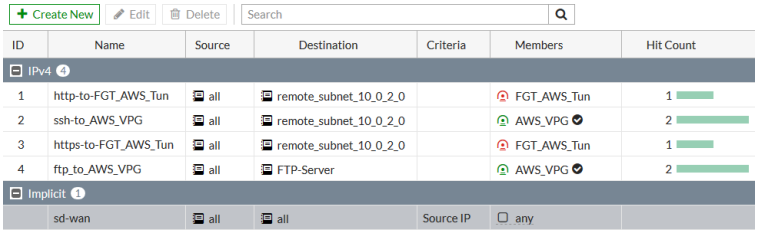
To simulate an issue on an overlay VPN tunnel:

On the cloud FortiGate-VM, disable the firewall policy allowing Core_Dialup to port2.



1. Health-checks through the FGT_AWS_Tun tunnel fail:
   a. Go to *Network* > *SD-WAN*, select the *Performance SLAs* tab, select *Packet Loss*, and click the *ping_AWS_Gateway* SLA:

   b. Run the following CLI command:

```
# diagnose sys sdwan health-check
...
Seq(1 AWS_VPG): state(alive), packet-loss(0.000%) latency(52.746), jitter(0.713) sla_
map=0x0
Seq(2 FGT_AWS_Tun): state(dead), packet-loss(19.000%) sla_map=0x0
```

2. Service rules show that the member is down:
   a. Go to *Network* > *SD-WAN* and select the *SD-WAN Rules* tab:

   b. Run the following CLI command:

```
# diagnose sys sdwan service

Service(1): Address Mode(IPV4) flags=0x0
  Gen(2), TOS(0x0/0x0), Protocol(6: 80->80), Mode(manual)

4. Routes to the *FGT_AWS_Tun* tunnel are removed:
   a. If *Optimal* dashboards is selected, go to *Dashboard* > *Network* and expand the Routing widget to view the routing table.
   If *Comprehensive* dashboards is selected, go to *Dashboard* > *Routing Monitor* and select *Static & Dynamic* in the widget toolbar to view the routing table:

Network	Gateway IP	Interfaces	Distance	IP Version	Type
IPv4 40					
0.0.0.0/0	10.100.64.254	Internet_A (port1)	1	IPv4	Static
0.0.0.0/0	10.100.65.254	Internet_B (port5)	1	IPv4	Static
10.0.2.0/24	169.254.55.153	AWS_VPG	1	IPv4	Static
10.0.10.0/24	0.0.0.0	VPN_A_Tunnel (Branch-HQ-A)	0	IPv4	Connected
10.0.10.1/32	0.0.0.0	VPN_A_Tunnel (Branch-HQ-A)	0	IPv4	Connected

   b. Run the following CLI command:

```
# get router info routing-table all
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default

Routing table for VRF=0
S*      0.0.0.0/0 [1/0] via 10.100.64.254, port1
                  [1/0] via 10.100.65.254, port5
S       10.0.2.0/24 [1/0] via 169.254.55.153, AWS_VPG
C       10.0.10.0/24 is directly connected, Branch-HQ-A
```

```
C       10.0.10.1/32 is directly connected, Branch-HQ-A
…
```

SD-WAN Network Monitor service

The SD-WAN Network Monitor service is a tool designed to determine upload and download speeds. Speed tests can be conducted either on-demand or according to a predetermined schedule, measuring upload and download speeds of up to 1 Gbps. The results of the tests can be used as reference for various applications, including the following:

- Configuring the estimated bandwidth of an interface, which can be employed in conjunction with various WAN intelligence strategies. See Using speed test results with SD-WAN for more information.
- Configuring the inbandwidth and outbandwidth of an interface for use in traffic shaping. See Using speed test results with traffic shaping for more information.
- Applying the speed test to dialup VPN tunnels in a hub and spoke deployment to conduct traffic shaping.

FortiOS offers a variety of methods for testing SD-WAN speed. The following table provides a brief overview of each method and guidance on when it might be most advantageous to use one method over the others.

Service	Overview	License
CLI speed test	• Provides the most flexibility and options, which enables the speed test to operate with user-defined parameters. • Results can be used as reference to manually add to the interface's estimated bandwidth, or inbandwidth and outbandwidth. • Server is on the cloud, which is maintained by Fortinet.	Requires a valid SD-WAN Network Monitor license.
GUI speed test	• Downloads the speed test server list automatically. • Results can be added to the interface's estimated bandwidth with one click. • Results are automatically updated in the interface `measured-upstream-bandwidth` and `measured-downstream-bandwidth` fields. • Results can be used as a reference to manually configure an interface's inbandwidth and outbandwidth. • Easier to use. • Server is on the cloud, which is maintained by Fortinet.	Requires a valid SD-WAN Network Monitor license.
Scheduled interface speed test	• Speed tests can be scheduled to run automatically. • Results are automatically updated in the interface `measured-upstream-bandwidth` and `measured-downstream-bandwidth` fields. • Results can be used as a reference to manually configure an interface's inbandwidth and outbandwidth. • Possible to temporarily bypass the bandwidth limits set	Requires a valid SD-WAN Network Monitor license.

Service	Overview	License
	on the interface and configure custom maximum bandwidth limits. • Server is on the cloud, which is maintained by Fortinet.	
Speed test from hub to spoke	• Server is the spoke. • Tests initiated from the hub. • Results are cached for future use. • Results can be dynamically applied to the dialup tunnel for egress traffic shaping. • Results can be used as a reference to manually configure an interface's inbandwidth and outbandwidth.	License not required.
Speed test from spokes to hub	• Server is the hub. • Tests initiated from spokes, even when a spoke is behind a NAT device. • Results are cached on the spoke for future use and sent to the hub. • Results can be dynamically applied to the dialup tunnel for egress traffic shaping. • Results can be used as a reference to manually configure an interface's inbandwidth and outbandwidth.	License not required.

CLI speed test

The speed test tool is compatible with iPerf3.6 with SSL support. It can test the upload bandwidth to the FortiGate Cloud speed test service. It can initiate the server connection and send download requests to the server. The tool can be run up to 10 times a day.

The FortiGate downloads the speed test server list. The list expires after 24 hours. One of the speed test servers is selected based on user input.

To configure the speed test settings:

```
config system speed-test-setting
    set latency-threshold <integer>
    set multiple-tcp-stream <integer>
end
```

`latency-threshold <integer>`	Set the speed test threshold for the auto mode, in milliseconds (0 - 2000, default = 60). If the latency exceeds this threshold, the speed test will use the UDP protocol; otherwise, it will use the TCP protocol.
`multiple-tcp-stream <integer>`	Set the number of parallel client streams for the TCP protocol to run during the speed test (1 - 64, default = 4).

To download the server list of speed tests:

1. Download the server list from FortiCloud:

```
# execute speed-test-server download
Download completed.
```

2. Verify the list:

```
# execute speed-test-server list
...
FTNT_CA_Toronto valid
        Host: 154.52.23.67 5200 fortinet
        ...
FTNT_CA_Vancouver valid
        Host: 154.52.20.6 5200 fortinet
        ...
FTNT_Global valid
        Host: 154.52.6.95 5203 fortinet
        ...
```

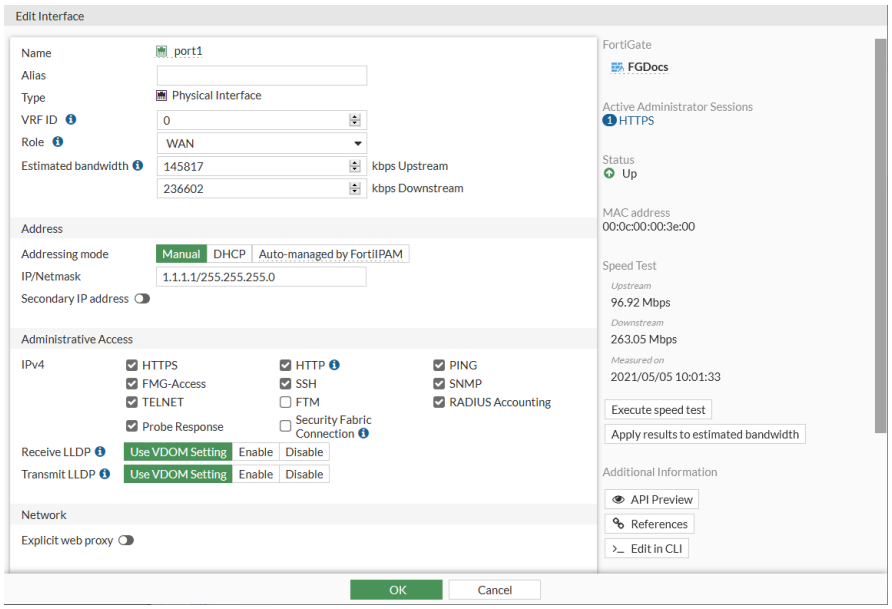
To run the speed test:

A speed test can be run with or without specifying a server. The system will automatically choose one server from the list and run the speed test. The test results are shown in the command terminal.

```
# execute speed-test <interface> <server> {Auto | TCP | UDP}
```

```
# diagnose netlink interface speed-test <interface> <server> {Auto | TCP | UDP}
```

See Speed test examples on page 1145 for a sample configurations.



GUI speed test

An interface speed test can be manually performed on WAN interfaces in the GUI. The results of the test can be added to the interface's *Estimated bandwidth*. The estimated upstream and downstream bandwidths can be used in SD-WAN service rules to determine the best link to use when either load balancing or best quality strategies are selected.

To run an interface speed test on a WAN interface:

1. Go to *Network* > *Interfaces*.
2. Edit a WAN interface. The interfaces can be grouped by role using the grouping dropdown on the right side of the toolbar.

3. Click *Execute speed test* in the right pane.

The CLI equivalent to running a speed test in the GUI is `execute speed-test <interface>`.

4. When the test completes, click *OK* in the *Confirm* pane to apply the results to the estimated bandwidth. The results can also be applied later by clicking *Apply results to estimated bandwidth*.

   The speed test results are used to populate the *Estimated bandwidth* fields.

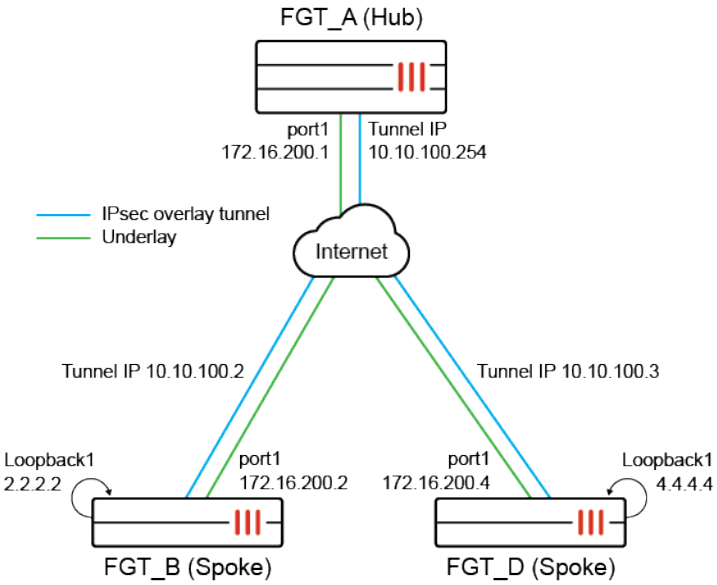
5. Click *OK*.

The FortiGate must be connected to FortiGuard, and able to reach either the AWS or Google speed test servers.

Scheduled interface speed test

The SD-WAN Network Monitor service supports running a speed test based on a schedule. The test results are automatically updated in the interface `measured-upstream-bandwidth` and `measured-downstream-bandwidth` fields. These fields do not impact the interface inbound bandwidth, outbound bandwidth, estimated upstream bandwidth, or estimated downstream bandwidth settings.

When the scheduled speed tests run, it is possible to temporarily bypass the bandwidth limits set on the interface and configure custom maximum or minimum bandwidth limits. These configurations are optional.



```
config system speed-test-schedule
    edit <interface>
        set mode {Auto | TCP | UDP}
        set schedules <schedule> ...
        set update-inbandwidth enable {enable | disable}
        set update-outbandwidth enable {enable | disable}
        set update-inbandwidth-maximum <integer>
        set update-outbandwidth-maximum <integer>
    next
end
```

`mode {Auto | TCP | UDP}`	Set the protocol used for the speed test: • `Auto` (default): dynamically select TCP or UDP based on the speed test setting. • `UDP`: use UDP. • `TCP`: use TCP.
`update-inbandwidth enable {enable | disable}`	Enable/disable bypassing the interface's inbound bandwidth setting.
`update-outbandwidth enable {enable | disable}`	Enable/disable bypassing the interface's outbound bandwidth setting.
`update-inbandwidth-maximum <integer>`	Set the maximum downloading bandwidth to be used in a speed test, in Kbps (0 - 16776000).
`update-outbandwidth-maximum <integer>`	Set the maximum uploading bandwidth to be used in a speed test, in Kbps (0 - 16776000).

See Example 4 for a sample configuration.

Hub and spoke speed tests

In an SD-WAN hub and spoke topology, connections between sites are typically made through VPN overlays. The hub usually acts as the VPN gateway with spokes connecting as dial-up VPN clients. In order to estimate the speed of the connection to each spoke, speed tests can be performed between the hub and each spoke. The results of the speed test can be used for egress traffic shaping on the VPN overlay tunnel.

A speed test server can be enabled on the hub or spoke with custom speed-test listening ports. The test measures the speeds of the link to each spoke so that QoS can be applied on the hub to the egress traffic shaping profile assigned to the IPsec overlay tunnel interface and the respective tunnel. An egress-shaping profile can be applied to local, remote, or both local and remote IPsec tunnels or no IPsec tunnels. Tests can be in upload or download direction and support both TCP and UDP protocols.

Speed test results are cached for future use. When speed tests are initiated from the hub, the results are cached on the hub. When speed tests are initiated from the spoke, the results are cached on the spoke, but sent to the hub.

When a speed-test server is enabled on a hub or spoke, two speed test daemons are started and listen on different ports for different purposes:

- The controller speed test daemon listens on the IPsec overlay interfaces to assign an access token to each incoming speed test for authentication.
- The speed test daemon listens on the IPsec underlay interfaces to handle the speed tests.

Each incoming speed test request must present the obtained access token to prevent random, unauthorized requests. Otherwise, the connection is closed immediately. As such, speed test access must be enabled on both the underlay and the IPsec overlay tunnel interfaces.

```
config system interface
    edit <interface>
        set allowaccess speed-test [other access] ...
    next
end
```

If the IPsec tunnel has a configured `exchange-ip`, speed test access must also be configured on the associated interface, such as the loopback interface.

The speed test client can be a hub or a spoke and must have `system speed-test-schedule` configured and the `dynamic-server` setting enabled. The speed-test schedule initiates the test.

On the speed test client, specify whether and how to apply the test results in a shaping profile. The shaping profile must be configured in the phase1 interface before it can be used with a speed test.

```
config system speed-test-schedule
    edit <interface>
        set server-port <integer>
        set ctrl-port <integer>
        set update-shaper {disable | local | remote | both}
    next
end
```

`set server-port <integer>`	Specify the port number for the speed-test server used for speed tests (1 - 65535, default = 5201).
`set ctrl-port <integer>`	Specify the port number for the controller on the speed-test server used for authentication (1 - 65535, default = 5200).
`set update-shaper {disable | local | remote | both}`	Set the egress shaper to use the speed test results: • `disable`: Disable updating the egress shaper (default). • `local`: Update the speed-test client egress shaper. • `remote`: Update the speed-test server egress shaper. • `both`: Update both the local and remote egress shapers.

CLI commands

Enable the speed-test server:

```
config system global
    set speedtest-server {enable | disable}
    set speedtestd-server-port <integer>
    set speedtestd-ctrl-port <integer>
end
```

`speedtest-server {enable | disable}`	Enable/disable the speed test server on the hub or spoke (default = disable).This enables iPerf in server mode, which listens on the default iPerf TCP port 5201.
`set speedtestd-server-port <integer>`	Specify a custom port number (1024 - 65535, default = 5201) for the speed test daemon. The port is used to perform the speed test.
`set speedtestd-ctrl-port <integer>`	Specify a custom port number (1024 - 65535. default = 5200) for the controller speed test daemon. The port is used to assign access tokens for authentication prior to performing the speed test.

Enable the speed test client:

```
config system speed-test-schedule
     edit <interface>
        set dynamic-server {enable | disable}
        set ctrl-port <integer>
        set server-port <integer>
        set update-shaper {disable | local | remote | both}
     next
 end
```

`<interface>`	The dial-up IPsec tunnel interface on the speed test client. The speed test client can be the hub or the spokes.
`dynamic-server {enable | disable}`	Enable/disable the dynamic speed test server (default = disable).
`Ctrl-port <integer>`	Specify the port number for the controller on the speed-test server used for authentication (1 - 65535, default = 5200).
`Server-port <integer>`	Specify the port number for the speed-test server used for speed tests (1 - 65535, default = 5201).
`Update-shaper {disable | local | remote | both}`	Set the egress shaper to use the speed test results: • `disable`: Disable updating the egress shaper (default). • `local`: Update the speed-test client egress shaper. • `remote`: Update the speed-test server egress shaper. • `both`: Update both the local and remote egress shapers.

To limit the maximum bandwidth used in the speed test, enable `set update-inbandwidth` and `set update-outbandwidth`. See Scheduled interface speed test on page 1125 for more information.

Enable speed test access on both the underlay and the IPsec overlay tunnel interfaces on the speed test server:

```
config system interface
    edit <interface>
        set allowaccess speed-test [other access] ...
    next
end
```

`<interface>`	The dial-up IPsec tunnel interface on the speed test server.
`set allowaccess {speed-test | [other access]}`	Enable speed-test access on the underlay and IPsec overlay interfaces.

Allow an SD-WAN member on the spoke to switch routes when on speed test from the hub to spokes:

```
config system sdwan
    set speedtest-bypass-routing {enable | disable}
    config neighbor
        edit <bgp neighbor>
            set mode speedtest
        next
    end
end
```

`speedtest-bypass-routing {enable | disable}`	Enable/disable bypass routing when doing a speed test on an SD-WAN member (default = disable).
`set mode speedtest`	Use the speed test to select the neighbor.

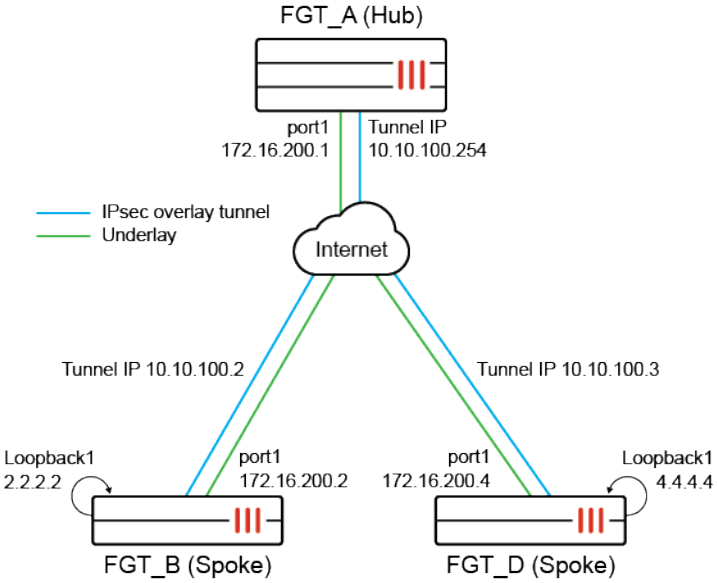
Manually run uploading speed test on the physical interfaces of each tunnel of a dial-up IPsec interface:

```
execute speed-test-dynamic <interface> <tunnel_name> <'y'/'n'> <max-out> <min-out>
```

`<interface>`	IPsec phase1 interface name.
`<tunnel_name>`	The tunnel name, or `all` for all tunnels.
`<'y'/'n'>`	Apply the result to the tunnels' shaper or not.
`<max-out>`	The maximum speed used in a speed test, in kbps.
`<min-out>`	The minimum speed used in a speed test, in kbps.

Manually run a non-blocking uploading speed test:

```
diagnose netlink interface speed-test-tunnel <interface> <tunnel_name>
```



Debug and test commands:

`diagnose debug application speedtest <int>`	Enable debug of the speed test module in the forticron daemon.

`diagnose debug application speedtestd <int>`	Enable debug of the speed test server daemon.
`diagnose test application forticron 9`	List the scheduled speed tests.
`diagnose test application forticron 10`	Show the cached speed test results.
`diagnose test application forticron 11`	Write the cached speed test results to disk.
`diagnose test application forticron 12`	Load the speed test results from disk.
`diagnose test application forticron 99`	Cancel all pending speed tests.

Running speed tests from the hub to the spokes in dial-up IPsec tunnels

In this example, the hub is configured as a VPN dial-up server and both of the spokes are connected to the hub. It is assumed that the VPN configuration is already done, with a dynamic gateway type and kernel device creation (`net-device`) disabled. Only one SD-WAN interface is used, so there is only one VPN overlay member in the SD-WAN zone. Multiple WAN interfaces and VPN overlays could be used.

The VPN interfaces and IP addresses are:

FortiGate	Interface	IP Address
FGT_A (Hub)	hub-phase1	10.10.100.254
FGT_B (Spoke)	spoke11-p1	10.10.100.2
FGT_D (Spoke)	spoke21-p1	10.10.100.3

A recurring speed test is configured that runs on the hub over the dial-up interfaces. The speed tests are performed over the underlay interface from the hub to the spoke. Each spoke is configured to operate as a speed test server and to allow

the speed test to run on its underlay interface. The spokes establish BGP peering with the hub over the VPN interface, and advertises its loopback network to the hub. The specific configuration is only shown for FGT_B.

When the speed test is running, routing through the VPN overlay can be bypassed, and route maps are used to filter the routes that are advertised to peers. The spoke's route map does not advertise any routes to the peer, forcing the hub to use others paths to reach the spoke's network.

When no speed tests are running, the spoke's route map allows its network to be advertised on the hub.

When the speed test is complete, the measured egress bandwidth is dynamically applied to the VPN tunnel on the hub, and the result is cached for future use, in case the tunnel is disconnected and reconnected again.

To configure the hub FortiGate (FGT_A) as the speed-test client:

1. Configure a shaping profile:

```
config firewall shaping-profile
    edit "profile_1"
        config shaping-entries
            edit 1
                set class-id 2
                set priority low
                set guaranteed-bandwidth-percentage 10
                set maximum-bandwidth-percentage 10
            next
        end
        set default-class-id 2
    next
end
```

   Three classes are used in the profile for low, medium, and high priority traffic. Each class is assigned a guaranteed and maximum bandwidth as a percentage of the measured bandwidth from the speed test.

2. Configure a shaping policy to assign certain traffic as a class ID:

   In this example, all traffic destined to the dialup tunnels are assigned class 3.

```
config firewall shaping-policy
    edit 2
        set service "ALL"
        set schedule "always"
        set dstintf "hub-phase1" "hub2-phase1"
        set class-id 3
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

3. Use the shaping profile in the interface:

```
config system interface
    edit "hub-phase1"
        set egress-shaping-profile "profile_1"
    next
end
```

4. Configure a schedule to use for the speed tests:

```
config firewall schedule recurring
    edit "speedtest_recurring"
```

```
        set start 01:00
        set end 23:00
        set day monday tuesday wednesday thursday friday saturday
    next
end
```

5. Configure the speed test schedule:

   The custom controller port used for authentication is set to 6000, and the custom port used to run the speed tests is set to 7000. The shaping profile is set to local.

```
config system speed-test-schedule
    edit "hub-phase1"
        set schedules "speedtest_recurring"
        set dynamic-server enable
        set ctrl-port 6000
        set server-port 7000
        set update-shaper remote
    next
end
```

To configure the spoke FortiGates (FGT_B) as a speed test server:

1. Enable a speed test server with custom speed-test listening ports:

   A speed test server is enabled on the hub. Port 7000 will run speed tests, and port 6000 will be the controller used to issue access tokens for speed test authentication.

```
config system global
     set speedtest-server enable
     set speedtestd-ctrl-port 6000
     set speedtestd-server-port 7000
end
```

2. Allow speed tests on the underlay:

```
config system interface
    edit "port1"
        append allowaccess speed-test
    next
end
```

3. Allow speed tests on the overlay:

```
config system interface
    edit "hub-spoke11-p1"
        set allowaccess ping speed-test
        ...
        set interface "port1"
    next
end
```

4. Configure SD-WAN with bypass routing enabled for speed tests on member *spoke11-p1*:

```
config system sdwan
    set speedtest-bypass-routing enable
    config members
        edit 1
            set interface "spoke11-p1"
        next
```

```
        end
        config neighbor
            edit "10.10.100.254"
                set member 1
                set mode speedtest
            next
        end
    end
```

5. Configure BGP routing:

```
config router route-map
    edit "No_Speed-Test"
        config rule
            edit 1
                set action permit
            next
        end
    next
    edit "Start_Speed-Test"
        config rule
            edit 1
                set action deny
            next
        end
    next
end

config router bgp
    set as 65412
    config neighbor
        edit "10.10.100.254"
            set remote-as 65412
            set route-map-out "Start_Speed-Test"
            set route-map-out-preferable "No_Speed-Test"
        next
    end
    config network
        edit 1
            set prefix 2.2.2.2 255.255.255.255
        next
        edit 2
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end
```

Results

1. Before the speed test starts, FGT_A can receive the route from FGT_B by BGP:

```
# get router info routing-table bgp
Routing table for VRF=0
B       2.2.2.2/32 [200/0] via 10.10.100.2 (recursive via 172.16.200.2, hub-phase1),
00:00:10
B       10.1.100.0/24 [200/0] via 10.10.100.2 (recursive via 172.16.200.2, hub-phase1),
00:00:10
```

2. At the scheduled time, the speed test starts for the hub-phase1 interface from hub to spoke:

```
# diagnose test application forticron 9
Speed test schedules:
    Interface     Server     Update    Up/Down-limit (kbps)                Days
H:M     TOS     Schedule
-------------------------------------------------------------------------------------------
----------------------------------
    hub-phase1    dynamic                                                   1111111
14:41    0x00    speedtest_recurring
Active schedules:
        64002f: hub-phase1(port1) 172.16.200.2     hub-phase1_1
        64002e: hub-phase1(port1) 172.16.200.4     hub-phase1_0
```

The `diagnose debug application speedtest -1` command can be used on both the hub and spokes to check the speed test execution.

3. While the speed test is running, FGT_A does not receive the route from FGT_B by BGP:

```
#  get router info routing-table bgp
Routing table for VRF=0
```

4. Speed tests results can be dynamically applied to the dial-up tunnel for egress traffic shaping:

```
# diagnose vpn tunnel list
------------------------------------------------------
name=hub-phase1_0 ver=2 serial=c 172.16.200.1:0->172.16.200.4:0 tun_id=172.16.200.4 dst_
mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
...
egress traffic control:
        bandwidth=737210(kbps) lock_hit=0 default_class=2 n_active_class=3
        class-id=2      allocated-bandwidth=73720(kbps)         guaranteed-
bandwidth=73720(kbps)
                        max-bandwidth=73720(kbps)       current-bandwidth=0(kbps)
                        priority=low    forwarded_bytes=52
                        dropped_packets=0       dropped_bytes=0
        class-id=3      allocated-bandwidth=221163(kbps)        guaranteed-
bandwidth=221162(kbps)
                        max-bandwidth=294883(kbps)      current-bandwidth=0(kbps)
                        priority=medium         forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
        class-id=4      allocated-bandwidth=442325(kbps)        guaranteed-
bandwidth=147441(kbps)
                        max-bandwidth=442325(kbps)      current-bandwidth=0(kbps)
                        priority=high   forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
------------------------------------------------------
name=hub-phase1_1 ver=2 serial=d 172.16.200.1:0->172.16.200.2:0 tun_id=172.16.200.2 dst_
mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
...
egress traffic control:
        bandwidth=726813(kbps) lock_hit=0 default_class=2 n_active_class=3
        class-id=2      allocated-bandwidth=72681(kbps)         guaranteed-
bandwidth=72681(kbps)
                        max-bandwidth=72681(kbps)       current-bandwidth=0(kbps)
                        priority=low    forwarded_bytes=123
                        dropped_packets=0       dropped_bytes=0
        class-id=3      allocated-bandwidth=218044(kbps)        guaranteed-
```

```
bandwidth=218043(kbps)
                        max-bandwidth=290725(kbps)      current-bandwidth=0(kbps)
                        priority=medium         forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
        class-id=4      allocated-bandwidth=436087(kbps)        guaranteed-
bandwidth=145362(kbps)
                        max-bandwidth=436087(kbps)      current-bandwidth=0(kbps)
                        priority=high   forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
```

5. Speed test results can be cached, indexed, and written to disk:

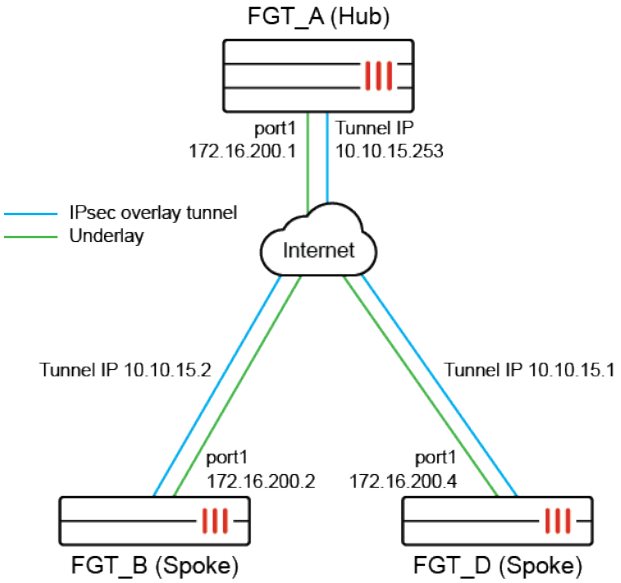
```
# diagnose test application forticron 10
Speed test results:
1: vdom=root, phase1intf=hub-phase1, peer-id='spoke11-p1', bandwidth=737210, last_
log=1624226603
2: vdom=root, phase1intf=hub-phase1, peer-id='spoke21-p1', bandwidth=726813, last_
log=1624226614

# diagnose test application forticron 11
Write 2 logs to disk.

# diagnose test application forticron 12
load 2 results.
```

Disable then reenable the IPsec VPN tunnel and the cached speed test results can be applied to the tunnel again:

```
# diagnose vpn tunnel list
------------------------------------------------------
name=hub-phase1_0 ver=2 serial=c 172.16.200.1:0->172.16.200.4:0 tun_id=172.16.200.4 dst_
mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
...
egress traffic control:
        bandwidth=737210(kbps) lock_hit=0 default_class=2 n_active_class=3
------------------------------------------------------
name=hub-phase1_1 ver=2 serial=d 172.16.200.1:0->172.16.200.2:0 tun_id=172.16.200.2 dst_
mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
...
egress traffic control:
        bandwidth=726813(kbps) lock_hit=0 default_class=2 n_active_class=3
```



Running speed tests from spokes to the hub in dial-up IPsec tunnels

In this hub and spoke example, the hub is configured as an IPsec VPN dial-up server with two IPsec tunnels, and each tunnel is connected to a spoke. The VPN interfaces and IP addresses are:

FortiGate	Interface	IP Address
FGT_A (Hub)	hub-phase1	10.10.15.253
FGT_B (Spoke)	spoke11-p1	10.10.15.2
FGT_D (Spoke)	spoke21-p1	10.10.15.1

The hub (FGT_A) is configured as a speed-test server to listen on custom ports (6000 and 7000), and the spokes (FGT_B and FGT_D) are configured as speed-test clients. This setup allows speed tests to successfully perform when spokes

are behind NAT devices. The results of the speed test will be applied to the hub-phase1 overlay tunnel(s) as specified by the speed-test clients.

The spokes are configured to initiate speed tests on a schedule on UDP. After the speed test completes, the results are sent to the hub, and the hub applies the results on its IPsec tunnels as egress traffic shaping. The results are also cached and can be used if an IPsec tunnel is disconnected and reconnected again.

To configure the hub FortiGate (FGT_A) as the speed test server:

1. Configure a shaping profile:

   In this example, the shaping profile is named profile_1.

```
config firewall shaping-profile
    edit "profile_1"
        set default-class-id 2
        config shaping-entries
            edit 1
                set class-id 2
                set priority low
                set guaranteed-bandwidth-percentage 10
                set maximum-bandwidth-percentage 10
            next
            edit 2
                set class-id 3
                set priority medium
                set guaranteed-bandwidth-percentage 30
                set maximum-bandwidth-percentage 40
            next
            edit 3
                set class-id 4
                set guaranteed-bandwidth-percentage 20
                set maximum-bandwidth-percentage 60
            next
        end
```

```
    end
end
```

Three classes are used in the profile for low, medium, and high priority traffic. Each class is assigned a guaranteed and maximum bandwidth as a percentage of the measured bandwidth from the speed test.

2. Configure a shaping policy to assign certain traffic as a class ID:

   In this example, all traffic destined to the dialup tunnels are assigned class 3.

```
config firewall shaping-policy
    edit 2
        set service "ALL"
        set schedule "always"
        set dstintf "hub-phase1" "hub2-phase1"
        set class-id 3
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

3. Enable a speed test server with custom speed-test listening ports:

   A speed test server is enabled on the hub. Port 7000 will run speed tests, and port 6000 will be the controller used to issue access tokens for speed test authentication.

```
config system global
    ...
    set speedtest-server enable
    set speedtestd-ctrl-port 6000
    set speedtestd-server-port 7000
end
```

4. Allow the speed test on the underlay:

```
config system interface
    edit "port1"
        set ip 172.16.200.1 255.255.255.0
        set allowaccess ping https ssh snmp http telnet fgfm radius-acct probe-response
fabric speed-test
        ...
    next
end
```

5. Allow the speed test on the overlay and use the shaping profile in the interface:

   In this example, speed tests are allowed on the overlay, and the shaping profile (profile_1) is used on the hub phase1 interface (port1).

```
config system interface
    edit "hub-phase1"
        set ip 10.10.15.253 255.255.255.255
        set allowaccess ping speed-test
        set egress-shaping-profile "profile_1"
        ...
        set interface "port1"
    next
end
```

To configure the first spoke FortiGate (FGT_B) as a speed test client:

1. Configure `system speed-test-schedule`:

   The protocol mode is set to UDP. The custom controller port used for authentication is set to 6000, and the custom port used to run the speed tests is set to 7000. The shaping profile is set to remote.

```
config system speed-test-schedule
    edit "spoke11-p1"
        set mode UDP
        set schedules "1"
        set dynamic-server enable
        set ctrl-port 6000
        set server-port 7000
        set update-shaper remote
    next
end
```

2. Configure a recurring schedule for the speed tests:

   Schedule 1 is set to start at 08:37 every day of the week.

```
config firewall schedule recurring
    edit "1"
        set start 08:37
        set day sunday monday tuesday wednesday thursday friday saturday
    next
end
```

To configure the second spoke FortiGate (FGT_D) as a speed test client:

1. Configure a speed test schedule:

   The protocol mode is set to UDP. The custom controller port used for authentication is set to 6000, and the custom port used to run the speed tests is set to 7000. The shaping profile is set to remote.

```
config system speed-test-schedule
    edit "spoke21-p1"
        set mode UDP
        set schedules "1"
        set dynamic-server enable
        set ctrl-port 6000
        set server-port 7000
        set update-shaper remote
    next
end
```

2. Configure a recurring schedule for the speed tests:

   Schedule 1 is set to start at 08:37 every day of the week.

```
config firewall schedule recurring
    edit "1"
        set start 08:37
        set day sunday monday tuesday wednesday thursday friday saturday
    next
end
```

To view the speed test results:

1. After the speed test schedule runs, view the result on spoke FGT_B:

   On spoke FGT_B, authentication succeeds through port 6000, and the test runs on port 7000. UDP mode is used, and the test is successful.

```
# diagnose debug application speedtest -1

......
fcron_speedtest_ipsec_request_init()-464: root: spoke11-p1(spoke11-p1) id=003900d5

[speedtest(4309)]
[speedtest(4309)] speed test Done.
fcron_speedtest_notify_func()-1275: Speed test pid=4309 done

fcron_speedtest_on_test_finish()-1211: Test 380011 for 'spoke21-p1' succeed with
up=454398, down=470794
fcron_speedtest_save_results()-1144: Write logs to disk: succ=1, fail=0
fcron_speedtest_sync_results()-1172: Sync cached results to secondary devices.
```

3. After the speed test schedule runs, view the result on the hub (FGT_A):

The server side uses `speedtestd`, while the client side uses `speedtest`.

The speed test results are applied on hub-phase1_0 and hub_phase1_1 as egress traffic shaping.

```
# diagnose debug application speedtestd -1

......
[speedtest(2771)] [  7] local 172.16.200.1 port 7000 connected to 172.16.200.2 port
17553
......
[speedtest(2771)] [  7] local 172.16.200.1 port 7000 connected to 172.16.200.2 port 7998
......
[sptestd::ctrl(0377):root] set shaper: if=hub-phase1, tun=hub-phase1_0, sp=profile_1,
bw=459745
......
[speedtest(2771)] [  7] local 172.16.200.1 port 7000 connected to 172.16.200.4 port
15349
......
[speedtest(2771)] [  7] local 172.16.200.1 port 7000 connected to 172.16.200.4 port
19586
......
[sptestd::ctrl(0377):root] set shaper: if=hub-phase1, tun=hub-phase1_1, sp=profile_1,
bw=470855
......
```

4. Verify the result is cached on the spokes.

- On FGT_B, the speed test results are cached:

```
#  diagnose test application forticron 10
Speed test results:
1: vdom=root, phase1intf=spoke11-p1, peer-id='172.16.200.1', up=454043, dw=459694,
time=12/13 12:32:19
```

- On FGT_D, the speed test results are cached:

```
#   diagnose test application forticron 10
Speed test results:
1: vdom=root, phase1intf=spoke21-p1, peer-id='172.16.200.1', up=454398, dw=470794,
time=12/12 16:33:18
```

5. On the hub (FGT_A), verify the speed test results are applied to the hub's IPsec tunnels as egress traffic shaping: On hub-phase1_0 and hub-phase1_1, the correct traffic control is displayed.

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
......
------------------------------------------------------

```

Speed test usage

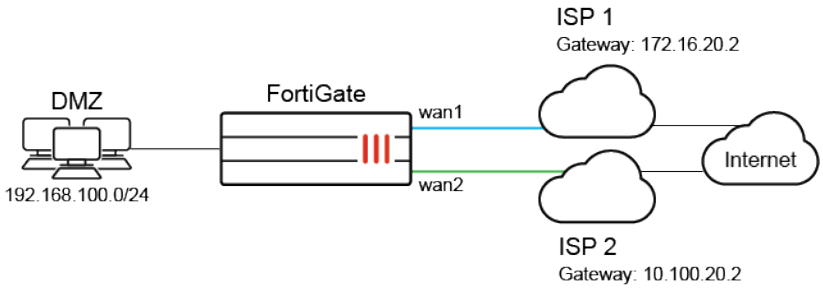
Using speed test results with SD-WAN

The interface speed test can be used to populate the bandwidth values based on the results.

To manually configure the upstream and downstream interface bandwidth values in the GUI:

1. Go to *Network* > *Interfaces*.
2. Edit a WAN interface.
3. Input the results from the speed test in the *Estimated bandwidth* section, specifically into the appropriate *kbps Upstream* or *kbps Downstream* fields.
4. Click *OK*.

Alternatively, use the GUI speed test on page 1124 to add the speed test results to the interface's estimated bandwidth with one click.



To manually configure the upstream and downstream interface bandwidth values in the CLI:

```
config system interface
    edit <interface>
        set estimated-upstream-bandwidth <speed in kbps>
        set estimated-downstream-bandwidth <speed in kbps>
    next
end
```

The populated bandwidth values can be employed in conjunction with various WAN intelligence strategies such as load balancing without SLA targets, load balancing with SLA targets, and best quality. These strategies are used to select an SD-WAN interface in SD-WAN service rules.

Example

In this example, SD-WAN interfaces, wan1 and wan2, are connected to two different internet service providers (ISPs), both providing access to the public internet. The preference is for Gmail services to use the link with the highest bandwidth.

To apply speed test results to a best quality SD-WAN rule:

1. Run theGUI speed test on page 1124 on wan1 and wan2:
   a. When the test is complete, click *OK* in the *Confirm* pane to apply the results to the estimated bandwidth.
2. Add wan1 and wan2 as SD-WAN members, then add a policy and static route. See SD-WAN quick start on page 765 for more information.
3. Configure the health check:
   a. Go to *Network* > *SD-WAN*, select the *Performance SLAs* tab, and click *Create New*.
   b. Enter a name for the performance SLA, such as *google*, and set the *Server* to *google.com*. See Health checks for more information.
   c. Click *OK*.
4. Configure an SD-WAN rule to use best quality with bandwidth set as the quality criteria:
   a. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
   b. Enter a name for the rule, such as *gmail*.
   c. Configure the following settings:

Internet service	*Google-Gmail*
Interface selection strategy	*Best quality*
Interface preference	*wan1* and *wan2*
Measured SLA	*google*
Quality criteria	*Bandwidth*

   d. Click *OK*.
5. Verify that the *Estimated bandwidth* values are used to select an SD-WAN interface in SD-WAN service rules.
   a. Verify the health check status:

```
# diagnose sys sdwan health-check status
Health Check(google):
Seq(1 wan1): state(alive), packet-loss(0.000%) latency(4.996), jitter(0.824), mos
(4.401), bandwidth-up(414400), bandwidth-dw(405115), bandwidth-bi(819515) sla_map=0x0
Seq(2 wan2): state(alive), packet-loss(0.000%) latency(4.634), jitter(0.340), mos
(4.402), bandwidth-up(443975), bandwidth-dw(699264), bandwidth-bi(1143239) sla_
map=0x0
```

   b. Verify the service rule 1 diagnostics:

```
# diagnose sys sdwan service 1

Service(1): Address Mode(IPV4) flags=0x4200 use-shortcut-sla use-shortcut
 Tie break: cfg
  Gen(1), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(priority),
link-cost-factor(bibandwidth), link-cost-threshold(10), heath-check(google)
  Members(2):
    1: Seq_num(2 wan2 virtual-wan-link), alive, bibandwidth: 1143239Kbps, selected
    2: Seq_num(1 wan1 virtual-wan-link), alive, bibandwidth: 819506Kbps, selected
  Internet Service(1): Google-Gmail(65646,0,0,0,0)
```

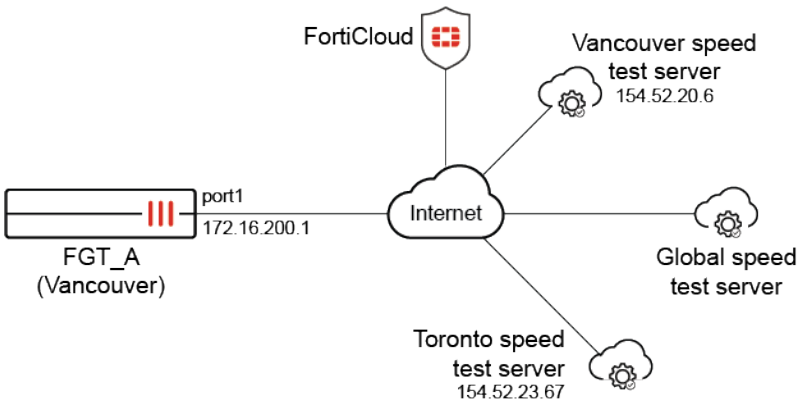
Since wan2 has superior bandwidth, SD-WAN will prioritize Seq_num(2) over Seq_num(1), and wan2 will be utilized to route Gmail traffic. The bandwidth is automatically determined by the *Estimated bandwidth* values, which were populated by running a speed test in the GUI.

Using speed test results with traffic shaping

The interface speed test can be used to populate the bandwidth values based on the results.

To configure the outbandwidth value in the GUI:

1. Go to *Network* > *Interfaces*.
2. Edit an interface.
3. In the *Traffic Shaping* section, enable *Outbound bandwidth* and enter the result obtained from the speed test's uploading mode.
4. Click *OK*.



To configure the outbandwidth and inbandwidth values in the CLI:

```
config system interface
    edit <interface>
        set outbandwidth <speed_in_kbps>
        set inbandwidth <speed_in_kbps>
    next
end
```

The populated bandwidth values can be used in conjunction with either an egress or ingress traffic shaping profile.

Speed test examples

This topic includes examples that show various tests based on different modes (auto, TCP, UDP), latency thresholds, and test servers. Some test protocols and servers are manually configured, while others are chosen by the FortiGate.

These examples assume the FortiGate is connected to the internet, has a valid SD-WAN Network Monitor license, and has downloaded the server list of speed tests from FortiCloud. See CLI speed test on page 1123 for more information.

- Example 1: executing a speed test without specifying the interface, server, and mode
- Example 2: executing a speed test with a lower latency threshold setting
- Example 3: executing the speed test with diagnose netlink interface speed-test
- Example 4: executing the speed test according to the schedule
- Example 5: executing multiple speed tests with TCP and UDP connections

Example 1: executing a speed test without specifying the interface, server, and mode

Geographically, the Vancouver server (154.52.20.6) has the smallest latency (around 7 ms) to FGT_A, so it will be automatically selected for the speed test because the latency 7 ms to 154.52.20.6 is less than the default `latency-threshold` of 60 ms. Meanwhile, four TCP connections will be initiated to perform the test since the default `multiple-tcp-stream` is 4.

To execute the speed test without specifying parameters:

1. Configure the speed test settings:

```
config system speed-test-setting
    set latency-threshold 60
    set multiple-tcp-stream 4
end
```

2. Execute a ping to the closest test server, 154.52.20.6, to learn the latency for the connection:

```
# execute ping 154.52.20.6
PING 154.52.20.6 (154.52.20.6): 56 data bytes
64 bytes from 154.52.20.6: icmp_seq=0 ttl=50 time=7.5 ms
64 bytes from 154.52.20.6: icmp_seq=1 ttl=50 time=7.2 ms
64 bytes from 154.52.20.6: icmp_seq=2 ttl=50 time=7.1 ms
64 bytes from 154.52.20.6: icmp_seq=3 ttl=50 time=7.1 ms
64 bytes from 154.52.20.6: icmp_seq=4 ttl=50 time=9.1 ms

--- 154.52.20.6 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 7.1/7.6/9.1 ms
```

3. Run the speed test with no parameters:

```
# execute speed-test
Initializing speed test.
current vdom=root
Run in uploading mode.
Connecting to host 154.52.20.6, port 5203
[  7] local 172.16.200.1 port 21219 connected to 154.52.20.6 port 5203
[  9] local 172.16.200.1 port 21220 connected to 154.52.20.6 port 5203
[ 11] local 172.16.200.1 port 21221 connected to 154.52.20.6 port 5203
[ 13] local 172.16.200.1 port 21222 connected to 154.52.20.6 port 5203
[ ID] Interval           Transfer     Bitrate         Retr  Cwnd
[  7]   0.00-1.00   sec  22.4 MBytes   188 Mbits/sec   17    140 KBytes
[  9]   0.00-1.00   sec  9.71 MBytes  81.4 Mbits/sec    6   73.5 KBytes
[ 11]   0.00-1.00   sec  18.5 MBytes   155 Mbits/sec   12    117 KBytes
...
[SUM]   0.00-5.02   sec   321 MBytes   536 Mbits/sec                  receiver

speed test Done.
Run in reverse downloading mode.
Connecting to host 154.52.20.6, port 5203
Reverse mode, remote host 154.52.20.6 is sending
[  7] local 172.16.200.1 port 21228 connected to 154.52.20.6 port 5203
[ 11] local 172.16.200.1 port 21229 connected to 154.52.20.6 port 5203
...
[SUM]   0.00-5.00   sec   331 MBytes   555 Mbits/sec                  receiver

speed test Done.
```

The tested upload/download speed for port1 is 536 Mbps/555 Mbps when connecting to the closest server with four TCP connections.

Example 2: executing a speed test with a lower latency threshold setting

The `latency-threshold` setting is changed to 5 ms, which is less than the latency 7 ms to 154.52.20.6. When executing the speed test, one UDP connection will be initiated as expected.

To execute the speed test with a lower latency threshold setting:

1. Edit the speed test settings:

```
config system speed-test-setting
    set latency-threshold 5
end
```

2. Run the speed test:

```
# execute speed-test
Speed test quota for 7/19 is 4
current vdom=root
Run in uploading mode.
Connecting to host 154.52.20.6, port 5202
[  7] local 172.16.200.1 port 5315 connected to 154.52.20.6 port 5202

[  7]   0.00-5.00   sec   355 MBytes   595 Mbits/sec  0.014 ms  295028/552025 (53%)
receiver

speed test Done.
```

The tested upload/download speed for port1 is 917 Mbps/595 Mbps when connecting to the closest server with one UDP connection.

Example 3: executing the speed test with diagnose netlink interface speed-test

After running this diagnose command, the results are recorded in the interface settings for reference as `measured-upstream-bandwidth` and `measured-downstream-bandwidth`.

To execute the speed test:

```
# diagnose netlink interface speed-test port1 FTNT_CA_Vancouver TCP
speed-test test ID is b0066
...
```

To view the interface settings:

```
show system interface port1
config system interface
    edit "port1"
        ...
        set measured-upstream-bandwidth 735682
        set measured-downstream-bandwidth 746573
        set bandwidth-measure-time 1689811319
        ...
    next
end
```

Example 4: executing the speed test according to the schedule

After running the speed test, the results are recorded in the interface settings for reference as `measured-upstream-bandwidth` and `measured-downstream-bandwidth`.

To execute the speed test according to the schedule:

1. Configure the recurring schedule:

```
config firewall schedule recurring
    edit "speedtest_recurring"
        set start 17:07
        set day sunday monday tuesday wednesday thursday friday saturday
    next
end
```

2. Configure the speed test schedule:

```
config system speed-test-schedule
    edit "port1"
        set mode TCP
        set schedules "speedtest_recurring"
    next
end
```

   The speed test will be initiated at 17:07 based on 10 TCP connections. The results will be recorded in port1's interface settings.

3. Verify the speed test results:

```
show system interface port1
config system interface
    edit "port1"
        ...
        set measured-upstream-bandwidth 715636
        set measured-downstream-bandwidth 819682
        set bandwidth-measure-time 1689811759
        ...
    next
end
```

Example 5: executing multiple speed tests with TCP and UDP connections

A speed test is executed to the closest server using 64 TCP connections and another speed test is executed using one UDP connection. The results can be checked with a third-party platform (such as Ookla), which returns comparable results.

To execute multiple speed tests with TCP and UDP connections:

1. Edit the speed test settings:

```
config system speed-test-setting
    set multiple-tcp-stream 64
end
```

2. Run the TCP speed test:

```
# execute speed-test port1 FTNT_CA_Vancouver TCP
...
Run in uploading mode.
...
[SUM]   0.00-5.00   sec   559 MBytes   938 Mbits/sec  2165             sender
[SUM]   0.00-5.01   sec   558 MBytes   933 Mbits/sec                  receiver

speed test Done.
Run in reverse downloading mode.
...
[SUM]   0.00-5.01   sec   505 MBytes   846 Mbits/sec  9329             sender
[SUM]   0.00-5.00   sec   491 MBytes   823 Mbits/sec                  receiver
```

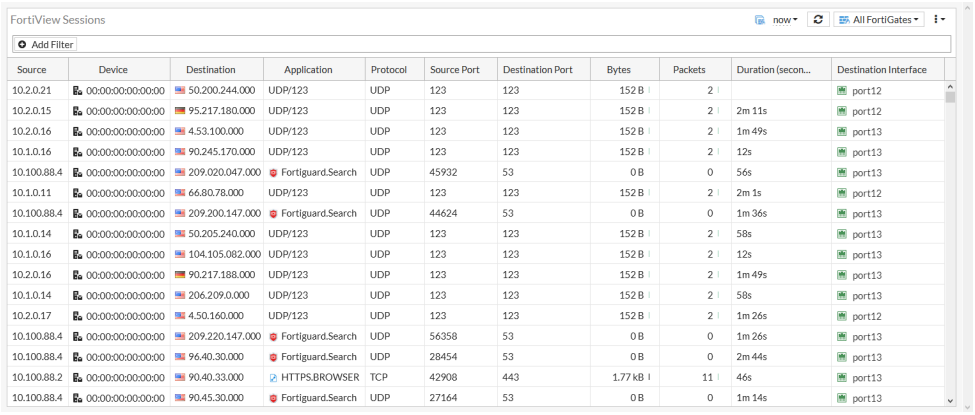
3. Run the UDP speed test:

```
# execute speed-test port1 FTNT_CA_Vancouver UDP
...
Run in uploading mode.
...
[  7]   0.00-5.00   sec   556 MBytes   933 Mbits/sec  0.000 ms  0/402727 (0%)  sender
[  7]   0.00-5.04   sec   556 MBytes   925 Mbits/sec  0.020 ms  393/402717 (0.098%)
receiver
...
Run in reverse downloading mode.
...
[  7]   0.00-5.04   sec   869 MBytes  1.45 Gbits/sec  0.000 ms  0/629383 (0%)  sender
[SUM]  0.0- 5.0 sec  2 datagrams received out-of-order
[  7]   0.00-5.00   sec   489 MBytes   821 Mbits/sec  0.005 ms  274103/628393 (44%)
receiver

speed test Done.
```

Troubleshooting SD-WAN

The following topics provide instructions on SD-WAN troubleshooting:



- Tracking SD-WAN sessions on page 1151
- Understanding SD-WAN related logs on page 1151
- SD-WAN related diagnose commands on page 1154
- Using SNMP to monitor health check on page 1159

Tracking SD-WAN sessions

You can check the destination interface in *Dashboard* > *FortiView Sessions* in order to see which port the traffic is being forwarded to.

The example below demonstrates a source-based load-balance between two SD-WAN members:

- If the source IP address is an *even* number, it will go to *port13*.
- If the source IP address is an *odd* number, it will go to *port12*.

Source	Device	Destination	Application	Protocol	Source Port	Destination Port	Bytes	Packets	Duration (secon...	Destination Interface
10.2.0.21	00:00:00:00:00:00	50.200.244.000	UDP/123	UDP	123	123	152 B	2		port12
10.2.0.15	00:00:00:00:00:00	95.217.180.000	UDP/123	UDP	123	123	152 B	2	2m 11s	port12
10.2.0.16	00:00:00:00:00:00	4.53.100.000	UDP/123	UDP	123	123	152 B	2	1m 49s	port13
10.1.0.16	00:00:00:00:00:00	90.245.170.000	UDP/123	UDP	123	123	152 B	2	12s	port13
10.100.88.4	00:00:00:00:00:00	209.020.047.000	Fortiguard.Search	UDP	45932	53	0 B	0	56s	port13
10.1.0.11	00:00:00:00:00:00	66.80.78.000	UDP/123	UDP	123	123	152 B	2	2m 1s	port12
10.100.88.4	00:00:00:00:00:00	209.200.147.000	Fortiguard.Search	UDP	44624	53	0 B	0	1m 36s	port13
10.1.0.14	00:00:00:00:00:00	50.205.240.000	UDP/123	UDP	123	123	152 B	2	58s	port13

Understanding SD-WAN related logs

This topic lists the SD-WAN related logs and explains when the logs will be triggered.

Health-check detects a failure:

- When health-check detects a failure, it will record a log:

```
1: date=2021-04-20 time=17:06:31 eventtime=1618963591590008160 tz="-0700"
logid="0100022921" type="event" subtype="system" level="critical" vd="root"
logdesc="Routing information changed" name="test" interface="R150" status="down"
msg="Static route on interface R150 may be removed by health-check test. Route:
(10.100.1.2->10.100.2.22 ping-down)"
```

- When health-check detects a recovery, it will record a log:

```
2: date=2021-04-20 time=17:11:46 eventtime=1618963906950174240 tz="-0700"
logid="0100022921" type="event" subtype="system" level="critical" vd="root"
logdesc="Routing information changed" name="test" interface="R150" status="up"
```

```
msg="Static route on interface R150 may be added by health-check test. Route:
(10.100.1.2->10.100.2.22 ping-up)"
```

Health-check has an SLA target and detects SLA qualification changes:

- When health-check has an SLA target and detects SLA changes, and changes to fail:

```
1: date=2021-04-20 time=21:32:33 eventtime=1618979553388763760 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN
status" eventtype="Health Check" healthcheck="test" slatargetid=1 oldvalue="2"
newvalue="1" msg="Number of pass member changed."

2: date=2021-04-20 time=21:32:33 eventtime=1618979553388751880 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN
status" eventtype="Health Check" healthcheck="test" slatargetid=1 member="1" msg="Member
status changed. Member out-of-sla."
```

- When health-check has an SLA target and detects SLA changes, and changes to pass:

```
1: date=2021-04-20 time=21:38:49 eventtime=1618979929908765200 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN
status" eventtype="Health Check" healthcheck="test" slatargetid=1 oldvalue="1"
newvalue="2" msg="Number of pass member changed."

2: date=2021-04-20 time=21:38:49 eventtime=1618979929908754060 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="information" vd="root"
logdesc="SDWAN status" eventtype="Health Check" healthcheck="test" slatargetid=1
member="1" msg="Member status changed. Member in sla."
```

SD-WAN calculates a link's session/bandwidth over/under its ratio and stops/resumes traffic:

- When SD-WAN calculates a link's session/bandwidth over its configured ratio and stops forwarding traffic:

```
1: date=2021-04-20 time=21:55:14 eventtime=1618980914728863220 tz="-0700"
logid="0113022924" type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN
volume status" eventtype="Volume" interface="R160" member="2" msg="Member enters into
conservative status with limited ablity to receive new sessions for too much traffic."
```

- When SD-WAN calculates a link's session/bandwidth according to its ratio and resumes forwarding traffic:

```
2: date=2021-04-20 time=22:12:52 eventtime=1618981972698753360 tz="-0700"
logid="0113022924" type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN
volume status" eventtype="Volume" interface="R160" member="2" msg="Member resume normal
status to receive new sessions for internal adjustment"
```

The SLA mode service rule's SLA qualified member changes:

- When the SLA mode service rule's SLA qualified member changes. In this example R150 fails the SLA check, but is still alive:

```
1: date=2021-04-20 time=22:40:46 eventtime=1618983646428803040 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN
status" eventtype="Service" serviceid=1 service="test" seq="2,1" msg="Service
prioritized by SLA will be redirected in sequence order."
```

- When the SLA mode service rule's SLA qualified member changes. In this example R150 changes from fail to pass:

```
2: date=2021-04-20 time=22:41:51 eventtime=1618983711678827920 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN
```

```
status" eventtype="Service" serviceid=1 service="test" seq="1,2" msg="Service
prioritized by SLA will be redirected in sequence order."
```

The priority mode service rule member's link status changes:

- When priority mode service rule member's link status changes. In this example R150 changes to better than R160, and both are still alive:

```
1: date=2021-04-20 time=22:56:55 eventtime=1618984615708804760 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN
status" eventtype="Service" serviceid=1 service="test" metric="packet-loss" seq="2,1"
msg="Service prioritized by performance metric will be redirected in sequence order."
```

- When priority mode service rule member's link status changes. In this example R160 changes to better than R150, and both are still alive:

```
2: date=2021-04-20 time=22:56:58 eventtime=1618984618278852140 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN
status" eventtype="Service" serviceid=1 service="test" metric="packet-loss" seq="1,2"
msg="Service prioritized by performance metric will be redirected in sequence order."
```

SD-WAN member is used in service and it fails the health-check:

- When SD-WAN member fails the health-check, it will stop forwarding traffic:

```
1: date=2021-04-20 time=23:04:32 eventtime=1618985072898756700 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN
status" eventtype="Service" interface="R150" member="1" serviceid=1 service="test"
gateway=10.100.1.1 msg="Member link is unreachable or miss threshold. Stop forwarding
traffic. "
```

- When SD-WAN member passes the health-check again, it will resume forwarding logs:

```
2: date=2021-04-20 time=23:06:08 eventtime=1618985168018789600 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN
status" eventtype="Service" interface="R150" member="1" serviceid=1 service="test"
gateway=10.100.1.1 msg="Member link is available. Start forwarding traffic. "
```

Load-balance mode service rule's SLA qualified member changes:

- When load-balance mode service rule's SLA qualified member changes. In this example R150 changes to not meet SLA:

```
1: date=2021-04-20 time=23:10:24 eventtime=1618985425048820800 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN
status" eventtype="Service" serviceid=1 service="test" member="2(R160)" msg="Service
will be load balanced among members with available routing."
```

- When load-balance mode service rule's SLA qualified member changes. In this example R150 changes to meet SLA:

```
2: date=2021-04-20 time=23:11:34 eventtime=1618985494478807100 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN
status" eventtype="Service" serviceid=1 service="test" member="2(R160),1(R150)"
msg="Service will be load balanced among members with available routing."
```

SLA link status logs, generated with interval sla-fail-log-period or sla-pass-log-period:

- When SLA fails, SLA link status logs will be generated with interval sla-fail-log-period:

```
1: date=2021-04-20 time=23:18:10 eventtime=1618985890469018260 tz="-0700"
logid="0113022925" type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN
SLA information" eventtype="SLA" healthcheck="test" slatargetid=1 interface="R150"
status="up" latency="0.061" jitter="0.004" packetloss="2.000%"
inbandwidthavailable="0kbps" outbandwidthavailable="200.00Mbps"
bibandwidthavailable="200.00Mbps" inbandwidthused="1kbps" outbandwidthused="1kbps"
bibandwidthused="2kbps" slamap="0x0" metric="packetloss" msg="Health Check SLA status.
SLA failed due to being over the performance metric threshold."
```

- When SLA passes, SLA link status logs will be generated with interval sla-pass-log-period:

```
2: date=2021-04-20 time=23:18:12 eventtime=1618985892509027220 tz="-0700"
logid="0113022925" type="event" subtype="sdwan" level="information" vd="root"
logdesc="SDWAN SLA information" eventtype="SLA" healthcheck="test" slatargetid=1
interface="R150" status="up" latency="0.060" jitter="0.003" packetloss="0.000%"
inbandwidthavailable="0kbps" outbandwidthavailable="200.00Mbps"
bibandwidthavailable="200.00Mbps" inbandwidthused="1kbps" outbandwidthused="1kbps"
bibandwidthused="2kbps" slamap="0x1" msg="Health Check SLA status."
```

SD-WAN related diagnose commands

This topic lists the SD-WAN related diagnose commands and related output.

To check SD-WAN health-check status:

```
FGT # diagnose sys sdwan health-check
Health Check(server):
Seq(1 R150): state(alive), packet-loss(0.000%) latency(0.110), jitter(0.024) sla_map=0x0
Seq(2 R160): state(alive), packet-loss(0.000%) latency(0.068), jitter(0.009) sla_map=0x0
```

```
FGT # diagnose sys sdwan health-check
Health Check(ping):
Seq(1 R150): state(alive), packet-loss(0.000%) latency(0.100), jitter(0.017) sla_map=0x0
Seq(2 R160): state(dead), packet-loss(100.000%) sla_map=0x0
```

```
FGT # diagnose sys sdwan health-check google
Health Check(google):
Seq(1 R150): state(alive), packet-loss(0.000%) latency(0.081), jitter(0.019) sla_map=0x0
Seq(2 R160): state(alive), packet-loss(0.000%) latency(0.060), jitter(0.004) sla_map=0x0
```

To check SD-WAN member status:

- When SD-WAN load-balance mode is *source-ip-based*/*source-dest-ip-based*.

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024,
weight: 0
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024,
weight: 0
```

- When SD-WAN load-balance mode is *weight-based*.

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024,
weight: 33
  Session count: 15
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024,
weight: 66
  Session count: 1
```

- When SD-WAN load-balance mode is *measured-volume-based*.
  - Both members are under volume and still have room:

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024,
weight: 33
  Config volume ratio: 33, last reading: 218067B, volume room 33MB
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024,
weight: 66
  Config volume ratio: 66, last reading: 202317B, volume room 66MB
```

  - Some members are overloaded and some still have room:

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024,
weight: 0
  Config volume ratio: 33, last reading: 1287767633B, overload volume 517MB
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024,
weight: 63
  Config volume ratio: 66, last reading: 1686997898B, volume room 63MB
```

- When SD-WAN load balance mode is *usage-based*/*spillover*.
  - When no spillover occurs:

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024,
weight: 255
  Egress-spillover-threshold: 400kbit/s, ingress-spillover-threshold: 300kbit/s
  Egress-overbps=0, ingress-overbps=0
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024,
weight: 254
  Egress-spillover-threshold: 0kbit/s, ingress-spillover-threshold: 0kbit/s
  Egress-overbps=0, ingress-overbps=0
```

  - When member has reached limit and spillover occurs:

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024,
weight: 255
  Egress-spillover-threshold: 400kbit/s, ingress-spillover-threshold: 300kbit/s
  Egress-overbps=1, ingress-overbps=0
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024,
weight: 254
  Egress-spillover-threshold: 0kbit/s, ingress-spillover-threshold: 0kbit/s
  Egress-overbps=0, ingress-overbps=0
```

  - You can also use the `diagnose netlink dstmac list` command to check if you are over the limit.

```
FGT # diagnose netlink dstmac list R150
dev=R150 mac=00:00:00:00:00:00 vwl rx_tcp_mss=0 tx_tcp_mss=0 egress_overspill_
```

```
threshold=50000 egress_bytes=100982 egress_over_bps=1 ingress_overspill_
threshold=37500 ingress_bytes=40 ingress_over_bps=0 sampler_rate=0 vwl_zone_id=1
intf_qua=0
```

To check SD-WAN service rules status:

- *Manual mode* service rules.

```
FGT # diagnose sys sdwan service
Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(manual)
  Members(2):
    1: Seq_num(1 R150), alive, selected
    2: Seq_num(2 R160), alive, selected
  Dst address(1):
        10.100.21.0-10.100.21.255
```

- *Auto mode* service rules.

```
FGT # diagnose sys sdwan service
Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(auto), link-cost-factor(latency),
link-cost-threshold(10), heath-check(ping)
  Members(2):
    1: Seq_num(2 R160), alive, latency: 0.066, selected
    2: Seq_num(1 R150), alive, latency: 0.093
  Dst address(1):
        10.100.21.0-10.100.21.255
```

- *Priority mode* service rules.

```
FGT # diagnose sys sdwan service
Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(priority), link-cost-factor
(latency), link-cost-threshold(10), heath-check(ping)
  Members(2):
    1: Seq_num(2 R160), alive, latency: 0.059, selected
    2: Seq_num(1 R150), alive, latency: 0.077, selected
  Dst address(1):
        10.100.21.0-10.100.21.255
```

- *Load-balance* mode service rules.

```
FGT # diagnose sys sdwan service
Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(load-balance hash-mode=round-robin)
  Members(2):
    1: Seq_num(1 R150), alive, sla(0x1), gid(2), num of pass(1), selected
    2: Seq_num(2 R160), alive, sla(0x1), gid(2), num of pass(1), selected
  Dst address(1):
        10.100.21.0-10.100.21.255
```

- *SLA mode* service rules.

```
FGT # diagnose sys sdwan service
Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Members(2):
    1: Seq_num(1 R150), alive, sla(0x1), gid(0), cfg_order(0), cost(0), selected
```

```
  2: Seq_num(2 R160), alive, sla(0x1), gid(0), cfg_order(1), cost(0), selected
Dst address(1):
      10.100.21.0-10.100.21.255
```

To check interface logs from the past 15 minutes:

```
FGT (root) # diagnose sys sdwan intf-sla-log R150
Timestamp: Wed Apr 21 16:58:27 2021, used inbandwidth: 655bps, used outbandwidth:
81655306bps, used bibandwidth: 81655961bps, tx bys: 3413479982bytes, rx bytes: 207769bytes.
Timestamp: Wed Apr 21 16:58:37 2021, used inbandwidth: 649bps, used outbandwidth:
81655540bps, used bibandwidth: 81656189bps, tx bys: 3515590414bytes, rx bytes: 208529bytes.

81688159bps, used bibandwidth: 81688830bps, tx bys: 4026141408bytes, rx bytes: 212726bytes.
```

To check SLA logs in the past 10 minutes:

```
FGT (root) # diagnose sys sdwan sla-log ping 1
Timestamp: Wed Apr 21 17:10:11 2021, vdom root, health-check ping, interface: R150, status:
up, latency: 0.079, jitter: 0.023, packet loss: 0.000%.
Timestamp: Wed Apr 21 17:10:12 2021, vdom root, health-check ping, interface: R150, status:
up, latency: 0.079, jitter: 0.023, packet loss: 0.000%.
Timestamp: Wed Apr 21 17:10:12 2021, vdom root, health-check ping, interface: R150, status:
up, latency: 0.081, jitter: 0.024, packet loss: 0.000%.
Timestamp: Wed Apr 21 17:10:13 2021, vdom root, health-check ping, interface: R150, status:
up, latency: 0.081, jitter: 0.025, packet loss: 0.000%.
Timestamp: Wed Apr 21 17:10:13 2021, vdom root, health-check ping, interface: R150, status:
up, latency: 0.082, jitter: 0.026, packet loss: 0.000%.
Timestamp: Wed Apr 21 17:10:14 2021, vdom root, health-check ping, interface: R150, status:
up, latency: 0.083, jitter: 0.026, packet loss: 0.000%.
Timestamp: Wed Apr 21 17:10:14 2021, vdom root, health-check ping, interface: R150, status:
up, latency: 0.084, jitter: 0.026, packet loss: 0.000%.
```

To check Application Control used in SD-WAN and the matching IP addresses:

```
FGT # diagnose sys sdwan internet-service-app-ctrl-list
Gmail(15817 4294836957): 64.233.191.19 6 443 Thu Apr 22 10:10:34 2021
Gmail(15817 4294836957): 142.250.128.83 6 443 Thu Apr 22 10:06:47 2021

YouTube(31077 4294838537): 209.85.200.132 6 443 Thu Apr 22 10:02:03 2021
```

To check the dynamic tunnel status:

```
# diagnose sys link-monitor interface <name> <name>_0
```

For example:

```
# diagnose sys link-monitor interface vd2-2
Interface(vd2-2): state(up, since Tue Jun 15 12:31:28 2021), bandwidth(up:1299bps,
down:0bps), session count(IPv4:2, IPv6:0), tx(2409919 bytes), rx(5292290 bytes), latency
(0.03), jitter(0.00), packet-loss(0.00).

# diagnose sys link-monitor interface vd2-2 vd2-2_0
Interface(vd2-2_0): state(up, since Tue Jun 15 15:21:52 2021), bandwidth(up:640bps,
down:0bps), session count(IPv4:0, IPv6:0), tx(102242 bytes), rx(16388 bytes), latency(0.03),
jitter(0.00), packet-loss(0.00).
```

To check BGP learned routes and determine if they are used in SD-WAN service:

```
FGT # get router info bgp network 10.100.11.0/24
VRF 0 BGP routing table entry for 10.100.11.0/24
Paths: (2 available, best #2, table Default-IP-Routing-Table)
  Advertised to non peer-group peers:
   10.100.1.1
  Original VRF 0
  20 10
    10.100.1.1 from 10.100.1.1 (5.5.5.5)
      Origin incomplete metric 0, route tag 15, localpref 100, valid, external, best
      Community: 30:5
      Advertised Path ID: 2
       Last update: Thu Apr 22 10:27:27 2021

  Original VRF 0
  20 10
    10.100.1.5 from 10.100.1.5 (6.6.6.6)
      Origin incomplete metric 0, route tag 15, localpref 100, valid, external, best
      Community: 30:5
      Advertised Path ID: 1
       Last update: Thu Apr 22 10:25:50 2021
```

```
FGT # diagnose sys sdwan route-tag-list
Route-tag: 15, address: v4(1), v6(0)Last write/now: 6543391 6566007
        service(1), last read route-tag 15 at 6543420
Prefix(24): Address list(1):
        10.100.11.0-10.100.11.255 oif: 50 48
```

```
FGT # diagnose firewall proute list
list route policy info(vf=root):
id=2133196801(0x7f260001) vwl_service=1(DataCenter) vwl_mbr_seq=1 2 dscp_tag=0xff 0xff
```

```
flags=0x40 order-addr tos=0x00 tos_mask=0x00 protocol=0 sport=0-65535 iif=0 dport=1-65535

hit_count=0 last_used=2021-04-22 10:25:10
```

Using SNMP to monitor health check

You can monitor SD-WAN health check related statistics using SNMP. The MIB file can be downloaded by going to *System* > *SNMP* and clicking *Download FortiGate MIB File*.

The following OIDs can be monitored:

Name	OID	Description
fgVWLHealthCheckLinkNumber	.1.3.6.1.4.1.12356.101.4.9.1	The number of health check links in fgVWLHealthCheckLinkTable
fgVWLHealthCheckLinkTable	.1.3.6.1.4.1.12356.101.4.9.2	SD-WAN health check statistics table. This table has a dependent expansion relationship with fgVdTable.Only health checks with a configured member link are present in this table.
fgVWLHealthCheckLinkTableEntry	.1.3.6.1.4.1.12356.101.4.9.2.1	SD-WAN health check statistics on a virtual domain.
fgVWLHealthCheckLinkID	.1.3.6.1.4.1.12356.101.4.9.2.1.1	SD-WAN health check link ID. Only health checks with configured member link are present in this table. Virtual-wan-link health check link IDs are only unique within a virtual domain.
fgVWLHealthCheckLinkName	.1.3.6.1.4.1.12356.101.4.9.2.1.2	Health check name.
fgVWLHealthCheckLinkSeq	.1.3.6.1.4.1.12356.101.4.9.2.1.3	SD-WAN member link sequence.
fgVWLHealthCheckLinkState	.1.3.6.1.4.1.12356.101.4.9.2.1.4	Health check state on a specific member link.
fgVWLHealthCheckLinkLatency	.1.3.6.1.4.1.12356.101.4.9.2.1.5	The average latency of a health check on a specific member link within last 30 probes, in float number.
fgVWLHealthCheckLinkJitter	.1.3.6.1.4.1.12356.101.4.9.2.1.6	The average jitter of a health check on a specific member link within last 30 probes, in float number.

Name	OID	Description
fgVWLHealthCheckLinkPacketSend	.1.3.6.1.4.1.12356.101.4.9.2.1.7	The total number of packets sent by a health check on a specific member link.
fgVWLHealthCheckLinkPacketRecv	.1.3.6.1.4.1.12356.101.4.9.2.1.8	The total number of packets received by a health check on a specific member link.
fgVWLHealthCheckLinkPacketLoss	.1.3.6.1.4.1.12356.101.4.9.2.1.9	The packet loss percentage of a health check on a specific member link within last 30 probes, in float number.
fgVWLHealthCheckLinkVdom	.1.3.6.1.4.1.12356.101.4.9.2.1.10	The VDOM that the link monitor entry exists in. This name corresponds to the fgVdEntName used in fgVdTable.
fgVWLHealthCheckLinkBandwidthIn	.1.3.6.1.4.1.12356.101.4.9.2.1.11	The available bandwidth of incoming traffic detected by a health check on a specific member link, in Mbps,
fgVWLHealthCheckLinkBandwidthOut	.1.3.6.1.4.1.12356.101.4.9.2.1.12	The available bandwidth of outgoing traffic detected by a health check on a specific member link, in Mbps.
fgVWLHealthCheckLinkBandwidthBi	.1.3.6.1.4.1.12356.101.4.9.2.1.13	The available bandwidth of bi-direction traffic detected by a health check on a specific member link, in Mbps.
fgVWLHealthCheckLinkIfName	.1.3.6.1.4.1.12356.101.4.9.2.1.14	SD-WAN member interface name.

Example

This example shows a SD-WAN health check configuration and its collected statistics.

To configure the SD-WAN health check:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
    end
    config members
        edit 1
            set interface "port1"
            set gateway 192.168.2.1
```

```
        next
        edit 2
            set interface "MPLS"
            set zone "SD-Zone2"
            set cost 20
        next
        edit 3
            set interface "port2"
        next
    end
    config health-check
        edit "pingserver"
            set server "8.8.8.8"
            set sla-fail-log-period 10
            set sla-pass-log-period 20
            set members 2 1 3
            config sla
                edit 1
                    set link-cost-factor jitter packet-loss
                    set packetloss-threshold 2
                next
            end
        next
    end
end
```

The collected statistics:

fgVWLHealthCheckLinkID	.1.3.6.1.4.1.12356.101.4.9.2.1.1	1	2	3
fgVWLHealthCheckLinkName	.1.3.6.1.4.1.12356.101.4.9.2.1.2	pingserver	pingserver	pingserver
fgVWLHealthCheckLinkSeq	.1.3.6.1.4.1.12356.101.4.9.2.1.3	2	1	3
fgVWLHealthCheckLinkState	.1.3.6.1.4.1.12356.101.4.9.2.1.4	0	0	0
fgVWLHealthCheckLinkLatency	.1.3.6.1.4.1.12356.101.4.9.2.1.5	39.302	43.124	44.348

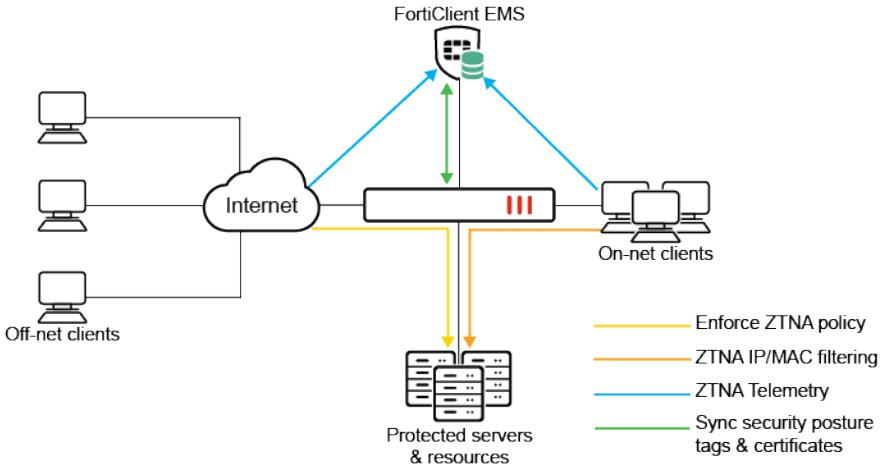
Zero Trust Network Access

This section includes information about ZTNA related new features:

- Zero Trust Network Access introduction on page 1163
  - Basic ZTNA configuration on page 1166
  - Establish device identity and trust context with FortiClient EMS on page 1177
    - ZTNA scalability support for concurrent endpoints on page 1183
  - SSL certificate based authentication on page 1185
  - Full versus simple ZTNA policies on page 1187
- ZTNA advanced configurations on page 1193
- ZTNA configuration examples on page 1206
- ZTNA troubleshooting and debugging commands on page 1285
- ZTNA troubleshooting scenarios on page 1290

Zero Trust Network Access introduction



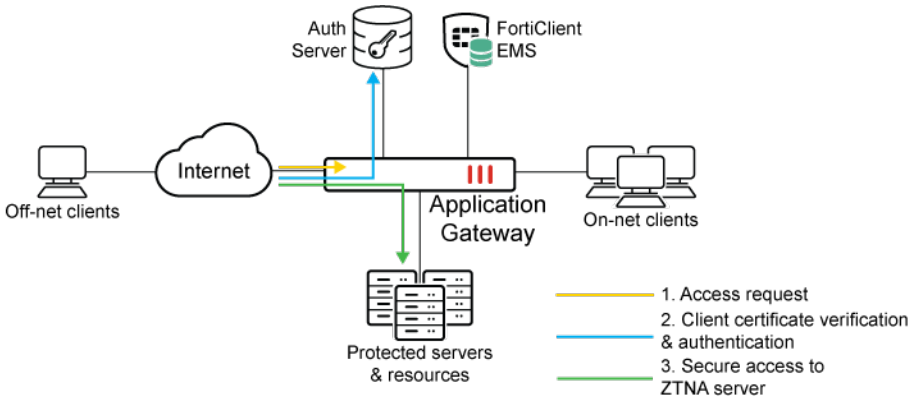
Zero Trust Network Access (ZTNA) is an access control method that uses client device identification, authentication, and security posture tags (formerly ZTNA tags) to provide role-based application access. It gives administrators the flexibility to manage network access for On-net local users and Off-net remote users. Access to applications is granted only after device verification, authenticating the user's identity, authorizing the user, and then performing context based posture checks using security posture tags.

Traditionally, a user and a device have different sets of rules for on-net access and off-net VPN access to company resources. With a distributed workforce and access that spans company networks, data centers, and cloud, managing the rules can become complex. User experience is also affected when multiple VPNs are needed to get to various resources. ZTNA can improve this experience.

ZTNA application gateway and IP/MAC based access control

- ZTNA application gateway allows users to securely access resources through an SSL encrypted access proxy. This simplifies remote access by eliminating the use of VPNs.
- IP/MAC based access control combines IP/MAC with security posture tags for identification and security posture check to implement role-based zero trust access.

ZTNA telemetry, tags, and policy enforcement



When On-net and Off-net FortiClient endpoints register to FortiClient EMS, device information, log on user information, and security posture are all shared over ZTNA telemetry with the EMS server. Clients also make a certificate signing request to obtain a client certificate from the EMS that is acting as the ZTNA Certificate Authority (CA).

Based on the client information, EMS applies matching Zero Trust tagging rules to tag the clients. These tags, and the client certificate information, are synchronized with the FortiGate in real-time. This allows the FortiGate to verify the client's identity using the client certificate, and grant access based on the security posture tags applied in the ZTNA policy.

For more information, see Establish device identity and trust context with FortiClient EMS on page 1177.

Application gateway

The FortiGate application gateway can proxy HTTP, SSH, RDP, SMB, FTP, and other TCP traffic over secure connections with the client. This enables seamless access from the client to the protected servers, without needing to form IPsec or SSL VPN tunnels.

HTTPS access proxy

The FortiGate HTTPS access proxy works as a reverse proxy for the HTTP server. When a client connects to a webpage hosted by the protected server, the address resolves to the FortiGate's access proxy VIP. The FortiGate proxies the connection and takes steps to authenticate the user. It prompts the user for their certificate on the browser, and verifies this against the ZTNA endpoint record that is synchronized from the EMS. If an authentication scheme, such as SAML authentication, is configured, the client is redirected to a captive portal for sign-on. If this passes, traffic is allowed based on ZTNA policies, and the FortiGate returns the webpage to the client.

For example configurations, see ZTNA HTTPS access proxy example on page 1206, ZTNA HTTPS access proxy with basic authentication example on page 1217, and ZTNA application gateway with SAML authentication example on page 1238.

TCP forwarding access proxy (TFAP)

The TCP forwarding access proxy works as a special type of HTTPS reverse proxy. Instead of proxying traffic to a web server, TCP traffic is tunneled between the client and the access proxy over HTTPS, and forwarded to the protected resource. The FortiClient on the remote endpoint intercepts traffic destined for the protected resources and routes them to the FortiGate proxy gateway. An HTTPS connection is made to the FortiGate's access proxy VIP, where the client certificate is verified and access is granted based on the ZTNA policies. TCP traffic is forwarded from the FortiGate to the protected resource, and an end to end connection is established. To reduce overhead, you can disable access proxy encryption on the client, as some TCP protocols, like RDP, are already secure. The TCP forwarding access proxy supports UTM scanning and deep inspection for HTTP, HTTPS, SMTP, SMTPS, IMAP, IMAPS, POP3, POP3S, SMB, and CIFS.

For an example configuration, see ZTNA TCP forwarding access proxy example on page 1224.

SSH access proxy

The SSH access proxy provides some benefits to proxying SSH connections over TFAP, including allowing SSH deep inspection, performing optional SSH host-key validation, and allowing one-time user authentication to authenticate the ZTNA SSH access proxy connection and SSH server connection.

For an example configuration, see ZTNA SSH access proxy example on page 1231.

Basic ZTNA configuration components

The basic components required to configure ZTNA application gateway on the FortiGate are:

1. FortiClient EMS fabric connector and security posture tags.
2. FortiClient EMS running version 7.0.0 or later or FortiClient EMS Cloud.
3. FortiClient running 7.0.0 or later.
4. ZTNA server
5. ZTNA policy
6. (Optional) User authentication
7. (Optional) HA configurations

For configuration details, see Basic ZTNA configuration on page 1166.

Basic ZTNA configuration

To deploy a ZTNA application gateway, configure the following components on the FortiGate:

1. Configure a FortiClient EMS connector on page 1166
2. Configure a ZTNA server on page 1168
3. Configure a ZTNA policy on page 1171
4. Optional authentication on page 1175
5. Optional HA configurations on page 1177

To configure ZTNA in the GUI, go to *System* > *Feature Visibility* and enable *Zero Trust Network Access*.

Entry-level models (below 100 series) have ZTNA settings disabled by default. To configure ZTNA, enable the following:

```
config system global
    set proxy-and-explicit-proxy enable
end
```

Configure a FortiClient EMS connector

To add an on-premise FortiClient EMS server in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiClient EMS* card.
2. Set the *Status* to *Enabled*.
3. Enter a name for the connector and the IP address or FQDN of the EMS.
4. Click *OK*.
5. A window appears to verify the EMS server certificate. Click *Accept*.
   See FortiClient EMS for more information.

To add an on-premise FortiClient EMS server in the CLI:

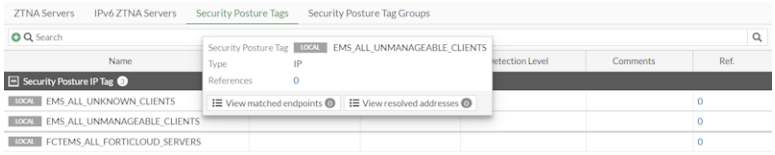
```
config endpoint-control fctems
    edit <name>
        set server <server IP or domain>
    next
end
```

To add FortiClient EMS Cloud in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiClient EMS* card.
2. Set the *Status* to *Enabled*.
3. Set the *Type* to *FortiClient EMS Cloud*.
4. Enter a name for the connector.
5. Click *OK*. A window appears to verify the EMS server certificate.

6. Click *Accept*.
   See FortiClient EMS for more information.

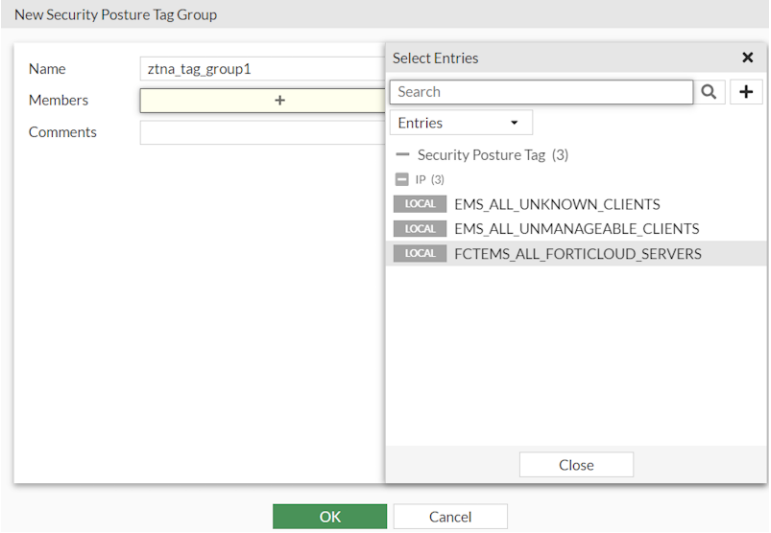
To add FortiClient EMS Cloud in the CLI:



```
config endpoint-control fctems
    edit <name>
        set fortinetone-cloud-authentication enable
        set certificate <string>
    next
end
```

Security posture tags

After the FortiGate connects to the FortiClient EMS, it automatically synchronizes security posture tags (formerly ZTNA tags). Security posture tags are generated from tagging rules configured on the FortiClient EMS. These tagging rules are based on various posture checks that can be applied on the endpoints. See Endpoint Posture Check Reference.



To view the synchronized security posture tags in the GUI:

1. Go to *Policy & Objects* > *ZTNA* and select the *Security Posture Tags* tab.
2. Hover the cursor over a tag name to view more information about the tag, such as its resolved addresses.

To create a security posture tag group in the GUI:

1. Go to *Policy & Objects* > *ZTNA* and select the *Security Posture Tag Group* tab.
2. Click *Create New*.
3. Enter a name for the group and select the group members.

4. Click *OK*.

To view the synchronized security posture tags in the CLI:

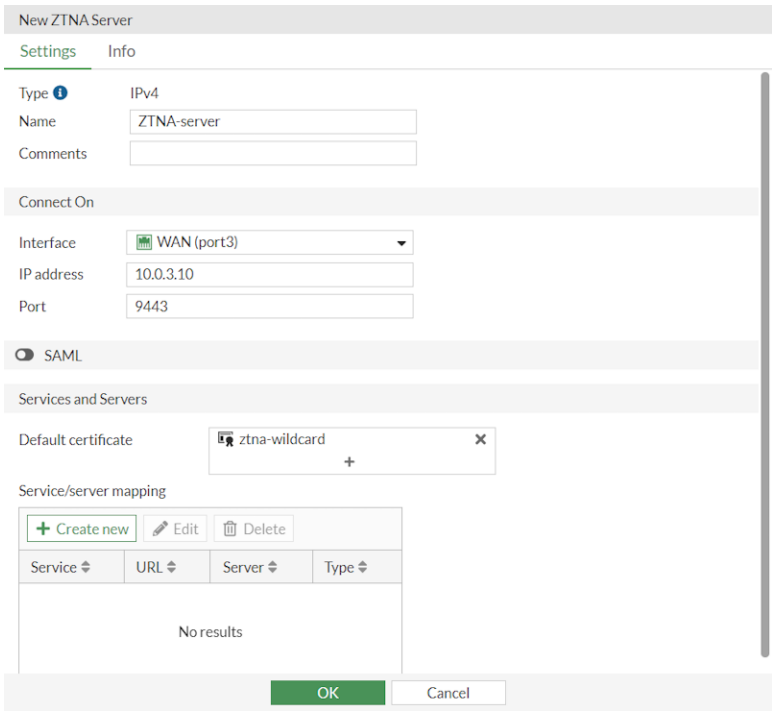
```
# diagnose firewall dynamic address
# diagnose firewall dynamic list
```

To create a security posture tag group in the CLI:

```
config firewall addrgrp
    edit <group name>
        set category ztna-ems-tag
        set member <members>
    next
end
```

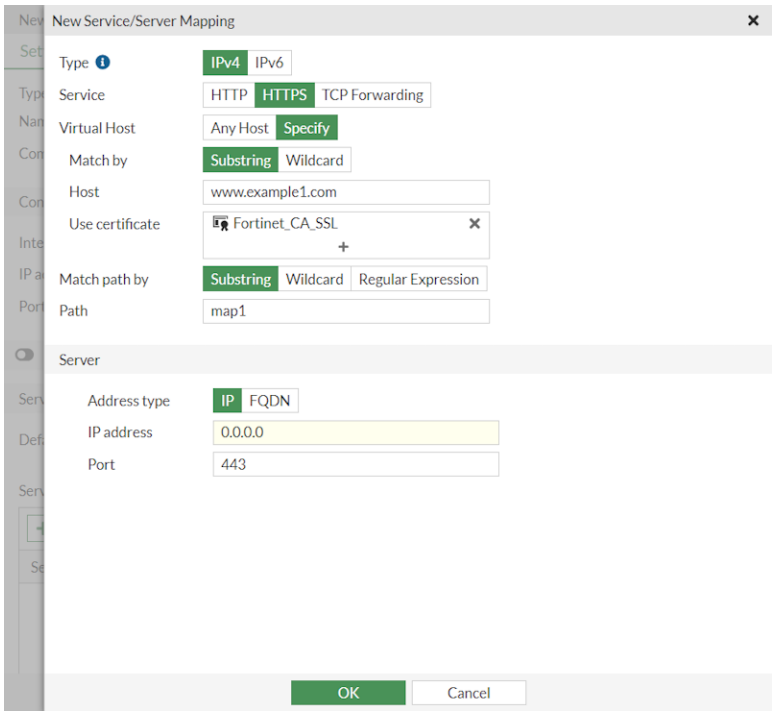
Configure a ZTNA server

To configure a ZTNA server, define the access proxy VIP and the real servers that clients will connect to. The access proxy VIP is the FortiGate ZTNA gateway that clients make HTTPS connections to. The service/server mappings define the virtual host matching rules and the real server mappings of the HTTPS requests.



To create a ZTNA server for HTTPS access proxy in the GUI:

1. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Servers* tab.
2. Click *Create New*.
3. Enter a name for the server.
4. Select an *Interface*. The *IP address* and *Port* fields are automatically filled in based on the interface selection.



Verify that the IP address and port do not conflict with management access to the interface. Otherwise, change the IP address to another address on that subnet.

5. Select the *Default certificate*. Clients will be presented with this certificate when they connect to the access proxy VIP.

6. Add a server mapping:
   a. In the *Service/server mapping* table, click *Create New*.
   b. Set *Service* to *HTTPS*.
   c. Set *Virtual Host* to *Any Host* or *Specify*.
      - *Any Host*: Any request that resolves to the access proxy VIP will be mapped to your real servers. For example, if both www.example1.com and www.example2.com resolve to the VIP, then both requests are mapped to your real servers.
      - *Specify*: Enter the name or IP address of the host that the request must match. For example, if www.example1.com is entered as the host, then only requests to www.example1.com will match.
   d. Configure the path as needed.

      The path can be matched by substring, wildcard, or regular expression. For example, if the virtual host is specified as www.example1.com, and the path substring is map1, then www.example1/map1 will be matched.

e. In the *Server* section, enter the server IP address and port number.

f. Click *OK*.

7. Click *OK*.
8. Use the CLI to add additional servers and mappings to the ZTNA server.

   After additional servers and mappings are added, the *Load balancing* option is visible in the GUI.

