```

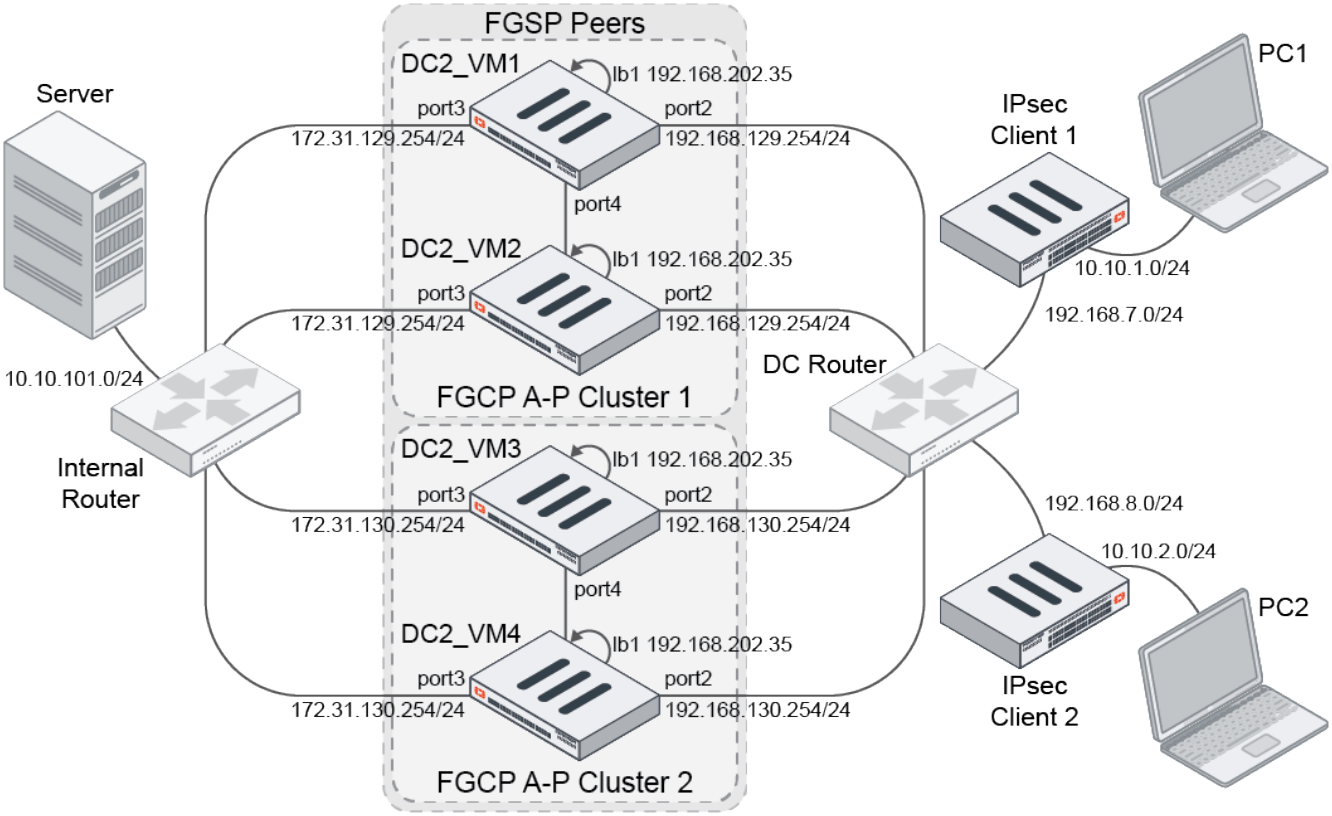
d. DC1_VM4:

```
DC1_VM4 # diagnose vpn tunnel list name vpn1_1
list ipsec tunnel by names in vd 0
```

The IPsec tunnel `role=sync-primary`on DC1_VM1 indicates that the IPsec tunnel was established on the FortiGate and traffic is being forwarded. On DC1_VM2 and DC1_VM3, the IPsec tunnel `role=standby` indicates that they are synchronized from the FGSP peer and are in standby for traffic forwarding.

The IPsec SAs do not synchronize to DC1_VM4 because `fgsp-sync` is disabled.



4. When a failure occurs on DC1_VM1, the tunnel traffic will fail over to either DC1_VM2 or DC1_VM3. Its tunnel role will become `role=sync-primary`.

FGCP over FGSP per-tunnel failover for IPsec

For additional redundancy, an FGCP cluster on one site may form FGSP peering with FGCP clusters on other sites. The FGCP over FGSP peers can still synchronize IPsec SAs and act as the primary gateway for individual tunnels for the same dialup servers. When failover happens within an FGCP cluster, tunnel traffic will failover to the other FGCP cluster member. When an FGCP cluster fails, tunnel traffic will failover to the other FGSP peer.

Example

In this example, each FGCP A-P cluster is connected on port4 as the heartbeat interface. The FGSP peers are connected on port5 over 172.31.2.1-2/24. Each FGSP peer and FGCP cluster has a loopback interface, lb1, with the same IP address. This loopback interface is used as the local gateway on each of the phase 1 connections to avoid each FGSP member having different IPs on port2. The DC Router uses ECMP to distribute traffic to each FGSP peer. It is assumed that the networking addresses are already configured properly.

Interface/setting	DC2_VM1	DC2_VM2	DC2_VM3	DC2_VM4
port2	192.168.129.254/24	192.168.129.254/24	192.168.130.254/24	192.168.130.254/24
port3	172.31.129.254/24	172.31.129.254/24	172.31.130.254/24	172.31.130.254/24
port4	FGCP HA heartbeat interface	FGCP HA heartbeat interface	FGCP HA heartbeat interface	FGCP HA heartbeat interface
port5	172.31.2.1/24	172.31.2.1/24	172.31.2.2/24	172.31.2.2/24

Interface/setting	DC2_VM1	DC2_VM2	DC2_VM3	DC2_VM4
lb1	192.168.202.35/32	192.168.202.35/32	192.168.202.35/32	192.168.205.35/32
fgsp-sync	Enabled	Enabled	Enabled	Enabled

There are two pairs of FGCP A-P HA clusters that form FGSP peering with each other. This is a typical FGCP over FGSP configuration used in large enterprises and service provider environments where high redundancy is needed. Each cluster uses the same loopback address for the local gateway. The DC Router uses ECMP to route traffic to the destination 192.168.202.31 through each of the participating FGSP peers.

In a larger scale there may be many more members in the FGCP clusters, more FGSP peers, and more IPsec dialup clients connecting. Each eligible FGSP peer will be the primary gateway for a set of dialup tunnels, and is in standby for the rest of the tunnels. When the FGCP cluster is configured in A-P mode, the tunnels will be established on the primary unit and synchronized to the standby unit.

The following configurations and example demonstrates PC1 initiating traffic to the Server. First, a dialup tunnel is formed between FortiGate IPsec Client 1 and DC2_VM1, which allows traffic to go through. IPsec SAs are synchronized to the FGCP standby unit, and to the FGSP peer. Upon failure of DC2_VM1, DC2_VM2 takes over as the primary of the HA cluster, and assumes the primary role for the failover tunnels.

If both DC2_VM1 and DC2_VM2 fail, the tunnels that were formed on this FGSP peer will now be re-routed to the other FGSP peer. The primary FGCP cluster member, DC2_VM3, will now pick up the tunnel traffic and assume the primary role for the failover tunnels.

To configure the HA clusters:

1. Configure FGCP A-P Cluster 1 (use the same configuration for DC2_VM1 and DC2_VM2):

```
config system ha
    set group-id 1
    set group-name "DC2_VM12"
    set mode a-p
    set password ********
    set hbdev "port4" 50
    set session-pickup enable
    set uninterruptible-upgrade disable
    set override disable
    set priority 100
end
```

2. Configure FGCP A-P Cluster 2 (use the same configuration for DC2_VM3 and DC2_VM4):

```
config system ha
    set group-id 2
    set group-name "DC2_VM34"
    set mode a-p
    set password ********
    set hbdev "port4" 50
    set session-pickup enable
    set uninterruptible-upgrade disable
    set override disable
    set priority 100
end
```

To configure the FGSP peers:

1. Configure DC2_VM1:

```
config system standalone-cluster
    set standalone-group-id 2
    set group-member-id 1
    config cluster-peer
        edit 1
            set peerip 172.31.2.2
        next
    end
end
```

   The configuration is automatically synchronized to DC2_VM2.

2. Configure DC2_VM3:

```
config system standalone-cluster
    set standalone-group-id 2
    set group-member-id 2
    config cluster-peer
        edit 1
            set peerip 172.31.2.1
        next
    end
end
```

   The configuration is automatically synchronized to DC2_VM4.

3. To configure the IPsec VPN settings (use the same configuration for DC2_VM1 and DC2_VM3).
   a. Configure the VPN tunnel phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "vpn1"
        set type dynamic
        set interface "port2"
        set ike-version 2
        set local-gw 192.168.202.35
        set keylife 90000
        set peertype one
        set net-device disable
        set proposal aes128-sha1
        set add-route disable
        set dpd on-idle
        set dhgrp 2
        set fgsp-sync enable
        set nattraversal disable
        set peerid "Nokia_Peer"
        set psksecret ********
        set dpd-retryinterval 60
    next
end
```

   b. Configure the VPN tunnel phase 2 settings:

```
config vpn ipsec phase2-interface
    edit "vpn1"
        set phase1name "vpn1"
```

```
        set proposal aes128-sha1
        set keylifeseconds 10800
    next
end
```

To verify the configuration:

1. The FGCP HA cluster and the FGSP peering have formed. Verify the respective HA statuses.
   a. Verify the FGCP cluster status on DC2_VM1:

```
DC2_VM1 # diagnose sys ha status

HA information
Statistics
        traffic.local = s:0 p:439253 b:89121494
        traffic.total = s:0 p:440309 b:89242174
        activity.ha_id_changes = 2
        activity.fdb  = c:0 q:0

enc_npuid=0
```

The IPsec tunnel `role=sync-primary`on DC2_VM1 indicates that it is being used to carry IPsec traffic. On DC2_VM2, DC2_VM3, and DC2_VM4, the IPsec tunnel `role=standby` indicates that they are in standby for traffic forwarding.

To test failover scenarios:

1. Verify the sniffer trace on DC2_VM1 before FGCP HA failover:

```
DC2_VM1 # diagnose sniffer packet any icmp 4
Using Original Sniffing Mode
interfaces=[any]
filters=[icmp]
0.171753 vpn1 in 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.171763 port3 out 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.171941 port3 in 10.10.101.2 -> 10.10.1.2: icmp: echo reply
0.171947 vpn1 out 10.10.101.2 -> 10.10.1.2: icmp: echo reply
```

   Traffic passes through DC2_VM1.
2. Reboot the primary FortiGate, DC2_VM1.
3. Verify the sniffer trace on DC2_VM2 after FGCP HA failover:

```
DC2_VM2 # diagnose sniffer packet any icmp 4
Using Original Sniffing Mode
interfaces=[any]
filters=[icmp]
0.111107 vpn1 in 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.111118 port3 out 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.111293 port3 in 10.10.101.2 -> 10.10.1.2: icmp: echo reply
0.111298 vpn1 out 10.10.101.2 -> 10.10.1.2: icmp: echo reply
```

```
^C
16 packets received by filter
0 packets dropped by kernel
```

Traffic passes through DC2_VM2.

4. Verify the tunnel list for vpn1_1 on DC2_VM2:

```
DC2_VM2 # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=vpn1_1 ver=2 serial=4 192.168.202.35:0->192.168.7.2:0 tun_id=192.168.7.2 tun_
id6=::10.0.0.4 dst_mtu=1500 dpd-link=on weight=1
bound_if=6 lgwy=static/1 tun=intf/0 mode=dial_inst/3 encap=none/8840 options[2288]=npu
rgwy-chg frag-rfc  run_state=0 role=sync-primary accept_traffic=1 overlay_id=0

parent=vpn1 index=1
proxyid_num=1 child_num=0 refcnt=5 ilast=0 olast=0 ad=/0
stat: rxp=58 txp=31 rxb=4872 txb=2604
dpd: mode=on-idle on=1 idle=60000ms retry=3 count=0 seqno=169
natt: mode=none draft=0 interval=0 remote_port=0
fec: egress=0 ingress=0
proxyid=vpn1 proto=0 sa=1 ref=3 serial=3
  src: 0:0.0.0.0-255.255.255.255:0
  dst: 0:10.10.1.0-10.10.1.255:0
  SA:  ref=3 options=602 type=00 soft=0 mtu=1438 expire=10730/0B replaywin=2048
       seqno=20 esn=0 replaywin_lastseq=0000003b qat=0 rekey=0 hash_search_len=1
  life: type=01 bytes=0/0 timeout=10790/10800
  dec: spi=37f426c1 esp=aes key=16 ef61b49078b6ab3e00a4d3a048d779f5
       ah=sha1 key=20 ee2e8de9c522d89b6481c37faa73a7bb54163645
  enc: spi=10aa4d58 esp=aes key=16 4cb95f12657ca8e269b9f8a25f9b19c1
       ah=sha1 key=20 326744c4e5b4a0758397725464593d94ba9390dc
  dec:pkts/bytes=116/9744, enc:pkts/bytes=62/7316
  npu_flag=00 npu_rgwy=192.168.7.2 npu_lgwy=192.168.202.35 npu_selid=1e dec_npuid=0 enc_
npuid=0
```

The role has changed to `role=sync-primary`.

5. Shut down DC2_VM1 and the DC2_VM2 IPsec uplink interface.
6. Verify the sniffer trace on DC2_VM3. As expected, traffic now passes through DC2_VM3:

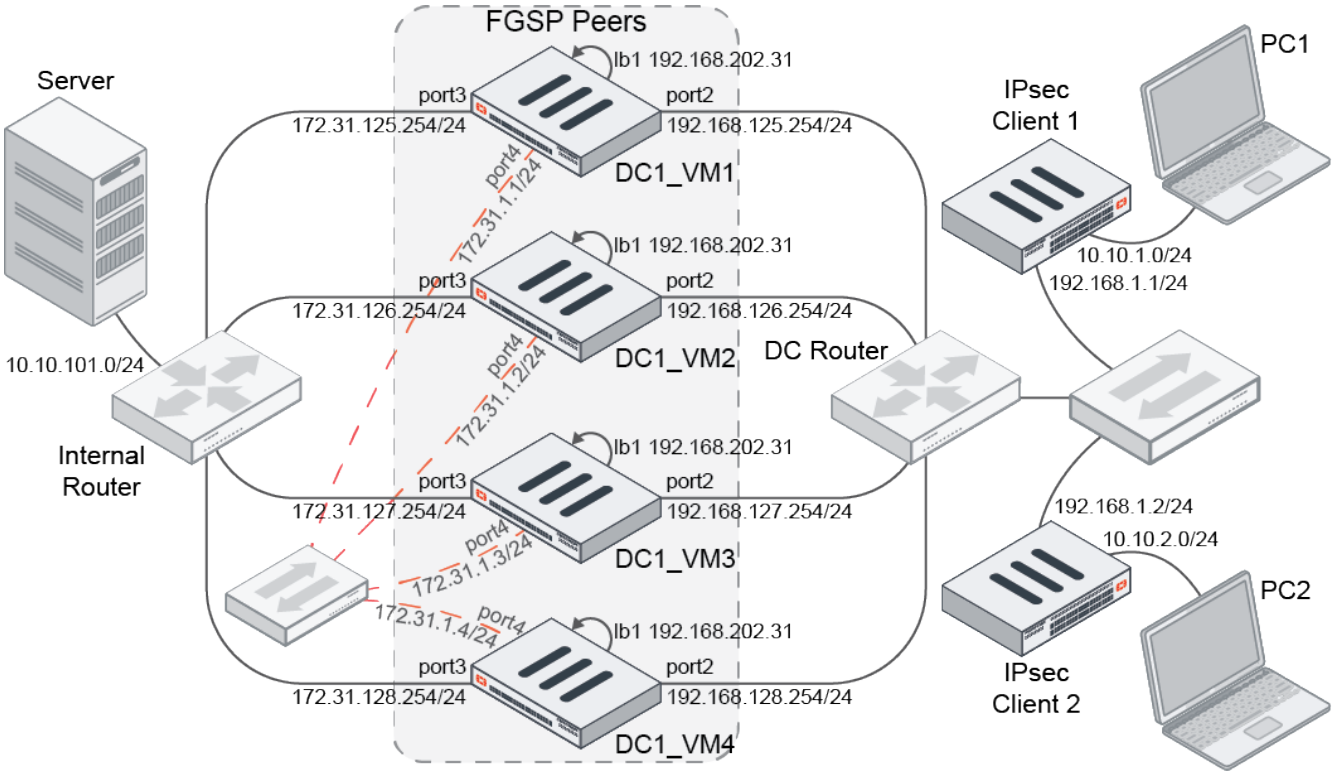
```
DC2_VM3 # diagnose sniffer packet any icmp 4
Using Original Sniffing Mode
interfaces=[any]
filters=[icmp]
0.165088 vpn1 in 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.165102 port3 out 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.165294 port3 in 10.10.101.2 -> 10.10.1.2: icmp: echo reply
0.165301 vpn1 out 10.10.101.2 -> 10.10.1.2: icmp: echo reply
^C
14 packets received by filter
0 packets dropped by kernel
```

7. Verify the tunnel list for vpn1_1 on DC2_VM3:

```
DC2_VM3 # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=vpn1_1 ver=2 serial=4 192.168.202.35:0->192.168.7.2:0 tun_id=192.168.7.2 tun_
```

```
id6=::10.0.0.4 dst_mtu=1500 dpd-link=on weight=1
bound_if=6 lgwy=static/1 tun=intf/0 mode=dial_inst/3 encap=none/8712 options[2208]=npu
frag-rfc  run_state=0 role=sync-primary accept_traffic=1 overlay_id=0

parent=vpn1 index=1
proxyid_num=1 child_num=0 refcnt=5 ilast=0 olast=0 ad=/0
stat: rxp=53 txp=53 rxb=4452 txb=4452
dpd: mode=on-idle on=1 idle=60000ms retry=3 count=0 seqno=0
natt: mode=none draft=0 interval=0 remote_port=0
fec: egress=0 ingress=0
proxyid=vpn1 proto=0 sa=1 ref=3 serial=3
  src: 0:0.0.0.0-255.255.255.255:0
  dst: 0:10.10.1.0-10.10.1.255:0
  SA:  ref=3 options=602 type=00 soft=0 mtu=1438 expire=10347/0B replaywin=2048
       seqno=10000155 esn=0 replaywin_lastseq=000001b0 qat=0 rekey=0 hash_search_len=1
  life: type=01 bytes=0/0 timeout=10790/10800
  dec: spi=37f426c1 esp=aes key=16 ef61b49078b6ab3e00a4d3a048d779f5
       ah=sha1 key=20 ee2e8de9c522d89b6481c37faa73a7bb54163645
  enc: spi=10aa4d58 esp=aes key=16 4cb95f12657ca8e269b9f8a25f9b19c1
       ah=sha1 key=20 326744c4e5b4a0758397725464593d94ba9390dc
  dec:pkts/bytes=88/7392, enc:pkts/bytes=88/10384
  npu_flag=00 npu_rgwy=192.168.7.2 npu_lgwy=192.168.202.35 npu_selid=1e dec_npuid=0 enc_
npuid=0
```



The role has changed to `role=sync-primary`.

Allow IPsec DPD in FGSP members to support failovers

In conjunction with support for FGSP per-tunnel failover for IPsec on page 2244, configuring DPD (dead peer detection) on an FGSP member is permitted. This allows a failed FGSP member to send out DPD probes during failover to detect unreachable remote peers and to flush the corresponding tunnels.

Example

In this example, using the same configuration as in FGSP per-tunnel failover for IPsec on page 2244, a tunnel can be established from one of the remote IPsec clients to one of the FGSP members (DC1_VM1). DPD can be set to `on-idle`, with a configured `dpd-retryinterval` of 60 seconds. When a client disappears, whether it is due to remote client failures or server-side routing failures, the FGSP member or gateway (DC1_VM1) will send out DPD probes for detection. Once the three iterations are complete and no responses are detected, the FGSP member will flush the tunnel and remove any routing to that peer.

Interface/setting	DC1_VM1	DC1_VM2	DC1_VM3	DC1_VM4
port2	192.168.125.254/24	192.168.126.254/24	192.168.127.254/24	192.168.128.254/24
port3	172.31.125.254/24	172.31.126.254/24	172.31.127.254/24	172.31.128.254/24
port4	172.31.1.1/24	172.31.1.2/24	172.31.1.3/24	172.31.1.4/24
lb1	192.168.202.31/32	192.168.202.31/32	192.168.202.31/32	192.168.202.31/32
`fgsp-sync`	Enabled	Enabled	Enabled	Disabled

To configure the FGSP peers (DC1_VM1):

The following steps are to configure DC1_VM1. The other peers have similar configurations based on the preceding table. In the `config vpn ipsec phase1-interface` settings, all peers should have the same local gateway external interface (192.168.202.31). For DC1_VM4, `fgsp-sync` is disabled in the VPN tunnel phase 1 settings.

1. Configure the FGSP settings:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
    config cluster-peer
        edit 1
            set peerip 172.31.1.2
        next
```

```
        edit 2
            set peerip 172.31.1.3
        next
        edit 3
            set peerip 172.31.1.4
        next
    end
end
```

2. Configure the VPN tunnel phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "vpn1"
        set type dynamic
        set interface "port2"
        set ike-version 2
        set local-gw 192.168.202.31
        set keylife 90000
        set peertype one
        set net-device disable
        set proposal aes128-sha1
        set dpd on-idle
        set dhgrp 2
        set fgsp-sync enable
        set nattraversal disable
        set peerid "Nokia_Peer"
        set psksecret xxxxx
        set dpd-retryinterval 60
    next
end
```

3. Configure the VPN tunnel phase 2 settings:

```
config vpn ipsec phase2-interface
    edit "vpn1"
        set phase1name "vpn1"
        set proposal aes128-sha1
        set keylifeseconds 10800
    next
end
```

To verify the configuration:

1. Once the FGSP members establish peering with each other, verify the standalone peers on DC1_VM1:

```
DC1_VM1 # diagnose sys ha standalone-peers
Group=1, ID=1
Detected-peers=3
Kernel standalone-peers: num=3.
peer0: vfid=0, peerip:port = 172.31.1.2:708, standalone_id=2
        session-type: send=0, recv=0
         packet-type: send=0, recv=0
peer1: vfid=0, peerip:port = 172.31.1.3:708, standalone_id=3
        session-type: send=0, recv=0
         packet-type: send=0, recv=0
peer2: vfid=0, peerip:port = 172.31.1.4:708, standalone_id=4
        session-type: send=0, recv=0
         packet-type: send=0, recv=0
```

```
Kernel standalone dev_base:
        standalone_id=0:
        standalone_id=1:
                phyindex=0: mac=00:0c:29:22:00:6b, linkfail=1

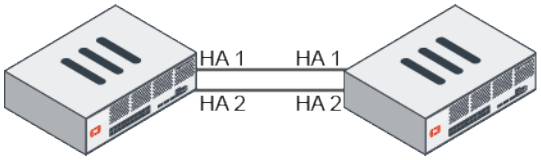
Standalone configuration synchronization

You can configure synchronization from one standalone FortiGate to another standalone FortiGate (`standalone-config-sync`). With the exception of some configurations that do not sync (settings that identify the FortiGate to the network), the rest of the configurations are synced, such as firewall policies, firewall addresses, and UTM profiles.

This option is useful in situations when you need to set up FGSP peers, or when you want to quickly deploy several FortiGates with the same configurations. You can set up `standalone-config-sync` for multiple members.

`standalone-config-sync` is an independent feature and should be used with caution as there are some limitations. We recommend disabling it once the configurations have been synced over.

Limitations



When standalone configuration synchronization is enabled, there are some limitations, including but not limited to the following:

- Network interruptions occur during firmware upgrades: when upgrading the firmware, all members in the `standalone-config-sync` group are upgraded simultaneously. This creates downtime if the FortiGates are the only outgoing gateway in the network. We recommend disabling the option before upgrading firmware.
- Some unwanted configurations might be synced: the current design and implementation of `standalone-config-sync` is based on requirements from specific customers. Thus, some users may find that unwanted parts of the configurations are synced. Should this occur, we recommend disabling the option and modifying those configurations manually.
- The wrong primary device might be selected accidentally: `standalone-config-sync` is derived from the HA primary unit selection mechanism. All members in the group will join the selection process in the same way as a the HA cluster selection process. It is important to select the correct device as the primary, otherwise the wrong device could be selected and existing configurations could be overwritten.

Setting up standalone configuration synchronization

Two or more standalone FortiGates should be connected to each other with one or more heartbeat interfaces, either back-to-back or via a switch. In the following example, the device supplying the configurations is called "conf-prim," and

the devices receiving the configurations are called "conf-secos."

To set up standalone configuration synchronization:

1. Configure the conf-prim device for the group:

```
config system ha
    set hbdev ha1 50 ha2 100
    set priority 255
    set override enable
    set standalone-config-sync enable
end
```

2. Configure the conf-prim device as needed to be functional.
3. Configure the other group members as conf-secos:

```
config system ha
    set standalone-config-sync enable
end
```

4. Wait 10–15 minutes for the configurations to sync over.
5. Verify the synchronization status:

```
# get system ha status
path=system, objname=ha, tablename=(null), size=5912
HA Health Status:
  WARNING: FG201E4Q17900771 has hbdev down;

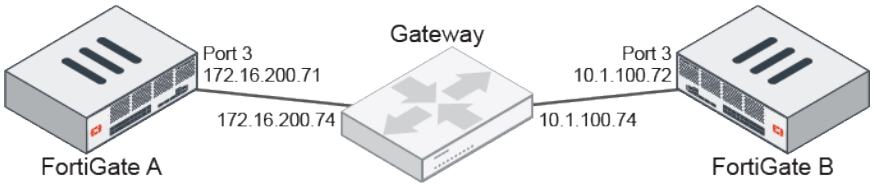
number of vcluster: 1
vcluster 1: work 169.254.0.1
Secondary: FG201E4Q17900771, HA operating index = 1
Primary: FG201ETK19900991, HA operating index = 0
```

If all members are `in-sync`, this means all members share the same configurations, except those that should not be synced. If any members are `out-of-sync`, this means the member failed to sync with the primary device.

Debugging is similar when a cluster is out of sync.

The following topic provides more information about standalone configuration synchronization:



- Layer 3 unicast standalone configuration synchronization on page 2267

Layer 3 unicast standalone configuration synchronization

Unicast standalone configuration synchronization is supported on layer 3, allowing peers to be synchronized in cloud environments that do not support layer 2 networking. Configuring a unicast gateway allows peers to be in different subnets.

Example

In this example, two FortiGates in different subnets are connected through a unicast gateway. Both cluster members use the same port for the heartbeat interface.

To configure unicast synchronization between peers:

1. Configure FortiGate A:

```
config system ha
    set group-name "testcs"
    set hbdev "port3" 50
    set standalone-config-sync enable
    config unicast-peers
        edit 1
            set peer-ip 10.1.100.72
        next
```

```
    end
    set override enable
    set priority 200
    set unicast-status enable
    set unicast-gateway 172.16.200.74
end
```

2. Configure FortiGate B:

```
config system ha
    set group-name "testcs"
    set hbdev "port3" 50
    set standalone-config-sync enable
    config unicast-peers
        edit 1
            set peer-ip 172.16.200.71
        next
    end
    set override enable
    set priority 100
    set unicast-status enable
    set unicast-gateway 10.1.100.74
end
```

3. Check the HA status on FortiGate A:

```
# get system ha status
HA Health Status: OK
Model: FortiGate-VM64
Mode: ConfigSync
Group: 0
Debug: 0
Cluster Uptime: 2 days 3:40:25
Cluster state change time: 2021-03-08 12:00:38
Primary selected using:
    <2021/03/08 12:00:38> FGVMSLTM00000001 is selected as the primary because its
override priority is larger than peer member FGVMSLTM00000002.
    <2021/03/06 11:50:35> FGVMSLTM00000001 is selected as the primary because it's the
only member in the cluster.
ses_pickup: disable
override: enable
Configuration Status:

5. Verify that configuration changes on the primary FortiGate are synchronized to the secondary FortiGate:
   a. Adjust the administrator timeout value on FortiGate A:

```
config system global
    set admintimeout 100
end
```

   b. Check the debug messages on FortiGate B:

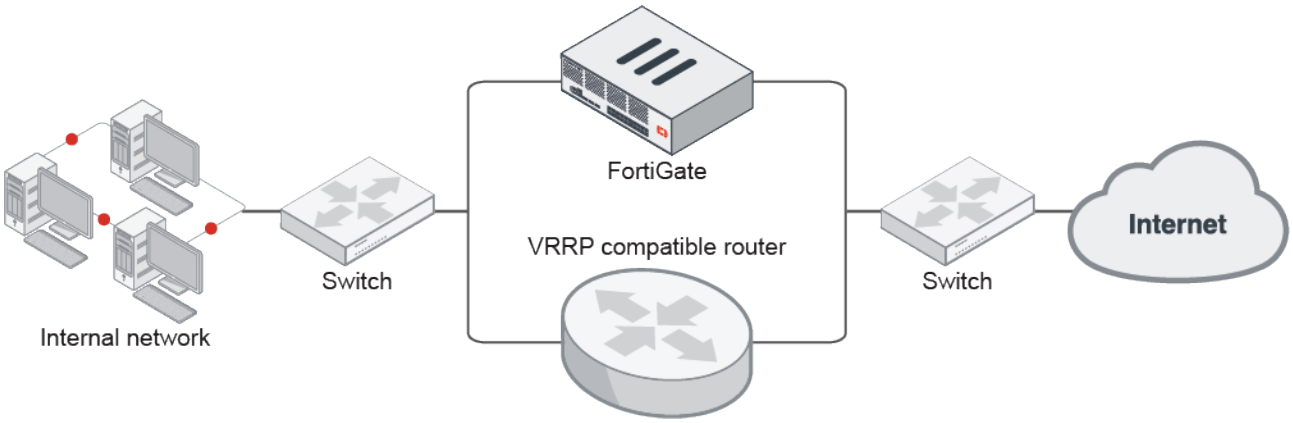
```
# diagnose debug cli 7
Debug messages will be on for 30 minutes.

# diagnose debug enable

create pid=15639, clictxno=0, last=1615246288
0: conf sys global
0: set admintimeout 100
0: end
```

VRRP

A Virtual Router Redundancy Protocol (VRRP) configuration can be used as a high availability solution to ensure that a network maintains connectivity with the internet (or with other networks) even if the default router for the network fails. If a router or a FortiGate fails, all traffic to this device transparently fails over to another router or FortiGate that takes over the role of the failed device. If the failed device is restored, it will take over processing the network traffic.



FortiOS supports VRRP versions 2 and 3. VRRP domains can be created, which can include multiple FortiGates and other VRRP-compatible routers. Different FortiGate models can be added to the same VRRP domain.

FortiOS supports IPv4 and IPv6 VRRP, so IPv4 and IPv6 VRRP virtual routers can be added to the same interface. FortiGates can quickly and easily integrate into a network that has already deployed VRRP.

Basic VRRP configuration

The most common VRRP application is to provide redundant default routers between an internal network and the internet. The default routers can be FortiGates or any routers that support VRRP.

Two or more FortiGate interfaces or routers must be configured with the same virtual router ID and IP address so they can automatically join the same VRRP domain. Priorities must be assigned to each FortiGate interface or router in the VRRP domain. All of the routers in the VRRP domain should have different priorities. One FortiGate interface or router must have the highest priority to become the primary router. The other FortiGates or routers in the domain are assigned lower priorities and become backups. If the primary router fails, VRRP automatically fails over to the router in the domain with the next highest priority.

To configure VRRP:

1. Add a virtual VRRP router to the internal interface of each FortiGate and/or router. This adds the FortiGates and routers to the same VRRP domain.
2. Set the VRRP IP address of the domain to the internal network default gateway IP address.
3. Set the priorities.

See Adding IPv4 and IPv6 virtual routers to an interface on page 2271 Single-domain VRRP example on page 2278, and Multi-domain VRRP example on page 2279 for configuration examples.

During normal operations, all traffic from the internal network to the internet passes through the primary VRRP router. The primary router also sends VRRP advertisement messages to the backup routers. A backup router will not attempt to become a primary router while receiving these messages. If the primary router fails, the backup router with the highest

priority becomes the new primary router after a short delay. All packets sent to the default route are now sent to the new primary router. If the new primary router is a FortiGate, the network continues to benefit from FortiOS security features. If the new primary router is just a router, traffic continues to flow, but FortiOS security features are unavailable until the FortiGate is back online.

If the backup router is a FortiGate, during a VRRP failover as the FortiGate begins operating as the new primary router, it will not have session information for all of the failed over in-progress sessions. So, it would normally not be able to forward in-progress session traffic.

Adding IPv4 and IPv6 virtual routers to an interface

This topic describes to how to add IPv4 and IPv6 virtual routers to an interface. VRRP can only be configured on physical or VLAN interfaces. VRRP cannot be configured on hardware switch interfaces where multiple physical interfaces are combined into a hardware switch interface.

IPv4 virtual router

In this example, an IPv4 VRRP router is added to port10 on the FortiGate. The VRRP virtual router has a virtual router ID of 200, uses IP address 10.31.101.200, and has a priority of 255. Since this is the highest priority in the configuration, this interface is configured to be the primary router of the VRRP domain.

To configure the interface settings:

```
config system interface
    edit port10
        config vrrp
            edit 200
                set vrip 10.31.101.200
                set priority 255
            next
        end
    next
end
```

IPv6 virtual router

In this example, an IPv6 VRRP router is added to port20 on the FortiGate. The VRRP virtual router has a virtual router ID of 220, uses IP address 2001:db8:1::12, and has a priority of 255. Since this is the highest priority in the configuration, this interface is configured to be the primary router of the VRRP domain.

To configure the interface settings:

```
config system interface
    edit port20
        config ipv6
            set vrip6_link_local <IPv6_address>
            config vrrp6
                edit 220
                    set vrip 2001:db8:1::12
                    set priority 255
                next
            end
```

```
        end
    next
end
```

VRRP failover

VRRP routers in a VRRP domain periodically send VRRP advertisement messages to all routers in the domain to maintain one router as the primary router and the others as backup routers. The primary router has the highest priority. If the backup routers stop receiving these packets from the primary router, the backup router with the highest priority becomes the new primary router.

The primary router stops sending VRRP advertisement messages if it fails or becomes disconnected. Up to two VRRP destination addresses can be configured to be monitored by the primary router. As a best practice, the destination addresses should be remote addresses. If the primary router is unable to connect to these destination addresses, it stops sending VRRP advertisement messages, and the backup router with the highest priority becomes the primary router.

To configure IPv4 VRRP with two destination addresses for monitoring:

```
config system interface
    edit port14
        config vrrp
            edit 12
                set vrdst 10.10.10.20 10.20.20.10
            next
        end
    next
end
```

To configure IPv6 VRRP with one destination address for monitoring:

```
config system interface
    edit port23
        config ipv6
            config vrrp6
                edit 223
                    set vrdst 2001:db8:1::12
                next
            end
        end
    next
end
```

IPv4 VRRP active failover

The `vrdst-priority` option can be used to reduce IPv4 VRRP failover times. This option causes the primary router to actively signal to the backup routers when the primary router cannot reach its configured destination addresses. The primary router sends a lower priority for itself in the VRRP advertisement messages. The backup router with the highest priority becomes the new primary router and takes over traffic processing.

In this example, the primary router is configured to have a priority of 255, so it should always become the primary router. The `vrdst-priority` is set to 10. If the primary router cannot connect to the 10.10.10.1 destination address, then the primary router informs the VRRP group that its priority is now 10.

To set the priority of the virtual router when the destination address is unreachable:

```
config system interface
    edit port10
        config vrrp
            edit 12
                set vrip 10.31.101.200
                set priority 255
                set vrdst 10.10.10.1
                set vrdst-priority 10
            next
        end
    next
end
```

IPv4 VIP and IP pool failover

The `proxy-arp` option can be used to map VIPs and IP pool address ranges to each router's VMAC (virtual MAC). After failover, the IP or ranges configured in the VRRP settings are routed to the new primary router's VMAC. In this example, a single IP and an address range are added for proxy ARP.

To configure the IP addresses for proxy ARP:

```
config system interface
    edit port5
        set vrrp-virtual-mac enable
        config vrrp
            edit 1
                config proxy-arp
                    edit 1
                        set ip 192.168.62.100-192.168.62.200
                    next
                    edit 2
                        set ip 192.168.62.225
                    next
                end
            next
        end
    next
end
```

Changing the advertisement message interval

By default, VRRP advertisement messages are sent once every second. The frequency can be changed with the `adv-interval` option to change the frequency of sending these messages (1 - 255 seconds).

The `adv-interval` also affects the period of time that a backup VRRP router waits before assuming the primary router has failed. The waiting period is three times the `adv-interval`. For example, if the `adv-interval` is set to 5, then the backup router waits for up to 15 seconds to receive a VRRP advertisement from the current primary router before taking over the role as the primary router.

To configure IPv4 VRRP to send advertisement messages every 10 seconds:

```
config system interface
    edit port14
        config vrrp
            edit 12
                set adv-interval 10
            next
        end
    next
end
```

To configure IPv6 VRRP to send advertisement messages every 20 seconds:

```
config system interface
    edit port23
        config ipv6
            config vrrp6
                edit 223
                set adv-interval 20
            next
        end
    next
end
```

Changing the VRRP startup time

The VRRP startup time is the time a backup or primary VRRP router waits before sending or receiving VRRP advertisements before potentially changing state (`start-time` in seconds, 1 - 255, default = 3). This timer is mainly visible when VRRP-monitored interfaces become up after previously been down. When this occurs, the device will wait for the time period before considering, and potentially changing its status.

There are some instances when the advertisement messages might be delayed. For example, some switches with spanning tree enabled may delay some of the advertisement message packets. If backup routers are attempting to become primary routers even though the primary router has not failed, extend the start time to ensure that the backup routers wait long enough for the advertisement messages.

To configure the IPv4 VRRP startup time to 10 seconds:

```
config system interface
    edit port14
        config vrrp
            edit 12
                set start-time 10
            next
        end
    next
end
```

To configure the IPv6 VRRP startup time to 15 seconds:

```
config system interface
    edit port23
        config ipv6
```

```
            config vrrp6
                edit 223
                set start-time 15
            next
        end
    next
end
```

VRRP groups

If VRRP routers are added to multiple interfaces of the same FortiGate, each router will be in a different VRRP domain. If one of the VRRP routers fails, it is useful if all of the VRRP routers added to the FortiGate also fail.

VRRP can only check the routers' status in a single VRRP domain and cannot track the status of routers in other domains. For multiple VRRP domains on a single FortiGate, only one can switch to being a backup, and the others remain operating normally. Using VRRP groups resolves this issue.

All the VRRP virtual routers on the FortiGate can be added to a VRRP group. If one of the virtual routers in a VRRP group switches to the backup, the VRRP group forces all members to switch to backups. All VRRP traffic being processed by the FortiGate fails over to other devices in the network.

The status of the virtual routers in a VRRP group only changes when one or more of the virtual routers in the group changes status. A VRRP group should not be used to manually change the status of the virtual routers in the group.

To configure two IPv4 VRRP routers in a VRRP group:

```
config system interface
    edit port10
        config vrrp
            edit 200
                set vrip 10.31.101.200
                set priority 255
                set vrgrp 10
            next
        end
    next
    edit port20
        config vrrp
            edit 100
                set vrip 10.23.1.223
                set priority 20
                set vrgrp 10
            next
        end
    next
end
```

To configure two IPv6 VRRP routers in a VRRP group:

```
config system interface
    edit port11
        config ipv6
```

```
            set vrip6_link_local <IPv6_address>
            config vrrp6
                edit 220
                    set vrip 2001:db8:1::12
                    set priority 255
                    set vrgrp 90
                next
            end
        end
    next
    edit port12
        config ipv6
            set vrip6_link_local <IPv6_address>
            config vrrp6
                edit 220
                    set vrip 2001:db8:1::14
                    set priority 100
                    set vrgrp 90
                next
            end
        end
    next
end
```

VRRP virtual MACs

The VRRP virtual MAC address (or virtual router MAC address) is a shared MAC address adopted by the primary router. If the primary router fails, the same virtual MAC address is picked up by the new primary router, allowing all devices on the network to transparently connect to the default route using the same virtual MAC address. This feature must be enabled on all members in a VRRP domain.

Each VRRP router has its own virtual MAC address. The last part octet is based on the VRRP router ID using the following format:

`00-00-5E-00-01-<VRID_hex>`

Where `<VRID_hex>` is the VRRP router ID in hexadecimal format in internet standard bit-order. For more information about virtual MAC formatting, see RFC 3768.

For example:

- If the VRRP router ID is 10, then the virtual MAC is `00-00-5E-00-01-0a`.
- If the VRRP router ID is 200, then the virtual MAC is `00-00-5E-00-01-c8`.

If the VRRP virtual MAC address feature is disabled (the default setting), the VRRP domain uses the MAC address of the primary router. On a FortiGate VRRP virtual router, this is the MAC address of the FortiGate interface that the VRRP router is added to. If the primary fails, when the new primary takes over, it sends gratuitous ARPs to associate the VRRP router IP address with the MAC address of the new primary (or the FortiGate interface that became the new primary).

When a VRRP virtual MAC address is enabled, the new primary uses the same MAC address as the old primary.

Since devices on the LAN do not have to learn a new MAC address for a new VRRP router in the event of a failover, this feature can improve network efficiency, especially in large and complex networks.

To enable virtual MAC addresses in IPv4 VRRP:

```
config system interface
    edit <name>
        set vrrp-virtual-mac enable
    next
end
```

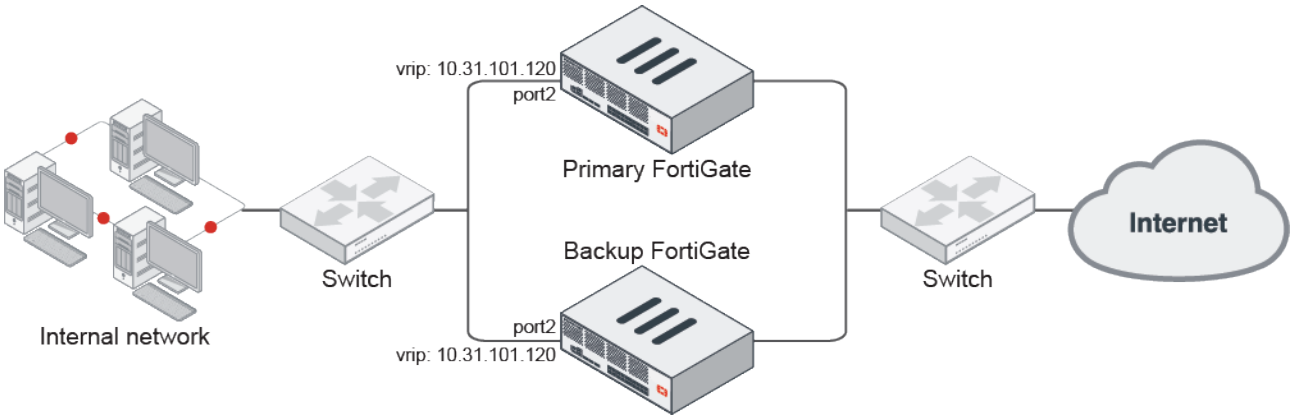
To enable virtual MAC addresses in IPv6 VRRP:

```
config system interface
    edit <name>
        config ipv6
            set vrrp-virtual-mac6 enable
        end
    next
end
```

Preempt mode

When preempt mode is enabled (the default setting), a higher priority backup router can preempt a lower priority primary router. This can happen if the primary router fails, the backup router becomes the primary router, and the failed primary router restarts. Since the restarted router has a higher priority, if preempt mode is enabled, the restarted router replaces the current primary router becoming the new primary router. If preempt mode is disabled, a restarted router that has a higher priority would not take over as the primary router.

To configure preempt mode in IPv4 VRRP:



```
config system interface
    edit <name>
        config vrrp
            edit <vrid>
                set preempt {enable | disable}
            next
        end
    next
end
```

To configure preempt mode in IPv6 VRRP:

```
config system interface
    edit <name>
        config ipv6
            config vrrp6
                edit <vrid>
                    set preempt {enable | disable}
                next
            end
        end
    next
end
```

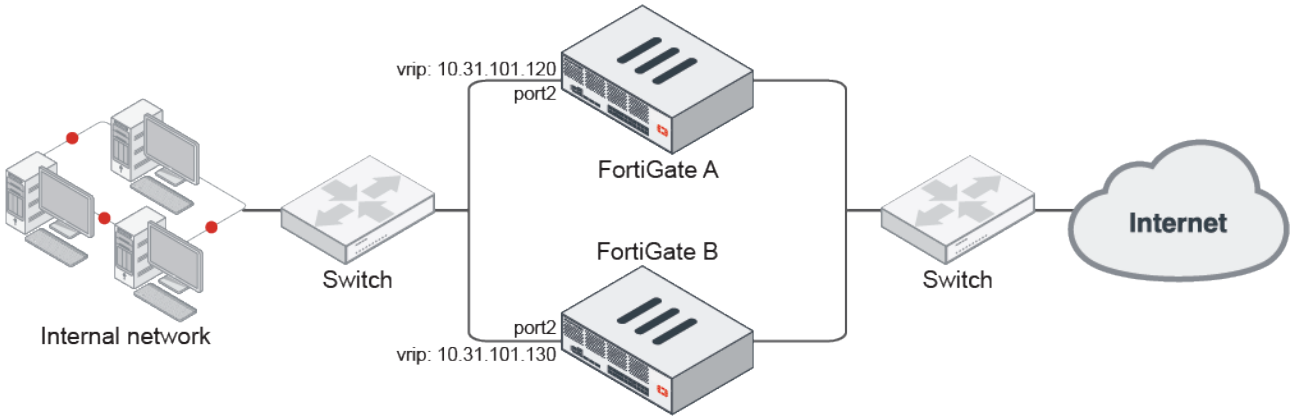
Single-domain VRRP example

This example consists of a VRRP domain with two FortiGates that connect an internal network to the internet. The FortiGate port2 interfaces connect to the internal network, and a VRRP virtual router is added to each port2 interface with VRRP virtual MAC addresses enabled. The internal network default route is 10.31.101.120. Each FortiGate port2 interface has an IP address that is different from the virtual router IP address. Since `vrrp-virtual-mac` is enabled, upon failover, the new primary VRRP router will use the same VMAC as the previous router.

To configure the primary FortiGate:

```
config system interface
    edit port2
        set vrrp-virtual-mac enable
        config vrrp
            edit 5
                set vrip 10.31.101.120
                set priority 255
            next
        end
    next
end
```

To configure the backup FortiGate:



```
config system interface
    edit port2
        set vrrp-virtual-mac enable
        config vrrp
            edit 5
                set vrip 10.31.101.120
                set priority 50
            next
        end
    next
end
```

Multi-domain VRRP example

This example consists of two VRRP domains, and both FortiGates participate in the domains that connect an internal network to the internet. One FortiGate is the primary router of one domain and the other FortiGate is the primary router of the other domain. The network distributes traffic between two different default routes (10.31.101.120 and 10.31.101.130). One VRRP domain is configured with one of the default route IP addresses and the other VRRP domain gets the other default route IP address. During normal operation, both FortiGates process traffic, and the VRRP domains are used to load balance the traffic between the two FortiGates.

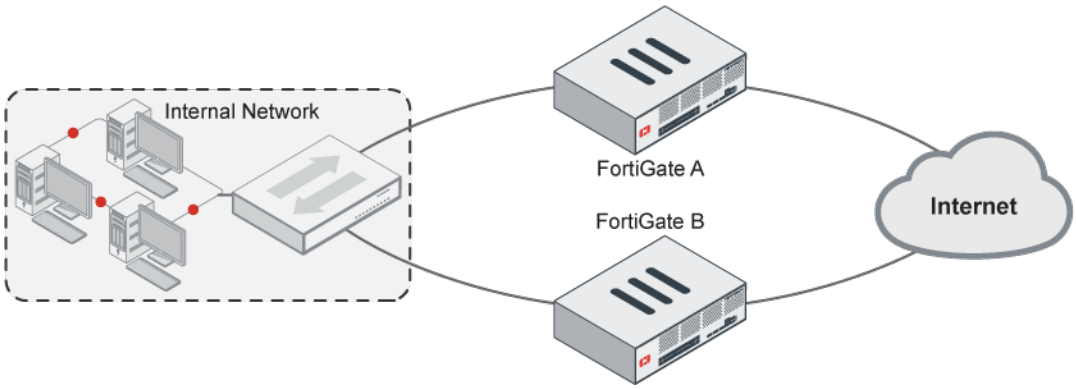
If one of the FortiGates fails, the remaining FortiGate becomes the primary router of both VRRP domains. The network sends all traffic for both default routes to this FortiGate. The result is a configuration that (under normal operational load) balances traffic between two FortiGates, but if one of the FortiGates fails, all traffic fails over to the FortiGate that is still operating.

VRRP virtual MAC address are enabled on both FortiGates' port2 interfaces so that the VRRP domains use their VRRP virtual MAC addresses.

Device	VRRP primary			VRRP backup		
	Virtual router IP	ID	Priority	Virtual router IP	ID	Priority
FortiGate A	10.31.101.120	50	255	10.31.101.130	100	50
FortiGate B	10.31.101.130	100	255	10.31.101.120	50	50

To configure FortiGate A:

```
config system interface
    edit port2
        set vrrp-virtual-mac enable
        config vrrp
            edit 50
                set vrip 10.31.101.120
                set priority 255
            next
            edit 100
                set vrip 10.31.101.130
                set priority 50
            next
        end
```



```
    next
end
```

To configure FortiGate B:

```
config system interface
    edit port2
        set vrrp-virtual-mac enable
        config vrrp
            edit 50
                set vrip 10.31.101.120
                set priority 50
            next
            edit 100
                set vrip 10.31.101.130
                set priority 255
            next
        end
    next
end
```

VRRP on EMAC-VLAN interfaces

Virtual Router Redundancy Protocol (VRRP) can be configured on EMAC-VLAN interfaces.

To configure the interfaces:

1. Configure FortiGate A:

```
config system interface
    edit "emac"
        set vdom "root"
        set ip 172.16.209.1 255.255.255.0
        set allowaccess ping https ssh snmp http telnet fgfm
        set type emac-vlan
        set vrrp-virtual-mac enable
        config vrrp
            edit 1
                set vrip 172.16.209.111
                set priority 200
            next
```

```
        end
        set snmp-index 61
        set interface "port1"
    next
end
```

2. Configure FortiGate B:

```
config system interface
    edit "emac"
        set vdom "root"
        set ip 172.16.209.2 255.255.255.0
        set allowaccess ping https ssh snmp http telnet fgfm
        set type emac-vlan
        set vrrp-virtual-mac enable
        config vrrp
            edit 1
                set vrip 172.16.209.111
                set priority 222
            next
        end
        set snmp-index 32
        set interface "port1"
    next
end
```

Check the VRRP information on the FortiGates:

Because FortiGate B has a higher priority, it is the primary device and FortiGate A is the backup.

1. FortiGate A:

```
# get router info vrrp
Interface: emac, primary IP address: 172.16.209.1
  UseVMAC: 1, SoftSW: 0, EmacVlan: 1 BrPortIdx: 0, PromiscCount: 0
  HA mode: primary (0:0:1) VRRP master number: 0
  VRID: 1 verion: 2
    vrip: 172.16.209.111, priority: 200 (200,0), state: BACKUP
    adv_interval: 1, preempt: 1, ignore_dft: 0 start_time: 3
    master_adv_interval: 100, accept: 1
    vrmac: 00:00:5e:00:01:01
    vrdst:
    vrgrp: 0
```

2. FortiGate B:

```
# get router info vrrp
Interface: emac, primary IP address: 172.16.209.2
  UseVMAC: 1, SoftSW: 0, EmacVlan: 1 BrPortIdx: 0, PromiscCount: 1
  HA mode: primary (0:0:1) VRRP master number: 1
  VRID: 1 verion: 2
    vrip: 172.16.209.111, priority: 222 (222,0), state: PRIMARY
    adv_interval: 1, preempt: 1, ignore_dft: 0 start_time: 3
    master_adv_interval: 100, accept: 1
    vrmac: 00:00:5e:00:01:01
    vrdst:
    vrgrp: 0
```

SNMP

SNMP enables you to monitor hardware on your network. You can configure the hardware, such as the FortiGate SNMP agent, to report system information and send traps (alarms or event messages) to SNMP managers. SNMP traps alert you to events that happen, such as when a log disk is full or a virus is detected.

The FortiGate SNMP implementation is read-only. SNMP v1/v2c, and v3 compliant SNMP managers have read-only access to FortiGate system information through queries, and can receive trap messages from the FortiGate unit.

- Interface access on page 2282
- MIB files on page 2282
- SNMP agent on page 2283
- SNMP v1/v2c communities on page 2284
- SNMP v3 users on page 2285
- Access control for SNMP on page 2287
- Important SNMP traps on page 2289
- SNMP traps and query for monitoring DHCP pool on page 2290

Interface access

Before a remote SNMP manager can connect to the FortiGate SNMP agent, you must configure one or more FortiGate interfaces to accept SNMP connections.

To configure a FortiGate interface to accept SNMP connections in the GUI:

1. Go to *Network* > *Interfaces*.
2. Edit the interface.
3. In the *Administrative Access* options, enable *SNMP*.
4. Click *OK*.

To configure a FortiGate interface to accept SNMP connections in the CLI:

```
config system interface
    edit <interface>
        append allowaccess snmp
        set snmp-index <integer>
        config ipv6
            append ip6-allowaccess snmp
        end
    next
end
```

MIB files

The FortiGate SNMP agent supports Fortinet proprietary MIBs, as well as the parts of RFC 2665 and RFC 1213 that apply to FortiGate unit configuration.

Your SNMP manager may already include standard and private MIBs in a compiled database that is ready to use. You must add the Fortinet proprietary MIBs to this database to have access to Fortinet specific information.

MIB file or RFC	Description
FORTINET-CORE-MIB.mib	The Fortinet core MIB includes all system configuration and trap information that is common to all Fortinet products. Your SNMP manager requires this information to monitor Fortinet device settings and receive traps from the FortiGate SNMP agent.
FORTINET-FORTIGATE-MIB.mib	The FortiGate MIB includes all system configuration information and trap information that is specific to FortiGate units. Your SNMP manager requires this information to monitor FortiGate settings and receive traps from the FortiGate SNMP agent.
RFC-1213 (MIB II)	The FortiGate SNMP agent supports MIB II groups with the following exceptions: • No support for the EGP group from MIB II (RFC 1213, section 3.11 and 6.10). • Protocol statistics returned for MIB II groups (IP/ICMP/TCP/UDP/etc.) do not accurately capture all Fortinet traffic activity. More accurate information can be obtained from the information reported by the Fortinet MIB.
RFC-2665 (Ethernet-like MIB)	The FortiGate SNMP agent supports Ethernet-like MIB information. FortiGate SNMP does not support for the dot3Tests and dot3Errors groups.

To download the MIB files:

1. Go to *System* > *SNMP*.
2. Click *Download FortiGate MIB File* and save the file to the management computer.
3. Click *Download Fortinet Core MIB File* and save the file to the management computer.

SNMP agent

The SNMP agent sends SNMP traps originating on the FortiGate to an external monitoring SNMP manager defined in a SNMP community. The SNMP manager can monitor the FortiGate system to determine if it is operating properly, or if any critical events occurring.

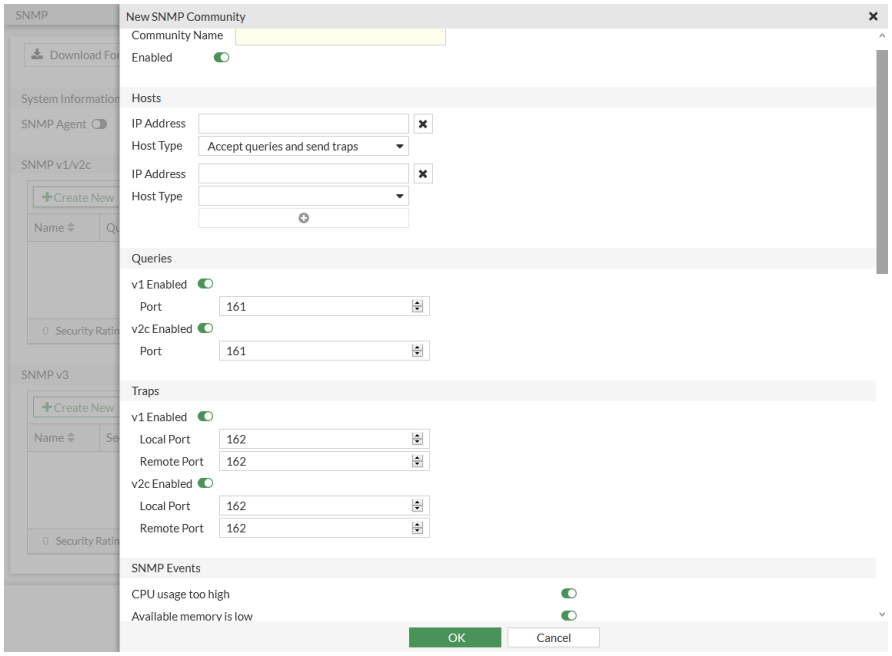
The description, location, and contact information for this FortiGate system will be part of the information that the SNMP manager receives. This information is useful if the SNMP manager is monitoring many devices, and enables faster responses when the FortiGate system requires attention.

To configure the SNMP agent in the GUI:

1. Go to *System* > *SNMP*.
2. Enable *SNMP Agent*.
3. Enter a description of the agent.
4. Enter the location of the FortiGate unit.
5. Enter a contact or administrator for the SNMP Agent or FortiGate unit.
6. Click *Apply*.

To configure the SNMP agent in the CLI:

```
config system snmp sysinfo
    set status enable
    set description <string>
    set contact-info <string>
    set location <string>
end
```



SNMP v1/v2c communities

An SNMP community is a grouping of equipment for network administration purposes. A single device can belong to multiple communities.

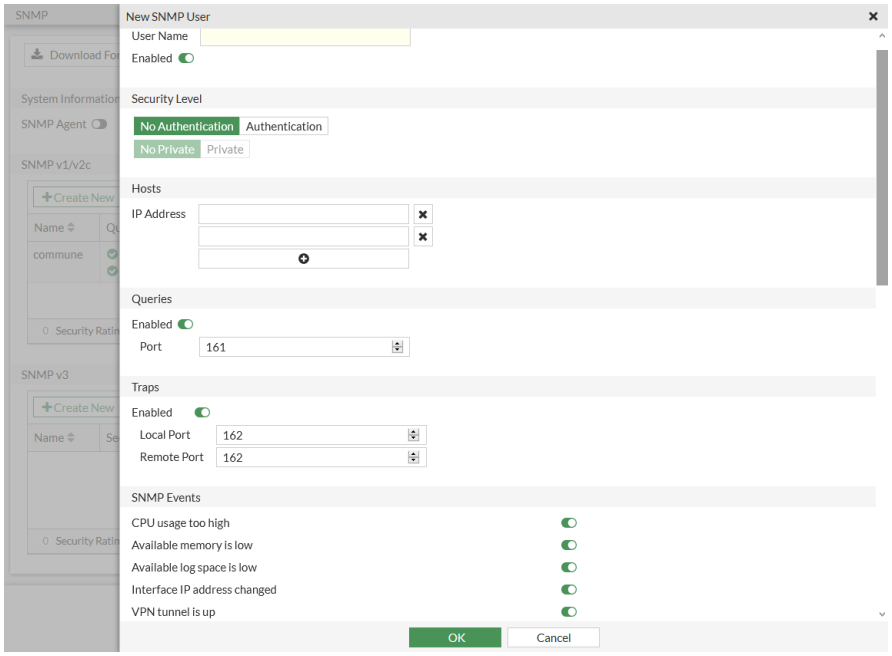
You must add an SNMP community to the FortiGate so that the SNMP manager can receive traps and system information. Up to three communities can be added.

To create a n SNMP v1/v2c community in the GUI:

1. Go to *System* > *SNMP*.
2. In the *SNMP v1/v2c* table, click *Create New*.

3. Enter a *Community Name* and enable the community.
4. In the *Hosts* section, enter the *IP Address* and select the *Host Type* for each SNMP manager.
5. In the *Queries* section, enable or disable v1 and v2c queries, then enter the port numbers that the SNMP managers in this community use for them.
6. In the *Traps* section, enable or disable v1 and v2c traps, then enter the local and remote port numbers that the SNMP managers in this community use for them.
7. In the *SNMP Events* section, enable or disable the events that activate traps in this community.
8. Click *OK*.

To create a n SNMP v1/v2c community in the CLI:



```
config system snmp community
    edit 2
        set name <string>
        set status {enable | disable}
        config hosts
            edit <host_id>
                set ip <ip/mask>
                set source-ip <class_ip>
                set ha-direct {enable | disable}
                set host-type {any | query | trap}
            next
        end
        set query-v1-port <port_number>
        set query-v1-status {enable | disable}
        set query-v2c-port <port_number>
        set query-v2c-status {enable | disable}
        set trap-v1-lport <port_number>
        set trap-v1-rport <port_number>
        set trap-v1-status {enable | disable}
        set trap-v2c-lport <port_number>
        set trap-v2c-rport <port_number>
        set trap-v2c-status {enable | disable}
        set events <events>
    next
end
```

SNMP v3 users

Authentication is used to ensure the identity of users. Privacy allows for encryption of SNMP v3 messages to ensure confidentiality of data. These protocols provide a higher level of security than is available in SNMP v1 and v2c, which use community strings for security. Both authentication and privacy are optional.

To create a n SNMP v3 user in the GUI:

1. Go to *System* > *SNMP*.
2. In the *SNMP v3* table, click *Create New*.

3. Enter a *User Name* and enable the user.
4. In the *Security Level* section, configure the security level:
   - *No Authentication*: No authentication or encryption.
   - *Authentication*: Select the authentication algorithm and password.
   - *Authentication and Private*: Select both the authentication and encryption algorithms and password.
5. In the *Hosts* section, enter the *IP Address* for each SNMP manager.
6. In the *Queries* section, enable or disable queries, then enter the port number that the SNMP managers use for them.
7. In the *Traps* section, enable or disable traps, then enter the local and remote port numbers that the SNMP managers use for them.
8. In the *SNMP Events* section, enable or disable the events that activate traps.
9. Click *OK*.

To create an SNMP v3 user in the CLI:

```
config system snmp user
    edit <user>
        set status {enable | disable}
        set trap-status {enable | disable}
        set trap-lport <port_number>
        set trap-rport <port_number>
        set queries {enable | disable}
        set query-port <port_number>
        set notify-hosts <class_ip> ... <class_ip>
        set source-ip <class_ip>
        set ha-direct {enable | disable}
        set events <events>
```

```
        set security-level {no-auth-no-priv | auth-no-priv | auth-priv}
        set auth-proto {md5 | sha | sha224 | sha256 | sha384 | sha512}
        set auth-pwd <password>
        set priv-proto {aes | des | aes256 | aes256cisco}
        set priv-pwd <password>
    next
end
```

Access control for SNMP

Administrators can provide access control to SNMP users and communities based on restricting a MIB view to specific OID subtrees. They can also define access based on the VDOM. This allows multi-tenant FortiGate deployments to provide restricted access per VDOM.

- MIB view access control allows the SNMP clients to query specific OIDs that are filtered by the MIB view settings.
- VDOM access control allows the SNMP clients to query data from specific VDOMs that are filtered by the VDOM settings.

When access control is enabled, the users can only access the information that is allowed by the access control, and all other information is inaccessible. Administrators have granular control, and can easily restrict specific information based on access control.

To configure MIB views:

```
config system snmp mib-view
    edit <name>
        set include <OIDs>
        set exclude <OIDs>
    next
end
```

`include <OIDs>`	Enter the OID subtrees to be included in the view. A maximum of 16 subtrees can be added.
`exclude <OIDs>`	Enter the OID subtrees to be excluded in the view. A maximum of 64 subtrees can be added.

To configure access control based on MIB views and VDOMs for SNMP users and communities:

```
config system snmp user
    edit <user>
        set mib-view <view>
        set vdoms <vdoms>
    next
end
```

```
config system snmp community
    edit <community>
        set mib-view <view>
        set vdoms <vdoms>
    next
end
```

`mib-view <view>`	Set the SNMP access control MIB view.
`vdoms <vdoms>`	Set the SNMP access control VDOMs.

Example

In this example, two MIB views are created and, with VDOMs, used to control access for SNMP users and communities.

To configure access control for SNMP users and communities:

1. Configure two MIB views:

```
config system snmp mib-view
    edit "view1"
        set include "1.3.6.1.2"
    next
    edit "view2"
        set include "1.3.6.1.2.1"
        set exclude "1.3.6.1.2.1.2.1" "1.3.6.1.2.1.4.31" "1.3.6.1.2.1.1.9.1"
    next
end
```

2. Add the MIB view and VDOM restrictions to SNMP users:

```
config system snmp user
    edit "v3user"
        set mib-view "view1"
    next
    edit "v3user1"
        set vdom "vdom1"
    next
    edit "v3user2"
        set mib-view "view1"
        set vdoms "root" "vdom1"
    next
end
```

3. Add the MIB view and VDOM restrictions to SNMP communities:

```
config system snmp community
    edit 1
        set name "REGR-SYS"
        set vdoms "vdom1"
    next
    edit 2
        set name "REGR-SYS1"
        set mib-view "view2"
    next
    edit 3
       set name "REGR-SYS2"
       set mib-view "view1"
       set vdoms "root" "vdom1"
    next
end
```

Important SNMP traps

Link Down and Link Up traps

This trap is sent when a FortiGate port either goes down or is brought up.

For example, the following traps are generated when the state of port34 is set to down using `set status down`, and then brought up using `set status up`:

```
NET-SNMP version 5.7.3 2019-01-31 14:11:48 10.1.100.1(via UDP: [10.1.100.1]:162->
[10.1.100.11]:162) TRAP, SNMP v1, community REGR-SYS SNMPv2-MIB::snmpTraps Link Down Trap
(0) Uptime: 0:14:44.95 IF-MIB::ifIndex.42 = INTEGER: 42 IF-MIB::ifAdminStatus.42 = INTEGER:
down(2) IF-MIB::ifOperStatus.42 = INTEGER: down(2) FORTINET-CORE-MIB::fnSysSerial.0 =
STRING: FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FortiGate-140D-POE
```

```
2019-01-31 14:11:48 <UNKNOWN> [UDP: [10.1.100.1]:162->[10.1.100.11]:162]: DISMAN-EVENT-
MIB::sysUpTimeInstance = Timeticks: (88495) 0:14:44.95 SNMPv2-MIB::snmpTrapOID.0 = OID: IF-
MIB::linkDown IF-MIB::ifIndex.42 = INTEGER: 42 IF-MIB::ifAdminStatus.42 = INTEGER: down(2)
IF-MIB::ifOperStatus.42 = INTEGER: down(2) FORTINET-CORE-MIB::fnSysSerial.0 = STRING:
FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FortiGate-140D-POE 2019-01-31 14:12:01
10.1.100.1(via UDP: [10.1.100.1]:162->[10.1.100.11]:162) TRAP, SNMP v1, community REGR-SYS
SNMPv2-MIB::snmpTraps Link Up Trap (0) Uptime: 0:14:57.98 IF-MIB::ifIndex.42 = INTEGER: 42
IF-MIB::ifAdminStatus.42 = INTEGER: up(1) IF-MIB::ifOperStatus.42 = INTEGER: up(1) FORTINET-
CORE-MIB::fnSysSerial.0 = STRING: FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING:
FortiGate-140D-POE
```

```
2019-01-31 14:12:01 <UNKNOWN> [UDP: [10.1.100.1]:162->[10.1.100.11]:162]: DISMAN-EVENT-
MIB::sysUpTimeInstance = Timeticks: (89798) 0:14:57.98 SNMPv2-MIB::snmpTrapOID.0 = OID: IF-
MIB::linkUp IF-MIB::ifIndex.42 = INTEGER: 42 IF-MIB::ifAdminStatus.42 = INTEGER: up(1) IF-
MIB::ifOperStatus.42 = INTEGER: up(1) FORTINET-CORE-MIB::fnSysSerial.0 = STRING:
FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FortiGate-140D-POE
```

fgFmTrapIfChange trap

This trap is sent when any changes are detected on the interface. The change can be very simple, such as giving an IPV4 address.

For example, the user has given the IP address of 1.2.3.4/24 to port 1 and the EMS Manager has detected the following trap:

```
DISMAN-EXPRESSION-MIB::sysUpTimeInstance = Timeticks: (7975058) 22:09:10.58 SNMPv2-
MIB::snmpTrapOID.0 = OID: FORTINET-FORTIGATE-MIB::fgFmTrapIfChange FORTINET-CORE-
MIB::fnSysSerial.0 = STRING: FG140P3G15800330 IF-MIB::ifName.45 = STRING: port1 FORTINET-
FORTIGATE-MIB::fgManIfIp.0 = IpAddress: 1.2.3.4 FORTINET-FORTIGATE-MIB::fgManIfMask.0 =
IpAddress: 255.255.255.0 FORTINET-FORTIGATE-MIB::fgManIfIp6.0 = STRING: 0:0:0:0:0:0:0:0
```

entConfigChange trap

The change to the interface in the previous example has also triggered the *ConfChange Trap* which is sent along with the *fgFmTrapIfChange* trap:

```
2018-11-15 09:30:23 FGT_A [UDP: [172.16.200.1]:162->[172.16.200.55]:162]: DISMAN-EXPRESSION-
MIB::sysUpTimeInstance = Timeticks: (8035097) 22:19:10.97 SNMPv2-MIB::snmpTrapOID.0 = OID:
ENTITY-MIB::entConfigChange
```

fgTrapDeviceNew trap

This trap is triggered when a new device, like a FortiSwitch, is connected to the FortiGate.

For example, the following scenario has given the device a new trap for adding FortiAP on a PoE interface a FortiGate 140D-POE. The trap has important information about the device name, device MAC address, and when it was last seen.

```
2018-11-15 11:17:43 UDP/IPv6: [2000:172:16:200::1]:162 [UDP/IPv6: [2000:172:16:200::1]:162]:
DISMAN-EXPRESSION-MIB::sysUpTimeInstance = Timeticks: (520817) 1:26:48.17 SNMPv2-
MIB::snmpTrapOID.0 = OID: FORTINET-FORTIGATE-MIB::fgTrapDeviceNew FORTINET-CORE-
MIB::fnSysSerial.0 = STRING: FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FGT_A IF-
MIB::ifIndex.0 = INTEGER: 0 FORTINET-FORTIGATE-MIB::fgVdEntIndex.0 = INTEGER: 0 FORTINET-
FORTIGATE-MIB::fgDeviceCreated.0 = Gauge32: 5 FORTINET-FORTIGATE-MIB::fgDeviceLastSeen.0 =
Gauge32: 5 FORTINET-FORTIGATE-MIB::fgDeviceMacAddress.0 = STRING: 90:6c:ac:f9:97:a0

2018-11-15 11:17:43 FGT_A [UDP: [172.16.200.1]:162->[172.16.200.55]:162]: DISMAN-EXPRESSION-
MIB::sysUpTimeInstance = Timeticks: (520817) 1:26:48.17 SNMPv2-MIB::snmpTrapOID.0 = OID:
FORTINET-FORTIGATE-MIB::fgTrapDeviceNew FORTINET-CORE-MIB::fnSysSerial.0 = STRING:
FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FGT_A IF-MIB::ifIndex.0 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fgVdEntIndex.0 = INTEGER: 0 FORTINET-FORTIGATE-
MIB::fgDeviceCreated.0 = Gauge32: 5 FORTINET-FORTIGATE-MIB::fgDeviceLastSeen.0 = Gauge32: 5
FORTINET-FORTIGATE-MIB::fgDeviceMacAddress.0 = STRING: 90:6c:ac:f9:97:a0
```

fgTrapAvOversize trap

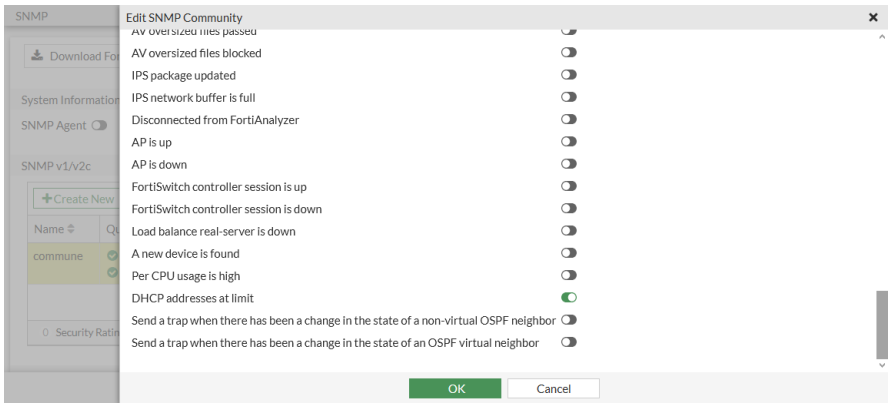
The `fgTrapAvOversize` trap is generated when the antivirus scanner detects an oversized file:

```
019-01-31 13:22:04 10.1.100.1(via UDP: [10.1.100.1]:162->[10.1.100.11]:162) TRAP, SNMP v1,
community REGR-SYS FORTINET-FORTIGATE-MIB::fgt140P Enterprise Specific Trap (602) Uptime: 1
day, 3:41:10.31 FORTINET-CORE-MIB::fnSysSerial.0 = STRING: FG140P3G15800330 SNMPv2-
MIB::sysName.0 = STRING: FortiGate-140D-POE 2019-01-31 13:22:29 <UNKNOWN> [UDP:
[10.1.100.1]:162->[10.1.100.11]:162]: DISMAN-EVENT-MIB::sysUpTimeInstance = Timeticks:
(9967031) 1 day, 3:41:10.31 SNMPv2-MIB::snmpTrapOID.0 = OID: FORTINET-FORTIGATE-
MIB::fgTrapAvOversize FORTINET-CORE-MIB::fnSysSerial.0 = STRING: FG140P3G15800330 SNMPv2-
MIB::sysName.0 = STRING: FortiGate-140D-POE
```

SNMP traps and query for monitoring DHCP pool

The SNMP DHCP event contains three traps and one query.

Traps are sent when:



- DHCP server IP pool usage reaches 90%
- DHCP server detect an IP address that is already in use
- DHCP client receives DHCP NAK

SNMP queries are accepted for DHCP lease usage information (OID = 1.3.6.1.4.1.12356.101.23). The query result is based on the leased out percentage.

To enable the SNMP DHCP event in the GUI:

1. Go to *System* > *SNMP*.
2. Click *Create New* in either the *SNMP v1/v2c* table or *SNMP v3* table, or edit an existing community or user.
3. Configure the settings as required.

4. In the *SNMP Events* list, enable *DHCP addresses at limit*.

5. Click *OK*.

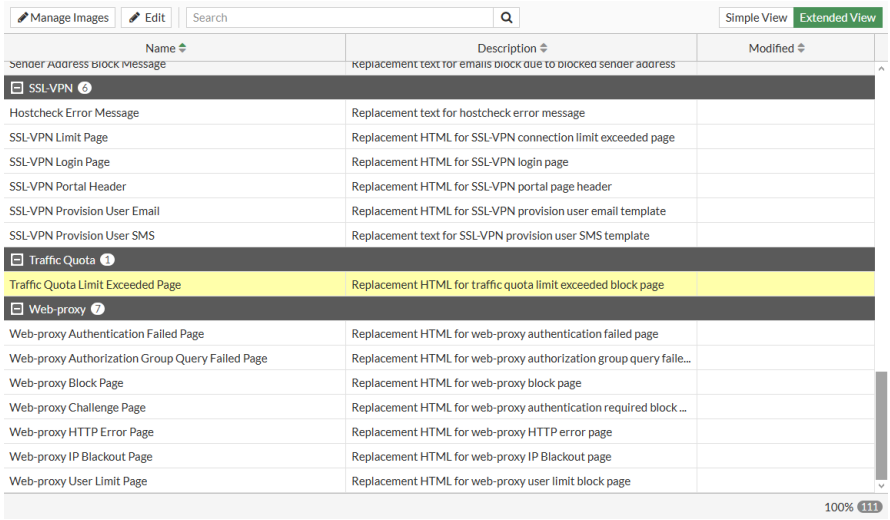
To enable the SNMP DHCP event in the CLI:

```
config system snmp community
    edit 1
        set name "REGR-SYS"
        config hosts
            edit 1
                set ip 10.1.100.11 255.255.255.255
            next
            edit 2
                set ip 172.16.200.55 255.255.255.255
            next
        end
        set events dhcp
    next
end

config system snmp user
    edit "1"
        set notify-hosts 172.10.1.0 172.20.1.0
        set events dhcp
        set security-level auth-priv
        set auth-proto sha384
        set auth-pwd ********************
        set priv-proto aes256
        set priv-pwd *********************
    next
end
```

Replacement messages

FortiOS has replacement messages that are HTML and text files. These messages can be customized to meet user requirements. The content can be modified, and images can be added.



Modifying replacement messages

The *Replacement Messages* page has two views. *Simple View* (the default view) shows the most commonly used replacement messages. *Extended View* shows the entire list and all replacement message categories.

To modify a replacement message in the GUI:

1. Go to *System* > *Replacement Messages*.
2. Select a replacement message and click *Edit*.

   If the message you want to edit is not visible, click *Extended View* in the upper right-hand corner of the top menu.

3. Edit the HTML code.

   The message is visible on the left alongside the HTML code on the right. The message view updates in real-time as you edit the content.

   When adding a variable to the code, right-click and select *Insert Tag* or type %% to view a list of the available variables, or start typing the variable name then press *Enter* or *TAB* to auto-complete the variable name.

4. Click *Save*.

Click *Restore Defaults* to return to the original message and code base.

To modify a replacement message in the CLI:

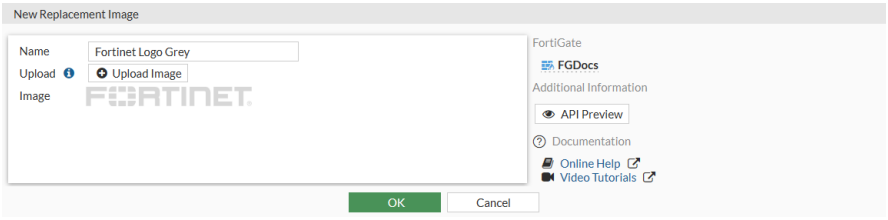
For example, to modify the *Traffic Quota Limit Exceeded Page* message:

```
config system replacemsg traffic-quota "per-ip-shaper-block"
    set buffer "<html>
  <head>
    <title>
      Traffic Quota Control
    </title>
  </head>
  <body>
    <font size=2>
      <table width=\"100%\">
        <tr>
          <td bgcolor=#3300cc align=\"center\" colspan=2>
            <font color=#ffffff>
              <b>
                Traffic blocked because exceeded session quota
              </b>
            </font>
          </td>
        </tr>
      </table>
      <br>
      <br>
      Traffic blocked because it exceeded the per IP shaper session quota. Please contact
the system administrator.
      <br>
      %%QUOTA_INFO%%
      <br>
      <br>
      <hr>
    </font>
  </body>
</html>"
    set header http
    set format html
end
```

Replacement message images

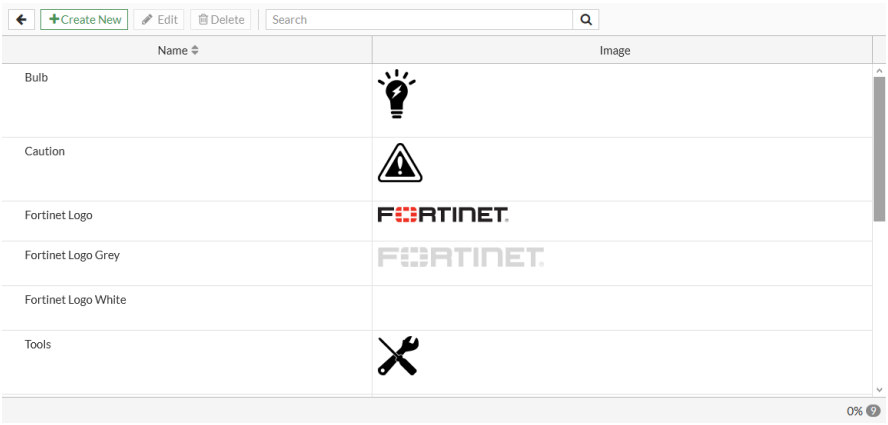
Images can be added to replacement messages on:

- Disclaimer pages
- Login pages
- Declined disclaimer pages
- Login failed pages



- Login challenge pages
- Keepalive pages

The supported image formats are GIF, JPEG, TIFF, and PNG. The maximum file size supported is 24 KB.



Adding images to replacement messages

To add images to replacement messages in the GUI:

1. Go to *System* > *Replacement Messages*.
2. In the top menu, click *Manage Images*.
3. Click *Create New*.
4. Enter a name for the image.
5. Click *Upload Image* and locate the file.

6. Click *OK*.
   The file is now visible in the list.

7. Return to the replacement message list and edit a message.
8. Right-click in the message code where you want to add the image, and select *Insert Image*.
9. Select the image from the list then press *Enter*, or double-click on the image to add it to the message.
10. Click *Save*.

To add images to replacement messages in the CLI:

1. Add the image to the FortiGate:

```
config system replacemsg-image
    edit <image_name>
        set image-type {gif | jpg | tiff | png}
        set image-base64 <string>
    next
end
```

2. Edit the replacement message, and include `%%IMAGE:<image name>%%` in the code to add the image.

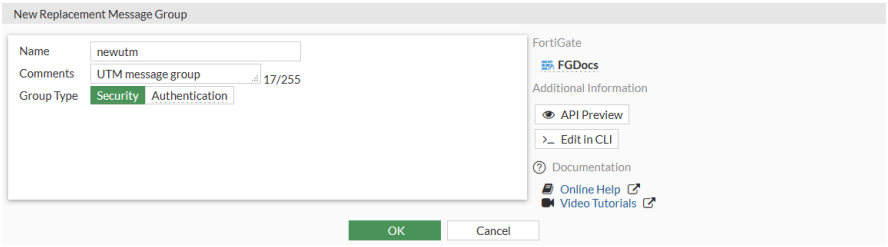
Replacement message groups

Replacement message groups allow users to customize replacement messages for individual policies and profiles.

There are two types of replacement message groups:

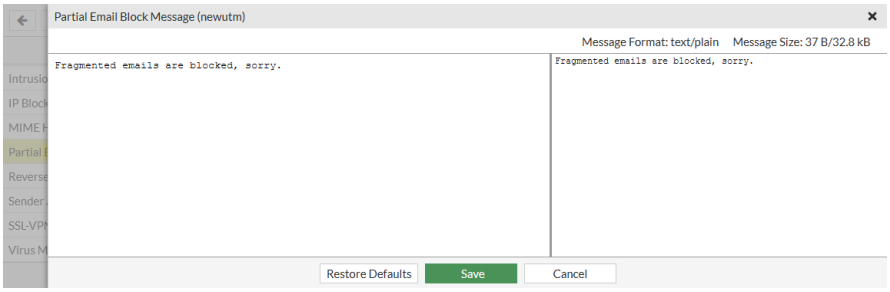
Type	Usage	Customizable categories
utm	Used with UTM settings in firewall policies.	• admin • alertmail • custom-message • fortiguard-wf • ftp • http • icap • mail • nac-quar • spam • sslvpn • traffic-quota • utm • webproxy
auth	Used with authentication pages in firewall policies.	• auth • webproxy

The messages added to a group do not need to be customized. The message body content, header type, and format will use the default values if not customized.



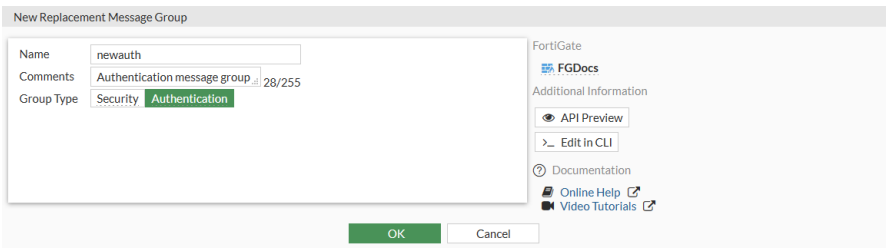
To make replacement message groups visible in the GUI:

```
config system settings
    set gui-replacement-message-groups enable
end
```



In the following example, two replacement message groups are created. The UTM message group includes custom mail-related messages and is assigned to an email filter profile. The authentication message group has a custom authentication success message that is applied to a proxy-based firewall policy that has an assigned email filter profile.

To create replacement message groups in the GUI:



1. Create the *Security* replacement message group:
   a. Go to *System* > *Replacement Message Groups*.
   b. Click *Create New*.
   c. For *Name*, enter *newutm*.
   d. In the *Comments* field, enter *UTM message group*.
   e. For *Group Type*, select *Security*.
   f. Click *OK*.

2. Customize the replacement messages in the *newutm* group:
   a. Go to *System* > *Replacement Message Groups*.
   b. Edit the *newutm* group.
   c. Select the *Partial Email Block Message*.

   d. Edit the message and click *Save*.
   e. Select the *ASE Block Message*.
   f. Edit the message and click *Save*.
3. Create the *Authentication* replacement message group:
   a. Go to *System* > *Replacement Message Groups*.
   b. Click *Create New*.
   c. For *Name*, enter *newauth*.
   d. In the *Comments* field, enter *Authentication message group*.
   e. For *Group Type*, select *Authentication*.
   f. Click *OK*.

4. Apply the *newutm* replacement message group to an email filter profile in the CLI:

```
config emailfilter profile
    edit "newmsgs"
        set replacemsg-group "newutm"
    next
end
```

5. Apply the *newauth* replacement message group and the email filter profile to a firewall policy in the CLI:

```
config firewall policy
    edit 1
        ...
        set replacemsg-override-group "newauth"
        set inspection-mode proxy
        set emailfilter-profile "newmsgs"
        ...
    next
end
```

To create replacement message groups in the CLI:

1. Create the replacement message groups:

```
config system replacemsg-group
    edit "newutm"
        set comment "UTM message group"
        set group-type utm
        config mail
            edit "partial"
                set buffer "Fragmented emails are blocked, sorry."
            next
        end
        config spam
            edit "smtp-spam-ase"
                set buffer "This message has been blocked because ASE reports it as
spam. You\'re welcome."
            next
        end
    next
    edit "newauth"
        set comment 'Authentication message group'
        set group-type auth
        config auth
            edit "auth-success-msg"
                set buffer "Welcome to the firewall. Your authentication has been
accepted, please reconnect."
            next
        end
    next
end
```

2. Apply the message group to the email filter:

```
config emailfilter profile
    edit "newmsgs"
        set replacemsg-group "newutm"
```

```
    next
end
```

3. Apply the email filter and message group to the policy:

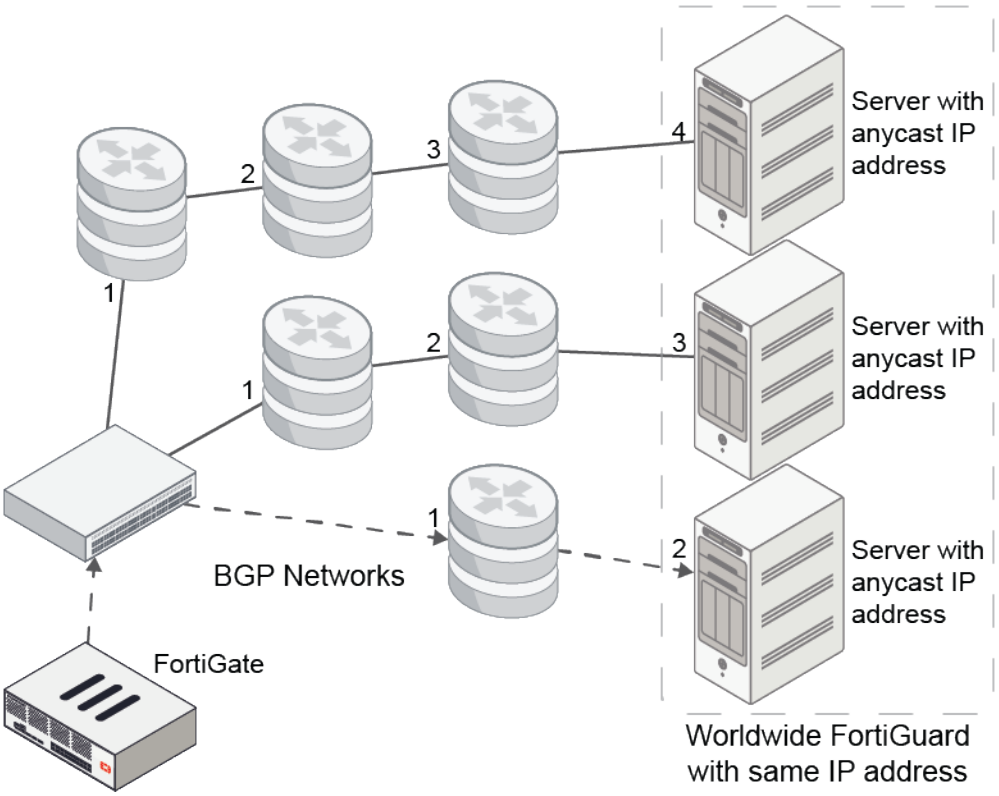
```
config firewall policy
    edit 1
        ...
        set replacemsg-override-group "newauth"
        set inspection-mode proxy
        set emailfilter-profile "newmsgs"
        ...
    next
end
```

FortiGuard

FortiGuard services comprise of signature packages and querying services that provide content, web and device security. It is delivered via various types of FortiGuard servers that are part of the FortiGuard Distribution Network (FDN).

FortiGuard service subscriptions can be purchased and registered to your FortiGate unit. The FortiGate must be connected to the Internet in order to automatically connect to the FDN to validate the license and download FDN updates or perform real-time queries.

To view FDN support contract information, go to *System* > *FortiGuard*. The *License Information* table shows the status of your FortiGate's entitlements and breaks down the status of each service.



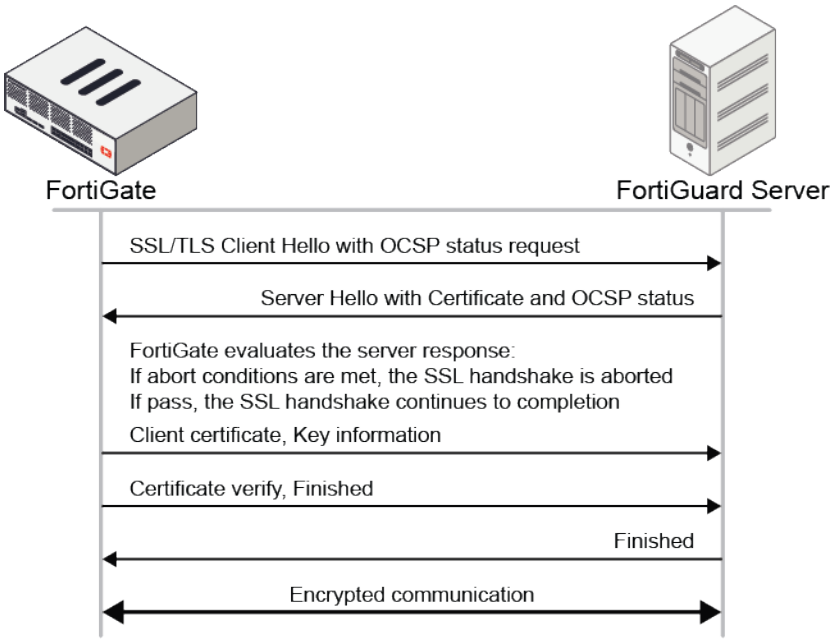
The following topics contain more information:

- Anycast on page 2299
- Connection and OCSP stapling on page 2299
- Configuring FortiGuard updates on page 2301
- Configuring a proxy server for FortiGuard updates on page 2301
- Manual updates on page 2302
- Automatic updates on page 2304
- Scheduled updates on page 2305
- Sending malware statistics to FortiGuard on page 2306
- Update server location on page 2307
- Filtering on page 2308
- Online security tools on page 2309
- Anycast and unicast services on page 2309
- Using FortiManager as a local FortiGuard server on page 2310
- Cloud service communication statistics on page 2311
- IoT detection service on page 2313
- FortiAP query to FortiGuard IoT service to determine device details on page 2316
- FortiGate Cloud / FDN communication through an explicit proxy on page 2316
- FDS-only ISDB package in firmware images on page 2318
- Licensing in air-gap environments on page 2319
- License expiration on page 2321

Anycast

FortiGuard servers use Anycast addresses in order to optimize and distribute traffic across many servers. Anycast is the default access mode for FortiGates when connecting to FortiGuard which by default utilizes HTTPS and port 443.

Each type of FortiGuard servers and services have a FortiGuard domain name that resolves to a single Anycast IP address. Regardless of where the FortiGate is located, the resolution is still the same. Fortinet maintains the network in the background to ensure routes to the FortiGuard servers are optimized. In the below diagram, several servers have the same Anycast IP, but the FortiGate will connect to the one with the least hops.



Connection and OCSP stapling

When the FortiGate connects to a FortiGuard server, it is important for it to validate the server is indeed a real FortiGuard server. Hence, FortiGuard servers provide the following security:

- The domain name of each FortiGuard service is the common name in that service's certificate, which is signed by a third-party intermediate CA.
- The FortiGuard server also applies Online Certificate Status Protocol (OCSP) stapling check, in which it attaches a time-stamped OCSP status of the server certificate from the OCSP server to the TLS response.

This ensures FortiGate can validate the FortiGuard server certificate efficiently during the TLS handshake.

The following illustrates the connection process:

FortiGate will only complete the TLS handshake with an anycast server when abort conditions are not met. Abort conditions include:

- The CN in the server's certificate does not match the domain name resolved from the DNS.
- The OCSP status is revoked or unknown.
- The issuer-CA is revoked by the root-CA.

To configure the anycast FortiGuard access mode:

```
config system fortiguard
    set fortiguard-anycast enable
end
```

If FortiGuard is not reachable via Anycast, choose between the following options to work around this issue:

1. Switch to other Anycast servers:

   ```
   config system fortiguard
       set fortiguard-anycast enable
       set fortiguard-anycast-source aws
   end
   ```

2. Disable Anycast and use HTTPS:

   ```
   config system fortiguard
       set fortiguard-anycast disable
       set protocol https
       set port 8888
   end
   ```

3. Disable Anycast and use UDP:

   ```
   config system fortiguard
       set fortiguard-anycast disable
       set protocol udp
       set port 53
   end
   ```

Configuring FortiGuard updates

To configure FortiGuard updates:

1. Go to *System* > *FortiGuard*
2. Scroll down to the *FortiGuard Updates* section.
3. Configure the options for connecting and downloading definition files:

Immediately download updates	The option can be enabled on 2U and larger hardware models when the FortiGuard are servers are connected in anycast mode. The FortiGate forms a secure, persistent connection with FortiGuard to get notifications of new updates through an HTTPS connection. The FortiGate uses the fds_notify daemon to wait for the notification, then makes another connection to the FortiGuard server to download the updates.
Scheduled Updates	Enable to schedule updates to be sent to the FortiGate at the specified time or automatically. See Scheduled updates on page 2305 and Automatic updates on page 2304.
Improve IPS quality	Enable to send information to the FortiGuard servers when an attack occurs. This can help keep the FortiGuard database current as attacks evolve, and improve IPS signatures.
Use extended IPS signature package	Enable to use the extended IPS database, that includes protection from legacy attacks, along with the regular IPS database that protects against the latest common and in-the-wild attacks.
AntiVirus PUP/PUA	Enable antivirus grayware checks for potentially unwanted applications.
Update server location	The FortiGuard update server location. See Update server location on page 2307 for details.

4. Click *Apply*.

Configuring a proxy server for FortiGuard updates

You can configure FortiOS to use a proxy server to connect to the FortiGuard Distribution Network (FDN).

Proxy tunneling is supported only for registration, AV, and IPS updates. For FortiGate virtual machines, proxy tunneling can also be used for license validation. For web filtering or spam filtering, UDP protocol is used on ports 53 or 8888. UDP protocol traffic cannot be directed over a proxy server, even if you are using versions of FortiOS that support web filtering over port 443.

Consider the following before configuring FortiOS to use a proxy server to connect to FDN:

- FortiOS connects to the proxy server using the HTTP CONNECT method. For information about the HTTP CONNECT method, see RFC 2616.
- The proxy server must not inspect the HTTPS traffic used for FortiOS communication.
- FortiOS sends to the proxy server an HTTP CONNECT request that specifies the IP address and port required for the FDN connection. Authentication information is optional for the request.
- FortiOS must be configured to use DNS servers that resolve the addresses of FDN servers to support AV and IPS updates.
- The proxy server establishes the connection to FDN and passes information between FortiOS and FDN.

Use the following syntax to configure a proxy server in the CLI:

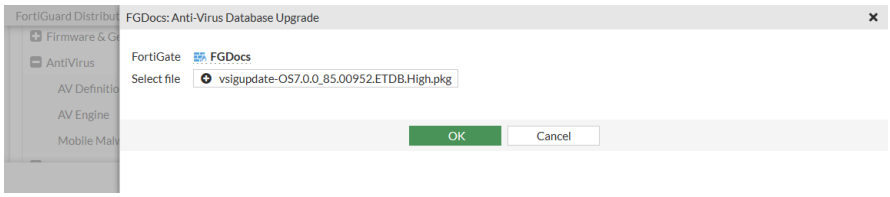
```
config system autoupdate tunneling
    set address <proxy_address>
    set port <proxy_port>
    set username <username>
    set password <password>
    set status {enable | disable}
end
```

In the following example, a proxy server with IP address 10.1.1.1 is configured to listen on port TCP/3128 without authentication.

To configure a proxy server:

```
config system autoupdate tunneling
    set address 10.1.1.1
    set port 3128
    set status enable
end
```

In a closed network without direct internet connection for web filtering or spam filtering, you can use FortiManager as a FortiGuard server. FortiManager supports proxy for both updates and rating, and FortiOS retrieves its updates and ratings through FortiManager. See Using FortiManager as a local FortiGuard server on page 2310.



Manual updates

When needed, FortiGuard Distribution Network (FDN) updates can be manually uploaded.

To manually update the signature definitions files:

1. Log in to the Fortinet Support website.
2. Go to *Support* > *Service Updates*.
3. Select your *OS Version* from the dropdown list.
4. Locate your device in the table, and download the signature definitions files.

5. On the FortiGate, go to *System* > *FortiGuard*.
6. In the *License Information* table, locate and expand the definitions that you are updating.
7. From the *Actions* menu in the rightmost column, select *Upgrade Database*.
8. In the pane that opens, click *Upload*, locate the downloaded definitions file on your computer, then click *Open*. The download may take a few minutes to complete.

9. Click *OK*.

AV and IPS manual updates

AV and IPS packages are signed by the Fortinet CA to ensure authenticity of the packages. During manual package updates, signed and validated packages will be accepted. If a package is not signed, the following applies:

- Level-0: accept the new package even if it is unsigned.
- Level-1: display a warning and request a user confirmation to accept.
- Level-2: display an error and reject the image.
- If no level is configured, apply Level-1.

Security levels are pre-configured on the BIOS.

To execute the update:

```
# execute restore ips tftp nids-720-19.261.pkg 172.16.200.55
```

To verify the manual AV and IPS package updates:

```
# diagnose debug app updated -1
# diagnose debug enable
```

Manual update of an unsigned package with level-1 configured

A warning message is displayed in the console, and requests a user confirmation to accept the update of an unsigned package.

To execute the update:

```
# execute restore ips tftp nids-720-19.261.pkg 172.16.200.55
This operation will overwrite the current IPS package!
Do you want to continue? (y/n)y

Please wait...
```

```
Connect to tftp server 172.16.200.55 ...
##

Get IPS database from tftp server OK.
******WARNING: This package file has no signature for validation.******
Fortinet cannot verify the authenticity of this package and therefore
there may be a risk that the package contains code unknown to Fortinet.
In short, Fortinet cannot validate the package and makes no warranties
or representations concerning the package.
Please continue only if you understand and are willing to accept the risks.
Do you want to continue? (y/n)y
```

Manual update of an unsigned package with level-2 configured

A warning message is displayed in the console, and the image is rejected.

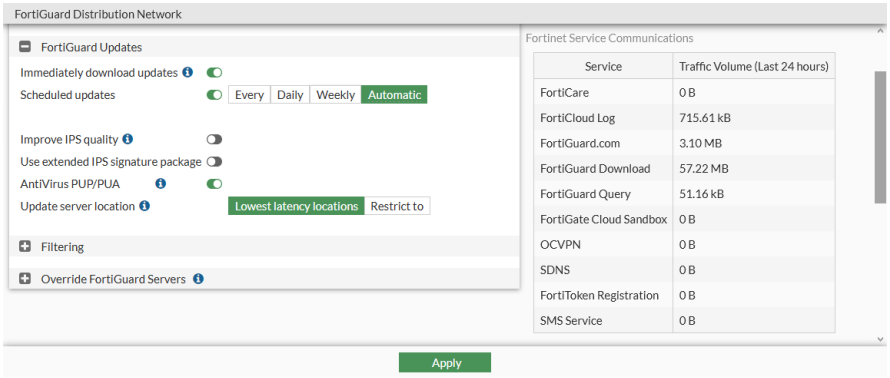
To execute the update:

```
# execute restore ips tftp nids-720-19.261.pkg 172.16.200.55
This operation will overwrite the current IPS package!
Do you want to continue? (y/n)y

Please wait...

Connect to tftp server 172.16.200.55 ...
##

Get IPS database from tftp server OK.
```



Automatic updates

The default auto-update schedule for FortiGuard packages is automatic. The update interval is calculated based on the model and percentage of valid subscriptions, within one hour.

For example, if a FortiGate 501E has 78% valid contracts, then based on this device model, the update schedule is calculated to be every 10 minutes. If you verify the system event logs (ID 0100041000), they are generated approximately every 10 minutes.

To configure automatic updates in the GUI:

1. Go to *System* > *FortiGuard*
2. In the *FortiGuard Updates* section, enable *Scheduled Updates* and select *Automatic*.

3. Click *Apply*.

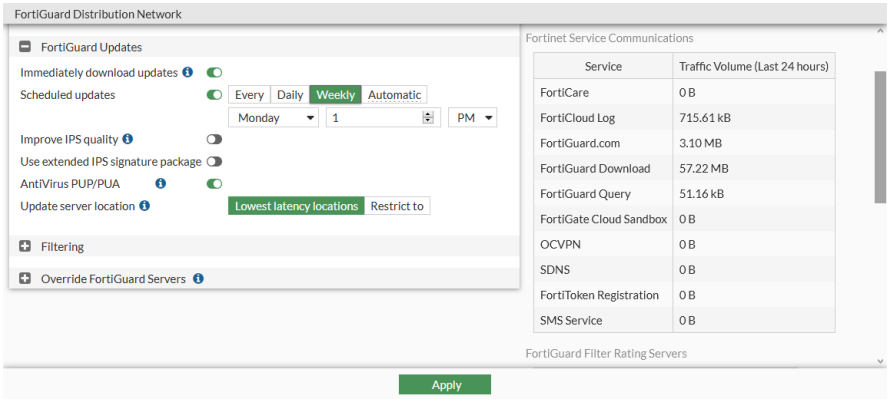
To configure scheduled updates in the CLI:

```
config system autoupdate schedule
    set status enable
    set frequency automatic
end
```

Scheduled updates

Scheduling updates ensures that the virus and IPS definitions are downloaded to your FortiGate on a regular basis.

Updating definitions can cause a brief disruption in traffic that is currently being scanned while the FortiGate unit applies the new signature database. Updates should be scheduled during off-peak hours when network usage is at a minimum to ensure that network activity will not be affected by downloading the definitions files.



A schedule of once a week means any urgent updates will not be pushed until the scheduled time. If an urgent update is required, click the *Update Licenses & Definitions Now* button to manually update the definitions.

To configure scheduled updates in the GUI:

1. Go to *System* > *FortiGuard*
2. In the *FortiGuard Updates* section, enable *Scheduled Updates*.

3. Configure the update schedule:

4. Click *Apply*.

To configure scheduled updates in the CLI:

```
config system autoupdate schedule
    set status enable
    set frequency {every | daily | weekly}
    set time <hh:mm>
    set day <day_of_week>
end
```

Sending malware statistics to FortiGuard

FortiGate devices periodically send encrypted antivirus, IPS, botnet IP list, and application control statistics to FortiGuard. Included with these data is the IP address and serial number of the FortiGate, and the country that it is in. This information is never shared with external parties, Fortinet Privacy Policy.

The malware statistics are used to improve various aspects of FortiGate malware protection. For example, antivirus data allow FortiGuard to determine what viruses are currently active. Signatures for those viruses are kept in the Active AV Signature Database that is used by multiple Fortinet products.Inactive virus signatures are moved to the Extended AV Signature Database (see Configuring FortiGuard updates on page 2301). When events for inactive viruses start appearing in the malware data, the signatures are moved back into the AV Signature Database.

The FortiGate and FortiGuard servers go through a 2-way SSL/TLS 1.2 authentication before any data is transmitted. The certificates used in this process must be trusted by each other and signed by the Fortinet CA server.

The FortiGate only accepts data from authorized FortiGuard severs. Fortinet products use DNS to find FortiGuard servers and periodically update their FortiGate server list. All other servers are provided by a list that is updated through the encrypted channel.

Malware statistics are accumulated and sent every 60 minutes by default.

To configure sharing this information, use the following CLI command:

```
config system global
    set fds-statistics {enable | disable}
    set fds-statistics-period <minutes>
end
```

The submission of malware data is in accordance with the Fortinet Privacy Policy.

There is no sensitive or personal information included in these submissions. Only malware statistics are sent.

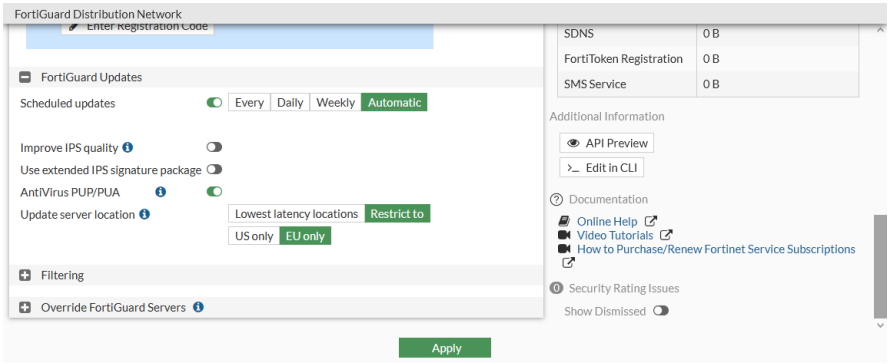
Fortinet uses the malware statistics collected in this manner to improve the performance of the FortiGate services and to display statistics on the Fortinet Support website for customers registered FortiGate devices.

Fortinet may also publish or share statistics or results derived from this malware data with various audiences. The malware statistics shared in this way do not include any customer data.

Update server location

Administrators can specify the location of the FortiGuard update server used by FortiGate. You can can set the location to only servers in the USA, only servers in the European Union (EU), or to servers with the lowest latency.

In EU locations, it can be required that certain traffic is only handled by servers located in the EU. By setting the update server location to EU only, the FortiGate will use EU domains to resolve to EU servers for FortiGuard traffic to update, URL rating, and IoT servers.



Server location	Anycast domain name	Non-Anycast FQDN addresses
EU only	euupdate.fortinet.net euguardservice.fortinet.net	
US only	usupdate.fortinet.net usguardservice.fortinet.net	usupdate.fortiguard.net UDP: usservice.fortiguard.net HTTPS: ussecurewf.fortiguard.net
Lowest latency (automatic)	globalupdate.fortinet.net globalguardservice.fortinet.net	update.fortiguard.net UDP: service.fortiguard.net HTTPS: securewf.fortiguard.net

On hardware FortiGate devices, the default is *Lowest latency locations*. On VM devices, the default is *US only*.

To configure the update server location in the GUI:

1. Go to *System* > *FortiGuard*
2. In the *FortiGuard Updates* section, set *Update server location* to *Lowest latency locations* or *Restrict to*.

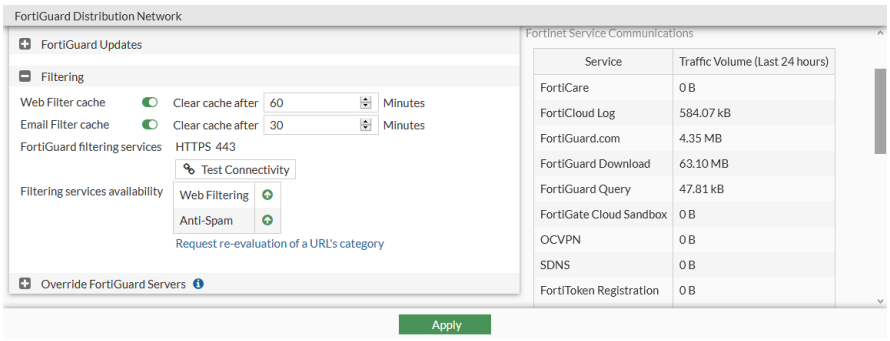
3. If *Restrict to* is selected, choose *US only* or *EU only*.

4. Click *Apply*.

To configure the update server location in the CLI:

```
config system fortiguard
    set update-server-location {automatic | usa | eu}
end
```

Filtering



Web filtering is used to block access to harmful, inappropriate, and dangerous web sites (see FortiGuard filter on page 1221).

Email filtering is used to detect and block spam messages (see FortiGuard-based filters on page 1338).

To configure filtering in the GUI:

1. Go to *System* > *FortiGuard*
2. Scroll down to the *Filtering* section.
3. Configure the settings as needed:

Web Filter Cache	Enable/disable web filter cache, and set the amount of time that the FortiGate will store a blocked IP address or URL locally. After the time expires, the FortiGate contacts the FDN to verify the address.
Email Filter Cache	Enable/disable email filter cache, and set the amount of time that the FortiGate will store an email address locally.
FortiGuard filtering services	The protocol and port used to contact the FortiGuard servers. These options can be changed in the CLI.
Filtering service availability	The status of the filtering service. Click *Test Connectivity* if the filtering service is not available.
Request re-evaluation of a URL's category	Click to re-evaluate a URL category rating on the FortiGuard web filter service.

4. Click *Apply*.

To configure filtering in the CLI:

```
config system fortiguard
    set protocol {https | udp}
    set port {443 | 53 | 8888}
    set antispam-force-off {enable | disable}
    set antispam-cache {enable | disable}
    set antispam-cache-ttl <integer>
    set antispam-cache-mpercent <percent>
    set antispam-timeout <integer>
    set webfilter-force-off {enable | disable}
    set webfilter-cache {enable | disable}
    set webfilter-cache-ttl <integer>
    set webfilter-timeout <integer>
end
```

When anycast is enabled (by default) the protocol is HTTPS and the port is 443.

Online security tools

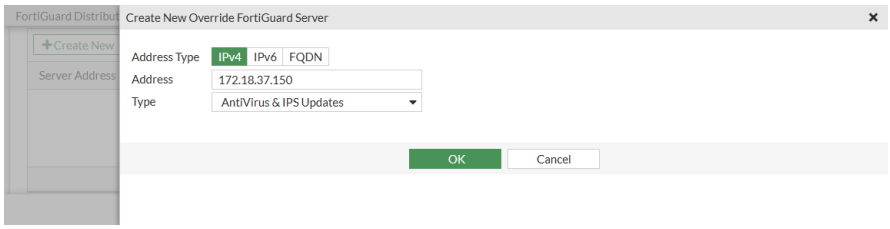
FortiGuard Labs provides a number of online security tools, including but not limited to:

- **URL lookup**
  Enter a website address to see if it has been rated and what category and classification it is filed as. If you find a site that has been wrongly categorized, use this page to request that the site be re-evaluated: https://www.fortiguard.com/webfilter
- **Threat Encyclopedia**
  Browse FortiGuard Labs extensive encyclopedia of threats. Search for viruses, botnet C&C, IPS, endpoint vulnerabilities, and mobile malware: https://www.fortiguard.com/encyclopedia
- **Application Control**
  Browse FortiGuard Labs extensive encyclopedia of applications: https://www.fortiguard.com/appcontrol

Anycast and unicast services

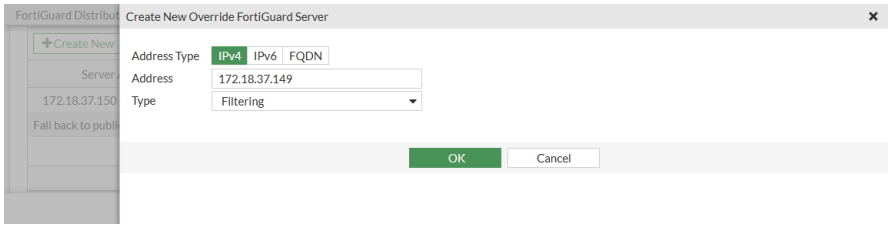
The following services are accessed by FortiGate:

Service	Non-Anycast FQDN addresses	Anycast Domain name
FortiGuard Object download	update.fortiguard.net	globalupdate.fortinet.net
Querying service (web-filtering, anti-spam ratings) over HTTPS	securewf.fortiguard.net	globalguardservice.fortinet.net
Querying service (web-filtering, anti-spam ratings) over UDP	service.fortiguard.net	Service only in Unicast
Device info Collection	Service only in Anycast	globaldevcollect.fortinet.net
Device info Query	Service only in Anycast	globaldevquery.fortinet.net
FortiGate Cloud logging	logctrl1.fortinet.com	globallogctrl.fortinet.net
FortiGate Cloud management	mgrctrl1.fortinet.com	globalmgrctrl.fortinet.net
FortiGate Cloud messaging	msgctrl1.fortinet.com	globalmsgctrl.fortinet.net
FortiGate Cloud sandbox	aptctrl1.fortinet.com	globalaptctrl.fortinet.net
Product API used by OCVPN registration and GUI icon download	productapi.fortinet.net	globalproductapi.fortinet.net
FortiCare registration	directregistration.fortinet.com	globalregistration.fortinet.net
Secure DNS	sdns.fortinet.net	globalsdns.fortinet.net
FortiCloud FortiClient	forticlient.fortinet.net	globalfctupdate.fortinet.net
FortiMobile Tokens	directregistration.fortinet.com	globalftm.fortinet.net
EMS cloud	forticlient-emsproxy.forticloud.com	Service only in Unicast
DDNS	ddns.fortinet.net	globalddns.fortinet.net
GeoIP	gip.fortinet.net	globalgip.fortinet.net
IP blocklist	ipbl.fortinet.net	N/A



Using FortiManager as a local FortiGuard server

FortiManager can provide a local FortiGuard server with port 443 access.



Anycast FortiGuard settings force the rating process to use port 443, even with an override server. Using a unique address in the same subnet as the FortiManager access IP address, the FortiManager can provide local FortiGuard updates and rating access with a dedicated IP address and port 443.

To use a FortiManager as a local FortiGuard server in the GUI:

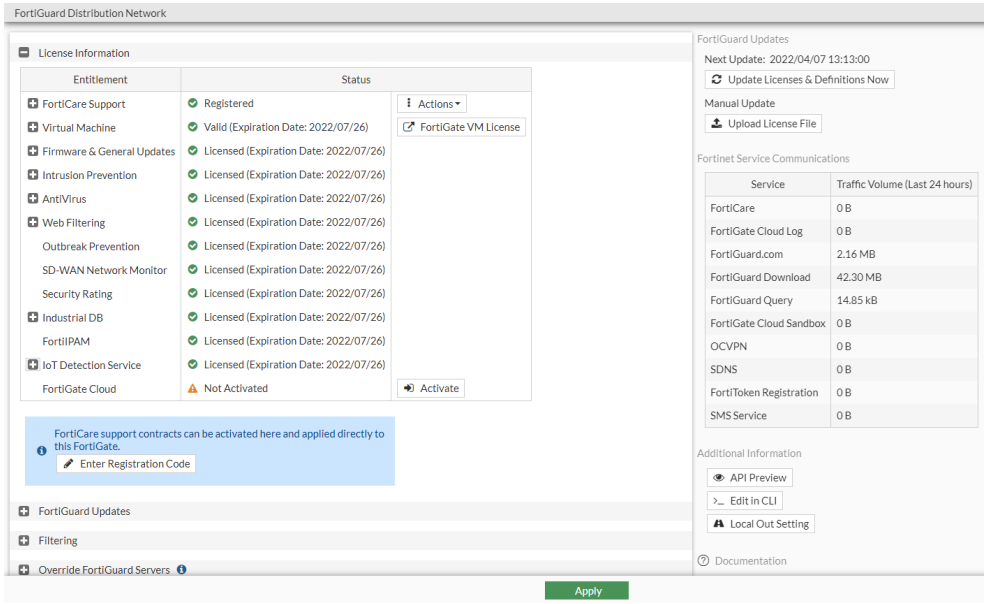
1. Go to *System* > *FortiGuard*
2. In the *Override FortiGuard Servers* table, click *Create New*. The *Create New Override FortiGuard Server* pane opens.
3. Select the server address type: *IPv4*, *IPv6*, or *FQDN*.
4. Enter the FortiManager address in the *Address* field.
5. Select the type of server: *AntiVirus & IPS Updates*, *Filtering*, or *Both*.

6. Click *OK*.
7. Click *Create New* again to add a second override FortiManager for filtering.

8. Click *OK*, then click *Apply*.

To use a FortiManager as a local FortiGuard server in the CLI:

```
config system central-management
    set type fortimanager
    set fmg "172.18.37.148"
    config server-list
        edit 1
            set server-type update
            set server-address 172.18.37.150
        next
        edit 2
            set server-type rating
            set server-address 172.18.37.149
        next
    end
    set fmg-update-port 443
    set include-default-servers enable
end
```



When `fmg-update-port` is set to `443`, the update process will use port 443 to connect to the override update server, which is the local FortiGuard server in the FortiManager. If this is not set, the update process will use port 8890, and the server address setting has to be the FortiManager access IP address. Override FortiGuard services come from the server list that is the local FortiGuard server in the FortiManager, and use the traditional, non-OCSP TLS handshake. If override servers in the FortiManager are not available, the default FortiGuard servers are connected, and the anycast OCSP TLS handshake is used.

Cloud service communication statistics

Fortinet service communications statistics are displayed on the *FortiGuard* page. The statistics correspond with the output from `diagnose sys service-communication`. The traffic volume values in the GUI are the sums of data from the last 24 hours.

To view Fortinet service communications statistics:

1. Go to *System* > *FortiGuard*.
   The *Fortinet Service Communications* statistics are displayed on the right side of the screen:

2. Enter the following CLI command:

```
# diagnose sys service-communication
FortiCare:
The last 1 hour(in bytes):  0 0 0 0 0 0 0 0 0 0 0 0
The last 24 hours(in bytes):  0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0
The last 7 days(in bytes):  0 0 0 0 0 0 0

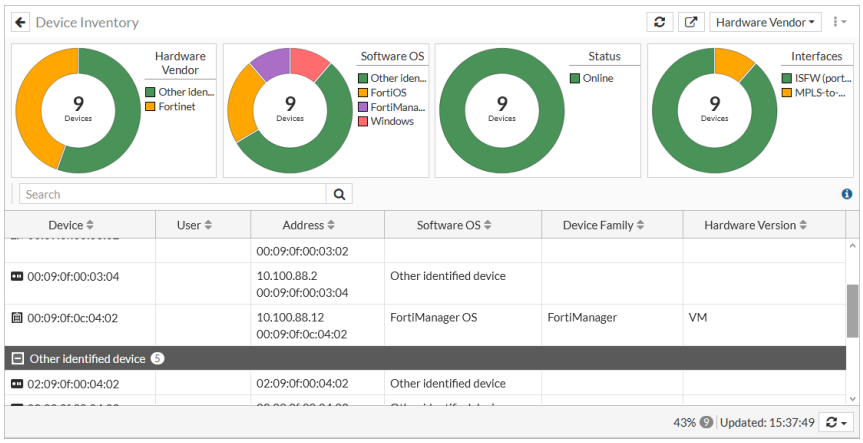
IoT detection service

Internet of Things (IoT) detection is a subscription service that allows FortiGate to detect unknown devices in FortiGuard that are not detected by the local Device Database (CIDB). When the service is activated, FortiGate can send device information to the FortiGuard collection server. When a new device is detected, FortiGate queries the results from the FortiGuard query for more information about the device.

This feature requires an IoT Detection Service license.

FortiGate device requirements:



The FortiGate device must be:

- Registered with FortiCare
- Connected to an anycast FortiGuard server

How the service works:

1. Enable Device Detection on an interface.
2. FortiGate uses the interface to detect device traffic flow.
3. Upon detecting traffic from an unknown device, FortiGate sends the device data to the FortiGuard collection server.
4. The collection server returns data about the new device to the FortiGuard query server.
5. If the device signature does not appear in the local Device Database (CIDB) or some fields are not complete, FortiGate queries FortiGuard for more information about the device.

To view the latest device information in the GUI, go to *Dashboard* > *Users & Devices* and expand the *Device Inventory* widget.

To debug the daemon in the CLI:

1. Disable the local device database in order to force all queries to go to FortiGuard.

   ```
   # diagnose cid sigs disable
   ```

2. Enable iotd debugs.

   ```
   # diagnose debug application iotd -1
   # diagnose debug enable
   ```

   FortiGate sends the device data to the FortiGuard collection server.

   ```
   FortiWiFi-60E # [iotd] recv request from caller size:61
   [iotd] service:collect hostname: ip: fd:-1 request tlv_len:41
   [iotd] txt(.....y...w.....Jasons-iPhone6....579=23..)

     type 'Mobile'  src fortiguard  id 0  weight 100
     family 'Mobile'  src fortiguard  id 0  weight 100
     os 'iOS'  src fortiguard  id 0  weight 100
     host 'Jasons-iPhone6'  src dhcp
```

Using FortiManager as an override server for IoT query services

FortiGate can use FortiManager as an override server for IoT query services. The FortiManager must be running 7.2.1 or later.

All IoT daemon query and collected data can be sent to a FortiManager, instead of directly to FortiGuard. This is useful when there are strict policies controlling the kind of traffic that can go to the internet.

To send all IoT daemon query and collected data to a FortiManager:

```
config system central-management
    config server-list
        edit 1
            set server-type iot-query iot-collect
            set server-address <x.x.x.x>
        next
    end
end
```

`server-type iot-query iot-collect`	Set the FortiGuard service types: • `iot-query`: IoT query server. • `iot-collect`: IoT device collection server.
`server-address <x.x.x.x>`	Enter the IPv4 address of the FortiManager.

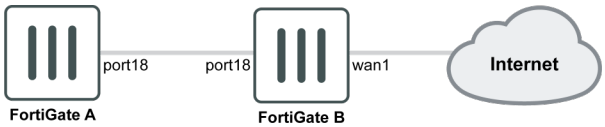
FortiAP query to FortiGuard IoT service to determine device details

A FortiAP collects packets from devices and queries FortiGuard with the help of the FortiGate. Device detection results are reported back to the FortiGate where this information is displayed. Querying the FortiGuard service requires an IoT Detection Service license.

The following attributes can be configured in `wireless-controller setting`:

Attribute	Description
device-weight <integer>	Set the device upper limit of confidence (0 - 255, default = 1, 0 = disable).
device-holdoff <integer>	Set the device lower limit of creation time, in minutes (0 - 60, default = 5).
device-idle <integer>	Set the device upper limit of idle time, in minutes (0 - 14400, default = 1440).

To query the FortiGuard IoT service:



```
config wireless-controller setting
    ...
    set device-weight 1
    set device-holdoff 5
    set device-idle 1440
    ...
end
```

```
# diagnose user device list
  vd root/0  54:27:1e:e6:26:3d  gen 89  req OUA/34
    created 70s  gen 86  seen 2s  port29  gen 28
    ip 10.29.1.214  src mac
    hardware vendor 'Asustek compute'  src fortiguard  id 0  weight 21
    type 'Home & Office'  src fortiguard  id 0  weight 21
    family 'Computer'  src fortiguard  id 0  weight 21
    os 'Linux'  src dhcp  id 822  weight 128
    host 'test-wifi'  src dhcp
```

FortiGate Cloud / FDN communication through an explicit proxy

Explicit proxy communication to FortiGate Cloud and FortiGuard servers from FortiGate is enabled. A proxy server can be configured in the FortiGuard settings so that all FortiGuard connections under the `forticldd` process can be established through the proxy server.

Not all FortiGuard services are supported by these proxy settings. For example, web filter service traffic to FortiGuard will not be directed to the configured proxy.

To configure a proxy server and communicate with FortiGate Cloud though it:

1. Configure FortiGate B as a proxy server:

```
config firewall proxy-policy
    edit 1
        set proxy explicit-web
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set service "webproxy"
        set action accept
        set schedule "always"
        set logtraffic all
        set users "guest1"
    next
end
config user local
    edit "guest1"
        set type password
        set passwd 123456
    next
end
config authentication scheme
    edit "local-basic"
        set method basic
        set user-database "local-user-db"
    next
end
config authentication rule
    edit "local-basic-rule"
        set srcaddr "all"
        set ip-based disable
        set active-auth-method "local-basic"
    next
end
```

2. Configure a firewall policy on FortiGate B to allow FortiGate A to get DNS resolution:

```
config firewall policy
    edit 1
        set name "dns"
        set srcintf "port18"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "DNS"
        set fsso disable
        set nat enable
    next
end
```

3. Configure the FortiGuard proxy settings on FortiGate A:

```
config system fortiguard
    set proxy-server-ip 10.2.2.2
```

```
        set proxy-server-port 8080
        set proxy-username "guest1"
        set proxy-password 123456
    end
```

4. On FortiGate A, log in to FortiGate Cloud to activate the logging service:

   ```
   execute fortiguard-log login <username> <password>
   ```

5. On FortiGate A, view the `forticldd` debug message to see the connection to the log controller through the proxy server:

   ```
   # diagnose test application forticldd 1
   ```

FDS-only ISDB package in firmware images

FortiOS firmware images include Fortinet objects in the built-in Internet Service Database (ISDB).

```
# diagnose firewall internet-service list
List internet service in kernel(global):
Internet Service Database Kernel Table: size 14974 bytes, Entry size 5844 bytes, number of
index entries 165 number of IP range entries 0

Group(0): Weight(15), number of entries(162)
......
```

This lightweight ISDB package allows firewall rules and policy routes that use ISDB to access FortiGuard servers to continue working after upgrading FortiOS. For example, the following policy will work after an upgrade:

```
config firewall policy
    edit 440
        set name "Fortinet Updates"
        set srcintf "port25"
        set dstintf "port1"
        set srcaddr "FortiAnalyzer" "FortiAuthenticator" "Tesla Management Interface"
"BackupFortinet" "SipFW" "ConnectVPNMgmt"
        set internet-service enable
        set internet-service-id 1245187 1245326 1245324 1245325 1245193 1245192 1245190
1245185
        set action accept
        set schedule "always"
        set logtraffic all
        set fsso disable
    next
end
```

After the FortiGate reboots after a firmware update, an automatic update will run in five minutes so that the FortiGate can get the ISDB, whether or not scheduled update is enabled.

```
# diagnose autoupdate versions | grep Internet -A 6

Internet-service Full Database

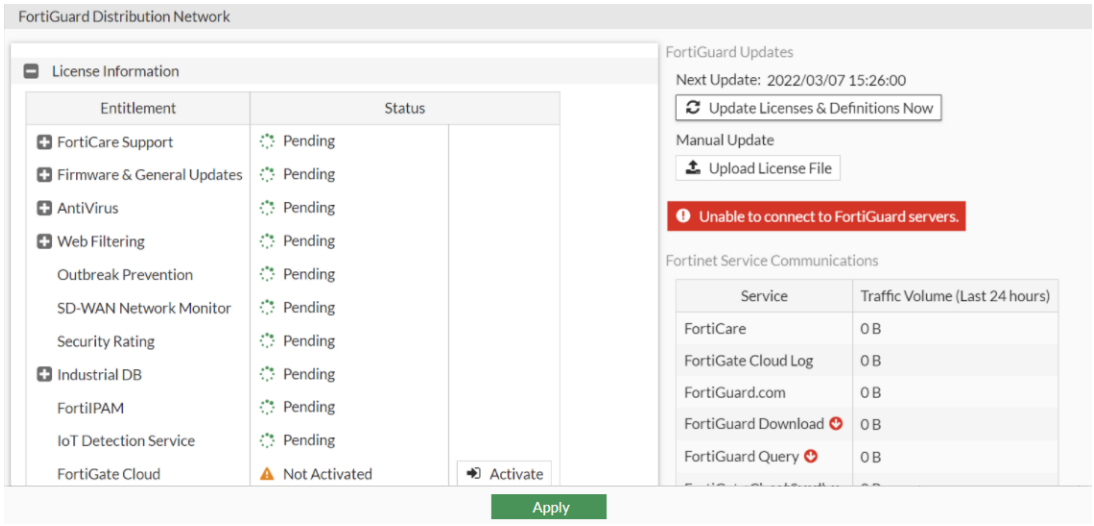
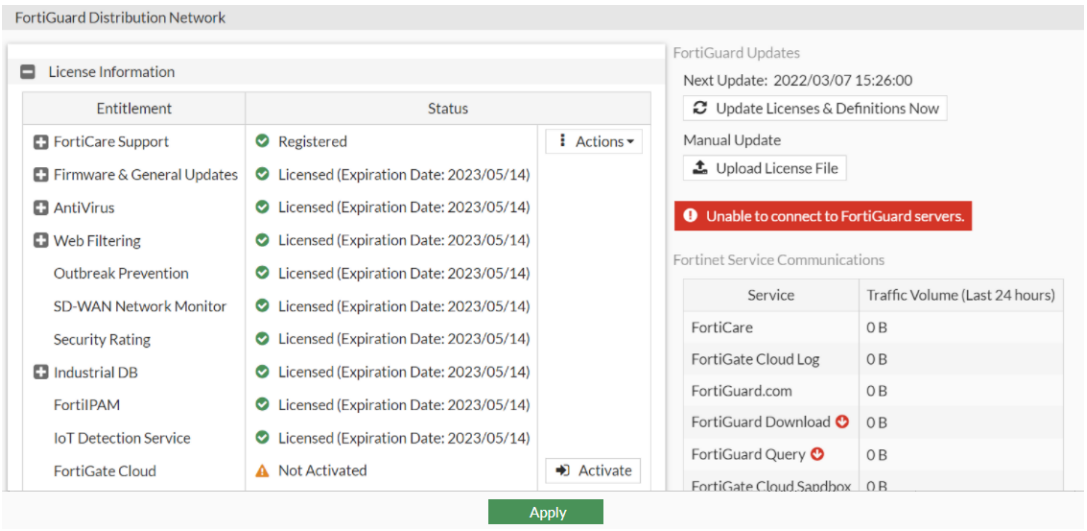
```



Licensing in air-gap environments

In the Operational Technology industry, industrial equipment is critical and must not be connected to the internet. However, the equipment is still required to be protected by a firewall in this air-gap environment. Without a gateway to FortiGuard in air-gap environments, FortiGuard packages, such as AntiVirus and IPS, must be manually uploaded to the FortiGate. FortiGate licenses can be downloaded from FortiCloud and uploaded manually to the FortiGate.

Manual licensing for air-gap environments is supported only on FortiGate hardware appliances, for both rugged and non-rugged models running FortiOS 7.2.0 or later. Manual licensing is currently not supported on FortiGate virtual machine (VM) appliances.



To manually upload FortiGate licenses in the GUI:

1. Register the FortiGuard license on FortiCloud. See Registration in the FortiOS Administration Guide for more information.
2. Download the product entitlement file in FortiCloud:
   a. Go to *Products* > *Product List*.
   b. Select the serial number of the FortiGate. The product page opens.
   c. In the *License & Key* section, click *Get The License File*. The file downloads to your device in the format `FG201E*********ProductEntitlement.lic`.
3. In FortiOS, go to *System* > *FortiGuard*. Currently, the status for all services is *Pending*.

4. Click *Upload License File*. The file explorer opens.
5. Navigate to the product entitlement file and click *Open*.

   The license file uploads to the FortiGate. Once the upload is complete, the FortiGate shows that it is registered and licensed.

6. Click *Apply*.

To manually upgrade the AntiVirus Database in the GUI:

1. Download the static upgrade file from FortiCloud:
   a. Go to support.fortinet.com.
   b. Go to *Download* > *Download FortiGuard Service Updates* > *FortiGate*.
   c. Select the FortiOS version from the *OS Version* dropdown.
   d. Select the file from the appropriate FortiGate product model section. The file downloads to your device.
2. In FortiOS, go to *System* > *FortiGuard* and expand the *AntiVirus* section to view the current licenses.

3. Click *Upgrade Database*. The *Anti-Virus Database Upgrade* pane opens.
4. Click *Upload*. The file explorer opens.
5. Navigate to the static upgrade file and click *Open*.
6. Click *OK*.
7. Click *Apply*.
   The AntiVirus Database is upgraded.

To manually upload FortiGate licenses in the CLI:

```
# execute restore manual-license {ftp | tftp} <license file name> <server> [args]
```

License expiration

The FortiGate will still function as a firewall if any or all of the FortiGuard licenses are expired. Valid FortiGuard licenses are required to receive database and signature updates, and to perform real-time or near-real-time security lookups to detect and quickly adjust your security posture for newly discovered attacks.

FortiGuard services are designed to be continuous. Any lapses in the service will require coverage back to the contract expiration date. For more information, see FortiCare/FortiGuard Renewal Continuous Service Policy.

License type	Expiration impact
Firmware & General Update	Application Control, Device & OS Identification, and Internet Service Database Definitions continue to work, but the databases are not updated and no new signatures are added. For example, if application control is used in a firewall policy that has an internet service applied to the source or destination addresses, then the policy will continue to inspect matching traffic using the FortiGate's existing application control signatures and ISDB definitions. Application control, device and OS detection, and internet service database are included in the base services that are included with all FortiCare support contracts See FortiGuard Security Services for details.
Intrusion Prevention	IPS scanning continues to work, but the IPS databases are not updated and no new signatures are added. For example, if an IPS sensor with *Block malicious URLs* enabled is used in a firewall policy, then the policy will continue to inspect matching traffic using the FortiGate's existing IPS signatures and malicious URLs database. An active IPS license is critical for stopping sophisticated and zero-day attacks, as FortiGuard IPS provides near-real-time intelligence with thousands of intrusion prevention rules to detect and block known and zero-day threats. For more information, see Intrusion prevention on page 1301.
Botnet IPs/Domains	IPS sensors and DNS Filter profiles with Botnet C&C configured continue to work, but the Botnet IPs and Botnet Domain databases are not updated and no new signatures are added. While Botnet IPs and Domain are listed in the Intrusion Prevention category, they are actually part of the Firmware & General Updates contract. For more information, see Botnet C&C domain blocking on page 1268 and IPS with botnet C&C IP blocking on page 1314.
AntiVirus	Antivirus scanning continues to work, but the antivirus database is not updated and no new signatures are added. For more information, see Antivirus on page 1169.

License type	Expiration impact
Web and DNS Filtering	Category-based Web and DNS filtering stops working, as URLs and domains are sent to FortiGuard in real-time to determine the category. By default, all web and DNS traffic is dropped. If allowing website or DNS requests when a rating error occurs is enabled, then all web and DNS traffic passes through without filtering. If static URL or domain filtering is applied in a filter profile, those filters continue to work. Configurations where only specific URLs and domains are allowed and all others are blocked continue to work, but this is not a scalable solution blocking websites or performing category filtering. For more information, see FortiGuard filter on page 1221 and FortiGuard category-based DNS domain filtering on page 1265.
Email Filtering	Spam filtering stops working, as it queries the FortiGuard spam filtering server in real-time to check spammer IP addresses and emails (except those that are locally configured), phishing URLs, spam URLs, spam email checksums, and spam submissions. Anti-spam signatures are not updated. Profile options based on local spam filtering continue to work. For more information, see Email filter on page 1330.
Outbreak Prevention	Outbreak prevention stops working, as it uses real-time lookups to the FortiGuard Global Threat Intelligence database. For more information, see FortiGuard outbreak prevention on page 1183.
Security Rating	The security rating check stops working. Security Rating licenses are required to run security rating checks across all of the devices in the Security Fabric. They allow rating scores to be submitted to and received from FortiGuard for network ranking. Without security rating checks, critical vulnerabilities and configuration weaknesses in the Security Fabric cannot be identified, and best practice recommendations cannot be implemented. For more information, see Security rating on page 2507.
Industrial DB	Industry Security Service (ISS) signatures continue to work, but the database attack definitions are not updated and no new signatures are added. ISS includes application control and IPS signatures for industrial applications and protocols. For example, if an IPS sensor enabled with ISS signatures is used in a firewall policy, then the policy will continue to inspect matching traffic using the FortiGate's existing industrial database IPS signatures. For more information, see Industrial signature database on page 1309.

Feature visibility

Feature visibility is used to control which features are visible in the GUI. This allows features that are not in use to be hidden. Some features are also invisible by default and must be made visible before they can be configure in the GUI.

The visibility of a feature does not affect its functionality or configuration. Invisible features can still be configured using the CLI.

To change the visibility of features:

1. Go to *System* > *Feature Visibility*.
2. Change the visibility of the features as required.
   For information about what settings each option affects, click on the + icon to the right of the feature name.
   Changes are listed on the right side of the content pane.
3. Click *Apply*.

Certificates

FortiOS leverages certificates in multiple areas, such as VPNs, administrative access, and deep packet inspection. This section contains topics about uploading certificates and provides examples of how certificates may be used to encrypt and decrypt communications, and represent the identity of the FortiGate. This sections assumes the reader has a high level understanding of the public key infrastructure (PKI) system, particularly how entities leverage trusted certificate authorities (CAs) to verify the authenticating party, and how public and private certificate keys work to secure communications.

The certificates feature is hidden by default in FortiOS. In the GUI, go to *System* > *Feature Visibility* and enable *Certificates*.

For additional capabilities and enhanced certificate management, please review the FortiAuthenticator Administration Guide and Cookbook.

The following topics provide information about certificates:

- Automatically provision a certificate on page 2324
- Generate a new certificate on page 2328
- Regenerate default certificates on page 2329
- Import a certificate on page 2329
- Generate a CSR on page 2332
- CA certificate on page 2334
- Remote certificate on page 2334
- Certificate revocation list on page 2335
- Export a certificate on page 2336
- Uploading certificates using an API on page 2336

The following topics provide examples of how to use certificates:

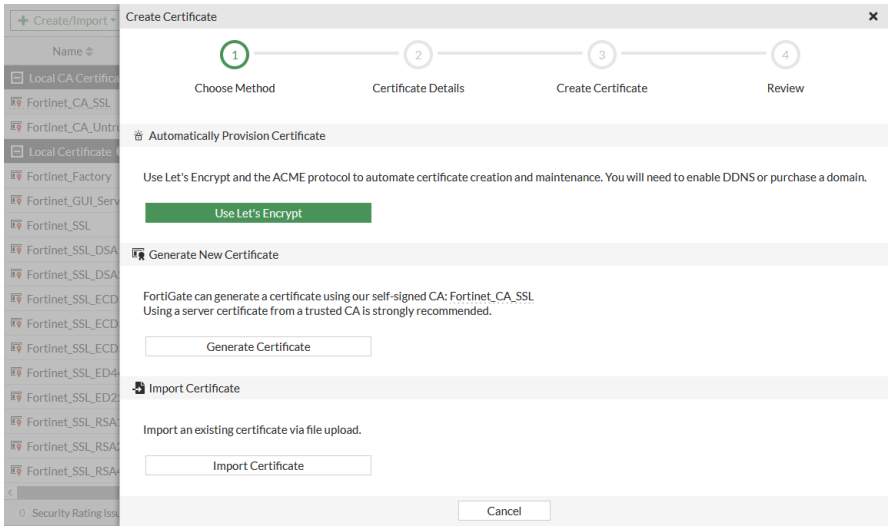
- Procuring and importing a signed SSL certificate on page 2341
- Microsoft CA deep packet inspection on page 2343
- Administrative access using certificates on page 2348
- Creating certificates with XCA on page 2348
- Site-to-site VPN with digital certificate on page 1468
- Configuring FortiClient EMS on page 2404
- SSL VPN with certificate authentication on page 1760

- SSL VPN with LDAP-integrated certificate authentication on page 1765
- Configuring certificates for SAML SSO on page 2493
- Protecting an SSL server on page 1397
- Using the default certificate for HTTPS administrative access on page 2108

Automatically provision a certificate

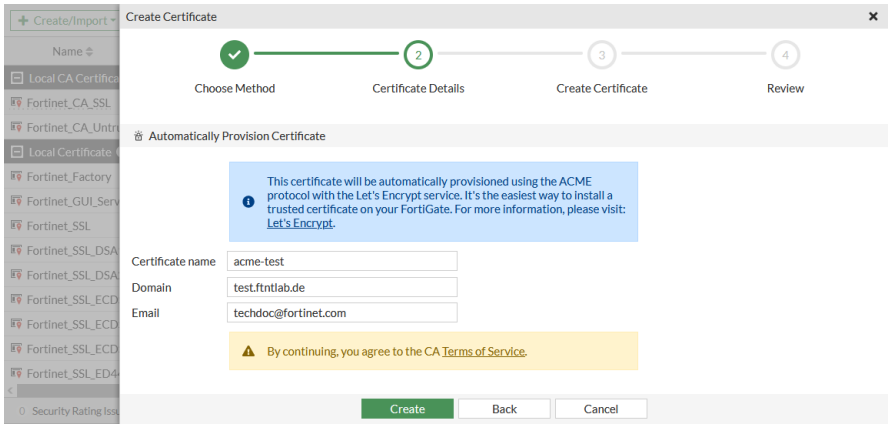
The Automated Certificate Management Environment (ACME), as defined in RFC 8555, is used by the public Let's Encrypt certificate authority (https://letsencrypt.org) to provide free SSL server certificates. The FortiGate can be configured to use certificates that are managed by Let's Encrypt, and other certificate management services, that use the ACME protocol. The server certificates can be used for secure administrator log in to the FortiGate.

- The FortiGate must have a public IP address and a hostname in DNS (FQDN) that resolves to the public IP address.
- The configured ACME interface must be public facing so that the FortiGate can listen for ACME update requests. It must not have any VIPs, or port forwarding on port 80 (HTTP) or 443 (HTTPS).
- The Subject Alternative Name (SAN) field is automatically filled with the FortiGate DNS hostname. It cannot be edited, wildcards cannot be used, and multiple SANs cannot be added.



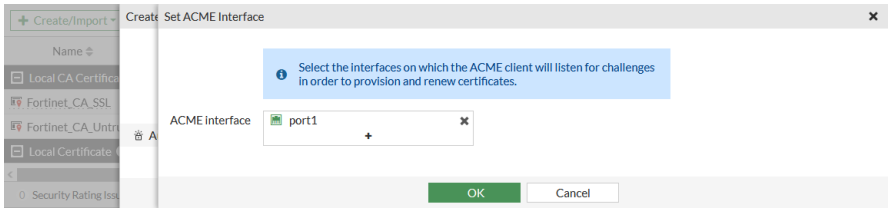
ACME certificates do not support loopback interfaces.

This example shows how to import an ACME certificate from Let's Encrypt, and use it for secured remote administrator access to the FortiGate.

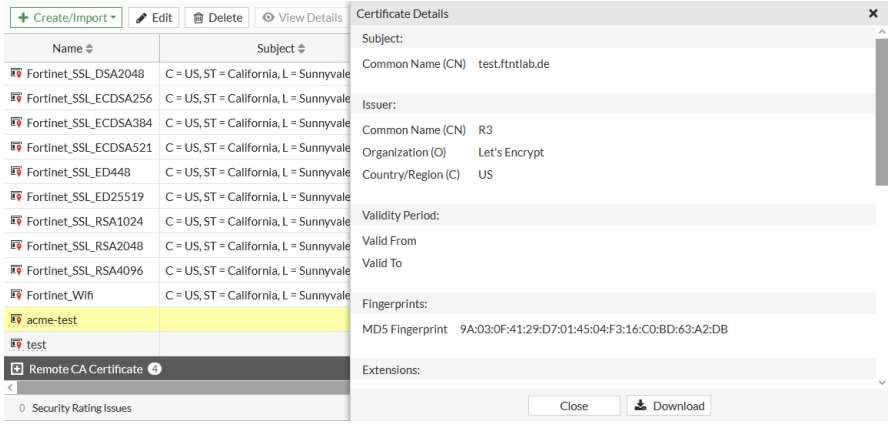


To generate a certificate using ACME and Let's Encrypt:

1. Go to *System* > *Certificates* and click *Create/Import* > *Certificate*.



2. Click *Use Let's Encrypt*.
3. Set *Certificate name* to an appropriate name for the certificate. This is what is referenced when using the certificate in FortiGate configurations.
4. Set *Domain* to the public FQDN of the FortiGate.



5. Set *Email* to a valid email address. The email is not used during the enrollment process.

6. Click *Create*.
7. Set the *ACME interface*, on which the ACME client will listen for challenges in order to provision and renew certificates. The challenge is how the certificate signing request is validated by Let's Encrypt.

8. Click *OK*. Let's Encrypt provisions the certificate and the certificate is added to the certificate list in the *Local Certificates* section.
9. Click *View Details* to verify that the FortiGate's FQDN is in the certificate's *Subject: Common Name (CN)*.

To import an ACME certificate in the CLI:

1. Set the interface that the FortiGate communicates with Let's Encrypt on:

```
config system acme
    set interface "port1"
end
```

2. Make sure that the FortiGate can contact the Let's Encrypt enrollment server:

```
# execute ping acme-v02.api.letsencrypt.org
PING ca80a1adb12a4fbdac5ffcbc944e9a61.pacloudflare.com (172.65.32.248): 56 data bytes
64 bytes from 172.65.32.248: icmp_seq=0 ttl=60 time=2.0 ms
64 bytes from 172.65.32.248: icmp_seq=1 ttl=60 time=1.7 ms
64 bytes from 172.65.32.248: icmp_seq=2 ttl=60 time=1.7 ms
64 bytes from 172.65.32.248: icmp_seq=3 ttl=60 time=2.1 ms
64 bytes from 172.65.32.248: icmp_seq=4 ttl=60 time=2.0 ms

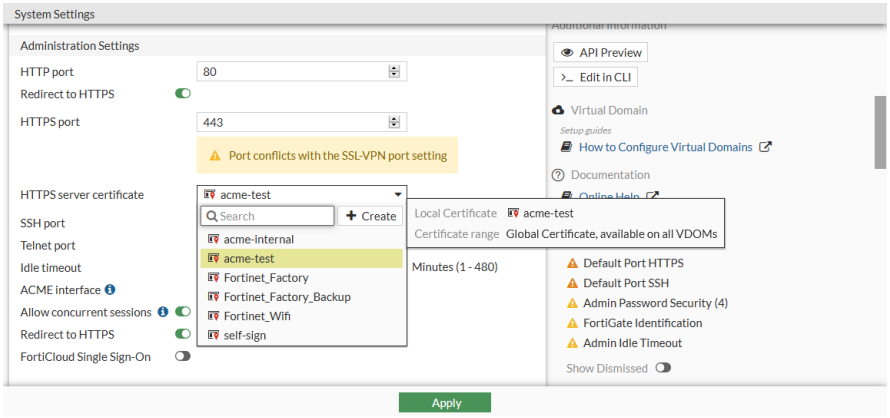
--- ca80a1adb12a4fbdac5ffcbc944e9a61.pacloudflare.com ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 1.7/1.9/2.1 ms
```

3. Configure the local certificate request:

```
config vpn certificate local
    edit "acme-test"
        set enroll-protocol acme2
        set acme-domain "test.ftntlab.de"
        set acme-email "techdoc@fortinet.com"
    next
By enabling this feature you declare that you agree to the Terms of Service at
https://acme-v02.api.letsencrypt.org/directory
Do you want to continue? (y/n)y
end
```

4. Verify that the enrollment was successful:

```
# get vpn certificate local details acme-test
path=vpn.certificate, objname=local, tablename=(null), size=2632
== [ acme-test ]
        Name:        acme-test
        Subject:     CN = test.ftntlab.de
        Issuer:      C = US, O = Let's Encrypt, CN = R3
        Valid from:  2021-03-11 17:43:04  GMT
        Valid to:    2021-06-09 17:43:04  GMT
        Fingerprint: 9A:03:0F:41:29:D7:01:45:04:F3:16:C0:BD:63:A2:DB
        Serial Num:  03:d3:55:80:d2:e9:01:b4:ca:80:3f:2e:fc:24:65:ad:7c:0c
ACME details:
        Status: The certificate for the managed domain has been renewed successfully and
can be used (valid since Thu, 11 Mar 2021 17:43:04 GMT).
        Staging status: Nothing in staging
```



5. Check the ACME client full status log for the CN domain:

```
# diagnose sys acme status-full test.ftntlab.de
{
  "name": "test.ftntlab.de",
  "finished": true,
  "notified": false,
  "last-run": "Thu, 11 Mar 2021 18:43:02 GMT",
  "valid-from": "Thu, 11 Mar 2021 17:43:04 GMT",
  "errors": 0,
  "last": {
    "status": 0,
    "detail": "The certificate for the managed domain has been renewed successfully and
can be used (valid since Thu, 11 Mar 2021 17:43:04 GMT). A graceful server restart now
is recommended.",
    "valid-from": "Thu, 11 Mar 2021 17:43:04 GMT"
```

```
    },
    "log": {
      "entries": [
        {
          "when": "Thu, 11 Mar 2021 18:43:05 GMT",
          "type": "message-renewed"
        },
        ...
        {
          "when": "Thu, 11 Mar 2021 18:43:02 GMT",
          "type": "starting"
        }
      ]
    }
}
```

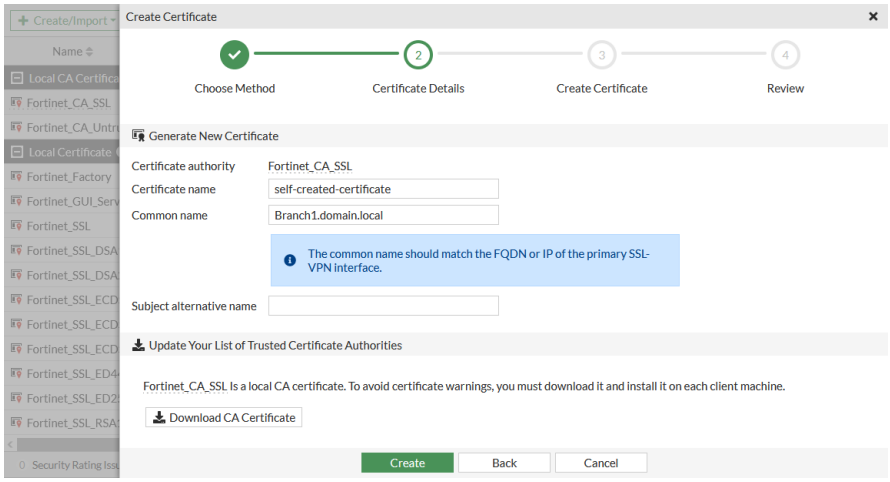
To exchange the default FortiGate administration server certificate for the new public Let's Encrypt server certificate in the GUI:

1. Go to *System* > *Settings*.
2. Set *HTTPS server certificate* to the new certificate.

3. Click *Apply*.
4. Log in to the FortiGate using an administrator account from any internet browser. There should be no warnings related to non-trusted certificates, and the certificate path should be valid.

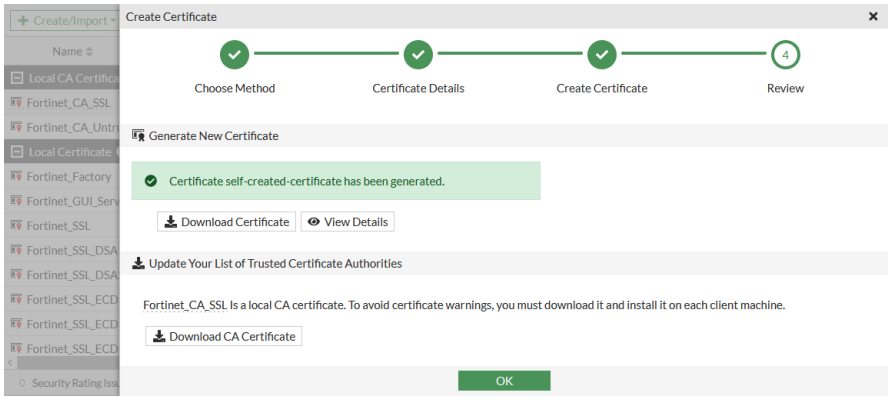
To exchange the default FortiGate administration server certificate for the new public Let's Encrypt server certificate in the CLI:

```
config system global
    set admin-server-cert "acme-test"
end
```



When you log in to the FortiGate using an administrator account there should be no warnings related to non-trusted certificates, and the certificate path should be valid.

Generate a new certificate



The FortiGate can generate a certificate using a pre-loaded, self-signed CA certificate: *Fortinet_CA_SSL*, instead of generating a CSR and providing it to a CA for signing. It is recommended that a server certificate from a well-known and trusted CA is used.

To generate a new certificate:

1. Go to *System* > *Certificates* and select *Create/Import* > *Certificate*.
2. Click *Generate Certificate*.
3. Set *Certificate name* to the name of the certificate. This is what is referenced when using the certificate in FortiGate configurations.
4. Set the *Common name* (CN) for the certificate. The common name should match the FQDN or IP of the primary SSL-VPN interface.
5. Optionally, set the *Subject alternative name*.
6. Click *Download CA Certificate* to download the CA certificate so that it can be installed or imported to all the machines that need to trust this certificate.

7. Click *Create*.
8. After the certificate is created, click *Download Certificate* to download the certificate. Click *View Details* to review the certificate details.

9. Click *OK*.

Regenerate default certificates

The FortiGate includes default certificates that are generated the first time that the FortiGate is booted up. In some circumstances, it can be necessary to regenerate these certificates, such as when they are nearing expiry, or if the key becomes compromised.

To regenerate default certificates:

```
# execute vpn certificate local generate default-gui-mgmt-cert
# execute vpn certificate local generate default-ssl-ca
# execute vpn certificate local generate default-ssl-ca-untrusted
# execute vpn certificate local generate default-ssl-key-certs
# execute vpn certificate local generate default-ssl-serv-key
```

`default-gui-mgmt-cert`	Regenerate the default GUI management admin-server (Fortinet_GUI_Server) certificate.
`default-ssl-ca`	Regenerate the default CA certificate (Fortinet_CA_SSL) used by SSL Inspection.
`default-ssl-ca-untrusted`	Regenerate the default untrusted CA certificate (Fortinet_CA_Untrusted) used by SSL Inspection.
`default-ssl-key-certs`	Regenerate the default RSA, DSA, ECDSA, and EdDSA key certificates for SSL resign: • Fortinet_SSL_DSA1024 • Fortinet_SSL_DSA2048 • Fortinet_SSL_ECDSA256 • Fortinet_SSL_ECDSA384 • Fortinet_SSL_ECDSA521 • Fortinet_SSL_ED448 • Fortinet_SSL_ED25519 • Fortinet_SSL_RSA1024 • Fortinet_SSL_RSA2048 • Fortinet_SSL_RSA4096
`default-ssl-serv-key`	Regenerate the default server key (Fortinet_SSL) used by SSL Inspection.

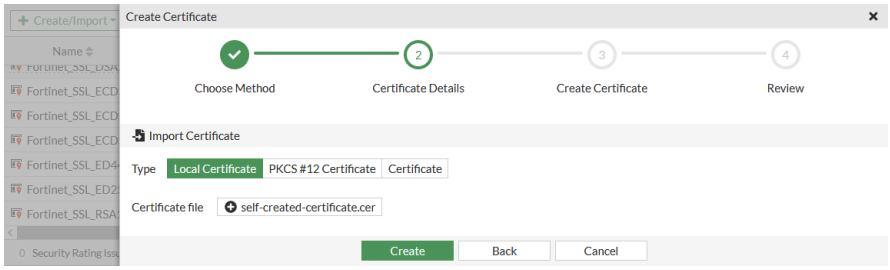
Import a certificate

You can upload a certificate to the FortiGate that was generated on its own. This is typical of wildcard certificates (*.domain.tld) where the same certificate is used across multiple devices (FGT.domain.tld, FAZ.domain.tld, and so on), but can also be used for individual certificates as long as the information provided to the signing CA matches that of the FortiGate.

Any certificate uploaded to a VDOM is only accessible to that VDOM. Any certificate uploaded to the Global VDOM is globally accessible by all VDOMs.

A signed certificate that is created using a CSR that was generated by the FortiGate does not include a private key, and can be imported to the FortiGate from a the management computer or a TFTP file server.

There are three options:



- Local certificate on page 2330
- PKCS #12 certificate on page 2330
- Certificate on page 2331

Local certificate

This option allows you to upload a single file and no key. Use it when you have created a CSR on the FortiGate (Generate a CSR on page 2332), as the key is generated as part of the CSR process and remains on the FortiGate. You must upload a .CER file.

To import a local certificate in the GUI:

1. Go to *System* > *Certificates* and select *Create/Import* > *Certificate*.
2. Click *Import Certificate*.
3. Set *Type* to *Local Certificate*.
4. Click *Upload*, and locate the certificate on the management computer.

5. Click *Create*, then click *OK* on the confirmation page.

To import a local certificate in the CLI:

```
execute vpn certificate local import tftp <filename> <tftp_IP> cer
```

PKCS #12 certificate

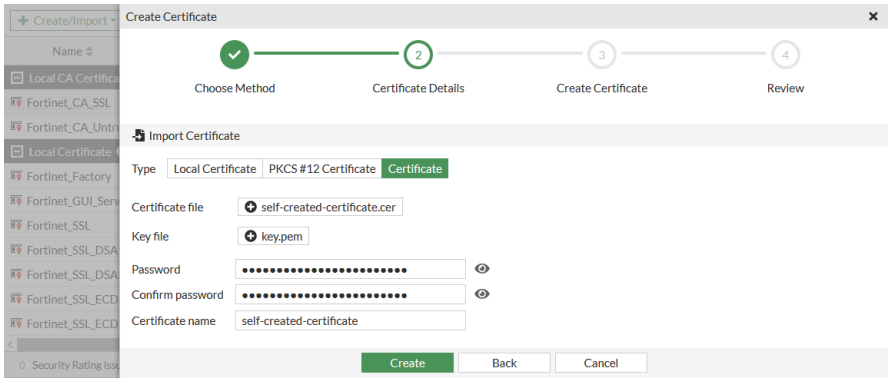
This option takes a specific certificate file type that contains the private key. The certificate is encrypted and a password must be supplied with the certificate file. PKCS #12 certificates are .PFX files.

To import a PKCS #12 certificate in the GUI:

1. Go to *System* > *Certificates* and select *Create/Import* > *Certificate*.
2. Click *Import Certificate*.
3. Set *Type* to *PKCS #12 Certificate*.
4. Click *Upload*, and locate the certificate on the management computer.
5. Enter the password, then confirm the password.

6. Optionally, customize the *Certificate name*.
7. Click *Create*, then click *OK* on the confirmation page.

To import a PKCS #12 certificate in the CLI:



```
execute vpn certificate local import tftp <filename> <tftp_IP> p12 <password>
```

Certificate

This option is intended for certificates that were generated without using the FortiGate's CSR. Because the certificate private key is being uploaded, a password is required. This option is similar to PKCS #12 certificate, but the certificate and key file are separate files, usually .CER and .PEM files.

To import a certificate in the GUI:

1. Go to *System* > *Certificates* and select *Create/Import* > *Certificate*.
2. Click *Import Certificate*.
3. Set *Type* to *Certificate*.
4. In the *Certificate* field, click *Upload*, and locate the certificate on the management computer.
5. In the *Key file* field, click *Upload*, and locate the key file on the management computer.
6. Enter the password, then confirm the password.

7. Optionally, customize the *Certificate name*.
8. Click *Create*, then click *OK* on the confirmation page.

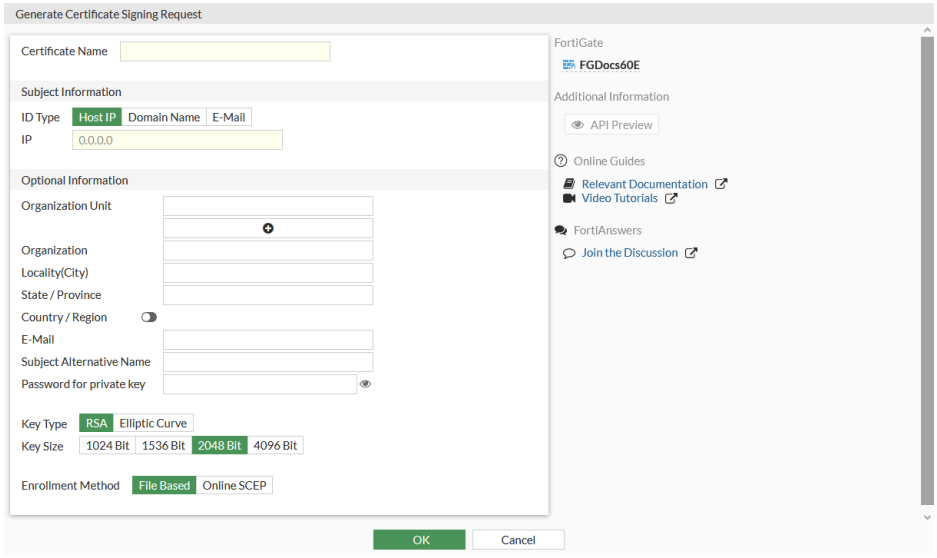
To import a certificate that requires a private key to a VDOM, or when VDOMs are disabled:

```
config vpn certificate {local | ca | remote | ocsp-server | crl}
```

Refer to the FortiOS CLI Reference for detailed options for each certificate type (local, CA, remote, OSCP server, CRL).

To import a global certificate that requires a private key when VDOMs are enabled:

```
config certificate {local | ca | remote | crl}
```



This command is only available when VDOMs are enabled. For details, see the FortiOS CLI Reference.

Generate a CSR

Certificate signing requests (CSRs) are used to generate a certificate which is then signed by a CA to create a chain of trust. The CSR includes details about the FortiGate and its public key. A CSR is not strictly necessary; some CAs allow you to provide the details of the FortiGate manually, but a CSR helps streamline the process.

To generate a CSR in the GUI:

1. Go to *System* > *Certificates* and select *Create/Import* > *Generate CSR*.

2. Enter the following information:

Certificate Name	Enter the certificate name; this is how it will appear in the *Local Certificates* list.
Subject Information	Specify an ID type: host IP address, domain name (FQDN), or email address.
Optional Information	Although listed as optional, we recommended entering the information for each field in this section. If you are generating a CSR for a third-party CA, you need to insure that these values reflect those listed for your company or organization at said certificate authority. If you are generating a certificate for a Microsoft CA, you need to check with the administrator regarding these values.
Organization Unit	Enter the name of the organizational unit under which the certificate will be issued.
Organization	Enter the overall name of the organization.
Locality(City)	Enter the city where the SSL certificate is located.
State / Province	Some issuers will reject a CSR that has an abbreviated state or province, so enter the full name of the state or province.
Country / Region	Enable the option and select the country from the dropdown.

E-Mail	Enter the email address of the technical contact for the SSL certificate that is being requested.
Subject Alternative Name	This field allows multiple domains to be used in an SSL certificate. Select from email addresses, IP addresses, URIs, DNS names, and so on.
Password for private key	If supplied, this is used as an encryption password for the private key file.
Key Type	Select *RSA* or *Elliptic Curve*.
Key Size	When *Key Type* is *RSA*, select 1024, 1536, 2048, or 4096 for bit-size/strength. We recommend using at least 2048 if your CA can issue certificates of that size.
Curve Name	When *Key Type* is *Elliptic Curve*, select the elliptic curve type: secp256r1, secp384r1, or secp521r1.

Enrollment Method	Select one of the following methods that determines how the CSR will be signed.
	• *File Based*: this will generate a certificate in the certificate menu under *Local Certificate*, which differs from the existing ones because it has no *Subject*, *Comments*, *Issuer*, or *Expires* values in the table. It will also show a *Pending* status because it is only a CSR at the moment and cannot function as a certificate just yet. You can download the CSR to provide to a CA for signing. If you open the CSR file, it should look similar to this:
	`-----BEGIN CERTIFICATE REQUEST-----`
	`MIIC7jCCAdYCAQAwgZUxCzAJBgNVBAYT (… )HEKjDX+Hg==`
	`-----END CERTIFICATE REQUEST-----`
	Next. the CSR file is supplied to a CA for signing and the returned file from the CA should be in .CER format. This file is then uploaded to the FortiGate by going to *System* > *Certificates* > *Import* > *Local Certificate* and uploading the CER file.
	• *Online SCEP*: the Simple Certificate Enrollment Protocol (SCEP) allows devices to enroll for a certificate by using a URL and a password. The SCEP server works as a proxy to forward the FortiGate's request to the CA and returns the result to the FortiGate (setting up an SCEP server is beyond the scope of this topic). Once the request is approved by the SCEP server, the FortiGate will have a signed certificate containing the details provided in the CSR.

3. Click *OK*.
   The CSR generated, and can be downloaded from the local certificate list.

To generate a CSR in the CLI:

```
# execute vpn certificate local generate cmp <certificate_name> <key_size> <server> <path>
<server_certificate> <auth_certificate> <user> <password> <subject> [SANs] [source_IP]
```

```
# execute vpn certificate local generate ec <certificate_name> <curve_name> <subject>
<country> <state/province> <city> <organization> <OU> <email> [SANs] [options]
```

```
# execute vpn certificate local generate rsa <certificate_name> <key_size> <subject>
<country> <state/province> <city> <organization> <OU> <email> [SANs] [options]
```

cmp	Generate a certificate request over CMPv2.
ec	Generate an elliptic curve certificate request.
rsa	Generate a RSA certificate request.

CA certificate

FortiGates come with many CA certificates from well-known certificate authorities pre-installed, just as most modern operating systems like Windows and MacOS. Use this option to add private CA certificates to the FortiGate so that certificates signed by this private CA are trusted by the FortiGate.

For example, a private CA can be used when two FortiGates are establishing a site-to-site VPN tunnel using a certificate not signed by a public or trustworthy CA, or for your LDAPS connection to your corporate AD server that also uses a certificate signed with a private CA in your domain. It is very common to upload a private CA when using PKI user authentication, since most PKI user certificates will be signed by an internal CA.

To import a CA certificate in the GUI:

1. Go to *System* > *Certificates* and select *Create/Import* > *CA Certificate*.
2. Set the *Type* to *Online SCEP* or *File*.
   - *Online SCEP*: Enter the *URL of the SCEP server* and optionally, the *Optional CA Identifier*. The FortiGate contacts an SCEP server to request the CA certificate.
   - *File*: Upload the CA certificate file directly from the management computer.
3. Click *OK*.

To import a CA certificate in the CLI:

```
# execute vpn certificate ca import auto <CA_server> [identifier] [source_ip] [fingerprint]
# execute vpn certificate ca import bundle <filename> <tftp_IP>
# execute vpn certificate ca import tftp <filename> <server_address>
# execute vpn certificate ems_ca import tftp <filename> <server_address>
```

auto	Import CA certificate via SCEP.
bundle	Import certificate bundle from a TFTP server.
tftp	Import CA certificate from a TFTP server.

Remote certificate

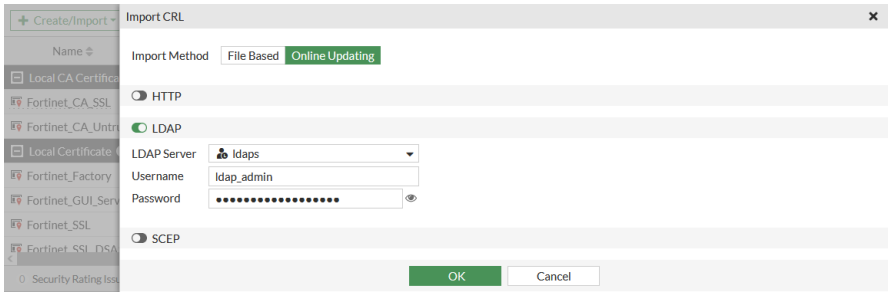
Remote certificates are public certificates and contain only the public key. They are used to identify a remote device. For example, when configuring your FortiGate for SAML authentication with the FortiGate as an identity provider (IdP), you can optionally specify the service provider (SP) certificate. However, when configuring your FortiGate as a SP, you must

specify the certificate used by the IdP. Both these certificates can be uploaded to the FortiGate as a remote certificate, since the private key is not necessary for its implementation.

To upload a remote certificate in the GUI:

1. Go to *System* > *Certificates* and select *Create/Import* > *Remote Certificate*.
2. Upload the remote certificate file directly from the management computer.
3. Click *OK*.

To upload a remote certificate in the CLI:



```
# execute vpn certificate remote import tftp <file_name> <server_address>
```

Certificate revocation list

Because it is not possible to recall a certificate, the certificate revocation list (CRL) details certificates signed by valid CAs that should no longer be trusted. Certificates may be revoked for many reasons, such as if the certificate was issued erroneously or if the private key of a valid certificate has been compromised.

To import a CRL in the GUI:

1. Go to *System* > *Certificates* and select *Create/Import* > *CA Certificate*.
2. Set the *Import Method* to *File Based* or *Online Updating*.
   - *File Based*: Upload the CRL file directly from the management computer. CAs publish files containing the list of certificates that should no longer be trusted.
   - *Online Updating*: This is the preferred method to keep the list of revoked certificates up to date. Configure the protocols as required.
     - *HTTP*: Enter the *URL of the HTTP server*.
     - *LDAP*: Select the *LDAP Server* and enter the *Username* and *Password*.
     - *SCEP*: Select the *Certificate* and enter the *URL of the SCEP server*.

3. Click *OK*.

To import a CRL in the CLI:

```
# execute vpn certificate crl import auto <CRL_name>
```

Export a certificate

Certificates can be downloaded to the management computer in the GUI and exported to a TFTP server in the CLI.

To back up a certificate in the GUI:

1. Go to *System* > *Certificates*.
2. Select the certificate from the list.
3. Click *Download*.
4. Save the file to the management computer.

To export the certificate in the CLI:

```
# execute vpn certificate ca export tftp <certificate_name> <filename> <tftp_IP>
# execute vpn certificate local export tftp <certificate_name> <file_type> <filename> <tftp_server>
# execute vpn certificate remote export tftp <certificate_name> <filename> <tftp_server>
```

Uploading certificates using an API

There are several API methods to upload a certificate based on the type and purpose of the certificate. The parameters of each method are available options, and some methods do not require all parameters to upload the certificate.

When uploading a certificate to the FortiGate using API, the certificate must be provided to the FortiGate in Base64 encoding. You must create a REST API user to authenticate to the FortiGate and use the generated API token in the request.

api/v2/monitor/vpn-certificate/ca/import

```

}
```

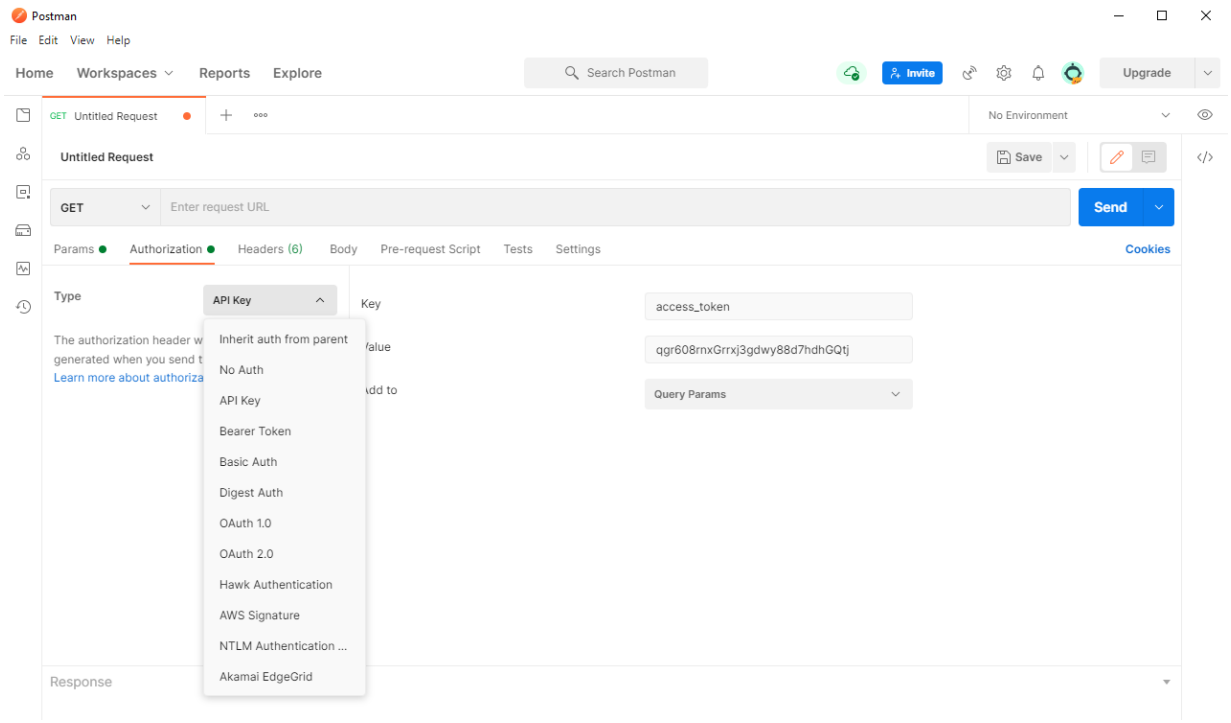
Example

In this example, a PKCS 12 certificate is uploaded as a local certificate using Postman as the API client. PowerShell is used for the Base64 encoding.



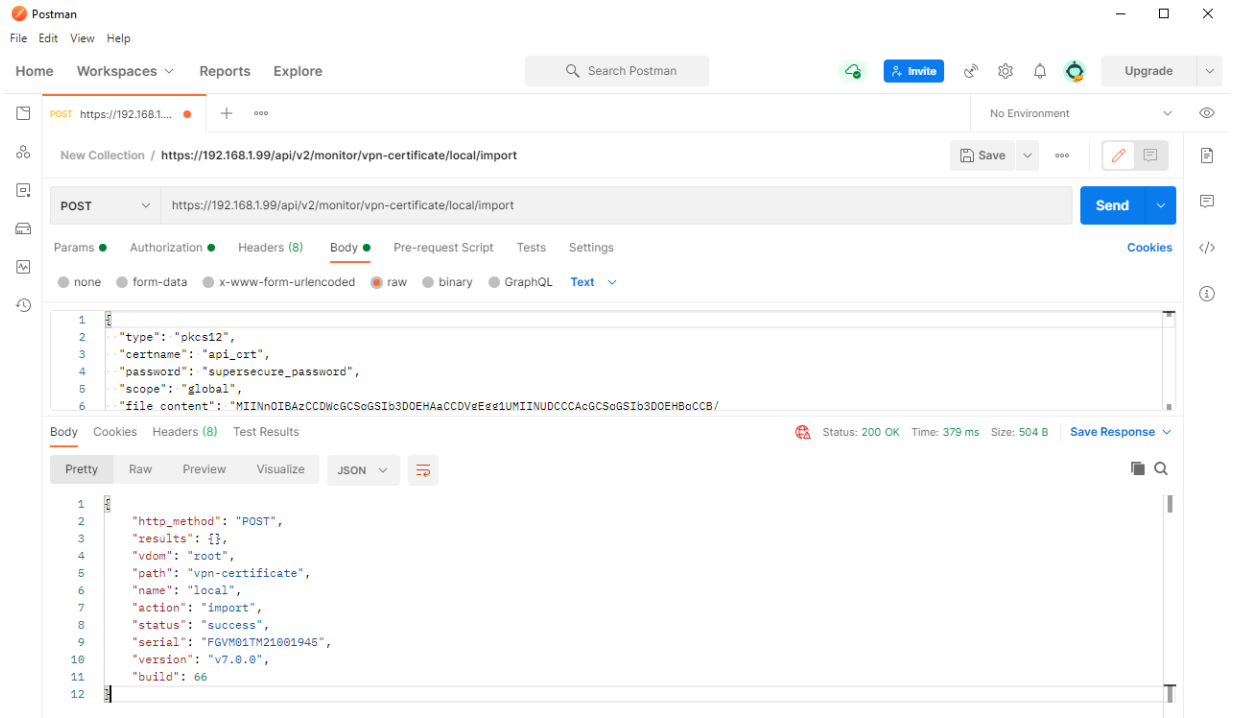
To upload a PKCS 12 certificate using an API:

1. In PowerShell , encode the PKCS 12 certificate to Base64:

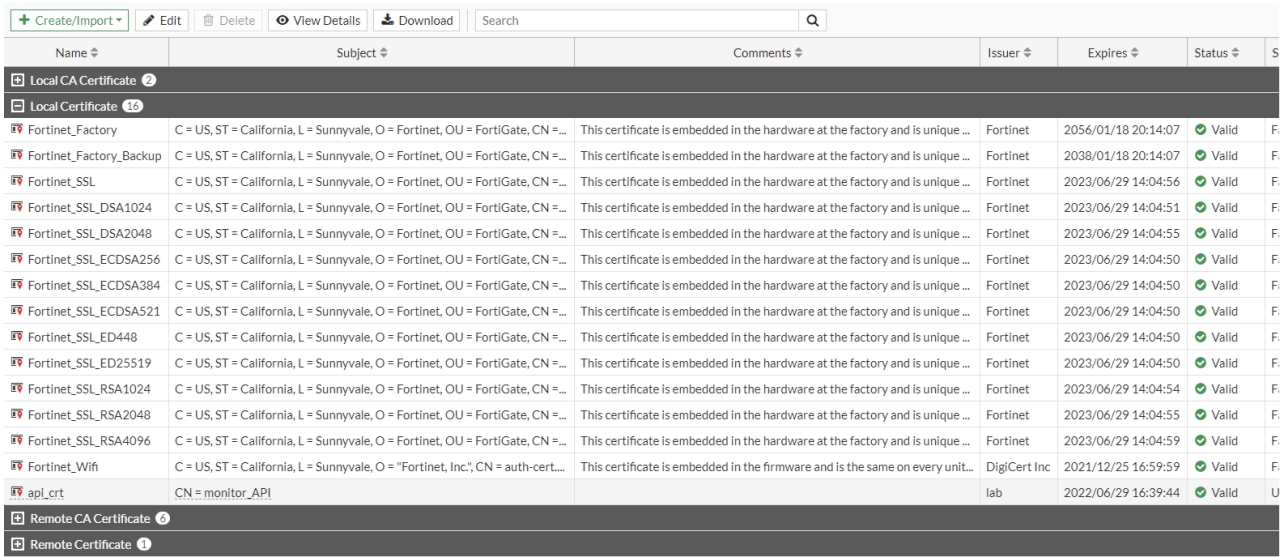
   ```
   cd C:\users\username\desktop
   $pkcs12cert = get-content 'C:\users\path\to\certificate\certificatename.p12' -Encoding
   Byte
   [System.Convert]::ToBase64String($pkcs12cert) | Out-File 'base12encodedcert.txt'
   ```

   These three lines of code do the following:

   a. Changes to working directory to the location where the encoded certificate will be created. In this example, it is the desktop.
   b. Creates a variable called `pkcs12cert` and defines it as the certificate file by specifying the full path to the certificate.
   c. Creates a text file called `base12encodedcert` at the location specified in the first step. You will copy and paste the contents of this as `file_content` later in Postman.
2. Generate an API token on the FortiGate by creating a REST API user. See Generate an API token on the Fortinet Developer Network. A subscription to the Fortinet Developer Network is required to view this topic.
3. Open Postman and create a new request:
   a. Click the +.
   b. Click the *Authorization* tab and in the *Type* dropdown, select *API Key*.
   c. For *Key*, enter *access_token* and enter the *Value* for the API user.
   d. For *Add to*, select *Query Params*.



4. In the HTTP request dropdown, change the request from *GET* to *POST*, and enter the FortiGate's IP address and the URL of the API call.
5. Click the *Body* tab, and copy and paste the API parameters.



6. Remove unnecessary parameters (ACME related parameters and `key_file_content`) and enter the correct settings for your certificate. Copy and paste the contents of the file generated by PowerShell earlier into `file_content`.

7. Click *Send*. The lower window will return the results.

8. In FortiOS, go to *System* > *Certificates* and verify that the uploaded certificate is shown in the table (*api_crt*).

Name	Subject	Comments	Issuer	Expires	Status
Local CA Certificate 2					
Local Certificate 16					
Fortinet_Factory	C = US, ST = California, L = Sunnyvale, O = Fortinet, OU = FortiGate, CN =...	This certificate is embedded in the hardware at the factory and is unique ...	Fortinet	2056/01/18 20:14:07	Valid
Fortinet_Factory_Backup	C = US, ST = California, L = Sunnyvale, O = Fortinet, OU = FortiGate, CN =...	This certificate is embedded in the hardware at the factory and is unique ...	Fortinet	2038/01/18 20:14:07	Valid

Remote Certificate 1					

To debug using the HTTPS daemon:

