "To" entity does not exist
  Policy doesn't exist or is not leaf
```

Related commands

move rule (traffic-control)

rule (traffic-control)

show traffic-control rule

show running-config traffic-control

show traffic-control rule

Overview Use this command to show specific rules or a complete list of rules configured for traffic control.

Syntax

```
show traffic-control rule [<1-65535>]
```

Parameter	Description
<1-65535>	The ID of the rule you want to display. If no ID is entered, all rules are displayed.

Default None

Mode Privileged Exec

Usage An asterisk will be printed at the start of a row if the rule is invalid. The rules are shown in a table showing the rule ID, the application, source and destination that the rule matches on and the policy and class that the matching traffic will be sent to.

Examples To show a list of all traffic control rules configured, use the command:

```
awplus#show traffic-control rule
```

To show traffic control rule 10 configured, use the command:

```
awplus#show traffic-control rule 10
```

Output Figure 39-9: Example output from **show traffic-control rule**

```
awplus#show traffic-control rule

[* - Rule is not valid - see "show traffic-control rule config-check"]
  ID      APP         From              To               Policy
-------------------------------------------------------------------
  10      udp-5001    ipv6.vlan3        ipv6.eth2        A.B5001

traffic-control enable

sub-class (htb)

Overview Use this command to configure a hierarchy token bucket (HTB) sub-class within an existing class.

Use the **no** variant of this command to delete an existing sub-class under the current class.

Syntax

```
sub-class <class-name> [cir <committed-rate>] [pir <peak-rate>] [bc <1-100000000>] [be <1-100000000>] [preference <0-7>] [queue-length <2-65536>] [set-dscp <dscp-value>] [red-curve <red-curve-name>]
```

```
sub-class <class-name> [cir <committed-rate>] [pir <peak-rate>] [bc <1-100000000>] [be <1-100000000>] [preference <0-7>] sub-sub-class-policy htb
```

```
no sub-class <class-name>
```

Parameter	Description
<class-name>	Name of the class.
cir *<committed-rate>*	Set the Committed Information Rate (CIR) for the queue. Specified in kbit/mbit/gbit per second, 1kbit-100gbit. This parameter is compulsory when creating a new sub-class. When editing an existing sub-class, this parameter is optional.
pir *<peak-rate>*	Set the Peak Information Rate (PIR) for the queue. This is the rate of the queue under peak conditions. Specified in kbit/mbit/gbit per second, in the range 1kbit-100gbit.
bc *<1-100000000>*	Set the Committed Burst size (BC). This is the burst allowed above the CIR, sent at the PIR rate.
be *<1-100000000>*	Set the Excess Burst size (BE). This is the burst allowed above the PIR, sent at the maximum rate.
preference *<0-7>*	Set the preference for a class to receive spare bandwidth (highest is 7).
queue-length *<2-65536>*	Set the maximum queue length in packets.
set-dscp *<dscp-value>*	Set the DSCP value to apply to the packets.
red-curve *<red-curve-name>*	Apply a random early discard template with the sub-class and enter the name of the red curve template to apply.
sub-sub-class-policy	Specify that the sub-class will contain sub-sub-classes.
htb	Sub-sub-classes will use the Hierarchy Token Bucket (HTB) queueing discipline.

Default BC and BE are assigned suitable values proportional to the CIR and PIR respectively and are larger that the MTU. PIR defaults to the CIR. Preference defaults to 7 and the queue length default to 1000 if the class is a leaf.

Mode Traffic-Control Class for an HTB sub-class policy.

Usage

If there is already a sub-class in the same level with the specified name, the command will replace the configuration of the existing sub class if it does not have any sub-sub-classes.

If you specify a sub-sub-class policy, this command puts you into sub-class mode so you can specify the sub-sub-class.

Examples

To configure a leaf sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 htb
awplus(config-tc-policy)#class c01 cir 100mbit pir 150mbit
sub-class-policy htb
wplus(config-tc-class)#sub-class s02 cir 20mbit queue-length
200 red-curve s02-red
```

To enter Traffic-Control Class mode for an existing sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#sub-class s01
awplus(config-tc-subclass)#
```

To delete an existing sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#no sub-class s01
```

Related commands

class (htb)

class (priority)

policy (traffic-control)

sub-sub-class (htb)

traffic-control

sub-class (priority)

Overview Use this command to configure a priority queue sub-class within a class.

Use the **no** variant of this command to delete an existing sub-class under the current class.

Syntax

```
sub-class <class-name> [priority-level <0-15>] [max <max-rate>] [queue-length <2-65536>] [set-dscp <dscp_value>] [red-curve <red-curve-name>]
```

```
sub-class <class-name> [priority-level <0-15>] sub-sub-class-policy {priority|wrr|htb}
```

```
no sub-class <class-name>
```

Parameter	Description
<class-name>	Name of the class.
priority-level *<0-15>*	Set the priority level (15 is the highest). This parameter is compulsory when creating a new sub-class. When editing an existing sub-class, this parameter is optional.
max *<max-rate>*	Set the maximum traffic rate of the queue (in kbit/mbit/gbit per second, 1kbit-100gbit).
queue-length *<2-65536>*	Set the maximum queue length in packets.
set-dscp*<dscp-value>*	Set the DSCP value to apply to the packets.
red-curve *<red-curve-name>*	Apply a random early discard template with the sub class and enter the name of the red curve template to apply.
sub-sub-class-policy	Create a sub-sub-class for the policy.
priority	Sub-sub-classes will use the Priority Queue queueing algorithm.
wrr	Sub-sub-classes will use the Weighted Round Robin (WRR) queueing algorithm.
htb	Sub-classes will use the Hierarchy Token Bucket (HTB) queueing algorithm.

Default A priority queue sub class has no max rate, DSCP value or sub-sub class policy. The queue length is 1000 by default if the class is a leaf.

Mode Traffic-Control Class for a priority sub-class policy.

Usage If there is already a sub-class in the same level with the specified name, the command will replace the configuration of the existing sub class if it does not have any sub-sub classes.

If a sub-sub class policy is specified, this command uses the Traffic-Control Class mode to apply it.

Examples

To configure a sub-class as the leaf class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 priority
awplus(config-tc-policy)#class c01 priority-level 5
sub-class-policy priority
awplus(config-tc-class)#sub-class s02 priority-level 8 max
50mbit queue-length 200 red-curve ss01-red
```

To enter Traffic-Control Class mode for an existing sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 priority
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#sub-class s01
awplus(config-tc-subclass)#
```

To delete an existing class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#no sub-class s01
```

Related commands

class (priority)

policy (traffic-control)

sub-sub-class (htb)

sub-sub-class (priority)

sub-sub-class (wrr)

traffic-control

sub-class (wrr)

Overview Use this command to configure a Weighted Round-Robin (WRR) sub-class within a class.

Use the **no** variant of this command to delete an existing sub-class under the current class.

Syntax

```
sub-class <class-name> [weight <1-100>] [queue-length <2-65536>] [set-dscp <dscp-value>] [red-curve <red-curve-name>]
```

```
sub-class <class-name> [weight <1-100>] sub-sub-class-policy wrr
```

```
no sub-class <class-name>
```

Parameter	Description
<class-name>	Name of the sub-class.
weight*<1-100>*	Set the weight.The relative weight is the available bandwidth divided between sibling WRR classes according to the ratio of their configured weights. This parameter is compulsory when creating a new sub-class. When editing an existing sub-class, this parameter is optional.
queue-length*<2-65536>*	Set the maximum queue length in packets.
set-dscp	Set the DSCP value to apply to packets.
<dscp-value>	DSCP value as an integer or lower-case DSCP name.
red curve *<red-curve-name>*	Apply a random early discard template with the sub-class and enter the name of the red curve template to apply.
sub-sub-class-policy	Create a sub-sub-class within the policy.
wrr	Sub sub classes use the Weighted Round Robin queueing discipline.

Default A weighted round-robin sub class has no DSCP value or sub-sub-class policy. The queue length is 1000 by default.

Mode Traffic-Control Class for a WRR sub-class policy.

Usage If there is already a class in the same level with the specified name, the command will replace the configuration of the existing class if it does not have any sub-classes.

If a sub class policy is specified, this command uses the Traffic-Control Class mode to apply it.

Examples

To configure a sub-class as a leaf class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 wrr
awplus(config-tc-policy)#class c02 weight 30 sub-class-policy
wrr
awplus(config-tc-class)#sub-class s02 weight 40 queue-length
200 red-curve s02-red
```

To enter Traffic-Control Class mode for an existing sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#sub-class s01
awplus(config-tc-subclass)#
```

To delete an existing sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#no sub-class s01
```

Related commands

class (priority)

class (wrr)

policy (traffic-control)

traffic-control

sub-sub-class (wrr)

sub-sub-class (htb)

Overview Use this command to configure a Hierarchy Token Bucket (HTB) sub-sub-class for a sub-class.

Use the **no** variant of this command to delete an existing sub-sub-class from the current sub-class.

Syntax

```
sub-sub-class <class-name> [cir <committed-rate>] [pir
<peak-rate>] [bc <1-100000000>] [be <1-100000000>] [preference
<0-7>] [queue-length <2-65536>] [set-dscp <dscp-value>]
[red-curve <red-curve-name>]
```

```
no sub-sub-class <class-name>
```

Parameter	Description
`<class-name>`	Name of the sub-sub-class.
`cir <committed-rate>`	Set the Committed Information Rate (CIR) for the queue. Specified in kbit/mbit/gbit per second, 1kbit-100gbit. This parameter is compulsory when creating a new sub-sub-class. When editing an existing sub-sub-class, this parameter is optional.
`pir <peak-rate>`	Set the Peak Information Rate (PIR) for the queue. This is the rate of the queue under peak conditions. Specified in kbit/mbit/gbit per second, in the range 1kbit-100gbit.
`bc <1-100000000>`	Set the Committed Burst size (BC). This is the burst allowed above the CIR, sent at the PIR rate.
`be <1-100000000>`	Set the Excess Burst size (BE. This is the burst allowed above the PIR, sent at the maximum rate..
`preference <0-7>`	Set the preference for a class to receive spare bandwidth (highest is 7).
`queue-length <2-65536>`	Set the maximum queue length.
`set-dscp <dscp-value>`	Set the DSCP value to apply to the packets.
`red-curve <red-curve-name>`	Apply a random early discard template with the sub-sub-class and enter the name of the red curve template to apply.

Default BC and BE are assigned suitable values proportional to the CIR and PIR respectively and are larger than the MTU. PIR defaults to the CIR. Preference defaults to 7 and Queue length defaults to 1000.

Mode Traffic-Control Sub-class for an HTB sub-sub-class policy.

Usage If there is already a sub-sub-class in the same level with the specified name, this command will replace the configuration of the existing sub-sub-class.

Examples

To configure a sub-sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 htb
awplus(config-tc-policy)#class c01 cir 100mbit pir 150mbit
sub-class-policy htb
awplus(config-tc-class)#sub-class s01 cir 10mbit
```

To configure a leaf sub-sub-class with a RED curve, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 htb
awplus(config-tc-policy)#class c01 cir 100mbit pir 150mbit
sub-class-policy htb
awplus(config-tc-class)#sub-class s01 cir 10mbit
sub-sub-class-policy htb
awplus(config-tc-subclass)#sub-sub-class ss01 cir 5mbit
queue-length 200 red-curve ss01-red
```

To delete an existing sub-sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#sub-class s01
awplus(config-tc-subclass)#no sub-sub-class ss01
```

```

```
no sub-sub-class <class-name>
```

Parameter	Description
<class-name>	Name of the class.
`priority-level` *<0-15>*	Set the priority level (15 is the highest). This parameter is compulsory when creating a new sub-sub-class. When editing an existing sub-sub-class, this parameter is optional.
`max` *<max-rate>*	Set the maximum traffic rate of the queue (in kbit/mbit/gbit per second, 1kbit-100gbit).
`queue-length` *<2-65536>*	Set the maximum queue length in packets.
`set-dscp` *<dscp-value>*	Set the DSCP value to apply to the packets.
`red-curve` *<red-curve-name>*	Apply a random early discard template with the sub-sub-class and enter the name of the red curve template to apply.

Default A priority queue sub-sub-class has no max rate or DSCP value. The queue length is 1000.

Mode Traffic-Control Sub-class for a priority sub-sub-class policy.

Usage If there is already a sub-sub-class in the same level with the specified name, this command will replace the configuration of the existing sub-sub-class.

Examples To configure a sub-sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 priority
awplus(config-tc-policy)#class c01 priority-level 5
awplus(config-tc-class)#sub-class s01 priority-level 7
awplus(config-tc-subclass)#sub-sub-class ss01 priority-level 3
```

To configure a sub-sub-class with a RED curve, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 priority
awplus(config-tc-policy)#class c01 priority-level 5
sub-class-policy priority
awplus(config-tc-class)#sub-class s01 priority-level 7
sub-sub-class-policy priority
awplus(config-tc-subclass)#sub-sub-class ss01 priority-level 3
max 5mbit queue-length 200 red-curve ss01-red
```

To delete an existing sub-sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#sub-class s01
awplus(config-tc-subclass)#no sub-sub-class ss01
```

Related commands

traffic-control

policy (traffic-control)

sub-class (priority)

sub-sub-class (wrr)

Overview Use this command to configure a Weighted Round-Robin (WRR) sub-sub-class within a sub-class.

Use the **no** variant of this command to delete an existing sub-sub-class from the current sub-class.

Syntax

```
sub-sub-class <class-name> [weight <1-100>] [queue-length <2-65536>] [set-dscp <dscp-value>] [red-curve <red-curve-name>]
no sub-sub-class <class-name>
```

Parameter	Description
<class-name>	Name of the sub-class.
`weight` *<1-100>*	Set the weight.The relative weight is the available bandwidth divided between sibling WRR classes according to the ratio of their configured weights. This parameter is compulsory when creating a new sub-sub-class. When editing an existing sub-sub-class, this parameter is optional.
`queue-length` *<2-65536>*	Set the maximum queue length in packets.
`set-dscp` *<dscp-value>*	Set the DSCP value to apply to packets.
`red-curve` *<red-curve-name>*	Apply a random early discard template with the sub-sub-class and enter the name of the red curve template to apply.

Default A weighted round-robin sub-sub-class has no DSCP value. The queue length is 1000 by default.

Mode Traffic-Control Sub-class for a WRR sub-sub-class policy.

Usage If there is already a sub-sub-class in the same level with the specified name, this command will replace the configuration of the existing sub-sub-class.

Examples To configure a sub-sub-class as a leaf class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 wrr
awplus(config-tc-policy)#class c01 weight 50 sub-class-policy wrr
awplus(config-tc-class)#sub-class s01 weight 30 sub-sub-class policy wrr
awplus(config-tc-subclass)#sub-sub-class ss01 weight 5 queue-length 200
```

To configure a sub-sub-class with a RED curve, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 wrr
awplus(config-tc-policy)#class c01 weight 50 sub-class-policy
wrr
awplus(config-tc-class)#sub-class s01 weight 30
sub-sub-class-policy wrr
awplus(config-tc-subclass)#sub-sub-class ss01 weight 5
queue-length 200 red-curve ss01-red
```

To delete an existing sub-sub-class, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#policy p01 htb
awplus(config-tc-policy)#class c01
awplus(config-tc-class)#sub-class s01
awplus(config-tc-subclass)#no sub-sub-class ss01
```

Related commands

traffic-control

policy (traffic-control)

sub-class (priority)

sub-class (wrr)

traffic-control enable

Overview Use this command to enable traffic control.

Use the **no** variant of this command to disable traffic control without losing your existing traffic control configuration.

Syntax

```
traffic-control enable
no traffic-control enable
```

Default Disabled

Mode Traffic-Control

Usage When traffic control is enabled and no rules are added, a default queueing discipline is applied to all interfaces that support traffic control. You can use the policy command to configure traffic control policies and the rule (traffic-control) command to apply the configured policies to the traffic.

Examples To enable traffic control, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#traffic-control enable
```

To disable traffic control, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#no traffic-control enable
```

Related commands policy (traffic-control)

rule (traffic-control)

traffic-control

traffic-control

Overview Use this command to enter into Traffic-Control configuration mode.

Use the **no** variant of this command to remove all traffic control configuration.

Syntax

```
traffic-control
no traffic-control
```

Default Disabled

Mode Global Configuration

Usage This command enters you into Traffic-Control configuration mode.

In Traffic-Control Configuration mode you can:

- enable or disable traffic control
- create and delete traffic control policies
- create, move and delete rules for traffic control
- set and unset packet overhead, system bandwidth and virtual bandwidth of interfaces

Examples To configure traffic-control, use the commands:

```
awplus#configure terminal
awplus(config)#traffic-control
awplus(config-tc)#
```

To remove all traffic control configuration, us the commands:

```
awplus#configure terminal
awplus(config)#no traffic-control
awplus(config)#
```

40 802.1X Commands

Introduction

Overview

802.1X is an IEEE standard providing a mechanism for authenticating devices attached to a LAN port or wireless device. Devices wishing to access services behind a port must authenticate themselves before any Ethernet packets are allowed to pass through. The protocol is referred to as 802.1X because it was initially defined in the IEEE standard 802.1X, published in 2001 and revised in 2004 and again as the current 802.1X 2010 standard.

The AR2050V supports 802.1X authentication with the following limitations:

- Only supported on the device's switch ports.
- Not supported on static channel-groups and dynamic (LACP) channel-groups.

This chapter provides an alphabetical reference of commands used to configure 802.1X port access control. For more information, see the AAA and Port Authentication_Feature Overview and Configuration Guide.

dot1x accounting

Overview This command overrides the **default** RADIUS accounting method for IEEE 802.1X-based authentication on an interface by allowing you to apply a user-defined named method list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method list.

Syntax

```
dot1x accounting {default|<list-name>}
no dot1x accounting
```

Parameter	Description
`default`	Apply the default accounting method list
<list-name>	Apply the user-defined named list

Default The **default** method list is applied to an interface by default.

Mode Interface Configuration for a switch port; or Authentication Profile mode.

Example To apply the named list 'vlan10_acct' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# dot1x accounting vlan10_acct
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no dot1x accounting
```

Related commands aaa accounting dot1x

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x authentication

Overview This command overrides the **default** 802.1X-based authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

Syntax

```
dot1x authentication {default|<list-name>}
no dot1x authentication
```

Parameter	Description
default	Apply the default authentication method list
<list-name>	Apply the user-defined named list

Default The **default** method list is applied to an interface by default.

Mode Interface Configuration for a switch port; or Authentication Profile mode.

Example To apply the named list 'vlan10_auth' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# dot1x authentication vlan10_auth
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no dot1x authentication
```

Related commands aaa authentication dot1x

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

debug dot1x

Overview Use this command to enable 802.1X IEEE Port-Based Network Access Control troubleshooting functions.

Use the **no** variant of this command to disable this function.

Syntax

```
debug dot1x [all|auth-web|event|nsm|packet|timer]
no debug all dot1x
no debug dot1x [all|auth-web|event|nsm|packet|timer]
```

Parameter	Description
`all`	Used with the **no** variant of this command exclusively; turns off all debugging for 802.1X.
`auth-web`	Specifies debugging for 802.1X auth-web information.
`events`	Specifies debugging for 802.1X events.
`nsm`	Specifies debugging for NSM messages.
`packet`	Specifies debugging for 802.1X packets.
`timer`	Specifies debugging for 802.1X timers.

Mode Privileged Exec and Global Configuration

Usage notes This command turns on a mode where trace-level information is output during authentication conversations. Be aware that this is a very verbose output. It is mostly useful to capture this as part of escalating an issue to ATI support.

Examples Use this command without any parameters to turn on normal 802.1X debug information.

```
awplus# debug dot1x
awplus# show debugging dot1x
```

```
802.1X debugging status:
  802.1X events debugging is
  802.1X timer debugging is on
  802.1X packets debugging is on
  802.1X NSM debugging is on
```

Related commands show debugging dot1x

undebug dot1x

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x control-direction

Overview This command sets the direction of the filter for the unauthorized interface.

If the optional **in** parameter is specified with this command then packets entering the specified port are discarded. The **in** parameter discards the ingress packets received from the supplicant.

If the optional **both** parameter is specified with this command then packets entering (ingress) and leaving (egress) the specified port are discarded. The **both** parameter discards the packets received from the supplicant and sent to the supplicant.

The **no** variant of this command sets the direction of the filter to **both**. The port will then discard both ingress and egress traffic.

Syntax

```
dot1x control-direction {in|both}
no dot1x control-direction
```

Parameter	Description
`in`	Discard received packets from the supplicant (ingress packets).
`both`	Discard received packets from the supplicant (ingress packets) and transmitted packets to the supplicant (egress packets).

Default The authentication port direction is set to **both** by default.

Mode Interface Configuration for a switch port; or Authentication Profile mode.

Examples To set the port direction to the default (**both**) for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x control-direction
```

To set the port direction to **in** for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x control-direction in
```

To set the port direction to **in** for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x control-direction in
```

Command changes

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x eap

Overview This command selects the transmit mode for the EAP packet. If the authentication feature is not enabled then EAP transmit mode is not enabled. The default setting discards EAP packets.

Syntax

```
dot1x eap {discard|forward|forward-untagged-vlan|forward-vlan}
```

Parameter	Description
`discard`	Discard.
`forward`	Forward to all ports on the switch.
`forward-untagged-vlan`	Forward to ports with the same untagged VLAN.
`forward-vlan`	Forward to ports with the same VLAN.

Default The transmit mode is set to `discard` EAP packets by default.

Mode Global Configuration

Examples To set the transmit mode of EAP packet to **forward**, to forward EAP packets to all ports on the switch, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward
```

To set the transmit mode of EAP packet to **discard**, to discard EAP packets, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap discard
```

To set the transmit mode of EAP packet to **forward-untagged-vlan**, to forward EAP packets to ports with the same untagged VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward-untagged-vlan
```

To set the transmit mode of EAP packet to **forward-vlan**, to forward EAP packets to ports with the same VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# dot1x eap forward-vlan
```

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x eapol-version

Overview This command sets the EAPOL protocol version for EAP packets when 802.1X port authentication is applied.

Use the **no** variant of this command to set the EAPOL protocol version to 1.

The default EAPOL protocol version is version 1.

Syntax

```
dot1x eapol-version {1|2}
no dot1x eapol-version
```

Parameter	Description
1|2	EAPOL protocol version 1 or 2.

Default The EAP version for 802.1X authentication is set to 1 by default.

Mode Interface Configuration for a switch port; or Authentication Profile mode.

Examples To set the EAPOL protocol version to 2 for port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x eapol-version 2
```

To set the EAPOL protocol version to the default version (1) for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x eapol-version
```

To set the EAPOL protocol version to 2 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x eapol-version 2
```

Validation Commands auth profile (global)

show dot1x

show dot1x interface

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x initialize interface

Overview This command removes authorization for a specified connected interface. The connection will attempt to re-authorize when the specified port attempts to make use of the network connection.

NOTE: *Reauthentication could be a long time after the use of this command because the reauthorization attempt is not triggered by this command. The attempt is triggered by the first packet from the interface trying to access the network resources.*

Syntax

```
dot1x initialize interface <interface-list>
```

Parameter	Description
<interface-list>	The interfaces or ports to configure. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list. The specified interfaces must exist.

Mode Privileged Exec

Examples To initialize 802.1X port authentication on the interface port1.0.2, use the command:

```
awplus# dot1x initialize interface port1.0.2
```

To unauthorize switch port1.0.2 and attempt reauthentication on switch port1.0.2, use the command:

```
awplus# dot1x initialize interface port1.0.2
```

To unauthorize all switch ports for a 18-port device and attempt reauthentication, use the command:

```
awplus# dot1x initialize interface port1.0.1-port1.0.18
```

Related commands

dot1x initialize supplicant

show dot1x

show dot1x interface

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x initialize supplicant

Overview This command removes authorization for a connected supplicant with the specified MAC address or username. The connection will attempt to re-authorize when the specified supplicant attempts to make use of the network connection.

NOTE: *Reauthentication could be a long time after the use of this command because the reauthorization attempt is not triggered by this command. The attempt is triggered by the first packet from the supplicant trying to access the network resources.*

Syntax

```
dot1x initialize supplicant {<macadd>|username}
```

Parameter	Description
`dot1x`	IEEE 802.1X Port-Based Access Control.
`initialize`	Initialize the port to attempt reauthentication.
`supplicant`	Specify the supplicant to initialize.
<macadd>	MAC (hardware address of the supplicant.
`username`	The name of the supplicant entry.

Mode Privileged Exec

Example To initialize the supplicant authentication, use the commands

```
awplus# configure terminal
awplus(config)# dot1x initialize supplicant 0090.99ab.a020
awplus(config)# dot1x initialize supplicant guest
```

Related commands

dot1x initialize interface

show dot1x

show dot1x supplicant

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x keytransmit

Overview Use this command to enable key transmission on the interface specified previously in Interface mode.

This command enables key transmission over an Extensible Authentication Protocol (EAP) packet between the authenticator and supplicant.

The **no** variant of this command disables key transmission on the interface specified.

Syntax

```
dot1x keytransmit
no dot1x keytransmit
```

Default Key transmission for port authentication is disabled by default.

Mode Interface Configuration for a switch port; or Authentication Profile mode.

Examples To enable the key transmit feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x keytransmit
```

To disable the key transmit feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x keytransmit
```

Related commands show dot1x

show dot1x interface

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x max-auth-fail

Overview Use this command to configure the maximum number of login attempts for a supplicant (client device) using the **auth-fail vlan** feature, when using 802.1X port authentication on an interface.

The **no** variant of this command resets the maximum login attempts for a supplicant (client device) using the auth-fail vlan feature, to the default configuration of 3 login attempts.

Syntax

```
dot1x max-auth-fail <0-10>
no dot1x max-auth-fail
```

Parameter	Description
<0-10>	Specify the maximum number of login attempts for supplicants on an interface using 802.1X port authentication.

Default The default maximum number of login attempts for a supplicant on an interface using 802.1X port authentication is 3 login attempts.

Mode Interface Configuration for a switch port; or Authentication Profile mode.

Usage notes This command sets the maximum number of login attempts for supplicants on an interface. The supplicant is moved to the auth-fail VLAN from the Guest VLAN after the number of failed login attempts using 802.1X authentication is equal to the number set with this command.

See the AAA and Port Authentication Feature Overview and Configuration Guide for information about:

- the auth-fail VLAN feature, and
- restrictions regarding combinations of authentication enhancements working together

Examples To configure the maximum number of login attempts for a supplicant on interface port1.0.2 to a single login attempt, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x max-auth-fail 1
```

To configure the maximum number of login attempts for a supplicant on interface port1.0.2 to the default number of 3 login attempts, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x max-auth-fail
```

To configure the maximum number of login attempts for a supplicant on authentication profile 'student' to a single login attempt, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x max-auth-fail 1
```

Related commands

show dot1x interface

Command changes

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x max-reauth-req

Overview Use this command to set the number of reauthentication attempts before an interface is unauthorized.

The **no** variant of this command resets the reauthentication delay to the default.

Syntax

```
dot1x max-reauth-req <1-10>
no dot1x max-reauth-req
```

Parameter	Description
<1-10>	Specify the maximum number of reauthentication attempts for supplicants on an interface using 802.1X port authentication.

Default The default maximum reauthentication attempts for interfaces using 802.1X port authentication is two (2) reauthentication attempts, before an interface is unauthorized.

Mode Interface Configuration for a switch port; or Authentication Profile mode.

Usage notes Use this command to set the maximum reauthentication attempts after failure.

Examples To configure the maximum number of reauthentication attempts for interface port1.0.2 to a single (1) reauthentication request, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x max-reauth-req 1
```

To configure the maximum number of reauthentication attempts for interface port1.0.2 to the default maximum number of two (2) reauthentication attempts, use the commands:

```
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x max-reauth-req
```

To configure the maximum number of reauthentication attempts for authentication profile 'student' to a single (1) reauthentication request, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x max-reauth-req 1
```

Related commands

auth profile (global)

dot1x max-auth-fail

show dot1x interface

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x port-control

Overview This command enables 802.1X port authentication on the interface specified, and sets the control of the authentication port.

The **no** variant of this command disables the port authentication on the interface specified.

Syntax

```
dot1x port-control {force-unauthorized|force-authorized|auto}
no dot1x port-control
```

Parameter	Description
`force-unauthorized`	Force the port state to unauthorized. Specify this to force a port to always be in an unauthorized state.
`force-authorized`	Force the port state to authorized. Specify this to force a port to always be in an authorized state.
`auto`	Allow the port client to negotiate authentication. Specify this to enable authentication on the port.

Default 802.1X port control is disabled by default.

Mode Interface Configuration for a switch port; or Authentication Profile mode.

Usage notes Use this command to force a port state.

When **port-control** is set to **auto**, the 802.1X authentication feature is executed on the interface, but only if the **aaa authentication dot1x** command has been issued.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be
removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

Examples To enable port authentication on the interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
```

To enable port authentication force authorized on the interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control force-authorized
```

To disable port authentication on the interface port1.0.2 use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x port-control
```

To enable port authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x port-control auto
```

show dot1x interface

Command changes

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

dot1x timeout tx-period

Overview This command sets the transmit timeout for the authentication request on the specified interface.

The **no** variant of this command resets the transmit timeout period to the default (30 seconds).

Syntax

```
dot1x timeout tx-period <1-65535>
no dot1x timeout tx-period
```

Parameter	Description
<1-65535>	Seconds.

Default The default transmit period for port authentication is 30 seconds.

Mode Interface Configuration for a switch port; or Authentication Profile mode.

Usage notes Use this command to set the interval between successive attempts to request an ID.

Examples To set the transmit timeout period to 5 seconds on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x timeout tx-period 5
```

To reset transmit timeout period to the default (30 seconds) on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no dot1x timeout tx-period
```

To set the transmit timeout period to 5 seconds on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# dot1x timeout tx-period 5
```

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

show debugging dot1x

Overview Use this command to see what debugging is turned on for 802.1X.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show debugging dot1x
```

Mode User Exec and Privileged Exec

Example To enable 802.1X debugging and display the debugging option set, use the following commands:

```
awplus# debug dot1x
awplus# show debugging dot1x
```

```
802.1X debugging status:
  802.1X events debugging is on
  802.1X timer debugging is on
  802.1X packets debugging is on
  802.1X NSM debugging is on
```

Related commands debug dot1x

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

show dot1x

Overview Use this command to show authentication information for 802.1X port authentication.

If you specify the optional **all** parameter then this command also displays all authentication information for each port available on the switch.

For information on filtering and saving command output, see the "Getting Started with AlliedWare_Plus" Feature Overview and Configuration Guide.

Syntax

```
show dot1x [all]
```

Parameter	Description
`all`	Displays all authentication information for each port available on the switch.

Mode Privileged Exec

Example

```
awplus# show dot1x all
```

Table 1: Example output from the **show dot1x all** command

```
awplus# show dot1x all

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

show dot1x diagnostics

Overview This command shows 802.1X authentication diagnostics for the specified interface (optional).

If no interface is specified then authentication diagnostics are shown for all interfaces.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show dot1x diagnostics [interface <interface-list>]
```

Parameter	Description
`interface`	Specify a port to show.
`<interface-list>`	The interfaces or ports to configure. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list. The specified interfaces must exist.

Mode Privileged Exec

Example See the sample output below showing 802.1X authentication diagnostics for port1.0.2:

```
awplus# show dot1x diagnostics interface port1.0.2
```

Output Figure 40-1: Example output from the **show dot1x diagnostics** command

```
Authentication Diagnostics for interface port1.0.2
   Supplicant address: 00d0.59ab.7037
      authEnterConnecting: 2

      authEapstartWhileAuthenticated: 0
      authEaplogoffWhileAuthenticated: 0
      BackendResponses: 2
      BackendAccessChallenges: 1
      BackendOtherrequestToSupplicant: 3
      BackendAuthSuccess: 1
```

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

show dot1x interface

Overview Use this command to show the status of 802.1X port-based authentication on the specified interface.

For information on filtering and saving command output, see the "Getting Started with AlliedWare_Plus" Feature Overview and Configuration Guide.

Syntax

```
show dot1x interface <interface-list>
```

Parameter	Description
<interface-list>	The interfaces to display information about. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.

Mode Privileged Exec

Examples See the sample output below showing 802.1X authentication status for port1.0.2:

```
awplus# show dot1x interface port1.0.2
```

Table 2: Example output from the **show dot1x interface** command for a port

```

Command changes

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

show dot1x sessionstatistics

Overview This command shows authentication session statistics for the specified interface, which may be a static channel (or static aggregator) or a dynamic (or LACP) channel group or a switch port.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show dot1x sessionstatistics [interface <interface-list>]
```

Parameter	Description
`interface`	Specify a port to show.
<interface-list>	The interfaces to display information about. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.

Mode Privileged Exec

Example See sample output below showing 802.1X authentication session statistics for port1.0.2:

```
awplus# show dot1x sessionstatistics interface port1.0.2
```

```
Authentication session statistics for interface port1.0.2
   session user name: manager
      session authentication method: Remote server
      session time: 19440 secs
      session terminat cause: Not terminated yet
```

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

show dot1x statistics interface

Overview Use this command to show the authentication statistics for the specified interface.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

The output from this command is the same as the output from the show auth statistics interface command.

Syntax

```
show dot1x statistics interface <interface-list>
```

Parameter	Description
<interface-list>	The interfaces to display information about. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.

Mode Privileged Exec

Example To display 802.1X authentication statistics for port1.0.2, use the command:

```
awplus# show dot1x statistics interface port1.0.2
```

Output Figure 40-2: Example output from **show dot1x statistics interface** for a port

```
awplus# show dot1x statistics interface port1.0.2
802.1X statistics for interface port1.0.2
   EAPOL Frames Rx: 5 - EAPOL Frames Tx: 16

   EAP Req/Id Frames Tx: 8 - EAP Request Frames Tx: 2
   Invalid EAPOL Frames Rx: 0 - EAP Length Error Frames Rx: 0
   EAPOL Last Frame Version Rx: 1 - EAPOL Last Frame
Src:00d0.59ab.7037
```

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

show dot1x supplicant

Overview This command shows the supplicant state of the authentication mode set for the switch.

This command shows a summary when the optional **brief** parameter is used.

For information on filtering and saving command output, see the "Getting Started with AlliedWare_Plus" Feature Overview and Configuration Guide.

Syntax

```
show dot1x supplicant [<macadd>] [brief]
```

Parameter	Description
<macadd>	MAC (hardware) address of the Supplicant.
`brief`	Brief summary of the Supplicant state.

Mode Privileged Exec

Example See sample output below showing the 802.1X authenticated supplicant on the switch:

```
awplus# show dot1x supplicant
```

```
authenticationMethod: dot1x
totalSupplicantNum: 1
authorizedSupplicantNum: 1
macBasedAuthenticationSupplicantNum: 0
dot1xAuthenticationSupplicantNum: 1
webBasedAuthenticationSupplicantNum: 0
Supplicant name: manager
Supplicant address: 00d0.59ab.7037
   authenticationMethod: dot1x
    Two-Step Authentication:
      firstAuthentication: Pass - Method: mac
      secondAuthentication: Pass - Method: dot1x
portStatus: Authorized - currentId: 4
abort:F fail:F start:F timeout:F success:T
PAE: state: Authenticated - portMode: Auto
PAE: reAuthCount: 0 - rxRespId: 0
PAE: quietPeriod: 60 - maxReauthReq: 2 - txPeriod: 30
BE: state: Idle - reqCount: 0 - idFromServer: 3
BE: suppTimeout: 30 - serverTimeout: 30
CD: adminControlledDirections: in - operControlledDirections: in
CD: bridgeDetected: false
KR: rxKey: false
KT: keyAvailable: false - keyTxEnabled: false
RADIUS server group (auth): radius
RADIUS server (auth): 192.168.1.40
```

See sample output below showing the supplicant on the switch using the **brief** parameter:

```
awplus# show dot1x supplicant 00d0.59ab.7037 brief
```

```
Interface port1.0.2
   authenticationMethod: dot1x
   totalSupplicantNum: 1
   authorizedSupplicantNum: 1
      macBasedAuthenticationSupplicantNum: 0
      dot1xAuthenticationSupplicantNum: 1
      webBasedAuthenticationSupplicantNum: 0
Interface   VID Mode MAC Address      Status         IP Address      Username
==========  === ==== ===============  =============  ==============  ========
port1.0.2   2   D    00d0.59ab.7037   Authenticated  192.168.2.201   manager
```

See sample output below showing the supplicant on the switch using the **brief** parameter:

```
awplus# show dot1x supplicant brief
```

For example, if two-step authentication is configured with 802.1X authentication as the first method and web authentication as the second method then the output is as follows:

```
Interface port1.0.2  authenticationMethod: dot1x/web
  Two-Step Authentication
    firstMethod: dot1x
    secondMethod: web
  totalSupplicantNum: 1
  authorizedSupplicantNum: 1
    macBasedAuthenticationSupplicantNum: 0
    dot1xAuthenticationSupplicantNum: 0
    webBasedAuthenticationSupplicantNum: 1
    otherAuthenticationSupplicantNum: 0

Interface   VID  Mode MAC Address    Status            IP Address      Username
==========  ====  ==== ============== ================= ==============  ========
port1.0.2   5    W    0008.0d5e.c216 Authenticated     192.168.1.200   web
```

Related commands show dot1x supplicant interface

Command changes Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

show dot1x supplicant interface

Overview Use this command to show the supplicant state of the authentication mode set for the interface.

This command shows a summary when the optional **brief** parameter is used.

For information on filtering and saving command output, see the "Getting Started with AlliedWare_Plus" Feature Overview and Configuration Guide.

Syntax

```
show dot1x supplicant interface <interface-list> [brief]
```

Parameter	Description
<interface-list>	The interfaces to display information about. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.
`brief`	Brief summary of the Supplicant state.

Mode Privileged Exec

Examples See sample output below showing the supplicant on the interface port1.0.2:

```
awplus# show dot1x supplicant interface port1.0.2
```

```
Interface port1.0.2
 authenticationMethod: dot1x
  totalSupplicantNum: 1
 authorizedSupplicantNum: 1
   macBasedAuthenticationSupplicantNum: 0
   dot1xAuthenticationSupplicantNum: 1
   webBasedAuthenticationSupplicantNum: 0
   otherAuthenticationSupplicantNum: 0

 Supplicant name: VCSPCVLAN10
 Supplicant address: 0000.cd07.7b60
   authenticationMethod: 802.1X
 Two-Step Authentication:
   firstAuthentication: Pass - Method: mac
   secondAuthentication: Pass - Method: dot1x
   portStatus: Authorized - currentId: 3
   abort:F fail:F start:F timeout:F success:T
   PAE: state: Authenticated - portMode: Auto
   PAE: reAuthCount: 0 - rxRespId: 0
   PAE: quietPeriod: 60 - maxReauthReq: 2
   BE: state: Idle - reqCount: 0 - idFromServer: 2
   CD: adminControlledDirections:in -
operControlledDirections:in
   CD: bridgeDetected: false
   KR: rxKey: false
   KT: keyAvailable: false - keyTxEnabled: false
```

See sample output below showing the supplicant on the switch using the **brief** parameter:

```
awplus# show dot1x supplicant interface port1.0.2 brief
```

```
Interface port1.0.2
   authenticationMethod: dot1x
Two-Step Authentication:
   firstMethod: mac
   secondMethod: dot1x
totalSupplicantNum: 1
authorizedSupplicantNum: 1
macBasedAuthenticationSupplicantNum: 0
dot1xAuthenticationSupplicantNum: 1
webBasedAuthenticationSupplicantNum: 0

41 Authentication Commands

Introduction

Overview

Port authentication commands enable you to specify three different types of device authentication: 802.1X authentication, web authentication, and MAC authentication.

- 802.1X is an IEEE standard providing a mechanism for authenticating devices attached to a LAN port or wireless device.
- Web authentication is applicable to devices that have a human user who opens the web browser and types in a user name and password when requested.
- MAC authentication is used to authenticate devices that have neither a human user nor implement 802.1X supplicant when making a network connection request.

The AR2050V supports port authentication with the following limitations:

- MAC authentication is supported on the device's switch ports static channel-groups and dynamic (LACP) channel-groups.
- 802.1X authentication is supported on the device's switch ports only. It is not supported on static channel-groups and dynamic (LACP) channel-groups.
- Web authentication is supported on the device's Eth interfaces only.

This chapter provides an alphabetical reference for MAC and web authentication commands. For a list of 802.1X commands see the 802.1X Commands chapter.

For more information on configuring and using port authentication, see the AAA and Port Authentication Feature Overview and Configuration Guide.

auth auth-fail vlan

Overview Use this command to enable the **auth-fail vlan** feature on the specified vlan interface. This feature assigns supplicants (client devices) to the specified VLAN if they fail port authentication.

Use the **no** variant of this command to disable the auth-fail vlan feature for a specified VLAN interface.

Syntax

```
auth auth-fail vlan <1-4094>
no auth auth-fail vlan
```

Parameter	Description
<1-4094>	Assigns the VLAN ID to any supplicants that have failed port authentication.

Default The auth-fail vlan feature is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes Use the auth-fail vlan feature when using web authentication instead of the Guest VLAN feature, when you need to separate networks where one supplicant (client device) requires authentication and another supplicant does not require authentication from the same interface.

This is because the DHCP lease time using the Web-Authentication feature is shorter, and the auth-fail vlan feature enables assignment to a different VLAN if a supplicant fails authentication.

To enable the auth-fail vlan feature with web authentication, you need to set the web authentication server virtual IP address by using the auth-web-server ipaddress command or the auth-web-server dhcp ipaddress command.

When using 802.1X port authentication, use a dot1x max-auth-fail command to set the maximum number of login attempts. Three login attempts are allowed by default for 802.1X port authentication before supplicants trying to authenticate are moved from the Guest VLAN to the auth-fail VLAN. See the dot1x max-auth-fail on page 2008 for command information.

See the AAA and Port Authentication Feature Overview and Configuration Guide for information about:

- the auth-fail VLAN feature, which allows the Network Administrator to separate the supplicants who attempted authentication, but failed, from the supplicants who did not attempt authentication, and
- restrictions regarding combinations of authentication enhancements working together

Examples

To enable the auth-fail vlan feature for port1.0.2 and assign VLAN 100, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth auth-fail vlan 100
```

To disable the auth-fail vlan feature for port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth auth-fail vlan
```

Command changes

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

auth critical

Overview Use this command to enable the critical port feature on the interface. When the critical port feature is enabled on an interface, and all the RADIUS servers are unavailable, then the interface becomes authorized.

The **no** variant of this command disables the critical port feature on the interface.

Syntax

```
auth critical
no auth critical
```

Default The critical port of port authentication is disabled.

Mode auth-web: Interface Configuration for an Eth interface, or Authentication Profile mode.
auth-mac: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.
dot1x: Interface Configuration for a a switch port; or Authentication Profile mode.

Examples To enable the critical port feature on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth critical
```

To disable the critical port feature on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth critical
```

To enable the critical port feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth critical
```

Related commands

auth dhcp-framed-ip-lease

Overview Use this command to enable DHCP Framed IP Lease on an interface.

When the DHCP Framed IP Lease feature is enabled on an interface, supplicants authenticated using 802.1x or MAC authentication will be assigned a specific IP address, and other network settings, gathered from the RADIUS server during the authentication process.

Use the **no** variant of this command to disable DHCP Framed IP Lease.

Syntax

```
auth dhcp-framed-ip-lease
no auth dhcp-framed-ip-lease
```

Default DHCP Framed IP Lease is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes You need to complete the following steps to configure the DHCP Framed IP Lease feature on your network.

On the RADIUS server:

- Configure the RADIUS server with the username and password for 802.1x or MAC authentication
- Configure the following 'framed' RADIUS attributes on the RADIUS server for the that user:
  - Framed-IP-Address (8): the IPv4 address for the supplicant
  - Framed-IP-Netmask (9): the netmask for the supplicant
  - Framed-Route (22): the default gateway IPv4 address for the supplicant
  - Session-Timeout (27): IP address lease time for the supplicant

NOTE: *The Frame-IP-Address (8) attribute must be configured for this feature to work. All other attributes are optional.*

On the DHCP server:

- Configure the RADIUS client
- Enable 802.1x or MAC authentication on the required interface/s
- Enable DHCP Framed IP Lease feature on the required interface/s
- Setup a DHCP pool with the network range for the IP address/es registered on the RADIUS server
- Enable DHCP server

For more information, see the AAA and Port Authentication Feature Overview and Configuration Guide.

Example

To enable DHCP Framed IP Lease on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# auth dhcp-framed-ip-lease
```

To disable DHCP Framed IP Lease on port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no auth dhcp-framed-ip-lease
```

show ip dhcp pool

Command changes

Version 5.4.8-2.1: command added

auth dynamic-vlan-creation

Overview Use this command to enable and disable the Dynamic VLAN assignment feature.

The Dynamic VLAN assignment feature allows a supplicant (client device) to be placed into a specific VLAN based on information returned from the RADIUS server during authentication, on a given interface.

Use the **no** variant of this command to disable the Dynamic VLAN assignment feature.

Syntax

```
auth dynamic-vlan-creation [rule {deny|permit}]
no auth dynamic-vlan-creation
```

Parameter	Description
`rule`	VLAN assignment rule.
`deny`	Deny a differently assigned VLAN ID. This is the default rule.
`permit`	Permit a differently assigned VLAN ID.

Default By default, the Dynamic VLAN assignment feature is disabled.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes If the Dynamic VLAN assignment feature is enabled (disabled by default), VLAN assignment is dynamic. If the Dynamic VLAN assignment feature is disabled then RADIUS attributes are ignored and configured VLANs are assigned to ports.

The optional **rule** parameter specifies the VLAN assignment rule when the second supplicant's VLAN ID is different from VLAN ID from the first supplicant. If the **deny** value is applied with the command then the second supplicant with a different VLAN ID is rejected. If the **permit** value is applied with the command then the second supplicant with a different VLAN ID is accepted and assigned to the first supplicant's VLAN.

If you issue an **auth dynamic-vlan-creation** command without a **rule** parameter then a second supplicant with a different VLAN ID is rejected. It is not assigned to the first supplicant's VLAN. Issuing an **auth dynamic-vlan-creation** command without a **rule** parameter has the same effect as issuing an **auth dynamic-vlan-creation rule deny** command rejecting supplicants with differing VIDs.

Examples

To enable the Dynamic VLAN assignment feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport access vlan 10
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# interface vlan10
awplus(config-if)# ip address 10.1.1.1/24
```

To enable the Dynamic VLAN assignment feature with Web Authentication on interface port1.0.2 when Web Authentication is needed, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ipaddress 1.2.3.4
awplus(config)# access-list hardware acl-web send-to-cpu ip any
1.2.3.4
awplus(config)# interface port1.0.2
awplus(config-if)# auth-web enable
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# access-group acl-web
awplus(config-if)# interface vlan1
awplus(config-if)# ip address 10.1.1.1/24
```

To disable the Dynamic VLAN assignment feature on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth dynamic-vlan-creation
```

To enable the Dynamic VLAN assignment feature on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth dynamic-vlan-creation
```

Command changes

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

auth guest-vlan

Overview Use this command to enable and configure the Guest VLAN feature on the interface specified by associating a Guest VLAN with an interface. This command does not start authentication. The supplicant's (client device's) traffic is associated with the native VLAN of the interface unless it is already associated with another VLAN. The **routing** option enables routing from the Guest VLAN to another VLAN, so the switch can lease DHCP addresses and accept access to a limited network.

The **no** variant of this command disables the guest VLAN feature on the interface specified.

Syntax

```
auth guest-vlan <1-4094> [routing]
no auth guest-vlan [routing]
```

Parameter	Description
<1-4094>	VLAN ID (VID).
`routing`	Enables routing from the Guest VLAN to other VLANs.

Default The Guest VLAN authentication feature is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes The Guest VLAN feature may be used by supplicants (client devices) that have not attempted authentication, or have failed the authentication process. Note that if a port is in multi-supplicant mode with per-port dynamic VLAN configuration, after the first successful authentication, subsequent hosts cannot use the guest VLAN due to the change in VLAN ID. This may be avoided by using per-user dynamic VLAN assignment.

When using the Guest VLAN feature with the multi-host mode, a number of supplicants can communicate via a guest VLAN before authentication. A supplicant's traffic is associated with the native VLAN of the specified switch port. The supplicant must belong to a VLAN before traffic from the supplicant can be associated.

Note that you must enable 802.1X on the port and define a VLAN using the vlan command before you can configure it as a guest VLAN.

Note that Guest VLAN can use only untagged ports.

See the AAA and Port Authentication Feature Overview and Configuration Guide for information about:

- Guest VLAN, and
- restrictions regarding combinations of authentication enhancements working together

Examples

To define vlan100 and assign the guest VLAN feature to vlan100 on interface port1.0.2, and enable routing from the guest VLAN to other VLANs, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 100
awplus(config-vlan)# exit
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth guest-vlan 100 routing
```

To disable the guest VLAN feature on port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth guest-vlan
```

To define vlan100 and assign the guest VLAN feature to vlan100 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 100
awplus(config-vlan)# exit
awplus(config)# auth profile student
awplus(config-auth-profile)# auth guest-vlan 100
```

show dot1x

show dot1x interface

Command changes

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

auth guest-vlan forward

Overview Use this command to enable packet forwarding from the guest VLAN to a destination IP address or subnet. If this command is configured, the device can lease DHCP addresses and accept access to a limited part of your network. Also, when using NAP authentication, the supplicant can log on to a domain controller to gain certification.

Use the **no** variant of this command to disable packet forwarding from the Guest VLAN to a destination IP address or subnet.

Syntax

```
auth guest-vlan forward {<ip-address>|<ip-address/mask>}
[dns|tcp <1-65535>|udp <1-65535>]
```

```
no auth guest-vlan forward {<ip-address>|<ip-address/mask>}
[dns|tcp <1-65535>|udp <1-65535>]
```

Parameter	Description
<ip-address> *<ip-address/mask>*	The IP address or subnet to which the guest VLAN can forward packets, in dotted decimal notation
`dns`	Enable forwarding of DNS packets
`tcp` *<1-65535>*	Enable forwarding of packets for the specified TCP port number
`udp` *<1-65535>*	Enable forwarding of packets for the specified UDP port number

Default Forwarding is disabled by default.

Mode Interface Configuration mode for a specified switch port, or Authentication Profile mode

Usage Before using this command, you must configure the guest VLAN with the auth guest-vlan command.

Example To enable packet forwarding from the guest VLAN to the destination IP address on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth guest-vlan forward 10.0.0.1
```

To enable forwarding of DNS packets from the guest VLAN to the destination IP address on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface
awplus(config-if)# auth guest-vlan forward 10.0.0.1 dns
```

To disable forwarding of DNS packets from the guest VLAN to the destination IP address on port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth guest-vlan forward 10.0.0.1 dns
```

To enable the TCP forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth guest-vlan forward 10.0.0.1
tcp 137
```

Related commands

Command changes

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

auth host-mode

Overview Use this command to select the host mode on the specified interface.

Use the **no** variant of this command to set host mode to the default setting (single host).

Syntax

```
auth host-mode {single-host|multi-host|multi-supplicant}
no auth host-mode
```

Parameter	Description
`single-host`	In this mode, only one supplicant is allowed per port. This is the default mode.
`multi-host`	In this mode, once the first host on a port is authenticated, all other downstream hosts are allowed without being authenticated (piggy-back mode).
`multi-supplicant`	In this mode, multiple separate supplicants are individually authenticated on one port.

Default The default host mode for port authentication is for a single host.

Mode auth-web: Interface Configuration for an Eth interface, or Authentication Profile mode.
auth-mac: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.
dot1x: Interface Configuration for a a switch port; or Authentication Profile mode.

Usage notes

Single-host mode

With this mode, only one supplicant may be authenticated on the port. Once that host has been authenticated, no other supplicants may be authenticated until the first supplicant's session has closed. This means, of course, that none of the other hosts downstream of the port will be able to send or receive traffic on that port.

This option is recommended when you know that there should only be one host connected to a port. By limiting the port to a single authenticated host, you guard against the consequences of someone accidentally or maliciously connecting a downstream switch to the port.

Multi-host mode

With this mode, once the first host has been authenticated on the port, all other downstream hosts are allowed without being authenticated. This is sometimes known as piggy-back mode. It is useful when the downstream switch attached to the authenticating port is an intelligent switch that can act as an authentication supplicant.

If you trust that malicious users cannot be connected to that switch but you do not know the identity of those users, then you can simply authenticate the switch and then allow its attached users to have network access. If the valid switch is

disconnected and an invalid one is connected which is not configured with the correct authentication credentials, then the devices connected to the invalid switch will be blocked from accessing the network.

Examples To set the host mode to multi-supplicant on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth host-mode multi-supplicant
```

To set the host mode to default (single host) on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth host-mode
```

To set the host mode to multi-supplicant on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth host-mode multi-supplicant
```

To set the host mode to default (single host) on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth host-mode
```

Related commands

auth log

Overview Use this command to configure the types of authentication feature log messages that are output to the log file.

Use the **no** variant of this command to remove either specified types or all types of authentication feature log messages that are output to the log file.

Syntax

```
auth log {dot1x|auth-mac|auth-web}
{success|failure|logoff|all}
```

```
no auth log {dot1x|auth-mac|auth-web}
{success|failure|logoff|all}
```

Parameter	Description
`dot1x`	Specify only 802.1X-Authentication log messages are output to the log file.
`auth-mac`	Specify only MAC-Authentication log messages are output to the log file.
`auth-web`	Specify only Web-Authentication log messages are output to the log file.
`success`	Specify only successful authentication log messages are output to the log file.
`failure`	Specify only authentication failure log messages are output to the log file.
`logoff`	Specify only authentication log-off messages are output to the log file. Note that link down, age out and expired ping polling messages will be included.
`all`	Specify all types of authentication log messages are output to the log file. Note that this is the default behavior for the authentication logging feature.

Default All types of authentication log messages are output to the log file by default.

Mode auth-web: Interface Configuration for an Eth interface, or Authentication Profile mode.
auth-mac: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.
dot1x: Interface Configuration for a a switch port; or Authentication Profile mode.

Examples To configure the logging of web authentication failures to the log file for supplicants (client devices) connected to interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth log auth-web failure
```

To configure the logging of web authentication failures to the log file for supplicants (client devices) connected to authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth log auth-web failure
```

To disable the logging of all types of authentication log messages to the log file for auth-mac supplicants (client devices) connected to authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth log auth-mac all
```

Related commands

auth profile (global)

show running-config

auth max-supplicant

Overview Use this command to set the maximum number of supplicants (client devices) that can be authenticated on the selected port. Once this value is exceeded, further supplicants will not be authenticated.

The **no** variant of this command resets the maximum supplicant number to the default.

Syntax

```
auth max-supplicant <2-1024>
no auth max-supplicant
```

Parameter	Description
<2-1024>	Limit number.

Default The max supplicant of port authentication is 1024.

Mode auth-web: Interface Configuration for an Eth interface, or Authentication Profile mode.
auth-mac: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.
dot1x: Interface Configuration for a a switch port; or Authentication Profile mode.

Examples To set the maximum number of supplicants to 10 on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth max-supplicant 10
```

To reset the maximum number of supplicants to the default value on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth max-supplicant
```

To set the maximum number of supplicants to 10 on authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth max-supplicant 10
```

To reset the maximum number of supplicants to the default value on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth max-supplicant
```

auth multi-vlan-session

Overview Use this command to enable packet forwarding on multiple VLANs for an authenticated supplicant attached to a trunked (tagged VLAN) port.

By default, AlliedWare Plus only allows packet forwarding on the VLAN that a device was authenticated on. This command enables packet forwarding to the attached device on any VLAN configured on the switchport. After the device authenticates it will have access to all VLANs configured on the switchport.

Use the **no** variant of this command to disable packet forwarding on multiple VLANs for an authenticated supplicant.

Syntax

```
auth multi-vlan-session
no auth multi-vlan-session
```

Default By default, **multi-vlan-session** is disabled.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To allow a client attached to port1.0.2 to access all VLANs configured on the AlliedWare Plus device, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode trunk
awplus(config-if)# switchport trunk allowed vlan all
awplus(config-if)# auth host-mode multi-supplicant
awplus(config-if)# auth multi-vlan-session
```

To disable **multi-vlan-session** on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth multi-vlan-session
```

Command changes Version 5.4.8-1.1: command added

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

auth priority

Overview Use this command to enable authentication priority on an interface. This sets the tri-authentication order of priority for MAC, 802.1X, and web-based authentication. If tri-authentication is not configured on the interface then this command has no effect.

You specify the authentication methods in order of priority. The first method in the list has the highest priority, the second method has the second highest priority, and the third method has the lowest priority. Any methods not specified will have the lowest priority.

Use the **no** variant of this command to disable authentication priority.

Syntax

```
auth priority {[auth-mac] [dot1x] [auth-web]}
no auth priority
```

Parameter	Description
`auth-mac`	Set MAC authentication priority.
`dot1x`	Set 802.1X authentication priority.
`auth-web`	Set web-based authentication priority.

Default Authentication priority is not set.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes Before using this command you must correctly configure tri-authentication on the interface. Tri-authentication is when multiple authentication methods (MAC, 802.1X, and/or web-based) are configured on the same interface. With tri-authentication, a supplicant is authorized to use the network as soon as they are successfully authenticated by any of the configured authentication methods.

When authentication priority is not set, once a supplicant is authenticated any future attempts to authenticate are ignored. When, however, authentication priority is set, and a higher priority authentication attempt is made by the supplicant, a new authentication process starts. The supplicant will then be authorized, or unauthorized, based on the result of this new authentication attempt.

Example

To configure 802.1X authentication to have a higher priority than MAC authentication on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth priority dot1x auth-mac
```

To disable authentication priority on interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth priority
```

To configure 802.1X authentication to have a higher priority than MAC authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth priority dot1x auth-mac
```

Related commands

Command changes

Version 5.5.0-2.1: command added

auth profile (global)

Overview Use this command to enter port authentication profile mode and configure a port authentication profile.

If the specified profile does not exist a new authentication profile is created with the name provided.

Use the **no** variant of this command to delete the specified port authentication profile.

Syntax

```
auth profile <profile-name>
no auth profile <profile-name>
```

Parameter	Description
<profile-name>	Name of the profile to create or configure.

Default No port authentication profiles are created by default.

Mode Global Configuration

Usage A port authentication profile is a configuration object that aggregates multiple port authentication commands. These profiles are attached or detached from an interface using the auth profile (interface) command.

Example To create a new authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)#
```

To delete an authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# no auth profile student
```

Related commands auth profile (interface)

description (auth-profile)

auth profile (interface)

Overview Use this command to attach a port authentication profile to the current interface.

Use the **no** variant of this command to detach a port authentication profile from the current interface.

Syntax

```
auth profile <profile-name>
no auth profile <profile-name>
```

Parameter	Description
<profile-name>	The name of the profile to attach to the current interface.

Default No profile is attached by default.

Mode auth-web: Interface Configuration for an Eth interface, or Authentication Profile mode.
auth-mac: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.
dot1x: Interface Configuration for a a switch port; or Authentication Profile mode.

Usage This command attaches an authentication profile, that was created using the auth profile (global) command, to an Eth port, a static channel, a dynamic (LACP) channel group, or a switch port.

You can only attach one profile to an interface at a time. Use the **no** variant of the command to detach a profile before attempting to attach another one.

Example To attach the authentication profile 'student' to eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth profile student
```

To detach the authentication profile 'student' from eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth profile student
```

Related commands auth profile (global)

auth reauthentication

Overview Use this command to enable reauthentication on the interface specified in the Interface mode.

Use the **no** variant of this command to disable reauthentication on the interface.

Syntax

```
auth reauthentication
no auth reauthentication
```

Default Reauthentication of port authentication is disabled by default.

Mode auth-web: Interface Configuration for an Eth interface, or Authentication Profile mode.
auth-mac: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.
dot1x: Interface Configuration for a a switch port; or Authentication Profile mode.

Examples To enable reauthentication on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth reauthentication
```

To disable reauthentication on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth reauthentication
```

To enable reauthentication on authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth reauthentication
```

auth roaming disconnected

Overview This command allows a supplicant to move to another authenticating interface without reauthentication, even if the link is down for the interface that the supplicant is currently connected to.

You must enter the auth roaming enable command on both interfaces before using this command.

The **no** variant of this command disables roaming authentication on interfaces that are link-down, and forces a supplicant to be reauthenticated when moving between interfaces.

See the AAA and Port Authentication Feature Overview and Configuration Guide for further information about this feature.

Syntax

```
auth roaming disconnected
no auth roaming disconnected
```

Default By default, the authentication status for a roaming supplicant is deleted when an interface goes down, so supplicants must reauthenticate.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes Note that 802.1X port authentication, MAC-authentication, or Web-authentication must be configured before using this feature. The port that the supplicant is moving to must have the same authentication configuration as the port the supplicant is moving from.

Examples To allow supplicants to move from port1.0.2 without reauthentication even when the link is down, when using 802.1X authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth roaming enable
awplus(config-if)# auth roaming disconnected
```

To require supplicants to reauthenticate when moving from port1.0.2 if the link is down, when using 802.1X authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth roaming disconnected
```

To allow supplicants using authentication profile 'student' to move between ports without reauthentication even when the link is down, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth roaming disconnected
```

To require supplicants using authentication profile 'student' to reauthenticate when moving between ports if the link is down, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth roaming disconnected
```

auth roaming enable

Overview Use this command to allow a supplicant to move to another authenticating interface without reauthentication, providing the link is up for the interface that the supplicant is currently connected to.

The **no** variant of this command disables roaming authentication on an interface, and forces a supplicant to be reauthenticated when moving between interfaces.

See the AAA and Port Authentication Feature Overview and Configuration Guide for further information about this feature.

Syntax

```
auth roaming enable
no auth roaming enable
```

Default Roaming authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes Note that 802.1X port authentication or MAC authentication must be configured before using this feature. The port that the supplicant is moving to must have the same authentication configuration as the port the supplicant is moving from.

This command only enables roaming authentication for links that are up. If you want roaming authentication on links that are down, you must also use the command auth roaming disconnected.

Examples To enable roaming authentication for port1.0.4, when using auth-mac authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# auth-mac enable
awplus(config-if)# auth roaming enable
```

To disable roaming authentication for port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no auth roaming enable
```

To enable roaming authentication for authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth roaming enable
```

auth supplicant-ip

Overview Use this command to add a supplicant (client device) IP address on a given interface and provides parameters for its configuration.

Use the **no** variant of this command to delete the supplicant IP address and reset other parameters to their default values. The IP address can be determined before authentication for auth-web clients only.

Syntax

```
auth supplicant-ip <ip-addr> [max-reauth-req <1-10>]
[port-control {auto|force-authorized|force-unauthorized|
skip-second-auth}] [quiet-period <1-65535>] [reauth-period
<1-4294967295>] [supp-timeout <1-65535>] [server-timeout
<1-65535>] [reauthentication]
```

```
no auth supplicant-ip <ip-addr> [reauthentication]
```

Parameter	Description
<ip-addr>	IP address of the supplicant entry in A.B.C.D/P format.
`max-reauth-req`	The number of reauthentication attempts before becoming unauthorized.
<1-10>	Count of reauthentication attempts (default 2).
`port-control`	Port control commands.
`auto`	A port control parameter that allows port clients to negotiate authentication.
`force-authorized`	A port control parameter that forces the port state to authorized.
`force-unauthorized`	A port control parameter that forces the port state to unauthorized.
`skip-second-auth`	Skip the second authentication.
`quiet-period`	Quiet period during which the port remains in the HELD state (default 60 seconds).
<1-65535>	Seconds for quiet period.
`reauth-period`	Seconds between reauthorization attempts (default 3600 seconds).
<1-4294967295>	Seconds for reauthorization attempts (reauth-period).
`supp-timeout`	Supplicant response timeout.
<1-65535>	Seconds for supplicant response timeout (default 30 seconds).
`server-timeout`	The period, in seconds, before the authentication server response times out.

Parameter	Description
<1-65535>	The server-timeout period, in seconds, default 3600 seconds.
`reauthentication`	Enable reauthentication on a port.

Default No supplicant IP address for port authentication exists by default until first created with the **auth supplicant-ip** command. The defaults for parameters applied are as shown in the table above.

Mode auth-web: Interface Configuration for an Eth interface, or Authentication Profile mode.
auth-mac: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.
dot1x: Interface Configuration for a a switch port; or Authentication Profile mode.

Examples To add the supplicant IP address 192.168.10.0/24 to force authorized port control for interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth supplicant-ip 192.168.10.0/24
port-control force-authorized
```

To delete the supplicant IP address 192.168.10.0/24 for interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth supplicant-ip 192.168.10.0/24
```

To disable reauthentication for the supplicant(s) IP address 192.168.10.0/24 for interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth supplicant-ip 192.168.10.0/24
reauthentication
```

To add the supplicant IP address 192.168.10.0/24 to force authorized port control for auth profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth supplicant-ip
192.168.10.0/24 port-control force-authorized
```

auth supplicant-mac

Overview This command adds a supplicant (client device) MAC address or MAC mask on a given interface with the parameters as specified in the table below.

Use the **no** variant of this command to delete the supplicant MAC address and reset other parameters to their default values.

Syntax

```
auth supplicant-mac <mac-addr> [mask <mac-addr-mask>]
[max-reauth-req <1-10>] [port-control {auto|force-authorized|
force-unauthorized|skip-second-auth}] [quiet-period <1-65535>]
[reauth-period <1-4294967295>] [supp-timeout <1-65535>]
[server-timeout <1-65535>] [reauthentication]
```

```
no auth supplicant-mac <mac-addr> [reauthentication]
```

Parameter	Description
<mac-addr>	MAC (hardware) address of the supplicant entry in HHHH.HHHH.HHHH MAC address hexadecimal format.
`mask`	A mask applied to MAC addresses in order to select only those addresses containing a specific string.
<mac-addr-mask>	The mask comprises a string of three (period separated) bytes, where each byte comprises four hexadecimal characters that will generally be either 1or 0. When the mask is applied to a specific MAC address, a match is only required for characters that correspond to a 1 in the mask. Characters that correspond to a 0 in the mask are effectively ignored. In the examples section below, the mask ffff.ff00.0000 is applied for the MAC address 0000.5E00.0000. The applied mask will then match only those MAC addresses that begin with 0000.5E (in this case the OUI component). The remaining portion of the addresses (in this case the NIC component) will be ignored.
`port-control`	Port control commands.
`auto`	Allow port client to negotiate authentication.
`force-authorized`	Force port state to authorized.
`force-unauthorized`	Force port state to unauthorized.
`skip-second-auth`	Skip the second authentication.
`quiet-period`	Quiet period in the HELD state (default 60 seconds).
<1-65535>	Seconds for quiet period.
`reauth-period`	Seconds between reauthorization attempts (default 3600 seconds).
<1-4294967295>	Seconds for reauthorization attempts (reauth-period).
`supp-timeout`	Supplicant response timeout (default 30 seconds).

Parameter	Description
<1-65535>	Seconds for supplicant response timeout.
`server-timeout`	Authentication server response timeout (default 30 seconds).
<1-65535>	Seconds for authentication server response timeout.
`reauthentication`	Enable reauthentication on a port.
`max-reauth-req`	No of reauthentication attempts before becoming unauthorized (default 2).
<1-10>	Count of reauthentication attempts.

Default No supplicant MAC address for port authentication exists by default until first created with the **auth supplicant-mac** command. The defaults for parameters are shown in the table above.

Mode auth-web: Interface Configuration for an Eth interface, or Authentication Profile mode.
auth-mac: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.
dot1x: Interface Configuration for a a switch port; or Authentication Profile mode.

Examples To add the supplicant MAC address 0000.5E00.5343 to force authorized port control for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth supplicant-mac 0000.5E00.5343
port-control force-authorized
```

To apply the mask ffff.ff00.0000 in order to add any supplicant MAC addresses whose MAC address begins with 0000.5E, and then to force authorized port control for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth supplicant-mac 0000.5E00.0000 mask
ffff.ff00.0000 port-control force-authorized
```

To delete the supplicant MAC address 0000.5E00.5343 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth supplicant-mac 0000.5E00.5343
```

To disable reauthentication for the supplicant MAC address 0000.5E00.5343 for interface port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth supplicant-mac 0000.5E00.5343
reauthentication
```

To add the supplicant MAC address 0000.5E00.5343 to force authorized port control for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth supplicant-mac
0000.5E00.5343 port-control force-authorized
```

To delete the supplicant MAC address 0000.5E00.5343 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth supplicant-mac
0000.5E00.5343
```

auth timeout connect-timeout

Overview Use this command to set the connect-timeout period for the interface.

Use the **no** variant of this command to reset the connect-timeout period to the default.

Syntax

```
auth timeout connect-timeout <1-65535>
no auth timeout connect-timeout
```

Parameter	Description
<1-65535>	Specifies the connect-timeout period (in seconds).

Default The connect-timeout default is 30 seconds.

Mode auth-web: Interface Configuration for an Eth interface, or Authentication Profile mode.
auth-mac: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.
dot1x: Interface Configuration for a a switch port; or Authentication Profile mode.

Usage notes This command is used for MAC and web authentication. If the connect-timeout has lapsed and the supplicant has the state **connecting**, then the supplicant is deleted. When auth-web-server session-keep or auth two-step enable is enabled, we recommend you configure a longer connect-timeout period.

Examples To set the connect-timeout period to 3600 seconds for interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth timeout connect-timeout 3600
```

To reset the connect-timeout period to the default (30 seconds) for interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth timeout connect-timeout
```

To set the connect-timeout period to 3600 seconds for authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout connect-timeout 3600
```

Related commands auth profile (global)

show dot1x interface

auth timeout quiet-period

Overview Use this command to set a time period for which another authentication request is not accepted on a given interface, after an authentication request has failed.

Use the **no** variant of this command to reset the quiet period to the default.

Syntax

```
auth timeout quiet-period <1-65535>
no auth timeout quiet-period
```

Parameter	Description
<1-65535>	Specifies the quiet period (in seconds).

Default The quiet period for port authentication is 60 seconds.

Mode auth-web: Interface Configuration for an Eth interface, or Authentication Profile mode.
auth-mac: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.
dot1x: Interface Configuration for a a switch port; or Authentication Profile mode.

Examples To set the quiet period to 10 seconds for interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth timeout quiet-period 10
```

To reset the quiet period to the default (60 seconds) for interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth timeout quiet-period
```

To set the quiet period to 10 seconds for authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout quiet-period 10
```

Related commands auth profile (global)

auth timeout reauth-period

Overview Use this command to set the timer for reauthentication on a given interface. The re-authentication for the supplicant (client device) is executed at this timeout. The timeout is only applied if the **auth reauthentication** command is applied.

Use the **no** variant of this command to reset the **reauth-period** parameter to the default (3600 seconds).

Syntax

```
auth timeout reauth-period <1-4294967295>
no auth timeout reauth-period
```

Parameter	Description
<1-4294967295>	The reauthentication timeout period (in seconds).

Default The default reauthentication period for port authentication is 3600 seconds, when reauthentication is enabled on the port.

Mode auth-web: Interface Configuration for an Eth interface, or Authentication Profile mode.
auth-mac: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.
dot1x: Interface Configuration for a a switch port; or Authentication Profile mode.

Examples To set the reauthentication period to 1 day for interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth timeout reauth-period 86400
```

To reset the reauthentication period to the default (3600 seconds) for interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth timeout reauth-period
```

To set the reauthentication period to 1 day for authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout reauth-period 86400
```

To reset the reauthentication period to the default (3600 seconds) for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth timeout reauth-period
```

auth timeout server-timeout

Overview Use this command to set the timeout for the waiting response from the RADIUS server on a given interface.

Use the **no** variant of this command to reset the server-timeout to the default (30 seconds).

Syntax

```
auth timeout server-timeout <1-65535>
no auth timeout server-timeout
```

Parameter	Description
<1-65535>	Server timeout period (in seconds).

Default The server timeout for port authentication is 30 seconds.

Mode auth-web: Interface Configuration for an Eth interface, or Authentication Profile mode.
auth-mac: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.
dot1x: Interface Configuration for a a switch port; or Authentication Profile mode.

Examples To set the server timeout to 120 seconds for interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth timeout server-timeout 120
```

To set the server timeout to the default (30 seconds) for interface `eth1`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth timeout server-timeout
```

To set the server timeout to 120 seconds for authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout server-timeout 120
```

To set the server timeout to the default (30 seconds) for authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth timeout server-timeout
```

auth timeout supp-timeout

Overview This command sets the timeout of the waiting response from the supplicant (client device) on a given interface.

The **no** variant of this command resets the supplicant timeout to the default (30 seconds).

Syntax

```
auth timeout supp-timeout <1-65535>
no auth timeout supp-timeout
```

Parameter	Description
<1-65535>	The supplicant timeout period (in seconds).

Default The supplicant timeout for port authentication is 30 seconds.

Mode auth-web: Interface Configuration for an Eth interface, or Authentication Profile mode.
auth-mac: Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.
dot1x: Interface Configuration for a a switch port; or Authentication Profile mode.

Examples To set the supplicant timeout to 2 seconds for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth timeout supp-timeout 2
```

To reset the supplicant timeout to the default (30 seconds) for interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth timeout supp-timeout
```

To set the supplicant timeout to 2 seconds for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth timeout supp-timeout 2
```

Related commands

auth profile (global)

show dot1x

show dot1x interface

show running-config

auth two-step enable

Overview Use this command to enable a two-step authentication feature on an interface. When this feature is enabled, the supplicant is authorized in a two-step process. If authentication succeeds, the supplicant becomes authenticated.

Use this command to apply the two-step authentication method based on 802.1X or MAC authentication.

Use the **no** variant of this command to disable the two-step authentication feature.

Syntax

```
auth two-step enable
no auth two-step enable
```

Default Two step authentication is disabled by default.

Mode Interface Configuration for a switch port; or Authentication Profile mode.

Usage The single step authentication methods (either user or device authentication) have a potential security risk:

- an unauthorized user can access the network with an authorized device, or
- an authorized user can access the network with an unauthorized device.

Two-step authentication solves this problem by authenticating both the user and the device. The supplicant will only become authenticated if both these steps are successful. If the first authentication step fails, then the second step is not started.

Examples To enable the two step authentication feature, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth two-step enable
```

To disable the two step authentication feature, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth two-step enable
```

To enable MAC authentication followed by 802.1X authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth dynamic-vlan-creation
awplus(config-if)# auth two-step enable
```

To enable the two step authentication feature for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth two-step enable
```

Command changes

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

auth two-step order

Overview Use this command to configure the order for two-step authentication. Two-step authentication and the relevant authentication methods must be enabled on the interface.

Use the **no** variant of this command to reset the authentication order to the default.

Syntax

```
auth two-step order auth-mac dot1x
auth two-step order dot1x auth-mac
no auth two-step order
```

Parameter	Description
auth-mac	MAC authentication
dot1x	802.1X authentication

Default Order is determined by the authentication methods configured on the interface (see **Usage notes**).

Mode Interface Configuration for a switch port; or Authentication Profile mode.

Usage notes The default authentication order depends on the combination of the authentication methods configured on the interface:

- If auth-mac is configured then auth-mac will be the first method.
- If auth-mac is **not** configured then dot1x will become the first method.

Examples To set the two-step authentication order on port1.0.1 for 802.1X authentication and then MAC authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport mode access
awplus(config-if)# auth-mac enable
awplus(config-if)# dot1x port-control auto
awplus(config-if)# auth two-step enable
awplus(config-if)# auth two-step order dot1x auth-mac
```

To reset the two-step authentication order back to the default, which would be MAC authentication then 802.1X authentication if configured as above, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no auth two-step order
```

Command changes

Version 5.5.0-0.3: command added

auth-mac accounting

Overview Use this command to override the **default** RADIUS accounting method for MAC-based authentication on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

Syntax

```
auth-mac accounting {default|<list-name>}
no auth-mac accounting
```

Parameter	Description
`default`	Apply the default accounting method list
<list-name>	Apply the user-defined named list

Default The **default** method list is applied to an interface by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To apply the named list 'vlan10_acct' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-mac accounting vlan10_acct
```

To remove the named list from the vlan10 interface and set the accounting method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-mac accounting
```

Related commands aaa accounting auth-mac

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

auth-mac authentication

Overview This command overrides the **default** MAC authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the **default** method.

Syntax

```
auth-mac authentication {default|<list-name>}
no auth-mac authentication
```

Parameter	Description
`default`	Apply the default authentication method list
<list-name>	Apply a user-defined named list

Default The **default** method list is applied to an interface by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Example To apply the named list 'vlan10_auth' on the vlan10 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# auth-mac authentication vlan10_auth
```

To remove the named list from the vlan10 interface and set the authentication method back to **default**, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no auth-mac authentication
```

Related commands aaa authentication auth-mac

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

auth-mac enable

Overview This command enables MAC authentication on the interface specified in the Interface command mode.

Use the **no** variant of this command to disable MAC authentication on an interface.

Syntax

```
auth-mac enable
no auth-mac enable
```

Default MAC-Authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Usage notes Enabling **spanning-tree edgeport** on ports after enabling MAC authentication avoids unnecessary re-authentication when the port state changes, which does not happen when spanning tree edgeport is enabled. Note that re-authentication is correct behavior without **spanning-tree edgeport** enabled.

Applying **switchport mode access** on ports is also good practice to set the ports to access mode with ingress filtering turned on, whenever ports for MAC authentication are in a VLAN.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be
removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

Examples To enable MAC authentication on interface port1.0.2 and enable spanning tree edgeport to avoid unnecessary re-authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac enable
awplus(config-if)# spanning-tree edgeport
awplus(config-if)# switchport mode access
```

To disable MAC authentication on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac enable
```

To enable MAC authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac enable
```

Related commands

Command changes

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

auth-mac method

Overview This command sets the type of authentication method for MAC authentication that is used with RADIUS on the interface specified in the interface command mode.

The **no** variant of this command resets the authentication method used to the default method (PAP) as the RADIUS authentication method used by the MAC authentication.

Syntax

```
auth-mac method [eap-md5|pap]
no auth-mac method
```

Parameter	Description
eap-md5	Enable EAP-MD5 as the authentication method.
pap	Enable PAP as the authentication method.

Default The MAC authentication method is PAP.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To set the MAC authentication method to PAP on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac method pap
```

To set the MAC authentication method to the default on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac method
```

To set the MAC authentication method to EAP-MD5 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac method eap-md5
```

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

auth-mac password

Overview This command changes the password for MAC-based authentication.

Use the **no** variant of this command to return the password to its default.

Syntax

```
auth-mac [encrypted] password <password>
no auth-mac password
```

Parameter	Description
`auth-mac`	MAC-based authentication
`encrypted`	Specify an encrypted password
`password`	Configure the password
<password>	The new password. Passwords can be up to 64 characters in length and can contain any printable characters except: • ? • " (double quotes) • space

Default By default, the password is the MAC address of the supplicant.

Mode Global Configuration

Usage notes Changing the password increases the security of MAC-based authentication, because the default password is easy for an attacker to discover. This is particularly important if:

- some MAC-based supplicants on the network are intelligent devices, such as computers.

Examples To change the password to verySecurePassword, use the commands:

```
awplus# configure terminal
awplus(config)# auth-mac password verySecurePassword
```

Related commands show auth

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

auth-mac reauth-relearning

Overview This command sets the MAC address learning of the supplicant (client device) to re-learning for re-authentication on the interface specified in the interface command mode.

Use the **no** variant of this command to disable the auth-mac re-learning option.

Syntax

```
auth-mac reauth-relearning
no auth-mac reauth-relearning
```

Default Re-learning for port authentication is disabled by default.

Mode Interface Configuration for a static channel, a dynamic (LACP) channel group, or a switch port; or Authentication Profile mode.

Examples To enable the re-authentication re-learning feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# auth-mac reauth-relearning
```

To disable the re-authentication re-learning feature on interface port1.0.2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no auth-mac reauth-relearning
```

To enable the re-authentication re-learning feature on authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-mac reauth-relearning
```

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

auth-mac static

Overview This command configures MAC authentication to use static entries in the FDB. Static entries persist in the FDB, even if there is no traffic flow from the supplicant.

When static FDB entries are configured, the auth roaming disconnected command is supported for MAC authentication. This command allows a supplicant to move to another authenticating interface without re-authentication.

Use the **no** variant of this command to revert to dynamic FDB entries.

Syntax

```
auth-mac static
no auth-mac static
```

Default By default MAC authentication supplicants are added to the FDB dynamically.

Mode Global Configuration

Example To configure MAC authentication to use static FDB entries, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-mac static
```

To configure MAC authentication to use dynamic FDB entries, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-mac static
```

auth-mac username

Overview Use this command to specify the format of the MAC address in the username and password field when a request for MAC-based authorization is sent to a RADIUS server.

Syntax

```
auth-mac username {ietf|unformatted} {lower-case|upper-case}
```

Parameter	Description
`ietf`	The MAC address includes a hyphen between each 2 bytes. (Example: xx-xx-xx-xx-xx-xx)
`unformatted`	The MAC address does not include hyphens. (Example: xxxxxxxxxxxx)
`lower-case`	The MAC address uses lower-case characters (a-f)
`upper-case`	The MAC address uses upper-case characters (A-F)

Default

```
auth-mac username ietf lower-case
```

Mode Global Configuration

Usage This command is provided to allow other vendors', AlliedWare, and AlliedWare Plus switches to share the same format on the RADIUS server.

Example To configure the format of the MAC address in the username and password field to be changed to IETF and upper-case, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-mac username ietf upper-case
```

Related commands auth-mac username

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

auth-web accounting

Overview This command overrides the default RADIUS accounting method for web-based authentication on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the default method.

Syntax

```
auth-web accounting {default|<list-name>}
no auth-web accounting
```

Parameter	Description
`default`	Apply the default accounting method list
`<list-name>`	Apply a named accounting method list

Default The **default** method list is applied to an interface by default.

Mode Interface Configuration for an Eth interface, or Authentication Profile mode.

Example To apply the named list 'example_acct' on the eth1 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web accounting example_acct
```

To remove the named list from the eth1 interface and set the accounting method back to default, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web accounting
```

Related commands aaa accounting auth-web

auth-web authentication

Overview Use this command to override the default web-based authentication method on an interface by allowing you to apply a user-defined named list.

Use the **no** variant of this command to remove the named list from the interface and apply the default method.

Syntax

```
auth-web authentication {default|<list-name>}
no auth-web authentication
```

Parameter	Description
`default`	Apply the default authentication method list
`<list-name>`	Apply the user-defined named list

Default The **default** method list is applied to an interface by default.

Mode Interface Configuration for an Eth interface, or Authentication Profile mode.

Example To apply the named list 'example_auth' on the eth1 interface, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web authentication example_auth
```

To remove the named list from the eth1 interface and set the authentication method back to default, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web authentication
```

Related commands aaa authentication auth-web

auth-web enable

Overview Use this command to enable web-based authentication in Interface mode on the interface specified.

Use the **no** variant of this command to apply its default.

Syntax

```
auth-web enable
```

```
no auth-web enable
```

Default Web authentication is disabled by default.

Mode Interface Configuration for an Eth interface, or Authentication Profile mode.

Usage notes You need to configure an IPv4 address for the Ethernet interface on which Web Authentication is running.

When the **protect (firewall)** command and the **web-auth enable** command are both configured, you need to configure a firewall rule to allow Auth-web traffic to pass through the firewall. Web-auth uses TCP ports 8081, 8082, 8083 and 8084. You can create a firewall rule like the following example:

```
!
application auth-apl
protocol tcp
dport 8081 to 8084
!
!
firewall
  rule 65 permit auth-apl from private.supplicant to
private.supplicant.router
!
```

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be
removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

Examples To enable web authentication on eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web enable
```

To disable web authentication on eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web enable
```

To enable web authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web enable
```

To disable web authentication on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web enable
```

auth-web forward

Overview Use this command to enable the web authentication packet forwarding feature on the interface specified. This command also enables ARP forwarding, and adds forwarded packets to the **tcp** or **udp** port number specified.

Use the **no** variant of this command to disable the specified packet forwarding feature on the interface.

Syntax

```
auth-web forward [<ip-address>|<ip-address/prefix-length>]
{dns|tcp <1-65535>|udp <1-65535>}
```

or

```
auth-web forward {arp|dhcp|dns|tcp <1-65535>|udp <1-65535>}
```

The **no** variants of this command are:

```
no auth-web forward [<ip-address>|<ip-address/prefix-length>]
{dns|tcp <1-65535>|udp <1-65535>}
```

or

```
no auth-web forward {arp|dhcp|dns|tcp <1-65535>|udp <1-65535>}
```

Parameter	Description
<ip-address> *<ip-address/prefix-length>*	The IP address or subnet on which the web authentication is to be enabled.
`arp`	Enable forwarding of ARP.
`dhcp`	Enable forwarding of DHCP (67/udp).
`dns`	Enable forwarding of DNS (53/udp).
`tcp`	Enable forwarding of TCP specified port number.
`<1-65535>`	TCP Port number.
`udp`	Enable forwarding of UDP specified port number.
`<1-65535>`	UDP Port number.

Default Packet forwarding for port authentication is enabled by default for “arp”, “dhcp” and “dns”.

Mode Interface Configuration for an Eth interface, or Authentication Profile mode.

Usage notes For more information about the *<ip-address>* parameter, and an example, see the “auth-web forward” section in the Alliedware Plus Technical Tips and Tricks.

Examples To enable the ARP forwarding feature on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web forward arp
```

To add TCP forwarding port 137 on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web forward tcp 137
```

To disable the ARP forwarding feature on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web forward arp
```

To delete TCP forwarding port 137 on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web forward tcp 137
```

To delete all TCP forwarding on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web forward tcp
```

To enable the ARP forwarding feature on authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web forward arp
```

To add TCP forwarding port 137 on authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web forward tcp 137
```

To disable the ARP forwarding feature on authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward arp
```

To delete TCP forwarding port 137 on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward tcp 137
```

To delete all TCP forwarding on authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web forward tcp
```

show auth interface

auth-web idle-timeout enable

Overview Use this command to enable the idle-timeout for client of web authentication on the interface.

The **no** variant of this command to disable the idle-timeout for client of web authentication on the interface.

Syntax

```
auth-web idle-timeout enable
no auth-web idle-timeout enable
```

Default The idle-timeout is disabled by default.

Mode Interface Configuration for an Eth interface, or Authentication Profile mode.

Example To enable the idle-timeout on an interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config)# auth-web enable
awplus(config-if)# auth-web idle-timeout enable
```

To disable the idle-timeout on an interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web idle-timeout enable
```

Related commands auth-web enable

auth-web idle-timeout timeout

auth-web idle-timeout timeout

Overview Use this command to set the timeout value for web authentication client in seconds. The client will be unauthorized when it does not have any activity for a period that exceeds the timeout value.

The **no** variant of this command sets the timeout value to the default setting, 3600 seconds.

Syntax

```
auth-web idle-timeout timeout <420-86400>
no auth-web idle-timeout timeout
```

Parameter	Description
<420-86400>	Time in seconds.

Default The timeout is 3600 seconds by default.

Mode Interface Configuration for an Eth interface, or Authentication Profile mode.

Example To set 30 minutes as the idle-timeout, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web idle-timeout timeout 1800
```

To return the idle-timeout to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web idle-timeout timeout
```

Related commands auth-web enable

auth-web idle-timeout enable

auth-web max-auth-fail

Overview Use this command to set the number of authentication failures allowed before rejecting further authentication requests. When the supplicant (client device) fails more than the specified number of times, then login requests are refused during the quiet period.

Use the **no** variant of this command to reset the maximum number of authentication failures to the default.

Syntax

```
auth-web max-auth-fail <0-10>
no auth-web max-auth-fail
```

Parameter	Description
<0-10>	The maximum number of authentication failures allowed before login requests are refused.

Default The maximum number of authentication failures is set to 3.

Mode Interface Configuration for an Eth interface, or Authentication Profile mode.

Examples To set the lock count to 5 on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web max-auth-fail 5
```

To set the lock count to the default on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no auth-web max-auth-fail
```

To set the lock count to 5 on authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web max-auth-fail 5
```

To set the lock count to the default on authentication profile ‘student’, use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no auth-web max-auth-fail
```

auth-web method

Overview Use this command to set the web authentication access method that is used with RADIUS on the interface specified.

Use the **no** variant of this command to set the authentication method to PAP for the interface specified when web authentication is also used with the RADIUS authentication method.

Syntax

```
auth-web method {eap-md5|pap}
no auth-web method
```

Parameter	Description
`eap-md5`	Enable EAP-MD5 as the authentication method.
`pap`	Enable PAP as the authentication method.

Default The web authentication method is set to PAP by default.

Mode Interface Configuration for an Eth interface, or Authentication Profile mode.

Example To set the web authentication method to EAP-MD5 on interface eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# auth-web method eap-md5
```

To set the web authentication method to EAP-MD5 for authentication profile 'student', use the commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# auth-web method eap-md5
```

Related commands

auth-web-server dhcp ipaddress

Overview Use this command to assign an IP address and enable the DHCP service on the Web-Authentication server for supplicants (client devices).

Use the **no** variant of this command to remove an IP address and disable the DHCP service on the Web-Authentication server for supplicants.

Syntax

```
auth-web-server dhcp ipaddress <ip-address/prefix-length>
no auth-web-server dhcp ipaddress
```

Parameter	Description
<ip-addr/prefix-length>	The IPv4 address and prefix length assigned for the DHCP service on the Web-Authentication server for supplicants.

Default No IP address for the Web-Authentication server is set by default.

Mode Global Configuration

Usage notes See the AAA and Port Authentication Feature Overview and Configuration Guide for information about:

- using DHCP with web authentication, and
- restrictions regarding combinations of authentication enhancements working together

You cannot use the IPv4 address assigned to the device's interface as the Web-Authentication server address.

Examples To assign the IP address 10.0.0.1 to the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp ipaddress 10.0.0.1/8
```

To remove an IP address on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server dhcp ipaddress
```

Related commands auth-web-server dhcp lease

show auth-web-server

show running-config

auth-web-server dhcp lease

Overview Use this command to set the DHCP lease time for supplicants (client devices) using the DHCP service on the Web-Authentication server.

Use the **no** variant of this command to reset to the default DHCP lease time for supplicants using the DHCP service on the Web-Authentication server.

Syntax

```
auth-web-server dhcp lease <20-60>
no auth-web-server dhcp lease
```

Parameter	Description
<20-60>	DHCP lease time for supplicants using the DHCP service on the Web-Authentication server in seconds.

Default The default DHCP lease time for supplicants using the DHCP service on the Web-Authentication server is set to 30 seconds.

Mode Global Configuration

Usage notes See the AAA and Port Authentication Feature Overview and Configuration Guide for information about:

- using DHCP with web authentication, and
- restrictions regarding combinations of authentication enhancements working together

Examples To set the DHCP lease time to 1 minute for supplicants using the DHCP service on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp lease 60
```

To reset the DHCP lease time to the default setting (30 seconds) for supplicants using the DHCP service on the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server dhcp lease
```

Validation Commands show running-config

Related commands show auth-web-server

auth-web-server dhcp ipaddress

auth-web-server dhcp-wpad-option

Overview This command sets the DHCP WPAD (Web Proxy Auto-Discovery) option for the Web-Authentication temporary DHCP service.

For more information and examples, see the "Web Auth Proxy" section in the Alliedware Plus Technical Tips and Tricks.

Use the **no** variant of this command to disable the DHCP WPAD function.

Syntax

```
auth-web-server dhcp wpad-option <url>
no auth-web-server dhcp wpad-option
```

Parameter	Description
<url>	URL to the server which gets a .pac file.

Default The Web-Authentication server DHCP WPAD option is not set.

Mode Global Configuration

Usage notes If the supplicant is configured to use WPAD, the supplicant's web browser will use TCP port 80 as usual. Therefore, the packet can be intercepted by Web-Authentication as normal, and the Web-Authentication Login page can be sent. However, after authentication, the browser does not know where to get the WPAD file and so cannot access external web pages. The WPAD file is usually named proxy.pac file and tells the browser what web proxy to use.

Use this command to tell the supplicant where it can get this file from. The switch itself can be specified as the source for this file, and it can deliver it to the supplicant on request.

Example To specify that the proxy.pac file is found on the server at 192.168.1.100, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server dhcp wpad-option
http://192.168.1.100/proxy/proxy.pac
```

Related commands show auth-web-server

auth-web-server host-name

Overview This command assigns a hostname to the web authentication server.

Use the **no** variant of this command to remove the hostname from the web authentication server.

Syntax

```
auth-web-server host-name <hostname>
no auth-web-server host-name
```

Parameter	Description
<hostname>	URL string of the hostname

Default The web authentication server has no hostname.

Mode Global Configuration

Usage notes When the web authentication server uses HTTPS protocol, the web browser will validate the certificate. If the certificate is invalid, the web page gives a warning message before displaying server content. However, the web page will not give warning message if the server has a hostname same as the one stored in the installed certificate.

Examples To set the auth.example.com as the hostname of the web authentication server, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server host-name auth.example.com
```

To remove hostname auth.example.com from the web authentication server, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server host-name
```

Related commands aaa authentication auth-web

auth-web enable

auth-web-server intercept-port

Overview This command specifies any additional TCP port numbers that the Web-Authentication server is to intercept.

Use the **no** variant of this command to stop intercepting the TCP port numbers.

Syntax

```
auth-web-server intercept-port {<1-65535>|any}
no auth-web-server intercept-port {<1-65535>|any}
```

Parameter	Description
<1-65535>	TCP port number.
any	Intercept all TCP packets

Default No additional TCP port numbers are intercepted by default.

Mode Global Configuration

Usage notes If this command is not specified, AlliedWare Plus Web-Authentication intercepts the supplicant's initial TCP port 80 connection to a web page and sends it the Web-Authentication Login page. However, if the supplicant is configured to use a web proxy, then it will usually be using TCP port 8080 (or another user configured port number). In this case Web-Authentication cannot intercept the connection.

To overcome this limitation you can use this command to tell the switch which additional port it should intercept, and then send the Web-Authentication Login page to the supplicant.

When the web authentication switch is in a guest network, the switch does not know the proxy server's port number in the supplicant's proxy setting. To overcome this limitation, you can use the **any** option in this command to intercept all TCP packets.

When you use this command in conjunction with a proxy server configured in the web browser, you must add the proxy server's network as a 'No Proxy' network. You can specify 'No Proxy' networks in the proxy settings in your web browser. For more information, see the "Web Auth Proxy" section in the Alliedware Plus Technical Tips and Tricks.

Example To additionally intercept port number 3128, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server intercept-port 3128
```

Related commands show auth-web-server

auth-web-server ipaddress

Overview This command sets the IP address for the Web-Authentication server.

Use the **no** variant of this command to delete the IP address for the Web-Authentication server.

You cannot use the IPv4 address assigned to the device's interface as the Web-Authentication server address.

Syntax

```
auth-web-server ipaddress <ip-address>
no auth-web-server ipaddress
```

Parameter	Description
<ip-address>	Web-Authentication server dotted decimal IP address in A.B.C.D format.

Default The Web-Authentication server address on the system is not set by default.

Mode Global Configuration

Examples To set the IP address `10.0.0.1` to the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ipaddress 10.0.0.1
```

To delete the IP address from the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ipaddress
```

Validation Commands

show auth

show auth-web-server

show running-config

auth-web-server page language

Overview Use this command to set the presentation language of Web authentication pages. Titles and subtitles of Web authentication pages will be set accordingly. Note that presently only English or Japanese are offered.

Use the **no** variant of this command to set the presentation language of Web authentication pages to its default (English).

Syntax

```
auth-web-server page language {english|japanese}
no auth-web-server page language
```

Parameter	Description
english	Web authentication pages are presented in English.
japanese	Web authentication pages are presented in Japanese.

Default Web authentication pages are presented in English by default.

Mode Global Configuration

Examples To set Japanese as the presentation language of Web authentication pages, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page language japanese
```

To set English as the presentation language of Web authentication pages, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page language english
```

To unset the presentation language of Web authentication pages and use English as the default presentation language, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page language
```

Related commands

auth-web-server page title

auth-web-server page sub-title

show auth-web-server page

auth-web-server login-url

Overview This command sets the web-authentication login page URL. This lets you replace the login page with your own page. See "Customising the Login Page" in the AAA and Port Authentication Feature Overview and Configuration Guide for details.

Use the **no** variant of this command to delete the URL.

Syntax

```
auth-web-server login-url <URL>
no auth-web-server login-url
```

Parameter	Description
<URL>	Set login page URL

Default The built-in login page is set by default.

Mode Global Configuration

Examples To set http://example.com/login.html as the login page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server login-url
http://example.com/login.html
```

To unset the login page URL, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server login-url
```

Related commands show running-config

auth-web-server page logo

Overview This command sets the type of logo that will be displayed on the web authentication page.

Use the **no** variant of this command to set the logo type to **auto**.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See "Customising the Login Page" in the AAA and Port Authentication Feature Overview and Configuration Guide.

Syntax

```
auth-web-server page logo {auto|default|hidden}
no auth-web-server page logo
```

Parameter	Description
`auto`	Display the custom logo if installed; otherwise display the default logo
`default`	Display the default logo
`hidden`	Hide the logo

Default Logo type is **auto** by default.

Mode Global Configuration

Examples To display the default logo with ignoring installed custom logo, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page logo default
```

To set back to the default logo type **auto**, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page logo
```

Validation Commands show auth-web-server page

auth-web-server page sub-title

Overview This command sets the custom sub-title on the web authentication page.

Use the **no** variant of this command to reset the sub-title to its default.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See "Customising the Login Page" in the AAA and Port Authentication Feature Overview and Configuration Guide.

Syntax

```
auth-web-server page sub-title {hidden|text <sub-title>}
no auth-web-server page sub-title
```

Parameter	Description
`hidden`	Hide the sub-title
<sub-title>	Text string of the sub-title

Default "Allied-Telesis" is displayed by default.

Mode Global Configuration

Examples To set the custom sub-title, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page sub-title text Web
Authentication
```

To hide the sub-title, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page sub-title hidden
```

To change back to the default title, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page sub-title
```

Validation Commands show auth-web-server page

auth-web-server page success-message

Overview This command sets the success message on the web-authentication page.

Use the **no** variant of this command to remove the success message.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See "Customising the Login Page" in the AAA and Port Authentication Feature Overview and Configuration Guide.

Syntax

```
auth-web-server page success-message text <success-message>
no auth-web-server page success-message
```

Parameter	Description
<success-message>	Text string of the success message

Default No success message is set by default.

Mode Global Configuration

Examples To set the success message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page success-message text Your success message
```

To unset the success message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page success-message
```

Validation Commands show auth-web-server page

auth-web-server page title

Overview This command sets the custom title on the web authentication page.

Use the **no** variant of this command to remove the custom title.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See "Customising the Login Page" in the AAA and Port Authentication Feature Overview and Configuration Guide.

Syntax

```
auth-web-server page title {hidden|text <title>}
no auth-web-server page title
```

Parameter	Description
`hidden`	Hide the title
<title>	Text string of the title

Default "Web Access Authentication Gateway" is displayed by default.

Mode Global Configuration

Examples To set the custom title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page title text Login
```

To hide the title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page title hidden
```

To unset the custom title on the web authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page title
```

Validation Commands show auth-web-server page

auth-web-server page welcome-message

Overview This command sets the welcome message on the web-authentication login page.

Use the **no** variant of this command to remove the welcome message.

Note that if you need to customize the login page extensively, you can instead replace it with your own page. See "Customising the Login Page" in the AAA and Port Authentication Feature Overview and Configuration Guide.

Syntax

```
auth-web-server page welcome-message text <welcome-message>
no auth-web-server page welcome-message
```

Parameter	Description
<welcome-message>	Text string of the welcome message

Default No welcome message is set by default.

Mode Global Configuration

Examples To set the welcome message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server page welcome-message text Your welcome message
```

To remove the welcome message on the web-authentication page, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server page welcome-message
```

Validation Commands show auth-web-server page

auth-web-server ping-poll enable

Overview This command enables the ping polling to the supplicant (client device) that is authenticated by Web-Authentication.

The **no** variant of this command disables the ping polling to the supplicant that is authenticated by Web-Authentication.

Syntax

```
auth-web-server ping-poll enable
no auth-web-server ping-poll enable
```

Default The ping polling feature for Web-Authentication is disabled by default.

Mode Global Configuration

Examples To enable the ping polling feature for Web-Authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll enable
```

To disable the ping polling feature for Web-Authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll enable
```

Validation Commands

show auth

show auth-web-server

show running-config

auth-web-server ping-poll failcount

Overview This command sets a fail count for the ping polling feature when used with Web-Authentication. The **failcount** parameter specifies the number of unanswered pings. A supplicant (client device) is logged off when the number of unanswered pings are greater than the failcount set with this command.

Use the **no** variant of this command to resets the fail count for the ping polling feature to the default (5 pings).

Syntax

```
auth-web-server ping-poll failcount <1-100>
no auth-web-server ping-poll failcount
```

Parameter	Description
<1-100>	Count.

Default The default failcount for ping polling is 5 pings.

Mode Global Configuration

Examples To set the failcount of ping polling to 10 pings, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll failcount 10
```

To set the failcount of ping polling to default, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll failcount
```

Validation Commands show auth

show auth-web-server

show running-config

auth-web-server ping-poll interval

Overview This command is used to change the ping poll interval. The interval specifies the time period between pings when the supplicant (client device) is reachable.

Use the **no** variant of this command to reset to the default period for ping polling (30 seconds).

Syntax

```
auth-web-server ping-poll interval <1-65535>
no auth-web-server ping-poll interval
```

Parameter	Description
<1-65535>	Seconds.

Default The interval for ping polling is 30 seconds by default.

Mode Global Configuration

Examples To set the interval of ping polling to 60 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll interval 60
```

To set the interval of ping polling to the default (30 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll interval
```

Validation Commands

show auth

show auth-web-server

show running-config

auth-web-server ping-poll reauth-timer-refresh

Overview This command modifies the **reauth-timer-refresh** parameter for the Web-Authentication feature. The **reauth-timer-refresh** parameter specifies whether a re-authentication timer is reset and when the response from a supplicant (a client device) is received.

Use the **no** variant of this command to reset the **reauth-timer-refresh** parameter to the default setting (disabled).

Syntax

```
auth-web-server ping-poll reauth-timer-refresh
no auth-web-server ping-poll reauth-timer-refresh
```

Default The `reauth-timer-refresh` parameter is disabled by default.

Mode Global Configuration

Examples To enable the `reauth-timer-refresh` timer, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll reauth-timer-refresh
```

To disable the `reauth-timer-refresh` timer, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll
reauth-timer-refresh
```

Validation Commands

show auth

show auth-web-server

show running-config

auth-web-server ping-poll timeout

Overview This command modifies the ping poll **timeout** parameter for the Web-Authentication feature. The **timeout** parameter specifies the time in seconds to wait for a response to a ping packet.

Use the **no** variant of this command to reset the timeout of ping polling to the default (1 second).

Syntax

```
auth-web-server ping-poll timeout <1-30>
no auth-web-server ping-poll timeout
```

Parameter	Description
<1-30>	Seconds.

Default The default timeout for ping polling is 1 second.

Mode Global Configuration

Examples To set the timeout of ping polling to 2 seconds, use the command:

```
awplus# configure terminal
awplus(config)# auth-web-server ping-poll timeout 2
```

To set the timeout of ping polling to the default (1 second), use the command:

```
awplus# configure terminal
awplus(config)# no auth-web-server ping-poll timeout
```

Validation Commands show auth

show auth-web-server

show running-config

auth-web-server port

Overview This command sets the HTTP port number for the Web-Authentication server.

Use the **no** variant of this command to reset the HTTP port number to the default (80).

Syntax

```
auth-web-server port <port-number>
no auth-web-server port
```

Parameter	Description
<port-number>	Set the local Web-Authentication server port within the TCP port number range 1 to 65535.

Default The Web-Authentication server HTTP port number is set to 80 by default.

Mode Global Configuration

Examples To set the HTTP port number 8080 for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server port 8080
```

To reset to the default HTTP port number 80 for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server port
```

Validation Commands

show auth

show auth-web-server

show running-config

auth-web-server redirect-delay-time

Overview Use this command to set the delay time in seconds before redirecting the supplicant to a specified URL when the supplicant is authorized.

Use the variant **no** to reset the delay time set previously.

Syntax

```
auth-web-server redirect-delay-time <5-60>
no auth-web-server redirect-delay-time
```

Parameter	Description
`redirect-delay-time`	Set the delay time before jumping to a specified URL after the supplicant is authorized.
<5-60>	The time in seconds.

Default The default redirect delay time is 5 seconds.

Mode Global Configuration

Examples To set the delay time to 60 seconds for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server redirect-delay-time 60
```

To reset the delay time, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server redirect-delay-time
```

Related commands auth-web-server redirect-url

show auth-web-server

show running-config

auth-web-server redirect-url

Overview This command sets a URL for supplicant (client device) authentication. When a supplicant is authorized it will be automatically redirected to the specified URL. Note that if the http redirect feature is used then this command is ignored.

Use the **no** variant of this command to delete the URL string set previously.

Syntax

```
auth-web-server redirect-url <url>
no auth-web-server redirect-url
```

Parameter	Description
<url>	URL (hostname or dotted IP notation).

Default The redirect URL for the Web-Authentication server feature is not set by default (null).

Mode Global Configuration

Examples To enable and set redirect a URL string www.alliedtelesis.com for the Web-Authentication server, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server redirect-url
http://www.alliedtelesis.com
```

To delete a redirect URL string, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server redirect-url
```

Related commands

auth-web-server redirect-delay-time

show auth

show auth-web-server

show running-config

auth-web-server session-keep

Overview This command enables the session-keep feature to jump to the original URL after being authorized by Web-Authentication.

Use the **no** variant of this command to disable the session keep feature.

Syntax
```
auth-web-server session-keep
no auth-web-server session-keep
```

Default The session-keep feature is disabled by default.

Mode Global Configuration

Usage notes This function doesn't ensure to keep session information in all cases. Authenticated supplicant may be redirected to unexpected page when session-keep is enabled. This issue occurred by supplicant sending HTTP packets automatically after authentication page is displayed and the URL is written.

Examples To enable the session-keep feature, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server session-keep
```

To disable the session-keep feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server session-keep
```

Validation Commands

show auth

show auth-web-server

show running-config

auth-web-server ssl

Overview This command enables HTTPS functionality for the Web-Authentication server feature.

Use the **no** variant of this command to disable HTTPS functionality for the Web-Authentication server.

Syntax

```
auth-web-server ssl
no auth-web-server ssl
```

Default HTTPS functionality for the Web-Authentication server feature is disabled by default.

Mode Global Configuration

Examples To enable HTTPS functionality for the Web-Authentication server feature, use the following commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ssl
```

To disable HTTPS functionality for the Web-Authentication server feature, use the following commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ssl
```

Validation Commands show auth

show auth-web-server

show running-config

auth-web-server ssl intercept-port

Overview Use this command to register HTTPS intercept port numbers when the HTTPS server uses custom port number (not TCP port number 443).

Note that you need to use the **auth-web-server intercept-port** command to register HTTP intercept port numbers.

Use the **no** variant of this command to delete registered port number.

Syntax

```
auth-web-server ssl intercept-port <1-65535>
no auth-web-server ssl intercept-port <1-65535>
```

Parameter	Description
<1-65535>	TCP port number in the range from 1 through 65535

Default 443/TCP is registered by default.

Mode Global Configuration

Examples To register HTTPS port number 3128, use the commands:

```
awplus# configure terminal
awplus(config)# auth-web-server ssl intercept-port 3128
```

To delete HTTPS port number 3128, use the commands:

```
awplus# configure terminal
awplus(config)# no auth-web-server ssl intercept-port 3128
```

Validation Commands show auth-web-server

Related commands auth-web-server intercept-port

copy proxy-autoconfig-file

Overview Use this command to download the proxy auto configuration (PAC) file to your switch. The Web-Authentication supplicant can get the downloaded file from the system web server.

Syntax

```
copy <filename> proxy-autoconfig-file
```

Parameter	Description
<filename>	The URL of the PAC file.

Mode Privileged Exec

Example To download the PAC file to this device, use the command:

```
awplus# copy tftp://server/proxy.pac proxy-autoconfig-file
```

Related commands

show proxy-autoconfig-file

erase proxy-autoconfig-file

copy web-auth-https-file

Overview Use this command to download the SSL server certificate for web-based authentication. The file must be in PEM (Privacy Enhanced Mail) format, and contain the private key and the server certificate.

Syntax

```
copy <filename> web-auth-https-file
```

Parameter	Description
<filename>	The URL of the server certificate file.

Mode Privileged Exec

Example To download the server certificate file `veriSign_cert.pem` from the TFTP server directory `server`, use the command:

```
awplus# copy tftp://server/veriSign_cert.pem
web-auth-https-file
```

Related commands

auth-web-server ssl

erase web-auth-https-file

show auth-web-server

description (auth-profile)

Overview Use this command to add a description to an authentication profile in Authentication Profile mode.

Use the **no** variant of this command to remove the current description.

Syntax

```
description <description>
```

Parameter	Description
<description>	Text describing the selected authentication profile.

Default No description configured by default.

Mode Authentication Profile

Example To add a description to the authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# description student room setting
```

To remove a description from the authentication profile 'student', use the following commands:

```
awplus# configure terminal
awplus(config)# auth profile student
awplus(config-auth-profile)# no description
```

Related commands auth profile (global)

erase proxy-autoconfig-file

Overview Use this command to remove the proxy auto configuration file.

Syntax
```
erase proxy-autoconfig-file
```

Mode Privileged Exec

Example To remove the proxy auto configuration file, use the command:
```
awplus# erase proxy-autoconfig-file
```

Related commands
show proxy-autoconfig-file

copy proxy-autoconfig-file

erase web-auth-https-file

Overview Use this command to remove the SSL server certificate for web-based authentication.

Syntax
```
erase web-auth-https-file
```

Mode Privileged Exec

Example To remove the SSL server certificate file for web-based authentication use the command:

```
awplus# erase web-auth-https-file
```

Related commands

auth-web-server ssl

copy web-auth-https-file

show auth-web-server

show auth

Overview This command shows the configuration state of authentication.

Syntax `show auth [all]`

Parameter	Description
`all`	Display all authentication information for each authenticated interface. This can be a static channel (or static aggregator), or a dynamic (or LACP) channel group, or a switch port.

Mode Privileged Exec

Example To display all authentication information, enter the command:

```
awplus# show auth all
```

Output Figure 41-1: Example output from the **show auth** command

```
awplus# show auth all
802.1X Port-Based Authentication Enabled
MAC-based Port Authentication Disabled
WEB-based Port Authentication Enabled
 RADIUS server address (auth): 150.87.17.192:1812

show auth diagnostics

Overview This command shows authentication diagnostics, optionally for the specified interface, which may be an Ethernet port.

If no interface is specified then authentication diagnostics are shown for all interfaces.

Syntax `show auth diagnostics [interface <interface-list>]`

Parameter	Description
`interface`	Specify ports to show.
`<interface-list>`	The interfaces or ports to configure. An interface-list can be: • an interface (e.g. `eth1`) • a continuous range of interfaces, e.g. `eth1-2` • a comma-separated list of the above; e.g. `eth1, eth2`. The specified interfaces must exist.

Mode Privileged Exec

Example To display authentication diagnostics for eth1, enter the command:

```
awplus# show auth diagnostics interface eth1
```

Output Figure 41-2: Example output from the **show auth diagnostics** command

```
Authentication Diagnostics for interface eth1
     Supplicant address: 00d0.59ab.7037
         authEnterConnecting: 2
         authEaplogoffWhileConnecting: 1
         authEnterAuthenticating: 2
         authSuccessWhileAuthenticating: 1
         authTimeoutWhileAuthenticating: 1
         authFailWhileAuthenticating: 0
         authEapstartWhileAuthenticating: 0
         authEaplogoggWhileAuthenticating: 0
         authReauthsWhileAuthenticated: 0
         authEapstartWhileAuthenticated: 0
      authEaplogoffWhileAuthenticated: 0

         BackendAccessChallenges: 1
         BackendOtherrequestToSupplicant: 3
         BackendAuthSuccess: 1
```

show auth interface

Overview This command shows the status of port authentication on the specified interface.

Syntax `show auth interface <interface-list>`

Parameter	Description
<interface-list>	The interfaces to display information about. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.

Mode Privileged Exec

Example To display the port-based authentication status for eth1, enter the command:

```
awplus# show auth interface eth1
```

If port-based authentication is not configured, the output will be:

```
% Port-Control not configured on eth1
```

To display the port-based authentication status for eth1, enter the command:

```
awplus# show auth interface eth1
```

```
awplus# show auth interface eth1
Authentication Info for interface eth1
 portEnabled: true - portControl: Auto
 portStatus: Authorized
 reAuthenticate: disabled
 reAuthPeriod: 3600
 PAE: quietPeriod: 60 - maxReauthReq: 2 - txPeriod: 30
 BE: suppTimeout: 30 - serverTimeout: 30
 CD: adminControlledDirections: in
 KT: keyTxEnabled: false
 critical: disabled

```

Related commands

show auth diagnostics

show dot1x sessionstatistics

show dot1x statistics interface

show dot1x supplicant interface

show auth sessionstatistics

Overview This command shows authentication session statistics for the specified interface.

Syntax `show auth sessionstatistics [interface <interface-list>]`

Parameter	Description
`interface`	Specify ports to show.
<interface-list>	The interfaces or ports to configure. An interface-list can be: • an interface (e.g. `eth1`) • a continuous range of interfaces, e.g. `eth1-2` • a comma-separated list of the above; e.g. `eth1,eth2` The specified interfaces must exist.

Mode Privileged Exec

Example To display authentication statistics for eth1, enter the command:

```
awplus# show auth sessionstatistics interface eth1
```

Output Figure 41-3: Example output from the **show auth sessionstatistics** command

```
Authentication session statistics for interface eth1     session
user name: manager
         session authentication method: Remote server
         session time: 19440 secs
         session terminat cause: Not terminated yet
```

show auth statistics interface

Overview Use this command to show the authentication statistics for the specified interface.

Syntax

```
show auth statistics interface <interface-list>
```

Parameter	Description
<interface-list>	The interfaces to display information about. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.

Mode Privileged Exec

Example To display authentication statistics for port1.0.2, enter the command:

```
awplus# show auth statistics interface port1.0.2
```

Output Figure 41-4: Example output from **show auth statistics interface** for a port

```
awplus# show auth statistics interface port1.0.2
802.1X statistics for interface port1.0.2

show auth supplicant

Overview Use this command to show the supplicant (client device) state when authentication is configured for the switch. Use the optional **brief** parameter to show a summary of the supplicant state.

Syntax

```
show auth supplicant [<macadd>] [brief]
```

Parameter	Description
<macadd>	Mac (hardware) address of the supplicant. Entry format is HHHH.HHHH.HHHH (hexadecimal).
`brief`	Brief summary of the supplicant state.

Mode Privileged Exec

Examples To display a summary of authenticated supplicant information on the device, enter the command:

```
awplus# show auth supplicant brief
```

To display authenticated supplicant information on the device, enter the command:

```
awplus# show auth supplicant
```

To display authenticated supplicant information for the device with MAC address 0000.5E00.5301, enter the command:

```
awplus# show auth supplicant 0000.5E00.5301
```

Output Figure 41-5: Example output from **show auth supplicant brief**

```
awplus#show auth supplicant brief
Interface port1.0.3
  authenticationMethod: dot1x/mac/web
  Two-Step Authentication
    firstMethod: mac
    secondMethod: dot1x/web

show auth supplicant interface

Overview This command shows the supplicant (client device) state for the authentication mode set for the interface. Use the optional **brief** parameter to show a summary of the supplicant state.

Syntax

```
show auth-web supplicant interface <interface-list> [brief]
```

Parameter	Description
<interface-list>	The interfaces or ports to configure. An interface-list can be: • an interface (e.g. `eth1`) • a continuous range of interfaces, e.g. `eth1-2` • a comma-separated list of the above; e.g. `eth1,eth2` The specified interfaces must exist.
`brief`	Brief summary of the supplicant state.

Mode Privileged Exec

Examples To display the authenticated supplicant on the interface eth1, enter the command:

```
awplus# show auth supplicant interface eth1
```

To display brief summary output for the authenticated supplicant on the interface eth1, enter the command:

```
awplus# show auth supplicant interface eth1 brief
```

show auth two-step supplicant brief

Overview This command displays the supplicant state of the two-step authentication feature on the interface.

Syntax

```
show auth two-step supplicant [interface <interface-list>]
brief
```

Parameter	Description
`interface`	The interface selected for display.
<interface-list>	The interfaces to display information about. An interface-list can be: • a VLAN (e.g. vlan2) • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of interfaces separated by a hyphen (e.g. port1.0.1-port1.0.3) • a comma-separated list (e.g. port1.0.1, port1.0.3-port1.0.4). Do not mix interface types in a list.

Mode Privileged Exec

Usage notes Do not mix interface types in a list. The specified interfaces must exist.

Example To display the supplicant state of the two-step authentication feature, enter the command:

```
awplus# show two-step supplicant interface port1.0.2 brief
```

Output Figure 41-8: Example output from **show auth two-step supplicant brief**

```
interface port1.0.2

  authenticationMethod: dot1x/mac

  Two-Step Authentication:
    firstMethod:mac
    secondMethod:dot1x

show auth-web-server

Overview This command shows the Web-Authentication server configuration and status on the switch.

Syntax

```
show auth-web-server
```

Mode Privileged Exec

Example To display Web-Authentication server configuration and status, enter the command:

```
awplus# show auth-web-server
```

Output Figure 41-9: Example output from the **show auth-web-server** command

```
Web authentication server
     Server status: enabled
     Server mode: none
     Server address: 192.168.1.1/24
       DHCP server enabled
       DHCP lease time: 20
       DHCP WPAD Option URL: http://192.168.1.1/proxy.pac
     HTTP Port No: 80
     Security: disabled
     Certification: default
     SSL Port No: 443
     Redirect URL: --
     Redirect Delay Time: 5
     HTTP Redirect: enabled
     Session keep: disabled
     PingPolling: disabled
     PingInterval: 30

42 AAA Commands

Introduction

Overview

AAA is the collective title for the three related functions of Authentication, Authorization and Accounting. These function can be applied in a variety of methods with a variety of servers.

The purpose of the AAA commands is to map instances of the AAA functions to sets of servers. The Authentication function can be performed in multiple contexts, such as authentication of users logging in at a console, or 802.1X-Authentication of devices connecting to Ethernet ports.

For each of these contexts, you may want to use different sets of servers for examining the proffered authentication credentials and deciding if they are valid. AAA Authentication commands enable you to specify which servers will be used for different types of authentication.

The AR2050V supports port authentication with the following limitations:

- MAC authentication is supported on the device's switch ports static channel-groups and dynamic (LACP) channel-groups.
- 802.1X authentication is supported on the device's switch ports only. It is not supported on static channel-groups and dynamic (LACP) channel-groups.
- Web authentication is supported on the device's Eth interfaces only.

This chapter provides an alphabetical reference for AAA commands for Authentication, Authorization and Accounting. For more information, see the AAA and Port_Authentication Feature Overview and Configuration Guide.

aaa accounting auth-mac

Overview This command configures an accounting method list for MAC-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with MAC-based authentication enabled, or a named method list, which can be applied to an interface with the auth-mac accounting command.

Use the **no** variant of this command to disable either the default or a named accounting method list for MAC-based authentication. Once all method lists are disabled, AAA accounting for MAC-based authentication is disabled globally.

Syntax
```
aaa accounting auth-mac {default|<list-name>}
{start-stop|stop-only|none} group {<group-name>|radius}
no aaa accounting auth-mac {default|<list-name>}
```

Parameter	Description
`default`	Configure the default accounting method list
`<list-name>`	Configure a named accounting method list
`start-stop`	Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session.
`stop-only`	Only sends a stop accounting message at the end of the session.
`none`	No accounting record sent.
`group`	Use a server group
`<group-name>`	Server group name.
`radius`	Use all RADIUS servers.

Default RADIUS accounting for MAC-based Authentication is disabled by default

Mode Global Configuration

Usage notes This command can be used to configure either the default accounting method list or a named accounting method list:

- **default**: the default accounting method list which is automatically applied to all interfaces with MAC-based authentication enabled.
- *<list-name>*: a user named list which can be applied to an interface using the auth-mac accounting command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius**: use all RADIUS servers configured by radius-server host command

- **group** <*group-name*>: use the specified RADIUS server group configured with the aaa group server command

The accounting event to send to the RADIUS server is configured with the following options:

- **start-stop**: sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only**: sends a **stop** accounting message at the end of a session.
- **none**: disables accounting.

Examples

To enable the default RADIUS accounting for MAC-based authentication, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-mac default start-stop
group radius
```

To disable RADIUS accounting for MAC-based Authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-mac default
```

To enable a named RADIUS accounting method list 'vlan10_acct' for MAC-based authentication, with the RADIUS server group 'rad_group_vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-mac vlan10_acct start-stop
group rad_group_vlan10
```

To disable a named RADIUS accounting method list 'vlan10_acct' for MAC-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-mac vlan10_acct
```

aaa accounting auth-web

Overview This command configures an accounting method list for Web-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with Web-based authentication enabled, or a named method list, which can be applied to an interface with the auth-web accounting command.

Use the **no** variant of this command to disable either the default or a named accounting method list for Web-based authentication. Once all method lists are disabled, AAA accounting for Web-based authentication is disabled globally.

Syntax

```
aaa accounting auth-web {default|<list-name>}
{start-stop|stop-only|none} group {<group-name>|radius}
no aaa accounting auth-web {default|<list-name>}
```

Parameter	Description
`default`	Configure the default accounting method list
`<list-name>`	Configure a named accounting method list
`start-stop`	Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session.
`stop-only`	Only sends a stop accounting message at the end of the session.
`none`	No accounting record sent.
`group`	Use a server group
`<group-name>`	Server group name.
`radius`	Use all RADIUS servers.

Default RADIUS accounting for Web-based authentication is disabled by default.

Mode Global Configuration

Usage notes This command can be used to configure either the default accounting method list or a named accounting method list:

- **default**: the default accounting method list which is automatically applied to all interfaces with Web-based authentication enabled.
- *<list-name>*: a user named list which can be applied to an interface using the auth-web accounting command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius**: use all RADIUS servers configured by radius-server host command

- **group** <*group-name*>: use the specified RADIUS server group configured with the aaa group server command

Configure the accounting event to be sent to the RADIUS server with the following options:

- **start-stop**: sends a start accounting message at the beginning of a session and a stop accounting message at the end of the session.
- **stop-only**: sends a stop accounting message at the end of a session.
- **none**: disables accounting.

Examples

To enable the default RADIUS accounting method for Web-based authentication, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-web default start-stop
group radius
```

To disable the default RADIUS accounting method for Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-web default
```

To enable a named RADIUS accounting method list 'example_acct' for Web-based authentication, with the RADIUS server group 'rad_group_example, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting auth-web example_acct start-stop
group rad_group_example
```

To disable a named RADIUS accounting method list 'example_acct' for Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting auth-web example_acct
```

aaa accounting commands

Overview This command configures and enables TACACS+ accounting on commands entered at a specified privilege level. Once enabled for a privilege level, accounting messages for commands entered at that privilege level will be sent to a TACACS+ server.

In order to account for all commands entered on a device, configure command accounting for each privilege level separately.

The command accounting message includes, the command as entered, the date and time the command finished executing, and the user-name of the user who executed the command.

Use the **no** variant of this command to disable command accounting for a specified privilege level.

Syntax

```
aaa accounting commands <1-15> default stop-only group tacacs+
no aaa accounting commands <1-15> default
```

Parameter	Description
<1-15>	The privilege level being configured, in the range 1 to 15.
`default`	Use the default method list, this means the command is applied globally to all user exec sessions.
`stop-only`	Send accounting message when the commands have stopped executing.
`group`	Specify the server group where accounting messages are sent. Only the tacacs+ group is available for this command.
`tacacs+`	Use all TACACS+ servers configured by the tacacs-server host command.

Default TACACS+ command accounting is disabled by default.

Mode Global Configuration

Usage notes This command only supports a **default** method list, this means that it is applied to every console and VTY line.

The **stop-only** parameter indicates that the command accounting messages are sent to the TACACS+ server when the commands have stopped executing.

The **group tacacs+** parameters signifies that the command accounting messages are sent to the TACACS+ servers configured by the tacacs-server host command.

Note that up to four TACACS+ servers can be configured for accounting. The servers are checked for reachability in the order they are configured with only the first reachable server being used. If no server is found, the accounting message is dropped.

Command accounting cannot coexist with triggers. An error message is displayed if you attempt to enable command accounting while a trigger is configured. Likewise, an error message is displayed if you attempt to configure a trigger while command accounting is configured.

Examples

To configure command accounting for privilege levels 1, 7, and 15, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting commands 1 default stop-only
group tacacs+
awplus(config)# aaa accounting commands 7 default stop-only
group tacacs+
awplus(config)# aaa accounting commands 15 default stop-only
group tacacs+
```

To disable command accounting for privilege levels 1, 7, and 15, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting commands 1 default
awplus(config)# no aaa accounting commands 7 default
awplus(config)# no aaa accounting commands 15 default
```

Related commands

aaa authentication login

aaa accounting login

tacacs-server host

aaa accounting dot1x

Overview Use this command to configure an accounting method list for IEEE 802.1X-based authentication. An accounting method list specifies what type of accounting messages are sent and which RADIUS servers the accounting messages are sent to. Use this command to configure either the default method list, which is automatically applied to interfaces with IEEE 802.1X-based authentication enabled, or a named method list, which can be applied to an interface with the dot1x accounting command.

Use the **no** variant of this command to disable either the default or a named accounting method list for 802.1X-based authentication. Once all method lists are disabled, AAA accounting for 802.1x-based authentication is disabled globally.

Syntax

```
aaa accounting dot1x {default|<list-name>}
{start-stop|stop-only|none} group {<group-name>|radius}
no aaa accounting dot1x {default|<list-name>}
```

Parameter	Description
`default`	Configure the default accounting method list
`<list-name>`	Configure a named accounting method list
`start-stop`	Sends a start accounting message at the beginning of the session and a stop accounting message at the end of the session.
`stop-only`	Only sends a stop accounting message at the end of the session.
`none`	No accounting record sent.
`group`	Use a server group
`<group-name>`	Server group name.
`radius`	Use all RADIUS servers.

Default RADIUS accounting for 802.1X-based authentication is disabled by default (there is no default server set by default).

Mode Global Configuration

Usage notes This command can be used to configure either the default accounting method list or a named accounting method list:

- **default**: the default accounting method list which is automatically applied to all interfaces with 802.1X-based authentication enabled.
- *<list-name>*: a user named list which can be applied to an interface using the dot1x accounting command.

There are two ways to define servers where RADIUS accounting messages will be sent:

- **group radius**: use all RADIUS servers configured by radius-server host command.
- **group** <*group-name*>: use the specified RADIUS server group configured with the aaa group server command.

The accounting event to send to the RADIUS server is configured by the following options:

- **start-stop**: sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only**: sends a **stop** accounting message at the end of a session.
- **none**: disables accounting.

Examples

To enable RADIUS accounting for 802.1X-based authentication, and use all available RADIUS Servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting dot1x default start-stop group radius
```

To disable RADIUS accounting for 802.1X-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting dot1x default
```

To enable a named RADIUS accounting method list 'vlan10_acct' for 802.1X-based authentication, with the RADIUS server group 'rad_group_vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# aaa accounting dot1x vlan10_acct start-stop group rad_group_vlan10
```

To disable a named RADIUS accounting method list 'vlan10_acct' for 802.1X-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting dot1x vlan10_acct
```

Command changes

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

aaa accounting login

Overview This command configures RADIUS and TACACS+ accounting for login shell sessions. The specified method list name can be used by the **accounting login** command in the Line Configuration mode. If the **default** parameter is specified, then this creates a default method list that is applied to every console and VTY line, unless another accounting method list is applied on that line.

Note that unlimited RADIUS servers and up to four TACACS+ servers can be configured and consulted for accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, i.e. is unreachable.

Use the **no** variant of this command to remove an accounting method list for login shell sessions configured by an **aaa accounting login** command. If the method list being deleted is already applied to a console or VTY line, accounting on that line will be disabled. If the default method list name is removed by this command, it will disable accounting on every line that has the default accounting configuration.

Syntax

```
aaa accounting login
{default|<list-name>}{start-stop|stop-only|none} {group
{radius|tacacs+|<group-name>}}
```

```
no aaa accounting login {default|<list-name>}
```

Parameter	Description
`default`	Default accounting method list.
`<list-name>`	Named accounting method list.
`start-stop`	Start and stop records to be sent.
`stop-only`	Stop records to be sent.
`none`	No accounting record to be sent.
`group`	Specify the servers or server group where accounting packets are sent.
`radius`	Use all RADIUS servers configured by the radius-server host command.
`tacacs+`	Use all TACACS+ servers configured by the tacacs-server host command.
`<group-name>`	Use the specified RADIUS server group, as configured by the aaa group server command.

Default Accounting for login shell sessions is disabled by default.

Mode Global Configuration

Usage notes

This command enables you to define a named accounting method list. The items that you define in the accounting options are:

- the types of accounting packets that will be sent
- the set of servers to which the accounting packets will be sent

You can define a default method list with the name **default** and any number of other named method lists. The name of any method list that you define can then be used as the *<list-name>* parameter in the accounting login command.

If the method list name already exists, the command will replace the existing configuration with the new one.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius** : use all RADIUS servers configured by radius-server host command
- **group** *<group-name>* : use the specified RADIUS server group configured with the aaa group server command

There is one way to define servers where TACACS+ accounting messages are sent:

- **group tacacs+** : use all TACACS+ servers configured by tacacs-server host command

The accounting event to send to the RADIUS or TACACS+ server is configured with the following options:

- **start-stop** : sends a **start** accounting message at the beginning of a session and a **stop** accounting message at the end of the session.
- **stop-only** : sends a **stop** accounting message at the end of a session.
- **none** : disables accounting.

Examples

To configure RADIUS accounting for login shell sessions, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting login default start-stop group radius
```

To configure TACACS+ accounting for login shell sessions, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting login default start-stop group tacacs+
```

To reset the configuration of the default accounting list, use the following commands:

```
awplus# configure terminal
awplus(config)#  no aaa accounting login default
```

aaa accounting update

Overview This command enables periodic accounting reporting to either the RADIUS or TACACS+ accounting server(s) wherever login accounting has been configured.

Note that unlimited RADIUS servers and up to four TACACS+ servers can be configured and consulted for accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, i.e. is unreachable.

Use the **no** variant of this command to disable periodic accounting reporting to the accounting server(s).

Syntax

```
aaa accounting update [periodic <1-65535>]
no aaa accounting update
```

Parameter	Description
`periodic`	Send accounting records periodically.
<1-65535>	The interval to send accounting updates (in minutes). The default is 30 minutes.

Default Periodic accounting update is disabled by default.

Mode Global Configuration

Usage notes Use this command to enable the device to send periodic AAA login accounting reports to the accounting server. When periodic accounting report is enabled, interim accounting records are sent according to the interval specified by the **periodic** parameter. The accounting updates are start messages.

If the **no** variant of this command is used to disable periodic accounting reporting, any interval specified by the **periodic** parameter is reset to the default of 30 minutes when accounting reporting is reenabled, unless this interval is specified.

Examples To configure the switch to send period accounting updates every 30 minutes, the default period, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting update
```

To configure the switch to send period accounting updates every 10 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa accounting update periodic 10
```

To disable periodic accounting update wherever accounting has been configured, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa accounting update
```

aaa accounting dot1x

aaa accounting login

aaa authentication auth-mac

Overview This command enables MAC-based authentication globally and allows you to enable either the default authentication method list (in this case, a list of RADIUS servers), which is automatically applied to every interface running MAC-based authentication, or a user named authentication method list, which is applied to an interface with the auth-mac authentication command.

Use the **no** variant of this command to disable either the default or a named method list for MAC-based authentication. Once all method lists are disabled MAC-based authentication is disabled globally.

Syntax

```
aaa authentication auth-mac {default|<list-name>} group
{<group-name>|radius}
```

```
no aaa authentication auth-mac {default|<list-name>}
```

Parameter	Description
`default`	Configure the default authentication method list
`<list-name>`	Configure a named authentication method list
`group`	Use a server group
`<group-name>`	Server group name.
`radius`	Use all RADIUS servers.

Default MAC-based Port Authentication is disabled by default.

Mode Global Configuration

Usage notes This command can be used to configure either the default authentication method list or a named authentication method list:

- **default**: the default authentication method list which is automatically applied to all interfaces with Web-based authentication enabled.
- **<***list-name***>**: a user named list which can be applied to an interface using the auth-web authentication command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius**: use all RADIUS servers configured by radius-server host command
- **group** <*group-name*>: use the specified RADIUS server group configured with the aaa group server command

All configured RADIUS Servers are automatically members of the server group **radius**. If a server is added to a named group <*group-name*>, it also remains a member of the group **radius**.

Examples

To enable MAC-based authentication globally for all RADIUS servers, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-mac default group radius
```

To disable MAC-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-mac default
```

To enable MAC-based authentication for named list 'vlan10_auth', with RADIUS server group 'rad_group_vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-mac vlan10_auth group rad_group_vlan10
```

To disable MAC-based authentication for named list 'vlan10_auth', use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-mac vlan10_acct
```

Related commands

aaa authentication auth-web

Overview This command enables Web-based authentication globally and allows you to enable either the default authentication method list (in this case, a list of RADIUS servers), which is automatically applied to every interface running Web-based authentication, or a user named authentication method list, which is applied to an interface with the auth-web authentication command.

Use the **no** variant of this command to disable either the default or a named method list for Web-based authentication. Once all method lists are disabled Web-based authentication is disabled globally.

Syntax

```
aaa authentication auth-web {default|<list-name>} group
{<group-name>|radius}
```

```
no aaa authentication auth-web {default|<list-name>}
```

Parameter	Description
`default`	Configure the default authentication method list
`<list-name>`	Configure a named authentication method list
`group`	Use a server group
`<group-name>`	Server group name.
`radius`	Use all RADIUS servers.

Default Web-based authentication is disabled by default.

Mode Global Configuration

Usage notes This command can be used to configure either the default authentication method list or a named authentication method list:

- **default**: the default authentication method list which is automatically applied to all interfaces with Web-based authentication enabled.
- **<***list-name***>**: a user named list which can be applied to an interface using the auth-web authentication command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius**: use all RADIUS servers configured by radius-server host command
- **group <***group-name***>**: use the specified RADIUS server group configured with the aaa group server command

Note that you need to configure an IPv4 address for the VLAN interface on which Web authentication is running.

Examples

To enable Web-based authentication globally for all RADIUS servers, and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-web default group radius
```

To disable Web-based authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication auth-web default
```

To enable Web-based authentication for named list 'example_auth', with RADIUS server group 'rad_group_example, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication auth-web example_auth group rad_group_example
```

To disable Web-based authentication for named list 'example_auth', use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication example_auth
```

Related commands

aaa accounting auth-web

aaa group server

aaa authentication dot1x

Overview Use this command to enable IEEE 802.1X-based authentication globally and to allow you to enable either the default authentication method list (in this case, a list of RADIUS servers), which is automatically applied to every interface running IEEE 802.1X-based authentication, or a user named authentication method list, which is applied to an interface with the dot1x authentication command.

Use the **no** variant of this command to disable either the default or a named method list for 802.1X-based authentication. Once all method lists are disabled 802.1x-based authentication is disabled globally.

Syntax

```
aaa authentication dot1x {default|<list-name>} group
{<group-name>|radius}
```

```
no aaa authentication dot1x {default|<list-name>}
```

Parameter	Description
`default`	Configure the default authentication method list
`<list-name>`	Configure a named authentication method list
`group`	Use a server group
`<group-name>`	Server group name.
`radius`	Use all RADIUS servers.

Default 802.1X-based Port Authentication is disabled by default.

Mode Global Configuration

Usage notes This command can be used to configure either the default authentication method list or a named authentication method list:

- **default**: the default authentication method list which is automatically applied to all interfaces with 802.1X-based authentication enabled.
- **<***list-name***>**: a user named list which can be applied to an interface using the aaa authentication dot1x command.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius**: use all RADIUS servers configured by radius-server host command
- **group <***group-name***>**: use the specified RADIUS server group configured with the aaa group server command

Examples To enable 802.1X-based authentication globally with all RADIUS servers, and use all available RADIUS servers, use the command:

```
awplus# configure terminal
awplus(config)# aaa authentication dot1x default group radius
```

To disable 802.1X-based authentication, use the command:

```
awplus# configure terminal
awplus(config)# no aaa authentication dot1x default
```

To enable 802.1X-based authentication for named list 'vlan10_auth', with RADIUS server group 'rad_group_vlan10', use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication dot1x vlan10_auth group
rad_group_vlan10
```

To disable 802.1X-based authentication for named list 'vlan10_auth' use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication dot1x vlan10_acct
```

Command changes

Version 5.4.9-2.1: command added to AR2050V, AR3050S, and AR4050S

aaa authentication enable default group tacacs+

Overview This command enables privilege level authentication against a TACACS+ server.

Use the **no** variant of this command to disable privilege level authentication.

Syntax

```
aaa authentication enable default group tacacs+ [local] [none]
no aaa authentication enable default
```

Parameter	Description
`local`	Use the locally configured enable password (**enable password** command) for authentication.
`none`	No authentication.

Default Local privilege level authentication is enabled by default (aaa authentication enable default local command).

Mode Global Configuration

Usage notes A user is configured on a TACACS+ server with a maximum privilege level. When they enter the enable (Privileged Exec mode) command they are prompted for an enable password which is authenticated against the TACACS+ server. If the password is correct and the specified privilege level is equal to or less than the users maximum privilege level, then they are granted access to that level. If the user attempts to access a privilege level that is higher than their maximum configured privilege level, then the authentication session will fail and they will remain at their current privilege level.

NOTE: *If both **local** and **none** are specified, you must always specify **local** first.*

If the TACACS+ server goes offline, or is not reachable during enable password authentication, and command level authentication is configured as:

- **aaa authentication enable default group tacacs+**

  then the user is never granted access to Privileged Exec mode.

- **aaa authentication enable default group tacacs+ local**

  then the user is authenticated using the locally configured enable password, which if entered correctly grants the user access to Privileged Exec mode. If no enable password is locally configured (**enable password** command), then the enable authentication will fail until the TACACS+ server becomes available again.

- **aaa authentication enable default group tacacs+ none**

  then the user is granted access to Privileged Exec mode with no authentication. This is true even if a locally configured enable password is configured.

- **aaa authentication enable default group tacacs+ local none**

  then the user is authenticated using the locally configured enable password. If no enable password is locally configured, then the enable authentication will grant access to Privileged Exec mode with no authentication.

If the password for the user is not successfully authenticated by the server, then the user is again prompted for an enable password when they enter **enable** via the CLI.

Examples

To enable a privilege level authentication method that will not allow the user to access Privileged Exec mode if the TACACS+ server goes offline, or is not reachable during enable password authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default group tacacs+
```

To enable a privilege level authentication method that will allow the user to access Privileged Exec mode if the TACACS+ server goes offline, or is not reachable during enable password authentication, and a locally configured enable password is configured, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default group tacacs+
local
```

To disable privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication enable default
```

Related commands

tacacs-server host

aaa authentication enable default local

Overview This command enables local privilege level authentication.

Use the **no** variant of this command to disable local privilege level authentication.

Syntax

```
aaa authentication enable default local
no aaa authentication enable default
```

Default Local privilege level authentication is enabled by default.

Mode Global Configuration

Usage notes The privilege level configured for a particular user in the local user database is the privilege threshold above which the user is prompted for an enable (Privileged Exec mode) command.

Examples To enable local privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication enable default local
```

To disable local privilege level authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication enable default
```

Related commands

aaa authentication login

aaa authentication isakmp

Overview Use this command to enable global RADIUS authentication for ISAKMP tunnels.

Use the **no** variant of this command to disable global RADIUS authentication of ISAKMP tunnels.

Syntax

```
aaa authentication isakmp default group [<group-name>|radius]
no aaa authentication isakmp default
```

Parameter	Description
<group-name>	Server group name
`radius`	Use all RADIUS servers

Default Disabled

Mode Global Configuration

Usage notes When RADIUS authentication is enabled globally to ISAKMP tunnels it is automatically applied to every ISAKMP tunnel interface.

There are two ways to define servers where radius accounting messages are sent:

- Group radius, where all RADIUS servers configured using this command are used
- Group <*group-name*>, where the specified RADIUS server group configured is used

Examples To enable RADIUS authentication for ISAKMP tunnels globally and use all available radius servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication isakmp default group radius
```

To disable RADIUS authentication for ISAKMP tunnels, use the commands:

```
awplus# configure terminal
awplus(config)# no authentication isakmp default
```

Related commands radius-server host

aaa group server

Command changes Version 5.4.9-0.1: command added

aaa authentication login

Overview Use this command to create an ordered list of methods to use to authenticate user login, or to replace an existing method list with the same name. Specify one or more of the options **local** or **group**, in the order you want them to be applied. If the **default** method list name is specified, it is applied to every console and VTY line immediately unless another method list is applied to that line by the login authentication command. To apply a non-default method list, you must also use the login authentication command.

Use the **no** variant of this command to remove an authentication method list for user login. The specified method list name is deleted from the configuration. If the method list name has been applied to any console or VTY line, user login authentication on that line will fail.

Note that the **no aaa authentication login default** command does not remove the default method list. This will return the default method list to its default state (**local** is the default).

Syntax

```
aaa authentication login {default|<list-name>} {[local] [group {radius|tacacs+|<group-name>}]}
no aaa authentication login {default|<list-name>}
```

Parameter	Description
`default`	Set the default authentication server for user login.
`<list-name>`	Name of authentication server.
`local`	Use the local username database.
`group`	Use server group.
`radius`	Use all RADIUS servers configured by the radius-server host command.
`tacacs+`	Use all TACACS+ servers configured by the tacacs-server host command.
`<group-name>`	Use the specified RADIUS server group, as configured by the aaa group server command.

Default If the default server is not configured using this command, user login authentication uses the local user database only.

If the **default** method list name is specified, it is applied to every console and VTY line immediately unless a named method list server is applied to that line by the **loginauthentication** command.

local is the default state for the default method list unless a named method list is applied to that line by the **login authentication** command. Reset to the default method list using the **no aaa authentication login default** command.

Mode Global Configuration

Usage notes

When a user attempts to log in, the switch sends an authentication request to the first authentication server in the method list. If the first server in the list is reachable and it contains a username and password matching the authentication request, the user is authenticated and the login succeeds. If the authentication server denies the authentication request because of an incorrect username or password, the user login fails. If the first server in the method list is unreachable, the switch sends the request to the next server in the list, and so on.

For example, if the method list specifies **group tacacs+ local**, and a user attempts to log in with a password that does not match a user entry in the first TACACS+ server, if this TACACS+ server denies the authentication request, then the switch does not try any other TACACS+ servers not the local user database; the user login fails.

Examples

To configure the default authentication method list for user login to first use all available RADIUS servers for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login default group radius
local
```

To configure a user login authentication method list called **USERS** to first use the RADIUS server group RAD_GROUP1 for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login USERS group RAD_GROUP1
local
```

To configure a user login authentication method list called USERS to first use the TACACS+ servers for user login authentication, and then use the local user database, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authentication login USERS group tacacs+
local
```

To return to the default method list (**local** is the default server), use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication login default
```

To delete an existing authentication method list USERS created for user login authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication login USERS
```

Related commands

aaa accounting commands

aaa authentication enable default group tacacs+

login authentication

aaa authentication openvpn

Overview This command enables RADIUS authentication of OpenVPN tunnels globally. It is automatically applied to every OpenVPN tunnel interface.

Use the **no** variant of this command to globally disable RADIUS authentication of OpenVPN tunnels.

Syntax

```
aaa authentication openvpn default group {<group-name>|radius}
no aaa authentication openvpn default
```

Parameter	Description
`radius`	Use all RADIUS servers.
<group-name>	Server group name.

Default RADIUS authentication of OpenVPN tunnels is disabled by default.

Mode Global Configuration

Usage notes Use the **no** variant of this command to reset the default authentication method for OpenVPN tunnels, to its default, that is, to use the group **radius**, containing all RADIUS servers configured by the **radius-server host** command.

Note that if the default authentication method is used, all OpenVPN tunnels will use the group **radius**, containing all RADIUS servers.

There are two ways to define servers where RADIUS accounting messages are sent:

- **group radius** : use all RADIUS servers configured by radius-server host command
- **group** <*group-name*> : use the specified RADIUS server group configured with the aaa group server command

Examples To enable RADIUS authentication of OpenVPN tunnels globally and use all available RADIUS servers, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authentication openvpn default group radius
```

To disable RADIUS authentication of OpenVPN tunnels, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authentication openvpn default
```

Related commands aaa group server

radius-server host

aaa authorization commands

Overview This command configures a method list for commands authorization that can be applied to console or VTY lines. When command authorization is enabled for a privilege level, only authorized users can executed commands in that privilege level.

Use the **no** variant of this command to remove a named method list or disable the default method list for a privilege level.

Syntax

```
aaa authorization commands <privilege-level>
{default|<list-name>} group tacacs+ [none]
```

```
no aaa authorization commands <privilege-level>
{default|<list-name>}
```

Parameter	Description
<privilege-level>	The privilege level of the set of commands the method list will be applied to. AlliedWare Plus defines three sets of commands, that are indexed by a level value: **Level = 1**: All commands that can be accessed by a user with privilege level between 1 and 6 inclusive **Level = 7:** All commands that can be accessed by a user with privilege level between 7 and 14 inclusive **Level = 15**: All commands that can be accessed by a user with privilege level 15
`group`	Specify the server group where authorization messages are sent. Only the `tacacs+` group is available for this command.
`tacacs+`	Use all TACACS+ servers configured by the tacacs-server host command.
`default`	Configure the default authorization commands method list.
<list-name>	Configure a named authorization commands method list
`none`	If specified, this provides a local fallback to command authorization so that if authorization servers become unavailable then the device will accept all commands normally allowed for the privilege level of the user.

Mode Global Configuration

Usage notes TACACS+ command authorization provides centralized control of the commands available to a user of an AlliedWare Plus device. Once enabled:

- The command string and username are encrypted and sent to the first available configured TACACS+ server (the first server configured) for authorization.

- The TACACS+ server decides if the user is authorized to execute the command and returns the decision to the AlliedWare Plus device.
- Depending on this decision the device will then either execute the command or notify the user that authorization has failed.

If multiple TACACS+ servers are configured, and the first server is unreachable or does not respond, the other servers will be queried, in turn, for an authorization decision. If all servers are unreachable and a local fallback has been configured, with the **none** parameter, then commands are authorized based on the user's privilege level; the same behavior as if command authorization had not been configured. If, however, the local fallback is not configured and all servers become unreachable then all commands except **logout**, **exit**, and **quit** will be denied.

The **default** method list is defined with a local fallback unless configured differently using this command.

Example To configure a commands authorization method list, named TAC15, using all TACACS+ servers to authorize commands for privilege level 15, with a local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 15 TAC15 group tacacs+ none
```

To configure the default method list to authorize commands for privilege level 7, with no local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 7 default group tacacs+
```

To remove the authorization method list TAC15, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization commands 15 TAC15
```

Related commands

aaa authorization config-commands

tacacs-server host

Command changes Version 5.4.6-2.1: command added

aaa authorization config-commands

Overview Use this command to enable command authorization on configuration mode commands. By default, command authorization applies to commands in exec mode only.

Use the **no** variant of this command to disable command authorization on configuration mode commands.

Syntax

```
aaa authorization config-commands
no aaa authorization config-commands
```

Default By default, command authorization is disabled on configuration mode commands.

Mode Global Configuration

Usage notes If authorization of configuration mode commands is not enabled then all configuration commands are accepted by default, including command authorization commands.

NOTE: *Authorization of configuration commands is required for a secure TACACS+ command authorization configuration as it prevents the feature from being disabled to gain access to unauthorized exec mode commands.*

Example To enable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authorization config-commands
```

To disable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization config-commands
```

Related commands aaa authorization commands

Command changes Version 5.4.6-2.1: command added

aaa group server

Overview This command configures a RADIUS server group. A server group can be used to specify a subset of RADIUS servers in **aaa** commands. The group name **radius** is predefined, which includes all RADIUS servers configured by the **radius-server host** command.

RADIUS servers are added to a server group using the **server** command. Each RADIUS server should be configured using the **radius-server host** command.

Use the **no** variant of this command to remove an existing RADIUS server group.

Syntax

```
aaa group server radius <group-name>
no aaa group server radius <group-name>
```

Parameter	Description
<group-name>	Server group name.

Mode Global Configuration

Usage notes Use this command to create an AAA group of RADIUS servers, and to enter Server Group Configuration mode, in which you can add servers to the group. Use a server group to specify a subset of RADIUS servers in AAA commands. Each RADIUS server must be configured by the **radius-server host** command. To add RADIUS servers to a server group, use the **server** command.