```
config firewall access-proxy
    edit "ZTNA-Server"
        config api-gateway
            edit 1
                config realservers
                    edit 0
                        set ip <real server 2 address>
                        set port <real server 2 port>
                    next
                end
            next
        end
    next
end
```

To create a ZTNA server and access proxy VIP in the CLI:

1. Configure an access proxy VIP:

```
config firewall vip
    edit <name>
        set type access-proxy
        set extip <external IP>
```

```
        set extintf <external interface>
        set server-type {https | ssh}
        set extport <external port>
        set ssl-certificate <certificate>
    next
end
```

2. If the virtual host is specified, configure the virtual host:

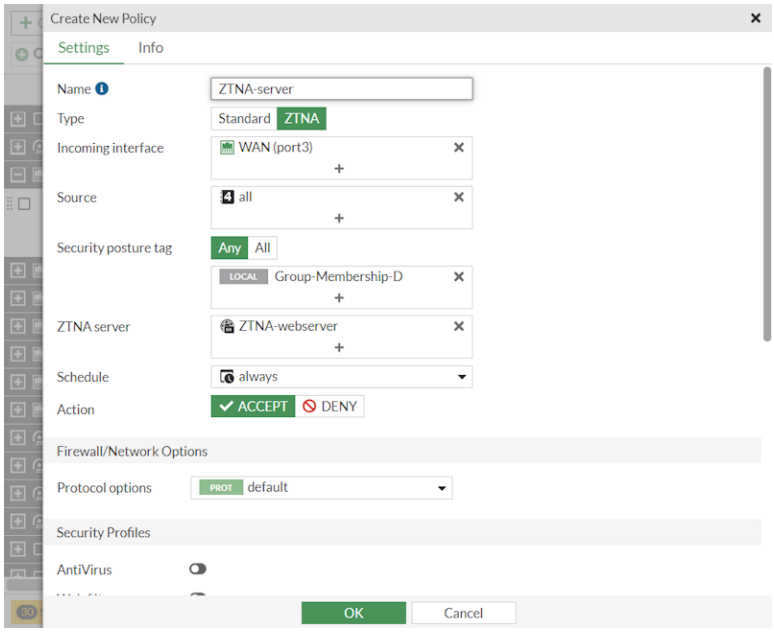
```
config firewall access-proxy-virtual-host
    edit <auto generated when configured from GUI>
        set ssl-certificate <certificate>
        set host <host name or IP>
        set host-type {sub-string | wildcard}
    next
end
```

3. Configure the server and path mapping:

```
config firewall access-proxy
    edit <name>
        set vip <vip name>
        set client-cert {enable | disable}
        set empty-cert-action {accept | block}
        set log-blocked-traffic {enable | disable}
        config api-gateway
            edit 1
                set url-map <mapped path>
                set service {http | https | tcp-forwarding | samlsp}
                set virtual-host <name of virtual-host if specified>
                set url-map-type {sub-string | wildcard | regex}
                config realservers
                    edit 1
                        set addr-type ip
                        set ip <ip of real server>
                        set port <port>
                        set status {active | standby | disable}
                        set health-check {enable | disable}
                        set translate-host {enable | disable}
                    next
                end
                set ldb-method static
                set persistence none
                set ssl-dh-bits 2048
                set ssl-algorithm high
                set ssl-min-version tls-1.1
                set ssl-max-version tls-1.3
            next
        end
    next
end
```

Configure a ZTNA policy

A ZTNA policy is used to enforce zero trust role based access control by using security posture tags or tag groups to verify a device's security posture. A ZTNA policy can also utilize security profiles to protect this traffic.



In earlier versions, ZTNA rules were special proxy policies that controlled access to the ZTNA servers, and they could be configured from the *Policy & Objects* > *ZTNA* > *ZTNA Rules* tab. However, on this version and above, these special proxy policies are now configured from *Policy & Objects* > *Proxy Policy* page.

There are two ways to configure ZTNA rules in the GUI by using a full or simple ZTNA policy:

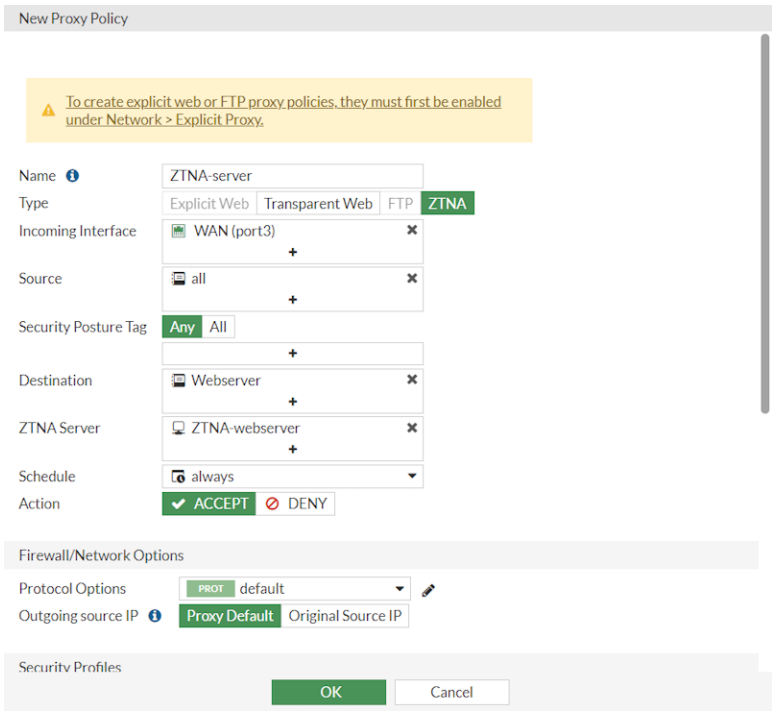
- Full ZTNA policy: The legacy method for configuring access-proxy policies.
- Simple ZTNA policy: A simplified method for configuring a ZTNA policy using firewall policies. This method covers most functionality of a Full ZTNA policy, except it cannot control access based on destination interface or real server's destination address.

To configure a simple ZTNA policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Enter a name for the ZTNA policy.
4. Set *Type* to *ZTNA*.
5. Select an *Incoming Interface* and *Source*.
6. Add the security posture tags or tag groups that are allowed access. If multiple tags are included, the matching method is set to *Any* by default.
7. Select the *ZTNA Server*.
8. Select the *Action*.

9. Configure the remaining options as needed.
10. Click OK.

To configure a simple ZTNA policy in the CLI:



```
config firewall policy
    edit 1
        set name <ZTNA policy name>
        set srcintf <interface>
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr <access proxy vip>
        set ztna-ems-tag <security posture tags>
        set schedule "always"
        set nat enable
    next
end
```

The `dstintf` command cannot be modified.

To configure a full ZTNA policy in the GUI:

1. Go to *System* > *Feature Visibility*.
2. Under *Security Features*, enabled *Explicit Proxy*.
3. Click *Apply*.
4. Go to *Policy & Objects* > *Proxy Policy*.
5. Click *Create New*.
6. Enter a name for the rule.
7. Select an *Incoming Interface* and *Source*.
8. Add the security posture tags or tag groups that are allowed access. If multiple tags are included, the matching method is set to *Any* by default.
9. Select the *Destination*.
10. Select the *ZTNA Server*.
11. Select the *Action*.

12. Configure the remaining options as needed.
13. Click *OK*.

To configure a full ZTNA policy in the CLI:

```
config firewall proxy-policy
    edit 1
        set name <ZTNA policy name>
        set proxy access-proxy
        set access-proxy <access proxy>
        set srcintf <interface>
        set srcaddr "all"
        set transparent {enable | disable}
        set dstaddr "all"
        set ztna-ems-tag <security posture tag(s)>
        set ztna-tags-match-logic {or | and}
        set action accept
        set schedule "always"
        set logtraffic all
        set poolname <ip_pool>
        set utm-status enable
        set ssl-ssh-profile <inspection profile>
    next
end
```

The `transparent` and `poolname` settings cannot be enabled at the same time. Use one setting at a time when configuring ZTNA policies.

Optional authentication

To configure authentication to the access proxy, you must configure an authentication scheme and authentication rule in the GUI or CLI. They are used to authenticate proxy-based policies, similar to configuring authentication for explicit and transparent proxy.

The authentication scheme defines the method of authentication that is applied. For ZTNA, basic HTTP and SAML methods are supported. Each method has additional settings to define the data source to check against. For example, with basic HTTP authentication, a user database can reference an LDAP server, RADIUS server, local database, or other supported authentication servers that the user is authenticated against.

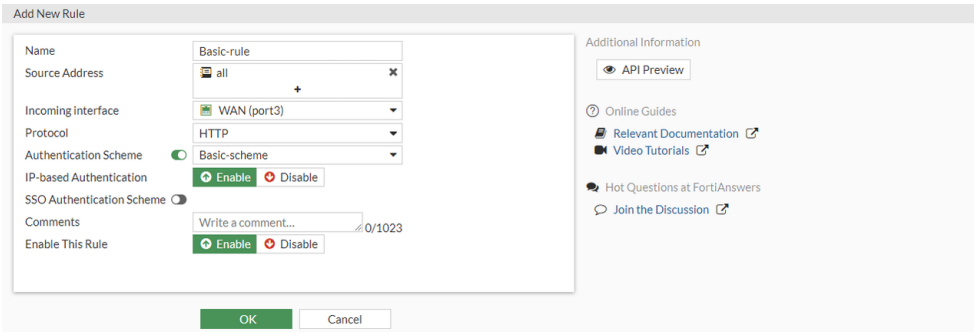
The authentication rule defines the proxy sources and destinations that require authentication, and which authentication scheme to apply. For ZTNA, active authentication method is supported. The active authentication method references a scheme where users are actively prompted for authentication, like with basic authentication.

After the authentication rule triggers the method to authenticate the user, a successful authentication returns the groups that the user belongs to. In the ZTNA policy you can define a user or user group as the allowed source. Only users that match that user or group are allowed through the proxy policy.

To configure a basic authentication scheme in the GUI:

1. Go to *Policy & Objects* > *Authentication Rules*.
2. Click *Create New* > *Authentication Scheme*.
3. Enter a name for the scheme.
4. Set the *Method* as *Basic*.
5. Select the *User database* as required.

6. Click *OK*.



To configure a basic authentication scheme in the CLI:

```
config authentication scheme
    edit <name>
        set method basic
        set user-database <auth server>
    next
end
```

To configure an authentication rule in the GUI:

1. Go to *Policy & Objects* > *Authentication Rules*.
2. Click *Create New* > *Authentication Rule*.
3. Enter a name for the rule.

4. Select the *Source Address*.
5. Select the *Incoming interface*.
6. Select the *Authentication Scheme*.

7. Click *OK*.

To configure an authentication rule in the CLI:

```
config authentication rule
    edit <name>
        set status enable
        set protocol http
        set srcintf <interface>
        set srcaddr <address>
        set dstaddr <address>
        set ip-based enable
        set active-auth-method <active auth scheme>
    next
end
```

To apply a user group to a full ZTNA policy in the GUI:

1. Go to *Policy & Objects* > *Proxy Policy*.
2. Edit an existing rule, or click *Create New* to create a new rule.
3. Click in the *Source* field, select the *User* tab, and select the users and user groups that will be allowed access.
4. Configure the remaining settings as required.
5. Click *OK*.

To apply a user group to a full ZTNA policy in the CLI:

```
config firewall proxy-policy
    edit <policy ID>
        set name <ZTNA policy name>
        set proxy access-proxy
        set access-proxy <access proxy>
        set srcintf <interface>
        set srcaddr "all"
        set dstaddr "all"
        set ztna-ems-tag <security posture tags>
        set ztna-tags-match-logic {or | and}
        set action accept
        set schedule "always"
```

```
        set logtraffic all
        set groups <user group>
        set utm-status enable
        set ssl-ssh-profile <inspection profile>
    next
end
```

The authentication rule and scheme defines the method used to authenticate users. With basic HTTP authentication, a sign in prompt is shown after the client certificate prompt. After the authentication passes, the returned groups that the user is a member of are checked against the user groups that are defined in the ZTNA policy. If a group matches, then the user is allowed access after passing a posture check.

For basic setup information, see ZTNA HTTPS access proxy with basic authentication example on page 1217.

For advanced setup information, see ZTNA application gateway with SAML authentication example on page 1238 and ZTNA application gateway with SAML and MFA using FortiAuthenticator example on page 1242.

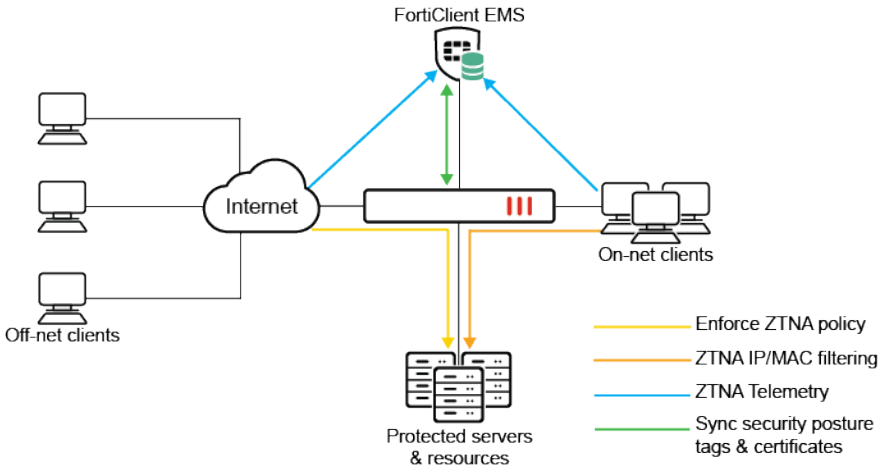
Optional HA configurations

User information and TLS sessions are synchronized between HA members for ZTNA proxy sessions. When a failover occurs, the new primary unit will continue allowing sessions from the logged in users without asking for the client certificate and re-authentication again.

There are no special configurations for HA. Refer to HA active-passive cluster setup on page 2786 and HA active-active cluster setup on page 2788 to configure your HA cluster.

HTTP access proxy vs TCP forwarding access proxy

In an HTTP access proxy connection, there is no configurations needed on the client endpoint. Users can simply access the HTTP website on a browser by entering its URL. For TCP forwarding access proxy, a ZTNA rule must be configured on the FortiClient endpoint. This rule instructs FortiClient to listen to traffic to the destination address and port, and redirects the traffic to the FortiGate access proxy over HTTPS.



When deciding between using HTTP access proxy or TFAP for accessing web applications, consider the following.

- Use HTTP access proxy when the protected web application address can be resolved by the remote users publicly.
- Use TFAP when the protected application address can only be resolved on the internal network. TCP forwarding rules allow the FortiClient to intercept the request to the destination address and forward them to the application gateway.

For more information, see ZTNA TCP forwarding access proxy example on page 1224.

Establish device identity and trust context with FortiClient EMS

How device identity is established through client certificates, and how device trust context is established between FortiClient, FortiClient EMS, and the FortiGate, are integral to ZTNA.

Device roles

FortiClient

FortiClient endpoints provide the following information to FortiClient EMS when they register to the EMS:

- Device information (network details, operating system, model, and others)
- Logged on user information
- Security posture (On-net/Off-net, antivirus software, vulnerability status, and others)

It also requests and obtains a client device certificate from the EMS ZTNA Certificate Authority (CA) when it registers to FortiClient EMS. The client uses this certificate to identify itself to the FortiGate.

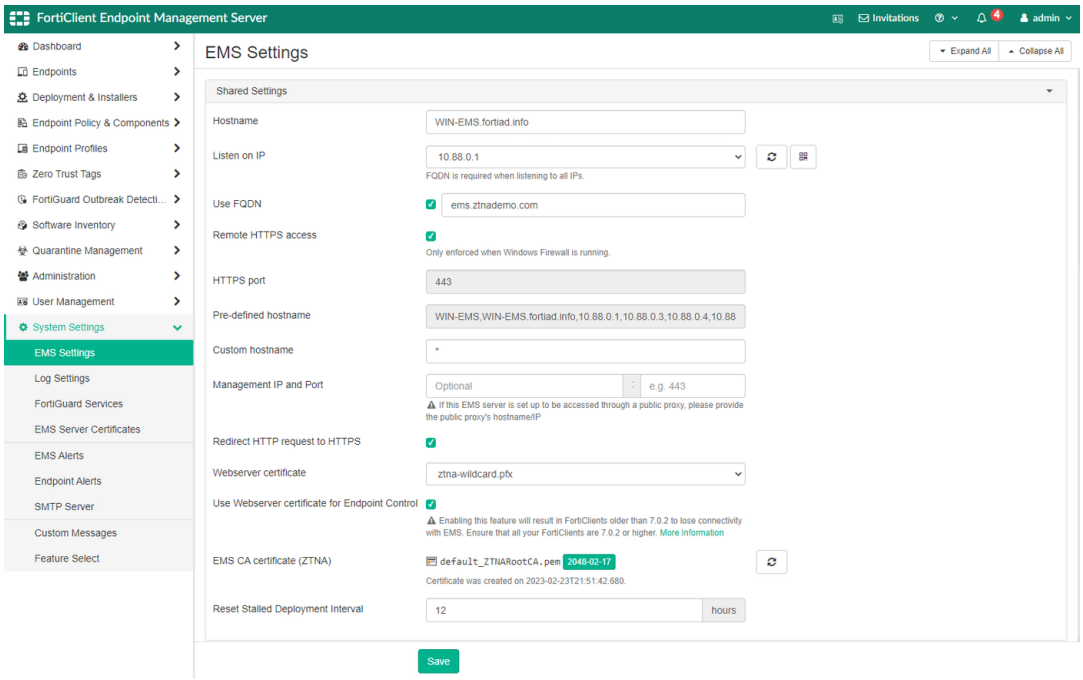
FortiClient EMS

FortiClient EMS issues and signs the client certificate with the FortiClient UID, certificate serial number, and EMS serial number. The certificate is then synchronized to the FortiGate. EMS also shares its EMS ZTNA CA certificate with the FortiGate, so that the FortiGate can use it to authenticate the clients.

FortiClient EMS uses zero trust tagging rules to tag endpoints based on the information that it has on each endpoint. The tags are also shared with the FortiGate. See Endpoint Posture Check Reference for a list of the endpoint posture checks that EMS can perform.

Each security posture tag creates two firewall addresses in all VDOMs on a FortiGate. One firewall address is the IP address, and the other firewall address is the MAC address. Because each FortiGate model has a global limit and a per-VDOM limit for the maximum number of supported firewall addresses, the FortiGate model determines the maximum number of security posture tags allowable by that unit, which is the maximum number of firewall address divided by two. For each FortiGate model's limit, see the Maximum Values table.

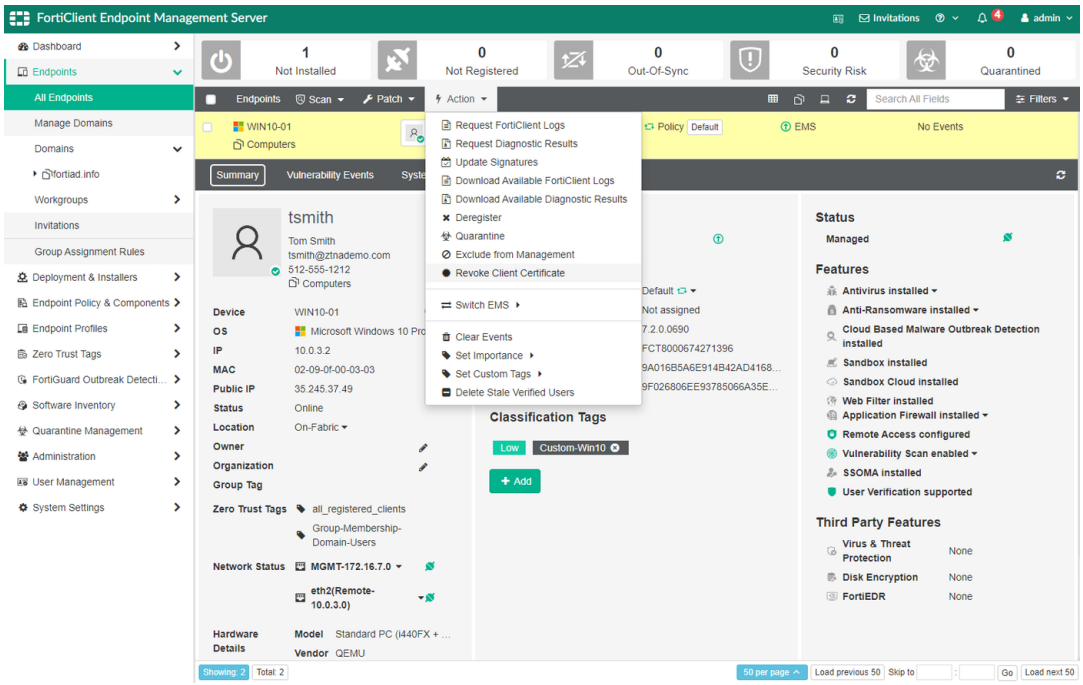
FortiGate



The FortiGate maintains a continuous connection to the EMS server to synchronize endpoint device information, including primarily:

- FortiClient UID
- Client certificate SN
- EMS SN
- Device credentials (user/domain)
- Network details (IP and MAC address and routing to the FortiGate)

When a device's information changes, such as when a client moves from on-net to off-net, or their security posture changes, EMS is updated with the new device information and then updates the FortiGate. The FortiGate's WAD daemon can use this information when processing ZTNA traffic. If an endpoint's security posture change causes it to no longer match the ZTNA policy criteria on an existing session, then the session is terminated.

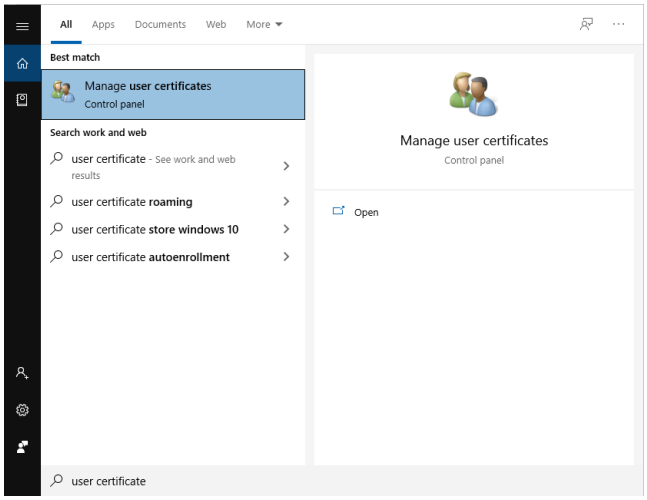


Certificate management on FortiClient EMS

FortiClient EMS has a *default_ZTNARootCA* certificate generated by default that the ZTNA CA uses to sign CSRs from the FortiClient endpoints. Clicking the refresh button revokes and updates the root CA, forcing updates to the FortiGate and FortiClient endpoints by generating new certificates for each client.

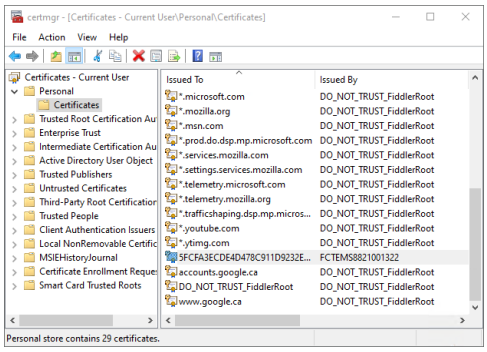
Do not confuse the EMS CA certificate (ZTNA) with the SSL certificate. The latter is the server certificate that is used by EMS for HTTPS access and fabric connectivity to the EMS server.

EMS can also manage individual client certificates. To revoke the current client certificate that is used by the endpoint: go to *Endpoint* > *All Endpoints*, select the client, and click *Action* > *Revoke Client Certificate*.



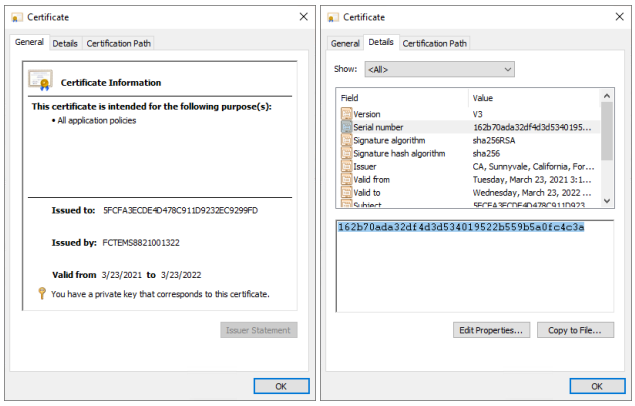
Locating and viewing the client certificate on an endpoint

In Windows, FortiClient automatically installs certificates into the certificate store. The certificate information in the store, such as certificate UID and SN, should match the information on EMS and the FortiGate.

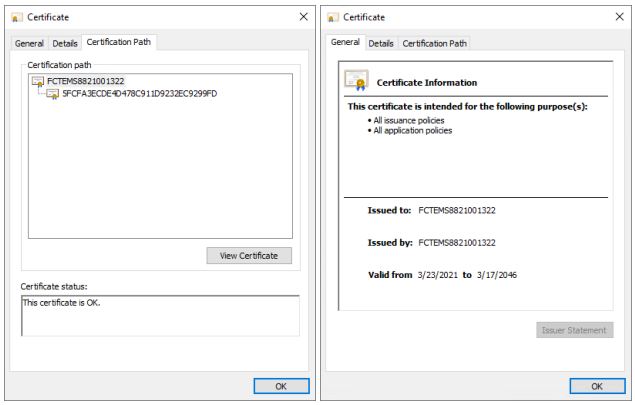


To locate certificates on other operating systems, consult the vendor documentation.

To locate the client certificate and EMS ZTNA CA certificate on a Windows PC:



1. In the Windows search box, enter *user certificate* and click *Manage user certificates* from the results.



2. In the certificate manager, go to *Certificates - Current User* > *Personal* > *Certificates* and find the certificate that is issued by the FortiClient EMS.

3. Right-click on it and select Properties.
4. The *General* tab shows the client certificate UID and the issue and expiry dates. The *Details* tab show the certificate SN.

5. Go to the *Certificate Path* tab to see the full certificate chain.
6. Select the root CA and click *View Certificate* to view the details about the EMS ZTNA CA certificate.

Verifying that the client information is synchronized to the FortiGate

The following diagnose commands help to verify the presence of matching endpoint record, and information such as the client UID, client certificate SN, and EMS certificate SN on the FortiGate. If any of the information is missing or incomplete, client certificate authentication might fail because the corresponding endpoint entry is not found. More in-depth diagnosis would be needed to determine the reason for the missing records.

Command	Description
`# diagnose endpoint record list <ip>`	Show the endpoint record list. Optionally, filter by the endpoint IP address.
`# diagnose wad dev query-by uid <uid> <ems sn> <ems tenant id>`	Query from WAD diagnose command by UID.
`# diagnose wad dev query-by ipv4 <ip>`	Query from WAD diagnose command by IP address.
`# diagnose test application fcnacd 7` `# diagnose test application fcnacd 8`	Check the FortiClient NAC daemon ZTNA and route cache.
`#diagnose test application fcnacd 5`	Force a sync with the FortiClient EMS server.

To check the endpoint record list for IP address 10.0.3.2:

```
# diagnose endpoint record list 10.0.3.2
Record #1:
                IP Address = 10.0.3.2
                MAC Address = 02:09:0f:00:03:03
                MAC list =
                VDOM =  (-1)
                EMS serial number: FCTEMS8822001975
                EMS tenant id: 00000000000000000000000000000000
                Client cert SN: 2B8D4FF0E71FE7E064288FE1B4F87E25232092D0
                Public IP address: 34.23.223.220
                Quarantined: no
                Online status: online
                Registration status: registered
                On-net status: on-net
                Gateway Interface:
                FortiClient version: 7.2.0
                AVDB version: 1.0
                FortiClient app signature version: 23.544
                FortiClient vulnerability scan engine version: 2.34
                FortiClient UID: 9A016B5A6E914B42AD4168C066EB04CA
                …
                Number of Routes: (0)
online records: 1; offline records: 0; quarantined records: 0; out-of-sync records: 0
```

To check the tags that are processed by the WAD daemon for a particular device:

```
# diagnose wad dev query-by uid 9A016B5A6E914B42AD4168C066EB04CA FCTEMS8822001975

ZTNA scalability support for concurrent endpoints

ZTNA scalability supports up to 50 thousand concurrent endpoints. Communication between FortiOS and FortiClient EMS has efficient queries that request incremental updates. Retrieved device information can be written to the FortiClient NAC daemon cache.

FortiOS can receive tag information from the EMS common tags API. This feature requires FortiClient EMS 7.0.3 or later.

The APIs `api/v1/report/fct/uid_tags` and `api/v1/report/fct/tags` replace the API `api/v1/report/fct/host_tags`.

To use the common tags API capability:

1. Enable the common tags API when connecting the EMS:

```
config endpoint-control fctems
    edit "local.ems"
        set server "10.6.30.213"
        set capabilities fabric-auth silent-approval websocket websocket-malware push-
ca-certs common-tags-api
    next
end
```

2. The FortiGate uses the new APIs to obtain device information from the EMS:

```
[ec_ems_context_submit_work:414] Call submitted successfully.
    obj-id: 11, desc: REST API to get updates of tag endpoints., entry:
api/v1/report/fct/tags.
[ec_ems_context_submit_work:414] Call submitted successfully.
    obj-id: 12, desc: REST API to get updates of tags associated with FCT UID., entry:
api/v1/report/fct/uid_tags.
[ec_ez_worker_process:334] Processing call for obj-id: 11, entry:
"api/v1/report/fct/tags"
[dynamic_addr_ha_act:215] called (EMS SN N/A).
[dynamic_addr_ha_act:215] called (EMS SN N/A).
[ec_ez_worker_process:441] Call completed successfully.
    obj-id: 11, desc: "REST API to get updates of tag endpoints.", entry:
"api/v1/report/fct/tags".
[ec_ez_worker_process:334] Processing call for obj-id: 12, entry:
"api/v1/report/fct/uid_tags"
[ec_record_sync_tags_info_store:1419] Received 1 tags for
3D86DF70B85E16CBAD67908A897B4494 with sn FCTEMS8888888888
[ec_record_sync_tags_info_store:1419] Received 1 tags for
DA12930442F13F84D2441F03FCB6A10E with sn FCTEMS8888888888
[ec_record_sync_tags_info_store:1419] Received 1 tags for
25C59C275F257F4C5FBC7F6F5F56788E with sn FCTEMS8888888888
[ec_ez_worker_process:441] Call completed successfully.
    obj-id: 12, desc: "REST API to get updates of tags associated with FCT UID.", entry:
"api/v1/report/fct/uid_tags".
[ec_ems_context_submit_work:414] Call submitted successfully.
    obj-id: 7, desc: REST API to get updates about system info., entry:
api/v1/report/fct/sysinfo.
[ec_ems_context_submit_work:414] Call submitted successfully.
    obj-id: 11, desc: REST API to get updates of tag endpoints., entry:
api/v1/report/fct/tags.
[ec_ez_worker_process:334] Processing call for obj-id: 11, entry:
"api/v1/report/fct/tags"
[ec_ez_worker_process:441] Call completed successfully.
    obj-id: 11, desc: "REST API to get updates of tag endpoints.", entry:
"api/v1/report/fct/tags".
(......)
```

3. Confirm that the device information from the EMS is written to the FortiClient NAC daemon cache:

```
# diagnose endpoint record list
    ...
          Avatar source: OS
            Phone number:
            Number of Routes: (1)
```

```
                    Gateway Route #0:
                            - IP:10.1.91.6, MAC: 4f:8d:c2:73:dd:fe, Indirect: no
                            - Interface:port2, VFID:1, SN: FG5H1E5999999999
online records: 37174; offline records: 0; quarantined records: 0; out-of-sync records:
0
```

4. Use the tags that are pulled from the EMS in a firewall address:

```
config firewall address
    edit "FCTEMS8888888888_ZT_AD_MGMT"
        set type dynamic
        set sub-type ems-tag
        set obj-tag "ZT_AD_MGMT"
        set tag-type "zero_trust"
    next
end
```

5. Check the tags' resolved IP and MAC addresses:

```
# diagnose firewall fqdn getinfo-ip FCTEMS8888888888_ZT_AD_MGMT
getinfo FCTEMS8888888888_ZT_AD_MGMT id:114 generation:106 count:187 data_len:6160 flag 0

# diagnose firewall fqdn getinfo-mac MAC_FCTEMS8888888888_ZT_AD_MGMT
getinfo MAC_FCTEMS8888888888_ZT_AD_MGMT id:163 generation:105 count:371 data_len:2226
flag 0

# diagnose firewall dynamic address  FCTEMS8888888888_ZT_AD_MGMT
CMDB name: FCTEMS8888888888_ZT_AD_MGMT
TAG name: ZT_AD_MGMT
FCTEMS8888888888_ZT_AD_MGMT: ID(114)
        ADDR(10.1.10.4)
(......)
        ADDR(10.1.99.195)
Total IP dynamic range blocks: 190.
Total IP dynamic addresses: 281.

# diagnose firewall dynamic address MAC_FCTEMS8888888888_ZT_AD_MGMT
CMDB name: MAC_FCTEMS8888888888_ZT_AD_MGMT
TAG name: ZT_AD_MGMT
MAC_FCTEMS8888888888_ZT_AD_MGMT: ID(163)
        MAC(52:f1:9d:06:1c:db)
        MAC(4b:77:2b:db:82:15)
        MAC(df:6e:9e:d9:04:1e)
Total MAC dynamic addresses: 393.
```

SSL certificate based authentication

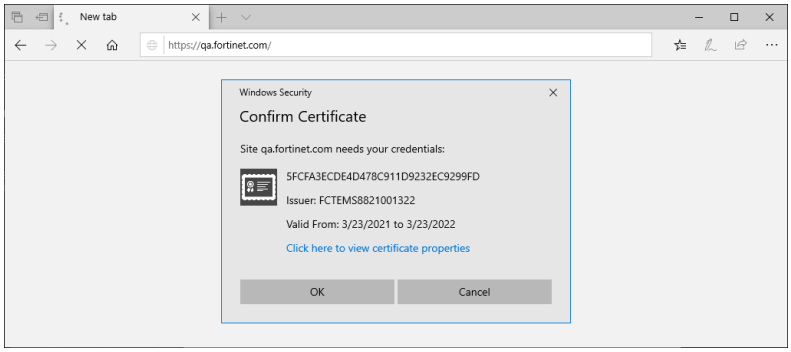
A client certificate is obtained when an endpoint registers to EMS. FortiClient automatically submits a CSR request and the FortiClient EMS signs and returns the client certificate. This certificate is stored in the operating system's certificate store for subsequent connections. The endpoint information is synchronized between the FortiGate and FortiClient EMS. When an endpoint disconnects or is unregistered from EMS, its certificate is removed from the certificate store and revoked on EMS. The endpoint obtains a certificate again when it reconnects to EMS.

By default, client certificate authentication is enabled on the access proxy, so when the HTTPS request is received the FortiGate's WAD process challenges the client to identify itself with its certificate. The FortiGate makes a decision based on the following possibilities:

1. If the client responds with the correct certificate that the client UID and certificate SN can be extracted from:
   - If the client UID and certificate SN match the record on the FortiGate, the client is allowed to continue with the ZTNA proxy rule processing.
   - If the client UID and certificate SN do not match the record on the FortiGate, the client is blocked from further ZTNA proxy rule processing.
2. If the client cancels and responds with an empty client certificate:
   - If `empty-cert-action` is set to `accept`, the client is allowed to continue with ZTNA proxy rule processing.
   - If `empty-cert-action` is set to `block`, the client is blocked from further ZTNA proxy rule processing.

To configure the client certificate actions:

```
config firewall access-proxy
    edit <name>
        set client-cert {enable | disable}
        set empty-cert-action {accept | block | accept-unmanageable}
    next
end
```



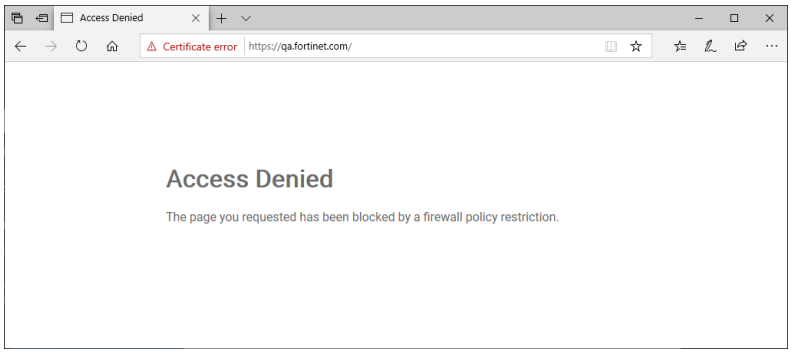
Example

In this example, a client connects to *qa.fortinet.com* and is prompted for a client certificate.

- `client-cert` is set to `enable`, and `empty-cert-action` is set to `block`.
- The ZTNA server is configured, and a ZTNA policy is set to allow this client.
- The domain resolves to the FortiGate access proxy VIP.

Scenario 1:

When prompted for the client certificate, the client clicks *OK* and provides a valid certificate that is verified by the FortiGate.



Result:

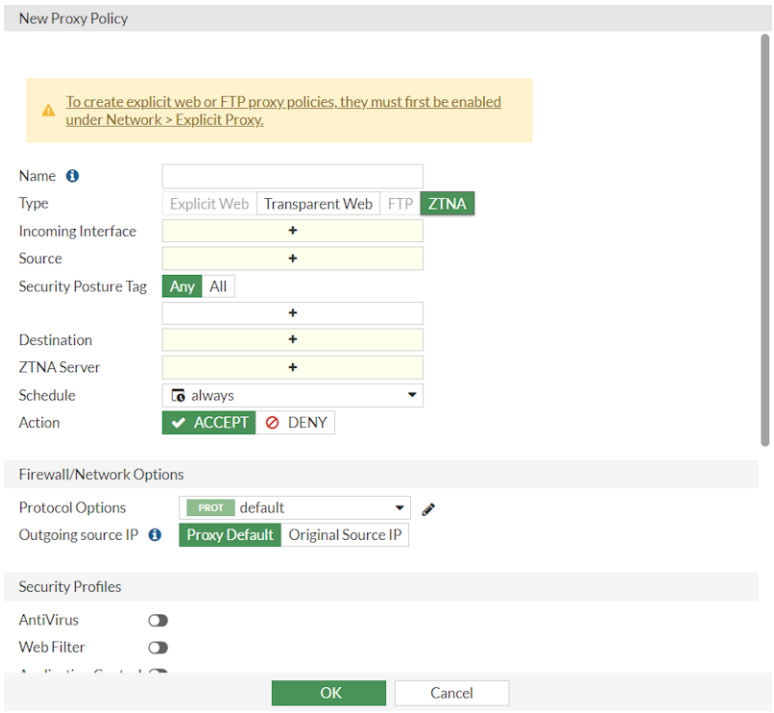
The client passes SSL certificate authentication and is allowed to access the website.

Scenario 2:

When prompted for the client certificate, the client clicks *Cancel*, resulting in an empty certificate response to the access proxy.

Result:

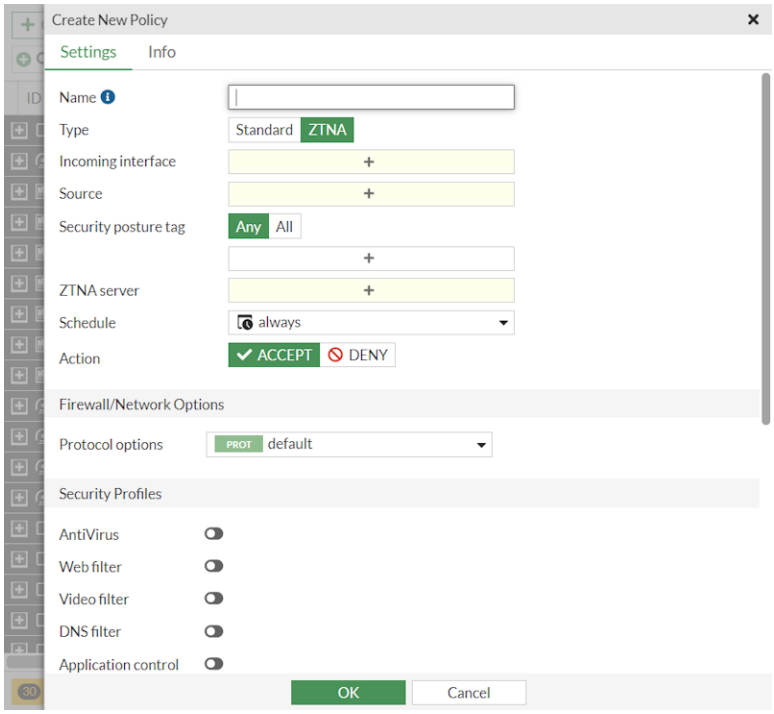
Because the certificate response is empty and `empty-cert-action` is set to `block`, the WAD daemon blocks the connection.



Currently, the Microsoft Edge, Google Chrome, and Safari browsers are supported by ZTNA.

Full versus simple ZTNA policies

There are two ways to configure ZTNA rules in the GUI by using a full or simple ZTNA policy.



Full ZTNA policy

In a full ZTNA policy, the CLI configuration remains the same as previous versions. In the GUI, the *Policy & Objects* > *ZTNA* > *ZTNA Rules* tab has been removed. Administrators can configure ZTNA policies from the *Policy & Objects* > *Proxy Policy* page, and by setting the *Type* to *ZTNA*.

Simple ZTNA policy

In a simple ZTNA policy, a regular firewall policy is used for policy management. When creating a new firewall policy, administrators can configure a ZTNA policy by setting the *Type* to *ZTNA*.

A simple ZTNA policy cannot control access based on the destination interface or the real server's destination address. See the Examples section for detailed configurations.

Authentication for ZTNA policies

Authentication remains largely the same between both ZTNA policy configuration modes. You can specify user groups under *Source* to define the groups in which the access control applies to. However, the underlying authentication schemes and rules must still be in place to direct the traffic to the ZTNA application gateway.

Authentication for regular firewall policies

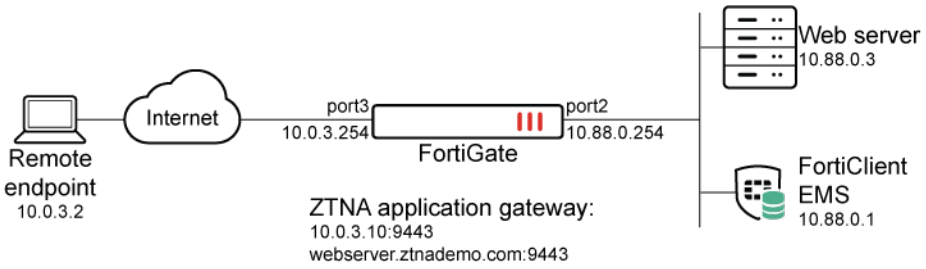
Authentication for regular firewall policies is traditionally handled by authd, which does not require an authentication scheme and rules to be configured in order to function. This enhancement allows authentication for regular firewall policies to be handled by WAD so that the authentication scheme and rules are used to determine the type of authentication and the traffic that requires authentication. This option is disabled by default, but can be enabled as follows:

```
config firewall auth-portal
    set proxy-auth {enable | disable}
end
```

Redirecting a simple ZTNA policy to a full ZTNA policy

An option is added so that after matching a simple ZTNA policy, the traffic can be redirected for a full ZTNA policy match. This setting can only be configured from the CLI, and it is disabled by default.

```
config firewall policy
    edit <id>
        set ztna-policy-redirect {enable | disable}
    next
end
```



For example, a client has both tag A and tag B. In the simple ZTNA policy, the client matches a policy that requires tag A for a posture check. If they are using the `ztna-policy-redirect` option, then it will also require a full ZTNA policy match.

If a full ZTNA policy allows either tag A or tag B or all traffic in general, then the traffic is allowed. Otherwise, if a full ZTNA policy explicitly denies one of the tags, the traffic will be denied.

If no full ZTNA policy is matched, then the traffic is implicitly denied.

Examples

The following examples demonstrate how to configure a ZTNA policy using the full and simple ZTNA policy modes.

It is assumed that the following settings are already configured:

- EMS connection and EMS tags (Malicious-File-Detected and FortiAD.Info)
- ZTNA server configuration (ZTNA-webserver)
- Authentication scheme and rule

Configuring a full ZTNA policy

To configure a full ZTNA policy in the GUI:

1. Go to *Policy & Objects* > *Proxy Policy* and click *Create New*.
2. Configure the following settings:

Name	*ZTNA-webserver*
Type	*ZTNA*
Incoming Interface	*port3*
Source	*all*
Destination	*Webserver1* (10.88.0.3/32)
ZTNA Server	*ZTNA-webserver*
Schedule	*always*
Action	*ACCEPT*

3. Click *OK*.

To configure a full ZTNA policy in the CLI:

```
config firewall proxy-policy
    edit 1
        set name "ZTNA-webserver"
        set proxy access-proxy
        set access-proxy "ZTNA-webserver"
        set srcintf "port3"
        set srcaddr "all"
        set dstaddr "Webserver1"
        set action accept
        set schedule "always"
    next
end
```

When traffic is allowed, the ZTNA logs show traffic passing through policy 1 on a policy called `ZTNA-webserver`, which is a proxy policy.

To verify the traffic logs:

```
# execute log filter category traffic
# execute log filter field subtype ztna
# execute log display
9 logs found.
9 logs returned.
1: date=2023-03-06 time=20:16:11 eventtime=1678162572109525759 tz="-0800" logid="0005000024"

rcvdbyte=303150 wanout=3755 lanin=2813 sentbyte=2813 lanout=304697 appcat="unscanned"
```

Configuring a simple ZTNA policy

To configure a simple ZTNA policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the following settings:

Name	*ZTNA-webserver-fp*
Type	*ZTNA*
Incoming Interface	*port3*
Source	*all*
ZTNA server	*ZTNA-webserver*
Schedule	*always*
Action	*ACCEPT*

3. Click *OK*.

To configure a simple ZTNA policy in the CLI:

```
config firewall policy
    edit 9
        set name "ZTNA-webserver-fp"
        set srcintf "port3"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "ZTNA-webserver"
        set schedule "always"
        set service "ALL"
```

```
    next
end
```

When traffic is allowed, the ZTNA logs show traffic passing through policy 9 on a policy called `ZTNA-webserver-fp`, which is a firewall policy.

To verify the traffic logs:

```
# execute log filter category traffic
# execute log filter field subtype ztna
# execute log display
14 logs found.
10 logs returned.

1: date=2023-03-06 time=23:01:55 eventtime=1678172515724776640 tz="-0800" logid="0005000024"
type="traffic" subtype="ztna" level="notice" vd="root" srcip=10.0.3.2 srcport=31687
srcintf="port3" srcintfrole="wan" dstcountry="Reserved" srccountry="Reserved"

```

Configuring a ZTNA simple policy with security posture tags and authentication

In this example, a simple ZTNA policy uses the FortiAD.Info tag for a posture check and authentication against a pre-configured Active Directory server where the user tsmith resides. The authentication scheme and rule have already been configured as follows:

```
config authentication scheme
    edit "ZTNA-Auth-scheme"
        set method basic
        set user-database "LDAP-fortiad"
    next
end

config authentication rule
    edit "ZTNA-Auth-rule"
        set srcintf "port3"
        set srcaddr "all"
        set active-auth-method "ZTNA-Auth-scheme"
    next
end
```

To append security posture tag and authentication settings to the simple ZTNA policy:

1. Go to *Policy & Objects* > *Firewall Policy* and edit the *ZTNA-webserver-fp* policy.
2. For the *Source* field, click the + and add the user group named *LDAP-Remote-Allowed-Group*.
3. For the *Security Posture Tag* field, click the + and add the *FortiAD.Info tag*.
4. Click *OK*.

To verify the configuration:

1. Connect to the web server from a client.
2. After selecting the client certificate, the browser will prompt for a username and password. Enter the username (tsmith) and their password.

   Upon a successful authentication, the user can access the web server.
3. On the FortiGate, verify that the logs for the allowed traffic show the user tsmith and the tag EMS1_ZTNA_FortiAD.Info:

```
# execute log filter field subtype ztna
# execute log display
18 logs found.
10 logs returned.
1: date=2023-03-06 time=23:25:23 eventtime=1678173923745891128 tz="-0800"
logid="0005000024" type="traffic" subtype="ztna" level="notice" vd="root" srcip=10.0.3.2

```

ZTNA advanced configurations

This section includes the following ZTNA advanced configurations:

- Access control of unmanageable and unknown devices on page 1193
- HTTP2 connection coalescing and concurrent multiplexing for ZTNA on page 1199
- Fabric integration with FortiGSLB on page 1202

Access control of unmanageable and unknown devices

The ZTNA application gateway can determine whether a client device that does not have FortiClient installed is a mobile device that is considered unmanageable, or is not a mobile device that is considered unknown. The ZTNA application gateway tags the device as either `EMS_ALL_UNMANAGEABLE_CLIENTS` or `EMS_ALL_UNKNOWN_CLIENTS` respectively. The FortiGate WAD process achieves this by either matching device TLS fingerprints against a library or learning information from the HTTP User-Agent header if the `set user-agent-detect` setting is enabled.

Configuring the ZTNA access proxy and proxy policy

The `EMS_ALL_UNMANAGEABLE_CLIENTS` and `EMS_ALL_UNKNOWN_CLIENTS` tags allow for ZTNA access control of unmanageable and unknown devices using a proxy policy. The `accept-unmanageable` option for the `empty-cert-`

`action` setting allows unmanageable clients to continue ZTNA proxy rule processing.

```
config firewall access-proxy
    edit <name>
        set client-cert enable
        set user-agent-detect {enable | disable}
        set empty-cert-action {accept | block | accept-unmanageable}
     next
end
```

`user-agent-detect {enable | disable}`	Enable/disable detecting the device type by HTTP User-Agent if no client certificate is provided (default = enable).
`empty-cert-action {accept | block | accept-unmanageable}`	Set the action for an empty client certificate: • `accept`: accept the SSL handshake if the client certificate is empty. • `block`: block the SSL handshake if the client certificate is empty. • `accept-unmanageable`: accept the SSL handshake only if the end point is unmanageable.

The `user-agent-detect` and `empty-cert-action` settings can only be configured in the CLI.

```
config firewall proxy-policy
    edit <id>
        set ztna-ems-tag {EMS_ALL_UNMANAGEABLE_CLIENTS | EMS_ALL_UNKNOWN_CLIENTS}
    next
end
```

`ztna-ems-tag {EMS_ALL_UNMANAGEABLE_CLIENTS | EMS_ALL_UNKNOWN_CLIENTS}`	Set the EMS tag names: • `EMS_ALL_UNMANAGEABLE_CLIENTS`: match any device that is unmanageable. • `EMS_ALL_UNKNOWN_CLIENTS`: match any device that is not recognized.

Consider the following use cases.

- Case 1: if a client device sends a TLS client hello in a mobile pattern, then WAD will try to match its TLS fingerprint with a WAD original library and mark it with an `EMS_ALL_UNMANAGEABLE_CLIENTS` tag.
- Case 2: if WAD cannot match the TLS fingerprint with an original library but `user-agent-detect` is enabled (under `config firewall access-proxy`), WAD will try to learn the device type from client request's User-Agent header. If it matches a mobile device, then it is still marked with an `EMS_ALL_UNMANAGEABLE_CLIENTS` tag.
- Case 3: if WAD cannot match the TLS fingerprint with an existing original or temporary library, or cannot learn it from User-Agent header, or `user-agent-detect` is disabled, then it will mark the device as `EMS_ALL_UNKNOWN_CLIENTS`.

In the access proxy settings, if `empty-cert-action` is set to `accept-unmanageable`, then only case 1 and 2 would go through the proxy policy. Case 3 would be denied, and a replacement message page would appear.

To configure ZTNA policy access control of unmanageable devices:

1. Configure the client certificate actions:

```
config firewall access-proxy
    edit "zt1"
        set vip "zt1"
        set client-cert enable
        set user-agent-detect enable
```

```
            set auth-portal disable
            set empty-cert-action accept
            set log-blocked-traffic disable
            set add-vhost-domain-to-dnsdb disable
            set decrypted-traffic-mirror ''
        next
    end
```

2. Configure the proxy policy with the ZTNA EMS tag to control device access:

```
config firewall proxy-policy
    edit 1
        set proxy access-proxy
        set access-proxy "zt1"
        set srcintf "port2" "ag2"
        set srcaddr "all"
        set dstaddr "all"
        set ztna-ems-tag "EMS_ALL_UNMANAGEABLE_CLIENTS"
    next
end
```

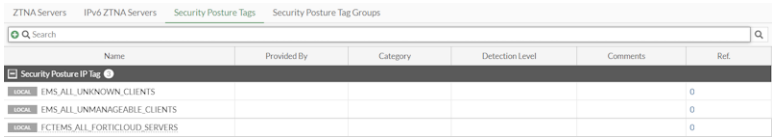
Configuring dynamic address local tags

Like other security posture tags,`EMS_ALL_UNMANAGEABLE_CLIENTS` and `EMS_ALL_UNKNOWN_CLIENTS` are dynamic addresses on the FortiGate. The following diagnostic commands can be used to view local tag information:

- `diagnose firewall dynamic address`: a list of unmanageable and unknown clients' IP addresses associated with the `EMS_ALL_MANAGEABLE_CLIENTS` and `EMS_ALL_UNKNOWN_CLIENTS` dynamic addresses, respectively, is displayed.
- `diagnose user-device-store device memory list`: when device detection is enabled on a FortiGate interface that has a layer 2 connection to unmanageable and unknown device clients, then a client's device information is displayed.

To verify the list of dynamic firewall addresses in the CLI:

```
(vdom1) # diagnose firewall dynamic address
List all dynamic addresses:
IP dynamic addresses in VDOM vdom1(vfid: 1):
...
CMDB name: EMS_ALL_UNMANAGEABLE_CLIENTS
EMS_ALL_UNMANAGEABLE_CLIENTS: ID(101)
        ADDR(10.1.100.22)
Total IP dynamic range blocks: 1.
Total IP dynamic addresses: 1.
CMDB name: EMS_ALL_UNKNOWN_CLIENTS
EMS_ALL_UNKNOWN_CLIENTS: ID(154)
Total IP dynamic range blocks: 0.
Total IP dynamic addresses: 0.
...
```

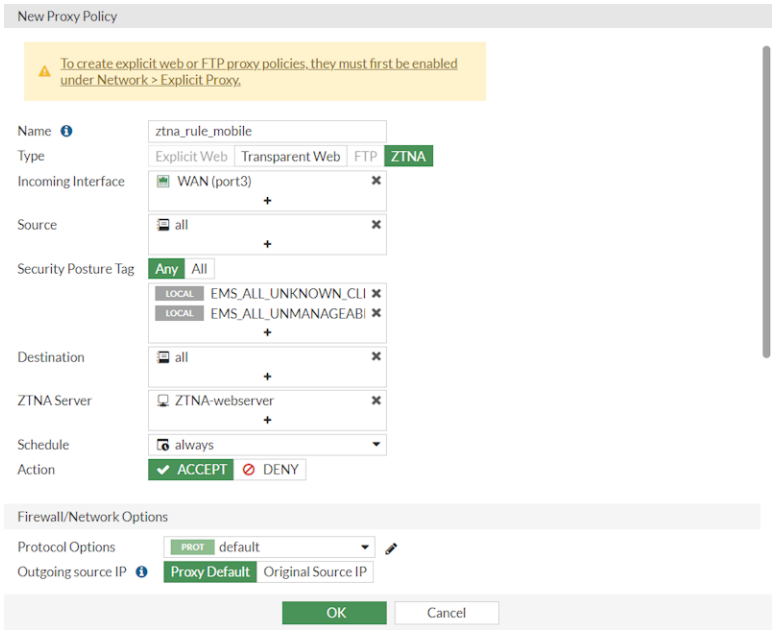


To verify the client device information in the CLI:

```
(vdom1) # diagnose user-device-store device memory list
Record #1:
         ...
```

```
device_info
        ...
        'is_online' = 'true'
        'is_ems_registered' = 'false'
        'active_start_time' = '1668811449'
        'is_fortiguard_src' = 'false'
        'tags' = 'EMS_ALL_UNMANAGEABLE_CLIENTS'
        ...
interface_info
...
```

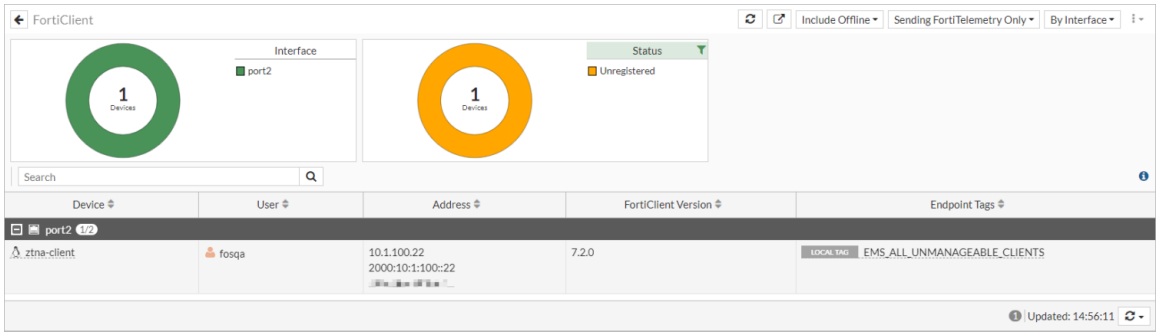
To view the local tag information in the GUI:



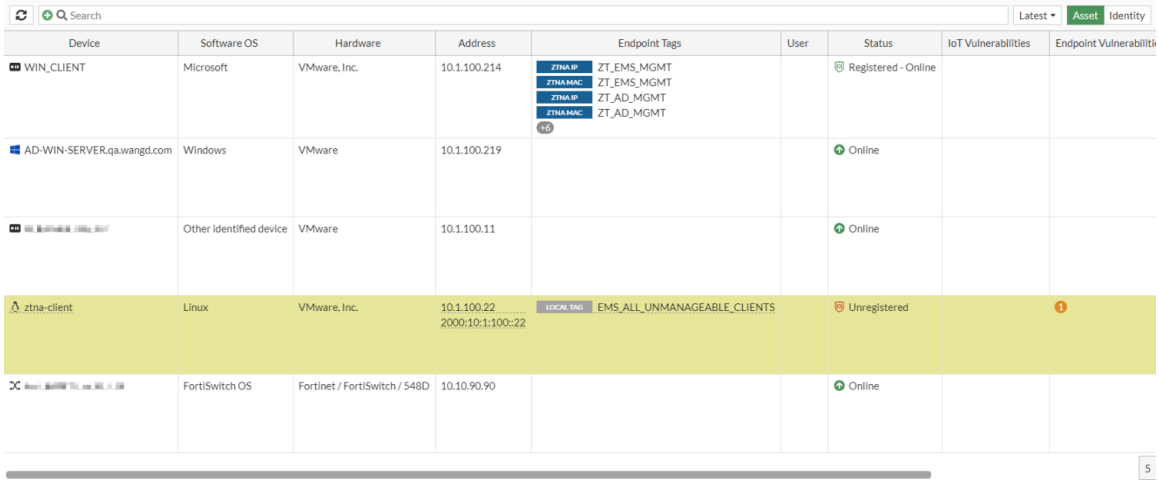
1. Go to *Policy & Objects* > *ZTNA* and select the *Security Posture Tags* tab.

2. Hover over a tag to view the tooltip, which displays matched endpoints and resolved addresses.

To apply a local tag in a full ZTNA policy:



1. Go to *Policy & Objects* > *Proxy Policy*.
2. Click *Create New*, or select and edit an existing entry.
3. In the *Security Posture Tag* field, click the + to add tags. The local tags appear in the *IP* section.



4. Configure the other settings as needed.
5. Click *OK*.

Local tag information is also available in the following GUI widgets and pages:

- *Dashboard* > *FortiClient* widget

- *Security Fabric* > *Asset Identity Center* page

Viewing ZTNA traffic logs

ZTNA traffic logs include the following fields related to unmanageable and unknown devices.

- Client connection status with EMS server with possible values of unknown, offline, or online:
  - CLI = `emsconnection`
  - GUI = *EMS Connection*
- Device manageability status with possible values of unknown, manageable, or unmanageable:
  - CLI = `clientdevicemanageable`
  - GUI = *Client Device Manageable*

The device manageability status can have one of the following values:

- Unknown: traffic from a client with an unknown TLS fingerprint and where the user agent information is not available for learning.
- Manageable: traffic from a non-mobile device (platform or operating system), with a known TLS fingerprint, or where the user agent information is available for learning.
- Unmanageable: traffic from a mobile device with a known mobile TLS fingerprint or user agent information is available for learning.

To view the ZTNA traffic logs in the CLI:

```
(vdom1)# execute log filter category 0
(vdom1)# execute log filter field subtype ztna
(vdom1)# execute log display

1: date=2022-11-18 time=14:23:57 eventtime=1668810238188622828 tz="-0800" logid="0005000024"

```

To view the ZTNA traffic logs in the GUI:

1. Go to *Log & Report* > *ZTNA Traffic*.
2. Select an entry and click *Details*.

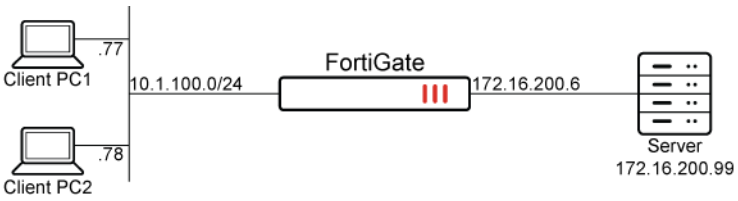
3. Check the *Client Device Manageable* and *EMS Connection* fields.

HTTP2 connection coalescing and concurrent multiplexing for ZTNA

HTTP2 connection coalescing and concurrent multiplexing allows multiple HTTP2 requests to share the same TLS connection when the destination IP is the same, and the host names are compatible in the certificate. In ZTNA scenarios, the FortiGate application gateway may accept multiple HTTP2 requests to the same ZTNA server destined to different virtual hosts on the same real server. These HTTP2 requests can share the same TLS connection between the FortiGate and the real server so that the handshake does not need to be performed multiple times for multiple connections.

In order for the FortiGate to match the SNI (Server Name Indication), this SNI value must appear under the SAN extension on the server certificate. Configuring the SNI value under the CN alone will not work.

To configure the ZTNA access proxy:



```
config firewall access-proxy
    edit <name>
        set http-supported-max-version {http1 | http2}
        set svr-pool-multiplex {enable | disable}
        set svr-pool-ttl <integer>
        set svr-pool-server-max-request <integer>
    next
end
```

`http-supported-max-version {http1 | http2}`	Set the maximum supported HTTP version: • http1: support HTTP 1.1 and HTTP1. • http2: support HTTP2, HTTP 1.1, and HTTP1 (default).

`svr-pool-multiplex {enable | disable}`	Enable/disable server pool multiplexing. When enabled, share the connected server in HTTP, HTTPS, and web portal API gateway.
`svr-pool-ttl <integer>`	Set the time-to-live in the server pool for idle connections to servers (in seconds, 0 - 2147483647, default = 15).
`svr-pool-server-max-request <integer>`	Set the maximum number of requests that servers in server pool handle before disconnecting (0 - 2147483647, default = 0).

Example

In this example, multiple clients submit requests in HTTP2. The requests hit the VIP address, and then FortiGate opens a session between itself (172.16.200.6) and the server (172.16.200.99). The coalescing occurs in this session as the multiple streams share the same TLS session to connect to the same destination server.

To configure connection coalescing and concurrent multiplexing with ZTNA:

1. Configure the VIP:

```
config firewall vip
    edit "vip-ztna"
        set type access-proxy
        set extip 10.1.100.223
        set extintf "port2"
        set server-type https
        set extport 443
        set ssl-certificate "Fortinet_SSL"
    next
end
```

2. Configure the ZTNA server and path mapping:

```
config firewall access-proxy
    edit "ztna"
        set vip "vip-ztna"
        set client-cert disable
        set svr-pool-multiplex enable
        set http-supported-max-version http2
        config api-gateway
            edit 1
                set url-map "/a"
                set virtual-host "a.ftnt.com"
                config realservers
                    edit 1
                        set ip 172.16.200.99
                    next
                end
```

```
            next
            edit 2
                set url-map "/b"
                set virtual-host "b.ftnt.com"
                config realservers
                    edit 1
                        set ip 172.16.200.99
                    next
                end
            next
        end
    next
end
```

3. Configure the ZTNA policy:

```
config firewall proxy-policy
    edit 3
        set proxy access-proxy
        set access-proxy "ztna"
        set srcintf "port2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set logtraffic all
        set utm-status enable
        set ssl-ssh-profile "deep-inspection-clone"
        set av-profile "av"
    next
end
```

4. Get the clients to access a.ftnt.com and b.ftnt.com. The clients share access with the same real server and certificate (CN=*.ftnt.com). The FortiGate shares the first TLS connection with second TLS connection.
5. Verify the sniffer packet capture on the FortiGate server side. There is one client hello.

No.	Time	Source	Destination	Protocol	Length	Info

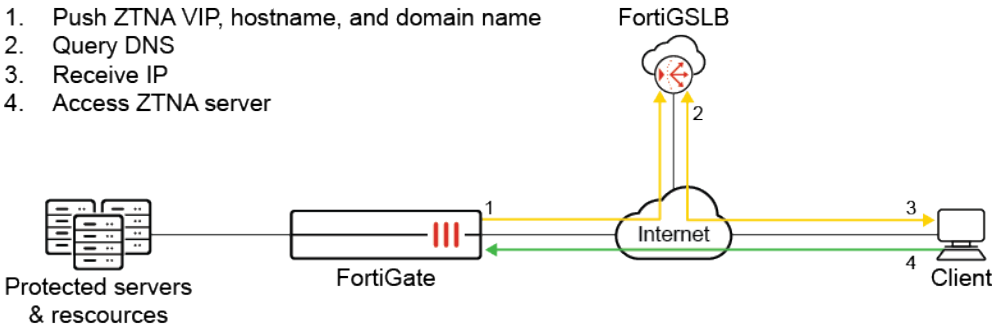
17	0.022590	172.16.200.6	172.16.200.99	TLSv1.2	145	Application Data
18	0.022686	172.16.200.99	172.16.200.6	TCP	66	443 → 7688 [ACK] Seq=2316 Ack=663 Win=64640 Len=0 TSval=834657471 TSecr=806057
19	0.022935	172.16.200.99	172.16.200.6	TLSv1.2	122	Application Data
20	0.022987	172.16.200.99	172.16.200.6	TLSv1.2	260	Application Data
21	0.022993	172.16.200.6	172.16.200.99	TCP	66	7688 → 443 [ACK] Seq=663 Ack=2566 Win=176128 Len=0 TSval=806057 TSecr=834657471
22	0.023285	172.16.200.6	172.16.200.99	TLSv1.2	108	Application Data
23	0.065172	172.16.200.99	172.16.200.6	TCP	66	443 → 7688 [ACK] Seq=2566 Ack=705 Win=64640 Len=0 TSval=834657513 TSecr=806057

6. Disable server pool multiplexing:

```
config firewall access-proxy
    edit "ztna"
        set vip "vip-ztna"
        set svr-pool-multiplex disable
    next
end
```

7. Verify the sniffer packet capture. This time, the FortiGate does not coalesce the TLS connection, so there are two client hellos.



No.	Time	Source	Destination	Protocol	Length	Info

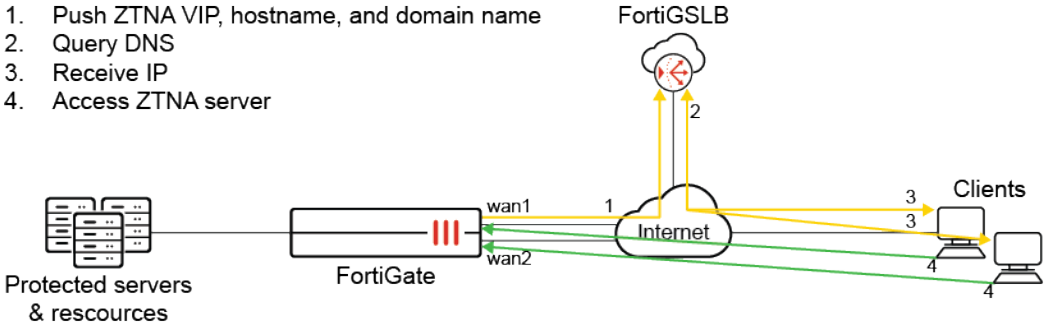
Fabric integration with FortiGSLB

Fabric integration between the FortiGate and FortiGSLB allows a FortiGate to publish custom host and domain names directly to FortiGSLB. This enables external IPs on VIPs used in ZTNA server objects to be published with the host and domain names directly to FortiGSLB, where its DNS service can provide nameserver lookups for the FQDNs.



In a basic use case, the hostname, domain name, and external IP of a ZTNA server can be published, and any subsequent updates to the address are immediately pushed to FortiGSLB.

1. Push ZTNA VIP, hostname, and domain name
2. Query DNS
3. Receive IP
4. Access ZTNA server

In more advanced setup, an FQDN may map to different external IPs, which can be load balanced by FortiGSLB.

1. Push ZTNA VIP, hostname, and domain name
2. Query DNS
3. Receive IP
4. Access ZTNA server

In addition, FortiGSLB can perform health checks on the external IPs, and then return the link with the better metrics. See How to add FortiGate SD-WAN Inbound Load Balancing to FortiGSLB in the FortiGSLB Handbook for more information.

This feature requires a valid FortiGSLB account contract (FGCS). If no valid FGCS contract is found, the CLI will return a warning message during configurations:

```
No license detected for FortiGSLB.
GSLB configuration and statistics will not be reported unless the
account is licensed.
```

To enable VIP and ZTNA server integration with the FortiGSLB Cloud service:

```
config system global
    set fortigslb-integration {enable | disable}
end
```

To configure the FortiGSLB setting in the VIP:

```
config firewall vip
    edit <name>
        set one-click-gslb-server {enable | disable}
        set gslb-hostname <string>
        set gslb-domain-name <string>
        config gslb-public-ips
            edit <id>
                set ip <IP_address>
            next
        end
    next
end
```

`one-click-gslb-server {enable | disable}`	Enable/disable integration with FortiGSLB.
`gslb-hostname <string>`	Enter the hostname portion of the FQDN that will be used within the configured FortiGSLB domain.
`gslb-domain-name <string>`	Enter the domain name of the FQDN that will be used within the configured FortiGSLB domain.
`ip <IP_address>`	Enter the custom publicly accessible IP address that overrides the external IP address (`extip`). This setting is optional.

Example

In this example, a FortiGate has three WAN interfaces, each configured with different VIPs that are used in ZTNA server objects that point to the same real server. These VIPs are configured with the same GSLB hostname and domain name. As a result, the hostname and domain name are mapped to three different addresses and sent to FortiGSLB. FortiGSLB's default setting will perform load balancing and respond to DNS queries by returning the addresses in a round-robin fashion.

To configure FortiGSLB integration:

1. Enable integration with FortiGSLB in the global settings:

   ```
   config system global
       set fortigslb-integration enable
   end
   ```

2. Enable integration with FortiGSLB on each firewall VIP:

   ```
   config firewall vip
       edit "ztna_vip1"
           set type access-proxy
           set server-type https
   ```

```
            set extip 172.18.62.66
            set extintf "port2"
            set one-click-gslb-server enable
            set gslb-hostname "qa.test"
            set gslb-domain-name "wangd.com"
            set extport 4443
            set ssl-certificate "default.test.com"
        next
        edit "ztna_vip2"
            set type access-proxy
            set server-type https
            set extip 172.18.62.67
            set extintf "port3"
            set one-click-gslb-server enable
            set gslb-hostname "qa.test"
            set gslb-domain-name "wangd.com"
            set extport 4443
            set ssl-certificate "default.test.com"
        next
        edit "ztna_vip3"
            set type access-proxy
            set server-type https
            set extip 172.18.62.68
            set extintf "port4"
            set one-click-gslb-server enable
            set gslb-hostname "qa.test"
            set gslb-domain-name "wangd.com"
            config gslb-public-ips
                edit 1
                    set ip 172.18.62.69
                next
            end
            set extport 4443
            set ssl-certificate "default.test.com"
        next
    end
```

3. Enable debugs:

```
# diagnose debug application cloudapid -1
# diagnose debug enable
```

A successful connection will produce output similar to the following:

```
<4234> 10 cloudapi_curl_debug()-19: CURL HEADER OUT: POST /api/v1.0/one-click-glb-
fgt/modifyconfig HTTP/2
Host: 1clickfgt.fortigslb-cloud.com
Accept: application/json
Content-Type: application/json
Content-Length: 553

<4234> 10 cloudapi_curl_debug()-19: CURL DATA OUT: {"members":[{"vdom_
name":"vdom1","name_key":"ztna_vip1","type":"ztna","ip_list":

```

Verification

Upon successfully passing the hostname, domain name, and IP address mappings to FortiGSLB, clients that are using FortiGSLB's DNS for DNS resolution can now get responses to their queries. Results on consecutive queries return the IP addresses in a round-robin fashion.

First query:

```
fosqa@ztna-client4:~/ztna_pytest$ dig @15.197.150.26 qa.test.wangd.com
; <<>> DiG 9.16.1-Ubuntu <<>> @15.197.150.26 qa.test.wangd.com
; (1 server found)
;; global options: +cmd
;; Got answer:
;; ->>HEADER<<- opcode: QUERY, status: NOERROR, id: 33860
;; flags: qr aa rd; QUERY: 1, ANSWER: 1, AUTHORITY: 1, ADDITIONAL: 2
;; WARNING: recursion requested but not available

;; OPT PSEUDOSECTION:

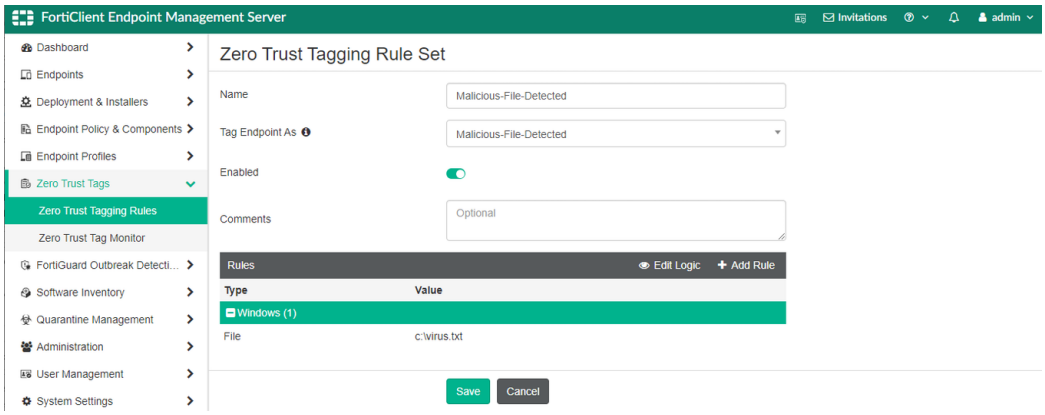
- Custom replacement message for ZTNA virtual hosts on page 1283

ZTNA HTTPS access proxy example

In this example, an HTTPS access proxy is configured to demonstrate its function as a reverse proxy on behalf of the web server it is protecting. It verifies user identity, device identity, and trust context, before granting access to the protected source.

This example shows access control that allows or denies traffic based on security posture tags. Traffic is allowed when the FortiClient endpoint is tagged as *Low Importance* using Classification tags, and denied when the endpoint is tagged with *Malicious-File-Detected*.

This example assumes that the FortiGate EMS fabric connector is already successfully connected.



To configure ZTNA in the GUI, go to *System* > *Feature Visibility* and enable *Zero Trust Network Access*.

To configure a Zero Trust tagging rule on the FortiClient EMS:

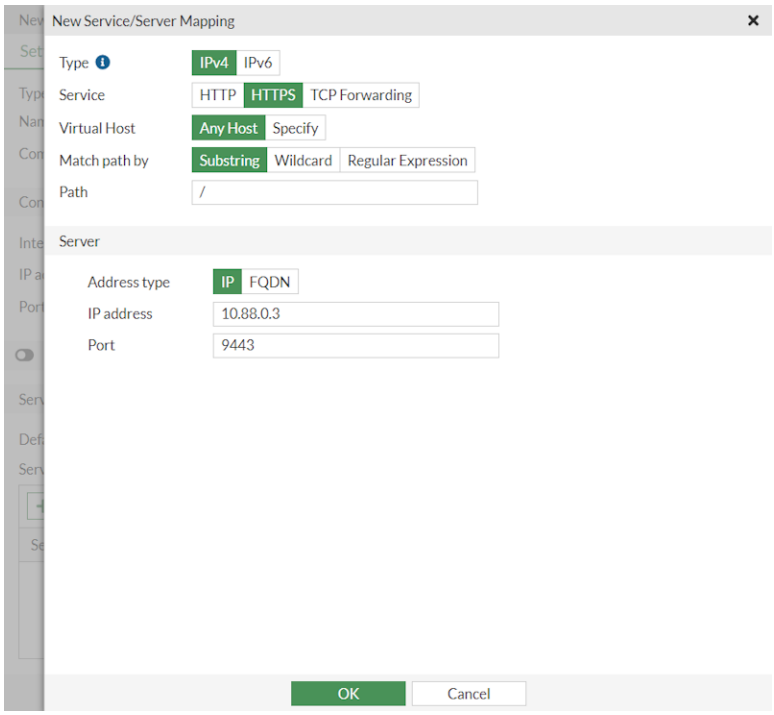
1. Log in to the FortiClient EMS.
2. Go to *Zero Trust Tags* > *Zero Trust Tagging Rules*, and click *Add*.
3. In the *Name* field, enter *Malicious-File-Detected*.
4. In the *Tag Endpoint As* dropdown list, select *Malicious-File-Detected*.

   EMS uses this tag to dynamically group together endpoints that satisfy the rule, as well as any other rules that are configured to use this tag.
5. Click *Add Rule* then configure the rule:
   a. For *OS*, select *Windows*.
   b. From the *Rule Type* dropdown list, select *File* and click the + button.
   c. Enter a file name, such as *C:\virus.txt*.
   d. Click *Save*.

6. Click *Save*.

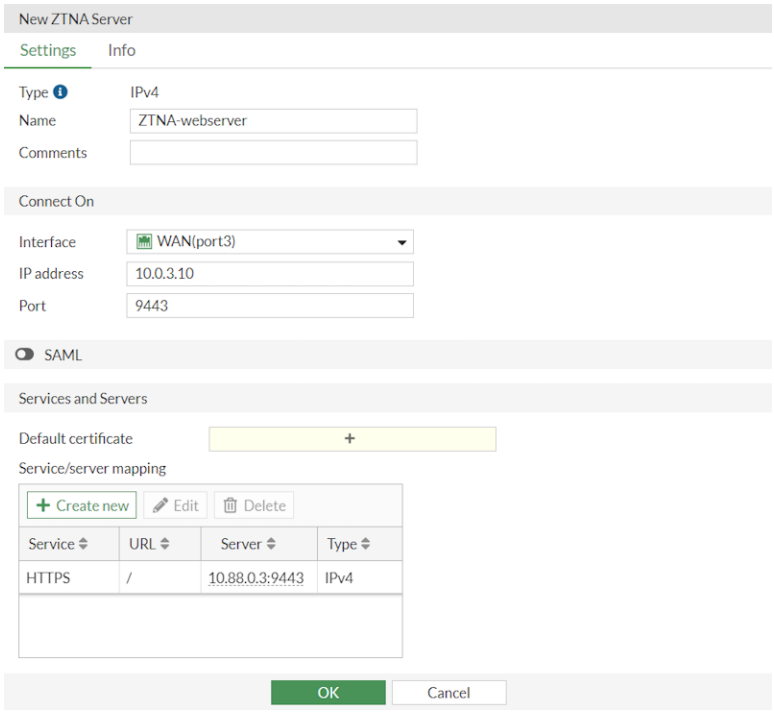
To configure FortiClient EMS to share classification tags:

1. Go to *Administration* > *Fabric Devices*.
2. Select the FortiGate device.
3. Click *Edit*.
4. Under *Tag Types Being Shared*, add *Classification Tags*.



5. Click *Save*.

To configure a ZTNA server for HTTPS access proxy in the GUI:

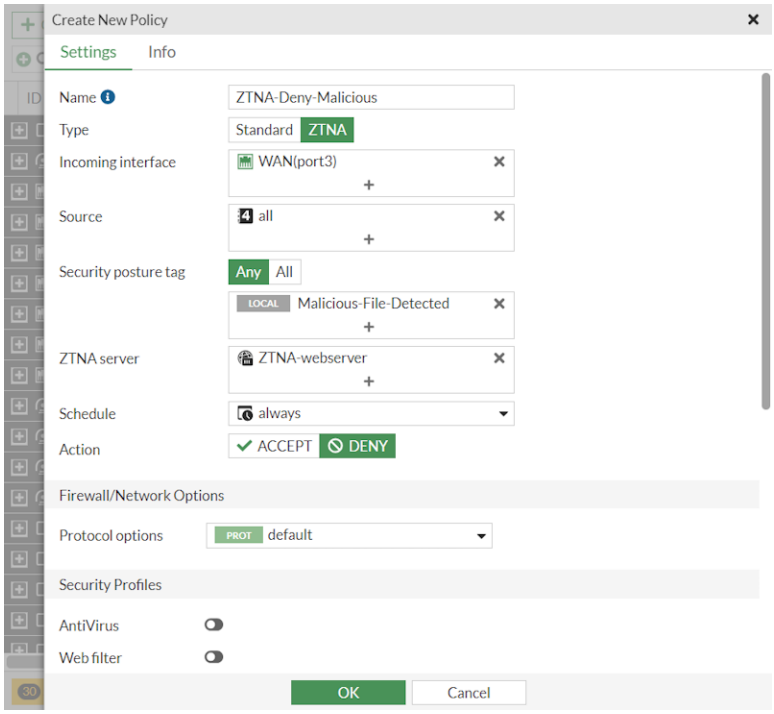


1. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Servers* tab.
2. Click *Create New*.
3. Set *Name* to *ZTNA-webserver*.
4. Set *Interface* to *port3*. The *IP address* and *Port* fields are automatically set to the IP of the selected interface and the default port of 443.
   a. Set *External IP* to *10.0.3.10*.
   b. Set *External port* to *9443*.

   Verify that the IP address and port do not conflict with management access to the interface. Otherwise, change the IP address to another address on that subnet.

5. Select the *Default certificate*. Clients will be presented with this certificate when they connect to the access proxy VIP.
6. Add server mapping:
   a. In the *Service/server mapping* table, click *Create New*.
   b. Set *Service* to *HTTPS*.
   c. Set *Virtual Host* to *Any Host*.
   d. Configure the path as needed. For example, to map to *webserver.ztnademo.com/fortigate*, enter */fortigate*.
   e. In the *Server* section, set *Address type* to *IP*.
   f. Set *IP address* to *10.88.0.3*.
   g. Set *Port* to *9443*.

h. Click *OK*. The server mapping is displayed.



7. Click *OK*.

To configure simple ZTNA policies to allow and deny traffic based on security posture tags in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Create a rule to deny traffic:

a. Click *Create New*.
b. Set *Name* to *ZTNA-Deny-malicious*.
c. Set *Type* to *ZTNA*.
d. Set *Incoming Interface* to *port3*.
e. Set *Source* to *all*.
f. Add the security posture tag *Malicious-File-Detected*.
   This tag is dynamically retrieved from EMS when you first created the Zero Trust Tagging Rule.
g. Select the ZTNA server *ZTNA-webserver*.
h. Set *Action* to *DENY*.
i. Enable *Log Violation Traffic*.

j. Click *OK*.

3. Create a rule to allow traffic:
   a. Click *Create New*.
   b. Set *Name* to *ZTNA-Allow-Simple*.
   c. Set *Type* to *ZTNA*.
   d. Set *Incoming Interface* to *port3*.
   e. Set *Source* to *all*. This can also be set to specific IP addresses to only allow those addresses to connect to this HTTPS access proxy.
   f. Add the *Class* tag *Low*.
   g. Select the ZTNA server *ZTNA-webserver*.
   h. Configure the remaining options as needed.
   i. Click *OK*.
4. On the firewall policy list, make sure that the deny rule (*ZTNA-Deny-malicious*) is above the allow rule (*ZTNA-Allow-Simple*).

To configure HTTPS access in the CLI:

1. Configure the access proxy VIP:

```
config firewall vip
    edit "ZTNA-webserver"
        set type access-proxy
        set extip 10.0.3.10
        set extintf "port3"
        set server-type https
        set extport 9443
        set ssl-certificate "ztna-wildcard"
    next
end
```

2. Configure the server and path mapping:

```
config firewall access-proxy
    edit "ZTNA-webserver"
        set vip "ZTNA-webserver"
        set client-cert enable
        set log-blocked-traffic enable
        config api-gateway
            edit 1
                config realservers
                    edit 1
                        set ip 10.88.0.3
                        set port 9443
                    next
                end
            next
        end
    next
end
```

3. Configure ZTNA policies:

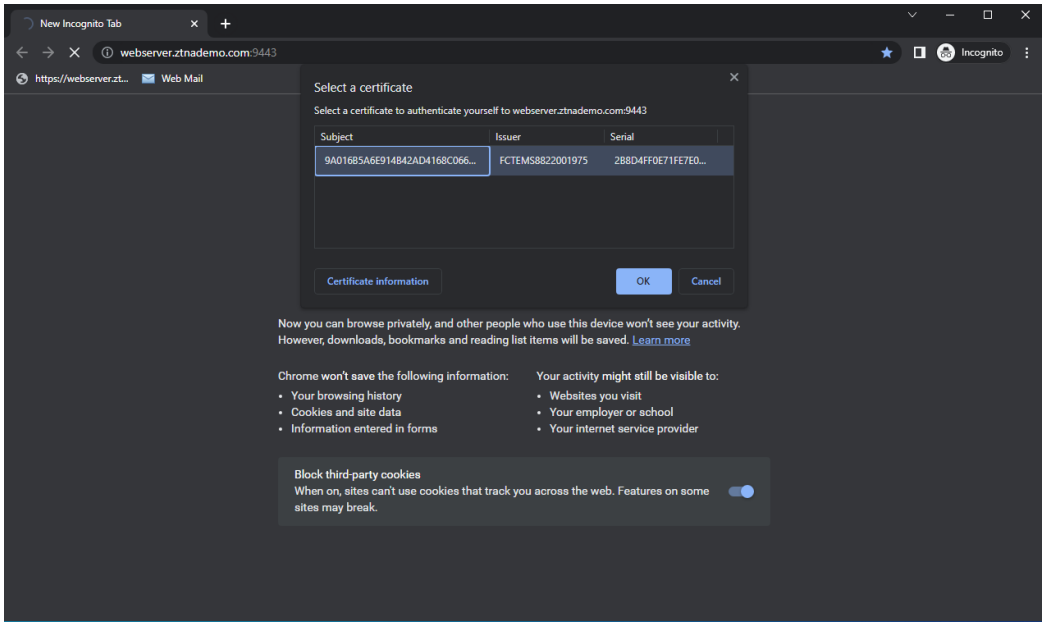
```
config firewall policy
     edit 9
        set name "ZTNA-Deny-Malicious"
        set srcintf "port3"
        set dstintf "any"
        set srcaddr "all"
        set dstaddr "ZTNA-webserver"
        set ztna-ems-tag "EMS1_ZTNA_Malicious-File-Detected"
        set schedule "always"
        set logtraffic all
    next
    edit 10
        set name "ZTNA-Allow-Simple"
        set srcintf "port3"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "ZTNA-webserver"
        set ztna-ems-tag "EMS1_CLASS_Low"
        set schedule "always"
        set logtraffic all
```

```
        set nat enable
    next
end
```

For configuration examples using full ZTNA policy, see Configure a ZTNA policy on page 1171.

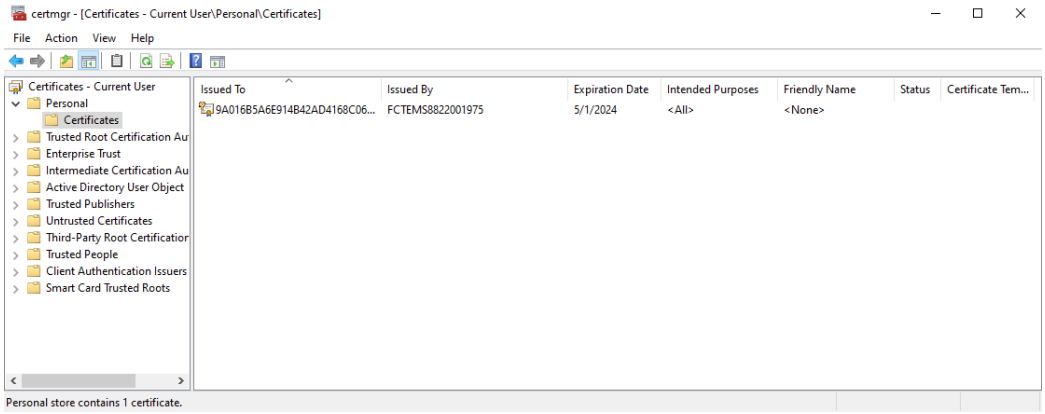
Testing the remote access to the HTTPS access proxy

After FortiClient EMS and FortiGate are configured, the HTTPS access proxy remote connection can be tested.

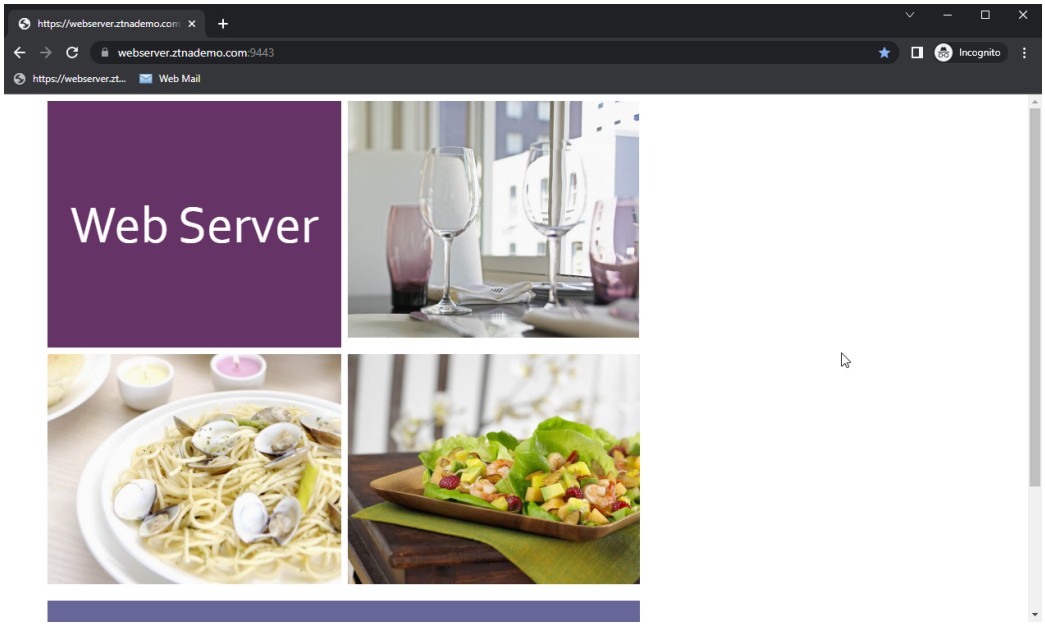


Access allowed:

1. On the remote Windows PC, open FortiClient.
2. On the *Zero Trust Telemetry* tab, make sure that you are connected to the EMS server.

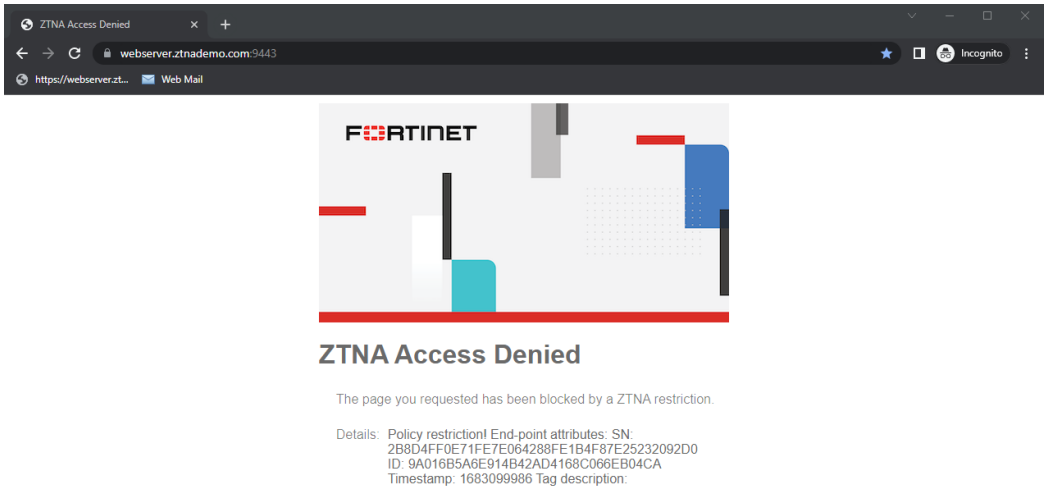


It is not necessary to configure a *ZTNA Destination* on FortiClient for the HTTPS access proxy use case. In fact, configuring a *ZTNA Destination* rule for the website may interfere with its operation.



3. Open a browser and enter the address of the server and the access port. When entering the FQDN, make sure that the DNS can resolve the address to the IP address of the FortiGate. In this example, webserver.ztnademo.com resolves to 10.0.3.10.
4. The browser prompts for the client certificate to use. Select the EMS signed certificate, then click *OK*.

The certificate is in the *User Configuration* store, under *Personal* > *Certificates*. The details show the SN of the certificate, which matches the record on the FortiClient EMS and the FortiGate.



5. The client is verified by the FortiGate to authenticate your identity.
6. The FortiGate matches your security posture by verifying your security posture tag and matching the corresponding ZTNA rule, and you are allowed access to the web server.

Access denied:

1. On the remote Windows PC, trigger the Zero Trust Tagging Rule by creating the file in C:\virus.txt.
2. Open a browser and enter the address http://webserver.ztnademo.com:9443.
3. The client is verified by the FortiGate to authenticate your identity.
4. FortiGate checks your security posture. Because EMS has tagged the PC with the *Malicious-File-Detected* tag, it matches the *ZTNA-Deny-malicious* rule.

5. You are denied access to the web server.

Logs and debugs

Access allowed:

```
# diagnose endpoint record list
Record #1:
                IP Address = 10.0.3.2
                MAC Address = 02:09:0f:00:03:03
                MAC list =
                VDOM =  (-1)
                EMS serial number: FCTEMS8822001975
                EMS tenant id: 00000000000000000000000000000000
                Client cert SN: 2B8D4FF0E71FE7E064288FE1B4F87E25232092D0

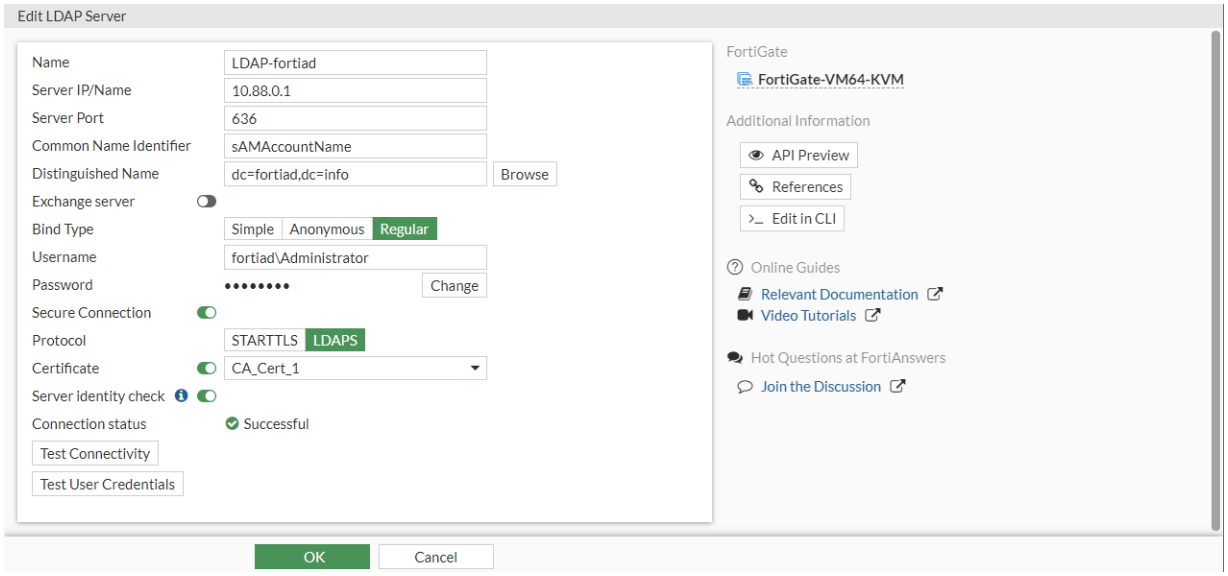
ZTNA HTTPS access proxy with basic authentication example

This example expands on the previous example (ZTNA HTTPS access proxy example on page 1206), adding LDAP authentication to the ZTNA rule. Users are allowed based on passing the client certificate authentication check, user authentication, and security posture check.

Users that are in the AD security group *ALLOWED-VPN* are allowed access to the access proxy. Users that are not part of this security group are not allowed access.

This example assumes that the FortiGate EMS fabric connector is already successfully connected.

LDAP/Active Directory Users and Groups:



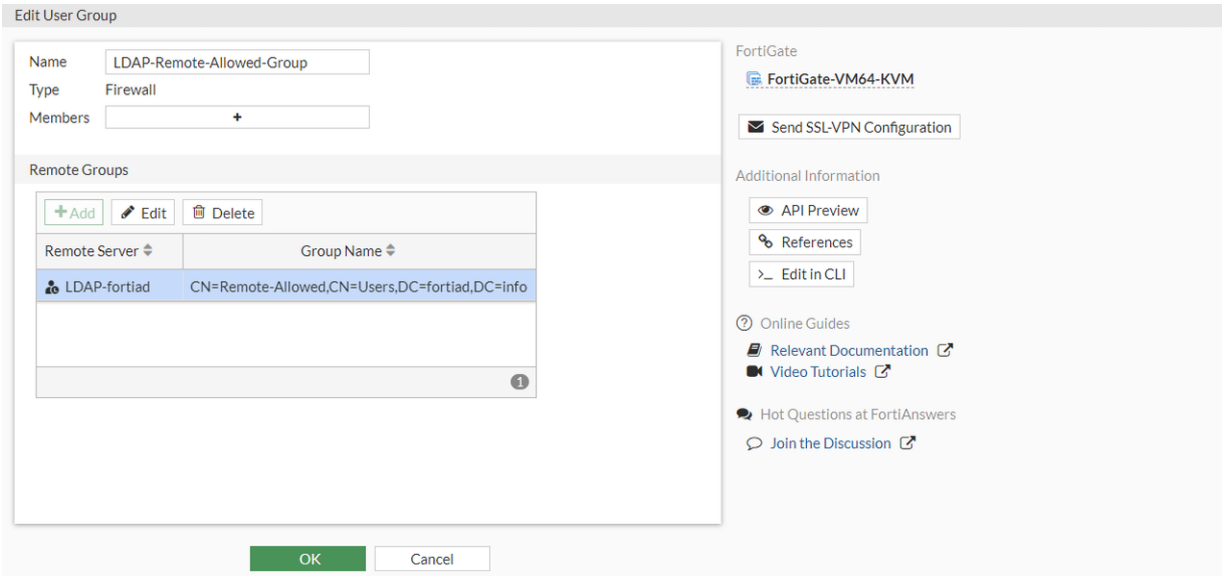
- Domain: fortiad.info
- Users (Groups):
  - tsmith (Domain Users, Remote-Allowed)
  - lhansen (Domain Users)

To configure a secure connection to the LDAP server in the GUI:

1. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
2. Configure the following settings:

Name	LDAP-fortiad
Server IP/Name	10.88.0.1
Server Port	636
Common Name Identifier	sAMAccountName

Distinguished Name	dc=fortiad,dc=info
Exchange server	Disabled
Bind Type	Regular Enter the *Username* and *Password* for LDAP binding and lookup.
Secure Connection	Enabled • Set *Protocol* to *LDAPS* • Enable *Certificate* and select the CA certificate to validate the server certificate.
Server identity check	Optionally, enable to verify the domain name or IP address against the server certificate.



3. Click *Test Connectivity* to verify the connection to the server.
4. Click *OK*.

To configure a secure connection to the LDAP server in the CLI:

```
config user ldap
    edit "LDAP-fortiad"
        set server "10.88.0.1"
        set cnid "sAMAccountName"
        set dn "dc=fortiad,dc=info"
        set type regular
        set username "fortiad\\Administrator"
        set password <password>
        set secure ldaps
        set ca-cert "CA_Cert_1"
        set port 636
    next
end
```

To configure a remote user group from the LDAP server in the GUI:

1. Go to *User & Authentication* > *User Groups* and click *Create New*.
2. Set the name to *LDAP-Remote-Allowed-Group*.
3. Set *Type* to *Firewall*.
4. In the *Remote Groups* table click *Add*:
   a. Set *Remote Server* to *LDAP-fortiad*.
   b. Locate the *Remote-Allowed* group, right-click on it, and click *Add Selected*.
   c. Click *OK*.

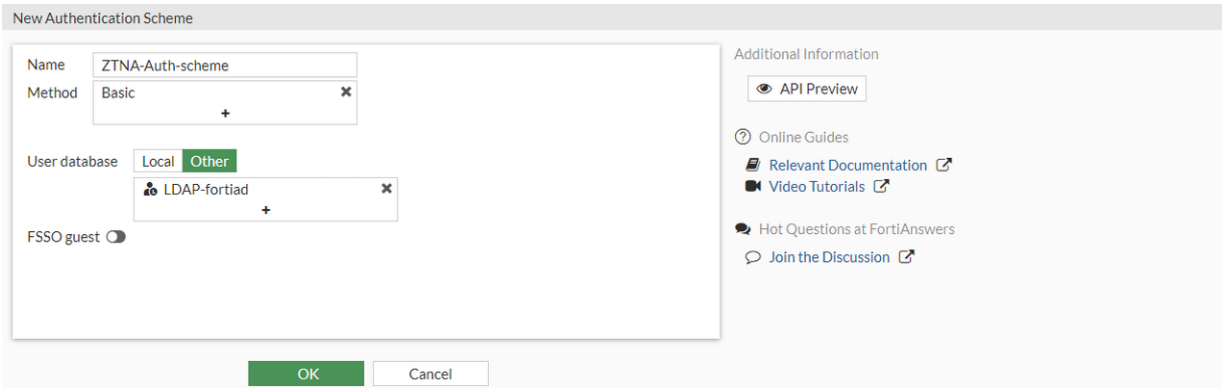
5. Click *OK*.

To configure a remote user group from the LDAP server in the CLI:

```
config user group
    edit "LDAP-Remote-Allowed-Group"
        set member "LDAP-fortiad"
        config match
            edit 1
                set server-name "LDAP-fortiad"
                set group-name "CN=Remote-Allowed,CN=Users,DC=fortiad,DC=info"
            next
        end
    next
end
```

Authentication scheme and rules

After the LDAP server and user group have been configured, an authentication scheme and rule must be configured.



To configure authentication schemes and rules in the GUI, go to *System* > *Feature Visibility* and enable *Explicit Proxy*.

Authentication scheme

The authentication scheme defines the method of authentication that is applied. In this example, basic HTTP authentication is used so that users are prompted for a username and password the first time that they connect to a website through the HTTPS access proxy.

To configure an authentication scheme in the GUI:

1. Go to *Policy & Objects* > *Authentication Rules* and click *Create New* > *Authentication Scheme*.
2. Set the name to *ZTNA-Auth-scheme*.
3. Set *Method* to *Basic*.
4. Set *User database* to *Other* and select *LDAP-fortiad* as the LDAP server.

5. Click *OK*.

To configure an authentication scheme in the CLI:

```
config authentication scheme
    edit "ZTNA-Auth-scheme"
        set method basic
        set user-database "LDAP-fortiad"
    next
end
```

Authentication rule

The authentication rule defines the proxy sources and destination that require authentication, and what authentication scheme is applied. In this example, active authentication through the basic HTTP prompt is used and applied to all sources.

To configure an authentication rule in the GUI:

1. Go to *Policy & Objects* > *Authentication Rules* and click *Create New* > *Authentication Rule*.
2. Set the name to *ZTNA-Auth-rule*.
3. Set *Source Address* to *all*.
4. Set *Protocol* to *HTTP*.
5. Enable *Authentication Scheme* and select *ZTNA-Auth-scheme*.
6. Click *OK*.

To configure an authentication rule in the CLI:

```
config authentication rule
    edit "ZTNA-Auth-rule"
        set srcaddr "all"
        set active-auth-method "ZTNA-Auth-scheme"
    next
end
```

Applying the user group to a ZTNA policy

A user or user group must be applied to the ZTNA policy that you need to control user access to. The authenticated user from the authentication scheme and rule must match the user or user group in the ZTNA policy.

In this example, the user group is applied to the two simple ZTNA policies that were configured in ZTNA HTTPS access proxy example on page 1206.

To apply a user group to the simple ZTNA policies in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Edit the *ZTNA-Deny-malicious* rule.
3. Click in the *Source* field, select the *User* tab, select the *LDAP-Remote-Allowed-Group* group, then click *Close*.
4. Click *OK*.
5. Edit the *ZTNA-Allow-Simple* rule.
6. Click in the *Source* field, select the *User* tab, select the *LDAP-Remote-ALlowed-Group* group, then click *Close*.
7. Click *OK*.

To apply a user group to the simple ZTNA policies in the CLI:

```
config firewall policy
     edit 9
        set name "ZTNA-Deny-Malicious"
        set srcintf "port3"
        set dstintf "any"
        set srcaddr "all"
        set dstaddr "ZTNA-webserver"
        set ztna-ems-tag "EMS1_ZTNA_Malicious-File-Detected"
        set schedule "always"
        set logtraffic all
        set groups "LDAP-Remote-Allowed-Group"
    next
    edit 10
        set name "ZTNA-Allow-Simple"
        set srcintf "port3"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "ZTNA-webserver"
        set ztna-ems-tag "EMS1_CLASS_Low"
        set schedule "always"
        set logtraffic all
        set nat enable
```

```
        set groups "LDAP-Remote-Allowed-Group"
    next
end
```

For configuration examples using full ZTNA policy, see Configure a ZTNA policy on page 1171.

Testing remote access to the HTTPS access proxy with user authentication

Scenario 1: access allowed - user tsmith

1. On a remote Windows PC, open the FortiClient app, select the *Zero Trust Telemetry* tab, and confirm that you are connected to the EMS server.

   It is not necessary to configure a *ZTNA Destination* on the FortiClient for the HTTPS access proxy use case. In fact, configuring a *ZTNA Destination* rule for the website may interfere with its operation.

2. In a browser, enter the address of the server and the access port.

   If entering an FQDN, make sure that DNS can resolve the address to the IP address of the FortiGate. In this example, *webserver.ztnademo.com* resolves to 10.0.3.10.

3. When the browser asks for the client certificate to use, select the EMS signed certificate, then click *OK*.

   The client certificate is verified by the FortiGate to authenticate your identity.

4. When prompted, enter the username *tsmith* and the password, and click *Sign in*.

   As *tsmith* is a member of the *Remote-Allowed-Group* group in Active Directory, it will match the *LDAP-Remote-Allowed-Group* user group. After the user authentication passes, the FortiGate performs a posture check on the ZTNA group. When that passes, you are allowed access to the website.

Verifying the results

```
#  diagnose firewall auth list

10.0.3.2, tsmith
        type: fw, id: 0, duration: 12, idled: 12
        expire: 288, allow-idle: 300
        packets: in 0 out 0, bytes: in 0 out 0
        group_id: 3
        group_name: LDAP-Remote-Allowed-Group
```

```
# diagnose test app fcnacd 7

```

Scenario 2: access denied – user lhansen

1. If scenario 1 has just been tested, log in to the FortiGate and deauthenticate the user:
   a. Go to *Dashboard* > *Assets & Identities* and expand the *Firewall Users* widget.
   b. Right-click on the user *tsmith* and select deauthenticate.
2. On a remote Windows PC, open the FortiClient app, select the *Zero Trust Telemetry* tab, and confirm that you are connected to the EMS server.
3. In a browser, enter the address *webserver.ztnademo.com*.
4. When the browser asks for the client certificate to use, select the EMS signed certificate, then click *OK*. This option might not appear if you have already selected the certificate when testing scenario 1.

   The client certificate is verified by the FortiGate to authenticate your identity.
5. When prompted, enter the username *lhansen* and the password, and click *Sign in*.