```
# diagnose debug reset
# diagnose debug enable
# diagnose debug application httpsd -1
<output>
# diagnose debug disable
```

Procuring and importing a signed SSL certificate

A signed SSL certificate can be used when configuring SSL VPN, for administrator GUI access, and for other functions that require a certificate.

Before creating a certificate, you must have a registered domain. With a valid FortiGuard subscription, FortiDDNS can be used to register a domain; see DDNS on page 241 for more information.

Follow these instructions to purchase, import, and use a signed SSL certificate:

- Obtain, setup, and download an SSL certificate package from a certificate authority
- Generate a CSR
- Import the signed certificate into your FortiGate
- Configure your FortiGate to use the signed certificate

Obtain, setup, and download an SSL certificate package from a certificate authority

SSL certificate packages can be purchased from any Certificate Authority (CA), such as DigiCert, GoDaddy, or GlobalSign.

Let's Encrypt can be used to generate a free, trusted SSL certificate. See Automatically provision a certificate on page 2324 for more information.

A third party CA might not sign a certificate with an intranet name or IP address. For details, see Can I request a certificate for an intranet name or IP address?

The process for purchasing, setting up, and downloading a certificate will vary depending on the CA that is used, and if a CSR must be generated on the FortiGate.

To purchase a certificate package:

1. Create an account with your chosen vendor, or use the account that you used to purchase your domain.
2. Locate the SSL Certificates page.
3. Purchase a basic SSL certificate for domain validation only. If required, a more secure SSL certificate can be purchased.
4. If required, load the CSR, either by uploaded the text file or copying and pasting the contents into the requisite text box. See Generate a CSR on page 2342 for information on generating the CSR on the FortiGate.
5. If required, set the server type to *Other*.
6. Verify the certificate per the requirements of the CA.
7. Download the signed certificate to your computer.
8. Import the signed certificate into your FortiGate; see Import the signed certificate into your FortiGate on page 2342.

Generate a CSR

Some CAs can auto-generate the CSR during the signing process, or provide tools for creating CSRs. If necessary, a CSR can be created in your FortiGate device's GUI.

To generate a CSR on your FortiGate:

1. Go to *System* > *Certificates* and select *Create/Import* > *Generate CSR*.
2. Configure the CSR:
   - Ensure that the certificate has a unique name.
   - Set the *ID Type* to *Domain Name* and enter a *Domain Name*.
   - An email address is required.
   - Ensure that the *Key Size* is set to *2048 Bit*.
   - Set the *Enrollment Method* to *File Based*.
3. Click *OK*.

   The CSR will be added to the certificate list with a status of *PENDING*.
4. In the certificate list, select the new CSR then click *Download* to save the CSR to your computer.

   The CSR file can be opened in any text editor, and will resemble the following:

```
-----BEGIN CERTIFICATE REQUEST-----
MIICuTCCAaECAQAwSzEcMBoGA1UEAxMTZm9ydGlzc2x2cG5kZW1vLmNvbTErMCkG

-----END CERTIFICATE REQUEST-----
```

Import the signed certificate into your FortiGate

To import the signed certificate into your FortiGate:

1. Unzip the file downloaded from the CA.

   There should be two CRT files: a CA certificate with *bundle* in the file name, and a local certificate.
2. Import the local certificate:
   a. Go to *System* > *Certificates* and select *Create/Import* > *Certificate*.
   b. Click *Import Certificate*.
   c. Set *Type* to *Local Certificate*, upload the local certificate file, then click *Create*. See Local certificate on page 2330 for more information.

      The status of the certificate will change from *PENDING* to *OK*.

3. Import the CA certificate:
   a. Go to *System* > *Certificates* and select *Create/Import* > *CA Certificate*.
   b. Set the *Type* to *File*, upload the CA certificate file, then click *OK*. See CA certificate on page 2334 for more information.

      The CA certificate will be listed in the *CA Certificates* section of the certificates list.

Configure your FortiGate to use the signed certificate

After the signed certificates have been imported, you can use it when configuring SSL VPN, for administrator GUI access, and for other functions that require a certificate.

To configure your FortiGate to use the signed certificate for SSL VPN:

1. Go to *VPN* > *SSL-VPN Settings*.
2. Set *Server Certificate* to the new certificate.
3. Configure other settings as needed.
4. Click *Apply*.

For more information on configuring SSL VPN, see SSL VPN on page 1713 and the Setup SSL VPN video in the Fortinet Video Library.

To configure using the certificate for administrator GUI access in the CLI:

```
config system global
    set admin-server-cert fortisslvpndemo
end
```

To change the certificate that is used for administrator GUI access in the GUI:

1. Go to *System* > *Settings*.
2. In the *Administration Settings* section, change *HTTPS server certificate* as needed.
3. Click *Apply*. You will be logged out of FortiOS.

Microsoft CA deep packet inspection

In most production environments, you want to use a certificate issued be your own PKI for deep packet inspection (DPI).

An existing Microsoft root CA can be used to issue a subordinate CA (sub CA) certificate that is installed as a DPI certificate on the FortiGate.

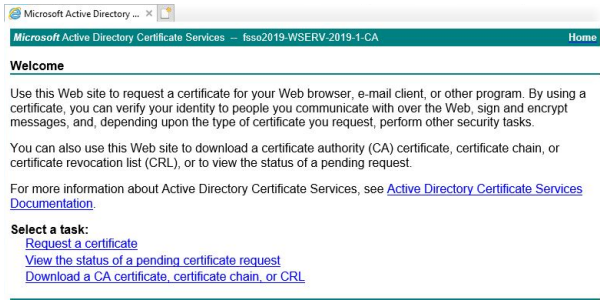
Complete the following steps to create your own sub CA certificate and use it for DPI:

1. Create a Microsoft sub CA certificate
2. Export the certificate and private key
3. Import the certificate and private key into the FortiGate
4. Configure a firewall policy for DPI
5. Verify that the sub CA certificate is being used for DPI

The FortiGate firewall uses information in the original web server certificate, then issues a new certificate signed by the Microsoft DPI certificate. The FortiGate then sends this certificate with the issuing DPI certificate to the client's web browser when the SSL session is being established.

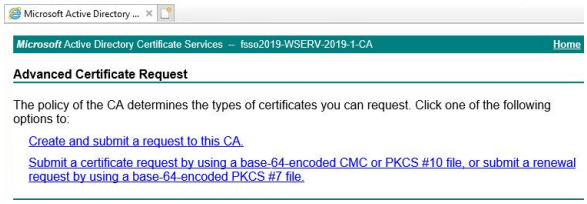
The browser verifies that the certificate was issued by a valid CA, then looks for the issuing CA of the Microsoft DPI certificate in its loca trusted root CA store to complete the path to trusted root CA.

The Microsoft CA root certificate is normally deployed to all client PCs in the Windows domain, so the client can complete the certificate path up to a trusted root CA. The FortiGate now controls and can inspect the two HTTPS sessions: one with the external web server, and one with the client PC.



Create a Microsoft sub CA certificate

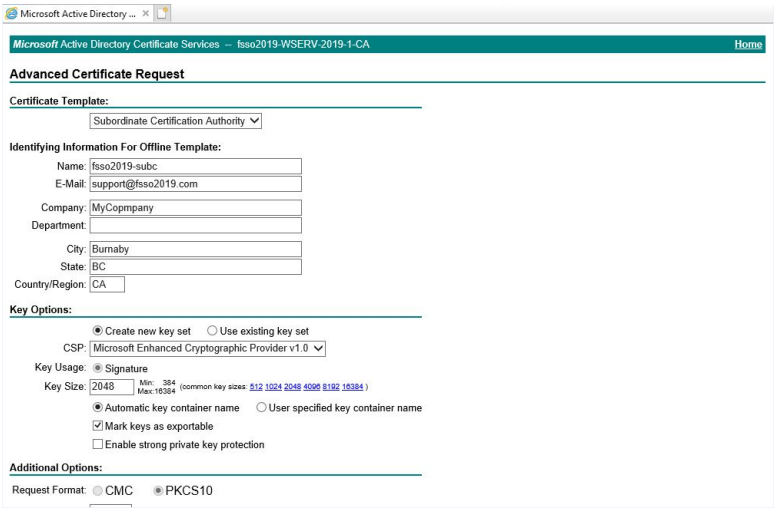
A Microsoft sub CA certificate can be created on a Microsoft CA server, or remotely using a web browser.



Creating a certificate remotely requires that the web enrollment option is configured on the Microsoft CA server. Remote certificate requests require HTTPS; requests are not allowed with HTTP.

To create a Microsoft sub CA certificate remotely:

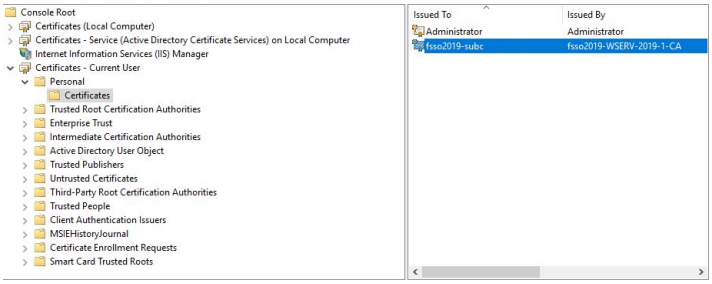
1. Open a web browser and go to one of the following URLs:
   - *https://<FQDN-CA-server>/CertSrv*
   - *https://<IP-CA-server>/CertSrv*.
2. Log in to a domain administrator account that has web enrollment rights.



3. Click *Request a certificate*.
4. Click *advanced certificate request*.

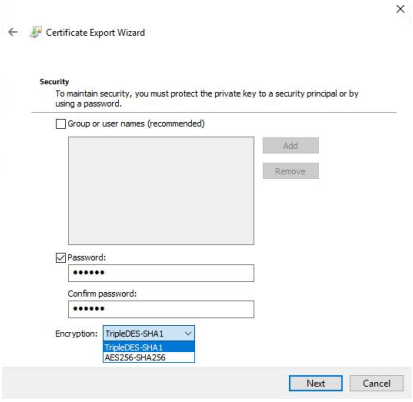
5. Click *Create and submit a request to this CA*, then click *Yes* in the *Web Access Confirmation* warning.
6. For the *Certificate Template*, select *Subordinate Certification Authority*.
7. Enable *Mark keys as exportable*.

8. Fill out the remaining information according to your security policy.



9. Submit the request.
10. Click *Yes* in the *Web Access Confirmation* warning.
11. Click *Install this certificate*.
    The certificate and private key are located in the current user's certificate store.

Export the certificate and private key



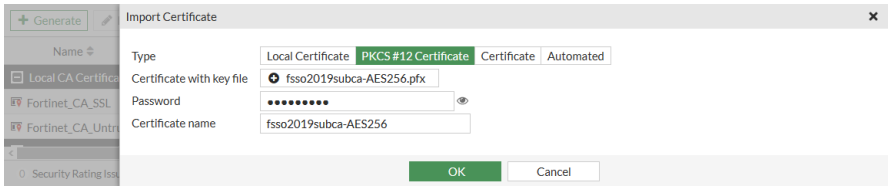
To export the certificate and private key:

1. Open the Microsoft Management Console (MMC) and add the *Certificate Snap-in*.
2. Go to the user's certificate store to locate the sub CA certificate that you just installed.

3. Right-click the certificate and select *All Tasks* > *Export*.
4. Click *Next* to start the *Microsoft Certificate Export Wizard*.
5. Follow the steps in the wizard:
   - When asked, select *Yes, export the private key*.
   - Only the PKCS #12 (.PFX) format is available, and it requires a password.
   - When selecting the encryption type, select *TripleDES-SHA1* if you are using an older version of FortiOS (5.6.9

and earlier). Otherwise, select *AES256-SHA256*.

6. Complete the wizard, and save the DPI certificate to a local folder.



Import the certificate and private key into the FortiGate

The certificate can be imported from the local computer using the GUI, or from a TFTP server using the CLI.

After importing the certificate, you can view it in the GUI to verify that it was successfully imported.

To import the certificate and private key into the FortiGate in the GUI:

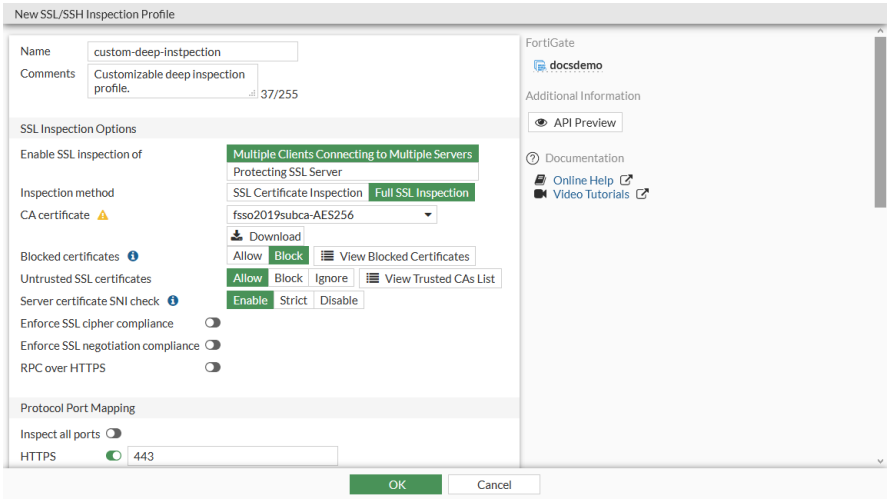
1. Go to *System* > *Certificates* and select *Create/Import* > *Certificate*.
2. Click *Import Certificate*.
3. Set *Type* to *PKCS #12 Certificate*.
4. Click *Upload*, and locate the certificate on the management computer.
5. Enter the password, then confirm the password.
6. Optionally, customize the *Certificate name*.

7. Click *OK*.

To import the certificate and private key into the FortiGate in the CLI:

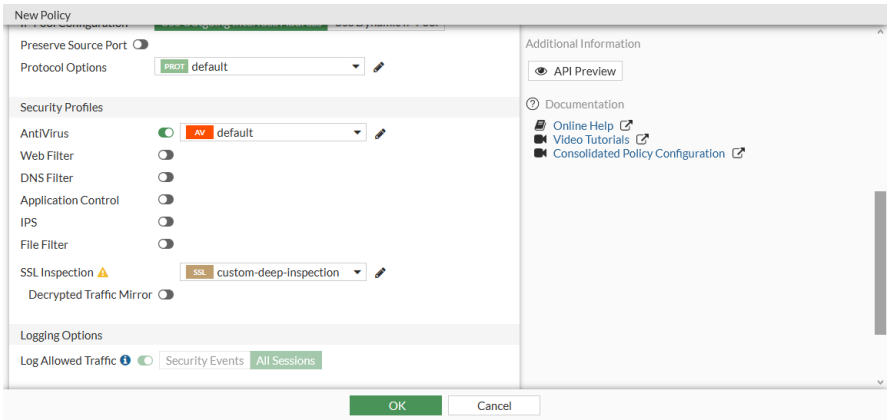
```
execute vpn certificate local import tftp fsso2019subca-AES256.pfx <tftp_IP> p12 <password>
```

To verify that the certificate was imported:



1. Go to *System* > *Certificates*.
2. Locate the newly imported certificate in the table.
3. Select the certificate and click *View Details* to view the certificate details.

Configure a firewall policy for DPI



The certificate is used in an SSL/SSH inspection profile that is then used in a firewall policy.

To configure a firewall policy for DPI:

1. Go to *Security Profiles* > *SSL/SSH Inspection* and click *Create New*.
2. Configure the inspection profile, selecting the new certificate

3. Click *Apply*.
4. Go to *Policy & Objects* > *Firewall Policy*.
5. Create a new policy, or edit an existing policy.
6. In the *SSL Inspection* field, select the new SSL inspection profile.

7. Configure the remaining settings as needed.
8. Click *OK*.

Verify that the sub CA certificate is being used for DPI

You can verify that the certificate is being used for resigning web server certificates when a user connects to an external HTTPS website.

To verify that the certificate is being used:

1. On a client PC that is behind the FortiGate, go to an external HTTPS website.
   When connecting to the website, no certificate warning should be shown.
2. In your web browser, view the certificate and certificate path.
   The methods for doing this vary depending on the browser. See your browsers documentation for information.

Administrative access using certificates

Certificates can be used for administrative authentication.

Generated key pairs can also be used for this authentication. See Public key SSH access on page 2053 for information about generating a key pair.

To log in to the FortiGate with a certificate private key:

1. On the PC, generate a certificate.
2. In FortiOS, import the PEM file for the remote certificate:

```
# execute vpn certificate remote import tftp certificate.pem 172.16.200.55
```

3. Display the imported remote certificate:

```
config certificate remote
    edit "REMOTE_Cert_1"
    next
end
```

4. Apply the remote certificate to the administrative user:

```
config system admin
    edit "admin1"
        set accprofile "prof_admin"
        set vdom "root"
        set ssh-certificate "REMOTE_Cert_1"
        set password ************
    next
end
```

5. On the PC, verify that the administrator can log in to the FortiGate with the SSH certificate:

```
root@PC05:~# ssh -i certificate-private.pem admin1@172.16.200.1
FortiGate-101F $ get system status
Version: FortiGate-101F v7.0.2,build0234,211019 (GA)
```

Creating certificates with XCA

This topic explains how to generate various certificates to be used in conjunction with a FortiGate, including:

- CA certificate
  - Signing server and client certificates
  - Issuing subordinate CAs for deep inspection

- Server certificate
  - SSL/TLS web administration authentication
  - VPN authentication
  - Internal SSL server protection
- Client certificate
  - End user authentication for SSL or IPsec VPN

XCA is an x509 certificate generation tool that handles RSA, DSA, and EC keys, as well as certificate signing requests (PKCS #10) and CRLs.

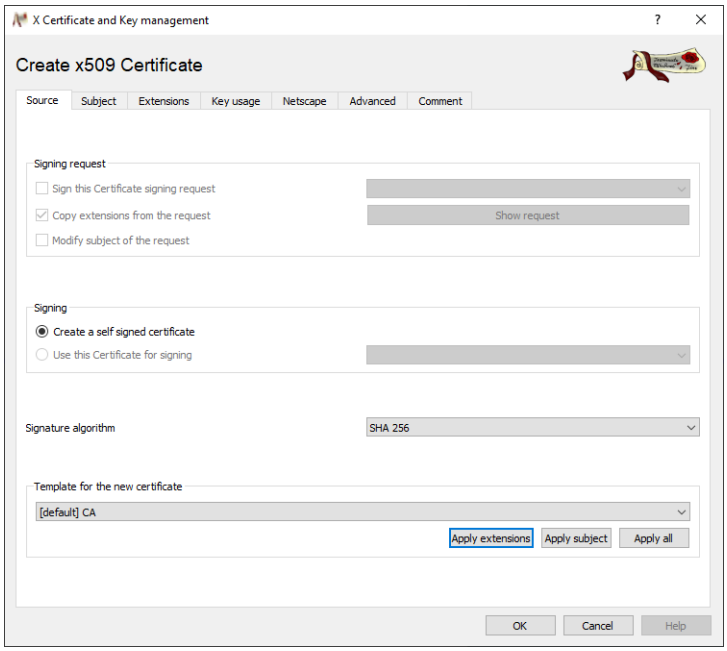
There are several options for generating and managing certificates. This topic covers basic certificate generation for XCA. It is not a comprehensive guide to its application and does not explore all options available when generating a certificate.

Creating the XCA database

Before creating any certificates, you must create an XCA database to group the certificates in. You should use a different database for each PKI you create.

To create the database:

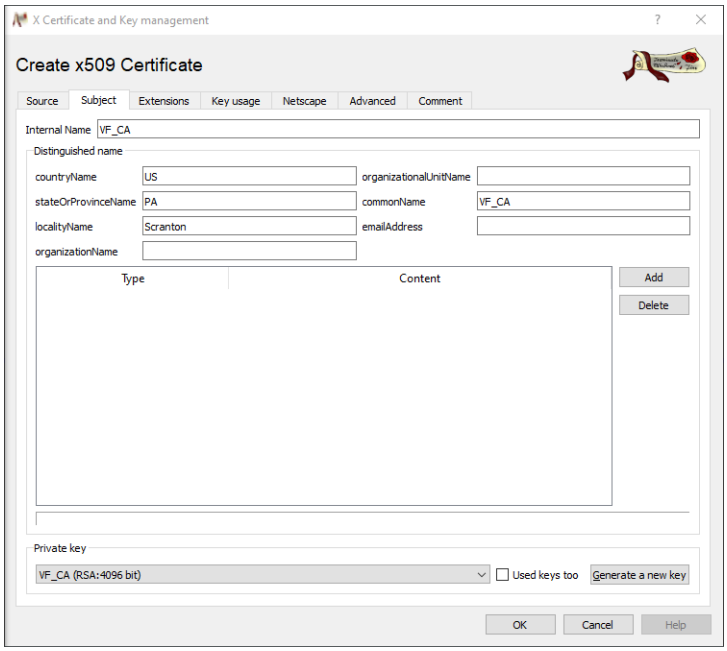
1. Go to *File* > *New Database*.
2. Select a directory to store the created certificates and keys.
3. Enter a name. The provided password encrypts the private keys and is used to access the XCA database in the future.



The remaining procedures in this topic assume you are using this XCA database.

Creating a CA certificate

A CA certificate marks the root of a certificate chain. If this CA certificate is trusted by an end entity, any certificates signed by the CA certificate are also trusted.



To create a CA certificate:

1. Click the *Certificates* tab, then click *New Certificate*.
2. Edit the *Source* tab:
   a. Set *Template for the new certificate* to *[default] CA*.
   b. Click *Apply extensions*.

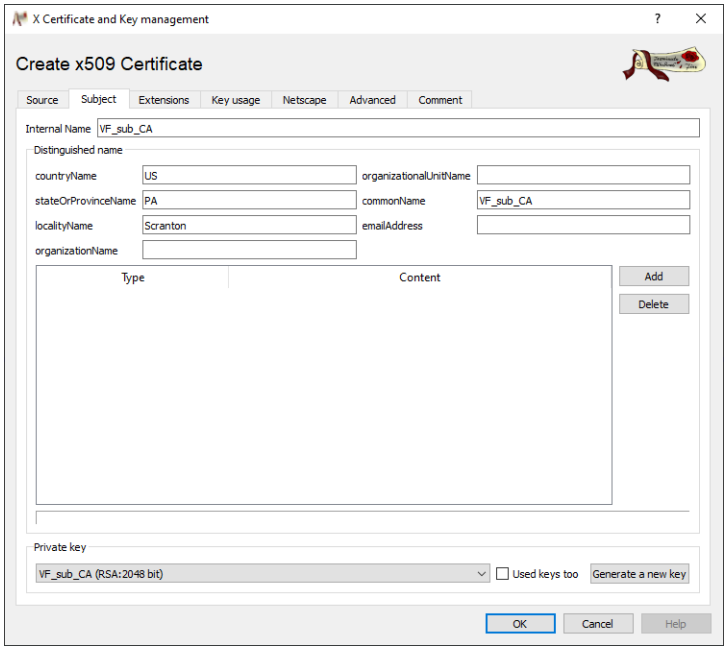
3. Edit the *Subject* tab:
   a. Enter an *Internal Name* to reference this certificate within XCA.
   b. Enter a *commonName*.
   c. Optionally, click *Add* to add other distinguished name fields.
   d. Since this XCA database does not contain any keys yet, click *Generate a new key*. The *Private key* field is now

populated.

4. Optionally, edit the *Extensions* tab:
   a. Adjust the *Time range* if needed.
   b. Click *Apply*.
5. Click *OK*.

Issuing a subordinate CA certificate for deep inspection

Subordinate CA certificates are similar to CA certificates because they are used to sign other certificates to establish trust of the signed certificate's content. This trust of the signed certificate is only valid if the subordinate CA is also trusted by the client.



When performing deep inspection on a FortiGate, the FortiGate proxies the connection between the endpoint and the server. This is done transparently so that the end user believes they are communicating with the server, and the server with the client. To do this, when the webpage is requested by a client, the FortiGate must present a certificate that matches the requested website and is trusted by the client.

The certificate presented by the FortiGate is generated on-demand to match the requested website and is signed by this subordinate CA to establish trust with the requesting endpoint. The subordinate CA must be installed on the ForitGate (with the private key) and on the client device (without the private key).

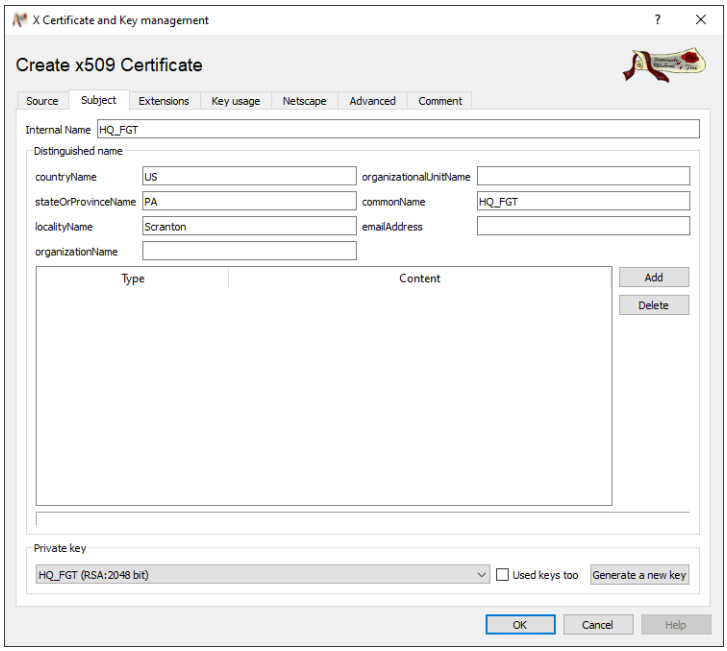
A subordinate CA is used in place of a CA so that it may be revoked as necessary. This is critical since the subordinate CA's private key is exported and becomes susceptible of being compromised. If the CA private key becomes compromised, you would be forced to re-create your entire PKI with a new root CA because root CAs cannot be revoked. See Microsoft CA deep packet inspection on page 2343 for more information about using subordinate CA certificates.

To issue a subordinate CA certificate for deep inspection:

1. Click the *Certificates* tab, then click *New Certificate*.
2. Edit the *Source* tab:
   a. Set *Use this Certificate for signing* to the CA created previously.
   b. Set *Template for the new certificate* to *[default] CA*.
   c. Click *Apply extensions*.
3. Edit the *Subject* tab:
   a. Enter an *Internal Name* to reference this certificate within XCA.
   b. Enter a *commonName*.
   c. Optionally, click *Add* to add other distinguished name fields.
   d. Click *Generate a new key* to create a new private key for the subordinate CA.

4. Optionally, edit the *Extensions* tab:
   a. Adjust the *Time range* if needed.
   b. Click *Apply*.
5. Click *OK*.

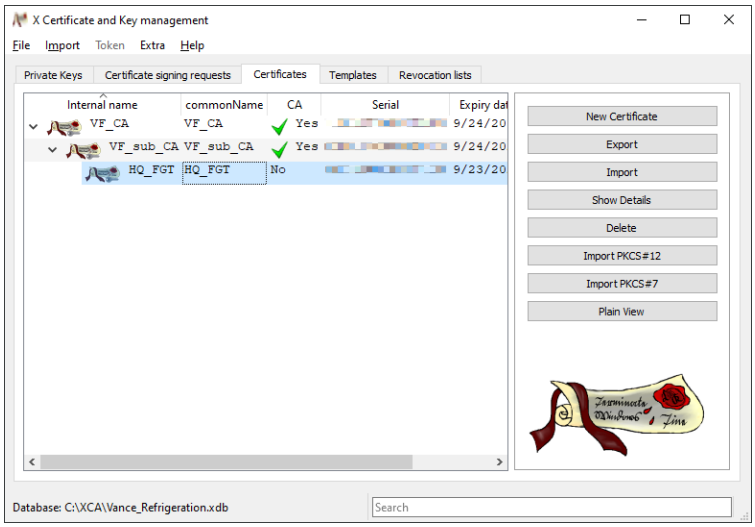
Creating a server host certificate



When a CA signs a host certificate, that CA is vouching for the credentials in the certificate. These credentials are what identifies the host.

Some endpoints can generate a certificate signing request (CSR). A CSR is a certificate outline that specifies the details of the endpoint, including its public key. This allows the CA to review the details and sign the request if they are true. This request is then returned or uploaded to the generating endpoint to be used.

Since some endpoints cannot generate their own CSR, you can create the certificate manually in XCA. If you already have a CSR, use the *Certificate signing requests* tab to import and then sign it.



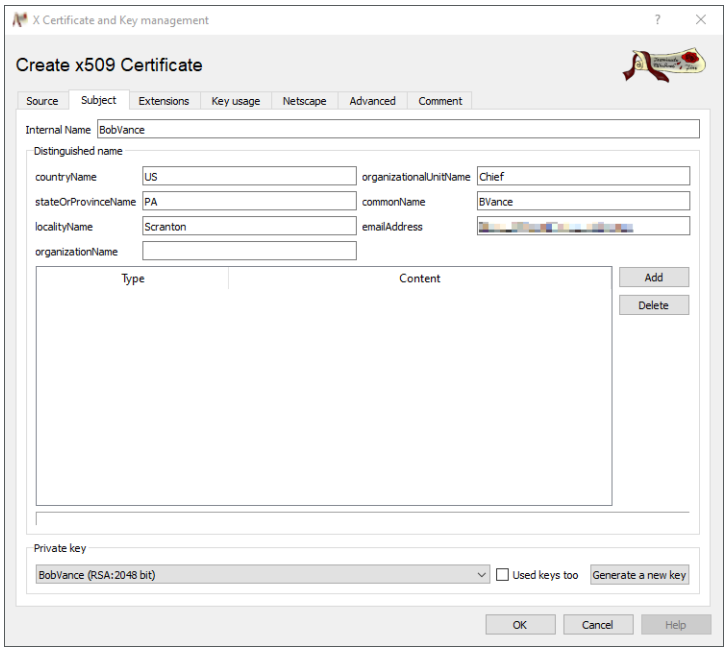
To create a server host certificate:

1. Click the *Certificates* tab, then click *New Certificate*.
2. Edit the *Source* tab:
   a. Set *Template for the new certificate* to *[default] TLS_server*.
   b. Click *Apply extensions*.
   c. In the *Signing* section, select *Use this Certificate for signing* and select the subordinate CA certificate.
3. Edit the *Subject* tab:
   a. Enter an *Internal Name* to reference this certificate within XCA.
   b. Enter the distinguished name fields as needed.
   c. Click *Generate a new key*.

4. Edit the *Extensions* tab:
   a. For *X509v3 Subject Alternative Name*, enter *email:user@domain.tld*.
5. Click *OK*.

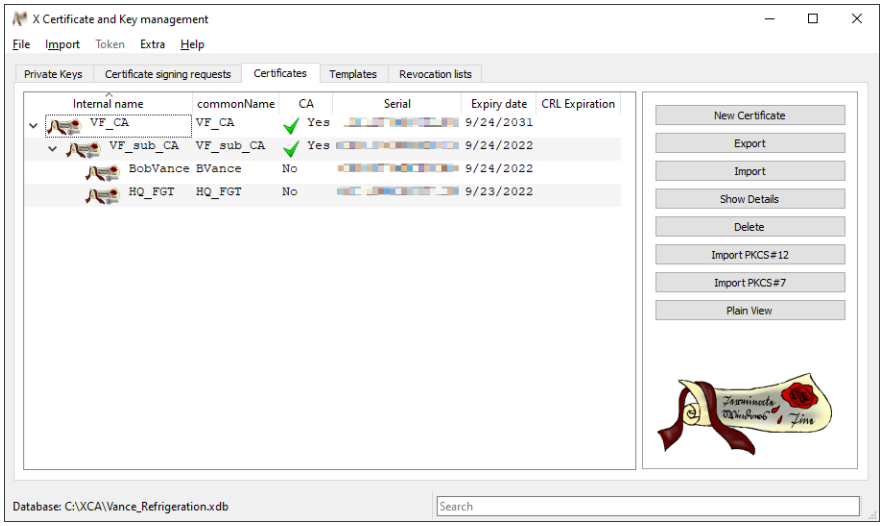
6. Click the *Certificates* tab to view the certificate.

This certificate may be used to identify an SSL or TLS server by uploading the certificate and key pair to the server, such as when the FortiGate presents the administrative webpage or for SSL VPN authentication (see Configure your FortiGate to use the signed certificate on page 2343). Another use case for a server host certificate is to enable SSL server protection so the FortiGate simulates the real server and brokers the connection (see Protecting an SSL server on page 1397).



Creating a client host certificate

A client host certificate is used to identify an end entity in a more secure way than a username and password. Once the client host certificate is generated, see SSL VPN with certificate authentication on page 1760 for more information about using the certificate.



To create a client host certificate:

1. Click the *Certificates* tab, then click *New Certificate*.
2. Edit the *Source* tab:
   a. In the *Signing* section, select *Use this Certificate for signing* and select the CA or subordinate CA.
   b. Set *Template for the new certificate* to *[default] TLS_client*.
   c. Click *Apply extensions*.
3. Edit the *Subject* tab:
   a. Enter an *Internal Name* to reference this certificate within XCA.
   b. Enter the distinguished name fields as needed.

c. Click *Generate a new key*.

4. Click *OK*.
5. Click the *Certificates* tab. The FortiGate and client certificates are listed under the signing CA certificate and are ready to be exported.

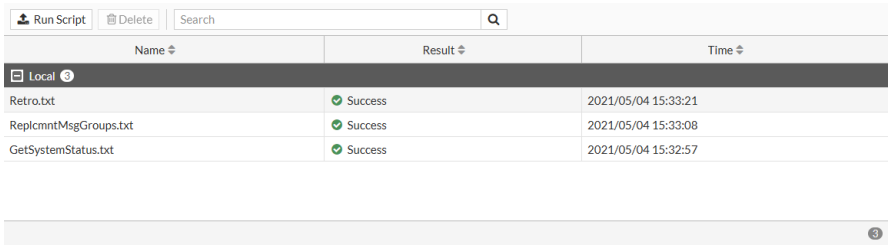
6. Select a certificate and click *Export*.
7. Enter the file name and select an export format.
8. Click *OK*.

Certificate formats

Certificate file formats indicate what is contained in the file, how it is formatted, and how it is encoded. See Import a certificate on page 2329 for more information about which formats the FortiGate expects for a given certificate type.

Configuration scripts

Configuration scripts are text files that contain CLI command sequences. They can be created using a text editor or copied from a CLI console, either manually or using the *Record CLI Script* function.



Scripts can be used to run the same task on multiple devices. For example, if your devices use the same security policies, you can enter or record the commands to create those policies in a script, and then run the script on each device. You could also create the policies in the GUI, and then copy and paste the CLI commands from the *CLI Console* using the *show* command.

If the FortiGate is managed by FortiManager, scripts can be uploaded to FortiManager and then run on any other FortiGates that are managed by that FortiManager. See Scripts in the FortiManager Administration Guide.

A comment line in a script starts with the number sign (#). Comments are not executed.

To run a script using the GUI:

1. Click on your username and select *Configuration* > *Scripts*.
2. Click *Run Script*.
3. Select the text file containing the script on your management computer, then click *OK*.
   The script runs immediately, and the *Script Execution History* table is updated, showing if the script ran successfully.

Workspace mode

Workspace mode allows administrators to make a batch of changes that are not implemented until the transaction is committed. Prior to committing, the changes can be reverted or edited as needed without impacting current operations.

When an object is edited in workspace mode it is locked, preventing other administrators from editing that object. A warning message will be shown to let the administrator know that the object is currently being configured in another transaction.

All administrators can use workspace mode; their permissions in workspace mode are the same as defined in their account profile.

A workspace mode transaction times out after five minutes if there is no activity. When a transaction times out, all changes are discarded. A warning message will be shown to let the administrator know that a timeout is imminent, or has already happened:

```
config transaction id=1 will expire in 30 seconds
config transaction id=1 will expire in 20 seconds
config transaction id=1 will expire in 10 seconds
config transaction id=1 has expired
```

The following commands are not changeable in a workspace transaction:

```
config system console
config system resource-limits
config system elbc
config system global
   set split-port
   set vdom-admin
   set management-vdom
   set wireless-mode
   set internal-switch-mode
end
config system settings
   set opmode
end
config system npu
config system np6
config system wireless
   set mode
end
config system vdom-property
config system storage
```

The `execute batch` command cannot be used in or to start workspace mode.

To use workspace mode:

1. Start workspace mode:
   ```
   execute config-transaction
   ```
   Once in workspace mode, the administrator can make configuration changes, all of which are made in a local CLI process that is not viewable by other processes.
2. Commit configuration changes:
   ```
   execute config-transaction commit
   ```
   After performing the commit, the changes are available for all other processes, and are also made in the kernel.
3. Abort configuration changes:
   ```
   execute config-transaction abort
   ```
   If changes are aborted, no changes are made to the current configuration or the kernel.

Diagnose commands

```
diagnose sys config-transaction show txn-meta
```

Show config transaction meta information. For example:

```
# diagnose sys config-transaction show txn-meta
txn_next_id=8, txn_nr=2
```

```
diagnose sys config-transaction show txn-info
```

Show config transaction information. For example:

```
# diagnose sys config-transaction show txn-info
current_jiffies=680372
```

```
txn_id=6, expire_jiffies=706104, clicmd_fpath='/dev/cmdb/txn/6_EiLl9G.conf'
txn_id=7, expire_jiffies=707427, clicmd_fpath='/dev/cmdb/txn/7_UXK6wY.conf'
```

```
diagnose sys config-transaction show txn-entity
```

Show config transaction entity. For example:

```
# diagnose sys config-transaction show txn-entity
vd='global', cli-node-oid=37(system.vdom), txn_id=7. location: fileid=0, storeid=0,
     pgnr=0, pgidx=0
vd='global', cli-node-oid=46(system.interface), txn_id=7. location: fileid=3,
     storeid=0, pgnr=0, pgidx=0
```

```
diagnose sys config-transaction show txn-lock
```

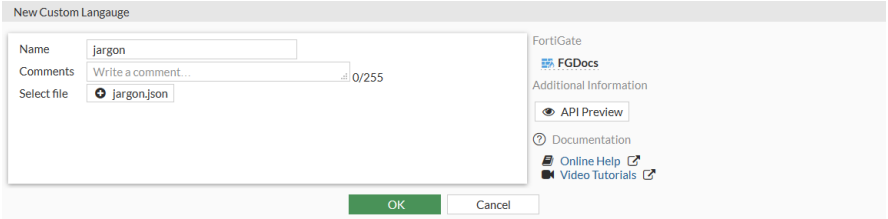
Show transaction lock status. For example:

```
# diagnose sys config-transaction show txn-lock
type=-1, refcnt=0, value=256, pid=128
```

```
diagnose sys config-transaction status
```

Show the transaction status in the current CLI.

Custom languages

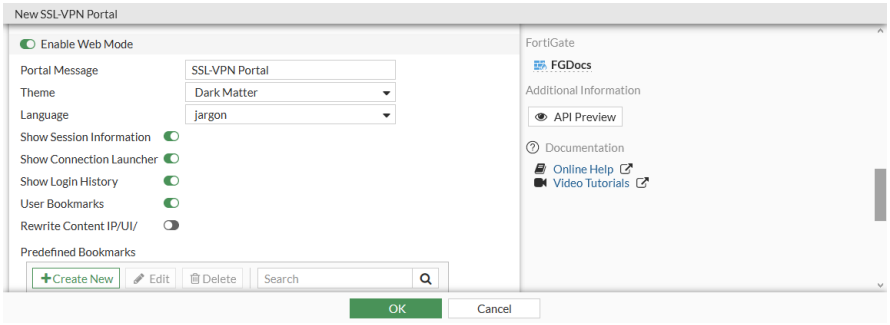


Custom languages can be uploaded and used for SSL VPN web portals. Custom languages must be enabled before they can be added in the GUI.

To enable custom languages:

```
config system global
    set gui-custom-language enable
end
```

To configure a custom language in the GUI:



1. Go to *System* > *Custom Languages* and click *Create New*.
2. Enter the name of the language.
3. Optionally, enter a comment.
4. Click *Upload* and upload the language JSON file from your management computer.

5. Click *OK*.

To configure a language in an SSL VPN web portal in the GUI:

1. Go to *VPN* > *SSL-VPN Portals*.
2. Edit an existing portal, or click *Create New* to create a new one.
3. Enable *Enable Web Mode*, then select the language from the *Language* field.

4. Click *OK*.

To configure a custom language in the CLI:

```
config system custom-language
    edit <language>
        set filename <file>
    next
end
```

To configure a language in an SSL VPN web portal in the GUI:

```
config vpn ssl web portal
    edit <portal>
        set web-mode enable
        set custom-lang <language>
    next
end
```

RAID

Most FortiGate devices with multiple disk drives (SSD or HHD) can be configured to use RAID.

Enabling or disabling RAID, and changing the RAID level, erases all data on the log disk and reboots the device.

To verify that the FortiGate has multiple disks:

- List disk devices and partitions:

```
# execute disk list

Disk SSD1 ref: 255 223.6GiB type: SSD [ATA INTEL SSDSC2KB24] dev: /dev/sda
```

```
  partition ref: 1 220.1GiB, 219.0GiB free mounted: Y label: LOGUSEDXA707476A dev:
/dev/sda1 start: 2048

Disk SSD2 ref: 16 223.6GiB type: SSD [ATA INTEL SSDSC2KB24] dev: /dev/sdb
  partition ref: 17 62.7GiB, 62.4GiB free mounted: Y label: WANOPTXX1FEBBFA1 dev:
/dev/sdb1 start: 2048
  partition ref: 18 63.7GiB, 63.7GiB free mounted: N label: dev: /dev/sdb2 start:
133625856
  partition ref: 19 85.0GiB, 85.0GiB free mounted: N label: dev: /dev/sdb3 start:
267249664
```

- Display information about all of the disks:

```
# diagnose hardware deviceinfo disk

Disk SSD1 ref: 255 223.6GiB type: SSD [ATA INTEL SSDSC2KB24] dev: /dev/sda
  partition ref: 1 220.1GiB, 219.0GiB free mounted: Y label: LOGUSEDXA707476A dev:
/dev/sda1 start: 2048

Disk SSD2 ref: 16 223.6GiB type: SSD [ATA INTEL SSDSC2KB24] dev: /dev/sdb
  partition ref: 17 62.7GiB, 62.4GiB free mounted: Y label: WANOPTXX1FEBBFA1 dev:
/dev/sdb1 start: 2048
  partition ref: 18 63.7GiB, 63.7GiB free mounted: N label: dev: /dev/sdb2 start:
133625856
  partition ref: 19 85.0GiB, 85.0GiB free mounted: N label: dev: /dev/sdb3 start:
267249664

Disk SYSTEM(boot) 14.9GiB type: SSD [ATA 16GB SATA Flash] dev: /dev/sdc
  partition 247.0MiB, 155.0MiB free mounted: N label: dev: /dev/sdc1(boot) start: 1
  partition 247.0MiB, 154.0MiB free mounted: Y label: dev: /dev/sdc2(boot) start: 524289
  partition ref: 35 14.2GiB, 14.0GiB free mounted: Y label: dev: /dev/sdc3 start:
1048577

Disk USB-6(user-usb) ref: 48 28.6GiB type: USB [SanDisk Ultra] dev: /dev/sdd
<<<<<<===this info for usb disk because i have usb disk on FGT301E
  partition ref: 49 28.6GiB, 28.6GiB free mounted: Y label: dev: /dev/sdd1 start: 0

Total available disks: 4
Max SSD disks: 2 Available storage disks: 2
```

To check the RAID status:

- RAID enabled:

```
# execute disk raid status
RAID Level: Raid-1
RAID Status: OK (Background-Synchronizing) (9%)
RAID Size: 239GB

Disk 1: OK Used 228GB
Disk 2: OK Used 228GB
```

- RAID disabled:

```
# execute disk raid status
RAID Level: Unavailable
RAID Status: Unavailable
RAID Size: 0GB
```

```
Disk 1: OK Not-Used 228GB
Disk 2: OK Not-Used 228GB
```

To enable RAID:

```
# execute disk raid enable
This will erase all data on the log disk, and system will reboot!
Do you want to continue? (y/n)y

Dependent storage SSD2 removed.
Dependent storage SSD1 removed.
Raid-0 created with 2 disks.

Performing raid on the requested disk(s) and rebooting, please wait.. .

Configuring raid...
- unmounting /data2 : ok
- unmounting /var/log : ok
- unmounting /usb : ok
- unmounting /var/storage/SSD2-WANOPTXX0EA0EF17 : ok

Formatting the disk...
- unmounting /usb : ok
Formatting /dev/md0 ... done

The system is going down NOW !!

Please stand by while rebooting the system.
Restarting system.
```

To rebuild the RAID:

```
# execute disk raid rebuild
```

To rebuild the RAID to another level:

1. Check the supported RAID levels:

   ```
   # execute disk raid rebuild-level
   <RAID level> supported: Raid-0, Raid-1
   ```

2. Rebuild the RAID to the required level:

   ```
   # execute disk raid rebuild-level Raid-1
   This will erase all data on the log disk, and system will reboot!
   Do you want to continue? (y/n)y

   Dependent storage RAID removed.
   Raid-1 created with 2 disks.

   Performing raid on the requested disk(s) and rebooting, please wait...

   Configuring raid...
   - unmounting /data2 : ok
   - unmounting /var/log : ok
   ```

```
- unmounting /usb : ok

Formatting the disk...
- unmounting /usb : ok
Formatting /dev/md0 ... done

The system is going down NOW !!

Please stand by while rebooting the system.
Restarting system.
```

To disable RAID:

```
# execute disk raid disable
This will erase all data on the log disk, and system will reboot!
Do you want to continue? (y/n)y

Dependent storage RAID removed.

Performing format on the requested disk(s) and rebooting, please wait...

Configuring raid...
- unmounting /data2 : ok
- unmounting /var/log : ok
- unmounting /usb : ok

Formatting the disk...

FortiGate encryption algorithm cipher suites

FortiGates use SSL/TLS encryption for HTTPS and SSH administrative access, and SSL VPN remote access. When establishing an SSL/TLS or SSH connection, you can control the encryption level and the ciphers that are used in order to control the security level.

HTTPS access

HTTP administrative access encryption is controlled using the following commands:

```
config system global
    set strong-crypto {enable | disable}
    set admin-https-ssl-versions {tlsv1-1 tlsv1-2 tlsv1-3}
    set admin-https-ssl-ciphersuites {<cipher_1> ... <cipher_n>}
    set admin-https-ssl-banned-ciphers {<cipher_1> ... <cipher_n>}
end
```

When strong encryption is enabled, only TLS 1.2 and TLS 1.3 are allowed. If strong encryption is then disabled, TLS 1.1 has to be manually enabled.

Setting `admin-https-ssl-ciphersuites` controls which cipher suites are offered in TLS 1.3. TLS 1.2 and lower are not affected by this command. To disable all TLS 1.3 cipher suites, remove TLS1-3 from `admin-https-ssl-versions`.

Setting `admin-https-ssl-banned-ciphers` controls which cipher technologies will not be offered for TLS 1.2 and lower.

Specific cipher suites are supported by each TLS version:

TLS version	Supported cipher suites	
TLS 1.1[1]	ECDHE-RSA-AES256-SHA[1]	AES256-SHA[1]
	ECDHE-RSA-AES128-SHA[1]	AES128-SHA[1]
TLS 1.2	ECDHE-RSA-AES256-GCM-SHA384	AES256-GCM-SHA384[1]
	ECDHE-RSA-AES128-GCM-SHA256	AES128-GCM-SHA256[1]
	ECDHE-RSA-CHACHA20-POLY1305	AES256-SHA256
	ECDHE-RSA-AES256-SHA384	AES128-SHA256
	ECDHE-RSA-AES128-SHA256	AES256-SHA[1]
	ECDHE-RSA-AES256-SHA[1]	AES128-SHA[1]
	ECDHE-RSA-AES128-SHA[1]	
TLS 1.3	TLS-AES-128-GCM-SHA256	TLS-AES-128-CCM-8-SHA256
	TLS-AES-256-GCM-SHA384	TLS-CHACHA20-POLY1305-SHA256
	TLS-AES-128-CCM-SHA256	

[1] Disabled if strong encryption (`strong-crypto`) is enabled.

SSH access

SSH access encryption is controlled using the following command:

```
config system global
    set admin-ssh-v1 {enable | disable}
```

```
    set strong-crypto {enable | disable}
    set ssh-enc-algo <algo_1> [<algo_2> ... <algo_n>]
    set ssh-kex-algo <algo_1> [<algo_2> ... <algo_n>]
    set ssh-mac-algo <algo_1> [<algo_2> ... <algo_n>]
end
```

The algorithms available when configuring `set ssh-enc-algo` are affected by `set strong-crypto` as follows:

Strong encryption setting	Supported ciphers	
Enabled	chacha20-poly1305@openssh.com	aes256-ctr
	aes256-gcm@openssh.com	
Disabled	chacha20-poly1305@openssh.com	aes128-ctr
	aes192-ctr	aes256-ctr
	arcfour256	arcfour128
	aes128-cbc	3des-cbc
	blowfish-cbc	cast128-cbc
	aes192-cbc	aes256-cbc
	arcfour	rijndael-cbc@lysator.liu.se
	aes128-gcm@openssh.com	aes256-gcm@openssh.com

The following options are available for the `ssh-kex-algo` algorithm based on the strong encryption setting:

Strong encryption setting	Supported ciphers	
Enabled	diffie-hellman-group-exchange-sha256	curve25519-sha256@libssh.org
	ecdh-sha2-nistp256	ecdh-sha2-nistp384
	ecdh-sha2-nistp521	
Disabled	diffie-hellman-group14-sha1	diffie-hellman-group-exchange-sha1
	diffie-hellman-group-exchange-sha256	curve25519-sha256@libssh.org
	ecdh-sha2-nistp256	ecdh-sha2-nistp384
	ecdh-sha2-nistp521	

The following options are available for the `ssh-mac-algo` algorithm based on the strong encryption setting:

Strong encryption setting	Supported ciphers	
Enabled	hmac-sha2-256	hmac-sha2-256-etm@openssh.com
	hmac-sha2-512	hmac-sha2-512-etm@openssh.com
Disabled	hmac-md5	hmac-md5-etm@openssh.com
	hmac-md5-96	hmac-md5-96-etm@openssh.com
	hmac-sha1	hmac-sha1-etm@openssh.com
	hmac-sha2-256	hmac-sha2-256-etm@openssh.com
	hmac-sha2-512	hmac-sha2-512-etm@openssh.com
	hmac-ripemd160	hmac-ripemd160@openssh.com
	hmac-ripemd160-etm@openssh.com	umac-64@openssh.com
	umac-128@openssh.com	umac-64-etm@openssh.com
	umac-128-etm@openssh.com	

SSL VPN

For SSL VPN connections, the TLS versions and cipher suites are controlled using the following commands:

```
config vpn ssl setting
    set algorithm {high | medium | low}
    set ssl-max-proto-ver {tls1-0 | tls1-1 | tls1-2 | tls1-3}
    set ssl-min-proto-ver {tls1-0 | tls1-1 | tls1-2 | tls1-3}
    set ciphersuite {TLS-AES-128-GCM-SHA256 TLS-AES-256-GCM-SHA384 TLS-CHACHA20-POLY1305-
SHA256 TLS-AES-128-CCM-SHA256 TLS-AES-128-CCM-8-SHA256}
end
```

Cipher suites (`ciphersuite`) can only be selected when the SSL maximum version is TLS 1.3.

When the SSL VPN security level (`algorithm`) is set to high, only high levels are allowed. When it is set to medium, high and medium levels are allowed. When it is set to low, any level is allowed.

The strong encryption (`strong-crypto`) command has no effect on the SSL VPN encryption level or ciphers.

Specific cipher suites are supported by each TLS version:

TLS version	Supported cipher suites	
TLS 1.0	ECDHE-RSA-AES256-SHA	DHE-RSA-CAMELLIA128-SHA
	DHE-RSA-AES256-SHA	AES128-SHA
	DHE-RSA-CAMELLIA256-SHA	SEED-SHA[1]
	AES256-SHA	CAMELLIA128-SHA
	CAMELLIA256-SHA	ECDHE-RSA-DES-CBC3-SHA[1]
	ECDHE-RSA-AES128-SHA	EDH-RSA-DES-CBC3-SHA[1]
	DHE-RSA-AES128-SHA[1]	DES-CBC3-SHA[1]
	DHE-RSA-SEED-SHA	
TLS 1.1	ECDHE-RSA-AES256-SHA	DHE-RSA-CAMELLIA128-SHA
	DHE-RSA-AES256-SHA	AES128-SHA
	DHE-RSA-CAMELLIA256-SHA	SEED-SHA[1]
	AES256-SHA	CAMELLIA128-SHA
	CAMELLIA256-SHA	ECDHE-RSA-DES-CBC3-SHA[1]
	ECDHE-RSA-AES128-SHA	EDH-RSA-DES-CBC3-SHA[1]
	DHE-RSA-AES128-SHA	DES-CBC3-SHA[1]
	DHE-RSA-SEED-SHA[1]	

TLS version	Supported cipher suites	
TLS 1.2	ECDHE-RSA-AES256-GCM-SHA384	ECDHE-RSA-AES128-SHA
	ECDHE-RSA-AES256-SHA384	DHE-RSA-AES128-GCM-SHA256
	ECDHE-RSA-AES256-SHA	DHE-RSA-AES128-CCM8
	DHE-RSA-AES256-GCM-SHA384	DHE-RSA-AES128-CCM
	ECDHE-RSA-CHACHA20-POLY1305	AES128-CCM8
	DHE-RSA-CHACHA20-POLY1305	AES128-CCM
	DHE-RSA-AES256-CCM8	DHE-RSA-AES128-SHA256
	DHE-RSA-AES256-CCM	DHE-RSA-AES128-SHA
	DHE-RSA-AES256-SHA256	ECDHE-RSA-CAMELLIA128-SHA256
	DHE-RSA-AES256-SHA	DHE-RSA-CAMELLIA128-SHA256
	ECDHE-RSA-CAMELLIA256-SHA384	DHE-RSA-SEED-SHA[1]
	DHE-RSA-CAMELLIA256-SHA256	DHE-RSA-CAMELLIA128-SHA
	DHE-RSA-CAMELLIA256-SHA	AES128-GCM-SHA256
	AES256-GCM-SHA384	AES128-SHA256
	AES256-CCM8	AES128-SHA
	AES256-CCM	CAMELLIA128-SHA256
	AES256-SHA256	SEED-SHA[1]
	AES256-SHA	CAMELLIA128-SHA
	CAMELLIA256-SHA256	ARIA128-GCM-SHA256
	CAMELLIA256-SHA	DHE-RSA-ARIA128-GCM-SHA256
	ARIA256-GCM-SHA384	ECDHE-ARIA128-GCM-SHA256
	DHE-RSA-ARIA256-GCM-SHA384	ECDHE-RSA-AES256-GCM-SHA384
	ECDHE-ARIA256-GCM-SHA384	ECDHE-RSA-DES-CBC3-SHA[1]
	ECDHE-RSA-AES128-GCM-SHA256	EDH-RSA-DES-CBC3-SHA[1]
	ECDHE-RSA-AES128-SHA256	DES-CBC3-SHA[1]
TLS 1.3	TLS_AES_256_GCM_SHA384	TLS_AES_128_CCM_SHA256
	TLS_CHACHA20_POLY1305_SHA256	TLS_AES_128_CCM_8_SHA256
	TLS_AES_128_GCM_SHA256	

[1] This cipher is not available when the SSL VPN security level (`algorithm`) is set to high.

Conserve mode

Each FortiGate model has a specific amount of memory that is shared by all operations. If most or all of that memory is in use, system operations can be affected in unexpected ways. To control how FortiOS functions when the available memory is very low, FortiOS enters conserve mode. This causes functions, such as antivirus scanning, to change how they operate to reduce the functionality and conserve memory without compromising security.

Three memory thresholds can be configured:

```
config system global
    set memory-use-threshold-extreme <integer>
    set memory-use-threshold-green <integer>
    set memory-use-threshold-red <integer>
end
```

`memory-use-threshold-extreme <integer>`	The threshold at which memory usage is considered extreme and new sessions are dropped, in percent of total RAM (70 - 97, default = 95).
`memory-use-threshold-green <integer>`	The threshold at which memory usage forces the FortiGate to leave conserve mode, in percent of total RAM (70 - 97, default = 82).
`memory-use-threshold-red <integer>`	The threshold at which memory usage forces the FortiGate to enter conserve mode, in percent of total RAM (70 - 97, default = 88).

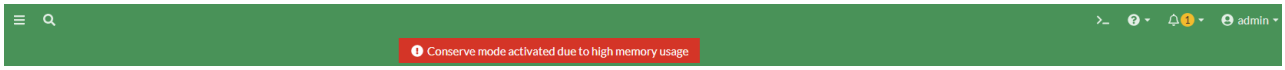
Proxy inspection in conserve mode

The FortiGate's proxy-based inspection behavior while in conserve mode is configured with the antivirus failopen command.

```
config system global
    set av-failopen {pass | off | one-shot}
end
```

`pass`	This is the default settings. Bypass the antivirus proxy and allow traffic to continue to its destination. Because traffic bypasses the proxy, security profiles that require the antivirus proxy are also bypassed. Security profiles that do not use the antivirus proxy continue to function normally. Use this setting when access is more important than security while the issue is resolved.
`off`	Force the FortiGate to stop all traffic that uses the antivirus proxy. New sessions are blocked, but active sessions continue to be processed normally unless they request more memory and are then terminated. If a security policy is configured to use antivirus scanning, then the traffic that it permits is blocked while in conserve mode. So, a policy with only IPS scanning enabled will continue normally, but a policy with both IPS and antivirus scanning is blocked because antivirus scanning requires the antivirus proxy. Use this setting when security is more important than access while the issue is resolved.
`one-shot`	Continue to bypass the antivirus proxy after the FortiGate is out of conserve mode, until the failopen setting is changed or the FortiGate is restarted.

Flow inspection in conserve mode



The FortiGate's flow-based inspection behavior while in conserve mode is configured with the IPS failopen command.

```
config ips global
    set fail-open {enable | disable}
end
```

- When disabled (default), the IPS engine drops all new sessions that require flow-based inspection.
- When enabled, the IPS engine does not perform any scans and allows new packets.

Diagnostics

When in conserve mode, FortiOS generates conserve mode log messages and SNMP traps, and a conserve mode banner is shown in the GUI.

To view current information about memory conservation status:

```
# diagnose hardware sysinfo conserve
memory conserve mode:                          on
total RAM:                                        997 MB
memory used:                                      735 MB   73% of total RAM
memory freeable:                                  173 MB   17% of total RAM
memory used + freeable threshold extreme:         947 MB   95% of total RAM
memory used threshold red:                        877 MB   88% of total RAM
memory used threshold green:                      817 MB   82% of total RAM
```

To view logs:

1. Go to *Log & Report* > *System Events* in the GUI.
2. If historical FortiView is enabled, select the *Logs* tab.
3. If the GUI is unresponsive due to high memory usage, making the logs inaccessible, they can be viewed in the CLI:

```
# execute log filter category 1
# execute log display

1: date=2022-11-02 time=16:58:37 eventtime=1667433517502192693 tz="-0700"
logid="0100022011" type="event" subtype="system" level="critical" vd="root"
logdesc="Memory conserve mode entered" service="kernel" conserve="on" total=997 MB
used=707 MB red="877 MB" green="698 MB" msg="Kernel enters memory conserve mode
```

To view the crash log in the CLI:

```
# diagnose debug crashlog read

1: 2022-10-27 14:22:36 service=kernel conserve=on total="997 MB" used="720 MB" red="877 MB"
2: 2022-10-27 14:22:36 green="817 MB" msg="Kernel enters memory conserve mode"
```

Using APIs

Administrators can use API calls to a FortiGate to:

- Retrieve, create, update, and delete configuration settings
- Retrieve system logs and statistics
- Perform basic administrative actions, such as a reboot or shut down through programming scripts.

Token-based authentication

There are two types of authentication used to make API calls on the FortiGate: session-based and token-based.

Token-based authentication requires the administrator to generate a token, which is then included in each API request for authentication. A token is automatically generated when a new API administrator is created in FortiOS.

Once the API administrator is created and the token displays, there is no way for the FortiGate to provide this token again. Ensure you record the token, and store it in a safe location; otherwise, you will have to generate a new token.

Creating the API administrator and generating the API token

When creating an API administrator, it is best practice to provide this account (and the associated token) with the minimum permissions required to complete the function. For example, if you only plan to use API calls to retrieve statistics or information from the FortiGate, the account should have read permissions.

The API administrator account used in this topic's examples has full permissions strictly to illustrate various call types and does not adhere to the preceding recommendation.

See REST API administrator on page 2048 for detailed steps to create a REST API administrator.

Making an API call to retrieve information from the FortiGate

The newly created API token is used to query the FortiGate for all firewall addresses. Many applications can be used for this query, and this example uses a web browser to demonstrate the functionality.

General API call

One of the simplest API calls is `api/v2/cmdb/firewall/address`, which returns all information about all firewall addresses.

To make a general API call:

1. Open the web browser.
2. In the address bar, enter `https://<FortiGate_address>/api/v2/cmdb/firewall/address/?access_token=<API_token>`.
3. The browser displays the output similar to the following (output shortened for brevity):

```
{
  "http_method":"GET",
  "revision":"124.0.206.9538334086041268915.1559577065",
  "results":[
    {
      "q_origin_key":"AD-Server",
      "name":"AD-Server",
      "uuid":"********-****-****-****-************",
      "subnet":"10.100.77.240 255.255.255.255",
      "type":"ipmask",
      "start-mac":"00:00:00:00:00:00",
      "end-mac":"00:00:00:00:00:00",
      "start-ip":"10.100.77.240",
      "end-ip":"255.255.255.255",
      "fqdn":"",
      "country":"",
      "wildcard-fqdn":"",
      "cache-ttl":0,
      "wildcard":"10.100.99.240 255.255.255.255",
      "sdn":"",
      "interface":"",
      "tenant":"",
      "organization":"",
      "epg-name":"",
      "subnet-name":"",
      "sdn-tag":"",
      "policy-group":"",
      "comment":"",
      "visibility":"enable",
      "associated-interface":"",
      "color":0,
      "filter":"",

```

Formatting an API call

Since a general API call for address objects returns a large amount of information, it may be beneficial to format the API call to display certain information using the `format` parameter. In this example, the `format` parameter is used to display the name and comment for each firewall address.

To use the format parameter in an API call:

1. Open the web browser.
2. In the address bar, enter `https://<FortiGate_address>/api/v2/cmdb/firewall/address/?access_token=<API_token>`**`&format=name|comment`**.
3. The browser displays the output similar to the following:

```
{
  "http_method":"GET",
  "revision":"160.0.206.9538334086041268915.1559577065",
  "results":[
    {
      "q_origin_key":"AD-Server",
      "name":"AD-Server",
      "comment":""
    },
    {
      "q_origin_key":"AWS-us-east-1a",
      "name":"AWS-us-east-1a",
      "comment":""
    },
    {
      "q_origin_key":"AWS-us-east-1b",
      "name":"AWS-us-east-1b",
      "comment":""
    },
```

Filtering an API call

The filter parameter can be used to specify a field and a keyword to limit what results match and are returned by a call. In this example, the preceding call is used with a filter to return only names and comments for address objects with the word `Sales` in the name.

To use the filter parameter in an API call:

1. Open the web browser.
2. In the address bar, enter `https://<FortiGate_address>/api/v2/cmdb/firewall/address/?access_token=<API_token>&format=name|comment`**`&filter=name=@Sales`**.
3. The browser displays the output similar to the following:

```
{
  "http_method":"GET",
  "revision":"196.0.206.9538334086041268915.1559577065",
  "results":[
    {
      "q_origin_key":"Sales Network",
```

```
        "name":"Sales Network",
        "comment":""
      },
      {
        "q_origin_key":"Sales-Portal",
        "name":"Sales-Portal",
        "comment":""
      }
    ],
    "vdom":"root",
    "path":"firewall",
    "name":"address",
    "status":"success",
    "http_status":200,
    "serial":"****************",
    "version":"v6.2.0",
    "build":866
}
```

For a complete list of API calls, see the Fortinet Development Network (FNDN). A subscription is required to access the FNDN.

Fortinet Security Fabric

The Fortinet Security Fabric provides an intelligent architecture that interconnects discrete security solutions into an integrated whole to detect, monitor, block, and remediate attacks across the entire attack surface. It delivers broad protection and visibility into every network segment and device, be they hardware, virtual, or cloud based.

- The physical topology view shows all connected devices, including access layer devices. The logical topology view shows information about the interfaces that each device is connected to.
- Security rating checks analyze the Security Fabric deployment to identify potential vulnerabilities and highlight best practices to improve the network configuration, deploy new hardware and software, and increase visibility and control of the network.
- Fabric connectors provide integration with multiple SDN, cloud, and partner technology platforms to automate the process of managing dynamic security updates without manual intervention.
- Automation pairs an event trigger with one or more actions to monitor the network and take the designated actions automatically when the Security Fabric detects a threat.

Security Fabric settings and usage

This section contains information about how to configure the following devices as part of the Fortinet Security Fabric:

- Components on page 2375
- Configuring the root FortiGate and downstream FortiGates
- Configuring FortiAnalyzer
- Configuring FortiGate Cloud on page 2387
- Configuring FortiAnalyzer Cloud service on page 2391
- Configuring FortiManager on page 2394
- Configuring FortiManager Cloud service on page 2396
- Configuring Sandboxing on page 2398
- Configuring FortiClient EMS on page 2404
- Synchronizing FortiClient ZTNA tags on page 2417
- Configuring FortiNAC on page 2420
- Configuring FortiAP and FortiSwitch on page 2422
- Configuring FortiMail on page 2423
- Configuring FortiNDR on page 2425
- Configuring FortiDeceptor on page 2429
- Configuring FortiWeb on page 2432
- Configuring FortiTester on page 2434
- Configuring FortiMonitor on page 2437
- Configuring FortiVoice on page 2439
- Using the Security Fabric
- Deploying the Security Fabric on page 2458
- Deploying the Security Fabric in a multi-VDOM environment on page 2466
- Synchronizing objects across the Security Fabric on page 2471

- Group address objects synchronized from FortiManager on page 2479
- Security Fabric over IPsec VPN on page 2480
- Leveraging LLDP to simplify Security Fabric negotiation on page 2486

System requirements

To set up the Security Fabric, the devices that you want to include must meet the Product Integration and Support requirements in the FortiOS Release Notes.

Some features of the Security Fabric are only available in certain firmware versions and models. Not all FortiGate models can run the FortiGuard Security Rating Service if they are the root FortiGate in a Security Fabric. For more information, see the Special Notices in the FortiOS Release Notes.

Prerequisites

- If devices are not already installed in your network, complete basic installation and configuration tasks by following the instructions in the device documentation.
- FortiGate devices must be operating in NAT mode.

Components

The Fortinet Security Fabric consists of different components that work together to secure you network.

The following devices are required to create a Security Fabric:

Device	Description
FortiGate	FortiGates are the core of the Security Fabric and can have one of the following roles: • **Root**: the root FortiGate is the main component in the Security Fabric. It is typically located on the edge of the network and connects the internal devices and networks to the internet through your ISP. From the root FortiGate, you can see information about the entire Security Fabric on the *Physical* and *Logical Topology* pages in the GUI. • **Downstream**: after a root FortiGate is installed, all other FortiGate devices in the Security Fabric act as Internal Segmentation Firewalls (ISFWs), located at strategic points in your internal network, rather than on the network edge. This allows extra security measures to be taken around key network components, such as servers that contain valuable intellectual property. ISFW FortiGates create network visibility by sending traffic and information about the devices that are connected to them to the root FortiGate. See Configuring the root FortiGate and downstream FortiGates on page 2378 for more information about adding FortiGate devices in the Security Fabric. FortiGate documentation: https://docs.fortinet.com/product/fortigate
FortiAnalyzer*	FortiAnalyzer gives you increased visibility into your network, centralized monitoring, and awareness of threats, events, and network activity by collecting and correlating logs from all Security Fabric devices. This gives you a deeper and more comprehensive view across the entire Security Fabric.

Device	Description
	See Configuring FortiAnalyzer on page 2385 for more information about adding FortiAnalyzer devices in the Security Fabric. FortiAnalyzer documentation: https://docs.fortinet.com/product/fortianalyzer
Cloud Logging*	There are two options for cloud logging: FortiAnalyzer Cloud and FortiGate Cloud. Either can be used to enable the Security Fabric root device; however, if using FortiGate Cloud, all downstream devices must belong to the same FortiCloud account. See Configuring FortiGate Cloud on page 2387 for more information about configuring a Security Fabric with FortiGate Cloud. FortiGate Cloud documentation: https://docs.fortinet.com/product/fortigate-cloud

* FortiAnalyzer or Cloud Logging is a required component for the Security Fabric. Either FortiAnalyzer, FortiAnalyzer Cloud, or FortiGate Cloud can be used to met this requirement.

The following devices are recommended:

Device	Description
FortiNDR	FortiNDR (formerly FortiAI) uses artificial neural networks (ANN) that can deliver sub-second malware detection and a verdict. Add FortiNDR to your Security Fabric to automatically quarantine attacks. See Configuring FortiNDR on page 2425 for more information about adding FortiNDR devices in the Security Fabric. FortiNDR documentation: https://docs.fortinet.com/product/fortindr
FortiAP	Add FortiAP devices to extend the Security Fabric to your wireless devices. Devices connected to a FortiAP appear in the Physical and Logical Topology pages in the Security Fabric menu. See Configuring FortiAP and FortiSwitch on page 2422 for more information about adding FortiAP devices in the Security Fabric. FortiAP documentation: https://docs.fortinet.com/product/fortiap
FortiClient	FortiClient adds endpoint control to devices that are located in the Security Fabric, allowing only traffic from compliant devices to flow through the FortiGate. FortiClient compliance profiles are applied by the first FortiGate that a device's traffic flows through. Device registration and on-net status information for a device that is running FortiClient appears only on the FortiGate that applies the FortiClient profile to that device. FortiClient documentation: https://docs.fortinet.com/product/forticlient
FortiDeceptor	FortiDeceptor automatically lays out a layer of decoys and lures, which helps conceal sensitive and critical assets behind a fabricated deception surface to confuse and redirect attackers while revealing their presence on your network. See Configuring FortiDeceptor on page 2429 for more information about adding FortiDeceptor devices in the Security Fabric. FortiDeceptor documentation: https://docs.fortinet.com/product/fortideceptor
FortiClient EMS	FortiClient EMS is used in the Security Fabric to provide visibility across your network, securely share information, and assign security profiles to endpoints.

Device	Description
	See Configuring FortiClient EMS on page 2404 for more information about adding FortiClient EMS devices in the Security Fabric. FortiClient EMS documentation: https://docs.fortinet.com/product/forticlient
FortiMail	FortiMail antispam processing helps offload from other devices in the Security Fabric that would typically carry out this process. See Configuring FortiMail on page 2423 for more information about adding FortiMail devices in the Security Fabric. FortiMail documentation: https://docs.fortinet.com/product/fortimail
FortiManager	Add FortiManager to simplify the network management of devices in the Security Fabric by centralizing management access in a single device. This allows you to easily control the deployment of security policies, FortiGuard content security updates, firmware revisions, and individual configurations for devices in the Security Fabric. See Configuring FortiManager on page 2394 for more information about adding FortiManager devices in the Security Fabric. FortiManager documentation: https://docs.fortinet.com/product/fortimanager
FortiSandbox	Add FortiSandbox to your Security Fabric to improve security with sandbox inspection. Sandbox integration allows FortiGate devices in the Security Fabric to automatically receive signature updates from FortiSandbox and add the originating URL of any malicious file to a blocked URL list. See Configuring Sandboxing on page 2398 for more information about adding FortiSandbox devices in the Security Fabric. FortiSandbox documentation: https://docs.fortinet.com/product/fortisandbox
FortiSwitch	A FortiSwitch can be added to the Security Fabric when it is managed by a FortiGate that is in the Security Fabric with the FortiLink protocol, and connected to an interface with *Security Fabric Connection* enabled. FortiSwitch ports to become logical extensions of the FortiGate. Devices connected to the FortiSwitch appear in the Physical and Logical Topology pages in the Security Fabric menu, and security features, such as FortiClient compliance profiles, are applied to them. See Configuring FortiAP and FortiSwitch on page 2422 for more information about adding FortiSwitch devices in the Security Fabric. FortiSwitch documentation: https://docs.fortinet.com/product/fortiswitch
FortiWeb	Add FortiWeb to defend the application attack surface from attacks that target application exploits. You can also configure FortiWeb to apply web application firewall features, virus scanning, and web filtering to HTTP traffic to help offload from other devices in the Security Fabric that would typically carry out these processes. See Configuring FortiWeb on page 2432 for more information about adding FortiWeb devices in the Security Fabric. FortiWeb documentation: https://docs.fortinet.com/product/fortiweb

The following devices are optional:

Device	Description
FortiADC	FortiADC devices optimize the availability, user experience, and scalability of enterprise application delivery. They enable fast, secure, and intelligent acceleration and distribution of even the most demanding enterprise applications. FortiADC documentation: https://docs.fortinet.com/product/fortiadc
FortiDDoS	FortiDDoS is a Network Behavior Anomaly (NBA) prevention system that detects and blocks attacks that intend to disrupt network service by overutilizing server resources. FortiDDoS documentation: https://docs.fortinet.com/product/fortiddos
FortiWLC	FortiWLC delivers seamless mobility and superior reliability with optimized client distribution and channel utilization. Both single and multi channel deployment options are supported, maximizing efficiency to make the most of available wireless spectrum. FortiWLC documentation: https://docs.fortinet.com/product/wireless-controller
Other Fortinet products	Other Fortinet products can be added to the Security Fabric, including FortiAuthenticator, FortiToken, FortiCache, and FortiSIEM. Documentation: https://docs.fortinet.com/
Third-party products	Third-party products that belong to the Fortinet Fabric-Ready Partner Program can be added to the Security Fabric.

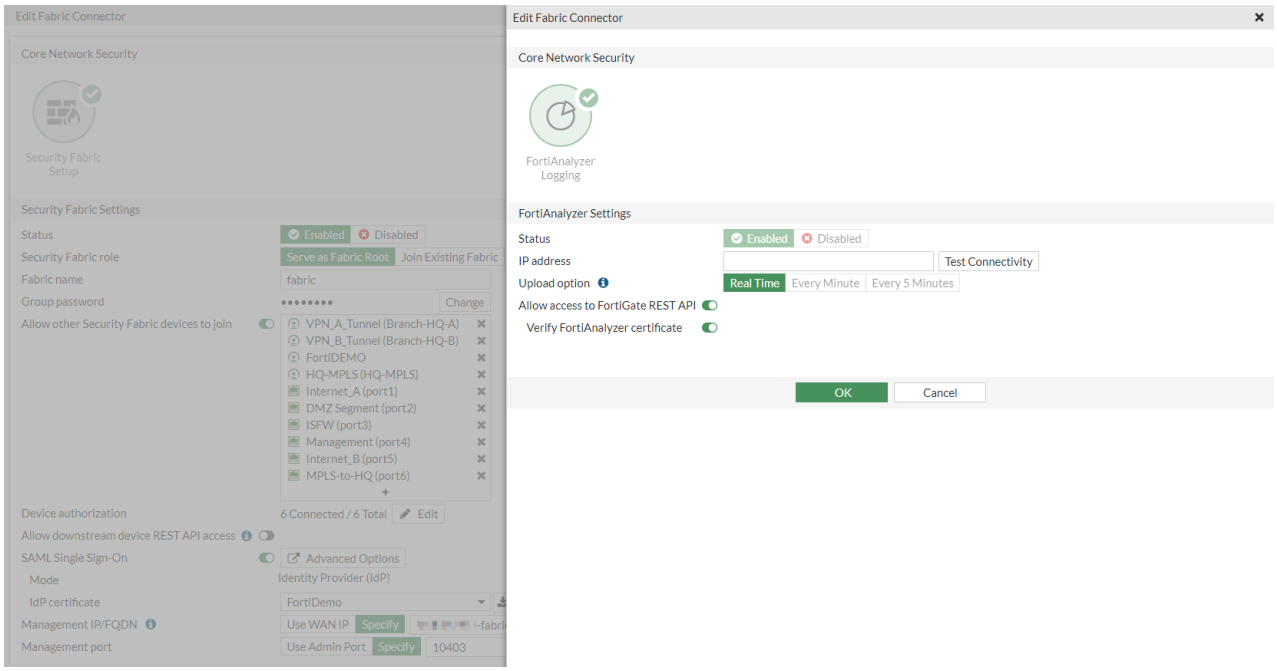
Configuring the root FortiGate and downstream FortiGates

The following procedures include configuration steps for a typical Security Fabric implementation, where the edge FortiGate is the root FortiGate with other FortiGates that are downstream from the root FortiGate.

For information about the recommended number of downstream FortiGates, see the *FortiOS Best Practices*.

Prerequisite

- The FortiGates must be operating in NAT mode.



Configuring the root FortiGate

The edge FortiGate is typically configured as the root FortiGate, as this allows you to view the full topology of the Security Fabric from the top down.

The following steps describe how to add the FortiGate to serve as the root device, and how to configure FortiAnalyzer logging.

To configure the root FortiGate:

1. On the root FortiGate, go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. For *Status*, click *Enable*.
3. Set the *Security Fabric role* to *Serve as Fabric Root*. FortiAnalyzer logging is automatically enabled and the settings can be configured in the slide-out pane.

When neither *FortiAnalyzer Logging* nor *Cloud Logging* are enabled, if the FortiGate detects that a FortiAnalyzer Cloud entitlement is available on this FortiGate, the slide-out pane will display *Cloud Logging* configurations. Otherwise, if *Cloud Logging* is enabled, the slide-out pane will display the *Cloud Logging* page. If *Cloud Logging* is disabled but FortiAnalyzer is enabled, then it will display the *FortiAnalyzer Logging* page.

In the *Cloud Logging* card, there are two options available, *FortiGate Cloud* and *FortiAnalyzer Cloud*. If there are multiple services enrolled on the FortiGate, the preference is: *Cloud Logging (FortiAnalyzer Cloud)*, *FortiAnalyzer Logging*, then *Cloud Logging (FortiGate Cloud)*.

4. Enter the FortiAnalyzer IP and select the *Upload option*.
5. In the *FortiAnalyzer Logging* section, in the *IP address* field, enter the IP address of the FortiAnalyzer.
6. If required, enable *Allow access to FortiGate REST API* and, optionally, *Verify FortiAnalyzer certificate*.
   The REST API accesses the FortiGate topology and shares data and results. The FortiGate will verify the FortiAnalyzer by retrieving its serial number and checking it against the FortiAnalyzer certificate. When verified, the FortiAnalyzer serial number is stored in the FortiGate configuration. When authorizing the FortiGate on the FortiAnalyzer, the FortiGate admin credentials do not need to be entered.
7. Click *Test Connectivity*.
   If you select *Test Connectivity* and this is the first time that you are connecting the FortiGate to the FortiAnalyzer, you will receive a warning message because the FortiGate has not yet been authorized on the FortiAnalyzer. You can configure this authorization when you configure the FortiAnalyzer. See Configuring FortiAnalyzer on page 2385.
8. Click *OK*. The FortiAnalyzer serial number is verified.
9. Enter a *Fabric name*.
10. Ensure *Allow other Security Fabric devices to join* is enabled.
11. Select the interfaces that will be listening for device join requests. Enabling an interface here has the same effect as going to *Network* > *Interfaces*, editing an interface, and enabling *Security Fabric Connection* under *Administrative Access*.

12. Click *OK*.

Using the root FortiGate with disk to store historic user and device information

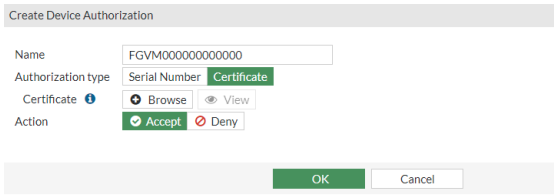
This backend implementation allows the root FortiGate in a Security Fabric to store historic user and device information in a database on its disk. This will allow administrators to visualize users and devices over a period of time.

The daemon, user_info_history, stores this data on the disk. The information source for the historical data will be the user_info daemon, which would be recorded on the disk when user_info notifies user_info_history that a user has logged out or the device is no longer connected.

Adding downstream devices

Downstream device serial numbers can be pre-authorized from the root FortiGate, or allowed to join by request. New authorization requests include the device serial number, IP address, and HA members. HA members can include up to four serial numbers and is used to ensure that, in the event of a fail over, the secondary FortiGate is still authorized.

A downstream device's certificate can also be used to authorize the device by uploading the certificate to the root FortiGate.

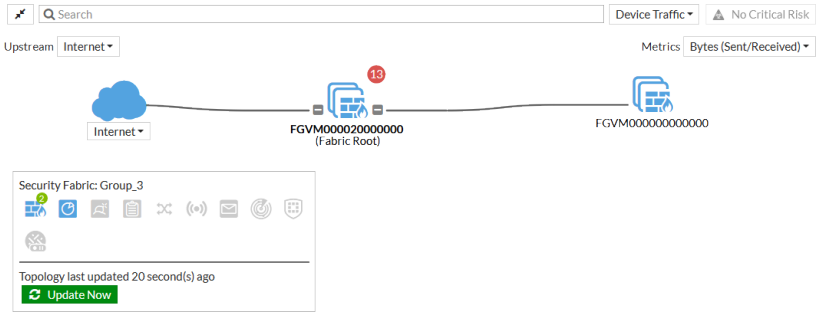


Pre-authorizing the downstream FortiGate

When a downstream Fortinet device's serial number or certificate is added to the trusted list on the root FortiGate, the device can join the Security Fabric as soon as it connects. After the new device is authorized, connected FortiAP and FortiSwitch devices are automatically included in the topology, where they can be authorized with one click.

The interface that connects to the downstream FortiGate must have *Security Fabric Connection* enabled.

To pre-authorize a FortiGate:

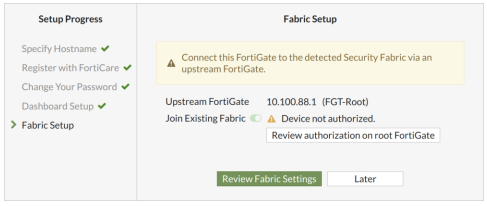


1. On the root FortiGate, go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. In the *Device authorization* field click *Edit*. The *Device Authorization* window opens.
3. Click *Create New* to add a new device for pre-authorization.
4. Enter the device name in the *Name* field.
5. Select the *Authorization type*, either *Serial Number* or *Certificate*.
6. If *Certificate* is selected, click *Browse* to upload the downstream device's certificate from the management computer.

7. Select the *Action*, either *Accept* or *Deny*.
8. Click *OK* and add more devices as required.
9. Click *OK*.

To configure a downstream FortiGate to connect to an upstream FortiGate:

1. Configure the downstream FortiGate:
   a. On the downstream FortiGate, go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. Set *Status* to *Enable*.
   c. Set *Security Fabric role* to *Join Existing Fabric*.
   d. Enter the IP address of the root FortiGate in the *Upstream FortiGate IP* field.
   e. Click *OK*.
2. On the root FortiGate, go to *Security Fabric* > *Physical Topology* and verify that the downstream FortiGate that you added appears in the Security Fabric topology.

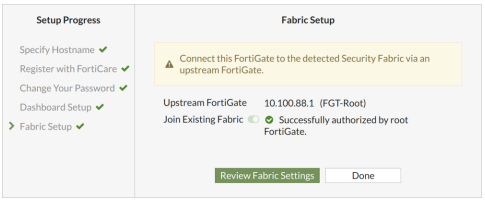


Authorizing a downstream FortiGate

When you log in to an unauthorized downstream FortiGate, the log in prompt includes the option to authorize the device on the root FortiGate.

To authorize a downstream FortiGate:

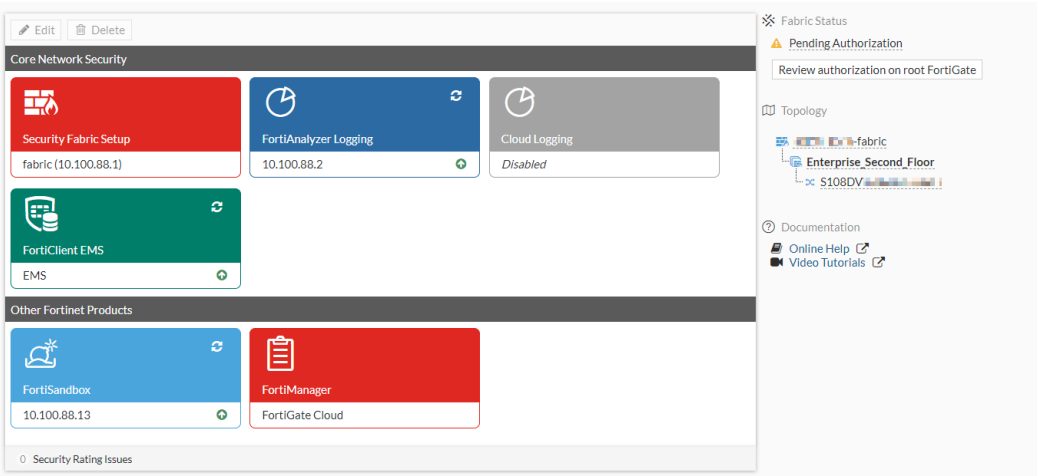
1. Log in to the unauthorized, downstream device.



2. In the *Fabric Setup* step, click *Review authorization on root FortiGate*.
   A pop-up window opens to a log in screen for the root FortiGate.

3. Enter the log in credentials for the root FortiGate, then click *Login*.
   A list of pending authorizations is shown.

4. Select *Allow* and then click *OK* to authorize the downstream FortiGate. You can also select *Deny* to reject the authorization, or *Later* to postpone the decision to the next time that you log in.
   When authorization is allowed, the pop-up window closes, and the log in prompt shows that the downstream FortiGate has been authorized.



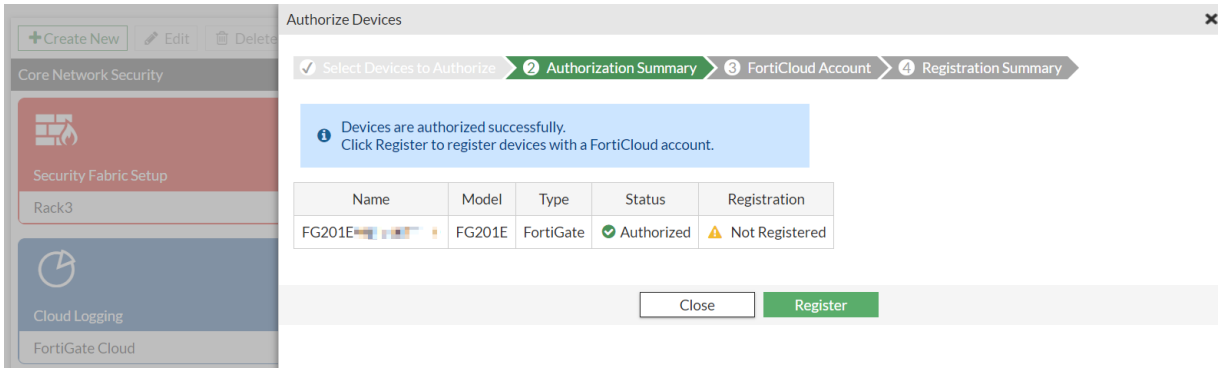
5. Click *Done* to log in to the downstream FortiGate.

Triggering authorization from the Fabric Connectors page

To authorize a downstream device from the Fabric Connectors page:

1. Go to *Security Fabric* > *Fabric Connectors*.
2. In the gutter on the right side of the screen, click *Review authorization on root FortiGate*.

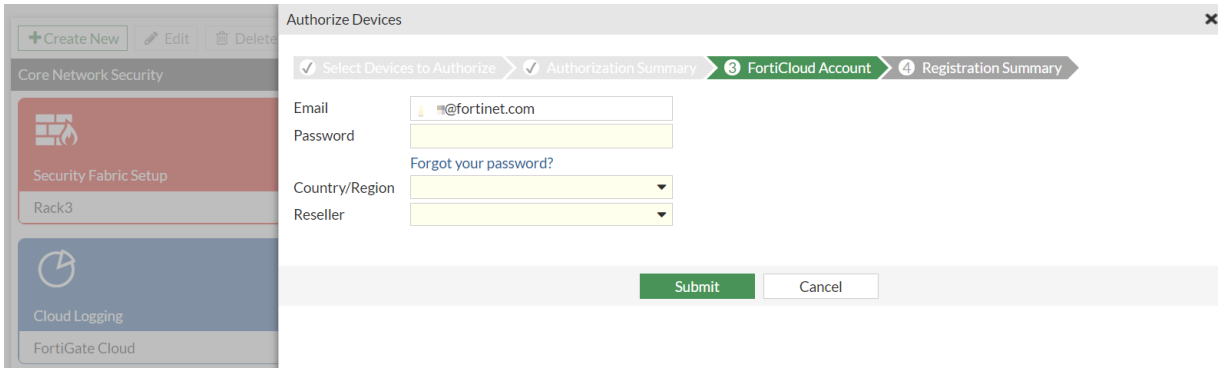
The root FortiGate pop-up window shows the state of the device authorization.



Authorizing the downstream FortiGate from the root

In this example, a downstream FortiGate is unauthorized and it is not registered to a FortiCloud account.

To authorize the downstream FortiGate from the root:



1. Log in to the root FortiGate and go to *Security Fabric* > *Fabric Connectors*. Devices requiring authorization are highlighted in the *Topology* tree (right-side gutter).

2. Click on a highlighted device and select *Authorize*. The *Authorize Devices* pane opens.
3. Click *Authorize*. The *Authorization Summary* pane opens.
4. The FortiGate is now authorized, so click *Register* to register the device to a FortiCloud account.

The *FortiCloud Account* pane opens.

5. Enter the required information (password, country/region, reseller). On the *Fabric Connectors* page, the same account name is implied for registration.

6. Click *Submit*. The *Registration Summary* pane opens.
7. Click *Close*.

You can use IPAM to automatically assign subnets to downstream FortiGates to prevent duplicate IP addresses from overlapping within the same Security Fabric. See Configure IPAM locally on the FortiGate on page 154.

CLI commands

Use the following commands to view, accept, and deny authorization requests, to view upstream and downstream devices, and to list or test Fabric devices:

Command	Description
`diagnose sys csf authorization pending-list`	View pending authorization requests on the root FortiGate.

Command	Description
`diagnose sys csf authorization accept <serial number>`	Authorize a device to join the Security Fabric.
`diagnose sys csf authorization deny <serial number>`	Deny a device from joining the Security Fabric.
`diagnose sys csf downstream`	Show connected downstream devices.
`diagnose sys csf upstream`	Show connected upstream devices.
`diagnose sys csf fabric-device list`	List all known Fabric devices.

Desynchronizing settings

By default, the settings for FortiAnalyzer logging, central management, sandbox inspection, and FortiClient EMS are synchronized between all FortiGates in the Security Fabric.

To disable automatic synchronization:

```
config system csf
    set configuration-sync local
end
```

Deauthorizing a device

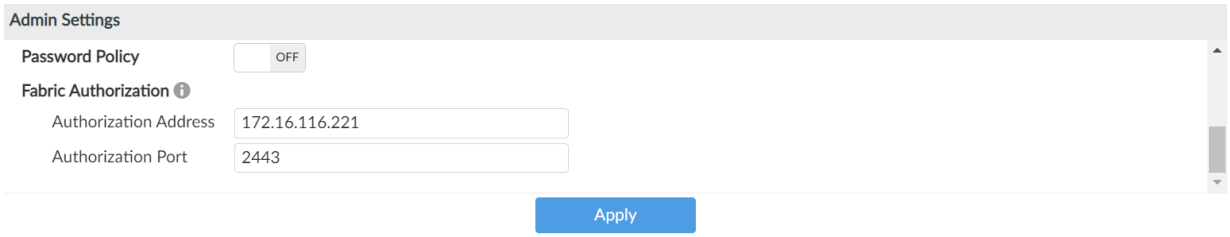
A device can be deauthorized to remove it from the Security Fabric.

To deauthorize a device:

1. On the root FortiGate, go to *Security Fabric* > *Fabric Connectors*.
2. In the topology tree, click the device and select *Deauthorize*.
   After a device is deauthorized, the serial number is saved in a trusted list that can be viewed in the CLI using the `show system csf` command. For example, this result shows a deauthorized FortiSwitch:

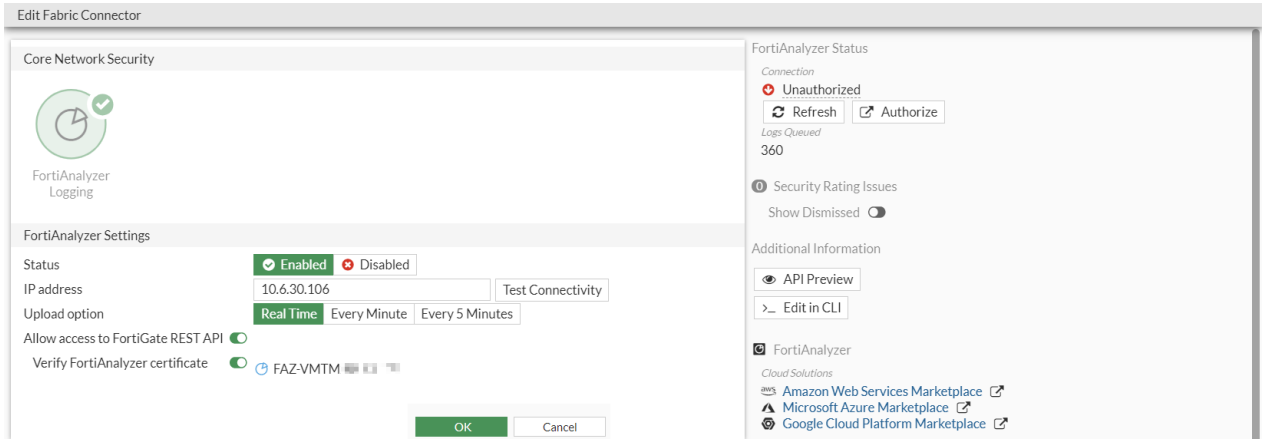
```
show system csf
    config system csf
        set status enable
        set group-name "Office-Security-Fabric"
        set group-password ************
        config trusted-list
            edit "FGT6HD391800000"
        next
            edit "S248DF3X1700000"
                set action deny
            next
        end
    end
```

Configuring FortiAnalyzer



FortiAnalyzer or Cloud Logging is a required component for the Security Fabric. Either FortiAnalyzer, FortiAnalyzer Cloud, or FortiGate Cloud can be used to met this requirement.

FortiAnalyzer allows the Security Fabric to show historical data for the Security Fabric topology and logs for the entire Security Fabric. For more information about using FortiAnalyzer, see the FortiAnalyzer Administration Guide.

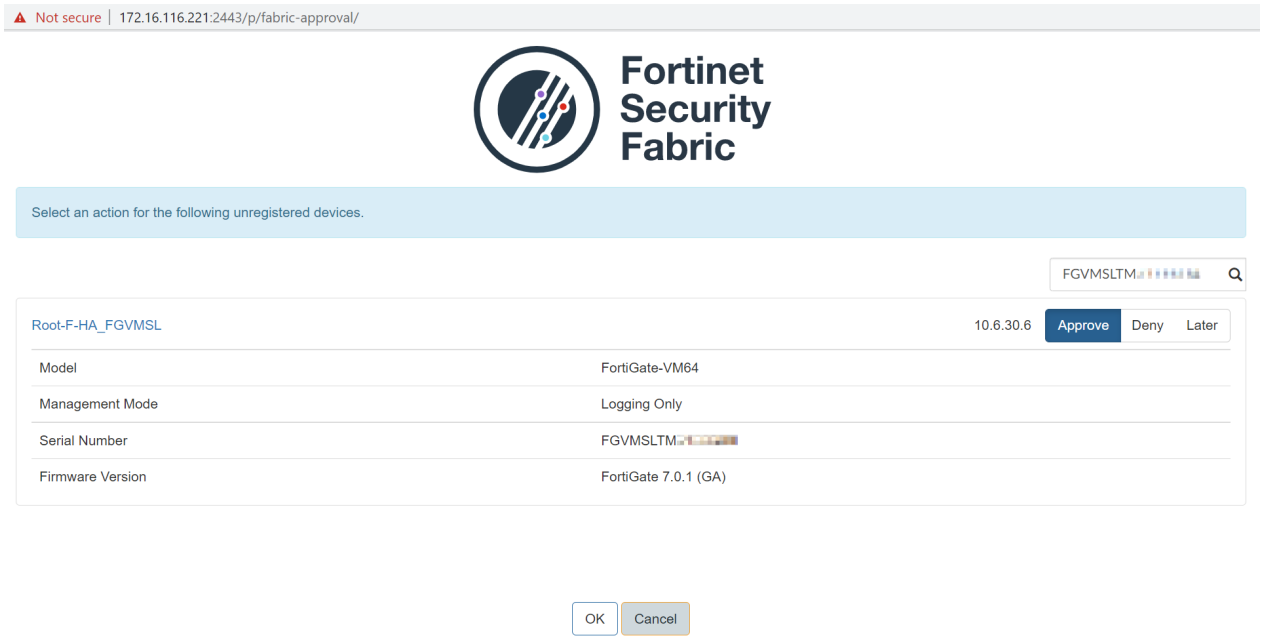


FortiAnalyzer 7.0.1 is used for this configuration example.

To authorize a FortiAnalyzer in the Security Fabric:

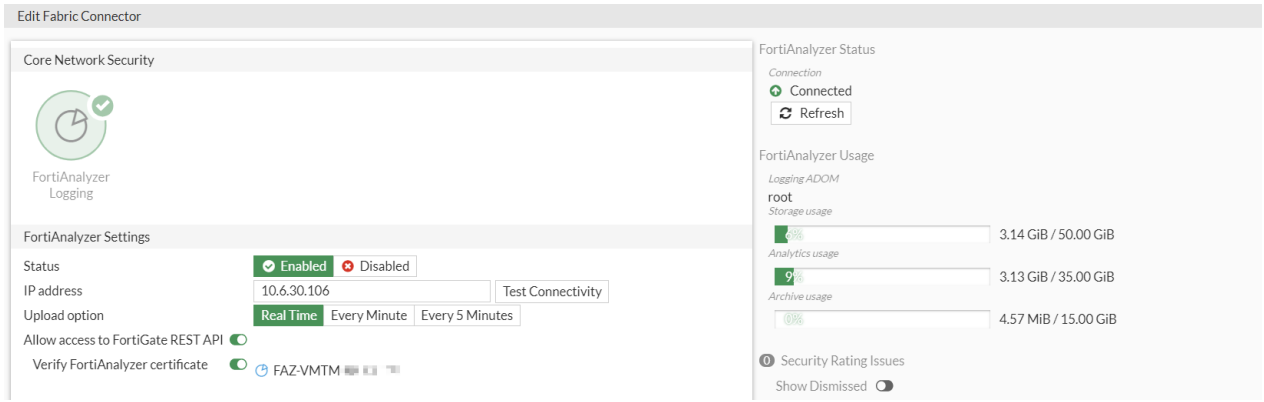
1. In FortiAnalyzer, configure the authorization address and port:
   a. Go to *System Settings* > *Admin* > *Admin Settings*.
   b. In the *Fabric Authorization* section, enter an *Authorization Address* and *Authorization Port*. This is used to access the FortiAnalyzer login screen.

   c. Click *Apply*.
2. In FortiOS, go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiAnalyzer Logging* card.
3. Enter the FortiAnalyzer IP.
4. Click *OK*. The *FortiAnalyzer Status* (in the right-side gutter) is *Unauthorized*.



5. Click *Authorize*. You are redirected to a login screen.

6. Enter the username and password, then click *Login*.



The authorization dialog opens.

7. Select *Approve* and click *OK* to authorize the FortiGate.

8. In FortiOS, refresh the *FortiAnalyzer Logging* page. The *FortiAnalyzer Status* is *Authorized*.

FortiGates with a FortiAnalyzer Cloud license can send all logs to FortiAnalyzer Cloud.

Configuring FortiGate Cloud

FortiGate Cloud is a hosted security management and log retention service for FortiGate devices. It provides centralized reporting, traffic analysis, configuration management, and log retention without the need for additional hardware or software.

FortiGate Cloud offers a wide range of features:

- **Simplified central management**
  FortiGate Cloud provides a central GUI to manage individual or aggregated FortiGate and FortiWiFi devices. Adding a device to the FortiGate Cloud management subscription is straightforward. FortiGate Cloud has detailed traffic and application visibility across the whole network.
- **Hosted log retention with large default storage allocated**
  Log retention is an integral part of any security and compliance program, but administering a separate storage system is onerous. FortiGate Cloud takes care of this automatically and stores the valuable log information in the cloud. Different types of logs can be stored, including Traffic, System Events, Web, Applications, and Security Events.
- **Monitoring and alerting in real time**
  Network availability is critical to a good end-user experience. FortiGate Cloud enables you to monitor your FortiGate network in real time with different alerting mechanisms to pinpoint potential issues. Alerting mechanisms can be delivered via email.
- **Customized or pre-configured reporting and analysis tools**
  Reporting and analysis are your eyes and ears into your network's health and security. Pre-configured reports are available, as well as custom reports that can be tailored to your specific reporting and compliance requirements. The reports can be emailed as PDFs, and can cover different time periods.
- **Maintain important configuration information uniformly**
  The correct configuration of the devices within your network is essential for maintaining optimum performance and security posture. In addition, maintaining the correct firmware (operating system) level allows you to take advantage of the latest features.
- **Service security**
  All communication (including log information) between the devices and the cloud is encrypted. Redundant data centers are always used to give the service high availability. Operational security measures have been put in place to make sure your data is secure — only you can view or retrieve it.

For more information about FortiGate Cloud, see the FortiGate Cloud documentation.

Registration and activation

Before you can activate a FortiGate Cloud account, you must first register your device.

FortiGate Cloud accounts can be registered manually through the FortiGate Cloud website, https://www.forticloud.com, or you can easily register and activate your account directly from your FortiGate.

To activate your FortiGate Cloud account:

1. On your device, go to *Dashboard* > *Status*.
2. In the *FortiGate Cloud* widget, click the *Not Activated* > *Activate* button in the *Status* field.
3. A pane will open asking you to register your FortiGate Cloud account. Click *Create Account*, enter your information, view and accept the terms and conditions, and then click *OK*.
4. A second dialogue window open , asking you to enter your information to confirm your account. This sends a confirmation email to your registered email. The dashboard widget then updates to show that confirmation is required.
5. Open your email, and follow the confirmation link it contains.
   A FortiGate Cloud page will open, stating that your account has been confirmed. The *Activation Pending* message on the dashboard will change to state the type of account you have, and will provide a link to the FortiGate Cloud portal.

Enabling logging to FortiGate Cloud

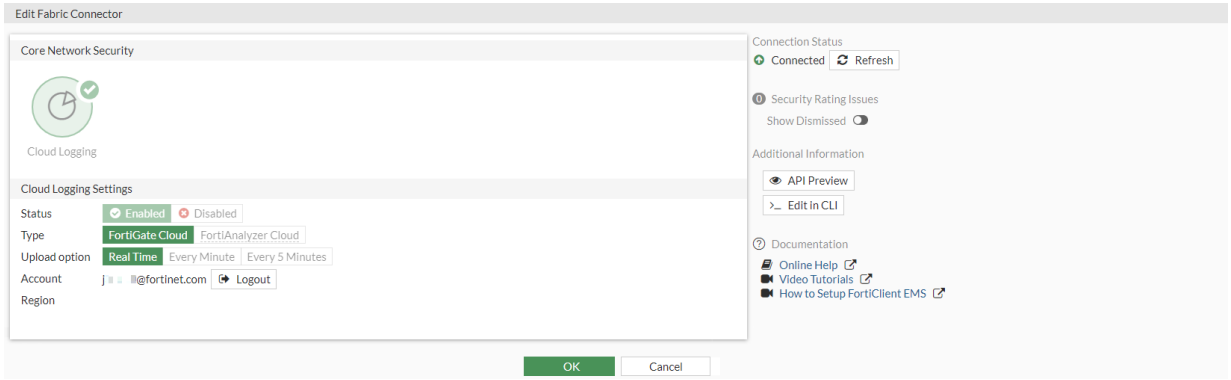
To enable logging to FortiGate Cloud:

1. Go to *Security Fabric* > *Fabric Connectors* > *Cloud Logging* or *Log & Report* > *Log Settings*.
2. Enable *Cloud Logging*.
3. Select an upload option: *Realtime*, *Every Minute*, or *Every 5 Minutes* (default).
4. Click *Apply*.

Logging into the FortiGate Cloud portal

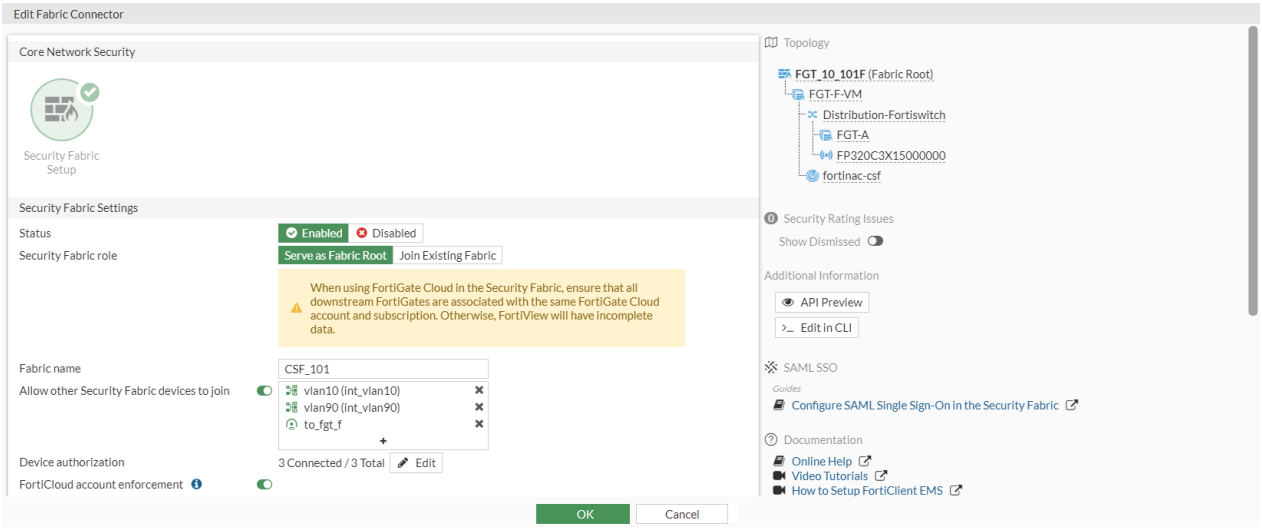
Once logging has been configured and you have registered your account, you can log into the FortiGate Cloud portal and begin viewing your logging results. There are two methods to reach the FortiGate Cloud portal:

- If you have direct network access to the FortiGate:
  a. Go to *Dashboard* > *Status*.
  b. In the *FortiGate Cloud* widget, in the *Status* field, click *Activated* > *Launch Portal*, or, in the *Licenses* widget, click *FortiCare Support* > *Launch Portal*.
- If you do not have access to the FortiGate's interface, visit the FortiGate Cloud website (https://www.forticloud.com) and log in remotely, using your email and password. It will ask you to confirm the FortiGate Cloud account you are connecting to and then you will be granted access.



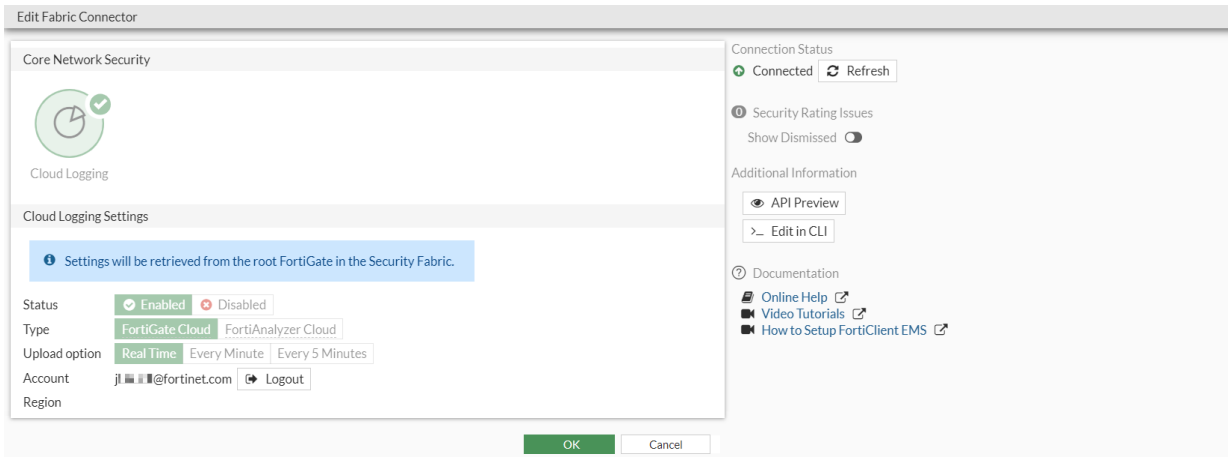
Configuring a Security Fabric with FortiGate Cloud logging

A Security Fabric can be created on the root device using FortiGate Cloud for cloud logging. When the FortiCloud account enforcement is enabled (by default), members joining the Fabric must be registered to the same FortiCloud account. Devices that are not activated with FortiCloud are also allowed.



For example, the root FortiGate (FGT_10_101F) is configured with FortiGate Cloud logging. In the Security Fabric settings, the *FortiCloud account enforcement* option is enabled by default. The downstream FortiGate, FGT-F-VM, with the same FortiCloud account ID is able to join the Fabric.

To configure a Security Fabric with FortiCloud logging in the GUI:



1. On the root FortiGate, configure FortiCloud logging:
   a. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Cloud Logging* card.
   b. Set the *Type* to *FortiGate Cloud*.
   c. Set the *Upload option* to *Real Time*.

   d. Click *OK*.
2. Configure the Security Fabric settings (see Configuring the root FortiGate and downstream FortiGates on page 2378). The *FortiCloud account enforcement* setting is enabled by default.

3. On the FGT-F-VM, check the FortiCloud logging settings:
   a. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Cloud Logging* card. The settings are automatically retrieved from the root and the *Account* is the same.

4. Configure the FGT-F-VM to join the Security Fabric:
   a. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. Set the *Security Fabric* role to *Join Existing Fabric*.
   c. Click *OK*. The FortiGate is authorized and successfully joins the Security Fabric.

To configure a Security Fabric with FortiCloud logging in the CLI:

```
config log fortiguard setting
    set status enable
    set upload-option realtime
end
```

The FortiCloud account enforcement setting is enabled by default in the Security Fabric settings:

```
show system csf
    config system csf
        set status enable
        set group-name "CSF_101"
        set forticloud-account-enforcement enable
    end
```

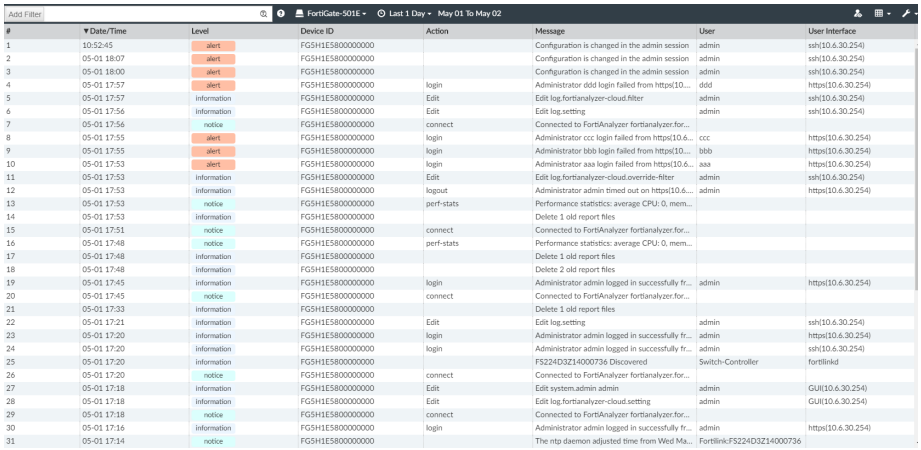
Cloud sandboxing

FortiGate Cloud can be used for automated sample tracking, or sandboxing, for files from a FortiGate. This allows suspicious files to be sent to be inspected without risking network security. If the file exhibits risky behavior, or is found to contain a virus, a new virus signature is created and added to the FortiGuard antivirus signature database.

See Configuring Sandboxing on page 2398 for instructions to configure FortiGate Cloud Sandbox. Sandboxing results are shown on the *Sandbox* tab in the FortiGate Cloud portal.

Configuring FortiAnalyzer Cloud service

FortiAnalyzer Cloud differs from FortiAnalyzer in the following ways:

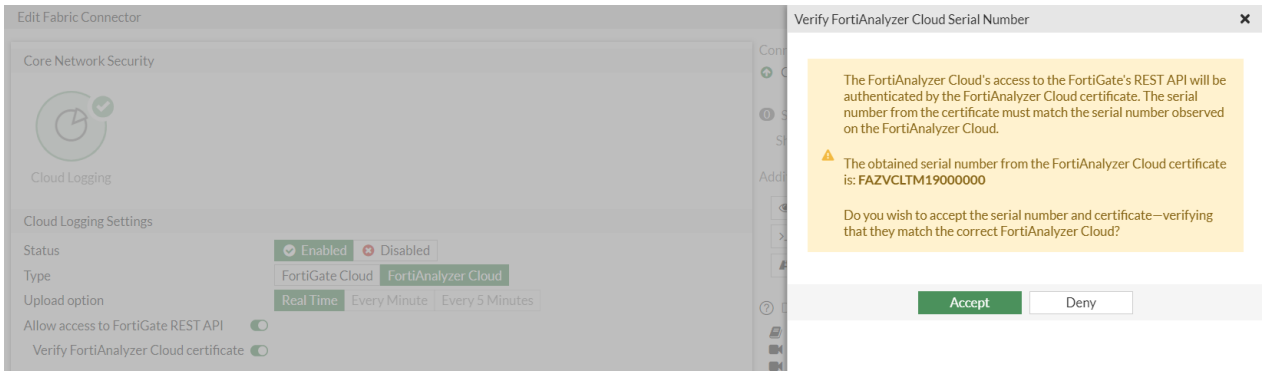


- You cannot enable FortiAnalyzer Cloud in `vdom override-setting` when global FortiAnalyzer Cloud is disabled.
- You must use the CLI to retrieve and display logs sent to FortiAnalyzer Cloud. The FortiOS GUI is not supported.
- You cannot enable FortiAnalyzer Cloud and FortiGate Cloud at the same time.

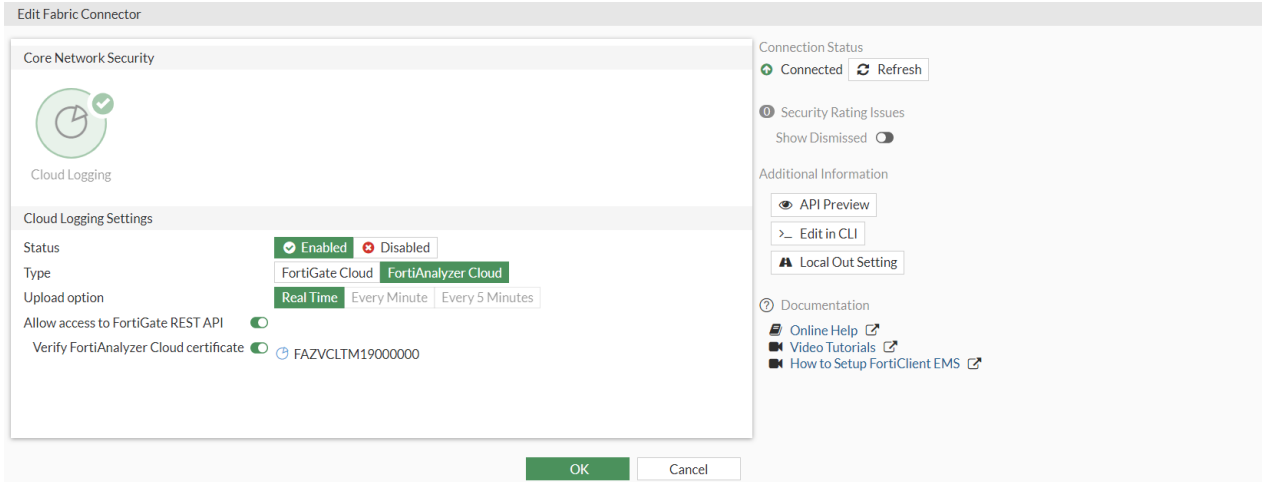
For more information, see Licensing in the FortiAnalyzer Cloud Deployment Guide.

In the *Security Fabric* > *Fabric Connectors* > *Cloud Logging* card settings, *FortiAnalyzer Cloud* is grayed out when you do not have a FortiAnalyzer Cloud entitlement. When you have a FortiAnalyzer Cloud entitlement, *FortiAnalyzer Cloud* is available and you can authenticate by the certificate.

You can also view the FortiAnalyzer Cloud settings in the *Log & Report* > *Log Settings* page.



In FortiAnalyzer Cloud, you can view logs from FortiOS in the *Event* > *All Types* page.



To configure FortiAnalyzer Cloud logging in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Cloud Logging* card.
2. Set the *Type* to *FortiAnalyzer Cloud*.

3. Click *OK*. A prompt appears to verify the FortiAnalyzer Cloud serial number.

4. Click *Accept*.
5. The verified FortiAnalyzer Cloud certificate appears in the settings.

To enable FortiAnalyzer Cloud logging in the CLI:

1. Configure the FortiAnalyzer Cloud settings:

```
config log fortianalyzer-cloud setting
    set status enable
    set ips-archive disable
    set certificate-verification enable
    set serial "FAZVCLTM19000000"
    set access-config enable
    set enc-algorithm high
    set ssl-min-proto-version default
    set conn-timeout 10
    set monitor-keepalive-period 5
    set monitor-failure-retry-period 5
    set upload-option realtime
end
```

2. Configure the FortiAnalyzer Cloud filters:

```
config log fortianalyzer-cloud filter
    set severity information
    set forward-traffic disable
```

```
    set local-traffic disable
    set multicast-traffic disable
    set sniffer-traffic disable
    set anomaly disable
    set voip disable
    set dlp-archive disable
end
```

To disable FortiAnalyzer Cloud logging for a specific VDOM in the CLI:

1. Enable override FortiAnalyzer in the general log settings:

```
config log setting
    set faz-override enable
end
```

2. Disable the override FortiAnalyzer Cloud setting:

```
config log fortianalyzer-cloud override-setting
    set status disable
end
```

To set FortiAnalyzer Cloud logging to filter for a specific VDOM in the CLI:

1. Enable override FortiAnalyzer in the general log settings:

```
config log setting
    set faz-override enable
end
```

2. Enable the override FortiAnalyzer Cloud setting:

```
config log fortianalyzer-cloud override-setting
    set status enable
end
```

3. Configure the override filters for FortiAnalyzer Cloud:

```
config log fortianalyzer-cloud override-filter
    set severity information
    set forward-traffic disable
    set local-traffic disable
    set multicast-traffic disable
    set sniffer-traffic disable
    set anomaly disable
    set voip disable
    set dlp-archive disable
end
```

To display FortiAnalyzer Cloud logs in the CLI:

```
# execute log filter device fortianalyzer-cloud
# execute log filter category event
# execute log display
```

Sample log

```

Configuring FortiManager

When a FortiManager device is added to the Security Fabric, it automatically synchronizes with any connected downstream devices.

To add a FortiManager to the Security Fabric, configure it on the root FortiGate. The root FortiGate then pushes this configuration to downstream FortiGate devices. The FortiManager provides remote management of FortiGate devices over TCP port 541. The FortiManager must have internet access for it to join the Security Fabric.

Once configured, the FortiGate can receive antivirus and IPS updates, and allows remote management through FortiManager or the FortiGate Cloud service. The FortiGate management option must be enabled so that the FortiGate can accept management updates to its firmware and FortiGuard services.

Adding a FortiManager device to the Security Fabric requires the following steps in FortiOS:

- Specify the FortiManager IP address or domain name.
- Approve the FortiManager serial number that is returned by the provided IP address or domain name.

You can complete the steps in FortiOS by using the GUI or CLI.

After you complete the steps in FortiOS, go to FortiManager to complete the process by authorizing the FortiGate.

To add a FortiManager to the Security Fabric using the CLI:

1. Provide FortiManager connection information:

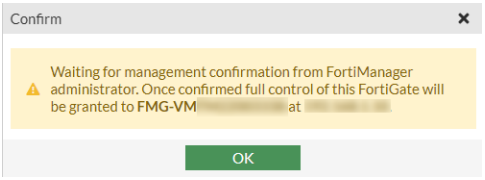
   ```
   config system central-management
       set type fortimanager
       set fmg {<IP_address> | <Domain name>}
   end
   ```

2. Approve the returned FortiManager serial number:

   When configuring the FortiManager connection from the CLI, no prompt is available to approve the returned FortiManager serial number. Therefore you must provide the following command:

   ```
   execute central-mgmt <fmg-serial-no> <PSK>
   ```

If you have not previously configured a model device in FortiManager and leveraged a pre-shared key for registration, you can enter any character for the PSK field in the `execute central-mgmt` command.



3. Go to FortiManager and authorize the FortiGate. See Authorizing the FortiGate in FortiManager on page 2395.

To add a FortiManager to the Security Fabric using the GUI:

1. On the root FortiGate, go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiManager* card.
   The FortiManager card is used to configure the FortiManager connection information.
2. For *Status*, click *Enable*.
3. For *Type*, click *On-Premise*.

4. Enter the *IP/Domain Name* of the FortiManager.
5. Click *OK*.
   The *Confirm* pane appears.

6. Review the serial number, and click *OK*.
7. Go to FortiManager and authorize the FortiGate. See Authorizing the FortiGate in FortiManager on page 2395.

Authorizing the FortiGate in FortiManager

After completing the GUI or CLI steps in FortiOS, go to FortiManager to authorize the FortiGate, which completes the process.

To authorize the FortiGate in FortiManager:

1. On FortiManager, go to *Device Manager* and find the FortiGate in the *Unauthorized Devices* list.
   The unauthorized device list is located in the root ADOM, regardless of the firmware version of the root ADOM or FortiOS.
2. Select the FortiGate device or devices, and click *Authorize* in the toolbar.
3. In the *Authorize Device* pop-up, adjust the device names as needed, select the appropriate ADOM (if applicable), and click *OK*.

For more information about using FortiManager, see the FortiManager Administration Guide.

Configuring FortiManager Cloud service

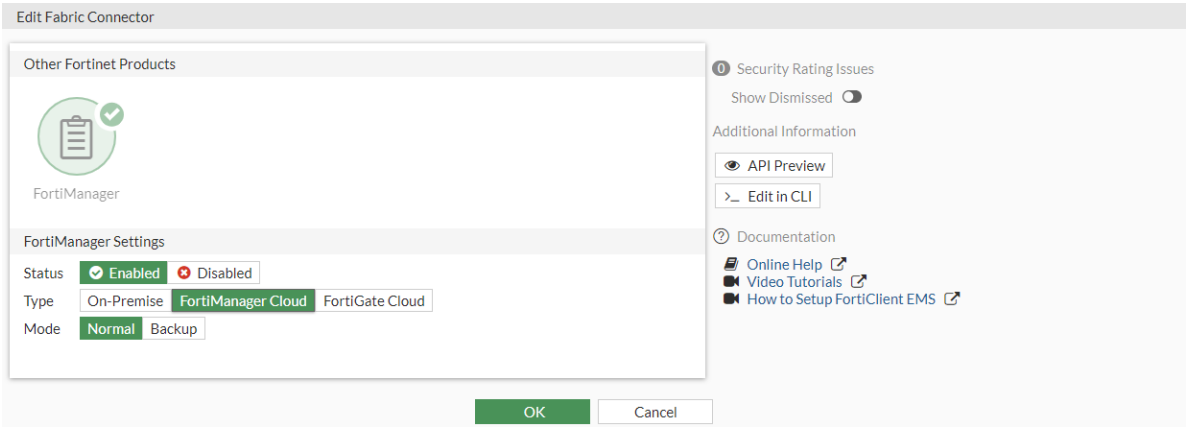
This cloud-based SaaS management service is available through FortiManager. This service is included in FortiCloud accounts with a FortiManager Cloud account level subscription (ALCI).

Configuring a per-device license

Once the FortiGate has acquired a contract named *FortiManager Cloud*, FortiCloud creates a cloud-based FortiManager instance under the user account. You can launch the portal for the cloud-based FortiManager from FortiCloud, and its URL starts with the User ID.

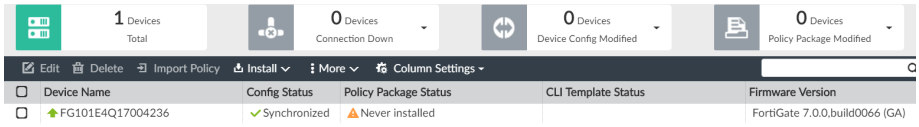
You can use a FortiGate with a contract for *FortiManager Cloud* to configure central management by using the FQDN of *fortimanager.forticloud.com*. A FortiGate-FortiManager tunnel is established between FortiGate and the FortiManager instance.

After the tunnel is established, you can execute FortiManager functions from the cloud-based FortiManager portal.



To configure FortiManager Cloud central management:

1. Enable FortiManager Cloud.
   a. Go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiManager* card.
   b. For *Status*, click *Enable*.
   c. For *Type*, click *FortiManager Cloud*.



d. Click *OK*.

The *FortiManager Cloud* button can only be selected if you have a FortiManager Cloud product entitlement.

2. In the FortiManager Cloud instance, go to *Device Manager* and authorize the FortiGate. See Authorizing devices for more information.
   When using the FortiGate to enable FortiManager Cloud, the FortiGate appears as an unauthorized device. After authorizing the FortiGate, it becomes a managed device.

   In FortiOS, the *Security Fabric* > *Fabric Connectors* page now displays green arrow in the *FortiManager* card because FortiManager Cloud is registered.

Diagnostics

To verify the contract information:

```
# diagnose test update info contract
...
System contracts:
    ...
Account contracts:
    FMGC,Thu Dec  2 16:00:00 2021
...
```

To verify the FortiManager Cloud instance has launched and the FortiGate is registered:

```
# diagnose fdsm central-mgmt-status
Connection status: Up
Registration status: Registered
```

Configuring Sandboxing

The Security Fabric supports the following FortiSandbox deployments.

Type	Description	Requirements
FortiGate Cloud Sandbox	Files are sent to Fortinet's Cloud Sandbox cluster for processing.	• The FortiGate must have a valid AV license. • The FortiCloud account provides access to a portal to view submissions. This is not required for the Security Fabric.
FortiSandbox Cloud	Files are sent to a dedicated FortiCloud hosted instance of FortiSandbox for processing.	• FortiCloud premium license • FortiSandbox Cloud entitlement • The FortiGate and FortiCloud license are registered to the same account.
FortiSandbox appliance	Files are sent to a physical appliance or VM, typically residing on premise, for processing.	• None

To apply sandboxing in a Security Fabric, connect one of the FortiSandbox deployments, then configure an antivirus profile to submit files for dynamic analysis. The submission results supplement the AV signatures on the FortiGate. FortiSandbox inspection can also be used in web filter profiles.

In a Security Fabric environment, sandbox settings are configured on the root FortiGate. Once configured, the root FortiGate pushes the settings to other FortiGates in the Security Fabric.

FortiGate Cloud Sandbox

FortiGate Cloud Sandbox allows users to take advantage of FortiSandbox features without having to purchase, operate, and maintain a physical appliance. It also allows you to control the region where your traffic is sent to for analysis. This allows you to meet your country's compliance needs regarding data storage locations.

Users are not required to have a FortiCloud account to use FortiGate Sandbox Cloud.

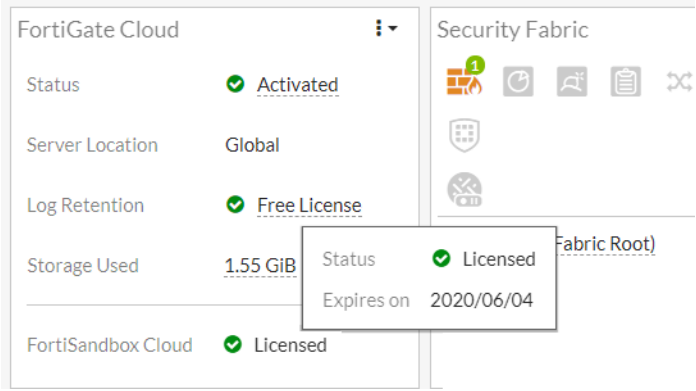
The submission to the cloud with a valid FortiGuard Antivirus (AVDB) license is rate limited per FortiGate model. Refer to the Service Description for details. For those without any AVDB license, the submission is limited to only 100 per day.

To configure FortiGate Cloud Sandbox, you must first activate the connection from the CLI. Note that FortiGate Cloud Sandbox is decoupled from FortiGate Cloud logging, so you do not need to have a FortiCloud account or have cloud logging enabled.

To activate the FortiGate Cloud Sandbox connection:

```
# execute forticloud-sandbox region
0  Europe
1  Global
2  Japan
```

```
3  US
Please select cloud sandbox region[0-3]:3
```



After a region is selected, the following configuration is added:

```
config system fortiguard
    set sandbox-region {0 | 1 | 2 | 3}
end
```

Alternatively, using the `execute forticloud-sandbox update` command also works.

To obtain or renew a FortiGuard antivirus license:

1. See the How to Purchase or Renew FortiGuard Services video for FortiGuard antivirus license purchase instructions.
2. Once a FortiGuard license is purchased and activated, users are provided with a paid FortiSandbox Cloud license.
   a. Go to *Dashboard* > *Status* to view the FortiSandbox Cloud license indicator.

   b. Alternatively, go to *System* > *FortiGuard* to view the FortiSandbox Cloud license indicator.

To enable FortiGate Cloud Sandbox in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Cloud Sandbox* card.
2. Set *Status* to *Enable*.
3. For Type, select *FortiGate Cloud*.

4. Select a *Region* from the dropdown.

5. Click *OK*.

FortiSandbox Cloud

FortiSandbox Cloud offers more features and better detection capability. Connecting to FortiSandbox Cloud will automatically use the cloud user ID of the FortiGate to connect to the dedicated FortiSandbox Cloud instance. The FortiGate automatically detects if there is a valid entitlement.

The following items are required to initialize FortiSandbox Cloud:

- A FortiCloud premium account.
- A valid FortiSandbox Cloud contract on the FortiGate. To view contract information in the CLI, enter `diagnose test update info`. The `User ID` at the end of the output shows FortiCloud which FortiSandbox Cloud account the FortiGate is connected to.
- A provisioned FortiSandbox Cloud. See Deploying FortiSandbox Cloud for information.

To configure FortiSandbox Cloud in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Cloud Sandbox* card.
2. Set *Status* to *Enable*.
3. For *Type*, select *FortiSandbox Cloud*.

If the *FortiSandbox Cloud* option is grayed out or not visible, enter the following in the CLI:

```
config system global
    set gui-fortigate-cloud-sandbox enable
end
```

4. Click *OK*.

To configure FortiSandbox Cloud in the CLI:

```
config system fortisandbox
    set status enable
    set forticloud enable
    set server <string>
end
```

If the FortiGate does not detect the proper entitlement, a warning is displayed and the CLI configuration will not save.

If the FortiSandbox Cloud is running version 4.0.0 and later, the FortiGate will automatically connect to fortisandboxcloud.com, and then discover the specific region and server to connect to based on which region the customer selected to deploy their FortiSandbox Cloud instance. The FortiGate must have a FortiCloud premium account license and a FortiSandbox Cloud VM license for this functionality.

FortiSandbox appliance

FortiSandbox appliance is the on-premise option for a full featured FortiSandbox. Connecting to a FortiSandbox appliance requires that Cloud Sandbox is disabled.

To switch from Cloud Sandbox to FortiSandbox in the Security Fabric:

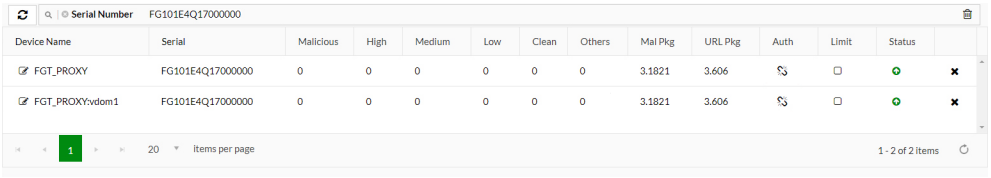
1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Cloud Sandbox* card.
2. Set *Status* to *Disabled*.
3. Click *OK*.

To enable FortiSandbox appliance in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiSandbox* card.
2. Set *Status* to *Enable*.
3. In the *Server* field, enter the FortiSandbox device's IP address.
4. Optionally, enter a *Notifier email*.
5. Click *OK*.

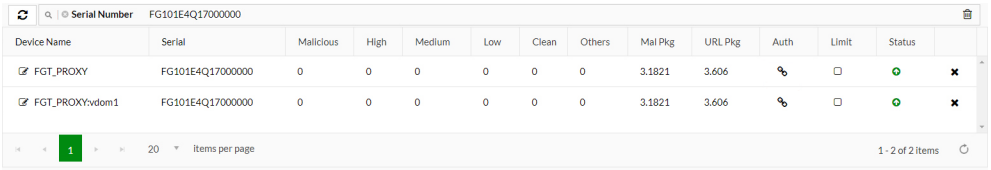
To enable FortiSandbox appliance in the CLI:

```
config system fortisandbox
    set status enable
    set forticloud disable
    set server <address>
end
```



Authorizing the FortiGate from FortiSandbox Cloud and a FortiSandbox appliance

Once the FortiGate makes a connection to the FortiSandbox Cloud or appliance, the FortiGate must be authorized.



To authorize a FortiGate from FortiSandbox:

1. In the FortiSandbox GUI, go to *Scan Input* > *Device* in 3.2 or *Security Fabric* > *Device* in 4.0.
2. Search using the FortiGate serial number to locate the FortiGate. In the *Auth* column, click the link icon to authorize the FortiGate.

3. Repeat this step to authorize the VDOMs if required.

The link icon changes from an open to a closed link, which indicates that the FortiGate is authorized.

4. In the FortiGate GUI, go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiSandbox* card.
5. Click *Test connectivity*. The FortiGate is now authorized and the status displays as *Connected*.

Antivirus profiles

An antivirus profile must be configured to send files to the sandbox. Once submitted, sandbox inspection is performed on the file to detect malicious activities. The FortiGate can use the dynamic malware detection database from the sandbox to supplement the AV signature database. See Using FortiSandbox post-transfer scanning with antivirus on page 1198 for more information.

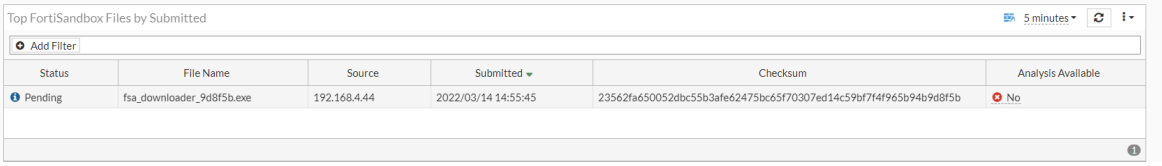
FortiSandbox inline scanning is supported on FortiSandbox appliances in proxy inspection mode. When inline scanning is enabled, the client's file is held while it is sent to FortiSandbox for inspection. Once a verdict is returned, the appropriate action is performed on the held file. If there is an error or timeout on the FortiSandbox, the FortiGate's configuration determines what to do with the held file. See Using FortiSandbox inline scanning with antivirus on page 1200 for more information.

Inline scanning requires a FortiSandbox appliance running version 4.2 later, or FortiGate Sandbox Cloud (SaaS). This feature is not supported on FortiSandbox Cloud (PaaS).

Web filter profiles

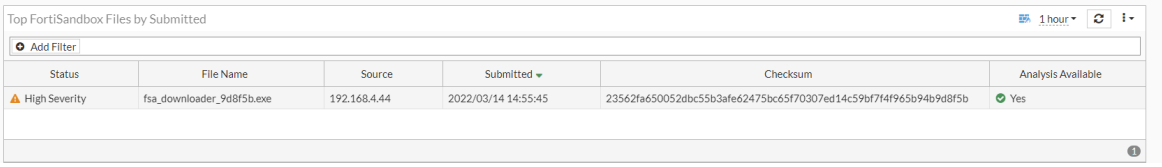
Sandbox inspection can be used in web filter profiles. The FortiGate uses URL threat detection database from the sandbox to block malicious URLs. See Block malicious URLs discovered by FortiSandbox on page 1239 for more information.

Top FortiSandbox Files FortiView monitor



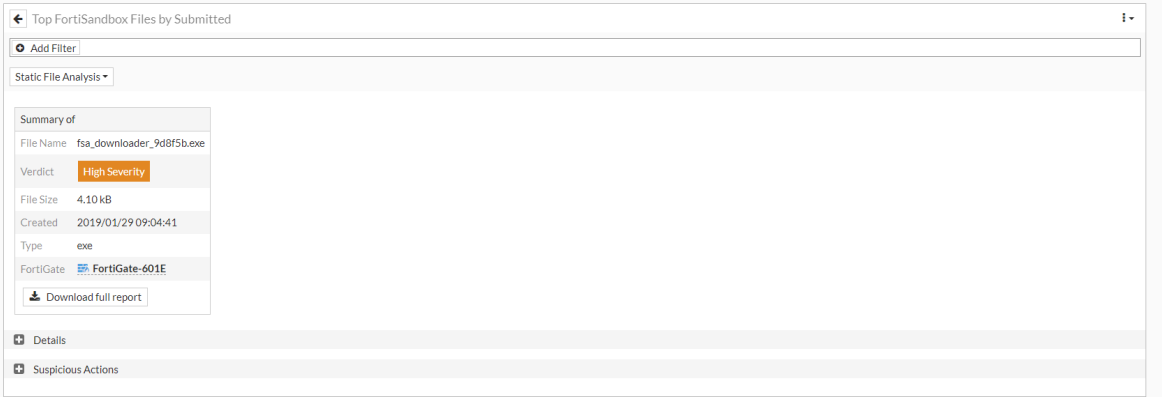
In the *Top FortiSandbox Files* FortiView monitor, users can select a submitted file and drill down to view its static and dynamic file analysis. The full FortiSandbox report can be downloaded in PDF format. This feature works with FortiGate Cloud Sandbox, FortiSandbox Cloud, and FortiSandbox appliance. FortiSandbox must be running version 3.2.1 and later.

Prerequisites:

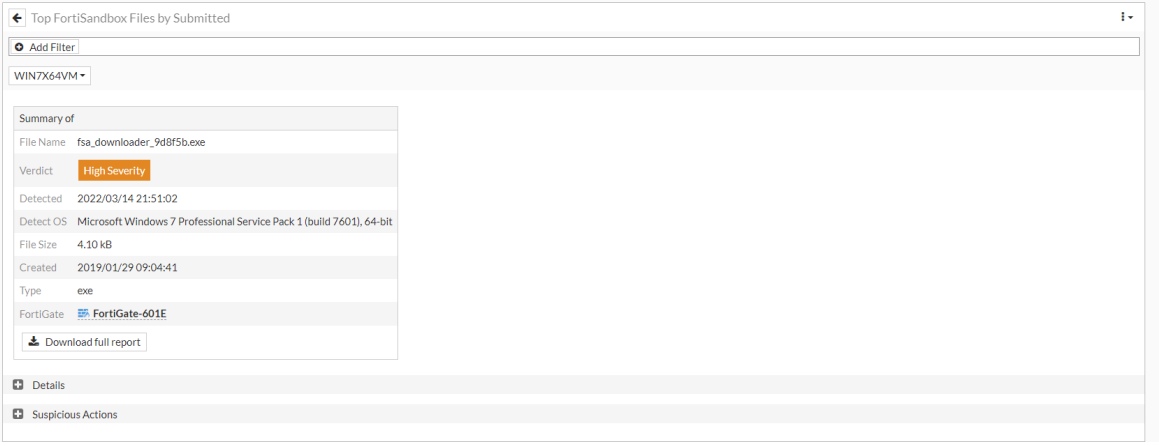


1. Add FortiSandbox to the Security Fabric.
2. Configure an AV profile with *Send files to FortiSandbox for inspection* enabled (see Using FortiSandbox post-transfer scanning with antivirus on page 1198).
3. Configure a firewall policy with the AV profile that allows traffic to the internet.
4. Add the *Top FortiSandbox Files* FortiView monitor (see Adding FortiView monitors on page 119).
5. On a client PC, attempt to download a suspicious file.

To view the FortiSandbox analysis and download the PDF:



1. Go to *Dashboard* > *Top FortiSandbox Files*. The entry appears in the table, but the analysis is not available yet.

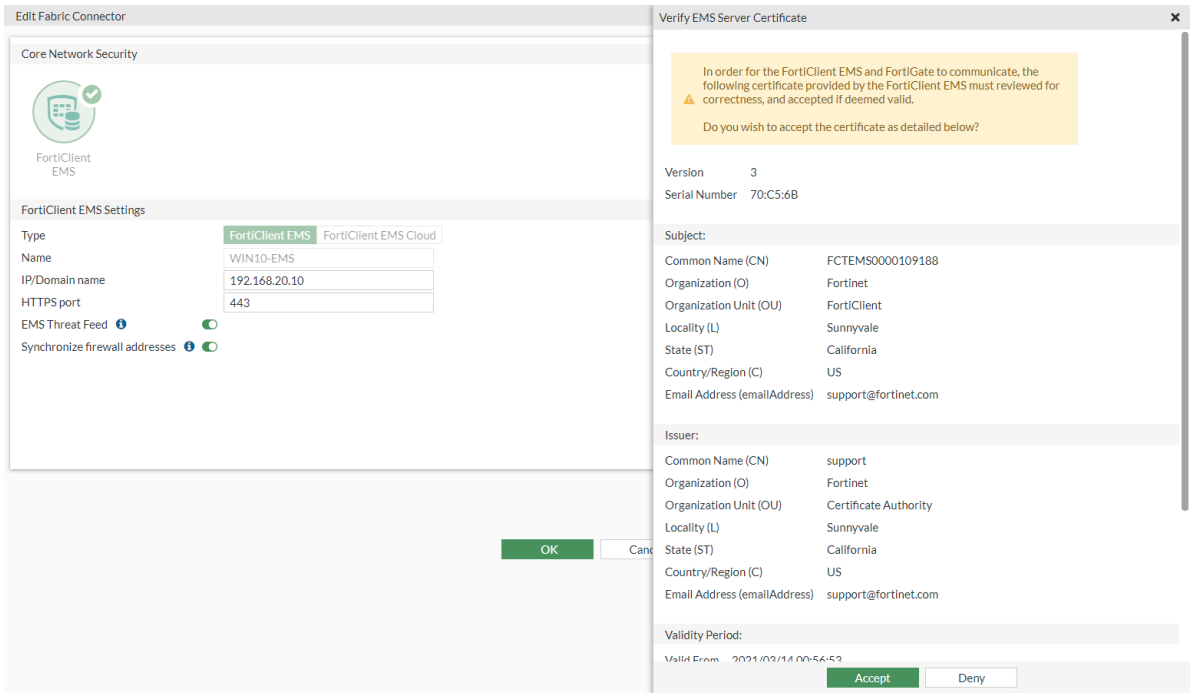


2. After about five to ten minutes, refresh the table. The analysis is available.

3. Select the entry, then right-click and select *Drill Down to Details*.
4. In the dropdown, select *Static File Analysis* to view the static file analysis.

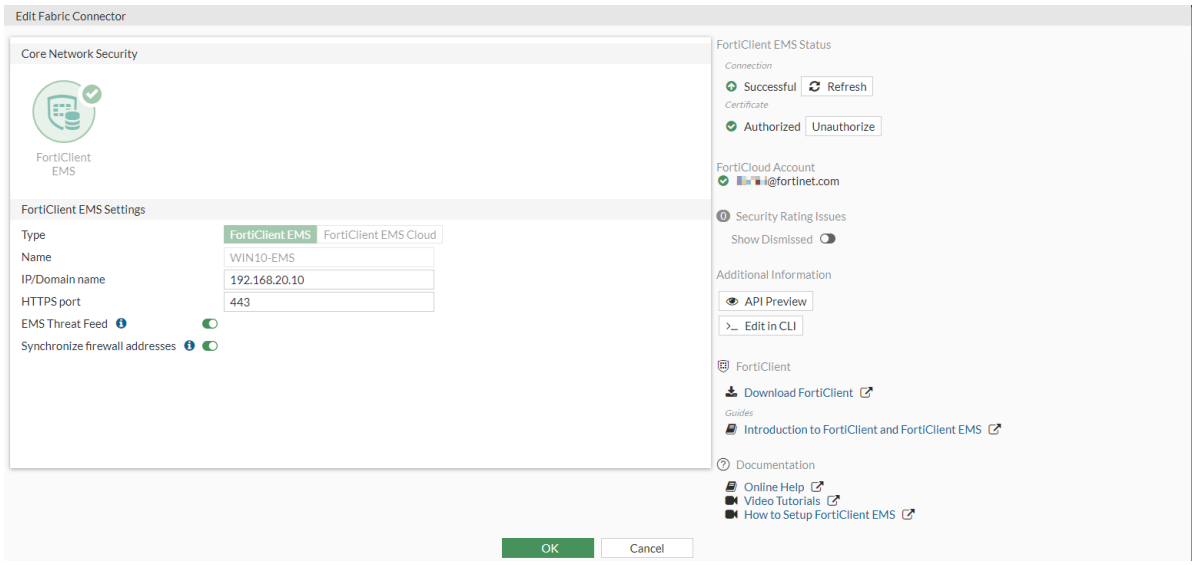
5. In the dropdown, select the client device to view the dynamic file analysis.

6. Click *Download full report* to download the detailed PDF report. The reports contains FortiSandbox job information, detailed file information, static analysis results, and dynamic analysis results.



Configuring FortiClient EMS

The FortiGate Security Fabric root device can link to FortiClient Endpoint Management System (EMS) and FortiClient EMS Cloud (a cloud-based EMS solution) for endpoint connectors and automation. Up to three EMS servers can be added to the Security Fabric, including a FortiClient EMS Cloud server. EMS settings are synchronized between all fabric members.



To enable cloud-based EMS services, the FortiGate must be registered to FortiCloud with an appropriate user account. The following examples presume that the EMS certificate has already been configured.

To add an on-premise FortiClient EMS server to the Security Fabric in the GUI:

1. On the root FortiGate, go to *System* > *Feature Visibility* and enable *Endpoint Control*.
2. Go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiClient EMS* card.
3. For *Type*, click *FortiClient EMS*.
4. Optionally, enable *EMS Threat Feed*. See Malware threat feed from EMS on page 1188 for more information about using this setting in an AV profile.
5. Enter a name and IP address or FQDN. When connecting to a multitenancy-enabled EMS, Fabric connectors must use an FQDN to connect to EMS, where the FQDN hostname matches a site name in EMS (including "Default"). The following are examples of FQDNs to provide when configuring the connector to connect to the default site and to a site named SiteA, respectively: default.ems.yourcompany.com, sitea.ems.yourcompany.com. See Multitenancy.
6. Click *OK*.
   A window appears to verify the EMS server certificate:

7. Click *Accept*.
   The *FortiClient EMS Status* section displays a *Successful* connection and an *Authorized* certificate:

8. If the device is not authorized, log in to the FortiClient EMS to authorize the FortiGate under *Administration* > *Fabric Devices*.

To add a FortiClient EMS Cloud server to the Security Fabric in the GUI:

FortiClient EMS Cloud can only be configured when the FortiGate is registered to FortiCloud and the EMS Cloud entitlement is verified.

If the FortiCloud account does not pass the FortiClient EMS Cloud entitlement check, the option is not selectable in the FortiClient EMS connector settings.

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiClient EMS* card.
2. Set *Type* to *FortiClient EMS Cloud*.
3. Enter a name.
4. Click *OK*.
   A window appears to verify the EMS server certificate.
5. Click *Accept*.
   The *FortiClient EMS Status* section displays a *Successful* connection and an *Authorized* certificate.

To test connectivity with the EMS server:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiClient EMS* or *FortiClient EMS Cloud* card.
2. In the *FortiClient EMS Status* section under *Connection*, click *Refresh*.

To add an on-premise FortiClient EMS server to the Security Fabric in the CLI:

```
config endpoint-control fctems
    edit {1 | 2 | 3 | 4 | 5}
        set status {enable | disable}
        set name <string>
        set server <ip_address>
        set certificate <string>
        set https-port <integer>
        set source-ip <ip_address>
    next
end
```

The `https-port` is the EMS HTTPS access port number, and the `source-ip` is the REST API call source IP address.

To add a FortiClient EMS Cloud server to the Security Fabric in the CLI:

```
config endpoint-control fctems
    edit {1 | 2 | 3 | 4 | 5}
        set status {enable | disable}
        set name <string>
        set fortinetone-cloud-authentication enable
        set certificate <string>
    next
end
```

To verify the EMS Cloud entitlement in the CLI:

```
# diagnose test update info
```

To verify an EMS certificate in the CLI:

```
# execute fctems verify ems137

        Subject:     C = CA, ST = bc, L = burnaby, O = devqa, OU = top3, CN =

                Digital Signature, Non Repudiation, Key Encipherment, Data Encipherment, Key
Agreement, Certificate Sign, CRL Sign, Encipher Only, Decipher Only

                Name:     X509v3 Extended Key Usage
                Critical: no
                Content:
                TLS Web Server Authentication, TLS Web Client Authentication

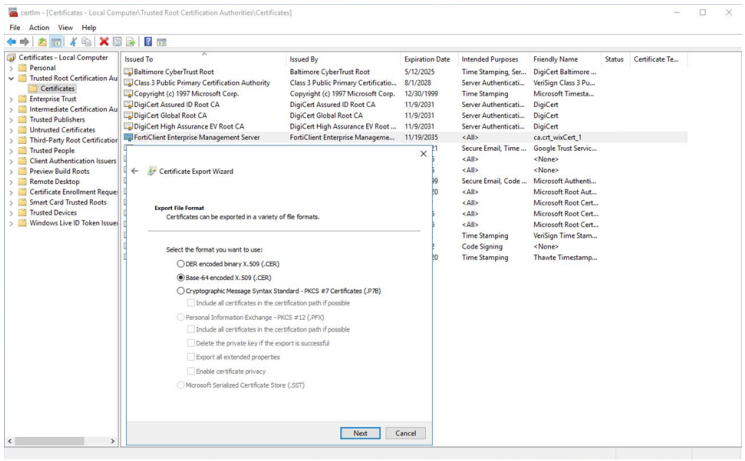
EMS configuration needs user to confirm server certificate.
Do you wish to add the above certificate to trusted remote certificates? (y/n)y
```

Troubleshooting

Certificate not trusted

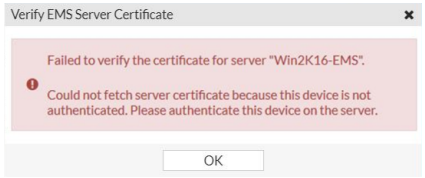
When configuring a new connection to an EMS server, the certificate might not be trusted.

When you click *Authorize*, a warning displays: *The server certificate cannot be authenticated with installed CA certificates. Please install its CA certificates on this FortiGate*.



In the CLI, an error message displays when you try to verify the certificate:

```
# execute fctems verify Win2K16-EMS
certificate not configured/verified: 2
Could not verify server certificate based on current certificate authorities.
Error 1--92-60-0 in get SN call: EMS Certificate is not signed by a known CA.
```



The default FortiClient EMS certificate that is used for the SDN connection is signed by the CA certificate that is saved on the Windows server when FortiClient EMS is first installed. You can manually export and install it on the FortiGate.

To manually export and install the certificate on to the FortiGate:

1. Export the EMS certificate on the server that EMS is installed on:
   a. On the Windows server that EMS is installed on, go to *Settings* > *Manage computer certificates*.
   b. In the certificate management module, go to *Trusted Root Certification Authorities* > *Certificates*.
   c. Right click on the certificate issued by FortiClient Enterprise Management Server and select *All Tasks* > *Export*.
   d. The *Certificate Export Wizard* opens. Click *Next*.
   e. Select *Base-64 encoded X.509*, then click *Next*.

   f. Enter a file name for the certificate and click *Browse* to select the folder where it will be located, then click *Next*.
   g. Review the settings, then click *Finish*. The certificate is downloaded to the specified folder.
2. On the FortiGate, import the certificate:
   a. Go to *System* > *Certificate*. By default, the *Certificate* option is not visible, see Feature visibility on page 2322 for information.
   b. Click *Import* > *CA Certificate*.
   c. Set *Type* to *File*, and click *Upload* to import the certificate from the management computer.
   d. Click *OK*. The imported certificate is shown in the *Remote CA Certificate* section of the certificate table.
3. Try to authorize the certificate on the FortiGate:
   a. Go to *Security Fabric* > *Fabric Connectors* and edit the FortiClient EMS connector. The connection status should now say that the certificate is not authorized.
   b. Click *Authorize*. The following warning is shown:

The warning can also be seen in the CLI:

```
# execute fctems verify Win2K16-EMS
failure in certificate configuration/verification: -4
Could not verify EMS. Error 1--94-0-401 in get SN call: Authentication denied.
```

4. Authorize the FortiGate on EMS:
   a. Log in to the EMS server console and go to *Administration* > *Fabric Devices*.
   b. Select the serial number of the FortiGate device, then click *Authorize*.
5. Try to authorize the certificate on the FortiGate again:
   a. On the FortiGate, go to *Security Fabric* > *Fabric Connectors* and edit the FortiClient EMS connector.
   b. Click *Authorize*.
   c. When presented with the EMS server certificate, click *Accept* to accept the certificate.
   Your connection should now be successful and authorized.

   d. Click *OK*.

Using EMS silent approval in the Security Fabric

FortiClient EMS with Fabric authorization and silent approval capabilities can approve the root FortiGate in a Security Fabric once, and then silently approve remaining downstream FortiGates in the Fabric. Similarly in an HA scenario, an approval only needs to be made once to the HA primary unit. The remaining cluster members are approved silently.

To use EMS silent approval:

1. Configure the EMS entry on the root FortiGate or HA primary:

```
config endpoint-control fctems
    edit "ems139"
        set fortinetone-cloud-authentication disable
        set server "172.16.200.139"
        set https-port 443
        set source-ip 0.0.0.0
        set pull-sysinfo enable
        set pull-vulnerabilities enable
        set pull-avatars enable
        set pull-tags enable
        set pull-malware-hash enable
        unset capabilities
        set call-timeout 30
        set websocket-override disable
    next
end
```

   When the entry is created, the capabilities are unset by default.
2. Authenticate the FortiGate with EMS:

```
# execute fctems verify ems_139
...
```

   The FortiGate will enable the Fabric authorization and silent approval based on the EMS supported capabilities.