Examples To create a RADIUS server group named GROUP1 with hosts `192.168.1.1`, `192.168.2.1` and `192.168.3.1`, use the commands:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# server 192.168.1.1 auth-port 1812 acct-port
1813
awplus(config-sg)# server 192.168.2.1 auth-port 1812 acct-port
1813
awplus(config-sg)# server 192.168.3.1 auth-port 1812 acct-port
1813
```

To remove a RADIUS server group named GROUP1 from the configuration, use the command:

```
awplus(config)# no aaa group server radius GROUP1
```

aaa local authentication attempts lockout-time

Overview This command configures the duration of the user lockout period.

Use the **no** variant of this command to restore the duration of the user lockout period to its default of 300 seconds (5 minutes).

Syntax

```
aaa local authentication attempts lockout-time <lockout-time>
no aaa local authentication attempts lockout-time
```

Parameter	Description
<lockout-time>	<0-10000>. Time in seconds to lockout the user.

Mode Global Configuration

Default The default for the lockout-time is 300 seconds (5 minutes).

Usage notes While locked out all attempts to login with the locked account will fail. The lockout can be manually cleared by another privileged account using the clear aaa local user lockout command.

Examples To configure the lockout period to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts lockout-time
600
```

To restore the default lockout period of 5 minutes (300 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts
lockout-time
```

Related commands aaa local authentication attempts max-fail

aaa local authentication attempts max-fail

Overview This command configures the maximum number of failed login attempts before a user account is locked out. Every time a login attempt fails the failed login counter is incremented.

Use the **no** variant of this command to restore the maximum number of failed login attempts to the default setting (five failed login attempts).

Syntax

```
aaa local authentication attempts max-fail <failed-logins>
no aaa local authentication attempts max-fail
```

Parameter	Description
<failed-logins>	<1-32>. Number of login failures allowed before locking out a user.

Mode Global Configuration

Default The default for the maximum number of failed login attempts is five failed login attempts.

Usage When the failed login counter reaches the limit configured by this command that user account is locked out for a specified duration configured by the aaa local authentication attempts lockout-time command.

When a successful login occurs the failed login counter is reset to 0. When a user account is locked out all attempts to login using that user account will fail.

Examples To configure the number of login failures that will lock out a user account to two login attempts, use the commands:

```
awplus# configure terminal
awplus(config)# aaa local authentication attempts max-fail 2
```

To restore the number of login failures that will lock out a user account to the default number of login attempts (five login attempts), use the commands:

```
awplus# configure terminal
awplus(config)# no aaa local authentication attempts max-fail
```

Related commands aaa local authentication attempts lockout-time

clear aaa local user lockout

aaa login fail-delay

Overview Use this command to configure the minimum time period between failed login attempts. This setting applies to login attempts via the console, SSH and Telnet.

Use the **no** variant of this command to reset the minimum time period to its default value.

Syntax

```
aaa login fail-delay <1-10>
no aaa login fail-delay
```

Parameter	Description
<1-10>	The minimum number of seconds required between login attempts

Default 1 second

Mode Global configuration

Example To apply a delay of at least 5 seconds between login attempts, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa login fail-delay 5
```

Related commands

aaa authentication login

aaa local authentication attempts lockout-time

clear aaa local user lockout

accounting login

Overview This command applies a login accounting method list to console or VTY lines for user login. When login accounting is enabled using this command, logging events generate an accounting record to the accounting server.

The accounting method list must be configured first using this command. If an accounting method list is specified that has not been created by this command then accounting will be disabled on the specified lines.

The **no** variant of this command resets AAA Accounting applied to console or VTY lines for local or remote login. **default** login accounting is applied after issuing the **no accounting login** command. Accounting is disabled with **default**.

Syntax

```
accounting login {default|<list-name>}
no accounting login
```

Parameter	Description
`default`	Default accounting method list.
`<list-name>`	Named accounting method list.

Default By default login accounting is disabled in the **default** accounting server. No accounting will be performed until accounting is enabled using this command.

Mode Line Configuration

Examples To apply the accounting server USERS to all VTY lines, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# accounting login USERS
```

To reset accounting for login sessions on the console, use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# no accounting login
```

Related commands aaa accounting commands

aaa accounting login

authorization commands

Overview This command applies a command authorization method list, defined using the aaa authorization commands command, to console and VTY lines.

Use the **no** variant of this command to reset the command authorization configuration on the console and VTY lines.

Syntax

```
authorization commands <privilege-level> {default|<list-name>}
no authorization commands <privilege-level>
```

Parameter	Description
`<privilege-level>`	The privilege level of the set of commands the method list will be applied to. AlliedWare Plus defines three sets of commands, that are indexed by a level value: **Level = 1**: All commands that can be accessed by a user with privilege level between 1 and 6 inclusive **Level = 7:** All commands that can be accessed by a user with privilege level between 7 and 14 inclusive **Level = 15**: All commands that can be accessed by a user with privilege level 15
`default`	Configure the default authorization commands method list.
`<list-name>`	Configure a named authorization commands method list

Default The **default** method list is applied to each console and VTY line by default.

Mode Line Configuration

Usage notes If the specified method list does not exist users will not be enable to execute any commands in the specified method list on the specified VTY lines.

Example To apply the TAC15 command authorization method list with privilege level 15 to VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# authorization commands 15 TAC15
```

To reset the command authorization configuration with privilege level 15 on VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# no authorization commands 15
```

Related commands aaa authorization commands

tacacs-server host

Command changes Version 5.4.6-2.1: command added

clear aaa local user lockout

Overview Use this command to clear the lockout on a specific user account or all user accounts.

Syntax

```
clear aaa local user lockout {username <username>|all}
```

Parameter	Description
`username`	Clear lockout for the specified user.
<username>	Specifies the user account.
`all`	Clear lockout for all user accounts.

Mode Privileged Exec

Examples To unlock the user account 'bob' use the following command:

```
awplus# clear aaa local user lockout username bob
```

To unlock all user accounts use the following command:

```
awplus# clear aaa local user lockout all
```

Related commands aaa local authentication attempts lockout-time

debug aaa

Overview This command enables AAA debugging.

Use the **no** variant of this command to disable AAA debugging.

Syntax

```
debug aaa [accounting|all|authentication|authorization]
no debug aaa [accounting|all|authentication|authorization]
```

Parameter	Description
`accounting`	Accounting debugging.
`all`	All debugging options are enabled.
`authentication`	Authentication debugging.
`authorization`	Authorization debugging.

Default AAA debugging is disabled by default.

Mode Privileged Exec

Examples To enable authentication debugging for AAA, use the command:

```
awplus# debug aaa authentication
```

To disable authentication debugging for AAA, use the command:

```
awplus# no debug aaa authentication
```

Related commands show debugging aaa

undebug aaa

login authentication

Overview Use this command to apply an AAA server for authenticating user login attempts from a console or remote logins on these console or VTY lines. The authentication method list must be specified by the **aaa authentication login** command. If the method list has not been configured by the **aaa authentication login** command, login authentication will fail on these lines.

Use the **no** variant of this command to reset AAA Authentication configuration to use the default method list for login authentication on these console or VTY lines.

Command Syntax

```
login authentication {default|<list-name>}
no login authentication
```

Parameter	Description
`default`	The default authentication method list. If the default method list has not been configured by the aaa authentication login command, the local user database is used for user login authentication.
<list-name>	Named authentication server.

Default The default login authentication method list, as specified by the aaa authentication login command, is used to authenticate user login. If this has not been specified, the default is to use the local user database.

Mode Line Configuration

Examples To apply the authentication method list called CONSOLE to the console port terminal line (asyn 0), use the following commands:

```
awplus# configure terminal
awplus(config)# line console 0
awplus(config-line)# login authentication CONSOLE
```

To reset user authentication configuration on all VTY lines, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 32
awplus(config-line)# no login authentication
```

Related commands aaa authentication login

line

proxy-port

Overview Use this command to change the local UDP port used for communication between local RADIUS client applications and the RadSecProxy AAA application. Any unused UDP port may be selected. The default port is 1645.

Use the **no** variant of this command to change the UDP port back to the default of 1645.

Syntax

```
proxy-port <port>
no proxy-port
```

Parameter	Description
<port>	UDP Port Number, 1-65536.

Default The default port is 1645.

Mode RadSecProxy AAA Configuration Mode

Usage notes It is not necessary to change the value from the default unless UDP port 1645 is required for another purpose.RADIUS requests received on this port from external devices will be ignored. The port is only used for local (intra-device) communication.

Example To configure change the UDP port to 7001, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# proxy-port 7001
```

Related commands

radius-secure-proxy aaa

server (radsecproxy-aaa)

server name-check

server trustpoint

radius-secure-proxy aaa

Overview Use this command to enter the RadSecProxy AAA (authentication, authorization, and accounting) application configuration mode. This application allows local RADIUS-based clients on system to communicate with remote RadSec servers via a secure (TLS) proxy.

Syntax

```
radius-secure-proxy aaa
```

Mode Global Configuration Mode

Example To change mode from User Exec mode to the RadSecProxy AAA configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)#
```

Related commands

proxy-port

server (radsecproxy-aaa)

server name-check

server trustpoint

server (radsecproxy-aaa)

Overview Use this command to add a server to the RadSecProxy AAA application. Local RADIUS client applications will attempt, via the proxy, to communicate with any RadSec servers that are operational (in addition to any non-TLS RADIUS servers that are configured).

Use the **no** variant of this command to delete a previously-configured server from the RadSecProxy AAA application.

Syntax

```
server {<hostname>|<ip-addr>} [timeout <1-1000>] [name-check {on|off}]
no server {<hostname>|<ip-addr>}
```

Parameter	Description	
<hostname>	Hostname of RadSec server	
<ip-addr>	Specify the client IPv4 address, in dotted decimal notation (A.B.C.D).	
`timeout`	Specify the amount of time that the RadSecProxy AAA application should wait for replies from this server. RADIUS server timeout (which defaults to 5 seconds).	
`<1-1000>`	Time in seconds to wait for a server reply.	
`name-check`	Specify whether or not to enforce certificate name checking for this client. If the parameter is not specified then the global behavior, which defaults to **on**, is used.	
	`on`	Enable name checking for this client.
	`off`	Disable name checking for this client.

Mode RadSecProxy AAA Configuration Mode

Usage notes The server may be specified by its domain name or by its IPv4 address. If a domain name is used, it must be resolvable using a configured DNS name server.

Each server may be configured with a timeout; if not specified, the global timeout value for RADIUS servers will be used. The global timeout may be changed using the **radius-server timeout** command. The default global timeout is 5 seconds.

Each server may be configured to use certificate name-checking; if not specified, the global behavior defined by **server name-check** or **no server name-check** will be used. If name checking is enabled, the Common Name portion of the subject field of the server's X.509 certificate must match the domain name or IP address specified in this command.

Example To add a server 'mynas.local' with a timeout of 3 seconds, and name checking off, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# server mynas.local name-check
off
```

Related commands

proxy-port

radius-secure-proxy aaa

server name-check

server trustpoint

server mutual-authentication

Overview This command enables or disables mutual certificate authentication for all RadSecProxy servers. When enabled, the RadSecProxy AAA application will send a local X.509 certificate to the server when establishing a TLS connection.

Use the **no** variant of this command to disable mutual certificate validation causing the RadSecProxy AAA application to not transmit a certificate to the server.

NOTE: *If mutual authentication is disabled on the client (AAA) application but enabled on the server, a connection will not be established.*

Syntax

```
server mutual-authentication
no server mutual-authentication
```

Default Mutual authentication is enabled by default.

Mode RadSecProxy AAA Configuration Mode

Example Disable mutual certificate validation with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# no server
mutual-authentication
```

Related commands

radius-secure-proxy aaa

server name-check

server (radsecproxy-aaa)

Command changes Version 5.4.6-2.1: command added

server name-check

Overview This command sets the global behavior for certificate name-checking for the RadSecProxy AAA application to **on**. This behavior will be used for all servers associated with the application that do not specify a behavior on a per-server basis. If name-checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in the **server (radsecproxy-aaa)** command.

Use the **no** variant of this command to set the global behavior for certificate name checking to **off**

Syntax

```
server name-check
no server name-check
```

Default Certificate name checking is on by default.

Mode RadSecProxy AAA Configuration Mode

Example Disable certificate name checking globally with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# no server name-check
```

Related commands

proxy-port

radius-secure-proxy aaa

server (radsecproxy-aaa)

server trustpoint

server trustpoint

Overview This command adds one or more trustpoints to be used with the RadSecProxy AAA application. Multiple trustpoints may be specified, or the command may be executed more than once, to add multiple trustpoints to the application.

The **no** version of this command removes one or more trustpoints from the list of trustpoints associated with the application.

Syntax

```
server trustpoint [<trustpoint-list>]
no server trustpoint [<trustpoint-list>]
```

Parameter	Description
<trustpoint-list>	Specify one or more trustpoints to be added or deleted.

Default By default, no trustpoints are associated with the application.

Mode RadSecProxy AAA Configuration Mode

Usage notes The device certificate associated with first trustpoint added to the application will be transmitted to remote servers. The certificate received from the remote server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

If no trustpoints are specified in the command, the trustpoint list will be unchanged.

If **no server trustpoint** is issued without specifying any trustpoints, then all trustpoints will be disassociated from the application.

Example You can add multiple trustpoints to the RadSecProxy AAA application by executing the command multiple times:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy aaa
awplus(config-radsecproxy-aaa)# server trustpoint example_1
awplus(config-radsecproxy-aaa)# server trustpoint example_2
```

Alternatively, add multiple trustpoints with a single command:

```
awplus(config-radsecproxy-aaa)# server trustpoint example_3
example_4
```

Disassociate all trustpoints from the RadSecProxy AAA application using the command:

```
awplus(config-radsecproxy-aaa)# no server trustpoint
```

show aaa local user locked

Overview This command displays the current number of failed attempts, last failure time and location against each user account attempting to log into the device.

Note that once the lockout count has been manually cleared by another privileged account using the clear aaa local user lockout command or a locked account successfully logs into the system after waiting for the lockout time, this command will display nothing for that particular account.

Syntax

```
show aaa local user locked
```

Mode User Exec and Privileged Exec

Example To display the current failed attempts for local users, use the command:

```
awplus# show aaa local user locked
```

Output Figure 42-1: Example output from the **show aaa local user locked** command

```
awplus# show aaa local user locked
Login           Failures Latest failure     From
bob                  3    05/23/14 16:21:37  ttyS0

show debugging aaa

Overview Use this command to see what debugging is turned on for AAA (Authentication, Authorization, Accounting).

Syntax

```
show debugging aaa
```

Mode User Exec and Privileged Exec

Example To display the current debugging status of AAA, use the command:

```
awplus# show debug aaa
```

Output Figure 42-3: Example output from the **show debug aaa** command

```
AAA debugging status:
 Authentication debugging is on
 Accounting debugging is off
```

show radius server group

Overview Use this command to show the RADIUS server group configuration.

Syntax

```
show radius server group [<group-name>]
```

Parameter	Description
<group-name>	RADIUS server group name.

Default Command name is set to something by default.

Mode Privileged Exec

Usage Use this command with the *<group-name>* parameter to display information for a specific RADIUS server group, or without the parameter to display information for all RADIUS server groups.

Example To display information for all RADIUS server groups, use the command:

```
awplus# show radius server group
```

To display a information for a RADIUS server group named 'rad_group_list1', use the command:

```
awplus# show radius server group rad_group_list1
```

Output Figure 42-4: Example output from **show radius server group**

```
awplus#show radius server group
RADIUS Group Configuration
  Group Name : radius?
    Server Host/    Auth  Acct  Auth    Acct

43 RADIUS Commands

Introduction

Overview This chapter provides an alphabetical reference for commands used to configure the device to use RADIUS servers. For more information, see the RADIUS Feature Overview and Configuration Guide.

Command List

- "deadtime (RADIUS server group)" on page 2201
- "debug radius" on page 2202
- "ip radius source-interface" on page 2203
- "radius-server deadtime" on page 2204
- "radius-server host" on page 2205
- "radius-server key" on page 2208
- "radius-server retransmit" on page 2209
- "radius-server timeout" on page 2211
- "server (server group)" on page 2213
- "show debugging radius" on page 2215
- "show radius" on page 2216
- "undebug radius" on page 2219

deadtime (RADIUS server group)

Overview Use this command to configure the **deadtime** parameter for the RADIUS server group. This command overrides the global dead-time configured by the radius-server deadtime command. The configured deadtime is the time period in minutes to skip a RADIUS server for authentication or accounting requests if the server is "dead". Note that a RADIUS server is considered "dead" if there is no response from the server within a defined time period.

Use the **no** variant of this command to reset the deadtime configured for the RADIUS server group. If the global deadtime for RADIUS server is configured the value will be used for the servers in the group. The global deadtime for the RADIUS server is set to 0 minutes by default.

Syntax

```
deadtime <0-1440>
no deadtime
```

Parameter	Description
<0-1440>	Amount of time in minutes.

Default The deadtime is set to 0 minutes by default.

Mode Server Group Configuration

Usage If the RADIUS server does not respond to a request packet, the packet is retransmitted the number of times configured for the **retransmit** parameter (after waiting for a **timeout** period to expire). The server is then marked "dead", and the time is recorded. The **deadtime** parameter configures the amount of time to skip a dead server; if a server is dead, no request message is sent to the server for the **deadtime** period.

Examples To configure the deadtime for 5 minutes for the RADIUS server group "GROUP1", use the command:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# server 192.168.1.1
awplus(config-sg)# deadtime 5
```

To remove the deadtime configured for the RADIUS server group "GROUP1", use the command:

```
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# no deadtime
```

Related commands aaa group server

radius-server deadtime

debug radius

Overview This command enables RADIUS debugging. If no option is specified, all debugging options are enabled.

Use the **no** variant of this command to disable RADIUS debugging. If no option is specified, all debugging options are disabled.

Syntax

```
debug radius [packet|event|all]
no debug radius [packet|event|all]
```

Parameter	Description
`packet`	Debugging for RADIUS packets is enabled or disabled.
`event`	Debugging for RADIUS events is enabled or disabled.
`all`	Enable or disable all debugging options.

Default RADIUS debugging is disabled by default.

Mode Privileged Exec

Examples To enable debugging for RADIUS packets, use the command:

```
awplus#  debug radius packet
```

To enable debugging for RADIUS events, use the command:

```
awplus#  debug radius event
```

To disable debugging for RADIUS packets, use the command:

```
awplus# no debug radius packet
```

To disable debugging for RADIUS events, use the command:

```
awplus# no debug radius event
```

Related commands show debugging radius

undebug radius

ip radius source-interface

Overview This command configures the source IP address of every outgoing RADIUS packet to use a specific IP address or the IP address of a specific interface. If the specified interface is down or there is no IP address on the interface, then the source IP address of outgoing RADIUS packets depends on the interface the packets leave.

Use the **no** variant of this command to remove the source interface configuration. The source IP address in outgoing RADIUS packets will be the IP address of the interface from which the packets are sent.

Syntax

```
ip radius source-interface {<interface>|<ip-address>}
no ip radius source-interface
```

Parameter	Description
<interface>	Interface name.
<ip-address>	IP address in the dotted decimal format A.B.C.D.

Default Source IP address of outgoing RADIUS packets depends on the interface the packets leave.

Mode Global Configuration

Examples To configure all outgoing RADIUS packets to use the IP address of the interface “vlan1” for the source IP address, use the following commands:

```
awplus# configure terminal
awplus(config)# ip radius source-interface vlan1
```

To configure the source IP address of all outgoing RADIUS packets to use 192.168.1.10, use the following commands:

```
awplus# configure terminal
awplus(config)# ip radius source-interface 192.168.1.10
```

To reset the source interface configuration for all outgoing RADIUS packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip radius source-interface
```

Related commands radius-server host

radius-server deadtime

Overview Use this command to specify the global **deadtime** for all RADIUS servers. If a RADIUS server is considered dead, it is skipped for the specified deadtime. This command specifies for how many minutes a RADIUS server that is not responding to authentication requests is passed over by requests for RADIUS authentication.

Use the **no** variant of this command to reset the global deadtime to the default of 0 seconds, so that RADIUS servers are not skipped even if they are dead.

Syntax

```
radius-server deadtime <minutes>
no radius-server deadtime
```

Parameter	Description
<minutes>	RADIUS server deadtime in minutes in the range 0 to 1440 (24 hours).

Default The default RADIUS deadtime configured on the system is 0 seconds.

Mode Global Configuration

Usage The RADIUS client considers a RADIUS server to be dead if it fails to respond to a request after it has been retransmitted as often as specified globally by the radius-server retransmit command or for the server by the radius-server host command. To improve RADIUS response times when some servers may be unavailable, set a **deadtime** to skip dead servers.

Examples To set the dead time of the RADIUS server to 60 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server deadtime 60
```

To disable the dead time of the RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server deadtime
```

Related commands

deadtime (RADIUS server group)

radius-server host

radius-server retransmit

radius-server host

Overview Use this command to specify a remote RADIUS server host for authentication or accounting, and to set server-specific parameters. The parameters specified with this command override the corresponding global parameters for RADIUS servers. This command specifies the IP address or host name of the remote RADIUS server host and assigns authentication and accounting destination UDP port numbers.

This command adds the RADIUS server address and sets parameters to the RADIUS server. The RADIUS server is added to the running configuration after you issue this command. If parameters are not set using this command then common system settings are applied.

Use the **no** variant of this command to remove the specified server host as a RADIUS authentication and/or accounting server and set the destination port to the default RADIUS server port number (1812).

Syntax

```
radius-server host {<host-name>|<ip-address>} [acct-port
<0-65535>] [auth-port <0-65535>] [key <key-string>] [retransmit
<0-100>] [timeout <1-1000>]
```

```
no radius-server host {<host-name>|<ip-address>} [acct-port
<0-65535>] [auth-port <0-65535>]
```

Parameter	Description
<host-name>	Server host name. The DNS name of the RADIUS server host.
<ip-address>	The IP address of the RADIUS server host.
`acct-port`	Accounting port. Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the server is not used for accounting. The default UDP port for accounting is 1813.
<0-65535>	UDP port number. (Accounting port number is set to (accounting port number is set to 1813 by default) Specifies the UDP destination port for RADIUS accounting requests. If 0 is specified, the host is not used for accounting.
`auth-port`	Authentication port. Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the server is not used for authentication. The default UDP port for authentication is 1812.
<0-65535>	UDP port number (authentication port number is set to 1812 by default). Specifies the UDP destination port for RADIUS authentication requests. If 0 is specified, the host is not used for authentication.
`timeout`	Specifies the amount of time to wait for a response from the server. If this parameter is not specified the global value configured by the **radius-server timeout** command is used.

Parameter	Description
<1-1000>	Time in seconds to wait for a server reply (timeout is set to 5 seconds by default). The time interval (in seconds to wait for the RADIUS server to reply before retransmitting a request or considering the server dead. This setting overrides the global value set by the **radius-server timeout** command. If no timeout value is specified for this server, the global value is used.
`retransmit`	Specifies the number of retries before skip to the next server. If this parameter is not specified the global value configured by the **radius-server retransmit** command is used.
<0-100>	Maximum number of retries (maximum number of retries is set to 3 by default). The maximum number of times to resend a RADIUS request to the server, if it does not respond within the timeout interval, before considering it dead and skipping to the next RADIUS server. This setting overrides the global setting of the **radius- server retransmit** command. If no retransmit value is specified, the global value is used.
`key`	Set shared secret key with RADIUS servers.
<key-string>	Shared key string applied. Specifies the shared secret authentication or encryption key for all RADIUS communications between this device and the RADIUS server. This key must match the encryption used on the RADIUS daemon. All leading spaces are ignored, but spaces within and at the end of the string are used. If spaces are used in the string, do not enclose the string in quotation marks unless the quotation marks themselves are part of the key. This setting overrides the global setting of the **radius-server key** command. If no key value is specified, the global value is used.

Default The RADIUS client address is not configured (null) by default. No RADIUS server is configured.

Mode Global Configuration

Usage Multiple **radius -server host** commands can be used to specify multiple hosts. The software searches for hosts in the order they are specified. If no host-specific timeout, retransmit, or key values are specified, the global values apply to that host. If there are multiple RADIUS servers for this client, use this command multiple times—once to specify each server.

If you specify a host without specifying the auth port or the acct port, it will by default be configured for both authentication and accounting, using the default UDP ports. To set a host to be a RADIUS server for authentication requests only, set the **acct-port** parameter to 0; to set the host to be a RADIUS server for accounting requests only, set the auth-port parameter to 0.

A RADIUS server is identified by IP address, authentication port and accounting port. A single host can be configured multiple times with different authentication or accounting ports. All the RADIUS servers configured with this command are included in the predefined RADIUS server group radius, which may be used by AAA authentication, authorization and accounting commands. The client transmits

(and retransmits, according to the **retransmit** and **timeout** parameters) RADIUS authentication or accounting requests to the servers in the order you specify them, until it gets a response.

Examples To add the RADIUS server `10.0.0.20`, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20
```

To set the secret key to **allied** on the RADIUS server `10.0.0.20`, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 10.0.0.20 key allied
```

To delete the RADIUS server `10.0.0.20`, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host 10.0.0.20
```

To configure `rad1.company.com` for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad1.company.com acct-port 0
```

To remove the RADIUS server `rad1.company.com` configured for authentication only, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server host rad1.company.com
acct-port 0
```

To configure `rad2.company.com` for accounting only, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host rad2.company.com auth-port 0
```

To configure 192.168.1.1 with authentication port 1000, accounting port 1001 and retransmit count 5, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server host 192.168.1.1 auth-port 1000
acct-port 1001 retransmit 5
```

Command changes Version 5.4.9-2.1: **key-encrypted** parameter added.

Related commands

aaa group server

radius-server key

radius-server retransmit

radius-server timeout

radius-server key

Overview This command sets a global secret key for RADIUS authentication on the device. The shared secret text string is used for RADIUS authentication between the device and a RADIUS server.

Note that if no secret key is explicitly specified for a RADIUS server, the global secret key will be used for the shared secret for the server.

Use the **no** variant of this command to reset the secret key to the default (null).

Syntax

```
radius-server key <key-string>
no radius-server key
```

Parameter	Description
<key-string>	Shared secret among RADIUS server and 802.1X client.

Default The RADIUS server secret key on the system is not set by default (null).

Mode Global Configuration

Usage Use this command to set the global secret key shared between this client and its RADIUS servers. If no secret key is specified for a particular RADIUS server using the **radius-server host** command, this global key is used.

After enabling AAA authentication with the **aaa authentication login** command, set the authentication and encryption key using the **radius-server key** command so the key entered matches the key used on the RADIUS server.

Examples To set the global secret key to **allied** for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server key allied
```

To set the global secret key to **secret** for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server key secret
```

To delete the global secret key for RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server key
```

Related commands radius-server host

radius-server retransmit

Overview This command sets the retransmit counter to use RADIUS authentication on the device. This command specifies how many times the device transmits each RADIUS request to the RADIUS server before giving up.

This command configures the **retransmit** parameter for RADIUS servers globally. If the **retransmit** parameter is not specified for a RADIUS server by the **radius-server host** command then the global configuration set by this command is used for the server instead.

Use the **no** variant of this command to reset the re-transmit counter to the default (3).

Syntax

```
radius-server retransmit <retries>
no radius-server retransmit
```

Parameter	Description
<retries>	RADIUS server retries in the range <0-100>. The number of times a request is resent to a RADIUS server that does not respond, before the server is considered dead and the next server is tried. If no retransmit value is specified for a particular RADIUS server using the **radius-server host** command, this global value is used.

Default The default RADIUS retransmit count on the device is 3.

Mode Global Configuration

Examples To set the RADIUS **retransmit** count to 1, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 1
```

To set the RADIUS **retransmit** count to the default (3), use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server retransmit
```

To configure the RADIUS **retransmit** count globally with 5, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 5
```

To disable retransmission of requests to a RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server retransmit 0
```

Related commands

radius-server deadtime

radius-server host

radius-server timeout

Overview Use this command to specify the RADIUS global timeout value. This is how long the device waits for a reply to a RADIUS request before retransmitting the request, or considering the server to be dead. If no timeout is specified for the particular RADIUS server by the **radius-server host** command, it uses this global timeout value.

Note that this command configures the **timeout** parameter for RADIUS servers globally.

The **no** variant of this command resets the transmit timeout to the default (5 seconds).

Syntax

```
radius-server timeout <seconds>
no radius-server timeout
```

Parameter	Description
<seconds>	RADIUS server timeout in seconds in the range 1 to 1000. The global time in seconds to wait for a RADIUS server to reply to a request before retransmitting the request, or considering the server to be dead (depending on the **radius-server retransmit** command).

Default The default RADIUS transmit timeout on the system is 5 seconds.

Mode Global Configuration

Examples To globally set the device to wait 20 seconds before retransmitting a RADIUS request to unresponsive RADIUS servers, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 20
```

To set the RADIUS **timeout** parameter to 1 second, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 1
```

To set the RADIUS **timeout** parameter to the default (5 seconds), use the following commands:

```
awplus# configure terminal
awplus(config)# no radius-server timeout
```

To configure the RADIUS server **timeout** period globally with 3 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server timeout 3
```

To reset the global **timeout** period for RADIUS servers to the default, use the following command:

```
awplus# configure terminal
awplus(config)# no radius-server timeout
```

Related commands

radius-server retransmit

server (server group)

Overview This command adds a RADIUS server to a server group in Server-Group Configuration mode. The RADIUS server should be configured by the radius-server host command.

The server is appended to the server list of the group and the order of configuration determines the precedence of servers. If the server exists in the server group already, it will be removed before added as a new server.

The server is identified by IP address and authentication and accounting UDP port numbers. So a RADIUS server can have multiple entries in a group with different authentication and/or accounting UDP ports. The **auth-port** specifies the UDP destination port for authentication requests to the server. To disable authentication for the server, set `auth-port` to 0. If the authentication port is missing, the default port number is 1812. The **acct-port** specifies the UDP destination port for accounting requests to the server. To disable accounting for the server, set `acct-port` to 0. If the accounting port is missing, the default port number is 1812.

Use the **no** variant of this command to remove a RADIUS server from the server group.

Syntax

```
server {<hostname>|<ip-address>} [auth-port
<0-65535>][acct-port <0-65535>]
```

```
no server {<hostname>|<ip-address>} [auth-port
<0-65535>][acct-port <0-65535>]
```

Parameter	Description
<hostname>	Server host name
<ip-address>	Server IP address The server is identified by IP address, authentication and accounting UDP port numbers. So a RADIUS server can have multiple entries in a group with different authentication and/or accounting UDP ports.
`auth-port`	Authentication port The **auth-port** specifies the UDP destination port for authentication requests to the server. To disable authentication for the server, set **auth-port** to 0. If the authentication port is missing, the default port number is 1812.
<0-65535>	UDP port number (default: 1812)
`acct-port`	Accounting port The **acct-port** specifies the UDP destination port for accounting requests to the server. To disable accounting for the server, set **acct-port** to 0. If the accounting port is missing, the default port number is 1813.
<0-65535>	UDP port number (default: 1813)

Default The default Authentication port number is 1812 and the default Accounting port number is 1813.

Mode Server Group Configuration

Usage notes The RADIUS server to be added must be configured by the **radius-server host** command. In order to add or remove a server, the **auth-port** and **acct-port** parameters in this command must be the same as the corresponding parameters in the **radius-server host** command.

Examples To create a RADIUS server group RAD_AUTH1 for authentication, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius RAD_AUTH1
awplus(config-sg)# server 192.168.1.1 acct-port 0
awplus(config-sg)# server 192.168.2.1 auth-port 1000 acct-port
0
```

To create a RADIUS server group RAD_ACCT1 for accounting, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius RAD_ACCT1
awplus(config-sg)# server 192.168.2.1 auth-port 0 acct-port
1001
awplus(config-sg)# server 192.168.3.1 auth-port 0
```

To remove server 192.168.3.1 from the existing server group **GROUP1**, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa group server radius GROUP1
awplus(config-sg)# no server 192.168.3.1
```

show debugging radius

Overview This command displays the current debugging status for the RADIUS servers.

Syntax

```
show debugging radius
```

Mode User Exec and Privileged Exec

Example To display the current debugging status of RADIUS servers, use the command:

```
awplus# show debugging radius
```

Output Figure 43-1: Example output from the **show debugging radius** command

```
RADIUS debugging status:
 RADIUS event debugging is off
 RADIUS packet debugging is off
```

show radius

Overview This command displays the current RADIUS server configuration and status.

Syntax

```
show radius
```

Mode User Exec and Privileged Exec

Example To display the current status of RADIUS servers, use the command:

```
awplus# show radius
```

Output Figure 43-2: Example output from the **show radius** command showing RADIUS servers

```
RADIUS Global Configuration
 Source Interface : not configured
 Secret Key : secret
 Timeout : 5 sec
 Retransmit Count : 3
 Deadtime : 20 min
Server Host : 192.168.1.10
 Authentication Port : 1812
 Accounting Port : 1813
 Secret Key : secret
 Timeout : 3 sec
 Retransmit Count : 2
Server Host : 192.168.1.11
 Authentication Port : 1812
 Accounting Port : not configured

Server Name/   Auth   Acct   Auth     Acct
IP Address     Port   Port   Status   Status
-----------------------------------------------------------
192.168.1.10   1812   1813   Alive    Alive
192.168.1.11   1812   N/A    Alive    N/A
```

Example See the sample output below showing RADIUS client status and RADIUS configuration:

```
awplus# show radius
```

Output Figure 43-3: Example output from the **show radius** command showing RADIUS client status

```
RADIUS global interface name: awplus
 Secret key:
 Timeout: 5
 Retransmit count: 3
 Deadtime: 0

Server Address: 150.87.18.89
 Auth destination port: 1812
 Accounting port: 1813
 Secret key: swg
 Timeout: 5
 Retransmit count: 3
 Deadtime: 0
```

Output Parameter	Meaning
Source Interface	The interface name or IP address to be used for the source address of all outgoing RADIUS packets.
Secret Key	A shared secret key to a radius server.
Timeout	A time interval in seconds.
Retransmit Count	The number of retry count if a RADIUS server does not response.
Deadtime	A time interval in minutes to mark a RADIUS server as “dead”.
Interim-Update	A time interval in minutes to send Interim-Update Accounting report.
Group Deadtime	The deadtime configured for RADIUS servers within a server group.
Server Host	The RADIUS server hostname or IP address.
Authentication Port	The destination UDP port for RADIUS authentication requests.
Accounting Port	The destination UDP port for RADIUS accounting requests.

Output Parameter	Meaning	
`Auth Status`	The status of the authentication port. The status ("dead", "error", or "alive") of the RADIUS authentication server and, if dead, how long it has been dead for.	
	`Alive`	The server is alive.
	`Error`	The server is not responding.
	`Dead`	The server is detected as dead and it will not be used for deadtime period. The time displayed in the output shows the server is in dead status for that amount of time.
	`Unknown`	The server is never used or the status is unknown.
`Acct Status`	The status of the accounting port. The status ("dead", "error", or "alive") of the RADIUS accounting server and, if dead, how long it has been dead for.	

undebug radius

Overview This command applies the functionality of the **no** debug radius command.

44 Local RADIUS Server Commands

Introduction

Overview This chapter provides an alphabetical reference for commands used to configure the local RADIUS server on the device. For more information, see the Local RADIUS Server Feature Overview and Configuration Guide.

Command List

- "attribute" on page 2222
- "authentication" on page 2224
- "client (radsecproxy-srv)" on page 2225
- "client mutual-authentication" on page 2227
- "client name-check" on page 2228
- "client trustpoint" on page 2229
- "clear radius local-server statistics" on page 2230
- "copy fdb-radius-users (to file)" on page 2231
- "copy local-radius-user-db (from file)" on page 2233
- "copy local-radius-user-db (to file)" on page 2234
- "crypto pki enroll local (deleted)" on page 2235
- "crypto pki enroll local local-radius-all-users (deleted)" on page 2236
- "crypto pki enroll local user (deleted)" on page 2237
- "crypto pki export local pem (deleted)" on page 2238
- "crypto pki export local pkcs12 (deleted)" on page 2239
- "crypto pki trustpoint local (deleted)" on page 2240
- "debug crypto pki (deleted)" on page 2241
- "domain-style" on page 2242
- "egress-vlan-id" on page 2243

- "egress-vlan-name" on page 2244
- "group" on page 2245
- "nas" on page 2246
- "help radius-attribute" on page 2247
- "radius-secure-proxy local-server" on page 2249
- "radius-server local" on page 2250
- "server auth-port" on page 2251
- "server enable" on page 2252
- "show radius local-server group" on page 2253
- "show radius local-server nas" on page 2254
- "show radius local-server statistics" on page 2255
- "show radius local-server user" on page 2256
- "user (RADIUS server)" on page 2258
- "vlan (RADIUS server)" on page 2260

attribute

Overview Use this command to define a RADIUS attribute for the local RADIUS server user group.

For a complete list of defined RADIUS attributes and values, see the Local RADIUS Server Feature Overview and Configuration Guide.

When used with the **value** parameter the **attribute** command configures RADIUS attributes to the user group. If the specified attribute is already defined then it is replaced with the new value.

Use the **no** variant of this command to delete an attribute from the local RADIUS server user group.

Syntax

```
attribute [repeated] {<attribute-name>|<attribute-id>} <value>
no attribute {<attribute-name>|<attribute-id>}
```

Parameter	Description
`repeated`	This optional parameter allows you to set multiple instances of the same attribute name or attribute id.
<attribute-name>	RADIUS attribute name for standard attributes or Vendor-Specific attributes (see the Local RADIUS Server Feature Overview and Configuration Guide for tables of attributes).
<attribute-id>	RADIUS attribute numeric identifier for standard attributes.
<value>	RADIUS attribute value.

Default By default, no attributes are configured.

Mode RADIUS Server Group Configuration

Usage notes For the Standard attributes, the attribute may be specified using either the attribute name, or its numeric identifier. For example, the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause 1
```

will produce the same results as the command:

```
awplus(config-radsrv-group)# attribute 49 1
```

In the same way, where the specific attribute has a pre-defined value, the parameter *<value>* may be substituted with the Value Name or with its numeric value, for example the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause
user-request
```

will produce the same results as the command:

```
awplus(config-radsrv-group)# attribute 49 1
```

or the command:

```
awplus(config-radsrv-group)# attribute acct-terminate-cause 1
```

You can define more than one instance of an attribute name (or id) by using the **repeated** parameter. For example:

```
awplus(config-radsrv-group)# attribute repeated
Nas-filter-Rule "deny in tcp from any to 0.0.0.0/0 23”
awplus(config-radsrv-group)# attribute repeated
Nas-filter-Rule "deny in tcp from any to fe80::b1 23"
```

Examples To define the attribute name ‘Service-Type’ with Administrative User (6) to the RADIUS User Group ‘Admin’, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group Admin
awplus(config-radsrv-group)# attribute Service-Type 6
```

To delete the attribute ‘Service-Type’ from the RADIUS User Group ‘Admin’, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group Admin
awplus(config-radsrv-group)# no attribute Service-Type
```

To define multiple values for attribute 'NAS-Filter-Rule', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group dynamicAcl
awplus(config-radsrv-group)# attribute repeated
NAS-Filter-Rule "deny in tcp from any to 0.0.0.0/0 23"
awplus(config-radsrv-group)# attribute repeated
NAS-Filter-Rule "deny in tcp from any to fe80::b1 23"
```

To delete a specific value from the attribute 'NAS-Filter-Rule', use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group dynamicAcl
awplus(config-radsrv-group)# no attribute NAS-Filter-Rule "deny
in tcp from any to 0.0.0.0/0 23"
```

help radius-attribute

Command changes Version 5.5.0-1.1: **repeated** parameter added

authentication

Overview Use this command to enable the specified authentication methods on the local RADIUS server.

Use the **no** variant of this command to disable specified authentication methods on the local RADIUS server.

Syntax

```
authentication {mac|eapmd5|eaptls|peap}
no authentication {mac|eapmd5|eaptls|peap}
```

Parameter	Description
`mac`	Enable MAC authentication method.
`eapmd5`	Enable EAP-MD5 authentication method.
`eaptls`	Enable EAP-TLS authentication method.
`peap`	Enable EAP-PEAP authentication method.

Default All authentication methods are enabled by default.

Mode RADIUS Server Configuration

Examples The following commands enable EAP-MD5 authentication methods on the local RADIUS server.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# authentication eapmd5
```

The following commands disable EAP-MD5 authentication methods on Local RADIUS server.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no authentication eapmd5
```

Related commands server enable

show radius local-server statistics

client (radsecproxy-srv)

Overview Use this command to add a RadSec client (for example, a NAS device) to the RadSecProxy local-server application. The application will accept RADIUS requests from all configured clients.

Use the **no** variant of this command to delete a previously-configured client from the RadSecProxy local-server application.

Syntax

```
client {<hostname>|<ip-addr>} [name-check {on|off}]
no client {<hostname>|<ip-addr>}
```

Parameter	Description	
<hostname>	Hostname of client.	
<ip-addr>	Specify the client IPv4 address, in dotted decimal notation (A.B.C.D).	
`name-check`	Specify whether or not to enforce certificate name checking for this client. If the parameter is not specified then the global behavior, which defaults to **on**, is used.	
	`on`	Enable name checking for this client.
	`off`	Disable name checking for this client.

Mode RadSecProxy Local Server Configuration

Usage notes The client may be specified by its domain name or by its IPv4 address. If a domain name is used, it must be resolvable using a configured DNS name server.

Each client may be configured to use certificate name-checking; if not specified, the global behavior defined by **client name-check** or **no client name-check** will be used. If name checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in this command.

NOTE: *If mutual authentication is disabled then this parameter has no effect, see the client mutual-authentication command.*

Example To add a client called 'mynas.local' with certificate name checking **off**, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# client mynas.local name-check
off
```

Related commands

client mutual-authentication

client name-check

client trustpoint

radius-secure-proxy local-server

client mutual-authentication

Overview This command enables or disables mutual certificate authentication for all RadSecProxy clients. When enabled, the RadSecProxy local-server application will request and validate an X.509 certificate from the client when establishing a connection.

The **no** variant of this command disables mutual certificate validation. The local-server application will still transmit the local server certificate to the client, but will not expect or validate a certificate from the client.

Syntax

```
client mutual-authentication
no client mutual-authentication
```

Default Mutual authentication is enabled by default.

Mode RadSecProxy Local Server Configuration

Example Disable mutual certificate validation with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# no client
mutual-authentication
```

Related commands

client (radsecproxy-srv)

client name-check

radius-secure-proxy local-server

Command changes Version 5.4.6-2.1: command added

client name-check

Overview This command sets the global behavior for certificate name-checking for the RadSecProxy localserver application to **on**. This behavior will be used for all clients associated with the application that do not specify a behavior on a per-client basis. If name-checking is enabled, the Common Name portion of the subject field of the client's X.509 certificate must match the domain name or IP address specified in the **client (radsecproxy-aaa)** command.

Use the **no** variant of this command to set the global behavior for certificate name checking to **off**

Syntax

```
client name-check
no client name-check
```

Default Certificate name checking is on by default.

Mode RadSecProxy Local Server Configuration

Example Disable certificate name checking globally with the following command:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# no client name-check
```

Related commands

client (radsecproxy-srv)

client trustpoint

radius-secure-proxy local-server

client trustpoint

Overview This command adds one or more trustpoints to be used with the RadSecProxy local-server application. Multiple trustpoints may be specified, or the command may be executed more than once, to add multiple trustpoints to the application.

The **no** version of this command removes one or more trustpoints from the list of trustpoints associated with the application.

Syntax

```
client trustpoint [<trustpoint-list>]
no client trustpoint [<trustpoint-list>]
```

Parameter	Description
<trustpoint-list>	Specify one or more trustpoints to be added or deleted.

Mode RadSecProxy Local Server Configuration

Usage notes The device certificate associated with the first trustpoint added to the application will be transmitted to remote servers. The certificate received from the remote server must have an issuer chain that terminates with the root CA certificate for any of the trustpoints that are associated with the application.

If you enter **client trustpoint** without specifying a trustpoint, the trustpoint list will be unchanged.

If you enter **no client trustpoint** without specifying a trustpoint, all trustpoints will be disassociated from the application.

Example You can add multiple trustpoints to the RadSecProxy local-server by executing the command multiple times:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)# client trustpoint example_1
awplus(config-radsecproxy-srv)# client trustpoint example_2
```

Alternatively, add multiple trustpoints with a single command:

```
awplus(config-radsecproxy-srv)# client trustpoint example_3
example_4
```

Disassociate all trustpoints from the RadSecProxy local-server application using the command:

```
awplus(config-radsecproxy-srv)# no client trustpoint
```

clear radius local-server statistics

Overview Use this command to clear the statistics stored on the device for the local RADIUS server.

Use this command without any parameters to clear all types of local RADIUS server statistics.

Syntax

```
clear radius local-server statistics [nas|server|user]
```

Parameter	Description
`nas`	Clear the NAS (Network Access Server) statistics on the device. For example, clearing statistics stored for NAS server invalid passwords.
`server`	Clear the Local RADIUS Server statistics on the device. For example, clearing Local RADIUS Servers statistics for all failed login attempts.
`user`	Clear the Local RADIUS Server user statistics. For example, clearing statistics stored for the number of successful user logins.

Mode Privileged Exec

Usage Refer to the sample output for the show radius local-server statistics for further information about the type of statistics each parameter option for this command clears. Both the **nas** and **server** parameters clear unknown username and invalid passwords statistics, while the `user` parameter clears the number of successful and failed logins for each local RADIUS server user.

Examples To clear the NAS (Network Access Server) statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics nas
```

To clear the local RADIUS server statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics server
```

To clear the local RADIUS server user statistics stored on the device, use the command:

```
awplus# clear radius local-server statistics user
```

Related commands show radius local-server statistics

copy fdb-radius-users (to file)

Overview Use this command to create a set of local RADIUS server users from MAC addresses in the local FDB. A local RADIUS server user created using this command can be used for MAC authentication.

Syntax

```
copy fdb-radius-users
{local-radius-user-db|nvs|flash|usb|debug|tftp|scp|
fserver|<url>} [interface <port>] [vlan <vid>] [group <name>]
[export-vlan [<radius-group-name>]]
```

Parameter	Description
`local-radius-user-db`	Copy the local RADIUS server users created to the local RADIUS server.
`nvs`	Copy the local RADIUS server users created to NVS memory.
`flash`	Copy the local RADIUS server users created to Flash memory.
`usb`	Copy the local RADIUS server users created to USB storage device.
`debug`	Copy the local RADIUS server users created to debug.
`tftp`	Copy the local RADIUS server users created to the TFTP destination.
`scp`	Copy the local RADIUS server users created to the SCP destination.
`fserver`	Copy the local RADIUS server users created to the remote file server.
<url>	Copy the local RADIUS server users created to the specified URL.
`interface` *<port>*	Copy only MAC addresses learned on a specified device port. Wildcards may be used when specifying an interface name.
`vlan` *<vid>*	Copy only MAC addresses learned on a specified VLAN.
`group` *<name>*	Assign a group name to the local RADIUS server users created.
`export-vlan`	Export VLAN ID assigned to exported FDB entry.
<radius-group-name>	Prefix for Radius group name storing VLAN ID

Mode Privileged Exec

Usage notes The local RADIUS server users created are written to a specified destination file in local RADIUS user CSV (Comma Separated Values) format. The local RADIUS server users can then be imported to a local RADIUS server using the copy local-radius-user-db (from file) command.

The name and password of the local RADIUS server users created use a MAC address, which can be used for MAC authentication.

This command does not copy a MAC address learned by the CPU or the management port.

This command can filter FDB entries by the interface name and the VLAN ID. When the interface name and the VLAN ID are specified, this command generates local RADIUS server users from only the MAC address learned on the specified interface and on the specified VLAN.

Examples

To register the local RADIUS server users from the local FDB directly to the local RADIUS server, use the command:

```
awplus# copy fdb-radius-users local-radius-user-db
```

To register the local RADIUS server users from the interface port1.0.1 to the local RADIUS server, use the command:

```
awplus# copy fdb-radius-users local-radius-user-db interface
port1.0.1
```

To copy output generated as local RADIUS server user data from MAC addresses learned on vlan10 on interface port1.0.1 to the file radius-user.csv, use the command:

```
awplus# copy fdb-radius-users radius-user.csv interface
port1.0.1 vlan10
```

To copy output generated as local RADIUS server user data from MAC addresses learned on vlan10 on interface port1.0.1 to a file on the remote file server, use the command:

```
awplus# copy fdb-radius-users fserver interface port1.0.1
vlan10
```

Related commands

copy local-radius-user-db (to file)

copy local-radius-user-db (from file)

copy local-radius-user-db (from file)

Overview Use this command to copy the Local RADIUS server user data from a file. The file, including the RADIUS user data in the file, must be in the CSV (Comma Separated Values) format.

You can select **add** or **replace** as the copy method. The **add** parameter option copies the contents of specified file to the local RADIUS server user database. If the same user exists then the old user is removed before adding a new user. The **replace** parameter option deletes all contents of the local RADIUS server user database before copying the contents of specified file.

Syntax

```
copy <source-url> local-radius-user-db [add|replace]
```

Parameter	Description
<source-url>	URL of the source file.
`add`	Add file contents to local RADIUS server user database.
`replace`	Replace current local RADIUS server user database with file contents.

Default When no copy method is specified with this command the **replace** option is applied.

Mode Privileged Exec

Examples To replace the current local RADIUS server user data to the contents of http://datahost/ user.csv, use the following command:

```
awplus# copy http://datahost/user.csv local-radius-user-db
```

To add the contents of http://datahost/user.csv to the current local RADIUS server user database, use the following command:

```
awplus# copy http://datahost/user.csv local-radius-user-db add
```

Related commands copy fdb-radius-users (to file)

copy local-radius-user-db (to file)

copy local-radius-user-db (to file)

Overview Use this command to copy the local RADIUS server user data to a file. The output file produced is CSV (Comma Separated Values) format.

Syntax

```
copy local-radius-user-db
{nvs|flash|usb|tftp|scp|<destination-url>}
```

Parameter	Description
`nvs`	Copy to NVS memory.
`flash`	Copy to Flash memory.
`usb`	Copy to USB storage device.
`tftp`	Copy to TFTP destination.
`scp`	Copy to SCP destination.
`<destination-url>`	URL of the Destination file.

Mode Privileged Exec

Example Copy the current local RADIUS server user data to http://datahost/user.csv.

```
awplus# copy local-radius-user-db http://datahost/user.csv
```

Overview This command is no longer available. Please use the following command instead:

```
crypto pki trustpoint <trustpoint>
```

Note that “local” is a valid name for a trustpoint, so you do not need to modify existing configurations or scripts.

debug crypto pki (deleted)

Overview This command is no longer available.

domain-style

Overview Use this command to enable a specified domain style on the local RADIUS server. The local RADIUS server decodes the domain portion of a username login string when this command is enabled.

Use the **no** variant of this command to disable the specified domain style on the local RADIUS server.

Syntax

```
domain-style {suffix-atsign|ntdomain}
no domain-style {suffix-atsign|ntdomain}
```

Parameter	Description
`suffix-atsign`	Enable at sign "@" delimited suffix style, i.e. "user@domain".
`ntdomain`	Enable NT domain style, i.e. "domain\user".

Default This feature is disabled by default.

Mode RADIUS Server Configuration

Usage notes When both domain styles are enabled, the first domain style configured has the highest priority. A username login string is matched against the first domain style enabled. Then, if the username login string is not decoded, it is matched against the second domain style enabled.

Examples To enable NT domain style on the local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# domain-style ntdomain
```

To disable NT domain style on the local RADIUS server, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no domain-style ntdomain
```

Related commands server enable

egress-vlan-id

Overview Use this command to configure the standard RADIUS attribute "Egress-VLANID (56)" for the local RADIUS Server user group.

Use the **no** variant of this command to remove the Egress-VLANID attribute from the local RADIUS server user group.

Syntax

```
egress-vlan-id <vid> [tagged|untagged]
no egress-vlan-id
```

Parameter	Description
<vid>	The VLAN identifier to be used for the Egress VLANID attribute, in the range 1 to 4094.
`tagged`	Set frames on the VLAN as tagged. This sets the tag indication field to indicate that all frames on this VLAN are tagged.
`untagged`	Set all frames on the VLAN as untagged. This sets the tag indication field to indicate that all frames on this VLAN are untagged.

Default By default, no Egress-VLANID attributes are configured.

Mode RADIUS Server Group Configuration

Examples To set the "Egress-VLANID" attribute for the *NormalUsers* local RADIUS server user group to VLAN identifier 200, with tagged frames, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# egress-vlan-id 200 tagged
```

To remove the "Egress-VLANID" attribute for the *NormalUsers* local RADIUS server user group, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no egress-vlan-id
```

Related commands attribute

egress-vlan-name

egress-vlan-name

Overview Use this command to configure the standard RADIUS attribute "Egress-VLAN-Name (58)" for the local RADIUS server user group.

Use the **no** variant of this command to remove the Egress-VLAN-Name attribute from the local RADIUS server user group.

Syntax

```
egress-vlan-name <vlan-name> [tagged|untagged]
no egress-vlan-name
```

Parameter	Description
<vlan-name>	The VLAN name to be configured as the Egress-VLAN-Name attribute.
`tagged`	Set frames on the VLAN as tagged. This sets the tag indication field to indicate that all frames on this VLAN are tagged.
`untagged`	Set all frames on the VLAN as untagged. This sets the tag indication field to indicate that all frames on this VLAN are untagged.

Default By default, no Egress-VLAN-Name attributes are configured.

Mode RADIUS Server Group Configuration

Examples To configure the "Egress-VLAN-Name" attribute for the RADIUS server user group *NormalUsers* with the VLAN name *vlan2* and all frames on this VLAN tagged, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# egress-vlan-name vlan2 tagged
```

To delete the "Egress-VLAN-Name" attribute for the *NormalUsers* group, use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no egress-vlan-name
```

Related commands attribute

egress-vlan-id

group

Overview Use this command to create a local RADIUS server user group, and enter local RADIUS Server User Group Configuration mode.

Use the **no** variant of this command to delete the local RADIUS server user group.

Syntax

```
group <user-group-name>
no group <user-group-name>
```

Parameter	Description
<user-group-name>	User group name string.

Mode RADIUS Server Configuration

Examples The following command creates the user group NormalUsers.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
```

The following command deletes user group NormalUsers.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no group NormalUsers
```

Related commands

nas

Overview This command adds a client device (the Network Access Server or the NAS) to the list of devices that are able to send authentication requests to the local RADIUS server. The NAS is identified by its IP address and a shared secret (also referred to as a shared key) must be defined that the NAS will use to establish its identity.

Use the **no** variant of this command to remove a NAS client from the list of devices that are allowed to send authentication requests to the local RADIUS server.

Syntax

```
nas <ip-address> key <nas-keystring>
no nas <ip-address>
```

Parameter	Description
<ip-address>	RADIUS NAS IP address.
<nas-keystring>	NAS shared keystring.

Mode RADIUS Server Configuration

Examples The following commands add the NAS with an IP address of `192.168.1.2` to the list of clients that may send authentication requests to the local RADIUS server. Note the shared key that this NAS will use to establish its identify is NAS_PASSWORD.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# nas 192.168.1.2 key NAS_PASSWORD
```

The following commands remove the NAS with an IP address of `192.168.1.2` from the list of clients that are allowed to send authentication requests to the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no nas 192.168.1.2
```

Related commands show radius local-server nas

help radius-attribute

Overview Use this command to display a list of standard and vendor specific valid RADIUS attributes that are supported by the local RADIUS server.

Syntax `help radius-attribute [<attribute-name>|<attribute-ID>]`

Parameter	Description
<attribute-name>	List the details and predefined values for the named attribute.
<attribute-ID>	List the details and predefined values for the given attribute ID.

Mode Privileged Exec

Usage notes When used without a parameter, this command lists all of the available RADIUS attributes.

When used with an attribute name or ID, this command displays the attribute name, value type, and any predefined values.

Example To list all available RADIUS attributes, use the following command:

```
awplus# help radius-attribute
```

```
awplus#help radius-attribute
Standard Attributes:
  1     User-Name
  2     User-Password
  3     CHAP-Password
  4     NAS-IP-Address
  5     NAS-Port
  6     Service-Type
...
```

To display the details for the RADIUS attribute Frag-Status, use the following command:

```
awplus# help radius-attribute frag-status
```

```
awplus#help radius-attribute frag-status
Frag-Status : integer (Integer number)

Pre-defined values :
    Fragmentation-Supported (1)
    More-Data-Pending (2)
    More-Data-Request (3)
    Reserved (0)
```

radius-secure-proxy local-server

Overview Use this command to enter the RadSecProxy local-server application configuration mode. This application allows remote RadSec clients to communicate with the local RADIUS server process via a secure (TLS) proxy.

Syntax
```
radius-secure-proxy local-server
```

Mode Global Configuration Mode

Example To change mode from User Exec mode to the RadSecProxy local-server configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# radius-secure-proxy local-server
awplus(config-radsecproxy-srv)#
```

Related commands
client (radsecproxy-srv)

radius-server local

Overview Use this command to navigate to the Local RADIUS server configuration mode (`config-radsrv`) from the Global Configuration mode (`config`).

Syntax
```
radius-server local
```

Mode Global Configuration

Example Local RADIUS Server commands are available from `config-radsrv` configuration mode. To change mode from User Exec mode to the Local RADIUS Server mode (config- radsrv), use the commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)#
```

Output

```
awplus(config)#radius-server local
Creating Local CA repository.....OK
Enrolling Local System to local trustpoint..OK
awplus(config-radsrv)#
```

server auth-port

Overview Use this command to change the UDP port number for local RADIUS server authentication.

Use the **no** variant of this command to reset the RADIUS server authentication port back to the default.

Syntax

```
server auth-port <1-65535>
no server auth-port
```

Parameter	Description
<1-65535>	UDP port number.

Default The default local RADIUS server UDP authentication port number is 1812.

Mode RADIUS Server Configuration

Examples The following commands set the RADIUS server authentication port to 10000.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server auth-port 10000
```

The following commands reset the RADIUS server authentication port back to the default UDP port of 1812.

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no server auth-port
```

Related commands

server enable

show radius local-server statistics

server enable

Overview This command enables the local RADIUS server. The local RADIUS server feature is started immediately when this command is issued.

The **no** variant of this command disables local RADIUS server. When this command is issued, the local RADIUS server stops operating.

Syntax

```
server enable
no server enable
```

Default The local RADIUS server is disabled by default and must be enabled for use with this command.

Mode RADIUS Server Configuration

Examples To enable the local RADIUS server, use the following commands:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# server enable
```

To disable the local RADIUS server, use the command:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no server enable
```

Overview Use this command to display information about NAS (Network Access Servers) registered to the local RADIUS server.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show radius local-server nas [<ip-address>]
```

Parameter	Description
<ip-address>	Specify NAS IP address for show output.

Mode User Exec and Privileged Exec

Example The following command displays NAS information.

```
awplus# show radius local-server nas
```

Output

Table 3: Example output from the **show radius local-server nas** command

```
NAS-Address     Shared-Key
-----------------------------------------------------------
127.0.0.1      awplus-local-radius-server
```

Table 4: Parameters in the output of the **show radius local-server nas** command

Parameter	Description
NAS-Address	IP address of NAS.
Shared-Key	Shared key used for RADIUS connection.

Related commands nas

show radius local-server statistics

Overview Use this command to display statistics about the local RADIUS server.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show radius local-server statistics
```

Mode User Exec and Privileged Exec

Usage notes Both unknown usernames and invalid passwords will display as failed logins in the show output.

Example The following command displays Local RADIUS server statistics.

```
awplus# show radius local-server statistics
```

Output

Table 5: Example output from the **show radius local-server statistics** command

```
Server status      : Run (administrative status is enable)

show radius local-server user

Overview Use this command to display information about the local RADIUS server user.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show radius local-server user [<user-name>]
show radius local-server user [<user-name>] format csv
show radius local-server user [<user-name>] detail
```

Parameter	Description
<user-name>	RADIUS user name. If no user name is specified, information for all users is displayed.
`format csv`	Format output as CSV. This parameter is only available in Privileged Exec mode.
`detail`	Display detailed information about the user.

Mode User Exec and Privileged Exec

Examples The following command displays Local RADIUS server user information for user Tom.

```
awplus# show radius local-server user Tom
```

Table 6: Example output from the **show radius local-server user** command

```
User-Name            Group               Vlan

Command changes

Version 5.4.9-0.1: **detail** parameter added

user (RADIUS server)

Overview Use this command to register a user to the local RADIUS server.

Use the **no** variant of this command to delete a user from the local RADIUS server.

Syntax

```
user <radius-user-name> [encrypted] password <user-password>
[group <user-group>]
```

```
no user <radius-user-name>
```

Parameter	Description
<radius-user-name>	RADIUS user name. This can also be a MAC address in the IEEE standard format of HH-HH-HH-HH-HH-HH if you are configuring MAC authentication to use local RADIUS server.
`encrypted`	Specifies that the password is being entered in its encrypted form, so that it is not further encrypted. When creating a new user, enter the password in plaintext, and do not use the **encrypted** parameter. Use the **encrypted** parameter only when referring to a user that has previously been created. For instance, when adding an existing user from another RADIUS server, use the **encrypted** parameter, and enter the encrypted version of the password that appears in the output of **show** commands for the user.
<user-password>	User password. This can also be a MAC address in the IEEE standard format of HH-HH-HH-HH-HH-HH if you are configuring MAC authentication to use local RADIUS server.
`group`	Specify the group for the user.
<user-group>	User group name.

Mode RADIUS Server Configuration

Usage notes RADIUS user names cannot contain question mark (?), space ( ), or quote (“ “) characters. RADIUS user names containing the below characters cannot use certificate authentication:

```
/ \ ‘$ &()*;< > ‘|
```

Certificates cannot be created and exported for RADIUS user names that contain the above characters. We advise you to avoid using these characters in RADIUS user names if you need to use certificate authentication, because you will not be able to create and export certificates.

You also can use the IEEE standard format hexadecimal notation (HH-HH-HH-HH-HH-HH) to specify a supplicant MAC address to configure the user name and user password parameters to use local RADIUS server for MAC Authentication. See the AAA and Port_Authentication Feature Overview and Configuration_Guide for a sample MAC configuration. See also the command **user**

00-db-59-ab-70-37 password 00-db-59-ab-70-37 as shown in the command examples.

Examples

The following commands add user "Tom" to the local RADIUS server and sets his password to "QwerSD".

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user Tom password QwerSD
```

The following commands add user "Tom" to the local RADIUS server user group "NormalUsers" and sets his password "QwerSD".

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user Tom password QwerSD group
NormalUsers
```

The following commands remove user "Tom" from the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no user Tom
```

The following commands add the supplicant MAC address 00-d0-59-ab-70-37 to the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# user 00-db-59-ab-70-37 password
00-db-59-ab-70-37
```

The following commands remove the supplicant MAC address 00-d0-59-ab-70-37 from the local RADIUS server:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# no user 00-db-59-ab-70-37
```

Related commands

group

show radius local-server user

vlan (RADIUS server)

Overview Use this command to set the VLAN ID or name for the local RADIUS server user group. The VLAN information is used for authentication with the dynamic VLAN feature.

Use the **no** variant of this command to clear the VLAN ID or VLAN name for the local RADIUS server user group.

Syntax

```
vlan {<vid>|<vlan-name>}
no vlan
```

Parameter	Description
<vid>	VLAN ID.
<vlan-name>	VLAN name.

Default VLAN information is not set by default.

Mode RADIUS Server Group Configuration

Examples The following commands set VLAN ID 200 to the group named *NormalUsers*:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# vlan 200
```

The following commands remove VLAN ID 200 from the group named *NormalUsers*:

```
awplus# configure terminal
awplus(config)# radius-server local
awplus(config-radsrv)# group NormalUsers
awplus(config-radsrv-group)# no vlan
```

show radius local-server user

45 Public Key Infrastructure and Crypto Commands

Introduction

Overview This chapter provides an alphabetical reference of commands used to configure the Public Key Infrastructure (PKI) capabilities on an AlliedWare Plus device. For more information about PKI, see the Public Key Infrastructure (PKI) Feature Overview and Configuration Guide.

Command List

- "crypto key generate rsa" on page 2262
- "crypto key zeroize" on page 2263
- "crypto pki authenticate" on page 2264
- "crypto pki enroll" on page 2265
- "crypto pki enroll user" on page 2266
- "crypto pki export pem" on page 2268
- "crypto pki export pkcs12" on page 2269
- "crypto pki import pem" on page 2271
- "crypto pki import pkcs12" on page 2273
- "crypto pki trustpoint" on page 2274
- "enrollment (ca-trustpoint)" on page 2275
- "fingerprint (ca-trustpoint)" on page 2276
- "no crypto pki certificate" on page 2278
- "rsakeypair (ca-trustpoint)" on page 2279
- "show crypto key mypubkey rsa" on page 2280
- "show crypto pki certificates" on page 2281
- "show crypto pki enrollment user" on page 2283
- "show crypto pki trustpoint" on page 2284
- "subject-name (ca-trustpoint)" on page 2285

crypto key generate rsa

Overview Use this command to generate a cryptographic public/private key pair for the Rivest-Shamir-Adleman (RSA) encryption algorithm.

Syntax

```
crypto key generate rsa [label <keylabel>] [<1024-4096>]
```

Parameter	Description
<keylabel>	The name of the key to be created. The name must start with an alphanumeric character, and may only contain alphanumeric characters, underscores, dashes, or periods. The maximum length of the name is 63 characters. If no label is specified the default value “server-default” is used.
<1024-4096>	The bit length for the key. If no bit length is specified the default of 2048 is used.

Mode Privileged Exec

Usage notes The generated key may be used for multiple server certificates in the system. A key is referenced by its label. A bit length between 1024 and 4096 bits may be specified. Larger bit lengths are more secure, but require more computation time.

The specified key must not already exist.

Example To create a key with the label "example-server-key" and a bit length of 2048, use the commands:

```
awplus> enable
awplus# crypto key generate rsa label example-server-key 2048
```

Related commands

crypto key zeroize

rsakeypair (ca-trustpoint)

show crypto key mypubkey rsa

crypto key zeroize

Overview Use this command to delete one or all cryptographic public/private key pairs.

Syntax

```
crypto key zeroize rsa <keylabel>
crypto key zeroize all
```

Parameter	Description
`rsa <keylabel>`	Delete a single key pair for the Rivest-Shamir-Adleman (RSA) encryption algorithm.
`all`	Delete all keys.

Mode Privileged Exec

Usage notes Note that this command has the same effect as using the **delete** command (it deletes the file from Flash memory but does not overwrite it with zeros).

The specified key must exist but must not be in use for any existing server certificates.

A key may not be deleted if it is associated with the server certificate or server certificate signing request for an existing trustpoint. To remove a server certificate so that the key may be deleted, use the **no crypto pki enroll** command to de-enroll the server.

Example To delete an RSA key named "example-server-key", use the following command:

```
awplus# crypto key zeroize rsa example-server-key
```

Related commands

crypto key generate rsa

show crypto key mypubkey rsa

Command changes

Version 5.4.6-1.1: zeroize functionality added to x930 Series

Version 5.4.8-1.2: zeroize functionality added to x220, XS900MX, x550 Series

Version 5.4.8-2.1: zeroize functionality added to SBx908 GEN2, x950 Series

crypto pki authenticate

Overview Use this command to authenticate a trustpoint by generating or importing the root CA certificate. This must be done before the server can be enrolled to the trustpoint.

Syntax

```
crypto pki authenticate <trustpoint>
```

Parameter	Description
<trustpoint>	The name of the trustpoint to be authenticated.

Mode Privileged Exec

Usage notes If the trustpoint's **enrollment** setting is "selfsigned", then this command causes a private key to be generated for the root CA, and a self-signed certificate to be generated based on that key.

If the trustpoint's **enrollment** setting is "terminal", then this command prompts the user to paste a certificate Privacy Enhanced Mail (PEM) file at the CLI terminal. If the certificate is a valid selfsigned CA certificate, then it will be stored as the trustpoint's root CA certificate.

The specified trustpoint must already exist, and its enrollment mode must have been defined.

Example To show the **enrollment** setting of a trustpoint named "example" and then generate a certificate from it, use the commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# enrollment selfsigned
awplus(config)# exit
awplus# exit
awplus# crypto pki authenticate example
```

Related commands

crypto pki import pem

crypto pki trustpoint

enrollment (ca-trustpoint)

crypto pki enroll

Overview Use this command to enroll the local server to the specified trustpoint.

Use the **no** variant of this command to de-enroll the server by removing its certificate

Syntax

```
crypto pki enroll <trustpoint>
no crypto pki enroll <trustpoint>
```

Parameter	Description
<trustpoint>	The name of the trustpoint to be enrolled

Mode Privileged Exec

Usage notes For the local server, "enrollment" is the process of creating of a certificate for the server that has been signed by a CA associated with the trustpoint. The public portion of the RSA key pair specified using the rsakeypair parameter for the trustpoint will be included in the server certificate.

If the trustpoint represents a locally self-signed certificate authority, then this command results in the direct generation of the server certificate, signed by the root CA for the trustpoint.

If the trustpoint represents an external certificate authority, then this command results in the generation of a Certificate Signing Request (CSR) file, which is displayed at the terminal in Privacy-Enhanced Mail (PEM) format, suitable for copying and pasting into a file or message. The CSR must be sent to the external CA for processing. When the CA replies with the signed certificate, that certificate should be imported using the crypto pki import pem command, to complete the enrollment process.

The specified trustpoint must already exist, and it must already be authenticated.

Example To enroll the local server with the trustpoint "example", use the following commands:

```
awplus> enable
awplus# crypto pki enroll example
```

Related commands

crypto pki enroll user

crypto pki import pem

crypto pki trustpoint

enrollment (ca-trustpoint)

crypto pki enroll user

Overview Use this command to enroll a single RADIUS user or all RADIUS users to the specified trustpoint.

Use the **no** variant of this command to remove the PKCS#12 file from the system. Note that the PKCS#12 files are generated in a temporary (volatile) file system, so a system restart also results in removal of all of the files.

Syntax

```
crypto pki enroll <trustpoint>
{user <username>|local-radius-all-users}
```

```
no crypto pki enroll <trustpoint>
{user <username>|local-radius-all-users}
```

Parameter	Description
<trustpoint>	The name of the trustpoint to which users are to be enrolled.
<username>	The name of the user to enroll to the trustpoint.

Mode Privileged Exec

Usage notes For RADIUS users, “enrollment” is the process of generating a private key and a corresponding client certificate for each user, with the certificate signed by the root CA for the trustpoint. The resulting certificates may be exported to client devices, for use with PEAP or EAP-TLS authentication with the local RADIUS server.

The specified trustpoint must represent a locally self-signed certificate authority.

The private key and certificate are packaged into a PKCS#12-formatted file, suitable for export using the **crypto pki export pkcs12** command. The private key is encrypted for security, with a passphrase that is entered at the command line. The passphrase is required when the PKCS#12 file is imported on the client system. The passphrase is not stored anywhere on the device, so users are responsible for remembering it until the export-import process is complete.

If **local-radius-all-users** is specified instead of an individual user, then keys and certificates for all RADIUS users will be generated at once. All the keys will be encrypted using the same passphrase.

The specified trustpoint must already exist, it must represent a locally self-signed CA, and it must already have been authenticated.

Example To enroll the user “example-user” with the trustpoint “example”, use the following commands:

```
awplus> enable
```

```
awplus# crypto pki enroll example user example-user
```

To enroll all local RADIUS users with the trustpoint “example”, use the following commands:

```
awplus> enable
awplus# crypto pki enroll example local-radius-all-users
```

Related commands

crypto pki export pkcs12

crypto pki trustpoint

crypto pki export pem

Overview Use this command to export the root CA certificate for the given trustpoint to a file in Privacy-Enhanced Mail (PEM) format. The file may be transferred to the specified destination URL, or displayed at the terminal.

Syntax

```
crypto pki export <trustpoint> pem [terminal|<url>]
```

Parameter	Description
<trustpoint>	The name of the trustpoint for which the root CA certificate is tobe exported.
`terminal`	Display the PEM file to the terminal.
<url>	Transfer the PEM file to the specified URL.

Default The PEM will be displayed to the terminal by default.

Mode Privileged Exec

Usage notes The specified trustpoint must already exist, and it must already be authenticated.

Example To display the PEM file for the trustpoint “example” to the terminal, use the following commands:

```
awplus> enable
awplus# crypto pki export example pem terminal
```

To export the PEM file “example.pem” for the trustpoint “example” to the URL “tftp://server_a/”, use the following commands:

```
awplus> enable
awplus# crypto pki export example pem
tftp://server_a/example.pem
```

Related commands

crypto pki authenticate

crypto pki import pem

crypto pki trustpoint

crypto pki export pkcs12

Overview Use this command to export a certificate and private key for an entity in a trustpoint to a file in PKCS#12 format at the specified URL. The private key is encrypted with a passphrase for security.

Syntax
```
crypto pki export <trustpoint> pkcs12 {ca|server|<username>}
<url>
```

Parameter	Description
<trustpoint>	The name of the trustpoint for which the certificate and key are tobe exported.
ca	If this option is specified, the command exports the root CA certificate and corresponding key.
server	If this option is specified, the command exports the server certificate and corresponding key.
<username>	If a RADIUS username is specified, the command exports the PKCS#12 file that was previously generated using the crypto pki enroll user command. To avoid ambiguity with keywords, the username may be prefixed by the string “user:”.
<url>	The destination URL for the PKCS#12 file. The format of the URLis the same as any valid destination for a file copy command.

Mode Privileged Exec

Usage notes If the **ca** option is specified, this command exports the root CA certificate and the corresponding private key, if the trustpoint has been authenticated as a locally selfsigned CA. (If the trustpoint represents an external CA, then there is no private key on the system corresponding to the root CA certificate. Use the **crypto pki export pem** file to export the certificate by itself.) The command prompts for a passphrase to encrypt the private key.

If the **server** option is specified, this command exports the server certificate and the corresponding private key, if the server has been enrolled to the trustpoint. The command prompts for a passphrase to encrypt the private key.

If a RADIUS username is specified, this command exports the PKCS#12 file that was generated using the **crypto pki enroll user** command. (The key within the file was already encrypted as part of the user enrollment process.)

In the event that there is a RADIUS user named “ca” or “server”, enter “user:ca” or “user:server” as the username.

The key and certificate must already exist.

Example To export the PKCS#12 file "example.pk12" for the trustpoint "example" to the URL "tftp://backup/", use the following commands:

```
awplus> enable
awplus# crypto pki export example pkcs12 ca
tftp://backup/example.pk12
```

Related commands

crypto pki enroll user

crypto pki export pem

crypto pki import pkcs12

crypto pki import pem

Overview This command imports a certificate for the given trustpoint from a file in Privacy-Enhanced Mail (PEM) format. The file may be transferred from the specified destination URL, or entered at the terminal.

Syntax

```
crypto pki import <trustpoint> pem [terminal|<url>]
```

Parameter	Description
`<trustpoint>`	The name of the trustpoint for which the root CA certificate is to be imported.
`terminal`	Optional parameter, If specified, the command prompts the user to enter (or paste) the PEM file at the terminal. If parameter is specified terminal is assumed by default.
`<url>`	Optional parameter, If specified, the PEM file is transferred from the specified URL

Default The PEM will be imported from the terminal by default.

Mode Privileged Exec

Usage notes The command is generally used for trustpoints representing external certificate authorities. It accepts root CA certificates, intermediate CA certificates, and server certificates. The system automatically detects the certificate type upon import.

Using this command to import root CA certificates at the terminal is identical to the functionality provided by the crypto pki authenticate command, for external certificate authorities. The imported certificate is validated to ensure it is a proper CA certificate.

Intermediate CA certificates are validated to ensure they are proper CA certificates, and that the issuer chain ends in a root CA certificate already installed for the trustpoint. If there is no root CA certificate for the trustpoint (i.e., if the trustpoint is unauthenticated) then intermediate CA certificates may not be imported.

Server certificates are validated to ensure that the issuer chain ends in a root CA certificate already installed for the trustpoint. If there is no root CA certificate for the trustpoint (i.e., if the trustpoint is unauthenticated) then server certificates may not be imported.

The specified trustpoint must already exist. If the imported certificate is self-signed, then no certificates may exist for the trustpoint. Otherwise, the issuer's certificate must already be present for the trustpoint.

Example To import the PEM file for the trustpoint "example" from the terminal, use the following commands:

```
awplus> enable
awplus# crypto pki import example pem
```

To import the PEM file for the trustpoint "example" from the URL "tftp://server_a/", use the following commands:

```
awplus> enable
awplus# crypto pki import example pem
tftp://server_a/example.pem
```

Related commands

crypto pki authenticate

crypto pki export pem

crypto pki trustpoint

crypto pki import pkcs12

Overview This command imports a certificate and private key for an entity in a trustpoint from a file in PKCS#12 format at the specified URL. The command prompts for a passphrase to decrypt the private key within the file.

Syntax

```
crypto pki import <trustpoint> pkcs12 {ca|server} <url>
```

Parameter	Description
<trustpoint>	The name of the trustpoint for which the certificate and key are to be imported.
ca	If this option is specified, the command imports the root CA certificate and corresponding key.
server	If this option is specified, the command imports the server certificate and corresponding key.
<url>	The source URL for the PKCS#12 file. The format of the URLis the same as any valid destination for a file copy command.

Mode Privileged Exec

Usage notes If the **ca** option is specified, this command imports the root CA certificate and the corresponding private key. This is only valid if the root CA certificate does not already exist for the trustpoint (i.e., if the trustpoint is unauthenticated).

If the **server** option is specified, this command imports the server certificate and the corresponding private key. The imported private key is given a new unique label of the form "localN", where N is a non-negative integer. This operation is only valid if the server certificate does not already exist for the trustpoint (i.e., if the server is not enrolled to the trustpoint).

PKCS#12 files for RADIUS users may not be imported with this command. (There is no value in doing so, as the files are not needed on the local system.)

The specified trustpoint must already exist. The key and certificate must not already exist.

Example To import the PKCS#12 file "example.pk12" for the trustpoint "example" to the URL "tftp://backup/", use the following commands:

```
awplus> enable
awplus# crypto pki import example pkcs12 ca
tftp://backup/example.pk12
```

Related commands crypto pki export pkcs12

crypto pki import pem

crypto pki trustpoint

Overview Use this command to declare the named trustpoint and enter trustpoint configuration mode.

Use the **no** variant of this command to destroy the trustpoint.

Syntax

```
crypto pki trustpoint <trustpoint>
no crypto pki trustpoint <trustpoint>
```

Parameter	Description
<trustpoint>	The name of the trustpoint. The name must start with an alphanumeric character, and may only contain alphanumeric characters, underscores, dashes, or periods. The maximum length of the name is 63 characters.

Mode Global Configuration

Usage notes If the trustpoint did not previously exist, it is created as a new trustpoint. The trustpoint will be empty (unauthenticated) unless the name "local" is selected, in which case the system will automatically authenticate the trustpoint as a local self-signed certificate authority.

The **no** variant of this command destroys the trustpoint by removing all CA and server certificates associated with the trustpoint, as well as the private key associated with the root certificate (if the root certificate was locally self-signed). This is a destructive and irreversible operation, so this command should be used with caution.

Example To configure a trustpoint named "example", use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
```

Related commands show crypto pki certificates

show crypto pki trustpoint

Command changes Version 5.4.6-1.1: command added to x930 Series

Version 5.4.8-1: command added to x220, XS900MX, x550 Series

Version 5.4.8-2.1: command added to SBx908 GEN2, x950 Series

enrollment (ca-trustpoint)

Overview Use this command to declare how certificates will be added to the system for the current trustpoint.

Syntax

```
enrollment {selfsigned|terminal}
```

Parameter	Description
`selfsigned`	Sets the enrollment mode for the current trustpoint to selfsigned.
`terminal`	Sets the enrollment mode for the current trustpoint to terminal.

Mode Trustpoint Configuration

Usage notes If the enrollment is set to **selfsigned**, then the system will generate a root CA certificate and its associated key when the **crypto pki authenticate** command is issued. It will generate a server certificate (signed by the root CA certificate) when the **crypto pki enroll** command is issued.

If the enrollment is set to **terminal**, then the system will prompt the user to paste the root CA certificate Privacy Enhanced Mail (PEM) file at the terminal, when the **crypto pki authenticate** command is issued. It will create a Certificate Signing Request (CSR) file for the local server when the **crypto pki enroll** command is issued. The server certificate received from the external CA should be imported using the **crypto pki import pem** command.

The trustpoint named “local” may only use the **selfsigned** enrollment setting.

If no enrollment mode is specified, the **crypto pki authenticate** command will fail for the trustpoint.

Example To configure the trustpoint named "example" and set its enrollment to **selfsigned**, use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# enrollment selfsigned
```

Related commands crypto pki enroll

fingerprint (ca-trustpoint)

Overview Use this command to declare that certificates with the specified fingerprint should be automatically accepted, when importing certificates from an external certificate authority. This can affect the behavior of the **crypto pki authenticate** and **crypto pki import pem** commands.

Use the **no** variant of this command to remove the specified fingerprint from the pre-accepted list.

Syntax

```
fingerprint <word>
no fingerprint <word>
```

Parameter	Description
<word>	The fingerprint as a series of 40 hexadecimal characters, optionally separated into multiple character strings.

Default By default, no fingerprints are pre-accepted for the trustpoint.

Mode Trustpoint Configuration

Usage notes Specifying a fingerprint adds it to a list of pre-accepted fingerprints for the trustpoint. When a certificate is imported, if it matches any of the pre-accepted values, then it will be saved in the system automatically. If the imported certificate's fingerprint does not match any pre-accepted value, then the user will be prompted to verify the certificate contents and fingerprint visually.

This command is useful when certificates from an external certificate authority are being transmitted over an insecure channel. If the certificate fingerprint is delivered via a separate messaging channel, then pre-entering the fingerprint value via cut-and-paste may be less errorprone than attempting to verify the fingerprint value visually.

The fingerprint is a series of 40 hexadecimal characters. It may be entered as a continuous string, or as a series of up to multiple strings separated by spaces. The input format is flexible because different certificate authorities may provide the fingerprint string in different formats.

Example To configure a fingerprint "5A81D34C 759CC4DA CFCA9F65 0303AD83 410B03AF" for the trustpoint named "example", use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# fingerprint 5A81D34C 759CC4DA CFCA9F65
0303AD83 410B03AF
```

Related commands crypto pki authenticate

crypto pki import pem

no crypto pki certificate

Overview Use this command to delete a certificate with the specified fingerprint from the specified trustpoint.

Syntax

```
no crypto pki certificate <trustpoint> <word>
```

Parameter	Description
<trustpoint>	The name of the trustpoint.
<word>	The fingerprint as a series of 40 hexadecimal characters, optionally separated into multiple character strings.

Default By default, no fingerprints are pre-accepted for the trustpoint.

Mode Privileged Exec

Usage notes The fingerprint can be found in the output of the **show crypto pki certificates** command. If there are dependent certificates in the trustpoint (i.e., if other certificates were signed by the specified certificate), the command will be rejected.

If the specified certificate is the root CA certificate and the trustpoint represents a locally selfsigned CA, then the corresponding private key is also deleted from the system. Deleting the root CA certificate effectively resets the trustpoint to an unauthenticated state.

Example To delete a certificate with the fingerprint "594EDEF9 C7C4308C 36D408E0 77E784F0 A59E8792" from the trustpoint “example”, use the following commands:

```
awplus> enable
awplus# no crypto pki certificate example
594EDEF9 C7C4308C 36D408E0 77E784F0 A59E8792
```

Related commands no crypto pki trustpoint

show crypto pki certificates

rsakeypair (ca-trustpoint)

Overview Use this command to declare which RSA key pair should be used to enroll the local server with the trustpoint. Note that this defines the key pair used with the server certificate, not the key pair used with the root CA certificate.

Use the **no** variant of this command to restore the default value, “server-default”.

Syntax

```
rsakeypair <keylabel> [<1024-4096>]
no rsakeypair
```

Parameter	Description
<keylabel>	The key to be used with the server certificate for this trustpoint. The name must start with an alphanumeric character, and may only contain alphanumeric characters, underscores, dashes, or periods. The maximum length of the name is 63 characters.
<1024-4096>	The bit length for the key, to be used if the key is implicitly generated during server enrollment.

Default The default value for **keylabel** is “server-default”.

The default value for the key bit length is 2048.

Mode Trustpoint Configuration

Usage notes If the label specified does not refer to an existing key created by the **crypto key generate rsa** command, the key will be implicitly generated when the **crypto pki enroll** command is issued to generate the server certificate or the server certificate signing request. The optional numeric parameter defines the bit length for the key, and is only applicable for keys that are implicitly created during enrollment.

This command does not affect server certificates or server certificate signing requests that have already been generated. The trustpoint’s server certificate is set to use whatever key pair was specified for the trustpoint at the time the **crypto pki enroll** command is issued.

The default key pair is “server-default”. The default bit length is 2048 bits.

Example To configure trustpoint "example" to use the key pair "example-server-key" with a bit length of 2048, use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# rsakeypair example-server-key 2048
```

Related commands crypto key generate rsa

show crypto key mypubkey rsa

Overview Use this command to display information about the specified Rivest-Shamir-Adleman encryption key.

Syntax

```
show crypto key mypubkey rsa [<keylabel>]
```

Parameter	Description
<keylabel>	The name of the key to be shown, if specified.

Default By default, all keys will be shown.

Mode Privileged Exec

Usage notes If no key label is specified, information about all keys is shown. The command displays the bit length of the key, a key fingerprint (a hash of the key contents to help uniquely identify a key), and a list of trustpoints in which the server certificate is using the key.

The specified keys must exist.

Example To show all keys, use the following commands:

```
awplus> enable
awplus# show crypto key mypubkey rsa
```

Output Figure 45-1: Example output from **show crypto key mypubkey rsa**

```
awplus#show crypto key mypubkey rsa
--------------------
RSA Key Pair "example-server-key":
   Key size    : 2048 bits
   Fingerprint : 1A605D73 C2274CB7 853886B3 1C802FC6 7CDE45FB
   Trustpoints : example
--------------------
RSA Key Pair "server-default":
   Key size    : 2048 bits
   Fingerprint : 34AC4D2D 5249A168 29D426A3 434FFC59 C4A19901
   Trustpoints : local
```

Related commands crypto key generate rsa

show crypto pki certificates

Overview Use this command to display information about existing certificates for the specified trustpoint.

Syntax

```
show crypto pki certificates [<trustpoint>]
```

Parameter	Description
<trustpoint>	The trustpoint for which the certificates are to be shown.

Default By default, the certificates for all trustpoints are shown.

Mode Privileged Exec

Usage notes If no trustpoint is specified, certificates for all trustpoints are shown. The command displays the certificates organized into certificate chains. It starts with the server certificate and then displays its issuer, and continues up the issuer chain until the root CA certificate is reached.

For each certificate, the command displays the certificate type, the subject's distinguished name (the entity identified by the certificate), the issuer's distinguished name (the entity that signed the certificate), the validity dates for the certificate, and the fingerprint of the certificate. The fingerprint is a cryptographic hash of the certificate contents that uniquely identifies the certificate.

The specified trustpoints must already exist.

Example To show the certificates for the trustpoint "example", use the following command:

```
awplus> enable
awplus# show crypto pki certificates example
```

Output Figure 45-2: Example output from **show crypto pki certificates**

```
awplus>enable
awplus#show crypto pki certificates example
--------------------
Trustpoint "example" Certificate Chain
--------------------
Server certificate
   Subject     : /O=local/CN=local.loc.lc
   Issuer      : /C=NZ/CN=local_Signing_CA
   Valid From  : Nov 11 15:35:21 2015 GMT
   Valid To    : Aug 31 15:35:21 2018 GMT

Related commands crypto pki trustpoint

show crypto pki enrollment user

Overview Use this command to display a list of trustpoints for which RADIUS user enrollments have been performed, using the **crypto pki enroll user** command. This indicates that PKCS#12 files for the user are available for export for the given trustpoints, using the **crypto pki export pkcs12** command.

Syntax

```
crypto pki enrollment user <username>
```

Parameter	Description
<username>	The user for which enrollments are to be shown.

Mode Privileged Exec

Example To show the list of trustpoints to which user "exampleuser1" is enrolled, use the following commands:

```
awplus> enable
awplus(config)# show crypto pki enrollment user exampleuser1
```

Output Figure 45-3: Example output from **show crypto pki enrollment user**

```
awplus> enable
awplus# show crypto pki enrollment user exampleuser1
User "exampleuser1" is enrolled to the following trustpoints:
local,example
```

Related commands

crypto pki enroll user

crypto pki export pkcs12

show crypto pki trustpoint

Overview Use this command to display information about the specified trustpoint.

Syntax

```
show crypto pki trustpoint [<trustpoint>]
```

Parameter	Description
<trustpoint>	The name of the trustpoint to be shown

Default By default, all trustpoints are shown.

Mode Privileged Exec

Usage notes If no trustpoint is specified, information about all trustpoints is shown. The command displays the authentication status of the trustpoint, the fingerprint of the root CA certificate (if it exists), the enrollment status of the local server with the trustpoint, a list of any applications that are configured to use the trustpoint, and the trustpoint parameters that were configured from trustpoint-configuration mode.

The specified trustpoints must already exist.

Example To show the details of the trustpoint “example”, use the following commands:

```
awplus> enable
awplus# show crypto pki trustpoint example
```

Output Figure 45-4: Example output from **show crypto pki trustpoint**

```
awplus> enable
awplus# show crypto pki trustpoint example
--------------------
Trustpoint "example"
   Type             : Self-signed certificate authority
   Root Certificate: 50C1856B EEC7555A 0F3A61F6 690D9463 67DF74D1
   Local Server     : The server is enrolled to this trustpoint.
   Server Key       : example-server-key
   Applications     : RADIUS

Authentication and Enrollment Parameters:
   Enrollment       : selfsigned
   RSA Key Pair     : example-server-key (2048 bits)
--------------------
```

Related commands

crypto pki trustpoint

show crypto pki certificates

subject-name (ca-trustpoint)

Overview Use this command to specify the distinguished name string that should be used for the subject field in the server certificate, when enrolling the server (generating the server certificate or server certificate signing request).

Syntax

```
subject-name <word>
```

Parameter	Description
<word>	Specify the subject name as a distinguished name string. Complex strings (e.g., strings containing spaces) should be surrounded with double-quote characters.

Default If no subject name is specified for the trustpoint, then the system automatically builds a name of the form "/O=AlliedWare Plus/CN=xxxx.yyyy.zzz", where "xxxx" is the hostname of the system and "yyyy.zzz" is the default search domain for the system.

Mode Trustpoint Configuration

Usage notes The subject name is specified as a variable number of fields, where each field begins with a forward-slash character ("/"). Each field is of the form "XX=value", where "XX" is the abbreviation of the node type in the tree.

Common values include:

- "C" (country),
- "ST" (state),
- "L" (locality),
- "O" (organization),
- "OU" (organizational unit), and
- "CN" (common name).

Of these fields, "CN" is usually the most important.

NOTE: *For a server certificate, many applications require that the network name of the server matches the common name in the server's certificate.*

Example To configure the trustpoint named "example" and set its subject name, use the following commands:

```
awplus> enable
awplus# configure terminal
awplus(config)# crypto pki trustpoint example
awplus(ca-trustpoint)# subject-name "/O=My
Company/CN=192.168.1.1
```

Related commands crypto pki enroll

46 TACACS+ Commands

Introduction

Overview This chapter provides an alphabetical reference for commands used to configure the device to use TACACS+ servers. For more information about TACACS+, see the TACACS+ Feature Overview and Configuration Guide.

Command List

- "aaa authorization commands" on page 2288
- "aaa authorization config-commands" on page 2290
- "authorization commands" on page 2291
- "ip tacacs source-interface" on page 2293
- "show tacacs+" on page 2294
- "tacacs-server host" on page 2296
- "tacacs-server key" on page 2298
- "tacacs-server timeout" on page 2299

aaa authorization commands

Overview This command configures a method list for commands authorization that can be applied to console or VTY lines. When command authorization is enabled for a privilege level, only authorized users can executed commands in that privilege level.

Use the **no** variant of this command to remove a named method list or disable the default method list for a privilege level.

Syntax

```
aaa authorization commands <privilege-level>
{default|<list-name>} group tacacs+ [none]
```

```
no aaa authorization commands <privilege-level>
{default|<list-name>}
```

Parameter	Description
<privilege-level>	The privilege level of the set of commands the method list will be applied to. AlliedWare Plus defines three sets of commands, that are indexed by a level value: **Level = 1**: All commands that can be accessed by a user with privilege level between 1 and 6 inclusive **Level = 7:** All commands that can be accessed by a user with privilege level between 7 and 14 inclusive **Level = 15**: All commands that can be accessed by a user with privilege level 15
`group`	Specify the server group where authorization messages are sent. Only the `tacacs+` group is available for this command.
`tacacs+`	Use all TACACS+ servers configured by the tacacs-server host command.
`default`	Configure the default authorization commands method list.
<list-name>	Configure a named authorization commands method list
`none`	If specified, this provides a local fallback to command authorization so that if authorization servers become unavailable then the device will accept all commands normally allowed for the privilege level of the user.

Mode Global Configuration

Usage notes TACACS+ command authorization provides centralized control of the commands available to a user of an AlliedWare Plus device. Once enabled:

- The command string and username are encrypted and sent to the first available configured TACACS+ server (the first server configured) for authorization.

- The TACACS+ server decides if the user is authorized to execute the command and returns the decision to the AlliedWare Plus device.
- Depending on this decision the device will then either execute the command or notify the user that authorization has failed.

If multiple TACACS+ servers are configured, and the first server is unreachable or does not respond, the other servers will be queried, in turn, for an authorization decision. If all servers are unreachable and a local fallback has been configured, with the **none** parameter, then commands are authorized based on the user's privilege level; the same behavior as if command authorization had not been configured. If, however, the local fallback is not configured and all servers become unreachable then all commands except **logout**, **exit**, and **quit** will be denied.

The **default** method list is defined with a local fallback unless configured differently using this command.

Example To configure a commands authorization method list, named TAC15, using all TACACS+ servers to authorize commands for privilege level 15, with a local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 15 TAC15 group tacacs+ none
```

To configure the default method list to authorize commands for privilege level 7, with no local fallback, use the following commands:

```
awplus# configure terminal
awplus(config)# aaa authorization commands 7 default group tacacs+
```

To remove the authorization method list TAC15, use the following commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization commands 15 TAC15
```

Related commands

aaa authorization config-commands

authorization commands

tacacs-server host

Command changes Version 5.4.6-2.1: command added

aaa authorization config-commands

Overview Use this command to enable command authorization on configuration mode commands. By default, command authorization applies to commands in exec mode only.

Use the **no** variant of this command to disable command authorization on configuration mode commands.

Syntax

```
aaa authorization config-commands
no aaa authorization config-commands
```

Default By default, command authorization is disabled on configuration mode commands.

Mode Global Configuration

Usage notes If authorization of configuration mode commands is not enabled then all configuration commands are accepted by default, including command authorization commands.

NOTE: *Authorization of configuration commands is required for a secure TACACS+ command authorization configuration as it prevents the feature from being disabled to gain access to unauthorized exec mode commands.*

Example To enable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# aaa authorization config-commands
```

To disable command authorization for configuration mode commands, use the commands:

```
awplus# configure terminal
awplus(config)# no aaa authorization config-commands
```

Related commands aaa authorization commands

authorization commands

tacacs-server host

Command changes Version 5.4.6-2.1: command added

authorization commands

Overview This command applies a command authorization method list, defined using the aaa authorization commands command, to console and VTY lines.

Use the **no** variant of this command to reset the command authorization configuration on the console and VTY lines.

Syntax

```
authorization commands <privilege-level> {default|<list-name>}
no authorization commands <privilege-level>
```

Parameter	Description
`<privilege-level>`	The privilege level of the set of commands the method list will be applied to. AlliedWare Plus defines three sets of commands, that are indexed by a level value: **Level = 1**: All commands that can be accessed by a user with privilege level between 1 and 6 inclusive **Level = 7:** All commands that can be accessed by a user with privilege level between 7 and 14 inclusive **Level = 15**: All commands that can be accessed by a user with privilege level 15
`default`	Configure the default authorization commands method list.
`<list-name>`	Configure a named authorization commands method list

Default The **default** method list is applied to each console and VTY line by default.

Mode Line Configuration

Usage notes If the specified method list does not exist users will not be enable to execute any commands in the specified method list on the specified VTY lines.

Example To apply the TAC15 command authorization method list with privilege level 15 to VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# authorization commands 15 TAC15
```

To reset the command authorization configuration with privilege level 15 on VTY lines 0 to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# line vty 0 5
awplus(config-line)# no authorization commands 15
```

Related commands aaa authorization commands

aaa authorization config-commands

tacacs-server host

Command changes

Version 5.4.6-2.1: command added

ip tacacs source-interface

Overview This command sets the source interface, or IP address, to use for all TACACS+ packets sent from the device. By default, TACACS+ packets use the source IP address of the egress interface.

Use the **no** variant of this command to remove the source interface configuration and use the source IP address of the egress interface.

Syntax

```
ip tacacs source-interface {<interface>|<ip-address>}
no ip tacacs source-interface
```

Parameter	Description
<interface>	Interface name.
<ip-address>	IP address in the dotted decimal format A.B.C.D.

Default The source IP address of outgoing TACACS+ packets default to the IP address of the egress interface.

Mode Global Configuration

Usage notes Setting the source interface ensures that all TACACS+ packets sent from the device will have the same source IP address. Once configured this affects all TACACS+ packets, namely accounting, authentication, and authorization.

If the specified interface is down or there is no IP address on the interface, then the source IP address of outgoing TACACS+ packets will default to the IP address of the egress interface.

Example To configure all outgoing TACACS+ packets to use the IP address of the loop-back "lo" interface as the source IP address, use the following commands:

```
awplus# configure terminal
awplus(config)# ip tacacs source-interface lo
```

To reset the source interface configuration for all TACACS+ packets, use the following commands:

```
awplus# configure terminal
awplus(config)# no ip tacacs source-interface
```

Related commands tacacs-server host

show tacacs+

Command changes Version 5.4.6-2.1: command added

show tacacs+

Overview This command displays the current TACACS+ server configuration and status.

Syntax `show tacacs+`

Mode User Exec and Privileged Exec

Example To display the current status of TACACS+ servers, use the command:

```
awplus# show tacacs+
```

Output Figure 46-1: Example output from the **show tacacs+** command

```
TACACS+ Global Configuration
  Source Interface    : not configured
  Timeout             : 5 sec

Server Host/      Server
IP Address        Status
------------------------------------------------------------
192.168.1.10      Alive
192.168.1.11      Unknown
```

Table 1: Parameters in the output of the **show tacacs+** command

Output Parameter	Meaning	
`Source Interface`	IP address of source interface if set with ip tacacs source-interface.	
`Timeout`	A time interval in seconds.	
`Server Host/IP Address`	TACACS+ server hostname or IP address.	
`Server Status`	The status of the authentication port.	
	`Alive`	The server is alive.
	`Dead`	The server has timed out.
	`Error`	The server is not responding or there is an error in the key string entered.
	`Unknown`	The server is never used or the status is unkown.
	`Unreachable`	The server is unreachable.
	`Unresolved`	The server name can not be resolved.

Command changes Version 5.4.6-2.1: **Source Interface** parameter added

tacacs-server host

Overview Use this command to specify a remote TACACS+ server host for authentication, authorization and accounting, and to set the shared secret key to use with the TACACS+ server. The parameters specified with this command override the corresponding global parameters for TACACS+ servers.

Use the **no** variant of this command to remove the specified server host as a TACACS+ authentication and authorization server.

Syntax

```
tacacs-server host {<host-name>|<ip-address>} [key
[8]<key-string>]
```

```
no tacacs-server host {<host-name>|<ip-address>}
```

Parameter	Description
<host-name>	Server host name. The DNS name of the TACACS+ server host.
<ip-address>	The IP address of the TACACS+ server host, in dotted decimal notation A.B.C.D.
key	Set shared secret key with TACACS+ servers.
8	Specifies that you are entering a password as a string that has already been encrypted instead of entering a plain text password. The running config displays the new password as an encrypted string even if password encryption is turned off.
<key-string>	Shared key string applied, a value in the range 1 to 64 characters. Specifies the shared secret authentication or encryption key for all TACACS+ communications between this device and the TACACS+ server. This key must match the encryption used on the TACACS+ server. This setting overrides the global setting of the tacacs-server key command. If no key value is specified, the global value is used.

Default No TACACS+ server is configured by default.

Mode Global Configuration

Usage A TACACS+ server host cannot be configured multiple times like a RADIUS server.

As many as four TACACS+ servers can be configured and consulted for login authentication, enable password authentication and accounting. The first server configured is regarded as the primary server and if the primary server fails then the backup servers are consulted in turn. A backup server is consulted if the primary server fails, not if a login authentication attempt is rejected. The reasons a server would fail are:

- it is not network reachable
- it is not currently TACACS+ capable

- it cannot communicate with the switch properly due to the switch and the server having different secret keys

Examples

To add the server `tac1.company.com` as the TACACS+ server host, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host tac1.company.com
```

To set the secret key to `secret` on the TACACS+ server `192.168.1.1`, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server host 192.168.1.1 key secret
```

To remove the TACACS+ server `tac1.company.com`, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server host tac1.company.com
```

Related commands

aaa accounting commands

aaa authentication login

tacacs-server key

tacacs-server timeout

show tacacs+

tacacs-server key

Overview This command sets a global secret key for TACACS+ authentication, authorization and accounting. The shared secret text string is used for TACACS+ communications between the switch and all TACACS+ servers.

Note that if no secret key is explicitly specified for a TACACS+ server with the tacacs-server host command, the global secret key will be used for the shared secret for the server.

Use the **no** variant of this command to remove the global secret key.

Syntax

```
tacacs-server key [8] <key-string>
no tacacs-server key
```

Parameter	Description
8	Specifies a string in an encrypted format instead of plain text. The running config will display the new password as an encrypted string even if password encryption is turned off.
<key-string>	Shared key string applied, a value in the range 1 to 64 characters. Specifies the shared secret authentication or encryption key for all TACACS+ communications between this device and all TACACS+ servers. This key must match the encryption used on the TACACS+ server.

Mode Global Configuration

Usage notes Use this command to set the global secret key shared between this client and its TACACS+ servers. If no secret key is specified for a particular TACACS+ server using the tacacs-server host command, this global key is used.

Examples To set the global secret key to `secret` for TACACS+ server, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server key secret
```

To delete the global secret key for TACACS+ server, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server key
```

Related commands tacacs-server host

show tacacs+

tacacs-server timeout

Overview Use this command to specify the TACACS+ global timeout value. The timeout value is how long the device waits for a reply to a TACACS+ request before considering the server to be dead.

Note that this command configures the **timeout** parameter for TACACS+ servers globally.

The **no** variant of this command resets the transmit timeout to the default (5 seconds).

Syntax

```
tacacs-server timeout <seconds>
no tacacs-server timeout
```

Parameter	Description
<seconds>	TACACS+ server timeout in seconds, in the range 1 to 1000.

Default The default timeout value is 5 seconds.

Mode Global Configuration

Examples To set the timeout value to 3 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# tacacs-server timeout 3
```

To reset the timeout period for TACACS+ servers to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# no tacacs-server timeout
```

Related commands tacacs-server host

show tacacs+

Part 6: High Availability

47 High Availability Commands

Introduction

Overview This chapter provides an alphabetical reference of commands used to configure high availability. For more information, see the High Availability Feature Overview and Configuration_Guide.

Command List

- "ha associate" on page 2302
- "wan-bypass (interface mode)" on page 2304

ha associate

Overview This command is used to change the mode of a VRRP session to High Availability (HA) mode, and to associate it with a HA bypass port.

Use the **no** variant of this command to take the VRRP session out of HA-Mode.

Syntax

```
ha associate [wan-bypass <1-2>]
no ha associate [wan-bypass <1-2>]
```

Parameter	Description
<wan-bypass>	The control wan bypass port.
<1-2>	The identifier number of wan bypass port.

Default The default state of bypass port 1 and port 2 is deactivated.

Mode Router Configuration

Usage notes One VRRP session can have the control of one or two bypass ports. After VRRP has the control of the wan-bypass ports, the state of the wan-bypass ports will be determined by the VRRP state. If the VRRP session is in master state, then the associated wan-bypass ports will be deactivated. If the VRRP session is in backup or initial state, then the associated wan-bypass ports will be activated.

If no wan-bypass ports are specified, then it puts the VRRP session in HA mode and the wan-bypass ports will always be deactived.

If there are one or more VRRP sessions running in HA mode, then the wan-bypass ports should not be controlled by an other feature.

Examples To change a VRRP session into HA mode, use the following commands:

```
awplus#configure terminal
awplus(config)#router vrrp 1 vlan1
awplus(config-router)#ha associate
```

To change a VRRP session into HA mode and allow it to control wan-bypass port 1, use the following commands:

```
awplus#configure terminal
awplus(config)#vrrp 1 vlan1
awplus(config-router)#ha associate wan-bypass 1
```

To change a VRRP session to stop control of a wan-bypass port 1, use the following commands:

```
awplus#configure terminal
awplus(config)#router vrrp 1 vlan1
awplus(config-router)#no ha associate wan-bypass 1
```

To change a VRRP session out of HA-mode, use the following commands:

```
awplus#configure terminal
awplus(config)#router vrrp 1 vlan1
awplus(config-router)#no ha associate
```

Related commands show vrrp

wan-bypass (interface mode)

Overview Use this command to manually activate bypass mode for a device's Ethernet interface. In bypass mode, the Ethernet interface is electrically disconnected from the device and diverted to the associated bypass port.

Use the **no** variant of this command to deactivate bypass mode.

Syntax

```
wan-bypass
no wan-bypass
```

Default Bypass mode is deactivated by default.

Mode Interface Configuration for an Eth interface.

Example To activate bypass mode on the interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# wan-bypass
```

To deactivate bypass mode on the interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# no wan-bypass
```

Related commands ha associate

Command changes Version 5.5.0-1.3: command added

48 VRRP Commands

Introduction

Overview

This chapter provides an alphabetical reference for commands used to configure the Virtual Router Redundancy Protocol (VRRP). For more information, see the VRRP Feature Overview and Configuration Guide.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Command List

- "advertisement-interval" on page 2307
- "alternate-checksum-mode" on page 2309
- "circuit-failover" on page 2310
- "debug vrrp" on page 2312
- "debug vrrp events" on page 2313
- "debug vrrp packet" on page 2314
- "disable (VRRP)" on page 2315
- "enable (VRRP)" on page 2316
- "preempt-mode" on page 2317
- "priority" on page 2319
- "router ipv6 vrrp (interface)" on page 2321
- "router vrrp (interface)" on page 2323
- "show debugging vrrp" on page 2325
- "show running-config router ipv6 vrrp" on page 2326
- "show running-config router vrrp" on page 2327
- "show vrrp" on page 2328
- "show vrrp counters" on page 2330
- "show vrrp ipv6" on page 2333

- "show vrrp (session)" on page 2334
- "transition-mode" on page 2336
- "undebug vrrp" on page 2338
- "undebug vrrp events" on page 2339
- "undebug vrrp packet" on page 2340
- "virtual-ip" on page 2341
- "virtual-ipv6" on page 2343
- "vrrp vmac" on page 2345

advertisement-interval

Overview Use this command to configure the advertisement interval of the virtual router. This is the length of time, in seconds, between each advertisement sent from the master to its backup(s).

IPv6 VRRP advertisements are sent to the multicast address assigned to the VRRP group (ff02:0:0:0:0) and a backup virtual router has to join all multicast groups within this range. VRRP advertisements are sent to a multicast address (ff02::12) every second by default.

Use the **no** variant of this command to remove an advertisement interval of the virtual router, which has been set using the **advertisement-interval** command, and revert to the default advertisement interval of 1 second.

Syntax

```
advertisement-interval [<1-255>|csec <1-4095>]
no advertisement-interval
```

Parameter	Description
<1-255>	Specifies the advertisement interval in seconds.
csec	Use centiseconds instead of seconds for the advertisement interval.
<1-4095>	Specifies the advertisement interval in centiseconds.

Default The default advertisement interval is 1 second.

Mode Router Configuration

Usage notes See the VRRP Feature Overview and Configuration Guide for more information about:

- setting the advertisement-interval when configuring VRRP
- using seconds for VRRPv2 host compatibility whenever you use transition-mode to upgrade or transition from VRRPv2 to VRRPv3
- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details

Examples The example below shows you how to configure the advertisement interval to 6 seconds for the VRRP IPv4 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# advertisement-interval 6
```

The example below shows you how to reset the advertisement interval to the default of 1 second for the VRRP IPv4 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no advertisement-interval
```

The example below shows you how to configure the advertisement interval to 6 seconds for the VRRPv3 IPv6 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 5 vlan2
awplus(config-router)# advertisement-interval 6
```

Related commands

router vrrp (interface)

router ipv6 vrrp (interface)

alternate-checksum-mode

Overview Use this command to enable an alternate checksum mode for VRRPv3 to allow inter-operability with some other vendors' products. The IPv4 checksum for VRRPv3 advertisements will then use a pseudo header in the calculation.

This mode may be required if the other product indicates checksum errors on VRRP packets sent by AlliedWare Plus devices.

Use the **no** variant of this command to disable the alternate checksum mode.

Syntax

```
alternate-checksum-mode
no alternate-checksum-mode
```

Default Disabled

Mode Router Configuration

Example To turn on the alternate checksum mode for VRRP instance 1 on VLAN1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# alternate-checksum-mode
```

To turn off the alternate checksum mode for VRRP instance 1 on VLAN1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# no alternate-checksum-mode
```

Related commands show running-config

Command changes Version 5.4.7-1.1: command added

circuit-failover

Overview Use this command to enable the VRRP circuit failover feature.

Circuit failover enables the device to take action if the uplink interface goes down, so that the VRRP backup, whose uplink interface is still active, takes over as VRRP master. See the Usage section below and the VRRP Feature Overview and Configuration Guide for more information.

Use the **no** variant of this command to disable this feature.

Syntax

```
circuit-failover <interface> <1-253>
no circuit-failover [<interface> <1-253>]
```

Parameter	Description
<interface>	The interface of the router that is monitored. The interface must exist on the router, and is usually an upstream interface. Should the interface go down, then another router that is configured as a backup router in the group takes over as the master. You should configure the circuit failover on an interface other than the active VRRP interface - generally the uplink interface.
<1-253>	Delta value. The value by which virtual routers decrement their priority value during a circuit failover event. Configure this value to be greater than the difference of priorities on the master and backup routers. In the case of failover, this priority delta value is subtracted from the current VR Master Router priority value.

Mode Router Configuration

Usage notes You can use Circuit Failover to monitor up to 32 interfaces per VRRP instance. If a VRRP instance is configured to monitor multiple interfaces, the VRRP priority will be cumulatively decremented by the configured delta for each interface as it goes down.

For example, if VRRP is configured to monitor VLAN2 and VLAN3 with the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip address 192.168.1.1/24
awplus(config-if)# exit
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# virtual-ip 192.168.1.10 backup
awplus(config-router)# priority 100
awplus(config-router)# circuit-failover vlan2 10
awplus(config-router)# circuit-failover vlan3 20
```

then the following examples explain the effect of each VLAN going down:

- If only VLAN2 fails, then the VRRP priority will be decremented by 10. VRRP priority would be adjusted to become 90, because 100 - 10 = 90.
- If only VLAN3 fails, then the VRRP priority will be decremented by 20. VRRP priority would be adjusted to become 80, because 100 - 20 = 80.
- If both VLAN2 and VLAN3 fail, then the VRRP priority will be decremented by the cumulative delta values of all monitored interfaces. VRRP priority would therefore be adjusted to become 70, because 100 - 10 - 20 = 70.

As each monitored interface recovers, the VRRP priority is incremented by the same delta value.

When you configure the delta values of the monitored interfaces, make sure their sum is high enough to ensure that the VRRP priority stays above zero if all the interfaces go down.

Examples To configure circuit failover on an IPv4 VRRP instance, so that if interface VLAN3 goes down, then the priority of VRRP instance 1 is reduced by 30, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan2
awplus(config-router)# circuit-failover vlan3 30
```

To remove all configured circuit failovers for the VRRP IPv4 session with VR ID 1 on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan2
awplus(config-router)# no circuit-failover
```

To configure circuit failover on a VRRPv3 IPv6 session with VR ID 1, so that when interface VLAN3 goes down, the priority of VRRP instance 1is reduced by 30, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 1 vlan2
awplus(config-router)# circuit-failover vlan3 30
```

To remove all configured circuit failovers for the VRRPv3 IPv6 session with VR ID 1 on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 1 vlan2
awplus(config-router)# no circuit-failover
```

Related commands router vrrp (interface)

debug vrrp

Overview Use this command to specify debugging options for VRRP. The **all** parameter turns on all the debugging options.

Use the **no** variant of this command to disable this function.

Syntax

```
debug vrrp [all]
no debug vrrp [all]
```

Mode Privileged Exec and Global Configuration

Usage notes See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 debugging details.

Examples The example below shows you how to enable all debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp all
```

The example below shows you how to disable all debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp all
```

Related commands

show debugging vrrp

undebug vrrp

debug vrrp events

Overview Use this command to specify debugging options for VRRP event troubleshooting.

Use the **no** variant of this command to disable this function.

Syntax

```
debug vrrp events
no debug vrrp events
```

Mode Privileged Exec and Global Configuration

Usage notes The **debug vrrp events** command enables the display of debug information related to VRRP internal events.

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 debugging details.

Examples The example below shows you how to enable events debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp events
```

The example below shows you how to disable events debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp events
```

Related commands show debugging vrrp

undebug vrrp events

debug vrrp packet

Overview Use this command to specify debugging options for VRRP packets.

Use the **no** variant of this command to disable this function.

Syntax

```
debug vrrp packet [send|recv]
no debug vrrp packet [send|recv]
```

Parameter	Description
`send`	Specifies the debug option set for sent packets.
`recv`	Specifies the debug option set for received packets.

Mode Privileged Exec and Global Configuration

Usage notes The **debug vrrp packet** command enables the display of debug information related to the sending and receiving of packets.

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 debugging details.

Examples The example below shows you how to enable received and sent packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet
```

The example below shows you how to enable only received packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet recv
```

The example below shows you how to enable only sent packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet send
```

The example below shows you how to disable packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp packet
```

Related commands show debugging vrrp

undebug vrrp packet

disable (VRRP)

Overview Use this command to disable a VRRP IPv4 session or a VRRPv3 IPv6 session on the router to stop it participating in virtual routing. Note that when this command is configured then a backup router assumes the role of master router depending on its priority. See the enable (VRRP) command to enable a VRRP IPv4 session or a VRRPv3 IPv6 session on the router.

Syntax

```
disable
```

Mode Router Configuration

Usage notes See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 IPv4 and IPv6 configuration details.

Examples The example below shows you how to disable the VRRP session for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# disable
```

The example below shows you how to disable the VRRPv3 session for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# disable
```

Related commands

enable (VRRP)

router vrrp (interface)

router ipv6 vrrp (interface)

show vrrp

enable (VRRP)

Overview Use this command to enable the VRRP session on the router to make it participate in virtual routing. To make changes to the VRRP configuration, first disable the router from participating in virtual routing using the disable (VRRP) command.

Syntax

```
enable
```

Mode Router Configuration

Usage notes You must configure the virtual IP address and define the interface for the VRRP session (using the virtual-ip or virtual-ipv6 and the router vrrp (interface) or router ipv6 vrrp (interface) commands) before using this command.

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 IPv4 and IPv6 configuration details.

Examples To enable the VRRP session for VRRP VR ID 5 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# enable
```

To enable the VRRPv3 session for VRRPv3 VR ID 3 on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# enable
```

Related commands

disable (VRRP)

virtual-ipv6

preempt-mode

Overview Use this command to configure preempt mode. If preempt-mode is set to **true**, then the highest priority backup will always be the master when the default master is unavailable.

If preempt-mode is set to **false**, then a higher priority backup will not preempt a lower priority backup who is acting as master.

If preempt-mode is set to **true**, an extra parameter is available called **delay-time**. If the delay-time parameter is used, a VRRP router with a higher priority will wait the configured length of time before it preempts the lower priority VRRP router to take over as master.

Syntax

```
preempt-mode {true|false}[delay-time <0-3600>]
```

Parameter	Description
`true`	Preemption is enabled.
`false`	Preemption is disabled.
`delay-time`	Enable preempting but delay the preempt by the amount of seconds specified by the delay-time value. Note, a delay-time of 0 means delayed preempting is disabled.

Default The default is **true**.

Mode Router Configuration

Usage notes When the master router fails, the backup routers come online in priority order—highest to lowest. Preempt mode means that a higher priority back up router will take over the master role from a lower priority back up. Preempt mode set to **true** allows a higher priority backup router to relieve a lower priority backup router.

By default, a preemptive scheme is enabled whereby a higher priority backup virtual router that becomes available takes over from the backup virtual router that was previously elected to become the master virtual router.

This preemptive scheme can be disabled using the **preempt-mode false** command. If preemption is disabled on a backup virtual router that is starting up, and this router has a higher priority than the current master, the higher priority backup will not preempt the current master, and the lower priority master will stay in the master role.

See the VRRP Feature Overview and Configuration Guide for more information about:

- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details
- preempt mode and preempt delay-time

Examples

The example below shows you how to configure preempt-mode as true for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# preempt-mode true
```

The example below shows you how to configure preempt-mode as false for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# preempt-mode false
```

The example below shows you how to configure preempt-mode as true for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# preempt-mode true
```

The example below shows you how to configure preempt-mode as false for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# preempt-mode false
```

The example below shows you how to configure delay-time as 20 seconds for VRRPv3 VR ID 5 on vlan5:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 5 vlan5
awplus(config-router)# preempt-mode true delay-time 20
```

circuit-failover

priority

router vrrp (interface)

router ipv6 vrrp (interface)

priority

Overview Use this command to configure the VRRP router priority within the virtual router. The highest priority router is Master (unless preempt-mode is false).

Use the **no** variant of this command to remove the VRRP router priority within the virtual router, which has been set using the **priority** command.

Syntax

```
priority <1-255>
no priority
```

Parameter	Description
<1-255>	The priority. For the master router, use 255 for this parameter; otherwise use any number from the range <1-254>.

Default Defaults for priority are: **master router**= 255; **backup**= 100.

Mode Router Configuration

Usage notes Priority determines the role that each VRRP router plays and what happens if the master virtual router fails. If a VRRP router owns the IP address of the virtual router and the IP address of the interface, then this VRRP router functions as the master virtual router.

Priority also determines whether a VRRP router functions as a backup virtual router and the order of ascendancy to becoming a master virtual router if the master virtual router fails. Configure the priority of each backup virtual router with a a value of 1 through 254.

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 IPv4 and IPv6 configuration details.

Examples The example below shows you how to configure 101 as the priority for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# priority 101
```

The example below shows you how to remove the priority configured for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no priority
```

The example below shows you how to configure 101 as the priority for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# priority 101
```

The example below shows you how to remove the configured priority for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# no priority
```

Related commands

preempt-mode

router ipv6 vrrp (interface)

Overview Use this command to configure VRRPv3 for IPv6 and define the interface that will participate in virtual routing to send and receive advertisement messages. This command allows you to enter the Router Configuration mode.

Use the **no** variant of this command to remove the VRRPv3 for IPv6 configuration. Disable the VRRP session before using the **no** variant of this command.

Syntax

```
router ipv6 vrrp <vrid> <interface>
no router ipv6 vrrp <vrid> <interface>
```

Parameter	Description
<vrid>	*<1-255>* The ID of the virtual router VRRPv3 IPv6 session to create.
<interface>	Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRPv3 IPv6 advertisement messages.

Mode Global Configuration

Usage notes Use the required *<interface>* placeholder to define the interface that will participate in virtual routing. This interface is used for two purposes - to send/receive advertisement messages and to forward on behalf of the virtual router when in master state.

NOTE: *Tunnels and PPP interfaces are not supported. VRRP is only configurable on VLANs.*

NOTE: *Configuring a high number of instances may adversely affect the device's performance, depending on the device CPU, the other protocols it is running, and whether you set the advertisement interval to less than 1 second.*

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 IPv6 configuration details.

Examples The example below shows you how to enable a VRRPv3 session with VR ID 3 on vlan2:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan2
awplus(config-router)# enable
awplus(config-router)#
```

The example below shows you how to disable a VRRPv3 session with VR ID 3 on vlan2:

```
awplus(config-router)# disable
awplus(config-router)# exit
awplus(config)# no router ipv6 vrrp 3 vlan2
awplus(config)#
```

router vrrp (interface)

Overview Use this command to configure VRRP IPv4 and define the interface that will participate in virtual routing to send and receive advertisement messages. This command allows you to enter the Router Configuration mode.

Use the **no** variant of this command to remove the VRRP IPv4 configuration. Disable the VRRP session before using the **no** variant of this command.

Syntax

```
router vrrp <vrid> <interface>
no router vrrp <vrid> <interface>
```

Parameter	Description
<vrid>	*<1-255>* The ID of the virtual router VRRP IPv4 session to create.
<interface>	Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRP IPv4 advertisement messages.

Mode Global Configuration

Usage notes Use the required *<interface>* placeholder to define the interface that will participate in virtual routing. This interface is used for two purposes - to send/receive advertisement messages and to forward on behalf of the virtual router when in master state.

NOTE: *Tunnels and PPP interfaces are not supported. VRRP is only configurable on VLANs*

NOTE: *Configuring a high number of instances may adversely affect the device's performance, depending on the device CPU, the other protocols it is running, and whether you set the advertisement interval to less than 1 second.*

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 IPv4 configuration details.

Examples To enable a VRRP session with VR ID 5 on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan1
awplus(config-router)# enable
```

To disable a VRRP session with VR ID 5 on vlan1, use the commands:

```
awplus(config-router)# disable
awplus(config-router)# exit
awplus(config)# no router vrrp 5 vlan1
```

show running-config router ipv6 vrrp

Overview Use this command to show the running configuration for VRRPv3 IPv6.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 IPv6 configuration details.

Syntax

```
show running-config router vrrp
```

Mode Privileged Exec, Global Configuration, Line Configuration, and Interface Configuration.

Example The example below shows you how to display the running configuration for VRRPv3 IPv6:

```
awplus# show running-config router ipv6 vrrp
```

Output Figure 48-1: Example output from the **show running-config router ipv6 vrrp** command

```
!
router ipv6 vrrp 3 vlan3
 virtual-ip fe80::202:b3ff:fed5:983e master
 circuit-failover vlan3 3
 advertisement-interval 6
 preempt-mode false
!
```

show running-config router vrrp

Overview Use this command to show the running configuration for VRRP IPv4.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 IPv4 configuration details.

Syntax

```
show running-config router vrrp
```

Mode Privileged Exec, Global Configuration, Line Configuration, and Interface Configuration.

Example The example below shows you how to display the running configuration for VRRP IPv4:

```
awplus# show running-config router vrrp
```

Output Figure 48-2: Example output from the **show running-config router vrrp** command

```
!
router vrrp 2 vlan2
 circuit-failover vlan2 2
 advertisement-interval 4
 preempt-mode true
!
```

show vrrp

Overview Use this command to display information about all VRRP IPv4 sessions. This command shows a summary when the optional **brief** parameter is used.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 IPv4 configuration details.

Syntax

```
show vrrp [brief]
```

Parameter	Description
`brief`	Brief summary of VRRP sessions.

Mode User Exec and Privileged Exec

Example To display information about all VRRP IPv4 sessions, enter the command:

```
awplus# show vrrp
```

To display brief summary output about VRRP IPv4 sessions, enter the command:

```
awplus# show vrrp brief
```

Output Figure 48-3: Example output from the **show vrrp** command

```
awplus#show vrrp
VMAC enabled
Address family IPv4
VRRP Id: 1 on interface: vlan2
 State: AdminUp   - Master
 Virtual IP address: 192.168.1.2 (Not-owner)

show vrrp counters

Overview This command displays VRRP SNMP counters on the console, as described in the VRRP MIB and RFC2787, for debugging use while you configure VRRP with commands in this chapter.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show vrrp counters
```

Mode User Exec and Privileged Exec

Usage notes The output has a section for global counters and a section of counters for each VRRP instance configured. See the descriptions of the counters below the sample output as per RFC2787.

NOTE: *Note that the counters displayed with this commands are the same counters as described in RFC 2787 (Copyright (C) The Internet Society (2000). All Rights Reserved) except for the "Monitored Circuit Up" and "Monitored Circuit Down" counters, which are additions beyond the MIB.*

Example To display information about VRRP SNMP counters on the console, enter the command:

```
awplus# show vrrp counters
```

Figure 48-5: Example output from the **show vrrp counters** command

```
awplus#show vrrp counters
VRRP Global Counters:
  Checksum Errors .... 230
  Version Errors ..... 0
  VRID Errors ........ 230

VRRP IPv4 counters for VR 10/vlan10:
  Master Transitions ........ 0
  Received Advertisements ... 0
  Internal Errors ........... 0
  TTL Errors ................ 0
  Received Priority 0 Pkt ... 0
  Sent Priority 0 Pkt ....... 0
  Received Invalid Type ..... 0
  Address List Errors ....... 0
  Packet Length Errors ...... 0
  Monitored Circuit Up ...... 0
  Monitored Circuit Down..... 0
```

```
VRRP IPv4 counters for VR 100/vlan100:
  Master Transitions ........ 1
  Received Advertisements ... 1614
  Internal Errors ........... 0
  TTL Errors ................ 0
  Received Priority 0 Pkt ... 0
  Sent Priority 0 Pkt ....... 0
  Received Invalid Type ..... 0
  Address List Errors ....... 0
  Packet Length Errors ...... 0
  Monitored Circuit Up ...... 0
  Monitored Circuit Down..... 2
```

Table 1: Global counters with descriptions for the **show vrrp counters** command:

Counter	Description
`Checksum Errors`	The total number of VRRP packets received with an invalid VRRP checksum value.
`Version Errors`	The total number of VRRP packets received with an unknown or unsupported version number.
`VRID Errors`	The total number of VRRP packets received with an invalid VRID for this virtual router.

Table 2: Per VR counters with descriptions for the **show vrrp counters** command:

Counter	Description
`Master Transitions`	The total number of times that this virtual router's state has transitioned to MASTER.
`Received Advertisements`	The total number of VRRP advertisements received by this virtual router.
`Internal Errors`	The total number of VRRP advertisement packets received for which the advertisement interval is different than the one configured for the local virtual router.
`TTL Errors`	The total number of VRRP packets received by the virtual router with IP TTL (Time-To-Live) not equal to 255.
`Received Priority 0 Pkt`	The total number of VRRP packets received by the virtual router with a priority of '0'.
`Sent Priority 0 Pkt`	The total number of VRRP packets sent by the virtual router with a priority of '0'.
`Received Invalid Type`	The number of VRRP packets received by the virtual router with an invalid value in the 'type' field.
`Address List Errors`	The total number of packets received for which the address list does not match the locally configured list for the virtual router.

Table 2: Per VR counters with descriptions for the **show vrrp counters** command: (cont.)

Counter	Description
`Packet Length Errors`	The total number of packets received with a packet length less than the length of the VRRP header.
`Monitored Circuit Up`	The total number of times the monitored circuit has generated the UP event.
`Monitored Circuit Down`	The total number of times the monitored circuit has generated the down event.

show vrrp ipv6

Overview Use this command to display information about all configured VRRPv3 IPv6 sessions for all interfaces, or all VRRPv3 IPv6 sessions for a given interface with the optional parameter.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 IPv6 configuration details.

Syntax

```
show vrrp ipv6 [<interface>]
```

Parameter	Description
<interface>	Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRPv3 IPv6 advertisement messages.

Mode User Exec and Privileged Exec

Example To display information about all VRRPv3 IPv6 sessions, enter the command:

```
awplus# show vrrp ipv6
```

Output Figure 48-6: Example output from the **show vrrp ipv6 vlan2** command

```
awplus#show vrrp ipv6 vlan2
VrId <1>
 State is Master
 Virtual IP is fe80::202:b3ff:fed5:983e (Owner)
 Interface is vlan2
 Priority is 255
 Advertisement interval is 4 sec
 Preempt mode is FALSE
```

Related commands

enable (VRRP)

disable (VRRP)

show vrrp (session)

Overview Use this command to display information for a particular VRRP session.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 IPv4 configuration details.

Syntax

```
show vrrp <vrid> <interface>
```

Parameter	Description
<vrid>	*<1-255>* The virtual router ID for which to display information. Session must already exist.
<interface>	The interface to display information about, for instance, `vlan2`.

Mode User Exec and Privileged Exec

Usage notes See the below sample output from the **show vrrp** command displaying information about VRRP session 1 configured on **vlan2**. Output shows that a Virtual IP address has been set.

```
awplus# show vrrp 1 vlan2
```

```
awplus#show vrrp 1 vlan2
Address family IPv4
VrId <1>
 Interface is vlan2
 State is Initialize
 Virtual IP address is 10.10.11.250 (Not IP owner)
 Priority is 100
 Advertisement interval is 1 sec
 Preempt mode is TRUE
 Multicase membership on IPv4 interface vlan1: JOINED
 Transition mode: FALSE
 Accept mode: TRUE
 Master address: 192.168.24.5
 High Availability:
enabled
  wan-bypass 1 (eth1) is on
```

See the below sample output from the **show vrrp** command displaying information about VRRP session 1 configured on **vlan3**. Output shows a Virtual IP address has not been set.

```
awplus# show vrrp 1 vlan3
```

```
awplus#show vrrp 1 vlan3
Address family IPv4
VrId <1>
 Interface is vlan3
 State is Initialize
 Virtual IP address is unset
 Priority is 100
 Advertisement interval is 1 sec
 Preempt mode is TRUE
Preempt mode is TRUE
 Multicase membership on IPv4 interface vlan3: JOINED
 Transition mode: FALSE
 Accept mode: TRUE
 Master address: 192.168.24.5
 High Availability:
enabled
  wan-bypass 1 (eth1) is on
```

Example The following command shows information about VRRP session 5 for interface **vlan2**.

```
awplus# show vrrp 5 vlan2
```

transition-mode

Overview Use this command to configure the IPv4 transition mode. Transition mode allows you to upgrade from VRRPv2 to VRRPv3 and gives interoperability between VRRPv2 and VRRPv3.

If transition-mode is set to **true**, then the IPv4 transition mode is enabled and VRRPv2 and VRRPv3 advertisements are sent allowing VRRPv2 and VRRPv3 interoperability. Received VRRPv2 advertisement packets are accepted and processed when transition-mode is true.

If transition-mode is set to **false**, then the IPv4 transition mode is disabled and only VRRPv3 advertisements are sent. Received VRRPv2 advertisement packets are dropped.

Note the advertisement-interval should not be configured to less than 1 second when using transition-mode. VRRPv2 can only use advertisements in whole second intervals.

Syntax

```
transition-mode {true|false}
```

Parameter	Description
`true`	Transition mode is enabled. This results in VRRPv2 and VRRPv3 IPv4 advertisements being sent. Transition mode is only available on VRRPv3 for interoperability with VRRPv2 while upgrading to VRRPv3.
`false`	Transition mode is disabled. This stops VRRPv2 IPv4 advertisements being sent. Only VRRPv3 advertisements are sent when disabled. Disable transition-mode after upgrading from VRRPv2 to VRRPv3.

Default The default is **false**.

Mode Router Configuration

Usage notes See the VRRP Feature Overview and Configuration Guide for more information:

- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details
- further information about configuring transition mode to upgrade from VRRPv2 to VRRPv3

Examples The example below shows you how to configure IPv4 transition-mode as true for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# transition-mode true
```

The example below shows you how to configure IPv4 transition-mode as false for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# transition-mode false
```

Related commands router vrrp (interface)

undebug vrrp

Overview Use this command to disable all VRRP debugging.

Syntax

```
undebug vrrp all
```

Mode Privileged Exec

Example The example below shows you how to disable all VRRP debugging:

```
awplus# undebug vrrp all
```

Related commands debug vrrp

undebug vrrp events

Overview Use this command to disable debugging options for VRRP event troubleshooting.

Syntax

```
undebug vrrp events
```

Mode Privileged Exec

Example The example below shows you how to disable VRRP event debugging:

```
awplus# undebug vrrp events
```

Related commands debug vrrp events

undebug vrrp packet

Overview Use this command to disable debugging options for VRRP packets.

Syntax

```
undebug vrrp packet [send|recv]
```

Parameter	Description
`send`	Disable the debug option set for sent packets.
`recv`	Disable the debug option set for received packets.

Mode Privileged Exec

Examples The example below shows you how to disable VRRP sent packet debugging:

```
awplus# undebug vrrp packet send
```

The example below shows you how to disable VRRP received packet debugging:

```
awplus# undebug vrrp packet recv
```

The example below shows you how to disable all VRRP packet debugging:

```
awplus# undebug vrrp packet
```

Related commands debug vrrp packet

virtual-ip

Overview Use this command to set the virtual IP address for the VRRP session. This is the IP address of the virtual router that end hosts set as their default gateway.

Use the **no** variant of this command to disable this feature.

Syntax

```
virtual-ip <ip-address> [master|backup|owner]
no virtual-ip
```

Parameter	Description
`<ip-address>`	The virtual IPv4 address of the virtual router, entered in dotted decimal format A.B.C.D.
`master`	Sets the default state of the VRRP router within the Virtual Router as **master**. For master, the router must own the Virtual IP address. Specify the **owner** option before using **master** option.
`backup`	Sets the default state of the VRRP router within the Virtual Router as **backup**.
`owner`	Sets the IPv6 address of the VRRP router within the Virtual Router as the **owner**. Specify this before using the **master** option.

Mode Router Configuration

Usage notes The VRRP master and owner of the virtual IPv4 address for the VRRP session only responds to the packets destined to the virtual IPv6 address. The VRRP master that is not an owner of the virtual IPv4 address for the VRRP session does not respond to the packets destined to the virtual IPv4 address, but forwards packets with a VMAC as the destination address. See the vrrp vmac command to enable and disable this feature.

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 IPv4 configuration details.

Examples The example below shows you how to set the virtual IP address for VRRP VR ID 5 and the router as the VRRP master:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 master
```

The example below shows you how to set the virtual IPv4 address for VRRP VR ID 5 and the router as the VRRP backup:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 backup
```

The example below shows you how to set the virtual IPv4 address for VRRP VR ID 5 and the router as owner of the virtual IPv4 address:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 owner
```

The example below shows you how to disable the virtual IPv4 address for VRRP VR ID 5

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no virtual-ip
```

Related commands

router vrrp (interface)

enable (VRRP)

vrrp vmac

virtual-ipv6

Overview Use this command to set the virtual IPv6 address for the VRRPv3 session. This is the IPv6 address of the virtual router that end hosts set as their default gateway.

Note that the primary IPv6 address specified is an IPv6 link-local address. See the Usage note below for further information.

Use the **no** variant of this command to disable this feature.

Syntax

```
virtual-ipv6 <ipv6-address> [master|backup]
[primary|secondary]
no virtual-ipv6
```

Parameter	Description
<ipv6-address>	The IPv6 address of the virtual router, entered in hexadecimal, in the format X:X::X.X.
`master`	Sets **master** to be the default state of the VRRPv3 router within the Virtual Router. For **master**, we recommend using a Virtual IP address that is not owned by any of the VRRP routers in the same grouping (that share the same VRID).
`backup`	Sets **backup** to be the default state of the VRRPv3 router within the Virtual Router.
`primary`	Sets the specified address as the primary IPv6 address. The primary address must be a link-local IPv6 address.
`secondary`	Sets the specified address as the secondary IPv6 address. Normally this would be a globally-routable IPv6 address. This enables you to specify a globally-routable address as the default gateway address for all the hosts on a VLAN.

Mode Router Configuration

Usage notes The virtual router will reply to ping, telnet, and SSH requests to the virtual IP address. The virtual router will reply even if it does not own the virtual IP address.

The AlliedWare Plus VRRPv3 implementation supports one IPv6 virtual link local address per virtual router ID. Note that in the command examples fe80::1 is an IPv6 link-local address. An IPv6 link-local address is used because IPv6 link-local addresses are used by IPv6 ND (Neighbor Discovery). A host's default route to a router points to the IPv6 link- local address, not a specific global IPv6 address for the router. For the host's traffic to switch over to a backup router, the IPv6 link-local address of the router is used by VRRPv3.

See the VRRP Feature Overview and Configuration Guide for more information about VRRPv3 IPv6 configuration details.

Examples

The example below shows you how to set the virtual IPv6 address for VRRPv3 VR ID 3 and the router as the VRRPv3 master:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# virtual-ipv6 fe80::1 master
```

The example below shows you how to set the virtual IPv6 address for VRRPv3 VR ID 3 and the router as the VRRPv3 backup:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# virtual-ipv6 fe80::1 backup
```

The example below shows you disable the virtual IPv6 address for VRRPv3 VR ID 3:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# no virtual-ipv6
```

Related commands

router ipv6 vrrp (interface)

enable (VRRP)

vrrp vmac

vrrp vmac

Overview Use this command to enable or disable the VRRP Virtual MAC feature. This feature is used by VRRP to make the hosts use the virtual MAC address as the physical hardware address of their gateway.

A VRRP router master will use the virtual MAC address for any ARP responses associated with the virtual IP address, or any gratuitous ARPs sent on behalf of the virtual IP address.

All VRRP advertisements are sent using this virtual MAC address as the source MAC address.

The virtual MAC address has the form 00:00:5e:00:01:<VRID>, where VRID is the ID of the Virtual Router.

Syntax

```
vrrp vmac {enable|disable}
```

Mode Global Configuration

Examples To enable Virtual MAC enter:

```
awplus# configure terminal
awplus(config)# vrrp vmac enable
```

To disable Virtual MAC enter:

```
awplus# configure terminal
awplus(config)# vrrp vmac disable
```

Part 7: Network Management

49 Allied Telesis Management Framework™ (AMF) Commands

Introduction

Overview This chapter provides an alphabetical reference for Allied Telesis Management Framework™ (AMF) commands.

AMF master nodes Every AMF network must have at least one master node, which acts as the core of the AMF network. Not all AlliedWare Plus devices are capable of acting as an AMF master. See the AMF Feature Overview and Configuration Guide for information about AMF master support.

AMF edge AlliedWare Plus CentreCOM® Series switches can only be used as edge switches in an AMF network. The full management power and convenience of AMF is available on these switches, but they can only link to one other AMF node. They cannot form cross-links or virtual links.

AMF naming convention When AMF is enabled on a device, it will automatically be assigned a host name. If a host name has already been assigned, by using the command hostname on page 264, this will remain. If however, no host name has been assigned, then the name applied will be the prefix, **host_** followed (without a space) by the MAC address of the device. For example, a device whose MAC address is **0016.76b1.7a5e** will have the name **host_0016_76b1_7a5e** assigned to it.

To efficiently manage your network using AMF, we strongly advise that you devise a naming convention for your network devices, and apply an appropriate hostname to each device in your AMF network.

AMF and STP On AR-Series UTM firewalls and Secure VPN routers, you cannot use STP at the same time as AMF.

Command List

application-proxy ip-filter

Overview Use this command to enable global IP filtering on a device. Once enabled the device will add a global ACL in response to a threat message from an AMF Security (AMF-Sec) Controller.

Use the **no** variant of this command to disable global IP filtering.

Syntax
```
application-proxy ip-filter
no application-proxy ip-filter
```

Default Global IP filtering is disabled by default.

Mode Global Configuration

Usage notes For this feature to work, the AMF Application Proxy service needs to be enabled on your network, using the command service atmf-application-proxy.

Example To enable global IP filtering, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy ip-filter
```

To disable global IP filtering, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy ip-filter
```

Related commands
application-proxy redirect-url

application-proxy threat-protection

clear application-proxy threat-protection

service atmf-application-proxy

show application-proxy threat-protection

Command changes Version 5.4.7-2.5: command added

application-proxy quarantine-vlan

Overview Use this command to set the quarantine VLAN to use when an AMF Security (AMF-Sec) Controller detects a threat. The port/s on which the threat is detected are moved to this VLAN if the application-proxy threat-protection action is set to **quarantine**.

Use the **no** variant of this command to delete the quarantine VLAN. If no quarantine VLAN is specified then no quarantine action will be performed.

Syntax

```
application-proxy quarantine-vlan <vlan-id>
no application-proxy quarantine-vlan
```

Parameter	Description
<vlan-id>	The ID of the VLAN to use. In the range 1-4094.

Default By default, no quarantine VLAN is configured.

Mode Global Configuration

Example To configure VLAN 100 as the quarantine VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy quarantine-vlan 100
```

To delete the quarantine VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy quarantine-vlan
```

clear application-proxy threat-protection

application-proxy threat-protection send-summary

service atmf-application-proxy

show application-proxy threat-protection

Command changes Version 5.4.7-2.2: command added

application-proxy redirect-url

Overview Use this command to redirect a user to a helpful URL when they are blocked because of an application-proxy ip-filter.

Use the **no** variant of this command to remove the URL redirect.

Syntax

```
application-proxy redirect-url <url>
no application-proxy redirect-url
```

Parameter	Description
<url>	URL to redirect the user to.

Default No URL is configured by default.

Mode Global Configuration

Example To configure a redirect URL, use the command:

```
awplus# application-proxy redirect-url http://my.dom/help.html
```

To remove a redirect URL, use the command:

```
awplus# no application-proxy redirect-url
```

Related commands

application-proxy ip-filter

clear application-proxy threat-protection

service atmf-application-proxy

show application-proxy threat-protection

Command changes Version 5.4.9-0.1: command added

application-proxy threat-protection

Overview Use this command to set the blocking action to take when a threat detected message is received from an AMF Security (AMF-Sec) Controller.

Use the **no** variant of this command to disable threat protection blocking actions on the port.

Syntax

```
application-proxy threat-protection {drop|link-down|
quarantine|log-only}
no application-proxy threat-protection
```

Parameter	Description
`drop`	Apply a Layer 2 drop for traffic generating the threat reports.
`link-down`	Set the link to error disabled in response to threats.
`quarantine`	Move the offending port to a quarantine VLAN.
`log-only`	Log when a threat is detected.

Default Threat protection is disabled by default.

Mode Interface Configuration

Example To set the threat protection blocking action on port1.0.4 to drop, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# application-proxy threat-protection drop
```

To disable threat protection blocking actions on port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no application-proxy threat-protection
```

Related commands

application-proxy threat-protection send-summary

Overview Use this command to send a summary of all current threat-protection blocking requests to all AMF Application Proxy service nodes. This command can only be performed on an AMF master.

Syntax
```
application-proxy threat-protection send-summary
```

Mode Privileged Exec

Example To send a summary of all current threat-protection blocking requests to all AMF Application Proxy service nodes, use the command:

```
awplus# application-proxy threat-protection send-summary
```

Related commands
- application-proxy quarantine-vlan
- application-proxy threat-protection
- clear application-proxy threat-protection
- service atmf-application-proxy
- show application-proxy threat-protection

Command changes Version 5.4.7-2.2: command added

application-proxy whitelist advertised-address

Overview Use this command to register a Layer 3 interface, and the IPv4 address that is attached to this interface, as the advertised application-proxy whitelist address for a device.

Use the **no** variant of this command to stop advertising the Layer 3 interface and its associated IPv4 address.

Syntax

```
application-proxy whitelist advertised-address <interface>
no application-proxy whitelist advertised-address
```

Parameter	Description
<interface>	Layer 3 interface to configure as the advertised address.

Default No address advertised by default.

Mode Global Configuration

Example To configure the IPv4 address attached to VLAN 1as the advertised address, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist advertised-address vlan1
```

To remove the advertised address, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist advertised-address
```

Related commands application-proxy whitelist server

show application-proxy whitelist advertised-address

Command changes Version 5.4.9-1.1: command added

application-proxy whitelist enable

Overview Use this command to enable application-proxy whitelist based authentication on an interface.

Use the **no** variant of this command to disable the whitelist authentication.

Syntax

```
application-proxy whitelist enable
no application-proxy whitelist enable
```

Default Application-proxy whitelist is disabled by default.

Mode Interface Configuration

Usage notes When **port-control** is set to **auto**, the 802.1X authentication feature is executed on the interface, but only if the **aaa authentication dot1x** command has been issued.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be
removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

Example To enable application-proxy whitelist authentication on the interface port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# application-proxy whitelist enable
```

To disable application-proxy whitelist authentication on the interface port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no application-proxy whitelist enable
```

Related commands

Command changes Version 5.4.9-0.1: command added

application-proxy whitelist protection tls

Overview Use this command to configure the application-proxy whitelist control channel to use TLS protection. If no trustpoint is specified then TLS will operate without authentication.

Use the **no** variant of this command to stop using TLS.

Syntax

```
application-proxy whitelist protection tls [trustpoint <name>]
no application-proxy whitelist protection tls
```

Parameter	Description
`trustpoint`	Specify an optional trustpoint. If no trustpoint is specified then TLS will operate without authentication.
<name>	Name of the trustpoint.

Default TLS is disabled by default.

Mode Global Configuration

Example To configure an AMF application-proxy whitelist to use TLS with the trustpoint 'corpca', use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist protection tls
trustpoint corpca
```

To configure an AMF application-proxy whitelist to stop using TLS, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist protection tls
```

Related commands

application-proxy whitelist enable

show application-proxy whitelist server

Command changes Version 5.5.0-2.1: command added

application-proxy whitelist server

Overview Use this command to set an AMF master to act as a whitelist authentication proxy between AMF members, acting as Network Access Servers, and an external whitelist RADIUS server.

Use the **no** variant of this command to disable the whitelist proxy functionality.

Syntax

```
application-proxy whitelist server <ip-address> key <key>
[auth-port <1-65535>]
```

```
no application-proxy whitelist server
```

Parameter	Description
`<ip-address>`	IPv4 address of the upstream RADIUS server in dotted decimal format A.B.C.D.
`key <key>`	Set the shared secret encryption key for communication with the upstream RADIUS server.
`auth-port <1-65535>`	Set the RADIUS server UDP port. This is only necessary if you don't want to use the default port 1812.

Default Disabled by default.