   As *lhansen* is not a member of the *Remote-Allowed* group in Active Directory, it will not match the *LDAP-Remote-Allowed-Group* user group. Because no other policies are matched, this user is implicitly denied

Verifying the results

Go to *Dashboard* > *Assets & Identities*, expand the *Firewall Users* widget, and confirm that user *lhansen* is listed, but no applicable user group is returned.

```
# execute log display

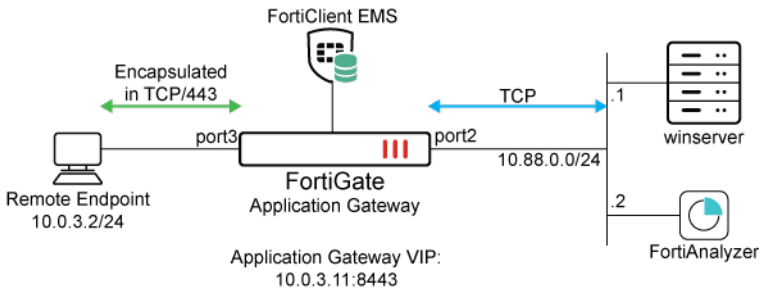
ZTNA TCP forwarding access proxy example



In this example, a TCP forwarding access proxy (TFAP) is configured to demonstrate an HTTPS reverse proxy that forwards TCP traffic to the designated resource. The access proxy tunnels TCP traffic between the client and the FortiGate over HTTPS, and forwards the TCP traffic to the protected resource. It verifies user identity, device identity, and trust context, before granting access to the protected source.

TCP forwarding access proxy supports communication between the client and the access proxy without SSL/TLS encryption. The connection still begins with a TLS handshake. The client uses the HTTP 101 response to switch protocols and remove the HTTPS stack. Further end to end communication between the client and server are encapsulated in the specified TCP port, but not encrypted by the access proxy. This improves performance by reducing the overhead of encrypting an already secured underlying protocol, such as RDP, SSH, or FTPS. Users should still enable the encryption option for end to end protocols that are insecure.

In this example, RDP (Remote Desktop Protocol) and SMB (Server Message Block) protocol access are configured to one server, and SSH access to the other server. Encryption is disabled for RDP and SSH, and enabled for SMB.

FortiClient (Windows) must be running 7.0.3 or later to detect SMB.

You cannot use ZTNA connection rules and TCP forwarding on a Windows 7 endpoint.

This example assumes that the FortiGate EMS fabric connector is already successfully connected.

To configure the ZTNA server for TCP access proxy in the GUI:

1. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Servers* tab.
2. Click *Create New*.
3. Set *Name* to *ZTNA-tcp-server*.
4. Set *Interface* to *port3*. The *IP address* and *Port* fields are automatically set to the IP address of the selected interface and the default port 443.
   a. Set *External IP* to *10.0.3.11*.
   b. Set *External port* to *8443*.

   Verify that the IP address and port do not conflict with management access to the interface. Otherwise, change the IP address to another address on that subnet.
5. Select the *Default certificate*. Clients will be presented with this certificate when they connect to the access proxy VIP.
6. Add server mapping:
   a. In the *Service/server mapping* table, click *Create New*.
   b. Set *Service* to *TCP Forwarding*.
   c. In the *Server* section, click *Address* and create a new address for the FortiAnalyzer server at 10.88.0.2.
   d. Set *Port* to *22*.
   e. Click *OK*.
7. Click *OK*.
8. Use the CLI to add another server for the winserver server at 10.88.0.1 with ports 445 and 3389 to correspond to SMB and RDP:

```
config firewall access-proxy
    edit "ZTNA-tcp-server"
        config api-gateway
            edit 1
                config realservers
                    edit 0
               set address "winserver"
               set mappedport 445 3389
                    next
                end
             next
        end
    next
end
```

9. In the GUI, edit the ZTNA server named *ZTNA-tcp-server*, and verify the server mapping for winserver.

To configure a simple ZTNA policy to allow traffic to the TCP access proxy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*, and click *Create New*.
2. Set *Name* to *ZTNA_remote*.
3. Set *Type* to *ZTNA*.

4. Set *Incoming Interface* to *port3*.
5. Set *Source* to *all*.
6. Select the ZTNA server *ZTNA-tcp-server*.
7. Configure the remaining options as needed.
8. Click *OK*.

To configure the access proxy VIP in the CLI:

```
config firewall vip
    edit "ZTNA-tcp-server"
        set type access-proxy
        set extip 10.0.3.11
        set extintf "port3"
        set server-type https
        set extport 8443
        set ssl-certificate "Fortinet_SSL"
    next
end
```

To configure the server addresses in the CLI:

```
config firewall address
    edit "FAZ"
        set subnet 10.88.0.2 255.255.255.255
    next
    edit "winserver"
        set subnet 10.88.0.1 255.255.255.255
    next
end
```

To configure access proxy server mappings in the CLI:

```
config firewall access-proxy
    edit "ZTNA-tcp-server"
        set vip "ZTNA-tcp-server"
        config api-gateway
            edit 1
                set url-map "/tcp"
                set service tcp-forwarding
                config realservers
                    edit 1
                        set address "FAZ"
                        set mappedport 22
                    next
                    edit 2
                        set address "winserver"
                        set mappedport 445 3389
                    next
                end
            next
        end
    next
end
```

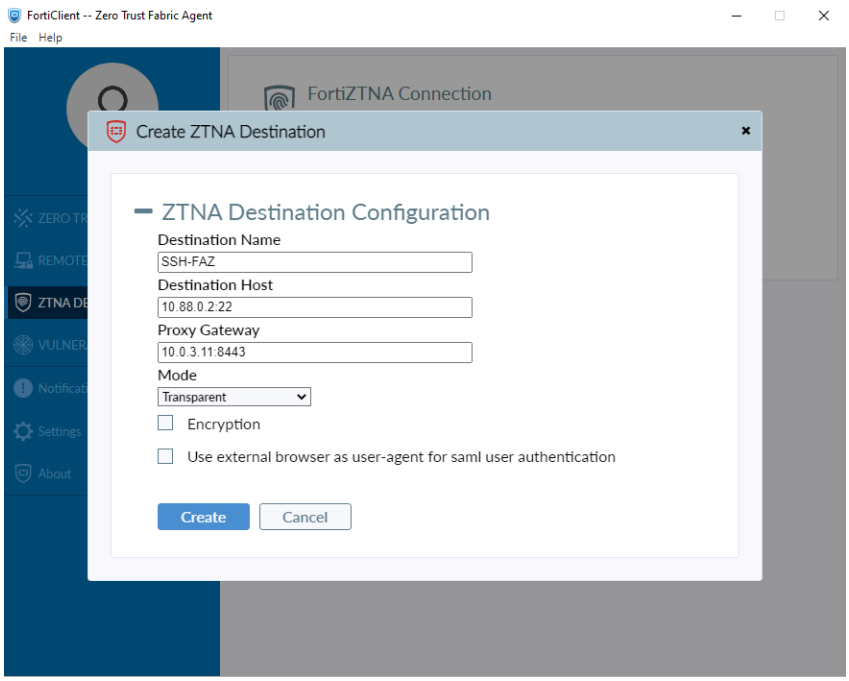
The mapped port (`mappedport`) restricts the mapping to the specified port or port range. If `mappedport` is not specified, then any port will be matched.

To configure a ZTNA rule (proxy policy) in the CLI:

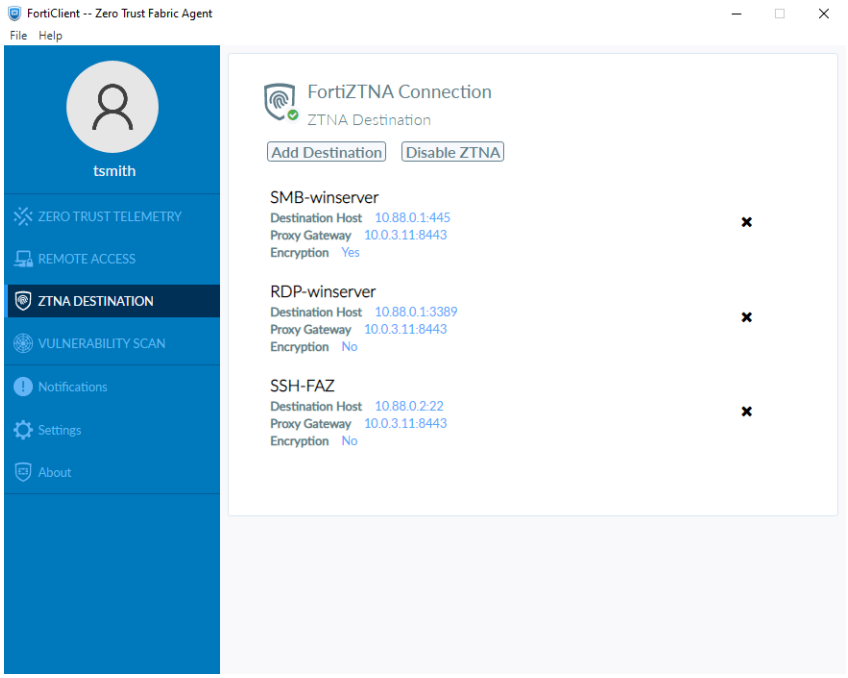
```
config firewall policy
    edit 11
        set name "ZTNA_remote"
        set srcintf "port3"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "ZTNA-tcp-server"
        set schedule "always"
        set logtraffic all
        set nat enable
    next
end
```

For configuration examples using full ZTNA policy, see Configure a ZTNA policy on page 1171.

Test the connection to the access proxy

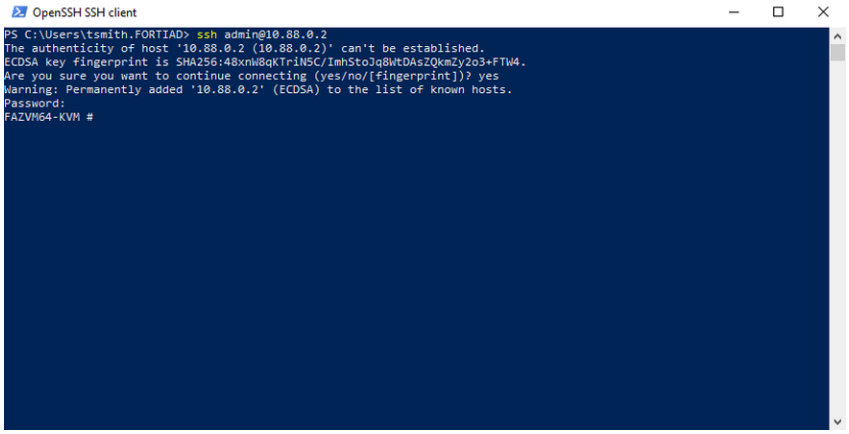


Before connecting, users must have a ZTNA connection rule in FortiClient.

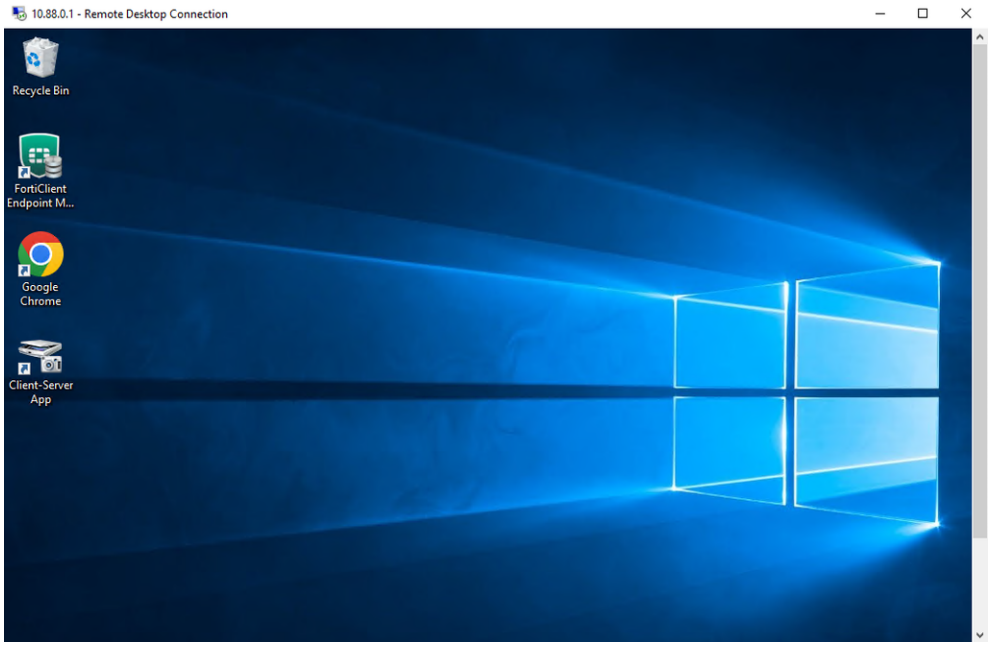


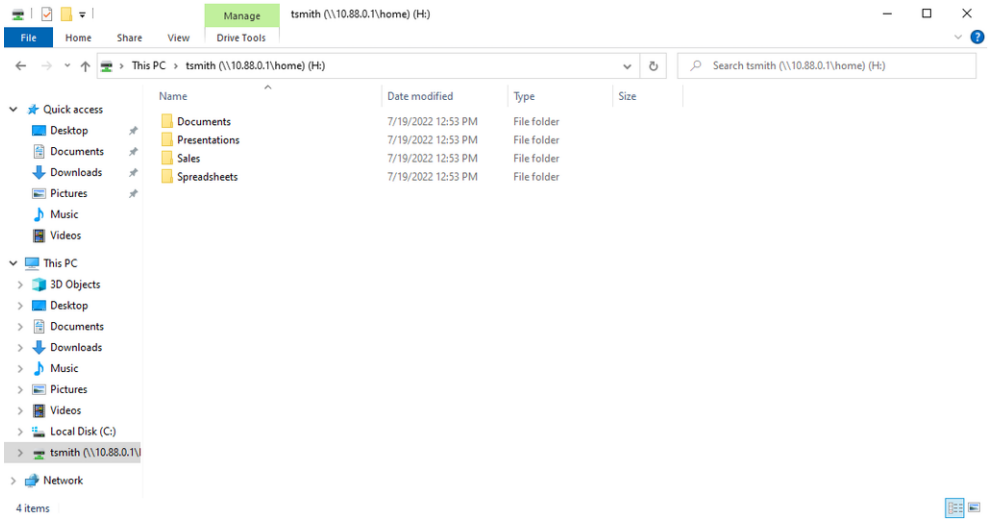
ZTNA TCP forwarding rules can be provisioned from the EMS server. See Provisioning ZTNA TCP forwarding rules via EMS for details.

To create a ZTNA Destination in FortiClient:



1. On the *ZTNA Destination* tab, click *Add Destination*.
2. Set *Destination Name* to *SSH-FAZ*.
3. Set *Destination Host* to *10.88.0.2:22*. This is the real IP address and port of the server.
4. Set *Proxy Gateway* to *10.0.3.11:8443*. This is the access proxy address and port that are configured on the FortiGate.
5. Leave *Encryption* disabled. This option determines whether or not the Client to FortiGate access proxy connection is encrypted in HTTPS.





6. Click *Create*.
7. Create a second rule with the following settings:
   - *Rule Name*: *RDP-winserver*
   - *Destination Host*: *10.88.0.1:3389*
   - *Proxy Gateway*: *10.0.3.11:8443*
   - *Encryption*: Disabled
8. Create a third rule with the following settings:
   - *Rule Name*: *SMB-winserver*
   - *Destination Host*: *10.88.0.1:445*
   - *Proxy Gateway*: *10.0.3.11:8443*
   - *Encryption*: Enabled

After creating the ZTNA connection rules, you can SSH, RDP, and SMB directly to the server IP address and port.

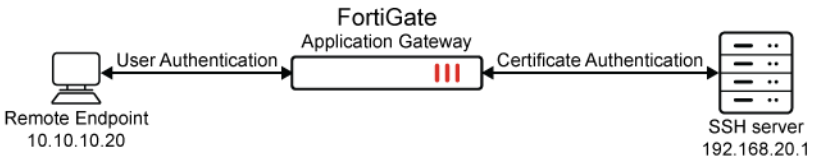
ZTNA SSH access proxy example

ZTNA can be configured with SSH access proxy to provide a seamless SSH connection to the server.

Advantages of using an SSH access proxy instead of a TCP forwarding access proxy include:

- Establishing device trust context with user identity and device identity checks.
- Applying SSH deep inspection to the traffic through the SSH related profile.
- Performing optional SSH host-key validation of the server.
- Using one-time user authentication to authenticate the ZTNA SSH access proxy connection and the SSH server connection.



Perform SSH host-key validation of the server

To act as a reverse proxy for the SSH server, the FortiGate must perform SSH host-key validation to verify the identity of the SSH server. The FortiGate does this by storing the public key of the SSH server in its SSH host-key configurations. When a connection is made to the SSH server, if the public key matches one that is used by the server, then the connection is established. If there is no match, then the connection fails.

One-time user authentication

SSH access proxy allows user authentication to occur between the client and the access proxy, while using the same user credentials to authenticate with the SSH server. The following illustrates how this works:

1. The remote endpoint registers to FortiClient EMS and receives the client certificate.
2. The remote endpoint tries to connect to the SSH access proxy. It must use the same username that is later used for access proxy authentication.
3. The FortiGate challenges the endpoint with device identity validation.
4. The remote endpoint provides the EMS issued certificate for device identification.
5. The FortiGate challenges the endpoint with user authentication. For example, this could be done with basic or SAML authentication.
6. The users enters their credentials on the remote endpoint.
7. The FortiGate authenticates the user and collects the username.
8. Using the FortiGate's CA or the customer's CA certificate, the FortiGate signs an SSH certificate and embeds the username in its principal.
9. The FortiGate attempts to connect to the SSH server using the certificate authentication.
10. The SSH server verifies the authenticity of the certificate, and matches the username principal against its authorized_keys file.
11. If the username matches a record in the file, then the SSH connection is established. If no match is found, then the SSH connection fails.

Example

In this example, an SSH connection is established using SSH access proxy with host-key validation and one-time authentication.

- The SSH server is a Linux based server that uses sshd to provide remote access
- For SSH host-key validation, the public key of the SSH server has been imported into the FortiGate.
- For one-time authentication using certificate authentication:
  - The SSH server must allow certificate authentication.
  - The SSH server must have the proper entry in its authorized_keys file that contains the user principal and the FortiGate CA's public key.
  - The entry is present in the user directory corresponding to the user that is trying to log in.

To pre-configure the Linux SSH server:

1. Retrieve the public key used for host-key validation:
   a. Locate the public key files in the SSH server:

   ```
   $ ls -la /etc/ssh/*.pub
   -rw-r--r-- 1 root root 186 Mar 29  2020 /etc/ssh/ssh_host_ecdsa_key.pub
   -rw-r--r-- 1 root root 106 Mar 29  2020 /etc/ssh/ssh_host_ed25519_key.pub
   -rw-r--r-- 1 root root 406 Mar 29  2020 /etc/ssh/ssh_host_rsa_key.pub2
   ```

   b. Choose the public key file based on the hash type (in this case, ECDSA), and show it's content:

   ```
   $ cat /etc/ssh/ssh_host_ecdsa_key.pub
   ecdsa-sha2-nistp256 AAAAE2*********IpEik=
   ```

   This key will be used when configuring the FortiGate.
2. Retrieve the FortiGate CA's public key from the FortiGate:

```
# show full firewall ssh local-ca Fortinet_SSH_CA
config firewall ssh local-ca
    edit "Fortinet_SSH_CA"
        set password ENC <hidden password>
        set private-key "-----BEGIN OPENSSH PRIVATE KEY-----
<hidden private key>
-----END OPENSSH PRIVATE KEY-----"
        set public-key "ssh-rsa AAAAB3**********JLXlxj3″
        set source built-in
    next
end
```

3. On the Linux server, enable the SSH service to use the authorized_keys file:
   a. Locate and edit the */etc/ssh/sshd_config* file.
   b. Ensure that the *AuthorizedKeysFile* line is uncommented, for example:

   ```
   AuthorizedKeysFile      .ssh/authorized_keys .ssh/authorized_keys2
   ```

4. Allow remote SSH log in with certificate authentication and principal name:
   a. Log in to the SSH server using the account that will be granted remote SSH access (in this example: *radCurtis*):
   b. Locate the account's authorized_keys file in the *~/.ssh* directory:

   ```
   $ ls -la ~/.ssh
   total 12
   drwxrwxr-x 2 radCurtis radCurtis 4096 Aug 10 19:14 .
   drwxr-xr-x 5 radCurtis radCurtis 4096 Aug 10 19:13 ..
   -rw-rw-r-- 1 radCurtis radCurtis  419 Aug 10 19:14 authorized_keys
   ```

   c. If the directory and file do not exist, create the directory:

   ```
   $ mkdir ~/.ssh
   ```

   d. Create an entry containing the following keywords and add them to the authorized_keys file:

   ```
   echo 'cert-authority,principals="radCurtis" ssh-rsa AAAAB3**********JLXlxj3' >>
   authorized_keys
   ```

   Where:

   - `cert-authority` - indicates that this entry is used in certificate authentication by validating the certificate using the public key provided in this entry.

- `principals="radCurtis"` - indicates the user that must match with the username embedded in the SSH certificate.
- `ssh-rsa AAAAB3**********JLXlxj3` - indicates the FortiGate CA's public key that is used to validate the SSH certificate.

5. Restart the sshd service:

```
$ sudo systemctl stop sshd
$ sudo systemctl start sshd
```

The SSH server can now accept SSH connection from *radCurtis@<server IP>*, where the SSH certificate used by the FortiGate to log in contains radCurtis embedded as a principal.

When a user connects from a SSH client using *<username>@<server IP>*, sshd will locate the authorized_keys file in the directory */home/<username>/.ssh/authorized_keys*. If the authorized_keys is not in that directory, authentication will fail on the SSH server side.

If you suspect that authentication is failing on the SSH server, use the following commands to manually start sshd in debug mode to troubleshoot:

```
$ sudo systemctl stop sshd
```

```
$ /usr/sbin/sshd -ddd -p 22
```

To configure the FortiGate :

1. Configure a new VIP to allow access to the SSH access proxy over 192.168.2.87:443:

```
config firewall vip
    edit "ZTNA_SSH"
        set type access-proxy
        set extip 192.168.2.87
        set extintf "any"
        set server-type https
        set extport 443
        set ssl-certificate "Fortinet_SSL"
    next
end
```

2. Configure the address object for the SSH server:

```
config firewall address
    edit "SSH_server"
        set subnet 192.168.20.1 255.255.255.255
    next
end
```

3. Configure the host-key that will be used to authenticate the SSH server. The public-key was retrieved when pre-configure the Linux SSH server (step 1b).

```
config firewall ssh host-key
    edit "ed25519"
        set type ECDSA
        set usage access-proxy
        set public-key "AAAAE2**********IpEik="
    next
end
```

4. Configure the access proxy SSH client certificate:

   A CA certificate is assigned to sign the SSH certificate that will be used in the SSH authentication. The SSH certificate will have the username embedded in the certificate principal.

```
config firewall access-proxy-ssh-client-cert
    edit "ssh-access-proxy"
        set source-address enable
        set auth-ca "Fortinet_SSH_CA"
    next
end
```

5. Configure the access-proxy server setting:

```
config firewall access-proxy
    edit "ZTNA_SSH"
        set vip "ZTNA_SSH"
        set client-cert enable
        config api-gateway
            edit 1
                set url-map "tcp"
                set service tcp-forwarding
                config realservers
                    edit 1
                        set address "SSH_server"
                        set type ssh
                        set ssh-client-cert "ssh-access-proxy"
                        set ssh-host-key-validation enable
                        set ssh-host-key "ed25519"
                    next
                end
            next
        end
    next
end
```

6. Configure the RADIUS setting, user setting, and user group to apply user authentication to the access proxy connection using RADIUS:

```
config user radius
    edit "Win2k16-Radius"
        set server "192.168.20.6"
        set secret ENC <secret>
    next
end
config user local
    edit "radCurtis"
        set type radius
        set radius-server "Win2k16-Radius"
    next
end
config user group
        edit "radius_group"
        set member "radCurtis" "Win2k16-Radius"
    next
end
```

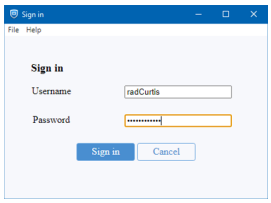
7. Create the authentication scheme and rule to perform the authentication:

```
config authentication scheme
    edit "basic_auth"
        set method basic
        set user-database "Win2k16-Radius"
    next
end
config authentication rule
    edit "ztna-basic"
        set srcaddr "all"
        set ip-based disable
        set active-auth-method "basic_auth"
        set web-auth-cookie enable
    next
end
```

8. Configure the full ZTNA policy to allow traffic to the SSH server, and apply user authentication, posture check, and a security profile where necessary:

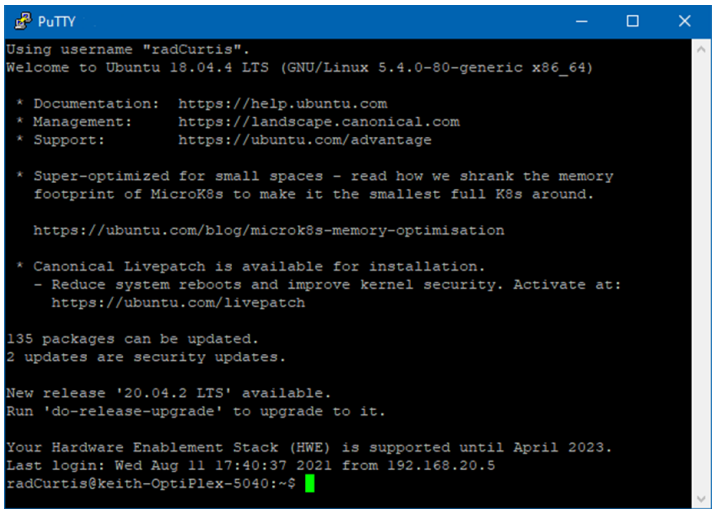
```
config firewall proxy-policy
    edit 5
        set name "SSH-proxy"
        set proxy access-proxy
        set access-proxy "ZTNA_SSH"
        set srcintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set ztna-ems-tag "FCTEMS8821001056_ems138_av_tag"
        set action accept
        set schedule "always"
        set groups "radius_group"
        set utm-status enable
        set ssl-ssh-profile "custom-deep-inspection"
    next
end
```

To check the results:



1. On the remote client, open FortiClient, go to the *Zero Trust Telemetry* tab, and make sure that it is connected to the EMS server.
2. Go to the *ZTNA Destination* tab and click *Add Destination*.
3. Configure the Destination, then click *Create*:

Rule Name	SSH-Linux
Destination Host	192.168.20.1:22
Proxy Gateway	192.168.2.87:443
Mode	Transparent
Encryption	Disabled (recommended)



When Encryption is disabled, the connection between the client and FortiGate application gateway is not encapsulated in HTTPS after the client and FortiGate connection is established. This allows for less overhead, because SSH is already a secure connection.

4. Open an SSH client, such as PuTTy, and make an SSH connection to *radCurtis@192.168.20.1* on port *22*.

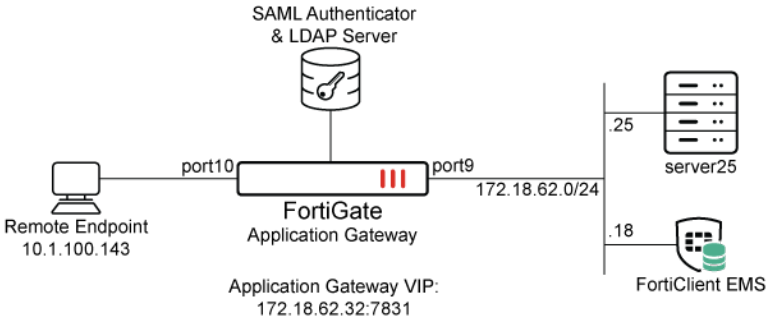
5. After device authentication is performed and passes in the background, FortiClient prompts the user to sign in. Enter the username, *radCurtis*, and password, then click *Sign in*.

After successful user authentication, the SSH connection is established without an additional log in.

6. On the FortiGate, check the logged in user:
   a. Go to *Dashboard* > *Assets & Identities* and expand the *Firewall Users* widget.
   b. Check the WAD proxy user list:

```
# diagnose wad user list
ID: 2, VDOM: root, IPv4: 10.10.10.25
  user name    : radCurtis
  worker       : 0
  duration     : 614
  auth_type    : Session
  auth_method  : Basic
  pol_id       : 5
  g_id         : 12
  user_based   : 0
  expire       : 53
  LAN:
    bytes_in=3403 bytes_out=5699
  WAN:
    bytes_in=3681 bytes_out=3132
```

7. The successful connection is logged in the forward traffic logs after the SSH connection has disconnected:



```
# execute log display
25 logs found.
10 logs returned.

1: date=2021-08-11 time=17:59:56 eventtime=1628729996110159120 tz="-0700"
logid="0000000024" type="traffic" subtype="forward" level="notice" vd="root"
```

ZTNA application gateway with SAML authentication example

In this example, an HTTPS access proxy is configured, and SAML authentication is applied to authenticate the client. The FortiGate acts as the SAML SP and a SAML authenticator serves as the IdP. In addition to verifying the user and device identity with the client certificate, the user is also authorized based on user credentials to establish a trust context before granting access to the protected resource.

This example assumes that the FortiGate EMS fabric connector is already successfully connected.

To configure the access proxy VIP:

```
config firewall vip
    edit "ZTNA_server01"
        set type access-proxy
        set extip 172.18.62.32
        set extintf "any"
        set server-type https
        set extport 7831
        set ssl-certificate "Fortinet_CA_SSL"
    next
end
```

To configure access proxy server mappings:

```
config firewall access-proxy
    edit "ZTNA_server01"
        set vip "ZTNA_server01"
        set client-cert enable
        config api-gateway
            edit 1
                set service https
                config realservers
                    edit 1
                        set ip 172.18.62.25
                        set port 443
```

```
                    next
                end
            next
        end
    next
end
```

To configure a SAML server:

```
config user saml
    edit "saml_ztna"
        set cert "Fortinet_CA_SSL"
        set entity-id "https://fgt9.myqalab.local:7831/samlap"
        set single-sign-on-url "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/login/"
        set single-logout-url "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/logout/"
        set idp-entity-id "http://MYQALAB.LOCAL/adfs/services/trust"
        set idp-single-sign-on-url "https://myqalab.local/adfs/ls"
        set idp-single-logout-url "https://myqalab.local/adfs/ls"
        set idp-cert "REMOTE_Cert_4"
        set digest-method sha256
        set adfs-claim enable
        set user-claim-type upn
        set group-claim-type group-sid
    next
end
```

To map the SAML server into an access proxy configuration:

```
config firewall access-proxy
    edit "ZTNA_server01"
        config api-gateway
             edit 3
                set service samlsp
                set saml-server "saml_ztna"
            next
        end
    next
end
```

To configure an LDAP server and an LDAP server group to verify user groups:

```
config user ldap
    edit "ldap-10.1.100.198"
        set server "10.1.100.198"
        set cnid "cn"
        set dn "dc=myqalab,dc=local"
        set type regular
        set username "cn=fosqa1,cn=users,dc=myqalab,dc=local"
        set password **********
        set group-search-base "dc=myqalab,dc=local"
    next
end
```

```
config user group
    edit "ldap-group-saml"
        set member "ldap-10.1.100.198"
```

```
    next
end
```

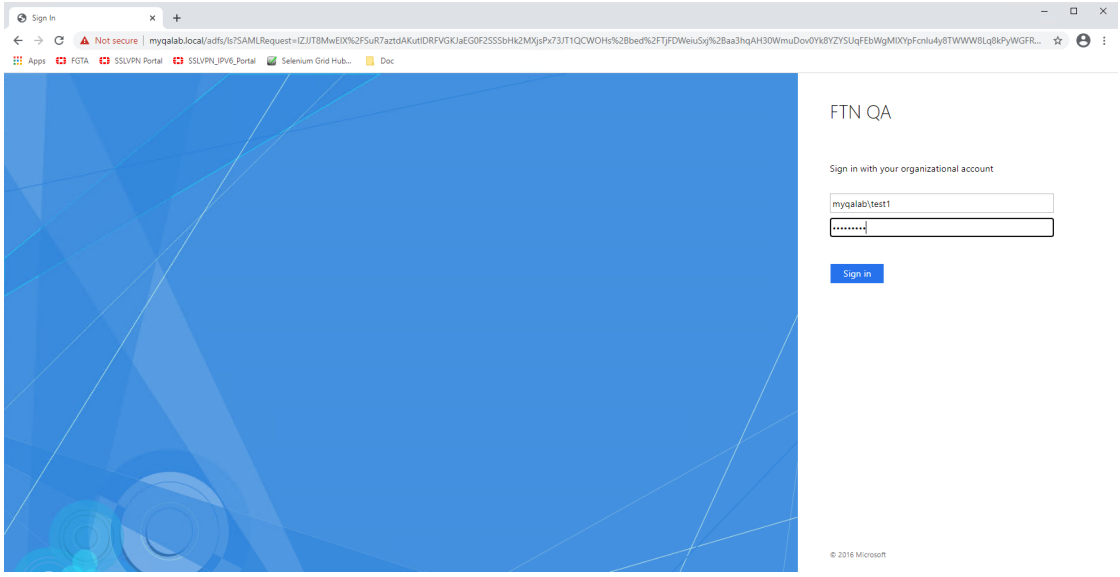
To configure the authentication rule and scheme to match the new SAML server:

```
config authentication rule
    edit "saml_ztna"
        set srcintf "port10"
        set srcaddr "all"
        set ip-based disable
        set active-auth-method "saml_ztna"
        set web-auth-cookie enable
    next
end
config authentication scheme
    edit "saml_ztna"
        set method saml
        set saml-server "saml_ztna"
        set saml-timeout 30
        set user-database "ldap-10.1.100.198"
    next
end
```

To enable user group authentication in an access-proxy type firewall proxy-policy:

```
config firewall proxy-policy
    edit 6
        set name "ZTNA_remote"
        set proxy access-proxy
        set access-proxy "ZTNA_server01"
        set srcintf "any"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set groups "ldap-group-saml"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
    next
end
```

Testing the connection



To test the connection:

It is not necessary to configure a *ZTNA Destination* on the FortiClient for the HTTPS access proxy use case. In fact, configuring a *ZTNA Destination* rule for the website may interfere with its operation.

1. On a client PC, try to access the webpage through the HTTPS access proxy. For example, go to http://172.18.62.32:7831 in a browser.

2. The client PC is prompted for a client certificate. After the certificate is validated, you are redirected to a SAML log in portal.

3. Enter your user credentials. The SAML server authenticates and sends a SAML assertion response message to the FortiGate.
4. The FortiGate queries the LDAP server for the user group, and then verifies the user group against the groups or groups defined in the proxy policy.
5. The user is proxied to the webpage on the real web server.

Logs and debugs

Use the following command to check the user information after the user has been authenticated:

```
# diagnose wad user list
ID: 7, VDOM: vdom1, IPv4: 10.1.100.143
  user name    : test1@MYQALAB.local
  worker       : 0
  duration     : 124
  auth_type    : Session
  auth_method  : SAML
  pol_id       : 6
  g_id         : 13
  user_based   : 0
  expire       : no
  LAN:
    bytes_in=25953 bytes_out=14158
  WAN:
    bytes_in=8828 bytes_out=6830
```

Event log:

```
1: date=2021-03-24 time=19:02:21 eventtime=1616637742066893182 tz="-0700" logid="0102043025"

```

ZTNA application gateway with SAML and MFA using FortiAuthenticator example

ZTNA application gateway supports device verification using device certificates that are issued by EMS. To authenticate users, administrators can use either basic or SAML authentication. An advantage of SAML authentication is that multi-factor authentication (MFA) can be provided by the SAML Identity Provider (IdP).

In these examples, a FortiAuthenticator is used as the IdP, and MFA is applied to user authentication for remote users accessing the web, RDP, and SSH resources over the ZTNA application gateway. It is assumed that the FortiGate EMS fabric connector has already been successfully connected.

- Configuring FortiAuthenticator on page 1243
- Configuring the FortiGate SAML settings on page 1247
- Example 1 - Applying SAML and MFA to ZTNA HTTPS access proxy on page 1251
- Example 2 - Applying SAML and MFA to a ZTNA TCP forwarding access proxy for RDP connections on page 1254
- Example 3 - Applying SAML and MFA to a ZTNA SSH access proxy on page 1256

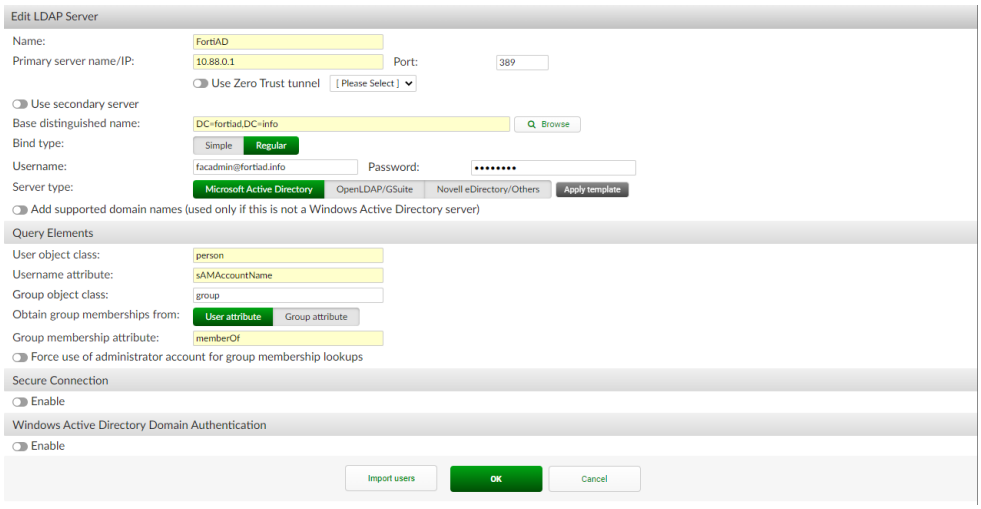
DNS resolutions:

- webserver.ztnademo.com:9443 -> 10.0.3.10:9443
- fac.ztnademo.com -> 10.0.3.7

The FortiAuthenticator (FAC) integrates with Active Directory (AD) on the Windows Domain Controller, which is also acting as the EMS server. Users are synchronized from the AD to the FAC, and remote users are configured with token-based authentication. SAML authentication is configured on the FortiGate, pointing to the FAC as the SAML IdP. The

SAML server is applied to the ZTNA application gateway authentication scheme and rule, to provide the foundation for applying user authentication on individual ZTNA policies.

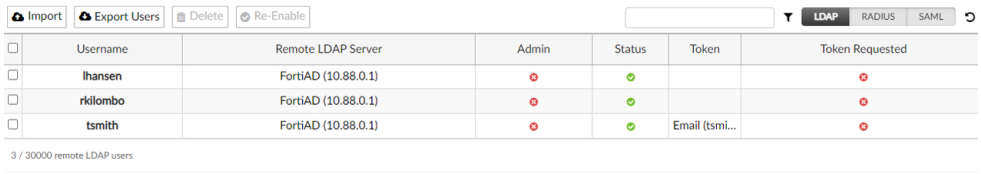
Configuring FortiAuthenticator



First configure FortiAuthenticator to synchronize users from AD using LDAP, apply MFA to individual remote users, and be the IdP.

To create a remote authentication server pointing to the Windows AD:

1. Go to *Authentication* > *Remote Auth. Servers* > *LDAP* and click *Create New*.
2. Configure the following:



Name	FortiAD
Primary server name / IP	10.88.0.1
Port	389 (or another port if using LDAPS)
Based distinguished name	DC=fortiad,DC=info
Bind type	Regular
Username	<user account used for LDAP bind>
Password	<password of user>
Server Type	Microsoft Active Directory
User object class	person (default)
Username attribute	sAMAccountName (default)
Group object class	group (default)
Obtain group membership from	User attribute
Group membership attribute	memberOf (default)
Secure connection	Enable if using LDAPS or STARTTLS

3. Click *OK*.
4. Edit the *FortiAD* entry.
5. At the bottom, click *Import users*.

6. On the *Import Remote LDAP User* screen, configure the following settings:
   a. For *Remote LDAP Server*, select *FortiAD*.
   b. For *Action*, select *Import users*.
      i. Click *Go*.
      ii. Select the users to import.
      iii. Click *OK*.

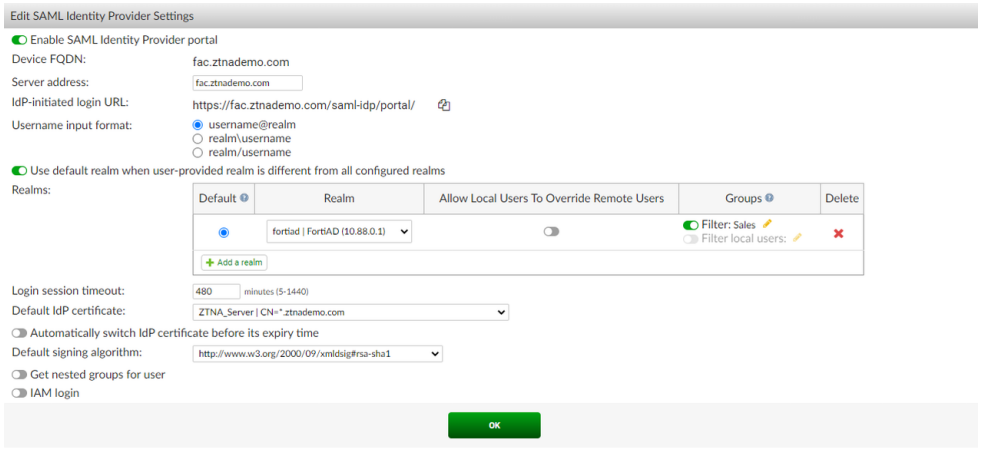
   The screen displays the users that are imported.

   For more details, see LDAP in the FortiAuthenticator Administration Guide.

To configure a remote LDAP user to use MFA:

1. Go to *Authentication* > *User Management* > *Remote Users*, and edit a user.
2. Enable *One-Time Password (OTP) authentication*.
   a. Set *Deliver token codes from*.
   b. Set *Deliver token by*.

   For this example, select *FortiToken* > *Mobile*, select the Token from the drop-down list, and set the *Activation delivery method* to email.
3. In the *User Information* section, add the email address that will be used for the FortiToken activation.



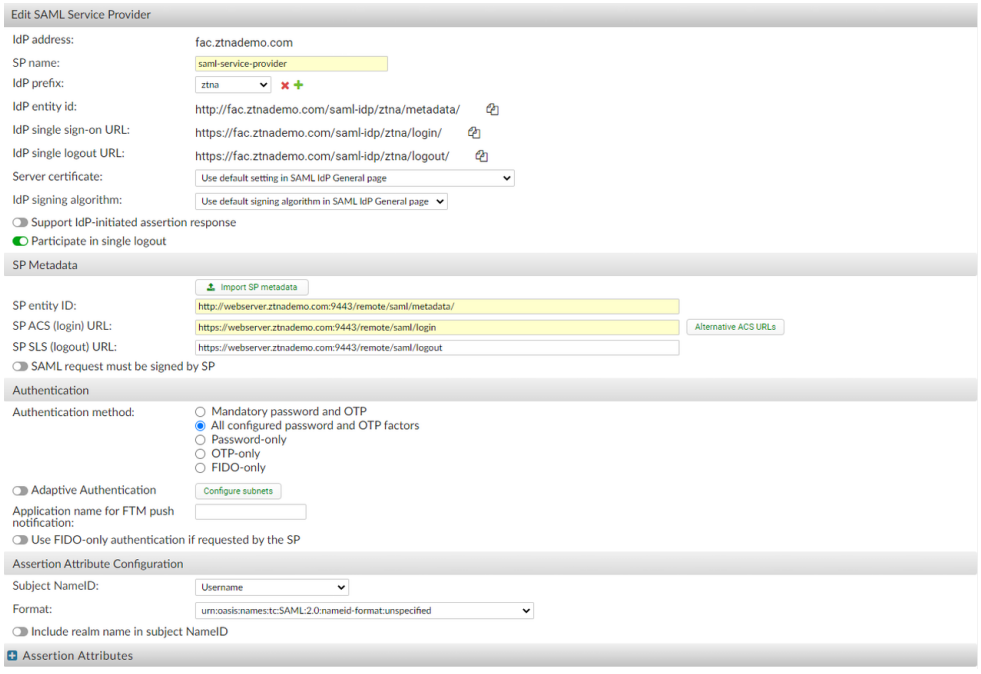
4. Click *OK*.

   An activation email is sent to the user that they can use to install the token to their FortiToken Mobile app.

   For more details, see Remote users in the FortiAuthenticator Administration Guide.

To configure SAML IdP:

1. Go to *Authentication* > *SAML IdP* > *General* and enable *Enable SAML Identity Provider portal*.
2. The *Server address* is the device FQDN or IP address (configured in the System Information widget at *System* > *Dashboard* > *Status*). In this example, it is *fac.ztnademo.com*.
3. Set *Username input format* to *username@realm*.
4. Click *Add a realm* in the *Realms* table:
   a. Set *Realm* to the just created LDAP realm (*FortiAD*).
   b. Optionally, enable *Filter* and select the required users groups. In this example, *Sales* is configured.
5. Set *Default IdP certificate* to the certificate that will be used in the HTTPS connection to the IdP portal.



6. Click *OK*.

7. Go to *Authentication* > *SAML IdP* > *Service Providers*, and click *Create New* to create a service provider (SP) for the FortiGate SP.
8. Configure the following, which must match what will be configured on the FortiGate:

SP name	saml-service-provider
IdP prefix	ztna
Server certificate	Use default setting in *SAML IdP* > *General* page.
SP entity ID	http://webserver.ztnademo.com:9443/remote/saml/metadata/
SP ACS (login) URL	https://webserver.ztnademo.com:9443/remote/saml/login
SP SLS (logout) URL	https://webserver.ztnademo.com:9443/remote/saml/logout
Participate in single logout	Enable

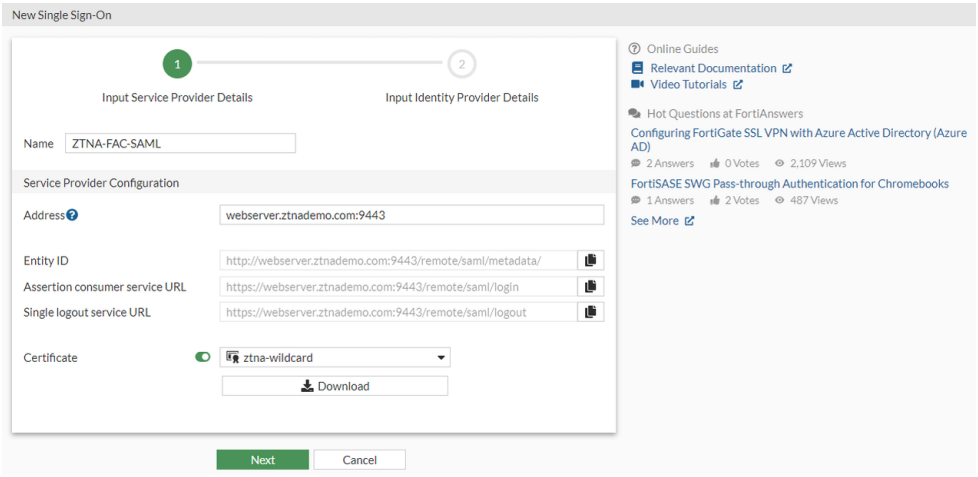
Where the *SP entity ID*, *SP ACS (login) URL*, and *SP SLS (logout) URL* break down as follows:

- *webserver.ztnademo.com* - The FQDN that resolves to the FortiGate SP.
- *9443* - The port that is used to map to the FortiGate's SAML SP service.
- */remote/saml* - The custom, user defined fields.
- */metadata*, */login*, and */logout* - The standard convention used to identify the SP entity, log in portal, and log out portal.

9. Click *OK*.
10. Edit the just created SP object and, under *Assertion Attribute*, click *Add Assertion Attribute*.
11. Set *SAML attribute* to the username and set *User attribute* to *Username*, then click *OK*.
12. Click *OK*.

For more details, see Configuring SAML settings in the SAML Interoperability Guide.

Configuring the FortiGate SAML settings



On FortiGate, a SAML user is used to define the SAML SP and IdP settings. This user is then applied to the ZTNA proxy using an authentication scheme, rule, and settings. A ZTNA server is then created to allow access to the SAML SP server so that end users can reach the FortiGate SP's captive portal. The SAML user must then be added to a ZTNA policy to trigger authentication when accessing the ZTNA application gateway.

To create a new SAML user/server from the GUI:

1. On the FortiGate, go to *User & Authentication* > *Single Sign-On*.
2. Click *Create New*.
3. Set *Name* to *ZTNA-FAC-SAML*.
4. Set *Address* to *webserver.ztnademo.com:9443*.

   The *Entity ID*, *Assertion consumer service URL* and *Single logout service URL* will be updated. These should be the same URLs you inputted into FAC.
5. Enable *Certificate*, then select the certificate used for the client.

   In this example, the *ztna-wildcard* certificate is a local certificate that is used to sign SAML messages that are exchanged between the client and the FortiGate SP.

6. Click *Next*.
7. Use the settings from the Identity Provider to fill the custom *Identity Provider Details*. In this example, we select *Fortinet Product*, and fill in the fields as follows:

Address	fac.ztnademo.com
Prefix	ztna
IdP certificate	REMOTE_Cert_1

   - Where the `REMOTE_Cert_1` certificate is a remote certificate that is used to identify the IdP; in this example, fac.ztnademo.com.
8. Set *Attribute used to identify users* to *username*. Attributes to identify users and groups are case sensitive.

9. Click *Submit* to save the settings.

To create a new SAML user/server from the CLI:

```
config user saml
    edit "ZTNA-FAC-SAML"
        set cert "ztna-wildcard"
        set entity-id "http://webserver.ztnademo.com:9443/remote/saml/metadata/"
        set single-sign-on-url "https://webserver.ztnademo.com:9443/remote/saml/login"
        set single-logout-url "https://webserver.ztnademo.com:9443/remote/saml/logout"
        set idp-entity-id "http://fac.ztnademo.com/saml-idp/ztna/metadata/"
        set idp-single-sign-on-url "https://fac.ztnademo.com/saml-idp/ztna/login/"
        set idp-single-logout-url "https://fac.ztnademo.com/saml-idp/ztna/logout/"
        set idp-cert "REMOTE_Cert_1"
        set user-name "username"
        set digest-method sha1
    next
end
```

To create a user group for the SAML user object:

1. Under *User & Authentication* > *User Groups*, click *Create New*.
2. Set *Name* to *ztna-saml-users*.
3. Under *Remote Groups*, click *Add*.
4. For *Remote Server*, select *ZTNA-FAC-SAML*.
5. Click *OK*.
6. Click *OK* again to save.

To apply the SAML server to proxy authentication from the GUI:

1. Go to *Policy & Objects* > *Authentication Rules*.
2. Click *Create New* > *Authentication Scheme*.
3. Set the name to *ZTNA-SAML-scheme*.

4. Set *Method* to *SAML*.
5. Set *SAML SSO server* to *ZTNA-FAC-SAML*.
6. Click *OK*.
7. Go to *Policy & Objects* > *Authentication Rules*.
8. Click *Create New* > *Authentication Rule*.
9. Set the *Name* to *ZTNA-SAML-rule*.
10. Set *Source Address* to *all*.
11. Set *Incoming interface* to *port3*.
12. Set *Protocol* to *HTTP*.
13. Enable *Authentication Scheme* and select *ZTNA-SAML-scheme*.
14. Set *IP-based Authentication* to *Disable*.
15. Click *OK*.

To apply the SAML server to proxy authentication from the CLI:

```
config authentication scheme
    edit "ZTNA-SAML-scheme"
        set method saml
        set saml-server "ZTNA-FAC-SAML"
    next
end
config authentication rule
    edit "ZTNA-SAML-rule"
        set srcintf "port3"
        set srcaddr "all"
        set ip-based disable
        set active-auth-method "ZTNA-SAML-scheme"
        set web-auth-cookie enable
    next
end
```

Assign an active authentication scheme and captive portal to serve the log in page for the SAML requests.

To configure the active authentication scheme and captive portal from the GUI:

1. Go to *User & Authentication* > *Authentication Settings*.
2. Enable *Authentication scheme*.
3. Select *ZTNA-SAML-scheme*.
4. Set *Captive portal type* to *FQDN*.
5. Enable *Captive Portal*.
6. Select the firewall address *webserver.ztnademo.com*. If this has not be created, create this firewall address.
7. Click *Apply* to save.

To configure the active authentication scheme and captive portal from the CLI:

```
config firewall address
    edit "webserver.ztnademo.com"
        set type fqdn
        set fqdn "webserver.ztnademo.com"
    next
```

```
end
config authentication setting
    set active-auth-scheme "ZTNA-SAML-scheme"
    set captive-portal "webserver.ztnademo.com"
end
```

To configure a ZTNA application gateway to allow SAML authentication requests to the SP:

1. Configure the ZTNA server:
   a. Go to *Policy & Objects* > *ZTNA*, select the *ZTNA Servers* tab, and click *Create New*.
   b. Configure the following:

Name	ZTNA-access
Interface	Any
IP	10.0.3.10
Port	9443
SAML	Enabled
SAML SSO Server	ZTNA-FAC-SAML
Default certificate	ztna-wildcard

   c. Click *OK*.
2. Define the full ZTNA policy to allow access to the ZTNA server:
   a. Go to *Policy & Objects* > *Proxy policy* and click *Create New*.
   b. Configure the following:

Name	ZTNA-Rule
Type	ZTNA
Incoming Interface	port3
Source (Address)	all
Source (User)	ztna-saml-users
Destination	all
ZTNA Server	ZTNA-access
Action	Accept
Log Allowed Traffic	All Sessions

   c. Click *OK*.

To configure a VIP and a firewall policy to forward IdP authentication traffic to the FortiAuthenticator:

Remote clients connect to the FortiAuthenticator IdP behind the FortiGate using a VIP. In this example, users connect to the FQDN fac.ztnademo.com that resolves to the VIP's external IP address.

1. Configure the VIP to forward traffic to the FortiAuthenticator:
   a. Go to *Policy & Objects* > *Virtual IPs* and navigate to the *Virtual IP* tab.
   b. Click *Create new* .
   c. Configure the following:

Name	FAC-VIP
Interface	Any
External IP address	10.0.3.7
Map to > IPv4 address/range	10.88.0.7
Port Forwarding	Enabled
Protocol	TCP
External service port	443
Map to IPv4 port	443

   d. Click *OK*.
2. Configure a firewall policy to allow VIP:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Configure the following:

Name	WAN_to_FAC
Type	Standard
Incoming Interface	port3
Outgoing Interface	port2
Source	All
ZTNA Server	FAC-VIP
Schedule	Always
Service	HTTP. HTTPS
Action	Accept
NAT	disabled

   c. Click *OK*.

Example 1 - Applying SAML and MFA to ZTNA HTTPS access proxy

In this HTTPS access proxy example, two real servers are implemented with round robin load balancing performed between them. The HTTPS access proxy is configured on the same ZTNA server as was configured in the authentication step. The same ZTNA rule and firewall policy also apply.

To configure the ZTNA server for HTTPS access proxy with load balancing:

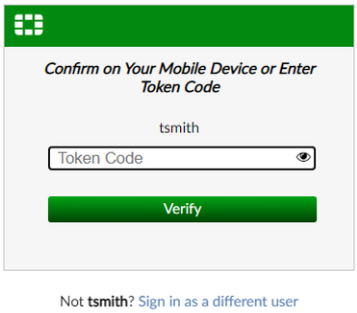
1. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Servers* tab.
2. Edit the ZTNA-access server.
3. In the *Service/server mapping* table, click *Create New*:
   a. Set *Service* to *HTTPS*.
   b. Set *Virtual Host* to *Any Host*.
   c. In the *Server* section, select *IP*:
      i. Set *IP address* to *10.88.0.3*.
      ii. Set *Port* to *9443*.
      iii. Click *OK*.
4. Click *OK*.
5. Use the CLI to configure the second server with IP *10.88.0.4*.

```
config firewall access-proxy
    edit "ZTNA-access"
        config api-gateway
            edit 1
                config realservers
                    edit 0
                        set ip 10.88.0.4
                        set port <real server 2 port>
                    next
                end
            next
        end
    next
end
```

6. In the GUI, edit the ZTNA-access server and verify the server mapping.
   a. In the *Service/server* mapping table, edit the entry. The *Load balancing* option is visible, and additional real servers can be added by clicking *Create new*.
   b. Click *Cancel*.

Testing and verification:

From the remote endpoint, user Tom Smith attempts to connect to the web server over ZTNA:



1. On the remote Windows computer, open FortiClient and register to the EMS server.

It is not necessary to configure a *ZTNA Destination* on the FortiClient for the HTTPS access proxy use case. In fact, configuring a *ZTNA Destination* rule for the website may interfere with its operation.

2. Open a browser and attempt to connect to the web server at *https://webserver.ztnademo.com:9443*.
3. Device authentication prompts the user for their device certificate. Select the certificate issued by EMS and click *OK*.
4. FortiGate receives the SAML request and redirects the user to the IdP login screen. Enter the username and password for Tom Smith and click *Login*.

5. A second prompt opens asking for the *Token Code*. Enter the code then click *Verify*.

6. The FortiAuthenticator IdP verifies the login, then sends the SAML assertion back to the user.
7. The browser redirects the assertion to the FortiGate SP, which decides if the user is allowed access.
8. On a successful log in, FortiGate redirects the user to the web page that they are trying to access.

Logs and debugs:

On the FortiGate, a successful connection can be seen in *Log & Report* > *Forward Traffic log*, or by using the CLI:

```
# execute log filter category 0
# execute log filter field subtype srcip
# execute log display
...

Log number ten shows that authentication first passes through the WAN_to_FAC policy. Log numbers two and eight show the traffic allowed through the ZTNA proxy-policy over two successive sessions. Note that they have different destination IP addresses (`dstip`), indicating that ZTNA was performing server load balancing.

Use the following command to show if the FortiGate's WAD process has an active record of the SAML user login:

```
# diagnose wad user list

ID: 8, VDOM: root, IPv4: 10.0.3.2
  user name    : tsmith
  worker       : 1
  duration     : 332
  auth_type    : Session
  auth_method  : SAML
  pol_id       : 1
  g_id         : 4
  user_based   : 0
  expire       : 390
  LAN:
    bytes_in=29519 bytes_out=629987
  WAN:
    bytes_in=958636 bytes_out=19201
```

Example 2 - Applying SAML and MFA to a ZTNA TCP forwarding access proxy for RDP connections

In this TCP forwarding access proxy example, RDP connections are allowed to be forwarded to the Windows/EMS server. Traffic to TCP/3389 is allowed through the ZTNA proxy.

To configure the ZTNA server for TCP forwarding on TCP/3389:

1. Create a firewall address for the Windows/EMS server:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.
   c. Configure the following:

Name	winserver
Type	Subnet
IP/Netmask	10.88.0.1/32
Interface	any

   d. Click *OK*.
2. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Servers* tab.
3. Edit the ZTNA-access server.
4. In the *Service/server mapping* table, click *Create New*:
   a. Set *Service* to *TCP Forwarding*.
   b. In the *Server* section, set *Address* to *winserver*.
   c. Set *Ports* to *3389*.

d. Click *OK*.

5. Click *OK*.

Testing and verification:

On the remote endpoint, manually configure a ZTNA destination to forward RDP traffic to the ZTNA application gateway. The rules can also be pushed from the EMS server; for details see Provisioning ZTNA TCP forwarding rules via EMS.

Configure the ZTNA Destination:

1. On the remote Windows computer, open FortiClient.
2. Register to the EMS server.
3. On the *ZTNA Destination* tab, click *Add Destination* to add a TCP forwarding rule.
4. Configure the following:

Rule Name	RDP-server
Destination Host	10.88.0.1:3389
Proxy Gateway	10.0.3.10:9443
Mode	Transparent
Encryption	Disabled *Encryption* can be enabled or disabled. When it is disabled, the client to access proxy connection is not encrypted in HTTPS. Because RDP is encrypted by default, disabling *Encryption* does not reduce security.

5. Click *Create*.

Connect over RDP:

1. On the remote PC, open a new RDP connection.
2. Enter the IP address 10.88.0.1. By default, RDP session use port 3389.

   When the connection to the ZTNA application gateway is established, FortiGate will redirect the SAML login request to the FortiAuthenticator IdP.

   A FortiClient prompt will open with the FortiAuthenticator login screen.
3. Enter the username and password then click *Login*.
4. A second prompt opens asking for the *Token Code*. Enter the code from your FortiToken app, then click *Verify*.
5. FortiAuthenticator verifies the token code, determines if the login is successful, then sends the SAML assertion back to the client.
6. The client redirects the response back to the FortiGate SP.
7. If the log in was successful, the user can now log on to the RDP session.

Logs and debugs:

On the FortiGate, a successful connection can be seen in *Log & Report* > *Forward Traffic log*, or by using the CLI:

```
# execute log filter category 0
# execute log filter field srcip 10.0.3.2
# execute log display
...
8: date=2023-05-09 time=01:14:34 eventtime=1683620074907124357 tz="-0700" logid="0005000024"
```

```
type="traffic" subtype="ztna" level="notice" vd="root" srcip=10.0.3.2 srcport=17556

```

Use the following command to show if the FortiGate's WAD process has an active record of the SAML user login:

```
# diagnose wad user list

ID: 9, VDOM: root, IPv4: 10.0.3.2
  user name    : tsmith
  worker       : 1
  duration     : 164
  auth_type    : Session
  auth_method  : SAML
  pol_id       : 1
  g_id         : 4
  user_based   : 0
  expire       : no
  LAN:
    bytes_in=80950 bytes_out=233010
  WAN:
    bytes_in=219973 bytes_out=58315
```

Example 3 - Applying SAML and MFA to a ZTNA SSH access proxy

In this SSH access proxy example, SSH connections can be forwarded to the FortiAnalyzer (10.88.0.2).

To configure the ZTNA server for SSH access proxy:

1. Create a firewall address for the web server:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.

c. Configure the following:

Name	FAZ
Type	Subnet
IP/Netmask	10.88.0.2/32
Interface	any

d. Click *OK*.

2. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Servers* tab.
3. Edit the ZTNA-access server.
4. In the *Service/server mapping* table, edit the *TCP Forwarding* entry:
   a. In the *Servers* table click *Create New*:
      i. Set *Address* to *FAZ*.
      ii. Set *Ports* to *22*.
      iii. Optionally, enable *Additional SSH Options* to configure other SSH options as needed.
      iv. Click *OK*.
   b. Click *OK*.
5. Click *OK*.

Testing and verification:

On the remote endpoint, manually configure ZTNA destination to forward SSH traffic to the ZTNA access proxy. The destination can also be pushed from the EMS server; for details see Provisioning ZTNA TCP forwarding rules via EMS.

Configure the ZTNA Destination:

1. On the remote Windows computer, open FortiClient.
2. Register to the EMS server.
3. On the *ZTNA Destination* tab, click *Add Destination* to add a TCP forwarding rule.
4. Configure the following:

Rule Name	SSH-FAZ
Destination Host	10.88.0.2:22
Proxy Gateway	10.0.3.10:9443
Mode	Transparent
Encryption	Disabled

5. Click *Create*.

Connect over SSH:

1. On the remote PC, open a new SSH connection.
2. Enter the host admin@10.88.0.2 on port 22.
   When the connection to the ZTNA application is established, FortiGate will redirect the SAML login request to the FortiAuthenticator IdP.
   A FortiClient prompt will open with the FortiAuthenticator login screen.

3. Enter the username and password then click *Login*.
4. A second prompt opens asking for the *Token Code*. Enter the code from your FortiToken app, then click *Verify*.
5. FortiAuthenticator verifies the token code, determines if the login is successful, then sends the SAML assertion back to the client.
6. The client redirects the response back to the FortiGate SP.
7. If the log in was successful, the user can now log on to the SSH session.

Logs and debugs:

On the FortiGate, a successful connection can be seen in *Log & Report* > *Forward Traffic log*, or by using the CLI:

```
# execute log filter category 0
# execute log filter field srcip 10.0.3.2
# execute log display
...
5: date=2023-05-09 time=10:06:04 eventtime=1683651963820802005 tz="-0700" logid="0005000024"
type="traffic" subtype="ztna" level="notice" vd="root" srcip=10.0.3.2 srcport=22536
srcintf="port3" srcintfrole="wan" dstcountry="Reserved" srccountry="Reserved"

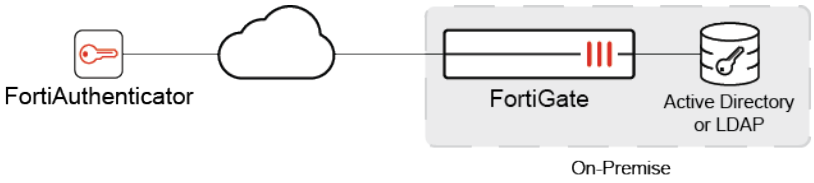
```

Use the following command to show if the FortiGate's WAD process has an active record of the SAML user login:



```
# diagnose wad user list

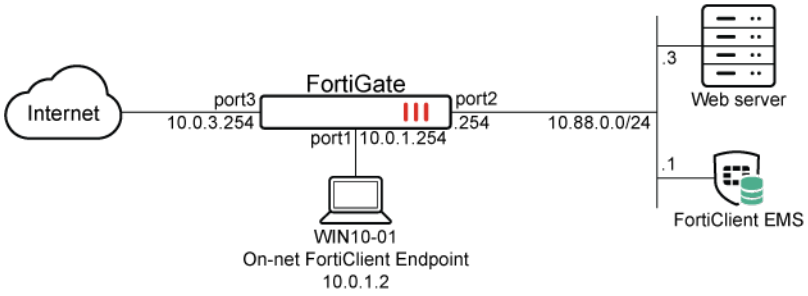
ID: 10, VDOM: root, IPv4: 10.0.3.2
  user name    : tsmith
  worker       : 1
  duration     : 387
  auth_type    : Session
  auth_method  : SAML
  pol_id       : 1
  g_id         : 4
  user_based   : 0
  expire       : no
  LAN:
    bytes_in=23261 bytes_out=14024
  WAN:
    bytes_in=3242 bytes_out=2541
```

Secure LDAP connection from FortiAuthenticator with zero trust tunnel example

When an on-premise Active Directory or LDAP server must be accessed remotely, a secure connection is important. LDAP without security should not be exposed on the internet, as user information and passwords are transferred in plain text.

This example describes how to configure a secure LDAP connection from a remote FortiAuthenticator to an on-premise AD server.

The on-premise FortiGate acts as a ZTNA application gateway to allow the FortiAuthenticator access to the AD using a TCP forwarding access proxy. Traditionally, this requires endpoints to have FortiClient installed with ZTNA destinations configured in order to connect and authenticate with a client certificate. In this scenario, the FortiAuthenticator will operate a local certificate authority, which generates a client certificate for the connection. The local root CA certificate is exported and installed on the FortiGate in order to authenticate and trust the client connection. This replaces the need for a FortiClient EMS server to manage the client certificate and act as the certificate authority.



For detailed configuration steps, see Setting up a zero trust tunnel on the FortiAuthenticator page.

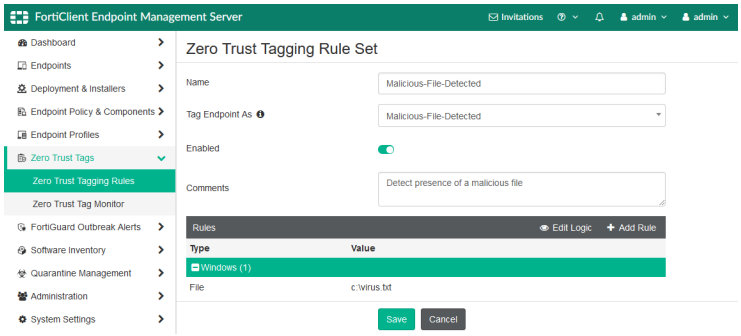
ZTNA IP MAC based access control example

In this example, firewall policies are configured that use security posture tags to control access between on-net devices and an internal web server. This mode does not require the use of the access proxy, and only uses security posture tags for access control. Traffic is passed when the FortiClient endpoint meets two conditions.

1. It is tagged with the *Domain-Users* security posture tag, identifying the device as logged on to the Domain.
2. It has the *High* importance classification tag indicating the device is High importance and low risk.

Traffic is denied when the FortiClient endpoint is tagged with *Malicious-File-Detected*.

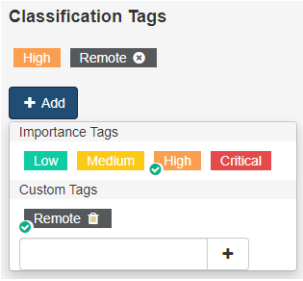
This example assumes that the FortiGate EMS fabric connector is already successfully connected.



To configure ZTNA in the GUI, go to *System* > *Feature Visibility* and enable *Zero Trust Network Access*.

To configure Zero Trust tagging rules on the FortiClient EMS:

1. Log in to the FortiClient EMS.
2. Go to *Zero Trust Tags* > *Zero Trust Tagging Rules*, and click *Add*.
3. In the *Name* field, enter *Malicious-File-Detected*.
4. In the *Tag Endpoint As* dropdown list, select *Malicious-File-Detected*.
5. Click *Add Rule* then configure the rule:



a. For *OS*, select *Windows*.
b. From the *Rule Type* dropdown list, select *File* and click the + button.
c. Enter a file name, such as *C:\virus.txt*.
d. Click *Save*.

6. Click *Save*.
7. Click *Add* again to add another rule.
8. In the *Name* field, enter *Domain-Users*.
9. In the *Tag Endpoint As* dropdown list, enter *Domain-Users* and press `Enter`.
10. Click *Add Rule*, then configure the rule:
    a. For *OS*, select *Windows*.
    b. From the *Rule Type* dropdown list, select *User in AD Group*.
    c. For *AD Group*, select the *Domain-Users* AD group.
    d. Click *Save*.

To configure a classification tag on the FortiClient EMS:

1. Go to *Endpoint* > *All Endpoints*.
2. Select the WIN10-01 computer that will be granted access. This computer should be already registered to FortiClient EMS.
3. In the *Summary* tab, under *Classification Tags*, click *Add* and then set to High Importance.

4. Go to *Administration* > *Fabric Devices*.
5. Select the connecting FortiGate, then click *Edit*.
6. Under *Tag Types Being Shared*, add *Classification Tags*.
7. Click *Save*.

To configure a firewall policy with IP/MAC based access control to deny traffic in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Set *Name* to *block-internal-malicious-access*.
3. Set *Type* to *Standard*.
4. Set *Incoming Interface* to *port1*.
5. Set *Outgoing Interface* to *port2*.
6. Set *Source* to *all*.
7. Set *IP/MAC Based Access Control* to the *Malicious-File-Detected* tag.
8. Set *Destination* to the address of the Web server. If no address is created, create a new address object for 10.88.0.3/32.
9. Set *Service* to *ALL*.
10. Set *Action* to *DENY*.
11. Enable *Log Violation Traffic*.
12. Configuring the remaining settings as needed.
13. Click *OK*.

To configure a firewall policy with IP/MAC based access control to allow access in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Set *Name* to *allow-internal-access*.
3. Set *Type* to *Standard*.
4. Set *Incoming Interface* to *port1*.
5. Set *Outgoing Interface* to *port2*.
6. Set *Source* to *all*.
7. Set *IP/MAC Based Access Control* to the *Domain-Users* ZTNA IP tag.
8. Set *Logical And With Secondary Tags* to *Specify*. This option allows for a second group of tags to be used with a logical And operator.
9. Set *Secondary Tags* as the *High* Class IP tag.
10. Set *Destination* to the address of the Web server.
11. Set *Service* to *ALL*.
12. Set *Action* to *ACCEPT*.
13. Enable *Log Allowed Traffic* and set it to *All Sessions*.
14. Configuring the remaining settings as needed.
15. Click *OK*.

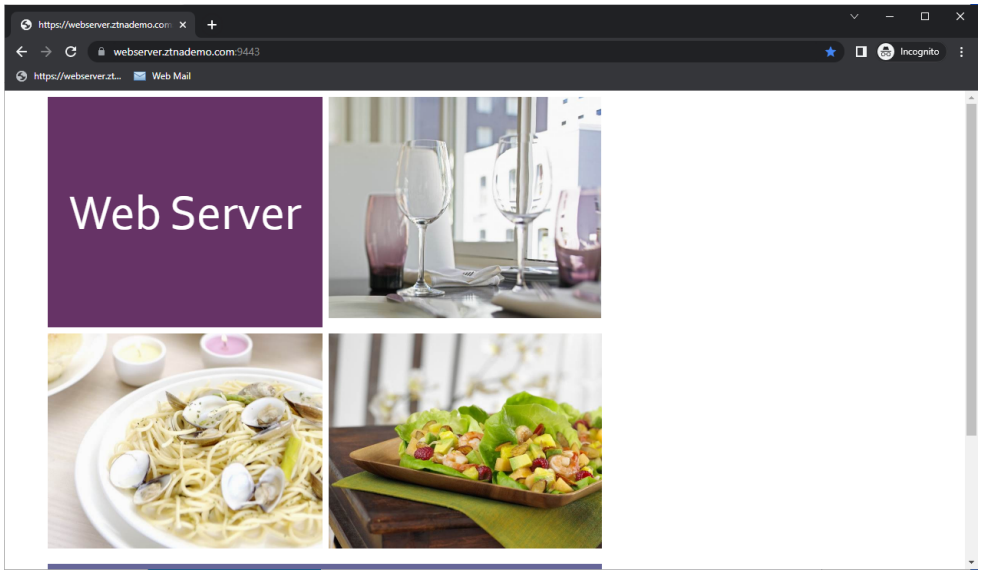
To configure firewall policies with IP/MAC based access control to block and allow access in the CLI:

```
config firewall policy
    edit 10
        set name "block-internal-malicious-access"
        set srcintf "port1"
        set dstintf "port2"
        set ztna-status enable
        set srcaddr "all"
        set dstaddr "Webserver"
        set ztna-ems-tag "EMS1_ZTNA_Malicious-File-Detected"
```

```
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
    edit 12
        set name "allow-internal-access"
        set srcintf "port1"
        set dstintf "port2"
        set action accept
        set ztna-status enable
        set srcaddr "all"
        set dstaddr "Webserver"
        set ztna-ems-tag "EMS1_ZTNA_Domain-Users"
        set ztna-ems-tag-secondary "EMS1_CLASS_High"
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
end
```

When multiple tags are selected with `set ztna-ems-tag <tags>`, matching occurs using a logical OR operator. Therefore any single tag that match will return true.

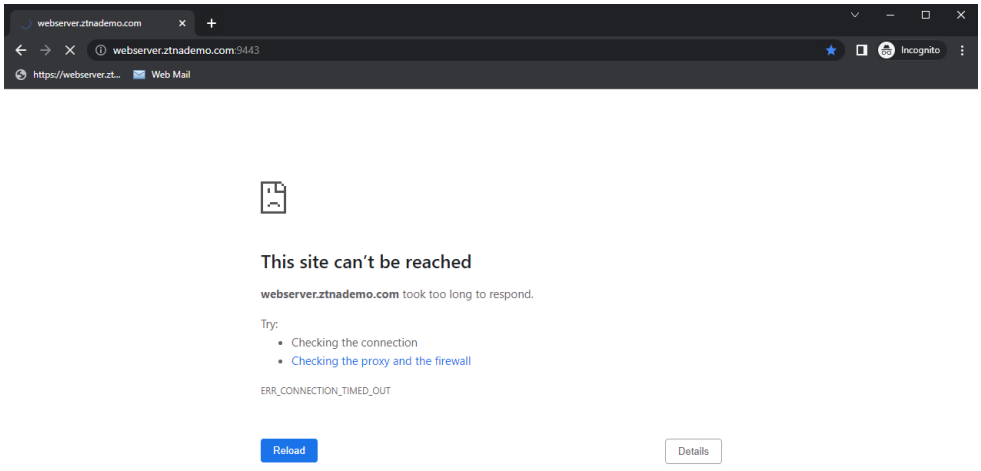
The `set ztna-tags-match-logic {and | or}` option cannot be used to change the logical operator. This option is applied by wad to tags selected for ZTNA proxy-policy.



The `set ztna-ems-tag-secondary <tags>` option by default allows a second group of tags to be specified. This group and the primary group are joined by the logical and operator.

Testing the access to the web server from the on-net client endpoint

Access allowed:



1. On the WIN10-01 PC, open FortiClient.
2. On the *Zero Trust Telemetry* tab, make sure that you are connected to the EMS server.
3. Open a browser and enter the address of the server.
4. The FortiGate matches your security posture by verifying your security posture tags and matching the

corresponding `allow-internal-access` firewall policy, and you are allowed access to the web server.

Access denied:

1. On the WIN10-01 PC, trigger the Zero Trust Tagging Rule by creating the file in C:\virus.txt.
2. Open a browser and enter the address of the server.
3. FortiGate checks your security posture. Because EMS has tagged the PC with the *Malicious-File-Detected* tag, it matches the *block-internal-malicious-access* firewall policy.
4. You are denied access to the web server.

Logs and debugs

Access allowed:

```
# diagnose endpoint record list

ZTNA IPv6 examples

IPv6 can be configured in ZTNA in several scenarios:

- IPv6 Client — IPv6 Access Proxy — IPv6 Server
- IPv6 Client — IPv6 Access Proxy — IPv4 Server
- IPv4 Client — IPv4 Access Proxy — IPv6 Server

These examples show the basic configuration for each scenario. It is assumed that the EMS fabric connector is already successfully connected.

Example 1: IPv6 Client — IPv6 Access Proxy — IPv6 Server

To configure the FortiGate:

1. Configure the IPv6 access proxy VIP:

```
config firewall vip6
    edit "zv6"
        set type access-proxy
        set extip 2000:172:18:62::66
        set server-type https
        set extport 6443
        set ssl-certificate "cert"
    next
end
```

2. Configure a virtual host:

```
config firewall access-proxy-virtual-host
    edit "vhost_ipv6"
        set ssl-certificate "cert"
        set host "qa6.test.com"
    next
end
```

   The client uses this address to connect to the access proxy.

3. Configure an IPv6 access proxy and IPv6 api-gateway, apply the VIP6 and virtual host to it, and assign an IPv6 address to the realserver:

```
config firewall access-proxy6
    edit "zs6"
        set vip "zv6"
        config api-gateway6
            edit 1
                set virtual-host "vhost_ipv6"
                config realservers
                    edit 1
                        set ip 2000:172:16:200::209
                    next
                end
            next
```

```
        end
    next
end
```

4. Apply the IPv6 access proxy to a proxy policy:

```
config firewall proxy-policy
    edit 1
        set name "ztna_rule"
        set proxy access-proxy
        set access-proxy6 "zs6"
        set srcintf "port2"
        set action accept
        set schedule "always"
        set logtraffic all
        set srcaddr6 "all"
        set dstaddr6 "all"
        set utm-status enable
        set ssl-ssh-profile "custom-deep-inspection"
        set webfilter-profile "monitor-all"
    next
end
```

5. Apply the IPv6 VIP to a firewall policy:

```
config firewall policy
    edit 4
        set name "ZTNA"
        set srcintf "port2"
        set dstintf "any"
        set action accept
        set srcaddr6 "all"
        set dstaddr6 "zv6"
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
        set logtraffic all
        set nat enable
    next
end
```

To test the configuration:

1. On an IPv6 client, ensure that the address qa6.test.com resolves to the IPv6 VIP address of 2000:172:18:62::66.
2. In a browser, connect to https://qa6.test.com:6443.
3. After device certificate verification, the browser will open up the webpage on the IPv6 real server.
4. In the Forward Traffic Log, the following log is available:

```
3: date=2021-06-25 time=13:38:18 eventtime=1624653498459580215 tz="-0700"
logid="0000000024" type="traffic" subtype="forward" level="notice" vd="root"
srcip=2000:10:1:100::214 srcport=55957 srcintf="port2" srcintfrole="undefined"
dstcountry="Reserved" srccountry="Reserved" dstip=2000:172:16:200::209 dstport=443
dstintf="root" dstintfrole="undefined" sessionid=92406 service="HTTPS" proto=6
action="accept" policyid=1 policytype="proxy-policy" poluuid="7afdac8c-d5db-51eb-dfc6-
67bb86e4bdcf" policyname="ztna_rule" duration=5 wanin=2031 rcvdbyte=2031 wanout=1332
lanin=1247 sentbyte=1247 lanout=950 appcat="unscanned" utmaction="allow" countweb=1
utmref=65445-0
```

Example 2: IPv6 Client — IPv6 Access Proxy — IPv4 Server

To configure the FortiGate:

1. Configure the IPv6 access proxy VIP:

```
config firewall vip6
    edit "zv6"
        set type access-proxy
        set extip 2000:172:18:62::66
        set server-type https
        set extport 6443
        set ssl-certificate "cert"
    next
end
```

2. Configure a virtual host:

```
config firewall access-proxy-virtual-host
    edit "vhost_ipv6"
        set ssl-certificate "cert"
        set host "qa6.test.com"
    next
end
```

   The client uses this address to connect to the access proxy.

3. Configure an IPv6 access proxy and IPv6 api-gateway, apply the VIP6 and virtual host to it, and assign an IPv4 address to the realserver:

```
config firewall access-proxy6
    edit "zs6"
        set vip "zv6"
        config api-gateway6
            edit 1
                set virtual-host "vhost_ipv6"
                config realservers
                    edit 1
                        set ip 172.16.200.209
                    next
                end
            next
        end
    next
end
```

4. Apply the IPv6 access proxy to a proxy policy:

```
config firewall proxy-policy
    edit 1
        set name "ztna_rule"
        set proxy access-proxy
        set access-proxy6 "zs6"
        set srcintf "port2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
```

```
        set logtraffic all
        set srcaddr6 "all"
        set dstaddr6 "all"
        set utm-status enable
        set ssl-ssh-profile "custom-deep-inspection"
        set webfilter-profile "monitor-all"
    next
end
```

5. Apply the IPv6 VIP to a firewall policy:

```
config firewall policy
    edit 4
        set name "ZTNA"
        set srcintf "port2"
        set dstintf "any"
        set action accept
        set srcaddr6 "all"
        set dstaddr6 "zv6"
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
        set logtraffic all
        set nat enable
    next
end
```

To test the configuration:

1. On an IPv6 client, ensure that the address qa6.test.com resolves to the IPv6 VIP address of 2000:172:18:62::66.
2. In a browser, connect to https://qa6.test.com:6443.
3. After device certificate verification, the browser will open up the webpage on the IPv4 real server.
4. In the Forward Traffic Log, the following log is available:

```
2: date=2021-06-25 time=13:46:54 eventtime=1624654014129553521 tz="-0700"
logid="0000000024" type="traffic" subtype="forward" level="notice" vd="root"
srcip=2000:10:1:100::214 srcport=60530 srcintf="port2" srcintfrole="undefined"
dstcountry="Reserved" srccountry="Reserved" dstip=172.16.200.209 dstport=443
dstintf="root" dstintfrole="undefined" sessionid=219 service="HTTPS" proto=6
action="accept" policyid=1 policytype="proxy-policy" poluuid="7afdac8c-d5db-51eb-dfc6-
67bb86e4bdcf" policyname="ztna_rule" duration=5 wanin=2028 rcvdbyte=2028 wanout=1321
lanin=1236 sentbyte=1236 lanout=947 appcat="unscanned" utmaction="allow" countweb=1
utmref=65443-14
```

Example 3: IPv4 Client — IPv4 Access Proxy — IPv6 Server

To configure the FortiGate:

1. Configure the IPv4 access proxy VIP:

```
config firewall vip
    edit "zv4"
        set type access-proxy
        set extip 172.18.62.66
        set extintf "any"
```

```
        set server-type https
        set extport 4443
        set ssl-certificate "cert"
    next
end
```

2. Configure a virtual host:

```
config firewall access-proxy-virtual-host
    edit "vhost_ipv4"
        set ssl-certificate "cert"
        set host "qa.test.com"
    next
end
```

   The client uses this address to connect to the access proxy.

3. Configure an IPv4 access proxy and IPv6 api-gateway, apply the VIP and virtual host to it, and assign an IPv6 address to the realserver:

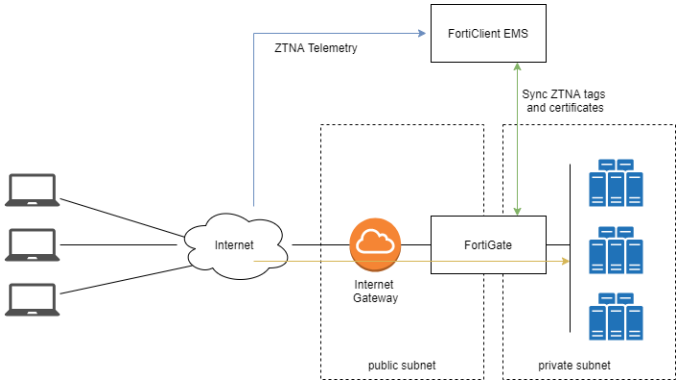
```
config firewall access-proxy
    edit "zs4"
        set vip "zv4"
        config api-gateway6
            edit 1
                set virtual-host "vhost_ipv4"
                config realservers
                    edit 1
                        set ip 2000:172:16:200::209
                    next
                end
            next
        end
    next
end
```

4. Apply the IPv4 access proxy to a proxy policy:

```
config firewall proxy-policy
    edit 1
        set name "ztna_rule"
        set proxy access-proxy
        set access-proxy "zs4"
        set srcintf "port2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set logtraffic all
        set srcaddr6 "all"
        set dstaddr6 "all"
        set utm-status enable
        set ssl-ssh-profile "custom-deep-inspection"
        set webfilter-profile "monitor-all"
    next
end
```

5. Apply the IPv4 VIP to a firewall policy:

```
config firewall policy
    edit 4
        set name "ZTNA"
        set srcintf "port2"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "zv4"
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
        set logtraffic all
        set nat enable
    next
end
```



To test the configuration:

1. On an IPv4 client, ensure that the address qa6.test.com resolves to the IPv4 VIP address of 172.18.62.66.
2. In a browser, connect to https://qa6.test.com:6443.
3. After device certificate verification, the browser will open up the webpage on the IPv6 real server.
4. In the Forward Traffic Log, the following log is available:

```
1: date=2021-06-25 time=13:52:30 eventtime=1624654350689576485 tz="-0700"
logid="0000000024" type="traffic" subtype="forward" level="notice" vd="root"

```

ZTNA Zero Trust application gateway example

The Zero Trust application gateway (ZTAG) for SaaS applications delivers Zero Trust Network Access (ZTNA) to companies that deploy SaaS applications and services in the cloud. A Zero Trust application gateway is deployed in the cloud, protecting resources on the private subnets by enforcing security and access control.

A Zero Trust application gateway can be deployed directly on AWS, Azure, and VMware. The deployment template can configure the necessary ZTNA settings to get the ZTNA configurations started.

For more information, see the Zero Trust Application Gateway Admin Guide.

ZTNA inline CASB for SaaS application access control

The FortiGate ZTNA application gateway can be configured to act as an inline cloud access security broker (CASB) by providing access control to software-as-a-service (SaaS) traffic using ZTNA access control rules. A CASB sits between users and their cloud service to enforce security policies as they access cloud-based resources.

The following components are required to use the ZTNA inline CASB feature:

- The FortiGuard Inline CASB Database (ICDB) used by the FortiGate and FortiClient EMS.
  - This database includes all FQDNs related to specific SaaS applications and corresponding FortiGuard packages for FortiOS and FortiClient.
- A FortiGate ZTNA TCP forwarding access proxy configuration that specifies SaaS application destinations using application names defined in the ICDB.
- ZTNA connection rules for SaaS traffic that are provisioned using FortiClient EMS (version 7.2.2 and later).
- FortiClient (version 7.2.0 and later) installed on the user's machine to receive the ZTNA connection rules for SaaS traffic from FortiClient EMS.

Syntax

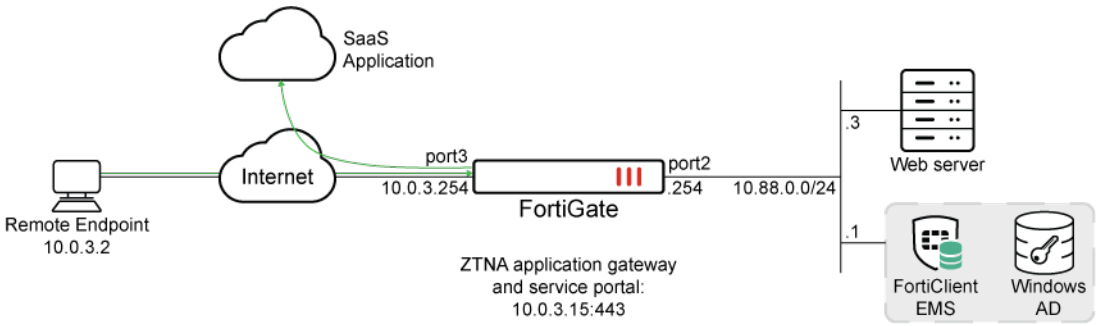
Users can configure the ZTNA application gateway with a new SaaS proxy access type and conveniently specify SaaS application destinations by application name or by application group name without needing to manually search for and enter FQDNs specific to each SaaS application. This can only be configured in the CLI.

To configure a ZTNA application gateway to use SaaS from the CLI:

```
config firewall access-proxy
    edit <name>
        config api-gateway
            edit <ID>
                set url-map "/saas"
                set service saas
                set application <app 1> [app 2] ...
            next
        end
    next
end
```

To configure the SaaS application destination from the CLI:

```
config firewall proxy-address
    edit <name>
        set type saas
        set application <app 1> [app 2] ...
    next
end
```



To configure a ZTNA proxy-policy to use the SaaS destination from the CLI:

```
config firewall proxy-policy
    edit <ID>
        set dstaddr <proxy-address>
    next
end
```

The FortiGate traffic log includes a `saasname` field when traffic is controlled by inline CASB for logging SaaS traffic on the FortiGate and FortiAnalyzer.

Example

In this example, the FortiGate is configured as a ZTNA application gateway with a VIP of 10.0.3.15 and uses the SaaS access proxy type. SaaS application Gmail is allowed, but the action of getting an attachment on Gmail is blocked.

To configure the FortiGate:

1. Configure the access proxy VIP for ZTNA:

```
config firewall vip
    edit "ZTNA-SaaS-Access"
        set type access-proxy
        set extip 10.0.3.15
        set extintf "any"
        set server-type https
        set extport 443
        set ssl-certificate "ztna-wildcard"
    next
end
```

2. Configure the firewall access proxy using the SaaS proxy access type and specify the SaaS application destinations:

```
config firewall access-proxy
    edit "ZTNA-SaaS-Access-Proxy"
        set vip "ZTNA-SaaS-Access"
        config api-gateway
            edit 1
                set service saas
                set url-map "/saas"
                set application "gmail"
            next
        end
```

```
    next
end
```

3. Configure the SaaS proxy address, which can be applied in a ZTNA proxy policy to allow Gmail:

```
config firewall proxy-address
    edit "ztna-saas-gmail"
        set type saas
        set application "gmail"
    next
end
```

4. Configure the SaaS proxy address, which can be applied in a ZTNA proxy policy to deny Gmail attachments:

```
config firewall proxy-address
    edit "ztna-saas-gmail-attach"
        set type saas
        set application "gmail-getAttach"
    next
end
```

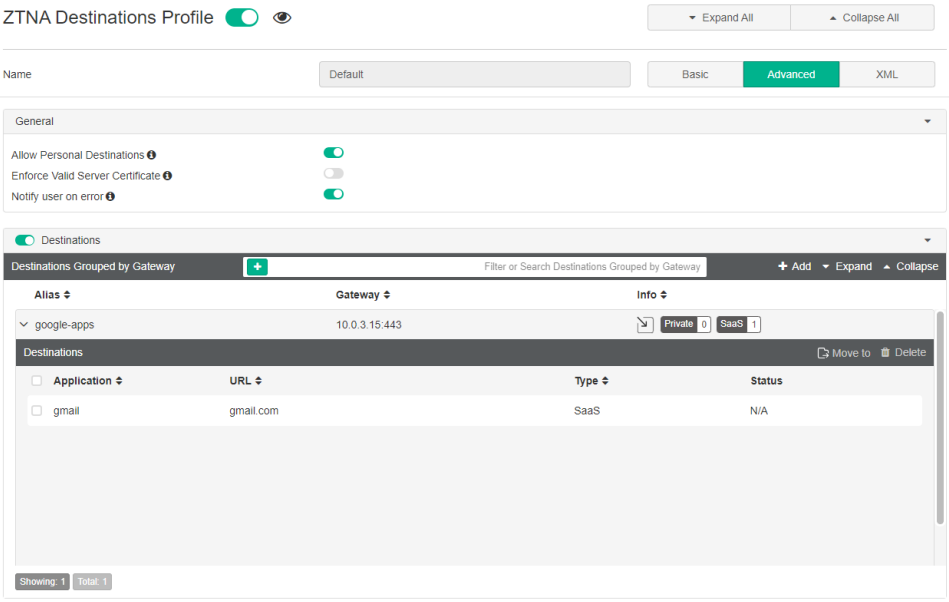
5. Configure a ZTNA rule using the SaaS proxy address as the destination to deny Gmail attachments:

```
config firewall proxy-policy
    edit 2
        set name "ZTNA-SaaS-Deny-Access"
        set proxy access-proxy
        set access-proxy "ZTNA-SaaS-Access-Proxy"
        set srcintf "port3"
        set srcaddr "all"
        set dstaddr "ztna-saas-gmail-attach"
        set schedule "always"
        set logtraffic all
    next
end
```

6. Configure a ZTNA rule using the SaaS proxy address as the destination to allow Gmail:

```
config firewall proxy-policy
    edit 3
        set name "ZTNA-SaaS-Access"
        set proxy access-proxy
        set access-proxy "ZTNA-SaaS-Access-Proxy"
        set srcintf "port3"
        set srcaddr "all"
        set dstaddr "ztna-saas-gmail"
        set action accept
        set schedule "always"
        set logtraffic all
    next
end
```

7. Optionally, if user authentication is configured, the ZTNA rule (`set users` or `set groups`), configure the authentication scheme and rule (see Applying user authentication in the ZTNA Deployment guide).



Before connecting, the users must have corresponding ZTNA Destinations in FortiClient. In FortiClient EMS, configure SaaS applications in *Endpoint Profiles* > *ZTNA Destinations* and push application destinations to FortiClient.

To configure the FortiClient EMS:

1. On FortiClient EMS, go to *Endpoint Profiles* > *ZTNA Destinations*.
2. Edit the *Default* profile.
3. Besides *Name*, click *Advanced*.
4. Click the eye icon beside *ZTNA Destination Profile* to enable this profile to be viewed on the FortiClient.
5. Under *Destinations*, click *Add* . The *Add New Gateway* dialog is displayed.
6. In *Proxy Gateway*, enter the following:

Enter the gateway proxy address	10.0.3.15:443
Select browser user-agent for SAML login	Use FortiClient embedded browser
Alias	google-apps

7. Click *Next*.
8. In *Private Applications*, click *Next*.
9. In *SaaS Applications*, expand *Google* and then select *gmail*.

10. Click *Finish*.
11. Click *Save*.

    The FortiClient endpoints will synchronize the destination from EMS.

Testing and results

Once connected, the FortiClient retrieves the list of hosted ZTNA services, including the SaaS service, and adds corresponding ZTNA connection rules for the configured SaaS applications.

Connect to Gmail from a browser. The traffic is allowed.

After closing the session, the corresponding traffic logs can be viewed from the FortiGate GUI or from the CLI.

```
# execute log filter field subtype ztna
# execute log display
365 logs found.
10 logs returned.
2.0% of logs has been searched.

ZTNA application gateway with KDC to access shared drives

Fortinet technical support cannot troubleshoot third-party applications involved in this solution.

Kerberos Key Distribution Center (KDC) proxy protocol can be used to remotely authenticate domain users and issue Kerberos tickets. A remote user can use the same Kerberos ticket to authenticate when remotely accessing shared drives through ZTNA application gateway.

The following options are available when setting up ZTNA application gateway on TCP 445 for remote access to mapped drives:

- Create the mapped drive using the server's IP address, which uses Windows NT LAN Manager (NTLM) to authenticate users.
- Create the mapped drive using the server's FQDN (or DNS name), which requires Kerberos authentication.

The preferred way to create mapped drives is using the server's DNS name. KDC proxy protocol can be a reliable way to initiate Kerberos authentication for remote users to seamlessly access mapped drives and requires the following steps:

1. Set up the KDC proxy service on a server.
2. Set up the ZTNA application gateway for mapped drives.

The KDC Proxy only works for domain-joined workstations.

Setting up the KDC proxy service

The following steps are required to set up the KDC proxy service on a server:

1. Deploy a server that is joined to the domain and create a trusted certificate.
2. Configure the KDC proxy service on the server.
3. Configure clients to use the KDC proxy.
4. If client machines cannot retrieve group policy updates, configure registry keys on the clients.

Deploying a server and creating a certificate

Deploy a server that is joined to the domain. At a minimum, the server must have a public network interface with a domain name pointed to it. Clients will connect to the server over the internet. For networking, you can forward port 443 if necessary.

Create a trusted certificate for the public domain name of the proxy endpoint:

- Domain: fortitest.net
- KDC proxy: kdcproxy.fortitest.net

The KDC proxy service is present on the server, but not configured.

Configuring the KDC proxy service on the server

The KDC proxy service must be configured before it can be started.

To configure the server:

1. Start an elevated command prompt, and configure a URL ACL for the endpoint:

   ```
   netsh http add urlacl url=https://+:443/KdcProxy user="NT authority\Network Service"
   ```

2. Associate the certificate created previously with the endpoint:

   ```
   netsh http add sslcert ipport=0.0.0.0:443 certhash=<thumbprint of your certificate>
   appid={generated Guid}
   ```

   This association instructs `HTTP.SYS` to use the certificate when connections occur over HTTPS.

For example: `netsh http add sslcert ipport=0.0.0.0:443 certhash=aaaabbbbccccddddeeeeffff0000111122223333 appid={aaaaaaaa-bbbb-cccc-dddd-aaaabbbbcccc}`

For `appid` you should generate a random GUID here. From PowerShell try `[Guid]::NewGuid()`. The `certhash` is the thumbprint of your certificate.

If the certificate contains extensions for CRL or AIA, those URLs should be reachable from the remote client.

3. If not using smart card certificates (or Windows Hello) for authentication, disable the certificate authentication requirement:

```
REG ADD "HKLM\SYSTEM\CurrentControlSet\Services\KPSSVC\Settings" /v HttpsClientAuth /t REG_DWORD /d 0x0 /f
```

4. Additionally if not using certificates, enable password authentication:

```
REG ADD "HKLM\SYSTEM\CurrentControlSet\Services\KPSSVC\Settings" /v DisallowUnprotectedPasswordAuth /t REG_DWORD /d 0x0 /f
```

5. Configure the KDC Proxy Service (KPSSVC) to start automatically:

```
sc config kpssvc start=auto
```

6. Start the service:

```
net start kpssvc
```

Configuring clients to use a KDC proxy

Clients must be configured to use a KDC proxy. This can be done through GPO or through modifying the registry directly. The GPO path is:

```
Computer Configuration\Policies\Administrative Templates\System\Kerberos\Specify KDC proxy servers for Kerberos clients
```

Enabling this policy requires setting a realm-to-value mapping. The realm is your domain name, starting with a period (for example `".fortitest.net"`), or a `"*"` to include all domains in a wildcard format. The value is specially crafted:

```
<https kdcproxy.fortitest.net:kdcproxy />
```

Deploy the policy, and reboot the client. Wait a while for caching to complete, and then log in. You should find users are now authenticating over the KDC proxy endpoint.

To verify from a logged in session, launch a command prompt and try the following command:

```
klist get krbtgt
```

Configuring registry keys on clients

If you are trying to deploy these settings on a client machine that cannot retrieve group policy updates, manually configure the registry keys for the client:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\System\Kerberos]
"KdcProxyServer_Enabled"=dword:00000001
```

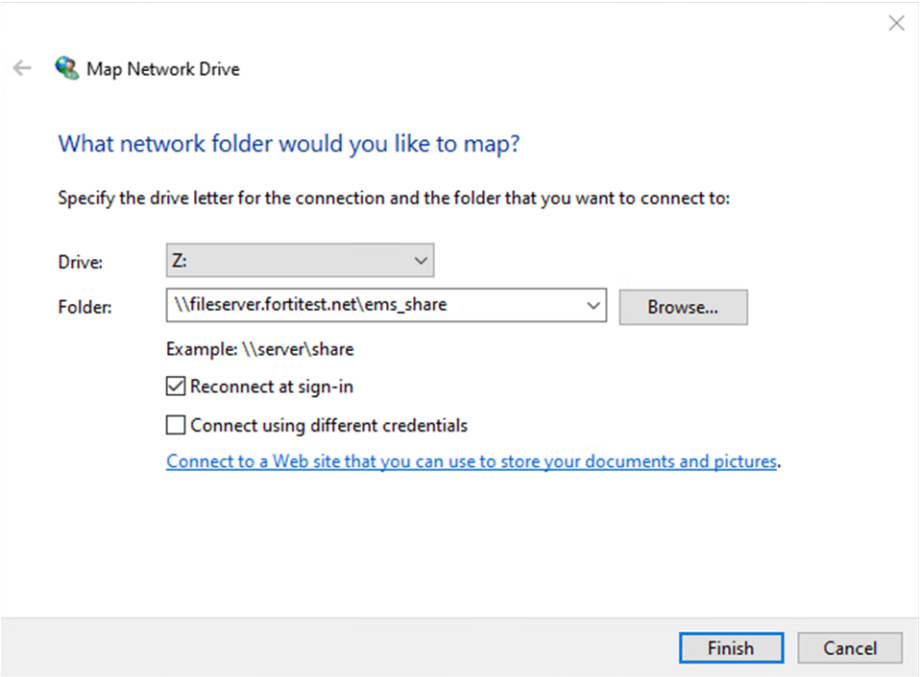
```
[HKEY_LOCAL_
MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\System\Kerberos\KdcProxy\ProxyServers]
```

```
"*"="<https kdcproxy.fortitest.net />" or ".fortitest.net"="<https kdcproxy.fortitest.net
/>"

[HKEY_LOCAL_
MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\System\Kerberos\Parameters]
"NoRevocationCheck"=dword:00000000
```

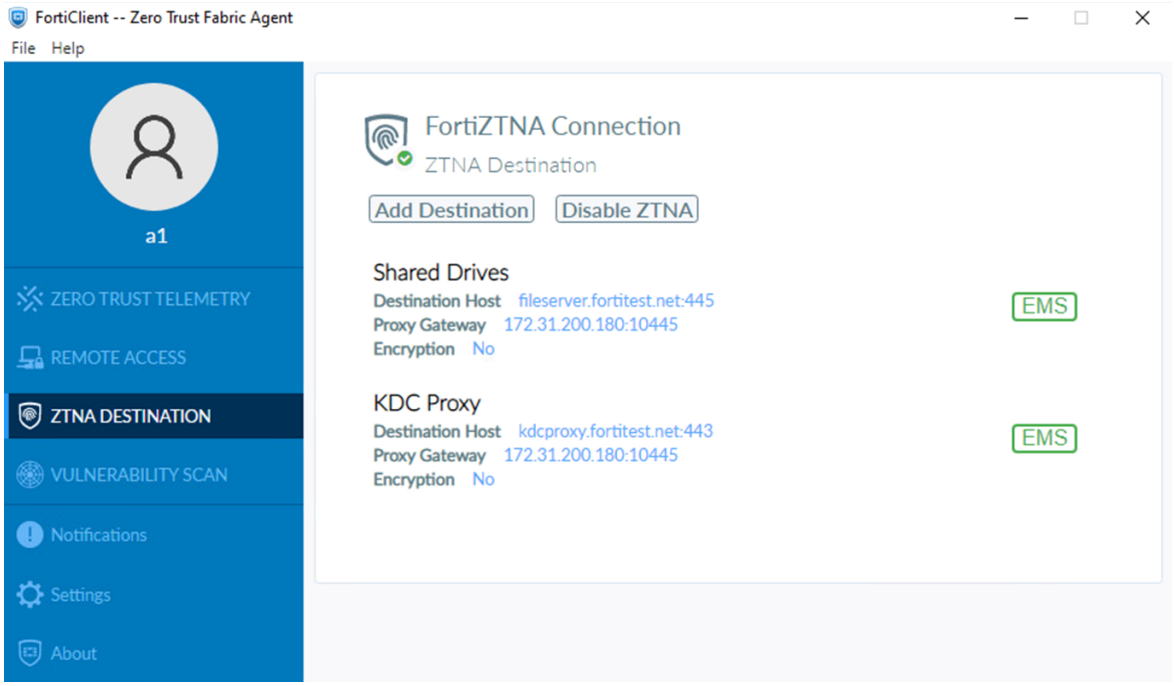
Setting up the ZTNA application gateway for mapped drives

The following steps are required to set up ZTNA application gateway for mapped drives on the FortiGate:



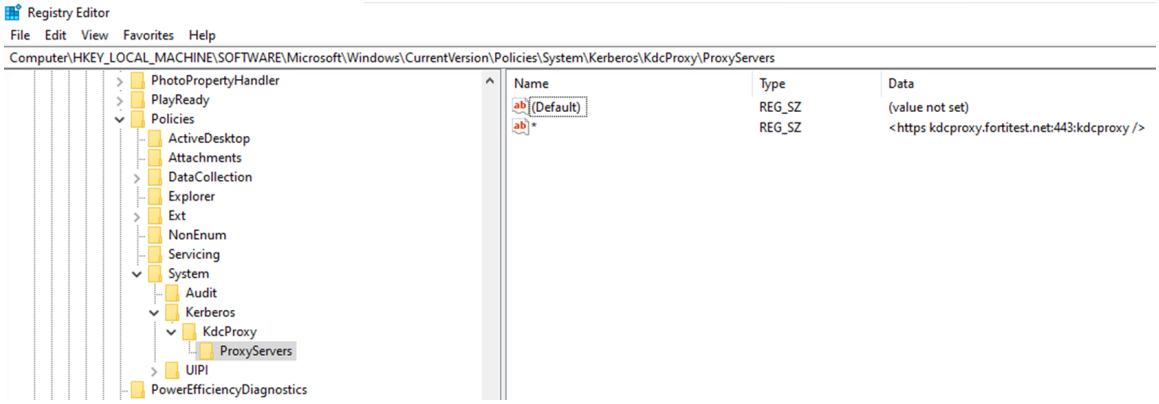
1. Configure FortiClient to have the ZTNA destination rule.
2. Configure a ZTNA server and proxy policy on FortiGate.

Configuring a ZTNA destination rule on FortiClient



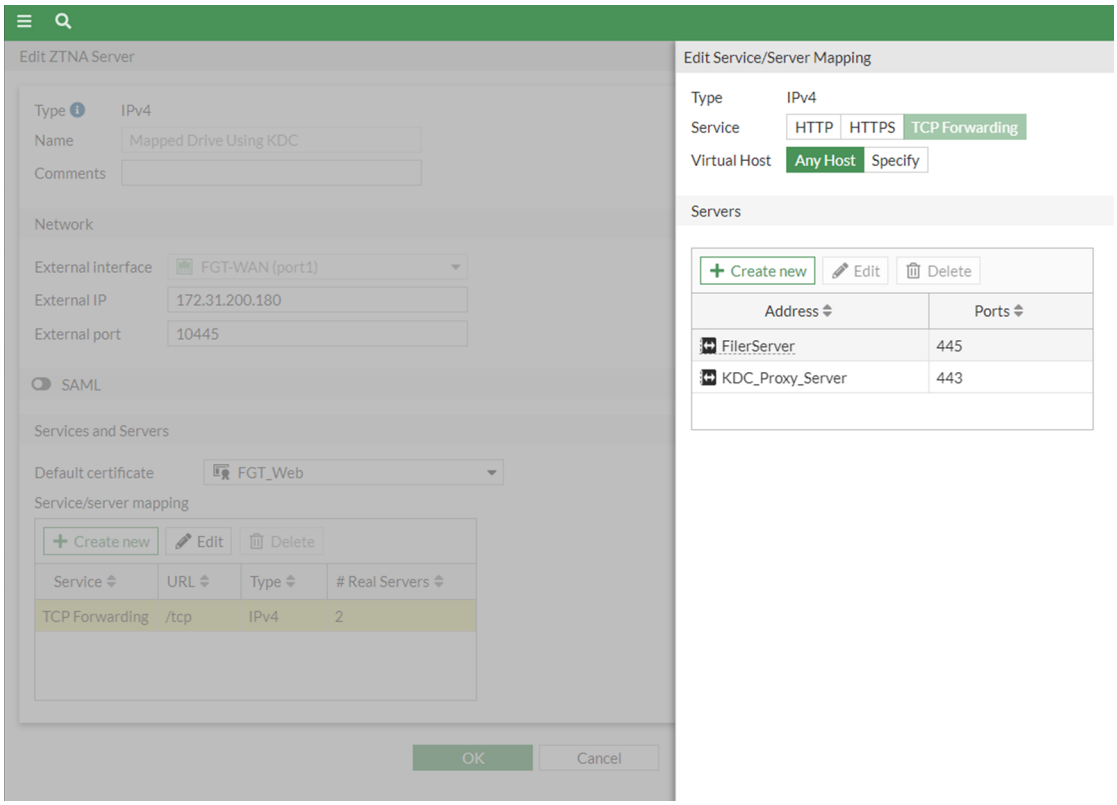
The ZTNA destination rule can be configured by using FortiClient EMS or by manually configuring FortiClient. The destination host matches the server's FQDN on port 445, and the proxy gateway should be the FortiGate WAN port on the chosen external port.

Another rule is required for the KDC proxy communication with the destination host defined as the FQDN of the KDC proxy server and port 443.

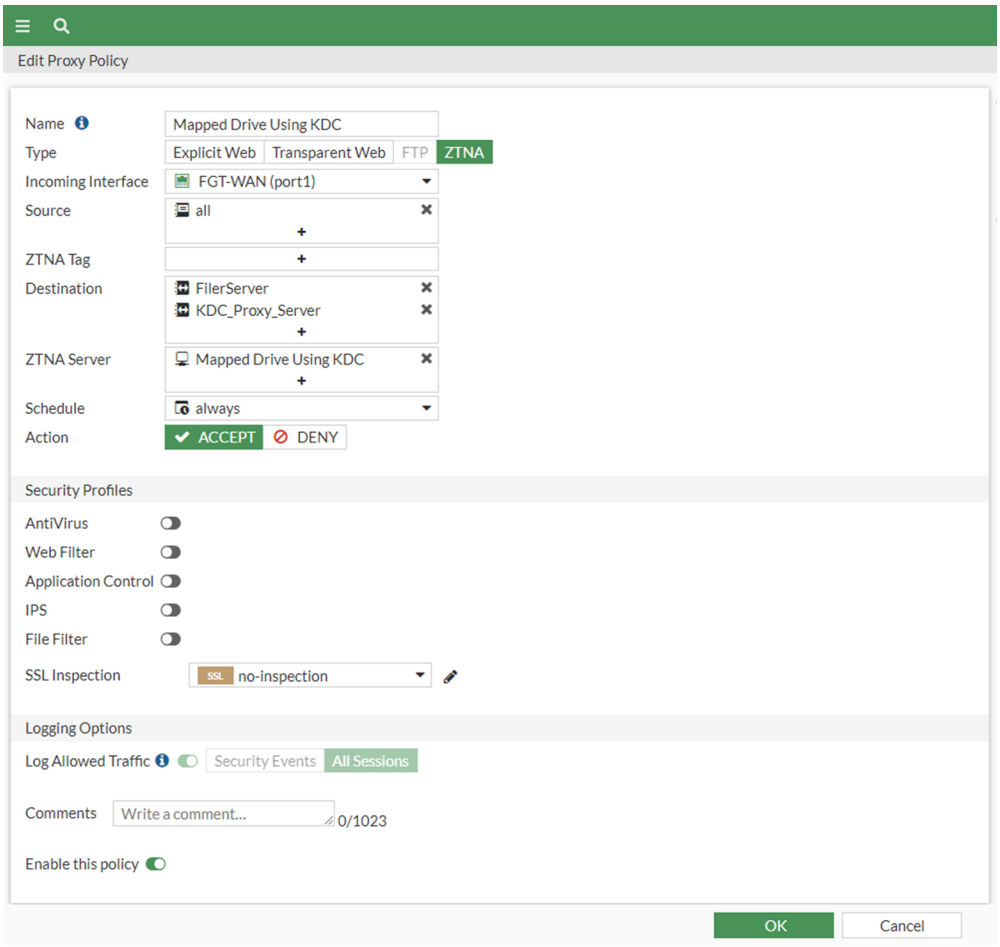


The map network drive configuration should be the last step after configuring the FortiGate. The following example shows the mapped drive:

The following example shows a ZTNA destination configured in FortiClient with the *Proxy Gateway*:



The following example shows the registry settings:



Configuring FortiGate

A ZTNA server and a proxy policy are required to verify and forward the incoming requests on port 10445 to the file server on port 445 as well as to the KDC proxy server on port 443.

The following example shows the ZTNA server:

The following example shows the proxy policy:

Custom replacement message for ZTNA virtual hosts

Each ZTNA virtual host can be configured to display messages from a custom replacement message group.

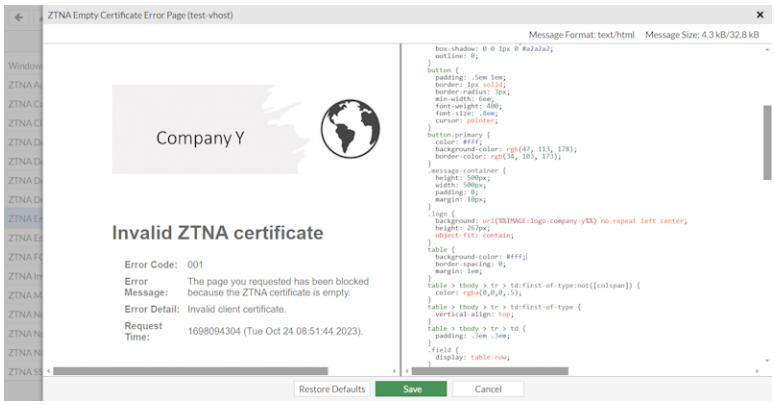
First create a replacement message group, and customize one ore more messages in the group. Then configure one or more ZTNA virtual hosts to use the replacement message group.

```
config firewall access-proxy-virtual-host
    edit <host name>
        set replacemsg-group <replacemsg group>
    next
end
```

When a client fails a ZTNA check with the virtual host, the replacement message is displayed.

Example

In this example, a ZTNA virtual host named *server1.ztna.local* is mapped to a replacement message group named *test-vhost*, and the group includes a customized *ZTNA Empty Certificate Error Page* message. The message is customized with a Company Y logo.



When clients fail a ZTNA check with the ZTNA virtual host (server1.ztna.local) because of an empty certificate, the custom replacement message is displayed.

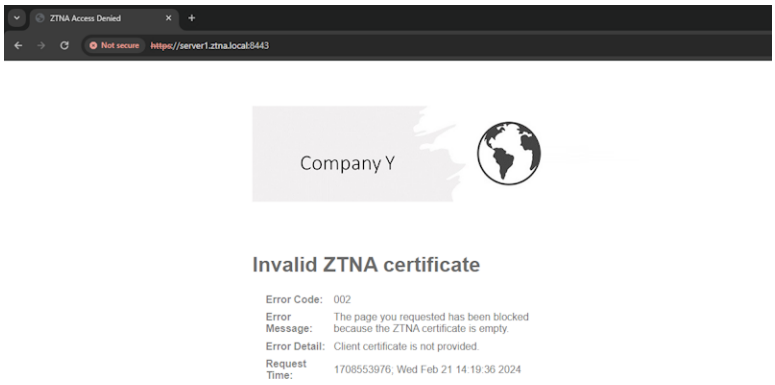
Go to *System* > *Feature Visibility* and enable *Replacement Message Groups*. See Feature visibility on page 2974 for more information.

To customize replacement messages for ZTNA virtual hosts:

1. Upload a logo to the FortiGate to use in replacement messages:
   a. Go to *System* > *Replacement Messages* and click *Manage Images*.
   b. Click *Create New*.
   c. Name and upload an image file.
   d. Click *OK*. The logo is uploaded to the FortiGate.
2. Create a replacement message group named, for example, *test-vhost*:
   a. Go to *System* > *Replacement Message Groups* and click *Create New*.
   b. Specify a name for the group, such as *test-vhost*.
   c. Set *Group Type* to *Security*.
   d. Click *OK*.
3. Customize one or more messages in the *test-vhost* group:
   In this example, the *ZTNA Empty Certificate Error Page* message is edited to add a custom logo.
   a. Double-click the *test-vhost* replacement message group to open it for editing.
   b. Select the *ZTNA Empty Certificate Error Page* message and click *Edit*.
   c. In the right pane, edit the URL for the `.logo` section by typing the logo name to select the uploaded logo, for example, *logo-company-y*.