```
config endpoint-control fctems
    edit "ems139"
        set server "172.18.62.12"
        set capabilities fabric-auth silent-approval websocket
    next
end
```

3. Configure a downstream device in the Security Fabric (see Configuring the root FortiGate and downstream FortiGates on page 2378 for more details). The downstream device will be silently approved.
4. Configure a secondary device in an HA system (see HA active-passive cluster setup on page 2166 and HA active-active cluster setup on page 2167 for more details). The secondary device will be silently approved.

Allowing deep inspection certificates to be synchronized to EMS and distributed to FortiClient

On FortiClient EMS versions that support `push CA certs` capability, the FortiGate will push CA certificates used in SSL deep inspection (see Deep inspection on page 1394 for more details) to the EMS server. On the EMS server, the CA certificates can be selected in the managed endpoint profiles so they can be installed on managed endpoints. FortiClient EMS 7.0.1 and later is required to use this feature.

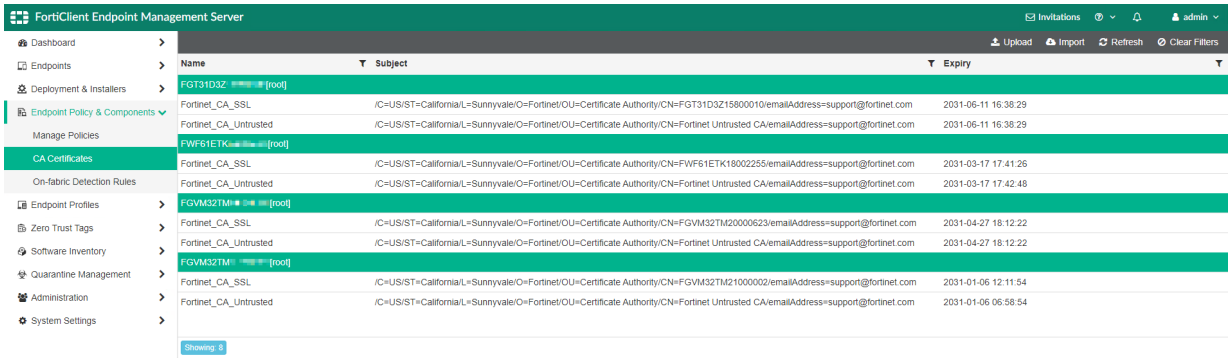
To configure deep inspection certificate synchronization to EMS:

1. Configure the EMS Fabric connector:

```
config endpoint-control fctems
    edit "ems138"
        set fortinetone-cloud-authentication disable
        set server "172.16.200.138"
        set https-port 443
        set source-ip 0.0.0.0
        set pull-sysinfo enable
        set pull-vulnerabilities enable
        set pull-avatars enable
        set pull-tags enable
        set pull-malware-hash enable
        set capabilities fabric-auth silent-approval websocket websocket-malware push-
ca-certs
        set call-timeout 30
        set websocket-override disable
        set preserve-ssl-session disable
    next
end
```

2. Apply the certificate to an SSL/SSH profile for deep inspection:

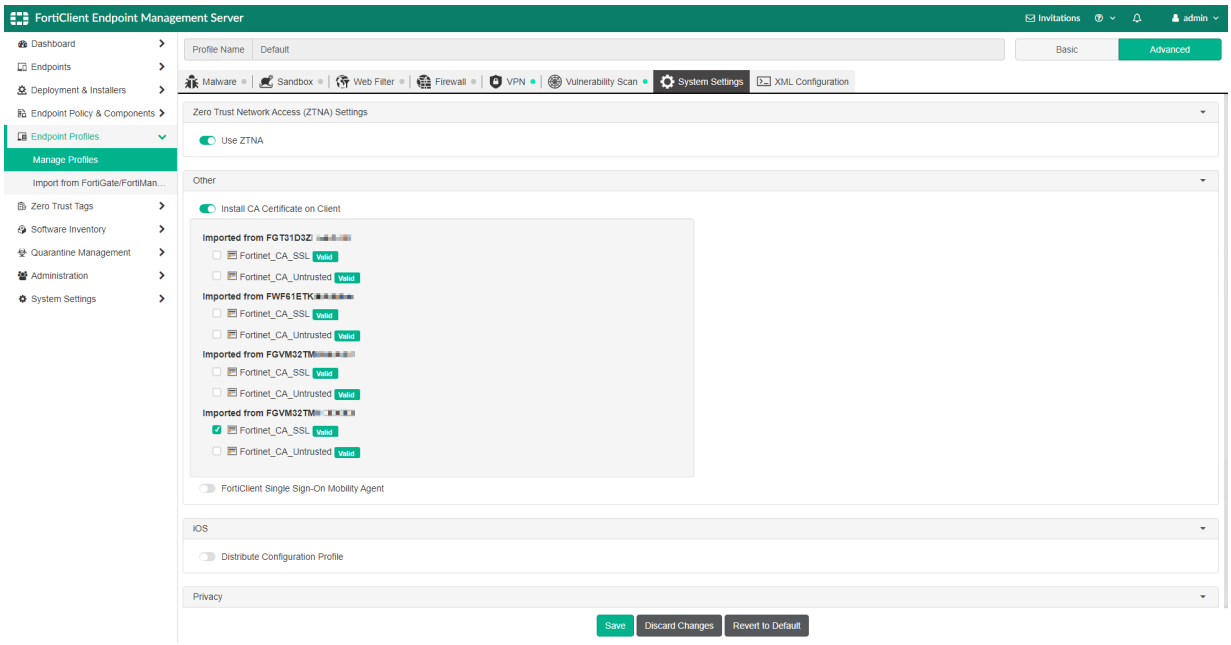
```
config firewall ssl-ssh-profile
    edit "deep-inspection"
        set comment "Read-only deep inspection profile."
        config https
            set ports 443
            set status deep-inspection
        end
        ...
        set server-cert-mode re-sign
        set caname "Fortinet_CA_SSL"
```



```
        set untrusted-caname "Fortinet_CA_Untrusted"
    next
end
```

The default deep inspection profile, CA certificate, and untrusted CA certificates are used in this example.

3. Configure the firewall policy:

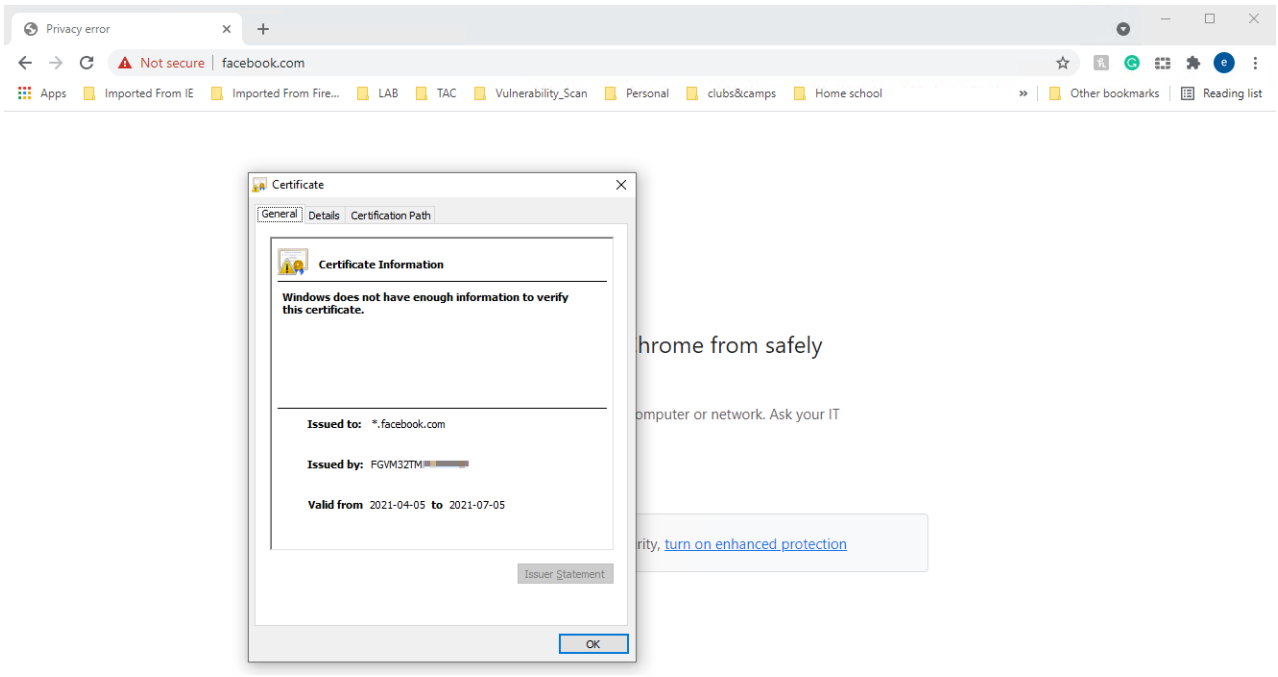


```
config firewall policy
    edit 1
        set name "deep-inspection"
        set srcintf "port14"
        set dstintf "port13"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set av-profile "default"
        set nat enable
    next
end
```

4. In EMS, verify that the CA certificate was pushed to EMS:
   a. Go to *Endpoint Policy & Components* > *CA Certificates*.

   b. Verify the certificate table to see that the EMS server received the CA certification from the different FortiGates.

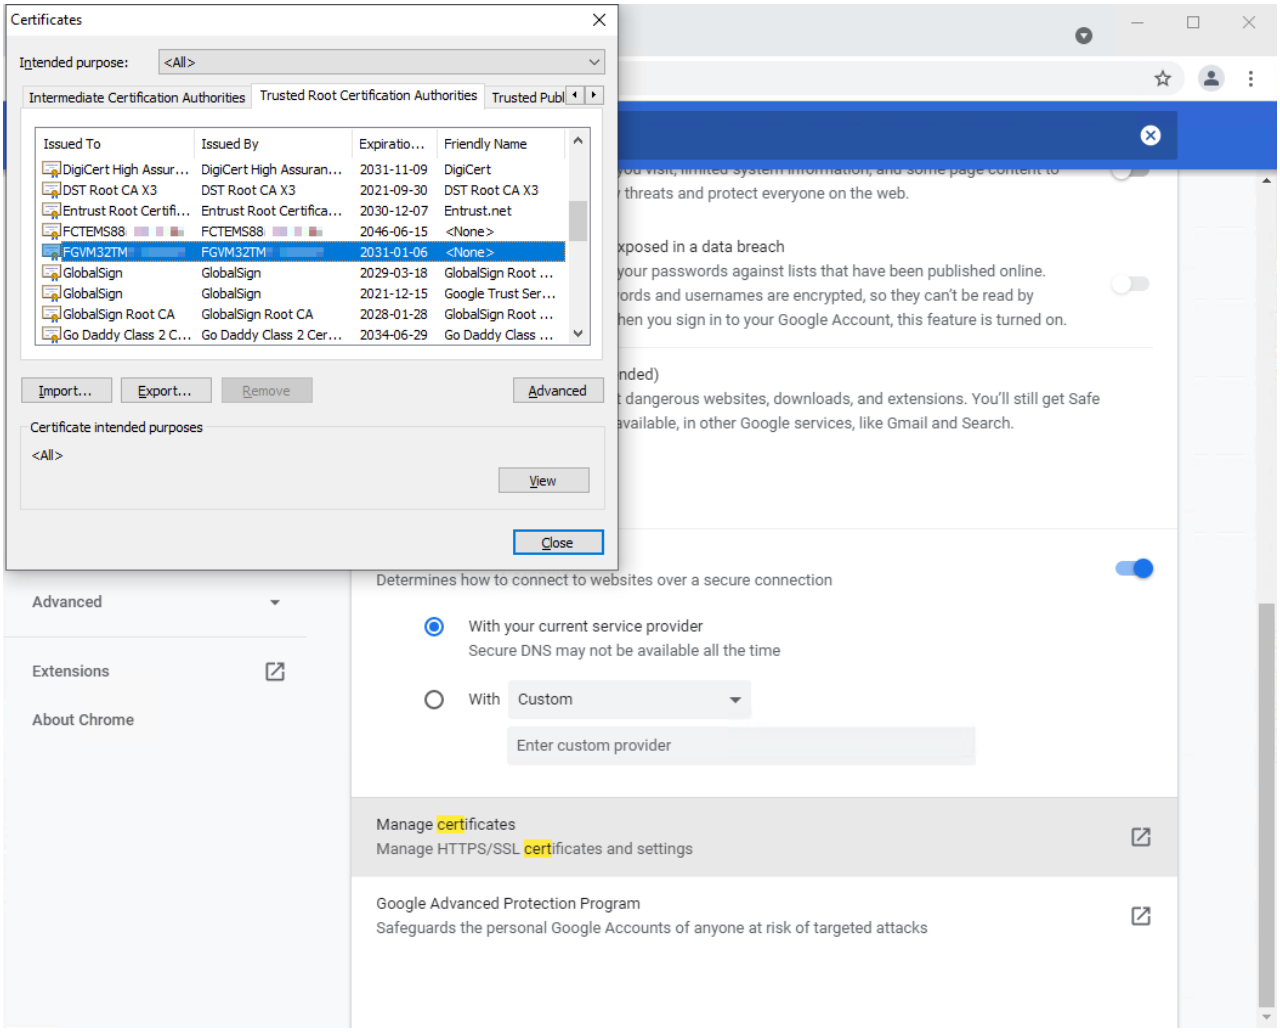
5. Select the CA certificate in the endpoint profile:
   a. Go to *Endpoint Profiles* > *Manage Profiles* and edit a profile. The default profile is used in this example.
   b. Click *Advanced* in the top right corner and click the *System Settings* tab.
   c. In the *Other* section, enable *Install CA Certificate on Client* and select the *Fortinet_CA_SSL* certificate for the desired endpoint.



d. Click *Save*.
Once the FortiClient endpoint is registered, it receives the CA certificate. When the FortiClient endpoint tries to access the internet through the FortiGate with the firewall policy that has deep inspection, no warning message is displayed. The server certificate is trusted with the installed CA certificate to complete the certificate chain.

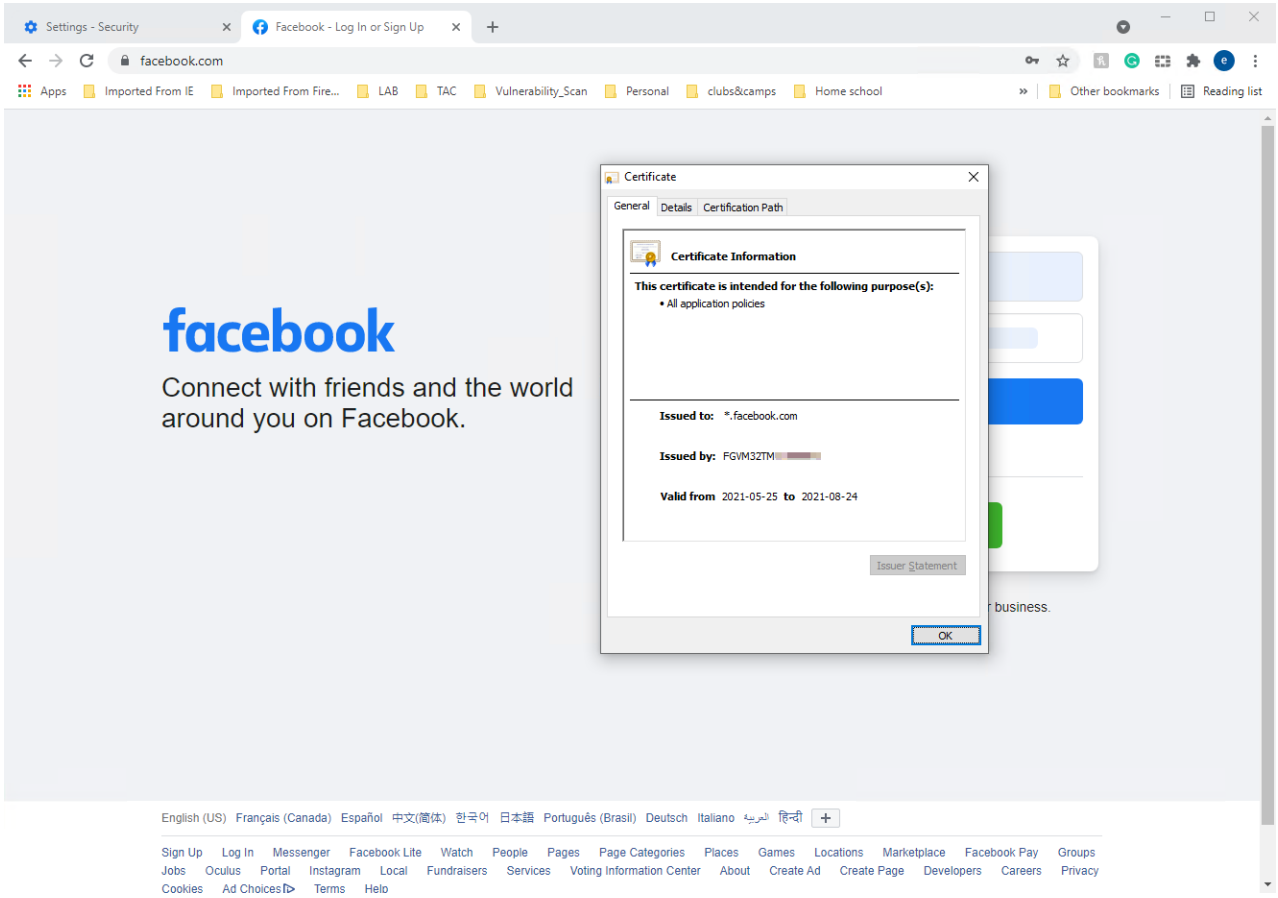
Verification

Before configuring deep inspection certificate synchronization, a warning message is displayed when a FortiClient endpoint accesses the internet through the FortiGate with the firewall policy that has deep inspection. The FortiClient certificate store does not have the FortiGate's CA that is used in the deep inspection SSL/SSH profile.



For example, accessing https://www.facebook.com in Chrome shows a warning. In the address bar, clicking *Not secure* > *Certificate* opens the *Certificate* dialog, which indicates that *Windows does not have enough information to verify the certificate.*

After the EMS profile is pushed to FortiClient endpoint, the expected FortiGate's certificate is shown in its certificate store.



To verify the deep inspection certificate synchronization:

1. In Chrome, go to *Settings* > *Privacy and security* and open *Manage certificates*.
2. Click the *Trusted Root Certification Authorities* tab. The FortiGate's certificate appears in the list.

3. On the FortiClient endpoint using Chrome, go to https://www.facebook.com. The website is displayed.

4. In the address bar, click the padlock, then click *Certificate*. The dialog displays the valid certificate information.

Diagnostics

Use the `diagnose endpoint fctems json deep-inspect-cert-sync` command in FortiOS to verify the certificate information. In the following example, there are multiple VDOMs with FortiGates in HA mode.

To verify the primary FortiGate:

```
FGT_EC_Primary (global) # diagnose endpoint fctems json deep-inspect-cert-sync
JSON:
"""
{
  "fortigates":[
    "FG2K5E39169*****",
    "FG2K5E39169*****"
  ],
  "vdoms":[
    {
      "vdom":"root",
      "certs":[
        {
          "name":"Fortinet_CA_SSL",
          "cert":"-----BEGIN CERTIFICATE-----\\nMIID5jCCAs6g...Sfu+Q8zE8Crmt6L1X\/bv+q\\n---
--END CERTIFICATE-----\\n"
```

```
        },
        {
          "name":"Fortinet_CA_Untrusted",
          "cert":"-----BEGIN CERTIFICATE-----\\nMIID8DCCAtig...3zBbfzP+nVUpC\\nZDPRZA==\\n--
---END CERTIFICATE-----"
        }
      ]
    },
    {
      "vdom":"vdom1",
      "certs":[
        {
          "name":"Fortinet_CA_SSL",
          "cert":"-----BEGIN CERTIFICATE-----\\nMIID5jCCAs6g...Sfu+Q8zE8Crmt6L1X\/bv+q\\n---
--END CERTIFICATE-----\\n"
        },
        {
          "name":"Fortinet_CA_Untrusted",
          "cert":"-----BEGIN CERTIFICATE-----\\nMIID8DCCAtig...3zBbfzP+nVUpC\\nZDPRZA==\\n--
---END CERTIFICATE-----"
        }
      ]
    }
  ]
}
"""
```

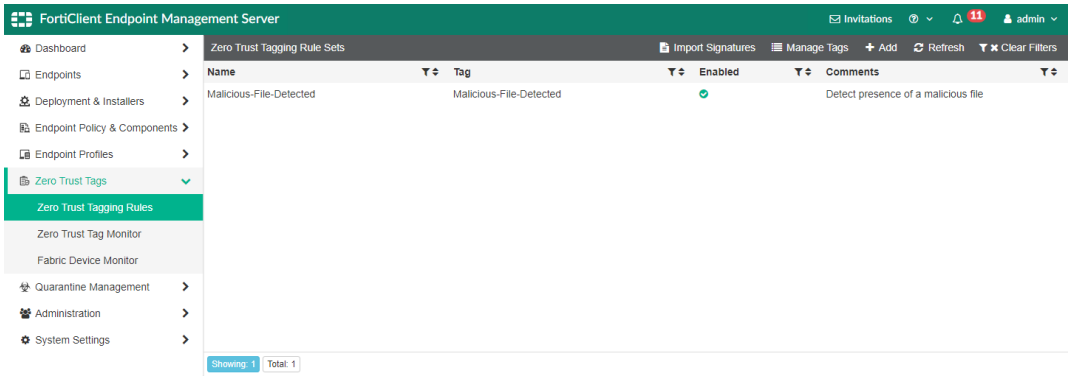
To verify the secondary FortiGate:

```
FGT_EC_Secondary(global) # diagnose endpoint fctems json deep-inspect-cert-sync
JSON:
"""
{
  "fortigates":[
    "FG2K5E39169*****",
    "FG2K5E39169*****"
  ],
  "vdoms":[
    {
      "vdom":"root",
      "certs":[
        {
          "name":"Fortinet_CA_SSL",
          "cert":"-----BEGIN CERTIFICATE-----\\nMIID5jCCAs6g...Sfu+Q8zE8Crmt6L1X\/bv+q\\n---
--END CERTIFICATE-----\\n"
        },
        {
          "name":"Fortinet_CA_Untrusted",
          "cert":"-----BEGIN CERTIFICATE-----\\nMIID8DCCAtig...3zBbfzP+nVUpC\\nZDPRZA==\\n--
---END CERTIFICATE-----"
        }
      ]
    },
    {
      "vdom":"vdom1",
      "certs":[
```

```
        {
          "name":"Fortinet_CA_SSL",
          "cert":"-----BEGIN CERTIFICATE-----\\nMIID5jCCAs6g...Sfu+Q8zE8Crmt6L1X\/bv+q\\n---
--END CERTIFICATE-----\\n"
        },
        {
          "name":"Fortinet_CA_Untrusted",
          "cert":"-----BEGIN CERTIFICATE-----\\nMIID8DCCAtig...3zBbfzP+nVUpC\\nZDPRZA==\\n--
---END CERTIFICATE-----"
        }
      ]
    }
  ]
}
"""
```

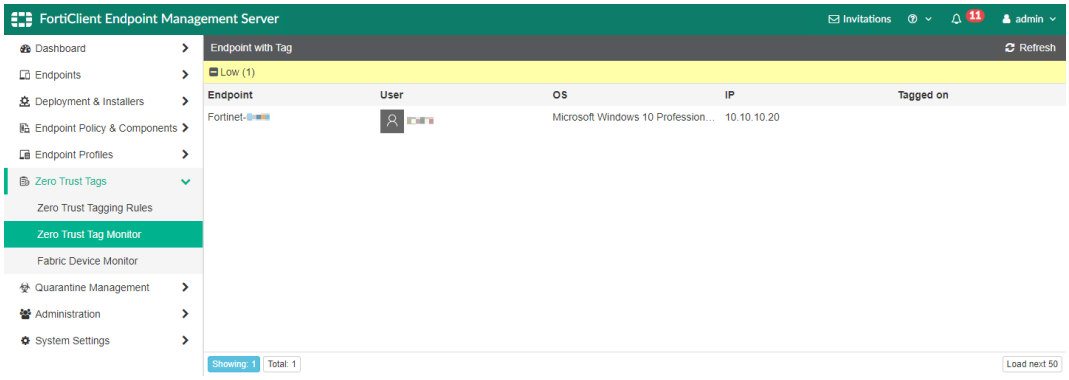
Synchronizing FortiClient ZTNA tags

ZTNA tags (formerly FortiClient EMS tags in FortiOS 6.4 and earlier) are tags synchronized from FortiClient EMS as dynamic address objects on the FortiGate. FortiClient EMS uses zero-trust tagging rules to automatically tag managed endpoints based on various attributes detected by the FortiClient. When the FortiGate establishes a connection with the FortiClient EMS server via the EMS Fabric connector, it pulls zero-trust tags containing device IP and MAC addresses and converts them to read-only dynamic address objects. It also establishes a persistent WebSocket connection to monitor for changes in zero-trust tags, which keeps the device information current. These ZTNA tags can then be used in ZTNA rules, firewall rules, and NAC policies to perform security posture checks. ZTNA tags are displayed in the *Device Inventory* widget, *FortiClient* widget, and *Asset Identity Center* page.



When using WebSocket, EMS pushes notifications to the corresponding FortiGate when there are updates to tags or other monitored attributes. The FortiGate then fetches the updated information using the REST API over TCP/8013. When WebSocket is not used (due to an override or unsupported EMS version), updates are triggered on demand from the FortiGate side over the REST API.

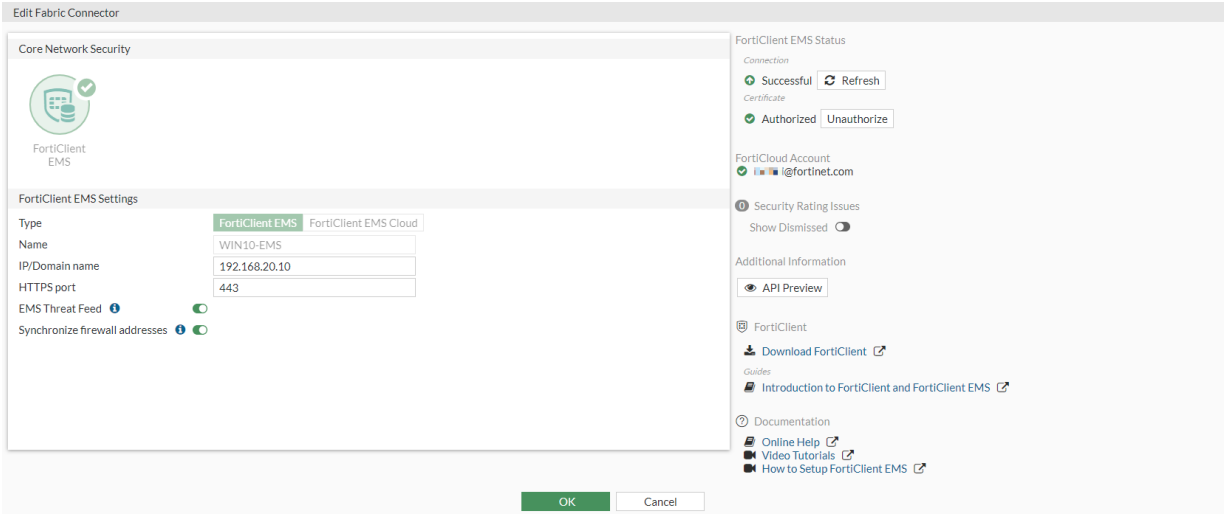
If the WebSocket capability is detected, the capabilities setting will automatically display the WebSocket option. You can use the `diagnose test application fcnacd 2` command to view the status of the WebSocket connection.



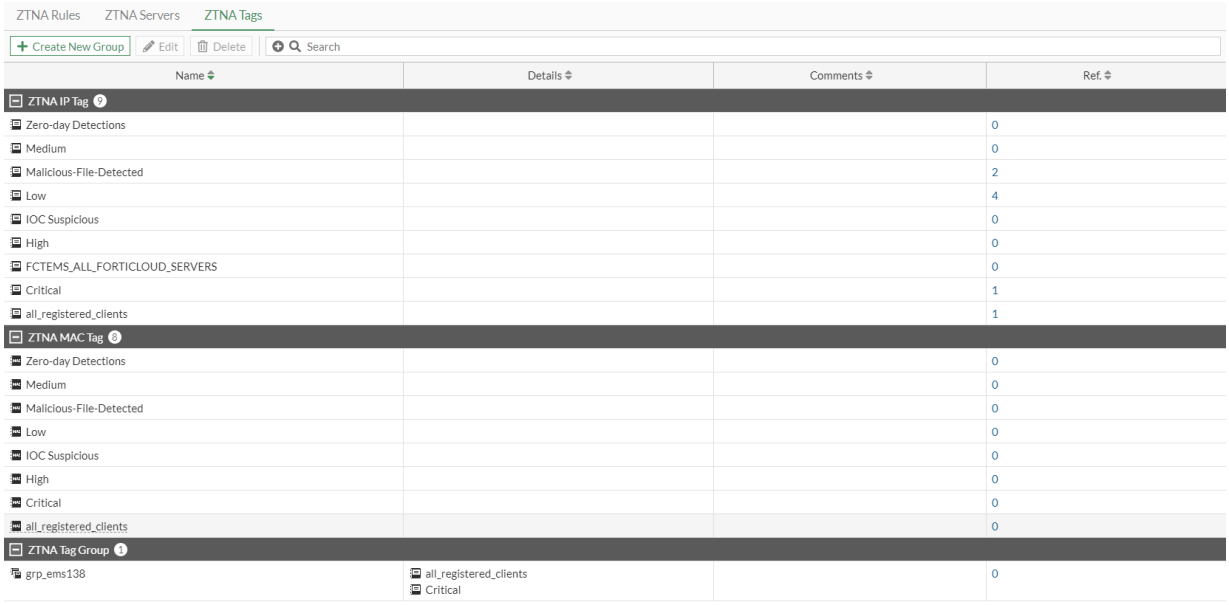
In the following example, the FortiGate connects to and retrieves ZTNA tags from a FortiClient EMS configured with tagging rules. It is assumed that zero-trust tags and rules are already created on the FortiClient EMS. For more information, see the Zero Trust Tags section of the EMS Administration Guide.

To verify zero-trust tags in FortiClient EMS:

1. Go to *Zero Trust Tags* > *Zero Trust Tagging Rules* to view the tags.



2. Go to *Zero Trust Tags* > *Zero Trust Tag Monitor* to view the registered users who match the defined tag.



To configure the EMS Fabric connector to synchronize ZTNA tags in the GUI:

1. Configure the EMS Fabric connector:
   a. On the root FortiGate, go to *Security Fabric* > *Fabric Connectors*.
   b. Click *Create New* and click *FortiClient EMS*.
   c. Enable *Synchronize firewall addresses*.

d. Configure the other settings as needed and validate the certificate.
e. Click *OK*.

2. Enable ZTNA:
   a. Go to *System* > *Feature Visibility* and enable *Zero Trust Network Access*.
   b. Click *Apply*.
3. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Tags* tab. You will see the ZTNA IP and ZTNA MAC tags synchronized from the FortiClient EMS.

To configure the EMS Fabric connector to synchronize ZTNA tags in the CLI:

1. Configure the EMS Fabric connector on the root FortiGate:

```
config endpoint-control fctems
    edit 1
        set status enable
        set name "WIN10-EMS"
        set server "192.168.20.10"
        set https-port 443
        set pull-sysinfo enable
        set pull-vulnerabilities enable
        set pull-avatars enable
        set pull-tags enable
        set pull-malware-hash enable
        set capabilities fabric-auth silent-approval websocket
    next
end
```

2. Verify which IPs the dynamic firewall address resolves to:

```
# diagnose firewall dynamic list
List all dynamic addresses:
FCTEMS0000100000_all_registered_clients: ID(51)
        ADDR(172.17.194.209)
        ADDR(10.10.10.20)
```

```
…

FCTEMS0000100000_Low: ID(78)
        ADDR(172.17.194.209)
        ADDR(10.10.10.20)
…

FCTEMS0000100000_Malicious-File-Detected: ID(190)
        ADDR(172.17.194.209)
        ADDR(10.10.10.20)
…
```

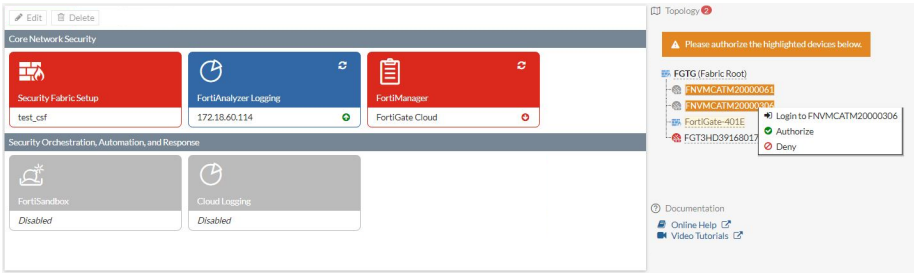
Configuring FortiNAC

A FortiNAC device can be added to the Security Fabric on the root FortiGate. After the device has been added and authorized, you can log in to the FortiNAC from the FortiGate topology views.

Adding a FortiNAC to the Security Fabric requires a FortiNAC with a license issued in the year 2020 or later that includes an additional certificate. The device cannot be added if it has an older license. Use the `licensetool` in the FortiNAC CLI to determine if your license includes the additional certificate.

The FortiNAC tags connector under *Security Fabric* > *Fabric Connectors* has been deprecated. It was replaced with a REST API (in FortiNAC and FortiOS) that is used by FortiNAC to send user logon and logoff information to the FortiGate. The FortiNAC tag dynamic firewall address type is used to store the device IP, FortiNAC firewall tags, and FortiNAC group information sent from FortiNAC by the REST API when user logon and logoff events are registered (see FortiNAC tag dynamic address on page 963 for more information).

For upgrade support, the FSSO FortiNAC user type can still be configured in the CLI.



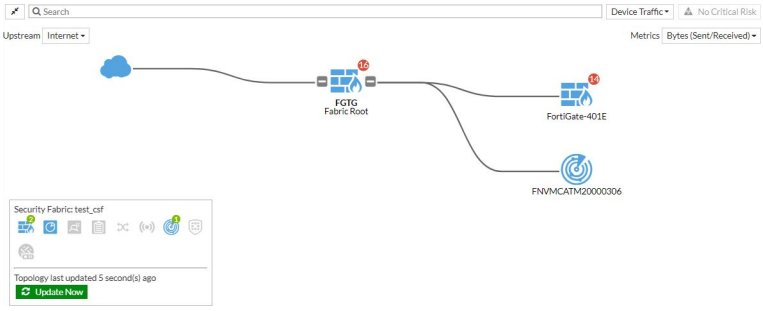
To add a FortiNAC to the Security Fabric:

1. On the FortNAC, configure telemetry and input the IP address of the root FortiGate. See Security Fabric Connection in the *FortiNAC Administration Guide* for more information.
2. On the root FortiGate, authorize the FortiNAC.
3. Verify the connection status in the topology views.

To authorize the FortiNAC on the root FortiGate in the GUI:

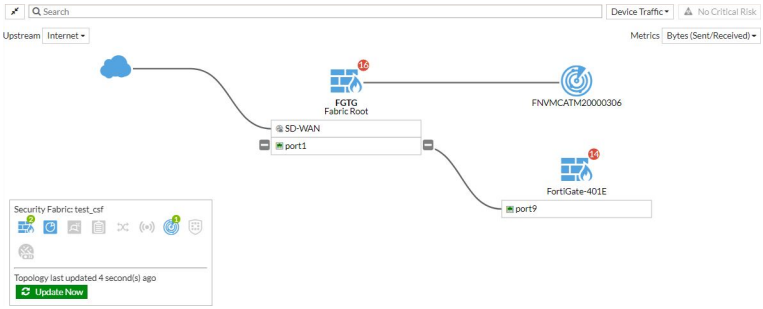
1. Go to *Security Fabric* > *Fabric Connectors*.
2. The FortiNAC device will be highlighted in the topology list in the right panel with the status *Waiting for Authorization*.

3. Click on the highlighted FortiNAC and select *Authorize*.



Optionally, you can also deny authorization to the FortiNAC to remove it from the list.

To authorize the FortiNAC on the root FortiGate in the CLI:

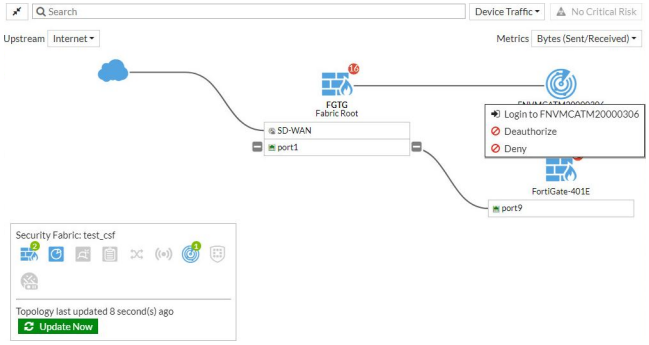


```
config system csf
    config trusted-list
        edit "FNVMCATM20000306"
            set action accept
        next
    end
end
```

To verify the connection status:

1. After the FortiNAC is authorized, go to *Security Fabric* > *Physical Topology* and confirm that it is included in the topology.

2. Go to *Security Fabric* > *Logical Topology* and confirm the FortiNAC is also displayed there.



3. Run the following command in the CLI to view information about the FortiNAC device's status:

```
# diagnose sys csf downstream-devices fortinac
{
  "path":"FG5H1E5818900126:FNVMCATM20000306",
  "mgmt_ip_str":"10.1.100.197",
```

```
  "mgmt_port":0,
  "admin_port":8443,
  "serial":"FNVMCATM20000306",
  "host_name":"adnac",
  "device_type":"fortinac",
  "upstream_intf":"port2",
  "upstream_serial":"FG5H1E5818900126",
  "is_discovered":true,
  "ip_str":"10.1.100.197",
  "downstream_intf":"eth0",
  "authorizer":"FG5H1E5818900126",
  "idx":1
}
```

To log in to the FortiNAC from the FortiGate:

1. On the FortiGate, go to *Security Fabric* > *Physical Topology* or *Security Fabric* > *Logical Topology*.
2. Click on the FortiNAC and select *Login to <serial_number>*.

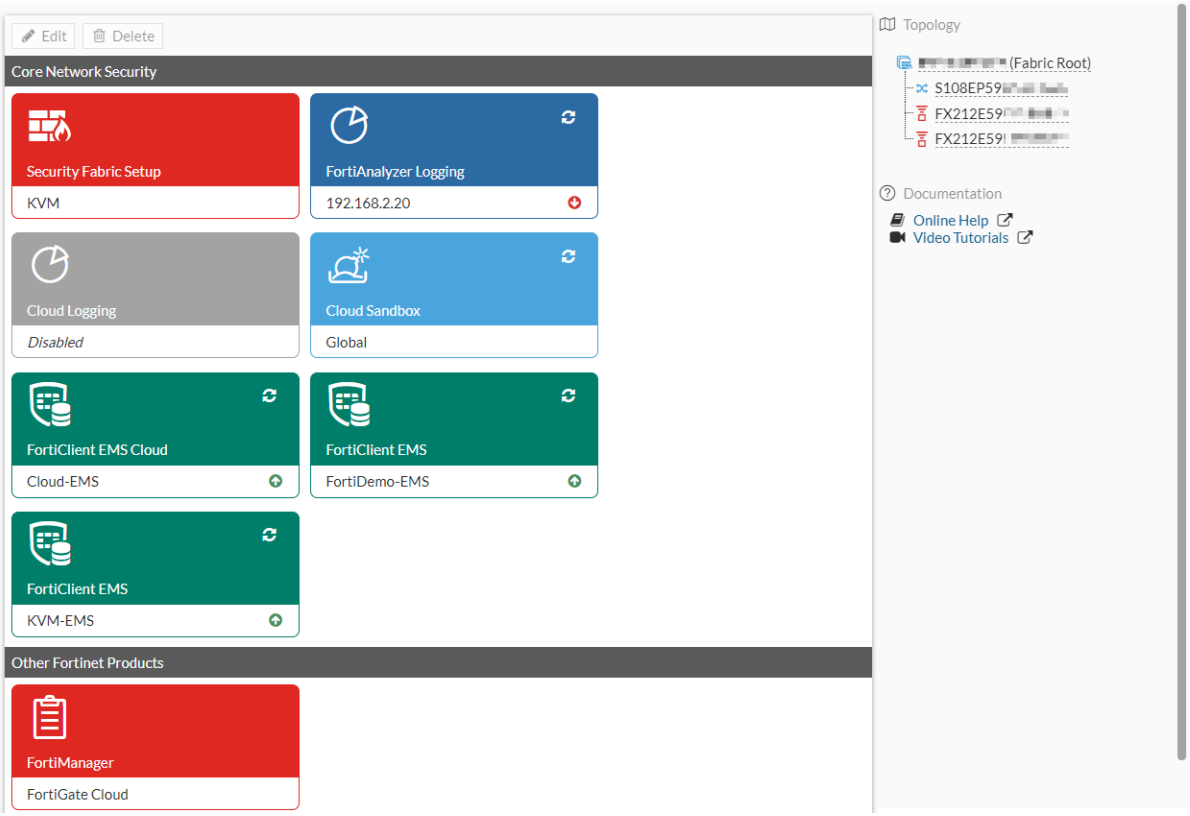
A new tab will open to the FortiNAC log in page.

3. Enter the username and password to log in to the FortiNAC.

Configuring FortiAP and FortiSwitch

FortiAP and FortiSwitch devices can be authorized in the Security Fabric with one click. After connecting a FortiAP or FortiSwitch device to an authorized FortiGate, it will automatically be listed in the topology tree.

If the default `auto-auth-extension-device` settings on the FortiAP or FortiSwitch have been modified, manual authorization in the Security Fabric may not be required.



For more information about configuring FortiAPs, see Configuring the FortiGate interface to manage FortiAP units and Discovering, authorizing, and deauthorizing FortiAP units.

For more information about configuring FortiSwitches, see Using the FortiGate GUI.

To authorize FortiAP and FortiSwitch devices:

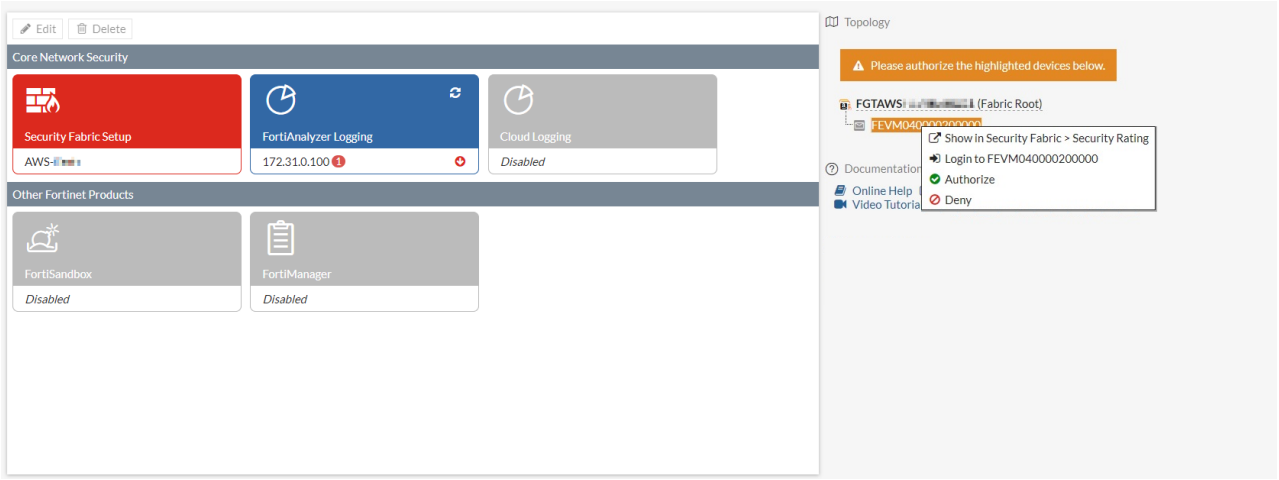
1. Connect the FortiAP or FortiSwitch device to a FortiGate.
2. On the root FortiGate, go to *Security Fabric* > *Fabric Connectors*. The new device is shown in the *Topology* tree.

3. Click the device and select *Authorize*.

Configuring FortiMail

FortiMail can be authorized into the Security Fabric using either the gutter on the *Fabric Connectors* page, or by pre-authorizing using the FortiMail serial number or certificate.

To join the Security Fabric from FortiMail:



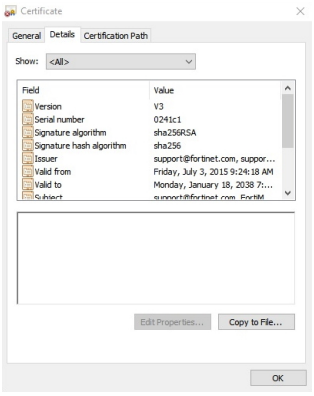
1. Go to *System* > *Customization* and click the *Corporate Security Fabric* tab (or the *Corporate Security Fabric* tab in FortiMail 6.4.2 and earlier).
2. Click the toggle to enable the Fabric.
3. Enter the *Upstream IP Address* (root FortiGate) and the *Management IP* of the FortiMail.
4. Click *Apply*.

Authorizing using FortiOS

If the FortiMail was added to the Security Fabric but not pre-authorized, you can authorize it in FortiOS on the *Fabric Connectors* page.

To authorize FortiMail:

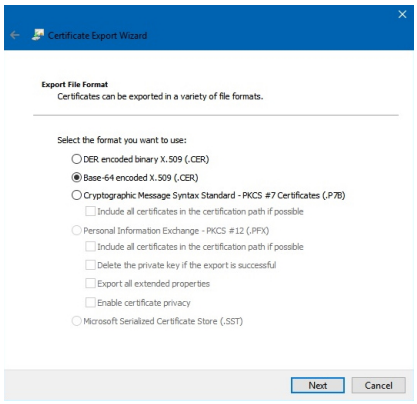
1. Go to *Security Fabric* > *Fabric Connectors*.
2. In the topology tree, hover over the FortiMail and click *Authorize*.



3. Verify the certificate is correct, then click *Accept*.

Pre-authorizing using the FortiMail certificate

FortiMail can be pre-authorized using its serial number or certificate. When you pre-authorize, the FortiMail can join at any time, and you will not need to authorize it FortiOS. In this example, FortiMail is pre-authorized using a certificate.



To pre-authorize FortiMail using a third-party or default certificate:

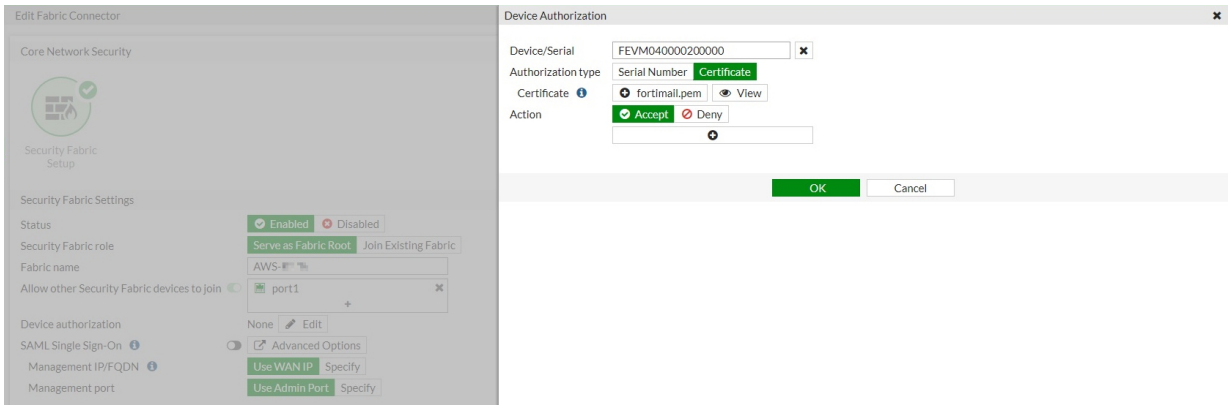
1. Log in to FortiMail.
2. Download the certificate. For example, in Chrome:
   a. In the left side of the address bar, click the icon to view the site information.
   b. Click *Certificate*.
   c. Click the *Details* tab, then click *Copy to File*.

   d. The *Certificate Export Wizard* opens. Click *Next* to continue.

e. For the file format, select *Base-64 encoded X.509 (.CER)*, then click *Next*.

f. Browse to the folder location and enter a file name, then click *Next*.

g. Click *Finish*, then click *OK* to close the dialog box.



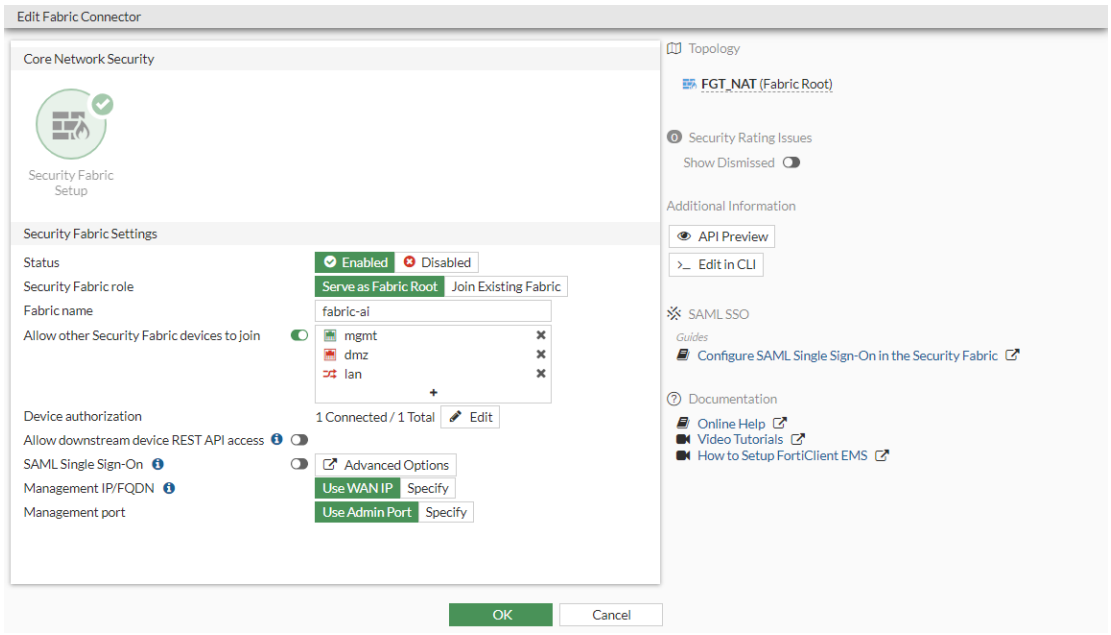
3. In FortiOS, go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.

4. Beside *Device authorization*, click *Edit* and configure the following:

a. Enter the FortiMail serial number.

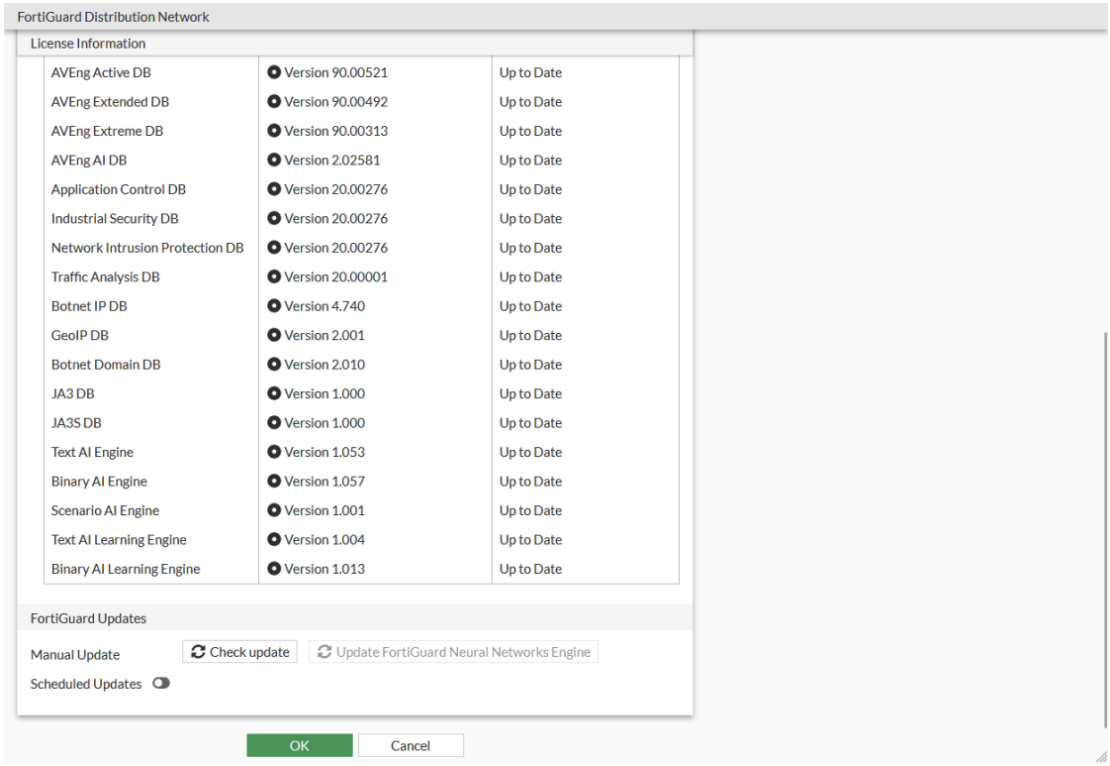
b. For *Authorization type*, select *Serial Number*.

c. For *Certificate*, upload the .CER file you saved previously.



d. Click *OK*.

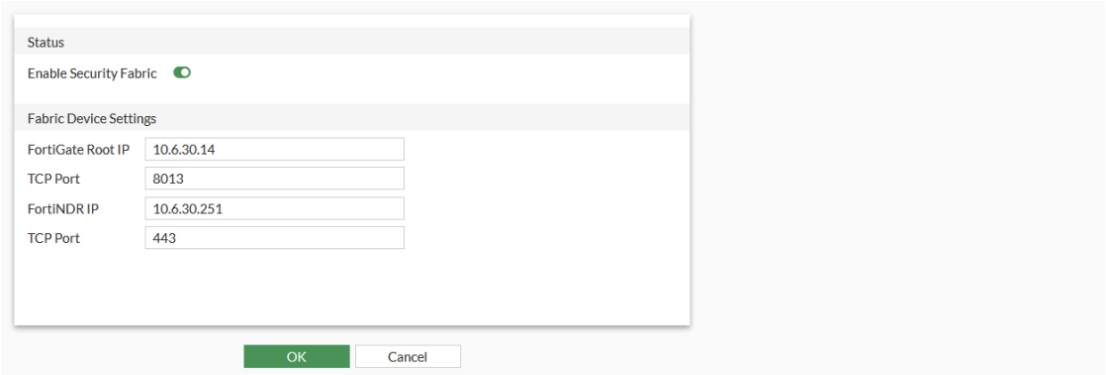
Configuring FortiNDR



FortiNDR (formerly FortiAI) can be added to the Security Fabric so it appears in the topology views and the dashboard widgets.

To add FortiNDR to the Security Fabric in the GUI:

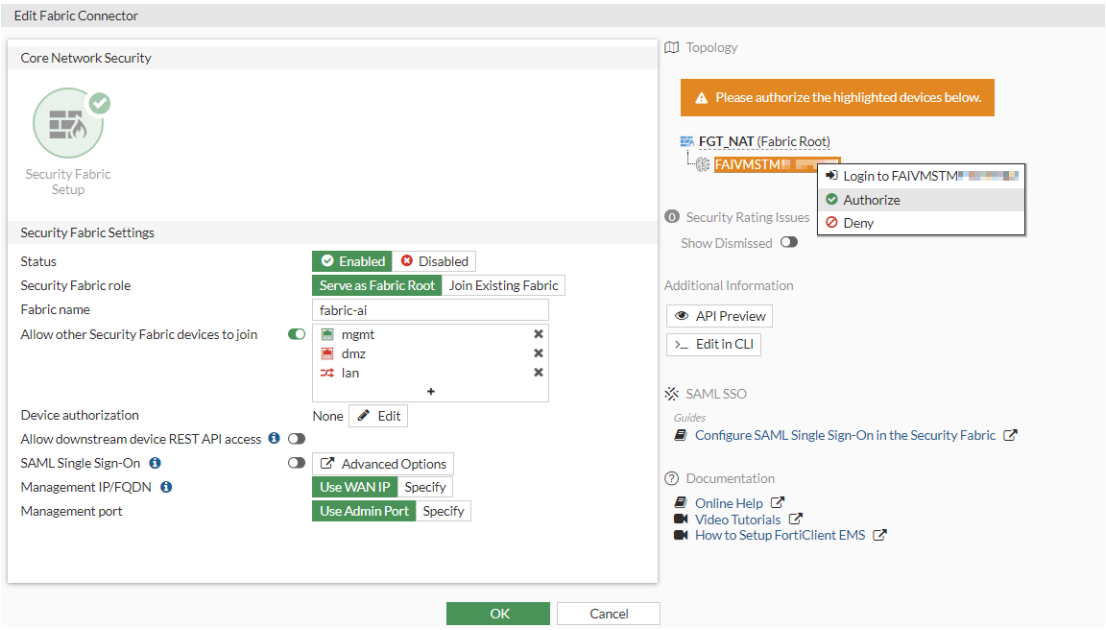
1. Enable the Security Fabric and configure the interface to allow other Security Fabric devices to join (see Configuring the root FortiGate and downstream FortiGates on page 2378).



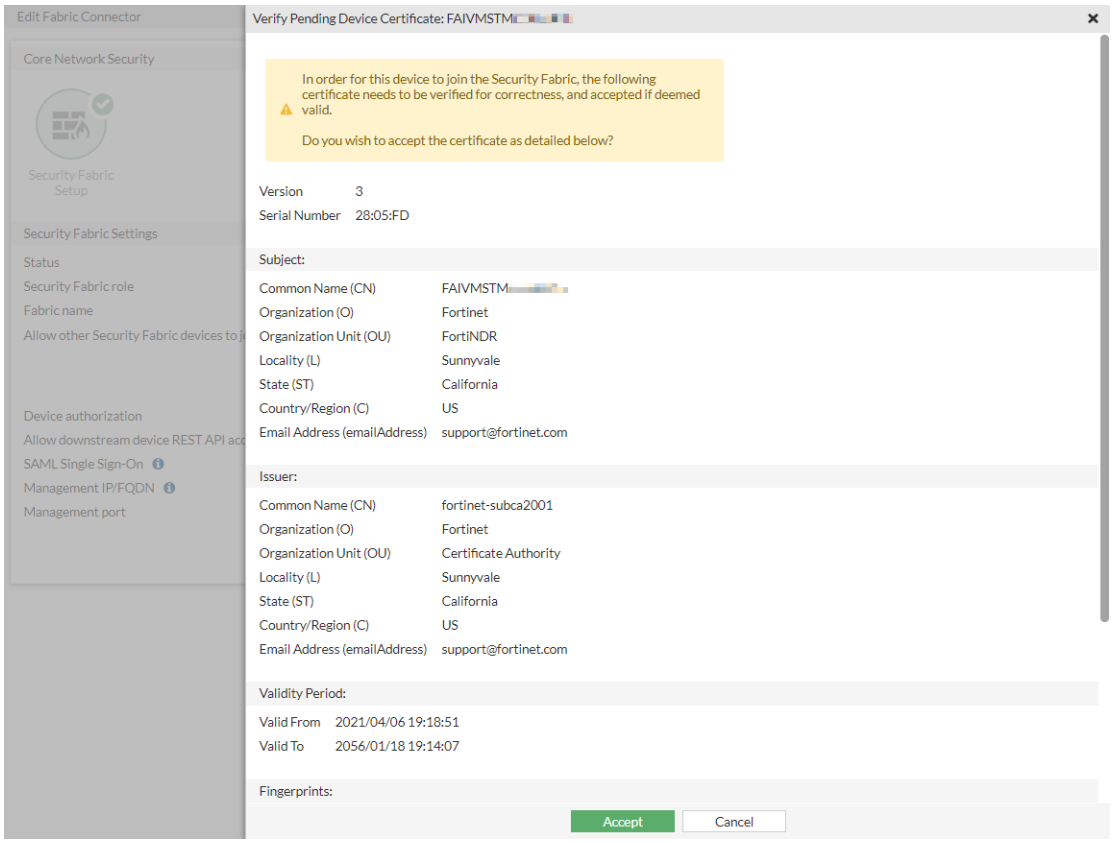
2. Install the FortiNDR appliance and activate the product with a valid license (see Registering products in the Asset Management Guide). A license file is provided after the product is registered.
3. In FortiNDR, go to *System* > *FortiGuard* and verify that the pre-trained models (engines) are up to date. Refer to the FortiGuard website for the latest FortiNDR ANN versions.

4. Configure and authorize the FortiGate in the FortiNDR GUI to join the Security Fabric:
   a. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric* card.
   b. Click the toggle to *Enable Security Fabric*.

c. Enter the IP addresses for the root FortiGate and the FortiNDR.



d. Click *OK*. The FortiNDR is now authorized.



5. Authorize the FortiNDR in FortiOS:

a. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.

b. In the topology tree, click the highlighted serial number and select *Authorize*.

c. Click *Accept* to verify the device certificate.

The *Security Fabric* widget on the dashboard also updates when the FortiNDR is authorized.

6. Go to *Security Fabric* > *Physical Topology* or *Security Fabric* > *Logical Topology* to view more information.

To add FortiNDR to the Security Fabric in the CLI:

1. Configure the interface to allow other Security Fabric devices to join:

```
config system interface
    edit "port1"
        ...
        set allowaccess ping https ssh http fgfm fabric
        ...
    next
end
```

2. Enable the Security Fabric:

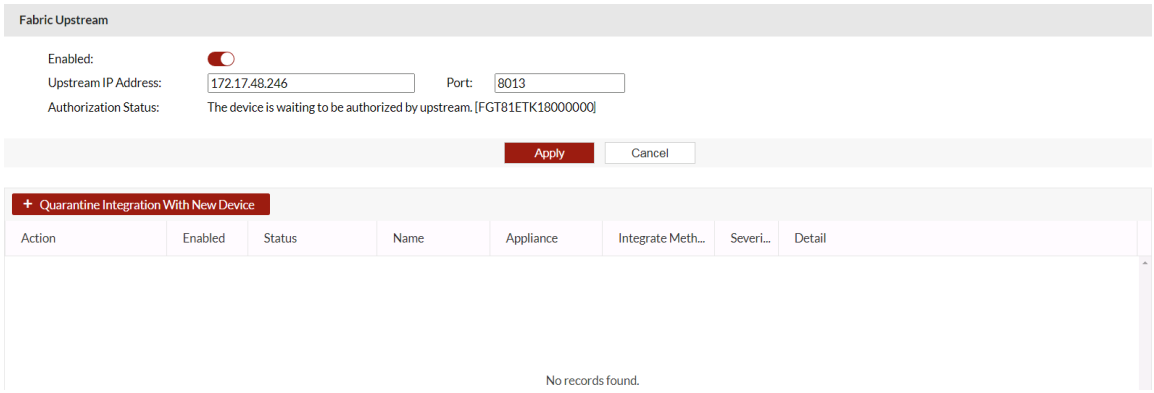
```
config system csf
    set status enable
    set group-name "fabric-ai"
end
```

3. In FortiNDR, configure the device to join the Security Fabric:

```
config system csf
    set status enable
    set upstream-ip 10.6.30.14
```

```
    set managment-ip 10.6.30.251
end
```

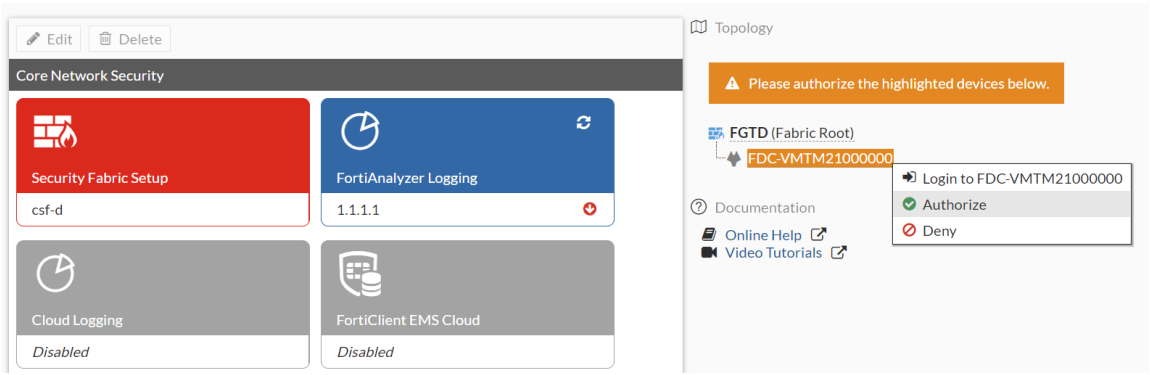
4. Authorize the FortiNDR in FortiOS:



```
config system csf
    set status enable
    set group-name "fabric-ai"
    config trusted-list
        edit "FAIVMSTM21000000"
            set authorization-type certificate
            set certificate "******************"
        next
    end
end
```

Configuring FortiDeceptor

FortiDeceptor can be added to the Security Fabric so it appears in the topology views and the dashboard widgets.

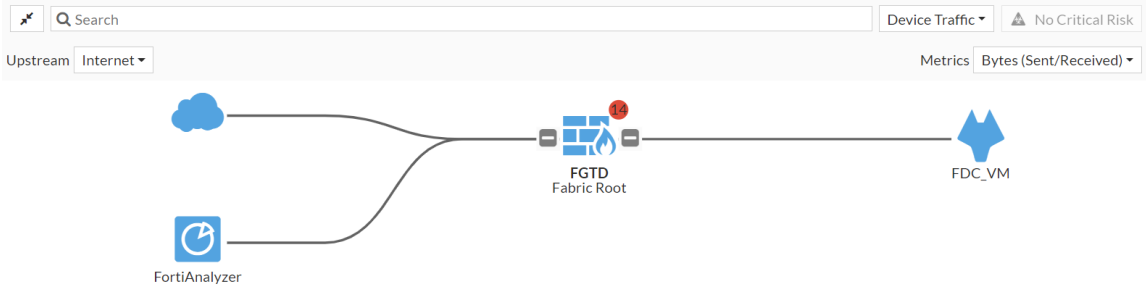


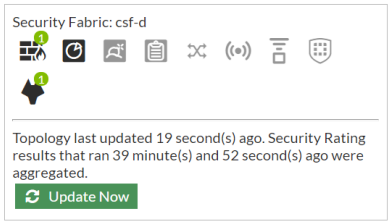
To add FortiDeceptor to the Security Fabric in the GUI:

1. Enable the Security Fabric (see Configuring the root FortiGate and downstream FortiGates on page 2378 for more details) with the following settings:
   a. Configure the interface to allow other Security Fabric devices to join.
   b. Enable *Allow downstream device REST API access* so the FortiDeceptor can communicate with the FortiGate, and select an *Administrator profile*. The minimum permission required for the selected *Administrator profile* is *Read/Write* for *User & Device* (`set authgrp read-write`).
2. In FortiDeceptor, integrate the device:
   a. Go to *Fabric* > *Integration Devices*.
   b. Click *Quarantine Integration With New Device*.
   c. Click the toggle to enable the device.
   d. For *Upstream IP Address*, enter the root FortiGate's management IP address.

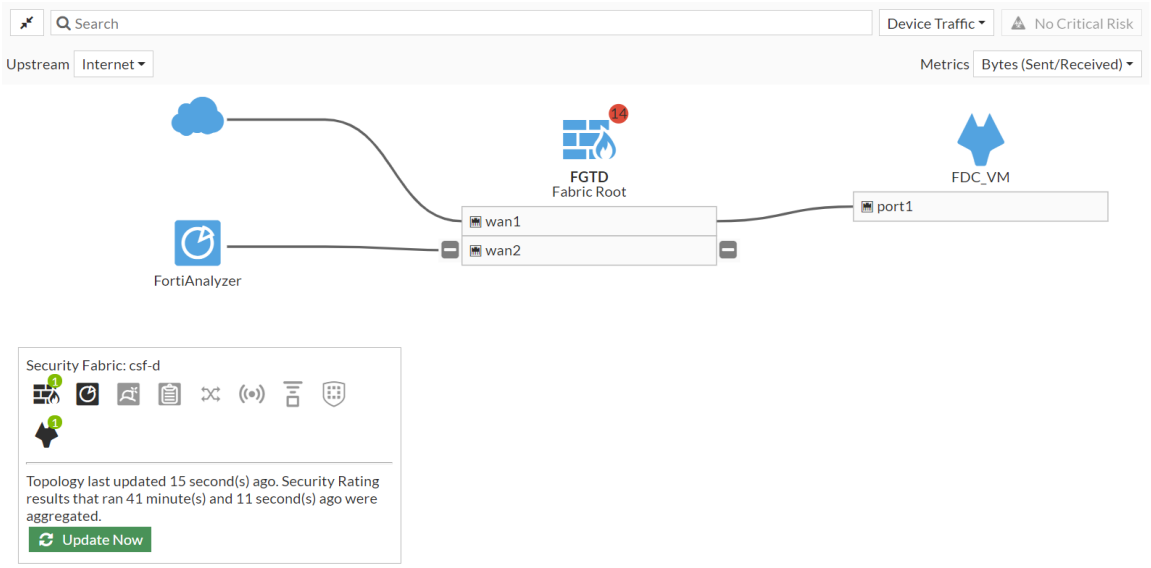
   e. Click *Apply*.

3. Authorize the FortiDeceptor in FortiOS:
   a. Go to *Security Fabric* > *Fabric Connectors*.
   b. In the topology tree, click the highlighted FortiDeceptor serial number and select *Authorize*.





The authorized device appears in the topology tree. Hover over the device name to view the tooltip.



The *Security Fabric* widget on the dashboard also updates when the FortiDeceptor is authorized.

4. Go to *Security Fabric* > *Physical Topology* or *Security Fabric* > *Logical Topology* to view more information.
Physical topology view:

Logical topology view:

To add FortiDeceptor to the Security Fabric in the CLI:

1. Configure the interface to allow other Security Fabric devices to join:

```
config system interface
    edit "wan1"
        ...
        set allowaccess ping https ssh snmp http fabric
        ...
    next
end
```

2. Enable the Security Fabric:

```
config system csf
    set status enable
    set group-name "csf-d"
    set downstream-access enable
    set downstream-accprofile "super_admin"
end
```

3. In FortiDeceptor, integrate the device:
   a. Go to *Fabric* > *Integration Devices*.
   b. Click *Quarantine Integration With New Device*.
   c. Click the toggle to enable the device.
   d. For *Upstream IP Address*, enter the root FortiGate's management IP address.
   e. Click *Apply*.
4. Authorize the FortiDeceptor in FortiOS:

```
config system csf
    set status enable
    set group-name "csf-d"
    config trusted-list
        edit "FDC-VMTM21000000"
            set serial "FDC-VMTM21000000"
        next
```

```
        end
    end
```

Configuring FortiWeb

A FortiWeb can be configured to join a Security Fabric through the root or downstream FortiGate. There are two methods to add a FortiWeb to the Security Fabric:

- Trigger the authorization on the FortiWeb side and authorize from the FortiOS side.
- Pre-authorize the FortiWeb from the FortiOS side.

Once the FortiWeb joins the Fabric, the following features are available:

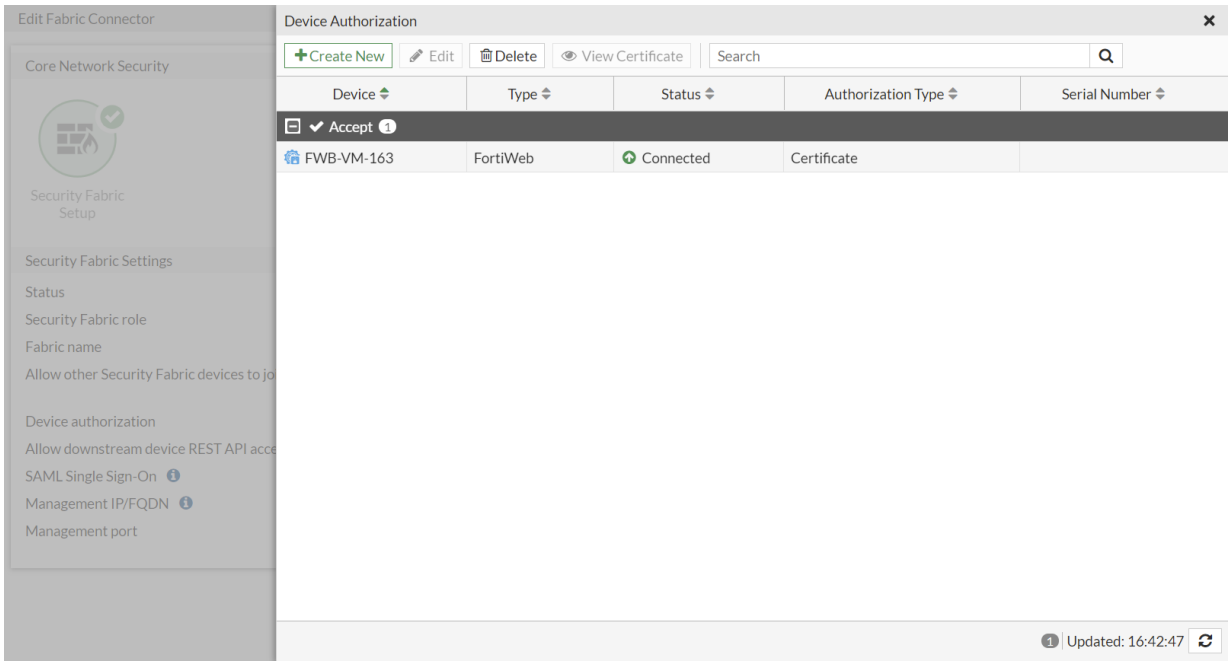
- View the FortiWeb on topology pages.
- Create a dashboard Fabric Device widget to view FortiWeb data.
- Configure single sign-on using SAML.

Triggering the authorization in FortiWeb

In this example, a FortiWeb triggers the authorization process, and then the device is approved in FortiOS. This is example assumes the Security Fabric has already been configured.

To trigger the Security Fabric authorization in FortiWeb:

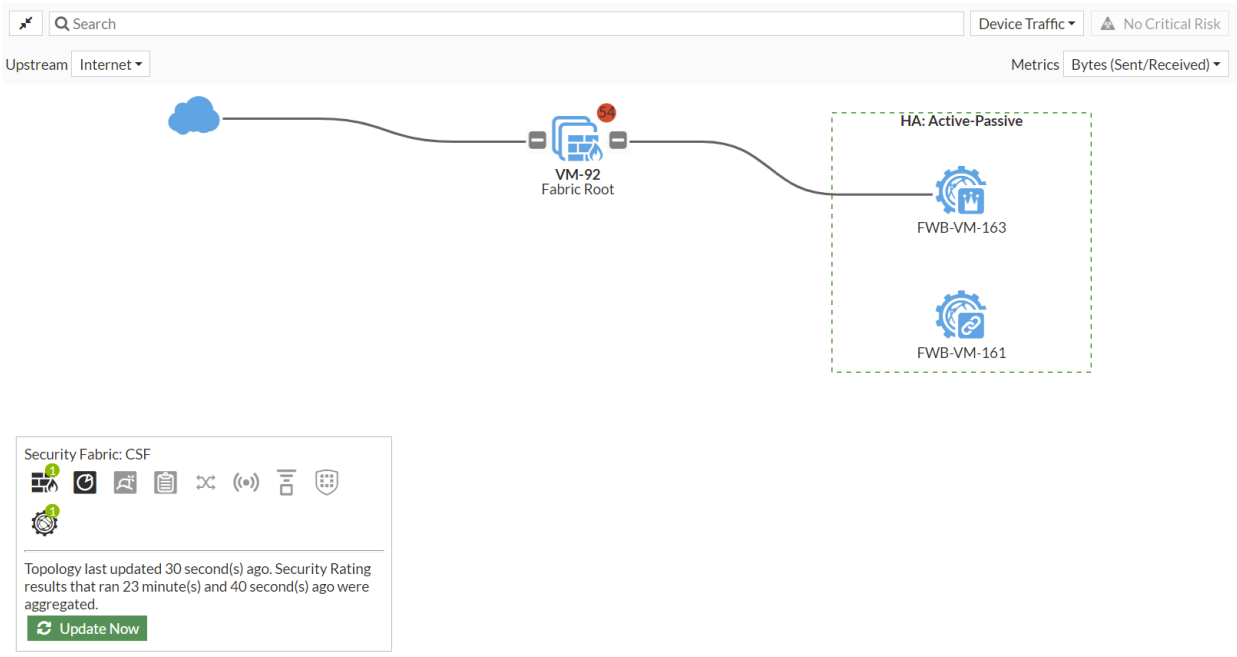
1. Edit the FortiGate *Fabric Connector* settings in FortiWeb (see Fabric Connector: Single Sign On with FortiGate). The *Connection Status* is currently *Authorize pending*.
2. In FortiOS, go to *Security Fabric* > *Fabric Connectors*.
3. In the topology tree, hover over the FortiWeb and click *Authorize*.
4. Verify that the certificate is correct, then click *Accept*.
5. In FortiWeb, verify that the FortiGate *Connection Status* is now *Authorized*.



Pre-authorizing the FortiWeb in FortiOS

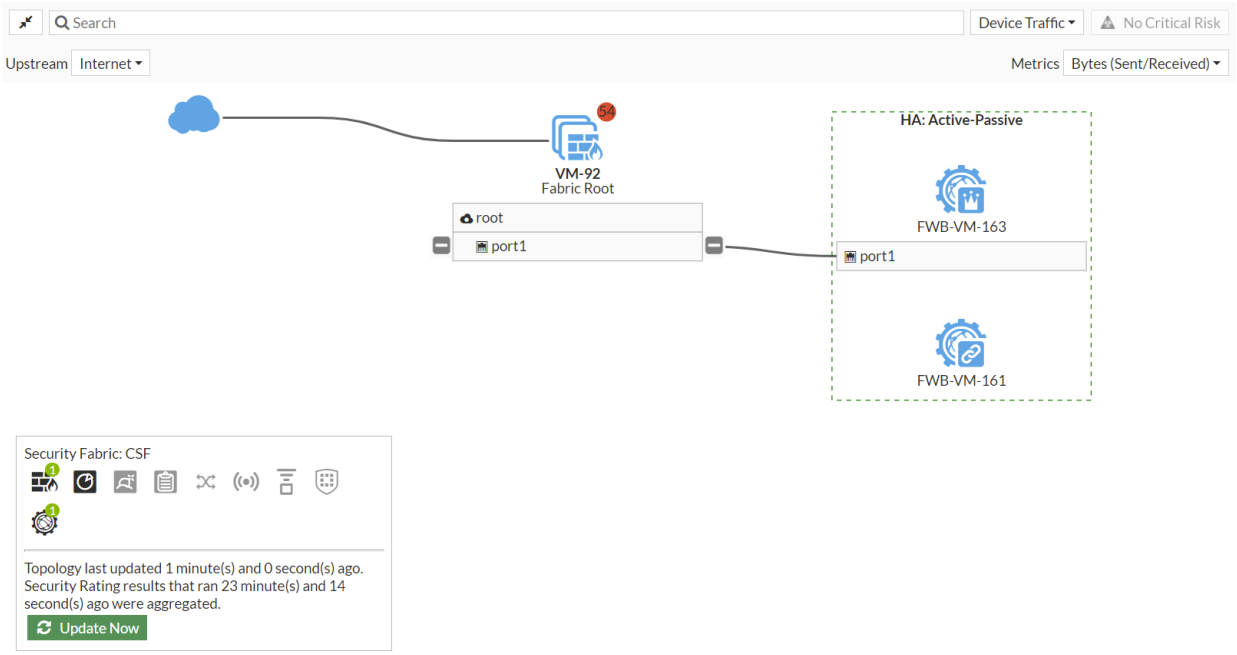
In this example, a FortiWeb is pre-authorized on the root FortiGate using certificate authorization. This is example assumes the Security Fabric has already been configured.

To authorize a FortiWeb to join the Security Fabric in FortiOS:



1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. Beside *Device authorization*, click *Edit*. The *Device authorization* pane opens.
3. Add the FortiWeb:
   a. Click *Create New* and enter a device name.
   b. For *Authorization type*, select *Certificate*.
   c. Click *Browse* to upload the certificate.
   d. For *Action*, select *Accept*.

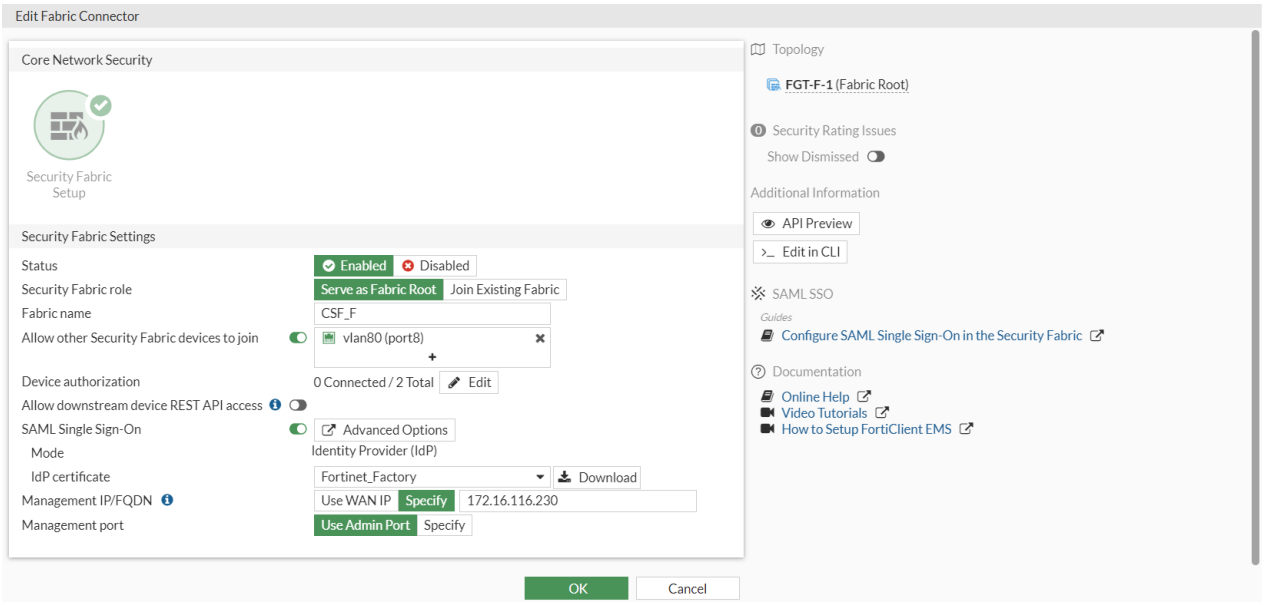
e. Click *OK*. The FortiWeb appears in the table.



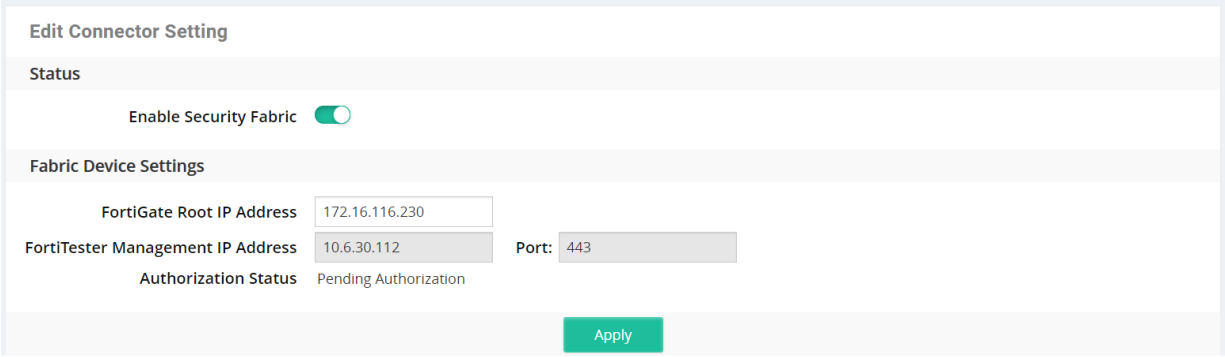
4. Go to *Security Fabric* > *Physical Topology* or *Security Fabric* > *Logical Topology* to view more information.

Physical topology view:

Logical topology view:

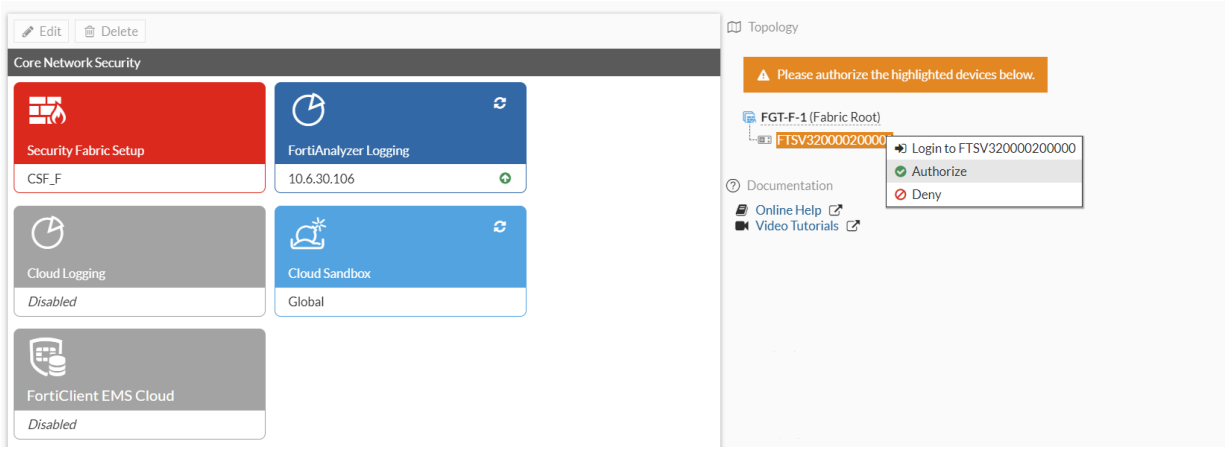


Configuring FortiTester

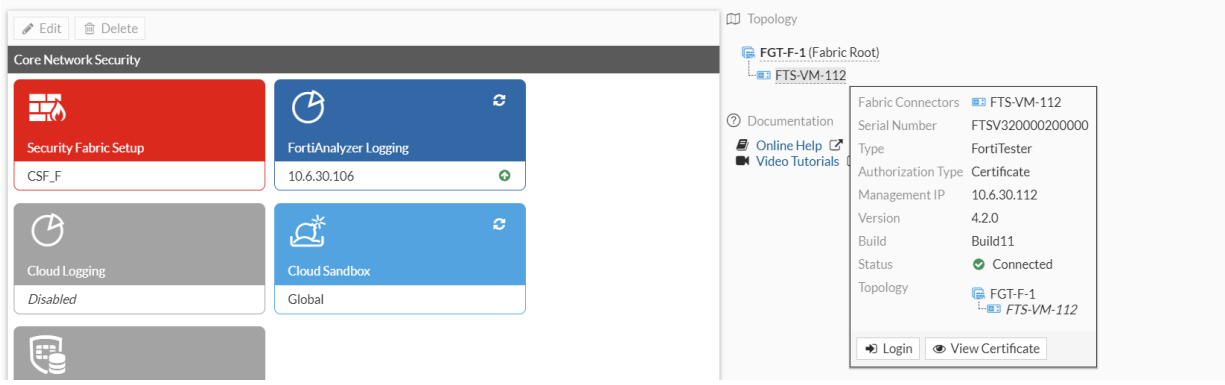


FortiTester can be added to the Security Fabric and authorized from the Security Fabric topology views. Once added, the FortiTester will appear in the *Security Fabric* widget on the dashboard. A FortiTester can be added to the dashboard as a Fabric device widget.

To add FortiTester to the Security Fabric in the GUI:



1. Enable the Security Fabric and configure the interface to allow other Security Fabric devices to join (see Configuring the root FortiGate and downstream FortiGates on page 2378).



2. In FortiTester, enable the Security Fabric:
   a. Go to *System Settings* > *Security Fabric* > *Settings*.
   b. Click the toggle to enable the device (*Enable Security Fabric*).
   c. Enter the *FortiGate Root IP Address*.

   d. Click *Apply*.
3. Authorize the FortiTester in FortiOS:
   a. Go to *Security Fabric* > *Fabric Connectors*.
   b. In the topology tree, click the highlighted FortiTester serial number and select *Authorize*.

   The authorized device appears in the topology tree. Hover over the device name to view the tooltip.

   The *Security Fabric* widget on the dashboard also updates when the FortiTester is authorized.
4. Go to *Security Fabric* > *Physical Topology* or *Security Fabric* > *Logical Topology* to view more information.
   Physical topology view:

Logical topology view:

To add FortiTester to the Security Fabric in the CLI:

1. Configure the interface to allow other Security Fabric devices to join:

```
config system interface
    edit "port8"
        ...
        set allowaccess ping https ssh http fgfm fabric
        ...
    next
end
```

2. Enable the Security Fabric:

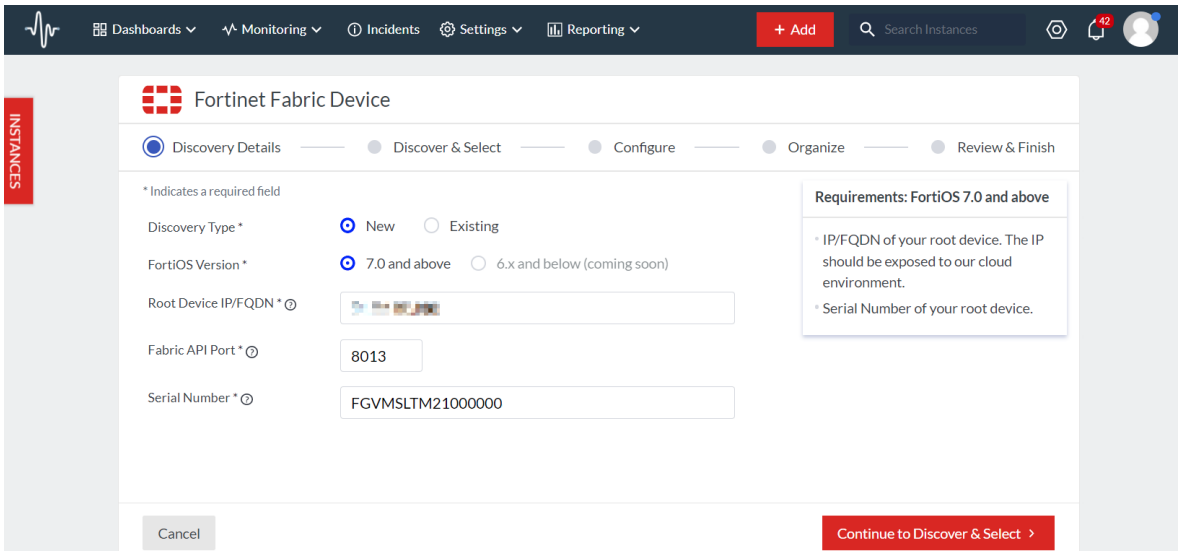
```
config system csf
    set status enable
    set group-name "CSF_F"
end
```

3. In FortiTester, enable the Security Fabric:

```
config system csf
    set ip 172.16.116.230
    set port 8013
    set status enable
end
```

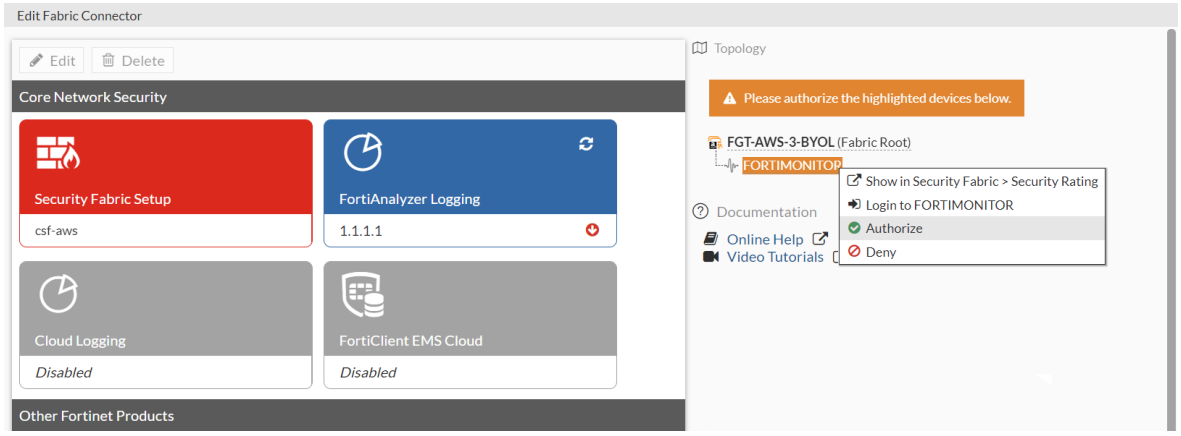
4. Authorize the FortiTester in FortiOS:

```
config system csf
    set status enable
    set group-name "CSF_F"
    config trusted-list
        edit "FTSV320000200000"
            set authorization-type certificate
            set certificate "********************"
        next
    end
end
```



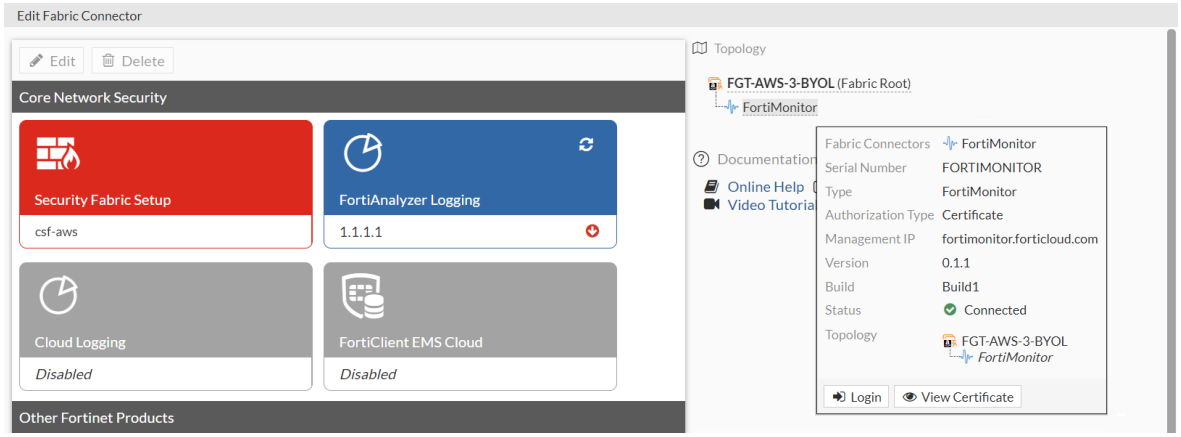
Configuring FortiMonitor

FortiMonitor can be added to the Security Fabric. When a FortiMonitor joins the Security Fabric and is authorized, it appears in the Fabric topology pages.

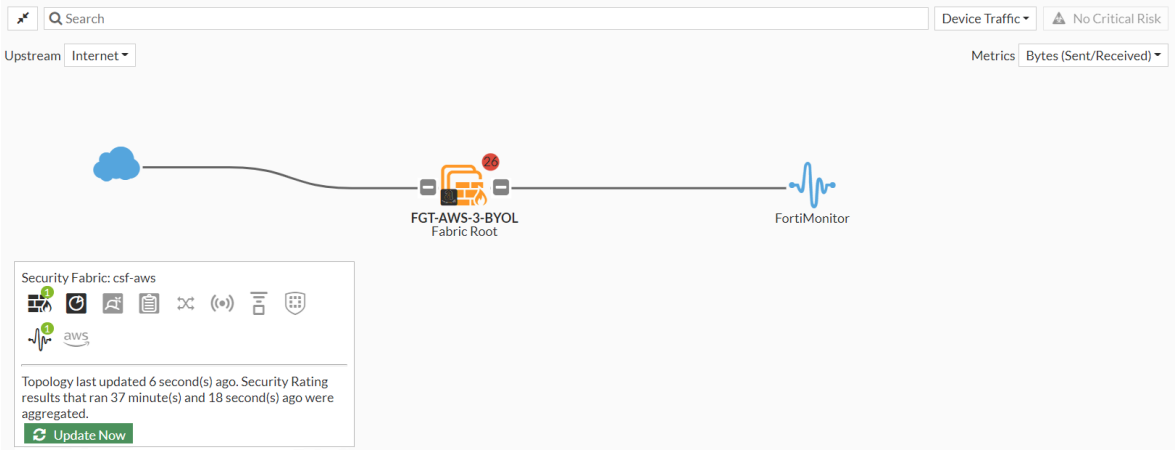


To add FortiMonitor to the Security Fabric:

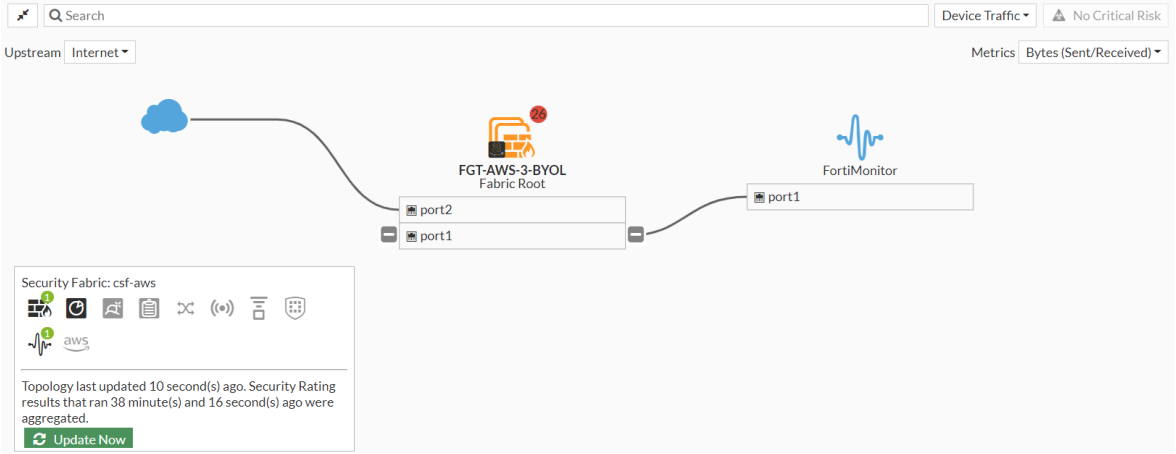
1. Enable the Security Fabric (see Configuring the root FortiGate and downstream FortiGates on page 2378) with the following settings:
   a. Configure the interface to allow other Security Fabric devices to join.
   b. Enable *Allow downstream device REST API access* and select an *Administrator profile*.
2. In FortiMonitor, start configuring the device to join the Security Fabric (see Enable Security Fabric monitoring for detailed instructions):



a. Complete the *Discovery Details* page.



3. Authorize the FortiMonitor in FortiOS:
   a. Go to *Security Fabric* > *Fabric Connectors*.
   b. In the topology tree, click the highlighted FortiMonitor and select *Authorize*.

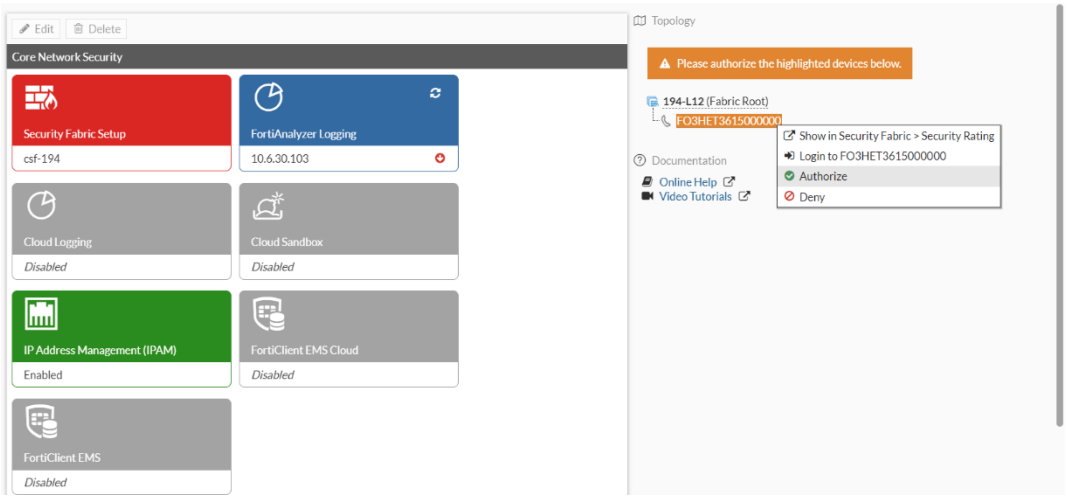


The authorized device appears in the topology tree. Hover over the device name to view the tooltip.

4. Go to *Security Fabric* > *Physical Topology* or *Security Fabric* > *Logical Topology* to view more information.
   Physical topology view:

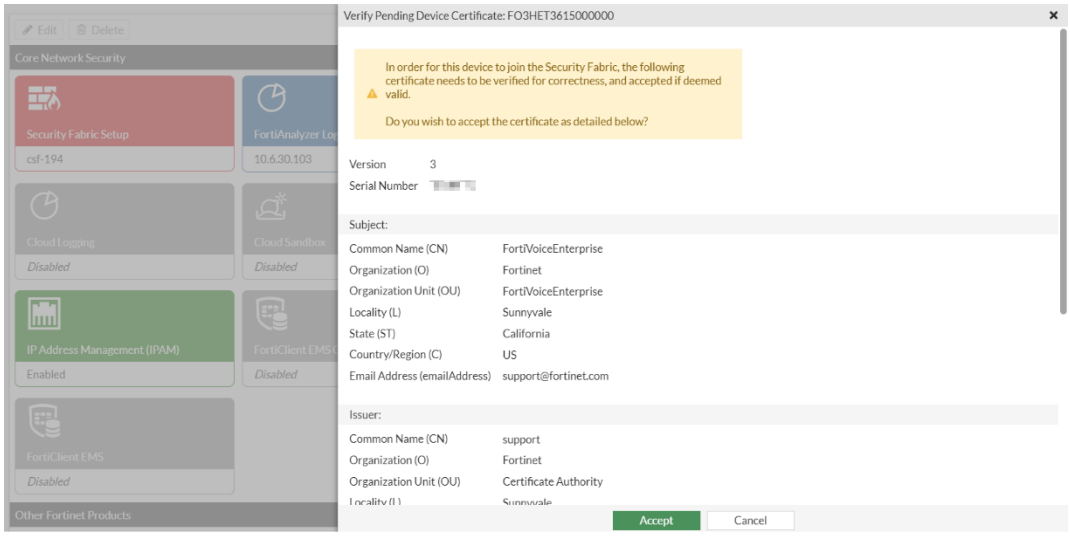
Logical topology view:

5. In FortiMonitor, complete the device configuration (see Enable Security Fabric monitoring for detailed instructions).



Configuring FortiVoice

A FortiVoice can be added to the Security Fabric on the root FortiGate. Once the FortiVoice is added and authorized, you can log in to the device from the Security Fabric topology pages or the topology tree. A FortiVoice can be authorized in FortiOS, or can be pre-authroized with its serial number or certificate. A FortiVoice can be added to the dashboard as a Fabric device widget.

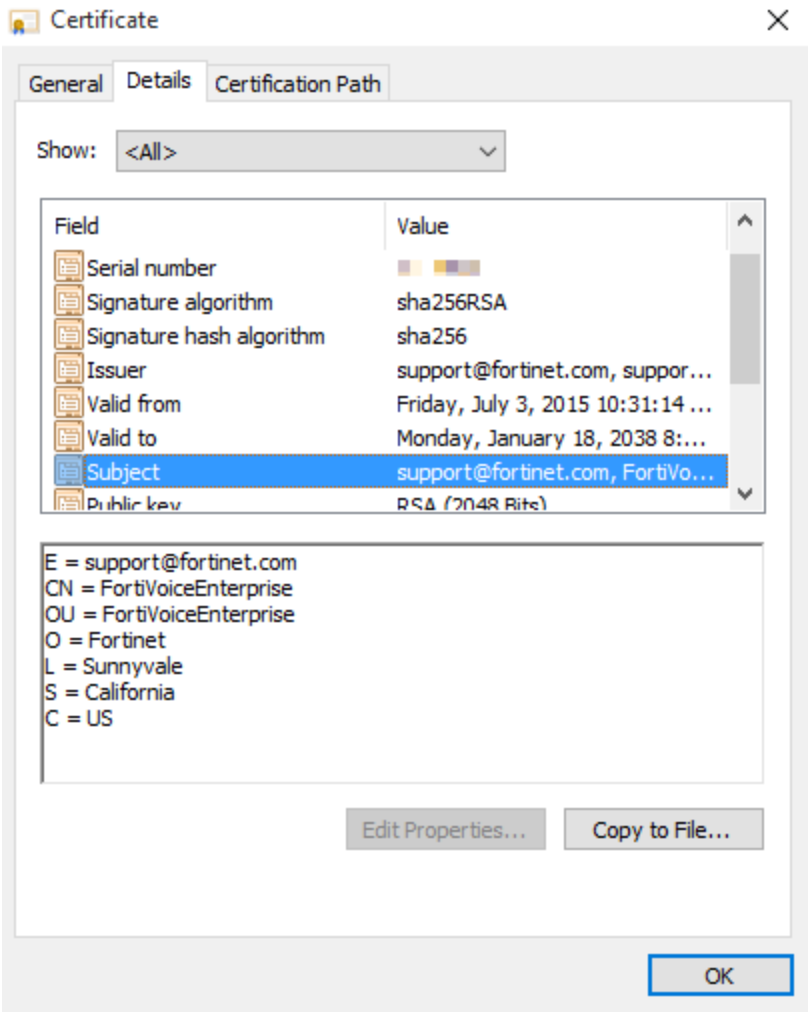


Authorizing using the FortiOS GUI

To authorize a FortiVoice to join the Security Fabric:

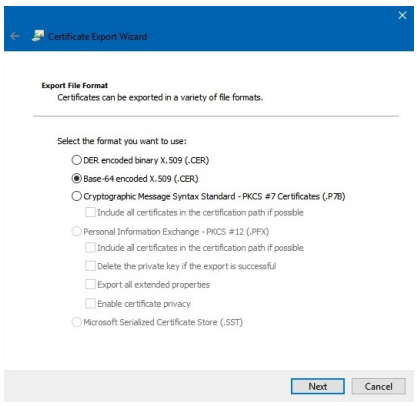
1. On the FortiVoice, enable the Security Fabric. See Enabling Security Fabric in the FortiVoice Phone System Administration Guide.
2. On the root FortiGate, go to *Security Fabric* > *Fabric Connectors*. The FortiVoice is highlighted in the topology list in the right panel with the status *Waiting for Authorization*.
3. Click the highlighted FortiVoice and select *Authorize*.

4. Verify that the certificate is correct, then click *Accept*.



Pre-authorizing using the FortiVoice certificate

A FortiVoice can be pre-authorized using its serial number or certificate. When pre-authorizing, the FortiVoice can join at any time, and it will not need to be authorized in FortiOS. In the following example, the FortiVoice is pre-authorized using a certificate.

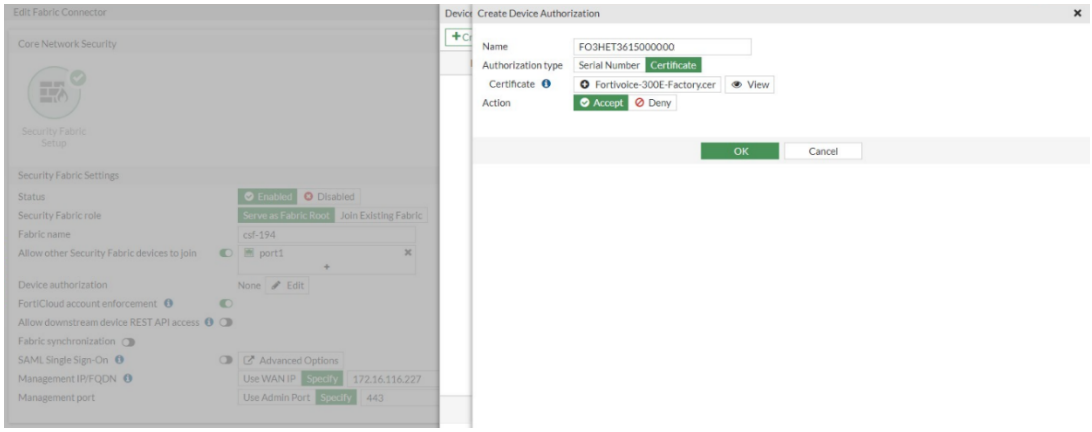


To pre-authorize a FortiVoice using a third-party or default certificate in the GUI:

1. Log in to the FortiVoice.
2. Download the certificate. For example, in Chrome:
   a. In the left side of the address bar, click the icon to view the site information.
   b. Click *Certificate*.
   c. In the *Certificate* window, click the *Details* tab, then click *Copy to File*.

d. The *Certificate Export Wizard* opens. Click *Next*.

e. Set the format to *Base-64 encoded X.509 (.CER)*, then click *Next*.



f. Browse to the folder location, enter a file name, then click *Next*.

g. Click *Finish*, then click *OK* to close the wizard.

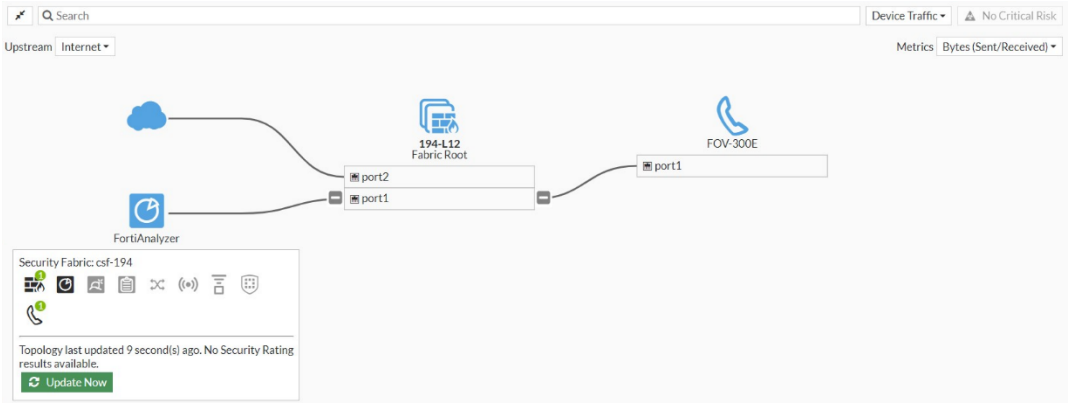
3. In FortiOS, go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.

4. Beside *Device authorization*, click *Edit*.

5. Click *Create New* and enter the following:
   a. In the *Name* field, enter the FortiVoice serial number.
   b. Set the *Authorization type* to *Certificate*.
   c. Upload the .CER file.

   d. Click *OK*, then close the *Device authorization* pane.

To pre-authorize a FortiVoice using a third-party or default certificate in the CLI:



```
config system csf
    config trusted-list
        edit "FOV-300E"
            set action accept
            set authorization-type certificate
            set certificate "-----BEGIN CERTIFICATE-----
...
<encrypted_certificate_data>
...
-----END CERTIFICATE-----"
        next
    end
end
```

To verify the connection status:

1. After the FortiVoice is authorized, go to *Security Fabric* > *Physical Topology* and confirm that it is included in the topology.

2. Go to *Security Fabric* > *Logical Topology* and confirm the FortiVoice is also displayed there.

Logging in to the FortiVoice using the Security Fabric

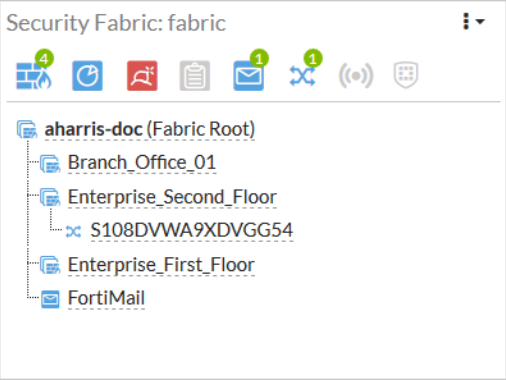
To log in using a topology page:

1. Go to *Security Fabric* > *Physical Topology* or *Security Fabric* > *Logical Topology*.
2. Click on the FortiVoice and select *Login to <serial_number>*.

To log in using the Fabric Connectors page:

1. Go to *Security Fabric* > *Fabric Connectors*.
2. In the topology tree, click the FortiVoice and select *Login to <serial_number>*.

Using the Security Fabric



Dashboard widgets

Security Fabric widgets can be added to FortiGate dashboards, including:

- Security Fabric status on page 2444
- Fabric Device on page 2444
- FortiGate Cloud on page 2445

Security Fabric status

The Security Fabric status widget shows a summary of the devices in the Security Fabric.

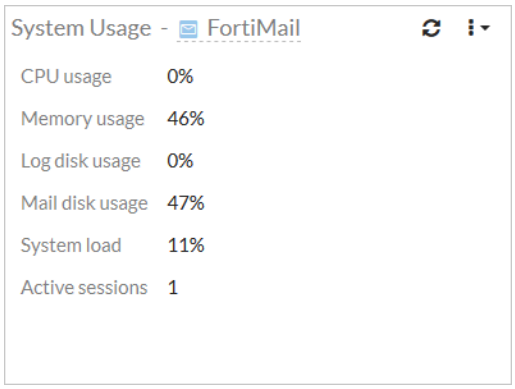
Hover the cursor over the top icons to view pop-ups showing the statuses of the devices in the fabric.

The device tree shows devices that are connected, or could be connected, to you Security Fabric, according to the following color scheme:

- Blue: connected to the network
- Gray: not configured or not detected
- Red: no longer connected or not authorized

Hover over a device in the tree to view details about the device, such as it's serial number, operation mode, IP address, CPU and memory usage, and others, depending on the device type.

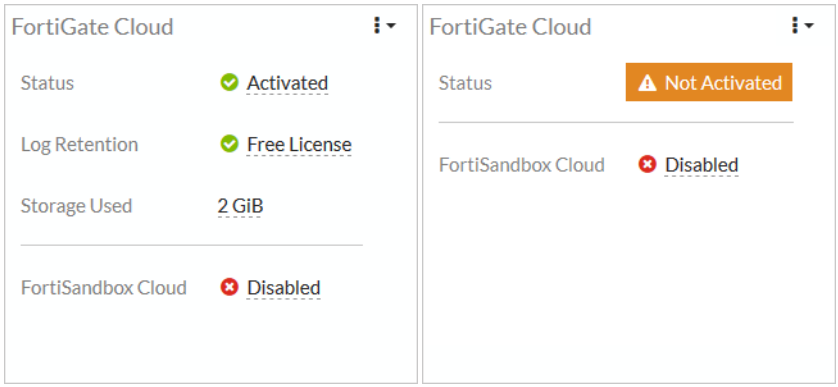
Unauthorized FortiAP and FortiSwitch devices are highlighted in the list, and can be authorized by clicking on the device name.



Fabric Device

A Fabric Device widget shows statistics and system information about the selected fabric device. Widgets can be added for various Fabric devices including FortiMail, FortiNDR (formerly FortiAI), and FortiDeceptor.

For a FortiMail device, the widget can show:



- Mail Statistics: a chart of the total messages and total spam messages over time.
- Statistics Summary: a pie chart summarizes mail statistics.
- System Information: The FortiMail System Information widget
- System Usage: System usage information, such as CPU, memory, and disk usage, as well as the number of active

sessions.

FortiGate Cloud

The FortiGate Cloud widget shows the FortiGate Cloud status and information. If your account is not activated, you can activate it from the widget.

To activate your FortiGate Cloud account:

1. Click on the *Not Activated* button and select *Activate*. The *Activate FortiGate Cloud* pane opens.
2. If you already have an account:
   a. Fill in your email address, password, country or region, and reseller.
   b. Click *OK*.
3. If you are creating an account:
   a. In the *FortiCloud* field select *Create Account*.
   b. Fill in all of the required information.
   c. Click *OK*.

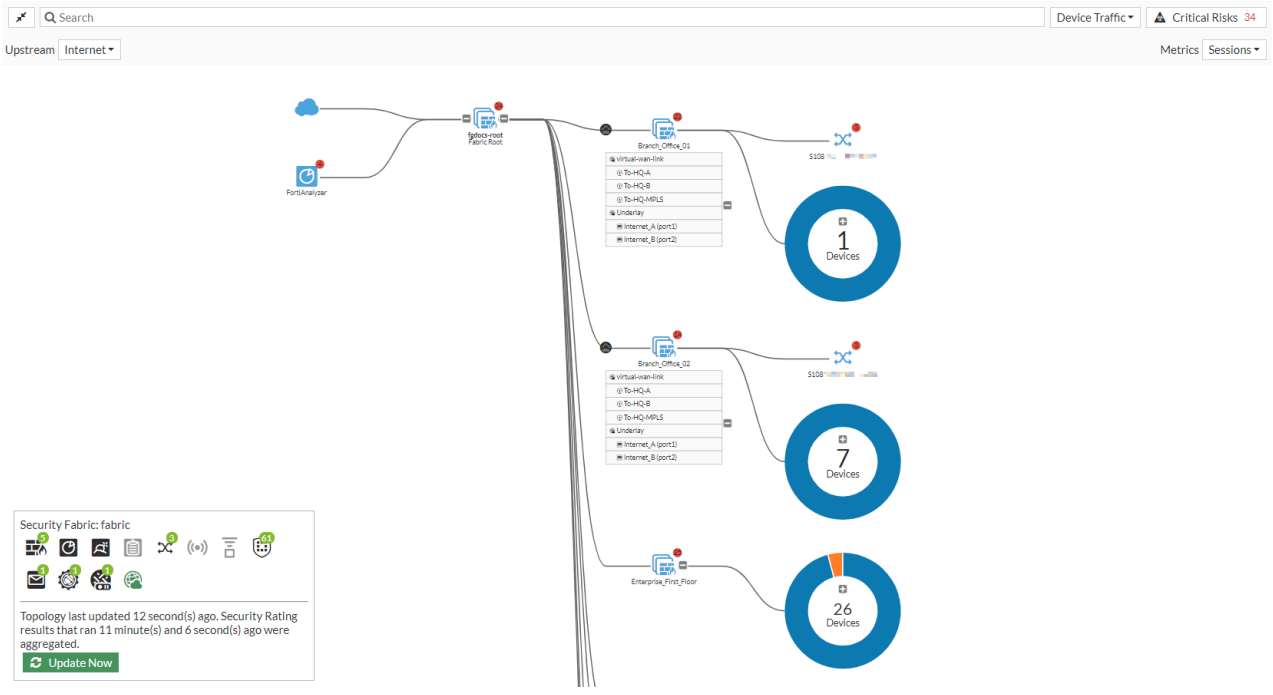
Topology

The full Security Fabric topology can be viewed on the root FortiGate. Downstream FortiGate devices' topology views do not include upstream devices.

The *Physical Topology* page shows the physical structure of your network, including all connected devices and the connections between them. The *Logical Topology* page shows information about the interfaces that connect devices to the Security Fabric.

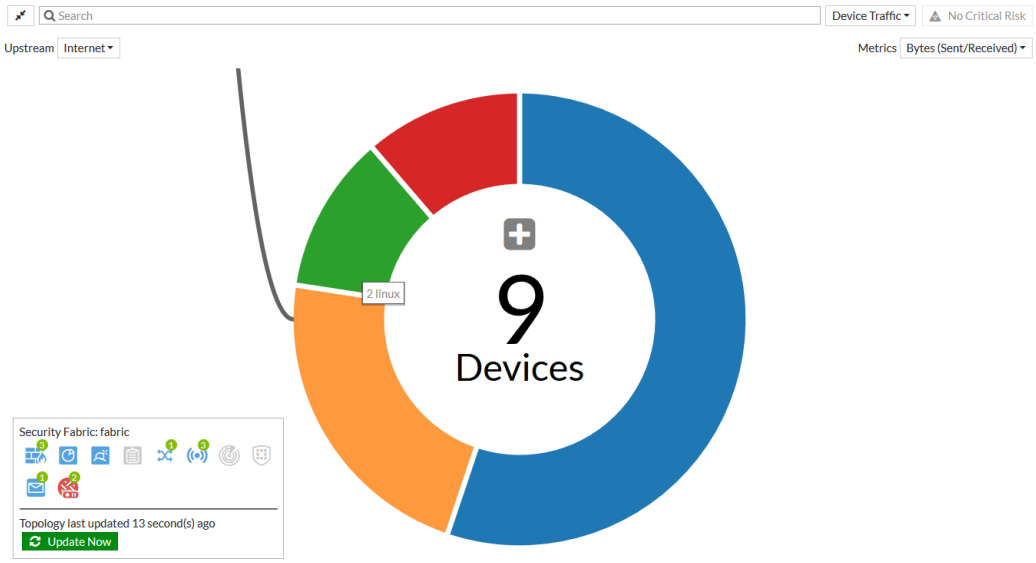
In both topology pages, you can use filtering and sorting options to control the information that is shown. Hover the cursor over a device icon, port number, or endpoint to open a tooltip that shows information about that specific device, port, or endpoint. Right-click on a device to log into, configure, or deauthorize it. Right-click on an endpoint to perform various tasks, such as drilling down for more details in FortiView, quarantining the host, and banning the IP address.

The small number that might be shown in the top right corner of a device icon is the number of security ratings recommendations or warnings for that device. The circle color indicates the severity of the highest security rating check that failed. Clicking it opens the *Security Rating* page. See Security rating on page 2507 for more information.



Views

From the dropdown list beside the search bar, select one of the following views:



- *Device Traffic*: organize devices by traffic.
- *Device Count*: organize devices by the number of devices connected to it.
- *Device Operating System*: organize devices by operating system.
- *Device Hardware Vendor*: organize devices by hardware vendor.
- *Risk*: only include devices that have endpoints with medium, high, or critical risk values of the specified type: *All*, *Compromised Host*, *Vulnerability*, or *Threat Score*.
- *No Devices*: do not show endpoints.

Endpoint groups

The *Device Traffic* and *Device Count* views display endpoint groups as donut charts, with the total number of endpoints in the group in the center of the chart. Each sector of the donut chart represents a different endpoint operating system.

To zoom in on a donut chart, click any chart sector. Each sector represents a different endpoint OS. Hovering over each sector allows you to see the OS that the sector represents and the number of endpoints that have that OS installed.

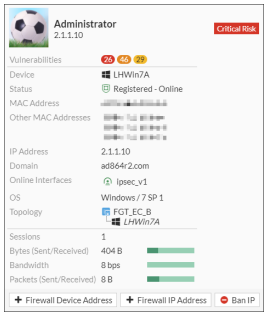
In this example, the endpoint group contains a total of nine endpoints, with the following OSes installed:

Donut sector color	OS	Number of endpoints
Orange	Linux	2
Green	FortiMail	1
Red	FortiManager	1
Blue	Other	5

To view the endpoint group in a bubble pack display, click the + button in the center of the donut chart. You can view each individual endpoint in the bubble pack view.

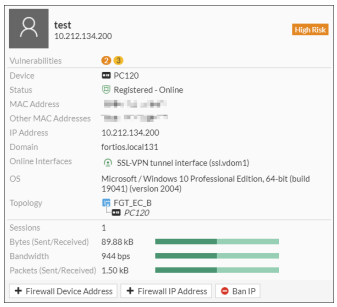
FortiAP and FortiSwitch devices

Newly discovered FortiAP and FortiSwitch devices are initially shown in the topologies with gray icons to indicate that they have not been authorized. To authorize a device, click on the device icon or name and select *Authorize*. Once authorized, the device icon will turn blue.



Right-click on an authorized FortiAP device to *Deauthorize* or *Restart* the device. Right-click on a FortiSwitch device to *Deauthorize*, *Restart*, or *Upgrade* the device, or to *Connect to the CLI*.

FortiAP and FortiSwitch links are enhanced to show link aggregation groups for the inter-switch link (ISL-LAG). To differentiate them from physical links, ISL-LAG links are shown with a thicker line. The endpoint circles can also be used as a reference to identify ISL-LAG groups that have more than two links.



Managed clients connected over a VPN

When managed clients are connected over a VPN, EMS collects user information about these registered clients, such as the VPN connection information. The FortiGate can synchronize this user information from EMS and display it in the logical topology view to provide a detailed picture of clients and their associated VPN interfaces.

Client using an IPsec VPN interface:

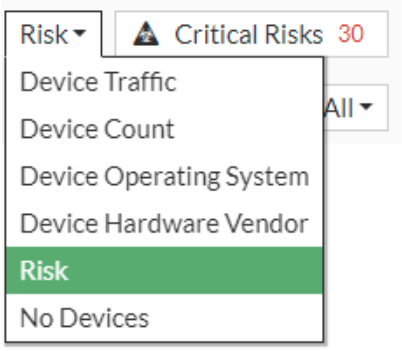
Client using an SSL VPN interface:

Critical risks

Click the *Critical Risks* button to see a list of endpoints that are deemed critical risks, organized by threat severity. These are the red endpoints in the current topology view.

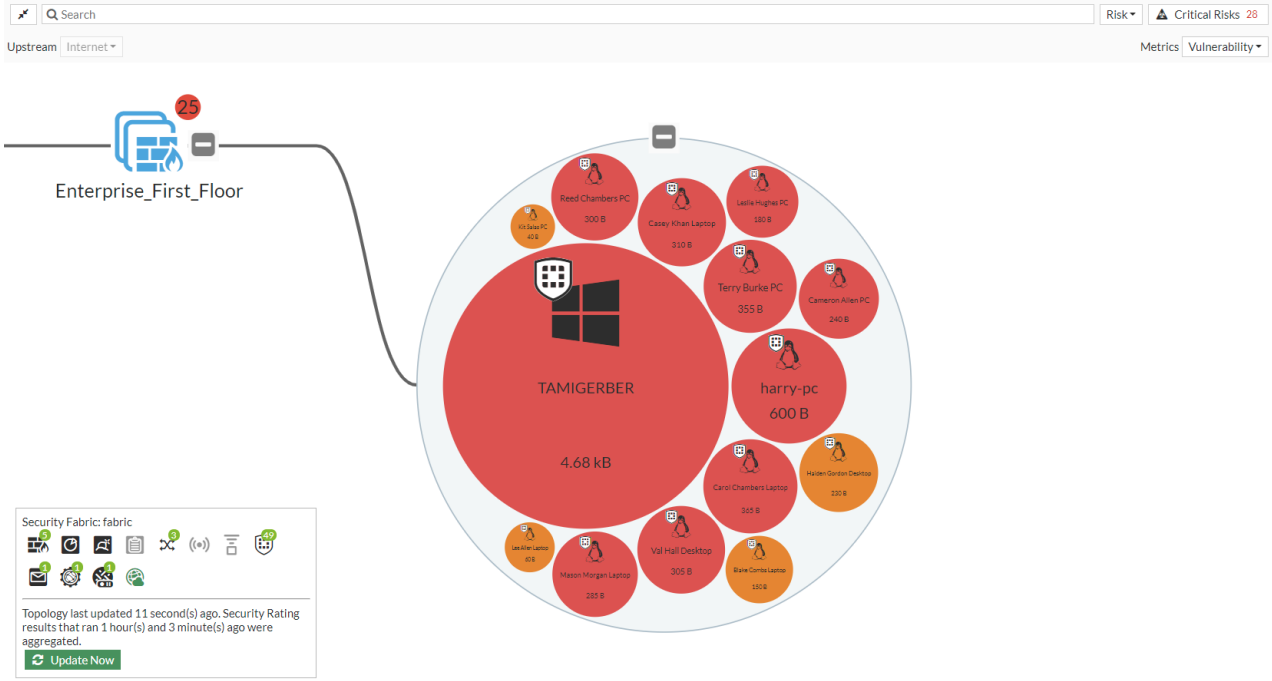
For each endpoint, the user's photo, name, IP address, email address, and phone number are shown. The number of vulnerabilities of each severity is shown, and if the IoC verdict is that the endpoint is compromised.

If applicable, the endpoint's host can be quarantined (click *Quarantine Host*) or their IP address can be banned (click *Ban IP*).



The dropdown menu also provides options to drill down to more information on compromised hosts or endpoint vulnerabilities.

Consolidated risk view

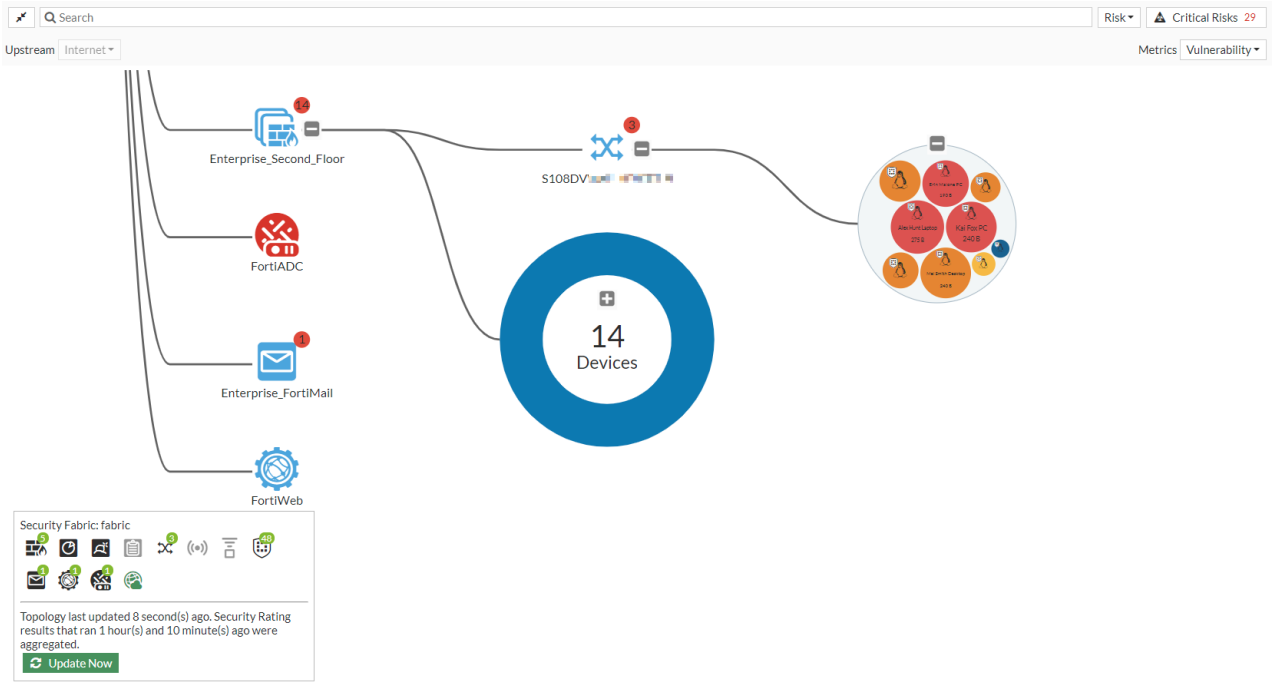


The consolidated *Risk* view mode displays different risks within the Security Fabric topology. You can use the *Risk* view mode to filter threats by *Compromised Hosts*, *Vulnerability*, and *Threat Score*.

To access the consolidated risk view mode:

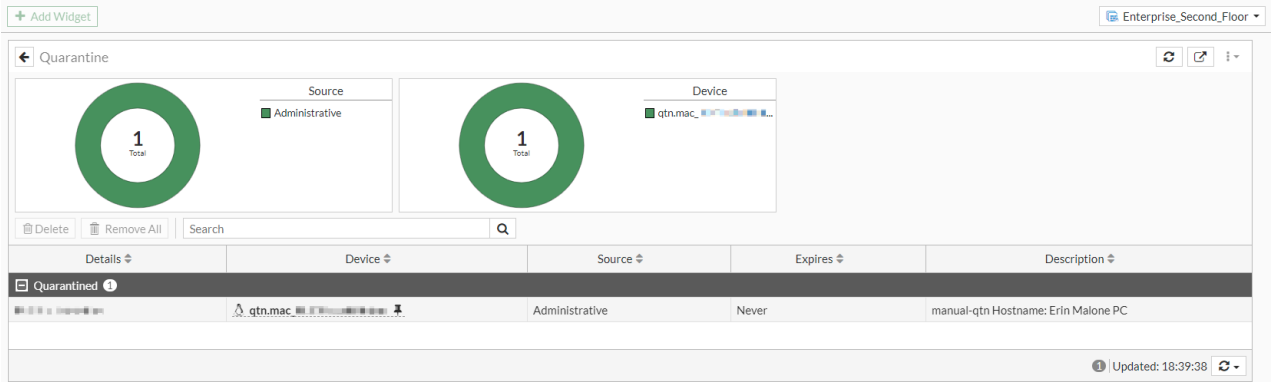
1. On one of the topology pages, in the view option dropdown list beside the search bar, select *Risk*.

2. Select one of the following options from the *Risk Type* dropdown menu:
   a. *All*
   b. *Compromised Hosts*
   c. *Vulnerability*
   d. *Threat Score*
3. When devices fit into the risk metric, they will appear in the endpoint groups. Click the + in the endpoint group to display the devices in a bubble chart.



Viewing and controlling network risks in topology view

On the physical and logical topology pages, you can view and control compromised hosts. Compromised hosts behind a FortiSwitch or FortiAP can be quarantined.



To view a compromised endpoint host:

1. Test that FortiGate detects a compromised endpoint host by opening a browser on the endpoint host and entering a malicious website URL. The browser displays a *Web Page Blocked!* warning and does not allow access to the website.
2. On the root FortiGate, go to *Security Fabric* > *Physical Topology* or *Security Fabric* > *Logical Topology*. Expand the endpoint group connected to a FortiSwitch or FortiAP.
   The endpoint host connected to the switch is highlighted in red. Mouse over the endpoint host to view a tooltip that shows the IoC verdict. The endpoint host is compromised.

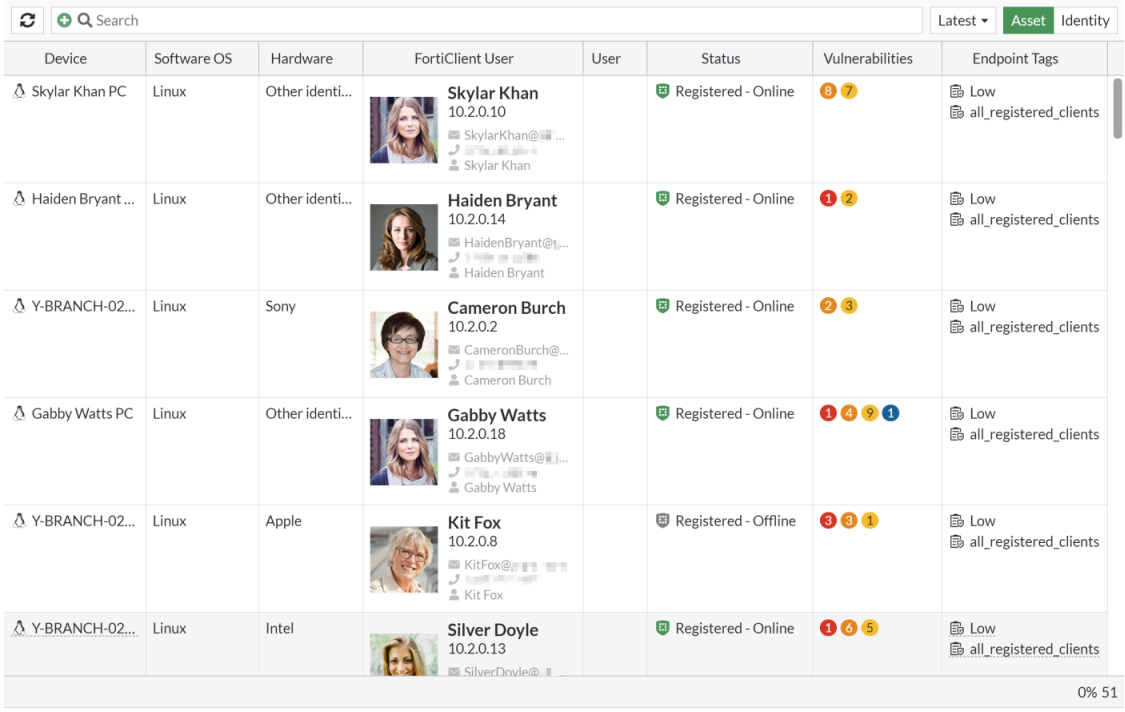
To quarantine a compromised endpoint host:

1. On the *Physical Topology* or *Logical Topology* page, right-click the endpoint host and select *Quarantine Host*.
   A dialog displays the FortiGate, host MAC address, and description of the host to be quarantined. Quarantine entries for each MAC address will be created on the FortiGate that the FortiSwitch or FortiAP is connected to.
2. Click *OK*.
3. Go to *Dashboard* > *User & Devices* and click the *Quarantine* widget to expand it.
4. In the top-right corner, use the dropdown to select the FortiGate in which this host was quarantined. In this example, it is the Enterprise_Second_Floor FortiGate.

5. On the endpoint host, open a browser and visit a website such as https://www.fortinet.com/. If the website cannot be accessed, this confirms that the endpoint host is quarantined.

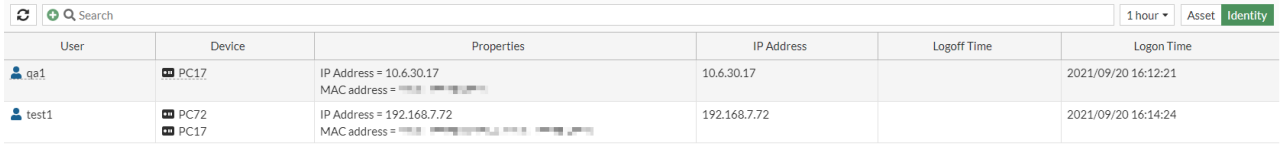
To show the quarantined device from the CLI:

1. Log in to the downstream device where the host was quarantined (Enterprise_Second_Floor).
2. Enter the following show command:



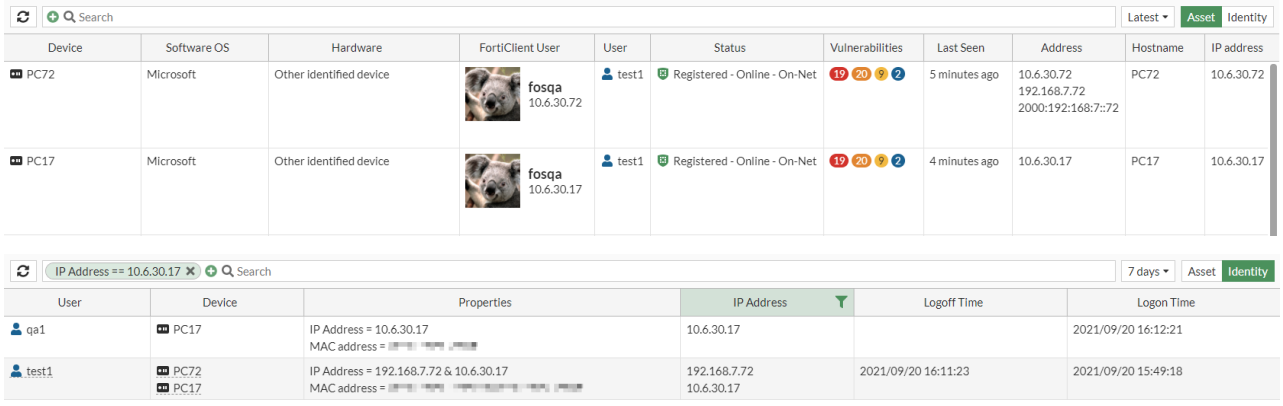
```
Enterprise_Second_Floor # show user quarantine
config user quarantine
    set firewall-groups "QuarantinedDevices"
    config targets
        edit "Erin Malone PC"
            set description "Manually quarantined"
            config macs
                edit **:**:**:**:**:**
                    set description "manual-qtn Hostname: Erin Malone PC"
                next
            end
        next
    end
end
```

Asset Identity Center page

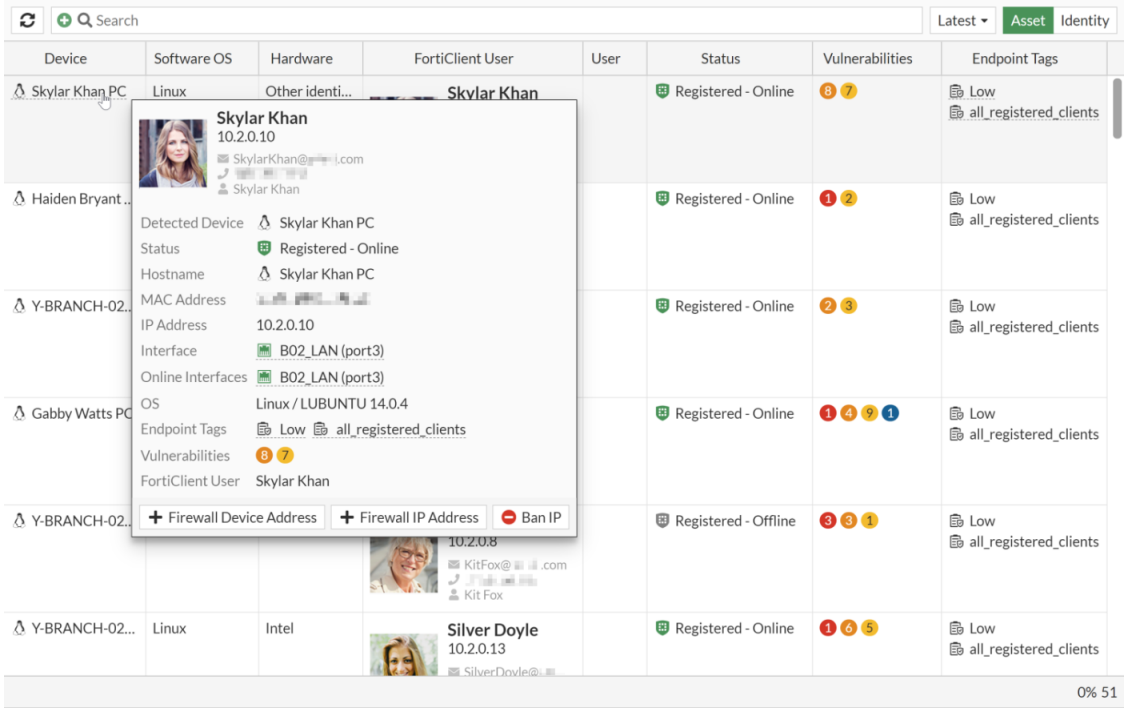


The *Asset Identity Center* page unifies information from detected addresses, devices, and users into a single page, while building a data structure to store the user and device information in the backend. *Asset* view groups information by *Device*, while *Identity* view groups information by *User*. Hover over a device or a user in the GUI to perform different actions relevant to the object, such as adding a firewall device address, adding an IP address, banning the IP, quarantining the host, and more.

To view the Asset Identity Center page:



1. Go to *Security Fabric* > *Asset Identity Center*.
2. Click *Asset* to view information by device. The default columns are *Device*, *Software OS*, *Hardware*, *FortiClient User*, *User*, *Status*, *Vulnerabilities*, *Endpoint Tags*, and *Last Seen*. The optional columns are *Address*, *Firewall Address*, *Hostname*, *IP Address*, and *Server*.



3. Click *Identity* to view information by user. The default columns are *User*, *Device*, and *Properties*. The optional columns are *IP Address*, *Logoff Time*, and *Logon Time*.

Each view has a dropdown option to view the information within different time frames (*Latest*, *1 hour*, *24 hours*, and *7 days*). Vulnerability information is displayed when applicable. The page displays user and device relationships, such as which users are logged in to multiple devices or if multiple users are logged in to single devices.

4. Hover over a device in the list to view the tooltip and possible actions. In this example, the available actions are add firewall device address, add firewall IP address, and ban the IP.

Diagnostics for the unified user device store

The following options are available for `diagnose user-device-store unified <option>`:

Option	Description
`device-memory-query`	Get device records and associated user records from memory.
`device-query`	Get device records and associated user records from memory and disk.
`user-memory-query`	Get user records and associated device records from memory.
`user-query`	Get user records and associated device records from memory and disk.
`re-query`	Retrieve query by `<query-id> <iteration-start> <iteration-count>` (takes 0-3 arguments).
`list`	List unified queries.
`clear`	Delete all unified queries.
`dump`	Dump unified query stats by `<query-id>` (takes 0-1 arguments).
`delete`	Delete unified query by `<query-id>` (takes 0-1 arguments).
`stats`	Get statistics for unified queries.
`debug`	Enable/disable debug logs for unified queries.

IoT devices

IoT device information (such as the device name, software OS, hardware vendor, status, IP address, hostname, time last seen, port, and VLAN) can be viewed on the *Asset Identity Center* page.

The following settings are required to display IoT devices:

1. The FortiGate must have a valid IoT Detection Service license.
2. Device detection must be configured on a LAN interface used by IoT devices.

To configure device detection in the GUI:

a. Go to *Network* > *Interfaces* and edit a LAN interface.
b. Enable *Device detection*.
c. Click *OK*.

To configure device detection in the CLI:

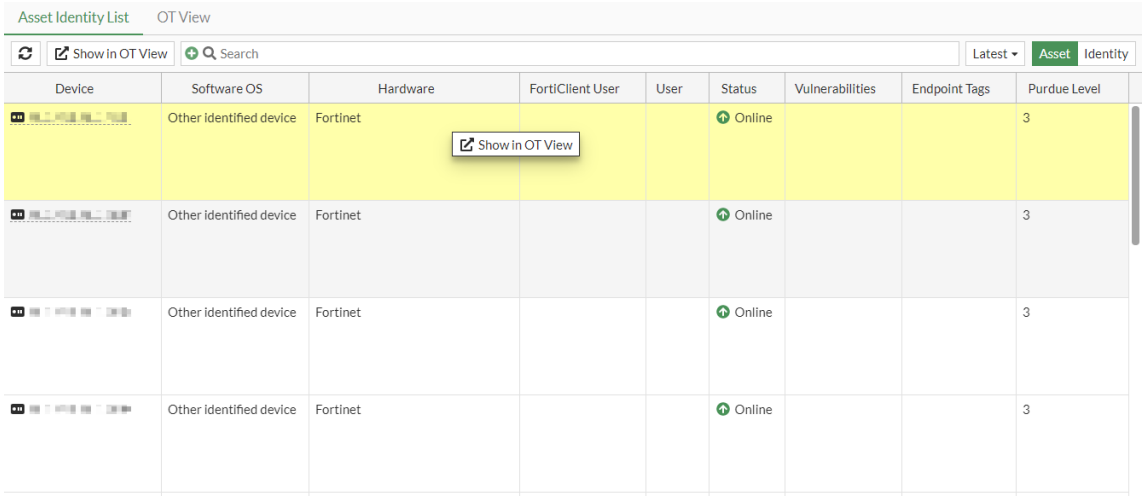
```
config system interface
    edit <name>
        set device-identification enable
    next
end
```

3. Configure a firewall policy with an application control sensor.

OT asset visibility and network topology

When the *Operational Technology (OT)* feature is enabled, tabs are added in the *Asset Identity Center* page to view the OT asset list and OT network topology using Purdue Levels. This feature is available regardless of whether a Security Fabric is enabled.

To enable the OT features in the GUI:

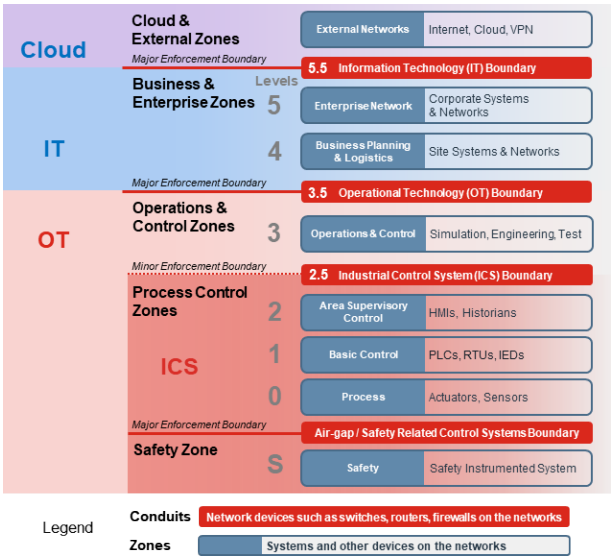


1. Go to *System* > *Feature Visibility*.
2. In the *Additional Features* section, enable *Operational Technology (OT)*.
3. Click *Apply*.

To enable the OT features in the CLI:

```
config system settings
    set gui-ot enable
end
```

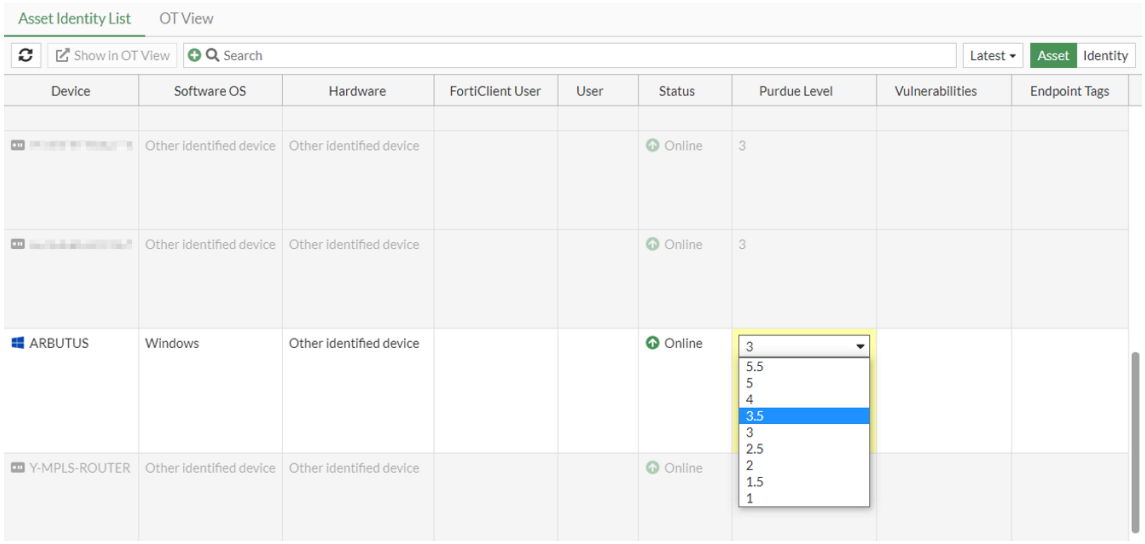
Once enabled, the *Security Fabric* > *Asset Identity Center* page displays an *Asset Identity List* tab and an *OT View* tab.



- The *Asset Identity List* tab includes a configurable *Purdue Level* column and a *Show in OT View* option for selected devices in the table.

- The *OT View* tab shows a topology of detected components and connections mapped to Purdue Levels. The default view is locked, but devices can be dragged and dropped to other Purdue Levels if the view is unlocked.

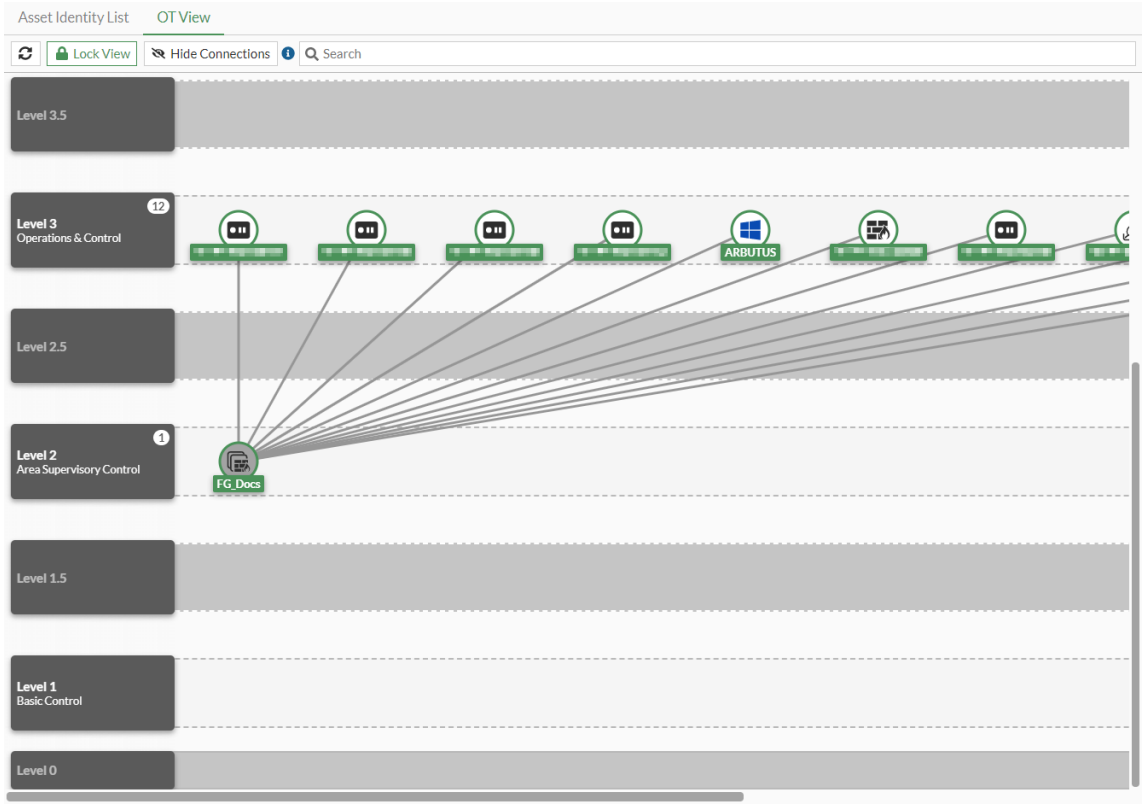
FortiGates and managed FortiSwitches are statically assigned Purdue Level 2 and cannot be changed. Other detected devices are assigned Purdue Level 3 by default and can be changed (except to level S, 0, or external).



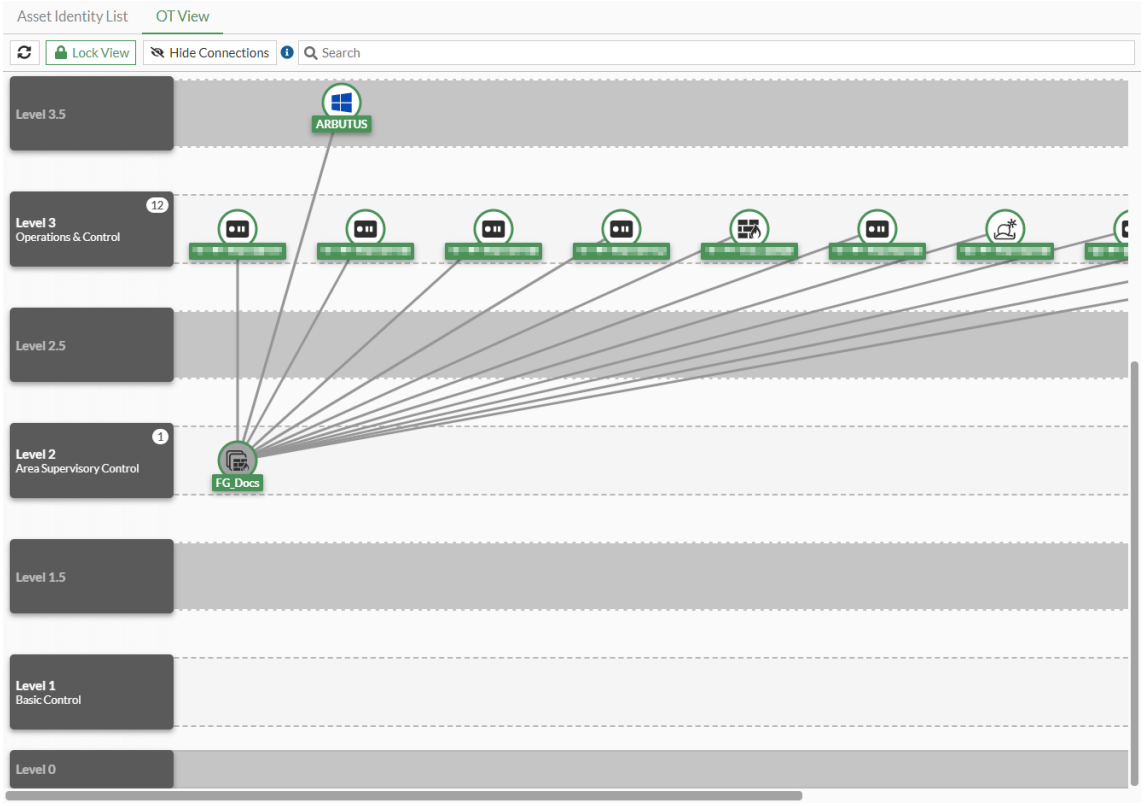
The following diagram lists the Purdue Levels based on OT network topologies:

To change the Purdue Level in the Asset Identity List tab:

1. Go to *Security Fabric* > *Asset Identity Center* and select the *Asset Identity List* tab.
2. Add the *Purdue Level* column to the table:
   a. Hover over the table header and click the gear icon (*Configure Table*).
   b. Select *Purdue Level*.
   c. Click *Apply*.
3. Select a device and hover over the *Purdue Level* value.
4. Click the pencil icon to edit the level.



5. Select a value from the dropdown.



6. Click *Apply*.

To change the Purdue Level in the OT View tab:

1. Go to *Security Fabric* > *Asset Identity Center* and select the *OT View* tab.
2. Click *Unlock View*.
3. Select a device.

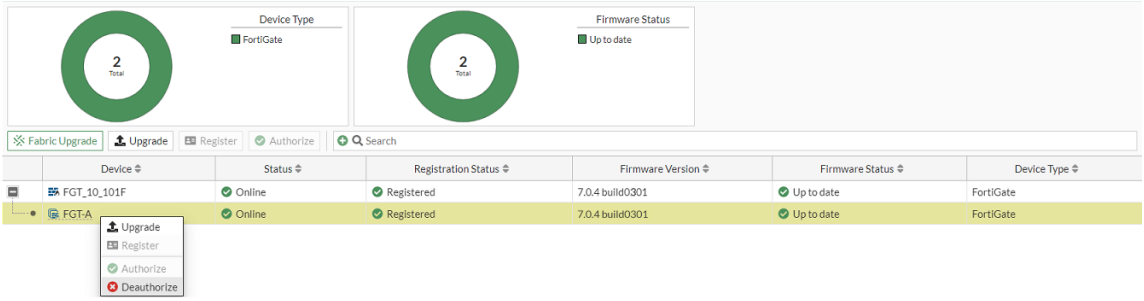
4. Drag the device icon to another level row.

5. Optionally, click *Lock View* to revert to the locked view.

To change the Purdue Level in the CLI:

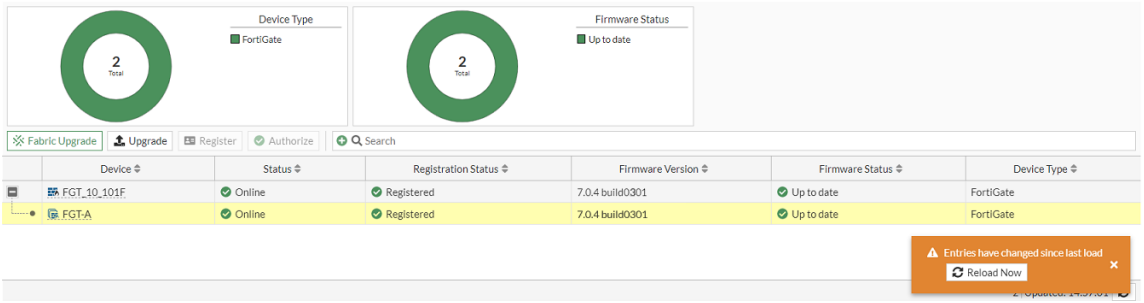
```
# diagnose user-device-store device memory ot-purdue-set <mac> <ip> <level>
```

`mac`	Enter the MAC address of the device.
`ip`	Enter the IPv4 address of the device.
`level`	Enter the Purdue Level: 1, 1.5, 2, 2.5, 3, 3.5, 4, 5, 5.5.



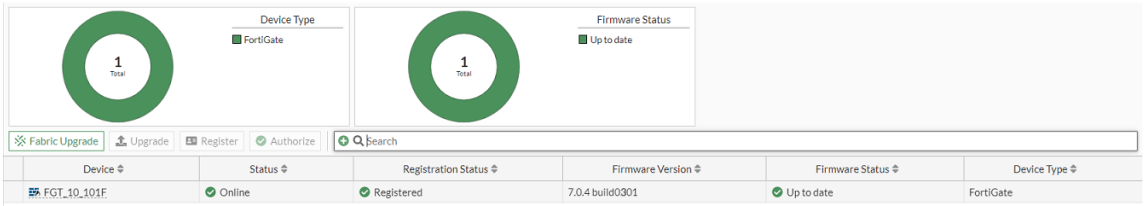
WebSocket for Security Fabric events

With the WebSocket for Security Fabric events, subscribers to the WebSocket (such as the *Fabric Management* page) are updated upon new Fabric events and alert users to reload the page.



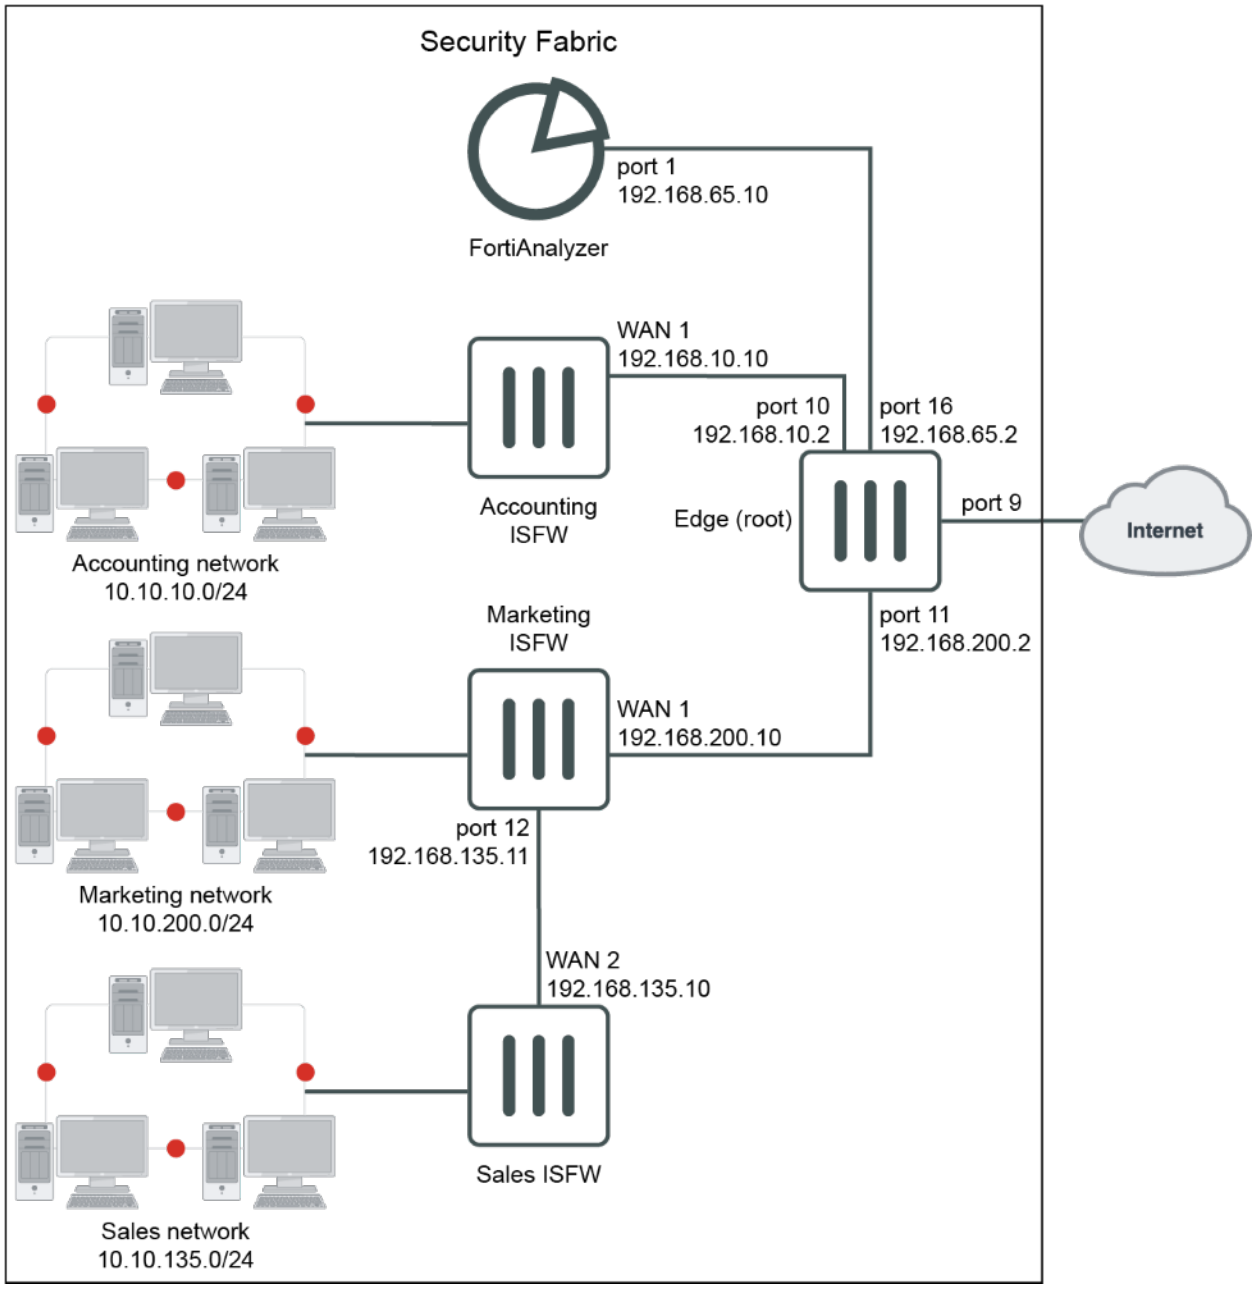
Example

To deauthorize a downstream FortiGate:



1. Go to *System* > *Fabric Management* and select a downstream FortiGate in the table.
2. Right-click on the device and select *Deauthorize*.

3. An alert appears in the bottom-right corner of the page. Click *Reload Now* to refresh the page.



The deauthorized FortiGate is removed from the table.

Deploying the Security Fabric

This topic provides an example of deploying Security Fabric with three downstream FortiGates connecting to one root FortiGate. To deploy Security Fabric, you need a FortiAnalyzer running firmware version 6.2 or later.

The following shows a sample network topology with three downstream FortiGates (Accounting, Marketing, and Sales) connected to the root FortiGate (Edge).

To configure the root FortiGate (Edge):

1. Configure interfaces:
   a. In the root FortiGate (Edge), go to *Network* > *Interfaces*.
   b. Edit *port16*:
      - Set *Role* to *DMZ*.
      - For the interface connected to FortiAnalyzer, set the *IP/Network Mask* to *192.168.65.2/255.255.255.0*

c. Edit *port10*:
- Set *Role* to *LAN*.
- For the interface connected to the downstream FortiGate (Accounting), set the *IP/Network Mask* to *192.168.10.2/255.255.255.0*

d. Edit *port11*:
- Set *Role* to *LAN*.
- For the interface connected to the downstream FortiGate (Marketing), set the *IP/Network Mask* to *192.168.200.2/255.255.255.0*

2. Configure Security Fabric:
a. In the root FortiGate (Edge), go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
b. For *Status*, click *Enable*.
c. Set the *Security Fabric role* to *Serve as Fabric Root*. The FortiAnalyzer settings can be configured.
d. Enter the FortiAnalyzer IP (*192.168.65.10*) and select and *Upload option* (the default is *Real Time*).
e. Click *Test Connectivity*.
A warning message indicates that the FortiGate is not authorized on the FortiAnalyzer. The authorization is configured in a later step on the FortiAnalyzer.
f. Click *OK*. The FortiAnalyzer serial number is verified.
g. Enter a *Fabric name*, such as *Office-Security-Fabric*.
h. Ensure *Allow other Security Fabric devices to join* is enabled and add *port10* and *port11*.
i. Click *OK*.
3. Create a policy to allow the downstream FortiGate (Accounting) to access the FortiAnalyzer:
a. In the root FortiGate (Edge), go to *Policy & Objects* > *Addresses*.
b. Click *Create New*.
- Set *Name* to *FAZ-addr*.
- Set *Type* to *Subnet*.
- Set *Subnet/IP Range* to *192.168.65.10/32*.
- Set *Interface* to *any*.

c. Click *OK*.
d. Click *Create New*.
- Set *Name* to *Accounting*.
- Set *Type* to *Subnet*.
- Set *Subnet/IP Range* to *192.168.10.10/32*.
- Set *Interface* to *any*.

e. Click *OK*.
f. In the root FortiGate (Edge), go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
- Set *Name* to *Accounting-to-FAZ*.
- Set *srcintf* to *port10*.
- Set *dstintf* to *port16*.
- Set *srcaddr* to *Accounting-addr*.
- Set *dstaddr* to *FAZ-addr*.
- Set *Action* to *Accept*.
- Set *Schedule* to *Always*.
- Set *Service* to *All*.
- Enable *NAT*.
- Set *IP Pool Configuration* to *Use Outgoing Interface Address*.

g. Click *OK*.

4. Create a policy to allow the two downstream FortiGates (Marketing and Sales) to access the FortiAnalyzer:
   a. In the root FortiGate (Edge), go to *Policy & Objects* > *Addresses* and click *Create New*.
      - Set *Name* to *Marketing-addr*.
      - Set *Type* to *Subnet*.
      - Set *Subnet/IP Range* to *192.168.200.10/32*.
      - Set *Interface* to *any*.
   b. Click *OK*.
   c. In the root FortiGate (Edge), go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
      - Set *Name* to *Marketing-to-FAZ*.
      - Set *srcintf* to *port11*.
      - Set *dstintf* to *port16*.
      - Set *srcaddr* to *Marketing-addr*.
      - Set *dstaddr* to *FAZ-addr*.
      - Set *Action* to *Accept*.
      - Set *Schedule* to *Always*.
      - Set *Service* to *All*.
      - Enable *NAT*.
      - Set *IP Pool Configuration* to *Use Outgoing Interface Address*.
   d. Click *OK*.

To configure the downstream FortiGate (Accounting):

1. Configure interface:
   a. In the downstream FortiGate (Accounting), go to *Network* > *Interfaces*.
   b. Edit interface *wan1*:
      - Set *Role* to *WAN*.
      - For the interface connected to root, set the *IP/Network Mask* to *192.168.10.10/255.255.255.0*
2. Configure the default static route to connect to the root FortiGate (Edge):
   a. In the downstream FortiGate (Accounting), go to *Network* > *Static Routes* and click *Create New* or *Create New* > *IPv4 Static Route*.
      - Set *Destination* to *0.0.0.0/0.0.0.0*.
      - Set *Interface* to *wan1*.
      - Set *Gateway Address* to *192.168.10.2*.
   b. Click *OK*.
3. Configure Security Fabric:
   a. In the downstream FortiGate (Accounting), go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. For *Status*, click *Enable*.
      FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Accounting) connects to the root FortiGate (Edge).
   c. Set the *Security Fabric role* to *Join Existing Fabric*.
   d. *Upstream FortiGate IP* is filled in automatically with the default static route *Gateway Address* of *192.168.10.2* set in the previous step.
   e. Disable *Allow other FortiGates to join*, because there is no downstream FortiGate connecting to it.
   f. Click *OK*.

To configure the downstream FortiGate (Marketing):

1. Configure interface:
   a. In the downstream FortiGate (Marketing), go to *Network* > *Interfaces*.
   b. Edit *port12*:
      - Set *Role* to *LAN*.
      - For the interface connected to the downstream FortiGate (Sales), set the *IP/Network Mask* to *192.168.135.11/255.255.255.0*.
   c. Edit *wan1*:
      - Set *Role* to *WAN*.
      - For the interface connected to the root FortiGate (Edge), set the *IP/Network Mask* to *192.168.200.10/255.255.255.0*.
2. Configure the default static route to connect to the root FortiGate (Edge):
   a. In the downstream FortiGate (Marketing), go to *Network* > *Static Routes* and click *Create New* or *Create New* > *IPv4 Static Route*.
      - Set *Destination* to *0.0.0.0/0.0.0.0*.
      - Set *Interface* to *wan1*.
      - Set *Gateway Address* to *192.168.200.2*.
   b. Click *OK*.
3. Configure Security Fabric:
   a. In the downstream FortiGate (Marketing), go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. For *Status*, click *Enable*.
   FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Marketing) connects to the root FortiGate (Edge).
   c. Set the *Security Fabric role* to *Join Existing Fabric*.
   d. *Upstream FortiGate IP* is filled in automatically with the default static route *Gateway Address* of *192.168.200.2* set in the previous step.
   e. Enable *Allow other FortiGates to join* and add *port12*.
   f. Click *OK*.
4. Create a policy to allow another downstream FortiGate (Sales) going through FortiGate (Marketing) to access the FortiAnalyzer:
   a. In the downstream FortiGate (Marketing), go to *Policy & Objects* > *Addresses* and click *Create New*.
      - Set *Name* to *FAZ-addr*.
      - Set *Type* to *Subnet*.
      - Set *Subnet/IP Range* to *192.168.65.10/32*.
      - Set *Interface* to *any*.
   b. Click *OK*.
   c. Click *Create New*.
      - Set *Name* to *Sales-addr*.
      - Set *Type* to *Subnet*.
      - Set *Subnet/IP Range* to *192.168.135.10/32*.
      - Set *Interface* to *any*.
   d. Click *OK*.

e. In the downstream FortiGate (Marketing), go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
- Set *Name* to *Sales-to-FAZ*.
- Set *srcintf* to *port12*.
- Set *dstintf* to *wan1*.
- Set *srcaddr* to *Sales-addr*.
- Set *dstaddr* to *FAZ-addr*.
- Set *Action* to *Accept*.
- Set *Schedule* to *Always*.
- Set *Service* to *All*.
- Enable *NAT*.
- Set *IP Pool Configuration* to *Use Outgoing Interface Address*.

f. Click *OK*.

To configure the downstream FortiGate (Accounting):

1. Configure interface:
   a. In the downstream FortiGate (Accounting), go to *Network* > *Interfaces*.
   b. Edit interface *wan1*:
      - Set *Role* to *WAN*.
      - For the interface connected to root, set the *IP/Network Mask* to *192.168.10.10/255.255.255.0*
2. Configure the default static route to connect to the root FortiGate (Edge):
   a. In the downstream FortiGate (Accounting), go to *Network* > *Static Routes* and click *Create New* or *Create New* > *IPv4 Static Route*.
      - Set *Destination* to *0.0.0.0/0.0.0.0*.
      - Set *Interface* to *wan1*.
      - Set *Gateway Address* to *192.168.10.2*.
   b. Click *OK*.
3. Configure Security Fabric:
   a. In the downstream FortiGate (Accounting), go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. For *Status*, click *Enable*.
   FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Accounting) connects to the root FortiGate (Edge).
   c. Set the *Security Fabric role* to *Join Existing Fabric*.
   d. *Upstream FortiGate IP* is filled in automatically with the default static route *Gateway Address* of *192.168.10.2* set in the previous step.
   e. Disable *Allow other FortiGates to join*, because there is no downstream FortiGate connecting to it.
   f. Click *OK*.

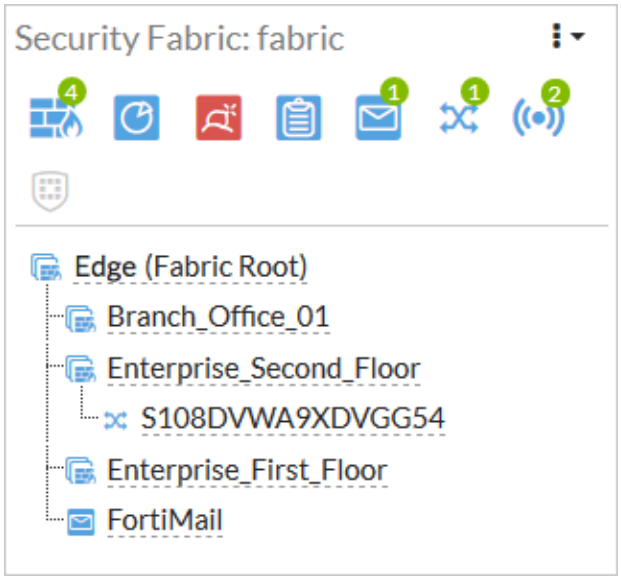
To configure the downstream FortiGate (Sales):

1. Configure interface:
   a. In the downstream FortiGate (Sales), go to *Network* > *Interfaces*.
   b. Edit *wan2*:
      - Set *Role* to *WAN*.
      - For the interface connected to the upstream FortiGate (Marketing), set the *IP/Network Mask* to *192.168.135.10/255.255.255.0*.

2. Configure the default static route to connect to the upstream FortiGate (Marketing):
   a. In the downstream FortiGate (Sales), go to *Network* > *Static Routes* and click *Create New* or *Create New* > *IPv4 Static Route*.
      - Set *Destination* to *0.0.0.0/0.0.0.0*.
      - Set *Interface* to *wan2*.
      - Set *Gateway Address* to *192.168.135.11*.
   b. Click *OK*.
3. Configure Security Fabric:
   a. In the downstream FortiGate (Sales), go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. For *Status*, click *Enable*.
   FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Sales) connects to the root FortiGate (Edge).
   c. Set the *Security Fabric role* to *Join Existing Fabric*.
   d. *Upstream FortiGate IP* is filled in automatically with the default static route *Gateway Address* of *192.168.135.11* set in the previous step.
   e. Disable *Allow other FortiGates to join*, because there is no downstream FortiGate connecting to it.
   f. Click *OK*.

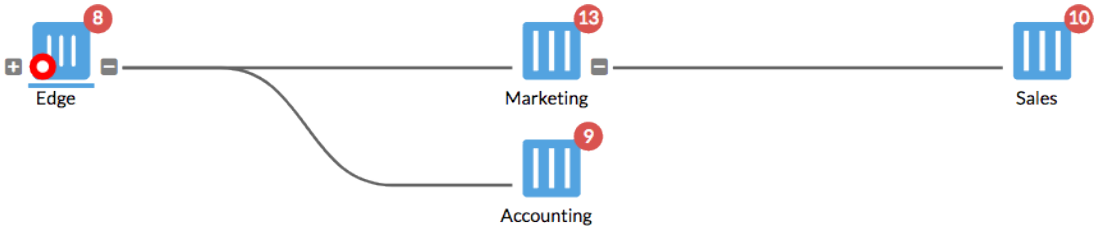
To authorize downstream FortiGates (Accounting, Marketing, and Sales) on the root FortiGate (Edge):

1. In the root FortiGate (Edge), go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   The *Topology* tree highlights two connected FortiGates with their serial numbers and asks you to authorize the highlighted devices.
2. Select the highlighted FortiGates and select *Authorize*.
   After they are authorized, the two downstream FortiGates (Accounting and Marketing) appear in the *Topology* tree in the *Security Fabric* > *Fabric Connectors* > *Security Fabric Setup* page. This means that the two downstream FortiGates (Accounting and Marketing) have successfully joined the Security Fabric.
3. The *Topology* tree now highlights the FortiGate with the serial number that is connected to the downstream FortiGate (Marketing) and asks you to authorize the highlighted device.
4. Select the highlighted FortiGates and select *Authorize*.
   After it is authorized, the downstream FortiGate (Sales) appears in the *Topology* tree in the *Security Fabric* > *Fabric Connectors* > *Security Fabric Setup* page. This means that the downstream FortiGates (Sales) has successfully joined the Security Fabric.



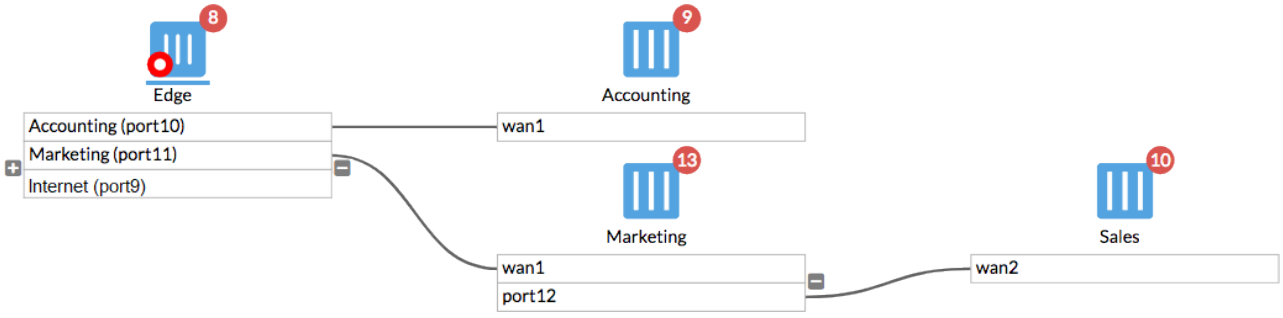
To use FortiAnalyzer to authorize all the Security Fabric FortiGates:

1. Authorize all the Security Fabric FortiGates on the FortiAnalyzer side:
   a. On the FortiAnalyzer, go to *System Settings* > *Network* > *All Interfaces*.
   b. Edit *port1* and set *IP Address/Netmask* to *192.168.65.10/255.255.255.0*.
   c. Go to *Device Manager* > *Unauthorized*. All of the FortiGates are listed as unauthorized.
      i. Select all the FortiGates and select *Authorize*. The FortiGates are now listed as authorized.
      After a moment, a warning icon appears beside the root FortiGate (Edge) because the FortiAnalyzer needs administrative access to the root FortiGate (Edge) in the Security Fabric.
      ii. Click the warning icon and enter the admin username and password of the root FortiGate (Edge).



2. Check FortiAnalyzer status on all the Security Fabric FortiGates:
   a. On each FortiGate, go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiAnalyzer Logging* card.
   b. Check that *Storage usage* information is shown.

To check Security Fabric deployment result:



1. On FortiGate (Edge), go to *Dashboard* > *Status*.
   The *Security Fabric* widget displays all the FortiGates in the Security Fabric.

2. On FortiGate (Edge), go to *Security Fabric* > *Physical Topology*.
   This page shows a visualization of access layer devices in the Security Fabric.

3. On FortiGate (Edge), go to *Security Fabric* > *Physical Topology*.
   This dashboard shows information about the interfaces of each device in the Security Fabric.

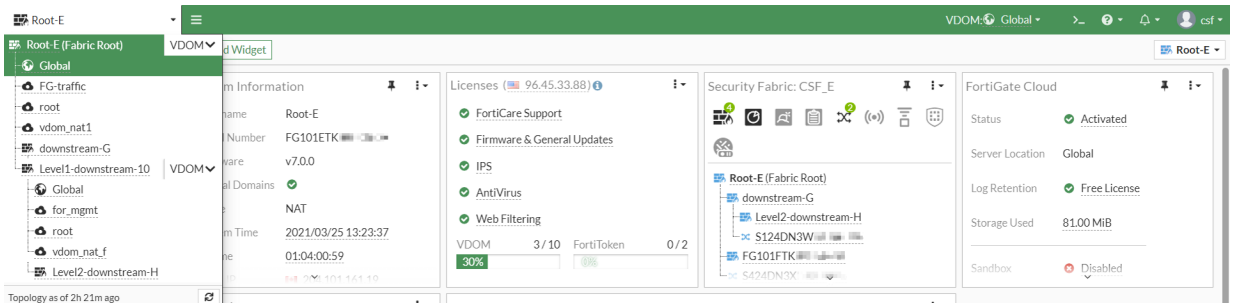
To run diagnose commands:

1. Run the `diagnose sys csf authorization pending-list` command in the root FortiGate to show the downstream FortiGate pending for root FortiGate authorization:

```
Edge # diagnose sys csf authorization pending-list
Serial                  IP Address      HA-Members    Path
--------------------------------------------------------------------------------
FG201ETK18902514        0.0.0.0                       FG3H1E5818900718:FG201ETK18902514
```

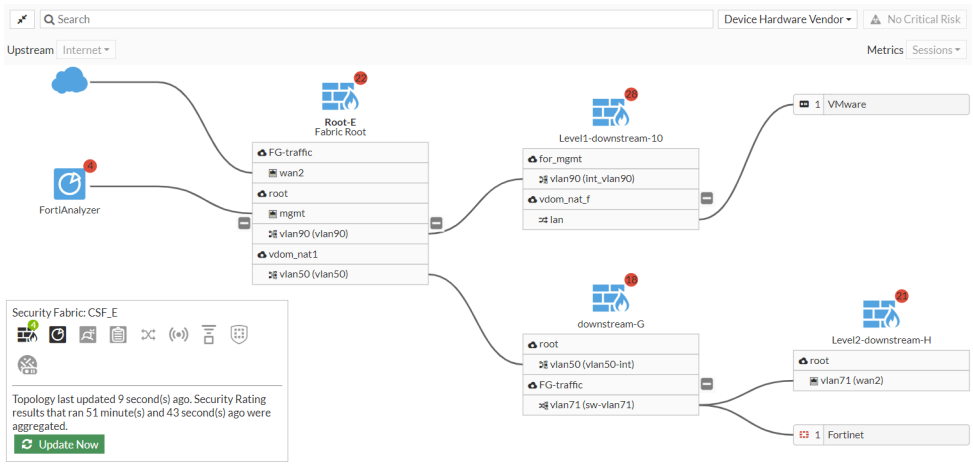
2. Run the `diagnose sys csf downstream` command in the root or middle FortiGate to show the downstream FortiGates after they join Security Fabric:

```
Edge # diagnose sys csf downstream
1:     FG201ETK18902514 (192.168.200.10) Management-IP: 0.0.0.0 Management-port:0
parent: FG3H1E5818900718
        path:FG3H1E5818900718:FG201ETK18902514
        data received: Y downstream intf:wan1 upstream intf:port11 admin-port:443
        authorizer:FG3H1E5818900718
2:     FGT81ETK18002246 (192.168.10.10) Management-IP: 0.0.0.0 Management-port:0 parent:
FG3H1E5818900718
        path:FG3H1E5818900718:FGT81ETK18002246
        data received: Y downstream intf:wan1 upstream intf:port10 admin-port:443
        authorizer:FG3H1E5818900718
3:     FG101ETK18002187 (192.168.135.10) Management-IP: 0.0.0.0 Management-port:0
parent: FG201ETK18902514
        path:FG3H1E5818900718:FG201ETK18902514:FG101ETK18002187
        data received: Y downstream intf:wan2 upstream intf:port12 admin-port:443
        authorizer:FG3H1E5818900718
```



3. Run the `diagnose sys csf upstream` command in any downstream FortiGate to show the upstream FortiGate after downstream FortiGate joins Security Fabric:

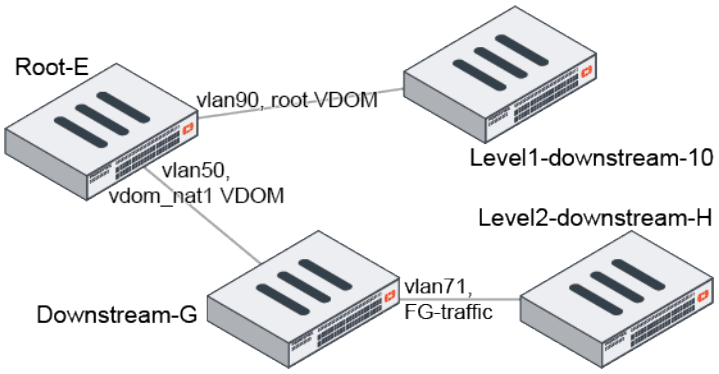
```
Marketing # diagnose sys csf upstream
Upstream Information:
Serial Number:FG3H1E5818900718
IP:192.168.200.2
Connecting interface:wan1
Connection status:Authorized
```



Deploying the Security Fabric in a multi-VDOM environment

A Security Fabric can be enabled in multi-VDOM environments. This allows access to all of the Security Fabric features, including automation, security rating, and topologies, across the VDOM deployment.

- Users can navigate to downstream FortiGate devices and VDOMs directly from the root FortiGate using the Fabric selection menu.



- The logical topology shows all of the configured VDOMs.

- Security rating reports include results for all of the configured VDOMs as well the entire Fabric.

Downstream FortiGate devices must connect to the upstream FortiGate from its management VDOM.

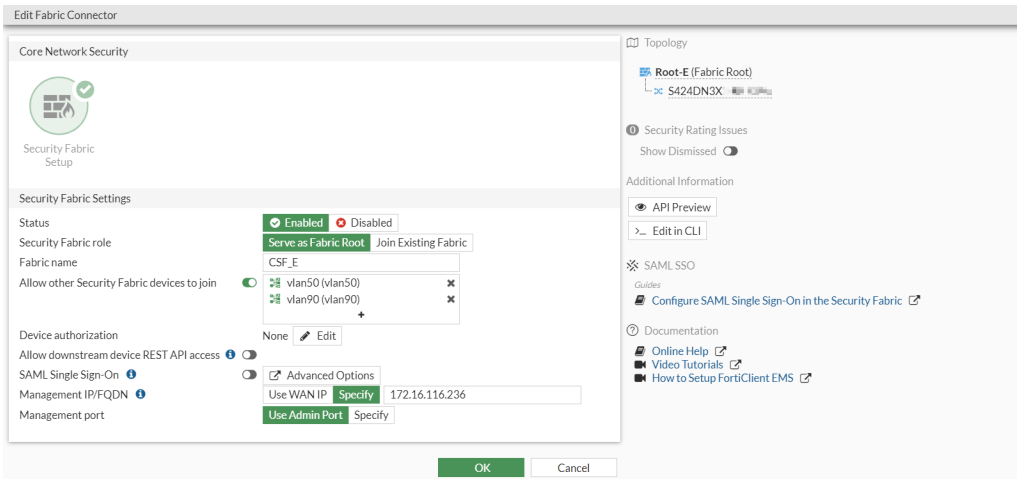
Topology

In this topology, there is a root FortiGate with three FortiGates connected through two different VDOMs. The root FortiGate is able to manage all devices running in multi-VDOM mode.

This example assumes multi-VDOM mode is already configured on each FortiGate, and that FortiAnalyzer logging is configured on the root FortiGate (see Configuring FortiAnalyzer on page 2385 and Configuring the root FortiGate and downstream FortiGates on page 2378 for more details).

To enable multi-VDOM mode:

```
config system global
    set vdom-mode multi-vdom
end
```



Device configurations

Root FortiGate (Root-E)

The Security Fabric is enabled, and configured so that downstream interfaces from all VDOMs can allow other Security Fabric devices to join.

To configure Root-E in the GUI:

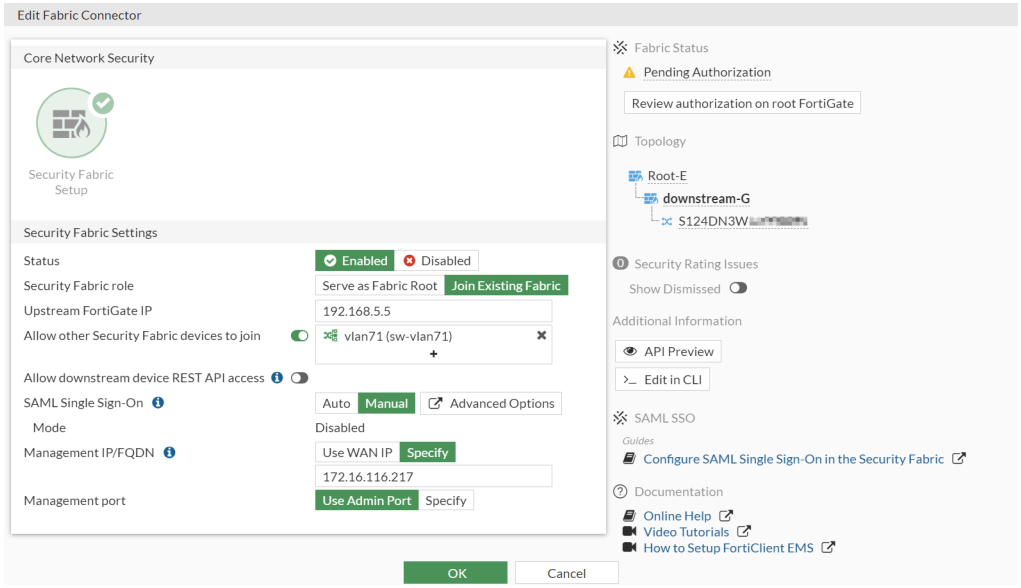
1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. Ensure that the *Status* is *Enabled* and the *Security Fabric role* is set to *Serve as Fabric Root*.
3. Enable *Allow other Security Fabric devices to join* and click the + to add the interfaces (vlan50 and vlan90) from the vdom_nat1 and root VDOMs.

4. Configure the other settings as needed.
5. Click *OK*.

To configure Root-E in the CLI:

1. Enable the Security Fabric:

```
config system csf
    set status enable
    set group-name "CSF_E"
end
```



2. Configure the interfaces:

```
config system interface
    edit "vlan50"
        set vdom "vdom_nat1"
        ...
        set allowaccess ping https ssh http fgfm fabric
        ...
    next
    edit "vlan90"
        set vdom "root"
        ...
        set allowaccess ping https ssh http fgfm fabric
        ...
    next
end
```

Downstream FortiGate 1 (Downstream-G)

To configure Downstream-G in the GUI:

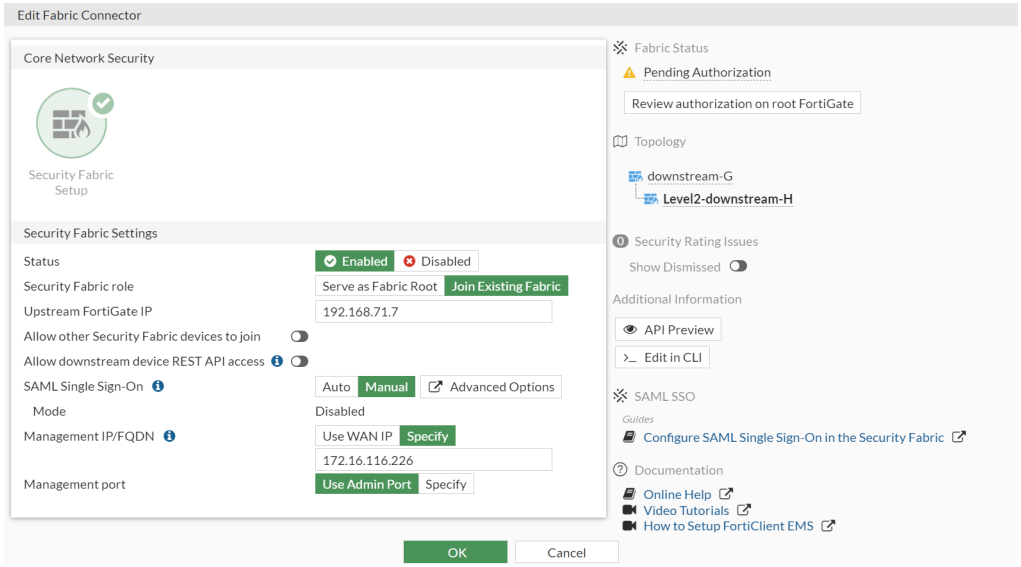
1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. For *Status*, select *Enabled* and set the role to *Join Existing Fabric*.
3. Enter the *Upstream FortiGate IP*, which is the IP of the root FortiGate vdom_nat1 interface (192.168.5.5). Downstream-G must use the interface from the management VDOM to connect to the upstream FortiGate IP.
4. Enable *Allow other Security Fabric devices to join* and click the + to add the downstream interface (sw-vlan71) from the FG-traffic VDOM.

5. Configure the other settings as needed.
6. Click *OK*.

To configure Downstream-G in the CLI:

1. Enable the Security Fabric:

```
config system csf
    set status enable
    set upstream-ip 192.168.5.5
end
```



2. Configure the interfaces:

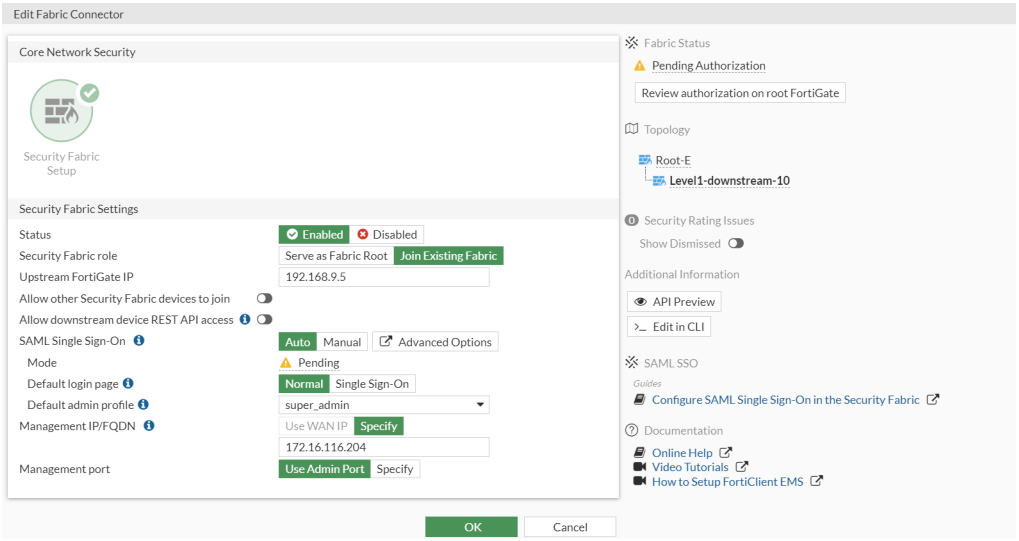
```
config system interface
    edit "sw-vlan71"
        set vdom "FG-traffic"
        ...
        set allowaccess ping https ssh http fgfm fabric
        ...
    next
end
```

Downstream FortiGate 2 (Level2-downstream-H)

To configure Level2-downstream-H in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. For *Status*, select *Enabled* and set the role to *Join Existing Fabric*.
3. Enter the *Upstream FortiGate IP*, which is the IP of the root VDOM on Downstream-G (192.168.71.7).

4. Configure the other settings as needed.
5. Click *OK*.



To configure Level2-downstream-H in the CLI:

```
config system csf
    set status enable
    set upstream-ip 192.168.71.7
end
```

Downstream FortiGate 3 (Level1-downstream-10)

To configure Level1-downstream-10 in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. For *Status*, select *Enabled* and set the role to *Join Existing Fabric*.
3. Enter the *Upstream FortiGate IP*, which is the IP of the root VDOM on Root-E (192.168.9.5).

4. Configure the other settings as needed.
5. Click *OK*.

To configure Level1-downstream-10 in the CLI:

```
config system csf
    set status enable
    set upstream-ip 192.168.9.5
end
```

Device authorization and verification

To authorize the downstream devices on the root FortiGate:

1. On Root-E, go to *Security Fabric* > *Fabric Connectors*.
2. In the topology tree, click the highlighted serial number and select *Authorize* for each downstream FortiGate. Once all the devices are authorized, the physical topology page shows the root and downstream FortiGates. The logical topology page shows the root and downstream FortiGates connected to interfaces in their corresponding VDOMs.

Synchronizing objects across the Security Fabric

When the Security Fabric is enabled, various objects such as addresses, services, and schedules are synced from the upstream FortiGate to all downstream devices by default. FortiOS has the following settings for object synchronization across the Security Fabric:

- Set object synchronization (`fabric-object-unification`) to `default` or `local` on a downstream device.
- Set a per object option to toggle whether the specific Fabric object will be synchronized or not. After upgrading from 6.4.3, this option is disabled for supported Fabric objects. The synchronized Fabric objects are kept as locally created objects on downstream FortiGates.
- Define the number of task workers to handle synchronizations.

The firewall object synchronization wizard helps identify objects that are not synchronized and resolves any conflicts. A warning message appears in the topology tree if there is a conflict.

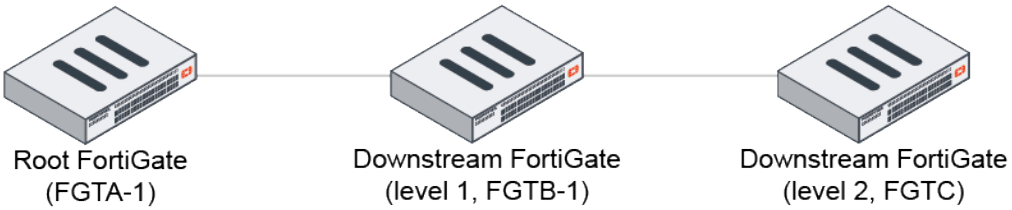
Summary of CLI commands

To configure object synchronization:

```
config system csf
    set fabric-object-unification {default | local}
    set configuration-sync {default | local}
    set fabric-workers <integer>
end
```

Parameter	Description
`fabric-object-unification`	*default*: Global CMDB objects will be synchronized in the Security Fabric. *local*: Global CMDB objects will not be synchronized to and from this device. This command is available on the root FortiGate. If set to local, the device does not synchronize objects from the root, but will send the synchronized objects downstream.
`configuration-sync`	*default*: Synchronize configuration for FortiAnalyzer, FortiSandbox, and Central Management to root node. *local*: Do not synchronize configuration with root node. If downstream FortiGates are set to local, the synchronized objects from the root to downstream are not applied locally. However, the downstream FortiGate will send the configuration to lower FortiGates.
`fabric-workers`	Define how many task worker process are created to handle synchronizations (1-4, default = 2). The worker processes dies if there is no task to perform after 60 seconds.

The per object setting can be configured on the root FortiGate as follows:



```
config firewall <object>
    edit <name>
        set fabric-object {enable | disable}
    next
end
```

Where:

- `<object>` is one of the following: `address`, `address6`, `addrgrp`, `addrgrp6`, `service category`, `service custom`, `service group`, `schedule group`, `schedule onetime`, or `schedule recurring`.
- Enabling `fabric-object` sets the object as a Security Fabric-wide global object that is synchronized to downstream FortiGates.
- Disabling `fabric-object` sets the object as local to this Security Fabric member.

- If a device in the Fabric is in multi-VDOM mode, the GUI will not display the Fabric synchronization option. Even if this is enabled in the CLI, the object will not be synchronized to any downstream devices.

Sample topology

In this Security Fabric, the root FortiGate (FGTA-1) has `fabric-object-unification` set to `default` so the Fabric objects can be synchronized to the downstream FortiGate. The level 1 downstream FortiGate (FGTB-1) has `configuration-sync` set to `local`, so it will not apply the synchronized objects locally. The level 2 downstream FortiGate (FGTC) has `configuration-sync` set to `default`, so it will apply the synchronized objects locally.

In this example, firewall addresses and address groups are used. Other supported Fabric objects have the same behaviors. The following use cases illustrate common synchronization scenarios:

- If no conflicts exist, firewall addresses and address groups can be synchronized to downstream FortiGates (see example below).
- If a conflict exists between the root and downstream FortiGates, it can be resolved with the conflict resolution wizard. After the conflict is resolved, the firewall addresses and address groups can be synchronized to downstream FortiGates (see example below).
- If `set fabric-object` (*Fabric synchronization* option in the GUI) is disabled for firewall addresses and address groups on the root FortiGate, they will not be synchronized to downstream FortiGates (see example below).

To configure the FortiGates used in this example:

```
FGTA-1 # config system csf
    set status enable
    set group-name "fabric"
    set fabric-object-unification default
    ...
end
```

```
FGTB-1 # config system csf
    set status enable
    set upstream-ip 10.2.200.1
    set configuration-sync local
    ...
end
```

```
FGTC # config system csf
    set status enable
    set upstream-ip 192.168.7.2
    set configuration-sync default
    ...
end
```

To synchronize a firewall address and address group in the Security Fabric:

1. Configure the firewall address on the root FortiGate:

```
FGTA-1 # config firewall address
    edit "add_subnet_1"
        set fabric-object enable
        set subnet 22.22.22.0 255.255.255.0
    next
end
```

2. Configure the address group on the root FortiGate:

```
FGTA-1 # config firewall addrgrp
    edit "group_subnet_1"
        set member "add_subnet_1"
        set fabric-object enable
    next
end
```

3. Check the firewall address and address group on the downstream FortiGates:

```
FGTB-1 # show firewall address add_subnet_1
entry is not found in table
```

```
FGTB-1 # show firewall addrgrp group_subnet_1
entry is not found in table
```

The synchronized objects are not applied locally on this FortiGate because `configuration-sync` is set to `local`.