Mode Global Configuration

Example To configure an AMF master to work as a proxy to the external RADIUS server 192.168.1.10, with shared secret 'mysecurekey', on port 1822, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist server 192.168.1.10
key mysecurekey auth-port 1822
```

To configure an AMF master to work as a proxy to the external RADIUS server 192.168.1.10, with shared secret 'mysecurekey', on the default port (1812), use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist server 192.168.1.10
key mysecurekey
```

To disable the whitelist proxy, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist server
```

Related commands

Command changes Version 5.4.9-0.1: command added

application-proxy whitelist trustpoint (deprecated)

Overview

This command has been deprecated. It has been replaced by the application-proxy whitelist protection tls command.

This command sets the trustpoint to use when communicating with the external whitelist RADIUS server. This enables RADIUS over TLS (RadSec) protection.

Syntax

```
application-proxy whitelist trustpoint <name>
no application-proxy whitelist trustpoint
```

Command changes

Version 5.4.9-1.1: command added

Version 5.5.0-2.1: command deprecated

area-link

Overview Use this command to create an area-link between a Virtual AMF Appliance (VAA) host controller and an AMF container.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the AMF Feature Overview and Configuration Guide for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove an area-link from a container.

Syntax

```
area-link <area-name>
no area-link
```

Parameter	Description
<area-name>	AMF area name of the container's area.

Mode AMF Container Configuration

Usage notes The AMF area-link connects the AMF controller on a VAA host to the AMF container. Once a container has been created with the atmf container command and an area-link configured with the **area-link** command, it can be enabled using the state command.

You can only configure a single area-link on a container. You will see the following message if you try and configure a second one:

```
% AreaLink already configured for this container
```

Each container has two virtual interfaces:

- Interface eth0, used to connect to the AMF controller on the VAA host via an AMF area-link, configured using this area-link command.
- Interface eth1, used to connect to the outside world using a bridged L2 network link, configured using the bridge-group command.

See the AMF Feature Overview and Configuration_Guide for more information on these virtual interfaces and links.

Example To create the area-link to "wlg" on container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# area-link wlg
```

To remove an area-link from container “vac-wlg-1”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# no area-link
```

Related commands

atmf container

show atmf container

Command changes

Version 5.4.7-0.1: command added

atmf-arealink

Overview This command to enable an Eth interface, on an AR-series device, as an AMF area link. AMF area links are designed to operate between two nodes in different areas in an AMF network. This command is only available if your network is running in AMF secure mode (see atmf secure-mode for more information on AMF secure mode).

Use the **no** variant of this command to remove any AMF area links that may exist for the selected Eth interface.

Syntax

```
atmf-arealink remote-area <area-name> vlan <2-4094>
no atmf-arealink
```

Parameter	Description
<area-name>	The name of the remote area that the interface is connecting to.
<2-4094>	The VLAN ID for the link. This VLAN cannot be used for any other purpose, and the same VLAN ID must be used at each end of the link.

Default By default, no area links are configured

Mode Eth interface on an AR-series device.

Usage notes Run this command on the interface at both ends of the link.

Each area must have the area-name configured, and the same area password must exist on both ends of the link.

Running this command will synchronize the area information stored on the two nodes.

You can configure multiple area links between two area nodes, but only one area link at any time will be in use. All other area links will block information, to prevent network storms.

NOTE: *See the switchport atmf-arealink command to configure an AMF area link on an a switch port or link aggregator*

Example To configure eth1 as an AMF area link to the 'Auckland' area on VLAN 6, use the following commands:

```
master_1# configure terminal
master_1(config)# interface eth1
master_1(config-if)# atmf-arealink remote-area Auckland vlan 6
```

To remove eth1 as an AMF area link, use the following commands:

```
master_1# configure terminal
master_1(config)# interface eth1
master_1(config-if)# no atmf-arealink
```

Related commands

atmf area

atmf area password

atmf virtual-link

show atmf links

Command changes

Version 5.5.0-1.1: command added

atmf-link

Overview Use this command to enable an Eth interface on an AR-series device as an up/down AMF link. This command is only available if your network is running in AMF secure mode (see atmf secure-mode for more information on AMF secure mode).

Use the **no** variant of this command to remove any AMF link that may exist for the selected Eth interface.

Syntax

```
atmf-link
no atmf-link
```

Mode Eth interface on an AR-series device.

Usage notes Up/down links and virtual links interconnect domains in a vertical hierarchy, with the highest domain being the core domain. In effect, they form a tree of interconnected AMF domains. This tree must be loop-free. Therefore you must configure your up/down and virtual links so that no loops are formed.

If you run the command and AMF secure mode is not enabled, you will see the following error message:

```
Node_1(config)#int eth1
Node_1(config-if)#atmf-link
% Cannot configure eth1 because atmf secure-mode is not enabled.
```

NOTE: *See the switchport atmf-link command to configure an AMF up/down link on an a switch port or link aggregator*

Example To configure eth1 as an AMF up/down link, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface eth1
Node_1(config-if)# atmf-link
```

To remove eth1 as an AMF up/down link, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface eth1
Node_1(config-if)# no atmf-link
```

Related commands

switchport atmf-link

Command changes Version 5.5.0-1.1: command added

atmf area

Overview This command creates an AMF area and gives it a name and ID number.

Use the **no** variant of this command to remove the AMF area.

This command is only valid on AMF controllers, master nodes and gateway nodes.

Syntax

```
atmf area <area-name> id <1-126> [local]
no atmf area <area-name>
```

Parameter	Description
<area-name>	The AMF area name. The area name can be up to 15 characters long. Valid characters are: a..z A..Z 0..9 - _ Names are case sensitive and must be unique within an AMF network. The name cannot be the word "local" or an abbreviation of the word "local" (such as "l", "lo" etc.).
<1-126>	An ID number that uniquely identifies this area.
`local`	Set the area to be the local area. The local area contains the device you are configuring.

Mode Global Configuration

Usage notes This command enables you to divide your AMF network into areas. Each area is managed by at least one AMF master node. Each area can have up to 120 nodes, depending on the license installed on that area's master node.

The whole AMF network is managed by up to 8 AMF controllers. Each AMF controller can communicate with multiple areas. The number of areas supported on a controller depends on the license installed on that controller.

You must give each area in an AMF network a unique name and ID number.

Only one local area can be configured on a device. You must specify a local area on each controller, remote AMF master, and gateway node.

Example To create the AMF area named *New-Zealand*, with an ID of 1, and specify that it is the local area, use the command:

```
controller-1(config)# atmf area New-Zealand id 1 local
```

To configure a remote area named *Auckland*, with an ID of 100, use the command:

```
controller-1(config)# atmf area Auckland id 100
```

Related commands

atmf area password

show atmf area

show atmf area summary

show atmf area nodes

switchport atmf-arealink

atmf area password

Overview This command sets a password on an AMF area.

Use the **no** variant of this command to remove the password.

This command is only valid on AMF controllers, master nodes and gateway nodes. The area name must have been configured first.

Syntax

```
atmf area <area-name> password [8] <password>
no atmf area <area-name> password
```

Parameter	Description
<area-name>	The AMF area name.
8	This parameter is displayed in **show running-config** output to indicate that it is displaying the password in encrypted form. You should not enter **8** on the CLI yourself.
<password>	The password is between 8 and 32 characters long. It can include spaces.

Mode Global Configuration

Usage notes You must configure a password on each area that an AMF controller communicates with, except for the controller's local area. The areas must already have been created using the atmf area command.

Enter the password identically on both of:

- the area that locally contains the controller, and
- the remote AMF area masters

The command **show running-config atmf** will display the encrypted version of this password. The encryption keys will match between the controller and the remote AMF master.

If multiple controller and masters exist in an area, they must all have the same area configuration.

Example To give the AMF area named *Auckland* a password of "secure#1" use the following command on the controller:

```
controller-1(config)# atmf area Auckland password secure#1
```

and also use the following command on the master node for the Auckland area:

```
auck-master(config)# atmf area Auckland password secure#1
```

Related commands

switchport atmf-arealink

atmf authorize

Overview On an AMF network, with secure mode enabled, use this command on an AMF master to authorize an AMF node to join the network. AMF nodes waiting to be authorized appear in the pending authorization queue, which can be examined using the show atmf authorization command with the **pending** parameter.

Use the **no** variant of this command to revoke authorization for an AMF node on an AMF master.

Syntax

```
atmf authorize {<node-name> [area <area-name>]|all-pending}
no atmf authorize <node-name> [area <area-name>]
```

Parameter	Description
<node-name>	The name of the node to be authorized or have its authorization revoked.
`area`	Specify an AMF area.
<area-name>	This is the name of the area the node belongs to.
`all-pending`	Authorize all nodes in the pending queue.

Mode Privileged Exec

Usage notes On an AMF controller, AMF remote-area masters must be authorized by the controller, and the AMF remote-area masters will also need to authorized access from the AMF controller.

Example To authorize all AMF nodes in the pending authorization queue on an AMF master, use the command:

```
awplus# atmf authorize all-pending
```

To authorize a node called “node2” in remote AMF area “area3”, use the command:

```
awplus# atmf authorize node2 area “area3”
```

To authorize a node called “node4” on an AMF master, use the command:

```
awplus# atmf authorize node4
```

To revoke authorization for a node called “node4” on an AMF master, use the command:

```
awplus# no atmf authorize node4
```

Command changes

Version 5.4.7-0.3: command added

atmf authorize provision

Overview Use this command from an AMF controller or AMF master to pre-authorize a node on an AMF network running in secure mode. This allows a node to join the AMF network the moment the atmf secure-mode command is run on that node.

Use the **no** variant of this command to remove a provisional authorization from and AMF controller or AMF master.

Syntax

```
atmf authorize provision [timeout <minutes>] node <node-name>
interface <interface-name> [area <area-name>]
atmf authorize provision [timeout <minutes>] mac <mac-address>
atmf authorize provision [timeout <minutes>] all
no atmf authorize provision node <node-name> interface
<interface-name> [area <area-name>]
no atmf authorize provision mac <mac-address>
no atmf authorize provision all
```

Parameter	Description
`timeout`	Timeout for provisional authorization. Authorization for provisioned nodes expires after the timeout period specified.
<minutes>	Timeout in minutes. A value between 1 and 6000 is permissible with the default being 60 minutes.
`node`	Specify a node to provision by node name.
<node-name>	The name of the node to provisionally authorize.
`interface`	Specify the interface the node will connect on.
<interface-name>	The name of the interface, this can be a switchport, link aggregator, LACP link, or virtual link.
`area`	Specify the AMF area.
<area-name>	This is the name of the area the node belongs to.
`mac`	Specify a node to provision by MAC address.
<mac-address>	Enter a MAC address to provisionally authorize in the format HHHH.HHHH.HHHH.
`all`	Provision authorization for all secure mode capable nodes.

Default The default timeout is 60 minutes.

Mode Privileged Exec

Example To provisionally authorize all non-secure AMF nodes, use the command:

```
awplus# atmf authorize provision all
```

To authorize a node with a MAC address of 0000.cd28.0880 for 2 hours, use the command:

```
awplus# authorize provision timeout 120 mac 0000.cd28.0880
```

To remove all provisional authorization, on an AMF master, use the command:

```
awplus# no atmf authorize provision all
```

Related commands

show atmf authorization

show atmf secure-mode

Command changes

Version 5.4.7-0.3: command added

atmf backup

Overview This command can only be applied to a master node. It manually schedules an AMF backup to start at a specified time and to execute a specified number of times per day.

Use the **no** variant of this command to disable the schedule.

Syntax `atmf backup {default|<hh:mm> frequency <1-24>}`

Parameter	Description
`default`	Restore the default backup schedule.
<hh:mm>	Sets the time of day to apply the first backup, in hours and minutes. Note that this parameter uses the 24 hour clock.
`backup`	Enables AMF backup to external media.
`frequency <1-24>`	Sets the number of times within a 24 hour period that backups will be taken.

Default Backups run daily at 03:00 AM, by default

Mode Global Configuration

Usage notes Running this command only configures the schedule. To enable the schedule, you should then apply the command atmf backup enable.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

Example To schedule backup requests to begin at 11 am and execute twice per day (11 am and 11 pm), use the following command:

```
node_1# configure terminal
node_1(config)# atmf backup 11:00 frequency 2
```

CAUTION: *File names that comprise identical text, but with differing case, such as Test.txt and test.txt, will not be recognized as being different on FAT32 based backup media such as a USB storage device. However, these filenames will be recognized as being different on your Linux based device. Therefore, for good practice, ensure that you apply a consistent case structure for your back-up file names.*

Related commands atmf backup enable

atmf backup stop

show atmf backup

atmf backup area-masters delete

Overview Use this command to delete from external media, a backup of a specified node in a specified area.

Note that this command can only be run on an AMF controller.

Syntax `atmf backup area-masters delete area <area-name> node <node-name>`

Parameter	Description
<area-name>	The area that contains the node whose backup will be deleted.
<node-name>	The node whose backup will be deleted.

Mode Privileged Exec

Example To delete the backup of the remote area-master named “well-gate” in the AMF area named Wellington, use the command:

```
controller-1# atmf backup area-masters delete area Wellington
node well-gate
```

Related commands show atmf backup area

atmf backup area-masters enable

Overview Use this command to enable backup of remote area-masters from the AMF controller. This command is only valid on AMF controllers.

Use the **no** form of the command to stop backups of remote area-masters.

Syntax

```
atmf backup area-masters enable
no atmf backup area-masters enable
```

Mode Global configuration

Default Remote area backups are disabled by default

Usage notes Use the following commands to configure the remote area-master backups:

- atmf backup to configure when the backups begin and how often they run
- atmf backup server to configure the backup server.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

Example To enable scheduled backups of AMF remote area-masters, use the commands:

```
controller-1# configure terminal
controller-1(config)# atmf backup area-masters enable
```

To disable scheduled backups of AMF remote area-masters, use the commands:

```
controller-1# configure terminal
controller-1(config)# no atmf backup area-masters enable
```

Related commands

atmf backup server

atmf backup

show atmf backup area

atmf backup area-masters now

Overview Use this command to run an AMF backup of one or more remote area-masters from the AMF controller immediately.

This command is only valid on AMF controllers.

Syntax `atmf backup area-masters now [area <area-name>|area <area-name> node <node-name>]`

Parameter	Description
<area-name>	The area whose area-masters will be backed up.
<node-name>	The node that will be backed up.

Mode Privileged Exec

Example To back up all local master nodes in all areas controlled by controller-1, use the command

```
controller-1# atmf backup area-masters now
```

To back up all local masters in the AMF area named Wellington, use the command

```
controller-1# atmf backup area-masters now area Wellington
```

To back up the local master “well-master” in the Wellington area, use the command

```
controller-1# atmf backup area-masters now area Wellington node well-master
```

Related commands

atmf backup area-masters enable

atmf backup area-masters synchronize

show atmf backup area

atmf backup area-masters synchronize

Overview Use this command to synchronize backed-up area-master files between the active remote file server and the backup remote file server. Files are copied from the active server to the remote server.

Note that this command is only valid on AMF controllers.

Syntax

```
atmf backup area-masters synchronize
```

Mode Privileged Exec

Example To synchronize backed-up files between the remote file servers for all area-masters, use the command:

```
controller-1# atmf backup area-masters synchronize
```

Related commands

atmf backup area-masters enable

atmf backup area-masters now

show atmf backup area

atmf backup bandwidth

Overview This command sets the maximum bandwidth in kilobytes per second (kBps) available to the AMF backup process. This command enables you to restrict the bandwidth that is utilized for downloading file contents during a backup.

NOTE: *This command will only run on an AMF master. An error message will be generated if the command is attempted on node that is not a master.*

Also note that setting the bandwidth value to zero will allow the transmission of as much bandwidth as is available, which can exceed the maximum configurable speed of 1000 kBps. In effect, zero means unlimited.

Use the **no** variant of this command to reset (to its default value of zero) the maximum bandwidth in kilobytes per second (kBps) available when initiating an AMF backup. A value of zero tells the backup process to transfer files using unlimited bandwidth.

Syntax

```
atmf backup bandwidth <0-1000>
no atmf backup bandwidth
```

Parameter	Description
<0-1000>	Sets the bandwidth in kilobytes per second (kBps)

Default The default value is zero, allowing unlimited bandwidth when executing an AMF backup.

Mode Global Configuration

Examples To set an atmf backup bandwidth of 750 kBps, use the commands:

```
node2# configure terminal
node2(config)# atmf backup bandwidth 750
```

To set the AMF backup bandwidth to the default value for unlimited bandwidth, use the commands:

```
node2# configure terminal
node2(config)# no atmf backup bandwidth
```

Related commands show atmf backup

atmf backup delete

Overview This command removes the backup file from the external media of a specified AMF node.

Note that this command can only be run from an AMF master node.

Syntax

```
atmf backup delete <node-name>
```

Parameter	Description
<node-name>	The AMF node name of the backup file to be deleted.

Mode Privileged Exec

Example To delete the backup file from node2, use the following command:

```
Node_1# atmf backup delete node2
```

Related commands

show atmf backup

atmf backup now

atmf backup stop

atmf backup enable

Overview This command enables automatic AMF backups on the AMF master node that you are connected to. By default, automatic backup starts at 3:00 AM. However, this schedule can be changed by the atmf backup command. Note that backups are initiated and stored only on the master nodes.

Use the **no** variant of this command to disable any AMF backups that have been scheduled and previously enabled.

Syntax

```
atmf backup enable
no atmf backup enable
```

Default Automatic AMF backup functionality is enabled on the AMF master when it is configured and external media, i.e. an SD card or a USB storage device or remote server, is detected.

Mode Global Configuration

Usage notes A warning message will appear if you run the atmf backup enable command with either insufficient or marginal memory availability on your external storage device.

You can use the command show atmf backup on page 2526 to check the amount of space available on your external storage device.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

Example To turn on automatic AMF backup, use the following command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup enable
```

Related commands

show atmf

show atmf backup

atmf backup

atmf backup now

atmf enable

atmf backup guests delete

Overview This command removes a guest node's backup files from external media such as a USB drive, SD card, or an external file server.

Syntax `atmf backup guests delete <node-name> <guest-port>`

Parameter	Description
<node-name>	The name of the guest's parent node.
<guest-port>	The port number on the parent node.

Mode User Exec/Privileged Exec

Example On a parent node named "node1" (which, in this case, the user has a direct console connection to) use the following command to remove the backup files of the guest node that is directly connected to port1.0.3.

```
node1# atmf backup guests delete node1 port1.0.3
```

Related Command

atmf backup delete

atmf backup area-masters delete

show atmf backup guest

atmf backup guests enable

Overview Use this command to enable backups of remote guest nodes from an AMF master.

Use the **no** variant of this command to disable the ability of the guest nodes to be backed up.

Syntax

```
atmf backup guests enable
no atmf backup guests enable
```

Default Guest node backups are enabled by default.

Mode Global Config

Usage notes We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

Example On the AMF master node, enable all scheduled guest node backups:

```
atmf-master# configure terminal
atmf-master(config)# atmf backup guests enable
```

Related commands

atmf backup area-masters enable

show atmf backup guest

atmf backup guests synchronize

atmf backup guests now

Overview This command manually triggers an AMF backup of guest nodes on a AMF Master.

Syntax

```
atmf backup guests now [<node-name>] [<guest-port>]
```

Parameter	Description
<node-name>	The name of the guest's parent node.
<guest-port>	The port number that connects to the guest node.

Default n/a

Mode Privileged Exec

Example Use the following command to manually trigger the backup of all guests in the AMF network

```
awplus# atmf backup guests now
```

Example To manually trigger the backup of a guest node connected to port 1.0.23 of node1, use the following command:

```
awplus# atmf backup guests now node1 port1.0.23
```

Related commands show atmf backup guest

atmf backup guests synchronize

Overview This command initiates a manual synchronization of all guest backup file-sets across remote file servers and various redundancy backup media, such as USB storage devices. This facility ensures that each device contains the same backup image files. Note that this backup synchronization process will occur as part of the regular backups scheduled by the atmf backup command.

Syntax
```
atmf backup guests synchronize
```

Default n/a

Mode User Exec/Privileged Exec

Example To synchronize backups across remote file servers and storage devices, use the command:

```
Node1#atmf backup guests synchronize
```

Related commands
atmf backup redundancy enable

show atmf guests

atmf backup guests enable

atmf backup now

Overview This command initiates an immediate AMF backup of either all AMF members, or a selected AMF member. Note that this backup information is stored in the external media on the master node of the device on which this command is run, even though the selected AMF member may not be a master node.

Note that this command can only be run on an AMF master node.

Syntax `atmf backup now [<nodename>]`

Parameter	Description
<nodename> or *<hostname>*	The name of the AMF member to be backed up, as set by the command hostname on page 264. Where no name has been assigned to this device, then you must use the default name, which is the word "host", then an underscore, then (without a space) the MAC address of the device to be backed up. For example host_0016_76b1_7a5e. Note that the node-name appears as the command Prompt when in Privileged Exec mode.

Default A backup is initiated for all nodes on the AMF (but stored on the master nodes).

Mode Privileged Exec

Usage notes Although this command will select the AMF node to be backed-up, it can only be run from any AMF master node.

NOTE: *The backup produced will be for the selected node but the backed-up config will reside on the external media of the AMF master node on which the command was run. However, this process will result in the information on one master being more up-to-date. To maintain concurrent backups on both masters, you can apply the backup now command to the master working-set. This is shown in Example 4 below.*

Example 1 In this example, an AMF member has not been assigned a host name. The following command is run on the AMF_Master_2 node to immediately backup the device that is identified by its MAC address of 0016.76b1.7a5e:

```
AMF_Master_2# atmf backup now host_0016_76b1_7a5e
```

NOTE: *When a host name is derived from its MAC address, the syntax format entered changes from XXXX.XXXX.XXXX to XXXX_XXXX_XXXX.*

Example 2 In this example, an AMF member has the host name, **office_annex**. The following command will immediately backup this device:

```
AMF_Master_2# atmf backup now office_annex
```

This command is initiated on the device's master node named **AMF_Master_2** and initiates an immediate backup on the device named **office_annex**.

Example 3 To initiate from AMF_master_1 an immediate backup of all AMF member nodes, use the following command:

```
AMF_Master_1# amf backup now
```

Example 4 To initiate an immediate backup of the node with the host-name “office_annex” and store the configuration on both masters, use the following process:

From the AMF_master_1, set the working-set to comprise only of the automatic group, master nodes.

```
AMF_Master_1# atmf working-set group master
```

This command returns the following display:

```
============================
AMF_Master_1, AMF_Master_2
============================

Working set join
```

Backup the AMF member with the host name, **office_annex** on both the master nodes as defined by the working set.

```
AMF_Master[2]# atmf backup now office_annex
```

Note that the [2] shown in the command prompt indicates a 2 node working-set.

Related commands

atmf backup

atmf backup stop

hostname

show atmf backup

atmf backup redundancy enable

Overview This command is used to enable or disable AMF backup redundancy.

Syntax

```
atmf backup redundancy enable
no atmf backup redundancy enable
```

Default Disabled

Mode Global Configuration

Usage notes If the AMF Master or Controller supports any removable media (SD card/USB), it uses the removable media as the redundant backup for the AMF data backup.

This feature is valid only if remote file servers are configured on the AMF Master or Controller.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

Example To enable AMF backup redundancy, use the commands:

```
awplus# configure terminal
awplus(config)# atmf backup redundancy enable
```

To disable AMF backup redundancy, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf backup redundancy enable
```

Related commands

atmf backup synchronize

show atmf backup

show atmf backup area

atmf backup server

Overview This command configures remote file servers as the destination for AMF backups.

Use the **no** variant of this command to remove the destination server(s). When all servers are removed the system will revert to backup from external media.

Syntax

```
atmf backup server id {1|2} <hostlocation> username <username>
[path <path>|port <1-65535>]
```

```
no atmf backup server id {1|2}
```

Parameter	Description
`id`	Remote server backup server identifier.
`{1|2}`	The backup server identifier number (1 or 2). Note that there can be up to two backup servers, numbered 1 and 2 respectively, and you would need to run this command separately for each server.
<hostlocation>	Either the name or the IP address (IPv4 or IPv6) of the selected backup server (1 or 2).
`username`	Configure the username to log in with on the selected remote file server.
<username>	The selected remote file server's username.
`path`	The location of the backup files on the selected remote file server. By default this will be the home directory of the username used to log in with.
<path>	The directory path utilized to store the backup files on the selected remote file server. No spaces are allowed in the path.
`port`	The connection to the selected remote backup file server using SSH. By default SSH connects to a device on TCP port 22 but this can be changed with this command.
`<1-65535>`	A TCP port within the specified range.

Defaults Remote backup servers are not configured. The default SSH TCP port is 22. The path utilized on the remote file server is the home directory of the username.

Mode Global Exec

Usage notes The hostname and username parameters must both be configured.

Examples To configure server 1 with an IPv4 address and a username of *backup1*, use the commands:

```
AMF_Master_1# configure terminal
```

```
AMF_Master_1(config)# atmf backup server id 1 192.168.1.1
username backup1
```

To configure server 1 with an IPv6 address and a username of *backup1*, use the command:

```
AMF_backup1_1# configure terminal
AMF_Master_1(config)# atmf backup server id 1 FFEE::01 username backup1
```

To configure server 2 with a hostname and username, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 2 www.example.com username backup2
```

To configure server 2 with a hostname and username in addition to the optional path and port parameters, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 2 www.example.com username backup2 path tokyo port 1024
```

To unconfigure the AMF remote backup file server 1, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# no atmf backup server id 1
```

Related commands show atmf backup

atmf backup stop

Overview Running this command stops a backup that is currently running on the master node you are logged onto. Note that if you have two masters and want to stop both, then you can either run this command separately on each master node, or add both masters to a working set, and issue this command to the working set.

Note that this command can only be run on a master node.

Syntax

```
atmf backup stop
```

Mode Privileged Exec

Usage notes This command is used to halt an AMF backup that is in progress. In this situation the backup process will finish on its current node and then stop.

Example To stop a backup that is currently executing on master node node-1, use the following command:

```
AMF_Master_1# amf backup stop
```

Related commands

atmf backup

atmf backup enable

atmf backup now

show atmf backup

atmf backup synchronize

Overview For the master node you are connected to, this command initiates a system backup of files from the node's active remote file server to its backup remote file server. Note that this process happens automatically each time the network is backed up.

Note that this command can only be run from a master node.

Syntax

```
atmf backup synchronize
```

Mode Privileged Exec

Example When connected to the master node AMF_Master_1, the following command will initiate a backup of all system related files from its active remote file server to its backup remote file server.

```
AMF_Master_1# atmf backup synchronize
```

Related commands

atmf cleanup

Overview This command is an alias to the erase factory-default command.

atmf container

Overview Use this command to create or update an AMF container on a Virtual AMF Appliance (VAA) virtual machine.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the AMF Feature Overview and Configuration Guide for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove an AMF container.

Syntax

```
atmf container <container-name>
no atmf container <container-name>
```

Parameter	Description
<container-name>	The name of the AMF container to create, update, or remove.

Mode AMF Container Configuration

Usage notes You cannot delete a container while it is still running. First use the **state disable** command to stop the container.

Examples To create or update the AMF container “vac-wlg-1”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)#
```

To remove the AMF container “vac-wlg-1”, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf container vac-wlg-1
```

Command changes Version 5.4.7-0.1: command added

atmf container login

Overview Use this command to login to an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the AMF Feature Overview and Configuration Guide for more information on running multiple tenants on a single VAA host.

Syntax

```
atmf container login <container-name>
```

Parameter	Description
<container-name>	The name of the AMF container you wish to login into.

Mode Privileged Exec

Usage notes If you try to login to a AMF container that has not been created, or is not running, you will see the following message:

```
% Container does not exist or is not running.
```

To exit from a container and return to the host VAA press <Ctrl+a q>.

Example To login to container "vac-wlg-1", use the command:

```
awplus# atmf container login vac-wlg-1
```

You will then be presented with a login screen for that container:

```
Connected to tty 1
Type <Ctrl+a q> to exit the console, <Ctrl+a Ctrl+a> to enter Ctrl+a itself

vac-wlg-1 login: manager
Password: friend

AlliedWare Plus (TM) 5.4.7 02/03/17 08:46:12

vac-wlg-1>
```

Command changes Version 5.4.7-0.1: command added

atmf controller

Overview Use this command to configure the device as an AMF controller. This enables you to split a large AMF network into multiple areas.

AMF controller is a licensed feature. The number of areas supported on a controller depends on the license installed on that controller.

Use the **no** variant of this command to remove the AMF controller functionality.

Syntax

```
atmf controller
no atmf controller
```

Mode Global configuration

Usage notes If a valid AMF controller license is not available on the device, the device will accept this command but will not act as a controller until you install a valid license. The following message will warn you of this:

"An AMF Controller license must be installed before this feature will become active"

NOTE: *If the AMF controller functionality is removed from a device using the* ***no atmf controller*** *command then the device must be rebooted if it is to function properly as an AMF master.*

Example To configure the node named *controller-1* as an AMF controller, use the commands:

```
controller-1# configure terminal
controller-1(config)# atmf controller
```

To stop the node named *controller-1* from being an AMF controller, use the commands:

```
controller-1# configure terminal
controller-1(config)# no atmf controller
```

Related commands atmf area

show atmf

atmf distribute firmware

Overview This command can be used to upgrade software one AMF node at a time. A URL can be selected from any media location. The latest compatible release for a node will be selected from this location.

Several procedures are performed to ensure the upgrade will succeed. This includes checking the current node release boots from flash. If there is enough space on flash, the software release is copied to flash on the new location.

The new release name is updated using the **boot system** command. The old release will become the backup release file. If a release file exists in a remote device (such as TFTP or HTTP, for example) then the URL should specify the exact release filename without using a wild card character.

The command will continue to upgrade software until all nodes are upgraded. At the end of the upgrade cycle the command should be used on the working-set.

Syntax `atmf distribute firmware <filename>`

Parameter	Description
<filename>	The filename and path of the file. See the File Management Feature Overview and Configuration Guide for valid syntax.

Mode Privileged Exec

Examples To upgrade nodes in a AMF network with a predefined AMF group called 'teams', use the following command:

```
Team1# atmf working-set group teams
```

```
============================
Team1, Team2, Team3:
============================
Working set join
```

```
ATMF_NETWORK[3]# atmf distribute firmware card:*.rel
```

```
Retrieving data from Team1
Retrieving data from Team2
Retrieving data from Team3

ATMF Firmware Upgrade:

Node Name          New Release File           Status
-----------------------------------------------------------------
Team1              x510-5.4.7-1.1.rel         Release ready
Team2              x930-5.4.7-1.1.rel         Release ready
Team3              x930-5.4.7-1.1.rel         Release ready
Continue the rolling reboot ? (y/n):y

Updating Release   : x930-5.4.7-1.1.rel information on Team3

=================================================================
New firmware will not take effect until nodes are rebooted.
=================================================================

ATMF_NETWORK[3]#
```

Related commands atmf working-set

atmf domain vlan

Overview The AMF domain VLAN is created when the AMF network is first initiated and is assigned a default VID of 4091. This command enables you to change the VID from this default value on this device.

The AMF domain VLAN is one of AMF's internal VLANs (the management VLAN is the other internal VLAN). AMF uses these internal VLANs to communicate network status information between nodes. These VLANs must be reserved for AMF and not used for other purposes.

An important point conceptually is that although the domain VLAN exists globally across the AMF network, it is assigned separately to each domain. The AMF network therefore can be thought of as comprising a series of domain VLANs each having the same VID and each being applied to a horizontal slice (domain) of the AMF. It follows therefore that the domain VLANs are only applied to ports that form cross-links and not to ports that form uplinks/downlinks.

CAUTION: *Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.*

CAUTION: *If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.*

Use the **no** variant of this command to reset the VLAN ID to its default value of 4091.

Syntax

```
atmf domain vlan <2-4090>
no atmf domain vlan
```

Parameter	Description
<2-4090>	The VLAN number in the range 2 to 4090.

Default VLAN 4091

Mode Global Configuration

Usage notes We recommend you only change the domain VLAN when first creating the AMF network, and only if VLAN 4091 is already being used in your network.

However, if you do need to change the VLAN on an existing AMF network, use the following steps:

1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the domain VLAN. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

3) Enter the new VLAN ID, using the commands:

```
test[10]# configure terminal
test(config)[10]# atmf domain vlan <2-4090>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new VLAN.

4) Create the working set again, using the commands:

```
master(config)# exit
master# atmf working-set group all
```

5) Save the configuration, using the command:

```
test[10]# write
```

6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the VLAN on missing devices by logging into their consoles directly.

NOTE: *The domain VLAN will automatically be assigned an IP subnet address based on the value configured by the command atmf management subnet.*

The default VLAN ID lies outside the user-configurable range. If you need to reset the VLAN to the default VLAN ID, use the **no** variant of this command to do so.

Examples To change the AMF domain VLAN to 4090 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# atmf domain vlan 4090
master(config)# exit
master# atmf working-set group all
test[10]# write
```

To reset the AMF domain VLAN to its default of 4091in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf domain vlan
master(config)# exit
master# atmf working-set group all
test[10]# write
```

Related commands

atmf management subnet

atmf management vlan

atmf enable

Overview This command manually enables (turns on) the AMF feature for the device being configured.

Use the **no** variant of this command to disable (turn off) the AMF feature on the member node.

Syntax

```
atmf enable
no atmf enable
```

Default Once AMF is configured, the AMF feature starts automatically when the device starts up.

Mode Global Configuration

Usage notes The device does not auto negotiate AMF domain specific settings such as the Network Name. You should therefore, configure your device with any domain specific (non default) settings before enabling AMF.

Examples To turn off AMF, use the command:

```
MyNode# config terminal
MyNode(config)# no atmf enable
```

To turn on AMF, use the command:

```
MyNode(config)# atmf enable
```

This command returns the following display:

```
% Warning: The ATMF network config has been set to enable
% Save the config and restart the system for this change to take
effect.
```

atmf group (membership)

Overview This command configures a device to be a member of one or more AMF groups. Groups exist in three forms: Implicit Groups, Automatic Groups, and User-defined Groups.

- Implicit Groups
  - all: All nodes in the AMF
  - current: The current working-set
  - local: The originating node.

Note that the Implicit Groups do not appear in show group output.

- Automatic Groups - These are defined by hardware architecture, e.g. x510, x230, x8100, AR3050S, AR4050S.
- User-defined Groups - These enable you to define arbitrary groups of AMF members based on your own criteria.

Each node in the AMF is automatically assigned membership to the implicit groups, and the automatic groups that are appropriate to its node type, e.g. x230, PoE. Similarly, nodes that are configured as masters are automatically assigned to the master group.

Use the **no** variant of this command to remove the membership.

Syntax

```
atmf group <group-list>
no atmf group <group-list>
```

Parameter	Description
<group-list>	A list of group names. These should be entered as a comma delimited list without spaces. Names can contain alphanumeric characters, hyphens and underscores.

Mode Global Configuration

Usage notes You can use this command to define your own arbitrary groups of AMF members based on your own network's configuration requirements. Applying a node to a non existing group will result in the group automatically being created.

Note that the master nodes are automatically assigned to be members of the pre-existing master group.

The following example configures the device to be members of three groups; two are company departments, and one comprises all devices located in building_2. To avoid having to run this command separately on each device that is to be added to these groups, you can remotely assign all of these devices to a working-set, then use the capabilities of the working-set to apply the atmf group (membership) command to all members of the working set.

Example 1 To specify the device to become a member of AMF groups named *marketing*, *sales*, and *building_2*, use the following commands:

```
node-1# configure terminal
node-1(config)# atmf group marketing,sales,building_2
```

Example 2 To add the nodes *member_node_1* and *member_node_2* to groups *building1* and *sales*, first add the nodes to the working-set:

```
master_node# atmf working-set member_node_1,member_node_2
```

This command returns the following output confirming that the nodes *member_node_1* and *member_node_2* are now part of the working-set:

```
============================
member_node_1, member_node_2
============================

Working set join
```

Then add the members of the working set to the groups:

```
atmf-net[2]# configure terminal
atmf-net[2](config)# atmf group building1,sales
atmf-net[2](config)# exit
atmf-net[2]# show atmf group
```

This command returns the following output displaying the groups that are members of the working-set.

```
====================
member_node_1
====================

AMF group information

building1, sales
```

show atmf group members

atmf guest-class

Overview This modal command creates a guest-class. Guest-classes are modal templates that can be applied to selected guest types. Once you have created a guest-class, you can select it by entering its mode. From here, you can then configure a further set of operational settings specifically for the new guest-class.

These settings can then all be applied to a guest link by running the switchport atmf-guestlink command. The following settings can be configured from each guest class mode:

- discovery method
- model type
- http-enable setting
- guest port, user name, and password

The **no** variant of this command removes the guest-class. Note that you cannot remove a guest-class that is assigned to a port.

Syntax

```
atmf guest-class <guest-class-name>
no atmf guest-class <guest-class-name>
```

Parameter	Description
<guest-class-name>	The name assigned to the guest-class type. This can be chosen from an arbitrary string of up to 15 characters.

Mode Global Configuration

Example To create a guest-class named 'camera' use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class camera
node1(config-atmf-guest)#
```

To remove the guest-class named 'camera' use the commands:

```
node1# configure terminal
node1(config)# no atmf guest-class camera
```

atmf log-verbose

Overview This command limits the number of log messages displayed on the console or permanently logged.

Use the **no** variant of this command to reset to the default.

Syntax

```
atmf log-verbose <1-3>
no atmf log-verbose
```

Parameter	Description
<1-3>	The verbose limitation (3 = noisiest, 1 = quietest)

Default The default log display is 3.

Usage This command is intended for use in large networks where verbose output can make the console unusable for periods of time while nodes are joining and leaving.

Mode Global Configuration

Example To set the log-verbose to noise level 2, use the command:

```
node-1# configure terminal
node-1(config)# atmf log-verbose 2
```

Validation Command show atmf

atmf management subnet

Overview This command is used to assign a subnet that will be allocated to the AMF management and domain management VLANs. From the address space defined by this command, two subnets are created, a management subnet component and a domain component, as explained in the Usage section below.

AMF uses these internal IPv4 subnets to communicate network status information between nodes. These subnet addresses must be reserved for AMF and not used for other purposes.

CAUTION: *Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.*

CAUTION: *If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.*

Use the **no** variant of this command to remove the assigned subnet.

Syntax

```
atmf management subnet <a.b.0.0>
no atmf management subnet
```

Parameter	Description
<a.b.0.0>	The IP address selected for the management subnet. Because a mask of 255.255.0.0 (i.e. /16) will be applied automatically, an IP address in the format a.b.0.0 must be selected. Usually this subnet address is selected from an appropriate range from within the private address space of 172.16.0.0 to 172.31.255.255, or 192.168.0.0, as defined in RFC1918.

Default 172.31.0.0. A subnet mask of 255.255.0.0 will automatically be applied.

Mode Global Configuration

Usage notes Running this command will result in the creation of a further two subnets (within the class B address space assigned) and the mask will extend from /16 to /17.

For example, if the management subnet is assigned the address 172.31.0.0/16, this will result in the automatic creation of the following two subnets:

- 172.31.0.0/17 assigned to the atmf management vlan
- 172.31.128.0/17 assigned to the atmf domain vlan.

We recommend you only change the management subnet when first creating the AMF network, and only if 172.31.0.0 is already being used in your network.

However, if you do need to change the subnet on an existing AMF network, use the following steps:

1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the domain VLAN, management VLAN, or management subnet. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

3) Enter the new subnet address, using the commands:

```
test[10]# configure terminal
test(config)[10]# atmf management subnet <a.b.0.0>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new subnet.

4) Create the working set again, using the commands:

```
master(config)# exit
master# atmf working-set group all
```

5) Save the configuration, using the command:

```
test[10]# write
```

6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the subnet on missing devices by logging into their consoles directly.

Examples To change the AMF management subnet address to 172.25.0.0 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# atmf management subnet 172.25.0.0
master(config)# exit
master# atmf working-set group all
test[10]# write
```

To reset the AMF management subnet address to its default of 172.31.0.0 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf management subnet
master(config)# exit
master# atmf working-set group all
test[10]# write
```

Related commands

atmf domain vlan

atmf management vlan

atmf management vlan

Overview The AMF management VLAN is created when the AMF network is first initiated and is assigned a default VID of 4092. This command enables you to change the VID from this default value on this device.

The AMF management VLAN is one of AMF's internal VLANs (the domain VLAN is the other internal VLAN). AMF uses these internal VLANs to communicate network status information between nodes. These VLANs must be reserved for AMF and not used for other purposes.

CAUTION: *Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.*

CAUTION: *If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.*

Use the **no** variant of this command to restore the VID to the default of 4092.

Syntax

```
atmf management vlan <2-4090>
no atmf management vlan
```

Parameter	Description
<2-4090>	The VID assigned to the AMF management VLAN.

Default VLAN 4092

Mode Global Configuration

Usage notes We recommend you only change the management VLAN when first creating the AMF network, and only if VLAN 4092 is already being used in your network.

However, if you do need to change the VLAN on an existing AMF network, use the following steps to ensure you change it on all nodes simultaneously:

1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the management VLAN. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

3) Enter the new VLAN ID, using the commands:

```
test[10]# configure terminal
test(config)[10]# atmf management vlan <2-4090>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new VLAN.

4) Create the working set again, using the commands:

```
master(config)# exit
master# atmf working-set group all
```

5) Save the configuration, using the command:

```
test[10]# write
```

6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the VLAN on missing devices by logging into their consoles directly.

NOTE: *The management VLAN will automatically be assigned an IP subnet address based on the value configured by the command atmf management subnet.*

The default VLAN ID lies outside the user-configurable range. If you need to reset the VLAN to the default VLAN ID, use the **no** variant of this command to do so.

Examples To change the AMF management VLAN to 4090 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# atmf management vlan 4090
master(config)# exit
master# atmf working-set group all
test[10]# write
```

To reset the AMF management VLAN to its default of 4092 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf management vlan
master(config)# exit
master# atmf working-set group all
test[10]# write
```

Related commands atmf domain vlan

atmf management subnet

atmf master

Overview This command configures the device to be an AMF master node and automatically creates an AMF master group. The master node is considered to be the core of the AMF network, and must be present for the AMF to form. The AMF master has its node depth set to 0. Note that the node depth vertical distance is determined by the number of uplinks/downlinks that exist between the node and its master.

An AMF master node must be present for an AMF network to form. Up to two AMF master nodes may exist in a network, and they **must** be connected by an AMF crosslink.

NOTE: *Master nodes are an essential component of an AMF network. In order to run AMF, an AMF License is required for each master node.*

If the crosslink between two AMF masters fails, then one of the masters will become isolated from the rest of the AMF network.

Use the **no** variant of this command to remove the device as an AMF master node. The node will retain its node depth of 0 until the network is rebooted.

NOTE: *Node depth is the vertical distance (or level) from the master node (whose depth value is 0).*

Syntax

```
atmf master
no atmf master
```

Default The device is not configured to be an AMF master node.

Mode Global Configuration

Example To specify that this node is an AMF master, use the following command:

```
node-1# configure terminal
node-1(config)# atmf master
```

Related commands show atmf

show atmf group

atmf mtu

Overview This command configures the AMF network Maximum Transmission Unit (MTU). The MTU value will be applied to the AMF Management VLAN, the AMF Domain VLAN and AMF Area links.

Use the **no** variant of this command to restore the default MTU.

Syntax

```
atmf mtu <1300-1442>
no atmf mtu
```

Parameter	Description
<1300-1442>	The value of the maximum transmission unit for the AMF network, which sets the maximum size of all AMF packets generated from the device.

Default 1300

Mode Global Configuration

Usage notes The default value of 1300 will work for all AMF networks (including those that involve virtual links over IPsec tunnels). If there are virtual links over IPsec tunnels anywhere in the AMF network, we recommend not changing this default. If there are no virtual links over IPsec tunnels, then this AMF MTU value may be increased for network efficiency.

Example To change the ATMF network MTU to 1442, use the command:

```
awplus(config)# atmf mtu 1442
```

Related commands show atmf detail

atmf network-name

Overview This command applies an AMF network name to a (prospective) AMF node. In order for an AMF network to be valid, its network-name must be configured on at least two nodes, one of which must be configured as a master and have an AMF License applied. These nodes may be connected using either AMF downlinks or crosslinks.

For more information on configuring an AMF master node, see the command atmf master.

Use the **no** variant of this command to remove the AMF network name.

Syntax

```
atmf network-name <name>
no atmf network-name
```

Parameter	Description
<name>	The AMF network name. Up to 15 printable characters can be entered for the network-name.

Mode Global Configuration

Usage notes This is one of the essential commands when configuring AMF and must be entered on each node that is to be part of the AMF.

A switching node (master or member) may be a member of only one AMF network.

CAUTION: *Ensure that you enter the correct network name. Entering an incorrect name will cause the AMF network to fragment (at the next reboot).*

Example To set the AMF network name to amf_net use the command:

```
Node_1(config)# atmf network-name amf_net
```

atmf provision (interface)

Overview This command configures a specified port on an AMF node to accept a provisioned node, via an AMF link, some time in the future.

Use the **no** variant of this command to remove the provisioning on the node.

Syntax

```
atmf provision <nodename>
no atmf provision
```

Parameter	Description
<nodename>	The name of the provisioned node that will appear on the AMF network in the future.

Mode Interface Configuration for a switchport, a static aggregator, dynamic channel group or an Eth port on an AR-Series device.

Usage notes The port should be configured as an AMF link or cross link and should be 'down' to add or remove a provisioned node.

Example To provision an AMF node named node1 for port1.0.1, use the commands:

```
host1(config)# interface port1.0.1
host1(config-if)# atmf provision node1
```

switchport atmf-link

switchport atmf-crosslink

atmf provision node

Overview Use this command to provision a replacement node for a specified interface. Node provisioning is effectively the process of creating a backup file-set on a master node that can be loaded onto a provisioned node some time in the future. This file-set is created just as if the provisioned node really existed and was connected to the network. Typically these comprise configuration, operating system, and license files etc.

You can optionally provision a node with multiple device-type backups. When a device is then attached to the network, AMF uses its device-type to find the correct configuration to use. For example you can create an x510 and an x530 provisioning configuration for a node called 'node1' and if either an x510 or an x530 is attached to that node the appropriate configuration will be used.

Use the **no** variant of this command to remove a provisioned node.

Syntax

```
atmf provision node <nodename> [device <device-type>]
no atmf provision node <nodename> [device <device-type>]
```

Parameter	Description
<nodename>	The name of the provisioned node that will appear on the AMF network.
`device`	Optionally specify a device type.
<device-type>	Any valid device type e.g. AR3050s, ie200, x950. For a full list of valid device types use the command **atmf provision node <nodename> device ?**.

Mode Privileged Exec

Usage notes This command creates the directory structure for the provisioned node's file-set. It also switches to the AMF provision node prompt so that the nodes backup file-set can be created or updated. This is typically done with the create (amf-provision) or clone (amf-provision) commands.

For more information on AMF provisioning, see the AMF Feature Overview and Configuration Guide..

Example To configure node named 'node1', use the command:

```
awplus# atmf provision node node1
awplus(atmf-provision)#
```

To configure a node named 'node1' for device type 'x530', use the command:

```
awplus# atmf provision node node1 device x530
awplus(atmf-provision)#
```

Command changes

Version 5.4.9-0.1: command added

atmf reboot-rolling

Overview This command enables you to reboot the nodes in an AMF working-set, one at a time, as a rolling sequence in order to minimize downtime. Once a rebooted node has finished running its configuration and its ports are up, it re-joins the AMF network and the next node is rebooted.

By adding the *url* parameter, you can also upgrade your devices' software one AMF node at a time.

The **force** parameter forces the rolling reboot to continue even if a previous node does not rejoin the AMF network. Without the **force** parameter, the unsuitable node will time-out and the rolling reboot process will stop. However, with the **force** parameter applied, the process will ignore the timeout and move on to reboot the next node in the sequence.

This command can take a significant amount of time to complete.

Syntax `atmf reboot-rolling [force] [<url>]`

Parameter	Description
`force`	Ignore a failed node and move on to the next node. Where a node fails to reboot a timeout is applied based on the time taken during the last reboot.
<url>	The path to the software upgrade file.

Mode Privileged Exec

Usage notes You can load the software from a variety of locations. The latest compatible release for a node will be selected from your selected location, based on the parameters and URL you have entered.

For example card:/5.4.6/x*-5.4.6-*.rel will select from the folder card:/5.4.6 the latest file that matches the selection x (wildcard) -5.4.6-(wildcard).rel. Because x* is applied, each device type will be detected and its appropriate release file will be installed.

Other allowable entries are:

Entry	Used when loading software
card:*.rel:	from an SD card
tftp:<*ip-address*>:	from a TFTP server
usb:	from a USB flash drive
flash:	from flash memory, e.g. from one x930 switch to another
scp:	using secure copy
http:	from an HTTP file server

Several checks are performed to ensure the upgrade will succeed. These include checking the current node release boots from flash. If there is enough space on flash, the software release is copied to flash to a new location on each node as it is processed. The new release name will be updated using the **boot system**<*release-name*> command, and the old release will become the backup release file.

NOTE: *If you are using TFTP or HTTP, for example, to access a file on a remote device then the URL should specify the exact release filename without using wild card characters.*

On bootup the software release is verified. Should an upgrade fail, the upgrading unit will revert back to its previous software version. At the completion of this command, a report is run showing the release upgrade status of each node.

NOTE: *Take care when removing external media or rebooting your devices. Removing an external media while files are being written entails a significant risk of causing a file corruption.*

Example 1 To reboot all x510 nodes in an AMF network, use the following command:

```
Bld2_Floor_1# atmf working-set group x510
```

This command returns the following type of screen output:

```
====================
node1, node2, node3:
====================

Working set join

AMF_NETWORK[3]#
```

```
ATMF_NETWORK[3]# atmf reboot-rolling
```

When the reboot has completed, a number of status screens appear. The selection of these screens will depend on the parameters set.

```
Bld2_Floor_1#atmf working-set group x510

Continue upgrading releases ? (y/n):
```

atmf recover

Overview This command is used to manually initiate the recovery (or replication) of an AMF node, usually when a node is being replaced.

Syntax

```
atmf recover [<node-name> master <node-name>]
atmf recover [<node-name> controller <node-name>]
```

Parameter	Description
<node-name>	The name of the device whose configuration is to be recovered or replicated.
`master` *<node-name>*	The name of the master device that holds the required configuration information. Note that although you can omit both the node name and the master name; you cannot specify a master name unless you also specify the node name.
`controller` *<node-name>*	The name of the controller that holds the required configuration information. Note that although you can omit both the node name and the controller name; you cannot specify a controller name unless you also specify the node name.

Mode Privileged Exec

Usage notes The recovery/replication process involves loading the configuration file for a node that is either about to be replaced or has experienced some problem. You can specify the configuration file of the device being replaced by using the *<node-name>* parameter, and you can specify the name of the master node or controller holding the configuration file.

If the *<node-name>* parameter is not entered then the node will attempt to use one that has been previously configured. If the replacement node has no previous configuration (and has no previously used node-name), then the recovery will fail.

If the master or controller name is not specified then the device will poll all known AMF masters and controllers and execute an election process (based on the last successful backup and its timestamp) to determine which to use. If no valid backup master or controller is found, then this command will fail.

No error checking occurs when this command is run. Regardless of the last backup status, the recovering node will attempt to load its configuration from the specified master node or controller.

If the node has previously been configured, we recommend that you suspend any AMF backup before running this command. This is to prevent corruption of the backup files on the AMF master as it attempts to both backup and recover the node at the same time.

Example To recover the AMF node named Node_10 from the AMF master node named Master_2, use the following command:

```
Master_2# atmf recover Node_10 master Master_2
```

Related commands

atmf backup stop

show atmf backup

show atmf

atmf recover guest

Overview Use this command to initiate a guest node recovery or replacement by reloading its backup file-set that is located within the AMF backup system. Note that this command must be run on the edge node device that connects to the guest node.

Syntax

```
atmf recover guest [<guest-port>]
```

Parameter	Description
<guest-port>	The port number that connects to the guest node.

Mode User Exec/Privileged Exec

Example To recover a guest on node1 port1.0.1, use the following command

```
node1# atmf recover guest port1.0.1
```

Related commands show atmf backup guest

atmf recover led-off

Overview This command turns off the recovery failure flashing port LEDs. It reverts the LED's function to their normal operational mode, and in doing so assists with resolving the recovery problem. You can repeat this process until the recovery failure has been resolved. For more information, see the AMF Feature Overview and Configuration Guide.

Syntax
```
atmf recover led-off
```

Default Normal operational mode

Mode Privileged Exec

Example To revert the LEDs on Node1 from recovery mode display to their normal operational mode, use the command:

```
Node1# atmf recover led-off
```

Related commands atmf recover

atmf recover over-eth

Overview Use this command to enable AMF recovery over an AR-series device's Eth port. This setting persists even after restoring a device to a 'clean' state with the erase factory-default or atmf cleanup command.

Use the **no** variant of this command to disable AMF recover over an Eth port.

Syntax
```
atmf recover over-eth
no atmf recover over-eth
```

Default Eth ports cannot be used for recovery.

Mode Privileged Exec

Usage notes AMF links over Eth ports are only available if your network is running in AMF secure mode (see atmf secure-mode for more information on AMF secure mode).

Example To enable AMF recovery over an Eth port, use the command:

```
awplus# atmf recover over-eth
```

To disable AMF recovery over an Eth port, use the commands:

```
awplus# no atmf recover over-eth
```

Related commands
atmf-link
atmf recover
atmf secure-mode
erase factory-default
show atmf detail

Command changes Version 5.5.0-1.1: command added

atmf recovery-server

Overview Use this command on an AMF master to process recovery requests from isolated AMF nodes. An isolated node is an AMF member that is only connected to the rest of the AMF network via a virtual-link.

This option allows these nodes, which have no AMF neighbors, to be identified for recovery or provisioning purposes. They are identified using an identity token which is stored on the AMF master.

Use the **no** variant of this command to disable processing of recovery requests from isolated AMF nodes.

Syntax

```
atmf recovery-server
no atmf recovery-server
```

Default Recovery-server is disabled by default.

Mode Global Configuration

Usage notes Once **recovery-server** is enabled on an AMF network, the next time an isolated node is backed up its identity token will be stored in the AMF master's database. Should the device fail it can then be replaced and auto-recovery will occur as long as:

- the AMF master is accessible to the isolated node, and
- either, a DHCP server is configured to send the Uniform Resource Identifier (URI) of the AMF master to the recovering node, or
- a DNS server is configured to resolve the default recovery URI (https://amfrecovery.alliedtelesis.com) to the IP address of the AMF master.

Provisioning of isolated nodes is achieved by creating an identity token for the new node using the identity (amf-provision) command.

See the AMF Feature Overview and Configuration Guide for information on preparing your network for recovering or provisioning isolated nodes.

Example To enable recovery-server on an AMF master, use the commands:

```
awplus# configure terminal
awplus(config)# atmf recovery-server
```

To disable recovery-server on an AMF master, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf recovery-server
```

Related commands

atmf cleanup

identity (amf-provision)

atmf virtual-link

Command changes Version 5.4.7-2.1: command added

atmf remote-login

Overview Use this command to remotely login to other AMF nodes in order to run commands as if you were a local user of that node.

Syntax

```
atmf remote-login [user <name>] <nodename>
```

Parameter	Description
<name>	The name of a user on the remote node.
<nodename>	The name of the remote AMF node you are connecting to.

Mode Privileged Exec (This command will only run at privilege level 15)

Usage notes You do not need a valid login on the local device in order to run this command. The session will take you to the enable prompt on the new device. If the remote login session exits for any reason (e.g. device reboot) you will be returned to the originating node.

You can create additional user accounts on nodes. AMF's goal is to provide a uniform management plane across the whole network, so we recommend you use the same user accounts on all the nodes in the network.

In reality, though, it is not essential to have the same accounts on all the nodes. Users can remote login from one node to a second node even if they are logged into the first node with a user account that does not exist on the second node (provided that atmf restricted-login is disabled and the user account on the first node has privilege level 15).

Moreover, it is possible to use a RADIUS or TACACS+ server to manage user authentication, so users can log into AMF nodes using user accounts that are present on the RADIUS or TACACS+ server, and not present in the local user databases of the AMF nodes.

The software will not allow you to run multiple remote login sessions. You must exit an existing session before starting a new one.

If you disconnect from the VTY session without first exiting from the AMF remote session, the device will keep the AMF remote session open until the exec-timeout time expires (10 minutes by default). If the exec-timeout time is set to infinity (**exec-timeout 0 0**), then the device is unable to ever close the remote session. To avoid this, we recommend you use the **exit** command to close AMF remote sessions, instead of closing the associated VTY sessions. We also recommend you avoid setting the exec-timeout to infinity.

Example To remotely login from node Node10 to Node20, use the following command:

```
Node10# atmf remote-login node20
Node20>
```

To close the session on Node20 and return to Node10's command line, use the following command:

```
Node20# exit
Node10#
```

In this example, user User1 is a valid user of node5. They can remotely login from node5 to node3 by using the following commands:

```
node5# atmf remote-login user User1 node3
node3> enable
```

Related commands atmf restricted-login

Command changes Version 5.4.6-2.1: changes to AMF user account requirements

atmf restricted-login

Overview By default, users who are logged into any node on an AMF network are able to manage any other node by using either working-sets or an AMF remote login. If the access provided by this feature is too wide, or contravenes network security restrictions, it can be limited by running this command, which changes the access so that:

- users who are logged into non-master nodes cannot execute any commands that involve working-sets, and
- from non-master nodes, users can use remote-login, but only to login to a user account that is valid on the remote device (via a statically configured account or RADIUS/TACACS+). Users are also required to enter the password for that user account.

Once entered on any AMF master node, this command will propagate across the network.

Use the **no** variant of this command to disable restricted login on the AMF network. This allows access to the **atmf working-set** command from any node in the AMF network.

Syntax

```
atmf restricted-login
no atmf restricted-login
```

Mode Privileged Exec

Default Master nodes operate with **atmf restricted-login** disabled.

Member nodes operate with **atmf restricted-login** enabled.

NOTE: *The default conditions of this command vary from those applied by its "no" variant. This is because the restricted-login action is only applied by **master** nodes, and in the absence of a master node, the default is to apply the restricted action to all **member** nodes with AMF configured.*

Usage notes In the presence of a **master** node, its default of **atmf restricted-login disabled** will propagate to all its member nodes. Similarly, any change in this command's status that is made on a master node, will also propagate to all its member nodes

Note that once you have run this command, certain other commands that utilize the AMF working-set command, such as the **include**, **atmf reboot-rolling** and **show atmf group members** commands, will operate only on master nodes.

Restricted-login must be enabled on AMF areas with more than 120 nodes.

Example To enable restricted login, use the command

```
Node_20(config)# atmf restricted-login node20
```

Related commands atmf remote-login

show atmf

Command changes Version 5.4.6-2.1: changes to AMF user account requirements

atmf retry guest-link

Overview Use this command to retry an AMF guest-link by restarting AMF guest discovery on a port if it is currently in the failed state.

If no port is specified then all configured AMF guest-link ports that are in the failed state are retried.

If a port is specified then that port will only be retried if it is both:

- configured as an AMF guest-link, and
- it is currently in the failed state.

Syntax

```
atmf retry guest-link [<interface>]
```

Parameter	Description
<interface>	Name of the interface the guest-link you want to retry is configured on.

Mode Privileged Exec

Example To retry all configured AMF guest-link currently in a failed state, use the command:

```
awplus# atmf retry guest-link
```

To retry an AMF guest-link configured on port1.0.2 currently in a failed state, use the command:

```
awplus# atmf retry guest-link port1.0.2
```

Related commands show atmf links guest

switchport atmf-guestlink

atmf secure-mode

Overview Use this command to enable AMF secure mode on an AMF node. AMF secure mode makes an AMF network more secure by:

- Adding an authorization mechanism before and AMF member is allowed to join an AMF network.
- The encryption of all AMF packets sent between AMF nodes.
- Adding support for user login authentication by RADIUS or TACACS+, and removing the requirement to have the same privileged user account in the local user database on all devices in the AMF network.
- Adding additional logging which enables network administrators to monitor attempts to gain unauthorized access to the AMF network.

Once the secure mode command is run on all nodes on an AMF network, the AMF masters and AMF controllers manage the addition of AMF nodes and AMF areas to the AMF network.

Use the **no** variant of this command to disable AMF secure mode on an AMF node.

Syntax

```
atmf secure-mode
no atmf secure-mode
```

Default Secure mode is disabled by default.

Mode Global Configuration

Usage notes When an AMF network is running in AMF secure mode the atmf restricted-login feature is automatically enabled. This restricts the atmf working-set command to users that are logged on to an AMF master. This feature cannot be disabled independently of secure mode.

When AMF secure mode is enabled the AMF controllers and masters in the AMF network form a group of certificate authorities. A node may only join a secure AMF network once it has been authorized by a master or controller. When enabled, all devices in the AMF network must be running in secure mode. Unsecured devices will not be able to join a secure AMF network.

Example To enable AMF secure mode on an AMF node, use the commands:

```
awplus# configure terminal
awplus(config)# atmf secure-mode
```

To disable AMF secure mode on an AMF node, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf secure-mode
```

Command changes Version 5.4.7-0.3: command added

atmf secure-mode certificate expire

Overview Use this command on an AMF master to expire a secure mode certificate. Running this command will force the removal of the AMF node from the network.

Syntax
```
atmf secure-mode certificate expire <node-name> [area
<area-name>]
```

Parameter	Description
<node-name>	Name of the AMF node you want to expire the certificate for.
`area`	Specify an AMF area.
<area-name>	Name of the AMF area you want to expire the AMF nodes certificate for.

Mode Privileged Exec

Example To remove an AMF node named “node3” from an AMF network, use the following command on the AMF master:

```
awplus# atmf secure-mode certificate expire node3
```

To remove an AMF node named “node2” in an area named “area2”, use the following command on the AMF master:

```
awplus# atmf secure-mode certificate expire node2 area area2
```

Related commands

Command changes Version 5.4.7-0.3: command added

atmf secure-mode certificate expiry

Overview Use this command to set the expiry time of AMF secure mode certificates. Once an AMF node's certificate expires it must re-authorize and obtain a new certificate from the AMF master.

Use the **no** variant of this command to reset the expiry time to 180 days.

Syntax

```
atmf secure-mode certificate expiry {<days>|infinite}
no atmf secure-mode certificate expiry
```

Parameter	Description
<days>	Length of time, in days, that an AMF secure mode certificate remains valid. A value between 1 and 365.
`infinite`	The authorization certificate does not expire, in other words AMF nodes stay authorized indefinitely.

Default The default expiry time is 180 days.

Mode Global Configuration

Example To set AMF secure mode certificate expiry to 7 days, use the commands:

```
awplus# configure terminal
awplus(config)# atmf secure-mode certificate expiry 7
```

To set AMF secure mode certificates to never expire, use the commands:

```
awplus# configure terminal
awplus(config)# atmf secure-mode certificate expiry infinite
```

To reset the certificate expiry to 180 days, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf secure-mode certificate expiry
```

Related commands atmf secure-mode

Command changes Version 5.4.7-0.3: command added

atmf secure-mode certificate renew

Overview Use this command to force all local certificates to expire and be renewed on an AMF secure mode network.

Secure mode certificates renew automatically but this command could be used to renew a certificate in a situation where the automatic renewal may happen while the device is not attached to the AMF network.

Syntax
```
atmf secure-mode certificate renew
```

Mode Privileged Exec

Example To renew a local certificate on a AMF member or AMF master, use the command:

```
awplus# atmf secure-mode certificate renew
```

Related commands show atmf secure-mode certificates

show atmf secure-mode statistics

Command changes Version 5.4.7-0.3: command added

atmf secure-mode enable-all

Overview Use this command to enable AMF secure mode on an entire network. AMF secure mode makes an AMF network more secure by:

- Adding an authorization mechanism before an AMF member is allowed to join an AMF network.
- The encryption of all AMF packets sent between AMF nodes.
- Adding support for user login authentication by RADIUS or TACACS+, and removing the requirement to have the same privileged user account in the local user database on all devices in the AMF network.
- Adding additional logging which enables network administrators to monitor attempts to gain unauthorized access to the AMF network.

Once this command is run on an AMF network, the AMF masters and AMF controllers manage the addition of AMF nodes and AMF areas to the AMF network.

This command can only be run on an AMF master.

Use the **no** variant of this command to disable AMF secure mode on an entire network.

Syntax

```
atmf secure-mode enable-all
no atmf secure-mode enable-all
```

Default Secure mode is disabled by default.

Mode Privileged Exec

Usage notes When an AMF network is running in AMF secure mode the atmf restricted-login feature is automatically enabled. This restricts the atmf working-set command to users that are logged on to an AMF master. This feature cannot be disabled independently of secure mode.

When AMF secure mode is enabled the AMF controllers and masters in the AMF network form a group of certificate authorities. A node may only join a secure AMF network once it has been authorized by a master or controller. When enabled, all devices in the AMF network must be running in secure mode. Unsecured devices will not be able to join a secure AMF network.

Running **atmf secure-mode enable-all**:

- Groups all AMF members in a working set.
- Executes clear atmf secure-mode certificates on the working set of members, which removes existing secure mode certificates from all the nodes.
- Groups all the AMF masters in a working set.
- Executes atmf authorize provision **all** on the working set of masters, so all masters provision all nodes.
- Groups all AMF nodes in a working set.

- Runs a script which executes atmf secure-mode and then writes the configuration file on each node.
- Starts a timer that ticks every 10 seconds, for a maximum of 10 times, and checks if all the secure mode capable nodes rejoin the AMF network.

Running **no atmf secure-mode enable-all**:

- Groups all AMF nodes in a working set.
- Runs a script which executes **no** atmf secure-mode and then writes the configuration file on each node.
- Starts a timer that ticks every 10 seconds, for a maximum of 10 times, and checks if all the secure mode capable nodes rejoin the AMF network.

NOTE: *Enabling or disabling secure mode on the network saves the running-config on every device.*

Example To enable AMF secure mode on the entire network, use the command:

```
awplus# atmf secure-mode enable-all
```

You will be prompted to confirm the action:

```
Total number of nodes 21
21 nodes support secure-mode

Enable secure-mode across the AMF network ? (y/n): y
```

To disable AMF secure mode on the entire network, use the command:

```
awplus# no atmf secure-mode enable-all
```

You will be prompted to confirm the action:

```
% Warning: All security certificates will be deleted.
Disable secure-mode across the AMF network ? (y/n): y
```

Command changes Version 5.4.7-0.3: command added

atmf select-area

Overview Use this command to access devices in an area outside the core area on the controller network. This command will connect you to the remote area-master of the specified area.

This command is only valid on AMF controllers.

The **no** variant of this command disconnects you from the remote area-master.

Syntax

```
atmf select-area {<area-name>|local}
no atmf select-area
```

Parameter	Description
<area-name>	Connect to the remote area-master of the area with this name.
`local`	Return to managing the local controller area.

Mode Privileged Exec

Usage notes After running this command, use the atmf working-set command to select the set of nodes you want to access in the remote area.

Example To access nodes in the area Canterbury, use the command

```
controller-1# atmf select-area Canterbury
```

This displays the following output:

```
Test_network[3]#atmf select-area Canterbury
=============================================
Connected to area Canterbury via host Avensis:
=============================================
```

To return to the local area for controller-1, use the command

```
controller-1# atmf select-area local
```

Alternatively, to return to the local area for controller-1, use the command

```
controller-1# no atmf select-area
```

Related commands atmf working-set

atmf topology-gui enable

Overview Use this command to enable the operation of Vista Manager EX on the Master device.

Vista Manager EX delivers state-of-the-art monitoring and management for your Autonomous Management Framework™ (AMF) network, by automatically creating a complete topology map of switches, firewalls and wireless access points (APs). An expanded view includes third-party devices such as security cameras.

Use the **no** variant of this command to disable operation of Vista Manager EX.

Syntax

```
atmf topology-gui enable
no atmf topology-gui enable
```

Default Disabled by default on AMF Master and member nodes. Enabled by default on Controllers.

Mode Global Configuration mode

Usage notes To use Vista Manager EX, you must also enable the HTTP service on all AMF nodes, including all AMF masters and controllers. The HTTP service is enabled by default on AlliedWare Plus switches and disabled by default on AR-Series firewalls. To enable it, use the commands:

```
Node1# configure terminal
Node1(config)# service http
```

On one master in each AMF area in your network, you also need to configure the master to send event notifications to Vista Manager EX. To do this, use the commands:

```
Node1# configure terminal
Node1(config)# log event-host <ip-address> atmf-topology-event
```

Examples To enable Vista Manager EX on Node1, use the commands:

```
Node1# configure terminal
Node1(config)# atmf topology-gui enable
```

To disable Vista Manager EX on Node1, use the commands:

```
Node1# configure terminal
Node1(config)# no atmf topology-gui enable
```

Related commands atmf enable

log event-host

service http

atmf trustpoint

Overview Use this command to set a PKI trustpoint for an AMF network. This command needs to be run on an AMF master or controller.

The self-signed certificate authority (CA) certificate is distributed to every node on the AMF network. It is used to verify client certificates signed by the trustpoint.

Use the **no** variant of this command to remove an AMF trustpoint.

Syntax

```
atmf trustpoint <trustpoint-name>
no atmf trustpoint <trustpoint-name>
```

Parameter	Description
<trustpoint-name>	Name of the trustpoint.

Default No trustpoint is configured by default.

Mode Global Configuration

Usage notes Before using the **atmf trustpoint** command you will need to establish a trustpoint. For example, you can create a local self-signed trustpoint using the procedure outlined below.

Create a self-signed trustpoint called 'our_trustpoint' with keypair 'our_key':

```
awplus# configure terminal
awplus(config)# crypto pki trustpoint our_trustpoint
awplus(ca-trustpoint)# enrollment selfsigned
awplus(ca-trustpoint)# rsakeypair our_key
awplus(ca-trustpoint)# exit
awplus(config)# exit
```

Create the root and server certificates for this trustpoint:

```
awplus# crypto pki authenticate our_trustpoint
awplus# crypto pki enroll our_trustpoint
```

For more information about the AlliedWare Plus implementation of Public Key Infrastructure (PKI), see the Public Key Infrastructure (PKI) Feature Overview and Configuration Guide

Example To configure an AMF trustpoint for the trustpoint 'our_trustpoint', use the commands:

```
awplus# configure terminal
awplus(config)# atmf trustpoint our_trustpoint
```

To remove an AMF trustpoint for the trustpoint 'our_trustpoint', use the commands:

```
awplus# configure terminal
awplus(config)# no atmf trustpoint our_trustpoint
```

Related commands

crypto pki trustpoint

Command changes

Version 5.4.7-2.1: command added

atmf virtual-crosslink

Overview Use this command to create a virtual crosslink. A virtual crosslink connects an AMF master or controller on a physical device to a Virtual AMF Appliance (VAA) master or controller.

All AMF master nodes must reside in the same AMF domain and are required to be directly connected using AMF crosslinks. In order to be able to meet this requirement for AMF masters running on VAAs, a virtual crosslink connects the AMF master or controller on the physical device to the master or controller on the VAA.

Use the **no** variant of this command to remove a virtual crosslink.

Syntax

```
atmf virtual-crosslink id <local-id> ip <local-ip> remote-id
<remote-id> remote-ip <remote-ip>
```

```
no atmf virtual-crosslink id <local-id>
```

Parameter	Description
<local-id>	ID of the local tunnel port, a value between 1 and 4094.
<local-ip>	IPv4 address of the local tunnel port in a.b.c.d format.
<remote-id>	ID of the remote tunnel port, a value between 1 and 4094.
<remote-ip>	IPv4 address of the remote tunnel port in a.b.c.d format.

Default No AMF virtual crosslinks are created by default.

Mode Global Configuration

Usage notes This command allows a virtual tunnel to be created between two remote sites over a layer 3 link. The tunnel encapsulates AMF packets and allows them to be sent transparently across a Wide Area Network (WAN) such as the Internet.

Configuration involves creating a local tunnel ID, a local IP address, a remote tunnel ID and a remote IP address. Each side of the tunnel must be configured with the same, but mirrored parameters.

NOTE: *Virtual crosslinks are not supported on AMF container masters, therefore if multiple tenants on a single VAA host are configured for secure mode, only a single AMF master is supported per area.*

Example To setup a virtual link from a local site, “siteA”, to a remote site, “siteB”, (assuming there is already IP connectivity between the sites), run the following commands at the local site:

```
siteA# configure terminal
```

```
siteA(config)# atmf virtual-crosslink id 5 ip 192.168.100.1
remote-id 10 remote-ip 192.168.200.1
```

At the remote site, run the commands:

```
siteB# configure terminal
siteB(config)# atmf virtual-crosslink id 10 ip 192.168.200.1
remote-id 5 remote-ip 192.168.100.1
```

To remove this virtual crosslink, run the following commands on the local site:

```
siteA# configure terminal
siteA(config)# no atmf virtual-crosslink id 5
```

On the remote site, run the commands:

```
siteB# configure terminal
siteB(config)# no atmf virtual-crosslink id 10
```

Related commands

Command changes

Version 5.4.7-0.3: command added

atmf virtual-link

Overview This command creates one or more Layer 2 tunnels that enable AMF nodes to transparently communicate across a wide area network using Layer 2 connectivity protocols.

Once connected through the tunnel, the remote member will have the same AMF capabilities as a directly connected AMF member.

Use the **no** variant of this command to remove the specified virtual link.

Syntax

```
atmf virtual-link id <1-4094> ip <a.b.c.d> remote-id <1-4094>
remote-ip <a.b.c.d> [remote-area <area-name>]
```

```
atmf virtual-link id <1-4094> interface <interface-name>
remote-id <1-4094> remote-ip <a.b.c.d> [remote-area
<area-name>]
```

```
no atmf virtual-link id <1-4094>
```

Parameter	Description
`id <1-4094>`	ID of the local tunnel point, in the range 1 to 4094.
`ip <a.b.c.d>`	Specify the local IP address of the local interface for the virtual-link (alternatively you can specify the interface's name, see below).
`interface <interface-name>`	Specify the local interface name for the virtual-link. This allows you to use a dynamic, rather than a static, local IP address.
`remote-id<1-4094>`	The ID of the (same) tunnel that will be applied by the remote node. Note that this must match the local-id that is defined on the remote node. This means that (for the same tunnel) the local and remote tunnel IDs are reversed on the local and remote nodes.
`remote-ip <a.b.c.d>`	The IP address of the remote node.
`remote-area <area-name>`	The name of the remote area connected to this virtual-link.

Mode Global Configuration

Usage notes The Layer 2 tunnel that this command creates enables a local AMF session to appear to pass transparently across a Wide Area Network (WAN) such as the Internet. The addresses configured as the local and remote tunnel IP addresses must have IP connectivity to each other. If the tunnel is configured to connect a head office and branch office over the Internet, typically this would involve using some type of managed WAN service such as a site-to-site VPN. Tunnels are only supported using IPv4.

Configuration involves creating a local tunnel ID, a local IP address, a remote tunnel ID and a remote IP address. A reciprocal configuration is also required on the corresponding remote device. The local tunnel ID must be unique to the device on which it is configured.

If an interface acquires its IP address dynamically then the local side of the tunnel can be specified by using the interface's name instead of using its IP address. When using a dynamic local address the remote address of the other side of the virtual-link must be configured with either:

- the IP address of the NAT device the dynamically configured interface is behind, or
- 0.0.0.0, if the virtual-link is configured as a secure virtual-link.

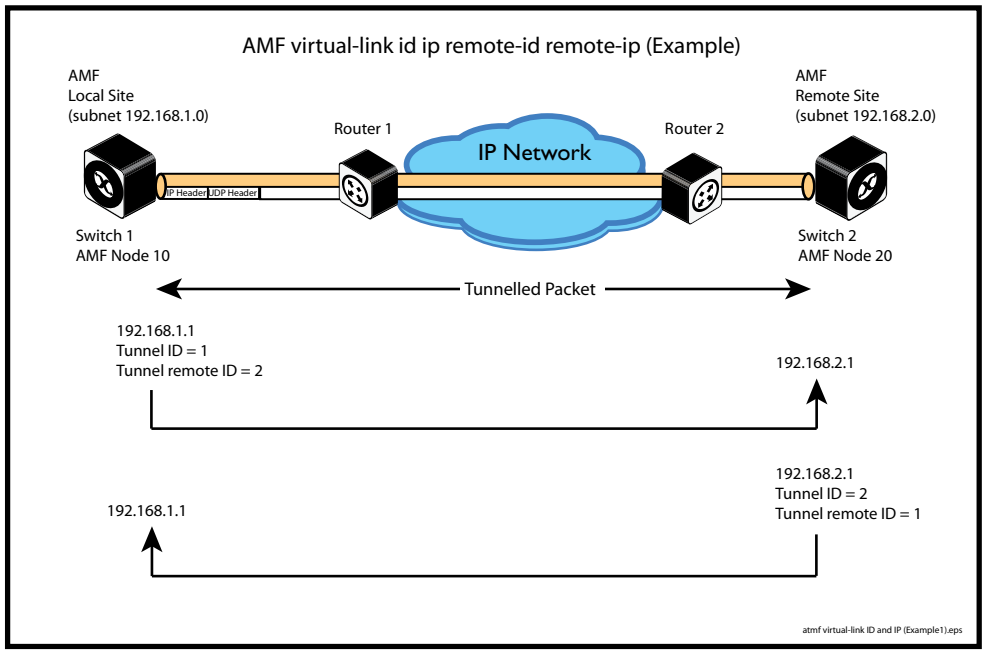
For instructions on how to configure dynamic IP addresses on virtual-links, see the AMF Feature Overview and Configuration Guide.

The tunneled link may operate via external (non AlliedWare Plus) routers in order to provide wide area network connectivity. However in this configuration, the routers perform a conventional router to router connection. The protocol tunneling function is accomplished by the AMF nodes.

NOTE: *AMF cannot achieve zero touch replacement of the remote device that terminates the tunnel connection, because you must pre-configure the local IP address and tunnel ID on that remote device.*

Example 1 Use the following commands to create the tunnel shown in the figure below.

Figure 49-1: AMF virtual link example



```
Node_10(config)# atmf virtual-link id 1 ip 192.168.1.1
remote-id 2 remote-ip 192.168.2.1
```

```
Node_20(config)# atmf virtual-link id 2 ip 192.168.2.1
remote-id 1 remote-ip 192.168.1.1
```

Example 2 To set up an area virtual link to a remote site (assuming IP connectivity between the sites already), one site must run the following commands:

```
SiteA# configure terminal
SiteA(config)# atmf virtual-link id 5 ip 192.168.100.1
remote-id 10 remote-ip 192.168.200.1 remote-area SiteB-AREA
```

The second site must run the following commands:

```
SiteB# configure terminal
SiteB(config)# atmf virtual-link id 10 ip 192.168.200.1
remote-id 5 remote-ip 192.168.100.1 remote-area SiteA-AREA
```

Before you can apply the above **atmf virtual-link** command, you must configure the area names *SiteB-AREA* and *SiteA-AREA*.

show atmf virtual-links

Command changes Version 5.4.9-0.1: **interface** parameter added

atmf virtual-link description

Overview Use this command to add a description to an existing AMF virtual-link.

Use the **no** variant of this command to remove a description from an AMF virtual-link.

Syntax

```
atmf virtual-link id <1-4094> description <description>
no atmf virtual-link id <1-4094> description
```

Parameter	Description
`id <1-4094>`	ID of the local tunnel point.
`<description>`	A description for the virtual-link.

Default No description is set by default.

Mode Global Configuration

Example To add a description to the virtual-link with id '5', use the commands:

```
awplus# configure terminal
awplus(config)# atmf virtual-link id 5 description TO SITE B
```

To remove a description from the virtual-link with id '5', use the commands:

```
awplus# configure terminal
awplus(config)# no atmf virtual-link id 5
```

Related commands

atmf virtual-link

show atmf links

show atmf virtual-links

atmf virtual-link protection

Overview Use this command to add protection to an existing AMF virtual-link. Secure AMF virtual-links encapsulate the L2TPv3 frames of the virtual-link with IPsec.

Use the **no** variant of this command to remove protection from an AMF virtual-link.

Syntax

```
atmf virtual-link id <1-4094> protection ipsec key [8]
<key-string>
```

```
no atmf virtual-link id <1-4094> protection
```

Parameter	Description
`id`	Specify the link ID.
<1-4094>	Link ID in the range 1 to 4094,
`protection`	Protection is on for this link.
`ipsec`	Security provided using IPsec.
`key`	Set the shared key.
`8`	Specifies a string in an encrypted format instead of plain text. The running config will display the new password as an encrypted string even if password encryption is turned off.
<key-string>	Specify the shared key for the link.

Default Protection is off by default.

Mode Global Configuration

Usage notes The following limitations need to be considered when creating secure virtual-links.

- Switch devices support a maximum of 20 downstream AMF nodes when using a secure virtual-link as an uplink.
- When there are two or more AMF members behind a shared NAT device, only one of the members will be able to use secure virtual-links.
- An AMF Multi-tenant environment supports a maximum cumulative total of 1200 secure virtual-links across all AMF containers.

Secure virtual-links are only supported on the following device listed in the table below. There is also a limit to the number of links these devices support.

Device	Virtual-link Limit
AMF Cloud/ VAA	300
AR4050S AR3050S AR2050V AR2010V	60
x220 x230/x230L x310 x510/x510L IX5-28GPX	2

Example To create and configure a virtual link with protection first create the virtual-link:

```
Host-A# configure terminal
Host-A(config)# atmf virtual-link id 1 ip 192.168.1.1 remote-id
2 remote-ip 192.168.2.1
```

Enable protection on the virtual link:

```
Host-A(config)# atmf virtual-link id 1 protection ipsec key
securepassword
```

Repeat these steps on the other side of the link:

```
Host-B(config)# atmf virtual-link id 2 ip 192.168.2.1 remote-id
1 remote-ip 192.168.1.1
Host-B(config)# atmf virtual-link id 2 protection ipsec key
securepassword
```

Command changes Version 5.4.9-0.1: command added

atmf working-set

Overview Use this command to execute commands across an individually listed set of AMF nodes or across a named group of nodes.

Note that this command can only be run on a master node.

Use the **no** variant of this command to remove members or groups from the current working-set.

Syntax

```
atmf working-set {[<node-list>]|[group
{<group-list>|all|local|current}]}
```

```
no atmf working-set {[<node-list>]|[group <group-list>]}
```

Parameter	Description
<node-list>	A comma delimited list (without spaces) of nodes to be included in the working-set.
`group`	The AMF group.
<group-list>	A comma delimited list (without spaces) of groups to be included in the working-set. Note that this can include either defined groups, or any of the Automatic, or Implicit Groups shown earlier in the bulleted list of groups.
`all`	All nodes in the AMF.
`local`	Local node Running this command with the parameters **group local** will return you to the local prompt and local node connectivity.
`current`	Nodes in current list.

Mode Privileged Exec

Usage notes You can put AMF nodes into groups by using the atmf group (membership) command.

This command opens a session on multiple network devices. When you change the working set to anything other than the local device, the prompt will change to the AMF network name, followed by the size of the working set, shown in square brackets. This command has to be run at privilege level 15.

In addition to the user defined groups, the following system assigned groups are automatically created:

- Implicit Groups
  - local: The originating node.
  - current: All nodes that comprise the current working-set.
  - all: All nodes in the AMF.

- Automatic Groups - These can be defined by hardware architecture, e.g. x510, x610, x8100, AR3050S or AR4050S, or by certain AMF nodal designations such as master.

Note that the Implicit Groups do not appear in show atmf group command output.

If a node is an AMF master it will be automatically added to the master group.

Example 1 To add all nodes in the AMF to the working-set, use the command:

```
node1# atmf working-set group all
```

NOTE: *This command adds the implicit group "all" to the working set, where "all" comprises all nodes in the AMF.*

This command displays an output screen similar to the one shown below:

```
=======================================
node1, node2, node3, node4, node5, node6:
=========================================

Working set join

ATMF_NETWORK_Name[6]#
```

Example 2 To return to the local prompt, and connect to only the local node, use the command:

```
ATMF_Network_Name[6]# atmf working-set group local
node1#
```

The following table describes the meaning of the prompts in this example.

Parameter	Description
ATMF_Network_Name	The name of the AMF network, as set by the atmf network-name command.
[6]	The number of nodes in the working-set.
node1	The name of the local node, as set by the hostname command.

bridge-group

Overview Use this command to connect an AMF container to a bridge created on a Virtual AMF Appliance (VAA) virtual machine. This allows the AMF container to connect to a physical network.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the AMF Feature Overview and Configuration Guide for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove a bridge-group from an AMF container.

Syntax

```
bridge-group <bridge-id>
no bridge-group
```

Parameter	Description
<bridge-id>	The ID of the bridge group to join, a number between 1 and 64.

Mode AMF Container Configuration

Usage notes Each container has two virtual interfaces:

1) Interface eth0, used to connect to the AMF controller on the VAA host via an AMF area-link, and configured using this area-link command.

2) Interface eth1, used to connect to the outside world using a bridged L2 network link, and configured using the **bridge-group** command.

Before using this command, a bridge must be created with the same bridge-id on the VAA host using the **bridge <bridge-id>** command.

See the AMF Feature Overview and Configuration Guide for more information on configuring the bridge.

Example To create a bridge group for AMF container “vac-wlg-1” and , use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# bridge-group 1
```

Related commands

atmf container

show atmf container

Command changes Version 5.4.7-0.1: command added

clear application-proxy threat-protection

Overview Use this command to clear the threat protection for a specified address.

Syntax
```
clear application-proxy threat-protection {<ip-address>|
<mac-address>|all}
```

Parameter	Description
<ip-address>	The IPv4 address you wish to clear the threat for, in A.B.C.D format.
<mac-address>	The MAC address you wish to clear the threat for, in HHHH.HHHH.HHHH format.
`all`	Clear the threat for all IPv4 and MAC addresses.

Mode Privileged Exec

Example To clear the threat for 10.34.199.117, use the command:

```
awplus# clear application-proxy threat-protection 10.34.199.117
```

Related commands
- application-proxy quarantine-vlan
- application-proxy threat-protection
- application-proxy threat-protection send-summary
- service atmf-application-proxy
- show application-proxy threat-protection

Command changes Version 5.4.7-2.2: command added

clear atmf links

Overview Use this command with no parameters to manually reset all the AMF links on a device. You can optionally specify an interface or range of interfaces to reset the links on.

Certain events or topology changes can cause AMF links to be incorrect or outdated. Clearing the links forces AMF to relearn the information from neighboring nodes and create a fresh, correct, view of the network.

Syntax

```
clear atmf links [<interface-list>]
```

Parameter	Description
<interface-list>	The interfaces or ports to perform the reset on. An interface-list can be: • a switchport (e.g. port1.0.1) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a local port (e.g. of0) • You can specify a continuous range of interfaces separated by a hyphen, or a comma-separated list (e.g. port1.0.1, port1.0.4-port1.0.18). The specified interfaces must exist. If this parameter is left out then all links of the specified type will be reset on the device.

Mode Privileged Exec

Example To clear all AMF links on a device, use the following command:

```
awplus# clear atmf links
```

To clear all AMF links on port1.0.1 to port1.0.4 and static aggregator sa1, use the following command:

```
awplus# clear atmf links port1.0.1-port1.0.4,sa1
```

Related commands clear atmf links virtual

show atmf links

Command changes Version 5.4.8-2.1: command added

clear atmf links virtual

Overview Use this command with no parameters to manually reset all the AMF virtual links on a device. You can, optionally, specify a comma separated list of virtual links to reset.

Certain events or topology changes can cause AMF links to be incorrect or outdated. Clearing the links forces AMF to relearn the information from neighboring nodes and create a fresh, correct view of the network.

Syntax

```
clear atmf links virtual [<virtuallink-list>]
```

Parameter	Description
<virtuallink-list>	A single, or list, of AMF virtual link identifiers to reset. This must be a comma separated list of links e.g. *vlink1, vlink2, vlink3*. Specifying a link range e.g *vlink1-vlink3* is not supported.

Mode Privileged Exec

Example To clear all AMF virtual links on a device, use the following command:

```
awplus# clear atmf links virtual
```

To clear AMF virtual links vlink11 and vlink21, use the following command:

```
awplus# clear atmf links virtual vlink11,vlink22
```

Related commands clear atmf links

show atmf links

Command changes Version 5.4.8-2.1: command added

clear atmf links statistics

Overview This command resets the values of all AMF link, port, and global statistics to zero.

Syntax
```
clear atmf links statistics
```

Mode Privilege Exec

Example To reset the AMF link statistics values, use the command:
```
node_1# clear atmf links statistics
```

Related commands show atmf links statistics

clear atmf recovery-file

Overview Use this command to delete all of a node's recovery files. It deletes the recovery files stored on:

- the local node,
- neighbor nodes, and
- external media (USB or SD card).

Syntax

```
clear atmf recovery-file
```

Mode Privileged Exec

Usage notes AMF recovery files are created for nodes with special links. Special links include:

- virtual links,
- area links terminating on an AMF master, and
- area virtual links terminating on an AMF master.

An AMF node with one of these special links pushes its startup configuration to its neighbors and to any attached external media. It then fetches and applies this configuration at recovery time. This configuration enables it to contact the AMF master and initiate a recovery.

Recovery files can become out of date if:

- a node's neighbor is off line when changes are made to its configuration, or
- when a node no longer contains a special link.

Example To clear a node's recovery files, use the command:

```
node1# clear atmf recovery-file
```

Output Figure 49-2: If AlliedWare Plus detects that a node contains a special link then the following message is displayed

```
node1#clear atmf recovery-file
% Warning: ATMF recovery files have been removed.
ATMF recovery may fail. Please save running-configuration.
```

Related commands show atmf recovery-file

Command changes Version 5.4.8-0.2: command added

clear atmf secure-mode certificates

Overview Use this command to remove all certificates from an AMF member or master. AMF nodes will need to be re-authorized once this command has been run.

Syntax

```
clear atmf secure-mode certificates
```

Mode Privileged Exec

Example To clear all certificates from an AMF node, use the command:

```
awplus# clear atmf secure-mode certificates
```

If this is the only master on the network you will see the following warning:

```
% Warning: This node is the only master in the network!
All the nodes will become isolated and refuse to join any ATMF
network. The certificates on all the isolated nodes must be
cleared before rejoining an ATMF network will be possible.

To clear certificates a reboot of the device is required.
Clear certificates and Reboot ? (y/n):
```

On an AMF member you will see the following message:

```
To clear certificates a reboot of the device is required.
Clear certificates and Reboot ? (y/n):
```

Related commands

Command changes Version 5.4.7-0.3: command added

clear atmf secure-mode statistics

Overview Use this command to reset all secure mode statistics to 0.

Syntax
```
clear atmf secure-mode statistics
```

Mode Privileged Exec

Example To reset the AMF secure mode statistics information, use the command:
```
awplus# clear atmf secure-mode statistic
```

Related commands show atmf secure-mode

show atmf secure-mode statistics

Command changes Version 5.4.7-0.3: command added

clone (amf-provision)

Overview This command sets up a space on the backup media for use with a provisioned node and copies into it almost all files and directories from a chosen backup or provisioned node.

Alternatively, you can set up a new, unique provisioned node by using the command create (amf-provision).

Syntax

```
clone <source-nodename>
```

Parameter	Description
<source-nodename>	The name of the node whose configuration is to be copied for loading to the clone.

Mode AMF Provisioning

Usage notes This command is only available on master nodes in the AMF network.

When using this command it is important to be aware of the following:

- A copy of <*media*>:atmf/<*atmf_name*>/nodes/<*source_node*>/flash will be made for the provisioned node and stored in the backup media.
- The directory <*node_backup_dir*>/flash/.config/ssh is excluded from the copy.
- All contents of <*root_backup_dir*>/nodes/<*nodename*> will be deleted or overwritten.
- Settings for the expected location of other provisioned nodes are excluded from the copy.

The active and backup configuration files are automatically modified in the following ways:

- The **hostname** command is modified to match the name of the provisioned node.
- The **stack virtual-chassis-id** command is removed, if present.

Example To copy from the backup of 'device2' to create backup files for the new provisioned node 'device3' use the following command:

```
device1# atmf provision node device3
device1(atmf-provision)# clone device2
```

Figure 49-3: Sample output from the **clone** command

```
device1# atmf provision node device3
device1(atmf-provision)#clone device2
Copying...
Successful operation
```

To confirm that a new provisioned node has been cloned, use the command:

```
device1# show atmf backup
```

The output from this command is shown in the following figure, and shows the details of the new provisioned node 'device3'.

Figure 49-4: Sample output from the **show atmf backup** command

```
device1#show atmf backup

Scheduled Backup ...... Enabled
  Schedule ............ 1 per day starting at 03:00

Command changes

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

configure boot config (amf-provision)

Overview This command sets the configuration file to use during the next boot cycle. This command can also set a backup configuration file to use if the main configuration file cannot be accessed for an AMF provisioned node. To unset the boot configuration or the backup boot configuration use the **no boot** command.

Syntax

```
configure boot config [backup] <file-path|URL>
configure no boot config [backup]
```

Parameter	Description
backup	Specify that this is the backup configuration file.
<file-path|URL>	The path or URL and name of the configuration file.

Default No boot configuration files or backup configuration files are specified for the provisioned node.

Mode AMF Provisioning

Usage notes When using this command to set a backup configuration file, the specified AMF provisioned node must exist. The specified file must exist in the flash directory created for the provisioned node in the AMF remote backup media.

Examples To set the configuration file 'branch.cfg' on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot config
branch.cfg
```

To set the configuration file 'backup.cfg' as the backup to the main configuration file on the AMF provisioned node 'node1', use the command:

```
MasterNodeName(atmf-provision)# configure boot config backup
usb:/atmf/amf_net/nodes/node1/config/backup.cfg
```

To unset the boot configuration, use the command:

```
MasterNodeName(atmf-provision)# configure no boot config
```

To unset the backup boot configuration, use the command:

```
MasterNodeName(atmf-provision)# configure no boot config backup
```

Command changes Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

configure boot system (amf-provision)

Overview This command sets the release file that will load onto a specified provisioned node during the next boot cycle. This command can also set the backup release file to be loaded for an AMF provisioned node. To unset the boot system release file or the backup boot release file use the **no boot** command.

Use the **no** variant of this command to return to the default.

This command can only be run on AMF master nodes.

Syntax

```
configure boot system [backup] <file-path|URL>
configure no boot system [backup]
```

Parameter	Description
<file-path|URL>	The path or URL and name of the release file.

Default No boot release file or backup release files are specified for the provisioned node.

Mode AMF Provisioning

Usage notes When using this command to set a backup release file, the specified AMF provisioned node must exist. The specified file must exist in the flash directory created for the provisioned node in the AMF remote backup media.

Examples To set the release file x930-5.4.9-0.1.rel on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot system
x930-5.4.9-0.1.rel
```

To set the backup release file x930-5.4.8-2.5.rel as the backup to the main release file on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot system backup
card:/atmf/amf_net/nodes/node1/flash/x930-5.4.8-2.5.rel
```

To unset the boot release, use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure no boot system
```

To unset the backup boot release, use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure no boot system backup
```

Command changes Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

copy (amf-provision)

Overview Use this command to copy configuration and release files for the node you are provisioning.

For more information about using the copy command see copy (filename) in the File and Configuration Management chapter.

Syntax `copy [force] <source-name> <destination-name>`

Parameter	Description
`force`	This parameter forces the copy command to overwrite the destination file, if it already exists, without prompting the user for confirmation.
<source-name>	The filename and path of the source file. See the Introduction of the File and Configuration Management chapter for valid syntax.
<destination-name>	The filename and path for the destination file. See Introduction of the File and Configuration Management chapter for valid syntax.

Mode AMF Provisioning

Example To copy a configuration file named current.cfg from Node_4's Flash into the future_node directory, and set that configuration file to load onto future_node, use the following commands:

```
node_4# atmf provision node future_node
node_4(atmf-provision)# create
node_4(atmf-provision)# locate
node_4(atmf-provision)# copy flash:current.cfg
./future_node.cfg
node_4(atmf-provision)# configure boot config future_node.cfg
```

Command changes Version 5.4.9-2.1: command added

create (amf-provision)

Overview This command sets up an empty directory on the backup media for use with a provisioned node. This directory can have configuration and release files copied to it from existing devices. Alternatively, the configuration files can be created by the user.

An alternative way to create a new provisioned node is with the command clone (amf-provision).

This command can only run on AMF master nodes.

Syntax

```
create
```

Mode AMF Provisioning

Usage notes This command is only available on master nodes in the AMF network.

A date and time is assigned to the new provisioning directory reflecting when this command was executed. If there is a backup or provisioned node with the same name on another AMF master then the most recent one will be used.

Example To create a new provisioned node named “device2” use the command:

```
device1# atmf provision node device2
device1(atmf-provision)# create
```

Running this command will create the following directories:

- <*media*>:atmf/<*atmf_name*>/nodes/<*node*>
- <*media*>:atmf/<*atmf_name*>/nodes/<*node*>/flash

To confirm the new node’s settings, use the command:

```
device1# show atmf backup
```

The output for the **show atmf backup** command is shown in the following figure, and shows details for the new provisioned node ‘device2’.

Figure 49-5: Sample output from the **show atmf backup** command

```
device1#show atmf backup

Command changes

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

debug atmf

Overview This command enables the AMF debugging facilities, and displays information that is relevant (only) to the current node. The detail of the debugging displayed depends on the parameters specified.

If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

The **no** variant of this command disables either all AMF debugging information, or only the particular information as selected by the command's parameters.

Syntax

```
debug atmf
[link|crosslink|arealink|database|neighbor|error|all]
```

```
no debug atmf
[link|crosslink|arealink|database|neighbor|error|all]
```

Parameter	Description
`link`	Output displays debugging information relating to uplink or downlink information.
`crosslink`	Output displays all crosslink events.
`arealink`	Output displays all arealink events.
`database`	Output displays only notable database events.
`neighbor`	Output displays only notable AMF neighbor events.
`error`	Output displays AMF error events.
`all`	Output displays all AMF events.

Default All debugging facilities are disabled.

Mode User Exec and Global Configuration

Usage notes If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

NOTE: *An alias to the **no** variant of this command is undebug atmf on page 2607.*

Examples To enable all AMF debugging, use the command:

```
node_1# debug atmf
```

To enable AMF uplink and downlink debugging, use the command:

```
node_1# debug atmf link
```

To enable AMF error debugging, use the command:

```
node_1# debug atmf error
```

Related commands no debug all

debug atmf packet

Overview This command configures AMF Packet debugging parameters. The debug only displays information relevant to the current node. The command has following parameters:

Syntax

```
debug atmf packet [direction {rx|tx|both}] [level {1|2|3}]
[timeout <seconds>] [num-pkts <quantity>]
[filter {node <name>|interface <ifname>}
[pkt-type [1][2][3][4][5][6][7][8][9][10][11][12][13]]]
```

Simplified Syntax

`debug atmf packet`	`[direction {rx|tx|both}]`
	`[level {[1][2|3}]`
	`[timeout <seconds>]`
	`[num-pkts <quantity>]`
`debug atmf packet filter`	`[node <name>]`
	`[interface <ifname>]`
	`[pkt-type [1][2][3][4][5][6][7][8][9][10][11][12][13]]`

NOTE: *You can combine the syntax components shown, but when doing so, you must retain their original order.*

Default Level 1, both Tx and Rx, a timeout of 60 seconds with no filters applied.

NOTE: *An alias to the **no** variant of this command - undebug atmf - can be found elsewhere in this chapter.*

Mode User Exec and Global Configuration

Usage notes If no additional parameters are specified, then the command output will apply a default selection of parameters shown below:

Parameter	Description
`direction`	Sets debug to packet received, transmitted, or both
`rx`	packets received by this node
`tx`	Packets sent from this node
`1`	AMF Packet Control header Information, Packet Sequence Number. Enter 1 to select this level.
`2`	AMF Detailed Packet Information. Enter 2 to select this level.
`3`	AMF Packet HEX dump. Enter 3 to select this level.
`timeout`	Sets the execution timeout for packet logging

Parameter	Description
<seconds>	Seconds
num-pkts	Sets the number of packets to be dumped
<quantity>	The actual number of packets
filter	Sets debug to filter packets
node	Sets the filter on packets for a particular Node
<name>	The name of the remote node
interface	Sets the filter to dump packets from an interface (portx.x.x) on the local node
<ifname>	Interface port or virtual-link
pkt-type	Sets the filter on packets with a particular AMF packet type
1	Crosslink Hello BPDU packet with crosslink links information. Enter 1 to select this packet type.
2	Crosslink Hello BPDU packet with downlink domain information. Enter 2 to select this packet type.
3	Crosslink Hello BPDU packet with uplink information. Enter 3 to select this packet type.
4	Downlink and uplink hello BPDU packets. Enter 4 to select this packet type.
5	Non broadcast hello unicast packets. Enter 5 to select this packet type.
6	Stack hello unicast packets. Enter 6 to select this packet type.
7	Database description. Enter 7 to select this packet type.
8	DBE request. Enter 8 to select this packet type.
9	DBE update. Enter 9 to select this packet type.
10	DBE bitmap update. Enter 10 to select this packet type.
11	DBE acknowledgment. Enter 11 to select this packet type.
12	Area Hello Packets. Enter 12 to select this packet type.
13	Gateway Hello Packets. Enter 13 to select this packet type.

Examples To set a packet debug on node 1 with level 1 and no timeout, use the command:

```
node_1# debug atmf packet direction tx timeout 0
```

To set a packet debug with level 3 and filter packets received from AMF node 1:

```
node_1# debug atmf packet direction tx level 3 filter node_1
```

To enable send and receive 500 packets only on vlink1 for packet types 1, 7, and 11, use the command:

```
node_1# debug atmf packet num-pkts 500 filter interface vlink1
pkt-type 1 7 11
```

This example applies the **debug atmf packet** command and combines many of its options:

```
node_1# debug atmf packet direction rx level 1 num-pkts 60
filter node x930 interface port1.0.1 pkt-type 4 7 10
```

delete (amf-provision)

Overview This command deletes files that have been created for loading onto a provisioned node. It can only be run on master nodes.

Syntax

```
delete
```

Mode AMF Provisioning

Usage notes This command is only available on master nodes in the AMF network. The command will only work if the provisioned node specified in the command has already been set up (although the device itself is still yet to be installed). Otherwise, an error message is shown when the command is run.

You may want to use the **delete** command to delete a provisioned node that was created in error or that is no longer needed.

This command cannot be used to delete backups created by the AMF backup procedure. In this case, use the command atmf backup delete to delete the files.

NOTE: *This command allows provisioned entries to be deleted even if they have been referenced by the atmf provision (interface) command, so take care to only delete unwanted entries.*

Example To delete backup files for a provisioned node named device3 use the command:

```
device1# atmf provision node device3
device1(atmf-provision)# delete
```

To confirm that the backup files for provisioned node device3 have been deleted use the command:

```
device1# show atmf backup
```

The output should show that the provisioned node device3 no longer exists in the backup file, as shown in the figure below:

Figure 49-6: Sample output showing the **show atmf backup** command

```
device1#show atmf backup

Scheduled Backup ...... Enabled
  Schedule ............ 1 per day starting at 03:00
  Next Backup Time .... 01 Oct 2016 03:00

Command changes

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

discovery

Overview Use this command to specify how AMF learns about guest nodes.

AMF nodes gather information about guest nodes by using one of two internally defined discovery methods: static or dynamic.

With dynamic learning (the default method), AMF learns IP address and MAC addresses of guest nodes from LLDP or DHCP snooping. Dynamic learning is only supported when using IPv4. For IPv6, use static learning.

With static learning, you use the switchport atmf-guestlink command to specify the guest class name and IP address of the guest node attached to each individual switch port. AMF then learns the MAC addresses of each of the guests of that class from ARP or Neighbor discovery tables.

If you are using the static method, ensure that you have configured the appropriate class type for each of your statically discovered guest nodes.

The **no** variant of this command returns the discovery method to **dynamic**.

Syntax

```
discovery [static|dynamic]
no discovery
```

Parameter	Description
`static`	Statically assigned.
`dynamic`	Learned from DCHCP Snooping or LLDP.

Default Dynamic

Mode AMF Guest Configuration

Usage notes This command is one of several modal commands that are configured and applied for a specific guest-class (mode). Its settings are automatically applied to a guest-node link by the switchport atmf-guestlink command.

NOTE: *AMF guest nodes are not supported on ports using the OpenFlow protocol.*

Example 1 To configure the discovery of the guest-class camera to operate statically, use the following commands:

```
Node1# configure terminal
Node1(config)# atmf guest-class camera
Node1(config-atmf-guest)# discovery static
```

Example 2 To return the discovery method for the guest class TQ4600-1 to its default of **dynamic**, use the following commands:

```
Node1# configure terminal
Node1(config)# atmf guest-class TQ4600-1
Node1(config-atmf-guest)# no discovery
```

Related commands

show atmf nodes

description (amf-container)

Overview Use this command to set the description on an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the AMF Feature Overview and Configuration Guide for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove the description from an AMF container.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	Enter up to 128 characters of text describing the AMF container.

Mode AMF Container Configuration

Example To set the description for AMF container "vac-wlg-1" to "Wellington area", use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# description Wellington area
```

To remove the description for AMF container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# no description
```

Command changes Version 5.4.7-0.1: command added

erase factory-default

Overview This command erases all data from NVS and all data from flash **except** the following:

- the boot release file (a .rel file) and its release setting file
- all license files
- the latest GUI release file

The device is then rebooted and returned to its factory default condition. The device can then be used for AMF automatic node recovery.

Syntax

```
erase factory-default
```

Mode Privileged Exec

Usage notes This command is an alias to the atmf cleanup command.

Example To erase data, use the command:

```
Node_1# erase factory-default
```

```
This command will erase all NVS, all flash contents except for
the boot release, a GUI resource file, and any license files,
and then reboot the switch. Continue? (y/n):y
```

Related commands atmf cleanup

http-enable

Overview This command is used to enable GUI access to a guest node. When **http-enable** is configured, the port number is set to its default of 80. If the guest node is using a different port for HTTP, you can configure this using the **port** parameter.

This command is used to inform the GUI that this device has an HTTP interface at the specified port number so that a suitable URL can be provided to the user.

Use the **no** variant of this command to disable HTTP.

Syntax

```
http-enable [port <port-number>]
no http-enable
```

Parameter	Description
`port`	TCP port number.
<port-number>	The port number to be configured.

Default Not set

Mode AMF Guest Configuration

Usage notes If **http-enable** is selected without a **port** parameter the port number will default to 80.

Example To enable HTTP access to a guest node on port 80 (the default), use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# http-enable
```

To enable HTTP access to a guest node on port 400, use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# http-enable port 400
```

To disable HTTP access to a guest node, use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# no http-enable
```

Related commands atmf guest-class

switchport atmf-guestlink

show atmf nodes

identity (amf-provision)

Overview Use this command to create an identity token for provisioning an isolated AMF node. An isolated node is an AMF member that is only connected to the rest of the AMF network via a virtual-link.

This command allows these nodes, which have no AMF neighbors, to be identified for provisioning purposes. They are identified using an identity token which is based on either the next-hop MAC address of the provisioned node, or the serial number of the device being provisioned. This identity token is stored on the AMF master.

Use the **no** variant of this command to remove the identity token for a node.

Syntax

```
identity mac-address <mac-address> prefix
<ip-address/prefix-length>
```

```
identity serial-number <serial-number> prefix
<ip-address/prefix-length>
```

```
no identity
```

Parameter	Description
`mac-address`	Specify the next-hop MAC address of the device being provisioned.
`<mac-address>`	MAC address of the port the provisioned node is connected to, in the format xxxx.xxxx.xxxx.
`serial-number`	Specify the serial number of the device to be provisioned.
`<serial-number>`	Serial number of the device that is being provisioned.
`prefix`	IPv4 address, and prefix length, of the virtual-link interface on the isolated node
`<ip-address/prefix-length>`	IPv4 address, and prefix length, in A.B.C.D/M format.

Mode AMF Provisioning

Usage notes To provision an isolated node, first create a configuration for the node using the create (amf-provision) and/or the clone (amf-provision) commands.

Then create an identity token for the provisioned node by either specifying its next-hop MAC address or by specifying the serial number of the replacement device. The advantage of using the next-hop MAC address is that any device, regardless of its serial number, can be added to the network but using the serial number maybe preferred in situations where the next-hop MAC address is not easy to obtain.

The atmf recovery-server option must be enabled on the AMF master before attempting to provision the device. This option allows the AMF master to process recovery requests from isolated AMF nodes.

See the AMF Feature Overview and Configuration Guide for information on preparing your network for recovering or provisioning isolated nodes.

Example To create a identity token on your AMF master for a device named "my-x930" with serial number "A10064A172100008", use the command:

```
awplus# atmf provision node my-x930
awplus(atmf-provision)# identity serial-number
A10064A172100008 prefix 192.168.2.25/24
```

To create a identity token on your AMF master for a device named "my-x930" with next-hop MAC address "0000.cd28.0880", use the command:

```
awplus# atmf provision node my-x930
awplus(atmf-provision)# identity mac-address 0000.cd28.0880
prefix 192.168.2.25/24
```

To delete the identity token from your AMF master for a device named "my-x930", use the command:

```
awplus# atmf provision node my-x930
awplus(atmf-provision)# no identity
```

Command changes

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

Version 5.4.7-2.1: command added

license-cert (amf-provision)

Overview This command is used to set up the license certificate for a provisioned node.

The certificate file usually has all the license details for the network, and can be stored anywhere in the network. This command makes a hidden copy of the certificate file and stores it in the space set up for the provisioned node on AMF backup media.

For node provisioning, the new device has not yet been part of the AMF network, so the user is unlikely to know its product ID or its MAC address. When such a device joins the network, assuming that this command has been applied successfully, the copy of the certificate file will be applied automatically to the provisioned node.

Once the new device has been resurrected on the network and the certificate file has been downloaded to the provisioned node, the hidden copy of the certificate file is deleted from AMF backup media.

Use the **no** variant of this command to set it back to the default.

This command can only be run on AMF master nodes.

Syntax

```
license-cert <file-path|URL>
no license-cert
```

Parameter	Description
<file-path|URL>	The name of the certificate file. This can include the file-path of the file.

Default No license certificate file is specified for the provisioned node.

Mode AMF Provisioning

Usage notes This command is only available on master nodes in the AMF network. It will only operate if the provisioned node specified in the command has already been set up, and if the license certification is present in the backup file. Otherwise, an error message is shown when the command is run.

Example 1 To apply the license certificate 'cert1.txt' stored on a TFTP server for AMF provisioned node "device2", use the command:

```
device1# atmf provision node device2
device1(atmf-provision)# license-cert
tftp://192.168.1.1/cert1.txt
```

Example 2 To apply the license certificate 'cert2.txt' stored in the AMF master's flash directory for AMF provisioned node 'host2', use the command:

```
device1# atmf provision node host2
device1(atmf-provision)# license-cert /cert2.txt
```

To confirm that the license certificate has been applied to the provisioned node, use the command show atmf provision nodes. The output from this command is shown below, and displays license certification details in the last line.

Figure 49-7: Sample output from the **show atmf provision nodes** command

```
device1#show atmf provision nodes

ATMF Provisioned Node Information:

Backup Media .............: SD (Total 3827.0MB, Free 3481.1MB)

Node Name                 : device2
Date & Time               : 06-Oct-2016 & 23:25:44
Provision Path            : card:/atmf/nodes

Boot configuration :
Current boot image        : x510-5.4.6-1.4.rel (file exists)
Backup  boot image        : x510-5.4.6-1.3.rel (file exists)

Command changes

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

locate (amf-provision)

Overview This command changes the present working directory to the directory of a provisioned node. This makes it easier to edit files and create a unique provisioned node in the backup.

This command can only be run on AMF master nodes.

NOTE: *We advise that after running this command, you return to a known working directory, typically flash.*

Syntax

```
locate
```

Mode AMF Provisioning

Example To change the working directory that happens to be on device1 to the directory of provisioned node device2, use the following command:

```
device1# atmf provision node device2
device1[atmf-provision]# locate
```

The directory of the node device2 should now be the working directory. You can use the command pwd to check this, as shown in the following figure.

Figure 49-8: Sample output from the **pwd** command

```
device2#pwd
card:/atmf/building_2/nodes/device2/flash
```

The output above shows that the working directory is now the flash of device2.

Command changes Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

log event-host

Overview Use this command to set up an external host to log AMF topology events through Vista Manager. This command is run on the Master device.

Use the **no** variant of this command to disable log events through Vista Manager.

Syntax

```
log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event
no log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event
```

Parameter	Description
<ipv4-addr>	ipv4 address of the event host
<ipv6-addr>	ipv6 address of the event host

Default Log events are disabled by default.

Mode Global Configuration

Usage notes Event hosts are set so syslog sends the messages out as they come.

Note that there is a difference between log event and log host messages:

- Log event messages are sent out as they come by syslog
- Log host messages are set to wait for a number of messages (20) to send them out together for traffic optimization.

Example To enable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
Node1(config)# log event-host 192.0.2.31 atmf-topology-event
```

To disable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
Node1(config)# no log event-host 192.0.2.31 atmf-topology-event
```

Related commands atmf topology-gui enable

login-fallback enable

Overview Use this command to enable login fallback on TQ model AMF guest nodes.This allows AMF to try the factory default username and password if the guest node's saved username and password fail.

Use the **no** variant of this command to disable login fallback.

Syntax

```
login-fallback enable
no login-fallback enable
```

Default Disabled

Mode AMF Guest Configuration

Usage notes This feature is only supported on TQ model guest nodes.

Login fallback means: if a guest node's saved username and password fail, AMF will try to connect to the node using the factory default username and password (manager/friend). When a new TQ replaces an existing TQ, this allows the new TQ to be discovered and managed as an AMF guest node. AMF can then start the AMF guest node recovery procedure.

Example To use the login fallback feature, first create an AMF guest class for TQ model APs. Then enable the login fall back feature.

For example, to enable login fallback on the guest-class AT-TQ5k, use the commands:

```
node1#configuration terminal
node1(config)#atmf guest-class AT-TQ5k
node1(config-atmf-guest)#login-fallback enable
node1(config-atmf-guest)#end
node1#
```

Command changes Version 5.5.0-1.1: command added

modeltype

Overview This command sets the expected model type of the guest node. The model type will default to **other** if nothing is set.

Use the **no** variant of this command to reset the model type to **other**.

Syntax

```
modeltype {alliedware|aw+|onvif|tq|other}
no modeltype
```

Parameter	Description
`alliedware`	A legacy Allied Telesis operating system.
`aw+`	The Allied Telesis AlliedWare Plus operating system.
`onvif`	ONVIF (Open Network Video Interface Forum) Profile Q devices
`tq`	An Allied Telesis TQ Series wireless access point.
`other`	Used where the model type is outside the above definitions.

Default Default to **other**

Mode AMF Guest Configuration

Examples To assign the model type **tq** to the guest-class called 'tq_device', use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class tq_device
node1(config-atmf-guest)# modeltype tq
```

To remove the model type **tq** from the guest-class called 'tq_device', and reset it to the default of **other**, use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class tq_device
node1(config-atmf-guest)# no modeltype
```

Command changes Version 5.4.9-2.1: **onvif** parameter added

service atmf-application-proxy

Overview Use this command to enable the AMF Application Proxy service. This service distributes messages across all AMF nodes.

Currently this is used for threat protection. When an AMF Security (AMF-Sec) Controller detects a threat, it issues a request to block the address the threat originated from. The AMF Application Proxy service distributes this message to all AMF nodes. An AMF master accepts this block request and instructs the subordinate AMF node to block the relevant device.

Use the **no** variant of this command to disable the AMF Application Proxy service.

Syntax

```
service atmf-application-proxy
no service atmf-application-proxy
```

Default The AMF Application Proxy service is disabled by default.

Mode Global Configuration

Usage notes The AMF master maintains a list of all threats and will send this list to any AMF node, or VCS member, when it boots and joins the AMF network.

In order for this to work the follow must be configured:

- the AMF Application Proxy service on all AMF nodes that need to receive the messages.
- the Hypertext Transfer Protocol (HTTP) service on all nodes that are running the AMF Application Proxy service (see service http).

Example To enable the AMF Application Proxy service, use the commands

```
awplus# configure terminal
awplus(config)# service atmf-application-proxy
```

To disable the AMF Application Proxy service, use the commands

```
awplus# configure terminal
awplus(config)# no service atmf-application-proxy
```

show application-proxy whitelist interface

Overview Use this command to display the status of port authentication on the specified interface.

Syntax

```
show application-proxy whitelist interface [<interface-list>]
```

Parameter	Description
<interface-list>	The interfaces or ports to display information about. An interface-list can be: • a switchport (e.g. port1.0.4) • a static channel group (e.g. sa2) • a dynamic (LACP) channel group (e.g. po2) • a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4) • a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list. The specified interface must exist.

Mode Privileged Exec

Example To display the port authentication information for all interfaces, use the command:

```
awplus# show application-proxy whitelist interface
```

To display the port authentication information for port1.0.4, use the command

```
awplus# show application-proxy whitelist interface port1.0.4
```

Output Figure 49-11: Example output from **show application-proxy whitelist interface**

Command changes Version 5.4.9-0.1: command added

show atmf

Overview Displays information about the current AMF node.

Syntax

```
show atmf [summary|tech|nodes|session]
```

Parameter	Description
`summary`	Displays summary information about the current AMF node.
`tech`	Displays global AMF information.
`nodes`	Displays a list of AMF nodes together with brief details.
`session`	Displays information on an AMF session.

Default Only summary information is displayed.

Mode User Exec and Privileged Exec

Usage notes AMF uses internal VLANs to communicate between nodes about the state of the AMF network. Two VLANs have been selected specifically for this purpose. Once these have been assigned, they are reserved for AMF and cannot be used for other purposes

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Example 1 To show summary information on AMF node_1 use the following command:

```
node_1# show atmf summary
```

Table 50: Output from the **show atmf summary** command

```
node_1#show atmf summary
ATMF Summary Information:

ATMF Status           : Enabled
Network Name          : Test_network
Node Name             : node_1
Role                  : Master
Restricted login      : Disabled
Current ATMF Nodes    : 3
```

Example 2 To show information specific to AMF nodes use the following command:

```
node_1# show atmf nodes
```

Example 3 The **show amf session** command displays all CLI (Command Line Interface) sessions for users that are currently logged in and running a CLI session.

To display AMF active sessions, use the following command:

```
node_1# show atmf session
```

For example, in the output below, node_1 and node_5 have active users logged in.

Table 51: Output from the **show atmf session** command

```
node_1#show atmf session

CLI Session Neighbors

Session ID                          : 73518

Example 4 The AMF tech command collects all the AMF commands, and displays them. You can use this command when you want to see an overview of the AMF network.

To display AMF technical information, use the following command:

```
node_1# show atmf tech
```

Table 52: Output from the **show atmf tech** command

```
node_1#show atmf tech
ATMF Summary Information:

ATMF Status           : Enabled
Network Name          : ATMF_NET
Node Name             : node_1
Role                  : Master
Current ATMF Nodes    : 8

ATMF Technical information:

Network Name                       : ATMF_NET

```

Table 53: Parameter definitions from the **show atmf tech** command

Parameter	Definition
`ATMF Status`	The Node's AMF status, either Enabled or Disabled.
`Network Name`	The AMF network that a particular node belongs to.

Table 53: Parameter definitions from the **show atmf tech** command (cont.)

Parameter	Definition
`Node Name`	The name assigned to a particular node.
`Role`	The role configured for this AMF device, either Master or Member.
`Current ATMF Nodes`	The count of AMF nodes in an AMF Network.
`Node Address`	An address used to access a remotely located node (.atmf).
`Node ID`	A unique identifier assigned to a Node on an AMF network.
`Node Depth`	The number of nodes in path from this node to level of the AMF root node. It can be thought of as the vertical depth of the AMF network from a particular node to the zero level of the AMF root node.
`Domain State`	The state of Node in a Domain in AMF network as Controller/Backup.
`Recovery State`	The AMF node recovery status. Indicates whether a node recovery is in progress on this device - Auto, Manual, or None.
`Management VLAN`	The VLAN created for traffic between Nodes of different domain (up/down links). • VLAN ID - In this example VLAN 4092 is configured as the Management VLAN. • Management Subnet - Network prefix for the subnet. • Management IP Address - The IP address allocated for this traffic. • Management Mask - The subnet mask used to create a subnet for this traffic (255.255.128.0).
`Domain VLAN`	The VLAN assigned for traffic between Nodes of same domain (crosslink). • VLAN ID - In this example VLAN 4091 is configured as the domain VLAN. • Domain Subnet. The subnet address used for this traffic. • Domain IP Address. The IP address allocated for this traffic. • Domain Mask. The subnet mask used to create a subnet for this traffic (255.255.128.0).
`Device Type`	The Product Series name.
`ATMF Master`	Whether the node is an AMF master node for its area ('Y' if it is and 'N' if it is not).
`SC`	The device configuration, one of C - Chassis (SBx8100 Series), S - Stackable (VCS) or N - Standalone.
`Parent`	The node to which the current node has an active uplink.
`Node Depth`	The number of nodes in the path from this node to the master node.

Related commands show atmf detail

show atmf area

Overview Use this command to display information about an AMF area. On AMF controllers, this command displays all areas that the controller is aware of. On remote AMF masters, this command displays the controller area and the remote local area. On gateways, this command displays the controller area and remote master area.

Syntax `show atmf area [detail] [<area-name>]`

Parameter	Description
`detail`	Displays detailed information
<area-name>	Displays information about master and gateway nodes in the specified area only.

Mode Privileged Exec

Example 1 To show information about all areas, use the command:

```
controller-1# show atmf area
```

The following figure shows example output from running this command on a controller.

Table 54: Example output from the **show atmf area** command on a Controller.

```
controller-1#show atmf area

  ATMF Area Information:

  * = Local area

  Area               Area   Local         Remote        Remote         Node
  Name               ID     Gateway       Gateway       Master         Count
------------------------------------------------------------------------------
* NZ                 1      Reachable     N/A           N/A             3
  Wellington         2      Reachable     Reachable     Auth OK         120
  Canterbury         3      Reachable     Reachable     Auth Error      -
  SiteA-AREA         14     Unreachable   Unreachable   Unreachable     -
  Auckland           100    Reachable     Reachable     Auth Start      -
  Southland          120    Reachable     Reachable     Auth OK         54

  Area count:        6                             Area node count:     177
```

The following figure shows example output from running this command on a remote master.

Table 55: Example output from the **show atmf area** command on a remote master.

```
Canterbury#show atmf area

  ATMF Area Information:

  * = Local area

  Area              Area   Local         Remote        Remote         Node
  Name              ID     Gateway       Gateway       Master         Count
-------------------------------------------------------------------------
  NZ                1      Reachable     N/A           N/A             -
* Canterbury        3      Reachable     N/A           N/A             40

  Area count:       2                       Local area node count:    40
```

Table 56: Parameter definitions from the **show atmf area** command

Parameter	Definition
*	Indicates the area of the device on which the command is being run.
Area Name	The name of each area.
Area ID	The ID of the area.
Local Gateway	Whether the local gateway node is reachable or not.
Remote Gateway	Whether the remote gateway node is reachable or not. This is one of the following: • Reachable, if the link has been established. • Unreachable, if a link to the remote area has not been established. This could mean that a port or vlan is down, or that inconsistent VLANs have been configured using the switchport atmf-arealink command. • N/A for the area of the controller or remote master on which the command is being run, because the gateway node on that device is local. • Auth Start, which may indicate that the area names match on the controller and remote master, but the IDs do not match. • Auth Error, which indicates that the areas tried to authenticate but there is a problem. For example, the passwords configured on the controller and remote master may not match, or a password may be missing on the remote master.? • Auth OK, which indicates that area authentication was successful and you can now use the atmf select-area command.
Remote Master	Whether the remote master node is reachable or not. This is N/A for the area of the controller or remote master on which the command is being run, because the master node on that device is local.
Node Count	The number of nodes in the area.
Area Count	The number of areas controlled by the controller.
Area Node Count	The total number of nodes in the area.

Example 2 To show detailed information about the areas, use the command:

```
controller-1# show atmf area detail
```

The following figure shows example output from running this command.

Table 57: Output from the **show atmf area detail** command

```
controller-1#show atmf area detail

 ATMF Area Detail Information:

 Controller distance       : 0

 Controller Id             : 21
 Backup Available          : FALSE

 Area Id                   : 2
 Gateway Node Name         : controller-1
 Gateway Node Id           : 342
 Gateway Ifindex           : 6013
 Masters Count             : 1
 Master Node Name          : well-master (329)
 Node Count                : 2

 Area Id                   : 3
 Gateway Node Name         : controller-1
 Gateway Node Id           : 342
 Gateway Ifindex           : 4511
 Masters Count             : 2
 Master Node Name          : cant1-master (15)
 Master Node Name          : cant2-master (454)
 Node Count                : 2
```

show atmf area summary

show atmf area nodes

show atmf area nodes-detail

show atmf area guests

Overview This command will display details of all guests that the controller is aware of.

Syntax `show atmf area guests [<area-name> [<node-name>]]`

Parameter	Description
<area-name>	The area name for guest information
<node-name>	The name of the node that connects to the guests.

Default n/a

Mode User Exec/Privileged Exec

Example 1 To display atmf area guest nodes on a controller, use the command,

```
GuestNode[1]#show atmf area guests
```

Output Figure 49-14: Example output from the **show atmf area guests** command

```
main-building Area Guest Node Information:
Device          MAC                                        IP/IPv6
Type            Address         Parent          Port       Address
-------------------------------------------------------------------------------
-               0008.5d10.7635  x230            1.0.3      192.168.5.4

main-building guest node count 4

GuestNode[1]#
```

Table 58: Parameters in the output from **show atmf area guests** command

Parameter	Description
Device Type	The device type as read from the guest node.
MAC Address	The MAC address of the guest-node
Parent	The device that directly connects to the guest-node
Port	The port number on the parent node that connects to the guest node.
IP/IPv6	The IP or IPv6 address of the guest node.

Related commands

show atmf area

show atmf area nodes

show atmf backup guest

show atmf area guests-detail

show atmf area guests-detail

Overview This command displays the local and remote guest information from an AMF controller.

Syntax `show atmf area guests-detail [<area-name> [<node-name>]]`

Parameter	Description
<area-name>	The name assigned to the AMF area. An area is an AMF network that is under the control of an AMF Controller.
<node-name>	The name assigned to the network node.

Default n/a.

Mode Privileged Exec

Example To display detailed information for all guest nodes attached to "node1", which is located within the area named "northern", use the following command:

```
AMF_controller#show atmf area guests-detail northern node1
```

Output Figure 49-15: Example output from the **show atmf guest detail** command.

```
#show atmf guest detail

Node Name                       : Node1

Table 59: Parameters shown in the output of the **show atmf guest detail** command

Parameter	Description
`Node Name`	The name of the guest's parent node.
`Port Name`	The port on the parent node that connects to the guest.
`IFindex`	An internal index number that maps to the port number on the parent node.
`Guest Description`	A brief description of the guest node as manually entered into the description (interface) command for the guest node port on the parent node.
`Device Type`	The device type as supplied by the guest node itself.
`Backup Supported`	Indicates whether AMF supports backup of this guest node.
`MAC Address`	The MAC address of the guest node.
`IP Address`	The IP address of the guest node.
`IPv6 Address`	The IPv6 address of the guest node.
`HTTP Port`	The HTTP port enables you to specify a port when enabling http to allow a URL for the http user interface of a Guest Node. This is determined by the http-enable command.
`Firmware Version`	The firmware version that the guest node is currently running.

Related commands

show atmf area nodes-detail

show atmf area guests

show atmf area nodes

Overview Use this command to display summarized information about an AMF controller's remote nodes.

Note that this command can only be run from a controller node.

Syntax `show atmf area nodes <area-name> [<node-name>]`

Parameter	Description
<area-name>	Displays information about nodes in the specified area.
<node-name>	Displays information about the specified node.

Mode Privileged Exec

Usage notes If you do not limit the output to a single area or node, this command lists all remote nodes that the controller is aware of. This can be a very large number of nodes.

Example To show summarized information for all the nodes in area 'Wellington', use the command:

```
controller-1# show atmf area nodes Wellington
```

The following figure shows partial example output from running this command.

Table 60: Output from the **show atmf area nodes Wellington** command

```
controller-1#show atmf area nodes Wellington

 Wellington Area Node Information:
 Node          Device             ATMF          Parent                    Node
 Name          Type               Master  SC    Domain                    Depth
 ---------------------------------------------------------------------------
 well-gate     x230-18GP          N       N     well-master               1
 well-master   AT-x930-28GPX      Y       N     none                      0

Wellington node count 2
```

Table 61: Parameter definitions from the **show atmf area nodes** command

Parameter	Definition
Node Name	The name assigned to a particular node.
Device Type	The Product series name.
ATMF Master	Whether the node is an AMF master node for its area ('Y' if it is and 'N' if it is not).

Table 61: Parameter definitions from the **show atmf area nodes** command

Parameter	Definition
SC	The device configuration, one of C - Chassis (SBx8100 series), S - Stackable (VCS) or N - Standalone.
Parent Domain	The node to which the current node has an active uplink.
Node Depth	The number of nodes in the path from this node to the master node.

Related commands

show atmf area

show atmf area nodes

show atmf area nodes-detail

show atmf authorization

Overview Use this command on an AMF master to display the authorization status of other AMF members and masters on the network.

On an AMF controller this command will show the authorization status of remote area AMF masters.

Syntax

```
show atmf authorization {current|pending|provisional}
```

Parameter	Description
`current`	Show the status of all authorized nodes.
`pending`	Show the status of unauthorized nodes in the pending queue. These are nodes that enabled secure mode with atmf secure-mode but have not yet been authorized with atmf authorize.
`provisional`	Show the status of provisionally authorized nodes. These are nodes that have been provisioned with atmf authorize provision.

Mode Privileged Exec

Example To display all authorized AMF nodes on an AMF controller or AMF master, use the command:

```
awplus# show atmf authorization current
```

To display AMF nodes which are requesting authorization on an AMF controller or AMF master, use the command:

```
awplus# show atmf authorization pending
```

To display AMF nodes which have provisional authorization, use the command:

```
awplus# show atmf authorization provisional
```

Output Figure 49-16: Example output from **show atmf authorization current**

```
  NZ Authorized Nodes:
  Node Name             Signer                Expires
-----------------------------------------------------------------
  master_1              master_1              4 Mar 2017
  area_1_node_1         master_1              4 Mar 2017
  area_1_node_2         master_1              4 Mar 2017
```

Table 49-1: Parameters in the output from **show atmf authorization current**

Parameter	Description
Node Name	AMF node name of the authorized node.
Signer	Name of the AMF master that authorized the node.
Expires	Expiry date of the authorization. Authorization expiry time is set using atmf secure-mode certificate expiry.

Output Figure 49-17: Example output from **show atmf authorization pending**

```
  Pending Authorizations:

  NZ Requests:
  Node Name           Product          Parent Node      Interface
-----------------------------------------------------------------------
  area_1_node_3       x230-18GP        master_1         port1.2.9
  area_1_node_4       x510-52GTX       master_1         sa1
```

Table 49-2: Parameters in the output from **show atmf authorization pending**

Parameter	Description
Node Name	Name of the node that is requesting authorization.
Product	Product name.
Parent Node	Authorization authority of the requesting node.
Interface	Interface that the authorization request came in on.

Output Figure 49-18: Example output from **show atmf authorization provisional**

```
 ATMF Provisional Authorization:

  Area - Node Name                 Start                  Timeout
  or MAC Address      Interface    Time                   Minutes
-----------------------------------------------------------------------
  3333.4444.5555                   5 Sep 2016 02:35:54     3
  1111.2222.3333                   5 Sep 2016 02:35:24     60
  NZ - blue           port1.0.3    5 Sep 2016 02:35:06     60
```

Table 49-3: Parameters in the output from **show atmf authorization provisional**

Parameter	Description
`Area - Node Name or MAC Address`	MAC address or node name of the node that has been provisionally authorized.
`Interface`	Interface that the node has been provisioned on.
`Start Time`	Time the node was provisioned.
`Timeout Minutes`	Length of time from `Start Time` until the provisional authorization expires.

Command changes

Version 5.4.7-0.3: command added

show atmf backup

Overview This command displays information about AMF backup status for all the nodes in an AMF network. It can only be run on AMF master and controller nodes.

Syntax

```
show atmf backup
show atmf backup logs
show atmf backup server-status
show atmf backup synchronize [logs]
```

Parameter	Description
`logs`	Displays detailed log information.
`server-status`	Displays connectivity diagnostics information for each configured remote file server.
`synchronize`	Display the file server synchronization status
`logs`	For each remote file server, display the logs for the last synchronization

Mode Privileged Exec

Example 1 To display the AMF backup information, use the command:

```
node_1# show atmf backup
```

To display log messages to do with backups, use the command:

```
node_1# show atmf backup logs
```

Table 49-4: Output from **show atmf backup**

```
Node_1# show atmf backup
ScheduledBackup ......Enabled
  Schedule............1 per day starting at 03:00
  Next Backup Time....04 May 2019 03:00
Backup Bandwidth .....Unlimited
Backup Media..........SD (Total 1974.0 MB, Free197.6MB)
Current Action........Starting manual backup
Started...............04 May 2019 10:08
CurrentNode...........atmf_testbox1
Backup Redundancy ....Enabled
  Local media ........SD (Total 3788.0MB, Free 3679.5MB)
  State ..............Active

Node Name               Date         Time      In ATMF  On Media   Status
-------------------------------------------------------------------------------
atmf_testbox1           04 May 2019  09:58:59  Yes      Yes        In Progress
atmf_testbox2           04 May 2019  10:01:23  Yes      Yes        Good
```

Table 49-5: Output from **show atmf backup logs**

```
Node_1#show atmf backup logs

Backup Redundancy ..... Enabled
Local media ......... SD (Total 3788.0MB, Free 1792.8MB)
State ............... Inactive (Remote file server is not available)

Log File Location: card:/atmf/ATMF/logs/rsync_<node name>.log

Node
Name Log Details
-------------------------------------------------------------------------------
atmf_testbox
2019/05/04 18:16:51 [9045] receiving file list

2019/05/04 18:16:52 [9047] >f+++++++ flash/a.rel
```

Example 2 To display the AMF backup synchronization status, use the command:

```
node_1# show atmf backup synchronize
```

To display log messages to do with synchronization of backups, use the command:

```
node_1# show atmf backup synchronize logs
```

Table 49-6: Output from **show atmf backup synchronize**

```
Node_1#show atmf backup synchronize

ATMF backup synchronization:

 * = Active file server

  Id  Date          Time       Status
-------------------------------------------------------------------
  1   04 May 2016   22:25:57   Synchronized
* 2   -             -          Active
```

Table 49-7: Output from **show atmf backup synchronize logs**

```
Node_1#show atmf backup synchronize logs

Id    Log Details
-------------------------------------------------------------------------------
1     2019/05/04 22:25:54 [8039] receiving file list
      2019/05/04 22:25:54 [8039] >f..t.... backup_Box1.info
      2019/05/04 22:25:54 [8039] sent 46 bytes received 39 bytes total size 40
```

Example 3 To display the AMF backup information with the optional parameter **server-status**, use the command:

```
Node_1# show atmf backup server-status
```

```
Node1#sh atmf backup server-status

Id   Last Check    State
-------------------------------------
1    186 s         File server ready
2    1 s           SSH no route to host
```

Table 50: Parameter definitions from the **show atmf backup** command

Parameter	Definition
Scheduled Backup	Indicates whether AMF backup scheduling is enabled or disabled.
Schedule	Displays the configured backup schedule.
Next Backup Time	Displays the date and time of the next scheduled.
Backup Media	The current backup medium in use. This will be SD or NONE. SD card only (and not USB) is supported for AMF backup. Utilized and available memory (MB) will be indicated if backup media memory is present.
Current Action	The task that the AMF backup mechanism is currently performing. This will be a combination of either (Idle, Starting, Doing, Stopping), or (manual, scheduled).
Started	The date and time that the currently executing task was initiated in the format DD MMM YYYY HH:MM
Current Node	The name of the node that is currently being backed up.
Backup Redundancy	Whether backup redundancy is enabled or disabled.
Local media	The local media to be used for backup redundancy; SD, USB, INTERNAL, or NONE, and total and free memory available on the media.
State	Whether SD or USB media is installed and available for backup redundancy. May be Active (if backup redundancy is functional—requires both the local redundant backup media and a remote server to be configured and available) or Inactive.
Node Name	The name of the node that is storing backup data - on its backup media.
Date	The data of the last backup in the format DD MMM YYYY.
Time	The time of the last backup in the format HH:MM:SS.
In ATMF	Whether the node shown is active in the AMF network, (Yes or No).
On Media	Whether the node shown has a backup on the backup media (Yes or No).

Table 50: Parameter definitions from the **show atmf backup** command (cont.)

Parameter	Definition
`Status`	The output can contain one of four values: • "-" meaning that the status file cannot be found or cannot be read. • "Errors" meaning that there are issues - note that the backup may still be deemed successful depending on the errors. • "Stopped" meaning that the backup attempt was manually aborted. • "Good" meaning that the backup was completed successfully. • "In Progress" meaning that the backup is currently running on that node.
`Log File Location`	All backup attempts will generate a result log file in the identified directory based on the node name. In the above example this would be: card:/amf/office/logs/rsync_amf_testbox1.log.
`Log Details`	The contents of the backup log file.
`server-status`	Displays connectivity diagnostics information for each configured remove file server.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Related commands

show atmf

atmf network-name

show atmf backup area

Overview Use this command to display backup status information for the master nodes in one or more areas.

Note that this command is only available on AMF controllers.

Syntax `show atmf backup area [<area-name> [<node-name>]] [logs]`

Parameter	Description
`logs`	Displays the logs for the last backup of each node.
<area-name>	Displays information about nodes in the specified area.
<node-name>	Displays information about the specified node.

Mode Privileged Exec

Example To show information about backups for an area, use the command:

```
controller-1# show atmf backup area
```

Table 51: Output from the **show atmf backup area** command

```
controller-1#show atmf backup area

```

Table 49-1: Parameters in the output from **show atmf backup guest**

Parameter	Description
Guest Backup	The status of the guest node backup process
Scheduled Backup	The timing configured for guest backups.
Schedule	Displays the configured backup schedule.
Next Backup Time	The time the next backup process will be initiated.
Backup Bandwidth	The bandwidth limit applied to the backup data flow measured in kilo Bytes /second. Note that unlimited means there is no limit set specifically for the backup data flow.
Backup Media	Detail of the memory media used to store the backup files and the current memory capacity available.

show atmf container

Overview Use this command to display information about the AMF containers created on a a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the AMF Feature Overview and_Configuration Guide for more information on running multiple tenants on a single VAA host.

Syntax `show atmf container [detail] [<container-name>]`

Parameter	Description
`detail`	Show detailed information.
`<container-name>`	The name of the AMF container you wish to display information for.

Mode Privileged Exec

Output Figure 49-20: Example output from **show atmf container**

```
awplus#show atmf container

ATMF Container Information:

  Container       Area        Bridge   State      Memory    CPU%
-------------------------------------------------------------------
  vac-wlg-1       wlg         br1      running    70.3 MB   1.2
  vac-akl-1       akl         br2      stopped    0 bytes   0.0
  vac-nsn-1       nsn         br3      running    53.2 MB   0.7

Current ATMF Container count: 3
```

Figure 49-21: Example output from **show atmf container vac-wlg-1**

```
awplus#show atmf container vac-wlg-1

ATMF Container Information:

  Container       Area        Bridge   State      Memory    CPU%
-------------------------------------------------------------------
  vac-wlg-1       wlg         br1      running    70.3 MB   1.2

Current ATMF Container count: 1
```

Table 49-2: Parameters in the output from **show atmf container**

Parameter	Description
Container	Name of the AMF container.
Area	Name of the area the container is in.
Bridge	Name of the bridge connecting the container to the physical network.
State	Container state, running or stopped. This is set with the state command.
Memory	The amount of memory the container is using on the VAA host.
CPU%	The percentage of CPU time the container is using on the VAA, at the time the show command is run.

Figure 49-22: Example output from **show atmf container detail vac-wlg-1**

```
awplus#show atmf container detail vac-wlg-1

ATMF Container Information:

Name: vac-wlg-1
State: RUNNING
PID: 980
IP: 172.31.0.1
IP: 192.168.0.2
IP: fd00:4154:4d46:3c::1
CPU use: 3.95 seconds
Memory use: 67.07 MiB
Memory use: 0 bytes
Link: vethP31UFA
TX bytes: 166.01 KiB
RX bytes: 141.44 KiB
Total bytes: 307.45 KiB
Link: vethYCT7BB
TX bytes: 674.27 KiB
RX bytes: 698.27 KiB
Total bytes: 1.34 MiB
```

Table 49-3: Parameters in the output from **show atmf container detail**

Parameter	Description
Name	Name of the AMF container.
State	Container state, RUNNING or STOPPED. This is set with the state command.

Table 49-3: Parameters in the output from **show atmf container detail** (cont.)

Parameter	Description
PID	Internal container id.
IP	This lists the IP addresses used by the container. These include the eth1 IP address and the AMF management IP address.
CPU use	The CPU usage of the container since it was enabled.
Memory use	Container memory usage.
Link	Each container has two links: 1 An AMF area-link, this connects the container to the AMF controller and uses virtual interface eth0 on the AMF container. 2 A bridged L2 network link, this connects the container to the outside world and uses the virtual interface eth1 on the AMF container. See the AMF Feature Overview and Configuration_Guide for more information on these links.
TX/RX bytes	Bytes sent and received on a link.
Total bytes	Total bytes transferred on a link.

Version 5.4.7-0.1: command added

show atmf detail

Overview This command displays details about an AMF node. It can only be run on AMF master and controller nodes.

Syntax

```
show atmf detail
```

Parameter	Description
`detail`	Displays output in greater depth.

Mode Privileged Exec

Example 1 To display the AMF node1 information in detail, use the command:

```
controller-1# show atmf detail
```

A typical output screen from this command is shown below:

```
atmf-1#show atmf detail
ATMF Detail Information:

Network Name                        : Test_network
Network Mtu                         : 1300
Node Name                           : controller-1
Node Address                        : controller-1.atmf
Node ID                             : 342
Node Depth                          : 0
Domain State                        : BackupDomainController
Recovery State                      : None
Recovery Over ETH Ports             : Disabled
Log Verbose Setting                 : Verbose
Topology GUI                        : Disabled

Management VLAN
 VLAN ID                            : 4000
 Management Subnet                  : 172.31.0.0
 Management IP Address              : 172.31.1.86
 Management Mask                    : 255.255.128.0
 Management IPv6 Address            : fd00:4154:4d46:1::156
 Management IPv6 Prefix Length      : 64

Domain VLAN
 VLAN ID                            : 4091
 Domain Subnet                      : 172.31.128.0
 Domain IP Address                  : 172.31.129.86
 Domain Mask                        : 255.255.128.0
```

Table 50: Parameter definitions from the **show atmf detail** command

Parameter	Definition
`Network MTU`	The network MTU for the ATMF network.
`Network Name`	The AMF network that a particular node belongs to.
`Node Name`	The name assigned to a particular node.
`Node Address`	An address used to access a remotely located node. This is simply the Node Name plus the dotted suffix atmf (.atmf).
`Node ID`	A unique identifier assigned to a node on an AMF network.
`Node Depth`	The number of nodes in the path from this node to the level of the AMF root node. It can be thought of as the vertical depth of the AMF network from a particular node to the zero level of the AMF root node.
`Domain State`	The state of a node in a Domain in an AMF network as Controller/Backup.
`Recovery State`	The AMF node recovery status. Indicates whether a node recovery is in progress on this device - Auto, Manual, or None.
`Recovery Over ETH Ports`	Allow AMF recovery over the Eth port on an AR-series device.
`Log Verbose Setting`	The state of the atmf log-verbose command.
`Topology GUI`	This feature allows your AMF network to interact with Vista Manager EX and must be enabled on your AMF master.
`Management VLAN`	The VLAN created for traffic between nodes of different domain (up/down links). • VLAN ID - in this example VLAN 4092 is configured as the Management VLAN. • Management Subnet - the network prefix for the subnet. • Management IP Address - the IP address allocated for this traffic. • Management Mask - the subnet mask used to create a subnet for this traffic (255.255.128.0).
`Domain VLAN`	The VLAN assigned for traffic between nodes of the same domain (crosslink). • VLAN ID - in this example VLAN 4091 is configured as the domain VLAN. • Domain Subnet - the subnet address used for this traffic. • Domain IP Address - the IP address allocated for this traffic. • Domain Mask - the subnet mask used to create a subnet for this traffic (255.255.128.0).
`Node Depth`	The number of nodes in the path from this node to the core domain.

show atmf group

Overview This command can be used to display the group membership within to a particular AMF node. It can also be used with the working-set command to display group membership within a working set.

Each node in the AMF is automatically added to the group that is appropriate to its hardware architecture, e.g. x510, x230. Nodes that are configured as masters are automatically assigned to the master group.

You can create arbitrary groups of AMF members based on your own selection criteria. You can then assign commands collectively to any of these groups.

Syntax
```
show atmf group [user-defined|automatic]
```

Parameter	Description
`user-defined`	User-defined-group information display.
`automatic`	Automatic group information display.

Default All groups are displayed

Mode Privileged Exec

Example 1 To display group membership of node2, use the following command:

```
node2# show atmf group
```

A typical output screen from this command is shown below:

```
ATMF group information

master, x510

node2#
```

This screen shows that node2 contains the groups **master** and **x510**. Note that although the node also contains the implicit groups, these do not appear in the show output.

Example 2 The following commands (entered on *node2*) will display all the automatic groups within the working set containing *node1* and all nodes that have been pre-defined to contain the *sysadmin* group:

First define the working-set:

```
node1# #atmf working-set node1 group sysadmin
```

A typical output screen from this command is shown below:

```
ATMF group information

master, poe, x8100

============================================
node1, node2, node3, node4, node5, node6:
============================================

ATMF group information

sysadmin, x8100

AMF_NETWORK[6]#
```

This confirms that the six nodes (*node1* to *node6*) are now members of the working-set and that these nodes reside within the *AMF-NETWORK*.

Note that to run this command, you must have previously entered the command atmf working-set on page 2457. This can be seen from the network level prompt, which in this case is *AMF_NETWORK[6]#*.

Table 51: Sample output from the **show atmf group** command for a working set.

```
AMF_NETWORK[6]#show atmf group
==============================
node3, node4, node5, node6:
==============================

ATMF group information

edge_switches, x510
```

Table 52: Parameter definitions from the **show atmf group** command for a working set

Parameter	Definition
`ATMF group information`	Displays a list of nodes and the groups that they belong to, for example: • master - Shows a common group name for Nodes configured as AMF masters. • Hardware Arch - Shows a group for all Nodes sharing a common Hardware architecture, e.g. x8100, x230, for example. • User-defined - Arbitrary groups created by the user for AMF nodes.

show atmf group members

Overview This command will display all group memberships within an AMF working-set. Each node in the AMF working set is automatically added to automatic groups which are defined by hardware architecture, e.g. x510, x230. Nodes that are configured as masters are automatically assigned to the master group. Users can define arbitrary groupings of AMF members based on their own criteria, which can be used to select groups of nodes.

Syntax

```
show atmf group members [user-defined|automatic]
```

Parameter	Description
`user-defined`	User defined group membership display.
`automatic`	Automatic group membership display.

Mode Privileged Exec

Example To display group membership of all nodes in a working-set, use the command:

```
ATMF_NETWORK[9]# show atmf group members
```

Table 53: Sample output from the **show atmf group members** command

```
ATMF Group membership

Automatic        Total
Groups           Members   Members
-----------------------------------------------------------------
master           1         Building_1
poe              1         HW_Team1
x510             3         SW_Team1 SW_Team2 SW_Team3
x930             1         HW_Team1
x8100            2         Building_1 Building_2

ATMF Group membership

User-defined     Total
Groups           Members   Members
-----------------------------------------------------------------
marketing          1       Bld1_Floor_1
software           3       SW_Team1 SW_Team2 SW_Team3
```

Table 54: Parameter definitions from the **show atmf group members** command

Parameter	Definition
`Automatic Groups`	Lists the Automatic Groups and their nodal composition. The sample output shows AMF nodes based on the same Hardware type or belonging to the same Master group.
`User-defined Groups`	Shows the grouping of AMF nodes in user defined groups.
`Total Members`	Shows the total number of members in each group.
`Members`	Shows the list of AMF nodes in each group.

atmf group (membership)

show atmf guests

Overview This command is available on any AMF master or controller in the network. It displays a summary of the AMF guest nodes that exist in the AMF network, including device type, parent node, and IP address.

Syntax
```
show atmf guests
```

Mode User Exec/Privileged Exec

Usage notes Use this command to display all guest nodes in a network. If you want to see only the guests attached to a single node, use the show atmf links guest command, which shows information about the guest nodes and also about their link to their parent node.

Example To display the AMF guest output, use the command:

```
awplus# show atmf guests
```

Output Figure 49-23: Example output from the **show atmf guests** command

```
master#show atmf guests

  Guest Information:

  Device          Device          Parent      Guest     IP/IPv6
  Name            Type            Node        Port      Address
-------------------------------------------------------------------
  node1-2.0.1     x600-24Ts       node1       2.0.1     192.168.2.10
  wireless-zone1  AT-TQ4600       node2       1.0.1     192.168.1.10
  wireless-zone2  AT-TQ4600       node2       1.0.2     192.168.1.12

  Current ATMF guest node count 3
```

Table 55: Parameters shown in the output of the **show atmf guests** command

Parameter	Description
Device Name	The name that is discovered from the device, or failing that, a name that is auto-assigned by AMF. The auto-assigned name consists of: <parent node name>-<attached port number> You can change this by configuring a description on the port.
Device Type	The product name of the guest node, which is discovered from the device. If no device type can be discovered, this shows the name of the AMF guest-class that has been assigned to the guest node by the atmf guest-class command.

Table 55: Parameters shown in the output of the **show atmf guests** command

Parameter	Description
`Parent Node`	The name of the AMF node that directly connects to the guest node.
`Guest Port`	The port on the parent node that directly connects to the guest node.
`IP/IPv6 Address`	The address discovered from the node, or statically configured on the parent node's attached port.

show atmf links guest

show atmf guests detail

Overview This command is available on any AMF master in the network. It displays details about the AMF guest nodes that exist in the AMF network, such as device type, IP address, MAC address etc.

Syntax `show atmf guests detail [<node-name>] [<guest-port>]`

Parameter	Description
<node-name>	The name of the guest node's parent.
<guest-port>	The port name on the parent node.

Mode User Exec/Privileged Exec

Usage notes If you want to see only the guests attached to a single node, you can use either:

- this command and specify the node name, or
- show atmf links guest detail, which shows information about the guest nodes and also about their link to their parent node.

Note that the parameters that are displayed depend on the guest node's model.

Example To display the AMF guest output, use the command:

```
awplus# show atmf guests detail
```

Output Figure 49-24: Example output from **show atmf guests detail**

```
master#show atmf guests detail

ATMF Guest Node Information:

Node Name                       : master
Port Name                       : port1.0.9

Firmware Version                : 3.1.0 B01
```

Table 56: Parameters in the output from **show atmf guests detail**.

Parameter	Description
Node Name	The name of the parent node, which is the AMF node that directly connects to the guest node.
Port Name	The port on the parent node that connects to the guest.
IfIndex	An internal index number that maps to the port number on the parent node.
Guest Description	A description that is discovered from the device, or failing that, auto-assigned by AMF. The auto-assigned name consists of: <parent node name>-<attached port number>. You can change this by configuring a description on the port.
Device Type	The product name of the guest node, which is discovered from the device. If no device type can be discovered, this shows the name of the AMF guest-class that has been assigned to the guest node by the atmf guest-class command.
Username	The user name configured on the guest node.
Backup Supported	Whether the guest node supports AMF backup functionality.
MAC Address	The MAC address of the guest node.
IP Address	The IP address of the guest node.
IPv6 Address	The IPv6 address of the guest node.
Firmware Version	The version of the firmware operating on the guest node.
HTTP port	The HTTP port as specified with the http-enable command when defining a guest class. You can set this if the guest node provides an HTTP user interface on a non-standard port (any port other than port 80).

Related commands

atmf guest-class

switchport atmf-guestlink

show atmf backup guest

show atmf links

Overview This command displays information about AMF links on a switch. The display output contains link status state information.

Syntax

```
show atmf links [brief]
```

Parameter	Description
`brief`	A brief summary of AMF links, their configuration and status.

Mode User Exec and Privileged Exec

Usage notes The **show atmf links** and **show atmf links brief** commands both produce a table of summarized link information. For a more detailed view use the show atmf links detail command.

This command does not show links that are configured on provisioned ports.