```
...
}
.logo {
  background: url(%%IMAGE:logo-company-y%%) no-repeat left center;
  height: 267px;
  object-fit: contain;
}
...
```

   d. Click *Save*. A green checkmark is displayed in the *Modified* column to indicate a customized message.



4. Configure a ZTNA server with a ZTNA virtual host named *server1.ztna.local*. See Configure a ZTNA server on page 1168.

   In the *Service/server* mapping, be sure to set *Virtual Host* to *Specify*, and enter the name or IP address of the host that the request must match. For example, if server1.ztna.local is entered as the host, then only requests to server1.ztna.local will match.
5. Map the ZTNA virtual host to the replacement message group in the CLI.

   In this example, the ZTNA virtual host named `server1.ztna.local` is configured to use the `test-vhost` replacement message group.

```
config firewall access-proxy-virtual-host
    edit "server1.ztna.local"
        set replacemsg-group "test-vhost"
    next
end
```

6. Create a ZTNA policy to allow traffic to the ZTNA server. See Configure a ZTNA policy on page 1171.
7. When a client fails to access the ZTNA virtual host named *server1.ztna.local* because of an empty certificate error, the following custom replacement message with the Company Y logo is displayed.

ZTNA troubleshooting and debugging commands

The following debug commands can be used to troubleshoot ZTNA issues:

Command	Description
`# diagnose endpoint fctems test-connectivity <EMS>`	Verify FortiGate to FortiClient EMS connectivity.
`# execute fctems verify <EMS>`	Verify the FortiClient EMS's certificate.
`# diagnose test application fcnacd 2`	Dump the EMS connectivity information.
`# diagnose debug app fcnacd -1` `# diagnose debug enable`	Run real-time FortiClient NAC daemon debugs.
`# diagnose endpoint ec-shm list <ip> <mac> <EMS_serial_number> <EMS_tenant_id>`	Show the endpoint record list. Optionally, add filters.

Command	Description
`# diagnose endpoint lls-comm send ztna find-uid <uid> <EMS_serial_number> <EMS_tenant_id>`	Query endpoints by client UID, EMS serial number, and EMS tenant ID.
`# diagnose endpoint lls-comm send ztna find-ip-vdom <ip> <vdom>`	Query endpoints by the client IP-VDOM pair.
`# diagnose wad dev query-by uid <uid> <EMS_serial_number> <EMS_tenant_id>`	Query from WAD diagnose command by UID, EMS serial number, and EMS tenant ID.
`# diagnose wad dev query-by ipv4 <ip>`	Query from WAD diagnose command by IP address.
`# diagnose firewall dynamic list`	List EMS security posture tags and all dynamic IP and MAC addresses.
`# diagnose test application fcnacd 7` `# diagnose test application fcnacd 8`	Check the FortiClient NAC daemon ZTNA and route cache.
`# diagnose wad worker policy list`	Display statistics associated with application gateway rules.

`# diagnose wad debug enable category all`
`# diagnose wad debug enable level verbose`
`# diagnose debug enable`
	Run real-time WAD debugs.

`# diagnose debug reset`	Reset debugs when completed

The WAD daemon handles proxy related processing. The FortiClient NAC daemon (fcnacd) handles FortiGate to EMS connectivity.

Troubleshooting usage and output

1. Verify the FortiGate to EMS connectivity and EMS certificate:

```
# diagnose endpoint fctems test-connectivity WIN10-EMS
Connection test was successful:

# execute fctems verify WIN10-EMS
Server certificate already verified.

# diagnose test application fcnacd 2
EMS context status:
FortiClient EMS number 1:
        name: WIN10-EMS confirmed: yes
        fetched-serial-number: FCTEMS0000109188
Websocket status: connected
```

2. If fcnacd does not report the proper status, run real-time fcnacd debugs:

```
# diagnose debug app fcnacd -1
# diagnose debug enable
```

3. Verify the following information about an endpoint:

- Network information
- Registration information
- Client certificate information
- Device information
- Vulnerability status
- Relative position with the FortiGate

```
# diagnose endpoint record list 10.6.30.214
Record #1:
                IP Address = 10.6.30.214
                MAC Address = 00:0c:29:ba:1e:61
                MAC list = 00:0c:29:ba:1e:61;00:0c:29:ba:1e:6b;
                VDOM = root (0)
                EMS serial number: FCTEMS8821001322
                EMS tenant id: 00000000000000000000000000000000
                Client cert SN: 17FF6595600A1AF53B87627AB4EBEDD032593E64
                Quarantined: no
                Online status: online
                Registration status: registered
                On-net status: on-net
                Gateway Interface: port2
                FortiClient version: 7.0.0
                AVDB version: 84.778
                FortiClient app signature version: 18.43
                FortiClient vulnerability scan engine version: 2.30
                FortiClient UID: 5FCFA3ECDE4D478C911D9232EC9299FD
                Host Name: ADPC
    …
                Number of Routes: (1)
                        Gateway Route #0:
                                - IP:10.1.100.214, MAC: 00:0c:29:ba:1e:6b, Indirect: no

```

4. Query the endpoint information, include security posture tags, by UID or IP address:

```
# diagnose endpoint lls-comm send ztna find-uid 5FCFA3ECDE4D478C911D9232EC9299FD
FCTEMS8821001322 00000000000000000000000000000000
UID: 5FCFA3ECDE4D478C911D9232EC9299FD
EMS Fabric ID: FCTEMS8821001322:00000000000000000000000000000000
        status code:ok
        Domain: qa.wangd.com
        User: user1
        Cert SN:17FF6595600A1AF53B87627AB4EBEDD032593E64
        EMS SN: FCTEMS8821001322
        Routes(1):
         - route[0]: IP=10.1.100.214, VDom=root
        Tags(3):
         - tag[0]: name=ZT_OS_WIN
         - tag[1]: name=all_registered_clients
         - tag[2]: name=Medium

# diagnose endpoint lls-comm send ztna find-ip-vdom 10.1.100.214 root
UID: 5FCFA3ECDE4D478C911D9232EC9299FD
        status code:ok
        Domain: qa.wangd.com
```

```
        User: user1
        Cert SN:17FF6595600A1AF53B87627AB4EBEDD032593E64
        EMS SN: FCTEMS8821001322
        Routes(1):
         - route[0]: IP=10.1.100.214, VDom=root
        Tags(3):
         - tag[0]: name=ZT_OS_WIN
         - tag[1]: name=all_registered_clients
         - tag[2]: name=Medium
```

5. Query endpoint information from WAD by UID or IP address:

```
# diagnose wad dev query-by uid 5FCFA3ECDE4D478C911D9232EC9299FD FCTEMS8821001322
00000000000000000000000000000000

6. List all the dynamic ZTNA IP and MAC addresses learned from EMS:

```
# diagnose firewall dynamic list
List all dynamic addresses:
FCTEMS0000109188_all_registered_clients: ID(51)
        ADDR(172.17.194.209)
        ADDR(192.168.40.8)
…
FCTEMS0000109188_Low: ID(78)
        ADDR(172.17.194.209)
        ADDR(192.168.40.8)
…
FCTEMS0000109188_Malicious-File-Detected: ID(190)
        ADDR(172.17.194.209)
        ADDR(192.168.40.8)
…
```

7. Check the FortiClient NAC daemon ZTNA and route cache:

```
# diagnose test application fcnacd 7
ZTNA Cache:
-uid 5FCFA3ECDE4D478C911D9232EC9299FD: { "tags": [ "ZT_OS_WIN", "all_registered_
clients", "Medium" ], "domain": "qa.wangd.com", "user_name": "user1", "client_cert_sn":
```

```
"17FF6595600A1AF53B87627AB4EBEDD032593E64", "owner": "FOSQA@qa.wangd.com", "gateway_
route_list": [ { "gateway_info": { "fgt_sn": "FG5H1E5819902474", "interface": "port2",

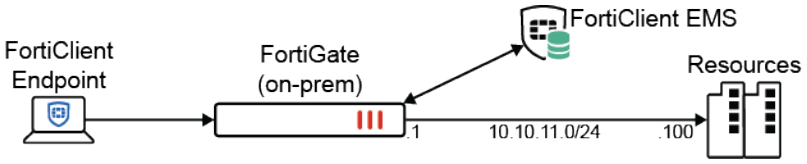
Always reset the debugs after using them:

```
# diagnose debug reset
```



ZTNA troubleshooting scenarios

This topic describes how to troubleshoot common FortiClient endpoint IP/MAC access control issues for the following topologies:

- ZTNA access control on page 1290
- IP/MAC based access control on page 1292

ZTNA access control

In this topology, FortiClient endpoints use an SSL encrypted connection to the FortiGate application gateway to access protected resources. FortiGate works with FortiClient EMS to use a combination of IP/MAC addresses and security posture tags to control FortiClient endpoint access to resources.

This section describes how to handle the following errors:

- Invalid ZTNA certificate on page 1291
- ZTNA policy mismatch on page 1291

Invalid ZTNA certificate

When FortiClient attempts to access a server protected by ZTNA, an *Invalid ZTNA certificate* error is shown. This error often appears when the serial number for the ZTNA certificate differs between the endpoint and the FortiGate.

1. Check the serial number for the ZTNA certificate on the endpoint and the FortiGate:
   a. On the endpoint, check the serial number for the certificate.
   b. On the FortiGate, check the serial number for the client certificate by running the following command:

   ```
   # diagnose endpoint record list
   ```
2. If the serial number for the ZTNA certificate differs between the endpoint and the FortiGate, and the serial number on the FortiGate is comprised of zeros, check the following:
   a. For FortiClient, make sure that the endpoint is running FortiClient 7.0 or later. FortiClient versions earlier than 7.0 do not support ZTNA.
   b. For FortiClient EMS, make sure that ZTNA is enabled. Check the profile on EMS and the endpoint's summary information.
   c. For licensing, make sure that you have a ZTNA agent license entitlement. Only some license types support ZTNA.
3. If the serial numbers still do not match, deregister FortiClient from EMS, and then connect FortiClient to EMS again to trigger a new certificate signing request.

ZTNA policy mismatch

In most cases, FortiGate denies incoming ZTNA requests because the endpoint FortiClient does not meet the tagging criteria configured in the ZTNA rule and is considered a policy mismatch.

1. On the FortiGate, look at the ZTNA event logs and the forwarded logs.
2. Run the following commands on the ZTNA server:

   ```
   # diagnose wad debug enable category policy
   # diagnose wad debug enable level verbose
   # diagnose debug enable
   ```

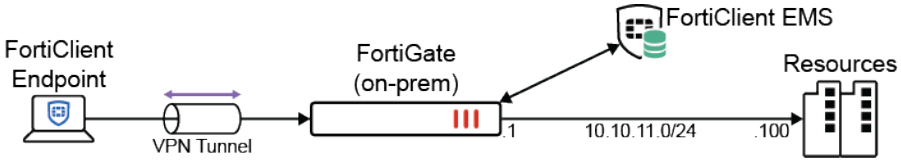
   The command output contains incoming ZTNA requests and the FortiGate process for matching the connection to a ZTNA rule.
3. Verify the zero trust tags for the endpoint:
   - On FortiClient, verify the applied tags. Click the avatar to view the zero trust tags.
   - On FortiClient EMS, verify the endpoint's tags. Go to the endpoint list and click the endpoint.

- On FortiGate, verify the tags using the following commands:
  - Display ZTNA cache data for all endpoints:

    ```
    # diagnose test application fcnacd 7
    ```

  - Display ZTNA cache data for an individual endpoint:

    ```
    # diagnose wad dev query-by uid <UID> <EMS S/N> <tenant ID>
    ```



4. If the tagging information differs between FortiGate and EMS, examine the EMS tag exchange communication between FortiGate and EMS by looking at the cmNotify and python logs in the debug diagnostics for EMS.

   For more information about FortiClient EMS diagnostics, see Generate Diagnostic Log in the FortiClient EMS Administration Guide.

IP/MAC based access control

In the following ZTNA topology, FortiClient endpoints use VPN to access resources. FortiGate works with FortiClient EMS to use a combination of IP/MAC addresses and security posture tags to control FortiClient endpoint access to resources.

For more information, see ZTNA IP MAC based access control example on page 1259.

Security posture tag information missing on the FortiGate

If the IP address for the FortiClient endpoint is not associated with a security posture tag on the FortiGate, a firewall policy mismatch occurs, and the FortiGate denies network access to the FortiClient endpoint.

The following workflow summarizes how FortiGate retrieves the IP address and tags for the FortiClient endpoint to help you better understand how to troubleshoot the situation:

1. FortiClient establishes a VPN connection to the FortiGate.
2. FortiGate uses the API to pass FortiClient's UUID and VPN IP address to FortiClient EMS.
3. FortiGate requests system information and tags from FortiClient based on the response from EMS.

Based on the workflow, start troubleshooting before the FortiClient endpoint attempts to establish a VPN connection to FortiGate. On FortiGate, run the following commands:

```
# diagnose debug application fcnacd -1
# diagnose debug console timestamp enable
# diagnose endpoint filter show-large-data yes
# diagnose debug enable
```

The following outputs illustrate how to examine the command output. The output can differ between environments. The outputs help illustrate how to understand the communication between FortiGate and FortiClient EMS.

In the following output, FortiGate's VPN daemon sends FortiClient's UUID and the VPN IP address to FortiClient EMS using the API. The NAC daemon makes the API call to send the details to FortiClient EMS:

```
2022-10-17 08:50:41 [fcems_call_vpn_client_gateway_call:1147] VPN act connect (UID:
3358095CFDCB414B9EDA49ADE79AF428, Interface: port1, IP: 10.212.134.200, VDom: root,

"""
```

The following example from the fcmNotify.log file on FortiClient EMS shows how FortiClient EMS interprets the information sent from FortiGate:

```
2022-10-26 11:59:37,817 DEBUG ems_logger 6 7 [VPN Gateway Details]: Request made with
params: {'is_snapshot': False, 'sn_list': ['FG10E0TB20903081', 'FG10E0TB20903034'], 'uid_
list': [{'uid': 'D997B2A7A78E4E6F832309FF97FC2215', 'vdom': 'root', 'interface': 'EXT',
'sn': 'FG10E0TB20903081', 'ip': '10.1.18.61', 'is_delete': False}]}.
2022-10-26 11:59:38,281 DEBUG ems_logger 6 7 [Sysinfo c44cc74b1185431491f71c133c097f00
Certificate user: FG10E0TB20903081]: Request with SN [FG10E0TB20903034,FG10E0TB20903081]
success. Returned 1 endpoints. uid_offset: D997B2A7A78E4E6F832309FF97FC2215, updated_after:
2022-10-26 15:59:37.8237471, is_final: True
2022-10-26 11:59:38,543 DEBUG ems_logger 6 7 [UID-Tags e6ecc42c058e48b2b71cf7d65ecd432c
Certificate user: FG10E0TB20903081]: Request with SN [FG10E0TB20903034,FG10E0TB20903081]
success. uid_offset: D997B2A7A78E4E6F832309FF97FC2215, updated_after: 2022-10-26
15:59:37.8227461, is_final: True
```

FortiGate uses the information from FortiClient EMS to make a targeted API call to FortiClient EMS to retrieve both system information and tag information (with the means of uid_offset and updated_after parameters) for the endpoint. The following is the API call to retrieve the tags from FortiClient EMS:

```
https://172.31.200.182/api/v1/report/fct/uid_tags?sn_list[]=FGVM02TM22018374&updated_
after=2022-10-17 15:59:37.8227461&uid_offset=3358095CFDCB414B9EDA49ADE79AF428
```

The following in an example of the API call and subsequent communication between FortiGate and FortiClient EMS to retrieve tags for the FortiClient endpoint IP address:

```
2022-10-17 08:50:42 [ec_ez_worker_base_prep_resolver:373] Outgoing interface index 0 for 2
(FortiClientEMS).
2022-10-17 08:50:42 [ec_ez_worker_prep_data_url:98] request (26):

Other useful CLI commands

Output the JSON-formatted list of FortiGate interfaces (gateways) with IP and MAC addresses. This is the list that FortiGate sends to EMS so that EMS can identify the endpoints that are directly connected to the firewall:

```
# diagnose endpoint fctems json gateway-mac-request
```

Makes EMS execute API calls to the EMS API endpoints on demand:

```
# diagnose test application fcnacd 5
```

Send the gateway list to EMS on demand. It could be useful to execute `diagnose test application fcnacd 5` right after command during troubleshooting, as EMS will have an updated list of firewall interfaces:

```
# diagnose test application fcnacd 99
```

For more commands, see ZTNA troubleshooting and debugging commands on page 1285.

Policy and Objects

This section contains topics on configuring policies and traffic shaping:

- Policies on page 1295
- Address objects on page 1427
- Protocol options on page 1464
- Traffic shaping on page 1469
- Internet Services on page 1531

Policies

The firewall policy is the axis around which most features of the FortiGate revolve. Many firewall settings end up relating to or being associated with the firewall policies and the traffic they govern. Any traffic going through a FortiGate has to be associated with a policy. These policies are essentially discrete compartmentalized sets of instructions that control the traffic flow going through the firewall. These instructions control where the traffic goes, how it is processed, if it is processed, and whether or not it is allowed to pass through the FortiGate.

When the firewall receives a connection packet, it analyzes the source address, destination address, and service (by port number). It also registers the incoming interface, the outgoing interface it needs to use, and the time of day. Using this information, the FortiGate firewall attempts to locate a security policy that matches the packet. If a policy matches the parameters, then the FortiGate takes the required action for that policy. If it is *Accept*, the traffic is allowed to proceed to the next step. If the action is *Deny* or a match cannot be found, the traffic is not allowed to proceed.

The two basic actions at the initial connection are either *Accept* or *Deny*:

- If the action is *Accept*, the policy permits communication sessions. There may be other packet processing instructions, such as requiring authentication to use the policy or restrictions on the source and destination of the traffic.
- If the action is *Deny*, the policy blocks communication sessions, and you can optionally log the denied traffic. If no security policy matches the traffic, the packets are dropped. A *Deny* security policy is needed when it is required to log the denied traffic, also called *violation traffic*.

One other action can be associated with the policy:

- *IPsec*: this is an *Accept* action that is specifically for IPsec VPNs.

Each field in a firewall policy that accepts multiple inputs, such as srcaddr and dstaddr, can accept as many inputs as there are unique objects created. The maximum number of objects depends on the model. See the Maximum Values Table for more details.

The following topics provide information on the available types of policies and configuration instructions:

- Firewall policy on page 1296
- NGFW policy on page 1313
- Local-in policy on page 1329

- DoS policy on page 1333
- Access control lists on page 1341
- Interface policies on page 1342

The following topics provide instructions on configuring policies:

- Source NAT on page 1342
- Destination NAT on page 1360
- Examples and policy actions on page 1384

Firewall policy

The firewall policy is the axis around which most of the other features of the FortiGate firewall revolve. A large portion of the settings in the firewall at some point will end up relating to or being associated with the firewall policies and the traffic that they govern. Any traffic going through a FortiGate unit has to be associated with a policy. These policies are essentially discrete compartmentalized sets of instructions that control the traffic flow going through the firewall. These instructions control where the traffic goes, how it's processed, if it's processed, and even whether or not it's allowed to pass through the FortiGate.

The following topics provide information on the firewall policy and configuration:

- Firewall policy parameters on page 1296
- Configurations in the GUI on page 1297
- Configurations in the CLI on page 1302
- Policy views on page 1307
- Policy lookup on page 1312

Firewall policy parameters

For traffic to flow through the FortiGate firewall, there must be a policy that matches its parameters:

- Incoming interface(s)
- Outgoing interface(s)
- Source address(es)
- User(s) identity
- Destination address(es)
- Internet service(s)
- Schedule
- Service

Traffic parameters are checked against the configured policies for a match. If the parameters do not match any configured policies, the traffic is denied.

Traffic flow initiated from each direction requires a policy, that is, if sessions can be initiated from both directions, each direction requires a policy.

Just because packets can go from point A to point B on port X does not mean that the traffic can flow from point B to point A on port X. A policy must be configured for each direction.

When designing a policy, there is often reference to the traffic flow, but most communication is two-way so trying to determine the direction of the flow might be confusing. If traffic is HTTP web traffic, the user sends a request to the

website, but most of the traffic flow will be coming from the website to the user or in both directions? For the purposes of determining the direction for a policy, the important factor is the direction of the initiating communication. The user is sending a request to the website, so this is the initial communication; the website is responding so the traffic is from the user's network to the Internet.

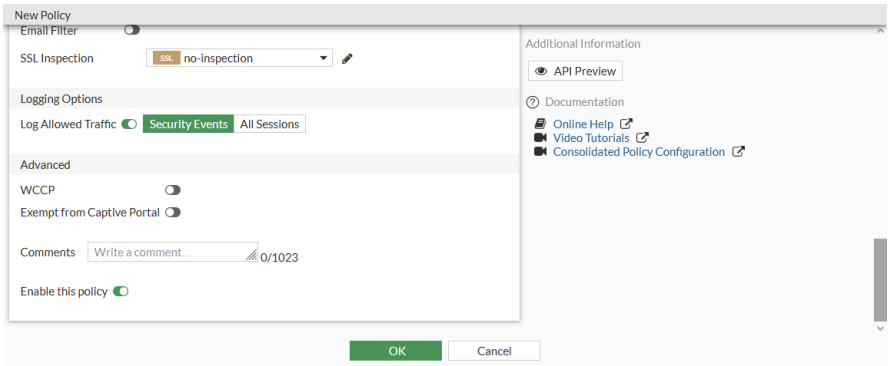
FortiOS does not perform a reverse-path check on reply traffic that matches an allowed session based on the IP tuple. The request traffic can be sent on one interface and the reply traffic could return on another interface.

Configurations in the GUI

Firewall policies can be created in the GUI by configuring the necessary parameters.

Incoming interface(s)	This is the interface or interfaces by which the traffic is first connected to the FortiGate unit. The exception being traffic that the FortiGate generates itself. This is not limited to the physical Ethernet ports found on the device. The incoming interface can also be a logical or virtual interface such as a VPN tunnel, a Virtual WAN link, or a wireless interface.
Outgoing interface(s)	This is the interface or interfaces used by traffic leaving a port once it has been processed by the firewall. Similar to incoming interfaces, it is not limited to only physical interfaces.
Source address(es)	The addresses that a policy can receive traffic from can be wide open or tightly controlled. For a public web server that the world at large should be able to access, the best choice will be *all*. If the destination is a private web server that only the branch offices of a company should be able to access, or a list of internal computers that are the only ones allowed to access an external resource, then a group of preconfigured addresses is the better strategy
User(s) identity	This parameter is based on a user identity that can be from a number of authentication authorities. It will be an account or group that has been set up in advance that can be selected from the drop down menu. The exception to this is the feature that allows the importing of LDAP Users. When the feature is used, a small wizard window will appear to guide the user through the setup. The caveat is that the LDAP server object in the *User & Authentication* > *LDAP Servers* section has to be already configured to allow the use of this import feature.
Destination address(es)	In the same way that the source address may need to be limited, the destination address can be used as a traffic filter. When the traffic is destined for internal resources, the specific address of the resource can be defined to better protect the other resources on the network. One of the specialized destination address options is to use a Virtual IP address. If the destination address doesn't need to be internal, you can define policies that are only for connecting to specific addresses on the Internet.
Internet service(s)	In this context, an Internet service is a combination of one or more addresses and one or more services associated with a service found on the Internet such as an update service for software.

Schedule	The time frame that is applied to the policy. This can be something as simple as a time range that the sessions are allowed to start, such as between 8:00 am and 5:00 pm. Something more complex like business hours that include a break for lunch and time of the session's initiation may need a schedule group because it will require multiple time ranges to make up the schedule.
Service	The services chosen represent the TCP/IP suite port numbers that will most commonly be used to transport the named protocols or groups of protocols. This is different than *Application Control* which looks more closely at the packets to determine the actual protocol used to create them. A case where either side can initiate the communication, like between two internal interfaces on the FortiGate unit, would be a more likely situation to require a policy for each direction.

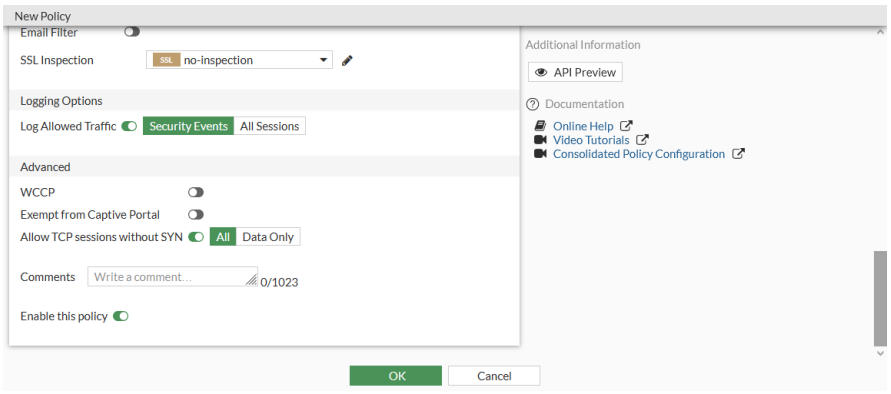


Enabling advanced policy options in the GUI

Advanced policy options can be enabled so that you can configure the options in the GUI.

To enable advanced policy options:

```
config system settings
    set gui-advanced-policy enable
end
```



Advanced policy options are now available when creating or editing a policy in the GUI:

To enable configuring TCP sessions without SYN:

```
config system settings
    set tcp-session-without-syn enable
end
```

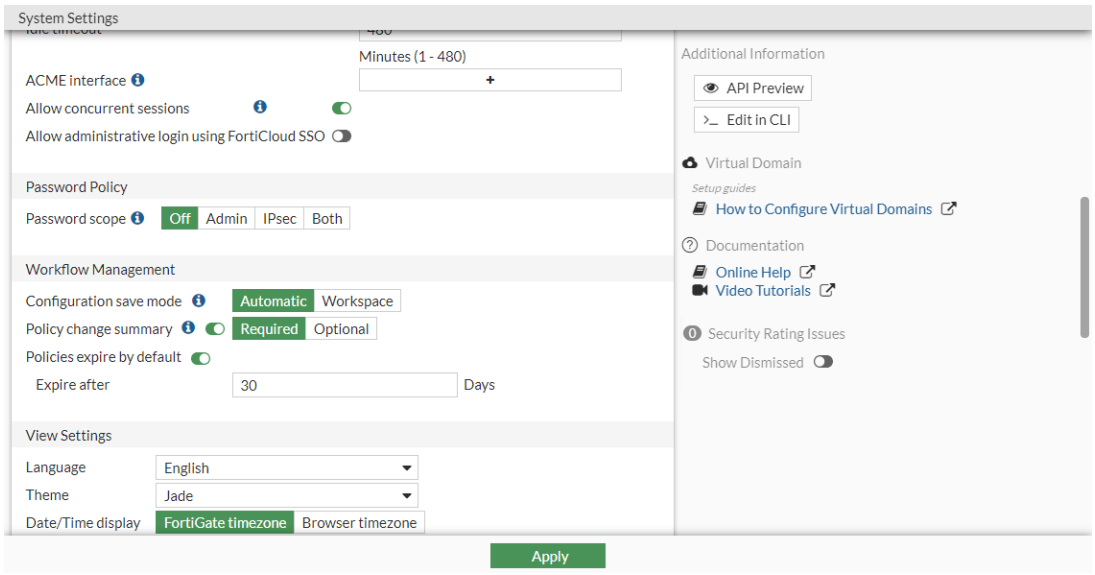
TCP sessions without SYN can now be configured when creating or editing a policy in the GUI:

Add Policy change summary and Policy expiration to Workflow Management

Two options, *Policy change summary* and *Policy expiration*, are included in *Workflow Management*. *Policy change summary* enforces an audit trail for changes to firewall policies. *Policy expiration* allows administrators to set a date for the firewall policy to be disabled.

There are three states for the *Policy change summary*:

- *Disable*: users will not be prompted to add a summary when editing a policy.
- *Required*: the *Policy change summary* will be enabled and will require users to add a summary when editing or creating a firewall policy.
- *Optional*: the *Policy change summary* will be enabled but users can leave the summary empty, if preferred, when editing or creating a firewall policy.

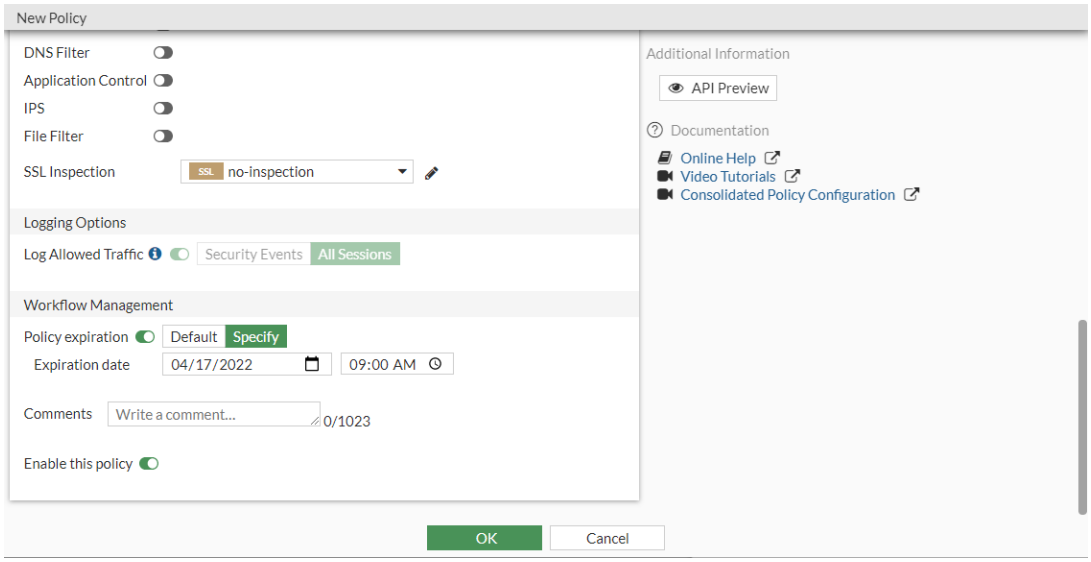


There are three states for *Policy expiration*:

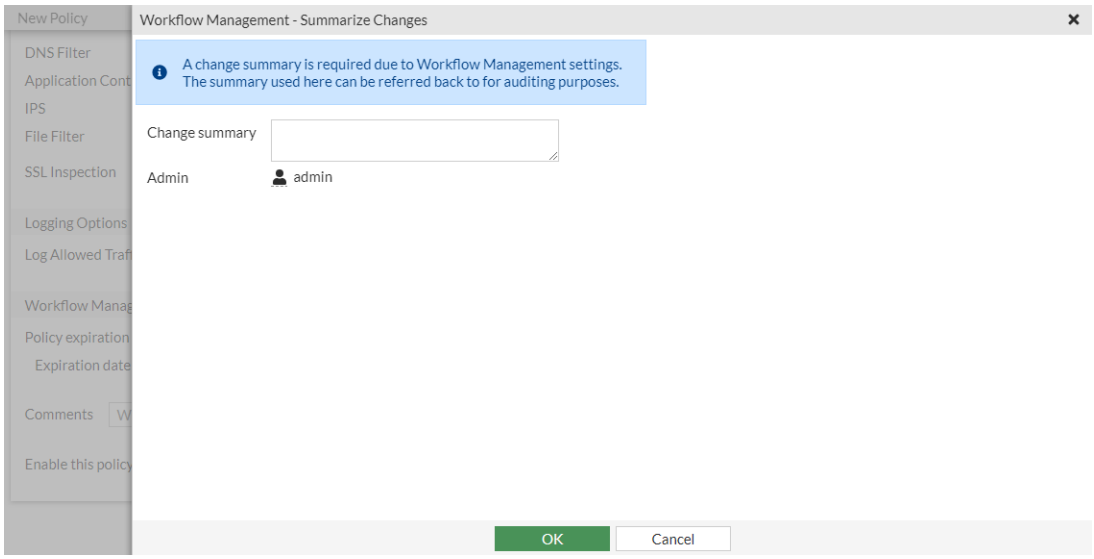
- *Disable*: the firewall policy will not expire. This is the default setting for *Policy expiration*.
- *Default*: the firewall policy will expire after the default number of days.
- *Specify*: the firewall policy will expire at a set date and time.

The default value for *Policy expiration* is 30 days. This number can be changed in the CLI or in *System* > *Settings* in the GUI to any value between zero and 365 days. If the default value is set to zero, the *Default* state will disable the *Policy expiration*.

To configure the firewall policy change summary and default expiration in the GUI:



1. Go to *System* > *Feature Visibility*.
2. Enable *Workflow Management*.
3. Click *Apply*.
4. Go to *System* > *Settings*.
5. In the *Workflow Management* section, set *Policy change summary* to *Required*. *Policies expire by default* is enabled by default with an *Expire after* value of *30*.



6. Click *Apply*.

To configure firewall policy expiration in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Name the policy and configure the necessary parameters.
3. Set *Policy expiration* to *Specify*. The *Expiration date* fields appears with the current date and time.

4. Select the date and time for the policy to expire from the *Expiration date* fields.
5. Click *OK*. The *Workflow Management - Summarize Changes* pane opens.

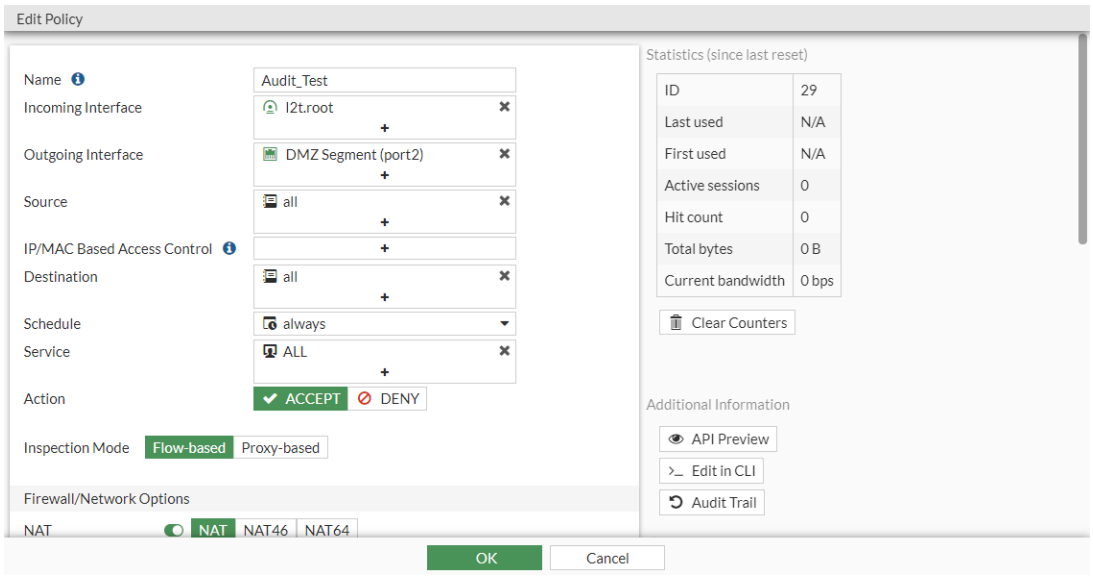
6. In the *Change summary* field, enter details about the changes made to the policy. These details can be referred to later for auditing purposes.
7. Click *OK*.

To configure the firewall policy change summary in the CLI:

```
config system settings
    set gui-enforce-change-summary {disable | require | optional}
end
```

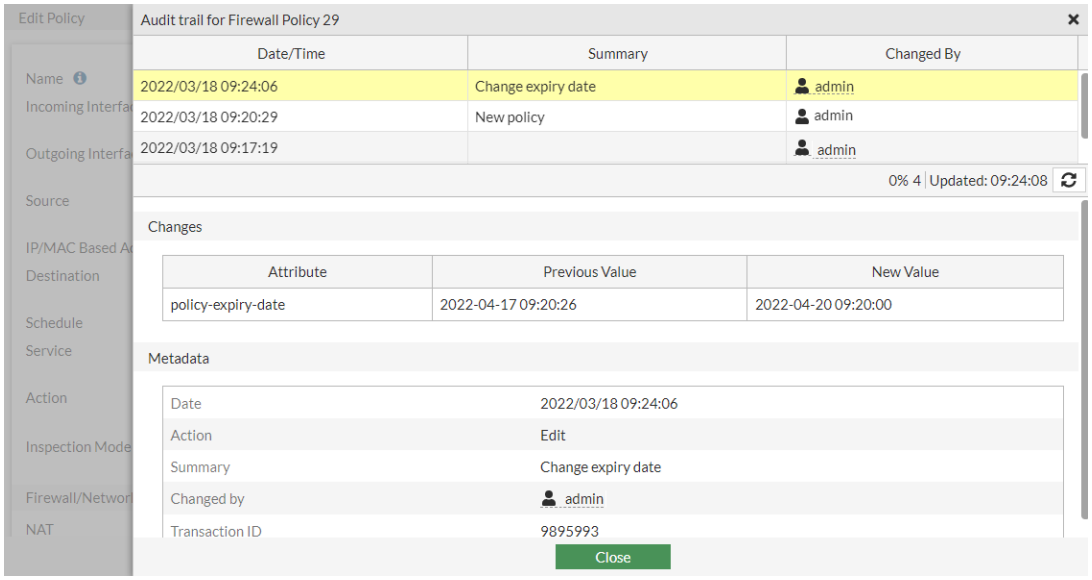
To configure the policy expiration default value in the CLI:

```
config system settings
    set default-policy-expiry-days <integer>
end
```



To configure firewall policy expiration in the CLI:

```
config firewall policy
    edit <id>
        set policy-expiry {enable | disable}
        set policy-expiry-date <YYYY-MM-DD HH:MM:SS>
    next
end
```



Policy change summaries are used to track changes made to a firewall policy. The *Audit trail* allow users to review the policy change summaries, including the date and time of the change and which user made the change.

To review the audit trail in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Select the policy you want to review and click *Edit*.

3. In the right-side banner, click *Audit Trail*. The *Audit trail for Firewall Policy* pane opens and displays the policy change summaries for the selected policy.

4. Select an entry to review the details of the change made.
5. When you are done reviewing the *Audit Trail*, click *Close*.
6. Click *Cancel* to exit the *Edit Policy* page.

Configurations in the CLI

Firewall policies can be created in the CLI by configuring the necessary parameters. See Configurations in the GUI on page 1297 for more information on the various parameters.

Parameter	Definition
srcintf	Incoming (ingress) interface.
dstintf	Outgoing (egress) interface.
srcaddr	Source IPv4 address and address group names.
dstaddr	Destination IPv4 address and address group names.
internet-service	Enable/disable use of Internet Services for this policy. If enabled, destination address and service are not used.
schedule	Schedule name.
service	Service and service group names.
anti-replay	Enable/disable checking of TCP flags per policy.
match-vip	Enable/disable matching of VIPs when used in a policy with a deny action.
auto-asic-offload	Enable/disable hardware acceleration. Available on select FortiGate models with Secure Processing Unit (SPU) hardware only.
tcp-mss-sender	Sender TCP maximum segment size (MSS).
tcp-mss-receiver	Receiver TCP maximum segment size (MSS).
session-ttl	Time-to-live (TTL) in seconds for session accepted by this policy.

Firewall anti-replay option per policy

When the global anti-replay option is disabled, the FortiGate does not check TCP flags in packets. The per policy anti-replay option overrides the global setting. This allows you to control whether or not TCP flags are checked per policy.

To enable the anti-replay option so TCP flags are checked using the CLI:

```
config firewall policy
    edit 1
        set name "policyid-1"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set anti-replay enable
        set logtraffic all
        set nat enable
    next
end
```

Deny matching with a policy with a virtual IP applied

Preventing hosts with specific source addresses from accessing a server behind the FortiGate may be required in some cases. For this scenario, you should have previously configured a firewall policy with a virtual IP (VIP) object applied to it

to allow such access. See Destination NAT on page 1360 for details.

When denying traffic destined for a typical firewall policy without a VIP applied, you would simply configure a new firewall policy with an action of `deny` and with specific source addresses above the firewall policy that you want to prevent these hosts from accessing. However, the FortiGate matches firewall policies with VIPs applied differently than typical firewall policies. Policies with VIPs applied have priority over typical firewall policies.

Therefore, to block specific source traffic destined for a firewall policy specified with an action of `accept` and with a VIP applied, you should configure `set match-vip enable` on the firewall policy with a `deny` action that has been configured to match traffic before the firewall policy with the VIP applied. By default, new `deny` action firewall policies have `match-vip` enabled.

If the policy action is set to `accept`, `match-vip` cannot be enabled.

To block VIP traffic in a deny policy:

```
config firewall policy
    edit 1
        set name "deny-policy-1"
        set srcintf "wan1"
        set dstintf "lan1"
        set srcaddr "src-hosts-to-deny-access"
        set dstaddr "all"
        set action "deny"
        set schedule "always"
        set service "all"
        set match-vip enable
    next
    edit 2
        set name "vip-policy-1"
        set srcintf "wan1"
        set dstintf "lan1"
        set srcaddr "all"
        set dstaddr "vip-object-1"
        set action "accept"
        set schedule "always"
        set service "ALL"
    next
end
```

Alternatively, to block access to a firewall policy with a VIP applied, you can configure a new VIP object configured with `set src-filter <range>`. Configure a new firewall policy with a `deny` action and with this new VIP applied, and then configure this policy to match traffic before the firewall policy with the same VIP applied with an action of `accept`. In this case, the firewall policy can simply have `set match-vip disable`.

To specify a VIP with source addresses specified with a deny policy:

```
config firewall vip
    edit "vip-with-srcaddr-to-deny"
        set extip "10.1.100.199"
        set extintf "wan1"
        set mappedip "172.16.200.55"
```

```
        set src-filter "1.1.1.1/24"
    next
end
config firewall policy
    edit 3
        set name "deny-policy-3"
        set srcintf "wan1"
        set dstintf "lan1"
        set srcaddr "all"
        set dstaddr "vip-with-srcaddr-to-deny"
        set action "deny"
        set match-vip disable
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "vip-policy-1"
        set srcintf "wan1"
        set dstintf "lan1"
        set srcaddr "all"
        set dstaddr "vip-object-1"
        set action "accept"
        set match-vip disable
        set schedule "always"
        set service "ALL"
    next
end
```

Hardware acceleration

Hardware acceleration is supported on select FortiGate devices and is enabled by default on all firewall policies to ensure optimal performance when processing network traffic traversing the FortiGate. See the Hardware Acceleration Reference Manual for details.

Typically, hardware acceleration on a specific firewall policy is disabled for one of two purposes:

- To allow CLI commands such as the packet sniffer and debug flow to display all traffic matching the policy since traffic offloaded by SPU hardware on a FortiGate device is not visible by those CLI tools.
- To troubleshoot any possible issues arising by using hardware acceleration.

To disable hardware acceleration in an IPv4 firewall policy:

```
config firewall policy
    edit 1
        set auto-asic-offload disable
    next
end
```

To disable hardware acceleration in an IPv6 firewall policy:

```
config firewall policy6
    edit 1
        set auto-asic-offload disable
    next
end
```

To disable hardware acceleration in a multicast firewall policy:

```
config firewall multicast-policy
    edit 1
        set auto-asic-offload disable
    next
end
```

TCP Maximum Segment Size (MSS)

The TCP maximum segment size (MSS) is the maximum amount of data that can be sent in a TCP segment. The MSS is the MTU size of the interface minus the 20 byte IP header and 20 byte TCP header. By reducing the TCP MSS, you can effectively reduce the MTU size of the packet.

The TCP MSS can be configured in a firewall policy, or directly on an interface. See Interface MTU packet size on page 176 for details on configuring TCP MSS directly on an interface.

To configure TCP MSS in a firewall policy:

```
config firewall policy
    edit <policy ID>
        set srcintf "internal"
        set dstintf "wan1"
        set srcaddr "10.10.10.6"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set tcp-mss-sender 1448
        set tcp-mss-receiver 1448
    next
end
```

Adjusting session time-to-live (TTL)

A session is a communication channel between two devices or applications across the network. Sessions allow FortiOS to inspect and act on a sequential group of packets in a session all at once instead of inspecting each packet individually. Each session has an entry in the session table that includes important information about the session.

The session time-to-live (TTL) parameter determines how long a session of a particular protocol such as TCP, UDP, or ICMP remains in the session table. To ensure proper operation of some devices or applications, the session TTL parameter may need to be increased or decreased to allow sessions to remain active in the session table for a longer or shorter duration, respectively.

To configure a modified session TTL in a firewall policy:

```
config firewall policy
    edit <policy ID>
        set srcintf "internal"
        set dstintf "wan1"
        set srcaddr "10.10.10.6"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set session-ttl 1800
```

```
    next
end
```

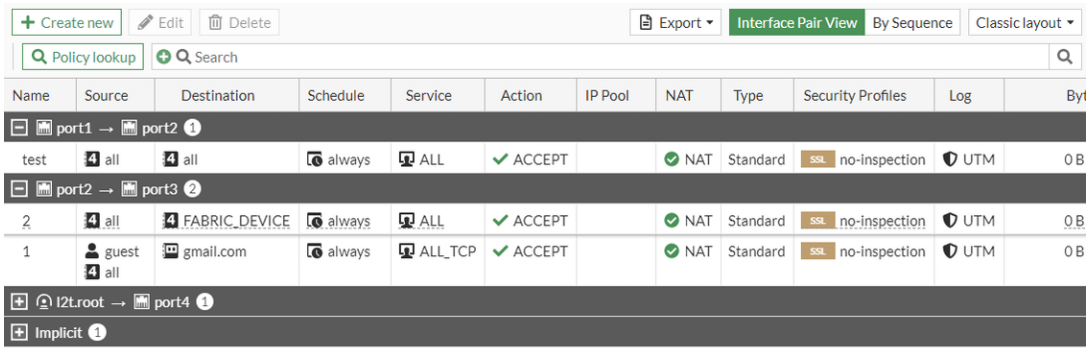
The session TTL can be set to zero or `never` to ensure a session never times out. See No session timeout on page 1406 for details.

Session TTL should only be set to zero or `never` after careful consideration of:

- The connected device's or application's requirements for sessions to always stay alive
- The expectation that a connected device or application will use the same session determined by traffic using a fixed source port, fixed destination port, fixed source IP address, and fixed destination IP address.

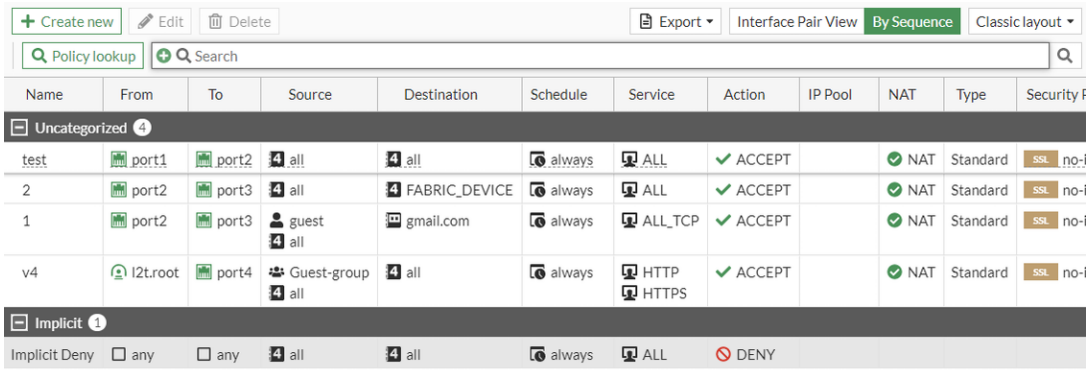
When session TTL is set to zero or `never`, then sessions will not be cleared from the session table or expire after a specified time unless the CLI commands `diagnose system session filter <filter>` and `diagnose system session clear` are used.

If this setting is used in the case when traffic through a firewall policy can generate numerous unique sessions, then this may have unintended consequences to the FortiGate's memory usage and performance due to the session table constantly growing and not clearing out idle sessions.



To disable session TTL in a firewall policy:

```
config firewall policy
    edit <policy ID>
        set srcintf "internal"
        set dstintf "wan1"
        set srcaddr "10.10.10.6"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set session-ttl never
    next
end
```

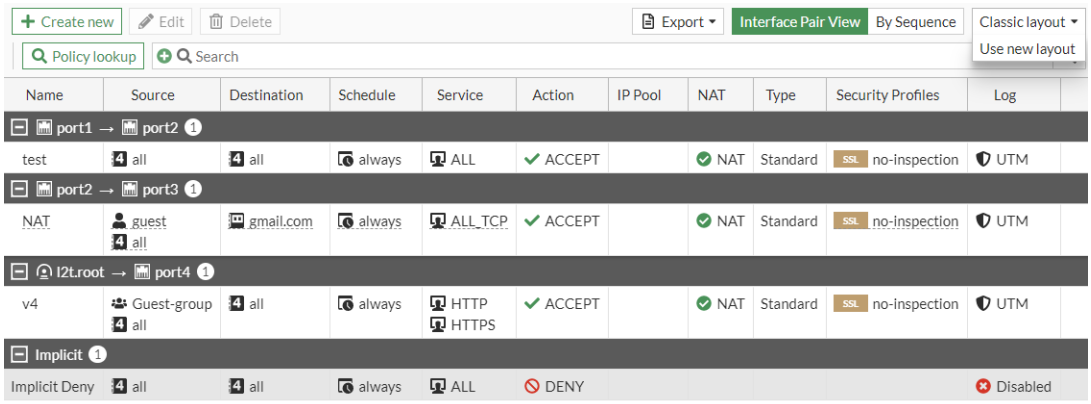


Policy views

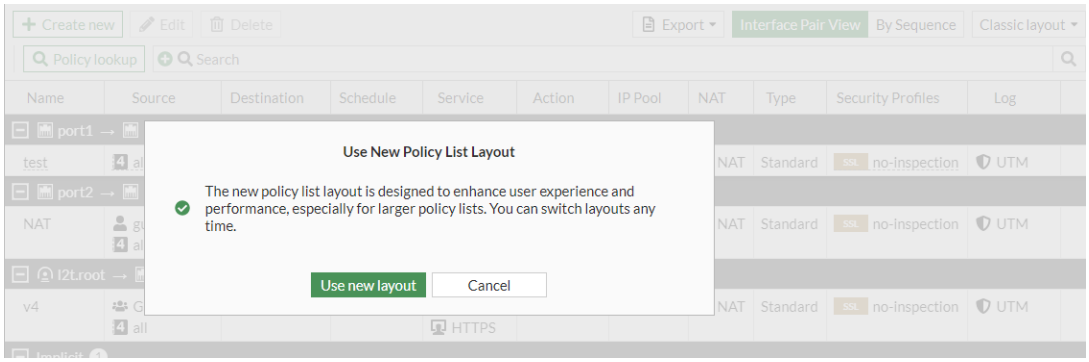
In *Policy & Objects* policy list pages, there are two policy views: *Interface Pair View* and *By Sequence* view.

Interface Pair View displays the policies in the order that they are checked for matching traffic, grouped by the pairs of incoming and outgoing interfaces in collapsible sections. The *Interface Pair View* can be used when a policy is configured with multiple interfaces.

By Sequence displays policies in the order that they are checked for matching traffic without any grouping.

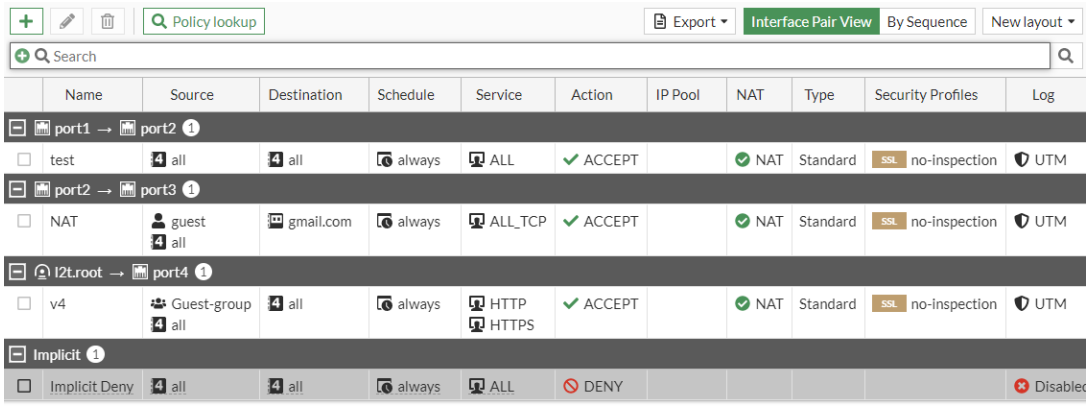


New layout for firewall policies



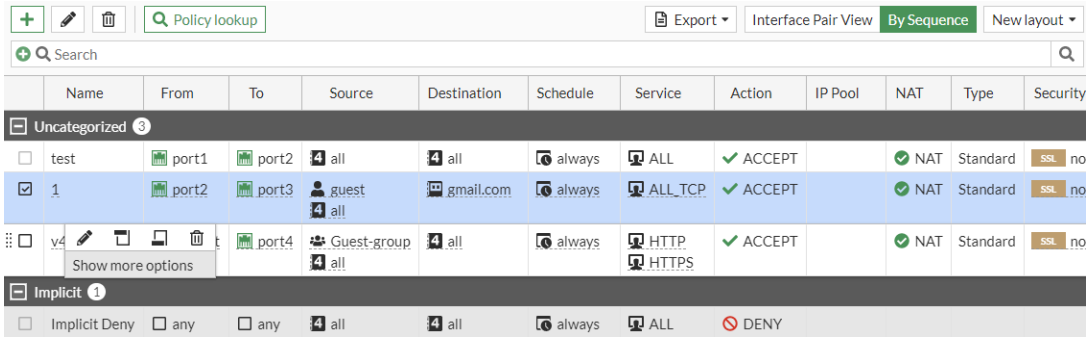
A new layout is available for the policy list with the option to alternate between the new layout and the old layout. To switch between the *Classic layout* and *New layout*, select the style from the dropdown menu.

To change from the classic layout to the new layout:

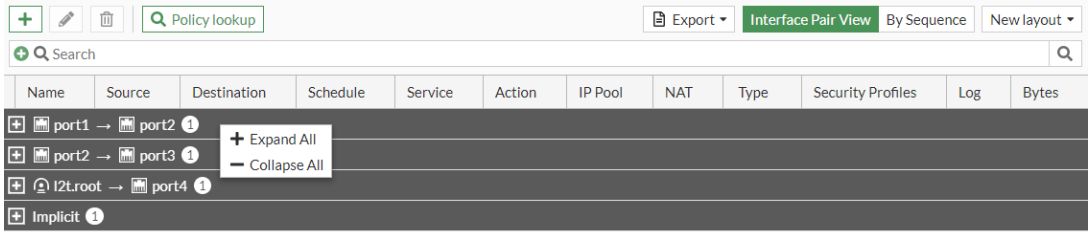


1. Go to *Policy & Objects* > *Firewall Policy*.
2. Select the *Classic layout* dropdown menu.

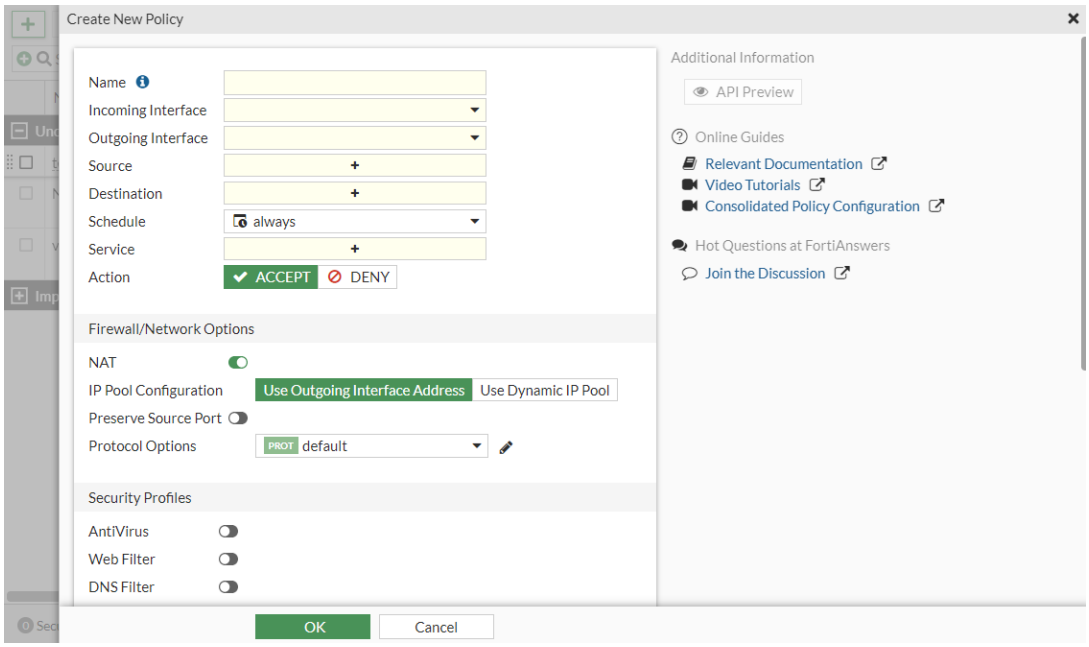
3. Select *Use new layout*. A confirmation message is displayed.



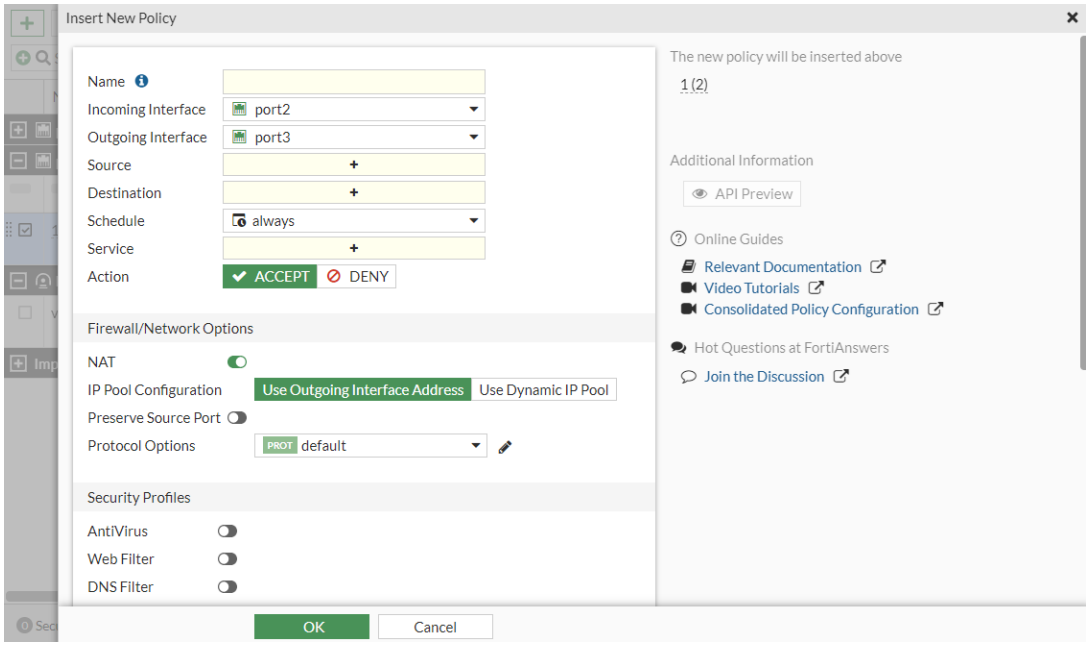
4. Click *Use new layout*. The new layout is displayed.



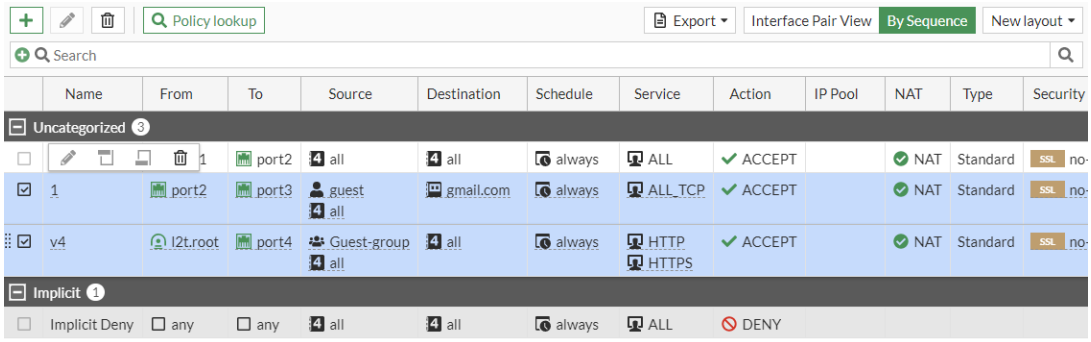
The *New layout* includes several features to enhance user experience when using the *Policy & Objects* > *Firewall Policy* page:



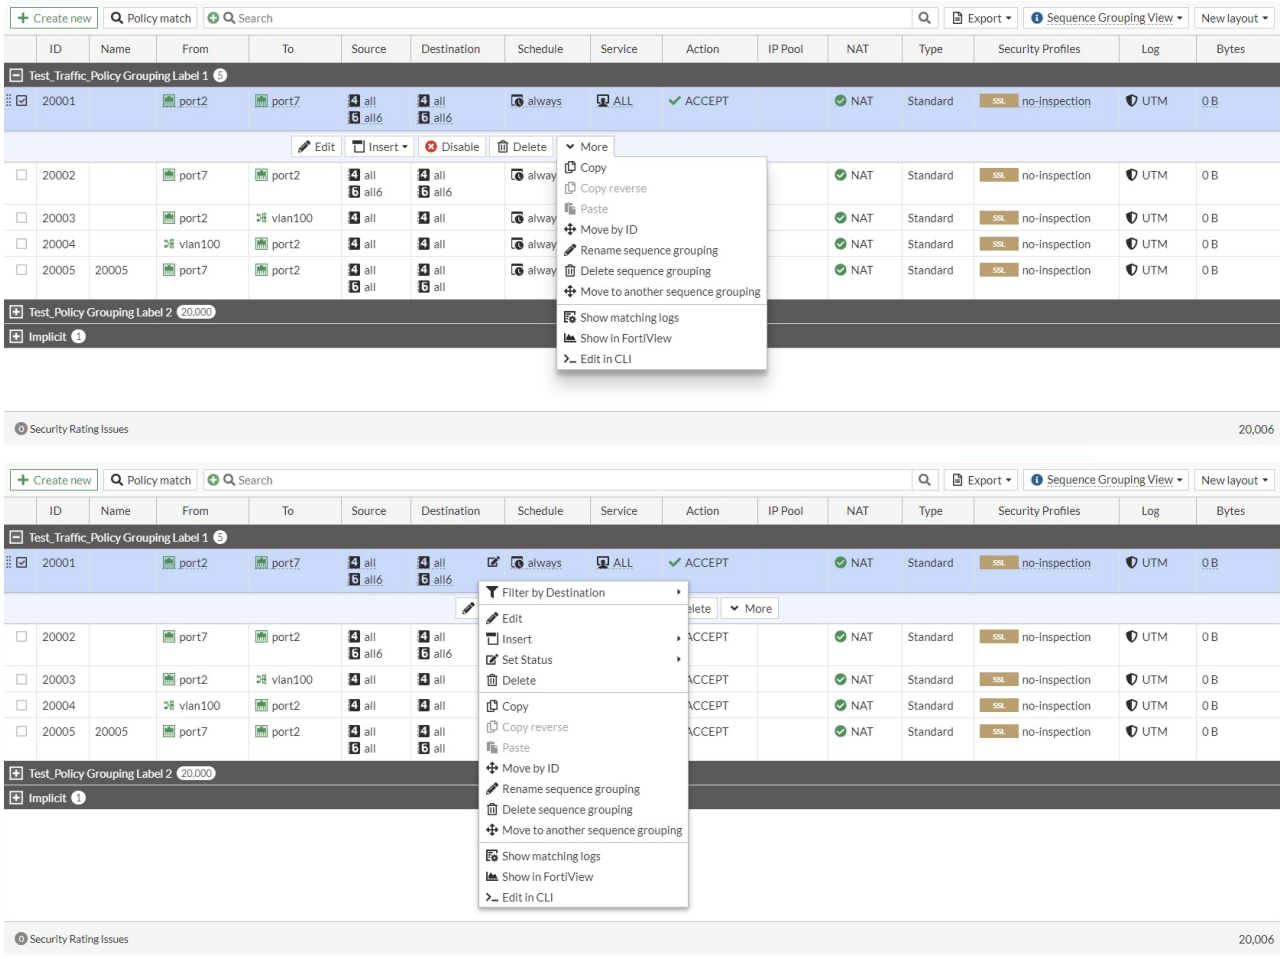
- The create, edit, and delete buttons are identified through icons instead of words. Selecting a policy also displays an inline menu with options to edit, delete, and insert policies, with the option to *Show more options* when hovered over.



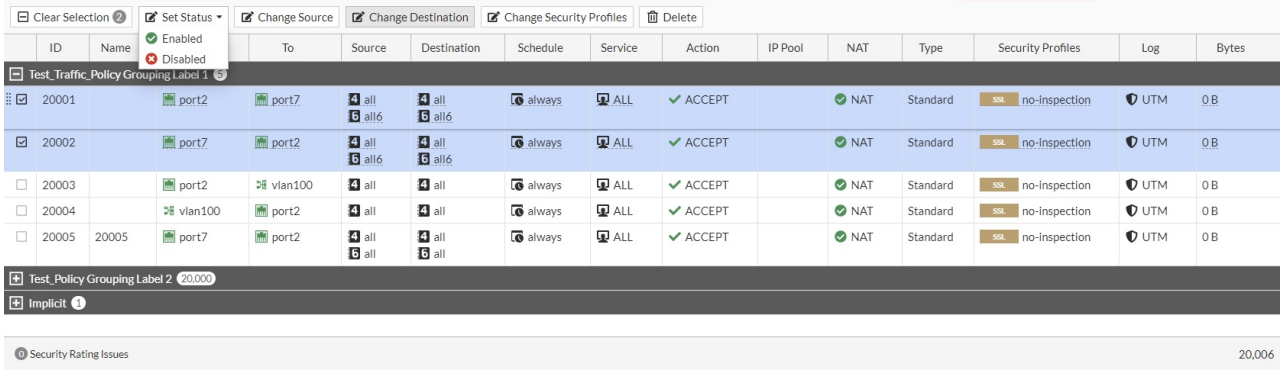
- Right-click in *Interface Pair View* to *Expand All* or *Collapse All* sections.



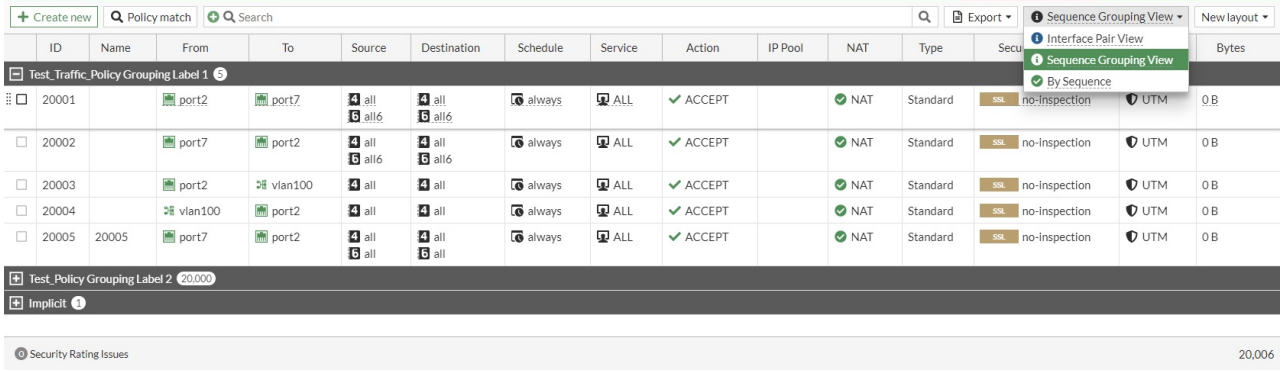
- A pane is used to create, edit, and insert policies instead of a separate page.



- When a policy is inserted in *Interface Pair View*, the *Incoming Interface* and *Destination Interface* fields will be automatically filled. You can confirm the location of the new policy in the right-side gutter before clicking *OK* to insert the policy.



- Multiple policies can be selected at once to efficiently work with a large number of policies.



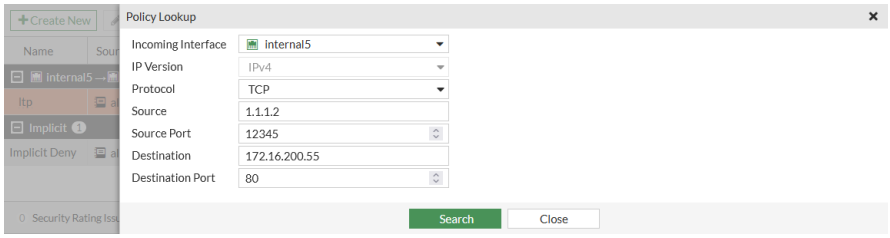
- When a single policy is selected, an inline menu opens below the row. The *More* dropdown menu includes the same expanded list of options that are available in the right-click menu.

- When multiple policies are selected, the top menu bar changes to show buttons that are applicable to the multiple selections.

- The view selector drop-down includes three options: *Interface Pair View*, *Sequence Grouping View*, and *By Sequence*. For large policy tables (thousands of policies), a tooltip will specify that the *By Sequence* view will load the fastest.

Policy lookup

Firewall policy lookup is based on the `Source_interfaces/Protocol/Source_Address/Destination_Address` that matches the `source-port` and `dst-port` of the protocol. Use this tool to find out which policy matches specific traffic from a number of policies. After completing the lookup, the matching firewall policy is highlighted on the policy list page.



The *Policy Lookup* tool has the following requirements:

- Transparent mode does not support policy lookup function.
- When executing the policy lookup, you need to confirm whether the relevant route required for the policy work already exists.

Sample configuration

This example uses the TCP protocol to show how policy lookup works:

1. On a *Policy & Objects* policy list page, click *Policy Lookup* and enter the traffic parameters.

2. Click *Search* to display the policy lookup results.

NGFW policy

Profile-based next-generation firewall (NGFW) mode is the traditional mode where you create a profile (antivirus, web filter, and so on) and then apply the profile to a policy.

In policy-based NGFW mode, you allow applications and URL categories to be used directly in security policies, without requiring web filter or application control profiles. However, it is possible to select and apply web filter URL categories and groups.

In policy-based mode:

- Central NAT is always enabled. If no Central SNAT policy exists, you must create one. See Central SNAT on page 1350 for more information.
- Pre-match rules are defined separately from security policies, and define broader rules, such as SSL inspection and user authentication.
- The IPsec wizard is not supported.

If your FortiGate operates in NAT mode, rather than enabling source NAT in individual NGFW policies, go to *Policy & Objects* > *Central SNAT* and add source NAT policies that apply to all matching traffic. In many cases, you may only need one SNAT policy for each interface pair.

The NGFW mode is set per VDOM, and it is only available when the VDOM inspection mode is flow-based. You can operate your entire FortiGate or individual VDOMs in NGFW policy mode. The application default port can be set as a service port in the NGFW mode using the `default-app-port-as-service` option.

In NGFW mode, administrators can configure a security policy in learn mode to monitor traffic. See Learn mode in security policies in NGFW mode on page 1324 for more information.

Enabling policy-based NGFW mode

To enable policy-based NGFW mode without VDOMs in the GUI:

1. Go to *System* > *Settings*.
2. In *NGFW Mode*, select *Policy-based*.
3. Click *Apply*.

To enable policy-based NGFW mode with VDOMs in the GUI:

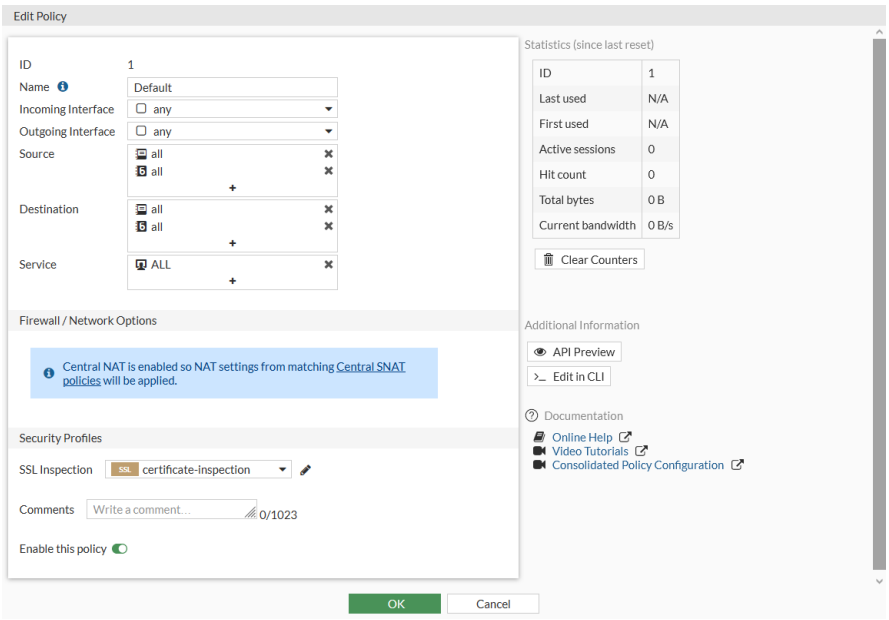
1. Go to *System* > *VDOM* .
2. Double-click a VDOM to edit the settings.

3. In *NGFW Mode*, select *Policy-based*.
4. Click *OK*.

To enable policy-based NGFW mode without VDOMs in the CLI:

```
config system settings
    set ngfw-mode policy-based
end
```

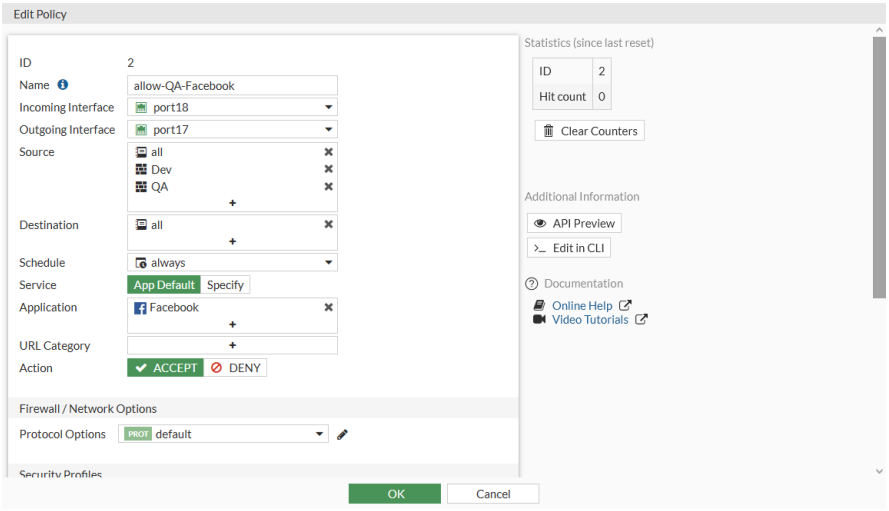
To enable policy-based NGFW mode with VDOMs in the CLI:



```
config vdom
    edit <vdom>
        config system settings
            set ngfw-mode policy-based
        end
    next
end
```

Security and SSL Inspection & Authentication policies

Security policies work with SSL Inspection & Authentication policies to inspect traffic. To allow traffic from a specific user or user group, both Security and SSL Inspection & Authentication policies must be configured. A default SSL Inspection & Authentication policy with the certificate-inspection SSL Inspection profile is preconfigured. Traffic will match the SSL Inspection & Authentication policy first. If the traffic is allowed, packets are sent to the IPS engine for application, URL category, user, and user group match, and then, if enabled, UTM inspection (antivirus, IPS, DLP, and email filter) is performed.



SSL Inspection & Authentication policies are used to pre-match traffic before sending the packets to the IPS engine:

- There are no schedule or action options; traffic matching the policy is always redirected to the IPS engine.
- SSL inspection, formerly configured in the VDOM settings, is configured in an SSL Inspection & Authentication policy.
- Users and user groups that require authentication must be configured in an SSL Inspection & Authentication policy.

Security policies work with SSL Inspection & Authentication policies to inspect traffic:

- Applications and URL categories can be configured directly in the policy.
- Users and user groups that require authentication must also be configured in a security policy.
- The available actions are *Accept* or *Deny*.
- The *Service* option can be used to enforce the standard port for the selected applications.
- UTM inspection is configured in a security policy.

To configure policies for Facebook and Gmail access in the CLI:

1. Configure an SSL Inspection & Authentication policy:

```
config firewall policy
    edit 1
        set name "Policy-1"
        set srcintf "port18"
```

```
        set dstintf "port17"
        set srcaddr "all"
        set dstaddr "all"
        set service "ALL"
        set ssl-ssh-profile "new-deep-inspection"
        set groups "Dev" "HR" "QA" "SYS"
    next
end
```

2. Configure security policies:

```
config firewall security-policy
    edit 2
        set name "allow-QA-Facebook"
        set srcintf "port18"
        set dstintf "port17"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set application 15832
        set groups "Dev" "QA"
    next
    edit 4
        set name "allow-QA-Email"
        set srcintf "port18"
        set dstintf "port17"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set url-category 23
        set groups "QA"
    next
end
```

Logs

In the application control and web filter logs, `securityid` maps to the security policy ID.

Application control log:

```
date=2019-06-17 time=16:35:47 logid="1059028704" type="utm" subtype="app-ctrl"
eventtype="signature" level="information" vd="vd1" eventtime=1560814547702405829 tz="-0700"

Other NGFW policy-based mode options

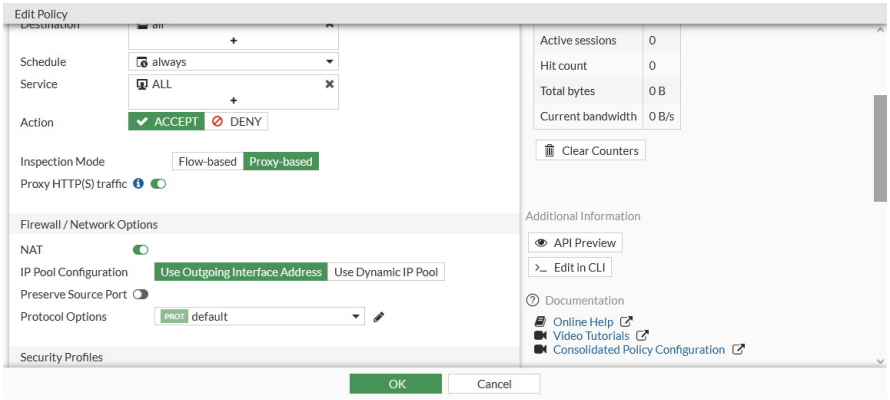
You can combine *Application Control* and *Web Filter* in the same NGFW mode policy.

The following security profiles can be used in NGFW policy-based mode:

- AntiVirus
- Web Filter
- Intrusion Prevention
- File Filter
- Email Filter

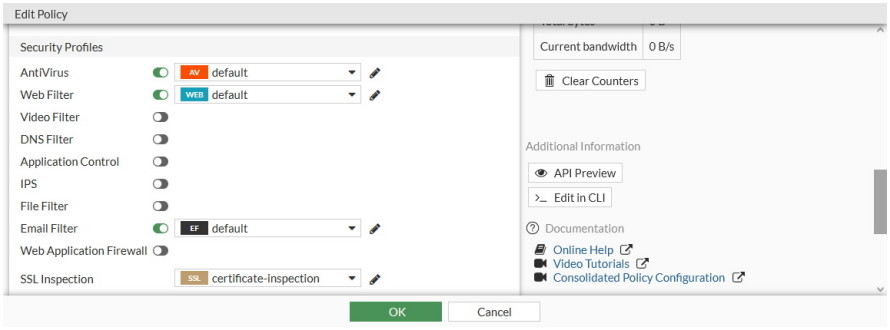
Logging can also be enabled in security policies.

Inspection mode per policy



Inspection mode is configured on a per-policy basis in NGFW mode. This gives you more flexibility when setting up different policies.

When configuring a firewall policy, you can select a *Flow-based* or *Proxy-basedInspection Mode*. The default setting is *Flow-based*.



To configure inspection mode in a policy:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Create a new policy, or edit an existing policy.

3. Configure the policy as needed.
   a. If you change the *Inspection Mode* to *Proxy-based*, the *Proxy HTTP(S) traffic* option displays.

   b. In the *Security Profiles* section, if no security profiles are enabled, the default *SSL Inspection* is *no-inspection*.
   c. In the *Security Profiles* section, if you enable any security profile, the *SSL Inspection* changes to *certificate-inspection*.

To see the inspection mode changes using the CLI:

```
config firewall policy
    edit 1
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
        set nat enable
    next
end
```

To see the HTTP and SSH policy redirect settings when inspection mode is set to proxy using the CLI:

```
config firewall policy
    edit 1
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
```

```
        set action accept
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
        set http-policy-redirect enable
        set ssh-policy-redirect enable
        set nat enable
    next
end
```

To see the default SSL-SSH policy set to no inspection using the CLI:

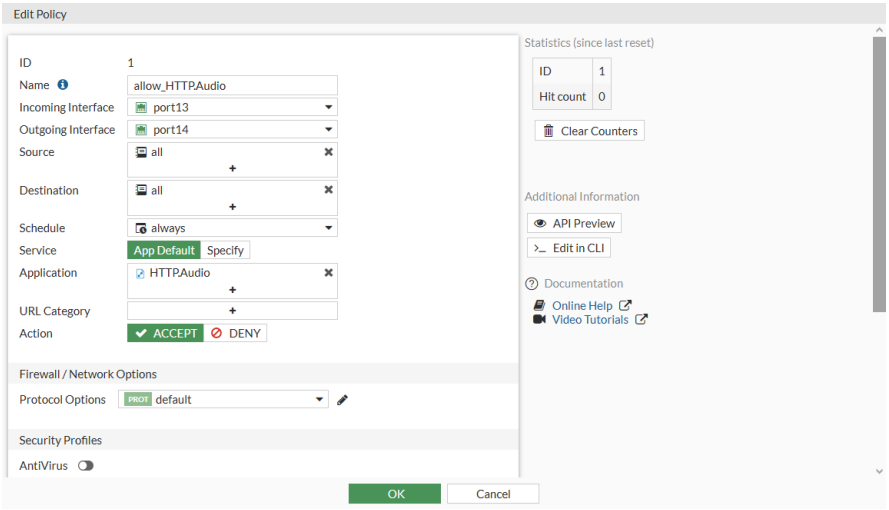
```
config firewall policy
    edit 1
       show fu | grep ssl-ssh-profile
        set ssl-ssh-profile "no-inspection"
    next
end
```

NGFW policy mode application default service

In NGFW policy-based mode, the application default service enforces applications running only on their default service port. The applications specified in the policy are monitored, and if traffic is detected from a nonstandard port, it is blocked, and a log entry is recorded with a *port-violation* event type.

If you are not using the default ports, and need to pick specific services, select *Specify* to select the required services.

Example



In this example, the standard port is enforced for HTTPS traffic using the HTTP.Audio application.

First, an SSL Inspection & Authentication policy is created do to traffic pre-match, and then a security policy is created to allow the HTTP.Audio application when using the default port. Fetching an MP3 file from an HTTP server using port 443 is allowed, but is blocked when using a nonstandard port, such as 8443.

To enforce the HTTP.Audio application using the default port in the GUI:

1. Create a new SSL Inspection & Authentication policy, or use the default policy.
2. Go to *Policy & Objects* > *Security Policy*, and click *Create New*.
3. Enter a name for the policy, such as *allow_HTTP.Audio*.
4. Configure the ports as needed.
5. Set *Service* to *App Default*.
6. In the *Application* field, select *HTTP.Audio*.

7. Set the *Action* to *Accept*.

8. Click *OK*.

To enforce the HTTP.Audio application using the default port in the CLI:

1. Create a firewall policy:

```
config firewall policy
    edit 1
        set name "consolidated_all"
        set srcintf "port13"
        set dstintf "port14"
        set srcaddr "all"
        set dstaddr "all"
        set service "ALL"
        set ssl-ssh-profile "new-deep-inspection"
    next
end
```

2. Create a security policy:

```
config firewall security-policy
    edit 1

        set name "allow_HTTP.Audio"
        set srcintf "port13"
        set dstintf "port14"
        set srcaddr "all"
        set enforce-default-app-port enable
        set action accept
        set schedule "always"
        set logtraffic all
        set application 15879
    next
end
```

Logs

The application logs show logs with an event type of `port-violation` for traffic on port 8443 that is blocked, and an event type of `signature` for traffic on port 443 that is allowed.

Blocked:

```
2: date=2019-06-18 time=16:15:40 logid="1060028736" type="utm" subtype="app-ctrl"
eventtype="port-violation" level="warning" vd="vd1" eventtime=1560899740218875746 tz="-0700"

url="/app_data/story.mp3" securityid=2 msg="Video/Audio: HTTP.Audio," apprisk="elevated"
```

Add option to set application default port as a service port

The `default-app-port-as-service` option can be used in NGFW mode to set the application default port as a service port. This allows applications to match the policy and be blocked immediately the first time that traffic hits the firewall. When this option is enabled, the NGFW policy aggregates the ports used by the applications in the policy and performs a pre-match on the traffic.

```
config system settings
    set default-app-port-as-service {enable | disable}
end
```

This option can be configured on a per-VDOM level.

This setting is enabled by default on new installations. When upgrading, the setting is disabled to retain the previous behavior.

To configure the application default port as service port:

1. Configure the VDOM settings:

```
config system settings
    set vdom-type traffic
    set opmode nat
    set ngfw-mode policy-based
    set block-land-attack disable
    set default-app-port-as-service enable
```

```
    set application-bandwidth-tracking disable
end
```

2. Configure the NGFW policy:

```
config firewall security-policy
    edit 1
        set name "test"
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set internet-service-src disable
        set enforce-default-app-port enable
        set action accept
    next
end
```

Sample logs

The following logging behavior occurs in NGFW mode with `default-app-port-as-service`:

- When `default-app-port-as-service` and `enforce-default-app-port` are enabled, traffic that does not match the default port is blocked immediately. Only a traffic log is generated.

  Log with SSH and FTP traffic:

  ```
  1: date=2022-02-24 time=11:16:36 eventtime=1645730197145603994 tz="-0800"

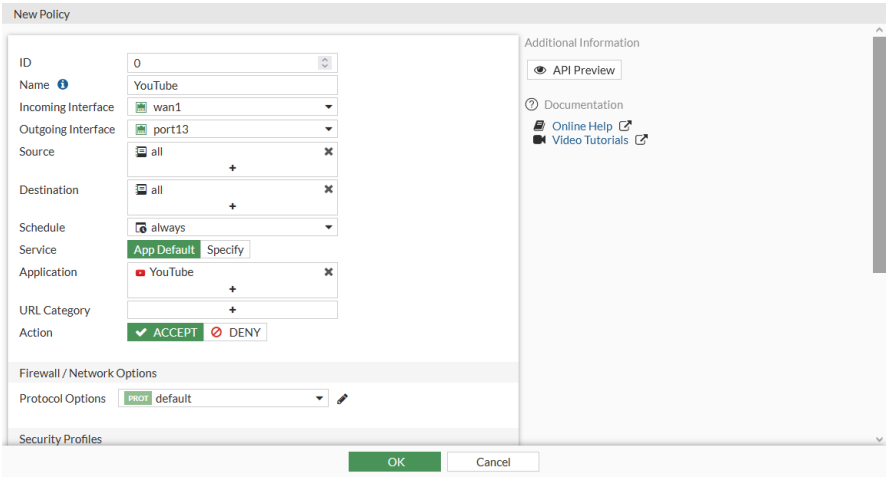
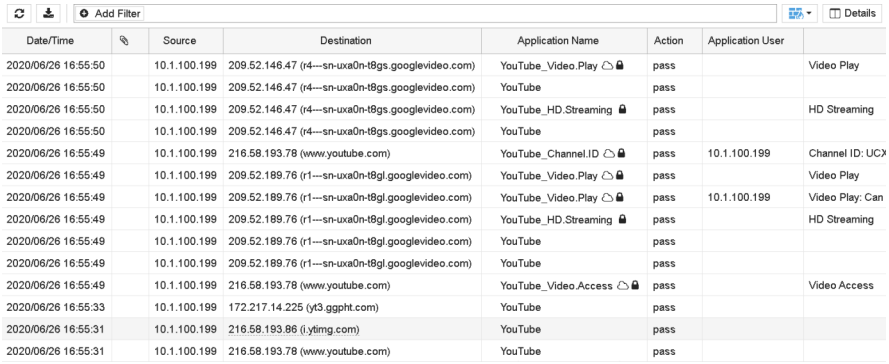
Application logging in NGFW policy mode



In NGFW policy mode, if an application, application category, or application group is selected on a security policy, and traffic logging is set to *UTM* or *All*, then application control logs will be generated. In addition, when a signature is set to the *ACCEPT* action under a security policy, all corresponding child signatures will be assessed and logged as well.

Under NGFW, with `default-app-port-as-service` enabled, enable APP Default. The traffic which doesn't match the default port will be blocked immediately, and there is only traffic log generated.



Under NGFW, with `default-app-port-as-service` disabled, enable APP Default. The traffic which doesn't match the default port will not be blocked immediately, and there is app and traffic logs generated.

To verify application logging:

1. Go to *Policy & Objects* > *Security Policy* and configure a new policy for YouTube.
2. Set *Action* to *ACCEPT* and *Log Allowed Traffic* to *Security Events*.

3. Configure the remaining settings as required, then click *OK*.
4. On a client system, play some YouTube videos.
5. On FortiOS, go to *Log & Report* > *Security Events* and view the *Application Control* logs.
   There are logs not only for *YouTube*, but also for *YouTube_Video.Play*, *YouTube_Video.Access*, and so on, as verified from the *Application Name* column.

Date/Time	Source	Destination	Application Name	Action	Application User

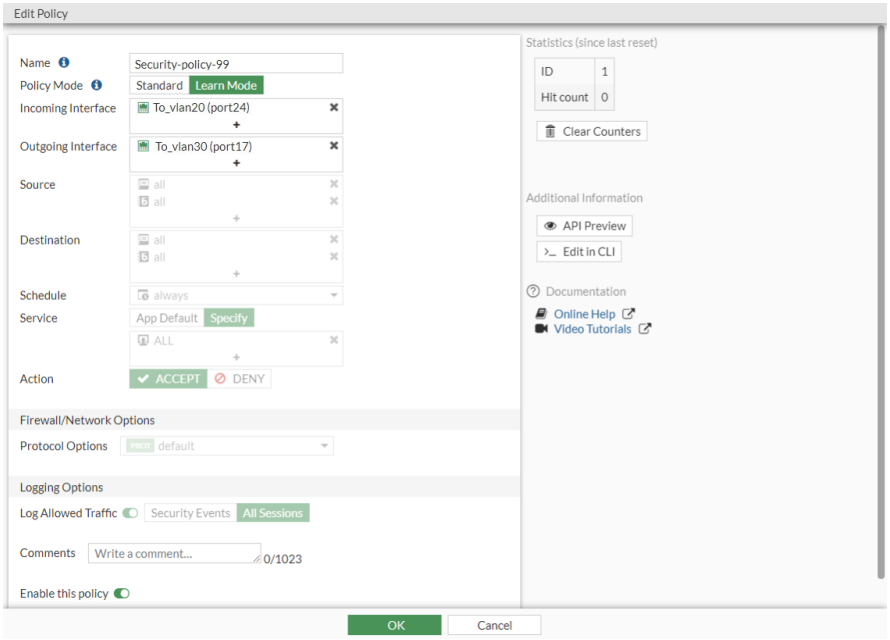
Learn mode in security policies in NGFW mode

In NGFW mode, administrators can configure a security policy in learn mode to monitor traffic that passes through the source and destination interfaces. The learn mode uses a special prefix in the `policymode` and `profile` fields in traffic and UTM logs for use by FortiAnalyzer and the Policy Analyzer Management Extension Application (MEA) that is available with FortiManager.



When enabled on FortiManager, Policy Analyzer MEA works with security policies in learning mode to analyze logs sent from a managed FortiGate to FortiAnalyzer. Based on the analyzed traffic, FortiManager administrators can choose to automatically create a policy in FortiManager for the managed FortiGate. For more information about Policy Analyzer MEA, see the Policy Analyzer Administration Guide.

The following limitations apply when learn mode is enabled in a security policy:

- Only interfaces with `device-identification enable` can be used as source interfaces in a security policy with learning mode enabled.
- Incoming and outgoing interfaces do not support `any`.
- Internet service is not supported.
- NAT46 and NAT64 are not supported.
- Users and groups are not supported.
- Some negate options are not supported.

To enable learn mode in the GUI:

1. Enable policy-based NGFW mode:
   a. Go to *System* > *Settings*.
   b. Set the *NGFW Mode* to *Policy-based* and click *Apply*.
2. Go to *Policy & Objects* > *Security Policy*, and open a security policy for editing.
3. Set the *Policy Mode* to *Learn Mode*.

4. Select an *Incoming Interface*.
5. Select an *Outgoing Interface*.
6. (Optional) Type a comment in the *Comments* box.
7. Toggle on *Enable this policy*.
8. Click *OK* to save the security policy.

To enable learn mode in the CLI:

1. Enable policy-based NGFW mode:

```
config system settings
    set ngfw-mode policy-based
end
```

2. Enable learn mode in a security policy:

```
config firewall security-policy
    edit <id>
        set learning-mode enable
    next
end
```

To view learn mode fields in logs in the CLI:

1. Filter and view fields in traffic logs:

```
# execute log filter category 0

# execute log display

1 logs found.

1 logs returned.

Dynamic address tags

Tags for dynamic addresses, including EMS (normal and local EMS tags), FortiPolicy, FortiVoice, and FortiNAC can be used as the source or destination address in security policies. Once these tags are used in security policies, run `diagnose ips pme dynamic-address list` to show the addresses that are used in the policy. The following example uses an EMS tag.

To apply an EMS tag object to a security policy in the GUI:

1. Go to *Policy & Objects* > *Security Policy*.
2. Click *Create new* or edit an existing policy.
3. In the *Source* field, click the + and select *EMS1_ZTNA_ZT_OS_WIN*.
4. Configure the other settings as needed.
5. Click *OK*.

To apply an EMS tag object to a security policy in the CLI:

1. Configure the policy:

```
config firewall security-policy
    edit 1
        set name "ddd"
        set srcintf "port8"
        set dstintf "port7"
        set srcaddr "EMS1_ZTNA_ZT_OS_WIN"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set logtraffic all
    next
end
```

2. Verify which IP addresses are used in the policy:

```
# diagnose ips pme dynamic-address list
EMS1_ZTNA_ZT_OS_WIN [vdom=0 type=IP]:
```

Local-in policy

While security profiles control traffic flowing through the FortiGate, local-in policies control inbound traffic that is going to a FortiGate interface.

Administrative access traffic (HTTPS, PING, SSH, and others) can be controlled by allowing or denying the service in the interface settings. Trusted hosts can be configured under an administrator to restrict the hosts that can access the administrative service.

Local-in policies allow administrators to granularly define the source and destination addresses, interface, and services. Traffic destined for the FortiGate interface specified in the policy that meets the other criteria is subject to the policies action.

Local-in policies can be used to restrict administrative access or other services, such as VPN, that can be specified as services. You can define source addresses or address groups to restrict access from. For example, by using a geographic type address you can restrict a certain geographic set of IP addresses from accessing the FortiGate. An IP Address threat feed can also be used as either a source or destination address; see Applying an IP address threat feed in a local-in policy on page 3404 for more information.

Local-in policies can also use virtual patching to mitigate known vulnerabilities targeted at the FortiGate. Vulnerability rules are scanned on local-in traffic on the specified interface, and all matched local-in traffic is dropped accordingly. See Virtual patching on the local-in management interface on page 1415 for more information.

Local-in policies can only be created or edited in the CLI. You can view the existing local-in policies in the GUI by enabling it in *System > Feature Visibility* under the *Additional Features* section. This page does not list the custom local-in policies.

To configure a local-in policy using the CLI:

```
config firewall {local-in-policy | local-in-policy6}
    edit <policy_number>
        set intf <interface>
        set srcaddr <source_address> [source_address] ...
        set dstaddr <destination_address> [destination_address] ...
        set action {accept | deny}
        set service <service_name> [service_name] ...
        set schedule <schedule_name>
        set virtual-patch {enable | disable}
        set comments <string>
    next
end
```

For example, to prevent the source subnet 10.10.10.0/24 from pinging port1, but allow administrative access for PING on port1:

```
config firewall address
    edit "10.10.10.0"
        set subnet 10.10.10.0 255.255.255.0
    next
end
config firewall local-in-policy
    edit 1
        set intf "port1"
        set srcaddr "10.10.10.0"
        set dstaddr "all"
        set service "PING"
        set schedule "always"
    next
end
```

To test the configuration:

1. From the PC at 10.10.10.12, start a continuous ping to port1:

   ```
   ping 192.168.2.5 –t
   ```

2. On the FortiGate, enable debug flow:

   ```
   # diagnose debug flow filter addr 10.10.10.12
   # diagnose debug flow filter proto 1
   # diagnose debug enable
   # diagnose debug flow trace start 10
   ```

3. The output of the debug flow shows that traffic is dropped by local-in policy 1:

   ```
   # id=20085 trace_id=1 func=print_pkt_detail line=5746 msg="vd-root:0 received a packet
   (proto=1, 10.10.10.12:1->192.168.2.5:2048) from port1. type=8, code=0, id=1, seq=128."
   id=20085 trace_id=1 func=init_ip_session_common line=5918 msg="allocate a new session-
   0017c5ad"
   ```

```
id=20085 trace_id=1 func=vf_ip_route_input_common line=2615 msg="find a route:
flag=80000000 gw-192.168.2.5 via root"
id=20085 trace_id=1 func=fw_local_in_handler line=474 msg="iprope_in_check() check
failed on policy 1, drop"
```

Implicit deny rule

If a local-in-policy is not functioning correctly and traffic that should be blocked is being allowed through, the issue may be that the implicit deny local-in-policy has not been created. Unlike IPv4 policies, there is no default implicit deny policy. The implicit deny policy should be placed at the bottom of the list of local-in-policies. Local-in-policies are created for each interface, but if you want to create a general implicit deny rule for all interfaces for a specific service, source, address, or destination address, use the `any` interface.

By default, no local-in policies are defined, so there are no restrictions on local-in traffic. When you define a local-in policy, if no action is set manually, then the action will default to `deny`.

For example, to allow only the source subnet 172.16.200.0/24 to ping port1:

```
config firewall address
    edit "172.16.200.0"
        set subnet 172.16.200.0 255.255.255.0
    next
end
config firewall local-in-policy
    edit 2
        set intf "port1"
        set srcaddr "172.16.200.0"
        set dstaddr "all"
        set action accept
        set service "PING"
        set schedule "always"
    next
    edit 3
        set intf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set service "PING"
        set schedule "always"
    next
end
```

To test the configuration:

1. From the PC at 172.16.200.2, start a continuous ping to port1:

   ```
   ping 172.16.200.1 -t
   ```

2. On the FortiGate, enable debug flow:

   ```
   # diagnose debug flow filter proto 1
   # diagnose debug enable
   # diagnose debug flow trace start 10
   ```

3. The output of the debug flow shows that ping traffic coming from the 172.16.200.0 subnet is allowed:

```
# id=65308 trace_id=25 func=print_pkt_detail line=5939 msg="vd-root:0 received a packet
(proto=1, 172.16.200.2:5->172.16.200.1:2048) tun_id=0.0.0.0 from port1. type=8, code=0,

id=5, seq=1."
```

4. From the PC at 172.20.120.13, start a continuous ping to port1:

```
ping 172.16.200.1 -t
```

5. The output of the debug flow shows that ping traffic coming from subnets other than 172.16.200.0 is dropped by local-in policy 3:

```
# id=65308 trace_id=21 func=print_pkt_detail line=5939 msg="vd-root:0 received a packet
(proto=1, 172.20.120.13:1->172.16.200.1:2048) tun_id=0.0.0.0 from port2. type=8, code=0,
id=1, seq=8."
id=65308 trace_id=21 func=init_ip_session_common line=6121 msg="allocate a new session-

slot=51, len=2"
id=65308 trace_id=21 func=fw_local_in_handler line=545 msg="iprope_in_check() check
failed on policy 3, drop"
```

Additional options

To disable or re-enable the local-in policy, use the `set status {enable | disable}` command.

To dedicate the interface as an HA management interface, use the `set ha-mgmt-intf-only enable` command.

Example:

```
config firewall local-in-policy
    edit 1
        set ha-mgmt-intf-only enable
        set intf port4
        set srcaddr all
        set dstaddr all
```

```
        set service ALL
        set schedule always
        set action accept
        set status enable
    next
end
```

If a user tries to set the HA reserved management interface during the local-in policy an error is generated. Use the `set ha-mgmt-intf-only enable` command to avoid the error.

TTL policies

You can configure a time-to-live (TTL) policy to block attack traffic with high TTLs. This feature only applies to local-in traffic and does not apply to traffic passing through the FortiGate. You can use `srcintf` to set the interface that the local-in traffic hits. See config firewall ttl-policy.

To configure a TTL policy using the CLI:

```
config firewall ttl-policy
    edit <id>
        set status {enable | disable}
        set action {accept | deny}
        set srcintf <interface>
        set srcaddr <source_address> [source_address] ...
        set service <service_name> [service_name] ...
        set schedule <schedule_name>
        set ttl <value/range>
    next
end
```

DoS policy

A Denial of Service (DoS) policy examines network traffic arriving at a FortiGate interface for anomalous patterns, which usually indicates an attack.

A denial of service occurs when an attacking system starts an abnormally large number of sessions with a target system. The large number of sessions slows down or disables the target system, preventing legitimate users from using it.

DoS policies are checked before security policies, preventing attacks from triggering more resource intensive security protection and slowing down the FortiGate.

DoS anomalies

Predefined sensors are setup for specific anomalous traffic patterns. New DoS anomalies cannot be added by the user.

The predefined anomalies that can be used in DoS policies are:

Anomaly	Description	Recommended Threshold
tcp_syn_flood	If the SYN packet rate of new TCP connections, including retransmission, to one destination IP address exceeds the configured threshold value, the action is executed.	2000 packets per second.
tcp_port_scan	If the SYN packet rate of new TCP connections, including retransmission, from one source IP address exceeds the configured threshold value, the action is executed.	1000 packets per second.
tcp_src_session	If the number of concurrent TCP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
tcp_dst_session	If the number of concurrent TCP connections to one destination IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
udp_flood	If the UDP traffic to one destination IP address exceeds the configured threshold value, the action is executed.	2000 packets per second.
udp_scan	If the UDP sessions setup rate originating from one source IP address exceeds the configured threshold value, the action is executed.	2000 sessions per second.
udp_src_session	If the number of concurrent UDP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
udp_dst_session	If the number of concurrent UDP connections to one destination IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
icmp_flood	If the number of ICMP packets sent to one destination IP address exceeds the configured threshold value, the action is executed.	250 packets per second.
icmp_sweep	If the ICMP sessions setup rate originating from one source IP address exceeds the configured threshold value, the action is executed.	100 sessions per second.
icmp_src_session	If the number of concurrent ICMP connections from one source IP address exceeds the configured threshold value, the action is executed.	300 concurrent sessions
icmp_dst_session	If the number of concurrent ICMP connections to one destination IP address exceeds the configured threshold value, the action is executed.	1000 concurrent sessions
ip_src_session	If the number of concurrent IP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
ip_dst_session	If the number of concurrent IP connections to one destination IP	5000 concurrent sessions.

Anomaly	Description	Recommended Threshold
	address exceeds the configured threshold value, the action is executed.	
sctp_flood	If the number of SCTP packets sent to one destination IP address exceeds the configured threshold value, the action is executed.	2000 packets per second
sctp_scan	If the number of SCTP sessions originating from one source IP address exceeds the configured threshold value, the action is executed.	1000 packets per second
sctp_src_session	If the number of concurrent SCTP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions
sctp_dst_session	If the number of concurrent SCTP connections to one destination IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions

For thresholds based on the number of concurrent sessions, blocking the anomaly will not allow more than the number of concurrent sessions to be set as the threshold.

For example, if the period for a particular anomaly is 60 seconds, such as those where the threshold is measured in concurrent sessions, after the 60 second timer has expired the number of allowed sessions that match the anomaly criteria is reset to zero. This means that, if you allow 10 sessions through before blocking, after the 60 seconds has elapsed, another 10 sessions will be allowed. The attrition of sessions from expiration should keep the allowed sessions from reaching the maximum.

For rate based thresholds, where the threshold is measured in packets per second, the *Block* action prevents anomalous traffic from overwhelming the firewall in two ways:

- continuous: Block packets once an anomaly is detected, and continue to block packets while the rate is above the threshold. This is the default setting.
- periodical: After an anomaly is detected, allow the configured number of packets per second.

For example, if a DoS policy is configured to block icmp_flood with a threshold of 10pps, and a continuous ping is started at a rate of 20pps for 1000 packets:

- In continuous mode, the first 10 packets are passed before the DoS sensor if triggered, and then the remaining 990 packets are blocked.
- In periodical mode, 10 packets are allowed to pass per second, so 500 packets are blocked in the 50 seconds during which the ping is occuring.

The actual numbers of passed and blocked packets may not be exact, as fluctuations in the rates can occur, but the numbers should be close to the defined threshold.

To configure the block action for rate based anomaly sensors:

```
config ips global
    set anomaly-mode {continuous | periodical}
end
```

DoS policies

A DoS policy can be configured to use one or more anomalies.

To configure a DoS policy in the GUI:

1. Go to *Policy & Objects* > *IPv4 DoS Policy* or *Policy & Objects* > *IPv6 DoS Policy* and click *Create New*.
   If the option is not visible, enable *DoS Policy* in *Feature Visibility*. See Feature visibility on page 2974 for details.
2. Configure the following:

Name	Enter a name for the policy.
Incoming Interface	Enter the interface that the policy applies to.
Source Address	Enter the source address.
Destination Address	Enter the destination address. This is the address that the traffic is addressed to. In this case, it must be an address that is associated with the firewall interface. For example, it could be an interface address, a secondary IP address, or the address assigned to a VIP address.
Service	Select the services or service groups. The ALL service can used or, to optimize the firewall resources, only the services that will be answered on an interface can be used.
L3 Anomalies **L4 Anomalies**	Configure the anomalies: • *Logging*: Enable/disable logging for specific anomalies or all of them. Anomalous traffic will be logged when the action is *Block* or *Monitor*. • *Action*: Select the action to take when the threshold is reached: • *Disable*: Do not scan for the anomaly. • *Block*: Block the anomalous traffic. • *Monitor*: Allow the anomalous traffic, but record a log message if logging is enabled. • *Threshold*: The number of detected instances that triggers the anomaly action.
Comments	Optionally, enter a comment.

3. Enable the policy, then click *OK*.

The quarantine option is only available in the CLI. See Quarantine on page 1338 for information.

To configure a DoS policy in the GUI:

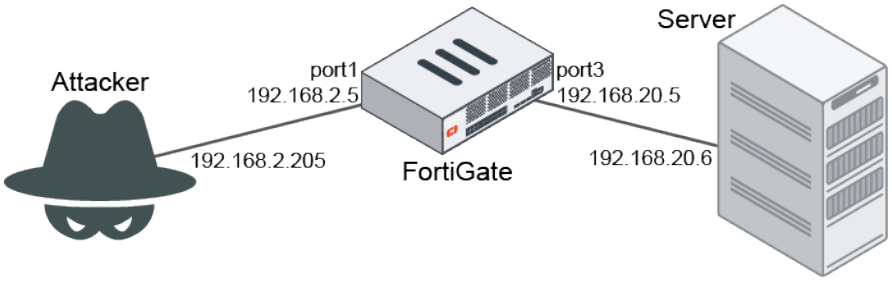
```
config firewall DoS-policy
    edit 1
        set name "Flood"
        set interface "port1"
        set srcaddr "all"
        set dstaddr "all"
        set service "ALL"
        config anomaly
            edit "icmp_flood"
                set status enable
                set log enable
                set action block
                set quarantine attacker
                set quarantine-expiry 1d1h1m
                set quarantine-log enable
                set threshold 100
            next
        end
    next
end
```

`name <string>`	Enter a name for the policy.
`interface <string>`	Enter the interface that the policy applies to.
`srcaddr <string>`	Enter the source address.
`dstaddr <string>`	Enter the destination address. This is the address that the traffic is addressed to. In this case, it must be an address that is associated with the firewall interface. For example, it could be an interface address, a secondary IP address, or the address assigned to a VIP address.
`service <string>`	Enter the services or service groups. The `ALL` service can used or, to optimize the firewall resources, only the services that will be answered on an interface can be used.
`status {enable | disable}`	Enable/disable this anomaly.
`log {enable | disable}`	Enable/disable anomaly logging. When enabled, a log is generated whenever the anomaly action is triggered, regardless of which action is configured.
`action {pass | block}`	Set the action to take when the threshold is reached: • `pass`: Allow traffic, but record a log message if logging is enabled. • `block`: Block traffic if this anomaly is found.
`quarantine {none | attacker}`	Set the quarantine method (see Quarantine on page 1338): • `none`: Disable quarantine. • `attacker`: Block all traffic from the attacker's IP address, and add the attacker's IP address to the banned user list.

`quarantine-expiry <###d##h##m>`	Set the duration of the quarantine, in days, hours, and minutes (###d##h##m) (1m - 364d23h59m, default = 5m). This option is available if `quarantine` is set `attacker`.
`quarantine-log {enable | disable}`	Enable/disable quarantine logging (default = disable). This option is available if `quarantine` is set `attacker`.
`threshold <integer>`	The number of detected instances - packets per second or concurrent session number - that triggers the anomaly action.

Quarantine

Quarantine is used to block any further traffic from a source IP address that is considered a malicious actor or a source of traffic that is dangerous to the network. Traffic from the source IP address is blocked for the duration of the quarantine, and the source IP address is added to the banned user list.



The banned user list is kept in the kernel, and used by Antivirus, Data Loss Prevention (DLP), DoS, and Intrusion Prevention System (IPS). Any policies that use any of these features will block traffic from the attacker's IP address.

To view the quarantined user list:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
192.168.2.205     Wed Nov 25 12:47:54 2020 Wed Nov 25 12:57:54 2020 DOS
```

Troubleshooting DoS attacks

The best way to troubleshoot DoS attacks is with Anomaly logs and IPS anomaly debug messages.