```
FGTC # show firewall address add_subnet_1
config firewall address
    edit "add_subnet_1"
        set uuid 378a8094-34cb-51eb-ce40-097f298fcfdc
        set fabric-object enable
        set subnet 22.22.22.0 255.255.255.0
    next
end
```

```
FGTC # show firewall addrgrp group_subnet_1
config firewall addrgrp
    edit "group_subnet_1"
        set uuid 4d7a8a52-34cb-51eb-fce7-d93f76915319
        set member "add_subnet_1"
        set color 19
        set fabric-object enable
    next
end
```

The objects are synchronized on this FortiGate because `configuration-sync` is set to `default`.

To resolve a firewall address and address group conflict in the Security Fabric:

1. On FGTC, create a firewall address:
   a. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
   b. Configure the following:

Name	sync_add_1
IP/Netmask	33.33.33.0 255.255.255.0

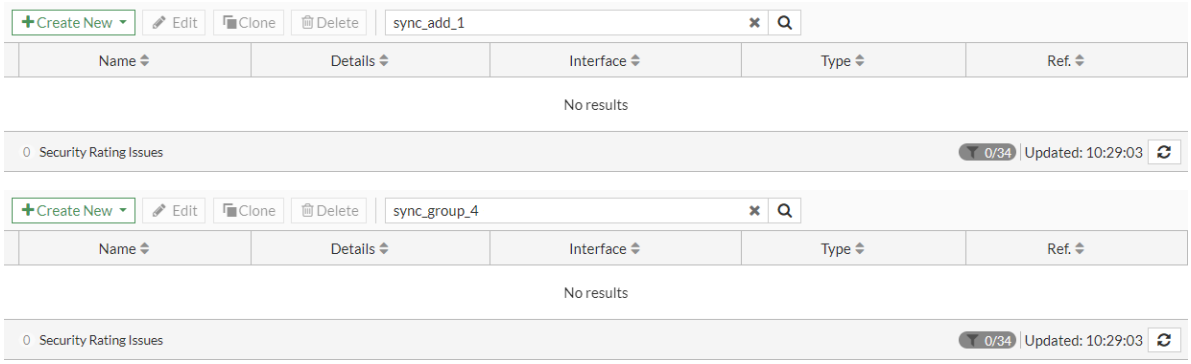
   c. Click *OK*.
2. On FGTA-1 (Fabric root), create the firewall address with same name but a different subnet:
   a. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
   b. Configure the following:

Name	sync_add_1
IP/Netmask	11.11.11.0 255.255.255.0
Fabric synchronization	Enable

   c. Click *OK*.
3. Add the address to a different address group than what is configured on FGTC:
   a. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address Group*.
   b. Configure the following:

Name	sync_group4
Members	sync_add_1
Fabric synchronization	Enable

   c. Click *OK*.
4. Go to *Security Fabric* > *Fabric Connectors*. In the topology tree, there is a message that *Firewall objects are in conflict with other FortiGates in the fabric*.



5. Resolve the conflict:
   a. Click *Review firewall object conflicts*. The *Firewall Object Synchronization* pane opens.
   b. Click *Rename All Objects*. The conflicted object will be renamed on the downstream FortiGate.

   c. The conflict is resolved. Click *Close* to exit the *Firewall Object Synchronization* pane.

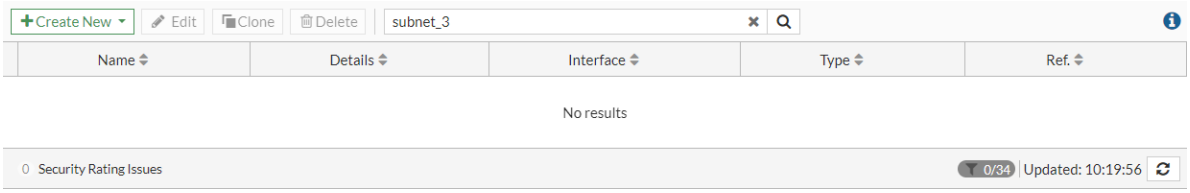
   d. The topology tree no longer indicates there is a conflict.
6. Verify the results on the downstream FortiGates:
   a. On FGTB-1, go to *Policy & Objects* > *Addresses*.
   b. Search for *sync_add_1* and *sync_group4*. No results are found. The synchronized objects are not applied locally on this FortiGate because `configuration-sync` is set to `local`.

c. On FGTC, go to *Policy & Objects* > *Addresses*.

d. Search for *sync_add_1*. The original firewall address *sync_add_1* was renamed to *sync_add_1_FGTC* by resolving the conflict on FGTA-1. The address *sync_add_1* and address group *sync_group4* are synchronized from FGTA-1.

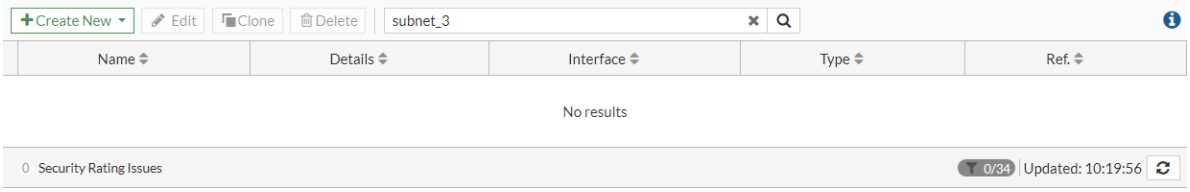
To disable Fabric synchronization on the root FortiGate in the GUI:

1. On FGTA-1, create a firewall address:
   a. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
   b. Configure the following:



Name	add_subnet_3
IP/Netmask	33.33.33.0 255.255.255.0
Fabric synchronization	Disable

   c. Click *OK*.
2. Create the firewall address group and add the address:
   a. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address Group*.
   b. Configure the following:



Name	group_subnet_3
Members	add_subnet_3
Fabric synchronization	Disable

   c. Click *OK*.

3. On FGTB-1, go to *Policy & Objects* > *Addresses* and search for *subnet_3*. No results are found because Fabric synchronization is disabled on the root FortiGate (FGTA-1).

4. On FGTC, go to *Policy & Objects* > *Addresses* and search for *subnet_3*. No results are found because Fabric synchronization is disabled on the root FortiGate (FGTA-1).

To disable Fabric synchronization on the root FortiGate in the CLI:

1. Configure the firewall address on the root FortiGate:

```
FGTA-1 # config firewall address
    edit "add_subnet_3"
        set subnet 33.33.33.0 255.255.255.0
        set fabric-object disable
    next
end
```

2. Configure the address group on the root FortiGate:

```
FGTA-1 # config firewall addrgrp
    edit "group_subnet_3"
        set member "add_subnet_3"
        set fabric-object disable
    next
end
```

3. Check the firewall address and address group on the downstream FortiGates:

```
FGTB-1 # show firewall address add_subnet_3
entry is not found in table

FGTB-1 # show firewall addrgrp group_subnet_3
entry is not found in table

FGTC # show firewall address add_subnet_3
entry is not found in table

FGTC # show firewall addrgrp group_subnet_3
entry is not found in table
```

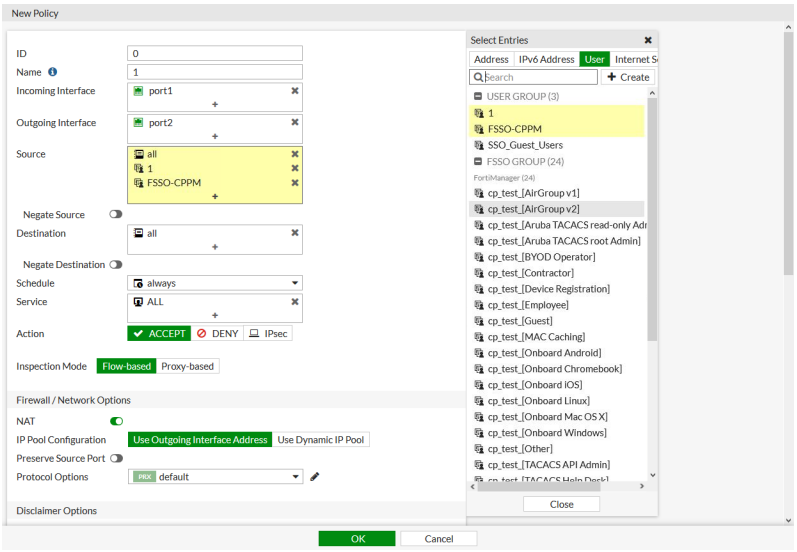
The objects are not synchronized from the root FortiGate (FGTA-1) because the `fabric-object` setting is disabled.

Group address objects synchronized from FortiManager

Address objects from external connectors that are learned by FortiManager are synchronized to FortiGate. These objects can be grouped together with the FortiGate CLI to simplify selecting connector objects in the FortiGate GUI. Multiple groups can be created.

This option is only available for objects that are synchronized from FortiManager.

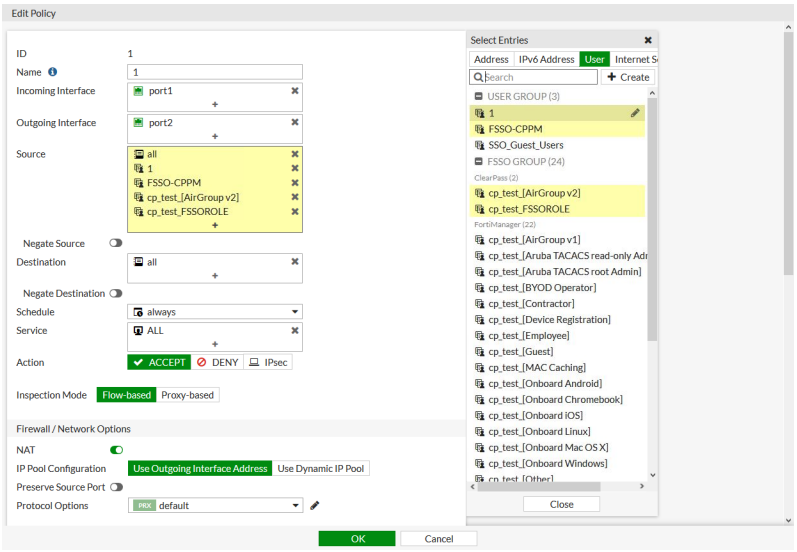
To add an object to a connector group:



```
config user adgrp
    edit <object_name>
        set server-name "FortiManager"
        set connector-source <group_name>
    next
end
```

Example

In this example, objects learned by the FortiManager from an Aruba ClearPass device are synchronized to the FortiGate. Some of the objects are then added to a group called *ClearPass* to make them easier to find in the object list when creating a firewall policy.

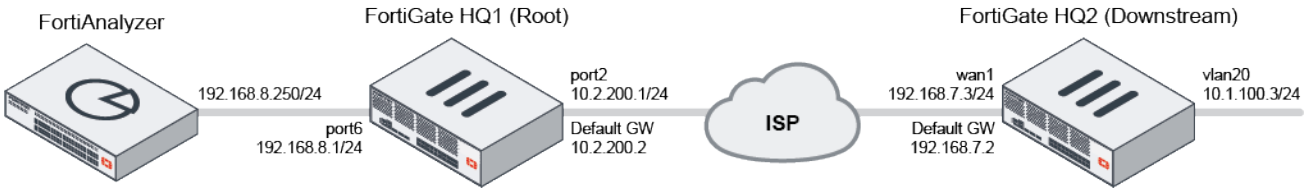


Prior to being grouped, the synchronized objects are listed under the FortiManager heading in the object lists.

To add some of the objects to a group:

```
config user adgrp
    edit "cp_test_FSSOROLE"
        set server-name "FortiManager"
        set connector-source "ClearPass"
    next
    edit "cp_test_[AirGroup v2]"
        set server-name "FortiManager"
        set connector-source "ClearPass"
    next
end
```

The objects are now listed under the *ClearPass* heading.



Security Fabric over IPsec VPN

This is an example of configuring Security Fabric over IPsec VPN.

Sample topology

This sample topology shows a downstream FortiGate (HQ2) connected to the root FortiGate (HQ1) over IPsec VPN to join Security Fabric.

Sample configuration

To configure the root FortiGate (HQ1):

1. Configure interface:
   a. In the root FortiGate (HQ1), go to *Network* > *Interfaces*.
   b. Edit *port2*:
      - Set *Role* to *WAN*.
      - For the interface connected to the Internet, set the *IP/Network Mask* to *10.2.200.1/255.255.255.0*
   c. Edit *port6*:
      - Set *Role* to *DMZ*.
      - For the interface connected to FortiAnalyzer, set the *IP/Network Mask* to *192.168.8.250/255.255.255.0*
2. Configure the static route to connect to the Internet:
   a. Go to *Network* > *Static Routes* and click *Create New* or *Create New* > *IPv4 Static Route*.
      - Set *Destination* to *0.0.0.0/0.0.0.0*.
      - Set *Interface* to *port2*.
      - Set *Gateway Address* to *10.2.200.2*.
   b. Click *OK*.
3. Configure IPsec VPN:
   a. Go to *VPN* > *IPsec Wizard*.
      - Set *Name* to *To-HQ2*.
      - Set *Template Type* to *Custom*.
      - Click *Next*.
      - Set *Authentication* to *Method*.
      - Set *Pre-shared Key* to *123456*.
   b. Leave all other fields in their default values and click *OK*.
4. Configure the IPsec VPN interface IP address which will be used to form Security Fabric:
   a. Go to *Network* > *Interfaces*.
   b. Edit *To-HQ2*:
      - Set *Role* to *LAN*.
      - Set the *IP/Network Mask* to *10.10.10.1/255.255.255.255*.
      - Set *Remote IP/Network Mask* to *10.10.10.3/255.255.255.0*.
5. Configure IPsec VPN local and remote subnet:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New*
      - Set *Name* to *To-HQ2_remote_subnet_2*.
      - Set *Type* to *Subnet*.
      - Set *IP/Network Mask* to *10.10.10.3/32*.
   c. Click *OK*.
   d. Click *Create New*
      - Set *Name* to *To-HQ2_local_subnet_1*.
      - Set *Type* to *Subnet*.
      - Set *IP/Network Mask* to *192.168.8.0/24*.
   e. Click *OK*.

f. Click *Create New*
- Set *Name* to *To-HQ2_remote_subnet_1*.
- Set *Type* to *Subnet*.
- Set *IP/Network Mask* to *10.1.100.0/24*.

g. Click *OK*.

6. Configure IPsec VPN static routes:

a. Go to *Network* > *Static Routes*

b. Click *Create New* or *Create New* > *IPv4 Static Route*.
- For *Named Address*, select *Type* and select *To-HQ2_remote_subnet_1*.
- Set *Interface* to *To-HQ2*.

Click *OK*.

c. Click *Create New* or *Create New* > *IPv4 Static Route*.
- For *Named Address*, select *Type* and select *To-HQ2_remote_subnet_1*.
- Set *Interface* to *Blackhole*.
- Set *Administrative Distance* to *254*.

d. Click *OK*.

7. Configure IPsec VPN policies:

a. Go to *Policy & Objects* > *Firewall Policy*

b. Click *Create New*.
- Set *Name* to *vpn_To-HQ2_local*.
- Set *Incoming Interface* to *port6*.
- Set *Outgoing Interface* to *To-HQ2*.
- Set *Source* to *To-HQ2_local_subnet_1*.
- Set *Destination* to *To-HQ2_remote_subnet_1*.
- Set *Schedule* to *Always*.
- Set *Service* to *All*.
- Disable *NAT*.

c. Click *OK*.

d. Click *Create New*.
- Set *Name* to *vpn_To-HQ2_remote*.
- Set *Incoming Interface* to *To-HQ2*.
- Set *Outgoing Interface* to *port6*.
- Set *Source* to *To-HQ2_remote_subnet_1, To-HQ2_remote_subnet_2*.
- Set *Destination* to *To-HQ2_local_subnet_1*.
- Set *Schedule* to *Always*.
- Set *Service* to *All*.
- Enable *NAT*.
- Set *IP Pool Configuration* to *Use Outgoing Interface Address*.

e. Click *OK*.

8. Configure Security Fabric:

a. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.

b. For *Status*, click *Enable*.
After *FortiGate Telemetry* is enabled, FortiAnalyzer automatically enables *Logging* and *Upload* is set to *Real Time*.

c. Set the *Security Fabric role* to *Serve as Fabric Root*. The FortiAnalyzer settings can be configured.

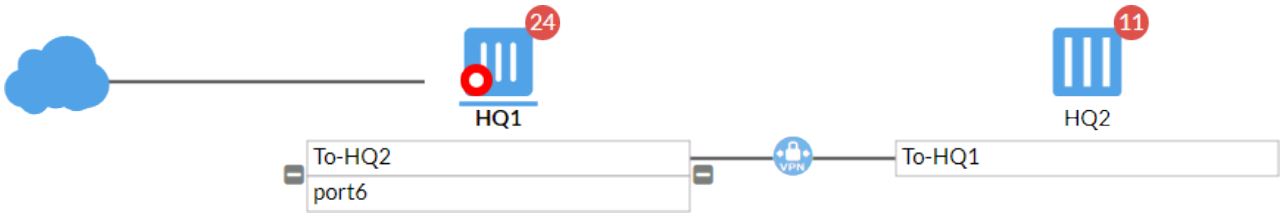
d. Enter the FortiAnalyzer IP (*192.168.8.250*).
e. Click *OK*. The FortiAnalyzer serial number is verified.
f. Enter a *Fabric name*, such as *Office-Security-Fabric*.
g. Ensure *Allow other Security Fabric devices to join* is enabled and add VPN interface *To-HQ2*.
h. Click *OK*.

To configure the downstream FortiGate (HQ2):

1. Configure interface:
   a. Go to *Network* > *Interfaces*.
   b. Edit interface *wan1*:
      - Set *Role* to *WAN*.
      - For the interface connected to the Internet, set the *IP/Network Mask* to *192.168.7.3/255.255.255.0*.
   c. Edit interface *vlan20*:
      - Set *Role* to *LAN*.
      - For the interface connected to local endpoint clients, set the *IP/Network Mask* to *10.1.100.3/255.255.255.0*.
2. Configure the static route to connect to the Internet:
   a. Go to *Network* > *Static Routes* and click *Create New* or *Create New* > *IPv4 Static Route*.
      - Set *Destination* to *0.0.0.0/0.0.0.0*.
      - Set *Interface* to *wan1*.
      - Set *Gateway Address* to *192.168.7.2*.
   b. Click *OK*.
3. Configure IPsec VPN:
   a. Go to *VPN* > *IPsec Wizard*.
      - Set *VPN Name* to *To-HQ1*.
      - Set *Template Type* to *Custom*.
      - Click *Next*.
      - In the *Network IP Address*, enter *10.2.200.1*.
      - Set *Interface* to *wan1*.
      - Set *Authentication* to *Method*.
      - Set *Pre-shared Key* to *123456*.
   b. Leave all other fields in their default values and click *OK*.
4. Configure the IPsec VPN interface IP address which will be used to form Security Fabric:
   a. Go to *Network* > *Interfaces*.
   b. Edit *To-HQ1*:
      - Set *Role* to *WAN*.
      - Set the *IP/Network Mask* to *10.10.10.3/255.255.255.255*.
      - Set *Remote IP/Network Mask* to *10.10.10.1/255.255.255.0.0*.
5. Configure IPsec VPN local and remote subnet:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New*
      - Set *Name* to *To-HQ1_local_subnet_1*.
      - Set *Type* to *Subnet*.
      - Set *IP/Network Mask* to *10.1.100.0/24*.
   c. Click *OK*.

   d. Click *Create New*
      - Set *Name* to *To-HQ1_remote_subnet_1*.
      - Set *Type* to *Subnet*.
      - Set *IP/Network Mask* to *192.168.8.0/24*.
   e. Click *OK*.
6. Configure IPsec VPN static routes:
   a. Go to *Network* > *Static Routes* and click *Create New* or *Create New* > *IPv4 Static Route*.
      - For *Named Address*, select *Type* and select *To-HQ1_remote_subnet_1*.
      - Set *Interface* to *To-HQ1*.
   b. Click *OK*.
   c. Click *Create New* or *Create New* > *IPv4 Static Route*.
      - For *Named Address*, select *Type* and select *To-HQ1_remote_subnet_1*.
      - Set *Interface* to *Blackhole*.
      - Set *Administrative Distance* to *254*.
   d. Click *OK*.
7. Configure IPsec VPN policies:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
      - Set *Name* to *vpn_To-HQ1_local*.
      - Set *Incoming Interface* to *vlan20*.
      - Set *Outgoing Interface* to *To-HQ1*.
      - Set *Source* to *To-HQ1_local_subnet_1*.
      - Set *Destination* to *To-HQ1_remote_subnet_1*.
      - Set *Schedule* to *Always*.
      - Set *Service* to *All*.
      - Disable *NAT*.
   b. Click *OK*.
   c. Click *Create New*.
      - Set *Name* to *vpn_To-HQ1_remote*.
      - Set *Incoming Interface* to *To-HQ1*.
      - Set *Outgoing Interface* to *vlan20*.
      - Set *Source* to *To-HQ1_remote_subnet_1*.
      - Set *Destination* to *-HQ1_local_subnet_1*.
      - Set *Schedule* to *Always*.
      - Set *Service* to *All*.
      - Disable *NAT*.
   d. Click *OK*.
8. Configure Security Fabric:
   a. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. For *Status*, click *Enable*.
      FortiAnalyzer automatically enables logging. FortiAnalyzer settings will be retrieved when the downstream FortiGate connects to the root FortiGate.
   c. Set the *Security Fabric role* to *Join Existing Fabric*.
   d. Set the *Upstream FortiGate IP* to *10.10.10.1*.
   e. Click *OK*.

To authorize the downstream FortiGate (HQ2) on the root FortiGate (HQ1):



1. In the root FortiGate (HQ1), go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   The *Topology* tree highlights the connected FortiGate (HQ2) with the serial number and asks you to authorize the highlighted device.
2. Select the highlighted FortiGates and select *Authorize*.
   After authorization, the downstream FortiGate (HQ2) appears in the *Topology* tree in the *Security Fabric* > *Fabric Connectors* > *Security Fabric Setup* page. This means the downstream FortiGate (HQ2) has successfully joined the Security Fabric.

To check Security Fabric over IPsec VPN:

1. On the root FortiGate (HQ1), go to *Security Fabric* > *Physical Topology*.
   The root FortiGate (HQ1) is connected by the downstream FortiGate (HQ2) with VPN icon in the middle.

2. On the root FortiGate (HQ1), go to *Security Fabric* > *Logical Topology*.
   The root FortiGate (HQ1) VPN interface *To-HQ2* is connected by downstream FortiGate (HQ2) VPN interface *To-HQ1* with VPN icon in the middle.

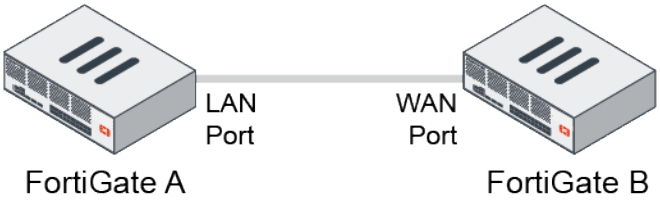
To run diagnose commands:

1. Run the `diagnose sys csf authorization pending-list` command in the root FortiGate (HQ1) to show the downstream FortiGate pending for root FortiGate authorization:

```
HQ1 # diagnose sys csf authorization pending-list
Serial                  IP Address      HA-Members
Path
--------------------------------------------------------------------------------
FG101ETK18002187        0.0.0.0
FG3H1E5818900718:FG101ETK18002187
```

2. Run the `diagnose sys csf downstream` command in the root FortiGate (HQ1) to show the downstream FortiGate (HQ2) after it joins Security Fabric:

```
HQ1 # diagnose sys csf downstream
 1:     FG101ETK18002187 (10.10.10.3) Management-IP: 0.0.0.0 Management-port:0 parent:
FG3H1E5818900718
        path:FG3H1E5818900718:FG101ETK18002187
        data received: Y downstream intf:To-HQ1 upstream intf:To-HQ2 admin-port:443
        authorizer:FG3H1E5818900718
```

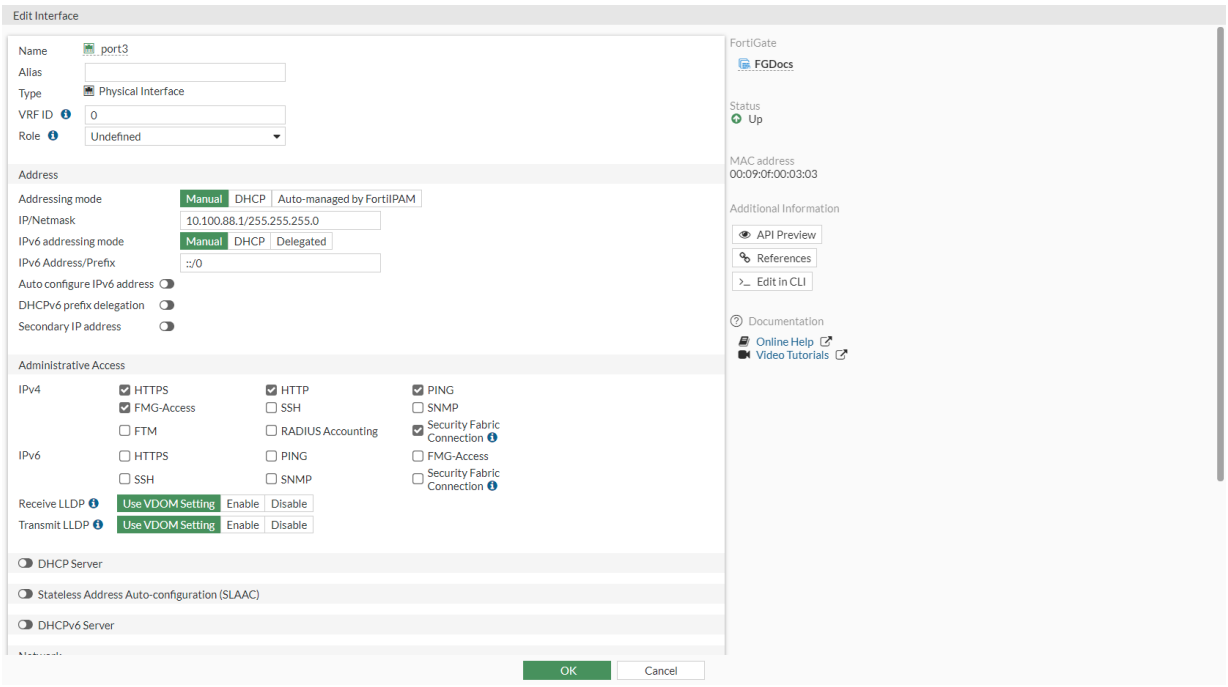


3. Run the `diagnose sys csf upstream` command in the downstream FortiGate (HQ2) to show the root FortiGate (HQ1) after the downstream FortiGate joins Security Fabric:

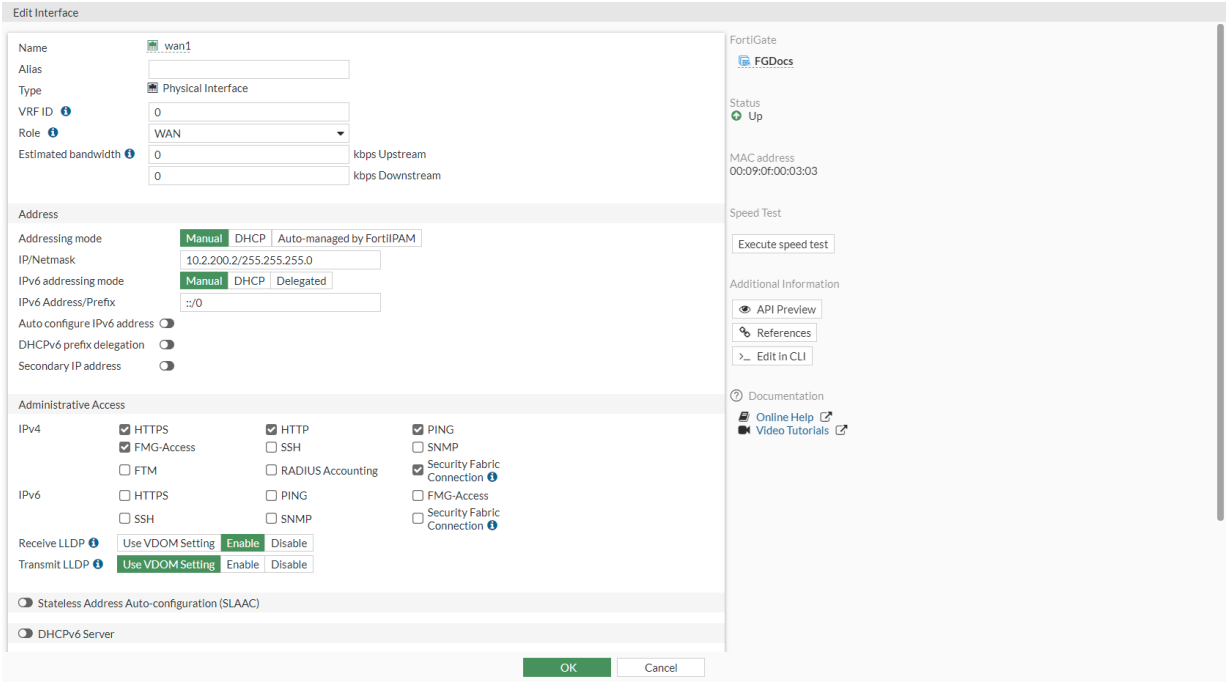
```
HQ2 # diagnose sys csf upstream
Upstream Information:
Serial Number:FG3H1E5818900718
IP:10.10.10.1
Connecting interface:To-HQ1
Connection status:Authorized
```

Leveraging LLDP to simplify Security Fabric negotiation

LLDP reception is enabled on WAN interfaces, which prompts FortiGates that are joining the Security Fabric if the upstream FortiGate asks.

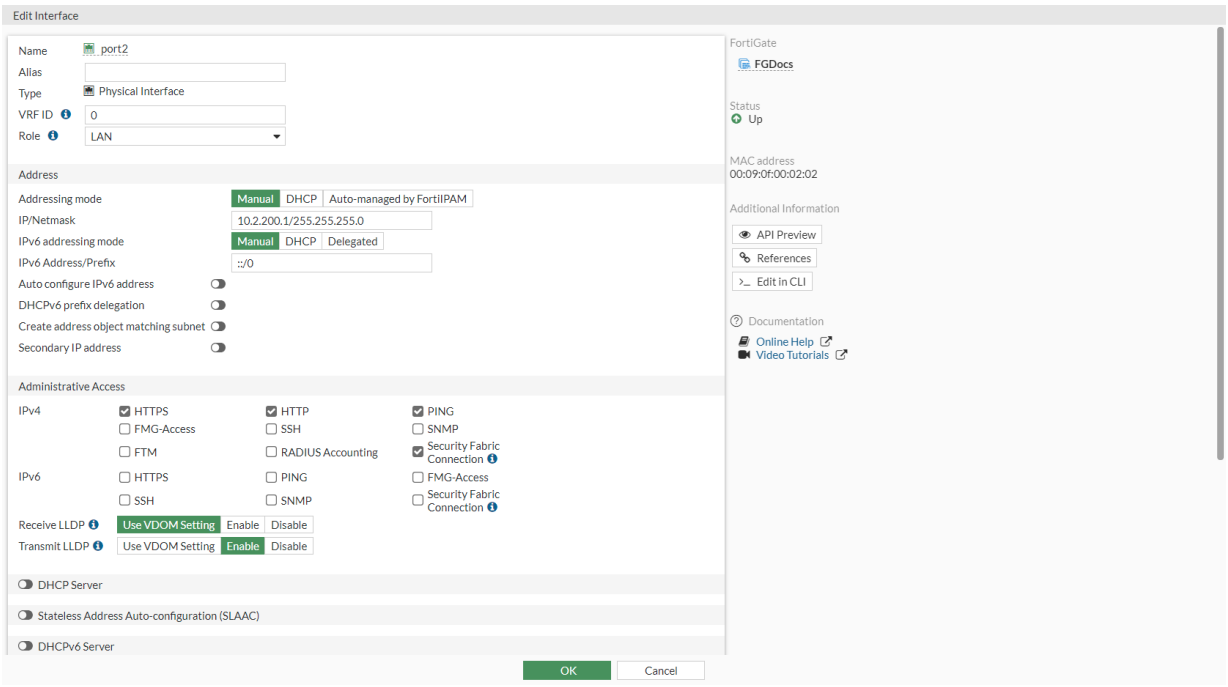


- If the interface role is undefined, LLDP reception and transmission inherit settings from the VDOM.
- If the interface role is WAN, LLDP reception is enabled.
- If the interface role is LAN, LLDP transmission is enabled.

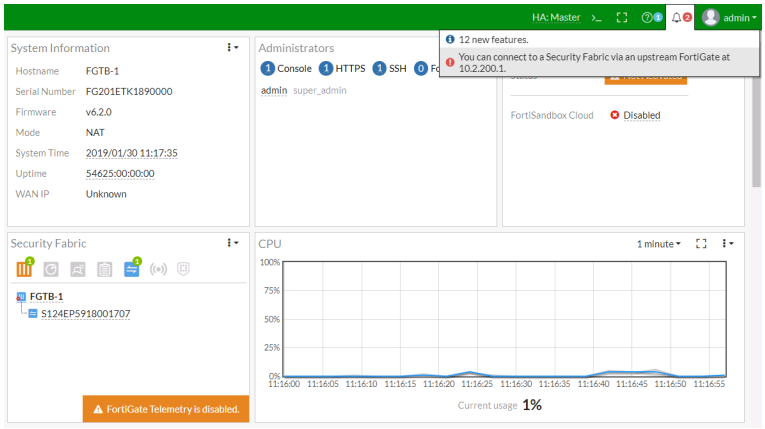


When a FortiGate B's WAN interface detects that FortiGate A's LAN interface is immediately upstream (through the default gateway), and FortiGate A has Security Fabric enabled, FortiGate B will show a notification on the GUI asking to join the Security Fabric.

To configure LLDP reception and join a Security Fabric in the GUI:



1. On FortiGate A, go to *Network* > *Interfaces*.
2. Configure an interface:
   - If the interface's role is undefined, under *Administrative Access*, set *Receive LLDP* and *Transmit LLDP* to *Use VDOM Setting*.



- If the interface's role is WAN, under *Administrative Access*, set *Receive LLDP* to *Enable* and *Transmit LLDP* to *Use VDOM Setting*.

- If the interface's role is LAN, under *Administrative Access*, set *Receive LLDP* to *Use VDOM Setting* and *Transmit LLDP* to *Enable*.

3. Click *OK*. A notification is shown on FortiGate B, *You can connect to a Security Fabric via an upstream FortiGate at 10.2.200.1*.

4. Click the notification. The *Core Network Security* page with the Security Fabric settings opens. All the required settings automatically configured.
5. Click *OK* to apply the settings.

To configure LLDP reception and join a Security Fabric in the CLI:

1. Configure the interface on FortiGate A:
   - Undefined role

```
config system interface
    edit "port3"
        set lldp-reception vdom
        set lldp-transmission vdom
        set role undefined
        ...
```

```
    next
end
```

- WAN role

```
config system interface
    edit "wan1"
        set lldp-reception enable
        set lldp-transmission vdom
        set role wan
        ...
    next
end
```

- LAN role

```
config system interface
    edit "port2"
        set lldp-reception vdom
        set lldp-transmission enable
        set role lan
        ...
    next
end
```

2. Edit the Security Fabric settings on FortiGate B:

```
config system csf
    set status enable
    set upstream-ip 10.2.200.1
end
```

Configuring the Security Fabric with SAML

Security Assertion Markup Language (SAML) is an open standard for exchanging authentication and authorization data between one Identity Provider (IdP) and one or more Service Providers (SP). Both parties exchange messages using the XML protocol as transport. FortiGate firewall devices can be configured as IdPs or SPs.

When the Security Fabric is enabled, you can configure the root FortiGate as the IdP. You can also configure downstream FortiGates to be automatically configured as SPs, with all links required for SAML communication, when added to the Security Fabric. Administrators must still be authorized on each device. Credentials are verified by the root FortiGate, and login credentials are shared between devices. Once authorized, an administrator can move between fabric devices without logging in again.

Optionally, the downstream FortiGate can also be manually configured as an SP, and then linked to the root FortiGate.

The authentication service is provided by the root FortiGate using local system admin accounts for authentication. Any of the administrator account types can be used for SAML log in. After successful authentication, the administrator logs in to the first downstream FortiGate SP, and can then connect to other downstream FortiGates that have the SSO account properly configured, without needing to provide credentials again, as long as admins use the same browser session. In summary, the root FortiGate IdP performs SAML SSO authentication, and individual device administrators define authorization on FortiGate SPs by using security profiles.

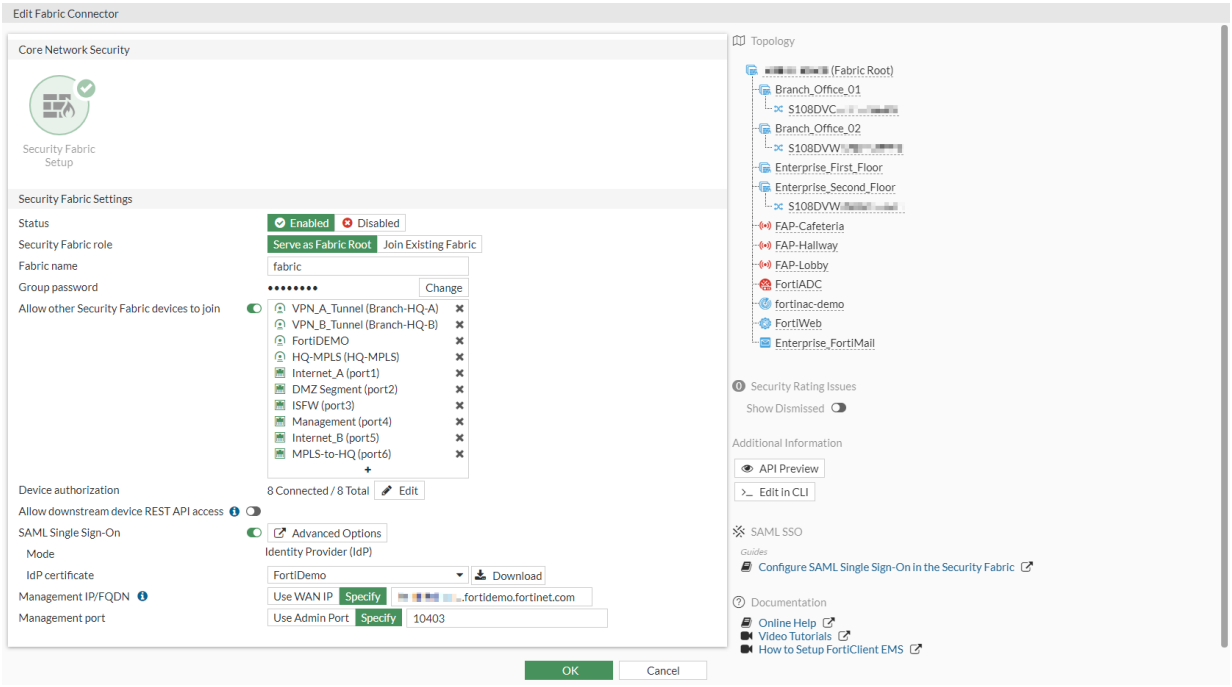
Configuring single-sign-on in the Security Fabric

SAML SSO enables a single FortiGate device to act as the identify provider (IdP), while other FortiGate devices act as service providers (SP) and redirect logins to the IdP.

Only the root FortiGate can be the identity provider (IdP). The downstream FortiGates can be configured as service providers (SP).

The process is as follows:

1. Configuring the root FortiGate as the IdP on page 2490
2. Configuring a downstream FortiGate as an SP on page 2491
3. Configuring certificates for SAML SSO on page 2493
4. Verifying the single-sign-on configuration on page 2495



You can also use the CLI. See CLI commands for SAML SSO on page 2496.

Configuring the root FortiGate as the IdP

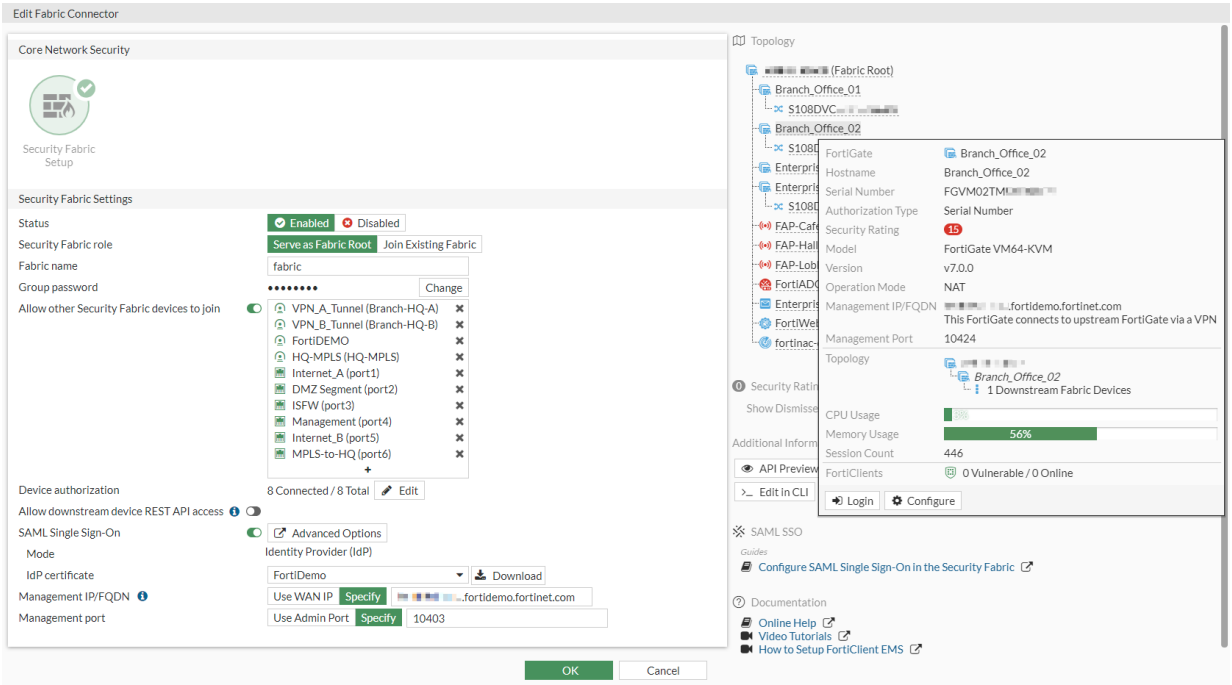
To configure the root FortiGate as the IdP:

1. Log in to the root FortiGate.
2. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
3. Enable *SAML Single Sign-On*. The *Mode* field is automatically populated as *Identity Provider (IdP)*.
4. Enter an IP address in the *Management IP/FQDN* box.
5. Enter a management port in the *Management port* box.
   The *Management IP/FQDN* will be used by the SPs to redirect the login request. The *Management IP/FQDN* and *Management port* must be reachable from the user's device.
6. Select the *IdP certificate*.

7. Click *OK*.

Configuring a downstream FortiGate as an SP

There are two ways to configure the downstream FortiGate:

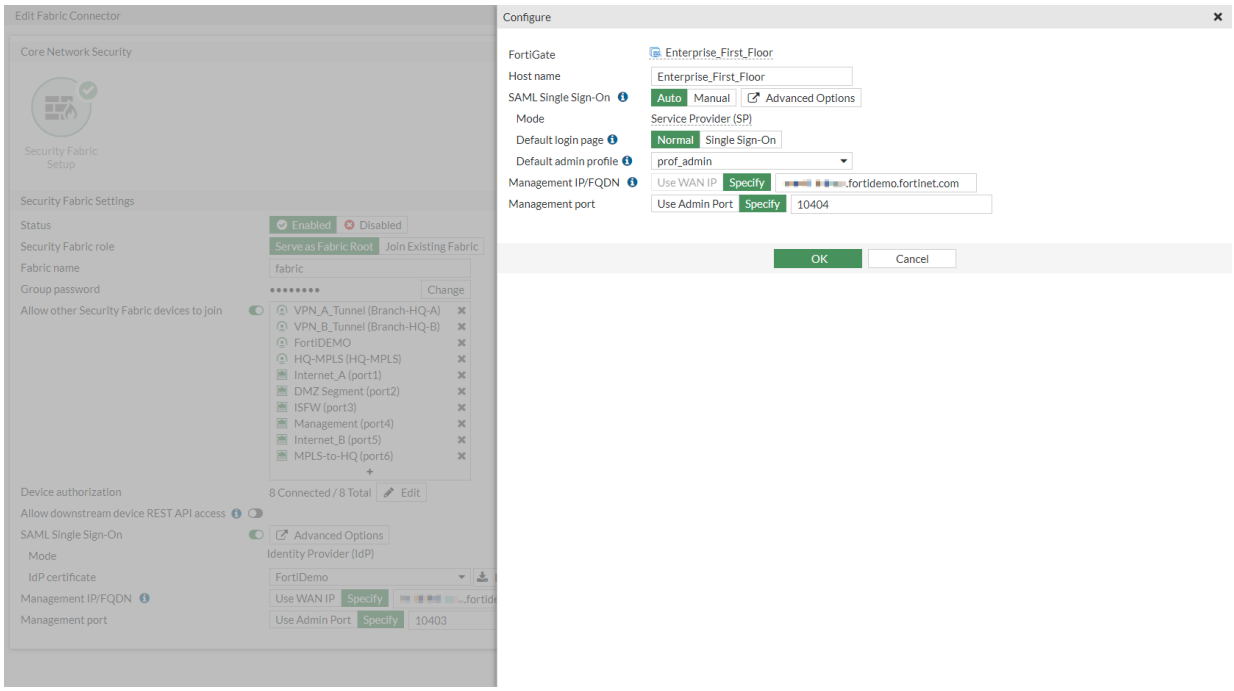


- From the root FortiGate
- From within the downstream device

An SP must be a member of the Security Fabric before you configure it.

To configure the downstream FortiGate from the root FortiGate:

1. Log in to the root FortiGate.
2. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.

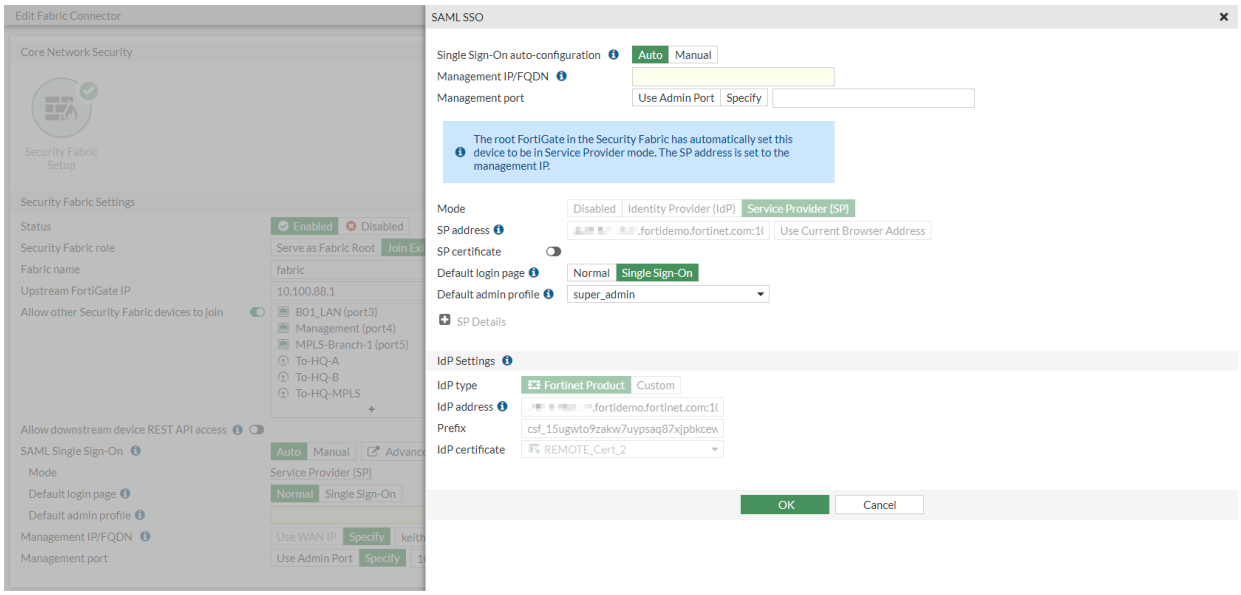


3. In the *Topology* tree, hover over a FortiGate and click *Configure*.

The *Configure* pane opens.

4. Select a *SAML Single Sign-On* option. *Auto* sets the device to SP mode. *Manual* allows you to configure the SSO settings by clicking *Advanced Options*.
5. Select a *Default login page* option.
6. Select one of the following *Default admin profile* types: *prof_admin*, *super_admin*, or *super_admin_readonly*.
7. Enter an IP address in the *Management IP/FQDN* box.
8. Enter a management port in the *Management port* box.
   The *Management IP/FQDN* will be used by the IdP and so other SPs can redirect to each other. The *Management port* must be reachable from the user's device.

9. Click *OK*.

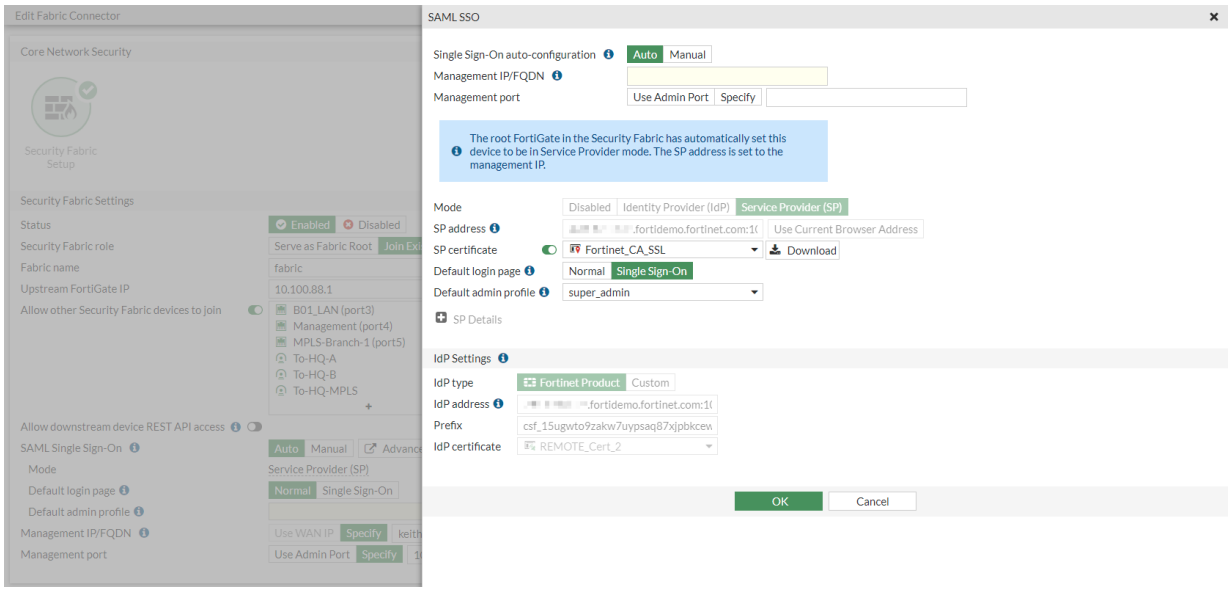


To configure the downstream FortiGate within the device:

1. Log in to the downstream FortiGate.
2. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
3. Select a *SAML Single Sign-On* option. *Auto* sets the device to SP mode. *Manual* allows you to configure the SSO settings by clicking *Advanced Options*.
4. Select a *Default login page* option.
5. Select one of the following *Default admin profile* types: *prof_admin*, *super_admin*, or *super_admin_readonly*.
6. Enter an IP address in the *Management IP/FQDN* box.
7. Enter a management port in the *Management port* box.
   The *Management IP/FQDN* will be used by the IdP and so other SPs can redirect to each other. The *Management port* must be reachable from the user's device.
8. Click *OK*.

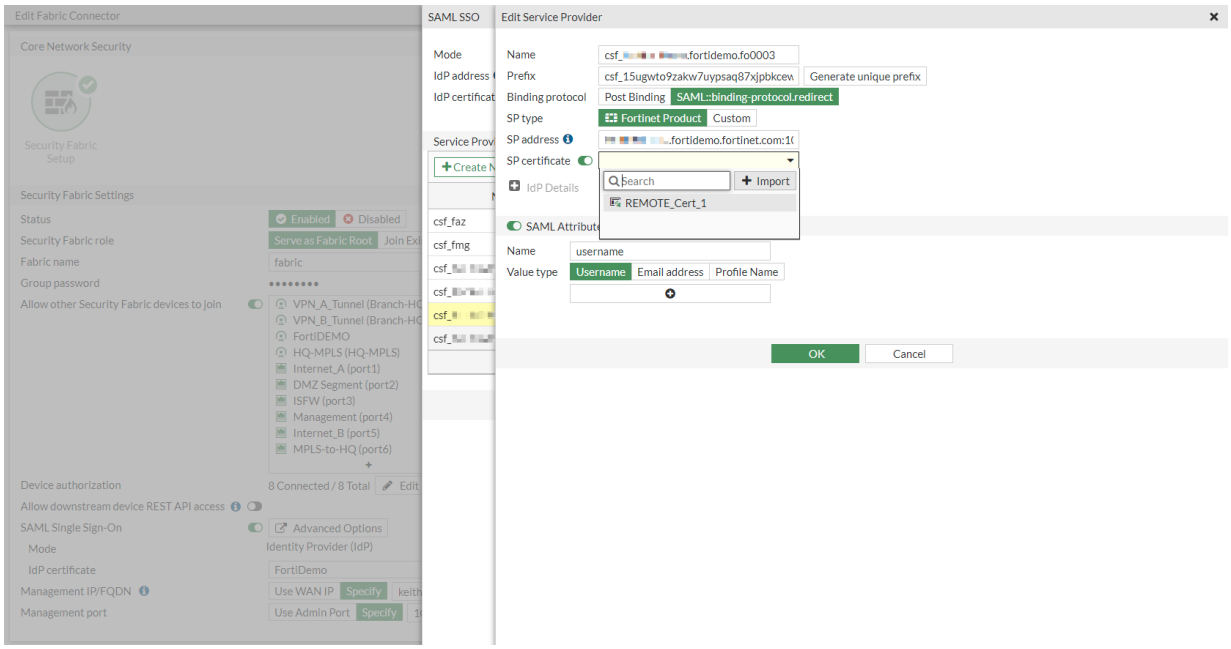
Configuring certificates for SAML SSO

Because communication between the root FortiGate IdP and FortiGate SPs is secured, you must select a local server certificate in the *IdP certificate* option on the root FortiGate. When downstream SPs join the IdP (root FortiGate), the SP automatically obtains the certificate.



In the following SP example, the *IdP certificate* displays *REMOTE_Cert_2*, which is the root server certificate for the IdP:

It is possible to manually import a certificate from an SP to the IdP so it can be used for authentication.



To manually import an SP certificate to an IdP:

1. Add the certificate:
   a. On the SP, go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. Click *Advanced Options*. The *SAML SSO* pane opens.
   c. Enable *SP certificate* and select a certificate from the dropdown box.
   d. Click *Download*. The certificate is downloaded on the local file system.
   e. Click *OK*.

2. Import the certificate:
   a. On the IdP, go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. Click *Advanced Options*. The *SAML SSO* pane opens.
   c. In the *Service Providers* table, select the SP from step 1 and click *Edit*.

d. Enable *SP certificate* and in the dropdown box, click *Import*.

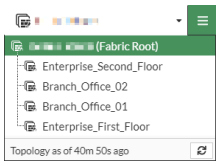
The *Upload Remote Certificate* window opens.

e. Click *Upload* and select the certificate downloaded in step 1.

f. Click *OK*. The certificate is imported.

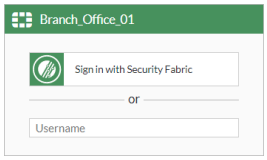
g. Click *OK*.

h. In the *IdP certificate* list, select the certificate that you imported.



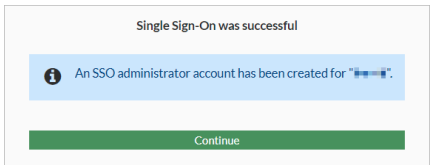
i. Click *OK*.

Verifying the single-sign-on configuration



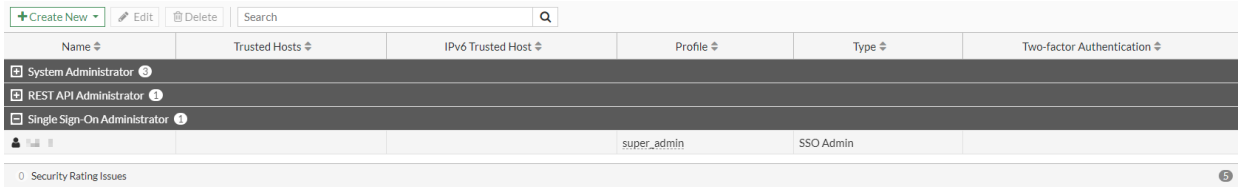
After you have logged in to a Security Fabric member using SSO, you can navigate between any Security Fabric member with SSO configured.

To navigate between Security Fabric members:



1. Log in to a Security Fabric member that is using SSO.
2. In the top banner, click the name of the device you are logged in to. A list of Security Fabric members displays.

3. Click a Security Fabric member. The login page appears. Click *Sign in with Security Fabric*.



4. A prompt appears that an SSO administrator account has been created. Click *Continue*.

You are now logged in to the Security Fabric member with SSO. The letters "SSO" also display beside the user name in the top banner.

5. Go to *System* > *Administrators* > *Single-Sign-On Administrator* to view the list of SSO admins created.

CLI commands for SAML SSO

To enter a question mark (?) or a tab, Ctrl + V must be entered first. Question marks and tabs cannot be typed or copied into the CLI Console or some SSH clients.

To configure the IdP:

```
config system saml
    set status enable
    set role identity-provider
    set cert "Fortinet_Factory"
    set server-address "172.16.106.74"
    config service-providers
        edit "csf_172.16.106.74:12443"
            set prefix "csf_ngczjwqxujfsbhgr9ivhehwu37fml20"
            set sp-entity-id "http://172.16.106.74/metadata/"
            set sp-single-sign-on-url "https://172.16.106.74/saml/?acs"
            set sp-single-logout-url "https://172.16.106.74/saml/?sls"
            set sp-portal-url "https://172.16.106.74/saml/login/"
            config assertion-attributes
                edit "username"
                next
                edit "tdoc@fortinet.com"
                    set type email
                next
            end
        next
    end
end
```

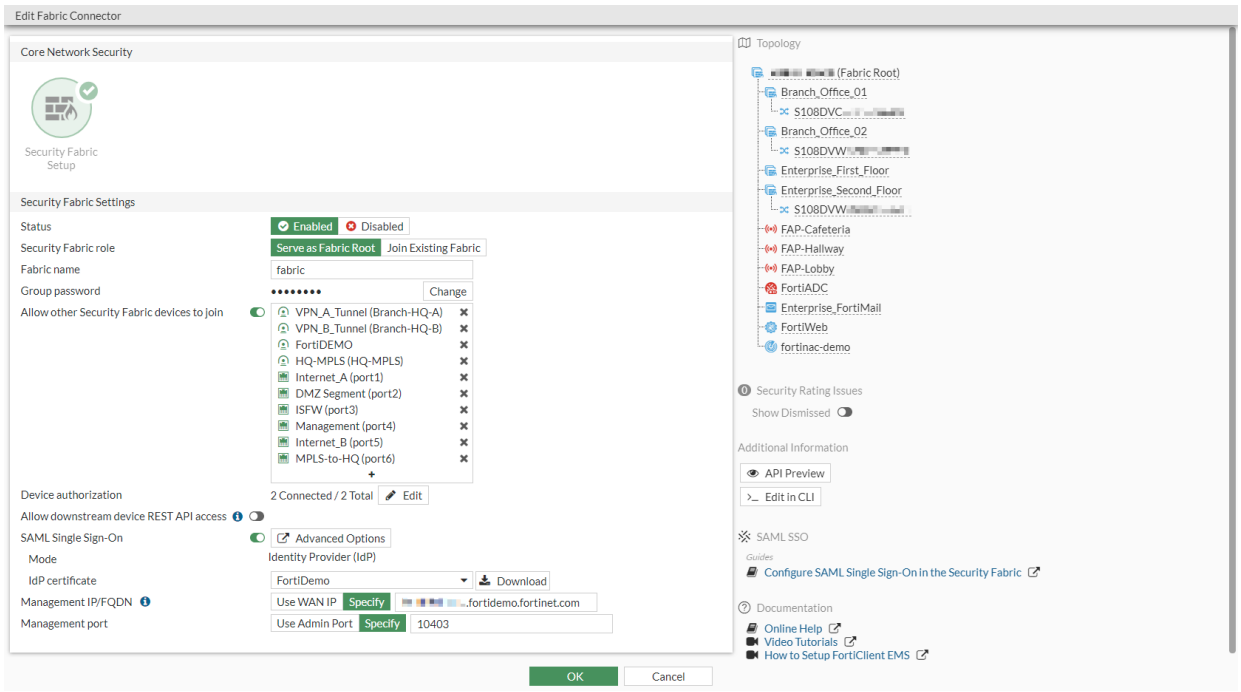
To configure an SP:

```
config system saml
    set status enable
    set cert "Fortinet_Factory"
    set idp-entity-id "http://172.16.106.74/saml-idp/csf_
```

```
ngczjwqxujfsbhgr9ivhehwu37fml20/metadata/"
    set idp-single-sign-on-url "https://172.16.106.74/csf_
ngczjwqxujfsbhgr9ivhehwu37fml20/login/"
    set idp-single-logout-url "https://172.16.106.74/saml-idp/csf_
ngczjwqxujfsbhgr9ivhehwu37fml20/logout/"
    set idp-cert "REMOTE_Cert_1"
    set server-address "172.16.106.74:12443"
end
```

To configure an SSO administrator:

```
config system sso-admin
    edit "SSO-admin-name"
        set accprofile <SSO admin user access profile>
        set vdom <Virtual domain(s) that the administrator can access>
    next
end
```



SAML SSO with pre-authorized FortiGates

You can set up SAML SSO authentication in a Security Fabric environment by starting with a root FortiGate that has one or more pre-authorized FortiGates.

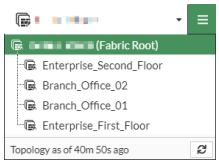
After the initial configuration, you can add more downstream FortiGates to the Security Fabric, and they are automatically configured with default values for a service provider.

To set up basic SAML SSO for the Security Fabric:

1. Log in to the root FortiGate of the Security Fabric.
2. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
3. Join two pre-authorized FortiGates to the root FortiGate (see Configuring the root FortiGate and downstream FortiGates on page 2378).

4. Configure the IdP (see Configuring the root FortiGate as the IdP on page 2490).
5. Configure the SPs (see Configuring a downstream FortiGate as an SP on page 2491).

Navigating between Security Fabric members with SSO



After you have logged in to a Security Fabric member by using SSO, you can navigate between any Security Fabric member with SSO configured. This can be done using the Security Fabric members dropdown menu or by logging in to a FortiGate SP from the root FortiGate IdP.

Security Fabric members dropdown

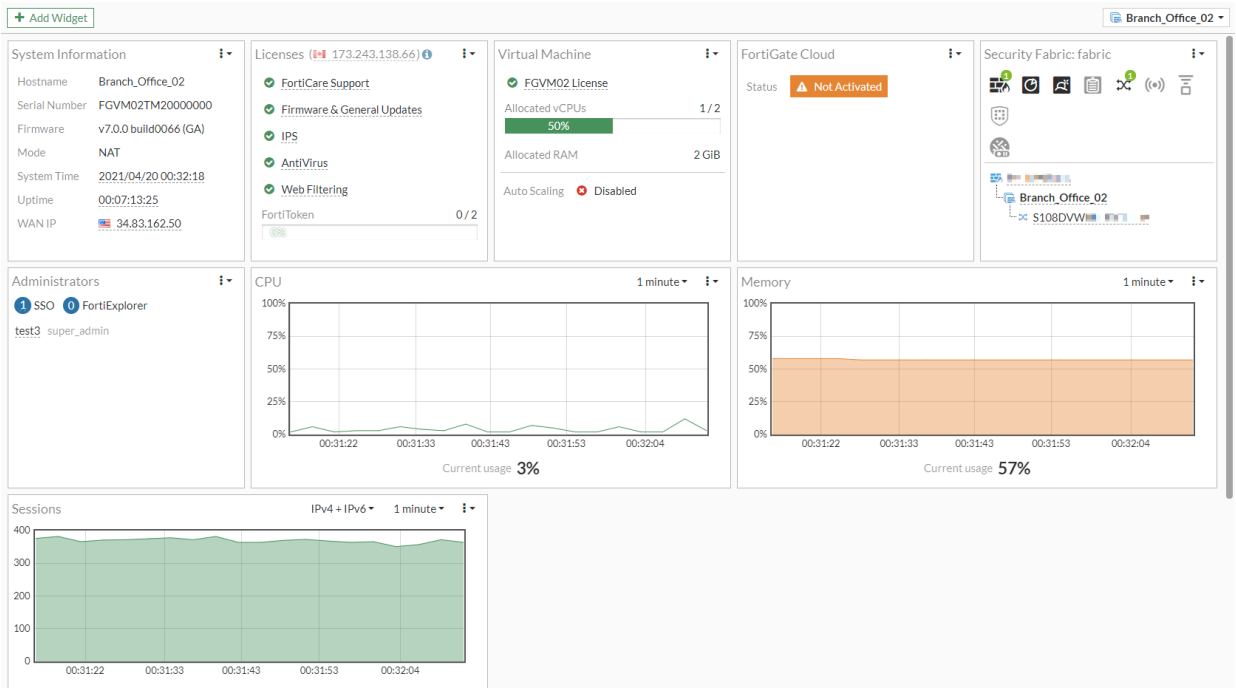
The Security Fabric members dropdown menu allows you to easily switch between all FortiGate devices that are connected to the Security Fabric. You can also use this menu to customize a FortiGate in the Security Fabric.

To navigate between Security Fabric members:

1. Log in to a Security Fabric member by using SSO.
2. In the top banner, click the name of the device you are logged into with SSO.
   A list of Security Fabric members is displayed.

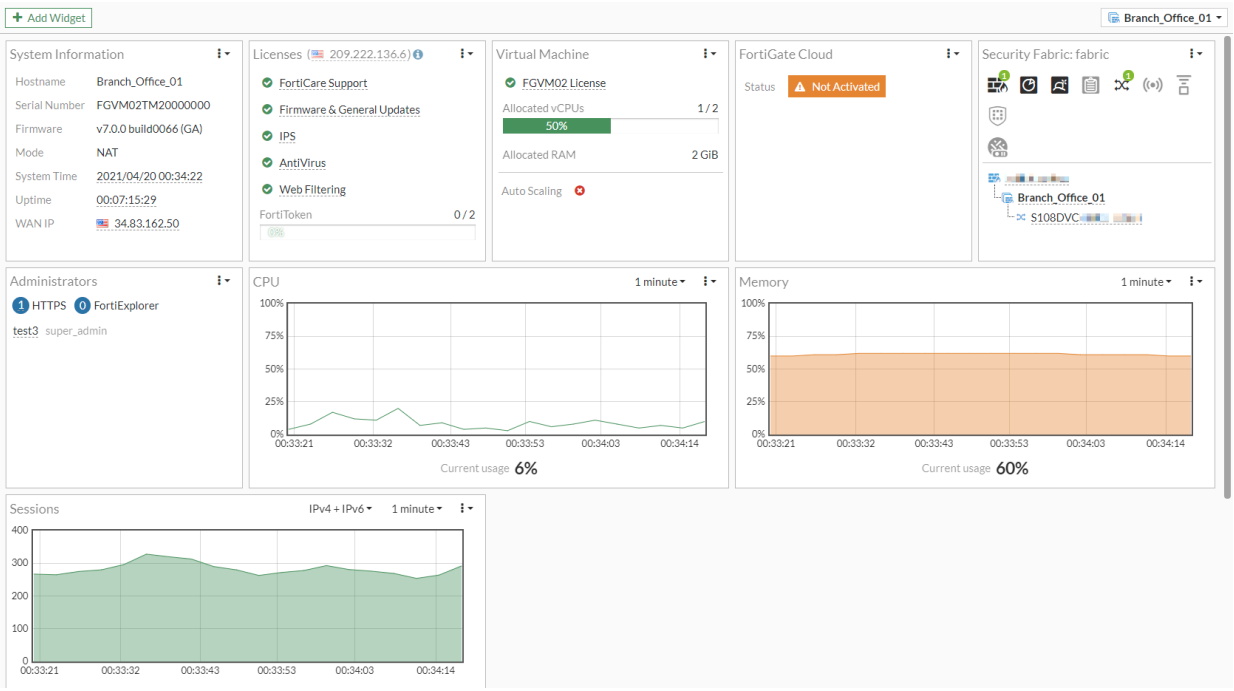
3. Click the Security Fabric member.
   You are logged in to the Security Fabric member without further authentication.

To customize a FortiGate in the Security Fabric:



1. In the Security Fabric members dropdown menu, hover the cursor over a FortiGate so the tooltip is shown.
2. Click *Configure*. The *Configure* pane opens.
3. Edit the settings as required.
4. Click *OK*.

Logging in to an SP from the root IdP



The following example describes how to log in to a root FortiGate IdP, and navigate to other FortiGate SPs in the Security Fabric without further authentication. The local administrator account is named *test3*. The local administrator account must also be available as an SSO administrator account on all downstream FortiGate SPs. Different tabs of the same browser are used to log in to the various FortiGates.

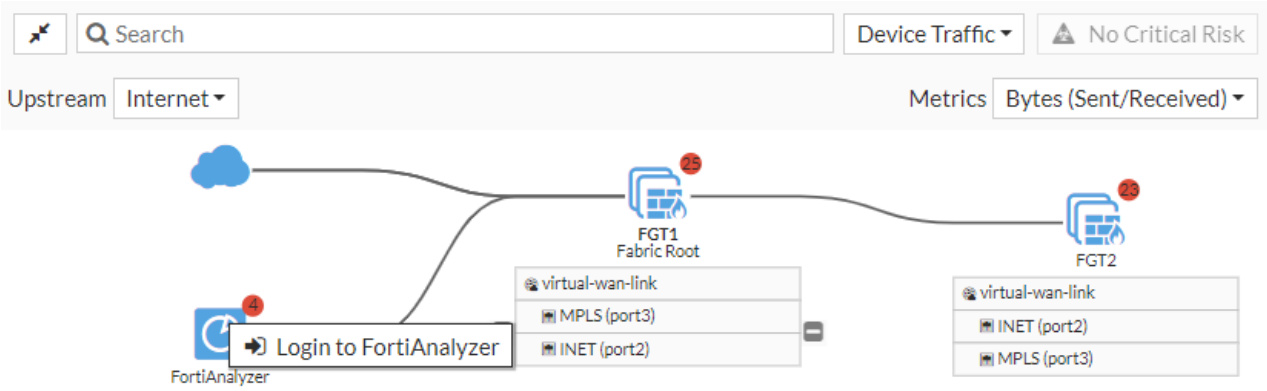
To log in to a FortiGate SP from a root FortiGate IdP:

1. Log in to the root FortiGate IdP by using the local administrator account.
   In this example, the local administrator account is named *test3*.
2. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
3. In the *Topology* tree, click one of the downstream FortiGate SPs, and select *Login to <name of FortiGate>*. The login screen is displayed.
4. In the login screen, select *Single Sign-On*.
   By using cookies in your local browser for the already-authenticated SSO administrator, FortiGate logs you in to the downstream FortiGate SP as the SSO administrator. In this example, the SSO administrator name is *test3*.

5. While still logged into the root FortiGate IdP in your browser, go to the browser tab for the root FortiGate IdP, and log in to another FortiGate SP that is displayed on the *Security Fabric* widget in the GUI.

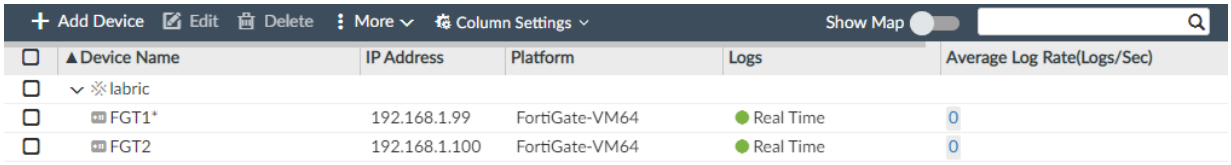
SAML SSO login uses *SAML_IDP* session cookies of already authenticated admin users in your local browser cache to send to the root FortiGate IdP for authentication. If your browser cache is manually cleared, or you close your browser, you must authenticate again.

It is possible to log in to one downstream FortiGate SP in a Security Fabric, and then open another tab in your browser to connect to another FortiGate SP that is not a member of the Security Fabric.



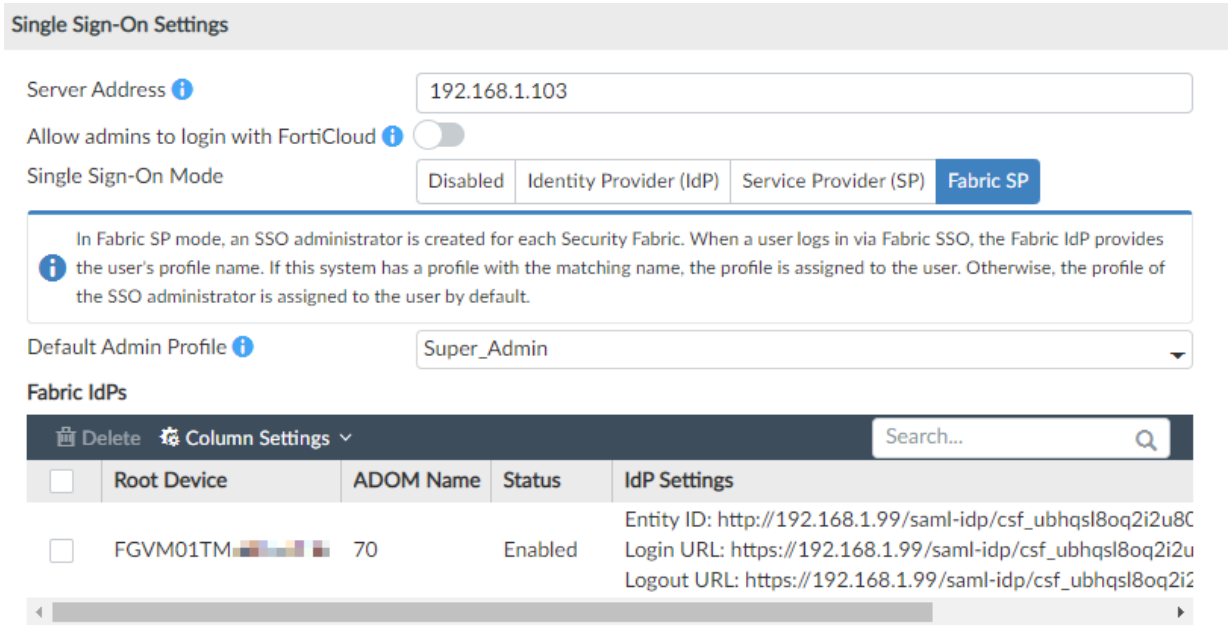
This is useful in cases where the SSO administrator and the local system administrator on the FortiGate SP both have the same login name, but are two different entities.

Integrating FortiAnalyzer management using SAML SSO



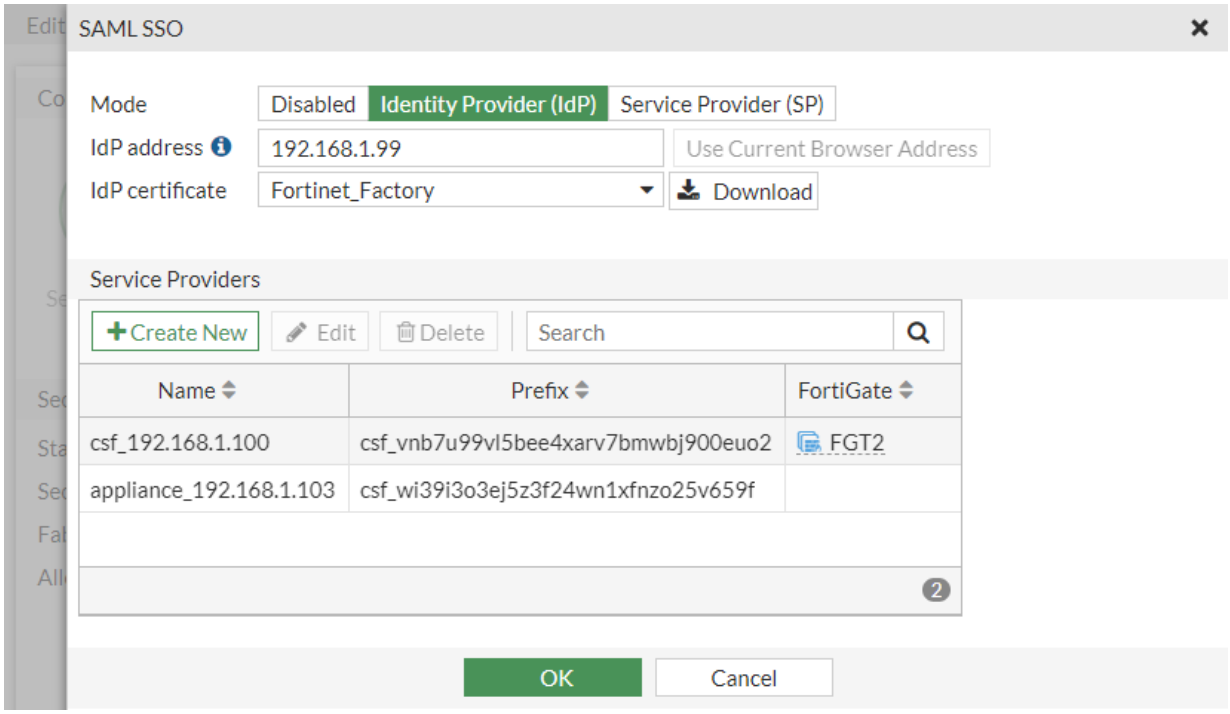
When a FortiGate acting as a Security Fabric root is configured as a SAML SSO identity provider (IdP), the FortiAnalyzer of the Security Fabric can register itself as a service provider (SP). This simplifies the configuration by enabling the setting in FortiAnalyzer to facilitate Fabric SSO access to the FortiAnalyzer once authenticated to the root FortiGate. When signed in using SSO, the FortiAnalyzer includes a Security Fabric navigation dropdown, which allows easy navigation to FortiGates in the Fabric.

To enable FortiAnalyzer as a Fabric SP in the GUI:



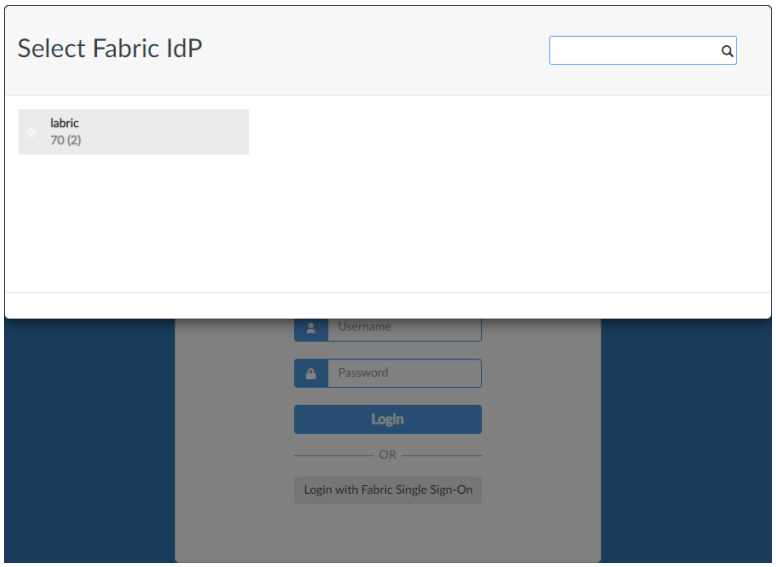
1. On the root FortiGate, go to *Security Fabric* > *Physical Topology* or *Logical Topology*.
2. In the topology, click the *FortiAnalyzer* icon and select *Login to FortiAnalyzer*.

3. Enter the credentials to log in. A Security Fabric must be configured with the Fabric devices listed under the Fabric name.
   a. Go to *Device Manager* to verify the Fabric setup. There is an asterisk beside the root FortiGate.



4. Edit the FortiAnalyzer SAML SSO settings:
   a. Go to *System Settings* > *Admin* > *SAML SSO*.
   b. For *Single Sign-On Mode*, select *Fabric SP* and enter the address to access the FortiAnalyzer in *Server Address*.

   c. Click *Apply* and log out of the FortiAnalyzer. The FortiAnalyzer will automatically register itself on the FortiGate and is a visible appliance in the list of SPs.



5. Verify that the FortiAnalyzer registration was successful:
   a. In FortiOS, go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. In the *SAML Single Sign-On* section click *Advanced Options*. There should be an entry for the FortiAnalyzer in the *Service Providers* table (*appliance_192.168.1.103*).

6. Log in to the FortiAnalyzer. There is a new option to *Login with Fabric Single Sign-On*.

7. Click *Login with Fabric Single Sign-On*. A dialog appears to select a Fabric IdP.

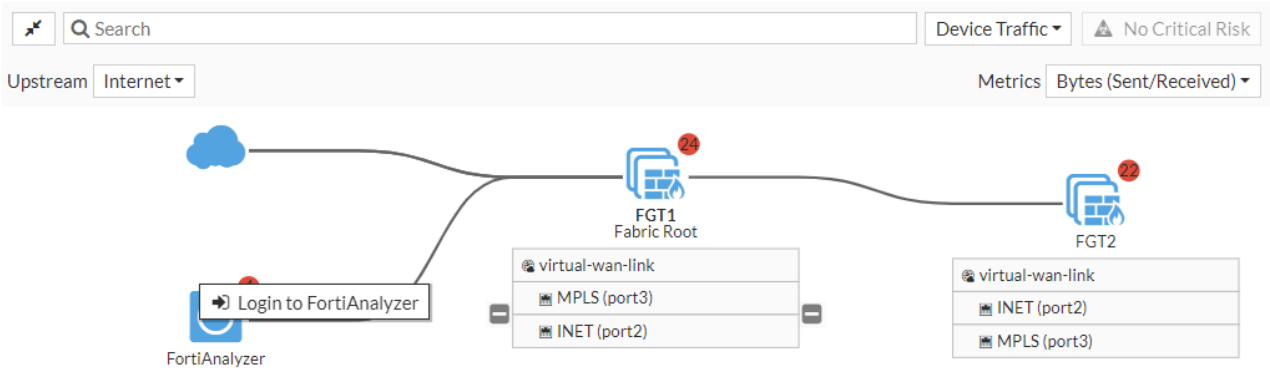
8. Select a FortiGate. The ADOM containing that FortiGate opens.

To enable FortiAnalyzer as a Fabric SP in the CLI:

1. In FortiAnalyzer, enable the device as a Fabric SP:

```
config system saml
    set status enable
    set role FAB-SP
    set server-address "192.168.1.99"
end
```

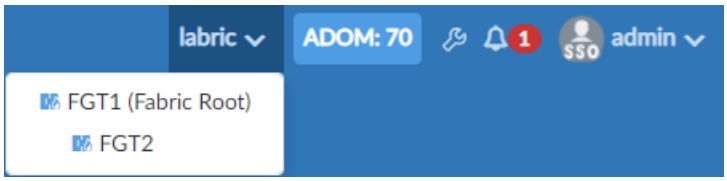
   FortiAnalyzer will register itself on the FortiGate as an appliance.



2. Verify the configuration in FortiOS:

```
show system saml
config system saml
    set status enable
    set role identity-provider
    set cert "fortigate.domain.tld"
    set server-address "192.168.1.99"
    config service-providers
        edit "appliance_192.168.1.103"
            set prefix "csf_76sh0bm4e7hf1ty54w42yrrv88tk8uj"
            set sp-entity-id "http://192.168.1.103/metadata/"
            set sp-single-sign-on-url "https://192.168.1.103/saml/?acs"
            set sp-single-logout-url "https://192.168.1.103/saml/?sls"
            set sp-portal-url "https://192.168.1.103/saml/login/"
            config assertion-attributes
                edit "username"
                next
                edit "profilename"
                    set type profile-name
                next
```

```
            end
        next
    end
end
```

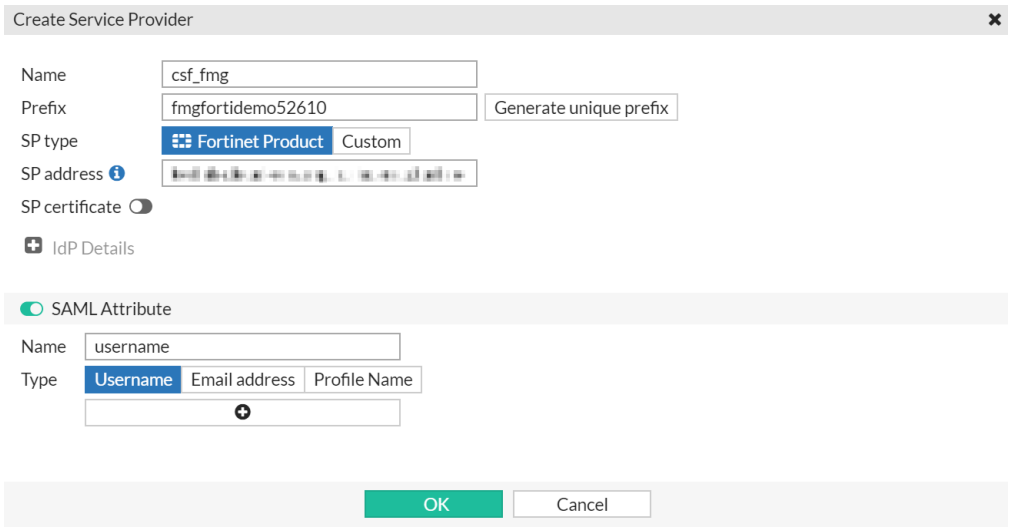


To navigate between devices using SAML SSO in FortiOS:

1. Log in to the root FortiGate.
2. Go to *Security Fabric* > *Physical Topology* or *Logical Topology*.
3. In the topology, click the *FortiAnalyzer* icon and select *Login to FortiAnalyzer*.

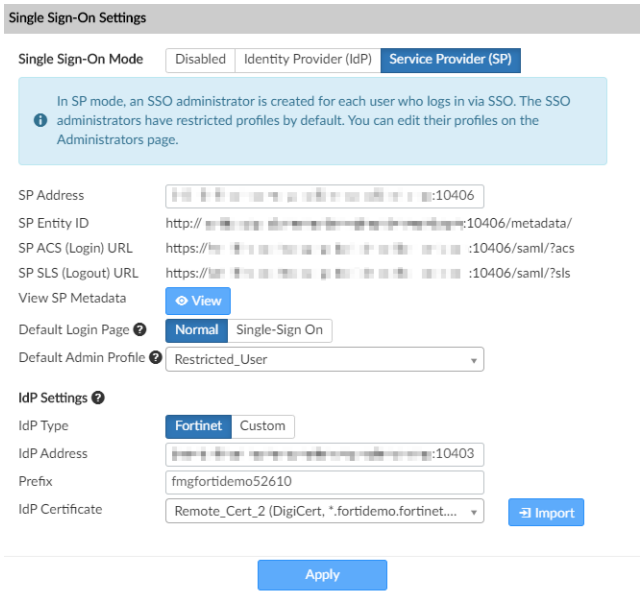
To navigate between devices using SAML SSO in FortiAnalyzer:

1. Log in to the FortiAnalyzer using SSO.
2. Navigate to the ADOM that contains the root FortiGate of the Security Fabric.
3. In the toolbar, click the Security Fabric name to display a dropdown a list of the Fabric FortiGates.



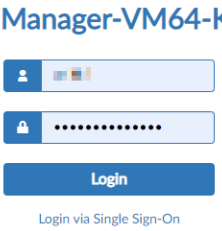
Integrating FortiManager management using SAML SSO

When a FortiGate is configured as the SAML SSO IdP, FortiManager can be added as an SP.



To configure FortiManager as a Fabric SP:

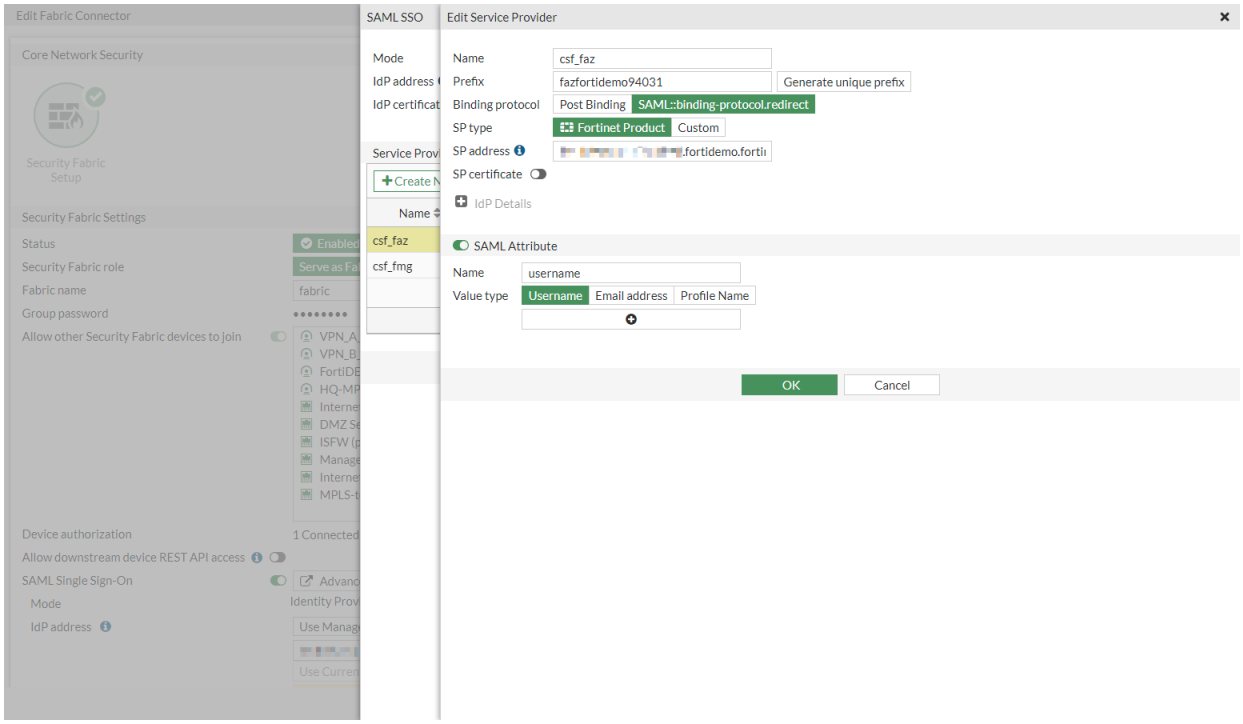
1. On the root FortiGate, go to *Security Fabric* > *Fabric Connectors*, and edit the *Security Fabric Setup* connector.
2. In the *Security Fabric Settings* section, click *Advanced Options*.
3. In the *Service Providers* section, click *Create New*.
4. Enter a name and a prefix for the SP. FortiOS generates a unique prefix, but you can enter your own.



5. In *SP address*, enter the FortiManager address including the port number.

6. Click *OK*.
7. In FortiManager, go to *System Settings* > *Admin* > *SAML SSO* and in the *Single Sign-On Mode* section, click *Service Provider (SP)*.
8. Configure the *IdP Settings*:
   a. For *IdP Type*, click *Fortinet*.
   b. For *IdP Address*, enter the root FortiGate address including the port number.
   c. Enter the *Prefix* of the SP.
   d. For *IdP Certificate*, import the same certificate used on the root FortiGate.
   e. Click *Apply*.

9. To verify that the configuration works, log out of FortiManager and log in using the *Login via Single-Sign-On* link.

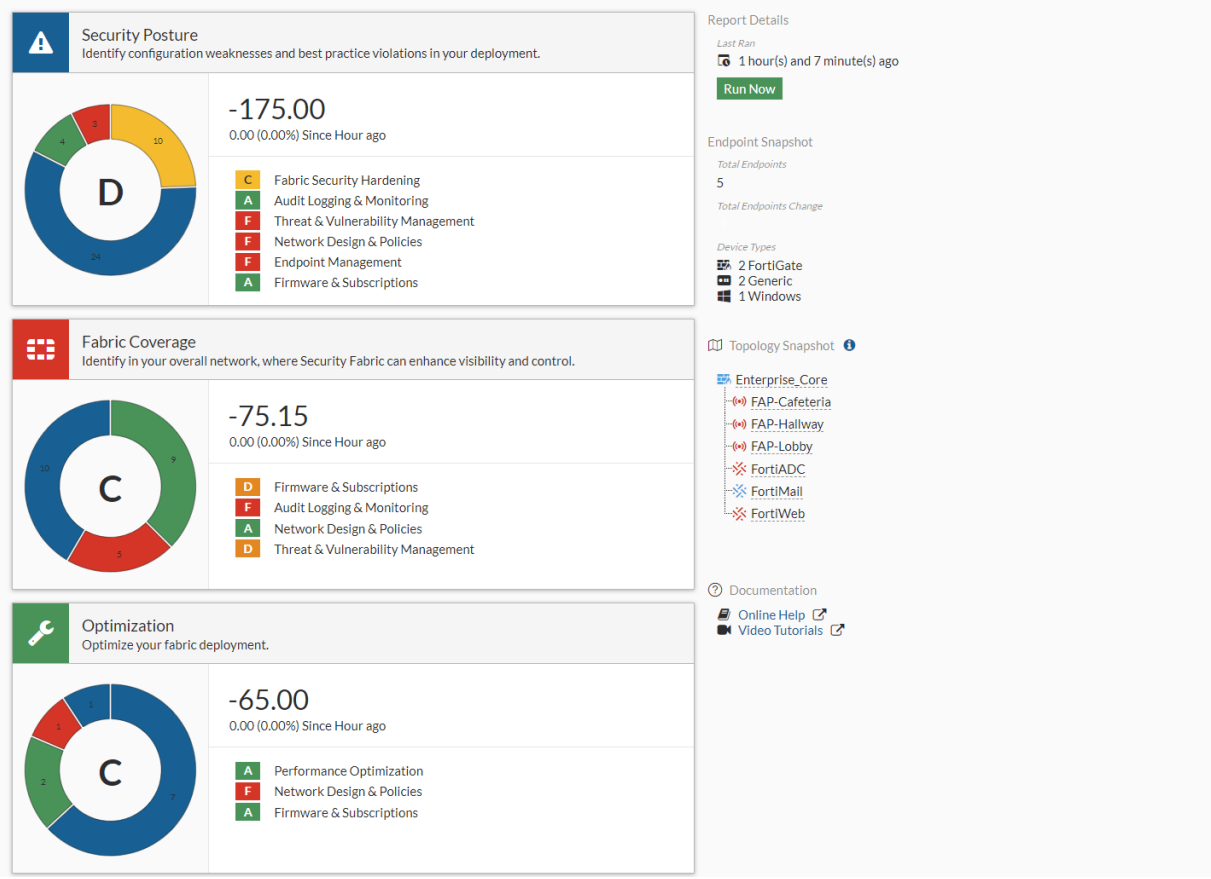


Advanced option - FortiGate SP changes

From a root FortiGate IdP, you can edit each of the FortiGate SPs. For example, you can edit a FortiGate SP to generate a new prefix, or you can add or modify SAML attributes. When you generate a new prefix value, it is propagated to the respective downstream FortiGates.

To edit an SP from the root FortiGate (IdP):

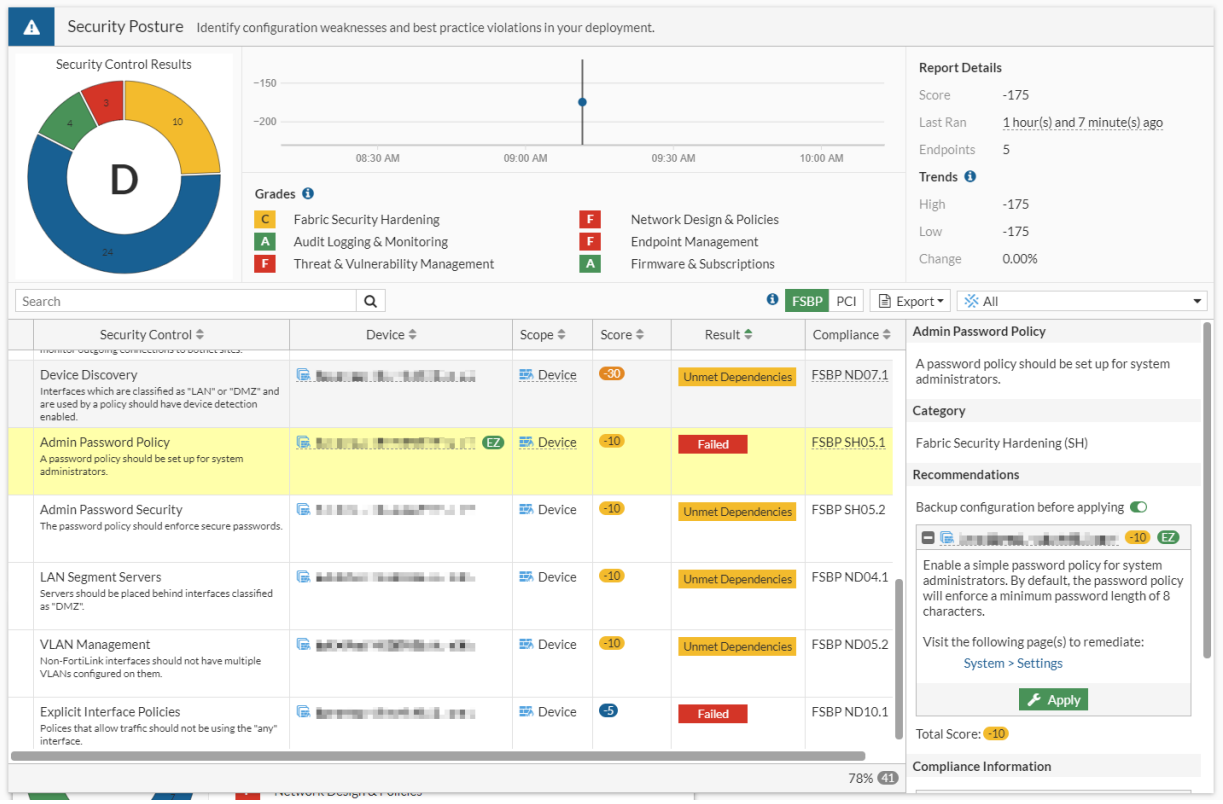
1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. Click *Advanced Options*. The *SAML SSO* pane opens.
3. In the *Service Providers* table, select a device and click *Edit*. The *Edit Service Provider* pane opens.



4. Edit the settings as needed.
5. Click *OK*.

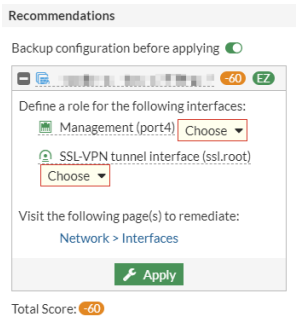
Security rating

The security rating uses real-time monitoring to analyze your Security Fabric deployment, identify potential vulnerabilities, highlight best practices that can be used to improve the security and performance of your network, and calculate Security Fabric scores.

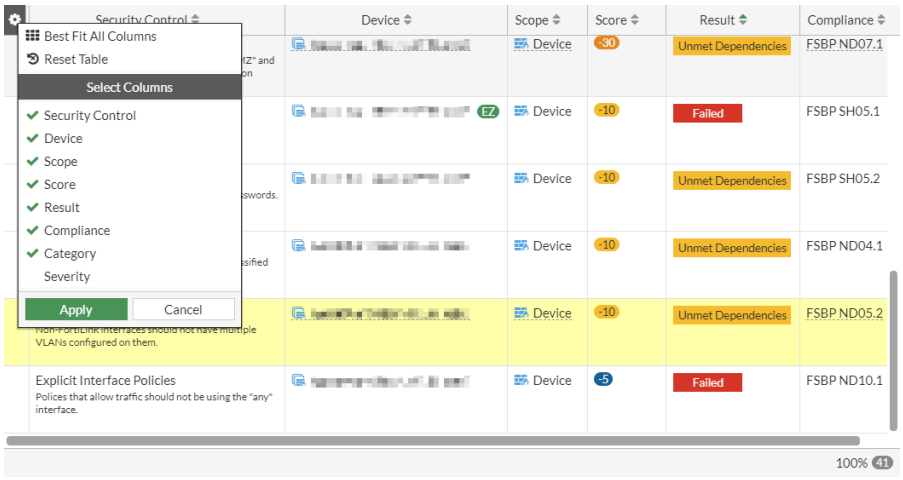


To view the security rating, go to *Security Fabric* > *Security Rating* on the root FortiGate.

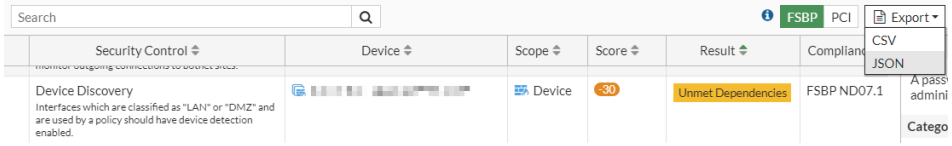
The *Security Rating* page is separated into three major scorecards: *Security Posture*, *Fabric Coverage*, and *Optimization*, which provide an executive summary of the three largest areas of security focus in the Security Fabric.



The scorecards show an overall letter grade and breakdown of the performance in sub-categories. Clicking a scorecard drills down to a detailed report of itemized results and compliance recommendations. The point score represents the net score for all passed and failed items in that area. In the drill down report, hover the cursor over a score to view the calculation breakdown.



The report includes the security controls that were tested against, linking to specific FSBP or PCI compliance policies. Click the *FSBP* and *PCI* buttons to reference the corresponding standard. Users can search or filter the report results. If there is a failed check on the scorecard, there is a link in the *Recommendations* section that takes you to the page to resolve the problem.



Certain remediations marked with an *EZ* symbol represent configuration recommendations that support *Easy Apply*. In the panel on the right, in the *Recommendations* section, click *Apply* to apply the changes to resolve the failed security control.

The report table can be customized by adding more columns, such as *Category*, to view, filter, or sort the results based on scorecard categories. Click the gear icon to customize the table.

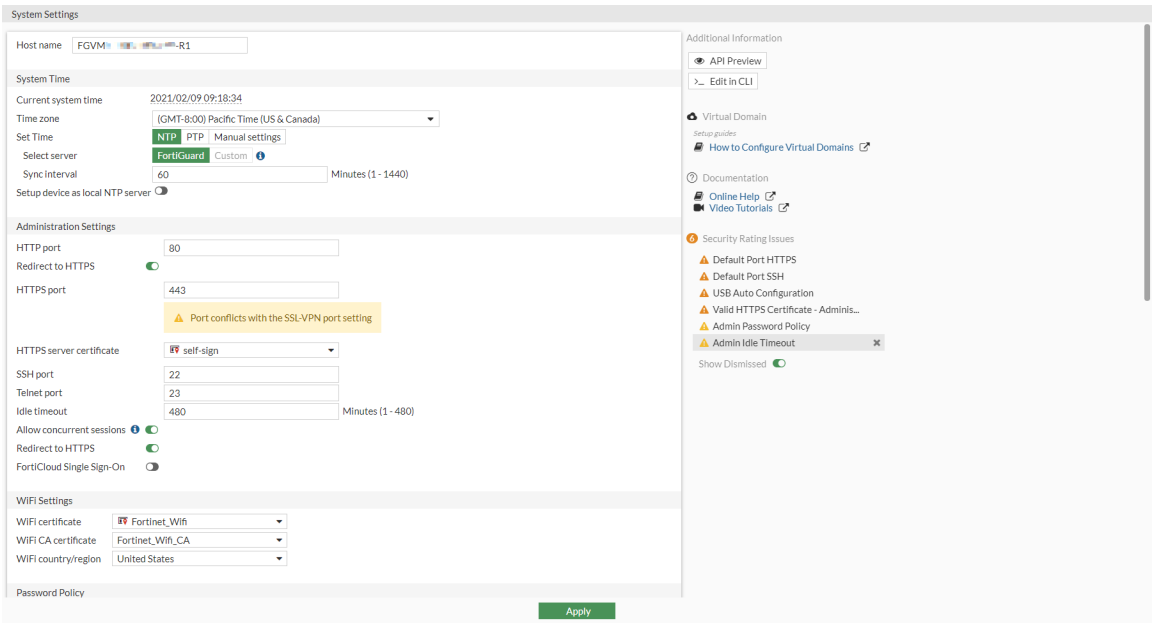
Users can also export the reports as CSV or JSON files by clicking the *Export* dropdown.

To exit the current view, click the icon beside the scorecard title to return to the summary view.

For more information about security ratings, and details about each of the checks that are performed, go to Security Best Practices & Security Rating Feature.

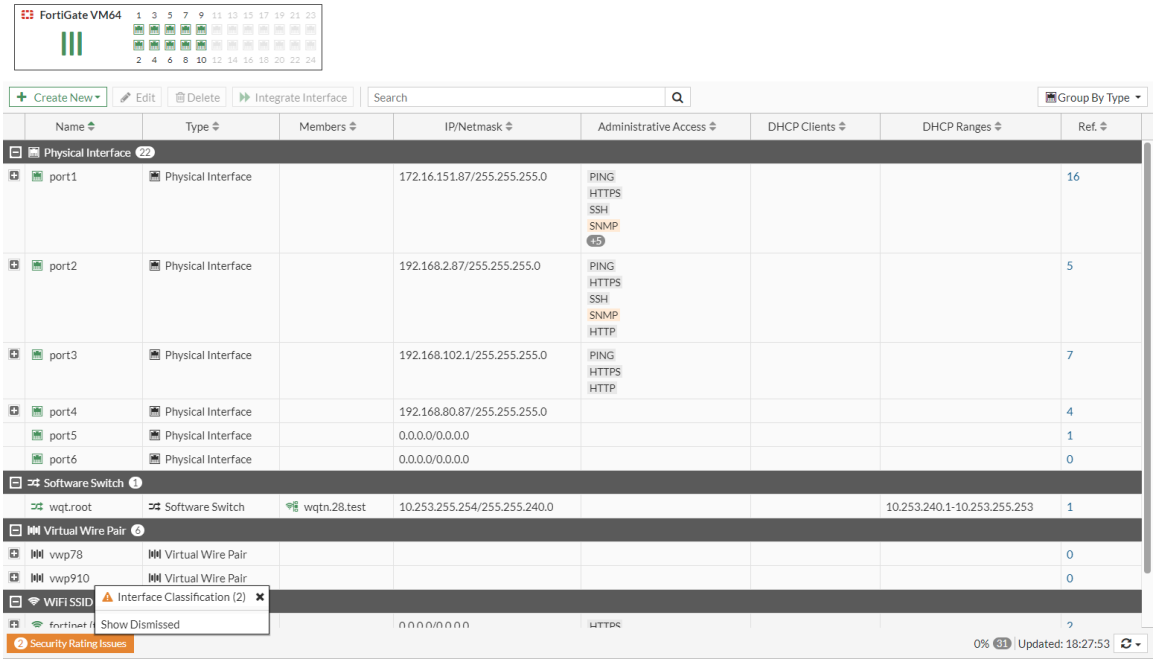
The following licensing options are available for security rating checks:

- A base set of free checks
- A licensed set that requires a FortiGuard Security Rating Service subscription



The base set can be run locally on any FortiGate and on all other devices in the Security Fabric. For a list of base and licensed security rating checks, see FortiGuard Security Rating Service.

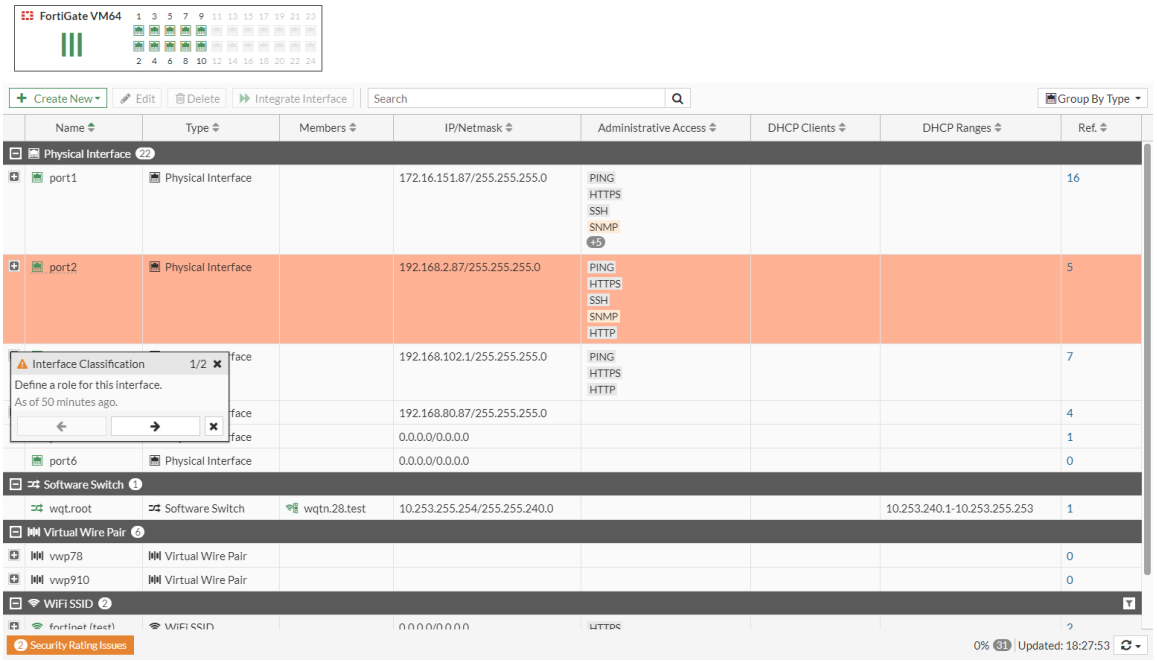
Security rating notifications



Security rating notifications are shown on settings pages, which list configuration issues determined by the security rating report. You can open the recommendations to see which items need to be fixed. Notifications can be dismissed in the GUI. Dismissed issues are unique for each administrator. Hashes for dismissed notifications are saved in local storage. If a user clears the local storage, all issues will show up again as not dismissed.

Notification locations

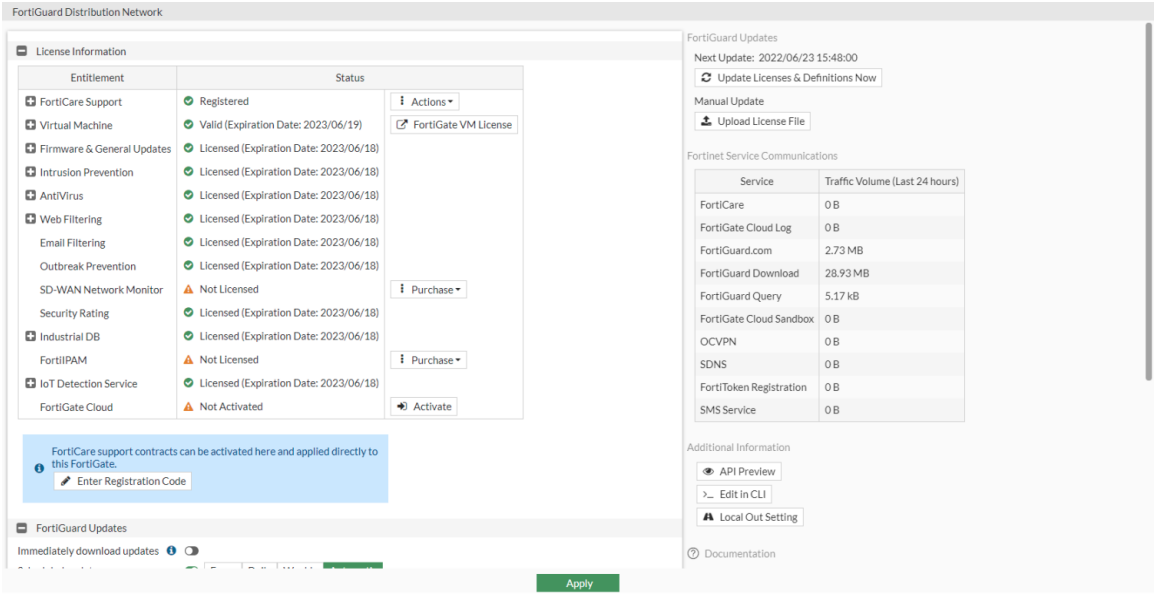
On the *System* > *Settings* page, there is a *Security Rating Issues* section in the right-side gutter. To dismiss a notification, hover over the issue and click the *X* beside it. To view dismissed notifications, enable *Show Dismissed*.



On the *Network* > *Interfaces* page, there is a *Security Rating Issues* section in the table footer. Click *Security Rating Issues* to view the list of issues. To dismiss a notification, click the *X* beside it. To view dismissed notifications, click *Show Dismissed*.

Notification pop-ups

When you click a security rating notification, a pop-up appears and the related setting is highlighted in the GUI. The pop-up contains a description of the problem and a timestamp of when the issue was found.



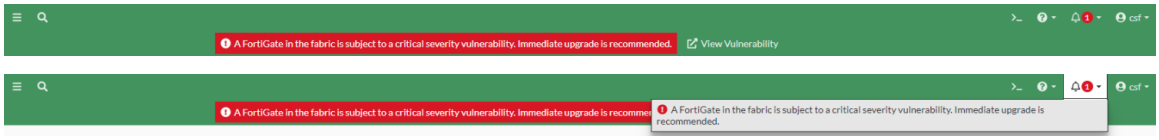
Once an issue is resolved, the notification disappears after the next security rating report runs.

PSIRT-related notifications

On a FortiGate with a valid Security Rating license, the separate Security Rating package downloaded from FortiGuard supports PSIRT vulnerabilities, which are highlighted in security rating results.

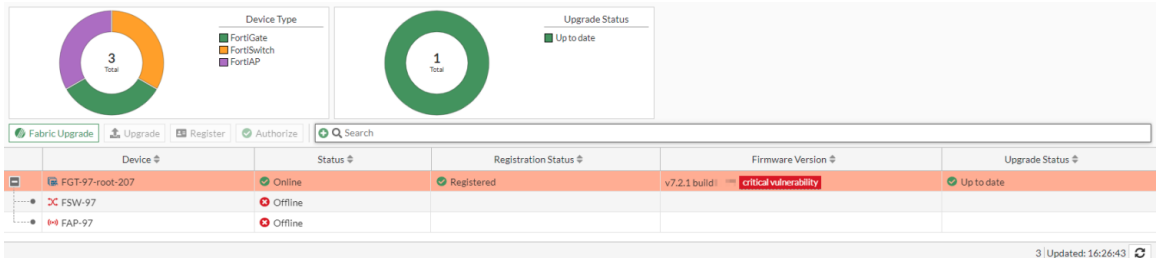
To verify the FortiGuard license entitlement in the GUI:

1. Go to *System* > *FortiGuard* and expand the *License Information* table.
2. Check that *Security Rating* appears in the list and the license is valid.



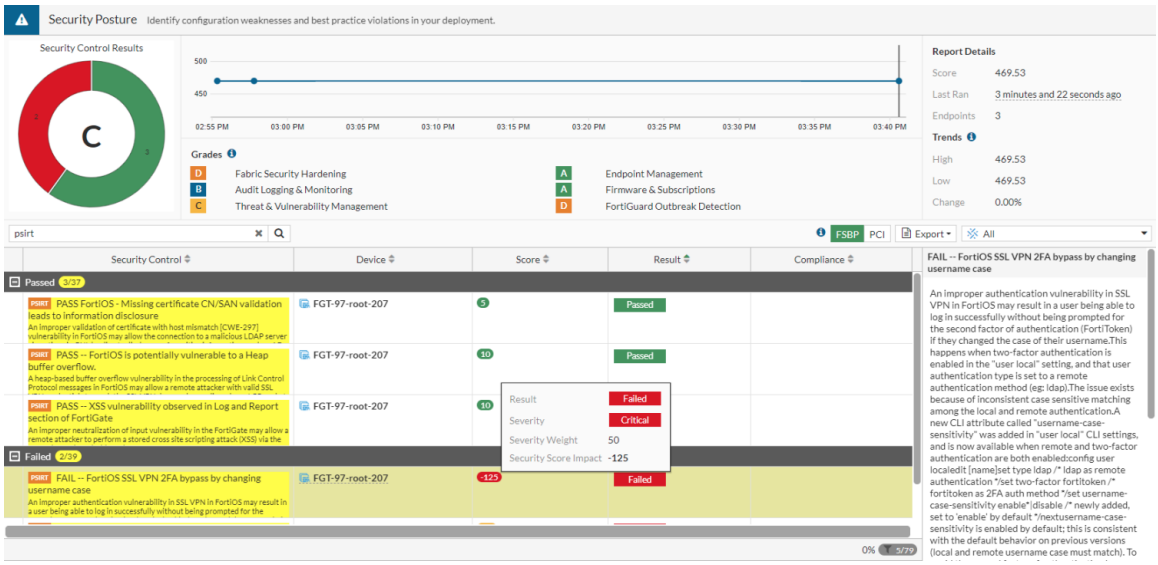
To verify the FortiGuard license entitlement in the CLI:

```
# diagnose autoupdate versions
...
Security Rating Data Package
---------
Version: 4.00008
Contract Expiry Date: Sun Jun 18 2023
Last Updated using scheduled update on Thu Jun 23 15:48:13 2022
Last Update Attempt: Thu Jun 23 15:48:13 2022
Result: Updates Installed



FDS Address
---------
173.243.140.6:443
```

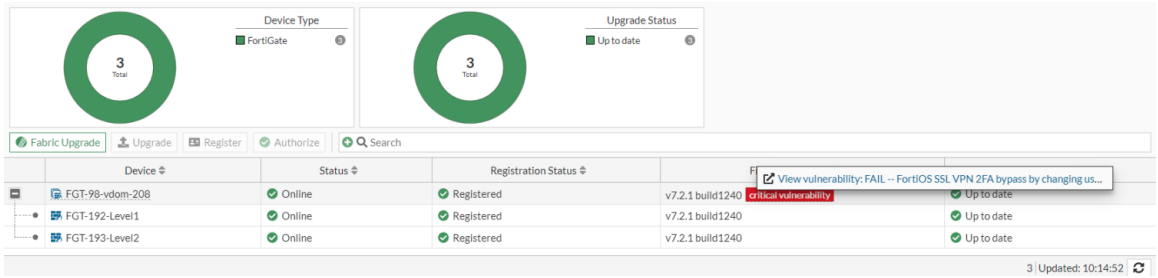
The following notifications are visible in the GUI.



- Warning message: if the security rating result indicates a vulnerability with a critical severity, then the FortiOS GUI displays a warning message in the header and a new notification under the bell icon. The *View Vulnerability* link appears in the header for global administrators.

  Clicking the warning message redirects to the *System* > *Fabric Management* page, where users are encouraged to update any affected Fortinet Fabric devices to the latest firmware releases to resolve the critical vulnerabilities.

- *Security Rating* page: when a failed result is selected, the security panel provides a description of the PSIRT vulnerability for failed results.



The *Recommendations* section includes a link to the *System* > *Fabric Management* page to update the firmware.

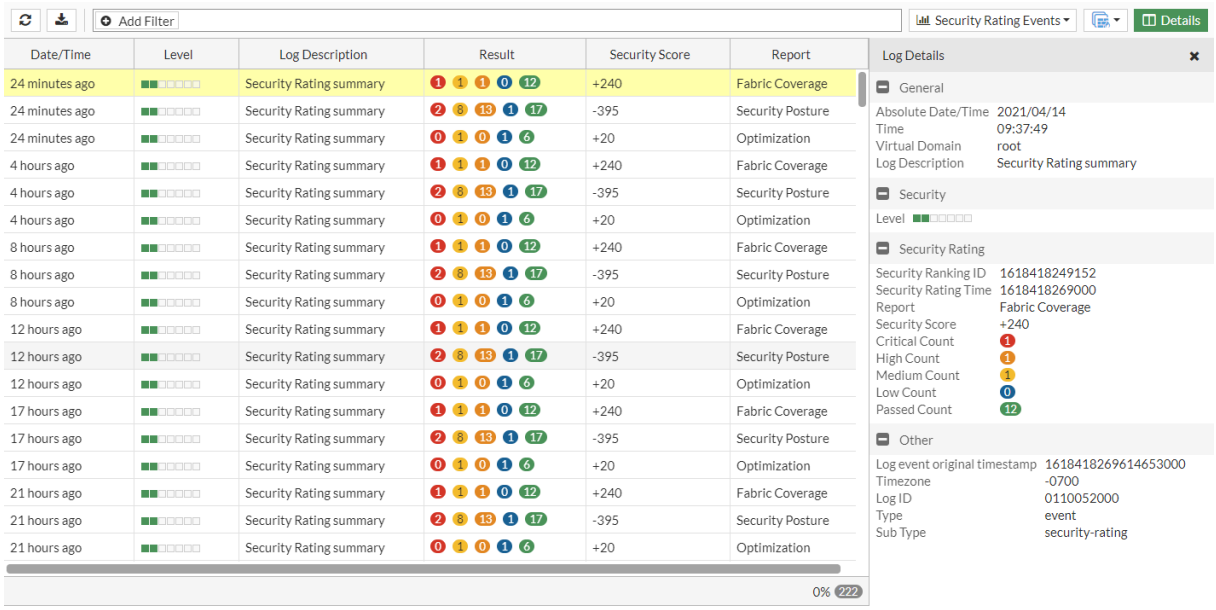
In the search bar, use PSIRT keywords to filter for PSIRT vulnerabilities.

- Tooltip: a tooltip for the *critical vulnerability* label on the *System* > *Fabric Management* page lists the vulnerability, and it links to the *Security Fabric* > *Security Rating* page where more details about the vulnerability are displayed.

Security rating check scheduling

Security rating checks by default are scheduled to run automatically every four hours.

To disable automatic security checks using the CLI:



```
config system global
    security-rating-run-on-schedule disable
end
```

To manually run a report using the CLI:

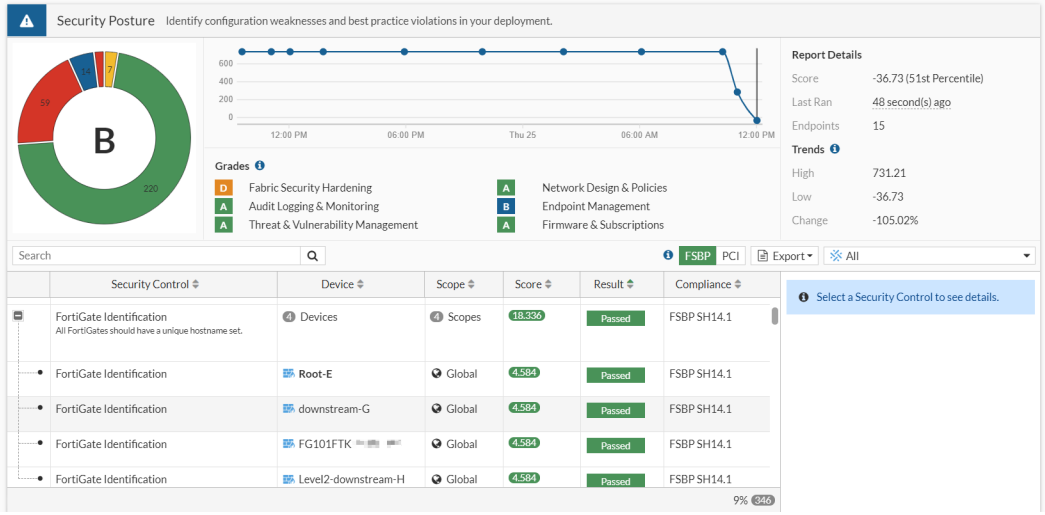
```
# diagnose report-runner trigger
```

Logging the security rating

The results of past security checks are available on the *Log & Report* > *System Events* page. Click the *Security Rating Events* card to see the detailed log.

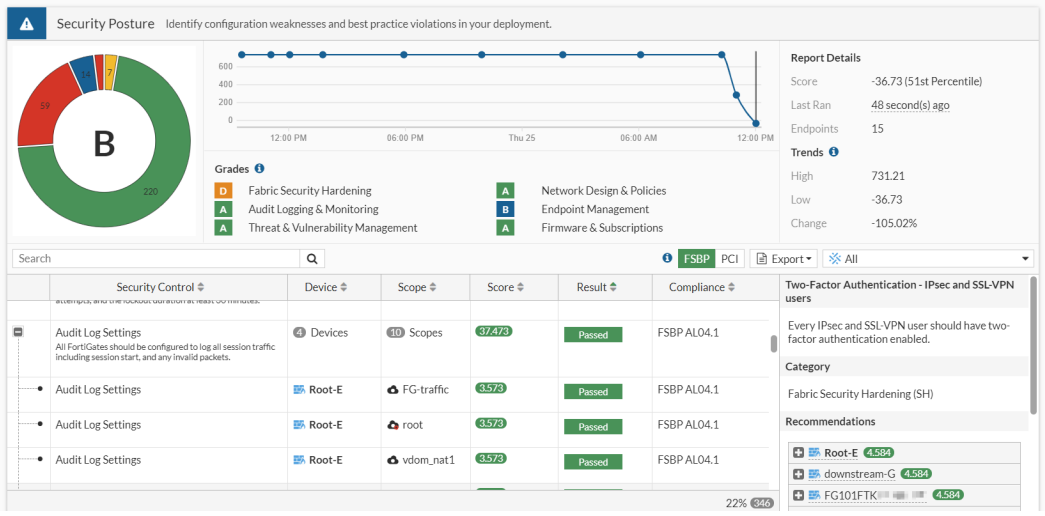
An event filter subtype can be created for the Security Fabric rating so event logs are created on the root FortiGate that summarize the results and show detailed information for the individual tests.

To configure security rating logging using the CLI:



```
config log eventfilter
    set security-rating enable
end
```

Multi VDOM mode



In multi VDOM mode, security rating reports can be generated in the Global VDOM for all of the VDOMs on the device. Administrators with read/write access can run the security rating report in the Global VDOM. Administrators with read-only access can only view the report.

On the report scorecards, the *Scope* column shows the VDOMs that the check was run on. On checks that support *Easy Apply*, the remediation can be run on all of the associated VDOMs.

Global scope:

VDOM scope:

The security rating event log is available on the root VDOM.

Security Fabric score

The Security Fabric score is calculated when a security rating check is run, based on the severity level of the checks that are passed or failed. A higher scores represents a more secure network. Points are added for passed checks and

removed for failed checks.

Severity level	Weight (points)
Critical	50
High	25
Medium	10
Low	5

To calculate the number of points awarded to a device for a passed check, the following equation is used:

$$\text{score} = \frac{\text{<severity level weight>}}{\text{<\# of FortiGates>}} \times \text{<secure FortiGate multiplier>}$$

The secure FortiGate multiplier is determined using logarithms and the number of FortiGate devices in the Security Fabric.

For example, if there are four FortiGate devices in the Security Fabric that all pass the compatible firmware check, the score for each FortiGate device is calculated with the following equation:

$$\frac{50}{4} \times 1.292 = 16.15 \text{ points}$$

All of the FortiGate devices in the Security Fabric must pass the check in order to receive the points. If any one of the FortiGate devices fails a check, the devices that passed are not awarded any points. For the device that failed the check, the following equation is used to calculated the number of points that are lost:

$$\text{score} = \text{<severity level weight>} \times \text{<secure FortiGate multiplier>}$$

For example, if the check finds two critical FortiClient vulnerabilities, the score is calculated with the following equation:

$$-50 \times 2 = -100 \text{ points}$$

Scores are not affected by checks that do not apply to your network. For example, if there are no FortiAP devices in the Security Fabric, no points will be added or subtracted for the FortiAP firmware version check.

Automation stitches

Automation stitches automate the activities between the different components in the Security Fabric, which decreases the response times to security events. Events from any source in the Security Fabric can be monitored, and action responses can be set up to any destination.

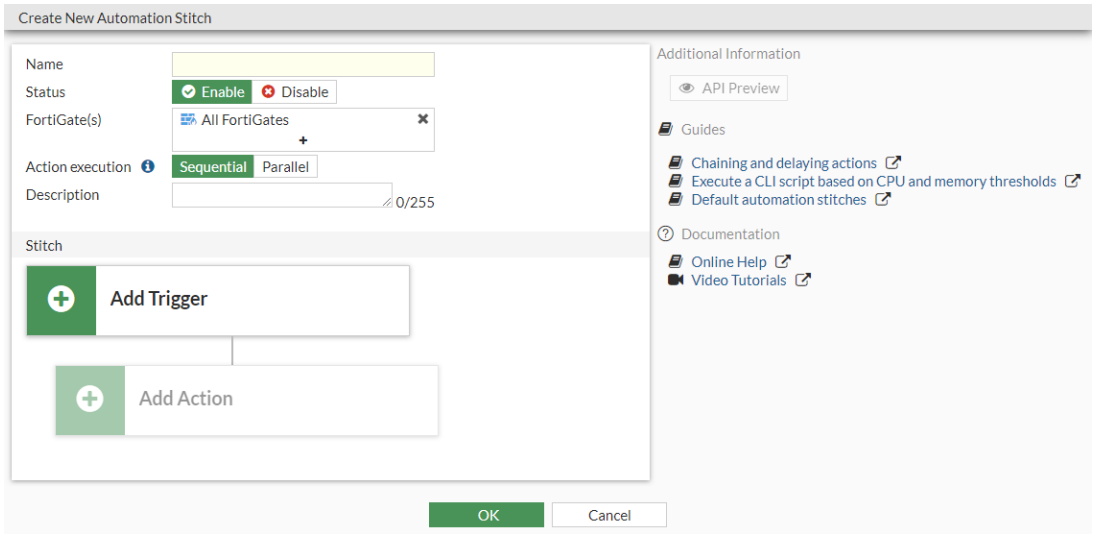
Automation stitches can also be used on FortiGate devices that are not part of a Security Fabric.

An automation stitch consists of two parts: the trigger and the actions. The trigger is the condition or event on the FortiGate that activates the action, for example, a specific log, or a failed log in attempt. The action is what the FortiGate does in response to the trigger.

Automation stitches that use cloud-based actions (AWS Lambda, Azure Function, Google Cloud Function, and AliCloud Function) have the option to delay an action after the previous action is completed.

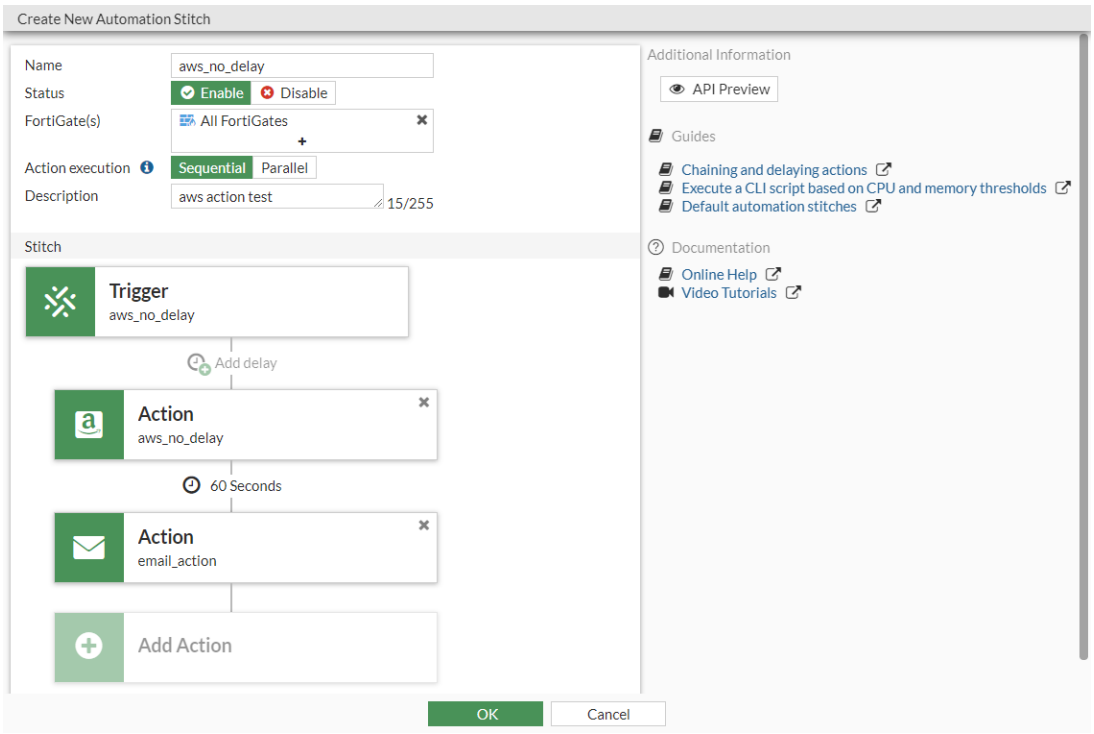
Diagnose commands are available in the CLI to test, log, and display the stitch history and settings.

Automation stitches can only be created on the root FortiGate in a Security Fabric.



Creating automation stitches

To create an automation stitch, a trigger event and a response action or actions are selected. Automation stitches can be tested after they are created.



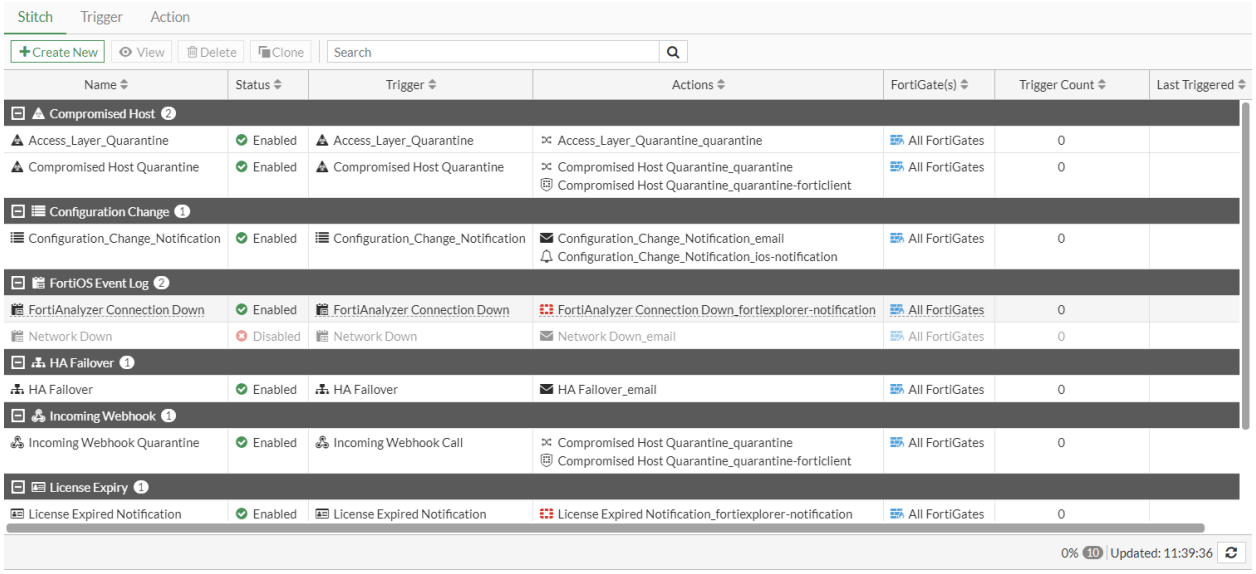
In the GUI, go to *Security Fabric* > *Automation* and click *Create New*. Automation stitches, actions, and triggers are configured in separate dialogs.

The stitch *Action execution* can be set to either *Sequential* or *Parallel*. In sequential execution, actions will execute one after another with a delay (if specified). If one action fails, then the action chain stops. This is the default setting. In parallel execution, all actions will execute immediately when the stitch is triggered.

When creating a stitch, clicking *Add Trigger* and *Add Action* displays a list of available triggers and actions, and the option to create a new one.

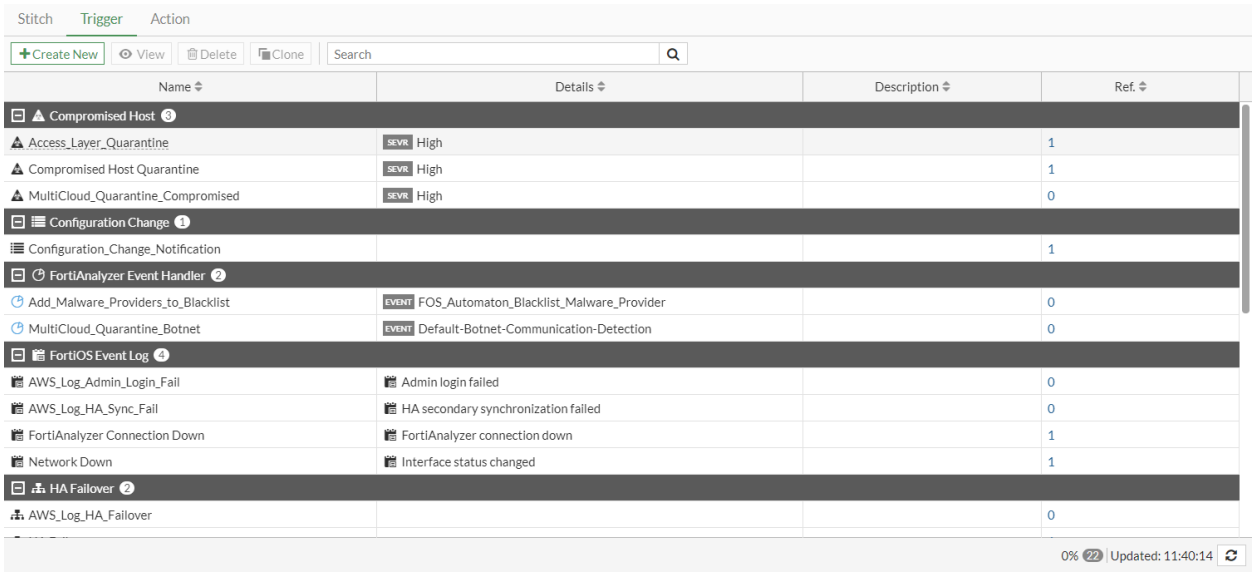
Once the stitch is configured, a process diagram of the trigger, actions, and delays is displayed. A delay can be added before an action if *Sequential* action execution is used. Executing the next action can be delayed by up to 3600 seconds (one hour).

Triggers and actions can be configured separately, and then added to an automation stitch.



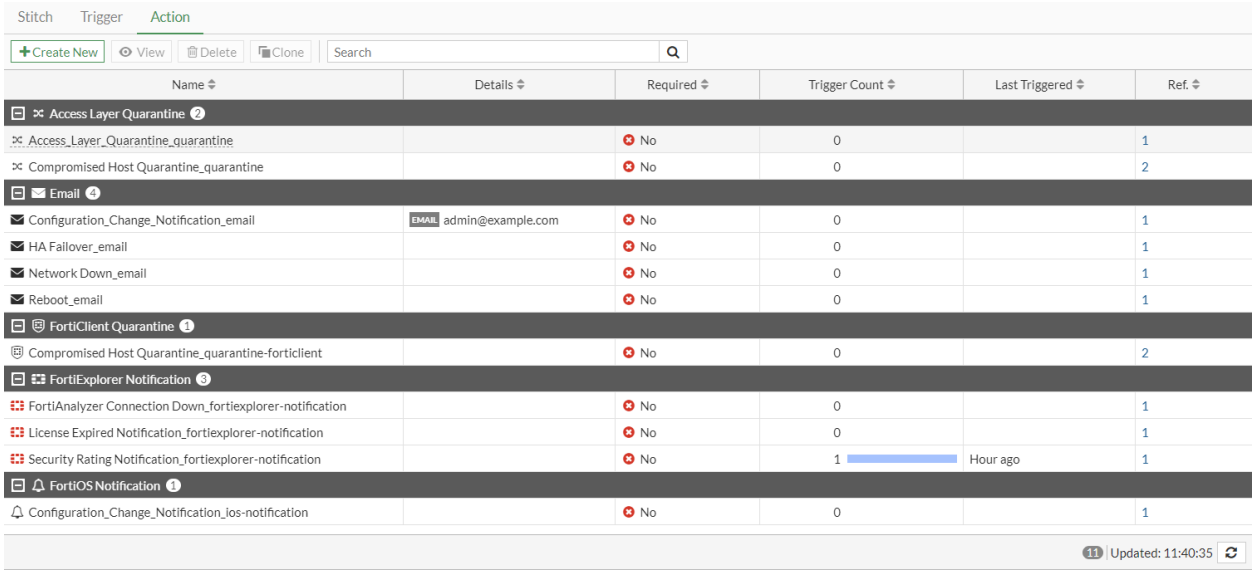
The maximum number of automation stitches that are allowed to run concurrently can be configured in the CLI (32 - 256, default = 128).

To configure the maximum number of concurrent automation stitches:



```
config automation setting
    set max-concurrent-stitches <integer>
end
```

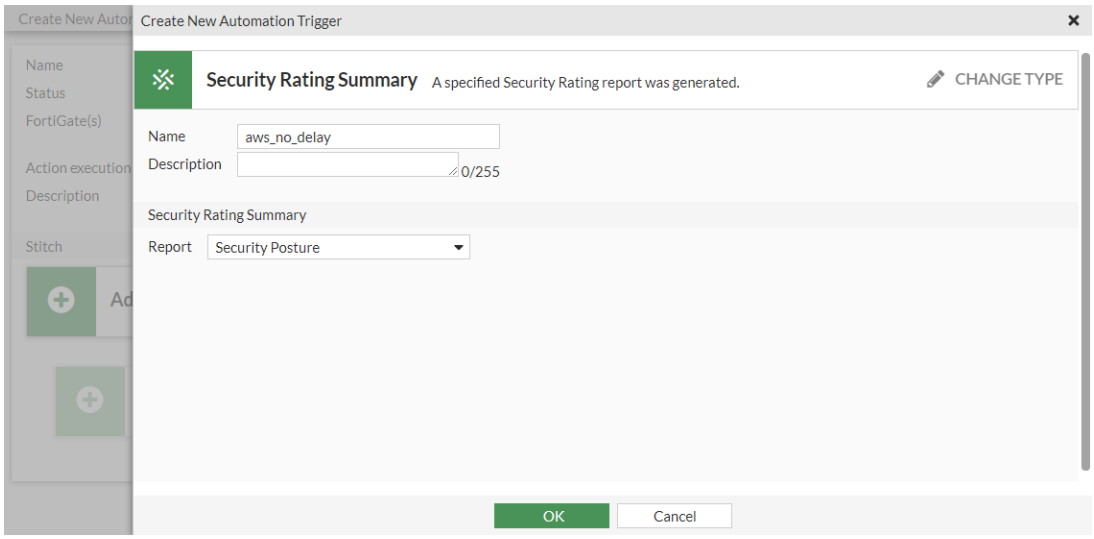
Tabs on the Automation page



On the *Security Fabric* > *Automation* page, there are tabs for *Stitch*, *Trigger*, and *Action*. The *Stitch* tab is the default view that lists the trigger and actions used in each stitch. Individual triggers and actions can be created or edited in the corresponding tabs.

Click *Trigger* to view the list of triggers.

Click *Action* to view the list of actions.



Sample configuration

The following example shows how to configure a Security Rating Summary automation stitch with AWS Lambda and Email actions. There is a 60-second delay before the Email action.

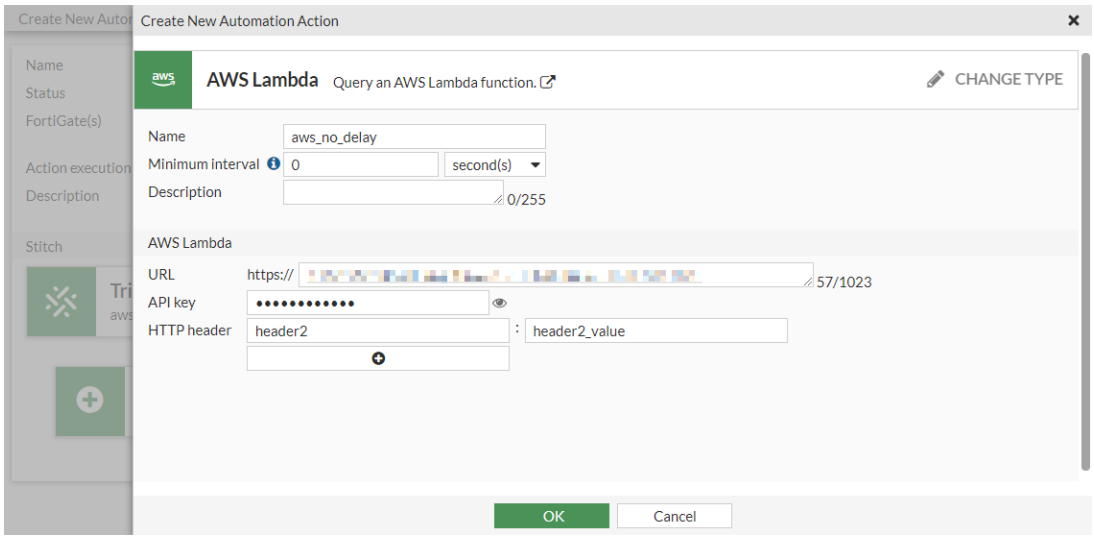
To configure the automation stitch in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name and description.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Security Rating Summary*.
   c. Enter the following:

Name	*aws_no_delay*
Report	*Security Posture*

d. Click *OK*.

e. Select the trigger in the list and click *Apply*.



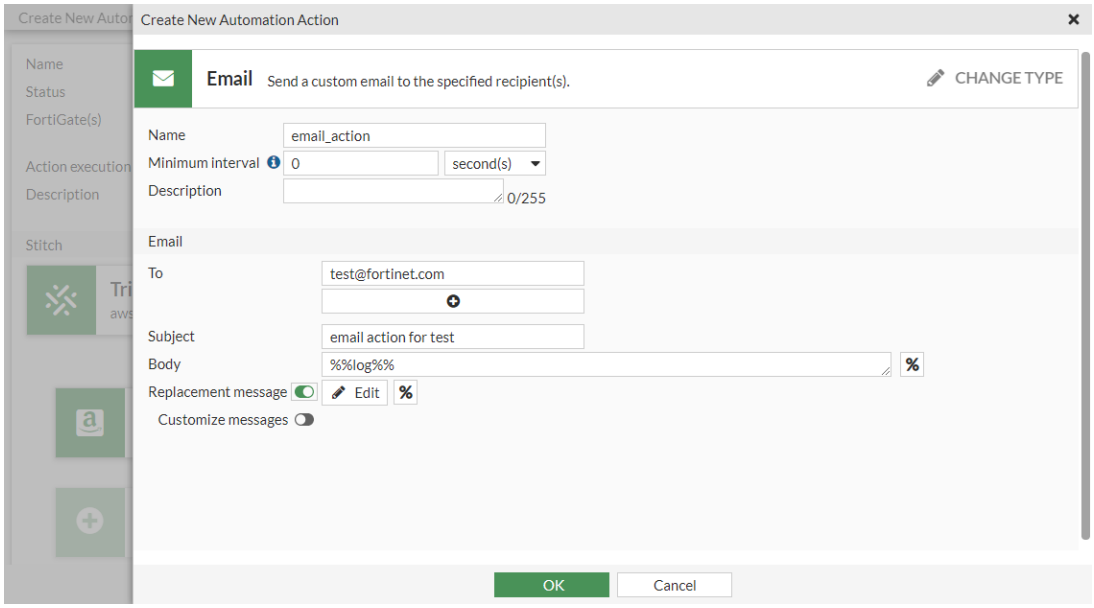
4. Configure the AWS Lambda function action:

a. Click *Add Action*.

b. Click *Create* and select *AWS Lambda*.

c. Enter the following:

Name	*aws_no_delay*
URL	Enter the request API URI
API key	Enter the API key
HTTP header	*header2 : header2_value*



d. Click *OK*.

e. Select the action in the list and click *Apply*.

5. Configure the Email notification action:
   a. Click *Add Action*.
   b. Click *Create* and select *Email*.
   c. Enter the following:

Name	*email_action*
To	Enter an email address
Subject	*email action for test*
Replacement message	Enable

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
6. Click the *Add delay* located between both actions. Enter *60* and click *OK*.
7. Click *OK*.

To configure the automation stitch in the CLI:

1. Configure the trigger:

```
config system automation-trigger
    edit "aws_no_delay"
        set event-type security-rating-summary
    next
end
```

2. Configure the actions:

```
config system automation-action
    edit "aws_no_delay"
        set action-type aws-lambda
        set aws-api-key xxxxxxxxxxxx
        set uri "xxxxxxxxxx.execute-api.us-east-1.amazonaws.com/xxxxxxxxxx"
        config http-headers
```

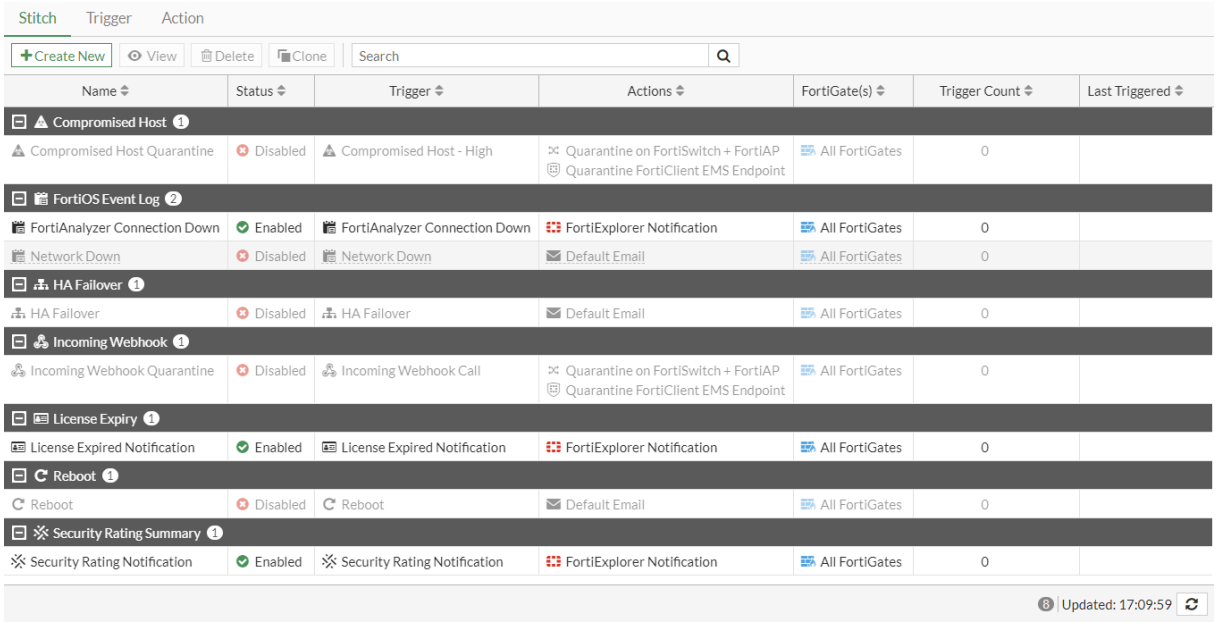
```
            edit 1
                set key "header2"
                set value "header2_value"
            next
        end
    next
    edit "email_action"
        set action-type email
        set email-to "test@fortinet.com"
        set email-subject "email action for test"
        set replacement-message enable
    next
end
```

3. Configure the stitch:

```
config system automation-stitch
    edit "aws_no_delay"
        set description "aws action test"
        set trigger "aws_no_delay"
        config actions
            edit 1
                set action "aws_no_delay"
                set required enable
            next
            edit 2
                set action "email_action"
                set delay 60
                set required enable
            next
        end
    next
end
```

Testing automation stitches

In the GUI, go to *Security Fabric* > *Automation*, right-click on the automation stitch and select *Test Automation Stitch*.



In the CLI, enter `diagnose automation test <automation-stitch name>`.

Default automation stitches

The following default automation stitches are included in FortiOS:

- Compromised Host Quarantine
- Incoming Webhook Quarantine
- HA Failover
- Network Down
- Reboot
- FortiAnalyzer Connection Down
- License Expired Notification
- Security Rating Notification

To view and edit the automation stitches in the GUI, go to *Security Fabric* > *Automation*.

CLI configurations

Compromised Host Quarantine

```
config system automation-action
    edit "Quarantine on FortiSwitch + FortiAP"
        set description "Default automation action configuration for quarantining a MAC
address on FortiSwitches and FortiAPs."
        set action-type quarantine
    next
    edit "Quarantine FortiClient EMS Endpoint"
        set description "Default automation action configuration for quarantining a
FortiClient EMS endpoint device."
        set action-type quarantine-forticlient
    next
end

config system automation-trigger
    edit "Compromised Host - High"
        set description "Default automation trigger configuration for when a high severity
compromised host is detected."
    next
end

config system automation-stitch
    edit "Compromised Host Quarantine"
        set description "Default automation stitch to quarantine a high severity compromised
host on FortiAPs, FortiSwitches, and FortiClient EMS."
        set status disable
        set trigger "Compromised Host - High"
        config actions
            edit 1
                set action "Quarantine on FortiSwitch + FortiAP"
            next
```

```
            edit 2
                set action "Quarantine FortiClient EMS Endpoint"
            next
        end
    next
end
```

FortiAnalyzer Connection Down

```
config system automation-action
    edit "FortiExplorer Notification"
        set description "Default automation action configuration for sending a notification
to any FortiExplorer mobile application."
        set action-type fortiexplorer-notification
    next
end
config system automation-trigger
    edit "FortiAnalyzer Connection Down"
        set description "Default automation trigger configuration for when the FortiAnalyzer
connection is lost."
        set event-type event-log
        set logid 22902
    next
end
config system automation-stitch
    edit "FortiAnalyzer Connection Down"
        set description "Default automation stitch to send a FortiExplorer notification when
the connection to FortiAnalyzer is lost."
        set trigger "FortiAnalyzer Connection Down"
        config actions
            edit 1
                set action "FortiExplorer Notification"
            next
        end
    next
end
```

Network Down

```
config system automation-action
     edit "Default Email"
        set description "Default automation action configuration for sending an email with
basic information on the log event."
        set action-type email
        set email-subject "%%log.logdesc%%"
    next
end
config system automation-trigger
    edit "Network Down"
        set description "Default automation trigger configuration for when a network
connection goes down."
        set event-type event-log
        set logid 20099
        config fields
```

```
            edit 1
                set name "status"
                set value "DOWN"
            next
        end
    next
end
```

```
config system automation-stitch
    edit "Network Down"
        set description "Default automation stitch to send an email when a network goes
down."
        set status disable
        set trigger "Network Down"
        config actions
            edit 1
                set action "Default Email"
            next
        end
    next
end
```

HA Failover

```
config system automation-action
    edit "Default Email"
        set description "Default automation action configuration for sending an email with
basic information on the log event."
        set action-type email
        set email-subject "%%log.logdesc%%"
    next
end
```

```
config system automation-trigger
    edit "HA Failover"
        set description "Default automation trigger configuration for when an HA failover
occurs."
        set event-type ha-failover
    next
end
```

```
config system automation-stitch
    edit "HA Failover"
        set description "Default automation stitch to send an email when a HA failover is
detected."
        set status disable
        set trigger "HA Failover"
        config actions
            edit 1
                set action "Default Email"
            next
        end
    next
end
```

Incoming Webhook Quarantine

```
config system automation-action
    edit "Quarantine on FortiSwitch + FortiAP"
        set description "Default automation action configuration for quarantining a MAC
address on FortiSwitches and FortiAPs."
        set action-type quarantine
    next
    edit "Quarantine FortiClient EMS Endpoint"
        set description "Default automation action configuration for quarantining a
FortiClient EMS endpoint device."
        set action-type quarantine-forticlient
    next
end

config system automation-trigger
    edit "Incoming Webhook Call"
        set description "Default automation trigger configuration for an incoming webhook."
        set event-type incoming-webhook
    next
end

config system automation-stitch
    edit "Incoming Webhook Quarantine"
        set description "Default automation stitch to quarantine a provided MAC address on
FortiAPs, FortiSwitches, and FortiClient EMS using an Incoming Webhook."
        set trigger "Incoming Webhook Call"
        config actions
            edit 1
                set action "Quarantine on FortiSwitch + FortiAP"
            next
            edit 2
                set action "Quarantine FortiClient EMS Endpoint"
            next
        end
    next
end
```

License Expired Notification

```
config system automation-action
    edit "FortiExplorer Notification"
        set description "Default automation action configuration for sending a notification
to any FortiExplorer mobile application."
        set action-type fortiexplorer-notification
    next
end

config system automation-trigger
    edit "License Expired Notification"
        set description "Default automation trigger configuration for when a license is near
expiration."
        set event-type license-near-expiry
        set license-type any
    next
end
```

```
config system automation-stitch
    edit "License Expired Notification"
        set description "Default automation stitch to send a FortiExplorer notification when
a license is near expiration."
        set trigger "License Expired Notification"
        config actions
            edit 1
                set action "FortiExplorer Notification"
            next
        end
    next
end
```

Reboot

```
config system automation-action
    edit "Default Email"
        set description "Default automation action configuration for sending an email with
basic information on the log event."
        set action-type email
        set email-subject "%%log.logdesc%%"
    next
end
```

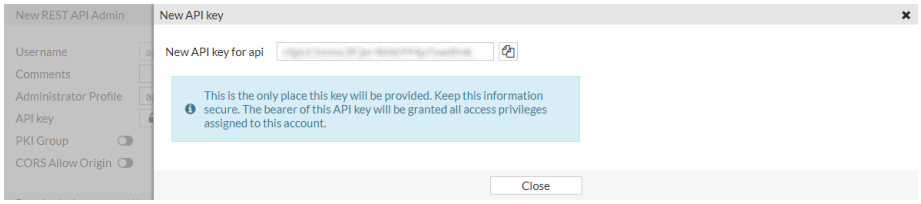
```
config system automation-trigger
    edit "Reboot"
        set description "Default automation trigger configuration for when a FortiGate is
rebooted."
        set event-type reboot
    next
end
```

```
config system automation-stitch
    edit "Reboot"
        set description "Default automation stitch to send an email when a FortiGate is
rebooted."
        set status disable
        set trigger "Reboot"
        config actions
            edit 1
                set action "Default Email"
            next
        end
    next
end
```

Security Rating Notification

```
config system automation-action
    edit "FortiExplorer Notification"
        set description "Default automation action configuration for sending a notification
to any FortiExplorer mobile application."
        set action-type fortiexplorer-notification
    next
end
```

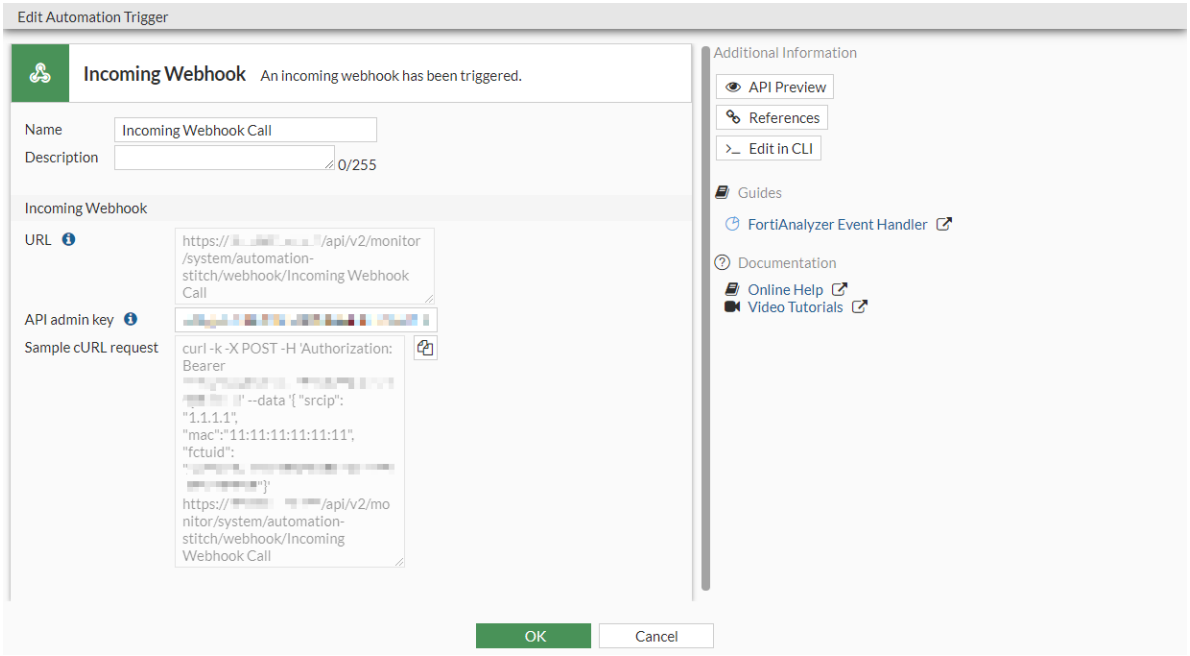
```
config system automation-trigger
    edit "Security Rating Notification"
        set description "Default automation trigger configuration for when a new Security
Rating report is available."
        set event-type security-rating-summary
        set report-type any
    next
end
```



```
config system automation-stitch
    edit "Security Rating Notification"
        set description "Default automation stitch to send a FortiExplorer notification when
a new Security Rating report is available."
        set trigger "Security Rating Notification"
        config actions
            edit 1
                set action "FortiExplorer Notification"
            next
        end
    next
end
```

Incoming Webhook Quarantine stitch

The Incoming Webhook Quarantine stitch for API calls to the FortiGate accepts multiple parameters (MAC address and FortiClient UUID) from an Incoming Webhook trigger, which enacts either the Access Layer Quarantine action (MAC address) or the FortiClient Quarantine action (FortiClient UUID). This is a default automation stitch included in FortiOS.



To trigger the Incoming Webhook Quarantine stitch in the GUI:

1. Create a new API user:
   a. Go to *System* > *Administrators*.
   b. Click *Create New* > *REST API Admin*.
   c. Configure the *New REST API Admin* settings, and copy the API key to the clipboard.

2. Enable the stitch:
   a. Go to *Security Fabric* > *Automation*.
   b. Under *Incoming Webhook*, right-click *Incoming Webhook Quarantine*, and select *Select Status* > *Enable*.
3. Get the sample cURL request:
   a. Click the *Trigger* trigger tab.
   b. Under *Incoming Webhook*, right-click *Incoming Webhook Call*, and select *Edit*.

c. In the *API admin key* field, enter the API key you recorded previously. The *Sample cURL request* field updates.

d. Copy the *Sample cURL request* to the clipboard.

e. Click *OK*.

4. Execute the request:

a. Edit the sample cURL request you just copied.

b. Add parameters to the `data` field (`"mac"` and `"fctuid"`), and then execute the request.