Example To display a brief summary of the AMF links, use the following command:

```
node-1# show atmf links brief
```

Figure 49-25: Example output from **show atmf links brief**

```
Example-core# show atmf links

ATMF Link Brief Information:

Local      Link       Link    ATMF         Adjacent       Adjacent    Link
Port       Type       Status  State        Node           Ifindex     State
-------------------------------------------------------------------------
1.0.10     Crosslink  Down    Init         *crosslink1     -          Blocking
1.0.14     Crosslink  Down    Init         *crosslink2     -          Blocking
1.0.1      Downlink   Down    Init         -               -          Blocking

1.0.8      Downlink   Up      Full         downlink1       5001       Forwarding

* = Provisioned.
```

Table 49-1: Parameter in the output from **show atmf links brief**

Parameter	Definition
`Local Port`	Shows the local port on the selected node.
`Link Type`	Shows link type as Uplink or Downlink (parent and child) or Cross-link (nodes in same domain).
`Link Status`	Shows the link status of the local port on the node as either Up or Down.

Table 49-1: Parameter in the output from **show atmf links brief** (cont.)

Parameter	Definition
ATMF State	Shows AMF state of the local port: • Init - Link is down. • Hold - Link transitioned to up state, but waiting for hold period to ensure link is stable. • Incompatible - Neighbor rejected the link because of inconsistency in AMF configurations. • OneWay - Link is up and has waited the hold down period and now attempting to link to another unit in another domain. • OneWaySim - Device is running in secure mode and link is up but waiting for authorization from an AMF master. • Full - Link hello packets are sent and received from its neighbor with its own node id. • Shutdown - Link has been shut down by user configuration.
Adjacent Node	Shows the Adjacent AMF Node to the one being configured.
Adjacent IF Index	Shows the IF index for the Adjacent AMF Node connected to the node being configured.
Link State	Shows the state of the AMF link. Valid states are either Forwarding or Blocking.

For information on filtering and saving command output, see the "Getting Started with AlliedWare_Plus" Feature Overview and Configuration Guide.

show atmf nodes

show atmf links detail

Overview This command displays detailed information on all the links configured in the AMF network. It can only be run on AMF master and controller nodes.

Syntax

```
show atmf links detail
```

Parameter	Description
`detail`	Detailed AMF links information.

Mode User Exec

Usage notes For summarized link information see the show atmf links command.

This command does not show links that are configured on provisioned ports.

Example To display the AMF link details use this command:

```
device1# show atmf links detail
```

The output from this command will display all the internal data held for AMF links. The following example gives details of the links that are summarized in the example in show atmf links.

```

Table 51: Parameter definitions from the **show atmf links detail** command output

Parameter	Definition
`Crosslink Ports Information`	Show details of all Crosslink ports on this Node: • Port - Name of the Port or static aggregation (sa<*>). • Ifindex - Interface index for the crosslink port. • VR ID - Virtual router id for the crosslink port. • Port Status - Status of the local port on the Node as UP or DOWN. • Port State - AMF State of the local port. – Init - Link is down. – Hold - Link transitioned to up state, but waiting for hold period to ensure link is stable. – Incompatible - Neighbor rejected the link because of inconsistency in AMF configurations. – OneWay - Link is up and has waited the hold down period and now attempting to link to – another unit in another domain – Full - Link hello packets are sent and received from its neighbor with its own node id. – Shutdown - Link has been shut down by user configuration. Port BPDU Receive Count - The number of AMF protocol PDU's received. • Adjacent Node Name - The name of the adjacent node connected to this node. • Adjacent Ifindex - Adjacent AMF Node connected to this Node. • Adjacent VR ID - Virtual router id of the adjacent node in the domain. • Adjacent MAC - MAC address of the adjacent node in the domain. • Port Last Message Response - Response from the remote neighbor to our AMF last hello packet.
`Link State Entries`	Shows all the link state database entries: • Node.Ifindex - Shows adjacent Node names and Interface index. • Transaction ID - Shows transaction id of the current crosslink transaction. • MAC Address - Shows adjacent Node MAC addresses. • Link State - Shows AMF states of adjacent nodes on the link.
`Domain Nodes Tree`	Shows all the nodes in the domain: • Node - Name of the node in the domain. • Links on Node - Number of crosslinks on a vertex/node. • Link no - Shows adjacent Node names and Interface index. • Forwarding State - Shows state of AMF link Forwarding/Blocking.
`Crosslink Transaction Entries`	Shows all the transaction entries: • Node - Name of the AMF node. • Transaction ID - transaction id of the node. • Uplink Transaction ID - transaction id of the remote node.

Table 51: Parameter definitions from the **show atmf links detail** command output (cont.)

Parameter	Definition
`Uplink Information`	Show all uplink entries. • Waiting for Sync - Flag if uplinks are currently waiting for synchronization. • Transaction ID - Shows transaction id of the local node. • Number of Links - Number of up downlinks in the domain. • Number of Local Uplinks - Number of uplinks on this node to the parent domain. • Originating Node - Node originating the uplink information. • Domain - Name of the parent uplink domain. • Node - Name of the node in the parent domain, that is connected to the current domain. • Ifindex - Interface index of the parent node's link to the current domain. • VR ID - Virtual router id of the parent node's link to the current domain. • Transaction ID - Transaction identifier for the neighbor in crosslink. • Flags - Used in domain messages to exchange the state: ATMF_DOMAIN_FLAG_DOWN = 0 ATMF_DOMAIN_FLAG_UP = 1 ATMF_DOMAIN_FLAG_BLOCK = 2 ATMF_DOMAIN_FLAG_NOT_PRESENT = 4 ATMF_DOMAIN_FLAG_NO_NODE = 8 ATMF_DOMAIN_FLAG_NOT_ACTIVE_PARENT = 16 ATMF_DOMAIN_FLAG_NOT_LINKS = 32 ATMF_DOMAIN_FLAG_NO_CONFIG = 64 • Domain Controller - Domain Controller in the uplink domain • Domain Controller MAC - MAC address of Domain Controller in uplink domain
`Downlink Domain Information`	Shows all the downlink entries: • Domain - Name of the downlink domain. • Domain Controller - Controller of the downlink domain. • Domain Controller MAC - MAC address of the domain controller. • Number of Links - Total number of links to this domain from the Node. • Number of Links Up - Total number of links that are in UP state. • Number of Links on This Node - Number of links terminating on this node. • Links are Blocked - 0 links are not blocked to the domain. 1 All links are blocked to the domain.

Table 51: Parameter definitions from the **show atmf links detail** command output (cont.)

Parameter	Definition
`Node Transaction List`	List of transactions from this downlink domain node. • Node - 0 links are not blocked to the domain. 1 All links are blocked to the domain. • Transaction ID - Transaction id for this node. • Domain List: Shows list of nodes in the current domain and their links to the downlink domain.: • Domain - Domain name of the downlink node. • Node - Name of the node in the current domain. • Ifindex - Interface index for the link from the node to the downlink domain. • Transaction ID - Transaction id of the node in the current domain. • Flags - As mentioned above.
`Up/Downlink Ports Information`	Shows all the configured up and down link ports on this node: • Port - Name of the local port. • Ifindex - Interface index of the local port. • VR ID - Virtual router id for the local port. • Port Status - Shows status of the local port on the Node as UP/DOWN. • Port State - AMF state of the local port. • Adjacent Node - nodename of the adjacent node. • Adjacent Internal ID - Unique node identifier of the remote node. • Adjacent Ifindex - Interface index for the port of adjacent AMF node. • Adjacent Board ID - Product identifier for the adjacent node. • Adjacent VR ID - Virtual router id for the port on adjacent AMF node. • Adjacent MAC - MAC address for the port on adjacent AMF node. • Adjacent Domain Controller - nodename of the Domain controller for Adjacent AMF node. • Adjacent Domain Controller MAC - MAC address of the Domain controller for Adjacent AMF node. • Port Forwarding State - Local port forwarding state Forwarding or Blocking. • Port BPDU Receive Count - count of AMF protocol PDU's received. • Port Sequence Number - hello sequence number, incremented every time the data in the hello packet changes. • Port Adjacent Sequence Number - remote ends sequence number used to check if we need to process this packet or just note it arrived. • Port Last Message Response - response from the remote neighbor to our last hello packet.

clear atmf links statistics

show atmf

show atmf links guest

Overview This command displays information about guest nodes visible to an AMF device.

Syntax `show atmf links guest [interface <interface-range>]`

Parameter	Description
`interface <interface-range>`	Select a specific range of ports to display information about guest nodes.

Default With no parameters specified this command will display its standard output for all ports with guest nodes connected.

Mode User Exec/Privileged Exec

Usage notes Use this command to display the guest nodes connected to a single parent node. If you want to see a list of all the guests in the AMF network, use show atmf guests.

Example 1 To display information about AMF guests that are connectible from node1, use the command:

```
node1# show atmf links guest
```

Output Figure 49-26: Example output from **show atmf links guest**

```
node1#sh atmf links guest

Guest Link Information:

DC = Discovery configuration
  S = static D = dynamic

Local    Guest         Model        MAC             IP / IPv6
Port     Class         Type      DC Address         Address
-----------------------------------------------------------------
1.0.1    -             other     D  0013.1a1e.4589  192.168.1.2
1.0.2    aastra-phone  other     D  0008.5d10.7635  192.168.1.3
1.0.3    cisco-phone2  other     S  -               192.168.2.1
1.0.4    panasonic...  other     D  0800.239e.f1fe  192.168.1.5
```

Table 49-1: Parameters in the output from **show atmf links guest**

Parameter	Description
`Local Port`	The port on the parent node that connects to the guest.
`Guest Class`	The name of the ATMF guest-class that has been assigned to the guest node by the atmf guest-class command.

Table 49-1: Parameters in the output from **show atmf links guest** (cont.)

Parameter	Description
`Model Type`	The model type of the guest node, as entered by the modeltype command. Can be one of the following: • alliedware • aw+ • tq • other
`DC`	The discovery method as applied by the discovery command. This can be either dynamic (D) or static (S).
`MAC Address`	The MAC address of the guest node.
`IP / IPv6 Address`	The IP address of the guest node.

show atmf links guest detail

Overview This command displays detailed information about guest nodes visible to an AMF device.

Syntax

```
show atmf links guest detail [interface <interface-range>]
```

Parameter	Description
`interface <interface-range>`	Select a specific range of ports to display information about guest nodes.

Mode User Exec and Privileged Exec

Usage notes Use this command to display the guest nodes connected to a single parent node. If you want to see a list of all the guests in the AMF network, use show atmf guests detail.

Note that the parameters that are displayed depend on the guest node's model and state.

Example To display detailed information about AMF guests, use the command:

```
node1# show atmf links guest detail
```

Output Figure 49-27: Example output from **show atmf links guest detail**

```
node1#show atmf links guest detail

Detailed Guest Link Information:

Interface                       : port1.0.13
Link State                      : Down

HTTP port                       : 80
```

Table 49-2: Parameters in the output from **show atmf links guest detail**

Parameter	Description
`Interface`	The port on the parent node that connects to the guest.
`Link State`	The state of the link to the guest node; one of: • Down: The physical link is down. • Up: The physical link has come up, but it is still during a timeout period that is enforced to allow other links to come up. • Learn: The timeout period described above has elapsed, and the link is now learning information from the AMF guest node. You can see what information it is learning from the "Node State" field below. • Full: The node connected by this link has joined the AMF network. • Fail: The port is physically up but something has prevented the guest node from joining the AMF network.
`Class Name`	The name of the ATMF guest-class that has been assigned to the guest node by the atmf guest-class command.

Table 49-2: Parameters in the output from **show atmf links guest detail** (cont.)

Parameter	Description
`Model Type`	The model type of the guest node, as entered by the modeltype command. The mode type can be one of the following: • alliedware • aw+ • onvif • tq • other
`Discovery Method`	The discovery method as applied by the discovery command. This can be either dynamic or static.
`IP Address`	The IP address of the guest node.
`Username`	The user name configured on the guest node.
`Login Fallback`	Whether the guest node supports Login Fallback. For TQ model guest nodes, when login fallback is enabled, if a guest node is replaced, then AMF logs in to the new TQ using the factory default manager/friend settings. The new TQ is then discovered and managed as an AMF guest node by an AMF master or member. This means any backed up settings for the replaced guest node can also be recovered.
`Node state`	The state of the guest node; one of: • Down: The initial state when a link to a guest node is first configured. This is also the state if the physical link goes down. • Getting IP: The AMF device is in the process of retrieving the IP address of the guest node. • Getting Mac: The AMF device is in the process of retrieving the MAC address of the guest node. • Getting Info: The AMF device is in the process of retrieving any other available information from the guest (firmware version etc). The information available depends on what device the guest node is. • Full: The AMF device has retrieved all necessary information and the guest node has joined the AMF network. Once this state is reached, the Link State also changes to "Full". • Failure: The physical link is up but the AMF member has failed to retrieve enough information to allow the guest node to join the AMF network.
`Backup Supported`	Whether the guest node supports AMF backup functionality.
`MAC Address`	The MAC address of the guest node.

Table 49-2: Parameters in the output from **show atmf links guest detail** (cont.)

Parameter	Description
`Device Type`	Model information for the guest node. This field shows the model information that AMF retrieved from the guest node. In contrast, the Model Type shows what a user entered as the type of device they intended this guest node to be.
`Description`	By default, this is a concatenation of the guest node's parent node and the port to which it is attached. You can change it by configuring a description on the port.
`Serial Number`	The serial number of the guest node.
`Firmware Name`	The name of the firmware operating on the guest node.
`Firmware Version`	The version of the firmware operating on the guest node.
`HTTP port`	The HTTP port as specified with the http-enable command when defining a guest class. You can set this if the guest node provides an HTTP user interface on a non-standard port (any port other than port 80).

Command changes

Version 5.5.0-1.1: **Login Fallback** parameter added

show atmf links statistics

Overview This command displays details of the AMF links configured on the device and also displays statistics about the AMF packet exchanges between the devices.

It is also possible to display the AMF link configuration and packet exchange statistics for a specified interface.

This command can only be run on AMF master and controller nodes

Syntax `show atmf links statistics [interface [<port-number>]]`

Parameter	Description
`interface`	Specifies that the command applies to a specific interface (port) or range of ports. Where both the interface and port number are unspecified, full statistics (not just those relating to ports will be displayed.
<port-number>	Enter the port number for which statistics are required. A port range, a static channel or LACP link can also be specified. Where no port number is specified, statistics will be displayed for all ports on the device.

Mode User Exec

Example 1 To display AMF link statistics for the whole device, use the command:

```
device1# show atmf links statistics
```

Table 50: Sample output from the **show atmf links statistics** command

```
ATMF Statistics:

Type20  0           : Discard packet - unknown neighbor
Type21  0           : Discard packet - port is shutdown
Type22  0           : Non broadcast hello msg received from unexpected neighbor
Type23  0           : Arealink hello msg received on non arealink port
Type24  0           : Discard arealink hello packet - not in correct state
Type25  0           : Discard arealink hello packet - failed basic processing
Type26  0           : Discard unicast packet - MAC address does not match node
Type27  0           : AMF Master license node limit exceeded
```

Example 2 To display the AMF links statistics on interface port1.0.4, use the command:

```
device1# show atmf links statistics interface port1.0.4
```

Figure 49-28: Sample output from the **show atmf links statistics** command for interface port1.0.4

```
device1# show atmf links statistics interface port1.0.4

ATMF Port Statistics:

                                          Transmit       Receive
-----------------------------------------------------------------
port1.0.4  Crosslink Hello                   231            232
port1.0.4  Crosslink Hello Domain            116            116
port1.0.4  Crosslink Hello Uplink            116            115
port1.0.4  Hello Link                        0              0
port1.0.4  Arealink Hello                    0              0
```

Figure 49-29: Parameter definitions from the **show atmf links statistics** command output

Parameter	Definition
Receive	Shows a count of AMF protocol packets received per message type.
Transmit	Shows the number of AMF protocol packets transmitted per message type.
Database Entries	Shows the number of AMF elements existing in the distributed database.
Database Full Ages	Shows the number of times the entries aged in the database.
ATMF Packet Discards	Shows the number of discarded packets of each type.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Related commands

clear atmf links statistics

show atmf

show atmf nodes

Overview This command displays nodes currently configured within the AMF network.

Note that the output also tells you whether or not node map exchange is active. Node map exchange improves the tracking of nodes joining and leaving an AMF network. This improves the efficiency of AMF networks. Node map exchange is only available if every node in your AMF network is running version 5.4.6-2.1 or later. We recommend running the latest version on all nodes in your network, so you receive the advantages of node map exchange and other improvements.

Syntax

```
show atmf nodes [guest|all]
```

Parameter	Description
`guest`	Display only guest nodes in the AMF network.
`all`	Display all nodes in the AMF network, including guest nodes.

Mode Privileged Exec

Usage notes You can use this command to display one of three sets of nodes:

- all nodes except guest nodes, by specifying **show atmf nodes**
- all nodes including guest nodes, by specifying **show atmf nodes all**
- only guest nodes, by specifying **show atmf nodes guest**

Examples To display AMF information for all nodes except guest nodes, use the command:

```
node1# show atmf nodes
```

Table 49-1: Sample output from **show atmf nodes**

```
node1#show atmf nodes guest

Node Information:

  * = Local device

 SC = Switch Configuration:
  C = Chassis   S = Stackable   N = Standalone

  Node                Device            ATMF         Parent              Node
  Name                Type              Master  SC   Domain              Depth
-------------------------------------------------------------------------------
* M1                  x510-28GTX          Y     S    none                  0
  N3                  x230-18GP           N     N    M1                    1
  N1                  AR4050S             N     N    M1                    1

 Node map exchange is active
 Current ATMF node count 3
```

To display AMF information for all nodes, including guest nodes, use the command:

```
node1# show atmf nodes all
```

Table 50: Sample output from **show atmf nodes all**. In this example, not all nodes support node map exchange, as shown by the message at the end

```
node1#show atmf nodes all

 Node and Guest Information:

  * = Local device

 SC = Switch Configuration:
  C = Chassis   S = Stackable   N = Standalone G = Guest

  Node/Guest           Device             ATMF         Parent              Node
  Name                 Type               Master  SC   Domain              Depth
-------------------------------------------------------------------------------
* M1                   x510-28GTX           Y     S    none                  0
  N3                   x230-18GP            N     N    M1                    1
  N1                   AR4050S              N     N    M1                    1
  N3-1.0.24            AT-TQ4600            N     G    N3                    -

Node map exchange is inactive
Firmware on some nodes does not support node map exchange, eg AR4050S
Current ATMF node count 4 (guests 1)
```

To display AMF information for guest nodes only, use the command:

```
node1# show atmf nodes guest
```

Table 49-1: Sample output from **show atmf nodes guest**

```
node1#show atmf nodes guest

Guest Information:
Device        MAC                                      IP/IPv6
Name          Address         Parent           Port    Address

show atmf backup guest

show atmf provision nodes

Overview This command displays information about each provisioned node with details about date and time of creation, boot and configuration files available in the backup, and license files present in the provisioned backup. This includes nodes that have joined the network but are yet to run their first backup.

This command can only be run on AMF master and controller nodes.

Syntax

```
show atmf provision nodes
```

Mode Privileged Exec

Usage notes This command will only work if provisioned nodes have already been set up. Otherwise, an error message is shown when the command is run.

Example To show the details of all the provisioned nodes in the backup use the command:

```
NodeName# show atmf provision nodes
```

Figure 49-30: Sample output from the **show atmf provision nodes** command

```
device1#show atmf provision nodes

ATMF Provisioned Node Information:

Backup Media .............: SD (Total 3827.0MB, Free 3481.1MB)

Node Name                : device2

show atmf recovery-file

Overview Use this command to display the recovery file information for an AMF node.

AMF recovery files are created for nodes with special links. Special links include:

- virtual links,
- area links terminating on an AMF master, and
- area virtual links terminating on an AMF master.

Syntax

```
show atmf recovery-file
```

Mode Privileged Exec

Example To display recovery file information for an AMF node, use the command:

```
node1# show atmf recovery-file
```

Output Figure 49-31: Example output from **show atmf recovery-file**

```
node1#show atmf recovery-file

ATMF Recovery File Info: Special Link Present
Location                      Date         Time

show atmf secure-mode

Overview Use this command to display an overview of the secure mode status of an AMF network.

Syntax

```
show atmf secure-mode
```

Mode Privileged Exec

Example To display an overview of AMF secure mode on an AMF master or member node, use the command:

```
awplus# show atmf secure-mode
```

Output Figure 49-32: Example output from **show atmf secure-mode** on an AMF master

```
ATMF Secure Mode:

Secure Mode Status                : Enabled
Certificate Expiry                : 180 Days

```

Table 49-2: Parameters in the output from **show atmf secure-mode**

Parameter	Description
`Secure Mode Status`	Shows the status of secure mode, `Enabled` or `Disabled`.
`Certificate Expiry`	Certificate expiry time. Set with atmf secure-mode certificate expiry
`Certificates Total`	Total number of certificates.
`Certificates Revoked`	Certificates that have been revoked by the AMF master.
`Certificates Rejected`	Certificates that have been rejected by the AMF master.
`Certificates Active`	Certificates that are currently active.
`Provisional Authorization`	Number of nodes with provisional authorization. For more information use the show atmf authorization **provisional** command.
`Pending Requests`	Number of nodes waiting for authorization on the AMF master. For more information use the show atmf authorization **pending** command.
`Trusted Master`	List of trusted masters in the AMF area.
`Key Fingerprint`	The AMF node's key fingerprint.

show atmf secure-mode audit

Overview Use this command to detect security vulnerabilities on a node.

Syntax
```
show atmf secure-mode audit
```

Mode Privileged Exec

Example To display AMF secure mode link audits for a node, use the command

```
awplus# show atmf secure-mode audit
```

Output Figure 49-34: Example output from **show atmf secure-mode audit**

```
ATMF Secure Mode Audit:

Warning   : The default username and password is enabled.
Good      : SNMP V1 or V2 is disabled.
Warning   : Telnet server is enabled.
Good      : ATMF is enabled. Secure-Mode is on.
Good      : ATMF Topology-GUI is disabled. No trustpoints configured.

ATMF Secure Mode Log Events:

------------------------------------------------------------------------
2017 Feb 2 00:59:25 user.notice node1 ATMF[848]: Sec_Audit - ATMF Secure
Mode is enabled.
2017 Feb 2 01:30:00 user.notice node1 ATMF[848]: Sec_Audit - Established
secure connection to area_1_node_1 on interface vlink1.
```

Table 49-3: Parameters in the output from **show atmf secure-mode audit link**

Parameter	Description
`ATMF Secure Mode Audit`	A list of security recommendations to secure the AMF network. Items prefaced with `Warning` need to be fixed. In the sample above the default username and password, and telnet, should be disabled.
`ATMF Secure Mode Log Events`	A list of recorded secure mode log events.

vlink1     Downlink   16/02/2017 09:28:22  Member3
```

Table 49-4: Parameters in the output from **show atmf secure-mode audit link**

Parameter	Description
`Port`	Port name on local device.
`Link Type`	Link type.
`Discovered`	Date discovered
`Node/Area Name`	Node or area name of remote device.

Related commands show atmf

show atmf secure-mode

Command changes Version 5.4.7-0.3: command added

show atmf secure-mode certificates

Overview Use this command to display the certificate status details when secure mode is enabled on an AMF network.

Syntax `show atmf secure-mode certificates [detail] [area <area-name>] [node <node-name>]`

Parameter	Description
`detail`	Display detailed certificate information.
`area`	Specify an AMF area.
<area-name>	The AMF area you want to see the certificate information for.
`node`	Specify an AMF node.
<node-name>	The AMF node you want to see information for.

Mode Privileged Exec

Example To display AMF secure mode certificates on a master or member node, use the command:

```
awplus# show atmf secure-mode certificates
```

To display detailed information about AMF secure mode certificates for a node named “area_2_node_1” in an area named “area-2”, use the command:

```
awplus# show atmf secure-mode certificates detail area area-2
node area_2_node_1
```

Output Figure 49-36: Example output from **show atmf secure-mode certificates**

```
  Area-1 Certificates:
  Node Name             Signer                Expires               Status
-------------------------------------------------------------------------------
  area_1_node_1         master_1              11 Mar 2017
                        master_2              4 Mar 2017            Active
  area_1_node_2         master_1              11 Mar 2017
                        master_2              4 Mar 2017            Revoked

  Area-2 Certificates:
  Node Name             Signer                Expires               Status
-------------------------------------------------------------------------------
  area_2_node_1         master_1              18 Mar 2017           Active
  area_2_node_2         master_1              18 Mar 2017           Rejected
```

Table 49-5: Parameters in the output from **show atmf secure-mode certificates**

Parameter	Description
`Node Name`	Name of AMF node the certificate was issued to.
`Signer`	Name of AMF master that issued the certificate.
`Expires`	Certificate expiry date.
`Status`	The status column will display `Active` before a member node is trusted, and can be accessed using AMF commands. Valid statuses are `Active`, `Revoked`, and `Rejected`.

Output Figure 49-37: Example output from **show atmf secure-mode certificates detail area area-2 node area_2_node_1**

```
 Certificates Detail:

-------------------------------------------------------------------------------
area_2_node_1 (area:area-2)
  MAC Address     : 0000.cd37.0003
  Status          : Active
  Serial Number   : A24SC8001
  Product         : x510-28GTX
  Key Fingerprint : cd:b4:c9:cd:7b:87:6a:30:98:25:d7:3c:89:8e:cb:74:e8:91:56:9d
  Flags           : 00000011
  Signer          : master_1
  Expiry Date     : 18 Mar 2017 21:17:42
```

Table 49-6: Parameters in the output from **show atmf secure-mode certificates detail**

Parameter	Description
`MAC Address`	MAC address of AMF node.
`Status`	The device status will show `Active` if a member node is trusted, and can be accessed using AMF commands. Valid statuses are `Active`, `Revoked`, and `Rejected`.
`Serial Number`	Device serial number.
`Product`	Device product type.
`Key Fingerprint`	AMF node key fingerprint.
`Flags`	Internal AMF information.
`Signer`	Name of AMF master that issued the certificate.
`Expiry Date`	Certificate expiry date.

show atmf secure-mode sa

Overview Use this command to display the security associations on the network. This is the list of links and neighbors that are trusted.

Syntax

```
show atmf secure-mode sa [detail] [link|neighbor|broadcast]
```

Parameter	Description
`detail`	Display detailed security association information.
`link`	Display security associations for type links.
`neighbor`	Display security associations for type neighbors.
`broadcast`	Display security associations for type broadcast.

Mode Privileged Exec

Example To display an overview of AMF secure mode security associations on a master or member node, use the command:

```
awplus# show atmf secure-mode sa
```

To display a detailed overview of AMF secure mode neighbor security associations on a master or member node, use the command:

```
awplus# show atmf secure-mode sa detail neighbor
```

Output Figure 49-38: Example output from **show atmf secure-mode sa**

```

Id                      : 321 (80000141)
 Type                   : Neighbor Cntl-Master
 State                  : Complete
 Remote MAC Address     : 0000.f427.93da
 Flags                  : 000003c0
```

Table 49-7: Parameters in the output from **show atmf secure-mode sa**

Parameter	Description
`Type`	Security Association (SA) types: • Link - SA for link • CrossLink - SA for crosslink • AreaLink - SA for area link • Neighbor Node - SA for node neighbor relationship • Neighbor Gateway - SA for gateway neighbor relationship • Neighbor Cntl-Master - SA for controller/master neighbor relationship • Broadcast - SA for working-set broadcast requests
`State`	Current state of the Security Association. The state must be `Complete` before a member node is trusted, and can be accessed using AMF commands. • CA Exchg Init - SA is ready to begin the SA exchange process • CA Exchg - SA is currently exchanging CAs • Cert Exchg - SA is currently exchanging certificates • Key Exchg - SA is currently exchanging ephemeral keys • Complete - SA exchange has completed
`ID`	Security Association ID. • For Neighbor types this is the remote node ID. • For Link types this is the local ifindex. • For Broadcast type this is always 4095.
`Details`	Human readable translation of ID. • For Neighbor types this is the node name • For Link types this is the interface name
`Remote MAC Address`	MAC address of the remote partner of the security association.
`Flags`	Internal AMF information.

show atmf secure-mode statistics

Overview Use this command to display AMF secure mode statistics. These statistics are from when AMF secure mode was first enabled or the statistics were cleared with the clear atmf secure-mode statistics command.

Syntax
```
show atmf secure-mode statistics
```

Mode Privileged Exec

Example To display AMF secure mode statistics on a master or member node, use the command:

```
awplus# show atmf secure-mode statistics
```

Output Figure 49-40: Example output from **show atmf secure-mode statistics** on an AMF master.

```
ATMF Secure Mode Statistics:

Certificates:
New ............. 7              Expired .......... 0
Updated ......... 7              Deleted .......... 0
Revoked ......... 1              Renewed .......... 2
Rejected ........ 1              Re-authorized .... 1
Authorized ...... 0

Local Certificates:
Valid ........... 4              Invalid  ......... 0

show atmf tech

Overview This command collects and displays all the AMF command output. The command can thus be used to display a complete picture of an AMF network.

Syntax

```
show atmf tech
```

Mode Privileged Exec

Example To display output for all AMF commands, use the command:

```
NodeName# show atmf tech
```

Table 50: Sample output from the **show atmf tech** command.

```
node1#show atmf tech
ATMF Summary Information:

ATMF Status           : Enabled

```

Table 51: Parameter definitions from the **show atmf tech** command

Parameter	Definition
ATMF Status	Shows status of AMF feature on the Node as Enabled/Disabled.
Network Name	The name of the AMF network to which this node belongs.
Node Name	The name assigned to the node within the AMF network.
Role	The role configured on the device within the AMF - either master or member.
Current ATMF Nodes	A count of the AMF nodes in the AMF network.
Node Address	The identity of a node (in the format name.atmf) that enables its access it from a remote location.
Node ID	A unique identifier assigned to an AMF node.
Node Depth	The number of nodes in the path from this node to the core domain.
Domain State	A node's state within an AMF Domain - either controller or backup.
Recovery State	The AMF node recovery status. Indicates whether a node recovery is in progress on this device - either Auto, Manual, or None.
Management VLAN	The VLAN created for traffic between nodes of different domains (up/down links). VLAN ID - In this example VLAN 4092 is configured as the Management VLAN. Management Subnet - the Network prefix for the subnet. Management IP Address - the IP address allocated for this traffic. Management Mask - the Netmask used to create a subnet for this traffic 255.255.128.0 (= prefix /17)

Table 51: Parameter definitions from the **show atmf tech** command (cont.)

Parameter	Definition
`Domain VLAN`	The VLAN assigned for traffic between Nodes of same domain (crosslink). VLAN ID - In this example VLAN 4091 is configured as the domain VLAN. Domain Subnet - the Subnet address used for this traffic. Domain IP Address - the IP address allocated for this traffic. Domain Mask - the Netmask used to create a subnet for this traffic 255.255.128.0 (= prefix /17)
`Device Type`	Shows the Product Series Name.
`ATMF Master`	Indicates the node's membership of the core domain (membership is indicated by Y)
`SC`	Shows switch configuration: • C - Chassis (such as SBx8100 series) • S - Stackable (VCS) • N - Standalone
`Parent`	A node that is connected to the present node's uplink, i.e. one layer higher in the hierarchy.
`Node Depth`	Shows the number of nodes in path from the current node to the Core domain.

NOTE: *The **show atmf tech** command can produce very large output. For this reason only the most significant terms are defined in this table.*

show atmf virtual-links

Overview This command displays a summary of all virtual links (L2TP tunnels) currently in the running configuration.

Syntax

```
show atmf virtual-links [macaddr]
show atmf virtual-links [id <1-4094>] [remote-id <1-4094>]
show atmf virtual-links detail [id <1-4094>]
```

Parameter	Description
`macaddr`	Display the virtual AMF links' MAC addresses.
`id <1-4094>`	ID of the local virtual link.
`remote-id <1-4094>`	ID of the remote virtual link
`detail`	Display information about a specific virtual link ID or range of virtual link IDs. Displays information such as: local and remote IP address, link type, packets received and transmitted.

Mode Privileged Exec

Example 1 To display AMF virtual links, use the command:

```
node_1# show atmf virtual-links
```

Table 49-1: Example output from **show atmf virtual-links**

```
ATMF Virtual-Link Information:

Local     Local                Remote               Tunnel    Tunnel
Port      ID   IP              ID   IP              Protect   State
-------------------------------------------------------------------------
vlink1    1    172.16.24.2     2    1.0.0.2         -         Complete
vlink2    2    172.16.24.2*    10   172.16.24.3*    ipsec     Complete
vlink3    3    (eth0)*         1    1.2.3.4         -         AcquireLocal

* = Dynamic Address.

Virtual Links Configured: 3
```

In the above example, a centrally located switch has the IP address space 192.0.2.x/24. It has two VLANs assigned the subnets 192.0.2.33 and 192.0.2.65 using the prefix /27. Each subnet connects to a virtual link. The first link has the IP address 192.168.1.1 and has a Local ID of 1. The second has the IP address 192.168.2.1 and has the Local ID of 2.

Example 2 To display details about AMF virtual link with ID 1, use the command:

```
node_1# show atmf virtual-links detail id 1
```

Table 49-2: Example output from **show atmf virtual-links**

```
  Virtual Link Detailed Information:

  ID 1     Description          : None
  ID 1     Local IP Address     : 192.168.5.1
  ID 1     Remote ID            : 1
  ID 1     Remote IP Address    : 192.168.5.20
  ID 1     Link Type            : virtual-link
  ID 1     Packets Received     : 236465
  ID 1     Packets Transmitted  : 192626
```

Example 3 To display AMF virtual links' MAC address information, use the command:

```
node_1# show atmf virtual-links macaddr
```

Table 49-3: Example output from **show atmf virtual-links macaddr**

```
ATMF Link Remote Information:

ATMF Management Bridge Information:

Bridge: br-atmfmgmt

port no mac addr                is local?       ageing timer
  1     00:00:cd:27:c2:07       yes                0.00
  2     8e:c7:ae:81:7e:68       yes                0.00
  2     00:00:cd:28:bf:e7       no                 0.01
```

Table 49-4: Parameters in the output from **show atmf virtual-links**

Parameter	Definition
Local Port	The tunnel name e.g. vlink1, vlink2, equivalent to an L2TP tunnel.
Local ID	The local ID of the virtual link. This matches the vlink<number>
Tunnel Protect	Tunnel protection protocol.
Tunnel State	The operational state of the vlink (either Up or Down). This state is always displayed once a vlink has been created.
mac addr	AMF virtual links terminate on an internal soft bridge. The "show atmf virtual-links macaddress" command displays MAC Address information.
is local?	Indicates whether the MAC displayed is for a local or a remote device.
ageing timer	Indicates the current aging state for each MAC address.

show debugging atmf

Overview Use this command to see what debugging is turned on for AMF.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show debugging atmf
```

Mode Privileged Exec

Example To display the AMF debugging status, use the command:

```
node_1# show debugging atmf
```

Table 49-1: Sample output from the **show debugging atmf** command.

```
node_1# show debugging atmf
ATMF debugging status:
ATMF arealink debugging is on
ATMF link debugging is on
ATMF crosslink debugging is on
ATMF database debugging is on
ATMF neighbor debugging is on
ATMF packet debugging is on
ATMF error debugging is on
```

Related commands debug atmf packet

show debugging atmf packet

Overview Use this command to see what debugging is turned on for AMF Packet debug.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show debugging atmf packet
```

Mode User Exec and Privileged Exec

Example To display the AMF packet debugging status, use the command:

```
node_1# show debug atmf packet
```

Table 49-2: Sample output from the **show debugging atmf packet** command.

```
ATMF packet debugging is on
=== ATMF Packet Debugging Parameters===
Node Name: x908
Port name: port1.1.1
Limit: 500 packets
Direction: TX
Info Level: Level 2
Packet Type Bitmap:
2. Crosslink Hello BPDU pkt with downlink domain info
3. Crosslink Hello BPDU pkt with uplink info
4. Down and up link Hello BPDU pkts
6. Stack hello unicast pkts
8. DBE request
9. DBE update
10. DBE bitmap update
```

Related commands debug atmf

debug atmf packet

show running-config atmf

Overview This command displays the running system information that is specific to AMF.

Syntax
```
show running-config atmf
```

Mode User Exec and Global Configuration

Example To display the current configuration of AMF, use the following commands:

```
node_1# show running-config atmf
```

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Related commands show running-config

no debug all

state

Overview This command sets the running state of an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the AMF Feature Overview and Configuration Guide for more information on running multiple tenants on a single VAA host.

Syntax

```
state {enable|disable}
```

Parameter	Description
`disable`	Stop the AMF container. The container's state changes to `stopped`.
`enable`	Start the AMF container. The container's state changes to `running`.

Default By default, **state** is disabled.

Mode AMF Container Configuration

Usage notes The first time the **state enable** command is executed on a container it assigns the container to an area and configures it as an AMF master. This is achieved by automatically adding the following configuration to the AMF container:

```
atmf network-name <AMF network-name>
atmf master
atmf area <container area-name> <container area-id> local
atmf area <container area-name> password <container area-password>
atmf area <host area-name> <host area-id>

interface eth0
 atmf-arealink remote-area <host area-name> vlan 4094
```

For this reason the **state enable** command should be run after the container has been created with the atmf container command and an area-link configured with the area-link command.

Once the start-up configuration has been saved from within the AMF container, all further configuration changes need to be made manually.

Example

To start the AMF container “vac-wlg-1” use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# state enable
```

To stop the AMF container “vac-wlg-1” use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# state disable
```

Related commands

atmf container

show atmf container

Command changes

Version 5.4.7-0.1: command added

switchport atmf-agentlink

Overview Use this command to configure a link between this device and an x600 Series switch, in order to integrate the x600 Series switch into your AMF network. The x600 Series switch is called an "AMF agent", and the link between the x600 and this device is called an "agent link".

The x600 Series switch must be running version 5.4.2-3.16 or later.

Use the **no** variant of this command to remove the agent link. If the x600 Series switch is still connected to the switch port, it will no longer be part of the AMF network.

Syntax

```
switchport atmf-agentlink
no switchport atmf-agentlink
```

Default By default, no agent links exist and x600 Series switches are not visible to AMF networks.

Mode Interface mode for a switch port. Note that the link between the x600 and the AMF network must be a single link, not an aggregated link.

Usage notes The x600 Series switch provides the following information to the AMF node that it is connected to:

- The MAC address
- The IPv4 address
- The IPv6 address
- The name/type of the device (Allied Telesis x600)
- The name of the current firmware
- The version of the current firmware
- The configuration name

AMF guestnode also makes most of this information available from x600 Series switches, but requires configuration with DHCP and/or LLDP. AMF agent is simpler; as soon the x600 is connected to an appropriately configured port of an AMF node, it is immediately integrated into the AMF network.

To see information about the x600 Series switch, use the **show atmf links guest detail** command.

Example To configure port1.0.1 as an agent link, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport atmf-agentlink
```

Related commands show atmf links guest

switchport atmf-arealink

Overview This command enables you to configure a port or aggregator to be an AMF area link. AMF area links are designed to operate between two nodes in different areas in an AMF network.

Use the **no** variant of this command to remove any AMF area link that may exist for the selected port or aggregated link.

This command is only available on AMF controllers and master nodes.

Syntax

```
switchport atmf-arealink remote-area <area-name> vlan <2-4094>
no switchport atmf-arealink
```

Parameter	Description
<area-name>	The name of the remote area that the port is connecting to.
<2-4094>	The VLAN ID for the link. This VLAN cannot be used for any other purpose, and the same VLAN ID must be used at each end of the link.

Default No arealinks are configured.

Mode Interface Configuration for a switchport, a static aggregator, or a dynamic channel group.

Usage notes Run this command on the port or aggregator at both ends of the link.

Each area must have the area-name configured, and the same area password must exist on both ends of the link.

Running this command will automatically place the port or static aggregator into trunk mode (i.e. switchport mode trunk) and will synchronize the area information stored on the two nodes.

You can configure multiple arealinks between two area nodes, but only one arealink at any time will be in use. All other arealinks will block information, to prevent network storms.

NOTE: *See the atmf-arealink command to configure an AMF area link on an AR-series Eth interface.*

Example To make switchport port1.0.2 an arealink to the 'Auckland' area on VLAN 6, use the commands:

```
controller-1# configure terminal
controller-1(config)# interface port1.0.2
controller-1(config-if)# switchport atmf-arealink remote-area
Auckland vlan 6
```

To remove switchport port1.0.1 as an AMF area link, use the commands:

```
controller-1# configure terminal
controller-1(config)# interface port1.0.1
controller-1(config-if)# no switchport atmf-arealink
```

Related commands

atmf area

atmf area password

atmf virtual-link

show atmf links

switchport atmf-crosslink

Overview This command configures the selected port, statically aggregated link or dynamic channel group (LACP) to be an AMF crosslink. Running this command will automatically place the port or aggregator into trunk mode (i.e. **switchport mode trunk**).

The connection between two AMF masters must utilize a crosslink. Crosslinks are used to carry the AMF control information between master nodes. Multiple crosslinks can be configured between two master nodes, but only one crosslink can be active at any particular time. All other crosslinks between masters will be placed in the blocking state, in order to prevent broadcast storms.

Use the **no** variant of this command to remove any crosslink that may exist for the selected port or aggregated link.

Syntax

```
switchport atmf-crosslink
no switchport atmf-crosslink
```

Mode Interface Configuration for a switchport, a static aggregator or a dynamic channel group.

Usage notes Crosslinks can be used anywhere within an AMF network. They have the effect of separating the AMF network into separate domains.

Where this command is used, it is also good practice to use the **switchport trunk native vlan** command with the parameter **none** selected. This is to prevent a network storm on a topology of ring connected devices.

Example 1 To make switchport port1.0.1 an AMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# switchport atmf-crosslink
```

Example 2 This example is shown twice. Example 2A is the most basic command sequence. Example 2B is a good practice equivalent that avoids problems such as broadcast storms that can otherwise occur.

Example 2A To make static aggregator sa1 an AMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
```

Example 2B To make static aggregator sa1 an AMF crosslink, use the following commands for good practice:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
Node_1(config-if)# switchport trunk allowed vlan add 2
Node_1(config-if)# switchport trunk native vlan none
```

In this example VLAN 2 is assigned to the static aggregator, and the native VLAN (VLAN 1) is explicitly excluded from the aggregated ports and the crosslink assigned to it.

NOTE: *The AMF management and domain VLANs are automatically added to the aggregator and the crosslink.*

Related commands show atmf links statistics

switchport atmf-guestlink

Overview Guest links are used to provide basic AMF functionality to non AMF capable devices. Guest links can be configured for either a selected switch port or a range of switch ports and use generic protocols to collect status and configuration information that the guest devices make available.

Use the **no** variant of this command to remove the guest node functionality from the selected port or ports.

NOTE: *AMF guest nodes are not supported on ports using the OpenFlow protocol.*

Syntax

```
switchport atmf-guestlink [class <guest-class>] [ip <A.B.C.D>|
ipv6 <X:X::X:X>]
no switchport atmf-guestlink
```

Parameter	Description
`class`	Set a guest class
<guest-class>	The name of the guest class.
`ip`	Specifies that the address following will have an IPv4 format
<A.B.C.D>	The guest node's IP address in IPv4 format.
`ipv6`	Specifies that the address following will have an IPv6 format
<X:X::X:X>	The guest node's IP address in IPv6 format.

Default No guest links are configured.

Mode Interface

Example 1 To configure switchport port1.0.1 to be a guest link, that will connect to a guest node having a guest class of **camera** and an IPv4 address of **192.168.3.3**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink class camera ip
192.168.3.3
```

Example 2 To configure switchport port1.0.1 to be a guest link, which will connect to a guest node having a guest class of **phone** and an IPv6 address of **2001:db8:21e:10d::5**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink class phone ipv6
2000:db8:21e:10d::5
```

Example 3 To configure switchport port1.0.1 to be a guest link, using the default model type and learning method address, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink
```

Example 4 To configure switchports port1.0.1 to port1.0.3 to be guest links, for the guest class **camera**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1-port1.0.3
node1(config-if)# switchport atmf-guestlink class camera
```

Example 5 To remove the guest-link functionality from switchport port1.0.1, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# no switchport atmf-guestlink
```

switchport atmf-link

Overview This command enables you to configure a port or aggregator to be an up/down AMF link. Running this command will automatically place the port or aggregator into trunk mode. If the port was previously configured in access mode, the configured access VLAN will be removed.

Use the **no** variant of this command to remove any AMF link that may exist for the selected port or aggregated link.

Syntax

```
switchport atmf-link
no switchport atmf-link
```

Mode Interface Configuration for a switchport, a static aggregator or a dynamic channel group.

Usage notes Up/down links and virtual links interconnect domains in a vertical hierarchy, with the highest domain being the core domain. In effect, they form a tree of interconnected AMF domains. This tree must be loop-free. Therefore you must configure your up/down and virtual links so that no loops are formed.

Within each domain, cross-links between AMF nodes define those nodes as siblings within the same domain. You can form rings by combining cross-links with up/down links and/or virtual links, as long as each AMF domain links upwards to only a single parent domain. Each domain may link downwards to multiple child domains.

NOTE: *See the atmf-link command to configure an AMF up/down link on an AR-series Eth interface.*

Example To configure switchport port1.0.1 as an AMF up/down link, use the commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# switchport atmf-link
```

To remove switchport port1.0.1 as an AMF up/down link, use the commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# no switchport atmf-link
```

Related commands

atmf-link

show atmf detail

show atmf links

type atmf node

Overview This command configures a trigger to be activated at an AMF node join event or leave event.

Syntax `type atmf node {join|leave}`

Parameter	Description
`join`	AMF node join event.
`leave`	AMF node leave event.

Mode Trigger Configuration

CAUTION: *Only configure this trigger on one device because it is a network wide event.*

Example 1 To configure trigger 5 to activate at an AMF node leave event, use the following commands. In this example the command is entered on node-1:

```
node1(config)# trigger 5
node1(config-trigger) type atmf node leave
```

Example 2 The following commands will configure trigger 5 to activate if an AMF node join event occurs on any node within the working set:

```
node1# atmf working-set group all
```

This command returns the following display:

```
====================
node1, node2, node3:
====================

Working set join
```

Note that the running the above command changes the prompt from the name of the local node, to the name of the AMF-Network followed, in square brackets, by the number of member nodes in the working set.

```
AMF-Net[3]# conf t
AMF-Net[3](config)# trigger 5
AMF-Net[3](config-trigger)# type atmf node leave
AMF-Net[3](config-trigger)# description “E-mail on AMF Exit”
AMF-Net[3](config-trigger)# active
```

Enter the name of the script to run at the trigger event.

```
AMF-Net[3](config-trigger)# script 1 email_me.scp
AMF-Net[3](config-trigger)# end
```

Display the trigger configurations

```
AMF-Net[3]# show trigger
```

This command returns the following display:

```
=======
node1:
========

TR# Type & Details     Description          Ac Te Tr Repeat     #Scr Days/Date
-------------------------------------------------------------------------------

Related commands show trigger

undebug atmf

Overview This command is an alias for the **no** variant of the debug atmf command.

username

Overview This command enables you to assign a **username** to a guest class. Guests may require a username and possibly also a password. In its non-encypted form the password must be between 1 and 32 characters and will allow spaces. In its encrypted form the password must be between 1 to 64 characters and will allow any character

Syntax

```
username <name> password [8] <userpass>
no username
```

Parameter	Description
`username`	Indicates that a user name is to follow.
<name>	User name of the guest node.
`password`	Indicates that a password (or specifier) is to follow.
8	Specifier indicating that the following password is encrypted. It's primary purpose is to differentiate between the configuration input and the CLI input. You should not specify this for CLI input.
<userpass>	The password to be entered for the guest node.

Default No usernames configured

Mode AMF Guest Configuration

Example To assign the user name 'reception' and the password of 'secret' to an AMF guest node that has the guest class of 'phone1' use the following commands:

```
node1# configure terminal
node1(config)# amf guest-class phone1
node1(config-atmf-guest)# username reception password secret
```

To remove a guest node username and password for the user guest class 'phone1', use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class phone1
node1(config-atmf-guest)# no username
```

50 Autonomous Wave Control Commands

Introduction

Overview

This chapter provides an alphabetical reference of commands used to configure *Autonomous Wave Control (AWC)*.

AWC is an advanced network technology that utilizes game theory to deliver significant improvements in wireless network connectivity and performance. AWC can automatically minimize coverage gaps and reduce Access Point (AP) interference and respond to network configuration changes and bandwidth demands from user devices.

You can configure AWC through the command line, or through the Device GUI.

The Auto Setup feature configures your wireless network automatically. AP configuration is created for discovered APs including their IP addresses and MAC addresses. The AP profile is created automatically by the model name. The network and security is created using defined default values.

For more information, see the Vista Manager mini User Guide.

Command List

- "airtime-fairness enable (wireless-ap-prof-radio)" on page 2614
- "antenna (wireless-ap-prof-radio)" on page 2616
- "ap" on page 2617
- "ap-profile (wireless)" on page 2618
- "ap-profile (wireless-ap)" on page 2619
- "authentication (wireless-sec-wep)" on page 2620
- "auto-discovery disable" on page 2621
- "band" on page 2622
- "band-steering (wireless-network)" on page 2623
- "bandwidth (wireless-ap-prof-radio)" on page 2624
- "bcast-key-refresh-interval (wireless-sec-wpa-ent)" on page 2625

- "bcast-key-refresh-interval (wireless-sec-wpa-psnl)" on page 2626
- "captive-portal" on page 2627
- "captive-portal virtual-ip" on page 2628
- "channels (wireless-ap-prof-radio)" on page 2629
- "channel (wireless-ap-radio)" on page 2630
- "ciphers (wireless-sec-wpa-ent)" on page 2631
- "ciphers (wireless-sec-wpa-psnl)" on page 2632
- "community read-only (wireless-ap-prof-snmp)" on page 2633
- "community trap (wireless-ap-prof-snmp)" on page 2634
- "country-code" on page 2635
- "day (wireless-task)" on page 2636
- "debug wireless" on page 2637
- "description (wireless-ap)" on page 2639
- "description (wireless-ap-prof)" on page 2640
- "description (wireless-mac-flt)" on page 2641
- "description (wireless-network)" on page 2642
- "description (wireless-sc-prof)" on page 2643
- "description (wireless-task)" on page 2644
- "enable (wireless-ap-prof-snmp)" on page 2645
- "emergency-mode" on page 2646
- "enable (wireless)" on page 2647
- "enable (wireless-ap)" on page 2648
- "enable (wireless-ap-prof-radio)" on page 2649
- "enable (wireless-network-cp)" on page 2650
- "enable (wireless-sec-wep)" on page 2651
- "enable (wireless-task)" on page 2652
- "enable (wireless-wds)" on page 2653
- "external-page-url" on page 2654
- "filter-entry" on page 2655
- "force-disable (wireless-ap-radio)" on page 2657
- "hide-ssid (wireless-network)" on page 2658
- "hwtype" on page 2659
- "index" on page 2661
- "initialization-button enable" on page 2662
- "ip-address (wireless-ap)" on page 2663

- "key (wireless-sc-prof)" on page 2664
- "key (wireless-sec-wep)" on page 2665
- "key (wireless-sec-wpa-psnl)" on page 2667
- "led enable" on page 2668
- "length (wireless-sec-wep)" on page 2669
- "log enable destination" on page 2670
- "log interval neighbor-ap" on page 2671
- "log rotate neighbor-ap" on page 2672
- "log rotate wireless-client" on page 2673
- "log size wireless-client" on page 2674
- "login username (wireless-ap)" on page 2675
- "login-password (wireless-ap)" on page 2676

airtime-fairness enable (wireless-ap-prof-radio)

Overview Use this command to enable **airtime-fairness** for all wireless clients regardless of speed.

Use the **no** variant of this command to disable airtime-fairness for all wireless clients.

Syntax

```
airtime-fairness enable
no airtime-fairness enable
```

Default Disabled.

Mode Wireless AP Profile Radio Configuration

Usage notes Airtime-fairness ensures that every client has equal access to air time, regardless of client capability. Client capability includes the wireless standard 802.11 mode and Radio Frequency (RF) link signal strength.

If two clients were each assigned a 10 Mbps bandwidth and sending equally sized frames then they potentially could have unequal air time if their RF link characteristics were different.

RF link characteristics are based upon the distance of the client from the Access Point (AP). A client that is closer to the AP typically operates at a higher data rate than a client farther from the AP. This is because the AP and client are deliberately designed to adapt their transmission rates in order to maintain an optimal quality of the RF link.

This behavior is normal between the AP and clients since the client devices are not expected to remain at a constant or equal distance from the AP. This could mean that one device is consuming more airtime than it is entitled to, even though that device is not consuming more than its bandwidth limit.

Note: This command is valid on TQ series devices only.

Example To enable airtime-fairness for 'radio 2' on 'ap-profile100' use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-prof 100
awplus(config-wireless-ap-prof)# ap-prof 100
awplus(config-wireless-ap-prof-radio)# radio 2
awplus(config-wireless-ap-prof-radio)# airtime-fairness enable
```

Related commands radio (wireless-ap-profile)

Command changes Version 5.4.7-2.4: command added.

antenna (wireless-ap-prof-radio)

Overview Use the antenna command to set the antenna model for a wireless Access Point (AP).

Use the **no** variant of this command to remove the designated antenna model for a wireless AP.

Syntax

```
antenna {an2458-10dp|an5158-16dp|an5158-19dp}
no antenna
```

Parameter	Description
an2458-10dp	Antenna model AN2458-10DP
an5158-16dp	Antenna model AN5158-16DP
an5158-19dp	Antenna model AN5158-19DP

Default Not set.

Mode Wireless AP Profile Radio Configuration

Example To configure an AP radio configuration to use the antenna model AN5158-19DP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap)# hwtype tq single spec 11n
awplus(config-wireless-ap)# band 5
awplus(config-wireless-ap)# radio 1
awplus(config-wireless-ap-radio)# antenna an5158-19dp
```

Related commands

hwtype

band

radio (wireless-ap-profile)

Command changes Version 5.4.7-2.4: command added

ap

Overview Use this command to configure an Access Point (AP).

If the AP doesn't already exist, then this command creates it.

Use the **no** variant of this command to remove an AP configuration.

Syntax `ap <1-65535>`

Parameter	Description
<1-65535>	AP configuration ID number.

Default Not set.

Mode Wireless Configuration

Usage notes This command adds an AP configuration and enters the AP configuration mode.

Example To configure an AP with an ID of 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 10
```

radio (wireless-ap-profile)

Command changes Version 5.4.7-2.4: command added.

ap-profile (wireless)

Overview Use this command to configure an AP (Access Point) profile. If the AP profile doesn't already exist, then this command creates it.

Use the **no** variant of this command to delete an AP profile.

Syntax

```
ap-profile <1-65535>
no ap-profile <1-65535>
```

Parameter	Description
<1-65535>	The AP profile ID number.

Default Not set.

Mode Wireless Configuration

Example To configure an AP profile with the ID profile number of 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
```

To remove the AP profile 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no ap-profile 10
```

show wireless ap-profile

Command changes Version 5.4.7-2.4: command added

ap-profile (wireless-ap)

Overview Use this command to set an Access Point (AP) Profile to an AP.

Use the **no** variant of this command to delete an AP Profile.

Syntax

```
ap-profile <1-65535>
no ap-profile
```

Parameter	Description
<1-65535>	AP Profile configuration ID number.

Default Not set.

Mode Wireless AP Configuration

Example To set AP Profile (ap-profile 100) to the AP 1configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 1
awplus(config-wireless-ap)# ap-profile 100
```

Related commands

ap

ap-profile (wireless)

show wireless ap

Command changes Version 5.4.7-2.4: command added.

authentication (wireless-sec-wep)

Overview Use this command to enable or disable authentication on a wireless Access Point (AP).

Syntax

```
authentication {both|open-system|shared-key}
```

Parameter	Description
`both`	Use both types of authentication: open-system and shared-key authentication.
`open-system`	No authentication.
`shared-key`	WEP authentication.

Default Open-system.

Mode Wireless Security WEP Configuration

Usage notes For **MWS** series devices, select either the open-system or shared-key parameter. You can't select the **both** parameter.

Example To configure WEP as the security authentication mode for clients, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 10 mode wep
awplus(config-wireless-sec-wep)# authentication shared-key
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added.

auto-discovery disable

Overview Use this command to disable the automatic search for new APs in an AWC Smart Connect (AWC-SC) network.

Use the **no** variant of this command to enable the automatic search for new APs.

Syntax

```
auto-discovery disable
no auto-discovery disable
```

Default Enabled

Mode Wireless Smart Connect Profile Configuration

Usage notes Auto-discovery is a function that allows an AP that is in the factory default state to automatically become part of an AWC-SC network. This is because when a wireless AP is activated in the factory default state, its IP and MAC address are added to the AP profile and the Smart Connect profile.

Example To turn auto-discovery off for Smart Connect profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# auto-discovery disable
```

Related commands smart-connect-profile

Command changes Version 5.5.0-0.1: command added

band

Overview Use this command to assign a frequency band to a single antenna wireless AP.

Use the **no** variant of this command to set the band to the default value of 2.

Syntax

```
band {2|5}
no band
```

Parameter	Description
2	2.4GHz band
5	5GHz band

Default The default band is 2 (2.4GHz).

Mode Wireless AP Profile Configuration

Usage notes The command can only be used with single antenna APs.

Example To configure a 5GHz band for a single antenna AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# band 5
```

Related commands

ap-profile (wireless)

show wireless ap-profile

antenna (wireless-ap-prof-radio)

Command changes Version 5.4.7-2.4: command added

band-steering (wireless-network)

Overview Use this command to enable band steering on a wireless Access Point (AP).

Use the **no** variant of this command to disable band steering.

Syntax

```
band-steering
no band-steering
```

Default Disabled.

Mode Wireless Network Configuration

Usage notes Band Steering detects dual-band capable clients and steers them to the 5 GHz frequency. This leaves the more crowded 2.4 GHz band available for legacy clients.

This helps improve end user experience by reducing channel utilization, especially in high density environments

This command is not supported on the **MWS** series products.

Example To enable band steering, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# band-steering
```

Related commands network (wireless)

show wireless network

Command changes Version 5.4.7-2.4: command added.

bandwidth (wireless-ap-prof-radio)

Overview Use this command to assign a bandwidth to an Access Point (AP).

Use the **no** variant of this command to revert to the default bandwidth.

Syntax

```
bandwidth {20|40|80}
no bandwidth
```

Parameter	Description
20	20MHz bandwidth
40	40MHz bandwidth
80	80MHz bandwidth

Default The default bandwidth value varies according to the configured hardware and radio type.

Mode Wireless AP Profile Radio Configuration

Example To assign a 40MHz bandwidth to AP-profile 100 for Radio 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# bandwidth 40
```

radio (wireless-ap-profile)

Command changes Version 5.4.7-2.4: command added.

bcast-key-refresh-interval (wireless-sec-wpa-ent)

Overview Use this command to set the refresh interval for the broadcast key used in a WPA-enterprise security configuration.

Use the **no** variant of this command to set the refresh interval for the broadcast key to the default.

Syntax

```
bcast-key-refresh-interval <0-86400>
no bcast-key-refresh-interval
```

Parameter	Description
<0-86400>	The refresh interval in seconds For the **MWS series**, the broadcast key refresh rate is *<0, 30-3600>* seconds.

Default The default refresh interval is 0 seconds.

Mode Wireless Security WPA-enterprise Configuration

Example To set 3600 seconds as the broadcast key refresh interval, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)#
bcast-key-refresh-interval 3600
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added

bcast-key-refresh-interval (wireless-sec-wpa-psnl)

Overview Use this command to set the refresh interval for a broadcast (group) key used in a WPA-personal security configuration.

Use the **no** variant of this command to set the refresh interval to the default value.

Syntax

```
bcast-key-refresh-interval <0-86400>
no bcast-key-refresh-interval
```

Parameter	Description
<0-86400>	The broadcast key refresh interval. For the **MWS series**, the broadcast key refresh rate is *<0, 30-3600>* seconds.

Default The default value is 0.

Mode Wireless Security WPA-personal Configuration

Example To set the broadcast key refresh interval to 3600 seconds on a WPA-personal security configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)#
bcast-key-refresh-interval 3600
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added.

captive-portal

Overview Use this command to add a Captive Portal (web authentication) configuration and enter the Captive Portal configuration mode.

Captive Portal lets wireless clients authenticate themselves or agree to terms and conditions before you grant them Wi-Fi access or external web access.

This setting is only valid for AT-TQ series wireless access points.

Use the **no** variant of this command to remove a Captive Portal configuration.

Syntax

```
captive-portal
no captive-portal
```

Default Captive Portal is not set.

Mode Wireless Network Configuration

Example To enter the Captive Portal configuration mode of network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
```

To reset all the Captive Portal configuration settings of network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no captive-portal
```

captive-portal virtual-ip

Overview Use this command to configure the virtual IP address on Captive Portal.

Captive Portal lets wireless clients authenticate themselves or agree to terms and conditions before you grant them Wi-Fi access or external web access.

Use the **no** variant of this command to remove the virtual IP address on Captive Portal.

Syntax

```
captive-portal virtual-ip <ip-address>
no captive-portal virtual-ip
```

Parameter	Description
<ip-address>	The IPv4 address uses the format A.B.C.D

Default Not set.

Mode Wireless AP Profile Configuration

Usage notes Captive Portal uses the AP's management IP address to show an authentication page. To avoid a potential security risk, this command allows you to hide the AP management IP address by providing a virtual IP address for Captive Portal authentication.

Example To configure a virtual IP address for Captive Portal, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 5
awplus(config-wireless-ap-prof)# captive-portal virtual-ip
1.1.1.1
```

channels (wireless-ap-prof-radio)

Overview Use this command to set the channel that a wireless Access Point (AP) uses when it is set to auto.

Use the **no** variant of this command to return the AP channel to its default.

Syntax

```
channels <1-255>
no channels
```

Parameter	Description
<1-255>	The channel number.

Default The default channel varies with each type of AP, its country-code, and outdoor settings.

Mode Wireless AP Profile Radio Configuration

Example To set the wireless AP radio channel, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# channels 10
```

Related commands

radio (wireless-ap-profile)

Command changes Version 5.4.7-2.4: command added.

channel (wireless-ap-radio)

Overview Use this command to configure a channel on an Access Point (AP). You can configure an AP to automatically select a channel or use a fixed channel.

Use the **no** variant of this command to remove any configured channels and return to the default value.

Syntax

```
channel {auto|<1-255>}
no channel
```

Parameter	Description
`auto`	The channel is automatically selected.
<1-255>	A list of fixed channels. The list is determined by the country-code.

Default The default is **auto**.

Mode Wireless AP Radio Configuration

Example To configure a fixed channel for an AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)# channel 1
```

Related commands

Command changes Version 5.4.7-2.4: command added.

ciphers (wireless-sec-wpa-ent)

Overview Use this command to set the cipher suite(s) used by WPA-personal security configurations.The cipher suites available are: CCMP (AES) and TKIP.

Use the **no** variant of this command to set the default cipher suite used by WPA-personal security configurations.

Syntax

```
ciphers <cipher-list>
no ciphers
```

Parameter	Description
<cipher-list>	The available cipher suite(s) in list format. The list can contain either **ccmp** or **tkip** or both and can be in any order.

Default CCMP.

Mode Wireless Security WPA-enterprise Configuration

Usage notes For **MWS** series devices, a combination of versions and ciphers are supported as follows:

- versions wpa2 and ciphers ccmp
- versions wpa, wpa2, and ciphers tkip and ccmp

Example To set both CCMP (AES) and TKIP as cipher suites on a security WPA-enterprise configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# ciphers ccma tkip
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added

ciphers (wireless-sec-wpa-psnl)

Overview Use this command to set the cipher suite(s) used by WPA-personal security configurations.The cipher suites available are: CCMP (AES) and TKIP.

Use the **no** variant of this command to set the default cipher suite used by WPA-personal security configurations.

Syntax

```
ciphers <cipher-list>
no ciphers
```

Parameter	Description
<cipher-list>	The available cipher suite(s) in list format. The list can contain either **ccmp** or **tkip** or both and can be in any order.

Default ccmp.

Mode Wireless Security WPA-personal Configuration

Usage notes For MWS series devices, a combination of versions and ciphers are supported as follows:

- versions wpa2 and ciphers ccmp
- versions wpa, wpa2, and ciphers tkip and ccmp

Example To configure WPA-personal to use both CCMP (AES) and TKIP as cipher suites in a security configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# ciphers ccmp tkip
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added.

community read-only (wireless-ap-prof-snmp)

Overview Use this command to set an SNMP read-only community name for the target AP profile. This command is valid for SNMP v1 and v2c only.

Use the **no** variant of this command to set the SNMP read-only community name back to the default (public).

Syntax

```
community read-only <community-name>
no community read-only
```

Parameter	Description
<community-name>	This is the community name to set. It can use the following symbols in addition to single-byte alphanumeric characters (", ', \, &, <, >).

Default public

Mode Wireless AP Profile SNMP Configuration

Example To set the SNMP read-only community name to 'private', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# community read-only
private
```

To set the SNMP trap community name back to the default (public), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no community read-only
```

Related commands

community trap (wireless-ap-prof-snmp)

Overview Use this command to set an SNMP trap community name for the target AP profile. This command is valid for SNMP v1 and v2c only.

Use the **no** variant of this command to set the SNMP trap community name to the default (public).

Syntax

```
community trap <community-name>
no community trap
```

Parameter	Description
<community-name>	This is the community name to set. It can use the following symbols in addition to single-byte alphanumeric characters (“, ‘, \, &, <, >).

Default public

Mode Wireless AP Profile SNMP Configuration

Example To set the SNMP trap community name to ‘private’, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# community trap private
```

To set the SNMP trap community name back to the default (public), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no community trap
```

Related commands

country-code

Overview Use this command to set the country code for an AP-profile.

Use the **no** variant of this command to revert back to the default country code for the device's region.

Syntax

```
country code <code>
no country code
```

Parameter	Description
<code>	A two letter code representing the country. Use the command show wireless country-code to see the full list of country codes available.

Default The default country code is '**jp**' for Japan or '**us**' for other regions.

Mode Wireless AP Profile Configuration

Usage notes To display a list of the country codes that can be applied, use the command **show wireless country-code**

Note, applying a new country code will reset the following configuration for the **ap-profile** and **ap-radio** modes:

- mode, bandwidth, and channel

Example To set the country code to 'New Zealand' for AP-profile 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
awplus(config-wireless-ap-prof)# country-code nz
```

day (wireless-task)

Overview Use this command to set a day or range of days to run a task.

You can use the **time** command along with the **day** command to more fully set the task run time configuration.

Use the **no** variant of this command to remove the day set to run a task.

Syntax

```
day {<day> <month> <year>|<daysofweek>|every-day}
no day
```

Parameter	Description
<day>	The day set for the task. Select a number from1-31.
<month>	The month to run the task. Enter the first three letters of the month, for example Jan, Feb, Mar...
<year>	The year to run the task. Select a year between <2000-2035>.
<daysofweek>	The day or days of the week to run the task. (sunday|monday|tuesday|wednesday|thursday|friday|saturday)
`every-day`	Set the task to run on every day of the week.

Default Not set.

Mode Wireless Task Configuration

Example To configure task 5 to run on the 22nd of September 2017, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# day 22 Sep 2017
```

Related commands

Command changes Version 5.4.7-2.4: command added.

debug wireless

Overview Use this command to enable wireless debugging. Debugging filters can be based on severity level and module name.

Use the **no** variant of this command to disable all wireless debugging.

Syntax

```
debug wireless level
{all|debug|dump|error|info|notice|trace|warning}
```

```
debug wireless module
{all|apca|apmgr|apreq|clnmgr|cwmcore|rogue|syncscan}
```

```
no debug wireless
```

Parameter	Description	
`level`	Filters logging events by severity level and displays the output by one of the following configured options:	
	`all`	All level events
	`debug`	Debug events
	`dump`	Dump events
	`error`	Error conditions
	`info`	Information messages
	`notice`	Normal, but significant conditions
	`trace`	Trace events
	`warning`	Warning conditions
`module`	Filters logging events by module name and displays the output by one of the following configured options:	
	`all`	All module events
	`apca`	Auto power/channel assignment events
	`apmgr`	AP manager events
	`apreq`	HTTP AP request events
	`clnmgr`	Client manager events
	`cwmcore`	CWM core events
	`rogue`	Rogue events
	`syncscan`	Sync scan events

Default Disabled

Mode User Exec

Example

To enable debugging of wireless with 'info' level on the 'apca' module, use the command:

```
awplus# debug wireless level info module apca
```

To disable debugging of wireless, use the command:

```
awplus# no debug wireless
```

Related commands

description (wireless-ap)

Overview Use this command to specify a description to identify an Access Point (AP).

Use the **no** variant of this command to remove the description of a selected AP.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	Text to describe a specific AP.

Default Not set.

Mode Wireless AP Configuration

Example To specify a description for an AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 10
awplus(config-wireless-ap)# description AP10_MEETING_SPACE
```

Related commands

Command changes Version 5.4.7-2.4: command added.

description (wireless-ap-prof)

Overview Use this command to configure an AP-profile description. You must be in the **config-wireless-ap-prof** mode to use this command.

Use the **no** variant of this command to remove an AP-profile description.

Syntax

```
description <description>
no description
```

Default Not set.

Mode Wireless AP Profile Configuration

Example To configure the description "PROF10" for an AP-profile, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
awplus(config-wireless-ap-prof)# description PROF10
```

Related commands ap-profile (wireless)

Command changes Version 5.4.7-2.4: command added

description (wireless-mac-flt)

Overview Use this command to set the description of a wireless MAC filter.

Use the **no** variant of this command to remove the description.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	Text describing the wireless MAC filter.

Default No description set by default.

Mode Wireless MAC Filter Configuration

Example To set the description of MAC filter '20' to 'mywhitelist', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# description mywhitelist
```

To remove the description from MAC filter '20', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# no description
```

Overview Use this command to set a description for the wireless network.

Use the **no** variant of this command to remove a description for a wireless network.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	Set a description for a wireless network.

Default Not set.

Mode Wireless Network Configuration

Example To set the description for a wireless network, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# description GUEST_NETWORK
```

Overview Use this command to configure a descriptive name for a Smart Connect profile.

Use the **no** variant of this command to remove a Smart Connect profile name.

Syntax

```
description <sc-profile-name>
no description
```

Parameter	Description
<sc-profile-name>	The descriptive name given to a Smart Connect profile.

Default Not set

Mode Wireless Smart Connect Profile Configuration

Example To set the descriptive name of SC-PROF10 for Smart Connect profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# description SC-PROF10
```

enable (wireless-ap-prof-snmp)

Overview Use this command to enable an SNMP configuration for the target AP profile.

Use the **no** variant of this command to disable the SNMP configuration for the target AP profile.

Syntax

```
enable
no enable
```

Default Disabled

Mode Wireless AP Profile SNMP Configuration

Example To enable SNMP, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# enable
```

To disable SNMP, use the commands:

```
awplus# configure terminal

emergency-mode

Overview Use this command to set emergency mode on a wireless network. Wireless networks in emergency mode are only active when AWC is also in emergency mode. You can use emergency mode to prevent people from being isolated from infrastructure in the event of a natural disaster such as an earthquake or typhoon.

Use the **no** variant of this command to remove the emergency mode from a wireless network.

Syntax

```
emergency-mode
no emergency-mode
```

Default Disabled.

Mode Wireless Network Configuration

Example To configure an emergency mode for network 5, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 5
awplus(config-wireless-network)# emergency-mode
```

Related commands show wireless network

Command changes Version 5.5.0-0.3: command added

enable (wireless)

Overview Use this command to enable Access Point (AP) management by Autonomous Wave Control (AWC).

Use the **no** variant of this command to disable AP management by AWC.

Syntax

```
enable
no enable
```

Default Disabled.

Mode Wireless Configuration

Usage notes You must use the **enable** command before you configure a management address.

Example To configure AP management by AWC, using an interface with the IP address 192.168.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# enable
awplus(config-wireless)# management address 192.168.0.1
```

Related commands management address

Overview Use this command to enable a wireless Access Point (AP) profile radio configuration.

Use the **no** variant of this command to disable a wireless AP profile radio configuration.

Syntax

```
enable
no enable
```

Default Disabled.

Mode Wireless AP Profile Radio Configuration

Example To enable an AP radio profile configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# enable

Command changes Version 5.4.7-2.4 command added.

external-page-url

Overview Use this command to configure the external URL authentication page for Captive Portal.

To use this command, you must first specify external-page-redirect using the **mode** command.

Use the **no** variant of this command to reset the external authentication page URL.

Syntax

```
external-page-url <URL>
no external-page-url
```

Parameter	Description
<URL>	URL of the external authentication page

Default Disabled

Mode Wireless Network Captive Portal Configuration

Example To enable and set URL string 'http://www.example.com' for a Captive Portal external web authentication server on network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# external-page-url
http://www.example.com
```

filter-entry

Overview Use this command to add a filter entry to a wireless MAC filter. You can optionally include a description for the filter.

Use the **no** variant of this command to remove an entry from the MAC filter list.

Syntax

```
filter-entry <mac-address> [description <description>]
no filter-entry <mac-address>
```

Parameter	Description
<mac-address>	MAC address of the filter entry in hexadecimal format HHHH.HHHH.HHHH. The maximum number of MAC addresses that can be entered per MAC filter is 2048.
`description`	Set an optional description for the filter entry.
<description>	Text describing the filter entry.

Default No filter entries exist

Mode Wireless MAC Filter Configuration

Example To add a filter entry to MAC filter '20', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# filter-entry
0000.cd28.0880.1234 description PC01
```

To remove a filter entry from MAC filter '20', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# no filter-entry

force-disable (wireless-ap-radio)

Overview Use this command to override and force the disabling of an Access Point (AP) radio status.

Use the **no** variant of this command to stop overrides of an AP radio status.

Syntax

```
force-disable
no force-disable
```

Default **no force-disable** (do not override the AP profile radio status).

Mode Wireless AP Radio Configuration

Example To force a disable of an AP radio status, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2

Command changes Version 5.4.7-2.4: command added

hide-ssid (wireless-network)

Overview Use this command to hide the SSID for a selected wireless network.

Use the **no** variant of this command to stop hiding the SSID for a selected wireless network.

Syntax

```
hide ssid
no hide ssid
```

Default The default is Disabled, which means the SSID **is** included in the Access Point (AP) beacon frames. For more information, see the **Usage** section below.

Mode Wireless Network Configuration

Usage notes The SSID differentiates one wireless network from another, so all APs and all devices attempting to connect to a specific wireless network must use the same SSID to enable effective roaming.

SSIDs are included in beacon frames.

A beacon frame is one of the management frames in the IEEE 802.11 standard. Every compliant AP periodically sends beacon frames to advertise the presence of an AP in an area, its capabilities, and some configuration and security information to the client devices.

Example To hide the SSID for network 20, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# hide-ssid
```

Related commands ssid (wireless-network)

Command changes Version 5.4.7-2.4: command added.

hwtype

Overview Use this command to configure the hardware type used for a wireless AP profile.

Use the **no** variant of this command to revert the AP hardware type to the default.

Syntax

```
hwtype <modelname>
hwtype tq {single|dual|triple} spec {11ac|11n}
hwtype tq dual spec {11ac|11n}
no hwtype
```

Parameter	Description
<modelname>	Set the model name. See the table below for a list of model names and associated settings.
`tq`	The hardware type used for the AT-TQ series
`mws`	The hardware type used for the AT-MWS series
`single`	Single antenna model. Only available for the AT-TQ series.
`dual`	Dual antenna model.
`spec`	Enable selection of support mode of the hardware type
`11ac`	Support for 802.11ac mode.
`11n`	Support for 802.11n mode.

Table 1: AP **modelname** parameters with applicable values

modelname	series	bands supported	standard supported

`at-tq5403`
`at-tqm5403`
`at-tq5403e`
	tq	triple	11ac

`at-tq4400`
`at-tq4400e`
`at-tq4600`
`at-tq1402`
`at-tqm1402`
	tq	dual	11ac

`at-tq2450`
`at-tq3400`
`at-tq3600`
	tq	dual	11n

`at-tq3200`	tq	single	11n
`at-mws1750ap` `at-mws2533ap`	mws	dual	11ac
`at-mws600ap`	mws	dual	11n

Default hwtype tq dual spec 11ac.

Mode Wireless AP Profile Configuration

Usage notes This command may reset the following configuration commands for:

- antenna (AP profile)
- mode
- bandwidth
- channel

Example To configure the AP hardware type as an AT-TQ5403 (TQ series, triple antenna, supported by 802.11ac), use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# hwtype tq triple 11ac
```

To use the <*modelname*> parameter to configure the AP hardware type as an AT-TQ5403 (TQ series, triple antenna, supported by 802.11ac), use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# hwtype at-tq5403
```

Version 5.4.9-1.1: <*modelname*> parameter added.

index

Overview Use this command to designate the key index number for WEP security.

Use the **no** variant of this command to use the default key index number for WEP security.

Syntax

```
index <1-4>
no index
```

Parameter	Description
<1-4>	The index number for the WEP security key.

Default The default key index number is set to **1**.

Mode Wireless Security WEP Configuration

Example To assign key index number 3 for a WEP security configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10 mode wep
awplus(config-wireless-sec-wep)# index 3
```

Related commands security (wireless))

key (wireless-sec-wep)

Command changes Version 5.4.7-2.4: command added.

initialization-button enable

Overview Use this command to enable the initialization button on a wireless AP using the selected AP profile.

Use the **no** variant of this command to disable the initialization button on a wireless AP using the selected AP profile.

Syntax

```
initialization-button enable
no initialization-button enable
```

Default Enabled.

Mode Wireless AP Profile Configuration

Usage notes This command effects only APs which have an initialization button.

Example To enable the initialization button on APs which use **ap-profile 100**, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# initialization-button enable
```

Related commands ap-profile (wireless)

show wireless ap-profile

Command changes Version 5.4.7-2.4: command added.

ip-address (wireless-ap)

Overview Use this command to specify the IP address of a wireless Access Point (AP).

Use the **no** variant of this command to remove the IP address of the selected wireless AP.

Syntax

```
ip-address <ip-address>
no ip-address
```

Parameter	Description
<ip-address>	IPv4 address of the wireless AP.

Default Not set.

Mode Wireless AP Configuration

Example To specify an IPv4 address for a wireless AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# ip address 192.168.0.100
```

Related commands ap

show wireless ap

Command changes Version 5.4.7-2.4: command added.

key (wireless-sc-prof)

Overview Use this command to set the Smart Connect profile security key.

Use the **no** variant of this command to remove the security key from the Smart Connect profile.

Syntax

```
key <key-word>
no key
```

Parameter	Description
<key-word>	The WPA shared key. This is an alphanumeric string 8-64 characters long.

Default Not set

Mode Wireless Smart Connect Profile Configuration

Usage notes This command configures the WPA shared key for the Smart Connect network. If no key is set, the security key will be automatically generated.

Example To set the security key for Smart Connect profile 10 to 'sc10-secret-keyword', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# key sc10-secret-keyword
```

Related commands smart-connect-profile

show wireless ap-profile

Command changes Version 5.5.0-0.1: command added

key (wireless-sec-wep)

Overview Use this command to set the key-string for a WEP security configuration.

Use the **no** variant of this command to remove a key-string for a WEP security configuration.

Syntax

```
key <1-4> [encrypted] <key-string>
no key <1-4>
```

Parameter	Description
<1-4>	The key's index number. To configure the index number(s), use the **index** command.
`encrypted`	This parameter is displayed in **show running-config** output to indicate that it is displaying the password in encrypted form. You should not enter **encrypted** on the CLI yourself.
<key-string>	The usable key-string characters, which depend on the key-string type. Use the **type** command to configure the key-string character type. See the table in the usage section below for more information.

Default Not set.

Mode Wireless Security WEP Configuration

Usage notes When using the **key** command, also use the **type** command to set the key-string type to either ASCII or Hex, this will also set the character and bit number limits as follows.

Type	Number of bits	Number of characters	Case sensitive
ascii	64	5	Yes
ascii	128	13	Yes
hex	64	10	No
hex	128	26	No

Example To assign the word 'friend' as the key-string at index 3 for a WEP security configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 10 mode wep
awplus(config-wireless-sec-wep)# type ascii
awplus(config-wireless-sec-wep)# key 3 friend
```

Related commands

Command changes

Version 5.4.7-2.4: command added.

key (wireless-sec-wpa-psnl)

Overview Use this command to set a string as the shared secret key on a wireless security WPA-personal configuration.

Use the **no** variant of this command to reset the shared key to the default.

Syntax

```
key [encrypted] <key-string>
no key
```

Parameter	Description
`encrypted`	This parameter is displayed in **show running-config** output to indicate that it is displaying the password in encrypted form. You should not enter **encrypted** on the CLI yourself.
<key-string>	The usable key-string characters for the configuration. You can enter 8 to 63 ASCII characters which are case-sensitive.

Default Not set.

Mode Wireless Security WPA-personal Configuration

Example To set **friend** as the shared secret key for a WPA-personal configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# key friend
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added.

led enable

Overview Use this command to turn on the LED of a wireless AP using the selected AP profile.

Use the **no** variant of this command to disable the LED of a wireless AP using the selected AP profile.

Syntax

```
led enable
no led enable
```

Default Enabled.

Mode Wireless AP Profile Configuration

Example To turn off the LED of a wireless AP using ap-profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# no led enable
```

Related commands ap-profile (wireless)

show wireless ap-profile

Command changes Version 5.4.7-2.4: command added

length (wireless-sec-wep)

Overview Use this command to set the key length for a WEP key on a wireless security WEP configuration.

Use the **no** variant of this command to reset the key length for a WEP key to the default value.

Syntax

```
length {64|128}
no length
```

Parameter	Description
64	Set 64 bit as the key length for a WEP key
128	Set 128 bit as the key length for a WEP key

Default 128 bit.

Mode Wireless Security WEP Configuration

Example To configure 64 bit length as the key length for a WEP key on a wireless security WEP configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10 mode wep
awplus(config-wireless-sec-wep)# length 64
```

Related commands security (wireless)

key (wireless-sec-wep)

Command changes Version 5.4.7-2.4: command added.

log enable destination

Overview Use this command to enable the external media function storing of wireless client and neighbor AP log files.

Use the **no** variant of this command to disable the external media function storing of wireless client and neighbor AP log files.

Syntax

```
log enable destination {usb|card}
no log enable
```

Parameter	Description
`usb`	USB storage device
`card`	SD card storage device

Default Disabled, there is no destination storage device set as a default.

Mode Wireless Configuration

Example To enable the log function and configure the log store destination to USB, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log enable destination usb
```

Related commands

log size wireless-client

log rotate wireless-client

Command changes Version 5.4.9-2.3: command added

log interval neighbor-ap

Overview Use this command to configure the interval times for storing a neighbor AP log.

Use the **no** variant of this command to revert to the default interval time of 30 minutes.

Syntax

```
log interval neighbor-ap <30-1440>
no log interval
```

Parameter	Description
<30-1440>	The interval time between storing neighbor AP logs. Enter a number in the range of 30 (min) -1440 (1 day).

Default 30 minutes

Mode Wireless Configuration

Example To configure a 60 minute interval time for storing neighbor AP logs, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log interval neighbor-ap 60
```

Related commands

log enable destination

log rotate neighbor-ap

show wireless

Command changes Version 5.4.9-2.3: command added

log rotate neighbor-ap

Overview Use this command to configure the number of rotations for storing neighbor AP log files. When the configured value is reached, the oldest log file is deleted and the latest log file is stored.

Use the **no** variant of this command to revert to the default value of 1.

Syntax

```
log rotate neighbor-ap <0-65534>
no log rotate neigbor-ap
```

Parameter	Description
<0-65534>	The number of rotations a neighbor AP log is stored for, before deleting the oldest stored file.

Default 1

Mode Wireless Configuration

Example To configure 100 generations of a neighbor's AP log files to be stored, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log rotate neighbor-ap 100
```

Related commands

log enable destination

log interval neighbor-ap

show wireless

Command changes Version 5.4.9-2.3: command added

log rotate wireless-client

Overview Use this command to configure the number of rotations for storing wireless client log files.

You can determine the size of each wireless client log by using this command and the **log size wireless-client** command together.

For example, log size wireless-client 50, log rotate wireless-client 4 -> 50 / (4+1) = 10Kbytes.

Use the **no** variant of this command to revert to the default value of 1.

Syntax

```
log rotate wireless-client <0-255>
no log rotate wireless-client
```

Parameter	Description
<0-255>	The number of rotations for a wireless-client log. Set a number in the range 0-255.

Default The default number of rotations is 1.

Mode Wireless Configuration

Example To configure 10 generations of a wireless-client log file, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log rotate wireless-client 10
```

Related commands

log enable destination

log size wireless-client

show wireless

Command changes Version 5.4.9-2.3: command added

log size wireless-client

Overview Use this command to configure the file size used for storing wireless client logs.

You can determine the size of each wireless client log by using this command and the **log rotate wireless-client** commands together.

For example, log size wireless-client 50, log rotate wireless-client 4 -> 50 / (4+1) = 10Kbytes.

Use the **no** variant of this command to revert to the default log size value.

Syntax

```
log size wireless-client <50-4194304>
no log size wireless-client
```

Parameter	Description
<50-4194304>	Wireless client log size in kilobytes

Default 50 kilobytes.

Mode Wireless Configuration

Example To configure a wireless-client log size of 1Mbyte, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log size wireless-client 1000000
```

Related commands

login username (wireless-ap)

Overview Use this command to specify a username and password for a wireless Access Point (AP).

Use the **no** variant of this command to remove a username and password for a wireless AP.

Syntax

```
login username <username> password <password>
no login username
```

Parameter	Description
<username>	The username for the selected AP.
<password>	An alphanumeric string of characters used as the password for the selected AP.

Default Not set.

Mode Wireless AP Configuration

Example To set the username **manager** and password **friend** for a wireless AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# login username manager password friend
```

Related commands ap

show wireless ap

Command changes Version 5.4.7-2.4: command added.

login-password (wireless-ap)

Overview Use this command to set the login password for an Access Point (AP).

Use the **no** variant of this command to remove the login password for an AP.

Syntax

```
login-password <password>
no login-password
```

Parameter	Description
<password>	An alphanumeric string of characters used as the password for the selected AP.

Default Not set.

Mode Wireless AP Configuration

Example To configure a password for AP 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# login-password friend
```

Related commands ap

show wireless ap

Command changes Version 5.4.7-2.4: command added.

mac-address (wireless-ap)

Overview Use this command to specify the MAC address for a wireless Access Point (AP).

Use the **no** variant of this command to remove the MAC address of the selected wireless AP.

Syntax

```
mac-address <mac-address>
no mac-address
```

Parameter	Description
<mac-address>	The MAC address of the wireless AP in hexadecimal notation with the format HHHH.HHHH.HHHH.

Default Not set.

Mode Wireless AP Configuration

Example To specify a MAC address for a wireless AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# mac-address 0000.5e00.5301
```

Related commands ap

show wireless ap

Command changes Version 5.4.7-2.4: command added.

mac-auth password

Overview Use this command to change the password for MAC-based authentication.

Use the **no** variant of this command to return the password to its default.

Syntax

```
mac-auth password <password>
no mac-auth password
```

Parameter	Description
<password>	The new password. Passwords can be up to 64 characters in length and can contain any printable characters except ?, " (double quotes), and spaces.

Default By default the password is the MAC address of the supplicant.

Mode Wireless Network Configuration

Example To set the password for MAC authentication to be 'SECRET', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# mac-auth password SECRET
```

To reset the password for MAC authentication to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no mac-auth password
```

Related commands

enable (wireless-network-cp)

network (wireless)

mac-auth radius auth group (wireless-network)

mac-auth username

Command changes Version 5.4.9-2.1: command added

mac-auth radius auth group (wireless-network)

Overview Use this command to enable MAC authentication of clients with a RADIUS group in a wireless network.

Use the **no** variant of this command to disable MAC authentication with a RADIUS group.

Syntax

```
mac-auth radius auth group {radius|<group-name>}
no mac-auth radius auth group
```

Parameter	Description
`radius`	Use a RADIUS group, which means **all** RADIUS servers.
<group-name>	The RADIUS server group.

Default Not set.

Mode Wireless Network.

Usage notes This command enables MAC authentication and designates a RADIUS server group to authenticate clients on a wireless network. RADIUS server groups are defined using the **aaa group server** command. RADIUS server groups can consist of multiple server hosts, but this command only uses two servers.

Example To enable MAC authentication with a RADIUS server group, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10
awplus(config-wireless-network)# mac-auth radius auth group radius
```

Related commands network (wireless)

Command changes Version 5.4.7-2.4: command added.

mac-auth username

Overview Use this command to set the format of the MAC address in the username and password field when a request for MAC-based authorization is sent to a RADIUS server.

Use the **no** variant of this command to reset the format to the default of hyphen and lower-case.

Syntax

```
mac-auth username {hyphen|colon|unformatted}
{lower-case|upper-case}
no mac-auth username
```

Parameter	Description
`hyphen`	The MAC address includes hyphens, e.g. xx-xx-xx-xx-xx-xx.
`colon`	The MAC address includes colons, e.g. xx:xx:xx:xx:xx:xx.
`unformatted`	The MAC address does not include hyphens or colons, e.g. xxxxxxxxxxxx.
`lower-case`	The MAC address uses lower-case characters (a-f).
`upper-case`	The MAC address uses upper-case characters (A-F).

Default Default format is hyphen lower-case.

Mode Wireless Network Configuration

Example To configure the format of the MAC address in the username and password field to be colon and upper-case, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# mac-auth username colon
upper-case
```

To reset the format of the MAC address in the username and password field to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no mac-auth username
```

Related commands

Command changes Version 5.4.9-2.1: command added

management address

Overview Use this command to configure a management address on the router for transmitting Autonomous Wave Control (AWC) packets to Access Points (APs). The management address must already exist on a device interface.

Use the **no** variant of this command to turn off AP management by AWC on the management address.

Syntax

```
managment address <ipv4-addr>
no management address
```

Parameter	Description
<ipv4-addr>	Set the IPv4 interface address used for AP management by AWC.
no	Unset the IPv4 management address used for AP management by AWC.

Default Not enabled.

Mode Wireless Configuration

Example To configure an AP management interface address, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# management address 192.168.0.1
```

To remove an AP management interface address, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no management address
```

Related commands enable (wireless)

Command changes Version 5.4.7-2.4: command added.

management-frame-protection enable (wireless-sec-wpa-ent)

Overview Use this command to enable management frame protection (MFP) in a WPA-enterprise configuration.

MFP provides security for management messages passed between wireless Access Points (APs) and client stations. MFP checks management messages for potential security issues such as rogue devices and denial-of-service attacks.

Use the **no** variant of this command to disable MFP.

Syntax

```
management-frame-protection enable
no management-frame-protection enable
```

Default Enabled.

Mode Wireless Security WPA-enterprise Configuration

Usage notes This command is supported on the following AT-TQ series devices: AT-TQ4400, AT-TQ4400e, and AT-TQ4600 with dual-band 802.11ac. Other AT-TQ series and MWS series devices do not support MFP.

Example To **disable** MFP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-enterprise
awplus(config-wireless-sec-wpa-psnl)# no
management-frame-protection enable
```

Related commands security (wireless)

management-frame-protection enable (wireless-sec-wpa-psnl)

Command changes Version 5.4.7-2.4: command added.

management-frame-protection enable (wireless-sec-wpa-psnl)

Overview Use this command to enable Management Frame Protection (MFP). MFP provides security for management messages passed between wireless Access Points (APs) and client stations. MFP checks management messages for potential security issues such as rogue devices and denial-of-service attacks.

This parameter will be ignored when the version list includes **wpa3** as WPA3 requires that MFP is enabled, see versions (wireless-sec-wpa-psnl).

Use the **no** variant of this command to disable MFP.

Syntax

```
management-frame-protection enable
no management-frame-protection enable
```

Default Enabled.

Mode Wireless Security WPA-personal Configuration

Usage notes This command is supported on the following AT-TQ series devices: AT-TQ4400, AT-TQ4400e, and AT-TQ4600 with dual-band 802.11ac. Other AT-TQ series and MWS series devices do not support MFP.

Example To disable MFP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 100 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# no
management-frame-protection enable
```

Related commands security (wireless)

management-frame-protection enable (wireless-sec-wpa-ent)

Command changes Version 5.4.7-2.4: command added.

max-clients

Overview Use this command to set the number of clients able to connect to a wireless Access Point (AP).

Use the **no** variant of this command to return the number of clients able to connect to the default value.

Syntax

```
max-clients <0-200>
no max-clients
```

Parameter	Description
<0-200>	The number of clients able to connect to the wireless AP. Configuring the **number 0** will disable all clients from connecting to the selected AP. For the **MWS** series, the range is: *<0-127>* with a default of 127.

Default 200.

Mode Wireless AP Profile Radio Configuration

Example To set the maximum number of clients that can connect to a wireless AP to 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# max-clients 100
```

Related commands radio (wireless-ap-profile)

Command changes Version 5.4.7-2.4: command added.

mode (wireless-ap-prof-radio)

Overview Use this command to set the **wireless standard** and **bandwidth** mode used by the Access Points (APs) in a secure wireless security configuration. The AP type or model determines which mode to select.

Use the **no** variant of this command to set the mode to the default values specified for an AP type.

Syntax

```
mode {a|bg|a-n|bg-n|n-only-a|n-only-g|a-n-ac|n-ac}
no mode
```

Parameter	Standard	Description
a	802.11a	Bandwidth 54Mbps - 5GHz
bg	802.11bg	Bandwidths 11 and 54Mbps- 2.4GHz.
a-n	802.11a/n	Bandwidths 54 and 300 Mbps - 2.4GHz.
bg-n	802.11b/g/n	Bandwidths 11, 54, and 300 Mbps - 2.4GHz
n-only-a	802.11n	Bandwidth 300 Mbps using the 5GHz bandwidth
n-only-g	802.11n	Bandwidth 300 Mbps using the 2.4GHz bandwidth
a-n-ac	802.11a/n/ac	Dual-band: supporting simultaneous connections on both the 2.4 GHz and 5 GHz Wi-Fi bands. 802.11ac offers backward compatibility to 802.11b/g/n and bandwidth rated up to 1300 Mbps on the 5 GHz band plus up to 450 Mbps on 2.4 GHz.
n-ac	802.11n/ac	Dual-band: Bandwidth 54, and 300Mbps using both the 2.4 and 5GHz frequencies.

Default The default values change with each antenna type and AP.

Mode Wireless AP Profile Radio Configuration

Example To configure the wireless mode **a-n-ac** for AP profile 100, radio 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# mode a-n-ac
```

Command changes Version 5.4.7-2.4: command added.

mode (wireless-network-cp)

Overview Use this command to set the Captive Portal (web authentication) mode.

Captive Portal lets wireless clients authenticate themselves or agree to terms and conditions before you grant them Wi-Fi access or external web access.

Use the **no** variant of this command to reset the Captive Portal mode to default.

Syntax

```
mode {click-through|radius|external-page-redirect}
no mode
```

Parameter	Description
`radius`	The user name and password entered from the browser screen are sent to the RADIUS server and a network connection is permitted after successful authentication.
`click-through`	This method asks users to agree to the terms of use (click-through agreement) before allowing them to connect to the wireless network.
`external-page-redirect`	Redirect the authentication page to a user configured URL such as a third party Captive Portal vendor page.

Default click-through

Mode Wireless Network Captive Portal Configuration

Usage notes Click-through is only valid for TQ4400, TQ4600, TQ4400e, TQ1402, TQ5403, TQ5403e, TQm1402, and TQm5403 wireless access points.

Click-through is not supported on TQ2450, TQ3200, TQ3400 or TQ3600 APs. Set the mode to **radius** (external RADIUS authentication) for these devices.

Example To set the Captive Portal authentication mode as RADIUS, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# mode radius
```

Version 5.5.0-1.3: **external-page-redirect** parameter added

network (wireless)

Overview Use this command to configure an Autonomous Wave Control (AWC) network.

If the network doesn't exist, then this command creates it.

Use the **no** variant of this command to remove an AWC network.

Syntax

```
network <1-65535>
```

Parameter	Description
<1-65535>	The network ID number

Default Not set.

Mode Wireless Configuration

Usage notes This commands adds a network configuration and enters the network configuration mode.

Example To configure an AWC network with an ID of 20, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
```

Related commands

Command changes Version 5.4.7-2.4: command added.

ntp designated-server

Overview Use this command to designate the NTP server that a wireless Access point (AP) refers to.

Use the **no** variant of this command to remove the configured IP address or host-name of the NTP server.

Syntax

```
ntp designated-server {ip <ip-address>|host <host-name>}
no ntp designated-server
```

Parameter	Description
<ip-address>	Specify the IP address of the NTP server, entered in the form A.B.C.D for an IPv4 address.
<host-name>	Specify the host-name for the NTP server

Default Disabled.

Mode Wireless AP Profile Configuration

Usage notes This command sets the NTP server that a wireless AP refers to. If the NTP server is disabled, then the AP will synchronize its time with the AWC router.

This is because the AP can not hold current time after a reboot because it does not have a real-time clock.

Therefore, the NTP master must be configured on the AWC router.

Example To configure an NTP server with an IP address of 192.168.0.254 for ap-profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# ntp designated-server
192.168.0.154
```

Related commands

Command changes Version 5.4.7-2.4: command added

ntp designated-server enable

Overview Use this command to configure NTP on a wireless Access Point (AP).

Use the **no** variant of this command to disable the NTP feature on an AP.

Syntax

```
ntp designated-server enable
no ntp designated-server enable
```

Default Enabled.

Mode Wireless AP Profile Configuration

Example To disable NTP for AP-profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# no ntp designated-server
enable
```

Related commands ntp designated-server

Command changes Version 5.4.7-2.4: command added.

ntp designated-server period

Overview Use this command to set the time adjustment period for an NTP server. This is the time adjustment period for a wireless AP using the selected AP profile.

Use the **no** variant of this command to reset the time adjustment period to the default of 10 minutes.

Syntax

```
ntp designated-server period <1-9999>
no ntp designated-server period
```

Parameter	Description
<1-9999>	The time adjustment period for the NTP server in minutes.

Default 10 minutes.

Mode Wireless AP Profile Configuration

Example To configure 30 minutes as the NTP server time adjustment period for ap-profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# ntp designated-server 192.168.0.254
awplus(config-wireless-ap-prof)# ntp designated-server period 30
```

Related commands

ap-profile (wireless)

show wireless ap-profile

ntp designated-server

Command changes Version 5.4.7-2.4: command added.

outdoor

Overview Use this command to designate that a wireless AP is located outdoors.

Use the **no** variant of this command to designate when a wireless AP is not located outdoors.

Syntax

```
outdoor
no outdoor
```

Default No outdoor.

Mode Wireless AP Profile Configuration

Usage notes This command indicates whether the wireless AP is located outdoors, and selects the mode and channel that corresponds to this. To configure a channel number, use the **channel** command in **wireless-ap-prof-radio** mode. If you configure an invalid channel number, an error message displays the valid channels that you may select in your region.

The command is ignored when the AP is already configured using the **hwtype** command.

Example To configure an AP to be located outdoors, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# outdoor
```

page-proxy-url

Overview Use this command in Captive Portal mode to set the location of the custom page to display for web authentication. This page will be displayed instead of the wireless access point's built-in authentication or click-through page.

Use the **no** variant of this command to remove the URL pointing to the custom web authentication page.

Syntax

```
page-proxy-url <URL>
no page-proxy-url
```

Parameter	Description
<URL>	URL of external web server (hostname or dotted IP notation).

Default No custom page is set by default.

Mode Wireless Network Captive Portal Configuration

Usage notes This setting is valid only for AT-TQ5403, AT-TQm5403, AT-TQ5403e, AT-TQ1402, and AT-TQm1402 wireless access points.

Example To enable and set the web authentication proxy page, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# page-proxy-url
http://www.mydomain.com/login_page
```

peer (wireless-wds)

Overview Use this command to add a pair of wireless Access Points (APs) to a WDS peer list.

Use the **no** variant of this command to remove a pair of wireless APs from a WDS peer list.

Syntax

```
peer ap <1-65535> radio <1-3> {ap <1-65535>|mac <mac-addr>}
radio <1-3>
no peer
```

Parameter	Description
`ap`	Signifies that the first AP identifier follows.
<1-65535>	The first AP identifier.
`radio`	Select the radio interface of the first AP.
<1-3>	Designate the radio interface for the first AP.
`ap`	Signifies that the second AP identifier follows.
<1-65535>	The second AP identifier.
`mac`	Signifies that the MAC address of the second AP follows.
<mac-addr>	The MAC address of the second AP. Enter the address in the format <HHHH.HHHH.HHHH> where *H* is a hexadecimal number.
`radio`	Select the radio interface of the second AP.
<1-3>	The radio interface for the second AP.

Default There are no APs configured in a WDS peer list by default.

Mode Wireless WDS Configuration

Example To add a pair of wireless APs to a WDS peer list, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wds 10
awplus(config-wireless-wds)# peer ap 10 radio 1 ap 20 radio 1
```

Related commands wds

Command changes Version 5.4.7-2.4: command added.

permit host (wireless-ap-prof-snmp)

Overview Use this command to set the SNMP permit host for the target AP profile. This command is valid for SNMP v1 and v2c only.

Use the **no** variant of this command to remove the SNMP permit host from the AP profile.

Syntax

```
permit host <host-name>
no permit host
```

Parameter	Description
<host-name>	Respond only to SNMP requests from the specified host name. For example FQDN, IP address, or subnet mask (manager.your.domain.com, 10.10.1.37, 192.168.1.1/24.

Default Not set

Mode Wireless AP Profile SNMP Configuration

Example To set the SNMP permit host to '192.168.1.1', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# permit host 192.168.1.1
```

To remove the SNMP permit host '192.168.1.1', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no permit host
```

Related commands

port (wireless-ap-prof-snmp)

Overview Use this command to set the SNMP listening port number for the target AP profile.

Use the **no** variant of this command to set the SNMP listening port back to the default (161).

Syntax

```
port <1-65535>
no port
```

Parameter	Description
<1-65535>	The SNMP listening port number to set.

Default 161

Mode Wireless AP Profile SNMP Configuration

Example To set the SNMP listening port to 166, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# port 166
```

To set the SNMP listening port back to the defautl (161), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no port
```

Related commands

power (wireless-ap-radio)

Overview Use this command to set the power level for client devices on a wireless Access Point (AP).

Use the **no** variant of this command to return the power level to its default value.

Syntax

```
power <1-100>
no power
```

Parameter	Description
<1-100>	The percentage power level value.

Default A power level of 100% is the default.

Mode Wireless AP Radio Configuration

Example To set a power level of 30% for radio 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)# power 30
```

Related commands show wireless ap

radio (wireless-ap)

Command changes Version 5.4.7-2.4: command added

pre-authentication enable (wireless-sec-wpa-ent)

Overview Use this command to enable WPA-enterprise pre-authentication for Access Points (APs) that have WPA2 clients.

Use the **no** variant of this command to disable WPA-enterprise pre-authentication.

Syntax

```
pre-authentication enable
no pre-authentication enable
```

Default Enabled.

Mode Wireless Security WPA-enterprise Configuration

Usage notes Enable this option if the AP has WPA2 clients and you want the AP to share the pre-authentication packets from the clients with other access points. If it is enabled, this can speed up authentication for roaming clients who connect to multiple access points. This option does not apply to WPA clients.

The MWS series of devices do not support pre-authentication, therefore, you should **disable** this command on these devices.

Example To disable pre-authentication on a WPA-enterprise configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# no pre-authentication
enable
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added

radio (wireless-ap)

Overview Use this command to enter **wireless-ap-radio** configuration mode.

Syntax

```
radio <1-3>
```

Parameter	Description
<1-3>	The radio interface.

Mode Wireless AP Configuration

Example To enter the AP Radio configuration mode, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)#
```

radio (wireless-ap-profile)

Overview Use this command to enter AP profile radio configuration mode. Once in this mode, you can create and modify the radio configuration parameters for an AP profile.

Syntax

```
radio <1-3>
```

Parameter	Description
<1-3>	The radio interface within the AP profile.

Mode Wireless AP Profile Configuration

Example To enter the AP profile radio configuration mode for interface 1, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# radio 1

radius accounting enable

Overview Use this command to configure RADIUS accounting on Captive Portal with external RADIUS.

Use the **no** variant of this command to disable RADIUS accounting on Captive Portal.

Syntax

```
radius accounting enable
no radius accounting enable
```

Default Disabled.

Mode Wireless Network Captive Portal Configuration

Usage notes The server settings used by Captive Portal RADIUS accounting are those configured by the **radius auth group** command. The port number used is the same one set on the primary server by the command **radius-server host**.

Example To configure RADIUS accounting on Captive Portal for network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# radius accounting enable
```

Related commands

radius auth group (wireless-network-cp)

Command changes Version 5.5.0-1.3: command added

radius auth group (wireless-network-cp)

Overview Use this command to set the RADIUS server/s that wireless APs use for Captive Portal (web authentication).

Use the **no** variant of this command to remove the RADIUS server/s used for authentication.

Syntax

```
radius auth group {radius|<groupname>}
no radius auth group {radius|<groupname>}
```

Parameter	Description
`radius`	Use a RADIUS server registered with the radius-server host command.
<groupname>	Use a RADIUS server that belongs to the specified server group. Use a server group created with the aaa group server radius command.

Default No RADIUS server set by default.

Mode Wireless Network Captive Portal Configuration

Usage notes This setting is only valid for TQ series APs. It has no effect on MWS series APs.

Example To use the RADIUS group 'my_rad' for Captive Portal authentication, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# mode radius
awplus(config-wireless-network-cp)# radius auth group my_rad
```

radius auth group (wireless-sec-wpa-ent)

Overview Use this command to set the RADIUS server group used to authenticate clients in a wireless WPA-enterprise.

Use the **no** variant of this command to set the RADIUS server group to the default.

Syntax

```
radius auth group {radius|<group-name>}
no radius auth group
```

Parameter	Description
`radius`	Use all RADIUS servers.
<group-name>	Server group name

Default RADIUS (all RADIUS servers).

Mode Wireless Security WPA-enterprise Configuration

Example To set **radius**, which means all RADIUS servers, to authenticate a wireless WPA-enterprise, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# radius auth group radius
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added

redirect-url

Overview Use this command to enable the redirect-url feature. After successful authentication this feature redirects the web browser to the URL specified in the command. If both session-keep and **redirect-url** are enabled, session-keep takes precedence.

Use the **no** variant of this command to disable the redirect-url feature.

Syntax

```
redirect-url <URL>
no redirect-url
```

Parameter	Description
<URL>	URL of page to redirect the user to (hostname or dotted IP notation).

Default Not set by default.

Mode Wireless Network Captive Portal Configuration

Usage notes This setting is valid only for TQ4400, TQ4600, TQ4400e, TQ1402, TQ5403, TQ5403e, TQm1402, and TQm5403 APs. It has no effect on TQ2450, TQ3200, TQ3400, TQ3600 and MWS series APs.

Example To enable and set the redirect-url for Captive Portal authentication on network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# redirect-url

rogue-ap-detection enable (wireless)

Overview Use this command to enable rogue application detection.

Use the **no** variant of this command to disable rogue application detection.

Syntax
```
rogue-ap-detection enable
no rogue-ap-detection enable
```

Default Disabled.

Mode Wireless Configuration

Example To enable rogue application detection, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# rogue-ap-detection enable
```

Related commands show wireless

Command changes Version 5.4.7-2.4 command added.

Use the **no** variant of this command to remove a Smart Connect profile configuration.

Syntax

```
sc-profile <1-65535>
no sc-profile
```

Parameter	Description
<1-65535>	The Smart Connect profile ID.

Default Not set

Mode Wireless AP Profile Configuration

Example To add Smart Connect profile 1 to AP profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
awplus(config-wireless-ap-prof)# sc-profile 1

sc-channel

Overview Use this command to set a fixed radio channel for an access point (AP) using Smart Connect.

Use the **no** variant of this command to delete this setting.

Syntax

```
sc-channel radio <1-3> channel {<channel-number>|auto}
no sc-channel
```

Parameter	Description
<1-3>	Select the radio channel fixed for AWC-SC use
<channel-number>	Select the radio channel that is defined in the AP profile
`auto`	The radio channel is automatically selected

Default Not set.

Mode Wireless Smart Connect Profile Configuration

Example To automatically configure the Smart Connect channel with AP profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# sc-channel radio 2 channel auto
```

security (wireless)

Overview Use this command to configure a wireless security instance. If the instance doesn't already exist, then this command creates it.

Use the **no** variant of this command to remove a wireless security instance.

Syntax

```
security <1-65535> mode {wep|wpa-personal|wpa-enterprise}
no security <1-65535>
```

Parameter	Description
<1-65535>	Wireless security instance identification number
`mode`	Security mode
`wep`	Security mode WEP. This assigns the configuration identifier to **config-wireless-sec-wep** mode and enters the mode.
`wpa-personal`	Security mode WPA-Personal. This assigns the configuration identifier to **config-wireless-sec-wpa-psnl** mode and enters the mode.
`wpa-enterprise`	Security mode WPA-Enterprise. This assigns the configuration identifier to **config-wireless-sec-wpa-ent** mode and enters the mode.

Default Not set.

Mode Wireless Configuration

Usage notes You create a wireless security instance by designating a security instance ID and selecting a security mode. There are three types of security modes:

- WEP
- WPA-Personal
- WPA-Enterprise

Example To configure and enter the wireless security mode for WPA-Personal, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)#

security (wireless-network)

Overview Use this command to designate a security configuration identifier for a wireless security configuration.

Use the **no** variant of this command to remove a security configuration identifier.

Syntax

```
security <1-65535>
no security
```

Parameter	Description
<1-65535>	The wireless security configuration identifier.

Default Not set.

Mode Wireless Network Configuration

Example To assign a security configuration identifier of 10 to wireless network 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 2
awplus(config-wireless-network)# security 10
```

Related commands network (wireless)

security (wireless-wds)

Overview Use this command to set a wireless security configuration identifier to the WDS configuration mode.

Use the **no** variant of this command to remove the WDS security configuration identifier.

Syntax

```
security <1-65535>
no security
```

Parameter	Description
<1-65535>	The wireless security configuration identifier.

Default Not set.

Mode Wireless WDS Configuration

Example To designate the wireless security configuration identifier to the WDS configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wds 10
awplus(config-wireless-wds)# security 2
```

service wireless

Overview Use this command to enable wireless services.

Use the **no** version of the command to disable unused wireless services.

Syntax

```
service wireless
no service wireless
```

Default Enabled

Mode Global Configuration

Usage notes On devices that support the wireless manage feature, sometimes it may be desirable to disable unused services, in order to reduce memory use. Disabling the wireless services will only take effect after you save the configuration and restart the device.

Example To disable the wireless service, use the commands:

```
awplus# configure terminal
awplus(config)# no service wireless
```

Output Figure 50-1: Example output from **no service wireless**

```
awplus(config)#no service wireless
% Save the config and restart the device for this change to take
effect
```

Command changes Version 5.5.0-0.1: command added

session-keep

Overview Use this command to enable the session-keep feature. After successful authentication this feature redirects the web browser back to the originally requested URL. If both **session-keep** and redirect-url are enabled, session-keep takes precedence.

Use the **no** variant of this command to disable the session-keep feature.

Syntax
```
session-keep
no session-keep
```

Default Not set by default.

Mode Wireless Network Captive Portal Configuration

Usage notes This setting is valid only for TQ4400, TQ4600, TQ4400e, TQ1402, TQ5403, TQ5403e, TQm1402, and TQm5403 APs. It has no effect on TQ2450, TQ3200, TQ3400, TQ3600 and MWS series APs.

Example To configure session-keep for Captive Portal authentication on network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# session-keep
```

Related commands
captive-portal
enable (wireless-network-cp)
mac-auth password
mac-auth username
page-proxy-url
radius auth group (wireless-network-cp)
redirect-url
session-keep
mode (wireless-network-cp)

Command changes Version 5.4.9-1.1: command added

session-key-refresh-interval

Overview Use this command to set the refresh interval for the session key used in a WPA-enterprise security configuration.

Use the **no** variant of this command to set the refresh interval to the default.

Syntax

```
session-key-refresh-interval <0-86400>
no session-refresh-key-interval
```

Parameter	Description
<0-86400>	The refresh interval in seconds.

Default The default refresh interval is 0 seconds.

Mode Wireless Security WPA-enterprise Configuration

Usage notes This command is for TQ series devices only.

Example To set 7200 seconds as the session key refresh rate, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wep-ent)#
session-key-refresh-interval 7200
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added

show debugging wireless

Overview Use this command to see what debugging is turned on for wireless management.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax
```
show debugging wireless
```

Mode User Exec and Privileged Exec

Example
```
awplus# show debugging wireless
```

Output Figure 50-2: Example output from the **show debugging wireless** command

```
awplus#show debugging wireless
 Wireless debugging is on
 Wireless all modules debugging is on
 Wireless warning level debugging is on
```

Related commands show wireless

show wireless

Overview Use this command to show the overall status information for Autonomous Wave Control (AWC).

Syntax

```
show wireless
```

Mode Privileged Exec

Example To show the status of AWC on a device, use the command:

```
awplus# show wireless
```

Output Figure 50-3: Example output from **show wireless**

```
awplus> show wireless
Wireless Controller Mode ........ Enable

Command changes Version 5.4.7-2.4: command added.

show wireless ap

Overview Use this command to display the configuration and status of wireless Access Points (APs).

Syntax

```
show wireless ap {<ap-id-range>|all} [brief|status|detail]
```

Parameter	Description
<ap-id-range>	Display the configuration and status for a selected AP or range of APs, <1-65535>.
`all`	Display the configuration and status of APs.
`brief`	Display the brief configuration details of APs.
`status`	Display the status of APs.
`detail`	Display the detailed status and device information of APs.

Mode Privileged Exec

Example To display the status and configuration of wireless APs, use the following commands:

```
awplus# show wireless ap
```

Output Figure 50-4: Example output from **show wireless ap**

```
awplus#show wireless ap

show wireless ap capability

Overview Use this command to display the configured specifications of a supported wireless Access Point (AP).

Syntax

```
show wireless ap capability
show wireless ap capability hwtype <modelname>
show wireless ap capability hwtype {tq|mws}
[single|dual|triple] [spec {11ac|11n}] [radio {1|2|3}] [country
<country-code>]
```

Parameter	Description
`hwtype`	To specify the display of a hardware type. When omitted, all hardware types will be displayed.
<modelname>	The model name of the wireless AP capabilities to be displayed. See hwtype for a full list of model names.
`tq`	Display hardware type AT-TQ series only.
`mws`	Display hardware type AT-MWS series only.
`single`	Display a single radio interface.
`dual`	Display a dual radio interface.
`spec`	To specify the display of an IEEE wireless networking standard mode. When omitted, all modes are displayed.
`11ac`	Display information for the 802.11ac mode only.
`11n`	Display information for the 802.11n mode only.
`radio`	To specify a radio bandwidth. When omitted, all radio bandwidths are displayed.
`1`	Display information for radio bandwidth 2.4GHz only.
`2`	Display information for radio 2 bandwidth 5GHz only.
`3`	Display information for radio 3 bandwidth 5GHz only.
`country`	To specify the display for a country. When omitted, the default country will be displayed.
<country-code>	Display the specified country code. The default country code is 'jp' for Japan or 'us' for other regions.

Mode User Exec and Privileged Exec

Output Figure 50-8: Example output from **show wireless ap capability**

```
awplus#show wireless ap capability
Country: jp

Command changes

Version 5.4.7-2.4: command added.

Version 5.4.9-1.1: <*modelname*> parameter added.

show wireless ap client

Overview Use this command to display the client information on a managed wireless Access Point (AP).

Syntax

```
show wireless ap [<ap-id-range>] client [radio <1-3>]
```

Parameter	Description
<ap-id-range>	Display information for the selected Access Point, or range <1-65535>.
`radio`	Select a radio interface on the AP.
<1-3>	Radio interface number.

Mode User Exec and Privileged Exec

Example To display the wireless AP client settings, use the following commands:

```
awplus# show wireless ap client
```

Output Figure 50-9: Example output from **show wireless ap client**

```
awplus#show wireless ap client
IP Address      Mac Address    AP  SSID        Radio Ch Signal Age
--------------- -------------- --- ----------- ----- -- ------ --------------

Related commands radio (wireless-ap)

Command changes Version 5.4.7-2.4: command added

show wireless ap neighbors

Overview Use this command to display the neighboring wireless Access Points (APs) connected to a radio or range of radios. If no parameters are specified, then all configurations are displayed.

Syntax

```
show wireless ap [<ap-id-range>|all] neighbors [radio <1-3>]
```

Parameter	Description
<ap-id-range>	Show the radio and wireless neighbors associated with an AP or range of APs. To select a range, use the range format <1-65535>.
`all`	Display the radio and neighbors for all APs.
`radio`	Display the configured radio.
<1-3>	Radio interface number.

Mode User Exec and Privileged Exec

Usage notes If the total number of AP neighbors in the system exceeds 12500, this command will only show the first 12500 neighbors. You can specify the AP ID to see all neighbors of each AP.

Example To display all wireless AP neighbors, use the following command:

```
awplus# show wireless ap neighbors
```

Output Figure 50-10: Example output from **show wireless ap neighbors**

```
awplus#show wireless ap neighbors

show wireless ap power-channel

Overview Use this command to display the currently configured status of an Access Point (AP) power-channel. If the command parameters are omitted, then the status for all APs will display.

Syntax

```
show wireless ap [<ap-id-range>|all] power-channel
```

Parameter	Description
<ap-id-range>	Display the current power-channel status for a selected AP or range of APs in the format <1-65535>
`all`	Display the current power-channel status for all APs.

Mode User Exec and Privileged Exec

Example To display the currently configured power-channel status for APs, use the command:

```
awplus# show wireless ap power-channel
```

Output Figure 50-11: Example output from **show wireless ap power-channel**

```
awplus#show wireless ap power-channel
AP    MAC address    Radio1        Radio2
----- -------------- ------------- -------------

show wireless ap-profile

Overview Use this command to display the AP-profile configuration for Autonomous Wave Control.

Syntax `show wireless ap-profile [<ap-profile-id-range>] [brief]`

Parameter	Description
<ap-profile-id-range>	Displays the AP-profile information for an ID range. The ID range is <1-65535>.
`brief`	Displays a brief summary of AP-profile configuration.

Mode User Exec and Privileged Exec

Output Figure 50-12: Example output from **show wireless ap-profile brief**

```
awplus#show wireless ap-profile brief

Version 5.4.7-2.4: command added

show wireless auto-config

Overview Use this command to display operational status for automatically configured wireless networks, profiles and APs.

Syntax

```
show wireless auto-config
```

Mode Privileged Exec

Example To display current information about an automatic configuration session, use the command:

```
awplus# show wireless auto-config
```

Output Figure 50-14: Example output from **show wireless auto-config**

```
awplus#show wireless auto-config
Last Time executed: 2018-2-26 13:05:26
Last Time updated: 2018-2-26 13:07:33
AP-Profile: 10
Country-code: Not set
Status: Creating configuration

IP Address       MAC Address     Hwtype          AP    Prof   Status
---------------- --------------- --------------- ----- ------ --------
192.168.120.117  0067.5ebb.92c4  tq-single-11n   -     -      NoMatch
192.168.120.113  0067.5e00.5301  tq-dual-11ac    -     -      Collected
192.168.120.133  0067.5e42.a451  tq-dual-11ac    20    10     Modify
192.168.120.121  0067.5e20.ac94  tq-dual-11ac    -     -      Collected
192.168.120.115  0067.5eac.606f  tq-dual-11ac    -     -      Awaiting
```

Table 50-1: Parameters in the output from **command name**

Parameter	Description
`Last Time executed`	The time that the wireless automatic configuration was last executed.
`Last Time updated`	The time that any AP status was last updated.
`auto-config Time-out`	The time that an automatic configuration session timed out. If the wireless controller completed a session before timing out, then it will show this time.
`AP-Profile`	Specified AP Profile ID for new configurations, or new profile ID of an automatically created one.
`Country-code`	This is a specified two letter code representing the country for the AP profile. If no country is specified then it appears as “Not set”.

Table 50-1: Parameters in the output from **command name** (cont.)

Parameter	Description
`Status`	**Initialized:** Wireless automatic discovery of AP list started. **In Progress:** Discovery AP list achieved, now collecting data and creating configuration. **IP Modifying:** Modifying IP address after creating another configuration (this status is brief in time). **Completed:** All configuration is finished successfully. **Aborted:** Automatic configuration process was stopped using the command **wireless auto-config abort**. **Failed:** Wireless automatic configuration failed, for example "Failed to set profile to discovered AP".
`IP Address`	Discovered wireless access point IP address.
`MAC Address`	Discovered wireless access point MAC address.
`Hwtype`	Discovered wireless access point hardware type.
`AP`	AP configuration for discovered wireless access points.
`Prof`	AP profile that attach to discovered wireless access points.
`Status`	Discovered wireless access points status: **Awaiting:** Waiting for completion of collecting the data. **Modify:** AP MAC address already exists. It will modify the IP address. **Skip:** Already configured AP MAC address and IP address, so will do nothing. **Done:** Successful retrieval of hardware type (model name) and configuration created. **NoMatch:** hardware type of specified AP profile did not match. **NoResp:** Centralized Wireless Manager (CWM) Agent(AP) did not respond. **Failed:** Failed to create configuration, for example "failed to create network %d".

Command changes Version 5.4.8-1.1: command added

show wireless captive-portal network walled-garden

Overview Use this command to display wireless network walled garden entries for Captive Portal.

Syntax

```
show wireless captive-portal {<network-ID>|all} walled-garden
```

Parameter	Description
<network-ID>	Display output for the specified wireless network ID or range of network IDs, valid network IDs are <1- 65535>.
`all`	Display all wireless network walled garden entries.

Mode Privileged Exec

Example To display the walled garden entries for Captive Portal on network 5, use the commands:

```
awplus# show wireless captive-portal network 5 walled-garden
```

Output Figure 50-15: Example output from **show wireless captive-portal network 5 walled-garden**

```
awplus#show wireless captive-portal network 5 walled-garden
WALLED GARDEN LIST FOR NETWORK ID 5:
 Entries ..................... 3

show wireless country-code

Overview Use this command to display a list of country codes that can be used on an Access Point (AP) Autonomous Wave Control (AWC) configuration.

Syntax
```
show wireless county-code
```

Mode User Exec and Privileged Exec

Example To display the list of AWC country codes, use the command:

```
awplus# show wireless country-code
```

Output Figure 50-16: Example output extract from **show wireless country-code**

```
awplus#show wireless country-code
Code  Country
----  -------------------------------
AD    Andorra
AE    United Arab Emirates
AF    Afghanistan
AG    Antigua and Barbuda

show wireless network

Overview Use this command to display the wireless network configuration for Autonomous Wave Control (AWC).

If you use the **brief** parameter, a summary of the configuration will be displayed, otherwise a detailed version is displayed.

Syntax `show wireless network <network-id-range> [brief]`

Parameter	Description
<network-id-range>	Display the network configuration for a selected network ID or network ID range <1-65535>.
`brief`	Display a brief summary of the network configuration.

Mode Privileged Exec

Example To display the full wireless network configuration for AWC, use the command:

```
awplus# show wireless network
```

Output Figure 50-17: Example output from **show wireless network brief**

```
awplus#show wireless network brief

Version 5.4.7-2.4: command added.

show wireless power-channel calculate

Overview Use this command to display the result of the optimal power per channel as calculated by Autonomous Wave Control (AWC).

Note: To see the currently assigned power per channel, use the command show wireless ap power-channel.

Syntax
```
show wireless power-channel calculate
```

Mode Privileged Exec

Example To display the optimal power for each channel as calculated by AWC, use the following command:

```
awplus# show wireless power-channel calculate
```

Output Figure 50-19: Example output from **show wireless power-channel calculate**

```
awplus#show wireless power-channel calculate

show wireless sc-profile

Overview Use this command to display the Smart Connect profile configuration.

Syntax

```
show wireless sc-profile [<sc-profile-range>|all] [brief]
```

Parameter	Description
<sc-profile-range>	The Smart Connect profile ID or IDs to display. Select from the range 1-65535
`all`	Display all Smart Connect profiles
`brief`	Display a brief summary of the Smart Connect profile configuration

Mode Privileged Exec

Example To display all the Smart Connect profile information, use the command:

```
awplus# show wireless sc-profile all
```

Output Figure 50-20: Example output from **show wireless sc-profile all**

```
awplus#show wireless sc-profile all
SC-PROFILE ID 1:

show wireless security

Overview Use this command to display the Autonomous Wave Control (AWC) security configuration. If the **brief** parameter is specified, then a summary of the configuration is displayed, otherwise the detailed configuration is displayed.

Syntax

```
show wireless security [<security-id-range>] [brief]
```

Parameter	Description
<security-id-range>	Display the security configuration for a specified ID range. Specify the ID range using the format <1-65535>
`brief`	Display the brief summary of the security configuration.

Mode Privileged Exec

Examples To display a detailed AWC security configuration, use the following command:

```
awplus# show wireless security
```

Output Figure 50-22: Example output from **show wireless security**

```
awplus# show wireless security
Security ID 1:
 Security Mode ................. wpa-personal

show wireless smart-connect ap

Overview Use this command to display AP connection status for Smart Connect.

Syntax

```
show wireless smart-connect ap [<sc-ap-range>|all] status
```

Parameter	Description
<sc-ap-range>	Display the connection status for a single Smart Connect AP or range of APs. Select from ID range 1-65535.
`all`	Display the connection status for all Smart Connect APs.

Mode Privileged Exec

Output Figure 50-23: Example output from **show wireless smart-connect ap all status**

```
awplus#show wireless smart-connect ap all status
SC-PROFILE ID: 1
Last Update Time: 2019-12-12 11:14:35

show wireless task

Overview Use this command to display the tasks associated with Autonomous Wave Control (AWC).

Syntax

```
show wireless task [<task-id-range>] [brief|status]
```

Parameter	Description
<task-id-range>	Display the task information for a specific task ID or ID range.
`brief`	Display the task information in summary format.
`status`	Display the task status information. For example the date and time that the task will be performed next.

Mode User Exec and Privileged Exec

Usage notes An AWC task is a periodic or scheduled action to be taken, such as applying a configuration to an Access Point (AP) on a specified date, or calculating optimal AP power-channel usage and applying the results to all APs. See the **task** command for more details.

Example To display the configured AWC tasks in detail, use the command:

```
awplus# show wireless task
```

Output Figure 50-24: Example output from **show wireless task**

```
awplus# show wireless task

show wireless wds

Overview Use this command to display the configuration of a Wireless Distribution System (WDS) with Autonomous Wave Control. A WDS enables the wireless interconnection of Access Points (APs) or Peers in an IEEE802.11 network.

Syntax

```
show wireless wds [<wds-id-range>][brief]
```

Parameter	Description
<wds-id-range>	Display the configured information for a specified ID or a range of IDs. To display a range of WDS IDs, use the format <1-65535>.
`brief`	Display a brief summary of the WDS configuration.

Mode User Exec and Privileged Exec

Example To display the full detail of a WDS configuration for a wireless network, use the following command:

```
awplus# show wireless wds
```

Output Figure 50-27: Example output from **show wireless wds**

```
awplus#show wireless wds
WDS ID 1: Enable
 Peer 1st AP ................... 10
      2nd AP ................... 11
 Security ...................... 100

WDS ID 2: Enable
 Peer AP1 ...................... 20
      AP2 ...................... abcd.1234.6789
 Security ...................... 100

WDS ID 3: Disable
Peer AP1 ...................... 30
     AP2 ...................... 16
Security ...................... 200
```

Figure 50-28: Example output from **show wireless wds brief**

```
awplus# show wireless wds brief
ID    Status  Peer 1st AP    Peer 2nd AP    Security
----- ------- -------------- -------------- --------
1     Enable  10             11             100

show wireless wireless-mac-filter

Overview Use this command to display the wireless MAC filter configuration for Autonomous Wave Control.

Syntax

```
show wireless wireless-mac-filter [<mac-filter-range>|all]
[brief]
```

Parameter	Description
<mac-filter-range>	<1-65535> Display the information for a specified ID or range of IDs.
`all`	Display the information for all MAC filters.
`brief`	Display a brief summary of the information

Mode Privileged Exec

Output Figure 50-29: Example output from **show wireless-mac-filter**

```
awplus#show wireless wireless-mac-filter

WIRELESS MAC FILTER ID 100:
  Description ................... Floor 1
  Entries ....................... 3

smart-connect-profile

Overview Use this command to create a Smart Connect profile and enter the Smart Connect profile configuration mode.

Use the **no** variant of this command to delete a Smart Connect profile from the wireless configuration.

Syntax

```
smart-connect-profile <1-65535>
no smart-connect-profile <1-65535>
```

Parameter	Description
<1-65535>	The Smart Connect profile ID

Default Not set

Mode Wireless Configuration

Example To configure Smart Connect profile 10 and enter the Smart Connect profile configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)#
```

To delete Smart Connect profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no smart-connect-profile 10
```

snmp (wireless-ap-prof)

Overview Use this command to enter SNMP configuration mode so you can add an SNMP configuration.

Use the **no** variant of this command to reset the SNMP parameters back to the default (not set).

Syntax

```
snmp
no snmp
```

Default Not set

Mode Wireless AP Profile Configuration

Example To enter the SNMP configuration mode of AP profile 2, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)#
```

To disable SNMP, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# no snmp
awplus(config-wireless-ap-prof)#

ssid (wireless-network)

Overview Use this command to configure the SSID (Service Set Identifier) for the wireless network.

Syntax

```
ssid <value>
```

Parameter	Description
<value>	The unique alphanumeric description or name of the SSID. The maximum character length is 32.

Default Default- {NETWORKID}.

Except for the default Guest Network, the default SSID for each network is 'Default-' followed by the unique Network ID.

Mode Wireless Network Configuration

Usage notes A network must be configured with an SSID of one or more alphanumeric characters. The SSID can be modified, but cannot be deleted.

Example To configure a SSID name for a wireless network, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# ssid GUEST_NETWORK_1
```

ssid (wireless-sc-prof)

Overview Use this command to set the SSID used for wireless communication between APs in a Smart Connect network.

Use the **no** variant of this command to remove the SSID from a Smart Connect profile.

Syntax

```
ssid <ssid-value>
no ssid
```

Parameter	Description
<ssid-value>	The SSID for the Smart Connect network. Enter a string up to 32 characters in length.

Default Not set

Mode Wireless Smart Connect Profile Configuration

Example To set the SSID ID of 10 used for wireless communication between APs in Smart Connect network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 20
awplus(config-wireless-sc-prof)# ssid SC-NETWORK-10
```

station-isolation enable (wireless-ap-prof-radio)

Overview Use this command to enable the **station-isolation** option. This option designates whether to allow communication between wireless clients which are connected to the same Virtual Access Point (VAP).

Use the **no** variant of this command to disable the station-isolation option on a selected VAP.

Syntax

```
station-isolation enable
no station-isolation enable
```

Default Disabled.

Mode Wireless AP Profile Radio Configuration

Example To enable the station-isolation option for **radio 2** on **ap-profile100**, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# station-isolation
enable
```

Related commands radio (wireless-ap-profile)

Command changes Version 5.4.7-2.4: command added.

task

Overview Use this command to configure an Autonomous Wave Control (AWC) task.

If the task doesn't exist, then this command creates it.

Use the **no** variant of this command to remove the task.

Syntax

```
task <1-65535>
no task <1-65535>
```

Parameter	Description
<1-65535>	Task ID number

Default Not set.

Mode Wireless Configuration

Usage notes A task is a configuration for a periodic or scheduled action to be taken. For example, the task may be to run a configuration, start an AWC calculation, or download AP firmware. Use commands such as **description**, **time**, and **day** to configure the task actions.

Example To add a task with an ID of 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 10
```

To remove task ID 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no task 10
```

time (wireless-task)

Overview Use this command to set a time to run a task using the 24-hour format.

You can use the **day** command along with the **time** command to more fully set the task run time configuration.

Use the **no** variant of this command to remove the time set to run a task.

Syntax

```
time <HH:MM>
no time
```

Parameter	Description
<HH:MM>	The time set to run a task in 24-hour time format.

Default Not set.

Mode Wireless Task Configuration

Example To set task 5 to run at 11:15 pm, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# time 23:15
```

trap host (wireless-ap-prof-snmp)

Overview Use this command to add an SNMP trap host to the entry for the target AP Profile.

Use the **no** variant of this command to remove the specified SNMP trap host from the entry.

Syntax

```
trap host <host-name>
no trap host <host-name>
```

Parameter	Description
<host-name>	The host that sends the SNMP trap. Specify the host name (FQDN) or IP address. For example manager.your.domain.com, 10.10.1.37.

Default The entry is empty.

Mode Wireless AP Profile SNMP Configuration

Usage notes The maximum number of registrations is 3 entries.

Example To add the SNMP trap host 192.168.1.1 to the entry, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# trap host 192.168.1.1
```

To remove the SNMP trap host 192.168.1.1 from the entry, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no trap host 192.168.1.1
```

Related commands

type (wireless-sec-wep)

Overview Use this command to assign the key-string type for a wireless security WEP configuration.

Use the **no** variant of this command to reset the assigned WEP key-string type to the default.

Syntax

```
type {ascii|hex}
no type
```

Parameter	Description
ascii	Use ASCII as the type for the WEP key
hex	Use Hex as the type for the WEP key

Default Hex.

Mode Wireless Security WEP Configuration

Example To configure ASCII as the key-string type for WEP for a wireless security WEP configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10 mode wep
awplus(config-wireless-sec-wep)# type ascii
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added.

type ap-configuration apply ap

Overview Use this command to apply a task configuration type to a selected wireless Access Point (AP) or range of wireless APs.

Syntax

```
type ap-configuration apply ap {all|<ap-id-range>}
```

Parameter	Description
`all`	Apply the configuration to all APs.
<ap-id-range>	Apply the configuration to a selected range of APs.

Default Not set.

Mode Wireless Task Configuration

Example To assign task 5 configuration to wireless AP ranges: 5-9 and 15-19, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# type ap-configuration apply ap 5-9,15-19
```

Related commands

task

show wireless task

ap

type download ap (wireless-task)

Command changes Version 5.4.7-2.4: command added.

type download ap (wireless-task)

Overview Use this command to download and update wireless Access Point (AP) firmware. The firmware must be stored on an HTTP server.

Syntax

```
type download ap {all|<ap-id-range>} url <URL> [username
<user-name> password <password>]
```

Parameter	Description
`all`	Run the task on all managed APs.
<ap-id-range>	Run the task on the selected identifier.
<URL>	The URL where the firmware is stored and can be downloaded from.
<user-name>	The username requiring authentication and access to the URL.
<password>	The password requiring authentication and access to the URL.

Mode Wireless Task Configuration

Example To set a task to download new firmware from the IP address192.168.0.1 to a wireless AP which is assigned '7' as its identifier, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# type download ap 7 url
http://192.168.0.1/AT-TQ4600-4.0.3.b02.img
```

Related commands

task

show wireless task

ap

type ap-configuration apply ap

type power-channel ap all

Command changes Version 5.4.7-2.4: command added.

type power-channel ap all

Overview Use this command to calculate the power usage on wireless Access Point (AP) channels and apply the results manually or automatically.

Syntax

```
type power-channel ap all {calculate|apply|calculate-and-apply}
```

Parameter	Description
`calculate`	Run the AWC power calculation on all APs.
`apply`	Apply the latest AWC power calculation results to all APs.
`calculate-and-apply`	Run the AWC power calculation and apply the results to all APs.

Default Not set.

Mode Wireless Task Configuration

Usage notes This command allows you to monitor how APs are being utilized at various times and adjust AP power levels if required.

Example To calculate all AP power-channel usage and apply the results to all APs, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config)# type power-channel ap all calculate-and-apply
```

Related commands

username (wireless-ap-prof-snmp)

Overview Use this command to set an SNMP version v3 username and password for the target AP profile. This command is valid for SNMP version v3 only.

Use the **no** variant of this command to remove an SNMP username and password.

Syntax

```
username <username> password [encrypted] <password>
no username
```

Parameter	Description
<username>	The user name that is used for user authentication and encryption. Enter up to 12 alphanumeric characters. The user name cannot begin with a number.
`encrypted`	Indicates that the following password is in its encrypted form. Its primary purpose is to use to store the shared key to startup-configuration. You should not use it when entering the command manually.
<password>	The password is used for encryption. Enter from 8 to 32 single-byte alphanumeric characters. The password can use the following symbols (“, ‘, $, &, *, :, <, >).

Default Not set

Mode Wireless AP Profile SNMP Configuration

Example To set the SNMP username to ‘manager’ and the password to ‘friend001’, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# username manager
password friend001
```

To remove the SNMP username and password, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof)# no username
```

Command changes

Version 5.5.0-2.1: command added

vap network (wireless-ap-prof-radio)

Overview Use this command to assign a network configuration ID to a Virtual Access Point (VAP) on a radio.

Use the **no** variant of this command to remove the network configuration for a VAP.

Syntax

```
vap <0-7> network <1-65535>
no vap <0-7>
```

Parameter	Description
<0-7>	VAP identification number
<1-65535>	Network configuration of the designated VAP

Default Not set.

Mode Wireless AP Profile Radio Configuration

Usage notes vap0 is the only VAP identification number valid on the **MWS series**.

Example To associate an AP with network (ID 100) to VAP 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# vap 2 network 2
```

Related commands radio (wireless-ap-profile)

network (wireless)

Command changes Version 5.4.7-2.4: command added.

version (wireless-ap-prof-snmp)

Overview Use this command to set the SNMP agent version for the target AP profile.

Use the **no** variant of this command to set it back to the default (v1 and v2c).

Syntax

```
version {v1v2c|v3}
no version
```

Parameter	Description
v1v2c	Set when the SNMP agent version is at v1 or v2c.
v3	Set when the SNMP agent version is v3.

Default v1v2c

Mode Wireless AP Profile SNMP Configuration

Example To set the SNMP version as v3, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# version v3
```

To set the SNMP listening port back to the default (v1v2c), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no version
```

versions (wireless-sec-wpa-ent)

Overview Use this command to set the WPA version used for a WPA-enterprise wireless security configuration.

Use the **no** variant of this command to reset the designated version to the default.

Syntax

```
versions <version-list>
no versions
```

Parameter	Description
<version-list>	The version list. You can use either **wpa**, **wpa2**, **wpa3**, or any combination of the three in any order.

Default wpa2.

Mode Wireless Security WPA-enterprise Configuration

Usage notes For MWS series devices, a combination of versions and ciphers are supported as follows:

- versions WPA2 and ciphers CCMP
- versions WPA, WPA2, and ciphers TKIP and CCMP

WPA3 is only supported on TS5403 series devices.

Example To configure both WPA and WPA2 as WPA versions on a security configuration for WPA-enterprise, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# versions wpa wpa2
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added.

Version 5.4.9-1.1: **wpa3** parameter added.

versions (wireless-sec-wpa-psnl)

Overview Use this command to set the WPA version used for a WPA-personal wireless security configuration.

Use the **no** variant of this command to reset the designated version to the default.

Syntax

```
versions <version-list>
no versions
```

Parameter	Description
<version-list>	The version list. You can use either **wpa**, **wpa2**, **wpa3**, or any combination of the three in any order.

Default wpa2.

Mode Wireless Security WPA-personal Configuration

Usage notes For MWS series devices, a combination of versions and ciphers are supported as follows:

- versions WPA2 and ciphers CCMP
- versions WPA, WPA2, and ciphers TKIP and CCMP

WPA3 is only supported on TS5403 series devices.

Example To configure both WPA and WPA2 as WPA versions on a security configuration for WPA-personal, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# versions wpa wpa2
```

Related commands security (wireless)

Command changes Version 5.4.7-2.4: command added.

Version 5.4.9-1.1: **wpa3** parameter added.

vlan (wireless-network)

Overview Use this command to configure the wireless VLAN that clients belong to.

Use the **no** variant of this command to reset the wireless VLAN to the default.

Syntax

```
vlan <1-4094>
no vlan
```

Parameter	Description
<1-4094>	VLAN ID number.

Default VLAN1.

Mode Wireless Network Configuration

Example To configure a VLAN ID, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# vlan 100
```

To restore VLAN 20 to its default value, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no vlan
```

Related commands network (wireless)

show wireless network

Command changes Version 5.4.7-2.4: command added

walled-garden entry

Overview Use this command to configure walled garden entry to a wireless network Captive Portal.

On the Internet, a walled garden typically controls a user's access to web content and services. The walled garden directs the user's navigation within particular areas to allow access to a selection of websites or prevent access to other websites.

A common example could be a hotel environment where unauthenticated users are allowed to navigate to a designated login page (for example, a hotel website) and all its contents.

Use the **no** variant of this command to remove a walled garden on a wireless network that's configured with a Captive Portal.

Syntax

```
walled-garden entry {A.B.C.D|A.B.A.D/M|FQDN}
no walled-garden entry {A.B.C.D|A.B.A.D/M|FQDN}
```

Parameter	Description
A.B.C.D	IPv4 address format, e.g. 1.1.1.1
A.B.C.D/M	IPv4 address format with subnet mask, e.g. 1.1.1.0/24
FQDN	FDQN format. Sequence of {LETTER/DIGIT/HYPHEN}.{LETTER/DIGIT/HYPHEN}...while each dotted part of the name (aa or bb or cc in this example) MUST NOT end with HYPHEN and the first character MUST be a LETTER or a DIGIT. And each dotted part (aa or bb or cc in this example) must be 63 characters or less, e.g. example.com www.example.com

Default Not set

Mode Wireless Network Captive Portal Configuration

Example To add a new entry to a walled garden list on Captive Portal for network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# walled-garden entry
example.com
```

Related commands

Command changes Version 5.5.0-1.3: command added

wds

Overview Use this command to add a Wireless Distribution System (WDS) configuration.

Use the **no** variant of this command to remove a WDS configuration.

Syntax `wds <1-65535>`

Parameter	Description
<1-65535>	WDS configuration ID number.

Default Not set.

Mode Wireless Configuration

Usage notes This command adds a WDS configuration and enters the configuration mode.

Example To add a WDS configuration for AWC, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wds 10
```

To remove a WDS configuration for AWC, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no wds 10
```

Related commands

show wireless wds

enable (wireless-wds)

security (wireless-wds)

Command changes Version 5.4.7-2.4: command added.

wds radio (wireless-ap)

Overview Use this command to designate a radio interface for an Access Point (AP) in a Wireless Distribution System (WDS) network.

Use the **no** variant of this command to remove a wireless radio interface.

Syntax

```
wds radio <1-3>
no wds radio
```

Parameter	Description
<1-3>	Designate a radio interface for the WDS connection.

Default Not set.

Mode Wireless AP Configuration

Example To configure 'radio 2' as the radio interface for a WDS connection, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# wds radio 2
```

Related commands ap

show wireless ap

Command changes Version 5.4.7-2.4: command added.

web-auth radius auth group

Overview Use this command to enable Web authentication of clients with a RADIUS group in a wireless network.

Use the **no** variant of this command to disable Web authentication with a RADIUS group.

Syntax

```
web-auth radius auth group {radius|<group-name>}
no web-auth radius auth group
```

Parameter	Description
`radius`	Use a RADIUS group, which means **all** RADIUS servers.
<group-name>	The RADIUS server group.

Default Not set.

Mode Wireless Network.

Usage notes This command enables Web authentication and designates a RADIUS server group to authenticate clients on a wireless network. RADIUS server groups are defined using the **aaa group server** command. RADIUS server groups can consist of multiple server hosts, but this command only uses two servers.

Example To enable Web authentication with a RADIUS server group, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10
awplus(config-wireless-network)# web-auth radius auth group radius
```

Related commands aaa group server

network (wireless)

Command changes Version 5.4.7-2.4: command added.

wireless

Overview Use this command to enter wireless configuration mode.

Use the **no** variant of this command to exit wireless configuration mode.

Syntax

```
wireless
no wireless
```

Mode Global Configuration

Example To enter wireless configuration mode, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)#
```

Command changes Version 5.4.7-2.4: command added.

wireless ap-configuration apply ap

Overview Use this command to apply a configuration to a single Access point (AP) or a range of APs. The configuration must exist before you use this command.

Syntax

```
wireless ap-configuration apply ap {all|<ap-idrange>}
```

Parameter	Description
`all`	Apply the configuration to all APs.
<ap-idrange>	Apply the configuration to a range of APs. The range format is 1-65535.

Mode Privileged Exec

Example To apply a configuration to the AP range 1-10, use the command:

```
awplus# configure terminal
awplus(config)# wireless ap-configuration apply 1-10
```

To apply a configuration to all APs, use the command:

```
awplus# wireless ap-configuration apply ap all
```

Related commands ap

Command changes Version 5.4.7-2.4: command added.

wireless auto-config

Overview Use this command to start an automatic discovery and configuration of wireless APs using Autonomous Wave Control (AWC).

Syntax

```
wireless auto-config create-new [country-code <code>]
wireless auto-config ap-profile <1-65535>
wireless auto-config abort
```

Parameter	Description
`ap-profile`	This parameter selects an existing profile to use for configuring the newly discovered APs.
<1-65535>	Profile ID number from the range 1 to 65535.
`create-new`	This parameter automatically creates a new profile based on the AP's model name.
`country-code`	Optional parameter, if specified the new profiles will have the country code set.
<code>	A two letter code representing the country. Use the command show wireless country-code to see the full list of country codes available.
`abort`	This parameter stops the automatic discovery process.

Mode Privileged Exec

Usage notes AP configuration is created for discovered APs including their IP addresses and MAC addresses. The AP profile is created automatically based on the model name. The network and security is created using defined default values.

Use the **abort** parameter to stop the automatic discovery process from continuing.

Examples To start an automatic discovery and configuration of a wireless network and apply the profile ID "1", use the command:

```
awplus# wireless auto-config ap-profile 1
```

To start an automatic discovery and configuration of a wireless network with a new AP profile, use the command:

```
awplus# wireless auto-config create-new
```

To stop an automatic discovery configuration, use the command:

```
awplus# wireless auto-config abort
```

Related commands show wireless auto-config

Command changes Version 5.4.8-1.1: command added

wireless download ap url

Overview Use this command to download Access Point (AP) firmware from a URL.

Syntax
```
wireless download ap {all|<aprange>} url [username <user-name>
password <password>]
```

Parameter	Description
`all`	All APs.
<aprange>	A range of APs *<1-65535>*
`username` *<user-name>*	The login username. The username can contain: • up to 255 characters. • any printable ASCII characters (ASCII 32-126) • special characters: backslash, double-quote or space, but they should be escaped with a backslash.
`password` *<password>*	Passwords can be up to 64 characters in length and can contain printable characters, except: • ? • "(double quotes) • space

Default Not set.

Mode Privileged Exec

NOTE: *AWC supports the following firmware version:*

- TW series: v4.0.5B02
- MWS2533AP: v2.2.1, v2.2.3
- MWS600AP/MWS1750AP: v2.2.3

Example To download new firmware to all APs from the URL 192.168.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless download ap all url
http://192.168.0.1/AT-TQ4600-4.0.3.n.b02.img
```

Related commands show wireless ap

Command changes Version 5.4.7-2.4: command added.

wireless emergency-mode

Overview Use this command to activate or deactivate AWC emergency mode. Wireless networks that have been flagged for emergency-mode are activated or deactivated when this command is configured.

Syntax
```
wireless emergency-mode {activate|deactivate}
```

Default Deactivated

Mode Privileged Exec

Example To activate the emergency mode in AWC, use the command:

```
awplus# wireless emergency-mode activate
```

Related commands emergency-mode

show wireless

Command changes Version 5.5.0-0.3: command added

wireless export

Overview Use this command to export MAC filter entries to a CSV file. If the specified file does not exist, it will be created. If the file does exist then it will be overwritten with the new data.

Syntax `wireless export wireless-mac-filter <mac-filter-id> <url>`

Parameter	Description
<mac-filter-id>	<1-65535> The ID of the MAC filter to export.
<url>	Path and filename of the export file.

Mode Privileged Exec

Example To export MAC filter '20' to a CSV file named 'whitelist.csv', use the following command:

```
awplus# wireless export wireless-mac-filter 20
flash://whitelist.csv
```

Figure 50-30: Sample export file:

```
"00:1a:eb:12:34:56","client1"
"00:1a:eb:12:34:57","client2"
"00:1a:eb:12:34:58","client3"

Command changes Version 5.4.8-2.1: command added

wireless import

Overview Use this command to import MAC filter entries from a CSV file. The imported entries can either replace or be appended to the existing entries.

Syntax
```
wireless import <url> wireless-mac-filter <mac-filter-id>
{add|replace}
```

Parameter	Description
<url>	Path and filename of the import file.
<mac-filter-id>	<1-65535> The ID of the MAC filter to import the entries to.
add	Add the filter entries to the specified MAC filter
replace	Overwrite the existing MAC filter with the imported entries.

Mode Privileged Exec

Example To add MAC filter entries from the file 'whitelist.csv' to MAC filter '20', use the following command:

```
awplus# wireless import flash://whitelist.csv
wireless-mac-filter 20 add
```

Figure 50-31: Sample import file:

```

Command changes Version 5.4.8-2.1: command added

wireless power-channel ap all

Overview This command activates AWC to calculate the optimal power-channel levels for all the Access Points (APs) in a wireless network. You can use this command to calculate and apply the latest AWC calculation results to the APs automatically or you can choose to apply them manually.

Syntax

```
wireless power-channel ap all
{calculate|apply|calculate-and-apply}
```

Parameter	Description
`calculate`	Use AWC to calculate the optimal power-channel levels for all APs.
`apply`	Apply the latest AWC optimal power-channel level results to all APs.
`calculate-and-apply`	Use AWC to calculate the optimal power-channel levels for all APs, and apply the results to the APs.