To test an icmp_flood attack:

1. From the Attacker, launch an icmp_flood with 50pps lasting for 3000 packets.
2. On the FortiGate, configure continuous mode and create a DoS policy with an icmp_flood threshold of 30pps:

```
config firewall DoS-policy
    edit 1
        set name icmpFlood
        set interface "port1"
        set srcaddr "all"
        set dstaddr "all"
        set service "ALL"
        config anomaly
            edit "icmp_flood"
```

```
                set status enable
                set log enable
                set action block
                set threshold 30
            next
        end
    next
end
```

3. Configure the debugging filter:

```
# diagnose ips anomaly config
DoS sensors in kernel vd 0:
DoS id 1 proxy 0
  0 tcp_syn_flood status 0 log 0 nac 0 action 0 threshold 2000
  ...
  7 udp_dst_session status 0 log 0 nac 0 action 0 threshold 5000
  8 icmp_flood status 1 log 1 nac 0 action 7 threshold 30
  9 icmp_sweep status 0 log 0 nac 0 action 0 threshold 100
  ...
total # DoS sensors: 1.

# diagnose ips anomaly filter id 8
```

4. Launch the icmp_flood from a Linux machine. This example uses Nmap:

```
$ sudo nping --icmp --rate 50 -c 3000 192.168.2.50
SENT (0.0522s) ICMP [192.168.2.205 > 192.168.2.50 Echo request (type=8/code=0) id=8597
seq=1] IP [ttl=64 id=47459 iplen=28 ]
...
Max rtt: 11.096ms | Min rtt: 0.028ms | Avg rtt: 1.665ms
Raw packets sent: 3000 (84.000KB) | Rcvd: 30 (840B) | Lost: 2970 (99.00%)
Nping done: 1 IP address pinged in 60.35 seconds
```

5. During the attack, check the anomaly list on the FortiGate:

```
# diagnose ips anomaly list
list nids meter:
id=icmp_flood         ip=192.168.2.50 dos_id=1 exp=998 pps=46 freq=50

total # of nids meters: 1.
```

id=icmp_flood	The anomaly name.
ip=192.168.2.50	The IP address of the host that triggered the anomaly. It can be either the client or the server. For icmp_flood, the IP address is the destination IP address. For icmp_sweep, it would be the source IP address.
dos_id=1	The DoS policy ID.
exp=998	The time to be expired, in jiffies (one jiffy = 0.01 seconds).
pps=46	The number of packets that had been received when the diagnose command was executed.
freq=50	For session based anomalies, freq is the number of sessions. For packet rate based anomalies (flood, scan):

	• In continuous mode: freq is the greater of pps, or the number of packets received in the last second. • In periodic mode: freq is the pps.

6. Go to *Log & Report* > *Security Events* and download the *Anomaly* logs:

```
date=2020-11-20 time=14:38:39 eventtime=1605911919824184594 tz="-0800"
logid="0720018433" type="utm" subtype="anomaly" eventtype="anomaly" level="alert"
vd="root" severity="critical" srcip=192.168.2.205 srccountry="Reserved"
dstip=192.168.2.50 srcintf="port1" srcintfrole="undefined" sessionid=0 action="clear_
session" proto=1 service="PING" count=1307 attack="icmp_flood" icmpid="0x2195"
icmptype="0x08" icmpcode="0x00" attackid=16777316 policyid=1 policytype="DoS-policy"
ref="http://www.fortinet.com/ids/VID16777316" msg="anomaly: icmp_flood, 31 > threshold
30, repeats 28 times" crscore=50 craction=4096 crlevel="critical"
```

```
date=2020-11-20 time=14:39:09 eventtime=1605911949826224056 tz="-0800"
logid="0720018433" type="utm" subtype="anomaly" eventtype="anomaly" level="alert"
vd="root" severity="critical" srcip=192.168.2.205 srccountry="Reserved"
dstip=192.168.2.50 srcintf="port1" srcintfrole="undefined" sessionid=0 action="clear_
session" proto=1 service="PING" count=1497 attack="icmp_flood" icmpid="0x2195"
icmptype="0x08" icmpcode="0x00" attackid=16777316 policyid=1 policytype="DoS-policy"
ref="http://www.fortinet.com/ids/VID16777316" msg="anomaly: icmp_flood, 50 > threshold
30, repeats 1497 times" crscore=50 craction=4096 crlevel="critical"
```

Analysis

In the first log message:

msg="anomaly: icmp_flood, 31 > threshold 30	At the beginning of the attack, a log is recorded when the threshold of 30pps is broken.
repeats 28 times	The number of packets that has exceeded the threshold since the last time a log was recorded.
srcip=192.168.2.205 **dstip=192.168.2.50**	The source and destination IP addresses of the attack.
action="clear_session"	Equivalent to block. If `action` was set to `monitor` and logging was enabled, this would be `action="detected"`.

In the second log message:

- Because it is an ongoing attack, the FortiGate generates one log message for multiple packets every 30 seconds..
- It will not generate a log message if:
  - The same attack ID happened more than once in a five second period, or
  - The same attack ID happened more than once in a 30 second period and the actions are the same and have the same source and destination IP addresses.

msg="anomaly: icmp_flood, 50 > threshold 30	In the second before the log was recorded, 50 packets were detected, exceeding the configured threshold.
repeats 1497 times	The number of packets that has exceeded the threshold since the last time a log was recorded

Access control lists

An access control list (ACL) is a granular, targeted blocklist that is used to block IPv4 and IPv6 packets on a specified interface based on the criteria configured in the ACL policy.

On FortiGate models with ports that are connected through an internal switch fabric with TCAM capabilities, ACL processing is offloaded to the switch fabric and does not use CPU resources. VLAN interfaces that are based on physical switch fabric interfaces are also supported. Interfaces that are connected through an internal switch fabric usually have names prefixed with *port* or *lan*, such as *port1* or *lan2*; other interfaces are not supported.

The packets will be processed by the CPU when offloading is disabled or not possible, such as when a port on a supported model does not connect to the internal fabric switch.

ACL is supported on the following FortiGate models:

- 100D, 100E, 100EF, 101E
- 140D, 140D-POE, 140E, 140E-POE
- 1500D, 1500DT
- 3000D, 3100D, 3200D, 3700D, 3800D
- All 300E and larger E-series models
- All 100F and larger F-series models

Example

To block all IPv4 and IPv6 telnet traffic from port2 to Company_Servers:

```
config firewall acl
    edit 1
       set interface "port2"
       set srcaddr "all"
       set dstaddr "Company_Servers"
       set service "TELNET"
    next
end
config firewall acl6
    edit 1
        set interface "port2"
        set srcaddr "all"
        set dstaddr "Company_Servers_v6"
        set service "TELNET"
    next
end
```

Diagnose commands

To check the number of packets dropped by an ACL:

```
# diagnose firewall acl counter
ACL id 1 dropped 0 packets
```

```
# diagnose firewall acl counter6
ACL id 2 dropped 0 packets
```

To clear the packet drop counters:

```
# diagnose firewall acl clearcounter
# diagnose firewall acl clearcounter6
```

Interface policies

Interface policies are implemented before the security policies and are only flow-based. They are configured in the CLI.

This feature allows you to attach a set of IPS policies with the interface instead of the forwarding path, so packets can be delivered to IPS before entering the firewall. This feature is used for following IPS deployments:

- One-Arm: By defining interface policies with IPS and DoS anomaly checks and enabling sniff-mode on the interface, the interface can be used for one-arm IDS.
- IPv6 IPS: IPS inspection can be enabled through interface IPv6 policy.
- Scan traffic that is destined to the FortiGate.
- Scan and log traffic that are silently dropped or flooded by Firewall or Multicast traffic.

IPS sensors can be assigned to an interface policy. Both incoming and outgoing packets are inspected by IPS sensor (signature).

To configure an interface policy:

```
config firewall interface-policy
    edit 1
        set status enable
        set comments 'test interface policy #1'
        set logtraffic utm
        set interface "port2"
        set srcaddr all
        set dstaddr all
        set service "ALL"
        set application-list-status disable
        set ips-sensor-status disable
        set dsri disable
        set av-profile-status enable
        set av-profile default
        set webfilter-profile-status disable
    next
end
```

Source NAT

The following topics provide instructions on configuring policies with source NAT:

- Static SNAT on page 1343
- Dynamic SNAT on page 1344
- Central SNAT on page 1350
- Configuring an IPv6 SNAT policy on page 1357
- SNAT policies with virtual wire pairs on page 1358
- Configuring PCP port mapping with SNAT and DNAT on page 1420

Static SNAT

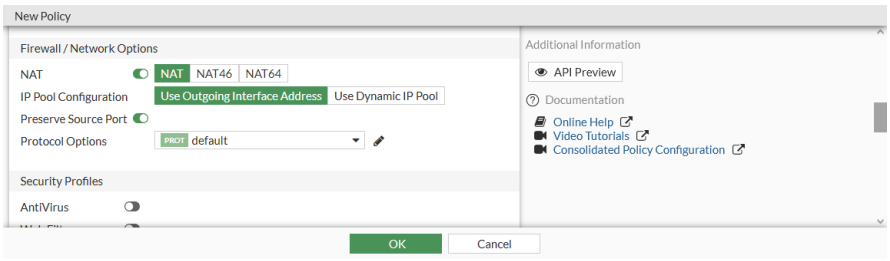
Network Address Translation (NAT) is the process that enables a single device such as a router or firewall to act as an agent between the Internet or Public Network and a local or private network. This agent acts in real time to translate the source or destination IP address of a client or server on the network interface. For the source IP translation, this enables a single public address to represent a significantly larger number of private addresses. For the destination IP translation, the firewall can translate a public destination address to a private address. So we don't have to configure a real public IP address for the server deployed in a private network.

We can subdivide NAT into two types: source NAT (SNAT) and destination NAT (DNAT). This topic is about SNAT, We support three NAT working modes: static SNAT, dynamic SNAT, and central SNAT.

In static SNAT all internal IP addresses are always mapped to the same public IP address. This is a port address translation, Since we have 60416 available port numbers, this one public IP address can handle the conversion of 60,416 internal IP addresses to the same service, where a service is defined by a specified protocol, destination IP address, and destination port.

Internal Source IP	Source Port	Translated Source IP	Translated Source Port
10.1.100.1	11110	172.16.200.1	5117
10.1.100.1	11111	172.16.200.1	5118
10.1.100.2	11112	172.16.200.1	5119
.....	.....	172.16.200.1	.....
.....	.....	172.16.200.1	65533

FortiGate firewall configurations commonly use the Outgoing Interface address.



Sample configuration

The following example of static SNAT uses an internal network with subnet 10.1.100.0/24 (vlan20) and an external/ISP network with subnet 172.16.200.0/24 (vlan30).

When the clients in internal network need to access the servers in external network, We need to translate IP addresses from 10.1.100.0/24 to an IP address 172.16.200.0/24, In this example, we implement static SNAT by creating a firewall policy.

To configure static NAT:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the required policy parameters.
3. Enable *NAT* and select *Use Outgoing Interface Address*. For packets that match this policy, its source IP address is translated to the IP address of the outgoing interface.
4. If needed, enable *Preserve Source Port* to keep the same source port for services that expect traffic to come from a specific source port. Disable *Preserve Source Port* to allow more than one connection through the firewall for that service.

5. Click *OK*.

Dynamic SNAT

Dynamic SNAT maps the private IP addresses to the first available public address from a pool of addresses. In the FortiGate firewall, this can be done by using IP pools. IP pools is a mechanism that allows sessions leaving the FortiGate firewall to use NAT. An IP pool defines a single IP address or a range of IP addresses to be used as the source address for the duration of the session. These assigned addresses are used instead of the IP address assigned to that FortiGate interface.

IP pool types

FortiGate uses four types of IPv4 IP pools. This topic focuses on some of the differences between them.

Overload

This type of IP pool is similar to static SNAT mode. We need to define an external IP range that contains one or more IP addresses. When there is only one IP address it is almost the same as static SNAT, the outgoing interface address is used. When it contains multiple IP addresses, it is equivalent to an extended mode of static SNAT.

For instance, if we define an overload type IP pool with two external IP addresses (172.16.200.1—172.16.200.2), since there are 60,416 available port numbers per IP, this IP pool can handle 60,416*2 internal IP addresses to the same service, where a service is defined by a specific protocol, destination IP address, and destination port.

Original Source IP	Original Source Port	Translated Source IP	Translated Source Port
10.1.100.1	11110	172.16.200.1	5117
10.1.100.2	11111	172.16.200.1	5118
.....	.....	172.16.200.1	.....
.....	.....	172.16.200.1	65533
.....	.....	172.16.200.2	5117
.....	.....	.....	.....
.....	.....	172.16.200.2	65533

The mapped IP address can be calculated from the source IP address. The index number of the address in the pool is the remainder of the source IP address, in decimal, divided by the number addresses in the pool.

To calculate the decimal value of the source IP address, either use an online calculator, or use the following equation:

$$a.b.c.d = a * (256)^3 + b * (256)^2 + c * (256) + d$$

For example:

$$192.168.0.1 = 192 * (256)^3 + 168 * (256)^2 + 0 * (256) + 1 = 3232235521$$

If there is one IP pool, where:

- P_1 = the first address in the IP pool
- R_1 = the number of IP addresses in the IP pool
- X = the source IP address as a decimal number
- Y = the mapped IP address

Then the equation to determine the mapped address is:

$$Y = P_1 + X \bmod R_1$$

For example:

IP pool	Source IP address
172.26.73.20 to 172.26.73.90	192.168.1.200

1. Convert the source IP address to a decimal number:
   $$192 * (256)^3 + 168 * (256)^2 + 1 * (256) + 200 = 3232235976$$
2. Determine the number of IP addresses in the pool:
   $$172.26.73.90 - 172.26.73.20 = 71$$
3. Find the remainder of the source IP address divided by the number of addresses in the pool:
   $$3232235976 \bmod 71 = 26$$
4. Add the remainder to the first IP address in the pool:
   $$172.26.73.20 + 26 = 172.26.73.46$$
   So, the mapped IP address is **172.26.73.46**.

If there are multiple IP pools, the calculation is similar to when there is only one pool.

If there are two IP pools, where:

- P_1 = the first address in the first IP pool
- P_2 = the first address in the second IP pool
- R_1 = the number of IP addresses in the first IP pool
- R_2 = the number of IP addresses in the second IP pool
- X = the source IP address as a decimal number
- Y = the mapped IP address

Then the equations to determine the mapped address are:

$$\text{If } X \bmod (R_1 + R_2) >= R_1, \text{ then } Y = P_2 + X \bmod R_2$$

$$\text{If } X \bmod (R_1 + R_2) < R_1, \text{ then } Y = P_1 + X \bmod R_1$$

For example:

IP pools	Source IP address
pool01: 172.26.73.20 to 172.26.73.90	192.168.1.200
pool02: 172.26.75.50 to 172.26.75.150	

1. Convert the source IP address to a decimal number:
   $$192 * (256)^3 + 168 * (256)^2 + 1 * (256) + 200 = 3232235976$$
2. Determine the total number of IP addresses in the pools:
   $$(172.26.73.90 - 172.26.73.20) + (172.26.75.50 - 172.26.75.150) = 71 + 101 = 172$$

3. Find the remainder of the source IP address divided by the number of addresses in the pools:
   3232235976 mod 172 = 108
4. The remainder is greater than the number of addresses in pool01, so the address is selected from pool02 and the remainder is recalculated based only on pool02:
   3232235976 mod 101 = 40
5. Add the new remainder to the first IP address in pool02:
   172.26.75.50 + 40 = 172.26.75.90

   So, the mapped IP address is **172.26.75.90**.

One-to-one

This type of IP pool means that the internal IP address and the external (translated) IP address match one-to-one. The port address translation (PAT) is disabled when using this type of IP pool. For example, if we define a one-to-one type IP pool with two external IP addresses (172.16.200.1 - 172.16.200.2), this IP pool only can handle two internal IP addresses.

Fixed port range

For the overload and one-to-one IP pool types, we do not need to define the internal IP range. For the fixed port range type of IP pool, we can define both internal IP range and external IP range. Since each external IP address and the number of available port numbers is a specific number, if the number of internal IP addresses is also determined, we can calculate the port range for each address translation combination. So we call this type fixed port range. This type of IP pool is a type of port address translation (PAT).

For instance, if we define one external IP address (172.16.200.1) and ten internal IP addresses (10.1.100.1-10.1.100.10), we have translation IP+Port combination like following table:

Original Source IP	Original Source Port	Translated Source IP	Translated Source Port Range
10.1.100.1	.....	172.16.200.1	5117~11157
10.1.100.2	.....	172.16.200.1	11158~17198
10.1.100.3	.....	172.16.200.1	.....
10.1.100.4	.....	172.16.200.1	.....
10.1.100.5	.....	172.16.200.1	.....

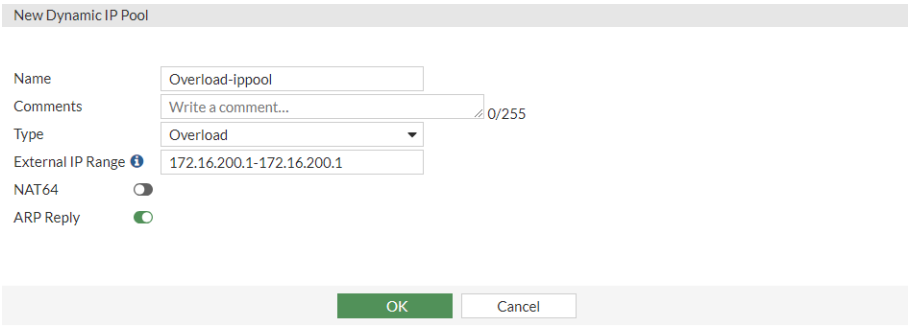
Port block allocation

This type of IP pool is also a type of port address translation (PAT). It gives users a more flexible way to control the way external IPs and ports are allocated. Users need to define *Block Size/Block Per User* and external IP range. *Block Size* means how many ports each Block contains. *Block per User* means how many blocks each user (internal IP) can use.

The following is a simple example:

- **External IP Range**: 172.16.200.1—172.16.200.1
- **Block Size**: 128
- **Block Per User**: 8

Result:



- **Total-PBAs**: 472 (60416/128)
- **Maximum ports can be used per User (Internal IP Address)**: 1024 (128*8)
- **How many Internal IP can be handled**: 59 (60416/1024 or 472/8)

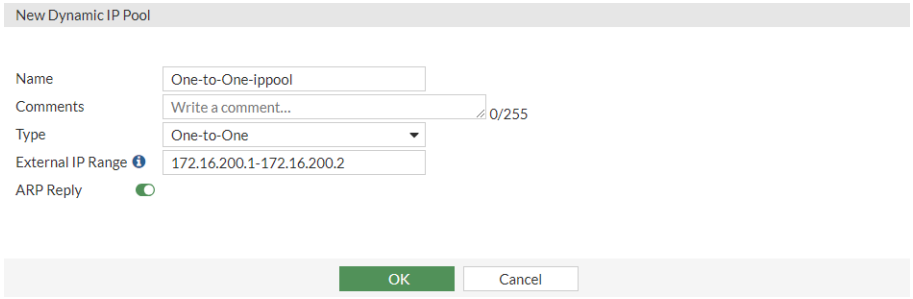
Sample configuration

When an IP pool object is created with *ARP Reply* enabled, the object does not need to be referenced in any policies before a FortiGate interface starts responding to ARP requests for the addresses in the IP pool.

To configure overload IP pool in the GUI:

1. In *Policy & Objects* > *IP Pools*, click *IP Pool*.
2. Click *Create new*.
3. Set *Type* to *Overload*.
4. Enter the external IP range separated by a hyphen (*172.16.200.1-172.16.200.1*).

5. Click *OK*.



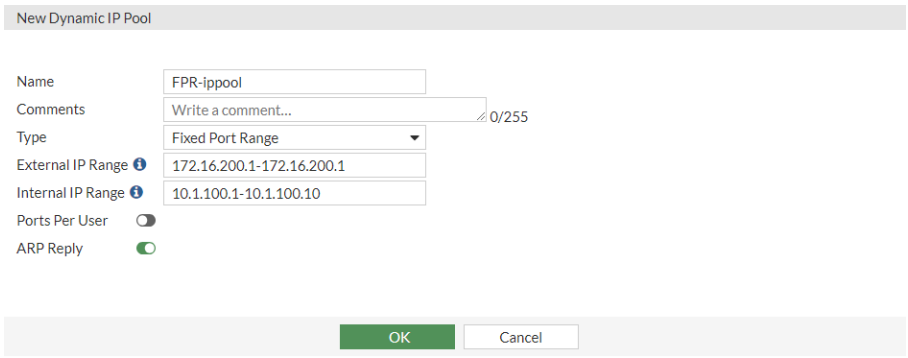
To configure overload IP pool in the CLI:

```
config firewall ippool
    edit "Overload-ippool"
        set startip 172.16.200.1
        set endip 172.16.200.1
    next
end
```

To configure one-to-one IP pool using the GUI:

1. In *Policy & Objects* > *IP Pools*, click *IP Pool*.
2. Click *Create new*.
3. Set *Type* to *One-to-One*.

4. Enter the external IP range separated by a hyphen (*172.16.200.1-172.16.200.2*).



5. Click *OK*.

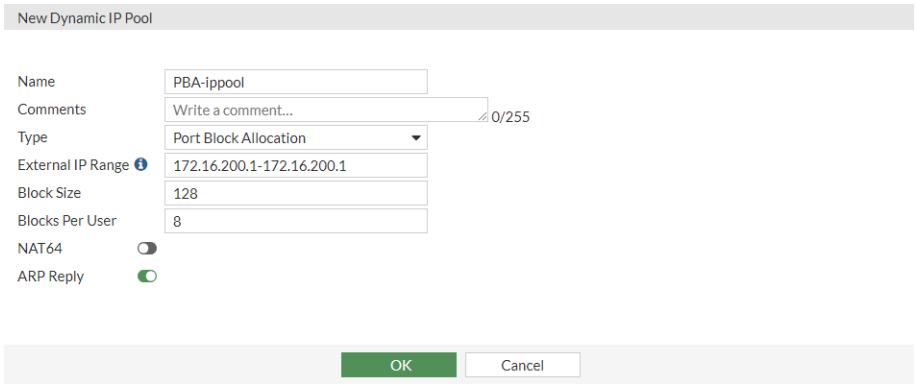
To configure one-to-one IP pool in the CLI:

```
config firewall ippool
    edit "One-to-One-ippool"
        set type one-to-one
        set startip 172.16.200.1
        set endip 172.16.200.2
    next
end
```

To configure fixed port range IP pool in the GUI:

1. In *Policy & Objects* > *IP Pools*, click *IP Pool*.
2. Click *Create new*.
3. Set *Type* to *Fixed Port Range*.
4. Enter the external IP range separated by a hyphen *172.16.200.1-172.16.200.1*).
5. Enter the internal IP range separated by a hyphen *10.1.100.1-10.1.100.10*).

6. Click *OK*.



To configure fixed port range IP pool in the CLI:

```
config firewall ippool
    edit "FPR-ippool"
        set type fixed-port-range
        set startip 172.16.200.1
        set endip 172.16.200.1
        set source-startip 10.1.100.1
        set source-endip 10.1.100.10
```

```
    next
end
```

To configure port block allocation IP pool in the GUI:

1. In *Policy & Objects* > *IP Pools*, click *IP Pool*.
2. Click *Create new*.
3. Set *Type* to *Port Block Allocation*.
4. Enter the external IP range separated by a hyphen *172.16.200.1-172.16.200.1*).

5. Click *OK*.

To configure port block allocation IP pool in the CLI:

```
config firewall ippool
    edit PBA-ippool
        set type port-block-allocation
        set startip 172.16.200.1
        set endip 172.16.200.1
        set block-size 128
        set num-blocks-per-user 8
    next
end
```

IP pools and VIPs as local IP addresses

IP pools and VIPs are considered local IP addresses if responding to ARP requests on these external IP addresses is enabled (`set arp-reply enable`, by default). In this case, the FortiGate is considered a destination for those IP addresses and can receive reply traffic at the application layer successfully.

However, as a side-effect, once an IP pool or VIP has been configured, even if it is never used in a firewall policy, the FortiGate considers it as a local address and will not forward traffic based on the routing table. Therefore, any unused IP pools or VIPs should be deleted to prevent any unexpected behavior.

For a history of behaviour changes related to IP pools and VIPs, see Technical Tip: IP pool and virtual IP behaviour changes in FortiOS 6.4, 7.0, 7.2, and 7.4.

Central SNAT

The central SNAT table enables you to define and control (with more granularity) the address translation performed by FortiGate. With the NAT table, you can define the rules for the source address or address group, and which IP pool the destination address uses.

FortiGate reads the NAT rules from the top down until it hits a matching rule for the incoming address. This enables you to create multiple NAT policies that dictate which IP pool is used based on source address, destination address, and source port. NAT policies can be rearranged within the policy list. NAT policies are applied to network traffic after a security policy.

The central SNAT table allows you to create, edit, delete, and clone central SNAT entries.

Central SNAT notes

- The central NAT feature is not enabled by default.
- If central NAT is enabled, the NAT option under IPv4 policies is skipped and SNAT must be done via `central-snat-map`. The firewall policy list and dialog boxes have messages and redirection links to show this information.
- If NGFW mode is policy-based, then it is assumed that central NAT (specifically SNAT) is enabled implicitly.

Sample configuration

To enable central SNAT from the GUI:

1. In *System* > *Settings*, under *System Operations Settings*, enable *Central SNAT*.
2. Click *Apply*.

To enable or disable central SNAT using the CLI:

```
config system settings
   set central-nat {enable | disable}
end
```

When central NAT is enabled, *Policy & Objects* displays the Central SNAT section.

The Central SNAT policy has many options:

Field	Description
Type	Specify whether you are performing SNAT on IPv4 or IPv6. This option only appears when IPv6 is enabled under *Feature Visibility*.
Incoming Interface	Specify one or more interfaces for the ingress traffic.
Outgoing Interface	Specify one or more interfaces for the egress traffic.
Source Address	Specify the address or address group of the source.
Destination Address	Specify the address or address group of the destination.
NAT	Enable or disable to perform NAT. When disabled, no source address translation will occur.
IP Pool Configuration	Use outgoing interface address:

Field	Description
	• Use the address of the outgoing interfaces as source address. Use Dynamic IP Pool: • Choose an IP Pool to perform source NAT.
Protocol	Choose from any, TCP, UDP, SCTP, or specify the protocol number to match. For example, for ICMP, click *specify* with the protocol number 1.
Explicit port mapping	Enable in order to match this NAT policy only when the following ports are a match: • Choose an original source port from one to 65535. NAT'd port will be chosen by the FortiGate based on the IP Pool configuration. Explicit port mapping cannot apply to some protocols which do not use ports, such as ICMP. When enabling a NAT policy which uses Explicit port mapping, always consider that ICMP traffic will not match this policy. When using IP Pools, only the Overload type IP Pool allows Explicit port mapping. When Explicit port mapping is applied, you must define an original source port range and a translated sort port range. The source port will map one to one with the translated port. Refer to Dynamic SNAT to understand how each IP Pool type works.
Comments	Enter comments for this NAT policy.
Enable this policy	Enable or disable this policy.

To configure central SNAT using the CLI:

```
config firewall central-snat-map
    edit <policyID number>
        set status {enable | disable}
        set orig-addr <valid address object preconfigured on the FortiGate>
        set srcintf <name of interface on the FortiGate>
        set dst-addr <valid address object preconfigured on the FortiGate>
        set dstintf <name of interface on the FortiGate>
        set protocol <integer for protocol number>
        set dst-port <integer for destination port or port range>
        set orig-port <integer for original port number>
        set nat-port <integer for translated port number>
        set comments <string>
    next
end
```

Setting the destination port for traffic matching is available when the protocols are TCP, UDP, or SCTP.

Example one

Apply SNAT to all traffic from port2 to port3.

To configure from the CLI:

```
config firewall central-snat-map
    edit 1
        set srcintf "port3"
        set dstintf "port2"
        set orig-addr "all"
        set dst-addr "all"
    next
end
```

Example two

Apply an IP Pool to all traffic from port3 to port2 that are TCP. NAT all other traffic using the outgoing interface IP.

To configure from the CLI:

```
config firewall ippool
    edit "Overload-IPPOOL"
        set startip 192.168.2.201
        set endip 192.168.2.202
    next
end
config firewall central-snat-map
    edit 1
        set srcintf "port3"
        set dstintf "port2"
        set orig-addr "all"
        set dst-addr "all"
        set protocol 6
        set nat-ippool "Overload-IPPOOL"
    next
    edit 2
        set srcintf "port3"
        set dstintf "port2"
        set orig-addr "all"
        set dst-addr "all"
    next
end
```

To collect session table output from the CLI:

```
diagnose sys session list
```

The TCP session (protocol 6) is NAT'd with Overload-IPPOOL to 192.168.2.201:

```
session info: proto=6 proto_state=05 duration=14 expire=0 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=860/7/1 reply=555/8/1 tuples=2
tx speed(Bps/kbps): 60/0 rx speed(Bps/kbps): 38/0
orgin->sink: org pre->post, reply pre->post dev=9->6/6->9 gwy=192.168.2.1/192.168.0.10
```

```
hook=post dir=org act=snat 192.168.0.10:49531->23.57.57.114:443(192.168.2.201:61776)
hook=pre dir=reply act=dnat 23.57.57.114:443->192.168.2.201:61776(192.168.0.10:49531)
pos/(before,after) 0/(0,0), 0/(0,0)
dst_mac=04:d5:90:5f:a2:2a
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0
serial=00011065 tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x040000
```

A UDP session (protocol 17) is NAT'd to the outgoing interface IP address 192.168.2.86:

```
session info: proto=17 proto_state=01 duration=16 expire=163 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ helper=dns-udp vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=59/1/1 reply=187/1/1 tuples=2
tx speed(Bps/kbps): 3/0 rx speed(Bps/kbps): 11/0
orgin->sink: org pre->post, reply pre->post dev=9->6/6->9 gwy=192.168.2.1/192.168.0.10
hook=post dir=org act=snat 192.168.0.10:52177->4.2.2.1:53(192.168.2.86:61770)
hook=pre dir=reply act=dnat 4.2.2.1:53->192.168.2.86:61770(192.168.0.10:52177)
dst_mac=04:d5:90:5f:a2:2a
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0
serial=00011061 tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x040000
```

Example three

Apply an IP Pool to all traffic from port3 to port2 that have a specific original port range, mapping the ports to the same NAT'd port range. Nat all other traffic using the outgoing interface IP.

To configure from the CLI:

```
config firewall central-snat-map
    edit 1
        set srcintf "port3"
        set dstintf "port2"
        set orig-addr "all"
        set dst-addr "all"
        set orig-port 50000-65535
        set nat-ippool "Overload-IPPOOL"
        set nat-port 50000-65535
    next
    edit 2
        set srcintf "port3"
        set dstintf "port2"
        set orig-addr "all"
        set dst-addr "all"
    next
end
```

To collect session table output from the CLI:

```
diagnose sys session list
```

Traffic with original port in the range between 50000-65535 will be NAT'd with the Overload type IP Pool. The mapped port is in the same port range:

```
session info: proto=17 proto_state=01 duration=3 expire=176 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ helper=dns-udp vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=71/1/1 reply=123/1/1 tuples=2
tx speed(Bps/kbps): 23/0 rx speed(Bps/kbps): 40/0
orgin->sink: org pre->post, reply pre->post dev=9->6/6->9 gwy=192.168.2.1/192.168.0.10
hook=post dir=org act=snat 192.168.0.10:52540->4.2.2.1:53(192.168.2.201:52540)
hook=pre dir=reply act=dnat 4.2.2.1:53->192.168.2.201:52540(192.168.0.10:52540)
dst_mac=04:d5:90:5f:a2:2a
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0
serial=00011399 tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x040000
```

Traffic with original port outside the range of 50000-65535 will be NAT'd to the outgoing interface IP:

```
session info: proto=6 proto_state=01 duration=3 expire=3597 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=2262/10/1 reply=2526/11/1 tuples=2
tx speed(Bps/kbps): 741/5 rx speed(Bps/kbps): 828/6
orgin->sink: org pre->post, reply pre->post dev=9->6/6->9 gwy=192.168.2.1/192.168.0.10
hook=post dir=org act=snat 192.168.0.10:49805->142.250.68.66:443(192.168.2.86:62214)
hook=pre dir=reply act=dnat 142.250.68.66:443->192.168.2.86:62214(192.168.0.10:49805)
pos/(before,after) 0/(0,0), 0/(0,0)
dst_mac=04:d5:90:5f:a2:2a
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0
serial=0001139a tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x040000
```

Protocols which do not use ports, such as ICMP, will be NAT'd to the outgoing interface IP:

```
session info: proto=1 proto_state=00 duration=7 expire=59 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=480/8/1 reply=480/8/1 tuples=2
```

```
tx speed(Bps/kbps): 66/0 rx speed(Bps/kbps): 66/0
orgin->sink: org pre->post, reply pre->post dev=9->6/6->9 gwy=192.168.2.1/192.168.0.10
hook=post dir=org act=snat 192.168.0.10:1->4.2.2.1:8(192.168.2.86:62209)
hook=pre dir=reply act=dnat 4.2.2.1:62209->192.168.2.86:0(192.168.0.10:1)
dst_mac=04:d5:90:5f:a2:2a
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0
serial=0001138b tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x040000
```

Example four

In the following example, two central SNAT rules will be created:

- Rule 3 will have a destination port set and IP pool `test-ippool4-3` applied.
- Rule 5 will have IP pool `test-ippool4-1` applied but will not set the destination port.

Example traffic will then be passed to see how the rule is matched.

To test central SNAT rule destination port support:

1. Configure central SNAT rule 3 with the destination port range specified:

```
config firewall ippool
    edit "test-ippool4-3"
        set startip 172.16.200.150
        set endip 172.16.200.150
    next
end
config firewall central-snat-map
    edit 3
        set srcintf "port24"
        set dstintf "port17"
        set orig-addr "all"
        set dst-addr "all"
        set protocol 6
        set nat-ippool "test-ippool4-3"
        set dst-port 80-443
    next
end
```

2. Configure central SNAT rule 5:

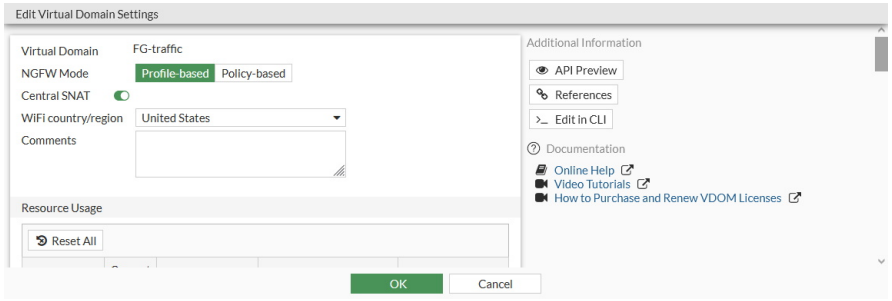
```
config firewall ippool
    edit "test-ippool4-1"
        set startip 172.16.200.151
        set endip 172.16.200.151
    next
end
config firewall central-snat-map
    edit 5
        set srcintf "port24"
        set dstintf "port17"
        set orig-addr "all"
        set dst-addr "all"
        set nat-ippool "test-ippool4-1"
```

```
    next
end
```

3. Send HTTP traffic to pass through the FortiGate that is expected to match central SNAT rule 3. IP pool `test-ippool4-3` will perform source NAT.
4. Check the session to review for expected behavior:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=2 expire=3599 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=1800/31/1 reply=77304/60/1 tuples=2
tx speed(Bps/kbps): 602/4 rx speed(Bps/kbps): 25854/206
orgin->sink: org pre->post, reply pre->post dev=24->17/17->24
gwy=172.16.200.55/10.1.100.42
hook=post dir=org act=snat 10.1.100.42:46731->172.16.200.55:80(172.16.200.150:46731)
hook=pre dir=reply act=dnat 172.16.200.55:80->172.16.200.150:46731(10.1.100.42:46731)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 policy_id=99 pol_uuid_idx=15864 auth_info=0 chk_client_info=0 vd=0
serial=00003c37 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x4000001 no_offload
no_ofld_reason:  disabled-by-policy
total session 1
```

5. Send PING traffic to pass through the FortiGate that is expected to match central SNAT rule 5. IP pool `test-ippool4-1` will perform source NAT.
6. Check the session to review for expected behavior:



```
# diagnose sys session list
session info: proto=1 proto_state=00 duration=2 expire=59 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=252/3/1 reply=252/3/1 tuples=2
tx speed(Bps/kbps): 99/0 rx speed(Bps/kbps): 99/0
orgin->sink: org pre->post, reply pre->post dev=24->17/17->24
gwy=172.16.200.55/10.1.100.42
hook=post dir=org act=snat 10.1.100.42:36732->172.16.200.55:8(172.16.200.151:36732)
hook=pre dir=reply act=dnat 172.16.200.55:36732->172.16.200.151:0(10.1.100.42:36732)
misc=0 policy_id=99 pol_uuid_idx=15864 auth_info=0 chk_client_info=0 vd=0
serial=00003f62 tos=ff/ff app_list=0 app=0 url_cat=0

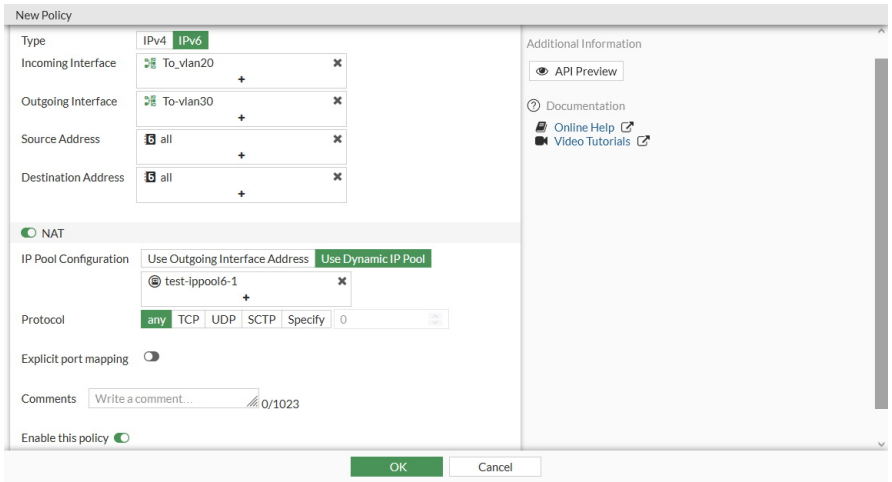
Configuring an IPv6 SNAT policy



IPv4 and IPv6 central SNAT maps are displayed in the same table.

To configure an IPv6 policy with central SNAT in the GUI:

1. Enable central SNAT:
   a. In the Global VDOM, go to *System* > *VDOM*.
   b. Select a VDOM and click *Edit*. The *Edit Virtual Domain Settings* pane opens.
   c. Enable *Central SNAT*.

   d. Click *OK*.
2. In the VDOM with central SNAT enabled (FG-traffic in this example), go to *Policy & Objects* > *Central SNAT* and click *Create New*.
3. Configure the policy settings:
   a. For *Type*, select *IPv6*.
   b. Enter the interface, address, and IP pool information.
   c. Configure the remaining settings as needed.

   d. Click *OK*.
   The matching SNAT traffic will be handled by the IPv6 central SNAT map.

To configure an IPv6 policy with central SNAT in the CLI:

1. Enable central SNAT:

```
config vdom
    edit FG-traffic
        config system settings
            set central-nat enable
        end
    next
end
```

2. Create an IPv6 central SNAT policy:

```
config vdom
    edit FG-traffic
        config firewall central-snat-map
            edit 2
                set type ipv6
                set srcintf "wan2"
                set dstintf "wan1"
                set orig-addr6 "all"
                set dst-addr6 "all"
                set nat-ippool6 "test-ippool6-1"
            next
        end
    next
end
```

3. Verify the SNAT traffic:

```
(FG-traffic) # diagnose sniffer packet any icmp6 4
interfaces=[any]
filters=[icmp6]
3.602891 wan2 in 2000:10:1:100::41 -> 2000:172:16:200::55: icmp6: echo request seq 0
3.602942 wan1 out 2000:172:16:200::199 -> 2000:172:16:200::55: icmp6: echo request seq 0
3.603236 wan1 in 2000:172:16:200::55 -> 2000:172:16:200::199: icmp6: echo reply seq 0
3.603249 wan2 out 2000:172:16:200::55 -> 2000:10:1:100::41: icmp6: echo reply seq 0
4.602559 wan2 in 2000:10:1:100::41 -> 2000:172:16:200::55: icmp6: echo request seq 1
4.602575 wan1 out 2000:172:16:200::199 -> 2000:172:16:200::55: icmp6: echo request seq 1
4.602956 wan1 in 2000:172:16:200::55 -> 2000:172:16:200::199: icmp6: echo reply seq 1
4.602964 wan2 out 2000:172:16:200::55 -> 2000:10:1:100::41: icmp6: echo reply seq 1
^C
8 packets received by filter
0 packets dropped by kernel
```

SNAT policies with virtual wire pairs

Source NAT (SNAT) can be configured in IPv4 and IPv6 policies with virtual wire pair (VWP) interfaces, and between VWP interfaces when central NAT is enabled.

To configure a policy using SNAT and a VWP interface when central NAT is disabled:

1. Create the VWP interface:

```
config system virtual-wire-pair
    edit "test-vw-1"
```

```
        set member "port1" "port4"
    next
end
```

2. Create the IP pool. The IP pool must have a different subnet than the VWP peers.

```
config firewall ippool
    edit "vwp-pool-1"
        set startip 172.16.222.99
        set endip 172.16.222.100
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 88
        set srcintf "port4"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
        set ippool enable
        set poolname "vwp-pool-1"
    next
end
```

4. Verify the IP pool functions as expected and traffic passes through:

```
# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
23.438095 port4 in 172.16.200.11 -> 172.16.200.156: icmp: echo request
23.438126 port1 out 172.16.222.100 -> 172.16.200.156: icmp: echo request
23.438492 port1 in 172.16.200.156 -> 172.16.222.100: icmp: echo reply
23.438501 port4 out 172.16.200.156 -> 172.16.200.11: icmp: echo reply
24.439305 port4 in 172.16.200.11 -> 172.16.200.156: icmp: echo request
24.439319 port1 out 172.16.222.100 -> 172.16.200.156: icmp: echo request
24.439684 port1 in 172.16.200.156 -> 172.16.222.100: icmp: echo reply
24.439692 port4 out 172.16.200.156 -> 172.16.200.11: icmp: echo reply

8 packets received by filter
0 packets dropped by kernel
```

To configure a SNAT between VWP interfaces when central NAT is enabled:

1. Enable central NAT:

```
config system settings
    set central-nat enable
end
```

2. Create the VWP interface:

```
config system virtual-wire-pair
    edit "test-vw-1"
        set member "port1" "port4"
    next
end
```

3. Create the IP pool. The IP pool must have a different subnet than the VWP peers.

```
config firewall ippool
    edit "vwp-pool-1"
        set startip 172.16.222.99
        set endip 172.16.222.100
    next
end
```

4. Configure the SNAT policy:

```
config firewall central-snat-map
    edit 2
        set srcintf "port4"
        set dstintf "port1"
        set orig-addr "all"
        set dst-addr "all"
        set nat-ippool "vwp-pool-1"
    next
end
```

5. Configure the firewall policy:

```
config firewall policy
    edit 90
        set srcintf "port4"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
end
```

Destination NAT

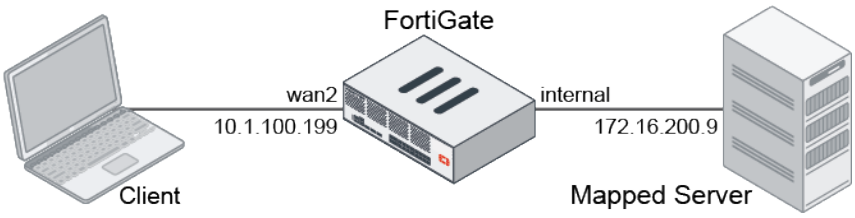
The following topics provide instructions on configuring policies with destination NAT:

- Static virtual IPs on page 1361
- Virtual IP with services on page 1363
- Virtual IPs with port forwarding on page 1365
- Virtual server load balance on page 1367
- Central DNAT on page 1375
- Configure FQDN-based VIPs on page 1379
- Remove overlap check for VIPs on page 1380
- VIP groups on page 1381

- HTTP2 connection coalescing and concurrent multiplexing for virtual server load balancing on page 1382
- Configuring PCP port mapping with SNAT and DNAT on page 1420

Static virtual IPs

Static Virtual IPs (VIP) are used to map external IP addresses to internal IP addresses. This is also called destination NAT, where a packet's destination is being NAT'd, or mapped, to a different address.



Static VIPs are commonly used to map public IP addresses to resources behind the FortiGate that use private IP addresses. A static one-to-one VIP is when the entire port range is mapped. A port forwarding VIP is when the mapping is configured on a specific port or port range.

Some of the VIP configuration options are:

Setting	Description
VIP Type	• IPv4 (`config firewall vip`) - The source and destination are both IPv4. • IPv6 (`config firewall vip6`) - The source and destination are both IPv6. **Note:** *IPv6* is only available when *IPv6* is enabled in the *Feature Visibility*.
Interface (`extintf`)	The external interface that the firewall policy source interface must match. For example, if the external interface is port1, then the VIP can be used in a policy from port1 to port3, but not in a policy from port2 to port3. If the external interface is *any*, then the VIP can be used in any firewall policy.
Type (`type`)	• Static NAT - Use an external IP address or address range. • FQDN - Use an external IP or FQDN address. • load-balance (CLI only) - Load balance traffic. • server-load-balance - Load balance traffic across multiple servers. SSL processing can be offloaded to the FortiGate. This type of VIP is configure from *Policy & Objects* > *Virtual Servers*. • dns-translation (CLI only) - DNS translation. • access-proxy - Used for ZTNA. See ZTNA HTTPS access proxy example on page 1206 for details.
External IP address/range (`extip`)	In a static NAT VIP, the external IP address is the IP address that the FortiGate listens for traffic on. When the external interface is not*any*, 0.0.0.0 can be used to make the external IP address equivalent to the external interface's IP address. The external IP address is also used to perform SNAT for the mapped server when the server outbound traffic with a destination interface that matches the external interface. The firewall policy must also have NAT enabled.
IPv4 address/range (`mappedip`)	The IPv4 address or range that the internal resource is being mapped to.
IPv6 address/range (`ipv6-mappedip`)	The IPv6 address or range that the internal resource is being mapped to.
`srcintf-filter` (CLI only)	Listen for traffic to the external IP address only on the specified interface.

Setting	Description
	While the external interface restricts the policies where the VIP can be used, it does not restrict listening to only the external interface. To restrict listening to only a specific interface, `srcint-filter` must be configured.
`nat-source-vip` (CLI only)	Force all of the traffic from the mapped server to perform SNAT with the external IP address, regardless of the destination interface. If `srcint-filter` is defined, then `nat-source-vip` only forces SNAT to be performed when the destination matches the `srcintf-filter` interface. In both cases, the firewall policy must have NAT enabled.
`arp-reply` (CLI only)	Enable/disable responding to ARP requests on the external IP address (default = enable). When a VIP object is created with `arp-reply` enabled, the object does not need to be referenced in any policies before a FortiGate interface starts responding to ARP requests for the addresses in the VIP.
Source address (`src-filter`)	Restrict the source IP address, address range, or subnet that is allowed to access the VIP.
Services (`service`)	Set the services that are allowed to be mapped.
Port Forwarding (`portforward`)	Enable port forwarding to specify the port (`mappedport`) to map to. If no services are configured, you can configure the protocol (`protocol`) to use when forwarding packets, the external service port range (`extport`) to be mapped to a port range on the destination network, and the mapped port range (`mappedport` and `ipv6-mappedport`) on the destination network.
Port Mapping Type	• One to one - Each external service port is mapped to one port. A range is allowed, but the number of ports should be the same. • Many to Many - The port mapping can be one to one, one to many, or many to one. There are no restrictions on how many external ports must map to internal ports.

Sample configuration

To create a virtual IP in the GUI:

1. In *Policy & Objects* > *Virtual IPs*.
2. Select the *Virtual IP* or *IPv6 Virtual IP* tab based on the IP versions used.
3. Click *Create new*.
4. Enter a unique name for the virtual IP.

5. Enter values for the external IP address/range and map to IPv4/IPv6 address/range fields.
6. Click *OK*.

To create a virtual IP in the CLI:

```
config firewall vip
    edit "Internal_WebServer"
        set extip 10.1.100.199
        set extintf "any"
        set mappedip "172.16.200.55"
    next
end
```

To apply a virtual IP to policy in the CLI:

```
config firewall policy
    edit 8
        set name "Example_Virtual_IP_in_Policy"
        set srcintf "wan2"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "Internal_WebServer"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

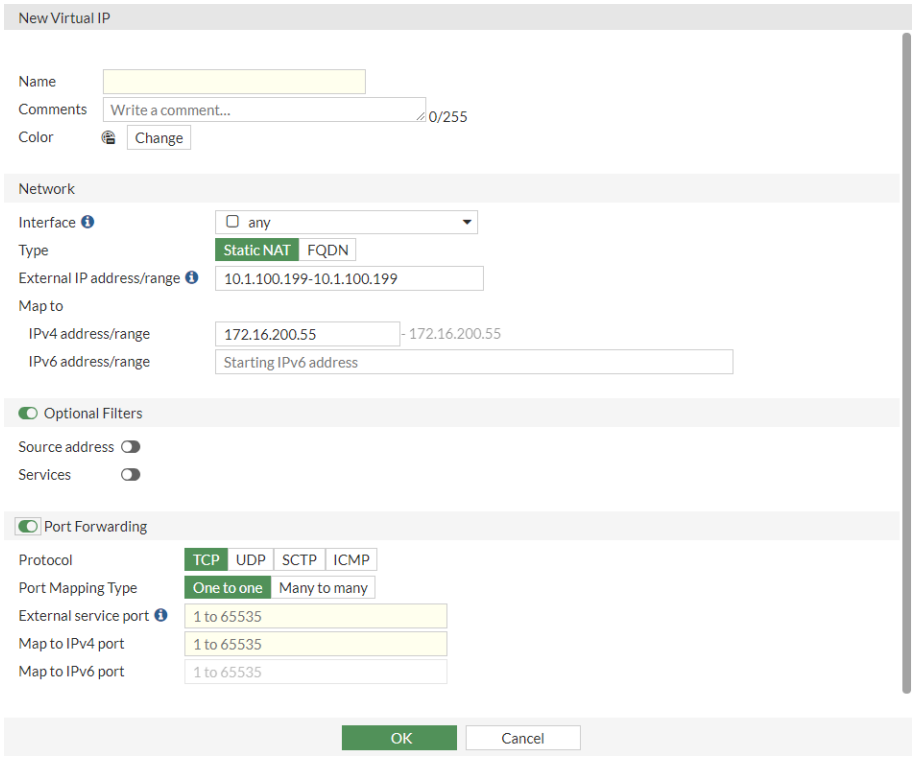
IP pools and VIPs as local IP addresses

IP pools and VIPs are considered local IP addresses if responding to ARP requests on these external IP addresses is enabled (`set arp-reply enable`, by default). In this case, the FortiGate is considered a destination for those IP addresses and can receive reply traffic at the application layer successfully.

However, as a side-effect, once an IP pool or VIP has been configured, even if it is never used in a firewall policy, the FortiGate considers it as a local address and will not forward traffic based on the routing table. Therefore, any unused IP pools or VIPs should be deleted to prevent any unexpected behavior.

For a history of behaviour changes related to IP pools and VIPs, see Technical Tip: IP pool and virtual IP behaviour changes in FortiOS 6.4, 7.0, 7.2, and 7.4.

Virtual IP with services



Virtual IP with services is a more flexible virtual IP mode. This mode allows users to define services to a single port number mapping.

This topic shows how to use virtual IP with services enabled. This example has one public external IP address. We map TCP ports 8080, 8081, and 8082 to an internal WebServer TCP port 80. This allows remote connections to communicate with a server behind the firewall.

Sample configuration

To create a virtual IP with services in the GUI:

1. In *Policy & Objects* > *Virtual IPs* and select the *Virtual IP* tab.
2. Click *Create new*.
3. Enter a unique name for the virtual IP and fill in the other fields.
4. Configure the fields in the *Network* section. For example:
   - Set *Interface* to *any*.
   - Set *External IP Address/Range* to *10.1.100.199*.
   - Set *Mapped IP Address/Range* to *172.16.200.55*.
5. Enable *Optional Filters* and then enable *Services*.
6. In the *Services* field click + to display the *Services* pane.
7. In the *Services* pane select *TCP_8080*, *TCP_8081*, and *TCP_8082*.
8. Enable *Port Forwarding* and set *Map to IPv4 port* to *80*.

9. Click *OK*.

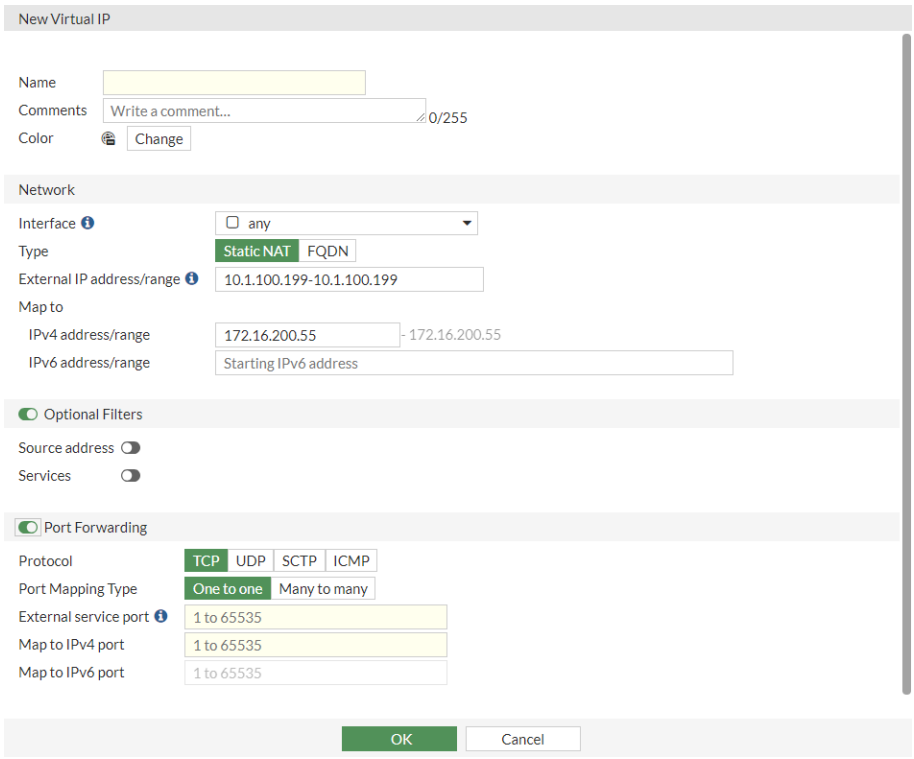
To see the results:

1. Apply the above virtual IP to the firewall policy.
2. The results are:
   - Access 10.1.100.199:8080 from external network and FortiGate maps to 172.16.200.55:80 in internal network.
   - Access 10.1.100.199:8081 from external network and FortiGate maps to 172.16.200.55:80 in internal network.
   - Access 10.1.100.199:8082 from external network and FortiGate maps to 172.16.200.55:80 in internal network.

To create a virtual IP with services in the CLI:

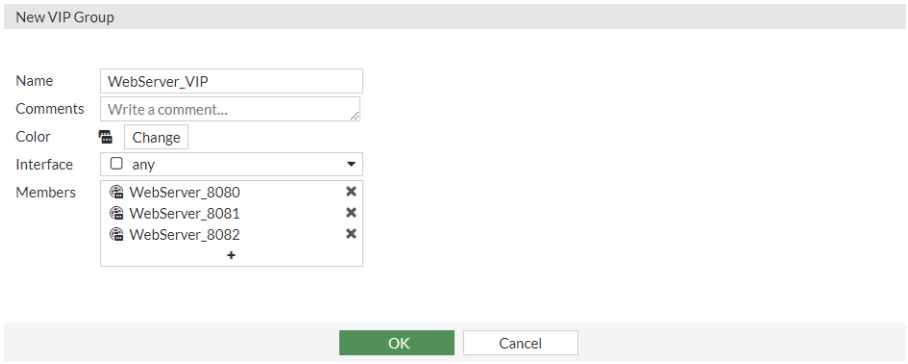
```
config firewall vip
    edit "WebServer_VIP_Services"
        set service "TCP_8080" "TCP_8081" "TCP_8082"
        set extip 10.1.100.199
        set extintf "any"
        set portforward enable
        set mappedip "172.16.200.55"
        set mappedport 80
    next
end
```

Virtual IPs with port forwarding



If you need to hide the internal server port number or need to map several internal servers to the same public IP address, enable port-forwarding for Virtual IP.

This topic shows how to use virtual IPs to configure port forwarding on a FortiGate unit. This example has one public external IP address. We map TCP ports 8080, 8081, and 8082 to different internal WebServers' TCP port 80. This allows remote connections to communicate with a server behind the firewall.



Sample configuration

To create a virtual IP with port forwarding in the GUI:

1. In *Policy & Objects* > *Virtual IPs* and select the *Virtual IP* tab.
2. Click *Create new*.
3. Enter a unique name for the virtual IP and fill in the other fields.
4. Configure the fields in the *Network* section. For example:
   - Set *Interface* to *any*.
   - Set *External IP Address/Range* to *10.1.100.199*.
   - Set *Mapped IP Address/Range* to *172.16.200.55*.
5. Leave *Optional Filters* disabled.
6. Enable *Port Forwarding*.
7. Configure the fields in the *Port Forwarding* section. For example:
   - Set *Protocol* to *TCP*.
   - Set *External Service Port* to *8080*.
   - Set *Map to IPv4 port* to *80*.

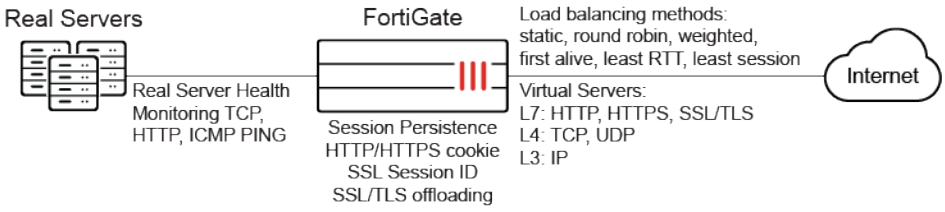
8. Click *OK*.
9. Follow the above steps to create two additional virtual IPs.
   a. For one virtual IP:
      - Use a different *Mapped IP Address/Range*, for example, *172.16.200.56*.
      - Set *External Service Port* to *8081*.
      - Use the same *Map to IPv4 port* number: *80*.
   b. For the other virtual IP:
      - Use a different *Mapped IP Address/Range*, for example, *172.16.200.57*.
      - Set *External Service Port* to *8082*.
      - Use the same *Map to IPv4 port* number: *80*.
10. Create a *Virtual IP Group* and put the above three virtual IPs into that group.

To see the results:

1. Apply the above virtual IP to the Firewall policy.
2. The results are:
   - Access 10.1.100.199:8080 from external network and FortiGate maps to 172.16.200.55:80 in internal network.
   - Access 10.1.100.199:8081 from external network and FortiGate maps to 172.16.200.56:80 in internal network.
   - Access 10.1.100.199:8082 from external network and FortiGate maps to 172.16.200.57:80 in internal network

Virtual server load balance

This topic shows a special virtual IP type: virtual server. Use this type of VIP to implement server load balancing.



The FortiOS server load balancing contains all the features of a server load balancing solution. You can balance traffic across multiple backend servers based on multiple load balancing schedules including:

- Static (failover)
- Round robin
- Weighted (to account for different sized servers or based on the health and performance of the server including round trip time and number of connections)

The load balancer supports HTTP, HTTPS, IMAPS, POP3S, SMTPS, SSL/TLS, and generic TCP/UDP and IP protocols. Session persistence is supported based on the SSL session ID based on an injected HTTP cookie, or based on the HTTP or HTTPS host. SSL/TLS load balancing includes protection from protocol downgrade attacks. Server load balancing is supported on most FortiGate devices and includes up to 10,000 virtual servers on high-end systems.

FortiOS HTTP and HTTPS server load balancing does not support load balancing based on URL routing. You can use FortiWeb server pools or FortiADC server load balancing to load balance sessions to two or more URL based routes.

Sample topology

SSL/TLS offloading

FortiGate SSL/TLS offloading is designed for the proliferation of SSL/TLS applications. The key exchange and encryption/decryption tasks are offloaded to the FortiGate unit where they are accelerated using FortiASIC technology which provides significantly more performance than a standard server or load balancer. This frees up valuable resources on the server farm to give better response to business operations. Server load balancing offloads most SSL/TLS versions including SSL 3.0, TLS 1.0, and TLS 1.2, and supports full mode or half mode SSL offloading with DH key sizes up to 4096 bits.

FortiGate SSL offloading allows the application payload to be inspected before it reaches your servers. This prevents intrusion attempts, blocks viruses, stops unwanted applications, and prevents data loss. SSL/TLS content inspection supports TLS versions 1.0, 1.1, and 1.2 and SSL versions 1.0, 1.1, 1.2, and 3.0.

Virtual server requirements

When creating a new virtual server, you must configure the following options:

- Virtual Server Type.
- Load Balancing Methods.
- Health check monitoring (optional).
- Session persistence (optional).
- Virtual Server IP (External IP Address).
- Virtual Server Port (External Port).
- Real Servers (Mapped IP Address & Port).

Virtual server types

Select the protocol to be load balanced by the virtual server. If you select a general protocol such as IP, TCP, or UDP, the virtual server load balances all IP, TCP, or UDP sessions. If you select specific protocols such as HTTP, HTTPS, or SSL, you can apply additional server load balancing features such as *Persistence* and *HTTP Multiplexing*.

HTTP	Select *HTTP* to load balance only HTTP sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced (usually port 80 for HTTP sessions). You can enable *HTTP Multiplexing*. You can also set *Persistence* to *HTTP Cookie* to enable cookie-based persistence.
HTTPS	Select *HTTPS* to load balance only HTTPS sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced (usually port 443 for HTTPS sessions). You can enable *HTTP Multiplexing*. You can also set *Persistence* to *HTTP Cookie* to enable cookie-based persistence, or you can set *Persistence* to *SSL Session ID*.
IMAPS	Select *IMAPS* to load balance only IMAPS sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced (usually port 993 for IMAPS sessions). You can also set *Persistence* to *SSL Session ID*.
POP3S	Select *POP3S* to load balance only POP3S sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced (usually port 995 for POP3S sessions). You can also set *Persistence* to *SSL Session ID*.
SMTPS	Select *SMTPS* to load balance only SMTPS sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced (usually port 465 for SMTPS sessions). You can also set *Persistence* to *SSL Session ID*.
SSL	Select *SSL* to load balance only SSL sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced. You can also set *Persistence* to *SSL Session ID*.
TCP	Select *TCP* to load balance only TCP sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced.

UDP	Select *UDP* to load balance only UDP sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced.
IP	Select *IP* to load balance all sessions accepted by the security policy that contains this virtual server.

Load balancing methods

The load balancing method defines how sessions are load balanced to real servers.

All load balancing methods do not send traffic to real servers that are down or not responding. FortiGate can only determine if a real server is not responding by using a health check monitor. You should always add at least one health check monitor to a virtual server or to real servers; otherwise load balancing might try to distribute sessions to real servers that are not functioning.

Static	The traffic load is statically spread evenly across all real servers. Sessions are not assigned according to how busy individual real servers are. This load balancing method provides some persistence because all sessions from the same source address always go to the same real server. Because the distribution is stateless, so if a real server is added, removed, or goes up or down, the distribution is changed and persistence might be lost.
Round Robin	Directs new requests to the next real server. This method treats all real servers as equals regardless of response time or the number of connections. This method does not direct requests to real servers that down or non responsive.
Weighted	Real servers with a higher weight value receive a larger percentage of connections. Set the real server weight when adding a real server.
Least Session	Directs requests to the real server that has the least number of current connections. This method works best in environments where the real servers or other equipment you are load balancing all have similar capabilities. This load balancing method uses the FortiGate session table to track the number of sessions being processed by each real server. The FortiGate unit cannot detect the number of sessions actually being processed by a real server.
Least RTT	Directs sessions to the real server with the lowest round trip time. The round trip time is determined by a ping health check monitor. The default is 0 if no ping health check monitors are added to the virtual server.
First Alive	Directs sessions to the first live real server. This load balancing schedule provides real server failover protection by sending all sessions to the first live real server. If a real server fails, all sessions are sent to the next live real server. Sessions are not distributed to all real servers so all sessions are processed by the first real server only.
HTTP Host	Load balances HTTP host connections across multiple real servers using the host's HTTP header to guide the connection to the correct real server.

Health check monitoring

In the FortiGate GUI, you can configure health check monitoring so that the FortiGate unit can verify that real servers are able respond to network connection attempts. If a real server responds to connection attempts, the load balancer continues to send sessions to it. If a real server stops responding to connection attempts, the load balancer assumes that the server is down and does not send sessions to it. The health check monitor configuration determines how the

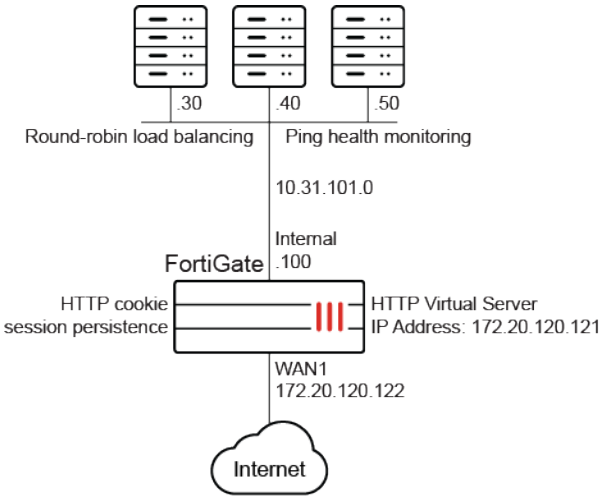
load balancer tests real servers. You can use a single health check monitor for multiple load balancing configurations. You can configure TCP, HTTP, DNS, and ping health check monitors. You usually set the health check monitor to use the same protocol as the traffic being load balanced to it. For example, for an HTTP load balancing configuration, you would normally use an HTTP health check monitor.

Session persistence

Use persistence to ensure a user is connected to the same real server every time the user makes an HTTP, HTTPS, or SSL request that is part of the same user session. For example, if you are load balancing HTTP and HTTPS sessions to a collection of eCommerce web servers, when users make a purchase, they will be starting multiple sessions as they navigate the eCommerce site. In most cases, all the sessions started by this user during one eCommerce session should be processed by the same real server. Typically, the HTTP protocol keeps track of these related sessions using cookies. HTTP cookie persistence ensure all sessions that are part of the same user session are processed by the same real server.

When you configure persistence, the FortiGate unit load balances a new session to a real server according to the load balance method. If the session has an HTTP cookie or an SSL session ID, the FortiGate unit sends all subsequent sessions with the same HTTP cookie or SSL session ID to the same real server.

Real servers



Add real servers to a load balancing virtual server to provide information the virtual server requires to send sessions to the server. A real server configuration includes the IP address of the real server and port number the real server receives sessions on. The FortiGate unit sends sessions to the real server's IP address using the destination port number in the real server configuration.

When configuring a real server, you can also specify the weight (if the load balance method is set to *Weighted*) and you can limit the maximum number of open connections between the FortiGate unit and the real server. If the maximum number of connections is reached for the real server, the FortiGate unit automatically switches all further connection requests to other real servers until the connection number drops below the limit. Setting *Maximum Connections* to 0 means that the FortiGate unit does not limit the number of connections to the real server.

Sample of HTTP load balancing to three real web servers

This example describes the steps to configure the load balancing configuration below. In this configuration, a FortiGate unit is load balancing HTTP traffic from the Internet to three HTTP servers on the internal network. HTTP sessions are accepted at the wan1 interface with destination IP address 172.20.120.121 on TCP port 8080, and forwarded from the internal interface to the web servers. When forwarded, the destination address of the session is translated to the IP address of one of the web servers.

This load balancing configuration also includes session persistence using HTTP cookies, round-robin load balancing, and TCP health monitoring for the real servers. Ping health monitoring consists of the FortiGate unit using ICMP ping to ensure the web servers can respond to network traffic.

General steps:

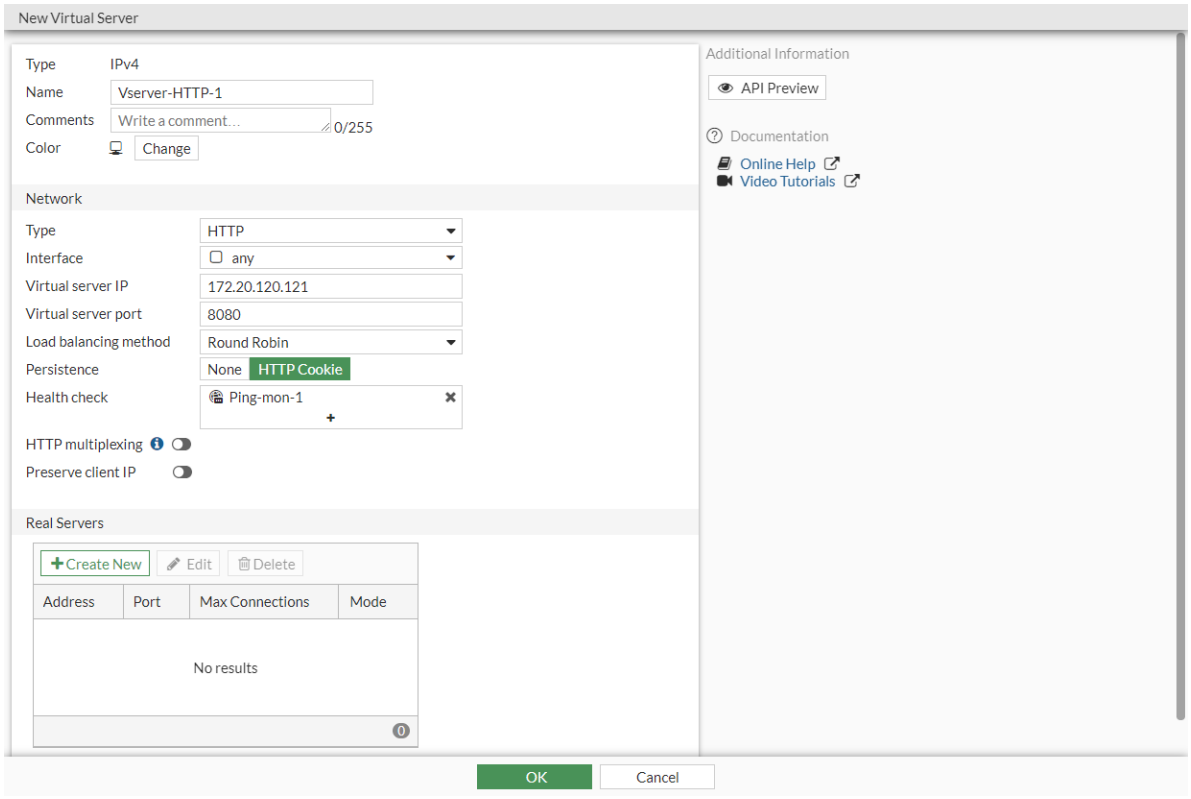
1. Create a health check monitor.

   A ping health check monitor causes the FortiGate to ping the real servers every 10 seconds. If one of the servers does not respond within 2 seconds, the FortiGate unit will retry the ping 3 times before assuming that the HTTP server is not responding.
2. Create a load balance virtual server with three real servers.
3. Add the load balancing virtual server to a policy as the destination address.

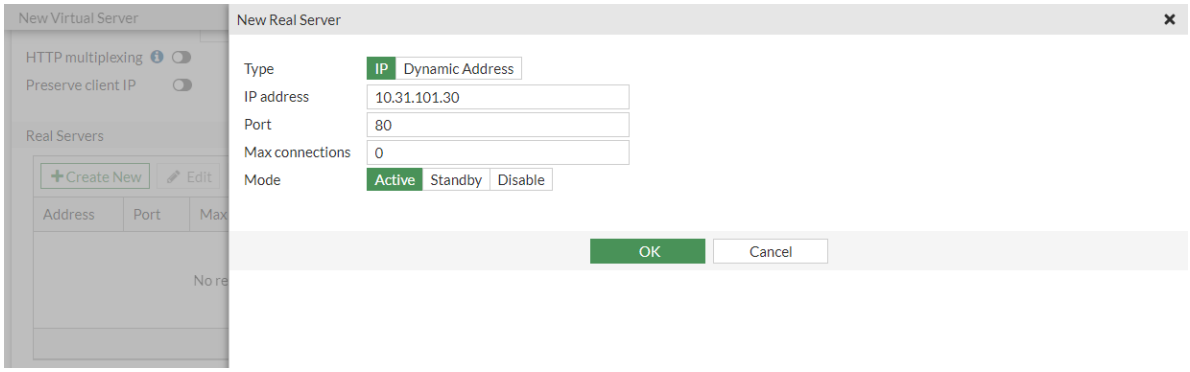
To see the virtual servers and health check monitors options in the GUI, *Load Balance* must be selected in *Feature Visibility* > *Additional Features*. See Feature visibility on page 2974 on page 1 for details.

Configure a load balancing virtual server in the GUI

To create a health check monitor:



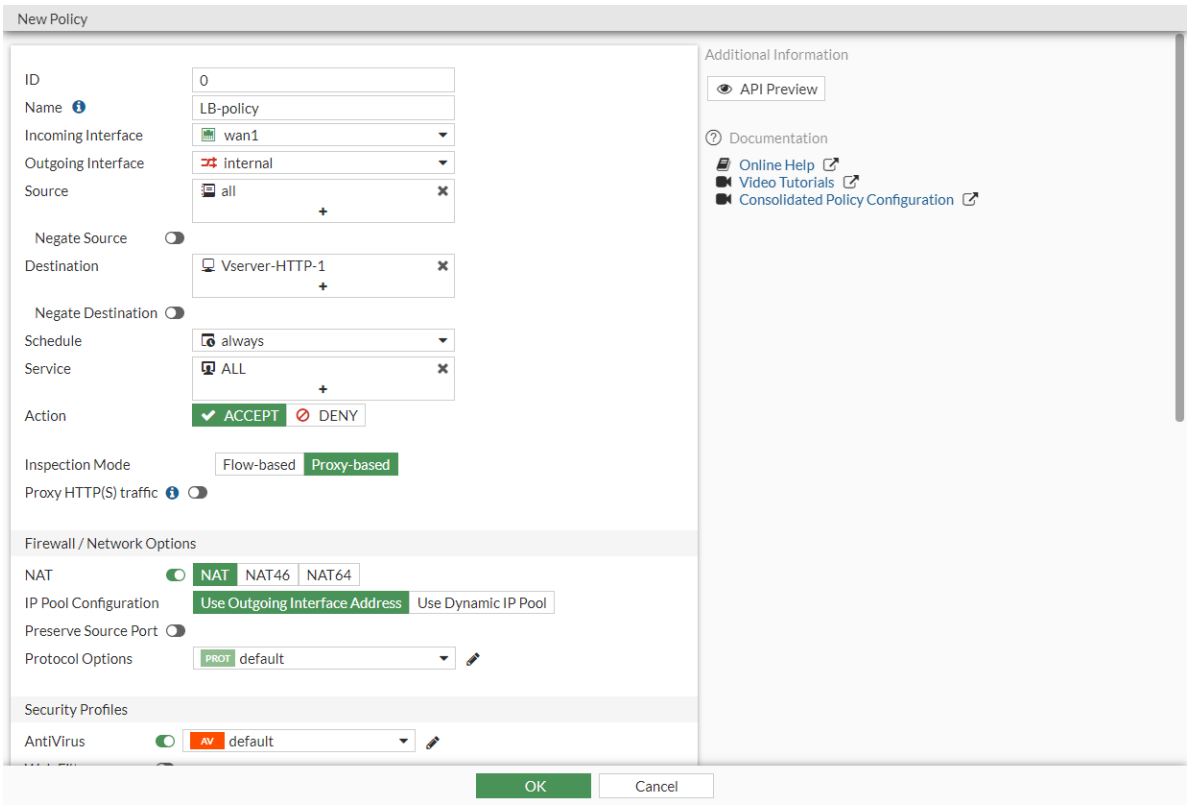
1. Go to *Policy & Objects* > *Health Check*.
2. Click *Create New*.
3. Set the following:
   - *Name* to *Ping-mon-1*
   - *Type* to *Ping*
   - *Interval* to *10* seconds
   - *Timeout* to *2* seconds
   - *Retry* to *3* attempt(s)



4. Click *OK*.

To create a virtual server:

1. Go to *Policy & Objects* > *Virtual Servers*.
2. Click *Create New*.
3. Set the following:
   - *Name* to *Vserver-HTTP-1*
   - *Type* to *HTTP*
   - *Interface* to *wan1*
   - *Virtual Server IP* to *172.20.120.121*
   - *Virtual Server Port* to *8080*
   - *Load Balance Method* to *Round Robin*
   - *Persistence* to *HTTP Cookie*
   - *Health Check* to *Ping-mon-1*



4. In the *Real Servers* table, click *Create New*.
5. Set the following for the first real server:
   - *Type* to *IP*
   - *IP Address* to *10.31.101.30*
   - *Port* to *80*
   - *Max Connections* to *0*
   - *Mode* to *Active*

6. Click *OK*. Configure two more real servers with IP addresses 10.31.101.40 and 10.31.101.50, and the same settings as the first real server.
7. Click *OK*.

To create a security policy that includes the load balance virtual server as the destination address:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Set the *Inspection Mode* to *Proxy-based*. The new virtual server will not be available if the inspection mode is *Flow-based*.
4. Set the following:
   - *Name* to *LB-policy*
   - *Incoming Interface* to *wan1*
   - *Outgoing Interface* to *internal*
   - *Source* to *all*
   - *Destination* to *Vserver-HTTP-1*
   - *Schedule* to *always*
   - *Service* to *ALL*
   - *Action* to *ACCEPT*
5. Enable *NAT* and set *IP Pool Configuration* to *Use Outgoing Interface Address*.
6. Enable *AntiVirus* and select an antivirus profile.

7. Click *OK*.

Configure a load balancing virtual server in the CLI

To configure HTTP load balancing to three real web servers in the CLI:

1. Create a health check monitor:

```
config firewall ldb-monitor
    edit "Ping-mon-1"
        set type ping
        set interval 10
        set timeout 2
        set retry 3
    next
end
```

2. Create a virtual server:

```
config firewall vip
    edit "Vserver-HTTP-1"
        set type server-load-balance
        set extip 172.20.120.121
        set extintf "any"
        set server-type http
        set monitor "Ping-mon-1"
        set ldb-method round-robin
        set persistence http-cookie
        set extport 8080
```

```
        config realservers
            edit 1
                set type ip
                set ip 10.31.101.30
                set port 80
            next
            edit 2
                set type ip
                set ip 10.31.101.40
                set port 80
            next
            edit 3
                set type ip
                set ip 10.31.101.50
                set port 80
            next
        end
    next
end
```

3. Add the load balancing virtual server to a policy as the destination address:

```
config firewall policy
    edit 2
        set name "LB-policy"
        set inspection-mode proxy
        set srcintf "wan1"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "Vserver-HTTP-1"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
        set av-profile "default"
        set fsso disable
        set nat enable
    next
end
```

Results

Traffic accessing 172.20.120.121:8080 is forwarded in turn to the three real servers.

If the access request has an http-cookie, FortiGate forwards the access to the corresponding real server according to the cookie.

Central DNAT

Central NAT allows for the central configuration of SNAT (source NAT) and DNAT (destination NAT).

To enable central NAT in the GUI:

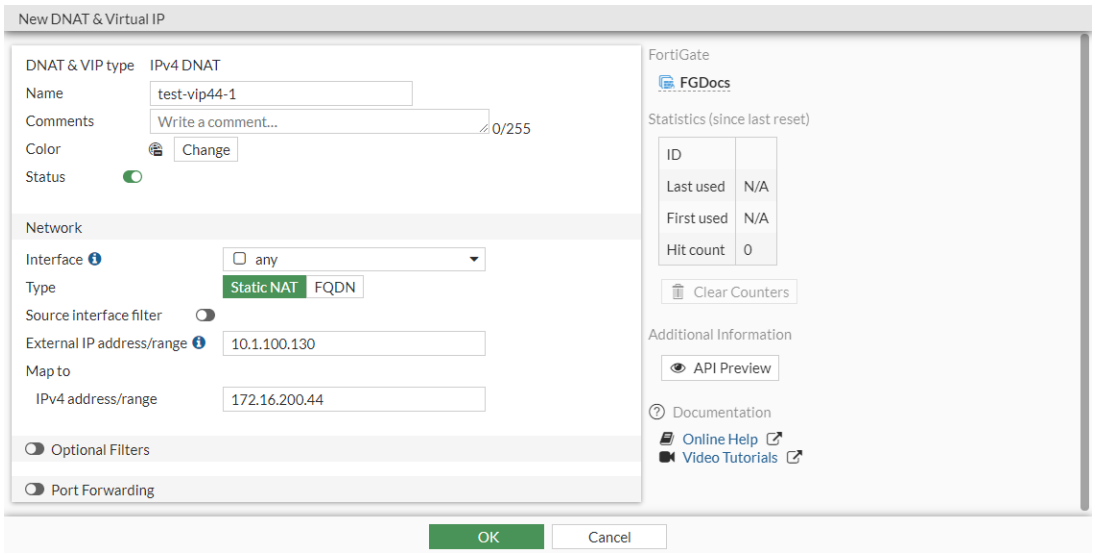
1. Go to *System* > *Settings*.
2. In the *System Operation Settings*, enable *Central SNAT*.
3. Click *Apply*.

To enable central NAT in the CLI:

```
config system settings
    set central-nat {enable | disable}
end
```

When central NAT is enabled, virtual IPs (VIPs) are not configured in the firewall policy. The VIPs are configured as separate objects where their status must be enabled.

This option is only available for IPv4 VIP and VIP46 objects.



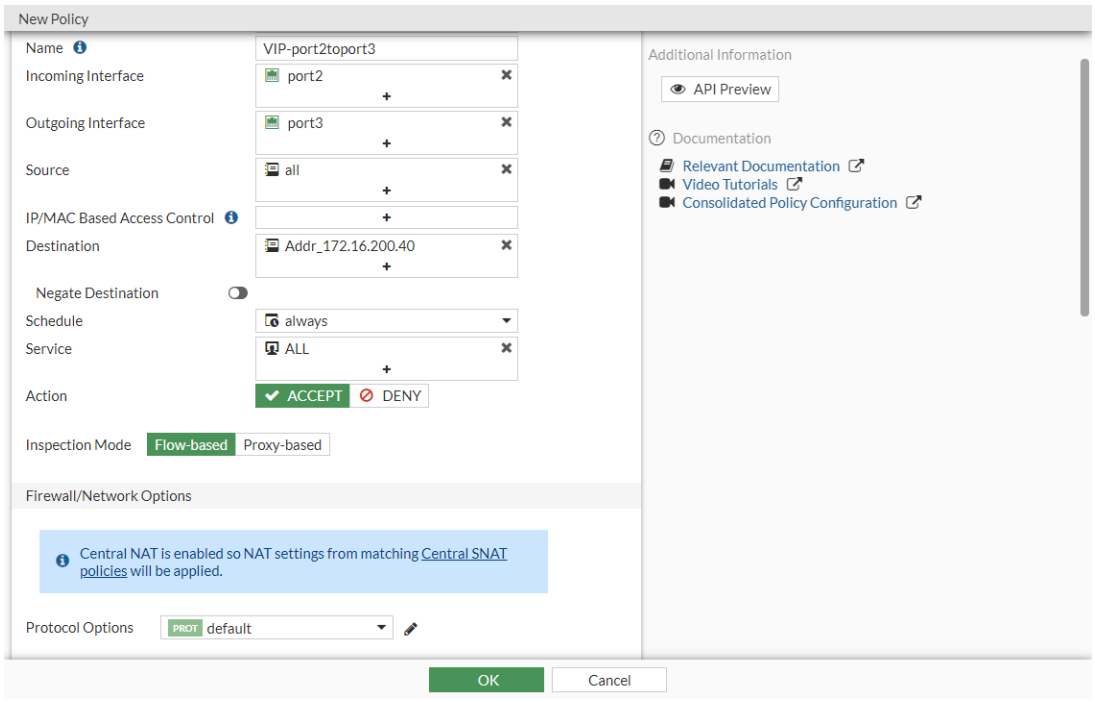
Configuring a DNAT and VIP object in central NAT mode is similar to configuring a VIP when central NAT is disabled. See Static virtual IPs on page 1361 for more information on each setting.

VIP objects can carry over when switching from non-central NAT mode to central NAT mode or vice-versa. However, if a VIP is assigned to a firewall policy in non-central NAT mode, it must be unassigned before switching to central NAT mode.

In this example, a DNAT and VIP are configured to forward traffic from 10.1.100.130 to 172.16.200.44. This example assumes that the firewall address, Addr_172.16.200.44/32, has already been configured.

To configure DNAT and a VIP in the GUI:

1. Configure the VIP:
   a. Go to *Policy & Objects* > *DNAT & Virtual IPs* and click *Create New* > *DNAT & Virtual IP*.
   b. Enter a name (*test-vip44-1*).
   c. Set the *External IP address/range* to *10.1.100.130*.
   d. Set the *Map to IPv4 address/range* to *172.16.200.44*.



e. Click *OK*.

2. Configure a firewall policy that allows traffic in the direction of the VIP:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Configure the following settings:

Name	*VIP-port2toport3*
Source	*all*
Destination	*Addr_172.16.200.40*
Schedule	*always*
Service	*ALL*
Action	*ACCEPT*

   c. Configure the other settings as needed. There is no SNAT configuration section, so central SNAT policies will be applied.

d. Click *OK*.

To configure DNAT and a VIP in the CLI:

1. Configure the VIP:

```
config firewall vip
    edit "test-vip44-1"
        set extip 10.1.100.130
        set mappedip "172.16.200.44"
        set extintf "any"
        set status enable
    next
end
```

2. Configure a firewall policy that allows traffic in the direction of the VIP:

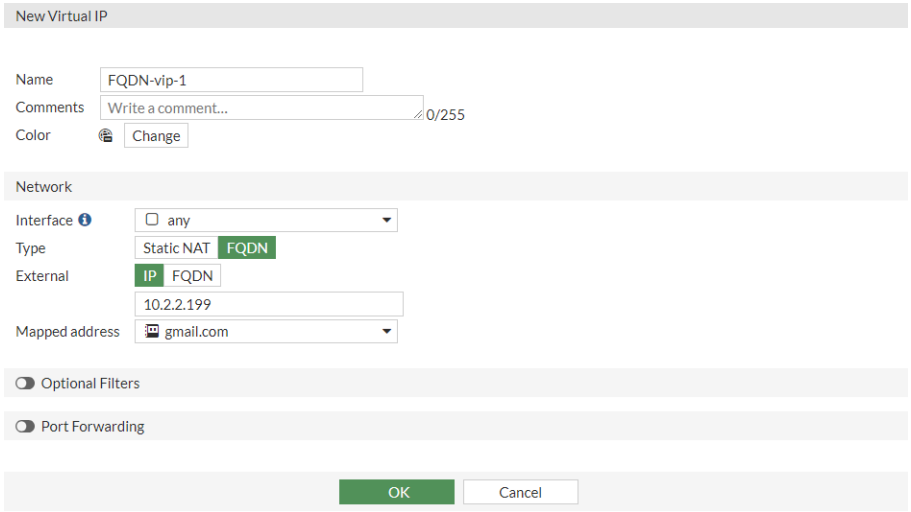
```
config firewall policy
    edit 3
        set name "VIP-port2toport3"
        set srcintf "port2"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "Addr_172.16.200.40"
        set schedule "always"
        set service "ALL"
    next
end
```

To verify the DNAT and VIP:

If the VIP status is enabled, it will appear in the VIP table:

```
# diagnose firewall iprope list 100000
policy index=7 uuid_idx=625 action=accept
flag (8000104): f_p nat pol_stats
cos_fwd=0  cos_rev=0
group=00100000 av=00000000 au=00000000 split=00000000
host=0 chk_client_info=0x0 app_list=0 ips_view=0
misc=0
zone(1): 0 -> zone(1): 0
source(1): 0.0.0.0-255.255.255.255, uuid_idx=0,
dest(1): 10.1.100.130-10.1.100.130, uuid_idx=625,
service(1):
        [0:0x0:0/(0,0)->(0,0)] helper:auto
nat(1): flag=0 base=10.1.100.130:0 172.16.200.44-172.16.200.44(0:0)
```

If the VIP status is disabled, it will not appear in the VIP table.



In this example, a one-to-one static NAT is enabled. Send a ping to 10.1.100.130, and the traffic will be forwarded to the destination 172.16.200.44.

Configure FQDN-based VIPs

In public cloud environments, sometimes it is necessary to map a VIP to an FQDN address.

To configure an FQDN-based VIP in the GUI:

1. Go to *Policy & Objects* > *Virtual IPs* and select the *Virtual IP* tab.
2. Click *Create new*.
3. Enter a name for the VIP.
4. Select an interface.
5. For *Type*, select *FQDN*.
6. For *External*, select *IP* and enter the external IP address.
7. For *Mapped address*, select an FQDN address.

8. Click *OK*.

To configure an FQDN-based VIP in the CLI:

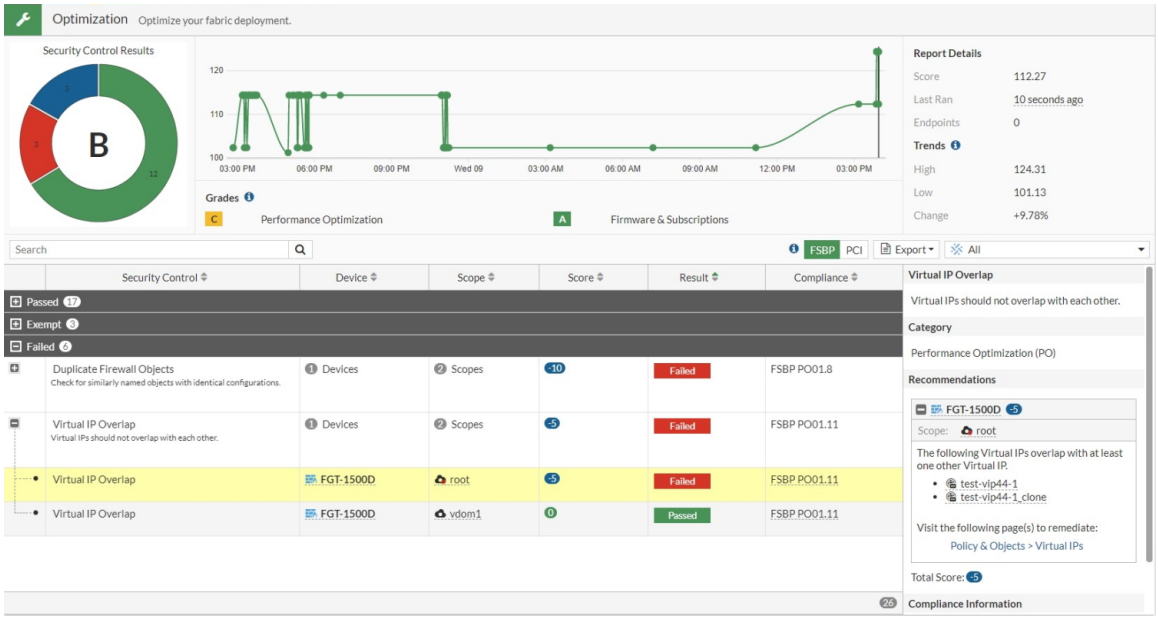
```
config firewall vip
    edit "FQDN-vip-1"
        set type fqdn
        set extip 10.2.2.199
        set extintf "any"
        set mapped-addr "destination"
    next
end
```

Remove overlap check for VIPs

There is no overlap check for VIPs, so there are no constraints when configuring multiple VIPs with the same external interface and IP. A new security rating report alerts users of any VIP overlaps.

To configure two VIPs with the same external interface and IP:

```
config firewall vip
    edit "test-vip44-1"
        set extip 10.1.100.154
        set mappedip "172.16.200.156"
        set extintf "port24"
    next
    edit "test-vip44-1_clone"
        set extip 10.1.100.154
        set mappedip "172.16.200.156"
        set extintf "port24"
        set src-filter 10.1.100.11
    next
end
```



No error message appears regarding the overlapping VIPs.

To view the security rating report:

1. Go to *Security Fabric* > *Security Rating* and click the *Optimization* scorecard.
2. Expand the *Failed* section. The *Virtual IP Overlap* results show an overlap (*test-vip44-1* and *test-vip44-1_clone*) on

the root FortiGate.

VIP groups

Virtual IP addresses (VIPs) can be organized into groups. This is useful in scenarios where there are multiple VIPs that are used together in firewall policies. If the VIP group members change, or a group member's settings change (such as the IP address, port, or port mapping type), then those changes are automatically updated in the corresponding firewall policies.

The following table summarizes which VIP types are allowed and not allowed to be members of a VIP group:

Group type	VIP types allowed as members	VIP types not allowed as members
IPv4	• Static NAT • Load balance • DNS translation • FQDN	• Access proxy • Server load balance
IPv6	• Static NAT	• Access proxy • Server load balance

Different VIP types can be added to the same group.

To configure a VIP group in the GUI:

1. Go to *Policy & Objects* > *Virtual IPs*.
2. Navigate to the *Virtual IP Group* or *IPv6 Virtual IP Group* tab.
3. Click *Create new*.
4. Enter a name.
5. Optionally, enter additional information in the *Comments* field.
6. For IPv4 groups, select the *Interface*. Select a specific interface if all of the VIPs are on the same interface; otherwise, select *any*.

7. Click the + in the *Members* field and select the members to add to the group.
8. Click *OK*.

To configure an IPv4 VIP group in the CLI:

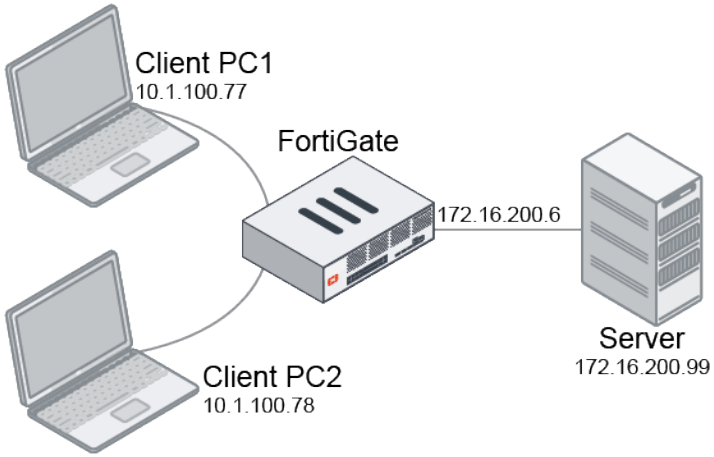
```
config firewall vipgrp
    edit <name>
        set interface <name>
        set member <vip1> <vip2> ...
    next
end
```

To configure an IPv6 VIP group in the CLI:

```
config firewall vipgrp6
    edit <name>
        set member <vip1> <vip2> ...
    next
end
```

HTTP2 connection coalescing and concurrent multiplexing for virtual server load balancing

HTTP2 connection coalescing and concurrent multiplexing allows multiple HTTP2 requests to share the same TLS connection when the destination IP is the same.



To configure the load balanced virtual server:

```
config firewall vip
    edit <name>
        set type server-load-balance
        set server-type {http | https}
        set http-multiplex {enable | disable}
        set http-multiplex-ttl <integer>
        set http-multiplex-max-request <integer>
        set http-supported-max-version {http1 | http2}
    next
end
```

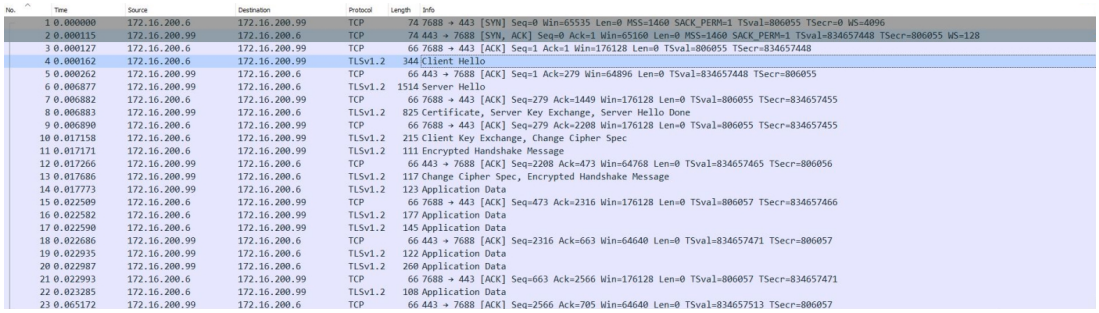
`http-multiplex {enable | disable}`	Enable/disable HTTP multiplexing.
`http-multiplex-ttl <integer>`	Set the time-to-live for idle connections to servers (in seconds, 0 - 2147483647, default = 15).
`http-multiplex-max-request <integer>`	Set the maximum number of requests that the multiplex server can handle before disconnecting (0 - 2147483647, default = 0).
`http-supported-max-version {http1 | http2}`	Set the maximum supported HTTP version: • http1: support HTTP 1.1 and HTTP1. • http2: support HTTP2, HTTP 1.1, and HTTP1 (default).

Example

In this example, multiple clients submit requests in HTTP2. The requests hit the VIP address, and then FortiGate opens a session between itself (172.16.200.6) and the server (172.16.200.99). The coalescing occurs in this session as the multiple streams share the same TLS session to connect to the same destination server.

To configure connection coalescing and concurrent multiplexing with virtual server load balancing:

1. Configure the virtual server:



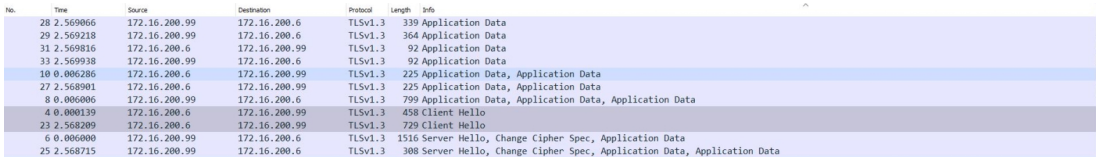
```
config firewall vip
    edit "vip-test"
        set type server-load-balance
        set extip 10.1.100.222
        set extintf "port2"
        set server-type https
        set extport 443
        config realservers
            edit 1
                set ip 172.16.200.99
                set port 443
            next
        end
        set http-multiplex enable
        set ssl-mode full
        set ssl-certificate "Fortinet_SSL"
    next
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "vip-test"
        set schedule "always"
        set service "ALL"
```

```
            set utm-status enable
            set inspection-mode proxy
            set ssl-ssh-profile "deep-inspection-clone"
            set av-profile "av"
            set logtraffic all
            set nat enable
        next
    end
```

3. Get the clients to access the VIP address (10.1.100.222). The FortiGate shares the first TLS connection with second TLS connection.
4. Verify the sniffer packet capture on the FortiGate server side. There is one client hello.



No.	Time	Source	Destination	Protocol	Length	Info
1	0.000000	172.16.200.6	172.16.200.99	TCP	74	7688 → 443 [SYN] Seq=0 Win=65535 Len=0 MSS=1460 SACK_PERM=1 TSval=806055 TSecr=0 WS=4096

12	0.017266	172.16.200.99	172.16.200.6	TCP	66	443 → 7688 [ACK] Seq=2208 Ack=473 Win=64768 Len=0 TSval=834657465 TSecr=806056
13	0.017686	172.16.200.99	172.16.200.6	TLSv1.2	117	Change Cipher Spec, Encrypted Handshake Message
14	0.017773	172.16.200.99	172.16.200.6	TLSv1.2	123	Application Data
15	0.022509	172.16.200.6	172.16.200.99	TCP	66	7688 → 443 [ACK] Seq=473 Ack=2316 Win=176128 Len=0 TSval=806057 TSecr=834657466
16	0.022582	172.16.200.6	172.16.200.99	TLSv1.2	177	Application Data
17	0.022590	172.16.200.6	172.16.200.99	TLSv1.2	145	Application Data
18	0.022686	172.16.200.99	172.16.200.6	TCP	66	443 → 7688 [ACK] Seq=2316 Ack=663 Win=64640 Len=0 TSval=834657471 TSecr=806057
19	0.022935	172.16.200.99	172.16.200.6	TLSv1.2	122	Application Data
20	0.022987	172.16.200.99	172.16.200.6	TLSv1.2	260	Application Data
21	0.022993	172.16.200.6	172.16.200.99	TCP	66	7688 → 443 [ACK] Seq=663 Ack=2566 Win=176128 Len=0 TSval=806057 TSecr=834657471
22	0.023285	172.16.200.6	172.16.200.99	TLSv1.2	108	Application Data
23	0.065172	172.16.200.99	172.16.200.6	TCP	66	443 → 7688 [ACK] Seq=2566 Ack=705 Win=64640 Len=0 TSval=834657513 TSecr=806057

5. Disable HTTP multiplexing:

```
config firewall vip
    edit "vip-test"
        config realservers
            edit 1
                set type ip
                set ip 172.16.200.99
                set port 443
            next
        end
        set http-multiplex disable
    next
end
```

6. Verify the sniffer packet capture. This time, the FortiGate does reuse the TLS connection, so there are two client hellos sent to the real server.

No.	Time	Source	Destination	Protocol	Length	Info
28	2.569066	172.16.200.99	172.16.200.6	TLSv1.3	339	Application Data
29	2.569218	172.16.200.99	172.16.200.6	TLSv1.3	364	Application Data

Examples and policy actions

The following topics provide examples and instructions on policy actions:

- NAT46 and NAT64 policy and routing configurations on page 1385
- Mirroring SSL traffic in policies on page 1396
- Recognize anycast addresses in geo-IP blocking on page 1398
- Matching GeoIP by registered and physical location on page 1399

- HTTP to HTTPS redirect for load balancing on page 1400
- Use Active Directory objects directly in policies on page 1402
- No session timeout on page 1406
- MAP-E support on page 1407
- Seven-day rolling counter for policy hit counters on page 1411
- Cisco Security Group Tag as policy matching criteria on page 1412
- Virtual patching on the local-in management interface on page 1415
- Configuring PCP port mapping with SNAT and DNAT on page 1420
- Refreshing active sessions for specific protocols and port ranges per VDOM in a specified direction on page 1425

NAT46 and NAT64 policy and routing configurations

Multiple NAT46 and NAT64 related objects are consolidated into regular objects. A per-VDOM virtual interface, naf.<vdom>, is automatically added to process NAT46/NAT64 traffic. The features include:

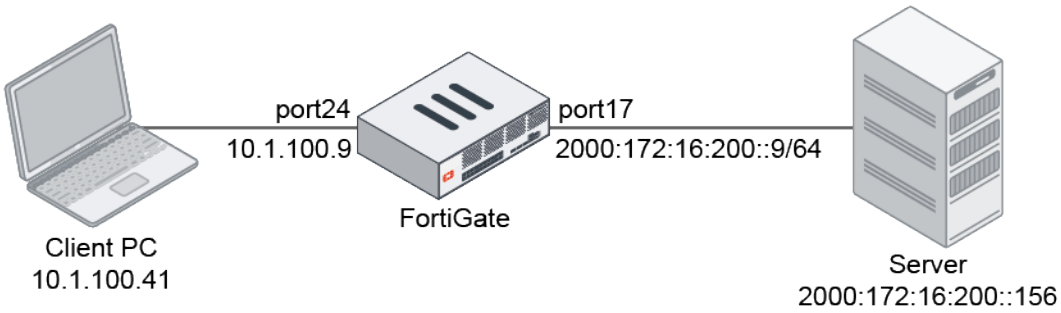
- `vip46` and `vip64` settings are consolidated in `vip` and `vip6` configurations.
- `policy46` and `policy64` settings are consolidated in `firewall policy` settings.
- `nat46`/`nat64` are included in `firewall policy` settings.
- `ippool` and `ippool6` support NAT46 and NAT64 (when enabled, the IP pool should match a subnet).
- Central SNAT supports NAT46 and NAT64.
- `add-nat46-route` in `ippool6` and `add-nat64-route` in `ippool` are enabled by default. The FortiGate generates a static route that matches the IP range in `ippool6` or `ippool` for the naf tunnel interface.

Automatic processing of the naf tunnel interface is not supported in security policies.

To configure NAT46/NAT64 translation, use the standard `vip`/`vip6` setting, apply it in a firewall policy, enable NAT46/NAT64, and enter the IP pool to complete the configuration.

The external IP address cannot be the same as the external interface IP address.

Examples

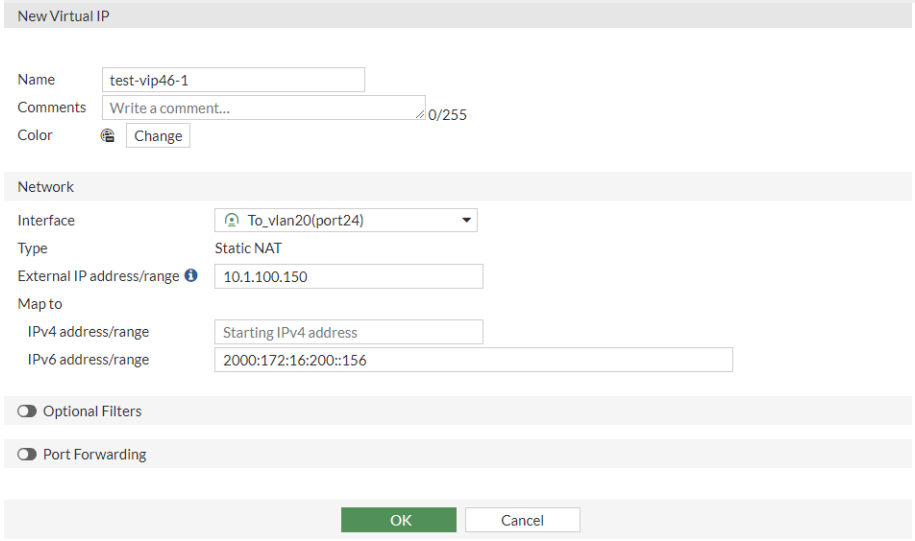


IPv6 must be enabled to configure these examples. In the GUI, so go to *System* > *Feature Visibility* and enable *IPv6*. In the CLI, enter the following:

```
config system global
    set gui-ipv6 enable
end
```

NAT46 policy

In this example, a client PC is using IPv4 and an IPv4 VIP to access a server that is using IPv6. The FortiGate uses NAT46 to translate the request from IPv4 to IPv6 using the virtual interface naf.root. An `ippool6` is applied so that the



request is SNATed to the `ippool6` address (2000:172:16:101::1 - 2000:172:16:101::1).

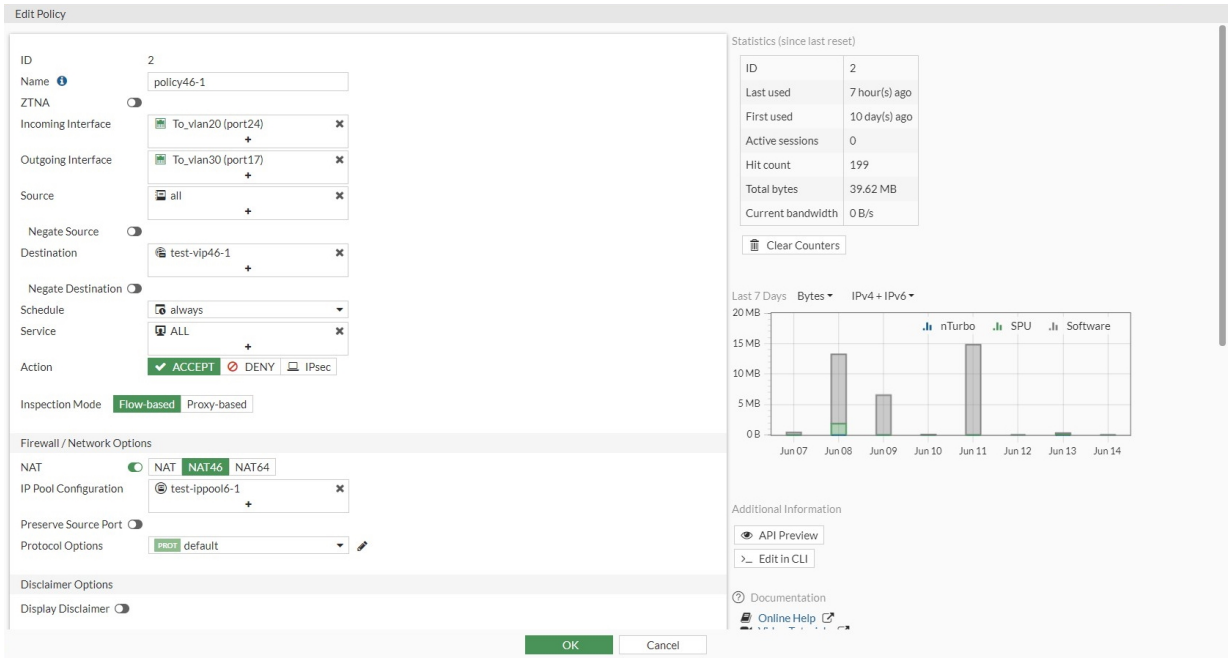
To create a NAT46 policy in the GUI:

1. Configure the VIP:
   a. Go to *Policy & Objects* > *Virtual IPs* and select the *Virtual IP* tab.
   b. Click *Create new*.
   c. Enter the following:

Name	test-vip46-1
Interface	To_vlan20
Type	Static NAT
External IP address/range	10.1.100.150
Map to IPv6 address/range	2000:172:16:200::156

   d. Click *OK*.
2. Configure the IPv6 pool:
   a. Go to *Policy & Objects* > *IP Pools* and select the *IPv6 IP Pool* tab.
   b. Click *Create new*.

c. Enter the following:



Name	test-ippool6-1
External IP address/range	2000:172:16:101::1-2000:172:16:101::1
NAT46	Enable

d. Click *OK*.

3. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New* or edit an existing policy.
   b. Enter the following:

Name	policy46-1
Incoming Interface	To_vlan20
Outgoing Interface	To_vlan30
Source	all
Destination	test-vip46-1
Schedule	always
Service	ALL
Action	ACCEPT
NAT	NAT46
IP Pool Configuration	test-ippool6-1

   c. Configure the other settings as needed.

   d. Click *OK*.

To create a NAT46 policy in the CLI:

1. Configure the VIP:

```
config firewall vip
    edit "test-vip46-1"
        set extip 10.1.100.150
        set nat44 disable
        set nat46 enable
        set extintf "port24"
        set arp-reply enable
        set ipv6-mappedip 2000:172:16:200::156
    next
end
```

2. Configure the IPv6 pool:

```
config firewall ippool6
    edit "test-ippool6-1"
        set startip 2000:172:16:101::1
        set endip 2000:172:16:101::1
        set nat46 enable
        set add-nat46-route enable
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 2
        set name "policy46-1"
        set srcintf "port24"
        set dstintf "port17"
        set action accept
        set nat46 enable
        set srcaddr "all"
        set dstaddr "test-vip46-1"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set ippool enable
        set poolname6 "test-ippool6-1"
    next
end
```

To verify the traffic and session tables:

1. Verify the traffic by the sniffer packets:

```
(root) # diagnose sniffer packet any 'icmp or icmp6' 4
interfaces=[any]
filters=[icmp or icmp6]
2.593302 port24 in 10.1.100.41 -> 10.1.100.150: icmp: echo request
2.593344 naf.root out 10.1.100.41 -> 10.1.100.150: icmp: echo request
2.593347 naf.root in 2000:172:16:101::1 -> 2000:172:16:200::156: icmp6: echo request seq
```

```
1
2.593383 port17 out 2000:172:16:101::1 -> 2000:172:16:200::156: icmp6: echo request seq
1
2.593772 port17 in 2000:172:16:200::156 -> 2000:172:16:101::1: icmp6: echo reply seq 1
2.593788 naf.root out 2000:172:16:200::156 -> 2000:172:16:101::1: icmp6: echo reply seq
1
2.593790 naf.root in 10.1.100.150 -> 10.1.100.41: icmp: echo reply
2.593804 port24 out 10.1.100.150 -> 10.1.100.41: icmp: echo reply
11 packets received by filter
0 packets dropped by kernel
```

2. Verify the session tables for IPv4 and IPv6:

```
(root) # diagnose sys session list
session info: proto=1 proto_state=00 duration=2 expire=59 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=

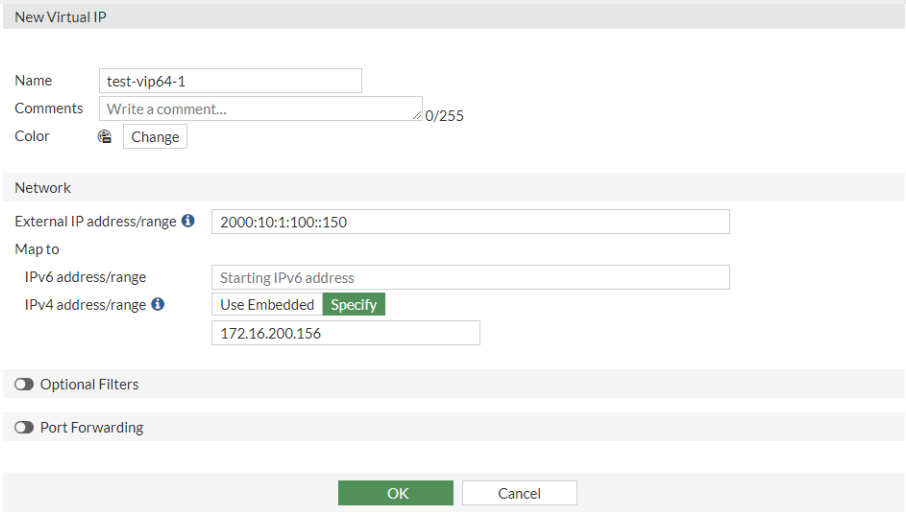
no_ofld_reason:  disabled-by-policy
total session 1
```

The IPv4 session is between the incoming physical interface port24 and naf.root. The IPv6 session is between the naf.root and the outgoing physical interface port17.

NAT64 policy

In this example, a client PC is using IPv6 and an IPv6 VIP to access a server that is using IPv4. The FortiGate uses NAT64 to translate the request from IPv6 to IPv4 using the virtual interface naf.root. An `ippool` is applied so that the request is SNATed to the `ippool` address (172.16.101.2 - 172.16.101.3).

An embedded VIP64 object is used in this configuration so a specific IPv4 mapped IP does not need to be set. The lower 32 bits of the external IPv6 address are used to map to the IPv4 address. Only an IPv6 prefix is defined. In this example, the IPv6 prefix is 2001:10:1:100::, so the IPv6 address 2001:10:1:100::ac10:c89c will be translated to 172.16.200.156.

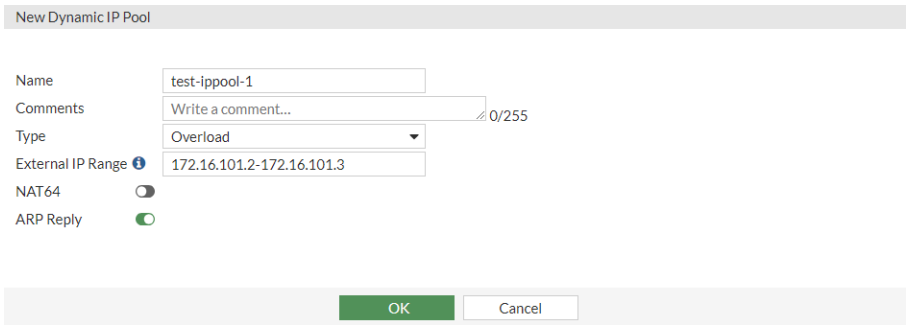


To create a NAT64 policy in the GUI:

1. Configure the VIP:
   a. Go to *Policy & Objects* > *Virtual IPs* and select the *IPv6 Virtual IP* tab.
   b. Click *Create new*.

c. Enter the following:

Name	test-vip64-1
External IP address/range	2000:10:1:100::150
Map to IPv4 address/range	**Specify**: 172.16.200.156



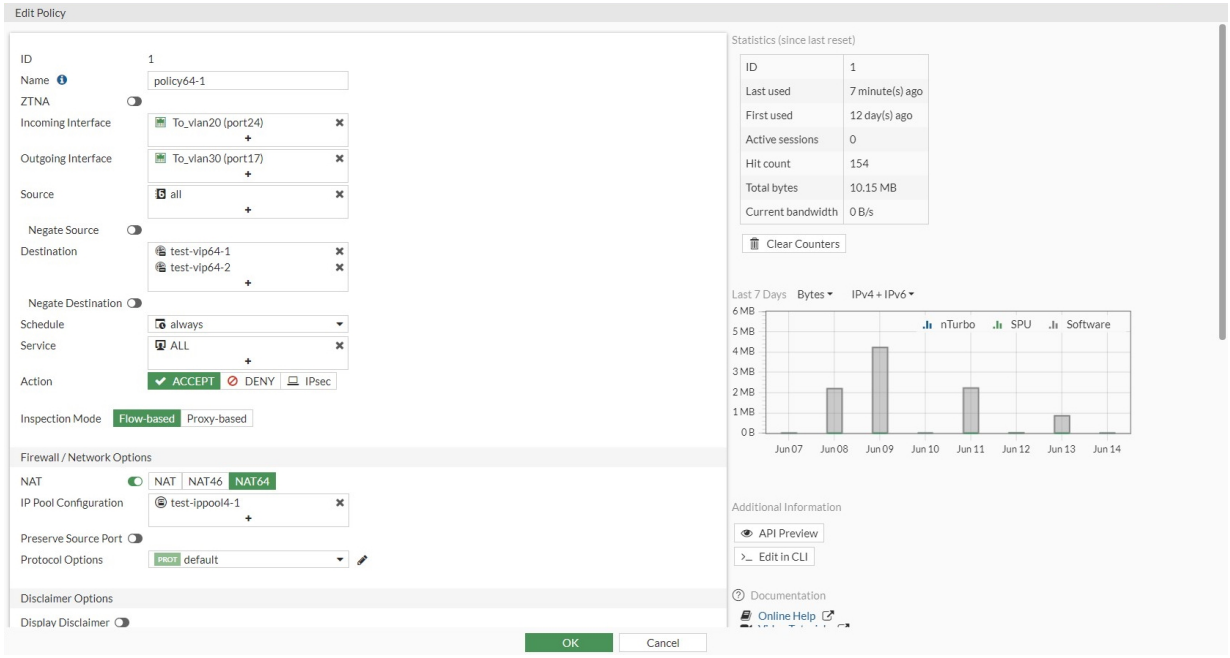
d. Click *OK*.

2. Configure the VIP with the embedded IPv4 address enabled:
   a. Go to *Policy & Objects* > *Virtual IPs* and select the *IPv6 Virtual IP* tab.
   b. Click *Create new*.
   c. Enter the following:

Name	test-vip64-2
External IP address/range	2001:10:1:100::-2001:10:1:100::ffff:ffff
Map to IPv4 address/range	Use Embedded

   d. Click *OK*.
3. Configure the IP pool:
   a. Go to *Policy & Objects* > *IP Pools* and select the *IP Pool* tab.
   b. Click *Create new*.
   c. Enter the following:

Name	test-ippool4-1
Type	Overload
External IP address/range	172.16.101.2-172.16.101.3
NAT64	Enable



d. Click *OK*.

4. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New* or edit an existing policy.
   b. Enter the following:
   c.

Name	policy64-1
Incoming Interface	To_vlan20
Outgoing Interface	To_vlan30
Source	all
Destination	test-vip64-1 test-vip64-2
Schedule	always
Service	ALL
Action	ACCEPT
NAT	NAT64
IP Pool Configuration	test-ippool4-1

d. Configure the other settings as needed.

e. Click *OK*.

To create a NAT64 policy in the CLI:

1. Configure the VIP:

```
config firewall vip6
    edit "test-vip64-1"
        set extip 2000:10:1:100::150
        set nat66 disable
        set nat64 enable
        set ipv4-mappedip 172.16.200.156
    next
end
```

2. Configure the VIP with the embedded IPv4 address enabled:

```
config firewall vip6
    edit "test-vip64-2"
        set extip 2001:10:1:100::-2001:10:1:100::ffff:ffff
        set nat66 disable
        set nat64 enable
        set embedded-ipv4-address enable
    next
end
```

3. Configure the IP pool:

```
config firewall ippool
    edit "test-ippool4-1"
        set startip 172.16.101.2
        set endip 172.16.101.3
        set nat64 enable
        set add-nat64-route enable
```

```
    next
end
```

4. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "policy64-1"
        set srcintf "port24"
        set dstintf "port17"
        set action accept
        set nat64 enable
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "test-vip64-1" "test-vip64-2"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set ippool enable
        set poolname "test-ippool4-1"
    next
end
```

To verify the traffic and session tables:

1. Verify the VIP64 traffic by the sniffer packets:

```
(root) # diagnose sniffer packet any 'icmp or icmp6' 4
interfaces=[any]
filters=[icmp or icmp6]
20.578417 port24 in 2000:10:1:100::41 -> 2000:10:1:100::150: icmp6: echo request seq 1
20.578495 naf.root out 2000:10:1:100::41 -> 2000:10:1:100::150: icmp6: echo request seq
1
20.578497 naf.root in 172.16.101.2 -> 172.16.200.156: icmp: echo request
20.578854 port17 out 172.16.101.2 -> 172.16.200.156: icmp: echo request
20.579083 port17 in 172.16.200.156 -> 172.16.101.2: icmp: echo reply
20.579093 naf.root out 172.16.200.156 -> 172.16.101.2: icmp: echo reply
20.579095 naf.root in 2000:10:1:100::150 -> 2000:10:1:100::41: icmp6: echo reply seq 1
20.579377 port24 out 2000:10:1:100::150 -> 2000:10:1:100::41: icmp6: echo reply seq 1
11 packets received by filter
0 packets dropped by kernel
```

2. Verify the session tables for IPv6 and IPv4:

```
(root) # diagnose sys session6 list
session6 info: proto=58 proto_state=00 duration=5 expire=56 timeout=0 flags=00000000
sockport=0 socktype=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log may_dirty
statistic(bytes/packets/allow_err): org=312/3/0 reply=312/3/0 tuples=2
tx speed(Bps/kbps): 55/0 rx speed(Bps/kbps): 55/0
orgin->sink: org pre->post, reply pre->post dev=24->53/53->24

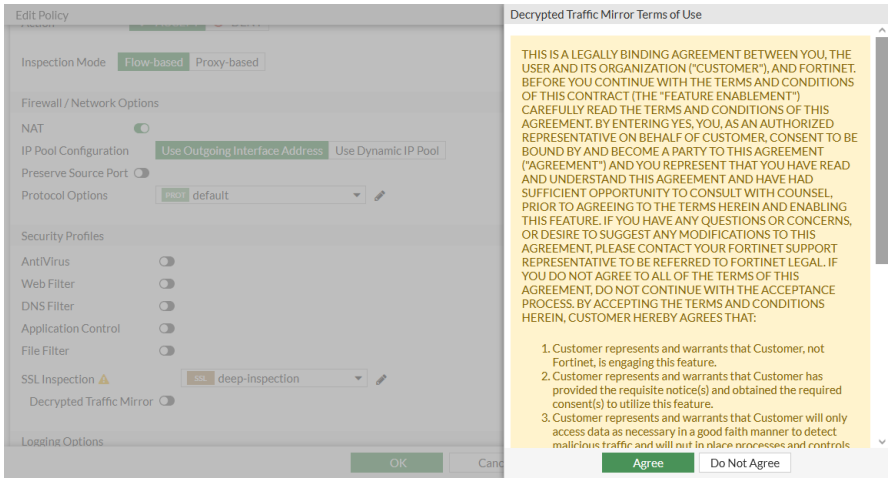
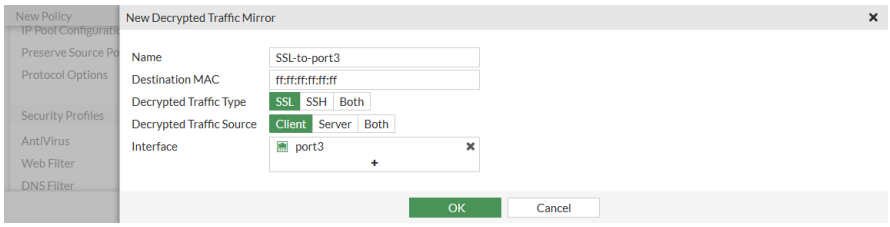
Mirroring SSL traffic in policies



SSL mirroring allows the FortiGate to decrypt and mirror traffic to a designated port. A new decrypted traffic mirror profile can be applied to IPv4, IPv6, and explicit proxy firewall policies in both flow and proxy mode. Full SSL inspection must be used in the policy for the traffic mirroring to occur.

SSL inspection is automatically enabled when you enable a security profile on the policy configuration page.



To configure SSL mirroring in a policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Create a new policy, or edit an existing one.
3. Configure the interfaces, sources, and other required information.
4. In the *Security Profiles* section, for *SSL Inspection*, select *deep-inspection*, or another profile that uses *Full SSL Inspection*.
5. Enable *Decrypted Traffic Mirror* . The terms of use agreement opens.

6. Click *Agree* to accept the terms.

7. In the drop-down list, select a decrypted traffic mirror, or click *Create* to create a new one.
   In this example, a new decrypted traffic mirror is created using the port3 interface.

8. Click *OK* to save the policy.

To configure SSL mirroring in proxy mode in the CLI:

1. Create the decrypted traffic mirror profile:

```
config firewall decrypted-traffic-mirror
    edit SSL-to-port3
        set dstmac ff:ff:ff:ff:ff:ff
        set traffic-type ssl
        set traffic-source client
        set interface port3
    next
end
```

2. Configure the policy to enable SSL traffic mirroring:

```
config firewall policy
    edit 1
        set name "mirror-policy"
        set srcintf "port1"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set ssl-ssh-profile "deep-inspection"
        set decrypted-traffic-mirror "SSL-to-port3"

THIS IS A LEGALLY BINDING AGREEMENT BETWEEN YOU, THE USER AND ITS ORGANIZATION
("CUSTOMER"), AND FORTINET. BEFORE YOU CONTINUE WITH THE TERMS AND CONDITIONS OF THIS
CONTRACT (THE "FEATURE ENABLEMENT") CAREFULLY READ THE TERMS AND CONDITIONS OF THIS
AGREEMENT. BY ENTERING YES, YOU, AS AN AUTHORIZED REPRESENTATIVE ON BEHALF OF CUSTOMER,
CONSENT TO BE BOUND BY AND BECOME A PARTY TO THIS AGREEMENT ("AGREEMENT") AND YOU
REPRESENT THAT YOU HAVE READ AND UNDERSTAND THIS AGREEMENT AND HAVE HAD SUFFICIENT
OPPORTUNITY TO CONSULT WITH COUNSEL, PRIOR TO AGREEING TO THE TERMS HEREIN AND ENABLING
THIS FEATURE. IF YOU HAVE ANY QUESTIONS OR CONCERNS, OR DESIRE TO SUGGEST ANY
MODIFICATIONS TO THIS AGREEMENT, PLEASE CONTACT YOUR FORTINET SUPPORT REPRESENTATIVE TO
BE REFERRED TO FORTINET LEGAL. IF YOU DO NOT AGREE TO ALL OF THE TERMS OF THIS
AGREEMENT, DO NOT CONTINUE WITH THE ACCEPTANCE PROCESS. BY ACCEPTING THE TERMS AND
CONDITIONS HEREIN, CUSTOMER HEREBY AGREES THAT:

1. Customer represents and warrants that Customer, not Fortinet, is engaging this
feature.
```

```
2. Customer represents and warrants that Customer has provided the requisite notice(s)
and obtained the required consent(s) to utilize this feature.

3. Customer represents and warrants that Customer will only access data as necessary in
a good faith manner to detect malicious traffic and will put in place processes and
controls to ensure this occurs.

4. Customer represents and warrants that Customer has the right to enable and utilize
this feature, and Customer is fully in compliance with all applicable laws in so doing.

5. Customer shall indemnify Fortinet in full for any of the above certifications being
untrue.

6. Customer shall promptly notify Fortinet Legal in writing of any breach of these Terms
and Conditions and shall indemnify Fortinet in full for any failure by Customer or any
of its employees or representatives to abide in full by the Terms and Conditions above.

7. Customer agrees that these Terms and Conditions shall be governed by the laws of the
State of California, without regards to the choice of laws provisions thereof and
Customer hereby agrees that any dispute related to these Terms and Conditions shall be
resolved in Santa Clara County, California, USA, and Customer hereby consents to
personal jurisdiction in Santa Clara County, California, USA.

Do you want to continue? (y/n) y

```

Recognize anycast addresses in geo-IP blocking

An anycast IP can be advertised from multiple locations and the router selects a path based on latency, distance, cost, number of hops, and so on. This technique is widely used by providers to route users to the closest server. Since the IP is hosted in multiple geographic locations, there is no way to specify one single location to that IP.

Anycast IP address ranges can be bypassed in geo-IP blocking. The ISDB contains a list of confirmed anycast IP ranges that can be used for this purpose.

When the source or destination is set to `geoip`, you can enable the `geoip-anycast` option. Once enabled, IPs where the anycast option is set to `1` in `geoip_db` are bypassed in country matching and blocking.

You can only use the CLI to configure this feature.

To enable the geoip-anycast option using the CLI:

```
config firewall policy
   edit 1
      set name "policyid-1"
      set srcintf "wan2"
      set dstintf "wan1"
      set srcaddr "all"
      set dstaddr "test-geoip-CA_1"
      set action accept
      set schedule "always"
```

```
      set service "ALL"
      set geoip-anycast enable
      set logtraffic all
      set nat enable
   next
end
```

To check the geoip-anycast option for an IP address using the CLI:

```
diagnose geoip ip2country 1.0.0.1
   1.0.0.1 - Australia, is anycast ip
```

The anycast IP is `1.0.0.1`.

Matching GeoIP by registered and physical location

IP addresses have both a physical and registered location in the geography IP database. Sometimes these two locations are different. The `geoip-match` command allows users to match an IPv4 address in an firewall policy to its physical or registered location when a GeoIP is used as a source or destination address. IPv6 policies currently support geography address objects but do not support `geoip-match`.

In the following example, the physical location of 220.243.219.10 is CA (Canada), the registered location is CN (China), and it is not an anycast IP.

To configure GeoIP matching based on registered location:

1. Create a firewall policy to match the IP:

```
config firewall policy
    edit 1
        set name "policy_id_1"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "test-geoip-CA"
        set action accept
        set schedule "always"
        set service "ALL"
        set geoip-match registered-location
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

   Since CA is applied as a destination address and registered location IP matching is enabled, if the destination IP of the traffic is 220.243.219.10, then the traffic will be blocked because the registered location is CN.

2. Verify that the policy is blocking traffic from the IP address:

```
# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
5.383798 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
6.381982 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
7.382608 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
```

```
^C
3 packets received by filter
0 packets dropped by kernel
```

To configure GeoIP matching based on physical location:

1. Create a firewall policy to match the IP:

```
config firewall policy
    edit 1
        set name "policy_id_1"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "test-geoip-CA"
        set action accept
        set schedule "always"
        set service "ALL"
        set geoip-match physical-location
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

   Since CA is applied as a destination address and physical location IP matching is enabled, if the destination IP of the traffic is 220.243.219.10, then the traffic will pass through.

2. Verify that the policy is allowing traffic from the IP address:

```
# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
5.273985 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
5.274176 wan1 out 172.16.200.10 -> 220.243.219.10: icmp: echo request
6.274426 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
6.274438 wan1 out 172.16.200.10 -> 220.243.219.10: icmp: echo request
7.273978 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
7.273987 wan1 out 172.16.200.10 -> 220.243.219.10: icmp: echo request
^C
6 packets received by filter
0 packets dropped by kernel
```

HTTP to HTTPS redirect for load balancing

You can configure a virtual server with HTTP to HTTPS redirect enabled. When enabled, a virtual server can convert a client's HTTP requests to HTTPS requests. Through this mandatory conversion, HTTP traffic is converted to HTTPS traffic. This conversion improves the security of the user network.

You can only enable this feature by using the CLI. After you enable this feature, traffic flows as follows:

- When FortiGate receives an HTTP request for an external IP, such as 10.1.100.201 in the following example, FortiGate sends an HTTP 303 response back to the original client and redirects HTTP to HTTPS, instead of forwarding the HTTP request to the real backend servers.
- The client browser restarts the TCP session to HTTPS.

- The HTTPS session comes to the FortiGate where a matching firewall policy allows the HTTPS traffic and establishes a secure SSL connection, and then forwards the request to the real backend servers.

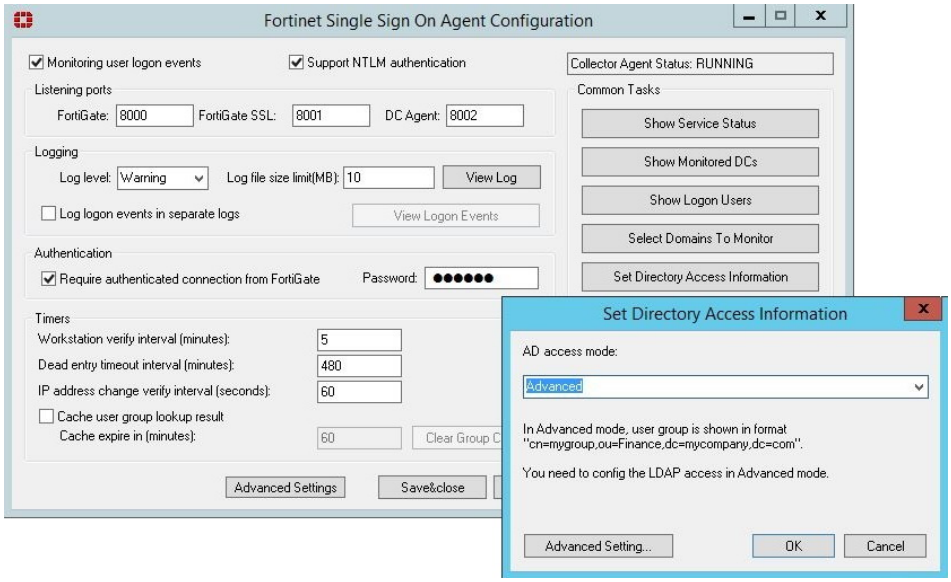
To configure virtual server with HTTPS redirect enabled:

1. Create a virtual server with `server-type` set to `http`:
```
config firewall vip
   edit "virtual-server-http"
      set type server-load-balance
      set extip 10.1.100.201
      set extintf "wan2"
      set server-type http
      set ldb-method round-robin
      set extport 80
      config realservers
         edit 1
            set ip 172.16.200.44
            set port 80
         next
         edit 2
            set ip 172.16.200.55
            set port 80
         next
      end
   next
end
```
2. Create a virtual server with `server-type` set to `https` and with the same external IP address:
```
config firewall vip
   edit "virtual-server-https"
      set type server-load-balance
      set extip 10.1.100.201
      set extintf "wan2"
      set server-type https
      set ldb-method round-robin
      set extport 443
         config realservers
            edit 1 set ip 172.16.200.44
            set port 443
         next
         edit 2
            set ip 172.16.200.55
            set port 443
         next
      end
      set ssl-certificate "Fortinet_CA_SSL"
   next
end
```
3. Enable the `http-redirect` option for the virtual server with `server-type` set to `http`:
```
config firewall vip
   edit "virtual-server-http"
      set http-redirect enable
   next
end
```
4. Add the two virtual servers to a policy:
```
config firewall policy
```

```
    edit 9
       set srcintf "wan2"
       set dstintf "wan1"
       set srcaddr "all"
       set dstaddr "virtual-server-http" "virtual-server-https"
       set action accept
       set schedule "always"
       set service "ALL"
       set inspection-mode proxy set logtraffic all
       set auto-asic-offload disable
       set nat enable
    next
end
```

Use Active Directory objects directly in policies

Active Directory (AD) groups can be used directly in identity-based firewall policies. You do not need to add remote AD groups to local FSSO groups before using them in policies.



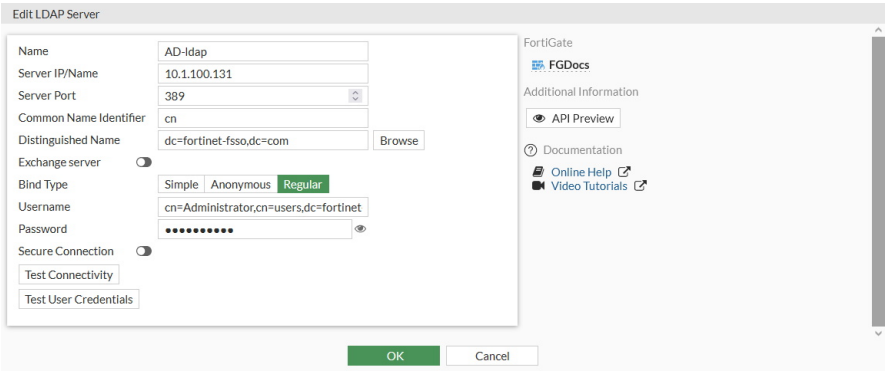
FortiGate administrators can define how often group information is updated from AD LDAP servers.

To retrieve and use AD user groups in policies:

1. Set the FSSO Collector Agent AD access mode on page 1402
2. Add an LDAP server on page 1403
3. Create the FSSO collector that updates the AD user groups list on page 1404
4. Use the AD user groups in a policy on page 1405

Set the FSSO Collector Agent AD access mode

To use this feature, you must set FSSO Collector Agent to *Advanced* AD access mode. If the FSSO Collector Agent is running in the default mode, FortiGate cannot correctly match user group memberships.



Add an LDAP server

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See Configuring an LDAP server on page 2492 and Configuring client certificate authentication on the LDAP server on page 2505.
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See Configuring least privileges for LDAP admin account authentication in Active Directory on page 2499.

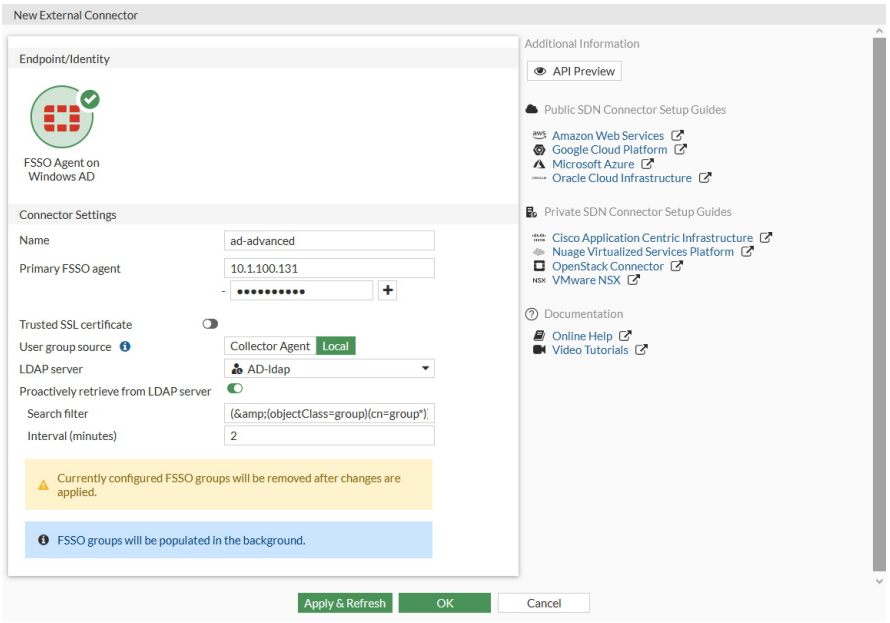
To add an LDAP server in the GUI:

1. Go to *User & Authentication* > *LDAP Servers*.
2. Click *Create New*.
3. Configure the settings as needed.

4. If secure communication over TLS is supported by the remote AD LDAP server:
   a. Enable *Secure Connection* .
   b. Select the protocol.
   c. Select the certificate from the CA that issued the AD LDAP server certificate.
   If the protocol is LDAPS, the port will automatically change to 636.
5. Click *OK*.

To add an LDAP server in the CLI:

```
config user ldap
    edit "AD-ldap"
        set server "10.1.100.131"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password XXXXXXXXXXXXXXXXXXXXXXXX
    next
end
```



Create the FSSO collector that updates the AD user groups list

To create an FSSO agent connector in the GUI:

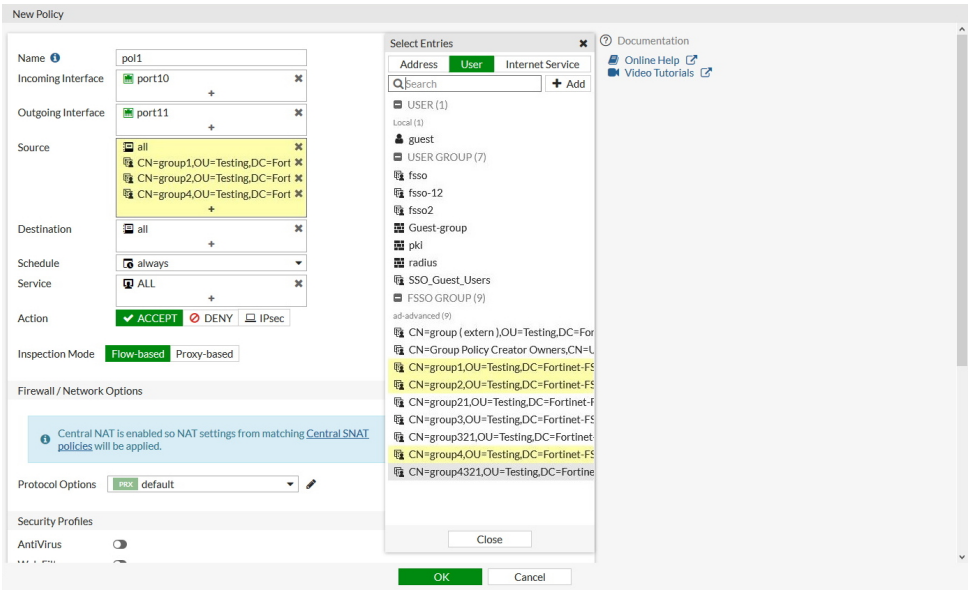
1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*.
3. In the *Endpoint/Identity* section, click *FSSO Agent on Windows AD*.
4. Fill in the *Name*
5. Set the *Primary FSSO Agent* to the IP address of the FSSO Collector Agent, and enter its password.
6. Set the *User Group Source* to *Local*.
7. Set the *LDAP Server* to the just created *AD-ldap* server.
8. Enable *Proactively Retrieve from LDAP Server*.
9. Set the *Search Filter* to *(&(objectClass=group)(cn=group*))*.

   The default search filter retrieves all groups, including Microsoft system groups. In this example, the filter is configured to retrieve *group1*, *group2*, etc, and not groups like *grp199*.

   The filter syntax is not automatically checked; if it is incorrect, the FortiGate might not retrieve any groups.
10. Set the *Interval (minutes)* to configure how often the FortiGate contacts the remote AD LDAP server to update the group information.

11. Click *OK*.
12. To view the AD user groups that are retrieved by the FSSO agent, hover the cursor over the group icon on the fabric

connector listing.



To create an FSSO agent connector in the CLI:

```
config user fsso
    edit "ad-advanced"
        set server "10.1.100.131"
        set password XXXXXXXXXXXXXX
        set ldap-server "AD-ldap"
        set ldap-poll enable
        set ldap-poll-interval 2
        set ldap-poll-filter "(&amp;(objectClass=group)(cn=group*))"
    next
end
```

You can view the retrieved AD user groups with the `show user adgrp` command.

Use the AD user groups in a policy

The AD user groups retrieved by the FortiGate can be used directly in firewall policies.

No session timeout

To allow clients to permanently connect with legacy medical applications and systems that do not have keepalive or auto-reconnect features, the session timeout can be set to never for firewall services, policies, and VDOMs.

The options to disable session timeout are hidden in the CLI.

To set the session TTL value of a custom service to never:

```
config firewall service custom
    edit "tcp_23"
        set tcp-portrange 23
        set session-ttl never
    next
end
```

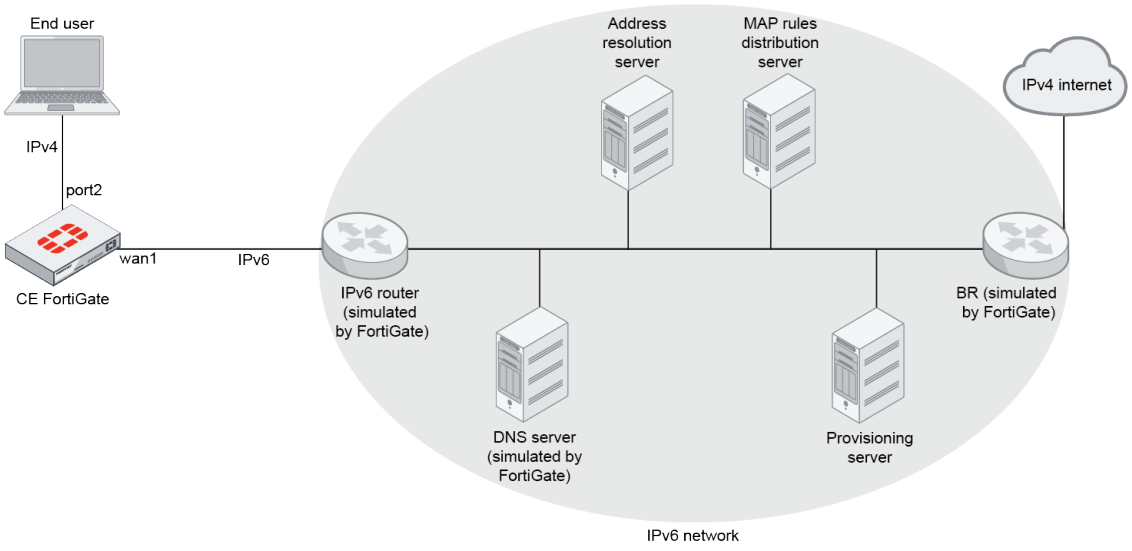
To set the session TTL value of a policy to never:

```
config firewall policy
    edit 201
        set srcintf "wan1"
        set dstintf "wan2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "TCP_8080"
        set logtraffic disable
        set session-ttl never
        set nat enable
    next
end
```

To set the session TTL value of a VDOM to never:

```
config system session-ttl
    set default never
    config port
        edit 1
            set protocol 6
            set timeout never
            set start-port 8080
            set end-port 8080
        next
    end
end
```

To view a session list with the timeout set to never:



```
# diagnose sys session list

session info: proto=6 proto_state=01 duration=9 expire=never timeout=never flags=00000000
sockflag=00000000 sockport=0 av_idx=0 use=3

MAP-E support

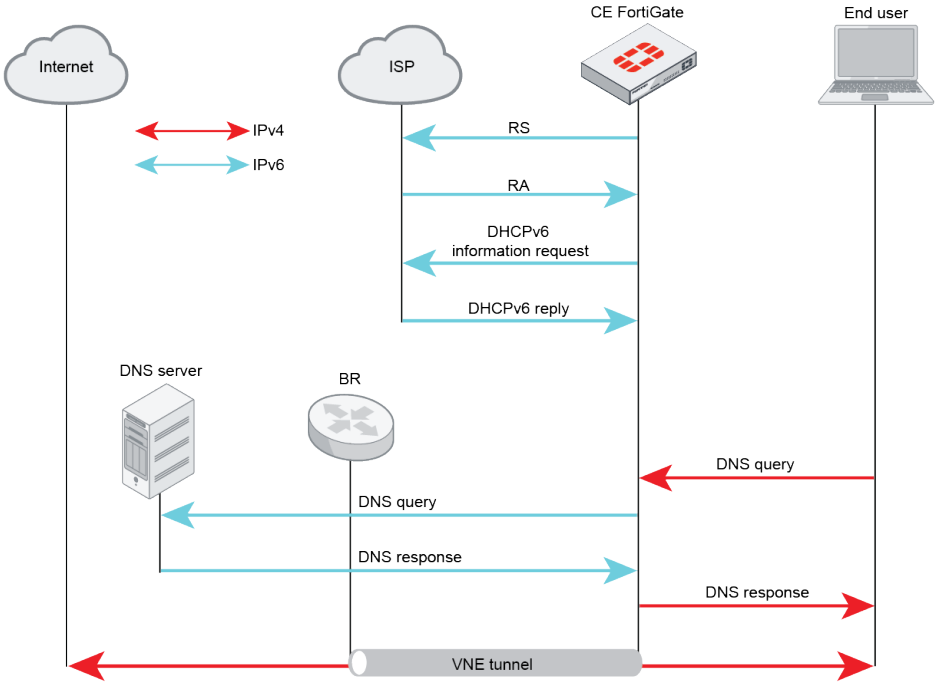
On a customer edge (CE) FortiGate, an IPv4-over-IPv6 (MAP-E) tunnel can be created between the FortiGate and the border relay (BR) operating in an IPv6 network. A tunnel interface is created between the FortiGate and BR, which can be applied to firewall policies and IPsec VPN.

To configure a MAP-E tunnel between the FortiGate and the BR:

1. Configure fixed IP mode.
   a. Configure IPv6 on the interface:

```
config system interface
    edit "wan1"
        config ipv6
            set autoconf enable
            set unique-autoconf-addr enable
            set interface-identifier ::6f:6c1f:3400:0
```

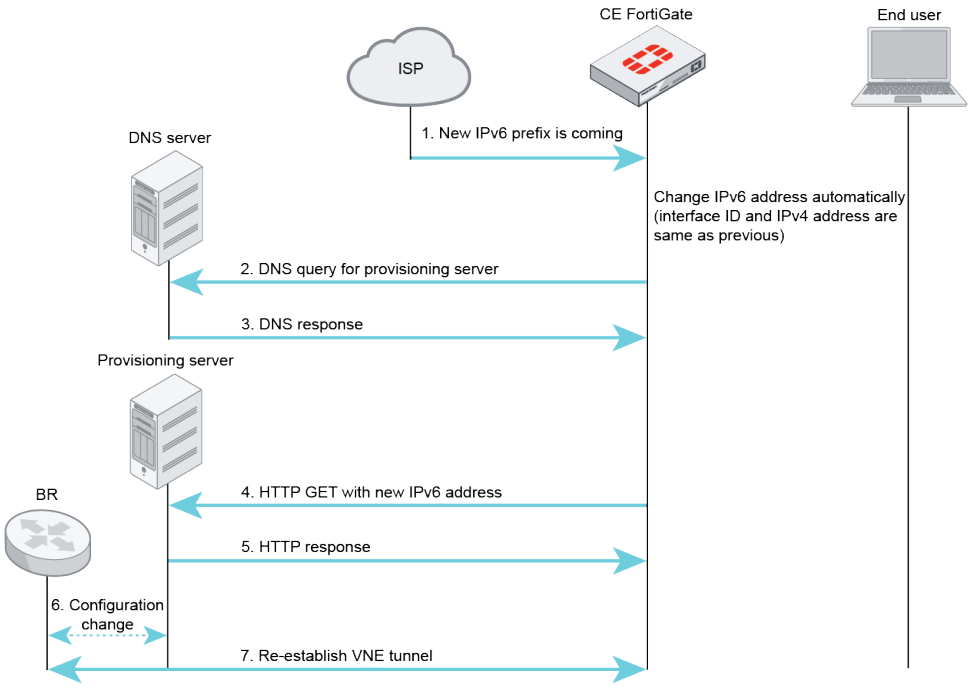
```
        end
    next
end
```



The `interface-identifier` is an IPv6 address. Its last 64-bit will be kept and the rest will be cleared automatically. It will combine with the IPv6 prefix it gets from the IPv6 router to generate the IPv6 address of the interface.

By default, `unique-autoconf-addr` is disabled. It must be enabled so it can handle IPv6 prefix changing.

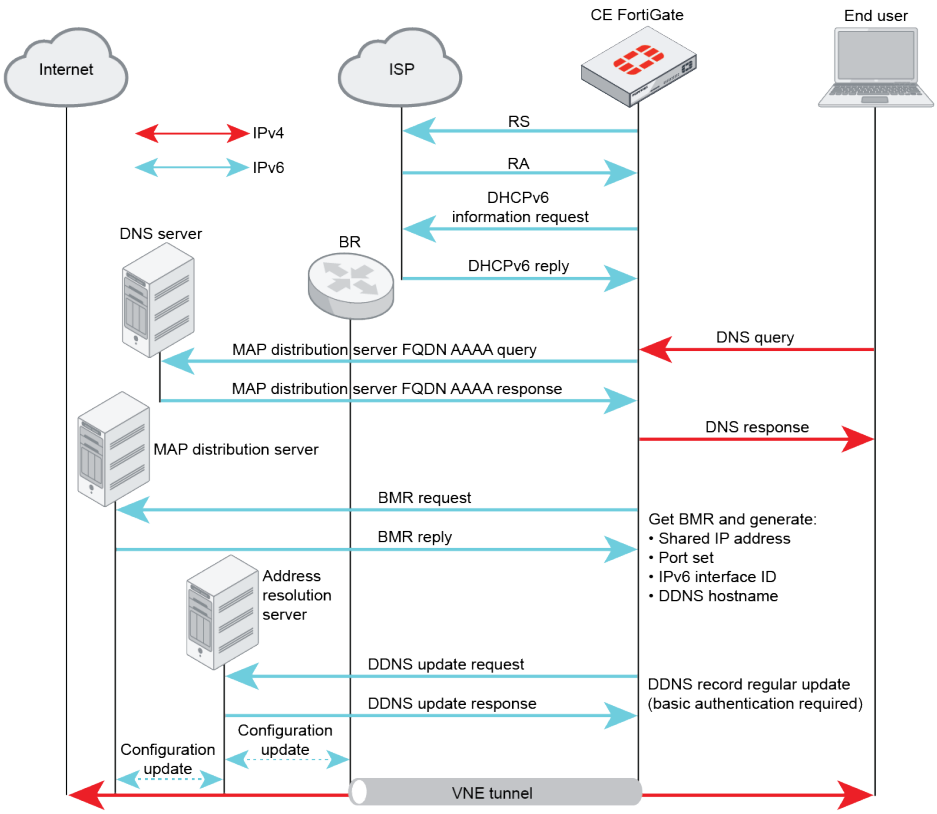
b. Configure the VNE tunnel:



```
config system vne-tunnel
    set status enable
    set interface "wan1"
    set mode fixed-ip
    set ipv4-address 10.10.81.81 255.255.255.0
    set br 2001:160::82
    set update-url "http://qa.forosqa.com/update?user=xxxx&pass=yyyy"
end
```

Initial sequence overview of VNE tunnel under fixed IP mode:

Once the IPv6 address of the FortiGate changes, the tunnel will be down because the BR does not know the FortiGate's new IPv6 address. The FortiGate uses `update-url` to update the new IPv6 address to the provisioning server. The provisioning server updates the FortiGate's IPv6 address to the BR so the VNE tunnel can be re-established.



Communication sequence overview of re-establishing VNE tunnel:

2. Configure the VNE tunnel to use MAP-E mode:

```
config system vne-tunnel
    set status enable
    set interface 'wan1'
    set ssl-certificate "Fortinet_Factory"
    set bmr-hostname ********
    set auto-asic-offload enable
    set mode map-e
end
```

Initial sequence overview of VNE tunnel under MAP-E mode:

The FortiGate sends a MAP rule request to the MAP distribution server once the IPv6 address is configured on the FortiGate by RS/RA. Next, the FortiGate will send an AAAA query to get the IPv6 address of the MAP distribution server. After sending the BMR request to the MAP distribution server, the FortiGate will get the IPv4 address, port set, BR IPv6 address, and hostname of the address resolution server from the BMR reply. The VNE tunnel between the FortiGate and BR is now established.

The address resolution server is actually a dynamic DNS. The hostname is used for the FortiGate to maintain an IPv6 address when it changes.

The FortiGate updates the DDNS server with its IPv6 address whenever it updates, which in turn provides the update to the MAP distribution server and BR so they know how to resolve the FortiGate by hostname.

Once the VNE tunnel is established, a tunnel interface is created (`vne.root`), and an IPv4-over-IPv6 tunnel is set up between the FortiGate and BR. The route, firewall policy, and DNS server can now be configured to let the traffic go through the VNE tunnel and the and protect the end-user. The VNE tunnel can also be used in IPsec phase 1.

3. Configure the route:

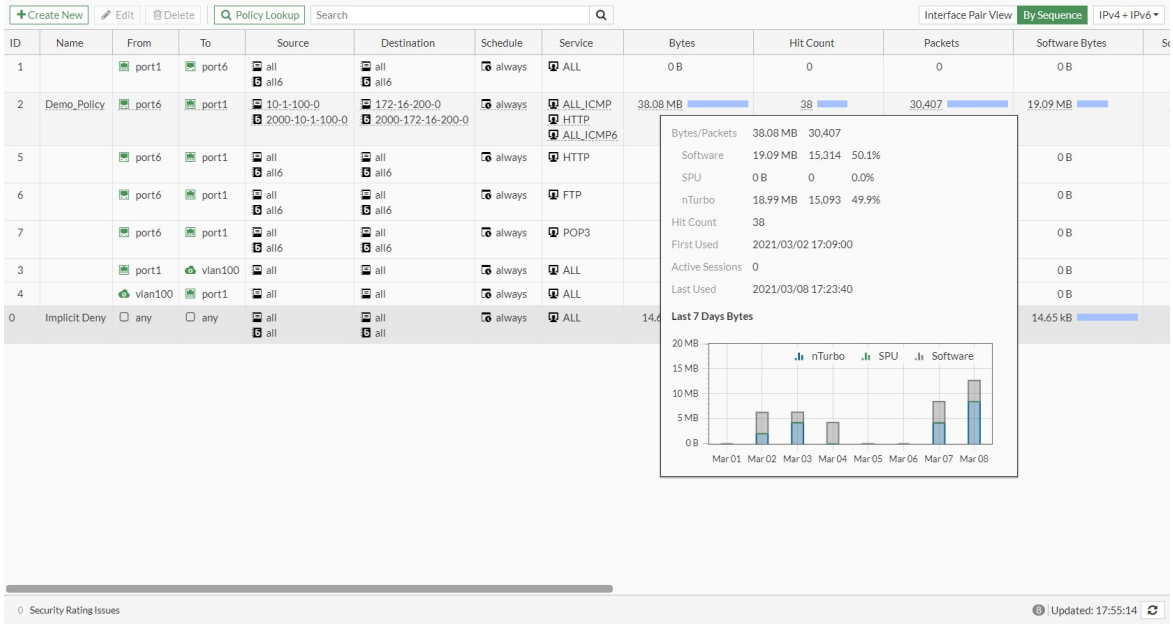
```
config router static
    edit 1
        set device "vne.root"
    next
end
```

4. Configure the firewall policy:

```
config firewall policy
    edit 111
        set name "ff"
        set srcintf "port2"
        set dstintf "vne.root"
```

```
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
        set av-profile "default"
        set nat enable
    next
end
```

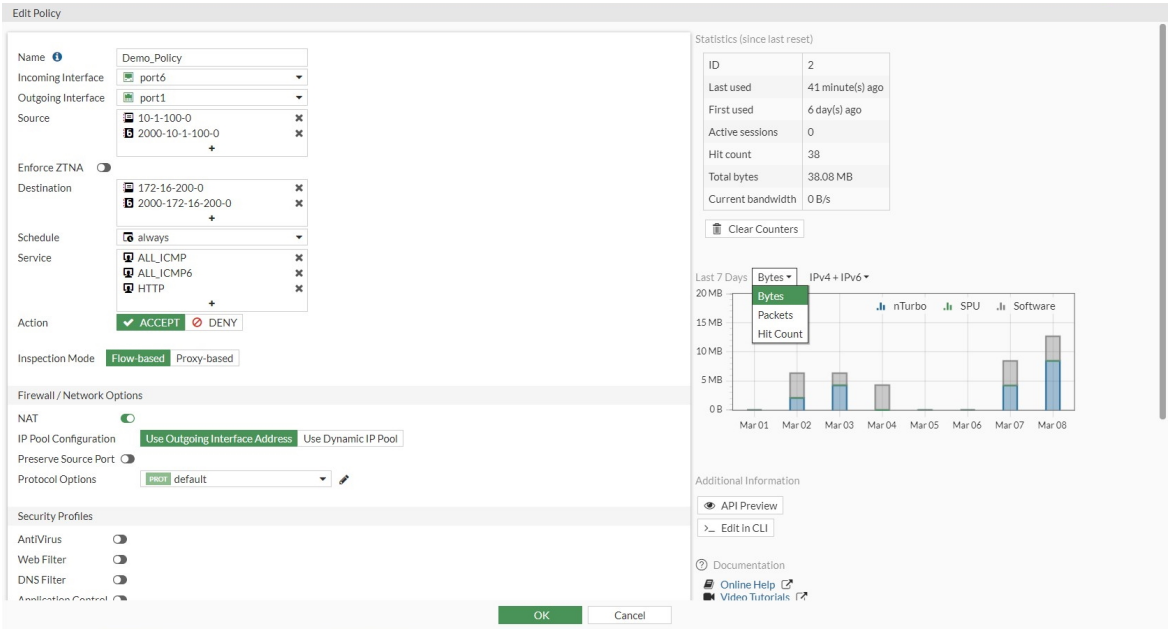
5. Configure the DNS server:



```
config system dns-server
    edit "port2"
    next
end
```

Seven-day rolling counter for policy hit counters

Instead of storing a single number for the hit count and byte count collected since the inception of each policy, seven numbers for the last seven days and an active counter for the current day are stored. The past seven-day hit count is displayed in the policy list and policy pages. A seven-day bar chart shows statistics on each policy page. This feature is currently supported in firewall and multicast policies, but not security policies.



To view the rolling counter information in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* or *Policy & Objects* > *Multicast Policy*.
2. Select a policy and hover over the *Bytes*, *Packets*, or *Hit Count* values to view the tooltip with the corresponding traffic statistics and bar graph (this example uses firewall policies).

3. Click *Edit*. The policy traffic statistics appear in the right-hand side of the page.

4. Use the dropdowns to filter the bar graph data by counter (*Bytes*, *Packets*, or *Hit Count*) and policy type (*IPv4*, *IPv6*, or *IPv4 + IPv6*).

5. Optionally, click *Clear Counters* to delete the traffic statistics for the policy.
6. Click *OK*.

To view the rolling counter information in the CLI:

```
# diagnose firewall iprope show 100004 2
idx=2 pkts/bytes=14709/18777329 asic_pkts/asic_bytes=8087/10413737 nturbo_pkts/nturbo_

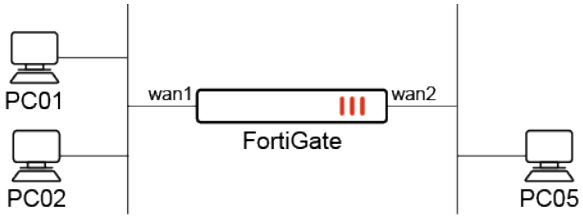
```

Cisco Security Group Tag as policy matching criteria

The FortiGate can read the Cisco Security Group Tag (SGT) in Ethernet frames, and use them as matching criteria in firewall policies. A policy can match based on the presence of an SGT, or the detection of a specific ID or IDs.

When a packet with a SGT passes through and a session is established, the `ext_header_type=0xc5:0xc5` flag is included in the session table.



This feature is available in flow mode policies for virtual wire pair policies or policies in transparent mode VDOMs.

To configure a firewall policy to detect SGTs in Ethernet frames:

```
config firewall policy
    edit 1
        set sgt-check {enable | disable}
        set sgt <ID numbers>
    next
end
```

Examples

In these examples, wan1 and wan2 are in a virtual wire pair. Firewall policies are created that pass traffic with SGTs with a specific ID number, any ID number, or either of two specific ID numbers.

To configure the virtual wire pair:

```
config system virtual-wire-pair
    edit "test-vwp-1"
        set member "wan1" "wan2"
        set wildcard-vlan enable
    next
end
```

To configure a firewall policy to match frames that have an SGT with ID 20 and allow them through:

```
config firewall policy
    edit 1
        set srcintf "wan1"
        set dstintf "wan2"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set sgt-check enable
        set sgt 20
    next
end
```

To configure a firewall policy to match frames that have an SGT with any ID:

```
config firewall policy
    edit 1
        set srcintf "wan1"
        set dstintf "wan2"
        set action accept
        set srcaddr "all"
```

```
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set sgt-check enable
    next
end
```

To configure a firewall policy to match frames that have the SGT with IDs 20 or 21:

```
config firewall policy
    edit 1
        set srcintf "wan1"
        set dstintf "wan2"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set sgt-check enable
        set sgt 20 21
    next
end
```

Processing only Ethernet frames with a Cisco Security Group Tag

In this example, an Ethernet frame is sent from PC01 with an SGT tag (ID 20), which can pass through to PC05 based on any of the firewall policies in the previous examples.

To verify the configuration:

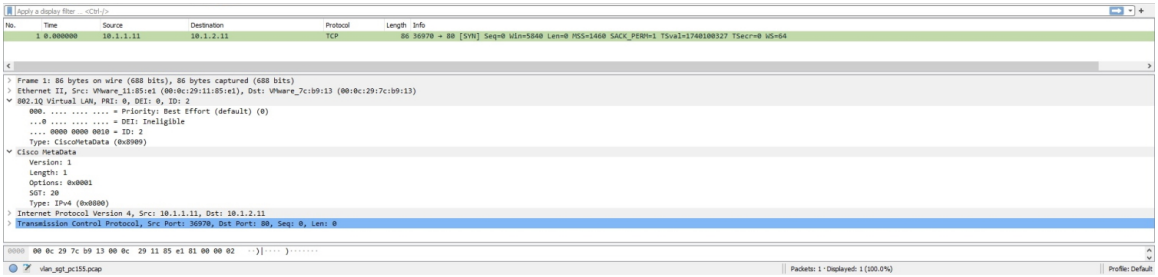
```
# diagnose sys session list

session info: proto=6 proto_state=01 duration=10 expire=3593 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log may_dirty br dst-vis f00
statistic(bytes/packets/allow_err): org=112/2/1 reply=60/1/1 tuples=2
tx speed(Bps/kbps): 10/0 rx speed(Bps/kbps): 5/0
orgin->sink: org pre->post, reply pre->post dev=13->10/10->13 gwy=0.0.0.0/0.0.0.0
hook=pre dir=org act=noop 10.1.1.11:36970->10.1.2.11:80(0.0.0.0:0)
hook=post dir=reply act=noop 10.1.2.11:80->10.1.1.11:36970(0.0.0.0:0)
pos/(before,after) 0/(0,0), 0/(0,0)
dst_mac=00:b0:e1:22:cf:e4
misc=0 policy_id=1 auth_info=0 chk_client_info=0 vd=1
serial=0000183c tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  disabled-by-policy
ext_header_type=0xc5:0xc5
total session 1
```

Processing Ethernet frames with a Cisco Security Group Tag and VLAN tag

The FortiGate has the ability to process Ethernet frames with both the Cisco Security Group Tag and VLAN tag.

In this example, PC02 is connected to a switch port configured for VLAN 2. An Ethernet frame is sent from PC02 with an SGT tag (ID 20) and VLAN ID (2), which can pass through to PC05 based on any of the firewall policies in the previous examples.



To verify the configuration:

1. Check the session list:

```
# diagnose sys session list

session info: proto=6 proto_state=01 duration=2007 expire=3482 timeout=3600
flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=may_dirty br
statistic(bytes/packets/allow_err): org=164/3/1 reply=120/2/1 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=8->7/7->8 gwy=0.0.0.0/0.0.0.0
hook=pre dir=org act=noop 10.1.1.11:36970->10.1.2.11:80(0.0.0.0:0)
hook=post dir=reply act=noop 10.1.2.11:80->10.1.1.11:36970(0.0.0.0:0)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 policy_id=1 pol_uuid_idx=572 auth_info=0 chk_client_info=0 vd=0
serial=0432fb8f tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
vlanid=2
npu_state=0x4000001 no_offload
no_ofld_reason:  disabled-by-policy
            ext_header_type=0xc5:0xc5
```

2. Perform a packet capture on PC05 (Wireshark is used in this example) and check that the packet includes the VLAN ID and Cisco SGT fields.

Virtual patching on the local-in management interface

Virtual patching is a method of mitigating vulnerability exploits by using the FortiGate's IPS engine to block known vulnerabilities. Virtual patching can be applied to traffic destined to the FortiGate by applying the FMWP (Firmware Virtual Patch) database to the local-in interface using local-in policies. Attacks geared towards GUI and SSH management access, for example, can be mitigated using the FMWP database pushed from FortiGuard, thereby virtually patching these vulnerabilities.

When the `virtual-patch` option is enabled in a local-in policy, the IPS engine queries the FortiGuard API server to:

- Obtain a list of vulnerabilities targeting the FortiGate on a particular version
- Determine whether the session destined to the local-in interface on the FortiGate requires a scan by identifying and tagging services in the session. The session's port number and protocol are used to identify the services. Currently only SSL VPN and web GUI services are tagged in a session.

If a tagged session lacks vulnerability signatures for the FortiOS version, then the IPS engine bypasses the session. This optimizes performance by only scanning and dropping sessions that are exploiting a vulnerability.

To configure virtual patching:

```
config firewall local-in-policy
    edit <id>
        set action accept
        set virtual-patch {enable | disable}
    next
end
```

The FortiGate must have a valid FMWR (Firmware) license to install the FMWP database. The FMWP database can be viewed by running the `diagnose autoupdate versions` command.

```
# diagnose autoupdate versions
FMWP Definitions
---------
Version: 23.00084 signed
Contract Expiry Date: Wed Jan  1 2031
Last Updated using manual update on Wed Sep  6 15:19:11 2023
Last Update Attempt: Wed Sep  6 15:40:08 2023
Result: No Updates
```

Once `virtual-patch` is enabled, the WAD process will periodically query vulnerability items from the FortiGuard API server and forward it to IPS.

Sample vulnerability item found on the FortiGuard API server

```
{"ID":918630,"product":"fortios","vendor":"fortinet","max_version":"7.2.5","min_
version":"7.2.0","severity":"high","vuln_type":"Format String","refs":
["https://www.fortiguard.com/psirt/FG-IR-23-137"],"description":"This indicates detection of
a Zero-Day vulnerability protected by a signature from Fortinet's FortiGuard Labs. This
signature should help mitigate the threat proactively both prior to, and after an official
statement is available from the vendor. Once an official advisory or statement is available
from the vendor, the signature name and its description will be updated to provide more
details regarding this vulnerability. Further details may also be made available in an
advisory on FortiGuard Center (http://www.fortiguard.com).","patch_sig_id":10004065,"patch_
sig_ids":[],"detection_sig_ids":null,"date_added":"2023-08-22T13:09:11","date_
updated":"2023-08-22T13:09:11"}
```

FortiGuard can be queried from the FortiOS CLI for a list of vulnerability rules while specifying parameters for the vendor, version, product, and model by running the `diagnose wad dev-vuln query` command. For example, to query Fortinet Inc.'s FortiOS 7.2.5:

```
# diagnose wad dev-vuln query vendor=fortinet&version=7.2.5&product=fortios
Dev-Vuln Lookup result: success, cache: found, fgd: unknown, item: 0x7fb474e0b4a0
Vulnerability details:
info entry (1):
        'vendor' = fortinet
```

```
       'product' = fortios
         'model' = N/A
   'version.min' = 7.2.0
   'version.max' = 7.2.5
      'firmware' = N/A
         'build' = N/A
    'date_added' = 2023-08-22T13:09:11
  'date_updated' = 2023-08-22T13:09:11
       'sig_id' = 10004065
      'vuln_id' = 918630
     'severity' = 3
...
```

After receiving the vulnerability rules from the WAD process, the IPS engine marks them as virtual patch rules mapped to each CVE vulnerability signature. For example:

FortiOS.NodeJS.Proxy.Authentication.Bypass(CVE-2022-40684)

FortiOS.SSL.VPN.Web.Portal.Password.Improper.Authentication(CVE-2018-13382)

FortiOS.SSL.VPN.Web.Protoal.Pathname.Information.Disclosure(CVE-2018-13379)

To show the list of available FMWP signatures from the FMWP database:

```
# get rule fmwp status
rule-name: "FortiOS.Fclicense.Daemon.Format.String."
rule-id: 10004067
rev: 23.082
date: 1697644800
action: block
status: enable
log: disable
log-packet: disable
severity: 3.high
service: TCP, HTTP
location: server
os: Linux
application: Other
rate-count: 0
rate-duration: 0
rate-track: none
rate-mode: continuous
vuln_type: Format String
cve: 202329181
fos_comp: Web-GUI
....
```

The following are the diagnose commands:

```
# diagnose ips vpatch {fmwp-status | fmwp-enable-all  | fmwp-reset}
```

`fmwp-status`	Shows the current status of enabled FMWP signatures.
`fmwp-enable-all`	Enable all FMWP signatures in FMWP database.
`fmwp-reset`	Revert the results of `fmwp-enable-all`.

Example

In this example, virtual patching is enabled for the local-in policy and the following scenarios are described:

- FortiGate with an SSL VPN vulnerability
- FortiGate with a web GUI vulnerability
- FortiGate with both an SSL VPN and web GUI vulnerability

To enable virtual patching:

1. Enable virtual patching in the local-in policy:

```
config firewall local-in-policy
    edit 1
        set intf "port2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set service "ALL"
        set schedule "always"
        set virtual-patch enable
    next
end
```

Because the IPS engine can currently only tag services related to SSL VPN and web GUI signatures, all other protocols are scanned when `service` is set to `ALL`. However, you can bypass scanning of other protocols, such as SSH and FTP, by setting `service` to only `HTTPS`.

2. Observe the outcome of the following scenarios:
   - In this example, FortiOS has an SSL VPN vulnerability. The IPS engine drops SSL VPN traffic to the local-in interface on the FortiGate and bypasses web GUI traffic. Traffic for other services is scanned and passed to the interface.

     Following is a log of the SSL VPN traffic that was dropped because of the vulnerability. Bypassed web GUI traffic did not generate any logs.

     ```
     # diagnose ips vpatch fmwp-status
     Enabled FMWP signatures: 3

       10002887 FortiOS.SSL-VPN.Heap.Buffer.Overflow.

     1: date=2023-11-07 time=14:53:44 eventtime=1699325624346021995 tz="+1200"
     logid="0419016384" type="utm" subtype="ips" eventtype="signature" level="alert"
     vd="root" severity="critical" srcip=10.1.100.22 srccountry="Reserved"
     dstip=10.1.100.1 dstcountry="Reserved" srcintf="port2" srcintfrole="undefined"
     dstintf="root" dstintfrole="undefined" sessionid=284 action="dropped" proto=6
     service="HTTPS" policyid=1 attack="FortiOS.SSL-VPN.Heap.Buffer.Overflow."

     FortiOS.SSL-VPN.Heap.Buffer.Overflow." crscore=50 craction=4096 crlevel="critical"
     ```

   - In this example, FortiOS has a web GUI vulnerability. The IPS engine drops web GUI traffic to the local-in interface on the FortiGate and bypasses SSL VPN traffic. Traffic for other services is scanned and passed to

the interface.

Following is a log of the web GUI traffic that was dropped because of the vulnerability. Bypassed SSL VPN traffic did not generate any logs.

```
# diagnose ips vpatch fmwp-status
Enabled FMWP signatures: 2

  10002156 FortiOS.NodeJS.Proxy.Authentication.Bypass.
  10002890 FortiOS.HTTPD.Content-Length.Memory.Corruption.

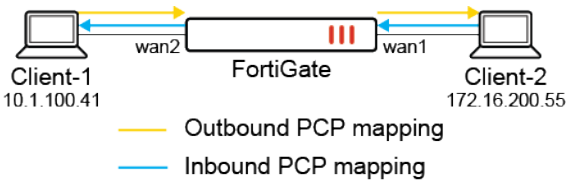
Configuring PCP port mapping with SNAT and DNAT



FortiOS supports the Port Control Protocol (PCP) by allowing the FortiGate to act as a PCP server, and dynamically manage network addresses and port translations for PCP clients. The PCP server must be enabled with a pool (`config system pcp-server`). In the firewall policy, enable either `pcp-outbound` or `pcp-inbound` mode and assign the pool.

```
config system pcp-server
    set status {enable | disable}
    config pools
        edit <name>
            set client-subnet <ip_address/subnet>
            set ext-intf <string>
            set extip ip>[-<ip>]
            set extport <port>[-<port>]
            set minimal-lifetime <integer>
            set maximal-lifetime <integer>
            set client-mapping-limit <integer>
            set mapping-filter-limit <integer>
            set allow-opcode {map peer announce}
            set third-party {allow | disallow}
            set multicast-announcement {enable | disable}
            set announcement-count <integer>
            set intl-intf <string>
            set recycle-delay <integer>
        next
    end
end
```

`client-subnet <ip_address/subnet>`	Enter the IP address with subnet from which PCP requests are accepted.
`ext-intf <string>`	Enter the external interface name.
`extip <ip>[-<ip>]`	Enter the IP address or address range on the external interface to map to an address on the internal network.
`extport <port>[-<port>]`	Enter the incoming port number or port range to map to a port number on the internal network.
`minimal-lifetime <integer>`	Set the minimal lifetime of a PCP mapping, in seconds (60 - 300, default = 120).
`maximal-lifetime <integer>`	Set the maximal lifetime of a PCP mapping, in seconds (3600 - 604800, default = 86400).
`client-mapping-limit <integer>`	Mapping limit per client (0 - 65535, default = 0, 0 = unlimited).
`mapping-filter-limit <integer>`	Filter limit per mapping (0 - 5, default = 1).
`allow-opcode {map peer announce}`	Set the allowed PCP OpCode: • `map`: allow MAP OpCode • `peer`: allow PEER OpCode • `announce`: allow ANNOUNCE OpCode

`third-party {allow | disallow}`	Allow/disallow the third-party option.
`multicast-announcement {enable | disable}`	Enable/disable multicast announcements.
`announcement-count <integer>`	Set the number of multicast announcements (3 - 10, default = 3).
`intl-intf <string>`	Enter the internal interface name.
`recycle-delay <integer>`	Set the minimum delay the PCP server will wait before recycling mappings that have expired, in seconds (0 - 3600, default = 0).

The following topology is used to demonstrate two use cases of PCP mapping: with SNAT and DNAT.

Example 1: PCP mapping with SNAT

This example demonstrates how PCP mapping works with SNAT. In the FortiGate PCP server settings, the pcp-pool1 pool is applied in the firewall policy with `pcp-outbound` mode. A PCP request is sent from Client-1 to the FortiGate to create PCP outbound mapping. When traffic is sent from Client-1 to Client-2, SNAT is performed by the PCP outbound mapping.

To configure the FortiGate as a PCP server:

1. Configure the PCP server settings:

```
config system pcp-server
    set status enable
    config pools
        edit "pcp-pool1"
            set client-subnet "10.1.100.41/32"
            set ext-intf "wan1"
            set extip 172.16.200.231
            set extport 50000-51000
            set intl-intf "wan2"
        next
    end
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 999
        set name "Outbound-pcp-policy999"
        set srcintf "wan2"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
```

```
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
        set pcp-outbound enable
        set pcp-poolname "pcp-pool1"
    next
end
```

To verify the configuration:

1. Generate a PCP peer request from Client-1 (10.1.100.41) to the FortiGate.
2. Verify the client's PCP request to the PCP server. In this example, an PCP client was installed on Ubuntu:

   ```
   root@pc41:~# pcp -i 10.1.100.41:41111 -p 172.16.200.55:80 -s 10.1.100.8
   ```

3. On the FortiGate, verify the PCP outbound mappings list:

   ```
   # diagnose firewall pcp-mapping list outbound
   PCP outbound mappings (vdom=root):
   pool:1 nonce:04307eb4037e0448317dc8b7 protocol:6 duration:8 lifetime:900 expiry:893
   intl:10.1.100.41:41111 ext:172.16.200.231:50000 remote:172.16.200.55:80
   ```

4. Send HTTP traffic that passes through the FortiGate and access Client-2 (172.16.200.55:80) from Client-1.
5. On the FortiGate, verify the session list. The source IP address of Client-1 is translated to 172.16.200.231:50000, which follows the PCP outbound mapping:

   ```
   # diagnose sys session list
   session info: proto=6 proto_state=01 duration=8 expire=3599 timeout=3600 flags=00000000
   socktype=0 sockport=0 av_idx=0 use=3
   origin-shaper=
   reply-shaper=
   per_ip_shaper=
   class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
   state=log may_dirty f00 pcp_outbound
   statistic(bytes/packets/allow_err): org=1812/33/1 reply=124168/92/1 tuples=2
   tx speed(Bps/kbps): 204/1 rx speed(Bps/kbps): 13998/111
   orgin->sink: org pre->post, reply pre->post dev=8->7/7->8 gwy=172.16.200.55/10.1.100.41
   hook=post dir=org act=snat 10.1.100.41:41111->172.16.200.55:80(172.16.200.231:50000)
   hook=pre dir=reply act=dnat 172.16.200.55:80->172.16.200.231:50000(10.1.100.41:41111)
   pos/(before,after) 0/(0,0), 0/(0,0)
   misc=0 policy_id=999 pol_uuid_idx=677 auth_info=0 chk_client_info=0 vd=0
   serial=0000b4f8 tos=ff/ff app_list=0 app=0 url_cat=0
   rpdb_link_id=00000000 ngfwid=n/a
   npu_state=0x4000001 no_offload
   no_ofld_reason:  disabled-by-policy
   total session 1
   ```

6. Send HTTP traffic that passes through the FortiGate and access another server from Client-1.
7. On the FortiGate, verify the session list. This time, the source IP address of Client-1 is not translated to 172.16.200.231:50000, since the traffic does not match the existing PCP outbound mapping:

   ```
   # diagnose sys session list
   session info: proto=6 proto_state=01 duration=6 expire=3596 timeout=3600 flags=00000000
   ```

```
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=1449/26/1 reply=98808/72/1 tuples=2
tx speed(Bps/kbps): 215/1 rx speed(Bps/kbps): 14703/117
orgin->sink: org pre->post, reply pre->post dev=8->7/7->8 gwy=172.16.200.155/10.1.100.41
hook=post dir=org act=snat 10.1.100.41:41111->172.16.200.155:80(172.16.200.8:41111)
hook=pre dir=reply act=dnat 172.16.200.155:80->172.16.200.8:41111(10.1.100.41:41111)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 policy_id=999 pol_uuid_idx=677 auth_info=0 chk_client_info=0 vd=0
serial=0000b596 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x4000001 no_offload
no_ofld_reason:  disabled-by-policy
total session 1
```

Example 2: PCP mapping with DNAT

This example demonstrates how PCP mapping works with DNAT. In the FortiGate PCP server settings, the pcp-pool1 pool is applied in the firewall policy with `pcp-inbound` mode. A PCP request is sent from Client-1 to the FortiGate to create PCP inbound mapping. When traffic is sent from Client-2 to access the external IP of Client-1 (172.16.200.231:50000), traffic passes by due to the PCP inbound mapping.

To configure the FortiGate as a PCP server:

1. Configure the PCP server settings:

```
config system pcp-server
    set status enable
    config pools
        edit "pcp-pool1"
            set client-subnet "10.1.100.41/32"
            set ext-intf "wan1"
            set extip 172.16.200.231
            set extport 50000-51000
            set intl-intf "wan2"
        next
    end
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 998
        set name "Inbound-pcp-policy998"
        set srcintf "wan1"
        set dstintf "wan2"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
```

```
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
        set pcp-inbound enable
        set pcp-poolname "pcp-pool1"
    next
end
```

To verify the configuration:

1. Generate a PCP peer request from Client-1 (10.1.100.41) to the FortiGate.
2. Verify the client's PCP request to the PCP server. In this example, an PCP client was installed on Ubuntu:

   ```
   root@pc41:~# pcp -i 10.1.100.41:80 -s 10.1.100.8
   ```

3. On the FortiGate, verify the PCP inbound mappings list:

   ```
   # diagnose firewall pcp-mapping list inbound
   PCP inbound mappings (vdom=root):
   pool:1 nonce:35e2ff035b959f7a4e669791 protocol:6 duration:3 lifetime:900 expiry:900
   intl:10.1.100.41:80 ext:172.16.200.231:50000
   ```

4. From Client-2 (172.16.200.55:80), send traffic that passes through the FortiGate and access the external IP of Client-1 (172.16.200.231:50000).
5. On the FortiGate, run a sniffer trace. The traffic is allowed through policy 998, and the destination IP:port is translated from 172.16.200.231:50000 to 10.1.100.41:80, which follows the PCP inbound mapping:

   ```
   # diagnose sniffer packet any 'tcp and port 50000 or port 80' 4
   interfaces=[any]
   filters=[tcp and port 50000 or port 80]
   2.959915 wan1 in 172.16.200.55.43284 -> 172.16.200.231.50000: syn 3480016601

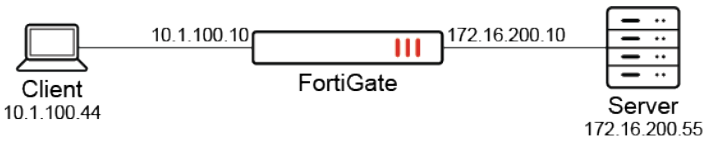
   2.995691 wan2 out 10.1.100.8.43284 -> 10.1.100.41.80: fin 3480016686 ack 2813145875
   2.996059 wan2 in 10.1.100.41.80 -> 10.1.100.8.43284: fin 2813145875 ack 3480016687
   2.996075 wan1 out 172.16.200.231.50000 -> 172.16.200.55.43284: fin 2813145875 ack
   3480016687
   2.996230 wan1 in 172.16.200.55.43284 -> 172.16.200.231.50000: ack 2813145876
   ```

```
2.996245 wan2 out 10.1.100.8.43284 -> 10.1.100.41.80: ack 2813145876
```

Only traffic matching the PCP inbound mapping will be forwarded by policy 998. Any other traffic is dropped.

Refreshing active sessions for specific protocols and port ranges per VDOM in a specified direction



Active sessions can be refreshed for specific protocols and port ranges per VDOM in a specified direction. This option can help prevent potential denial of service (DoS) attacks by controlling the direction of traffic that refreshes existing sessions.

```
config system session-ttl
    config port
        edit <id>
            set protocol <integer>
            set timeout <timeout_value>
            set refresh-direction {both | outgoing | incoming}
        next
    end
end
```

Setting the `refresh-direction` to `outgoing` will use the original direction, while `incoming` will use the reply direction. To refresh in both directions, select `both`.

Example

In this example, active sessions for UDP port 5001 will be refreshed in the incoming direction.

To refresh active sessions for UDP port 5001 in the incoming direction:

1. Configure the global session TTL timer:

```
config system session-ttl
    set default 3600
    config port
        edit 5001
            set protocol 17
            set timeout 5001
            set refresh-direction incoming
            set start-port 5001
            set end-port 5001
        next
    end
end
```

2. Send UDP 5001 traffic from the client to the server.
3. Verify the session table:

```
# diagnose sys session list
session info: proto=17 proto_state=00 duration=77 expire=4923 timeout=5001 refresh_
dir=reply flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=58/2/1 reply=0/0/0 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=18->17/17->18 gwy=172.16.200.55/0.0.0.0
hook=post dir=org act=snat 10.1.100.41:2041->172.16.200.55:5001(172.16.200.10:62458)
hook=pre dir=reply act=dnat 172.16.200.55:5001->172.16.200.10:62458(10.1.100.41:2041)
src_mac=00:0c:29:b6:e8:be  dst_mac=00:0c:29:92:89:96
misc=0 policy_id=99 pol_uuid_idx=1501 auth_info=0 chk_client_info=0 vd=0
serial=00005071 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  disabled-by-policy
total session: 1
```

The timeout and refresh for the reply direction are attached to the session.

4. Send UDP 5001 traffic again from the client to the server.
5. Verify the diagnostics.
   a. Run the sniffer trace:

```
# diagnose sniffer packet any 'udp and port 5001' 4
interfaces=[any]
filters=[udp and port 5001]
3.387747 wan2 in 10.1.100.41.2041 -> 172.16.200.55.5001: udp 1
3.387757 wan1 out 172.16.200.10.62458 -> 172.16.200.55.5001: udp 1
^C
2 packets received by filter
0 packets dropped by kernel
```

   b. Verify the session table:

```
# diagnose sys session list
session info: proto=17 proto_state=00 duration=119 expire=4881 timeout=5001 refresh_
dir=reply flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=116/4/1 reply=0/0/0 tuples=2
tx speed(Bps/kbps): 1/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=18->17/17->18
gwy=172.16.200.55/0.0.0.0
hook=post dir=org act=snat 10.1.100.41:2041->172.16.200.55:5001(172.16.200.10:62458)
hook=pre dir=reply act=dnat 172.16.200.55:5001->172.16.200.10:62458(10.1.100.41:2041)
src_mac=00:0c:29:b6:e8:be  dst_mac=00:0c:29:92:89:96
misc=0 policy_id=99 pol_uuid_idx=1501 auth_info=0 chk_client_info=0 vd=0
serial=00005071 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
```

```
no_ofld_reason:  disabled-by-policy
total session: 1
```

As the traffic flows from the client to the server (outgoing), the expiration timer continues to count down and is not refreshed.

6. Send reverse UDP 5001 traffic from the server to the client.
7. Verify the diagnostics again.
   a. Run the sniffer trace:

```
# diagnose sniffer packet any 'udp and port 62458 or port 2041' 4
interfaces=[any]
filters=[udp and port 62458 or port 2041]
3.237328 wan1 in 172.16.200.55.5001 -> 172.16.200.10.62458: udp 1
3.237339 wan2 out 172.16.200.55.5001 -> 10.1.100.41.2041: udp 1
^C
2 packets received by filter
0 packets dropped by kernel
```

   b. Verify the session table:

```
# diagnose sys session list
session info: proto=17 proto_state=01 duration=1710 expire=4995 timeout=5001 refresh_
dir=reply flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=116/4/1 reply=116/4/1 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=18->17/17->18
gwy=172.16.200.55/10.1.100.41
hook=post dir=org act=snat 10.1.100.41:2041->172.16.200.55:5001(172.16.200.10:62458)
hook=pre dir=reply act=dnat 172.16.200.55:5001->172.16.200.10:62458(10.1.100.41:2041)
src_mac=00:0c:29:b6:e8:be  dst_mac=00:0c:29:92:89:96
misc=0 policy_id=99 pol_uuid_idx=1501 auth_info=0 chk_client_info=0 vd=0
serial=00005071 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  disabled-by-policy
total session: 1
```

As the traffic flows from the server to the client (incoming), the expiration timer is refreshed.

Address objects

Addresses define sources and destinations of network traffic and can be used in many functions such as firewall policies, ZTNA, etc.

To view the possible uses list of address object usage:

1. Go to *Policy & Objects* > *Addresses*.
2. Click the number under *Ref*. The *Usage of Address:<Predefined address>* pane opens, where *<Predefined address>* is one of the predefined addresses, such as SSLVPN_TUNNEL_ADDR1.
3. In the *Usage of Address:<Predefined address>* pane, click *Possible Uses* to view the list.

When properly set up, these address objects can be used with great flexibility to make the configuration of different functions simpler and more intuitive. When used in a firewall policy, the FortiGate compares the IP addresses contained in packet headers with a policy's source and destination addresses to determine if the policy matches the traffic. The matching of IP addresses in packet headers is also performed for other FortiGate functions configured with address objects.

Address Types

When creating an IPv4 address, there are several different types of addresses that can be specified. Which one is chosen will depend on which method most easily yet accurately describes the addresses that you are trying to include with as few entries as possible based on the information that you have. For instance, if you are trying to describe the addresses of a specific company's web server but do not know how extensive their web server farm is, you would be more likely to use a Fully Qualified Domain Name (FQDN) rather than a specific IP address. On the other hand, some computers do not have FQDNs and a specific IP address must be used.

The following table provides a short description of the different types of addresses:

Address type	Description
Subnet	The subnet type of address is expressed using a host address and a subnet mask. This is the most flexible of the address types because the address can refer to as little as one individual address (x.x.x.x/32) or as many as all of the available addresses (0.0.0.0/0). See Subnet on page 1430 and Dynamic policy — Fabric devices on page 1431 for more information.
IP range	The IP range type can be used to define a continuous set of IP addresses between one specific IP address and another (inclusive). It is a flexible way to describe a continuous set of addresses while being specific and granular, without needing to fall within the boundaries of standard subnets. See IP range on page 1433 for more information.
FQDN	The Fully Qualified Domain Name (FQDN) address type accepts an address string and resolves it to one or more IP addresses. It relies on DNS to keep up with address changes without having to manually change the IP addresses on the FortiGate. See FQDN addresses on page 1434 for more information. FQDN can also be specified as wildcard addresses such as *.example.com. See Using wildcard FQDN addresses in firewall policies on page 1435 for more information.

Address type	Description
Geography	Geography addresses are those determined by the country/region of origin. The IPs for the country/region is automatically determined from the Geography IP database. See Geography based addresses on page 1437 and IPv6 geography-based addresses on page 1440 for more information.
Dynamic	Dynamic address objects are collections of addresses that are integrated from different external sources or other modules within the FortiGate. They can be used in policies that support the dynamic address type and come in different subtypes. • ClearPass: IP addresses gathered from the ClearPass Policy Manager. See ClearPass integration for dynamic address objects on page 1451 for more information. • Device & OS Identification: MAC addresses gathered from device detection that can be filtered by hardware vendor, model, OS, and OS version. See MAC addressed-based policies on page 1459 for more information. • Fabric Connector Address: IP addresses retrieved from SDN connectors, such as public and private cloud connectors. See Getting started with public and private SDN connectors on page 3306 for more information. • FortiNAC Tag: IP addresses collected from FortiNAC. See FortiNAC tag dynamic address on page 1455 for more information. • FortiVoice Tag: IP and MAC addresses collected from FortiVoice. See FortiVoice tag dynamic address on page 1458 for more information. • FortiPolicy Tag: IP addresses pushed from FortiPolicy. See Configuring FortiPolicy on page 3120 for more information. • FortiVoice Tag: IP addresses collected from FortiVoice. • Fortinet Single Sign-On (FSSO): IP addresses of authenticated users from a FSSO collector agent, CPPM by FortiManager, or FortiNAC. See FSSO dynamic address subtype on page 1448 for more information. • Switch Controller NAC Policy Tag: MAC addresses collected from NAC policies.
Device (Mac address)	A MAC address is a link layer-based address type and it cannot be forwarded across different IP segments. In FortiOS, you can configure a firewall address object with a singular MAC, wildcard MAC, multiple MACs, or a MAC range. See MAC addressed-based policies on page 1459, Adding MAC-based addresses to devices on page 125, ISDB well-known MAC address list on page 1461, and IPv6 MAC addresses and usage in firewall policies on page 1462 for more information.
Wildcard (CLI only)	Wildcard addresses are addresses that identify ranges of IP addresses, reducing the amount of firewall addresses and security policies required to match some of the traffic on your network. See Wildcard addressing on page 1442 for more information.

Address type	Description
Interface subnet (CLI only)	For all interfaces set to a LAN or DMZ role, an option is available and enabled by default to automatically create an address object for the connected network. If the interface's subnet changes, the address object subnet changes too. See Interface subnet on page 1443 for more information.

Address Group

Address groups are designed for ease of use in the administration of the device. If you have several addresses or address ranges that will commonly be treated the same or require the same security policies, you can put them into address groups, rather than entering multiple individual addresses in each policy that refers to them.

There are two different types of address groups and the following table provides a short description of each type:

Address group type	Description
Group	Members of an address group type group can belong to multiple address groups. See Address group on page 1444, Allow empty address groups on page 1446, and Address group exclusions on page 1447 for more information.
Folder	Members or an address group type folder can only belong to a single address folder. See Address folders on page 1445 for more information.

When an address group with no members is configured in a firewall policy, the policy will not match any traffic and will just match the implicit deny policy. See Allow empty address groups on page 1446 for more information.

Subnet

A subnet address object is usually used to refer internal networks or addresses which are defined by the network administrator.

A subnet address usually consists of a network address and a netmask, for example, 192.168.1.0 255.255.255.0. In this example, the network address is 192.168.1.0 and the netmask is 255.255.255.0. The network address defines the network to match and the netmask specify the IP address to match on the network.

In the above example, the subnet address 192.168.1.0 255.255.255.0 would match the following IP addresses:

```
192.168.1.1
192.168.1.2
192.168.1.3
...
192.168.1.255
```

For defining a subnet address object the valid format of IP address and netmask could be either:

`x.x.x.x/x.x.x.x`, such as 192.168.1.0/255.255.255.0

or

`x.x.x.x/x`, such as 192.168.1.0/24

To define a single address using subnet, use the netmask 255.255.255.255 or /32. A warning message will be shown if any other netmask is used and will not let the user save the address object.

To create a subnet address:

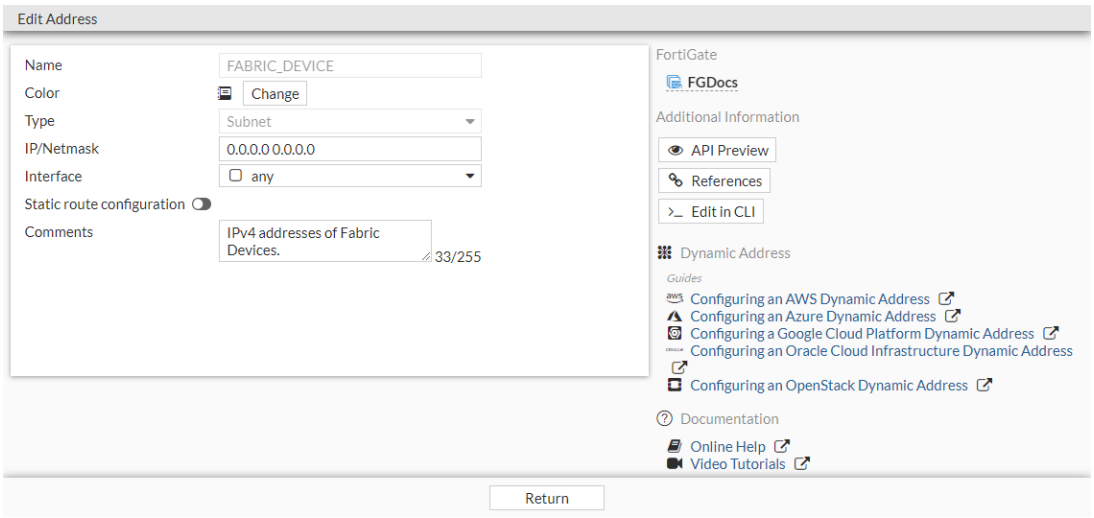
1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Select *Create new*.
3. Enter a *Name* for the address object.
4. In the *Type* field, select *Subnet* from the dropdown menu.
5. In the *IP/Netmask* field, enter the address and subnet mask according to the format x.x.x.x/x.x.x.x or the short hand format of x.x.x.x/x
6. In the *Interface* field, leave as the default *any* or select a specific interface from the dropdown menu.
7. Enable/disable *Static route configuration*.
8. Enter any additional information in the *Comments* field.
9. Click *OK*.

Dynamic policy — Fabric devices

The dynamic address group represents the configured IP addresses of all Fortinet devices connected to the Security Fabric. It currently includes FortiManager, FortiAnalyzer, FortiClient EMS, FortiMail, FortiAP(s), and FortiSwitch(es). Like other dynamic address groups for fabric connectors, it can be used as an IPv4 address in firewall policies and objects.

The list of firewall addresses includes a default address object called `FABRIC_DEVICE`. You can apply the `FABRIC_DEVICE` object to the following types of policies:

- Firewall policy, including virtual wire pairs, NAT 46, and NAT 64 (IPv4 only)
- IPv4 shaping policy
- IPv4 ACL policy
- Security policy (NGFW mode)



You cannot apply the `FABRIC_DEVICE` object to the following types of policies:

- IPv4 explicit proxy policy

You also cannot use the `FABRIC_DEVICE` object with the following settings:

- Custom extension on `internet-service`
- Exclusion of `addrgrp`

Initially the `FABRIC_DEVICE` object does not have an address value. The address value is populated dynamically as things change. As a result, you cannot edit the `FABRIC_DEVICE` object, add any addresses to the object, or remove any addresses from the object. The *Edit Address* pane in the GUI only has a *Return* button because the object is read-only:

The `FABRIC_DEVICE` object address values are populated based on:

- FortiAnalyzer IP (from the *Fabric Settings* pane)
- FortiManager IP (from the *Fabric Settings* pane)
- FortiMail IP (from the *Fabric Settings* pane)
- FortiClient EMS IP (from the *Fabric Settings* pane)
- FortiAP IPs (from the *FortiAP Setup* pane or DHCP)
- FortiSwitch IPs (from the *FortiSwitch Setup* page or DHCP)

To apply the FABRIC_DEVICE object to a firewall policy using the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Create a new policy or edit an existing policy.
3. For the *Destination* field, select *FABRIC_DEVICE* from the list of address entries.
4. Configure the rest of the policy as needed.
5. Click *OK*.

To apply the FABRIC_DEVICE object to a firewall policy using the CLI:

```
config firewall address
    edit "FABRIC_DEVICE"
        set type ipmask
        set comment "IPv4 addresses of Fabric Devices."
        set visibility enable
        set associated-interface ''
        set color 0
        set allow-routing disable
        set subnet 0.0.0.0 0.0.0.0
    next
end

config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
```

```
        set dstaddr "FABRIC_DEVICE"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set fsso disable
        set nat enable
    next
end
```

Diagnose commands

You can run diagnose commands to list IP addresses of Fortinet devices that are configured in the Security Fabric or used in a security policy.

To view the IP addresses of Fabric devices:

```
(root) # diagnose firewall sf-addresses list

FabricDevices: 172.18.64.48
FortiAnalyzer: 172.18.60.25
FortiSandbox: 172.18.52.154
FortiManager: 172.18.28.31
FortiClientEMS: 172.18.62.6
FortiAP:
FortiSwitch:
FortiAP/SW-DHCP:
```

To view which IP addresses are used in a security policy:

```
(root) # diagnose ips pme fabric-address list
VDOM 0:
- builtin [mask=0x1e]:
  - type=4: 172.18.62.213
  - type=4: 172.18.62.219
  - type=2: 172.18.70.82
- query:
  - 168.254.1.2
  - 0.0.0.0
  - 168.254.1.2
```

IP range

The IP range type of address can describe a group of addresses while being specific and granular. It does this by specifying a continuous set of IP addresses between one specific IP address and another.

The format would be:

`x.x.x.x-x.x.x.x`, such as 192.168.110.100-192.168.110.120

To create an IP range address:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Select *Create new*.
3. Enter a *Name* for the address object.
4. In the *Type* field, select *IP Range* from the dropdown menu.
5. In the *IP Range* field, enter the range of addresses in the following format: x.x.x.x-x.x.x.x (no spaces)
6. In the *Interface* field, leave as the default any or select a specific interface from the drop down menu.
7. Enter any additional information in the *Comments* field.
8. Click *OK*.

FQDN addresses

By using Fully Qualified Domain Name (FQDN) addressing you can take advantage of the dynamic ability of DNS to keep up with address changes without having to manually change the addresses on the FortiGate. FQDN addresses are most often used with external web sites but they can be used for internal web sites as well if there is a trusted DNS server that can be accessed. FQDN addressing also comes in handy for large web sites that may use multiple addresses and load balancers for their web sites. The FortiGate firewall automatically maintains a cached record of all the addresses resolved by the DNS for the FQDN addresses used.

For example, if you were doing this manually and you wanted to have a security policy that involved Google, you could track down all of the IP addresses that they use across multiple countries. Using the FQDN address is simpler and more convenient.

When representing hosts by an FQDN, the domain name can also be a subdomain, such as mail.example.com.

Valid FQDN formats include:

- <host_name>.<top_level_domain_name>, such as example.com
- <host_name>.<second_level_domain_name>.<top_level_domain_name>, such as mail.example.com.

The FortiGate firewall keeps track of the DNS TTLs so as the entries change on the DNS servers the IP address will effectively be updated for the FortiGate. As long as the FQDN address is used in a security policy, it stores the address in the DNS cache.

There is a possible security downside to using FQDN addresses. Using a fully qualified domain name in a security policy means that your policies are relying on the DNS server to be accurate and correct. Should the DNS server be compromised, security policies requiring domain name resolution may no longer function properly.

To create a Fully Qualified Domain Name address:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Select *Create new*.
3. Enter a *Name* for the address object.
4. In the *Type* field, select *FQDN* from the dropdown menu.
5. Enter the domain name in the *FQDN* field.
6. In the *Interface* field, leave as the default *any* or select a specific interface from the dropdown menu.
7. Enable/disable *Static route configuration*.

8. Enter any additional information in the *Comments* field.
9. Click *OK*.

Using wildcard FQDN addresses in firewall policies

You can use wildcard FQDN addresses in firewall policies. IPv4, IPv6, ACL, local, shaping, NAT64, NAT46, and NGFW policy types support wildcard FQDN addresses.

For wildcard FQDN addresses to work, the FortiGate should allow DNS traffic to pass through.

Initially, the wildcard FQDN object is empty and contains no addresses. When the client tries to resolve a FQDN address, the FortiGate will analyze the DNS response. The IP address(es) contained in the answer section of the DNS response will be added to the corresponding wildcard FQDN object. It is therefore necessary to have the DNS session-helpers defined in the `config system session-helper` setting.

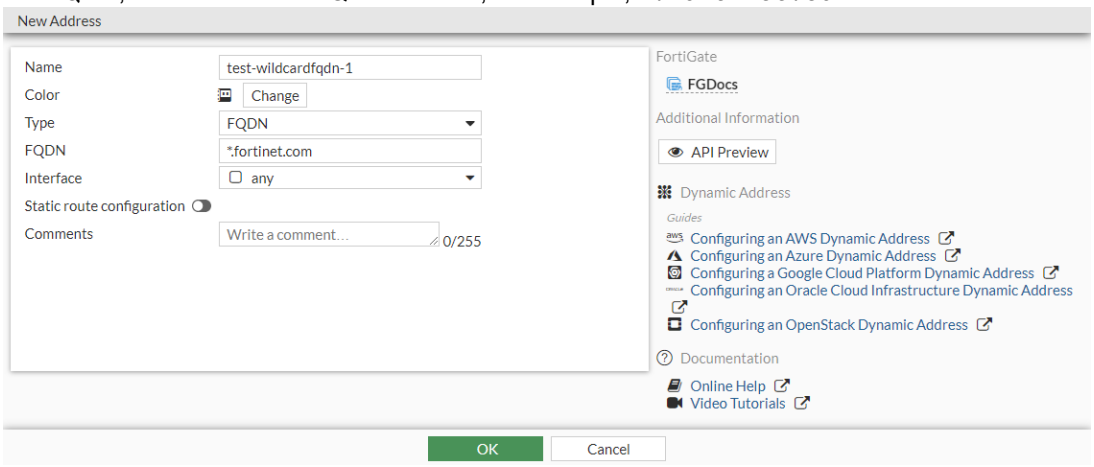
Since FortiGate must analyze the DNS response, it does not work with DNS over HTTPS.

In FortiOS 7.0 and later, FortiGate supports DNS over TLS. It is possible to analyze DNS responses sent over DoT, as long as there is a firewall policy that allows the DNS traffic from the client and is configured with a DNS filter that supports DoT. For information on configuring this, see DNS inspection with DoT and DoH on page 1698.

When the wildcard FQDN gets the resolved IP addresses, FortiOS loads the addresses into the firewall policy for traffic matching.

The FortiGate will keep the IP addresses in the FQDN object table as long as the DNS entry itself has not expired. Once it expires, the IP address is removed from the wildcard FQDN object until another query is made. At any given time, a single wildcard FQDN object may have up to 1000 IP addresses.

The DNS expiry TTL value is set by the authoritative name server for that DNS record. If the TTL for a specific DNS record is very short and you would like to cache the IP address longer, then you can extend it with the CLI. See To extend the TTL for a DNS record in the CLI: on page 1437



Wildcard FQDN IPs are synchronized to other autoscale members whenever a peer learns of a wildcard FQDN address.

To create a wildcard FQDN using the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. Specify a *Name*.
4. For *Type*, select *FQDN*.

5. For *FQDN*, enter a wildcard FQDN address, for example, `*.fortinet.com`.

6. Click *OK*.

To use a wildcard FQDN in a firewall policy using the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. For *Destination*, select the wildcard FQDN.
3. Configure the rest of the policy as needed.
4. Click *OK*.

To create a wildcard FQDN using the CLI:

```
config firewall address
    edit "test-wildcardfqdn-1"
        set type fqdn
        set fqdn "*.fortinet.com"
    next
end
```

To use wildcard FQDN in a firewall policy using the CLI:

```
config firewall policy
    edit 2
        set srcintf "port3"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "test-wildcardfqdn-1"
        set action accept
        set schedule "always"
        set service "ALL"
        set auto-asic-offload disable
        set nat enable
    next
end
```

To use the diagnose command to list resolved IP addresses of wildcard FQDN objects:

```
# diagnose firewall fqdn list

List all FQDN:
```

***.fortinet.com**: ID(48) ADDR(96.45.36.159) ADDR(192.168.100.161) ADDR(65.39.139.161)

Alternatively:

```
# diagnose test application dnsproxy 6

worker idx: 0

vfid=0 name=*.fortinet.com ver=IPv4  min_ttl=3266:0, cache_ttl=0 , slot=-1, num=3,
wildcard=1

       96.45.36.159 (ttl=68862:68311:68311) 192.168.100.161 (ttl=3600:3146:3146)
65.39.139.161

(ttl=3600:3481:3481)
```

To use the diagnose command for firewall policies which use wildcard FQDN:

```
# diagnose firewall iprope list 100004
...
destination fqdn or dynamic address (1):*.fortinet.com ID(48) uuid_idx=57 ADDR
(208.91.114.104) ADDR(208.91.114.142) ADDR(173.243.137.143) ADDR(65.104.9.196) ADDR
(96.45.36.210)
...
```

To extend the TTL for a DNS record in the CLI:

The TTL for DNS records can be configured globally, or for a specific FQDN address. If it is configured for an FQDN address, that setting will supersede the global setting for that address. See Important DNS CLI commands on page 272 for information about configuring a global TTL.

In this the example the `set cache-ttl` value has been extended to 3600 seconds.