```
root@pc:~# curl -k -X POST -H 'Authorization: Bearer
cfgtct1mmx3fQxr4khb994p7swdfmk' --data '{ "mac":"0c:0a:00:0c:ce:b0", "fctuid":
"0000BB0B0ABD0D00B0D0A0B0E0F0B00B"}'
https://172.16.116.226/api/v2/monitor/system/automation-
stitch/webhook/Incoming%20Webhook%20Quarantine
{
   "http_method":"POST",
   "status":"success",
   "http_status":200,
   "serial":"FGT00E0Q00000000",
   "version":"v6.4.0",
   "build":1545
```

Encode spaces in the automation stitch name with `%20`. For example, `Incoming%20Webhook%20Quarantine`

Once the automation stitch is triggered, the MAC address is quarantined by the FortiGate, and an event log is created. The FortiClient UUID is quarantined on the EMS server side.

To trigger the Incoming Webhook Quarantine stitch in the CLI:

1. Create a new API user and note the API key:

```
config system api-user
```

2. Enable the automation stitch:

```
config system api-user
    edit "api"
        set api-key ************
        set accprofile "api_profile"
        set vdom "root"
        config trusthost
            edit 1
                set ipv4-trusthost 10.6.30.0 200.200.200.0
            next
        end
    next
end
```

3. Edit the cURL request to include parameters in the `data` field (`"mac"` and `"fctuid"`), then execute the request:

```
root@pc56:~# curl -k -X POST -H 'Authorization: Bearer
cfgtct1mmx0fQxr4khb000p70wdfmk' --data '{ "mac":"0c:0a:00:0c:ce:b0", "fctuid":
"3000BB0B0ABD0D00B0D0A0B0E0F0B00B"}'
https://100.10.100.200/api/v2/monitor/system/automation-
stitch/webhook/Incoming%20Webhook%20Quarantine
{
   "http_method":"POST",
   "status":"success",
   "http_status":200,
   "serial":"FGT80E0Q00000000",
   "version":"v6.4.0",
   "build":1545
```

Encode spaces in the automation stitch name with `%20`. For example, `Incoming%20Webhook%20Quarantine`.

Once the automation stitch is triggered, the MAC address is quarantined by the FortiGate, and an event log is created. The FortiClient UUID is quarantined on the EMS server side.

Sample log

```
date=2020-02-14 time=15:37:48 logid="0100046600" type="event" subtype="system"
level="notice" vd="root" eventtime=1581723468644200712 tz="-0800" logdesc="Automation
stitch triggered" stitch="Incoming Webhook Quarantine" trigger="Incoming Webhook
Quarantine" stitchaction="Compromised Host Quarantine_quarantine,Compromised Host
Quarantine_quarantine-forticlient" from="log" msg="stitch:Incoming Webhook Quarantine is
triggered."
```

Triggers

The following table outlines the available triggers.

Category	Trigger	Description
Security Fabric		

Category	Trigger	Description
	Compromised Host	An indicator of compromise (IoC) is detected on a host endpoint. The threat level must be selected and can be *Medium* or *High*. If *Medium* is selected, both medium and high level threats are included. Additional actions are available only for *Compromised Host* triggers: • Access Layer Quarantine • FortiClient Quarantine • VMware NSX Security Tag • IP Ban
	Fabric Connector Event	An event has occurred on a specific Fabric connector. See Fabric connector event trigger on page 2538 for details.
	FortiAnalyzer Event Handler	The specified FortiAnalyzer event handler has occurred. See FortiAnalyzer event handler trigger on page 2533 for details.
	FortiGate Cloud-Based IOC	IOC detection from the FortiGate Cloud IOC service. This option requires an IOC license, a web filter license, and FortiCloud logging must be enabled.
	FortiGate Cloud Event Handler	The specified FortiGate Cloud event handler has occurred. This option requires a FortiGate Cloud log retention license.
	Security Rating Summary	A summary is available for a recently run Security Rating report. Options include: • Security Posture • Fabric Coverage • Optimization • Any
System		
	AV & IPS DB Update	The antivirus and IPS database is updating.
	Configuration Change	A FortiGate configuration change has occurred.
	Conserve Mode	A FortiGate entered conserve mode due to low memory. See Execute a CLI script based on CPU and memory thresholds on page 2589 for an example.
	HA Failover	An HA failover is occurring.
	High CPU	A FortiGate has high CPU usage. See Execute a CLI script based on CPU and memory thresholds on page 2589 for an example.
	License Expiry	A FortiGuard license is expiring. The license type must be selected. Options include: • FortiCare Support • FortiGuard Web Filter • FortiGuard AntiSpam • FortiGuard AntiVirus • FortiGuard IPS

Category	Trigger	Description
		• FortiGuard Management Service • FortiGate Cloud • Any
	Local Certificate Expiry	A local certificate is about to expire. See Certificate expiration trigger on page 2547 for an example.
	Reboot	A FortiGate is rebooting.
Event Log Category		
	Anomaly Logs	An anomalous event has occurred. See Event log category triggers on page 2544 for an example.
	IPS Logs	An IPS event has occurred.
	SSH Logs	An SSH event has occurred.
	Traffic Violation	A traffic policy has been violated.
	Virus Logs	A virus event has occurred.
	Web Filter Violation	A web filter policy has been violated.
Miscellaneous		
	FortiOS Event Log	The specified FortiOS log has occurred. Multiple event log IDs can be selected, and log field filters can be applied. See FortiOS event log trigger on page 2543 for an example.
	Incoming Webhook	An incoming webhook is triggered.
	Schedule	A scheduled monthly, weekly, daily, hourly, or one-time trigger. Set to occur on a specific minute of an specific hour on a specific day. When using the one-time trigger, set to occur on specific date and time in the future. See Schedule trigger on page 2550 for an example.

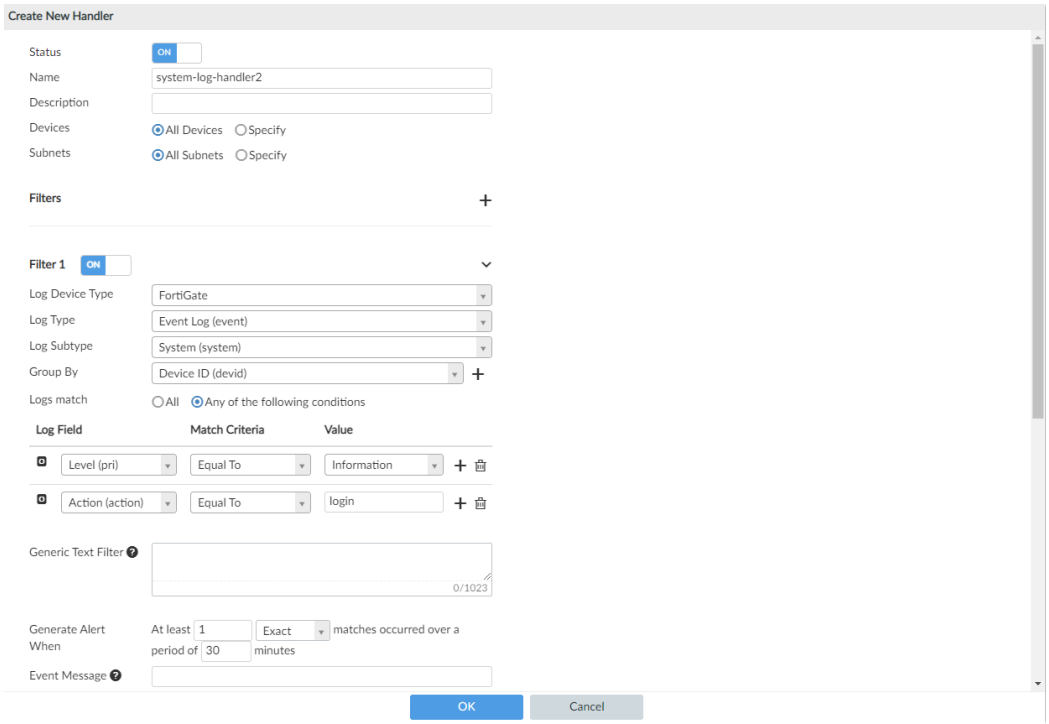
FortiAnalyzer event handler trigger

You can trigger automation stitches based on FortiAnalyzer event handlers. This allows you to define rules based on complex correlations across devices, log types, frequencies, and other criteria.

To set up a FortiAnalyzer event handler trigger:

1. Configure a FortiGate event handler on the FortiAnalyzer
2. Configure FortiAnalyzer logging on the FortiGate on page 2534
3. Configure an automation stitch that is triggered by a FortiAnalyzer event handler on page 2535

Configure a FortiGate event handler on the FortiAnalyzer



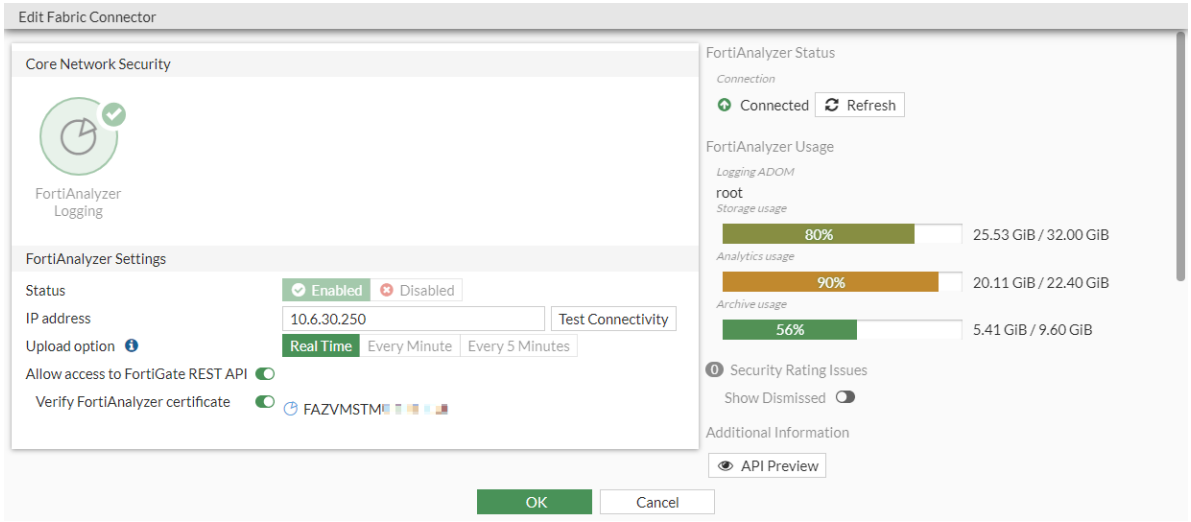
On the FortiAnalyzer, configure an event handler for the automation stitch. In this example, the event handler is triggered when an administrator logs in to the FortiGate. See Creating a custom event handler in the FortiAnalyzer Administration Guide for more information.

To configure an event handler on the FortiAnalyzer:

1. Go to *FortiSoC* > *Handlers* > *FortiGate Event Handlers*, and click *Create New*.
2. Configure an event handler with two conditions for the automation stitch:

Log Type	Event Log
Log Subtype	System
Group By	Device ID
Logs match	Any of the following conditions
Log Field	Level
Match Criteria	Equal To
Value	Information
Log Field	Action
Match Criteria	Equal To
Value	login

3. Configure the other settings as needed.



4. Click *OK*.

Configure FortiAnalyzer logging on the FortiGate

See Configuring FortiAnalyzer on page 2385 for more information.

To configure FortiAnalyzer logging in the GUI:

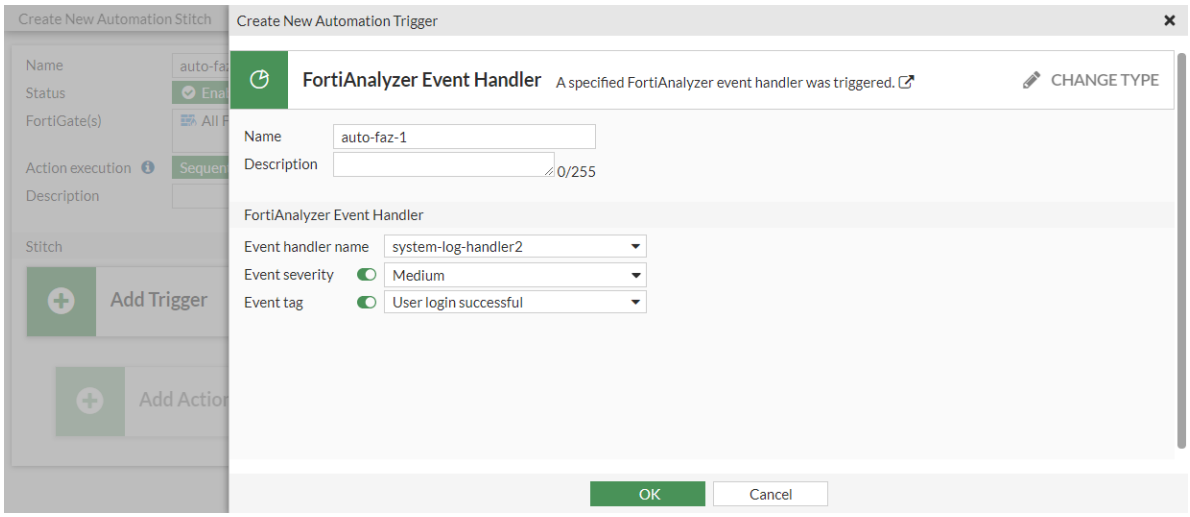
1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiAnalyzer Logging* card.
2. Ensure the *Status* is *Enabled*, and configure the settings as needed.

3. Click *OK*.

To configure FortiAnalyzer logging in the CLI:

```
config log fortianalyzer setting
    set status enable
    set server "10.6.30.250"
    set serial "FL-4HET000000000"
    set upload-option realtime
    set reliable enable
end
```

Configure an automation stitch that is triggered by a FortiAnalyzer event handler



When a FortiAnalyzer event handler is triggered, it sends a notification to the FortiGate automation framework, which generates a log and triggers the automation stitch.

To configure an automation stitch that is triggered by a FortiAnalyzer event handler in the GUI:

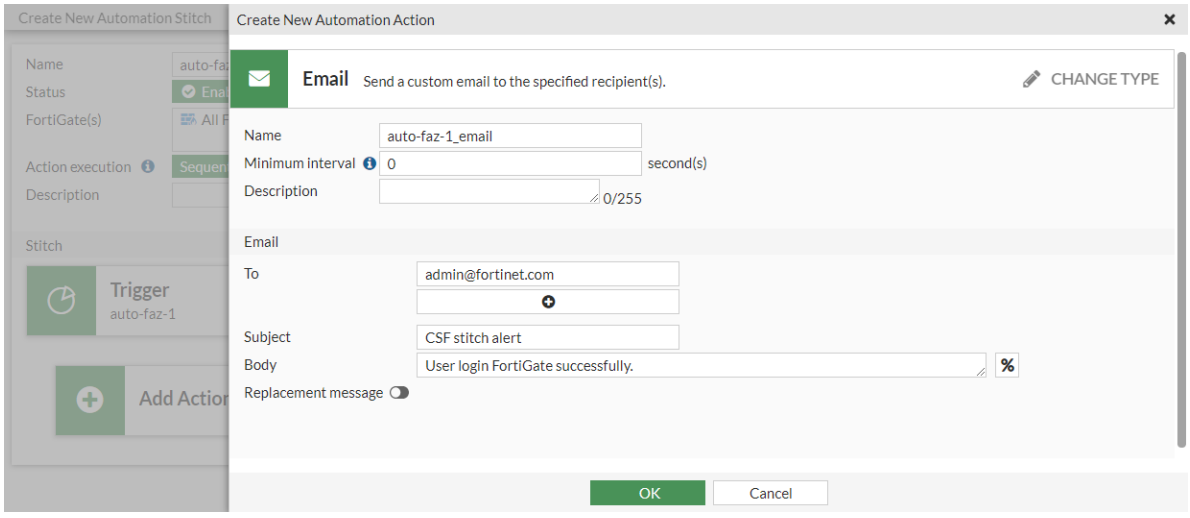
1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name, *auto-faz-1*.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *FortiAnalyzer Event Handler*.
   c. Enter the following:

Name	auto-faz-1
Event handler name	system-log-handler2
Event severity	Medium

Event tag	User login successful

d. Click *OK*.

e. Select the trigger in the list and click *Apply*.



4. Configure the Email notification action:

a. Click *Add Action*.

b. Click *Create* and select *Email*.

c. Enter the following:

Name	auto-faz-1_email
To	Enter an email address
Subject	CSF stitch alert
Body	User login FortiGate successfully.

d. Click *OK*.

e. Select the action in the list and click *Apply*.

5. Click *OK*.

To configure an automation stitch that is triggered by a FortiAnalyzer event handler in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
    edit "auto-faz-1"
        set event-type faz-event
        set faz-event-name "system-log-handler2"
        set faz-event-severity "medium"
        set faz-event-tags "User log in successful"
    next
end
```

2. Create an automation action:

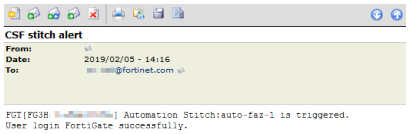
```
config system automation-action
    edit "auto-faz-1_email"
        set action-type email
        set email-to "admin@fortinet.com"
        set email-subject "CSF stitch alert"
        set message "User login FortiGate successfully."
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto-faz-1"
        set trigger "auto-faz-1"
        config actions
            edit 1
                set action "auto-faz-1_email"
                set required enable
            next
        end
    next
end
```

View the trigger event log

To view the trigger event log in the GUI:



1. Log in to the FortiGate.
   The FortiAnalyzer sends a notification to the FortiGate automation framework, generates an event log on the FortiGate, and triggers the automation stitch.
2. Go to *Log & Report* > *System Events* and select *General System Events*. From the log location dropdown, select *FortiAnalyzer*.

To view the trigger event log in the CLI:

```
# execute log display
    ...
    date=2019-02-05 time=14:16:17 logid="0100046600" type="event" subtype="system"
level="notice" vd="root" eventtime=1549404977 logdesc="Automation stitch triggered"
stitch="auto-faz-1" trigger="auto-faz-1" from="log" msg="stitch:auto-faz-1 is triggered."
    ...
```

Sample email

The email sent by the action will look similar to the following:

Fabric connector event trigger

With the *Fabric Connector Event* trigger, any supported Fabric connector is able to trigger an automation stitch on the FortiGate based on a specific event defined on the Fabric connector. Currently, only FortiDeceptor 4.1 supports this trigger for the *Insider Threat*, *Notify Ban*, and *Notify Unban* events.

In the following example, an authorized FortiDeceptor in the Security Fabric deploys a decoy called ubuntu16 configured with SSH, SAMBA, HTTP, and HTTPS services.

This example assumes the Security Fabric is already configured. Refer to Configuring the root FortiGate and downstream FortiGates and FortiDeceptor for detailed configuration steps. On the root FortiGate, the *Allow downstream device REST API access* option must be enabled (`set downstream-access enable`). The minimum permission required for the selected *Administrator profile* is *Read/Write* for *User & Device* (`set authgrp read-write`).

Three stitches are configured, one for each FortiDeceptor trigger type:

Stitch name	Fabric connector event trigger	Actions
fortideceptor_threat	Insider threat	Email and IP ban
fortideceptor_ban	Notify ban	Email and IP ban
fortideceptor_unban	Notify unban	Email and CLI script

To configure stitches with the Fabric connector event trigger in the GUI:

1. Configure the triggers:
   a. Go to *Security Fabric* > *Automation*, select the *Trigger* tab, and click *Create New*.
   b. In the *Security Fabric* section, click *Fabric Connector Event* and enter the following:

Name	*fdc_Insider_Threat*
Description	*Insider_Threat*
Connector	Select the FortiDeceptor connector
Event Name	*Insider Threat*

   c. Click *OK*.
   d. Repeat these steps to create two more triggers with the following settings:

Name	*fdc_Notify_Ban*
Description	*Notify_Ban*

Connector	Select the FortiDeceptor connector
Event Name	*Notify Ban*

Name	*fdc_Notify_Unban*
Description	*Notify_Unban*
Connector	Select the FortiDeceptor connector
Event Name	*Notify Unban*

2. Configure the actions:
   a. Go to *Security Fabric* > *Automation*, select the *Action* tab, and click *Create New*.
   b. In the *Security Response* section, click *IP Ban* and enter the name, *fdc_ban-ip*.
   c. Click *OK*.
   d. Repeat these steps to create an *Email* (in the *Notifications* section) and a *CLI Script* (in the *General* section) action with the following settings:

Email	
Name	*email_log*
To	Enter an email address
Subject	*CSF stitch alert*

CLI Script	
Name	*fdc_unban*
Script	*diagnose user banned-ip delete src4 %%log.srcip%%*
Administrator profile	*super_admin*

3. Configure the *fortideceptor_threat* stitch:
   a. Go to *Security Fabric* > *Automation*, select the *Stitch* tab, and click *Create New*.
   b. Enter the name, *fortideceptor_threat*.
   c. Click *Add Trigger*. Select *fdc_Insider_Threat* and click *Apply*.
   d. Click *Add Action*. Select *email_log* and click *Apply*.
   e. Click *Add Action*. Select *fdc_ban-ip* and click *Apply*.
   f. Click the *Add delay* located between both actions. Enter *5* and click *OK*.
   g. Click *OK*.
4. Configure the *fortideceptor_ban* stitch:
   a. Go to *Security Fabric* > *Automation*, select the *Stitch* tab, and click *Create New*.
   b. Enter the name, *fortideceptor_ban*.
   c. Click *Add Trigger*. Select *fdc_Notify_Ban* and click *Apply*.
   d. Click *Add Action*. Select *email_log* and click *Apply*.
   e. Click *Add Action*. Select *fdc_ban-ip* and click *Apply*.
   f. Click the *Add delay* located between both actions. Enter *5* and click *OK*.
   g. Click *OK*.

5. Configure the *fortideceptor_unban* stitch:
   a. Go to *Security Fabric > Automation*, select the *Stitch* tab, and click *Create New*.
   b. Enter the name, *fortideceptor_unban*.
   c. Click *Add Trigger*. Select *fdc_Notify_Unban* and click *Apply*.
   d. Click *Add Action*. Select *email_log* and click *Apply*.
   e. Click *Add Action*. Select *fdc_unban* and click *Apply*.
   f. Click the *Add delay* located between both actions. Enter *5* and click *OK*.
   g. Click *OK*.

To configure stitches with the Fabric connector event trigger in the CLI:

1. Configure the triggers:

```
config system automation-trigger
    edit "fdc_Insider_Threat"
        set description "Insider_Threat"
        set event-type fabric-event
        set serial "FDC-VMTM210000**"
        set fabric-event-name "insider_threat"
    next
    edit "fdc_Notify_Ban"
        set description "Notify_Ban"
        set event-type fabric-event
        set serial "FDC-VMTM210000**"
        set fabric-event-name "notify_ban"
    next
    edit "fdc_Notify_Unban"
        set description "Notify_Unban"
        set event-type fabric-event
        set serial "FDC-VMTM210000**"
        set fabric-event-name "notify_unban"
    next
end
```

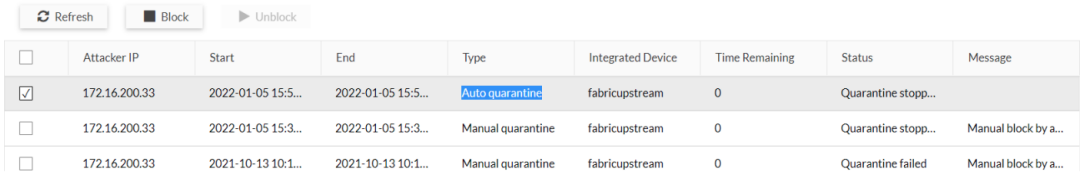
2. Configure the actions:

```
config system automation-action
    edit "fdc_ban-ip"
        set action-type ban-ip
    next
    edit "fdc_unban"
        set action-type cli-script
        set script "diagnose user banned-ip delete src4 %%log.srcip%%"
        set output-size 10
        set timeout 0
        set accprofile "super_admin"
    next
    edit "email_log"
        set action-type email
        set email-to "*******@fortinet.com"
        set email-subject "CSF stitch alert"
    next
end
```

3. Configure the stitches:

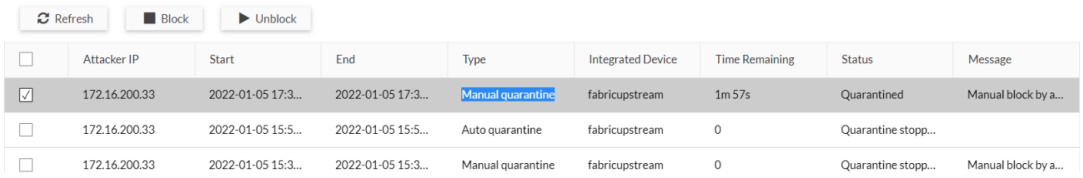
```
config system automation-stitch
    edit "fortideceptor_threat"
        set trigger "fdc_Insider_Threat"
        config actions
            edit 1
                set action "email_log"
                set required enable
            next
            edit 2
                set action "fdc_ban-ip"
                set delay 5
                set required enable
            next
        end
    next
    edit "fortideceptor_ban"
        set trigger "fdc_Notify_Ban"
        config actions
            edit 1
                set action "email_log"
                set required enable
            next
            edit 2
                set action "fdc_ban-ip"
                set delay 5
                set required enable
            next
        end
    next
    edit "fortideceptor_unban"
        set trigger "fdc_Notify_Unban"
        config actions
            edit 1
                set action "email_log"
                set required enable
            next
            edit 2
                set action "fdc_unban"
                set delay 5
                set required enable
            next
        end
    next
end
```

Verification



A device with IP 172.16.200.33 uses SSH to access the decoy (ubuntu16) deployed in the FortiDeceptor. The FortiDeceptor will detect the attacker IP 172.16.200.33, automatically quarantine it, and send the insider threat notification to the FortiGate. This notification will trigger the *fortideceptor_threat* stitch due to the insider threat event trigger, so an email alert is sent and the attacker IP (172.16.200.33) is banned.

In FortiDeceptor, if the attacker IP (172.16.200.33) is manually blocked or unblocked, the FortiDeceptor will send out the internal block or unblock notification to FortiGate (see Quarantine Status for more details). This notification will trigger

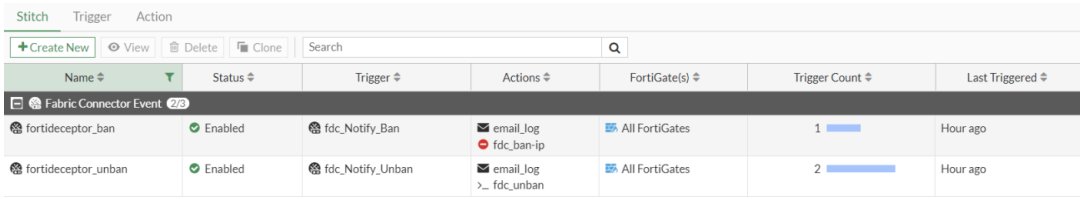


the *fortideceptor_ban* or *fortideceptor_unban* stitch due the notify ban or unban event trigger. An email alert is sent, and based on the event, the IP is banned or the CLI script runs to unban the IP.

To view the quarantine details in FortiDeceptor:

1. Go to *Fabric* > *Quarantine Status*.
   a. Automatic quarantine:

   b. Manual block or unblock:



To confirm that the stitch was triggered in the FortiOS GUI:

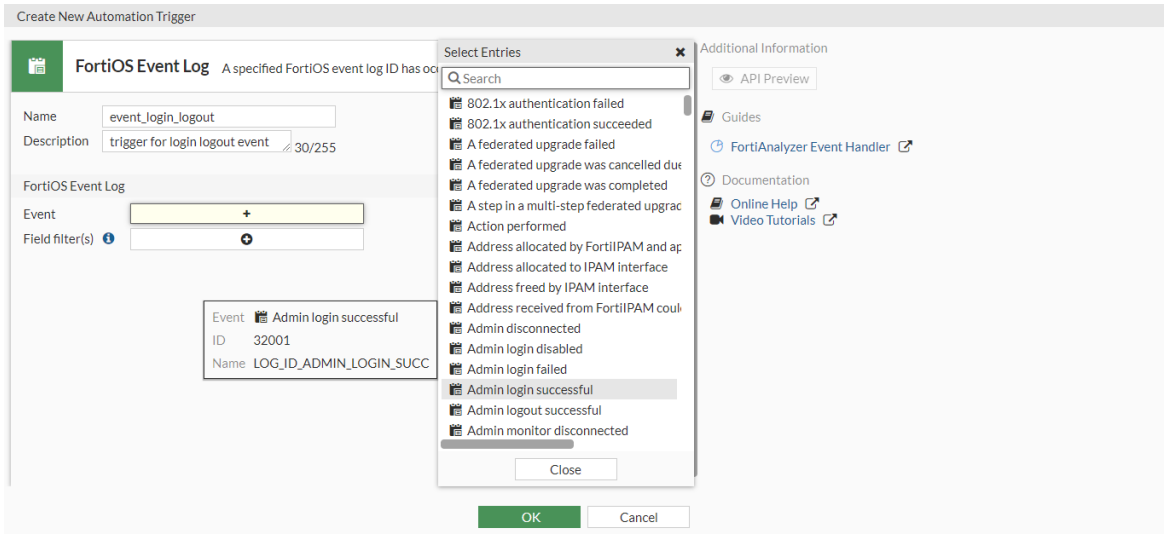
1. Go to *Security Fabric* > *Automation* and select the *Stitch* tab.
   a. Triggered insider threat:

   b. Triggered notify ban or unban:

To view the quarantined IP details in the FortiOS CLI:

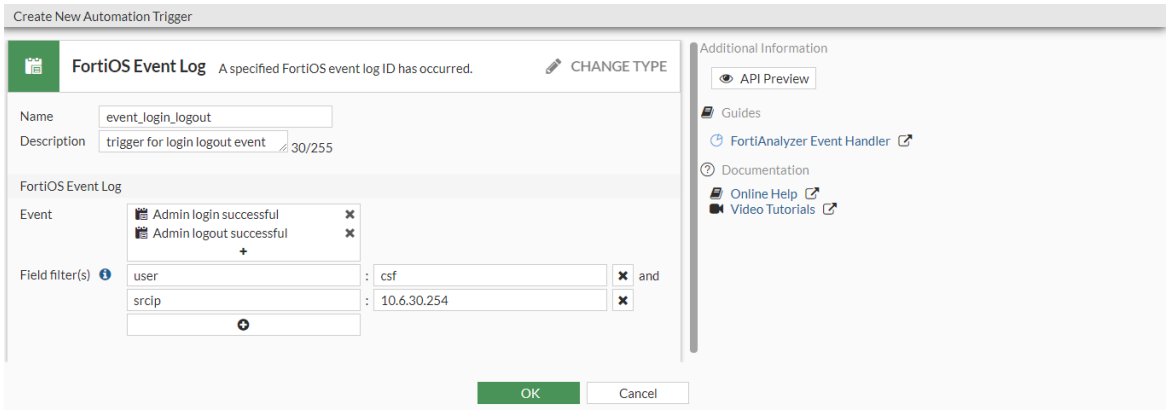
```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
172.16.200.33     Wed Jan  5 15:57:41 2022 indefinite               Administrative
```

If the IP is unbanned by the stitch, the list will be empty:



```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
```

FortiOS event log trigger



You can configure a FortiOS event log trigger for when a specific event log ID occurs. You can select multiple event log IDs, and apply log field filters.

To configure a FortiOS event log trigger in the GUI:

1. Go to *Security Fabric* > *Automation*, select the *Trigger* tab, and click *Create New*.
2. In the *Miscellaneous* section, click *FortiOS Event Log*.
3. Enter a name and description.
4. In the *Event* field, click the + to select multiple event log IDs.
   The *Event* options correspond to the *Message Meaning* listed in the FortiOS Log Message Reference. Hover over an entry to view the tooltip that includes the event ID and log name. In this example, the *Admin login successful* event in the GUI corresponds to log ID *32001*, which is *LOG_ID_ADMIN_LOGIN_SUCC*.

5. In the *Field filter(s)* field, click the + to add multiple field filters. The configured filters much match in order for the stitch to be triggered.
   a. To view the list of available fields for a log, refer to the FortiOS Log Message Reference by appending the log ID to the document URL (https://docs.fortinet.com/document/fortigate/7.2.3/fortios-log-message-reference/<log_ID>).

6. Click *OK*.

To configure a FortiOS event log trigger in the CLI:

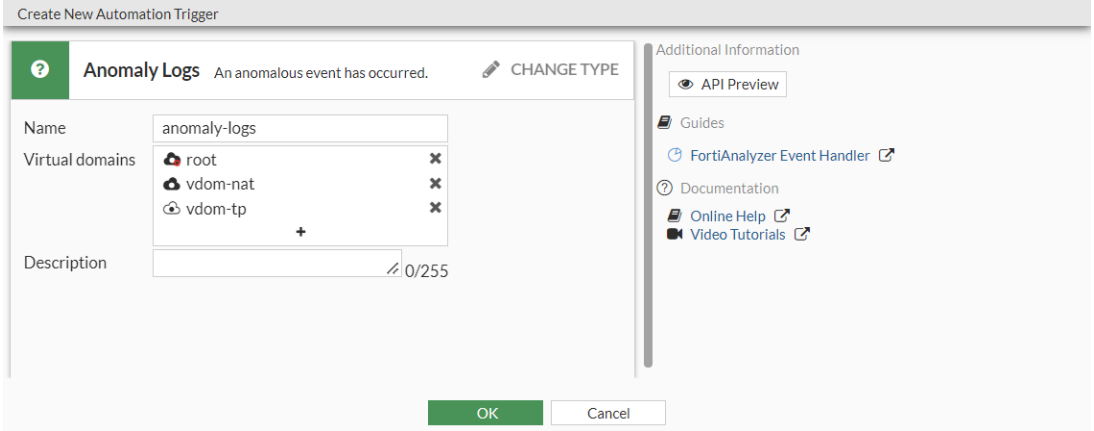
```
config system automation-trigger
    edit "event_login_logout"
        set description "trigger for login logout event"
        set event-type event-log
        set logid 32001 32003
        config fields
            edit 1
                set name "user"
                set value "csf"
            next
            edit 2
                set name "srcip"
                set value "10.6.30.254"
            next
        end
    next
end
```

Event log category triggers

There are six automation triggers based on event log categories:

- Anomaly logs
- IPS logs
- SSH logs
- Traffic violations
- Virus logs
- Web filter violations

When multi VDOM mode is enabled, individual VDOMs can be specified so that the trigger is only applied to those VDOMs.



```
config system automation-trigger
    edit <name>
        set event-type {ips-logs | anomaly-logs | virus-logs | ssh-logs | webfilter-
violation | traffic-violation}
        set vdom <name>
    next
end
```

Example

In this example, an automation stitch is created that uses an anomaly logs trigger and an email notification action. The trigger specifies which VDOMs should be used. There is a three-second delay between the trigger and action.

To configure an automation stitch with the anomaly logs trigger in the GUI:

1. Configure the trigger:
   a. Go to *Security Fabric* > *Automation*, select the *Trigger* tab, and click *Create New*.
   b. In the *Event Log Category* section, click *Anomaly Logs*.
   c. Enter a name (*anomaly-logs*) and add the required VDOMs (*root*, *vdom-nat*, *vdom-tp*).

d. Click *OK*.

2. Configure the action:
   a. Go to *Security Fabric* > *Automation*, select the *Action* tab, and click *Create New*.
   b. In the *Notifications* section, click *Email* and enter the following:

Name	*email_default_rep_message*
To	Enter an email address
Subject	*CSF stitch alert*
Replacement message	Enable

   c. Click *OK*.
3. Configure the stitch:
   a. Go to *Security Fabric* > *Automation*, select the *Stitch* tab, and click *Create New*.
   b. Enter the name, *anomaly-logs-stitch*.
   c. Click *Add Trigger*. Select *anomaly-logs* and click *Apply*.
   d. Click *Add Action*. Select *email_default_rep_message* and click *Apply*.
   e. Click *Add delay* (between the trigger and action). Enter *3* and click *OK*.
   f. Click *OK*.

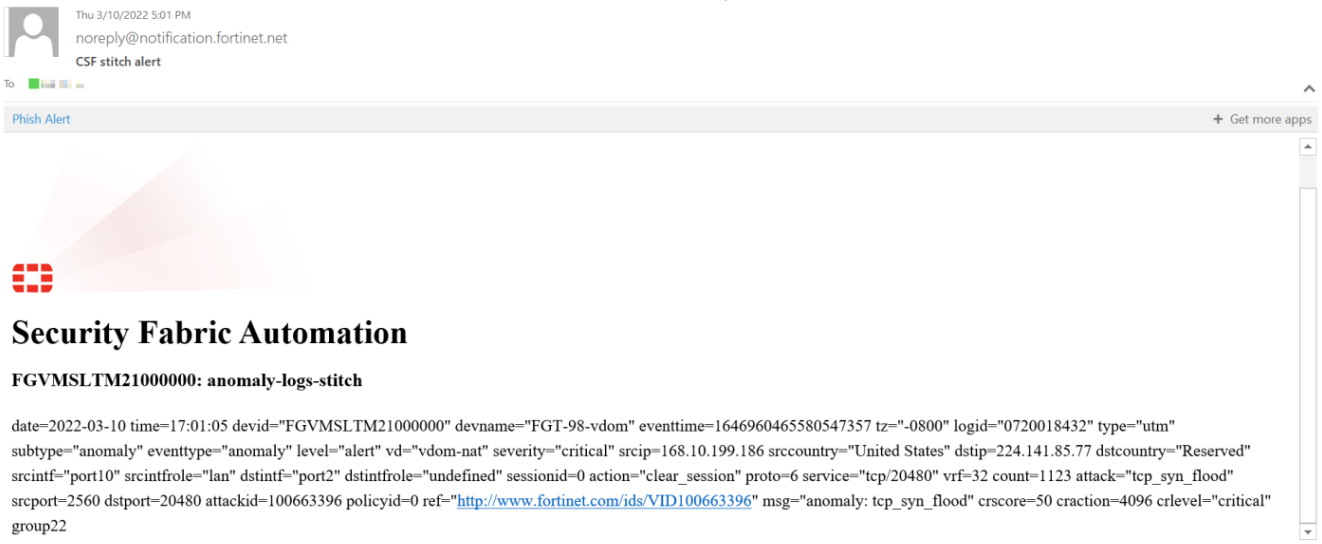
To configure an automation stitch with the anomaly logs trigger in the CLI:

1. Configure the trigger:

```
config system automation-trigger
    edit "anomaly-logs"
        set event-type anomaly-logs
        set vdom "root" "vdom-nat" "vdom-tp"
    next
end
```

2. Configure the action:

```
config system automation-action
    edit "email_default_rep_message"
        set action-type email
        set email-to "admin@fortinet.com"
```



```
        set email-subject "CSF stitch alert"
        set replacement-message enable
    next
end
```

3. Configure the stitch:

```
config system automation-stitch
    edit "anomaly-logs-stitch"
        set description "anomaly-logs"
        set trigger "anomaly-logs"
        config actions
            edit 1
                set action "email_default_rep_message"
                set delay 3
                set required enable
            next
        end
    next
end
```

Verification

Once the anomaly log is generated, the automation stitch is triggered end the email notification is sent.

To confirm that the stitch was triggered in the GUI:

1. Go to *Security Fabric* > *Automation* and select the *Stitch* tab.
2. Verify the *Last Triggered* column.

To confirm that the stitch was triggered in the CLI:

```
# diagnose test application autod 2
...
stitch: anomaly-logs-stitch
        destinations: all
        trigger: anomaly-logs
```

```
                type:anomaly logs

                field ids:
                        (id:6)vd=root,vdom-nat,vdom-tp

        local hit: 1 relayed to: 0 relayed from: 0
        actions:
                email_default_rep_message type:email interval:0
                        delay:3 required:yes
                        subject: CSF stitch alert
                        body: %%log%%
                        sender:
                        mailto:admin@fortinet.com;
```

Certificate expiration trigger

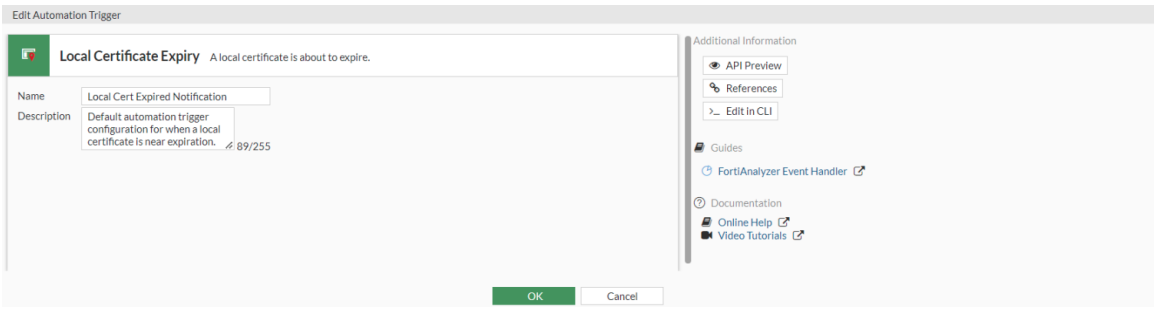
The local certificate expiry trigger (`local-certificate-near-expiry`) can be used in an automation stitch if a user-supplied local certificate used for SSL VPN, deep inspection, or other purpose is about to expire. This trigger relies on a VPN certificate setting in the CLI configuration setting for the certificate log expiring warning threshold:

```
config vpn certificate setting
    set cert-expire-warning <integer>
end
```

`cert-expire-warning <integer>`	Set the certificate log expiring warning threshold, in days (0 - 100, default = 14).

Example

In this example, the local certificate expiry trigger is used with an email notification action to remind an administrator to re-sign or load a new local certificate to avoid any service interruptions. The local certificate, fw-cert-30-days, will expire in 30 days. The certificate log expiring warning threshold is set to 31 days.



To configure the certificate log expiring warning threshold:

```
config vpn certificate setting
    set cert-expire-warning 31
end
```

To configure an automation stitch with the local certificate expiry trigger in the GUI:

1. Configure the trigger:
   a. Go to *Security Fabric* > *Automation*, select the *Trigger* tab, and click *Create New*.
   b. In the *System* section, click *Local Certificate Expiry*, and enter the following:

Name	*Local Cert Expired Notification*
Description	*Default automation trigger configuration for when a local certificate is near expiration.*

c. Click *OK*.

2. Configure the action:
   a. Go to *Security Fabric* > *Automation*, select the *Action* tab, and click *Create New*.
   b. In the *Notifications* section, click *Email*, and enter the following:

Name	*email_no_rep_message*
To	Enter an email address.
Subject	*CSF stitch alert*

   c. Click *OK*.
3. Configure the stitch:
   a. Go to *Security Fabric* > *Automation*, select the *Stitch* tab, and click *Create New*.
   b. Enter the name, *cert-expiry*.
   c. Click *Add Trigger*. Select *Local Cert Expired Notification* and click *Apply*.
   d. Click *Add Action*. Select *email_no_rep_message* and click *Apply*.
   e. Click *OK*.

To configure an automation stitch with the local certificate expiry trigger in the CLI:

1. Configure the trigger:

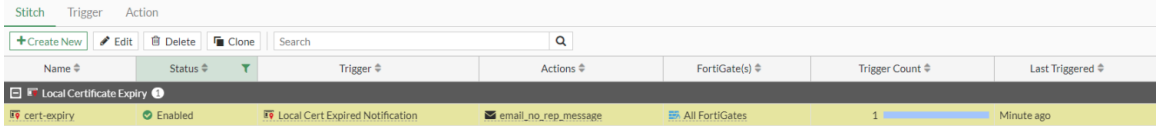
```
config system automation-trigger
    edit "Local Cert Expired Notification"
        set description "Default automation trigger configuration for when a local
certificate is near expiration."
        set event-type local-cert-near-expiry
    next
end
```

2. Configure the action:

```
config system automation-action
    edit "email_no_rep_message"
        set action-type email
        set email-to "*******@fortinet.com"
        set email-subject "CSF stitch alert"
    next
end
```

3. Configure the stitch:

```
config system automation-stitch
    edit "cert-expiry"
        set trigger "Local Cert Expired Notification"
        config actions
            edit 1
                set action "email_no_rep_message"
                set required enable
            next
        end
    next
end
```



Verification

Once the event log is generated for the local certificate expiry, the automation stitch is triggered end the email notification is sent.

To confirm that the stitch was triggered in the GUI:

1. Go to *Security Fabric* > *Automation* and select the *Stitch* tab.
2. Verify the *Last Triggered* column.

To confirm that the stitch was triggered in the CLI:

```
# diagnose test application autod 3
alert mail log count: 0

stitch: cert-expiry

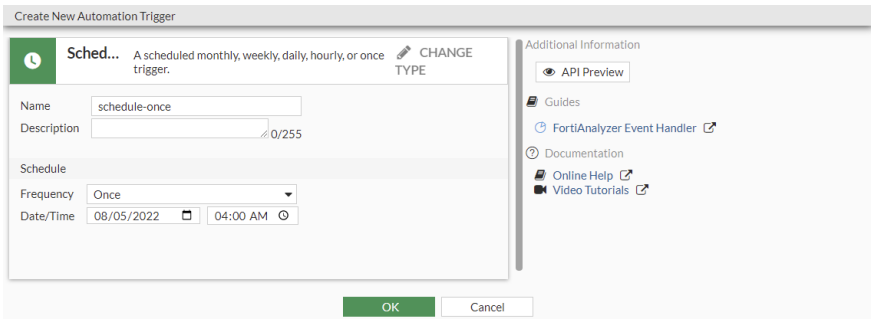
        local hit: 1 relayed to: 0 relayed from: 0
        last trigger:Thu Jun 23 09:32:21 2022
        last relay:
        actions:
                email_no_rep_message:
                        done: 1 relayed to: 0 relayed from: 0
                        last trigger:Thu Jun 23 09:32:21 2022
                        last relay:

logid to stitch mapping:
id:22207  local hit: 1 relayed hits: 0
        cert-expiry
```

Schedule trigger

The schedule automation trigger can be used for monthly, weekly, daily, hourly, or one-time triggers, including a one-time configuration backup to a disk, a reboot, or a shutdown.

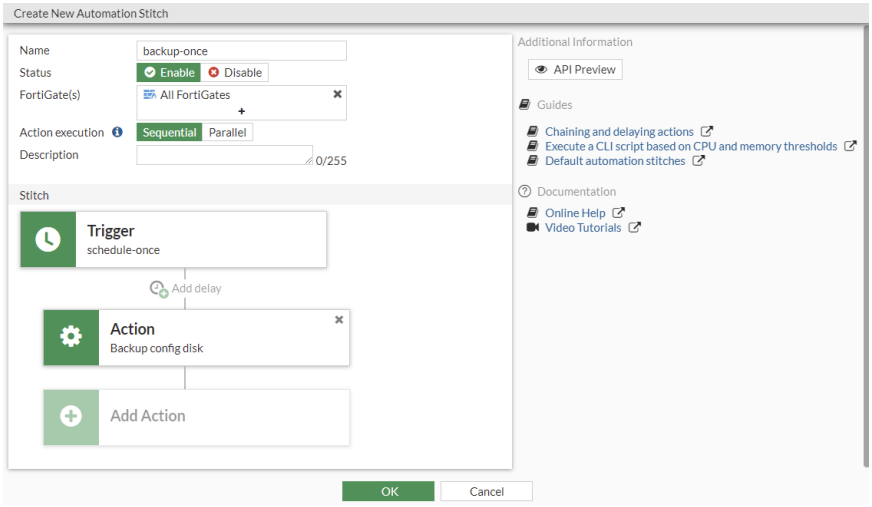
```
config system automation-trigger
    edit <name>
        set trigger-type scheduled
        set trigger-frequency {hourly | daily | weekly | monthly | once}
        set trigger-hour <inetger>
        set trigger-minute <integer>
        set trigger-weekday {sunday | monday | tuesday | wednesday | thursday | friday |
saturday}
        set trigger-day <integer>
        set trigger-datetime <YYYY-MM-DD HH:MM:SS>
    next
end
```



`trigger-frequency {hourly | daily | weekly | monthly | once}`	Set the scheduled trigger frequency (default = daily).
`trigger-hour <inetger>`	Set the hour of the day on which to trigger (0 - 23, default = 1), available for daily, weekly, and monthly schedule.
`trigger-minute <integer>`	Set the minute of the hour on which to trigger (0 - 59, default = 0), available for hourly, daily, weekly, and monthly schedule.
`trigger-weekday {sunday | monday | tuesday | wednesday | thursday | friday | saturday}`	Set the day of the week to trigger, available for weekly schedule.
`trigger-day <integer>`	Set the day within a month to trigger, available for monthly schedule.
`trigger-datetime <YYYY-MM-DD HH:MM:SS>`	Set the trigger time in YYYY-MM-DD HH:MM:SS format for one-time triggers.

Example

In this example, an automation stitch is created to trigger a one-time configuration backup to a disk. The backup will occur August 5, 2022 at 4:00 AM.



To schedule a one-time automation stitch in the GUI:

1. Configure the trigger:
   a. Go to *Security Fabric* > *Automation*, select the *Trigger* tab, and click *Create New*.
   b. In the *Miscellaneous* section, click *Schedule*.
   c. Enter a name (*schedule-once*) in the *Name* field.
   d. In the *Frequency* dropdown list, select *Once*.
   e. Select when the trigger will occur in the *Date/Time* fields.

f. Click *OK*.

2. Configure the action:
   a. Go to *Security Fabric* > *Automation*, select the *Action* tab, and click *Create New*.
   b. In the *General* section, click *System Action*.
   c. Enter a name (*Backup config disk*) and an action description.
   d. In the *Action* dropdown list, select *Backup configuration*.
   e. Click *OK*.
3. Configure the stitch:
   a. Go to *Security Fabric* > *Automation*, select the *Stitch* tab, and click *Create New*.
   b. Enter the name, *backup-once*.
   c. Click *Add Trigger*. Select *schedule-once* and click *Apply*.
   d. Click *Add Action*. Select *Backup config disk* and click *Apply*.

   e. Click *OK*. The backup configuration will occur once at the date and time you set.

To schedule a one-time automation stitch in the CLI:

1. Configure the trigger:

```
config system automation-trigger
    edit "schedule-once"
        set trigger-type scheduled
        set trigger-frequency once
        set trigger-datetime 2022-08-05 04:00:00
```

```
    next
end
```

2. Configure the action:

```
config system automation-action
    edit "Backup config disk"
        set description "Default automation action configuration for backing up the
configuration on disk."
        set action-type system-actions
        set system-action backup-config
    next
end
```

3. Configure the stitch:

```
config system automation-stitch
    edit "backup-once"
        set trigger "schedule-once"
        config actions
            edit 1
                set action "Backup config disk"
                set required enable
            next
        end
    next
end
```

4. To view automation stitch information:

```
# diagnose test application autod 3
stitch: backup-once (scheduled)

        local hit: 0 relayed to: 0 relayed from: 0
        last trigger:   last relay:
        next scheduled trigger:Fri Aug  5 05:00:00 2022
        actions:
                backup config disk:
                        done: 0 relayed to: 0 relayed from: 0
                        last trigger:                   last relay:

logid to stitch mapping:
id:0 (scheduled stitches) local hit: 0 relayed hits: 0
        backup-once
```

Actions

The following table outlines the available actions. Multiple actions can be added to an automation stitch. Actions can be reorganized in the *Edit Automation Stitch* page by dragging and dropping the actions in the diagram.

Category	Action	Description
Security Response		
	Access Layer Quarantine	This option is only available for Compromised Host triggers.

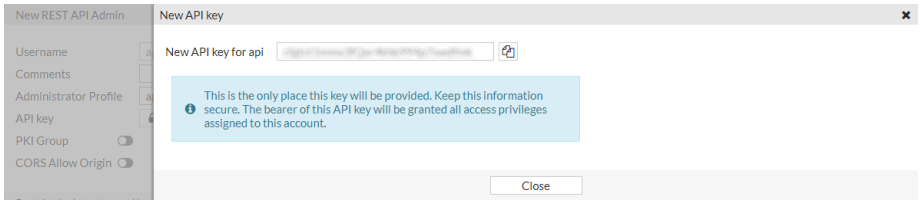
Category	Action	Description
		Quarantine the MAC address on access layer devices (FortiSwitch and FortiAP).
	FortiClient Quarantine	This option is only available for Compromised Host triggers. Use FortiClient EMS to block all traffic from the source addresses that are flagged as compromised hosts. Quarantined devices are flagged on the Security Fabric topology views. Go to the *Dashboard* > *Users & Devices* > *Quarantine* widget to view and manage quarantined IP addresses.
	FortiNAC Quarantine	This option is only available for Compromised Host and Incoming Webhook triggers. Use FortiNAC to quarantine a client PC and disable its MAC address. See FortiNAC Quarantine action on page 2554 for details.
	VMware NSX Security Tag	This option is only available for Compromised Host triggers. If an endpoint instance in a VMware NSX environment is compromised, the configured security tag is assigned to the compromised endpoint. See VMware NSX security tag action on page 2558 and VMware NSX-T security tag action on page 2562 for details.
	IP Ban	This option is only available for Compromised Host triggers. Block all traffic from the source addresses flagged by the IoC. Go to the *Dashboard* > *Users & Devices* > *Quarantine* widget to view and manage quarantined IP addresses.
Notifications		
	Email	Send a custom email message to the selected recipients. At least one recipient and an email subject must be specified. The email body can use parameters from logs or previous action results. Wrapping the parameter with %% will replace the expression with the JSON value for the parameter, for example: *%%results.source%%* is the source property from the previous action. Replacement messages can be enabled in the email body to create branded email alerts. See Replacement messages for email alerts on page 2565 for details.
	FortiExplorer Notification	Send push notifications to FortiExplorer. The FortiGate must be registered to FortiCare on the mobile app that will receive the notification.
	Slack Notification	Send a notification to a Slack channel. See Slack Notification action on page 2569 for details.
	Microsoft Teams Notification	Send a notification to channels in Microsoft Teams. See Microsoft Teams Notification action on page 2574 for details.

Category	Action	Description
Cloud Compute		
	AWS Lambda	Send log data to an integrated AWS service. See AWS Lambda action on page 2579 for details.
	Azure Function	Send log data to an Azure function. See Azure Function action on page 2581 for details.
	Google Cloud Function	Send log data to a Google Cloud function. See Google Cloud Function action on page 2582 for details.
	AliCloud Function	Send log data to an AliCloud function. See AliCloud Function action on page 2584 for details.
General		
	CLI Script	Run one or more CLI scripts. See CLI script action on page 2586 for details. See Execute a CLI script based on CPU and memory thresholds on page 2589 for an example.
	Webhook	Send an HTTP request using a REST callback. See Webhook action on page 2596 for details, and Slack integration webhook on page 2601 and Microsoft Teams integration webhook on page 2603 for examples.
	System Action	Execute one of the following system actions: reboot, shut down, or back up the configuration. See System action on page 2605 for an example.
	Alert	Generate a FortiOS dashboard alert. This option is only available in the CLI.
	Disable SSID	Disable the SSID interface. This option is only available in the CLI.

FortiNAC Quarantine action

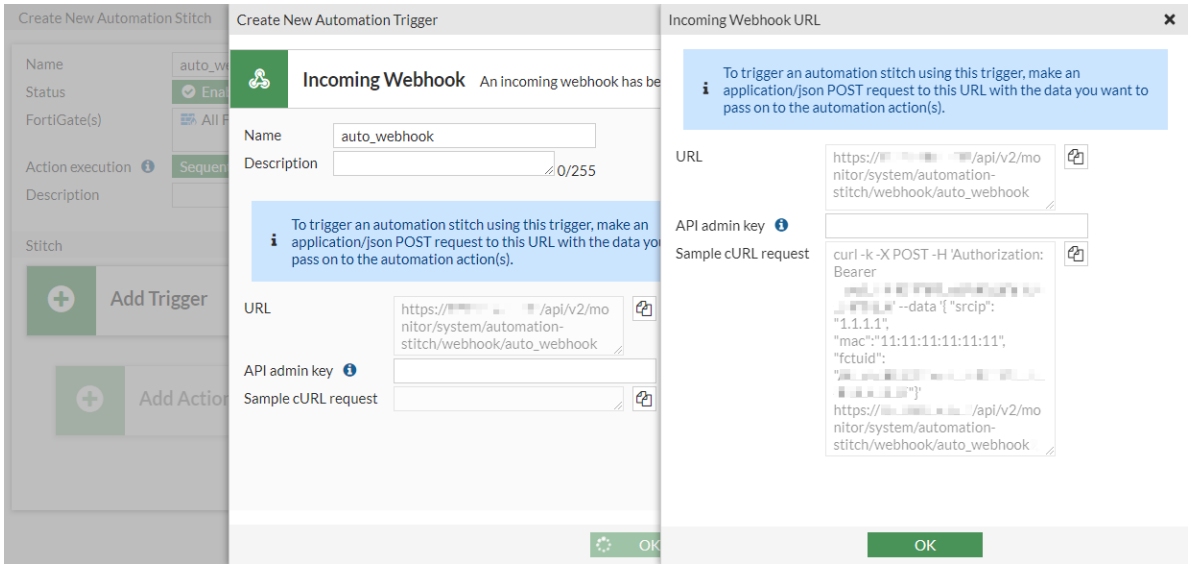
Users can configure an automation stitch with the FortiNAC Quarantine action with a Compromised Host or Incoming Webhook trigger. When the automation is triggered, the client PC will be quarantined and its MAC address is disabled in the configured FortiNAC.

In this example, the FortiNAC has been configured to join an enabled Security Fabric. See Configuring FortiNAC on page 2420 for more information.



The FortiNAC must also be configured to isolate disabled hosts:

- Endpoints connecting to FortiWiFi or wired ports on FortiGate:
  - See the requisite *Configure FortiNAC* section in the FortiGate Endpoint Management Integration Guide.
- Endpoints connecting to FortiAP:
  - Set the *Dead End* VLAN. See Model configuration.
- Endpoints connecting to FortiSwitch:



- Set the *Dead End* VLAN. See Model configuration.
- Add the switch to the physical address filtering group. See Systems groups and Modify a group.

To configure an automation stitch with a FortiNAC quarantine action in the GUI:

1. Create a new API user and generate the API key:
   a. Go to *System* > *Administrators* and click *Create New* > *REST API Admin*.
   b. Configure the settings as needed.
   c. Click *OK*. The *New API key* window opens.
   d. Copy the key to the clipboard and click *Close*.

   e. Click *OK*.
2. Configure the automation stitch trigger:
   a. Go to *Security Fabric* > *Automation* and click *Create New*.
   b. Enter the stitch name (*auto_webhook*).
   c. Click *Add Trigger*.
   d. Click *Create* and select *Incoming Webhook*.
   e. Enter a name (*auto_webhook*).
   f. Click *OK*.
   g. Paste the key in the *API admin key* field.

   h. Click *OK*.
   i. Select the trigger in the list and click *Apply*.
3. Configure the automation stitch action:
   a. Click *Add Action*.
   b. Click *Create* and select *FortiNAC Quarantine*.
   c. Enter an action name (*auto_webhook_quarantine-fortinac*) and click *OK*.

d. Select the action in the list and click *Apply*.
e. Click *OK*.

4. On a Linux PC accessible by the FortiGate, create a cURL request to trigger the automation stitch:

```
root@pc56:~# curl -k -X POST -H 'Authorization: Bearer ckx7d9xdzzx14Nztd1Ncr701dpwwy9' -
-data '{ "srcip": "1.1.1.1", "mac":"00:0C:29:0B:A6:16", "fctuid":
"A8BA0B12DA694E47BA4ADF24F8358E2F"}'
https://172.17.48.225:4431/api/v2/monitor/system/automation-stitch/webhook/auto_webhook
```

5. In FortiOS, verify the automation stitch is triggered and the action is executed:
   a. Go to *Log & Report* > *System Events* to confirm that the stitch was activated.
   b. Go to *Security Fabric* > *Automation* to see the last time that the stitch was triggered.
   In FortiNAC, the *Host View* shows the status of the client PC. It is quarantined and its MAC address is disabled.

To configure an automation stitch with a FortiNAC quarantine action in the CLI:

1. Create a new API user and generate the API key:

```
config system api-user
    edit "g-api-rw-user"
        set api-key ************
        set accprofile "super_admin"
        set vdom "root"
        config trusthost
            edit 1
                set ipv4-trusthost 10.6.30.0 255.255.255.0
            next
        end
    next
end
```

2. Configure the automation trigger:

```
config system automation-trigger
    edit "auto_webhook"
        set event-type incoming-webhook
    next
end
```

3. Configure the automation action:

```
config system automation-action
    edit "auto_webhook_quarantine-fortinac"
        set action-type quarantine-fortinac
    next
end
```

4. Configure the automation stitch:

```
config system automation-stitch
    edit "auto_webhook"
        set trigger "auto_webhook"
        config actions
            edit 1
                set action "auto_webhook_quarantine-fortinac"
                set required enable
            next
        end
    next
end
```

5. On a Linux PC accessible by the FortiGate, create a cURL request to trigger the automation stitch:

```
root@pc56:~# curl -k -X POST -H 'Authorization: Bearer ckx7d9xdzzx14Nztd1Ncr701dpwwy9' -
-data '{ "srcip": "1.1.1.1", "mac":"00:0C:29:0B:A6:16", "fctuid":
"A8BA0B12DA694E47BA4ADF24F8358E2F"}'
https://172.17.48.225:4431/api/v2/monitor/system/automation-stitch/webhook/auto_webhook
```

6. In FortiOS, verify that the automation stitch is triggered and the action is executed:

```
# diagnose test application autod 2
csf: enabled    root:yes
version:1592949233 sync time:Tue Jun 23 15:03:15 2020

total stitches activated: 1

stitch: auto_webhook
        destinations: all
        trigger: auto_webhook

                (id:15)service=auto_webhook

        local hit: 1 relayed to: 0 relayed from: 0
        actions:
                auto_webhook_quarantine-fortinac type:quarantine-fortinac interval:0

date=2020-06-23 time=15:25:44 logdesc="Internal Message" path="system" name="automation-
stitch" action="webhook" mkey="auto_webhook" srcip="1.1.1.1" mac="00:0C:29:0B:A6:16"

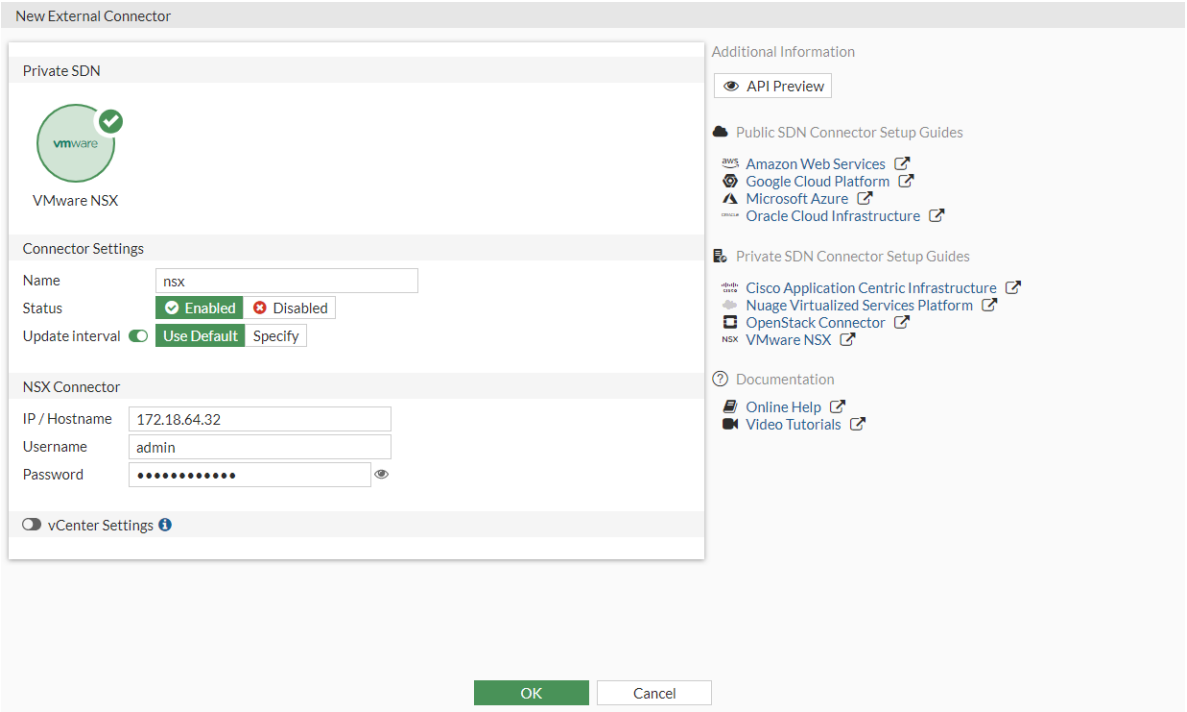
stitch triggered" stitch="auto_webhook" trigger="auto_webhook" stitchaction="auto_
webhook_quarantine-fortinac" from="log" msg="stitch:auto_webhook is triggered."
```

VMware NSX security tag action

If an endpoint instance in a VMware NSX environment is compromised, this action will assign the configured security tag to the compromised endpoint.

This action is only available when the automation trigger is set to compromised host.

To set up the NSX quarantine action, you need to:



1. Configure a VMware NSX SDN connector
2. Configure an NSX security tag automation stitch
3. Configure FortiAnalyzer logging on the FortiGate

Configure a VMware NSX SDN connector

The FortiGate retrieves security tags from the VMware NSX server through the connector.

To configure a VMware NSX SDN connector in the GUI:

1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*.
3. Select *VMware NSX*.
4. Configure the settings as needed.

5. Click *OK*.

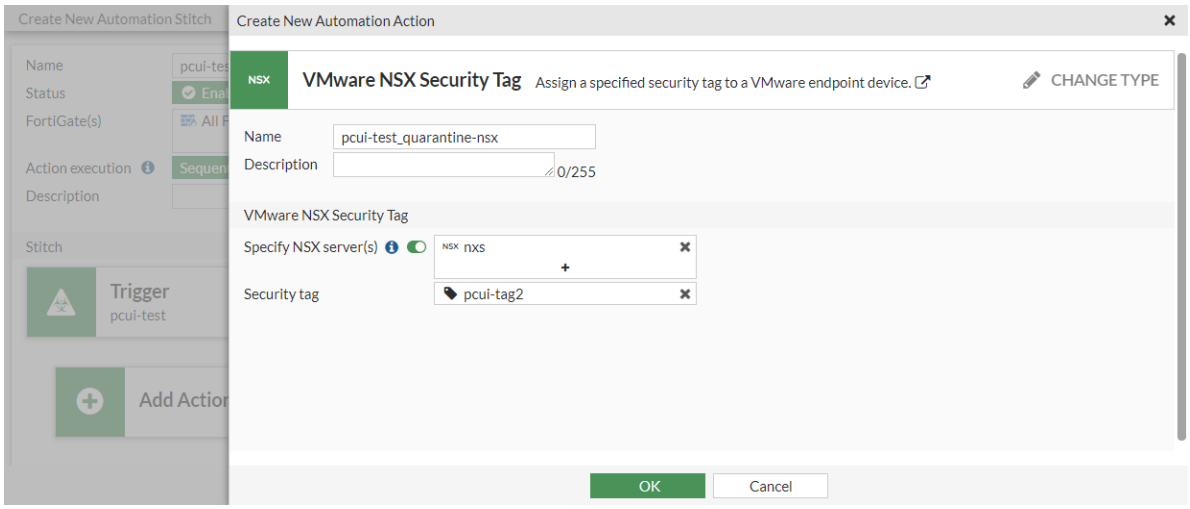
To configure a VMware NSX SDN connector in the CLI:

```
config system sdn-connector
    edit "nsx"
        set type nsx
```

```
        set server "172.18.64.32"
        set username "admin"
        set password xxxxxxxxxxxx
    next
end
```

Configure an NSX security tag automation stitch

Security tags are retrieved from the VMware NSX server through the NSX SDN connector.



To configure an automation stitch with an NSX security tag in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name (*pcui-test*).
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Compromised Host*.
   c. Enter the following:

Name	pcui-test
Threat level threshold	High

   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.
4. Configure the VMware NSX Security Tag action:
   a. Click *Add Action*.
   b. Click *Create* and select *VMware NSX Security Tag*.
   c. Enter the following:

Name	pcui-test_quarantine-nsx
Specify NSX server(s)	Enable and select the SDN connector
Security tag	Select an existing tag, or create a new one

d. Click *OK*.
e. Select the action in the list and click *Apply*.

5. Click *OK*.

To configure an automation stitch with an NSX security tag in the CLI:

1. Create an automation trigger:

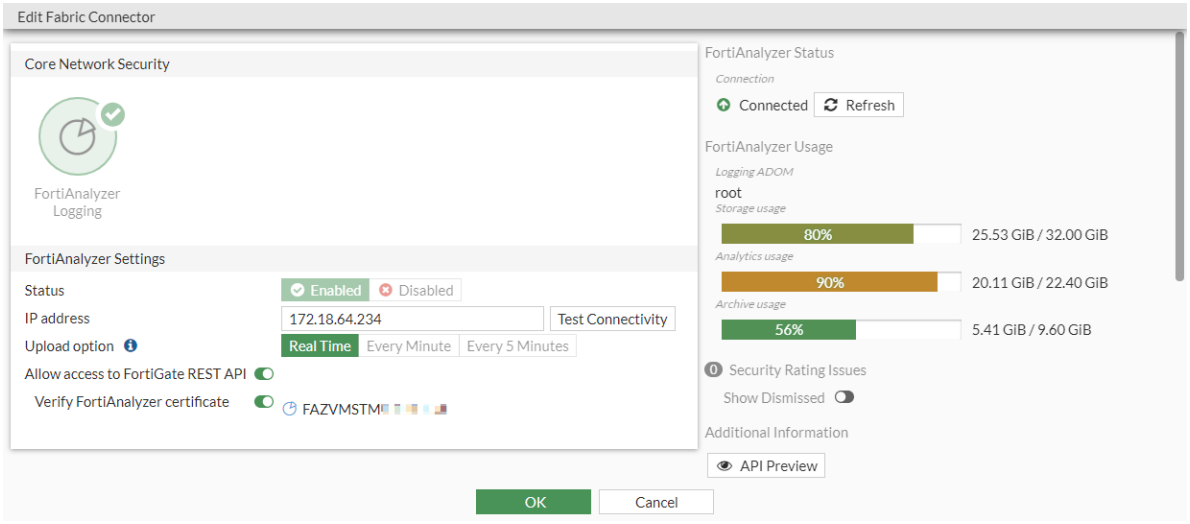
```
config system automation-trigger
    edit "pcui-test"
        set ioc-level high
    next
end
```

2. Create an automation action:

```
config system automation-action
    edit "pcui-test_quarantine-nsx"
        set action-type quarantine-nsx
        set security-tag "pcui-tag2"
        set sdn-connector "nsx"
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "pcui-test"
        set trigger "pcui-test"
        config actions
            edit 1
                set action "pcui-test_quarantine-nsx"
                set required enable
            next
        end
    next
end
```



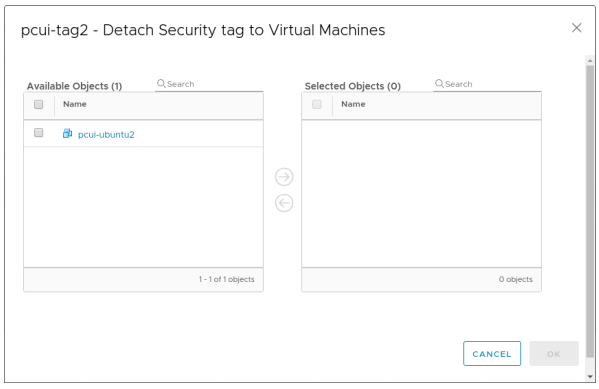
Configure FortiAnalyzer logging on the FortiGate

The FortiAnalyzer is used to send endpoint compromise notification to the FortiGate.

See Configuring FortiAnalyzer on page 2385 for more information.

To configure FortiAnalyzer logging in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiAnalyzer Logging* card.
2. Ensure the *Status* is *Enabled*, and configure the settings as needed.



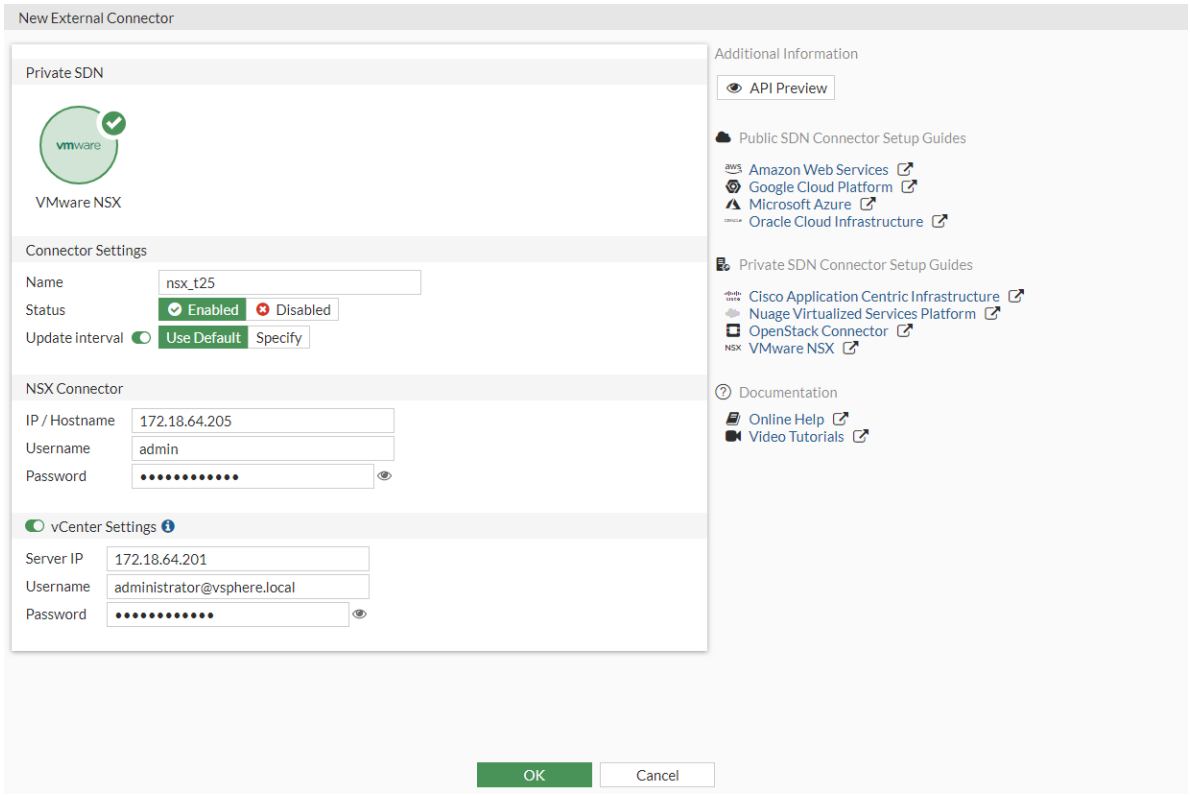
3. Click *Apply*.

To configure FortiAnalyzer logging in the CLI:

```
config log fortianalyzer setting
    set status enable
    set server "172.18.64.234"
    set serial "FL-8HFT000000000"
    set upload-option realtime
    set reliable enable
end
```

When an endpoint instance is compromised

When an endpoint instance, such as *pcui-ubuntu2*, in the VMware NSX environment is compromised, the automation stitch is triggered. The FortiGate then assigns the configured security tag, *pcui-tag2* in this example, to the compromised NSX endpoint instance.



VMware NSX-T security tag action

VMware NSX SDN connectors' vCenter server and credentials can be configured so the FortiGate resolves NSX-T VMs. The FortiGate uses the VMWare NSX Security Tag automation action to assign a tag to the VM through an automation stitch.

The FortiGate is notified of a compromised host on the NSX-T network by an incoming webhook or other means, such as FortiGuard IOC. An automation stitch can be configured to process this trigger and action it by assigning a VMware NSX security tag on the VM instance.

To configure an automation stitch to assign a security tag to NSX-T VMs in the GUI:

1. Configure the NSX SDN connector:
   a. Go to *Security Fabric* > *External Connectors* and click *Create New*.
   b. Select *VMware NSX*.
   c. Configure the connector settings.
   d. Enable *vCenter Settings* and configure as needed.

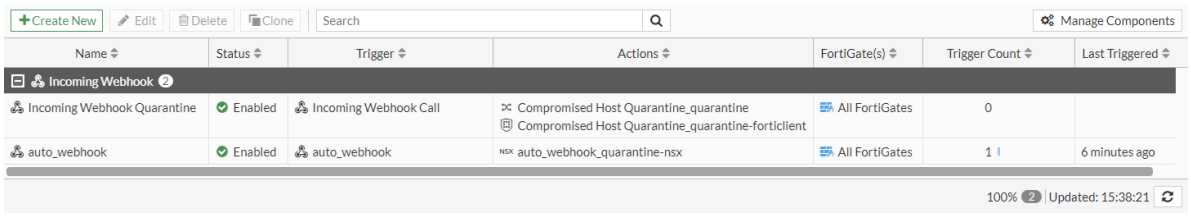
   e. Click *OK*.
2. Configure the automation stitch trigger:
   a. Go to *Security Fabric* > *Automation* and click *Create New*.
   b. Enter the stitch name (*auto_webhook*).
   c. Click *Add Trigger*.
   d. Click *Create* and select *Incoming Webhook*.
   e. Enter a name (*auto_webhook*).

f. Click *OK* to close the *Incoming Webhook URL* prompt.
g. Select the trigger in the list and click *Apply*.

3. Configure the automation stitch action:
   a. Click *Add Action*.
   b. Click *Create* and select *VMware NSX Security Tag*.
   c. Enter the following:

Name	auto_webhook_quarantine-nsx
Specify NSX server(s)	Enable and select the SDN connector
Security tag	Select an existing tag, or create a new one

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.



4. Click *OK*.
5. In NSX-T, create a cURL request to trigger the automation stitch on the FortiGate:

```
root@pc56:/home# curl -k -X POST -H 'Authorization: Bearer
3fdxNG08mgNg0fh4NQ51g1NQ1QHcxx' --data '{ "srcip": "10.1.30.242"}'
https://172.16.116.230/api/v2/monitor/system/automation-stitch/webhook/auto_webhook
{
  "http_method":"POST",
  "status":"success",
  "http_status":200,
  "serial":"FGVM08TM20000000",
  "version":"v6.4.0",
  "build":1608
}
```

The automation stitch is triggered and the configured tag is added to the NSX-T VM.

In FortiOS, the *Security Fabric* > *Automation* page shows the last trigger time.

To configure an automation stitch to assign a security tag to NSX-T VMs in the CLI:

1. Configure the NSX SDN connector:

```
config system sdn-connector
    edit "nsx_t25"
        set type nsx
        set server "172.18.64.205"
        set username "admin"
        set password xxxxxxxxxxxx
        set vcenter-server "172.18.64.201"
        set vcenter-username "administrator@vsphere.local"
        set vcenter-password xxxxxxxxxxxx
    next
end
```

2. Configure the automation stitch:

```
config system automation-trigger
    edit "auto_webhook"
        set trigger-type event-based
        set event-type incoming-webhook
    next
end

config system automation-action
    edit "auto_webhook_quarantine-nsx"
        set action-type quarantine-nsx
        set security-tag "automation_tag"
        set sdn-connector "nsx_t25"
    next
end
```

```
config system automation-stitch
    edit "auto_webhook"
        set trigger "auto_webhook"
        config actions
            edit 1
                set action "auto_webhook_quarantine-nsx"
                set required enable
            next
        end
    next
end
```

3. In NSX-T, create a cURL request to trigger the automation stitch on the FortiGate:

```
root@pc56:/home# curl -k -X POST -H 'Authorization: Bearer
3fdxNG08mgNg0fh4NQ51g1NQ1QHcxx' --data '{ "srcip": "10.1.30.242"}'
https://172.16.116.230/api/v2/monitor/system/automation-stitch/webhook/auto_webhook
{
  "http_method":"POST",
  "status":"success",
  "http_status":200,
  "serial":"FGVM08TM20000000",
  "version":"v6.4.0",
  "build":1608
}
```

To verify the automation stitch is triggered and the action is executed:

```
# diagnose test application autod 2

csf: enabled root:yes
version:1586883541 sync time:Tue Apr 14 11:04:05 2020

total stitches activated: 1

stitch: auto_webhook
destinations: all
trigger: auto_webhook

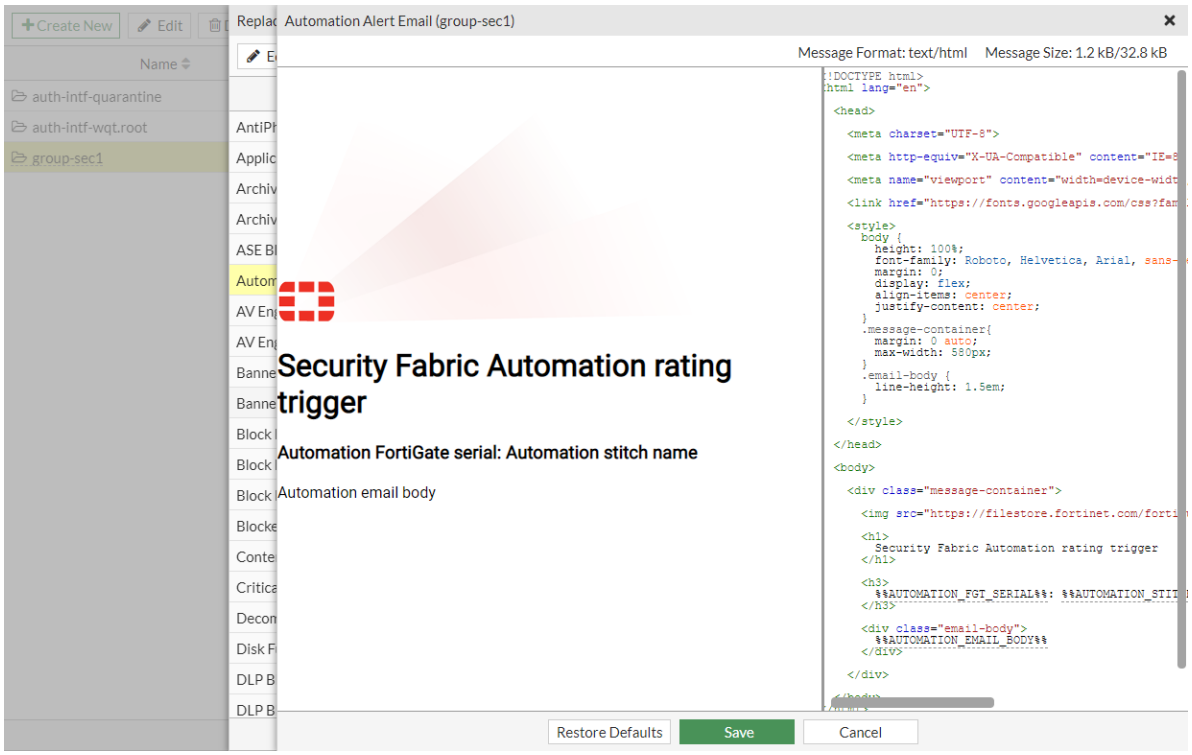
(id:15)service=auto_webhook

local hit: 1 relayed to: 0 relayed from: 0
actions:
auto_webhook_quarantine-nsx type:quarantine-nsx interval:0
security tag:automation_tag
sdn connector:
nsx_t25;
```

Replacement messages for email alerts

Automation stitches with an Email action can leverage the formatting options provided by replacement messages to create branded email alerts.

You can enable a replacement message and edit the message body or select a customized replacement message group when you configure the automation action. When the automation stitch is triggered, the FortiGate will send the email with the defined replacement message.



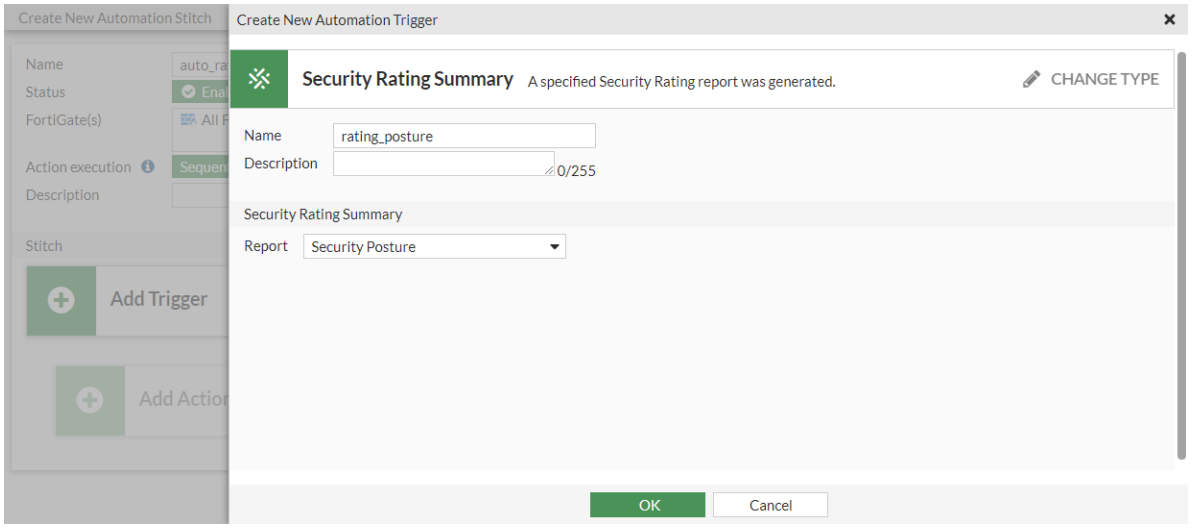
In this example, a Security Rating report triggers an Email notification action. The email uses a customized replacement message group.

To configure the replacement message group in the GUI:

1. Go to *System* > *Replacement Message Groups* and click *Create New*.
2. Enter the following:

Name	group-sec1
Group Type	Security

3. Click *OK*.
4. Select the group in the list and click *Edit*.
5. Select *Automation Alert Email* and click *Edit*.



6. Edit the HTML code as needed, then click *Save*.

To configure the email action in the GUI:

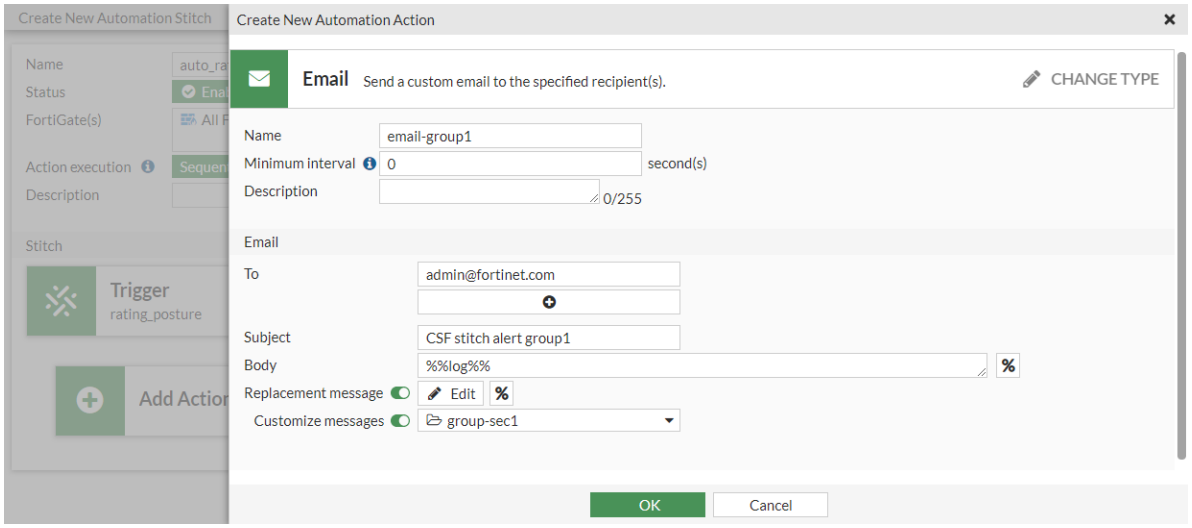
1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Security Rating Summary*.
   c. Enter the following:

Name	rating_posture

Description	rating test
Report	Security Posture

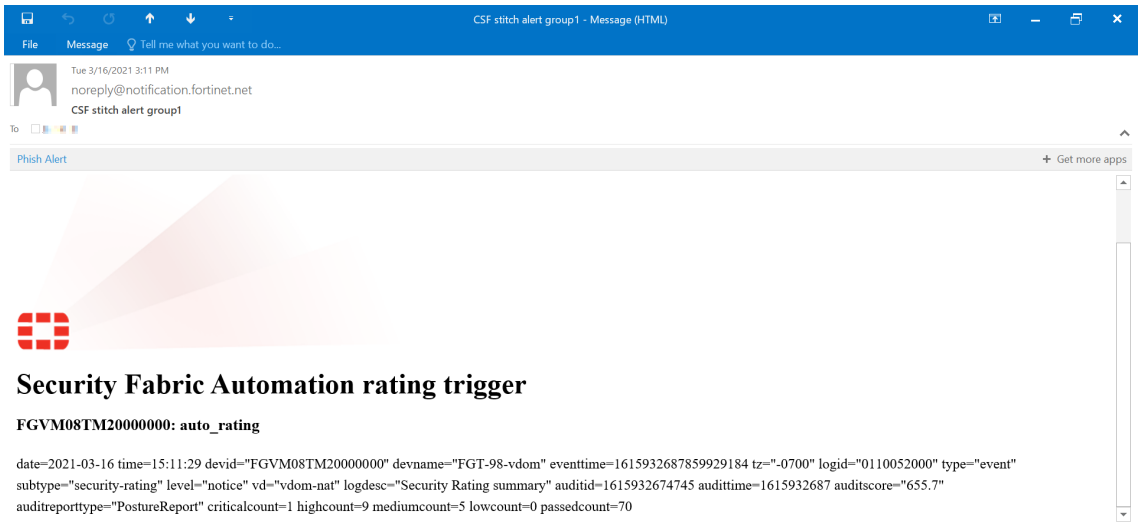
d. Click *OK*.

e. Select the trigger in the list and click *Apply*.



4. Configure the Email notification action:

a. Click *Add Action*.



b. Click *Create* and select *Email*.

c. Enter the following:

Name	email-group1
To	Enter an email address
Subject	CSF stitch alert group1
Replacement message	Enable
Customize messages	Enable and select group-sec1 from the dropdown

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
5. Click *OK*.
6. Right-click the automation stitch, and click *Test Automation Stitch*.
   After the Security Rating report is finished, the automation is triggered, and the email is delivered with the customized replacement message in the email body.

To configure the replacement message group in the CLI:

```
config system replacemsg-group
    edit "group-sec1"
        set comment ""
        set group-type utm
        config automation
            edit "automation-email"
                set buffer "...<h1> Security Fabric Automation rating trigger </h1>..."
                ...
            next
        end
    next
end
```

To configure the email action in the CLI:

1. Configure the automation trigger:

```
config system automation-trigger
    edit "rating_posture"
        set description "rating test"
        set event-type security-rating-summary
    next
end
```

2. Configure the automation action:

```
config system automation-action
    edit "email-group1"
```

```
        set action-type email
        set email-to "admin@fortinet.com"
        set email-subject "CSF stitch alert group1"
        set replacement-message enable
        set replacemsg-group "group-sec1"
    next
end
```

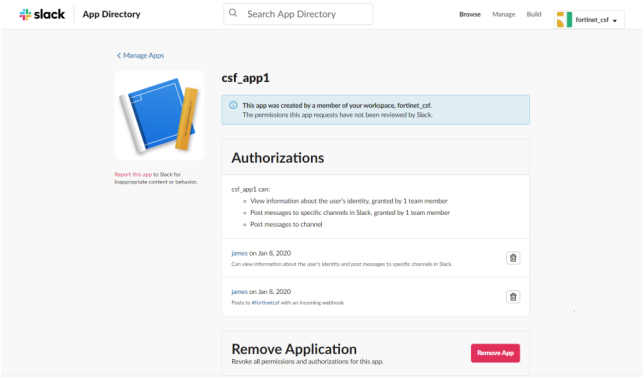
3. Configure the automation stitch:

```
config system automation-stitch
    edit "auto_rating"
        set trigger "rating_posture"
        config actions
            edit 1
                set action "email-group1"
                set required enable
            next
        end
    next
end
```

4. To view the automation stitch information after it is triggered:

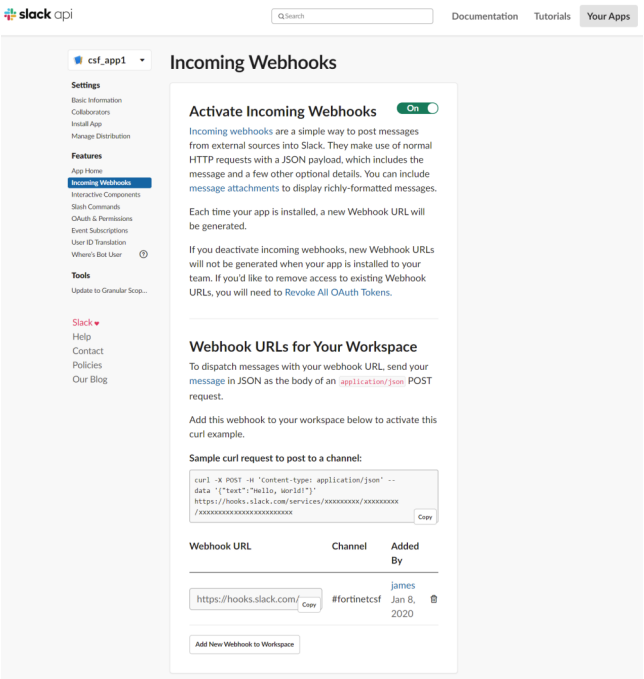
```
# diagnose test application autod 3
stitch: auto_rating
        local hit: 1 relayed to: 0 relayed from: 0
        last trigger:Tue Mar 16 15:11:29 2021
        last relay:
        actions:
                email-group1:
                        done: 1 relayed to: 0 relayed from: 0
                        last trigger:Tue Mar 16 15:11:29 2021
                        last relay:

logid2stitch mapping:
id:52000  local hit: 1 relayed hits: 0
        auto_rating
```



Slack Notification action

To configure an automation stitch with a Slack Notification action, you first need to configure an incoming webhook in Slack. Then you can enter the webhook URL when you configure the Slack Notification action.



This example uses a Security Rating Summary trigger in the automation stitch with two Slack Notification actions with different notification messages. One message is a custom message, and the other is for the Security Rating Summary log with a 90 second delay.

To create an Incoming Webhook in Slack:

1. Go to the Slack website, and create a workspace.
2. Create a Slack application for the workspace.

3. Add an Incoming Webhook to a channel in the workspace (see Sending messages using Incoming Webhooks for more details).
4. Activate the Incoming Webhook, and copy the *Webhook URL* to the clipboard.

To configure an automation stitch with Slack Notification actions in the GUI:

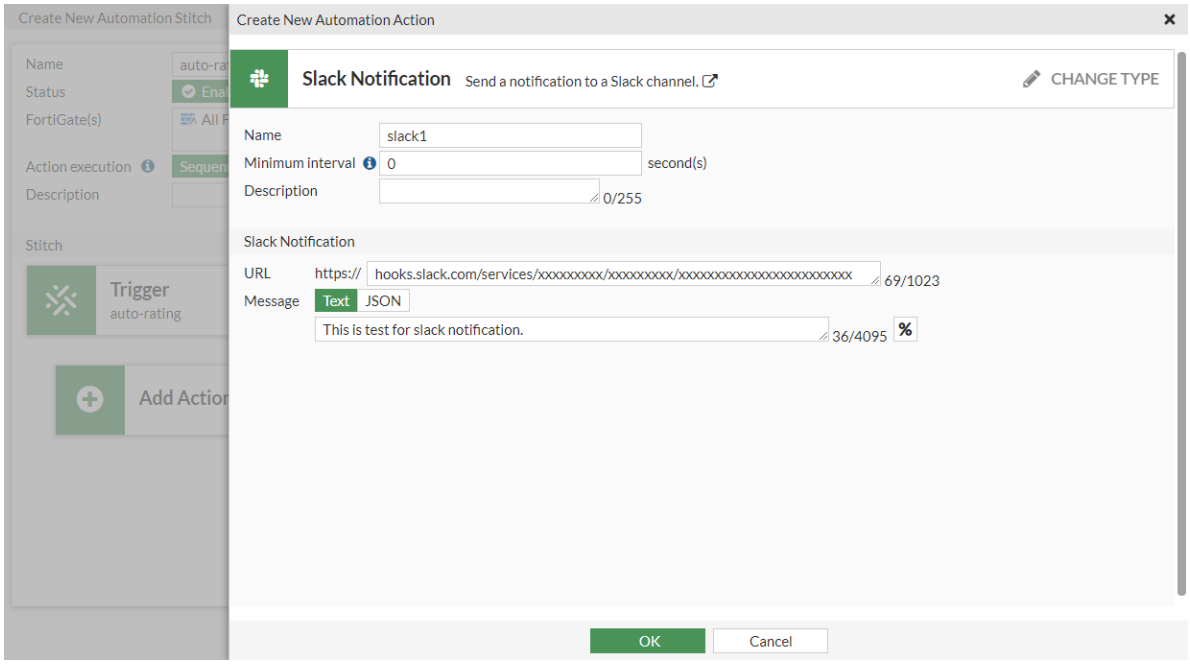
1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the Security Rating Summary trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Security Rating Summary*.

c. Enter the following:

Name	auto-rating
Report	Security Posture

d. Click *OK*.

e. Select the trigger in the list and click *Apply*.



4. Configure the first Slack Notification action:

a. Click *Add Action*.

b. Click *Create* and select *Slack Notification*.

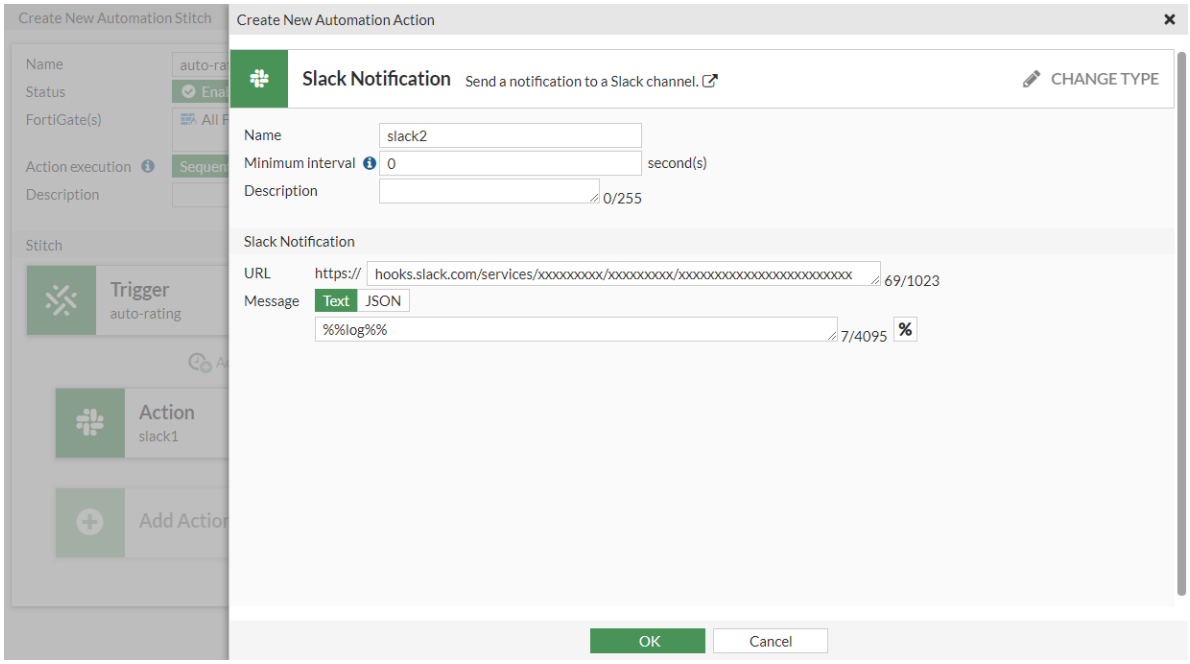
c. Enter the following:

Name	slack1
URL	Paste the webhook URL from the clipboard
Message	Text
Message text	This is test for slack notification.

d. Click *OK*.

e. Select the action in the list and click *Apply*.

5. Configure the second Slack Notification action:

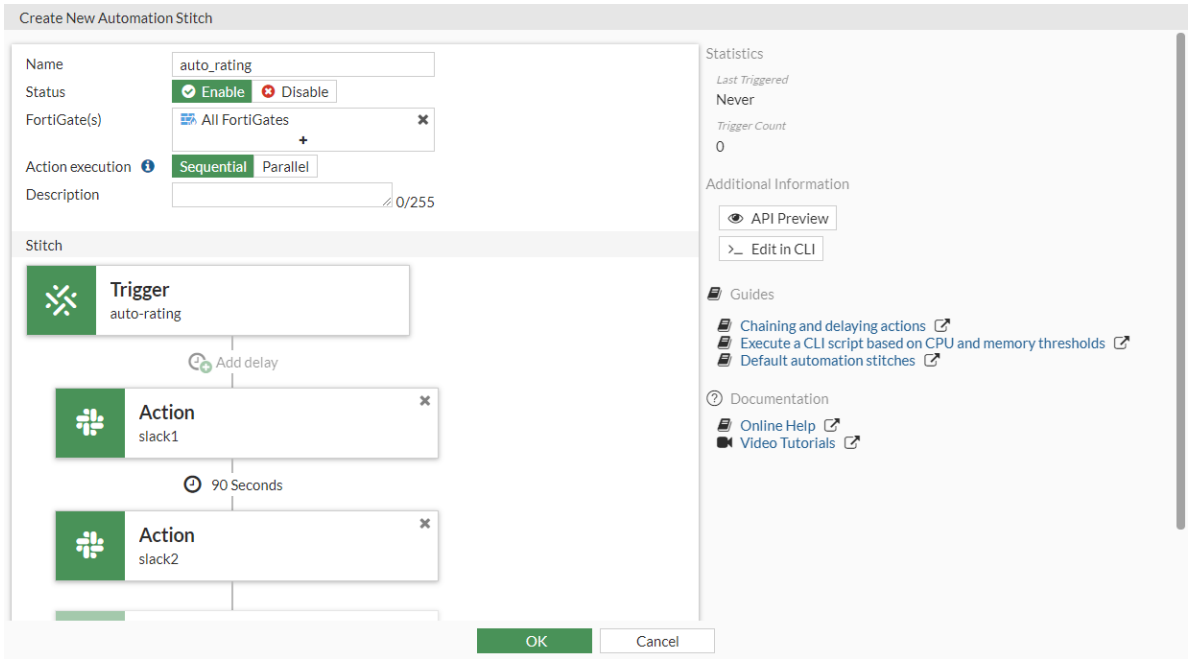


a. Click *Add Action*.

b. Click *Create* and select *Slack Notification*.

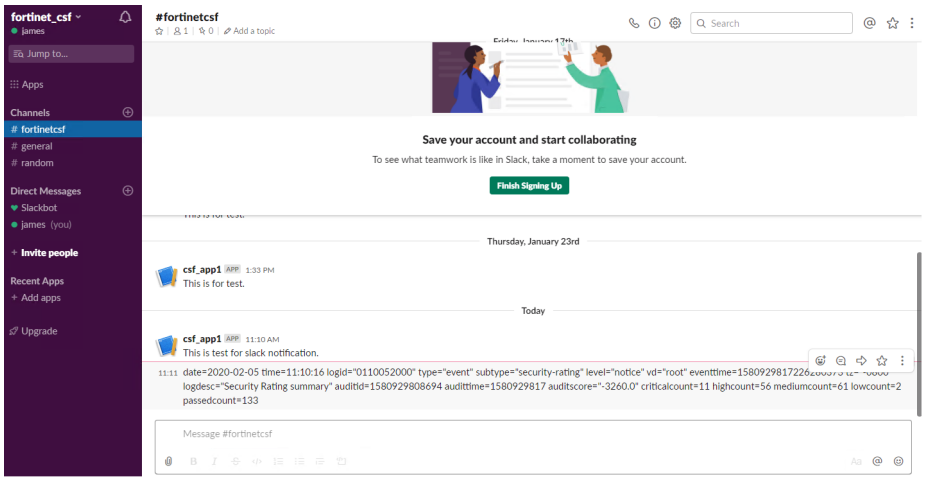
c. Enter the following:

Name	slack2
URL	Paste the webhook URL from the clipboard



Message	Text
Message text	%%log%%

d. Click *OK*.



e. Select the action in the list and click *Apply*.

f. Click the *Add delay* located between both actions. Enter *90* and click *OK*.

6. Click *OK*.

7. Trigger the automation stitch:
   a. Right-click the automation stitch and select *Test Automation Stitch*.
   After the Security Rating report is finished, the automation is triggered and an event log is created by the FortiGate. The two notifications are sent to the Slack channel.

To configure an automation stitch with Slack Notification actions in the CLI:

1. Configure the automation trigger:

```
config system automation-trigger
    edit "auto-rating"
        set event-type security-rating-summary
    next
end
```

2. Configure the automation actions:

```
config system automation-action
    edit "slack1"
        set action-type slack-notification
        set message "This is test for slack notification."
        set uri "hooks.slack.com/services/xxxxxxxxx/xxxxxxxxx/xxxxxxxxxxxxxxxxxxxxxxxx"
    next
    edit "slack2"
        set action-type slack-notification
        set uri "hooks.slack.com/services/xxxxxxxxx/xxxxxxxxx/xxxxxxxxxxxxxxxxxxxxxxxx"
    next
end
```

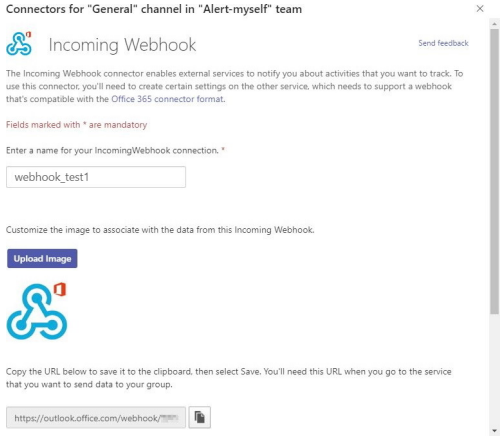
3. Configure the automation stitch:

```
config system automation-stitch
    edit "auto_rating"
        set trigger "auto-rating"
        config actions
            edit 1
                set action "slack1"
                set required enable
            next
            edit 2
                set action "slack2"
```

```
                set delay 90
                set required enable
            next
        end
    next
end
```

4. Verify that the automation action was triggered:

```
# diagnose test application autod 3
stitch: auto-rating
    local hit: 1 relayed to: 0 relayed from: 0
    last trigger:Wed Feb 05 11:10:23 2020
    last relay:
    actions:
        slack1:
            done: 1 relayed to: 0 relayed from: 0
            last trigger:Wed Feb 11:10:23 2020
            last relay:
        slack2:
            done: 1 relayed to: 0 relayed from: 0
            last trigger:Wed Feb 05 11:10:23 2020
            last relay:
```

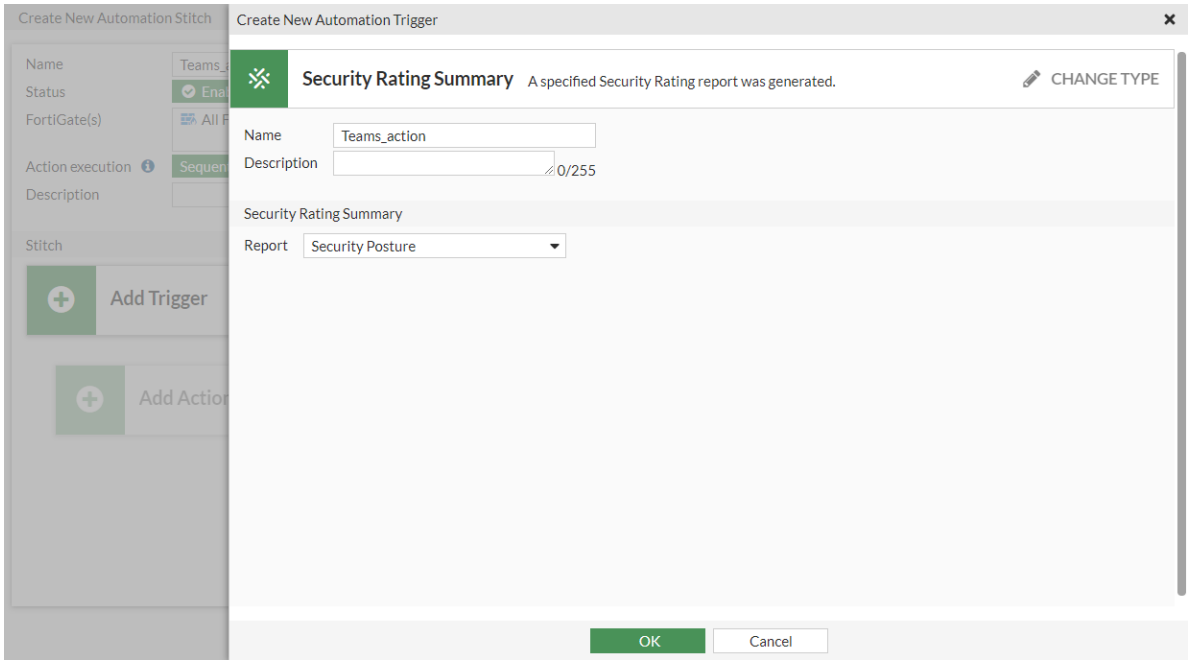


Microsoft Teams Notification action

Microsoft Teams Notification actions can be configured to send notifications to channels in Microsoft Teams. To trigger the notifications, you need to add an Incoming Webhook connector to a channel in Microsoft Teams, then you can configure the automation stitch with the webhook URL.

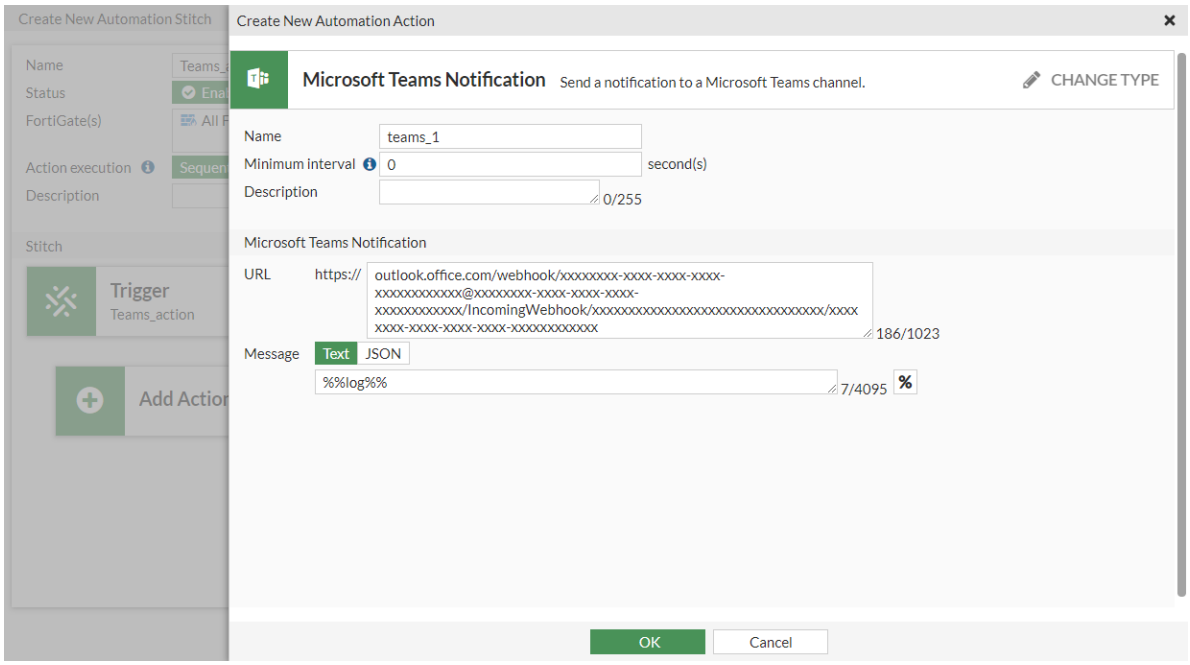
In the following example, you will configure an automation stitch with a Security Rating Summary trigger and two Microsoft Teams Notification actions with different notification messages. One message is for the Security Rating Summary log, and the other is a custom message with a ten second delay.

To add the Incoming Webhook connector in a Microsoft Teams channel:



1. In Microsoft Teams, click the ... (*More options*) beside the channel name, and select *Connectors*.
2. Search for *Incoming Webhook* and click *Configure*.
3. Enter a name for the webhook, upload an image for the webhook, and click *Create*.
4. Copy the webhook to the clipboard and save it.

5. Click *Done*.



To configure an automation stitch with Microsoft Teams Notification actions in the GUI:

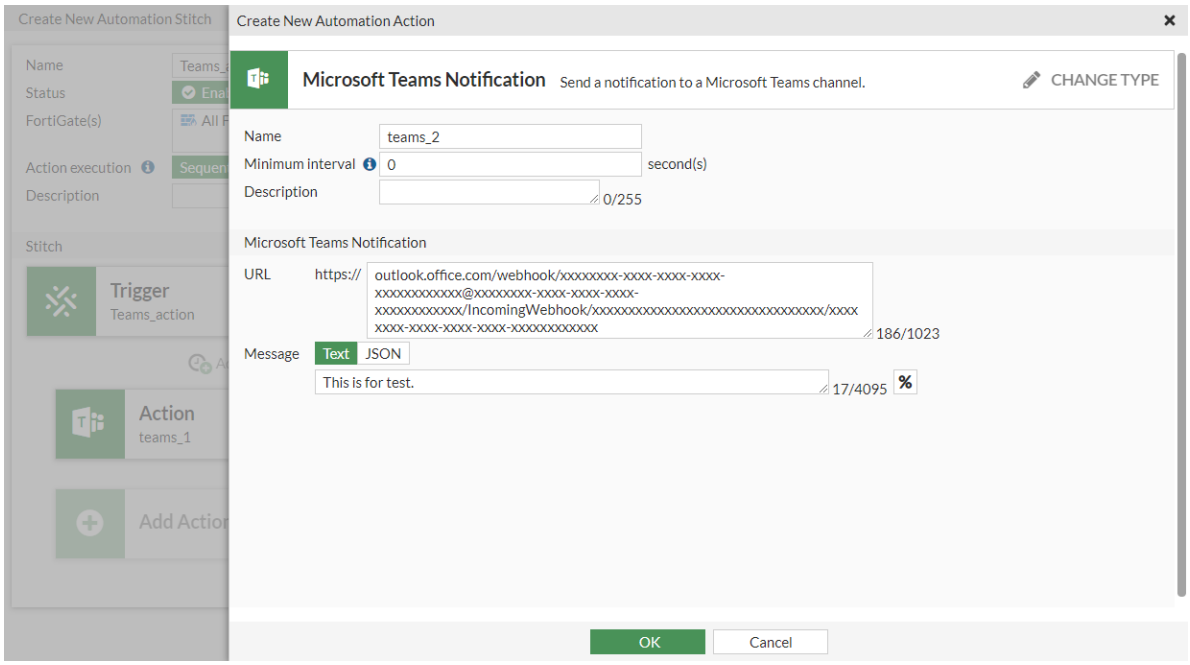
1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the Security Rating Summary trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Security Rating Summary*.
   c. Enter a name, and for *Report*, select *Security Posture*.

   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.
4. Configure the first Microsoft Teams Notification action:
   a. Click *Add Action*.
   b. Click *Create* and select *Microsoft Teams Notification*.
   c. Enter the following:

Name	teams_1
URL	Paste the webhook URI from the clipboard
Message	Text
Message text	%%log%%

d. Click *OK*.

e. Select the action in the list and click *Apply*.

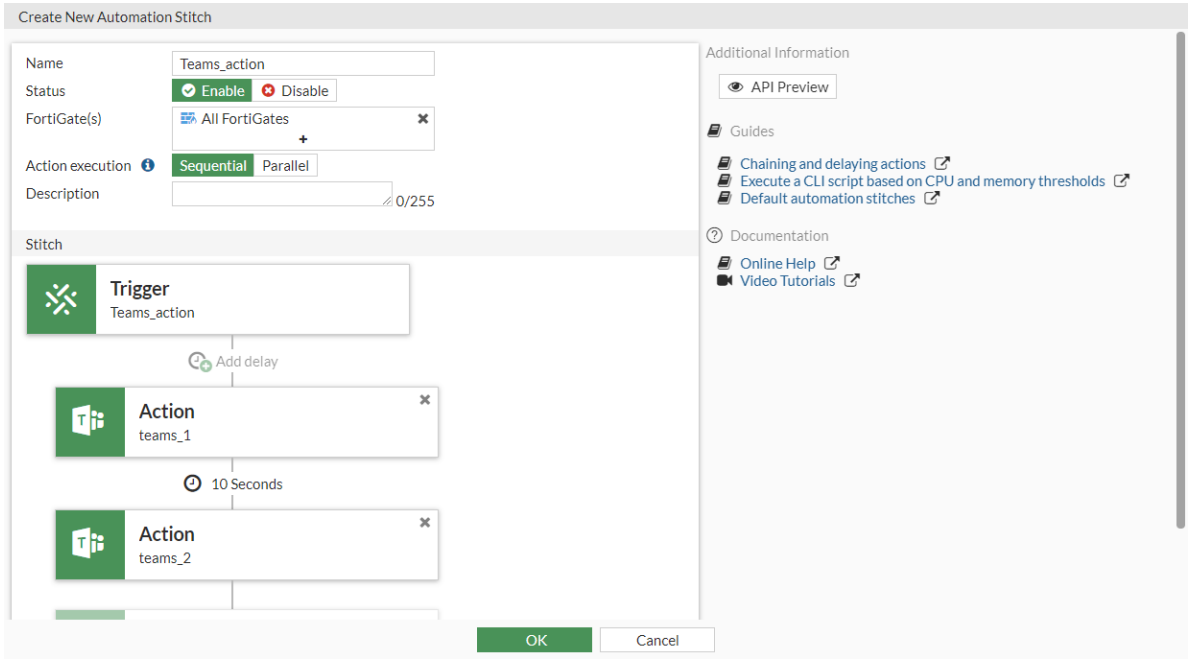


5. Configure the second Microsoft Teams Notification action:

a. Click *Add Action*.

b. Click *Create* and select *Microsoft Teams Notification*.

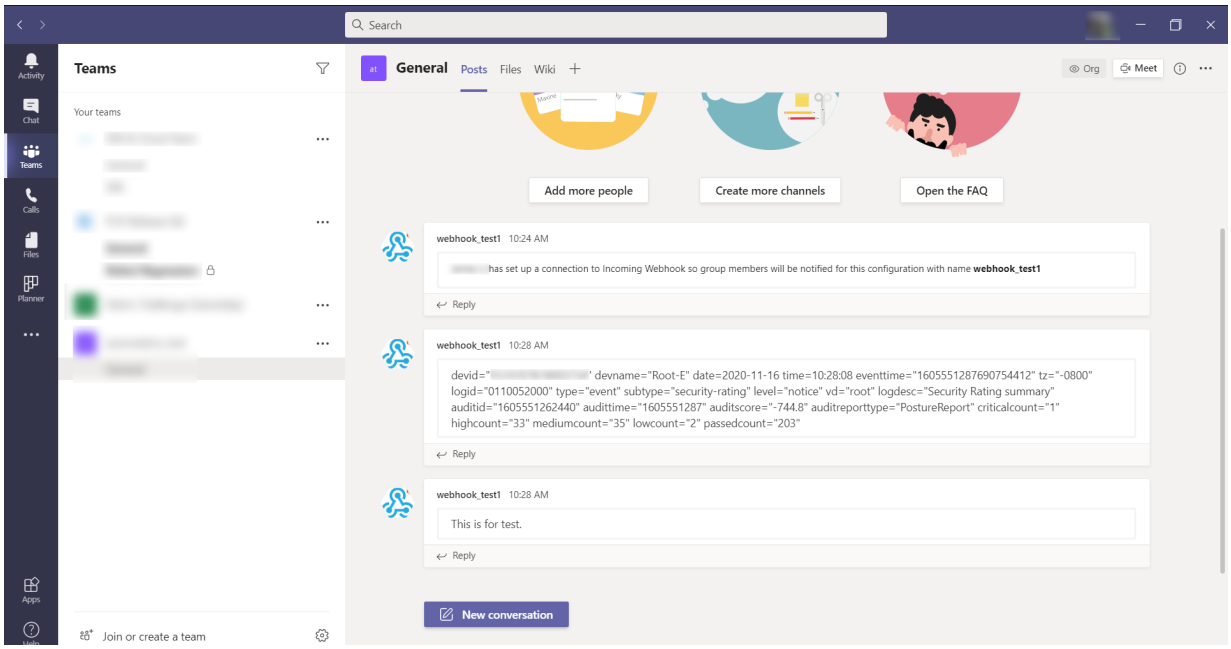
c. Enter the following:



Name	teams_2
URL	Paste the webhook URI from the clipboard
Message	Text
Message text	This is for test.

d. Click *OK*.

e. Select the action in the list and click *Apply*.



f. Click the *Add delay* located between both actions. Enter *10* and click *OK*.

6. Click *OK*.

7. Trigger the automation stitch:

a. Right-click the automation stitch and select *Test Automation Stitch*.
After the Security Rating report is finished, the automation is triggered and an event log is created by the FortiGate. The two notifications are sent to the Microsoft Teams channel.

To configure an automation stitch with Microsoft Teams Notification actions in the CLI:

1. Configure the automation trigger:

```
config system automation-trigger
    edit "Teams_action"
        set event-type security-rating-summary
    next
end
```

2. Configure the automation actions:

```
config system automation-action
    edit "teams_1"
        set action-type microsoft-teams-notification
        set uri "outlook.office.com/webhook/xxxxxxxx-xxxx-xxxx-xxxx-
xxxxxxxxxxxx@xxxxxxxx-xxxx-xxxx-xxxx-
xxxxxxxxxxxx/IncomingWebhook/xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx/xxxxxxxx-xxxx-xxxx-xxxx-
xxxxxxxxxxxx"
    next
    edit "teams_2"
        set action-type microsoft-teams-notification
        set message "This is for test."
        set uri "outlook.office.com/webhook/xxxxxxxx-xxxx-xxxx-xxxx-
xxxxxxxxxxxx@xxxxxxxx-xxxx-xxxx-xxxx-
xxxxxxxxxxxx/IncomingWebhook/xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx/xxxxxxxx-xxxx-xxxx-xxxx-
xxxxxxxxxxxx"
    next
end
```

3. Configure the automation stitch:

```
config system automation-stitch
    edit "Teams_action"
        set trigger "Teams_action"
```

```
        config actions
            edit 1
                set action "teams_1"
                set required enable
            next
            edit 2
                set action "teams_2"
                set delay 10
                set required enable
            next
        end
    next
end
```

4. Verify that the automation action was triggered:

```
# diagnose test application autod 3
stitch: Teams_action
   local hit: 2 relayed to: 0 relayed from: 0
   last trigger:Mon Nov 16 10:28:08 2020
   last relay:

```

AWS Lambda action

AWS Lambda functions can be called when an automation stitch is triggered. This example uses a Security Rating Summary trigger in the automation stitch.

To configure an AWS Lambda function automation stitch in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Security Rating Summary*.
   c. Enter the following:

Name	auto-aws
Report	Security Posture

   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.

4. Configure the AWS Lambda function action:
   a. Click *Add Action*.
   b. Click *Create* and select *AWS Lambda*.
   c. Enter the following:

Name	aws-action-1
URL	Enter the request API URI
API key	Enter the API key
HTTP header	header2 : header2_value

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
5. Click *OK*.

To configure an AWS Lambda function automation stitch in the CLI:

1. Create the automation trigger:

```
config system automation-trigger
    edit "auto-aws"
        set event-type security-rating-summary
    next
end
```

2. Create the automation action:

```
config system automation-action
    edit "aws-action-1"
        set action-type aws-lambda
        set aws-api-key *************
        set uri "0100000000.execute-api.us-east-2.amazonaws.com/default/xxxxx-
autobatoon-XXX-lambdaXXX"
        config http-headers
            edit 1
                set key "header2"
                set value "header2_value"
            next
        end
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto-aws"
        set trigger "auto-aws"
        config actions
            edit 1
                set action "aws-action-1"
                set required enable
            next
        end
    next
end
```

When the automation stitch is triggered, the *Security Fabric* > *Automation* page shows the stitch trigger time. In AWS, the log shows that the function was called, executed, and finished.

Azure Function action

Azure functions can be called when an automation stitch is triggered. This example uses a Security Rating Summary trigger in the automation stitch.

To configure an Azure function automation stitch in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Security Rating Summary*.
   c. Enter the following:

Name	auto-azure
Report	Security Posture

   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.
4. Configure the Azure Function action:
   a. Click *Add Action*.
   b. Click *Create* and select *Azure Function*.
   c. Enter the following:

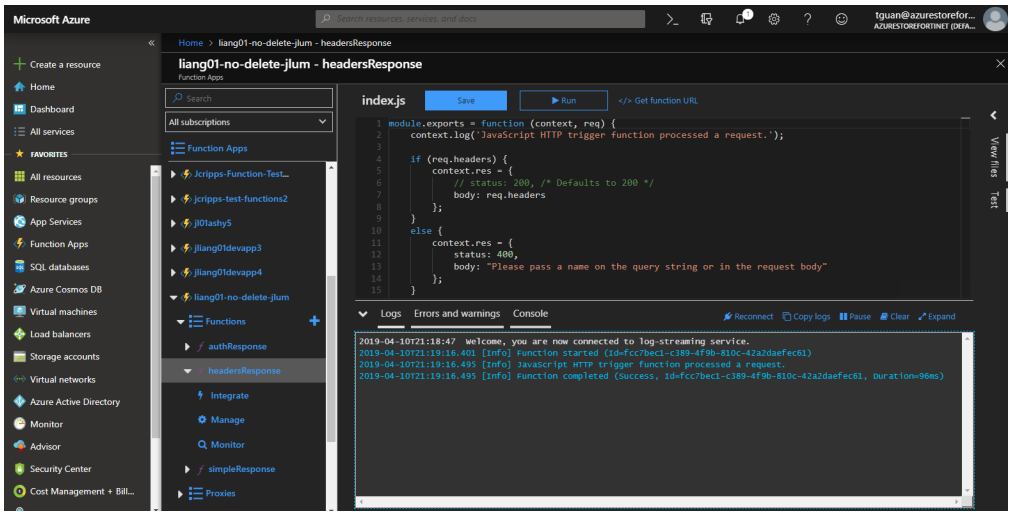
Name	azure_function
URL	Enter the request API URI
Authorization	Function
API key	Enter the API key
HTTP header	header1 : value1

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
5. Click *OK*.

To configure an Azure function automation stitch in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
    edit "auto-azure"
        set event-type security-rating-summary
    next
end
```



2. Create an automation action:

```
config system automation-action
    edit "azure_function"
        set action-type azure-function
        set azure-function-authorization function
        set azure-api-key **********
        set uri "xxxxx00-no-delete-xxxx.azurewebsites.net/api/headersResponse"
        config http-headers
            edit 1
                set key "header1"
                set value "value1"
            next
        end
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto-azure"
        set trigger "auto-azure"
        config actions
            edit 1
                set action "azure_function"
                set required enable
            next
        end
    next
end
```

When the automation stitch is triggered, the *Security Fabric* > *Automation* page shows the stitch trigger time. In Azure, the function log shows that the function was called, executed, and finished:

Google Cloud Function action

Google Cloud functions can be called when an automation stitch is triggered. This example uses a Security Rating Summary trigger in the automation stitch.

To configure a Google Cloud function automation stitch in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Security Rating Summary*.
   c. Enter the following:

Name	auto-google1
Report	Security Posture

   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.
4. Configure the Google Cloud Function action:
   a. Click *Add Action*.
   b. Click *Create* and select *Google Cloud Function*.
   c. Enter the following:

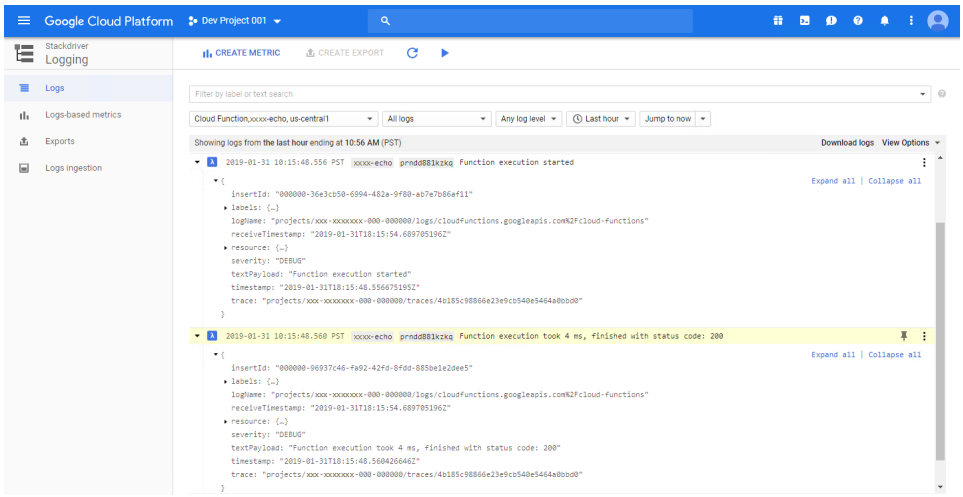
Name	google-echo
URL	Enter the request API URI
HTTP header	echo-header : echo-value

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
5. Click *OK*.

To configure a Google Cloud function automation stitch in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
    edit "auto-google1"
        set event-type security-rating-summary
    next
end
```



2. Create an automation action:

```
config system automation-action
    edit "google-echo"
        set action-type google-cloud-function
        set uri "us-central1-xxx-xxxxxxx-000-000000.cloudfunctions.net/xxxx-echo"
        config http-headers
            edit 1
                set key "echo-header"
                set value "echo-value"
            next
        end
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto-google1"
        set trigger "auto-google1"
        config actions
            edit 1
                set action "google-echo"
                set required enable
            next
        end
    next
end
```

When the automation stitch is triggered, the *Security Fabric* > *Automation* page shows the stitch trigger time. In Google Cloud, go to *Logs* to see the function log showing that the configured function was called, executed, and finished:

AliCloud Function action

AliCloud functions can be called when an automation stitch is triggered. This example uses a Security Rating Summary trigger in the automation stitch.

To configure an AliCloud function automation stitch in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Security Rating Summary*.
   c. Enter the following:

Name	auto-ali
Report	Security Posture

   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.

4. Configure the AliCloud Function action:
   a. Click *Add Action*.
   b. Click *Create* and select *AliCloud Function*.
   c. Enter the following:

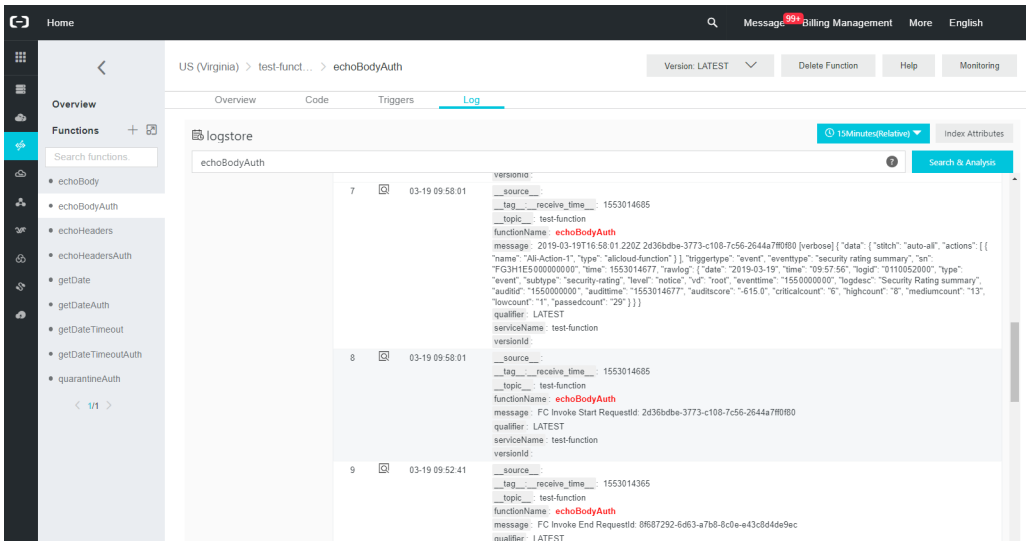
Name	Ali-Action-1
URL	Enter the request API URI
Authorization	Function
AccessKey ID	Enter the access key ID
AccessKey Secret	Enter the access key secret

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
5. Click *OK*.

To configure an AliCloud function automation stitch in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
    edit "auto-ali"
        set event-type security-rating-summary
    next
end
```



2. Create an automation action:

```
config system automation-action
    edit "Ali-Action-1"
        set action-type alicloud-function
        set alicloud-function-authorization function
        set alicloud-access-key-id "XXXXXxXXXXxxxxxx"
        set alicloud-access-key-secret xxxxxx
        set uri "0000000000000000.us-east-1.fc.aliyuncs.com/2099-99-99/proxy/test-
function/echoBodyAuth/"
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto-ali"
        set trigger "auto-ali"
        config actions
            edit 1
                set action "Ali-Action-1"
                set required enable
            next
        end
    next
end
```

When the automation stitch is triggered, the *Security Fabric* > *Automation* page shows the stitch trigger time. In AliCloud, the function log shows that the function was called, executed, and finished:

CLI script action

CLI scripts can run when an automation stitch is triggered. The scripts can be entered manually, uploaded as a file, or recorded in the CLI console. The output of the script can be sent as an email action.

The maximum length of the CLI script action output is 16 thousand characters. The CLI script can be configured in the GUI and CLI; however, the output size and timeout settings can only be configured in the CLI.

```
config system automation-action
    edit <name>
        set action-type cli-script
        set output-size <integer>
        set timeout <integer>
    next
end
```

`output-size <integer>`	Set the size to limit the script output, in megabytes (1 - 1024, default = 10).
`timeout <integer>`	Set the maximum running time for this script, in seconds (0 - 300, 0 = no timeout).

Example

In this example, the script sets the idle timeout value to 479 minutes, and sends an email with the script output.

To configure a stitch with a CLI script action in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name (*auto-cli-1*).
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Security Rating Summary*.

c. Enter the following:

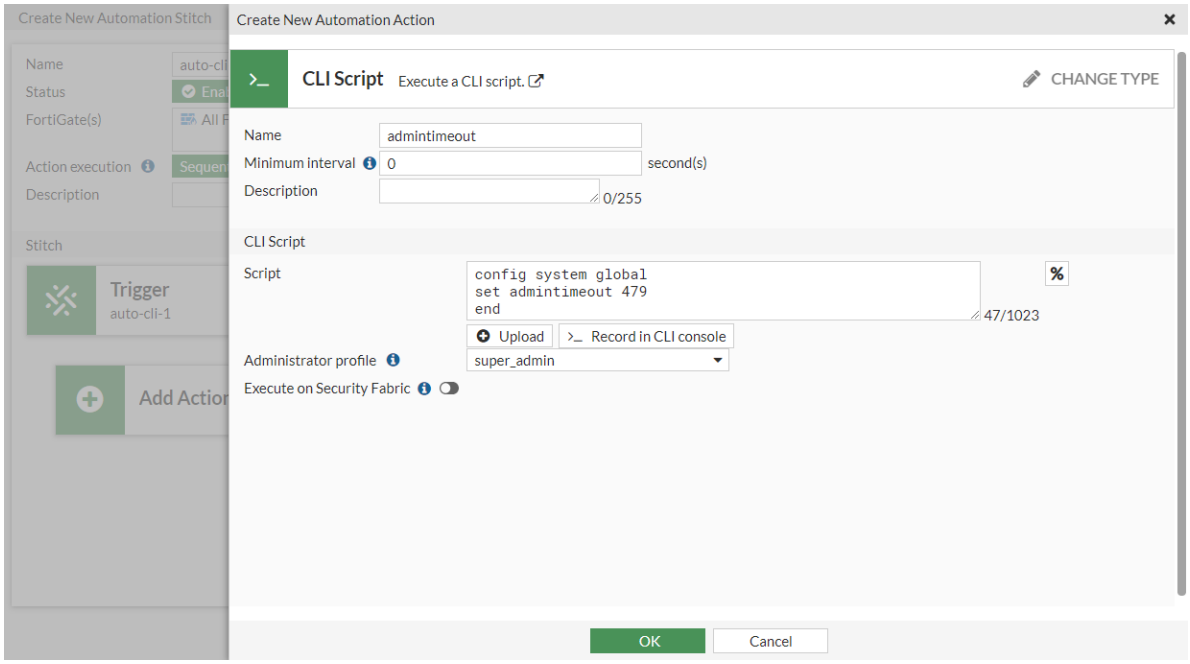
Name	auto-cli-1
Report	Security Posture

d. Click *OK*.

e. Select the trigger in the list and click *Apply*.

4. Configure the CLI Script action:

a. Click *Add Action*.



b. Click *Create* and select *CLI Script*.

c. Enter the following:

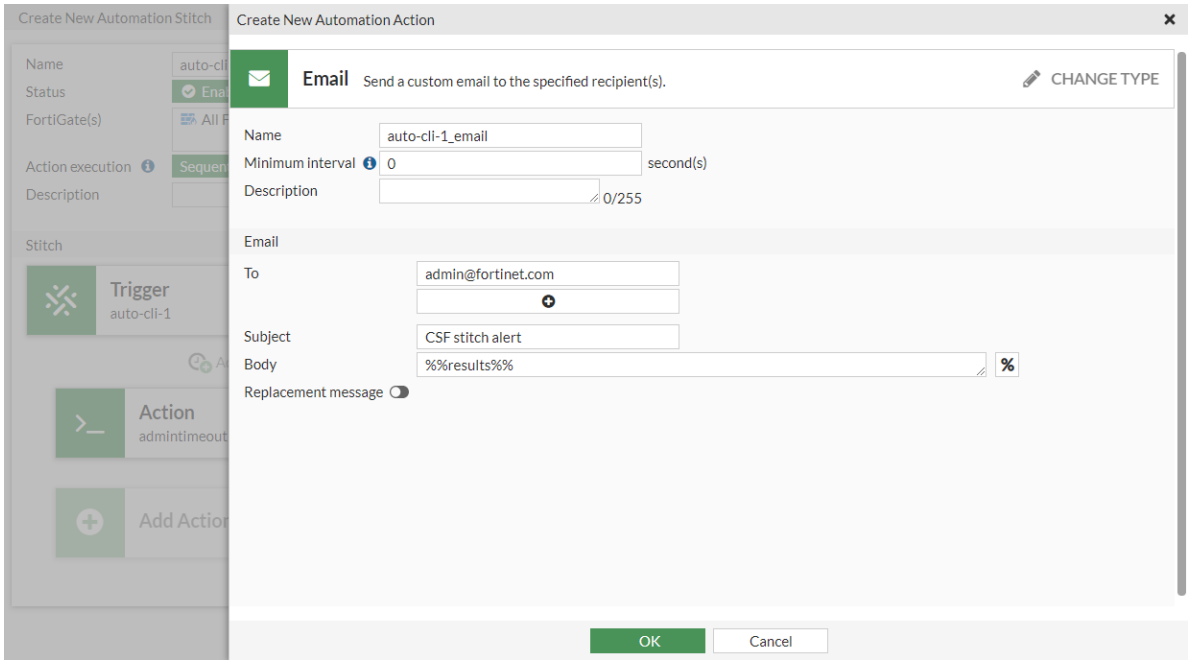
Name	admintimeout

Script	`config system global`
	`  set admintimeout 479`
	`end`
	
	Alternatively, click *Upload* to upload a file, or click *>_Record in CLI console* and enter the CLI commands.

Administrator profile	Select a profile

d. Click *OK*.

e. Select the action in the list and click *Apply*.



5. Configure the Email notification action:

a. Click *Add Action*.

b. Click *Create* and select *Email*.

c. Enter the following:

Name	auto-cli-1_email
To	Enter an email address
Subject	CSF stitch alert
Body	%%results%%

d. Click *OK*.

e. Select the action in the list and click *Apply*.

6. Click *OK*.

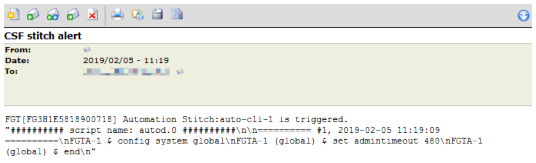
To configure a stitch with a CLI script action in the CLI:

1. Create the automation trigger:

```
config system automation-trigger
    edit "auto-cli-1"
        set event-type security-rating-summary
    next
end
```

2. Create the automation actions:

```
config system automation-action
    edit "admintimeout"
        set action-type cli-script
        set script "config system global
            set admintimeout 479
            end"
        set output-size 10
        set timeout 0
        set accprofile "super_admin"
```



```
    next
    edit "auto-cli-1_email"
        set action-type email
        set email-to "admin@fortinet.com"
        set email-subject "CSF stitch alert"
        set message "%%results%%"
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto-cli-1"
        set trigger "auto-cli-1"
        config actions
            edit 1
                set action "admintimeout"
                set required enable
            next
            edit 2
                set action "auto-cli-1_email"
                set required enable
            next
        end
    next
end
```

Sample email

The email sent by the action will look similar to the following:

Execute a CLI script based on CPU and memory thresholds

Automation stitches can be created to run a CLI script and send an email message when CPU or memory usage exceeds specified thresholds.

In this example, two automation stitches are created that run a CLI script to collect debug information, and then email the results of the script to a specified email address when the CPU usage threshold is exceeded, or memory usage causes the FortiGate to enter conserve mode.

The maximum size of the CLI script action output is 16K characters.

To define CPU and memory usage thresholds:

```
config system global
    set cpu-use-threshold <percent>
    set memory-use-threshold-extreme <percent>
    set memory-use-threshold-green <percent>
    set memory-use-threshold-red <percent>
end
```

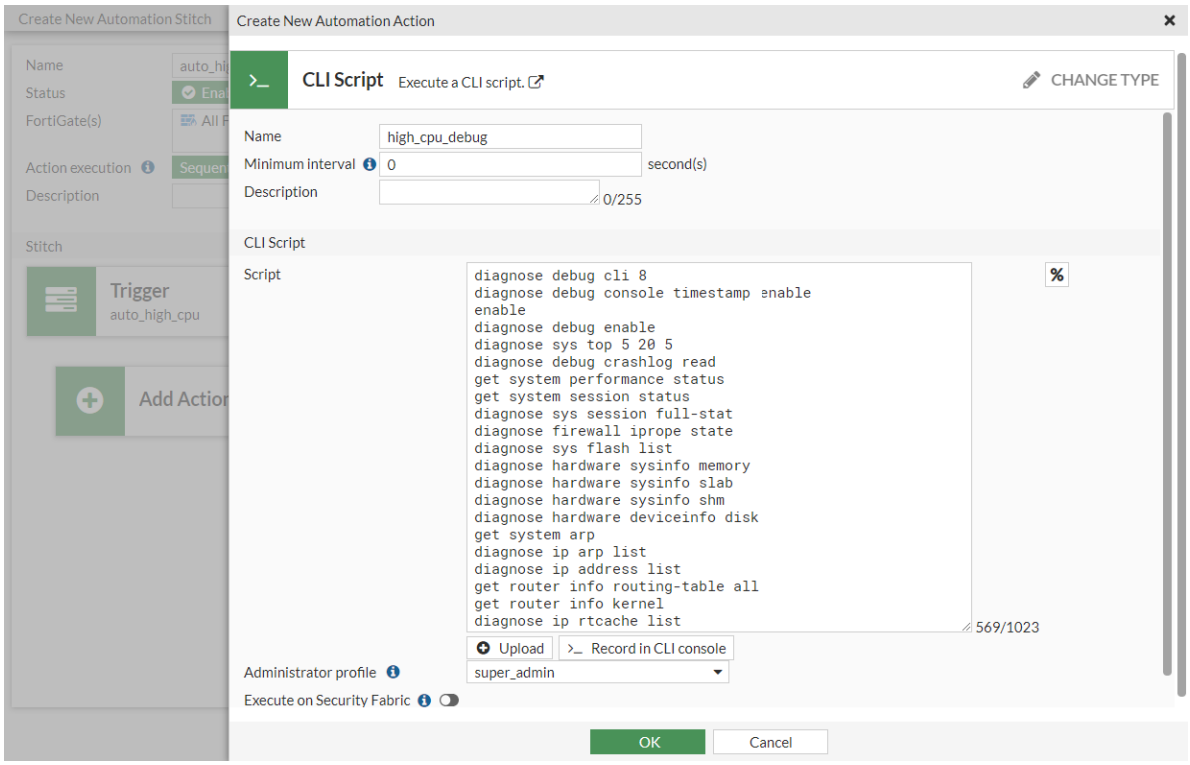
Where:

`cpu-use-threshold`	Threshold at which CPU usage is reported, in percent of total possible CPU utilization (default = 90).
`memory-use-threshold-extreme`	Threshold at which memory usage is considered extreme, and new sessions are dropped, in percent of total RAM (default = 95).
`memory-use-threshold-green`	Threshold at which memory usage forces the FortiGate to exit conserve mode, in percent of total RAM (default = 82).
`memory-use-threshold-red`	Threshold at which memory usage forces the FortiGate to enter conserve mode, in percent of total RAM (default = 88).

Configuring the automation stitches

High CPU usage stitch

To create an automation stitch for high CPU usage in the GUI:



1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name (*auto_high_cpu*).
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *High CPU*.
   c. Enter the name, *auto_high_cpu*.
   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.
4. Configure the CLI Script action:
   a. Click *Add Action*.
   b. Click *Create* and select *CLI Script*.
   c. Enter the following:

Name	high_cpu_debug

Script	`diagnose debug cli 8`
	`diagnose debug console timestamp enable`
	`diagnose debug enable`
	`diagnose sys top 5 20 5`
	`diagnose debug crashlog read`
	`get system performance status`

```
get system session status
diagnose sys session full-stat
diagnose firewall iprope state
diagnose sys flash list
diagnose hardware sysinfo memory
diagnose hardware sysinfo slab
diagnose hardware sysinfo shm
diagnose hardware deviceinfo disk
get system arp
diagnose ip arp list
diagnose ip address list
get router info routing-table all
get router info kernel
diagnose ip rtcache list
```

Administrator profile	Select a profile

d. Click *OK*.

e. Select the action in the list and click *Apply*.

5. Configure the Email notification action:

a. Click *Add Action*.

b. Click *Create* and select *Email*.

c. Enter the following:

Name	auto_high_cpu_email
To	Enter an email address

Subject	CSF stitch alert: high_cpu
Body	%%results%%

d. Click *OK*.
e. Select the action in the list and click *Apply*.

6. Click *OK*.

To create an automation stitch for high CPU usage in the CLI:

1. Create the automation trigger:

```
config system automation-trigger
    edit "auto_high_cpu"
        set event-type high-cpu
    next
end
```

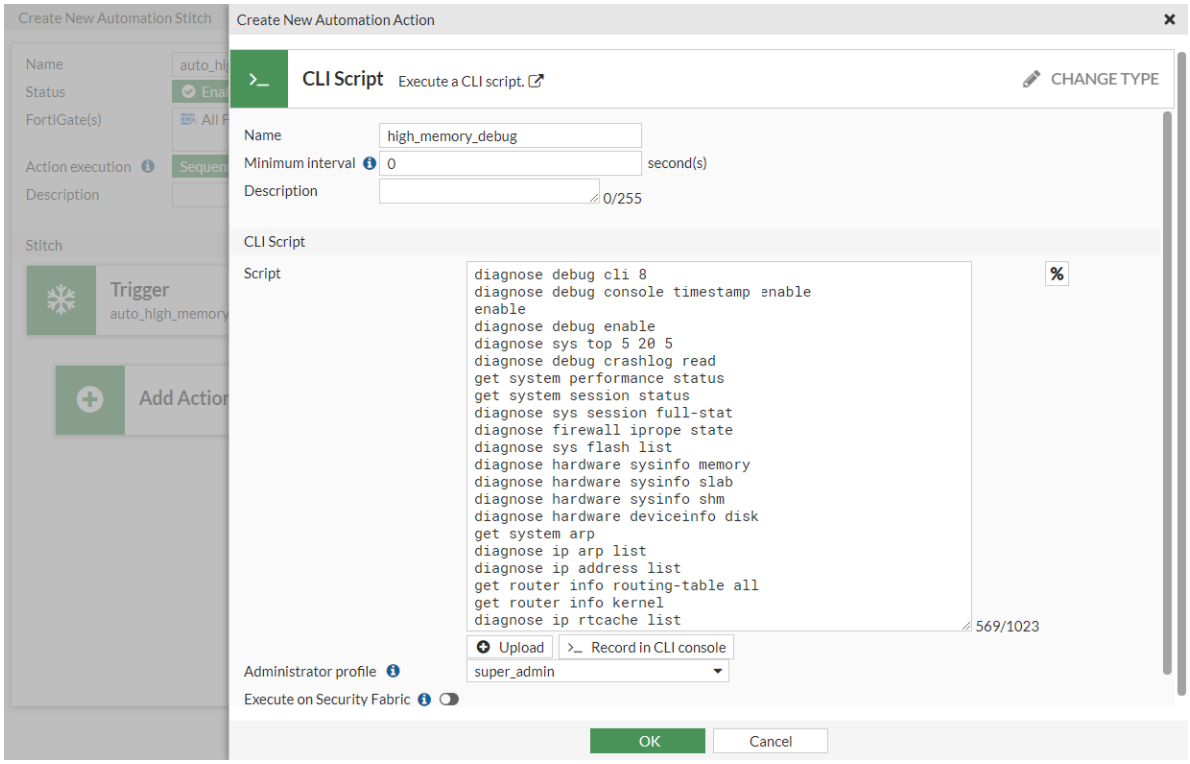
2. Create the automation actions:

```
config system automation-action
    edit "high_cpu_debug"
        set action-type cli-script
        set script "diagnose debug cli 8
diagnose debug console timestamp enable
diagnose debug enable
diagnose sys top 5 20 5
diagnose debug crashlog read
get system performance status
get system session status
diagnose sys session full-stat
diagnose firewall iprope state
diagnose sys flash list
diagnose hardware sysinfo memory
diagnose hardware sysinfo slab
diagnose hardware sysinfo shm
diagnose hardware deviceinfo disk
get system arp
diagnose ip arp list
diagnose ip address list
get router info routing-table all
get router info kernel
diagnose ip rtcache list"
        set output-size 10
        set timeout 0
        set accprofile "super_admin"
    next
    edit "auto_high_cpu_email"
        set action-type email
        set email-to "person@fortinet.com"
        set email-subject "CSF stitch alert: high_cpu"
        set message "%%results%%"
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto_high_cpu"
        set trigger "auto_high_cpu"
        config actions
            edit 1
                set action "high_cpu_debug"
                set required enable
            next
            edit 2
                set action "auto_high_cpu_email"
                set required enable
            next
        end
    next
end
```

High memory usage stitch



To create an automation stitch for high memory usage in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name (*auto_high_memory*).
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Conserve Mode*.
   c. Enter the name, *auto_high_memory*.
   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.
4. Configure the CLI Script action:
   a. Click *Add Action*.
   b. Click *Create* and select *CLI Script*.
   c. Enter the following:

Name	high_memory_debug

Script	`diagnose debug cli 8`
	`diagnose debug console timestamp enable`
	`diagnose debug enable`
	`diagnose sys top 5 20 5`
	`diagnose debug crashlog read`
	`get system performance status`
	`get system session status`
	`diagnose sys session full-stat`
	`diagnose firewall iprope state`
	`diagnose sys flash list`
	`diagnose hardware sysinfo memory`
	`diagnose hardware sysinfo slab`
	`diagnose hardware sysinfo shm`
	`diagnose hardware deviceinfo disk`

	get system arp diagnose ip arp list diagnose ip address list get router info routing-table all get router info kernel diagnose ip rtcache list
Administrator profile	Select a profile

d. Click *OK*.

e. Select the action in the list and click *Apply*.

5. Configure the Email notification action:
   a. Click *Add Action*.
   b. Click *Create* and select *Email*.
   c. Enter the following:

Name	auto_high_memory_email
To	Enter an email address
Subject	CSF stitch alert: high_memory
Body	%%results%%

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
6. Click *OK*.

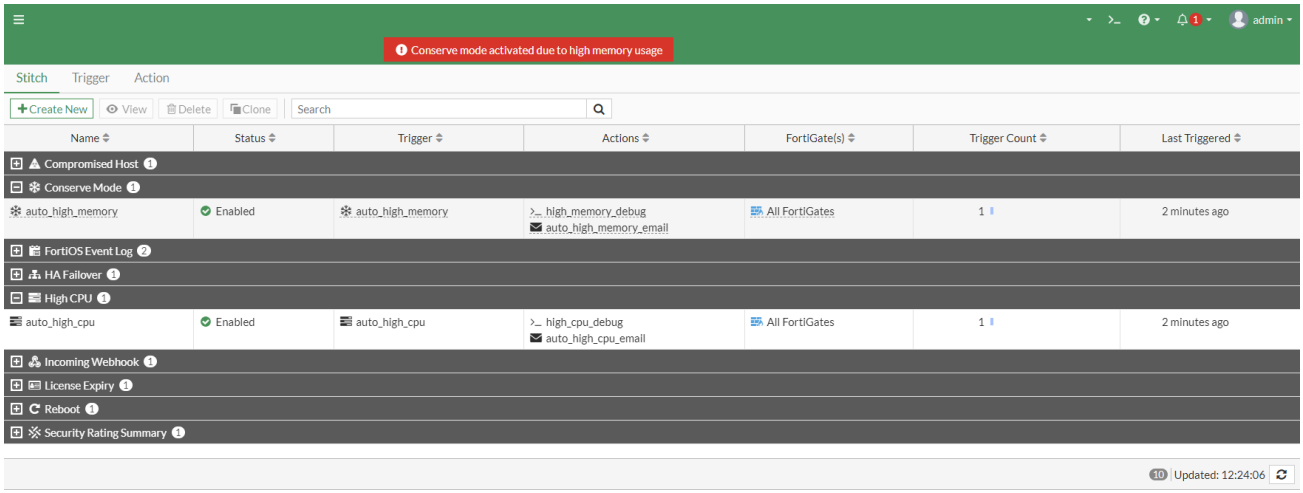
To create an automation stitch for high memory usage in the CLI:

1. Create the automation trigger:

```
config system automation-trigger
    edit "auto_high_memory"
        set event-type low-memory
    next
end
```

2. Create the automation actions:

```
config system automation-action
    edit "high_memory_debug"
        set action-type cli-script
        set script "diagnose debug cli 8
diagnose debug console timestamp enable
diagnose debug enable
diagnose sys top 5 20 5
diagnose debug crashlog read
get system performance status
get system session status
diagnose sys session full-stat
diagnose firewall iprope state
diagnose sys flash list
diagnose hardware sysinfo memory
diagnose hardware sysinfo slab
diagnose hardware sysinfo shm
diagnose hardware deviceinfo disk
get system arp
diagnose ip arp list
diagnose ip address list
get router info routing-table all
get router info kernel
diagnose ip rtcache list"
        set output-size 10
        set timeout 0
        set accprofile "super_admin"
    next
    edit "auto_high_memory_email"
        set action-type email
        set email-to "person@fortinet.com"
        set email-subject "CSF stitch alert: high_memory"
        set message "%%results%%"
    next
end
```



3. Create the automation stitch:

```
config system automation-stitch
    edit "auto_high_memory"
        set trigger "auto_high_memory"
        config actions
            edit 1
                set action "high_memory_debug"
                set required enable
            next
            edit 2
```

```
                set action "auto_high_memory_email"
                set required enable
            next
        end
    next
end
```

Results

When the FortiGate enters conserve mode due to the `memory-use-threshold-red` being exceeded, the GUI displays a notice, and the *auto_high_memory* automation stitch is triggered. This causes the CLI script to run and the script results are emailed to the specified address.

Here is sample text from the email message:

```
CSF stitch alert: high_memory
noreply@notification.fortinet.net
Thu 11/21/2019 11:06 AM
John Doe
FGT[FGVM16TM19000000] Automation Stitch:auto_high_memory is triggered.

```

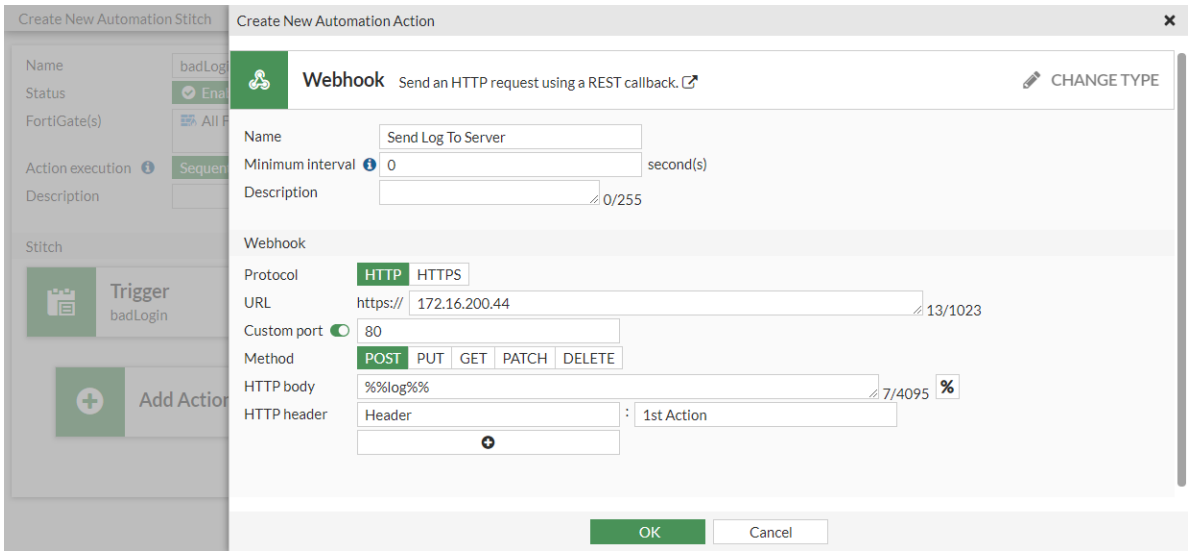
Webhook action

The webhook automation stitch action makes HTTP and HTTPS requests to a specified server, with custom headers, bodies, ports, and methods. It can be used to leverage the ubiquity of HTML requests and APIs to integrate with other

tools.

The URI and HTTP body can use parameters from logs or previous action results. Wrapping the parameter with %% will replace the expression with the JSON value for the parameter, for example: *%%results.source%%* is the source property from the previous action.

In this example, a specific log message (failed administrator log in attempt) triggers the FortiGate to send the contents of the log to a server. The server responds with a generic reply. This example assumes that the server is already configured and able to communicate with the FortiGate.



To configure the webhook automation stitch in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name (*badLogin*).
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *FortiOS Event Log*.
   c. Enter the following:

Name	badLogin
Event	Admin login failed

   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.
4. Configure the automation stitch action:
   a. Click *Add Action*.
   b. Click *Create* and select *Webhook*.
   c. Enter the following:

Name	Send Log To Server
Protocol	HTTP
URL	172.16.200.44
Custom port	Enable and enter 80
Method	POST
HTTP body	%%log%%
HTTP header	Header : 1st Action

d. Click *OK*.

e. Select the action in the list and click *Apply*.

5. Click *OK*.

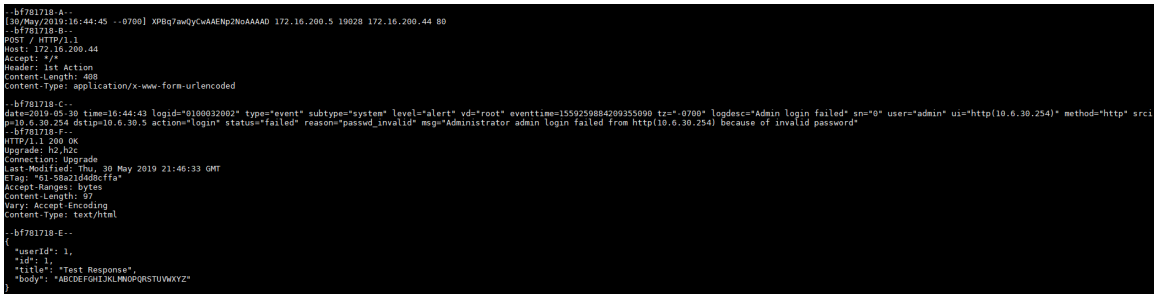
To configure the webhook automation stitch in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
    edit "badLogin"
        set event-type event-log
        set logid 32002
    next
end
```

2. Create the automation action:

```
config system automation-action
    edit "Send Log To Server"
        set action-type webhook
        set uri "172.16.200.44"
        set http-body "%%log%%"
        set port 80
        config http-headers
            edit 1
                set key "Header"
                set value "1st Action"
            next
        end
    next
end
```



3. Create the automation stitch:

```
config system automation-stitch
    edit "badLogin"
        set trigger "badLogin"
        config actions
```

```
            edit 1
                set action "Send Log To Server"
                set required enable
            next
        end
    next
end
```

To test the automation stitch:

1. Attempt to log in to the FortiGate with an incorrect username or password.
2. On the server, check the log to see that its contents were sent by the FortiGate.

   The body content is replaced with the log from the trigger.
3. On the FortiGate, go to *Log & Report* > *System Events* to confirm that the stitch was activated.
4. Go to *Security Fabric* > *Automation* to see the last time that the stitch was triggered.

Diagnose commands

To enable log dumping:

```
# diagnose test application autod 1
autod dumped total:1 logs, num of logids:1
autod log dumping is enabled

vdom:root(0) logid:32002 len:408 log:
date=2019-05-30 time=17:41:03 logid="0100032002" type="event" subtype="system" level="alert"

```

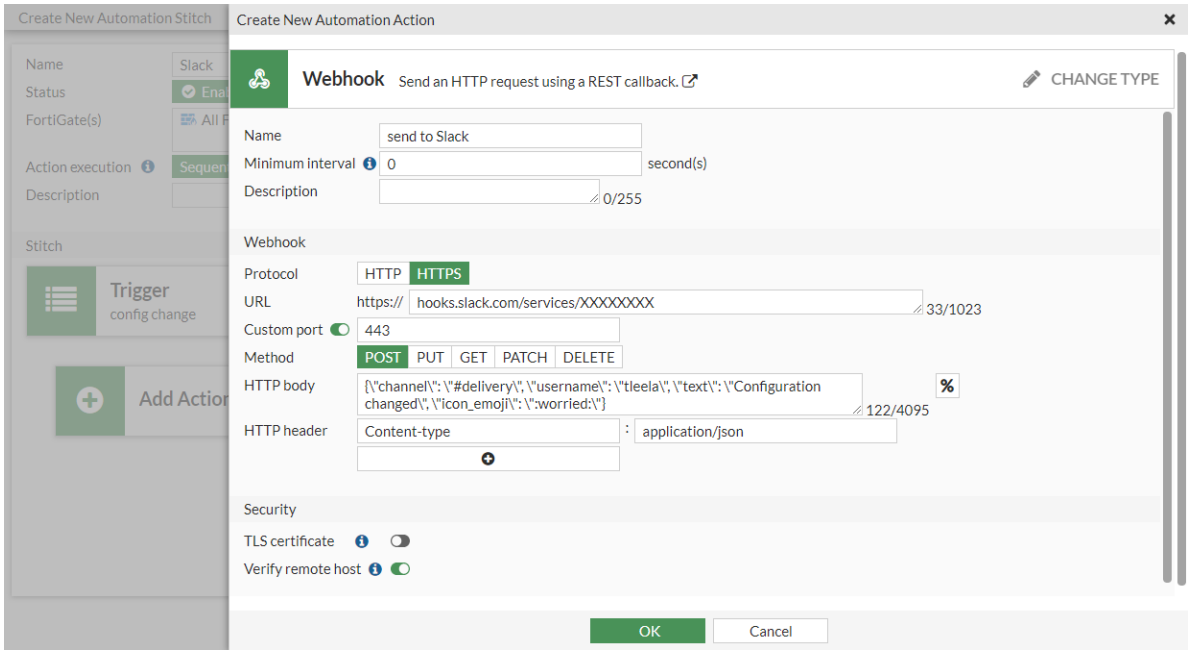
Slack integration webhook

A webhook can be created to post messages and notifications to Slack.



In this example, a configuration change triggers the FortiGate to post a message to Slack.

To create a webhook automation stitch for Slack integration in the GUI:

1. Create an incoming webhook in Slack. See Sending messages using Incoming Webhooks for more information.
2. Go to *Security Fabric* > *Automation* and click *Create New*.

3. Enter the stitch name.
4. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Configuration Change*.
   c. Enter a name (*config change*).
   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.
5. Configure the action:
   a. Click *Add Action*.
   b. Click *Create* and select *Webhook*.
   c. Enter the following:

Name	send to Slack
Protocol	HTTPS
URL	Enter the incoming webhook URL created in Slack
Custom port	Enable and enter 443
Method	POST
HTTP body	{\"channel\": \"#delivery\", \"username\": \"tleela\", \"text\": \"Configuration changed\", \"icon_emoji\": \":worried:\"}
HTTP header	Content-type : application/json

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
6. Click *OK*.

To create a webhook automation stitch for Slack integration in the CLI:

1. Create an incoming webhook in Slack. See Sending messages using Incoming Webhooks for more information.
2. Create the automation trigger:

```
config system automation-trigger
    edit "config change"
        set event-type config-change
    next
end
```

3. Create the automation action:

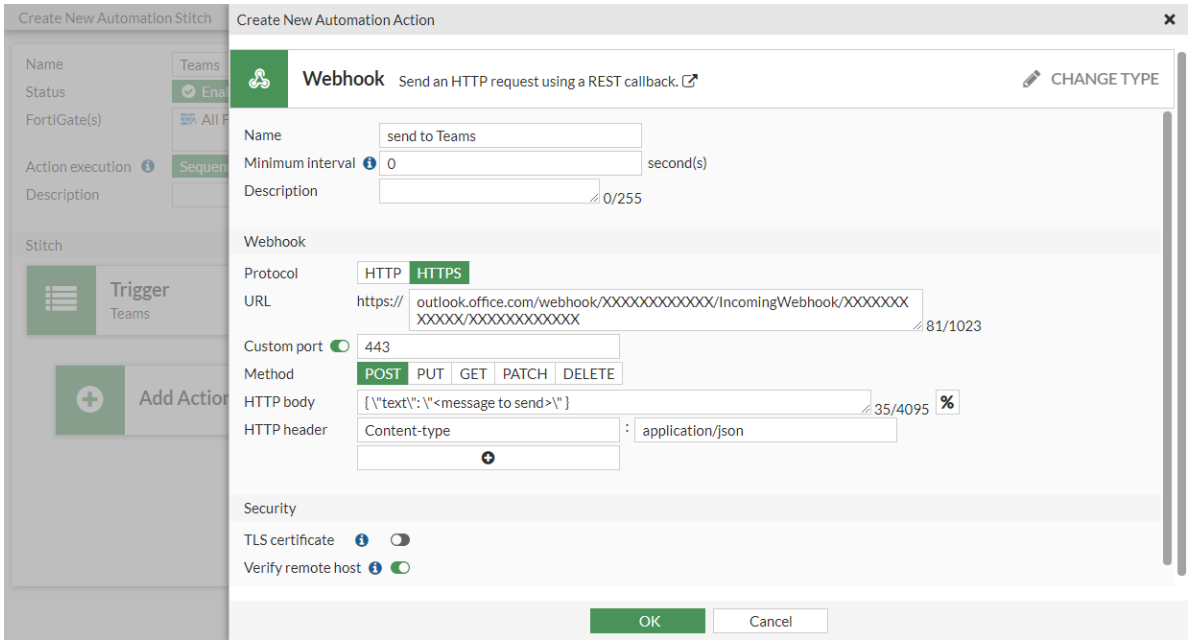
```
config system automation-action
    edit "send to Slack"
        set action-type webhook
        set protocol https
        set uri "hooks.slack.com/services/XXXXXXXX"
        set http-body "{\"channel\": \"#delivery\", \"username\": \"tleela\", \"text\":
\"Configuration changed\", \"icon_emoji\": \":worried:\"}"
        set port 443
        config http-headers
            edit 1
                set key "Content-type"
                set value "application/json"
            next
        end
    next
end
```

4. Create the automation stitch:

```
config system automation-stitch
    edit "Slack"
        set trigger "config change"
        config actions
            edit 1
                set action "send to Slack"
                set required enable
            next
        end
    next
end
```

Microsoft Teams integration webhook

A webhook can be created to post messages and notifications to Microsoft Teams.



In this example, a configuration change triggers the FortiGate to post a message to Teams.

To create a webhook automation stitch for Teams integration in the GUI:

1. Create an incoming webhook in Teams. See Create an incoming webhook for information.
2. Go to *Security Fabric* > *Automation* and click *Create New*.
3. Enter the stitch name.

4. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Configuration Change*.
   c. Enter a name (*Teams*).
   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.
5. Configure the action:
   a. Click *Add Action*.
   b. Click *Create* and select *Webhook*.
   c. Enter the following:

Name	send to Teams
Protocol	HTTPS
URL	Enter the incoming webhook URL created in Teams
Custom port	Enable and enter 443
Method	POST
HTTP body	{ \"text\": \"<message to send>\" }
HTTP header	Content-type : application/json

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
6. Click *OK*.

To create a webhook automation stitch for Teams integration in the CLI:

1. Create an incoming webhook in Teams. See Create an incoming webhook for information.
2. Create the automation trigger:

```
config system automation-trigger
    edit "Teams"
        set event-type config-change
    next
end
```

3. Create the automation action:

```
config system automation-action
    edit "send to Teams"
        set action-type webhook
        set protocol https
        set uri
"outlook.office.com/webhook/XXXXXXXXXXXX/IncomingWebhook/XXXXXXXXXXXX/XXXXXXXXXXXX"
        set http-body "{ \"text\": \"<message to send>\" }"
        set port 443
        config http-headers
            edit 1
                set key "Content-type"
                set value "application/json"
            next
        end
    next
end
```

4. Create the automation stitch:

```
config system automation-stitch
    edit "Teams"
        set trigger "Teams"
        config actions
            edit 1
                set action "send to Teams"
                set required enable
            next
        end
    next
end
```

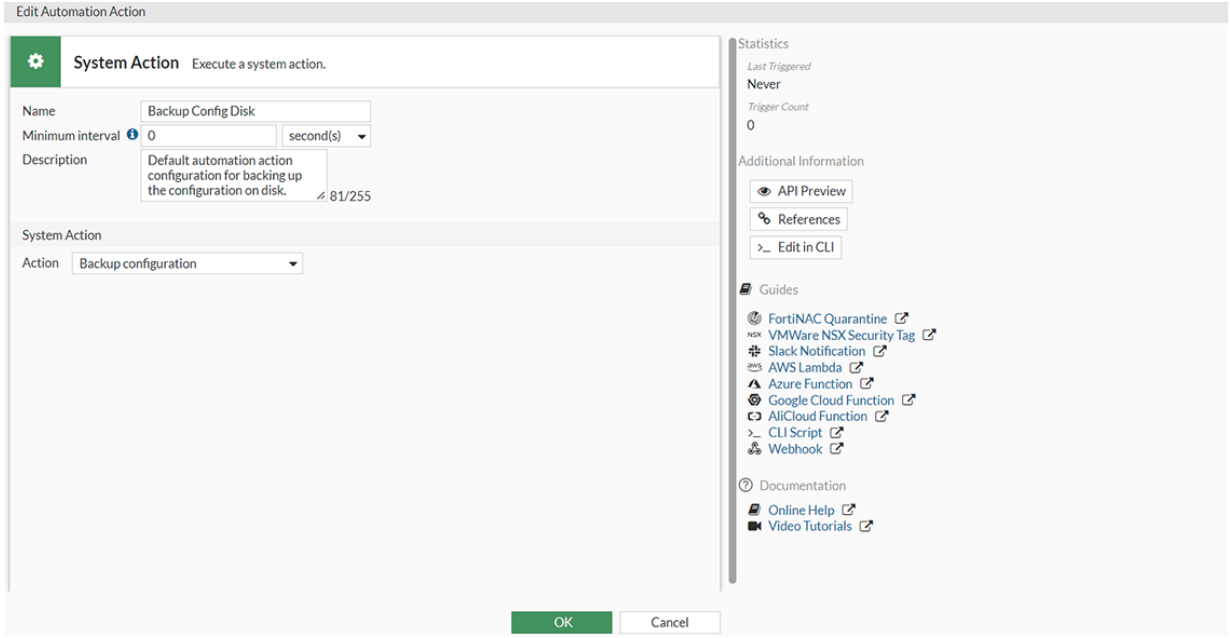
For information about more advanced messages that can be configured and sent to the Teams incoming webhook, see Sending messages to connectors and webhooks.

System action

The system action can be used to back up the configuration of the FortiGate, reboot the FortiGate, or shut down the FortiGate.

These actions can occur even if the FortiGate is in conserve mode, and allows the automation stitch to bypass the CLI user confirmation prompts, which the CLI script action does not support.

```
config system automation-action
    edit <name>
        set action-type system-actions
        set system-action {reboot | shutdown | backup-config}
    next
end
```

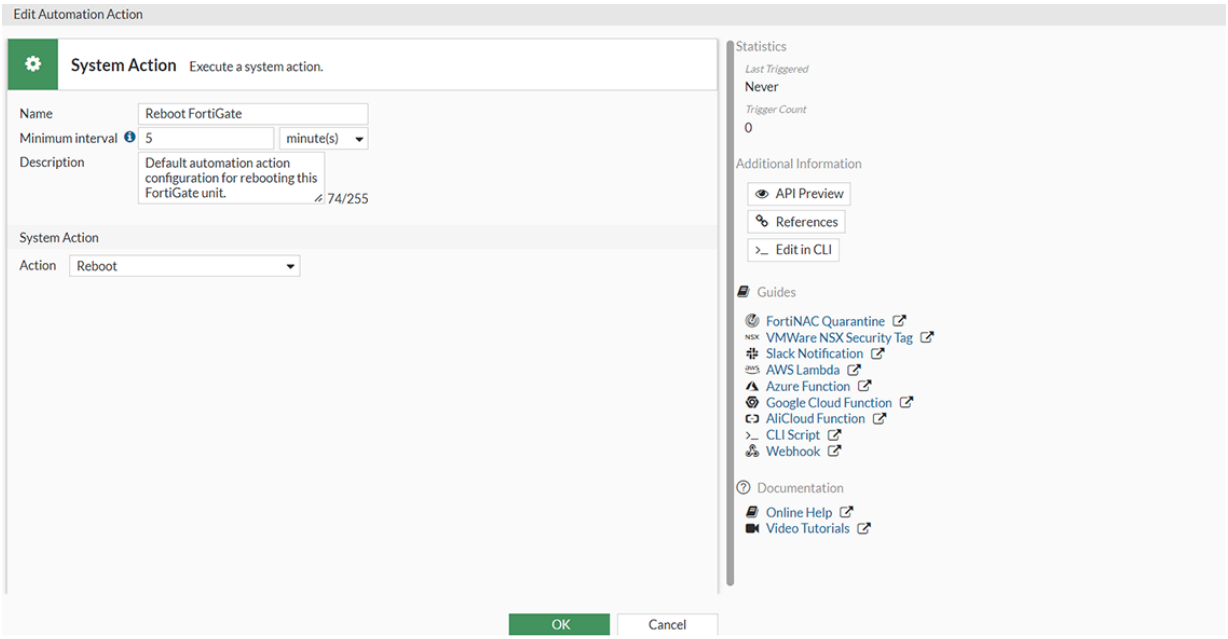


Example

In this example, an automation stitch is created that uses a `low-memory` event trigger, a `backup-config` action to back up the configuration to the FortiGate's disk, and then a `reboot` action to reboot the FortiGate. There is a 120-second delay between the two actions.

To configure an automation stitch with system actions in the GUI:

1. Configure the trigger:
   a. Go to *Security Fabric* > *Automation*, select the *Trigger* tab, and click *Create New*.
   b. In the *System* section, click *Conserve Mode*.
   c. Enter a name (*conserver-mode*).
   d. Click *OK*.
2. Configure the back up action:
   a. Go to *Security Fabric* > *Automation*, select the *Action* tab, and click *Create New*.
   b. In the *General* section, click *System Action* and enter the following:



Name	*Backup Config Disk*
Description	*Default automation action configuration for backing up the configuration on disk.*
Action	*Backup configuration*

   c. Click *OK*.

3. Configure the reboot action:
   a. Go to *Security Fabric* > *Automation*, select the *Action* tab, and click *Create New*.
   b. In the *General* section, click *System Action* and enter the following:

Name	*Reboot FortiGate*
Description	*Default automation action configuration for rebooting this FortiGate unit.*
Action	*Reboot*
Minimum interval	*5 minutes*

   c. Click *OK*.
4. Configure the stitch:
   a. Go to *Security Fabric* > *Automation*, select the *Stitch* tab, and click *Create New*.
   b. Enter the name, *system-action-stitch*.
   c. Click *Add Trigger*. Select *conserver-mode* and click *Apply*.
   d. Click *Add Action*. Select *Backup Config Disk* and click *Apply*.
   e. Click *Add Action*. Select *Reboot FortiGate* and click *Apply*.
   f. Click *Add delay* (between the actions). Enter *120* and click *OK*.

g. Click *OK*.

To configure an automation stitch with system actions in the CLI:

1. Configure the trigger:

```
config system automation-trigger
    edit "conserver-mode"
        set event-type low-memory
    next
end
```

2. Configure the back up and reboot actions:

```
config system automation-action
    edit "Backup Config Disk"
        set description "Default automation action configuration for backing up the
configuration on disk."
        set action-type system-actions
        set system-action backup-config
    next
    edit "Reboot FortiGate"
        set description "Default automation action configuration for rebooting this
FortiGate unit."
        set action-type system-actions
        set system-action reboot
        set minimum-interval 300
    next
end
```

3. Configure the stitch:

```
config system automation-stitch
    edit "system-action-stitch"
        set trigger "conserver-mode"
        config actions
```

```
            edit 1
                set action "Backup Config Disk"
                set required enable
            next
            edit 2
                set action "Reboot FortiGate"
                set delay 120
                set required enable
            next
        end
    next
end
```

Verification

When the FortiGate enters conserve mode due to low memory, the automation stitch will be triggered and it will back up the configuration to the FortiGate disk, then reboot the FortiGate.