Default Not set.

Mode Privileged Exec

Example To activate AWC to calculate the optimal power-channel levels for all APs, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless power-channel ap all calculate
```

To apply the latest optimal power-channel results manually to all APs, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless power-channel ap all apply
```

To activate AWC to calculate the optimal power-channel levels for all APs and then automatically apply the results to the APs, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless power-channel ap all
calculate-and-apply
```

Related commands show wireless ap power-channel

Command changes Version 5.4.7-2.4: command added.

wireless reset ap

Overview Use this command to reset the current configuration applied to a wireless Access Point (AP).

Syntax

```
wireless reset ap {all|<aprange>}
```

Parameter	Description
<aprange>	Reset the range of APs in the format *<1-65535>*
`all`	Reset all APs.

Mode Privileged Exec

Example To reset the configuration for wireless APs in the range 1-10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless reset ap 1-10
```

To reset the configuration for all wireless APs, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless reset ap all
```

Related commands ap

Command changes Version 5.4.7-2.4: command added.

wireless-mac-filter (wireless)

Overview Use this command to configure a wireless MAC filter. If the filter does not already exist it will be created when you issue this command.

Use the **no** variant of this command to remove a wireless MAC filter.

Syntax

```
wireless-mac-filter <mac-filter-id>
no wireless-mac-filter <mac-filter-id>
```

Parameter	Description
<mac-filter-id>	<1-65535> Enter the ID of the MAC filter to assign to the AP profile.

Default No MAC filters are set by default.

Mode Wireless Configuration

Example To add a MAC filter with ID '20' and enter configuration mode for that filter, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)#
```

To remove a MAC filter with ID '20', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no wireless-mac-filter 20
```

wireless export

wireless import

wireless-mac-filter (wireless-ap-prof)

wireless-mac-filter enable

Command changes Version 5.4.8-2.1: command added

wireless-mac-filter (wireless-ap-prof)

Overview Use this command to assign a MAC filter to a wireless AP profile. You can configure the filter as a 'whitelist' or a 'blacklist'. An AP profile can only have one MAC filter assigned to it.

Use the **no** variant of this command to remove a MAC filter from an AP profile.

Syntax

```
wireless-mac-filter {permit|deny} <mac-filter-id>
no wireless-mac-filter
```

Parameter	Description
`permit`	Set the MAC filter as a whitelist.
`deny`	Set the MAC filter as a blacklist.
`<mac-filter-id>`	<1-65535> Enter the ID of the MAC filter to assign to the AP profile.

Default No MAC filter assigned by default.

Mode Wireless AP Profile Configuration

Example To assign the MAC filter '20' as a whitelist to wireless AP profile '1', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 1
awplus(config-wireless-ap-prof)# wireless-mac-filter permit 20
```

To remove a MAC filter from wireless AP profile '1', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 1
awplus(config-wireless-ap-prof)# no wireless-mac-filter
```

show wireless wireless-mac-filter

wireless export

wireless import

wireless-mac-filter (wireless)

wireless-mac-filter enable

Command changes Version 5.4.8-2.1: command added

wireless-mac-filter enable

Overview Use this command to enable the MAC filter on a Virtual Access Point (VAP). It will enable the MAC filter based on the filter entry set in the AP profile.

Use the **no** variant of this command to disable the AMC filter on a VAP.

Syntax
```
wireless-mac-filter enable
no wireless-mac-filter enable
```

Default Disabled by default.

Mode Wireless Network Configuration

Example To enable wireless MAC filter on APs that use network 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 100
awplus(config-wireless-network)# wireless-mac-filter enable
```

To disable wireless MAC filter on APs that use network 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 100
awplus(config-wireless-network)# no wireless-mac-filter enable
```

51 Device Discovery using SNMP Commands

Introduction

Overview

This chapter provides an alphabetical reference of commands used to configure Device Discovery using SNMP.

SNMP Device Discovery is available from the AlliedWare Plus CLI and is also available from Vista Manager mini. This feature provides information that allows the CLI to display third party vendor device data in real time.

For more information, see the Device Discovery and Monitoring using SNMP Feature Overview and Configuration Guide.

Command List

- "clear snmp-discovery" on page 2794
- "service snmp-discovery" on page 2795
- "show running-config snmp-discovery" on page 2796
- "show snmp-discovery" on page 2797
- "snmp-discovery arp-polling-interval" on page 2800
- "snmp-discovery community" on page 2801
- "snmp-discovery deny" on page 2802
- "snmp-discovery permit" on page 2804
- "snmp-discovery snmp-polling-interval" on page 2805
- "snmp-discovery snmp-version" on page 2806
- "snmp-discovery user" on page 2807

clear snmp-discovery

Overview Use this command to remove information learned by the SNMP Discovery process.

Syntax

```
clear snmp-discovery ip [<ipv4-address>]
clear snmp-discovery nodes [<ipv4-address>]
```

Parameter	Description
`ip`	Internet Protocol (IP)
<ipv4-address>	IPv4 network address for the discovered device, for example 192.168.3.1
`nodes`	Node information
<ipv4-address>	IPv4 network address for the discovered nodes, for example 192.168.3.1

Default No information is cleared.

Mode Privileged Exec

Examples To remove all SNMP discovered devices, use the command:

```
node1# clear snmp-discovery nodes
```

To remove a particular SNMP discovered device, use the command:

```
node1# clear snmp-discovery nodes 192.168.3.1
```

To remove all entries from SNMP Discovery's database of devices discovered by ARP, use the command:

```
node1# clear snmp-discovery ip
```

To remove a particular entry from SNMP Discovery's database of devices discovered by ARP, use the command:

```
node1# clear snmp-discovery ip 192.168.3.1
```

Related commands show snmp-discovery

Command changes Version 5.5.0-0.3: command added

service snmp-discovery

Overview Use this command to enable SNMP Discovery to discover devices on an AMF network.

Use the **no** variant of this command to disable SNMP Discovery.

Syntax
```
service snmp-discovery
no service snmp-discovery
```

Default Disabled

Mode Global Configuration

Usage notes The server starts a process which detects IP addresses reachable on a network. An SNMP 'get' request is performed on these IP addresses to detect device information. The SNMP name, SNMP description, SNMP location, and SNMP serial number are obtained if they are available.

SNMP Discovery will not run if there are no Layer 3 IP interfaces configured.

Example To start the discovery service on the AMF node, use the commands:

```
awplus# configure terminal
awplus(config)# service snmp-discovery
```

Related commands

Command changes Version 5.5.0-0.3: command added

show running-config snmp-discovery

Overview Use this command to display the running configuration for SNMP Discovery.

Syntax

```
show running-config snmp-discovery
```

Mode Privileged Exec

Example To display the running configuration for SNMP Discovery, use the command:

```
awplus# show running-config snmp-discovery
```

Output Figure 51-1: Example output from **show running-config snmp-discovery**

```
node1#show running-config snmp-discovery
service snmp-discovery
snmp-discovery community accounting
snmp-discovery user tim encrypted auth md5

snmp-discovery permit ip 192.168.3.2
snmp-discovery permit ip 192.168.3.6
snmp-discovery deny ip 192.168.3.5
```

Related commands show snmp-discovery

Command changes Version 5.5.0-0.3: command added

show snmp-discovery

Overview Use this command to show information about the SNMP Discovery process.

Syntax

```
show snmp-discovery [detail|ip|nodes]
```

Parameter	Description
`detail`	SNMP Discovery node detail
`ip`	SNMP Discovery IP addresses
`nodes`	SNMP Discovery node information

Mode User Exec

Examples To display information about the SNMP Discovery status, use the command:

```
awplus# show snmp-discovery
```

To display information about the SNMP Discovery IPv4 addresses learned, use the command:

```
awplus# show snmp-discovery ip
```

To display information about the SNMP Discovery nodes learned, use the command:

```
awplus# show snmp-discovery nodes
```

To display information about the SNMP Discovery in greater detail, use the command:

```
awplus# show snmp-discovery detail
```

Output Figure 51-2: Example output from **show snmp-discovery**

```
awplus#show snmp-discovery

SNMP Discovery information:

SNMP Discovery                : Enabled
SNMP Polling interval         : 300
ARP Polling interval          : 60
SNMP Discovery version        : v2c
SNMPv2 Discovery Community    : accounting
```

Figure 51-3: Example output from **show snmp-discovery ip**

```
node1#show snmp-discovery ip

Related commands

clear snmp-discovery

service snmp-discovery

show running-config snmp-discovery

snmp-discovery arp-polling-interval

snmp-discovery deny

snmp-discovery permit

snmp-discovery snmp-polling-interval

Command changes

Version 5.5.0-0.3: command added

snmp-discovery arp-polling-interval

Overview Use this command to configure the SNMP ARP polling interval.

Use the **no** variant of this command to set the SNMP ARP polling interval back to the default (60 seconds).

Syntax

```
snmp-discovery arp-polling-interval <1-3600>
no snmp-discovery arp-polling-interval
```

Parameter	Description
<1-3600>	The polling number in seconds to interval in the range from 1 to 3600.

Default ARP requests are sent out every 60 seconds

Mode Global Configuration

Usage notes SNMP Discovery first uses ARP to discover subnets that are reachable from the AMF node. This polling happens every 60 seconds by default. Use this command to change the polling interval.

Examples To configure the SNMP Discovery ARP polling interval to 120 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery arp-polling-interval 120
```

To set the SNMP Discovery ARP polling interval back to the default (60 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery arp-polling-interval
```

Related commands service snmp-discovery

show snmp-discovery

Command changes Version 5.5.0-0.3: command added

snmp-discovery community

Overview Use this command to create an SNMP community in read-only mode for SNMPv1 and v2c only.

Use the **no** variant of this command to remove an SNMP community.

Syntax

```
snmp-discovery community <community-name>
```

Parameter	Description
<community-name>	The name of the community that can be up to 20 characters long and is case sensitive.

Default The SNMP Discovery community name is 'public' by default

Mode Global Configuration

Usage notes This command creates an SNMP community in read-only mode. The community allows access to all MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used for SNMPv3.

Examples To configure an SNMP community named 'accounting', use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery community accounting
```

To set the SNMP community name back to the default (public), use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery community
```

Related commands service snmp-discovery

show snmp-discovery

Command changes Version 5.5.0-0.3: command added

snmp-discovery deny

Overview Use this command to prevent ARP requests from being sent. When an interface or IPv4 address is denied, it means an ARP request and SNMP 'get' request will never be sent to that device when the command **service snmp-discovery** is enabled.

Use the **no** variant of this command to remove the configuration.

Syntax

```
snmp-discovery deny interface <interface-range>
snmp-discovery deny ip <ipv4-address>
no snmp-discovery deny interface <interface-range>
no snmp-discovery deny ip <ipv4-address>
```

Parameter	Description
`interface`	Interfaces to deny
<interface-name>	Interface name, for example VLAN2
`ip`	IP address
<ipv4-address>	IPv4 address to deny

Default The AMF management VLAN is denied

Mode Global Configuration

Examples To configure a deny interface command for VLAN2, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery deny interface vlan2
```

To stop interface VLAN2 from being denied, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery deny interface vlan2
```

To configure a deny IP command for IP address 192.168.3.2, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery deny ip 192.168.3.2
```

To stop IP address 192.168.3.2 from being denied, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery deny ip 192.168.3.2
```

Output Figure 51-6: Example output from **show snmp-discovery ip**

```
awplus#show snmp-discovery ip
SNMP Discovery Devices:

IP Address       MAC Address     Type     State         Last Seen Time
-------------------------------------------------------------------------
192.168.3.2      -               Deny     -             -
1.2.3.6          -               Permit   -             30 Jul, 2020 06:30:55
1.2.3.4          -               Permit   -             31 Jul, 2020 05:49:04
192.168.2.2      3863.bb5c.b900  Dynamic  Up            -
```

Related commands

service snmp-discovery

show snmp-discovery

Command changes

Version 5.5.0-0.3: command added

snmp-discovery permit

Overview Use this command if you want to allow SNMP Discovery to do requests on interfaces with greater than 256 members. You can permit a specific IP address.

Syntax

```
snmp-discovery permit ip <ipv4-address>
no snmp-discovery permit ip <ipv4-address>
```

Parameter	Description
`ip`	Internet Protocol (IP)
<ipv4-address>	IPv4 network address

Default All IPv4 interfaces with 256 members or less are included in SNMP Discovery.

Mode Global Configuration

Examples To configure a permit IP command for the address 192.168.3.2, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery permit ip 192.168.3.2
```

To remove the permit configuration for the address 192.168.3.2, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery permit ip 192.168.3.2
```

Output Figure 51-7: Example output from **show snmp-discovery ip**

```
awplus#show snmp-discovery ip
SNMP Discovery Devices:

IP Address       MAC Address     Type     State         Last Seen Time
-------------------------------------------------------------------------
1.2.3.5          -               Deny     -             -
1.2.3.6          -               Permit   -             Jul 27, 2020 03:33:39
1.2.3.4          -               Permit   -             Jul 28, 2020 04:25:05
192.168.2.2      3863.bb5c.b900  Dynamic  Up            -
192.168.3.2      4263.cc3c.b500  permit   Up            -
```

Related commands service snmp-discovery

show snmp-discovery

Command changes Version 5.5.0-0.3: command added

snmp-discovery snmp-polling-interval

Overview Use this command to change the SNMP request polling interval (in seconds).

Use the **no** variant of this command to set the SNMP request polling interval back to the default (300 seconds).

Syntax

```
snmp-discovery snmp-polling-interval <60-3600>
no snmp-discovery snmp-polling-interval
```

Parameter	Description
<60-3600>	The number of seconds for the SNMP polling interval. From the range 60 to 3600.

Default 300 seconds (5 minutes)

Mode Global Configuration

Usage notes ARP polling and SNMP Discovery uses SNMP 'get' requests to poll the devices discovered by the ARP polling. This polling happens every 300 seconds (5 minutes) by default.

SNMP polling is enabled when **service snmp-discovery** is enabled.

Examples To configure the SNMP discovery polling interval to 120 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery snmp-polling-interval 120
```

To set the SNMP discovery polling interval back to the default (300 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery snmp-polling-interval
```

Related commands service snmp-discovery

show snmp-discovery

Command changes Version 5.5.0-0.3: command added

snmp-discovery snmp-version

Overview Use this command to set the SNMP version that you are using.

Use the **no** variant of this command to set the SNMP version back to the default (v2c).

Syntax

```
snmp-discovery snmp-version {v1|v2c|v3}
no snmp-discovery snmp-version
```

Parameter	Description
v1	Enter the SNMP version number you are using
v2c	If you are using SNMP version v2c, set the community name with the command **snmp-discovery community**
v3	If you are using SNMP version v3, set the security with the command **snmp-discovery user**

Default SNMP version v2c

Mode Global Configuration

Usage notes This command defaults to SNMP version v2c and creates an SNMP community in read-only mode. The community allows access to all the MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used when operating SNMPv3.

If using SNMPv3, you can choose the security level and then the authentication protocol and privacy protocol.

Examples To configure SNMP Discovery to use SNMP version 3, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery snmp-version v3
```

To set the SNMP Discovery SNMP version back to the default (v2c), use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery snmp-version
```

Related commands service snmp-discovery

Command changes Version 5.5.0-0.3: command added

snmp-discovery user

Overview Use this command to create a user for SNMPv3 'get' requests only.

Use the **no** variant of this command to remove an SNMPv3 user.

Syntax

```
snmp-discovery user <user-name> [encrypted] [auth {md5|sha}
<auth-password>] [priv {des|aes} <privacy-password>]
```

```
no snmp-discovery user <user-name>
```

Parameter	Description
<user-name>	The user name is a string up to 20 characters long and is case sensitive. For example, 'Rodger'.
`encrypted`	Use the encrypted parameter when you want to enter encrypted passwords.
`auth`	Authentication protocol that can be either MD5 or SHA.
`md5`	MD5 Message Digest Algorithms.
`sha`	SHA Secure Hash Algorithm.
<auth-password>	Authentication password that is a string from 8 to 20 characters and is case sensitive.
`priv`	Privacy protocol that can be either DES or AES.
`des`	DES Data Encryption Standard.
`aes`	AES Advanced Encryption Standards.
<privacy-password>	Privacy password is a string from 8 to 20 characters and is case sensitive.

Default No user is configured

Mode Global Configuration

Usage notes Additionally, this command provides the option of selecting an authentication protocol and (where appropriate) an associated password. Similarly, options are offered for selecting a privacy protocol and password.

The authentication method must match what is used on the devices being configured.

Use the **encrypted** parameter when you want to enter already encrypted passwords in encrypted form as displayed in the running and startup configurations stored on the switch.

User passwords are entered using plain text without the **encrypted** parameter and are encrypted according to the authentication and privacy protocols selected.

User passwords are viewed as encrypted passwords in running and startup configurations shown from the **show running-config** and **show startup-config**

commands. Copy and paste encrypted passwords from the running configuration or startup configuration to avoid entry errors.

Examples To add SNMP Discovery user 'authuser' with authentication protocol 'md5', authentication password 'authpass' privacy protocol 'des' and privacy password privpass, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery user authuser auth md5 Authpass
priv des Privpass
```

To enter existing SNMP user 'authuser' with existing passwords with authentication protocol 'md5' plus the encrypted authentication password '0x1c74b9c22118291b0ce0cd883f8dab6b74', privacy protocol 'des' plus the encrypted privacy password '0x0e0133db5453ebd03822b004eeacb6608f', use the following commands:

Note Copy and paste the encrypted passwords from the running-config or the startup-config displayed, using the show running-config and show startup-config commands respectively, into the command line to avoid key stroke errors issuing this command.

```
awplus# configure terminal
awplus(config)# snmp-discovery user authuser encrypted auth
md50x1c74b9c22118291b0ce0cd883f8dab6b74 priv des
0x0e0133db5453ebd03822b004eeacb6608f
```

To delete SNMP user 'authuser', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery user authuser
```

Output Figure 51-8: Example output from **show snmp-discovery**

```
awplus#show snmp-discovery
SNMP Discovery information:

SNMP Discovery                : Enabled
SNMP Polling interval         : 300
ARP Polling interval          : 60
SNMP Discovery version        : v3

Command changes Version 5.5.0-0.3: command added

52 Dynamic Host Configuration Protocol (DHCP) Commands

Introduction

Overview

This chapter provides an alphabetical reference for commands used to configure DHCP.

Note that the DHCP client does not support tunnel interfaces.

For more information, see the DHCP Feature Overview and Configuration Guide.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Command List

- "bootfile" on page 2811
- "clear ip dhcp binding" on page 2812
- "default-router" on page 2813
- "dns-server" on page 2814
- "domain-name" on page 2815
- "host (DHCP)" on page 2816
- "ip address dhcp" on page 2817
- "ip dhcp bootp ignore" on page 2819
- "ip dhcp leasequery enable" on page 2820
- "ip dhcp option" on page 2821
- "ip dhcp pool" on page 2823
- "ip dhcp-client default-route distance" on page 2824
- "ip dhcp-client request vendor-identifying-specific" on page 2826
- "ip dhcp-client vendor-identifying-class" on page 2827
- "ip dhcp-relay agent-option" on page 2828
- "ip dhcp-relay agent-option checking" on page 2830

- "ip dhcp-relay agent-option remote-id" on page 2832
- "ip dhcp-relay information policy" on page 2834
- "ip dhcp-relay maxhops" on page 2836
- "ip dhcp-relay max-message-length" on page 2837
- "ip dhcp-relay server-address" on page 2839
- "ip dhcp-relay use-client-side-address" on page 2841
- "lease" on page 2843
- "network (DHCP)" on page 2845
- "next-server" on page 2846
- "option" on page 2847
- "probe enable" on page 2849
- "probe packets" on page 2850
- "probe timeout" on page 2851
- "probe type" on page 2852
- "range" on page 2853
- "route" on page 2854
- "service dhcp-relay" on page 2855
- "service dhcp-server" on page 2856
- "short-lease-threshold" on page 2857
- "show counter dhcp-client" on page 2859
- "show counter dhcp-relay" on page 2860
- "show counter dhcp-server" on page 2864
- "show dhcp lease" on page 2866
- "show ip dhcp binding" on page 2867
- "show ip dhcp pool" on page 2869
- "show ip dhcp-relay" on page 2874
- "show ip dhcp server statistics" on page 2876
- "show ip dhcp server summary" on page 2878
- "subnet-mask" on page 2879

bootfile

Overview This command sets the boot filename for a DHCP server pool. This is the name of the boot file that the client should use in its bootstrap process. It may need to include a path.

The **no** variant of this command removes the boot filename from a DHCP server pool.

Syntax

```
bootfile <filename>
no bootfile
```

Parameter	Description
<filename>	The boot file name.

Mode DHCP Configuration

Example To configure the boot filename for a pool P2, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# bootfile boot/main_boot.bt
```

clear ip dhcp binding

Overview This command clears either a specific lease binding or the lease bindings specified by the command or DHCP server. The command will only take effect on dynamically allocated bindings, not statically configured bindings.

Syntax

```
clear ip dhcp binding {ip <ip-address>|mac
<mac-address>|all|pool <pool-name>|range <low-ip-address>
<high-ip-address>}
```

Parameter	Description
`ip <ip-address>`	IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D.
`mac <mac-address>`	MAC address of the DHCP client, in hexadecimal notation in the format HHHH.HHHH.HHHH.
`all`	All DHCP bindings.
`pool <pool-name>`	Description used to identify DHCP server address pool. Valid characters are any printable character. If the name contains spaces then you must enclose these in “quotation marks”.
`range<low-ip-address> <high-ip-address>`	IPv4 address range for DHCP clients, in dotted decimal notation. The first IP address is the low end of the range, the second IP address is the high end of the range.

Mode User Exec and Privileged Exec

Usage A specific binding may be deleted by **ip** address or **mac** address, or several bindings may be deleted at once using **all**, **pool** or **range**.

Note that if you specify to clear the **ip** or **mac** address of what is actually a static DHCP binding, an error message is displayed. If **all**, **pool** or **range** are specified and one or more static DHCP bindings exist within those addresses, any dynamic entries within those addresses are cleared but any static entries are not cleared.

Examples To clear the specific IP address binding `192.168.1.1`, use the command:

```
awplus# clear ip dhcp binding ip 192.168.1.1
```

To clear all dynamic DHCP entries, use the command:

```
awplus# clear ip dhcp binding all
```

Related commands show ip dhcp binding

default-router

Overview This command adds a default router to the DHCP address pool you are configuring. You can use this command multiple times to create a list of default routers on the client's subnet. This sets the router details using the pre-defined option 3. Note that if you add a user-defined option 3 using the **option** command, then you will override any settings created with this command.

The **no** variant of this command removes either the specified default router, or all default routers from the DHCP pool.

Syntax

```
default-router <ip-address>
no default-router [<ip-address>]
```

Parameter	Description
<ip-address>	IPv4 address of the default router, in dotted decimal notation.

Mode DHCP Configuration

Examples To add a router with an IP address 192.168.1.2 to the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# default-router 192.168.1.2
```

To remove a router with an IP address 192.168.1.2 to the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no default-router 192.168.1.2
```

To remove all routers from the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no default-router
```

dns-server

Overview This command adds a Domain Name System (DNS) server to the DHCP address pool you are configuring. You can use this command multiple times to create a list of DNS name servers available to the client. This sets the DNS server details using the pre-defined option 6.

Note that if you add a user-defined option 6 using the option command, then you will override any settings created with this command.

The **no** variant of this command removes either the specified DNS server, or all DNS servers from the DHCP pool.

Syntax

```
dns-server <ip-address>
no dns-server [<ip-address>]
```

Parameter	Description
<ip-address>	IPv4 address of the DNS server, in dotted decimal notation.

Mode DHCP Configuration

Examples To add the DNS server with the assigned IP address 192.168.1.1 to the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# dns-server 192.168.1.1
```

To remove the DNS server with the assigned IP address 192.168.1.1 from the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no dns-server 192.168.1.1
```

To remove all DNS servers from the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no dns-server
```

Related commands

default-router

option

service dhcp-server

show ip dhcp pool

subnet-mask

domain-name

Overview This command adds a domain name to the DHCP address pool you are configuring. Use this command to specify the domain name that a client should use when resolving host names using the Domain Name System. This sets the domain name details using the pre-defined option 15.

Note that if you add a user-defined option 15 using the option command, then you will override any settings created with this command.

The **no** variant of this command removes the domain name from the address pool.

Syntax

```
domain-name <domain-name>
no domain-name
```

Parameter	Description
<domain-name>	The domain name you wish to assign the DHCP pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".

Mode DHCP Configuration

Examples To add the domain name `Nerv_Office` to DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# domain-name Nerv_Office
```

To remove the domain name `Nerv_Office` from DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no domain-name Nerv_Office
```

option

service dhcp-server

show ip dhcp pool

subnet-mask

host (DHCP)

Overview This command adds a static host address to the DHCP address pool you are configuring. The client with the matching MAC address is permanently assigned this IP address. No other clients can request it.

The **no** variant of this command removes the specified host address from the DHCP pool. Use the **no host all** command to remove all static host addresses from the DHCP pool.

Syntax

```
host <ip-address> <mac-address>
no host <ip-address>
no host all
```

Parameter	Description
<ip-address>	IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D
<mac-address>	MAC address of the DHCP client, in hexadecimal notation in the format HHHH.HHHH.HHHH

Mode DHCP Configuration

Usage Note that a network/mask must be configured using a **network** command before issuing a **host** command. Also note that a host address must match a network to add a static host address.

Examples To add the host at `192.168.1.5` with the MAC address `000a.451d.6e34` to DHCP pool `1`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool 1
awplus(dhcp-config)# network 192.168.1.0/24
awplus(dhcp-config)# host 192.168.1.5 000a.451d.6e34
```

To remove the host at `192.168.1.5` with the MAC address `000a.451d.6e34` from DHCP pool `1`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool 1
awplus(dhcp-config)# no host 192.168.1.5 000a.451d.6e34
```

Related Commands

lease

range

show ip dhcp pool

ip address dhcp

Overview This command activates the DHCP client on the interface you are configuring. This allows the interface to use the DHCP client to obtain its IP configuration details from a DHCP server on its connected network.

The **client-id** and **hostname** parameters are identifiers that you may want to set in order to interoperate with your existing DHCP infrastructure. If neither option is needed, then the DHCP server uses the MAC address field of the request to identify the host.

The DHCP client supports the following IP configuration options:

- Option 1— the subnet mask for your device.
- Option 3— a list of default routers.
- Option 6 — a list of DNS servers. This list appends the DNS servers set on your device with the ip name-server command.
- Option 15—a domain name used to resolve host names. This option replaces the domain name set with the ip domain-name command. Your device ignores this domain name if it has a domain list set using the ip domain-list command.
- Option 51—lease expiration time.

The **no** variant of this command stops the interface from obtaining IP configuration details from a DHCP server.

Syntax

```
ip address dhcp [client-id <interface>] [hostname <hostname>]
no ip address dhcp
```

Parameter	Description
`client-id <interface>`	The name of the interface you are activating the DHCP client on. If you specify this, then the MAC address associated with the specified interface is sent to the DHCP server in the optional identifier field. Default: no default
`hostname <hostname>`	The hostname for the DHCP client on this interface. Typically this name is provided by the ISP. Default: no default

Mode Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

Examples To set the interface vlan2 to use DHCP to obtain an IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip address dhcp
```

To stop the interface vlan2 from using DHCP to obtain its IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip address dhcp
```

Related commands

ip address (IP Addressing and Protocol)

show ip interface

show running-config

ip dhcp bootp ignore

Overview This command configures the DHCP server to ignore any BOOTP requests it receives. The DHCP server accepts BOOTP requests by default.

The **no** variant of this command configures the DHCP server to accept BOOTP requests. This is the default setting.

Syntax

```
ip dhcp bootp ignore
no ip dhcp bootp ignore
```

Mode Global Configuration

Examples To configure the DHCP server to ignore BOOTP requests, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp bootp ignore
```

To configure the DHCP server to respond to BOOTP requests, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp bootp ignore
```

Related commands show ip dhcp server summary

ip dhcp leasequery enable

Overview Use this command to enable the DHCP server to respond to DHCPLEASEQUERY packets. Enabling the DHCP leasequery feature allows a DHCP Relay Agent to obtain IP address information directly from the DHCP server using DHCPLEASEQUERY messages.

Use the **no** variant of this command to disable the support of DHCPLEASEQUERY packets.

For more information, see the DHCP Feature Overview and Configuration Guide.

Syntax

```
ip dhcp leasequery enable
no ip dhcp leasequery enable
```

Default DHCP leasequery support is disabled by default.

Mode Global Configuration

Examples To enable DHCP leasequery support, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp leasequery enable
```

To disable DHCP leasequery support, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp leasequery enable
```

Related commands

show counter dhcp-server

show ip dhcp server statistics

show ip dhcp server summary

ip dhcp option

Overview This command creates a user-defined DHCP option. Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

You can use this option when configuring a DHCP pool, by using the option command.

The **no** variant of this command removes either the specified user-defined option, or removes all user-defined options. This also automatically removes the user-defined options from the associated DHCP address pools.

Syntax

```
ip dhcp option <1-254> [name <option-name>] [<option-type>]
no ip dhcp option [<1-254>|<option-name>]
```

Parameter	Description	
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.	
<option-name>	Option name used to identify the option. You cannot use a number as the option name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". Default: no default	
<option-type>	The option value. You must specify a value that is appropriate to the option type:	
	`asci`	An ASCII text string
	`hex`	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.
	`ip`	An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually by using the option command multiple times.
	`integer`	A number from 0 to 4294967295.
	`flag`	A value that either sets (to 1) or unsets (to 0) a flag: **true**, **on**, or **enabled** will set the flag. **f alse**, **off** or **disabled** will unset the flag.

Mode Global Configuration

Examples

To define a user-defined ASCII string option as option 66, without a name, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp option 66 ascii
```

To define a user-defined hexadecimal string option as option 46, with the name "tcpip-node-type", use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option 46 name tcpip-node-type hex
```

To define a user-defined IP address option as option 175, with the name `special-address`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option 175 name special-address ip
```

To remove the specific user-defined option with the option number 12, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option 12
```

To remove the specific user-defined option with the option name `perform-router-discovery`, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option perform-router-discovery
```

To remove all user-defined option definitions, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option
```

Related commands

default-router

dns-server

domain-name

option

service dhcp-server

show ip dhcp server summary

subnet-mask

ip dhcp pool

Overview This command will enter the configuration mode for the pool name specified. If the name specified is not associated with an existing pool, the device will create a new pool with this name, then enter the configuration mode for the new pool.

Once you have entered the DHCP configuration mode, all commands executed before the next **exit** command will apply to this pool.

You can create multiple DHCP pools on devices with multiple interfaces. This allows the device to act as a DHCP server on multiple interfaces to distribute different information to clients on the different networks.

The **no** variant of this command deletes the specific DHCP pool.

Syntax

```
ip dhcp pool <pool-name>
no ip dhcp pool <pool-name>
```

Parameter	Description
<pool-name>	Description used to identify this DHCP pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”.

Mode Global Configuration

Example To create the DHCP pool named P2 and enter DHCP Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)#
```

To delete the DHCP pool named P2, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp pool P2
```

Related commands service dhcp-server

ip dhcp-client default-route distance

Overview Use this command to specify an alternative Administrative Distance (AD) for the current default route (from DHCP) for an interface.

Use the **no** variant of this command to set the AD back to the default of 1.

Syntax

```
ip dhcp-client default-route distance [<1-255>]
no ip dhcp-client default-route distance
```

Parameter	Description
<1-255>	Administrative Distance (AD) from the range 1 though 255.

Default 1

Mode Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

Usage notes DHCP client interfaces can automatically add a default route with an AD of 1 into the IP Routing Information Base (RIB).

Any pre-existing default route(s) via alternative interfaces (configured with a higher AD) will no longer be selected as the preferred forwarding path for traffic when the DHCP based default route is added to the IP routing table.

This can be problematic if the DHCP client is operating via an interface that is only intended to be used for back-up interface redundancy purposes, such as a VLAN containing a single switchport, or a 4G cellular interface on an AR-Series Firewall.

Use this command to set the AD of the default route (via a specific DHCP client interface) to a non-default (higher cost) value, ensuring any pre-existing default route(s) via any other interface(s) continue to be selected as the preferred forwarding path for network traffic.

When the command is used, the static default route is deleted from the RIB, the distance value of the route is modified to the configured distance value, then it is reinstalled into the RIB.

Examples To set the AD for the default route added by DHCP via cellular interface wwan0 to 150, use the commands:

```
awplus# configure terminal
awplus(config)# interface wwan0
awplus(config-if)# ip dhcp-client default-route distance 150
```

To set the AD for the default route back to the default value of 1, use the commands:

```
awplus# configure terminal
awplus(config)# interface wwan0
awplus(config-if)# no ip dhcp-client default-route distance
```

Related commands

show ip route

show ip route database

Command changes

Version 5.4.7-0.2 Command added.

ip dhcp-client request vendor-identifying-specific

Overview Use this command to add vendor-identifying vendor-specific information (option 125) requests to the DHCP discovery packets sent by an interface. This option, along with option 124, can be used to send vendor-specific information back to a DHCP client.

See RFC3925 for more information on Vendor-Identifying Vendor Options for DHCPv4.

Use the **no** variant of this command to remove the vendor-identifying-specific request from an interface.

Syntax

```
ip dhcp-client request vendor-identifying-specific
no ip dhcp-client request vendor-identifying-specific
```

Default The vendor-identifying-specific request is not configured by default.

Mode Interface Configuration

Usage notes The DHCP client must be activated on the interface, using the ip address dhcp command, so that DHCP discovery packets are sent.

Example To add the vendor-identifying-specific request on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-client request
vendor-identifying-specific
```

To remove the vendor-identifying-specific request on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-client request
vendor-identifying-specific
```

Related commands ip address dhcp

ip dhcp-client vendor-identifying-class

Command changes Version 5.4.7-2.1: command added

ip dhcp-client vendor-identifying-class

Overview Use this command to add a vendor-identifying vendor class (option 124) to the DHCP discovery packets sent by an interface. This option places the Allied Telesis Enterprise number (207) into the discovery packet. Option 124, along with option 125, can be used to send vendor-specific information back to a DHCP client.

See RFC3925 for more information on Vendor-Identifying Vendor Options for DHCPv4.

Use the **no** variant of this command to remove the vendor-identifying-class from an interface.

Syntax

```
ip dhcp-client vendor-identifying-class
no ip dhcp-client vendor-identifying-class
```

Default The vendor-identifying-class is not configured by default.

Mode Interface Configuration

Usage notes The DHCP client must be activated on the interface, using the ip address dhcp command, so that DHCP discovery packets are sent.

Example To remove the vendor-identifying-class on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-client vendor-identifying-class
```

Related commands ip address dhcp

ip dhcp-client request vendor-identifying-specific

Command changes Version 5.4.7-2.1: command added

ip dhcp-relay agent-option

Overview This command enables the DHCP Relay Agent to insert the DHCP Relay Agent Information Option (Option 82) into the client-request packets that it relays to its DHCP server. This allows the DHCP Relay Agent to pass on information to the server about the network location of the client device. The DHCP Relay Agent strips the DHCP Relay Agent Option 82 field out of the DHCP server's response, so that the DHCP client never sees this field.

When the DHCP Relay Agent appends its DHCP Relay Agent Option 82 data into the packet, it first overwrites any pad options present; then if necessary, it increases the packet length to accommodate the DHCP Relay Agent Option 82 data.

The **no** variant of this command stops the DHCP Relay Agent from appending the Option 82 field onto DHCP requests before forwarding it to the server.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

NOTE: *The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands ip dhcp-relay agent-option and ip dhcp-relay information policy have been configured.*

Syntax

```
ip dhcp-relay agent-option
no ip dhcp-relay agent-option
```

Default DHCP Relay Agent Information Option (Option 82) insertion is disabled by default.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Usage notes Use this command to alter the DHCP Relay Agent Option 82 setting when your device is the first hop for the DHCP client. To limit the maximum length of the packet, use the ip dhcp-relay max-message-length command.

Examples To make the DHCP Relay Agent listening on vlan2 append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the DHCP Relay Agent from appending the DHCP Relay Agent Option 82 field on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option
```

To make the relay agent listening on PPP interface ppp0 append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the relay agent from appending the DHCP Relay Agent Option 82 field on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip dhcp-relay agent-option
```

Related commands

ip dhcp-relay agent-option remote-id

ip dhcp-relay information policy

ip dhcp-relay max-message-length

service dhcp-relay

ip dhcp-relay agent-option checking

Overview This command enables the DHCP Relay Agent to check DHCP Relay Agent Information Option (Option 82) information in response packets returned from DHCP servers. If the information does not match the information it has for its own client (downstream) interface then the DHCP Relay Agent drops the packet. Note that ip dhcp-relay agent-option must be configured.

The DHCP Relay Agent Option 82 field is included in relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled (ip dhcp-relay agent-option), and
- DHCP Relay Agent is enabled on the device (service dhcp-relay)

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

Syntax

```
ip dhcp-relay agent-option checking
no ip dhcp-relay agent-option checking
```

Mode Interface Configuration for a VLAN interface or a PPP interface.

Examples To make the DHCP Relay Agent listening on vlan2 check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the DHCP Relay Agent on vlan2 from checking the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option checking
```

To make the relay agent listening on PPP interface ppp0 check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the relay agent from checking the DHCP Relay Agent Information Option (Option 82) field on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip dhcp-relay agent-option checking
```

Related commands

ip dhcp-relay agent-option

ip dhcp-relay agent-option remote-id

ip dhcp-relay information policy

service dhcp-relay

ip dhcp-relay agent-option remote-id

Overview Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field the DHCP Relay Agent inserts into clients' request packets. The Remote ID identifies the device that is inserting the DHCP Relay Agent Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the device's MAC address.

Use the **no** variant of this command to return the Remote ID for an interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

Syntax

```
ip dhcp-relay agent-option remote-id <remote-id>
no ip dhcp-relay agent-option remote-id
```

Parameter	Description
<remote-id>	An alphanumeric (ASCII) string, 1 to 63 characters in length. Additional characters allowed are hyphen (-), underscore (_) and hash (#). Spaces are not allowed.

Default The Remote ID is set to the device's MAC address by default.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Usage notes The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled (ip dhcp-relay agent-option), and
- DHCP Relay Agent is enabled on the device (service dhcp-relay)

Examples To set the Remote ID to myid for client DHCP packets received on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

To set the Remote ID to myid for client DHCP packets received on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0 timeslots all
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0 timeslots all
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

Related commands

ip dhcp-relay agent-option

ip dhcp-relay agent-option checking

show ip dhcp-relay

ip dhcp-relay information policy

Overview This command sets the policy for how the DHCP relay deals with packets arriving from the client that contain DHCP Relay Agent Option 82 information.

If the command **ip dhcp-relay agent-option** has not been configured, then this command has no effect at all - no alteration is made to Option 82 information in packets arriving from the client side.

However, if the command **ip dhcp-relay agent-option** has been configured, this command modifies how the DHCP relay service deals with cases where the packet arriving from the client side already contains DHCP Relay Agent Option 82 information.

This command sets the action that the DHCP relay should take when a received DHCP client request contains DHCP Relay Agent Option 82 information.

By default, the DHCP Relay Agent replaces any existing DHCP Relay Agent Option 82 field with its own DHCP Relay Agent field. This is equivalent to the functionality of the **replace** parameter.

The **no** variant of this command returns the policy to the default behavior - i.e. replacing the existing DHCP Relay Agent Option 82 field.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

NOTE: *The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands ip dhcp-relay agent-option and ip dhcp-relay information policy have been configured.*

Syntax

```
ip dhcp-relay information policy {append|drop|keep|replace}
no ip dhcp-relay information policy
```

Parameter	Description
`append`	The DHCP Relay Agent appends the DHCP Relay Agent Option 82 field of the packet with its own DHCP Relay Agent Option 82 details.
`drop`	The DHCP Relay Agent discards the packet.
`keep`	The DHCP Relay Agent forwards the packet without altering the DHCP Relay Agent Option 82 field.
`replace`	The DHCP Relay Agent replaces the existing DHCP Relay Agent details in the DHCP Relay Agent Option 82 field with its own details before forwarding the packet.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Examples

To make the DHCP Relay Agent listening on vlan2 drop any client requests that already contain DHCP Relay Agent Option 82 information, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay information policy drop
```

To reset the DHCP relay information policy to the default policy for interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay information policy
```

Related commands

ip dhcp-relay agent-option

ip dhcp-relay agent-option checking

service dhcp-server

ip dhcp-relay maxhops

Overview This command sets the hop count threshold for discarding BOOTP messages. When the hops field in a BOOTP message exceeds the threshold, the DHCP Relay Agent discards the BOOTP message. The hop count threshold is set to 10 hops by default.

Use the **no** variant of this command to reset the hop count to the default.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

Syntax

```
ip dhcp-relay maxhops <1-255>
no ip dhcp-relay maxhops
```

Parameter	Description
<1-255>	The maximum hop count value.

Default The default hop count threshold is 10 hops.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Example To set the maximum number of hops to 5 for packets received on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay maxhops 5
```

Related commands service dhcp-relay

ip dhcp-relay max-message-length

Overview This command applies when the device is acting as a DHCP Relay Agent and DHCP Relay Agent Option 82 insertion is enabled. It sets the maximum DHCP message length (in bytes) for the DHCP packet with its DHCP Relay Agent Option 82 data inserted. From this value it calculates the maximum packet size that it will accept at its input. Packets that arrive greater than this value will be dropped.

The **no** variant of this command sets the maximum message length to its default of 1400 bytes.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

Syntax

```
ip dhcp-relay max-message-length <548-1472>
no ip dhcp-relay max-message-length
```

Parameter	Description
<548-1472>	The maximum DHCP message length (this is the message header plus the inserted DHCP option fields in bytes).

Default The default is 1400 bytes.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Usage notes When a DHCP Relay Agent (that has DHCP Relay Agent Option 82 insertion enabled) receives a request packet from a DHCP client, it will append the DHCP Relay Agent Option 82 component data, and forward the packet to the DHCP server. The DHCP client will sometimes issue packets containing pad option fields that can be overwritten with Option 82 data.

Where there are insufficient pad option fields to contain all the DHCP Relay Agent Option 82 data, the DHCP Relay Agent will increase the packet size to accommodate the DHCP Relay Agent Option 82 data. If the new (increased) packet size exceeds that defined by the **maximum-message-length** parameter, then the DHCP Relay Agent will drop the packet.

NOTE: *Before setting this command, you must first run the ip dhcp-relay agent-option command. This will allow the DHCP Relay Agent Option 82 fields to be appended.*

Example To set the maximum DHCP message length to 1200 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay max-message-length 1200
```

To reset the maximum DHCP message length to the default of 1400 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay max-message-length
```

Related commands service dhcp-relay

ip dhcp-relay server-address

Overview This command adds a DHCP server for the DHCP Relay Agent to forward client DHCP packets to on a particular interface. You can add up to five DHCP servers on each device interface that the DHCP Relay Agent is listening on.

The **no** variant of this command deletes the specified DHCP server from the list of servers available to the DHCP relay agent.

The **no ip dhcp-relay** command removes all DHCP relay settings from the interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

Syntax

```
ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}
no ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}
no ip dhcp-relay
```

Parameter	Description
<ipv4-address>	Specify the IPv4 address of the DHCP server for the DHCP Relay Agent to forward client DHCP packets to, in dotted decimal notation. The IPv4 address uses the format A.B.C.D.
<ipv6-address>	Specify the IPv6 address of the DHCPv6 server for the DHCPv6 Relay Agent to forward client DHCP packets to, in hexadecimal notation.
<server-interface>	Specify the interface name of the DHCPv6 server. It is only required for a DHCPv6 server with an IPv6 address.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Usage notes For a DHCP server with an IPv6 address you must specify the interface for the DHCP server. See examples below for configuration differences between IPv4 and IPv6 DHCP relay servers.

See also the service dhcp-relay command to enable the DHCP Relay Agent on your device. The ip dhcp-relay server-address command defines a relay destination on an interface on the device, needed by the DHCP Relay Agent to relay DHCP client packets to a DHCP server.

Examples

To enable the DHCP Relay Agent to relay DHCP packets on interface vlan2 to the DHCP server with the IPv4 address 192.0.2.200, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay server-address 192.0.2.200
```

To remove the DHCP server with the IPv4 address 192.0.2.200 from the list of servers available to the DHCP Relay Agent on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay server-address 192.0.2.200
```

To enable the DHCP Relay Agent on your device to relay DHCP packets on interface vlan10 to the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan10
awplus(config-if)# ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

To remove the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20 from the list of servers available to the DHCP Relay Agent on interface vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

To disable DHCP relay on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay
```

Related commands

service dhcp-relay

ip dhcp-relay use-client-side-address

Overview Use this command to configure DHCP-Relay to use the client-side interface (that is the interface receiving the DHCP client packets) IP address as the source address of the relayed DHCP packets.

Use the **no** variant of this command to disable the use of the client-side interface IP address as the source IP address for relayed DHCP packets.

Syntax

```
ip dhcp-relay use-client-side-address
no ip dhcp-relay use-client-side-address
```

Parameter	Description
`use-client-side-address`	Use the client side interface IP address as the source IP address for relayed DHCP packets.

Default By default, the server-side interface IP address is used as the source IP address of DHCP relayed packets.

Mode Global Configuration

Usage notes In most cases, there are filters placed between the DHCP relay and DHCP server which only allow DHCP packets from the client subnet to the server and back. This command allows you to configure the DHCP relay so that the relay will use the IP address of the interface **receiving** clients DHCP requests to be used as the source IP address of the relayed DHCP packets.

Example To configure the client-side IP address as the source IP address of DHCP relayed packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp-relay use-client-side-address
```

Output Figure 52-1: Example output from **show ip dhcp-relay**

Note that the second line of the display output shows the status of the client-side address being enabled as the source IP address.

```
awplus#sh ip dhcp-relay

DHCP Relay Service is enabled
Use of client side address as source address is enabled

vlan2 is down, line protocol is down
Maximum hop count is 10
Maximum DHCP message length is 1400
Insertion of Relay Agent Option is disabled
Checking of Relay Agent Option is disabled
Insertion of Subscriber-ID auto-MAC is disabled
The Remote Id string for Relay Agent Option is 0000.0000.0000
Relay Information policy is to replace existing relay agent information
List of servers :   10.1.1.100
```

Related commands ip dhcp-relay server-address

Command changes Version 5.4.9-0.7: command added

lease

Overview This command sets the expiration time for a leased address for the DHCP address pool you are configuring. The time set by the days, hours, minutes and seconds is cumulative. The minimum total lease time that can be configured is 20 seconds. The maximum total lease time that can be configured is 120 days.

Note that if you add a user-defined option 51 using the option command, then you will override any settings created with this command. Option 51 specifies a lease time of 1 day.

Use the **infinite** parameter to set the lease expiry time to infinite (leases never expire).

Use the **no** variant of this command to return the lease expiration time back to the default of one day.

Syntax

```
lease <days> <hours> <minutes> [<seconds>]
lease infinite
no lease
```

Parameter	Description
<days>	The number of days, from 0 to 120, that the lease expiry time is configured for. Default: 1
<hours>	The number of hours, from 0 to 24, that the lease expiry time is configured for. Default: 0
<minutes>	The number of minutes, from 0 to 60, the lease expiry time is configured for. Default: 0
<seconds>	The number of seconds, from 0 to 60, the lease expiry time is configured for.
`infinite`	The lease never expires.

Default The default lease time is 1 day.

Mode DHCP Configuration

Examples To set the lease expiration time for address pool P2 to 35 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# lease 0 0 35
```

To set the lease expiration time for the address pool `Nerv_Office` to 1 day, 5 hours, and 30 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# lease 1 5 30
```

To set the lease expiration time for the address pool P3 to 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P3
awplus(dhcp-config)# lease 0 0 0 20
```

To set the lease expiration time for the pool to never expire, use the command:

```
awplus(dhcp-config)# lease infinite
```

To return the lease expiration time to the default of one day, use the command:

```
awplus(dhcp-config)# no lease
```

Related commands

option

service dhcp-server

short-lease-threshold

network (DHCP)

Overview This command sets the network (subnet) that the DHCP address pool applies to.

The **no** variant of this command removes the network (subnet) from the DHCP address pool.

Syntax

```
network
{<ip-subnet-address/prefix-length>|<ip-subnet-address/mask>}
no network
```

Parameter	Description
<ip-subnet-address/prefix-length>	The IPv4 subnet address in dotted decimal notation followed by the prefix length in slash notation.
<ip-subnet-address/mask>	The IPv4 subnet address in dotted decimal notation followed by the subnet mask in dotted decimal notation.

Mode DHCP Configuration

Usage notes This command will fail if it would make existing ranges invalid. For example, if they do not lie within the new network you are configuring.

The **no** variant of this command will fail if ranges still exist in the pool. You must remove all ranges in the pool before issuing a **no network** command to remove a network from the pool.

Examples To configure a network for the address pool P2, where the subnet is `192.0.2.5` and the mask is `255.255.255.0`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# network 192.0.2.5/24
```

or you can use dotted decimal notation instead of slash notation for the subnet-mask:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# network 192.0.2.5 255.255.255.0
```

Related commands service dhcp-server

subnet-mask

next-server

Overview This command sets the next server address for a DHCP server pool. It is the address of the next server that the client should use in its bootstrap process.

The **no** variant of this command removes the next server address from the DHCP address pool.

Syntax

```
next-server <ip-address>
no next-server
```

Parameter	Description
<ip-address>	The server IP address, entered in dotted decimal notation.

Mode DHCP Configuration

Example To set the next-server address for the address pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# next-server 192.0.2.2
```

option

Overview This command adds a user-defined option to the DHCP address pool you are configuring. For the **hex**, **integer**, and **flag** option types, if the option already exists, the new option overwrites the existing option's value. Options with an **ip** type can hold a list of IP addresses or masks (i.e. entries that have the A.B.C.D address format), so if the option already exists in the pool, then the new IP address is added to the list of existing IP addresses.

Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

The **no** variant of this command removes the specified user-defined option from the DHCP pool, or all user-defined options from the DHCP pool.

Syntax

```
option [<1-254>|<option-name>] <option-value>
no option [<1-254>|<option-value>]
```

Parameter	Description	
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.	
<option-name>	Option name associated with the option.	
<option-value>	The option value. You must specify a value that is appropriate to the option type:	
	`hex`	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.
	`ip`	An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually using the option command multiple times.
	`integer`	A number from 0 to 4294967295.
	`flag`	A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.

Mode DHCP Configuration

Examples

To add the ASCII-type option named `tftp-server-name` to the pool P2 and give the option the value `server1`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# option tftp-server-name server1
```

To add the hex-type option named `tcpip-node-type` to the pool P2 and give the option the value `08af`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# option tcpip-node-type 08af
```

To add multiple IP addresses for the ip-type option `175`, use the command:

```
awplus(dhcp-config)# option 175 192.0.2.6
awplus(dhcp-config)# option 175 192.0.2.12
awplus(dhcp-config)# option 175 192.0.2.33
```

To add the option `179` to a pool, and give the option the value `123456`, use the command:

```
awplus(dhcp-config)# option 179 123456
```

To add a user-defined flag option with the name `perform-router-discovery`, use the command:

```
awplus(dhcp-config)# option perform-router-discovery yes
```

To clear all user-defined options from a DHCP address pool, use the command:

```
awplus(dhcp-config)# no option
```

To clear a user-defined option, named `tftp-server-name`, use the command:

```
awplus(dhcp-config)# no option tftp-server-name
```

Related commands

probe enable

Overview Use this command to enable lease probing for a DHCP pool. Probing is used by the DHCP server to check if an IP address it wants to lease to a client is already being used by another host.

The **no** variant of this command disables probing for a DHCP pool.

Syntax

```
probe enable
no probe enable
```

Default Probing is enabled by default.

Mode DHCP Pool Configuration

Examples To enable probing for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe enable
```

To disable probing for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe enable
```

Related commands

ip dhcp pool

probe packets

probe timeout

show ip dhcp pool

probe packets

Overview Use this command to specify the number of packets sent for each lease probe. Lease probing is configured on a per-DHCP pool basis. When set to 0 probing is effectively disabled.

The **no** variant of this command sets the number of probe packets sent to the default of 5.

Syntax

```
probe packets <0-10>
no probe packets
```

Parameter	Description
<0-10>	The number of probe packets sent.

Default The default is 5.

Mode DHCP Pool Configuration

Examples To set the number of probe packets to 2 for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe packets 2
```

To set the number of probe packets to the default 5 for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe packets
```

Related commands

probe enable

probe timeout

probe type

show ip dhcp pool

probe timeout

Overview Use this command to set the timeout value in milliseconds that the server waits for a response after each probe packet is sent. Lease probing is configured on a per-DHCP pool basis.

The **no** variant of this command sets the probe timeout value to the default setting, 200 milliseconds.

Syntax

```
probe timeout <50-5000>
no probe timeout
```

Parameter	Description
<50-5000>	Timeout interval in milliseconds.

Default The default timeout interval is 200 milliseconds.

Mode DHCP Pool Configuration

Examples To set the probe timeout value to 500 milliseconds for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe timeout 500
```

To set the probe timeout value for pool P2 to the default, 200 milliseconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe timeout
```

Related commands

probe enable

probe packets

probe type

show ip dhcp pool

probe type

Overview Use this command to set the probe type for a DHCP pool. The probe type specifies how the DHCP server checks whether an IP address is being used by other hosts, referred to as lease probing. If **arp** is specified, the server sends an ARP request to determine if an address is in use. If **ping** is specified, the server will send an ICMP Echo Request (ping).

The **no** variant of this command sets the probe type to the default setting, ping.

Syntax

```
probe type {arp|ping}
no probe type
```

Parameter	Description
`arp`	Probe using ARP.
`ping`	Probe using ping.

Default The default probe type is ping.

Mode DHCP Pool Configuration

Examples To set the probe type to `arp` for the pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe type arp
```

To set the probe type for the pool P2 to the default, `ping`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe type
```

Related commands

ip dhcp pool

show ip dhcp pool

range

Overview This command adds an address range to the DHCP address pool you are configuring. The DHCP server responds to client requests received from the pool's network. It assigns an IP addresses within the specified range. The IP address range must lie within the network. You can add multiple address ranges and individual IP addresses for a DHCP pool by using this command multiple times.

The **no** variant of this command removes an address range from the DHCP pool. Use the **no range all** command to remove all address ranges from the DHCP pool.

Syntax

```
range <ip-address> [<ip-address>]
no range <ip-address> [<ip-address>]
no range all
```

Parameter	Description
<ip-address>	IPv4 address range for DHCP clients, in dotted decimal notation. The first IP address is the low end of the range, the second IP address is the high end. Specify only one IP address to add an individual IP address to the address pool.

Mode DHCP Configuration

Examples To add an address range of `192.0.2.5` to `192.0.2.16` to the pool `Nerv_Office`, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# range 192.0.2.5 192.0.2.16
```

To add the individual IP address `192.0.2.2` to a pool, use the command:

```
awplus(dhcp-config)# range 192.0.2.2
```

To remove all address ranges from a pool, use the command:

```
awplus(dhcp-config)# no range all
```

Related commands

ip dhcp pool

service dhcp-server

show ip dhcp pool

route

Overview This command allows the DHCP server to provide static routes to clients.

Syntax

```
route A.B.C.D/M A.B.C.D {both|opt249|rfc3442}
```

Parameter	Description
`A.B.C.D/M`	Subnet for the route
`A.B.C.D`	Next hop for the route
`both`	opt249 and rft3442
`opt249`	Classless static route option for DHCP
`rfc3442`	Classless static route option for DHCP

Mode DHCP Configuration

Examples To distribute static routes for route `0.0.0.0/0` whose next hop is `192.16.1.1` to clients using both `opt249` and `rfc3442`, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool pubic
awplus(dhcp-config)# route 0.0.0.0/0 192.16.1.1 both
```

Related commands ip dhcp pool

service dhcp-relay

Overview This command enables the DHCP Relay Agent on the device. However, on a given IP interface, no DHCP forwarding takes place until at least one DHCP server is specified to forward/relay all clients' DHCP packets to.

The **no** variant of this command disables the DHCP Relay Agent on the device for all interfaces.

Syntax

```
service dhcp-relay
no service dhcp-relay
```

Mode Global Configuration

Usage notes A maximum number of 400 DHCP Relay Agents (one per interface) can be configured on the device. Once this limit has been reached, any further attempts to configure DHCP Relay Agents will not be successful.

Default The DHCP-relay service is enabled by default.

Examples To enable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
```

To disable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-relay
```

Related commands

ip dhcp-relay agent-option

ip dhcp-relay agent-option checking

ip dhcp-relay information policy

ip dhcp-relay maxhops

ip dhcp-relay server-address

service dhcp-server

Overview This command enables the DHCP server on your device. The server then listens for DHCP requests on all IP interfaces. It will not run if there are no IP interfaces configured.

The **no** variant of this command disables the DHCP server.

Syntax

```
service dhcp-server
no service dhcp-server
```

Mode Global Configuration

Example To enable the DHCP server, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-server
```

Related commands

ip dhcp pool

show ip dhcp server summary

subnet-mask

short-lease-threshold

Overview Use this command to configure a short lease threshold.

Use the **no** variant of this command to return the short lease threshold to the default of one minute.

Syntax

```
short-lease-threshold <hours> <minutes>
no short-lease-threshold
```

Parameter	Description
<hours>	The number of hours, from 0 to 24.
<minutes>	The number of minutes, from 0 to 60.

Default 1 minute.

Mode DHCP Configuration

Usage notes DHCP leases need to be backed up in NVS so that when the DHCP server reboots or goes through a power cycle it won't lose all the knowledge of these leases.

Some networks have a high number of mobile devices repeatedly requesting DHCP leases every few seconds before their existing lease expires. This can happen for example, when mobile devices move in and out of a Wi-Fi zone or when Wi-Fi signal strength changes. This means the same IP address can have multiple lease entries which can take up unnecessary backup file space.

The **short-lease-threshold** command allows you to configure the threshold for a short lease, from 1 minute to 24 hours. Any lease less than the threshold is deemed to be a short lease and will NOT be backed up to NVS.

This is useful if you have:

- limited backup file space, and
- you don't need to restore leases after a device reboot or power cycle

Example To set the short lease threshold for address pool P2 to 40 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# short-lease-threshold 0 40
```

To set the short lease threshold for address pool Nerv_Office to 5 hours and 35 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# short-lease-threshold 5 35
```

To return the short lease threshold to the default of one minute, use the following commands:

```
awplus# configure terminal
awplus(config)# no short-lease-threshold
```

Command changes Version 5.4.8-2.1: command added

show counter dhcp-client

Overview This command shows counters for the DHCP client on your device.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show counter dhcp-client
```

Mode User Exec and Privileged Exec

Example To display the message counters for the DHCP client on your device, use the command:

```
awplus# show counter dhcp-client
```

Output Figure 52-2: Example output from the **show counter dhcp-client** command

```
show counter dhcp-client

DHCPDISCOVER out      ......... 10
DHCPREQUEST out       ......... 34
DHCPDECLINE out       ......... 4
DHCPRELEASE out       ......... 0
DHCPOFFER in          ......... 22
DHCPACK in            ......... 18
DHCPNAK in            ......... 0
```

Table 1: Parameters in the output of the **show counter dhcp-client** command

Parameter	Description
DHCPDISCOVER out	The number of DHCP Discover messages sent by the client.
DHCPREQUEST out	The number of DHCP Request messages sent by the client.
DHCPDECLINE out	The number of DHCP Decline messages sent by the client.
DHCPRELEASE out	The number of DHCP Release messages sent by the client.
DHCPOFFER in	The number of DHCP Offer messages received by the client.
DHCPACK in	The number of DHCP Acknowledgement messages received by the client.
DHCPNAK in	The number of DHCP Negative Acknowledgement messages received by the client.

Related commands ip address dhcp

show counter dhcp-relay

Overview This command shows counters for the DHCP Relay Agent on your device.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show counter dhcp-relay
```

Syntax (VRF-lite)

```
show counter dhcp-relay [vrf <vrf-name>|global]
```

Parameter	Description
`vrf`	Display the output for a VRF instance
<vrf-name>	The name of the specific VRF instance.
`global`	Display the output for the Global VRF instance

Mode User Exec and Privileged Exec

Examples To display counters for the DHCP Relay Agent on your device, use the following command:

```
awplus# show counter dhcp-relay
```

Output Figure 52-3: Example output from the **show counter dhcp-relay** command

```
awplus#show counter dhcp-relay

Figure 52-4: Example output from the **show counter dhcp-relay** command for VRF instance red

```
DHCP relay counters

[VRF red]
Requests In ..................... 4
Replies In ...................... 4
Relayed To Server ............... 4
Relayed To Client ............... 4
Out To Server Failed ............ 0
Out To Client Failed ............ 0
Invalid hlen .................... 0
Bogus giaddr .................... 0
Corrupt Agent Option ............ 0
Missing Agent Option ............ 0
Bad Circuit ID .................. 0
Missing Circuit ID .............. 0
Option Insert Failed ............ 0
```

Parameter	Description
`Requests In`	The number of DHCP Request messages received from clients.
`Replies In`	The number of DHCP Reply messages received from servers.
`Relayed To Server`	The number of DHCP Request messages relayed to servers.
`Relayed To Client`	The number of DHCP Reply messages relayed to clients.
`Out To Server Failed`	The number of failures when attempting to send request messages to servers. This is an internal debugging counter.
`Out To Client Failed`	The number of failures when attempting to send reply messages to clients. This is an internal debugging counter.
`Invalid hlen`	The number of incoming messages dropped due to an invalid hlen field.
`Bogus giaddr`	The number of incoming DHCP Reply messages dropped due to the bogus giaddr field.
`Corrupt Agent Option`	The number of incoming DHCP Reply messages dropped due to a corrupt relay agent information option field. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command.

Parameter	Description
`Missing Agent Option`	The number of incoming DHCP Reply messages dropped due to a missing relay agent information option field. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command.
`Bad Circuit ID`	The number of incoming DHCP Reply messages dropped due to a bad circuit ID. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command
`Missing Circuit ID`	The number of incoming DHCP Reply messages dropped due to a missing circuit ID. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command
`Bad Remote ID`	The number of incoming DHCP Reply messages dropped due to a bad remote ID. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command
`Missing Remote ID`	The number of incoming DHCP Reply messages dropped due to a missing remote ID. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command

Parameter	Description
`Option Insert Failed`	The number of incoming DHCP Request messages dropped due to an error adding the DHCP Relay Agent information (option-82). This counter increments when: • the DHCP Relay Agent is set to drop packets with the DHCP Relay Agent Option 82 field already filled by another DHCP Relay Agent. This policy is set with the ip dhcp-relay information policy command. • there is a packet error that stops the DHCP Relay Agent from being able to append the packet with its DHCP Relay Agent Information Option (Option 82) field.
Note that the following parameters are only used on the Global VRF instance when DHCPv6 is running	
`DHCPv6 Requests In`	The number of incoming DHCPv6 Request messages.
`DHCPv6 Replies In`	The number of incoming DHCPv6 Reply messages.
`DHCPv6 Relayed to Server`	The number of DHCPv6 messages relayed to the server.
`DHCPv6 Relayed to Client`	The number of DHCPv6 messages relayed to the client.

show counter dhcp-server

Overview This command shows counters for the DHCP server on your device.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show counter dhcp-server
```

Mode User Exec and Privileged Exec

Example To display counters for the DHCP server on your device, use the command:

```
awplus# show counter dhcp-server
```

Output Figure 52-5: Example output from the **show counter dhcp-server** command

```
DHCP server counters
DHCPDISCOVER in       ......... 20
DHCPREQUEST in        ......... 12
DHCPDECLINE in        ......... 1
DHCPRELEASE in        ......... 0
DHCPINFORM in         ......... 0
DHCPOFFER out         ......... 8
DHCPACK out           ......... 4
DHCPNAK out           ......... 0
BOOTREQUEST in        ......... 0
BOOTREPLY out         ......... 0
```

Table 2: Parameters in the output of the **show counter dhcp-server** command

Parameter	Description
DHCPDISCOVER in	The number of Discover messages received by the DHCP server.
DHCPREQUEST in	The number of Request messages received by the DHCP server.
DHCPDECLINE in	The number of Decline messages received by the DHCP server.
DHCPRELEASE in	The number of Release messages received by the DHCP server.
DHCPINFORM in	The number of Inform messages received by the DHCP server.
DHCPOFFER out	The number of Offer messages sent by the DHCP server.
DHCPACK out	The number of Acknowledgement messages sent by the DHCP server.

Table 2: Parameters in the output of the **show counter dhcp-server** command

Parameter	Description
`DHCPNAK out`	The number of Negative Acknowledgement messages sent by the DHCP server. The server sends these after receiving a request that it cannot fulfil because either there are no available IP addresses in the related address pool, or the request has come from a client that doesn't fit the network setting for an address pool.
`BOOTREQUEST in`	The number of bootp messages received by the DHCP server from bootp clients.
`BOOTREPLY out`	The number of bootp messages sent by the DHCP server to bootp clients.

show dhcp lease

Overview This command shows details about the leases that the DHCP client has acquired from a DHCP server for interfaces on the device.

For information on filtering and saving command output, see "Controlling "show" Command Output" in the "Getting Started with AlliedWare_Plus" Feature Overview and Configuration Guide.

Syntax

```
show dhcp lease [<interface>]
```

Parameter	Description
<interface>	Interface name to display DHCP lease details for.

Mode User Exec and Privileged Exec

Example To show the current lease expiry times for all interfaces, use the command:

```
awplus# show dhcp lease
```

To show the current lease for vlan1, use the command:

```
awplus# show dhcp lease vlan1
```

Output Figure 52-6: Example output from the **show dhcp lease vlan1** command

```
Interface vlan1
----------------------------------------------------------------
IP Address:                    192.168.22.4

Related commands ip address dhcp

show ip dhcp binding

Overview This command shows the lease bindings that the DHCP server has allocated clients.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax `show ip dhcp binding [<ip-address>|<address-pool>]`

Parameter	Description
<ip-address>	IPv4 address of a leased IP address, in dotted decimal notation. This displays the lease information for the specified IP address.
<address-pool>	Name of an address pool. This displays the lease information for all clients within the address pool.

Mode User Exec and Privileged Exec

Examples To display all leases for every client in all address pools, use the command:

```
awplus# show ip dhcp binding
```

To display the details for the leased IP address `172.16.2.16`, use the command:

```
awplus# show ip dhcp binding 172.16.2.16
```

To display the leases from the address pool `MyPool`, use the command:

```
awplus# show ip dhcp binding MyPool
```

Output Figure 52-7: Example output from the **show ip dhcp binding** command

```
Pool 30_2_network Network 172.16.2.0/24

Overview This command displays the configuration details and system usage of the DHCP address pools configured on the device.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ip dhcp pool [<address-pool>]
```

Parameter	Description
<address-pool>	Name of a specific address pool. This displays the configuration of the specified address pool only.

Mode User Exec and Privileged Exec

Example

```
awplus# show ip dhcp pool
```

Output Figure 52-8: Example output from the **show ip dhcp pool** command

```
Pool p1 :
  network: 192.168.1.0/24
  address ranges:
    addr: 192.168.1.10 to 192.168.1.18
  static host addresses:
    addr: 192.168.1.12     MAC addr: 1111.2222.3333
  lease <days:hours:minutes:seconds> <1:0:0:0>
  subnet mask: 255.255.255.0 (pool's network mask)
  Probe:                        Default Values
    Status:       Enabled      [Enabled]
    Type:         ARP          [Ping]
    Packets:      2            [5]
    Timeout:      200 msecs    [200]
  Dynamic addresses:
    Total:        8
    Leased:       2
    Utilization:  25.0 %
  Static host addresses:
    Total:        1
    Leased:       1
```

Output Figure 52-9: Example output from the **show ip dhcp pool** command with IP address 192.168.1.12 assigned to a VLAN interface on the device:

```
Pool p1 :
  network: 192.168.1.0/24
  address ranges:
    addr: 192.168.1.10 to 192.168.1.18
            (interface addr 192.168.1.12 excluded)
            (static host addr 192.168.1.12 excluded)
  static host addresses:
    addr: 192.168.1.12     MAC addr: 1111.2222.3333
            (= interface addr, so excluded)
  lease <days:hours:minutes:seconds> <1:0:0:0>
  subnet mask: 255.255.255.0 (pool's network mask)
  Probe:                       Default Values
    Status:       Enabled      [Enabled]
    Type:         ARP          [Ping]
    Packets:      2            [5]
    Timeout:      200 msecs    [200]
  Dynamic addresses:
    Total:        8
    Leased:       2
    Utilization:  25.0 %
  Static host addresses:
    Total:        1
    Leased:       1
```

Output Figure 52-10: Example output from the **show ip dhcp pool** command with a host with MAC 0000.cd38.05f9 is registered as a static host by DHCP Framed IP Lease feature from AUTHD:

```
Pool p1 :
  network: 10.1.1.0/24
  address ranges:
    addr: 10.1.1.101 to 10.1.1.199
            (static host addr 10.1.1.122 excluded)
            (static host addr 10.1.1.111 excluded)
  static host addresses:
    addr: 10.1.1.122       MAC addr: 0000.1111.2222
    addr: 10.1.1.111       MAC addr: 0000.cd38.05f9
                           Netmask : 255.255.255.0
                           Gateway : 10.1.1.1
                           Lease   : 60 seconds
                           Added by AUTHD
  lease  <1:0:0:0>
  subnet mask: 255.255.255.0 (pool's network mask)
  Probe:                       Default Values
    Status:       Enabled      [Enabled]
    Type:         Ping         [Ping]
    Packets:      5            [5]

    Leased:       1
    Utilization:  1.0 %
  Static host addresses:
    Total:        2
    Leased:       2
```

Table 3: Parameters in the output of the **show ip dhcp pool** command

Parameter	Description
Pool	Name of the pool.
network	Subnet and mask length of the pool.
address ranges	Individual IP addresses and address ranges configured for the pool. The DHCP server can offer clients an IP address from within the specified ranges only. Any of these addresses that match an interface address on the device, or a static host address configured in the pool, will be automatically excluded from the range, and a message to this effect will appear beneath the range entry.

Table 3: Parameters in the output of the **show ip dhcp pool** command (cont.)

Parameter	Description
static host addresses	The static host addresses configured on the pool. Each IP address is permanently assigned to the client with the matching MAC address. Any of these addresses that match an interface address on the device will be automatically excluded, and a message to this effect will appear beneath the static host entry.
lease <days:hours:minutes>	The lease duration for address allocated by this pool.
domain	The domain name sent by the pool to clients. This is the domain name that the client should use when resolving host names using DNS.
subnet mask	The subnet mask sent by the pool to clients.
Probe - Status	Whether lease probing is enabled or disabled.
Probe - Type	The lease probe type configured. Either ping or ARP.
Probe - Packets	The number of packets sent for each lease probe in the range 0 to 10.
Probe - Timeout	The timeout value in milliseconds to wait for a response after each probe packet is sent. In the range 50 to 5000.
dns servers	The DNS server addresses sent to by the pool to clients.
default-router(s)	The default router addresses sent by the pool to clients.
user-defined options	The list of user-defined options sent by the pool to clients.
Dynamic addresses- Total	The total number of IP addresses that have been configured in the pool for dynamic allocation to DHCP clients.
Dynamic addresses- Leased	The number of IP addresses in the pool that have been dynamically allocated (leased) to DHCP clients.
Dynamic addresses - Utilization	The percentage of IP addresses in the pool that are currently dynamically allocated to clients.
Static host addresses- Total	The number of static IP addresses configured in the pool for specific DHCP client hosts.
Static host addresses - Leased	The number of static IP addresses assigned to specific DHCP client hosts.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax
```
show ip dhcp-relay [interface <interface-name>]
```

Syntax (VRF-lite)
```
show ip dhcp-relay [vrf <name>|global] [interface
<interface-name>]
```

Parameter	Description
<interface-name>	Name of a specific interface. This displays the DHCP configuration for the specified interface only.
`vrf`	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.
`global`	The Global VRF instance.

Mode User Exec and Privileged Exec

Example To display the DHCP Relay Agent's configuration on the interface vlan2, use the command:

```
awplus# show ip dhcp-relay interface vlan2
```

Output Figure 52-11: Example output from the **show ip dhcp-relay** command

```
DHCP Relay Service is enabled

vlan2 is up, line protocol is up
Maximum hop count is 10
Insertion of Relay Agent Option is disabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay information policy is to append new relay agent
information
List of servers :   192.168.1.200
```

Output (VRF-lite)

Figure 52-12: Example output from the **show ip dhcp-relay** command applied for VRF instance red

```
DHCP Relay Service is enabled

[VRF: red]
vlan2 is up, line protocol is up
Maximum hop count is 10
Maximum DHCP message length is 1400
Insertion of Relay Agent Option is enabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay Information policy is to replace existing relay agent
information
List of servers :   192.168.1.3
```

Command changes

Version 5.4.6-2.1: VRF-lite support added.

show ip dhcp server statistics

Overview This command shows statistics related to the DHCP server.

You can display the server counters using the show counter dhcp-server command as well as with this command.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ip dhcp server statistics
```

Mode User Exec and Privileged Exec

Example To display the server statistics, use the command:

```
awplus# show ip dhcp server statistics
```

Output Figure 52-13: Example output from the **show ip dhcp server statistics** command

```
DHCP server counters
DHCPDISCOVER in       ......... 20
DHCPREQUEST in        ......... 12
DHCPDECLINE in        ......... 1
DHCPRELEASE in        ......... 0
DHCPINFORM in         ......... 0
DHCPOFFER out         ......... 8
DHCPACK out           ......... 4
DHCPNAK out           ......... 0
BOOTREQUEST in        ......... 0
BOOTREPLY out         ......... 0
DHCPLEASEQUERY in       ....... 0
DHCPLEASEUNKNOWN out    ....... 0
DHCPLEASEACTIVE out     ....... 0
DHCPLEASEUNASSIGNED out ....... 0
```

Table 4: Parameters in the output of the **show ip dhcp server statistics** command

Parameter	Description
DHCPDISCOVER in	The number of Discover messages received by the DHCP server.
DHCPREQUEST in	The number of Request messages received by the DHCP server.
DHCPDECLINE in	The number of Decline messages received by the DHCP server.

Table 4: Parameters in the output of the **show ip dhcp server statistics** command (cont.)

Parameter	Description
DHCPRELEASE in	The number of Release messages received by the DHCP server.
DHCPINFORM in	The number of Inform messages received by the DHCP server.
DHCPOFFER out	The number of Offer messages sent by the DHCP server.
DHCPACK out	The number of Acknowledgement messages sent by the DHCP server.
DHCPNAK out	The number of Negative Acknowledgement messages sent by the DHCP server. The server sends these after receiving a request that it cannot fulfil because either there are no available IP addresses in the related address pool, or the request has come from a client that doesn't fit the network setting for an address pool.
BOOTREQUEST in	The number of bootp messages received by the DHCP server from bootp clients.
BOOTREPLY out	The number of bootp messages sent by the DHCP server to bootp clients.
DHCPLEASEQUERY in	The number of Lease Query messages received by the DHCP server from DHCP Relay Agents.
DHCPLEASEUNKNOWN out	The number of Lease Unknown messages sent by the DHCP server to DHCP Relay Agents.
DHCPLEASEACTIVE out	The number of Lease Active messages sent by the DHCP server to DHCP Relay Agents.
DHCPLEASEUNASSIGNED out	The number of Lease Unassigned messages sent by the DHCP server to DHCP Relay Agents.

Related commands

show counter dhcp-server

service dhcp-server

show ip dhcp binding

show ip dhcp pool

show ip dhcp server summary

Overview This command shows the current configuration of the DHCP server. This includes:

- whether the DHCP server is enabled
- whether the DHCP server is configured to ignore BOOTP requests
- whether the DHCP server is configured to support DHCP lease queries
- the details of any user-defined options
- a list of the names of all DHCP address pools currently configured

This show command does not include any configuration details of the address pools. You can display these using the show ip dhcp pool command.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ip dhcp server summary
```

Mode User Exec and Privileged Exec

Example To display the current configuration of the DHCP server, use the command:

```
awplus# show ip dhcp server summary
```

Output Figure 52-14: Example output from the **show ip dhcp server summary** command

```
DHCP Server service is disabled
BOOTP ignore is disabled
DHCP leasequery support is disabled
Pool list: p2
```

Related commands

ip dhcp leasequery enable

ip dhcp pool

service dhcp-server

subnet-mask

Overview This command sets the subnet mask option for a DHCP address pool you are configuring. Use this command to specify the client's subnet mask as defined in RFC 950. This sets the subnet details using the pre-defined option 1. Note that if you create a user-defined option 1 using the option command, then you will override any settings created with this command. If you do not specify a subnet mask using this command, then the pool's network mask (specified using the next-server command) is applied.

The **no** variant of this command removes a subnet mask option from a DHCP pool. The pool reverts to using the pool's network mask.

Syntax

```
subnet-mask <mask>
no subnet-mask
```

Parameter	Description
<mask>	Valid IPv4 subnet mask, in dotted decimal notation.

Mode DHCP Configuration

Examples To set the subnet mask option to `255.255.255.0` for DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# subnet-mask 255.255.255.0
```

To remove the subnet mask option from DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no subnet-mask
```

53 DHCP for IPv6 (DHCPv6) Commands

Introduction

Overview

This chapter provides an alphabetical reference for commands used to configure DHCPv6. For more information, see the DHCPv6 Feature Overview and Configuration Guide.

DHCPv6 is a network protocol used to configure IPv6 hosts with IPv6 addresses and IPv6 prefixes for an IPv6 network. DHCPv6 is used instead of SLAAC (Stateless Address Autoconfiguration) at sites where centralized management of IPv6 hosts is needed. IPv6 routers require automatic configuration of IPv6 addresses and IPv6 prefixes.

DHCPv6 Prefix Delegation provides automatic configuration of IPv6 addresses and IPv6 prefixes.

Note that DHCPv6 client does not support tunnel interface.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

NOTE: *The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.*

Command List

- "show ipv6 dhcp binding" on page 2941
- "show ipv6 dhcp interface" on page 2944
- "show ipv6 dhcp pool" on page 2946
- "sntp-address" on page 2948

address prefix

Overview Use this command in DHCPv6 Configuration mode to specify an address prefix for address assignment with DHCPv6 server pool configuration.

Use the **no** variant of this command to remove the address prefix from the DHCPv6 server pool.

Syntax

```
address prefix <ipv6-prefix/prefix-length> [lifetime
{<valid-time>|infinite} {<preferred-time>|infinite}]
```

```
no address prefix <ipv6-prefix/prefix-length>
```

Parameter	Description
<ipv6-prefix/prefix-length>	Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
`lifetime`	Specify a time period for the hosts to remember router advertisements (RAs). If you specify the optional lifetime parameter with this command then you must also specify a *valid-time* and a *preferred-time* value. See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry.
<valid-time>	Specify a valid lifetime in seconds in the range <5-315360000>. The default valid lifetime is 2592000 seconds.
`infinite`	Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.
<preferred-time>	Specify a preferred lifetime in seconds in the range <5-315360000>. The default preferred lifetime is 604800 seconds.

Mode DHCPv6 Configuration

Default The default valid lifetime is 2592000 seconds and the default preferred lifetime is 604800 seconds.

Usage notes This command creates a pool of prefixes from which addresses are assigned to clients on request, and allocates a network prefix from which the DHCPv6 Server leases addresses. This command is an alternative to using a range set using the address range command.

The DHCPv6 Server selects an IPv6 address from the range available allocated by the IPv6 prefix, randomly generating the suffix of the IPv6 address, with the specified preferred and valid lifetime leases. Leased IPv6 address are found in the

DHCPv6 Server REPLY packet, which is located within the IANA (Identity Association for Non-temporary Addresses) IA address field in the **REPLY** message.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Examples To add IPv6 address prefix `2001:0db8:1::/48` for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# address prefix 2001:0db8:1::/48
```

To remove a configured IPv6 address prefix for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# no address prefix 2001:0db8:1::/48
```

address range

Overview Use this command in DHCPv6 Configuration mode to specify an address range for address assignment with DHCPv6 server pool configuration.

Use the **no** variant of this command to remove an address range from the DHCPv6 server pool.

Syntax

```
address range <first-ipv6-address>
<last-ipv6-address>[lifetime {<valid-time>|infinite}
{<preferred-time>|infinite}]
```

```
no address range <first-ipv6-address> <last-ipv6-address>
```

Parameter	Description
<first-ipv6-address>	Specify the first IPv6 address of the IPv6 address range, in hexadecimal notation in the format X:X::X:X.
<last-ipv6-address>	Specify the last IPv6 address of the IPv6 address range, in hexadecimal notation in the format X:X::X:X.
`lifetime`	Optional. Specify a time period for the hosts to remember router advertisements (RAs). If you specify this parameter then you must also specify a *valid-time* and a *preferred-time* value. See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry.
<valid-time>	Specify a valid lifetime in seconds in the range <5-31536000>. The default valid lifetime is 2592000 seconds.
`infinite`	Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.
<preferred-time>	Specify a preferred lifetime in seconds in the range <5-31536000>. The default preferred lifetime is 604800 seconds.

Default The default valid lifetime is 2592000 seconds and the default preferred lifetime is 604800 seconds.

Mode DHCPv6 Configuration

Usage Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Examples

To add the IPv6 address range `2001:0db8:1::1` to `2001:0db8:1fff::1` for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# address range 2001:0db8:1::1
2001:0db8:1fff::1
```

To remove a configured IPv6 address range for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# no address range
```

Related commands

address prefix

ipv6 dhcp pool

Validation Commands

show ipv6 dhcp binding

show ipv6 dhcp pool

clear counter ipv6 dhcp-client

Overview Use this command in Privileged Exec mode to clear DHCPv6 client counters.

Syntax
```
clear counter ipv6 dhcp-client
```

Mode Privileged Exec

Example To clear DHCPv6 client counters, use the following command:
```
awplus# clear counter ipv6 dhcp-client
```

Related commands show counter ipv6 dhcp-client

clear counter ipv6 dhcp-server

Overview Use this command in Privileged Exec mode to clear DHCPv6 server counters.

Syntax
```
clear counter ipv6 dhcp-server
```

Mode Privileged Exec

Example To clear DHCPv6 server counters, use the following command:
```
awplus# clear counter ipv6 dhcp-server
```

Related commands show counter ipv6 dhcp-server

clear ipv6 dhcp binding

Overview Use this command in Privileged Exec mode to clear either a specific lease binding or the lease bindings as specified by the command parameters. The command will only take effect on dynamically allocated bindings, not statically configured bindings. This command clears binding entries on the DHCPv6 server binding table.

Syntax `clear ipv6 dhcp binding {ipv6 <prefix>|duid <DUID>|all|pool <name>}`

Parameter	Description
`ipv6 <prefix>`	Optional. Specify the IPv6 prefix of the DHCPv6 client, in hexadecimal notation in the format X:X::X:X.
`duid <DUID>`	Specify the DUID (DHCPv6 unique ID) of the DHCPv6 client.
`all`	All DHCPv6 bindings.
`pool <name>`	Description used to identify DHCPv6 server address pool. Valid characters are any printable character. If the name contains spaces then you must enclose these in "quotation marks".

Mode Privileged Exec

Usage notes A specific binding may be deleted by **ipv6** address or **duid** address, or several bindings may be deleted at once using **all** or **pool**.

Note that if you specify to clear the **ipv6** or **duid** address of what is actually a static DHCPv6 binding, an error message is displayed. If **all** or **pool** are specified and one or more static DHCPv6 bindings exist within those addresses, any dynamic entries within those addresses are cleared but any static entries are not cleared.

The clear ipv6 dhcp binding command is used as a server function. A binding table entry on the DHCPv6 server is automatically:

- Created whenever a prefix is delegated to a client from the configuration pool.
- Updated when the client renews, rebinds, or confirms the prefix delegation.
- Deleted when the client releases all the prefixes in the binding, all prefix lifetimes have expired, or when a user runs the clear ipv6 dhcp binding command.

If the **clear ipv6 dhcp binding** command is used with the optional IPv6 address parameter, only the binding for the specified client is deleted. If the **clear ipv6 dhcp binding** command is used without the optional IPv6 address parameter, then all automatic client bindings are deleted from the DHCPv6 bindings table.

Example To clear all dynamic DHCPv6 server binding entries, use the command:

```
awplus# clear ipv6 dhcp binding all
```

Output Figure 53-1: Example output from the **clear ipv6 dhcp binding all** command

```
awplus#clear ipv6 dhcp binding all
% Deleted 1 entries
```

Related commands show ipv6 dhcp binding

clear ipv6 dhcp client

Overview Use this command in Privileged Exec mode to restart a DHCPv6 client on an interface.

Syntax

```
clear ipv6 dhcp client <interface>
```

Parameter	Description
<interface>	Specify the interface name to restart a DHCPv6 client on.

Mode Privileged Exec

Example To restart a DHCPv6 client on interface vlan1, use the following command:

```
awplus# clear ipv6 dhcp client vlan1
```

Related commands show ipv6 dhcp binding

dns-server (DHCPv6)

Overview Use this command to add a Domain Name System (DNS) server to the DHCPv6 address pool you are configuring. You can use this command multiple times to create a list of DNS name servers available to the client. This sets the DNS server details using the pre-defined option 6. Note that if you add a user-defined option 6 using the option (DHCPv6) command, then you will override any settings created with this command.

Use the **no** variant of this command to remove either the specified DNS server or all DNS servers from the DHCPv6 pool.

Syntax

```
dns-server <ipv6-address>
no dns-server [<ipv6-address>]
```

Parameter	Description
<ipv6-address>	Specify an IPv6 address of the DNS server, in hexadecimal notation in the format X:X::X:X. This parameter is required when adding a DNS server to the DHCPv6 address pool. All DNS servers are removed from the DHCPv6 pool if you enter the no dns-server command without this parameter.

Mode DHCPv6 Configuration

Examples To add the DNS server with the assigned IPv6 address 2001:0db8:3000:3000::32 to the DHCPv6 server pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# dns-server 2001:0db8:3000:3000::32
```

To remove the DNS server with the assigned IPv6 address 2001:0db8:3000:3000::32 from the DHCPv6 server pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no dns-server 2001:0db8:3000:3000::32
```

To remove all DNS servers from the DHCPv6 server pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no dns-server
```

Related commands

ipv6 dhcp pool

option (DHCPv6)

show ipv6 dhcp pool

domain-name (DHCPv6)

Overview Use this command in DHCPv6 Configuration mode to add a domain name to the DHCPv6 server address pool you are configuring.

Use the **no** variant of this command to remove a domain name from the address pool.

Syntax

```
domain-name <domain-name>
no domain-name
```

Parameter	Description
<domain-name>	Specify the domain name you wish to assign the DHCPv6 server address pool. Valid characters are printable characters. If the name contains spaces then you must enclose it in "quotation marks".

Mode DHCPv6 Configuration

Usage This command specifies the domain name that a client should use when resolving host names using the Domain Name System, and sets the domain name details using the pre- defined option 15. Note that if you add a user-defined option 15 using the option (DHCPv6) command, then you will override any settings created with this command.

Examples To add the domain name `Engineering` to DHCPv6 server pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# domain-name Engineering
```

To remove the domain name `Engineering` from DHCPv6 server pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no domain-name Engineering
```

Related commands

dns-server (DHCPv6)

option (DHCPv6)

show ipv6 dhcp pool

ip dhcp-relay agent-option

Overview This command enables the DHCP Relay Agent to insert the DHCP Relay Agent Information Option (Option 82) into the client-request packets that it relays to its DHCP server. This allows the DHCP Relay Agent to pass on information to the server about the network location of the client device. The DHCP Relay Agent strips the DHCP Relay Agent Option 82 field out of the DHCP server's response, so that the DHCP client never sees this field.

When the DHCP Relay Agent appends its DHCP Relay Agent Option 82 data into the packet, it first overwrites any pad options present; then if necessary, it increases the packet length to accommodate the DHCP Relay Agent Option 82 data.

The **no** variant of this command stops the DHCP Relay Agent from appending the Option 82 field onto DHCP requests before forwarding it to the server.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

NOTE: *The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands ip dhcp-relay agent-option and ip dhcp-relay information policy have been configured.*

Syntax

```
ip dhcp-relay agent-option
no ip dhcp-relay agent-option
```

Default DHCP Relay Agent Information Option (Option 82) insertion is disabled by default.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Usage notes Use this command to alter the DHCP Relay Agent Option 82 setting when your device is the first hop for the DHCP client. To limit the maximum length of the packet, use the ip dhcp-relay max-message-length command.

Examples To make the DHCP Relay Agent listening on vlan2 append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the DHCP Relay Agent from appending the DHCP Relay Agent Option 82 field on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option
```

To make the relay agent listening on PPP interface ppp0 append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the relay agent from appending the DHCP Relay Agent Option 82 field on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip dhcp-relay agent-option
```

Related commands

ip dhcp-relay agent-option remote-id

ip dhcp-relay information policy

ip dhcp-relay max-message-length

service dhcp-relay

ip dhcp-relay agent-option checking

Overview This command enables the DHCP Relay Agent to check DHCP Relay Agent Information Option (Option 82) information in response packets returned from DHCP servers. If the information does not match the information it has for its own client (downstream) interface then the DHCP Relay Agent drops the packet. Note that ip dhcp-relay agent-option must be configured.

The DHCP Relay Agent Option 82 field is included in relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled (ip dhcp-relay agent-option), and
- DHCP Relay Agent is enabled on the device (service dhcp-relay)

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

Syntax

```
ip dhcp-relay agent-option checking
no ip dhcp-relay agent-option checking
```

Mode Interface Configuration for a VLAN interface or a PPP interface.

Examples To make the DHCP Relay Agent listening on vlan2 check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the DHCP Relay Agent on vlan2 from checking the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option checking
```

To make the relay agent listening on PPP interface ppp0 check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the relay agent from checking the DHCP Relay Agent Information Option (Option 82) field on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip dhcp-relay agent-option checking
```

Related commands

ip dhcp-relay agent-option

ip dhcp-relay agent-option remote-id

ip dhcp-relay information policy

service dhcp-relay

ip dhcp-relay agent-option remote-id

Overview Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field the DHCP Relay Agent inserts into clients' request packets. The Remote ID identifies the device that is inserting the DHCP Relay Agent Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the device's MAC address.

Use the **no** variant of this command to return the Remote ID for an interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

Syntax

```
ip dhcp-relay agent-option remote-id <remote-id>
no ip dhcp-relay agent-option remote-id
```

Parameter	Description
<remote-id>	An alphanumeric (ASCII) string, 1 to 63 characters in length. Additional characters allowed are hyphen (-), underscore (_) and hash (#). Spaces are not allowed.

Default The Remote ID is set to the device's MAC address by default.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Usage notes The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled (ip dhcp-relay agent-option), and
- DHCP Relay Agent is enabled on the device (service dhcp-relay)

Examples To set the Remote ID to myid for client DHCP packets received on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

To set the Remote ID to myid for client DHCP packets received on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0 timeslots all
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0 timeslots all
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

Related commands

ip dhcp-relay agent-option

ip dhcp-relay agent-option checking

show ip dhcp-relay

ip dhcp-relay information policy

Overview This command sets the policy for how the DHCP relay deals with packets arriving from the client that contain DHCP Relay Agent Option 82 information.

If the command **ip dhcp-relay agent-option** has not been configured, then this command has no effect at all - no alteration is made to Option 82 information in packets arriving from the client side.

However, if the command **ip dhcp-relay agent-option** has been configured, this command modifies how the DHCP relay service deals with cases where the packet arriving from the client side already contains DHCP Relay Agent Option 82 information.

This command sets the action that the DHCP relay should take when a received DHCP client request contains DHCP Relay Agent Option 82 information.

By default, the DHCP Relay Agent replaces any existing DHCP Relay Agent Option 82 field with its own DHCP Relay Agent field. This is equivalent to the functionality of the **replace** parameter.

The **no** variant of this command returns the policy to the default behavior - i.e. replacing the existing DHCP Relay Agent Option 82 field.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

NOTE: *The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands ip dhcp-relay agent-option and ip dhcp-relay information policy have been configured.*

Syntax

```
ip dhcp-relay information policy {append|drop|keep|replace}
no ip dhcp-relay information policy
```

Parameter	Description
`append`	The DHCP Relay Agent appends the DHCP Relay Agent Option 82 field of the packet with its own DHCP Relay Agent Option 82 details.
`drop`	The DHCP Relay Agent discards the packet.
`keep`	The DHCP Relay Agent forwards the packet without altering the DHCP Relay Agent Option 82 field.
`replace`	The DHCP Relay Agent replaces the existing DHCP Relay Agent details in the DHCP Relay Agent Option 82 field with its own details before forwarding the packet.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Examples

To make the DHCP Relay Agent listening on vlan2 drop any client requests that already contain DHCP Relay Agent Option 82 information, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay information policy drop
```

To reset the DHCP relay information policy to the default policy for interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay information policy
```

Related commands

ip dhcp-relay agent-option

ip dhcp-relay agent-option checking

service dhcp-server

ip dhcp-relay maxhops

Overview This command sets the hop count threshold for discarding BOOTP messages. When the hops field in a BOOTP message exceeds the threshold, the DHCP Relay Agent discards the BOOTP message. The hop count threshold is set to 10 hops by default.

Use the **no** variant of this command to reset the hop count to the default.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

Syntax

```
ip dhcp-relay maxhops <1-255>
no ip dhcp-relay maxhops
```

Parameter	Description
<1-255>	The maximum hop count value.

Default The default hop count threshold is 10 hops.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Example To set the maximum number of hops to 5 for packets received on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay maxhops 5
```

Related commands service dhcp-relay

ip dhcp-relay max-message-length

Overview This command applies when the device is acting as a DHCP Relay Agent and DHCP Relay Agent Option 82 insertion is enabled. It sets the maximum DHCP message length (in bytes) for the DHCP packet with its DHCP Relay Agent Option 82 data inserted. From this value it calculates the maximum packet size that it will accept at its input. Packets that arrive greater than this value will be dropped.

The **no** variant of this command sets the maximum message length to its default of 1400 bytes.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

Syntax

```
ip dhcp-relay max-message-length <548-1472>
no ip dhcp-relay max-message-length
```

Parameter	Description
<548-1472>	The maximum DHCP message length (this is the message header plus the inserted DHCP option fields in bytes).

Default The default is 1400 bytes.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Usage notes When a DHCP Relay Agent (that has DHCP Relay Agent Option 82 insertion enabled) receives a request packet from a DHCP client, it will append the DHCP Relay Agent Option 82 component data, and forward the packet to the DHCP server. The DHCP client will sometimes issue packets containing pad option fields that can be overwritten with Option 82 data.

Where there are insufficient pad option fields to contain all the DHCP Relay Agent Option 82 data, the DHCP Relay Agent will increase the packet size to accommodate the DHCP Relay Agent Option 82 data. If the new (increased) packet size exceeds that defined by the **maximum-message-length** parameter, then the DHCP Relay Agent will drop the packet.

NOTE: *Before setting this command, you must first run the ip dhcp-relay agent-option command. This will allow the DHCP Relay Agent Option 82 fields to be appended.*

Example To set the maximum DHCP message length to 1200 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay max-message-length 1200
```

To reset the maximum DHCP message length to the default of 1400 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay max-message-length
```

Related commands service dhcp-relay

ip dhcp-relay server-address

Overview This command adds a DHCP server for the DHCP Relay Agent to forward client DHCP packets to on a particular interface. You can add up to five DHCP servers on each device interface that the DHCP Relay Agent is listening on.

The **no** variant of this command deletes the specified DHCP server from the list of servers available to the DHCP relay agent.

The **no ip dhcp-relay** command removes all DHCP relay settings from the interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the DHCP Feature Overview and Configuration Guide.

Syntax

```
ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}
```

```
no ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}
```

```
no ip dhcp-relay
```

Parameter	Description
<ipv4-address>	Specify the IPv4 address of the DHCP server for the DHCP Relay Agent to forward client DHCP packets to, in dotted decimal notation. The IPv4 address uses the format A.B.C.D.
<ipv6-address>	Specify the IPv6 address of the DHCPv6 server for the DHCPv6 Relay Agent to forward client DHCP packets to, in hexadecimal notation.
<server-interface>	Specify the interface name of the DHCPv6 server. It is only required for a DHCPv6 server with an IPv6 address.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Usage notes For a DHCP server with an IPv6 address you must specify the interface for the DHCP server. See examples below for configuration differences between IPv4 and IPv6 DHCP relay servers.

See also the service dhcp-relay command to enable the DHCP Relay Agent on your device. The ip dhcp-relay server-address command defines a relay destination on an interface on the device, needed by the DHCP Relay Agent to relay DHCP client packets to a DHCP server.

Examples

To enable the DHCP Relay Agent to relay DHCP packets on interface vlan2 to the DHCP server with the IPv4 address 192.0.2.200, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay server-address 192.0.2.200
```

To remove the DHCP server with the IPv4 address 192.0.2.200 from the list of servers available to the DHCP Relay Agent on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay server-address 192.0.2.200
```

To enable the DHCP Relay Agent on your device to relay DHCP packets on interface vlan10 to the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan10
awplus(config-if)# ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

To remove the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20 from the list of servers available to the DHCP Relay Agent on interface vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

To disable DHCP relay on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay
```

Related commands

service dhcp-relay

ipv6 address (DHCPv6 PD)

Overview Use this command in Interface Configuration mode for a VLAN interface to append an IPv6 address suffix to the IPv6 prefix provided by a DHCPv6 Prefix Delegation (PD) server.

Use the **no** variant of this command to remove the IPv6 address assigned and disable IPv6. Note that if no global addresses are left after removing the IPv6 address then IPv6 is disabled.

Syntax

```
ipv6 address [<ipv6-prefix-name>] <ipv6-addr/prefix-length> [eui64]
```

```
no ipv6 address [<ipv6-prefix-name>] <ipv6-addr/prefix-length> [eui64]
```

Parameter	Description
<ipv6-prefix-name>	The IPv6 prefix name advertised on the router advertisement message sent from the device. The IPv6 prefix name is delegated from the DHCPv6 Server configured for DHCPv6 Prefix-Delegation.
<ipv6-addr/prefix-length>	Specifies the IPv6 address to be set, for example ::1/64. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
[eui64]	EUI-64 is a method of automatically deriving the lower 64 bits of an IPv6 address, based on the switch's MAC address.

Mode Interface Configuration for a VLAN or a PPP interface.

Usage notes When specifying the **eui64** parameter, the interface identifier of the IPv6 address is derived from the MAC address of the device.

For more information about EUI64, see the IPv6 Feature Overview and Configuration Guide.

Examples To configure a PD prefix named prefix1 on interface vlan1 and then add an IPv6 address, use the following commands. In this example, the prefix will be assigned from the pool on the PD client. The host portion or suffix will be ::1 for the last 64 bits:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 address prefix1::1/64
```

To configure a PD prefix named prefix1 on interface vlan1 and then add an IPv6 address using EUI-64 identifiers, use the following commands. In this example, the prefix will be assigned from the pool on the PD client. The host portion or suffix is created from the EUI-64 identifier of the interface for the last 64 bits:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 address prefix1/64 eui64
```

To assign the IPv6 address 2001:0db8::a2/48 to the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::a2/48
```

To remove the IPv6 address 2001:0db8::a2/48 from the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::a2/48
```

To assign the IPv6 address to the PPP interface ppp0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-fr-subif)# ipv6 address 2001:0db8::a2/64
```

To remove the IPv6 address 2001:0db8::a2/64 from the PPP interface ppp0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 address 2001:0db8::a2/64
```

To assign the **eui64** derived address in the prefix 2001:db8::/64 to VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::/64 eui64
```

To remove the **eui64** derived address in the prefix 2001:db8::/32 from VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::/64 eui64
```

Related commands

ipv6 dhcp client pd

ipv6 dhcp pool

ipv6 local pool

ipv6 nd prefix (DHCPv6)

prefix-delegation pool

ipv6 address dhcp

Overview Use this command to activate the DHCPv6 client on the interface that you are configuring. This allows the interface to use the DHCPv6 client to obtain its IPv6 configuration details from a DHCPv6 server on its connected network.

The command also enables IPv6 on the interface, which creates an EUI-64 link-local address as well as enabling RA processing and SLAAC.

Use the **no** variant of this command to stop the interface from obtaining IPv6 configuration details from a DHCPv6 server.

The DHCPv6 client supports the following IP configuration options:

- Option 1—the subnet mask for your device.
- Option 3—a list of default routers.
- Option 6 —a list of DNS servers. This list appends the DNS servers set on your device with the dns-server (DHCPv6) command.
- Option 15—a domain name used to resolve host names. This option replaces any domain name that you have set with the domain-name (DHCPv6) command.
- Option 51—lease expiration time.

Syntax

```
ipv6 address dhcp [default-route-to-server]
no ipv6 address dhcp
```

Parameter	Description
`default-route-to-server`	Allow the automatic configuration of a default route to the DHCPv6 server. This option is not enabled by default when you enable the DHCP client on an interface.

Mode Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

Usage notes Use the **default-route-to-server** option to allow the automatic configuration of a default route to the DHCPv6 server. Note that this option is not enabled by default when you enable the DHCP client on an interface.

Examples To set the interface vlan2 to use DHCPv6 to obtain an IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 address dhcp
```

To stop the interface vlan2 from using DHCPv6 to obtain its IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address dhcp
```

To set the PPP interface ppp0 to use DHCPv6 to obtain an IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ipv6 address dhcp
```

To stop the PPP interface ppp0 from using DHCPv6 to obtain its IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 address dhcp
```

Related commands

clear ipv6 dhcp client

ipv6 address

ipv6 address (DHCPv6 PD)

show ipv6 dhcp interface

show running-config

ipv6 dhcp client pd

Overview Use this command in Interface Configuration mode to enable the DHCPv6 client process and enable requests for prefix delegation through the interface that you are configuring.

Use the **no** variant of this command to disable requests for prefix delegation. This is the default setting.

For further information about DHCPv6 Prefix Delegation, which is used to automate the process of assigning prefixes, see the DHCPv6 Feature Overview and Configuration Guide.

Syntax

```
ipv6 dhcp client pd <prefix-name> <default-route-to-server>
no ipv6 dhcp client pd
```

Parameter	Description
<prefix-name>	Specify an IPv6 general prefix name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".
<default-route-to-server>	Specify the default route to the DHCP server

Mode Interface Configuration

Default Prefix delegation is disabled by default on an interface.

Usage notes Entering the **ipv6 dhcp client pd** command starts the DHCPv6 client process if not already running, and enables requests for prefix delegation through the interface on which the command is configured.

When prefix delegation is enabled and a prefix is acquired, the prefix is stored in the IPv6 prefix pool with an internal name defined by the required *<prefix-name>* placeholder parameter. The ipv6 address command can then refer to the prefixes stored in the IPv6 prefix pool.

Examples To enable prefix delegation with the prefix name prefix-name on the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd my-prefix-name
```

To disable prefix delegation on the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 dhcp client pd
```

Related commands

show ipv6 dhcp interface

ipv6 dhcp option

Overview Use this command in Global Configuration mode to create a user-defined DHCPv6 option. You can then use this option when configuring a DHCPv6 server address pool, by using the option (DHCPv6) command.

Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

Use the **no** variant of this command to remove either the specified user-defined option. This also removes user-defined options from the associated DHCPv6 server address pools.

Syntax

```
ipv6 dhcp option <1-254> [name <option-name>] [<option-type>]
no ipv6 dhcp option <1-254>|<option-name>
```

Parameter	Description	
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.	
<option-name>	Option name used to identify the option. You cannot use a number as the option name. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”. Default: no default	
<option-type>	The option value. You must specify a value that is appropriate to the option type:	
	`asci`	An ASCII text string
	`hex`	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.
	`ipv6`	An IPv6 address or prefix that has hexadecimal notation in the format HHHH : HHHH : : HHHH : HHHH. To create a list of IPv6 addresses, you must add each IPv6 address individually by using the option command multiple times.
	`integer`	A number from 0 to 4294967295.
	`flag`	A value that either sets (to 1) or unsets (to 0) a flag: **true**, **on**, or **enabled** will set the flag. **f alse**, **off** or **disabled** will unset the flag.

Mode Global Configuration

Examples

To define a user-defined ASCII string option as option 66, without a name, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 66 ascii
```

To define a user-defined hexadecimal string option as option 46, with the name "tcpip- node-type", use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 46 name tcpip-node-type hex
```

To define a user-defined IP address option as option 175, with the name `special-address`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 175 name special-address ip
```

To remove the specific user-defined option with the option number 12, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp option 12
```

To remove the specific user-defined option with the option name `perform-router-discovery`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp option perform-router-discovery
```

Related commands

dns-server (DHCPv6)

domain-name (DHCPv6)

option (DHCPv6)

show ipv6 dhcp

ipv6 dhcp pool

Overview Use this command in Global Configuration mode to enter the DHCPv6 Configuration mode for the DHCPv6 server pool name as specified in the required command parameter. If the name specified is not associated with an existing pool, the device will create a new pool with this name, then enter the configuration mode for the new pool.

Once you have entered the DHCPv6 configuration mode, all commands executed before the next **exit** command will apply to this pool.

You can create multiple DHCPv6 server pools on devices with multiple interfaces. This allows the device to act as a DHCPv6 server on multiple interfaces to distribute different information to clients on the different networks.

Use the **no** variant of this command to delete the specific DHCPv6 pool.

Syntax

```
ipv6 dhcp pool <DHCPv6-poolname>
no ipv6 dhcp pool <DHCPv6-poolname>
```

Parameter	Description
<DHCPv6-poolname>	Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”.

Mode Global Configuration

Usage All DHCPv6 prefix pool names must be unique. IPv6 prefix pools have a similar function to IPv4 address pools. Contrary to IPv4, a block of IPv6 addresses (an IPv6 address prefix) are assigned and not single IPv6 addresses. IPv6 prefix pools are not allowed to overlap.

Once a pool is configured, it cannot be changed. To change the configuration, you must remove then recreate a IPv6 prefix pool. All IPv6 prefixes already allocated are also freed.

Examples To create the DHCPv6 pool named P2 and enter DHCPv6 configuration mode, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)#
```

To delete the DHCPv6 pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp pool P2
```

ipv6 dhcp server

Overview Use this command in Interface Configuration mode to enable DHCPv6 server for the current IPv6 configured interface to use the specified DHCPv6 server pool name.

The DHCPv6 server service listens for DHCPv6 requests on the IPv6 configured interface. The DHCPv6 server service does not run on interfaces without IPv6 configured on them.

Use the **no** variant of this command to disable the DHCPv6 server.

Syntax

```
ipv6 dhcp-server [<DHCPv6-poolname>]
no ipv6 dhcp-server
```

Parameter	Description
<DHCPv6-poolname>	Specify a named DHCPv6 server pool as defined with the ipv6 dhcp pool command. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".

Mode Interface Configuration

Usage notes The **ipv6 dhcp server** command enables the DHCPv6 service on a specified interface using the pool for prefix delegation and configuration through the specified interface.

Note that DHCPv6 client, DHCPv6 server and DHCPv6 relay are mutually exclusive on an interface. When one of the DHCPv6 functions is enabled on an interface then another DHCPv6 function cannot be enabled on the same interface.

Examples To enable the DHCPv6 server service and use the DHCPv6 pool named P2 on VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 dhcp server P2
```

To disable the DHCPv6 server on VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 dhcp server
```

Related commands

ipv6 dhcp pool

ipv6 local pool

Overview Use this command in Global Configuration mode to configure a local DHCPv6 server prefix delegation pool specifying a poolname and a prefix/prefix length. You can optionally exclude the locally assigned prefix from the pool with the **exclude-local-prefix** keyword.

Use the **no** variant of this command to remove a local DHCPv6 server prefix delegation pool specifying the poolname.

Syntax

```
ipv6 local pool <DHCPv6-poolname> <delegated-prefix-name>
<ipv6-prefix/prefix-length> <assigned-length>
[exclude-local-prefix]
```

```
no ipv6 local pool
```

Parameter	Description
<DHCPv6-poolname>	Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in “quotation marks”.
<delegated-prefix-name>	Description used to identify the delegated prefix name from the parent PD (Prefix Delegation) server. If the name contains spaces then you must enclose it in “quotation marks”.
<ipv6-prefix/prefix-length>	Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.
<assigned-length>	Specify an IPv6 prefix length assigned to the user from the pool in the range <1-128>. Note that the value of the *assigned-length* parameter entered cannot be less than or equal to the *prefix-length* parameter value entered. An assigned length must be longer than a prefix length.
exclude-local-prefix	Specify this keyword to exclude the locally assigned prefix from the pool.

Default No DHCPv6 server prefix delegation pool is configured by default.

Mode Global Configuration

Usage notes All IPv6 prefix pool names must be unique. IPv6 prefix pools have a similar function to IPv4 address pools. Contrary to IPv4, a block of IPv6 addresses (an IPv6 address prefix) are assigned and not single IPv6 addresses. IPv6 prefix pools are not allowed to overlap.

Once a pool is configured, it cannot be changed. To change the configuration, you must remove then recreate a IPv6 prefix pool. All IPv6 prefixes already allocated are also freed.

Examples To create a local DHCPv6 local pool named P2 with the IPv6 prefix and prefix length 2001:0db8::/32 with an assigned length of 64, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 local pool P2 2001:0db8::/32 64
```

To remove a configured DHCPv6 local pool, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 local pool
```

Related commands ipv6 dhcp pool

show ipv6 dhcp pool

ipv6 nd prefix (DHCPv6)

Overview Use this command to specify IPv6 RA (Router Advertisement) prefix information generated from the DHCPv6 server for DHCPv6 prefix-delegation for a VLAN.

Use the **no** variant of this command to remove IPv6 RA prefix information from the DHCPv6 Server for DHCPv6 Prefix-Delegation for the interface. Use the **all** parameter with the **no** variant of this command to remove all prefix names and all prefixes for an interface.

Syntax

```
ipv6 nd prefix <ipv6-prefix-name>
<ipv6-prefix/length>{<valid-lifetime>|infinite}
{<preferred-lifetime>|infinite} {off-link|no-autoconfig}
```

```
no ipv6 nd prefix {<ipv6-prefix-name>|<ipv6-prefix/length>|all}
```

Parameter	Description
<ipv6-prefix-name>	The IPv6 prefix name advertised on the router advertisement message sent from the device. The IPv6 prefix name is delegated from the DHCPv6 Server configured for DHCPv6 Prefix-Delegation.
<ipv6-prefix/length>	The IPv6 prefix and prefix length advertised on the router advertisement message sent from the device. The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.
<valid-lifetime>	The the period during which the specified IPv6 address prefix is valid. This can be set to a value between 5 and 315360000 seconds. Note that this period should be set to a value greater than that set for the prefix preferred-lifetime. See the Usage notes after this parameter table for a description of valid lifetime and how it determines invalid IPv6 addresses upon expiry.
`infinite`	Specifying this keyword instead of entering a value for the *<valid-lifetime>* parameter applies an infinite valid lifetime.
<preferred-lifetime>	Specifies the IPv6 prefix preferred lifetime. This is the period during which the IPv6 address prefix is considered current. Set this to a value between 0 and 315360000 seconds. Note that this period should be set to a value less than that set for the prefix valid-lifetime. See the Usage notes after this parameter table for a description of preferred lifetime and how it determines deprecated IPv6 addresses upon expiry.
`infinite`	Specifying this keyword instead of entering a value for the *<preferred-lifetime>* parameter applies an infinite valid lifetime.
`off-link`	Specify the IPv6 prefix off-link flag.
`no-autoconfig`	Specify the IPv6 prefix no autoconfiguration flag. Setting this flag indicates that the prefix is not to be used for autoconfiguration.
`all`	Specify all prefix names and all prefixes are removed when used with the no variant of this command.

Mode Interface Configuration for a VLAN interface or a PPP interface.

Usage notes This command specifies the IPv6 prefix flags that are advertised by the router advertisement message.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Examples The following example configures the device to issue RAs (Router Advertisements) on the VLAN interface vlan2, and advertises the DHCPv6 prefix name prefix1 and the IPv6 address prefix of 2001:0db8::/32.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 nd prefix prefix1 2001:0db8::/32
```

The following example resets router advertisements on the VLAN interface vlan2, so the address prefix of 2001:0db8::/32 is not advertised from the device.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd prefix 2001:0db8::/32
```

The following example removes all prefix names and prefixes from VLAN interface vlan2:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd prefix all
```

link-address

Overview Use this command in DHCPv6 Configuration mode to specify a link-address prefix within a DHCPv6 Server pool.

Note that you can only configure one link address per DHCPv6 pool. Configuring another link address in the same DHCPv6 pool overwrites the previously configured link address.

Use the **no** variant of this command to remove the link-address prefix from the DHCPv6 Server pool.

Syntax

```
link-address <ipv6-prefix/prefix-length>
no link-address
```

Parameter	Description
<ipv6-prefix/prefix-length>	Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.

Default No DHCPv6 Server pool configuration link address prefix is configured by default.

Mode DHCPv6 Configuration

Usage notes Link addresses are configured in DHCPv6 Server address pools when there are remote clients that communicate via intermediate relay(s).

RELAY-FORW and RELAY-REPL relay packets contain the requesting link address source.

This command is used to match incoming requests from PD (Prefix Delegation) clients (received via an intermediate relay) to a configured delegation pool.

When an address on the incoming interface of the DHCPv6 server or a link address set in the incoming delegation request packet from the prefix delegation client matches the link-address prefix configured in the delegation pool, the DHCPv6 server is able to match and use the appropriate delegation pool for relayed delegation request messages.

If there is no match between incoming delegation request packets from the prefix delegation client and the link-address prefix configured in the delegation pool, the DHCPv6 Server does not delegate an IPv6 prefix to the requesting device.

The link address should be set to the network prefix where the prefix delegation client resides. The prefix delegation server will also need a forwarding path (IPv6 route) back to the network prefix where the prefix delegation client resides.

For more information, see the DHCPv6 Feature Overview and Configuration Guide.

Examples

To configure the IPv6 prefix and prefix length 2001:0db8:1::/48 as the link address for pool P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# address prefix 2001:0db8:2::/48
awplus(config-dhcp6)# link-address 2001:0db8:1::/48
```

To remove the link address, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# no link-address
```

Related commands

ipv6 dhcp pool

show ipv6 dhcp pool

option (DHCPv6)

Overview Use this command in DHCPv6 Configuration mode to add a user-defined option to the DHCPv6 prefix pool you are configuring. For the **hex**, **integer**, and **flag** option types, if the option already exists, the new option overwrites the existing option's value.

Use the **no** variant of this command to remove the specified user-defined option from the DHCPv6 server pool, or to remove all user-defined options from the DHCPv6 server pool.

Syntax

```
option [<1-254>|<option-name>] <option-value>
no option [<1-254>|<option-value>]
```

Parameter	Description	
<1-254>	The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.	
<option-name>	Option name associated with the option.	
<option-value>	The option value. You must specify a value that is appropriate to the option type:	
	`hex`	A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.
	`ipv6`	An IPv6 prefix that has the hexadecimal X:X::X:X notation. To create a list of IPv6 prefixes, you must add each IPv6 prefix individually using this command multiple times.
	`integer`	A number from 0 to 4294967295.
	`flag`	A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.

Mode DHCPv6 Configuration

Usage You must define a DHCPv6 option using the ipv6 dhcp option command before using the option (DHCPv6) command.

Note that options with an **ipv6** type can hold a list of IPv6 prefix (i.e. entries that have theX:X::X:X address format), so if the option already exists in the pool, then the new IP address is added to the list of existing IPv6 prefixes. Also note options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

Examples

To add the IPv6 type option named `sntp-server-addr` to the pool P2 and give the option the value `ipv6`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 22 name sntp_server_addr ipv6
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option sntp_server_addr ipv6
```

To add the ASCII-type option named `tftp-server-name` to the pool P2 and give the option the value `server1`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option tftp-server-name server1
```

To add the hex-type option named `tcpip-node-type` to the pool P2and give the option the value `08af`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option tcpip-node-type 08af
```

To add multiple IP addresses for the ip-type option `175`, use the following commands:

```
awplus(config-dhcp6)# option 175 2001:0db8:3001::/64
awplus(config-dhcp6)# option 175 2001:0db8:3002::/64
awplus(config-dhcp6)# option 175 2001:0db8:3003::/64
```

To add the option `179` to a pool, and give the option the value `123456`, use the following command:

```
awplus(config-dhcp6)# option 179 123456
```

To add a user-defined flag option with the name `perform-router-discovery`, use the following command:

```
awplus(config-dhcp6)# option perform-router-discovery yes
```

To clear all user-defined options from a DHCP address pool, use the following command:

```
awplus(config-dhcp6)# no option
```

To clear a user-defined option, named `tftp-server-name`, use the following command:

```
awplus(config-dhcp6)# no option tftp-server-name
```

Related commands

dns-server (DHCPv6)

ipv6 dhcp option

ipv6 dhcp pool

show ipv6 dhcp pool

prefix-delegation pool

Overview Use this command in DHCPv6 Configuration mode to add a DHCPv6 server prefix-delegation pool entry to the current DHCPv6 pool configuration. You must define a DHCPv6 server prefix-delegation pool using the ipv6 dhcp pool command before using this command.

Use the **no** variant of this command to remove a DHCPv6 server prefix-delegation pool from the current DHCPv6 pool configuration.

Syntax

```
prefix-delegation pool <DHCPv6-poolname> [lifetime
{<valid-time>|infinite} {<preferred-time>|infinite}]
```

```
no prefix-delegation pool <DHCPv6-poolname>
```

Parameter	Description
<DHCPv6-poolname>	Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".
`lifetime`	Optional. Specify a time period for the hosts to remember router advertisements (RAs). If you specify this parameter then you must also specify a *valid-time* and a *preferred-time* value. See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry.
<valid-time>	Specify a valid lifetime in seconds in the range <5-315360000>.
`infinite`	Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.
<preferred-time>	Specify a valid lifetime in seconds in the range <5-315360000>.

Default No IPv6 local prefix pool is specified by default.

Mode DHCPv6 Configuration

Usage notes The DHCPv6 server assigns prefixes dynamically from an IPv6 local prefix pool, which is configured using the ipv6 local pool command and is associated with a DHCPv6 configuration pool using this command. When the server receives a prefix request from a client, it attempts to obtain unassigned prefixes from the pool. After the client releases the previously assigned prefixes, the server returns the prefixes to the pool for reassignment.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source

address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Example This example adds DHCPv6 Prefix Delegation pool pd_pool1 to DHCPv6 pool pool1:

```
awplus# configure terminal
awplus(config)# ipv6 local pool pd_pool1 2001:0db8::/48 56
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# prefix-delegation pool pd_pool1
```

Related commands

ipv6 dhcp pool

show ipv6 dhcp pool

service dhcp-relay

Overview This command enables the DHCP Relay Agent on the device. However, on a given IP interface, no DHCP forwarding takes place until at least one DHCP server is specified to forward/relay all clients' DHCP packets to.

The **no** variant of this command disables the DHCP Relay Agent on the device for all interfaces.

Syntax

```
service dhcp-relay
no service dhcp-relay
```

Mode Global Configuration

Usage notes A maximum number of 400 DHCP Relay Agents (one per interface) can be configured on the device. Once this limit has been reached, any further attempts to configure DHCP Relay Agents will not be successful.

Default The DHCP-relay service is enabled by default.

Examples To enable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
```

To disable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-relay
```

show counter dhcp-relay

Overview This command shows counters for the DHCP Relay Agent on your device.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show counter dhcp-relay
```

Syntax (VRF-lite)

```
show counter dhcp-relay [vrf <vrf-name>|global]
```

Parameter	Description
`vrf`	Display the output for a VRF instance
<vrf-name>	The name of the specific VRF instance.
`global`	Display the output for the Global VRF instance

Mode User Exec and Privileged Exec

Examples To display counters for the DHCP Relay Agent on your device, use the following command:

```
awplus# show counter dhcp-relay
```

Output Figure 53-2: Example output from the **show counter dhcp-relay** command

```
awplus#show counter dhcp-relay

DHCP relay counters
Requests In              ......... 4
Replies In               ......... 4
Relayed To Server        ......... 4
Relayed To Client        ......... 4

DHCPv6 Relayed to Client ......... 0
```

Output (VRF-lite)

Figure 53-3: Example output from the **show counter dhcp-relay** command for VRF instance red

```
DHCP relay counters

[VRF red]
Requests In ..................... 4
Replies In ...................... 4
Relayed To Server ............... 4
Relayed To Client ............... 4
Out To Server Failed ............ 0
Out To Client Failed ............ 0
Invalid hlen .................... 0
Bogus giaddr .................... 0
Corrupt Agent Option ............ 0
Missing Agent Option ............ 0
Bad Circuit ID .................. 0
Missing Circuit ID .............. 0
Option Insert Failed ............ 0
```

Parameter	Description
`Requests In`	The number of DHCP Request messages received from clients.
`Replies In`	The number of DHCP Reply messages received from servers.
`Relayed To Server`	The number of DHCP Request messages relayed to servers.
`Relayed To Client`	The number of DHCP Reply messages relayed to clients.
`Out To Server Failed`	The number of failures when attempting to send request messages to servers. This is an internal debugging counter.
`Out To Client Failed`	The number of failures when attempting to send reply messages to clients. This is an internal debugging counter.
`Invalid hlen`	The number of incoming messages dropped due to an invalid hlen field.
`Bogus giaddr`	The number of incoming DHCP Reply messages dropped due to the bogus giaddr field.
`Corrupt Agent Option`	The number of incoming DHCP Reply messages dropped due to a corrupt relay agent information option field. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command.

Parameter	Description
`Missing Agent Option`	The number of incoming DHCP Reply messages dropped due to a missing relay agent information option field. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command.
`Bad Circuit ID`	The number of incoming DHCP Reply messages dropped due to a bad circuit ID. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command
`Missing Circuit ID`	The number of incoming DHCP Reply messages dropped due to a missing circuit ID. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command
`Bad Remote ID`	The number of incoming DHCP Reply messages dropped due to a bad remote ID. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command
`Missing Remote ID`	The number of incoming DHCP Reply messages dropped due to a missing remote ID. Note that Agent Option counters only increment on errors occurring if the ip dhcp-relay agent-option command is configured for an interface. Messages generating the errors are only dropped if the ip dhcp-relay agent-option checking command is configured on the interface as well as the ip dhcp-relay agent-option command

Parameter	Description
`Option Insert Failed`	The number of incoming DHCP Request messages dropped due to an error adding the DHCP Relay Agent information (option-82). This counter increments when: • the DHCP Relay Agent is set to drop packets with the DHCP Relay Agent Option 82 field already filled by another DHCP Relay Agent. This policy is set with the ip dhcp-relay information policy command. • there is a packet error that stops the DHCP Relay Agent from being able to append the packet with its DHCP Relay Agent Information Option (Option 82) field.
Note that the following parameters are only used on the Global VRF instance when DHCPv6 is running	
`DHCPv6 Requests In`	The number of incoming DHCPv6 Request messages.
`DHCPv6 Replies In`	The number of incoming DHCPv6 Reply messages.
`DHCPv6 Relayed to Server`	The number of DHCPv6 messages relayed to the server.
`DHCPv6 Relayed to Client`	The number of DHCPv6 messages relayed to the client.

show counter ipv6 dhcp-client

Overview Use this command in User Exec or Privilege Exec mode to show DHCPv6 client counter information. See show counter ipv6 dhcp-server for DHCPv6 server information.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax
```
show counter ipv6 dhcp-client
```

Mode User Exec and Privileged Exec

Example To display the DHCPv6 client counter information, use the command:

```
awplus# show counter ipv6 dhcp-client
```

Output Figure 53-4: Example output from the **show counter ipv6 dhcp-client** command

```
awplus#show counter ipv6 dhcp-client
SOLICIT out             ......... 20
ADVERTISE in            ......... 12
REQUEST out             ......... 1
CONFIRM out             ......... 0
RENEW out               ......... 0
REBIND out              ......... 0
REPLY in                ......... 0
RELEASE out             ......... 0
DECLINE out             ......... 0
INFORMATION-REQUEST out ......... 0
```

Table 1: Parameters in the output of the **show counter ipv6 dhcp-client** command

Parameter	Description
SOLICIT out	Displays the count of SOLICIT messages sent by the DHCPv6 client.
ADVERTISE in	Displays the count of ADVERTISE messages received by the DHCPv6 client.
REQUEST out	Displays the count of REQUEST messages sent by the DHCPv6 client.
CONFIRM out	Displays the count of CONFIRM messages sent by the DHCPv6 client.
RENEW out	Displays the count of RENEW messages sent by the DHCPv6 client.

Table 1: Parameters in the output of the **show counter ipv6 dhcp-client** command (cont.)

Parameter	Description
`REBIND out`	Displays the count of REBIND messages sent by the DHCPv6 client.
`REPLY in`	Displays the count of REPLY messages received by the DHCPv6 client.
`RELEASE out`	Displays the count of RELEASE messages sent by the DHCPv6 client.
`DECLINE out`	Displays the count of DECLINE messages sent by the DHCPv6 client.
`INFORMATION-REQUEST out`	Displays the count of INFORMATION-REQUEST messages sent by the DHCPv6 client.

Related commands show counter ipv6 dhcp-server

show counter ipv6 dhcp-server

Overview Use this command in User Exec or Privileged Exec mode to show DHCPv6 server counter information. See show counter ipv6 dhcp-client for DHCPv6 client information.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax
```
show counter ipv6 dhcp-server
```

Mode User Exec and Privileged Exec

Example To display the DHCPv6 server counter information, use the command:

```
awplus# show counter ipv6 dhcp-server
```

Output Figure 53-5: Example output from the **show counter ipv6 dhcp-server** command

```
awplus#show counter ipv6 dhcp-server
SOLICIT in              ......... 20
ADVERTISE out           ......... 12

REPLY out               ......... 0
RELEASE in              ......... 0
DECLINE in              ......... 0
INFORMATION-REQUEST in  ......... 0
```

Table 2: Parameters in the output of the **show counter ipv6 dhcp-server** command

Parameter	Description
SOLICIT in	Displays the count of SOLICIT messages received by the DHCPv6 server.
ADVERTISE out	Displays the count of ADVERTISE messages sent by the DHCPv6 server.
REQUEST in	Displays the count of REQUEST messages received by the DHCPv6 server.
CONFIRM in	Displays the count of CONFIRM messages received by the DHCPv6 server.
RENEW in	Displays the count of RENEW messages received by the DHCPv6 server.

Table 2: Parameters in the output of the **show counter ipv6 dhcp-server** command (cont.)

Parameter	Description
`REBIND in`	Displays the count of REBIND messages received by the DHCPv6 server.
`REPLY out`	Displays the count of REPLY messages sent by the DHCPv6 server.
`RELEASE in`	Displays the count of RELEASE messages received by the DHCPv6 server.
`DECLINE in`	Displays the count of DECLINE messages received by the DHCPv6 server.
`INFORMATION-REQUEST in`	Displays the count of INFORMATION-REQUEST messages received by the DHCPv6 server

Related commands show counter ipv6 dhcp-client

show ip dhcp-relay

Overview This command shows the configuration of the DHCP Relay Agent on each interface.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax
```
show ip dhcp-relay [interface <interface-name>]
```

Syntax (VRF-lite)
```
show ip dhcp-relay [vrf <name>|global] [interface
<interface-name>]
```

Parameter	Description
<interface-name>	Name of a specific interface. This displays the DHCP configuration for the specified interface only.
`vrf`	Apply this command to a VRF instance.
<vrf-name>	The name of the VRF instance.
`global`	The Global VRF instance.

Mode User Exec and Privileged Exec

Example To display the DHCP Relay Agent's configuration on the interface vlan2, use the command:

```
awplus# show ip dhcp-relay interface vlan2
```

Output Figure 53-6: Example output from the **show ip dhcp-relay** command

```
DHCP Relay Service is enabled

vlan2 is up, line protocol is up
Maximum hop count is 10
Insertion of Relay Agent Option is disabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay information policy is to append new relay agent
information
List of servers :   192.168.1.200
```

Output (VRF-lite)

Figure 53-7: Example output from the **show ip dhcp-relay** command applied for VRF instance red

```
DHCP Relay Service is enabled

[VRF: red]
vlan2 is up, line protocol is up
Maximum hop count is 10
Maximum DHCP message length is 1400
Insertion of Relay Agent Option is enabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay Information policy is to replace existing relay agent
information
List of servers :   192.168.1.3
```

Command changes

Version 5.4.6-2.1: VRF-lite support added.

show ipv6 dhcp

Overview Use this command in User Exec or Privileged Exec mode to show the DHCPv6 unique identifier (DUID) configured on your device.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ipv6 dhcp
```

Mode User Exec and Privileged Exec

Usage notes The DUID is based on the link-layer address for both DHCPv6 client and DHCPv6 server identifiers. The device uses the MAC address from the lowest interface number for the DUID.

The DUID is used by a DHCPv6 client to obtain an IPv6 address from a DHCPv6 server. A DHCPv6 server compares the DUID with its database of DUIDs and sends configuration data for an IPv6 address plus the preferred and valid lease time values to a DHCPv6 client.

Example To display the DUID configured on your device, use the command:

```
awplus# show ipv6 dhcp
```

Output Figure 53-8: Example output from the **show ipv6 dhcp** command

```
awplus#show ipv6 dhcp
DHCPv6 Server DUID: 0001000117ab6876001577f7ba23
```

Related commands ipv6 address dhcp

show ipv6 dhcp binding

Overview Use this command in User Exec or Privileged Exec mode to show the IPv6 address entries that the DHCPv6 server leases to DHCPv6 clients. Note that applying this command with the optional *summary* keyword parameter displays the number of addresses per pool, but not the address or prefix entries per pool.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ipv6 dhcp binding [summary]
```

Parameter	Description
`summary`	Optional. Specify the **summary** keyword to display summarized information for DHCPv6 server leases to client nodes, displaying the number of address entries per pool, not the addresses or prefixes.

Mode User Exec and Privileged Exec

Example 1 To display the total DHCPv6 leasing address entries for all pools, use the command:

```
awplus# show ipv6 dhcp binding summary
```

Output Figure 53-9: Example output from the **show ipv6 dhcp binding summary** command

```
awplus# show ipv6 dhcp binding summary
Pool Name                 Number of Leased Addresses
-------------------------------------------------
ia-na1                    3
ia-pd1                    5

Total in all Pools:       8
```

Table 3: Parameters in the output of the **show ipv6 dhcp binding summary** command

Parameter	Description
`Pool Name`	Displays a list of all the pool names.
`Number of Leased Addresses`	Displays the number of leased address entries for the pool.
`Total in all Pools`	Displays the total number of leased address entries for all pools.

Example 2 To display addresses, prefixes, and lifetimes for all DHCPv6 leasing entries by pool, enter:

```
awplus# show ipv6 dhcp binding
```

Output Figure 53-10: Example output from the **show ipv6 dhcp binding** command

```
awplus#show ipv6 dhcp binding
Pool ia-na1
 Address 2002:0:3c0::1
         client IAID 77f7ba23, DUID 0001000117c4bbb4001577f7ba23
         preferred lifetime 604800, valid lifetime 2592000
         starts  at 20 Aug 2012 18:38:29
         expires at 19 Sep 2012 18:38:29
Pool ia-pd1
 Prefix  2002:0:3c0::/42
         client IAID 77f7ba23, DUID 0001000117c4bbb4001577f7ba23
         preferred lifetime 604800, valid lifetime 2592000
         starts  at 20 Aug 2012 18:38:29
         expires at 19 Sep 2012 18:38:29
```

Table 4: Parameters in the output of the **show ipv6 dhcp binding** command

Parameter	Description
`Address`	Address delegated to the indicated IAID and DUID. See the IAID and DUID descriptions below for further information.
`Prefix`	Prefix delegated to the indicated IAID and DUID. See the IAID and DUID descriptions below for further information.
`DUID`	DHCPv6 unique identifier (DUID) (see RFC 3315). Each DHCPv6 client has as DUID. DHCPv6 servers use DUIDs to identify clients for the association of IAs (Identity Associations) with DHCPv6 clients. DHCPv6 clients use DUIDs to identify a DHCPv6 server.
`IAID`	Identify Association Identifier (IAID) (see RFC 3315). IAIDs are identifiers for IAs (Identity Associations), where an IA is a collection of IPv6 addresses assigned to a DHCPv6 client. Each IA has an associated IAD. Each DHCPv6 client may have more than one IA assigned to it. Each IA holds one type of address.
`preferred lifetime`	The preferred lifetime setting in seconds for the specified IAID and DUID. Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires. Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.
`valid lifetime`	The valid lifetime setting in seconds for the specified IAID and DUID. An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

Table 4: Parameters in the output of the **show ipv6 dhcp binding** command

Parameter	Description
`starts at`	The date and time at which the valid lifetime expires.
`expires at`	The date and time at which the valid lifetime expires.

Related commands

clear ipv6 dhcp binding

ipv6 dhcp pool

show ipv6 dhcp pool

show ipv6 dhcp interface

Overview Use this command in User Exec or Privileged Exec mode to display DHCPv6 information for a specified interface, or all interfaces when entered without the interface parameter.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax

```
show ipv6 dhcp interface [<interface-name>]
```

Parameter	Description
<interface-name>	Optional. Specify the name of the interface to show DHCPv6 information about. Omit this optional parameter to display DHCPv6 information for all interfaces DHCPv6 is configured on.

Mode User Exec and Privileged Exec

Example To display DHCPv6 information for all interfaces DHCPv6 is configured on, use the command:

```
awplus# show ipv6 dhcp interface
```

Output Figure 53-11: Example output from the **show ipv6 dhcp interface** command

```
awplus# show ipv6 dhcp interface
vlan1 is in client mode
 Address 1001::3c0:1
         preferred lifetime 9000, valid lifetime 5000
         starts  at 20 Jan 2012 09:21:35
         expires at 20 Jan 2012 10:25:32
```

Example 2 To display DHCPv6 information for interface vlan2, use the command:

```
awplus# show ipv6 dhcp interface vlan2
```

Output Figure 53-12: Example output from the **show ipv6 dhcp interface** command for a specific interface

```
awplus# show ipv6 dhcp interface vlan2
vlan2 is in client (Prefix-Delegation) mode
 Prefix name pd1
         prefix 2002:0:3c0::/42
         preferred lifetime 604800, valid lifetime 2592000
         starts  at 20 Aug 2012 09:21:33
         expires at 19 Sep 2012 09:21:33
```

Table 5: Parameters in the output of the **show counter dhcp-client** command

Parameter	Description
`<interface> is in server/client/(Prefix-Delegation) mode`	Displays whether the specified interface is in server or client mode and whether prefix-delegation is applied to an interface.
`Address`	Displays the address of the DHCPv6 server on the interface.
`Prefix name`	Displays the IPv6 general prefix pool name, where prefixes are stored for the interface.
`Using pool`	Displays the name of the pool used by the interface.
`Preference`	Displays the preference value for the DHCPv6 server.

Related commands ipv6 dhcp client pd

show ipv6 dhcp pool

Overview Use this command in User Exec or Privileged Exec mode to display the configuration details and system usage of the DHCPv6 address pools configured on the device.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Syntax `show ipv6 dhcp pool [<DHCPv6-address-pool-name>]`

Parameter	Description
<DHCPv6-address-pool-name>	Name of a specific DHCPv6 address pool. This displays the configuration of the specified DHCPv6 address pool only.

Mode User Exec and Privileged Exec

Example `awplus# show ipv6 dhcp pool`

Output Figure 53-13: Example output from the **show ipv6 dhcp pool** command

```
awplus# show ipv6 dhcp pool
DHCPv6 Pool: ia-na
 Address Prefix   : 1001::/64
         Lifetime: 2592000(valid), 604800(preferred)
 DNS Server: 2001::1
 DNS Server: 2001::2
 Domain Name: example.com
 Domain Name: example.co.jp
 SNTP Server: 2001::5
 SNTP Server: 2001::6
 Option Code : 150
        Value: [ASCII] test-test
DHCPv6 Pool: ia-pd
 PD Pool Name: pd1
    Prefix    : 2002::/38-42
    Lifetime : 2592000(valid), 604800(preferred)
```

Table 6: Parameters in the output of the **show ipv6dhcp pool** command

Parameter	Description
`DHCPv6 Pool`	Name of the DHCPv6 pool.
`Address Prefix`	Address prefix to the DHCPv6 pool.

Table 6: Parameters in the output of the **show ipv6dhcp pool** command (cont.)

Parameter	Description
`Address Lifetime`	Valid and preferred lifetimes to the DHCPv6 pool. Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires. Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected. An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.
`DNS Server`	IPv6 address of the DNS Server
`Domain name`	URL for the domain name.
`SNTP Server`	IPv6 address of the SNTP (Simple Network Time Protocol) Server.
`Option Code`	DHCP Option code (see RFC 2132).
`Option Value`	DHCP Option value type (see RFC 2132).

Related commands ipv6 dhcp pool

sntp-address

Overview Use this command in DHCPv6 Configuration mode to add an SNTP Server IPv6 address to a DHCPv6 Server pool.

Use the **no** variant of this command to remove an SNTP Server IPv6 address from a DHCPv6 Server pool.

Syntax

```
sntp-address <ipv6-address>
no sntp-address <ipv6-address>
```

Parameter	Description
<ipv6-address>	Specify an SNTP Server IPv6 address, in hexadecimal notation in the format X:X::X:X.

Mode DHCPv6 Configuration

Examples The following example adds an SNTP Server IPv6 address of 2001:0db8::/32 to the DHCPv6 pool named P2:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# sntp-address 2001:0db8::/32
```

The following example removes an SNTP Server IPv6 address of 2001:0db8::/32 to the DHCPv6 pool named P2:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# no sntp-address 2001:0db8::/32
```

54 NTP Commands

Introduction

Overview

This chapter provides an alphabetical reference for commands used to configure the Network Time Protocol (NTP). For more information, see the NTP Feature Overview and_Configuration Guide.

The device can act as an NTP client to receive time from one or more NTP servers, and as an NTP server.

For information on filtering and saving command output, see the "Getting Started with AlliedWare_Plus" Feature Overview and Configuration Guide.

Command List

- "ntp authentication-key" on page 2950
- "ntp broadcastdelay" on page 2951
- "ntp master" on page 2952
- "ntp peer" on page 2953
- "ntp rate-limit" on page 2955
- "ntp restrict" on page 2956
- "ntp server" on page 2958
- "ntp source" on page 2960
- "show ntp associations" on page 2962
- "show ntp counters" on page 2964
- "show ntp counters associations" on page 2965
- "show ntp status" on page 2966

ntp authentication-key

Overview This command defines each of the authentication keys. Each key has a key number, a type (MD5 or SHA1), and a value.

The **no** variant of this disables the authentication key.

Syntax

```
ntp authentication-key <keynumber> md5 <key-string> [trusted]
ntp authentication-key <keynumber> sha1 <key-string> [trusted]
no ntp authentication-key <keynumber>
```

Parameter	Description
`<keynumber>`	*<1-4294967295>* An identification number for the key.
`md5`	Define an MD5 key.
`sha1`	Define an SHA1 key.
`<key-string>`	The authentication key. For SHA1, this is a 20 hexadecimal character string. For MD5, this is a string of up to 31 ASCII characters.
`trusted`	Add this key to the list of authentication keys that this server trusts.

Mode Global Configuration

Examples To define an MD5 authentication key number 134343 and a key value ‘mystring’, use the commands:

```
awplus# configure terminal
awplus(config)# ntp authentication-key 134343 md5 mystring
```

To disable the authentication key number 134343 with the key value ‘mystring’, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp authentication-key 134343
```

Command changes Version 5.4.9-2.1 sha1-encrypted parameter added.

ntp broadcastdelay

Overview Use this command to set the estimated round-trip delay for broadcast packets.

Use the **no** variant of this command to reset the round-trip delay for broadcast packets to the default offset of 0 microseconds.

Syntax

```
ntp broadcastdelay <delay>
no ntp broadcastdelay
```

Parameter	Description
<delay>	*<1-999999>* The broadcast delay in microseconds.

Default 0 microsecond offset, which can only be applied with the **no** variant of this command.

Mode Global Configuration

Examples To set the estimated round-trip delay to 23464 microseconds for broadcast packets, use these commands:

```
awplus# configure terminal
awplus(config)# ntp broadcastdelay 23464
```

To reset the estimated round-trip delay for broadcast packets to the default setting (0 microseconds), use these commands:

```
awplus# configure terminal
awplus(config)# no ntp broadcastdelay
```

ntp master

Overview Use this command to make the device to be an authoritative NTP server, even if the system is not synchronized to an outside time source.

Use the **no** variant of this command to stop the device being the designated NTP server.

Syntax

```
ntp master [<stratum>]
no ntp master
```

Parameter	Description
<stratum>	*<1-15>* The stratum number defines the configured level that is set for this master within the NTP hierarchy. The default stratum number is 12.

Mode Global Configuration

Usage notes The stratum levels define the distance from the reference clock and exist to prevent cycles in the hierarchy. Stratum 1 is used to indicate time servers, which are more accurate than Stratum 2 servers. For more information on the Network Time Protocol go to: www.ntp.org

Examples To stop the device from being the designated NTP server, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp master
```

To make the device the designated NTP server with stratum number 2, use the commands:

```
awplus# configure terminal
awplus(config)# ntp master 2
```

ntp peer

Overview Use this command to configure an NTP peer association. An NTP association is a peer association if this system is willing to either synchronize to the other system, or allow the other system to synchronize to it.

Use the **no** variant of this command to remove the configured NTP peer association.

Syntax

```
ntp peer {<peeraddress>|<peername>}
ntp peer {<peeraddress>|<peername>} [prefer] [key <key>] [version <version>]
no ntp peer {<peeraddress>|<peername>}
```

Parameter	Description
<peeraddress>	Specify the IP address of the peer, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X:X for an IPv6 address.
<peername>	Specify the peer hostname. The peer hostname can resolve to an IPv4 and an IPv6 address.
`prefer`	Prefer this peer when possible.
`key <key>`	*<1-4294967295>* Configure the peer authentication key.
`version <version>`	*<1-4>* Configure for this NTP version.

Mode Global Configuration

Examples See the following commands for options to configure NTP peer association, key and NTP version for the peer with an IPv4 address of `192.0.2.23`:

```
awplus# configure terminal
awplus(config)# ntp peer 192.0.2.23
awplus(config)# ntp peer 192.0.2.23 prefer
awplus(config)# ntp peer 192.0.2.23 prefer version 4
awplus(config)# ntp peer 192.0.2.23 prefer version 4 key 1234
awplus(config)# ntp peer 192.0.2.23 version 4 key 1234
awplus(config)# ntp peer 192.0.2.23 version 4
awplus(config)# ntp peer 192.0.2.23 key 1234
```

To remove an NTP peer association for this peer with an IPv4 address of `192.0.2.23`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 192.0.2.23
```

See the following commands for options to configure NTP peer association, key and NTP version for the peer with an IPv6 address of `2001:0db8:010d::1`:

```
awplus# configure terminal
awplus(config)# ntp peer 2001:0db8:010d::1
awplus(config)# ntp peer 2001:0db8:010d::1 prefer
awplus(config)# ntp peer 2001:0db8:010d::1 prefer version 4
awplus(config)# ntp peer 2001:0db8:010d::1 prefer version 4 key
1234
awplus(config)# ntp peer 2001:0db8:010d::1 version 4 key 1234
awplus(config)# ntp peer 2001:0db8:010d::1 version 4
awplus(config)# ntp peer 2001:0db8:010d::1 key 1234
```

To remove an NTP peer association for this peer with an IPv6 address of `2001:0db8:010d::1`, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 2001:0db8:010d::1
```

Related commands

ntp server

ntp source

ntp rate-limit

Overview Use this command to enable NTP server response rate-limiting. Limiting NTP server responses can reduce network traffic when occurrences such as misconfigured or broken NTP clients poll the NTP server too frequently. Excessive polling can lead to network overload.

Use the **no** variant of this command to remove the rate-limit configuration.

Syntax

```
ntp rate-limit {interval<1-4096>|burst <1-255>|leak <2-16>}
no ntp rate-limit
```

Parameter	Description
`interval`	The minimum interval between responses configured in seconds. The default interval is 8 seconds.
`burst`	The maximum number of responses that can be sent in a burst, temporarily exceeding the limit specified by the interval option. The default burst is 8 responses.
`leak`	The rate at which responses are randomly allowed even if the limits specified by the interval and burst options are exceeded. The default leak is 4, i.e. on average, every fourth request has a response.

Mode Global Configuration

Default Interval - 8 seconds.

Burst - 8 responses.

Leak - 4.

Example To configure an NTP rate-limiting interval of 30 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# ntp rate-limit interval 30
```

Related commands ntp restrict

Command changes Version 5.4.8-1.1: command added

ntp restrict

Overview Use this command to configure a restriction (allow or deny) on NTP packets or NTP functionality for a specific host/network or all hosts of a given IP family.

This means you can control host access to NTP service and NTP server status queries.

Use the **no** variant of this command to remove a restriction from one or more hosts.

Syntax

```
ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>}
{allow|deny}
```

```
ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>} query
{allow|deny}
```

```
ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>} serve
{allow|deny}
```

```
no ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>}
```

Parameter	Description
`default-v4`	Apply this restriction to all IPv4 hosts.
`default-v6`	Apply this restriction to all IPv6 hosts.
`<host-address>`	Apply this restriction to the specified IPv4 or IPv6 host. Enter an IPv4 address in the format A.B.C.D. Enter an IPv6 address in the format X:X::X:X.
`<host-subnet>`	Apply this restriction to the specified IPv4 subnet or IPv6 prefix. Enter an IPv4 subnet in the format A.B.C.D/M. Enter an IPv6 prefix in the format X:X::X:X/X.
`query`	Control NTP server status queries to matching hosts.
`serve`	Control NTP time service to matching hosts.
`allow`	Allow the configured restriction.
`deny`	Deny the configured restriction.

Default By default, time service is allowed to all hosts, and NTP server status querying is denied to all hosts.

Mode Global Configuration

Example

To prevent all IPv4 hosts from accessing a device for NTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict default-v4 deny
```

To prevent the host 192.168.1.1 from accessing a device for NTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict 198.168.1.1 deny
```

To allow all hosts in the 10.10.10.0/24 subnet to access a device for NTP server status, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict 10.10.10.0/24 query allow
```

Related commands

ntp rate-limit

Command changes

Version 5.4.8-1.1: command added

ntp server

Overview Use this command to configure an NTP server. This means that this system will synchronize to the other system, and not vice versa.

Use the **no** variant of this command to remove the configured NTP server.

Syntax

```
ntp server {<serveraddress>|<servername>}
ntp server {<serveraddress>|<servername>} [prefer] [key <key>] [version <version>]
no ntp server {<serveraddress>|<servername>}
```

Parameter	Description
<serveraddress>	Specify the IP address of the peer, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X.X for an IPv6 address.
<servername>	Specify the server hostname. The server hostname can resolve to an IPv4 and an IPv6 address.
`prefer`	Prefer this server when possible.
`key <key>`	*<1-4294967295>* Configure the server authentication key.
`version <version>`	*<1-4>* Configure for this NTP version.

Mode Global Configuration

Examples See the following commands for options to configure an NTP server association, key and NTP version for the server with an IPv4 address of 192.0.1.23:

```
awplus# configure terminal
awplus(config)# ntp server 192.0.1.23
awplus(config)# ntp server 192.0.1.23 prefer
awplus(config)# ntp server 192.0.1.23 prefer version 4
awplus(config)# ntp server 192.0.1.23 prefer version 4 key 1234
awplus(config)# ntp server 192.0.1.23 version 4 key 1234
awplus(config)# ntp server 192.0.1.23 version 4
awplus(config)# ntp server 192.0.1.23 key 1234
```

To remove an NTP peer association for this peer with an IPv4 address of 192.0.1.23, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp server 192.0.1.23
```

See the following commands for options to configure an NTP server association, key and NTP version for the server with an IPv6 address of 2001:0db8:010e::2:

```
awplus# configure terminal
awplus(config)# ntp server 2001:0db8:010e::2
awplus(config)# ntp server 2001:0db8:010e::2 prefer
awplus(config)# ntp server 2001:0db8:010e::2 prefer version 4
awplus(config)# ntp server 2001:0db8:010e::2 prefer version 4
key 1234
awplus(config)# ntp server 2001:0db8:010e::2 version 4 key 1234
awplus(config)# ntp server 2001:0db8:010e::2 version 4
awplus(config)# ntp server 2001:0db8:010e::2 key 1234
```

To remove an NTP peer association for this peer with an IPv6 address of 2001:0db8:010e::2, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp server 2001:0db8:010e::2
```

Related commands

ntp peer

ntp source

ntp source

Overview Use this command to configure an IPv4 or an IPv6 address for the NTP source interface. This command defines the socket used for NTP messages, and only applies to NTP client behavior.

Note that you cannot use this command when using AMF (Allied Telesis Management Framework).

Use the **no** variant of this command to remove the configured IPv4 or IPv6 address from the NTP source interface.

Syntax

```
ntp source <source-address>
no ntp source
```

Parameter	Description
<source-address>	Specify the IP address of the NTP source interface, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X.X for an IPv6 address.

Default An IP address is selected based on the most appropriate egress interface used to reach the NTP peer if a configured NTP client source IP address is unavailable or invalid.

Mode Global Configuration

Usage notes Adding an IPv4 or an IPv6 address allows you to select which source interface NTP uses for peering. The IPv4 or IPv6 address configured using this command is matched to the interface.

When selecting a source IP address to use for NTP messages to the peer, if the configured NTP client source IP address is unavailable then default behavior will apply, and an alternative source IP address is automatically selected. This IP address is based on the most appropriate egress interface used to reach the NTP peer. The configured NTP client source IP may be unavailable if the interface is down, or an invalid IP address is configured that does not reside on the device.

Note that this command only applies to NTP client behavior. The egress interface that the NTP messages use to reach the NTP server is determined by the ntp peer and ntp server commands.

Note that you cannot use this command when using AMF (Allied Telesis Management Framework).

Examples To configure the NTP source interface with the IPv4 address 192.0.2.23, enter the commands:

```
awplus# configure terminal
awplus(config)# ntp source 192.0.2.23
```

To configure the NTP source interface with the IPv6 address 2001:0db8:010e::2, enter the commands:

```
awplus# configure terminal
awplus(config)# ntp source 2001:0db8:010e::2
```

To remove a configured address for the NTP source interface, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp source
```

Related commands

ntp peer

ntp server

show ntp associations

Overview Use this command to display the status of NTP associations.