```
config firewall address
    edit "fortinet.com"
        set type fqdn
        set fqdn "www.fortinet.com"
        set cache-ttl 3600
    next
end
```

Geography based addresses

Geography addresses are those determined by country of origin. The IP for the country or region is automatically determined from the Geography IP database.

To view IP Geography database:

```
#diagnose autoupdate versions | grep -A 6 "IP Geography DB"
IP Geography DB
---------
Version: 3.00152
Contract Expiry Date: n/a
Last Updated using manual update on Thu Nov 17 17:52:00 2022
Last Update Attempt: Wed Nov 23 10:56:46 2022
Result: No Updates
```

Without a valid license, local IP geography database will continue to work. However the FortiGate will stop receiving geography IP updates from the FortiGuard servers and the geography IP database will no longer be updated. IP geolocation service is part of base services included with all FortiCare support contracts. See FortiGuard Security Services for more information.

To create a geography address:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Select *Create new*.
3. Enter a *Name* for the address object.
4. In the *Type* field, select *Geography* from the dropdown menu.
5. In the *Country/Region* field, select a single country from the dropdown menu.
6. In the *Interface* field, leave as the default *any* or select a specific interface from the dropdown menu.
7. Enter any additional information in the *Comments* field.
8. Click *OK*.

Overrides

It is possible to assign a specific IP address range to a customized country ID. Generally, geographic addressing is done at the VDOM level; it could be considered global if you are using the root VDOM, but the `geoip-override setting` is a global setting.

To configure a geography IP override:

1. Assign a specific IP address range to a customized country ID:

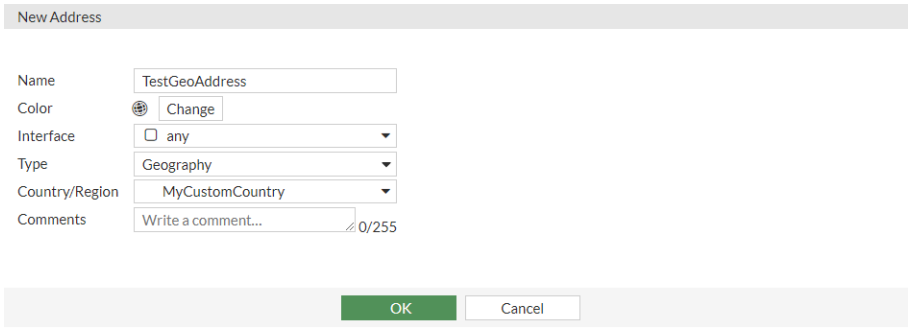
```
config system geoip-override
    edit "MyCustomCountry"
        config ip-range
            edit 1
                set start-ip 1.1.1.1
                set end-ip 1.1.1.2
            next
        end
    next
end
```

2. Use get sys geoip-country XX to determine the name corresponding to the custom 2-digit country code A0:

```
# get sys geoip-country A0
id                  : A0
name                : MyCustomCountry
```

3. Show the full configuration of the geography IP override just created to show that it corresponds to country code A0:

```
# show full sys geoip-override
config system geoip-override
    edit "MyCustomCountry"
        set description ''
        set country-id "A0"
```



```
        config ip-range
            edit 1
                set start-ip 1.1.1.1
                set end-ip 1.1.1.2
            next
        end
    next
end
```

To configure a geography address:

1. Enable debug to display the CLI commands running on the backend in response to certain GUI configuration:

```
# diagnose debug enable
# diagnose debug cli 7
Debug messages will be on for 30 minutes.
```

2. Go to *Policy & Objects* > *Addresses* and create a geography address using the previously created custom country code:

3. Observe the corresponding CLI commands run on the backend:

```
FGT # 0: config firewall address
0: edit "TestGeoAddress"
0: set type geography
0: set country "A0"
0: end
```

Diagnose commands

There are a few diagnose commands used with geographic addresses:

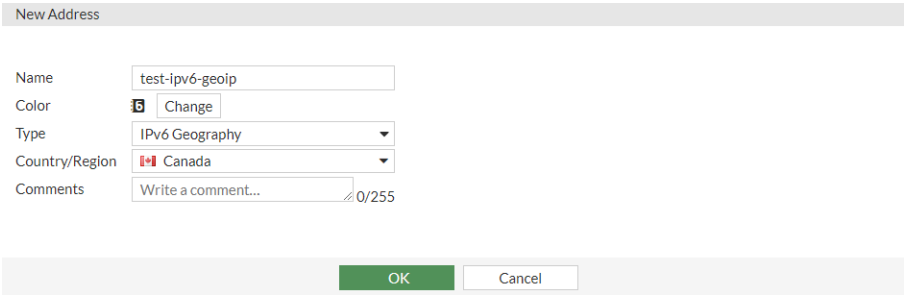
```
diagnose firewall ipgeo [country-list | ip-list | ip2country | override | copyright-notice]
```

Diagnose command	Description
country-list	List of all countries.
ip-list	List of the IP addresses associated with the country.
ip2country	Used to determine which country a specific IP address is assigned to.
override	List of user defined geography data; items configured with the `config system geoip-override` command.
copyright-notice	Shows the copyright notice.

```
diagnose geoip [geoip-query | ip2country | iprange]
```

Diagnose command	Description
geoip-query	Used to determine the complete geolocation of a specific IP address from the FortiGuard IP Geography DB.
ip2country	Used to determine the physical and registered locations of the IP address as well and if the type is anycast.
Iprange	List the IP addresses or IP ranges associated with the country.

For more details and examples using these diagnose commands, see the Fortinet Community article Technical Tip: Commands to verify GeoIP information and troubleshoot GeoIP database.

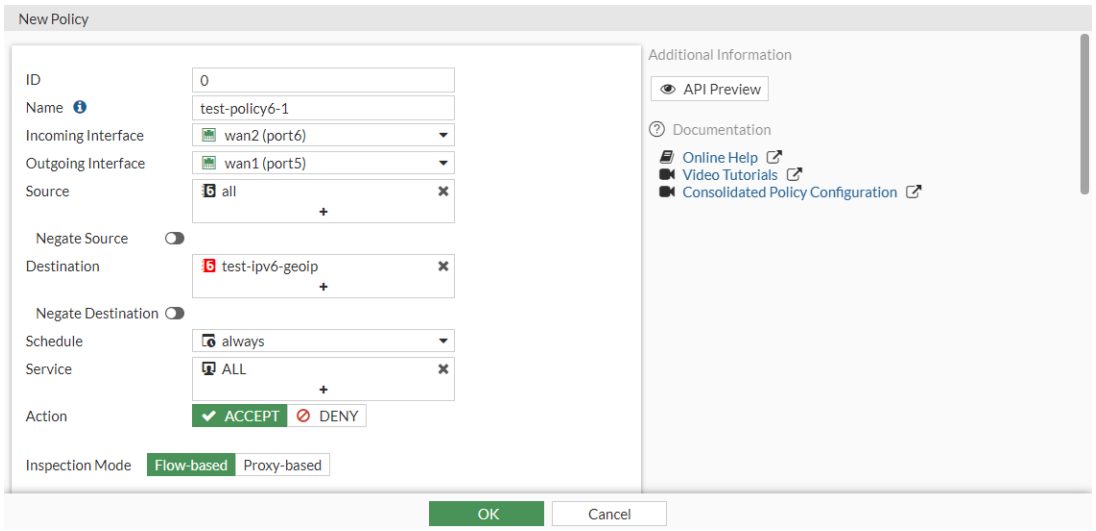


IPv6 geography-based addresses

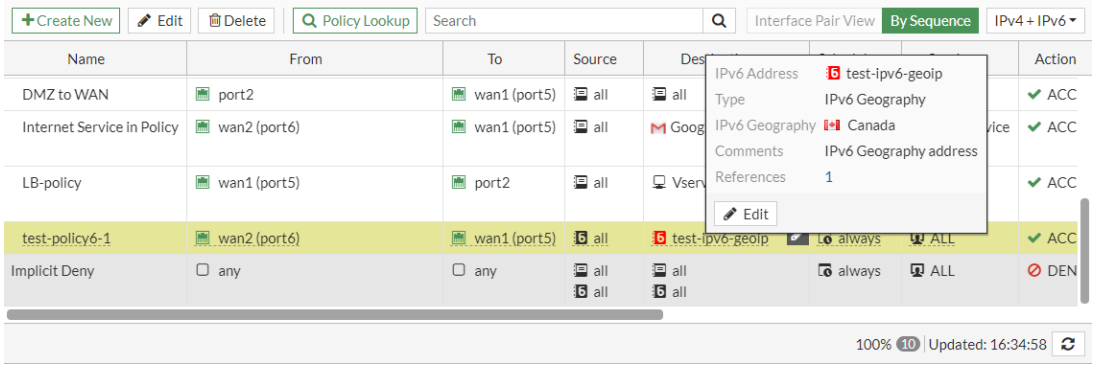
Geography-based IPv6 addresses can be created and applied to IPv6 firewall policies.

IPv6 geography-based addresses do not support `geoip-override` or `geoip-anycast`.

To create an IPv6 geography-based address in the GUI:



1. Go to *Policy and Objects* > *Addresses* and select *IPv6 Address*.
2. Click *Create new*.
3. Enter a name for the address.
4. Set *Type* to *IPv6 Geography*.
5. Select the *Country/Region* from the list.
6. Optionally, enter comments.



7. Click *OK*.

To use the IPv6 geography address in a policy:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Edit an existing policy, or create a new one, using the IPv6 geography address as the *Source* or *Destination Address*.

3. In the policy list, hover over the address to view details.

To configure an IPv6 geography-based address in the CLI:

1. Create an IPv6 geography-based address:

```
config firewall address6
    edit "test-ipv6-geoip"
        set type geography
        set color 6
        set comment "IPv6 Geography address"
        set country "CA"
    next
end
```

2. Use the IPv6 geography-based address in a policy:

```
config firewall policy
    edit 1
        set name "test-policy6-1"
        set srcintf "port6"
        set dstintf "port5"
        set srcaddr6 "all"
        set dstaddr6 "test-ipv6-geoip"
        set action accept
        set schedule "always"
```

```
            set service "ALL"
            set nat enable
        next
    end
```

Wildcard addressing

Wildcard addresses are addresses that identify ranges of IP addresses, reducing the amount of firewall addresses and security policies required to match some of the traffic on your network. Wildcard addresses are an advanced feature, usually required only for complex networks with complex firewall filtering requirements. By using these wildcard addresses in the firewall configuration, administrators can eliminate creating multiple, separate IP based address objects and then grouping them to then apply to multiple security policies.

A wildcard address consists of an IP address and a wildcard netmask, for example, 192.168.0.56 255.255.0.255. In this example, the IP address is 192.168.0.56 and the wildcard netmask is 255.255.0.255. The IP address defines the networks to match and the wildcard netmask defines the specific addresses to match on these networks.

In a wildcard netmask, zero denotes ignoring the value of the octet in the IP address. This means the wildcard firewall address matches any number in this address octet. This also means that the number included in this octet of IP address is ignored and can be any number. Usually, if the octet in the wildcard netmask is zero, the corresponding octet in the IP address is also zero.

In a wildcard netmask, a number denotes matching addresses according to how the numbers translate into binary addresses. For example, the wildcard netmask is 255; the wildcard address will only match addresses with the value for this octet that is in the IP address part of the wildcard address. So, if the first octet of the IP address is 192 and the first octet of the wildcard netmask is 255, the wildcard address will only match addresses with 192 in the first octet.

In the above example, the wildcard address 192.168.0.56 255.255.0.255 would match the following IP addresses:

```
192.168.0.56
192.168.1.56
192.168.2.56
...
192.168.255.56
```

The wildcard addresses 192.168.0.56 255.255.0.255 and 192.168.1.56 255.255.0.255 define the same thing since the 0 in the wildcard mask means to match any address in the third octet.

The following is an example of how to configure a wildcard firewall address.

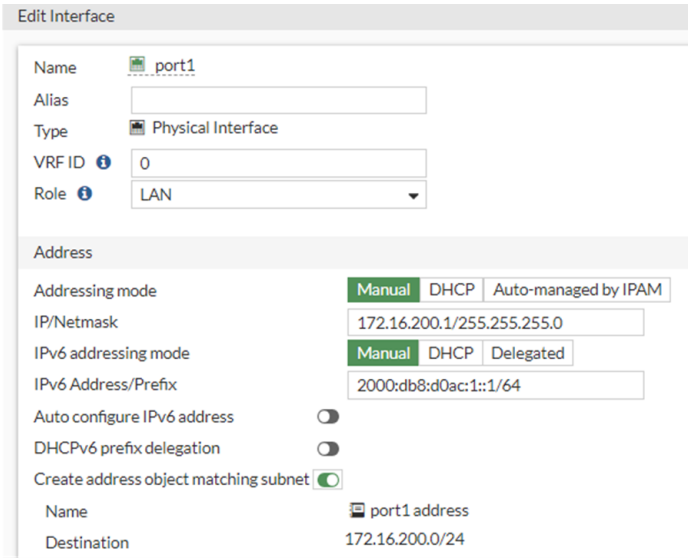
```
config firewall address
    edit example_wildcard_address
        set type wildcard
        set wildcard 192.168.0.56 255.255.0.255
    next
end
```

Wildcard firewall addresses are initially configured in the CLI. You cannot choose wildcard in the GUI when creating the address, but after the address is created in the CLI, it will show up in the GUI. The *Type* field shows a grayed-out value of *Wildcard* and the settings, other than the *Type*, can be edited.

Interface subnet

Interface subnet address type enables an address object to be created automatically for the interface with which it is associated. Once created, the address object is updated when the interface IP/netmask changes on the associated interface.

To create the interface subnet address type object, create or edit an interface under *Network* > *Interfaces*, and enable the *Create address object matching subnet* option.



The *Create address object matching subnet* option is automatically enabled and displayed in the GUI when *Role* is set to *LAN* or *DMZ*.

When you disable the *Create address object matching subnet* option, the feature is disabled, and the associated firewall address is deleted.

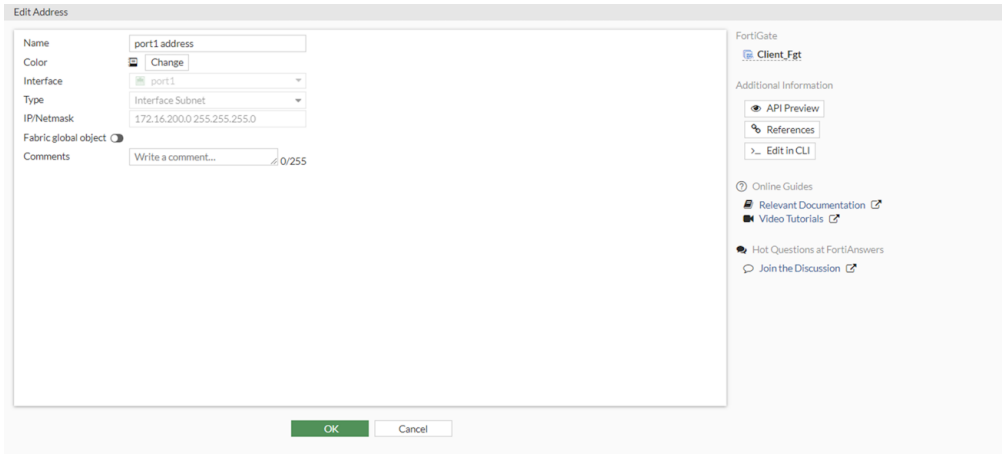
To create an interface subnet:

1. Go to *Network* > *Interfaces*.
2. Select *Create New* > *Interface* or select existing interface and *Edit*.
3. Set *Role* to either *LAN* or *DMZ*.
4. Verify that *Create address object matching subnet* is available and automatically enabled.

5. Click *OK*.

The following is an example of how to configure an interface subnet firewall address on the CLI:

```
config firewall address
    edit "port1 address"
        set type interface-subnet
        set interface "port1"
    next
end
```



Interface subnet addresses are automatically created when *Role* is set to *LAN* or *DMZ* in the *Interface* page, or you can manually configure interface subnet addresses in the CLI. You cannot choose *Interface Subnet* in the GUI when creating

the address, but after the address is created, *Interface Subnet* displays in the GUI. However, all the settings are grayed out, except *Name* and *Comments*, which can be edited.

When *Role* is set to *LAN* or *DMZ* in the *Interface* page, the new address object displays on the *Policy & Objects* > *Address* > *Interface Subnet* page.

After the address is created, the subnet is dynamically assigned to the address object, which can be seen in both GUI and CLI. If the interface address changes, the subnet will update dynamically.

```
config firewall address
    edit "port1 address"
        set type interface-subnet
        set subnet 172.16.200.0 255.255.255.0
        set interface "port1"
    next
end
```

Address group

The use of groups is not mandatory. However, adding individual addresses to a policy sometimes becomes tedious. If you use several different addresses with a given policy, these address objects can be grouped into an address group as it is much easier to add or subtract addresses from the group.

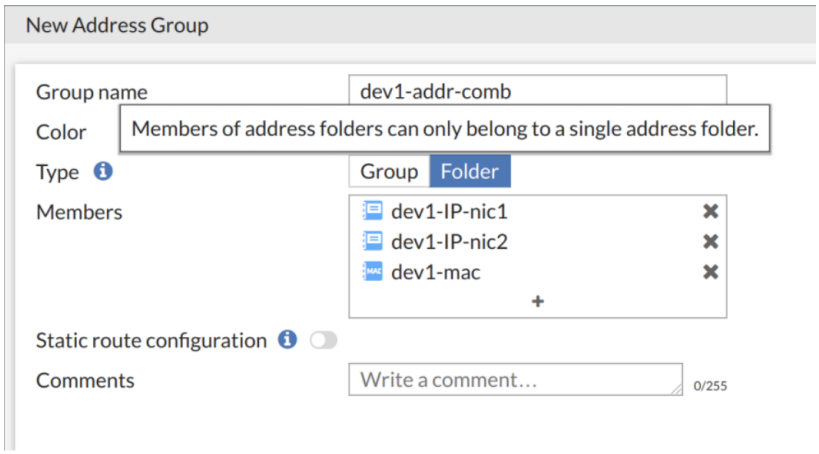
Security policies require addresses with homogenous network interfaces. Therefore, address groups should contain only addresses bound to the same network interface or Any.

For example, if address 1.1.1.1 is associated with port1, and address 2.2.2.2 is associated with port2, they cannot be in the same group. However, if 1.1.1.1 and 2.2.2.2 are configured with an interface of Any, they can be grouped, even if the addresses involve different networks.

To create an address group:

1. Go to *Policy & Objects* > *Addresses* and select *Address Group*.
2. Go to *Create new*.
3. Enter a *Name* for the address object.
4. In the *Type* field, select *Group*.

5. Select the + in the *Members* field. The *Select Entries* pane opens.
6. Select members of the group. It is possible to select more than one entry. Select the *x* icon in the field to remove an entry.
7. Enable/disable *Static route configuration*.
8. Enter any additional information in the *Comments* field.
9. Click *OK*.



Address folders

Some address objects logically belong to the same device, such as two IPs from the same computer. These address objects can be grouped into an address folder, which is an exclusive list of address objects that do not appear in other address groups or folders.

In the CLI, the folder type can be set after the member list is already populated. If the member list contains an incompatible entry, then the setting will be discarded when the `next`/`end` command is issued. If the folder type is set before the member list is populated, then the possible member entry list will be filtered according to the selected type.

To create an address folder in the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Address Group*.
2. Click *Create new* and enter a name.
3. For *Type*, select *Folder*.
4. For *Members*, click the + to add the addresses. Address folders and groups are exclusive, so the *Select Entries* window filters out address objects that are a member of an existing group or folder.

5. Click *OK*.
6. In the address table, expand the *Address Group* section to view the folder (*dev1-addr-comb*). The expandable

folder view shows the address folder's child objects:

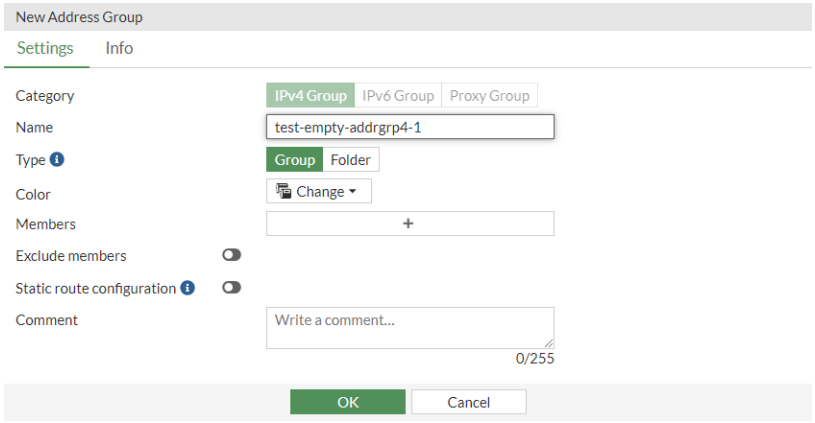
	safe-network1-devices	Address Group (Folder)	2 entries		0
	dev1-addr-comb	Address Group (Folder)	3 entries		1
	dev1-IP-nic1	Subnet	192.168.1.25/32		1
	dev1-IP-nic2	Subnet	192.168.1.22/32		1
	dev1-mac	Device (MAC Address)	00:0a:95:9d:68:16		1
	dev2-addr-comb	Address Group (Folder)	4 entries		1
	dev2-IP-nic1	Subnet	192.168.1.101/32		1
	dev2-IP-nic2	Subnet	192.168.1.102/32		1
	dev2-IP-nic3	Subnet	192.168.1.103/32		1
	dev2-mac	Device (MAC Address)	11:5b:12:2c:87:02		1

To configure an address folder in the CLI:

```
config firewall addrgrp
    edit "safe-network1-devices"
        set type folder
        set member "dev1-addr-comb" "dev2-addr-comb"
        set comment ''
        set exclude disable
        set color 13
    next
end
```

```
config firewall addrgrp
    edit "dev1-addr-comb"
        set type folder
        set member "dev1-IP-nic1" "dev1-IP-nic2" "dev1-mac"
        set comment ''
        set exclude disable
        set color 18
    next
end
```

```
config firewall addrgrp
    edit "dev2-addr-comb"
        set type folder
        set member "dev2-IP-nic1" "dev2-IP-nic2" "dev2-IP-nic3" "dev2-mac"
        set comment ''
        set exclude disable
        set color 5
    next
end
```



Allow empty address groups

Address groups with no members can be configured in the GUI, CLI, and through the API. In previous versions of FortiOS, error messages appear for empty address groups and they cannot be configured.

When an address group with no members is configured in a firewall policy, the policy will not match any traffic. In this case, policy matching logic will proceed down the list of firewall policies until matching the implicit deny policy.

To create an empty address group in the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Address Group*.
2. Click *Create new* .
3. Enter a name.

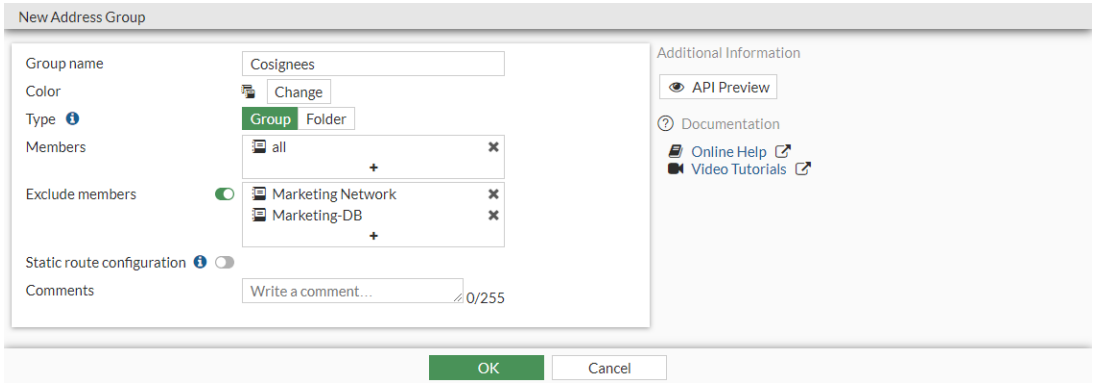
4. Click *OK*. The *This field is required.* error is not displayed under the *Members* field.

To create an empty address group in the CLI:

```
config firewall addrgrp
    edit "test-empty-addrgrp4-1"
    next
end
```

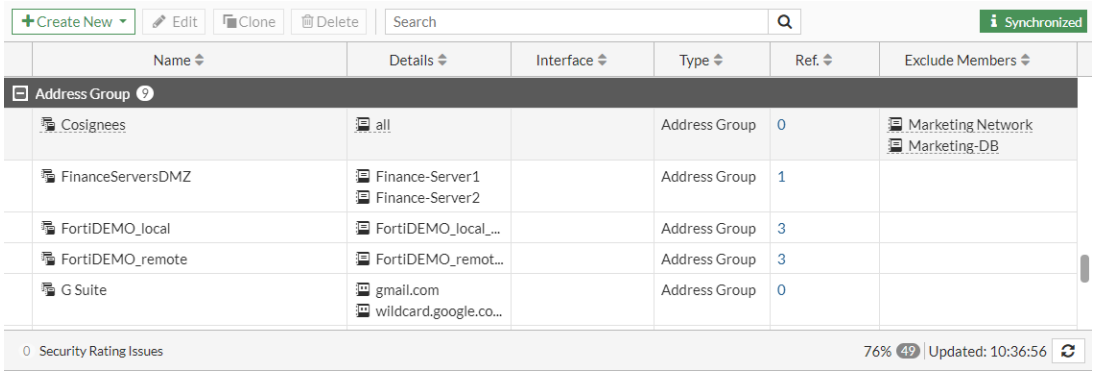
No error message is returned in the console.

Address group exclusions



Specific IP addresses or ranges can be subtracted from the address group with the *Exclude Members* setting in IPv4 address groups.

This feature is only supported for IPv4 address groups, and only for addresses with a *Type* of *IP Range* or *Subnet*.



To exclude addresses from an address group using the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Address Group*.
2. Create a new address group, or edit an existing address group.
3. Enable *Exclude Members* and click the + to add entries.
4. Configure the other settings as needed.

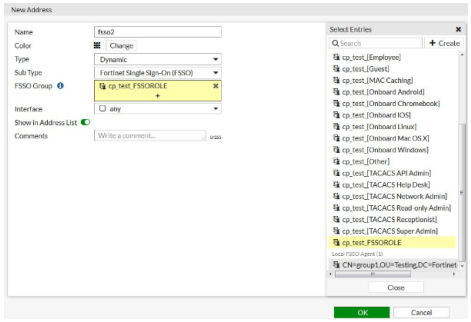
5. Click *OK*.

The excluded members are listed in the *Exclude Members* column.

To exclude addresses from an address group using the CLI:

```
config firewall addrgrp
    edit <address group>
        set exclude enable
        set exclude-member <address> <address> ... <address>
    next
end
```

FSSO dynamic address subtype



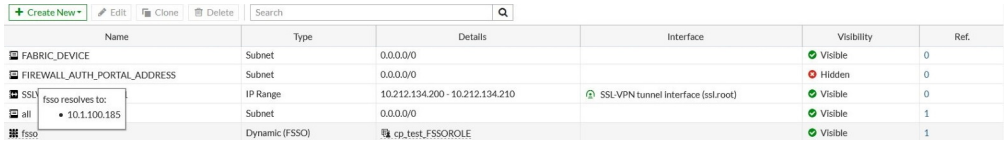
The Fortinet Single Sign-ON (FSSO) dynamic firewall address subtype can be used in policies that support dynamic address types. The FortiGate will update the dynamic address used in firewall policies based on the source IP information for the authenticated FSSO users.

It can also be used with FSSO group information that is forwarded by ClearPass Policy Manager (CPPM) via FortiManager, and other FSSO groups provided by the FSSO collector agent or FortiNAC. Up to 3000 dynamic FSSO IP addresses are supported per dynamic FSSO group.

To configure FSSO dynamic addresses with CPPM and FortiManager in the GUI:

1. Create the dynamic address object:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.

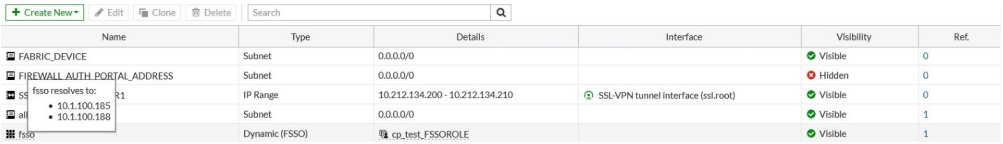
c. For *Type*, select *Dynamic*.
d. For *Sub Type*, select *Fortinet Single Sign-On (FSSO)*.
e. Select one or more groups.
f. Click *OK* to save the configuration.



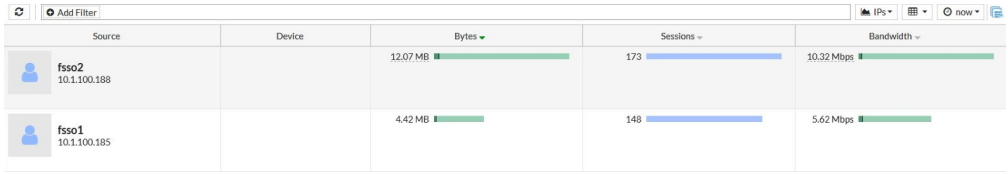
In the address table, there will be an error message for the address you just created (*Unresolved dynamic address: fsso*). This is expected because there are currently no authenticated FSSO users (based on source IP) in the local FSSO user list.

2. Add the dynamic address object to a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Create a new policy or edit an existing policy.
   c. For *Source*, select Address from the dropdown list and add the dynamic FSSO address object you just created.
   d. Configure the rest of the policy as needed.
   e. Click *OK* to save your changes.
3. Test the authentication to add a source IP address to the FSSO user list:
   a. Log in as user and use CPPM for user authentication to connect to an external web server. After successful authentication, CPPM forwards the user name, source IP address, and group membership to the FortiGate via FortiManager.
   b. Go to *Monitor* > *Firewall User Monitor* to view the user name (*fsso1*) and IP address.

   c. Go to *Policy & Objects* > *Addresses* to view the updated address table. The error message no longer appears.
   d. Hover over the dynamic FSSO address to view the IP address (*fsso resolves to: 10.1.100.185*).



To verify user traffic in the GUI:



1. Go to *Log & Report* > *Forward Traffic*.
   Details for the user *fsso1* are visible in the traffic log:

- If another user is authenticated by CPPM, then the dynamic address *fsso* entry in the address table will be updated. The IP address for user *fsso2* (*10.1.100.188*) is now visible:

2. Go to *FortiView* > *Sources* to verify that the users were able to successfully pass the firewall policy.

If a user logs off and CPPM receives log off confirmation, then CPPS updates the FortiGate FSSO user list via FortiManager. The user IP address is deleted from the dynamic FSSO address, and the user is no longer be able to pass the firewall policy.

To configure FSSO dynamic addresses with CPPM and FortiManager in the CLI:

1. Create the dynamic address object:

```
config firewall address
    edit "fsso"
        set type dynamic
        set sub-type fsso
        set fsso-group "cp_test_FSSOROLE"
    next
end
```

2. Add the dynamic address object to a policy:

```
config firewall policy
    edit 1
        set name "pol1"
        set srcintf "port2"
```

```
        set dstintf "port3"
        set srcaddr "fsso"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set fsso disable
        set nat enable
    next
end
```

To verify user traffic in the CLI:

1. Check the FSSO user list:

```
diagnose debug authd fsso list
----FSSO logons----
IP: 10.1.100.185  User: fsso1  Groups: cp_test_FSSOROLE  Workstation:  MemberOf: FSSO-
CPPM cp_test_FSSOROLE
Total number of logons listed: 1, filtered: 0
----end of FSSO logons----
```

2. Check the authenticated firewall users list:

```
diagnose firewall auth list
10.1.100.185, fsso1
type: fsso, id: 0, duration: 2928, idled: 2928
server: FortiManager
packets: in 0 out 0, bytes: in 0 out 0
group_id: 2 33554433
group_name: FSSO-CPPM cp_test_FSSOROLE
----- 1 listed, 0 filtered ------
```

After user traffic passes through the firewall, the nu

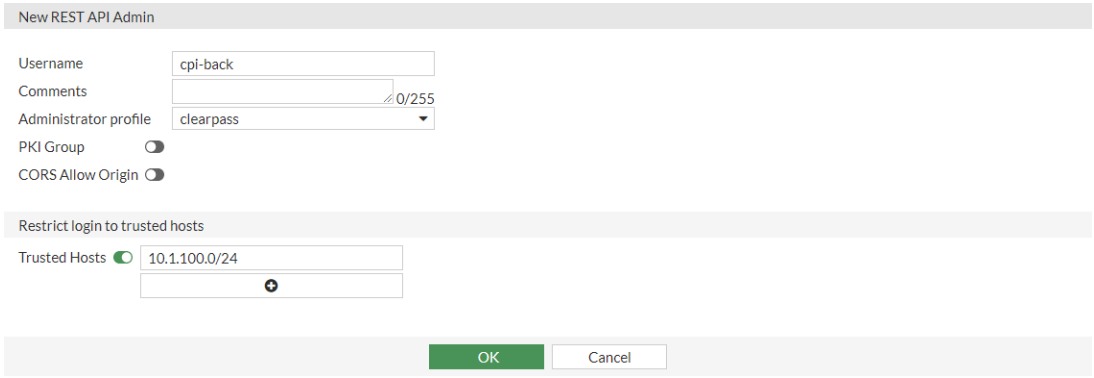
```
diagnose firewall auth list
10.1.100.185, fsso1
type: fsso, id: 0, duration: 3802, idled: 143
server: FortiManager
packets: in 1629 out 1817, bytes: in 2203319 out 133312
group_id: 2 33554433
group_name: FSSO-CPPM cp_test_FSSOROLE
----- 1 listed, 0 filtered ------
```

ClearPass integration for dynamic address objects

ClearPass Policy Manager (CPPM) can gather information about the statuses of network hosts, for example, the latest patches or virus infections. Based on this information, CPPM send the IP addresses and current states, such as Healthy or Infected, to the FortiGate.

On the FortiGate, the IP addresses received from CPPM are added to a dynamic firewall address with the *clearpass-spt* subtype. This address can be used in any policy that supports dynamic addresses, such as Firewall or SSL-VPN policies.

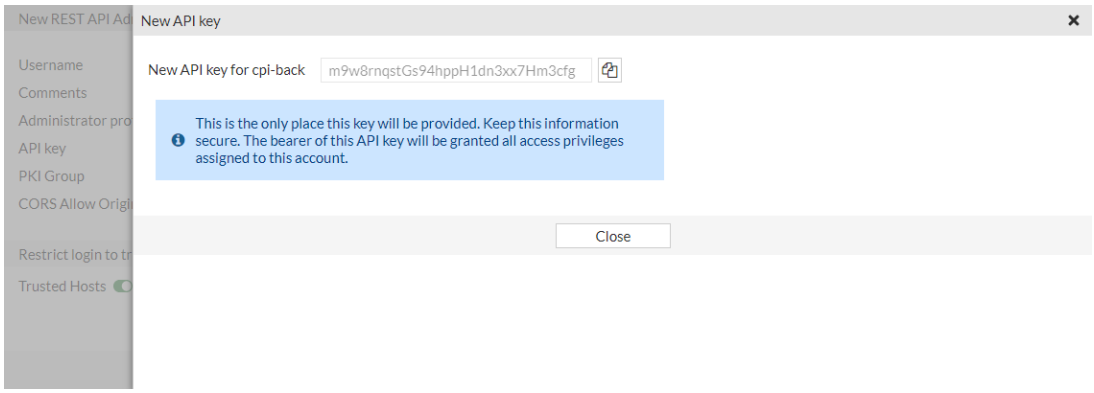
In this example, you create two dynamic IP addresses that are used in two firewall policies (deny and allow). One policy allows traffic (host state = Healthy), and the other denies traffic (host state = Infected). When CPPM sends the information, the IP addresses are assigned according to their host state: Healthy or Infected.



You can then verify that traffic from the Infected host is denied access by the deny policy, and traffic from the Healthy host is allowed access by the allow policy.

Create a REST API administrator

A REST API administrator is required to generate an authorization token for REST API messages, and to limit hosts that can send REST API messages to the FortiGate.



To create a REST API administrator in the GUI:

1. Go to *System* > *Administrators*.
2. Click *Create New* > *REST API Admin*.
3. Configure the *Username* and other information as needed.
4. Disable *PKI Group*.
5. In the *Trusted Hosts* field, enter *10.1.100.0/24*.

For this example, an administrator profile called *clearpass* was created with full read/write access. See Administrator profiles on page 2671 for details.

6. Click *OK*.
The *New API key* pane opens.

The API key is the REST API authorization token that is used in REST API messages sent by CPPM to the FortiGate.

7. Copy the API key to a secure location. A new key can be generated if this one is lost or compromised.
8. Click *Close*.

To create a REST API administrator in the CLI:

```
config system api-user
    edit "cpi-back"
        set accprofile "clearpass"
        config trusthost
            edit 1
                set ipv4-trusthost 10.1.100.0 255.255.255.0
            next
        end
    next
end
```

```
execute api-user generate-key cp-api
    New API key: 0f1HxGHh9r9p74k7qgfHNH40p51bjs
    NOTE: The bearer of this API key will be granted all access privileges assigned to the
api-user cp-api.
```

Create dynamic IP addresses with the clearpass subtype

Two dynamic IP addresses are required, one for the allow policy, and the other for the deny policy.

To create the dynamic IP addresses:

```
config firewall address
    edit "cppm"
        set type dynamic
        set sub-type clearpass-spt
        set clearpass-spt healthy
        set comment ''
        set visibility enable
        set associated-interface ''
        set color 0
    next
    edit "cppm-deny"
        set type dynamic
        set sub-type clearpass-spt
        set clearpass-spt infected
        set comment ''
        set visibility enable
        set associated-interface ''
        set color 0
    next
end
```

Create firewall policies

Two firewall policies are required, one to accept traffic (*cppm-allow*), and the other to deny traffic (*cppm-deny*).

To create the firewall policies in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Configure the allow policy:
   a. Click *Create New*.
   b. Enter a name for the policy.
   c. Set *Source* set to *cppm*.
   d. Set *Action* to *ACCEPT*.
   e. Configure the remaining settings as needed.
   f. Click *OK*.
3. Configure the deny policy:
   a. Click *Create New*.
   b. Enter a name for the policy.
   c. Set *Source* set to *cppm-deny*.
   d. Set *Action* to *DENY*.
   e. Configure the remaining settings as needed.
   f. Click *OK*.

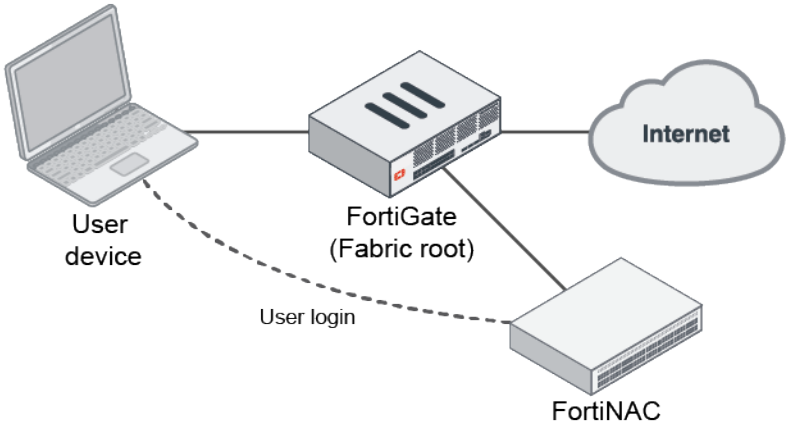
To create the firewall policies in the CLI:

```
config firewall address
    edit "cppm"
        set type dynamic
        set sub-type clearpass-spt
        set clearpass-spt healthy
        set comment ''
        set visibility enable
        set associated-interface ''
        set color 0
    next
    edit "cppm-deny"
        set type dynamic
        set sub-type clearpass-spt
        set clearpass-spt infected
        set comment ''
        set visibility enable
        set associated-interface ''
        set color 0
    next
end
```

Verification

Go to *Log & Report* > *Forward Traffic* to review traffic logs and ensure that traffic is allowed or denied as expected.

To verify that FortiGate addresses are assigned correctly, enter the following:



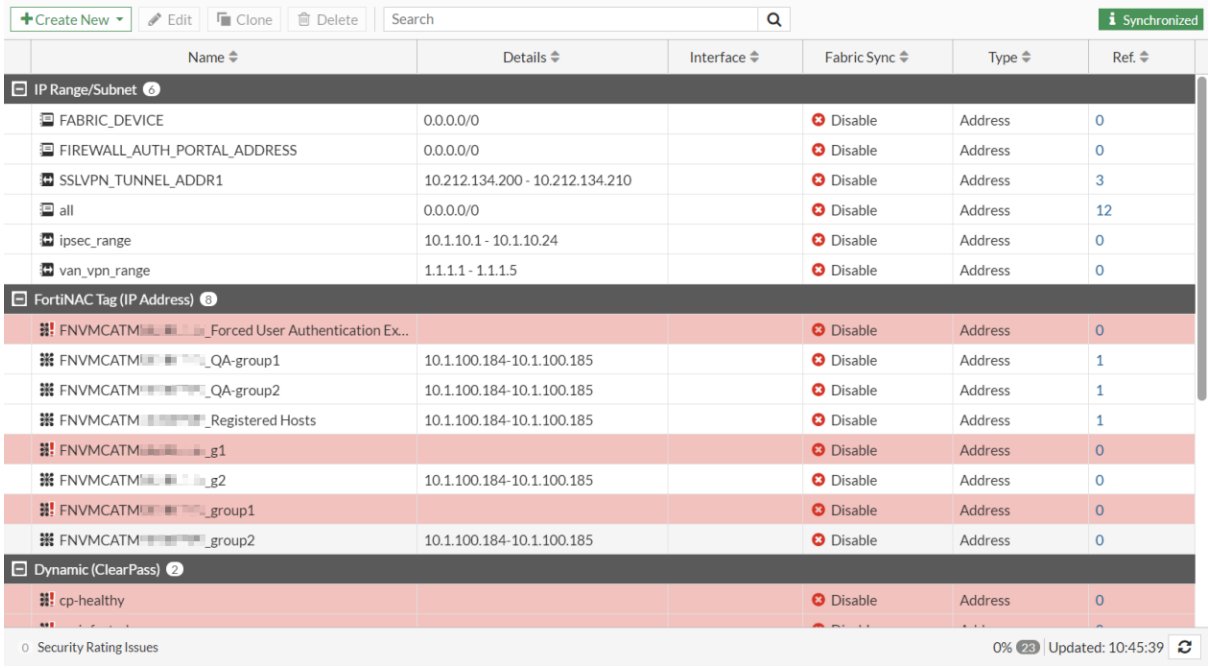
```
# diagnose firewall dynamic list
List all dynamic addresses:
cppm-deny: ID(141)
        ADDR(10.1.100.188)
```

```
cppm: ID(176)
        ADDR(10.1.100.185)
        ADDR(10.1.100.186)
```

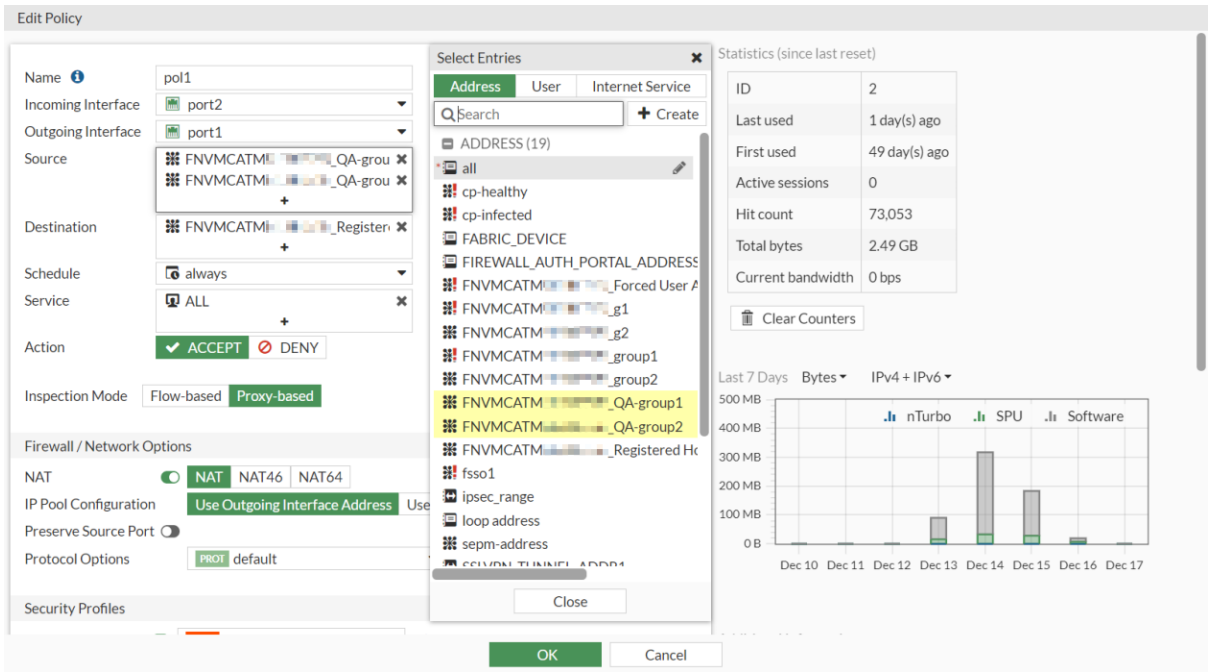
FortiNAC tag dynamic address

The FortiNAC tag dynamic firewall address type is used to store the device IP, FortiNAC firewall tags, and FortiNAC group information sent from FortiNAC by the REST API when user logon and logoff events are registered.

In the following example, the user connecting to the network will be required to first log on to the FortiNAC. When the login succeeds, the logon information is synchronized to the FortiGate using the REST API. The FortiGate updates the dynamic firewall address object with the user and IP information of the user device. This firewall address is used in firewall policies to dynamically allow network access for authenticated users, thereby allowing SSO for the end user.



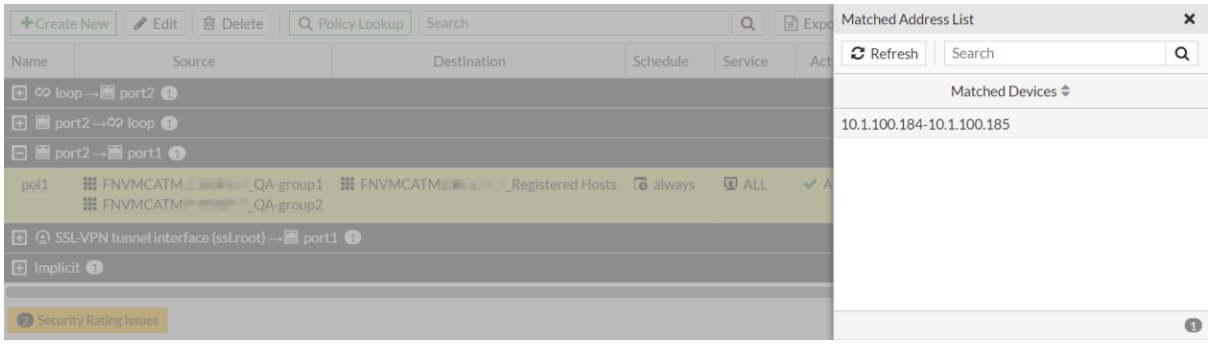
This example assumes the following:



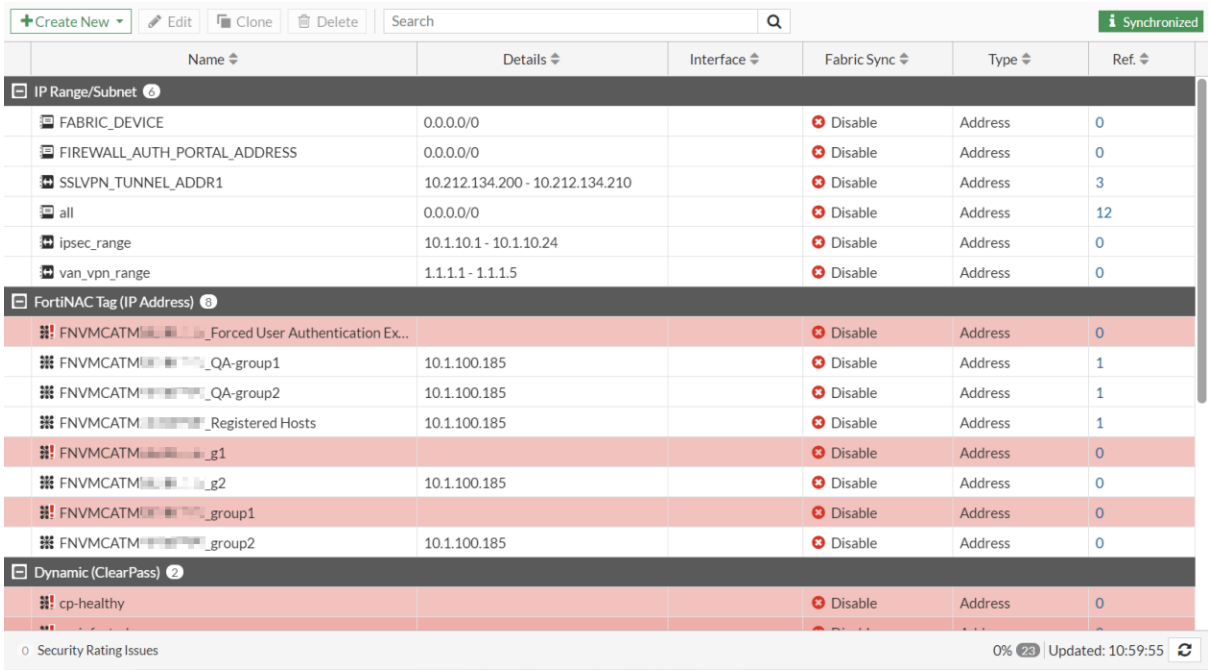
- The FortiGate is the Security Fabric root device (refer to Configuring the root FortiGate and downstream FortiGates on page 3057 for more information).
- The FortiNAC is running version 9.2.2 (or later), and it is connected to the Security Fabric (refer to Configuring FortiNAC on page 3117 for more information).
- Firewall tags and groups have been assigned in FortiNAC to the registered FortiGate (refer to Virtualized Devices for more information). Unlike firewall tags, which are simple labels that can be configured on FortiNAC, firewall groups can be local, built-in, user-defined, or remote user groups imported from a remote server used for user authentication. Only groups that the user of the current logon event belongs to are sent to the FortiGate. Firewall tags are sent for all user authentication.

To use a FortiNAC tag dynamic firewall address in a policy:

1. Trigger two user logon events on the FortiNAC.
2. In FortiOS, go to *Policy & Objects* > *Addresses*, and expand the *FortiNAC Tag (IP Address)* section to view the newly created dynamic firewall address objects. The dynamic firewall addresses matching the current user logon status on FortiNAC have the current IP address of user devices. The addresses without matching user logons are marked with a red exclamation mark (!).

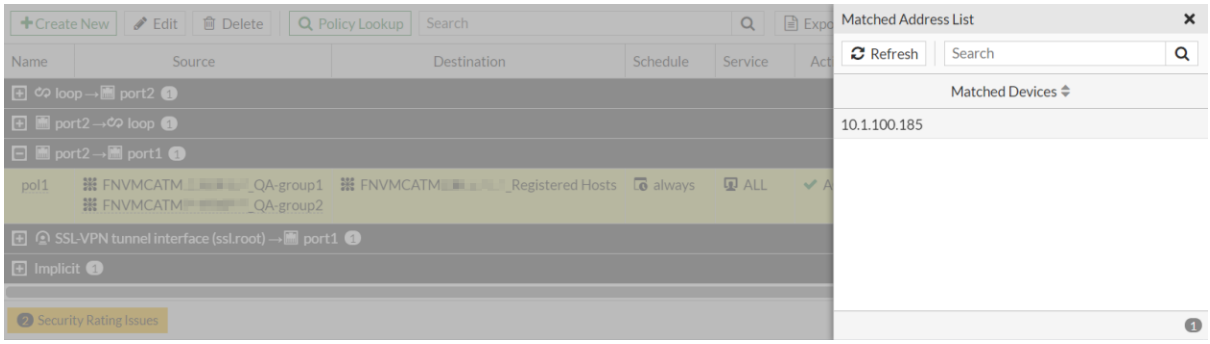


3. Go to *Policy & Objects* > *Firewall Policy* and click *Create New* or edit an existing policy. FortiNAC tag dynamic firewall address an be used as source or destination addresses.



4. Configure the settings as needed, then click *OK*. In this policy, traffic can only pass if it originates from any of the mapped IP addresses (10.1.100.184 and 10.1.100.185); other traffic cannot pass.

5. Hover over the address in the policy, then in the tooltip, click *View Matched Addresses*.



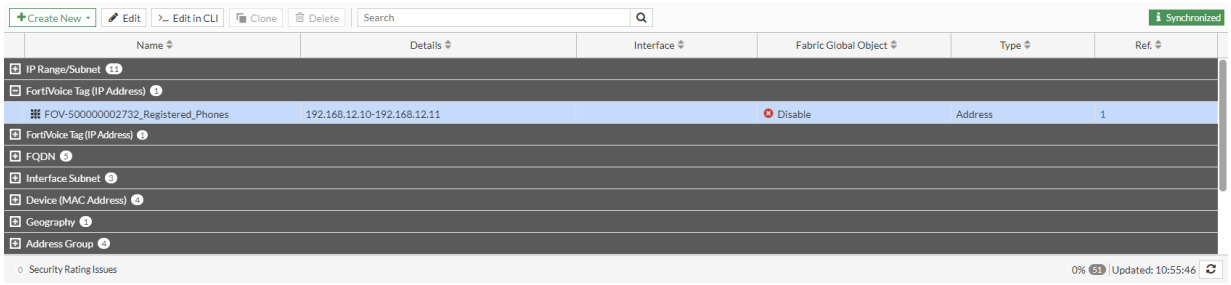
6. Have one of the users log off from the FortiNAC.
7. In FortiOS, go to *Policy & Objects* > *Addresses* and verify the *FortiNAC Tag* addresses. A user logged off from 10.1.100.184, so now only 10.1.100.185 is mapped to the dynamic firewall objects.

All firewall policies using those objects are automatically updated.

8. Go to *Policy & Objects* > *Firewall Policy* . Hover over the address in the policy, then in the tooltip, click *View Matched Addresses*.

The firewall policy was automatically updated so that traffic from 10.1.100.184 can no longer pass, and only traffic from 10.1.100.185 can pass.

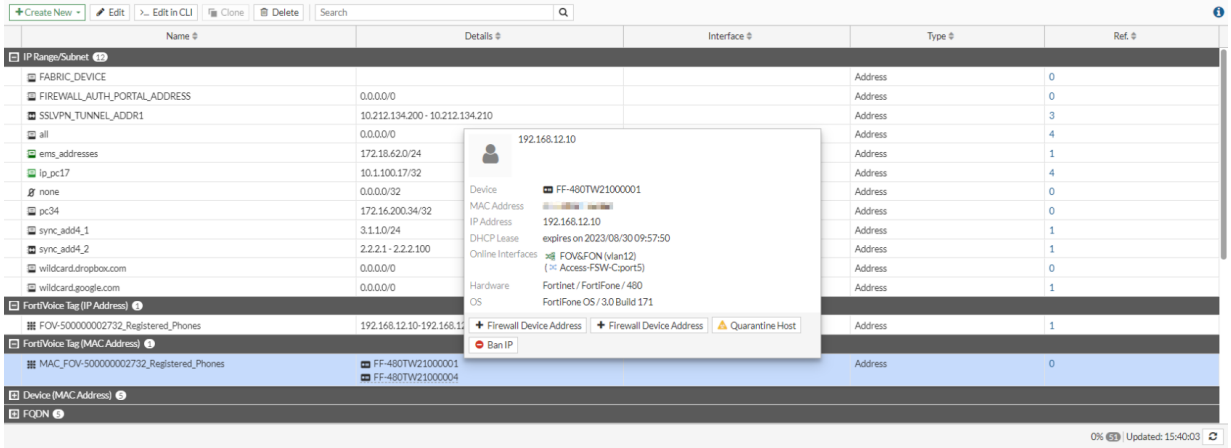
FortiVoice tag dynamic address



When a FortiVoice-supplied MAC or IP address is used in a firewall policy, a FortiVoice tag (MAC/IP) dynamic address is automatically created on the FortiGate that contains all the provisioned FortiFones registered with FortiVoice. The dynamic address can be used in firewall policies to restrict rules to authorized FortiFones only. This is useful for large voice deployments that require security and efficiency.

Example

In this example, two FortiFones are registered to FortiVoice and are assigned names and extension numbers. A FortiVoice Fabric connector has been authorized to join the Security Fabric. The dynamic FortiVoice tags are applied to a firewall policy.



To use a FortiVoice tag dynamic firewall address in a policy:

1. Configure and authorize the FortiVoice Fabric connector (see Configuring FortiVoice on page 3124 for more information).
2. Go to *Policy & Objects* > *Addresses* to view the newly created dynamic firewall address objects:
   a. Expand the *FortiVoice Tag (IP Address)* section.

   There is one entry, *FOV-500000002732_Registered_Phones*, which matches 192.168.12.10 to 192.168.12.11.

   b. Expand the *FortiVoice Tag (MAC Address)* section. There is one entry, *MAC_FOV-500000002732_Registered_Phones*, which matches two devices. Hover over the device serial number to view the tooltip that contains the MAC address and additional information.

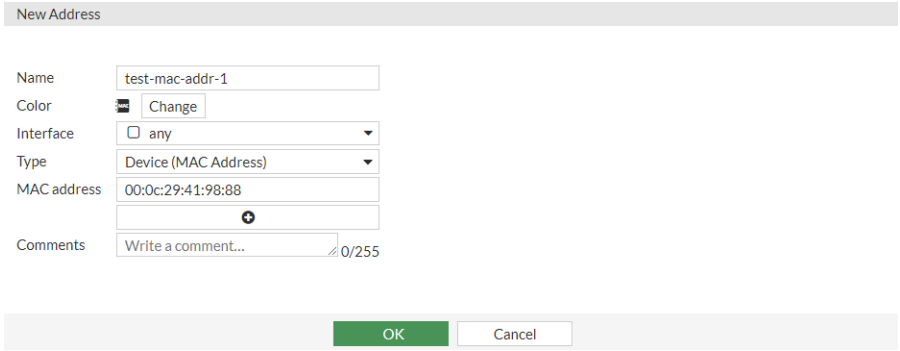
3. Go to *Policy & Objects* > *Firewall Policy* and click *Create new* or edit an existing policy.

4. In the *Source* field, click the + and add the *FOV-500000002732_Registered_Phones* and *MAC_FOV-500000002732_Registered_Phones* addresses.
5. In the *Destination* field, click the + and add the *FOV-500000002732_Registered_Phones* address.
6. Configure the other settings as needed.
7. Click *OK*.

MAC addressed-based policies

MAC addresses can be added to the following IPv4 policies:

- Firewall
- Virtual wire pair
- ACL
- Central SNAT
- DoS



A MAC address is a link layer-based address type and it cannot be forwarded across different IP segments. In FortiOS, you can configure a firewall address object with a singular MAC, wildcard MAC, multiple MACs, or a MAC range.

FortiOS only supports the MAC address type as source address for policies in NAT mode VDOM. When you use the MAC address type in a policy as source address in NAT mode VDOM, IP address translation (NAT) is still performed according to the rules defined in the policy. The MAC address type only works for source address matching. It does not have any association with NAT actions.

For policies in transparent mode or the virtual wire pair interface, you can use the MAC address type as source or destination address.

To configure a MAC address using the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. Enter a name.
4. For *Category*, select *Address*.
5. For *Type*, select *Device (MAC Address)*.
6. Enter the MAC address.

7. Click *OK*.

8. Go to *Policy & Objects* > *Firewall Policy* to apply the address type to a policy in NAT mode VDOM:
   a. For *Source*, select the MAC address you just configured.
   b. For *Destination*, select an address.

   In NAT mode VDOM, this address type cannot be used as destination address.

   c. Configure the other settings as needed.
   d. Click *OK*.

To configure a MAC address using the CLI:

1. Create a new MAC address:

```
config firewall address
    edit "test-mac-addr1"
        set type mac
        set macaddr 00:0c:29:41:98:88
    next
end
```

2. Apply the address type to a policy. In transparent mode or the virtual wire pair interface, this address type can be mixed with other address types in the policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "test-mac-addr1" "10-1-100-42"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
    next
end
```

Device & OS Identification dynamic address subtype

Another type of MAC address object is the dynamic *Device & OS identification* subtype. This firewall address subtype is an advanced feature that can be used in policies that support dynamic address subtypes, and it relies on device detection configured on the interface connected to user devices to determine device information.

The FortiGate will update the dynamic address used in firewall policies based on the MAC address and other device and OS information for devices matching configured criteria. The criteria could be hardware vendor, hardware model, software OS, software version, or a combination of these parameters.

Only existing devices whose device information has already been detected by the FortiGate and is known can be added to this dynamic address subtype.

Similar to MAC address-based objects, the dynamic address subtype can be used as a source address for firewall policies, proxy policies, and ZTNA rules. The dynamic address subtype can be used as a source or destination address for transparent mode policies or a virtual wire pair policy.

To use the dynamic *Device & OS Identification* subtype, go to *System* > *Feature Visibility* and enable *Dynamic Device & OS Identification*. Once enabled, the dynamic address subtype can be configured on the *Policy & Objects* > *Addresses* page.

ISDB well-known MAC address list

The Internet Service Database (ISDB) includes well-known vendor MAC address range lists. The lists can only be used for source MAC addresses in IPv4 policies, and include the vendor name and the MAC address ranges that the vendor belongs to.

To view the vendor list:

```
# diagnose vendor-mac id
Please input Vendor MAC ID.
ID: 1 name: "Asus"
ID: 2 name: "Acer"
ID: 3 name: "Amazon"
ID: 4 name: "Apple"
ID: 5 name: "Xiaomi"
ID: 6 name: "BlackBerry"
ID: 7 name: "Canon"
ID: 8 name: "Cisco"
ID: 9 name: "Linksys"
ID: 10 name: "D-Link"
ID: 11 name: "Dell"
ID: 12 name: "Ericsson"
ID: 13 name: "LG"
ID: 14 name: "Fujitsu"
ID: 15 name: "Fitbit"
ID: 16 name: "Fortinet"
ID: 17 name: "OPPO"
ID: 18 name: "Hitachi"
ID: 19 name: "HTC"
ID: 20 name: "Huawei"
ID: 21 name: "HP"
ID: 22 name: "IBM"
ID: 23 name: "Juniper"
ID: 24 name: "Lenovo"
ID: 25 name: "Microsoft"
ID: 26 name: "Motorola"
ID: 27 name: "Netgear"
ID: 28 name: "Nokia"
ID: 29 name: "Nintendo"
ID: 30 name: "PaloAltoNetworks"
ID: 31 name: "Polycom"
ID: 32 name: "Samsung"
ID: 33 name: "Sharp"
ID: 34 name: "Sony"
ID: 35 name: "Toshiba"
ID: 36 name: "VMware"
```

```
ID: 37 name: "Vivo"
ID: 38 name: "Zyxel"
ID: 39 name: "ZTE"
```

To view the MAC address ranges for a vendor:

```
# diagnose vendor-mac id 16
Vendor MAC: 16(Fortinet)
Version: 0000700021
Timestamp: 201908081432
Number of MAC ranges: 6
00:09:0f:00:00:00 - 00:09:0f:ff:ff:ff
04:d5:90:00:00:00 - 04:d5:90:ff:ff:ff
08:5b:0e:00:00:00 - 08:5b:0e:ff:ff:ff
70:4c:a5:00:00:00 - 70:4c:a5:ff:ff:ff
90:6c:ac:00:00:00 - 90:6c:ac:ff:ff:ff
e8:1c:ba:00:00:00 - e8:1c:ba:ff:ff:ff
```

To query the vendor of a specific MAC address or range:

```
# diagnose vendor-mac match 00:09:0f:ff:ff:ff 48
Vendor MAC: 16(Fortinet), matched num: 1
```

To use the vendor ID in a firewall policy:

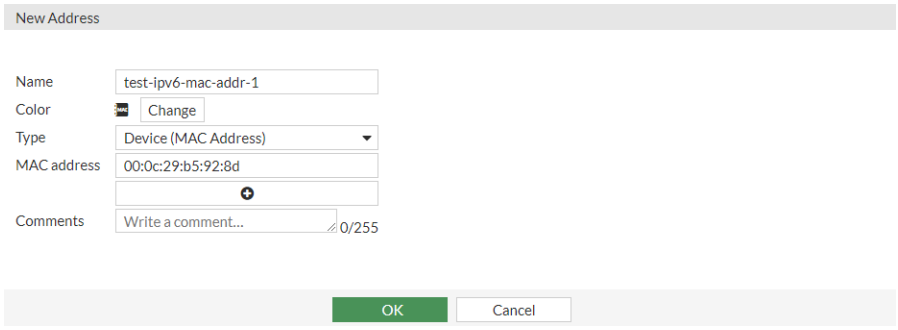
```
config firewall policy
    edit 9
        set name "policy_id_9"
        set uuid 6150cf30-308d-51e9-a7a3-bcbd05d61f93
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set vendor-mac 36 16
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

Only packets whose source MAC address belong to Fortinet or VMware are passed by the policy.

IPv6 MAC addresses and usage in firewall policies

Users can define IPv6 MAC addresses that can be applied to the following policies:

- Firewall
- Virtual wire pair
- ACL/DoS
- Central NAT



- NAT64
- Local-in

In FortiOS, you can configure a firewall address object with a singular MAC, wildcard MAC, multiple MACs, or a MAC range. In this example, a firewall policy is configured in a NAT mode VDOM with the IPv6 MAC address as a source address.

IPv6 MAC addresses cannot be used as destination addresses in VDOMs when in NAT operation mode.

To configure IPv6 MAC addresses in a policy in the GUI:

1. Create the MAC address:
   a. Go to *Policy & Objects* > *Addresses* and select *IPv6 Address*.
   b. Click *Create New*.
   c. Enter an address name.
   d. For *Type*, select *Device (MAC Address)*.
   e. Enter the the MAC address.

   f. Click *OK*.
2. Configure the policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. For *Source*, select the IPv6 MAC address object.
   c. Configure the other settings as needed.
   d. Click *OK*.

To configure IPv6 MAC addresses in a policy in the CLI:

1. Create the MAC address:

```
config firewall address6
    edit "test-ipv6-mac-addr-1"
        set type mac
        set macaddr 00:0c:29:b5:92:8d
    next
end
```

2. Configure the policy:

```
config firewall policy
    edit 2
```

```
            set srcintf "wan2"
            set dstintf "wan1"
            set srcaddr "all"
            set dstaddr "all"
            set srcaddr6 "test-ipv6-mac-addr-1" "2000-10-1-100-0"
            set dstaddr6 "all"
            set action accept
            set schedule "always"
            set service "ALL"
            set logtraffic all
            set auto-asic-offload disable
            set nat enable
        next
    end
```

Protocol options

Firewall policies contain a *Protocol Options* field that defines the parameters for handling protocol-specific traffic. Multiple protocol options profiles can be configured in FortiOS since the requirements may differ between policies. A single protocol options profile is applied per policy, but the profile can be used in multiple policies.

To create a protocol options profile, go to *Policy & Objects* > *Protocol Options*. The following settings can be configured.

Log oversized files

Enable this option to log the occurrence of oversized files being processed. This does not change how they are processed. It only allows the FortiGate to log that they were either blocked or allowed through.

It is common practice to allow larger files through without antivirus processing. Monitor the logs for the frequency of oversized file processing to determine whether or not to alter the settings for treating oversized files. The threshold setting for oversized files and emails is located in the *Common Options* section.

RPC over HTTP

This protocol is used by Microsoft Exchange Servers to perform virus scanning on emails that use RPC over HTTP.

Protocol port mapping

To optimize the FortiGate's resources, the mapping and inspection of the following protocols can be enabled or disabled:

- HTTP
- SMTP
- POP3
- IMAP
- FTP
- NNTP
- MAPI
- DNS
- CIFS

Each protocol has a default TCP port. The ports can be modified to inspect any port with flowing traffic. The packet headers indicate which protocol generated the packet.

Protocol port mapping only works with proxy-based inspection. Flow-based inspection inspects all ports regardless of the protocol port mapping configuration.

Common options

The *Comfort Clients* and *Block Oversized File/Email* options apply to multiple protocols.

Comfort clients

When proxy-based antivirus scanning is enabled, the FortiGate buffers files as they are downloaded. Once the entire file is captured, the FortiGate begins scanning the file. The user must wait during the buffering and scanning procedure. After the scan is completed and if no infection is found, the file is sent to the next step in the process flow. If the file is large, this part of the process can take some time. In some cases, enough time that some users may get impatient and cancel the download.

The *Comfort Clients* option mitigates this potential issue by feeding a trickle of data while waiting for the scan to complete. The user is aware that processing is taking place, and that there has not been a failure in the transmission. The slow transfer rate continues until the antivirus scan is complete. The transfer will proceed at full speed once the file is scanned successfully and does not contain any viruses.

If there is evidence of an infection, the FortiGate caches the URL and drops the connection. The client does not receive any notification of what happened because the download to the client has already started. Instead, the download stops and the user is left with a partially downloaded file. If the user tries to download the same file again within a short period of time, the cached URL is matched and the download is blocked. A notification is displayed that the download was blocked. The number of URLs in the cache is limited by the size of the cache.

Client comforting is available for HTTP and FTP traffic. If the FortiGate supports SSL content scanning and inspection, client comforting can be configured for HTTPS and FTPS traffic.

Buffering the entire file allows the FortiGate to eliminate the danger of missing an infection due to fragmentation because the file is reassembled before examination. This buffering is performed whenever the *Comfort Clients* option is disabled.

Client comforting can send unscanned and potentially infected content to the client, so only enable this option if you are prepared to accept this risk. Keeping the client comforting interval high and the amount low will reduce the amount of potentially infected data that is downloaded.

Block oversized files and emails

This option is related to antivirus scanning. The FortiGate has a finite amount of resources to buffer and scan a file. If a large file (such as an ISO image or video file) is downloaded, this could overwhelm or exceed the FortiGate's memory, especially if other large files are being downloaded at the same time.

A threshold is assigned to identify an oversize file or email. The default is 10 MB. The range varies per model, and the minimum is 1 MB. Any file or email over this threshold will not be processed by policies applying the antivirus security profile.

If the FortiGate enters conserve mode on a regular basis, lowering the threshold can lessen the impact of processing the files on memory. This can increase risk, even though malware is more likely to be in smaller files.

Web options

The *Chunked Bypass* option applies to traffic containing web protocols.

Chunked bypass

Chunked bypass is a mechanism in HTTP 1.1 that allows a web server to start sending chunks of dynamically generated output in response to a request before actually knowing the actual size of the content. For dynamically generated content, enabling chunked bypass speeds up the initial response to HTTP requests, but the content is not held in the proxy as an entire file before proceeding.

Email options

The *Allow Fragmented Messages* and *Append Signature (SMTP)* options apply to email protocols.

Allow fragmented messages

The specifications of RFC 2046 allow for the breaking up of emails and sending the fragments in parallel to be rebuilt and read at the other end by the mail server. It was originally designed to increase the performance over slower connections where larger email messages were involved. Feasibility of using this function depends on the mail configuration. Outside of Microsoft Outlook, not many email clients are set up to break up messages like this. The drawback of this feature is that if malware is broken up between multiple fragments of the message, there is a risk that it will not be detected by some antivirus configurations because all the code may not be present at the same time to identify the malware.

Append signature

This option adds a plain text email signature to SMTP email messages as they pass through the FortiGate. The message maximum is 1023 characters.

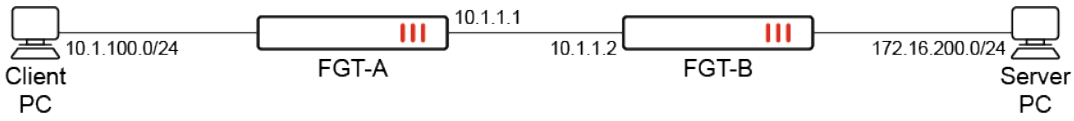
This feature works best in an environment where there is some standardization of what goes into the senders' personal signatures so that there is no duplication or contradiction of information. For example:

- *This email should not be forwarded without prior approval.*
- *Please consider the environment before printing this email.*
- *For questions regarding purchasing our products, please call ...*

Stripping the X-Forwarded-For value in the HTTP header

The X-Forwarded-For value in the HTTP header can be stripped when the `strip-x-forwarded-for` option is enabled under `firewall profile-protocol-options`. This feature sets the value to empty using the IPS engine.

The following types of traffic support X-Forwarded-For stripping:



- HTTP/1.1, HTTP/2, and HTTP/3 traffic that matches an NGFW mode security policy with flow-based inspection.
- Plain HTTP/1.1 traffic that matches a firewall policy with proxy-based inspection.

The following types of traffic do not support X-Forwarded-For stripping:

- HTTPS traffic that matches a firewall policy with proxy-based inspection.
- HTTP and HTTPS traffic that matches an explicit web proxy policy.

Example

In this example, FGT-A is configured with `strip-x-forwarded-for` enabled for HTTP. On FGT-B, the IPS sensor is configured to monitor the Eicar.Virus.Test.File signature. The IPS logs on FGT-B are used to verify the traffic sent from FGT-A to FGT-B, namely the `forwardedfor` value in the `rawdata` field.

To configure X-Forwarded-For stripping:

1. Configure FGT-A:
   a. Configure the protocol options for HTTP:

```
config firewall profile-protocol-options
    edit "protocol-xff"
        config http
            set ports 80
            unset options
            set strip-x-forwarded-for enable
            unset post-lang
        end
    next
end
```

   b. Configure the firewall policy (ensure that an IPS sensor is applied):

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port5"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set profile-protocol-options "protocol-xff"
        set ssl-ssh-profile "ssl-deep"
        set ips-sensor "default"
        set nat enable
    next
end
```

2. Configure FGT-B:
   a. Configure the IPS sensor with extended logging:

```
config ips sensor
    edit "monitor-eicar"
        set extended-log enable
        config entries
            edit 1
                set rule 29844
                set status enable
                set action pass
            next
        end
    next
end
```

   b. Configure the firewall policy (ensure that an IPS sensor is applied):

```
config firewall policy
    edit 3
        set srcintf "port5"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "ssl-deep"
        set ips-sensor "monitor-eicar"
        set nat enable
    next
end
```

To verify the configuration:

1. Use a cURL request to send HTTPS traffic with HTTP header X-Forwarded-For from the Client PC to the Server PC:

```
curl -vk -H "X-Forwarded-For: 10.22.22.22" https://172.16.200.52/eicar.com
```

2. On FGT-B, verify the corresponding IPS logs.
   a. For HTTP/1.1, the `X-Forwarded-For` value is removed from the `rawdata` field, and the `forwardedfor` value is not included:

```
1: date=2023-09-21 time=14:05:34 eventtime=1695330334919589600 logid="0419016384"
type="utm" subtype="ips" eventtype="signature" level="alert" vd="root"
severity="info" srcip=10.1.1.1 srccountry="Reserved" dstip=172.16.200.42
dstcountry="Reserved" srcintf="port5" srcintfrole="undefined" dstintf="port1"
dstintfrole="undefined" sessionid=2471 action="detected" proto=6 service="HTTPS"
policyid=3 poluuid="782b9e86-58a3-51ee-8e0f-79c7682223dd" policytype="policy"
attack="Eicar.Virus.Test.File" srcport=36018 dstport=443 hostname="172.16.200.42"
url="/eicar.com" agent="curl/7.61.1" httpmethod="GET" direction="incoming"
attackid=29844 profile="monitor-eicar" ref="http://www.fortinet.com/ids/VID29844"
incidentserialno=75497475 msg="file_transfer: Eicar.Virus.Test.File" rawdataid="1/1"
rawdata="Response-Content-Type=application/x-msdos-program" crscore=5 craction=65536
crlevel="low"
```

b. For HTTP/2 and HTTP/3, the `X-Forwarded-For` value is removed from the `rawdata` field, and `forwardedfor` is included:

```
1: date=2023-09-21 time=14:05:56 eventtime=1695330356543624871 logid="0419016384"
type="utm" subtype="ips" eventtype="signature" level="alert" vd="root"
severity="info" srcip=10.1.1.1 srccountry="Reserved" dstip=172.16.200.52
dstcountry="Reserved" srcintf="port5" srcintfrole="undefined" dstintf="port1"
dstintfrole="undefined" sessionid=2474 action="detected" proto=6 service="HTTPS"
policyid=3 poluuid="782b9e86-58a3-51ee-8e0f-79c7682223dd" policytype="policy"
attack="Eicar.Virus.Test.File" srcport=37786 dstport=443 hostname="172.16.200.52"
url="/eicar.com" agent="curl/7.61.1" httpmethod="GET" direction="incoming"
attackid=29844 profile="monitor-eicar" ref="http://www.fortinet.com/ids/VID29844"
incidentserialno=75497476 msg="file_transfer: Eicar.Virus.Test.File" rawdataid="1/1"
forwardedfor="\r\n" rawdata="Response-Content-Type=application/x-msdos-program"
crscore=5 craction=65536 crlevel="low"
```

3. On FGT-A, disable `strip-x-forwarded-for` for HTTP:

```
config firewall profile-protocol-options
    edit "protocol-xff"
        config http
            set strip-x-forwarded-for disable
        end
    next
end
```

4. Send the same HTTPS traffic with HTTP header X-Forwarded-For from the Client PC to the Server PC.
5. On FGT-B, verify the corresponding IPS log, which includes `forwardedfor` and `X-Forwarded-For` values in the `rawdata` field:

```
1: date=2023-09-21 time=16:33:06 eventtime=1695339187144132034 logid="0419016384"
type="utm" subtype="ips" eventtype="signature" level="alert" vd="root" severity="info"
srcip=10.1.1.1 srccountry="Reserved" dstip=172.16.200.52 dstcountry="Reserved"
srcintf="port5" srcintfrole="undefined" dstintf="port1" dstintfrole="undefined"
sessionid=3776 action="detected" proto=6 service="HTTPS" policyid=3 poluuid="782b9e86-

srcport=37788 dstport=443 hostname="172.16.200.52" url="/eicar.com" agent="curl/7.61.1"
httpmethod="GET" direction="incoming" attackid=29844 profile="monitor-eicar"
ref="http://www.fortinet.com/ids/VID29844" incidentserialno=75497478 msg="file_transfer:
Eicar.Virus.Test.File" rawdataid="1/1" forwardedfor="10.22.22.22" rawdata="Response-
Content-Type=application/x-msdos-program|X-Forwarded-For=10.22.22.22" crscore=5
craction=65536 crlevel="low"
```

Traffic shaping

A FortiGate provides quality of service (QoS) by applying bandwidth limits and prioritization to network traffic. Traffic shaping is one technique used by the FortiGate to provide QoS. A basic approach to traffic shaping is to prioritize higher priority traffic over lower priority traffic during periods of traffic congestion. This provides a stabilizing effect for important traffic while throttling less important traffic.

The FortiGate can be configured to deliver traffic shaping with policing or traffic shaping with queuing. The general difference between the two is as follows:

Technique	Description
Traffic shaping with policing	When traffic exceeds the configured bandwidth limits, traffic is dropped.
Traffic shaping with queuing	When traffic exceeds the configured bandwidth limits, traffic is delayed for transport until bandwidth frees up. Traffic may be dropped if the queues are full.

Policing and queuing can both prioritize traffic and deliver guaranteed bandwidth and maximum bandwidth by setting bandwidth limits. The implementation differs though, since queuing uses queues, and policing does not. In queuing, before a packet egresses an interface, it is first enqueued to a queue using an algorithm such as RED or FIFO. The kernel dequeues the packet based on the HTB algorithm before sending it out. In policing, traffic simply drops if it is over the allocated bandwidth.

The following topics provide information about configuring traffic shaping:

- Traffic shaping policies on page 1472
- Traffic shaping profiles on page 1482
- Traffic shapers on page 1492
- Global traffic prioritization on page 1507
- DSCP matching and DSCP marking on page 1510
- Examples on page 1514

Configuration methods

There are different methods to configure traffic shaping on the FortiGate. The following table lists the methods and their capabilities in order of preference. If all three methods are configured, the first will be preferred over the second, which is preferred over the third.

Method	Policing		Queuing
	Traffic prioritization	Guaranteed and maximum bandwidth limits	Traffic queuing
Traffic shaping profile*	Yes	Yes, based on percentage of outbandwidth	Yes
Traffic shaper	Yes	Yes, based on rate	No
Global traffic prioritization	Yes	No	No

* Traffic shaping profiles are configured as either policing or queuing types. Queuing allows for additional options when configuring a shaping class entry.

The features of each method's implementation are slightly different. The following is a brief summary of the traffic policing features and the approach each method takes.

Traffic prioritization

The FortiGate can place packets into different priority levels in order to prioritize certain traffic over others.

Method	Description
Traffic shaping profile	Traffic is placed into classes. A total of 30 classes are available. For each class, traffic can be configured into five priority levels.
Traffic shaper	Traffic can be prioritized into the high (2), medium (3), or low (4) levels. When traffic is below the guaranteed bandwidth of the shaper, the traffic is automatically applied the critical level (1).
Global traffic prioritization	Traffic is prioritized into high (2), medium (3), or low (4) based on ToS (type of service) or DSCP.

Guaranteed and maximum bandwidth limits

The general purpose for configuring guaranteed bandwidth is to allocate a certain proportion of the total outbandwidth to guarantee transport for a certain type of traffic. This is configured and handled differently in each method.

A traffic shaping profile, when applied to an interface's egress shaping profile, can be configured to use up to 100% of the interface's configured bandwidth between all the classes. It does not matter what priority is configured in each class. The guaranteed bandwidth is always honored.

Traffic shapers, however, do not have a hard limit on the guaranteed bandwidth. Administrators need to be aware how much guaranteed bandwidth has been allocated to all their traffic shapers, so that they do not exceed the total outbandwidth of an interface. Traffic under the guaranteed bandwidth of a traffic shaper is given a priority of one. If the total traffic with priority one exceeds the total outbandwidth, traffic can be dropped.

The maximum bandwidth limit caps the maximum bandwidth that can be used. This is configured as a percentage of the outbandwidth in a traffic shaping profile. It is configured as a rate for traffic shapers.

Configuring outbandwidth

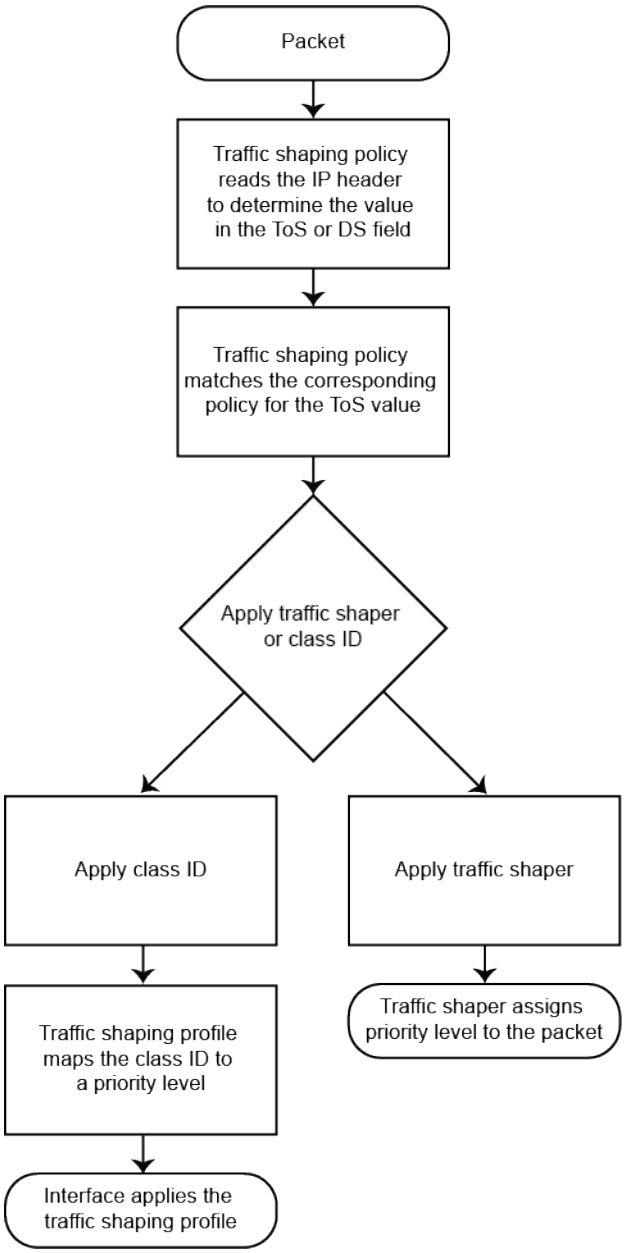
Traffic shaping is generally configured for egress traffic leaving the FortiGate. Therefore, it is necessary for the interface outbandwidth to be defined for traffic prioritization to take place in all of the traffic shaping configuration methods. Interface outbandwidth is also needed when defining the guaranteed and maximum bandwidth in a traffic shaping profile.

For traffic shapers, configuring outbandwidth is not necessary to apply maximum bandwidth limits; however, outbandwidth is necessary for guaranteed bandwidth. Traffic under the guaranteed bandwidth limit on a traffic shaper is given priority 1. If outbandwidth is not configured, traffic prioritization does not take place and the priority is meaningless.

Traffic shaping policy

Traffic shaping profiles and traffic shapers are methods of policing traffic. Traffic shaping policies are used to map traffic to a traffic shaper or assign them to a class.

A traffic shaping policy is a rule that matches traffic based on certain IP header fields and/or upper layer criteria. For example, it can match traffic based on source and destination IP, service, application, and URL category. One common use case is to match traffic based on the ToS or DS (differentiated services) field in the IP header. This allows Type of Service or Differentiated Services (DiffServ) tags to be read from traffic from a downstream device and prioritized accordingly on the FortiGate.



DSCP matching and DSCP marking

DSCP matching and DSCP marking can be performed on a firewall shaping policy and a regular firewall policy. DSCP matching is used to match DSCP tags from ingress traffic, and DSCP marking is used to change the DSCP tag on egress traffic.

In a firewall shaping policy and regular firewall policy, use the `tos` and `tos-mask` fields to perform DSCP matching. Use the `diffserv-forward` and `diffserv-reverse` fields to perform DSCP marking.

Traffic shaping policies

As mentioned in Traffic shaping on page 1469, traffic shaping starts with the traffic shaping policy. Traffic shaping policies are used to map traffic to a traffic shaper or assign them to a class. Traffic is then shaped by the shaper or the shaping profile that is applied on an interface.

Traffic can also be shaped by applying traffic shapers directly on a firewall policy. However, this legacy approach can only be configured from the CLI, and is not a preferred method for applying traffic shaping. As the number of firewall policies increases, managing shaping on each individual policy becomes increasingly difficult. For the same reason, it is also not recommended to mix the legacy approach with traffic shaping policies to avoid the added complexity.

Overview

A traffic shaping policy is a rule that matches traffic based on certain IP header fields and/or upper layer criteria. When traffic hits the firewall, the FortiGate will first look up a firewall policy, and then match a shaping policy. The matching traffic will apply a traffic shaper, class ID, or assign a DSCP DiffServ tag to the outgoing traffic.

The traffic shaping policies must be placed in the correct order in the traffic shaping policy list page to obtain the desired results. Policies are matched from top-down, so the traffic shaping policies should be arranged in a sequence that places the more granular policies above general policies.

The policy can be configured by going to *Policy & Objects* > *Traffic Shaping* and selecting the *Traffic Shaping Policies* tab. If the menu does not display the traffic shaping settings, go to *System* > *Feature Visibility* and enable *Traffic Shaping*.

Configuring traffic shaping policies

A traffic shaping policy can be split into two parts:

- Options used to match the traffic
- Options used to apply actions to the matched traffic

In the GUI, the options are configured in the *If Traffic Matches* and *Then* sections. In the CLI, all options are configured under `config firewall shaping-policy`. Some options can only be configured from the CLI.

The following options can be configured for traffic matching criteria:

GUI option	CLI option	Description
Source		
Address	`set srcaddr <address_object>`	Select the address object to match the source IP.
User	`set users <user_object>`	Select the user object to match the user authenticated for the session.

Internet Service	`set internet-service-src enable`
	`set internet-service-src-name <name>`
	`set internet-service-src-group <group>`
	`set internet-service-src-custom <custom>`
	`set internet-service-src-custom-group <custom_group>`
		Select the internet service to match the source of the incoming traffic. Internet service currently cannot be used with source address.

Destination		
Address	`set dstaddr <address_object>`	Select the address object to match the destination IP.

Internet Service	`set internet-service enable`
	`set internet-service-name <name>`
	`set internet-service-group <group>`
	`set internet-service-custom <custom>`
		Select the internet service to match the destination of the incoming traffic. Internet service currently cannot be used with destination address and service.

GUI option	CLI option	Description
	`set internet-service-custom-group <custom_group>`	
Schedule	`set schedule <schedule>`	Enable to select a schedule (one-time, recurring, or group).
Service	`set service <service>`	Select the service or service group for the traffic.
Application		Application control must be enabled in the related firewall policy to learn the application of the traffic.
Application	`set application <application>`	Select the application to match the application of the traffic.
Category	`set app-category <category>`	Select the application category to match the application of the traffic.
Group	`set app-group <groups>`	Select the application group to match the application of the traffic.
URL Category	`set url-category <category>`	Select the URL category to match the URL of the traffic. A web filter profile must be enabled in the related firewall policy to know the URL of the traffic (see Web filter on page 1617).

n/a	`set tos-mask <hexadecimal_mask>`
	`set tos <value>`
	`set tos-negate {enable | disable}`
		Specify the type of service (ToS) and mask to match.
		These options can only be configured in the CLI.

The following options can be configured for actions to apply to the matched traffic:

GUI option	CLI option	Description
Outgoing interface	`set dstintf <interface>`	Select the destination interface that the traffic shaping applies to (required).
Apply shaper		
Shared shaper	`set traffic-shaper <shaper>`	Select the shared shaper to be applied to traffic in the ingress-to-egress direction. For example, on traffic that egresses on the wan interface, the shaper is applied to upload or outbound traffic.

GUI option	CLI option	Description
Reverse shaper	`set traffic-shaper-reverse <shaper>`	Select the reverse shaper to be applied to traffic in the egress-to-ingress direction. For example, on traffic that egresses on the wan interface, the shaper is applied to download or inbound traffic.
Per-IP shaper	`set per-ip-shaper <shaper>`	Select the per-IP shaper. Per-IP shapers affect downloads and uploads. The allotted bandwidth applies to each individual IP. In a shared shaper, the allotted bandwidth applies to all IPs.
Assign shaping class ID		
Traffic shaping class ID	`set class-id <class>`	Set the class ID to apply the matching traffic. Class IDs are further prioritized within a traffic shaping profile and applied to an interface.

n/a	`set diffserv-forward {enable | disable}`
	`set diffservcode-forward <code>`
	`set diffserv-reverse {enable | disable}`
	`set diffservcode-reverse <code>`
		Specify the settings to apply a DSCP tag to the forward or reverse traffic. The DiffServ code is in 6-bit binary format.
		These options can only be configured in the CLI.

Traffic shapers and class IDs can be applied at the same time when configuring traffic shaping policies. However, to reduce the complexity, it is recommended to use one method over the other.

The following topics include examples with traffic shaping policies:

- Local-in and local-out traffic matching on page 1476
- VLAN CoS matching on a traffic shaping policy on page 1479
- Interface-based traffic shaping profile on page 1514
- Shared traffic shaper on page 1492
- Per-IP traffic shaper on page 1497

Local-in and local-out traffic matching

A FortiGate can apply shaping policies to local traffic entering or leaving the firewall interface based on source and destination IP addresses, ports, protocols, and applications.

```
config firewall shaping-policy
    edit <id>
        set traffic-type {forwarding | local-in | local-out}
    next
end
```

This topic contains the following examples:

- Example 1: local-in traffic shaping
- Example 2: local-out traffic shaping

Example 1: local-in traffic shaping

In this example, the traffic shaping policy applies to local-in traffic. The local-in traffic originates from the Linux client and is destined to port1 on the FortiGate.

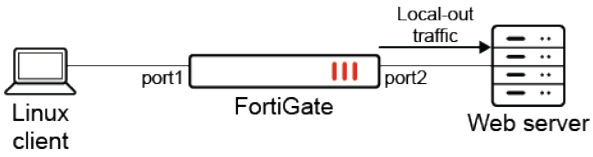
To configure the traffic shaping policy:

```
config firewall shaping-policy
    edit 2
        set traffic-type local-in
        set service "ALL"
        set schedule "always"
        set class-id 3
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

To verify the configuration:

1. Check the shaping policy information for local-in traffic to verify that the correct class ID (3) is applied:

```
# diagnose firewall iprope list 100018
policy index=2 uuid_idx=1300 action=accept
flag (0):
schedule(always)
cos_fwd=0  cos_rev=0
group=00100018 av=00000000 au=00000000 split=00000000
host=1 chk_client_info=0x0 app_list=0 ips_view=0
misc=0
zone(1): 0 -> zone(1): 0
source(1): 0.0.0.0-255.255.255.255, uuid_idx=1106,
dest(1): 0.0.0.0-255.255.255.255, uuid_idx=1106,
service(1):
        [0:0x0:0/(0,65535)->(0,65535)] flags:0 helper:auto
class_id: 3
```



2. Check the session list to verify that the class ID (3) matches the shaping policy ID (2):

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=1195 expire=3574 timeout=3600
flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=3 shaping_policy_id=2 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log local may_dirty
statistic(bytes/packets/allow_err): org=18274/350/1 reply=826037/603/1 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 1/0
orgin->sink: org pre->in, reply out->post dev=17->34/34->17 gwy=172.16.200.2/0.0.0.0
hook=pre dir=org act=noop 172.16.200.254:55432->172.16.200.2:443(0.0.0.0:0)
```

```
hook=post dir=reply act=noop 172.16.200.2:443->172.16.200.254:55432(0.0.0.0:0)
pos/(before,after) 0/(0,0), 0/(0,0)
src_mac=08:5b:0e:7d:42:db
misc=0 policy_id=4294967295 pol_uuid_idx=0 auth_info=0 chk_client_info=0 vd=1
serial=0000009d tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=00000000
no_ofld_reason:  local
```

Example 2: local-out traffic shaping

In this example, the traffic shaping policy applies to local-out traffic. The local-out traffic originates from port2 on the FortiGate and is destined to an external web server.

To configure the traffic shaping policy:

```
config firewall shaping-policy
    edit 3
        set traffic-type local-out
        set service "ALL"
        set schedule "always"
        set class-id 2
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

To verify the configuration:

1. Check the shaping policy information for local-out traffic to verify that the correct class ID (2) is applied:

```
# diagnose firewall iprope list 100019
policy index=3 uuid_idx=1301 action=accept
flag (0):
schedule(always)
cos_fwd=0  cos_rev=0
group=00100019 av=00000000 au=00000000 split=00000000
host=1 chk_client_info=0x0 app_list=0 ips_view=0
misc=0
zone(1): 0 -> zone(1): 0
source(1): 0.0.0.0-255.255.255.255, uuid_idx=1106,
dest(1): 0.0.0.0-255.255.255.255, uuid_idx=1106,
service(1):
        [0:0x0:0/(0,65535)->(0,65535)] flags:0 helper:auto
class_id: 2
```

2. Check the session list to verify that the class ID (2) matches the shaping policy ID (3):

```
# diagnose sys session list
session info: proto=6 proto_state=05 duration=40 expire=110 timeout=3600 flags=00000000
```

```
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=2 shaping_policy_id=3 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=255/255
state=log local
statistic(bytes/packets/allow_err): org=3676/14/1 reply=3848/11/1 tuples=2
tx speed(Bps/kbps): 90/0 rx speed(Bps/kbps): 94/0
orgin->sink: org out->post, reply pre->in dev=34->17/17->34 gwy=0.0.0.0/172.16.200.2
hook=out dir=org act=noop 172.16.200.2:19178->140.174.22.68:443(0.0.0.0:0)
hook=in dir=reply act=noop 140.174.22.68:443->172.16.200.2:19178(0.0.0.0:0)
pos/(before,after) 0/(0,0), 0/(0,0)
dst_mac=08:5b:0e:7d:42:db

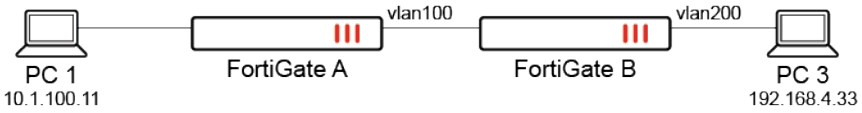
npu_state=00000000
no_ofld_reason:  local
```

VLAN CoS matching on a traffic shaping policy



A FortiGate can use the class of service (CoS) value of VLAN packets as a matching criterion for shaping policies. This enables the FortiGate to prioritize traffic based on the CoS value assigned by the switch or router.

```
config firewall shaping-policy
    edit <id>
        set traffic-type {forwarding | local-in | local-out}
        set cos-mask <3-bit_binary>
        set cos <3-bit_binary>
    next
end
```

`traffic-type {forwarding | local-in | local-out}`	Set the traffic type. • `forwarding`: use forwarding traffic (default) • `local-in`: local-in traffic • `local-out`: local-out traffic
`cos-mask <3-bit_binary>`	Set the VLAN CoS evaluated bits, 3-bit binary (000 - 111). This setting is only available for forwarding traffic.
`cos <3-bit_binary>`	Set the VLAN CoS bit pattern, 3-bit binary (000 - 111). This setting is available once `cos-mask` is configured.

Example

In this example, FortiGate A forwards traffic to FortiGate B with VLAN CoS 3, which matches firewall policy 6. When FortiGate B receives traffic, it applies the traffic shaping policy and will prioritize based on the CoS value.

The VLAN CoS range is 000 to 111 (0 - 7), which includes the following values: 000, 001, 010, 011, 100, 101, 110, and 111. The `cos` and `cos-mask` settings can be used to match multiple `vlan_cos` values with a single shaping policy. The following matching logic is used: (`vlan_cos` AND `cos-mask`) == (`cos` AND `cos-mask`).

To match all possible `vlan_cos` values, set the `cos-mask` to `000`.

To configure VLAN CoS marking with traffic shaping:

1. Configure the firewall policy on FortiGate A with VLAN CoS forwarding:

```
config firewall policy
    edit 6
        set srcintf "port1"
        set dstintf "vlan100"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set vlan-cos-fwd 3
    next
end
```

   Traffic marked with CoS 3 will be forwarded to FortiGate B.

2. On FortiGate A, check the session list to verify that CoS 3 is marked:

```
# diagnose sys session list
session info: proto=1 proto_state=00 duration=1 expire=59 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=3/255
state=log may_dirty npu f00
statistic(bytes/packets/allow_err): org=168/2/1 reply=168/2/1 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=19->47/47->19 gwy=20.20.20.2/10.1.100.11
hook=pre dir=org act=noop 10.1.100.11:28489->192.168.4.33:8(0.0.0.0:0)
hook=post dir=reply act=noop 192.168.4.33:28489->10.1.100.11:0(0.0.0.0:0)
src_mac=00:0c:29:57:2a:01  dst_mac=70:4c:a5:7d:d4:95
misc=0 policy_id=6 pol_uuid_idx=1128 auth_info=0 chk_client_info=0 vd=2
serial=000717ca tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x4000c00 ofld-O ofld-R
npu info: flag=0x81/0x81, offload=8/8, ips_offload=0/0, epid=79/78, ipid=78/79,
vlan=0x0000/0x0064
vlifid=78/79, vtag_in=0x0000/0x0064 in_npu=2/2, out_npu=2/2, fwd_en=0/0, qid=0/1
```

3. Configure the traffic shaping policy to match VLAN CoS 3:

```
config firewall shaping-policy
    edit 1
        set traffic-type forwarding
        set name "vlan-cos-matching"
        set service "ALL"
        set srcintf "vlan100"
        set dstintf "vlan200"
        set class-id 2
        set cos-mask 111
        set cos 011
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

Based on this shaping policy:

- `vlan_cos` = 3, which corresponds to `011`

  `cos-mask` = `111`

  AND both get `011`
- `cos-mask` = `111`

  `cos` = `011`

  AND both get `011`
- (`vlan_cos` AND `cos-mask`) == (`cos` AND `cos-mask`), so traffic will pass

The shaping policy will match `vlan_cos3`.

4. Configure the firewall policy on FortiGate B:

```
config firewall policy
    edit 3
        set srcintf "vlan100"
        set dstintf "vlan200"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
end
```

5. On FortiGate B, check the session list to verify that the class ID (2) matches the shaping policy ID (1):

```
# diagnose sys session list
session info: proto=1 proto_state=00 duration=672 expire=59 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=2 shaping_policy_id=1 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=56532/673/1 reply=56532/673/1 tuples=2
tx speed(Bps/kbps): 82/0 rx speed(Bps/kbps): 82/0
```

```
orgin->sink: org pre->post, reply pre->post dev=59->61/61->59 gwy=20.20.200.3/20.20.20.1
hook=pre dir=org act=noop 10.1.100.11:28735->192.168.4.33:8(0.0.0.0:0)
hook=post dir=reply act=noop 192.168.4.33:28735->10.1.100.11:0(0.0.0.0:0)
src_mac=90:6c:ac:fb:bb:97  dst_mac=04:d5:90:36:73:3f
misc=0 policy_id=3 pol_uuid_idx=1245 auth_info=0 chk_client_info=0 vd=1
serial=0000160b tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x040000
no_ofld_reason:  non-npu-intf
```

If a particular session matches both the `firewall policy` and `firewall shaping-policy`, then anything configured in the `firewall shaping-policy` overrides whatever was configured in the `firewall policy`.

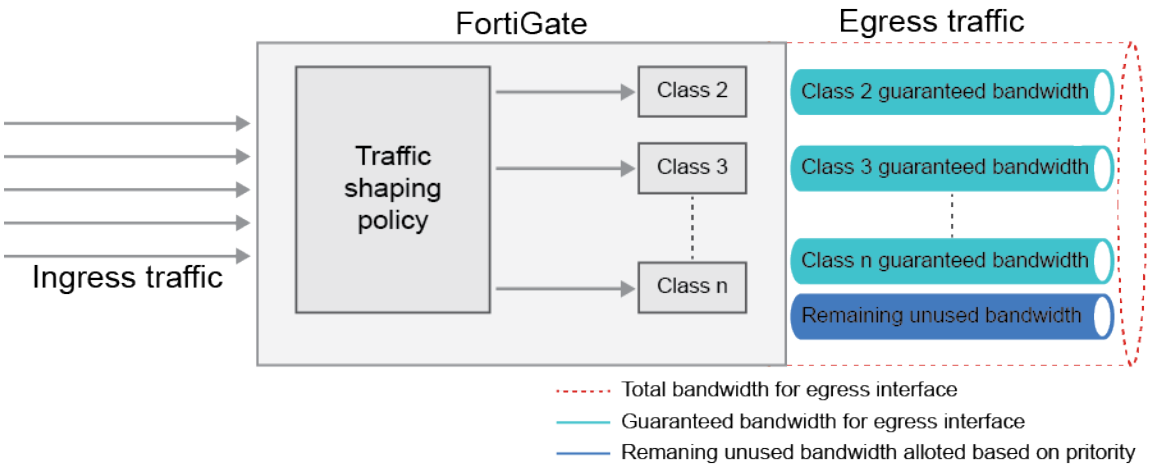
Traffic shaping profiles

As mentioned in Traffic shaping on page 1469, the three main methods of configuring traffic shaping are:

- Traffic shaping profiles
- Traffic shapers
- Global traffic prioritization

A traffic shaping profile allows traffic shaping to be configured with policing or queuing. Up to 30 classes can be defined, with prioritization and bandwidth limits configured for each class. When queuing is enabled, metrics can be configured for traffic queuing in each class.

Traffic shaping with policing



At the most basic level, policing involves traffic prioritization and bandwidth limits. Traffic prioritization helps categorize traffic into different priority levels: low, medium, high, critical, and top. When bandwidth is limited, traffic with higher priority levels will take precedence over lower priority traffic. Traffic with lower priority levels that exceeds available bandwidth will be dropped. These levels are only applicable in the context of traffic shaping profiles and should not be confused with global traffic prioritization levels.

Bandwidth limits define the guaranteed and maximum bandwidth allotted to each traffic class. These limits are configured as a percentage of the outbandwidth, which is the outbound bandwidth configured on an interface.

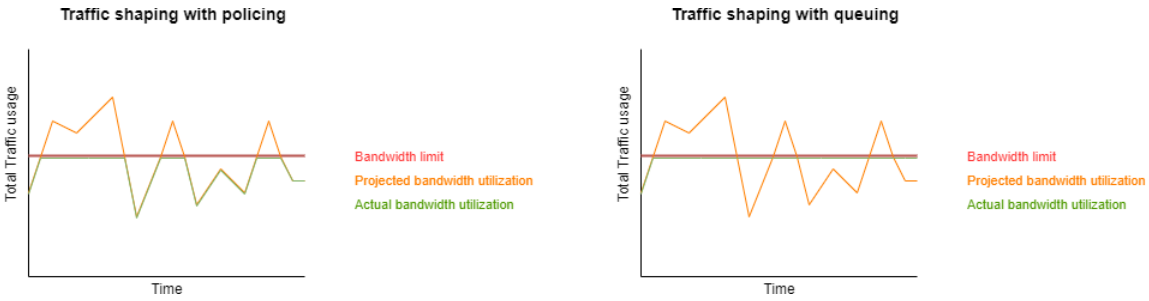
Guaranteed bandwidth limits guarantee the minimum bandwidth that is allotted to a given class of traffic. The sum of all guaranteed bandwidth of all classes within a traffic shaping profile cannot exceed 100%. However, the sum of all guaranteed bandwidth does not need to add up to 100%. The guaranteed bandwidth is always respected, even if one class has lower priority than another.