To confirm that the stitch was triggered in the GUI:

1. Go to *Security Fabric* > *Automation* and select the *Stitch* tab.
2. Verify the *Last Triggered* column.

To confirm that the stitch was triggered in the CLI:

```
# diagnose test application autod 3
alert mail log count: 0

stitch: system-action-stitch

    local hit: 1 relayed to: 0 relayed from: 0
    last trigger:Thu Jun 23 11:31:25 2022

Public and private SDN connectors

Cloud SDN connectors provide integration and orchestration of Fortinet products with public and private cloud solutions. In a typical cloud environment, resources are dynamic and often provisioned and scaled on-demand. By using an SDN connector, you can ensure that changes to cloud environment attributes are automatically updated in the Security Fabric.

To protect the East-West or North-South traffic in these environments, the FortiGate uses the SDN connector to sync the dynamic addresses that these volatile environments use. You can then configure the dynamic address objects as sources or destinations for firewall policies. When you make changes to cloud environment resources, such as moving them to a new location or assigning different IP addresses to them, you do not need to modify the policy in FortiOS, as the SDN connector syncs changes to the cloud address objects.

These configurations consist of three primary steps:

1. Configure the cloud SDN connector to connect your FortiGate and public or private cloud account.
2. Create dynamic address objects to use the SDN connector. Use filters to sync only cloud address objects that you require.
3. Apply the dynamic address objects to your firewall policy to protect your traffic.

This chapter explores the steps in detail and describes how to connect to each currently supported cloud platform. This chapter does not discuss cloud account role-based or permission requirements. The respective cloud documents contain this information.

The following external connectors are available in the Security Fabric:

Category	Connector	Example configuration
Public SDN		
	Amazon Web Services (AWS)	AWS SDN connector using access key on page 2617
	Microsoft Azure	Azure SDN connector using service principal on page 2623
	Google Cloud Platform (GCP)	GCP SDN connector using service account on page 2631
	Oracle Cloud Infrastructure (OCI)	OCI SDN connector using certificates on page 2656
	IBM Cloud	IBM Cloud SDN connector using API keys on page 2632
	AliCloud	AliCloud SDN connector using access key on page 2615
Private SDN		
	Kubernetes	Kubernetes (K8s) SDN connectors on page 2636
	VMware ESXi	VMware ESXi SDN connector using server credentials on page 2665
	VMware NSX	VMware NSX-T Manager SDN connector using NSX-T Manager credentials on page 2667
	OpenStack (Horizon)	OpenStack SDN connector using node credentials on page 2658

Category	Connector	Example configuration
	Application Centric Infrastructure (ACI)	Cisco ACI SDN connector using a standalone connector on page 2624
	Nuage Virtualized Services Platform	Nuage SDN connector using server credentials on page 2652
	Nutanix	Nutanix SDN connector using server credentials on page 2654
	SAP	SAP SDN connector on page 2662
Endpoint/Identity		
	FSSO Agent on Windows AD	Fortinet single sign-on agent on page 2678
	Symantec Endpoint Protection	Symantec endpoint connector on page 2680
	Poll Active Directory Server	Poll Active Directory server on page 2679
	RADIUS Single Sign-On Agent	RADIUS single sign-on agent on page 2686
	Exchange Server	Exchange Server connector on page 2689
Threat Feeds		
	FortiGuard Category	Threat feeds on page 2692
	IP Address	External blocklist policy on page 2700 External blocklist authentication on page 2702
	Domain Name	External resources for DNS filter on page 2704
	Malware Hash	External blocklist file hashes on page 2702

If VDOMs are enabled, SDN and Threat Feeds connectors are in the global settings, and Endpoint/Identity connectors are per VDOM.

Getting started with public and private SDN connectors

You can use SDN connectors to connect your FortiGate to public and private cloud solutions. By using an SDN connector, you can ensure that changes to cloud environment attributes are automatically updated in the Security Fabric. You can use SDN connector address objects to create policies that provide dynamic access control based on cloud environment attribute changes. There is no need to manually reconfigure addresses and policies whenever changes to the cloud environment occur.

There are four steps to creating and using an SDN connector:

1. Gather the required information. The required information depends on which public or private cloud solution SDN connector you are configuring.

2. Creating the SDN connector on page 2612
3. Creating an SDN connector address on page 2612
4. Adding the address to a firewall policy on page 2614

The following provides general instructions for creating an SDN connector and using the dynamic address object in a firewall policy. For instructions for specific public and private cloud solutions, see the relevant topic in this guide. For advanced scenarios regarding SDN connectors, see the appropriate FortiOS 7.2 cloud platform guide.

Creating the SDN connector

To create an SDN connector in the GUI:

1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*.
3. Click the desired public or private cloud.
4. Enter the *Name*, *Status*, and *Update Interval* for the connector.
5. Enter previously collected information for the connector as needed.
6. Click *OK*.

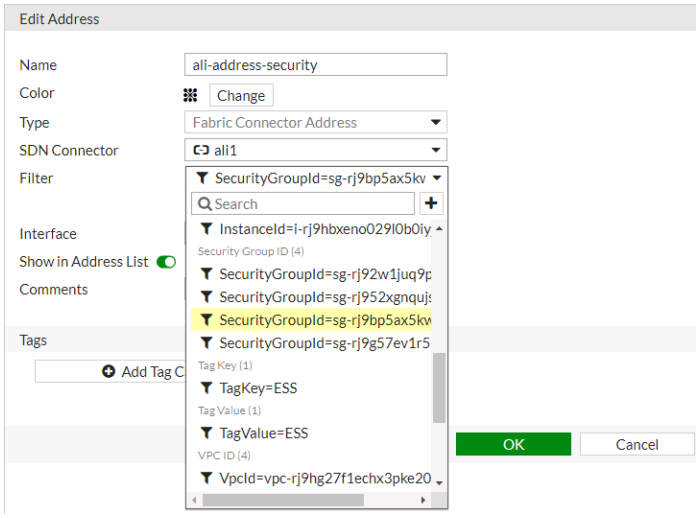
To create an SDN connector in the CLI:

```
config system sdn-connector
    edit <name>
        set status {enable | disable}
        set type {connector type}
        ...
        set update-interval <integer>
    next
end
```

The available CLI commands vary depending on the selected SDN connector type.

Creating an SDN connector address

You can use an SDN connector address in the following ways:



- As the source or destination address for firewall policies.
- To automatically update changes to addresses in the public or private cloud environment, based on specified filters.
- To automatically apply changes to firewall policies that use the address, based on specified filters.

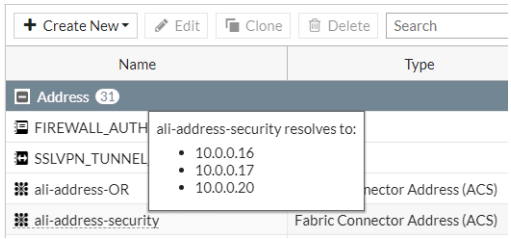
To create an SDN connector address in the GUI:

1. Go to *Policy & Objects* > *Addresses*.
2. Click *Create New* > *Address*.
3. Configure the address:
   a. Set the *Type* to *Dynamic*.
   b. From the *Sub Type* dropdown list, select *Fabric Connector Address*.

c. From the *SDN Connector* dropdown list, select the desired SDN connector.

d. From the *Filter* dropdown list, configure the desired filter. The filters available depend on the selected SDN connector type. The SDN connector automatically populates and updates IP addresses only for instances that satisfy the filter requirements. In this example, the address will automatically populate and update IP addresses only for AliCloud instances that belong to the specified security group:

You can set filtering conditions using multiple entries with AND ("&") or OR ("|"). When both AND and OR are specified, AND is interpreted first, then OR.



e. Configure other settings as desired.

f. Click *OK*.

4. Ensure that the SDN connector resolves dynamic firewall IP addresses as configured:

a. Go to *Policy & Objects* > *Addresses*.

b. Hover over the address that you created to see a list of IP addresses for instances that satisfy the filter that you configured. In this case, the IP addresses of instances that belong to the specified security group display:

To create an SDN connector address in the CLI:

1. Create the address:

```
config firewall address
   edit <name>
      set type dynamic
      set sdn <sdn_connector>
      set visibility enable
      set associated-interface <interface_name>
      set color <integer>
      ...
      set comment <comment>
      config tagging
         edit <name>
```

```
            set category <string>
            set tags <strings>
         next
      end
   next
end
```

2. Ensure that the SDN connector resolves dynamic firewall IP addresses as configured by running `show`. The following shows example output:

```
config firewall address
   edit "ali-address-security"
      set type dynamic
      config list
         edit "10.0.0.16"
         next
         edit "10.0.0.17"
         next
         edit "10.0.20.20"
         next
      end
      ...
   next
end
```

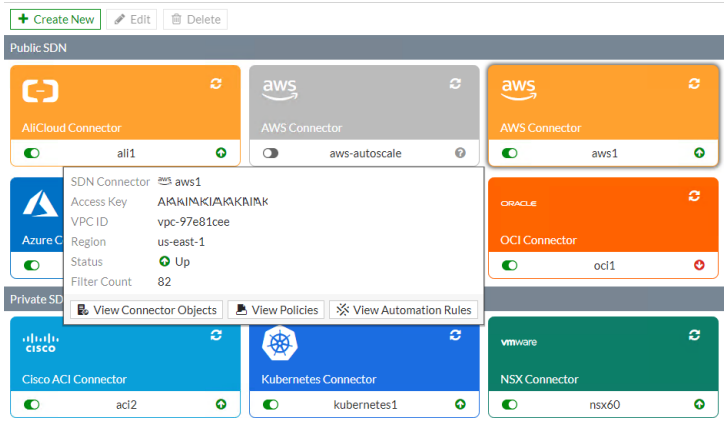
The available CLI commands vary depending on the selected SDN connector type.

Adding the address to a firewall policy

You can use an SDN connector address as the source or destination address in a policy.

To add the address to a firewall policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Use the SDN connector address as the source or destination address.
4. Configure the remaining settings as needed.
5. Click *OK*.



To add the address to a firewall policy in the CLI:

```
config firewall policy
    edit 0
        set name <name>
        set srcintf <port_name>
        set dstintf <port_name>
        set srcaddr <firewall_address>
        set dstaddr <firewall_address>
        set action accept
        set schedule <schedule>
        set service <service>
```

```
    next
end
```

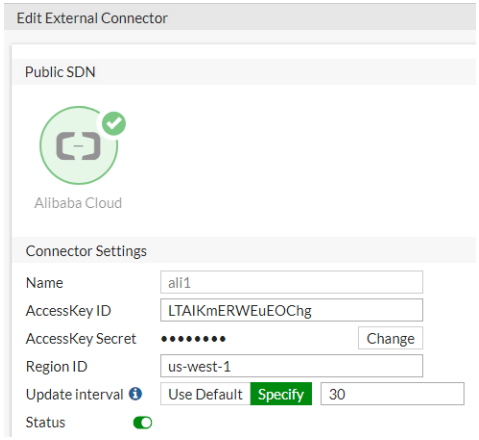
Connector tooltips

In *Security Fabric* > *External Connectors*, hover over an SDN connector to view a tooltip that shows basic configuration information.

Three buttons provide additional information:

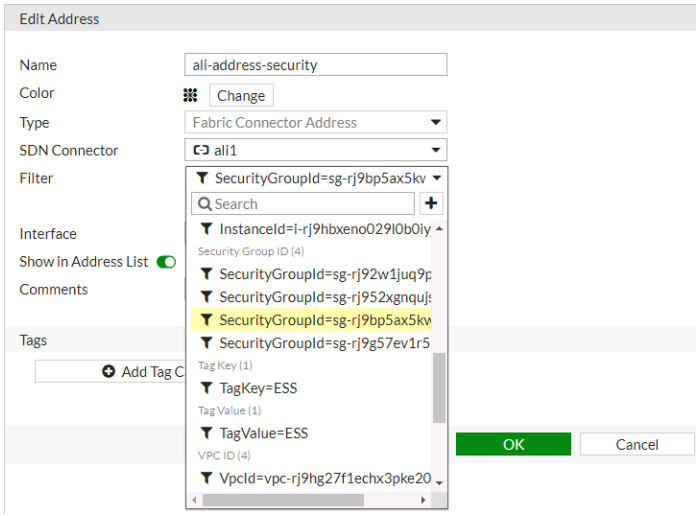
Button	Information
View Connector Objects	Connector's dynamic objects, such as filters and instances.
View Policies	List of policies that use the dynamic addresses from the connector.
View Automation Rules	List of automation actions that use the connector.

AliCloud SDN connector using access key



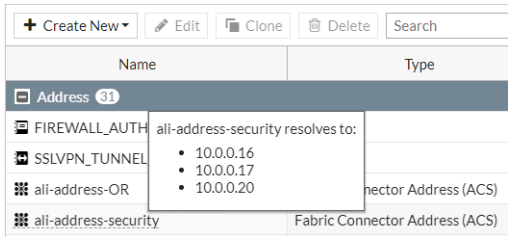
FortiOS automatically updates dynamic addresses for AliCloud using an AliCloud SDN connector, including mapping the following attributes from AliCloud instances to dynamic address groups in FortiOS:

- ImageId
- InstanceId
- SecurityGroupId
- VpcId
- VSwitchId
- TagKey
- TagValue



To configure AliCloud SDN connector using the GUI:

1. Configure the AliCloud SDN connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*, and select *AliCloud*.



c. Configure as shown, substituting the access key, secret, and region ID for your deployment. The update interval is in seconds.

2. Create a dynamic firewall address for the configured AliCloud SDN connector:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New*, then select *Address*.
   c. Configure the address as shown, selecting the desired filter in the *Filter* dropdown list. In this example, the address will automatically populate and update IP addresses only for AliCloud instances that belong to the specified security group:

3. Ensure that the AliCloud SDN connector resolves dynamic firewall IP addresses:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Hover over the address created in step 2 to see a list of IP addresses for instances that belong to the security group configured in step 2:

To configure AliCloud SDN connector using CLI commands:

1. Configure the AliCloud SDN connector:
```
config system sdn-connector
   edit "ali1"
      set type acs
      set access-key "LTAIKmERWEuEOChg"
      set secret-key xxxxx
      set region "us-west-1"
      set update-interval 30
   next
end
```
2. Create a dynamic firewall address for the configured AliCloud SDN connector with the supported AliCloud filter. In this example, the AliCloud SDN Connector will automatically populate and update IP addresses only for instances that belong to the specified security group:
```
config firewall address
   edit "ali-address-security"
      set type dynamic
      set sdn "ali1"
      set filter "SecurityGroupId=sg-rj9bp5ax5kwy3gqdizqb"
   next
end
```
3. Confirm that the AliCloud SDN connector resolves dynamic firewall IP addresses using the configured filter:
```
config firewall address
   edit "ali-address-security"
      set type dynamic
      set sdn "ali1"
      set filter "SecurityGroupId=sg-rj9bp5ax5kwy3gqdizqb"
      config list
         edit "10.0.0.16"
         next
         edit "10.0.0.17"
         next
         edit "10.0.0.20"
         next
      end
   next
end
```

AWS SDN connector using access key

FortiOS automatically updates dynamic addresses for AWS using an AWS SDN connector, including mapping attributes from AWS instances to dynamic address groups in FortiOS.

Configuring the SDN connector using the GUI, then checking the configuration using the CLI is recommended.

To configure an AWS SDN connector using the GUI:

1. Configure the AWS SDN connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*, and select *Amazon Web Services (AWS)*.
   c. In the *Access key ID* field, enter the key created in the AWS management portal.

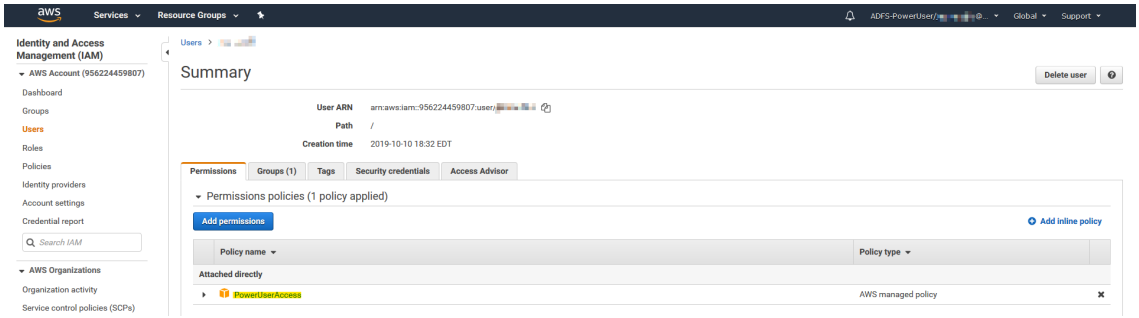
d. In the *Secret access key* field, enter the secret access key accompanying the above access key.
e. In the *Region name* field, enter the region name. Refer to AWS service endpoints for the desired region name.
f. In the *VPC ID* field, enter the VPC ID within the specified region you desire to cover with the SDN connector.
g. Click *OK*.

2. Check the configuration using the CLI:

```
config system sdn-connector
   edit "<connector-name>"
      show
```

The output resembles the following:

```
config system sdn-connector
   edit "<connector-name>"
      set access-key "<example-access-key>"
      set secret-key ENC <example-secret-key>
      set region "us-west-2"
      set vpc-id "vpc-e1e4b587"
      set update-interval 1
   next
end
```



If you see that the SDN connector is not enabled in *Security Fabric > External Connectors* in the GUI, run the following commands to enable the SDN connector:

```
diagnose debug application awsd -1
diagnose debug enable
```

The output may display an error like the following:

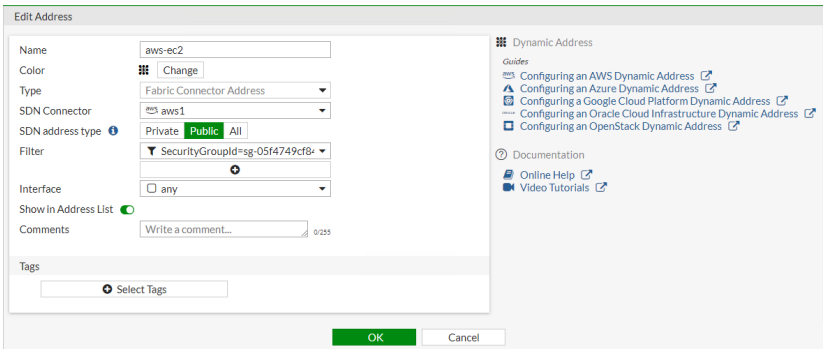
```
FGT # awsd sdn connector AWS_SDN prepare to update
awsd sdn connector AWS_SDN start updating
aws curl response err, 403
<?xml version="1.0" encoding="UTF-8"?>
<Response><Errors><Error><Code>UnauthorizedOperation</Code><Message>You are not
      authorized to perform this
      operation.</Message></Error></Errors><RequestID>8403cc11-b185-41da-ad6d-
      23bb4db7d00a</RequestID></Response>
awsd curl failed 403
awsd sdn connector AWS_SDN failed to get instance list
aws curl response err, 403
{"Message":"User: arn:aws:iam::956224459807:user/jcarcavallo is not authorized to
      perform: eks:ListClusters on resource: arn:aws:eks:us-east-
      1:956224459807:cluster/*"}
awsd sdn connector AWS_SDN get EKS cluster list failed
awsd sdn connector AWS_SDN list EKS cluster failed
awsd sdn connector AWS_SDN start updating IP addresses
awsd sdn connector AWS_SDN finish updating IP addresses
awsd reap child pid: 569
```

In this case, you must configure power user access for the current administrator in the AWS management console:

After configuring power user access, run the following commands:

```
diagnose debug application awsd -1
diagnose debug enable
```

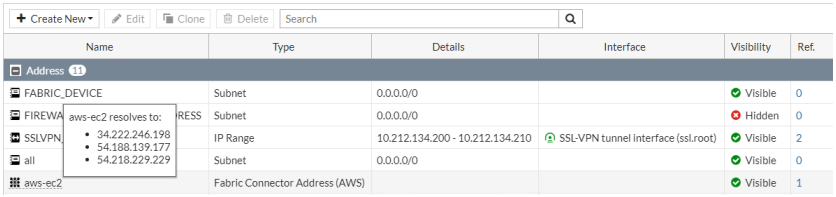
The output should display without error, as follows:



```
FGT # AWSD: update sdn connector AWS_SDN status to enabled
awsd sdn connector AWS_SDN prepare to update
awsd sdn connector AWS_SDN start updating
awsd get ec2 instance info successfully
awsd sdn connector AWS_SDN start updating IP addresses
awsd sdn connector AWS_SDN finish updating IP addresses
awsd reap child pid: 893
```

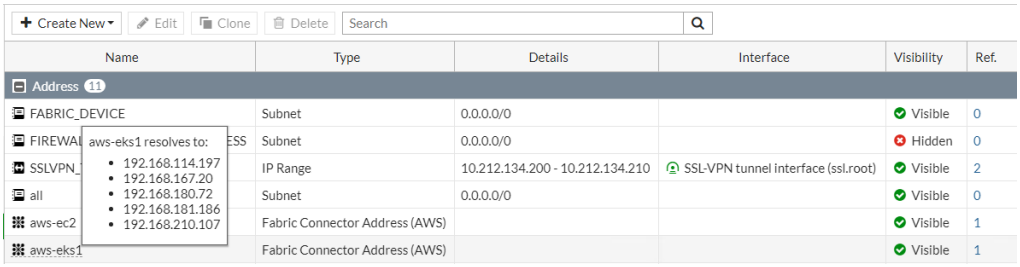
The AWS connector is now enabled.

3. Create a dynamic firewall address for the configured AWS SDN connector:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New*, then select *Address*.
   c. From the *Type* dropdown list, select *Dynamic*.
   d. From the *Sub Type* dropdown list, select *Fabric Connector Address*.



e. In the *Filter* field, add the desired filters. The following filters are supported:

Description	Key	Example value
Architecture	architecture	x86
Autoscaling group	AutoScaleGroup	10703c-4f731e90-fortigate-payg-auto-scaling-group
AZ	placement.availabilityzone	us-east-1a
Group name	placement.groupname	
Image ID	imageId	ami-123456
Instance ID	instanceId	i-12345678
Instance type	instanceType	t2.micro
Key name	keyName	
Kubernetes cluster	k8s_cluster	
Kubernetes label and its name	k8s_label.Name	
Kubernetes namespace	k8s_namespace	
Kubernetes node name	k8s_nodename	
Kubernetes pod name	k8s_podname	
Kubernetes region	k8s_region	
Kubernetes service name	k8s_servicename	
Kubernetes zone	k8s_zone	
Private DNS name	privateDnsName	ip-172-31-10-211.us-west-2.compute.internal
Public DNS name	publicDnsName	ec2-54-202-168-254.us-west-2.compute.amazonaws.com
Security group ID	SecurityGroupId	
Subnet ID	subnetId	sub-123456
Tag and its name. This key supports a maximum of eight tags.	tag.Name	
Tenancy placement	placement.tenancy	
VPC ID	VpcId	



4. Ensure that the AWS SDN connector resolves dynamic firewall IP addresses:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Hover over the address created in step 2 to see a list of IP addresses for instances that belong to the security group configured in step 2.

      The following is an example for a public SDN address type:

      The following is an example for a private SDN address type:

To configure AWS SDN connector using CLI commands:

1. Configure the AWS connector:

```
config system sdn-connector
   edit "<connector-name>"
      set access-key "<example-access-key>"
      set secret-key ENC <example-secret-key>
      set region "us-west-2"
      set vpc-id "vpc-e1e4b587"
      set update-interval 1
   next
end
```

2. Create a dynamic firewall address for the configured AWS SDN connector with the supported filter:

```
config firewall address
   edit "aws-ec2"
      set type dynamic
      set sdn "<connector-name>"
      set filter "SecurityGroupId=sg-05f4749cf84267548"
      set sdn-addr-type public
```

```
    next
    edit "aws-eks1"
      set type dynamic
      set sdn "<connector-name>"
      set filter "K8S_Region=us-west-2"
    next
end
```

3. Confirm that the AWS SDN connector resolves dynamic firewall IP addresses using the configured filter:

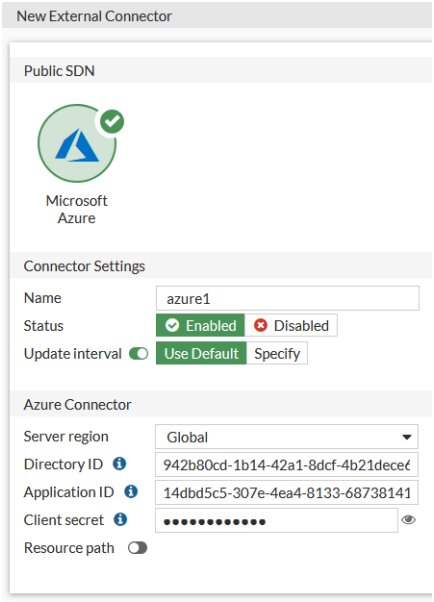
```
config firewall address
  edit "aws-ec2"
    set type dynamic
    set sdn "<connector-name>"
    set filter "SecurityGroupId=sg-05f4749cf84267548"
    set sdn-addr-type public
    config list
      edit "34.222.246.198"
      next
      edit "54.188.139.177"
      next
      edit "54.218.229.229"
      next
    end
  next
  edit "aws-eks1"
    set type dynamic
    set sdn "<connector-name>"
    set filter "K8S_Region=us-west-2"
    config list
      edit "192.168.114.197"
      next
      edit "192.168.167.20"
      next
      edit "192.168.180.72"
      next
      edit "192.168.181.186"
      next
      edit "192.168.210.107"
      next
    end
  next
end
```

To add an EC2 instance to test automatic address population:

1. Assume that you want to boot up another instance with an IP address of 34.222.246.178, which is currently stopped. This instance belongs to the security group that the aws-ec2 address is filtering for. In the AWS management portal, start the instance.
2. Verify that the instance is running.
3. At this point, running `show` again shows the SDN connector has automatically populated and added the 34.222.246.178 instance.

```
config firewall address
  edit "aws-ec2"
    set type dynamic
    set sdn "<connector-name>"
    set filter "SecurityGroupId=sg-05f4749cf84267548"
```

```
        set sdn-addr-type public
        config list
           edit "34.222.246.198"
           next
           edit "54.188.139.177"
           next
           edit "54.218.229.229"
           next
           edit "34.222.246.178"
           next
        end
     next
end
```



Therefore, administrators do not need to add this instance to the address manually. When a firewall policy is applied to this address, 34.222.246.178 is automatically covered.

Azure SDN connector using service principal

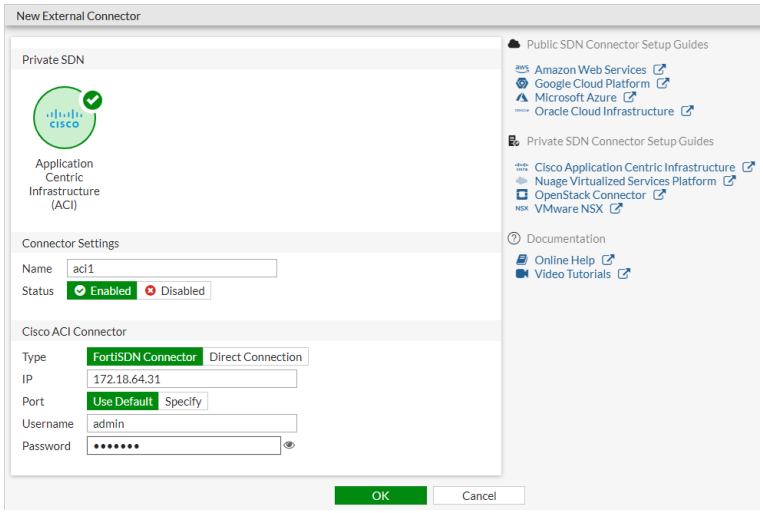
FortiOS automatically updates dynamic addresses for Azure using Azure SDN connector, including mapping attributes from Azure instances to dynamic address groups in FortiOS.

To configure the Azure SDN connector using service principal:

1. Create an Azure SDN connector:
   a. Go to *Security Fabric* > *External Connectors* and click *Create New*.
   b. Select *Microsoft Azure*.
   c. Configure the connector. See Azure SDN connector service principal configuration requirements:

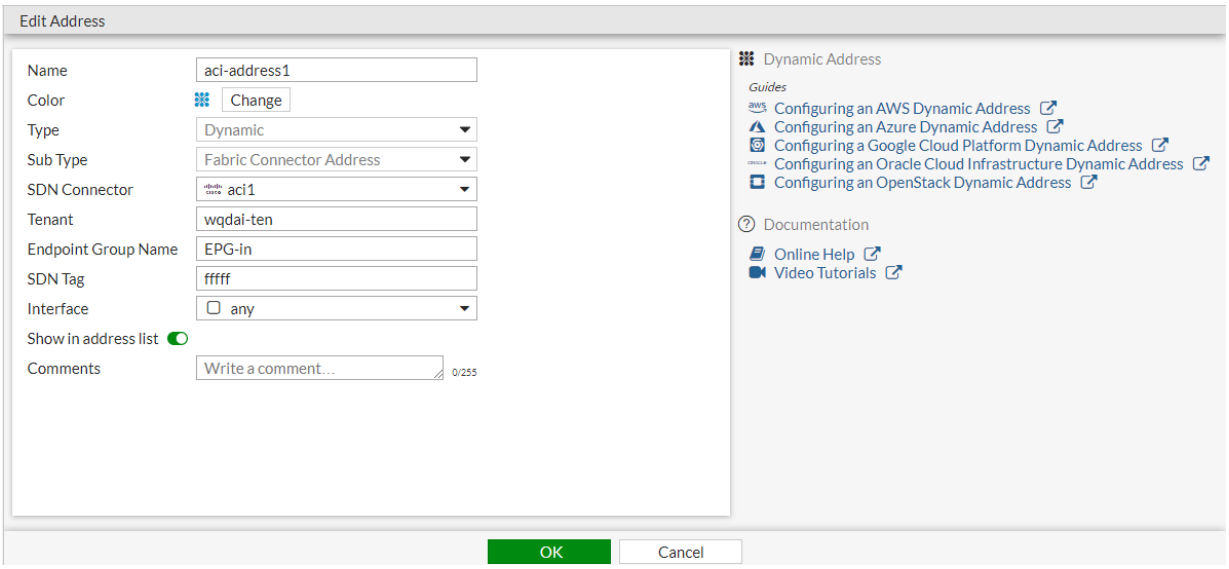
   d. Click *OK*.
2. Create a dynamic firewall address for the Azure connector.
   a. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
   b. From the *Type* dropdown list, select *Dynamic*.
   c. From the *Sub Type* dropdown list, select *Fabric Connector Address*.

d. From the *SDN Connector* dropdown list, select the Azure SDN connector.
e. In the *Filter* field, add filters as desired. The Azure SDN connector supports the following filters:
   - `vm=<VM name>`
   - `securitygroup=<nsg id>`
   - `vnet=<VNet id>`
   - `subnet=<subnet id>`
   - `vmss=<VM scale set>`
   - `tag.<key>=<value>`
   - `servicetag=<value>`
   - `tag.<key>=<value>`
f. Click *OK*.
g. Hover the cursor over the address name to see the dynamic IP addresses that the connector resolves.



Cisco ACI SDN connector using a standalone connector

Cisco ACI (Application Centric Infrastructure) SDN connectors can be used in dynamic firewall addresses.



The Fortinet SDN Connector for Cisco ACI and Nuage Networks is a standalone connector that connects to SDN controllers within Cisco ACI and Nuage Networks. You must configure a connection to the Fortinet SDN connector in FortiOS to query the dynamic addresses.

To configure a Cisco ACI connector in the GUI:

1. Create the Cisco ACI SDN connector:
   a. Go to *Security Fabric* > *External Connectors* and click *Create New*.
   b. In the *Private SDN* section, click *Application Centric Infrastructure (ACI)*.
   c. In the *Cisco ACI Connector* section, for *Type*, select *Fortinet SDN Connector* and configure the remaining settings as needed.
   d. Click *OK*.

2. Create the dynamic firewall address for the connector:
   a. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
   b. Configure the following settings:
      i. For *Type*, select *Dynamic*.
      ii. For *Sub Type*, select *Fabric Connector Address*.
      iii. For *SDN Connector*, select the first ACI connector.
      iv. Configure the remaining settings as needed.
   c. Click *OK*.

To verify the dynamic firewall IPs are resolved by the SDN connector in the GUI:

1. Go to *Policy & Objects* > *Addresses*.
2. In the address table, hover over the address to view which IPs it resolves to.

To configure a Cisco ACI connector in the CLI:

1. Create the SDN connector:

```
config system sdn-connector
    edit "aci1"
        set type aci
        set server "172.18.64.31"
        set username "admin"
        set password xxxxxxx
    next
end
```

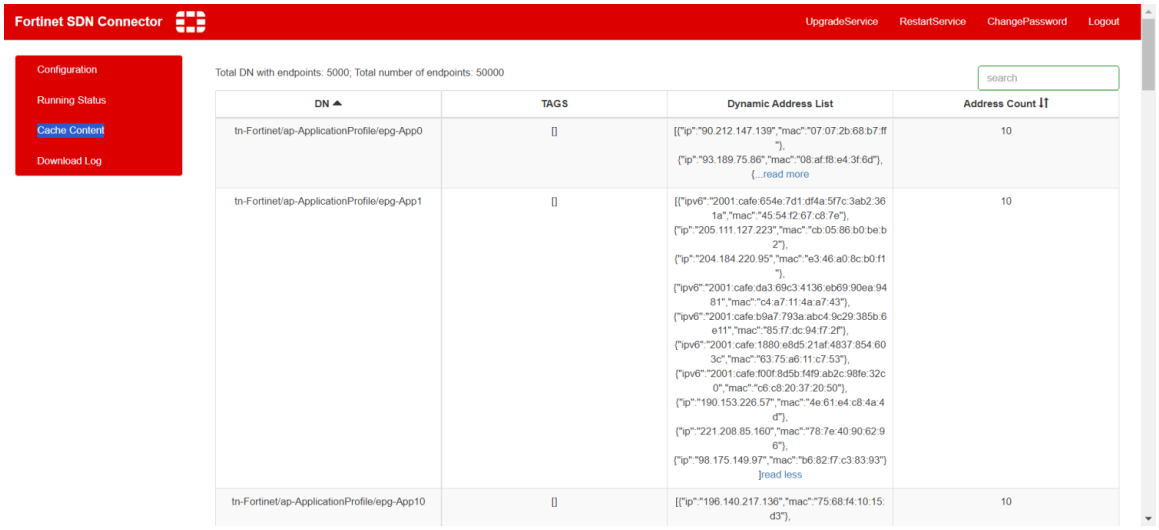
2. Create the dynamic firewall address for the connector:

```
config firewall address
    edit "aci-address1"
        set type dynamic
        set sdn "aci1"
        set color 17
        set tenant "wqdai-ten"
```

```
            set epg-name "EPG-in"
            set sdn-tag "fffff"
        next
    end
```

To verify the dynamic firewall IPs are resolved by the SDN connector in the CLI:

```
# diagnose firewall dynamic list



List all dynamic addresses:
aci1.aci.wqdai-ten.EPG-in.fffff: ID(171)
        ADDR(192.168.100.20)
```

Retrieve IPv6 dynamic addresses from Cisco ACI SDN connector

IPv6 dynamic addresses can be retrieved from Cisco ACI SDN connectors. IPv6 addresses imported from Cisco ACI to the Fortinet SDN Connector VM can be imported into the FortiGate as IPv6 dynamic addresses. The Fortinet SDN Connector VM must be running version 1.1.10 or later.

```
config firewall address6
    edit <name>
        set type dynamic
        set sdn <ACI_connector>
    next
end
```

The following example assumes the Fortinet SDN Connector VM has already connected to Cisco ACI and learned the IPv6 addresses. See Configuring the SDN Connector in the Cisco ACI Administration Guide for more information. The *Dynamic Address List* values for the DN with the filter *tn-Fortinet/ap-ApplicationProfile/epg-App1* is used in this example.

To configure the Cisco ACI connector and dynamic address:

1. Configure the Cisco ACI SDN connector:

```
config system sdn-connector
    edit "aci_64.115_115"
```

```
        set type aci
        set server-list "10.6.30.115"
        set server-port 5671
        set username "admin"
        set password xxxxxxx
    next
end
```

2. Verify that the SDN connector status is up:

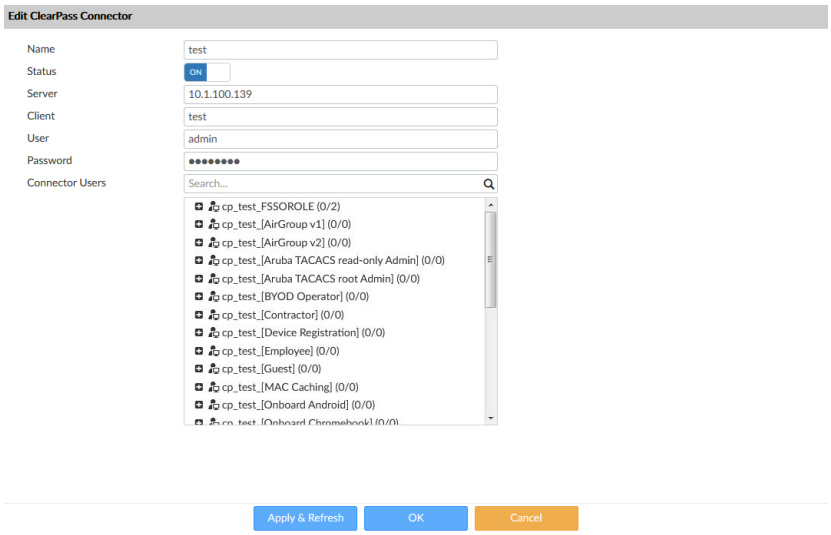
```
# diagnose sys sdn status "aci_64.115_115"
SDN Connector                        Type        Status
-------------------------------------------------------------
aci_64.115_115                       aci         Up
```

3. Configure the IPv6 dynamic firewall address (filters for tenant and endpoint group are used in this example):

```
config firewall address6
    edit "aci-add6-App1"
        set type dynamic
        set sdn "aci_64.115_115"
        set color 17
        set tenant "Fortinet"
        set epg-name "App1"
    next
end
```

4. Verify the list of resolved IPv6 addresses:

```
# diagnose firewall dynamic6 list "aci-add6-App1"
aci_64.115_115.aci.Fortinet.App1.*: ID(220)
        ADDR(2001:cafe:654e:7d1:df4a:5f7c:3ab2:361a)
        ADDR(2001:cafe:da3:69c3:4136:eb69:90ea:9481)
        ADDR(2001:cafe:b9a7:793a:abc4:9c29:385b:6e11)
        ADDR(2001:cafe:1880:e8d5:21af:4837:854:603c)
        ADDR(2001:cafe:f00f:8d5b:f4f9:ab2c:98fe:32c0)
```



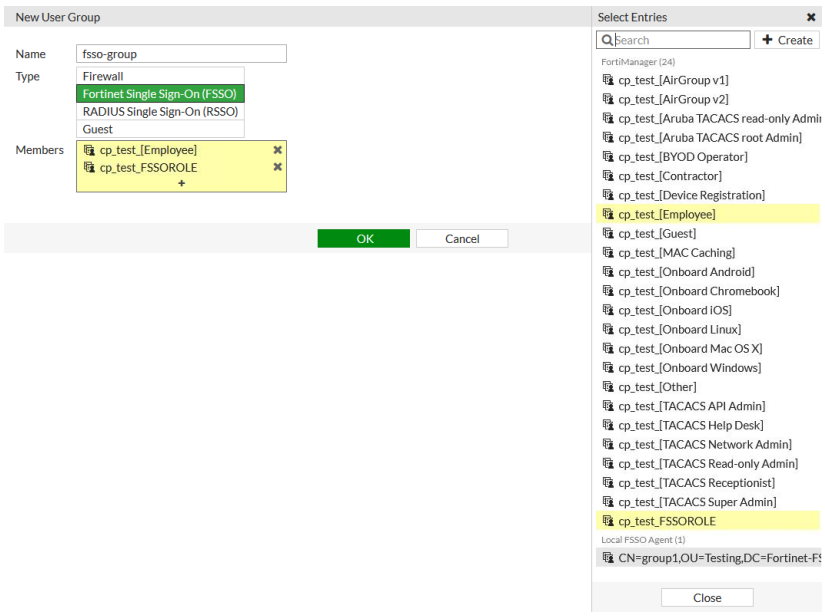
ClearPass endpoint connector via FortiManager

ClearPass Policy Manager (CPPM) is a network access system that can send information about authenticated users to third party systems, such as a FortiGate or FortiManager.

In this example, communications are established between CPPM and FortiManager, and then the FortiManager forwards information to a managed FortiGate. On the FortiGate, the user information can be used in firewall policies and added to FSSO dynamic addresses.

Configure the FortiManager

Establish communications between FortiManager and CPPM so that FortiManager can synchronize CPPM user groups. See Creating a ClearPass connector in the FortiManager Administration Guide.



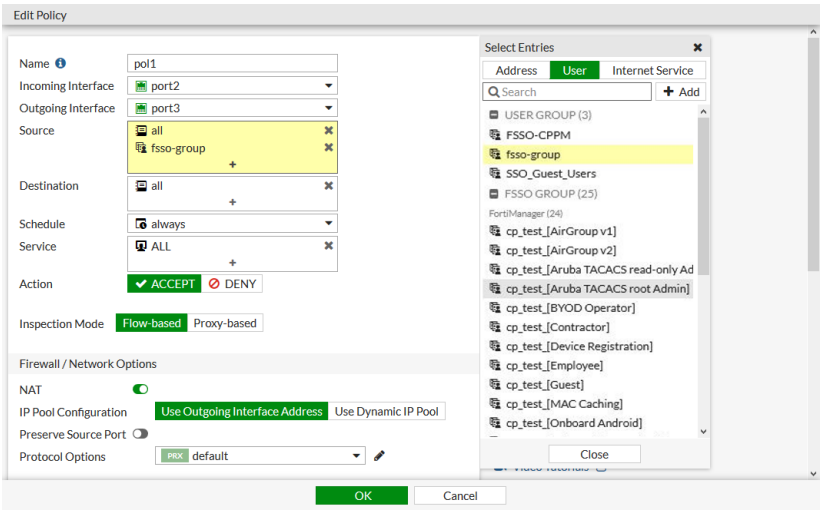
FortiManager forwards the group information to managed FortiGates.

Adding CPPM FSSO user groups to a local user group

To add CPPM user groups to a local user group in the GUI:

1. On the FortiGate, go to *User & Authentication* > *User Groups*.
2. Click *Create New*.
3. Enter a name for the group and set *Type* to *Fortinet Single Sign-On (FSSO)*.
4. Click the *Members* field, and add one or more FSSO groups.
   FSSO groups can come from multiple sources; CPPM FSSO groups are prefixed with *cp_* and are listed under the *FortiManager* heading.

5. Click *OK*.



To add CPPM user groups to a local user group in the CLI:

```
config user group
    edit fsso-group
        set group-type fsso-service
        set member "cp_test_[Employee]" "cp_test_FSSOROLE"
    next
end
```

Using the local FSSO user group in a firewall policy

To add the local FSSO user group to a firewall policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Create a new policy, or edit an existing one.
3. Click in the *Source* field and add the *fsso-group* user group.

CPPM user groups can also be added directly to the policy.

4. Click *OK*.

To add the local FSSO user group to a firewall policy in the CLI:

```
config firewall policy
    edit 1
        set name "pol1"
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set groups "fsso-group"
        set nat enable
    next
end
```

Verification

To verify that a user was added to the FSSO list on the FortiGate:

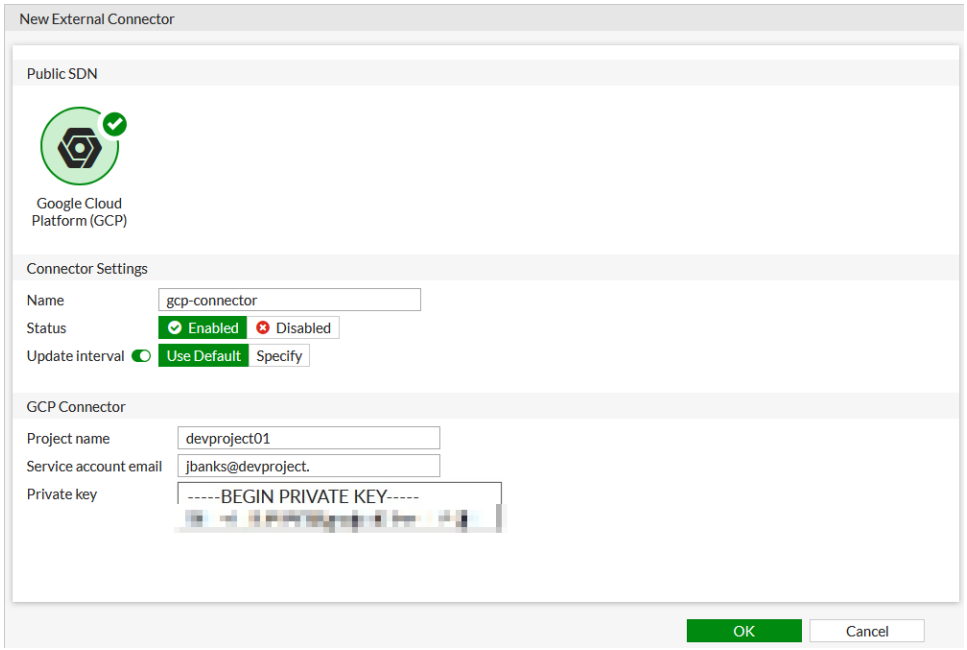
1. Log on to the client and authenticate with CPPM.
   After successful authentication, the user is added to the FSSO list on the FortiGate.
2. On the FortiGate, go to *Dashboard* > *Users & Devices* and look at the *Firewall Users* widget to verify that the user was added.

   The user group *cp_test_FSSOROLE* is listed separately because the user is a member of that group on the CPPM.

To verify that traffic can pass the firewall:

1. Log on to the client and browse to an external website.
2. On the FortiGate, go to *Dashboard* > *FortiView Sources*.
3. Double-click on the user and select the *Destinations* tab to verify that traffic is being passed by the firewall.

To verify the user address groups:



```
show user adgrp
    config user adgrp
        edit "cp_test_FSSOROLE"
            set server-name "FortiManager"
        next
        edit "cp_test_[AirGroup v1]"
            set server-name "FortiManager"
        next
        edit "cp_test_[AirGroup v2]"
            set server-name "FortiManager"
        next
        edit "cp_test_[Aruba TACACS read-only Admin]"
            set server-name "FortiManager"
        next
        edit "cp_test_[Aruba TACACS root Admin]"
            set server-name "FortiManager"
        next
        edit "cp_test_[BYOD Operator]"
            set server-name "FortiManager"
        next
        edit "cp_test_[Contractor]"
            set server-name "FortiManager"
        next
        edit "cp_test_[Device Registration]"
            set server-name "FortiManager"
        next
        ...
        edit "CN=group1,OU=Testing,DC=Fortinet-FSSO,DC=COM"
            set server-name "Local FSSO Agent"   <----- !!!
        next
    end
```

GCP SDN connector using service account

FortiOS automatically updates dynamic addresses for GCP using a GCP SDN connector, including mapping attributes from GCP instances to dynamic address groups in FortiOS.

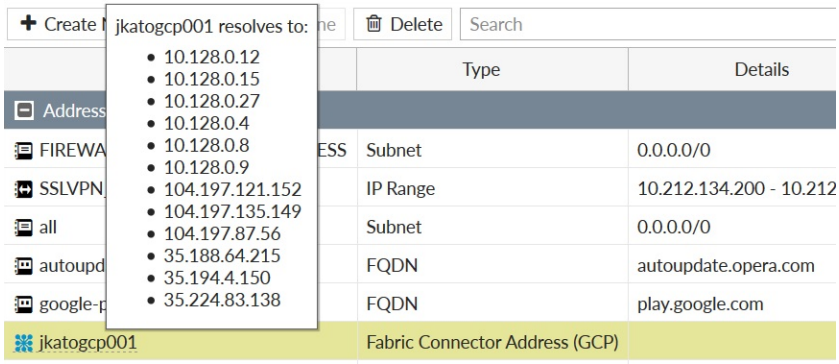
To configure GCP connector using the GUI:

1. In FortiOS, go to *Security Fabric* > *External Connectors*.
2. Click *Create New*, and select *Google Cloud Platform (GCP)*.
   Note you can create only one SDN Connector per connector type. For example, you can create one entry for GCP.
3. Configure the connector as follows:
   a. *Project name*: Enter the name of the GCP project. The VMs whose IP addresses you want to populate should be running within this project.
   b. *Service account email*: Enter the email address associated with the service account that will call APIs to the GCP project specified above.
   c. *Private key*: Enter the private key statement as shown in the text box. For details, see Creating a GCP service account.

   Once the connector is successfully configured, a green indicator appears at the bottom right corner. If the indicator is red, the connector is not working. See Troubleshooting GCP SDN Connector.
4. Create a dynamic firewall address for the configured GCP SDN connector:
   a. Go to *Policy & Objects* > *Addresses*. Click *Create New*, then select *Address*.
   b. Configure the address:
      i. *Name*: Enter the desired name.
      ii. *Type*: Select *Dynamic*.
      iii. *Fabric Connector Type*: Select *Google Cloud Platform (GCP)*.
      iv. *Filter*: The SDN connector automatically populates and updates only instances that match this filtering condition. Currently GCP supports the following filters:
         - `id=<instance id>` : This matches an VM instance ID.
         - `name=<instance name>` : This matches a VM instance name.

- `zone=<gcp zones>` : This matches a zone name.
- `network=<gcp network name>` : This matches a network name.
- `subnet=<gcp subnet name>` : This matches a subnet name.
- `tag=<gcp network tags>` : This matches a network tag.
- `label.<gcp label key>=<gcp label value>` : This matches a free form GCP label key and its value.

In the example, the filter is set as `'network=default & zone=us-central-1f'`. This configuration populates all IP addresses that belong to the default network in the zone us-central-1f.

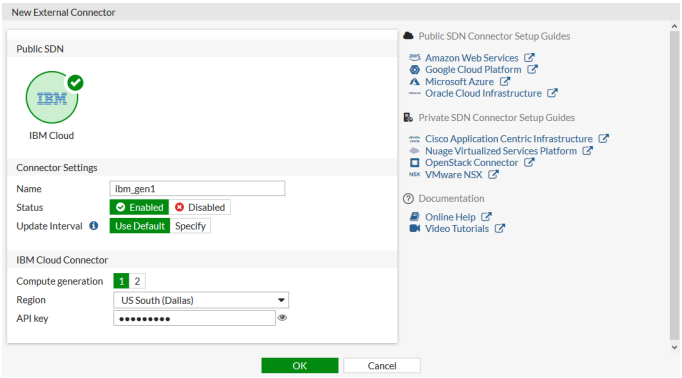


You can set filtering conditions using multiple entries with AND ("&") or OR ("|"). When both AND and OR are specified, AND is interpreted first, then OR.

Note that wildcards (such as the asterisk) are not allowed in filter values.

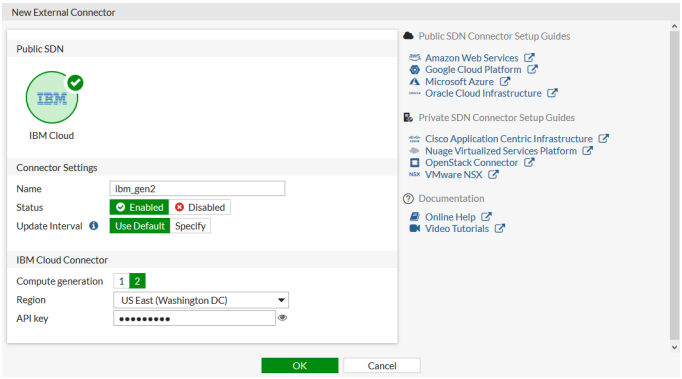
v. Click *OK*.

The address has been created. Wait for a few minutes before the setting takes effect. You will know that the address is in effect when the exclamation mark disappears from the address entry. When you hover over the address, you can see the list of populated IP addresses.



If the exclamation mark does not disappear, check the address settings.

IBM Cloud SDN connector using API keys



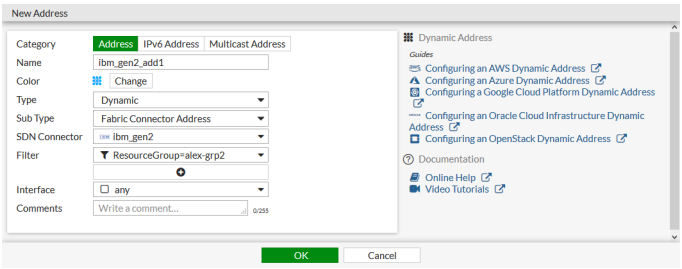
FortiOS can automatically update dynamic addresses for IBM Cloud using an SDN connector.

To configure IBM Cloud SDN connectors using the GUI:

1. Create SDN connectors for compute generation 1 and 2:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*, then select *IBM Cloud*.
   c. Configure the connector for computer generation 1:

   d. Click *OK*.
   e. Click *Create New*, then select *IBM Cloud*.
   f. Configure the connector for computer generation 2:

   g. Click *OK*.
2. Create dynamic firewall addresses for the configured connectors:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New* > *Address*.
   c. From the *Type* dropdown list, select *Dynamic*.
   d. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
   e. From the *SDN Connector* dropdown list, select the IBM SDN connector.
   f. In the *Filter* field, add the desired filters. The following filters are supported:
      - <InstanceId>
      - <InstanceName>
      - <ImageId>
      - <ImageName>
      - <Architecture>
      - <Profile>
      - <Vpc>
      - <Zone>

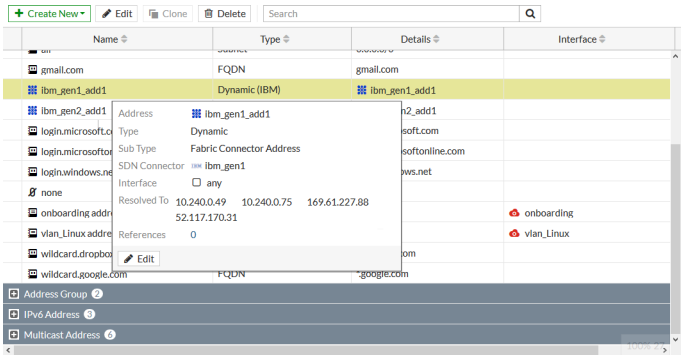


- <Subnet>
- <ResourceGroup>

g. Click *OK*.

h. Click *Create New* > *Address*.

i. Repeat the process for computer generation 2:



j. Click *OK*.

3. Ensure that the connectors resolve dynamic firewall IP addresses:

a. Go to *Policy & Objects* > *Addresses*.

b. Hover over the addresses created in step 2 to see a list of IP addresses that the connector has resolved:

To configure IBM Cloud SDN connectors using the CLI:

1. Create SDN connectors for compute generation 1 and 2:

```
config system sdn-connector
    edit "ibm_gen1"
        set status enable
        set type ibm
        set api-key xxxxxx
        set compute-generation 1
        set ibm-region us-south
        set update-interval 60
    next
```

```
    edit "ibm_gen2"
        set status enable
        set type ibm
        set api-key xxxxxx
        set compute-generation 2
        set ibm-region us-east
        set update-interval 60
    next
end
```

2. Create dynamic firewall addresses for the configured connectors:

```
config firewall address
    edit "ibm_gen1_add1"
        set type dynamic
        set sdn "ibm_gen1"
        set color 19
        set filter "Vpc=alex-vpc1"
    next
    edit "ibm_gen2_add1"
        set type dynamic
        set sdn "ibm_gen2"
        set color 19
        set filter "ResourceGroup=alex-grp2"
    next
end
```

3. Ensure that the connectors resolve dynamic firewall IP addresses:

```
# show firewall address ibm_gen1_add1
config firewall address
    edit "ibm_gen1_add1"
        set uuid 586841c4-7f46-51ea-dc66-dbf840af03d3
        set type dynamic
        set sdn "ibm_gen1"
        set color 19
        set filter "Vpc=alex-vpc1"
        config list
            edit "10.240.0.49"
            next
            edit "10.240.0.75"
            next
            edit "169.61.227.88"
            next
            edit "52.117.170.31"
            next
        end
    next
end
```

```
# show firewall address ibm_gen2_add1
config firewall address
    edit "ibm_gen2_add1"
        set uuid 5868c4f0-7f46-51ea-2b79-b5170fbfd4a8
        set type dynamic
        set sdn "ibm_gen2"
        set color 19
        set filter "ResourceGroup=alex-grp2"
```

```
            config list
                edit "10.241.128.4"
                next
                edit "10.241.128.5"
                next
                edit "10.241.129.4"
                next
                edit "52.117.126.69"
                next
            end
        next
    end
```

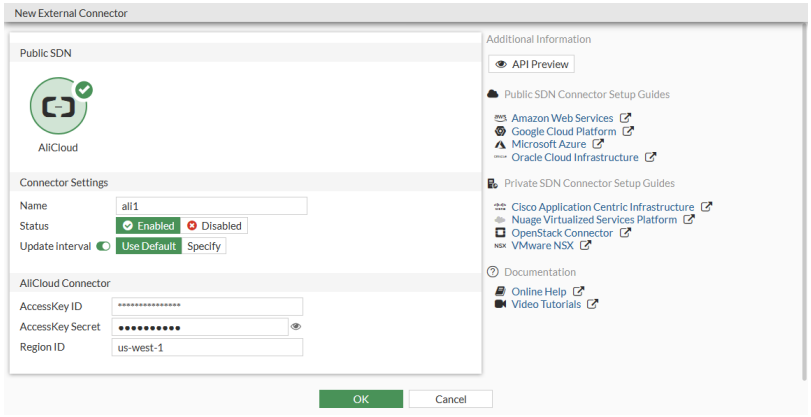
Kubernetes (K8s) SDN connectors

The following topics provide information about configuring Kubernetes SDN connectors:

- AliCloud Kubernetes SDN connector using access key on page 2636
- AWS Kubernetes (EKS) SDN connector using access key on page 2638
- Azure Kubernetes (AKS) SDN connector using client secret on page 2641
- GCP Kubernetes (GKE) SDN connector using service account on page 2643
- Oracle Kubernetes (OKE) SDN connector using certificates on page 2646
- Private cloud K8s SDN connector using secret token on page 2648

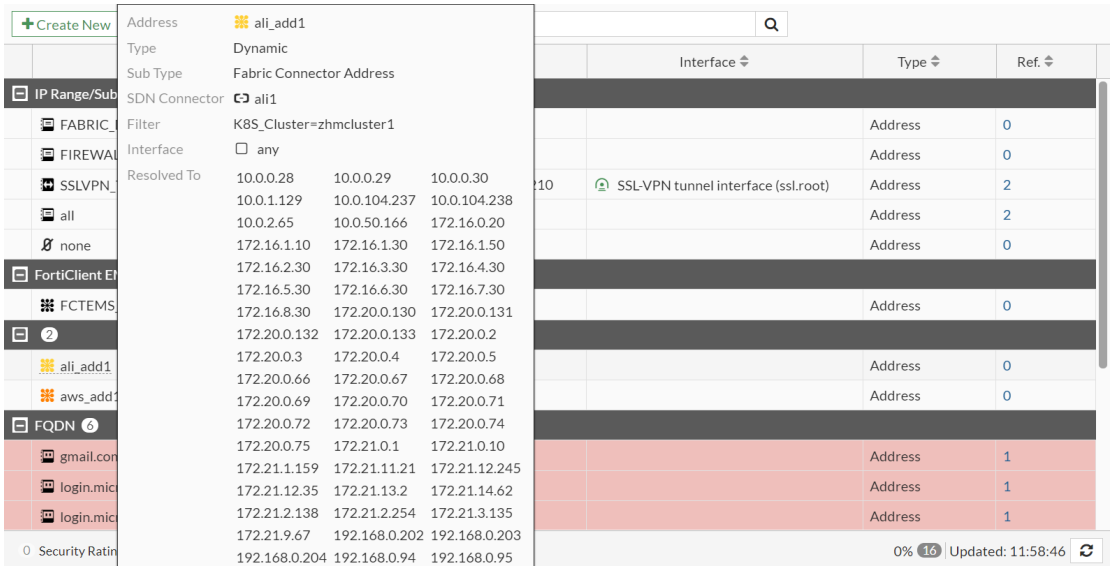
AliCloud Kubernetes SDN connector using access key

When an AliCloud SDN connector is configured, dynamic address objects can support Kubernetes filters based on cluster, service, node, pod, and more.



The following address filters can be applied:

- K8S_Cluster
- K8S_Namespace
- K8S_ServiceName
- K8S_NodeName
- K8S_PodName
- K8S_Region
- K8S_Zone
- K8S_Label



To configure an AliCloud SDN connector with a Kubernetes filter in the GUI:

1. Configure the AliCloud SDN connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*, and select *AliCloud*.

c. Configure the settings as needed and click *OK*.

2. Create a dynamic firewall address with the supported Kubernetes filter:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New* > *Address* and enter a name.
   c. Configure the following settings:
      i. For *Type*, select *Dynamic*.
      ii. For *Sub Type*, select *Fabric Connector Address*.
      iii. For *SDN Connector*, select the connector created in step 1.
      iv. For *SDN address type*, select *Private*.
      v. For *Filter*, select *K8S_Cluster=zhmcluster*.
   d. Click *OK*.
      The corresponding IP addresses are dynamically updated and resolved after applying the Kubernetes filter.
3. Confirm that the AliCloud SDN connector resolves dynamic firewall IP addresses using the configured filter:
   a. Go to *Policy & Objects* > *Addresses*.
   b. In the address table, hover over the address created in step 2 to view which IPs it resolves to:

To configure an AliCloud SDN connector with a Kubernetes filter in the CLI:

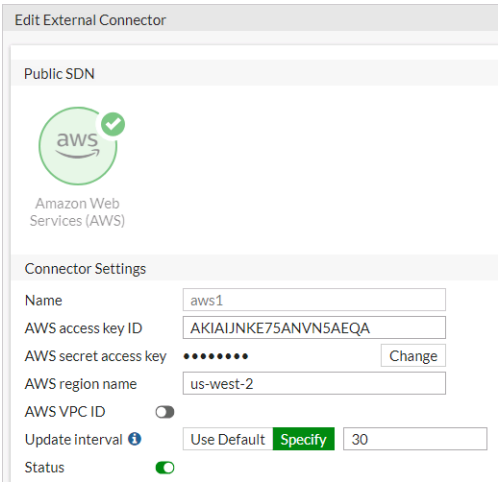
1. Configure the AliCloud SDN connector:

```
config system sdn-connector
    edit "ali1"
        set type alicloud
        set access-key "****************"
        set secret-key xxxxxxxx
        set region "us-west-1"
    next
end
```

2. Create a dynamic firewall address with the supported Kubernetes filter:

```
config firewall address
    edit "ali_add1"
        set type dynamic
        set sdn "ali1"
        set color 10
        set filter "K8S_Cluster=zhmcluster1"
    next
end
```

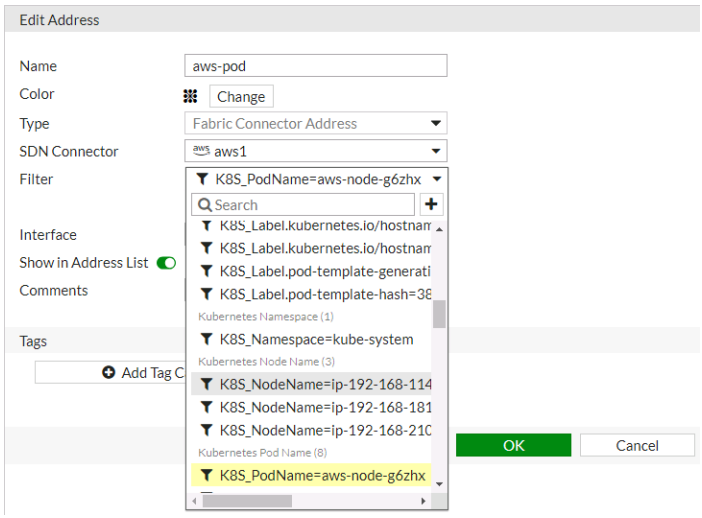
3. Confirm that the AliCloud SDN connector resolves dynamic firewall IP addresses using the configured filter:



```
config firewall address
    edit "ali_add1"
        show
            config firewall address
                edit "ali_add1"
                    set uuid c48e4f00-5435-51eb-0547-aced5cf80f1f
                    set type dynamic
                    set sdn "ali1"
                    set color 10
                    set filter "K8S_Cluster=zhmcluster1"
                    config list
                        edit "10.0.0.28"
                        next
                        edit "10.0.0.29"
                        next
                        edit "10.0.0.30"
                        next
                        ...
                    end
                next
            end
    next
end
```

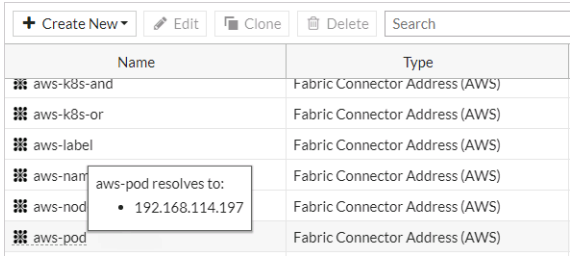
AWS Kubernetes (EKS) SDN connector using access key

AWS SDN connectors support dynamic address groups based on AWS Kubernetes (EKS) filters.



To enable an AWS SDN connector to fetch IP addresses from AWS Kubernetes:

1. Go to *Security Fabric* > *External Connectors*. Click *Create New*, then select *Amazon Web Services (AWS)*. Configure the SDN connector as desired. See AWS SDN connector using access key on page 2617



2. Go to *Policies & Objects* > *Addresses*. Click *Create New* > *Address* to create a dynamic firewall address for the configured SDN connector using the supported Kubernetes filter.
3. From the *Type* dropdown list, select *Dynamic*.
4. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
5. From the *SDN Connector* dropdown list, select the desired SDN connector.
6. In the *Filter* field, add the desired filters. The following filters are supported:

Filter	Description
k8s_cluster	Name of Kubernetes cluster.
k8s_namespace	Namespace of a Kubernetes service or pod.
k8s_svcname	Name of a Kubernetes service.
k8s_nodename	Name of a Kubernetes node.
k8s_zone	Zone of a Kubernetes node.
k8s_region	Region of a Kubernetes node.
k8s_podname	Name of a Kubernetes pod.
k8s_label.xxx	Name of label of a Kubernetes resource (cluster/service/node/pod).

7. Configure the rest of the settings, then click *OK*.
8. Ensure that the SDN connector resolves the dynamic firewall address IP addresses by going to *Policy & Objects* > *Addresses* and hovering over the newly created address.

To configure an AWS Kubernetes SDN connector through the CLI:

1. Configure the SDN connector:

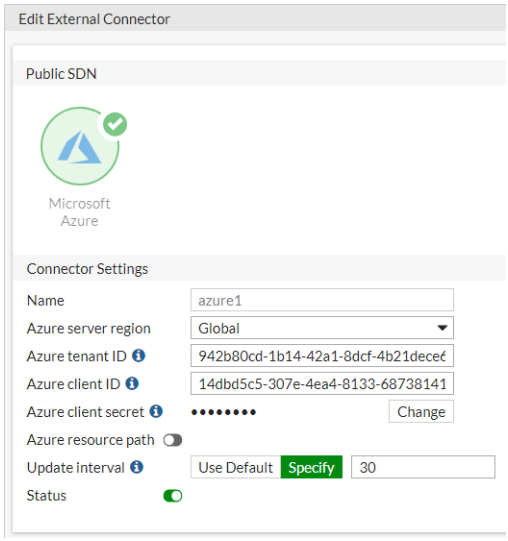
```
config system sdn-connector
   edit "aws1"
      set type aws
      set access-key "AKIAIJNKE75ANVN5AEQA"
      set secret-key xxxxx
      set region "us-west-2"
      set update-interval 30
   next
end
```

2. Create a dynamic firewall address for the SDN connector with a supported Kubernetes filter:

```
config firewall address
   edit "aws-pod"
      set type dynamic
      set sdn "aws1"
      set filter "K8S_PodName=aws-node-g6zhx"
   next
end
```

The SDN connector resolves the dynamic firewall address IP address:

```
config firewall address
   edit "aws-pod"
      set type dynamic
      set sdn "aws1"
```



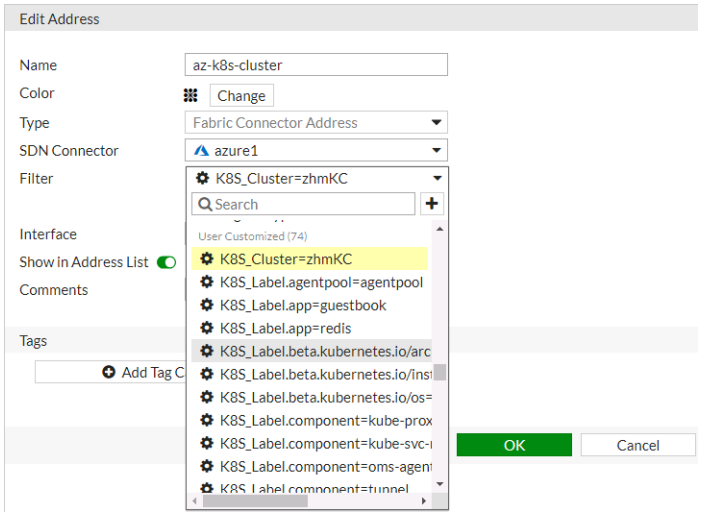
```
        set filter "K8S_PodName=aws-node-g6zhx"
        config list
           edit "192.168.114.197"
           next
        end
     next
  end
```

Azure Kubernetes (AKS) SDN connector using client secret

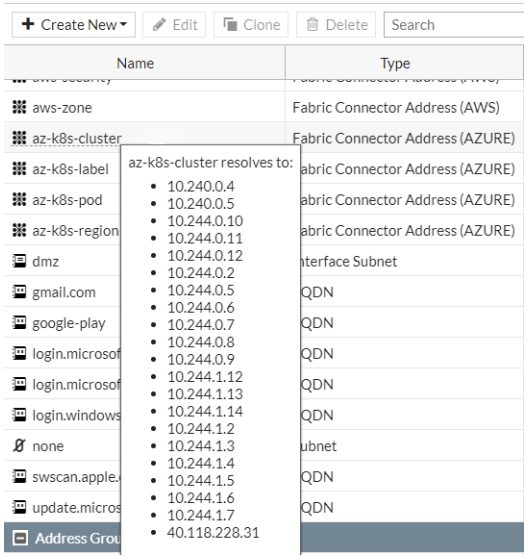
Azure SDN connectors support dynamic address groups based on Azure Kubernetes (AKS) filters.

To enable an Azure SDN connector to fetch IP addresses from Azure Kubernetes:

1. Configure the Azure SDN connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*, and select *Azure*.
   c. Configure as shown substituting the region, tenant and client IDs, and client secret for your deployment. See Azure SDN connector service principal configuration requirements.



2. Create a dynamic firewall address for the configured K8s SDN connector:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New*, then select *Address*.
   c. From the *Type* dropdown list, select *Dynamic*.
   d. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
   e. From the *SDN Connector* dropdown list, select the desired SDN connector.
   f. In the *Filter* field, add the desired filter. The following filters are supported:



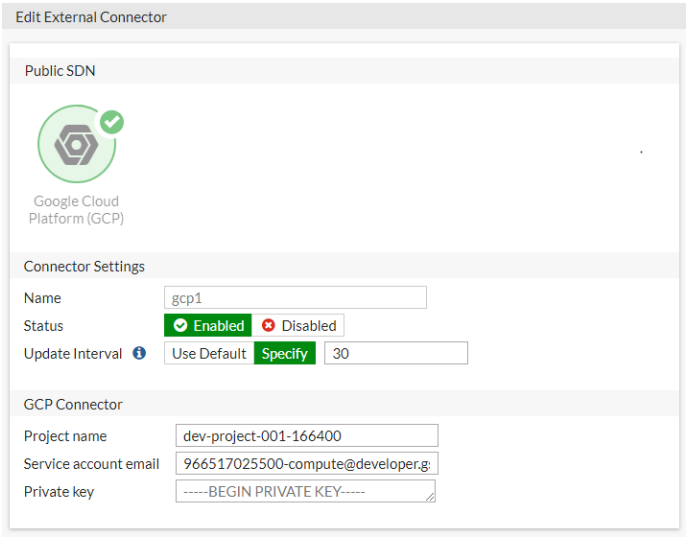
Filter	Description
k8s_cluster	Name of Kubernetes cluster.
k8s_namespace	Namespace of a Kubernetes service or pod.

Filter	Description
k8s_svcname	Name of a Kubernetes service.
k8s_nodename	Name of a Kubernetes node.
k8s_zone	Zone of a Kubernetes node.
k8s_region	Region of a Kubernetes node.
k8s_podname	Name of a Kubernetes pod.
k8s_label.xxx	Name of label of a Kubernetes resource (cluster/service/node/pod).

In this example, the address is configured to automatically populate and update IP addresses only for instances that belong to the zhmKC cluster:

3. Ensure that the K8s SDN connector resolves dynamic firewall IP addresses:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Hover over the address created in step 2 to see a list of IP addresses for instances that belong to the zhmKC cluster as configured in step 2:

To configure an Azure Kubernetes SDN connector through the CLI:

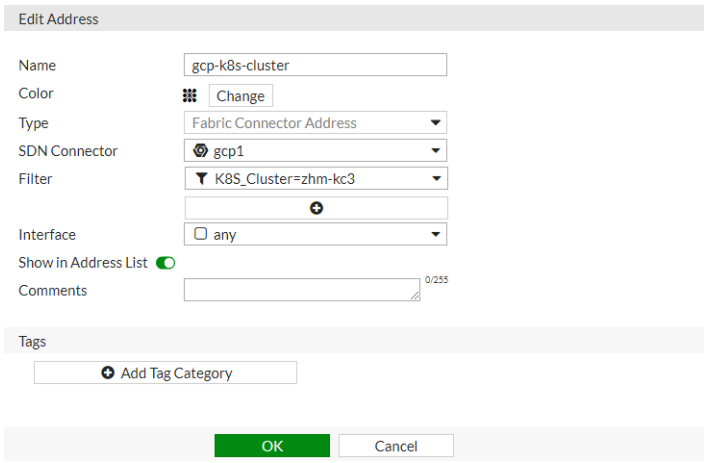


1. Configure the SDN connector:
```
config system sdn-connector
   edit "azure1"
      set type azure
      set tenant-id "942b80cd-1b14-42a1-8dcf-4b21dece61ba"
      set client-id "14dbd5c5-307e-4ea4-8133-68738141feb1"
      set client-secret xxxxx
      set update-interval 30
   next
end
```
2. Create a dynamic firewall address for the SDN connector with a supported Kubernetes filter. In this example, the address will automatically populate and update IP addresses only for instances that belong to the zhmKC cluster:
```
config firewall address
   edit "az-k8s-cluster"
      set type dynamic
      set sdn "azure1"
      set filter "K8S_Cluster=zhmKC"
   next
end
```
3. Confirm that the Azure SDN connector resolves dynamic firewall IP addresses using the configured filter:
```
config firewall address
   edit "az-k8s-cluster"
      set type dynamic
      set sdn "azure1"
      set filter "K8S_Cluster=zhmKC"
      config list
         edit "10.240.0.4"
         next
         edit "10.240.0.5"
         next
         edit "10.244.0.10"
         next
      end
   next
end
```

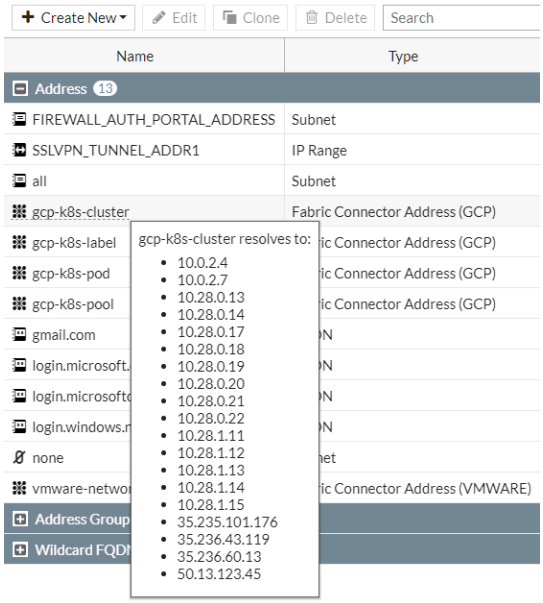
GCP Kubernetes (GKE) SDN connector using service account

Google Cloud Platform (GCP) SDN connectors support dynamic address groups based on GCP Kubernetes Engine (GKE) filters.

To enable a GCP SDN connector to fetch IP addresses from GKE:



1. Go to *Security Fabric* > *External Connectors*, and configure an SDN connector for GCP.



2. Go to *Policies & Objects* > *Addresses* and create a dynamic firewall address for the configured SDN connector using the supported Kubernetes filter.
3. To filter out the Kubernetes IP addresses, select the address filter or filters. The following filters are supported:

Filter	Description
k8s_cluster	Name of Kubernetes cluster.
k8s_namespace	Namespace of a Kubernetes service or pod.
k8s_svcname	Name of a Kubernetes service.
k8s_nodename	Name of a Kubernetes node.
k8s_zone	Zone of a Kubernetes node.
k8s_region	Region of a Kubernetes node.
k8s_podname	Name of a Kubernetes pod.
k8s_label.xxx	Name of label of a Kubernetes resource (cluster/service/node/Pod).

In this example, the GCP SDN connector will automatically populate and update IP addresses only for instances that belong to the zhm-kc3 cluster:

4. Configure the rest of the settings, then click *OK*.
   The dynamic firewall address IP is resolved by the SDN connector.

To configure a GCP Kubernetes SDN connector through the CLI:

1. Configure an SDN connector for Kubernetes:

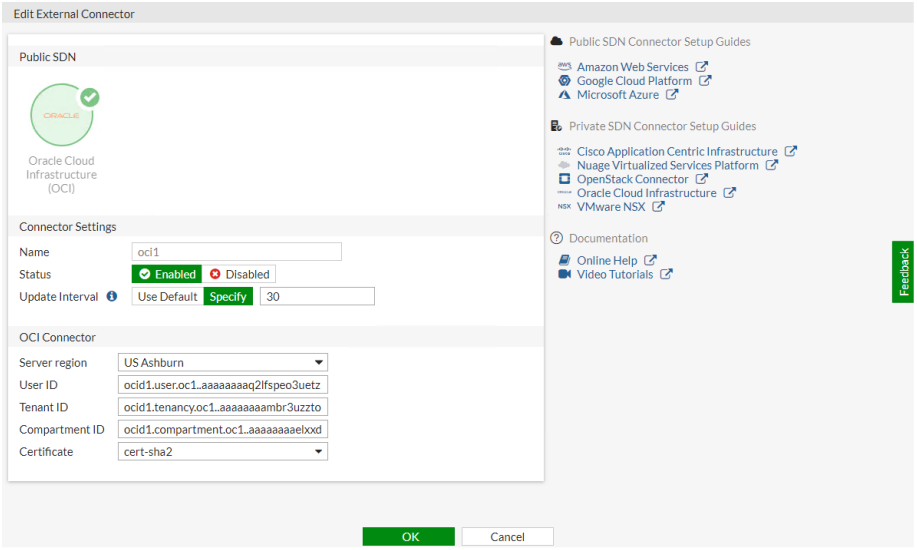
```
config system sdn-connector
   edit "gcp1"
      set type gcp
      set gcp-project "dev-project-001-166400"
      set service-account "966517025500-compute@developer.gserviceaccount.com"
      set update-interval 30
   next
end
```

2. Create a dynamic firewall address for the SDN connector with a supported Kubernetes filter:

```
config firewall address
   edit "gcp-k8s-cluster"
      set type dynamic
      set sdn "gcp1"
```

```
        set filter "K8S_Cluster=zhm-kc3"
    next
end
```

The dynamic firewall address IP is resolved by the SDN connector:

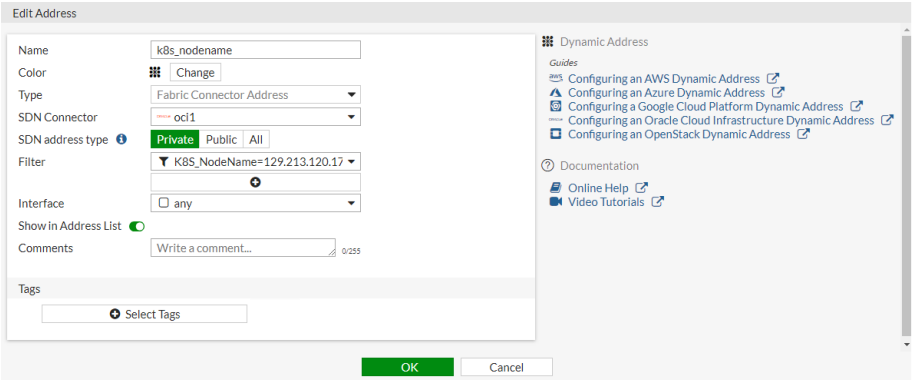


```
config firewall address
    edit "gcp-k8s-cluster"
        set type dynamic
        set sdn "gcp1"
        set filter "K8S_Cluster=zhm-kc3"
        config list
            edit "10.0.2.4"
            next
            edit "10.0.2.7"
            next
            edit "10.28.0.13"
            next
        end
    next
end
```

Oracle Kubernetes (OKE) SDN connector using certificates

OCI SDN connectors support dynamic address groups based on Oracle Kubernetes (OKE) filters.

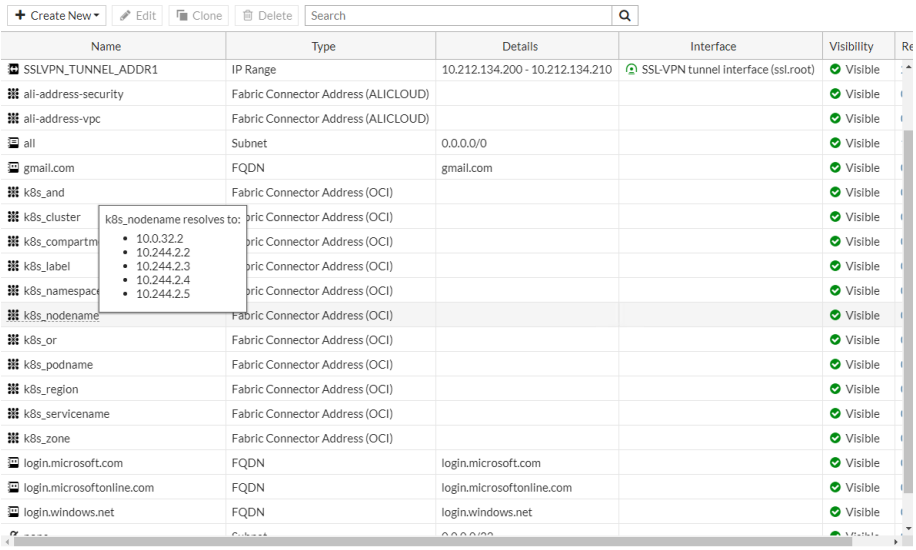
To enable an OCI SDN connector to fetch IP addresses from Oracle Kubernetes:



1. Configure the OCI SDN connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*, and select *Oracle Cloud Infrastructure (OCI)*.
   c. Configure as shown substituting the region, tenant and client IDs, and client secret for your deployment. The update interval is in seconds.

2. Create dynamic firewall addresses for the configured SDN connector with supported Kubernetes filter:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New*, then select *Address*.

c. In the *Filter* field, select the desired filters. The following filters are supported:



Filter	Description
k8s_cluster	Name of Kubernetes cluster.
k8s_namespace	Namespace of a Kubernetes service or pod.
k8s_svcname	Name of a Kubernetes service.
k8s_nodename	Name of a Kubernetes node.
k8s_zone	Zone of a Kubernetes node.
k8s_region	Region of a Kubernetes node.
k8s_podname	Name of a Kubernetes pod.
k8s_label.xxx	Name of label of a Kubernetes resource (cluster/service/node/Pod).

3. Confirm that the SDN connector resolves dynamic firewall IP addresses:

a. Go to *Policy & Objects* > *Addresses*.

b. Hover over the address created in step 2 to see a list of IP addresses for instances:

To configure an SDN connector through the CLI:

1. Configure the OCI SDN connector:

```
config system sdn-connector
   edit "oci1"
      set type oci
      set tenant-id
           "ocid1.tenancy.oc1..aaaaaaaambr3uzztoyhweohbzqqdo775h7d3t54zpmzkp4b2cf35vs5
           5cxxx"
      set user-id
           "ocid1.user.oc1..aaaaaaaaq2lfspeo3uetzbzpiv2pqvzzevozccnys347stwssvizqlatfx
           xx"
      set compartment-id
           "ocid1.compartment.oc1..aaaaaaaaelxxdjazqo7nzczpgypyiqcgkmytjry6nfq5345vw7e
           avpwnmxxx"
      set oci-region ashburn
      set oci-cert "cert-sha2"
      set update-interval 30
   next
end
```

2. Create dynamic firewall addresses for the configured SDN connector with supported Kubernetes filter:

```
config firewall address
   edit "k8s_nodename"
      set type dynamic
      set sdn "oci1"
      set filter "K8S_NodeName=129.213.120.172"
   next
end
```

3. Confirm that the SDN connector resolves dynamic firewall IP addresses:

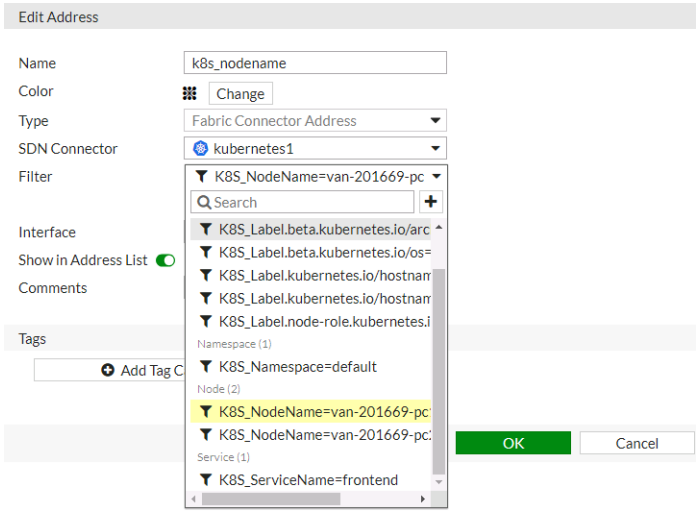
```
config firewall address
   edit "k8s_nodename"
      set type dynamic
      set sdn "oci1"
      set filter "K8S_NodeName=129.213.120.172"
      config list
         edit "10.0.32.2"
         next
         edit "10.244.2.2"
         next
         edit "10.244.2.3"
         next
         edit "10.244.2.4"
         next
         edit "10.244.2.5"
         next
      end
   next
end
```

Private cloud K8s SDN connector using secret token

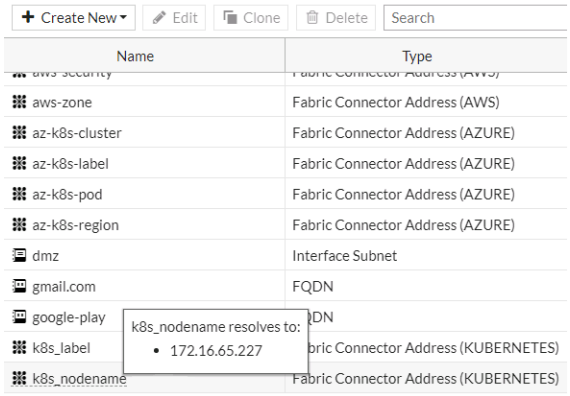
FortiOS automatically updates dynamic and cluster IP addresses for Kubernetes (K8s) by using a K8s SDN connector, enabling FortiOS to manage K8s pods as global address objects, as with other connectors. This includes mapping the following attributes from K8s instances to dynamic address groups in FortiOS:

Filter	Description
Namespace	Filter service IP addresses in a given namespace.
ServiceName	Filter service IP addresses by the given service name.
NodeName	Filter node IP addresses by the given node name.
PodName	Filter IP addresses by the pod name.
Label.XXX	Filter service or node IP addresses with the given label XXX. For example: `K8S_Label.app=nginx`.

FortiOS 6.2.3 and later collect cluster IP addresses in addition to external IP addresses for exposed K8s services.



There is no maximum limit for the number of IP addresses populated with the filters.



To configure K8s SDN connector using the GUI:

1. Configure the K8s SDN connector:
   a. Go to *Security Fabric* > *External Connectors* > *Create New Connector*.
   b. Select *Kubernetes*.
   c. In the *IP* field, enter the IP address that you obtained in Obtaining the IP address, port, and secret token in Kubernetes.
   d. In the *Port* field, select *Specify*, then enter the port that you obtained in Obtaining the IP address, port, and secret token in Kubernetes.
   e. In the *Secret token* field, enter the token that you obtained in Obtaining the IP address, port, and secret token in Kubernetes.
   f. Configure the other fields as desired.
2. Create a dynamic firewall address for the configured K8S SDN connector:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New*, then select *Address*.
   c. Configure the address as shown, selecting the desired filter in the *Filter* dropdown list. In this example, the K8s SDN connector will automatically populate and update IP addresses only for node instances that match

the specified node name:

3. Ensure that the K8s SDN connector resolves dynamic firewall IP addresses:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Hover over the address created in step 2 to see a list of IP addresses for node instances that match the node name configured in step 2:

To configure K8s SDN connector using CLI commands:

1. Configure the K8s SDN connector:

```
config system sdn-connector
   edit "kubernetes1"
      set type kubernetes
      set server "<IP address obtained in Obtaining the IP address, port, and secret
          token in Kubernetes>"
      set server-port <Port obtained in Obtaining the IP address, port, and secret token
          in Kubernetes>
      set secret-token <Secret token obtained in Obtaining the IP address, port, and
          secret token in Kubernetes>
      set update-interval 30
   next
end
```

2. Create a dynamic firewall address for the configured K8s SDN connector with the supported K8s filter. In this example, the K8s SDN connector will automatically populate and update IP addresses only for node instances that match the specified node name:

```
config firewall address
   edit "k8s_nodename"
      set type dynamic
      set sdn "kubernetes1"
      set filter "K8S_NodeName=van-201669-pc1"
   next
end
```

3. Confirm that the K8s SDN connector resolves dynamic firewall IP addresses using the configured filter:

```
config firewall address
   edit "k8s_nodename"
      set type dynamic
      set sdn "kubernetes1"
      set filter "K8S_NodeName=van-201669-pc1"
      config list
         edit "172.16.65.227"
         next
      end
   next
end
```

To troubleshoot the connection:

1. In FortiOS, run the following commands:

```
diagnose deb application kubed -1
diagnose debug enable
```

2. Reset the connection on the web UI to generate logs and troubleshoot the issue. The following shows the output in the case of a failure:

```
fortigate # diagnose deb application kubed -1
Debug messages will be on for 30 minutes.

fortigate # diagnose debug enable

fortigate # k8s: update sdn connector kubernetes1 status to enabled
k8s: update sdn connector kubernetes2 status to disabled
kubed sdn connector kubernetes1 prepare to update
getting token
kubed sdn connector kubernetes1 start updating
kube url: https://172.17.215.10:6443/api/v1/services
kube host: 172.17.215.10:6443:172.17.215.10
{"kind":"Status","apiVersion":"v1","metadata":{},"status":"Failure","message":"s

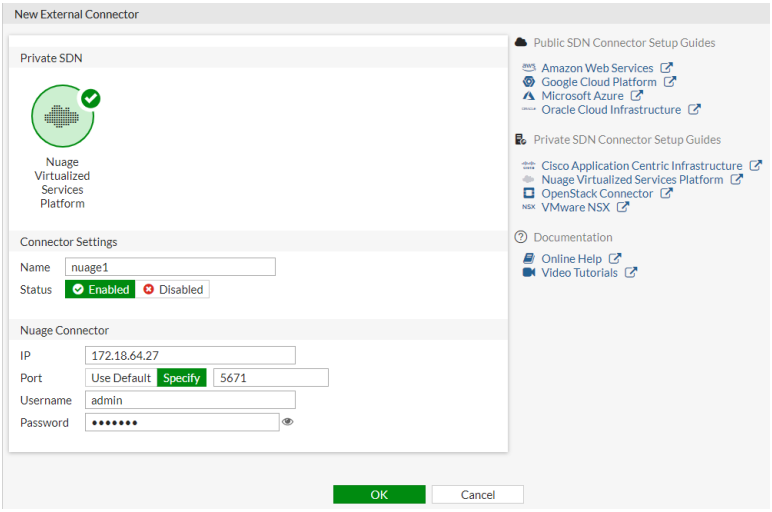
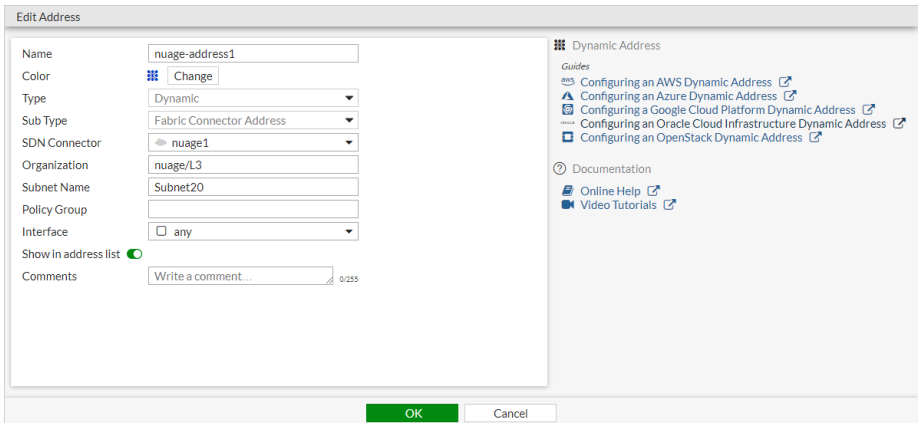
  10.184.0.1
kubed sdn connector kubernetes2 finish updating IP addresses
kubed reap child pid: 1252
```



Nuage SDN connector using server credentials

You can use Nuage SDN connectors in dynamic firewall addresses.

The Fortinet SDN Connector for Cisco ACI and Nuage Networks is a standalone connector that connects to SDN controllers within Cisco ACI and Nuage Networks. You must configure a connection to the Fortinet SDN connector in FortiOS to query the dynamic addresses.



To configure a Nuage connector in the GUI:

1. Create the Nuage SDN connector:
   a. Go to *Security Fabric* > *External Connectors* and click *Create New*.
   b. In the *Private SDN* section, click *Nuage Virtualized Services Platform*.
   c. Configure the settings as needed.
   d. Click *OK*.

2. Create the dynamic firewall address for the connector:
   a. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
   b. Configure the following settings:
      i. For *Type*, select *Dynamic*.
      ii. For *Sub Type*, select *Fabric Connector Address*.
      iii. For *SDN Connector*, select the Nuage connector.
      iv. Configure the remaining settings as needed.

c. Click *OK*.

To verify the SDN connector resolves the dynamic firewall IP addresses in the GUI:

1. Go to *Policy & Objects* > *Addresses*.
2. In the address table, hover over an address to view which IP addresses it resolves to.

To configure a Nuage connector in the CLI:

1. Create the SDN connector:

```
config system sdn-connector
    edit "nuage1"
        set type nuage
        set server "172.18.64.27"
        set server-port 5671
        set username "admin"
        set password xxxxxxx
    next
end
```

2. Create the dynamic firewall address for the connector:

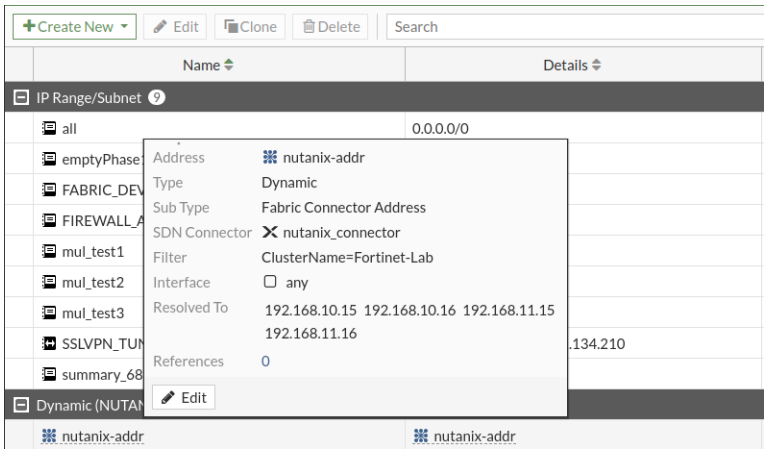
```
config firewall address
    edit "nuage-address1"
        set type dynamic
        set sdn "nuage1"
        set color 19
        set organization "nuage/L3"
        set subnet-name "Subnet20"
    next
end
```

To verify the SDN connector resolves the dynamic firewall IP addresses in the CLI:

```
# diagnose firewall dynamic list

List all dynamic addresses:
nuage1.nuage.nuage/L3.Subnet20.*: ID(196)
        ADDR(192.168.20.92)
        ADDR(192.168.20.240)
```

Nutanix SDN connector using server credentials



FortiOS automatically updates dynamic addresses for Nutanix using an Nutanix SDN connector, including mapping the following attributes from Nutanix instances to dynamic address groups in FortiOS:

- Cluster name
- Cluster UUID
- Description
- Host name
- Host UUID
- Hypervisor type
- Image name
- Image UUID
- Subnet name
- Subnet UUID
- VM name
- VM UUID

To configure a Nutanix connector using the GUI:

1. Configure the Nutanix SDN connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Select *Nutanix*.
   c. In the *IP address* field, enter the IP address for your Nutanix environment.
   d. In the *Port* field, enter the desired port.
   e. In the *Username* and *Password* fields, enter the credentials for your Nutanix environment.
   f. Click *OK*.
2. Create a dynamic firewall address for the configured Nutanix SDN connector:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New*, then select *Address*.
   c. From the *Type* dropdown list, select *Dynamic*.
   d. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
   e. From the *SDN Connector* dropdown list, select the Nutanix connector.
   f. From the *Filter* dropdown list, select the desired filters.
   g. Click *OK*.
3. Ensure that the Nutanix SDN connector resolves dynamic firewall IP addresses:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Hover over the address created in step 2 to see a list of IP addresses for instances that satisfy the filter

requirements configured in step 2. In this example, the configured filter is "ClusterName=Fortinet-Lab":

To configure a Nutanix connector using the CLI:

1. Configure the Nutanix SDN connector:

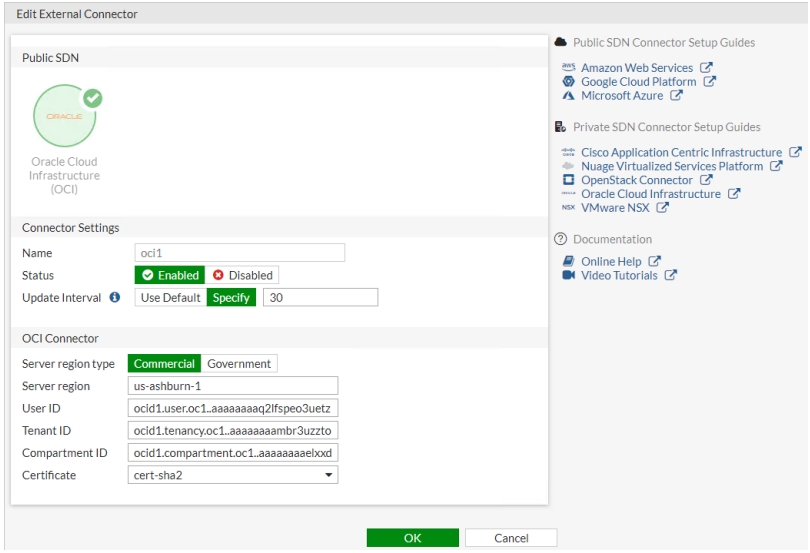
```
config system sdn-connector
   edit "nutanix_connector"
      set status disable
      set type nutanix set server "172.18.33.59"
      set server-port 9440
      set username "admin"
      set password **********
      set update-interval 60
   next
end
```

2. Create a dynamic firewall address for the configured Nutanix SDN connector:

```
config firewall address
   edit "nutanix-addr"
      set uuid 382ceafe-8e72-51eb-7300-0807ee907946
      set type dynamic
      set sdn "nutanix_connector"
      set color 2
      set filter "ClusterName=Fortinet-Lab"
   next
end
```

3. Ensure that the Nutanix SDN connector resolves dynamic firewall IP addresses:

```
config firewall address
   edit "nutanix-addr"
      set uuid 382ceafe-8e72-51eb-7300-0807ee907946
      set type dynamic
      set sdn "nutanix_connector"
      set color 2
      set filter "ClusterName=Fortinet-Lab"
      config list
         edit "192.168.10.15"
         next
         edit "192.168.10.16"
         next
         edit "192.168.11.15"
         next
         edit "192.168.11.16"
```



```
        next
      end
    next
end
```

OCI SDN connector using certificates

You can configure SDN connector integration with Oracle Cloud Infrastructure (OCI).

To configure an OCI SDN connector in the GUI:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *Public SDN* section, select *Oracle Cloud Infrastructure (OCI)*.
3. Configure the connector as desired:
   a. *User ID*: Enter the OCID of the OCI user who belongs to the administrator group. See Certificate-based SDN connector requirements.
   b. For the *OCI Certificate* field, you must select a certificate that satisfies OCI key size limits. The minimum size is 2048 bits. Do one of the following:
      i. Select the built-in default certificate called Fortinet_Factory.
      ii. Follow steps 1-2 in Using custom certificates to configure a custom certificate.

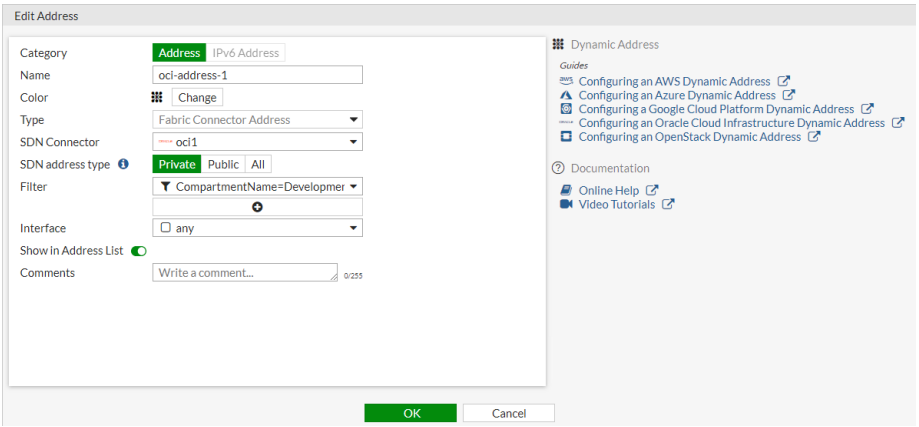
4. Click *OK*.
5. At this stage, you must register the certificate's fingerprint to the specified OCI user.
   a. Go to the OCI user, then *API Keys* > *Add Public Key*.
   b. If you selected the Fortinet_Factory certificate in step 2f, do the following:
      i. In FortiOS, go to *System* > *Certificate*. Select Fortinet_Factory, then click *Download*.
      ii. You now have the Fortinet_Factory.cer file. Create a public key file in PEM format from it, using a freely available tool of your choice such as OpenSSL.
   c. Copy and paste the content of the certificate PEM key file in the *Add Public Key* window in OCI. Click *Add*.

d. You now see the fingerprint.

You can configure the following for the fingerprint:

1. *Update Interval*: The default value is 60 seconds. You can change the value to between 1 and 3600 seconds.
2. *Status*: Green means that the connector is enabled. You can disable it at any time by toggling the switch.

e. Click *OK*.



6. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
7. Configure the address as needed, selecting the OCI connector in the *SDN Connector* field. The following filters are supported:

   `'vm_name=<vm name>'`: matches VM instance name.

   `'instance_id=<instance id>'`: matches instance OCID.

   `'tag.<key>=<value>'`: matches freeform tag key and its value.

   `'definedtag.<namespace>.<key>=<value>'`: matches a tag namespace, tag key, and its value.

8. Click *OK*.

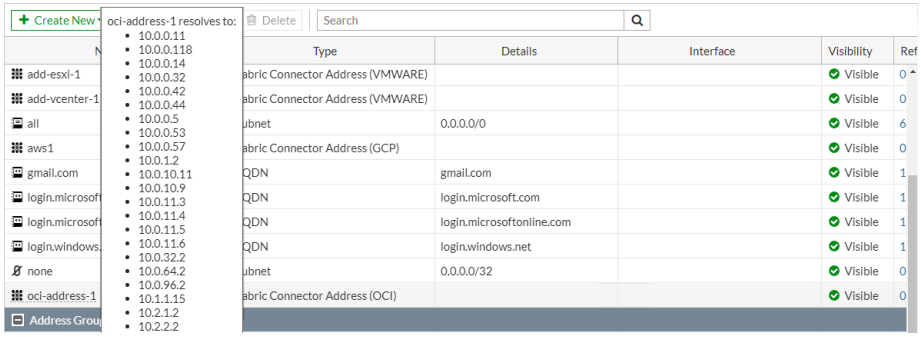
To configure an OCI SDN connector in the CLI:

1. Configure an SDN connector:

```
config system sdn-connector
    edit "oci1"
        set status enable
        set type oci
        set tenant-id
"ocid1.tenancy.oc1..aaaaaaaaaaa3aaaaaaaaaaaaaaaaa77xxxxxx54bbbbbb4xxxx35xx55xxxx"
        set user-id
"ocid1.user.oc1..aaaaaaaaa2laaaaa3aaaaaaaaaabbbbbbbbbbcccc3ccccccccccxxxxxxxx"
        set compartment-id
"ocid1.compartment.oc1..aaaaaaaaaaaaaaaaa7bbbbbbbbbbccccccccc6xxx53xxxx7xxxxxxxxx"
        set oci-region "us-ashburn-1"
```

```
        set oci-region-type commercial
        set oci-cert "cert-sha2"
        set update-interval 30
    next
end
```

2. Create a dynamic firewall address for the SDN connector with a supported filter:



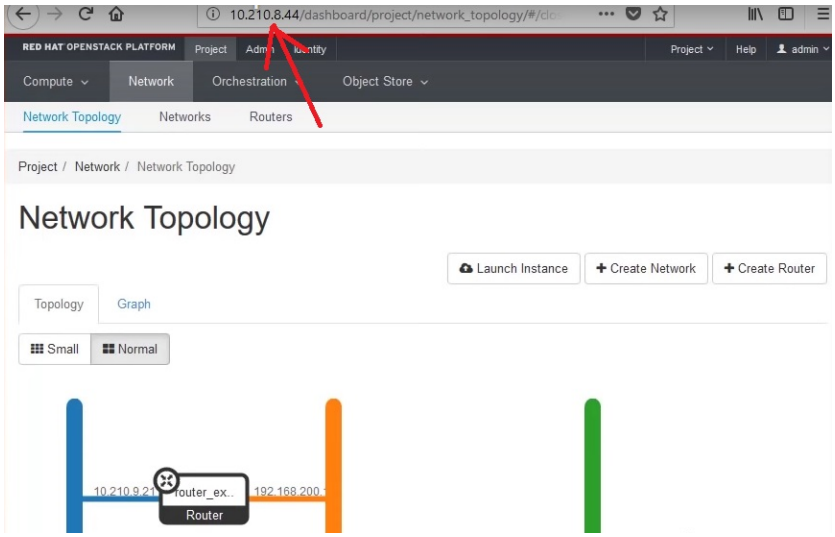
```
config firewall address
    edit "oci-address-1"
        set type dynamic
        set sdn "oci1"
        set filter "CompartmentName=DevelopmentEngineering"
    next
end
```

To confirm that dynamic firewall addresses are resolved by the SDN connector:

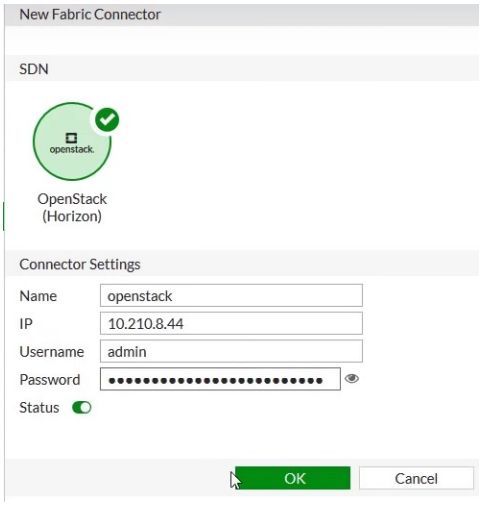
1. In the CLI, check that the addresses are listed:

```
config firewall address
    edit "oci-address-1"
        set type dynamic
        set sdn "oci1"
        set filter "CompartmentName=DevelopmentEngineering"
        config list
            edit "10.0.0.11"
            next
            edit "10.0.0.118"
            next
            ...
            next
        end
    next
end
```

2. In the GUI, go to *Policy & Objects* > *Addresses* and hover the cursor over the address name.



OpenStack SDN connector using node credentials



To configure OpenStack SDN connector using node credentials:

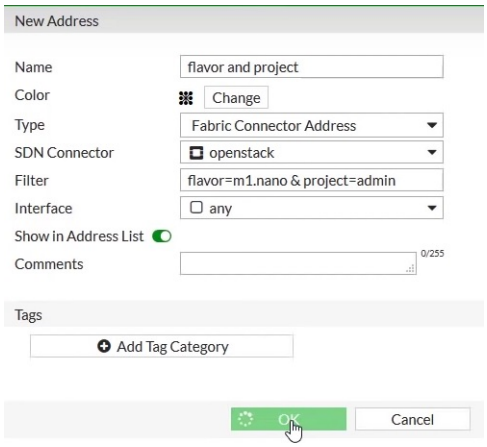
1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*, then select *OpenStack (Horizon)*.

3. Configure the fields as follows:
   a. *Name*: Name the connector as desired.
   b. *IP*: Enter the OpenStack management component's IP address. Generally you can find it in the OpenStack identity.

   c. *User name*: Enter the specified node's administrator name.
   d. *Password*: Enter the administrator password.

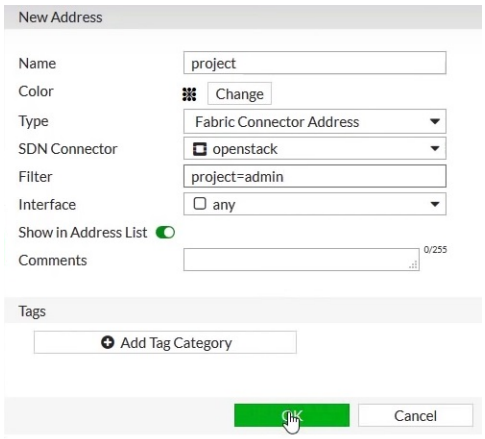
4. Click *OK*. The SDN connector is now configured.

To configure a dynamic firewall address:



The next step is to create an address that will be used as an address group or single address that acts as the source/destination for firewall policies. The address is based on IP addresses and contains VM instances' IP addresses.

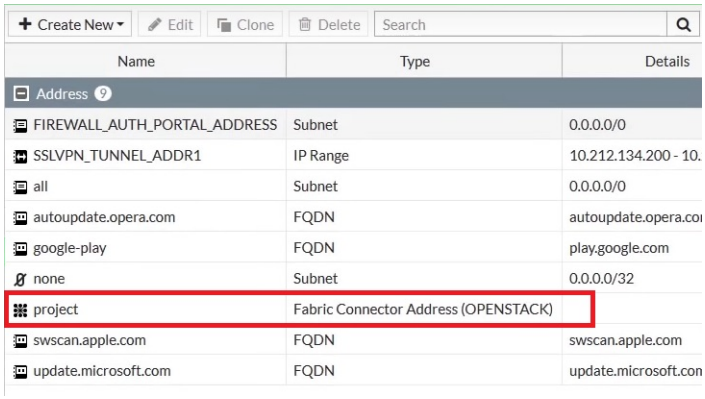
No matter what changes occur to the instances, the SDN connector populates and updates the changes automatically based on the specified filtering condition so that administrators do not need to reconfigure the address content manually. Appropriate firewall policies using the address are applied to instances that are members of the address.



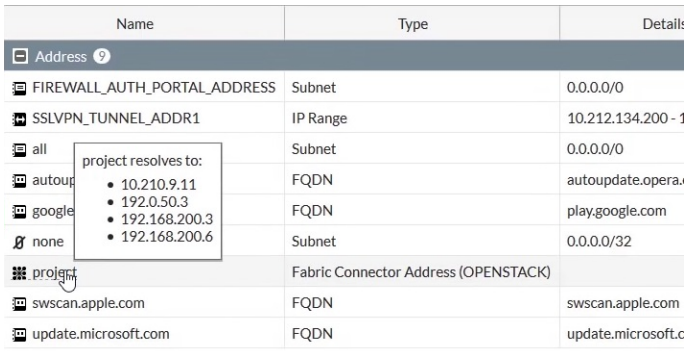
1. Go to *Policy & Objects* > *Address*. Click *Create New*, then select *Address*.
2. Configure the address as follows:
   a. *Name*: Name the address as desired.
   b. *Type*: Select *Dynamic*.
   c. *Sub Type*: Select *Fabric Connector Address*.
   d. *SDN Connector*: Select *openstack*.
   e. *Filter*: The SDN connector automatically populates and updates only IP addresses belonging to the specified filter that matches the condition. OpenStack Horizon connectors support the following filters:
      i. `id=<instance id>`: This matches a VM instance ID.
      ii. name=<instance name>: This matches a VM instance name.
      iii. `flavor=<instance flavor name>`: This matches an instance flavor name.
      iv. `keypair=<key pair name>`: This matches a key pair name.
      v. `network=<net name>`: This matches a network name.
      vi. `project=<project name>`: This matches a project name.
      vii. `availabilityzone=<zone name>`: This matches an availability zone name.
      viii. `servergroup=<group name>`: This matches a server group name.
      ix. `securitygroup=<security group name>`: This matches a security group name.
      x. `metadata.<key>=<value>`: This matches metadata with its key and value pair.

   You can set filtering conditions using multiple entries with AND ("&") or OR ("|"). When both AND and OR are specified, AND is interpreted first, then OR.

   For example, you could enter `flavor=m1.nano&project=admin`. In this case, IP addresses of instances that match both the flavor name and project name are populated. Wildcards (asterisks) are not allowed in values.

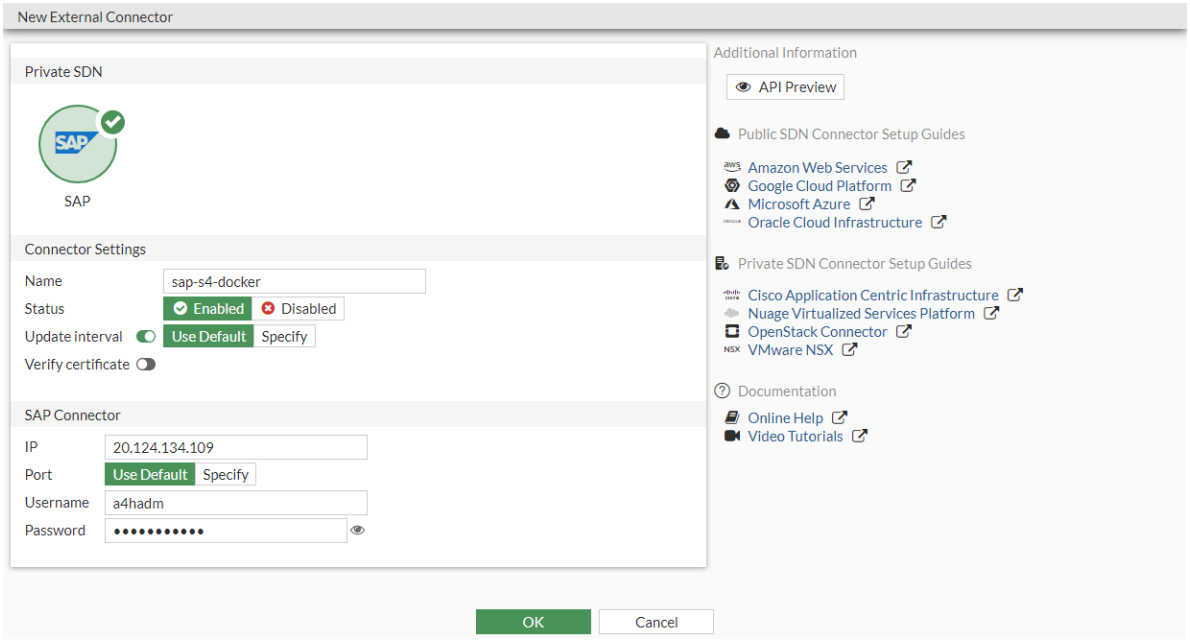


In this example, let's use project=admin, assuming the project name is admin.

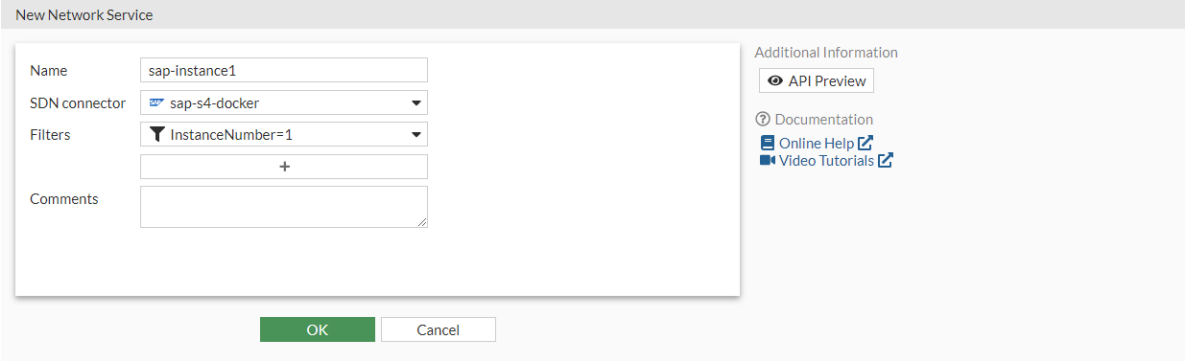


3. Click *OK* after completing all required fields.
4. Ensure that the address was created.

5. After a few minutes, the new address takes effect. Hover your cursor on the address to see a list of IP addresses and instances with the project name "admin".



SAP SDN connector

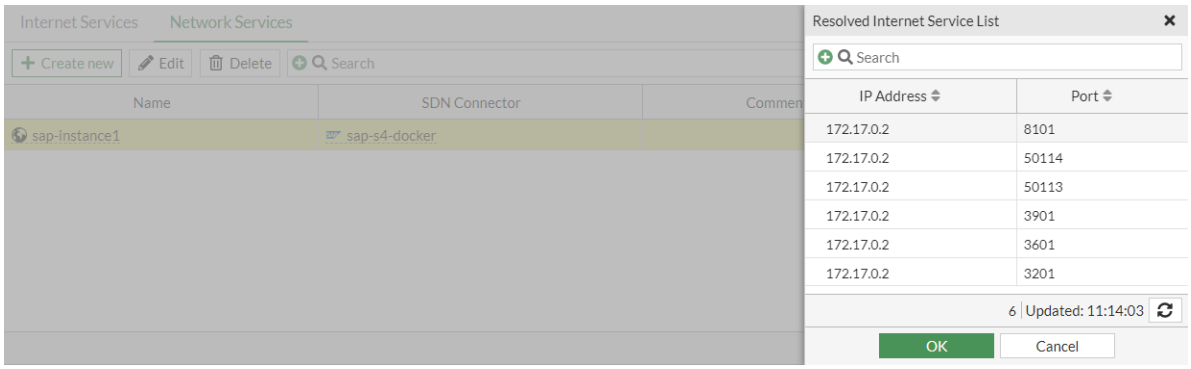


The SAP external Fabric connector allows the FortiGate to connect to an SAP instance to synchronize dynamic address objects and ports for SAP workloads. These address objects can be used in firewall policies to grant access control to dynamic SAP workloads.

To configure an SAP connector in the GUI:

1. Configure the SAP SDN connector:
   a. Go to *Security Fabric* > *External Connectors* and click *Create New*.
   b. In the *Private SDN* section, select *SAP*.
   c. Enter a *Name* (*sap-s4-docker*).
   d. Enter the *IP* for the SAP instance.
   e. Enter the *Username* and *Password*.

   f. Click *OK*.
2. Configure a network service associated with the configured SAP SDN connector:
   a. Go to *Policy & Objects* > *Internet Service Database*, select the *Network Services* tab, and click *Create New*.
   b. Enter a *Name* (*sap-instance1*).
   c. Set *SDN connector* to *sap-s4-docker*.
   d. Select a filter, such as *InstanceNumber=1*. The available filters are for HostName, InstanceNumber, and ServiceName.



e. Click *OK*.

3. Ensure that the SAP SDN connector resolves dynamic network services:
   a. Go to *Policy & Objects* > *Internet Service Database*, select the *Network Services* tab.
   b. Hover over the *sap-instance1* and click *View Resolved Entries*.

A list of resolved internet services is displayed.

Click *OK* to close the list.

4. Configure a firewall policy with the resolved dynamic network service as the destination:
   a. Go to *Policy & Objects* >*Firewall Policy* and click *Create New*.
   b. Set the *Destination* to the *sap-instance1* network service.
   c. Configure the other settings as needed.
   d. Click *OK*.

To configure an SAP connector in the CLI:

1. Configure the SAP SDN connector:

```
config system sdn-connector
    edit "sap-s4-docker"
        set type sap
        set verify-certificate disable
        set server "20.124.134.109"
```

```
        set server-port 50014
        set username "a4hadm"
        set password ************
    next
end
```

2. Configure a network service associated with the configured SAP SDN connector (available filters are HostName, InstanceNumber, and ServiceName):

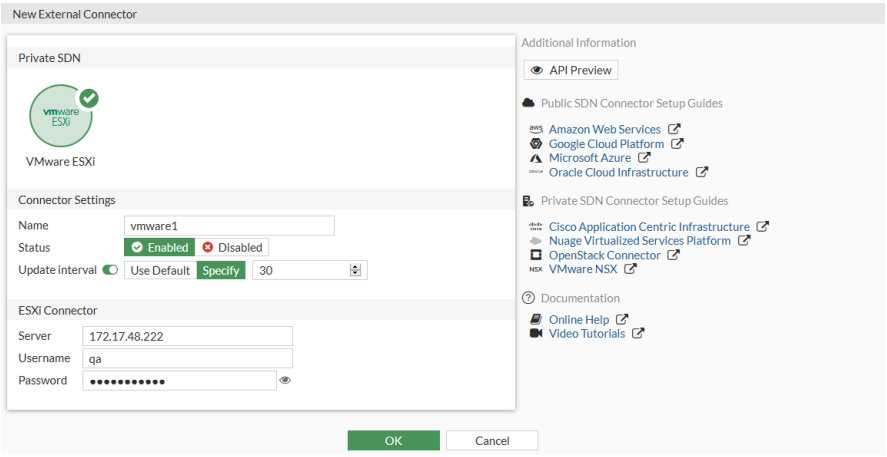
```
config firewall network-service-dynamic
    edit "sap-instance1"
        set sdn "sap-s4-docker"
        set filter "InstanceNumber=1"
    next
end
```

3. Ensure that the SAP SDN connector resolves dynamic network services:

```
# diagnose firewall network-service-dynamic list "sap-instance1"
List internet service in kernel(custom):
name=sap-instance1 id=4294770689 reputation=0 (null) singularity=0 flags=0x0 protocol=6
port=8101-8101
addr ip range(1): 172.17.0.2-172.17.0.2
name=sap-instance1 id=4294770689 reputation=0 (null) singularity=0 flags=0x0 protocol=6
port=50114-50114
addr ip range(1): 172.17.0.2-172.17.0.2
name=sap-instance1 id=4294770689 reputation=0 (null) singularity=0 flags=0x0 protocol=6
port=50113-50113
addr ip range(1): 172.17.0.2-172.17.0.2
name=sap-instance1 id=4294770689 reputation=0 (null) singularity=0 flags=0x0 protocol=6
port=3901-3901
addr ip range(1): 172.17.0.2-172.17.0.2
name=sap-instance1 id=4294770689 reputation=0 (null) singularity=0 flags=0x0 protocol=6
port=3601-3601
addr ip range(1): 172.17.0.2-172.17.0.2
name=sap-instance1 id=4294770689 reputation=0 (null) singularity=0 flags=0x0 protocol=6
port=3201-3201
addr ip range(1): 172.17.0.2-172.17.0.2
```

4. Configure a firewall policy with the resolved dynamic network service as the destination:

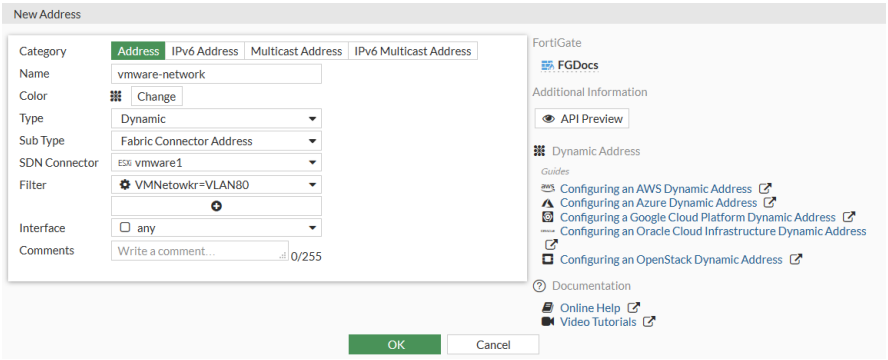
```
config firewall policy
    edit 2
        set name "FGT97-service-dynamic"
        set srcintf "port3"
        set dstintf "port10"
        set action accept
        set srcaddr "all"
        set internet-service enable
        set network-service-dynamic "sap-instance1"
        set schedule "always"
        set nat enable
    next
end
```



VMware ESXi SDN connector using server credentials

Dynamic addresses for VMware ESXi and vCenter servers can be automatically updated by using a VMware ESXi SDN connector, including mapping the following attributes from VMware ESXi and vCenter objects to dynamic address groups in FortiOS:

- vmid
- host
- name
- uuid
- vmuuid
- vmnetwork
- guestid
- guestname
- annotation
- datacenter
- tag



To configure VMware ESXi SDN connector using the GUI:

1. Configure the VMware ESXi SDN connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*, and select *VMware ESXi*.
   c. Configure as shown, substituting the server IP address, username, and password for your deployment. The update interval is in seconds. The password cannot contain single or double quotes.

2. Create a dynamic firewall address for the configured VMware ESXi SDN connector:
   a. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
   b. Configure the address as shown, selecting the desired filter in the *Filter* dropdown list. In this example, the VMware ESXi fabric connector will automatically populate and update IP addresses only for instances that

belong to VLAN80:

3. Ensure that the VMware ESXi SDN connector resolves dynamic firewall IP addresses:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Hover over the address created in step 2 to see a list of IP addresses for instances that belong to VLAN80 as configured in step 2:

To configure VMware ESXi SDN connector using CLI commands:

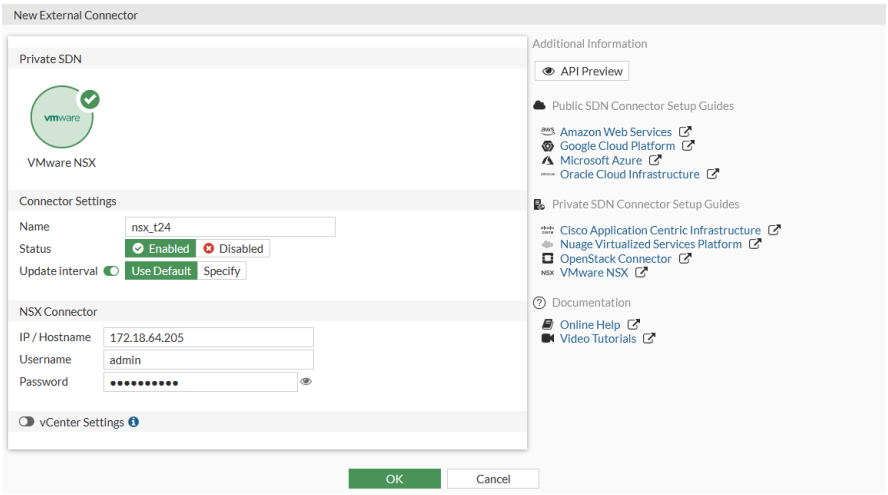
1. Configure the VMware ESXi SDN connector:

```
config system sdn-connector
   edit "vmware1"
      set type vmware
      set server "172.17.48.222"
      set username "example_username"
      set password xxxxx
      set update-interval 30
   next
end
```

2. Create a dynamic firewall address for the configured VMware ESXi SDN connector with the supported VMware ESXi filter. In this example, the VMware ESXi SDN connector will automatically populate and update IP addresses only for instances that belong to the specified VLAN:

```
config firewall address
   edit "vmware-network"
      set type dynamic
      set sdn "vmware1"
      set filter "vmnetwork=VLAN80"
   next
end
```

3. Confirm that the VMware ESXi SDN connector resolves dynamic firewall IP addresses using the configured filter:



```
config firewall address
   edit "vmware-network"
      set type dynamic
      set sdn "vmware1"
      set filter "vmnetwork=VLAN80"
      config list
         edit "192.168.8.240"
         next
      end
   next
end
```

VMware NSX-T Manager SDN connector using NSX-T Manager credentials

This feature provides SDN connector configuration for VMware NSX-T manager. You can import specific groups, or all groups from the NSX-T Manager.

To configure SDN connector for NSX-T Manager in the GUI:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *Private SDN* section, click *VMware NSX*.

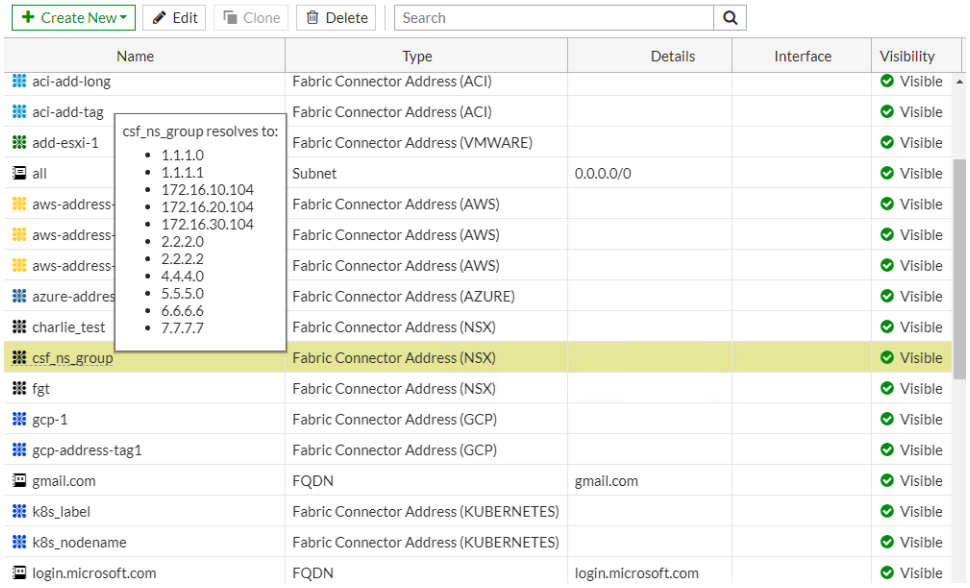
3. Configure the settings and click *OK*.

To configure SDN connector for NSX-T Manager in the CLI:

```
config system sdn-connector
    edit "nsx_t24"
        set type nsx
        set server "172.18.64.205"
        set username "admin"
        set password xxxxxx
    next
end
```

To import a specific group from the NSX-T Manager:

```
# execute nsx group import nsx_t24 root csf_ns_group
[1] 336914ba-0660-4840-b0f1-9320f5c5ca5e csf_ns_group:
  Name:csf_ns_group
  Address:1.1.1.0
  Address:1.1.1.1
  Address:172.16.10.104
  Address:172.16.20.104
  Address:172.16.30.104
  Address:2.2.2.0
  Address:2.2.2.2
  Address:4.4.4.0
  Address:5.5.5.0
```



```
  Address:6.6.6.6
  Address:7.7.7.7
```

To import all groups from NSX-T Manager:

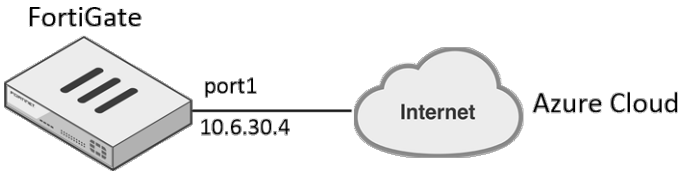
```
# execute nsx group import nsx_t24 root
[1] 663a7686-b9a3-4659-b06f-b45c908349a0 ServiceInsertion_NSGroup:
  Name:ServiceInsertion_NSGroup
  Address:10.0.0.2
[2] 336914ba-0660-4840-b0f1-9320f5c5ca5e csf_ns_group:
  Name:csf_ns_group
  Address:1.1.1.0
  Address:1.1.1.1
  Address:172.16.10.104
  Address:172.16.20.104
  Address:172.16.30.104
  Address:2.2.2.0
  Address:2.2.2.2
  Address:4.4.4.0
  Address:5.5.5.0
  Address:6.6.6.6
  Address:7.7.7.7
[3] c462ec4d-d526-4ceb-aeb5-3f168cecd89d charlie_test:
  Name:charlie_test
  Address:1.1.1.1
  Address:2.2.2.2
  Address:6.6.6.6
  Address:7.7.7.7
[4] ff4dcb08-53cf-46bd-bef4-f7aeda9c0ad9 fgt:
  Name:fgt
  Address:172.16.10.101
  Address:172.16.10.102
  Address:172.16.20.102
  Address:172.16.30.103
[5] 3dd7df0d-2baa-44e0-b88f-bd21a92eb2e5 yongyu_test:
  Name:yongyu_test
  Address:1.1.1.0
  Address:2.2.2.0
  Address:4.4.4.0
  Address:5.5.5.0
```

To view the dynamic firewall IP addresses that are resolved by the SDN connector in the GUI:

1. Go to *Policy & Objects* > *Addresses* to view the IP addresses resolved by an SDN connector.

To view the dynamic firewall IP addresses that are resolved by the SDN connector in the CLI:

```
# show firewall address csf_ns_group
config firewall address
    edit "csf_ns_group"
        set uuid ee4a2696-bacd-51e9-f828-59457565b880
        set type dynamic
        set sdn "nsx_t24"
        set obj-id "336914ba-0660-4840-b0f1-9320f5c5ca5e"
        config list
            edit "1.1.1.0"
            next
            edit "1.1.1.1"
            next
            edit "172.16.10.104"
            next
            edit "172.16.20.104"
            next
            edit "172.16.30.104"
            next
            edit "2.2.2.0"
            next
            edit "2.2.2.2"
            next
            edit "4.4.4.0"
            next
            edit "5.5.5.0"
            next
            edit "6.6.6.6"
            next
            edit "7.7.7.7"
            next
```



```
        end
    next
end
```

Multiple concurrent SDN connectors

This guide shows how to configure SDN connectors and resolve dynamic firewall addresses through the configured SDN connector in FortiOS.

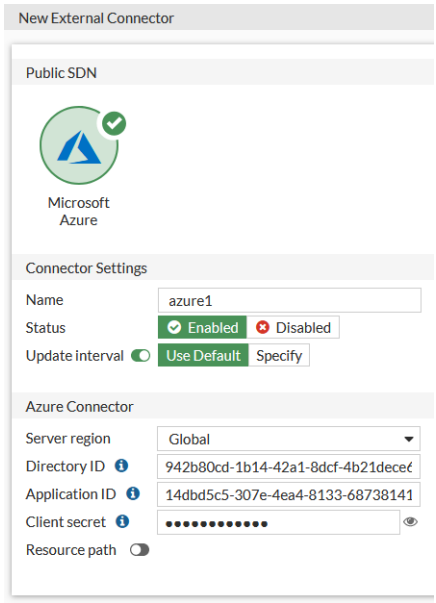
FortiOS supports multiple SDN connectors including public connectors (AWS, Azure, GCP, OCI, AliCloud) and private connectors (Kubernetes, VMware ESXi, VMware NSX, OpenStack, Cisco ACI, Nuage). FortiOS also supports multiple instances for each type of SDN connector.

This guide uses an Azure SDN connector as an example. The configuration procedure for all supported SDN connectors is the same. In the following topology, the FortiGate accesses the Azure public cloud through the Internet:

This process consists of the following:

1. Configure the interface.
2. Configure a static route to connect to the Internet.
3. Configure two Azure SDN connectors with different client IDs.
4. Check the configured SDN connectors.
5. Create two firewall addresses.
6. Check the resolved firewall addresses after the update interval.
7. Run diagnose commands.

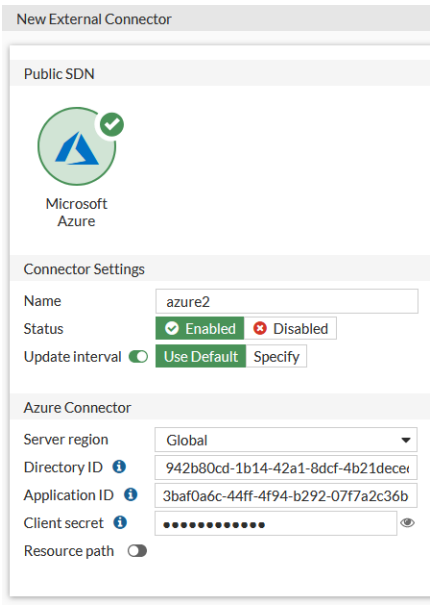
To configure the interface:



1. In FortiOS, go to *Network* > *Interfaces*.
2. Edit port1:
   a. From the *Role* dropdown list, select *WAN*.
   b. In the *IP/Network Mask* field, enter 10.6.30.4/255.255.255.0 for the interface connected to the Internet.

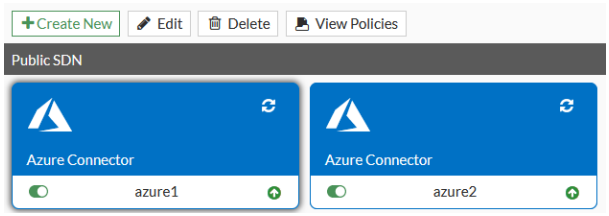
To configure a static route to connect to the Internet:

1. Go to *Network* > *Static Routes*. Click *Create New*.
2. In the *Destination* field, enter 0.0.0.0/0.0.0.0.
3. From the *Interface* dropdown list, select *port1*.
4. In the *Gateway Address* field, enter 10.60.30.254.



To configure two Azure SDN connectors with different client IDs:

1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*. Configure the first SDN connector:
   a. Select *Microsoft Azure*.
   b. In the *Name* field, enter azure1.
   c. In the *Status* field, select *Enabled*.
   d. From the *Server* region dropdown list, select *Global*.
   e. In the *Directory ID* field, enter the directory ID. In this example, it is 942b80cd-1b14-42a1-8dcf-4b21dece61ba.
   f. In the *Application ID* field, enter the application ID. In this example, it is 14dbd5c5-307e-4ea4-8133-68738141feb1.
   g. In the *Client secret* field, enter the client secret.
   h. Leave the *Resource path* disabled.
   i. Click *OK*.

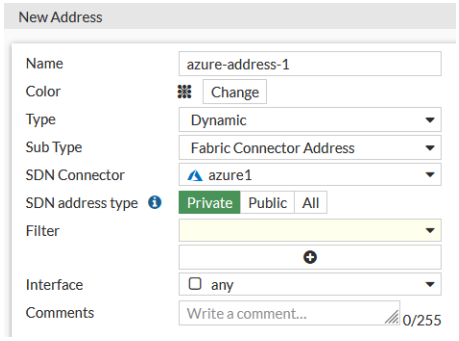


3. Click *Create New*. Configure the second SDN connector:
   a. Select *Microsoft Azure*.
   b. In the *Name* field, enter azure2.
   c. In the *Status* field, select *Enabled*.
   d. From the *Server* region dropdown list, select *Global*.
   e. In the *Directory ID* field, enter the directory ID. In this example, it is 942b80cd-1b14-42a1-8dcf-4b21dece61ba.
   f. In the *Application ID* field, enter the application ID. In this example, it is 3baf0a6c-44ff-4f94-b292-07f7a2c36be6.
   g. In the *Client secret* field, enter the client secret.
   h. Leave the *Resource path* disabled.

i. Click *OK*.

To check the configured SDN connectors:

1. Go to *Security Fabric* > *External Connectors*.
2. Click the *Refresh* icon in the upper right corner of each configured SDN connector. A green up arrow appears in the lower right corner, meaning that both SDN connectors are connected to the Azure cloud using different client IDs.

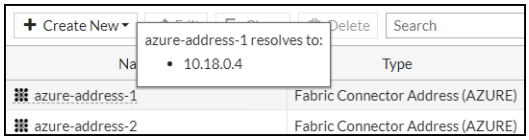


To create two firewall addresses:

This process creates two SDN connector firewall addresses to associate with the configured SDN connectors.

1. Go to *Policy & Objects* > *Addresses*.
2. Click *Create New* > *Address*. Configure the first SDN connector firewall address:
   a. In the *Name* field, enter azure-address-1.
   b. From the *Type* dropdown list, select *Dynamic*.
   c. From the *Sub Type* dropdown list, select *Fabric Connector address*.
   d. From the *SDN Connector* dropdown list, select *azure1*.
   e. For *SDN address type*, select *Private*.
   f. From the *Filter* dropdown list, select the desired filter.
   g. For *Interface*, select *any*.

h. Click *OK*.



3. Click *Create New* > *Address*. Configure the second SDN connector firewall address:
   a. In the *Name* field, enter azure-address-1.
   b. From the *Type* dropdown list, select *Dynamic*.
   c. From the *Sub Type* dropdown list, select *Fabric Connector address*.
   d. From the *SDN Connector* dropdown list, select *azure2*.
   e. For *SDN address type*, select *Private*.
   f. From the *Filter* dropdown list, select the desired filter.
   g. For *Interface*, select *any*.
   h. Click *OK*.

To check the resolved firewall addresses after the update interval:

By default, the update interval is 60 seconds.

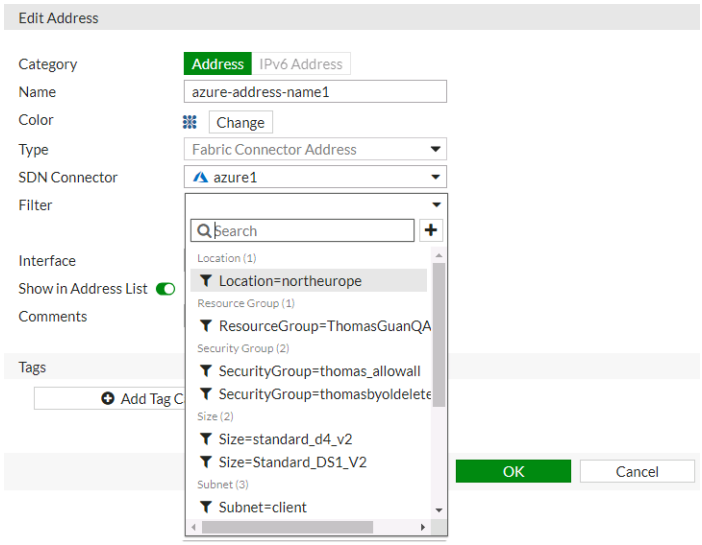
1. Go to *Policy & Objects* > *Addresses*.
2. Hover over the created addresses. The firewall address that the configured SDN connectors resolved display.

To run diagnose commands:

Run the `show sdn connector status` command. Both SDN connectors should appear with a status of `connected`.

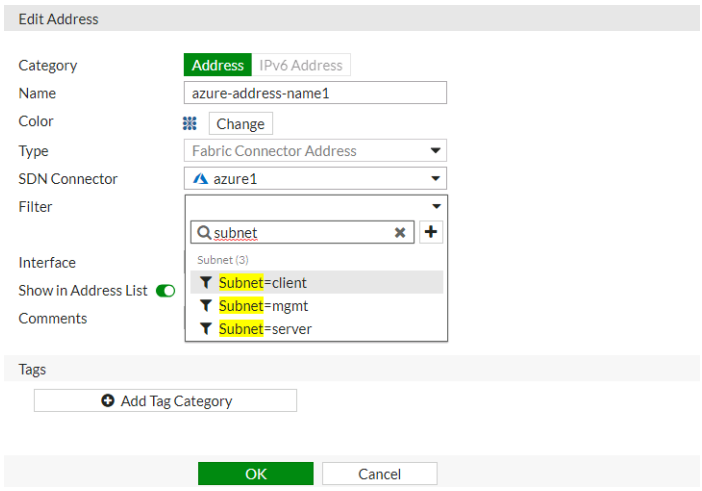
Run the `diagnose debug application azd -1` command. The output should look like the following:

```
Level2-downstream-D # diagnose debug application azd -1
...
azd sdn connector azure1 start updating IP addresses
azd checking firewall address object azure-address-1, vd 0
IP address change, new list:
10.18.0.4
...
```



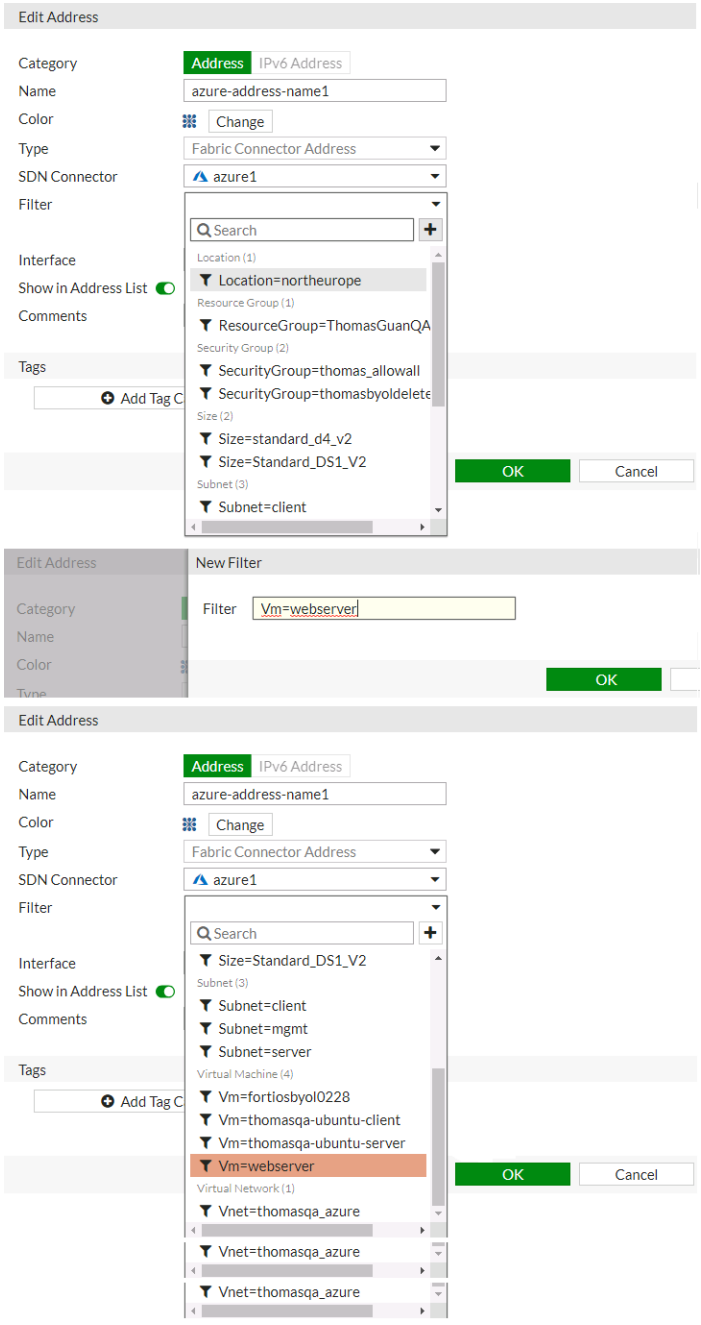
To restart the Azure SDN connector daemon, run the `diagnose test application azd 99` command.

Filter lookup in SDN connectors



When configuring dynamic address mappings for filters in SDN connectors for Azure, GCP, OpenStack, Kubernetes, and AliCloud, FortiGate can query the filters automatically.

To use the filter lookup:



1. Navigate to *Policy & Objects* > *Addresses*.
2. Create or edit an SDN connector type dynamic IP address.
   Supported SDN connector types include: AWS, Azure, GCP, OpenStack, Kubernetes, and AliCloud. The example below is for an Azure SDN connector.
3. In the address *Filter* field, you can perform the following actions:
   - List all available filters.

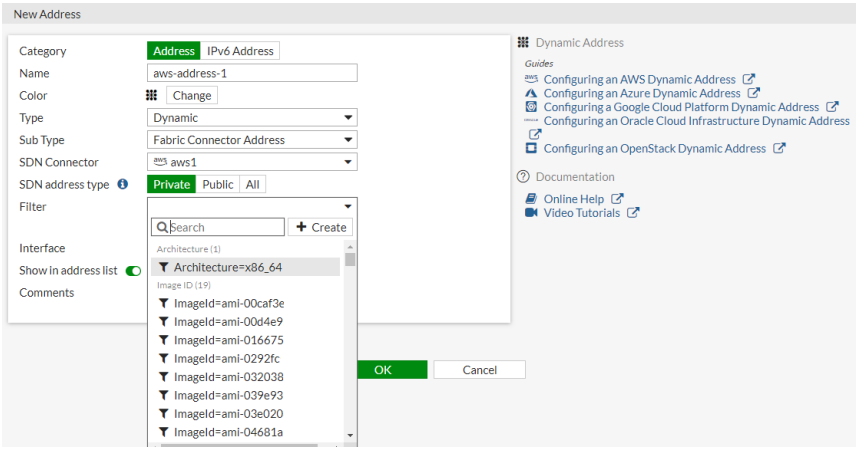
   - Search the available filters.

- Create custom filters.

- Set filter logic [and|or].

Support for wildcard SDN connectors in filter configurations

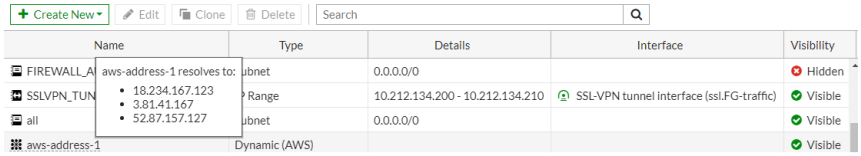
Wildcards are supported for SDN connectors when configuring dynamic address filters.



The following SDN connector types are currently supported:

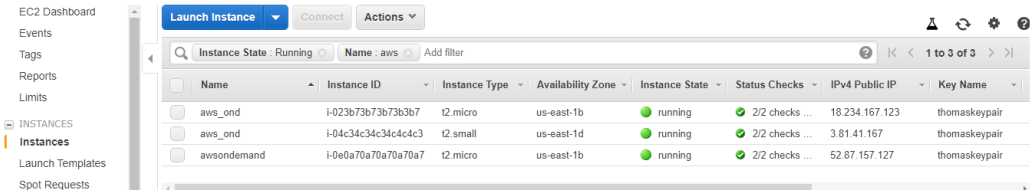
- AWS
- Azure
- Google Cloud Platform
- Kubernetes
- OpenStack
- Oracle Cloud Infrastructure
- VMware ESXi

To configure a dynamic address filter for AWS in the GUI:



1. Create the SDN connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*.
   c. In the *Public SDN* section, click *Amazon Web Services (AWS)*.
   d. Configure the settings as needed.
   e. Click *OK*.
2. Create the dynamic firewall address:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New* > *Address*
   c. Enter a name for the address, then configure the following settings:
      - Set *Type* to *Dynamic*.
      - Set *Sub Type* to *Fabric Connector Address*.
      - Set *SDN Connector* to *aws1*.
      - Set *SDN address type* to *Private*.

- For *Filter*, click *Create*, enter `Tag.Name=aws*`, the click *OK*.



d. Click *OK*.

3. In the address table, hover over the address to view what IPs it resolves to.

4. In AWS, verify to confirm the IP addresses match.

To configure a dynamic address filter for AWS in the CLI:

1. Configure the SDN connector:

```
config firewall address
    edit "aws-address-1"
        set type dynamic
        set sdn "aws1"
        set filter "Tag.Name=aws*"
        set sdn-addr-type public
    next
end
```

2. Create the dynamic firewall address and verify where the IP addresses resolve to:

```
config firewall address
    edit "aws-address-1"
        set type dynamic
        set sdn "aws1"
        set filter "Tag.Name=aws*"
        set sdn-addr-type public
        config list
            edit "18.234.167.123"
```

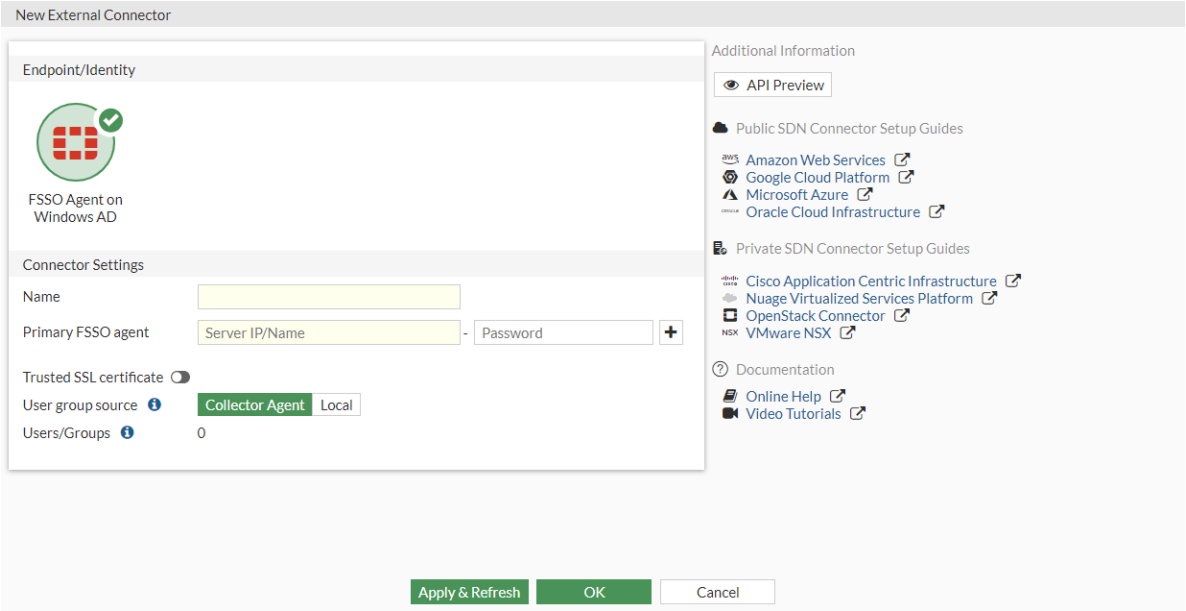
```
                next
                edit "3.81.41.167"
                next
                edit "52.87.157.127"
                next
            end
        next
    end
```

3. In AWS, verify that the IP addresses match.

Endpoint/Identity connectors

SSO fabric connectors integrate SSO authentication into the network. This allows users to enter their credentials only once, and have those credentials reused when accessing other network resources through the FortiGate.

The following fabric connectors are available:



- Fortinet single sign-on agent on page 2678
- Poll Active Directory server on page 2679
- Symantec endpoint connector on page 2680
- RADIUS single sign-on agent on page 2686
- Exchange Server connector on page 2689

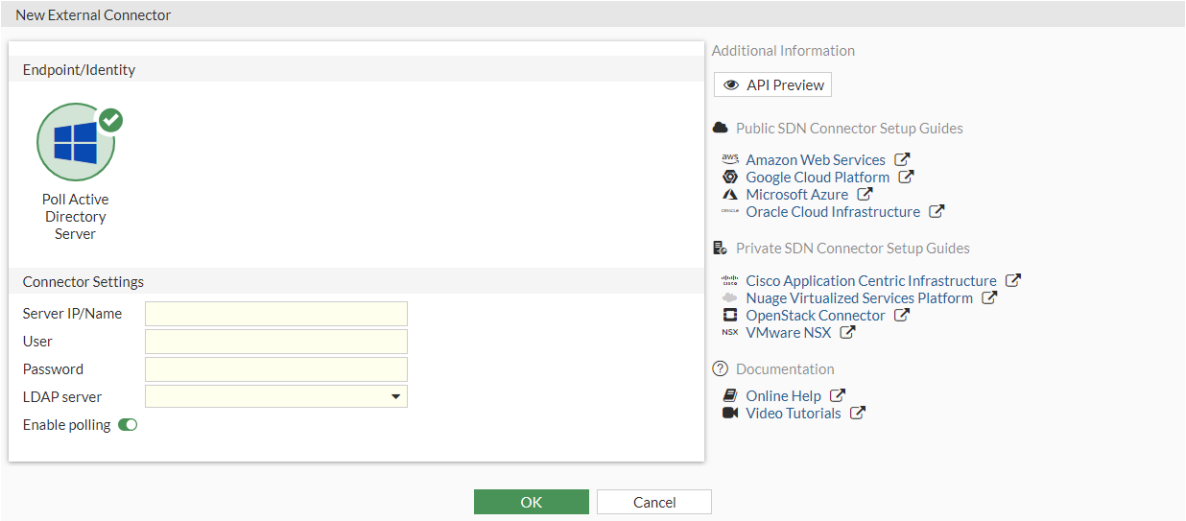
Fortinet single sign-on agent

To create an FSSO agent connector in the GUI:

1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*.

3. In the *Endpoint/Identity* section, click *FSSO Agent on Windows AD*.

4. Fill in the *Name*, and *Primary FSSO Agent* server IP address or name and *Password*.
5. Optionally, add more FSSO agents by clicking the plus icon.
6. Optionally, enable *Trusted SSL certificate* and select or import a certificate.
7. Select the *User group source*:
   - *Collector Agent*: User groups will be pushed to the FortiGate from the collector agent. Click *Apply & Refresh* to fetch group filters from the collector agent.
   - *Local*: User groups will be specified in the FortiGate unit's configuration. Select the LDAP server from the list, then click *Edit* to select the *Users*, *Groups*, and *Organizational Units*. Optionally, enable *Proactively retrieve from LDAP server* and configure the *Search filter* and *Interval*.
8. Click *OK*.



Poll Active Directory server

The FortiGate unit can authenticate users and allow them network access based on groups membership in Windows Active Directory (AD).

To create an AD server connector in the GUI:

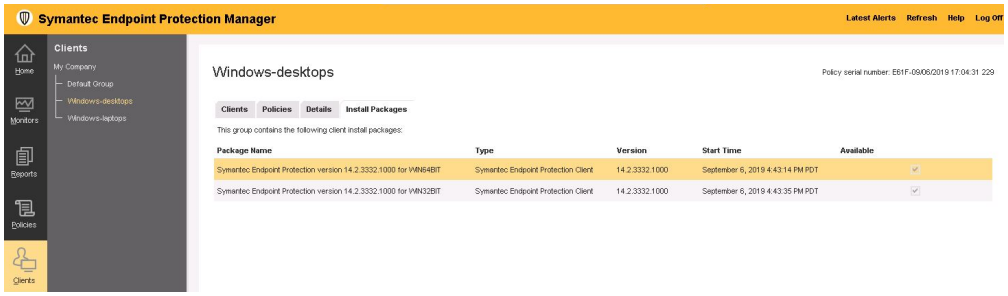
1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*.

3. In the *Endpoint/Identity* section, click *Poll Active Directory Server*.

4. Fill in the *Server IP/Name*, *User*, and *Password* for the AD server.
5. Select the LDAP server from the list.
6. If necessary, disable *Enable Polling*. This can be used to temporarily stop the FortiGate from polling security event logs on the Windows logon server, for troubleshooting purposes.
7. Click *OK*.

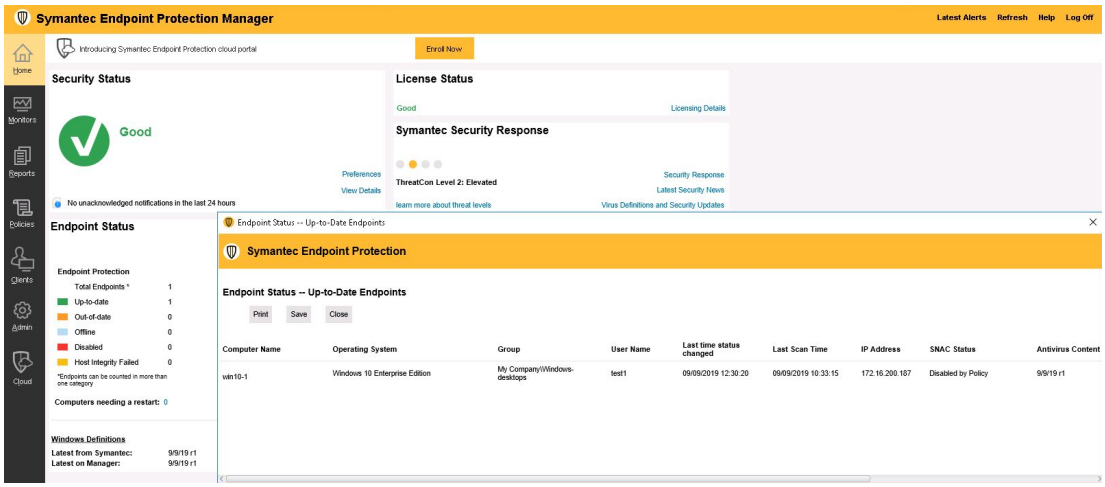
Symantec endpoint connector

With the Fabric connector for Symantec Endpoint Protection Manager (SEPM), you can use the client IP information from SEPM to assign to dynamic IP addresses on FortiOS.



When communication between FortiGate and SEPM is established, FortiGate polls every minute for updates via TLS over port 8446. You can use the CLI to change the default one minute polling interval.

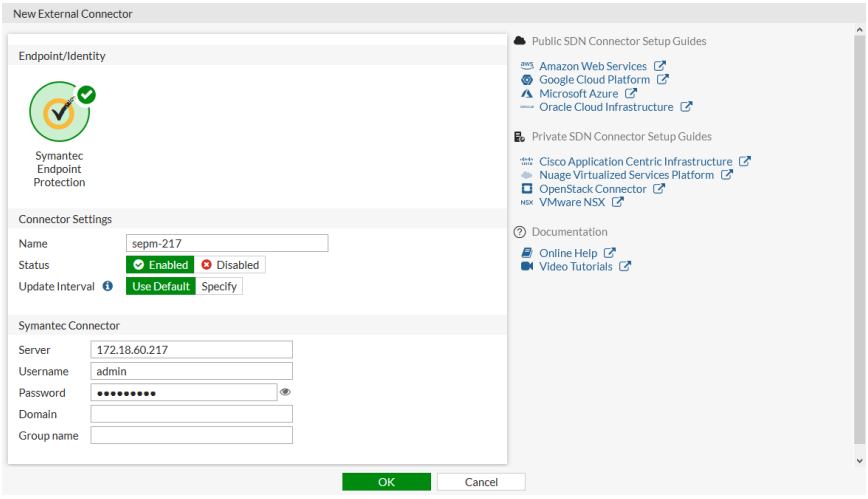
For example, you can create a dynamic Fabric Connector IP address subtype and use it in firewall policies as the source address. The dynamic IP address contains all IP addresses sent by SEPM.



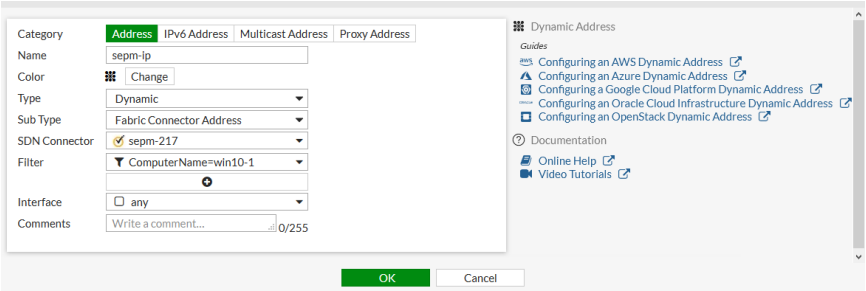
This example shows a dynamic IP address with SEPM and one client PC managed by SEPM using FortiGate as the default gateway.

To configure SEPM on a managed client PC:

1. In SEPM, create client packages for client hosts and group them into SEPM groups.
   You can install packages locally on clients or download them directly from SEPM.



2. When a package is installed on the client host, the host is considered managed by SEPM. Even if the host has multiple interfaces, only one IP per host is displayed.

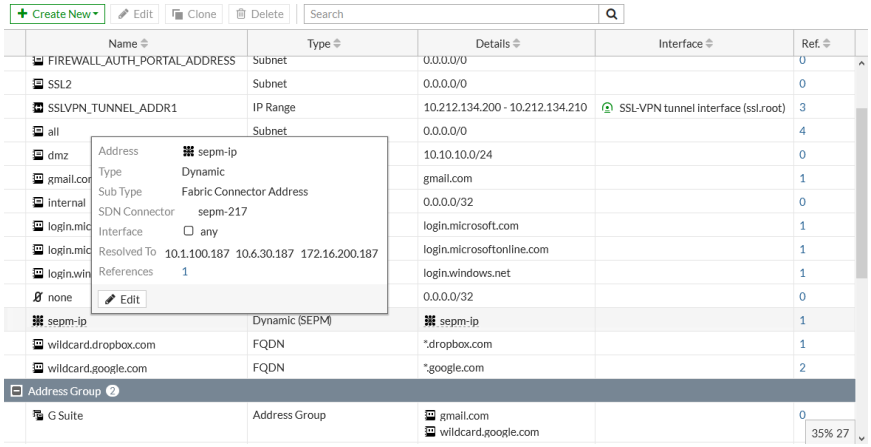


To configure Symantec endpoint connector on FortiGate in the GUI:

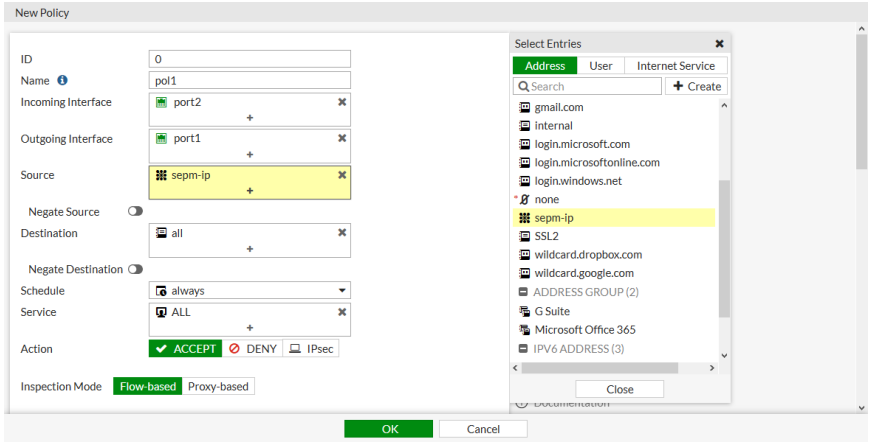
1. Go to *Security Fabric* > *External Connectors* and click *Create New*:
   a. In the *Endpoint/Identity* section, click *Symantec Endpoint Protection*.
   b. Fill in the *Name*, and set the *Status* and *Update Interval*.
   c. Set *Server* to the SEPM IP address.
   d. Enter the *Username* and *Password* for the server.
   e. To limit the domain or group that is monitored, enter them in the requisite fields.

   f. Click *OK*.
   When the connection is established, you can see a green up arrow in the bottom right of the card. You might need to refresh your browser to see the established connection.
2. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*:
   a. Fill in the address *Name*.
   b. Set *Type* to *Dynamic*.
   c. Set *Sub Type* to *Fabric Connector Address*.
   d. Set *SDN Connector* to the fabric connector that you just created.

e. Add *Filters* as needed.



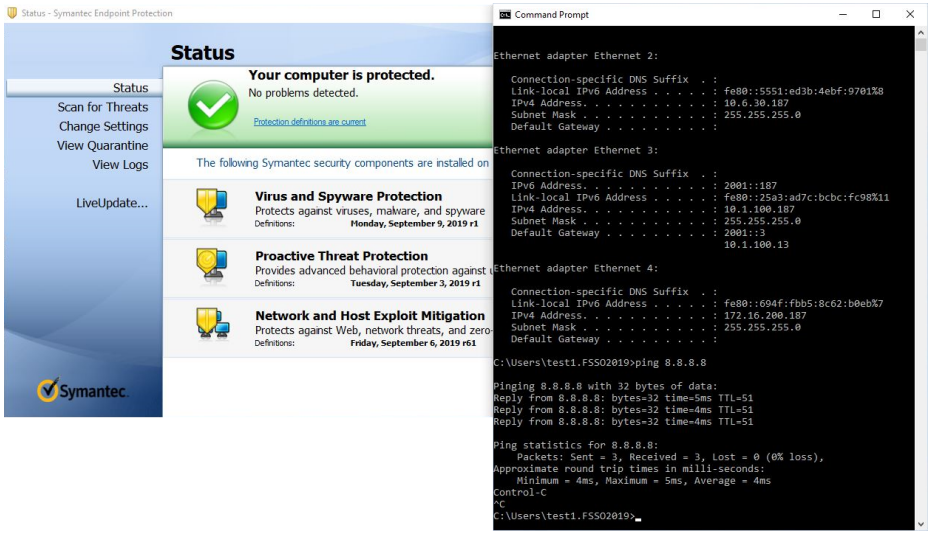
f. Click *OK*.



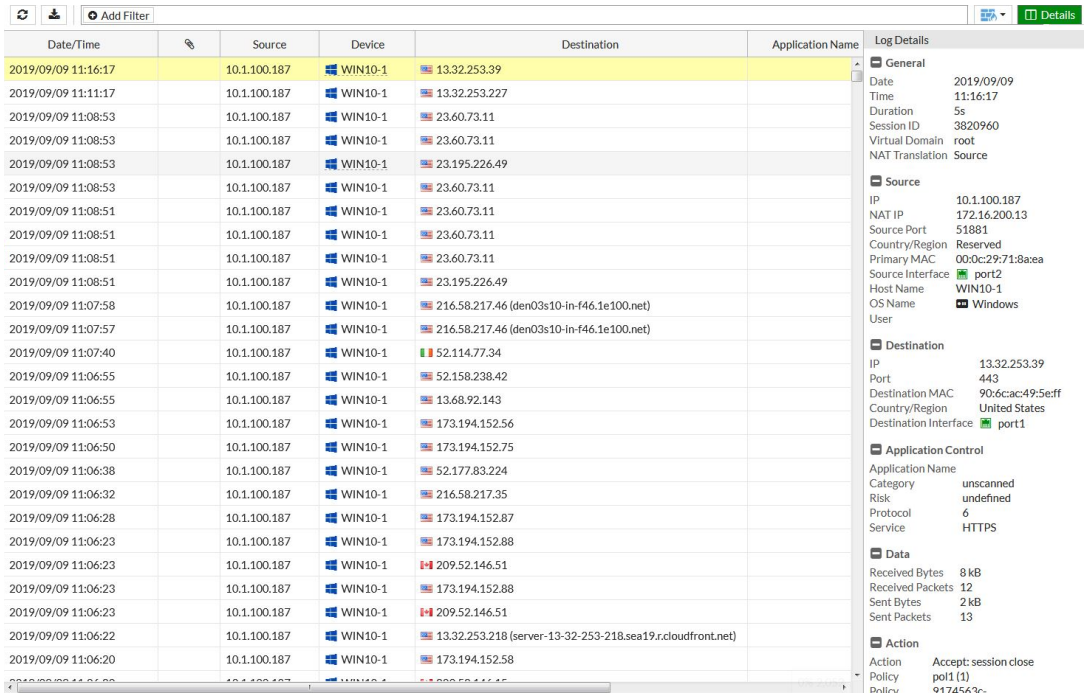
Filter options are only available for active computers that are configured and registered in SEPM. Free-form filters can be created manually by clicking *Create* and entering the filter, in the format: `filter_type=value`.

Possible manual filter types are: `GroupName`, `GroupID`, `ComputerName`, `ComputerUUID`, and `OSName`. For example: `GroupName=MyGroup`.

3. Go to *Policy & Objects* > *Addresses* and hover the cursor over the name of the new address to see the resolved IP addresses of the host.



4. Go to *Policy & Objects* > *Firewall Policy*, click *Create New*, and add a policy that uses the dynamic IP address.



To verify the configuration:

1. On the client PC, check that it is managed by SEPM to access the Internet.

2. On the FortiGate, you can check in *Dashboard* > *FortiView Sources* and *Log & Report* > *Forward Traffic*.

Because this traffic is not authenticated traffic but is based on source IP address only, it is not shown in the GUI firewall monitor or in the `diagnose firewall auth list` CLI command.

To configure Symantec endpoint connector on FortiGate in the CLI:

1. Create the fabric connector:

```
config system sdn-connector
    edit "sepm-217"
        set type sepm
        set server "172.18.60.217"
        set username "admin"
        set password *********
        set status enable
    next
end
```

2. Create the dynamic IP address:

```
config firewall address
    edit "sepm-ip"
        set type dynamic
        set sdn "sepm-217"
        set filter "ComputerName=win10-1"
        config list
            edit "10.1.100.187"
            next
            edit "10.6.30.187"
            next
            edit "172.16.200.187"
            next
        end
    next
end
```

3. Add the dynamic IP address to the firewall policy:

```
config firewall policy
    edit 1
        set name "pol1"
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "sepm-ip"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
        set av-profile "default"
        set logtraffic all
        set fsso disable
        set nat enable
    next
end
```

To troubleshoot Symantec SD connector in the CLI:

```
# diagnose debug application sepmd -1

Output is sent every minute (default). All IPv4 learned from SEPM. IPv6 also sent but not
```

```
yet supported.

2019-09-09 12:03:09 2001:0000:0000:0000:0000:0000:0000:0187 is not in IPv4 presentation
format
```

To list the SEPM daemon SDN connectors:

```
# diagnose test application sepmd 1
sepm SDN connector list:
  name: sepm-217, status: enabled, updater_interval: 60
```

To list the SEPM daemon SDN filters:

```
# diagnose test application sepmd 2
sepm SDN connector sepm-217 filter list:
  name: sepm-ip, vd 0, filter 'ComputerName=win10-1'
```

RADIUS single sign-on agent

With RADIUS single sign-on (RSSO), a FortiGate can authenticate users who have authenticated on a remote RADIUS server. Based on which user group the user belongs to, the security policy applies the appropriate UTM profiles.

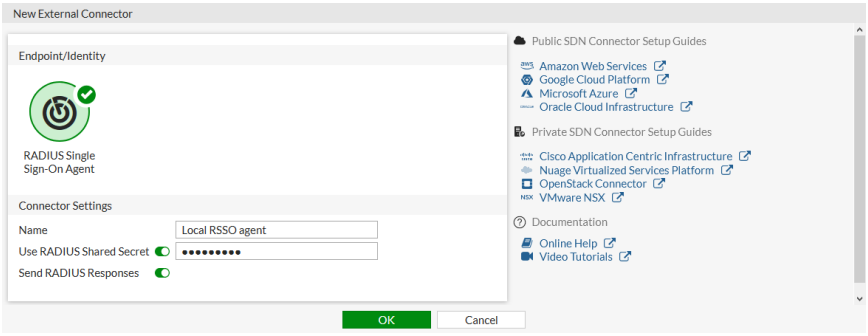
The FortiGate does not interact with the remote RADIUS server; it only monitors RADIUS accounting records that the server forwards (originating from the RADIUS client). These records include the user IP address and user group. The remote RADIUS server sends the following accounting messages to the FortiGate:

Message	Action
Start	If the information in the start message matches the RSSO configuration on the FortiGate, the user is added to the local list of authenticated firewall users.
Stop	The user is removed from the local list of authenticated firewall users because the user session no longer exists on the RADIUS server.

You can configure an RSSO agent connector using the FortiOS GUI; however, in most cases, you will need to use the CLI. There are some default options you may need to modify that can only be done in the CLI.