Syntax `show ntp associations`

Mode User Exec and Privileged Exec

Example See the sample output of the **show ntp associations** command displaying the status of NTP associations.

Table 54-1: Example output from **show ntp associations**

```
awplus#show ntp associations
 remote           refid            st t when poll reach    delay   offset  disp
------------------------------------------------------------------------------
*server1.example.com
                 192.0.2.2        4 u   47   64   377    0.177    0.021   0.001
+192.168.1.10    10.32.16.80      5 u   46   64   377    0.241   -0.045   0.000
* system peer, # backup, + candidate, - outlier, x false ticker
```

Table 54-2: Parameters in the output from **show ntp associations**

Parameter	Description
`* system peer`	The peer that NTP uses to calculate variables like the offset and root dispersion of this AlliedWare Plus device. NTP passes these variables to the clients using this AlliedWare Plus device.
`# backup`	Peers that are usable, but are not among the first six peers sorted by synchronization distance. These peers may not be used.
`+ candidate`	Peers that the NTP algorithm has determined can be used, along with the system peer, to discipline the clock (i.e. to set the time on the AlliedWare Plus device).
`- outlier`	Peers that are not used because their time is significantly different from the other peers.
`x false ticker`	Peers that are not used because they are not consider trustworthy.
`space`	Peers that are not used because they are, for example, unreachable.
`remote`	The peer IP address
`refid`	The IP address of the reference clock, or an abbreviation indicating the type of clock (e.g. GPS indicates that the server uses GPS for the reference clock). INIT indicates that the reference clock is initializing, so it is not operational.

Table 54-2: Parameters in the output from **show ntp associations** (cont.)

Parameter	Description
st	The stratum, which is the number of hops between the server and the accurate time source such as an atomic clock.
t	Type, one of: u: unicast or manycast client b: broadcast or multicast clientl: local reference clock s: symmetric peer A: manycast server B: broadcast server M: multicast server
when	When last polled (seconds ago, h hours ago, or d days ago).
poll	Time between NTP requests from the device to the server.
reach	An indication of whether or not the NTP server is responding to requests. 0 indicates there has never been a successful poll; 1 indicates that the last poll was successful; 3 indicates that the last two polls were successful; 377 indicates that the last 8 polls were successful.
delay	The round trip communication delay to the remote peer or server, in milliseconds.
offset	The mean offset (phase) in the times reported between this local host and the remote peer or server (root mean square, milliseconds).
disp	The amount of clock error (in milliseconds) of the server due to clock resolution, network congestion, etc.

show ntp counters

Overview This command displays packet counters for NTP.

Syntax `show ntp counters`

Mode Privileged Exec

Example To display counters for NTP use the command:

```
awplus# show ntp counters
```

Figure 54-1: Example output from **show ntp counters**

```
awplus#show ntp counters
Server Received           4
Server Dropped            0
Client Sent               90
Client Received           76
Client Valid Received     76
```

Table 54-3: Parameters in the output from **show ntp counters**

Parameter	Description
`Server Received`	Number of NTP packets received from NTP clients.
`Server Dropped`	Number of NTP packets received from NTP clients but dropped.
`Client Sent`	Number of NTP packets sent to servers.
`Client Received`	Number of NTP packets received from servers
`Client Valid Received`	Number of valid NTP packets received from servers.

show ntp counters associations

Overview Use this command to display NTP packet counters for individual servers and peers.

Syntax

```
show ntp counters associations
```

Mode Privileged Exec

Examples To display packet counters for each NTP server and peer that is associated with a device, use the command:

```
awplus# show ntp counters associations
```

Output Figure 54-2: Example output from **show ntp counters associations**

```
awplus#show ntp counters associations
Peer 2001::1
 sent:          -
 received:      -
Peer 10.37.219.100
 sent:          7
 received:      7
```

Table 54-4: Parameters in the output from **show ntp counters associations**

Parameter	Description
`Peer`	An NTP peer or server that the device is associated with.
`sent`	The number of NTP packets that this device sent to the peer.
`received`	The number of NTP packets that this device received from the peer.

Related commands ntp restrict

show ntp status

Overview Use this command to display the status of the Network Time Protocol (NTP).

Syntax `show ntp status`

Mode User Exec and Privileged Exec

Example To see information about NTP status, use the command:

```
awplus# show ntp status
```

For information about the output displayed by this command, see ntp.org.

Figure 54-3: Example output from **show ntp status**

```
awplus#show ntp status
Reference ID    : C0A8010A (192.168.1.10)
Stratum         : 4
Ref time (UTC)  : Fri Jun 15 05:32:38 2018
System time     : 0.000002004 seconds fast of NTP time
Last offset     : -0.002578615 seconds
RMS offset      : 0.000928071 seconds
Frequency       : 5.099 ppm slow
Residual freq   : -9.120 ppm
Skew            : 17.486 ppm
Precision       : -21 (0.000000477 seconds)
Root delay      : 0.031749818 seconds
Root dispersion : 0.133974627 seconds

```

55 SNMP Commands

Introduction

Overview This chapter provides an alphabetical reference for commands used to configure SNMP. For more information, see:

- the Support for Allied Telesis Enterprise_MIBs in AlliedWare Plus, for information about which MIB objects are supported.
- the SNMP Feature Overview and Configuration_Guide.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Command List

- "alias (interface)" on page 2969
- "debug snmp" on page 2970
- "show counter snmp-server" on page 2971
- "show debugging snmp" on page 2975
- "show running-config snmp" on page 2976
- "show snmp-server" on page 2977
- "show snmp-server community" on page 2978
- "show snmp-server group" on page 2979
- "show snmp-server user" on page 2980
- "show snmp-server view" on page 2981
- "snmp trap link-status" on page 2982
- "snmp trap link-status suppress" on page 2984
- "snmp-server" on page 2986
- "snmp-server community" on page 2988
- "snmp-server contact" on page 2989
- "snmp-server enable trap" on page 2990

- "snmp-server engineID local" on page 2993
- "snmp-server engineID local reset" on page 2995
- "snmp-server group" on page 2996
- "snmp-server host" on page 2998
- "snmp-server legacy-ifadminstatus" on page 3000
- "snmp-server location" on page 3001
- "snmp-server source-interface" on page 3002
- "snmp-server startup-trap-delay" on page 3003
- "snmp-server user" on page 3004
- "snmp-server view" on page 3007
- "undebug snmp" on page 3008

alias (interface)

Overview Use this command to set an alias name for a port, as returned by the SNMP ifMIB in OID 1.3.6.1.2.1.31.1.1.1.18.

Use the **no** variant of this command to remove an alias name from a port.

Syntax

```
alias <ifAlias>
no alias
```

Parameter	Description
<ifAlias>	64 character name for an interface in a network management system. All printable characters are valid.

Default Not set.

Mode Interface Configuration

Usage notes The interface alias can also be set via SNMP.

Third-party management systems often use standard MIBs to access device information. Network managers can specify an alias interface name to provide a non-volatile way to access the interface.

Example To configure the alias interface name 'uplink_a' for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# alias uplink_a
```

To remove an alias interface name from port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no alias
```

Command changes Version 5.4.8-2.1: command added

debug snmp

Overview This command enables SNMP debugging.

The **no** variant of this command disables SNMP debugging.

Syntax

```
debug snmp
[all|detail|error-string|process|receive|send|xdump]
```

```
no debug snmp
[all|detail|error-string|process|receive|send|xdump]
```

Parameter	Description
`all`	Enable or disable the display of all SNMP debugging information.
`detail`	Enable or disable the display of detailed SNMP debugging information.
`error-string`	Enable or disable the display of debugging information for SNMP error strings.
`process`	Enable or disable the display of debugging information for processed SNMP packets.
`receive`	Enable or disable the display of debugging information for received SNMP packets.
`send`	Enable or disable the display of debugging information for sent SNMP packets.
`xdump`	Enable or disable the display of hexadecimal dump debugging information for SNMP packets.

Mode Privileged Exec and Global Configuration

Example To start SNMP debugging, use the command:

```
awplus# debug snmp
```

To start SNMP debugging, showing detailed SNMP debugging information, use the command:

```
awplus# debug snmp detail
```

To start SNMP debugging, showing all SNMP debugging information, use the command:

```
awplus# debug snmp all
```

Related commands

show debugging snmp

terminal monitor

undebug snmp

show counter snmp-server

Overview This command displays counters for SNMP messages received by the SNMP agent.

Syntax

```
show counter snmp-server
```

Mode User Exec and Privileged Exec

Example To display the counters for the SNMP agent, use the command:

```
awplus# show counter snmp-server
```

Output Figure 55-1: Example output from the **show counter snmp-server** command

```
SNMP-SERVER counters
inPkts                ......... 11
inBadVersions         ......... 0
inBadCommunityNames   ......... 0
inBadCommunityUses    ......... 0
inASNParseErrs        ......... 0
inTooBigs             ......... 0
inNoSuchNames         ......... 0
inBadValues           ......... 0

WrongDigest           ......... 0
DecryptionErrors      ......... 0
UnknownSecModels      ......... 0
InvalidMsgs           ......... 0
UnknownPDUHandlers    ......... 0
```

Table 1: Parameters in the output of the **show counter snmp-server** command

Parameter	Meaning
inPkts	The total number of SNMP messages received by the SNMP agent.
inBadVersions	The number of messages received by the SNMP agent for an unsupported SNMP version. It drops these messages.The SNMP agent on your device supports versions 1, 2C, and 3.
inBadCommunityNames	The number of messages received by the SNMP agent with an unrecognized SNMP community name. It drops these messages.
inBadCommunityUses	The number of messages received by the SNMP agent where the requested SNMP operation is not permitted from SNMP managers using the SNMP community named in the message.
inASNParseErrs	The number of ASN.1 or BER errors that the SNMP agent has encountered when decoding received SNMP Messages.
inTooBigs	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'tooBig'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.
inNoSuchNames	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'noSuchName'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.
inBadValues	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'badValue'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.
inReadOnlys	The number of valid SNMP PDUs received by the SNMP agent where the value of the error-status field is 'readOnly'. The SNMP manager should not generate a PDU which contains the value 'readOnly' in the error-status field. This indicates that there is an incorrect implementations of the SNMP.
inGenErrs	The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'genErr'.

Table 1: Parameters in the output of the **show counter snmp-server** command

Parameter	Meaning
inTotalReqVars	The number of MIB objects that the SNMP agent has successfully retrieved after receiving valid SNMP Get-Request and Get-Next PDUs.
inTotalSetVars	The number of MIB objects that the SNMP agent has successfully altered after receiving valid SNMP Set-Request PDUs.
inGetRequests	The number of SNMP Get-Request PDUs that the SNMP agent has accepted and processed.
inGetNexts	The number of SNMP Get-Next PDUs that the SNMP agent has accepted and processed.
inSetRequests	The number of SNMP Set-Request PDUs that the SNMP agent has accepted and processed.
inGetResponses	The number of SNMP Get-Response PDUs that the SNMP agent has accepted and processed.
inTraps	The number of SNMP Trap PDUs that the SNMP agent has accepted and processed.
outPkts	The number of SNMP Messages that the SNMP agent has sent.
outTooBigs	The number of SNMP PDUs that the SNMP agent has generated with the value 'tooBig' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outNoSuchNames	The number of SNMP PDUs that the SNMP agent has generated with the value `noSuchName' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outBadValues	The number of SNMP PDUs that the SNMP agent has generated with the value 'badValue' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outGenErrs	The number of SNMP PDUs that the SNMP agent has generated with the value 'genErr' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.
outGetRequests	The number of SNMP Get-Request PDUs that the SNMP agent has generated.

Table 1: Parameters in the output of the **show counter snmp-server** command

Parameter	Meaning
`outGetNexts`	The number of SNMP Get-Next PDUs that the SNMP agent has generated.
`outSetRequests`	The number of SNMP Set-Request PDUs that the SNMP agent has generated.
`outGetResponses`	The number of SNMP Get-Response PDUs that the SNMP agent has generated.
`outTraps`	The number of SNMP Trap PDUs that the SNMP agent has generated.
`UnSupportedSecLevels`	The number of received packets that the SNMP agent has dropped because they requested a securityLevel unknown or not available to the SNMP agent.
`NotInTimeWindows`	The number of received packets that the SNMP agent has dropped because they appeared outside of the authoritative SNMP agent's window.
`UnknownUserNames`	The number of received packets that the SNMP agent has dropped because they referenced an unknown user.
`UnknownEngineIDs`	The number of received packets that the SNMP agent has dropped because they referenced an unknown snmpEngineID.
`WrongDigest`	The number of received packets that the SNMP agent has dropped because they didn't contain the expected digest value.
`DecryptionErrors`	The number of received packets that the SNMP agent has dropped because they could not be decrypted.
`UnknownSecModels`	The number of messages received that contain a security model that is not supported by the server. Valid for SNMPv3 messages only.
`InvalidMsgs`	The number of messages received where the security model is supported but the authentication fails. Valid for SNMPv3 messages only.
`UnknownPDUHandlers`	The number of times the SNMP handler has failed to process a PDU. This is a system debugging counter.

Related commands show snmp-server

show debugging snmp

Overview This command displays whether SNMP debugging is enabled or disabled.

Syntax

```
show debugging snmp
```

Mode User Exec and Privileged Exec

Example To display the status of SNMP debugging, use the command:

```
awplus# show debugging snmp
```

Output Figure 55-2: Example output from the **show debugging snmp** command

```
Snmp (SMUX) debugging status:
  Snmp debugging is on
```

Related commands debug snmp

show running-config snmp

Overview This command displays the current configuration of SNMP on your device.

Syntax

```
show running-config snmp
```

Mode Privileged Exec

Example To display the current configuration of SNMP on your device, use the command:

```
awplus# show running-config snmp
```

Output Figure 55-3: Example output from the **show running-config snmp** command

```
snmp-server contact AlliedTelesis
snmp-server location Philippines
snmp-server group grou1 auth read view1 write view1 notify view1
snmp-server view view1 1 included
snmp-server community public
snmp-server user user1 group1 auth md5 password priv des
password
```

Related commands show snmp-server

show snmp-server

Overview This command displays the status and current configuration of the SNMP server.

Syntax

```
show snmp-server
```

Mode Privileged Exec

Example To display the status of the SNMP server, use the command:

```
awplus# show snmp-server
```

Output Figure 55-4: Example output from the **show snmp-server** command

```
SNMP Server ......................... Enabled
IP Protocol ......................... IPv4
SNMPv3 Engine ID (configured name) ... Not set
SNMPv3 Engine ID (actual) ............ 0x80001f888021338e4747b8e607
```

Related commands

show counter snmp-server

snmp-server

snmp-server engineID local

snmp-server engineID local reset

show snmp-server community

Overview This command displays the SNMP server communities configured on the device. SNMP communities are specific to v1 and v2c.

Syntax

```
show snmp-server community
```

Mode Privileged Exec

Example To display the SNMP server communities, use the command:

```
awplus# show snmp-server community
```

Output Figure 55-5: Example output from the **show snmp-server community** command

```
SNMP community information:
  Community Name ........... public
    Access ................. Read-only
    View ................... none
```

Related commands

show snmp-server

snmp-server community

show snmp-server group

Overview This command displays information about SNMP server groups. This command is used with SNMP version 3 only.

Syntax

```
show snmp-server group
```

Mode Privileged Exec

Example To display the SNMP groups configured on the device, use the command:

```
awplus# show snmp-server group
```

Output Figure 55-6: Example output from the **show snmp-server group** command

```
SNMP group information:
  Group name ............... guireadgroup
    Security Level ........ priv
    Read View ............. guiview
    Write View ............ none
    Notify View ........... none

  Group name ............... guiwritegroup
    Security Level ........ priv
    Read View ............. none
    Write View ............ guiview
    Notify View ........... none
```

Related commands

show snmp-server

snmp-server group

show snmp-server user

Overview This command displays the SNMP server users and is used with SNMP version 3 only.

Syntax
```
show snmp-server user
```

Mode Privileged Exec

Example To display the SNMP server users configured on the device, use the command:

```
awplus# show snmp-server user
```

Output Figure 55-7: Example output from the **show snmp-server user** command

```
Name                Group name          Auth        Privacy
-------             -------------       -------     ----------
freddy              guireadgroup        none        none
```

Related commands show snmp-server

snmp-server user

show snmp-server view

Overview This command displays the SNMP server views and is used with SNMP version 3 only.

Syntax
```
show snmp-server view
```

Mode Privileged Exec

Example To display the SNMP server views configured on the device, use the command:

```
awplus# show snmp-server view
```

Output Figure 55-8: Example output from the **show snmp-server view** command

```
SNMP view information:
  View Name ............... view1
    OID ................... 1
    Type .................. included
```

Related commands show snmp-server

snmp-server view

snmp trap link-status

Overview Use this command to enable SNMP to send link status notifications (traps) for the interfaces when an interface goes up (linkUp) or down (linkDown).

Use the **no** variant of this command to disable the sending of link status notifications.

Syntax

```
snmp trap link-status [enterprise]
no snmp trap link-status
```

Parameter	Description
`enterprise`	Send an Allied Telesis enterprise type of link trap.

Default Disabled

Mode Interface Configuration

Usage notes The link status notifications can be enabled for the following interface types:

- switch port (e.g. port1.0.1)
- VLAN (e.g. vlan2)
- Ethernet (e.g. eth1)
- static and dynamic link aggregation (e.g. sa2, po2)

To specify where notifications are sent, use the snmp-server host command. To configure the device globally to send other notifications, use the snmp-server enable trap command.

Examples To enable SNMP to send link status notifications for port1.0.1 to port1.0.3 use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.3
awplus(config-if)# snmp trap link-status
```

To disable the sending of link status notifications for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no snmp trap link-status
```

Related commands

show interface

snmp trap link-status suppress

snmp-server enable trap

snmp-server host

snmp trap link-status suppress

Overview Use this command to enable the suppression of link status notifications (traps) for the interfaces beyond the specified threshold, in the specified interval.

Use the **no** variant of this command to disable the suppression of link status notifications for the ports.

Syntax

```
snmp trap link-status suppress {time {<1-60>|default}|threshold {<1-20>|default}}
no snmp trap link-status suppress
```

Parameter	Description
`time`	Set the suppression timer for link status notifications.
<1-60>	The suppress time in seconds.
`default`	The default suppress time in seconds (60).
`threshold`	Set the suppression threshold for link status notifications. This is the number of link status notifications after which to suppress further notifications within the suppression timer interval.
<1-20>	The number of link status notifications.
`default`	The default number of link status notifications (20).

Default By default, if link status notifications are enabled (they are enabled by default), the suppression of link status notifications is enabled: notifications that exceed the notification threshold (default 20) within the notification timer interval (default 60 seconds) are not sent.

Mode Interface Configuration

Usage notes An unstable network can generate many link status notifications. When notification suppression is enabled, a suppression timer is started when the first link status notification of a particular type (linkUp or linkDown) is sent for an interface.

If the threshold number of notifications of this type is sent before the timer reaches the suppress time, any further notifications of this type generated for the interface during the interval are not sent. At the end of the interval, the sending of link status notifications resumes, until the threshold is reached in the next interval.

Examples To suppress link status notifications for port1.0.1 to port1.0.3 after 10 notifications in 40 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.3
awplus(config-if)# snmp trap link-status suppress time 40 threshold 10
```

To stop suppressing link status notifications for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no snmp trap link-status suppress
```

Related commands

show interface

snmp trap link-status

snmp-server

Overview Use this command to enable the SNMP agent (server) on the device. The SNMP agent receives and processes SNMP packets sent to the device, and generates notifications (traps) that have been enabled by the snmp-server enable trap command.

Use the **no** variant of this command to disable the SNMP agent on the device. When SNMP is disabled, SNMP packets received by the device are discarded, and no notifications are generated. This does not remove any existing SNMP configuration.

Syntax

```
snmp-server [ip|ipv6]
no snmp-server [ip|ipv6]
```

Parameter	Description
ip	Enable or disable the SNMP agent for IPv4.
ipv6	Enable or disable the SNMP agent for IPv6.

Default By default, the SNMP agent is enabled for both IPv4 and IPv6. If neither the **ip** parameter nor the **ipv6** parameter is specified for this command, then SNMP is enabled or disabled for both IPv4 and IPv6.

Mode Global Configuration

Examples To enable SNMP on the device for both IPv4 and IPv6, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server
```

To enable the SNMP agent for IPv4 on the device, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server ip
```

To disable the SNMP agent for both IPv4 and IPv6 on the device, use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-server
```

To disable the SNMP agent for IPv4, use the commands:

```
awplus(config)# no snmp-server ipv4
```

Related commands

show snmp-server

show snmp-server user

snmp-server community

snmp-server contact

snmp-server enable trap

snmp-server engineID local

snmp-server group

snmp-server host

snmp-server location

snmp-server view

snmp-server community

Overview This command creates an SNMP community, optionally setting the access mode for the community. The default access mode is read only. If view is not specified, the community allows access to all the MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used when operating SNMPv3.

The **no** variant of this command removes an SNMP community. The specified community must already exist on the device.

Syntax

```
snmp-server community <community-name> {view <view-name>|ro|rw}
no snmp-server community <community-name> [{view <view-name>}]
```

Parameter	Description
<community-name>	Community name. The community name is a case sensitive string of up to 20 characters.
`view`	Configure SNMP view. If view is not specified, the community allows access to all the MIB objects.
<view-name>	View name. The view name is a string up to 20 characters long and is case sensitive.
`ro`	Read-only community.
`rw`	Read-write community.

Mode Global Configuration

Example The following command creates an SNMP community called “public” with read only access to all MIB variables from any management station.

```
awplus# configure terminal
awplus(config)# snmp-server community public ro
```

The following command removes an SNMP community called “public”

```
awplus# configure terminal
awplus(config)# no snmp-server community public
```

Related commands

show snmp-server

show snmp-server community

snmp-server view

snmp-server contact

Overview This command sets the contact information for the system. The contact name is:

- displayed in the output of the show system command
- stored in the MIB object sysContact

The **no** variant of this command removes the contact information from the system.

Syntax

```
snmp-server contact <contact-info>
no snmp-server contact
```

Parameter	Description
<contact-info>	The contact information for the system, from 0 to 255 characters long. Valid characters are any printable character and spaces.

Mode Global Configuration

Example To set the system contact information to "support@alliedtelesis.co.nz", use the command:

```
awplus# configure terminal
awplus(config)# snmp-server contact
support@alliedtelesis.co.nz
```

Related commands

show system

snmp-server location

snmp-server group

snmp-server enable trap

Overview Use this command to enable the switch to transmit the specified notifications (traps).

Note that the Environmental Monitoring traps defined in the AT-ENVMONv2-MIB are enabled by default.

Use the **no** variant of this command to disable the transmission of the specified notifications.

Syntax `snmp-server enable trap <trap-list>`

`no snmp-server enable trap <trap-list>`

Depending on your device model, you can enable some or all of the traps in the following table:

Parameter	Description
`atmf`	AMF traps.
`atmflink`	AMF link traps.
`atmfnode`	AMF node traps.
`atmfrr`	AMF reboot-rolling traps.
`auth`	Authentication failure.
`bgp`	BGP traps.
`chassis`	Chassis traps.
`dhcpsnooping`	DHCP snooping and ARP security traps. These notifications must also be set using the **ip dhcp snooping violation** command, and/or the arp security violation **arp security violation** command.
`epsr`	EPSR traps.
`g8032`	G.8032 ERP traps.
`lldp`	Link Layer Discovery Protocol (LLDP) traps. These notifications must also be enabled using the **lldp notifications** command, and/or the **lldp med-notifications** command.
`loopprot`	Loop Protection traps.
`mstp`	MSTP traps.
`nsm`	NSM traps.
`ospf`	OSPF traps.
`pim`	PIM traps.
`power-inline`	Power-inline traps (Power Ethernet MIB RFC 3621).
`qsp`	QoS Storm Protection

Parameter	Description
`rmon`	RMON traps.
`thrash-limit`	MAC address Thrash Limiting traps.
`vcs`	VCS traps.
`vrrp`	Virtual Router Redundancy (VRRP) traps.
`ufo`	Upstream Forwarding Only (UFO) traps.

Default Disabled

Mode Global Configuration

Usage notes This command cannot be used to enable link status notifications globally. To enable link status notifications for particular interfaces, use the snmp trap link-status command.

To specify where notifications are sent, use the snmp-server host command.

Note that you can enable (or disable) multiple traps with a single command, by specifying a space-separated list of traps.

Examples To enable the device to send a notification if an AMF node changes its status, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap atmfnode
```

To enable the device to send MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap thrash-limit
```

To disable the device from sending MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap thrash-limit
```

To enable the device to send OSPF and VRRP-related traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap ospf vrrp
```

To disable OSPF traps being sent out by the device, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap ospf
```

Command changes

Version 5.4.7-2.1: **ufo** parameter added

snmp-server engineID local

Overview Use this command to configure the SNMPv3 engine ID. The SNMPv3 engine ID is used to uniquely identify the SNMPv3 agent on a device when communicating with SNMP management clients. Once an SNMPv3 engine ID is assigned, this engine ID is permanently associated with the device until you change it.

Use the **no** variant of this command to set the user defined SNMPv3 engine ID to a system generated pseudo-random value by resetting the SNMPv3 engine. The **no snmp-server engineID local** command has the same effect as the **snmp-server engineID local default** command.

Note that the snmp-server engineID local reset command is used to force the system to generate a new engine ID when the current engine ID is also system generated.

Syntax

```
snmp-server engineID local {<engine-id>|default}
no snmp-server engineID local
```

Parameter	Description
`<engine-id>`	Specify SNMPv3 Engine ID value, a string of up to 27 characters.
`default`	Set SNMPv3 engine ID to a system generated value by resetting the SNMPv3 engine, provided the current engine ID is user defined. If the current engine ID is system generated, use the snmp-server engineID local reset command to force the system to generate a new engine ID.

Mode Global Configuration

Usage notes All devices must have a unique engine ID which is permanently set unless it is configured by the user.

Example To set the SNMPv3 engine ID to 800000cf030000cd123456, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local
800000cf030000cd123456
```

To set a user defined SNMPv3 engine ID back to a system generated value, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server engineID local
```

Output The following example shows the engine ID values after configuration:

```
awplus(config)#snmp-server engineid local asdgdfh231234d
awplus(config)#exit
awplus#show snmp-server

SNMP Server ......................... Enabled
IP Protocol ......................... IPv4
SNMPv3 Engine ID (configured name) ... asdgdfh231234d
SNMPv3 Engine ID (actual) ............ 0x80001f888029af52e149198483

awplus(config)#no snmp-server engineid local
awplus(config)#exit
awplus#show snmp-server

SNMP Server ......................... Enabled
IP Protocol ......................... IPv4
SNMPv3 Engine ID (configured name) ... Not set
SNMPv3 Engine ID (actual) ............ 0x80001f888029af52e149198483
```

Related commands

show snmp-server

snmp-server engineID local reset

snmp-server group

snmp-server engineID local reset

Overview Use this command to force the device to generate a new pseudo-random SNMPv3 engine ID by resetting the SNMPv3 engine. If the current engine ID is user defined, use the snmp-server engineID local command to set SNMPv3 engine ID to a system generated value.

Syntax

```
snmp-server engineID local reset
```

Mode Global Configuration

Example To force the SNMPv3 engine ID to be reset to a system generated value, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local reset
```

Related commands

snmp-server engineID local

show snmp-server

snmp-server group

Overview This command is used with SNMP version 3 only, and adds an SNMP group, optionally setting the security level and view access modes for the group. The security and access views defined for the group represent the minimum required of its users in order to gain access.

The **no** variant of this command deletes an SNMP group, and is used with SNMPv3 only. The group with the specified authentication/encryption parameters must already exist.

Syntax

```
snmp-server group <groupname> {auth|noauth|priv} [read
<readname>|write <writename>|notify <notifyname>]
```

```
no snmp-server group <groupname> {auth|noauth|priv}
```

Parameter	Description
<groupname>	Group name. The group name is a string up to 20 characters long and is case sensitive.
`auth`	Authentication.
`noauth`	No authentication and no encryption.
`priv`	Authentication and encryption.
`read`	Configure read view.
<readname>	Read view name.
`write`	Configure write view.
<writename>	Write view name. The view name is a string up to 20 characters long and is case sensitive.
`notify`	Configure notify view.
<notifyname>	Notify view name. The view name is a string up to 20 characters long and is case sensitive.

Mode Global Configuration

Examples To add SNMP group, for ordinary users, user the following commands:

```
awplus# configure terminal
```

```
awplus(config)# snmp-server group usergroup noauth read
useraccess write useraccess
```

To delete SNMP group `usergroup`, use the following commands

```
awplus# configure terminal
```

```
awplus(config)# no snmp-server group usergroup noauth
```

snmp-server host

Overview This command specifies an SNMP trap host destination to which Trap or Inform messages generated by the device are sent.

For SNMP version 1 and 2c you must specify the community name parameter. For SNMP version 3, specify the authentication/encryption parameters and the user name. If the version is not specified, the default is SNMP version 1. Inform messages can be sent instead of traps for SNMP version 2c and 3.

Use the **no** variant of this command to remove an SNMP trap host. The trap host must already exist.

The trap host is uniquely identified by:

- host IP address (IPv4 or IPv6),
- inform or trap messages,
- community name (SNMPv1 or SNMP v2c) or the authentication/encryption parameters and user name (SNMP v3).

Syntax

```
snmp-server host {<ipv4-address>|<ipv6-address>} [traps]
[version 1] <community-name>]
```

```
snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 2c <community-name>
```

```
snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 3 {auth|noauth|priv} <user-name>
```

```
no snmp-server host {<ipv4-address>|<ipv6-address>} [traps]
[version 1] <community-name>
```

```
no snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 2c <community-name>
```

```
no snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 3 {auth|noauth|priv} <user-name>
```

Parameter	Description
<ipv4-address>	IPv4 trap host address in the format `A.B.C.D`, for example, `192.0.2.2`.
<ipv6-address>	IPv6 trap host address in the format `x:x::x:x` for example, `2001:db8::8a2e:7334`.
`informs`	Send Inform messages to this host.
`traps`	Send Trap messages to this host (default).
`version`	SNMP version to use for notification messages. Default: version 1.
`1`	Use SNMPv1 (default).
`2c`	Use SNMPv2c.
`3`	Use SNMPv3.

Parameter	Description
`auth`	Authentication.
`noauth`	No authentication.
`priv`	Encryption.
<community-name>	The SNMPv1 or SNMPv2c community name.
<user-name>	SNMPv3 user name.

Mode Global Configuration

Examples To configure the device to send generated traps to the IPv4 host destination `192.0.2.5` with the SNMPv2c community name public, use the following command:

```
awplus# configure terminal
awplus(config)# snmp-server host  version 2c public192.0.2.5
```

To configure the device to send generated traps to the IPv6 host destination `2001:db8::8a2e:7334` with the SNMPv2c community name private, use the following command:

```
awplus# configure terminal
awplus(config)# snmp-server host  version 2c
private2001:db8::8a2e:7334
```

To remove a configured trap host of 192.0.2.5 with the SNMPv2c community name public, use the following command:

```
awplus# configure terminal
awplus(config)# no snmp-server host  version 2c public192.0.2.5
```

Related commands

snmp trap link-status

snmp-server enable trap

snmp-server view

snmp-server legacy-ifadminstatus

Overview Use this command to set the ifAdminStatus to reflect the operational state of the interface, rather than the administrative state.

The **no** variant of this command sets the ifAdminStatus to reflect the administrative state of the interface.

Syntax

```
snmp-server legacy-ifadminstatus
no snmp-server legacy-ifadminstatus
```

Default Legacy ifAdminStatus is turned off by default, so by default the SNMP ifAdminStatus reflects the administrative state of the interface.

Mode Global Configuration

Usage notes Note that if you enable Legacy ifAdminStatus, the ifAdminStatus will report a link's status as Down when the link has been blocked by a process such as loop protection.

Example To turn on Legacy ifAdminStatus, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server legacy-ifadminstatus
```

Related commands show interface

snmp-server location

Overview This command sets the location of the system. The location is:

- displayed in the output of the show system command
- stored in the MIB object sysLocation

The **no** variant of this command removes the configured location from the system.

Syntax

```
snmp-server location <location-name>
no snmp-server location
```

Parameter	Description
<location-name>	The location of the system, from 0 to 255 characters long. Valid characters are any printable character and spaces.

Mode Global Configuration

Example To set the location to "server room 523", use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server location server room 523
```

Related commands

show snmp-server

show system

snmp-server contact

snmp-server source-interface

Overview Use this command to specify the originating interface for SNMP traps or informs. An interface specified by this command must already have an IP address assigned to it.

Use the **no** variant of this command to reset the interface to its default value (the originating egress interface).

Syntax

```
snmp-server source-interface {traps|informs} <interface-name>
no snmp-server source-interface {traps|informs}
```

Parameter	Description
`traps`	SNMP traps.
`informs`	SNMP informs.
<interface-name>	Interface name (must already have an IP address assigned).

Default The originating egress interface of the traps and informs messages

Mode Global Configuration

Usage notes When an SNMP server sends an SNMP trap or inform message, the message carries the notification IP address of its originating interface. Use this command to assign this interface.

Example The following commands set vlan2 to be the interface whose IP address is used as the originating address in SNMP informs packets.

```
awplus# configure terminal
awplus(config)# snmp-server source-interface informs vlan2
```

The following commands reset the originating source interface for SNMP trap messages to be the default interface (the originating egress interface):

```
awplus# configure terminal
awplus(config)# no snmp-server source-interface traps
```

Validation Commands show running-config

snmp-server startup-trap-delay

Overview Use this command to set the time in seconds after following completion of the device startup sequence before the device sends any SNMP traps (or SNMP notifications).

Use the no variant of this command to restore the default startup delay of 30 seconds.

Syntax

```
snmp-server startup-trap-delay <delay-time>
no snmp-server startup-trap-delay
```

Parameter	Description
<delay-time>	Specify an SNMP trap delay time in seconds in the range of 30 to 600 seconds.

Default The SNMP server trap delay time is 30 seconds. The no variant restores the default.

Mode Global Configuration

Example To delay the device sending SNMP traps until 60 seconds after device startup, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server startup-trap-delay 60
```

To restore the sending of SNMP traps to the default of 30 seconds after device startup, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server startup-trap-delay
```

Validation Commands show snmp-server

snmp-server user

Overview Use this command to create or move users as members of specified groups. This command is used with SNMPv3 only.

The **no** variant of this command removes an SNMPv3 user. The specified user must already exist.

Syntax

```
snmp-server user <username> <groupname> [encrypted] [auth
{md5|sha} <auth-password>] [priv {des|aes} <privacy-password>]
```

```
no snmp-server user <username>
```

Parameter	Description
<username>	User name. The user name is a string up to 20 characters long and is case sensitive.
<groupname>	Group name. The group name is a string up to 20 characters long and is case sensitive.
`encrypted`	Use the encrypted parameter when you want to enter encrypted passwords.
`auth`	Authentication protocol.
`md5`	MD5 Message Digest Algorithms.
`sha`	SHA Secure Hash Algorithm.
<auth-password>	Authentication password. The password is a string of 8 to 20 characters long and is case sensitive.
`priv`	Privacy protocol.
`des`	DES: Data Encryption Standard.
`aes`	AES: Advanced Encryption Standards.
<privacy-password>	Privacy password. The password is a string of 8 to 20 characters long and is case sensitive.

Mode Global Configuration

Usage notes Additionally this command provides the option of selecting an authentication protocol and (where appropriate) an associated password. Similarly, options are offered for selecting a privacy protocol and password.

- Note that each SNMP user must be configured on both the manager and agent entities. Where passwords are used, these passwords must be the same for both entities.
- Use the **encrypted** parameter when you want to enter already encrypted passwords in encrypted form as displayed in the running and startup configs stored on the device. For example, you may need to move a user from one group to another group and keep the same passwords for the user instead of removing the user to apply new passwords.

- User passwords are entered using plaintext without the **encrypted** parameter and are encrypted according to the authentication and privacy protocols selected.
- User passwords are viewed as encrypted passwords in running and startup configs shown from **show running-config** and **show startup-config** commands respectively. Copy and paste encrypted passwords from running-configs or startup-configs to avoid entry errors.

Examples To add SNMP user authuser as a member of group 'usergroup', with authentication protocol MD5, authentication password 'Authpass', privacy protocol AES and privacy password 'Privpass' use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server user authuser usergroup auth md5
Authpass priv aes Privpass
```

Validate the user is assigned to the group using the **show snmp-server user** command:

```
awplus#show snmp-server user
Name                Group name          Auth         Privacy
-------             -------------       -------      ----------
authuser            usergroup           md5          aes
```

To enter existing SNMP user 'authuser' with existing passwords as a member of group 'newusergroup' with authentication protocol MD5 with the encrypted authentication password 0x1c74b9c22118291b0ce0cd883f8dab6b74, and privacy protocol AES with the encrypted privacy password 0x0e0133db5453ebd03822b004eeacb6608f, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server user authuser newusergroup
encrypted auth md5 0x1c74b9c22118291b0ce0cd883f8dab6b74 priv
aes 0x0e0133db5453ebd03822b004eeacb6608f
```

NOTE: *Copy and paste the encrypted passwords from the **running-config** or the **startup-config** displayed, using the **show running-config** and **show startup- config** commands respectively, into the command line to avoid key stroke errors issuing this command.*

Validate the user has been moved from the first group using the **show snmp-server user** command:

```
awplus#show snmp-server user
Name                Group name          Auth         Privacy
-------             -------------       -------      ----------
authuser            newusergroup        md5          aes
```

To delete SNMP user 'authuser', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server user authuser
```

Related commands

show snmp-server user

snmp-server view

snmp-server view

Overview Use this command to create an SNMP view that specifies a sub-tree of the MIB. Further sub-trees can then be added by specifying a new OID to an existing view. Views can be used in SNMP communities or groups to control the remote manager's access.

NOTE: *The object identifier must be specified in a sequence of integers separated by decimal points.*

The **no** variant of this command removes the specified view on the device. The view must already exist.

Syntax

```
snmp-server view <view-name> <mib-name> {included|excluded}
no snmp-server view <view-name>
```

Parameter	Description
`<view-name>`	SNMP server view name. The view name is a string up to 20 characters long and is case sensitive.
`<mib-name>`	Object identifier of the MIB.
`included`	Include this OID in the view.
`excluded`	Exclude this OID in the view.

Mode Global Configuration

Examples The following command creates a view called "loc" that includes the system location MIB sub-tree.

```
awplus(config)# snmp-server view loc 1.3.6.1.2.1.1.6.0 included
```

To remove the view "loc" use the following command

```
awplus(config)# no snmp-server view loc
```

56 LLDP Commands

Introduction

Overview

LLDP and LLDP-MED can be configured using the commands in this chapter, or by using SNMP with the LLDP-MIB and LLDP-EXT-DOT1-MIB (see the Support for Allied Telesis Enterprise MIBs in AlliedWare Plus).

The Voice VLAN feature can be configured using commands in VLAN Commands chapter.

For more information about LLDP, see the LLDP Feature Overview and Configuration Guide.

LLDP can transmit a lot of data about the network. Typically, the network information gathered using LLDP is transferred to a Network Management System by SNMP. For security reasons, we recommend using SNMPv3 for this purpose (see the SNMP Feature Overview and Configuration Guide).

LLDP operates over physical ports only. For example, it can be configured on switch ports that belong to static or dynamic channel groups, but not on the channel groups themselves.

- "show lldp neighbors" on page 3055
- "show lldp neighbors detail" on page 3056
- "show lldp statistics" on page 3060
- "show lldp statistics interface" on page 3062
- "show location" on page 3064

clear lldp statistics

Overview This command clears all LLDP statistics (packet and event counters) associated with specified ports. If no port list is supplied, LLDP statistics for all ports are cleared.

Syntax

```
clear lldp statistics [interface <port-list>]
```

Parameter	Description
<port-list>	The ports for which the statistics are to be cleared.

Mode Privileged Exec

Examples To clear all LLDP statistics for all ports, use the command:

```
awplus# clear lldp statistics
```

Related commands

show lldp statistics

show lldp statistics interface

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

clear lldp table

Overview This command clears the table of LLDP information received from neighbors through specified ports. If no port list is supplied, neighbor information is cleared for all ports.

Syntax

```
clear lldp table [interface <port-list>]
```

Parameter	Description
<port-list>	The ports for which the neighbor information table is to be cleared.

Mode Privileged Exec

Examples To clear the entire table of neighbor information received through all ports, use the command:

```
awplus# clear lldp table
```

Related commands show lldp neighbors

debug lldp

Overview This command enables specific LLDP debug for specified ports. When LLDP debugging is enabled, diagnostic messages are entered into the system log. If no port list is supplied, the specified debugging is enabled for all ports.

The **no** variant of this command disables specific LLDP debug for specified ports. If no port list is supplied, the specified debugging is disabled for all ports.

Syntax

```
debug lldp {[rx][rxpkt][tx][txpkt]} [interface [<port-list>]]
debug lldp operation
no debug lldp {[rx][rxpkt][tx][txpkt]} [interface [<port-list>]]
no debug lldp operation
no debug lldp all
```

Parameter	Description
`rx`	LLDP receive debug.
`rxpkt`	Raw LLDPDUs received in hex format.
`tx`	LLDP transmit debug.
`txpkt`	Raw Tx LLDPDUs transmitted in hex format.
`<port-list>`	The ports for which debug is to be configured.
`operation`	Debug for LLDP internal operation on the switch.
`all`	Disables all LLDP debugging for all ports.

Default By default no debug is enabled for any ports.

Mode Privileged Exec

Examples To enable debugging of LLDP transmit with packet dump on all ports, use the command:

```
awplus# debug lldp tx txpkt
```

To turn off all LLDP debugging on all ports, use the command:

```
awplus# no debug lldp all
```

Related commands show debugging lldp

show running-config lldp

terminal monitor

lldp faststart-count

Overview Use this command to set the fast start count for LLDP-MED. The fast start count determines how many fast start advertisements LLDP sends from a port when it starts sending LLDP-MED advertisements from the port, for instance, when it detects a new LLDP-MED capable device.

The **no** variant of this command resets the LLDPD-MED fast start count to the default (3).

Syntax

```
lldp faststart-count <1-10>
no lldp faststart-count
```

Parameter	Description
<1-10>	The number of fast start advertisements to send.

Default The default fast start count is 3.

Mode Global Configuration

Examples To set the fast start count to 5, use the command:

```
awplus# configure terminal
awplus(config)# lldp faststart-count 5
```

To reset the fast start count to the default setting (3), use the command:

```
awplus# configure terminal
awplus(config)# no lldp faststart-count
```

Related commands show lldp

lldp holdtime-multiplier

Overview This command sets the holdtime multiplier value. The transmit interval is multiplied by the holdtime multiplier to give the Time To Live (TTL) value that is advertised to neighbors.

The **no** variant of this command sets the multiplier back to its default.

Syntax

```
lldp holdtime-multiplier <2-10>
no lldp holdtime-multiplier
```

Parameter	Description
<2-10>	The multiplier factor.

Default The default holdtime multiplier value is 4.

Mode Global Configuration

Usage The Time-To-Live defines the period for which the information advertised to the neighbor is valid. If the Time-To-Live expires before the neighbor receives another update of the information, then the neighbor discards the information from its database.

Examples To set the holdtime multiplier to 2, use the commands:

```
awplus# configure terminal
awplus(config)# lldp holdtime-multiplier 2
```

To set the holdtime multiplier back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp holdtime-multiplier 2
```

Related commands show lldp

lldp management-address

Overview This command sets the IPv4 address to be advertised to neighbors (in the Management Address TLV) via the specified ports. This address will override the default address for these ports.

The **no** variant of this command clears the user-configured management IP address advertised to neighbors via the specified ports. The advertised address reverts to the default.

Syntax

```
lldp management-address <ipaddr>
no lldp management-address
```

Parameter	Description
<ipaddr>	The IPv4 address to be advertised to neighbors, in dotted decimal format. This must be one of the IP addresses already configured on the device.

Default The local loopback interface primary IPv4 address if set, else the primary IPv4 interface address of the lowest numbered VLAN the port belongs to, else the MAC address of the device's baseboard if no VLAN IP addresses are configured for the port.

Mode Interface Configuration

Usage notes To see the management address that will be advertised, use the show lldp interface command or show lldp local-info command.

Examples To set the management address advertised by port1.0.1 and port1.0.2, to be 192.168.1.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp management-address 192.168.1.6
```

To clear the user-configured management address advertised by port1.0.1 and port1.0.2, and revert to using the default address, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp management-address
```

Related commands show lldp interface

show lldp local-info

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

lldp med-notifications

Overview Use this command to enable LLDP to send LLDP-MED Topology Change Detected SNMP notifications relating to the specified ports. The switch sends an SNMP event notification when a new LLDP-MED compliant IP Telephony device is connected to or disconnected from a port on the switch.

Use the **no** variant of this command to disable the sending of LLDP-MED Topology Change Detected notifications relating to the specified ports.

Syntax

```
lldp med-notifications
no lldp med-notifications
```

Default The sending of LLDP-MED notifications is disabled by default.

Mode Interface Configuration

Examples To enable the sending of LLDP-MED Topology Change Detected notifications relating to ports port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp med-notifications
```

To disable the sending of LLDP-MED notifications relating to port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-notifications
```

Related commands

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

lldp med-tlv-select

Overview Use this command to enable LLDP-MED Organizationally Specific TLVs for transmission in LLDP advertisements via the specified ports. The LLDP-MED Capabilities TLV must be enabled before any of the other LLDP-MED Organizationally Specific TLVs are enabled.

Use the **no** variant of this command to disable the specified LLDP-MED Organizationally Specific TLVs for transmission in LLDP advertisements via these ports. In order to disable the LLDP-MED Capabilities TLV, you must also disable the rest of these TLVs. Disabling all these TLVs disables LLDP-MED advertisements.

Syntax

```
lldp med-tlv-select [capabilities] [network-policy] [location]
[inventory-management]
```

```
lldp med-tlv-select all
```

```
no lldp med-tlv-select [capabilities] [network-policy]
[location] [inventory-management]
```

```
no lldp med-tlv-select all
```

Parameter	Description
`capabilities`	LLDP-MED Capabilities TLV. When this is enabled, the MAC/PHY Configuration/Status TLV from IEEE 802.3 Organizationally Specific TLVs is also automatically included in LLDP-MED advertisements, whether or not it has been explicitly enabled by the lldp tlv-select command.
`network-policy`	Network Policy TLV. This TLV is transmitted if Voice VLAN parameters have been configured using the commands: • switchport voice dscp • switchport voice vlan • switchport voice vlan priority
`location`	Location Identification TLV. This TLV is transmitted if location information has been configured using the commands: • location elin-location-id • location civic-location identifier • location civic-location configuration • location coord-location identifier • location coord-location configuration • location elin-location

Parameter	Description
`inventory-management`	Inventory Management TLV Set, including the following TLVs: • Hardware Revision • Firmware Revision • Software Revision • Serial Number • Manufacturer Name • Model Name • Asset ID
`all`	All LLDP-MED Organizationally Specific TLVs.

Default By default LLDP-MED Capabilities, Network Policy, Location Identification and Extended Power-via-MDI TLVs are enabled. Therefore, if LLDP is enabled using the lldp run command, by default LLDP-MED advertisements are transmitted on ports that detect LLDP-MED neighbors connected to them.

Mode Interface Configuration

Usage notes LLDP-MED TLVs are only sent in advertisements via a port if there is an LLDP-MED-capable device connected to it. To see whether there are LLDP-MED capable devices connected to the ports, use the show lldp neighbors command.

Examples To enable inclusion of the Inventory TLV Set in advertisements transmitted via port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp med-tlv-select inventory-management
```

To exclude the Inventory TLV Set in advertisements transmitted via port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-tlv-select inventory-management
```

To disable LLDP-MED advertisements transmitted via port1.0.1 and port1.0.2, disable all these TLVs using the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-tlv-select all
```

Command changes

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

lldp non-strict-med-tlv-order-check

Overview Use this command to enable non-strict order checking for LLDP-MED advertisements it receives. That is, use this command to enable LLDP to receive and store TLVs from LLDP-MED advertisements even if they do not use standard TLV order.

Use the **no** variant of this command to disable non-strict order checking for LLDP-MED advertisements, that is, to set strict TLV order checking, so that LLDP discards any LLDP-MED TLVs that occur before the LLDP-MED Capabilities TLV in an advertisement.

Syntax

```
lldp non-strict-med-tlv-order-check
no lldp non-strict-med-tlv-order-check
```

Default By default TLV non-strict order checking for LLDP-MED advertisements is disabled. That is, strict order checking is applied to LLDP-MED advertisements, according to ANSI/TIA-1057, and LLDP-MED TLVs in non-standard order are discarded.

Mode Global Configuration

Usage notes The ANSI/TIA-1057 specifies standard order for TLVs in LLDP-MED advertisements, and specifies that if LLDP receives LLDP advertisements with non-standard LLDP-MED TLV order, the TLVs in non-standard order should be discarded. This implementation of LLDP-MED follows the standard: it transmits TLVs in the standard order, and by default discards LLDP-MED TLVs that occur before the LLDP-MED Capabilities TLV in an advertisement. However, some implementations of LLDP transmit LLDP-MED advertisements with non-standard TLV order. To receive and store the data from these non-standard advertisements, enable non-strict order checking for LLDP-MED advertisements using this command.

Examples To enable strict TLV order checking, use the commands:

```
awplus# configure terminal
awplus(config)# lldp tlv-order-check
```

To disable strict TLV order checking, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp tlv-order-check
```

Related commands show running-config lldp

lldp notification-interval

Overview This command sets the notification interval. This is the minimum interval between LLDP SNMP notifications (traps) of each kind (LLDP Remote Tables Change Notification and LLDP-MED Topology Change Notification).

The **no** variant of this command sets the notification interval back to its default.

Syntax

```
lldp notification-interval <5-3600>
no lldp notification-interval
```

Parameter	Description
<5-3600>	The interval in seconds.

Default The default notification interval is 5 seconds.

Mode Global Configuration

Examples To set the notification interval to 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp notification-interval 20
```

To set the notification interval back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp notification-interval
```

Related commands lldp notifications

snmp-server enable trap

lldp port-number-type

Overview This command sets the type of port identifier used to enumerate, that is to count, the LLDP MIB local port entries. The LLDP MIB (IEEE Standard 802.1AB-2005, Section 12, LLDP MIB Definitions.) requires the port number value to count LLDP local port entries.

This command also enables you to optionally set an interface index to enumerate the LLDP MIB local port entries, if required by your management system.

The **no** variant of this command resets the type of port identifier back to the default setting (number).

Syntax

```
lldp port-number-type [number|ifindex]
no lldp port-number-type
```

Parameter	Description
`number`	Set the type of port identifier to a port number to enumerate the LLDP MIB local port entries.
`ifindex`	Set the type of port identifier to an interface index to enumerate the LLDP MIB local port entries.

Default The default port identifier type is number. The no variant of this command sets the port identifier type to the default.

Mode Global Configuration

Examples To set the type of port identifier used to enumerate LLDP MIB local port entries to port numbers, use the commands:

```
awplus# configure terminal
awplus(config)# lldp port-number-type number
```

To set the type of port identifier used to enumerate LLDP MIB local port entries to interface indexes, use the commands:

```
awplus# configure terminal
awplus(config)# lldp port-number-type ifindex
```

To reset the type of port identifier used to enumerate LLDP MIB local port entries the default (port numbers), use the commands:

```
awplus# configure terminal
awplus(config)# no lldp port-number-type
```

Related commands show lldp

lldp reinit

Overview This command sets the value of the reinitialization delay. This is the minimum time after disabling LLDP on a port before it can reinitialize.

The **no** variant of this command sets the reinitialization delay back to its default setting.

Syntax

```
lldp reinit <1-10>
no lldp reinit
```

Parameter	Description
<1-10>	The delay in seconds.

Default The default reinitialization delay is 2 seconds.

Mode Global Configuration

Examples To set the reinitialization delay to 3 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp reinit 3
```

To set the reinitialization delay back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp reinit
```

Related commands show lldp

lldp run

Overview This command enables the operation of LLDP on the device.

The **no** variant of this command disables the operation of LLDP on the device. The LLDP configuration remains unchanged.

Syntax

```
lldp run
no lldp run
```

Default LLDP is disabled by default.

Mode Global Configuration

Examples To enable LLDP operation, use the commands:

```
awplus# configure terminal
awplus(config)# lldp run
```

To disable LLDP operation, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp run
```

Related commands show lldp

lldp timer

Overview This command sets the value of the transmit interval. This is the interval between regular transmissions of LLDP advertisements.

The **no** variant of this command sets the transmit interval back to its default.

Syntax

```
lldp timer <5-32768>
no lldp timer
```

Parameter	Description
<5-32768>	The transmit interval in seconds. The transmit interval must be at least four times the transmission delay timer (lldp tx-delay command).

Default The default transmit interval is 30 seconds.

Mode Global Configuration

Examples To set the transmit interval to 90 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp timer 90
```

To set the transmit interval back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp timer
```

Related commands lldp tx-delay

show lldp

lldp tlv-select

Overview This command enables one or more optional TLVs, or all TLVs, for transmission in LLDP advertisements via the specified ports. The TLVs can be specified in any order; they are placed in LLDP frames in a fixed order (as described in IEEE 802.1AB). The mandatory TLVs (Chassis ID, Port ID, Time To Live, End of LLDPDU) are always included in LLDP advertisements.

In LLDP-MED advertisements the MAC/PHY Configuration/Status TLV will be always be included regardless of whether it is selected by this command.

The **no** variant of this command disables the specified optional TLVs, or all optional TLVs, for transmission in LLDP advertisements via the specified ports.

Syntax

```
lldp tlv-select {[<tlv>]...}
lldp tlv-select all
no lldp tlv-select {[<tlv>]...}
no lldp tlv-select all
```

Parameter	Description
<*tlv*>	The TLV to transmit in LLDP advertisements. One of these keywords: • port-description (specified by the description (interface) command) • system-name (specified by the hostname command) • system-description • system-capabilities • management-address • port-vlan • port-and-protocol-vlans • vlan-names • protocol-ids • mac-phy-config • power-management (Power Via MDI TLV) • link-aggregation • max-frame-size
`all`	All TLVs.

Default By default no optional TLVs are included in LLDP advertisements. The MAC/PHY Configuration/Status TLV (**mac-phy-config**) is included in LLDP-MED advertisements whether or not it is selected by this command.

Mode Interface Configuration

lldp transmit receive

Overview This command enables transmission and/or reception of LLDP advertisements to or from neighbors through the specified ports.

The **no** variant of this command disables transmission and/or reception of LLDP advertisements through specified ports.

Syntax

```
lldp {[transmit] [receive]}
no lldp {[transmit] [receive]}
```

Parameter	Description
`transmit`	Enable or disable transmission of LLDP advertisements via this port or ports.
`receive`	Enable or disable reception of LLDP advertisements via this port or ports.

Default LLDP advertisement transmission and reception are enabled on all ports by default.

Mode Interface Configuration

Examples To enable transmission of LLDP advertisements on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp transmit
```

To enable LLDP advertisement transmission and reception on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp transmit receive
```

To disable LLDP advertisement transmission and reception on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp transmit receive
```

Related commands show lldp interface

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

lldp tx-delay

Overview This command sets the value of the transmission delay timer. This is the minimum time interval between transmitting LLDP advertisements due to a change in LLDP local information.

The **no** variant of this command sets the transmission delay timer back to its default setting.

Syntax

```
lldp tx-delay <1-8192>
no lldp tx-delay
```

Parameter	Description
<1-8192>	The transmission delay in seconds. The transmission delay cannot be greater than a quarter of the transmit interval (lldp timer command).

Default The default transmission delay timer is 2 seconds.

Mode Global Configuration

Examples To set the transmission delay timer to 12 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp tx-delay 12
```

To set the transmission delay timer back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp tx-delay
```

Related commands lldp timer

show lldp

location civic-location configuration

Overview Use these commands to configure a civic address location. The country parameter must be specified first, and at least one of the other parameters must be configured before the location can be assigned to a port.

Use the **no** variants of this command to delete civic address parameters from the location.

Syntax

```
country <country>
state <state>
no state
county <county>
no county
city <city>
no city
division <division>
no division
neighborhood <neighborhood>
no neighborhood
street-group <street-group>
no street-group
leading-street-direction <leading-street-direction>
no leading-street-direction
trailing-street-suffix <trailing-street-suffix>
no trailing-street-suffix
street-suffix <street-suffix>
no street-suffix
house-number <house-number>
no house-number
house-number-suffix <house-number-suffix>
no house-number-suffix
landmark <landmark>
no landmark
additional-information <additional-information>
no additional-information
```

Syntax (cont.)

```
name <name>
no name
postalcode <postalcode>
no postalcode
building <building>
no building
unit <unit>
no unit
floor <floor>
no floor
room <room>
no room
place-type <place-type>
no place-type
postal-community-name <postal-community-name>
no postal-community-name
post-office-box <post-office-box>
no post-office-box
additional-code <additional-code>
no additional-code
seat <seat>
no seat
primary-road-name <primary-road-name>
no primary-road-name
road-section <road-section>
no road-section
branch-road-name <branch-road-name>
no branch-road-name
sub-branch-road-name <sub-branch-road-name>
no sub-branch-road-name
street-name-pre-modifier <street-name-pre-modifier>
no street-name-pre-modifier
streetname-post-modifier <streetname-post-modifier>
no streetname-post-modifier
```

Parameter	Description
<country>	Upper-case two-letter country code, as specified in ISO 3166.
<state>	State (Civic Address (CA) Type 1): national subdivisions (state, canton, region).
<county>	County (CA Type 2): County, parish, gun (JP), district (IN).
<city>	City (CA Type 3): city, township, shi (JP).
<division>	City division (CA Type 4): City division, borough, city district, ward, chou (JP).
<neighborhood>	Neighborhood (CA Type 5): neighborhood, block.
<street-group>	Street group (CA Type 6): group of streets below the neighborhood level.
<leading-street-direction>	Leading street direction (CA Type 16).
<trailing-street-suffix>	Trailing street suffix (CA Type 17).
<street-suffix>	Street suffix (CA Type 18): street suffix or type.
<house-number>	House number (CA Type 19).
<house-number-suffix>	House number suffix (CA Type 20).
<landmark>	Landmark or vanity address (CA Type 21).
<additional-information>	Additional location information (CA Type 22).
<name>	Name (CA Type 23): residence and office occupant.
<postal-code>	Postal/zip code (CA Type 24).
<building>	Building (CA Type 25): structure.
<unit>	Unit (CA Type 26): apartment, suite.
<floor>	Floor (CA Type 27).
<room>	Room (CA Type 28).
<place-type>	Type of place (CA Type 29).
<postal-community-name>	Postal community name (CA Type 30).
<post-office-box>	Post office box (P.O. Box) (CA Type 31).
<additional-code>	Additional code (CA Type 32).
<seat>	Seat (CA Type 33): seat (desk, cubicle, workstation).
<primary-road-name>	Primary road name (CA Type 34).
<road-section>	Road section (CA Type 35).

Parameter	Description
<branch-road-name>	Branch road name (CA Type 36).
<sub-branch-road-name>	Sub-branch road name (CA Type 37).
<street-name-pre-modifier>	Street name pre-modifier (CA Type 38).
<street-name-post-modifier>	Street name post-modifier (CA Type 39).

Default By default no civic address location information is configured.

Mode Civic Address Location Configuration

Usage notes The **country** parameter must be configured before any other parameters can be configured; this creates the location. The country parameter cannot be deleted. One or more of the other parameters must be configured before the location can be assigned to a port. The country parameter must be entered as an upper-case two-letter country code, as specified in ISO 3166. All other parameters are entered as alpha-numeric strings. Do not configure all the civic address parameters (this would generate TLVs that are too long). Configure a subset of these parameters—enough to consistently and precisely identify the location of the device. If the location is to be used for Emergency Call Service (ECS), the particular ECS application may have guidelines for configuring the civic address location. For more information about civic address format, see the LLDP Feature Overview and Configuration Guide.

To specify the civic address location, use the location civic-location identifier command. To delete the civic address location, use the **no** variant of the **location civic-location identifier** command. To assign the civic address location to particular ports, so that it can be advertised in TLVs from those ports, use the command location civic-location-id command.

Examples To configure civic address location 1 with location "27 Nazareth Avenue, Christchurch, New Zealand" in civic-address format, use the commands:

```
awplus# configure terminal
awplus(config)# location civic-location identifier 1
awplus(config-civic)# country NZ
awplus(config-civic)# city Christchurch
awplus(config-civic)# primary-road-name Nazareth
awplus(config-civic)# street-suffix Avenue
awplus(config-civic)# house-number 27
```

Related commands location civic-location-id

location civic-location identifier

show lldp local-info

show location

location civic-location identifier

Overview Use this command to enter the Civic Address Location Configuration mode to configure the specified location.

Use the **no** variant of this command to delete a civic address location. This also removes the location from any ports it has been assigned to.

Syntax

```
location civic-location identifier <civic-loc-id>
no location civic-location identifier <civic-loc-id>
```

Parameter	Description
<civic-loc-id>	A unique civic address location ID, in the range 1 to 4095.

Default By default there are no civic address locations.

Mode Global Configuration

Usage notes To configure the location information for this civic address location identifier, use the location civic-location configuration command. To associate this civic location identifier with particular ports, use the location elin-location-id command.

Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

Examples To enter Civic Address Location Configuration mode for the civic address location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# location civic-location identifier 1
awplus(config-civic)#
```

To delete the civic address location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location civic-location identifier 1
```

Related commands

location civic-location-id

location civic-location configuration

show location

show running-config lldp

location civic-location-id

Overview Use this command to assign a civic address location to the ports. The civic address location must already exist. This replaces any previous assignment of civic address location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location identifier from the ports.

Syntax

```
location civic-location-id <civic-loc-id>
no location civic-location-id [<civic-loc-id>]
```

Parameter	Description
<civic-loc-id>	Civic address location ID, in the range 1 to 4095.

Default By default no civic address location is assigned to ports.

Mode Interface Configuration

Usage notes The civic address location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, create the location using the following commands:

- location civic-location identifier command
- location civic-location configuration command

If a civic-address location is deleted using the **no** variant of the location civic-location identifier command, it is automatically removed from all ports.

Examples To assign the civic address location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location civic-location-id 1
```

To remove a civic address location from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location civic-location-id
```

Related commands

Command changes Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

location coord-location configuration

Overview Use this command to configure a coordinate-based location. All parameters must be configured before assigning this location identifier to a port.

Syntax

```
latitude <latitude>
lat-resolution <lat-resolution>
longitude <longitude>
long-resolution <long-resolution>
altitude <altitude> {meters|floor}
alt-resolution <alt-resolution>
datum {wgs84|nad83-navd|nad83-mllw}
```

Parameter	Description
<lat-resolution>	Latitude resolution, as a number of valid bits, in the range 0 to 34.
<latitude>	Latitude value in degrees in the range -90.0 to 90.0
<long-resolution>	Longitude resolution, as a number of valid bits, in the range 0 to 34.
<longitude>	Longitude value in degrees, in the range -180.0 to 180.0.
<alt-resolution>	Altitude resolution, as a number of valid bits, in the range 0 to 30. A resolution of 0 can be used to indicate an unknown value.
<altitude>	Altitude value, in meters or floors.
`meters`	The altitude value is in meters.
`floors`	The altitude value is in floors.
`datum`	The geodetic system (or datum) that the specified coordinate values are based on.
`wgs84`	World Geodetic System 1984.
`nad83-navd`	North American Datum 1983 - North American Vertical Datum.
`nad83-mllw`	North American Datum 1983 - Mean Lower Low Water vertical datum.

Default By default no coordinate location information is configured.

Mode Coordinate Configuration

Usage Latitude and longitude values are always stored internally, and advertised in the Location Identification TLV, as 34-bit fixed-point binary numbers, with a 25-bit fractional part, irrespective of the number of digits entered by the user. Likewise

altitude is stored as a 30- bit fixed point binary number, with an 8-bit fractional part. Because the user-entered decimal values are stored as fixed point binary numbers, they cannot always be represented exactly—the stored binary number is converted to a decimal number for display in the output of the show location command. For example, a user-entered latitude value of "2.77" degrees is displayed as "2.769999980926513671875000".

The **lat-resolution**, **long-resolution**, and **alt-resolution** parameters allow the user to specify the resolution of each coordinate element as the number of valid bits in the internally-stored binary representation of the value. These resolution values can be used by emergency services to define a search area.

To specify the coordinate identifier, use the location coord-location identifier command. To remove coordinate information, delete the coordinate location by using the **no** variant of that command. To associate the coordinate location with particular ports, so that it can be advertised in TLVs from those ports, use the location elin-location-id command.

Example To configure the location for the White House in Washington DC, which has the coordinates based on the WGS84 datum of 38.89868 degrees North (with 22 bit resolution), 77.03723 degrees West (with 22 bit resolution), and 15 meters height (with 9 bit resolution), use the commands:

```
awplus# configure terminal
awplus(config)# location coord-location identifier 1
awplus(config-coord)# la-resolution 22
awplus(config-coord)# latitude 38.89868
awplus(config-coord)# lo-resolution 22
awplus(config-coord)# longitude -77.03723
awplus(config-coord)# alt-resolution 9
awplus(config-coord)# altitude 15 meters
awplus(config-coord)# datum wgs84
```

Related commands

show location

location coord-location identifier

Overview Use this command to enter Coordinate Location Configuration mode for this coordinate location.

Use the **no** variant of this command to delete a coordinate location. This also removes the location from any ports it has been assigned to.

Syntax

```
location coord-location identifier <coord-loc-id>
no location coord-location identifier <coord-loc-id>
```

Parameter	Description
<coord-loc-id>	A unique coordinate location identifier, in the range 1 to 4095.

Default By default there are no coordinate locations.

Mode Global Configuration

Usage Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

To configure this coordinate location, use the location coord-location configuration command. To associate this coordinate location with particular ports, so that it can be advertised in TLVs from those ports, use the location coord-location-id command.

Examples To enter Coordinate Location Configuration mode to configure the coordinate location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# location coord-location identifier 1
awplus(config-coord)#
```

To delete coordinate location 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location coord-location identifier 1
```

Related commands

location coord-location-id

location coord-location configuration

show lldp local-info

show location

location coord-location-id

Overview Use this command to assign a coordinate location to the ports. The coordinate location must already exist. This replaces any previous assignment of coordinate location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location from the ports.

Syntax

```
location coord-location-id <coord-loc-id>
no location coord-location-id [<coord-loc-id>]
```

Parameter	Description
<coord-loc-id>	Coordinate location ID, in the range 1 to 4095.

Default By default no coordinate location is assigned to ports.

Mode Interface Configuration

Usage notes The coordinate location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, configure the location using the following commands:

- location coord-location identifier command
- location coord-location configuration command

If a coordinate location is deleted using the **no** variant of the location coord-location identifier command, it is automatically removed from all ports.

Examples To assign coordinate location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location coord-location-id 1
```

To remove a coordinate location from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location coord-location-id
```

location elin-location

Overview Use this command to create or modify an ELIN location.

Use the **no** variant of this command to delete an ELIN location, and remove it from any ports it has been assigned to.

Syntax

```
location elin-location <elin> identifier <elin-loc-id>
no location elin-location identifier <elin-loc-id>
```

Parameter	Description
<elin>	Emergency Location Identification Number (ELIN) for Emergency Call Service (ECS), in the range 10 to 25 digits long. In North America, ELINs are typically 10 digits long.
<elin-loc-id>	A unique ELIN location identifier, in the range 1 to 4095.

Default By default there are no ELIN location identifiers.

Mode Global Configuration

Usage Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

To assign this ELIN location to particular ports, so that it can be advertised in TLVs from those ports, use the location elin-location-id command.

Examples To create a new ELIN location with ID 1, and configure it with ELIN "1234567890", use the commands:

```
awplus# configure terminal
awplus(config)# location elin-location 1234567890 identifier 1
```

To delete existing ELIN location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location elin-location identifier 1
```

Related commands

location elin-location-id

show lldp local-info

location elin-location-id

Overview Use this command to assign an ELIN location to the ports. The ELIN location must already exist. This replaces any previous assignment of ELIN location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location identifier from the ports.

Syntax

```
location elin-location-id <elin-loc-id>
no location elin-location-id [<elin-loc-id>]
```

Parameter	Description
<elin-loc-id>	ELIN location identifier, in the range 1 to 4095.

Default By default no ELIN location is assigned to ports.

Mode Interface Configuration

Usage notes An ELIN location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, configure the location using the location elin-location command.

If an ELIN location is deleted using the **no** variant of one of the location elin-location command, it is automatically removed from all ports.

Examples To assign ELIN location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location elin-location-id 1
```

To remove ELIN location 1 from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location elin-location-id 1
```

show debugging lldp

Overview This command displays LLDP debug settings for specified ports. If no port list is supplied, LLDP debug settings for all ports are displayed.

Syntax

```
show debugging lldp [interface <port-list>]
```

Parameter	Description
<port-list>	The ports for which the LLDP debug settings are shown.

Mode User Exec and Privileged Exec

Examples To display LLDP debug settings for all ports, use the command:

```
awplus# show debugging lldp
```

Output Figure 56-1: Example output from the **show debugging lldp** command

Table 1: Parameters in the output of the **show debugging lldp** command

Parameter	Description
Port	Port name.
Rx	Whether debugging of LLDP receive is enabled on the port.
RxPkt	Whether debugging of LLDP receive packet dump is enabled on the port.
Rx	Whether debugging of LLDP transmit is enabled on the port.
RxPkt	Whether debugging of LLDP transmit packet dump is enabled on the port.

Related commands debug lldp

show lldp

Overview This command displays LLDP status and global configuration settings.

Syntax

```
show lldp
```

Mode User Exec and Privileged Exec

Example To display LLDP status and global configuration settings, use the command:

```
awplus# show lldp
```

Output

Table 2: Example output from the **show lldp** command

```
awplus# show lldp

LLDP Global Configuration:              [Default Values]
LLDP Status ............... Enabled     [Disabled]
Notification Interval ..... 5 secs      [5]
Tx Timer Interval ......... 30 secs     [30]
Hold-time Multiplier ...... 4           [4]
(Computed TTL value ....... 120 secs)
Reinitialization Delay .... 2 secs      [2]
Tx Delay .................. 2 secs      [2]

Port Number Type........... Ifindex     [Port-Number]
Fast Start Count .......... 5           [3]

LLDP Global Status:
Total Neighbor Count ...... 47
Neighbors table last updated 0 hrs 0 mins 43 secs ago
```

Table 3: Parameters in the output of the **show lldp** command

Parameter	Description
`LLDP Status`	Whether LLDP is enabled. Default is disabled.
`Notification Interval`	Minimum interval between LLDP notifications.
`Tx Timer Interval`	Transmit interval between regular transmissions of LLDP advertisements.
`Hold-time Multiplier`	The holdtime multiplier. The transmit interval is multiplied by the holdtime multiplier to give the Time To Live (TTL) value that is advertised to neighbors.
`Reinitialization Delay`	The reinitialization delay. This is the minimum time after disabling LLDP transmit on a port before it can reinitialize again.

Table 3: Parameters in the output of the **show lldp** command (cont.)

Parameter	Description
`Tx Delay`	The transmission delay. This is the minimum time interval between transmitting advertisements due to a change in LLDP local information.
`Port Number Type`	The type of port identifier used to enumerate LLDP MIB local port entries, as set by the lldp port-number-type command.
`Fast Start Count`	The number of times fast start advertisements are sent for LLDP-MED.
`Total Neighbor Count`	Number of LLDP neighbors discovered on all ports.
`Neighbors table last updated`	The time since the LLDP neighbor table was last updated.

Related commands

show lldp interface

show running-config lldp

show lldp interface

Overview This command displays LLDP configuration settings for specified ports. If no port list is specified, LLDP configuration for all ports is displayed.

Syntax

```
show lldp interface [<port-list>]
```

Parameter	Description
<port-list>	The ports for which the LLDP configuration settings are to be shown.

Mode User Exec and Privileged Exec

Examples To display LLDP configuration settings for all ports, use the command:

```
awplus# show lldp interface
```

Output Figure 56-2: Example output from the **show lldp interface** command

Table 4: Parameters in the output of the **show lldp interface** command

Parameter	Description
`Port`	Port name.
`Rx`	Whether reception of LLDP advertisements is enabled on the port.
`Tx`	Whether transmission of LLDP advertisements is enabled on the port.
`Notif`	Whether sending SNMP notification for LLDP is enabled on the port: • RM = Remote Tables Change Notification • TP = LLDP-MED Topology Change Notification
`Management Addr`	Management address advertised to neighbors.
`Base TLVs Enabled for Tx`	List of optional Base TLVs enabled for transmission: • Pd = Port Description • Sn =System Name • Sd = System Description • Sc =System Capabilities • Ma = Management Address

Table 4: Parameters in the output of the **show lldp interface** command (cont.)

Parameter	Description
`802.1 TLVs Enabled for Tx`	List of optional 802.1 TLVs enabled for transmission: • Pv = Port VLAN ID • Pp = Port And Protocol VLAN ID • Vn = VLAN Name • Pi =Protocol Identity
`802.3 TLVs Enabled for Tx`	List of optional 802.3 TLVs enabled for transmission: • Mp = MAC/PHY Configuration/Status • Po = Power Via MDI (PoE) • La = Link Aggregation • Mf = Maximum Frame Size
`MED TLVs Enabled for Tx`	List of optional LLDP-MED TLVs enabled for transmission: • Mc = LLDP-MED Capabilities • Np = Network Policy • Lo = Location Information, • Pe = Extended Power-Via-MDI • In = Inventory

Related commands

show lldp

show running-config lldp

show lldp local-info

Overview This command displays local LLDP information that can be transmitted through specified ports. If no port list is entered, local LLDP information for all ports is displayed.

Syntax
```
show lldp local-info [base] [dot1] [dot3] [med] [interface
<port-list>]
```

Parameter	Description
`base`	Information for base TLVs.
`dot1`	Information for 802.1 TLVs.
`dot3`	Information for 802.3 TLVs.
`med`	Information for LLDP-MED TLVs.
<port-list>	The ports for which the local information is to be shown.

Mode User Exec and Privileged Exec

Usage notes Whether and which local information is transmitted in advertisements via a port depends on:

- whether the port is set to transmit LLDP advertisements (lldp transmit receive command)
- which TLVs it is configured to send (lldp tlv-select command, lldp med-tlv-select command)

Examples To display local information transmitted via all ports, use the command:

```
awplus# show lldp local-info
```

Output Figure 56-3: Example output from **show lldp local-info**

```

Table 56-1: Parameters in the output of **show lldp local-info**

Parameter	Description
`Chassis ID Type`	Type of the Chassis ID.
`Chassis ID`	Chassis ID that uniquely identifies the local device.
`Port ID Type`	Type of the Port ID.
`Port ID`	Port ID of the local port through which advertisements are sent.
`TTL`	Number of seconds that the information advertised by the local port remains valid.
`Port Description`	Port description of the local port, as specified by the description (interface) command.
`System Name`	System name, as specified by the hostname command.
`System Description`	System description.
`System Capabilities (Supported)`	Capabilities that the local port supports.
`System Capabilities (Enabled)`	Enabled capabilities on the local port.
`Management Addresses`	Management address associated with the local port. To change this, use the lldp management-address command.
`Port VLAN ID (PVID)`	VLAN identifier associated with untagged or priority tagged frames received via the local port.
`Port & Protocol VLAN (Supported)`	Whether Port & Protocol VLANs (PPV) is supported on the local port.
`Port & Protocol VLAN (Enabled)`	Whether the port is in one or more Port & Protocol VLANs.
`Port & Protocol VLAN (VIDs)`	List of identifiers for Port & Protocol VLANs that the port is in.
`VLAN Names`	List of VLAN names for VLANs that the local port is assigned to.
`Protocol IDs`	List of protocols that are accessible through the local port.
`MAC/PHY Auto-negotiation`	Auto-negotiation support and current status of the 802.3 LAN on the local port.

Table 56-1: Parameters in the output of **show lldp local-info** (cont.)

Parameter	Description
Power Via MDI (PoE)	PoE-capability and current status on the local port.
Port Class	Whether the device is a PSE (Power Sourcing Entity) or a PD (Powered Device)
Pair Control Ability	Whether power pair selection can be controlled
Power Pairs	Which power pairs are selected for power ("Signal Pairs" or "Spare Pairs") if pair selection can be controlled
Power Class	The power class of the PD device on the port (class 0, 1, 2, 3 or 4)
Link Aggregation	Whether the link is capable of being aggregated and it is currently in an aggregation.
Aggregated Port-ID	Aggregated port identifier.
Maximum Frame Size	The maximum frame size capability of the implemented MAC and PHY.
LLDP-MED Device Type	LLDP-MED device type
LLDP-MED Capabilities	Capabilities LLDP-MED capabilities supported on the local port.
Network Policy	List of network policies configured on the local port.
VLAN ID	VLAN identifier for the port for the specified application type
Tagged Flag	Whether the VLAN ID is to be used as tagged or untagged
Layer-2 Priority:	Layer 2 User Priority (in the range 0 to 7)
DSCP Value	Diffserv codepoint (in the range 0 to 63)
Location Identification	Location configured on the local port.
Extended Power Via MDI (PoE)	PoE-capability and current status of the PoE parameters for Extended Power-Via-MDI TLV on the local port.
Power Source	The power source the switch currently uses; either primary power or backup power.
Power Priority	The power priority configured on the port; either critical, high or low.

Table 56-1: Parameters in the output of **show lldp local-info** (cont.)

Parameter	Description
`Power Value`	The total power the switch can source over a maximum length cable to a PD device on the port. The value shows the power value in Watts from the PD side.
`Inventory Management`	Inventory information for the device.

Table 58: Parameters in the output of the **show lldp neighbors detail** command

Parameter	Description
`Chassis ID Type`	Type of the Chassis ID.
`Chassis ID`	Chassis ID that uniquely identifies the neighbor.
`Port ID Type`	Type of the Port ID.
`Port ID`	Port ID of the neighbor.
`TTL`	Number of seconds that the information advertised by the neighbor remains valid.
`Port Description`	Port description of the neighbor's port.
`System Name`	Neighbor's system name.
`System Description`	Neighbor's system description.
`System Capabilities (Supported)`	Capabilities that the neighbor supports.
`System Capabilities (Enabled)`	Capabilities that are enabled on the neighbor.
`Management Addresses`	List of neighbor's management addresses.
`Port VLAN ID (PVID)`	VLAN identifier associated with untagged or priority tagged frames for the neighbor port.
`Port & Protocol VLAN (Supported)`	Whether Port & Protocol VLAN is supported on the LLDP neighbor.
`Port & Protocol VLAN (Enabled)`	Whether Port & Protocol VLAN is enabled on the LLDP neighbor.
`Port & Protocol VLAN (VIDs)`	List of Port & Protocol VLAN identifiers.
`VLAN Names`	List of names of VLANs that the neighbor's port belongs to.
`Protocol IDs`	List of protocols that are accessible through the neighbor's port.
`MAC/PHY Auto-negotiation`	Auto-negotiation configuration and status
`Power Via MDI (PoE)`	PoE configuration and status of 802.3 Power-Via-MDI TLV
`Link Aggregation`	Link aggregation information

Table 58: Parameters in the output of the **show lldp neighbors detail** command (cont.)

Parameter	Description
`Maximum Frame Size`	The maximum frame size capability
`LLDP-MED Device Type`	LLDP-MED Device type
`LLDP-MED Capabilities`	LLDP-MED capabilities supported
`Network Policy`	List of network policies
`Location Identification`	Location information
`Extended Power Via MDI (PoE)`	PoE-capability and current status
`Inventory Management`	Inventory information

Related commands show lldp neighbors

show lldp statistics

Overview This command displays the global LLDP statistics (packet and event counters).

Syntax

```
show lldp statistics
```

Mode User Exec and Privileged Exec

Example To display global LLDP statistics information, use the command:

```
awplus# show lldp statistics
```

Output

Table 59: Example output from the **show lldp statistics** command

```
awplus# show lldp statistics

Global LLDP Packet and Event counters:

  Frames:    Out ................... 345
             In .................... 423
             In Errored ............ 0
             In Dropped ............ 0
  TLVs:      Unrecognized .......... 0
             Discarded ............. 0
  Neighbors: New Entries ........... 20
             Deleted Entries ....... 20
             Dropped Entries ....... 0
             Entry Age-outs ........ 20
```

Table 60: Parameters in the output of the **show lldp statistics** command

Parameter	Description
Frames Out	Number of LLDPDU frames transmitted.
Frames In	Number of LLDPDU frames received.
Frames In Errored	Number of invalid LLDPDU frames received.
Frames In Dropped	Number of LLDPDU frames received and discarded for any reason.
TLVs Unrecognized	Number of LLDP TLVs received that are not recognized but the TLV type is in the range of reserved TLV types.
TLVs Discarded	Number of LLDP TLVs discarded for any reason.
Neighbors New Entries	Number of times the information advertised by neighbors has been inserted into the neighbor table.

Table 60: Parameters in the output of the **show lldp statistics** command (cont.)

Parameter	Description
`Neighbors Deleted Entries`	Number of times the information advertised by neighbors has been removed from the neighbor table.
`Neighbors Dropped Entries`	Number of times the information advertised by neighbors could not be entered into the neighbor table because of insufficient resources.
`Neighbors Entry Age-outs Entries`	Number of times the information advertised by neighbors has been removed from the neighbor table because the information TTL interval has expired.

```

Output

Table 61: Example output from the **show lldp statistics interface** command

Table 62: Parameters in the output of the **show lldp statistics interface** command

Parameter	Description
`Frames Out`	Number of LLDPDU frames transmitted.
`Frames In`	Number of LLDPDU frames received.
`Frames In Errored`	Number of invalid LLDPDU frames received.
`Frames In Dropped`	Number of LLDPDU frames received and discarded for any reason.
`TLVs Unrecognized`	Number of LLDP TLVs received that are not recognized but the TLV type is in the range of reserved TLV types.
`TLVs Discarded`	Number of LLDP TLVs discarded for any reason.
`Neighbors New Entries`	Number of times the information advertised by neighbors has been inserted into the neighbor table.
`Neighbors Deleted Entries`	Number of times the information advertised by neighbors has been removed from the neighbor table.

Table 62: Parameters in the output of the **show lldp statistics interface** command (cont.)

Parameter	Description
`Neighbors Dropped Entries`	Number of times the information advertised by neighbors could not be entered into the neighbor table because of insufficient resources.
`Neighbors Entry Age-outs Entries`	Number of times the information advertised by neighbors has been removed from the neighbor table because the information TTL interval has expired.

Related commands

clear lldp statistics

show lldp statistics

show location

Overview Use this command to display selected location information configured on the switch.

Syntax

```
show location {civic-location|coord-location|elin-location}
show location {civic-location|coord-location|elin-location}
identifier {<civic-loc-id>|<coord-loc-id>|<elin-loc-id>}
show location {civic-location|coord-location|elin-location}
interface <port-list>
```

Parameter	Description
`civic-location`	Display civic location information.
`coord-location`	Display coordinate location information.
`elin-location`	Display ELIN (Emergency Location Identifier Number) information.
<civic-loc-id>	Civic address location identifier, in the range 1 to 4095.
<coord-loc-id>	Coordinate location identifier, in the range 1 to 4095.
<elin-loc-id>	ELIN location identifier, in the range 1 to 4095.
<port-list>	Ports to display information about.

Mode User Exec and Privileged Exec

Examples To display a civic address location configured on port1.0.1, use the command:

```
awplus# show location civic-location interface port1.0.1
```

Table 63: Example output from the **show location** command

```
awplus# show location civic-location interface port1.0.1
Port     ID   Element Type          Element Value
-------------------------------------------------------------
1.0.1    1    Country               NZ
              City                  Christchurch
              Street-suffix         Avenue
              House-number          27
              Primary-road-name     Nazareth
```

To display coordinate location information configured on the identifier 1, use the command:

```
awplus# show location coord-location identifier 1
```

Table 64: Example output from the **show location** command

```
awplus# show location coord-location identifier 1
  ID  Element Type             Element Value
------------------------------------------------------------------
  1   Latitude Resolution      15 bits
      Latitude                 38.898648113012313842773437 5 degrees
      Longitude Resolution     15 bits
      Longitude                130.232323229312896728515625 0 degrees
      Altitude Resolution      10 bits
      Altitude                 2.50000000 meters
      Map Datum                WGS 84
```

The coordinate location information displayed may differ from the information entered because it is stored in binary format. For more information, see the location coord-location configuration command.

To display all ELIN location information configured on the switch, use the command:

```
awplus# show location elin-location
```

Table 65: Example output from the **show location elin-location** command

```
awplus# show location elin-location
  ID  ELIN
-----------------------------------
  1   1234567890
  2   5432154321
```

Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

57 Mail (SMTP) Commands

Introduction

Overview

This chapter provides an alphabetical reference for commands used to configure mail. The mail feature uses Simple Mail Transfer Protocol (SMTP) to transfer mail from an internal email client operating within the AlliedWare Plus device. This feature is typically used to email event notifications to an external email server from the AlliedWare Plus device.

For information on using the mail feature, see the Mail (SMTP) Feature Overview and Configuration Guide.

Command List

- "debug mail" on page 3067
- "delete mail" on page 3068
- "mail" on page 3069
- "mail from" on page 3071
- "mail smtpserver" on page 3072
- "mail smtpserver authentication" on page 3073
- "mail smtpserver port" on page 3075
- "show counter mail" on page 3077
- "show mail" on page 3078
- "undebug mail" on page 3079

debug mail

Overview This command turns on debugging for sending emails.

The **no** variant of this command turns off debugging for sending emails.

Syntax

```
debug mail
no debug mail
```

Mode Privileged Exec

Examples To turn on debugging for sending emails, use the command:

```
awplus# debug mail
```

To turn off debugging for sending emails, use the command:

```
awplus# no debug mail
```

Related commands

mail smtpserver

show counter mail

show mail

undebug mail

delete mail

Overview This command deletes mail from the queue.

You need the *mail-id* from the **show mail** command output to delete specific emails, or use the **all** parameter to clear all messages in the queue completely.

Syntax

```
delete mail [mail-id <mail-id>|all]
```

Parameter	Description	
`mail-id`	Deletes a single mail from the mail queue.	
	<mail-id>	A unique mail ID number. Use the show mail command to display this for an item of mail.
`all`	Delete all the mail in the queue.	

Mode Privileged Exec

Examples To delete the unique mail item "20060912142356.1234" from the queue, use the command:

```
awplus# delete mail 20060912142356.1234
```

To delete all mail from the queue, use the command:

```
awplus# delete mail all
```

debug mail

mail

mail from

mail smtpserver

show mail

mail

Overview This command sends an email using the SMTP protocol. If you specify a file the text inside the file is sent in the message body.

If you do not specify the **to**, **file**, or **subject** parameters, the CLI prompts you for the missing information.

Before you can send mail using this command, you must specify the sending email address using the mail from command and a mail server using the mail smtpserver command.

Syntax `mail [to <to>] [subject <subject>] [file <filename>]`

Parameter	Description	
`to`	The email recipient.	
	<to>	Email address.
`subject`	Description of the subject of this email. Use quote marks when the subject text contains spaces.	
	<subject>	String.
`file`	File to insert as text into the message body.	
	<filename>	String.

Mode Privileged Exec

Usage notes When you use the **mail** command you can use parameter substitutions in the subject field. The following table lists the parameters that can be substituted and their descriptions:

Parameter	Description
<%N>	When this parameter is specified, the %N is replaced by the host name of your device.
<%S>	When this parameter is specified, the %S is replaced by the serial number of your device.
<%D> *<%L>* *<%T>*	When any of these parameters is specified, they are replaced by the current date and time (local time) on your device.
<%U>	When this parameter is specified, the %U is replaced by the current date and time (UTC time) on your device.

NOTE: *If no local time is configured, it will use UTC.*

Examples

To send an email to “admin@example.com” with the subject “test email” and with the message body inserted from the file “test.conf”, use the command:

```
awplus# mail to admin@example.com subject "test email" filename
test.conf
```

To send an email using parameter substitutions for the host name, serial number and date, use the commands:

```
awplus# mail to admin@example.com subject "Sending email from
Hostname:%N Serial Number:%S Date:%T"
```

mail smtpserver

mail smtpserver authentication

mail smtpserver port

show counter mail

show mail

mail from

Overview This command sets an email address as the sender. You must specify a sending email address with this command before you can send email.

Use the **no** variant of this command to remove the "mail from" address.

Syntax

```
mail from <from>
no mail from
```

Parameter	Description
<from>	The email address that the mail is sent from (also known as the hostname).

Mode Global Configuration

Example To set up your email address as the sender "kaji@nerv.com", use the command:

```
awplus(config)# mail from kaji@nerv.com
```

Related commands

debug mail

delete mail

mail

mail smtpserver

show counter mail

show mail

undebug mail

mail smtpserver

Overview This command specifies the IP address or domain name of the SMTP server that your device sends email to. You must specify a mail server with this command before you can send email.

Use the **no** variant of this command to remove the configured mail server.

Syntax

```
mail smtpserver {<ip-address>|<name>}
no mail smtpserver
```

Parameter	Description
<ip-address>	Internet Protocol (IP) address for the mail server.
<name>	Domain name (FQDN) for the mail server (also known as the host name).

Mode Global Configuration

Usage notes If you specify the server by specifying its domain name, you must also ensure that the DNS client on your device is enabled. It is enabled by default but if it has been disabled, you can re-enable it by using the ip domain-lookup command.

Examples To specify a mail server at "192.168.0.1", use the command:

```
awplus(config)# mail smtpserver 192.168.0.1
```

To specify a mail server that has a host name of "smtp.example.com", use the command:

```
awplus(config)# mail smtpserver smtp.example.com
```

To remove the configured mail server, use the command:

```
awplus(config)# no mail smtpserver
```

show counter mail

show mail

mail smtpserver authentication

Overview Use this command to configure SMTP mail server authentication.

Use the **no** variant of this command to remove the configured SMTP mail server authentication.

Syntax

```
mail smtpserver authentication {crammd5|login|plain} username
<username> password [8] <password>
```

```
no mail smtpserver authentication
```

Parameter	Description
`crammd5`	This is a Challenge Request Authentication Mechanism based on the HMAC-MD5 mechanism and is the most secure option.
`login`	A BASE64 encryption method
`plain`	A BASE64 encryption method
<username>	Registered user name
8	The registered user password is presented in an already encrypted format. This is how the running configuration stores the plain text password and is not for general use.
<password>	Registered user password

Default No authentication option is set by default.

Mode Global Configuration

Usage notes You cannot change the IP address or Domain Name of the SMTP server if authentication is configured. If you attempt to change it when authentication is configured, the following error message is displayed:

```
% Error: authentication configuration still exists
```

Examples To configure the SMTP mail server authentication to crammd5, use the commands:

```
awplus# configure terminal
awplus(config)# mail smtpserver authentication crammd5 username
admin password unguessablePassword
```

To remove SMTP mail server authentication, use the commands:

```
awplus# configure terminal
awplus(config)# no mail smtpserver authentication
```

Output Figure 57-1: Example output from **show mail**:

```
awplus#show mail
Mail Settings
-------------------------------------------------------------
State                              : Alive

Command changes Version 5.4.8-1.1: command added

mail smtpserver port

Overview Use this command to configure the SMTP mail client/server communication port.

Use the **no** variant of this command to remove the configured port and set it back to the default port 25.

Syntax

```
mail smtpserver port <port>
no mail smtpserver port
```

Parameter	Description
<port>	Port number from the range 1 to 65535

Default Port 25 is the default port.

Mode Global Configuration

Examples To configure the mail server communication over port 587, use the commands:

```
awplus# configure terminal
awplus(config)# mail smtpserver port 587
```

To remove the configured port and set it back to the default port 25, use the commands:

```
awplus# configure terminal
awplus(config)# no mail smtpserver port
```

Output Figure 57-2: Example output from **show mail**:

```
awplus#show mail
Mail Settings
-------------------------------------------------------------
State                               : Alive
SMTP Server                         : 10.24.165.4
Host Name                           : admin@example.com
Authentication                      : plain
Username                            : admin
Port                                : 587
Debug                               : Disabled

awplus#show running-config
!
mail smtpserver port 587

Command changes

Version 5.4.8-1.1: command added

show counter mail

Overview This command displays the mail counters.

Syntax

```
show counter mail
```

Mode User Exec and Privileged Exec

Example To show the emails in the queue use the command:

```
awplus# show counter mail
```

Output Figure 57-3: Example output from the **show counter mail** command

```
Mail Client (SMTP) counters
Mails Sent            ......... 2
Mails Sent Fails      ......... 1
```

Table 1: Parameters in the output of the **show counter mail** command

Parameter	Description
`Mails Sent`	The number of emails sent successfully since the last device restart.
`Mails Sent Fails`	The number of emails the device failed to send since the last device restart.

58 Secure Shell (SSH) Commands

Introduction

Overview This chapter provides an alphabetical reference for commands used to configure Secure Shell (SSH). For more information, see the SSH Feature Overview and Configuration Guide.

Command List

- "banner login (SSH)" on page 3082
- "clear ssh" on page 3083
- "crypto key destroy hostkey" on page 3084
- "crypto key destroy userkey" on page 3085
- "crypto key generate hostkey" on page 3086
- "crypto key generate userkey" on page 3088
- "crypto key pubkey-chain knownhosts" on page 3089
- "crypto key pubkey-chain userkey" on page 3091
- "debug ssh client" on page 3093
- "debug ssh server" on page 3094
- "service ssh" on page 3095
- "show banner login" on page 3097
- "show crypto key hostkey" on page 3098
- "show crypto key pubkey-chain knownhosts" on page 3100
- "show crypto key pubkey-chain userkey" on page 3102
- "show crypto key userkey" on page 3103
- "show running-config ssh" on page 3104
- "show ssh" on page 3106
- "show ssh client" on page 3108

- "show ssh server" on page 3109
- "show ssh server allow-users" on page 3111
- "show ssh server deny-users" on page 3112
- "ssh" on page 3113
- "ssh client" on page 3115
- "ssh server" on page 3117
- "ssh server allow-users" on page 3119
- "ssh server authentication" on page 3121
- "ssh server deny-users" on page 3123
- "ssh server max-auth-tries" on page 3125
- "ssh server resolve-host" on page 3126
- "ssh server scp" on page 3127
- "ssh server secure-ciphers" on page 3128
- "ssh server sftp" on page 3129
- "undebug ssh client" on page 3130
- "undebug ssh server" on page 3131

banner login (SSH)

Overview This command configures a login banner on the SSH server. This displays a message on the remote terminal of the SSH client before the login prompt. SSH client version 1 does not support this banner.

To add a banner, first enter the command **banner login**, and hit [Enter]. Write your message. You can use any character and spaces. Use Ctrl+D at the end of your message to save the text and re-enter the normal command line mode.

The banner message is preserved if the device restarts.

The **no** variant of this command deletes the login banner from the device.

Syntax

```
banner login
no banner login
```

Default No banner is defined by default.

Mode Global Configuration

Examples To set a login banner message, use the commands:

```
awplus# configure terminal
awplus(config)# banner login
```

The screen will prompt you to enter the message:

```
Type CNTL/D to finish.
... banner message comes here ...
```

Enter the message. Use Ctrl+D to finish, like this:

```
^D
awplus(config)#
```

To remove the login banner message, use the commands:

```
awplus# configure terminal
awplus(config)# no banner login
```

Related commands show banner login

clear ssh

Overview This command deletes Secure Shell sessions currently active on the device. This includes both incoming and outgoing sessions. The deleted sessions are closed. You can only delete an SSH session if you are a system manager or the user who initiated the session. If **all** is specified then all active SSH sessions are deleted.

Syntax

```
clear ssh {<1-65535>|all}
```

Parameters	Description
<1-65535>	Specify a session ID in the range 1 to 65535 to delete a specific session.
`all`	Delete all SSH sessions.

Mode Privileged Exec

Examples To stop the current SSH session 123, use the command:

```
awplus# clear ssh 123
```

To stop all SSH sessions active on the device, use the command:

```
awplus# clear ssh all
```

Related commands service ssh

ssh

crypto key destroy hostkey

Overview This command deletes the existing public and private keys of the SSH server.

When you enable the SSH server, the server automatically generates an SSHv2 host key pair (public and private keys), using RSA with 1024-bit key generation. If you need a key with different parameters than this, you can use the crypto key generate hostkey command to generate that key before you enable the SSH server.

Syntax

```
crypto key destroy hostkey {dsa|ecdsa|rsa|rsa1}
```

Parameters	Description
dsa	Deletes the existing DSA public and private keys.
ecdsa	Deletes the existing ECDSA public and private keys.
rsa	Deletes the existing RSA public and private keys configured for SSH version 2 connections.
rsa1	Deletes the existing RSA public and private keys configured for SSH version 1 connections.

Mode Global Configuration

Example To destroy the RSA host key used for SSH version 2 connections, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy hostkey rsa
```

Related commands

crypto key generate hostkey

service ssh

crypto key destroy userkey

Overview This command destroys the existing public and private keys of an SSH user configured on the device.

Syntax

```
crypto key destroy userkey <username> {dsa|rsa|rsa1}
```

Parameters	Description
<username>	Name of the user whose userkey you are destroying. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
dsa	Deletes the existing DSA userkey.
rsa	Deletes the existing RSA userkey configured for SSH version 2 connections.
rsa1	Deletes the existing RSA userkey for SSH version 1 connections.

Mode Global Configuration

Example To destroy the RSA user key for the SSH user `remoteuser`, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy userkey remoteuser rsa
```

Related commands

crypto key generate hostkey

show ssh

show crypto key hostkey

crypto key generate hostkey

Overview This command generates public and private keys for the SSH server.

When you enable the SSH server, the server automatically generates an SSHv2 host key pair (public and private keys), using RSA with 1024-bit key generation.

If you need a key with different parameters than this, you can use this command to generate that key before you enable the SSH server. If a host key exists with the same cryptography algorithm, this command replaces the old host key with the new key.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

Syntax

```
crypto key generate hostkey {dsa} [<768-1024>]
crypto key generate hostkey {rsa|rsa1} [<768-32768>]
crypto key generate hostkey {ecdsa} [<256|384>]
```

Parameters	Description
`dsa`	Creates a DSA hostkey. Both SSH version 1 and 2 connections can use the DSA hostkey.
`rsa`	Creates an RSA hostkey for SSH version 2 connections.
`rsa1`	Creates an RSA hostkey for SSH version 1 connections.
`ecdsa`	Creates an ECDSA hostkey. Both SSH version 1 and 2 connections can use the ECDSA hostkey.
<768-32768>	The length in bits of the generated key. The default is 1024 bits.
<256|384>	The ECDSA key size in bits. The default is 256, but it can be set to 384.

Default The default key length for RSA and DSA is 1024 bits.

The default key size for ECDSA is 256 bits.

Mode Global Configuration

Examples To generate an RSA host key for SSH version 2 connections that is 2048 bits in length, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate hostkey rsa 2048
```

To generate a DSA host key, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate dsa
```

To generate an ECDSA host key with an elliptic curve size of 384 bits, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate ecdsa 384
```

Related commands

crypto key destroy hostkey

service ssh

show crypto key hostkey

crypto key generate userkey

Overview This command generates public and private keys for an SSH user using either an RSA or DSA cryptography algorithm. To use public key authentication, copy the public key of the user onto the remote SSH server.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

Syntax

```
crypto key generate userkey <username> {dsa} [<768-1024>]
crypto key generate userkey <username> {rsa|rsa1} [<768-32768>]
crypto key generate userkey <username> {ecdsa} [<256|384>]
```

Parameters	Description
<username>	Name of the user that the user key is generated for. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
`dsa`	Creates a DSA userkey. Both SSH version 1 and 2 connections can use a key created with this command.
`rsa`	Creates an RSA userkey for SSH version 2 connections.
`rsa1`	Creates an RSA userkey for SSH version 1 connections.
`ecdsa`	Creates an ECDSA hostkey. Both SSH version 1 and 2 connections can use the ECDSA hostkey.
<768-32768>	The length in bits of the generated key. The default is 1024 bits.
<256|384>	The ECDSA key size in bits. The default is 256, but it can be set to 384.

Mode Global Configuration

Examples To generate a 2048-bits RSA user key for SSH version 2 connections for the user "bob", use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey bob rsa 2048
```

To generate a DSA user key for the user "lapo", use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey lapo dsa
```

Related commands crypto key pubkey-chain userkey

show crypto key userkey

crypto key pubkey-chain knownhosts

Overview This command adds a public key of the specified SSH server to the known host database on your device. The SSH client on your device uses this public key to verify the remote SSH server.

The key is retrieved from the server. Before adding a key to this database, check that the key sent to you is correct.

If the server's key changes, or if your SSH client does not have the public key of the remote SSH server, then your SSH client will inform you that the public key of the server is unknown or altered.

The **no** variant of this command deletes the public key of the specified SSH server from the known host database on your device.

Syntax
```
crypto key pubkey-chain knownhosts [ip|ipv6] <hostname> [rsa|dsa|rsa1]
no crypto key pubkey-chain knownhosts <1-65535>
```

Syntax (VRF-lite)
```
crypto key pubkey-chain knownhosts [vrf <vrf-name>] [ip|ipv6] <hostname> [rsa|dsa|rsa1]
no crypto key pubkey-chain knownhosts [vrf <vrf-name>] <1-65535>
```

Parameter	Description
`vrf`	Apply this command to the specified VRF instance.
<vrf-name>	The VRF instance name
`ip`	Keyword used prior to specifying an IPv4 address
`ipv6`	Keyword used prior to specifying an IPv6 address
<hostname>	IPv4/IPv6 address or hostname of a remote server in the format `a.b.c.d` for an IPv4 address, or in the format `x:x::x:x` for an IPv6 address.
`rsa`	Specify the RSA public key of the server to be added to the known host database.
`dsa`	Specify the DSA public key of the server to be added to the known host database.
`rsa1`	Specify the SSHv1 public key of the server to be added to the know host database.
<1-65535>	Specify a key identifier when removing a key using the **no** parameter.

Default If no cryptography algorithm is specified, then **rsa** is used as the default cryptography algorithm.

Mode Privilege Exec

Usage notes

This command adds a public key of the specified SSH server to the known host database on the device. The key is retrieved from the server. The remote SSH server is verified by using this public key. The user is requested to check the key is correct before adding it to the database.

If the remote server's host key is changed, or if the device does not have the public key of the remote server, then SSH clients will inform the user that the public key of the server is altered or unknown.

Examples

To add the RSA host key of the remote SSH host IPv4 address `192.0.2.11` to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts 192.0.2.11
```

To delete the second entry in the known host database, use the command:

```
awplus# no crypto key pubkey-chain knownhosts 2
```

Examples (VRF-lite)

To add the RSA host key of the remote SSH host IPv4 address `192.0.2.11` in VRF `red` to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts vrf red 192.0.2.11
```

To delete the second entry in the known host database in VRF `red`, use the command:

```
awplus# no crypto key pubkey-chain knownhosts vrf red 2
```

Validation Commands

show crypto key pubkey-chain knownhosts

Command changes

Version 5.4.6-2.1: VRF-lite support added.

crypto key pubkey-chain userkey

Overview This command adds a public key for an SSH user on the SSH server. This allows the SSH server to support public key authentication for the SSH user. When configured, the SSH user can access the SSH server without providing a password from the remote host.

The **no** variant of this command removes a public key for the specified SSH user that has been added to the public key chain. When a SSH user's public key is removed, the SSH user can no longer login using public key authentication.

Syntax

```
crypto key pubkey-chain userkey <username> [<filename>]
no crypto key pubkey-chain userkey <username> <1-65535>
```

Parameters	Description
<username>	Name of the user that the SSH server associates the key with. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. Default: no default
<filename>	Filename of a key saved in flash. Valid characters are any printable character. You can add a key as a hexadecimal string directly into the terminal if you do not specify a filename.
<1-65535>	The key ID number of the user's key. Specify the key ID to delete a key.

Mode Global Configuration

Usage notes You should import the public key file from the client node. The device can read the data from a file on the flash or user terminal.

Or you can add a key as text into the terminal. To add a key as text into the terminal, first enter the command **crypto key pubkey-chain userkey** <*username*>, and hit [Enter]. Enter the key as text. Note that the key you enter as text must be a valid SSH RSA key, not random ASCII text. Use [Ctrl]+D after entering it to save the text and re-enter the normal command line mode.

Note you can generate a valid SSH RSA key on the device first using the **crypto key generate host rsa** command. View the SSH RSA key generated on the device using the **show crypto hostkey rsa** command. Copy and paste the displayed SSH RSA key after entering the **crypto key pubkey-chain userkey** <*username*> command. Use [Ctrl]+D after entering it to save it.

Examples

To generate a valid SSH RSA key on the device and add the key, use the following commands:

```
awplus# configure terminal
awplus(config)# crypto key generate host rsa
awplus(config)# exit
awplus# show crypto key hostkey
rsaAAAAB3NzaC1yc2EAAAABIwAAAIEAr1s7SokW5aW2fcOw1TStpb9J20bWluh

ITzvvyZW4/I4pbN8=
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey joeType CNTL/D
to
finish:AAAAB3NzaC1yc2EAAAABIwAAAIEAr1s7SokW5aW2fcOw1TStpb9J20b
WluhnUC768EoWhyPW6FZ2t5360O5M29EpKBmGqlkQaz5V0mU9IQe66+5YyD4Ux
OKSDtTI+7jtjDcoGWHb2u4sFwRpXwJZcgYrXW16+6NvNbk+h+c/pqGDijj4Svf
ZZfeITzvvyZW4/I4pbN8=control-D
awplus(config)#
```

To add a public key for the user `graydon` from the file `key.pub`, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey graydon key.pub
```

To add a public key for the user `tamara` from the terminal, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey tamara
```

and enter the key. Use Ctrl+D to finish.

To remove the first key entry from the public key chain of the user `john`, use the commands:

```
awplus# configure terminal
awplus(config)# no crypto key pubkey-chain userkey john 1
```

Related commands

show crypto key pubkey-chain userkey

debug ssh client

Overview This command enables the SSH client debugging facility. When enabled, any SSH, SCP and SFTP client sessions send diagnostic messages to the login terminal.

The **no** variant of this command disables the SSH client debugging facility. This stops the SSH client from generating diagnostic debugging message.

Syntax

```
debug ssh client [brief|full]
no debug ssh client
```

Parameter	Description
`brief`	Enables brief debug mode.
`full`	Enables full debug mode.

Default SSH client debugging is disabled by default.

Mode Privileged Exec and Global Configuration

Examples To start SSH client debugging, use the command:

```
awplus# debug ssh client
```

To start SSH client debugging with extended output, use the command:

```
awplus# debug ssh client full
```

To disable SSH client debugging, use the command:

```
awplus# no debug ssh client
```

Related commands

debug ssh server

show ssh client

undebug ssh client

debug ssh server

Overview This command enables the SSH server debugging facility. When enabled, the SSH server sends diagnostic messages to the system log. To display the debugging messages on the terminal, use the **terminal monitor** command.

The **no** variant of this command disables the SSH server debugging facility. This stops the SSH server from generating diagnostic debugging messages.

Syntax

```
debug ssh server [brief|full]
no debug ssh server
```

Parameter	Description
`brief`	Enables brief debug mode.
`full`	Enables full debug mode.

Default SSH server debugging is disabled by default.

Mode Privileged Exec and Global Configuration

Examples To start SSH server debugging, use the command:

```
awplus# debug ssh server
```

To start SSH server debugging with extended output, use the command:

```
awplus# debug ssh server full
```

To disable SSH server debugging, use the command:

```
awplus# no debug ssh server
```

Related commands debug ssh client

show ssh server

undebug ssh server

service ssh

Overview Use this command to enable the Secure Shell server on the device. Once enabled, connections coming from SSH clients are accepted.

When you enable the SSH server, the server automatically generates an SSHv2 host key pair (public and private keys), using RSA with 1024-bit key generation. If you need a key with different parameters than this, you can use the crypto key generate hostkey command to generate that key before you enable the SSH server.

Use the **no** variant of this command disables the Secure Shell server. When the Secure Shell server is disabled, connections from SSH, SCP, and SFTP clients are not accepted. This command does not affect existing SSH sessions. To terminate existing sessions, use the clear ssh command.

Syntax

```
service ssh [ip|ipv6]
no service ssh [ip|ipv6]
```

Default The Secure Shell server is disabled by default. Both IPv4 and IPv6 Secure Shell server are enabled when you issue **service ssh** without specifying the optional **ip** or **ipv6** parameters.

Mode Global Configuration

Examples To enable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh
```

To enable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ip
```

To enable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ipv6
```

To disable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh
```

To disable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh ip
```

To disable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh ipv6
```

show banner login

Overview This command displays the banner message configured on the device. The banner message is displayed to the remote user before user authentication starts.

Syntax

```
show banner login
```

Mode User Exec, Privileged Exec, Global Configuration, Interface Configuration, Line Configuration

Example To display the current login banner message, use the command:

```
awplus# show banner login
```

Related commands banner login (SSH)

show crypto key hostkey

Overview This command displays the public keys generated on the device for the SSH server.

When you enable the SSH server, the server automatically generates an SSHv2 host key pair (public and private keys), using RSA with 1024-bit key generation. If you need a key with different parameters than this, you can use the crypto key generate hostkey command to generate that key before you enable the SSH server.

The private key remains on the device secretly. The public key is copied to SSH clients to identify the server. This command displays the public key.

Syntax

```
show crypto key hostkey [dsa|ecdsa|rsa|rsa1]
```

Parameter	Description
dsa	Displays the DSA algorithm public key. Both SSH version 1 and 2 connections can use the DSA hostkey
ecdsa	Displays the ECDSA algorithm public key. Both SSH version 1 and 2 connections can use the ECDSA hostkey.
rsa	Displays the RSA algorithm public key for SSH version 2 connections.
rsa1	Displays the RSA algorithm public key for SSH version 1 connections.

Mode User Exec, Privileged Exec and Global Configuration

Examples To show the public keys generated on the device for SSH server, use the command:

```
awplus# show crypto key hostkey
```

To display the RSA public key of the SSH server, use the command:

```
awplus# show crypto key hostkey rsa
```

Output Figure 58-1: Example output from the **show crypto key hostkey** command

```
Type Bits   Fingerprint
-------------------------------------------------------
rsa  2058   4e:7d:1d:00:75:79:c5:cb:c8:58:2e:f9:29:9c:1f:48
dsa  1024   fa:72:3d:78:35:14:cb:9a:1d:ca:1c:83:2c:7d:08:43
rsa1 1024   e2:1c:c8:8b:d8:6e:19:c8:f4:ec:00:a2:71:4e:85:8b
```

Table 1: Parameters in output of the **show crypto key hostkey** command

Parameter	Description
`Type`	Algorithm used to generate the key.
`Bits`	Length in bits of the key.
`Fingerprint`	Checksum value for the public key.

Related commands

crypto key destroy hostkey

crypto key generate hostkey

show crypto key pubkey-chain knownhosts

Overview This command displays the list of public keys maintained in the known host database on the device.

Syntax
```
show crypto key pubkey-chain knownhosts [<1-65535>]
```

Syntax (VRF-lite)
```
show crypto key pubkey-chain knownhosts [vrf <vrf-name>|global]
[<1-65535>]
```

Parameter	Description
`global`	When VRF-lite is configured, apply the command to the global routing and forwarding table.
`vrf`	Apply the command to the specified VRF instance.
<vrf-name>	The name of the VRF instance.
<1-65535>	Key identifier for a specific key. Displays the public key of the entry if specified.

Default Display all keys.

Mode User Exec, Privileged Exec and Global Configuration

Usage When VRF-lite is configured:

- If **vrf** is specified, this command displays the known host database from the specified VRF instance.
- If **global** is specified, this command displays the known host database from the global routing environment.
- If neither **vrf** nor **global** is specified, this command displays the known host database from the global routing environment and each configured VRF.

For more information about VRF, see the VRF Lite Feature Overview and Configuration Guide.

Examples To display public keys of known SSH servers, use the command:

```
awplus# show crypto key pubkey-chain knownhosts
```

To display the key data of the first entry in the known host data, use the command:

```
awplus# show crypto key pubkey-chain knownhosts 1
```

Output Figure 58-2: Example output from the **show crypto key public-chain knownhosts** command

```
No    Hostname        Type Fingerprint
------------------------------------------------------------------------
1     172.16.23.1     rsa  c8:33:b1:fe:6f:d3:8c:81:4e:f7:2a:aa:a5:be:df:18
2     172.16.23.10    rsa  c4:79:86:65:ee:a0:1d:a5:6a:e8:fd:1d:d3:4e:37:bd

                      rsa1 af:4e:b4:a2:26:24:6d:65:20:32:d9:6f:32:06:ba:57
```

Table 2: Parameters in the output of the **show crypto key public-chain knownhosts** command

Parameter	Description
`No`	Number ID of the key.
`Hostname`	Host name of the known SSH server.
`Type`	The algorithm used to generate the key.
`Fingerprint`	Checksum value for the public key.

Related commands crypto key pubkey-chain knownhosts

Command changes Version 5.4.6-2.1: VRF-lite support added.

show crypto key pubkey-chain userkey

Overview This command displays the public keys registered with the SSH server for SSH users. These keys allow remote users to access the device using public key authentication. By using public key authentication, users can access the SSH server without providing password.

Syntax

```
show crypto key pubkey-chain userkey <username> [<1-65535>]
```

Parameter	Description
<username>	User name of the remote SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
<1-65535>	Key identifier for a specific key.

Default Display all keys.

Mode User Exec, Privileged Exec and Global Configuration

Example To display the public keys for the user `manager` that are registered with the SSH server, use the command:

```
awplus# show crypto key pubkey-chain userkey manager
```

Output Figure 58-3: Example output from the **show crypto key public-chain userkey** command

```
No Type Bits Fingerprint
-----------------------------------------------------------------
1  dsa  1024 2b:cc:df:a8:f8:2e:8f:a4:a5:4f:32:ea:67:29:78:fd
2  rsa  2048 6a:ba:22:84:c1:26:42:57:2c:d7:85:c8:06:32:49:0e
```

Table 3: Parameters in the output of the **show crypto key userkey** command

Parameter	Description
`No`	Number ID of the key.
`Type`	The algorithm used to generate the key.
`Bits`	Length in bits of the key.
`Fingerprint`	Checksum value for the key.

show crypto key userkey

Overview This command displays the public keys created on this device for the specified SSH user.

Syntax

```
show crypto key userkey <username> [dsa|rsa|rsa1]
```

Parameter	Description
<username>	User name of the local SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.
`dsa`	Displays the DSA public key.
`rsa`	Displays the RSA public key used for SSH version 2 connections.
`rsa1`	Displays the RSA key used for SSH version 1 connections.

Mode User Exec, Privileged Exec and Global Configuration

Examples To show the public key generated for the user, use the command:

```
awplus# show crypto key userkey manager
```

To store the RSA public key generated for the user manager to the file “user.pub”, use the command:

```
awplus# show crypto key userkey manager rsa > manager-rsa.pub
```

Output Figure 58-4: Example output from the **show crypto key userkey** command

```
Type Bits   Fingerprint
-----------------------------------------------------------

show running-config ssh

Overview This command displays the current running configuration of Secure Shell (SSH).

Syntax

```
show running-config ssh
```

Mode Privileged Exec and Global Configuration

Example To display the current configuration of SSH, use the command:

```
awplus# show running-config ssh
```

Output Figure 58-5: Example output from the **show running-config ssh** command

```
!
ssh server session-timeout 600
ssh server login-timeout 30
ssh server allow-users manager 192.168.1.*
ssh server allow-users john
ssh server deny-user john*.a-company.com
ssh server
```

Table 5: Parameters in the output of the **show running-config ssh** command

Parameter	Description
`ssh server`	SSH server is enabled.
`ssh server v2`	SSH server is enabled and only support SSHv2.
`ssh server<port>`	SSH server is enabled and listening on the specified TCP port.
`no ssh server scp`	SCP service is disabled.
`no ssh server sftp`	SFTP service is disabled.
`ssh server session-timeout`	Configure the server session timeout.
`ssh server login-timeout`	Configure the server login timeout.
`ssh server max-startups`	Configure the maximum number of concurrent sessions waiting authentication.
`no ssh server authentication password`	Password authentication is disabled.
`no ssh server authentication publickey`	Public key authentication is disabled.

Table 5: Parameters in the output of the **show running-config ssh** command

Parameter	Description
`ssh server allow-users`	Add the user (and hostname) to the allow list.
`ssh server deny-users`	Add the user (and hostname) to the deny list.

Related commands

show ssh

Overview This command displays the active SSH sessions on the device, both incoming and outgoing.

Syntax `show ssh`

Mode User Exec, Privileged Exec and Global Configuration

Example To display the current SSH sessions on the device, use the command:

```
awplus# show ssh
```

Output Figure 58-6: Example output from the **show ssh** command

```
Secure Shell Sessions:
ID  Type Mode   Peer Host    Username   State       Filename
-------------------------------------------------------------
414 ssh  server 172.16.23.1  root       open
456 ssh  client 172.16.23.10 manager    user-auth
459 scp  client 172.16.23.12 root       download    example.awd
463 ssh  client 5ffe:33fe:5632:ffbb:bc35:ddee:0101:ac51
                             manager    user-auth
```

Table 6: Parameters in the output of the **show ssh** command

Parameter	Description
`ID`	Unique identifier for each SSH session.
`Type`	Session type; either SSH, SCP, or SFTP.
`Mode`	Whether the device is acting as an SSH client (client) or SSH server (server) for the specified session.
`Peer Host`	The hostname or IP address of the remote server or client.
`Username`	Login user name of the server.

Table 6: Parameters in the output of the **show ssh** command (cont.)

Parameter	Description	
State	The current state of the SSH session. One of:	
	connecting	The device is looking for a remote server.
	connected	The device is connected to the remote server.
	accepted	The device has accepted a new session.
	host-auth	host-to-host authentication is in progress.
	user-auth	User authentication is in progress.
	authenticated	User authentication is complete.
	open	The session is in progress.
	download	The user is downloading a file from the device.
	upload	The user is uploading a file from the device.
	closing	The user is terminating the session.
	closed	The session is closed.
Filename	Local filename of the file that the user is downloading or uploading.	

Related commands clear ssh

show ssh client

Overview This command displays the current configuration of the Secure Shell client.

Syntax

```
show ssh client
```

Mode User Exec, Privileged Exec and Global Configuration

Example To display the current configuration for SSH clients on the login shell, use the command:

```
awplus# show ssh client
```

Output Figure 58-7: Example output from the **show ssh client** command

```
Secure Shell Client Configuration
-----------------------------------------------------------------
Port                            : 22
Version                         : 2,1
Connect Timeout                 : 30 seconds
Session Timeout                 : 0 (off)
Debug                           : NONE
```

Table 7: Parameters in the output of the **show ssh client** command

Parameter	Description
`Port`	SSH server TCP port where the SSH client connects to. The default is port 22.
`Version`	SSH server version; either "1", "2" or "2,1".
`Connect Timeout`	Time in seconds that the SSH client waits for an SSH session to establish. If the value is 0, the connection is terminated when it reaches the TCP timeout.
`Debug`	Whether debugging is active on the client.

Related commands show ssh server

```

Table 8: Parameters in the output of the **show ssh server** command

Parameter	Description
SSH Server	Whether the Secure Shell server is enabled or disabled.
Port	TCP port where the Secure Shell server listens for connections. The default is port 22.
Version	SSH server version; either '1', '2' or '2,1'.
Services	List of the available Secure Shell service; one or more of SHELL, SCP or SFTP.
Authentication	List of available authentication methods.

Table 8: Parameters in the output of the **show ssh server** command (cont.)

Parameter	Description
`Login Timeout`	Time (in seconds) that the SSH server will wait the SSH session to establish. If the value is 0, the client login will be terminated when TCP timeout reaches.
`Idle Timeout`	Time (in seconds) that the SSH server will wait to receive data from the SSH client. The server disconnects if this timer limit is reached. If set at 0, the idle timer remains off.
`Maximum Startups`	The maximum number of concurrent connections that are waiting authentication. The default is 10.
`Debug`	Whether debugging is active on the server.
`Ciphers`	The current ciphers in use.

```

Output Figure 58-9: Example output from the **show ssh server allow-users** command

```
Username          Remote Hostname (pattern)
----------------- ------------------------------
awplus            192.168.*
john
manager           *.alliedtelesis.com
```

Table 9: Parameters in the output of the **show ssh server allow-users** command

Parameter	Description
`Username`	User name that is allowed to access the SSH server.
`Remote Hostname (pattern)`	IP address or hostname pattern of the remote client. The user is allowed requests from a host that matches this pattern. If no hostname is specified, the user is allowed from all hosts.

Related commands

ssh server allow-users

ssh server deny-users

show ssh server deny-users

Overview This command displays the user entries in the deny list of the SSH server. The user in the deny list is rejected to access the SSH server. If a user is not included in the access list of the SSH server, the user is also rejected.

Syntax

```
show ssh server deny-users
```

Mode User Exec, Privileged Exec and Global Configuration

Example To display the user entries in the deny list of the SSH server, use the command:

```
awplus# show ssh server deny-users
```

Output Figure 58-10: Example output from the **show ssh server deny-users** command

```
Username          Remote Hostname (pattern)
----------------- ------------------------------
john              *.b-company.com
manager           192.168.2.*
```

Table 10: Parameters in the output of the **show ssh server deny-user** command

Parameter	Description
`Username`	The user that this rule applies to.
`Remote Hostname (pattern)`	IP address or hostname pattern of the remote client. The user is denied requests from a host that matches this pattern. If no hostname is specified, the user is denied from all hosts.

Related commands

ssh server allow-users

ssh server deny-users

ssh

Overview Use this command to initiate a Secure Shell connection to a remote SSH server.

If the server requests a password to login, you need to type in the correct password at the "Password:" prompt.

An SSH client identifies the remote SSH server by its public key registered on the client device. If the server identification is changed, server verification fails. If the public key of the server has been changed, the public key of the server must be explicitly added to the known host database.

NOTE: *A hostname specified with SSH cannot begin with a hyphen (-) character.*

Syntax

```
ssh [ip|ipv6] [user <username>|port <1-65535>|version {1|2}]
<remote-device> [<command>]
```

Syntax (VRF-lite) If the platform supports multicast for VRFs then specifying a VRF name the command will take effect on that VRF and not specifying a VRF will do it for the global VRF.

```
ssh vrf <vrf-name> [ip|ipv6] [user <username>|port
<1-65535>|version {1|2}] <remote-device> [<command>]
```

Parameter	Description	
`vrf`	Apply the command to the specified VRF instance.	
<vrf-name>	The name of the VRF instance.	
`ip`	Specify IPv4 SSH.	
`ipv6`	Specify IPv6 SSH.	
`user`	Login user. If user is specified, the username is used for login to the remote SSH server when user authentication is required. Otherwise the current user name is used.	
	<username>	User name to login on the remote server.
`port`	SSH server port. If port is specified, the SSH client connects to the remote SSH server with the specified TCP port. Otherwise, the client port configured by "ssh client" command or the default TCP port (22) is used.	
	<1-65535>	TCP port.
`version`	SSH client version. If version is specified, the SSH client supports only the specified SSH version. By default, SSH client uses SSHv2 first. If the server does not support SSHv2, it will try SSHv1. The default version can be configured by "ssh client" command.	
	1	Use SSH version 1.
	2	Use SSH version 2.

Parameter	Description
<remote-device>	IPv4/IPv6 address or hostname of a remote server. The address is in the format A.B.C.D for an IPv4 address, or in the format X:X::X:X for an IPv6 address. Note that a hostname specified with SSH cannot begin with a hyphen (-) character.
<command>	A command to execute on the remote server. If a command is specified, the command is executed on the remote SSH server and the session is disconnected when the remote command finishes.

Mode User Exec and Privileged Exec

Examples To login to the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 as user "manager", use the command:

```
awplus# ssh ip user manager 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 that is listening on TCP port 2000, use the command:

```
awplus# ssh port 2000 192.0.2.5
```

To login to the remote SSH server with "example_host" using an IPv6 session, use the command:

```
awplus# ssh ipv6 example_host
```

To run the **cmd** command on the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5 cmd
```

Example (VRF-lite) To login to the remote SSH server at 192.168.1.1 on VRF "red", use the command:

```
awplus# ssh vrf red 192.168.1.1
```

Related commands

debug ssh client

ssh client

Command changes Version 5.4.6-2.1: VRF-lite support added for AR-Series devices.

Version 5.4.8-1.2: secure mode syntax added for x220, x930, x550, XS900MX.

Version 5.4.8-2.1: secure mode syntax added for x950, SBx908 GEN2.

ssh client

Overview This command modifies the default configuration parameters of the Secure Shell (SSH) client. The configuration is used for any SSH client on the device to connect to remote SSH servers. Any parameters specified on SSH client explicitly override the default configuration parameters.

The change affects the current user shell only. When the user exits the login session, the configuration does not persist. This command does not affect existing SSH sessions.

The **no** variant of this command resets configuration parameters of the Secure Shell (SSH) client changed by the ssh client command, and restores the defaults.

This command does not affect the existing SSH sessions.

Syntax

```
ssh client {port <1-65535>|version {1|2}|session-timeout
<0-3600>|connect-timeout <1-600>}
```

```
no ssh client {port|version|session-timeout|connect-timeout}
```

Parameter	Description	
`port`	The default TCP port of the remote SSH server. If an SSH client specifies an explicit port of the server, it overrides the default TCP port. Default: 22	
	<1-65535>	TCP port number.
`version`	The SSH version used by the client for SSH sessions. The SSH client supports both version 2 and version 1 Default: version 2 Note: SSH version 2 is the default SSH version. SSH client supports SSH version 1 if SSH version 2 is not configured using a ssh version command.	
	1	SSH clients on the device supports SSH version 1 only.
	2	SSH clients on the device supports SSH version 2 only
`session-timeout`	The global session timeout for SSH sessions. If the session timer lapses since the last time an SSH client received data from the remote server, the session is terminated. If the value is 0, then the client does not terminate the session. Instead, the connection is terminated when it reaches the TCP timeout. Default: 0 (session timer remains off)	
	<0-3600>	Timeout in seconds.

Parameter	Description
`connect-timeout`	The maximum time period that an SSH session can take to become established. The SSH client terminates the SSH session if this timeout expires and the session is still not established. Default: 30
	<1-600> Timeout in seconds.

Mode Privileged Exec

Examples To configure the default TCP port for SSH clients to 2200, and the session timer to 10 minutes, use the command:

```
awplus# ssh client port 2200 session-timeout 600
```

To configure the connect timeout of SSH client to 10 seconds, use the command:

```
awplus# ssh client connect-timeout 10
```

To restore the connect timeout to its default, use the command:

```
awplus# no ssh client connect-timeout
```

Related commands show ssh client

ssh

ssh server

Overview Use this command to modify the configuration of the SSH server. Changing these parameters affects new SSH sessions connecting to the device.

Use the **no** variant of this command to restore the configuration of a specified parameter to its default. The change affects the SSH server immediately if the server is running. Otherwise, the configuration is used when the server starts.

To enable the SSH server, use the service ssh command.

Syntax

```
ssh server {[v1v2|v2only]|<1-65535>}
ssh server {[session-timeout <0-3600>] [login-timeout <1-600>]
[max-startups <1-128>]}
no ssh server {[session-timeout] [login-timeout]
[max-startups]}
```

Parameter	Description
v1v2	Supports both SSHv2 and SSHv1client connections. Default: v1v2
v2only	Supports SSHv2 client connections only.
<1-65535>	The TCP port number that the server listens to for incoming SSH sessions. Default: 22
session-timeout	The maximum time period that the server waits before deciding that a session is inactive and should be terminated. The server considers the session inactive when it has not received any data from the client, and when the client does not respond to keep alive messages. Default: 0 (session timer remains off).
	<0-3600> Timeout in seconds.
login-timeout	The maximum time period the server waits before disconnecting an unauthenticated client. Default: 60
	<1-600> Timeout in seconds.
max-startups	The maximum number of concurrent unauthenticated connections the server accepts. When the number of SSH connections awaiting authentication reaches the limit, the server drops any additional connections until authentication succeeds or the login timer expires for a connection. Default: 10
	<1-128> Number of sessions.

Mode Global Configuration

Examples

To configure the session timer of SSH server to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server login-timeout 600
```

To configure the login timeout of SSH server to 30 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server login-timeout 30
```

To limit the number of SSH client connections waiting for authentication from SSH server to 3, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server max-startups 3
```

To set max-startups parameters of SSH server to the default configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server max-startups
```

To support the Secure Shell server with TCP port 2200, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server 2200
```

To force the Secure Shell server to support SSHv2 only, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server v2only
```

To support both SSHv2 and SSHv1, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server v1v2
```

Related commands

show ssh server

ssh client

ssh server allow-users

Overview This command adds a username pattern to the allow list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is accepted.

When there are no registered users in the server's database of allowed users, the SSH server does not accept SSH sessions even when enabled.

SSH server also maintains the deny list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.

The **no** variant of this command deletes a username pattern from the allow list of the SSH server. To delete an entry from the allow list, the username and hostname pattern should match exactly with the existing entry.

Syntax

```
ssh server allow-users <username-pattern> [<hostname-pattern>]
no ssh server allow-users <username-pattern>
[<hostname-pattern>]
```

Parameter	Description
<username-pattern>	The username pattern that users can match to. An asterisk acts as a wildcard character that matches any string of characters.
<hostname-pattern>	The host name pattern that hosts can match to. If specified, the server allows the user to connect only from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters.

Mode Global Configuration

Examples To allow the user `john` to create an SSH session from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john
```

To allow the user `john` to create an SSH session from a range of IP address (from 192.168.1.1 to 192.168.1.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john 192.168.1.*
```

To allow the user `john` to create a SSH session from `a-company.com` domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john *.a-company.com
```

To delete the existing user entry `john 192.168.1.*` in the allow list, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server allow-users john 192.168.1.*
```

Related commands

show running-config ssh

show ssh server allow-users

ssh server deny-users

ssh server authentication

Overview This command enables RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **ssh server authentication** command to enable password authentication for users. Apply the **publickey** keyword with the **ssh server authentication** command to enable RSA public-key authentication for users.

Use the **no** variant of this command to disable RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **no ssh authentication** command to disable password authentication for users. Apply the required **publickey** keyword with the **no ssh authentication** command to disable RSA public-key authentication for users.

Syntax

```
ssh server authentication {password|publickey}
no ssh server authentication {password|publickey}
```

Parameter	Description
`password`	Specifies user password authentication for SSH server.
`publickey`	Specifies user publickey authentication for SSH server.

Default Both RSA public-key authentication and password authentication are enabled by default.

Mode Global Configuration

Usage For password authentication to authenticate a user, password authentication for a user must be registered in the local user database or on an external RADIUS server, before using the **ssh server authentication password** command.

For RSA public-key authentication to authenticate a user, a public key must be added for the user, before using the **ssh server authentication publickey** command.

Examples To enable `password` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication password
```

To enable `publickey` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication publickey
```

To disable `password` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server authentication password
```

To disable `publickey` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server authentication publickey
```

Related commands

crypto key pubkey-chain userkey

service ssh

show ssh server

ssh server deny-users

Overview This command adds a username pattern to the deny list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is rejected.

SSH server also maintains the allow list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.

If a hostname pattern is specified, the user is denied from the hosts matching the pattern.

The **no** variant of this command deletes a username pattern from the deny list of the SSH server. To delete an entry from the deny list, the username and hostname pattern should match exactly with the existing entry.

Syntax

```
ssh server deny-users <username-pattern> [<hostname-pattern>]
no ssh server deny-users <username-pattern>
[<hostname-pattern>]
```

Parameter	Description
<username-pattern>	The username pattern that users can match to. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen, full stop and asterisk symbols. An asterisk acts as a wildcard character that matches any string of characters.
<hostname-pattern>	The host name pattern that hosts can match to. If specified, the server denies the user only when they connect from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters.

Mode Global Configuration

Examples To deny the user `john` to access SSH login from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john
```

To deny the user john to access SSH login from a range of IP address (from 192.168.2.1 to 192.168.2.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john 192.168.2.*
```

To deny the user `john` to access SSH login from `b-company.com` domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john*.b-company.com
```

To delete the existing user entry `john 192.168.2.*` in the deny list, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server deny-users john 192.168.2.*
```

Related commands

show running-config ssh

show ssh server deny-users

ssh server allow-users

ssh server max-auth-tries

Overview Use this command to specify the maximum number of SSH authentication attempts that the device will allow.

Use the **no** variant of this command to return the maximum number of attempts to its default value of 6.

Syntax

```
ssh server max-auth-tries <1-32>
no ssh server max-auth-tries
```

Parameter	Description
<1-32>	Maximum number of SSH authentication attempts the device will allow.

Default 6 attempts

Mode Global Configuration

Usage By default, users must wait one second after a failed login attempt before trying again. You can increase this gap by using the command aaa login fail-delay.

Example To set the maximum number of SSH authentication attempts to 3, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server max-auth-tries 3
```

Related commands show ssh server

ssh server resolve-host

Overview This command enables resolving an IP address from a host name using a DNS server for client host authentication.

The **no** variant of this command disables this feature.

Syntax

```
ssh server resolve-hosts
no ssh server resolve-hosts
```

Default This feature is disabled by default.

Mode Global Configuration

Usage notes Your device has a DNS Client that is enabled automatically when you add a DNS server to your device. Use the ip name-server command to add a DNS server to the list of servers that the device queries.

Example To resolve a host name using a DNS server, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server resolve-hosts
```

Related commands

ip name-server

show ssh server

ssh server allow-users

ssh server deny-users

ssh server scp

Overview This command enables the Secure Copy (SCP) service on the SSH server. Once enabled, the server accepts SCP requests from remote clients.

You must enable the SSH server as well as this service before the device accepts SCP connections. The SCP service is enabled by default as soon as the SSH server is enabled.

The **no** variant of this command disables the SCP service on the SSH server. Once disabled, SCP requests from remote clients are rejected.

Syntax

```
ssh server scp
no ssh server scp
```

Mode Global Configuration

Examples To enable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server scp
```

To disable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server scp
```

Related commands show running-config ssh

show ssh server

ssh server secure-ciphers

Overview Use this command to set the SSH server to only negotiate ciphers regarded as current-best-practice.

Use the **no** variant of this command to return to the default setting of not set.

Syntax

```
ssh server secure-ciphers
no ssh server secure-ciphers
```

Parameter	Description
`secure-ciphers`	Negotiate only with ciphers that are still considered current-best-practice and secure

Default Not set

Mode Global Configuration

Usage notes This command uses the same cipher string as the OpenSSH default, which excludes CBC, as CBC has been regarded as a weak cipher.

When the command is used, the ciphers included are: chacha20-poly1305@openssh.com, aes128-ctr, aes192-ctr, aes256-ctr, aes128-gcm@openssh.com, aes256-gcm@openssh.com

Example To configure the SSH server to only negotiate ciphers regarded as current best practice, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-ciphers
```

Related commands show ssh server

Command changes Version 5.5.0-1.1: command added

ssh server sftp

Overview This command enables the Secure FTP (SFTP) service on the SSH server. Once enabled, the server accepts SFTP requests from remote clients.

You must enable the SSH server as well as this service before the device accepts SFTP connections. The SFTP service is enabled by default as soon as the SSH server is enabled. If the SSH server is disabled, SFTP service is unavailable.

The **no** variant of this command disables SFTP service on the SSH server. Once disabled, SFTP requests from remote clients are rejected.

Syntax

```
ssh server sftp
no ssh server sftp
```

Mode Global Configuration

Examples To enable the SFTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server sftp
```

To disable the SFTP service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server sftp
```

59 Trigger Commands

Introduction

Overview

This chapter provides an alphabetical reference for commands used to configure Triggers. For more information, see the Triggers Feature Overview and Configuration Guide.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Command List

- "active (trigger)" on page 3134
- "day" on page 3135
- "debug trigger" on page 3137
- "description (trigger)" on page 3138
- "repeat" on page 3139
- "script" on page 3140
- "show debugging trigger" on page 3142
- "show running-config trigger" on page 3143
- "show trigger" on page 3144
- "test" on page 3149
- "time (trigger)" on page 3150
- "trap" on page 3152
- "trigger" on page 3153
- "trigger activate" on page 3154
- "type atmf node" on page 3155
- "type cpu" on page 3158
- "type interface" on page 3159
- "type linkmon-probe" on page 3160

- "type log" on page 3162
- "type memory" on page 3163
- "type periodic" on page 3164
- "type ping-poll" on page 3165
- "type reboot" on page 3166
- "type time" on page 3167
- "type usb" on page 3168
- "undebug trigger" on page 3169

active (trigger)

Overview This command enables a trigger. This allows the trigger to activate when its trigger conditions are met.

The **no** variant of this command disables a trigger. While in this state the trigger cannot activate when its trigger conditions are met.

Syntax

```
active
no active
```

Default Active, which means that triggers are enabled by default

Mode Trigger Configuration

Usage notes Configure a trigger first before you use this command to activate it.

For information about configuring a trigger, see the Triggers_Feature Overview and Configuration Guide.

Examples To enable trigger 172, so that it can activate when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 172
awplus(config-trigger)# active
```

To disable trigger 182, preventing it from activating when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 182
awplus(config-trigger)# no active
```

Related commands

show trigger

trigger

trigger activate

day

Overview This command specifies the days or date that the trigger can activate on. You can specify one of:

- A specific date
- A specific day of the week
- A list of days of the week
- A day of any month of any year
- A day of a specific month in any year
- Every day

By default, the trigger can activate on any day.

Syntax

```
day every-day
day <1-31>
day <1-31> <month>
day <1-31> <month> <year>
day <weekday>
```

Parameter	Description
`every-day`	Sets the trigger so that it can activate on any day.
<1-31>	Day of the month the trigger is permitted to activate on.
<month>	Sets the month that the trigger is permitted to activate on. Valid keywords are: **january, february, march, april, may, june, july, august, september, october, november**, and **december**.
<year>	Sets the year that the trigger is permitted to activate in, between 2000 and 2035.
<weekday>	Sets the days of the week that the trigger can activate on. You can specify one or more week days in a space separated list. Valid keywords are: **monday, tuesday, wednesday, thursday, friday, saturday**, and **sunday**.

Default **every-day**, so by default, the trigger can activate on any day.

Mode Trigger Configuration

Usage notes For example trigger configurations that use the **day** command, see "Restrict Internet Access" and "Turn off Power to Port LEDs" in the Triggers Feature Overview and Configuration Guide.

Examples

To permit trigger 55 to activate on the 1 June 2019, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 55
awplus(config-trigger)# day 1 jun 2019
```

To permit trigger 12 to activate on Mondays, Wednesdays and Fridays, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# day monday wednesday friday
```

To permit trigger 17 to activate on the 5th day of any month, in any year, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 17
awplus(config-trigger)# day 5
```

To permit trigger 6 to activate on the 20th day of September, in any year, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 6
awplus(config-trigger)# day 20 september
```

To permit trigger 14 to activate on the 1st day of each month, in any year, at 11.00am, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 14
awplus(config-trigger)# day 1
awplus(config-trigger)# type time 11:00
```

Related commands

show trigger

type time

trigger

Command changes

Version 5.4.8-2.1: day of the month functionality added

debug trigger

Overview This command enables trigger debugging. This generates detailed messages about how your device is processing the trigger commands and activating the triggers.

The **no** variant of this command disables trigger debugging.

Syntax

```
debug trigger
no debug trigger
```

Mode Privilege Exec

Examples To start trigger debugging, use the command:

```
awplus# debug trigger
```

To stop trigger debugging, use the command:

```
awplus# no trigger
```

Related commands

show debugging trigger

show trigger

test

trigger

undebug trigger

description (trigger)

Overview This command adds an optional description to help you identify the trigger. This description is displayed in show command outputs and log messages.

The **no** variant of this command removes a trigger's description. The show command outputs and log messages stop displaying a description for this trigger.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	A word or phrase that uniquely identifies this trigger or its purpose. Valid characters are any printable character and spaces, up to a maximum of 40 characters.

Mode Trigger Configuration

Examples To give trigger 240 the description `daily status report`, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 240
awplus(config-trigger)# description daily status report
```

To remove the description from trigger 36, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 36
awplus(config-trigger)# no description
```

Related commands

show trigger

test

trigger

repeat

Overview This command specifies the number of times that a trigger is permitted to activate. This allows you to specify whether you want the trigger to activate:

- only the first time that the trigger conditions are met
- a limited number of times that the trigger conditions are met
- an unlimited number of times

Once the trigger has reached the limit set with this command, the trigger remains in your configuration but cannot be activated. Use the **repeat** command again to reset the trigger so that it is activated when its trigger conditions are met.

By default, triggers can activate an unlimited number of times. To reset a trigger to this default, specify either **yes** or **forever**.

Syntax

```
repeat {forever|no|once|yes|<1-4294967294>}
```

Parameter	Description
`yes|forever`	The trigger repeats indefinitely, or until disabled.
`no|once`	The trigger activates only once.
<1-4292967294>	The trigger repeats the specified number of times.

Mode Trigger Configuration

Examples To allow trigger 21 to activate only once, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 21
awplus(config-trigger)# repeat no
```

To allow trigger 22 to activate an unlimited number of times whenever its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 22
awplus(config-trigger)# repeat forever
```

To allow trigger 23 to activate only the first 10 times the conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 23
awplus(config-trigger)# repeat 10
```

Related commands show trigger

trigger

script

Overview This command specifies one or more scripts that are to be run when the trigger activates. You can add up to five scripts to a single trigger.

The sequence in which the trigger runs the scripts is specified by the number you set before the name of the script file. One script is executed completely before the next script begins.

Scripts may be either ASH shell scripts, indicated by a **.sh** filename extension suffix, or AlliedWare Plus™ scripts, indicated by a **.scp** filename extension suffix. AlliedWare Plus™ scripts only need to be readable.

The **no** variant of this command removes one or more scripts from the trigger's script list. The scripts are identified by either their name, or by specifying their position in the script list. The **all** parameter removes all scripts from the trigger.

Syntax

```
script <1-5> {<filename>}
no script {<1-5>|<filename>|all}
```

Parameter	Description
<1-5>	The position of the script in execution sequence. The trigger runs the lowest numbered script first.
<filename>	The path to the script file.

Mode Trigger Configuration

Examples To configure trigger 71 to run the script flash:/cpu_trig.sh in position 3 when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# script 3 flash:/cpu_trig.sh
```

To configure trigger 99 to run the scripts **flash:reconfig.scp**, **flash:cpu_trig.sh** and **flash:email.scp** in positions 2, 3 and 5 when the trigger activates, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 99
awplus(config-trigger)# script 2 flash:/reconfig.scp 3
flash:/cpu_trig.sh 5 flash:/email.scp
```

To remove the scripts 1, 3 and 4 from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script 1 3 4
```

To remove the script flash:/cpu_trig.sh from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script flash:/cpu_trig.sh
```

To remove all the scripts from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script all
```

show debugging trigger

Overview This command displays the current status for trigger utility debugging. Use this command to show when trigger debugging has been turned on or off from the debug trigger command.

Syntax

```
show debugging trigger
```

Mode User Exec and Privileged Exec

Example To display the current configuration of trigger debugging, use the command:

```
awplus# show debugging trigger
```

Output Figure 59-1: Example output from the **show debugging trigger** command

```
awplus#debug trigger
awplus#show debugging trigger
Trigger debugging status:
  Trigger debugging is on

awplus#no debug trigger
awplus#show debugging trigger
Trigger debugging status:
  Trigger debugging is off
```

Related commands debug trigger

show running-config trigger

Overview This command displays the current running configuration of the trigger utility.

Syntax

```
show running-config trigger
```

Mode Privileged Exec

Example To display the current configuration of the trigger utility, use the command:

```
awplus# show running-config trigger
```

Figure 59-2: Example output from the **show running-config trigger** command

```
 trigger 1
  type card in

type usb in
 trigger 2

type usb out
 !
```

Related commands show trigger

show trigger

Overview This command displays configuration and diagnostic information about the triggers configured on the device. Specify the **show trigger** command without any options to display a summary of the configuration of all triggers.

Syntax

```
show trigger [<1-250>|counter|full]
```

Parameter	Description
<1-250>	Displays detailed information about a specific trigger, identified by its trigger ID.
`counter`	Displays statistical information about all triggers.
`full`	Displays detailed information about all triggers.

Mode Privileged Exec

Example To get summary information about all triggers, use the following command:

```
awplus# show trigger
```

Table 59-1: Example output from **show trigger**

```
awplus#show trigger
TR# Type & Details       Name                Ac Te Repeat     #Scr Days/Date
-------------------------------------------------------------------------------
001 CPU (80% any)        Busy CPU            Y  N  5           1   smtwtfs
005 Periodic (30 min)    Regular status check Y  N  Continuous  1   -mtwtf-
007 Memory (85% up)      High mem usage      Y  N  8           1   smtwtfs
011 Time (00:01)         Weekend access      Y  N  Continuous  1   ------s
013 Reboot                                   Y  N  Continuous  2   smtwtfs
019 Ping-poll (5 up)     Connection to svr1  Y  N  Continuous  1   smtwtfs
-------------------------------------------------------------------------------
```

Table 59-2: Parameters in the output of **show trigger**

Parameter	Description
`TR#`	Trigger identifier (ID).
`Type & Details`	The trigger type, followed by the trigger details in brackets.
`Name`	Descriptive name of the trigger configured with the description (trigger) command.
`Ac`	Whether the trigger is active (Y), or inactive (N).
`Te`	Whether the trigger is in test mode (Y) or not (N).

Table 59-2: Parameters in the output of **show trigger** (cont.)

Parameter	Description
Repeat	Whether the trigger repeats continuously, and if not, the configured repeat count for the trigger. To see the number of times a trigger has activated, use the **show trigger** <1-250> command.
#Scr	Number of scripts associated with the trigger.
Days/Date	Days or date when the trigger may be activated. For the days options, the days are shown as a seven character string representing Sunday to Saturday. A hyphen indicates days when the trigger cannot be activated.

To display detailed information about trigger 3, use the command:

```
awplus# show trigger 3
```

Figure 59-3: Example output from **show trigger** for a specific trigger

```
awplus#show trigger 1

Table 60: Parameters in the output of **show trigger full** and **show trigger** for a specific trigger

Parameter	Description
`Trigger`	The ID of the trigger.
`Name`	Descriptive name of the trigger.
`Type and details`	The trigger type and its activation conditions.
`Days`	The days on which the trigger is permitted to activate.

Table 60: Parameters in the output of **show trigger full** and **show trigger** for a specific trigger (cont.)

Parameter	Description
Date	The date on which the trigger is permitted to activate. Only displayed if configured, in which case it replaces "Days".
Active	Whether or not the trigger is permitted to activate.
Test	Whether or not the trigger is operating in diagnostic mode.
Trap	Whether or not the trigger is enabled to send SNMP traps.
Repeat	Whether the trigger repeats an unlimited number of times (Continuous) or for a set number of times. When the trigger can repeat only a set number of times, then the number of times the trigger has been activated is displayed in brackets.
Modified	The date and time of the last time that the trigger was modified.
Number of activations	Number of times the trigger has been activated since the last restart of the device.
Last activation	The date and time of the last time that the trigger was activated.
Number of scripts	How many scripts are associated with the trigger, followed by the names of the script files in the order in which they run.

To display counter information about all triggers use the command:

```
awplus# show trigger counter
```

Figure 59-4: Example output from **show trigger counter**

```
awplus# show trigger counter
Trigger Module Counters

-------------------------------------------------------
```

Related commands

active (trigger)

debug trigger

script

trigger

trigger activate

test

Overview This command puts the trigger into a diagnostic mode. In this mode the trigger may activate but when it does it will not run any of the trigger's scripts. A log message will be generated to indicate when the trigger has been activated.

The **no** variant of this command takes the trigger out of diagnostic mode, restoring normal operation. When the trigger activates, the scripts associated with the trigger will be run, as normal.

Syntax

```
test
no test
```

Mode Trigger Configuration

Usage notes Configure a trigger first before you use this command to diagnose it. For information about configuring a trigger, see the Triggers_Feature Overview and Configuration Guide.

Examples To put trigger 5 into diagnostic mode, where no scripts will be run when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# test
```

To take trigger 205 out of diagnostic mode, restoring normal operation, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no test
```

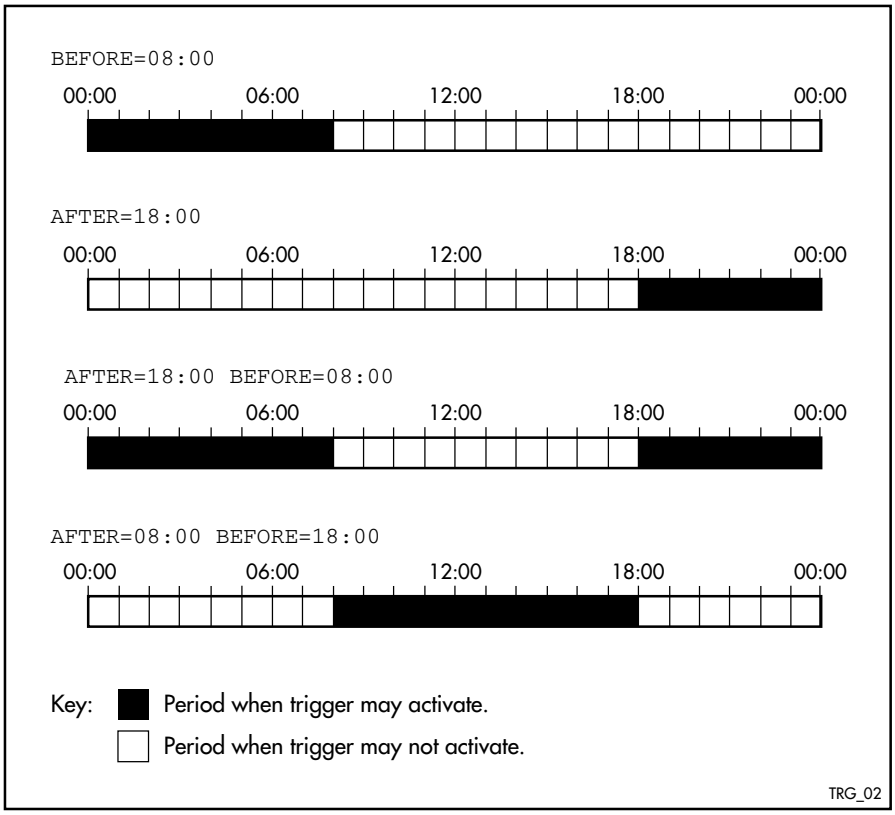
Related commands show trigger

trigger

time (trigger)

Overview This command specifies the time of day when the trigger is permitted to activate. The after parameter specifies the start of a time period that extends to midnight during which trigger may activate. By default the value of this parameter is 00:00:00 (am); that is, the trigger may activate at any time. The **before** parameter specifies the end of a time period beginning at midnight during which the trigger may activate. By default the value of this parameter is 23:59:59; that is, the trigger may activate at any time. If the value specified for **before** is later than the value specified for **after**, a time period from **"** after **"** to **"** before **"** is defined, during which the trigger may activate. This command is not applicable to time triggers (**type time**).

The following figure illustrates how the **before** and **after** parameters operate.



Syntax `time {[after <hh:mm:ss>] [before <hh:mm:ss>]}`

Parameter	Description
`after`*<hh:mm:ss>*	The earliest time of day when the trigger may be activated.
`before`*<hh:mm:ss>*	The latest time of day when the trigger may be activated.

Mode Trigger Configuration

Usage notes

For example trigger configurations that use the **time (trigger)** command, see "Restrict Internet Access" and "Turn off Power to Port LEDs" in the Triggers Feature Overview and Configuration Guide.

Examples

To allow trigger 63 to activate between midnight and 10:30am, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 63
awplus(config-trigger)# time before 10:30:00
```

To allow trigger 64 to activate between 3:45pm and midnight, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 64
awplus(config-trigger)# time after 15:45:00
```

To allow trigger 65 to activate between 10:30am and 8:15pm, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 65
awplus(config-trigger)# time after 10:30:00 before 20:15:00
```

Related commands

show trigger

trigger

trap

Overview This command enables the specified trigger to send SNMP traps.

Use the **no** variant of this command to disable the sending of SNMP traps from the specified trigger.

Syntax

```
trap
no trap
```

Default SNMP traps are enabled by default for all defined triggers.

Mode Trigger Configuration

Usage notes You must configure SNMP before using traps with triggers. For more information, see:

- Support for Allied Telesis Enterprise_MIBs_in_AlliedWare Plus, for information about which MIB objects are supported.
- the SNMP Feature Overview and Configuration_Guide.
- the SNMP Commands chapter.

Since SNMP traps are enabled by default for all defined triggers, a common usage will be for the **no** variant of this command to disable SNMP traps from a specified trap if the trap is only periodic. Refer in particular to AT-TRIGGER-MIB in the Support for Allied Telesis Enterprise_MIBs_in AlliedWare Plus for further information about the relevant SNMP MIB.

Examples To enable SNMP traps to be sent from trigger 5, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# trap
```

To disable SNMP traps being sent from trigger 205, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no trap
```

Related commands trigger

show trigger

trigger

Overview This command is used to access the Trigger Configuration mode for the specified trigger. Once Trigger Configuration mode has been entered the trigger type information can be configured and the trigger scripts and other operational parameters can be specified. At a minimum the trigger type information must be specified before the trigger can become active.

The **no** variant of this command removes a specified trigger and all configuration associated with it.

Syntax

```
trigger <1-250>
no trigger <1-250>
```

Parameter	Description
<1-250>	A trigger ID.

Mode Global Configuration

Examples To enter trigger configuration mode for trigger 12, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 12
```

To completely remove all configuration associated with trigger 12, use the commands:

```
awplus# configure terminal
awplus(config)# no trigger 12
```

Related commands show trigger

trigger activate

trigger activate

Overview This command is used to manually activate a specified trigger from the Privileged Exec mode, which has been configured with the **trigger** command from the Global Configuration mode.

Syntax

```
trigger activate <1-250>
```

Parameter	Description
<1-250>	A trigger ID.

Mode Privileged Exec

Usage notes This command manually activates a trigger without the normal trigger conditions being met.

The trigger is activated even if it has been configured as inactive by using the command **no active**. The scripts associated with the trigger will be executed even if the trigger is in the diagnostic test mode.

Triggers activated manually do not have their repeat counts decremented or their 'last triggered' time updated, and do not result in updates to the '[type] triggers today' counters.

Example To manually activate trigger 12 use the command:

```
awplus# trigger activate 12
```

Related commands

active (trigger)

show trigger

trigger

type atmf node

Overview This command configures a trigger to be activated at an AMF node join event or leave event.

Syntax

```
type atmf node {join|leave}
```

Parameter	Description
join	AMF node join event.
leave	AMF node leave event.

Mode Trigger Configuration

CAUTION: Only configure this trigger on one device because it is a network wide event.

Example 1 To configure trigger 5 to activate at an AMF node leave event, use the following commands. In this example the command is entered on node-1:

```
node1(config)# trigger 5
node1(config-trigger) type atmf node leave
```

Example 2 The following commands will configure trigger 5 to activate if an AMF node join event occurs on any node within the working set:

```
node1# atmf working-set group all
```

This command returns the following display:

```
====================
node1, node2, node3:
====================

Working set join
```

Note that the running the above command changes the prompt from the name of the local node, to the name of the AMF-Network followed, in square brackets, by the number of member nodes in the working set.

```
AMF-Net[3]# conf t
AMF-Net[3](config)# trigger 5
AMF-Net[3](config-trigger)# type atmf node leave
AMF-Net[3](config-trigger)# description “E-mail on AMF Exit”
AMF-Net[3](config-trigger)# active
```

Enter the name of the script to run at the trigger event.

```
AMF-Net[3](config-trigger)# script 1 email_me.scp
AMF-Net[3](config-trigger)# end
```

Display the trigger configurations

```
AMF-Net[3]# show trigger
```

This command returns the following display:

```
=======
node1:
=======

TR# Type & Details     Description          Ac Te Tr Repeat     #Scr Days/Date
-------------------------------------------------------------------------------
001 Periodic (2 min)   Periodic Status Chk  Y  N  Y Continuous  1   smtwtfs
005 ATMF node (leave)  E-mail on ATMF Exit  Y  N  Y Continuous  1   smtwtfs
-------------------------------------------------------------------------------

==============
Node2, Node3,
==============

TR# Type & Details     Description          Ac Te Tr Repeat     #Scr Days/Date
-------------------------------------------------------------------------------
005 ATMF node (leave)  E-mail on ATMF Exit  Y  N  Y Continuous  1   smtwtfs
-------------------------------------------------------------------------------
```

Display the triggers configured on each of the nodes in the AMF Network.

```
AMF-Net[3]# show running-config trigger
```

This command returns the following display:

```
========
Node1:
========

trigger 1
 type periodic 2
 script 1 atmf.scp
trigger 5
 type atmf node leave
description “E-mail on ATMF Exit”
 script 1 email_me.scp
!

============
Node2, Node3:
============

trigger 5
 type atmf node leave
description “E-mail on ATMF Exit”
 script 1 email_me.scp
!
```

Related commands show trigger

type cpu

Overview This command configures a trigger to activate based on CPU usage level. Selecting the **up** option causes the trigger to activate when the CPU usage exceeds the specified usage level. Selecting the **down** option causes the trigger to activate when CPU usage drops below the specified usage level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

Syntax

```
type cpu <1-100> [up|down|any]
```

Parameter	Description
<1-100>	The percentage of CPU usage at which to trigger.
up	Activate when CPU usage exceeds the specified level.
down	Activate when CPU usage drops below the specified level
any	Activate when CPU usage passes the specified level in either direction

Mode Trigger Configuration

Usage notes For an example trigger configuration that uses the **type cpu** command, see "Capture Unusual CPU and RAM Activity" in the Triggers Feature Overview and Configuration Guide.

Examples To configure trigger 28 to be a CPU trigger that activates when CPU usage exceeds 80% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 28
awplus(config-trigger)# type cpu 80 up
```

To configure trigger 5 to be a CPU trigger that activates when CPU usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65
```

or

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65 any
```

Related commands show trigger

trigger

type interface

Overview This command configures a trigger to activate based on the link status of an interface. The trigger can be activated when the interface becomes operational by using the **up** option, or when the interface closes by using the **down** option. The trigger can also be configured to activate when either one of these events occurs by using the **any** option.

Syntax

```
type interface <interface> {up|down|any}
```

Parameter	Description
<interface>	Interface name.
up	Activate when interface becomes operational.
down	Activate when the interface closes.
any	Activate when any interface link status event occurs.

Mode Trigger Configuration

Example To configure trigger 19 to be an interface trigger that activates when port1.0.1 becomes operational, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 19
awplus(config-trigger)# type interface port1.0.1 up
```

Related commands show trigger

trigger

type linkmon-probe

Overview Use this command to create a trigger that will run a script when a Link Health Monitoring probe reports that a link becomes “good”, “bad”, or “unreachable”.

Syntax

```
type linkmon-probe <probename> <profilename>
{good|bad|unreachable|any}
```

Parameter	Description
<probename>	The name of the Link Health Monitoring probe that will be used for executing the trigger.
<profilename>	The name of the Link Health Monitoring performance profile that will be used for determine if the Link Health Monitoring probe is good, bad, or unreachable.
`good`	If the Link Health Monitoring probe becomes 'good' according to the Link Health Monitoring performance profile then the trigger will be executed.
`bad`	If the Link Health Monitoring probe goes 'bad' according to the Link Health Monitoring performance profile then the trigger will be executed.
`unreachable`	If the Link Health Monitoring probe becomes 'unreachable' according to the Link Health Monitoring performance profile then the trigger will be executed.
`any`	If the Link Health Monitoring probe changes state according to the Link Health Monitoring performance profile then the trigger will be executed.

Mode Trigger Configuration

Example When the Link Health Monitoring probes sent to the “test-probe” destination no longer meet the performance profile “test-profile” the link will be deemed “bad”. To create a trigger that will run a script when a Link Health Monitoring probe is deemed “bad”, use the following commands:

```
awplus# trigger 1
awplus(config)# script 1 link-bad.scp
awplus(config)# type linkmon-probe test-probe test-profile bad
```

To create a trigger that will run a script when the link is deemed “good” again, use the following commands:

```
awplus# trigger 2
awplus(config)# script 1 link-good.scp
awplus(config)# type linkmon-probe test-probe test-profile good
```

Related commands trigger

Command changes Version 5.4.8-1.1: command added

type log

Overview Use this command to configure a trigger to activate based on the content of log messages matching a string or regular expression.

Syntax

```
type log <log-message-string>
```

Parameter	Description
<log-message-string>	A string or a regular expression (PCRE) to match a log message or part of a log message.

Default There is no type or log message string set by default.

Mode Trigger Configuration

Usage notes Log type triggers fully support regular expressions using PCRE (Perl-Compatible Regular Expression) syntax.

Only log messages of severity level notice or higher can activate a trigger.

Note that any command executed by the script will generate a log message with level notice, and will include '[SCRIPT]' before the command string. Therefore, if something in the script matches the configured log message trigger string, it will retrigger indefinitely.

Example To configure trigger 6 to activate when a log message of level notice or higher indicates that any port has 'failed', use the commands:

```
awplus# configure terminal
awplus(config)# trigger 6
awplus(config-trigger)# type log port.+ failed
```

Related commands show trigger

trigger

Command changes Version 5.4.7-2.1: command added

type memory

Overview This command configures a trigger to activate based on RAM usage level. Selecting the **up** option causes the trigger to activate when memory usage exceeds the specified level. Selecting the **down** option causes the trigger to activate when memory usage drops below the specified level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

Syntax

```
type memory <1-100> [up|down|any]
```

Parameter	Description
<1-100>	The percentage of memory usage at which to trigger.
up	Activate when memory usage exceeds the specified level.
down	Activate when memory usage drops below the specified level.
any	Activate when memory usage passes the specified level in either direction.

Mode Trigger Configuration

Examples To configure trigger 12 to be a memory trigger that activates when memory usage exceeds 50% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# type memory 50 up
```

To configure trigger 40 to be a memory trigger that activates when memory usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65
```

or

```
awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65 any
```

Related commands show trigger

trigger

type periodic

Overview This command configures a trigger to be activated at regular intervals. The time period between activations is specified in minutes.

Syntax

```
type periodic <1-1440>
```

Parameter	Description
<1-1440>	The number of minutes between activations.

Mode Trigger Configuration

Usage notes A combined limit of 10 triggers of the type periodic and time can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or
periodic
```

For an example trigger configuration that uses the **type periodic** command, see "See Daily Statistics" in the Triggers_Feature Overview and Configuration Guide.

Example To configure trigger 44 to activate periodically at 10 minute intervals use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 44
awplus(config-trigger)# type periodic 10
```

Related commands show trigger

trigger

type ping-poll

Overview This command configures a trigger that activates when Ping Polling identifies that a target device's status has changed. This allows you to run a configuration script when a device becomes reachable or unreachable.

Syntax

```
type ping-poll <1-100> {up|down}
```

Parameter	Description
<1-100>	The ping poll ID.
up	The trigger activates when ping polling detects that the target is reachable.
down	The trigger activates when ping polling detects that the target is unreachable.

Mode Trigger Configuration

Example To configure trigger 106 to activate when ping poll 12 detects that its target device is now unreachable, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 106
awplus(config-trigger)# type ping-poll 12 down
```

Related commands show trigger

trigger

type reboot

Overview This command configures a trigger that activates when your device is rebooted.

Syntax

```
type reboot
```

Mode Trigger Configuration

Example To configure trigger 32 to activate when your device reboots, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 32
awplus(config-trigger)# type reboot
```

Related commands show trigger

trigger

type time

Overview This command configures a trigger that activates at a specified time of day.

Syntax

```
type time <hh:mm>
```

Parameter	Description
<hh:mm>	The time to activate the trigger.

Mode Trigger Configuration

Usage A combined limit of 10 triggers of the type time and type periodic can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or
periodic
```

Example To configure trigger 86 to activate at 15:53, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type time 15:53
```

Related commands show trigger

trigger

type usb

Overview Use this command to configure a trigger that activates on either the removal or the insertion of a USB storage device.

Syntax

```
type usb {in|out}
```

Parameter	Description
`in`	Trigger activates on insertion of a USB storage device.
`out`	Trigger activates on removal of a USB storage device.

Mode Trigger Configuration

Usage notes USB triggers cannot execute script files from a USB storage device.

Examples To configure trigger 1 to activate on the insertion of a USB storage device, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type usb in
```

Related commands

trigger

show running-config trigger

show trigger

undebug trigger

Overview This command applies the functionality of the **no** debug trigger command.

60 Ping-Polling Commands

Introduction

Overview

This chapter provides an alphabetical reference for commands used to configure Ping Polling. For more information, see the Ping Polling Feature Overview and Configuration Guide.

For information on filtering and saving command output, see the "Getting Started with AlliedWare Plus" Feature Overview and Configuration Guide.

Table 60-1: The following table lists the default values when configuring a ping poll

Default	Value
Critical-interval	1 second
Description	No description
Fail-count	5
Length	32 bytes
Normal-interval	30 seconds
Sample-size	5
Source-ip	The IP address of the interface from which the ping packets are transmitted
Time-out	1 second
Up-count	30

Command List

- "active (ping-polling)" on page 3172
- "clear ping-poll" on page 3173
- "critical-interval" on page 3174
- "debug ping-poll" on page 3175

- "description (ping-polling)" on page 3176
- "fail-count" on page 3177
- "ip (ping-polling)" on page 3178
- "length (ping-poll data)" on page 3179
- "normal-interval" on page 3180
- "ping-poll" on page 3181
- "sample-size" on page 3182
- "show counter ping-poll" on page 3184
- "show ping-poll" on page 3186
- "source-ip" on page 3190
- "timeout (ping polling)" on page 3192
- "up-count" on page 3193
- "undebug ping-poll" on page 3194

active (ping-polling)

Overview This command enables a ping-poll instance. The polling instance sends ICMP echo requests to the device with the IP address specified by the ip (ping-polling) command.

By default, polling instances are disabled. When a polling instance is enabled, it assumes that the device it is polling is unreachable.

The **no** variant of this command disables a ping-poll instance. The polling instance no longer sends ICMP echo requests to the polled device. This also resets all counters for this polling instance.

Syntax

```
active
no active
```

Mode Ping-Polling Configuration

Examples To activate the ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# active
```

To disable the ping-poll instance 43 and reset its counters, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no active
```

Related commands

debug ping-poll

ip (ping-polling)

ping-poll

show ping-poll

clear ping-poll

Overview This command resets the specified ping poll, or all ping poll instances. This clears the ping counters, and changes the status of polled devices to unreachable. The polling instance changes to the polling frequency specified with the critical-interval command. The device status changes to reachable once the device responses have reached the up-count.

Syntax

```
clear ping-poll {<1-100>|all}
```

Parameter	Description
<1-100>	A ping poll ID number. The specified ping poll instance has its counters cleared, and the status of the device it polls is changed to unreachable.
`all`	Clears the counters and changes the device status of all polling instances.

Mode Privileged Exec

Examples To reset the ping poll instance 12, use the command:

```
awplus# clear ping-poll 12
```

To reset all ping poll instances, use the command:

```
awplus# clear ping-poll all
```

Related commands active (ping-polling)

ping-poll

show ping-poll

critical-interval

Overview This command specifies the time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable.

This command enables the device to quickly observe changes in state, and should be set to a much lower value than the normal-interval command.

The **no** variant of this command sets the critical interval to the default of one second.

Syntax

```
critical-interval <1-65536>
no critical-interval
```

Parameter	Description
<1-65536>	Time in seconds between pings, when the device has failed to a ping, or the device is unreachable.

Default The default is 1 second.

Mode Ping-Polling Configuration

Examples To set the critical interval to 2 seconds for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# critical-interval 2
```

To reset the critical interval to the default of one second for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# no critical-interval
```

Related commands

fail-count

normal-interval

sample-size

show ping-poll

timeout (ping polling)

up-count

debug ping-poll

Overview This command enables ping poll debugging for the specified ping-poll instance. This generates detailed messages about ping execution.

The **no** variant of this command disables ping-poll debugging for the specified ping-poll.

Syntax

```
debug ping-poll <1-100>
no debug ping-poll {<1-100>|all}
```

Parameter	Description
<1-100>	A unique ping poll ID number.
all	Turn off all ping-poll debugging.

Mode Privileged Exec

Examples To enable debugging for ping-poll instance 88, use the command:

```
awplus# debug ping-poll 88
```

To disable all ping poll debugging, use the command:

```
awplus# no debug ping-poll all
```

To disable debugging for ping-poll instance 88, use the command:

```
awplus# no debug ping-poll 88
```

Related commands

active (ping-polling)

clear ping-poll

ping-poll

show ping-poll

undebug ping-poll

description (ping-polling)

Overview This command specifies a string to describe the ping-polling instance. This allows the ping-polling instance to be recognized easily in show commands. Setting this command is optional.

By default ping-poll instances do not have a description.

Use the **no** variant of this command to delete the description set.

Syntax

```
description <description>
no description
```

Parameter	Description
<description>	The description of the target. Valid characters are any printable character and spaces. There is no maximum character length.

Mode Ping-Polling Configuration

Examples To add the text “Primary Gateway” to describe the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# description Primary Gateway
```

To delete the description set for the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no description
```

Related commands ping-poll

show ping-poll

fail-count

Overview This command specifies the number of pings that must be unanswered, within the total number of pings specified by the sample-size command, for the ping-polling instance to consider the device unreachable.

If the number set by the sample-size command and the **fail-count** commands are the same, then the unanswered pings must be consecutive. If the number set by the sample-size command is greater than the number set by the **fail-count** command, then a device that does not always reply to pings may be declared unreachable.

The **no** variant of this command resets the fail count to the default.

Syntax

```
fail-count <1-100>
no fail-count
```

Parameter	Description
<1-100>	The number of pings within the sample size that a reachable device must fail to respond to before it is classified as unreachable.

Default The default is 5.

Mode Ping-Polling Configuration

Examples To specify the number of pings that must fail within the sample size to determine that a device is unreachable for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# fail-count 5
```

To reset the fail-count to its default of 5 for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no fail-count
```

Related commands

critical-interval

normal-interval

ping-poll

sample-size

show ping-poll

timeout (ping polling)

up-count

ip (ping-polling)

Overview This command specifies the IPv4 address of the device you are polling.

Syntax `ip {<ip-address>|<ipv6-address>}`

Parameter	Description
<ip-address>	An IPv4 address in dotted decimal notation `A.B.C.D`
<ipv6-address>	An IPv6 address in hexadecimal notation `X:X::X:X`

Mode Ping-Polling Configuration

Examples To set ping-poll instance 5 to poll the device with the IP address `192.168.0.1`, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 5
awplus(config-ping-poll)# ip 192.168.0.1
```

To set ping-poll instance 10 to poll the device with the IPv6 address `2001:db8::`, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 10
awplus(config-ping-poll)# ip 2001:db8::
```

Related commands ping-poll

source-ip

show ping-poll

length (ping-poll data)

Overview This command specifies the number of data bytes to include in the data portion of the ping packet. This allows you to set the ping packets to a larger size if you find that larger packet types in your network are not reaching the polled device, while smaller packets are getting through. This encourages the polling instance to change the device's status to unreachable when the network is dropping packets of the size you are interested in.

The **no** variant of this command resets the data bytes to the default of 32 bytes.

Syntax

```
length <4-1500>
no length
```

Parameter	Description
<4-1500>	The number of data bytes to include in the data portion of the ping packet.

Default The default is 32.

Mode Ping-Polling Configuration

Examples To specify that ping-poll instance 12 sends ping packet with a data portion of 56 bytes, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length 56
```

To reset the number of data bytes in the ping packet to the default of 32 bytes for ping- poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length
```

Related commands ping-poll

show ping-poll

normal-interval

Overview This command specifies the time period between pings when the device is reachable.

The **no** variant of this command resets the time period to the default of 30 seconds.

Syntax

```
normal-interval <1-65536>
no normal-interval
```

Parameter	Description
<1-65536>	Time in seconds between pings when the target is reachable.

Default The default is 30 seconds.

Mode Ping-Polling Configuration

Examples To specify a time period of 60 seconds between pings when the device is reachable for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# normal-interval 60
```

To reset the interval to the default of 30 seconds for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no normal-interval
```

Related commands

critical-interval

fail-count

ping-poll

sample-size

show ping-poll

timeout (ping polling)

up-count

ping-poll

Overview This command enters the ping-poll configuration mode. If a ping-poll exists with the specified number, then this command enters its configuration mode. If no-ping poll exists with the specified number, then this command creates a new ping poll with this ID number.

To configure a ping-poll, create a ping poll using this command, and use the ip (ping-polling) command to specify the device you want the polling instance to poll. It is not necessary to specify any further commands unless you want to change a command's default.

The **no** variant of this command deletes the specified ping poll.

Syntax

```
ping-poll <1-100>
no ping-poll <1-100>
```

Parameter	Description
<1-100>	A unique ping poll ID number.

Mode Global Configuration

Examples To create ping-poll instance 3 and enter ping-poll configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 3
awplus(config-ping-poll)#
```

To delete ping-poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# no ping-poll 3
```

Related commands

active (ping-polling)

clear ping-poll

debug ping-poll

description (ping-polling)

ip (ping-polling)

length (ping-poll data)

show ping-poll

source-ip

sample-size

Overview This command sets the total number of pings that the polling instance inspects when determining whether a device is unreachable. If the number of pings specified by the **fail-count** command go unanswered within the inspected sample, then the device is declared unreachable.

If the numbers set in this command and fail-count command are the same, the unanswered pings must be consecutive. If the number set by this command is greater than that set with the fail-count command, a device that does not always reply to pings may be declared unreachable.

You cannot set this command's value lower than the fail-count value.

The polling instance uses the number of pings specified by the up-count command to determine when a device is reachable.

The **no** variant of this command resets this command to the default.

Syntax

```
sample-size <1-100>
no sample size
```

Parameter	Description
<1-100>	Number of pings that determines critical and up counts.

Default The default is 5.

Mode Ping-Polling Configuration

Examples To set the sample-size to 50 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# sample-size 50
```

To reset sample-size to the default of 5 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no sample-size
```

up-count

show counter ping-poll

Overview This command displays the counters for ping polling.

Syntax `show counter ping-poll [<1-100>]`

Parameter	Description
<1-100>	A unique ping poll ID number. This displays the counters for the specified ping poll only. If you do not specify a ping poll, then this command displays counters for all ping polls.

Mode User Exec and Privileged Exec

Output Figure 60-1: Example output from the **show counter ping-poll** command

```
Ping-polling counters
Ping-poll: 1
PingsSent              ......... 15
PingsFailedUpState     ......... 0
PingsFailedDownState   ......... 0
ErrorSendingPing       ......... 2
CurrentUpCount         ......... 13
CurrentFailCount       ......... 0
UpStateEntered         ......... 0
DownStateEntered       ......... 0

Ping-poll: 2
PingsSent              ......... 15
PingsFailedUpState     ......... 0
PingsFailedDownState   ......... 0
ErrorSendingPing       ......... 2
CurrentUpCount         ......... 13
CurrentFailCount       ......... 0
UpStateEntered         ......... 0
DownStateEntered       ......... 0

Ping-poll: 5
PingsSent              ......... 13
PingsFailedUpState     ......... 0
PingsFailedDownState   ......... 2
ErrorSendingPing       ......... 2
CurrentUpCount         ......... 9
CurrentFailCount       ......... 0
UpStateEntered         ......... 0
DownStateEntered       ......... 0
```

Table 61: Parameters in output of the **show counter ping-poll** command

Parameter	Description
`Ping-poll`	The ID number of the polling instance.
`PingsSent`	The total number of pings generated by the polling instance.
`PingsFailedUpState`	The number of unanswered pings while the target device is in the Up state. This is a cumulative counter for multiple occurrences of the Up state.
`PingsFailedDownState`	Number of unanswered pings while the target device is in the Down state. This is a cumulative counter for multiple occurrences of the Down state.
`ErrorSendingPing`	The number of pings that were not successfully sent to the target device. This error can occur when your device does not have a route to the destination.
`CurrentUpCount`	The current number of sequential ping replies.
`CurrentFailCount`	The number of ping requests that have not received a ping reply in the current sample-size window.
`UpStateEntered`	Number of times the target device has entered the Up state.
`DownStateEntered`	Number of times the target device has entered the Down state.

Example To display counters for the polling instances, use the command:

```
awplus# show counter ping-poll
```

Related commands

debug ping-poll

ping-poll

show ping-poll

show ping-poll

Overview This command displays the settings and status of ping polls.

Syntax `show ping-poll [<1-100>|state {up|down}] [brief]`

Parameter	Description	
<1-100>	Displays settings and status for the specified polling instance.	
`state`	Displays polling instances based on whether the device they are polling is currently reachable or unreachable.	
	`up`	Displays polling instance where the device state is reachable.
	`down`	Displays polling instances where the device state is unreachable.
`brief`	Displays a summary of the state of ping polls, and the devices they are polling.	

Mode User Exec and Privileged Exec

Output Figure 60-2: Example output from the **show ping-poll brief** command

```
Ping Poll Configuration
---------------------------------------------------------
Id Enabled State Destination
---------------------------------------------------------
1  Yes     Down  192.168.0.1
2  Yes     Up    192.168.0.100
```

Table 62: Parameters in output of the **show ping-poll brief** command

Parameter	Meaning
Id	The ID number of the polling instance, set when creating the polling instance with the ping-poll command.
Enabled	Whether the polling instance is enabled or disabled.

Table 62: Parameters in output of the **show ping-poll brief** command (cont.)

Parameter	Meaning	
State	The current status of the device being polled:	
	Up	The device is reachable.
	Down	The device is unreachable.
	Critical Up	The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.
	Critical Down	The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up.
Destination	The IP address of the polled device, set with the ip (ping-polling) command.	

Figure 60-3: Example output from the **show ping-poll** command

```
Ping Poll Configuration
---------------------------------------------------------

Poll 1:
Description                         : Primary Gateway
Destination IP address              : 192.168.0.1
Status                              : Down
Enabled                             : Yes
Source IP address                   : 192.168.0.10
Critical interval                   : 1
Normal interval                     : 30
Fail count                          : 10
Up count                            : 5
Sample size                         : 50
Length                              : 32
Timeout                             : 1
Debugging                           : Enabled
```

```
Poll 2:
Description                          : Secondary Gateway
Destination IP address               : 192.168.0.100
Status                               : Up
Enabled                              : Yes
Source IP address                    : Default
Critical interval                    : 5
Normal interval                      : 60
Fail count                           : 20
Up count                             : 30
Sample size                          : 100
Length                               : 56
Timeout                              : 2
Debugging                            : Enabled
```

Table 63: Parameters in output of the **show ping-poll** command

Parameter	Description	
`Description`	Optional description set for the polling instance with the description (ping-polling) command.	
`Destination IP address`	The IP address of the polled device, set with the ip (ping-polling) command.	
`Status`	The current status of the device being polled:	
	`Up`	The device is reachable.
	`Down`	The device is unreachable.
	`Critical Up`	The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.
	`Critical Down`	The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up.
`Enabled`	Whether the polling instance is enabled or disabled. The active (ping-polling) and active (ping-polling) commands enable and disable a polling instance.	
`Source IP address`	The source IP address sent in the ping packets. This is set using the source-ip command.	
`Critical interval`	The time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable. This is set with the critical-interval command.	
`Normal interval`	The time period between pings when the device is reachable. This is set with the normal-interval command.	

Table 63: Parameters in output of the **show ping-poll** command (cont.)

Parameter	Description
`Fail count`	The number of pings that must be unanswered, within the total number of pings specified by the sample-size command, for the polling instance to consider the device unreachable. This is set using the fail-count command.
`Up count`	The number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again. This is set using the up-count command.
`Sample size`	The total number of pings that the polling instance inspects when determining whether a device is unreachable. This is set using the sample-size command.
`Length`	The number of data bytes to include in the data portion of the ping packet. This is set using the length (ping-poll data) command.
`Timeout`	The time in seconds that the polling instance waits for a response to a ping packet. This is set using the timeout (ping polling) command.
`Debugging`	Indicates whether ping polling debugging is **Enabled** or **Disabled**. This is set using the debug ping-poll command.

Examples

To display the ping poll settings and the status of all the polls, use the command:

```
awplus# show ping-poll
```

To display a summary of the ping poll settings, use the command:

```
awplus# show ping-poll brief
```

To display the settings for ping poll 6, use the command:

```
awplus# show ping-poll 6
```

To display a summary of the state of ping poll 6, use the command:

```
awplus# show ping-poll 6 brief
```

To display the settings of ping polls that have reachable devices, use the command:

```
awplus# show ping-poll state up
```

To display a summary of ping polls that have unreachable devices, use the command:

```
awplus# show ping-poll state down brief
```

Related commands

debug ping-poll

ping-poll

source-ip

Overview This command specifies the source IP address to use in ping packets.

By default, the polling instance uses the address of the interface through which it transmits the ping packets. It uses the device's local interface IP address when it is set. Otherwise, the IP address of the interface through which it transmits the ping packets is used.

The **no** variant of this command resets the source IP in the packets to the device's local interface IP address.

Syntax

```
source-ip {<ip-address>|<ipv6-address>}
no source-ip
```

Parameter	Description
<ip-address>	An IPv4 address in dotted decimal notation `A.B.C.D`
<ipv6-address>	An IPv6 address in hexadecimal notation `X:X::X:X`

Mode Ping-Polling Configuration

Examples To configure the ping-polling instance 43 to use the source IP address `192.168.0.1` in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 192.168.0.1
```

To configure the ping-polling instance 43 to use the source IPv6 address `2001:db8::` in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 2001:db8::
```

To reset the source IP address to the device's local interface IP address for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no source-ip
```

show ping-poll

timeout (ping polling)

Overview This command specifies the time in seconds that the polling instance waits for a response to a ping packet. You may find a higher time-out useful in networks where ping packets have a low priority.

The **no** variant of this command resets the set time out to the default of one second.

Syntax

```
timeout <1-30>
no timeout
```

Parameter	Description
<1-30>	Length of time, in seconds, that the polling instance waits for a response from the polled device.

Default The default is 1 second.

Mode Ping-Polling Configuration

Examples To specify the timeout as 5 seconds for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# timeout 5
```

To reset the timeout to its default of 1 second for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no timeout
```

sample-size

show ping-poll

up-count

up-count

Overview This command sets the number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again.

The **no** variant of this command resets the up count to the default of 30.

Syntax

```
up-count <1-100>
no up-count
```

Parameter	Description
<1-100>	Number of replied pings before an unreachable device is classified as reachable.

Default The default is 30.

Mode Ping-Polling Configuration

Examples To set the upcount to 5 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# up-count 5
```

To reset the upcount to the default value of 30 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no up-count
```

Part 8: Firewall and Network Address Translation (NAT)

61 Firewall Commands

Introduction

Overview This chapter provides an alphabetical reference of commands used to configure AlliedWare Plus Firewall. For more information see the Firewall_and Network Address Translation (NAT) Feature Overview and Configuration_Guide.

The table below lists the firewall commands and their applicable modes.

Figure 61-1: Firewall commands and applicable modes

Mode	Command
Privileged Exec	clear firewall connections
	debug firewall
	show debugging firewall
	show firewall
	show firewall connections
	show firewall rule
	show firewall rule config-check
	show running-config firewall
Global Configuration	firewall
Firewall Configuration	protect (firewall)
	rule (firewall)
	move rule (firewall)

Command List

- "clear firewall connections" on page 3198
- "connection-limit (firewall)" on page 3199
- "connection-log events" on page 3201

- "firewall" on page 3202
- "debug firewall" on page 3203
- "ip tcp timeout established" on page 3204
- "move rule (firewall)" on page 3205
- "protect (firewall)" on page 3206
- "rule (firewall)" on page 3207
- "show connection-log events" on page 3209
- "show firewall" on page 3210
- "show firewall connections" on page 3211
- "show firewall connections limits" on page 3212
- "show firewall connections limits config-check" on page 3213
- "show firewall rule" on page 3214
- "show firewall rule config-check" on page 3216
- "show debugging firewall" on page 3217
- "show running-config firewall" on page 3218

clear firewall connections

Overview Use this command to clear firewall connections.

Syntax

```
clear firewall connections
```

Mode Privileged Exec

Usage notes Removing the Network Address Translation (NAT) rule by using the **no nat rule** command for an actively translated flow does not stop translating immediately. This means subsequent packets in the flow are continued to be translated.

The continued translation after associated NAT rule is removed will only stop when:

- You use the **clear firewall connections** command to manually stop translations immediately, when the associated rule has been deleted regardless whether the firewall feature is actually configured with NAT or not.
- The traffic flow ends naturally, for example, when it is stopped from the source. If the flow is re-initiated from a host, it will not be translated by the firewall, as the rule is deleted after the first flow stopped.

Examples To clear firewall connections, use the command:

```
awplus# clear firewall connections
```

Validation commands show firewall connections

Related commands rule (nat)

connection-limit (firewall)

Overview Use this command to limit firewall connections for an entity. The limit imposed by a connection-limit rule applies to the sum of TCP and UDP flows that match the rule.

Use the **no** variant of this command to remove the limit.

Syntax

```
connection-limit [<1-65535>] from <entity-name> with limit
<0-100000>
```

```
no connection-limit {<1-65535>|all}
```

Parameter	Description
<1-65535>	Unique numeric identifier for the limit.
<entity-name>	An entity represents a logical grouping of subnets, hosts or interfaces. For more information about entity, see the Application and Entity Commands.
<0-100000>	The maximum number of permitted connections for the entity.
`all`	Delete all limits.

Default The limiting is disabled by default and the number of connections will not be limited. However, the number is up to the maximum total number of allowed connections.

Mode Firewall Configuration

Usage notes This command allows you to limit the number of firewall sessions associated with a specific entity. The limit will be applied to each host on that entity. This means connection limits applied to an entity with multiple addresses will apply the limit to individual hosts, not the total connections for the entity. The limit applies to both IPv4 and IPv6.

If a connection limit rule is removed, any running connections are not stopped. Changes to limits only affect new connections. Adding a lower limit will not affect existing connections.

Examples To set a connection limit for entity DMZ, use the following command:

```
awplus(config-firewall)# connection-limit 1 from DMZ with limit
10000
```

To remove the connection limit, use the following command:

```
awplus(config-firewall)# no connection-limit 1
```

Validation commands show firewall connections

show firewall connections limits

Command changes Version 5.5.0-1.1: Firewall session limiting rules apply to UDP connections, where previously the limiting rules only applied to TCP connections.

connection-log events

Overview Use this command to enable extra logging for indicating the start and the end of connections passing through the firewall.

Use the **no** variant of this command to turn off the extra logging of connections passing through the firewall.

Syntax

```
connection-log events [new|end|all]
no connection-log events [new|end|all]
```

Parameter	Description
new	New connection
end	Connections closed
all	All new connections and connections closed. Default.

Default Connection logging is not enabled by default.

Mode Global Configuration.

Usage notes There are two types of messages you can log: new connections and connections that ended. You can control the amount of messages you log by choosing to log either type of message or all of the message types.

Messages contain the following information:

- time
- source and destination addresses (NATed and unNATed)
- protocol
- source and destination ports (NATed and unNATed)
- bytes and packets passed (found in the connection end message)

Example To log all of the new connections and all of the closed connections, use the commands:

```
awplus# configure terminal
awplus(config)# connection-log events all
```

Related commands show connection-log events

Command changes Version 5.4.7-1.1: command added.

firewall

Overview Use this command to configure the firewall.

Use the **no** variant of this command to remove all firewall configuration.

Syntax

```
firewall
no firewall
```

Mode Global Configuration

Usage notes This command allows you to enter the Firewall Configuration mode. The command prompt for this mode is **awplus(config-firewall)#**

In the Firewall Configuration mode, you can:

- Enable or disable firewall protection, see the protect (firewall) command.
- Create, move, or delete rules for the firewall, see the rule (firewall) command and the move rule (firewall) command.

Examples To configure the firewall, use the commands:

```
awplus# configure terminal
awplus(config)# firewall
awplus(config-firewall)#
```

To remove all firewall configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no firewall
```

Validation commands

show firewall

show running-config firewall

debug firewall

Overview Use this command to enable firewall debugging and Network Address Translation (NAT) debugging. This will cause additional detailed debugging information to be logged at the “informational” and “debugging” levels.

Use the **no** variant of this command to disable firewall debugging and NAT debugging.

For more information about NAT, see the Firewall_and Network Address Translation (NAT) Feature Overview and Configuration_Guide.

Syntax

```
debug firewall
no debug firewall
```

Default Firewall debugging and NAT debugging are disabled by default.

Mode Privileged Exec

Examples To enable firewall debugging and NAT debugging, use the command:

```
awplus# debug firewall
```

To disable firewall debugging and NAT debugging, use the command:

```
awplus# no debug firewall
```

Validation commands show debugging firewall

ip tcp timeout established

Overview Use this command to set the idle timeout for all established TCP connections.

Use the **no** variant of this command to set the idle timeout back to the default of 3600 seconds.

Syntax

```
ip tcp timeout established <1-31536000>
no ip tcp timeout established
```

Parameter	Description
<1-31536000>	Idle timeout for established TCP connections in seconds from 1 to 3153600.

Default 3600 seconds (1 hour)

Mode Global Configuration

Usage notes By default, when a TCP session is successfully established through the firewall, when the session goes idle, it automatically times out of the firewall connection tracking table after 3600 seconds. In some situations it may be beneficial to time out unused established TCP sessions earlier.

For example, in a busy environment where there is an excessive number of sessions being established, the firewall connection tracking table could become oversubscribed, with new connections being blocked until older sessions are timed out.

Example To set a non-default TCP session timeout for established idle sessions of 1800 seconds (30 minutes), use the commands:

```
awplus# configure terminal
awplus(config)# ip tcp timeout established 1800
```

Example To set the TCP session timeout for established idle sessions back to the default setting of 3600 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# no ip tcp timeout established
```

Related commands show running-config

Command changes Version 5.4.6-1.1: command added

move rule (firewall)

Overview Use this command to change the order of firewall rules.

Firewall rules are applied in rule ID order. When rules match the same application, source entity and destination entity, only the rule with the lowest ID is applied.

Note that you can move an existing rule ID only to an ID that is not assigned to any rule; otherwise you will be given an error message. Also note that a change to the rule order may change the rule results.

Syntax

```
move rule <1-65535> to <1-65535>
```

Parameter	Description
`move rule <1-65535>`	Move the ID of a given rule. The rule ID of the given rule must exist. Each rule has an ID which is either designated by the user or automatically generated when the rule is created. The rule ID is an integer from 1 to 65535.
`to <1-65535>`	New rule ID to assign. The new rule ID must not be used by any existing rule.

Mode Firewall Configuration

Examples To change the rule ID from `20` to `10`, use the commands:

```
awplus# configure terminal
awplus(config)# firewall
awplus(config-firewall)# move rule 20 to 10
```

Validation commands show firewall rule

show running-config firewall

Related commands rule (firewall)

protect (firewall)

Overview Use this command to enable firewall protection.

Use the **no** variant of this command to disable firewall protection without losing the existing firewall configuration.

Syntax

```
protect
no protect
```

Default Firewall protection is disabled by default.

Mode Firewall Configuration

Usage notes Firewall protection is disabled by default and all traffic can pass through the firewall. When the firewall is enabled and no rules are added, all traffic will be blocked by default. You can use the rule (firewall) command to configure rules to allow traffic to pass through the firewall.

Examples To enable firewall protection, use the commands:

```
awplus# configure terminal
awplus(config)# firewall
awplus(config-firewall)# protect
```

To disable firewall protection, use the commands:

```
awplus# configure terminal
awplus(config)# firewall
awplus(config-firewall)# no protect
```

Validation commands show firewall

show running-config firewall

rule (firewall)

Overview Use this command to create a rule for the firewall. Firewall security policy is specified in the form of firewall rules. Each rule defines the appropriate processing of a type of traffic passing through the firewall.

Use the **no** variant of this command to remove a rule.

Syntax

```
rule [<1-65535>] {permit|deny|reject|log} <application-name>
from <source-entity> to <destination-entity>
[no-state-enforcement] [log]
```

```
no rule {<1-65535>|all}
```

Parameter	Description
<1-65535>	Rule ID is an integer in the range <1-65535>. If you don't designate a rule ID, a rule ID will be automatically generated and it will be greater than the current highest rule ID.
`permit`	Permit connections that match the application, source entity and destination entity specified with this command.
`deny`	Drop connections that match the application, source entity and destination entity specified with this command. No error message is sent back to the source host.
`reject`	Reject connections that match the application, source entity and destination entity specified with this command. An error message (for instance, a TCP reset for a rejected TCP connection, or a destination unreachable message for an ICMP connection, etc.) is sent back to the source host.
`log`	When 'log' is the action for the rule, log an event each time the rule is hit. The traffic will also be processed by subsequent firewall rules which may permit, deny or reject the connection.
<application-name>	Application name. You can either specify an application name or use the word any, which stands for all applications. For more information about applications, see Application and Entity Commands.
<source-entity>	Source entity name. An entity represents a logical grouping of subnets, hosts or interfaces. For more information about entities, see Application and Entity Commands.
<destination-entity>	Destination entity name.

Parameter	Description
`no-state-enforcement`	Optionally disable state enforcement for this rule. Use this option with caution as it will allow reverse path connection initiation. It should be used only when the traffic forward and reverse paths must be different and there is no alternative approach available. This option is disabled by default.
`log`	When 'log' is appended to a rule, the action is applied and a log message is also generated each time the rule is hit.
`all`	Delete all rules.

Mode Firewall Configuration

Usage notes When the firewall is enabled and no rules are added, all traffic is blocked by default, you can use this command to create rules for permitting packets between entities.

The rule is not valid and cannot be hit if either the application, source entity or destination entity the rule applies to is not properly configured, for example, the application does not exist or does not have a protocol configured or the entity does not exist. To configure applications and entities, see Application and Entity Commands. You can also use the show firewall rule config-check command to check rule configuration validity.

You can change the rule order by using the move rule (firewall) command.

Examples To create a rule for permitting application ping between 'public' and 'private', use the command:

```
awplus(config-firewall)# rule 10 permit
ping from public to private
```

To create a rule for denying application http between 'public.wan' and 'private.lan', use the command:

```
awplus(config-firewall)# rule 20 deny
http from public.wan to private.lan
```

To create a firewall rule to permit application 'ping' between 'public' and 'dmz' entities and to log the results, use the commands:

```
awplus(config-firewall)# rule 30 permit
ping from public to dmz log
```

Related commands move rule (firewall)

show firewall rule

show firewall rule config-check

Command changes Version 5.4.7-0.1: **no-state-enforcement** option added.

show connection-log events

Overview This command displays the configuration state (enabled or disabled) for the logging of connections passing through the firewall, as configured by the connection-log events command.

Syntax
```
show connection-log events
```

Mode User Exec

Example To show the logging configuration state for the connections passing through the firewall, use the command:

```
awplus# show connection-log events
```

Output Figure 61-2: Example output from **show connection-log events**

```
awplus#show connection-log events
Log new connection events:    Disabled
Log connection end events:    Enabled
```

Related commands connection-log events

Command changes Version 5.4.7-1.1: command added.

show firewall

Overview Use this command to show the protection state of the firewall and the number of active connections being handled by the firewall.

You can use the protect (firewall) command to enable firewall protection.

Syntax

```
show firewall
```

Mode Privileged Exec

Examples To show the state of the firewall, use the command:

```
awplus# show firewall
```

Output Figure 61-3: Example output from the **show firewall** command

```
awplus#show firewall
Firewall protection is enabled
Active connections: 9
```

Related commands protect (firewall)

show firewall connections

Overview Use this command to show the connections currently being tracked by the firewall.

Syntax

```
show firewall connections
```

Mode Privileged Exec

Examples To show the connections currently being tracked by the firewall, use the command:

```
awplus# show firewall connections
```

Output Figure 61-4: Example output from the **show firewall connections** command

```
awplus#show firewall connections
tcp ESTABLISHED src=192.168.1.2 dst=172.16.1.2 sport=58616
dport=23 packets=16
bytes=867 src=172.16.1.2 dst=172.16.1.1 sport=23 dport=58616
packets=11 bytes=636
[ASSURED]
icmpv6 src=2001:db8::2 dst=2001:db8::1 type=128 code=0 id=1416

dport=80 packets=5
bytes=564 src=2001:db8:2::2 dst=2001:db8:1::2 sport=80 dport=48740
packets=5
bytes=594 [ASSURED]
```

Related commands clear firewall connections

show firewall connections limits

Overview Use this command to show the configured firewall connection-limits for a given entity.

Syntax

```
show firewall connections limits
```

Mode Privileged Exec

Examples To show the information about all the firewall connection limits, use the command:

```
awplus# show firewall connections limits
```

Output Figure 61-5: Example output from the **show firewall connections limits** command

```
awplus#show firewall connections limits
ID       Entity              Limit       Hit Count
-------------------------------------------------
10       DMZ                 100         42
```

Related commands show firewall connections limits config-check

show firewall connections limits config-check

Overview Use this command to check configuration validity of firewall connection limits.

An invalid rule will not be active and cannot be hit. This command also shows the reasons why a limit configuration is not valid.

Syntax
```
show firewall connections limits config-check
```

Mode Privileged Exec

Usage notes Firewall limits are applied to entities only. A limit is not valid if the source entity (zone) is not configured properly. This command checks if the entity exists at all, and if it does it also checks if the entity (zone) has a valid subnet.

Examples To check configuration validity of connection-limit rules, use the command:

```
awplus# show firewall connections limits
config-check
```

Output Figure 61-6: Example output from the **show firewall connections limits config-check** command on the console if rule configuration errors are detected. Connection-limit 10 uses an entity that exists; however no subnet has been specified. Connection-limit 20 uses an entity that doesn't exist.

```
awplus#show firewall connections limits config-check
Connection-limit 10:
  "From" entity has no subnet or host addresses
Connection-limit 20:
  "From" entity does not exist
```

Output Figure 61-7: Example output from the s**how firewall connections limits config-check** command if all limit rules are valid

```
awplus#show firewall connection limits config-check
All rules are valid
```

Related commands show firewall connections limits

show firewall rule

Overview Use this command to show information about firewall rules.

Syntax

```
show firewall rule [<1-65535>]
```

Parameter	Description
<1-65535>	Rule ID

Mode Privileged Exec

Examples To show information about all firewall rules, use the command:

```
awplus# show firewall rule
```

Output Figure 61-8: Example output from the **show firewall rule** command

```
awplus#show firewall rule

[* = Rule is not valid - see "show firewall rule config-check"]
  ID    Action  App       From            To                Hits
------------------------------------------------------------------
  10    permit  ping      public          private           0
  20    permit  ping      public          dmz               0
  40    permit  ping      private         dmz               0
* 50    permit  voice     public          private           0
```

To show information about a specific firewall rule, use the command:

```
awplus# show firewall rule 10
```

Output Figure 61-9: Example output from the **show firewall rule** command

```
awplus#show firewall rule 10

[* = Rule is not valid - see "show firewall rule config-check"]
 ID    Action  App     From            To                  Hits
------------------------------------------------------------------
 10    permit  ping    public          private             0
```

Output Parameter	Description
*	Indicates the rule is not valid and cannot be hit. See the show firewall rule config-check command.
Action	The rule action set by the rule (firewall) command.
App	Application name.

Output Parameter	Description
`From`	Source entity.
`To`	Destination entity.
`Hits`	The number of times the firewall rule has been hit.

Related commands rule (firewall)

show firewall rule config-check

Overview Use this command to check configuration validity of firewall rules.

An invalid rule will not be active and cannot be hit. This command also shows the reasons why a rule is not valid.

Syntax

```
show firewall rule config-check
```

Mode Privileged Exec

Usage notes Firewall rules are applied to applications and entities. A rule is not valid if either the application, source entity or destination entity the rule applies to is not configured properly.

To configure applications and entities, see Application and Entity Commands.

Examples To check configuration validity of firewall rules, use the command:

```
awplus# show firewall rule config-check
```

Output Figure 61-10: Example output from the **show firewall rule config-check** command if rule configuration errors are detected

```
awplus#show firewall rule config-check
Rule 10:
  Application does not have a protocol configured
  "From" entity does not exist
  "To" entity has no subnet or host addresses
```

Output Figure 61-11: Example output from the s**how firewall rule config-check** command if all rules are valid

```
awplus#show firewall rule config-check
All rules are valid
```

Related commands rule (firewall)

show firewall rule

show debugging firewall

Overview Use this command to see what debugging is turned on for firewall and Network Address Translation (NAT).

You can use the debug firewall command to enable firewall and NAT debugging.

For more information about NAT, see the Firewall_and Network Address Translation (NAT) Feature Overview and Configuration_Guide.

Syntax

```
show debugging firewall
```

Mode Privileged Exec

Examples To show the firewall and NAT debugging status, use the command:

```
awplus# show debugging firewall
```

Output Figure 61-12: Example output from the **show debugging firewall** command

```
awplus#show debugging firewall
Firewall Debugging Status: on
```

Related commands debug firewall

show running-config firewall

Overview Use this command to show the configuration commands that have been used to configure the firewall.

Syntax

```
show running-config firewall
```

Mode Privileged Exec

Examples To show the configuration commands that have been used to configure the firewall, use the command:

```
awplus# show running-config firewall
```

Output Figure 61-13: Example output from the **show running-config firewall** command

```
awplus#show running-config firewall
firewall
 rule 10 permit ping from public to private
 protect
!
```

62 Application and Entity Commands

Introduction

Overview This chapter provides an alphabetical reference of commands used to configure application and entity. For more information, see the Firewall_and Network Address Translation (NAT) Feature Overview and Configuration_Guide.

The table below lists the application commands and their applicable modes.

Figure 62-1: Application commands and applicable modes

Mode	Command
Privileged Exec	show application
	show application detail
Global Configuration	application
Application Mode	protocol
	icmp-type
	icmp-code
	sport
	dport

The table below lists the entity commands and their applicable modes.

Figure 62-2: Entity commands

Mode	Command
Privileged Exec	show entity
Global Configuration	zone
Zone Mode	network (zone)

Mode	Command
Network Mode	`ip subnet`
	`ipv6 subnet`
	`host (network)`
Host Mode	`ip address (host)`
	`ipv6 address (host)`

Command List

- "application" on page 3221
- "dport" on page 3223
- "dscp" on page 3225
- "host (network)" on page 3227
- "icmp-code" on page 3229
- "icmp-type" on page 3231
- "ip address (host)" on page 3233
- "ip subnet" on page 3235
- "ipv6 address (host)" on page 3237
- "ipv6 subnet" on page 3239
- "network (zone)" on page 3241
- "protocol" on page 3243
- "show application" on page 3244
- "show application detail" on page 3245
- "show entity" on page 3247
- "sport" on page 3250
- "zone" on page 3252

application

Overview Use this command to create or modify a custom application.

An application is a high level abstraction of application packets being transported by network traffic. Traffic matching for applications can be achieved by using several techniques, for example, matching packets to port numbers or searching for application signatures in flows of packets.

Use the **no** variant of this command to delete a custom application.

Syntax

```
application <application-name>
no application <application-name>
```

Parameter	Description
<application-name>	Application name. You can use all alphanumeric ASCII characters, and the dash (-) and underscore (_) characters. The name can be 1 to 64 characters long. The application name is case-sensitive. If you create two application names with the same spelling but one in upper case and the other one in lower case, the last overwrites the first entry.

Mode Global Configuration

Usage notes Use this command to enter the Application Configuration mode, to create a custom application or configure an existing application. You can configure the source port, destination port, protocol, ICMP code and ICMP type for the application. An application is invalid if its protocol, source or destination are not properly configured, for example, if the application has no protocol configured, or source and destination ports are applied to protocols that are not TCP, UDP or SCTP.

There are 40 predefined applications with protocols, source and destinations ports.

You can change the protocol, source and destination ports of the predefined applications. You can only delete the predefined application when you change either its protocol, source or destination port.

Use the show application command to show all the custom and predefined applications.

Examples To create a custom application named ‘isakmp’, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)#
```

To delete the custom application named ‘isakmp’, use the commands:

```
awplus# configure terminal
awplus(config)# no application isakmp
```

dport

Overview Use this command to specify a destination port or port range for an application.

A port number is part of the addressing information used to identify a specific process to which a network message is to be forwarded between a sender and a receiver. For the full list of port numbers and their assignment, you can visit the Internet Assigned Numbers Authority (IANA) website at www.iana.org.

Use the **no** variant of this command to delete a port or a port range from an application. Note that the port or port range that you want to delete must match exactly the existing port or port range. You cannot remove a port range that is part of an existing port range.

Syntax

```
dport {<destination-port>|any|<start-range> to <end-range>}
no dport {<destination-port>|any|<start-range> to <end-range>}
```

Parameter	Description
<destination-port>	The destination port number, either TCP or UDP, specified as an integer in the range <1-65535>.
any	Any port number in the range <1-65535>. This equals to a range of 1 to 65535.
<start-range>	Starting port number in the range <1-65535>.
to *<end-range>*	Ending port number in the range <1-65535> or max.

Mode Application Mode

Usage notes You can create more than one destination port number or port range for an application.

Examples To specify destination port 500 for the application named isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# dport 500
```

To specify destination port 500 and a range of ports for the application named isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# dport 500
awplus(config-application)# dport 60000 to max
```

To specify the destination port any (a port number range of 1-65535) for the application named isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# dport any
```

To remove destination port 500 from the application named isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# no dport 500
```

To remove port **any** from the application isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# no dport 1 to 65535
```

dscp

Overview Use this command to specify one or more DSCP values used by an application.

Use the **no** variant of this command to remove one or more DSCP values from an application.

Syntax

```
dscp <dscp-list>
dscp {af11|af12|af13|af21|af22|af23|af31|af32|af33|af41|af42|af43|ef|be}
dscp {cs0|cs1|cs2|cs3|cs4|cs5|cs6|cs7}
no dscp
no dscp <dscp-list>
no dscp {af11|af12|af13|af21|af22|af23|af31|af32|af33|af41|af42|af43|ef|be}
no dscp {cs0|cs1|cs2|cs3|cs4|cs5|cs6|cs7}
```

Parameter	Description
<dscp-list>	One or more DSCP values, in the range 0-63. Use spaces to separate values.
af11 ... be	One or more DSCP values specified according to the Assured Forwarding group, as defined in RFC 2597 and RFC 3260. See the table below for values. “ef” means expedited forwarding (DSCP 46) and “be” means best effort (DSCP 0). Voice traffic is typically given a value of ef.
cs0 ... cs7	One or more DSCP values specified according to the Class Selector group. This is equivalent to TOS IP precedence values, so that CS0 is equivalent to an IP precedence value of 0, CS1 is equivalent to an IP precedence value of 1, and so on.

Table 62-1: Assured Forwarding (AF) behavior group

	Class 1	Class 2	Class 3	Class 4
Low drop probability	AF11 (DSCP 10)	AF21 (DSCP 18)	AF31 (DSCP 26)	AF41 (DSCP 34)
Medium drop probability	AF12 (DSCP 12)	AF22 (DSCP 20)	AF32 (DSCP 28)	AF42 (DSCP 36)
High drop probability	AF13 (DSCP 14)	AF23 (DSCP 22)	AF33 (DSCP 30)	AF43 (DSCP 38)

Mode Application Mode

Usage notes You can specify only one set of DSCP values for an application. The newly specified list will replace the existing one; it will not be added to the existing one.

Example To specify a DSCP of **ef** for the application named **voice**, use the commands:

```
awplus# configure terminal
awplus(config)# application voice
awplus(config-application)# dscp ef
```

To specify DSCPs of 12 and 13 for the application named **test**, use the commands:

```
awplus# configure terminal
awplus(config)# application test
awplus(config-application)# dscp 12 13
```

To remove DSCP12 from the application named **test**, use the commands:

```
awplus# configure terminal
awplus(config)# application test
awplus(config-application)# no dscp 12
```

To stop the application named **test** from using DSCP values, use the commands:

```
awplus# configure terminal
awplus(config)# application test
awplus(config-application)# no dscp
```

host (network)

Overview Use this command to add a host to a network entity or to configure an existing host.

Host is a high level abstraction of a single node in a network. This is commonly used if a particular device, for example a server, has a static IP address that needs to be specified in a firewall policy.

Use the **no** variant of this command to remove a host from a network entity.

Syntax

```
host <host-name>
no host <host-name>
```

Parameter	Description
<host-name>	Host name. You can use all alphanumeric ASCII characters, and the dash (-) and underscore (_) characters. The name can be 1 to 64 characters in long.

Mode Network Mode

Usage notes You can create multiple hosts for a network. A host entity is identified by its parent network using the dot notation, for example, ZoneName.NetworkName.HostName.

This commands allows you to enter the Host Mode with the prompt **awplus(config- host)#**. The Host Mode enables you to configure IPv4 address and IPv6 address for the host. For more information about host IPv4 address and IPv6 address, see ip address (host) command and ipv6 address (host) command respectively.

Example To create a host entity named `ftp` under network entity `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# host ftp
awplus(config-host)#
```

To remove host entity `ftp` and its IP address configuration from network entity `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# no host ftp
```

icmp-code

Overview Use this command to configure an ICMP message code for an application.

ICMP has many messages that are identified by a "type" field and many of these ICMP types have a "code" field. Use the icmp-type command to specify the ICMP type. For the full list of the ICMP code assignments, you can visit the Internet Assigned Numbers Authority (IANA) website at www.iana.org.

Use the **no** variant of this command to restore the ICMP message code to its default, which is **any**.

Syntax

```
icmp-code {<code-number>|any}
no icmp-code
```

Parameter	Description
<code-number>	Specify an ICMP message code number in the range of 0 to 255.
any	Any ICMP message code in the range of 0 to 255.

Default The default ICMP code number is **any**.

Mode Application Mode

Usage notes You should configure the ICMP code only for applications that use protocol ICMP. To configure the application protocol, see the protocol command.

You can specify only one ICMP message code for an application. The newly specified code will replace the previous one.

Examples To specify ICMP code 5 (redirect) for the application named icmp, use the commands:

```
awplus# configure terminal
awplus(config)# application icmp
awplus(config-application)# icmp-code 5
```

To specify the ICMP code as **any** for the application named icmp, use the commands:

```
awplus# configure terminal
awplus(config)# application icmp
awplus(config-application)# icmp-code any
```

To restore the ICMP message code to its default of **any** for the application named icmp, use the commands:

```
awplus# configure terminal
awplus(config)# application icmp
awplus(config-application)# no icmp-code
```

icmp-type

Overview Use this command to configure an ICMP message type for an application.

The ICMP protocol has many messages that are identified by a "type" field. For the full list of the ICMP type assignments, you can visit the Internet Assigned Numbers Authority (IANA) website at www.iana.org.

Use the **no** variant of this command to restore the ICMP message type to its default, which is **any**.

Syntax

```
icmp-type {<type-number>|any}
no icmp-type
```

Parameter	Description
<type-number>	Specify an ICMP message type number in the range of 0 to 255.
any	Any ICMP message type in the range of 0 to 255.

Default The default ICMP type is **any**.

Mode Application Mode

Usage notes You should configure the ICMP type only for applications that use protocol ICMP. To configure the application protocol, see the protocol command.

You can specify only one ICMP message type for an application. The newly specified type will replace the previous one.

Examples To specify ICMP message type 8 (echo) for the application named icmp, use the commands:

```
awplus# configure terminal
awplus(config)# application icmp
awplus(config-application)# icmp-type 8
```

To specify the ICMP message type as **any** for the application named icmp, use the commands:

```
awplus# configure terminal
awplus(config)# application icmp
awplus(config-application)# icmp-type any
```

To restore the ICMP message type to its default of **any** for the application named icmp, use the commands:

```
awplus# configure terminal
awplus(config)# application icmp
awplus(config-application)# no icmp-type
```

network (zone)

show application

ip address (host)

Overview Use this command to assign an IPv4 address to a host entity.

Use the **no** variant of this command to remove an IPv4 address from the host.

Syntax

```
ip address <ipv4-address>
ip address dynamic fqdn <domain_name>
ip address dynamic interface <interface_name>
no ip address <ipv4-address>
no ip address dynamic fqdn <domain_name>
no ip address dynamic interface <interface_name>
```

Parameter	Description
<ipv4-address>	The IPv4 address uses the format A.B.C.D.
dynamic	Dynamic IP address, for example, obtained from a DHCP server.
<domain_name>	The FQDN to resolve IP addresses for.
<interface_name>	Interface to acquire IP addresses from.

Mode Host

Usage notes You can add multiple IP addresses to a host entity. If the IP address is not in the scope of any of its parent network's IPv4 subnets, a warning message will be given. Such an IP address is still acceptable because in the future the user may assign a network subnet that contains the host's IP address. Firewall policy rules will not apply to an IP address that is not in at least one of the network's subnets.

If you are adding an FQDN, DNS Relay cache and **ip domain-lookup via-relay** must be enabled for this command to work. DNS requests passing through the router are inspected for matching FQDNs. Because of this, the DNS cache is cleared when this command is entered so that the IP addresses can be picked up.

You can add multiple dynamic FQDNs for a host entity.

Examples To add an IP address to host `ftp`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ip subnet 192.168.1.0/24
awplus(config-network)# host ftp
awplus(config-host)# ip address 192.168.1.5
```

To add multiple IP addresses to host `ftp`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ip subnet 192.168.1.0/24
awplus(config-network)# host ftp
awplus(config-host)# ip address 192.168.1.8
awplus(config-host)# ip address 192.168.1.9
awplus(config-host)# ip address 192.168.1.10
```

To add the IPv4 addresses of the FQDN “google.com” to a zone, use the following commands:

```
awplus# configure terminal
awplus(config)# zone Public
awplus(config-zone)# network Router
awplus(config-network)# ip subnet 0.0.0.0/0
awplus(config-network)# host google
awplus(config-host)# ip address dynamic fqdn google.com
```

To remove an IP address from host `ftp`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# host ftp
awplus(config-host)# no ip address 192.168.1.5
```

Command changes Version 5.4.8-1.1: FQDN parameter and output added

ip subnet

Overview Use this command to add an IPv4 subnet to a network entity.

Use the **no** variant of this command to remove a subnet from a network entity.

Syntax

```
ip subnet <ip-network/m> [interface <interface-name>]
no ip subnet <ip-network/m> [interface <interface-name>]
```

Parameter	Description
<ip-network/m>	IP address of the network, entered in the form A.B.C.D/M. Dotted decimal notation followed by a forward slash, and then the subnet mask length.
`interface`	Specify an interface name. An interface may be specified to add a further restriction on the subnet. No interface configured indicates that any matching address from any interface is a member of this network.
<interface-name>	Interface name. Any AlliedWare Plus interface type (eth, vlan, ppp, tunnel, lo and so on). A warning message is given if the interface does not match an existing interface on the device.

Mode Network Mode

Usage notes You can create multiple subnets to a network entity.

Examples To add a subnet to network `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ip subnet 192.168.2.0/24
```

To add a subnet and an interface to network `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ip subnet 192.168.2.0/24 interface eth1
```

To add multiple subnets to network `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ip subnet 192.168.2.0/24 interface eth1
awplus(config-network)# ip subnet 10.1.0.0/16 interface eth1
```

To remove a subnet from network `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# no ip subnet 192.168.2.0/24
```

Validation commands show entity

Related commands network (zone)

ipv6 address (host)

Overview Use this command to assign an IPv6 address to a host entity.

Use the **no** variant of this command to remove an IPv6 address from an host entity.

Syntax

```
ipv6 address <ipv6-address>
ipv6 address dynamic fqdn <domain_name>
ipv6 address dynamic interface <interface_name>
no ipv6 address <ipv6-address>
no ipv6 address dynamic fqdn <domain_name>
no ipv6 address dynamic interface <interface_name>
```

Parameter	Description
<ipv6-address>	The IPv6 address in the format x:x::x:x.
dynamic	Dynamic IPv6 address, for example, obtained from a DHCP server.
<domain_name>	The FQDN to resolve IP addresses for.
<interface_name>	Interface to acquire IP addresses from.

Mode Host Mode

Usage notes You can add multiple IPv6 addresses to a host entity. If the IPv6 address is not in the scope of any of its parent network's IPv6 subnets, a warning message will be given. Such an IP address is still acceptable because in the future the user may assign a network subnet that contains the host's IPv6 address. Firewall policy rules will not apply to an IPv6 address that is not in at least one of the network's subnets.

If you are adding an FQDN, DNS Relay cache and **ip domain-lookup via-relay** must be enabled for this command to work. DNS requests passing through the router are inspected for matching FQDNs. Because of this, the DNS cache is cleared when this command is entered so that the IPv6 addresses can be picked up.

You can add multiple dynamic FQDNs for a host entity.

Examples To add an IPv6 address to host `web-server`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ipv6 subnet 2001:db8:24:100::/64
awplus(config-network)# host web-server
awplus(config-host)# ipv6 address 2001:db8:24:100::1
```

To add multiple IP addresses to host `web-server`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ipv6 subnet 2001:db8:24:100::/64
awplus(config-network)# host web-server
awplus(config-host)# ipv6 address 2001:db8:24:100::2
awplus(config-host)# ipv6 address 2001:db8:24:100::3
awplus(config-host)# ipv6 address 2001:db8:24:100::4
```

To add the IPv6 addresses of the FQDN “google.com” to a zone, use the following commands:

```
awplus# configure terminal
awplus(config)# zone Public
awplus(config-zone)# network Router
awplus(config-network)# ip subnet ::/0
awplus(config-network)# host google
awplus(config-host)# ip address dynamic fqdn google.com
```

To remove an IPv6 address from host `web-server`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# host web-server
awplus(config-host)# no ipv6 address 2001:db8:24:100::2
```

Validation commands show entity

ipv6 subnet

Overview Use this command to assign an IPv6 subnet to a network entity.

Use the **no** variant of this command to remove a IPv6 subnet from a network entity.

Syntax

```
ipv6 subnet <ip-network/m> [interface <interface-name>]
no ipv6 subnet <ip-network/m> [interface <interface-name>]
```

Parameter	Description
<ip-network/m>	IPv6 address of the network, entered in the form X:X::X:X/M, followed by the prefix length in slash notation.
`interface`	Specify an interface name. An interface may be specified to add a further restriction on the subnet. No interface configured indicates that any matching address from any interface is a member of this network.
<interface-name>	Interface name. Any AlliedWare Plus interface type (eth, vlan, ppp, tunnel, lo and so on.) followed by any character. A warning message is given if the interface does not match an existing interface on the device.

Mode Network Mode

Usage notes You can create multiple subnets for a network entity.

Examples To add a subnet to network `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ipv6 subnet 2001:db8::/32
```

To add a subnet and an interface to network `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ipv6 subnet 2001:db8::/32 interface
eth1
```

To add multiple subnets to network `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# ipv6 subnet 2001:db8::7/32 interface
eth1
awplus(config-network)# ipv6 subnet 2001:db8::8/32 interface
eth1
```

To remove a subnet from network `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)# no ipv6 subnet 2001:db8::/32
```

Validation commands show entity

Related commands network (zone)

network (zone)

Overview Use this command to add a network to a zone entity or configure an existing network.

A network is a high level abstraction of a logical network in a zone. This consists of the IP subnets and interfaces over which it is reachable. Subnets are grouped into networks to apply a common set of rules among the subnets.

Use the **no** variant of this command to destroy a network entity.

Syntax

```
network <network-name>
no network <network-name>
```

Parameter	Description
<network-name>	Network name. You can use all alphanumeric ASCII characters, and the dash (-) and underscore (_) characters. The name can be 1 to 64 characters in long.

Mode Zone Mode

Usage notes A network is a member of a zone. You can create multiple networks in a zone. A network entity is identified with its parent zone using the dot notation, for example, ZoneName.NetworkName.

This commands allows you to enter the Network Mode with the prompt **awplus(config- network)#**. In the Network Mode, you can:

- Configure subnets and interfaces for the network entity
- Create and delete host entities in the network

A network must have at least one valid network address for it to result in functioning rules using that network entity. For more information about how to add network address, see the ip subnet command and the ipv6 subnet command.

Note that if the network entity is destroyed, the subnets and hosts in the network entity will be destroyed as well.

Example To create a network entity named `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# network servers
awplus(config-network)#
```

To destroy a network entity named `servers`, use the commands:

```
awplus# configure terminal
awplus(config)# zone dmz
awplus(config-zone)# no network servers
```

protocol

Overview Use this command to specify a protocol used by an application.

Protocol numbers are used to configure firewalls, routers, and proxy servers. The protocol number is in the protocol field of the IPv4 header and the next header field of IPv6 header. For the full list of the IP Protocol assignments, you can visit the Internet Assigned Numbers Authority (IANA) website at www.iana.org.

Use the **no** variant of this command to unset the protocol in an application.

Syntax

```
protocol {tcp|udp|icmp|ipv6-icmp|<protocol-number>}
no protocol
```

Parameter	Description
`tcp`	Transmission Control Protocol. The protocol number is 6.
`udp`	User Datagram Protocol. The protocol number is 17.
`icmp`	Internet Control Message Protocol for Internet Protocol version 4. The protocol number is 1.
`ipv6-icmp`	Internet Control Message Protocol for Internet Protocol version 6. The protocol number is 58.
`<protocol-number>`	Protocol number in the range of 0 to 255.

Mode Application Mode

Usage notes You can specify only one protocol for an application. The newly specified protocol will replace the previous one.

Examples To specify protocol udp for the application named isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# protocol udp
```

To unset the protocol in the application named isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# no protocol
```

Related commands application

show application

show application

Overview Use this command to show the custom and predefined applications currently configured.

You can use the show application detail command to show detailed information of the applications.

Syntax

```
show application

                            transfer)
...
```

Table 62-2: Parameters in the output from **show application detail**

Parameter	Description
Name	Application name—the short name used when referenced from application-aware features (for instance firewall).
Mark	Application mark—the hexadecimal DPI application index representing each protocol or application. This value appears in Firewall log messages, indicating which application the packet or flow was identified as by DPI.
Detail	For custom and pre-defined applications—the IP protocol and port numbers associated with the application. For DPI applications— a longer description of the application.
Cat	Category—a general and high-level category for the application.

Related commands

show application

Command changes

Version 5.4.7-2.1: More detail added to the output for DPI commands.

Version 5.4.9-1.1: Category added to output for built-in provider

show entity

Overview Use this command to show entity information.

Entity is a high level abstraction of a network device, a group of networks or subnets. It is the instance that firewall policy can be applied to. There are three types of entity:

- zone
- network
- host

Syntax `show entity [<entity>]`

Parameter	Description
<entity>	Specific entity in dot notation.

Mode Privileged Exec

Examples To show the information about all entities, use the command:

```
awplus# show entity
```

Output Figure 62-6: Example output from the **show entity** command

```
awplus#show entity
Zone:        zone1
 Network:    zone1.network1
  Subnet:    1:db8:24:100::/64
  Subnet:    2001:db8:24:100::/64
  Host:      zone1.network1.host1
   Address:  2001:db8:24:100::1

Zone:        zone2
 Network:    zone2.network2
  Host:      zone2.network2.host1
```

To show information associated with the network entity `zone1.network1`, use the command:

```
awplus# show entity zone1.network1
```

Output Figure 62-7: Example output from the **show entity** command

```
awplus#show entity zone1.network1
Network:    zone1.network1
 Subnet:    1:db8:24:100::/64
 Subnet:    2001:db8:24:100::/64
 Host:      zone1.network1.host1
  Address:  2001:db8:24:100::1
```

To show information associated with the host entity `zone1.network1.host1`, use the command:

```
awplus# show entity zone1.network1.host1
```

Output Figure 62-8: Example output from the **show entity** command

```
awplus#show entity zone1.network1.host1
Host:        zone1.network1.host1
 Address:    192.168.1.5
```

When the entity is using dynamic interface addresses, this will be shown in the output:

Output Figure 62-9: Example output from the **show entity** command

```
awplus#show entity Public
Zone:         Public
 Network:     Public.Router
  Subnet:     0.0.0.0/0 via ppp0
  Host:       Public.Router.ppp0
   Address:   10.0.6.1 (dynamic)
```

When the entity is using dynamic FQDN addresses, this will be shown in the output:

Output Figure 62-10: Example output from the **show entity** command using dynamic FQDN addresses on the console

```
awplus#show entity Public
Zone:         Public
 Network:     Public.FQDNs
  Subnet:     0.0.0.0/0
  Subnet:     ::/0
  Host:       Public.FQDNs.alliedtelesis
   FQDN IPv4: alliedtelesis.com
   FQDN IPv6: alliedtelesis.com
   Address:   54.66.120.42 (dynamic)
```

```
  Host:       Public.FQDNs.facebook
   FQDN IPv4: facebook.com
   FQDN IPv6: facebook.com
   Address:   157.240.8.35 (dynamic)
   Address:   2a03:2880:f119:8083:face:b00c:0:25de (dynamic)
  Host:       Public.FQDNs.google
   FQDN IPv4: google.com
   FQDN IPv6: google.com
   Address:   216.58.196.142 (dynamic)
   Address:   2404:6800:4006:809::200e (dynamic)
  Host:       Public.FQDNs.microsoft
   FQDN IPv4: microsoft.com
   FQDN IPv6: microsoft.com
   Address:   23.96.52.53 (dynamic)
   Address:   23.100.122.175 (dynamic)
   Address:   104.40.211.35 (dynamic)
   Address:   104.43.195.251 (dynamic)
   Address:   191.239.213.197 (dynamic)
```

Command changes Version 5.4.8-1.1: added output for dynamic interface and FQDN addresses.

sport

Overview Use this command to specify a source port or a port range used for an application.

A port number is part of the addressing information used to identify a specific process to which a network message is to be forwarded between a sender and a receiver. For the full list of port numbers and their assignment, you can visit the Internet Assigned Numbers Authority (IANA) Web site: www.iana.org.

Use the **no** variant of this command to delete ports or port ranges from an application.

NOTE:

The port or port range that you want to delete must match exactly the existing port or port range. You cannot remove a port range that is part of an existing port range.

Syntax

```
sport {<source-port>|any|<start-range> to <end-range>}
no sport {<source-port>|any|<start-range> to <end-range>}
```

Parameter	Description
<source-port>	The source port number, either TCP or UDP, specified as an integer between 1 and 65535.
any	Any port number in the range <1-65535>. This equals to a range of 1 to 65535.
<start-range>	Starting port number in the range <1-65535>.
to *<end-range>*	Ending port number in the range <1-65535> or max.

Mode Application Mode

Usage notes You can create more than one source port number or port range for an application.

Examples To specify source port 500 for the application named isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# sport 500
```

To specify source port 500 and a range of ports for the application named isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# sport 500
awplus(config-application)# sport 60000 to max
```

To specify the source port **any** (a port number range of 1-65535) for the application named isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# sport any
```

To remove source port 500 from the application named isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# no sport 500
```

To remove all source ports from the application named isakmp, use the commands:

```
awplus# configure terminal
awplus(config)# application isakmp
awplus(config-application)# no sport 1 to 65535
```

application

dport

show application

zone

Overview Use this command to create a zone entity or configure an existing zone.

Zone is a high level abstraction for a logical grouping or segmentation of physical networks. This is the highest level of partitioning that firewall policy can be applied to. Zone establishes the security border of your networks. A zone defines a boundary where traffic is subjected to policy restrictions as it crosses to another region of your networks. The minimum zones normally implemented would be a trusted zone for the private network behind the firewall and a untrusted zone for the Internet. Other common zones are a Demilitarized Zone (DMZ) for publicly visible web servers and a Virtual Private Network (VPN) zone for remote access users or tunnels to other networks.

Use the **no** variant of this command to destroy a zone entity.

Syntax

```
zone <zone-name>
no zone <zone-name>
```

Parameter	Description
<zone-name>	Zone name. You can use all alphanumeric ASCII characters, and the dash (-) and underscore (_) characters. The name can be 1 to 64 characters long.

Mode Global Configuration

Usage notes This command allows you to enter the Zone Mode with the prompt **awplus(config- category)#**. The Zone Mode enables you to create, configure and delete network entities. For more information about network entity, see the network (zone) command.

A zone entity must have at least one network entity for it to result in functioning rules using that zone entity. Fore more information about how to add network entities, see the network (zone) command.

Note that if the zone entity is destroyed, the networks and hosts of this zone will be destroyed as well.

Examples To create a zone named `private`, use the commands:

```
awplus# configure terminal
awplus(config)# zone private
awplus(config-zone)#
```

To destroy zone `private` and all its networks, subnets and hosts, use the commands:

```
awplus# configure terminal
awplus(config)# no zone private
```

Validation commands show entity

63 NAT Commands

Introduction

Overview This chapter provides an alphabetical reference of commands used to configure Network Address Translation (NAT). For more information about NAT introduction and configuration example, see the Firewall_and Network Address Translation (NAT) Feature Overview and Configuration_Guide.

The following figure lists the NAT commands and their applicable modes.

Figure 63-1: NAT commands and applicable modes

Mode	Command
Privileged Exec	show nat
	show nat rule
	show nat rule config-check
	show running-config nat
Global Configuration	nat
NAT Configuration	enable (nat)
	move rule (nat)
	rule (nat)

Command List

- "enable (nat)" on page 3256
- "ip limited-local-proxy-arp" on page 3257
- "local-proxy-arp" on page 3259
- "move rule (nat)" on page 3260
- "nat" on page 3261
- "rule (nat)" on page 3262

- "show nat" on page 3266
- "show nat rule" on page 3267
- "show nat rule config-check" on page 3269
- "show running-config nat" on page 3270

enable (nat)

Overview Use this command to enable NAT .

Use the **no** variant of this command to disable NAT without losing existing NAT configuration.

Syntax

```
enable
no enable
```

Default NAT is disabled by default.

Mode NAT Configuration

Examples To enable NAT, use the commands:

```
awplus# configure terminal
awplus(config)# nat
awplus(config-nat)# enable
```

To disable NAT, use the commands:

```
awplus# configure terminal
awplus(config)# nat
awplus(config-nat)# no enable
```

Validation commands show nat

show running-config nat

ip limited-local-proxy-arp

Overview Use this command to enable local proxy ARP, but only for a specified set of IP addresses. This makes the device respond to ARP requests for those IP addresses when the addresses are reachable via the interface you are configuring.

To specify the IP addresses, use the command local-proxy-arp.

Use the **no** variant of this command to disable limited local proxy ARP. This stops your device from intercepting and responding to ARP requests for the specified hosts. This allows the hosts to use MAC address resolution to communicate directly with one another.

Syntax

```
ip limited-local-proxy-arp
no ip limited-local-proxy-arp
```

Default Limited local proxy ARP is disabled by default.

Mode Interface Configuration

Usage Limited local proxy ARP supports Static NAT configurations in which the NAT configuration's public address is different to the ethernet interface's address.

On such ethernet interfaces, the device needs to respond to ARP requests for the public address so that it will receive packets targeted at that address.

Limited local proxy ARP makes this possible. It is especially useful when you have a number of 1-1 NAT configurations and each public address falls within the public interface's subnet. If you enable limited local proxy ARP on the public interface and specify suitable addresses, the device will respond to ARP requests for those addresses, as long as the addresses are routed out the interface the ARP requests are received on. The device responds with its own MAC address.

Example The following configuration snippet shows how to use limited local proxy ARP, if you are using NAT for an HTTP server with an address of 172.22.0.3 connected via eth1, and eth1 has an address of 172.22.0.1:

```
! Create a private zone for the HTTP server with address 172.22.200.3:
zone private
network vlan1
ip subnet 172.22.200.0/24
host http_server
ip address 172.22.200.3
!
! Create a public zone for the HTTP server with address 172.22.0.3:
zone public
network eth1
ip subnet 0.0.0.0/0 interface eth1
host http_server
ip address 172.22.0.3
!
! Create a NAT rule to map from the public to the private zone:
nat
rule 10 portfwd http from public.eth1 to public.eth1.http_server with dst
private.vlan1.http_server
enable
!
! Configure eth1. It has a different public address than the HTTP server:
interface eth1
ip limited local-proxy-arp
ip address 172.22.0.1/24
!
! Configure vlan1:
interface vlan1
ip address 172.22.200.5/24
!
! Tell the device to respond to ARPs for the HTTP server public address:
local-proxy-arp 172.22.0.3/32
```

Related commands ip local-proxy-arp

local-proxy-arp

local-proxy-arp

Overview Use this command to specify an IP subnet for use with limited local proxy ARP. When limited local proxy ARP is enabled with the command ip limited-local-proxy-arp, the device will respond to ARP requests for addresses in that subnet.

Use the **no** variant of this command to stop specifying a subnet for use with limited local proxy ARP.

Syntax

```
local-proxy-arp [<ip-add/mask>]
no local-proxy-arp [<ip-add/mask>]
```

Parameter	Description
<ip-add/mask>	The IP subnet to use with limited local proxy ARP, in dotted decimal format (A.B.C.D/M). To specify a single IP address, use a 32-bit mask.

Default No subnets are specified for use with limited local proxy ARP.

Mode Global Configuration

Example To specify limited local proxy ARP for the address 172.22.0.3, use the following commands:

```
awplus# configure terminal
awplus(config)# local-proxy-arp 172.22.0.3/32
```

This is part of a configuration snippet that shows how to use limited local proxy ARP with static NAT. See the command ip limited-local-proxy-arp for the whole example.

Related commands ip limited-local-proxy-arp

move rule (nat)

Overview Use this command to change the order of a NAT rule.

You can move an existing rule ID only to an ID that is not assigned to any rule, otherwise you will receive an error message.

Syntax

```
move rule <1-65535> to <1-65535>
```

Parameter	Description
`move rule <1-65535>`	Move the order of a given rule. The rule ID of the given rule must exist. Each rule has an ID which is either designated by the user or automatically generated when the rule is created. The rule ID is an integer from 1 to 65535.
`to <1-65535>`	New rule ID to assign. The new rule ID must not be used by any existing rule.

Mode NAT Configuration

Examples To change the ID of a rule from `10` to `30`, use the commands:

```
awplus# configure terminal
awplus(config)# nat
awplus(config-nat)# move rule 10 to 30
```

Validation commands

show nat rule

show running-config nat

Related commands

rule (nat)

nat

Overview Use this command to configure NAT.

Use the **no** variant of this command to remove all NAT configuration.

Syntax

```
nat
no nat
```

Mode Global Configuration

Usage notes This command allows you to enter the NAT Configuration mode. The command prompt for this mode is **awplus(config-nat)#**.

In the NAT Configuration mode, you can:

- Enable NAT, see the enable (nat) command.
- Create NAT rules or change the order of NAT rules, see the rule (nat) command and the move rule (nat) command.

Examples To configure NAT, use the commands:

```
awplus# configure terminal
awplus(config)# nat
awplus(config-nat)#
```

To remove all NAT configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no nat
```

Validation commands show nat

rule (nat)

Overview Use this command to create a NAT rule.

Use the **no** variant of this command to remove a specified rule or all rules.

Syntax

```
rule [<1-65535>] masq <application-name> from <source-entity>
to <destination-entity> [with src <source-host-entity>]
```

```
rule [<1-65535>] portfw <application-name> from <source-entity>
[to <destination-entity>] with dst <destination-host-entity>
[dport <1-65535>]
```

```
rule [<1-65535>] netmap <application-name> from
<source-subnet-entity> to <destination-subnet-entity> with
{src|dst} <translated-subnet-entity>
```

```
no rule {<1-65535>|all}
```

Parameter	Description
<1-65535>	Rule ID is an integer in the range 1 to 65535. If you do not designate a rule ID, a rule ID will be automatically generated and it will be greater than the current highest rule ID.
`masq`	The type of NAT rule. NAT with IP Masquerade is a case where all or a range of addresses are mapped to a single address with source port translation to identify the association. This single address masquerades as the public source address for the private addresses.
`portfw`	The type of NAT rule. Port forwarding allows remote hosts to connect to a specific host or service within a private LAN. This will forward IPv4 packets on to another device, for example, forward HTTP traffic to an internal web server.
`netmap`	The type of NAT rule. Use subnet-based NAT to translate the subnet portion of IP addresses while leaving the host portion unchanged.
<application-name>	In all NAT rules, the application name, either one of the predefined applications or an application defined by using the **application** command.

Parameter	Description
<source-entity>	Source entity name. An entity represents a logical grouping of subnets, hosts or interfaces, created by the **zone**, **network (Entity)**, or **host (Entity)** commands. In a **masq** rule, the source entity defines the private side of the router. You assign private IP addresses (RFC 1918) to hosts on the private side of the router. When those hosts send traffic, the router translates the private addresses to one or more publicly valid addresses before routing the traffic. When the router receives traffic that is destined for those hosts, it translates the public addresses back to the appropriate private addresses. In a **portfw** rule, the source entity may be an entity outside your private network.
<destination-entity>	The destination entity name. The destination entity defines the pool of public-valid IP addresses. It can be a zone (created by the **zone** command), network (**network (Entity)** command) or host (**host (Entity)** command).
<source-host-entity>	In a **masq** rule, the specific source host address that the traffic will masquerade as.The source -host-entity must be a host with one IP address, created by using the **host (Entity)** command.
<destination-host-entity>	In a **portfw** rule, the target entity name of the specific destination host that the traffic will be port-forwarded to. The target entity must be a host with one IP address, created by using the **host (Entity)** command.
`dport <1-65535>`	In a **portfw** rule, modify the destination port to the specified port. (Only for protocols that have ports.)
<source-subnet-entity>	The source entity that the netmap rule will apply to, for instance a network created by the **network (Entity)** command. When the **with src** parameter is used, this source-subnet-entity is translated to the <translated-subnet-entity> specified.
<destination-subnet-entity>	The destination entity that the **netmap** rule applies to, for instance a network created by the **network (Entity)** command. When the **with dst** parameter is used, this destination subnet is translated to the <translated-subnet-entity> specified.

Parameter	Description
<translated-subnet-entity>	In a **netmap** rule: **with src**: Modify the source-subnet-entity to the specified translated-subnet-entity, for instance a network created by the **network (Entity)** command. Both network entities must contain one subnet with a matching subnet mask. **with dst**: Modify the destination-subnet-entity to the specified translated-subnet-entity, for instance a network created by the **network (Entity)** command. Both network entities must contain one subnet with a matching subnet mask.
`all`	Remove all rules.

Mode NAT Configuration

Usage notes You can change the rule order by using the move rule (nat) command.

Firewall is used in conjunction with NAT. Port forwarding (**portfw**) and masquerade (**masq**) rules do not implicitly permit packets. **Portfw** rules (actions) are applied before any other firewall and **masq** rules (actions) are applied after any other firewall rules. When firewall protection is enabled, all traffic is blocked by default. Use the rule (firewall) command to configure firewall rules which allow the same application, source and destination entities you configure for the NAT rules.

Netmap **dst** rules are applied to traffic before it reaches the firewall rules, and netmap **src** rules are applied after the firewall has permitted the traffic. Firewall rules must be written to permit the traffic after it has been translated by the netmap **dst** rules.

Entities should have valid interfaces on which inbound and outbound traffic can be properly translated. You can use the ip subnet command and the ipv6 subnet command to configure the interfaces.

Removing a NAT rule for an actively translated flow does not stop it translating immediately. This means subsequent packets in the flow continue to be translated.

The continued translation after the associated NAT rule is removed will only stop when:

- The clear firewall connections command is executed or the flow stops.
- One of the following actions occurs:
  - You can use the clear firewall connections command to manually stop translations immediately, when the associated rule has been deleted regardless whether the firewall feature is actually configured with NAT or not.
  - The NAT rule is cleared when the traffic flow ends naturally, for example, stopped from the source. If the flow is re-initiated from a host, it will not be translated by the firewall, as the rule is deleted after the first flow stopped.

Examples

To perform network address translation and port forward application 'http' from entity 'public' to any with target destination dmz.servers.web_server, use the commands:

```
awplus# configure terminal
awplus(config)# nat
awplus(config-nat)# rule 10 portfw
http from public with dst dmz.servers.web_server
```

To perform network address translation and masquerade application 'http' from entity 'private' to 'public', use the commands:

```
awplus# configure terminal
awplus(config)# nat
awplus(config-nat)# rule 20 masq
http from private to public
```

To use subnet-based NAT to translate the source address of all traffic from 'private.lan' going to 'remote.lan' with the new subnet specified in 'private.global', use the commands:

```
awplus# configure terminal
awplus(config)# nat
awplus(config-nat)# rule 30 netmap all from private.lan to
remote.lan with src private.global
```

To remove NAT rule 10, use the command:

```
awplus(config-nat)# no rule 10
```

Command changes

Version 5.4.7-0.1: **netmap** option added.

show nat

Overview Use this command to show the configuration state of NAT.

Syntax

```
show nat
```

Mode Privileged Exec

Examples To show the configuration state of NAT, use the commands:

```
awplus# show nat
```

Output Figure 63-2: Example output from the **show nat** command

```
awplus#show nat
NAT is enabled
```

Related commands enable (nat)

show nat rule

Overview Use this command to show information about NAT rules.

Syntax `show nat rule [<1-65535>]`

Parameter	Description
<1-65535>	Rule ID

Mode Privileged Exec

Examples To show information about all NAT rules, use the command:

```
awplus# show nat rule
```

Output Figure 63-3: Example output from the **show nat rule** command

```
awplus#show nat rule

[* = Rule is not valid - see "show nat rule config-check"]
  ID     Action  App        From      To        With       Hits
-------------------------------------------------------------
* 30     masq    any        private   public    -          0
  10     portfw  http       public    -         dmz.a.b    0
```

To show information about a specific NAT rule, use the command:

```
awplus# show nat rule 10
```

Output Figure 63-4: Example output from the **show nat rule** command

```
awplus#show nat rule 10

[* = Rule is not valid - see "show nat rule config-check"]
  ID     Action  App        From      To        With       Hits
-------------------------------------------------------------
  10     portfw  http       public    -         dmz.a.b    0
```

Output Parameter	Description
*	Indicates the rule is not valid and cannot be hit, see the show nat rule config-check command.
App	Application name.
From	Source entity.

Output Parameter	Description
`with`	Target entity name.
`To`	Destination entity.
`Hits`	The number of times the NAT rule has been hit.

Related commands

rule (nat)

show nat rule config-check

show nat rule config-check

Overview Use this command to check configuration validity of NAT rules.

An invalid rule will not be active and cannot be hit.

This command also shows the reasons why a rule is not valid.

Syntax

```
show nat rule config-check
```

Mode Privileged Exec

Usage notes NAT rules are applied to applications and entities. A rule is not valid if either the application, source entity or destination entity the rule applies to is not configured properly.

To configure applications and entities, see Application and Entity Commands.

Examples To check configuration validity of NAT rules, use the command:

```
awplus# show nat rule config-check
```

Output Figure 63-5: Example output from the **show nat rule config-check** command if rule configuration errors are detected

```
awplus#show nat rule config-check
Rule 10:
  Application does not have a protocol configured
  "From" entity does not exist
  "To" entity has no subnet or host addresses
```

Output Figure 63-6: Example output from the **show nat rule config-check** command if all rules are valid

```
awplus#show nat rule config-check
All rules are valid
```

show running-config nat

Overview Use this command to show the configuration commands that have been used to configure NAT.

Syntax

```
show running-config nat
```

Mode Privileged Exec

Examples To show the configuration commands that have been used to configure NAT, use the commands:

```
awplus# show running-config nat
```

Output Figure 63-7: Example output from the **show running-config nat** command

```
awplus#show running-config nat
nat
 rule 10 masq http from private to public
 rule 20 portfw http from public with dst dmz.servers.wb
 enable
!
```

Part 9: Advanced Network Protection

64 IPS Commands

Introduction

Overview This chapter provides an alphabetical reference of commands used to configure Intrusion Prevention System (IPS). For more information, see the IPS Feature Overview and Configuration_Guide.

The table below lists the IPS commands and their applicable modes.

Figure 64-1: IPS Commands and Applicable Modes

Mode	Command
Privileged Exec	show ips
	show ips categories
	show running-config ips
Global Configuration	ips
IPS Mode	alert-thresholding
	category action (IPS)
	protect (IPS)

Command List

- "alert-thresholding" on page 3273
- "category action (IPS)" on page 3274
- "ips" on page 3275
- "protect (IPS)" on page 3276
- "show ips" on page 3277
- "show ips categories" on page 3278
- "show running-config ips" on page 3280

alert-thresholding

Overview Use this command to limit IPS to a maximum of 6 alerts per minute per destination IP address. This prevents IPS alerts from overwhelming the log files.

Use the **no** variant of this command to turn off the limit if you need to log every packet that matches an IPS rule (for example, for debugging purposes).

Syntax

```
alert-thresholding
no alert-thresholding
```

Default Enabled

Mode IPS Configuration

Example To stop limiting the number of IPS alerts, so that the device logs every packet that matches an IPS rule, use the commands:

```
awplus# configure terminal
awplus(config)# ips
awplus(config-ips)# no alert-thresholding
```

To limit the number of IPS alerts again, use the commands:

```
awplus# configure terminal
awplus(config)# ips
awplus(config-ips)# alert-thresholding
```

Related commands show log

show ips

Command changes Version 5.5.0-2.1: command added

category action (IPS)

Overview Use this command to configure an action for a specified category.

Use the **no** variant of this command to set the default action of alert for a specified category.

Syntax

```
category <category-name> action {alert|deny|disable}
no category <category-name> action
```

Parameter	Description
<category-name>	Category name. A category is a label that helps to classify the nature of traffic, for example, whether it is spammer, spot or spyware and so on. Once IPS protection is enabled, traffic will be categorized according to the available IPS categories. You can use the show ips categories command to view the categories and their actions.
`alert`	Generate a log message. This is the default action.
`deny`	Drop the matching packets. No error message is sent back to the source host.
`disable`	Ignore a specified category. Ignored categories will not be used to categorize traffic.

Default The default action is alert.

Mode IPS Mode

Examples To drop packet categorized as `checksum`, use the commands:

```
awplus# configure terminal
awplus(config)# ips
awplus(config-ips)# category checksum action deny
```

To set the default action for category `checksum`, use the commands:

```
awplus# configure terminal
awplus(config)# ips
awplus(config-ips)# no category checksum action
```

Validation Commands show ips categories

show running-config ips

ips

Overview Use this command to configure IPS.

Use the **no** variant of this command to remove all IPS configuration.

Syntax

```
ips
no ips
```

Mode Global Configuration

Usage notes This command allows you to enter the IPS mode. The command prompt for this mode is **awplus(config-ips)#**.

In the IPS mode, you can:

- Enable or disable IPS protection, see the protect (IPS) command.
- Configure an action for specified categories, see the category action (IPS) command.

Examples To configure IPS, use the commands:

```
awplus# configure terminal
awplus(config)# ips
awplus(config-ips)#
```

To remove all IPS configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no ips
```

protect (IPS)

Overview Use this command to enable IPS protection .

Use the **no** variant of this command to disable IPS protection.

Syntax

```
protect
no protect
```

Usage notes Once IPS protection is enabled, traffic will be categorized according to the available IPS categories. See the show ips categories command for the list of available IPS categories.

Default IPS is disabled by default.

Mode IPS Mode

Examples To enable IPS protection, use the commands:

```
awplus# configure terminal
awplus(config)# ips
awplus(config-ips)# protect
```

To disable IPS protection, use the commands:

```
awplus# configure terminal
awplus(config)# ips
awplus(config-ips)# no protect
```

Validation Commands

show ips

show running-config ips

show ips

Overview Use this command to show the IPS configuration state and event count for the Intrusion Prevention System (IPS).

Syntax

```
show ips
```

Mode Privileged Exec

Examples To display information about IPS, use the command:

```
awplus# show ips
```

Output Figure 64-2: Example output from **show ips**

```
awplus#show ips
Status:             Enabled (Active)
Events:             4
Alert Thresholding: Enabled
```

Table 64-1: Parameters in the output from **show ips**

Parameter	Description
Alert Thresholding	Either Enabled or Disabled. When enabled, IPS produces a maximum of 6 alerts per minute per destination IP address. This prevents IPS alerts from overwhelming the log files. To enable or disable this, use the alert-thresholding command.

show ips categories

Overview Use this command to show the IPS categories and their actions.

Note that if the IPS database provider is configured, this commands shows only the provider's categories.

Syntax

```
show ips categories
```

Mode Privileged Exec

Examples To show the IPS categories and their actions, use the command:

```
awplus# show ips categories
```

Output Figure 64-3: Example output of built-in categories from the **show ips categories** command

```
awplus#show ips categories
Category (* = invalid)       Action
--------------------------------------
  checksum                   alert
  ftp-bounce                 alert
  gre-decoder-events         alert
  http-events                alert
  icmp-decoder-events        alert
  ip-decoder-events          alert
  ppp-decoder-events         alert
  smtp-events                alert
  stream-events              alert
  udp-decoder-events         alert
```

Parameter	Description
`checksum`	Invalid checksums, e.g. IPv4, TCPv4, UDPv4, ICMPv4,TCPv6, UDPv6, ICMPv6.
`ftp-bounce`	GPL FTP PORT bounce attempt.
`gre-decoder events`	GRE anomalies, e.g. GRE packet too small, GRE wrong version, GRE v0 recursion control, GRE v0 flags, GRE v0 header too big, GRE v1 checksum present, GRE v1 routing present, GRE v1 strict source route, GRE v1 recursion control.
`http-events`	HTTP anomalies, e.g. HTTP unknown error, HTTP gzip decompression failed, HTTP request field missing colon, HTTP response field missing colon, HTTP invalid request chunk len, HTTP invalid response chunk len, HTTP status 100-Continue already seen, HTTP unable to match response to request, HTTP invalid server port in request.

Parameter	Description
`icmp-decoder-events`	ICMP anomalies, e.g. IPv6 with ICMPv4 header, ICMPv4 packet too small, ICMPv4 unknown type, ICMPv6 truncated packet, ICMPv6 unknown version.
`ip-decoder-events`	IPv4 & IPv6 anomalies, e.g. IPv4 packet too small, IPv4 header size too small, IPv4 wrong IP version, IPv6 packet too small, IPv6 duplicated Routing extension header, IPv6 duplicated Hop-By-Hop Options extension header, IPv6 DSTOPTS only padding, SLL packet too small, Ethernet packet too small, VLAN header too small, FRAG IPv4 Fragmentation overlap, FRAG IPv6 Packet size too large, IPv4-in-IPv6 invalid protocol, IPv6-in-IPv6 packet too short.
`ppp-decoder-events`	PPP anomalies, e.g. PPP packet too small, PPP IPv6 too small, PPP wrong type, PPPoE wrong code, PPPoE malformed tags.
`smtp-events`	SMTP anomalies, e.g. SMTP invalid reply, SMTP max reply line len exceeded, SMTP tls rejected, SMTP data command rejected.
`stream-events`	TCP anomalies, e.g. 3way handshake with ack in wrong dir, 3way handshake async wrong sequence, 3way handshake right seq wrong ack evasion, 4way handshake SYNACK with wrong ACK, STREAM CLOSEWAIT FIN out of window, STREAM ESTABLISHED SYNACK resend, STREAM FIN invalid ack, STREAM FIN1 ack with wrong seq, STREAM TIMEWAIT ACK with wrong seq, stream-events TCP packet too small, stream-events TCP duplicated option)
`udp-decoder-events`	UDP anomalies, e.g. UDP packet too small, UDP header length too small, UDP invalid header length

show running-config ips

Overview Use this command to show the configuration commands that have been used to configure IPS.

Syntax

```
show running-config ips
```

Mode Privileged Exec

Examples To show the commands that have been used to configure IPS, use the command:

```
awplus# show running-config ips
```

Output Figure 64-4: Example output from the **show running-config ips** command

```
awplus#show running-config ips
ips
 protect
!
```

65 URL Filtering Commands

Introduction

Overview

This chapter provides an alphabetical reference of commands used to configure URL filtering.

URL filtering blocks all HTTP and HTTPS access to a list of websites. You can specify a short list of websites (up to 1000 blacklist and 1000 whitelist rules) using custom blacklists to block URLs and custom whitelists to allow access to URLs.

For more information, see the URL Filtering Feature Overview_and Configuration Guide.

The following table lists the URL filtering commands and their applicable modes.

Figure 65-1: URL filtering commands and applicable modes

Mode	Command
`Privileged Exec`	show running-config url-filter
	show url-filter
	url-filter reload custom-lists
`Global Configuration`	url-filter
`URL Filter Configuration`	blacklist
	protect (url-filter)
	whitelist (url-filter)

Command List

- "blacklist" on page 3283
- "log url-requests" on page 3284
- "protect (url-filter)" on page 3285
- "show running-config url-filter" on page 3286
- "show url-filter" on page 3287

- "url-filter reload custom-lists" on page 3288
- "url-filter" on page 3289
- "whitelist (url-filter)" on page 3290

blacklist

Overview Use this command to add a custom blacklist file to the URL filtering configuration.

Use the **no** variant of this command to remove a blacklist from the URL filtering configuration.

Syntax

```
blacklist <location_of_blacklist_file>
no blacklist <location_of_blacklist_file>
```

Parameter	Description
<location_of_blacklist_file>	Location of the blacklist file. The blacklist file can be located in flash or on a USB device.

Mode URL Filter Configuration

Usage notes You can use custom blacklists to specify URLs to be blocked.

For information about blacklist rule format, see the URL Filtering Feature Overview and Configuration Guide.

You can use the whitelist (url-filter) command to add a whitelist that will override any corresponding blacklist entries.

Examples To add a blacklist that uses a custom file that is stored on a USB device, and then enable URL filtering, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# blacklist usb:/my_blacklist.txt
awplus(config-url-filter)# protect
```

To remove that blacklist file from the URL filtering configuration, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# no blacklist usb:/my_blacklist.txt
```

Related commands

protect (url-filter)

show url-filter

url-filter reload custom-lists

whitelist (url-filter)

log url-requests

Overview

If URL Filtering is enabled, then by default, black list hits and issues with match criteria and list files are logged.

Use this command to enable logging of all HTTP and HTTPS URL requests (both permitted and denied) passing through the firewall.

Use the **no** variant of this command to disable extra logging of HTTP and HTTPS URL requests passing through the firewall.

Syntax

```
log url-requests
no log url-requests
```

Default

Disabled by default.

Mode

URL Filter Configuration

Usage notes

When enabled, additional log messages for HTTP and HTTPS URL requests passing through the firewall contain the:

- URL being accessed
- IP address of the user that requested the URL

Example

To configure logging of all HTTP and HTTPS URL requests passing through the firewall (permitted as well as denied), use the following commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# log url-requests
```

Related commands

url-filter

Command changes

Version 5.4.7-1.1: command added

protect (url-filter)

Overview Use this command to enable URL filter protection.

Use the **no** variant of this command to disable URL filter protection without losing the existing URL filter configuration.

Syntax

```
protect
no protect
```

Default URL filter protection is disabled by default and all HTTP and HTTPS traffic is allowed.

Mode URL Filter Configuration

Examples To enable URL filter protection, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# protect
```

To disable URL filter protection, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# no protect
```

Related commands show url-filter

Command changes Version 5.4.7-1.1: HTTPS support added.

show running-config url-filter

Overview Use this command to show the running configuration information for URL filtering

Syntax
```
show running-config url-filter
```

Mode Privileged Exec

Examples To show the running configuration of URL filtering, use the command:
```
awplus# show running-config url-filter
```

show url-filter

Overview Use this command to show information about the configuration state of URL filtering.

Syntax

```
show url-filter
```

Mode Privileged Exec

Examples To show information about the configuration state of URL filtering, use the command:

```
awplus# show url-filter
```

Output Figure 65-2: Example output from **show url-filter**

```
awplus#show url-filter

Status:      Enabled (Active)
 Events:     104
Custom blacklists   Entries
 blacklist-example.txt  365
Custom whitelists   Entries
 whitelist-example.txt  4
```

Command changes Version 5.4.7-0.1: Event count added to the command output.

url-filter reload custom-lists

Overview Use this command to reload all custom blacklists and whitelists after editing one or more of them.

Syntax
```
url-filter reload custom-lists
```

Mode Privileged Exec

Examples To reload all custom blacklists and whitelists, use the following command:

```
awplus# url-filter reload custom-lists
```

Related commands blacklist

whitelist (url-filter)

url-filter

Overview Use this command to enter URL Filter Configuration mode and configure URL filtering functionality.

Use the **no** variant of this command to remove all URL filtering configuration.

Syntax

```
url-filter
no url-filter
```

Mode Global Configuration

Usage notes This command allows you to enter the URL Filter Configuration mode and changes the command prompt to **awplus(config-url-filter)#**.

The URL Filter Configuration mode enables you to:

- Enable URL filtering protection; see the protect (url-filter) command.
- Configure custom blacklists; see the blacklist command.
- Configure custom whitelists; see the whitelist (url-filter) command.

Examples To enter the URL Filter Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)#
```

To remove all URL filter configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no url-filter
```

Related commands

blacklist

protect (url-filter)

show running-config

show url-filter

whitelist (url-filter)

whitelist (url-filter)

Overview Use this command to add a custom whitelist file to the URL filtering configuration.

Use the **no** variant of this command to remove a whitelist from the URL filter configuration.

Syntax

```
whitelist <url_of_whitelist_file>
no whitelist <location_of_whitelist_file>
```

Parameter	Description
<location_of_whitelist_file>	Location of the whitelist file. The whitelist file can be located in flash or on a USB device.

Mode URL Filter Configuration

Usage notes Whitelist matching precedes blacklist matching. You can use custom whitelists to override any corresponding blacklist entries. An HTTP or HTTPS request that includes a URL that matches an entry in a whitelist will be permitted.

For information about whitelist rule format, see the URL Filtering Feature Overview and_Configuration Guide.

Examples To add a whitelist that uses a custom file that is stored on a USB device, and then enable URL filtering, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# whitelist usb:/my_whitelist.txt
awplus(config-url-filter)# protect
```

To remove that whitelist file from the URL filtering configuration, use the commands:

```
awplus# configure terminal
awplus(config)# url-filter
awplus(config-url-filter)# no whitelist usb:/my_whitelist.txt
```

Related commands

blacklist

protect (url-filter)

show url-filter

url-filter reload custom-lists

Command changes Version 5.4.7-1.1: HTTPS support added.

66 Application Awareness Commands

Introduction

This chapter provides an alphabetical reference of commands used to configure application awareness, which uses Deep Packet Inspection (DPI). For more information about application awareness and a configuration example, see the Application Awareness Feature Overview and Configuration_Guide.

Command List

- "counters detailed" on page 3292
- "dpi" on page 3293
- "enable (dpi)" on page 3294
- "provider (dpi)" on page 3296
- "show dpi" on page 3297
- "show dpi statistics" on page 3298
- "show running-config dpi" on page 3300

counters detailed

Overview Use this command to enable the display of transmit and receive counters for each entity in DPI mode.

Once you have enabled detailed counters, you can use the command **show dpi statistics <entity-name>** to display statistics for different applications on individual entities (zones, networks or hosts). This is called DPI statistics per entity.

Use the **no** variant of this command to disable DPI statistics per entity.

Syntax

```
counters detailed
no counters detailed
```

Default Disabled

Mode DPI Configuration

Usage notes These counters will require system resources and should only be configured when required. Use the **no** variant to turn them off when not required.

Example To configure DPI statistics per entity, use the commands:

```
awplus# configure terminal
awplus(config)# dpi
awplus(config-dpi)# provider built-in
awplus(config-dpi)# enable
awplus(config-dpi)# counters detailed
```

To disable DPI statistics per entity, use the commands:

```
awplus# configure terminal
awplus(config)# dpi
awplus(config-dpi)# no counters detailed
```

Related commands show dpi statistics

Command changes Version 5.4.9-1.1: command added

dpi

Overview Use this command to enter DPI Configuration mode to configure DPI for application awareness.

Use the **no** variant of this command to remove all DPI configuration.

Syntax

```
dpi
no dpi
```

Mode Global Configuration

Usage notes In DPI Configuration mode, you can:

- Set the DPI provider, using the provider (dpi) command.
- Enable DPI, using the enable (dpi) command.

Examples To begin configuring DPI, use the commands:

```
awplus# configure terminal
awplus(config)# dpi
awplus(config-dpi)#
```

To remove all DPI configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no dpi
```

Command changes Version 5.4.7-2.1: command added

enable (dpi)

Overview Use this command to enable DPI for application awareness.

Use the **no** variant of this command to disable DPI without losing existing DPI configuration.

Syntax

```
enable
no enable
```

Default DPI is disabled by default.

Mode DPI Configuration

Usage notes Use the provider (dpi) command to configure the DPI provider before enabling DPI.

When DPI is enabled, it can classify network traffic and identify today's most common applications.

DPI itself does not control or apply rules to the traffic. You can use the application awareness provided by DPI for:

- Network visibility
- Application Control, using the rule (firewall) command to enforce security policy and apply rules to the DPI applications
- Traffic Control, using the traffic control rules
- Policy-based Routing (PBR), using the PBR rules.

You can use the show dpi statistics command to show statistics for the applications being inspected by DPI.

For more information about configuring and using DPI, see the Application Awareness Feature_Overview and Configuration Guide .

Examples To enable DPI to use the built-in library, use the commands:

```
awplus# configure terminal
awplus(configt)# dpi
awplus(config-dpi)# provider built-in
awplus(config-dpi)# enable
```

To disable DPI, use the commands:

```
awplus# configure terminal
awplus(config)# dpi
awplus(config-dpi)# no enable
```

Related commands

provider (dpi)

show dpi

show running-config dpi

Command changes

Version 5.4.7-2.1: command added

provider (dpi)

Overview Use this command to set the DPI provider for the library of applications used for DPI to the built-in library predefined in device's operating system. Application awareness uses DPI, if enabled, to identify applications by matching packets to a library of application signatures.

Syntax

```
provider built-in
```

Default No provider is set by default.

Mode DPI Configuration

Usage notes You can use the show application command and the show application detail command to view all applications that the device recognizes. If DPI is enabled, the show commands can include the commands in the library specified with this provider command.

Note that custom applications override DPI applications, which override AlliedWare Plus predefined applications. For more information about applications, see the application command.

Note that you need to use this command before using the enable (dpi) command to enable DPI.

Examples To set the DPI provider to the built-in library of application signatures, use the commands:

```
awplus# configure terminal
awplus(config)# dpi
awplus(config-dpi)# provider built-in
awplus(config-dpi)# enable
```

Related commands

enable (dpi)

show application detail

show dpi

show running-config dpi

Command changes Version 5.4.7-2.1: command added

show dpi

Overview Use this command to show the DPI configuration state.

Syntax

```
show dpi
```

Mode Privileged Exec

Examples To show information about the DPI configuration and provider's library, use the command:

```
awplus# show dpi
```

Output Figure 66-1: Example output from **show dpi** with DPI enabled and the provider set to **built-in**

```
awplus#show dpi
Status:      running
Provider:    built-in
```

Table 66-1: Parameters in the output from **show dpi**

Parameter	Description
`Status`	The status of DPI: • running—DPI is running — DPI is enabled, and the provided library is available • disabled—DPI is disabled
`Provider`	The provider for the library of application signatures used to identify applications.

Related commands

enable (dpi)

provider (dpi)

Command changes Version 5.4.7-2.1: command added

show dpi statistics

Overview Use this command to display statistics for each application being inspected by DPI. This command gives you counts of the total number of packets and bytes of the applications being inspected by DPI. You can use the rule (firewall) command, traffic control rules or PBR rules to apply rules to the DPI applications.

You can also use this command to display application DPI statistics for an individual entity (zone, network or host). Enable this with the counters detailed command.

Syntax

```
show dpi statistics [<entity-name>]
```

Parameter	Description
<entity-name>	The name of an individual entity, for example the name of a zone, network or host.

Mode Privileged Exec

Examples To display the statistics for each application being inspected by DPI, use the command:

```
awplus# show dpi statistics
```

Output Figure 66-2: Example output from the **show dpi statistics** command on the console.

```
awplus#show dpi statistics
Application  Packets            Bytes
-----------------------------------------------
http         30                 2020
icmp         348                29232
telnet       45                 2553
```

To show information about the DPI statistics for an individual entity, for example the entity “joeb”, use the command:

```
awplus# show dpi statistics joeb
```

Figure 66-3: Examples output from **show dpi statistics**

```
awplus#show dpi statistics joeb
Statistics for entity: joeb
Application   TX Packets    RX Packets      TX Bytes      RX Bytes
-----------------------------------------------------------------
youtube            15413         16542         15412      45123645
google             15413           654         12205        451254
facebook            4115          8153          1100        123588
twitter            15413          4865         35459         24236
```

Table 66-2: Parameters in the output from **show dpi statistics**

Parameter	Description
Application	The application associated with the packet
TX Packets	Transmitted packets
RX Packets	Received packets
TX Bytes	Bytes transmitted
RX Bytes	Bytes received

Related commands counters detailed

Command changes Version 5.4.7-2.1: command added

Version 5.4.9-1.1: entity parameter added

show running-config dpi

Overview Use this command to show the configuration commands that have been used to configure DPI.

Syntax

```
show running-config dpi
```

Mode Privileged Exec

Examples To show the configuration commands that have been used to configure DPI, use the command:

```
awplus# show running-config dpi
```

Output Figure 66-4: Example output from the **show running-config dpi** command

```
awplus#show running-config dpi
dpi
 provider built-in
 enable
!
```

Command changes Version 5.4.7-2.1: command added

67 URL Offload Commands

Introduction

Overview

This chapter provides an alphabetical reference of commands used to configure URL offload.

You can use these commands to bypass a VPN or proxy server for particular destinations, and then send this traffic direct to the Internet. Destinations to be bypassed (offloaded) are based on provided lists of endpoint URLs or IP addresses. You can both:

- manually configure particular endpoint URLs or IP entries that you want to offload, and
- configure a router to periodically fetch and filter URLs or IP entries from the Microsoft Office365 endpoint service.

The Microsoft Office endpoint service can then automatically update information about which URLs or IP addresses can be offloaded directly to the Internet. This speeds up access to Microsoft Office365 cloud services when your network architecture routes all traffic to a VPN or Proxy server by default.

For more information, see the URL Offload Feature Overview and Configuration Guide.

Command List

- "endpoint-source" on page 3303
- "entry (endpoint-manual)" on page 3305
- "exclude-entry (endpoint-manual)" on page 3307
- "exclude-entry (endpoint-office365)" on page 3309
- "filter-endpoint" on page 3311
- "filter-endpoint include all" on page 3314
- "filter-entry exclude" on page 3316
- "filter-entry exclude type" on page 3318
- "pac-file http-server port" on page 3320

- "pac-file proxy-address" on page 3322
- "pac-file template" on page 3323
- "parser-updates enable" on page 3325
- "parser-updates interval" on page 3326
- "service url-offload" on page 3327
- "show running-config url-offload" on page 3328
- "show url-offload endpoint-source" on page 3329
- "show url-offload endpoint-source manual entries" on page 3330
- "show url-offload endpoint-source office365 entries" on page 3332
- "show url-offload endpoint-source office365 raw-data" on page 3335
- "show url-offload pac-file" on page 3338
- "show url-offload pac-file template" on page 3342
- "update-interval (endpoint-office365)" on page 3344
- "url (endpoint office365)" on page 3345
- "url-offload" on page 3346
- "url-offload update-now" on page 3347

endpoint-source

Overview Use this command to add a new URL offload endpoint source, or to enter the configuration mode for an existing endpoint source.

Use the **no** variant of this command to remove a URL offload endpoint source.

Syntax

```
endpoint-source <name> type {office365|manual}
no endpoint-source <name> type {office365|manual}
```

Parameter	Description
<name>	This is the identifier name for the endpoint source. The identifier is unique to the source type. For example, it is possible to create two endpoints with the same name, as long as the type is different.
`office365`	Configure an endpoint source that uses the Microsoft office365 endpoint service.
`manual`	Configure an endpoint source that holds manually configured entries.

Default No endpoint source name identifier or type is set.

Mode URL Offload Configuration

Usage notes This command adds a new endpoint source for URL offload. The endpoint source types supported are 'office365' and 'manual'.

Use the 'office365' type to fetch endpoints from the Microsoft Office365 endpoints service.

Use the 'manual' type to manually specify include entries for use with URL offload (see the entry (endpoint-manual) command).

This command enters a new configuration mode. From here you can enter the configuration needed for a specific endpoint type. The mode is dependent on the type of endpoint source.

Example To configure an office365 endpoint source using the name identifier 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)#
```

To configure a manual endpoint source using the name identifier 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type manual
awplus(config-endpoint-manual)#
```

Command changes

Version 5.5.0-0.1: command added

entry (endpoint-manual)

Overview Use this command to manually add endpoint entries to be included for URL offload. These entries are added to the '%%INCLUDE_CONDITION%%' section of the PAC file along with any other include entries from either manual or automatic sources.

Use the **no** variant of this command to remove the include entry from the endpoint entry list.

Syntax

```
entry {ip|ipv6|url} <value>
no entry {ip|ipv6|url} <value>
```

Parameter	Description
`ip`	IPv4 prefix to include for URL offload
`ipv6`	IPv6 prefix to include for URL offload
`url`	URL to include for URL offload
<value>	IPv4 prefix, IPv6 prefix, or URL to include for URL offload

Default No addresses are included for URL offload

Mode URL Offload Endpoint Manual Configuration

Usage notes To show the entries that are included for URL offload in the PAC file, use the **show url-offload pack-file** command. You will see the entries listed in the '%%INCLUDE_CONDITION%%' section of the PAC file.

Examples To include the endpoint entry URL 'test.example.com' in the inclusion list for URL offload under manual endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type manual
awplus(config-endpoint-manual)# entry url test.example.com
```

To remove the endpoint entry URL 'test.example.com', from the inclusion list for URL offload under manual endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type manual
awplus(config-endpoint-manual)# entry url test.example.com
```

To add the endpoint entry IP address '192.168.1.0/24' to the inclusion list for URL offload under manual endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type manual
awplus(config-endpoint-manual)# entry ip 192.168.0.1/24
```

Related commands

show url-offload pac-file

Command changes

Version 5.5.0-0.1: command added

exclude-entry (endpoint-manual)

Overview Use this command to exclude endpoint entries for URL offload. These entries are added to the '%%EXCLUDE_CONDITION%%' section of the PAC file to be processed before the include entries.

Use the **no** variant of this command to remove endpoint entries from the inclusion list for URL offload.

Syntax

```
exclude-entry {ip|ipv6|url} <value>
no exclude-entry {ip|ipv6|url} <value>
```

Parameter	Description
`ip`	IPv4 prefix to exclude from URL offload
`ipv6`	IPv6 prefix to exclude from URL offload
`url`	URL to exclude from URL offload
<value>	IPv4 prefix, IPv6 prefix, or URL to exclude from URL offload

Default No entries are excluded

Mode URL Offload Endpoint Manual Configuration

Usage notes The primary use for this command is if you want to exclude a specific entry that is part of a larger wildcard or subnet entry.

Examples To explicitly exclude 'example.facebook.com' from URL offload under manual endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type manual
awplus(config-endpoint-manual)# exclude-entry url
example.facebook.com
```

To remove the exclude entry that prevents 'example.facebook.com' from bypassing the VPN or proxy via URL offload under manual endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type manual
awplus(config-endpoint-manual)# no exclude-entry url
example.facebook.com
```

To include all entries for subnet 192.168.1.0/24 for URL offload except 192.168.1.2 under manual endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type manual
awplus(config-endpoint-manual)# entry ip 192.168.1.0/24
awplus(config-endpoint-manual)# exclude-entry ip
192.168.1.2/32
```

Command changes

Version 5.5.0-0.1: command added

exclude-entry (endpoint-office365)

Overview Use this command to explicitly exclude particular endpoint entries for URL offload. These entries are added to the '%%EXCLUDE_CONDITION%%' section of the PAC file to be processed before the include entries.

Use the **no** variant of this command to remove endpoint entries from the inclusion list for URL offload.

Syntax

```
exclude-entry {ip|ipv6|url} <value>
no exclude-entry {ip|ipv6|url} <value>
```

Parameter	Description
`ip`	IPv4 prefix to exclude from URL offload
`ipv6`	IPv6 prefix to exclude from URL offload
`url`	URL to exclude from URL offload
<value>	IPv4 prefix, IPv6 prefix, or URL to exclude from URL offload

Default No entries are excluded

Mode URL Offload Endpoint Office365 Configuration

Usage notes The primary use for this command is to exclude a specific endpoint entry from an endpoint that is included. This command is functionally equivalent to creating an exclude entry as part of a manual source, but is included in the office365 configuration mode to logically group related entries.

Examples To explicitly exclude 'example.facebook.com' from URL offload under office365 endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)# exclude-entry url
example.facebook.com
```

To remove the exclude entry that prevents 'example.facebook.com' from bypassing the VPN or proxy via URL offload under office365 endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)# no exclude-entry url
example.facebook.com
```

Related commands

show url-offload pac-file

Command changes

Version 5.5.0-0.1: command added

filter-endpoint

Overview Use this command to filter the endpoints retrieved from the office365 endpoints service.

Use the **no** variant of this command to remove all filtering.

Syntax

```
filter-endpoint {include|exclude} key <key> boolean
{true|false}
filter-endpoint {include|exclude} key <key> string <value>
filter-endpoint {include|exclude} key <key> integer <value>
no filter-endpoint
```

Parameter	Description
`include`	Include endpoints that have this key-value pair.
`exclude`	Exclude endpoints that have this key-value pair.
`key <key>`	The name of the key to filter on. The key that you use must exactly match the key in the Microsoft Endpoint data.
`boolean {true|false}`	Specify that the key value is a boolean, and whether it is **true** or **false**.
`string <value>`	Specify that the key value is a string, and what the string is (for example 'Optimize').
`integer <value>`	Specify that the key value is an integer, and what the integer is (for example 32).

Default No filter entries are included

Mode URL Offload Endpoint Office365 Configuration

Usage notes The endpoints entries retrieved via this service are grouped into endpoints for a particular service and categorized using various 'key-value' pairs. These values are used to filter which endpoints are included for URL offload.

An example of a single endpoint is shown in the output below. At the time of this example the 'worldwide' endpoints list contained 146 endpoints.

Figure 67-1: Example output from **show url-offload endpoint-source office365 entries**

```
{
    "id": 1,
    "serviceArea": "Exchange",
    "serviceAreaDisplayName": "Exchange Online",
    "urls": [
      "outlook.office.com",
      "outlook.office365.com"
    ],
    "ips": [
      "13.107.6.152/31",
      "13.107.18.10/31",
      ...
      "2603:1006::/40",
      "2603:1016::/40",
      "2603:1026::/40",
       ...
      "2a01:111:f400::/48"
    ],
    "tcpPorts": "80,443",
    "expressRoute": true,
    "category": "Optimize",
    "required": true
   },
```

You can use include and exclude filters. Use include filters to include whole endpoints in the list (like the example above). Use exclude filters to remove whole endpoints from the list. Exclude filters override include filters.

In this feature, an office365 endpoint is a block like the one shown in the example above. An endpoint entry is a single URL or IP address. This command operates at the level of include or exclude whole endpoints.

Examples To include entries marked as required: true for endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)# filter-endpoint include key
required boolean true
```

To include all entries except the entry with id: 32 for endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)# filter-endpoint exclude key
id integer 32
```

To include entries marked as category: Optimize for endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)# filter-endpoint include key category string Optimize
```

Command changes

Version 5.5.0-0.1: command added

filter-endpoint include all

Overview Use this command to include all endpoints from the office365 source. See the Usage notes below before using this command.

Use the **no** variant of this command to disable the inclusion of all endpoints from the office365 source.

Syntax

```
filter-endpoint include all
no filter-endpoint include all
```

Default No endpoints are included

Mode URL Offload Endpoint Office365 Configuration

Usage notes Using this command without examining the result and explicitly excluding endpoint entries is not recommended. This is because this command includes URLs for a number of third-party services, for example, Facebook, Google and Dropbox.

Without this command or at least one other include filter, no endpoints will be included.

Example To use all endpoints in the office365 endpoint information for the endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)# filter-endpoint include all
```

To disable including all endpoints in the office365 endpoint information for the endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)# no filter-endpoint include
all
```

Command changes

Version 5.5.0-0.1: command added

filter-entry exclude

Overview Use this command to filter out specific endpoint entries from the list of entries included for URL offload for an office365 endpoint source. The entries are removed from the list of entries stored for the source.

Use the **no** variant of this command to remove an entry from the list.

Syntax

```
filter-entry exclude {ip|ipv6|url} <value>
no filter-entry exclude {ip|ipv6|url} <value>
```

Parameter	Description
`ip`	Filter out entries with the given IPv4 prefix
`ipv6`	Filter out entries with the given IPv6 prefix
`url`	Filter out entries with the given URL
<value>	The IPv4 prefix, IPv6 prefix, or URL to exclude.

Default There is no default

Mode URL Offload Endpoint Office365 Configuration

Examples To filter out entries for 'www.example.com' from URL offload under office365 endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-url-offload-office365)# filter-entry exclude url
www.example.com
```

To remove the filter entry 'www.example.com', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-url-offload-office365)# no filter-entry exclude
url www.example.com
```

Command changes Version 5.5.0-0.1: command added

filter-entry exclude type

Overview Use this command to explicitly exclude a particular endpoint entry type for URL offload. Entries of this type are removed from the entry list.

Use the **no** variant of this command to stop excluding entry types.

Syntax

```
filter-entry exclude type {url|ip|ipv6}
no filter-entry exclude type {url|ip|ipv6}
```

Parameter	Description
`url`	Filter out URL entries
`ip`	Filter out IPv4 entries
`ipv6`	Filter out IPv6 entries

Default All types are included

Mode URL Offload Endpoint Office365 Configuration

Example To exclude IP entries from being stored and included in the PAC file for office365 endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-url-offload-office365)# filter-entry exclude ip
```

To stop excluding IP entries from being stored and included in the PAC file for office365 endpoint source 'test', use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-url-offload-office365)# no filter-entry exclude ip
```

show url-offload pac-file

Command changes Version 5.5.0-0.1: command added

pac-file http-server port

Overview Use this command to set the HTTP port to use for serving URL offload PAC files.

Use the **no** variant of this command to disable serving URL offload PAC files.

Syntax

```
pac-file http-server port <port>
no pac-file http-server
```

Parameter	Description
<port>	The port number you want to use to serve the PAC file, in the range 1 to 65535.

Default Disabled

Mode URL Offload Configuration

Usage notes Use this command to configure the router to serve Proxy Auto-Configuration (PAC) files that are generated by the URL offload feature. If configured, an HTTP service is provided on the configured port that serves a PAC file with the name extension 'wpad.dat'.

The port number may be the same as the main management HTTP web server, but if it is, requests may be redirected to the HTTPS secure port.

The main reason for choosing a non-default port number is to allow locking down access to the management HTTP server, to specific hosts without blocking the access that all clients need to download the PAC file.

NOTE: *Attempting to assign a port that is bound to another service may cause your device to restart.*

Examples To serve the PAC file on port 80, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# pac-file http-server port 80
```

To disable serving the PAC file on port 80, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# no pac-file http-server
```

Related commands

pac-file proxy-address

show running-config url-offload

show url-offload pac-file

show url-offload pac-file template

Command changes Version 5.5.0-0.1: command added

pac-file proxy-address

Overview Use this command to configure a proxy address to use in the Proxy Auto-Configuration (PAC) file generated by URL offload.

Use the **no** variant of this command to remove the configured proxy address.

Syntax

```
pac-file proxy-address <address>
no pac-file proxy-address
```

Parameter	Description
<address>	Proxy address to use in the generated PAC file. We recommend to use an IP address, but you can also use a host name or URL.

Default No proxy address is set

Mode URL Offload Configuration

Usage notes Use this command to configure the proxy address to use in the PAC file generated by URL offload. This address is a text string. If you use a non-default PAC file template, it replaces the placeholder '%%PROXY_ADDRESS%%' in the template.

The proxy address can be a host name, URL, or IP address with a port number.

Example To configure the proxy address 10.10.10.10 on port 8080, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# pac-file proxy-address
10.10.10.10:8080
```

To unset the proxy address 10.10.10.10 on port 8080, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# no pac-file proxy-address
```

Related commands

show running-config url-offload

show url-offload pac-file

show url-offload pac-file template

Command changes Version 5.5.0-0.1: command added

pac-file template

Overview Use this command to configure a custom (instead of the default) template to use for URL offload.

Use the **no** variant of this command to revert back to the default template to use for URL offload.

Syntax

```
pac-file template {local|remote} <url>
no pac-file template
```

Parameter	Description
`local`	Use a template file stored on the local file system of your device
`remote`	Use a template file fetched via HTTP
<url>	For the local option, URLs must start with 'flash', 'usb' or 'card'. The file must exist at one of these locations. For the remote option, a URL is used. No validation is performed on the URL, but the URL should point to a PAC file template with the required placeholders.

Default Default PAC file template

Mode URL Offload Configuration

Usage notes The template can be stored in the file system of your device, or fetched from a remote server using HTTP. Both of these options cause the URL offload feature to fetch the template when updating the PAC file. A cached version of the template is used if multiple updates occur within a 1 minute time period.

The template must include two placeholders '%%EXCLUDE_MATCHES%%' and '%%INCLUDE_MATCHES%%'. These are replaced by the relevant condition statements. The template may also include the '%%PROXY_ADDRESS%%' placeholder. If it does, this is replaced by the proxy address configured using the command **pac-file proxy-address** in URL Offload Configuration mode.

NOTE: *Exclude conditions should always be processed before include conditions.*

Using the command **show url-offload pac-file template** shows the contents of the template that is being used. Running this command before configuring a template shows the default template. The default template has an example of how to write a template.

Example To use the file 'pac_template.pac' in the device flash as the template, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# pac-file template local
flash:/pac_template.pac
```

To use the PAC file template 'remote_pac_template.pac' stored on a (reachable) HTTP server at 192.168.1.2, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# pac-file template remote
http://192.168.1.2/remote_pac_template.pac
```

To revert back to the default template, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# no pac-file template
```

Related commands

pac-file proxy-address

Command changes

Version 5.5.0-0.1: command added

parser-updates enable

Overview Use this command to enable automatic updates of the parsing functionality used by URL offload via the Allied Telesis Update Server.

Use the **no** variant of this command to disable automatic updates of the parsing functionality used by URL offload via the Allied Telesis Update Server.

Syntax

```
parser-updates enable
no parser-updates enable
```

Default Disabled

Mode URL Offload Configuration

Example To enable the automatic updates, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# parser-updates enable
```

To disable the automatic updates, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# no parser-updates enable
```

Related commands parser-updates interval

show running-config url-offload

Command changes Version 5.5.0-0.1: command added

parser-updates interval

Overview Use this command to configure the parsing interval for periodic updates via the Allied Telesis update server.

Use the **no** variant of this command to set the interval back to the default (60 minutes).

Syntax

```
parser-updates interval {minutes <10-525600>|hours
<1-8760>|days <1-365>|weeks <1-52>}
no parser-updates interval
```

Parameter	Description
`minutes <10-525600>`	Configure the interval in minutes, in the range 10 to 525600
`hours <1-8760>`	Configure the interval in hours, in the range 1 to 8760
`days <1-365>`	Configure the interval in days, in the range 1 to 365
`weeks <1-52>`	Configure the interval in weeks, in the range 1 to 52

Default 60 minutes

Mode URL Offload Configuration

Examples To set the parser updates interval to 180 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# parser-updates interval minutes 180
```

To set the parser updates interval back to the default value (60 minutes), use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# no parser-updates interval
```

Related commands parser-updates enable

show running-config url-offload

Command changes Version 5.5.0-0.1: command added

service url-offload

Overview Use this command to enable the URL offload service.

Use the **no** version of the command to disable the URL offload service if it is unused.

Syntax

```
service url-offload
no service url-offload
```

Default Enabled

Mode Global Configuration

Usage notes Sometimes it may be desirable to disable unused services, in order to reduce memory use. This command lets you disable the URL offload service.

Example To disable the URL offload service, use the commands:

```
awplus# configure terminal
awplus(config)# no service url-offload
```

Command changes Version 5.5.0-0.1: command added

show running-config url-offload

Overview Use this command to show the current configuration for the URL offload feature.

Syntax

```
show running-config url-offload
```

Mode Privileged Exec

Example To show the current URL offload configuration, use the command:

```
awplus# show running-config url-offload
```

Output Figure 67-2: Example output from **show running-config url-offload**

```
url-offload
 endpoint-source test type office365
  url https://endpoints.office.com/endpoints/worldwide
  update-interval hours 1
  filter-endpoint include key category string Optimize
  filter-entry exclude type ip
 pac-file proxy-address 10.10.10.10:8080
 pac-file http-server port 80
 pac-file template local flash:/wpad.template
!
```

show url-offload endpoint-source

Overview Use this command to show information about configured URL offload endpoint sources.

Syntax
```
show url-offload endpoint-source
```

Mode Privileged Exec

Usage notes For Office365 type sources, the name, URL, update interval and last update time are shown. For manual type sources, only the name is shown.

Example To show information about configured URL offload endpoint sources, use the commands:

```
awplus# show url-offload endpoint-source
```

Output Figure 67-3: Example output from **show url-offload endpoint-source**

```
awplus#show url-offload endpoint-source

Microsoft Office365 endpoint sources:

Name: test
 URL: https://endpoints.office.com/endpoints/worldwide
 Update interval: 1 hours
 Update time: 2019-10-02T12:56:21Z

Manual endpoint sources:

Name: manual_test
```

Related commands
endpoint-source

update-interval (endpoint-office365)

url-offload

Command changes Version 5.5.0-0.1: command added

show url-offload endpoint-source manual entries

Overview Use this command to show endpoint entries for a URL offload manual endpoint source. Manually configured entries attached to an endpoint source are displayed.

Syntax

```
show url-offload endpoint-source manual entries
show url-offload endpoint-source manual <name> entries
```

Parameter	Description
<name>	The name of the manual endpoint source, for example 'test'.

Mode Privileged Exec

Usage notes Use the optional parameter to display a specific endpoint source by its *<name>*. If no parameter is used, then all endpoint entries for all manual endpoint sources are displayed.

Examples To show endpoint entries for manual endpoint source 'test', use the command:

```
awplus# show url-offload endpoint-source manual test entries
```

To show endpoint entries for all manual endpoint sources, use the command:

```
awplus# show url-offload endpoint-source manual entries
```

Output Figure 67-4: Example output from **show url-offload endpoint-source manual test entries**

```
awplus#show url-offload endpoint-source manual test entries
Name: test

Include Entries:
 Type: url
 Value: *.example.com

 Type: ip

```

Related commands entry (endpoint-manual)

Command changes Version 5.5.0-0.1: command added

show url-offload endpoint-source office365 entries

Overview Use this command to show endpoint entries for office365 endpoints.

Syntax

```
show url-offload endpoint-source office365 <name> entries
[filtered|unusable]
```

```
show url-offload endpoint-source office365 entries
[filtered|unusable]
```

Parameter	Description
<name>	This is the name of an endpoint source, for example 'test'. If you do not use this parameter, then all endpoint sources are displayed.
`filtered`	Use this parameter to show entries that are included, or explicitly excluded, for this source.
`unusable`	Use this parameter to show URLs and IPs from the endpoint information that can not be used to create entries. For example, this is usually because there is a missing full stop after a wildcard.

Mode Privileged Exec

Usage notes Entries that are displayed using this command are parsed from the information fetched from the endpoint service. You can show all parsed entries, or only entries that are included or excluded using the **filtered** parameter.

Examples To show all the parsed endpoint entries for the endpoint source 'test', use the command:

```
awplus# show url-offload endpoint-source office365 test entries
```

To show endpoint entries specifically included or excluded for the endpoint source 'test', use the command:

```
awplus# show url-offload endpoint-source office365 test entries
filtered
```

To show endpoint entries that can't be parsed for the endpoint source 'test', use the command:

```
awplus# show url-offload endpoint-source office365 test entries
unusable
```

Output Figure 67-5: Example output from **show url-offload endpoint-source office365 test entries filtered**

```
awplus#show url-offload endpoint-source office365 test entries filtered
Endpoint source: test
Include entries:
Type  Value
------------------------------------------------------------------------------
ip    13.107.6.152/31
ip    13.107.18.10/31
...
ip    150.171.40.0/22
ip    191.234.140.0/22
ip    204.79.197.215/32
ipv6  2603:1006::/40
...
ipv6  2a01:111:f402::/48
url   *.sharepoint.com
url   outlook.office.com
url  outlook.office365.com

Exclude entries:
Type  Value
------------------------------------------------------------------------------
url   mobile.facebook.com
```

Figure 67-6: Example output from **show url-offload endpoint-source office365 test entries unusable**

```
awplus#show url-offload endpoint-source office365 test entries unusable
Endpoint source: test
Unusable entries
------------------------------------------------------------------------------
*-files.sharepoint.com
*-myfiles.sharepoint.com
*broadcast.officeapps.live.com
*cdn.onenote.net
*excel.officeapps.live.com
*onenote.officeapps.live.com

show url-offload endpoint-source office365 raw-data

Command changes Version 5.5.0-0.1: command added

show url-offload endpoint-source office365 raw-data

Overview Use this command to show the raw JSON data fetched from the Microsoft Office365 endpoint service for diagnostic and configuration debug purposes.

Syntax

```
show url-offload endpoint-source office365 <name> raw-data
```

Parameter	Description
<name>	This is the name of an endpoint source, for example 'test'. If you do not use this parameter, then all endpoint sources are displayed.

Mode Privileged Exec

Usage notes Use this command to work out what filtering you require. The output is quite long.

Example To show raw JSON data fetched from the office365 endpoint source 'test', use the command:

```
awplus# show url-offload endpoint-source office365 test
raw-data
```

Output Figure 67-7: Example output from **show url-offload endpoint-source office365 raw-data**

```
awplus#show url-offload endpoint-source office365 test raw-data

Command changes

Version 5.5.0-0.1: command added

show url-offload pac-file template

Overview Use this command to show the template that is currently used to generate the Proxy Auto-Configuration (PAC) file for the URL offload feature.

Syntax

```
show url-offload pac-file template
```

Mode Privileged Exec

Usage notes The template must include two placeholders '%%EXCLUDE_MATCHES%%' and '%%INCLUDE_MATCHES%%'. These are replaced by the relevant condition statements. The template may also include the '%%PROXY_ADDRESS%%' placeholder. If it does, this is replaced by the proxy address configured using the command **pac-file proxy address** in URL Offload Configuration mode.

NOTE: *Exclude conditions should always be processed before include conditions.*

The default template can be shown, and then used as an example when writing a different template.

Example To display the default template that is currently in use, use the command:

```
awplus# show url-offload pac-file template
```

Output Figure 67-9: Example output from **show url-offload pac-file template**

```
awplus#show url-offload pac-file template

function FindProxyForURLEx(url, host)
{
    var direct = "DIRECT";
    var proxyServer = "PROXY %%PROXY_ADDRESS%%";

    /* Host is on local network (no dots in name) */
    if (isPlainHostName (host))
    {
        return direct;
    }

    /* Exclude matches */
    if(%%EXCLUDE_MATCHES%%)
    {
        return proxyServer;
    }

    /* Include matches */
    if(%%INCLUDE_MATCHES%%)
    {
        return direct;
    }

    return proxyServer;
}

function FindProxyForURL(url, host)
{
    return FindProxyForURLEx (url, host);
}
```

update-interval (endpoint-office365)

Overview Use this command to configure the update interval for URL offload office365 endpoints.

Use the **no** variant of this command to disable automatic updating for URL offload office365 endpoints. You can use the **url-offload update-now** command to update the endpoints if you want to.

Syntax

```
update-interval {days <1-30>|hours <1-720>|minutes <1-43200>}
no update-interval
```

Parameter	Description
`days <1-30>`	Specify the update interval in days, in the range 1 to 30
`hours <1-720>`	Specify the update interval in hours, in the range 1 to 720
`minutes <1-43200>`	Specify the update interval in minutes, in the range 1 to 43200

Default Disabled

Mode URL Offload Endpoint Office365 Configuration

Examples To update the endpoint source 'test' at hourly intervals, use the commands:

```
awplus# configure terminal
awplus(config)# url offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)# update-interval hours 1
```

To disable automatic updates, use the commands:

```
awplus# configure terminal
awplus(config)# url offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)# no update-interval
```

Related commands

url (endpoint office365)

Overview Use this command to set the URL to use as the source for the office365 endpoint service.

Use the **no** variant of this command to remove the configured URL as the source for the office365 endpoints service.

Syntax

```
url <url>
no url
```

Parameter	Description
<url>	The URL address to use to fetch the JSON data from the office365 endpoints service.

Default No URL is configured

Mode URL Offload Endpoint Office365 Configuration

Examples To configure the URL so you can use the office365 endpoint service, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)# url
https://endpoints.office.com/endpoints/worldwide
```

To remove the configured URL for the office365 endpoint service, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)# endpoint-source test type office365
awplus(config-endpoint-office365)# no url
```

Related commands show running-config url-offload

show url-offload endpoint-source

Command changes Version 5.5.0-0.1: command added

url-offload

Overview Use this command to enter configuration mode for the URL offload feature.

Syntax
```
url-offload
```

Mode Global Configuration

Usage notes URL offload allows you to divert particular URL traffic directly to the Internet, rather than sending it to a proxy server or VPN.

Example To enter configuration mode for the URL offload feature, use the commands:

```
awplus# configure terminal
awplus(config)# url-offload
awplus(config-url-offload)#
```

Related commands show running-config url-offload

Command changes Version 5.5.0-0.1: command added

url-offload update-now

Overview Use this command to trigger an immediate update of all URL offload endpoints. The latest endpoint data is fetched and the PAC file is regenerated.

Syntax

```
url-offload update-now
```

Mode Privileged Exec

Example To trigger an immediate update of all URL offload endpoint data, use the command:

```
awplus# url-offload update-now
```

Related commands show running-config url-offload

show url-offload pac-file

Command changes Version 5.5.0-0.1: command added

Introduction

Overview

This chapter provides an alphabetical reference of commands used to configure Internet Protocol Security (IPsec) tunnel.

For introductory information about IPsec tunnel in AlliedWare Plus, including overview and configuration information, see the:

- Internet Protocol Security (IPsec) Feature Overview and_Configuration Guide
- GRE and Multipoint VPNs Feature Overview and Configuration Guide

- "version (ISAKMP)" on page 3404

clear isakmp sa

Overview Use this command to delete Internet Security Association Key Management Protocol (ISAKMP) Security Associations (SAs). SAs specify the Security Parameter Index (SPI), protocols, algorithms and keys for protecting a single flow of traffic between two IPSec peers. For more information about SA, see the Internet Protocol Security (IPSec) Feature Overview and Configuration Guide.

Syntax

```
clear [crypto] isakmp sa [peer <ipv4-addr>|<ipv6-addr>|
<hostname>] [force]
```

Parameter	Description
<ipv4-addr>	Destination IPv4 address. The IPv4 address uses the format A.B.C.D.
<ipv6-addr>	Destination IPv6 address. The IPv4 address uses the format X:X::X:X.
<hostname>	Destination host name.
`force`	Force to clear ISAKMP SAs without negotiating with the peer.

Mode Privileged Exec

Examples To delete the ISAKMP security associations at the peer for an IPv6 address, use the command:

```
awplus# clear isakmp sa peer 2001:0db8::1
```

To delete the ISAKMP security associations at the peer for an IPv4 address, use the command:

```
awplus# clear isakmp sa peer 192.168.2.1
```

To delete the ISAKMP security associations at the peer for a host name, use the command:

```
awplus# clear isakmp sa peer remote.example.com
```

Related commands crypto isakmp key

show isakmp sa

Command Changes Version 5.4.7-0.1: Parameter <hostname> added for DDNS feature.

crypto ipsec profile

Overview Use this command to configure a custom IPsec profile.

An IPsec profile comprises one or more transforms that can be configured by using the transform (IPsec Profile) command.

Use the **no** variant to delete a previously created profile.

Syntax

```
crypto ipsec profile <profile_name>
no crypto ipsec profile <profile_name>
```

Parameter	Description
<profile_name>	Profile name. Profile names are case insensitive and can be up to 64 characters long composed of printable ASCII characters. Profile names can have only letters from a to z and A to Z, numbers from 0 to 9, - (dash), or _ (underscore).

Default The default IPsec profile with transforms in order of preference is listed in the following table. Which IPsec profile will actually be used depends on how the negotiation between the peers is carried out when establishing the connection. Note that you cannot delete or edit the default profile. Expiry time of 8 hours applies to the default IPsec profile.

Table 68-1: IPsec default profile

Attribute	Transform 1	Transform 2	Transform 3	Transform 4	Transform 5	Transform 6
Protocol	ESP	ESP	ESP	ESP	ESP	ESP
Encryption (all CBC)	AES256	AES256	AES128	AES128	3DES	3DES
Integrity (all HMAC)	SHA256	SHA1	SHA256	SHA1	SHA256	SHA1

Mode Global Configuration

Examples To configure a custom IPsec profile for establishing IPSec SAs with a remote peer, use the following commands:

```
awplus# configure terminal
awplus(config)# crypto ipsec profile my_profile
awplus(config-ipsec-profile)# transform 2 protocol esp
integrity sha1 encryption 3des
```

To delete a custom profile, use the following commands:

```
awplus# configure terminal
awplus(config)# no crypto ipsec profile my_profile
```

transform (IPsec Profile)

crypto isakmp key

Overview Use this command to configure an ISAKMP authentication key. These keys can be of type Pre-shared Key (PSK) or Extensible Authentication Protocol (EAP). Keys are stored encrypted in the running-configuration.

You must configure this key whenever you specify authentication keys in an (Internet Key Exchange) IKE policy and at both peers.

This command specifies both the value of the key and also an identifier (the hostname, address or policy parameters). This identifier is used to decide which key to use for a particular ISAKMP message exchange.

See the Usage section below for more information, and see the following guides for examples:

- Internet Protocol Security (IPsec) Feature Overview and_Configuration Guide
- GRE and Multipoint VPNs Feature Overview and Configuration Guide

Use the **no** variant to remove a key.