```
config user radius
    edit <name>
        set rsso enable
        set rsso-radius-response enable
        set rsso-secret <password>
        set rsso-endpoint-attribute <attribute>
        set sso-attribute <attribute>
        set delimiter {plus | comma}
    next
end
```

To configure an RSSO agent connector:

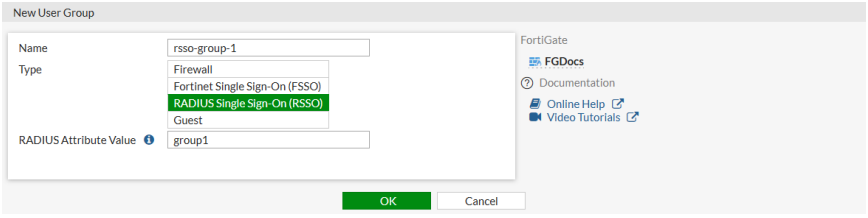


1. Create the new connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*.
   c. In the *Endpoint/Identity* section, click *RADIUS Single Sign-On Agent*. The *New Fabric Connector* pane opens.
   d. Enter the connector name.

e. Enable *Use RADIUS Shared Secret*.

The value entered in *Use RADIUS Shared Secret* must be identical to what the remote RADIUS server uses to authenticate when it sends RADIUS accounting messages to the FortiGate.

f. Enable *Send RADIUS Responses*.



You should enable *Send RADIUS Responses* because some RADIUS servers continue to send the same RADIUS accounting message several times if there is no response.

g. Click *OK*.

2. Edit the network interface:
   a. Go to *Network* > *Interfaces*.
   b. Double-click the interface that will receive the RADIUS accounting messages. The *Edit Interface* pane opens.
   c. In the *Administrative Access* section, select the *RADIUS Accounting* checkbox. This will open listening for port 1813 on this interface. The FortiGate will then be ready to receive RADIUS accounting messages.
   d. Click *OK*.
3. Create a local RSSO user group:
   a. Go to *User & Authentication* > *User Groups*.
   b. Click *Create New*.
   c. Enter the group name.
   d. For the *Type* field, click *RADIUS Single-Sign-ON (RSSO)*.
   e. Enter a value for *RADIUS Attribute Value*.
   This value by default is the class attribute. The FortiGate uses the content of this attribute in RADIUS accounting start messages to map a user to a FortiGate group, which then can be used in firewall policies.
   In this example configuration, the FortiGate will only add a remote RADIUS user to the local firewall user list if the class attribute in the RADIUS accounting START message contains the value group1.

If your users are in multiple groups, you will need to add multiple local RSSO user group.

If the RADIUS attribute value used to map users to a local RSSO group is different than the RADIUS attribute in the RADIUS accounting messages forwarded by the server, you must change it in the CLI.

f. Click *OK*.

4. Edit the local RSSO agent to modify default options using the CLI.
   For example, the default value for `rsso-endpoint-attribute` might work in common remote access scenarios where users are identified by their unique `Calling-Station-Id`, but in other scenarios the user name might be in a different attribute.

```
config user radius
    edit "Local RSSO Agent"
        set rsso-endpoint-attribute <attribute>
        set sso-attribute <attribute>
    next
end
```

5. Add the local RSSO user group to a firewall policy.

Verifying the RSSO configuration

Verification requires a working remote RADIUS server configured for RADIUS accounting forwarding and wireless or wired clients that use RADIUS for user authentication.

For a quick test, you can use one of the publicly available RADIUS test tools to send RADIUS accounting start and stop messages to the FortiGate. You can also use radclient.

To verify the RSSO configuration:

1. In radclient, enter the RADIUS attributes. These attributes are then executed with the FortiGate IP parameters (sends accounting messages to port 1813) and shared password you configured. `-x` is used for verbose output:

```
root@ControlPC:~# echo "Acct-Status-Type =Start,Framed-Ip-Address=10.1.100.185,User-
Name=test2,Acct-Session-Id=0211a4ef,Class=group1,Calling-Station-Id=00-0c-29-44-BE-B8" |
 radclient -x 10.1.100.1 acct 123456
Sending Accounting-Request of id 180 to 10.1.100.1 port 1813
        Acct-Status-Type = Start
        Framed-IP-Address = 10.1.100.185
        User-Name = "test2"
        Acct-Session-Id = "0211a4ef"
        Class = 0x67726f757031
        Calling-Station-Id = "00-0c-29-44-BE-B8"
rad_recv: Accounting-Response packet from host 10.1.100.1 port 1813, id=180, length=20
root@ControlPC:~#
```

2. Verify that the user is in the local firewall user list with the correct type (`rsso`) and local firewall group (`rsso-group1`):

```
# diagnose firewall auth l

10.1.100.185, test2
        type: rsso, id: 0, duration: 5, idled: 5
        flag(10): radius
        server: vdom1
        packets: in 0 out 0, bytes: in 0 out 0
        group_id: 3
        group_name: rsso-group-1

----- 1 listed, 0 filtered ------
```

Exchange Server connector

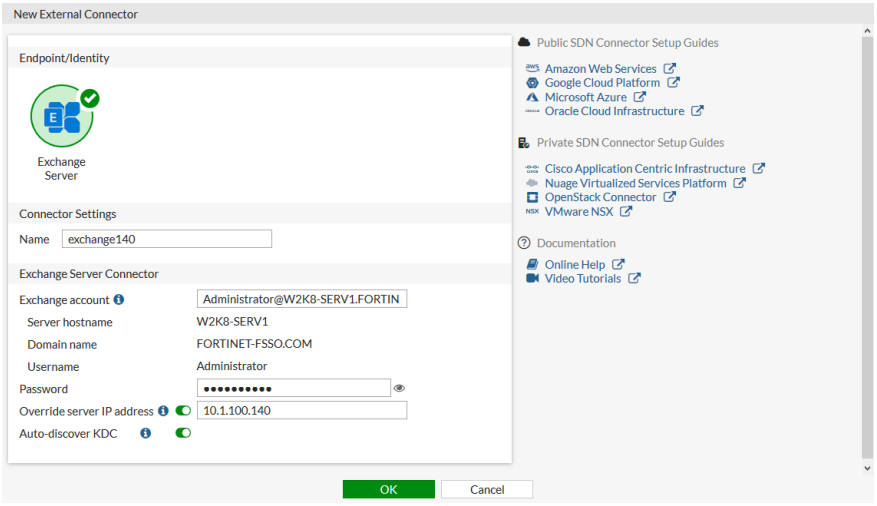
FortiGate can collect additional information about authenticated users from corporate Microsoft Exchange Servers. After a user logs in, the additional information can be viewed in various parts of the GUI.

The Exchange connector must be mapped to the LDAP server that is used for authentication.

The following attributes are retrieved:

USER_INFO_FULL_NAME	USER_INFO_COMPANY	USER_INFO_CITY
USER_INFO_FIRST_NAME	USER_INFO_DEPARTMENT	USER_INFO_STATE
USER_INFO_LAST_NAME	USER_INFO_GROUP	USER_INFO_POSTAL_CODE
USER_INFO_LOGON_NAME	USER_INFO_TITLE	USER_INFO_COUNTRY
USER_INFO_TELEPHONE	USER_INFO_MANAGER	USER_INFO_ACCOUNT_EXPIRES
USER_INFO_EMAIL	USER_INFO_STREET	
USER_INFO_USER_PHOTO	USER_INFO_POST_OFFICE_BOX	

Kerberos Key Distribution Center (KDC) automatic discovery is enabled by default. The FortiGate must be able to use DNS to resolve the KDC IP addresses, otherwise the FortiGate will be unable to retrieve additional user information from the Exchange Server.



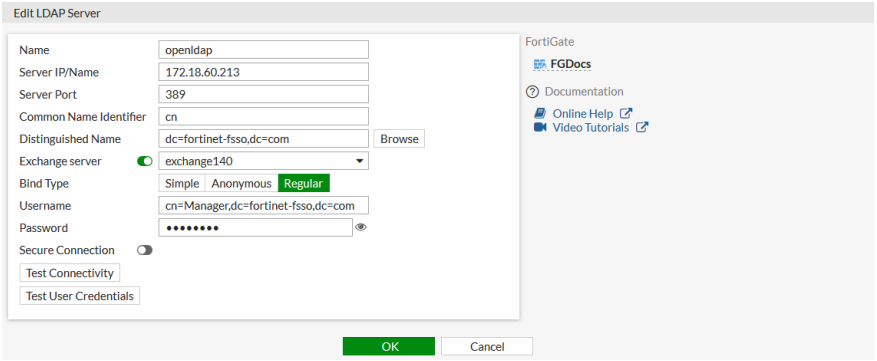
KDC automatic discovery can be disabled, and one or more internal IP addresses that the FortiGate can reach can be configured for KDC.

The Override server IP address is enabled when the IP address of the Exchange server cannot be resolved by DNS and must be entered manually.

To configure an Exchange connector in the GUI:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *Endpoint/Identity* section, click *Exchange Server*.
3. Set *Name* to *exchange140*.
4. Set *Exchange account* to *Administrator@W2K8-SERV1.FORTINET-FSSO.COM*.
   Administrator is the username, *W2K8-SERV1* is the exchange server name, and *FORTINET-FSSO.COM* is the domain name.
5. Set *Password* to the password.
6. Enable *Override server IP address* and set it to *10.1.100.140*.

7. Ensure that *Auto-discover KDC* is enabled.



If *Auto-discover KDC* is disabled, one or more KDC IP addresses can be manually entered.

8. Click *OK*.

To link the connector to the LDAP server in the GUI:

1. Go to *User & Authentication* > *LDAP Servers*.
2. Edit an existing LDAP server, or click *Create New* to create a new one.
3. Enable *Exchange server*, and select the connector from the list.
4. Configure the remaining settings as required.

5. Click *OK*.

To configure an Exchange connector with automatic KDC discovery in the CLI:

```
config user exchange
    edit "exchange140"
        set server-name "W2K8-SERV1"
        set domain-name "FORTINET-FSSO.COM"
        set username "Administrator"
        set password **********
        set ip 10.1.100.140
        set auto-discover-kdc enable
    next
end
```

To link the connector to the LDAP server in the CLI:

```
config user ldap
    edit "openldap"
        set server "172.18.60.213"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=Manager,dc=fortinet-fsso,dc=com"
        set password **********
        set group-member-check group-object
        set group-object-filter "(&(objectclass=groupofnames)(member=*))"
        set member-attr "member"
        set user-info-exchange-server "exchange140"
    next
end
```

Verification

To verify that KDC auto-discovery is working:

```
# diagnose wad debug enable category all
# diagnose wad debug enable level verbose
# diagnose debug enable
# diagnose wad user exchange test-auto-discover
```

```
wad_diag_session_acceptor(3115): diag socket 20 accepted.
__wad_fmem_open(557): fmem=0x12490bd8, fmem_name='cmem 9188 bucket', elm_sz=9188, block_
sz=73728, overhead=0, type=advanced
Starting auto-discover test for all configured user-exchanges.
[NOTE]: If any errors are returned, try manually configuring IPs for the reported errors.

wad_rpc_nspi_test_autodiscover_kdc(1835): Starting DNS SRV request for srv(0x7f938e052050)
query(_kerberos._udp.FORTINET-FSSO.COM)

    addr[2]: 10.6.30.131
    addr[3]: 2001::131
    addr[4]: 2003::131
wad_rpc_nspi_dns_on_discover_kdc_done(1787): Received response for DNS autodiscover req
(0x7f938dfe8050) query(_kerberos._udp.FORTINET-FSSO.COM) n_rsp(3)
```

```
Completed auto-discover test for all configured user-exchanges.
```

To check the collected information after the user has been authenticated:

1. In the GUI, go to *Dashboard* > *Users & Devices*, expand the *Firewall Users* widget, and hover over the user name.
2. In the CLI, run the following diagnose command:

```
# diagnose wad user info 20 test1
'username' = 'test1'
'sourceip' = '10.1.100.185'
'vdom' = 'root'
'cn' = 'test1'
'givenName' = 'test1'
'sn' = 'test101'
'userPrincipalName' = 'test1@Fortinet-FSSO.COM'
'telephoneNumber' = '604-123456'
'mail' = 'test1@fortinet-fsso.com'
'thumbnailPhoto' = '/tmp/wad/user_info/76665fff62ffffffffffffffffffff75ff68fffffffffa'
'company' = 'Fortinet'
'department' = 'Release QA'
'memberOf' = 'CN=group321,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'memberOf' = 'CN=g1,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'memberOf' = 'CN=group21,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'memberOf' = 'CN=group1,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'manager' = 'CN=test6,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'streetAddress' = 'One Backend Street 1901'
'l' = 'Burnaby'
'st' = 'BC'
'postalCode' = '4711'
'co' = 'Canada'
'accountExpires' = '9223372036854
```

If the results are not as expected, verify what information FortiGate can collect from the Exchanger Server:

```
# diagnose test application wad 2500
# diagnose test application wad 162
```

Threat feeds

Threat feeds dynamically import an external block list from an HTTP server in the form of a plain text file, or from a STIX/TAXII server. Block lists can be used to enforce special security requirements, such as long term policies to always block access to certain websites, or short term requirements to block access to known compromised locations. The lists are dynamically imported, so that any changes are immediately imported by FortiOS.

There are four types of threat feeds:

FortiGuard Category	The file contains one URL per line. It is available as a *Remote Category* in Web Filter profiles, SSL inspection exemptions, and proxy addresses. See Web rating override on page 1417 for more information. Example:

	`http://example/com.url`
	`https://example.com/url`
	`http://example.com:8080/url`

IP Address	The file contains one IP/IP range/subnet per line. It is available as an *External IP Block List* in DNS Filter profiles, and as a *Source/Destination* in IPv4, IPv6, and proxy policies.
	Example:
	`192.168.2.100`
	`172.200.1.4/16`
	`172.16.1.2/24`
	`172.16.8.1-172.16.8.100`
	`2001:0db8::eade:27ff:fe04:9a01/120`
	`2001:0db8::eade:27ff:fe04:aa01-2001:0db8::eade:27ff:fe04:ab01`

Domain Name	The file contains one domain per line. Simple wildcards are supported. It is available as a *Remote Category* in DNS Filter profiles. See External resources for DNS filter on page 2704 for more information.
	Example:
	`mail.*.example.com`
	`*-special.example.com`
	`www.*example.com`
	`example.com`

Malware Hash	The file contains one hash per line in the format `<hex hash> [optional hash description]`. Each line supports MD5, SHA1, and SHA256 hex hashes. It is automatically used for virus outbreak prevention on antivirus profiles with `external-blocklist` enabled.
	Note: For optimal performance, do not mix different hashes in the list. Only use one of MD5, SHA1, or SHA256.
	Example:
	`292b2e6bb027cd4ff4d24e338f5c48de`
	`dda37961870ce079defbf185eeeef905 Trojan-Ransom.Win32.Locky.abfl`
	`3fa86717650a17d075d856a41b3874265f8e9eab Trojan-Ransom.Win32.Locky.abfl`
	`c35f705df9e475305c0984b05991d444450809c35dd1d96106bb8e7128b9082f Trojan-Ransom.Win32.Locky.abfl`
	See External malware block list on page 1185 for an example.

External resources file format

File format requirements for a HTTP/HTTPS external resources file:

- The file is in plain text format with each URL list, IP address, domain name, or malware hash occupying one line. Comments can be added by using the number sign, for example: `# This is a test.`
- The file is limited to 10 MB or 128 × 1024 (131072) entries, whichever limit is hit first.
- The entry limit also follows the table size limitation defined by CMDB per model.
- The external resources update period can be set to 1 minute, hourly, daily, weekly, or monthly (43200 min, 30 days).
- The external resources type as category (URL list) and domain (domain name list) share the category number range 192 to 221 (total of 30 categories).
- There is no duplicated entry validation for the external resources file (entry inside each file or inside different files).

- If the number of entries exceed the limit, a warning is displayed. Additional entries beyond the threshold will not be loaded.

For domain name list (type = domain):

- Simple wildcards are allowed in the domain name list, for example: *.test.com.
- IDN (international domain name) is supported.

For IP address list (type = address):

- The IP address can be a single IP address, subnet address, or address range. For example, 192.168.1.1, 192.168.10.0/24, or 192.168.100.1-192.168.100.254.
- The address can be an IPv4 or IPv6 address. An IPv6 address does not need to be in [ ] format.

For URL list (type = category):

- The scheme is optional, and will be truncated if found; https:// and http:// are not required.
- Wildcards are allowed at the beginning or end or the URL, for example: *.domain.com or domain.com.*.
- IDN and UTF encoding URL are supported .
- The URL can be an IPv4 or IPv6 address. An IPv6 URL must be in [ ] format.

To determine the external resource table size limit for your device:

```
# print tablesize
...
system.external-resource: 0 256 512
...
```

For this device, a FortiGate 60E, the global limit is 512 and the limit per VDOM is 256.

Configuring a threat feed

When configuring a threat feed, there are two options available for the update method, external feed or push API.

When multi VDOM mode is enabled, threat feed external connectors can be defined in the global VDOM or within a VDOM. See Threat feed connectors per VDOM on page 2708 for example configurations.

Configuring a threat feed with an external feed update

The threat feed will periodically fetch entries from the URI using HTTP or HTTPS.

To configure the threat feed in the GUI:

1. Go *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *Thread Feeds* section, select the required feed type.

3. Configure the connector settings:

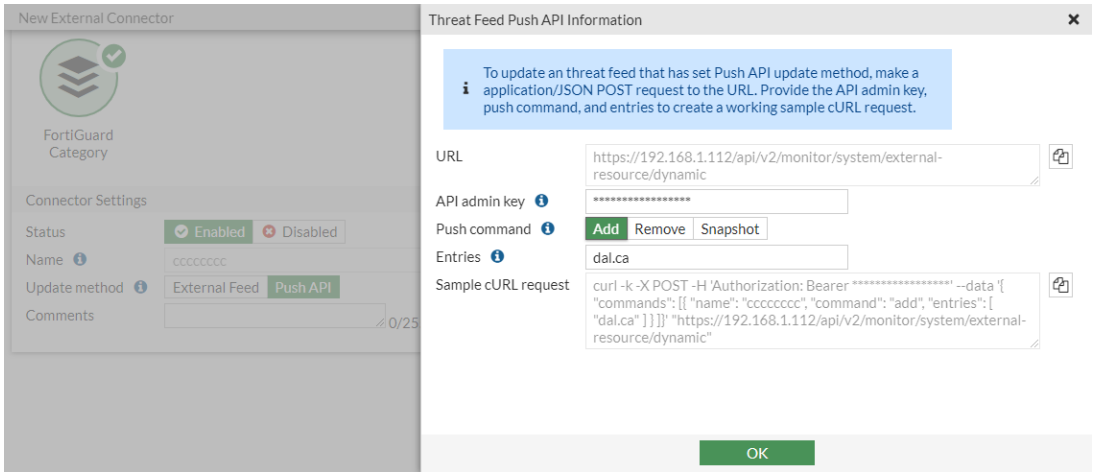
Status	Enable/disable the connector.
Name	Enter a name for the threat feed connector.
Update method	Select *External Feed*.
URI of external resource	Enter the link to the external resource file. HTTP, HTTPS, and STIX protocols are supported.
HTTP basic authentication	Enable/disable basic HTTP authentication. When enabled, enter the username and password in the requisite fields.
Refresh Rate	The time interval to refresh the external resource, in minutes (1 - 43200, default = 5). The applicable threat feed will be triggered to refresh between 0 minutes and the configured value. When the refresh is triggered, if another task is being processed be the schedule worker, the refresh task will be added to the queue.
Comments	Optionally, enter a description of the connector.

4. Click *OK*.

To configure the threat feed in the CLI:

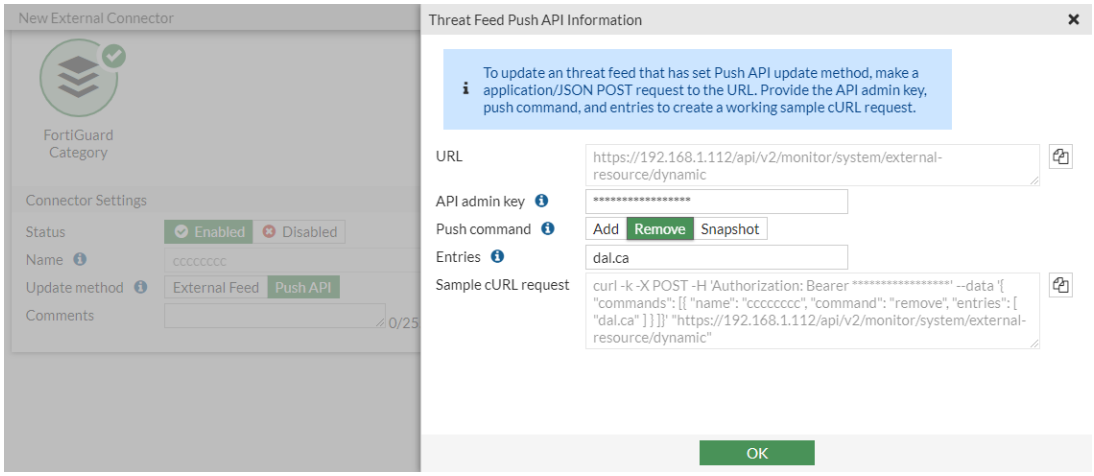
```
config system external-resource
    edit <name>
        set status {enable | disable}
        set type {category | address | domain | malware}
        set category <integer>
        set username <string>
        set password <string>
        set comments <string>
        *set resource <resource-uri>
        set user-agent <string>
        *set refresh-rate <integer>
        set source-ip <ip address>
        set interface-select-method {auto | sdwan | specify}
    next
end
```

Parameters marked with an asterisk (*) are mandatory and must be filled in. Other parameters either have default values or are optional.



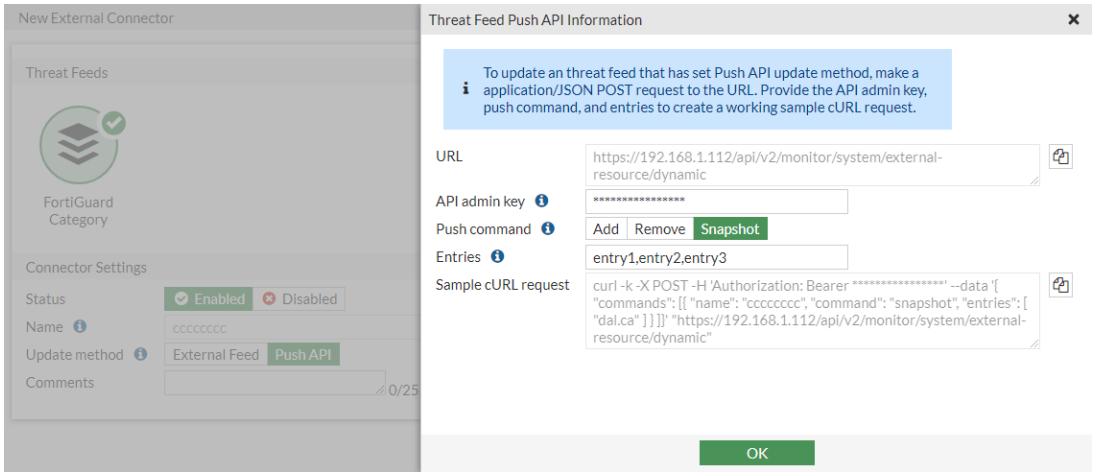
Configuring a threat feed with a push API update

The threat feed receives entry updates from webhook requests to the FortiGate REST API. This method provides the code samples needed to perform add, remove, and snapshot operations.



In the following example, a *FortiGuard Category* threat feed is used to show the different API push options.

To configure the threat feed in the GUI:



1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *FortiGuard Category*.
3. Enter a name.
4. Set the *Update method* to *Push API*.
5. Click *OK*. The *Threat Feed Push API Information* pane opens that contains the following fields:
   - *URL*: the FortiGate's API URL to call in order to perform the update.
   - *API admin key*: when an API administrator user is configured on the FortiGate, an *API admin key* will be associated with the API administrator. Input the API key to see the final cURL request.
   - *Push command*: select one of three push methods.
     - *Add*: add the specified entries to the threat feed.

     - *Remove*: remove the specified entries from the threat feed.

- *Snapshot*: replace the threat feed with all specified entries.

  - *Entries*: enter the entries separated by a comma (,) to be applied to the FortiGuard Category threat feed list.
  - *Sample cURL request*: copy this cURL command to perform the push API update on the FortiGate against the list (*cccccccc*).

  See REST API administrator on page 2048 for more information.

6. Copy the content in the *Sample cURL request* field (*Add* is used in this example).
7. Click *OK*.
8. On a client, generate the API request for the threat feed.

To configure the threat feed in the CLI:

```
config system external-resource
    edit "cccccccc"
        set update-method push
        set category 201
    next
end
```

To use the API in the CLI:

```
# diagnose system external-resource {push-add | push-remove | push-snapshot} <feed_name>
<entry>
```

To use the API with a JSON file:

```
# diagnose sys external-resource push-api-json-commands

{
  "commands": [<array (mandatory)>
    {<object (mandatory)>
         "name": <string (mandatory)>,
      "command": <string (mandatory, "add", "remove", or "snapshot")>,
      "entries": [<array (mandatory)>
        <string (mandatory, such as "10.100.1.1")>,
      ]
    }
```

```
  ]
}
```

Sample:

```
# diagnose sys external-resource push-api-json-commands '{"commands":
[{"name":"test","command":"add","entries":["10.10.10.1","10.10.10.2"]},
{"name":"test","command":"whatever","entries":["10.10.10.3","10.10.10.4"]}]}'
command returned: EXT_RESOURCE_PUSH_CMD_RETURN_OK
Returned json:
[
  {
    "name":"test",
    "command":"add",
    "status":"success"
  },
  {
    "name":"test",
    "command":"whatever",
    "error":"Invalid command.",
    "status":"error"
  }
]
```

To use the API with a Postman REST client:

1. Create an API administrator in FortiOS with write access.
2. Ensure the API token is generated.
3. Configure the external resource list as needed.
4. In the Postman client, create a new request, set the HTTP method to *POST*, enter the URL.
5. Configure the access token using one of the following methods:
   - To use the bearer token: click the *Authorization* tab, set the *Type* to *Bearer*, and enter the REST API administrator token.
   - To use the access_token parameter: click the *Params* tab and enter the access_token key-value pair (*access_token* and <*key*>).
6. Click the *Body* tab and configure the following:
   a. Select *raw* and set the input type to *JSON*.
   b. Insert the JSON data payload.
7. Click *Send* to send the POST request. If there is a response, the response body appears. For example,

```
POST https://172.18.52.153/api/v2/monitor/system/external-resource/dynamic?access_
token=g1mnfs8bzxk5hf8Qwcz4kx7yn3jHmG&vdom=vd1
Content-Type: application/json
User-Agent: PostmanRuntime/7.29.2
Accept: */*
Postman-Token: 04e10736-190e-4119-92e1-04e91bf99c10
Host: 172.18.52.153
Accept-Encoding: gzip, deflate, br
Connection: keep-alive
Content-Length: 485

{
```

```
   "commands":[
      {
         "name":"ip",
         "command":"add",
         "entries":[
            "10.10.10.1",
            "10.10.10.2"
         ]
      },
      {
         "name":"fqdn",
         "command":"remove",
         "entries":[
            "10.10.10.1",

Viewing the update history

To review the update history of a threat feed, go to *Security Fabric* > *External Connectors*, select a feed, and click *Edit*. The *Last Update* field shows the date and time that the feed was last updated.

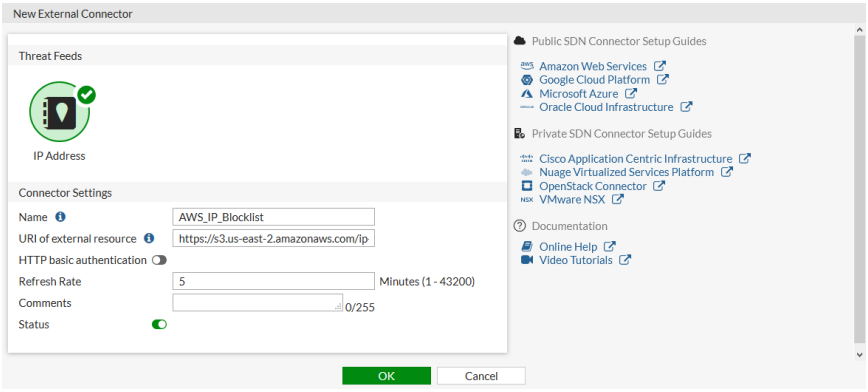
Click *View Entries* to view the current entries in the list.

EMS threat feed

A FortiGate can pull malware threat feeds from FortiClient EMS, which in turn receives malware hashes detected by FortiClients. The malware hash can be used in an antivirus profile when AV scanning is enabled with block or monitor actions. See Malware threat feed from EMS on page 1188 for an example.

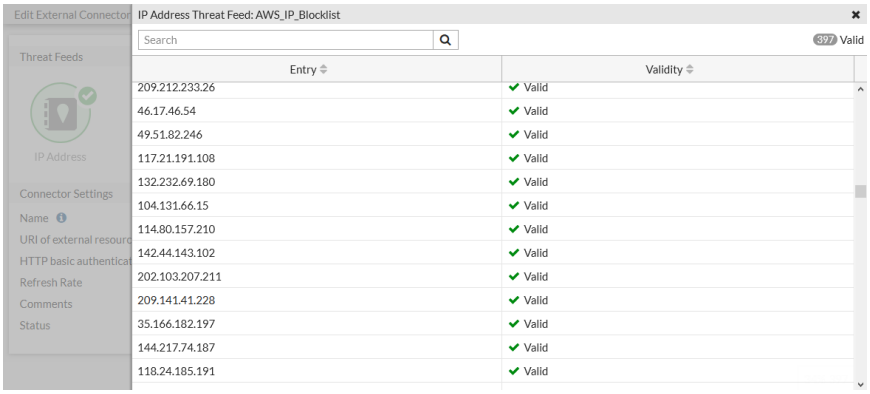
External blocklist policy

You can use the external blocklist (threat feed) for web filtering, DNS, and in firewall policies.



Sample configuration

In this example, an IP address blocklist connector is created so that it can be used in a firewall policy.



To configure an external block list connector in the GUI:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *IP Address*.

3. Set *Name* to *AWS_IP_Blocklist*.
4. Set the *URI of external resource* to *https://s3.us-east-2.amazonaws.com/ip-blocklist/ip.txt*.

5. Configure the remaining settings as required, then click *OK*.
6. Edit the connector, then click *View Entries* to view the IP addresses in the feed.

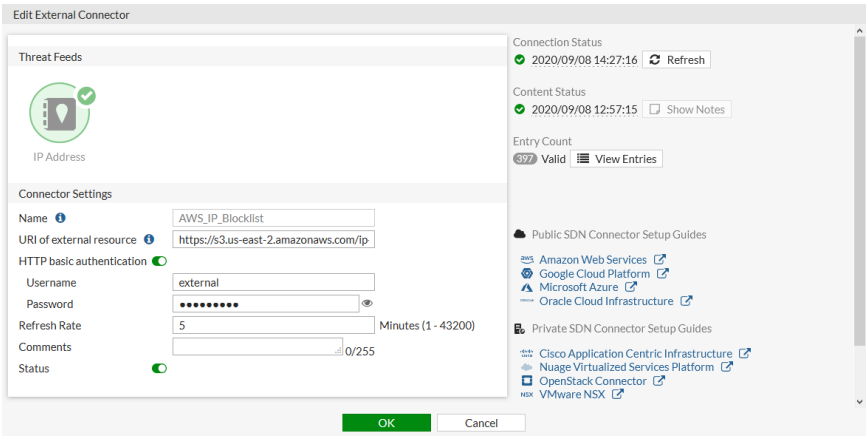
The blocklist can now be used in web filter and DNS profiles, and in firewall policies.

To configure an external block list connector in the CLI:

```
config system external-resource
   edit "AWS_IP_Blocklist"
      set status enable
      set type address
      set username ' '
      set password *********
      set comments ''
      set resource "https://s3.us-east-2.amazonaws.com/ip-blocklist/ip.txt"
      set refresh-rate 15
   next
end
```

To apply an external block list to a firewall policy in the CLI:

```
config firewall policy
   edit 1
      set name "policyid-1"
      set srcintf "wan2"
      set dstintf "wan1"
      set srcaddr "all"
```



```
        set dstaddr "AWS_IP_Blocklist"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

External blocklist authentication

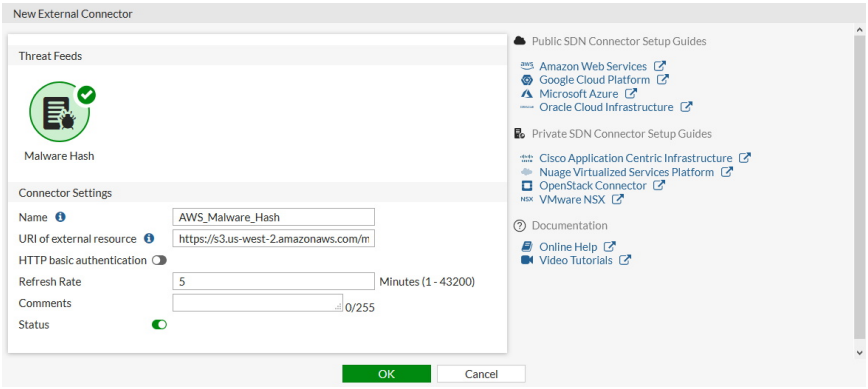
Thread feed external connectors support username and password authentication.

To enable username and password authentication in a thread feed connector:

1. Go to *Security Fabric* > *External Connectors*.
2. Edit an existing *Threat Feed* or create a new one by selecting *Create New*.
3. Enable *HTTP basic authentication*
4. Enter the *Username* and *Password*.

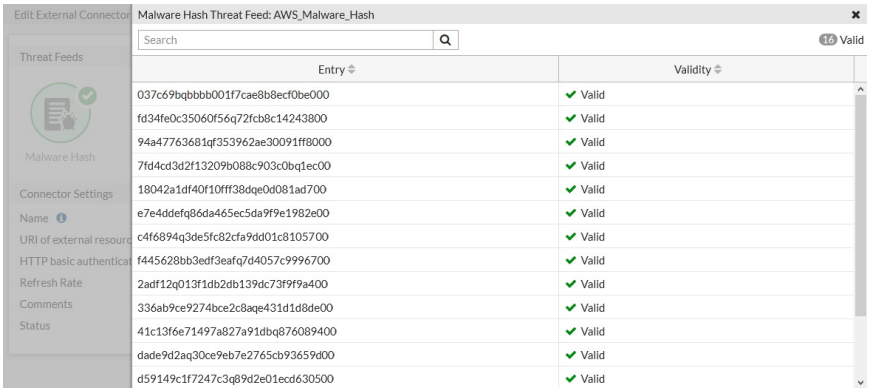
5. Click *OK*.

External blocklist file hashes



The malware hash threat feed connector supports a list of file hashes that can be used as part of virus outbreak prevention.

This example retrieves a malware hash from an Amazon S3 bucket, and then enables malware block lists in a antivirus profile.



To configure a malware hash connector in the GUI:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *Malware Hash*.
3. Set *Name* to *AWS_Malware_Hash*.

4. Set the *URI of external resource* to *https://s3.us-west-2.amazonaws.com/malware-hash-feeds/fortinet-malware-hash-list*.

5. Click *OK*.
6. Edit the connector, then click *View Entries* to view the hash list.

7. Go to *Security Profiles* > *AntiVirus* and create a new profile, or edit an existing one.
8. Enable *Use external malware block list*.
9. Click the + and select *AWS_Malware_Hash* from the list.
10. Click *OK*.

To configure a malware hash connector in the CLI:

```
config system external-resource
    edit "AWS_Malware_Hash"
        set type malware
        set resource "https://s3.us-west-2.amazonaws.com/malware-hash-feeds/fortinet-
malware-hash-list"
    next
end

config antivirus profile
    edit "av-profile"
            set external-blocklist-enable-all disable
            set external-blocklist "AWS_Malware_Hash"
        end
    next
end
```

Logs

The `filehash` and `filehashsrc` are included in outbreak prevention detection event logs.

This example shows the log generated when a file is detected by external malware hash list outbreak prevention:

```
1: date=2018-07-30 time=13:59:41 logid="0207008212" type="utm" subtype="virus"
eventtype="malware-list" level="warning" vd="root" eventtime=1532984381 msg="Blocked by
local malware list." action="blocked" service="HTTP" sessionid=174963 srcip=192.168.101.20

analyticssubmit="false"
```

External resources for DNS filter

External resources provides the ability to dynamically import an external block list into an HTTP server. This feature enables the FortiGate to retrieve a dynamic URL, domain name, IP address, or malware hash list from an external HTTP server periodically. The FortiGate uses these external resources as the web filter's remote categories, DNS filter's remote categories, policy address objects, or antivirus profile's malware definitions. If external resources are updated, FortiGate objects are also updated dynamically.

External resource is divided into four types:

- URL list (type = category)
- Domain name list (type = domain)
- IP address list (type = address)
- Malware hash list (type = malware)

Remote categories and external IP block list

The DNS filter profile can use two types of external resources: *domain type* (domain name list) and *address type* (IP address list).

When a *domain type* external resource is configured, it is treated as a remote category in the DNS filter profile. If the domain name in DNS query matches the entry in this external resource file, it is treated as the remote category and follows the action configured for this category in DNS filter profile.

When an *address type* external resource is configured, it can be enabled as *external-ip-blocklist* in DNS filter profile. If a DNS resolved IP address in DNS response matches the entry in the *external-ip-blocklist*, this DNS query is blocked by the DNS filter.

For external resources file format and limits, see External resources file format on page 2693.

Configuring external resources in the CLI

In the CLI, you can configure external resources files in an external HTTP server. Under global, configure the external resources file location and specify the resource type.

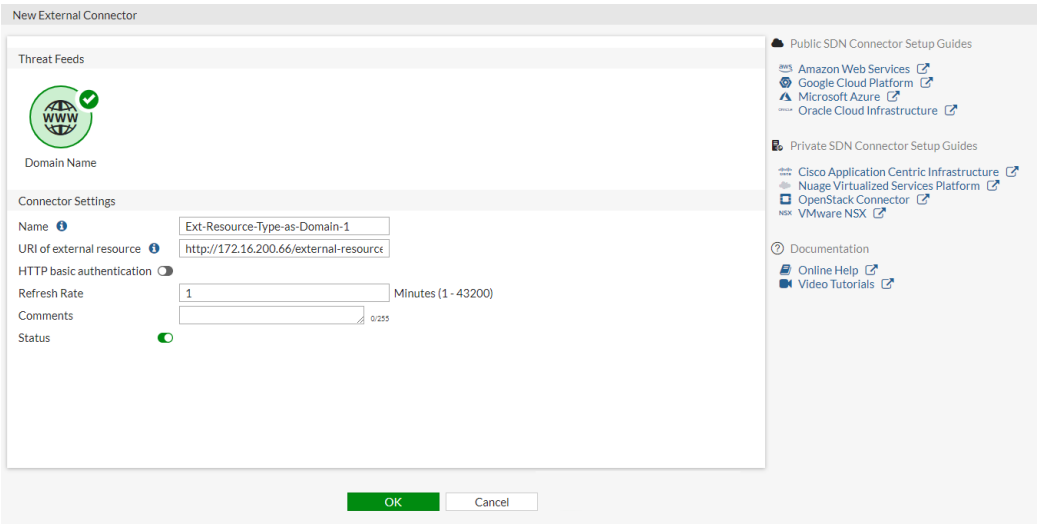
To configure external resources:

```
config system external-resource
   edit "Ext-Resource-Type-as-Domain-1"
      set type domain
      set category 194
      set resource "http://172.16.200.66/external-resources/Ext-Resource-Type-as-Domain-
1.txt"
      set refresh-rate 1
   next
   edit "Ext-Resource-Type-as-Address-1"
      set status enable
      set type address
      set username ' '
      set password *********
      set comments ''
      set resource "http://172.16.200.66/external-resources/Ext-Resource-Type-as-Address-
1.txt"
      set refresh-rate 1
   next
end
```

In each VDOM, the domain type external resource can be used in the DNS filter as remote category. In this example, the domain name list in the Ext-Resource-Type-as-Domain-1.txt file is treated as a remote category (category ID 194). The IP address list in the Ext-Resource-Type-as-Address-1.txt file can be applied in the DNS filter as an `external-ip-blocklist`. If the DNS resolved IP address matches any entry in the list in that file, the DNS query is blocked.

To configure the external IP block list and apply it to a policy:

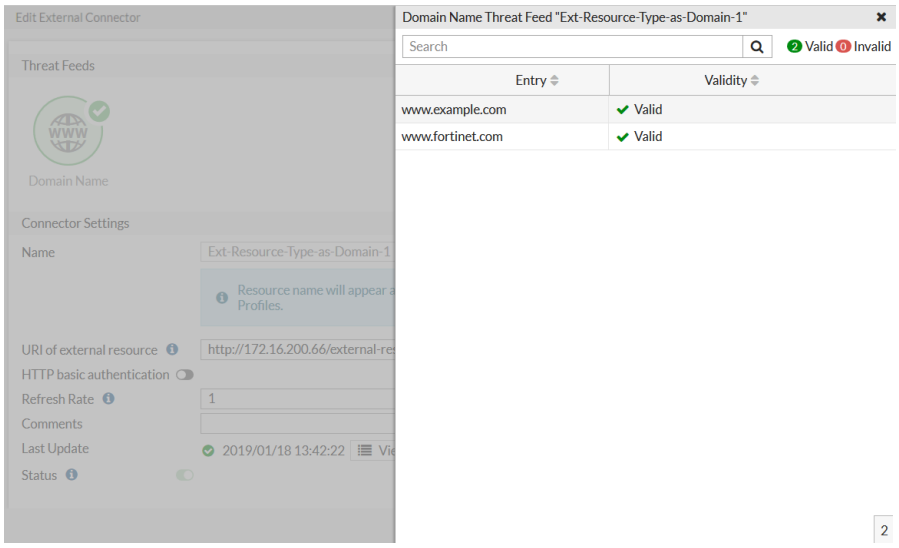
```
config dnsfilter profile
   edit "default"
      set comment "Default dns filtering."
      config ftgd-dns
         config filters
            edit 1
               set category 194
               set action block
            next
            edit 2
               set category 12
            next
            edit 3
            next
         end
      end
      set block-botnet enable
      set external-ip-blocklist "Ext-Resource-Type-as-Address-1"
   next
end
```



```
config firewall policy
   edit 1
      set name "DNSFilter"
      set srcintf "port10"
      set dstintf "port9"
      set srcaddr "all"
```

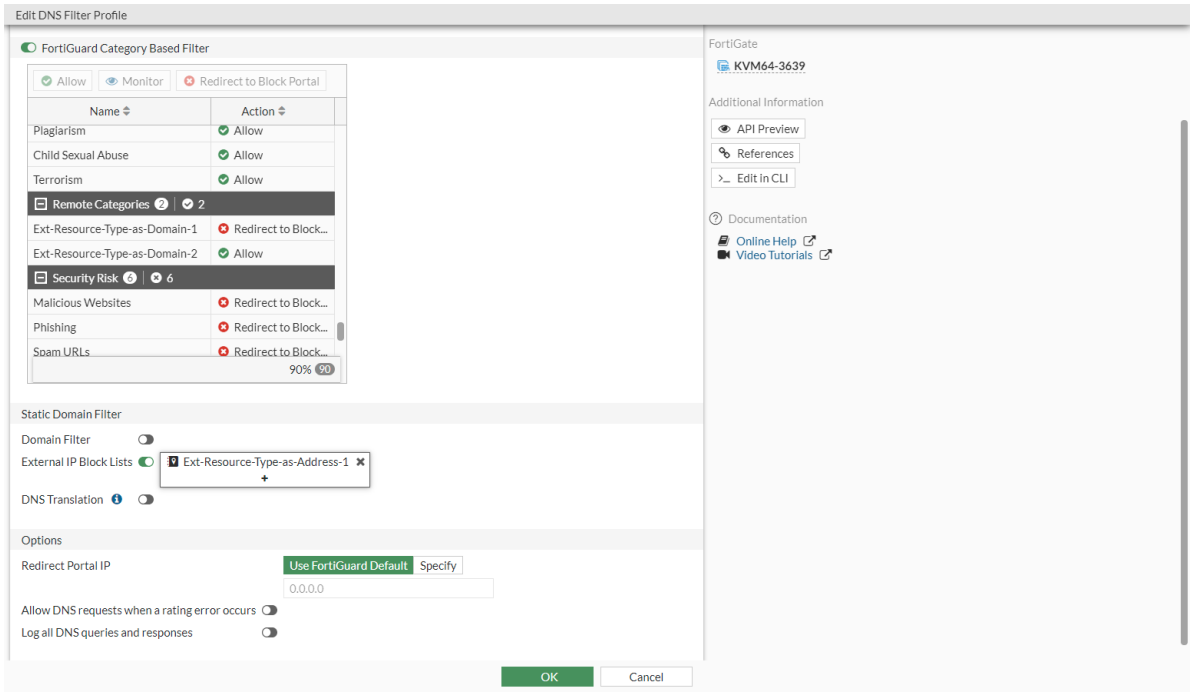
```
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set logtraffic all
        set dnsfilter-profile "default"
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set nat enable
    next
end
```

Configuring external resources in the GUI



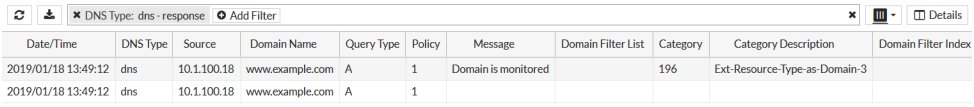
To configure, edit, or view the entries for external resources in the GUI:

1. Go to *Global* > *Security Fabric* > *External Connectors*.
2. Click *Create New*.
3. In the *Threat Feeds* section, select *Domain Name* or *IP Address*.
4. Enter the Resource *Name*, URL, location of the resource file, resource authentication credentials, and *Refresh Rate*.



5. Click *OK*.
6. Double-click the *Threat Feeds Object* you just configured to open the *Edit* page.

7. Click *View Entries* to view the entry list in the external resources file.



8. Go to *VDOM* > *Security Profiles* > *DNS Filter* and open a DNS filter profile. The configured external resources displays, and you can apply it in each DNS filter profile (remote category or external IP block lists).

Log sample

Remote categories

Go to *VDOM* > *Log & Report* > *Security Events* and select the *DNS Query* card. Some domains that match the remote category list are rated as remote category, overriding their original domain rating.

Date/Time	DNS Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description	Domain Filter Index
2019/01/18 13:49:12	dns	10.1.100.18	www.example.com	A	1	Domain is monitored		196	Ext-Resource-Type-as-Domain-3	
2019/01/18 13:49:12	dns	10.1.100.18	www.example.com	A	1					

Log example:

```
1: date=2019-01-18 time=13:49:12 logid="1501054802" type="utm" subtype="dns" eventtype="dns-
response" level="notice" vd="vdom1" eventtime=1547848151 policyid=1 sessionid=82998

qname="www.example.com" qtype="A" qtypeval=1 qclass="IN"
```

Threat feed connectors per VDOM

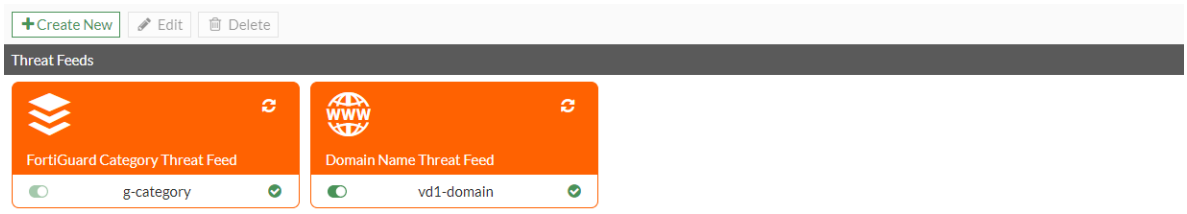
When multi-VDOM mode is enabled, a threat feed external connector can be defined in global or within a VDOM. Global threat feeds can be used in any VDOM, but cannot be edited within the VDOM. FortiGuard category and domain name-based external feeds have an added category number field to identify the threat feed. The threat feed name in global must start with `g-`. Threat feed names in VDOMs cannot start with `g-`.

FortiGuard category and domain name-based external feed entries must have a number assigned to them that ranges from 192 to 221. This number can be assigned to both external feed types. However, when a category number is used under a global entry, such as 192 with the name `g-cat-192`, this category number cannot be used in any other global or VDOM entries. If a category is used under a VDOM entry, such as 192 under VDOM1 with the name `cat-192`, the category 192 can be used in another VDOM or root with the name `cat-192`.

A thread feed connector can only be used in profiles in the VDOM that it was created in. Global connectors can be used in all VDOMs.

Each VDOM can have a maximum of 256 thread feed entries. But in total, a FortiGate can only have 511 thread feed entries.

To configure an external threat feed connector under global in the GUI:



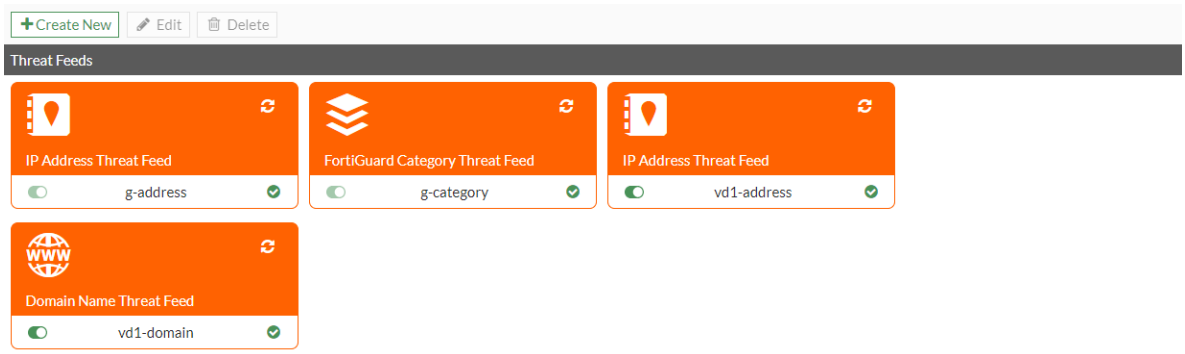
1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *FortiGuard Category*.
3. Enter a name that begins with `g-`.
4. Configure the other settings as needed.
5. Click *OK*.

To configure an external threat feed connector under global in the CLI:

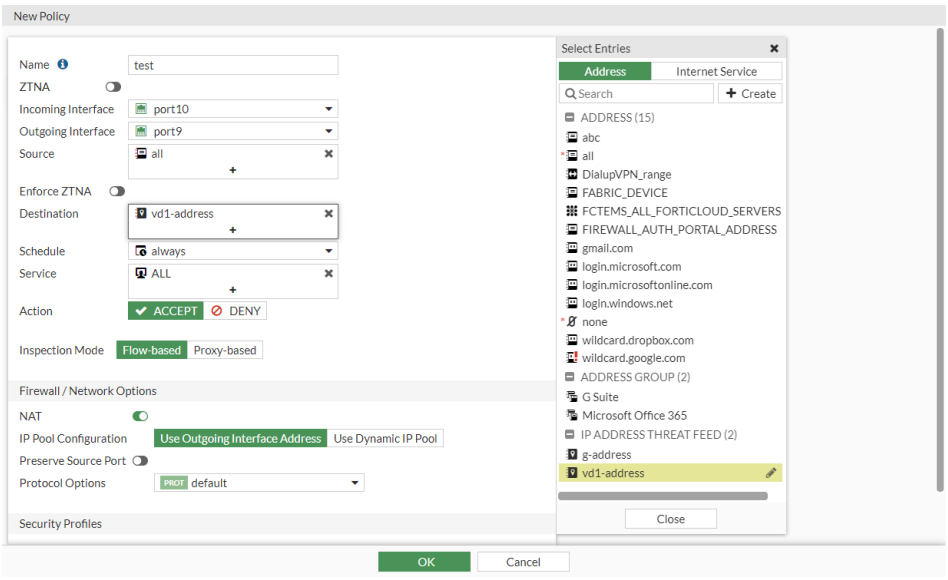
```
config global
    config system external-resource
        edit "g-category"
            set status enable
            set type category
            set category 192
            set comments ''
            set resource "http://172.16.200.55/external-resource-test/513-FDGCategory.txt"
            set refresh-rate 5
        next
    end
end
```

To configure an external threat feed connector under a VDOM in the GUI:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *Domain Name*.
3. Enter a name that does not begin with `g-`.
4. Configure the other settings as needed.
5. Click *OK*. The threat feed connector created under global also appears, but it is not editable.



To configure an external threat feed connector under a VDOM in the CLI:



```
config vdom
    edit vd1
        config system external-resource
            edit "vd1-domain"
                set status enable
                set type domain
                set category 193
                set comments ''
                set resource "http://172.16.200.55/external-resource-test/513-Domain.txt"
                set refresh-rate 5
            next
        end
    next
end
```

To use an IP address threat feed in a policy in the GUI:

1. Configure an IP address connector in global:
   a. Go to *Security Fabric* > *External Connectors* and click *Create New*.
   b. In the *Threat Feeds* section, click *IP Address*.
   c. Enter a name that begins with `g-`.
   d. Configure the other settings as needed.
   e. Click *OK*.
2. Configure an IP address connector in the VDOM (vd1):
   a. Go to *Security Fabric* > *External Connectors* and click *Create New*.
   b. In the *Threat Feeds* section, click *IP Address*.
   c. Enter a name that does not begin with `g-`.
   d. Configure the other settings as needed.
   e. Click *OK*. The threat feed connectors created under global also appear, but they are not editable.

3. Configure the firewall policy in the VDOM (vd1):
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. For *Destination*, select *vd1-address*. Since this policy is configured under vd1, *g-address* can also be set as the destination.

c. Configure the other settings as needed.

d. Click *OK*.

To use an IP address threat feed in a policy in the CLI:

1. Configure the IP address connectors:

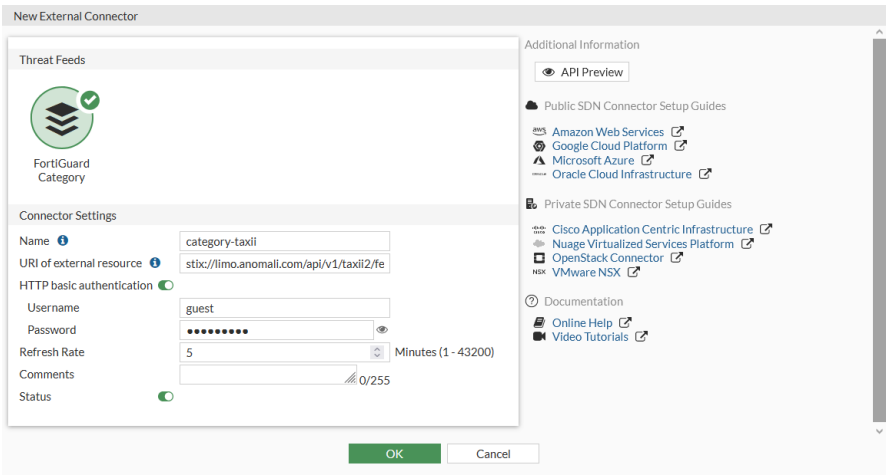
```
config global
    config system external-resource
        edit "g-address"
            set status enable
            set type address
            set username ''
            set comments ''
            set resource "http://172.16.200.55/external-resource-test/513-IP.txt"
            set refresh-rate 5
        next
    end
end

config vdom
    edit vd1
        config system external-resource
            edit "vd1-address"
                set status enable
                set type address
                set comments ''
                set resource "http://172.16.200.55/external-resource-test/513-IP.txt"
                set user-agent "curl/7.58.0"
                set refresh-rate 5
            next
        end
    next
end
```

2. In the VDOM, configure a firewall policy with the external address as the destination address:

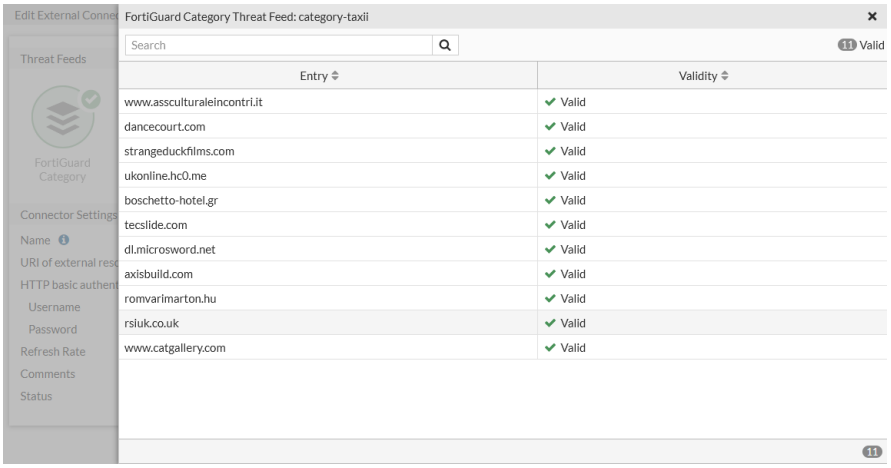
```
config vdom
    edit vd1
        config firewall policy
            edit 1
                set name "test"
                set srcintf "port10"
                set dstintf "port9"
                set srcaddr "all"
                set dstaddr "vd1-address"
                set action accept
                set schedule "always"
                set service "ALL"
                set profile-protocol-options "protocol"
                set nat enable
            next
        end
    next
end
```

Since this firewall policy is configured under `vd1`, `g-address` can also be set as the `dstaddr`.



STIX format for external threat feeds

The FortiGate's external threat feeds support feeds that are in the STIX/TAXII format. Use the `stix://` prefix in the URI to denote the protocol.



All external threat feeds support the STIX format. In this example, a FortiGuard Category threat feed in the STIX format is configured.

To configure a FortiGuard Category threat feed in the STIX format in the GUI:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. Select *FortiGuard Category* from the *Threat Feeds* section.
3. Configure the connector:
   - *Name*: *category-taxii*
   - *URI of external resource*: *stix://limo.anomali.com/api/v1/taxii2/feeds/collections/200/objects/*
   - *HTTP basic authentication*: Enable and enter the username and password, such as *guest* and *guest*.

4. Click *OK*.
5. Edit the connector, and click *View Entries* in the right side bar to view the retrieved entries.

To configure a FortiGuard Category threat feed in the STIX format in the CLI:

```
config system external-resource
    edit "category-taxii"
        set category 194
        set username "guest"
        set password guest
        set resource "stix://limo.anomali.com/api/v1/taxii2/feeds/collections/200/objects/"
    next
end
```

If the connector is used in webfilter that blocks category 194, the traffic that matches the retrieved URLs, such as *rsiuk.co.uk*, is blocked:

```
1: date=2021-10-06 time=18:07:46 eventtime=1633568867163763708 tz="-0700" logid="0316013056"
type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning" vd="vd1" policyid=1

srcuuid="c6753ba2-231b-51ec-1675-090f2b5f1384" dstip=78.129.255.151 dstport=443
dstintf="port1" dstintfrole="undefined" dstuuid="c6753ba2-231b-51ec-1675-090f2b5f1384"
proto=6 service="HTTPS" hostname="rsiuk.co.uk" profile="test" action="blocked"
reqtype="direct" url="https://rsiuk.co.uk/" sentbyte=75 rcvdbyte=0 direction="outgoing"
```

```
msg="URL belongs to a denied category in policy" method="domain" cat=194 catdesc="category-taxii"
```

Monitoring the Security Fabric using FortiExplorer for Apple TV

FortiExplorer for Apple TV allows you to use a TV screen to monitor your entire Security Fabric.

FortiExplorer for Apple TV is an analysis tool that provides easy to use NOC and SOC monitoring capabilities. The app features real-time data traffic, visual alerts, as well as a general overview of hardware devices, operating systems, and interfaces. The monitor also provides a wireless health summary of your entire network across multiple buildings. If an access point goes offline, you will be notified about the network's health. After the issues are resolved, you will immediately see the health update on your screen.

Getting started with FortiExplorer for Apple TV

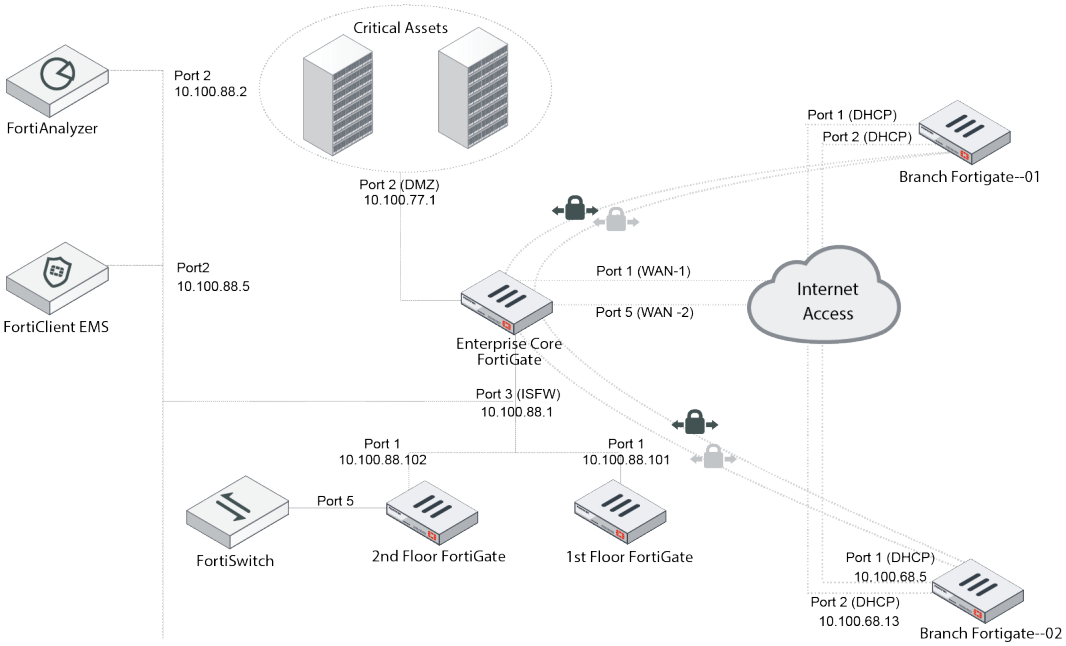
Download FortiExplorer for Apple TV from the app store on Apple TV. After the app is installed, add devices using the Apple TV remote or by sharing a login profile with FortiExplorer. Once the devices are added, you can use FortiExplorer for Apple TV to view real-time data in the Network Operations Center, Security Operations Center, and Software-Defined Branch.

To get started with FortiExplorer for Apple TV:

1. Download the app and add devices to FortiExplorer for Apple TV.
   You can add devices by sharing a login profile with FortiExplorer or logging into the device directly on FortiExplorer for Apple TV.
2. View the physical topology of the Fabric to identify risks
3. View the Fabric components as seen on the root FortiGate.

4. View an executive summary of the three largest areas of security focus in the Security Fabric.
5. View data collected by FortiAnalyzer on the endpoints on your network.
6. View vulnerability data collected by FortiClient EMS.
7. Use the Software-Defined Branch module to monitor interface SD-WAN usage and associated service level agreements.

NOC and SOC example



In this example, you have configured your FortiGates, FortiAnalyzer and other devices in your Security Fabric. Now you want to use FortiExplorer for Apple TV to display the status of the devices on a TV in your Network Operation Center or Security Operation Center.

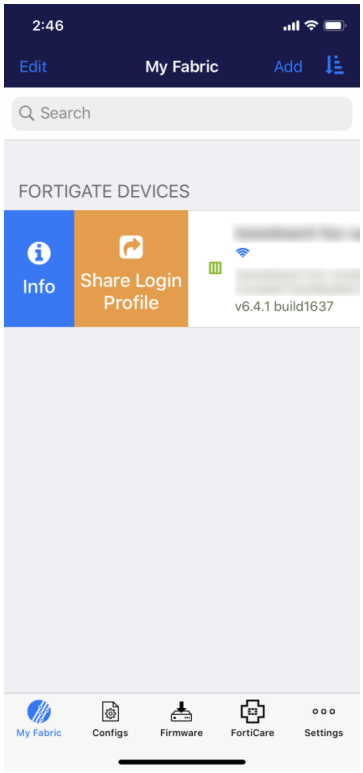
Topology

This topology has a Headquarter and two Branches. Within the Headquarter is the Enterprise Core and two FortiGates acting as ISFWs. In addition, an on-premise FortiAnalyzer collects all logging information from the fabric devices. The FortiClient EMS manages all the endpoints within the topology.

The two branches are configured with SD-WAN with VPN overlays to the Enterprise Core. Traffic is steered towards the overlays and underlays based on SD-WAN Rules.

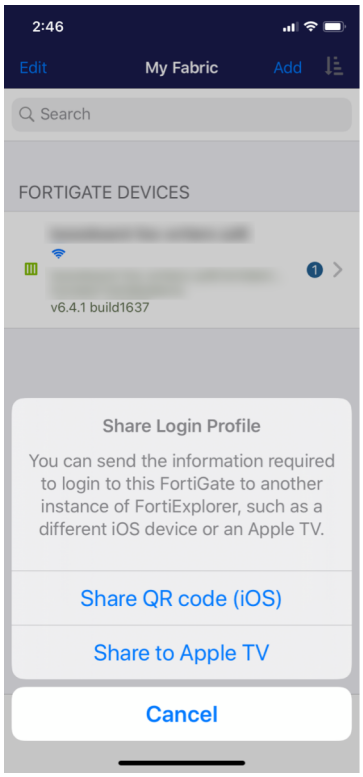
Using FortiExplorer for Apple TV, you will be able to monitor the different components in this topology.

To take advantage of the views in the FortiExplorer for Apple TV, you should configure:



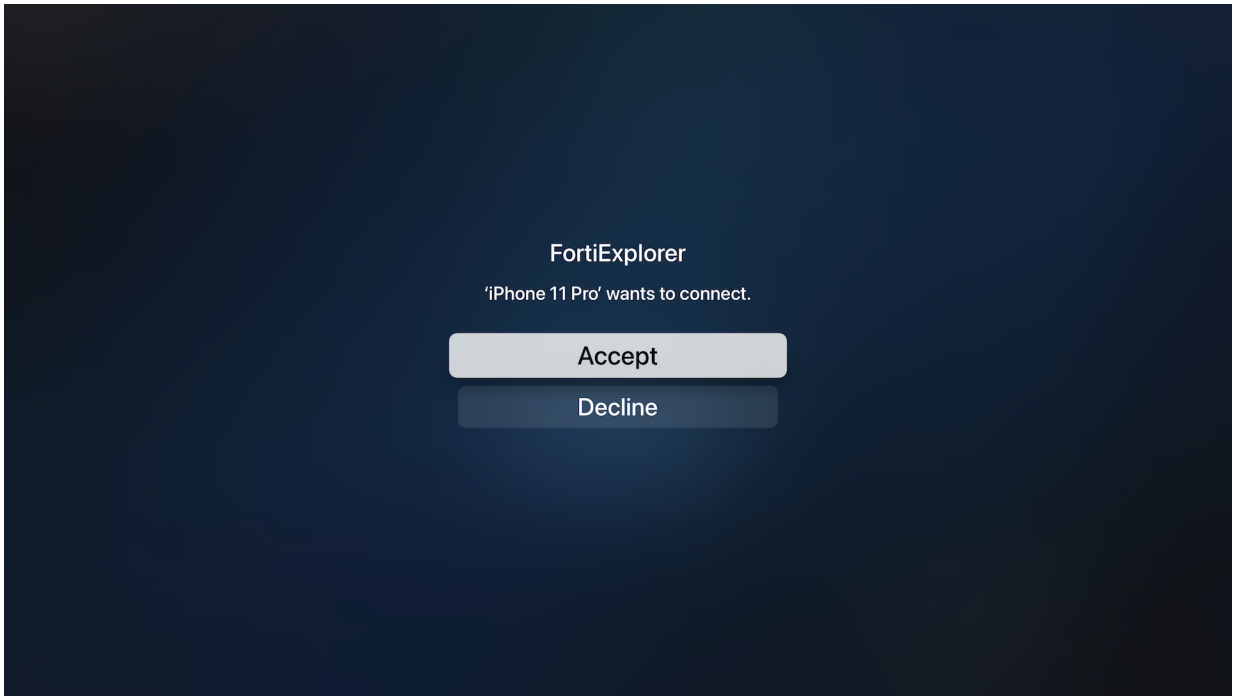
- Security Fabric on all FortiGates. See Configuring the root FortiGate and downstream FortiGates on page 2378.
- FortiAnalyzer Logging. See Configuring FortiAnalyzer on page 2385.
- FortiClient EMS. See Configuring FortiClient EMS on page 2404

Adding the root FortiGate to FortiExplorer for Apple TV



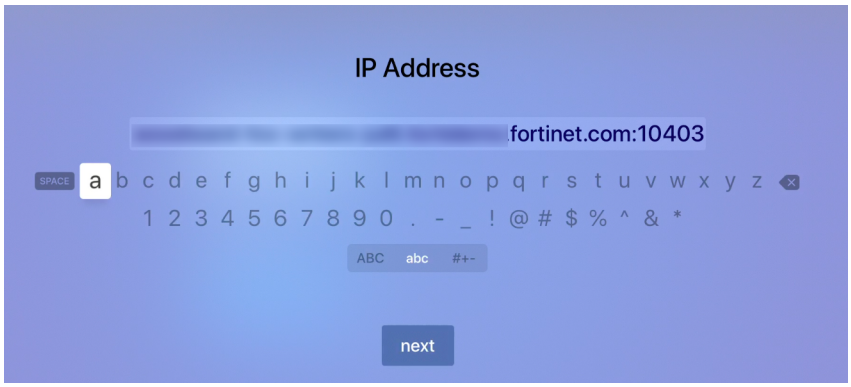
By adding the root FortiGate, you can view the entire topology and navigate to branch FortiGates in the SD-WAN view. If you are already using FortiExplorer on a mobile device, you can connect the same FortiGate device to Apple TV by sharing the login credentials on both devices. Alternatively, you can manually connect to your root FortiGate directly from the app.

To share login credentials between FortiExplorer and FortiExplorer for Apple TV:

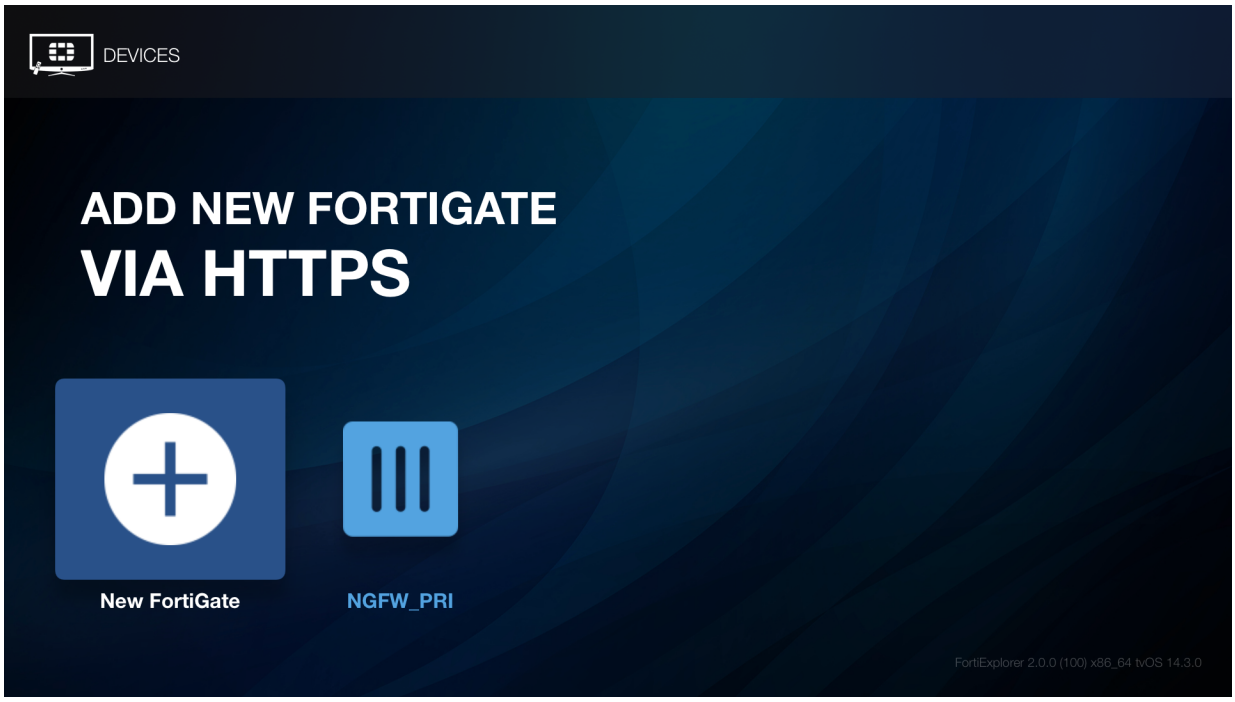


1. Connect the FortiExplorer and FortiExplorer for Apple TV devices to the same network.
2. On FortiExplorer for Apple TV, click *New FortiGate*.
3. In FortiExplorer, go to *My Fabric*.
4. Swipe right on the device you want to share, and tap *Share Login Profile*.

5. Tap *Share to Apple TV*.



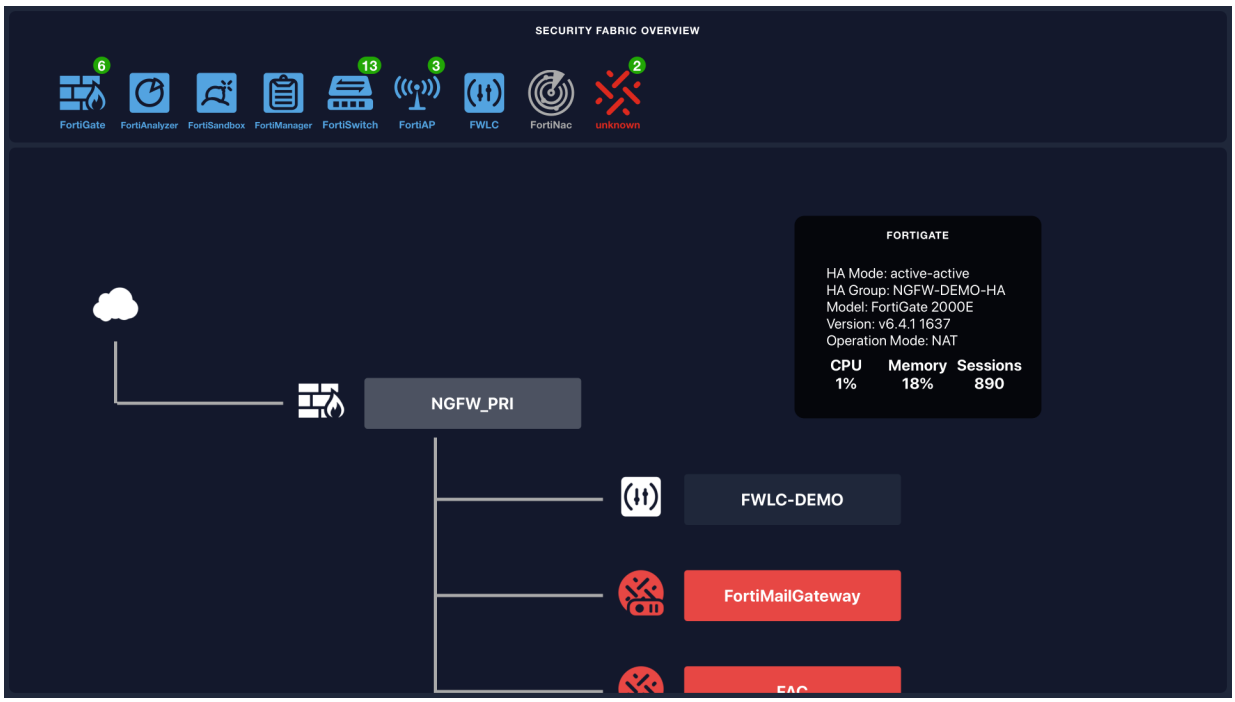
6. On Apple TV, click *Accept*. FortiExplorer for Apple TV confirms the request and proceeds to the device main menu.



To add devices to FortiExplorer for Apple TV:

1. In the *Devices* menu, click *New FortiGate*. The *Login to FortiGate* dialog box is displayed.
2. In the *IP Address/Host Name* field, take one of the following actions:
   - Enter the device IP address and port, if not using the default admin port 443
   - Enter the full host name including the domain. Enter port if not using the default admin port 443.

3. Enter the *Username* and *Password* for the FortiGate device.
4. Click *Remember* to save time entering the login credentials later.
5. Click *Login*. The device is added to FortiExplorer for Apple TV.

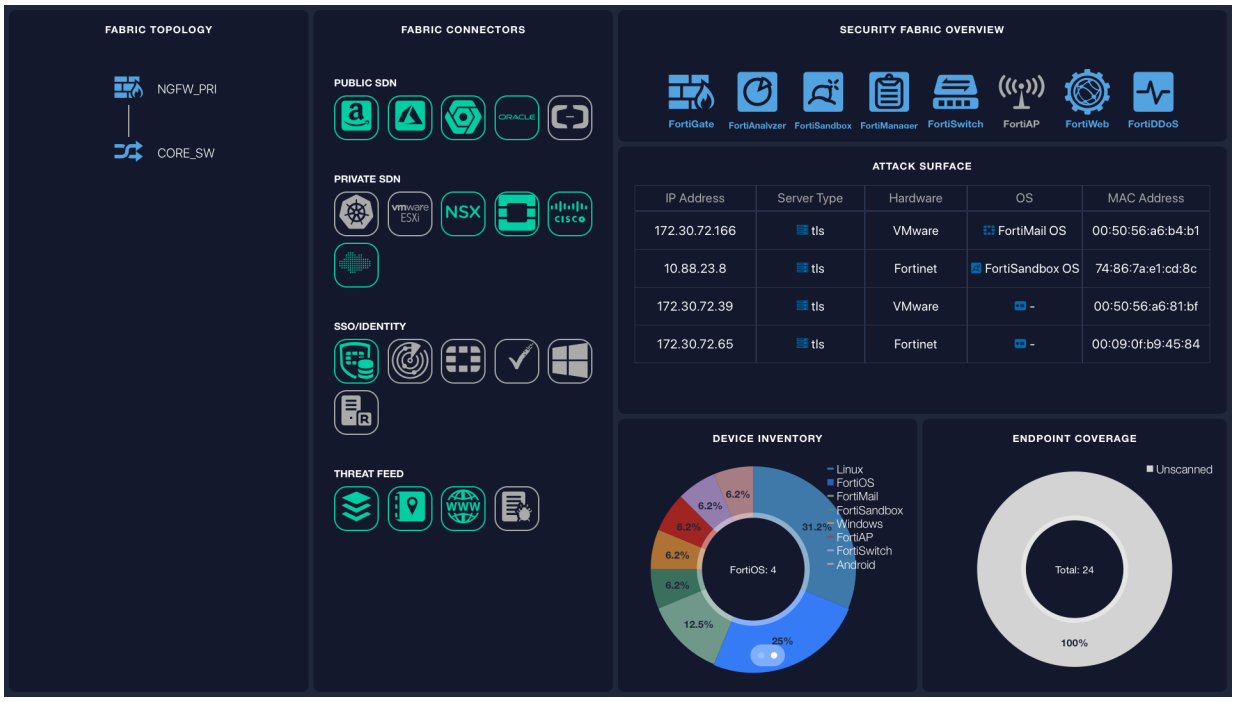


If the IP or hostname is not defined in the CN or SAN field of your certificate, you will receive a prompt that "Your connection is not private". You may choose to continue with your connection.

Viewing the Fabric Topology monitor

Use the Fabric Topology monitor to view the physical topology of the Fabric to identify risks. FortiGate devices with version 6.4. and above can drilldown further to see additional information for devices such as FortiGates, FortiAPs, and FortiSwitches.

To view the Fabric Topology monitor, go to *Network Operations Center* > *Fabric Topology*. This monitor displays the same information as the *Physical Topology* on the FortiGate



Use your remote to navigate through the devices in the Fabric topology. Click a device to view the drilldown information. To return to the default view, click the *Menu* button.

Viewing the Fabric Overview monitor

Use the Fabric Overview monitor to view the Fabric components as seen on the Dashboard of the Fabric Root FortiGate in the example topology. Each device must be authorized and be part of the Fabric.

For information about configuring the Security Fabric, see Fortinet Security Fabric on page 2374

To view the Fabric Overview monitor, go to *Network Operations Center* > *Fabric Overview*.

The Security Fabric monitor has multiple panes. To see data populated on the panes, ensure that proper configurations are applied on the Fabric devices:

Pane	Description	Configuration
Fabric Connectors	Displays external SDN connectors that are enabled.	Configure *Security Fabric* > *External Connectors*.
Security Fabric Overview	Displays the number of devices in the topology.	Configure *Security Fabric* > *Fabric Connectors*.
Attack Surface	Displays devices detected by the FortiGate with a server tag.	Ensure Device Detection is configured on the interfaces(s). Go to *Network* > *Interfaces*.
Device Inventory	Displays devices based on Hardware Vendor and detected OS	Ensure Device Detection is configured on the interface(s). Go to *Network* > *Interfaces*.
Endpoint Coverage	Displays the number of online devices and the percentage of Unscanned, Vulnerable, and Secured devices.	Ensure Device Detection is configured on the interface(s). Vulnerability scan results come from FortiClient EMS. Go to *Network* > *Interfaces*.

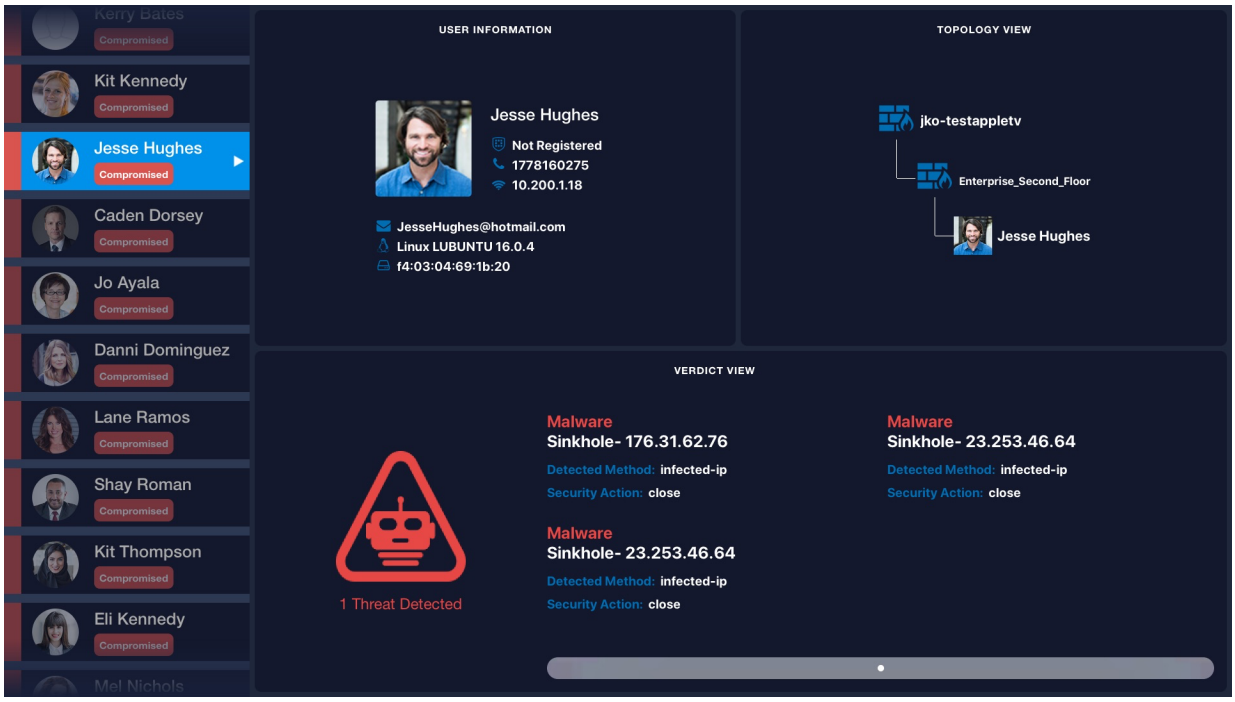
Device related information only corresponds to devices local to the FortiGate. Device information from downstream FortiGates do not propagate to the Upstream FortiGate.

Viewing the Security Rating monitor

The Security Rating monitor is separated into three major scorecards: *Security Posture*, *Fabric Coverage*, and *Optimization*, which provide an executive summary of the three largest areas of security focus in the Security Fabric.

To see the Security Rating summary, the root FortiGate and all FortiGates within the Fabric should have the proper FortiGuard Security Rating license. Security rating is performed on the root FortiGate. Its reports are generated periodically.

To view the Security Rating monitor, go to *Network Operations Center* > *Security Rating*.



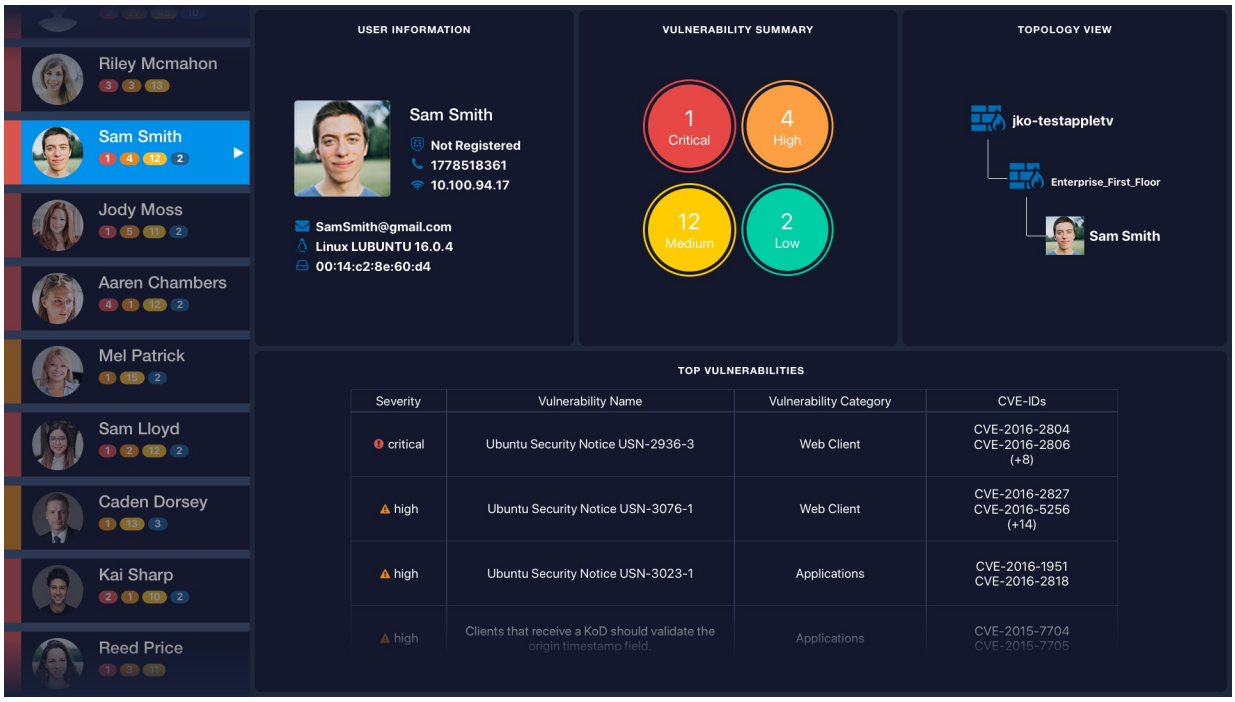
The scorecards show an overall score of the performance and sub-categories. The point score represents the net score for all passed and failed items in that area.

For more information about the Security Rating score, see Security Fabric score on page 2515.

Viewing the Compromised Hosts monitor

The Compromised Hosts monitor leverages the data collected by FortiAnalyzer on the endpoints on your network. To see compromised hosts, the FortiAnalyzer must have a FortiGuard Indicators of Compromise license. The IOC service helps identify compromised hosts based on infected websites that it may have visited.

This monitor captures the same information as seen on the *Compromised Hosts* monitor on the FortiGate.



To view the Compromised Hosts monitor:

1. Go to *Security Operations Center* > *Compromised Hosts*.
2. In the left-hand pane, scroll through the user list. The monitor displays three panes:
   - The *User Information* pane displays the user's contact information and IP address.
   - The *Topology View* pane displays the user's location in the topology.
   - The *Verdict View* pane displays the *Malware*, *Detected Method*, and *Security Action*.

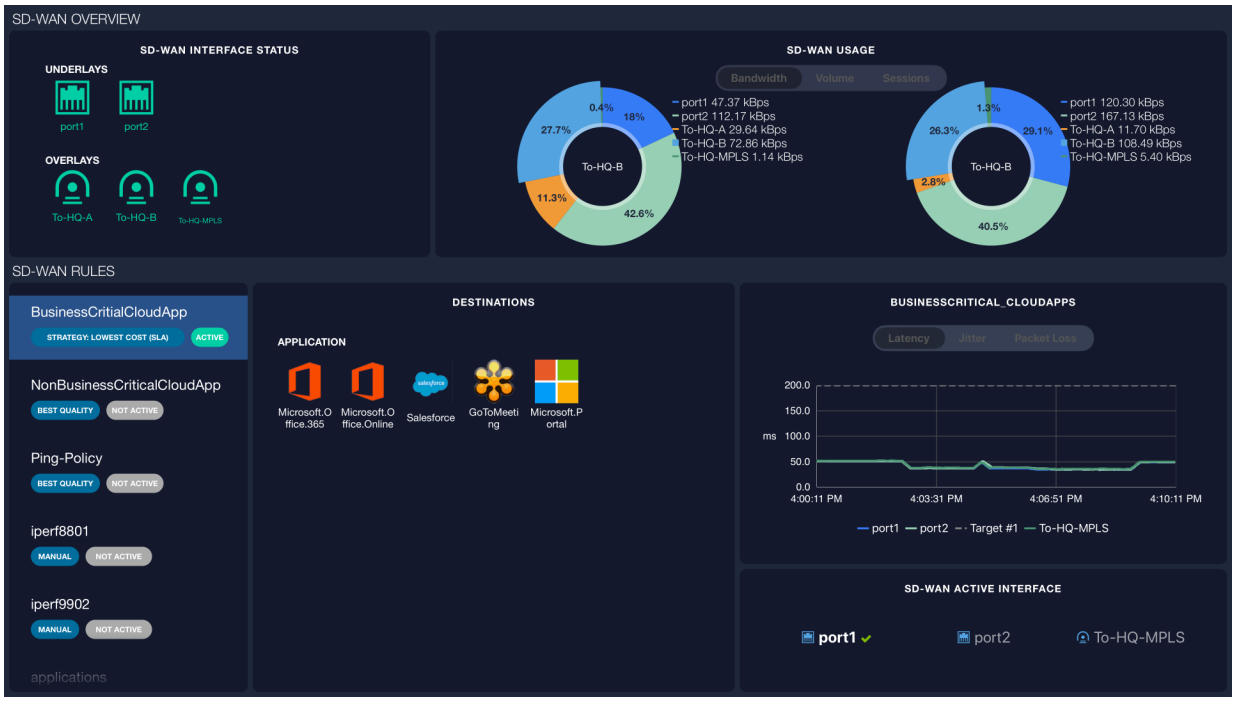
Viewing the Vulnerability Monitor

The Vulnerability Monitor obtains data from FortiClient EMS. It displays vulnerabilities detected by the FortiClient endpoint, categorized into Critical, High, Medium and Low risk. In this example, an on-premise FortiClient EMS is connected on the root FortiGate's Fabric Connector.

This monitor captures the same information as seen on the *Top Vulnerable Endpoint Devices* monitor on the FortiGate.

To view the Vulnerability Monitor:

1. Go to *Security Operations Center* > *Vulnerability Monitor*. The monitor displays a user list and their vulnerabilities.
2. Use your remote to scroll through the user list. The vulnerability details are displayed on the right side of the monitor.

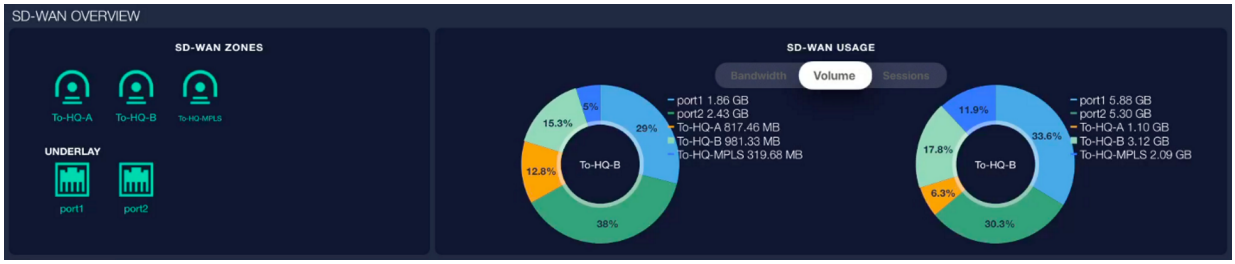


- The *User Information* pane displays the user's contact details and IP address.
- The *Vulnerability Summary* pane displays the number of vulnerabilities categorized into *Critical*, *High*, *Medium* and *Low* risk.
- The *Topology View pane* displays the user's location in the topology.
- The *Top Vulnerabilities* pane displays the top vulnerabilities by severity.

Using the SD-WAN monitor

In the example topology, the branches are configured to use SD-WAN. You can use the top-right navigation menu in the SD-WAN monitor to navigate to the Branch FortiGate to display information about the SD-WAN.

To view the SD-WAN monitor, go to *Software-Defined Branch* > *SD-WAN Monitor*.



The SD-WAN monitor summarizes the SD-WAN members, Zones, SD-WAN Rules and health checks deployed on the FortiGate. It shows the interface member's SD-WAN usage and its associated service level agreements. The monitor contains a chart that shows if the ports are meeting the SLA target for bandwidth, jitter and latency per the health check in use in each SD-WAN Rule.

Some of the SD-WAN statistics are only available in FOS 6.4.1 and higher.

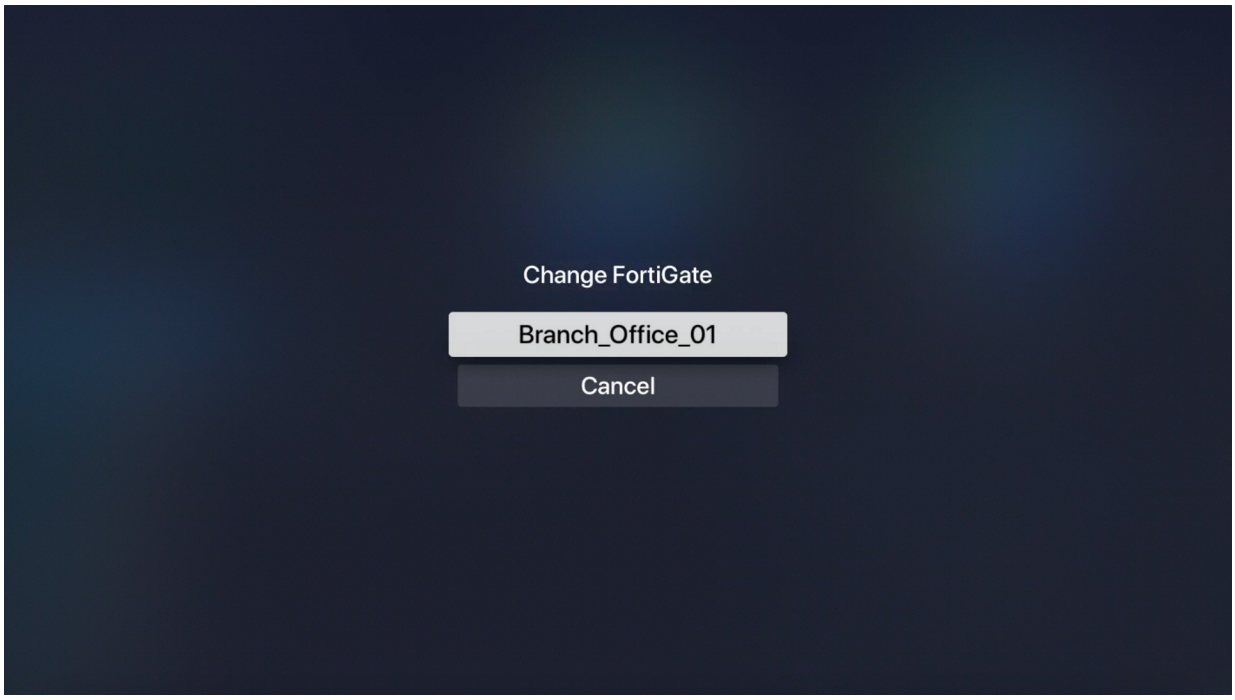
To view SD-WAN usage charts:

1. In the *SD-WAN Overview* area, Use your remote to select the *SD-WAN Usage* pane.
2. Scroll left and right to view *Bandwidth*, *Volume* and *Sessions* charts for the *VIRTUAL-WAN-LINK* and *Underlay* interfaces in the *SD-WAN Zones* pane.

To view SLA targets:

1. In the *SD-WAN Rules* area, use your remote to scroll the rules pane at the left-side of the monitor.
   - The *Destinations* pane displays the destination details.
   - The *Performance SLA* pane displays the SLA targets for the rule.
   - The *SD-WAN Active Interface* pane displays a checkmark next to the active interface.

2. Use your remote to navigate between the *Latency*, *Jitter*, and *Packet Loss* charts.



To view a branch in the topology:

1. Use your remote to swipe to the top navigation in the monitor. Wait for the topology to load.
2. At the top-right of the monitor, select the current device.

3. Select the device you want to view.

Troubleshooting

The following topics provide troubleshooting information for the Fortinet Security Fabric:

- Viewing a summary of all connected FortiGates in a Security Fabric on page 2726
- Diagnosing automation stitches on page 2728

Viewing a summary of all connected FortiGates in a Security Fabric

In downstream FortiGates, the `diagnose sys csf global` command shows a summary of all of the connected FortiGates in the Security Fabric.

To view a Security Fabric summary on a downstream FortiGate:

```
# diagnose sys csf global
Current vision:

Diagnosing automation stitches

Diagnose commands are available to:

- Test an automation stitch
- Enable or disable log dumping for automation stitches
- Display the settings of every automation stitch
- Display statistics on every automation stitch

To test an automation stitch:

```
diagnose automation test <automation-stitch-name>
```

Example:

```
# diagnose automation test HA-failover
automation test is done. stitch:HA-failover
```

To toggle log dumping:

```
diagnose test application autod 1
```

Examples:

```
# diagnose test application autod 1
autod log dumping is enabled
```

```
# diagnose test application autod 1
autod log dumping is disabled

autod logs dumping summary:
autod dumped total:7 logs, num of logids:4
```

To display the settings for all of the automation stitches:

```
diagnose test application autod 2
```

Example:

```
# diagnose test application autod 2
csf: enabled root:yes
total stitches activated: 3

stitch: Compromised-IP-Banned
        destinations: all
        trigger: Compromised-IP-Banned

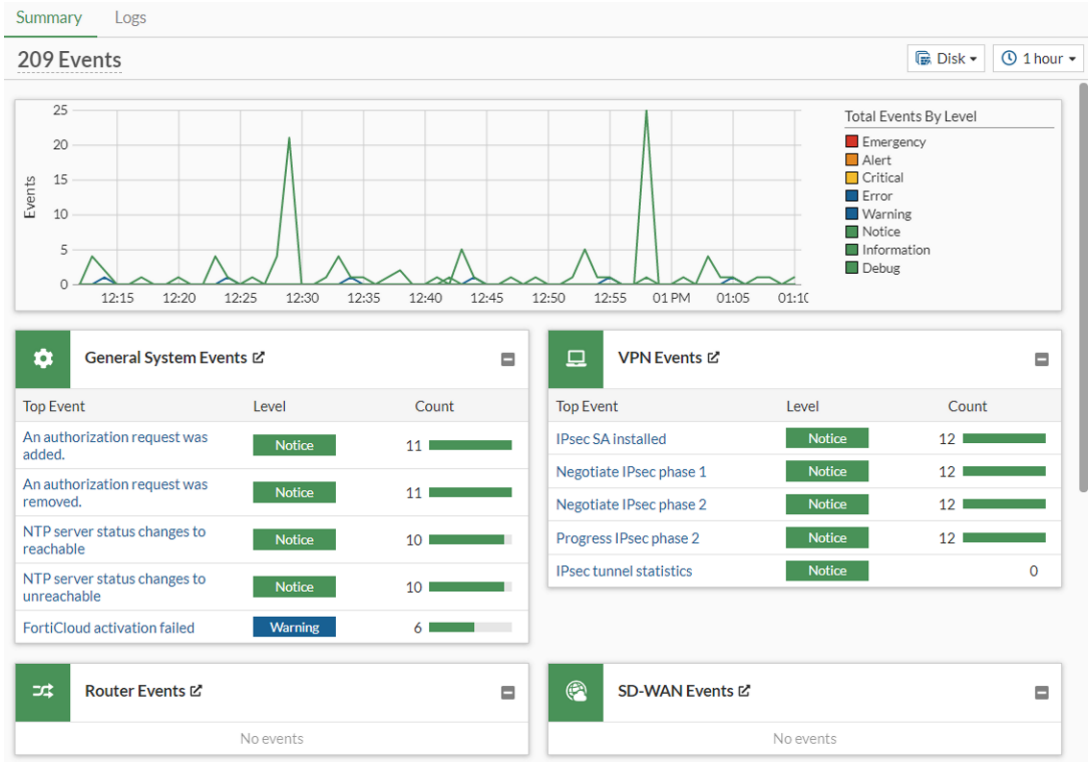
Log and Report

Logging and reporting are useful components to help you understand what is happening on your network, and to inform you about certain network activities, such as the detection of a virus, a visit to an invalid website, an intrusion, a failed log in attempt, and myriad others.

Logging records the traffic that passes through, starts from, or ends on the FortiGate, and records the actions the FortiGate took during the traffic scanning process. After this information is recorded in a log message, it is stored in a log file that is stored on a log device (a central storage location for log messages). FortiGate supports sending all log types to several log devices, including FortiAnalyzer, FortiAnalyzer Cloud, FortiGate Cloud, and syslog servers. Approximately 5% of memory is used for buffering logs sent to FortiAnalyzer. The FortiGate system memory and local disk can also be configured to store logs, so it is also considered a log device. See Log settings and targets on page 2743 for more information.

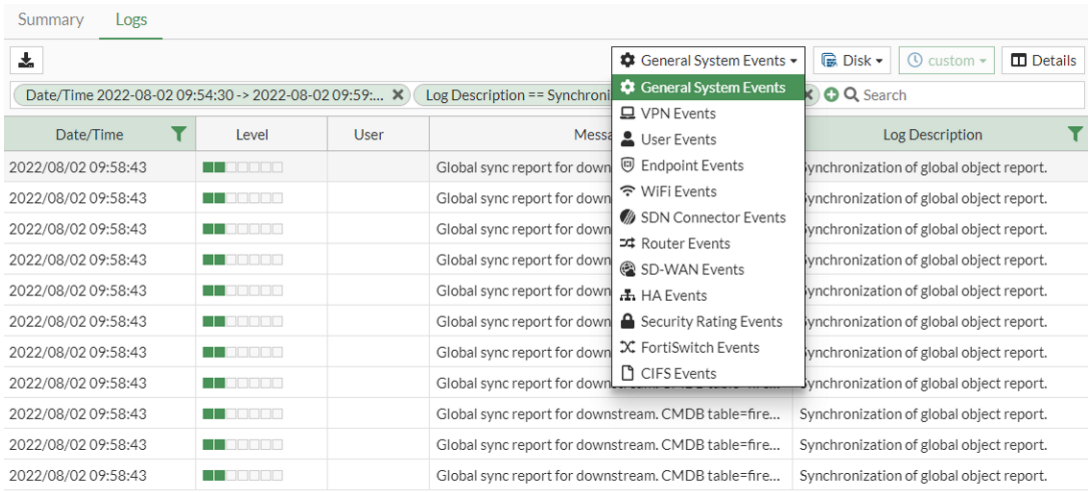
Reports show the recorded activity in a more readable format. A report gathers all the log information that it needs, then presents it in a graphical format with a customizable design and automatically generated charts showing what is happening on the network. Reports can be generated on FortiGate devices with disk logging and on FortiAnalyzer devices.

FortiView is a more comprehensive network reporting and monitoring tool. It integrates real-time and historical data into a single view in FortiOS. For more information, see FortiView monitors and widgets on page 118.



Performance statistics are not logged to disk. Performance statistics can be received by a syslog server or by FortiAnalyzer.

The following topics provide information about logging and reporting:



- Viewing event logs on page 2732
- System Events log page on page 2735
- Security Events log page on page 2740
- Log settings and targets on page 2743
- Threat weight on page 2748
- Logging to FortiAnalyzer on page 2749
- Advanced and specialized logging on page 2758
- Sample logs by log type on page 2775
- Troubleshooting on page 2796

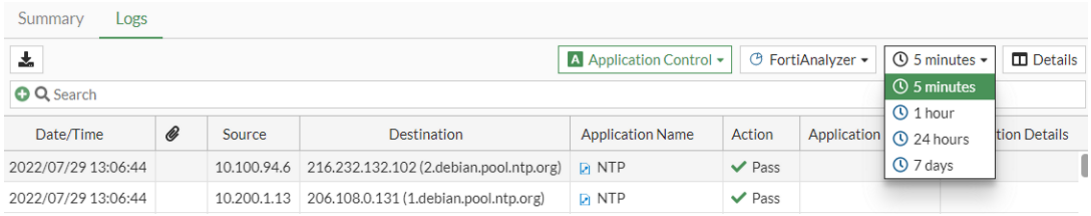
Viewing event logs

Event log subtypes are available on the *Log & Report* > *System Events* page. Not all of the event log subtypes are available by default. See System Events log page on page 2735 for more information.

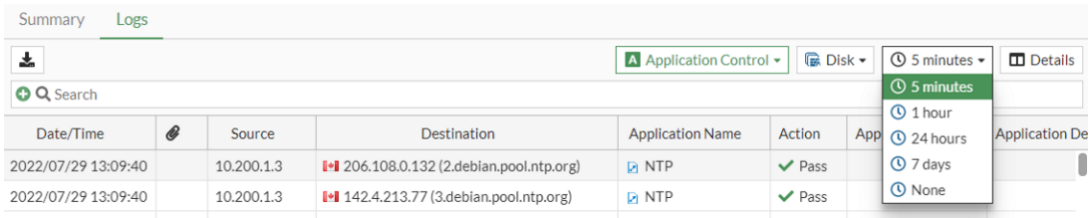
When viewing event logs in the *Logs* tab, use the event log subtype dropdown list on the to navigate between event log types.

System Events	Always available.
Router Events	Always available.
VPN Events	Available when *VPN* is enabled in *System* > *Feature Visibility*.
SD-WAN Events	Always available.
User Events	Always available.

Endpoint Events	Available when *Endpoint Control* is enabled in *System* > *Feature Visibility*.
HA Events	Always available.
Security Rating Events	Always available, but logs are only generated when a Security Rating License is registered.
WAN Opt. & Cache Events	Available on devices with two hard disks by default. On devices with one hard disk, the disk usage must be set to `wanopt` and then *WAN Opt. & Cache* must be enabled in *System* > *Feature Visibility*.
WiFi Events	Available on hardware devices when *WiFi Controller* is enabled in *System* > *Feature Visibility*.
FortiExtender Events	Available when *FortiExtender* is enabled in *System* > *Feature Visibility*.
SDN Connector Events	Always available.
FortiSwitch Events	Available when *Switch Controller* is enabled in *System* > *Feature Visibility*.
CIFS Events	Always available.
REST API Events	Always available.



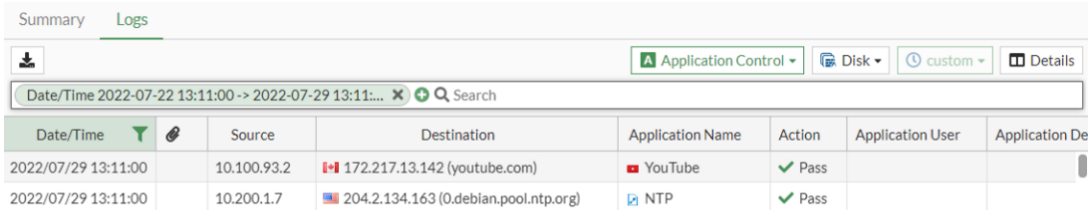
Logs can be filtered by date and time in the *Log & Report* > *System Events* page. The log viewer can be filtered with a custom range or with specific time frames.



UTM logs can also be filtered by date and time in *Log & Report* > *Security Events*. See Security Events log page on page 2740.

The time frame available is dependent on the source:

- Logs sourced from FortiAnalyzer, FortiGate Cloud, and FortiAnalyzer Cloud have the same time frame options as FortiView (*5 minutes*, *1 hour*, *24 hours*, or *7 days*).

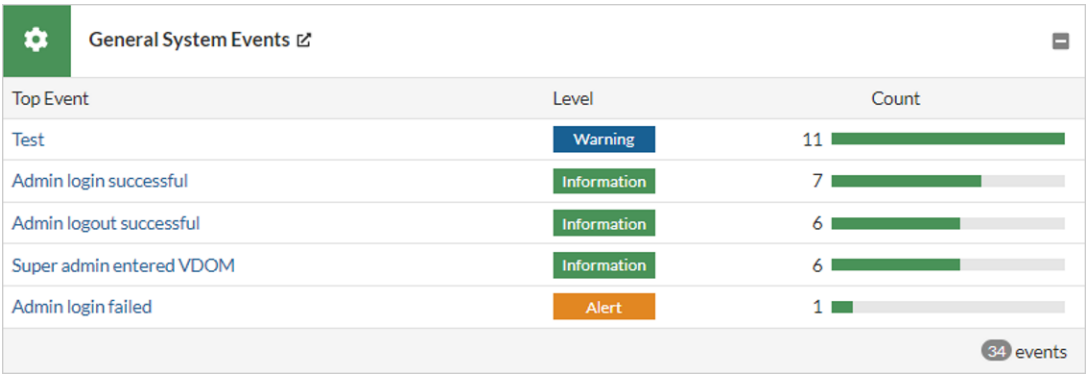


- Logs sourced from the Disk have the time frame options of *5 minutes*, *1 hour*, *24 hours*, *7 days*, or *None*.

- Logs source from Memory do not have time frame filters.

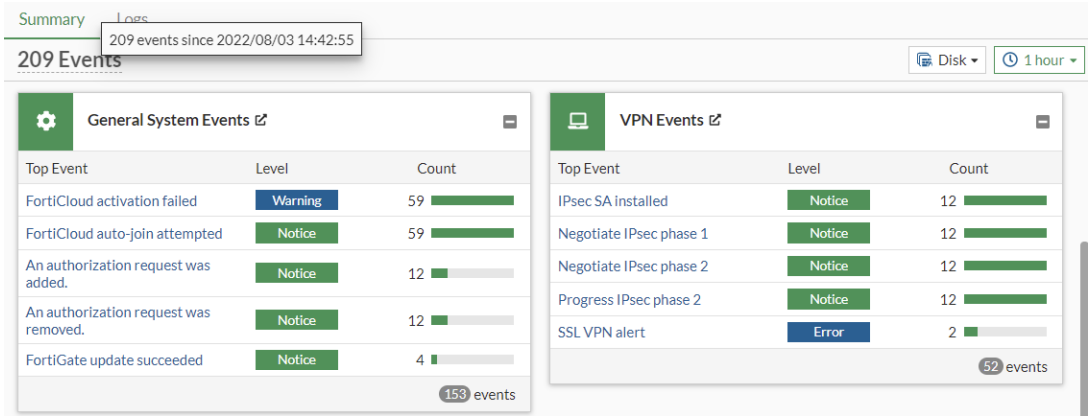
A custom time frame can be applied using the *Date/Time* filter. If the *Date/Time* filter is applied, the time frame will be disabled and set to *custom*.

Time frame settings for each *Log & Report* page are independent of each other. For example, if you change the time frame on the *System Events* page, the time frame will be different than that of the *Security Events* page unless it is also changed to match.



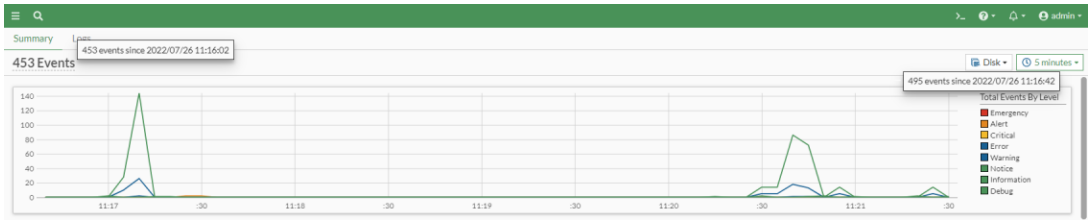
System Events log page

The *Log & Report* > *System Events* page includes:

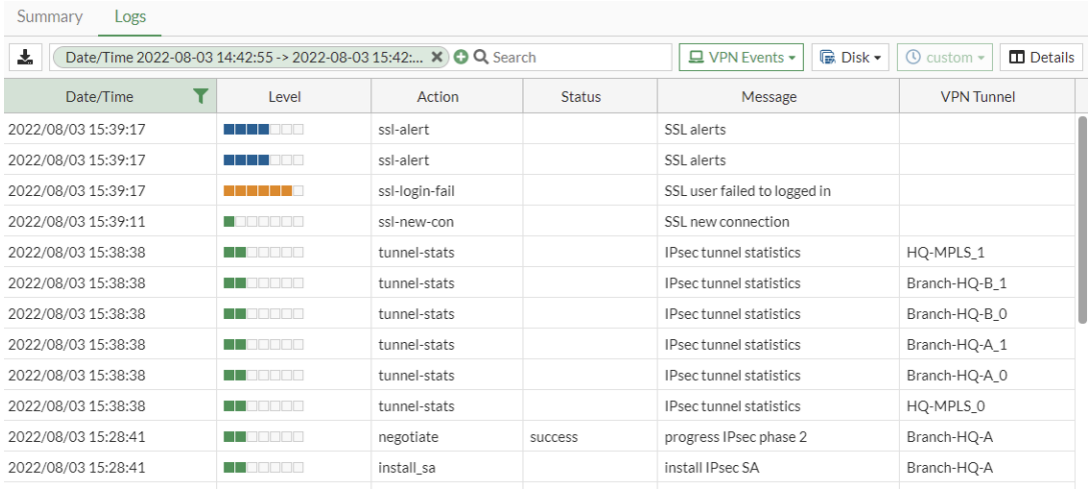


- A *Summary* tab that displays the top five most frequent events in each type of event log and a line chart to show aggregated events by each severity level. Clicking on a peak in the line chart will display the specific event count for the selected severity level.
- A *Logs* tab that displays individual, detailed log views for event type.

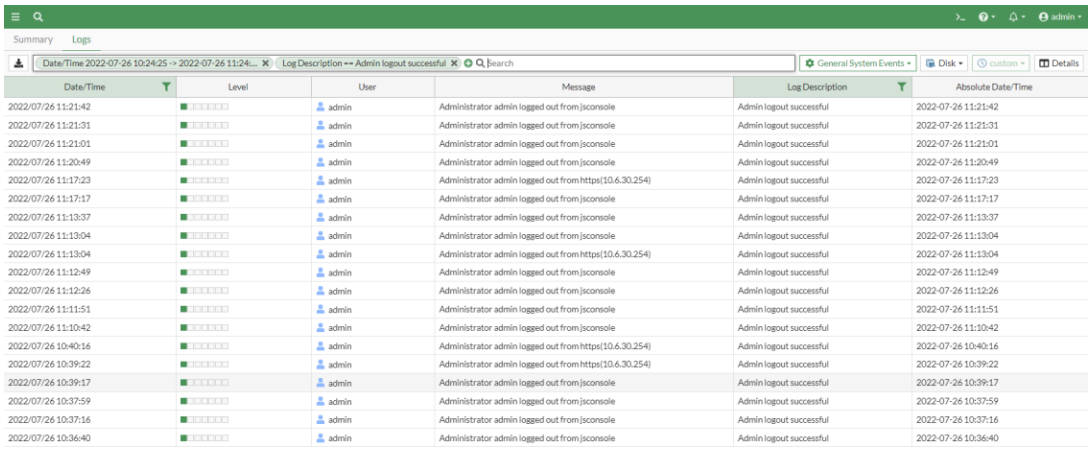
The *Summary* tab includes the following enhancements:



- Event list footers show a count of the events that relate to the type.

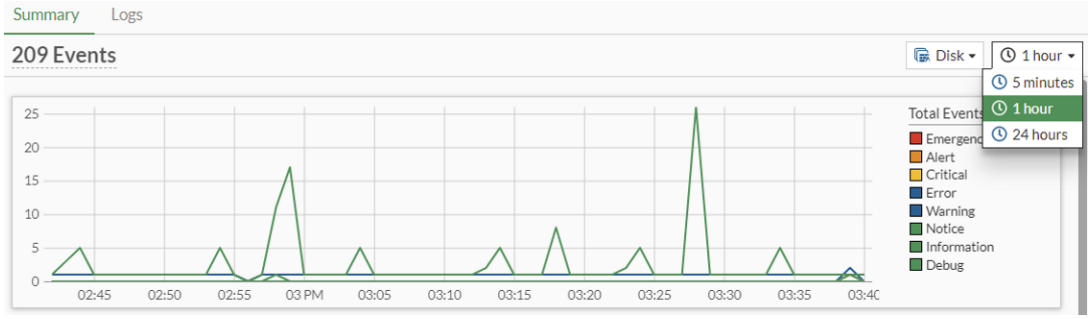


- A count of the total events is shown at the top of the *Summary*. Hovering over the count shows the number of events with a time stamp.



- Hovering over the *Total Events By Level* shows the shows the number of events with a time stamp.

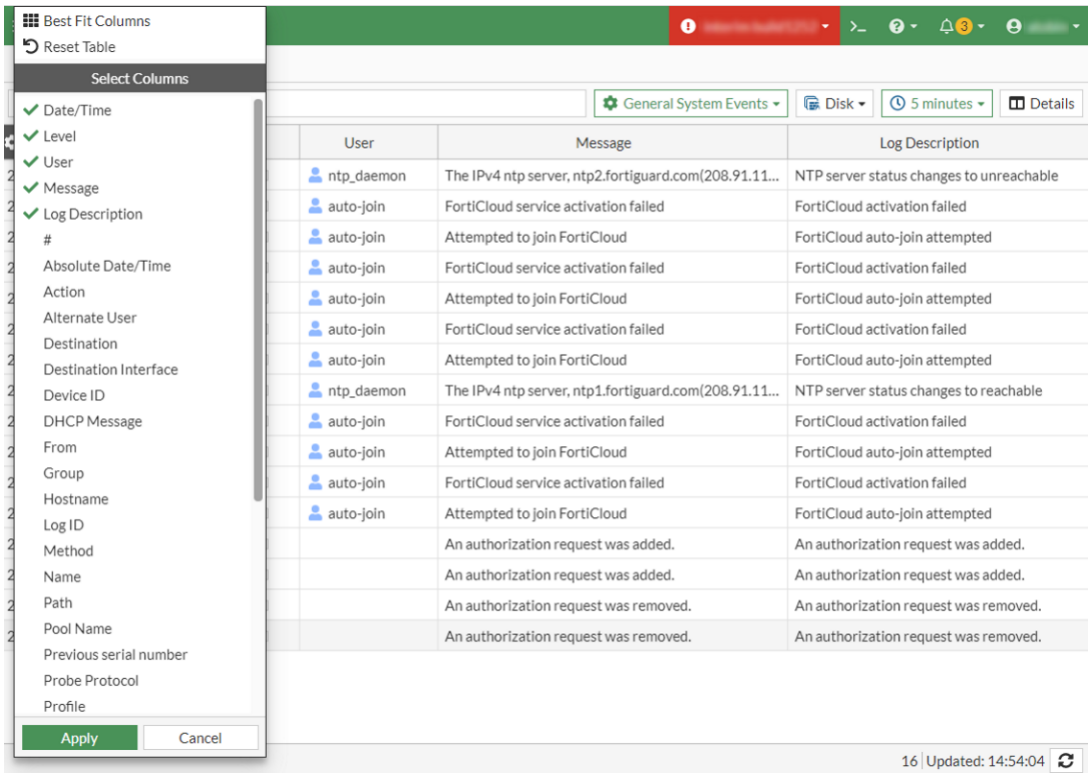
- Clicking on any event type title opens the *Logs* page for that event type filtered by the selected time span.
  For example, clicking *VPN Events* opens the following page:



- Clicking on any event entry opens the *Logs* page for that event type filtered by the selected time span and log description.
  For example, in the *General System Events* box, clicking *Admin logout successful* opens the following page:

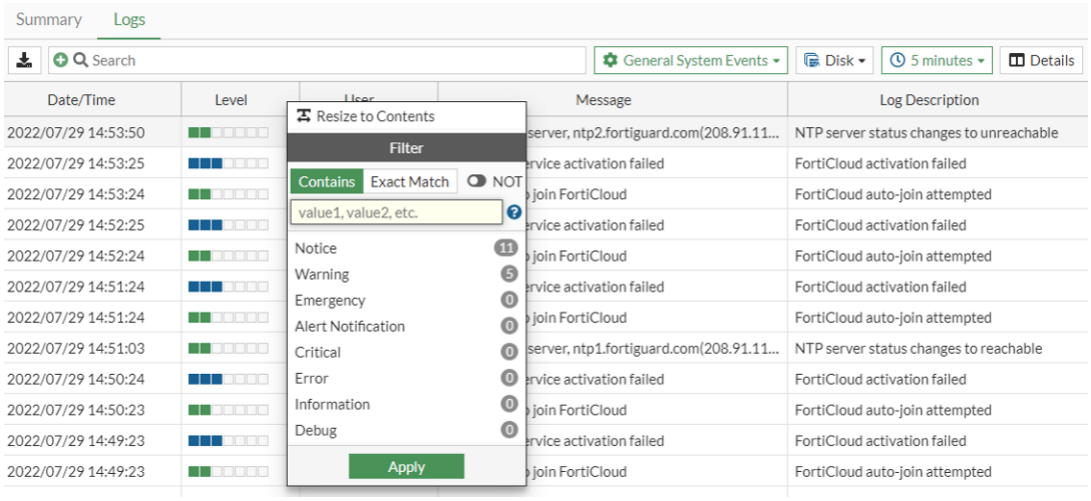
Disk logging and historical FortiView must be enabled for the *Summary* tab to display valid data. See Log settings and targets on page 2743 for more information.

A time frame can be selected from the dropdown.



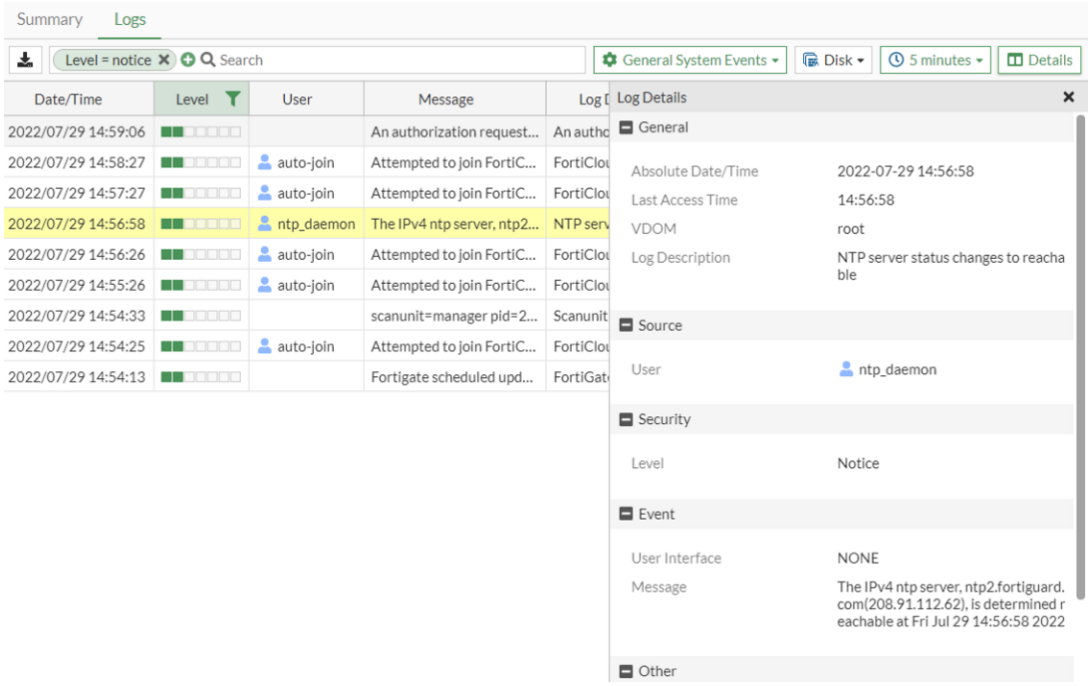
The line chart will display all of the system events, and the non-empty event cards will list up to five *Top Event* entries within the time frame set.

Data is retrieved from FortiView with the *5 minutes* range updated first. When selecting either the *1 hour* or *24 hours* time range, there may be a delay to update *Top Event* entries.



Up to 100 *Top Event* entries can be listed in the CLI using the `diagnose fortiview result event-log` command.

To view filtered log information:



1. Go to *Log & Report* > *System Events*.
2. Select the *Logs* tab.
3. Hover over the leftmost column and click the gear icon. A list of column you can filter is displayed.

4. Select the columns you want displayed.
5. Click *Apply*. The selected columns are displayed.
6. Click the filter icon for the column you want to filter. The filter dialog is displayed and the number of logs for each filter type is listed.

7. Select the filters you want and click *Apply*. The logs that match the set filters are displayed and the filter is listed in the search bar.
8. Select the log you want to see more information on.
9. Click *Details*. The *Log Details* pane is displayed.

To list system events in the CLI:

```
# diagnose fortiview result event-log

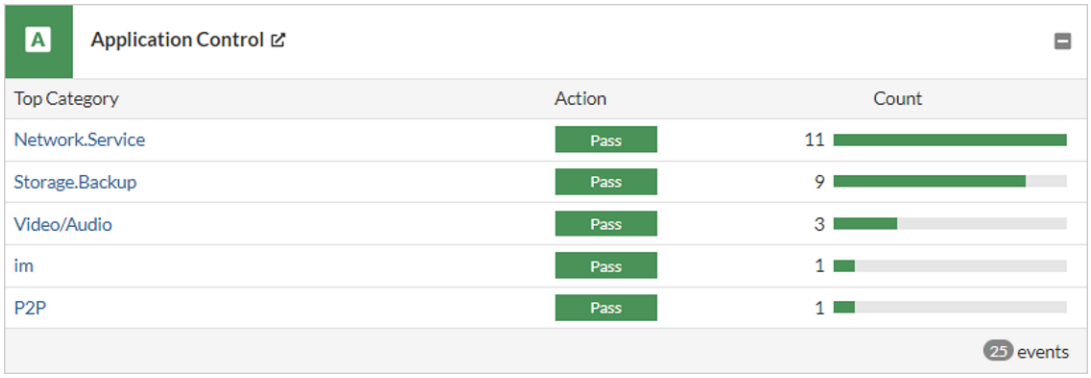
    data(1646760000-1646846401):
    0). subtype-ha | eventname-HA device interface failed | level-warning | count-1 |
    1). subtype-system | eventname-DHCP statistics | level-information | count-40 |
    2). subtype-system | eventname-Super admin left VDOM | level-information | count-13 |
    3). subtype-system | eventname-Admin performed an action from GUI | level-warning |
count-5 |
    4). subtype-system | eventname-Super admin entered VDOM | level-information | count-4 |
    5). subtype-system | eventname-Global setting changed | level-notice | count-3 |
    6). subtype-system | eventname-Attribute configured | level-information | count-2 |
    7). subtype-system | eventname-Clear active sessions | level-warning | count-2 |
    8). subtype-system | eventname-Disk log rolled | level-notice | count-2 |
    9). subtype-system | eventname-Log rotation requested by FortiCron | level-notice |
count-1 |
    10). subtype-system | eventname-Report generated successfully | level-notice | count-1 |
    11). subtype-system | eventname-Test | level-warning | count-1 |
    12). subtype-system | eventname-VDOM added | level-notice | count-1 |
    13). subtype-user | eventname-Authentication failed | level-notice | count-1 |
    14). subtype-user | eventname-Authentication lockout | level-warning | count-1 |
    15). subtype-user | eventname-FortiGuard override failed | level-warning | count-1 |
```

The data is collected from FortiView for the last 24 hours by default. To specify a specific time range, customize the time filter using the `diagnose fortiview time` command.

To filter the time range of system events in the CLI:

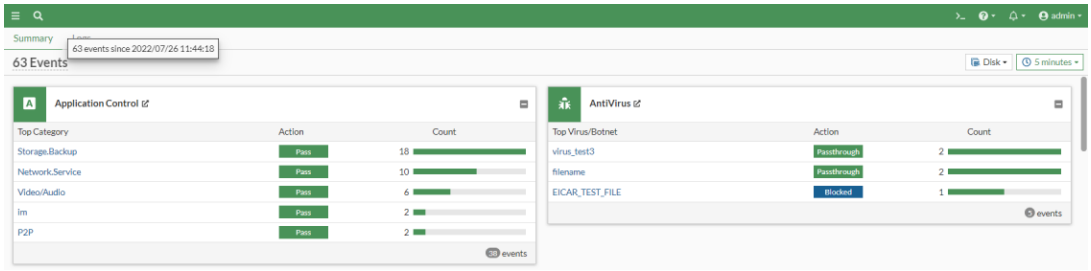
```
# diagnose fortiview time <arg1> <arg2>
```

Where `<arg1>` is the start time in YYYY-MM-DD HH:MM:SS and `<arg2>` is the end time in YYYY-MM-DD HH:MM:SS.



Security Events log page

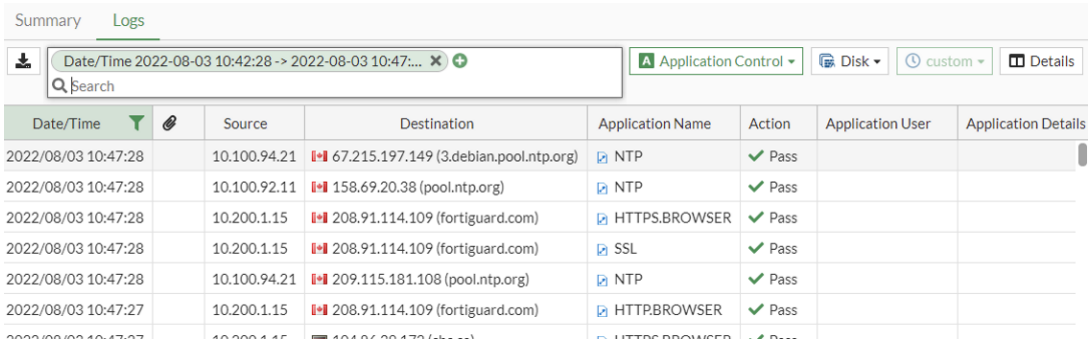
The *Log & Report* > *Security Events* log page includes:



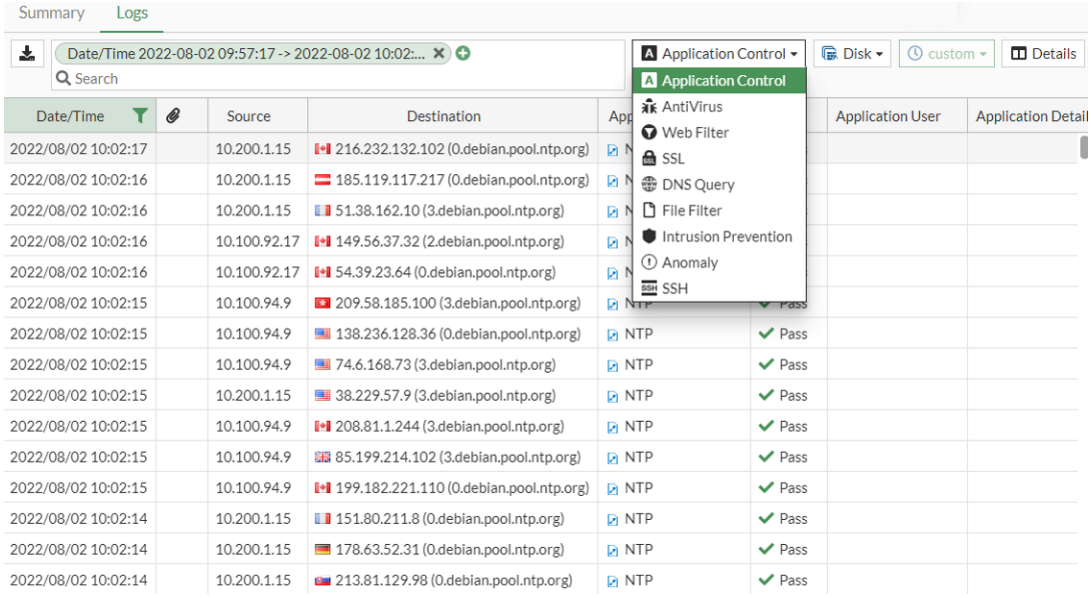
- A *Summary* tab that displays the five most frequent events for all of the enabled UTM security events.
- A *Logs* tab that displays individual, detailed logs for each UTM type.

The *Summary* tab includes the following enhancements:

- Event list footers show a count of the events that relate to the type.



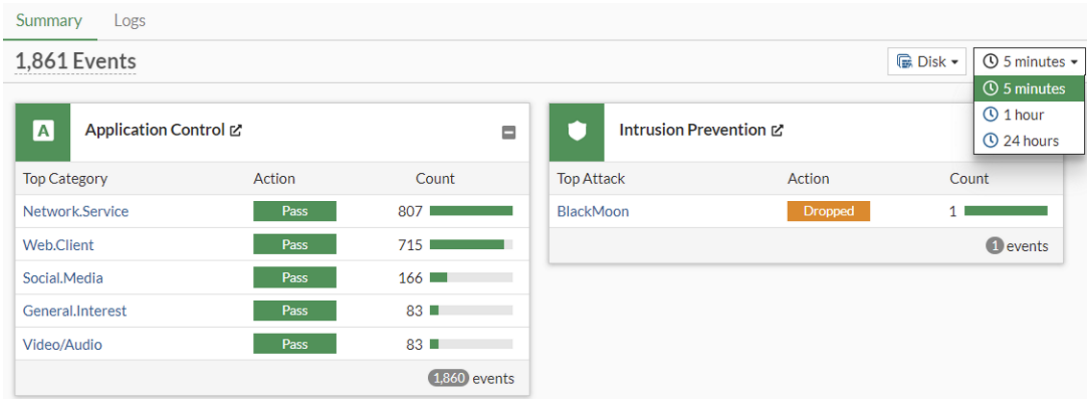
- A count of the total events is shown at the top of the *Summary*. Hovering over the count shows the number of events with a time stamp.



- Clicking on any event type title opens the *Logs* page for that event type filtered by the selected time span.

  For example, clicking *Application Control* opens the following page:

  The security event type can be changed in the top-right dropdown list.



- Clicking on any event entry opens the *Logs* page for that event type filtered by the selected time span and log description.

  For example, in the *Application Control* box, clicking *Network.Service* opens the following page:

Disk logging and historical FortiView must be enabled for the *Summary* tab to display valid data. See Log settings and targets on page 2743 for more information.

A time frame can be selected from the dropdown.

The non-empty security event cards will list up to five top entries within the time range set.

Data is retrieved from FortiView with the *5 minutes* range updated first. When selecting either the *1 hour* or *24 hours* time range, there may be a delay to update top security event entries. Logs sourced from the Disk have different time frames available for filtering. See Viewing event logs on page 2732.

Up to 100 top security event entries can be listed in the CLI using the `diagnose fortiview result security-log` command.

To list security events in the CLI:

```
# diagnose fortiview result security-log [<filters>]
```

To list security events in the CLI with no filters applied:

```
# diagnose fortiview result security-log

```

Log settings and targets

Log settings determine what information is recorded in logs, where the logs are stored, and how often storage occurs. Log settings can be configured in the GUI and CLI. In the GUI, *Log & Report* > *Log Settings* provides the settings for local and remote logging.

Local Log	
Disk	Define local log storage on the FortiGate: • *Enable*: Logs will be stored on a local disk. Local disk logging is not available in the GUI if the Security Fabric is enabled. When the Security Fabric is enabled, disk logging can still be configured on the root FortiGate in the CLI but is not available for downstream FortiGates. • *Disable*: Logs will be stored remotely to FortiAnalyzer/FortiManager or to a Cloud logging device.
Enable Local Reports	Define log reporting on the FortiGate: • *Enable*: Local reports will be available on the FortiGate. Reports can be reviewed in *Log & Report* > *Local Reports*. If the Security Fabric is enabled, *Local Reports* can be enabled in *System* >

	Feature Visibility. • *Disable*: Local reports will not be available on the FortiGate.
Enable Historical FortiView	Define the presentation of log information on FortiView: • *Enable*: Historical log data will be available on a FortiView monitor. By default, logs older than seven days are deleted. Disk logging must be enabled. • *Disable*: Historical log data will not be available on FortiView.
Remote Logging and Archiving	
Send logs to FortiAnalyzer/FortiManager	Define the status of remote logging to FortiAnalyzer and FortiManager: • *Enable*: Logs are sent to FortiAnalyzer or FortiManager for remote logging. HTTP transaction logs are also sent to a FortiAnalyzer unit to generate additional details in reports. • *Disable*: Logs are stored to system memory, a local disk, or a Cloud logging device.
Server	Set the server IP address for the FortiAnalyzer or FortiManager. Use *Test Connectivity* to test the connection status to the server.
Connection status	Displays authorization status on FortiAnalyzer: • *Successful*: The FortiGate is connected to the FortiAnalyzer. Remote logging to the FortiAnalyzer can be configured. • *Unauthorized*: The FortiGate is not connected to the FortiAnalyzer. Click Authorize to review the approval status on FortiAnalyzer or see Configuring FortiAnalyzer on page 2385 for more information.
Storage usage	Presents the storage used and the total storage available on the remote logging device.
Analytics usage	Presents the analytics space used and the total analytics space available on the remote logging device.
Archives usage	Presents the archive space used and the total archive space available on the remote logging device.
Upload option	Select the frequency of log uploads to the remote device: • *Real Time*: Logs are sent to the remote device in real time. • *Every Minute*: Logs are sent to the remote device once every minute. This option is unavailable if the Security Fabric Connections is enabled. • *Every 5 Minutes*: Logs are sent to the remote device once every five minutes. This is the default option. This option is unavailable if the Security Fabric Connection is enabled. • `store-and-upload`: Store logs to a local disk before uploading to FortiAnalyzer or FortiManager at a scheduled time. This option is only available for CLI configuration.
Allow access to FortiGate REST API	Define access to FortiGate REST API: • *Enable*: The REST API accesses the FortiGate topology and shares data and results.

	• *Disable*: The REST API foes not share data and results.
Verify FortiAnalyzer certificate	Define the FortiAnalyzer certificate verification process: • *Enable*: The FortiGate will verify the FortiAnalyzer serial number against the FortiAnalyzer certificate. When verified, the serial number is stored in the FortiGate configuration. • *Disable*: The FortiGate will not verify the FortiAnalyzer certificate against the serial number.
Cloud Logging Settings	
Type	Specify remote logging to the FortiGate Cloud or FortiAnalyzer Cloud device. If multiple devices are enabled, the default preference is FortiAnalyzer Cloud.
Connection status	Displays the current connection status to the selected *Type*. Use *Test Connectivity* to test the connection status to the Cloud logging device.
Upload option	Select the frequency of log uploads to the Cloud device: • *Real Time*: Logs are sent to the Cloud device in real time. • *Every Minute*: Logs are sent to the Cloud device once every minute. This option is unavailable if the Security Fabric Connection is enabled. • *Every 5 Minutes*: Logs are sent to the Cloud device once every five minutes. This is the default option. This option is unavailable if the Security Fabric Connection is enabled.
Allow access to FortiGate REST API	Define access to FortiGate REST API: • *Enable*: The REST API accesses the FortiGate topology and shares data and results. • *Disable*: The REST API foes not share data and results.
Verify FortiAnalyzer Cloud certificate	Define the FortiAnalyzer Cloud certificate verification process: • *Enable*: The FortiGate will verify the FortiAnalyzer serial number against the FortiAnalyzer certificate. When verified, the serial number is stored in the FortiGate configuration. • *Disable*: The FortiGate will not verify the FortiAnalyzer certificate against the serial number.
UUIDs in Traffic Log	
Policy	Define the use of policy UUIDs in traffic logs: • *Enable*: Policy UUIDs are stored in traffic logs. UUIDs can be matched for each source and destination that match a policy in the traffic log. See Source and destination UUID logging on page 2762 for more information. • *Disable*: Policy UUIDs are excluded from the traffic logs.
Address	Define the use of address UUIDs in traffic logs: • *Enable*: Address UUIDs are stored in traffic logs. When viewing *Forward Traffic* logs, a filter is automatically set based on UUID. • *Disable*: Address UUIDs are excluded from traffic logs.

Log Settings	
Event Logging	Define the allowed set of event logs to be recorded: • *All*: All event logs will be recorded. • *Customize*: Select specific event log types to be recorded. Deselect all options to disable event logging.
Local Traffic Log	Define the allowed set of traffic logs to be recorded: • *All*: All traffic logs to and from the FortiGate will be recorded. • *Customize*: Select specific traffic logs to be recorded. Deselect all options to disable traffic logging. Local traffic logging is disabled by default due to the high volume of logs generated.
GUI Preferences	
Resolve Hostnames	Define the translation of IP addresses to host names: • *Enable*: IP addresses are translated to host names using reverse DNS lookup. If the DNS server is not available or is slow to reply, requests may time out. • *Disable*: IP addresses are not translated to host names.
Resolve Unknown Applications	Define the resolution of unknown applications: • *Enable*: Unknown applications are resolved using the Internet Service Database. • *Disable*: Unknown applications are not resolved.

Configuring logs in the CLI

The FortiGate can store logs locally to its system memory or a local disk. Logs can also be stored externally on a storage device, such as FortiAnalyzer, FortiAnalyzer Cloud, FortiGate Cloud, or a syslog server.

Disk logging

Disk logging must be enabled for logs to be stored locally on the FortiGate. By default, logs older than seven days are deleted from the disk. Log age can be configured in the CLI. Approximately 75% of disk space is available for log storage. Log storage space can be determined using the `diagnose sys logdisk usage` command.

To configure local disk logging:

```
config log disk setting
    set status enable
    set maximum-log-age <integer>
    set max-log-file-size <integer>
end
```

Remote logging

The process to configure FortiGate to send logs to FortiAnalyzer or FortiManager is identical. Remote logging to FortiAnalyzer and FortiManager can be configured using both the GUI and CLI. When using the CLI, use the `config`

`log fortianalyzer setting` command for both FortiAnalyzer and FortiManager.

If VDOMs are configured on the FortiGate, multiple FortiAnalyzers and syslog servers can be added globally. SeeConfiguring multiple FortiAnalyzers (or syslog servers) per VDOM on page 2754 and Configuring multiple FortiAnalyzers on a FortiGate in multi-VDOM mode on page 2755 for more information.

To configure remote logging to FortiAnalyzer:

```
config log fortianalyzer setting
    set status enable
    set server <server_IP>
    set upload option {store-and-upload | realtime | 1-minute | 5-minute}
end
```

Remote logging can also be configured to FortiCloud, FortiSIEM, and syslog servers. Up to four syslog servers or FortiSIEM devices can be configured using the `config log syslogd` command and can send logs to syslog in CSV and CEF formats.

To configure remote logging to FortiCloud:

```
config log fortiguard setting
    set status enable
    set source-ip <source IP used to connect FortiCloud>
end
```

To configure remote logging to a syslog server:

```
config log syslogd setting
    set status enable
    set server <syslog_IP>
    set format {default | cev | cef}
end
```

Log filters

Log filter settings can be configured to determine which logs are recorded to the FortiAnalyzer, FortiManager, and syslog servers. This allows certain logging levels and types of logs to be directed to specific log devices.

To configure log filters for FortiAnalyzer:

```
config log fortianalyzer filter
    set severity <level>
    set forward-traffic {enable | disable}
    set local-traffic {enable | disable}
    set multicast-traffic {enable | disable}
    set sniffer-traffic {enable | disable}
end
```

To configure log filters for a syslog server:

```
config log syslogd filter
    set severity <level>
    set forward-traffic {enable | disable}
```

```
    set local-traffic {enable | disable}
    set multicast-traffic {enable | disable}
    set sniffer-traffic {enable | disable}
end
```

Email alerts

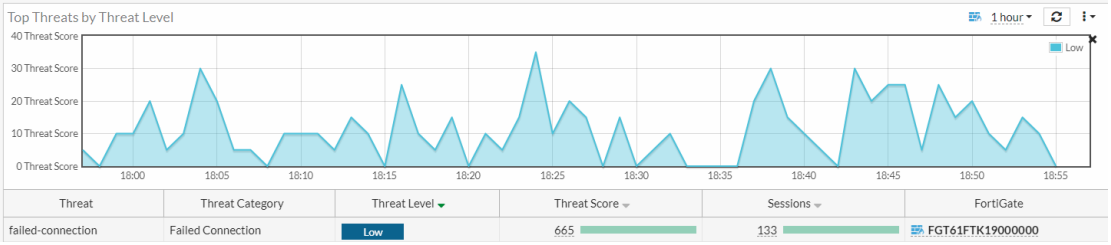
FortiGate events can be monitored at all times using email alerts. Email alerts send notifications to up to three recipients and can be triggered based on log event and severity level. Email alerts will be sent every five minutes by default but this can be configured in the CLI.

To configure email alerts:

```
config alertemail setting
    set username <name>
    set mailto1 <email>
    set filter-mode {category | threshold}
    set email-interval <integer>
    set IPS-logs {enable | disable}
    set HA-logs {enable | disable}
    set antivirus-logs {enable | disable}
    set webfilter-logs {enable | disable}
    set log-disk-usage-warning {enable | disable}
end
```

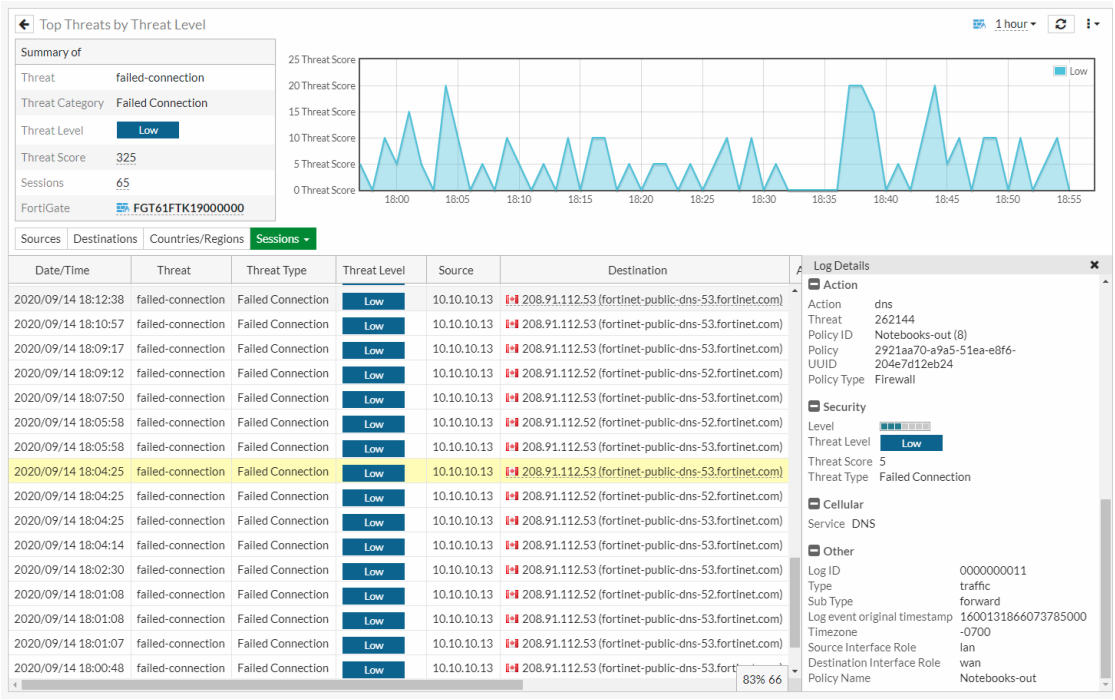
Threat weight

Threat weight helps aggregate and score threats based on user-defined severity levels. It adds several fields such as threat level (`crlevel`), threat score (`crscore`), and threat type (`craction`) to traffic logs. Threat weight logging is enabled by default and the settings can be customized. Threats can be viewed from the *Top Threats* FortiView dashboard.



To configure threat weight settings:

1. Go to *Log & Report* > *Threat Weight*.
2. Adjust the settings as needed, such as individual weights per threat type and risk level values.
3. Click *Apply*.



To add the Top Threats monitor to the dashboard:

1. In the tree menu, click *Dashboard* and in the FortiView section, click the + sign (*Add Monitor*).
2. In the *Security* section, enable *Show More* and click *Top Threats*.
3. Configure the settings as needed.
4. Click *Add Monitor*.

5. Go to *Dashboard* > *Top Threats*. The *Top Threats* monitor displays threats based on the scores in the traffic logs.

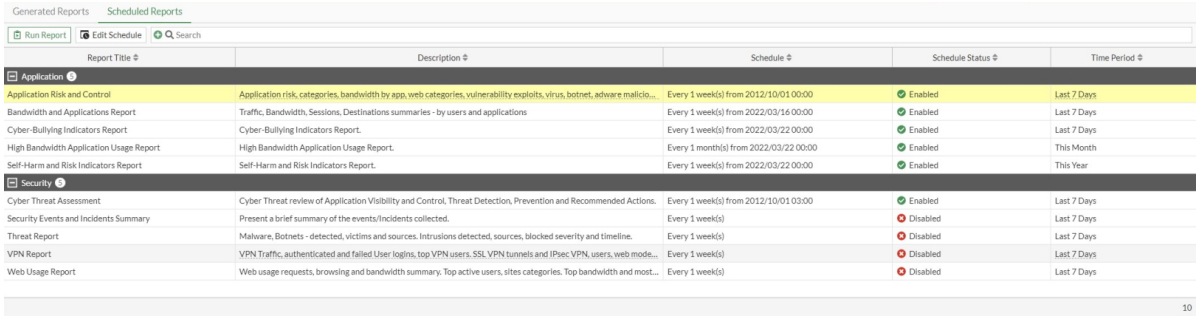
6. Double-click a threat to view the summary.
7. Click *Sources*, *Destinations*, *Countries/Regions*, or *Sessions* to view more information. Double-click an entry to view the log details.

Logging to FortiAnalyzer

The following topics provide instructions on logging to FortiAnalyzer:

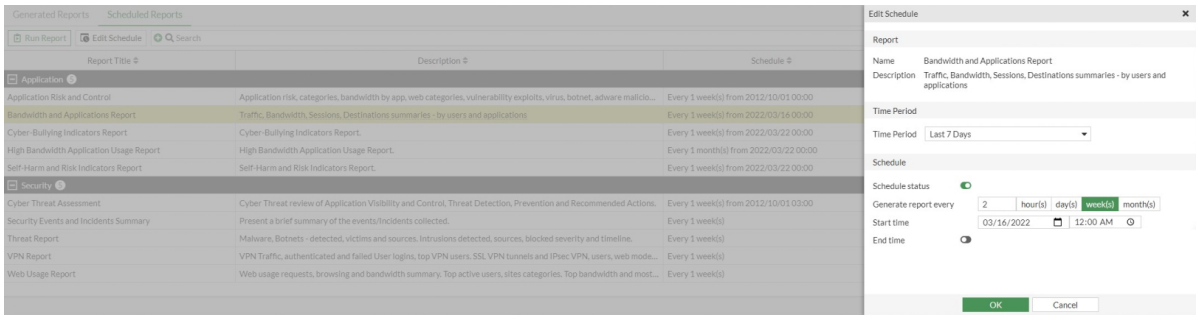
- FortiAnalyzer Reports page in the GUI on page 2749
- FortiAnalyzer log caching on page 2751
- Configuring multiple FortiAnalyzers (or syslog servers) per VDOM on page 2754
- Configuring multiple FortiAnalyzers on a FortiGate in multi-VDOM mode on page 2755

FortiAnalyzer Reports page in the GUI



FortiAnalyzer reports can be viewed in the GUI on the *Log & Report* > *FortiAnalyzer Reports* page. Administrators can generate, delete, and edit report schedules, and view and download generated reports.

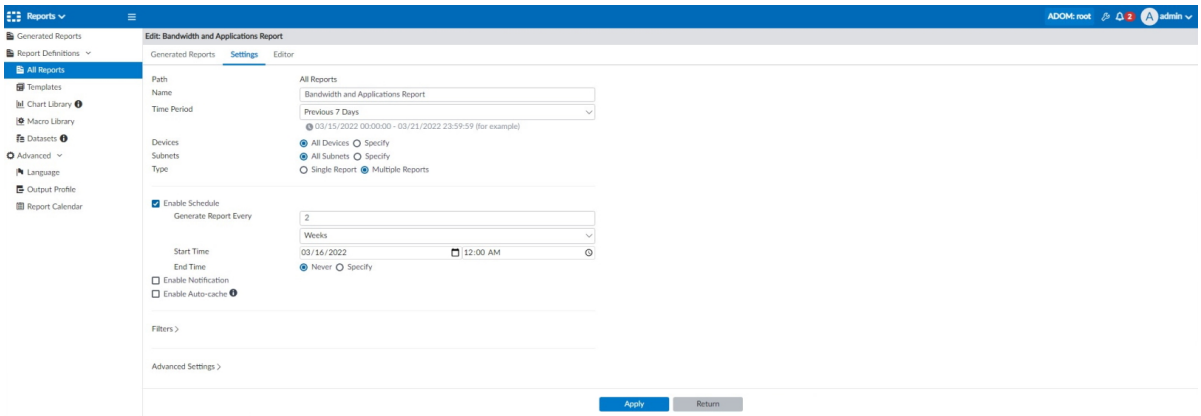
FortiAnalyzer must be configured in FortiOS. If the FortiGate is unauthorized on FortiAnalyzer, or the connection to FortiAnalyzer is down, the *FortiAnalyzer Reports* page loads with *No results*.



When the Security Fabric is enabled, only the root FortiGate can run, edit, and delete FortiAnalyzer reports. Downstream FortiGates can only view the generated reports.

To edit a report schedule:

1. Go to *Log & Report* > *FortiAnalyzer Reports* and select the *Scheduled Reports* tab.

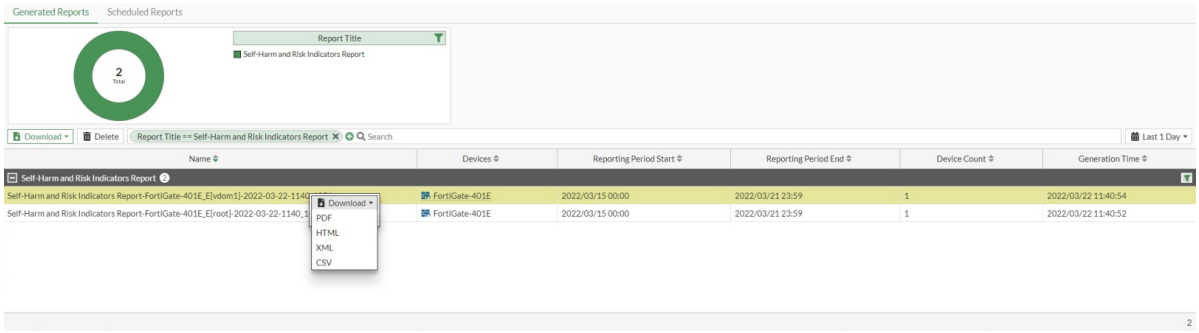


2. Select a report and click *Edit Schedule*. The *Edit Schedule* pane opens. In this example, the schedule for the Bandwidth and Applications report is changed to run from every week to every two weeks.
3. In the *Schedule* section, set the values for *Generate report every* to *2 week(s)*.

4. Click *OK*.

   The schedule is also updated automatically in FortiAnalyzer for the same report (go to *Reports* > *Report Definitions* > *All Reports* and edit the report to view the settings).

To view and download reports:



1. Go to *Log & Report* > *FortiAnalyzer Reports* and select the *Generated Reports* tab.

   A pie chart displays the total count of FortiAnalyzer reports, categorized by report title. Generated reports are listed below and arranged by title, which includes reports from all VDOMs.

   In this example, the Self-Harm and Risk Indicators reports are filtered, and the report for vdom1 is downloaded.

2. In the pie chart, click the green segment to filter the Self-Harm and Risk Indicators reports
3. In the filtered results, select the report for vdom1. Right-click and select *Download*.

4. Select a file format. The report is saved to the default download location.

FortiAnalyzer log caching

Reliable logging to FortiAnalyzer prevents lost logs when the connection between FortiOS and FortiAnalyzer is disrupted. When reliable mode is enabled:

1. Logs are cached in a FortiOS memory queue.
2. FortiOS sends logs to FortiAnalyzer, and FortiAnalyzer uses `seq_no` to track received logs.
3. After FortiOS sends logs to FortiAnalyzer, logs are moved to a confirm queue in FortiOS.
4. FortiOS periodically queries FortiAnalyzer for the latest `seq_no` of the last log received, and clears logs from the confirm queue up to the `seq_no`.
5. If the connection between FortiOS and FortiAnalyzer is disrupted, FortiOS resends the logs in the confirm queue to FortiAnalyzer when the connection is reestablished.

FortiAnalyzer 7.2.0 and later is required.

To enable reliable mode:

```
config log fortianalyzer setting
    set reliable enable
end
```

To view the memory and confirm queues:

1. Verify that log synchronization is enabled for FortiAnalyzer:

```
# diagnose test application fgtlogd 1
vdom-admin=0
mgmt=root

fortilog:
faz: global , enabled
    server=172.16.200.251, realtime=1, ssl=1, state=connected
    server_log_status=Log is allowed.,
    src=, mgmt_name=FGh_Log_root_172.16.200.251, reliable=1, sni_prefix_type=none,
    required_entitlement=none, region=ca-west-1,,
    logsync_enabled:1, logsync_conn_id:65535, seq_no:790
...
```

2. When a network disruption disconnects FortiOS from FortiAnalyzer and FortiOS continues to generate logs, the logs are cached in the memory queue.
   - View the number of logs in the cache and queue:

```
# diagnose test application fgtlogd 41

                'total log count':28,  'total data len':6292
```

```
Confirm queue for: global-faz
        queue:
                num:29 size:19092(0MB) total size:26068(0MB) max:189516595(180MB)
                        type:3, cat=1, log_count=1, seq_no=1, data len=290 size:366
                        type:3, cat=1, log_count=1, seq_no=2, data len=233 size:309
                        ......
                        type:3, cat=0, log_count=1, seq_no=28, data len=524 size:600
                        type:3, cat=1, log_count=1, seq_no=29, data len=307 size:383
                'total log count':76,  'total data len':16888
```

There are nine OFTP items cached to the memory queue, and 29 OFTP items to send from FortiOS to FortiAnalyzer that are waiting for confirmation from FortiAnalyzer.

- Go to *Log & Report* > *Log Settings* to view the queue in the GUI:

3. Re-establish the connection between FortiOS and FortiAnalyzer and confirm that the queue has cleared by checking the `seq_no`, which indicates the latest confirmation log from FortiAnalyzer:

```
# diagnose test application fgtlogd 30
VDOM:root
Memory queue for: global-faz
    queue:
        num:0 size:0(0MB) total size:0(0MB) max:189516595(180MB)
        'total log count':0,  'total data len':0

Confirm queue for: global-faz
    queue:
        num:0 size:0(0MB) total size:0(0MB) max:189516595(180MB)
        'total log count':0,  'total data len':0
```

The queue has been cleared, meaning that FortiOS received confirmation from FortiAnalyzer and cleared the confirm queue.

```
# diagnose test application fgtlogd 1
vdom-admin=0
mgmt=root
```

```
fortilog:
faz: global , enabled
        server=172.16.200.251, realtime=1, ssl=1, state=connected
        server_log_status=Log is allowed.,
        src=, mgmt_name=FGh_Log_root_172.16.200.251, reliable=1, sni_prefix_type=none,
        required_entitlement=none, region=ca-west-1,
        logsync_enabled:1, logsync_conn_id:65535, seq_no:67
            status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_verified=Y
            SNs: last sn update:38 seconds ago.
                Sn list:
               (FAZ-VMTM21000000,age=38s)
            queue: qlen=0.
```

OFTP items with a `seq_no` lower than 67 have been sent to FortiAnalyzer and were confirmed.

Configuring multiple FortiAnalyzers (or syslog servers) per VDOM

In a VDOM, multiple FortiAnalyzer and syslog servers can be configured as follows:

- Up to three override FortiAnalyzer servers
- Up to four override syslog servers

If the VDOM `faz-override` and/or `syslog-override` setting is enabled or disabled (default) before upgrading, the setting remains the same after upgrading.

If the override setting is disabled, the GUI displays the global FortiAnalyzer1 or syslog1 setting. If the override setting is enabled, the GUI displays the VDOM override FortiAnalyzer1 or syslog1 setting.

You can only use CLI to enable the override to support multiple log servers.

To enable FortiAnalyzer and syslog server override under VDOM:

```
config log setting
    set faz-override enable
    set syslog-override enable
end
```

When `faz-override` and/or `syslog-override` is enabled, the following CLI commands are available for configuring VDOM override:

To configure VDOM override for FortiAnalyzer:

1. Configure the FortiAnalyzer override settings:

```
config log fortianalyzer/fortianalyzer2/fortianalyzer3 override-setting
    set status enable
    set server "123.12.123.123"
    set reliable enable
end
```

2. Configure the override filters:

```
config log fortianalyzer/fortianalyzer2/fortianalyzer3 override-filter
    set severity information
    set forward-traffic enable
```

```
        set local-traffic enable
        set multicast-traffic enable
        set sniffer-traffic enable
        set anomaly enable
        set voip enable
        set dlp-archive enable
        set dns enable
        set ssh enable
        set ssl enable
    end
```

To configure VDOM override for a syslog server:

1. Configure the syslog override settings:

```
config log syslogd/syslogd2/syslogd3/syslogd4 override-setting
    set status enable
    set server "123.12.123.12"
    set facility local1
end
```

2. Configure the override filters:

```
config log syslogd/syslogd2/syslogd3/syslogd4 override-filter
    set severity information
    set forward-traffic enable
    set local-traffic enable
    set multicast-traffic enable
    set sniffer-traffic enable
    set anomaly enable
    set voip enable
    set dns enable
    set ssh enable
    set ssl enable
end
```

Configuring multiple FortiAnalyzers on a FortiGate in multi-VDOM mode

This topic shows a sample configuration of multiple FortiAnalyzers on a FortiGate in multi-VDOM mode.

In this example:

- The FortiGate has three VDOMs:
  - Root (management VDOM)
  - VDOM1
  - VDOM2
- There are four FortiAnalyzers.
  These IP addresses are used as examples in the instructions below.
  - FAZ1: `172.16.200.55`
  - FAZ2: `172.18.60.25`
  - FAZ3: `192.168.1.253`
  - FAZ4: `192.168.1.254`

- Set up FAZ1 and FAZ2 under global.
  - These two collect logs from the root VDOM and VDOM2.
  - FAZ1 and FAZ2 must be accessible from management VDOM root.
- Set up FAZ3 and FAZ4 under VDOM1.
  - These two collect logs from VDOM1.
  - FAZ3 and FAZ4 must be accessible from VDOM1.

To set up FAZ1 as global FortiAnalyzer 1 from the GUI:

Prerequisite: FAZ1 must be reachable from the management root VDOM.

1. Go to *Global* > *Log & Report* > *Log Settings*.
2. Enable *Send logs to FortiAnalyzer/FortiManager*.
3. Enter the FortiAnalyzer IP.
   In this example: `172.16.200.55`.
4. For *Upload option*, select *Real Time*.
5. Click *Apply*.

To set up FAZ2 as global FortiAnalyzer 2 from the CLI:

Prerequisite: FAZ2 must be reachable from the management root VDOM.

```
config log fortianalyzer2 setting
    set status enable
    set server "172.18.60.25"
    set upload-option realtime
end
```

To set up FAZ3 and FAZ4 as VDOM1 FortiAnalyzer 1 and FortiAnalyzer 2:

Prerequisite: FAZ3 and FAZ4 must be reachable from VDOM1.

```
config log setting
   set faz-override enable
end

config log fortianalyzer override-setting
   set status enable
   set server "192.168.1.253"
   set upload-option realtime
end

config log fortianalyzer2 override-setting
   set status enable
   set server "192.168.1.254"
   set upload-option realtime
end
```

Checking FortiAnalyzer connectivity

To use the diagnose command to check FortiAnalyzer connectivity:

1. Check the global FortiAnalyzer status:

```
FGTA(global) # diagnose test application miglogd 1
faz: global , enabled
        server=172.16.200.55, realtime=3, ssl=1, state=connected, src=, mgmt_name=FGh_
Log_root_172.16.200.55, reliable=1
                status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_
verified=N
                SNs: last sn update:1369 seconds ago.
                        Sn list:

                queue: qlen=0.
filter: severity=6, sz_exclude_list=0
         voip dns ssh ssl
subcategory:
        traffic: forward local multicast sniffer
        anomaly: anomaly

        server: global, id=0, fd=90, ready=1, ipv6=0, 172.16.200.55/514
        oftp-state=5
faz2: global , enabled
        server=172.18.60.25, realtime=1, ssl=1, state=connected, src=, mgmt_name=FGh_
Log_root_172.18.60.25, reliable=0
                status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_
verified=N
                SNs: last sn update:1369 seconds ago.
                        Sn list:

                queue: qlen=0.
filter: severity=6, sz_exclude_list=0
         voip dns ssh ssl
subcategory:
        traffic: forward local multicast sniffer
        anomaly: anomaly

        server: global, id=1, fd=95, ready=1, ipv6=0, 172.18.60.25/514
        oftp-state=5
```

2. Check the VDOM1 override FortiAnalyzer status:

```
FGTA(global) # diagnose test application miglogd 3101
faz: vdom, enabled, override
        server=192.168.1.253, realtime=1, ssl=1, state=connected, src=, mgmt_name=FGh_
Log_root_192.168.1.253, reliable=1
                status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_
verified=N
                SNs: last sn update:1369 seconds ago.
                        Sn list:
                        (FAZ-VM0000000001,age=17s)
                queue: qlen=0.
filter: severity=6, sz_exclude_list=0
         voip dns ssh ssl
subcategory:
```

```
        traffic: forward local multicast sniffer
        anomaly: anomaly

        server: vdom, id=0, fd=72, ready=1, ipv6=0, 192.168.1.253/514
        oftp-state=5
faz2: vdom, enabled, override
        server=192.168.1.254, realtime=1, ssl=1, state=connected, src=, mgmt_name=FGh_
Log_root_192.168.1.254, reliable=0
                status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_
verified=N
                SNs: last sn update:1369 seconds ago.
                        Sn list:
                        (FL-1KET318000008,age=17s)
                queue: qlen=0.
filter: severity=6, sz_exclude_list=0
         voip dns ssh ssl
subcategory:
        traffic: forward local multicast sniffer
        anomaly: anomaly

        server: vdom, id=1, fd=97, ready=1, ipv6=0, 192.168.1.254/514
        oftp-state=5
faz3: vdom, disabled, override
```

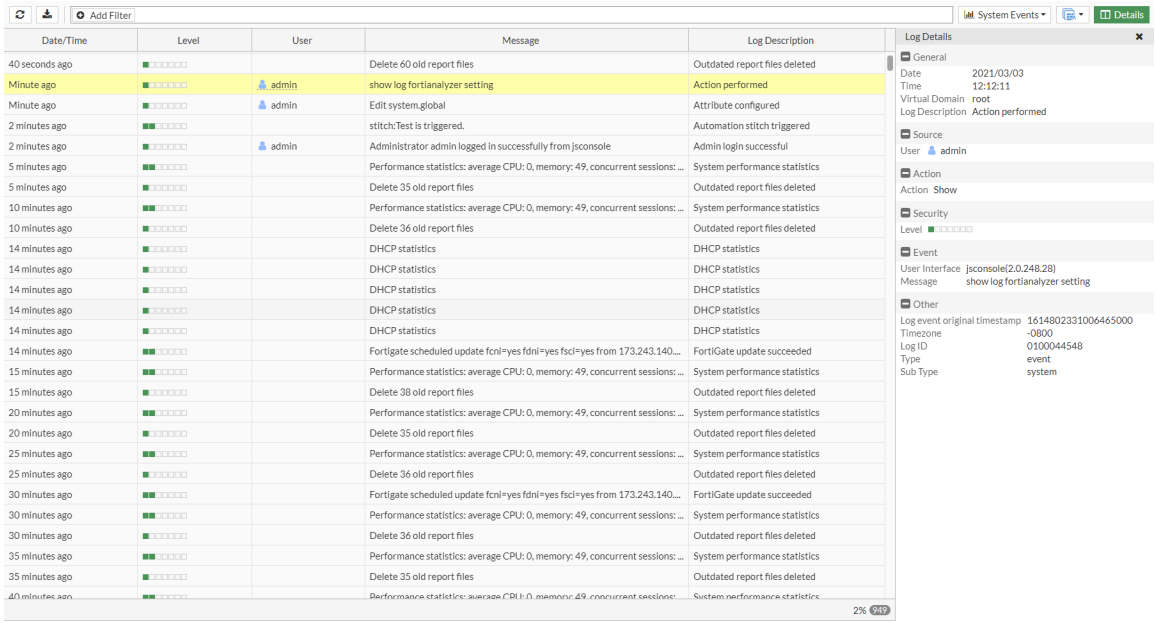
Advanced and specialized logging

The following topics provide information on advanced and specialized logging:

- Logs for the execution of CLI commands on page 2758
- Log buffer on FortiGates with an SSD disk on page 2760
- Source and destination UUID logging on page 2762
- Configuring and debugging the free-style filter on page 2764
- Logging the signal-to-noise ratio and signal strength per client on page 2766
- RSSO information for authenticated destination users in logs on page 2768
- Destination user information in UTM logs on page 2771

Logs for the execution of CLI commands

The `cli-audit-log` option records the execution of CLI commands in system event logs (log ID 44548). In addition to `execute` and `config` commands, `show`, `get`, and `diagnose` commands are recorded in the system event logs.



The `cli-audit-log` data can be recorded on memory or disk, and can be uploaded to FortiAnalyzer, FortiGate Cloud, or a syslog server.

To enable the CLI audit log option:

```
config system global
    set cli-audit-log enable
end
```

To view system event logs in the GUI:

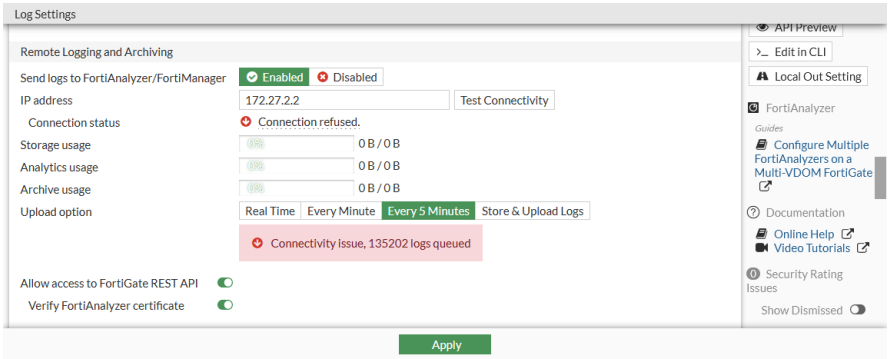
1. Run the command in the CLI (`# show log fortianalyzer setting`).
2. Go to *Log & Report* > *System Events*.
3. Select *General System Events*.
4. Select the log entry and click *Details*.

To display the logs:

```
# execute log filter device disk
# execute log filter category event
# execute log filter field subtype system
# execute log filter field logid 0100044548
# execute log display
```

Sample log:

```
1: date=2020-11-16 time=10:43:00 eventtime=1605552179970875703 tz="-0800" logid="0100044548"
type="event" subtype="system" level="information" vd="root" logdesc="Action performed"
user="admin" ui="jsconsole(2.0.225.112)" action="Show" msg="show log fortianalyzer setting"



2: date=2020-11-16 time=10:42:43 eventtime=1605552163502003054 tz="-0800" logid="0100044548"
type="event" subtype="system" level="information" vd="root" logdesc="Action performed"
user="admin" ui="jsconsole(2.0.225.112)" action="Get" msg="get sys status"

3: date=2020-11-16 time=09:47:04 eventtime=1605548824762387718 tz="-0800" logid="0100044548"
type="event" subtype="system" level="information" vd="root" logdesc="Action performed"
user="admin" ui="jsconsole(2.0.228.202)" action="Diagnose" msg="diagnose log test"
```

Log buffer on FortiGates with an SSD disk

FortiGates with an SSD disk have a configurable log buffer. When the connection to FortiAnalyzer is unreachable, the FortiGate is able to buffer logs on disk if the memory log buffer is full. The logs queued on the disk buffer can be sent successfully once the connection to FortiAnalyzer is restored.

The number of logs queued on the disk buffer is visible in the *Log & Report* > *Log Settings* page:

The queued logs are buffered to the memory first and then disk. `Main miglogd` handles the disk buffering job, while `miglogd-children` handles the memory buffering. Disk buffer statistics only appear under `Main miglogd`, and memory buffer statistics only appears under `miglogd-children`. If the total buffer is full, new logs will overwrite the old logs.

To configure the log buffer:

1. Allocate disk space (MB) to temporarily store logs to FortiAnalyzer:

```
config system global
    set faz-disk-buffer-size 200
end
```

2. Check the `Main miglogd` and `miglogd-children` statistics. The 200 MB disk buffer has been set, and there are currently no logs buffered in memory or on disk when FortiAnalyzer is reachable:

```
# diagnose test application miglogd 41 0
cache maximum: 106100940(101MB) objects: 0 used: 0(0MB) allocated: 0(0MB)
VDOM:root
Queue for: global-faz

    memory queue:
        num:0 size:0(0MB) max:101906636(97MB) logs:0

    disk max queue size:200MB total:0MB
        totol items:0
        disk queue agents:
            devid:-1-10-0-1
            buffer path:/var/log/qbuf/10.0/1
            saved size:0MB cached size:0
            save roll:0 restore roll:0
            restore id:0 space:0MB

# diagnose test application miglogd 41 1
cache maximum: 106100940(101MB) objects: 0 used: 0(0MB) allocated: 0(0MB)
```

```
VDOM:root
Queue for: global-faz

    memory queue:
        num:0 size:0(0MB) max:101906636(97MB) logs:0

    disk queue client:
        devid:-1-10-0-1 status:buffering
        Total in cache:0 size:0(0MB) max:4MB logs:0
```

3. Disable the connection between the FortiGate and FortiAnalyzer. For example, delete the FortiGate from the FortiAnalyzer authorized device list.
   Assuming a massive number of logs (~ 300000) are recorded during this downtime, the logs will be queued in the memory buffer first. If the memory buffer is full, then the remaining logs will be queued on the disk buffer.
4. Check the `Main miglogd` and `miglogd-children` statistics again. All 97 MB of the memory buffer is occupied, and 76 of the 200 MB has been taken from the disk buffer:

```
# diagnose test application miglogd 41 0
cache maximum: 106100940(101MB) objects: 0 used: 0(0MB) allocated: 0(0MB)
VDOM:root
Queue for: global-faz

        memory queue:
                num:0 size:0(0MB) max:101906636(97MB) logs:0

        disk max queue size:200MB total:76MB
                totol items:128917
                disk queue agents:
                        devid:-1-10-0-1
                        buffer path:/var/log/qbuf/10.0/1
                        saved size:76MB cached size:3324984
                        save roll:19 restore roll:0
                        restore id:0 space:0MB

# diagnose test application miglogd 41 1
cache maximum: 106100940(101MB) objects: 165721 used: 101908358(97MB) allocated:
106449280(101MB)
VDOM:root
Queue for: global-faz

        memory queue:
                num:165718 size:101906500(97MB) max:101906636(97MB) logs:165718

        disk queue client:
                devid:-1-10-0-1 status:restoring
                restore id:1267 space:0MB
                Total in cache:3 size:1858(0MB) max:4MB logs:3
```

The overall `miglogd` statistics shows the total cached logs is the sum of the logs buffered in memory and on disk:

```
# diagnose test application miglogd 6
mem=0, disk=11, alert=0, alarm=0, sys=0, faz=300053, faz-cloud=0, webt=0, fds=0
interface-missed=44
Queues in all miglogds: cur:165718  total-so-far:165718
global log dev statistics:
faz 0: sent=0, failed=0, cached=300053, dropped=0 , relayed=0
Num of REST URLs: 0
```

5. Enable the connection between FortiAnalyzer and the FortiGate.
6. After a while, check the `miglogd` statistics to confirm that all buffered logs are being sent to FortiAnalyzer successfully:

```
# diagnose test application miglogd 6
mem=0, disk=11, alert=0, alarm=0, sys=0, faz=300058, faz-cloud=0, webt=0, fds=0
interface-missed=44
Queues in all miglogds: cur:4294832957  total-so-far:165726
global log dev statistics:
faz 0: sent=300058, failed=0, cached=0, dropped=0 , relayed=0
Num of REST URLs: 15

# diagnose test application miglogd 41 0
cache maximum: 106100940(101MB) objects: 0 used: 0(0MB) allocated: 0(0MB)
VDOM:root
Queue for: global-faz

        memory queue:
                num:0 size:0(0MB) max:101906636(97MB) logs:0

        disk max queue size:200MB total:0MB
                totol items:0
                disk queue agents:
                        devid:-1-10-0-1
                        buffer path:/var/log/qbuf/10.0/1
                        saved size:0MB cached size:0
                        save roll:20 restore roll:20
                        restore id:1267 space:0MB

# diagnose test application miglogd 41 1
cache maximum: 106100940(101MB) objects: 0 used: 0(0MB) allocated: 0(0MB)
VDOM:root
Queue for: global-faz

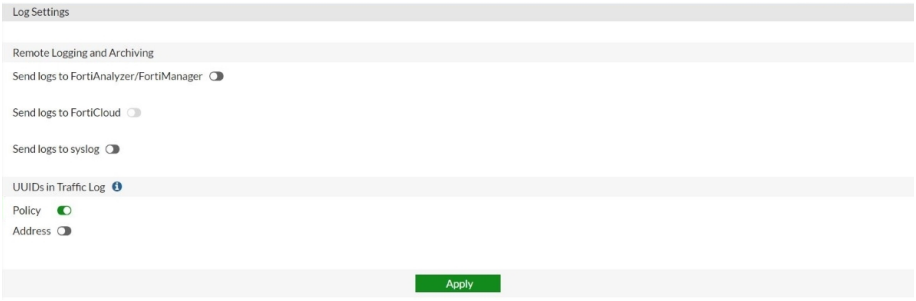
        memory queue:
                num:0 size:0(0MB) max:101906636(97MB) logs:0

        disk queue client:
                devid:-1-10-0-1 status:buffering
                Total in cache:0 size:0(0MB) max:4MB logs:0
```

Source and destination UUID logging

The `log-uuid` setting in `system global` is split into two settings: `log-uuid-address` and `log-uuid policy`.

The traffic log includes two `internet-service` name fields: *Source Internet Service* (`srcinetsvc`) and *Destination Internet Service* (`dstinetsvc`).



Log UUIDs

UUIDs can be matched for each source and destination that match a policy that is added to the traffic log. This allows the address objects to be referenced in log analysis and reporting.

As this may consume a significant amount of storage space, this feature is optional. By default, policy UUID insertion is enabled and address UUID insertion is disabled.

To enable address and policy UUID insertion in traffic logs using the GUI:

1. Go to *Log & Report* > *Log Settings*.
2. Under *UUIDs in Traffic Log*, enable *Policy* and/or *Address*.
3. Click *Apply*.

To enable address and policy UUID insertion in traffic logs using the CLI:

```
config system global
   set log-uuid-address enable
   set log-uuid-policy enable
end
```

Sample log

```
date=2019-01-25 time=11:32:55 logid="0000000013" type="traffic" subtype="forward"
level="notice" vd="vdom1" eventtime=1528223575srcip=192.168.1.183 srcname="PC24"
srcport=33709 srcintf="lan" srcintfrole="lan" dstip=192.168.70.184 dstport=80 dstintf="wan1"

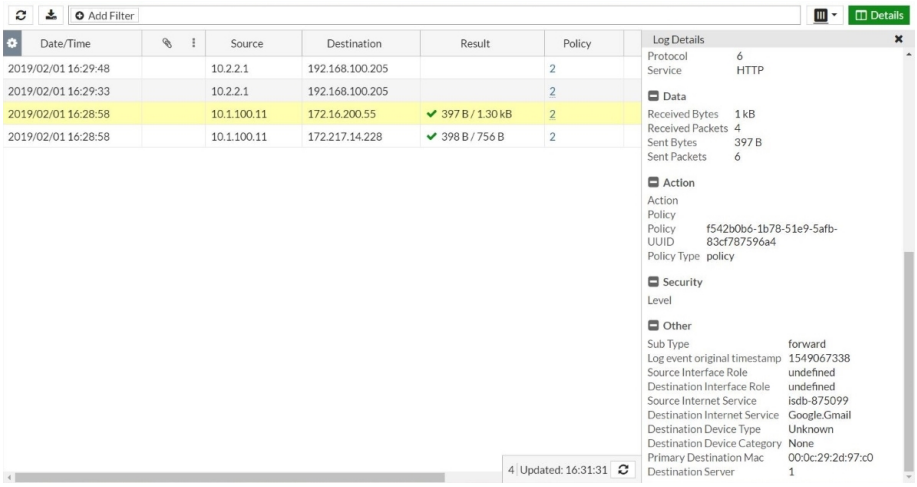
```



Internet service name fields

Traffic logs for `internet-service` include two fields: *Source Internet Service* and *Destination Internet Service*.

To view the internet service fields using the GUI:

1. Go to *Log & Report* > *Forward Traffic*.
2. Double-click on an entry to view the *Log Details*. The *Source Internet Service* and *Destination Internet Service* fields

are visible in the *Log Details* pane.

Sample log

```

```

Configuring and debugging the free-style filter

Free-style filters allow users to define a filter for logs that are captured to each individual logging device type. Filters can include log categories and specific log fields. The filters can be created as an inclusive list or exclusive list.

Free-style filters can also be used to filter logs that have been captured on logging devices already to narrow down the list of logs to view.

```
config log syslogd filter
    config free-style
        edit <id>
            set category <option>
            set filter <string>
            set filter-type {include | exclude}
        next
    end
end
```

`category <option>`	Set the log category. The following options are available: `traffic`, `event`, `virus`, `webfilter`, `attack`, `spam`, `anomaly`, `voip`, `dlp`, `app-ctrl`, `waf`, `dns`, `ssh`, `ssl`, `file-filter`, `icap`, and `ztna`.

`filter <string>`	Enter the filter criteria. Multiple values can be added, for example: `set filter "logid <id> <id>"`
`filter-type {include | exclude}`	Include/exclude logs that match the filter.

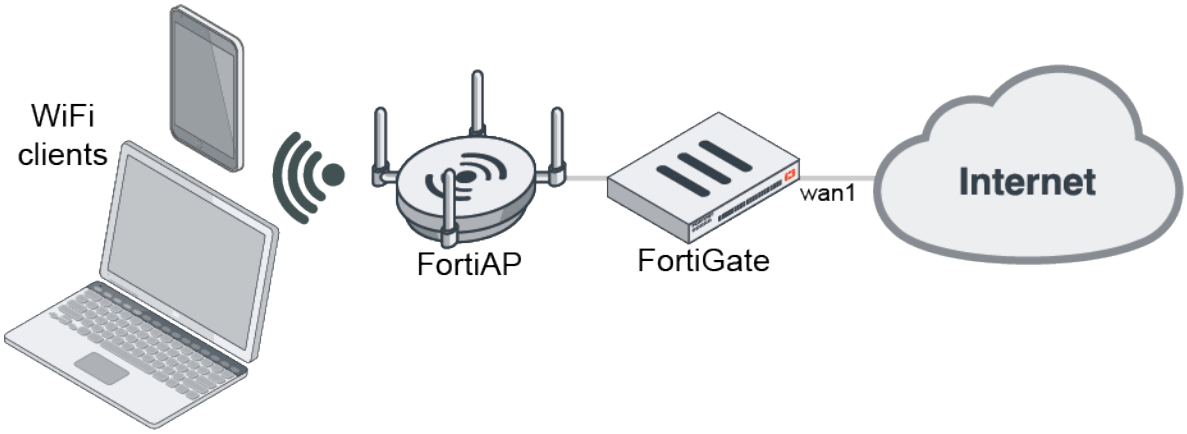
Use the following commands to view the results when multiple fields are used:

```
# execute log filter free-style "logid <id> <id>"
# execute log filter free-style "srcip <IP_address> <IP_address>"
# execute log filter free-style "(logid <id>) or (srcip <IP_address> <IP_address>)"
# execute log filter free-style "(srcip <IP_address>) and (dstip <IP_address>)"
```

In this example, the free-style filter is set to filter log IDs 0102043039 and 0102043040. The source IPs, 192.168.2.5 and 192.168.2.205, are also checked.

To configure the syslogd free-style filter with multiple values:

```
config log syslogd filter
    config free-style
        edit 1
            set category event
            set filter "logid 0102043039 0102043040"
        next
    end
end
```



To view the syslogd free-style filter results:

```
# execute log filter free-style "logid 0102043039 0102043040"
# execute log filter dump
category: event
device: disk
start-line: 1
view-lines: 10
max-checklines: 0
HA member:
log search mode: on-demand

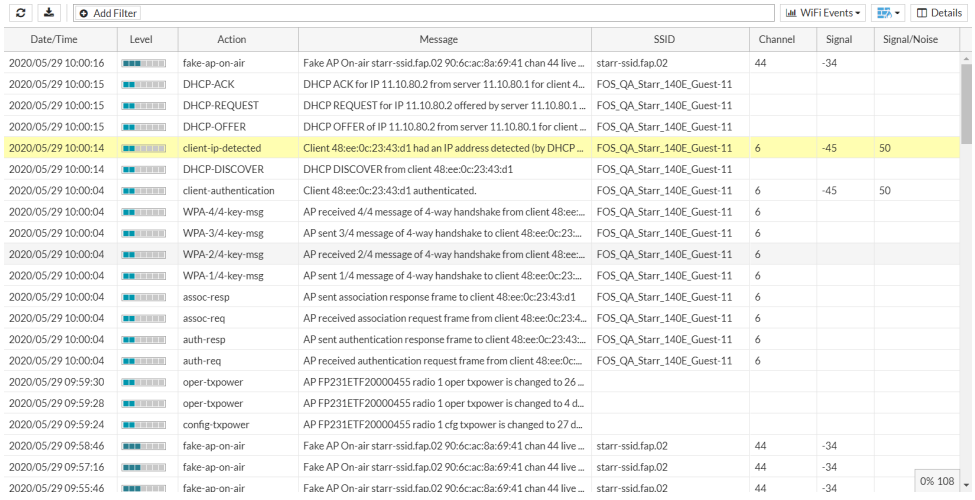
Oftp search string: (or (or (or srcip==192.168.2.5) (or srcip==192.168.2.205)) (or
logid=="0102043039" not-exact))
```

Logging the signal-to-noise ratio and signal strength per client



The signal-to-noise ratio (`snr`) and signal strength (`signal`) are logged per client in the WiFi event and traffic logs.

When a WiFi client connects to a tunnel or local-bridge mode SSID on an FortiAP that is managed by a FortiGate, signal-to-noise ratio and signal strength details are included in WiFi event logs for local-bridge traffic statistics and authentication, and in forward traffic logs for tunnel traffic. This allows you to store and view clients' historical signal strength and signal-to-noise ratio information.

To verify when a client is connecting to an SSID:

1. Go to *Log & Report* > *System Events* and select *WiFi Events*.
   The *Signal* and *Signal/Noise* columns show the signal strength and signal-to-noise ratio for each applicable client.

Add Filter | WiFi Events | Details

```

RSSO information for authenticated destination users in logs

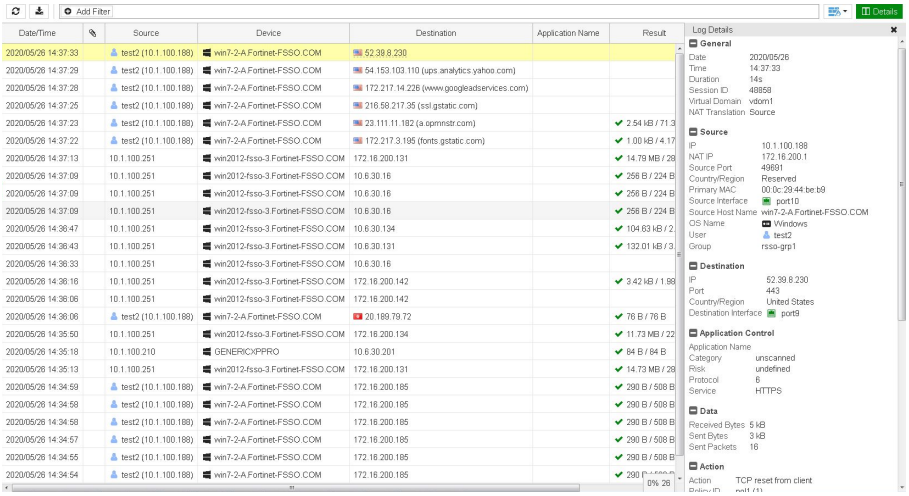
FortiGate can use RSSO accounting information from authenticated RSSO users to populate destination users and groups, along with source users and groups.

RSSO user login information can be forwarded by the RADIUS server to the FortiGate that is listening for incoming RADIUS accounting start messages on the RADIUS accounting port. Accounting start messages usually contain the IP address, user name, and user group information. FortiGate uses this information in traffic logs, which include *dstuser* and *dstgroup* fields for user and group destination information .

For instructions on configuring RSSO, see RADIUS single sign-on agent on page 2686.

The three following scenarios show traffic between pc1 and the internet, and pc1 and pc2.

Scenario 1



In this scenario, RSSO user *test2* in group *rsso-grp1* is authenticated on pc1. Traffic flows from pc1 to the internet.

Expected result:

In the logs, user *test2* is shown as the source user in the *rsso-grp1* group.

To verify the results:

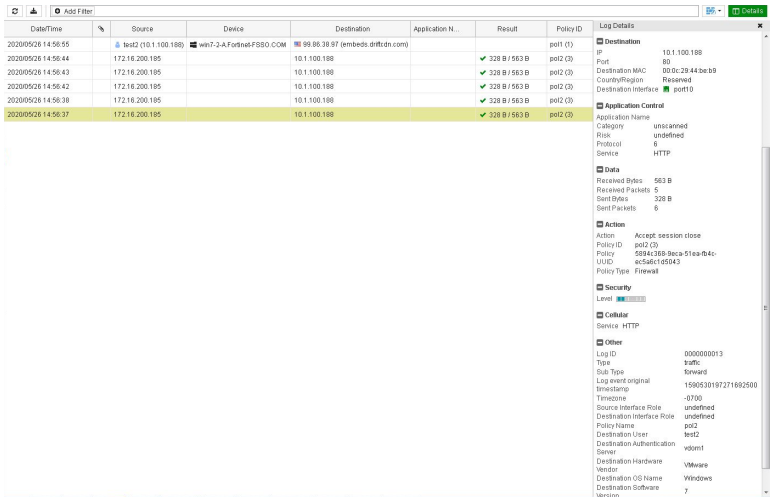
1. In the GUI, go to *Log & Report* > *Forward Traffic* and view the details of an entry with test2 as the source.
2. In the *Source* section, *User* is *test2* and *Group* is the *rsso-grp1*.

3. The log message shows the user and group:

```
10: date=2020-05-25 time=15:34:43 logid="0000000013" type="traffic" subtype="forward"
level="notice" vd="vdom1" eventtime=1590446083718007055 tz="-0700" srcip=10.1.100.188
srcname="win7-2-A.Fortinet-FSSO.COM" srcport=56982 srcintf="port10"
srcintfrole="undefined" dstip=172.217.3.195 dstport=443 dstintf="port9"
dstintfrole="undefined" srccountry="Reserved" dstcountry="United States"
sessionid=120651 proto=17 action="accept" policyid=1 policytype="policy"
poluuid="d130f886-9ec6-51ea-206e-8c561c5244c6" policyname="pol1" user="test2"
group="rsso-grp1" authserver="vdom1" service="udp/443" trandisp="snat"
transip=172.16.200.1 transport=56982 duration=181 sentbyte=2001 rcvdbyte=1820 sentpkt=6
rcvdpkt=4 appcat="unscanned" sentdelta=0 rcvddelta=0 srchwvendor="VMware"
osname="Windows" srcswversion="7" mastersrcmac="00:0c:29:44:be:b9"
srcmac="00:0c:29:44:be:b9" srcserver=0
```

Scenario 2

In this scenario, RSSO user *test2* is authenticated on pc1. Traffic is initialized on pc2 (172.16.200.185) going to pc1 (10.1.100.188).



Expected result:

In the logs, user *test2* is shown as the destination user (`dstuser`). No destination group (`dstgroup`) is logged because no RSSO user is logged in on pc2, so the traffic from pc2 is unauthenticated.

To verify the results:

1. In the GUI, go to *Log & Report* > *Forward Traffic* and view the details of an entry with 172.16.200.185 (pc2) as the source.

2. In the *Other* section, *Destination User* is *test2* and no destination group is shown.

3. The log message shows the destination user:

```
1: date=2020-05-22 time=07:38:06 logid="0000000020" type="traffic" subtype="forward"
level="notice" vd="root" eventtime=1590158286585506922 tz="-0700" srcip=172.16.200.185
identifier=1 srcintf="port9" srcintfrole="undefined" dstip=10.1.100.188 dstintf="port10"
dstintfrole="undefined" srccountry="Reserved" dstcountry="Reserved" sessionid=4395
proto=1 action="accept" policyid=3 policytype="policy" poluuid="d4f18e1e-9c36-51ea-6ec0-
3a354d5910ee" policyname="pol2" dstuser="test2" dstauthserver="root" service="PING"

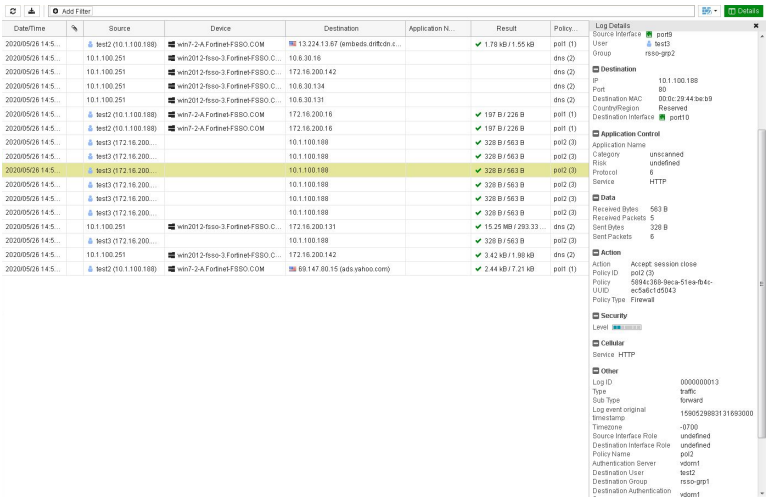
sentpkt=127 rcvdpkt=87 appcat="unscanned" sentdelta=7620 rcvddelta=5220
```

Scenario 3



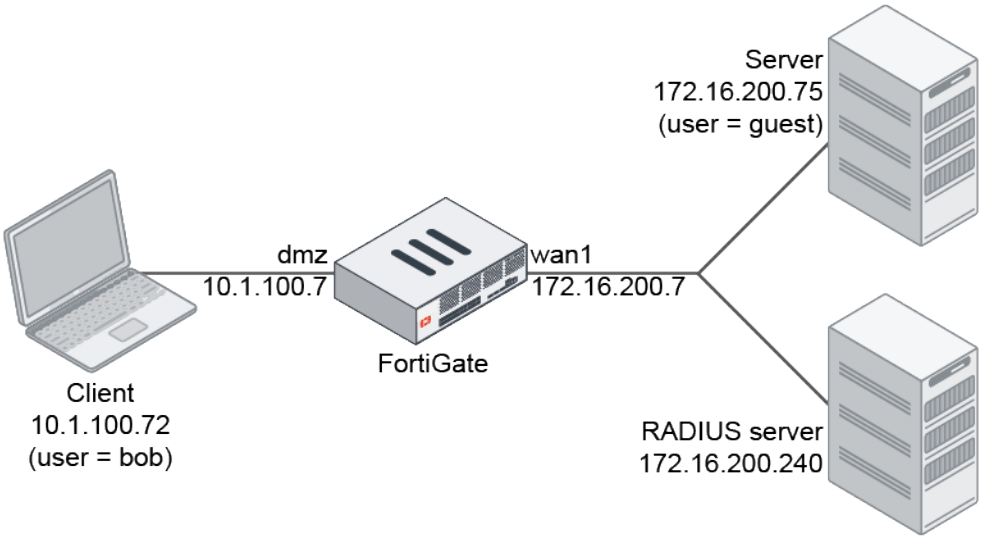
In this scenario, RSSO user *test2* in group *rsso-grp1* is authenticated on pc1, and user *test3* in group *rsso-grp2* is authenticated on pc2. Traffic flows from pc2 to pc1.

Expected result:

In the logs, user *test3* is shown as the source user in the *rsso-grp1* group. User *test2* is shown as destination user (`dstuser`) in the *rsso-grp1* destination group (`dstgroup`). The destination group is logged because an RSSO user is logged in to pc2.

To verify the results:

1. In the GUI, go to *Log & Report* > *Forward Traffic* and view the details of an entry with 172.16.200.185 (pc2) as the source.
2. In the *Source* section, *User* is *test3* and *Group* is the *rsso-grp2*. In the *Other* section, *Destination User* is *test2* and *Destination Group* is *rsso-grp1*.



3. The log message shows both the source and the destination users and groups:

```
8: date=2020-05-25 time=14:23:07 logid="0000000013" type="traffic" subtype="forward"

masterdstmac="00:0c:29:44:be:b9" dstmac="00:0c:29:44:be:b9" dstserver=0
```

Destination user information in UTM logs

The `dstuser` field in UTM logs records the username of a destination device when that user has been authenticated on the FortiGate.

In the following example topology, the user, bob, is authenticated on a client computer. The user, guest, is authenticated on the server. Log are collected for AV and IPS in flow inspection mode. Logs are collected for application control and web filter in proxy mode.

To configure the RADIUS user and user groups:

1. Configure the RADIUS server:

```
config user radius
    edit "Ubuntu_docker"
        set server "172.16.200.240"
        set secret ************
    next
end
```

2. Configure the local user:

```
config user local
    edit "guest"
        set type password
        set passwd ************
    next
end
```

3. Configure the RADIUS user groups:

```
config user group
    edit "RADIUS_User_Group"
        set member "Ubuntu_docker"
    next
    edit "Local_User"
        set member "guest"
    next
end
```

Flow inspection mode

To verify AV and IPS logs in flow mode:

1. Configure the firewall policies:

```
config firewall policy
    edit 1
        set name "WAN_out"
        set srcintf "dmz"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "deep-inspection"
        set av-profile "g-default"
        set ips-sensor "sensor-11"
        set nat enable
        set groups "RADIUS_User_Group" "Local_User"
    next
    edit 3
        set name "WAN_in"
        set srcintf "wan1"
        set dstintf "dmz"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
        set groups "RADIUS_User_Group" "Local_User"
    next
end
```

2. Verify the AV log:

```
date=2021-09-14 time=16:37:25 eventtime=1631662646131356720 tz="-0700"
logid="0211008192" type="utm" subtype="virus" eventtype="infected" level="warning"

C9QQUNLRVQ+"
```

Proxy inspection mode

To verify application control and web filter logs in proxy mode:

1. Configure the firewall policies:

```
config firewall policy
    edit 1
        set name "WAN_out"
        set srcintf "dmz"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set av-profile "g-default"
        set application-list "g-default"
        set webfilter-profile "1"
        set nat enable
        set groups "RADIUS_User_Group" "Local_User"
    next
    edit 3
        set name "WAN_in"
        set srcintf "wan1"
        set dstintf "dmz"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
        set logtraffic all
        set nat enable
        set groups "RADIUS_User_Group" "Local_User"
    next
end
```

2. Verify the application control log:

```
date=2021-09-14 time=17:05:45 eventtime=1631664345570951500 tz="-0700"
logid="1059028704" type="utm" subtype="app-ctrl" eventtype="signature"
level="information" vd="vdom1" appid=38783 user="bob" group="RADIUS_User_Group"

        set ssl-ssh-profile "ssl"
        set nat enable
    next
end
```

For SSL-Traffic-log, enable `logtraffic all`

```
config firewall policy
    edit 1
        set srcintf "dmz"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set logtraffic all
        set ssl-ssh-profile "deep-inspection"
        set nat enable
    next
end
```

For SSL-UTM-log

```
#EVENTTYPE="SSL-ANOMALIES"
```

By default, `ssl-anomaly-log` is enabled.

```
config firewall ssl-ssh-profile
    edit "deep-inspection"
        set comment "Read-only deep inspection profile."
        set server-cert-mode re-sign
        set caname "Fortinet_CA_SSL"
        set untrusted-caname "Fortinet_CA_Untrusted"
        set ssl-anomaly-log enable
        set ssl-exemption-log disable
        set ssl-negotiation-log disable
        set rpc-over-https disable
        set mapi-over-https disable
        set use-ssl-server disable
    next
end
```

```
# EVENTTYPE="SSL-EXEMPT"
```

Enable `ssl-exemption-log` to generate ssl-utm-exempt log.

```
config firewall ssl-ssh-profile
    edit "deep-inspection"
        set comment "Read-only deep inspection profile."
        set server-cert-mode re-sign
        set caname "Fortinet_CA_SSL"
        set untrusted-caname "Fortinet_CA_Untrusted"
        set ssl-anomaly-log enable
        set ssl-exemption-log enable
        set ssl-negotiation-log disable
        set rpc-over-https disable
        set mapi-over-https disable
        set use-ssl-server disable
    next
end
```

```
# EVENTTYPE="SSL-negotiation"
```

Enable `ssl-negotiation-log` to log SSL negotiation. Enable `ssl-server-cert-log` to log server certificate information. Enable `ssl-handshake-log` to log TLS handshakes.

```
config firewall ssl-ssh-profile
    edit "deep-inspection"
        set comment "Read-only deep inspection profile."
        set server-cert-mode re-sign
        set caname "Fortinet_CA_SSL"
        set untrusted-caname "Fortinet_CA_Untrusted"
        set ssl-anomaly-log enable
        set ssl-exemption-log enable
        set ssl-negotiation-log enable
        set rpc-over-https disable

Troubleshooting

The following topics provide information about troubleshooting logging and reporting:

- Log-related diagnose commands on page 2797
- Backing up log files or dumping log messages on page 2802
- SNMP OID for logs that failed to send on page 2804

Log-related diagnose commands

This topic shows commonly used examples of log-related diagnose commands.

Use the following diagnose commands to identify log issues:

- The following commands enable debugging log daemon (`miglogd`) at the proper debug level:

```
diagnose debug application miglogd x
diagnose debug enable
```

- The following commands display different status/statistics of `miglogd` at the proper level:

```
diagnose test application miglogd x
diagnose debug enable
```

To get the list of available levels, press `Enter` after `diagnose test/debug application miglogd`. The following are some examples of commonly use levels.

If the debug log display does not return correct entries when log filter is set:

```
diagnose debug application miglogd 0x1000
```

For example, use the following command to display all login system event logs:

```
execute log filter device disk
execute log filter category event
execute log filter field action login

execute log display

```

You can check and/or debug the FortiGate to FortiAnalyzer connection status.

To show connect status with detailed information:

```
diagnose test application miglogd 1

faz: global , enabled
        server=172.18.64.234, realtime=3, ssl=1, state=connected, src=, mgmt_name=FGh_Log_
vdom1_172.18.64.234, reliable=0, sni_prefix_type=none, required_entitlement=none
                status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_verified=Y
                SNs: last sn update:107 seconds ago.
                        Sn list:
                        (FL-8HFT718900132,age=107s)
                queue: qlen=0.
filter: severity=6, sz_exclude_list=0
         voip dns ssh ssl cifs
subcategory:
        traffic: forward local multicast sniffer
        anomaly: anomaly

        server: global, id=0, fd=132, ready=1, ipv6=0, 172.18.64.234/514
        oftp-state=5
```

To collect debug information when FortiAnalyzer is enabled:

```
diagnose debug application miglogd 0x100

To check the FortiGate to FortiGate Cloud log server connection status:

```
diagnose test application miglogd 20

FGT-B-LOG # diagnose test application miglogd 20
Home log server:
    Address: 172.16.95.92:514
Alternative log server:
    Address: 172.16.95.26:514
    oftp status: established
Debug zone info:
    Server IP:      172.16.95.92
    Server port:    514
    Server status:  up
```

```
    Log quota:      102400MB
    Log used:       673MB
    Daily volume:   20480MB
    FDS arch pause: 0
    fams archive pause: 0
```

To check real-time log statistics by log type since the miglogd daemon start:

```
diagnose test application miglogd 4

FGT-B-LOG (global) # diagnose test application miglogd 4
info for vdom: root

```

To check log statistics to the local/remote log device since the miglogd daemon start:

```
diagnose test application miglogd 6 1     <<<  1 means the first child daemon

diagnose test application miglogd 6 2     <<<  2 means the second child daemon
```

```
FGT-B-LOG (global) # diagnose test application miglogd 6 1
mem=4288, disk=4070, alert=0, alarm=0, sys=5513, faz=4307, webt=0, fds=0
interface-missed=208
Queues in all miglogds: cur:0  total-so-far:36974
global log dev statistics:
syslog 0: sent=6585, failed=152, relayed=0
faz 0: sent=13, failed=0, cached=0, dropped=0 , relayed=0
```

To check the miglogd daemon number and increase/decrease miglogd daemon:

```
diagnose test application miglogd 15     <<<  Show miglog ID

diagnose test application miglogd 13     <<<  Increase one miglogd child

diagnose test application miglogd 14     <<<  Decrease one miglogd child

FGT-B-LOG (global) # diagnose test application miglogd 15
Main miglogd: ID=0, children=2, active-children=2
        ID=1, duration=70465.
        ID=2, duration=70465.

FGT-B-LOG (global) # diagnose test application miglogd 13

FGT-B-LOG (global) # diagnose test application miglogd 15
Main miglogd: ID=0, children=3, active-children=3
        ID=1, duration=70486.
        ID=2, duration=70486.
        ID=3, duration=1.

FGT-B-LOG (global) # diagnose test application miglogd 14

FGT-B-LOG (global) # diagnose test application miglogd 15
Main miglogd: ID=0, children=2, active-children=2
        ID=1, duration=70604.
        ID=2, duration=70604.
```

To check the remote queue and see the maximum buffered memory size:

```
diagnose test application miglogd 41

cache maximum: 105405644(100MB) objects: 0 used: 0(0MB) allocated: 0(0MB)

VDOM:root
Queue for: global-faz

       memory queue:
               num:0 size:0(0MB) max:105405644(100MB) logs:0

Queue for: fds

        memory queue:
                num:0 size:0(0MB) max:97852620(93MB) logs:0
```

Backing up log files or dumping log messages

When a log issue is caused by a particular log message, it is very help to get logs from that FortiGate. This topic provides steps for using `execute log backup` or dumping log messages to a USB drive.

Backing up full logs using execute log backup

This command backs up all disk log files and is only available on FortiGates with an SSD disk.

Before running `execute log backup`, we recommend temporarily stopping `miglogd` and `reportd`.

To stop and kill miglogd and reportd:

```
diagnose sys process daemon-auto-restart disable miglogd
diagnose sys process daemon-auto-restart disable reportd
```

Or

1. Determine the process, or thread, ID (PID) of `miglogd` and `reportd`:

   ```
   # diagnose sys top 10 99
   ```

2. Kill each process:

   ```
   # diagnose sys kill 9 <PID>
   ```

To store the log file on a USB drive:

1. Plug in a USB drive into the FortiGate.
2. Run this command:

   ```
   execute log backup /usb/log.tar
   ```

To restart miglogd and reportd:

```
diagnose sys process daemon-auto-restart enable miglogd
diagnose sys process daemon-auto-restart enable reportd
```

Dumping log messages

To dump log messages:

1. Enable log dumping for `miglogd` daemon:

   ```
   (global) # diagnose test application miglogd 26 1
   miglogd(1) log dumping is enabled
   ```

2. Display all `miglogd` dumping status:

   ```
   global) # diagnose test application miglogd 26 0 255
   miglogd(0) log dumping is disabled
   miglogd(1) log dumping is enabled
   miglogd(2) log dumping is disabled

   (global) # diagnose test application miglogd 26 2
   miglogd(2) log dumping is enabled

   (global) # diagnose test application miglogd 26 0
   miglogd(0) log dumping is enabled

   (global) # diagnose test application miglogd 26 0 255
   miglogd(0) log dumping is enabled
   ```

```
miglogd(1) log dumping is enabled
miglogd(2) log dumping is enabled
```

3. Let the FortiGate run and collect log messages.
4. List the log dump files:

```
(global) # diagnose test application miglogd 33
2019-04-17 15:50:02          20828      log-1-0.dat
2019-04-17 15:48:31           4892      log-2-0.dat
```

5. Back up log dump files to the USB drive:

```
(global) # diagnose test application miglogd 34

Dumping file miglog1_index0.dat copied to USB disk OK.

Dumping file miglog2_index0.dat copied to USB disk OK.
```

6. Disable log dumping for `miglogd` daemon:

```
(global) # diagnose test application miglogd 26 0
miglogd(0) log dumping is disabled

(global) # diagnose test application miglogd 26 1
miglogd(1) log dumping is disabled

(global) # diagnose test application miglogd 26 2
miglogd(2) log dumping is disabled

(global) # diagnose test application miglogd 26 0 255
miglogd(0) log dumping is disabled
miglogd(1) log dumping is disabled
miglogd(2) log dumping is disabled
```

SNMP OID for logs that failed to send

When a syslog server encounters low-performance conditions and slows down to respond, the buffered syslog messages in the kernel might overflow after a certain number of retransmissions, causing the overflowed messages to be lost. OIDs track the lost messages or failed logs.

SNMP query OIDs include log statistics for global log devices:

- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDeviceNumber 1.3.6.1.4.1.12356.101.21.1.1
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceEntryIndex 1.3.6.1.4.1.12356.101.21.2.1.1.1
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceEnabled 1.3.6.1.4.1.12356.101.21.2.1.1.2
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceName 1.3.6.1.4.1.12356.101.21.2.1.1.3
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceSentCount 1.3.6.1.4.1.12356.101.21.2.1.1.4

- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceRelayedCount 1.3.6.1.4.1.12356.101.21.2.1.1.5
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceCachedCount 1.3.6.1.4.1.12356.101.21.2.1.1.6
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceFailedCount 1.3.6.1.4.1.12356.101.21.2.1.1.7
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceDroppedCount 1.3.6.1.4.1.12356.101.21.2.1.1.8

Where:

- fgLogDeviceNumber is the number of devices in the table.
- fgLogDeviceEnabled is either 1 or 0, indicating whether the device is enabled.
- fgLogDeviceName is the name of the device.

A FortiGate connected to a syslog server or FortiAnalyzer generates statistics that can be seen using the `diagnose test application miglogd` command:

```
(global) # diagnose test application miglogd 6
    mem=404, disk=657, alert=0, alarm=0, sys=920, faz=555, webt=0, fds=0
    interface-missed=460
    Queues in all miglogds: cur:0 total-so-far:526
    global log dev statistics:
    syslog 0: sent=254, failed=139, relayed=0
    syslog 1: sent=220, failed=139, relayed=0
    syslog 2: sent=95, failed=73, relayed=0
    faz 0: sent=282, failed=0, cached=0, dropped=0 , relayed=0
    Num of REST URLs: 3
    /api/v2/monitor/system/csf/ : 0 : 300
    /api/v2/cmdb/system/interface/ : 394.0.673.15877729363538323653.1547149763 : 1200
    /api/v2/monitor/system/ha-checksums/ : 0 : 1200
    faz 1: sent=272, failed=0, cached=0, dropped=0 , relayed=0
    Num of REST URLs: 2
    /api/v2/monitor/system/csf/ : 0 : 300
    /api/v2/cmdb/system/interface/ : 394.0.673.15877729363538323653.1547149763 : 1200
```

The same statistics are also available in `snmpwalk/snmpget` on the OID 1.3.6.1.4.1.12356.101.21.

```

FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.8 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.8.0 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.8.1 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.8.2 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.8.3 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.8.4 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.8.5 = Counter32: 0
```

```
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.8.6 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.8.7 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.8.8 = Counter32: 0
```

To get the type of logging device that is attached to the FortiGate:

```
root@PC05:/home/tester/autolib/trunk# snmpwalk -v2c -c REGR-SYS 172.16.200.1
1.3.6.1.4.1.12356.101.21.2.1.1.3
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.0 = STRING: "syslog"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.1 = STRING: "syslog2"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.2 = STRING: "syslog3"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.3 = STRING: "syslog4"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.4 = STRING: "faz"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.5 = STRING: "faz2"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.6 = STRING: "faz3"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.7 = STRING: "webtrends"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.8 = STRING: "fds"
```

To get the present state of the logging device that is attached to the FortiGate:

```
root@PC05:/home/tester/autolib/trunk# snmpwalk -v2c -c REGR-SYS 172.16.200.1
1.3.6.1.4.1.12356.101.21.2.1.1.2
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.0 = INTEGER: 1
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.1 = INTEGER: 1
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.2 = INTEGER: 1
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.3 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.4 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.5 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.6 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.7 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.8 = INTEGER: 0
```

To get the failed log count value:

```
root@PC05:/home/tester/autolib/trunk# snmpwalk -v2c -c REGR-SYS 172.16.200.1
1.3.6.1.4.1.12356.101.21.2.1.1.7
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.0 = Counter32: 139
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.1 = Counter32: 139
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.2 = Counter32: 73
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.3 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.4 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.5 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.6 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.7 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.8 = Counter32: 0
```

VM

This section contains topics on deploying FortiGate-VM:

- Amazon Web Services on page 2808
- Microsoft Azure on page 2808

- Oracle OCI on page 2808
- AliCloud on page 2809
- Private cloud on page 2809
- VM license on page 2809
- Permanent trial mode for FortiGate-VM on page 2814
- Adding VDOMs with FortiGate v-series on page 2817
- Terraform: FortiOS as a provider on page 2820
- PF and VF SR-IOV driver and virtual SPU support on page 2824
- Using OCI IMDSv2 on page 2826
- FIPS cipher mode for AWS, Azure, OCI, and GCP FortiGate-VMs on page 2828

Amazon Web Services

See the FortiOS 7.2.3 AWS Administration Guide.

Microsoft Azure

See the FortiOS 7.2.3 Azure Administration Guide.

Google Cloud Platform

See the 7.2.3 FortiOS GCP Administration Guide.

Oracle OCI

See the 7.2.3 FortiOS OCI Administration Guide.

AliCloud

See the 7.2.3 FortiOS AliCloud Administration Guide.

Private cloud

See FortiGate Private Cloud in the document library.

VM license

You can access the *FortiGate VM License* page from the *Dashboard* > *Status* page in the *Virtual Machine* widget. Click the device license and select *FortiGate VM License*.

The *FortiGate VM License* page displays the following information:

Field	Description
License status	Displays one of the following statuses: • Valid: VM can connect and validate the license against a FortiManager or FortiGuard server. All features are available. • Warning: VM cannot connect and validate against a FortiManager or FortiGuard server. A check is made against how many days the warning status is continuous. If the number is less than 30 days, the status does not change. • Invalid: VM cannot connect and validate against a FortiManager or FortiGuard server. A check is made against how many days the warning status is continuous. If the number is 30 days or more, the status changes to invalid. GUI access is restricted until a valid license is uploaded. Firewall policies do not work. FortiGuard downloads are unavailable. • Pending: temporary state where the VM attempts to validate its license. Reasons for having a warning or invalid status include: • The network environment does not allow FortiGate-VM to connect to the FortiGuard server. • The license may be expired. Check the expiration date for evaluation or term-based licenses. • Another VM has been already validated with FortiGuard using the same license. See VM license activation for details about duplicated VM instances.
Allocated vCPUs	Number of allocated and total allowable vCPUs
Allocated RAM	Amount of allocated RAM. There are no RAM restrictions.
Expires on	Expiry date (value depends on the type of license)

This information is visible in the CLI by running `get system status` (see CLI troubleshooting).

Uploading a license file

After you submit an order for a FortiGate-VM, Fortinet sends a license registration code to the email address that you entered in the order form. Use this code on the FortiCloud portal to register the FortiGate-VM.

Once the VM is registered, you can download the license file in .LIC format. On the *FortiGate VM License* page, click *Upload*. The system prompts you to reboot and validate the license with the FortiGuard server. Once validated, your FortiGate-VM is fully functional.

The VM license window may also appear immediately after logging in if you are running a VM with an evaluation license that has expired.

In cases where the GUI is not accessible, you can upload the license using secure copy (SCP).

To upload the license using SCP:

1. Enable SCP:

```
config system global
    set admin-scp enable
end
```

2. Enable SSH in the administrative access for the interface where the transfer will take place:

```
config system interface
    edit <interface>
        append allowaccess ssh
    next
end
```

3. On your computer, upload the VM license. This example is for Linux:

```
scp <filename> <admin-user>@<FortiGate_IP>:vmlicense
```

VM license types

FortiGate-VM offers perpetual licensing (normal series and V-series) and annual subscription licensing (S-series). SKUs are based on the number of vCPUs (1, 2, 4, 8, 16, 32, or unlimited).

FortiOS 7.2.1 introduces a new permanent trial license, and moves away from the 15-day trial license. See Permanent trial mode for FortiGate-VM on page 2814.

The FortiFlex program allows qualified enterprise and MSSP customers to create as many VM entitlements as required. Resource consumption is based upon predefined points that are calculated on a daily basis.

Feature	Normal series	Trial	V-series	S-series	FortiFlex
Licensing and support	The VM base is perpetual. You must separately contract support services on an annual basis. See the price list for details.	Hardware configuration restrictions apply. Support is not available.	The VM base is perpetual. You must separately contract support services on an annual basis. See the price list for details.	Single annually contracted SKU that contains a VM base and a FortiCare service bundle. Four support service bundle types are available: • Only FortiCare • UTM • Enterprise • ATP	An annually contracted program to create multiple sets of a single entitlement per VM. Entitlements contain a VM base and FortiCare bundle. Four support service bundle types are available: • Only FortiCare • UTM • Enterprise • ATP
vCPU number upgrade during contracted term	Not supported.			Supported. You can also upgrade the support service bundle. Contact a Fortinet sales representative to upgrade.	Supported. You can apply different VM entitlement configurations in the FortiFlex portal. API is not supported at this time.
vCPU number downgrade during contracted term	Not supported.				
VDOM support	By default, each CPU level supports up to a certain number of VDOMs. Refer to the FortiGate-VM data sheet for default limits.	VDOMs are supported, but restricted by the CPU allowance for the trial license.	By default, all CPU levels do not support adding VDOMs.	By default, all CPU levels do not support adding VDOMs. S-series VM instances support the subscription VDOM license.	

Consuming a new vCPU

In a scenario where you have not allocated all the vCPUs allotted by your VM entitlement, you can add additional vCPUs to your FortiGate VM. The vCPU allocation can be verified in the GUI and CLI.

To confirm the vCPU allocation in the GUI:

1. Go to *Dashboard* > *Status*, and locate the *Virtual Machine* widget.
2. Verify the *Allocate vCPUs* field, which displays the number and percentage of allocated vCPUs.

To confirm the vCPU allocation in the CLI:

```
# get system status | grep "VM Resources"
VM Resources: 1 CPU/4 allowed, 2006 MB RAM
```

You can increase the number of vCPUs on running FortiGate VM models that support hot-adding. Once the hot-adding is complete, perform one of the following for FortiOS to recognize the new CPUs:

- Enter `execute cpu add <number_of_new_vCPUs>`.
- Reboot the FortiGate.

CLI troubleshooting

In some cases, you can view more information from the CLI to diagnose issues with VM licensing. This is also useful when the GUI is inaccessible due to an invalid contract.

Before you begin, ensure your FortiGate has the proper routes to connect to the internet. Run all following debug commands for a full picture of the issue.

To view the license status, expiration date, and VM resources:

```
# get system status
Version: FortiGate-VM64-KVM v6.4.2,build1723,200730 (GA)
...
Serial-Number: FGVM08**********
....
License Status: Valid
License Expiration Date: 2020-12-10
VM Resources: 1 CPU/8 allowed, 2010 MB RAM
...
```

To display license details:

```
# diagnose debug vm-print-license
SerialNumber: FGVM08**********
CreateDate: Tue Dec 10 00:57:32 2019
License expires: Thu Dec 10 00:00:00 2020
Expiry: 366
Key: yes
Cert: yes
Key2: yes
Cert2: yes
Model: 08 (11)
```

```
CPU: 8
MEM: 2147483647
```

To display license information from FortiGuard:

```
# diagnose hardware sysinfo vm full
UUID:     abbe**************************
valid:    1
status:   1
code:     200
warn:     0
copy:     0
received: 4604955037
warning:  4600905081
recv:     202009152207
dup:
```

Field	Value and description
Valid	0 – Invalid 1 – Valid
Status	0 – Startup 1 – Success 2 – Warning 3 – Error 4 – Invalid Copy 5 – Eval Expired 6 - Grace Period. For FortiFlex, there is a two-hour grace period to begin passing traffic upon retrieving the license from FortiCare.
Code	2xx, 3xx – Success 200 – Valid 202 – Accepted (treated as correct response code) 4xx - Error 400 – Expired 401 – Duplicate 5xx – Warning 500 - Warning 502 – Invalid. Cannot connect to FortiGuard Distribution Servers 6xx – Evaluation license expired Other codes - Error

The following are examples of common combinations:

This combination indicates the license is valid and functioning normally:

```
valid: 1
status: 1
code: 200
```

This combination indicates the license itself is valid, but is running on a duplicate instance:

```
valid: 1
status: 4
code: 401
```

This combination indicates the system cannot connect to FortiGuard:

```
valid:    0
status:   2
code:     502
```

This combination indicates the license is expired and invalid:

```
valid: 0
status: 3
code: 400
```

This combination indicates the VM is unlicensed:

```
valid: 0
status: 3
code: 0
```

For FortiFlex licenses, the following command allows you to enter the license token and proxy information:

```
# execute vm-license <token> https://<username>:<password>@<proxy IP address>:<proxy port>
```

FortiOS can receive the following error codes from the FortiCare server:

```
1 - Runtime error (server unhandled error on FortiCare sever)
57 - License Token is invalid
58 - License Token is already used and cannot be used again to retrieve license key
```

The FortiGate can generate the following error code:

```
60 - Failed to request forticare license. Failed to download VM license.
```

Contact Fortinet Support for assistance if your licensing issue persists.

Permanent trial mode for FortiGate-VM

A permanent evaluation VM license replaces the 15 day evaluation period for FortiGate-VM. The evaluation VM license applies to all private cloud (VMware ESXi, KVM, and so on) and all bring your own license (BYOL) public cloud instances.

When spinning up a new FortiGate-VM, you choose to log in to FortiCare to activate the VM trial or upload a new license.

Limitations of the evaluation VM license include the following:

- Maximum of one free evaluation copy per FortiCare account
- Support for low encryption operation only, except for GUI management access and FortiManager communications
- Maximum of 1 CPU and 2 GB of memory
- Maximum of three interfaces, firewall policies, and routes
- No FortiCare support
- No FortiGuard support

To obtain the permanent VM trial license from FortiCare using the CLI:

1. A newly deployed FortiGate-VM no longer has a valid evaluation license, even if the instance has only 1 CPU and 2 GB of memory. Run `get sys stat`. The following output is expected:

```
Version: FortiGate-VM64 v7.2.1,build1242,220715 (interim)
...
Serial-Number: FGVMEVNXFLTGKOBC
License Status: Invalid
VM Resources: 1 CPU/1 allowed, 2007 MB RAM/2048 MB allowed
```

2. Obtain the permanent VM trial license from FortiCare:

```
exec vm-license-options account-id xxxx@fortinet.com

exec vm-license-options account-password xxxxxxx

exec vm-license
This VM is using the evaluation license. This license does not expire.
Limitations of the Evaluation VM license include:
  1.Support for low encryption operation only
  2.Maximum of 1 CPU and 2GiB of memory
  3.Maximum of three interfaces, firewall policies, and routes each
  4.No FortiCare Support
This operation will reboot the system !
Do you want to continue? (y/n)y

Connection to 10.6.30.74 closed.
```

3. You can run the following commands to check that the permanent VM trial license is valid:
   - `get sys stat`. The following output is expected:

```
Version: FortiGate-VM64 v7.2.1,build1242,220715 (interim)
...
Serial-Number: FGVMEVNXFLTGKOBC
License Status: Valid
VM Resources: 1 CPU/1 allowed, 2007 MB RAM/2048 MB allowed
```

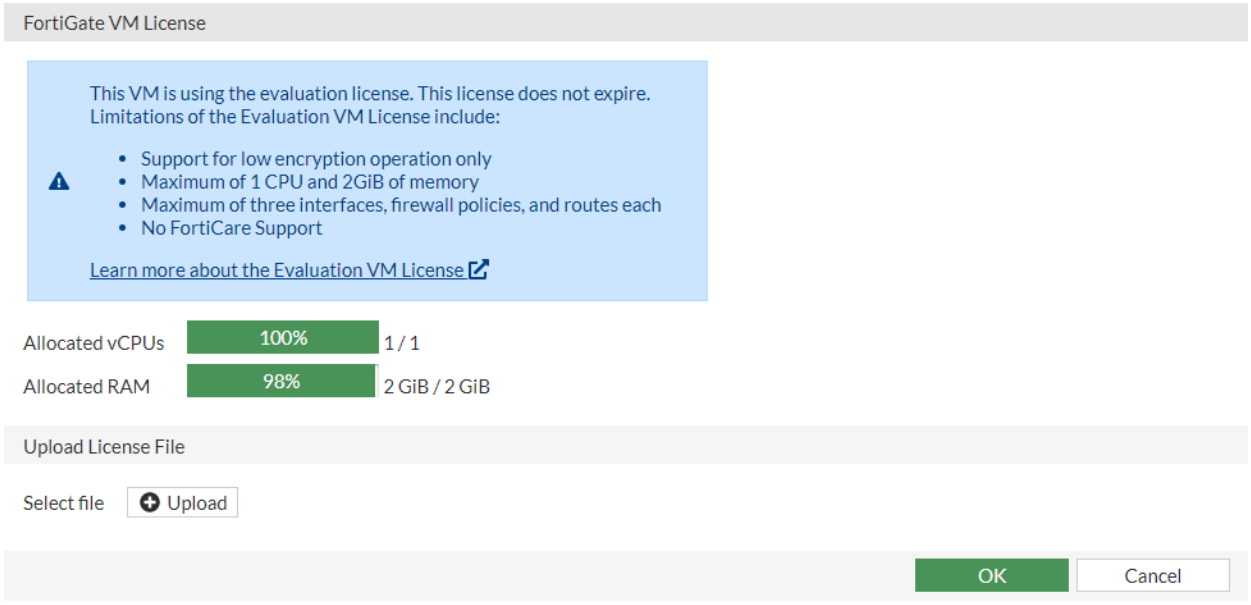
   - `diagnose hardware sysinfo vm full`. The following output is expected:

```
UUID:     4213dbbc94f2520b0d75eeafe1b319c7
valid:    1
status:   1
code:     0
warn:     0
copy:     0
received: 4294939472
warning:  4294939472
recv:     202207162014
dup:
```

   - `diagnose debug vm-print-license`. The following output is expected:

```
SerialNumber: FGVMEVNXFLTGKOBC
CreateDate: Sat Jul 16 20:11:15 2022
UUID: 4213dbbc94f2520b0d75eeafe1b319c7
```

```
Key: yes
Cert: yes
Key2: yes
Cert2: yes
Model: EVAL (1)
CPU: 1
MEM: 2048
VDOM license:
  permanent: 2
  subscription: 0
```



To obtain the permanent VM trial license from FortiCare using the GUI:

1. When unlicensed, the FortiOS GUI allows you to download the permanent VM trial license from FortiCare with your FortiCare account credentials. In the FortiGate VM License page, for *How will you license this VM?*, select *Evaluation License*.

2. In the *Email* field, enter your FortiCare account email address.
3. In the *Password* field, enter your FortiCare account password.
4. Click *OK*. When a permanent VM trial license is applied, the FortiOS, the GUI shows a summary of the license

limitations and allows you to upload a paid VM license.

To allow FortiManager to apply a license to an unlicensed FortiGate-VM instance:

1. Confirm that the FortiGate is unlicensed by running `get system status` in the FortiOS CLI. The following shows expected output for this command:

```
Version: FortiGate-VM64-AZURE v7.2.1,build1252,220728 (interim)
...
Serial-Number: FGVMEVTN8UP4KIA6
License Status: Invalid
VM Resources: 1 CPU/1 allowed, 1945 MB RAM/2048 MB allowed
```

2. In the FortiOS CLI, configure the FortiManager as central management:

```
config system central-management
    set type fortimanager
    set fmg "<FortiManager IP address>"
end
```

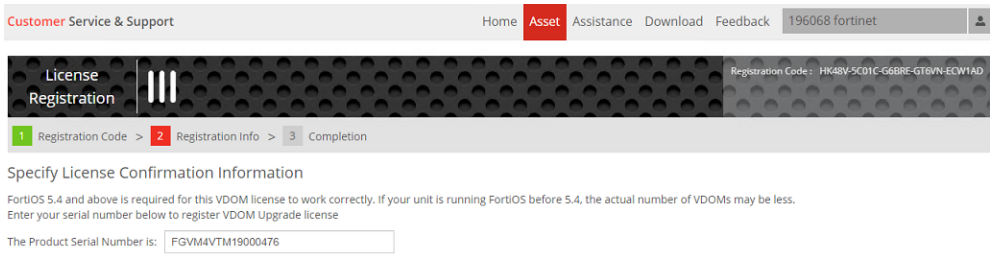
3. In FortiManager, configure the VM license as Installing VM licenses describes.

Adding VDOMs with FortiGate v-series

Each FortiGate-VM base license type allows a default number of virtual domains (VDOM). This topic provides sample procedures to add VDOMs beyond the default number using separately purchased VDOM licenses.

This topic consists of the following steps:

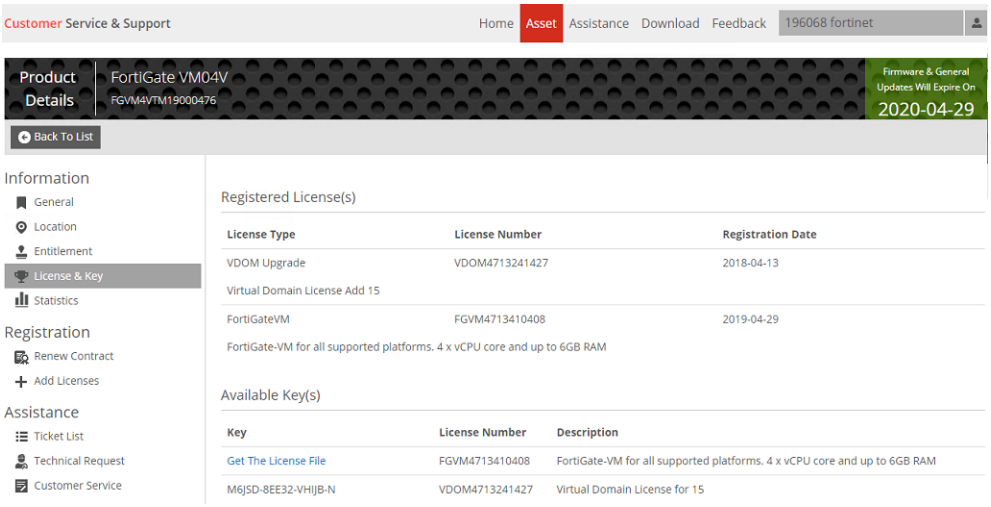
1. Activate the FortiGate-VM with the base license.
2. Add more VDOMs to the FortiGate-VM.



To activate the FortiGate-VM with the base license:

1. Purchase and register the FortiGate-VM base license in FortiCare:
   a. Purchase the FortiGate-VM base license from Fortinet or a Fortinet reseller.
   b. You receive a license certification with a registration code. Open the certification.
   c. Log in to Fortinet Customer Service & Support.
   d. Go to *Register Now* and enter the provided registration code.
   e. Follow the registration process. The serial number generates and displays on the *Registration Completion* page.
   f. Go to *Asset* > *Manage/View Products*. Click the serial number to download the license file.
2. Upload the FortiGate-VM base license file to FortiOS:
   a. Log in to the FortiGate-VM GUI.
   b. In *Dashboard* > *Status*, in the *Virtual Machine* widget, click *FortiGate VM License*.
   c. Click the *Upload* button.
   d. Select the FortiGate-VM base license file, then click *OK*. The FortiGate-VM reboots after applying the base license.
3. Verify the FortiGate-VM base license status and VDOM information:
   a. Log in to the FortiGate-VM GUI.
   b. In *Dashboard* > *Status*, in the *Virtual Machine* widget, ensure that there is a checkmark in front of the FortiGate-VM base license name. The checkmark indicates that the base license is valid.
   c. You can check VDOM information using the CLI. The following output shows that the maximum number of VDOMs is currently one. This is correct since the FortiGate-VM base license only supports the default root VDOM that the system uses.

To add more VDOMs to the FortiGate-VM:



You can repeat this procedure multiple times to stack multiple VDOM licenses on the same FortiGate-VM.

1. Purchase and register the FortiGate-VM upgrade license in FortiCare. This example adds 15 VDOMs:
   a. Purchase the FortiGate-VM upgrade license from Fortinet or a Fortinet reseller.
   b. You receive a license certification with a registration code. Open the certification.
   c. Log in to Fortinet Customer Service & Support.
   d. Go to *Asset* > *Register/Activate* and enter the provided registration code.
   e. On the *Specify License Confirmation Information* screen, enter the FortiGate-VM serial number to apply the VDOM upgrade license to the FortiGate-VM. In this example, the FortiGate-VM serial number is *FGVM4VTM19000476*.

   f. Follow the registration process.
   g. Go to *Asset* > *Manage/View Products* > . Select the desired product, then click *License & Key*. The VDOM upgrade license displays under *Registered License(s)*, and a key for adding 15 VDOMs (in this example

M6JSD-8EE32-VHIJB-N) displays under *Available Key(s)*.

2. Apply the FortiGate-VM upgrade license key to FortiOS:
   a. Log in to the FortiGate-VM CLI in the local console or using SSH.
   b. Apply the VDOM upgrade license key:
   ```
   FGVM4VTM19000476 # execute upd-vd-license M6JSD-8EE32-VHIJB-N
   update vdom license succeeded
   ```
3. Verify the FortiGate-VM VDOM information:
   a. Log in to the FortiGate-VM CLI in the local console or using SSH.
   b. Check VDOM information using the CLI. The following output shows that the maximum number of VDOMs is currently 15. When you add VDOMs for the first time on a FortiGate-VM v-series instance, FortiOS does not count the default VDOM, as the default VDOM is the so-called root VDOM that the system uses and FortiOS does not treat it as a countable VDOM in terms of VDOM addition. Therefore, as in this example, if your FortiGate-VM had the default VDOM configuration, then you add 15 VDOMs, FortiOS displays the maximum VDOM number as 15, not 16.

   ```
   # get system status
   Version: FortiGate-VM64-KVM v6.4.4,build1803,201209 (GA)
   Virus-DB: 82.00644(2020-12-18 12:20)

```

Terraform: FortiOS as a provider

Fortinet's Terraform support provides customers with more ways to efficiently deploy, manage, and automate security across physical FortiGate appliances and virtual environments. You can use Terraform to automate various IT infrastructure needs, thereby diminishing mistakes from repetitive manual configurations.

For example, if Fortinet is releasing a new FortiOS version, your organization may require you to test a new functionality to determine how it may impact the environment before globally deploying the new version. In this case, the ability to rapidly stand up environments and test these functions prior to production environment integration provides a resource-efficient and fault-tolerant approach.

The following example demonstrates how to use the Terraform FortiOS provider to perform simple configuration changes on a FortiGate unit. It requires the following:

- FortiOS 6.0 or later
- FortiOS Provider: This example uses terraform-provider-fortios 1.0.0.
- Terraform: This example uses Terraform 0.11.14.
- REST API administrator created on the FortiGate with the API key

For more information, see the Terraform FortiOS Provider at https://www.terraform.io/docs/providers/fortios/index.html.

To create a REST API administrator:

1. On the FortiGate, go to *System* > *Administrators* and click *Create New* > *REST API Admin*.
2. Enter the *Username* and, optionally, enter *Comments*.
3. Select an *Administrator Profile*.
4. We recommend that you create a new profile with minimal privileges for this terraform script:
   a. In the *Administrator Profile* drop down click *Create New*.
   b. Enter a name for the profile.
   c. Configure the *Access Permissions*:
      - *None*: The REST API is not permitted access to the resource.
      - *Read*: The REST API can send read requests (`HTTP GET`) to the resource.
      - *Read/Write*: The REST API can send read and write requests (`HTTP GET`/`POST`/`PUT`/`DELETE`) to the resource.
   d. Click *OK*.
5. Enter *Trusted Hosts* to specify the devices that are allowed to access this FortiGate.
6. Click *OK*.
   An API key is displayed. This key is only shown once, so you must copy and store it securely.

To configure FortiGate with Terraform Provider module support:

1. Download the terraform-provider-fortios file to a directory on the management computer.
2. Create a new file with the .tf extension for configuring your FortiGate:
```
root@mail:/home/terraform# ls
terraform-provider-fortios_v1.0.0_x4 test.tf
```
3. Edit the test.tf Terraform configuration file:
In this example, the FortiGate's IP address is 10.6.30.5, and the API user token is 17b**********63ck. Your provider information must also be changed.
```
# Configure the FortiOS Provider
provider "fortios" {
hostname = "10.6.30.5"
token = "17b**********63ck"
}
```
4. Create the resources for configuring your DNS object and adding a static route:
```
resource "fortios_system_setting_dns" "test1" {
primary = "172.16.95.16"
secondary = "8.8.8.8"
}
resource "fortios_networking_route_static" "test1" {
dst = "110.2.2.122/32"
gateway = "2.2.2.2"
blackhole = "disable"
distance = "22"
weight = "3"
priority = "3"
device = "port2"
comment = "Terraform test"
}
```
5. Save your Terraform configuration file.
6. In the terminal, enter `terraform init` to initialize the working directory.
It reads the provider if the name follows the convention `terraform-provider-[name]`:
```
root@mail:/home/terraform# terraform init
Initializing the backend...
Terraform has been successfully initialized!
You may now begin working with Terraform. Try running "terraform plan" to see
any changes that are required for your infrastructure. All Terraform commands
should now work.
If you ever set or change modules or backend configuration for Terraform,
rerun this command to reinitialize your working directory. If you forget, other
commands will detect it and remind you to do so if necessary.
```
7. Run `terraform -v` to verify the version of loaded provider module:
```
root@mail:/home/terraform# terraform -v
Terraform v0. 11.14
+ provider.fortios v1.0.0
```
8. Enter `terraform plan` to parse the configuration file and read from the FortiGate configuration to see what Terraform changes:
This example create a static route and updates the DNS address. You can see that Terraform reads the DNS addresses from the FortiGate and then lists them.

```
root@mail:/home/terraform# terraform plan
Refreshing Terraform state in-memory prior to plan...
The refreshed state will be used to calculate this plan, but will not be
persisted to local or remote state storage.
fortios_networking_route_static.test1: Refreshing state... (ID: 2)
fortios_system_setting_dns.test1: Refreshing state... (ID: 96.45.45.45)
------------------------------------------------------------------------
An execution plan has been generated and is shown below.
Resource actions are indicated with the following symbols:
+ create
~ update in-place
Terraform will perform the following actions:
+ fortios_networking_route_static.test1
id: <computed>
blackhole: "disable"
comment: "Terraform test"
device: "port2"
distance: "22"
dst: "110.2.2.122/32"
gateway: "2.2.2.2"
priority: "3"
weight: "3"
~ fortios_system_setting_dns.test1
primary: "96.45.45.45" => "172.16.95.16"
secondary: "208.91.112.22" => "8.8.8.8"
Plan: 1 to add, 1 to change, 0 to destroy.
------------------------------------------------------------------------
Note: You didn't specify an "-out" parameter to save this plan, so Terraform
can't guarantee that exactly these actions will be performed if
"terraform apply" is subsequently run.
```

If you are running terraform-provider-fortios 1.1.0, you may see the following error:

```
Error: Error getting CA Bundle, CA Bundle should be set when
     insecure is false.
```

In this case, add the following line to the FortiOS provider configuration in the test.tf file:

```
insecure = "true"
```

9. Enter `terraform apply` to continue the configuration:

```
root@mail:/home/terraform# terraform apply
fortios_system_setting_dns.test1: Refreshing state... (ID: 96.45.45.45)
fortios_networking_route_static.test1: Refreshing state... (ID: 2)
An execution plan has been generated and is shown below.
Resource actions are indicated with the following symbols:
+ create
~ update in-place
Terraform will perform the following actions:
+ fortios_networking_route_static.test1
id: <computed>
blackhole: "disable"
comment: "Terraform test"
device: "port2"
distance: "22"
dst: "110.2.2.122/32"
gateway: "2.2.2.2"
```

```
priority: "3"
weight: "3"
~ fortios_system_setting_dns.test1
primary: "96.45.45.45" => "172.16.95.16"
secondary: "208.91.112.22" => "8.8.8.8"
Plan: 1 to add, 1 to change, 0 to destroy.
Do you want to perform these actions?
Terraform will perform the actions described above.
Only 'yes' will be accepted to approve.
Enter a value: yes
fortios_networking_route_static.test1: Creating...
blackhole: "" => "disable"
comment: "" => "Terraform test"
device: "" => "port2"
distance: "" => "22"
dst: "" => "110.2.2.122/32"
gateway: "" => "2.2.2.2"
priority: "" => "3"
weight: "" => "3"
fortios_system_setting_dns.test1: Modifying... (ID: 96.45.45.45)
primary: "96.45.45.45" => "172.16.95.16"
secondary: "208.91.112.22" => "8.8.8.8"
fortios_networking_route_static.test1: Creation complete after 0s (ID: 2)
fortios_system_setting_dns.test1: Modifications complete after 0s (ID: 172.16.95.16)
Apply complete! Resources: 1 added, 1 changed, 0 destroyed.
```

The FortiGate is now configured according to the configuration file.

10. To change or delete something in the future, edit the configuration file and then apply it again. In supported cases, it deletes, adds, or updates new entries as configured. For instance, in this example you can remove the static route and revert the DNS address to its original configuration by changing the .tf file:

    a. Edit the configuration file:

    ```
    # Configure the FortiOS Provider
    provider "fortios" {
    hostname = "10.6.30.5"
    token = "17b********************63ck"
    }
    resource "fortios_system_setting_dns" "test1" {
    primary = "96.45.45.45"
    secondary = "208.91.112.22"
    }
    #resource "fortios_networking_route_static" "test1" {
    # dst = "110.2.2.122/32"
    # gateway = "2.2.2.2"
    # blackhole = "disable"
    # distance = "22"
    # weight = "3"
    # priority = "3"
    # device = "port2"
    # comment = "Terraform test"
    #}
    ```

    b. Entering `terraform apply` deletes the static route that is commented out of the configuration file, and reverts the DNS address to the old address:

    ```
    root@mail:/home/terraform# terraform apply
    fortios_system_setting_dns.test1: Refreshing state... (ID: 172.16.95.16)
    ```

```
fortios_networking_route_static.test1: Refreshing state... (ID: 2)
An execution plan has been generated and is shown below.
Resource actions are indicated with the following symbols:
~ update in-place
- destroy
Terraform will perform the following actions:
- fortios_networking_route_static.test1
~ fortios_system_setting_dns.test1
primary: "172.16.95.16" => "96.45.45.45"
secondary: "8.8.8.8" => "208.91.112.22"
Plan: 0 to add, 1 to change, 1 to destroy.
Do you want to perform these actions?
Terraform will perform the actions described above.
Only 'yes' will be accepted to approve.
Enter a value: yes
fortios_networking_route_static.test1: Destroying... (ID: 2)
fortios_system_setting_dns.test1: Modifying... (ID: 172.16.95.16)
primary: "172.16.95.16" => "96.45.45.45"
secondary: "8.8.8.8" => "208.91.112.22"
fortios_networking_route_static.test1: Destruction complete after 0s
fortios_system_setting_dns.test1: Modifications complete after 0s (ID: 96.45.45.45)
Apply complete! Resources: 0 added, 1 changed, 1 destroyed.
```

Troubleshooting

Use the HTTPS daemon debug to begin troubleshooting why a configuration was not accepted:

```
# diagnose debug enable
# diagnose debug application httpsd -1
```

The REST API 403 error means that your administrator profile does not have sufficient permissions.

The REST API 401 error means that you do not have the correct token or trusted host.

PF and VF SR-IOV driver and virtual SPU support

Physical Function (PF) and Virtual Function (VF) PCI Passthrough and SR-IOV drivers in FortiGate guest VM are supported.

PF provides the ability for PCI Passthrough, but requires an entire Network Interface Card (NIC) for a VM. It can usually achieve greater performance than a Virtual Function (VF) based SR-IOV. PF is also expensive. While VF allows one NIC to be shared among multiple guests VMs, PF is allocated to one port on a VM.

The supported driver versions are:

Driver	Version	Hypervisor	PCI-Passthrough/SR-IOV	vSPU (In-guest DPDK)	Note
ixgbe	5.6.5	ESXi, KVM	Yes	Yes	
Ixgbevf	4.6.3	ESXi, KVM	Yes		
i40e	2.10.19.82	ESXi, KVM	Yes	Yes	
i40evf	3.6.15	ESXi, KVM	Yes	Yes	Available in FortiOS 6.4.0 and earlier versions.
Iavf	4.1.1	ESXi, KVM	Yes	Yes	Replaces i40evf in FortiOS 6.4.1 and later versions. Supports Intel E810-C 100G adapters.
Mlx5	4.6-1.0.1	ESXi, KVM	Yes	Yes	Supports Nvidia ConnectX-5 and ConnectX-6 100G adapters.
Bnxt_en	1.10.1-216.0.416.1	ESXi, KVM	Yes	Yes	Available in FortiOS 6.4.3 and later versions. Supports Broadcom P2100G 100G adapters.
Vmxnet3	1.4.a.0-k-NAPI	ESXi		Yes	The combination of VMware ESXi and NSX-T does not support virtual SPU (vSPU).

Other hypervisors, such as Xen or Microsoft Hyper-V, may work with vSPU, although they are unverified.

All tools and software utilities for UEFI 1.X have been removed from 6.2.0 and later releases. Update to UEFI 2.x to use the UEFI tools or software utilities.

You perform the configuration to use PF or VF on the hypervisor, and do not configure it on the FortiGate.

To check what driver is being used on the FortiGate:

```
# diagnose hardware deviceinfo nic port2
Name:        port2
Driver:      i40e
Version:     2.4.10
Bus:         0000:03:00.0
Hwaddr:      3c:fd:fe:1e:98:02
```

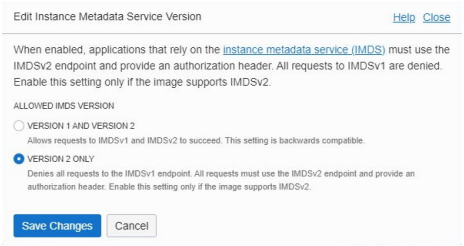
```
Permanent Hwaddr:3c:fd:fe:1e:98:02
State:       up
Link:        up
Mtu:         1500
Supported:   auto 1000full 10000full
Advertised:  auto 1000full 10000full
Auto:        disabled
Rx packets:      0
Rx bytes:        0
Rx compressed:       0
...
```

Using OCI IMDSv2

OCI IMDSv2 offers increased security for accessing instance metadata compared to IMDSv1. IMDSv2 is used in OCI SDN connectors and on instance deployments with bootstrap metadata. When upgrading from previous FortiOS builds with legacy IMDSv1 endpoints, the endpoints will be updated to IMDSv2, and the same calls can be made.

The following use cases illustrate IMDSv2 support on the FortiGate-VM.

To configure the Oracle OCI instance to use IMDSv2:



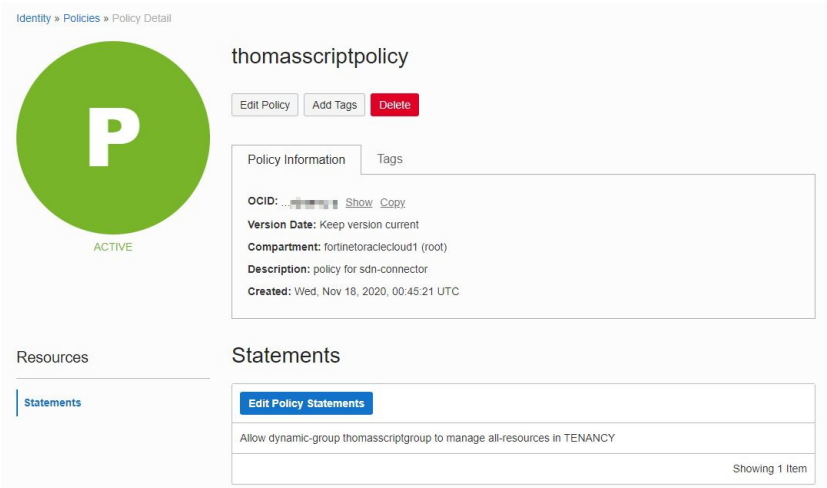
1. In OCI, deploy an instance using IMDSv2 with bootstrap metadata. There are two methods to enable IMDSv2 :
   - Use the OCI command line to deploy an instance using `user-data`. This example uses a MIME file that contains the license and configuration, as well as a JSON file that specifies to disable V1 metadata.

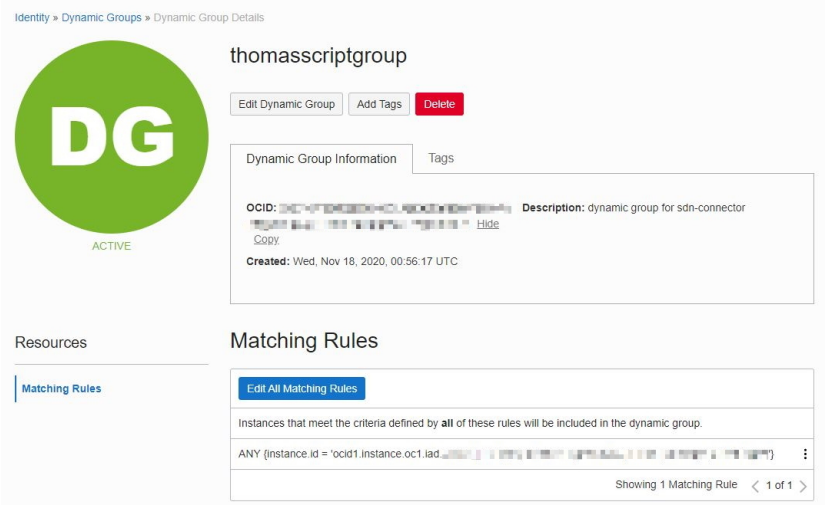
     ```
     oci compute instance launch
     --availability-domain wwwl:US-ASHBURN-AD-1
     --compartment-id
     ocid1.tenancy.oc1..aaaaaaaaaaa3aaaaaaaaaaaaaaaaa7xxxxxxx54aaaaaa4xxxxxxxx55xxxa
     --display-name fos-byol-v6.4.6-b2290-emulated
     --image-id
     ocid1.image.oc1.iad.aaaaaaaa6xxx43xxxxxxxxx7aaaaaaaaaaaaaaaaaaa3xxxxxxxxxxxxxxx
     --subnet-id
     ocid1.subnet.oc1.iad.aaaaaaaaxxxxxxxxx2xxxxxxxxxxxxxxxxxxxx5aaa4xxxxxxxxxxx42aaa
     --shape VM.Standard1.4
     --assign-public-ip true
     --user-data-file /home/oci/userdata/mime.txt
     --ssh-authorized-keys-file /home/oci/userdata/myfirstkeypair.pub
     --instance-options file://home/oci/scripts/metadatav2.json
     ```

     ```
     root@mail:/home/oci/scripts# cat metadatav2.json
     {
       "areLegacyImdsEndpointsDisabled": true
     }
     ```

   - While the instance is running, edit the instance metadata service version in the GUI ,and change the allowed

IMDS version to *VERSION 2 ONLY* (see Getting Instance Metadata in the OCI documentation).





2. The FortiGate will use the metadata v2 endpoints to get the metadata bootstrap information. In FortiOS, verify this by running the following after bootup:

```
# diagnose debug cloudinit show
```

To configure an SDN connector with meta-IAM enabled and firewall addresses to obtain dynamic addresses:

1. Configure an IAM policy and dynamic group (see How Policies Work and Managing Dynamic Groups in the OCI documentation).

2. In FortiOS, configure the OCI Fabric connector (see OCI SDN connector using certificates on page 2656 for detailed instructions):

a. Create the SDN connector.
b. Verify that the OCI connector comes up (*Security Fabric* > *External Connectors* page indicates the status is up).
c. Configure a dynamic firewall address with a filter.
d. Verify the dynamic firewall address is resolved by the SDN connector.

To manually update the external IP:

```
# execute update-eip
instance: fos-byol-v6.4.6-b2290-emulated
    vnic0: fos-byol-v6.4.6-b2290-emulated
           10.0.0.58 (129.213.138.192)
port1: 10.0.0.58, eip: 129.213.138.192
EIP is updated successfully
```

To verify the OCI daemon debugs related to metadata:

```
# diagnose test application ocid 4
instance: fos-byol-v6.4.6-b2290-emulated
    vnic0: fos-byol-v6.4.6-b2290-emulated
           10.0.0.58

# diagnose test application ocid 5
Compartment
Id:ocid1.tenancy.oc1..aaaaaaaaaaa3aaaaaaaaaaaaaaaaa7xxxxxxx54aaaaaa4xxxxxxxx55xxxa
Instance Id:ocid1.instance.oc1.iad.axxxxxxxxxxxxxxxxxxx4aaaaa5aaaaaaaaa4xxxxxxx2aaaaaaaa
Instance Name:fos-byol-v6.4.6-b2290-emulated
OCI Regarxiehlion:us-ashburn-1

# diagnose test application ocid 6
Instance Principal Token has been refreshed
```

FIPS cipher mode for AWS, Azure, OCI, and GCP FortiGate-VMs

AWS, Azure, OCI, and GCP FortiGate-VMs support FIPS cipher mode. You must remove all VPN configurations before you can enable FIPS CC mode.

FIPS cipher mode only allows a restricted set of ciphers for features that require encryption, such as SSH, IPsec and SSL VPN, and HTTPS. You cannot use insecure protocols such as Telnet, TFTP, and HTTP to access the FortiGate-VM.

You must perform a factory reset to disable `fips-ciphers` mode.

To enable fips-cipher mode:

```
config system fips-cc
    set status fips-ciphers
end
Warning: entering fips-ciphers mode. To exit this mode, factory reset is required.
Do you want to continue? (y/n) y
```

The following behavior occurs when you enable FIPS cipher mode:

- You can restore a license, image, configuration, and so on from an FTP server.
- The following options are available:

SSH algorithms	• aes128-gcm@openssh.com • aes256-gcm@openssh.com • hmac-sha2-256 • hmac-sha2-512
IKE/IPsec phase1 proposals	• aes128-sha256 • aes128-sha256 • aes128-sha384 • aes128-sha384 • aes128-sha512 • aes128-sha512 • aes128gcm-prfsha256 • aes128gcm-prfsha256 • aes128gcm-prfsha384 • aes128gcm-prfsha384 • aes128gcm-prfsha512 • aes128gcm-prfsha512 • aes256-sha256 • aes256-sha256 • aes256-sha384 • aes256-sha384 • aes256-sha512 • aes256-sha512 • aes256gcm-prfsha256 • aes256gcm-prfsha256 • aes256gcm-prfsha384 • aes256gcm-prfsha384 • aes256gcm-prfsha512 • aes256gcm-prfsha512
IKE/IPsec phase2 proposals	• aes128-sha256 • aes128-sha256 • aes128-sha384 • aes128-sha384 • aes128-sha512 • aes128-sha512 • aes128gcm • aes128gcm • aes256-sha256 • aes256-sha256 • aes256-sha384 • aes256-sha384 • aes256-sha512 • aes256-sha512

	• aes256gcm • aes256gcm
IKE/IPsec DH groups	• Default = 19, or any three from 14 - 21, 27 - 32
HTTPS for admin and SSL VPN (with RSA server certificate) TLS suites	PFS: • TLS_AES_256_GCM_SHA384 • ECDHE-RSA-AES256-GCM-SHA384 • DHE-RSA-AES256-GCM-SHA384 • TLS_AES_128_GCM_SHA256 • ECDHE-RSA-AES128-GCM-SHA256 • DHE-RSA-AES128-GCM-SHA256 Elliptic curves: • prime256v1 • secp384r1 • secp521r1 DH group: • RFC3526/Oakley group 14 (2048 bits)
HTTPS for admin and SSL VPN (with ECC server certificate) TLS suites	PFS: • TLS_AES_256_GCM_SHA384 • ECDHE-ECDSA-AES256-GCM-SHA384 • TLS_AES_128_GCM_SHA256 • ECDHE-ECDSA-AES128-GCM-SHA256 Elliptic curves: • prime256v1 • secp384r1 • secp521r1

- The FortiCare license is validated.
- FortiGuard databases and engines are updated.
- The DH-RSA-AES128-GCM-SHA256 and DH-RSA-AES256-GCM-SHA384 ciphers are not supported.

Hyperscale firewall

Hyperscale hardware and facilities can scale a distributed computing environment up to thousands of servers. It is about achieving massive scale in computing, typically for big data or cloud computing.

A hyperscale firewall secures hyperscale data centers and 5G networks.

See the Hyperscale Firewall Guide.

Troubleshooting

This section is intended for administrators with super_admin permissions who require assistance with basic and advanced troubleshooting. Administrators with other types of permissions may not be able to perform all of the tasks in this section.

This section contains the following troubleshooting topics:

- Troubleshooting methodologies on page 2833
- Troubleshooting scenarios on page 2836
  - Checking the system date and time on page 2837
  - Checking the hardware connections on page 2838
  - Checking FortiOS network settings on page 2839
  - Troubleshooting CPU and network resources on page 2842
  - FortiGuard server settings on page 2878
  - Troubleshooting high CPU usage on page 2844
  - Checking the modem status on page 2848
  - Running ping and traceroute on page 2849
  - Checking the logs on page 2852
  - Verifying routing table contents in NAT mode on page 2853
  - Verifying the correct route is being used on page 2854
  - Verifying the correct firewall policy is being used on page 2854
  - Checking the bridging information in transparent mode on page 2855
  - Checking wireless information on page 2856
  - Performing a sniffer trace or packet capture on page 2857
  - Debugging the packet flow on page 2858
  - Testing a proxy operation on page 2861
  - Displaying detail Hardware NIC information on page 2862
  - Performing a traffic trace on page 2864
  - Using a session table on page 2865
  - Finding object dependencies on page 2868
  - Diagnosing NPU-based interfaces on page 2869
  - Identifying the XAUI link used for a specific traffic stream on page 2870
  - Running the TAC report on page 2871
  - Using the process monitor on page 2872
  - Other commands on page 2874
  - FortiGuard troubleshooting on page 2877
  - View open and in use ports on page 2880
- Additional resources on page 2881

Troubleshooting methodologies

The sections in this topic provide an overview of how to prepare to troubleshoot problems in FortiGate. They include verifiying your user permissions, establishing a baseline, defining the problem, and creating a plan.

Verify user permissions

Before you begin troubleshooting, verify the following:

- You have administrator privileges for the FortiGate.
- The FortiGate is integrated into your network.
- The operation mode is configured.
- The system time, DNS settings, administrator password, and network interfaces are configured.
- Firmware, FortiGuard AntiVirus, FortiGuard Application Control, and FortiGuard IPS are up to date.

If you are using a FortiGate that has virtual domains (VDOMs) enabled, you can often troubleshoot within your own VDOM. However, you should inform the super_admin for the FortiGate that you will be performing troubleshooting tasks.

You may also need access to other networking equipment, such as switches, routers, and servers to carry out tests. If you do not have access to this equipment, contact your network administrator for assistance.

Establish a baseline

FortiGate operates at all layers of the OSI model. For this reason, troubleshooting can be complex. Establishing baseline parameters for your system before a problem occurs helps to reduce the complexity when you need to troubleshoot.

A best practice is to establish and record the normal operating status. Regular operation data shows trends, and allows you to see where changes occur when problems arise. You can gather this data by using logs and SNMP tools to monitor the system performance or by regularly running information gathering commands and saving the output.

You should back up your FortiOS configuration on a regular basis even when you are not troubleshooting. You can restore the backed up configuration as needed to save time recreating it from the factory default settings.

Use the following CLI commands to obtain normal operating data for a FortiGate:

`get system status`	Displays firmware versions and FortiGuard engine versions, and other system information.
`get system performance status`	Displays CPU and memory states, average network usage, average sessions and session setup rate, viruses caught, IPS attacks blocked, and uptime.
`get hardware memory`	Displays information about memory.

`get system session status`	Displays total number of sessions.
`get router info routing-table all`	Displays all the routes in the routing table, including their type, source, and other useful data.
`get ips session`	Displays memory used and maximum amount available to IPS as well as counts
`get webfilter ftgd-statistics`	Displays a list of FortiGuard related counts of status, errors, and other data.
`diagnose sys session list`	Displays the list of current detailed sessions.
`show sys dns`	Displays the configured DNS servers.
`diagnose sys ntp status`	Displays information about NTP servers.

You can run any commands that apply to your system for information gathering. For example, if you have active VPN connections, use the `get vpn` series of commands to get more information about them.

Use `execute tac report` to get an extensive snapshot of your system. This command runs many diagnostic commands for specific configurations. It also records the current state of each feature regardless of the features deployed on your FortiGate. If you need to troubleshoot later, you can run the same command again and compare the differences to identify any suspicious output.

Define the problem

The following questions are intended to compare the current behavior of the FortiGate with normal operations to help you define the problem. Be specific with your answers. After you define the problem, search for a solution in the troubleshooting scenarios section, and then create a plan to resolve it.

What is the problem?	The problem being observed may not be the actual problem. You should determine where the problem lies before starting to troubleshoot the FortiGate.
Was the device working before?	If the device never worked, it might be defective. For more information, see Troubleshooting your installation on page 84.
Can the problem be reproduced?	If the problem is intermittent, it may be dependent on system load. Intermittent problems are challenging to troubleshoot because they are difficult to reproduce.
What has changed?	Use the FortiGate event log to identify possible configuration changes. There may be changes in the operating environment. For example, there might be a gradual increase in load as more sites are forwarded through the firewall. If something has changed, roll back the change and assess the impact.
What is the scope of the problem?	After you isolate the problem, determine what applications, users, devices, and operating systems the problem affects. The following questions are intended to narrow the scope of the problem and identify what to check during troubleshooting. The more factors you can eliminate, the less you need to check. For this reason, be as specific and accurate as possible when gathering information. • What is not working?

	• Is more than one thing not working? • Is it partly working? If so, what parts are working? • Is it a connectivity issue for the entire device, or is there an application that isn't reaching the Internet? • Where did the problem occur? • When did the problem occur and to which users or groups of users? • What components are involved? • What applications are affected? • Can you use a packet sniffer to trace the problem? • Can you use system debugging or look in the session table to trace the problem? • Do any of the log files indicate a failure has occurred?

Create a troubleshooting plan

After you define the problem and its scope, develop a troubleshooting plan.

Create checklist	Make a list all the possible causes of the problem and how you can test for each cause. Create a checklist to keep track of what has been tried and what is left to test. Checklists are useful when more than one person is performing troubleshooting tasks.
Obtain the required equipment	Testing your solution may require additional networking equipment, computers, or other devices. Network administrators usually have additional networking equipment available to loan you, or a lab where you can bring the FortiGate unit to test. If you do not have access to equipment, check for shareware applications that can perform the same tasks. Often, there are software solutions you can use when hardware is too expensive.
Consult Fortinet troubleshooting resources	After the checklist is created, refer to the troubleshooting scenarios sections to assist with implementing your plan. See Troubleshooting scenarios on page 2836.
Gather information for technical support	If you still require technical assistance after the plan is implemented, be prepared to provide Fortinet technical support with following information: • Firmware build version (use the `get system status` command) • Network topology diagram • Recent configuration file • Recent debug log (optional) • Summary of troubleshooting steps you have taken and the results.  Do not provide the output from the `execute tac` report unless the support team requests it. The output from this command is very large and is not required in many cases.

Contact technical support	Before contacting technical support, ensure you have login access (preferably with full read/write privileges) to all networking devices that could be relevant to troubleshooting. If you are using VMs, be prepared to have someone who can log in to the virtual hosting platform in case it is necessary to check and possibly modify resource allocation. For information about contacting technical support, go to FortiCare Support Service page.

Troubleshooting scenarios

The following table is intended to help you diagnose common problems and provides links to the corresponding troubleshooting topics:

Problem	Probable cause	Recommended action
Hardware connections	• Are all of the cables and interfaces connected properly? • Is the LED for the interface green?	Checking the hardware connections on page 2838
FortiOS network settings	• If you are having problems connecting to the management interface, is your protocol enabled on the interface for administrative access? • Does the interface have an IP address?	Checking FortiOS network settings on page 2839
CPU and memory resources	• Is the CPU running at almost 100 percent usage? • Is your FortiGate running low on memory?	Troubleshooting CPU and network resources on page 2842
Modem status	• Is the modem connected? • Are there PPP issues?	Checking the modem status on page 2848
Ping and traceroute	Is the FortiGate experiencing complete packet loss?	Running ping and traceroute on page 2849
Logs	Do you need to identify a problem?	Checking the logs on page 2852
Contents of the routing table (in NAT mode)	• Are there routes in the routing table for default and static routes? • Do all connected subnets have a route in the routing table? • Does a route have a higher priority than it should?	Verifying routing table contents in NAT mode on page 2853
Traffic routes	Is the traffic routed correctly?	Verifying the correct route is being used on page 2854

Problem	Probable cause	Recommended action
Firewall policies	Is the correct firewall policy applied to the expected traffic?	Verifying the correct firewall policy is being used on page 2854
Bridging information in transparent mode	Are you having problems in transparent mode?	Checking the bridging information in transparent mode on page 2855
Firewall session list	• Are there active firewall sessions?	Using a session table on page 2865
Wireless Network	Is the wireless network working properly?	Checking wireless information on page 2856
FortiGuard connectivity	Is the FortiGate communicating properly with FortiGuard?	Verifying connectivity to FortiGuard on page 2877
Sniffer trace	• Is traffic entering the FortiGate? Does the traffic arrive on the expected interface? • Is the ARP resolution correct for the next-hop destination? • Is the traffic exiting the FortiGate to the destination as expected? • Is the FortiGate sending traffic back to the originator?	Performing a sniffer trace or packet capture on page 2857
Packet flow	Is traffic entering or leaving the FortiGate as expected?	Debugging the packet flow on page 2858

Checking the system date and time

The system date and time are important for FortiGuard services, logging events, and sending alerts. The wrong time makes the log entries confusing and difficult to use.

When possible, use Network Time Protocol (NTP) to set the date and time. This is an automatic method that does not require manual intervention. However, you must ensure that the port is allowed through the firewalls on your network. FortiToken synchronization requires NTP in many situations.

For information about setting the system date and time, see Setting the system time on page 2089.

To view and configure the date and time in the GUI:

1. Go to *Dashboard* > *Status*. The date and time are displayed in the *System Information* widget, next to *System Time*.
2. Go to *System* > *Settings*.
3. In the *System Time* section, select *NTP*, and then configure the *Time Zone*, and *Set Time* settings as required.

To view the date and time in the CLI:

```
execute date
execute time
```

To configure the date and time in the CLI:

Use the `set timezone ?` command to display a list of timezones and the integers that represent them.

```
config system global
   set timezone <integer>
end
config system ntp
   set type custom
      config ntpserver
         edit 1
            set server "ntp1.fortinet.net"
         next
         edit 2
            set server "ntp2.fortinet.net"
         next
      end
   set ntpsync enable
   set syncinterval 60
end
```

Checking the hardware connections

If traffic is not flowing from the FortiGate, there may be a problem with the hardware connection.

To check hardware connections:

1. Ensure the network cables are plugged into the interfaces.
2. Verify the LED connection lights for the network cables indicate there is a connection. The lights are typically green when there is a connection.
3. Change the cable when:
   - The cable or its connector are damaged.
   - You are unsure of the type or quality of the cable, such as straight through or crossover.
   - You see exposed wires at the connector.
4. Connect the FortiGate to different hardware.
5. Go to *Network* > *Interfaces* to ensure the link status for the interface is set to *Up*.
   The link status is based on the physical connection and cannot be set in FortiOS.

To enable an interface in the GUI:

You should still perform basic software connectivity tests to ensure complete connectivity even if there was a problem with the hardware connection. The interface might also be disabled, or its *Status* might be set to *Down*. See Interfaces on page 146.

1. Go to *Network* > *Interfaces*.
2. Select an interface, such as *Port1*, and click *Edit*.
3. In the *Miscellaneous* area, next to *Status*, click *Enabled*.
4. Click *OK*.

To enable an interface in the CLI:

```
config system interface
```

```
    edit port1
      set status up
    next
end
```

Checking FortiOS network settings

Check the FortiOS network settings if you have problems connecting to the management interface. FortiOS network settings include, interface settings, DNS Settings, and DHCP settings.

Interface settings

If you can access the FortiGate with the management cable only, you can view the interface settings in the GUI.

To view the interface settings in the GUI:

1. Go to *Network* > *Interfaces*.
2. Select an interface and click *Edit*.
3. Check the following interfaces to ensure they are not blocking traffic.

Setting	Description
Link Status	The status is *Up* when a valid cable is plugged in. The status is *Down* when an invalid cable is plugged in. The Link Status is shown physically by the connection LED for the interface. If the LED is green, the connection is good. If Link Status is *Down*, the interface does not work. Link status also appears in the *Network* > *Interfaces* page by default.
Addressing mode	Do not use *DHCP* if you do not have a DHCP server. You will not be able to log into an interface in DHCP mode as it will not have an IP address.
IP/Network Mask	An interface requires an IP address to connect to other devices. Ensure there is a valid IP address in this field. The one exception is when *DHCP* is enabled for this interface to get its IP address from an external DHCP server.
IPv6 address	The same protocol must be used by both ends to complete the connection. Ensure this interface and the remote connection are both using IPv4 or both are using IPv6 addresses.
Administrative access	If no protocols are selected, you will have to use the local management cable to connect to the unit. If you are using IPv6, configure the IPv6 administrative access protocols.
Status	Ensure the status is set to *Up* or the interface will not work.

To display the internal interface settings in the CLI:

```
FGT# show system interface <interface_name>
```

To view the list of possible interface settings:

```
config system interface
   edit <interface_name>
      get
end
```

DNS settings

To view DNS settings in the GUI:

Go to *Network* > *DNS*.

You can trace many networking problems back to DNS issues. Check the following items:

1. Are there values for both the *Primary DNS server* and *Secondary DNS server* fields.
2. Is the *Local Domain Name* correct?
3. Are you using IPv6 addressing? If so, are the IPv6 DNS settings correct?
4. Are you using Dynamic DNS (DDNS)? If so, is it using the correct server, credentials, and interface?
5. Can you contact both DNS servers to verify the servers are operational?
6. If an interface addressing mode is set to DHCP and is set to override the internal DNS, is that interface receiving a valid DNS entry from the DHCP server? Is it a reasonable address and can it be contacted to verify it is operational?
7. Are there any DENY security policies that need to allow DNS?
8. Can any internal device perform a successful traceroute to a location using the FQDN?

DHCP server settings

DHCP servers are common on internal and wireless networks. The DHCP server will cause problems if it is not configured correctly.

To view DHCP server settings in the GUI:

1. Go to *Network* > *Interfaces*.
2. Select an interface, and click *Edit*.

Check the following items:

1. Is the DHCP server enabled?
2. Is the DHCP server entry set to *Relay*? If so, verify there is another DHCP server to which requests can be relayed. Otherwise, set it to *Server*.
3. Does the DHCP server use a valid IP address range? Are other devices using the addresses? If one or more devices are using IP addresses in this range, you can use the IP reservation feature to ensure the DHCP server does not use these addresses. See DHCP servers and relays on page 325
4. Is there a gateway entry? If not, add a gateway entry to ensure that the server's clients have a default route.
5. Is the system DNS setting being used? A best practice is to avoid confusion by using the system DNS whenever possible. However, you can specify up to three custom DNS servers, and you should use all three entries for redundancy.

There are some situations, such as a new wireless interface, or during the initial FortiGate configuration, where interfaces override the system DNS entries. When this happens, it often shows up as intermittent Internet connectivity.

To fix the problem, go to *Network* > *DNS*, and enable *Use FortiGuard Servers*.

Checking CPU and memory resources

Check the CPU and memory resources when the FortiGate is not working, the network is slow, or there is a reduced firewall session setup rate. All processes share the system resources in FortiOS, including CPU and memory.

To view system resources in the GUI:

Go to *Dashboard* > *Status*. The resource information is located in the *CPU* and *Memory* widgets. For information, see Dashboards and Monitors on page 87.

To view system resources in the CLI:

```
# get system performance status
```

Sample output:

```
# get system performance status
CPU states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU0 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU1 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU2 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU3 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
Memory: 2039608k total, 1154872k used (56.6%), 571856k free (28.0%), 312880k freeable
(15.4%)
Average network usage: 0 / 0 kbps in 1 minute, 1 / 9 kbps in 10 minutes, 2 / 45 kbps in 30
minutes
Maximal network usage: 1 / 0 kbps in 1 minute, 36 / 1630 kbps in 10 minutes, 655 / 6758 kbps
in 30 minutes
Average sessions: 7 sessions in 1 minute, 7 sessions in 10 minutes, 6 sessions in 30 minutes
Maximal sessions: 9 sessions in 1 minute, 13 sessions in 10 minutes, 36 sessions in 30
minutes
Average session setup rate: 0 sessions per second in last 1 minute, 0 sessions per second in
last 10 minutes, 0 sessions per second in last 30 minutes
Maximal session setup rate: 0 sessions per second in last 1 minute, 5 sessions per second in
last 10 minutes, 14 sessions per second in last 30 minutes
Average NPU sessions: 0 sessions in last 1 minute, 0 sessions in last 10 minutes, 0 sessions
in last 30 minutes
Maximal NPU sessions: 0 sessions in last 1 minute, 0 sessions in last 10 minutes, 0 sessions
in last 30 minutes
Virus caught: 0 total in 1 minute
IPS attacks blocked: 0 total in 1 minute
Uptime: 9 days, 0 hours, 38 minutes
```

- The first lines of the output show the CPU usage by category for each CPU core:

  ```
  CPU states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
  CPU0 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
  ```

```
CPU1 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU2 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU3 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
```

- The next line of the output shows the memory usage:

  ```
  Memory: 2039608k total, 1154872k used (56.6%), 571856k free (28.0%), 312880k freeable
  (15.4%)
  ```

  Memory usage should not exceed 90%. Using too much memory prevents some processes from functioning properly. For example, if the system is running low on memory, antivirus scanning enters into *failopen* mode where it drops connections or bypasses the antivirus system.
- Network usage, session, session setup rate, and NPU sessions are shown next, summarizing the network and session usage. Samples are taken every three seconds. The `Average` values are the average of all of the samples taken during the sample period (1, 10, 30 minutes, and so on). The `Maximal` values are the maximum values recorded during the sample period.
- For example, a high `average network usage` may indicate high traffic processing on the FortiGate, while a very low or zero `average session setup rate` may indicate the proxy is overloaded and unable to function.
- The `viruses caught` and `IPS attacks blocked` lines help determine why system resource usage is high.

Troubleshooting CPU and network resources

FortiGate has stopped working

If the FortiGate has stopped working, the first line of the output will look similar to this:

```
CPU states: 0% user 0% system 0% nice 100% idle
```

Network is slow

If your network is running slow, the first line of the output will look similar to this:

```
CPU states: 1% user 98% system 0% nice 1% idle
```

This example shows that all of the CPU is being used by system processes, and the FortiGate is overloaded. When overloading occurs, it is possible a process such as `scanunitid` is using all the resources to scan traffic. In this case you need to reduce the amount of traffic being scanned by blocking unwanted protocols, configuring more security policies to limit scanning to certain protocols, or similar actions.

It is also possible a hacker has accessed your network and is overloading it with malicious activity, such as running a spam server or using zombie PCs to attack other networks on the Internet.

You can use the following commands to investigate the problem with the CPU:

```
# get system performance top <delay> <lines>
```

```
# diagnose sys top <delay> <lines> <repeat>
```

These commands show all of the top processes that are running on the FortiGate and their CPU usage; the process names are on the left. If a process is using most of the CPU cycles, investigate it to determine whether that activity is normal.

Reduced firewall session setup rate

A reduced firewall session setup rate can be caused by a lack of system resources on the FortiGate, or reaching the session count limit for a VDOM.

As a best practice, administrators should record the session setup rate during normal operation to establish a baseline to help define a problem when your are troubleshooting.

The session setup rate appears in the `average sessions` section of the output.

A reduced firewall session setup rate will look similar to this:

```
Average sessions: 80 sessions in 1 minute, 30 sessions in 10 minutes, 42 sessions in 30
minutes
Average session setup rate: 3 sessions per second in last 1 minute, 0 sessions per second in
last 10 minutes, 0 sessions per second in last 30 minutes
```

In the example above, there were 80 sessions in 1 minute, or an average of 3 sessions per second.

The values for `10 minutes` and `30 minutes` allow you to take a longer average for a more reliable value if your FortiGate is working at maximum capacity. The smallest FortiGate can have 1,000 sessions established per second across the unit.

The session setup rate is a global command. If you have multiple VDOMs configured with many sessions in each VDOM, the session setup rate per VDOM will be slower than if there are no VDOMs configured.

High memory usage

As with any system, a FortiGate has limited hardware resources, such as memory, and all processes running on the FortiGate share the memory. Each process uses more or less memory, depending on its workload. For example, a process usually uses more memory in high traffic situations. If some processes use all of the available memory, other processes will not be able to run.

When high memory usage occurs, the services may freeze up, connections may be lost, or new connections may be refused.

If you see high memory usage in the *Memory* widget, the FotiGate may be handling high traffic volumes. Alternatively, the FortiGate may have problems with connection pool limits that are affecting a single proxy. If the FortiGate receives large volumes of traffic on a specific proxy, the unit may exceed the connection pool limit. If the number of free connections within a proxy connection pool reaches zero, issues may occur.

To view current memory usage information in the CLI:

```
# diagnose hardware sysinfo memory
```

Sample output:

```
# diagnose hardware sysinfo memory
MemTotal:        3075676 kB
MemFree:         1067428 kB
MemAvailable:    1490772 kB
```

```

Troubleshooting high CPU usage

Connection-related problems may occur when FortiGate's CPU resources are over extended. This occurs when you deploy too many FortiOS features at the same time.

Examples of CPU intensive features:

- VPN high-level encryption
- Intensive scanning of all traffic
- Logging all traffic and packets
- Dashboard widgets that frequently perform data updates

For information on customizing the CPU use threshold, see Execute a CLI script based on CPU and memory thresholds on page 2589.

Determining the current level of CPU usage

You can view CPU usage levels in the GUI or CLI. For precise usage values for both overall usage and specific processes, use the CLI.

To view CPU usage in the GUI:

Go to *Dashboard* > *Status*. Real-time CPU usage information is located in the *CPU* widget.

To view CPU usage in the CLI:

- Show top processes information:
  ```
  diagnose sys top
  ```
- Show top threads information:
  ```
  diagnose sys top-all
  ```

Sample output:

```
Run Time: 86 days, 0 hours and 10 minutes
0U, 0N, 0S, 100I, 0WA, 0HI, 0SI, 0ST; 3040T, 2437F
     bcm.user 93 S < 3.1 0.4
     httpsd 18922 S 1.5 0.5
     httpsd 19150 S 0.3 0.5
     newcli 20195 R 0.1 0.1
     cmdbsvr 115 S 0.0 0.8
     pyfcgid 20107 S 0.0 0.6
     forticron 146 S 0.0 0.5
     httpsd 139 S 0.0 0.5
     cw_acd 166 S 0.0 0.5
     miglogd 136 S 0.0 0.5
     pyfcgid 20110 S 0.0 0.4
     pyfcgid 20111 S 0.0 0.4
     pyfcgid 20109 S 0.0 0.4
     httpsd 20192 S 0.0 0.4
     miglogd 174 S 0.0 0.4
     miglogd 175 S 0.0 0.4
     fgfmd 165 S 0.0 0.3
     newcli 20191 S 0.0 0.3
     initXXXXXXXXXXX 1 S 0.0 0.3
     httpsd 184 s 0.0 0.3
```

The following table explains the codes in the second line of the output:

Code	Description
U	Percentage of user space applications that are currently using the CPU
N	Percentage of time that the CPU spent on low priority processes since the last shutdown
S	Percentage of system processes (or kernel processes) that are using the CPU
I	Percentage of idle CPU resources
WA	Percentage of time that the CPU spent waiting on IO peripherals since the last shutdown
HI	Percentage of time that the CPU spent handling hardware interrupt routines since the last shutdown
SI	Percentage of time that the CPU spent handling software interrupt routines since the last shutdown
ST	Steal time: Percentage of time a virtual CPU waits for the physical CPU when the hypervisor is servicing another virtual processor
T	Total FortiOS system memory in MB
F	Free memory in MB

Each additional line of the command output displays information specific to processes or threads that are running on the FortiGate unit. For example, the sixth line of the output is: `newcli 20195 R 0.1 0.1`

The following table describes the data in the sixth line of the output:

Item	Description
newcli	The process (or thread) name. Duplicate process or thread names indicate that separate instances of that process or thread are running.
20195	The process or thread ID, which can be any number.
R	Current state of the process or thread. The process or thread state can be: • R - running • S - sleep • Z - zombie • D- disk sleep
0.1	The percentage of CPU capacity that the process or thread is using. CPU usage can range from 0.0 for a process or thread that is sleeping to higher values for a process or thread that's taking a lot of CPU time.
0.1	The amount of memory that the process or thread is using. Memory usage can range from 0.1 to 5.5 and higher.

You can use the following single-key commands when running `diagnose sys top` or `diagnose sys top-all`:

- `q` to quit and return to the normal CLI prompt.
- `p` to sort the processes by the amount of CPU that the processes are using.
- `m` to sort the processes by the amount of memory that the processes are using.

The output only displays the top processes or threads that are running. For example, if 20 are listed, they are the top 20 currently running, sorted by either CPU or memory usage. You can configure the number of processes or threads displayed, using the following CLI commands:

```
diagnose sys top <integer_seconds> <integer_maximum_lines>
diagnose sys top-all <integer_seconds> <integer_maximum_lines>
```

Where:

- `<integer_seconds>` is the delay in seconds (default is 5)
- `<integer_maximum_lines>` is the maximum number of lines (or processes) to list (default is 20)

Determining which features are using the most CPU resources

You can use the CLI to view the top few processes that are currently running and using the most CPU resources.

To view processes using the most CPU resources:

```
get system performance top
```

The entries at the top are using the most CPU resources. The second column from the right shows CPU usage by percentage. Note which processes are using the most resources and try to reduce their CPU load.

Processes you will see include:

- `ipsengine`: the IPS engine that scans traffic for intrusions
- `scanunitd`: antivirus scanner
- `httpsd`: secure HTTP
- `iked`: internet key exchange (IKE) in use with IPsec VPN tunnels
- `newcli`: active whenever you're accessing the CLI
- `sshd`: there are active secure socket connections
- `cmdbsrv`: the command database server application

Go to the features that are at the top of the list and look for evidence of CPU overuse. Generally, the monitor for a feature is a good place to start.

Checking for unnecessary CPU “wasters”

These are some best practices that will reduce your CPU usage, even if the FortiGate is not experiencing high CPU usage. Note that if the following information instructs you to turn off a feature that you require, disregard that part of the instructions.

- Use hardware acceleration wherever possible to offload tasks from the CPU. Offloading tasks, such as encryption, frees up the CPU for other tasks.
- Schedule antivirus, IPS, and firmware updates during off-peak hours. These updates do not usually consume CPU resources but they can disrupt normal operation.
- Check the log levels and which events are being logged. This is the severity of the messages that are recorded. Consider going up one level to reduce the amount of logging. Also, if there are events you do not need to monitor, remove them from the list.
- Log to FortiCloud instead of logging to memory or disk. Logging to memory quickly uses up resources and logging to local disk impacts overall performance and reduces the lifetime of the unit.
  Fortinet recommends logging to FortiCloud to avoid using too much CPU.

- If the disk is almost full, transfer the logs or data off the disk to free up space. When a disk is almost full it consumes a lot of resources to find free space and organize the files.
- If packet logging is enabled on the FortiGate, consider disabling it. When packet logging is enabled, it records every packet that comes through that policy.
- Halt all sniffers and traces.
- Ensure the FortiGate isn't scanning traffic twice. Traffic does not need to be rescanned if it enters the FortiGate on one interface, goes out another, and then comes back in again. Doing so is a waste of resources. However, ensure that traffic truly is being scanned once.
- Reduce the session timers to close unused sessions faster. Enter the following CLI commands, which reduce the default values. Note that, by default, the system adds 10 seconds to `tcp-timewait`.

```
config system global
   set tcp-halfclose-timer 30
   set tcp-halfopen-timer 30
   set tcp-timewait-timer 0
   set udp-idle-timer 60
end
```

- Go to *System* > *Feature Visibility*, and enable only features that you need.

SNMP monitoring

When CPU usage is under control, use SNMP to monitor CPU usage. Alternatively, use logging to record CPU and memory usage every 5 minutes.

Once the system is back to normal, you should set up a warning system that sends alerts when CPU resources are used excessively. A common method to do this is using SNMP. SNMP monitors many values in FortiOS and allows you to set high water marks that generate events. You can run an application on your computer to watch for and record these events.

To enable SNMP:

1. Go to *System* > *SNMP*.
2. Configure an SNMP community.

See SNMP on page 2282.

You can use the *System Resources* widget to record CPU usage if SNMP is too complicated. However, the widget only records problems as they happen and will not send you alerts for problems.

Checking the modem status

You can use the CLI to troubleshoot a modem that is not working properly, or troubleshoot a FortiGate that does not detect the modem.

To diagnose modem issues in the CLI:

```
diagnose sys modem {cmd | com | detect | history | external-modem | query| reset}
```

You should always run the following command after you connect a USB modem to FortiGate:

```
diagnose sys modem detect
```

Use the following command to view the modem's configuration, vendor and custom product identification number:

```
get system modem
```

Use the following commands to resolve connectivity issues:

- `diagnose debug enable`: Activates the debug on the console
- `diagnose debug application modemd`: Dumps communication between the modem and the unit.
- `diagnose debug application ppp`: Dumps the PPP negotiating messages.
- `execute modem dial`: Displays modem debug output.

The modem diagnose output should not contain errors when initializing. You should also verify the number used to dial into your ISP.

Running ping and traceroute

Ping and traceroute are useful tools in network troubleshooting. Alone, either tool can determine network connectivity between two points. However, ping can be used to generate simple network traffic that you can view using `diagnose` commands in FortiGate. This combination can be very powerful when you are trying to locate network problems.

Ping and traceroute can also tell you if your computer or network device has access to a domain name server (DNS). Both tools can use IP addresses or device domain names to determine why particular services, such as email or web browsing, may not work properly.

If ping does not work, it may be disabled on at least one of the interface settings and security policies for that interface.

Both ping and traceroute require particular ports to be open on firewalls to function. Since you typically use these tools to troubleshoot, you can allow them in the security policies and on interfaces only when you need them. Otherwise, keep the ports disabled for added security.

Ping

The ping command sends a very small packet to a destination, and waits for a response. The response has a timer that expires when the destination is unreachable.

Ping is part of layer 3 on the OSI Networking Model. Ping sends Internet Control Message Protocol (ICMP) “echo request” packets to the destination, and listens for “echo response” packets in reply. However, many public networks block ICMP packets because ping can be used in a denial of service (DoS) attack (such as Ping of Death or a smurf attack), or by an attacker to find active locations on the network. By default, FortiGate units have ping enabled while broadcast-forward is disabled on the external interface.

What ping can tell you

Beyond the basic connectivity information, ping can tell you the amount of packet loss (if any), how long it takes the packet to make the round trip, and the variation in that time from packet to packet.

If packet loss is detected, you should investigate the following:

- Possible ECMP, split horizon, or network loops.
- Cabling, to ensure there are no loose connections.

- Verify which security policy was used. To do this:
  Go *to Policy & Objects* > *Firewall Policy* and view the packet count column.

If there is total packet loss, you should investigate the following:

1. Ensure cabling is correct, and all equipment between the two locations is accounted for.
2. Ensure all IP addresses and routing information along the route is configured as expected.
3. Ensure all firewalls, including FortiGate security policies allow PING to pass through.

How to use ping

Ping syntax is the same for nearly every type of system on a network.

To ping from a FortiGate unit:

1. Go to *Dashboad*, and connect to the CLI through either telnet or the CLI widget.
2. Enter `execute ping 10.11.101.101` to send 5 ping packets to the destination IP address. There are no options for this command.

```
Head_Office_620b # execute ping 10.11.101.101
PING 10.11.101.101 (10.11.101.101): 56 data bytes
64 bytes from 10.11.101.101: icmp_seq=0 ttl=255 time=0.3 ms
64 bytes from 10.11.101.101: icmp_seq=1 ttl=255 time=0.2 ms
64 bytes from 10.11.101.101: icmp_seq=2 ttl=255 time=0.2 ms
64 bytes from 10.11.101.101: icmp_seq=3 ttl=255 time=0.2 ms
64 bytes from 10.11.101.101: icmp_seq=4 ttl=255 time=0.2 ms

--- 10.11.101.101 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 0.2/0.2/0.3 ms
```

To ping from a Microsoft Windows PC:

1. Open a command window.
2. Enter `ping 10.11.101.100` to ping the default internal interface of the FortiGate with four packets.
   Other options include:
   - `-t` to send packets until you press `Ctrl+C`
   - `-a` to resolve addresses to domain names where possible
   - `-n X` to send X ping packets and stop

```
C:\>ping 10.11.101.101

Pinging 10.11.101.101 with 32 bytes of data:
Reply from 10.11.101.101: bytes=32 time=10ms TTL=255
Reply from 10.11.101.101: bytes=32 time<1ms TTL=255
Reply from 10.11.101.101: bytes=32 time=1ms TTL=255
Reply from 10.11.101.101: bytes=32 time=1ms TTL=255

Ping statistics for 10.11.101.101:
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
Minimum = 0ms, Maximum = 10ms, Average = 3ms
```

To ping from a Linux PC:

1. Go to a shell prompt.
2. Enter "`ping 10.11.101.101`".

Traceroute

Where ping will only tell you if it reached its destination and returned successfully, traceroute shows each step of the journey to its destination and how long each step takes. If ping finds an outage between two points, you can use traceroute to locate exactly where the problem is.

Traceroute works by sending ICMP packets to test each hop along the route. It sends three packets, and then increases the time to live (TTL) setting by one each time. This effectively allows the packets to go one hop farther along the route. This is why most traceroute commands display their maximum hop count before they start tracing the route, which is the maximum number of steps it takes before it declares the destination unreachable. Also, the TTL setting may result in steps along the route timing out due to slow responses. There are many possible reasons for this to occur.

By default, traceroute uses UDP datagrams with destination ports numbered from 33434 to 33534. The traceroute utility may also offer the option to select use of ICMP echo request (type 8) instead, which the Windows tracert utility uses. If you must, allow both protocols inbound through the FortiGate security policies (UDP with ports from 33434 to 33534 and ICMP type 8).

To track traceroute packets in the GUI:

Go to *Policy & Objects* > *Firewall Policy* and view the packet count column.

This allows you to verify the connection and confirm which security policy the traceroute packets are using.

What traceroute can tell you

Both ping and traceroute verify connectivity between two points. However, only traceroute shows you each step in the connection path. Also, ping and traceroute use different protocols and ports, so one may succeed where the other fails.

You can verify your DNS connection using traceroute. If you enter an FQDN instead of an IP address for the traceroute, DNS tries to resolve that domain name. If the name isn't resolved, you have DNS issues.

Using traceroute

The traceroute command varies slightly between operating systems. In Microsoft Windows, the command name is shortened to "`tracert`". Also, your output lists different domain names and IP addresses along your route.

To use traceroute on a Microsoft Windows PC:

1. Open a command window.
2. Enter `tracert fortinet.com` to trace the route from the PC to the Fortinet web site.

```
C:\>tracert fortinet.com
Tracing route to fortinet.com [208.70.202.225]
over a maximum of 30 hops:
1 <1 ms <1 ms <1 ms 172.20.120.2
2 66 ms 24 ms 31 ms 209-87-254-xxx.storm.ca [209.87.254.221]
3 52 ms 22 ms 18 ms core-2-g0-0-1104.storm.ca [209.87.239.129]
4 43 ms 36 ms 27 ms core-3-g0-0-1185.storm.ca [209.87.239.222]
5 46 ms 21 ms 16 ms te3-x.1156.mpd01.cogentco.com [38.104.158.69]
```

```
6 25 ms 45 ms 53 ms te8-7.mpd01.cogentco.com [154.54.27.249]
7 89 ms 70 ms 36 ms te3-x.mpd01.cogentco.com [154.54.6.206]
8 55 ms 77 ms 58 ms sl-st30-chi-.sprintlink.net [144.232.9.69]
9 53 ms 58 ms 46 ms sl-0-3-3-x.sprintlink.net [144.232.19.181]
10 82 ms 90 ms 75 ms sl-x-12-0-1.sprintlink.net [144.232.20.61]
11 122 ms 123 ms 132 ms sl-0-x-0-3.sprintlink.net [144.232.18.150]
12 129 ms 119 ms 139 ms 144.232.20.7
13 172 ms 164 ms 243 ms sl-321313-0.sprintlink.net [144.223.243.58]
14 99 ms 94 ms 93 ms 203.78.181.18
15 108 ms 102 ms 89 ms 203.78.176.2
16 98 ms 95 ms 97 ms 208.70.202.225
```

The first column on the left is the hop count, which cannot exceed 30 hops. When that number is reached, the traceroute ends.

The second, third, and fourth columns display how much time each of the three packets takes to reach this stage of the route. These values are in milliseconds and normally vary quite a bit. Typically a value of `<1ms` indicates a local connection.

The fifth column (farthest to the right) shows the domain name of the device and its IP address, or possibly only the IP address.

To perform a traceroute on a Linux PC:

1. Go to a command line prompt.
2. Enter "`traceroute fortinet.com`".
   The Linux traceroute output is very similar to the Windows `tracert` output.

To trace a route from a FortiGate to a destination IP address in the CLI:

```
# execute traceroute www.fortinet.com

traceroute to www.fortinet.com (66.171.121.34), 32 hops max, 84 byte packets
1 172.20.120.2 0.637 ms 0.653 ms 0.279 ms
2 209.87.254.221 <static-209-87-254-221.storm.ca> 2.448 ms 2.519 ms 2.458 ms
3 209.87.239.129 <core-2-g0-2.storm.ca> 2.917 ms 2.828 ms 9.324 ms
4 209.87.239.199 <core-3-bdi1739.storm.ca> 13.248 ms 12.401 ms 13.009 ms
5 216.66.41.113 <v502.core1.tor1.he.net> 17.181 ms 12.422 ms 12.268 ms
6 184.105.80.9 <100ge1-2.core1.nyc4.he.net> 21.355 ms 21.518 ms 21.597 ms
7 198.32.118.41 <ny-paix-gni.twgate.net> 83.297 ms 84.416 ms 83.782 ms
8 203.160.228.217 <217-228-160-203.TWGATE-IP.twgate.net> 82.579 ms 82.187 ms 82.066 ms
9 203.160.228.229 <229-228-160-203.TWGATE-IP.twgate.net> 82.055 ms 82.455 ms 81.808 ms
10 203.78.181.2 82.262 ms 81.572 ms 82.015 ms
11 203.78.186.70 83.283 ms 83.243 ms 83.293 ms
12 66.171.127.177 84.030 ms 84.229 ms 83.550 ms
13 66.171.121.34 <www.fortinet.com> 84.023 ms 83.903 ms 84.032 ms
14 66.171.121.34 <www.fortinet.com> 83.874 ms 84.084 ms 83.810 ms
```

Checking the logs

A log message records the traffic passing through FortiGate to your network and the action FortiGate takes when it scans the traffic. You should log as much information as possible when you first configure FortiOS. If FortiGate logs are too large, you can turn off or scale back the logging for features that are not in use.

It is difficult to troubleshoot logs without a baseline. Before you can determine if the logs indicate a problem, you need to know what logs result from normal operation.

When troubleshooting with log files

- Compare current logs to a recorded baseline of normal operation.
- If you need to, increase the level of logging (such as from Warning to Information) to obtain more information. When increasing logging levels, ensure that you configure email alerts and select both disk usage and log quota. This ensures that you will be notified if the increase in logging causes problems.

To configure the log settings in the GUI:

Go to *Log & Report* > *Log Settings*.

Determine the activities that generate the most log entries:

- Check all logs to ensure important information is not overlooked.
- Filter or order log entries based on different fields, such as level, service, or IP address, to look for patterns that may indicate a specific problem, such as frequent blocked connections on a specific port for all IP addresses.

Logs can help identify and locate any problems, but they do not solve them. The purpose of logs is to speed up your problem solving and save you time and effort.

For more information about logging and log reports, see Log and Report on page 2732.

Verifying routing table contents in NAT mode

Verify the contents of the routing table when a FortiGate has limited or no connectivity.

The routing table stores the routes currently in use for both static and dynamic protocols. Storing a route in the routing table saves time and resources performing a lookup. To ensure the most recently used routes remain in the table, old routes are bumped to make room for new ones. You cannot perform this task when FortiGate is in transparent mode.

If FortiGate is running in NAT mode, verify that all desired routes are in the routing table, including local subnets, default routes, specific static routes, and dynamic routing protocols.

To view the routing table in the CLI:

```
get router info routing-table all
```

Sample output:

```
FGT# get router info routing-table all
Codes:
   K - kernel, C - connected, S - static, R - RIP, B - BGP
   O - OSPF, IA - OSPF inter area
   N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
   E1 - OSPF external type 1, E2 - OSPF external type 2
   i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
   * - candidate default
S* 0.0.0.0/0 [10/0] via 172.20.120.2, wan1
C 10.31.101.0/24 is directly connected, internal
C 172.20.120.0/24 is directly connected, wan1
```

Verifying the correct route is being used

Run a trace route from a machine in the local area network (LAN) to ensure traffic is flowing as expected through the correct route when there is more than one default route.

In the following example output:

- The first hop contains the IP address `10.10.1.99`, which is the internal interface of the FortiGate.
- The second hop contains the IP address `172.20.120.2`, to which the wan1 interface of the FortiGate is connected.

This means the route through the wan1 interface is being used for this traffic.

```
C:\>tracert www.fortinet.com
Tracing route to www.fortinet.com [66.171.121.34]
over a maximum of 30 hops:
1 <1 ms <1 ms <1 ms 10.10.1.99
2 1 ms <1 ms <1 ms 172.20.120.2
3 3 ms 3 ms 3 ms static-209-87-254-221.storm.ca [209.87.254.221]
4 3 ms 3 ms 3 ms core-2-g0-2.storm.ca [209.87.239.129]
5 13 ms 13 ms 13 ms core-3-bdi1739.storm.ca [209.87.239.199]
6 12 ms 19 ms 11 ms v502.core1.tor1.he.net [216.66.41.113]
7 22 ms 22 ms 21 ms 100ge1-2.core1.nyc4.he.net [184.105.80.9]
8 84 ms 84 ms 84 ms ny-paix-gni.twgate.net [198.32.118.41]
9 82 ms 84 ms 82 ms 217-228-160-203.TWGATE-IP.twgate.net [203.160.22
8.217]
10 82 ms 81 ms 82 ms 229-228-160-203.TWGATE-IP.twgate.net [203.160.22
8.229]
11 82 ms 82 ms 82 ms 203.78.181.2
12 84 ms 83 ms 83 ms 203.78.186.70
13 84 ms * 85 ms 66.171.127.177
14 84 ms 84 ms 84 ms fortinet.com [66.171.121.34]
15 84 ms 84 ms 83 ms fortinet.com [66.171.121.34]
```

You can also see the route taken for each session by debugging the packet flow in the CLI. For more information, see Debugging the packet flow on page 2858.

Verifying the correct firewall policy is being used

If you have more than one firewall policy, you can check which policy is being used in the *Policy & Objects* module in the GUI.

To verify the firewall policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Look in the *Count* column to see which policy is being used. The count must show traffic increasing.

Debugging the packet flow in the CLI shows the policy ID that's allowing the traffic. For information, see Debugging the packet flow on page 2858.

Checking the bridging information in transparent mode

Checking the bridging information is useful when you are experiencing connectivity problems. When FortiGate is set to transparent mode, it acts like a bridge and sends all incoming traffic out on the other interfaces. Each bridge is a link between interfaces.

When traffic is flowing between the interfaces, you can see the bridges listed in the CLI. If no bridges are listed, this is the likely cause of the connectivity issue. When investigating bridging information, check for the MAC address of the interface or device in question.

How to check the bridging information

To view the list of bridge instances in the CLI:

```
diagnose netlink brctl list
```

Sample output:

```
#diagnose netlink brctl list
list bridge information
1. root.b fdb: size=256 used=6 num=7 depth=2 simple=no
Total 1 bridges
```

How to display forwarding domain information

You can use forwarding domains, or collision domains, in routing to limit where packets are forwarded on the network. Layer 2 broadcasts are limited to the same group. By default, all interfaces are in group 0. For example, if the FortiGate has 12 interfaces, only two may be in the same forwarding domain, which limits packets that are broadcast to those two interfaces. This reduces traffic on the rest of the network.

Collision domains prevent the forwarding of ARP packets to all VLANs on an interface. Without collision domains, duplicate MAC addresses on VLANs may cause ARP packets to be duplicated. Duplicate ARP packets can cause some switches to reset. It's important to know what interfaces are part of which forwarding domains because this determines which interfaces can communicate with each other.

To manually configure forwarding domains in transparent mode in the CLI:

```
config system interface
   edit <interface_name>
      set forward-domain <integer>
   end
```

To display the forward domains information in the CLI:

```
diagnose netlink brctl domain <name> <id>
```

Where `<name>` is the name of the forwarding domain to display and `<id>` is the domain ID.

Sample output:

```
diagnose netlink brctl domain ione 101
show bridge root.b ione forward domain.
```

```
id=101 dev=trunk_1 6
```

To list the existing bridge MAC table in the CLI:

```
diagnose netlink brctl name host <name>
```

Sample output:

```
show bridge control interface root.b host.
fdb: size=256, used=6, num=7, depth=2, simple=no
Bridge root.b host table
```

port no	device	devname	mac addr	ttl	attributes
2	7	wan2	02:09:0f:78:69:00	0	Local Static
5	6	vlan_1	02:09:0f:78:69:01	0	Local Static
3	8	dmz	02:09:0f:78:69:01	0	Local Static
4	9	internal	02:09:0f:78:69:02	0	Local Static
3	8	dmz	00:80:c8:39:87:5a	194	
4	9	internal	02:09:0f:78:67:68	8	
1	3	wan1	00:09:0f:78:69:fe	0	Local Static

To list the existing bridge port list in the CLI:

```
diagnose netlink brctl name port <name>
```

Sample output:

```
show bridge root.b data port.
trunk_1 peer_dev=0
internal peer_dev=0
dmz peer_dev=0
wan2 peer_dev=0
wan1 peer_dev=0
```

Checking wireless information

Check wireless connections, stations, and interfaces when the problem is not caused by a physical interface.

Troubleshooting station connection issues

To check if a station entry is created on access control in the CLI:

```
FG600B3909600253 # diagnose wireless-controller wlac -d sta
* vf=0 wtp=70 rId=2 wlan=open ip=0.0.0.0 mac=00:09:0f:db:c4:03 rssi=0 idle=148 bw=0 use=2
vf=0 wtp=70 rId=2 wlan=open ip=172.30.32.122 mac=00:25:9c:e0:47:88 rssi=-40 idle=0 bw=9
     use=2
```

Enabling diagnostics for a specific station

This example uses the station MAC address to find where it is failing:

```
FG600B3909600253 # diagnose wireless-controller wlac sta_filter 00:25:9c:e0:47:88 1
Set filter sta 00:25:9c:e0:47:88 level 1
FG600B3909600253 # 71419.245 <ih> IEEE 802.11 mgmt::disassoc <== 00:25:9c:e0:47:88 vap open
     rId 1 wId 0 00:09:0f:db:c4:03
71419.246 <dc> STA del 00:25:9c:e0:47:88 vap open rId 1 wId 0
71419.246 <cc> STA_CFG_REQ(34) sta 00:25:9c:e0:47:88 del ==> ws (0-192.168.35.1:5246) rId 1
     wId 0
71419.246 <cc> STA del 00:25:9c:e0:47:88 vap open ws (0-192.168.35.1:5246) rId 1 wId 0
     00:09:0f:db:c4:03 sec open reason I2C_STA_DEL
71419.247 <cc> STA_CFG_RESP(34) 00:25:9c:e0:47:88 <== ws (0-192.168.35.1:5246) rc 0
     (Success).
```

Performing a sniffer trace or packet capture

When you troubleshoot networks and routing in particular, it helps to look inside the headers of packets to determine if they are traveling the route that you expect them to take. Packet sniffing is also known as network tap, packet capture, or logic analyzing.

For FortiGates with NP2, NP4, or NP6 interfaces that are offloading traffic, disable offloading on these interfaces before you perform a trace or it will change the sniffer trace.

Sniffing packets

To perform a sniffer trace in the CLI:

Before you start sniffing packets, you should prepare to capture the output to a file. A large amount of data may scroll by and you will not be able to see it without saving it first. One method is to use a terminal program like puTTY to connect to the FortiGate CLI. Once the packet sniffing count is reached, you can end the session and analyze the output in the file.

The general form of the internal FortiOS packet sniffer command is:

```
# diagnose sniffer packet <interface_name> <'filter'> <verbose> <count> <tsformat>
```

To stop the sniffer, type `CTRL+C`.

<interface_name>	The name of the interface to sniff, such as `port1` or `internal`. This can also be `any` to sniff all interfaces.
<'filter'>	What to look for in the information the sniffer reads. `none` indicates no filtering, and all packets are displayed as the other arguments indicate. The filter must be inside single quotes (‘).
<verbose>	The level of verbosity as one of: • **1 -** print header of packets • **2 -** print header and data from IP of packets • **3 -** print header and data from Ethernet of packets • **4 -** print header of packets with interface name
<count>	The number of packets the sniffer reads before stopping. If you don't put a number here, the sniffer will run until you stop it with <`CTRL+C`>.

<tsformat>	The timestamp format. • a: absolute UTC time, yyyy-mm-dd hh:mm:ss.ms • l: absolute LOCAL time, yyyy-mm-dd hh:mm:ss.ms • otherwise: relative to the start of sniffing, ss.ms

Simple sniffing example:

```
# diagnose sniffer packet port1 none 1 3.
```

This displays the next three packets on the port1 interface using no filtering, and verbose level 1. At this verbosity level, you can see the source IP and port, the destination IP and port, action (such as ack), and sequence numbers.

In the output below, port 443 indicates these are HTTPS packets and that 172.20.120.17 is both sending and receiving traffic.

```
Head_Office_620b # diagnose sniffer packet port1 none 1 3
interfaces=[port1]
filters=[none]
0.545306 172.20.120.17.52989 -> 172.20.120.141.443: psh 3177924955 ack 1854307757
0.545963 172.20.120.141.443 -> 172.20.120.17.52989: psh 1854307757 ack 3177925808
0.562409 172.20.120.17.52988 -> 172.20.120.141.443: psh 4225311614 ack 3314279933
```

Using packet capture

To use packet capture, the FortiGate must have a disk. You can enable `capture-packet` in the firewall policy.

To enable packet capture in the CLI:

```
config firewall policy
    edit <id>
        set capture-packet enable
    next
end
```

For information about using the packet capture tool in the GUI, see Using the packet capture tool on page 535.

Debugging the packet flow

Debug the packet flow when network traffic is not entering and leaving the FortiGate as expected. When debugging the packet flow in the CLI, each command configures a part of the debug action. The final command starts the debug.

For information about using the debug flow tool in the GUI, see Using the debug flow tool on page 539.

To trace the packet flow in the CLI:

```
# diagnose debug flow trace start
```

To follow packet flow by setting a flow filter:

```
# diagnose debug flow {filter | filter6} <option>
```

- Enter `filter` if your network uses IPv4.
- Enter `filter6` if your network uses IPv6.

Replace `<option>` with one of the following variables:

Variable	Description
`addr`	IPv4 or IPv6 address
`clear`	clear filter
`daddr`	destination IPv4 or IPv6 address
`dport`	destination port
`negate`	inverse IPv4 or IPv6 filter
`port`	port
`proto`	protocol number
`saddr`	source address
`sport`	source port
`vd`	index of virtual domain; `-1` matches all

If FortiGate is connected to FortiAnalyzer or FortiCloud, the diagnose debug flow output will be recorded as event log messages and then sent to the devices. Do not run this command longer than necessary, as it generates a significant amount of data.

FortiASIC NP4 or NP6 interface pairs that offload traffic will change the packet flow. Before debugging any NP4 or NP6 interfaces, disable offloading on those interfaces.

To do this, enter `diagnose npu <interface pair> fastpath disable`, where `interface pair` is `np4`, `np6`, `np4lite`, or `np6lite`.

To start flow monitoring with a specific number of packets:

```
# diagnose debug flow trace start <N>
```

To stop flow tracing at any time:

```
# diagnose debug flow trace stop
```

The following example shows the flow trace for a device with an IP address of `203.160.224.97`:

```
# diagnose debug enable
# diagnose debug flow filter addr 203.160.224.97
# diagnose debug flow show function-name enable
# diagnose debug flow trace start 100
```

Sample output: HTTP

To observe the debug flow trace, connect to the website at the following address:

`https://www.fortinet.com`

Comment: SYN packet received:

```
id=20085 trace_id=209 func=resolve_ip_tuple_fast
line=2700 msg="vd-root received a packet(proto=6,
192.168.3.221:1487->203.160.224.97:80) from port5."
```

SYN sent and a new session is allocated:

```
id=20085 trace_id=209 func=resolve_ip_tuple line=2799
msg="allocate a new session-00000e90"
```

Lookup for next-hop gateway address:

```

msg="find a route: gw-192.168.11.254 via port6"
```

Source NAT, lookup next available port:

```
id=20085 trace_id=209 func=get_new_addr line=1219
msg="find SNAT: IP-192.168.11.59, port-31925"
direction"
```

Matched security policy. Check to see which policy this session matches:

```
id=20085 trace_id=209 func=fw_forward_handler line=317
msg="Allowed by Policy-3: SNAT"
```

Apply source NAT:

```
id=20085 trace_id=209 func=__ip_session_run_tuple
line=1502 msg="SNAT 192.168.3.221->192.168.11.59:31925"
```

SYN ACK received:

```
id=20085 trace_id=210 func=resolve_ip_tuple_fast line=2700
msg="vd-root received a packet(proto=6, 203.160.224.97:80-
>192.168.11.59:31925) from port6."
```

Found existing session ID. Identified as the reply direction:

```
id=20085 trace_id=210 func=resolve_ip_tuple_fast line=2727
msg="Find an existing session, id-00000e90, reply direction"
```

Apply destination NAT to inverse source NAT action:

```
id=20085 trace_id=210 func=__ip_session_run_tuple
line=1516 msg="DNAT 192.168.11.59:31925-
>192.168.3.221:1487"
```

Lookup for next-hop gateway address for reply traffic:

```
id=20085 trace_id=210 func=vf_ip4_route_input line=1543
msg="find a route: gw-192.168.3.221 via port5"
```

ACK received:

```
id=20085 trace_id=211 func=resolve_ip_tuple_fast line=2700
msg="vd-root received a packet(proto=6,
192.168.3.221:1487->203.160.224.97:80) from port5."
```

Match existing session in the original direction:

```
id=20085 trace_id=211 func=resolve_ip_tuple_fast line=2727
msg="Find an existing session, id-00000e90, original
direction"
```

Apply source NAT:

```

     66.236.56.226" tunnel-RemotePhase1"
id=20085 trace_id=2 msgid=20085 trace_id=2 msg="send to 66.236.56.230 via intf-wan1"
```

Testing a proxy operation

To monitor proxy operations in the CLI:

```
diagnose test application <application> <option>
```

To display a list of available application values:

```
diagnose test application ?
```

To display a list of available option values:

```
diagnose test application <application> ?
```

The `<option>` value will depend on the application value used in the command.

For example, if the application is `http`, the CLI command that displays the `<option>` values is:

```
diagnose test application http ?
```

Displaying detail Hardware NIC information

Monitoring the hardware NIC is important because interface errors indicate data link or physical layer issues which may impact the performance of the FortiGate.

To monitor hardware network operations in the CLI:

```
diagnose hardware deviceinfo nic <interface>
```

Sample output:

The following is sample output when the `<interface>` is set to `lan`:

```
System_Device_Name lan
Current_HWaddr 00:09:0f:68:35:60
Permanent_HWaddr 00:09:0f:68:35:60
State up
Link up
Speed 100
Duplex full
[……]
Rx_Packets=5685708
Tx_Packets=4107073
Rx_Bytes=617908014
Tx_Bytes=1269751248
Rx_Errors=0
Tx_Errors=0
Rx_Dropped=0
Tx_Dropped=0
[……]
```

Error descriptions

The `diagnose hardware deviceinfo nic` command displays a list of error names and values that are related to hardware.

The following table describes possible hardware errors:

Field	Description
Rx_Errors = rx error count	Bad frame was marked as error by PHY
Rx_CRC_Errors + Rx_Length_Errors - Rx_Align_Errors	This error is only valid in 10/100M mode
Rx_Dropped or Rx_No_Buffer_ Count	Running out of buffer space
Rx_Missed_Errors	Equals Rx_FIFO_Errors + CEXTERR (Carrier Extension Error Count); only valid in 1000M mode, which is marked by PHY
Tx_Errors = Tx_ Aborted_Errors	ECOL (Excessive Collisions Count); only valid in half-duplex mode
Tx_Window_Errors	Late Collisions (LATECOL) Count Late collisions are collisions that occur after 64-byte time into the transmission of the packet while working in 10 to 100 Mb/s data rate and 512-byte time into the transmission of the packet while working in the 1,000 Mb/s data rate. This register only increments if transmits are enabled and the device is in half-duplex mode.
Rx_Dropped	See Rx_Errors
Tx_Dropped	Not defined
Collisions	Total number of collisions experienced by the transmitter; valid in half-duplex mode
Rx_Length_Errors	Transmission length error
Rx_Over_Errors	Not defined
Rx_CRC_Errors	Frame CRC error
Rx_Frame_Errors	Same as Rx_Align_Errors This error is only valid in 10/100M mode.
Rx_FIFO_Errors	Same as Rx_Missed_Errors - a missed packet count
Tx_Aborted_Errors	See Tx_Errors
Tx_Carrier_Errors	The PHY should assert the internal carrier sense signal during every transmission. Failure to do so may indicate that the link has failed or the PHY has an incorrect link configuration. This register only increments if transmits are enabled. This register isn't valid in internal SerDes 1 mode (TBI mode for the 82544GC/EI) and is valid only when the Ethernet controller is operating at full duplex.
Tx_FIFO_Errors	Not defined
Tx_Heartbeat_Errors	Not defined
Tx_Window_Errors	See LATECOL

Field	Description
Tx_Single_Collision_ Frames	Counts the number of times that a successfully transmitted packet encountered a single collision The value increments only if transmits are enabled and the Ethernet controller is in half-duplex mode.
Tx_Multiple_ Collision_Frames	A Multiple Collision Count which indicates the number of times that a transmit encountered more than one collision, but less than 16. The value increments only if transmits are enabled and the Ethernet controller is in half-duplex mode.
Tx_Deferred	Counts defer events. A deferred event occurs when the transmitter cannot immediately send a packet due to: • The medium being busy because another device is transmitting • The IPG timer hasn't expired • Half-duplex deferral events are occurring • XOFF frames are being received • he link is not up. This register only increments if transmits are enabled. This counter does not increment for streaming transmits that are deferred due to TX IPG.
Rx_Frame_Too_ Longs	The Rx frame is oversized
Rx_Frame_Too_ Shorts	The Rx frame is too short
Rx_Align_Errors	This error is only valid in 10/100M mode
Symbol Error Count	Counts the number of symbol errors between reads - SYMERRS. The count increases for every bad symbol that's received, whether or not a packet is currently being received and whether or not the link is up. This register increments only in internal SerDes mode.

Performing a traffic trace

Traffic tracing allows you to follow a specific packet stream. This is useful when you want to confirm that packets are using the route you expect them to take on your network.

To view traffic sessions:

Use this command to view the characteristics of a traffic session though specific security policies.

```
diagnose sys session
```

To trace per-packet operations for flow tracing:

```
diagnose debug flow
```

To trace per-Ethernet frame:

```
diagnose sniffer packet
```

To trace a route from a FortiGate to a destination IP address:

```
# execute traceroute www.fortinet.com
traceroute to www.fortinet.com (66.171.121.34), 32 hops max, 84 byte packets
1 172.20.120.2 0.637 ms 0.653 ms 0.279 ms
2 209.87.254.221 <static-209-87-254-221.storm.ca> 2.448 ms 2.519 ms 2.458 ms
3 209.87.239.129 <core-2-g0-2.storm.ca> 2.917 ms 2.828 ms 9.324 ms
4 209.87.239.199 <core-3-bdi1739.storm.ca> 13.248 ms 12.401 ms 13.009 ms

11 203.78.186.70 83.283 ms 83.243 ms 83.293 ms
12 66.171.127.177 84.030 ms 84.229 ms 83.550 ms
13 66.171.121.34 <www.fortinet.com> 84.023 ms 83.903 ms 84.032 ms
14 66.171.121.34 <www.fortinet.com> 83.874 ms 84.084 ms 83.810 ms
```

Using a session table

A session is a communication channel between two devices or applications across the network. Sessions allow FortiOS to inspect and act on a sequential group of packets in a session all at once instead of inspecting each packet individually. Each session has an entry in the session table that includes important information about the session.

You can view FortiGate session tables from the FortiGate GUI or CLI. The most useful troubleshooting data comes from the CLI. The session table in the GUI also provides useful summary information, particularly the current policy number that the session is using.

When to use a session table

Session tables are useful when verifying open connections. For example, if you have a web browser open to browse the Fortinet website, you would expect a session entry from your computer on port 80 to the IP address for the Fortinet website.

You can also use a session table to investigate why there are too many sessions for FortiOS to process.

GUI

To view session information in the GUI:

1. Go to *Security Fabric* > *Physical Topology*.
2. From the *Metrics* dropdown, select *Sessions*.

Finding the security policy for a specific connection

Every program and device on your network must have an open communication channel or session to pass information. FortiGate manages these sessions with features such as traffic shaping, antivirus scanning, and blocking known bad websites. Each session will have an entry in the session table.

If a secure web browser session is not working properly, you can check the session table to ensure the session is still active and going to the proper address. The session table can also tell you the security policy number it matches, so you can check what is happening in that policy.

1. Get the connection information.

You need to be able to identify the session you want. To do this, you will need:

- The source IP address (usually your computer)
- The destination IP address (if you have it)
- The port number which is determined by the program you are using. Common ports are:
  - Port 80 (HTTP for web browsing)
  - Port 443 (HTTPS for SSL encrypted web browsing)
  - Port 22 (SSH for Secure Shell)
  - Port 25 (SMTP for Mail Transfer)

2. Find the session and policy ID

Go to *Security Fabric* > *Physical Topology*. From the *Metrics* dropdown, select *Sessions*.

To find your session, search for your source IP address, destination IP address (if you have it), and port number. The policy ID is listed after the destination information.

3. Use filters to find a session

If there are multiple pages of sessions, you can use a filter to hide the sessions you do not need. To filter the sessions in the table, click *Add Filter*, and select an option from the list. You can filter the table by *Destination IP*, *Source IP*, or *Source Port*.

CLI

The session table output in the CLI is very large. The CLI command supports filters to show only the data you need.

To view session data in the CLI:

```
diagnose sys session list
```

An entry is placed in the session table for each traffic session passing through a security policy

To filter session data:

```
diagnose sys session filter <option>
```

The values for `<option>` include the following:

Value	Definition
`clear`	Clear session filter
`dintf`	Destination interface
`dport`	Destination port

Value	Definition
`dst`	Destination IP address
`duration`	Duration of the session
`expire`	Expire
`negate`	Inverse filter
`nport`	NAT'd source port
`nsrc`	NAT'd source ip address
`policy`	Policy ID
`proto`	Protocol number
`proto-state`	Protocol state
`session-state1`	Session state1
`session-state2`	Session state2
`sintf`	Source interface
`sport`	Source port
`src`	Source IP address
`vd`	Index of virtual domain, `-1` matches all

Even though UDP is a sessionless protocol, FortiGate keeps track of the following states:

- When UDP reply does not have a value of 0
- When UDP reply has a value of 1

The following table displays firewall session states from the session table:

State	Description
log	Session is being logged
local	Session is originated from or destined for local stack
ext	Session is created by a firewall session helper
may_dirty	Session is created by a policy For example, the session for `ftp control channel` will have this state but `ftp data channel` won't. This is also seen when NAT is enabled.
ndr	Session will be checked by IPS signature
nds	Session will be checked by IPS anomaly
br	Session is being bridged (TP) mode

Examining the firewall session list

The firewall session list displays all open sessions in FortiGate. Examine the list for strange patterns, such as no sessions apart from the internal network, or all sessions are only to one IP address.

When you examine the firewall session list in the CLI, you can use filters to reduce the output.

To examine the firewall session list in the CLI:

You can use a filter to limit the sessions displayed by source, destination address, port, or NAT'd address. To use more than one filter, enter a separate line for each value.

The following example filters the session list based on a source address of 10.11.101.112:

```
FGT# diagnose sys session filter src 10.11.101.112
FGT# diagnose sys session list
```

The following example filters the session list based on a destination address of 172.20.120.222.

```
FGT# diagnose sys session filter dst 172.20.120.222
FGT# diagnose sys session list
```

To clear all sessions corresponding to a filter:

```
FGT# diagnose sys session filter dst 172.20.120.222
FGT# diagnose sys session clear
```

Checking source NAT information

Checking source NAT is important when you are troubleshooting from the remote end of the connection outside the firewall.

To check the source NAT information in the CLI:

When you display the session list in the CLI, you can match the NAT'd source address (`nsrc`) and port (`nport`). This is useful when multiple internal IP addresses are NAT'd to a common external-facing source IP address.

```
FGT# diagnose sys session filter nsrc 172.20.120.122
FGT# diagnose sys session filter nport 8888
FGT# diagnose sys session list
```

Finding object dependencies

You may be prevented from deleting a configuration object when other configuration objects depend on it. You can use the GUI or CLI to identify objects which depend on, or make reference to the configuration you are trying to delete. Additionally, if you have a virtual interface with dependent objects, you will need to find and remove those dependencies before deleting the interface.

To remove interface object dependencies in the GUI:

1. Go to *Network* > *Interfaces*. The *Ref.* column displays the number of objects that reference this interface.
2. Select the number in the *Ref* . column for the interface. A window listing the dependencies appears.
3. Use these detailed entries to locate and remove object references to this interface. The trash can icon is enabled

after all the object dependencies are removed.

4. Remove the interface by selecting the check box for the interface, and select *Delete*.

To find object dependencies in the CLI:

When running multiple VDOMs, use the following command in the global configuration only.

```
diagnose sys cmdb refcnt show <path.object.mkey>
```

The command searches for the named object in both the most recently used global and VDOM configurations.

Examples

To verify which objects a security policy with an ID of 1 refers to:

```
diagnose sys cmdb refcnt show firewall.policy.policyid 1
```

To check what is referred to by interface `port1`:

```
diagnose sys cmdb refcnt show system.interface.name port1
```

To show all dependencies for an interface:

```
diagnose sys cmdb refcnt show system.interface.name <interface name>
```

Sample output:

In this example , the interface has dependent objects, including four address objects, one VIP, and three security policies.

```
entry used by table firewall.address:name '10.98.23.23_host'
entry used by table firewall.address:name 'NAS'
entry used by table firewall.address:name 'all'
entry used by table firewall.address:name 'fortinet.com'
entry used by table firewall.vip:name 'TORRENT_10.0.0.70:6883'
entry used by table firewall.policy:policyid '21'
entry used by table firewall.policy:policyid '14'
entry used by table firewall.policy:policyid '19'
```

Diagnosing NPU-based interfaces

Some Fortinet products contain network processors, such as NP4, NP6Lite, or NP6. Offloading requirements will vary depending on the model.

To view the initial session setup for NPU-based interfaces:

```
diagnose debug flow
```

- If the session is programmed into the ASIC (fastpath) correctly, the command will not detect the packets that arrive at the CPU.
- If the NPU functionality is disabled, the CPU detects all the packets. However, you should only disable the NPU functionality for troubleshooting purposes.

To diagnose NPU-based interfaces:

1. Get the NPx or NPU ID and port numbers.
   ```
   diagnose npu <processor> list
   ```
   The output will look like this:
   ```
   ID Model Slot Interface
   0 On-board port1 fabric1 fabric3 fabric5
   1 On-board fabric2 port2 base2 fabric4
   ```
2. Disable the NPU functionality.
   ```
   diagnose npu <processor> fastpath disable <dev_id>
   ```
   The `dev_id` is the NPx ID number.
3. Analyze the packets.
   ```
   diagnose npu <processor> fastpath-sniffer enable port1
   ```

These commands only apply to NP4 and NP6 interfaces.

The output will look similar to:
```
NP4 Fast Path Sniffer on port1 enabled
```
This causes traffic on `port1` of the network processor to be sent to the CPU. This means you can perform a standard sniffer trace and use other diagnostic commands, if it is a standard CPU-driven port.

Identifying the XAUI link used for a specific traffic stream

The `diagnose npu np6 xaui-hash` command takes a 6-tuple input of the traffic stream to identify the NP6 XAUI link that the traffic passes through.

This command is only available on the 38xxD, 39xxD, 34xxE, 36xxE, and 5001E series devices.

Syntax

```
diagnose npu np6 xaui-hash <interface> <proto> <src_ip> <dst_ip> <src_port> <dst_port>
```

Variable	Description
`<interface>`	The network interface that the packets are coming from.
`<proto>`	The proto number, 6 for TCP or 17 for UDP.
`<src_ip>`	The source IP address.
`<dst_ip>`	The destination IP address.
`<src_port>`	The source port.
`<dst_port>`	The destination port.

Examples

```
# diagnose npu np6 xaui-hash port1 6 1.1.1.1 2.2.2.1 4567 80
 NP6_ID: 0, XAUI_LINK: 2
```

```
# diagnose npu np6 xaui-hash port1 6 1.1.1.1 2.2.2.1 4567 200
NP6_ID: 6, XAUI_LINK: 2

# diagnose npu np6 xaui-hash port1 6 1.1.1.1 2.2.2.1 4567 20
NP6_ID: 1, XAUI_LINK: 2

# diagnose npu np6 xaui-hash port1 6 1.1.1.1 2.2.2.1 4567 23
NP6_ID: 1, XAUI_LINK: 1
```

The `NP6_ID` is the NP index of the model that is being used. It can be found with the `diagnose npu np6 port-list` command.

Date and time settings

Fortinet support may ask you to check the date and time settings for log message timestamp synchronization and for certificates that have a time requirement to check for validity.

To check time settings:

```
execute time
```

To check date settings:

```
execute date
```

If all devices have the same time, it helps to correlate log entries from different devices.

```
execute time
current time is: 12:40:48
last ntp sync:Thu Mar 16 12:00:21 2006
execute date
current date is: 2006-03-16
```

To force synchronization with an NTP server:

```
config system ntp
   set ntpsync {enable | disable}
end
```

If all devices have the same time, it helps to correlate log entries from different devices.

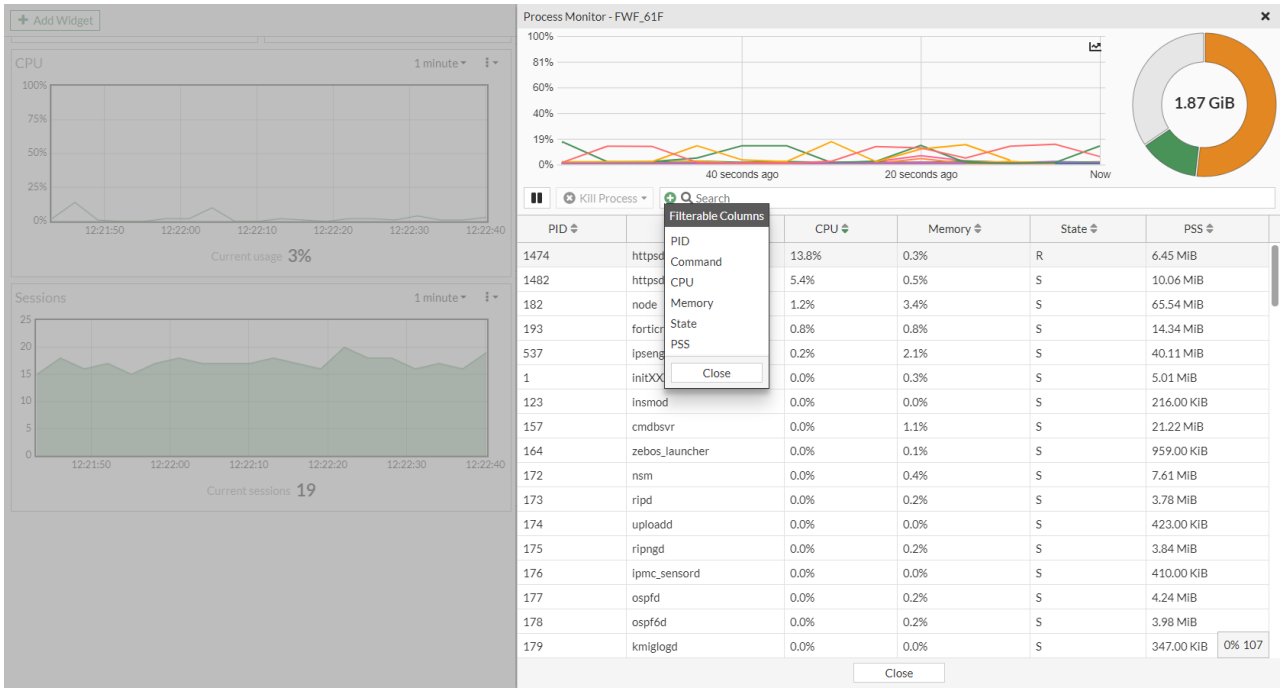
Running the TAC report

The Technical Assistance Center (TAC) report runs an exhaustive series of diagnostic commands. Some of the commands are only needed if you are using features, such as HA, VPN tunnels, or a modem. Fortinet support my ask you to use the report output to provide information about the current state of your FortiGate.

Due the amount of output generated, the report may take a few minutes to run. If you are logging CLI output to a file, you can run this command to familiarize yourself with the diagnostic commands.

To run the TAC report in the CLI:

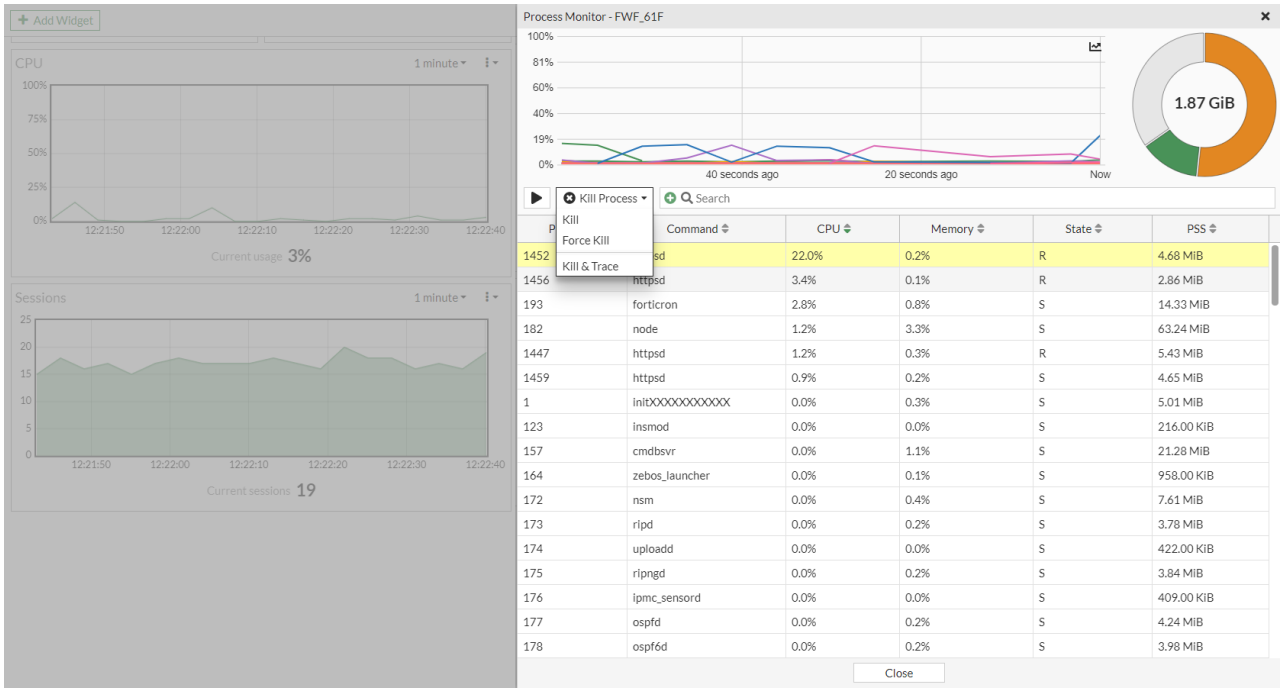
```
execute tac report
```



Using the process monitor

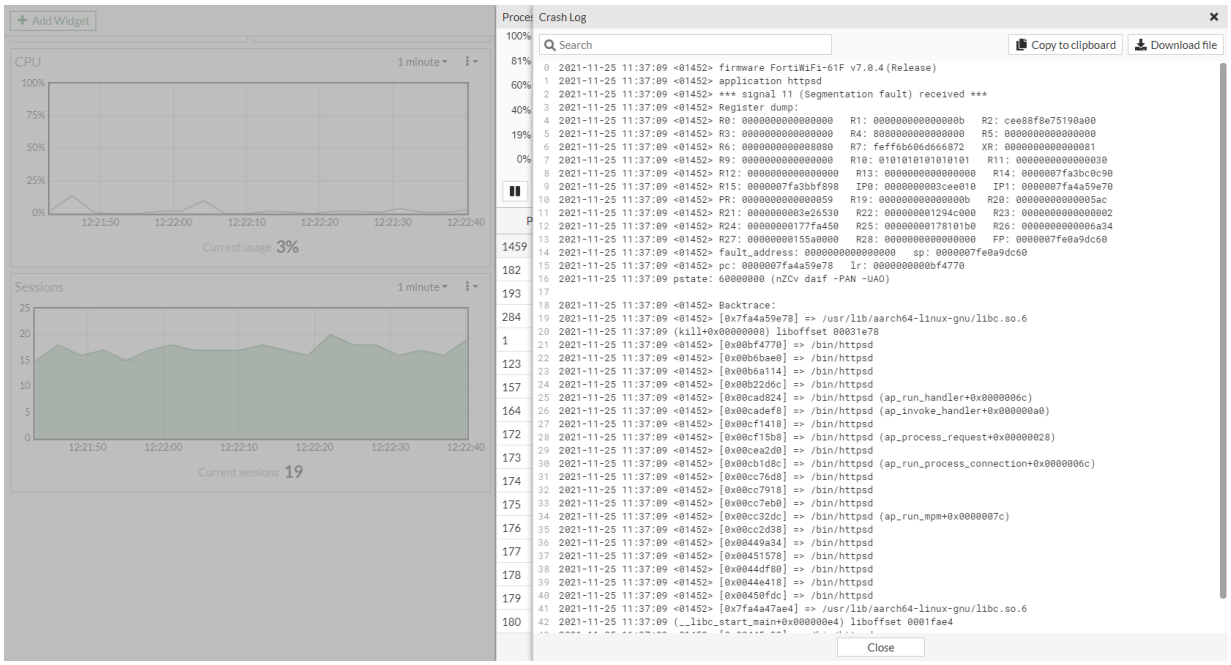
The *Process Monitor* displays running processes with their CPU and memory usage levels. Administrators can sort, filter, and terminate processes within the *Process Monitor* pane.

To access the process monitor:



1. Go to *Dashboard* > *Status*:
   - Left-click in the *CPU* or *Memory* widget and select *Process Monitor*.
   - Click the user name in the upper right-hand corner of the screen, then go to *System* > *Process Monitor*.

   The *Process Monitor* appears, which includes a line graph, donut chart, and process list.
2. Click the + beside the search bar to view which columns can be filtered.



To kill a process within the process monitor:

1. Select a process.
2. Click the *Kill Process* dropdown.

3. Select one of the following options:
   - *Kill*: the standard kill option that produces one line in the crash log (`diagnose debug crashlog read`).
   - *Force Kill*: the equivalent to `diagnose sys kill 9 <pid>`. This can be viewed in the crash log.
   - *Kill & Trace*: the equivalent to `diagnose sys kill 11 <pid>`. This generates a longer crash log and backtrace. A crash log is displayed afterwards.

Other commands

You may be asked to provide the following information when you contact Fortinet support.

- ARP table on page 2874
- IP address on page 2876

ARP table

The ARP table is used to determine the destination MAC addresses of the network nodes, as well as the VLANs and ports from where the nodes are reached.

To view the ARP table:

```
# get system arp

Address           Age(min)    Hardware Addr      Interface
10.10.1.3         1           50:b7:c3:75:ea:dd internal7
192.168.0.190     0           28:f1:0e:03:2a:97 wan1
192.168.0.97      0           f4:f2:6d:37:b0:99 wan1
```

To view the ARP cache in the system:

```
# diagnose ip arp list

index=14 ifname=internal7 10.10.1.3 50:b7:c3:75:ea:dd state=00000004 use=2494 confirm=1995
update=374 ref=3
index=5 ifname=wan1 192.168.0.190 28:f1:0e:03:2a:97 state=00000002 use=88 confirm=86
update=977639 ref=2
index=22 ifname=internal 192.168.1.111 00:0c:29:c6:79:3d state=00000004 use=3724
confirm=9724 update=3724 ref=0
index=5 ifname=wan1 224.0.1.140 01:00:5e:00:01:8c state=00000040 use=924202 confirm=930202
update=924202 ref=1
index=5 ifname=wan1 192.168.0.97 f4:f2:6d:37:b0:99 state=00000002 use=78 confirm=486
update=614 ref=26
index=14 ifname=internal7 10.10.1.11 state=00000020 use=172 confirm=1037790 update=78 ref=2
```

ARP request and cache

The FortiGate must make an ARP request when it tries to reach a new destination. The base ARP reachable value determines how often an ARP request it sent; the default is 30 seconds. The actual ARP reachable time is a random number between half and three halves of the base reachable time, or 15 to 45 seconds. The random number is updated every five minutes.

ARP entries in the ARP cache are updated based on the state of the ARP entry and the objects that are using it, as highlighted in the following output sample:

```
index=5 ifname=wan1 224.0.1.140 01:00:5e:00:01:8c state=00000040 use=924202
confirm=930202 update=924202 ref=1
```

There are multiple possible states for an ARP entry, and the state-transition mechanism can be complex. Common states include the following:

State	Meaning	Description
000000002 or 0x02	REACHABLE	An ARP response was received
000000004 or 0x04	STALE	No ARP response within the expected time
000000008 or 0x08	DELAY	A transition state between STALE and REACHABLE before Probes are sent out
000000020 or 0x20	FAILED	Did not manage to resolve within the maximum configured number of probes
000000040 or 0x40	NOARP	Device does not support ARP, e.g. IPsec interface
000000080 or 0x80	PERMANENT	A statically defined ARP entry

An entry that is in the STALE (0x04) or FAILED (0x20) states with no references to it (ref=0) can be deleted. Many factors affect the state-transmit mechanism and if an entry is used by other subsystems. For example, ARP creation, ARP request/reply, neighbor lookup, routing, and others can cause an ARP entry to be in use or referenced.

The garbage collection mechanism runs every 30 seconds, and checks and removes stale and unreferenced entries if they have been stale for longer than 60 seconds. Garbage collection will also be triggered when the number of ARP entries exceeds the configured threshold. If the threshold is exceeded, no entries can be added to the ARP table.

To set the maximum number of ARP entries threshold:

```
config system global
    set arp-max-entry <integer>
end
```

arp-max-entry <integer>	The maximum number of dynamically learned MAC addresses that can be added to the ARP table (131072 to 2147483647, default = 131072).

To set the ARP reachable time on an interface:

```
config system interface
    edit port1
        set reachable-time <integer>
    next
end
```

reachable-time <integer>	The reachable time (30000 to 3600000, default = 30000).

To clear all of the entries in the ARP table:

```
execute clear system arp table
```

To delete a single ARP entry from the ARP table:

```
diagnose ip arp delete <interface name> <IP address>
```

To add static ARP entries:

```
config system arp-table
    edit 1
        set interface "internal"
        set ip 192.168.50.8
        set mac bc:14:01:e9:77:02
    next
end
```

To view a summary of the ARP table:

```
# diagnose sys device list root

list virtual firewall root info:
ip4 route_cache: table_size=65536 max_depth=2 used=31 total=34
arp: table_size=16 max_depth=2 used=5 total=6
proxy_arp: table_size=256 max_depth=0 used=0 total=0
arp6: table_size=32 max_depth=1 used=3 total=3
proxy_arp6: table_size=256 max_depth=0 used=0 total=0
local table version=00000000 main table version=0000002b
vf=root dev=root vrf=0
vf=root dev=ssl.root vrf=0
...
vf=root dev=internal5 vrf=0
ses=0/0 ses6=0/0 rt=0/0 rt6=0/0
```

IP address

You may want to verify the IP addresses assigned to the FortiGate interfaces are what you expect them to be.

To verify IP addresses:

```
diagnose ip address list
```

The output lists the:

- IP address and mask (if available)
- `index` of the interface (a type of ID number)
- `devname` (the interface name)

While physical interface names are set, virtual interface names can vary. A good way to use this command is to list all of the virtual interface names. For `vsys_ha` and `vsys_fgfm`, the IP addresses are the local host, which are virtual interfaces that are used internally.

Sample output:

```
# diagnose ip address list
IP=10.31.101.100->10.31.101.100/255.255.255.0 index=3 devname=internal
IP=172.20.120.122->172.20.120.122/255.255.255.0 index=5 devname=wan1
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=8 devname=root
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=11 devname=vsys_ha
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=13 devname=vsys_fgfm
```

FortiGuard troubleshooting

The FortiGuard service provides updates to AntiVirus (AV), Antispam (AS), Intrusion Protection Services (IPS), Webfiltering (WF), and more. The FortiGuard Distribution System (FDS) consists of a number of servers across the world that provide updates to your FortiGate unit. Problems can occur with the connection to FDS and its configuration on your local FortiGate unit.

Some of the more common troubleshooting methods are listed here, including:

- Verifying connectivity to FortiGuard on page 2877
- Troubleshooting process for FortiGuard updates on page 2878
- FortiGuard server settings on page 2878

Verifying connectivity to FortiGuard

You can verify FortiGuard connectivity in the GUI and CLI.

To verify FortiGuard connectivity in the GUI:

1. Got to *Dashboard* > *Status*.
2. Check the *Licenses* widget. When FortiGate is connected to FortiGuard, a green check mark appears next to the available FortiGuard services.

To verify FortiGuard connectivity in the CLI:

```
execute ping service.fortiguard.net
```

```
execute ping update.fortiguard.net
```

Sample output:

```
FG100D# execute ping service.fortiguard.net
PING guard.fortinet.net (208.91.112.196): 56 data bytes
64 bytes from 208.91.112.196: icmp_seq=0 ttl=51 time=61.0 ms
64 bytes from 208.91.112.196: icmp_seq=1 ttl=51 time=60.0 ms
64 bytes from 208.91.112.196: icmp_seq=2 ttl=51 time=59.6 ms
64 bytes from 208.91.112.196: icmp_seq=3 ttl=51 time=58.9 ms
64 bytes from 208.91.112.196: icmp_seq=4 ttl=51 time=59.2 ms

--- guard.fortinet.net ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 58.9/59.7/61.0 ms

FG100D# execute ping update.fortiguard.net
PING fds1.fortinet.com (208.91.112.68): 56 data bytes
64 bytes from 208.91.112.68: icmp_seq=0 ttl=53 time=62.0 ms
64 bytes from 208.91.112.68: icmp_seq=1 ttl=53 time=61.8 ms
64 bytes from 208.91.112.68: icmp_seq=2 ttl=53 time=61.3 ms
64 bytes from 208.91.112.68: icmp_seq=3 ttl=53 time=61.9 ms
64 bytes from 208.91.112.68: icmp_seq=4 ttl=53 time=61.8 ms
```

Troubleshooting process for FortiGuard updates

The following process shows the logical steps you should take when troubleshooting problems with FortiGuard updates:

1. **Does the device have a valid license that includes these services?**
   Each device requires a valid FortiGuard license to access updates for some or all of these services. You can verify the status of the support contract for your devices at the Fortinet Support website.
2. **If the device is part of a high availability (HA) cluster, do all members of the cluster have the same level of support?**
   You can verify the status of the support contract for all of the devices in your HA cluster at the Fortinet Support website.
3. **Are services enabled on the device?**
   To see the FortiGuard information and status for a device in the GUI, go to *System* > *FortiGuard*.
   Use this page to verify the status of each component, and enable each service.
4. **Can the device communicate with FortiGuard servers?**
   Go to *System* > *FortiGuard* in the GUI, and try to update AntiVirus and IPS, or test the availability of Web Filtering and AS default and alternate ports.
5. **Is there proper routing to reach the FortiGuard servers?**
   Ensure there is a static or dynamic route that allows your FortiGate to reach the FortiGuard servers. Usually a generic default route to the internet is enough, but you may need to verify this if your network is complex.
6. **Are there issues with DNS?**
   An easy way to test this is to attempt a traceroute from behind the FortiGate to an external network using the Fully Qualified Domain Name (FQDN) for a location. If the traceroute FQDN name doesn't resolve, you have general DNS problems.
7. **Is there anything upstream that might be blocking FortiGuard traffic, either on the network or ISP side?**
   Many firewalls block all ports, by default, and ISPs often block ports that are low. There may be a firewall between the FortiGate and the FortiGuard servers that's blocking the traffic. By default, FortiGuard uses port 53. If that port is blocked you need to either open a hole for it or change the port it is using.
8. **Is there an issue with source ports?**
   It is possible that ports that FortiGate uses to contact FortiGuard are being changed before they reach FortiGuard or on the return trip before they reach FortiGate. A possible solution for this is to use a fixed-port at NAT'd firewalls to ensure the port remains the same. You can use packet sniffing to find more information about what's happening with ports.
9. **Are there security policies that include antivirus?**
   If none of the security policies include antivirus, the antivirus database will not be updated. If antivirus is included, only the database type that's used will be updated.

FortiGuard server settings

Your local FortiGate connects to remote FortiGuard servers to get updates to FortiGuard information, such as new viruses that may have been found or other new threats.

The default setting to reach FortiGuard is anycast. However, FortiGate can be configured to use unicast server. See FortiGuard on page 2298 for more information.

This section provides methods to display FortiGuard server information on your FortiGate, and how to use that information and update it to fix potential problems.

Displaying the server list

To get a list of FDS servers FortiGate uses to send web filtering requests:

```
get webfilter status
```

or

```
diagnose debug rating
```

Rating requests are only sent to the server at the top of the list in normal operation. Each server is probed for Round Trip Time (RTT) every two minutes. Rating may not be enabled on your FortiGate.

Optionally, you can add a refresh rate to the end of the command to determine how often the server list is refreshed.

Sample output:

```
Locale       : English

Service      : Web-filter
Status       : Enable
License      : Contract

Service      : Antispam
Status       : Disable

Service      : Virus Outbreak Prevention
Status       : Disable

Num. of servers : 2
Protocol        : https
Port            : 443
Anycast         : Disable
Default servers : Included

--= Server List (Wed Nov 16 14:42:08 2022) --=
IP                                            Weight    RTT Flags   TZ  FortiGuard-requests
 Curr Lost Total Lost             Updated Time
140.174.22.68                                     30    866         -5
13          0          0 Wed Nov 16 14:41:35 2022
12.34.97.18                                       30    878 DI      -5
12          0          0 Wed Nov 16 14:41:35 2022
```

Output details

The server list includes the IP addresses of alternate servers if the first entry cannot be reached. In this example, the IP addresses are not public addresses.

The following flags in `get webfilter status` indicate the server status:

Flag	Description
D	The server was found through the DNS lookup of the hostname. If the hostname returns more than one IP address, all of them are flagged with D and are used first for INIT requests before falling back to the other servers.

Flag	Description
I	The server to which the last INIT request was sent
F	The server hasn't responded to requests and is considered to have failed
T	The server is currently being timed
S	Rating requests can be sent to the server. The flag is set for a server only in two cases: • The server exists in the servers list received from the FortiManager or any other INIT server. • The server list received from the FortiManager is empty so the FortiManager is the only server that the FortiGate knows and it should be used as the rating server.

Please note that the example output displays `Anycast` as `Disable` because the CLI commands above work with the FortiGuard unicast server case and not with the FortiGuard anycast servers case.

Also, in the example output above, the server 12.34.97.18 was found through a DNS lookup (`D` flag) and was sent the last INIT request (`I` flag).

Sorting the server list

The server list is sorted first by weight. The server with the smallest RTT appears at the top of the list, regardless of weight. When a packet is lost (there has been no response in 2 seconds), it is re-sent to the next server in the list. Therefore, the top position in the list is selected based on RTT, while the other positions are based on weight.

Calculating weight

The weight for each server increases with failed packets and decreases with successful packets. To lower the possibility of using a remote server, the weight isn't allowed to dip below a base weight. The base weight is calculated as the difference in hours between the FortiGate and the server multiplied by 10. The farther away the server is, the higher its base weight is and the lower it appears in the list.

View open and in use ports

Traffic destined for the FortiGate itself, and not being passed through or dropped, is called local-in traffic. It can be from a variety of services, such as HTTPS for administrative access, or BGP for inter-router communication.

Local-in traffic is controlled by local-in policies. To enable viewing local-in policies in the GUI, go to *System* > *Feature Visibility* and enable *Local In Policy*.

The *Policy & Objects* > *Local In Policy* page shows a read-only list of the local policies, populated with default values, and values that are automatically enabled when the related service is enabled, for example, enabling BGP opens TCP port 179. For more information, see Local-in policy on page 852.

To view ports that are being listened on, and active connections and the services or processes using them:

```
# diagnose sys tcpsock | grep 0.0.0.0
0.0.0.0:10400->0.0.0.0:0->state=listen err=0 socktype=4 rma=0 wma=0 fma=0 tma=0 inode=10621
process=142/authd
```

```
...
0.0.0.0:53->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=8067
process=177/dnsproxy
0.0.0.0:22->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=13390
process=225/sshd
0.0.0.0:541->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=13155
process=215/fgfmd
...
0.0.0.0:9980->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=5063
process=129/httpsd
0.0.0.0:179->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=10583
process=148/bgpd
...
```

For more information on incoming and outgoing ports, see the FortiOS Ports guide.

Additional resources

To learn more about FortiGate and FortiOS, and for information about technical issues, refer to the following resources.

Fortinet Document Library

Installation Guides, Administration Guides, Quick Start Guides, and other technical documents are available online at the Fortinet Document Library.

Release notes

Issues that arise after the technical documentation has been published are often listed in the release notes. The release notes are available in the Fortinet Document Library.

Fortinet Video Library

The Fortinet Video Library hosts a collection of videos that provide valuable information about Fortinet products.

Fortinet Community

The Fortinet Community provides a place to collaborate, share insights and experiences, and get answers to questions. It incorporates the Fortinet Knowledge Base and technical discussion forums. You can access the Fortinet Community at https://community.fortinet.com.

Knowledge Base

The Fortinet Knowledge Base provides access to a variety of articles, white papers, and other documentation that provides technical insight into a range of Fortinet products. You can access the Knowledge Base at

https://community.fortinet.com/t5/Knowledge-Base/ct-p/knowledgebase.

Fortinet technical discussion forums

The online technical forum allows administrators to contribute to discussions about issues related to their Fortinet products. Searching the forum can help an administrator identify if an issue has been experienced by another user. You can access the support forum at https://community.fortinet.com/t5/Fortinet-Forum/bd-p/fortinet-discussion.

Fortinet Training Institute

The Fortinet Training Institute hosts a collection of tutorials and training materials that you can use to increase your knowledge of Fortinet products. You can access these training resources at https://www.fortinet.com/training.html.

Fortinet Support

You defined your problem, researched a solution, put together a plan to find the solution, and executed that plan. At this point, if the problem has not been solved, contact Fortinet Support for assistance.