Syntax

```
crypto isakmp key [8] <key> hostname <hostname> [type {eap|psk}]
no crypto isakmp key [8] <key> hostname <hostname> [type {eap|psk}]
crypto isakmp key [8] <key> address {<ipv4-addr>|<ipv6-addr>} [type {eap|psk}]
no crypto isakmp key [8] <key> address {<ipv4-addr>|<ipv6-addr>} [type {eap|psk}]
crypto isakmp key [8] <key> policy <policy-name> [type {eap|psk}]
no crypto isakmp key [8] <key> policy <policy-name> [type {eap|psk}]
```

Parameter	Description
`crypto`	Security specific command.
`isakmp`	Internet Security Association Key Management Protocol provides a common framework for key management implementations.
`key`	Pre-shared key (PSK) or Extensible Authentication Protocol (EAP).
<key>	Specify the key. Use any combination of alphanumeric characters up to 128 bytes.
8	Specifies that an encrypted key follows.
<hostname>	A hostname (e.g. example.com).
<ipv4-addr>	IPv4 address. The IPv4 address uses the format A.B.C.D.
<ipv6-addr>	IPv6 address. The IPv6 address uses the format X:X::X:X.

Parameter	Description
<policy-name>	The local policy name. This is the name of the tunnel (e.g. tunnel2).
`type`	ISAKMP key type
`eap`	Extensible Authentication Protocol. This can be used with multipoint VPN when performing RADIUS authentication. See the GRE and Multipoint VPNs Feature Overview and Configuration Guide for more information.
`psk`	Pre-shared Key (default)

Default ISAKMP keys do not exist.

Mode Global Configuration

Usage notes Use this command to configure an authentication key for use with the ISAKMP protocol.

Before a tunnel can be protected by IPsec, each endpoint of the tunnel must verify that they are communicating with an authorized entity. ISAKMP uses authentication keys in the initial handshake between peers to ensure both endpoints are allowed to communicate.

This command specifies both the value of the key and also an identifier which is used to decide which key to use for a particular ISAKMP message exchange. Because the responding endpoint does not identify itself to the local device until after the key is used, it is important that the key identifier is part of the tunnel configuration on the initiating device.

The tunnel configuration parameter used to select which key to use when negotiating IPsec protection for that tunnel is in priority order:

1) **tunnel remote name**

2) **tunnel destination <ipv4-address>|<ipv6-address>** (if the remote name is not specified)

3) **tunnel local name**

4) **tunnel source <ipv4-address>|<ipv6-address>** (if the remote name is not specified)

For point-to-point tunnels, we recommend you configure local and remote names on the tunnels. Then use the remote name of the other device to identify the authentication keys on the local device.

For point-to-multipoint tunnels, it may be necessary to identify the authentication key by the local name of the tunnel, if the ISAKMP negotiation is to be initiated by that tunnel. This is because it is not possible to configure multiple remote names. However, it is possible to use the expected remote addresses or names of the remote initiating tunnels to identify keys. This is because the remote tunnel will identify itself when it initiates a connection.

Examples

To configure a pre-shared authentication key of "friend", using a hostname, use the commands below:

```
awplus# configure terminal
awplus(config)# crypto isakmp key friend hostname
mypeer@my.domain.com
```

To remove that pre-shared key, use the commands below:

```
awplus# configure terminal
awplus(config)# no crypto isakmp key friend hostname
mypeer@my.domain.com
```

To configure a pre-shared already-encrypted authentication key, using an IPv4 address, use the commands below:

```
awplus# configure terminal
awplus(config)# crypto isakmp key 8 Nhe6ioQmzbysQaJr6Du+cA==
address 192.168.1.2
```

To configure a pre-shared key, using the local policy "tunnel2", use the commands:

```
awplus# configure terminal
awplus(config)# crypto isakmp key friend policy tunnel2
```

To remove that key, use the commands:

```
awplus# configure terminal
awplus(config)# no crypto isakmp key friend policy tunnel2
```

To configure an ISAKMP key using EAP, enter the commands:

```
awplus# configure terminal
awplus(config)# crypto isakmp key friend hostname example.com
type eap
```

Related commands

Version 5.4.9-1.1: **policy** parameter added

crypto isakmp peer

Overview Use this command to configure a peer to use a specific ISAKMP profile.

Use the **no** variant to set the peer back to using the default profile.

Syntax

```
crypto isakmp peer address {<ipv4-addr>|<ipv6-addr>} profile <profile-name>
no crypto isakmp peer address {<ipv4-addr>|<ipv6-addr>} profile
crypto isakmp peer dynamic profile <profile-name>
no crypto isakmp peer dynamic profile
crypto isakmp peer hostname <hostname> profile <profile-name>
no crypto isakmp peer hostname <hostname> profile
crypto isakmp peer policy <policy-name> profile <profile-name>
no crypto isakmp peer policy <policy-name> profile
```

Parameter	Description
<ipv4-addr>	IPv4 address. The IPv4 address uses the format A.B.C.D.
<ipv6-addr>	IPv6 address. The IPv6 address uses the format X:X::X:X.
dynamic	Remote endpoint with a dynamic IP address.
<hostname>	Remote endpoint with a host name as the destination.
<policy-name>	The name of a local policy. This is the name of the tunnel (e.g. tunnel2).
<profile-name>	Profile name.

Default By default, all peers use the default profile.

Mode Global Configuration

Usage notes Use this command to configure a peer to use a specific ISAKMP profile.

When IPsec protection is applied to a tunnel, an ISAKMP profile is selected for use when IPsec parameters need to be negotiated. This profile is chosen when the tunnel first becomes active, and so must be selected based on local configuration only.

The tunnel configuration parameter used to select which ISAKMP profile to use when negotiating IPsec protection for that tunnel is in the following priority order:

1) **tunnel destination dynamic** (if a dynamic profile has been configured)

2) **tunnel endpoint dynamic** (if a dynamic profile has been configured)

3) **tunnel remote name**

4) **tunnel destination <ipv4-address>|<ipv6-address>** (if the remote name is not specified)

5) **tunnel endpoint <ipv4-address>**

6) **tunnel local name**

7) **tunnel source <ipv4-address>|<ipv6-address>** (if the remote name is not specified)

8) **tunnel destination <hostname>** (if the hostname is not specified)

9) **tunnel endpoint <hostname>** (if the hostname is not specified)

Examples

To configure a profile for a peer, using a dynamic IP address, use the following commands:

```
awplus# configure terminal
awplus(config)# crypto isakmp peer dynamic profile peer_profile
```

To set the profile for the peer back to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# no crypto isakmp peer dynamic profile
```

To configure a profile for a peer, using a local policy name of “tunnel2”, use the commands:

```
awplus# configure terminal
awplus(config)# crypto isakmp peer policy tunnel2 profile
peer-profile
```

To set the profile for the peer back to the default, use the commands:

```
awplus# configure terminal
awplus(config)# no crypto isakmp peer policy tunnel2 profile
```

Command Changes

Version 5.4.7-0.1: **hostname** parameter added.

Version 5.4.9-1.1: **policy** parameter added.

crypto isakmp profile

Overview Use this command to configure a custom ISAKMP profile.

An ISAKMP profile comprises one or more transforms that can be configured by using the transform (ISAKMP Profile) command.

Use the **no** variant to delete a previously created profile.

Syntax

```
crypto isakmp profile <profile_name>
no crypto isakmp profile <profile_name>
```

Parameter	Description
<profile_name>	Profile name. Profile names are case insensitive and can be up to 64 characters long composed of printable ASCII characters. Profile names can have only letters from a to z and A to Z, numbers from 0 to 9, - (dash), or _ (underscore).

Default Which ISAKMP profile transform will actually be used depends on how the negotiation between the peers is carried out when establishing the connection. For more information about default ISAKMP profiles, see the following table. Note that you cannot delete or edit the default profile. Expiry time of 24 hours applies to the default profile.

Table 68-2: ISAKMP default profile

Attribute	Encryption	Integrity	Group	Authentication
Transform 1	AES256	SHA256	14	Pre-shared
Transform 2	AES256	SHA256	16	Pre-shared
Transform 3	AES256	SHA1	14	Pre-shared
Transform 4	AES256	SHA1	16	Pre-shared
Transform 5	AES128	SHA256	14	Pre-shared
Transform 6	AES128	SHA256	16	Pre-shared
Transform 7	AES128	SHA1	14	Pre-shared
Transform 8	AES128	SHA1	16	Pre-shared
Transform 9	3DES	SHA256	14	Pre-shared
Transform 10	3DES	SHA256	16	Pre-shared
Transform 11	3DES	SHA1	14	Pre-shared
Transform 12	3DES	SHA1	16	Pre-shared

Mode Global Configuration

Examples

To configure a custom ISAKMP profile for establishing ISAKMP SAs with a remote peer, use the following commands:

```
awplus# configure terminal
awplus(config)# crypto isakmp profile my_profile
awplus(config-isakmp-profile)# transform 2 integrity sha1
encryption 3des group 5
```

To delete a custom profile, use the following commands:

```
awplus# configure terminal
awplus(config)# no crypto isakmp profile my_profile
```

debug isakmp

Overview Use this command to enable debugging ISAKMP.

To disable debugging ISAKMP, see no debug isakmp or undebug isakmp.

Syntax `debug [crypto] isakmp [info|trace|all]`

Parameter	Description
`debug`	Debugging function.
`crypto`	Security specific command.
`isakmp`	Internet Security Association Key Management Protocol provides a common framework for key management implementations.
`info`	Informational debug messages such as protocol events.
`trace`	Verbose debug messages including protocol events and message traces.
`all`	All debug enabled.

Mode Privileged Exec

Examples Figure 68-1: Example output from the **debug isakmp** command on the console.

undebug isakmp

dpd-interval

Overview Use this command to specify the Dead Peer Detection (DPD) interval for an ISAKMP profile.

DPD is an IKE mechanism using a form of keep-alive to determine if a tunnel peer is still active.

The interval parameter specifies the amount of time the device waits for traffic from its peer before sending a DPD acknowledgment message.

Use the **no** variant to set the interval to its default (30 seconds).

Syntax

```
dpd-interval <10-86400>
no dpd-interval
```

Parameter	Description
<10-86400>	Interval expressed in seconds.

Default If you do not specify an interval, the default interval of 30 seconds applies.

Mode ISAKMP Profile Configuration

Examples To specify a DPD interval, use the following commands:

```
awplus(config)# crypto isakmp profile my_profile
awplus(config-isakmp-profile)# dpd-interval 20
```

To set the interval to its default, use the following commands:

```
awplus(config-isakmp-profile)# no dpd-interval
```

Related commands crypto isakmp profile

Validation Commands show isakmp profile

dpd-timeout

Overview Use this command to specify a Dead Peer Detection (DPD) timeout for IKEv1.

DPD is an IKE mechanism using a form of keep-alive to determine if a tunnel peer is still active.

DPD timeout defines the timeout interval after which all connections to a peer are deleted in case of inactivity. This only applies to IKEv1, in IKEv2 the default retransmission timeout applies as every exchange is used to detect dead peers.

Use the **no** variant to set the timeout to its default (150 seconds).

Syntax

```
dpd-timeout <10-86400>
no dpd-timeout
```

Parameter	Description
<10-86400>	Timeout in seconds.

Default If you do not specify a timeout, the default timeout of 150 seconds applies.

Mode ISAKMP Profile Configuration

Examples To specify a DPD timeout for IKEv1, use the following commands:

```
awplus(config)# crypto isakmp profile my_profile
awplus(config-isakmp-profile)# dpd-timeout 200
```

To set the timeout to its default, use the following command:

```
awplus(config-isakmp-profile)# no dpd-timeout
```

Related commands crypto isakmp profile

Related commands show isakmp profile

interface tunnel (IPsec)

Overview Use this command to create a tunnel interface or to enter Interface mode to configure an existing tunnel. Tunnel interfaces are identified by an index identifier that is an integer in the range from 0 through 65535.

Use the **no** variant of this command to remove a previously created tunnel interface.

Syntax

```
interface tunnel<0-65535>
no interface tunnel<tunnel-index>
```

Parameter	Description
<0-65535>	Specify a tunnel interface index identifier in the range from 0 to 65535.

Default Tunnel interfaces do not exist.

Mode Global Configuration

Usage notes After you have created the tunnel interface, use the **tunnel mode** command to enable the tunnel.

Note that you need to designate a tunnel mode, tunnel source address, tunnel destination address, IP address of tunnel interface and use tunnel protection ipsec (IPsec) command to encrypt and authenticate the packets travelling though the tunnel.

Examples To configure an IPsec tunnel interface with index 100, enter the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel100
awplus(config-if)# tunnel mode ipsec ipv4
```

To remove the IPsec tunnel interface tunnel100, enter the commands below:

```
awplus# configure terminal
awplus(config)# no interface tunnel100
```

Command changes Version 5.4.7-2.1: increased range for **tunnel** index identifier.

lifetime (IPsec Profile)

Overview Use this command to specify a lifetime for an IPsec SA.

Lifetime measures how long the IPsec SA can be maintained before it expires. Lifetime prevents a connection from being used too long.

Use the **no** variant to set the lifetime to default (28800 seconds).

Syntax

```
lifetime seconds <300-31449600>
no lifetime seconds
```

Parameter	Description
<300-31449600>	Lifetime in seconds.

Default If you do not specify a lifetime, the default lifetime of 28800 seconds (8 hours) applies.

Mode IPsec Profile Configuration

Examples To specify a lifetime for an IPsec SA, use the following commands:

```
awplus(config)# crypto ipsec profile my_profile
awplus(config-ipsec-profile)# lifetime seconds 400
```

To set the lifetime to its default, use the following commands:

```
awplus(config)# crypto ipsec profile my_profile
awplus(config-ipsec-profile)# no lifetime seconds
```

Related commands crypto ipsec profile

lifetime (ISAKMP Profile)

Overview Use this command to specify a lifetime for an ISAKMP SA.

Lifetime measures how long the ISAKMP SA can be maintained before it expires. Lifetime prevents a connection from being used too long.

Use the **no** variant to set the lifetime to default (86400 seconds).

Syntax

```
lifetime <600-31449600>
no lifetime
```

Parameter	Description
<600-31449600>	Lifetime in seconds.

Default If you do not specify a lifetime, the default lifetime of 86400 seconds (8 hours) applies.

Mode ISAKMP Profile Configuration

Examples To specify a lifetime for an ISAKMP SA, use the following commands:

```
awplus(config)# configure isakmp profile my_profile
awplus(config-isakmp-profile)# lifetime 700
```

To set the lifetime to its default, use the following commands:

```
awplus(config-isakmp-profile)# no lifetime
```

Related commands crypto isakmp profile

no debug isakmp

Overview Use this command to disable debugging ISAKMP.

To enable debugging ISAKMP, see debug isakmp.

Syntax

```
no [crypto] isakmp [info|trace|all]
```

Parameter	Description
`no`	Disable debugging function.
`crypto`	Security specific.
`isakmp`	Internet Security Association Key Management Protocol provides a common framework for key management implementations.
`info`	Informational debug messages such as protocol events.
`trace`	Verbose debug messages including protocol events and message traces.
`all`	All debug enabled.

Mode Privileged Exec

Related commands debug isakmp

undebug isakmp

pfs

Overview Use this command to enable PFS and set a Diffie-Hellman group for PFS in an IPsec profile.

Use the **no** variant to disable PFS.

Syntax

```
pfs {2|5|14|15|16|18}
no pfs
```

Parameter	Description
2	1024-bit MODP Group
5	1536-bit MODP Group
14	2048-bit MODP Group
15	3072-bit MODP Group
16	4096-bit MODP Group
18	8192-bit MODP Group

Default PFS is disabled.

Mode IPsec Profile Configuration

Usage notes Perfect Forward Secrecy (PFS) ensures generated keys, for example IPsec SA keys are not compromised if any other keys, for example, ISAKMP SA keys are compromised.

The specified PFS group must match the PFS group setting on the peer - especially when IKEv2 is used for ISAKMP SA negotiation. With IKEv2, if there is a PFS group mismatch an IPsec SA will be established and the tunnel will come up because PFS is not required for the initial child SA negotiation. However, when the IPsec SA rekeys it will fail due to the PFS group mismatch, and upon IPsec SA expiry the tunnel will no longer be able to carry traffic.

Examples To enable PFS and set a Diffie-Hellman group for PFS, use the following commands:

```
awplus(config)# crypto ipsec profile my_profile
awplus(config-ipsec-profile)# pfs 15
```

To disable PFS, use the following command:

```
awplus(config-ipsec-profile)# no pfs
```

Related commands crypto ipsec profile

Validation Commands show ipsec profile

rekey

Overview Use this command to set the rekey policy for an IPsec profile. This policy will be used to make a decision or whether the SA will rekey at its expiry.

The options are **always**, **never**, and **on-demand**. The **on-demand** option makes its decision based on whether the link has seen any traffic since the SA's last rekey.

Use the **no** variant of this command to set the rekey policy back to its default of **always**.

Syntax

```
rekey {always|never|on-demand}
no rekey
```

Parameter	Description
`always`	Always rekey this SA (default)
`never`	Never rekey this SA
`on-demand`	Only rekey this SA if it has been used since the last rekey

Default By default, an IPsec SA will always rekey.

Mode IPsec Profile Configuration

Usage notes These options may be useful if you have a hub and spoke VPN topology and need to provision more than the maximum number of concurrent active VPNs supported by your device. **Never** and **on-demand** allow unused VPNs to be aged out, making more efficient use of the number of available VPNs.

Example To only rekey when traffic is detected over the interface, for the profile named 'myprofile', use the commands:

```
awplus# configure terminal
awplus(config)# crypto ipsec profile myprofile
awplus(config-ipsec-profile)# rekey on-demand
```

To reset the rekey policy back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# crypto ipsec profile myprofile
awplus(config-ipsec-profile)# no rekey
```

Related commands crypto ipsec profile

show ipsec profile

Command changes Version 5.4.9-2.1: command added

show debugging isakmp

Overview Use this command to show if debugging ISAKMP is enabled.

Syntax

```
show debugging [crypto] isakmp
```

Parameter	Description
`debugging`	Debugging information.
`crypto`	Security specific command.
`isakmp`	Internet Security Association Key Management Protocol provides a common framework for key management implementations.

Mode Privileged Exec

Examples To show if debugging ISAKMP is enabled, enter the command below:

```
awplus# show debugging isakmp
```

Output Figure 68-2: Example output from the **show debugging isakmp** command

```
awplus#show debugging isakmp
ISAKMP Debugging status:
  ISAKMP Informational debugging is enabled
  ISAKMP Trace debugging is disabled
```

show interface tunnel (IPsec)

Overview Use this command to display status information of tunnels.

The tunnel remains inactive if no valid tunnel source or tunnel destination is configured.

Syntax `show interface tunnel<tunnel-index>`

Parameter	Description
`tunnel`	Specify this parameter to display tunnel status information of a given tunnel identified by the <*tunnel-index*> parameter.
`<tunnel-index>`	Specify a tunnel index in the range from 0 through 65535.

Mode Privileged Exec

Examples To display status information for IPsec tunnel "tunnel2", use the command:

```
awplus# show interface tunnel2
```

Output Figure 68-3: Example output from the **show interface tunnel** command

```
awplus#show interface tunnel2
Interface tunnel2
  Link is UP, administrative state is UP
  Hardware is Tunnel
  IPv4 address 192.168.1.1/24 point-to-point 192.168.1.255
  index 21 metric 1 mtu 1438
  <UP,POINT-TO-POINT,RUNNING,MULTICAST>
  SNMP link-status traps: Disabled
  Tunnel source 10.1.0.10, destination 10.2.0.10
  Tunnel name local 10.1.0.10, remote 10.2.0.10
  Tunnel traffic selectors (ID, local, remote)
    1    192.168.2.0/24             192.168.3.0/24
    2    0.0.0.0/0                  192.168.10.0/24
  Tunnel protocol/transport ipsec ipv4, key disabled, sequencing disabled
  Checksumming of packets disabled, path MTU discovery disabled
  Tunnel protection via IPsec (profile "default")
    input packets 11, bytes 924, dropped 0, multicast packets 0
    output packets 0, bytes 0, multicast packets 0 broadcast packets 0
  Time since last state change: 0 days 03:23:10
```

Related commands interface tunnel (IPsec)

show ipsec counters

Overview Use this command to show IPSec counters.

Syntax `show [crypto] ipsec counters`

Parameter	Description
`crypto`	Security specific command.
`ipsec`	Internet Protocol Security defines the protection of IP packets using encryption and authentication.
`counters`	Show IPSec transformation statistic.

Mode Privileged Exec

Examples To show IPSec counters, enter the command below:

```
awplus# show ipsec counters
```

Output Figure 68-4: Example output from the **show ipsec counters** command

```
awplus#show ipsec counters
Name                        Value
-------------------------------------
InError                     0
InBufferError               0

OutPolDead                  0
OutPolError                 0
FwdHdrError                 0
```

show ipsec peer

Overview Use this command to show IPSec information on a per peer basis.

Syntax `show [crypto] ipsec peer [<hostname>|<ipv4-addr>|<ipv6-addr>]`

Parameter	Description
`crypto`	Security specific command.
`peer`	Remote endpoint.
<hostname>	Destination hostname.
<ipv4-addr>	Destination IPv4 address. The IPv4 address uses the format A.B.C.D.
<ipv6-addr>	Destination IPv6 address. The IPv6 address uses the format X:X::X:X.

Mode Privileged Exec

Examples To show IPSec information on a per peer basis, enter the command below:

```
awplus# show ipsec peer 172.16.0.1
```

Output Figure 68-5: Example output from the **show ipsec peer** command

```
awplus#show ipsec peer 172.16.0.1
172.16.0.2
  IPsec

```

show ipsec policy

Overview Use this command to show IPSec policies.

Syntax

```
show [crypto] ipsec policy
```

Parameter	Description
`crypto`	Security specific command.
`ipsec`	Internet Protocol Security defines the protection of IP packets using encryption and authentication.
`policy`	Policy.

Mode Privileged Exec

Examples To show IPSec policies, enter the command below:

```
awplus# show ipsec policy
```

Output Figure 68-6: Example output from the **show ipsec policy** command

```
awplus#show ipsec policy
Traffic Selector (addresses protocol ports interface)
  Profile           Peer
0.0.0.0/0 0.0.0.0/0   tunnel1
  default           10.2.0.10
```

show ipsec profile

Overview Use this command to show IPsec default and custom profiles.

An IPsec profile consists of a set of parameters that are used by IPsec when establishing IPsec SAs with a remote peer. AlliedWare Plus provides default ISAKMP and IPsec profiles that contain a priority ordered set of transforms that are considered secure by the security community.

Syntax `show [crypto] ipsec profile [<profile_name>]`

Parameter	Description
`crypto`	Security specific.
`ipsec`	Internet Protocol Security defines the protection of IP packets using encryption and authentication.
`profile`	An IPsec profile consists of a set of parameters that are used by IPsec SAs with a remote peer.
<profile_name>	Custom profile name.

Mode Privileged Exec

Examples To show all IPsec profiles, including the default profile, use the following command:

```
awplus# show ipsec profile
```

Output Figure 68-7: Example output from the **show ipsec profile** command

```
awplus#show ipsec profile
IPsec Profile: default
  Replay-window: 32
  Rekey: Always
  Expiry: 8h
  PFS group: disabled
  Transforms:
  Protocol Integrity Encryption
    1 ESP SHA256 AES256
    2 ESP SHA1 AES256
    3 ESP SHA256 AES128
    4 ESP SHA1 AES128
    5 ESP SHA256 3DES
    6 ESP SHA1 3DES

IPsec Profile: my_profile
 Replay-window: 32
 Rekey: On Demand
 Expiry: 8h
 PFS group: disabled
 Transforms:
 Protocol Integrity Encryption
  2 ESP SHA1 3DES
```

Examples To show IPsec profile “my_profile”, use the command:

```
awplus# show ipsec profile my_profile
```

Output Figure 68-8: Example output from the **show ipsec profile** command

```
awplus#show ipsec profile my_profile
IPsec Profile: my_profile
  Replay-window: 32
  Rekey: On Demand
  Expiry: 8h
  PFS group: disabled
  Transforms:
  Protocol Integrity Encryption
   2 ESP SHA1 3DES
```

Related commands crypto ipsec profile

show ipsec sa

Overview Use this command to view the settings used by current security associations. SAs specify the Security Parameter Index (SPI), protocols, algorithms and keys for protecting a single flow of traffic between two IPSec peers. For more information about SA, see the Internet Protocol Security (IPSec) Feature Overview and Configuration Guide.

Syntax

```
show [crypto] ipsec sa
```

Parameter	Description
`crypto`	Security specific command.
`ipsec`	Internet Protocol Security defines the protection of IP packets using encryption and authentication.
`sa`	Security Association.

Mode Privileged Exec

Examples To view the settings used by current security associations, enter the command below:

```
awplus# show ipsec sa
```

Output Figure 68-9: Example output from the **show ipsec sa** command

```
awplus#show ipsec sa

```

show isakmp key (IPsec)

Overview Use this command to show ISAKMP authentication keys. These keys can be of type Pre-shared Key (PSK) or Extensible Authentication Protocol (EAP). Keys are stored encrypted in the running-configuration.

Syntax

```
show [crypto] isakmp key
```

Parameter	Description
`crypto`	Security specific command.
`isakmp`	Internet Security Association Key Management Protocol provides a common framework for key management implementations.
`key`	Pre-shared key (PSK), or Extensible Authentication Protocol (EAP).

Mode Privileged Exec

Examples To show the ISAKMP keys, enter the command below:

```
awplus# show isakmp key
```

Output Figure 68-11: Example output from the **show isakmp key** command

```
awplus#show isakmp key
Hostname/IP address          PSK               EAP
-------------------------------------------------------------------
10.1.1.1                   mykeyone          mykeytwo
10.1.5.1                   mykeyfive         -
10.1.7.1                   -                 mykeyseven
```

Related commands crypto isakmp key

show isakmp peer

Overview Use this command to show ISAKMP profile and key status for ISAKMP peers.

Syntax `show isakmp peer [<hostname>|<ipv4-addr>|<ipv6-addr>]`

Parameter	Description
<hostname>	Destination hostname.
<ipv4-addr>	Destination IPv4 address. The IPv4 address uses the format A.B.C.D.
<ipv6-addr>	Destination IPv6 address. The IPv6 address uses the format X:X::X:X.

Mode Privileged Exec

Examples To show ISAKMP profile and key status for ISAKMP peers, use the following command:

```
awplus# show isakmp peer
```

Output Figure 68-12: Example output from the **show isakmp peer** command

```
awplus#show isakmp peer
Peer                  Profile (* incomplete)          Key
-----------------------------------------------------------------

show isakmp sa

Overview Use this command to show current IKE security associations at a peer.

Syntax `show [crypto] isakmp sa`

Parameter	Description
`crypto`	Security specific command.
`isakmp`	Internet Security Association Key Management Protocol provides a common framework for key management implementations.
`sa`	Security Association.

Mode Privileged Exec

Examples To show current IKE security associations at a peer, enter the command below:

```
awplus# show isakmp sa
```

Output Figure 68-15: Example output from the **show isakmp sa** command

```
awplus#show isakmp sa
-------------------------------------------------------------------------------
Peer                Cookies (initiator:responder)       Auth  Ver   Expires

```

transform (IPsec Profile)

Overview Use this command to create an IPsec profile transform, which specifies the encryption and authentication algorithms used to protect data.

Use the **no** variant to delete a previously created transform.

Syntax

```
transform <1-255> protocol esp integrity {sha1|sha256|sha512}
encryption {3des|aes128|aes192|aes256|null}
```

```
no transform <1-255>
```

Parameter	Description
<1-255>	Transform priority (1 is the highest)
`sha1`	Secure Hash Standard with 160-bit digest size
`sha256`	Secure Hash Standard with 256-bit digest size
`sha512`	Secure Hash Standard with 512 bit digest size
`3des`	Triple DES symmetric key block cipher with a 168-bit key
`aes128`	Advanced Encryption Standard symmetric key block cipher with a 128-bit key
`aes192`	Advanced Encryption Standard symmetric key block cipher with a 192-bit key
`aes256`	Advanced Encryption Standard symmetric key block cipher with a 256-bit key
`null`	No encryption. This option is not intended for use in a live network. It should only be used for testing purposes.

Default By default, an IPsec profile has no transforms and so will not be active.

Mode IPsec Profile Configuration

Examples To configure an IPsec profile transform, use the following commands:

```
awplus(config)# crypto ipsec profile my_profile
```

```
awplus(config-ipsec-profile)# transform 2 protocol esp
integrity sha1 encryption 3des
```

To delete a created transform, use the following command:

```
awplus(config-ipsec-profile)# no transform 2
```

Related commands crypto ipsec profile

Validation Commands show ipsec profile

transform (ISAKMP Profile)

Overview Use this command to create an ISAKMP profile transform which specifies the encryption and authentication algorithms used to protect data in the tunnel.

Use the **no** variant to delete a previously created transform.

Syntax

```
transform <1-255> integrity {sha1|sha256|sha512} encryption
{3des|aes128|aes192|aes256} group {2|5|14|15|16|18}
```

```
no transform <1-255>
```

Parameter	Description
<1-255>	Transform priority (1 is the highest)
sha1	Secure Hash Standard with 160-bit digest size
sha256	Secure Hash Standard with 256-bit digest size
sha512	Secure Hash Standard with 512 bit digest size
3des	Triple DES symmetric key block cipher with a 168-bit key
aes128	Advanced Encryption Standard symmetric key block cipher with a 128-bit key
aes192	Advanced Encryption Standard symmetric key block cipher with a 192-bit key
aes256	Advanced Encryption Standard symmetric key block cipher with a 256-bit key
group	Diffie-Hellman group
2	1024-bit MODP Group
5	1536-bit MODP Group
14	2048-bit MODP Group
15	3072-bit MODP Group
16	4096-bit MODP Group
18	8192-bit MODP Group

Default By default, an ISASMP profile has no transforms and so will not be active.

Mode ISAKMP Profile Configuration

Examples To create an ISAKMP profile transform, use the following commands:

```
awplus(config)# crypto isakmp profile my_profile
```

```
awplus(config-isakmp-profile)# transform 2 integrity sha1
encryption 3des group 5
```

To delete a created transform, use the following command:

```
awplus(config-isakmp-profile)# no transform 2
```

Related commands crypto isakmp profile

tunnel destination (IPsec)

Overview Use this command to specify a destination IPv4 or IPv6 address or destination network name for the remote end of the tunnel.

Use the **no** variant of this command to remove a configured tunnel destination address.

Syntax

```
tunnel destination {<WORD>|<ipv4-address>|<ipv6-address>}
no tunnel destination {<WORD>|<ipv4-address>|<ipv6-address>}
```

Parameter	Description
<WORD>	Destination network name or "dynamic". The "dynamic" parameter allows you to specify a dynamic IP address for the remote endpoint. The dynamic IP address can be obtained, for example, via DHCP.
<ipv4-address>	Destination IPv4 address. The IPv4 address uses the format A.B.C.D.
<ipv6-address>	Destination IPv6 address. The IPv6 address uses the format X:X::X:X.

Mode Interface Configuration

Examples To configure a destination IPv4 address for IPsec tunnel45, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel45
awplus(config-if)# tunnel mode ipsec ipv4
awplus(config-if)# tunnel destination 192.0.3.1
```

To configure a destination IPv6 address for IPsec tunnel45, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel45
awplus(config-if)# tunnel mode ipsec ipv6
awplus(config-if)# tunnel destination 2001:0db8::
```

To configure a destination network name for IPsec tunnel45, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel45
awplus(config-if)# tunnel mode ipsec ipv4
awplus(config-if)# tunnel destination www.example.com
```

To configure a dynamic IP address for the tunnel destination, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel45
awplus(config-if)# tunnel mode ipsec ipv4
awplus(config-if)# tunnel destination dynamic
```

To remove the destination address of IPSec tunnel45, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel45
awplus(config-if)# no tunnel destination 192.0.3.1
```

Related commands tunnel source (IPsec)

tunnel local name (IPsec)

Overview Use this command to specify an IPSec tunnel hostname to send to the peer for authentication when you apply tunnel protection ipsec (IPsec) to encrypt the packets and configure an ISAKMP key.

Use the **no** variant of this command to remove a previously configured IPSec tunnel hostname.

Syntax

```
tunnel local name <local-name>
no tunnel local name
```

Parameter	Description
<*local-name*>	Source tunnel hostname.

Default The default tunnel local name is the IP address of tunnel source.

Mode Interface Configuration

Examples To configure the tunnel local name office1 for tunnel6, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel local name office1
```

To remove a configured tunnel local name for tunnel6, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel local name
```

Related commands tunnel remote name (IPsec)

tunnel local selector

Overview Use this command to specify a local subnet for a traffic selector pair.

Use the **no** variant of this command to unset the local subnet for the traffic selector pair so that it matches all sources, i.e. 0.0.0.0/0 or ::/0 for IPv4 and IPv6, respectively. When local and remote subnets for a traffic selector pair are both unset, the traffic selector pair is removed.

Syntax

```
tunnel local selector [<traffic-selector-ID>]
{<ipv4-subnet>|<ipv6-subnet>}
```

```
no tunnel local selector [<traffic-selector-ID>]
```

Parameter	Description
<traffic-selector-ID>	Optional traffic selector ID from 1 through 65535. The default is 1.
<ipv4-subnet>	IPv4 subnet in the format A.B.C.D/M.
<ipv6-subnet>	IPv6 subnet in the format of X:X::X:X/M

Default When no traffic selector pairs are configured there is an implicit traffic selector pair, where the local and remote subnets are 0.0.0.0/0 or ::/0 depending on the tunnel IPsec mode.

Mode Interface configuration

Usage notes A traffic selector pair is an agreement between IKE peers to permit traffic through a tunnel if the traffic matches a specified pair of local and remote subnets. When the local selector is specified but the remote selector is not, the selector pair implicitly matches all destinations.

Examples To specify an IPv4 destination address as the traffic selector for the traffic to match for tunnel0, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# tunnel source eth1
awplus(config-if)# tunnel destination 10.0.0.2
awplus(config-if)# tunnel local name office
awplus(config-if)# tunnel mode ipsec ipv4
awplus(config-if)# tunnel local selector 192.168.1.0/24
awplus(config-if)# tunnel remote selector 192.168.2.0/24
```

To configure an additional source and destination traffic selector pair for the traffic to match for tunnel0, use the commands:

```
awplus(config-if)# tunnel local selector 5 192.168.1.0/24
awplus(config-if)# tunnel remote selector 5 192.168.2.0/24
```

To specify an IPv6 source address as the traffic selector for the traffic to match for `tunnel0`, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# tunnel source eth1
awplus(config-if)# tunnel destination 2001:db8:10::1
awplus(config-if)# tunnel local name office
awplus(config-if)# tunnel mode ipsec ipv6
awplus(config-if)# tunnel local selector 2001:db8:1::/64
awplus(config-if)# tunnel remote selector 2001:db8:2::/64
```

To configure an additional source and destination traffic selector pair for the traffic to match for tunnel0, use the commands:

```
awplus(config-if)# tunnel local selector 5 2001:db8:1::/64
awplus(config-if)# tunnel remote selector 5 2001:db8:2::/64
```

To unset the destination traffic selector for the traffic selector pair with ID 1, for tunnel 6, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel remote selector
```

or

```
awplus(config-if)# no tunnel remote selector 1
```

Related commands

tunnel remote selector

tunnel selector paired

show interface tunnel (IPsec)

tunnel mode ipsec

Overview Use this command to configure the encapsulation tunneling mode to use.

Use the **no** variant of this command to remove an established tunnel.

Syntax

```
tunnel mode ipsec {ipv4|ipv6}
no tunnel mode
```

Parameter	Description
`ipsec ipv4`	IPv4 IPsec tunnel
`ipsec ipv6`	IPv6 IPsec tunnel

Default Virtual tunnel interfaces have no mode set.

Mode Interface Configuration

Usage notes A tunnel will not become operational until it is configured with this command.

Examples To configure IPSec in IPv4 tunnel mode, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel mode ipsec ipv4
```

To remove the configured IPSec tunnel mode for tunnel6, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel mode
```

tunnel protection ipsec (IPsec)

Overview Use this command to enable IPsec protection for packets encapsulated by this tunnel.

Use the **no** variant to disable IPsec protection.

Syntax

```
tunnel protection ipsec [profile <profile_name>]
no tunnel protection ipsec
```

Default IPsec protection for packets encapsulated by tunnel is disabled. If no custom profile is specified, the default profile is used.

Parameter	Description
<profile_name>	Custom profile name. You can use the crypto ipsec profile command to create custom profiles.

Mode Interface Configuration

Usage notes IPsec mode tunnels (IPv4 and IPv6) require this command for them to work. GRE IPv6 and L2TPv3 IPv6 tunnel have IPsec protection as an option.

Examples To enable IPsec protection by using default profile, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel14
awplus(config-if)# tunnel protection ipsec
```

To enable IPsec protection by using a custom profile, use the following commands:

```
awplus(config)# interface tunnel14
awplus(config-if)# tunnel protection ipsec profile
my_profile
```

To disable IPsec protection for packets encapsulated by `tunnel14`, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel14
awplus(config-if)# no tunnel protection ipsec
```

Related commands crypto ipsec profile

tunnel remote name (IPsec)

Overview Use this command to specify a tunnel remote name to authenticate the tunnel's remote peer device when you apply tunnel protection ipsec (IPsec) to encrypt the packets and configure an ISAKMP key.

Use the **no** variant of this command to remove a previously configured tunnel remote name.

Syntax

```
tunnel remote name <remote-name>
no tunnel local name
```

Parameter	Description
<remote-name>	Destination tunnel hostname

Default The default tunnel remote name is the IP address of tunnel destination.

Mode Interface Configuration

Examples To configure tunnel remote name office2 for tunnel6, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel remote name office2
```

To remove a configured tunnel local name for tunnel6, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel remote name
```

Related commands tunnel local name (IPsec)

tunnel remote selector

Overview Use this command to specify a destination subnet for a traffic selector pair.

Use the **no** variant of this command to unset the remote subnet for a traffic selector pair so that it matches all destinations, i.e. 0.0.0.0/0 or ::/0 for IPv4 and IPv6, respectively. When local and remote subnets for a traffic selector pair are both unset, the traffic selector pair is removed.

Syntax

```
tunnel remote selector [<traffic-selector-ID>]
{<IPv4-subnet>|<IPv6-subnet>}
```

```
no tunnel remote selector [<traffic-selector-ID>]
```

Parameter	Description
<traffic-selector-ID>	Traffic selector ID from 1 through 65535. If not specified the default value 1 is used.
<ipv4-subnet>	IPv4 subnet in the format A.B.C.D/M.
<ipv6-subnet>	IPv6 subnet in the format of X:X::X:X/M

Default When no traffic selector pairs are configured there is an implicit traffic selector pair, where the local and remote subnets are 0.0.0.0/0 or ::/0 depending on the tunnel IPsec mode.

Mode Interface configuration

Usage notes A traffic selector pair is an agreement between IKE peers to permit trafic through a tunnel if the traffic matches a specified pair of local and remote subnets. When the remote selector is specified but the local selector is not, the selector pair implicitly matches all sources.

Examples To specify an IPv4 destination address as the traffic selector for the traffic to match for tunnel0, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# tunnel source eth1
awplus(config-if)# tunnel destination 10.0.0.2
awplus(config-if)# tunnel local name office
awplus(config-if)# tunnel mode ipsec ipv4
awplus(config-if)# tunnel local selector 192.168.1.0/24
awplus(config-if)# tunnel remote selector 192.168.2.0/24
```

When no traffic selector ID is specified the default ID value is used. By specifying a traffic selector ID, additional selector pairs can be configured.

To configure an additional source and destination traffic selector pair for the traffic to match for tunnel0, use the commands:

```
awplus(config-if)# tunnel local selector 5 192.168.1.0/24
awplus(config-if)# tunnel remote selector 5 192.168.2.0/24
```

To specify an IPv6 source address as the traffic selector for the traffic to match for tunnel0, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# tunnel source eth1
awplus(config-if)# tunnel destination 2001:db8:10::1
awplus(config-if)# tunnel local name office
awplus(config-if)# tunnel mode ipsec ipv6
awplus(config-if)# tunnel local selector 2001:db8:1::/64
awplus(config-if)# tunnel remote selector 2001:db8:2::/64
```

To configure an additional source and destination traffic selector pair for the traffic to match for tunnel0, use the commands:

```
awplus(config-if)# tunnel local selector 5 2001:db8:1::/64
awplus(config-if)# tunnel remote selector 5 2001:db8:2::/64
```

To unset the destination traffic selector for the traffic selector pair with ID 1, for tunnel6, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel remote selector
```

or

```
awplus(config-if)# no tunnel remote selector 5
```

Related commands

tunnel local selector

tunnel selector paired

show interface tunnel (IPsec)

tunnel security-reprocessing

Overview Use this command to enable stream security reprocessing on all tunnel interfaces.

Use the **no** variant of this command to disable security reprocessing on all tunnel interfaces.

Note that tunnel security reprocessing increases the load on your device and reduces throughput. This is because traffic is processed twice through the DPI engine. Therefore, it should only be enabled if your solution requires it.

Syntax

```
tunnel security-reprocessing
no tunnel security-reprocessing
```

Default Security reprocessing is disabled by default.

Mode Global Configuration

Usage notes Use this command when you need to reinspect the traffic in a tunnel terminating on the device using stream UTM features after tunnel headers and encryption have been removed. For a configuration example using this command, see the Internet Protocol Security (IPsec) Feature Overview and_Configuration Guide.

Example To enable security reprocessing, use the commands:

```
awplus# configure terminal
awplus(config)# tunnel security-reprocessing
```

To disable security reprocessing, use the commands:

```
awplus# configure terminal
awplus(config)# no tunnel security-reprocessing
```

Related commands

show interface tunnel (GRE)

show interface tunnel (L2TPv3)

show interface tunnel (OpenVPN)

Command changes Version 5.4.8-0.2: command added

tunnel selector paired

Overview Use this command when multiple selector pairs are configured. This command forces ISAKMP to use strict pairing and therefore create separate Phase 2 IPsec SAs between pairs of source and destination selectors, based on selector ID.

Use the **no** variant of this command to stop forcing strict selector ID pairing.

Syntax

```
tunnel selector paired
```

Default Disabled

Mode Interface mode for a tunnel

Usage notes When this command is disabled, if you specify address selectors, the tunnel can permit any combination of matching sources and/or destinations. While this conforms to the RFC, it may not be the expected behavior and may cause the IPsec SA to either fail negotiation or fail to pass traffic correctly.

This command forces ISAKMP to create individual IPsec SAs for each pair of source and destination selectors that have the same selector ID. Only traffic that matches a selector pair is permitted to flow via the associated SA.

Example To create a tunnel between 172.16.1.0/24 and 172.16.2.0/24, and also between 172.16.1.0/24 and any other destination, use the following tunnel selector commands:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# tunnel local selector 2 172.16.1.0/24
awplus(config-if)# tunnel remote selector 2 172.16.2.0/24
awplus(config-if)# tunnel local selector 3 172.16.1.0/24
awplus(config-if)# tunnel remote selector 3 0.0.0.0/0
awplus(config-if)# tunnel selector paired
```

Related commands

tunnel local selector

show interface tunnel (IPsec)

Command changes Version 5.4.8-1.1: command added

tunnel source (IPsec)

Overview Use this command to specify an IPv4 or IPv6 source address or interface name for packets being encapsulated in the IPsec tunnel. The source address should be an existing IPv4 address or IPv6 address or interface name configured for an interface.

Note that if the tunnel source interface has multiple IP addresses, for example, one primary and one or more secondary IP addresses, the lowest IP address on the interface is used for transporting the tunnel encapsulated traffic.

Use the **no** variant of this command to remove a tunnel source address for a tunnel interface.

Syntax

```
tunnel source {<interface-name>|<ipv4-address>|<ipv6-address>}
no tunnel source
{<interface-name>|<ipv4-address>|<ipv6-address>}
```

Parameter	Description
<interface-name>	Interface name.
<ipv4-address>	The IPv4 address uses the format A.B.C.D.
<ipv6-address>	The IPv6 address uses the format X:X::X:X.

Mode Interface Configuration

Examples To configure a source IPv4 address for IPsec tunnel45, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel45
awplus(config-if)# tunnel mode ipsec ipv4
awplus(config-if)# tunnel source 192.168.1.1
```

To configure a source IPv6 address for IPsec tunnel45, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel45
awplus(config-if)# tunnel mode ipsec ipv6
awplus(config-if)# tunnel source 2001:db8::
```

To configure a source interface for IPsec tunnel45, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel45
awplus(config-if)# tunnel mode ipsec ipv4
awplus(config-if)# tunnel source eth1
```

To remove the source address of IPsec tunnel45, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel45
awplus(config-if)# no tunnel source 192.168.1.1
```

Related commands tunnel destination (IPsec)

undebug isakmp

Overview Use this command to disable debugging ISAKMP.

To enable debugging ISAKMP, see debug isakmp.

Syntax `undebug [crypto] isakmp [info|trace|all]`

Parameter	Description
`undebug`	Disable debugging function.
`crypto`	Security specific command.
`isakmp`	Internet Security Association Key Management Protocol provides a common framework for key management implementations.
`info`	Informational debug messages such as protocol events.
`trace`	Verbose debug messages including protocol events and message traces.
`all`	All debug enabled.

Mode Privileged Exec

Related commands debug isakmp

no debug isakmp

version (ISAKMP)

Overview Use this command to set the ISAKMP protocol version.

Use the **no** variant to set the protocol version to default (IKEv2).

Syntax

```
version {1 mode {aggressive|main}|2}
no version
```

Parameter	Description
`1`	IKEv1
`main`	IKEv1 Main mode. An IKE session begins with the initiator and recipient sending three two-way exchanges to define what encryption and authentication protocols are acceptable, how long keys should remain active, and whether perfect forward secrecy should be enforced. Main mode uses more packets for the process than Aggressive mode, but Main mode is considered more secure.
`aggressive`	IKEv1 Aggressive mode. The initiator and recipient accomplish the same objectives, but in only two exchanges.
`2`	IKEv2

Default If you do not specify the version, the default version is IKEv2

Mode IPsec ISAKMP Configuration

Examples To set the ISAKMP protocol version of profile "my_profile" to IKEv1 main mode, use the following commands:

```
awplus(config)# configure isakmp profile my_profile
awplus(config-isakmp-profile)# version 1 mode main
```

To set the version to its default, use the following command:

```
awplus# no version
```

Related commands crypto isakmp profile

69 GRE Tunneling Commands

Introduction

Overview This chapter provides an alphabetical reference of commands used to configure IPv6 tunnels. For more information about IPv6 tunnels, see the Generic Routing Encapsulation (GRE) Feature Overview and_Configuration Guide.

Command List

- "interface tunnel (GRE)" on page 3406
- "local authentication" on page 3407
- "remote authentication" on page 3409
- "show interface tunnel (GRE)" on page 3411
- "tunnel checksum" on page 3412
- "tunnel dscp" on page 3413
- "tunnel destination (GRE)" on page 3414
- "tunnel endpoint" on page 3416
- "tunnel local name (GRE)" on page 3418
- "tunnel mode gre" on page 3419
- "tunnel mode gre multipoint" on page 3420
- "tunnel protection ipsec (GRE)" on page 3421
- "tunnel remote name (GRE)" on page 3422
- "tunnel security-reprocessing" on page 3423
- "tunnel source (GRE)" on page 3424
- "tunnel ttl" on page 3426

interface tunnel (GRE)

Overview Use this command to create a tunnel interface or to enter Interface mode to configure an existing tunnel. Tunnel interfaces are identified by an index identifier that is an integer in the range from 0 through 65535.

Use the **no** variant of this command to remove a previously created tunnel interface.

Syntax

```
interface tunnel<0-65535>
no interface tunnel<tunnel-index>
```

Parameter	Description
<0-65535>	Specify a tunnel interface index identifier in the range from 0 through 65535.

Default Tunnel interfaces do not exist.

Mode Global Configuration

Usage notes After you have created the tunnel interface, use the **tunnel mode** command to enable the tunnel.

Examples To configure a tunnel interface with index 30 and enable GRE, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel30
awplus(config-if)# tunnel mode gre
```

To remove the GRE tunnel interface tunnel30, use the commands:

```
awplus# configure terminal
awplus(config)# no interface tunnel30
```

Command changes Version 5.4.7-2.1: increased range for **tunnel** index identifiers.

local authentication

Overview Use this command to specify the authentication method for the local device for a GRE Multipoint tunnel.

Use the **no** variant of this command to set the local authentication for an ISAKMP profile back to the default pre-shared.

Syntax

```
local authentication [pre-shared|eap-radius]
no local authentication
```

Parameter	Description
`pre-shared`	Authenticate using pre-shared keys (default)
`eap-radius`	Authenticate using a radius server

Default Pre-shared

Mode ISAKMP Profile configuration

Usage notes This command allows you to choose between pre-shared, where a fixed key is known by both ends and eap-radius, where a key is stored on a radius server.

- Local authentication can be reset back to pre-shared (the default) for the device to authenticate using pre-shared keys.
- Local authentication can be set to eap-radius for the device to authenticate using a radius server.

Examples To configure local authentication for an ISAKMP profile, use the commands:

```
awplus# configure terminal
awplus(config)# configure isakmp profile my_profile
awplus(config-isakmp-profile)# local authentication eap-radius
```

To set the local authentication for an ISAKMP profile back to the default (pre-shared), use the commands:

```
awplus# configure terminal
awplus(config)# configure isakmp profile my_profile
awplus(config-isakmp-profile)# no local authentication
```

Related commands

remote authentication

show interface tunnel (GRE)

show isakmp profile

tunnel endpoint

tunnel mode gre multipoint

Command changes Version 5.4.9-0.1: command added

remote authentication

Overview Use this command to specify the authentication method for the remote device for a GRE Multipoint tunnel.

Use the **no** variant of this command to set the remote authentication back to the default (pre-shared).

Syntax

```
remote authentication [pre-shared|eap-radius]
no remote authentication
```

Parameter	Description
`pre-shared`	Authenticate using pre-shared keys (default)
`eap-radius`	Authenticate using a radius server

Default Pre-shared

Mode ISAKMP profile configuration

Usage notes This command allows you to choose between pre-shared, where a fixed key is known by both ends and eap-radius, where a key is stored on a radius server.

- Remote authentication can be reset back to pre-shared (the default) for the device to authenticate using pre-shared keys.
- Remote authentication can be set to eap-radius for the device to authenticate using a radius server.

Examples To configure remote authentication for an ISAKMP profile, use the following commands:

```
awplus# configure terminal
awplus(config)# configure isakmp profile my_profile
awplus(config-isakmp-profile)# remote authentication
eap-radius
```

To configure remote authentication for an ISAKMP profile back to the default (pre-shared), use the following commands:

```
awplus# configure terminal
awplus(config)# configure isakmp profile my_profile
awplus(config-isakmp-profile)# no remote authentication
```

Related commands

local authentication

show interface tunnel (GRE)

show isakmp profile

tunnel endpoint

tunnel mode gre multipoint

Command changes Version 5.4.9-0.1: command added

show interface tunnel (GRE)

Overview Use this command to display status information of tunnels.

The tunnel remains inactive if no valid tunnel source or tunnel destination is configured.

Syntax `show interface tunnel<tunnel-index>`

Parameter	Description
`tunnel`	Specify this parameter to display tunnel status information of a given tunnel identified by the <0-65535> parameter.
<0-65535>	Specify a tunnel index in the range from 0 through 65535.

Mode Privileged Exec

Example To display status information for GRE tunnel `tunnel20`, use the command:

```
awplus# show interface tunnel20
```

Figure 69-1: Example output from the **show interface tunnel** command

```
awplus#show interface tunnel20
Interface tunnel20
  Link is UP, administrative state is UP
  Hardware is Tunnel
  IPv4 address 172.16.1.1/24 pointopoint 172.16.1.255
  index 4750 metric 1 mtu 1480
  arp ageing timeout 300
  <UP,POINTOPOINT,RUNNING,MULTICAST>
  SNMP link-status traps: Disabled
  Tunnel source 192.168.1.1, destination 192.168.2.1
  Tunnel local 192.168.1.1, remote 192.168.2.1
  Tunnel protocol/transport gre, key disabled, sequencing disabled
  Tunnel TTL inherit
  Checksumming of packets disabled, path MTU discovery disabled
    input packets 0, bytes 0, dropped 0, multicast packets 0
    output packets 0, bytes 0, multicast packets 0 broadcast
packets 0
  Time since last state change: 0 days 00:05:25
```

tunnel checksum

Overview Use this command to enable GRE tunnel checksum insertion and checking. This results in the first two bytes after the protocol field in the IPv4 header containing the checksum. The tunnel checksum is used to detect packet corruption.

Use the **no** variant of this command to disable checksum insertion and checking.

Syntax

```
tunnel checksum
no tunnel checksum
```

Default Checksum insertion and checking is disabled.

Mode Interface Configuration

Examples To enable checksum insertion and checking, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel mode gre
awplus(config-if)# tunnel checksum
```

To disable checksum insertion and checking, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# no tunnel checksum
```

tunnel dscp

Overview Use this command to configure the Differentiated Services Code Point (DSCP) value for the DSCP field in the packet header that encapsulates the tunneled packets.

Use the **no** variant of this command to reset the DSCP field to its default value.

Syntax

```
tunnel dscp <0-63>
no tunnel dscp
```

Parameter	Description
<0-63>	Specify the DSCP value in the range from 0 through 63 for the DSCP field in the packet header that encapsulates the tunneled packets.

Default The IPv4 DSCP field value is inherited from the inner header to the outer header.

Mode Interface Configuration

Examples To configure the DSCP value to 10 for tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel dscp 10
```

To remove a configured DSCP value for tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# no tunnel dscp
```

Related commands interface tunnel (IPv6)

interface tunnel (GRE)

tunnel destination (GRE)

Overview Use this command to specify a tunnel destination for the remote end of the tunnel. Tunnel destination can be specified by using a destination network name or an IPv4 address.

Use the **no** variant of this command to remove a configured tunnel destination.

Syntax

```
tunnel destination {<ipv4-addr>|<destination-network-name>}
no tunnel destination
```

Parameter	Description
<ipv4-addr>	Specify the tunnel destination IPv4 address in the dotted decimal format A.B.C.D. The endpoints of the tunnel must be configured by mirroring IP addresses, that is, the tunnel source on one endpoint must be specified as the tunnel destination on the other endpoint.
<destination-network-name>	Destination network name. If the destination network name cannot be resolved, then the GRE tunnel remains inactive.

Mode Interface Configuration

Examples To configure an IPv4 tunnel destination by using an IPv4 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# tunnel mode gre
awplus(config-if)# tunnel destination 2.2.2.2
```

To configure a GRE tunnel destination by using a destination network name, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# tunnel mode gre
awplus(config-if)# tunnel destination
corporate_lan.example.com
```

To remove a GRE tunnel destination, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# no tunnel destination
```

Related commands

interface tunnel (GRE)

tunnel mode gre

tunnel source (GRE)

tunnel endpoint

Overview Use this command to set an endpoint to a GRE Multipoint tunnel interface.

Use the **no** variant of this command to remove an existing configured endpoint.

Syntax

```
tunnel endpoint {<ipv4-addr>|<network-name>|dynamic}
no tunnel endpoint {<ipv4-addr>|<network-name>|dynamic}
```

Parameter	Description
<ipv4-address>	Specify the tunnel endpoint IPv4 address in the dotted decimal format A.B.C.D.
<network-name>	Specify the endpoint network name.
dynamic	Dynamically learn tunnel endpoints.

Default Virtual tunnel interfaces have no endpoints set.

Mode Interface Configuration

Examples To configure an IPv4 tunnel endpoint for tunnel6, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel endpoint 192.168.100.1
```

To remove the IPv4 tunnel endpoint for tunnel6, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel endpoint 192.168.100.1
```

To configure a tunnel endpoint network name “example_lan.com” for tunnel6, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel endpoint example_lan.com
```

To remove the tunnel endpoint network name “example_lan.com” for tunnel6, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel endpoint example_lan.com
```

To configure a dynamic tunnel endpoint for tunnel6, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel endpoint dynamic
```

To remove the dynamic tunnel endpoint for tunnel6, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel endpoint dynamic
```

tunnel mode gre multipoint

Command changes

Version 5.4.9-0.1: command added

tunnel local name (GRE)

Overview Use this command to specify an IPsec tunnel hostname to send to the peer for authentication when you apply tunnel protection ipsec (GRE) to encrypt the packets and configure an ISAKMP key.

Use the **no** variant of this command to remove a previously configured IPsec tunnel hostname.

Syntax

```
tunnel local name <local-name>
no tunnel local name
```

Parameter	Description
<*local-name*>	Source tunnel hostname.

Default The default tunnel local name is the IP address of tunnel source.

Mode Interface Configuration

Examples To configure the tunnel local name office1 for `tunnel6`, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel local name office1
```

To remove a configured tunnel local name for `tunnel6`, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel local name
```

Related commands tunnel remote name (GRE)

tunnel mode gre

Overview Use this command to configure the encapsulation tunneling mode to use. This command sets GRE IPv4 or IPv6 as the payload over IPv4 or IPv6 tunneling.

Use the **no** variant of this command to remove an established tunnel.

Syntax

```
tunnel mode gre [ipv6]
no tunnel mode
```

Parameter	Description
`gre ipv6`	Specify GRE IPv4 or IPv6 as the payload over IPv6 tunneling. IPv6 is the delivery protocol.

Default Virtual tunnel interfaces have no mode set by default. If you specify a mode of **gre**, the delivery protocol is IPv4 unless you specify IPv6.

Mode Interface Configuration

Usage notes A tunnel will not become operational until it is configured with this command.

Examples To configure GRE as the encapsulation mode for tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel mode gre
```

To remove a configured GRE tunnel mode for tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# no tunnel mode
```

Related commands interface tunnel (GRE)

tunnel mode gre multipoint

Overview Use this command to set the tunnel mode to GRE Multipoint.

Use the **no** variant of this command to unconfigure this tunnel mode.

Syntax

```
tunnel mode gre multipoint
no tunnel mode
```

Default Virtual tunnel interfaces have no mode set.

Mode Interface Configuration

Examples To configure gre multipoint tunnel mode for tunnel6, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel mode gre multipoint
```

To remove the configured gre multipoint tunnel mode for tunnel6, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel mode
```

show interface tunnel (GRE)

tunnel endpoint

Command changes Version 5.4.9-0.1: command added

tunnel protection ipsec (GRE)

Overview Use this command to optionally enable IPsec protection for packets encapsulated by this tunnel.

Use the **no** variant to disable IPsec protection.

Syntax

```
tunnel protection ipsec [profile <ipsec-profile>]
no tunnel protection ipsec
```

Parameter	Description
<ipsec-profile>	The name of an optional custom IPsec profile (crypto ipsec profile command) to use to protect this tunnel.

Default IPsec protection for packets encapsulated by tunnel is disabled.

Mode Interface Configuration

Usage notes You also need to configure a pre-shared key in conjunction with this command. See the crypto isakmp key command for more information about configuring the pre-shared key.

Examples To enable IPsec protection for packets encapsulated by `tunnel14`, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel14
awplus(config-if)# tunnel protection ipsec
```

To disable IPsec protection for packets encapsulated by `tunnel14`, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel14
awplus(config-if)# no tunnel protection ipsec
```

Related commands

crypto ipsec profile

crypto isakmp key

show isakmp key (IPsec)

tunnel remote name (GRE)

Overview Use this command to specify a tunnel remote name to authenticate the tunnel's remote peer device when you apply tunnel protection ipsec (GRE) to encrypt the packets and configure an ISAKMP key.

Use the **no** variant of this command to remove a previously configured tunnel remote name.

Syntax

```
tunnel remote name <remote-name>
no tunnel local name
```

Parameter	Description
<remote-name>	Destination tunnel hostname

Default The default tunnel remote name is the IP address of tunnel destination.

Mode Interface Configuration

Examples To configure tunnel remote name `office2` for `tunnel6`, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel remote name office2
```

To remove a configured tunnel local name for `tunnel6`, use the commands below:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel remote name
```

Related commands tunnel local name (GRE)

tunnel security-reprocessing

Overview Use this command to enable stream security reprocessing on all tunnel interfaces.

Use the **no** variant of this command to disable security reprocessing on all tunnel interfaces.

Note that tunnel security reprocessing increases the load on your device and reduces throughput. This is because traffic is processed twice through the DPI engine. Therefore, it should only be enabled if your solution requires it.

Syntax

```
tunnel security-reprocessing
no tunnel security-reprocessing
```

Default Security reprocessing is disabled by default.

Mode Global Configuration

Usage notes Use this command when you need to reinspect the traffic in a tunnel terminating on the device using stream UTM features after tunnel headers and encryption have been removed. For a configuration example using this command, see the Internet Protocol Security (IPsec) Feature Overview and_Configuration Guide.

Example To enable security reprocessing, use the commands:

```
awplus# configure terminal
awplus(config)# tunnel security-reprocessing
```

To disable security reprocessing, use the commands:

```
awplus# configure terminal
awplus(config)# no tunnel security-reprocessing
```

tunnel source (GRE)

Overview Use this command to specify a tunnel source for the tunnel interface. Tunnel source can be specified by using an interface name or an IPv4 address. The source address must be an existing IPv4 address configured for an interface.

Use the **no** variant of this command to remove a tunnel source for a tunnel interface.

Syntax

```
tunnel source {<ipv4-addr>|<interface-name>}
no tunnel source
```

Parameter	Description
<ipv4-addr>	Specify the tunnel source IPv4 address for the GRE tunnel interface in the dotted decimal format A.B.C.D. The endpoints of the tunnel must be configured by mirroring IP addresses, that is, the tunnel source on one endpoint must be specified as the tunnel destination on the other endpoint.
<interface-name>	Available interface name. Any AlliedWare Plus interface type (eth, vlan, ppp, tunnel, lo and so on). Using interface name can minimize the number of user-configured IP addresses and allow the tunnel source IP address to be dynamically issued via, for example, DHCP.

Mode Interface Configuration

Examples To configure a GRE tunnel source IPv4 address, use the commands:

```
awplus# configure terminal
awplus# interface eth1
awplus(config-if)# ip address 1.1.1.1/24
awplus(config-if)# interface tunnel1
awplus(config-if)# tunnel mode gre
awplus(config-if)# tunnel source 1.1.1.1
```

To use an interface name as the tunnel source, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel mode gre
awplus(config-if)# tunnel source eth2
```

To remove a GRE tunnel source, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel1
awplus(config-if)# no tunnel source
```

Related commands

interface tunnel (GRE)

tunnel ttl

Overview Use this command to configure the value to use for the Time to Live (TTL) field in the IPv4 header that encapsulates the tunneled IPv4 or IPv6 packets.

Use the **no** variant of this command to set the TTL value to its default.

Syntax

```
tunnel ttl <1-255>
no tunnel ttl
```

Parameter	Description
<1-255>	TTL value from 1 through 255.

Default The default TTL value is inherited from the encapsulated packet.

Mode Interface Configuration

Example To set the TTL value of the packet to 255, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel20
awplus(config-if)# tunnel ttl 255
```

To remove the configured TTL value of the packet, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel20
awplus(config-if)# no tunnel ttl
```

70 OpenVPN Commands

Introduction

This chapter provides an alphabetical reference of commands used to configure AlliedWare Plus OpenVPN.

For introductory information about AlliedWare Plus OpenVPN, including overview and configuration information, see the OpenVPN Feature Overview and Configuration_Guide.

The table below lists the OpenVPN commands and their applicable modes.

Figure 70-1: OpenVPN commands and applicable modes

Mode	Command
Privileged Exec	show openvpn connections
	show openvpn connections detail
Interface Configuration	tunnel mode openvpn tap
	tunnel mode openvpn tun
	tunnel openvpn port
	tunnel openvpn tagging

Command List

- "ip tcp adjust-mss" on page 3429
- "ipv6 tcp adjust-mss" on page 3431
- "show interface tunnel (OpenVPN)" on page 3433
- "show openvpn connections" on page 3434
- "show openvpn connections detail" on page 3435
- "tunnel openvpn authentication" on page 3436
- "tunnel openvpn cipher" on page 3437

- "tunnel mode openvpn tap" on page 3439
- "tunnel mode openvpn tun" on page 3440
- "tunnel openvpn expiry-bytes" on page 3441
- "tunnel openvpn expiry-seconds" on page 3442
- "tunnel openvpn port" on page 3443
- "tunnel openvpn tagging" on page 3444
- "tunnel security-reprocessing" on page 3445

ip tcp adjust-mss

Overview Use this command to set the Maximum Segment Size (MSS) size for an interface, where MSS is the maximum TCP data packet size that the interface can transmit before fragmentation.

Use the **no** variant of this command to remove a previously specified MSS size for a PPP interface, and restore the default MSS size.

Syntax

```
ip tcp adjust-mss {<mss-size>|pmtu}
no ip tcp adjust-mss
```

Parameter	Description
<mss-size>	<64-1460> Specifies the MSS size in bytes.
pmtu	Adjust TCP MSS automatically with respect to the MTU on the interface.

Default The default setting allows a TCP server or a TCP client to set the MSS value for itself.

Mode Interface Configuration

Usage notes When a host initiates a TCP session with a server it negotiates the IP segment size by using the MSS option field in the TCP packet. The value of the MSS option field is determined by the Maximum Transmission Unit (MTU) configuration on the host.

You can set a feasible MSS value on the following interfaces:

- PPP
- Ethernet
- Tunnel
- VLAN

Examples To configure an MSS size of 1452 bytes on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip tcp adjust-mss 1452
```

To configure an MSS size of 1452 bytes on Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip tcp adjust-mss 1452
```

To configure an MSS size of 1452 bytes on interface tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# ip tcp adjust-mss 1452
```

To restore the MSS size to the default size on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip tcp adjust-mss
```

Command changes

Version 5.4.8-2.1: interface tunnel example added

ipv6 tcp adjust-mss

Overview Use this command to set the IPv6 Maximum Segment Size (MSS) size for an interface, where MSS is the maximum TCP data packet size that the interface can transmit before fragmentation.

Use the **no** variant of this command to remove a previously specified MSS size for a PPP interface, and restore the default MSS size.

Syntax

```
ipv6 tcp adjust-mss {<mss-size>|pmtu}
no ipv6 tcp adjust-mss
```

Parameter	Description
<mss-size>	<64-1460> Specifies the MSS size in bytes.
pmtu	Adjust TCP MSS automatically with respect to the MTU on the interface.

Default The default setting allows a TCP server or a TCP client to set the MSS value for itself.

Mode Interface Configuration

Usage notes When a host initiates a TCP session with a server it negotiates the IP segment size by using the MSS option field in the TCP packet. The value of the MSS option field is determined by the Maximum Transmission Unit (MTU) configuration on the host.

You can set a feasible MSS value on the following interfaces:

- PPP
- Ethernet
- Tunnel
- VLAN

Examples To configure an IPv6 MSS size of 1452 bytes on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ipv6 tcp adjust-mss 1452
```

To configure an IPv6 MSS size of 1452 bytes on Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 tcp adjust-mss 1452
```

To adjust IPv6 TCP MSS automatically with respect to the MTU on interface tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# ipv6 tcp adjust-mss pmtu
```

To restore the MSS size to the default size on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 tcp adjust-mss
```

Command changes

Version 5.4.8-2.1: interface tunnel example added

show interface tunnel (OpenVPN)

Overview Use this command to display status information of a tunnel.

The tunnel remains inactive if no valid tunnel source or tunnel destination is configured.

Syntax

```
show interface tunnel<tunnel-index>
```

Parameter	Description
<tunnel-index>	The tunnel index in the range from 0 to 65535.

Mode Privileged Exec

Examples To display brief status information for OpenVPN tunnel0, enter the command below:

```
awplus# show interface tunnel0
```

Output Figure 70-2: Example output from the **show interface tunnel** command

```
awplus#show interface tunnel0
Interface tunnel0
  Link is UP, administrative state is UP
  Hardware is Tunnel
  IPv4 address 192.168.1.1/24 pointopoint 192.168.1.255
  IPv6 address 2001:db8:1::1/64
  IPv6 address fe80::200:cdff:fe38:111/64
  index 12 metric 1 mtu 1500
  <UP,POINTOPOINT,RUNNING,MULTICAST>
  SNMP link-status traps: Disabled
  Tunnel source UNKNOWN, destination UNKNOWN
  Tunnel name local AR3050S, remote  UNKNOWN
  Tunnel ID local (not set), remote (not set)
  Tunnel protocol/transport openvpn tun, key disabled, sequencing disabled
  Tunnel TTL -
  Checksumming of packets disabled, path MTU discovery disabled
    input packets 0, bytes 0, dropped 0, multicast packets 0
    output packets 8, bytes 488, multicast packets 0 broadcast packets 0
  Time since last state change: 0 days 00:00:36
```

Command changes Version 5.5.0-2.1: command added to AR1050V

show openvpn connections

Overview Use this command to show information about connected OpenVPN users.

Syntax

```
show openvpn connections
```

Mode Privileged Exec

Examples To show information about connected OpenVPN users, use the command:

```
awplus# show openvpn connections
```

Output Figure 70-3: Example output from the **show openvpn connections** command

```
awplus#show openvpn connections

Maximum connections: 100

Interface: tunnel0
                                      Rx      Tx
Username    Real Address              Bytes   Bytes   Connected Since
-------------------------------------------------------------------------------
foo         ::ffff:192.168.1.2        3553    3906    Wed Aug 13 01:09:07 2014
```

Related commands show openvpn connections detail

Command changes Version 5.5.0-2.1: command added to AR1050V

show openvpn connections detail

Overview Use this command to show detailed information about connected OpenVPN users.

Note that in the output, parameters (such as Route, Address, DNS Server) for a specific user may vary because the parameters depend on the configuration information of the RADIUS server associated with the user.

Syntax

```
show openvpn connections detail
```

Mode Privileged Exec

Examples To show detailed information about connected OpenVPN users, use the command:

```
awplus# show openvpn connections detail
```

Output Figure 70-4: Example output from the **show openvpn connections detail** command

```
awplus#show openvpn connections detail

Interface: tunnel0
 Username: user1
  Route:      192.168.20.0 255.255.255.0 192.168.10.2
  Address:    192.168.10.3 255.255.255.0
  DNS Server: 192.168.10.253
  DNS Server: 192.168.10.254
  VID:        20
 Username: user2
  Route:      192.168.20.0 255.255.255.0 192.168.10.2
  Address:    192.168.10.4 255.255.255.0
  DNS Server: 192.168.10.253
  DNS Server: 192.168.10.254
  VID:        20
```

Related commands show openvpn connections

Command changes Version 5.5.0-2.1: command added to AR1050V

tunnel openvpn authentication

Overview Use this command to configure the data channel authentication digest for an OpenVPN tunnel.

Use the **no** variant of this command to set the data channel authentication digest for an OpenVPN tunnel to its default value of SHA1.

Syntax

```
tunnel openvpn authentication {sha1|sha256}
no tunnel openvpn authentication
```

Parameter	Description
sha1	Use Secure Hash Standard with 160-bit digest size as the data channel authentication digest.
sha256	Use Secure Hash Standard with 256-bit digest size as the data channel authentication digest.

Default SHA1

Mode Interface configuration

Usage notes You need to configure the client to use the same setting as the server. To do this, include one of the following lines in your client's OpenVPN configuration (.ovpn) file:

Setting	Line
SHA1	auth SHA1
SHA256	auth SHA256

Example To configure tunnel 5, which is an OpenVPN tunnel, to use SHA256 data channel authentication, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel5
awplus(config-if)# tunnel openvpn authentication SHA256
```

Related commands tunnel openvpn cipher

Command changes Version 5.4.7-0.1: command added

Version 5.5.0-2.1: command added to AR1050V

tunnel openvpn cipher

Overview Use this command to configure the data channel encryption cipher for an OpenVPN tunnel.

Use the **no** variant of this command to set the data channel encryption cipher for an OpenVPN tunnel to its default value of AES-128.

Syntax

```
tunnel openvpn cipher {aes128|aes256}
no tunnel openvpn cipher
```

Parameter	Description
aes128	Use Advanced Encryption Standard symmetric key block cipher with a 128-bit key as the data channel encryption cipher.
aes256	Use Advanced Encryption Standard symmetric key block cipher with a 256-bit key as the data channel encryption cipher.

Default AES-128

Mode Interface configuration

Usage notes You need to configure the client to use the same setting as the server. To do this, include one of the following lines in your client's OpenVPN configuration (.ovpn) file:

Setting	Line
AES-128	cipher AES-128-CBC
AES-256	cipher AES-256-CBC

For example, consider a client file tun.ovpn that has the following settings:

```
# tun.ovpn
client
auth-user-pass
cipher AES-128-CBC
dev tap
proto udp
remote 192.168.1.1
ca c:/users/support/cacert.pem
verb 7
```

To change the client to AES-256, replace the line "cipher AES-128-CBC" with "cipher AES-256-CBC".

Example To configure tunnel 5, which is an OpenVPN tunnel, to use AES-256 data channel encryption, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel5
awplus(config-if)# tunnel openvpn cipher aes256
```

Related commands tunnel openvpn authentication

Command changes Version 5.4.7-0.1: command added

Version 5.5.0-2.1: command added to AR1050V

tunnel mode openvpn tap

Overview Use this command to set the tunnel mode to OpenVPN TAP for a tunnel interface.

Use the **no** variant of this command to remove the mode.

TAP is a virtual network device. TAP creates a Virtual Tunnel Interface (VTI) that carries layer 2 frames. You may want to use TAP in the following scenarios:

- You want to use bridges to transport Ethernet frames
- You want to transport any network protocol, such as IPv4, IPv6, IPX

Note that TAP will cause broadcast overhead on the VPN tunnel and add the overhead of Ethernet headers on all packets transported over the VPN tunnel.

Note that the distribution of client IP addresses through DHCP is only supported in TAP mode.

Syntax

```
tunnel mode openvpn tap
no tunnel mode
```

Mode Interface Configuration

Examples To set tunnel5 to be an OpenVPN tunnel in TAP mode, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel5
awplus(config-if)# tunnel mode openvpn tap
```

To remove the configured mode for tunnel5, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel5
awplus(config-if)# no tunnel mode
```

Related commands tunnel mode openvpn tun

Command changes Version 5.5.0-2.1: command added to AR1050V

tunnel mode openvpn tun

Overview Use this command to set the tunnel mode to OpenVPN TUN for a tunnel interface.

Use the **no** variant of this command to remove the mode.

TUN is a virtual network device. TUN creates a Virtual Tunnel Interface (VTI) that carries layer 3 packets. You may want to use TUN in the following scenarios:

- You want to transport traffic that is destined for the VPN client
- You want to transport only layer 3 packets
- You want to support VPN on mobile devices

Note that TUN cannot be used in bridges and broadcast traffic is not transported in TUN mode.

Syntax

```
tunnel mode openvpn tun
no tunnel mode
```

Mode Interface Configuration

Examples To set tunnel5 to be an OpenVPN tunnel in TUN mode, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel5
awplus(config-if)# tunnel mode openvpn tun
```

To remove the configured mode for tunnel5, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel5
awplus(config-if)# no tunnel mode
```

Related commands tunnel mode openvpn tap

Command changes Version 5.5.0-2.1: command added to AR1050V

tunnel openvpn expiry-bytes

Overview Use this command to change how the firewall decides when to renegotiate client keys. By default, client keys are renegotiated after an hour; you can use this command to base rekeying on data usage instead of time.

Use the **no** variant of this command to return to time-based rekeying instead.

Syntax

```
tunnel openvpn expiry-bytes <0-4294967295>
no tunnel openvpn expiry-bytes
```

Parameter	Description
`expiry-bytes <0-4294967295>`	The number of bytes of traffic after which the firewall renegotiates client keys. A value of 0 bytes means that keys are not renegotiated after the VPN is formed. Otherwise, setting the expiry-bytes to a non-zero value will cause a rekey when the firewall has received that many bytes of traffic.

Default Not configured - the firewall renegotiates keys every hour instead.

Mode Interface mode for a tunnel

Example To configure tunnel2 to rekey after 1 GB of traffic, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel openvpn expiry-bytes 1000000000
```

To return tunnel2 to the default of rekeying hourly, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# no tunnel openvpn expiry-bytes
```

Related commands tunnel openvpn expiry-seconds

Command changes Version 5.4.7-0.1: command added

Version 5.5.0-2.1: command added to AR1050V

tunnel openvpn expiry-seconds

Overview Use this command to change when client keys are renegotiated. By default, client keys are renegotiated after an hour; you can use this command to turn off renegotiation or to change that time period.

Use the **no** variant of this command to return to the default of 1 hour.

Syntax

```
tunnel openvpn expiry-seconds <0-4294967295>
no tunnel openvpn expiry-seconds
```

Parameter	Description
`expiry-seconds <0-4294967295>`	The length of time after which the firewall renegotiates client keys. A value of 0 seconds means that keys are not renegotiated after the VPN is formed. Otherwise, setting the expiry-seconds to a non-zero timer value will cause a rekey when that time is exceeded.

Default 3600 seconds (1 hour).

Mode Interface mode for a tunnel

Example To configure tunnel2 to rekey every 30 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel openvpn expiry-seconds 1800
```

To return tunnel2 to the default of rekeying hourly, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# no tunnel openvpn expiry-seconds
```

Related commands tunnel openvpn expiry-bytes

Command changes Version 5.4.7-0.1: command added

Version 5.5.0-2.1: command added to AR1050V

tunnel openvpn port

Overview Use this command to specify the UDP listening port that is used to receive OpenVPN tunnel connections.

Use the **no** variant to set the port number to its default value which is 1194.

Syntax

```
tunnel openvpn port <1-65535>
no tunnel openvpn port
```

Parameter	Description
<1-65535>	Port number from 1 through 65535.

Default The default UDP port number is 1194.

Mode Interface Configuration

Usage notes If firewall protection is enabled, you need to create a firewall rule that allows the OpenVPN application traffic to traverse the firewall. OpenVPN is a pre-defined application with destination port number 1194. You can use the show application detail command to see the application details. If you specify a UDP number that is different to the default port number, you need to create an application with the same specified UDP port number for OpenVPN, and then create a firewall rule to allow the application to traverse the firewall. For more information about firewall rules, see the rule (firewall) command.

Examples To configure tunnel tunnel5 to receive incoming tunnel connections on UDP port 4567, use the commands:

```
awplus(config)# interface tunnel5
awplus(config-if)# tunnel openvpn port 4567
```

To remove the specified UDP port for tunnel tunnel5 and set the UDP port to its default value, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel5
awplus(config-if)# no tunnel openvpn port
```

Command changes Version 5.5.0-2.1: command added to AR1050V

tunnel openvpn tagging

Overview This command configures an OpenVPN tunnel to add an 802.1Q tag (a VLAN ID) to traffic received over the tunnel. VLAN ID (VID) is a VLAN identifier that is used to determine which VLAN the traffic belongs to. The VID is determined from information received from the RADIUS server during the authentication process. If no VID information is received from the RADIUS server, the value specified in this command is used.

Use the **no** variant of this command to remove the VID over the tunnel.

Note that you can add an 802.1Q tag in the TAP mode only.

Syntax

```
tunnel openvpn tagging <1-4094>
no tunnel openvpn tagging
```

Parameter	Description
<1-4094>	VLAN ID from 1 through 4094

Mode Interface Configuration

Examples To add an 802.1Q tag of 1 to packets received over the tunnel named tunnel5, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel5
awplus(config-if)# tunnel openvpn tagging 1
```

To remove the 802.1Q tag for the tunnel named tunnel5, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel5
awplus(config-if)# no tunnel openvpn tagging
```

Command changes Version 5.5.0-2.1: command added to AR1050V

tunnel security-reprocessing

Overview Use this command to enable stream security reprocessing on all tunnel interfaces.

Use the **no** variant of this command to disable security reprocessing on all tunnel interfaces.

Note that tunnel security reprocessing increases the load on your device and reduces throughput. This is because traffic is processed twice through the DPI engine. Therefore, it should only be enabled if your solution requires it.

Syntax

```
tunnel security-reprocessing
no tunnel security-reprocessing
```

Default Security reprocessing is disabled by default.

Mode Global Configuration

Usage notes Use this command when you need to reinspect the traffic in a tunnel terminating on the device using stream UTM features after tunnel headers and encryption have been removed. For a configuration example using this command, see the Internet Protocol Security (IPsec) Feature Overview and_Configuration Guide.

Example To enable security reprocessing, use the commands:

```
awplus# configure terminal
awplus(config)# tunnel security-reprocessing
```

To disable security reprocessing, use the commands:

```
awplus# configure terminal
awplus(config)# no tunnel security-reprocessing
```

71 L2TPv2 PPP Commands

Introduction

This chapter provides an alphabetical reference of commands used to configure L2TPv2 tunnels.

For introductory information about tunneling of PPP over L2TPv2 in AlliedWare Plus, including overview and configuration information, see the L2TPv2 Feature Overview and Configuration Guide

Command List

- "debug l2tp" on page 3448
- "destination" on page 3449
- "encapsulation ppp" on page 3450
- "ip-version" on page 3452
- "l2tp tunnel" on page 3453
- "l2tp unmanaged port" on page 3455
- "l2tp-profile" on page 3456
- "local-subaddress" on page 3457
- "protection ipsec" on page 3458
- "protection local-name" on page 3459
- "protection profile" on page 3461
- "protection remote-name" on page 3462
- "remote-subaddress" on page 3464
- "shared-secret" on page 3465
- "show debugging l2tp" on page 3466
- "show l2tp session" on page 3467
- "show l2tp tunnel" on page 3469
- "show l2tp tunnel config-check" on page 3473

- "show running-config l2tp-profile" on page 3475
- "show running-config l2tp-tunnel" on page 3476
- "source" on page 3477
- "version" on page 3478

debug l2tp

Overview Use this command to enable debugging of L2TPv2 tunnels.

Use the **no** variant of this command to disable debugging of L2TPv2 tunnels.

Syntax
```
debug l2tp
no debug l2tp
undebug l2tp
```

Default Debugging of L2TPv2 tunnels is disabled by default.

Mode Privileged Exec

Example To enable debugging for L2TPv2 tunnels, use the commands:

```
awplus# debug l2tp
awplus# terminal monitor
% Warning: Console logging enabled
```

To disable debugging of L2TPv2 tunnels, use the command:

```
awplus# no debug l2tp
```

or the command:

```
awplus# undebug l2tp
```

Related commands debug pppoe-ac

show debugging l2tp

destination

Overview Use this command to set the destination of an L2TP tunnel.

Use the **no** variant of this command to remove the destination from the L2TP tunnel.

Syntax

```
destination [<ipv4-addr>|<ipv6-addr>|<domain-name>]
no destination
```

Parameter	Description
<ipv4-addr>	The destination of the L2TP tunnel as an IPv4 address.
<ipv6-addr>	The destination of the L2TP tunnel as an IPv6 address.
<domain-name>	The destination of the L2TP tunnel as a fully-qualified domain name.

Default No destination is set by default.

Mode L2TP Tunnel Configuration

Example To set the destination IP address for tunnel1 to 10.1.1.1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# destination 10.1.1.1
```

To remove the destination IP address from tunnel1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no destination
```

source

version

encapsulation ppp

Overview Use this command to enable PPP encapsulation and create one or more PPP interfaces over Ethernet, a cellular interface, or an L2TPv2 managed VPN.

Use the **no** variant of this command to disable PPP encapsulation and remove the specified PPP interface.

Syntax

```
encapsulation ppp <index>
no encapsulation ppp <index>
```

Parameter	Description
<index>	The PPP interface index number in the range from 0 to 255.

Default No PPP encapsulation or interfaces are configured by default.

Mode Interface Configuration mode for an Ethernet interface (e.g. **interface eth1**), or an Ethernet sub-interface (e.g. **interface eth1.1**), or a cellular interface (e.g. **interface cellular0**).

L2TP Tunnel Configuration mode for an L2TP tunnel (e.g. **l2tp tunnel tunnel0**).

Examples To configure a PPP interface with index 0 for Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# encapsulation ppp 0
```

To shut down the ppp0 interface and remove it from Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# shutdown
awplus(config-if)# interface eth1
awplus(config-if)# no encapsulation ppp 0
```

To set the L2TP tunnel tunnel1 to encapsulate the PPP interface with index 1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# encapsulation ppp 1
```

To remove the PPP interface with index 1 from L2TP tunnel tunnel1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no encapsulation ppp 1
```

ppp service-name (PPPoE)

show interface (PPP)

ip-version

Overview Use this command to set the IP version for the L2TP tunnel.

The IP version must be set to the same value at both ends of the tunnel.

Syntax

```
ip-version [4|6]
```

Parameter	Description
4	IPv4
6	IPv6

Default The IP version is set to IPv4 by default.

Mode L2TP Tunnel Configuration

Example To set the IP version for tunnel1 to IPv6, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# ip-version 6
```

To set the IP version for tunnel1 to the default (IPv4), use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# ip-version 4
```

l2tp tunnel

Overview Use this command to create a named L2TP tunnel, and to enter L2TP Tunnel Configuration mode to configure it.

Use the **no** variant of this command to remove the named tunnel and all of its configuration.

Syntax

```
l2tp tunnel <tunnel-name>
no l2tp tunnel <tunnel-name>
```

Parameter	Description
<tunnel-name>	The name of the tunnel to create, change or delete.

Default No L2TP tunnel is configured by default.

Mode Global Configuration

Example To create and begin configuring a new L2TP tunnel named 'tunnel1', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)#
```

To remove the tunnel 'tunnel1' and its configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no l2tp tunnel tunnel1
```

l2tp unmanaged port

Overview Use this command to set the UDP port for an (IPv4 and IPv6) unmanaged L2TP tunnel (L2TPv3 Ethernet Pseudowires).

This command can only change the UDP port when there is no unmanaged L2TP tunnel (L2TPv3 Ethernet Pseudowires) configured.

Use the **no** variant of this command to reset the UDP port to the default (1701).

Syntax

```
l2tp unmanaged port [<1-65535>]
no l2tp unmanaged port
```

Parameter	Description
<1-65535>	The number of the UDP port to use for an unmanaged L2TP tunnel (L2TPv3 Ethernet Pseudowires).

Default The UDP port is 1701 by default.

Mode Global Configuration

Usage notes The default UDP port for both unmanaged and managed L2TP tunnels is 1701. If both kinds of tunnel will be configured, the UDP port for the unmanaged tunnel must be changed to a different port by using the **l2tp unmanaged port** command.

Be aware of potential clashes with other UDP port users. Unless it is likely to be used for other purposes, we recommend configuring UDP port 1702 as a suitable alternative.

Example To set the UDP port for an L2TP unmanaged tunnel (L2TPv3 Ethernet Pseudowires) to 1702, use the following commands:

```
awplus# configure terminal
awplus(config)# l2tp unmanaged port 1702
```

Related commands tunnel mode l2tp v3

show running-config

l2tp-profile

Overview Use this command to create an L2TP profile and to enter the L2TP Profile Configuration mode.

Use the **no** variant of this command to remove the L2TP profile and all its configuration.

Syntax

```
l2tp-profile <name>
no l2tp-profile <name>
```

Parameter	Description
<name>	The name of the L2TP profile being created or configured.

Default No L2TP profile is configured by default. This command is not configured by default.

Mode Global Configuration

Example To create a L2TP profile named "public", use the commands:

```
awplus# configure terminal
awplus(config)# l2tp-profile public
awplus(config-l2tp-profile)#
```

To remove all configuration of this L2TP profile, use the commands:

```
awplus# configure terminal
awplus(config)# no l2tp-profile public
```

Related commands

l2tp profile

shared-secret

show running-config l2tp-profile

version

local-subaddress

Overview Use this command to set the local sub-address for L2TPv2 tunnel authentication.

Use the **no** variant of this command to remove the configured local sub-address.

Syntax

```
local-subaddress [<sub-address>]
no local-subaddress
```

Parameter	Description
<sub-address>	The local sub-address for the tunnel.

Default The local sub-address is not set by default; by default, the received L2TPv2 sub-address AVP will not be checked before establishing the tunnel.

Mode L2TP Tunnel Configuration

Usage notes If a local sub-address is set, this is checked against incoming the sub-address AVP as a requirement for tunnel establishment. The received sub-address AVP content must match the configured local sub-address.

Example To set the local-sub address of tunnel1 to 'office1', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# local-subaddress office1
```

To remove the local sub-address configuration from tunnel1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no local-subaddress
```

Related commands

l2tp tunnel

remote-subaddress

show l2tp tunnel config-check

show running-config l2tp-tunnel

protection ipsec

Overview Use this command to enable IPsec protection on the L2TP tunnel.

Use the **no** variant of this command to disable IPsec on the tunnel.

Syntax

```
protection ipsec
no protection ipsec
```

Default IPsec protection is disabled by default.

Mode L2TP Tunnel Configuration

Example To protect tunnel1 with IPsec, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# protection ipsec
```

To disable IPsec protection for tunnel1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no protection ipsec
```

Related commands

l2tp tunnel

protection ipsec

protection local-name

protection profile

protection remote-name

show l2tp tunnel config-check

show running-config l2tp-tunnel

protection local-name

Overview Use this command to set the IPsec local name for the L2TP tunnel. This is the local identifier for IKE.

Use the **no** variant of this command to reset the local name to the default—the source IP address of the L2TP tunnel.

Syntax

```
protection local-name [<ipsec-local-name>]
no protection local-name
```

Parameter	Description
<ipsec-local-name>	The IPsec local name for the tunnel.

Default By default, the IPsec local name is set to the source IP address of the L2TP tunnel.

Mode L2TP Tunnel Configuration

Usage notes If no local name is configured with this command, the source IP address of the tunnel is used. If a local name is configured with this command, the **crypto isakmp key** command is required to configure a preshared authentication key using this local name as the hostname.

Example To set the IPsec local name for tunnel1 to office1 and set the key to 'friend', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# protection ipsec
awplus(config-l2tp-tunnel)# protection local-name office1
awplus(config)# crypto isakmp key friend hostname office1
```

To remove the IPsec local name for tunnel1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no protection local-name
```

Related commands

crypto isakmp key

show running-config l2tp-tunnel

protection profile

Overview Use this command to set the IPsec profile to use for this L2TP tunnel.

Use the **no** variant of this command to set it back to the default IPsec profile: the profile named 'default'.

Syntax

```
protection profile [<profile-name>]
no protection profile
```

Parameter	Description
<profile-name>	The name of the IPsec profile to use. This is the profile created by the **crypto ipsec profile** command.

Default The L2TP tunnel protection profile is set to the IPsec profile named 'default' by default.

Mode L2TP Tunnel Configuration

Example To set up tunnel1 with IPsec protection using IPsec profile 'profile1', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# protection ipsec
awplus(config-l2tp-tunnel)# protection profile profile1
```

To reset tunnel1 to use IPsec protection with IPsec profile 'default', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no protection profile
```

Related commands

crypto ipsec profile

l2tp tunnel

protection ipsec

protection local-name

protection remote-name

show l2tp tunnel config-check

show running-config l2tp-tunnel

protection remote-name

Overview Use this command to set the L2TP tunnel IPsec remote name. This is the remote identifier for IKE.

Use the **no** variant of this command to reset the remote name to the default—the destination IP address of the tunnel.

Syntax

```
protection remote-name [<ipsec-remote-name>]
no protection remote-name
```

Parameter	Description
<ipsec-remote-name>	The IPsec remote name for the tunnel.

Default By default, the IPsec remote name is set to the destination IP address of the tunnel.

Mode L2TP Tunnel Configuration

Usage notes In order to set the IPsec remote name for the tunnel and add a corresponding ISAKMP key for the tunnel, set the IPsec remote name with this command (**protection remote-name**) and set the key for this by using the **crypto isakmp key** command with this remote name as the hostname.

Example To set the IPsec remote name for tunnel1 to 'office2' and set the key to 'friend', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# protection ipsec
awplus(config-l2tp-tunnel)# protection remote-name office2
awplus(config)# crypto isakmp key friend hostname office2
```

To reset the IPsec remote name for tunnel1 to default (destination IP address of the tunnel), use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no protection remote-name
```

Related commands

crypto isakmp key

l2tp tunnel

protection ipsec

protection local-name

protection profile

show l2tp tunnel config-check

show running-config l2tp-tunnel

remote-subaddress

Overview Use this command to set the remote sub-address for L2TPv2 tunnel authentication.

Use the **no** variant of this command to remove the sub-address from the tunnel configuration.

Syntax

```
remote-subaddress [<sub-address>]
no remote-subaddress
```

Parameter	Description
<sub-address>	The remote sub-address for the tunnel.

Default The remote sub-address is not set by default; the outgoing L2TP sub-address AVP for the tunnel will not be populated.

Mode L2TP Tunnel Configuration

Usage notes If the L2TP peer is also an AR-Series firewall, the remote-subaddress must match the local sub-address configured at the other end of the tunnel.

If a remote sub-address is configured for the tunnel, this value is placed in the outgoing sub-address AVP. The other tunnel end point can check this value against its configured local sub-address for the tunnel before establishing the tunnel.

Example To set the remote sub-address of tunnel1 to 'office1', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# remote-subaddress office1
```

To remove the remote sub-address configuration from tunnel1, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no remote-subaddress
```

Related commands

l2tp tunnel

local-subaddress

show l2tp tunnel config-check

show running-config l2tp-tunnel

shared-secret

Overview Use this command to set the secret password that is shared with L2TP tunnel peers.

Use the **no** variant of this command to remove the shared secret.

Syntax

```
shared-secret <secret>
no shared-secret
```

Parameter	Description
<secret>	The password shared with the tunnel peer.

Default No shared secret is configured by default.

Mode L2TP Profile Configuration and L2TP Tunnel Configuration

Example To set tunnel secret to "my_password" for tunnel profile "public", use the commands:

```
awplus# configure terminal
awplus(config)# l2tp-profile public
awplus(config-l2tp-profile)# shared-secret my_password
```

To set tunnel secret to "my_password" for tunnel "tunnelone", use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnelone
awplus(config-l2tp-tunnel)# shared-secret my_password
```

To remove the tunnel secret for the tunnel profile, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp-profile public
awplus(config-l2tp-profile)# no shared-secret
```

To remove the tunnel secret for the tunnel ‘tunnelone’, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnelone
awplus(config-l2tp-tunnel)# no shared-secret
```

Related commands

show debugging l2tp

Overview Use this command to see what debugging is turned on for L2TP tunnels.

Syntax

```
show debugging l2tp
```

Mode Privileged Exec

Example To display whether debugging of L2TP tunnels is on or off, use the command:

```
awplus# show debugging l2tp
```

Output Figure 71-1: Example output from **show debugging l2tp**

```
awplus#show debugging l2tp
L2TP Tunnel Debugging is on
```

Related commands debug l2tp

show l2tp session

Overview Use this command to display a summary or detailed list of information about L2TP sessions.

Syntax

```
show l2tp session [detail]
```

Parameter	Description
`detail`	Displays more detailed information about L2TP sessions.

Mode Privileged Exec

Example To display summary information about all L2TPv2 sessions, use the command:

```
awplus# show l2tp session
```

Output Figure 71-2: Example output from **show l2tp session**

```
awplus#show l2tp session

L2TP Session Information

------------------------------------------------------------------
Session ID:                     59400
Tunnel ID:                      25351
State:                          RETRY
Type:                           LAIC
Created At:                     May 31 20:03:04 2016
Interface Name:                 ppp1
Remote Session ID:              61156
Establish Timeout:              120
```

Table 71-1: Parameters in the output from **show l2tp session**

Parameter	Description
`Session ID`	L2TP session ID.
`Tunnel ID`	The ID of the L2TP tunnel for this session.

Table 71-1: Parameters in the output from **show l2tp session** (cont.)

Parameter	Description
`State`	The current state of the L2TP session: • idle—Idle • wait-tunnel—Await tunnel • wait-reply—Await reply • wait-connect—Await connect • wait-cs-answer—Await circuit switched answer • established—Successful connection • retry—Retrying connection
`Type`	The type of the L2TP session: • LAIC—LAC incoming call • LAOC—LAC outgoing call • LNIC—LNS incoming call • LNOC—LNS outgoing call • UNSPEC—unspecified call type
`Created At`	The date and time when the session was created.
`Interface Name`	The name of the interface for this session.
`Remote Session ID`	The ID of the session on the peer.
`Establish Timeout`	The time (in seconds) that a session will wait for the peer to complete the session setup message exchange.

Related commands

l2tp tunnel

show l2tp tunnel

show l2tp tunnel

Overview Use this command to display information about all the current L2TP tunnels.

Syntax

```
show l2tp tunnel [detail]
```

Parameter	Description
`detail`	Display additional detailed information about the tunnels.

Mode Privileged Exec

Usage notes The output from this command depends on whether it won the tiebreaker and took the LAC role for the tunnel, or lost the tiebreaker and took the LNS role. In the latter case, a corresponding idle LAC tunnel is also displayed.

Example To display information about all L2TPv2 tunnels, use the command:

```
awplus# show l2tp tunnel
```

Output Figure 71-3: Example output from **show l2tp tunnel**

```
AWP-2#show l2tp tunnel

L2TP Tunnel Information

------------------------------------------------------------------------
Tunnel ID:                      25351
Tunnel Name:                    tunnel1
Local IP Address:               10.1.1.2
Remote IP Address:              10.1.1.1
State:                          ESTABLISHED
Created At:                     May 31 20:03:04 2016
Tunnel Mode:                    LAC
Remote Tunnel ID:               43832
Remote Host Name:               AWP-1
Remote Vendor Name:             Allied Telesis International
Local UDP Port:                 1701
Remote UDP Port:                1701
Hello Timeout:                  60
Retry Timeout:                  1
Idle Timeout:                   0
Establish Timeout:              60
```

```

Table 72: Parameters in the output from **show l2tp tunnel** .

Parameter	Description
`Tunnel ID`	The L2TP tunnel ID, (assigned automatically by the device.
`Tunnel Name`	The name of the L2TP tunnel as specified by the **l2tp tunnel** command.
`Local IP Address`	The IPv4 or IPv6 address of the tunnel on this device. This is either specified by the configuration if the device is in LAC mode, or assigned automatically by the device if it is in LNS mode.This may be specified directly by the **source** command, or derived from the interface set by that command.
`Remote IP Address`	The IPv4 or IPv6 address of the device at the remote end of the tunnel. This may be specified directly by the **destination** command, or derived from a domain name set by that command.
`State`	The current state of the tunnel: • idle—Idle • wait-ctl-reply—Await control reply • wait-ctl-conn—Await connect reply • established—Successful connection • closing—Closing connection • retry—Tie breaker lost, retrying connection
`Created at`	The date and time when the tunnel was created.
`Tunnel Mode`	The tunnel mode: • LAC—L2TP Access Concentrator—the initiating end of the tunnel • LNS—L2TP Network Server—the other end of the tunnel, authenticates the user and starts the PPP negotiation.
`Remote Tunnel ID`	The tunnel ID on the L2TP peer.
`Remote Host Name`	The host name of the L2TP peer.
`Remote Vendor Name`	The name of the vendor for the L2TP peer device. E.g. Allied Telesis International.
`Local UDP Port`	By default the local UDP port used for both L2TPv2 managed tunnels and L2TPv3 unmanaged tunnels (Ethernet Pseudowires) is 1701. If both are configured, change the UDP port for the unmanaged tunnel (**l2tp unmanaged port** command).
`Remote UDP Port`	The UPD port used by the remote device for this L2TP tunnel.

Table 72: Parameters in the output from **show l2tp tunnel** . (cont.)

Parameter	Description
`Hello Timeout`	The period between sending L2TP Hello messages (in seconds).
`Retry Timeout`	The delay (in seconds) before sending the first retry of unacknowledged control frames.
`Idle Timeout`	The time (in seconds) that a tunnel will remain after its last session has been torn down.
`Establish Timeout`	The time (in seconds) that a tunnel will wait for the peer to complete the tunnel setup message exchange.

Related commands l2tp tunnel

show l2tp tunnel config-check

Overview Use this command to check the configuration of the specified L2TP tunnel or all L2TP tunnels for errors or missing required configuration.

Syntax

```
show l2tp tunnel [<tunnel-name>] config-check
```

Parameter	Description
<tunnel-name>	The name of the L2TP tunnel to check. If not specified, all tunnels are checked.

Mode Privileged Exec

Usage notes Only tunnels that have a complete configuration may appear in the **show l2tp tunnel** commands. For details of the configuration in the system, use the **show running-config l2tp-tunnel** command.

Example To check for missing L2TP tunnel configuration for the tunnel 'tunnel1', use the command:

```
awplus# show l2tp tunnel config-check
```

Output Figure 71-5: Example output from **show l2tp tunnel config-check**

```
awplus#show l2tp tunnel config-check

L2TP Tunnel tunnel1:
  Complete Configuration

L2TP Tunnel tunnel2:
  Incomplete Configuration
  Missing tunnel name or tunnel name mismatch
  Required: PPP interface
  Required: destination
  Source IP address required when IPSec protection on
```

Table 71-1: Parameters in the output from **show l2tp tunnel config-check**

Parameter	Description
`Complete configuration`	The tunnel has a complete and valid configuration.
`Incomplete configuration`	There is configuration still required or invalid for this tunnel, as specified. Examples of possible messages indicating missing or invalid configuration include: • Missing tunnel name or tunnel name mismatch • Required: PPP interface • Required: destination • Required: IP version • Destination IP address does not match the configured IP version • Source IP address does not match the configured IP version • Source IP address required when IPSec protection on

Related commands show running-config l2tp-tunnel

show running-config l2tp-profile

Overview Use this command to display the running configuration for L2Tp profiles.

Syntax
```
show running-config l2tp-profile
```

Mode Privileged Exec

Example To display the running configuration of L2TP profiles, use the command:

```
awplus# show running-config l2tp-profile
```

Output Figure 71-6: Example output from **show running-config l2tp-profile**

```
awplus#show running-config l2tp-profile

l2tp-profile public
 version 2
 secret "my_password"
```

Related commands

show l2tp tunnel config-check

source

version

source

Overview Use this command to set the source address or interface for an L2TP tunnel.

Use the **no** variant of this command to remove the source address or interface from an L2TP tunnel.

Syntax

```
source [<interface-name>|<ipv4-addr>|<ipv6-addr>
no source
```

Parameter	Description
<interface-name>	The name of the interface to be used as the tunnel starting point.
<ipv4-addr>	The IPv4 address to be used as the tunnel starting point.
<ipv6-addr>	The IPv6 address to be used as the tunnel starting point.

Default If no source address or interface is configured, the source address used will be calculated based on the route to the tunnel destination.

Mode L2TP Tunnel Configuration

Example To configure IP address 10.1.1.2 as the source address for the tunnel named 'tunnel1', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# source 10.1.1.2
```

To remove the configured source address from 'tunnel1', so that it uses the default source, use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnel1
awplus(config-l2tp-tunnel)# no source
```

Related commands

destination

l2tp tunnel

show l2tp tunnel

version

Overview Use this command to specify the protocol version of a L2TP tunnel.

Syntax `version [<version>]`

Parameter	Description
<version>	The protocol version of the L2TP tunnel. Version 2 is supported.

Default The L2TP version is 2 by default.

Mode L2TP Profile Configuration and L2TP Tunnel Configuration

Example To use L2TPv2 for L2TP tunnel profile 'public', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp-profile public
awplus(config-l2tp-profile)# version 2
```

To use L2TPv2 for L2TP tunnel 'tunnelone', use the commands:

```
awplus# configure terminal
awplus(config)# l2tp tunnel tunnelone
awplus(config-l2tp-tunnel)# version 2
```

72 L2TPv3 Ethernet Pseudowire Commands

Introduction

Overview

This chapter provides an alphabetical reference of commands used to configure L2TPv3 Ethernet pseudowires.

For introductory information about L2TPV3 in AlliedWare Plus, including overview and configuration information, see the L2TPv3 Ethernet Pseudowire Feature Overview and Configuration Guide.

Command List

- "interface tunnel (L2TPv3)" on page 3480
- "l2tp unmanaged port" on page 3481
- "show interface tunnel (L2TPv3)" on page 3482
- "tunnel destination (L2TPv3)" on page 3483
- "tunnel df" on page 3485
- "tunnel local id" on page 3486
- "tunnel mode l2tp v3" on page 3487
- "tunnel protection ipsec" on page 3488
- "tunnel remote id" on page 3489
- "tunnel security-reprocessing" on page 3490
- "tunnel source (L2TPv3)" on page 3491

interface tunnel (L2TPv3)

Overview Use this command to create a tunnel interface or to enter Interface mode to configure an existing tunnel. Tunnel interfaces are identified by an index identifier that is an integer in the range from 0 through 65535.

Use the **no** variant of this command to remove a previously created tunnel interface.

Syntax

```
interface tunnel<0-65535>
no interface tunnel<tunnel-index>
```

Parameter	Description
<0-65535>	Specify a tunnel interface index identifier in the range from 0 through 65535.

Default Tunnel interfaces do not exist.

Mode Global Configuration

Usage notes After you have created the tunnel interface, use the **tunnel mode** command to enable the tunnel.

Examples To configure a tunnel interface with index 30 and enable L2TPv3 mode, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel30
awplus(config-if)# tunnel mode l2tp v3
```

To remove the tunnel interface tunnel30, use the commands:

```
awplus# configure terminal
awplus(config)# no interface tunnel30
```

Related commands show interface tunnel (L2TPv3)

tunnel mode l2tp v3

Command changes Version 5.4.7-2.1: increased range for **tunnel** index identifiers.

l2tp unmanaged port

Overview Use this command to set the UDP port for an (IPv4 and IPv6) unmanaged L2TP tunnel (L2TPv3 Ethernet Pseudowires).

This command can only change the UDP port when there is no unmanaged L2TP tunnel (L2TPv3 Ethernet Pseudowires) configured.

Use the **no** variant of this command to reset the UDP port to the default (1701).

Syntax

```
l2tp unmanaged port [<1-65535>]
no l2tp unmanaged port
```

Parameter	Description
<1-65535>	The number of the UDP port to use for an unmanaged L2TP tunnel (L2TPv3 Ethernet Pseudowires).

Default The UDP port is 1701 by default.

Mode Global Configuration

Usage notes The default UDP port for both unmanaged and managed L2TP tunnels is 1701. If both kinds of tunnel will be configured, the UDP port for the unmanaged tunnel must be changed to a different port by using the **l2tp unmanaged port** command.

Be aware of potential clashes with other UDP port users. Unless it is likely to be used for other purposes, we recommend configuring UDP port 1702 as a suitable alternative.

Example To set the UDP port for an L2TP unmanaged tunnel (L2TPv3 Ethernet Pseudowires) to 1702, use the following commands:

```
awplus# configure terminal
awplus(config)# l2tp unmanaged port 1702
```

Related commands tunnel mode l2tp v3

show running-config

show interface tunnel (L2TPv3)

Overview Use this command to display status information of a tunnel.

Syntax

```
show interface tunnel<0-65535>
```

Parameter	Description
<0-65535>	Specify a tunnel index in the range from 0 through 65535.

Mode Privileged Exec

Examples To display status information for L2TPv3 tunnel tunnel20, use the command.

```
awplus#show interface tunnel20
```

Output Figure 72-1: Example output from **show tunnel interface** on the console.

```
awplus#show interface tunnel20
Interface tunnel20
 Link is UP, administrative state is UP
 Hardware is Tunnel
 IPv4 address 192.168.10.1/24 broadcast 192.168.10.255
 IPv6 address 2001:db8:10::1/64
 IPv6 address fe80::5054:d4ff:fe84:d1aa/64
 index 16795714 metric 1 mtu 1480
 arp ageing timeout 300
 <UP,BROADCAST,RUNNING,MULTICAST>
 SNMP link-status traps: Disabled
 Tunnel source 192.168.1.1, destination 192.168.1.2
 Tunnel name local 192.168.1.1, remote 192.168.1.2
 Tunnel ID local 66, remote 77
 Tunnel protocol/transport l2tp v3, key disabled, sequencing
disabled
 Tunnel TTL inherit
 Checksumming of packets disabled, path MTU discovery disabled
 input packets 0, bytes 0, dropped 0, multicast packets 0
 output packets 5, bytes 366, multicast packets 0 broadcast
packets 0
 Time since last state change: 0 days 00:00:24
```

Related commands interface tunnel (L2TPv3)

tunnel destination (L2TPv3)

Overview Use this command to specify a tunnel destination for the remote end of the tunnel. Tunnel destination can be specified by using a destination network name or an IPv4 address.

Use the **no** variant of this command to remove a configured tunnel destination.

Syntax

```
tunnel destination {<ipv4-addr>|<destination-network-name>}
no tunnel destination
```

Parameter	Description
<ipv4-addr>	Specify the tunnel destination IPv4 address in the dotted decimal format A.B.C.D. The endpoints of the tunnel must be configured by mirroring IP addresses, that is, the tunnel source on one endpoint must be specified as the tunnel destination on the other endpoint.
<destination-network-name>	Destination network name. If the destination network name cannot be resolved, then the L2TPv3 tunnel remains inactive.

Mode Interface Configuration

Examples To configure an IPv4 tunnel destination by using an IPv4 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# tunnel mode l2tp v3
awplus(config-if)# tunnel destination 2.2.2.2
```

To configure an L2TPv3 tunnel destination by using a destination network name, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# tunnel mode l2tp v3
awplus(config-if)# tunnel destination
corporate_lan.example.com
```

To remove a tunnel destination, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# no tunnel destination
```

Related commands

interface tunnel (L2TPv3)

tunnel mode l2tp v3

tunnel source (L2TPv3)

tunnel df

Overview Use this command to specify whether the DF (Don't Fragment) bit in the IP header should be set or not on outgoing packets from L2TPv3 tunnels.

Use the **no** variant of this command to return to the default setting.

Syntax

```
tunnel df {set|clear}
no tunnel df
```

Parameter	Description
`set`	Set the DF bit in the outer header
`clear`	Clear the DF bit in the outer header

Default The DF bit is **set** on all outgoing packets.

Mode Interface Configuration

Usage notes This command gives you the opportunity to clear the DF bit allowing packets greater than the MTU to be fragmented and transmitted via the L2TPv3 Ethernet pseudo-wire. This may be necessary if an L2TPv3 tunnel is connected to a bridge and MTU-exceeded messages cannot be sent back to clients.

NOTE: *If fragmentation of larger packets occurs as a result of setting the tunnel Do Not Fragment bit to clear, this may slightly increase latency of the associated traffic flow traversing the VPN, due to the fragmentation and re-assembly that occurs.*

Example To specify the DF bit on the L2TPv3 tunnel (tunnel2), use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel mode l2tp v3
awplus(config-if)# tunnel df clear
```

To set the DF bit on the L2TPv3 tunnel (tunnel2) back to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# no tunnel df
```

Related commands tunnel mode l2tp v3

Command changes Version 5.4.9-1.1: command added

tunnel local id

Overview This command specifies a tunnel local identifier sent to the peer to match.

Use the **no** variant of this command to remove the tunnel local ID.

Syntax

```
tunnel local id <1-2147483647>
no tunnel local id
```

Parameter	Description
<1-2147483647>	Tunnel ID from 1 through 2147483647

Default No tunnel local ID is set.

Mode Interface Configuration

Usage notes The endpoints of the tunnel must be configured by mirroring tunnel IDs, that is, the tunnel local ID on one endpoint must be specified as the tunnel remote ID on the other endpoint.

The local session ID defaults to the tunnel local ID and the local session ID is not configurable. A session provides the data channel in L2TPv3. There is a single pseudowire per L2TP session.

Examples To specify a tunnel local ID, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel20
awplus(config-if)#tunnel mode l2tp v3
awplus(config-if)#tunnel local id 22
```

To remove the tunnel local ID, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel20
awplus(config-if)#no tunnel local id
```

Related commands tunnel remote id

Validation Commands show interface tunnel (L2TPv3)

tunnel mode l2tp v3

Overview Use this command to configure the encapsulation tunneling mode.

Use the **no** variant of this command to remove an established tunnel.

Syntax

```
tunnel mode l2tp v3 [ipv6]
no tunnel mode
```

Parameter	Description
ipv6	Specify IPv6 as the delivery protocol.

Default Virtual tunnel interfaces have no mode set by default. If you specify a mode of **l2tp v3**, the delivery protocol is IPv4 unless you specify IPv6.

Mode Interface Configuration

Usage notes A tunnel will not become operational until it is configured with this command.

Examples To configure L2TPv3 as the encapsulation tunneling mode for tunnel20, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel20
awplus(config-if)#tunnel mode l2tp v3
```

To remove the established tunnel20, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel20
awlus(config-if)#no tunnel mode
```

Related commands

interface tunnel (L2TPv3)

show interface tunnel (L2TPv3)

tunnel df

tunnel protection ipsec

Overview Use this command to optionally enable IPsec protection for packets encapsulated by this tunnel.

Use the **no** variant of this command to disable IPsec protection.

Syntax

```
tunnel protection ipsec [profile <ipsec-profile>]
no tunnel protection ipsec
```

Parameter	Description
<ipsec-profile>	The name of an optional custom IPsec profile (crypto ipsec profile command) to use to protect this tunnel.

Default IPsec protection for packets encapsulated by tunnel is disabled.

Mode Interface Configuration

Usage notes You also need to configure a pre-shared key in conjunction with this command. See the crypto isakmp key command for more information about configuring the pre-shared key.

Examples To enable IPsec protection for packets encapsulated by tunnel114, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel114
awplus(config-if)#tunnel protection ipsec
```

To disable IPsec protection for packets encapsulated by tunnel114, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel114
awplus(config-if)#no tunnel protection ipsec
```

Related commands

crypto ipsec profile

crypto isakmp key

show isakmp key (IPsec)

tunnel remote id

Overview This command specifies a tunnel remote identifier sent to the peer for match.

Use the **no** variant of this command to remove the tunnel remote ID.

Syntax

```
tunnel remote id <1-2147483647>
no tunnel remote id
```

Parameter	Description
<1-2147483647>	Tunnel ID from 1 through 2147483647

Default No tunnel remote ID is set.

Mode Interface Configuration

Usage notes The endpoints of the tunnel must be configured by mirroring tunnel IDs, that is, the tunnel remote ID on one endpoint must be specified as the tunnel local ID on the other endpoint.

The remote session ID defaults to the tunnel remote ID and the remote session ID is not configurable. A session provides the data channel in L2TPv3. There is a single pseudowire per L2TP session.

Examples To specify a tunnel remote ID, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel20
awplus(config-if)#tunnel mode l2tp v3
awplus(config-if)#tunnel remote id 22
```

To remove the tunnel remote ID, use the commands:

```
awplus#configure terminal
awplus(config)#interface tunnel20
awplus(config-if)#no tunnel remote id
```

Related commands tunnel local id

Validation Commands show interface tunnel (L2TPv3)

tunnel security-reprocessing

Overview Use this command to enable stream security reprocessing on all tunnel interfaces.

Use the **no** variant of this command to disable security reprocessing on all tunnel interfaces.

Note that tunnel security reprocessing increases the load on your device and reduces throughput. This is because traffic is processed twice through the DPI engine. Therefore, it should only be enabled if your solution requires it.

Syntax

```
tunnel security-reprocessing
no tunnel security-reprocessing
```

Default Security reprocessing is disabled by default.

Mode Global Configuration

Usage notes Use this command when you need to reinspect the traffic in a tunnel terminating on the device using stream UTM features after tunnel headers and encryption have been removed. For a configuration example using this command, see the Internet Protocol Security (IPsec) Feature Overview and_Configuration Guide.

Example To enable security reprocessing, use the commands:

```
awplus# configure terminal
awplus(config)# tunnel security-reprocessing
```

To disable security reprocessing, use the commands:

```
awplus# configure terminal
awplus(config)# no tunnel security-reprocessing
```

Related commands

show interface tunnel (GRE)

show interface tunnel (IPsec)

show interface tunnel (L2TPv3)

show interface tunnel (OpenVPN)

Command changes Version 5.4.8-0.2: command added

tunnel source (L2TPv3)

Overview Use this command to specify a tunnel source for the tunnel interface. The tunnel source can be specified by using an interface name or an IPv4 address. The source address must be an existing IPv4 address configured for an interface.

Use the **no** variant of this command to remove a tunnel source for a tunnel interface.

Syntax

```
tunnel source {<ipv4-addr>|<interface-name>}
no tunnel source
```

Parameter	Description
<ipv4-addr>	Specify the tunnel source IPv4 address for the tunnel interface in the dotted decimal format A.B.C.D. The endpoints of the tunnel must be configured by mirroring IP addresses, that is, the tunnel source on one endpoint must be specified as the tunnel destination on the other endpoint.
<interface-name>	Available interface name. Any AlliedWare Plus interface type (eth, vlan, ppp, tunnel, lo and so on). Using interface name can minimize the number of user-configured IP addresses and allow the tunnel source IP address to be dynamically issued via, for example, DHCP.

Mode Interface Configuration

Examples To configure an L2TPv3 tunnel source IPv4 address, use the commands:

```
awplus# configure terminal
awplus# interface eth1
awplus(config-if)# ip address 1.1.1.1/24
awplus(config-if)# interface tunnel1
awplus(config-if)# tunnel mode l2tp v3
awplus(config-if)# tunnel source 1.1.1.1
```

To use an interface name as the tunnel source, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel mode l2tp v3
awplus(config-if)# tunnel source eth2
```

To remove a tunnel source, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel1
awplus(config-if)# no tunnel source
```

Related commands

73 Transitioning IPv4 to IPv6 Commands

Introduction

Overview

This chapter provides an alphabetical reference of commands used to configure Light Weight 4 over 6 and MAP E.

Many ISPs have migrated from IPv4 to IPv6 networks. However, many customers are still using IPv4 facilities. IPv6 transition technologies, such as Light Weight 4 over 6 (LW4o6) and MAP-E, provide interoperability between IPv4 and IPv6 networks. This enables ISPs with IPv6 networks to provide Internet connectivity to customers with IPv4 facilities.

MAP-E provides a mechanism for mapping between an IPv4 prefix or IPv4 address or IPv4 shared address and an IPv6 address. It also uses the encapsulation mode described in RFC 2473 (IPv6 Tunneling) to transport IPv4 packets over an IPv6 network.

Dual-Stack Lite (DS-Lite) (RFC 6333) describes an architecture for transporting IPv4 packets over an IPv6 network. This chapter describes an extension to DS-Lite called **Lightweight 4over6**, which moves the Network Address and Port Translation (NAPT) function from the centralized DS-Lite tunnel concentrator to the tunnel client located in the Customer Premises Equipment (CPE).

This removes the requirement for a Carrier Grade NAT function in the tunnel concentrator and reduces the amount of centralized state that must be held to a per-subscriber level. In order to delegate the NAPT function and make IPv4 address sharing possible, port-restricted IPv4 addresses are allocated to the CPEs.

Useful Terms

- **Softwire**: A tunnel between two IPv6 end-points to carry IPv4 packets or two IPv4 end-points to carry IPV6 packets.
- **B4**: Softwire at the customer end that encapsulates native packets and tunnels them to a softwire concentrator (AFTR) at the service provider.
- **AFTR**: Softwire that decapsulates the packets received from a softwire B4 and sends them to their destination.

For more information, see the Transitioning IPv4 to IPv6 Feature Overview and Configuration Guide.

Command List

- "br-address (softwire)" on page 3495
- "mesh-mode" on page 3496
- "method (softwire)" on page 3497
- "rule (softwire)" on page 3498

br-address (softwire)

Overview Use this command to specify the IPv6 address of the MAP-E Border Router. Note, before using this command you must configure the command **method (Softwire Configuration)** with the **static** parameter.

Use the **no** variant of this command to remove the MAP-E Border Router address configuration.

Syntax

```
br-address <ipv6-address>
no br-address
```

Parameter	Description
<ipv6-address>	IPv6 address of MAP-E Border Router

Default Not set.

Mode SoftWire Configuration

Example To configure 'swconfig' to the softwire configuration MAP-E Border Router IPv6 address, use the following commands:

```
awplus# configure terminal
awplus(config)# softwire-configuration swconfig
awplus(config-softwire)# br-address 2001::1
```

To remove the MAP-E Border Router IPv6 address configuration for 'swconfig', use the following commands:

```
awplus# configure terminal
awplus(config)# softwire-configuration swconfig
awplus(config-softwire)# no br-address
```

Related commands show softwire-configuration

Command changes Version 5.4.9-0.1: command added

mesh-mode

Overview Use this command to enable mesh-mode. Mesh-mode enables softwire tunnels to work with devices that share the same IP address at the tunnel endpoint.

Use the **no** variant of this command to disable mesh-mode.

Syntax

```
mesh-mode
no mesh-mode
```

Default No mesh-mode.

Mode SoftWire Configuration

Usage notes Softwire tunnels may require communication with endpoints sharing the same IP address. The CPU resource required to support this is significant, so this command enables this support.

Example To configure a softwire named 'demo' to communicate with endpoints that share the same IP address, use the following commands:

```
awplus# configure terminal
awplus(config)# softwire-configuration demo
awplus(config-softwire)# mesh-mode
```

Related commands show softwire-configuration

softwire-configuration

Command changes Version 5.4.9-0.1: command added

method (softwire)

Overview Use this command to specify the configuration method (or source) for a softwire configuration. The configuration method can be either static or DHCP.

Use the **no** variant of this command to remove a configured method.

Syntax

```
method {static|dhcp}
no method
```

Parameter	Description
`static`	Softwire configuration is statically configured
`dhcp`	Softwire configuration is acquired through DHCP

Default Not set.

Mode SoftWire Configuration

Example To set the 'swconfig' softwire configuration method to **static**, use the commands:

```
awplus# configure terminal
awplus(config)# softwire-configuration swconfig
awplus(config-softwire)# method static
```

To set the 'swconfig' softwire configuration method to **DHCP**, use the commands:

```
awplus# configure terminal
awplus(config)# softwire-configuration swconfig
awplus(config-softwire)# method dhcp
```

To remove the softwire configuration method from 'swconfig', use the commands:

```
awplus# configure terminal
awplus(config)# softwire-configuration swconfig
awplus(config-softwire)# no method
```

Related commands show softwire-configuration

rule (softwire)

Command changes Version 5.4.9-0.1: command added

rule (softwire)

Overview Use this command to statically configure a MAP rule. Note, before using this command you must configure the command **method (Softwire Configuration)** with the **static** parameter.

You would normally obtain the values to use in this command from your ISP.

Use the **no** variant of this command to remove a MAP rule configuration.

Syntax

```
rule <0-65535> ipv4-prefix <ipv4-prefix> ipv6-prefix
<ipv6-prefix> psid-length <0-15> psid <psid-value> [offset
<0-16>] [forwarding]
```

```
rule <0-65535> ipv4-prefix <ipv4-prefix> ipv6-prefix
<ipv6-prefix> ea-length <0-48> [offset <0-16>] [forwarding]
```

```
no rule <0-65535>
```

Parameter	Description
`rule <0-65535>`	Rule ID is an integer in the range <1-65535>
`ipv4-prefix <ipv4-prefix>`	IPv4 prefix (e.g. 192.0.2.0/24)
`ipv6-prefix <ipv6-prefix>`	IPv6 prefix (e.g. 2001:db8: :/32)
`ea-length <0-48>`	Embedded address length is an integer in the range <0-48>.
`psid-length <0-15>`	Port Set ID (PSID) length is an integer in the range <0-15>, the default length is 0.
`psid <psid-value>`	Port Set ID (PSID) value is either decimal <0-65535> or hexadecimal with a leading 0x. Different PSID values guarantee non-overlapping port sets.
`offset <0-16>`	Port Set ID (PSID) offset is an integer in the range <0-16>.
`forwarding`	Indicates if this rule is a Forwarding Mapping Rule (FMR). Otherwise, this is only used as a Basic Mapping Rule (BMR)

Default Not set.

Mode SoftWire Configuration

Example

To configure a MAP rule 1 and MAP rule 2 in Softwire Configuration 'swconfig', use the following commands:

```
awplus# configure terminal
awplus(config)# softwire-configuration swconfig
awplus(config-softwire)# rule 1 ipv4-prefix 192.0.2.0/24
ipv6-prefix 2001:db8:1::/48 ea-length 16 forwarding
awplus(config-softwire)# rule 2 ipv4-prefix 192.0.2.23/32
ipv6-prefix 2001:db8:1:1781::/64 psid-length 8 psid 129
```

These two example rules above produce the same resulting IPv4 address and PSID if the IPv6 subnet on the upstream interface is 2001:db8:1:1781::/64.

To the remove rule 1 in Softwire Configuration 'swconfig', use the following commands:

```
awplus# configure terminal
awplus(config)# softwire-configuration swconfig
awplus(config-softwire)# no rule 1
```

show running-config softwire-configuration

Overview Use this command to display the running configuration information for a softwire configuration.

Syntax
```
show running-config softwire-configuration
<softwire-config-name>
```
```
show running-config softwire-configuration
```

Parameter	Description
<softwire-config-name>	The name assigned for the Softwire Configuration

Mode Privileged Exec

Example To show the running configuration for **all** softwire configuration, use the following command:

```
awplus# show running-config softwire-configuration
```

To show the running configuration for softwire configuration 'swconfig1', use the following command:

```
awplus# show running-config softwire-configuration swconfig1
```

Output Figure 73-1: Example output from **show running-config softwire-configuration**

```
awplus#show running-config softwire-configuration

Command changes Version 5.4.9-0.1: command added

show softwire-configuration

Overview Use this command to show information about the configuration state of softwire configuration. You can show information for all softwire configurations or define a specific configuration for display.

Syntax

```
show softwire-configuration <softwire-config-name>
show softwire-configuration
```

Parameter	Description
<softwire-config-name>	Name assigned to the Softwire Configuration

Mode Privileged Exec

Example To show information about the configuration state of **all** softwire configuration, use the command:

```
awplus# show softwire-configuration
```

To show information about the configuration state of softwire configuration 'swconfig1', use the command:

```
awplus# show softwire-configuration swconfig1
```

Output Figure 73-2: Example output for a Static MAP-E softwire configuration

```
awplus#show softwire-configuration swconfig1

Softwire Configuration: swconfig1

 Configuration Source: static
 Upstream Interface: eth1
 MAP-E Version: rfc
 No LW4o6 Configuration

 Border Relay Device: 2001:db8::1
  Rule 0
   IPv4-prefix: 192.0.2.0/24
   IPv6-prefix: 2001:db8::/32
   Embedded address length: 16
   Forwarding: enabled
   PSID offset: default
   PSID length: default
   PSID: default (0x0)
```

Figure 73-3: Example output for LW4o6 (config method DHCP)

```
awplus#show softwire-configuration

Softwire Configuration: lw4o6

 Configuration Source: dhcp
 Upstream Interface: eth1
 MAP-E Version: rfc
 lwAFTR Address: 2001:0db8:acc3:0055:0000:0000:0000:0001
 lw4o6 Rule:
  IPv4-Address: 192.0.2.123
  IPv6-Prefix: 2001:0db8::/32
   PSID offset: 0
   PSID length: 9
   PSID: 346 (0x15a)

Border Relay Device: Not Set
```

Command changes

Version 5.4.9-0.1: command added

softwire-configuration

Overview Use this command to enter the Softwire Configuration mode. This mode allows you to configure softwire settings.

In computer networking, a softwire is a type of tunneling protocol that creates a virtual "wire" that transparently encapsulates another protocol. Softwires are used for various purposes, one of which is to carry IPv4 traffic over IPv6 and vice versa, in order to support IPv6 transition mechanisms.

Use the **no** variant of this command to remove a softwire configuration.

Syntax

```
softwire-configuration <softwire-config-name>
no softwire-configuration <softwire-config-name>
```

Parameter	Description
<softwire-config-name>	The name assigned for this softwire configuration

Mode Global Configuration

Example To configure softwire settings for 'softwire1', use the following commands:

```
awplus# configure terminal
awplus(config)# softwire-configuration softwire1
awplus(config-softwire)#
```

To remove softwire 'softwire1', MAP Rules configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# no softwire-configuration softwire1
```

Related commands show softwire-configuration

Command changes Version 5.4.9-0.1: command added

tunnel security-reprocessing

Overview Use this command to enable stream security reprocessing on all tunnel interfaces.

Use the **no** variant of this command to disable security reprocessing on all tunnel interfaces.

Note that tunnel security reprocessing increases the load on your device and reduces throughput. This is because traffic is processed twice through the DPI engine. Therefore, it should only be enabled if your solution requires it.

Syntax

```
tunnel security-reprocessing
no tunnel security-reprocessing
```

Default Security reprocessing is disabled by default.

Mode Global Configuration

Usage notes Use this command when you need to reinspect the traffic in a tunnel terminating on the device using stream UTM features after tunnel headers and encryption have been removed. For a configuration example using this command, see the Internet Protocol Security (IPsec) Feature Overview and_Configuration Guide.

Example To enable security reprocessing, use the commands:

```
awplus# configure terminal
awplus(config)# tunnel security-reprocessing
```

To disable security reprocessing, use the commands:

```
awplus# configure terminal
awplus(config)# no tunnel security-reprocessing
```

Related commands

show interface tunnel (GRE)

show interface tunnel (IPsec)

show interface tunnel (L2TPv3)

show interface tunnel (OpenVPN)

Command changes Version 5.4.8-0.2: command added

tunnel destination (DS-Lite)

Overview Use this command to specify the tunnel destination for a DS-Lite tunnel.

Use the **no** variant of this command to remove a configured tunnel destination.

Syntax

```
tunnel destination dhcp interface <interface-name>
no tunnel destination
```

Parameter	Description
<interface-name>	The interface which receives the DHCP reply.

Mode Interface Configuration

Example To configure a DS-Lite tunnel destination, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# tunnel mode ds-lite
awplus(config-if)# tunnel destination dhcp interface eth1
```

To remove the tunnel destination, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# no tunnel mode destination
```

Related commands tunnel mode ds-lite

Command changes Version 5.4.9-0.1: command added

tunnel mode ds-lite

Overview Use this command to set the tunnel mode to DS-Lite for a tunnel interface.

Use the **no** variant of this command to remove the tunnel mode.

Syntax

```
tunnel mode ds-lite
no tunnel mode
```

Default Not set.

Mode Interface Configuration

Example To configure the DS-Lite tunnel mode on interface 'tunnel0', use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# tunnel mode ds-lite
```

To remove the configured DS-Lite tunnel mode for 'tunnel0', use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# no tunnel mode
```

Related commands tunnel mode (IPv6)

Command changes Version 5.4.9-0.1: command added

tunnel mode lw4o6

Overview Use this command to set the tunnel mode to Light Weight 4over6 (lw4o6) for a tunnel interface.

Use the **no** variant of this command to remove an established lw406 tunnel.

Syntax

```
tunnel mode lw4o6
no tunnel mode
```

Default Not set.

Mode Interface Configuration

Example To configure lw4o6 tunnel mode for tunnel6, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel mode lw4o6
```

To removed the configured lw4o6 tunnel mode for tunnel6, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel mode
```

Related commands tunnel mode (IPv6)

Command changes Version 5.4.9-0.1: command added

tunnel mode map-e

Overview Use this command to set the tunnel mode to MAP-E for a tunnel interface.

Use the **no** variant of this command to remove the MAP-E mode from a tunnel interface.

Syntax

```
tunnel mode map-e
no tunnel mode
```

Default Not set.

Mode User Exec and Privileged Exec

Example To configure the MAP-E tunnel mode on interface 'tunnel6', use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel mode map-e
```

To remove the configured MAP-E tunnel mode for 'tunnel6', use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel mode
```

Related commands show softwire-configuration

Command changes Version 5.4.9-0.1: command added

tunnel softwire

Overview Use this command to configure the softwire configuration to use for a tunnel interface.

Note that **tunnel-mode map-e** or **tunnel mode lw4o6** must be configured in order for the command **tunnel softwire** to be valid.

Use the **no** variant of this command to remove a tunnel softwire configuration.

Syntax

```
tunnel softwire <softwire-config-name>
no tunnel softwire
```

Parameter	Description
<softwire-config-name>	The softwire configuration used for a tunnel interface

Default Not set.

Mode Interface Configuration

Example To set the softwire configuration called 'swconfig' to an interface called 'tunnel6', use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# tunnel softwire swconfig
```

To remove the softwire configuration for interface 'tunnel6', use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel6
awplus(config-if)# no tunnel softwire
```

Related commands tunnel mode map-e

tunnel mode lw4o6

Command changes Version 5.4.9-0.1: command added

upstream-interface

Overview Use this command to assign a softwire configuration to an upstream interface configured with a globally scoped IPv6 address.

Use the **no** variant of this command to remove a configured upstream interface.

Syntax

```
upstream-interface <interface-name>
no upstream-interface
```

Parameter	Description
<interface-name>	Name of the interface connected to upstream (e.g. eth1, br1, vlan1)

Default Not set.

Mode SoftWire Configuration

Example To configure the softwire configuration ('swconfig') upstream-interface to eth1, use the following commands:

```
awplus# configure terminal
awplus(config)# softwire-configuration swconfig
awplus(config-softwire)# upstream-interface eth1
```

To remove the softwire configuration ('swconfig') upstream-interface configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# softwire-configuration swconfig
awplus(config-softwire)# no upstream-interface
```

Related commands show softwire-configuration

Command changes Version 5.4.9-0.1: command added

74 IPv6 Tunneling Commands

Introduction

Overview This chapter provides an alphabetical reference of commands used to configure IPv6 Tunneling.

For more information, see the IPv6 Tunneling Feature Overview and Configuration Guide.

Command List

- "interface tunnel (IPv6)" on page 3512
- "ip address (IP Addressing and Protocol)" on page 3513
- "ip tcp adjust-mss" on page 3515
- "ipv6 address" on page 3517
- "ipv6 tcp adjust-mss" on page 3519
- "mtu" on page 3521
- "show interface tunnel (IPv6)" on page 3523
- "tunnel destination (IPv6)" on page 3524
- "tunnel dscp" on page 3526
- "tunnel mode (IPv6)" on page 3527
- "tunnel source (IPv6)" on page 3528
- "tunnel ttl" on page 3530

interface tunnel (IPv6)

Overview Use this command to create a tunnel interface or to enter Interface mode to configure an existing tunnel. Tunnel interfaces are identified by an index identifier that is an integer in the range from 0 through 65535.

Use the **no** variant of this command to remove a previously created tunnel interface.

Syntax

```
interface tunnel<tunnel-index>
no interface tunnel<tunnel-index>
```

Parameter	Description
<tunnel-index>	Specify a tunnel interface index identifier in the range from 0 through 65535.

Default Tunnel interfaces do not exist.

Mode Global Configuration

Usage notes After you have created the tunnel interface, use the **tunnel mode** command to enable the tunnel.

Examples To configure a tunnel interface with index 30 and use IPv6 tunneling, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel30
awplus(config-if)# tunnel mode ipv6
```

To remove the IPv6 tunnel interface tunnel30, use the commands:

```
awplus# configure terminal
awplus(config)# no interface tunnel30
```

Command changes Version 5.4.8-2.1: command added

ip address (IP Addressing and Protocol)

Overview This command sets a static IP address on an interface.

The **no** variant of this command removes the IP address from the interface.

You cannot remove the primary address when a secondary address is present.

Syntax

```
ip address <ip-addr/prefix-length> [secondary] [label <label>]
no ip address [<ip-addr/prefix-length>] [secondary]
```

Parameter	Description
<ip-addr/prefix-length>	The IPv4 address and prefix length you are assigning to the interface.
`secondary`	Secondary IP address.
`label`	Adds a user-defined description of the secondary IP address.
<label>	A user-defined description of the secondary IP address. Valid characters are any printable character and spaces.

Mode Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

Usage notes To set the primary IP address on the interface, specify only **ip address** *<ip-addr/prefix-length>*. This overwrites any configured primary IP address. To add additional IP addresses on this interface, use the **secondary** parameter. You must configure a primary address on the interface before configuring a secondary address.

NOTE: *Use **show running-config interface**, instead of **show ip interface brief**, when you need to view a secondary address configured on an interface. **show ip interface brief** will only show the primary address, not a secondary address for an interface.*

Examples To add the IP address 10.10.10.50/24 to the interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip address 10.10.10.50/24
```

To add the secondary IP address 10.10.11.50/24 to the same interface, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip address 10.10.11.50/24 secondary
```

To add the IP address 10.10.11.50/24 to the local loopback interface lo, use the following commands:

```
awplus# configure terminal
awplus(config)# interface lo
awplus(config-if)# ip address 10.10.11.50/24
```

To add the IP address 10.10.11.50/24 to the PPP interface ppp0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip address 10.10.11.50/24
```

To add the IP address 10.10.11.50/24 to the tunnel tunnel0, use the following commands:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-if)# ip address 10.10.11.50/24
```

Related commands

interface (to configure)

show ip interface

show running-config interface

ip tcp adjust-mss

Overview Use this command to set the Maximum Segment Size (MSS) size for an interface, where MSS is the maximum TCP data packet size that the interface can transmit before fragmentation.

Use the **no** variant of this command to remove a previously specified MSS size for a PPP interface, and restore the default MSS size.

Syntax

```
ip tcp adjust-mss {<mss-size>|pmtu}
no ip tcp adjust-mss
```

Parameter	Description
<mss-size>	<64-1460> Specifies the MSS size in bytes.
pmtu	Adjust TCP MSS automatically with respect to the MTU on the interface.

Default The default setting allows a TCP server or a TCP client to set the MSS value for itself.

Mode Interface Configuration

Usage notes When a host initiates a TCP session with a server it negotiates the IP segment size by using the MSS option field in the TCP packet. The value of the MSS option field is determined by the Maximum Transmission Unit (MTU) configuration on the host.

You can set a feasible MSS value on the following interfaces:

- PPP
- Ethernet
- Tunnel
- VLAN

Examples To configure an MSS size of 1452 bytes on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ip tcp adjust-mss 1452
```

To configure an MSS size of 1452 bytes on Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ip tcp adjust-mss 1452
```

To configure an MSS size of 1452 bytes on interface tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# ip tcp adjust-mss 1452
```

To restore the MSS size to the default size on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ip tcp adjust-mss
```

Command changes

Version 5.4.8-2.1: interface tunnel example added

ipv6 address

Overview Use this command to set the IPv6 address of an interface. The command also enables IPv6 on the interface, which creates an EUI-64 link-local address as well as enabling RA processing and SLAAC.

To stop the device from processing prefix information (routes and addresses from the received Router Advertisements) use the command **no ipv6 nd accept-ra-pinfo**.

To remove the EUI-64 link-local address, use the command **no ipv6 eui64-linklocal**.

Use the **no** variant of this command to remove the IPv6 address assigned and disable IPv6. Note that if no global addresses are left after removing the IPv6 address then IPv6 is disabled.

Syntax

```
ipv6 address <ipv6-addr/prefix-length>
no ipv6 address <ipv6-addr/prefix-length>
```

Parameter	Description
<ipv6-addr/prefix-length>	Specifies the IPv6 address to be set. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.

Mode Interface Configuration for a VLAN interface, an Eth interface, an 802.1Q sub-interface, a local loopback interface, a PPP interface, a bridge, or a tunnel.

Usage notes Note that the device keeps link-local addresses until you remove them with the **no** variant of the command that established them. See the ipv6 enable command for more information.

Also note that the device keeps the link-local address if the global address is removed using a command other than the command that was used to establish the link-local address. For example, if a link local address is established with the ipv6 enable command then it will not be removed using a **no ipv6 address** command.

Examples To assign the IPv6 address 2001:0db8::a2/64 to the VLAN interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::a2/64
```

To remove the IPv6 address 2001:0db8::a2/64 from the VLAN interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::a2/64
```

To assign the IPv6 address to the PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-fr-subif)# ipv6 address 2001:0db8::a2/64
```

To assign the IPv6 address to the tunnel tunnel0, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel0
awplus(config-fr-subif)# ipv6 address 2001:0db8::a2/64
```

To remove the IPv6 address 2001:0db8::a2/64 from the PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 address 2001:0db8::a2/64
```

ipv6 tcp adjust-mss

Overview Use this command to set the IPv6 Maximum Segment Size (MSS) size for an interface, where MSS is the maximum TCP data packet size that the interface can transmit before fragmentation.

Use the **no** variant of this command to remove a previously specified MSS size for a PPP interface, and restore the default MSS size.

Syntax

```
ipv6 tcp adjust-mss {<mss-size>|pmtu}
no ipv6 tcp adjust-mss
```

Parameter	Description
<mss-size>	<64-1460> Specifies the MSS size in bytes.
pmtu	Adjust TCP MSS automatically with respect to the MTU on the interface.

Default The default setting allows a TCP server or a TCP client to set the MSS value for itself.

Mode Interface Configuration

Usage notes When a host initiates a TCP session with a server it negotiates the IP segment size by using the MSS option field in the TCP packet. The value of the MSS option field is determined by the Maximum Transmission Unit (MTU) configuration on the host.

You can set a feasible MSS value on the following interfaces:

- PPP
- Ethernet
- Tunnel
- VLAN

Examples To configure an IPv6 MSS size of 1452 bytes on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# ipv6 tcp adjust-mss 1452
```

To configure an IPv6 MSS size of 1452 bytes on Ethernet interface eth1, use the commands:

```
awplus# configure terminal
awplus(config)# interface eth1
awplus(config-if)# ipv6 tcp adjust-mss 1452
```

To adjust IPv6 TCP MSS automatically with respect to the MTU on interface tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# ipv6 tcp adjust-mss pmtu
```

To restore the MSS size to the default size on PPP interface ppp0, use the commands:

```
awplus# configure terminal
awplus(config)# interface ppp0
awplus(config-if)# no ipv6 tcp adjust-mss
```

Command changes

Version 5.4.8-2.1: interface tunnel example added

mtu

Overview Use this command to set the Maximum Transmission Unit (MTU) size for interfaces, where MTU is the maximum packet size that interfaces can transmit. The MTU size setting is applied to both IPv4 and IPv6 packet transmission.

Use the **no** variant of this command to remove a previously specified Maximum Transmission Unit (MTU) size, and restore the default MTU size. For example the VLAN interface default is 1500 bytes.

Syntax

```
mtu <68-1582>
no mtu
```

Default The default MTU size, for example 1500 bytes for VLAN interfaces.

Mode Interface Configuration

Usage notes If a device receives an IPv4 packet for Layer 3 switching to another interface with an MTU size smaller than the packet size, and if the packet has the '**don't fragment**' bit set, then the device will send an ICMP '**destination unreachable**' (3) packet type and a '**fragmentation needed and DF set**' (4) code back to the source. For IPv6 packets bigger than the MTU size of the transmitting interface, an ICMP '**packet too big**' (ICMP type 2 code 0) message is sent to the source.

You can set an MTU value on the following interfaces:

- PPP
- Ethernet
- Tunnel
- VLAN

Note that you cannot configure MTU on bridge interfaces. The MTU of the bridge interface is determined by the member interface of the bridge which has the lowest MTU. For example, if you attach eth1 with MTU 1200, ppp1 with MTU 1400, and vlan1 with MTU 1500 to a bridge interface, the MTU for that interface will be 1200.

Note that show interface output will only show MTU size for VLAN interfaces.

Examples To configure an MTU size of 1555 bytes on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# mtu 1555
```

To configure an MTU size of 1555 bytes for tunnel 'tunnel2', use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# mtu 1555
```

To restore the MTU size to the default MTU size of 1500 bytes on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no mtu
```

Related commands show interface

show interface tunnel (IPv6)

Overview Use this command to display status information of tunnels.

The tunnel remains inactive if no valid tunnel source or tunnel destination is configured.

Syntax `show interface tunnel<tunnel-index>`

Parameter	Description
`tunnel`	Specify this parameter to display tunnel status information of a given tunnel identified by the <0-255> parameter.
<0-255>	Specify a tunnel index in the range from 0 through 255.

Mode Privileged Exec

Example To display status information for IPv6 tunnel `tunnel20`, use the command:

```
awplus# show interface tunnel20
```

Figure 74-1: Example output from the **show interface tunnel** command

```
awplus#show interface tunnel20
Interface tunnel20
  Link is UP, administrative state is UP
  Hardware is Tunnel
  IPv4 address 192.168.10.1/24 pointopoint 192.168.10.255
  index 4751 metric 1 mtu 1480
  arp ageing timeout 300
  <UP,POINTOPOINT,RUNNING,MULTICAST>
  SNMP link-status traps: Disabled
  Tunnel source 2001:db8::1:1, destination 2001:db8::2:1
  Tunnel name local 2001:db8::1:1, remote 2001:db8::2:1
  Tunnel ID local (not set), remote (not set)
  Tunnel protocol/transport ipv6, key disabled, sequencing disabled
  Tunnel TTL 64
  Checksumming of packets disabled, path MTU discovery disabled
    input packets 0, bytes 0, dropped 0, multicast packets 0
    output packets 0, bytes 0, multicast packets 0 broadcast packets 0
  Time since last state change: 0 days 22:38:35
```

Command changes Version 5.4.8-2.1: command added

tunnel destination (IPv6)

Overview Use this command to specify a tunnel destination for the remote end of the tunnel. Tunnel destination can be specified by using a destination network name or an IPv6 address.

Use the **no** variant of this command to remove a configured tunnel destination.

Syntax

```
tunnel destination {<ipv6-addr>|<destination-network-name>}
no tunnel destination
```

Parameter	Description
<ipv6-addr>	Specify the tunnel destination IPv6 address in the dotted decimal format x:x::x:x. The endpoints of the tunnel must be configured by mirroring IP addresses, that is, the tunnel source on one endpoint must be specified as the tunnel destination on the other endpoint.
<destination-network-name>	Destination network name. If the destination network name cannot be resolved, then the IPv6 tunnel remains inactive.

Mode Interface Configuration

Examples To configure an IPv6 tunnel destination by using an IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# tunnel mode ipv6
awplus(config-if)# tunnel destination 2001:db8::1:1
```

To configure an IPv6 tunnel destination by using a destination network name, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# tunnel mode ipv6
awplus(config-if)# tunnel destination
corporate_lan.example.com
```

To remove a IPv6 tunnel destination, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel40
awplus(config-if)# no tunnel destination
```

tunnel dscp

Overview Use this command to configure the Differentiated Services Code Point (DSCP) value for the DSCP field in the packet header that encapsulates the tunneled packets.

Use the **no** variant of this command to reset the DSCP field to its default value.

Syntax

```
tunnel dscp <0-63>
no tunnel dscp
```

Parameter	Description
<0-63>	Specify the DSCP value in the range from 0 through 63 for the DSCP field in the packet header that encapsulates the tunneled packets.

Default The IPv4 DSCP field value is inherited from the inner header to the outer header.

Mode Interface Configuration

Examples To configure the DSCP value to 10 for tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel dscp 10
```

To remove a configured DSCP value for tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# no tunnel dscp
```

Related commands interface tunnel (IPv6)

interface tunnel (GRE)

tunnel mode (IPv6)

Overview Use this command to configure the encapsulation tunneling mode to use. This command sets IPv6 tunneling.

Use the **no** variant of this command to remove an established tunnel.

Syntax

```
tunnel mode ipv6
no tunnel mode
```

Default Virtual tunnel interfaces have no mode set by default.

Mode Interface Configuration

Usage notes A tunnel will not become operational until it is configured with this command.

Examples To configure IPv6 as the encapsulation mode for tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel mode ipv6
```

To remove a configured IPv6 tunnel mode for tunnel2, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# no tunnel mode
```

Related commands interface tunnel (IPv6)

Command changes Version 5.4.8-2.1: command added

tunnel source (IPv6)

Overview Use this command to specify a tunnel source for the tunnel interface. Tunnel source can be specified by using an interface name or an IPv6 address. The source address must be an existing IPv6 address configured for an interface.

Use the **no** variant of this command to remove a tunnel source for a tunnel interface.

Syntax

```
tunnel source {<ipv6-addr>|<interface-name>}
no tunnel source
```

Parameter	Description
<ipv6-addr>	Specify the tunnel source IPv6 address for the IPv6 tunnel interface in the dotted decimal format x:x::x:x. The endpoints of the tunnel must be configured by mirroring IP addresses, that is, the tunnel source on one endpoint must be specified as the tunnel destination on the other endpoint.
<interface-name>	Available interface name. Any AlliedWare Plus interface type (eth, vlan, ppp, tunnel, lo and so on). Using interface name can minimize the number of user-configured IP addresses and allow the tunnel source IP address to be dynamically issued via, for example, DHCP.

Mode Interface Configuration

Examples To configure an IPv6 tunnel source IPv6 address, use the commands:

```
awplus# configure terminal
awplus# interface eth1
awplus(config-if)# ip address 2001:db8::1:1/48
awplus(config-if)# interface tunnel1
awplus(config-if)# tunnel mode ipv6
awplus(config-if)# tunnel source 2001:db8::1:1
```

To use an interface name as the tunnel source, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel2
awplus(config-if)# tunnel mode ipv6
awplus(config-if)# tunnel source eth1
```

To remove an IPv6 tunnel source, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel1
awplus(config-if)# no tunnel source
```

tunnel ttl

Overview Use this command to configure the value to use for the Time to Live (TTL) field in the IPv4 header that encapsulates the tunneled IPv4 or IPv6 packets.

Use the **no** variant of this command to set the TTL value to its default.

Syntax

```
tunnel ttl <1-255>
no tunnel ttl
```

Parameter	Description
<1-255>	TTL value from 1 through 255.

Default The default TTL value is inherited from the encapsulated packet.

Mode Interface Configuration

Example To set the TTL value of the packet to 255, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel20
awplus(config-if)# tunnel ttl 255
```

To remove the configured TTL value of the packet, use the commands:

```
awplus# configure terminal
awplus(config)# interface tunnel20
awplus(config-if)# no tunnel ttl
```