Maximum bandwidth limits define the maximum percentage of the outbandwidth that a traffic class can use up. This value often will be 100%, given that when there is no other traffic going through other classes, you would want to fully utilize the bandwidth of the outbound link. Traffic throughput exceeding the maximum bandwidth will be dropped.

The following diagram illustrates ingress traffic and how the FortiGate assigns classes and bandwidth to each class.

When comparing traffic shaping profiles and traffic shapers, it is important to remember that guaranteed and maximum bandwidth in a traffic shaping profile is a percentage of the outbandwidth, while guaranteed and maximum bandwidth in a traffic shaper is a rate (Kbps, Mbps, and so on). As long as the outbandwidth is true to its measurement, the bandwidth usage should not exceed the available bandwidth of a link when using a traffic shaping profile.

Congestion occurs when actual traffic surpasses the outbandwidth limit. At this point, traffic prioritization helps determine which traffic will be prioritized over others. First, the guaranteed bandwidth limit is allocated for each class. The left over bandwidth is allocated to traffic classes based on priority. The traffic classes with the highest priority can use as much of the remaining bandwidth as needed. Then, the remaining bandwidth can be allocated to classes at the next priority level, and so forth.



To see examples of applied traffic prioritization and bandwidth limits, see the debugs in Verifying that the traffic is being shaped on page 1486.

Traffic shaping with queuing

When traffic congestion occurs and if there is no queuing, then the excess packets are dropped. With queuing, when traffic exceeds the configured bandwidth limits, the traffic is delayed for transport until bandwidth frees up. Traffic may still be dropped if the queues are full.

In queuing, before a packet egresses an interface, it is first enqueued using an algorithm, such as random early detection (RED) or first in, first out (FIFO). The kernel then dequeues the packet based on the HTB algorithm before sending it out. Queuing can be configured per shaping profile, and it can be customized per class.

The following diagram shows how traffic policing differs from traffic queuing by comparing the bandwidth limit, projected bandwidth utilization, and actual bandwidth utilization.

For more information about traffic shaping with queuing, see Traffic shaping with queuing using a traffic shaping profile on page 1488.

Configuring traffic shaping profiles

The main steps to configure traffic shaping are:

1. Configure the traffic shaping policy, and assign matched traffic to a class (see Traffic shaping policies on page 1472).
2. Configure the traffic shaping profile and apply traffic bandwidth, prioritization and/or queuing per class.
3. Configure the interface outbandwidth and apply an egress shaping profile to the interface.

Configuring the traffic shaping profile

A traffic shaping profile consists of the class ID and the settings per class ID. It also defines the type of traffic shaping to apply (policing or queuing) and the default class ID for traffic that does not match any traffic shaping policies.

A class can be configured in the GUI as part of a traffic shaping profile or policy. In the CLI, a traffic class must be defined before it can be assigned within a traffic shaping profile. Class IDs range from 2 - 31, and they can be reused between different traffic shaping profiles.

When NPU offloading is enabled on the NP6, SoC3, or SoC4 platforms, the class ID limit for egress traffic is 2 - 15. Setting the egress traffic class ID outside of these limits can result in unexpected behavior.

If NPU offloading is disabled, or enabled on the NP7 platform, the class ID limit for egress traffic is 2 - 31.

When configuring a traffic shaping profile, the settings can be defined per class.

The following options can be configured for traffic shaping classes:

GUI option	CLI option	Description
Default	`set default-class-id <class-id>`	Set the default class ID. Each profile must have one default class ID. The default class ID can be changed at any time.
Traffic shaping class ID	`set class-id <integer>`	Set the class ID (2 - 31).
Guaranteed bandwidth	`set guaranteed-bandwidth-percentage <integer>`	Set the percentage of the outbandwidth that will be guaranteed for the class ID.
Maximum bandwidth	`set maximum-bandwidth-percentage <integer>`	Set the percentage of the outbandwidth that will be the maximum bandwidth for the class ID.
Priority	`set priority {top | critical | high | medium | low}`	Select the priority level for the class ID.

To configure a traffic shaping profile in the GUI:

1. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Profiles* tab, and click *Create New*.
2. Enter the profile name, and optionally enter a comment.
3. In the *Traffic Shaping Classes* section, click *Create New*.
4. Configure the traffic shaping class ID settings (*Traffic shaping class ID*, *Guaranteed bandwidth*, *Maximum bandwidth*, and *Priority*).
5. Click *OK*.
6. Create more shaping classes as needed (the total guaranteed bandwidth of all classes cannot exceed 100%).
7. Click *OK*.

To configure a traffic shaping profile in the CLI:

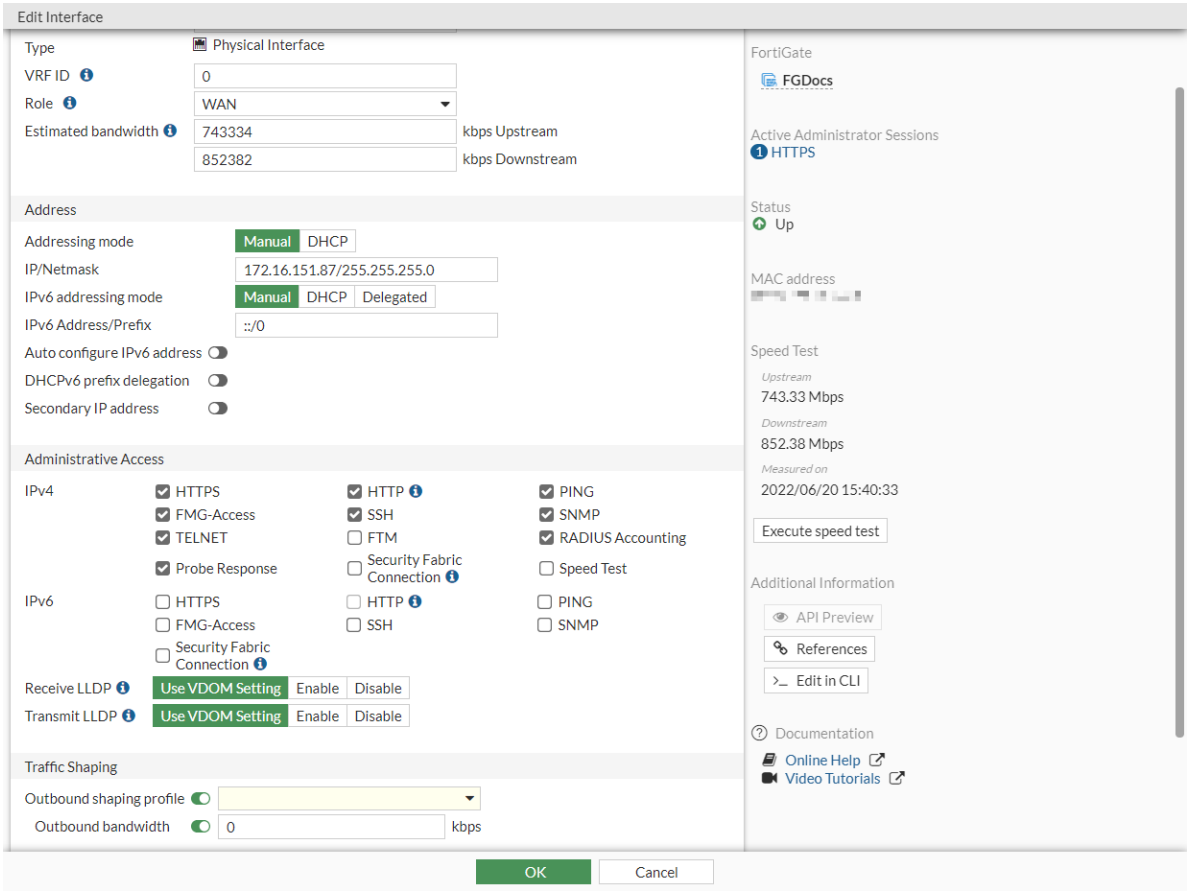
1. Configure the shaping class:

```
config firewall traffic-class
    edit <integer>
        set class-name <string>
    next
end
```

2. Configure the shaping profile:

```
config firewall shaping-profile
    edit <name>
        set type {policing | queuing}
        set default-class-id <class-id>
        config shaping-entries
            edit <id>
                set class-id <integer>
                set priority {top | critical | high | medium | low}
                set guaranteed-bandwidth-percentage <integer>
                set maximum-bandwidth-percentage <integer>
            next
        end
    next
end
```

Configuring the interface outbandwidth



There are two settings that must be configured on an interface that has traffic shaping applied to egressing traffic: a traffic shaping profile must be assigned, and the outbound bandwidth must be configured.

Since traffic shaping is often configured on the WAN interface for egressing traffic, the outbound bandwidth is effectively the upstream bandwidth allowed by your ISP. On the FortiGate, it is possible to perform a speed test on interfaces are assigned a WAN role assigned (see GUI speed test on page 1124). The speed test performs measurements against public cloud servers, and provides an accurate measurement of the upstream bandwidth. After the test is complete, the results can be used to populate the *Outbound bandwidth* field.

To configure traffic shaping on an interface:

1. Go to *Network* > *Interfaces* and double-click an interface to edit it.
2. For interfaces assigned a *WAN* role, in the right-side of the screen, click *Execute speed test*.

3. When the test completes, click *OK* in the *Confirm* pane to apply the results to the estimated bandwidth. The speed test results are populated in the *Estimated bandwidth* fields for *kbps Upstream* and *kbps Downstream*.

4. In the *Traffic Shaping* section, enable *Outbound shaping profile* and select a profile.
5. Enable *Outbound bandwidth* and copy the *kbps Upstream* value from the speed test, or enter a custom value.
6. Click *OK*.

Verifying that the traffic is being shaped

In this example, three traffic classes are defined in the traffic shaping profile assigned to port1. The outbandwidth configured on port1 is 1000 Kbps. Each class has an `allocated-bandwidth`, `guaranteed-bandwidth`, `max-bandwidth`, and `current-bandwidth` value.

- The `guaranteed-bandwidth` and `max-bandwidth` are rates that are converted from the percentage of outbandwidth configured for each class. For example, `class-id` 2 has 10% `guaranteed-bandwidth`, equivalent to 100 Kbps, and 100% `max-bandwidth` equivalent to 1000 Kbps.
- The `allocated-bandwidth` displays the real-time bandwidth allocation for the traffic class based on all available factors. This value changes as traffic demand changes.
- The `current-bandwidth` displays the real-time bandwidth usage detected for the traffic class.

To verify that traffic is being shaped by the traffic shaping profile:

1. Enable debug flow to view the live traffic as it matches a traffic shaping policy:

```
# diagnose debug flow show function-name enable
# diagnose debug flow show iprope enable
# diagnose debug flow filter <filters>
# diagnose debug flow trace start <repeat_number>
# diagnose debug enable
```

The `iprope_shaping_check` function outputs the shaping policy matched for any given traffic:

```
...
id=20085 trace_id=21 func=iprope_shaping_check line=934 msg="in-[port3], out-[port1],
skb_flags-02000000, vid-0"
id=20085 trace_id=21 func=__iprope_check line=2277 msg="gnum-100015, check-
ffffffffa002a8fe"
id=20085 trace_id=21 func=__iprope_check_one_policy line=2029 msg="checked gnum-100015
policy-3, ret-matched, act-accept"
id=20085 trace_id=21 func=__iprope_check_one_policy line=2247 msg="policy-3 is matched,
act-accept"
id=20085 trace_id=21 func=__iprope_check line=2294 msg="gnum-100015 check result: ret-
matched, act-accept, flag-00000000, flag2-00000000"
```

2. Display the session list:

```
# diagnose sys session filter <filters>
# diagnose sys session list
```

Sessions that match a shaping policy will display `class_id` and `shaping_policy_id` fields:

```
...
session info: proto=6 proto_state=05 duration=32 expire=0 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=4
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=4 shaping_policy_id=3 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
```

3. Display the interface statistics:

```
# diagnose netlink interface list port1
if=port1 family=00 type=1 index=3 mtu=1500 link=0 master=0
ref=95 state=start present fw_flags=2001b800 flags=up broadcast run allmulti multicast
Qdisc=pfifo_fast hw_addr=52:54:00:7e:af:a6 broadcast_addr=ff:ff:ff:ff:ff:ff
inbandwidth=10000(kbps)         total_bytes=2098887K    drop_bytes=7854K
egress traffic control:
        bandwidth=1000(kbps) lock_hit=241 default_class=3 n_active_class=3
        class-id=2      allocated-bandwidth=140(kbps)   guaranteed-bandwidth=100(kbps)
                        max-bandwidth=1000(kbps)        current-bandwidth=147(kbps)
                        priority=low    forwarded_bytes=8161K
                        dropped_packets=2032    dropped_bytes=3074K

```

If the debug output does not display egress traffic control by class and displays them by priority, it is likely that global traffic prioritization is configured. The global traffic prioritization settings must be disabled to view the preceding debug output (see Global traffic prioritization on page 1507).

Traffic shaping with queuing using a traffic shaping profile

You can use the weighted random early detection (WRED) queuing function within traffic shaping.

This topic includes two parts:

- Traffic shaping with queuing on page 1488
- Burst control in queuing mode on page 1489

You cannot configure or view WRED in the GUI; you must use the CLI.

WRED is not supported when traffic is offloaded to an NPU.

Traffic shaping with queuing

Traffic shaping has a queuing option. Use this option to fine-tune the queue by setting the profile queue size or performing random early drop (RED) according to queue usage.

This example shows setting the profile queue size limit to 5 so that the queue can contain a maximum of five packets and more packets are dropped.

To set the profile queue size limit:

```
config firewall shaping-profile
    edit "profile"
        set type queuing
        set default-class-id 31
        config shaping-entries
            edit 31
                set class-id 31
                set guaranteed-bandwidth-percentage 5
                set maximum-bandwidth-percentage 10
                set limit 5  <range from 5 to 10000; default: 1000>
            next
        end
    next
end
```

This example shows performing RED according to queue usage by setting `red-probability`, `min`, and `max`. Setting `red-probability` to `10` means start to drop packets when queue usage reaches the `min` setting. When queue usage reaches the `max` setting, drop 10% of the packets.

- Level 1: when queue is less than `min` packets, drop 0% of packets.
- Level 2: when queue reaches `min` packets, start to drop packets.
- Level 3: when queue usage is between `min` and `max` packets, drop 0–10% of packets by proportion.
- Level 4: when queue (average queue size) is more than `max` packets, drop 100% of packets.

To set RED according to queue usage:

```
config firewall shaping-profile
    edit "profile"
        set type queuing
        set default-class-id 31
        config shaping-entries
            edit 31
                set class-id 31
                set guaranteed-bandwidth-percentage 5
                set maximum-bandwidth-percentage 10
                set red-probability 10 <range from 0 to 20; default: 0 no drop>
                set min 100 <range from 3 to 3000>
                set max 300 <range from 3 to 3000>
            next
        end
    next
end
```

To troubleshoot this function, use the following diagnose commands:

```
diagnose netlink intf-class list <intf>
diagnose netlink intf-qdisc list <intf>
```

Burst control in queuing mode

In a hierarchical token bucket (HTB) algorithm, each traffic class has buckets to allow a burst of traffic. The maximum burst is determined by the bucket size `burst` (for guaranteed bandwidth) and `cburst` (for maximum bandwidth). The shaping profile has `burst-in-msec` and `cburst-in-msec` parameters for each shaping entry (`class id`) to control the bucket size.

This example uses the outbandwidth of the interface as 1 Mbps and the maximum bandwidth of class is 50%.

burst = burst-in-msec * guaranteed bandwidth = 100 ms × 1 Mbps x 50% = 50000 b = 6250 B

cburst = cburst-in-msec * maximum bandwidth = 200 ms × 1 Mbps x 50% = 100000 b = 12500 B

The following example sets `burst-in-msec` to 100 and `cburst-in-msec` to 200.

To set burst control in queuing mode:

```
config firewall shaping-profile
    edit "profile"
        set type queuing
        set default-class-id 31
        config shaping-entries
```

```
            edit 31
                set class-id 31
                set guaranteed-bandwidth-percentage 5
                set maximum-bandwidth-percentage 50
                set burst-in-msec 100 <range from 0 to 2000>
                set cburst-in-msec 200 <range from 0 to 2000>
            next
        end
    next
end
```

Example

Enabling RED for FTP traffic from QA

This example shows how to enable RED for FTP traffic from QA. This example sets a maximum of 10% of the packets to be dropped when queue usage reaches the maximum value.

To configure the firewall address:

```
config firewall address
    edit QA_team
        set subnet 10.1.100.0/24
    next
end
```

To set the shaping policy to classify traffic into different class IDs:

```
config firewall shaping-policy
    edit 1
        set service HTTPS HTTP
        set dstintf port1
        set srcaddr QA_team
        set dstaddr all
        set class-id 10
    next
    edit 2
        set service FTP
        set dstintf port1
        set srcaddr QA_team
        set dstaddr all
        set class-id 20
    next
end
```

To set the shaping policy to define the speed of each class ID:

```
config firewall shaping-profile
    edit QA_team_profile
       set type queuing
       set default-class-id 30
            config shaping-entries
                edit 1
                    set class-id 10
```

```
                    set guaranteed-bandwidth-percentage 50
                    set maximum-bandwidth-percentage 100
                next
                edit 2
                    set class-id 20
                    set guaranteed-bandwidth-percentage 30
                    set maximum-bandwidth-percentage 60
                    set red-probability 10
                next
                edit 3
                    set class-id 30
                    set guaranteed-bandwidth-percentage 20
                    set maximum-bandwidth-percentage 50
                next
            end
    next
end
```

To apply the shaping policy to the interface:

```
config sys interface
    edit port1
        set outbandwidth 10000
        set egress-shaping-profile QA_team_profile
    next
end
```

To use diagnose commands to troubleshoot:

```
# diagnose netlink intf-class list port1

Traffic shapers

The following topics provide more information about traffic shapers:

- Shared traffic shaper on page 1492
- Per-IP traffic shaper on page 1497
- Changing traffic shaper bandwidth unit of measurement on page 1500
- Multi-stage DSCP marking and class ID in traffic shapers on page 1500
- Multi-stage VLAN CoS marking on page 1502
- Adding traffic shapers to multicast policies on page 1506

Shared traffic shaper

Shared traffic shaper is used in a firewall shaping policy to indicate the priority and guaranteed and maximum bandwidth for a specified type of traffic use.

The maximum bandwidth indicates the largest amount of traffic allowed when using the policy. You can set the maximum bandwidth to a value between 1 and 16776000 Kbps. The GUI displays an error if any value outside this range is used. If you want to allow unlimited bandwidth, use the CLI to enter a value of 0.

The guaranteed bandwidth ensures that there is a consistent reserved bandwidth available. When setting the guaranteed bandwidth, ensure that the value is significantly less than the interface's bandwidth capacity. Otherwise, the interface will allow very little or no other traffic to pass through, potentially causing unwanted latency.

In a shared traffic shaper, the administrator can prioritize certain traffic as high, medium, or low. FortiOS provides bandwidth to low priority connections only when high priority connections do not need the bandwidth. For example, you should assign a high traffic priority to a policy for connecting a secure web server that needs to support e-commerce traffic. You should assign less important services a low priority.

When you configure a shared traffic shaper, you can apply bandwidth shaping per policy or for all policies. By default, a shared traffic shaper applies traffic shaping evenly to all policies that use the shared traffic shaper.

When configuring a per-policy traffic shaper, FortiOS applies the traffic shaping rules defined for each security policy individually. For example, if a per-policy traffic shaper is configured with a maximum bandwidth of 1000 Kbps, any security policies that have that traffic shaper enabled get 1000 Kbps of bandwidth each.

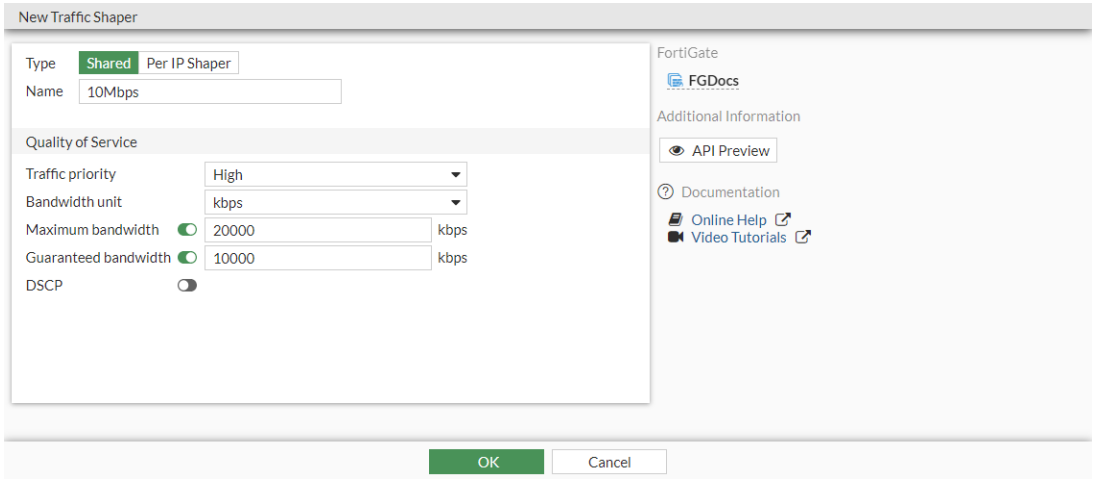
If a traffic shaper for all policies is configured with a maximum bandwidth of 1000 Kbps, all policies share the 1000 Kbps on a first-come, first-served basis.

The configuration is as follows:

```
config firewall shaper traffic-shaper
   edit "traffic_shaper_name"
      set per-policy enable
   next
end
```

The shared traffic shaper selected in the traffic shaping policy affects traffic in the direction defined in the policy. For example, if the source port is LAN and the destination is WAN1, the traffic shaping affects the flow in this direction only, affecting the outbound traffic's upload speed. You can define the traffic shaper for the policy in the opposite direction (reverse shaper) to affect the inbound traffic's download speed. In this example, that would be from WAN1 to LAN.

Only traffic through forward traffic shapers will be included in FortiView; reverse and per-IP shapers are not included.



Traffic shapers can be added to a multicast policy when multicast routing is enabled.

The following example shows how to apply different speeds to different types of service. The example configures two shared traffic shapers to use in two firewall shaping policies. One policy guarantees a speed of 10 Mbps for VoIP traffic. The other policy guarantees a speed of 1 Mbps for other traffic. In the example, FortiOS communicates with a PC using port10 and the Internet using port9.

To configure shared traffic shapers in the GUI:

1. Create a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Set the *Name* to *Internet Access*.
   c. Set the *Incoming Interface* to *port10*.
   d. Set the *Outgoing Interface* to *port9*.
   e. Set the *Source* and *Destination* to *all*.
   f. Set the *Schedule* to *always*.
   g. Set the *Service* to *ALL*.
   h. Click *OK*.
2. Create the shared traffic shapers:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shapers* tab, and click *Create New*.
   b. Set the *Name* to *10Mbps*. This shaper is for VoIP traffic.
   c. Set the *Traffic Priority* to *High*.
   d. Enable *Max Bandwidth* and enter *20000*.

e. Enable *Guaranteed Bandwidth* and enter *10000*.

f. Click *OK*.

g. Repeat the above steps to create another traffic shaper named *1Mbps* with the *Traffic Priority* set to *Low*, the *Max Bandwidth* set to *10000*, and the *Guaranteed Bandwidth* set to *1000*.

3. Create a firewall shaping policy:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policies* tab, and click *Create New*.
   b. Set the *Name* to *VoIP_10Mbps_High*. This policy is for VoIP traffic.
   c. Set the *Source* and *Destination* to *all*.
   d. Set the *Service* to all VoIP services.
   e. Set the *Outgoing Interface* to *port9*.
   f. Enable *Shared shaper* and select *10Mbps*.
   g. Enable *Reverse shaper* and select *10Mbps*.
   h. Click *OK*.
   i. Repeat the above steps to create another firewall shaping policy named *Other_1Mbps_Low* for other traffic, with the *Source* and *Destination* set to *all*, *Service* set to *ALL*, *Outgoing Interface* set to *port9*, and *Shared shaper* and *Reverse shaper* set to *1Mbps*.

To configure shared traffic shapers in the CLI:

1. Create a firewall policy:

```
config firewall policy
   edit 1
      set name "Internet Access"
      set srcintf "port10"
      set dstintf "port9"
      set srcaddr "all"
      set dstaddr "all"
      set action accept
      set schedule "always"
      set service "ALL"
      set fsso disable
      set nat enable
   next
end
```

2. Create the shared traffic shapers:

```
config firewall shaper traffic-shaper
```

```
    edit "10Mbps"
      set guaranteed-bandwidth 10000
      set maximum-bandwidth 20000
    next
    edit "1Mbps"
      set guaranteed-bandwidth 1000
      set maximum-bandwidth 10000
      set priority low
    next
end
```

3. Create a firewall shaping policy:

```
config firewall shaping-policy
    edit 1
      set name "VOIP_10Mbps_High"
      set service "H323" "IRC" "MS-SQL" "MYSQL" "RTSP" "SCCP" "SIP" "SIP-MSNmessenger"
      set dstintf "port9"
      set traffic-shaper "10Mbps"
      set traffic-shaper-reverse "10Mbps"
      set srcaddr "all"
      set dstaddr "all"
    next
    edit 2
      set name "Other_1Mbps_Low"
      set service "ALL"
      set dstintf "port9"
      set traffic-shaper "1Mbps"
      set traffic-shaper-reverse "1Mbps"
      set srcaddr "all"
      set dstaddr "all"
    next
end
```

To troubleshoot shared traffic shapers:

1. Check if specific traffic is attached to the correct traffic shaper. The example output shows the traffic attached to the 10Mbps and 1Mbps shapers:

```
# diagnose firewall iprope list 100015
policy index=1 uuid_idx=0 action=accept
flag (0):
shapers: orig=10Mbps(2/1280000/2560000)
cos_fwd=0 cos_rev=0
group=00100015 av=00000000 au=00000000 split=00000000
host=4 chk_client_info=0x0 app_list=0 ips_view=0
misc=0 dd_type=0 dd_mode=0
zone(1): 0 -> zone(1): 38
source(1): 0.0.0.0-255.255.255.255, uuid_idx=0,
dest(1): 0.0.0.0-255.255.255.255, uuid_idx=0,
service(15):
   [6:0x0:0/(1,65535)->(1720,1720)] helper:auto
   [6:0x0:0/(1,65535)->(1503,1503)] helper:auto
   [17:0x0:0/(1,65535)->(1719,1719)] helper:auto
   [6:0x0:0/(1,65535)->(6660,6669)] helper:auto
   [6:0x0:0/(1,65535)->(1433,1433)] helper:auto
   [6:0x0:0/(1,65535)->(1434,1434)] helper:auto
   [6:0x0:0/(1,65535)->(3306,3306)] helper:auto
   [6:0x0:0/(1,65535)->(554,554)] helper:auto
```

```
   [6:0x0:0/(1,65535)->(7070,7070)] helper:auto
   [6:0x0:0/(1,65535)->(8554,8554)] helper:auto
   [17:0x0:0/(1,65535)->(554,554)] helper:auto
   [6:0x0:0/(1,65535)->(2000,2000)] helper:auto
   [6:0x0:0/(1,65535)->(5060,5060)] helper:auto
   [17:0x0:0/(1,65535)->(5060,5060)] helper:auto
   [6:0x0:0/(1,65535)->(1863,1863)] helper:auto

policy index=2 uuid_idx=0 action=accept

npu info: flag=0x00/0x00, offload=0/0, ips_offload=0/0, epid=0/0, ipid=0/0,
     vlan=0x0000/0x0000
vlifid=0/0, vtag_in=0x0000/0x0000 in_npu=0/0, out_npu=0/0, fwd_en=0/0, qid=0/0
no_ofld_reason: offload-denied helper
total session 1
```

3. Check the statuses of shared traffic shapers:

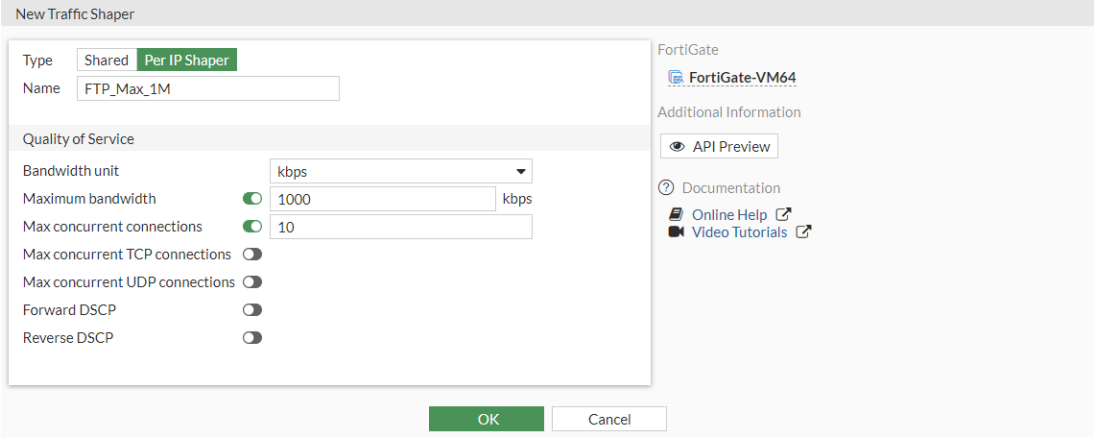
```
# diagnose firewall shaper traffic-shaper list
name 10Mbps
maximum-bandwidth 2500 KB/sec
guaranteed-bandwidth 1250 KB/sec
current-bandwidth 0 B/sec
priority 2
tos ff
packets dropped 0
```

```
bytes dropped 0

name 1Mbps
maximum-bandwidth 1250 KB/sec
guaranteed-bandwidth 125 KB/sec
current-bandwidth 0 B/sec
priority 4
tos ff
packets dropped 0
bytes dropped 0
```

Per-IP traffic shaper

With per-IP traffic shaping, you can limit each IP address's behavior to avoid a situation where one user uses all of the available bandwidth. In addition to controlling the maximum bandwidth used per IP address, you can also define the maximum number of concurrent sessions for an IP address. For example, if you apply a per-IP shaper of 1 Mbps to your entire network, FortiOS allocates each user/IP address 1 Mbps of bandwidth. Even if the network consists of a single user, FortiOS allocates them 1 Mbps. If there are ten users, each user gets 1 Mbps of bandwidth, totaling 10 Mbps of outgoing traffic.



For shared shapers, all users share the set guaranteed and maximum bandwidths. For example, if you set a shared shaper for all PCs using an FTP service to 10 Mbps, all users uploading to the FTP server share the 10 Mbps.

Shared shapers affect upload speed. If you want to limit the download speed from the FTP server in the example, you must configure the shared shaper as a reverse shaper. Per-IP shapers apply the speed limit on both upload and download operations. Only traffic through forward traffic shapers will be included in FortiView; reverse and per-IP shapers are not included.

The following example shows how to apply a per-IP shaper to a traffic shaping policy. This shaper assigns each user a maximum bandwidth of 1 Mbps and allows each user to have a maximum of ten concurrent connections to the FTP server. In the example, FortiOS communicates with users using port10 and the FTP server using port9.

To configure a per-IP traffic shaper in the GUI:

1. Create a firewall policy:
   a. Go to *Policy & Objects* > *IPv4 Policy* and click *Create New*.
   b. Set the *Name* to *FTP Access*.
   c. Set the *Incoming Interface* to *port10*.
   d. Set the *Outgoing Interface* to *port9*.
   e. Set the *Source* to *all*.
   f. Set the *Destination* to *FTP_Server*.
   g. Set the *Schedule* to *always*.
   h. Set the *Service* to *ALL*.
   i. Click *OK*.
2. Create the per-IP traffic shaper:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shapers* tab, and click *Create New*.
   b. Set *Type* to *Per IP Shaper*.
   c. Enter the *Name* (*FTP_Max_1M*). This shaper is for VoIP traffic.
   d. Enable *Max Bandwidth* and enter *1000*.
   e. Enable *Max Concurrent Connections* and enter *10*. This means that each user can have up to ten concurrent connections to the FTP server.

f. Click *OK*.

3. Create a firewall shaping policy:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policies* tab, and click *Create New*.
   b. Enter the *Name* (*FTP speed 1M*).
   c. Set the *Source* to the addresses and users that require access to the FTP server.
   d. Set the *Destination* to *FTP_Server*.
   e. Set the *Service* to *ALL*.
   f. Set the *Outgoing Interface* to *port9*.
   g. Enable *Per-IP shaper* and select *FTP_Max_1M*.
   h. Click *OK*.

To configure a per-IP traffic shaper in the CLI:

1. Create a firewall policy:

```
config firewall policy
   edit 1
      set name "FTP Access"
      set srcintf "port10"
      set dstintf "port9"
      set srcaddr "all"
      set dstaddr "FTP_Server"
      set action accept
      set schedule "always"
      set service "ALL"
      set fsso disable
      set nat enable
   next
end
```

2. Create the per-IP traffic shaper:

```
config firewall shaper per-ip-shaper
   edit "FTP_Max_1M"
      set max-bandwidth 1000
      set max-concurrent-session 10
   next
end
```

3. Create a firewall shaping policy:

```
config firewall shaping-policy
   edit 1
```

```
      set name "FTP speed 1M"
      set service "ALL"
      set dstintf "port9"
      set per-ip-shaper "FTP_Max_1M"
      set srcaddr "PC1" "WinPC" "PC2"
      set dstaddr "FTP_Server"
   next
end
```

To troubleshoot per-IP traffic shapers:

1. Check if specific traffic is attached to the correct traffic shaper. The example output shows the traffic attached to the FTP_Max_1M shaper:

```
# diagnose firewall iprope list 100015
policy index=3 uuid_idx=0 action=accept
flag (0):
shapers: per-ip=FTP_Max_1M
cos_fwd=0 cos_rev=0
group=00100015 av=00000000 au=00000000 split=00000000
host=2 chk_client_info=0x0 app_list=0 ips_view=0
misc=0 dd_type=0 dd_mode=0
zone(1): 0 -> zone(1): 38
source(3): 10.1.100.11-10.1.100.11, uuid_idx=30, 10.1.100.143-10.1.100.143, uuid_idx=32,
     10.1.100.22-10.1.100.22, uuid_idx=31,
dest(1): 172.16.200.55-172.16.200.55, uuid_idx=89,
service(1):
   [0:0x0:0/(0,65535)->(0,65535)] helper:auto
```

2. Check if the correct traffic shaper is applied to the session. The example output shows that the FTP_Max_1M shaper is applied to the session:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=36 expire=3567 timeout=3600 flags=00000000
     sockflag=00000000 sockport=0 av_idx=0 use=4
origin-shaper=
reply-shaper=
per_ip_shaper=FTP_Max_1M
class_id=0 shaping_policy_id=3 ha_id=0 policy_dir=0 tunnel=/ helper=ftp vlan_cos=0/255
state=may_dirty per_ip npu npd mif route_preserve
statistic(bytes/packets/allow_err): org=506/9/1 reply=416/6/1 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=39->38/38->39 gwy=172.16.200.55/0.0.0.0
hook=post dir=org act=snat 10.1.100.11:58275->172.16.200.55:21(172.16.200.1:58275)
hook=pre dir=reply act=dnat 172.16.200.55:21->172.16.200.1:58275(10.1.100.11:58275)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 policy_id=1 auth_info=0 chk_client_info=0 vd=2
serial=0000211a tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id = 00000000
dd_type=0 dd_mode=0
npu_state=0x100000
npu info: flag=0x00/0x00, offload=0/0, ips_offload=0/0, epid=0/0, ipid=0/0,

no_ofld_reason: offload-denied helper
```

3. Check the statuses of per-IP traffic shapers. The output should resemble the following:

```
# diagnose firewall shaper per-ip-shaper list
name FTP_Max_1M
```

```
    maximum-bandwidth 125 KB/sec
    maximum-concurrent-session 10
    tos ff/ff
    packets dropped 0
    bytes dropped 0
    addr=10.1.100.11 status: bps=0 ses=3
```

Changing traffic shaper bandwidth unit of measurement

Bandwidth speeds are measured in kilobits per second (Kbps), and bytes that are sent and received are measured in megabytes (MB). In some cases, this can cause confusion depending on whether your ISP uses kilobits per second (Kbps), kilobytes per second (KBps), megabits per second (Mbps), or gigabits per second (Gbps).

You can change the unit of measurement for traffic shapers in the CLI.

To change the bandwidth unit of measurement for a shared traffic shaper:

```
config firewall shaper traffic-shaper
    edit <traffic_shaper_name>
        set bandwidth-unit {kbps | mbps | gbps}
    next
end
```

To change the bandwidth unit of measurement for a per-IP traffic shaper:

```
config firewall shaper per-ip-shaper
    edit <traffic_shaper_name>
        set bandwidth-unit {kbps | mbps | gbps}
    next
end
```

Multi-stage DSCP marking and class ID in traffic shapers

Traffic shapers have a multi-stage method so that packets are marked with a different differentiated services code point (DSCP) and `class id` at different traffic speeds. Marking packets with a different DSCP code is for the next hop to classify the packets. The FortiGate benefits by marking packets with a different `class id`. Combined with the egress interface shaping profile, the FortiGate can handle the traffic differently according to its `class id`.

Rule	DSCP code	Class ID
speed < guarantee bandwidth	`diffservcode`	`class id` in shaping policy
guarantee bandwidth < speed < exceed bandwidth	`exceed-dscp`	`exceed-class-id`
exceed bandwidth < speed	`maximum-dscp`	`exceed-class-id`

This example sets the following parameters:

- When the current bandwidth is less than 50 Kbps, mark packets with `diffservcode` 100000 and set `class id` to 10.
- When the current bandwidth is between 50 Kbps and 100 Kbps, mark packets with `exceed-dscp` 111000 and set `exceed-class-id` to 20.

- When the current bandwidth is more than 100 Kbps, mark packets with `maximum-dscp` 111111 and set `exceed-class-id` to 20.

To set multi-stage DSCP marking and class ID in a traffic shaper:

```
config firewall shaper traffic-shaper
    edit "50k-100k-150k"
        set guaranteed-bandwidth 50
        set maximum-bandwidth 150
        set diffserv enable
        set dscp-marking-method multi-stage
        set exceed-bandwidth 100
        set exceed-dscp 111000
        set exceed-class-id 20
        set maximum-dscp 111111
        set diffservcode 100000
    next
end
```

```
config firewall shaping-policy
     edit 1
         set service "ALL"
         set dstintf PORT2
         set srcaddr "all"
         set dstaddr "all"
         set class-id 10
     next
end
```

Traffic shapers also have an `overhead` option that defines the per-packet size overhead used in rate computation.

To set the traffic shaper overhead option:

```
config firewall shaper traffic-shaper
    edit "testing"
        set guaranteed-bandwidth 50
        set maximum-bandwidth 150
        set overhead 14 <range from 0 to 100>
    next
end
```

Example

This example shows how to mark QA traffic with a different DSCP according to real-time traffic speed.

To configure the firewall address:

```
config firewall address
    edit QA_team
        set subnet 10.1.100.0/24
    next
end
```

To configure the firewall shaper traffic shaper:

```
config firewall shaper traffic-shaper
    edit "500k-1000k-1500k"
        set guaranteed-bandwidth 500
        set maximum-bandwidth 1500
        set diffserv enable
        set dscp-marking-method multi-stage
        set exceed-bandwidth 1000
        set exceed-dscp 111000
        set maximum-dscp 111111
        set diffservcode 100000
    next
end
```

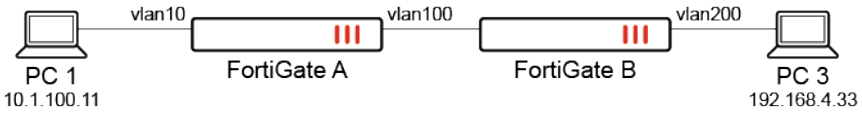
```
config firewall shaping-policy
    edit QA_team
        set service "ALL"
        set dstintf port1
        set traffic-shaper "500k-1000k-1500k"
        set traffic-shaper-reverse "500k-1000k-1500k"
        set srcaddr "QA_team"
        set dstaddr "all"
    next
end
```

Multi-stage VLAN CoS marking

A FortiGate can configure the traffic shaper to dynamically change the CoS value of outgoing VLAN packets based on the shaper profile. This allows the FortiGate to mark traffic with different CoS values at different stages of the shaping process.

```
config firewall shaper traffic-shaper
    edit <name>
        set bandwidth-unit {kbps | mbps | gbps}
        set guaranteed-bandwidth <integer>
        set maximum-bandwidth <integer>
        set cos-marking {enable | disable}
        set cos-marking-method {static | multi-stage}
        set cos <3-bit_binary>
        set exceed-cos <3-bit_binary>
        set maximum-cos <3-bit_binary>
        set exceed-bandwidth <integer>
    next
end
```

`cos-marking {enable | disable}`	Enable/disable VLAN CoS marking (default = `disable`).
`cos-marking-method {static | multi-stage}`	Set the VLAN CoS marking method. • `static`: use static VLAN CoS marking (default) • `multi-stage`: multi-stage VLAN CoS marking
`cos <3-bit_binary>`	Set the VLAN CoS mark, 3-bit binary (000 - 111).



`exceed-cos <3-bit_binary>`	Set the VLAN CoS mark for traffic in `guaranteed-bandwidth` and `exceed-bandwidth`, 3-bit binary (000 - 111).
`maximum-cos <3-bit_binary>`	Set the VLAN CoS mark for traffic in `exceed-bandwidth` and `maximum-bandwidth`, 3-bit binary (000 - 111).
`exceed-bandwidth <integer>`	Set the exceed bandwidth used for DSCP or VLAN CoS multi-stage marking. The integer value range depends on the `bandwidth-unit` setting. This setting is only available for CoS multi-stage marking.

Example

In this example, mutli-stage VLAN CoS marking is configured using traffic shapers on FortiGate A and FortiGate B. FortiGate A applies multi-stage CoS marking with the following traffic shaper settings:

- Traffic below the guaranteed bandwidth will apply CoS 6.
- Traffic greater than the guaranteed bandwidth will apply CoS 6 and 5.
- Traffic greater than the exceed bandwidth will apply CoS 6, 5, and 4.

A traffic shaper and shaping policy are configured on FortiGate B. When traffic comes from FortiGate A with CoS 6, the traffic shaping policy will be applied because the CoS matches.

Multi-stage VLAN CoS marking is not supported on NP models. Traffic is not offloaded when it is enabled.

To configure mutli-stage VLAN CoS marking on FortiGate A:

1. Configure the firewall policy:

```
config firewall policy
    edit 7
        set srcintf "port1"
        set dstintf "vlan100"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set traffic-shaper "multi-stage-cos-fgta"
        set traffic-shaper-reverse "multi-stage-cos-fgta"
    next
end
```

2. Configure the traffic shaper:

```
config firewall shaper traffic-shaper
    edit "multi-stage-cos-fgta"
        set guaranteed-bandwidth 1000
        set maximum-bandwidth 4000
        set per-policy enable
        set exceed-bandwidth 2000
        set cos-marking enable
        set cos-marking-method multi-stage
        set cos 110
        set exceed-cos 101
        set maximum-cos 100
    next
end
```

3. Check the session list to verify that CoS 6 is marked:

```
# diagnose sys session list
session info: proto=17 proto_state=00 duration=6 expire=180 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=multi-stage-cos-fgta prio=2 guarantee 125000Bps max 500000Bps traffic
504900Bps drops 163905268B
reply-shaper=multi-stage-cos-fgta prio=2 guarantee 125000Bps max 500000Bps traffic
504900Bps drops 0B
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=6/6
state=log may_dirty npu npd os rs f00
statistic(bytes/packets/allow_err): org=3804176/292/1 reply=0/0/0 tuples=2
tx speed(Bps/kbps): 583462/4667 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=19->47/47->19 gwy=20.20.20.2/0.0.0.0
hook=pre dir=org act=noop 10.1.100.11:37586->192.168.4.33:5001(0.0.0.0:0)
hook=post dir=reply act=noop 192.168.4.33:5001->10.1.100.11:37586(0.0.0.0:0)
src_mac=00:0c:29:57:2a:01  dst_mac=70:4c:a5:7d:d4:95
misc=0 policy_id=7 pol_uuid_idx=1129 auth_info=0 chk_client_info=0 vd=2
serial=0006613c tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x4000000
npu info: flag=0x00/0x00, offload=0/0, ips_offload=0/0, epid=0/0, ipid=0/0,
vlan=0x0000/0x0000
vlifid=0/0, vtag_in=0x0000/0x0000 in_npu=0/0, out_npu=0/0, fwd_en=0/0, qid=0/0
no_ofld_reason:  offload-denied
```

To configure mutli-stage VLAN CoS marking on FortiGate B:

1. Configure the firewall policy:

```
config firewall policy
    edit 4
        set srcintf "vlan100"
        set dstintf "vlan200"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
```

```
    next
end
```

2. Configure the traffic shaper:

```
config firewall shaper traffic-shaper
    edit "multi-stage-cos-fgtb"
        set guaranteed-bandwidth 250
        set maximum-bandwidth 1000
        set per-policy enable
        set cos-marking enable
        set cos-marking-method multi-stage
        set cos 100
        set exceed-cos 101
        set maximum-cos 110
        set exceed-bandwidth 500
    next
end
```

Based on this traffic shaper, the following CoS marking rules will be applied:

- If all traffic is less than the guaranteed bandwidth, then the traffic will be marked with CoS 4.
- If all traffic is greater than the guaranteed bandwidth but less than the exceed bandwidth, then 50% of the traffic will be marked as CoS 4 and 50% as CoS 5.
- If traffic is greater than the guaranteed bandwidth but less than the maximum bandwidth, then 50% of the traffic will be marked as CoS 6; CoS 4 and 5 will have another 50%.
- If traffic is greater than the maximum bandwidth, then 50% of the traffic will be marked as CoS 6, 25% will be marked as CoS 4, and 25% will be marked as CoS 5. Packet drops will be visible in the debug output.

3. Configure the traffic shaping policy:

```
config firewall shaping-policy
    edit 1
        set service "ALL"
        set srcintf "vlan100"
        set dstintf "vlan200"
        set traffic-shaper "multi-stage-cos-fgtb"
        set traffic-shaper-reverse "multi-stage-cos-fgtb"
        set class-id 2
        set cos-mask 111
        set cos 110
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

4. Check the session list to verify that the shaping ID (1) applied and CoS 4 is marked:

```
# diagnose sys session list
session info: proto=1 proto_state=00 duration=1 expire=59 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=multi-stage-cos-fgtb prio=2 guarantee 31250Bps max 125000Bps traffic
236Bps drops 0B
reply-shaper=multi-stage-cos-fgtb prio=2 guarantee 31250Bps max 125000Bps traffic 236Bps
drops 0B
per_ip_shaper=
class_id=2 shaping_policy_id=1 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=4/4
state=log may_dirty os rs f00
```

```
statistic(bytes/packets/allow_err): org=168/2/1 reply=168/2/1 tuples=2
tx speed(Bps/kbps): 120/0 rx speed(Bps/kbps): 120/0
orgin->sink: org pre->post, reply pre->post dev=59->61/61->59 gwy=20.20.200.3/20.20.20.1

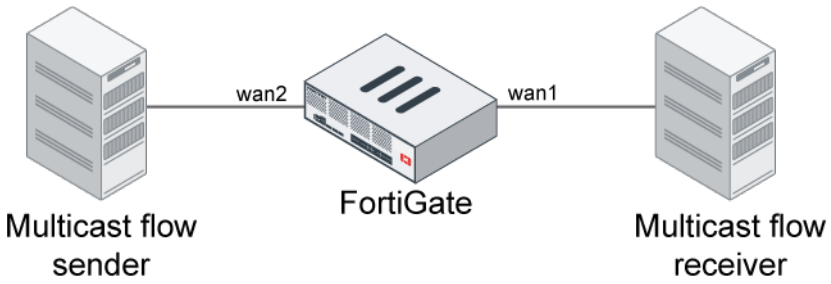
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x040000
no_ofld_reason:  non-npu-intf
total session 1
```

Adding traffic shapers to multicast policies



When multicast routing is enabled, a traffic shaper can be added to a multicast policy.

Only a shared traffic shaper with the `per-policy` option disabled can be used. This is the default state of the `per-policy` option. The `auto-asic-offload` option must also be disabled on the multicast policy.

This feature is currently not supported on IPv6 multicast policies or on transparent mode VDOMs.

Example

In this example, a traffic shaper is applied to the multicast policy. A multicast flow sender sends the multicast data stream. The shaper attached to the multicast session is checked, and the shaping of the data stream is confirmed in the multicast session.

To apply traffic shaping to a multicast policy:

1. Enable multicast routing on the VDOM:

```
config router multicast
    set multicast-routing enable
    config pim-sm-global
        config rp-address
            edit 1
                set ip-address 10.1.100.10
            next
        end
```

```
        end
        config interface
            edit "wan2"
                set pim-mode sparse-mode
            next
            edit "wan1"
                set pim-mode sparse-mode
            next
        end
    end
```

2. Create a traffic shaper:

```
config firewall shaper traffic-shaper
    edit "shaper128kbps-high"
        set guaranteed-bandwidth 128
        set maximum-bandwidth 128
        set per-policy disable
        set diffserv enable
        set diffservcode 010101
    next
end
```

3. Apply the traffic shaper to the multicast policy and disable NPU offloading:

```
config firewall multicast-policy
    edit 1
        set name "test_multicast-policy"
        set logtraffic enable
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set snat enable
        set auto-asic-offload disable
        set traffic-shaper "shaper128kbps-high"
    next
end
```

4. Check the shaper and DSCP in the multicast session:

```
# diagnose sys mcast-session list
    session info: id=26 vf=0 proto=17 10.1.100.41.35537->230.0.0.1.7878
    used=2 path=1 duration=118 expire=179 indev=18 pkts=119 bytes=64260
    state=00000000:
    session-npu-info: ipid/vlifid=0/0 vlanid/vtag_in=0/0 in_npuid=0 tae_index=0 qid=0
fwd_map=0x00000000
    path: log snat npu-deny nsaddr=172.16.200.10 policy=1, outdev=17, tos=0x15
            origin-shaper=shaper128kbps-high prio=2 tos=0x15 guarantee 16000Bps max
16000Bps traffic 620Bps drops 0pkt/0B
    Total 1 sessions
```

Global traffic prioritization

Global traffic prioritization allows your traffic to be prioritized as high (2), medium (3), or low (4) based on ToS (type of service) or DSCP. When using ToS-based priority, integers 0 to 15 can be used, which correspond to the definitions of

the ToS field values in RFC 1349. When using DSCP, values 0 to 63 can be used, which correspond to the six bits in the DSCP value.

The outbandwidth must be defined in order for global prioritization to take effect. When the outbandwidth is defined on an interface without an applied `egress-shaping-profile`, the interface has a total of five priority levels:

Priority level	Description
0	Top
1	Critical
2	High
3	Medium
4	Low

Priority level 0 is reserved for administrative and local out traffic. Priority level 1 is used for traffic that is below guaranteed bandwidth when using a traffic shaper.

Traffic shaper and traffic shaping profile configurations take precedence over global traffic prioritization.

CLI commands

The following commands are used to configure the prioritization either by ToS or DSCP.

To configure the traffic prioritization type and level:

```
config system global
    set traffic-priority {tos | dscp}
    set traffic-priority-level {high | medium | low}
end
```

To configure the ToS-based priority table:

```
config system tos-based-priority
    edit <id>
        set tos <0-15>
        set priority (high | medium | low)
    next
end
```

To configure the DSCP-based priority table:

```
config system dscp-based-priority
    edit <id>
        set ds <0-63>
        set priority (high | medium | low)
    next
end
```

To configure the interface outbandwidth:

```
config system interface
    edit <name>
        set outbandwidth <bandwidth in kbps>
    next
end
```

Example

In the following configuration, packets with DSCP markings of 1 are prioritized as high, and packets with DSCP markings of 2 are prioritized as medium. All the other traffic is prioritized as low. The outbandwidth on interface port3 is set to 1000 kbps.

To configure DSCP-based traffic prioritization:

1. Configure DSCP-based prioritization in the global settings:

```
config system global
    set traffic-priority dscp
    set traffic-priority-level low
end
```

2. Configure the DSCP-based priority table:

```
config system dscp-based-priority
    edit 1
        set ds 1
        set priority high
    next
    edit 2
        set ds 2
        set priority medium
    next
end
```

3. Configure the outbandwidth on port3:

```
config system interface
    edit "port3"
        set outbandwidth 1000
    next
end
```

Verifying the traffic prioritization

When traffic exceeds the outbandwidth of 1000 kbps, traffic prioritization will take effect. Since the form of traffic shaping applied here is policing, excess packets above the outbandwidth are dropped.

In scenario 1, approximately 300 kbps of high priority traffic and 300 kbps of medium priority traffic passes through the FortiGate on port3.

To debug the bandwidth allocation:

```
# diagnose netlink interface list port3
if=port3 family=00 type=1 index=5 mtu=1500 link=0 master=0
```

```
ref=35 state=start present fw_flags=3800 flags=up broadcast run allmulti multicast
Qdisc=pfifo_fast hw_addr=52:54:00:fb:81:0c broadcast_addr=ff:ff:ff:ff:ff:ff
outbandwidth=1000(kbps)
        priority=0      allocated-bandwidth=0(kbps)     total_bytes=9311K       drop_
bytes=197K
        priority=1      allocated-bandwidth=0(kbps)     total_bytes=0   drop_bytes=0
        priority=2      allocated-bandwidth=354(kbps)   total_bytes=20407K      drop_
bytes=48K
        priority=3      allocated-bandwidth=354(kbps)   total_bytes=7093K       drop_
bytes=1262K
        priority=4      allocated-bandwidth=290(kbps)   total_bytes=266018K     drop_
bytes=7743K
stat: rxp=15450901 txp=25933756 rxb=5456860515 txb=17257309292 rxe=0 txe=0 rxd=0 txd=0 mc=0
collision=0 @ time=1629439926
re: rxl=0 rxo=0 rxc=0 rxf=0 rxfi=0 rxm=0
te: txa=0 txc=0 txfi=0 txh=0 txw=0
misc rxc=0 txc=0
input_type=0 state=3 arp_entry=0 refcnt=35
```

High priority (2) traffic is allocated 354 kbps of bandwidth. Medium priority (3) traffic is also allocated 354 kbps of bandwidth. The remaining bandwidth is allocated to low priority (4) traffic.

In scenario 2, approximately 400 kbps of high priority traffic and 800 kbps of medium priority traffic passes through the FortiGate on port3.

To debug the bandwidth allocation:

```
# diagnose netlink interface list port3
if=port3 family=00 type=1 index=5 mtu=1500 link=0 master=0
ref=36 state=start present fw_flags=3800 flags=up broadcast run allmulti multicast
Qdisc=pfifo_fast hw_addr=52:54:00:fb:81:0c broadcast_addr=ff:ff:ff:ff:ff:ff
outbandwidth=1000(kbps)
        priority=0      allocated-bandwidth=7(kbps)     total_bytes=9981K       drop_
bytes=240K
        priority=1      allocated-bandwidth=0(kbps)     total_bytes=0   drop_bytes=0
        priority=2      allocated-bandwidth=425(kbps)   total_bytes=31478K      drop_
bytes=101K
        priority=3      allocated-bandwidth=567(kbps)   total_bytes=12056K      drop_
bytes=1984K
        priority=4      allocated-bandwidth=0(kbps)     total_bytes=266795K     drop_
bytes=7771K
stat: rxp=15461740 txp=25950805 rxb=5459688950 txb=17273940560 rxe=0 txe=0 rxd=0 txd=0 mc=0
collision=0 @ time=1629440553
re: rxl=0 rxo=0 rxc=0 rxf=0 rxfi=0 rxm=0
te: txa=0 txc=0 txfi=0 txh=0 txw=0
misc rxc=0 txc=0
input_type=0 state=3 arp_entry=0 refcnt=36
```

High priority (2) traffic is allocated 425 kbps of bandwidth. Medium priority (3) traffic is allocated 567 kbps of bandwidth. Since the total bandwidth required exceeds 1000 kbps, the remaining medium priority (3) traffic is dropped. In comparing the successive debug outputs, the `drop_bytes` counter for medium priority (3) traffic gets bigger.

DSCP matching and DSCP marking

This feature has three parts:

- DSCP matching in firewall policies
- DSCP matching in firewall shaping policies
- DSCP marking in firewall shaping policies

DSCP matching in firewall policies

Traffic is allowed or blocked according to the Differentiated Services Code Point (DSCP) values in the incoming packets.

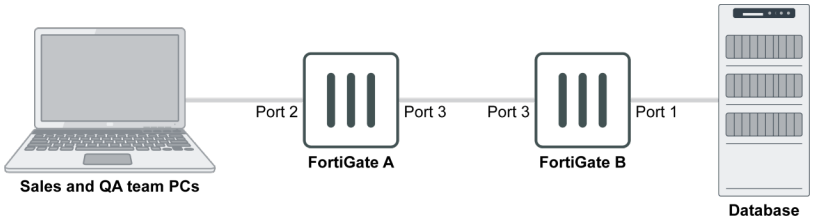
The following CLI variables are available in the `config firewall policy` command:

`tos-mask <mask_value>`	Non-zero bit positions are used for comparison. Zero bit positions are ignored (default = 0x00). This variable replaces the `dscp-match` variable.
`tos <tos_value>`	Type of Service (ToC) value that is used for comparison (default = 0x00). This variable is only available when `tos-mask` is not zero. This variable replaces the `dscp-value` variable.
`tos-negate {enable | disable}`	Enable/disable negated ToS match (default = disable). This variable is only available when `tos-mask` is not zero. This variable replaces the `dscp-negate` variable.

DSCP matching in firewall shaping policies

Shaping is applied to the session or not according to the DSCP values in the incoming packets. The same logic and commands as in firewall policies are used.

DSCP marking in firewall shaping policies



Traffic is allowed or blocked according to the DSCP values in the incoming packets. DSCP marking in firewall shaping policies uses the same logic and commands as in firewall policy and traffic-shaper.

When DSCP marking on `firewall shaper traffic-shaper`, `firewall shaping-policy`, and `firewall policy` all apply to the same session, `shaping-policy` overrides `policy`, and `shaper traffic-shaper` overrides both `shaping-policy` and `policy`.

The following CLI variables in `config firewall policy` are used to mark the packets:

`diffserv-forward {enable | disable}`	Enable/disable changing a packet's DiffServ values to the value specified in `diffservcode-forward` (default = disable).
`diffservcode-forward <dscp_value>`	The value that packet's DiffServ is set to (default = 000000). This variable is only available when `diffserv-forward` is enabled.
`diffserv-reverse {enable | disable}`	Enable/disable changing a packet's reverse (reply) DiffServ values to the value specified in `diffservcode-rev` (default = disable).
`diffservcode-rev <dscp_value>`	The value that packet's reverse (reply) DiffServ is set to (default = 000000). This variable is only available when `diffserv-rev` is enabled.

Examples

Example 1

FortiGate A marks traffic from the sales and QA teams with different DSCP values. FortiGate B does DSCP matching, allowing only the sales team to access the database.

1. Configure FortiGate A:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "QA"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set diffserv-forward enable
        set diffservcode-forward 110000
        set nat enable
    next
    edit 5
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "Sales"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set diffserv-forward enable
        set diffservcode-forward 111011
        set nat enable
    next
end
```

2. Configure FortiGate B:

```
config firewall policy
    edit 2
        set srcintf "port3"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "Database"
        set action accept
        set schedule "always"
        set service "ALL"
        set tos-mask 0xf0
```

```
        set tos 0xe0
        set fsso disable
        set nat enable
    next
end
```

Example 2

FortiGate A marks traffic from the sales and QA teams with different DSCP values. FortiGate B uses a firewall shaping policy to do the DSCP matching, limiting the connection speed of the sales team to the database to 10MB/s.

1. Configure FortiGate A:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "QA"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set diffserv-forward enable
        set diffservcode-forward 110000
        set nat enable
    next
    edit 5
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "Sales"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set diffserv-forward enable
        set diffservcode-forward 111011
        set nat enable
    next
end
```

2. Configure FortiGate B:

```
config firewall policy
    edit 2
        set srcintf "port3"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
config firewall shaper traffic-shaper
    edit "10MB/s"
        set guaranteed-bandwidth 60000
```

```
        set maximum-bandwidth 80000
    next
end
config firewall shaping-policy
    edit 1
        set service "ALL"
        set dstintf "port1"
        set tos-mask 0xf0
        set tos 0xe0
        set traffic-shaper "10MB/s"
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

Example 3

FortiGate A has a traffic shaping policy to mark traffic from the QA team with a DSCP value of 100000, while reverse traffic is marked with 000011.

1. Configure FortiGate A:

```
config firewall shaping-policy
    edit 1
        set name "QA Team 50MB"
        set service "ALL"
        set dstintf "port3"
        set traffic-shaper "50MB/s"
        set traffic-shaper-reverse "50MB/s"
        set diffserv-forward enable
        set diffserv-reverse enable
        set srcaddr "QA"
        set dstaddr "all"
        set diffservcode-forward 100000
        set diffservcode-rev 000011
    next
end
```

Examples

This section includes the following traffic shaping configuration examples:

- Interface-based traffic shaping profile on page 1514
- Interface-based traffic shaping with NP acceleration on page 1523
- QoS assignment and rate limiting for FortiSwitch quarantined VLANs on page 1524
- Ingress traffic shaping profile on page 1525

Interface-based traffic shaping profile

A traffic shaping policy can be used for interface-based traffic shaping by organizing traffic into 30 class IDs. The shaping profile defines the percentage of the interface bandwidth that is allocated to each class. Each traffic class ID is shaped to the assigned speed according to the outgoing bandwidth limit configured to the interface.

Traffic classification

A shaping policy classifies traffic and organizes it into different class IDs, based on matching criteria. For traffic matching a criteria, you can choose to put it into 30 different shaping classes, identified by class ID 2 - 31.

When NPU offloading is enabled on the NP6, SoC3, or SoC4 platforms, the class ID limit for egress traffic is 2 - 15. Setting the egress traffic class ID outside of these limits can result in unexpected behavior.

If NPU offloading is disabled, or enabled on the NP7 platform, the class ID limit for egress traffic is 2 - 31.

You must select an outgoing interface for the traffic. The shaping policy is only applied when the traffic goes to one of the selected outgoing interfaces.

Criterion	Description
Source	• Address: match the source address of the traffic to the selected address or address group. • User: use the user credentials of the traffic to match the selected user or user group. At least one address, address group, or internet service must also be selected. • Internet service: match the traffic to the selected internet service. Internet services cannot be used if addresses or address or groups are used.
Destination	• Address: match the destination address of the traffic to the selected address or address group. • Internet service: match the traffic to the selected internet service. Internet services cannot be used if addresses or address or groups are used.
Schedule	Match the current date and time to the selected schedule. You can select a one-time schedule, recurring schedule, or schedule group. This setting is optional.
Service	Match the service of the traffic to the selected service or service group.
Application	Match the application of the traffic to the selected application, application category, or application group. Application control must be enabled in the related firewall policy to know the application of the traffic. See Application control on page 1708 for more information.
URL category	Match the URL of the traffic to the selected URL category. Web filter must be enabled in the related firewall policy to know the URL of the traffic. See Web filter on page 1617 for more information.

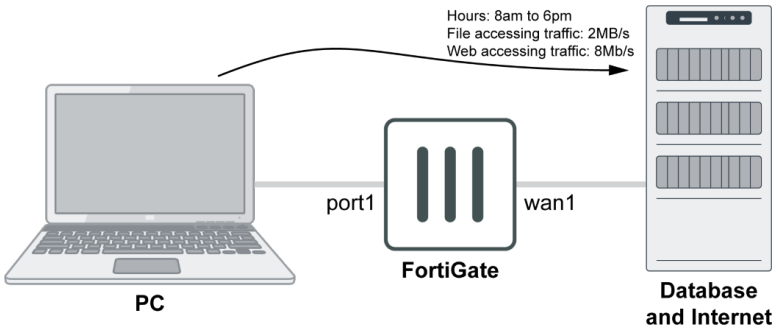
When multiple items are selected in one criterion, it is considered a match when traffic matches any one of them.

Traffic prioritization

Shaping profiles define how different shaping classes of traffic are prioritized. For each class, you can define three prioritization strategies: guaranteed bandwidth, maximum bandwidth, and priority.

For each shaping profile, a default shaping class must be defined. Traffic is prioritized based on the default shaping group in the following two circumstances:

- All traffic to the outgoing interface that does not match to any shaping policy
- Traffic with a shaping group that is not defined in a shaping profile



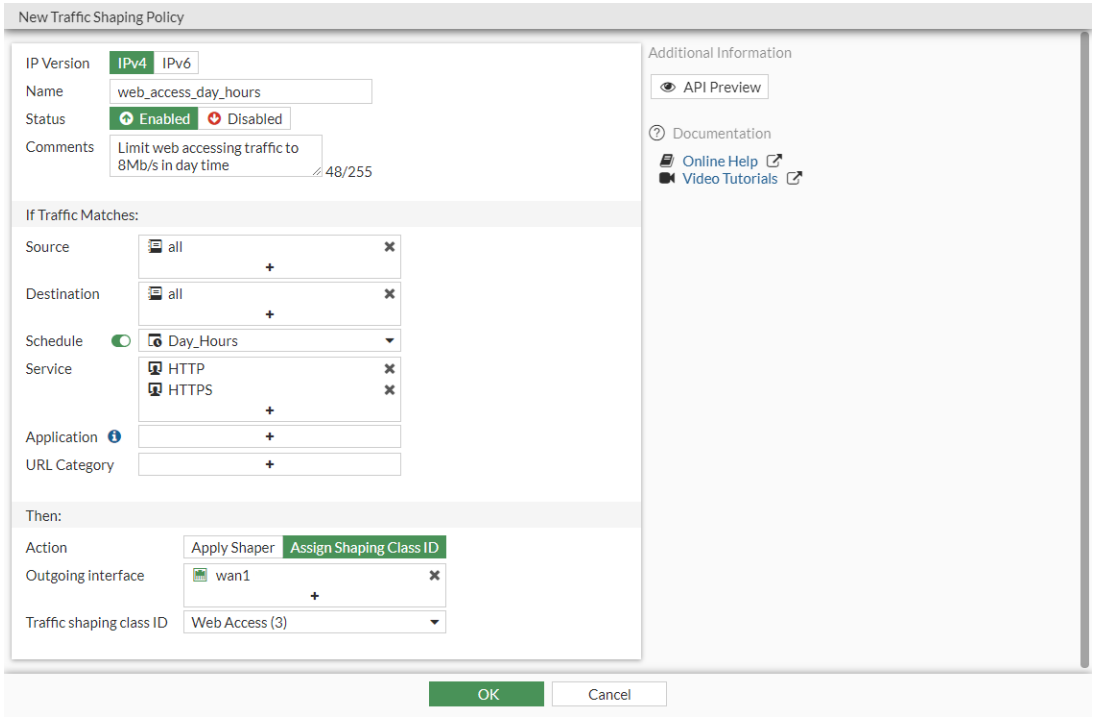
Prioritization strategy	Description
Guaranteed bandwidth	The percentage of the link speed that is reserved for the shaping group. The total guaranteed bandwidth for all shaping groups cannot exceed 100%.
Maximum bandwidth	The maximum percentage of the link speed that the shaping group can use.
Priority	The shaping class priority: top, critical, high, medium, or low. When groups are competing for bandwidth on the interface, the group with the higher priority wins.

Applying a shaping profile to an interface

Traffic shaping is accomplished by configuring the outgoing bandwidth and outgoing shaping profile on an interface. The shaping profile uses the outgoing bandwidth of the interface as the maximum link speed, and it only works when the outgoing bandwidth is configured.

This example shows how to apply interface-based traffic shaping to web and file accessing traffic according to a schedule:

- The link speed of the wan1 interface is 10 Mb/s.
- File access can use up to 2 Mb/s from 8:00 AM to 6:00 PM.
- Web access can use 8 Mb/s from 8:00 AM to 6:00 PM.



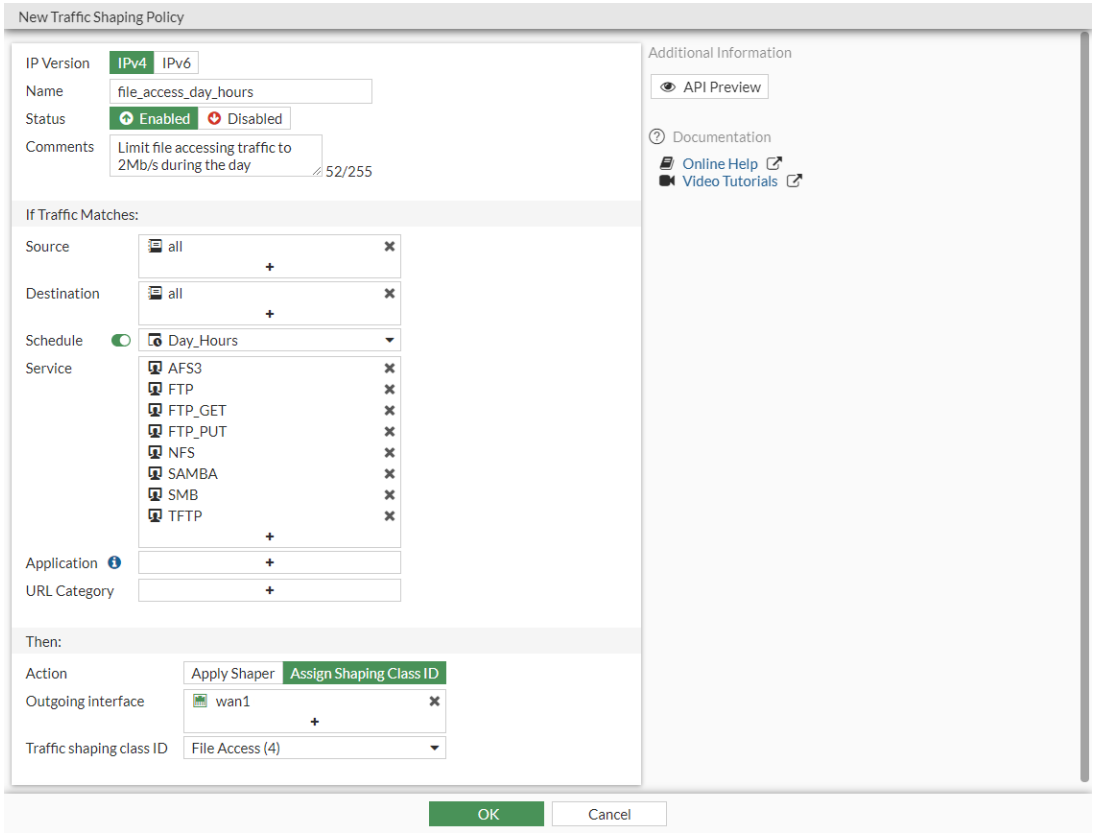
Putting the traffic into shaping classes

To create a recurring schedule in the GUI:

1. Go to *Policy & Objects* > *Schedules* and navigate to the *Recurring Schedule* tab.
2. Click *Create New*.
3. Configure a recurring schedule called *Day_Hours* for everyday from 8:00 AM to 6:00 PM.
4. Click *OK*.

To create a traffic shaping policy and class ID for the web accessing traffic in the GUI:

1. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policies* tab, and click *Create New*.
2. Enter a name for the policy, such as *web_access_day_hours*.
3. Enable *Schedule* and select the schedule you just created.
4. Set *Service* to web accessing services, such as *HTTP* and *HTTPS*.
5. Set *Action* to *Assign Shaping Class ID*, and *Outgoing interface* to *wan1*.
6. Click the *Traffic shaping class ID* drop down then click *Create*.
7. Enter an integer value for the *ID* (*3*) and a description for the *Name*, such as *Web Access*.
8. Click *OK*.
9. Select the class ID you just created for *Traffic shaping class ID*.



10. Configure the remaining settings as required.
11. Click *OK*.

To create a traffic shaping policy and class ID for the file accessing traffic in the GUI:

1. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policies* tab, and click *Create New*.
2. Enter a name for the policy, such as *file_access_day_hours*.
3. Enable *Schedule* and select the schedule you just created.
4. Set *Service* to file accessing services, such as *ASF3*, *FTP* and *SMB*.
5. Set *Action* to *Assign Shaping Class ID*, and *Outgoing interface* to *wan1*.
6. Click the *Traffic shaping class ID* drop down then click *Create*.
7. Enter an integer value for the *ID* (*4*) and a description for the *Name*, such as *File Access*.
8. Click *OK*.

9. Select the class ID you just created for *Traffic shaping class ID*.

10. Configure the remaining settings as required.
11. Click *OK*.

To put the traffic into shaping classes in the CLI:

1. Create a recurring schedule:

```
config firewall schedule recurring
    edit "Day_Hours"
        set start 08:00
        set end 18:00
        set day sunday monday tuesday wednesday thursday friday saturday
    next
end
```

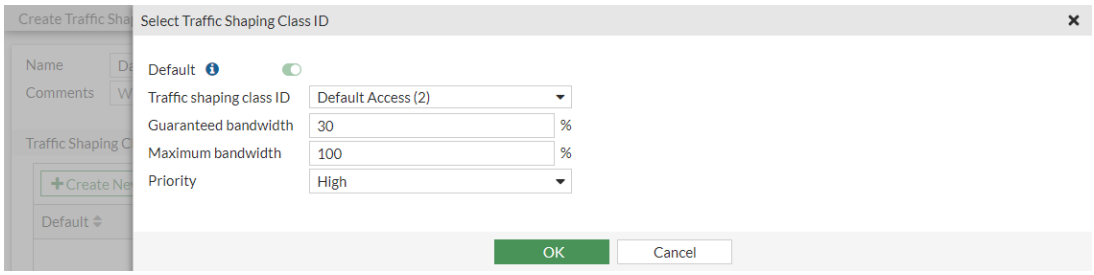
2. Create the traffic class IDs:

```
config firewall traffic-class
    edit 3
        set class-name "Web Access"
    next
    edit 4
        set class-name "File Access"
    next
end
```

3. Create the web and file accessing traffic shaping policies:

```
config firewall shaping-policy
    edit 2
        set name "web_access_day_hours"
        set comment "Limit web accessing traffic to 8Mb/s in day time"
        set service "HTTP" "HTTPS"
        set schedule "Day_Hours"
        set dstintf "wan1"
        set class-id 3
        set srcaddr "all"
        set dstaddr "all"
    next
    edit 3
        set name "file_access_day_hours"
        set comment "Limit file accessing traffic to 2Mb/s during the day"
        set service "AFS3" "FTP" "FTP_GET" "FTP_PUT" "NFS" "SAMBA" "SMB" "TFTP"
        set schedule "Day_Hours"
        set dstintf "wan1"
        set class-id 4
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

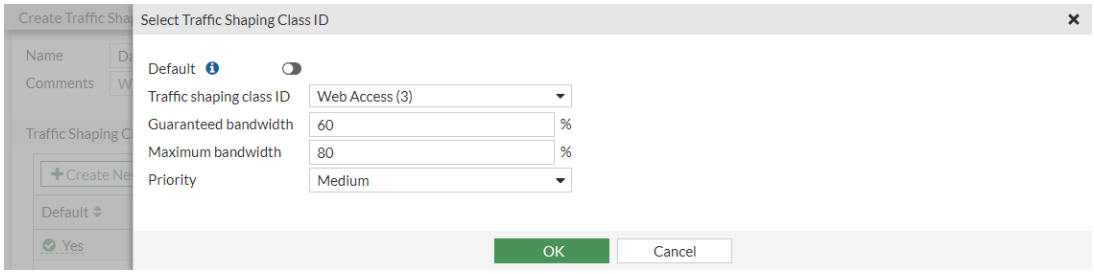
Allocating bandwidth to the shaping classes



A traffic shaping profile defines the guaranteed and maximum bandwidths each class receives. In this example, file access can use up to 2 Mb/s and web access can use 8 Mb/s from 8:00 AM to 6:00 PM.

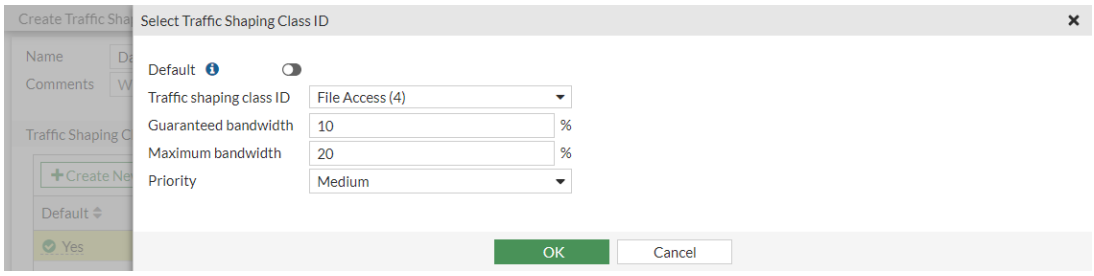
To create a traffic shaping profile using the GUI:

1. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Profiles* tab, and click *Create New*.
2. Enter a name for the profile, such as *Day_Hours_Profile*.
3. Configure a default traffic shaping class:
   This class has a high priority, meaning that when the other classes have reached their guaranteed bandwidths, this default class will use the rest of the available bandwidth.
   a. In the *Traffic Shaping Classes* table click *Create New*.
   b. Click the *Traffic shaping class ID* drop down then click *Create*.
   c. Enter a name for the class, such as *Default Access*.
   d. Click *OK*.
   e. Select the class ID you just created for *Traffic shaping class ID*.

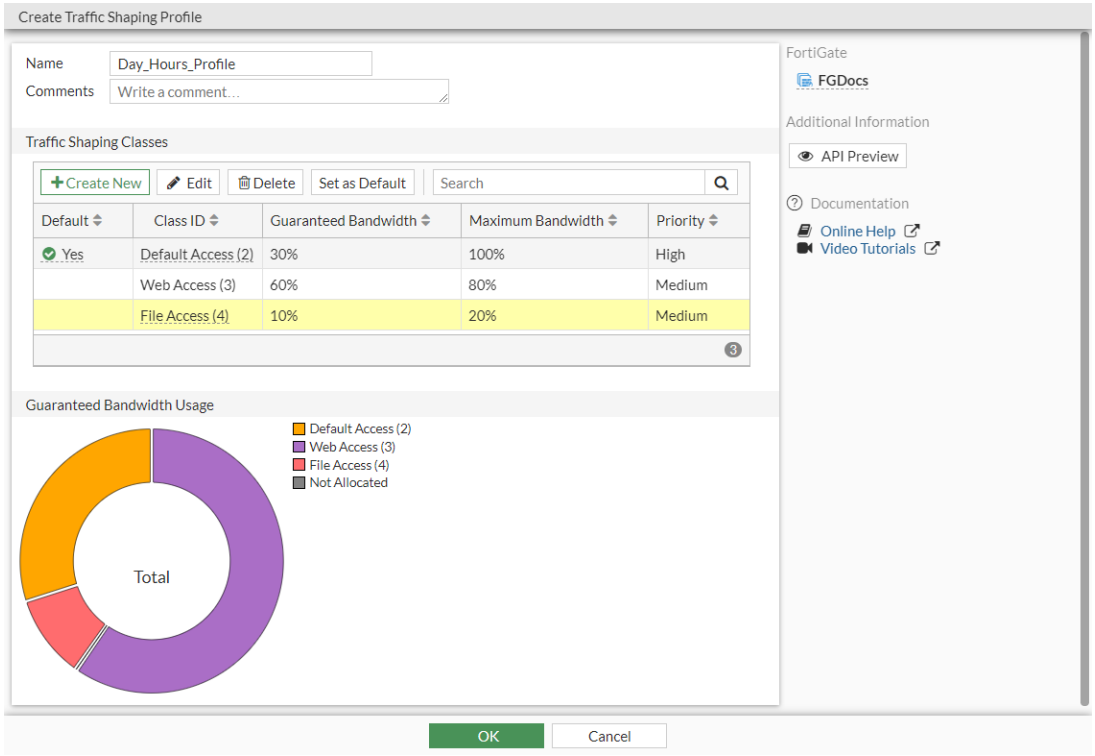


f. Configure the following settings, then click *OK*:

Guaranteed bandwidth	30
Maximum bandwidth	100
Priority	High



4. Configure a web accessing traffic shaping class:
When other types of traffic are competing for bandwidth, this class is guaranteed to 6 Mb/s, or 60% of the bandwidth.
   a. In the *Traffic Shaping Classes* table click *Create New*.
   b. Configure the following settings, then click *OK*:



Traffic shaping class ID	Web Access
Guaranteed bandwidth	60
Maximum bandwidth	80
Priority	Medium

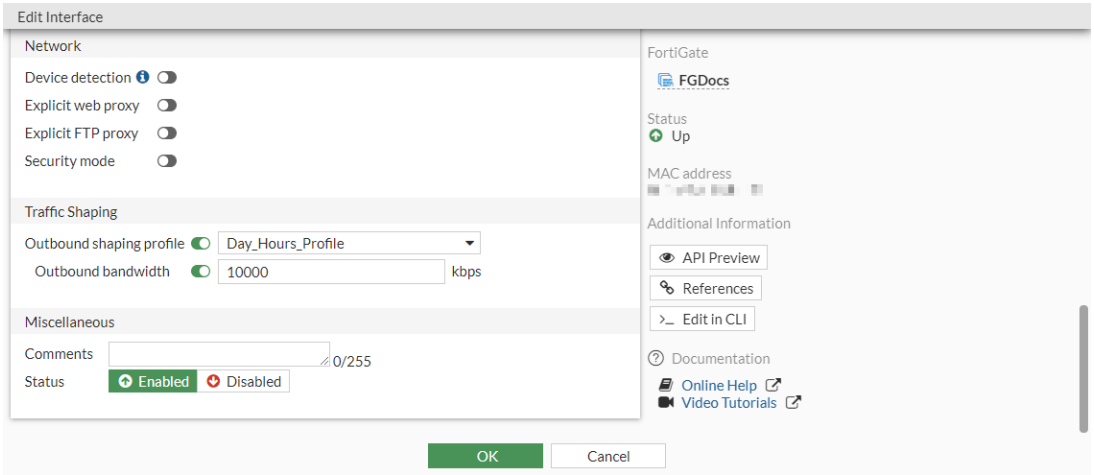
5. Configure a file accessing traffic shaping class:
When other types of traffic are competing for bandwidth, this group is guaranteed to 1 Mb/s, or 10% of the bandwidth.
   a. In the *Traffic Shaping Classes* table click *Create New*.
   b. Configure the following settings, then click *OK*:

Traffic shaping class ID	File Access
Guaranteed bandwidth	10
Maximum bandwidth	20
Priority	Medium

6. Click *OK*.

To create a traffic shaping profile using the CLI:

```
config firewall shaping-profile
    edit "Day_Hours_Profile"
        set default-class-id 2
        config shaping-entries
            edit 1
                set class-id 2
                set guaranteed-bandwidth-percentage 30
                set maximum-bandwidth-percentage 100
            next
            edit 2
                set class-id 3
                set priority medium
                set guaranteed-bandwidth-percentage 60
                set maximum-bandwidth-percentage 80
            next
            edit 3
                set class-id 4
```



```
                set priority medium
                set guaranteed-bandwidth-percentage 10
                set maximum-bandwidth-percentage 20
            next
        end
    next
end
```

Defining the available bandwidth on an interface

In this example, the link speed of the wan1 interface is 10 Mb/s.

To set the bandwidth of the wan1 interface in the GUI:

1. Go to *Network* > *Interfaces*.
2. Edit the wan1 interface.
3. Under Traffic Shaping, enable *Outbound shaping profile* and select the profile that you just created, *Day_Hours_Profile*.
4. Enable *Outbound Bandwidth* and set it to *10000* Kbps.

5. Click *OK*.

To set the bandwidth of the wan1 interface in the CLI:

```
config system interface
    edit "wan1"
        set egress-shaping-profile "Day_Hours_Profile"
        set outbandwidth 10000
    next
end
```

Diagnose commands

To check that the specific traffic is put into the correct shaping group or class ID:

```
# diagnose firewall iprope list 100015
```

To check the speed limit for each class ID on an interface:

```
# diagnose netlink interface list wan1
```

Interface-based traffic shaping with NP acceleration

Interface-based traffic shaping with NP acceleration is supported on some devices.

An administrator configures the WAN interface's maximum outbound bandwidth and, based on that, creates a traffic shaping profile with a percentage based shaper. This allows for proper QoS and traffic shaping. VLAN interfaces are not supported.

This feature is supported on FortiGate 600E, 500E, 400E, and 300E models.

To configure interface-based traffic shaping:

1. Enable NPU offloading when doing interface-based traffic shaping according to the egress-shaping-profile:

```
config system npu
    set intf-shaping-offload enable
end
```

2. Configure shaping profiles:

```
config firewall shaping-profile
    edit "sdwan"
        set default-class-id 4
        config shaping-entries
            edit 1
                set class-id 4
                set guaranteed-bandwidth-percentage 3
                set maximum-bandwidth-percentage 5
            next
            edit 2
                set class-id 3
                set priority medium
                set guaranteed-bandwidth-percentage 50
                set maximum-bandwidth-percentage 100
            next
            edit 3
                set class-id 2
                set priority low
                set guaranteed-bandwidth-percentage 1
                set maximum-bandwidth-percentage 5
            next
        end
    next
end
```

The class number is limited to 16.

3. Configure a traffic shaper and shaping policy:

```
config firewall shaper traffic-shaper
    edit "Transactional"
        set priority medium
    next
end

config firewall shaping-policy
    edit 1
        set service "ALL"
        set dstintf "any"
        set traffic-shaper "Transactional"
        set class-id 3
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

4. Apply the egress shaping profile on the interface:

```
config system interface
    edit "port2"
        set vdom "root"
        set ip 10.1.100.23 255.255.255.0
        set allowaccess ping
        set type physical
        set outbandwidth 500
        set egress-shaping-profile "sdwan"
        set snmp-index 4
    next
end
```

5. Configure a firewall policy:

```
config firewall policy
    edit 3
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
    next
end
```

QoS assignment and rate limiting for FortiSwitch quarantined VLANs

When devices are quarantined, they are isolated from the rest of the network. However, they can still impact the network if not controlled beyond isolation. A quarantined host, which offers heavy traffic, could congest the network and create a DOS-style reduction in service to authorized hosts.

Within the quarantined VLAN, two restrictions are available within the network:

- Traffic policing (also known as rate limiting)
- QoS (Quality of Service) assignment (also known as priority assignment)

Each quarantined host's traffic can be subject to rate limiting and priority adjustment. This reduces the impact that any quarantined host can have on authorized traffic on the network.

To configure QoS assignment and rate limiting for quarantined VLANs:

1. Configure a traffic policy, or use the default "quarantine" policy:

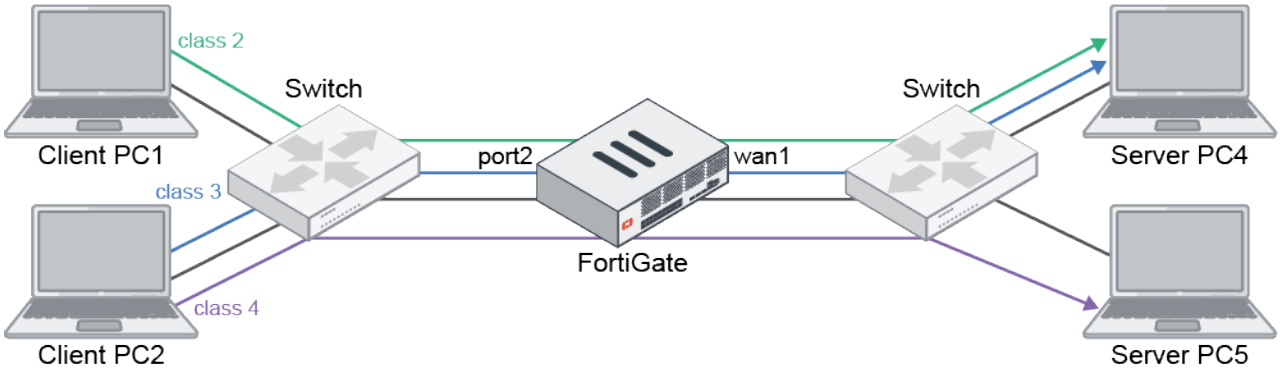
```
config switch-controller traffic-policy
    edit "quarantine"
        set description "Rate control for quarantined traffic"
        set guaranteed-bandwidth 163840
        set guaranteed-burst 8192
        set maximum-burst 163840
        set cos-queue 0
    next
end
```

2. Configure an interface:

```
config system interface
    edit "qtn.aggr1"
        set vdom "root"
        set ip 10.254.254.254 255.255.255.0
        set description "Quarantine VLAN"
        set security-mode captive-portal
        set replacemsg-override-group "auth-intf-qtn.aggr1"
        set device-identification enable
        set snmp-index 30
        set switch-controller-access-vlan enable
        set switch-controller-traffic-policy "quarantine"
        set color 6
        set interface "aggr1"
        set vlanid 4093
    next
end
```

   By default, `switch-controller-traffic-policy` is empty. You need to apply the necessary traffic policy (not only limited to "quarantine").

Ingress traffic shaping profile



A traffic shaping profile can be applied to an interface for traffic in the ingress direction. Similar to an egress traffic shaping profile, the guaranteed bandwidth and priority of the profile will be respected when an interface receives inbound traffic. When congestion occurs, any remaining bandwidth will be allotted to classes based on priority.

Ingress traffic shaping does not support NPU offloading.

Example

In this example, the port2 interface has a total inbound bandwidth of 100 Mbps. Traffic from certain clients to certain servers are assigned different classes.

IPv6 traffic from any client PCs to server PCs is assigned class 5.

For each class, the priority, guaranteed bandwidth, and maximum bandwidth are as follows:

Class	Priority	Guaranteed bandwidth	Maximum bandwidth
2	Low	10%	60%
3	High	20%	100%
4	High	30%	100%
5	Medium	10%	50%

Bandwidth will first be allotted to each class according to its guaranteed bandwidth. Then remaining available bandwidth will be allotted to class 3 and 4 first based on their priority. The allocation will be proportional to their guaranteed bandwidth ratio.

To configure ingress traffic shaping:

1. Configure the client and server addresses:

```
config firewall address
    edit "pc1"
        set subnet 10.1.100.11 255.255.255.255
    next
    edit "pc2"
        set subnet 10.1.100.22 255.255.255.255
    next
    edit "pc4"
        set subnet 172.16.200.44 255.255.255.255
    next
    edit "pc5"
        set subnet 172.16.200.55 255.255.255.255
    next
end
```

2. Configure the class IDs:

```
config firewall traffic-class
    edit 2
        set class-name "class2"
    next
    edit 3
        set class-name "class3"
    next
    edit 4
        set class-name "class4"
    next
    edit 4
        set class-name "class5"
    next
end
```

3. Configure traffic shaping policies to assign classes to each group of traffic.
   a. Configure a policy to assign traffic from PC1 to PC4 in class 2:

```
config firewall shaping-policy
    edit 1
        set name "shaping policy 1"
        set service "ALL"
        set dstintf "wan1"
        set class-id 2
        set srcaddr "pc1"
        set dstaddr "pc4"
    next
end
```

   b. Configure a policy to assign traffic from PC2 to PC4 in class 3:

```
config firewall shaping-policy
    edit 2
        set name "shaping policy 2"
        set service "ALL"
        set dstintf "wan1"
        set class-id 3
        set srcaddr "pc2"
        set dstaddr "pc4"
    next
end
```

   c. Configure a policy to assign traffic from PC2 to PC5 in class 4:

```
config firewall shaping-policy
    edit 3
        set name "shaping policy 3"
        set service "ALL"
        set dstintf "wan1"
        set class-id 4
        set srcaddr "pc2"
        set dstaddr "pc5"
    next
end
```

d. Configure a policy to assign all IPv6 traffic to class 5:

```
config firewall shaping-policy
    edit 4
        set name "shaping policy 4"
        set ip-version 6
        set service "ALL"
        set dstintf "wan1"
        set class-id 5
        set srcaddr6 "all"
        set dstaddr6 "all"
    next
end
```

4. Configure a shaping profile to set the priority, and the guaranteed and maximum bandwidth percentages for each class:

```
config firewall shaping-profile
    edit "ingShapeProfile"
        set default-class-id 2
        config shaping-entries
            edit 2
                set class-id 2
                set priority low
                set guaranteed-bandwidth-percentage 10
                set maximum-bandwidth-percentage 60
            next
            edit 3
                set class-id 3
                set guaranteed-bandwidth-percentage 20
                set maximum-bandwidth-percentage 100
            next
            edit 4
                set class-id 4
                set guaranteed-bandwidth-percentage 30
                set maximum-bandwidth-percentage 100
            next
            edit 5
                set class-id 5
                set priority medium
                set guaranteed-bandwidth-percentage 10
                set maximum-bandwidth-percentage 50
            next
        end
    next
end
```

5. Configure the inbandwidth and apply the ingress shaping profile on port2:

```
config system interface
    edit "port2"
        set ip 10.1.100.1 255.255.255.0
        set inbandwidth 100000
        set ingress-shaping-profile "ingShapeProfile"
        config ipv6
            set ip6-address 2000:10:1:100::1/64
        end
```

```
    next
end
```

Inbandwidth must be configured for traffic shaping to take effect.

6. Configure a firewall policy to allow traffic to go through. Since traffic shaping is for inbound traffic on port2, the policy is defined from port2 to wan1:

```
config firewall policy
    edit 2
        set srcintf "port2"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

NPU must be disabled by configuring `set auto-asic-offload disable`.

Verifying that the traffic is being shaped

In each of the following cases, the server PCs (PC4 and PC5) are configured as iPerf servers. The client PCs (PC1 and PC2) are configured as iPerf clients. The client sends traffic to the server from the client to server direction, triggering inbound traffic shaping on the port2 interface. The inbound bandwidth on port2 is 100 Mbps.

Case 1: single stream, PC1 to PC4

Traffic is sent from PC1 to PC4. There is no other traffic. Traffic is marked with class ID 2 and allocated the maximum bandwidth 60 Mbps (60%).

```
# diagnose netlink interface list port2
if=port2 family=00 type=1 index=20 mtu=1500 link=0 master=0
ref=25 state=start present fw_flags=3800 flags=up broadcast run multicast
Qdisc=mq hw_addr=70:4c:a5:7d:d4:95 broadcast_addr=ff:ff:ff:ff:ff:ff
ingress traffic control:
        bandwidth=100000(kbps) lock_hit=50 default_class=2 n_active_class=4
        class-id=2      allocated-bandwidth=60000(kbps)         guaranteed-bandwidth=10000
(kbps)
                        max-bandwidth=60000(kbps)       current-bandwidth=60002(kbps)
                        priority=low    forwarded_bytes=58157K
                        dropped_packets=94K     dropped_bytes=125385K
        class-id=5      allocated-bandwidth=1000(kbps)  guaranteed-bandwidth=10000(kbps)
                        max-bandwidth=50000(kbps)       current-bandwidth=0(kbps)
                        priority=medium         forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
        class-id=3      allocated-bandwidth=15000(kbps)         guaranteed-bandwidth=20000
(kbps)
                        max-bandwidth=100000(kbps)      current-bandwidth=0(kbps)
                        priority=high   forwarded_bytes=0
```

```
                        dropped_packets=0       dropped_bytes=0
        class-id=4      allocated-bandwidth=24000(kbps)         guaranteed-bandwidth=30000
(kbps)
                        max-bandwidth=100000(kbps)      current-bandwidth=0(kbps)
                        priority=high   forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
stat: rxp=173465879 txp=2430534 rxb=194665548609 txb=2767375732 rxe=0 txe=0 rxd=0 txd=0 mc=0

te: txa=0 txc=0 txfi=0 txh=0 txw=0
misc rxc=0 txc=0
input_type=0 state=3 arp_entry=0 refcnt=25
```

Case 2: dual stream, PC1 to PC4, PC2 to PC4

Traffic is sent from both PC1 and PC2 to PC4. PC1 to PC4 traffic is marked with class ID 2 and low priority, and PC2 to PC4 traffic is marked with class ID 3 and high priority. Both class 2 and 3 will be allocated their guaranteed bandwidth first, using up 10% and 20% respectively. The remaining available bandwidth is used by class 3 since it has a higher priority. Class 2 uses around 10 Mbps, and class 3 uses around 90 Mbps.

```
# diagnose netlink interface list port2
if=port2 family=00 type=1 index=20 mtu=1500 link=0 master=0
ref=36 state=start present fw_flags=3800 flags=up broadcast run multicast
Qdisc=mq hw_addr=70:4c:a5:7d:d4:95 broadcast_addr=ff:ff:ff:ff:ff:ff
ingress traffic control:
        bandwidth=100000(kbps) lock_hit=181 default_class=2 n_active_class=4
        class-id=2      allocated-bandwidth=10000(kbps)         guaranteed-bandwidth=10000
(kbps)
                        max-bandwidth=60000(kbps)       current-bandwidth=10001(kbps)
                        priority=low    forwarded_bytes=1799482K
                        dropped_packets=5998K   dropped_bytes=7965553K
        class-id=5      allocated-bandwidth=1000(kbps)  guaranteed-bandwidth=10000(kbps)
                        max-bandwidth=50000(kbps)       current-bandwidth=0(kbps)
                        priority=medium         forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
        class-id=3      allocated-bandwidth=88000(kbps)         guaranteed-bandwidth=20000
(kbps)
                        max-bandwidth=100000(kbps)      current-bandwidth=88000(kbps)
                        priority=high   forwarded_bytes=345039K
                        dropped_packets=324K    dropped_bytes=430862K
        class-id=4      allocated-bandwidth=1000(kbps)  guaranteed-bandwidth=30000(kbps)
                        max-bandwidth=100000(kbps)      current-bandwidth=0(kbps)
                        priority=high   forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
stat: rxp=181269891 txp=2433428 rxb=205136511596 txb=2771214402 rxe=0 txe=0 rxd=0 txd=0 mc=0

re: rxl=0 rxo=0 rxc=0 rxf=0 rxfi=0 rxm=0
te: txa=0 txc=0 txfi=0 txh=0 txw=0
misc rxc=0 txc=0
input_type=0 state=3 arp_entry=0 refcnt=36
```

Case 3: multiple streams

Multiple streams of traffic are sent at the same time:

- PC1 to PC4 traffic is assigned class 2 with low priority, and a guaranteed bandwidth of 10 Mbps.
- PC2 to PC4 traffic is assigned class 3 with high priority, and a guaranteed bandwidth of 20 Mbps.
- PC2 to PC5 traffic is assigned class 4 with high priority, and a guaranteed bandwidth of 30 Mbps.

All classes will be allocated their guaranteed bandwidth first, using up 10 Mbps, 20 Mbps, and 30 Mbps respectively. The remaining available bandwidth (40 Mbps) is shared by class 3 and class 4 based on their guaranteed bandwidth ratio of 20:30.

- Class 3's share of the remaining 40 Mbps traffic = 40 × 20/(20 + 30) =16 Mpbs
- Class 4's share of the remaining 40 Mbps traffic = 40 × 30/(20 + 30) =24 Mpbs

Each class is allocated roughly the following bandwidth:

- Class 2: 10 Mbps
- Class 3: 20 Mbps + 16 Mbps = 36 Mbps
- Class 4: 30 Mbps + 24 Mbps = 54 Mbps

```
# diagnose netlink interface list port2
if=port2 family=00 type=1 index=20 mtu=1500 link=0 master=0
ref=27 state=start present fw_flags=3800 flags=up broadcast run multicast
Qdisc=mq hw_addr=70:4c:a5:7d:d4:95 broadcast_addr=ff:ff:ff:ff:ff:ff
ingress traffic control:
        bandwidth=100000(kbps) lock_hit=148731 default_class=2 n_active_class=4
        class-id=2      allocated-bandwidth=10000(kbps)         guaranteed-bandwidth=10000
(kbps)
                        max-bandwidth=60000(kbps)       current-bandwidth=10004(kbps)
                        priority=low    forwarded_bytes=2267956K
                        dropped_packets=10389K  dropped_bytes=13796469K
        class-id=5      allocated-bandwidth=1000(kbps)  guaranteed-bandwidth=10000(kbps)
                        max-bandwidth=50000(kbps)       current-bandwidth=0(kbps)
                        priority=medium         forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0

Internet Services

The following topics provide instructions on configuring policies with Internet Service:

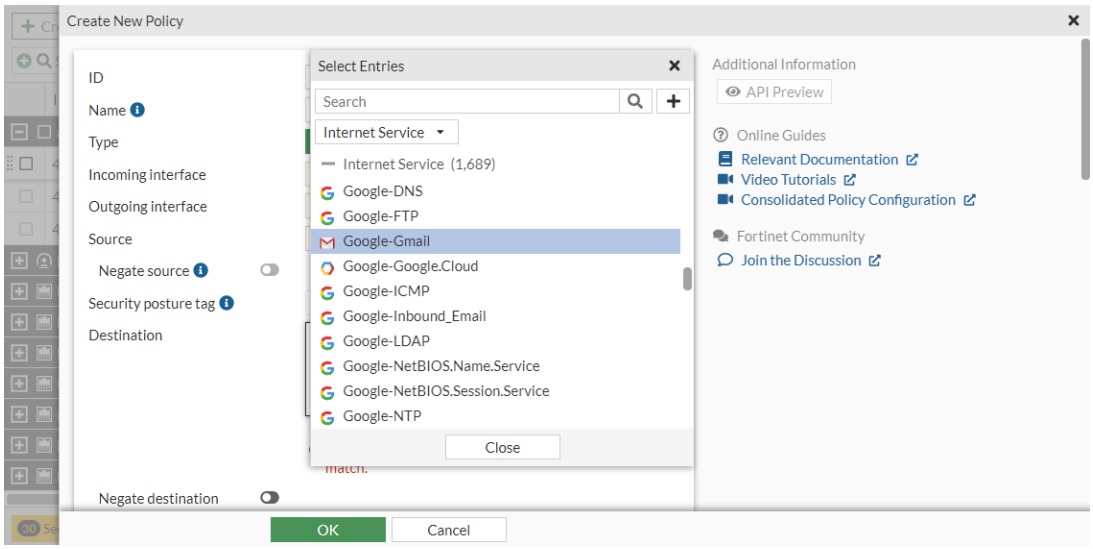
- Using Internet Service in a policy on page 1532
- Using custom Internet Service in policy on page 1536
- Using extension Internet Service in policy on page 1538
- Global IP address information database on page 1540
- IP reputation filtering on page 1542
- Internet service groups in policies on page 1544
- Allow creation of ISDB objects with regional information on page 1547
- Internet service customization on page 1550
- Look up IP address information from the Internet Service Database page on page 1551
- Internet Service Database on-demand mode on page 1552
- Enabling the ISDB cache in the FortiOS kernel on page 1554

Using Internet Service in a policy

This topic shows how to apply a predefined Internet Service entry into a policy.

The Internet Service Database is a comprehensive public IP address database that combines IP address range, IP owner, service port number, and IP security credibility. The data comes from the FortiGuard service system. Information is regularly added to this database, for example, geographic location, IP reputation, popularity & DNS, and so on. All this information helps users define Internet security more effectively. You can use the contents of the database as criteria for inclusion or exclusion in a policy.

From FortiOS version 5.6, Internet Service is included in the firewall policy. It can be applied to a policy only as a destination object. From version 6.0, Internet Service can be applied both as source and destination objects in a policy. You can also apply Internet Services to shaping policy.



There are three types of Internet Services you can apply to a firewall policy:

- Predefined Internet Services
- Custom Internet Services
- Extension Internet Services

Sample IPv4 configuration

To apply a predefined Internet Service entry to a policy using the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Click in the *Destination* field.
3. In the *Select Entries* pane, select *Internet Service* from the dropdown list and select *Google-Gmail*.

4. Configure the remaining fields as needed.
5. Click *OK*.

To apply a predefined Internet Service entry to a policy in the CLI:

In the CLI, enable the `internet-service` first and then use its ID to apply the policy.

This example uses Google Gmail and its ID is 65646. Each Internet Service has a unique ID.

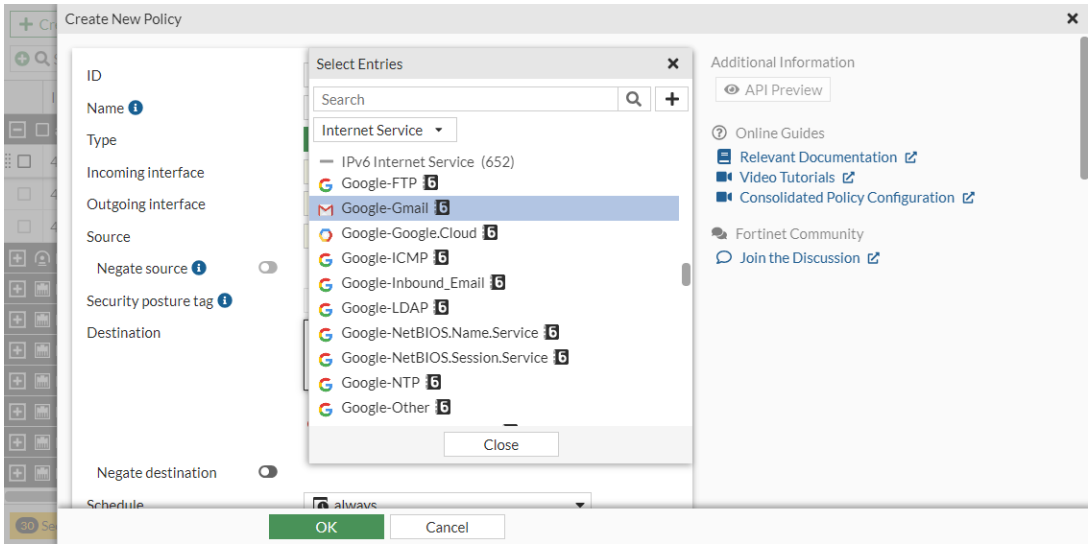
```
config firewall policy
    edit 9
        set name "Internet Service in Policy"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set internet-service enable
        set internet-service-id 65646
        set action accept
        set schedule "always"
        set utm-status enable
        set av-profile "g-default"
        set ssl-ssh-profile "certificate-inspection"
        set nat enable
    next
end
```

To diagnose an Internet Service entry in the CLI:

```
# diagnose internet-service id-summary 65646
Version: 0000600096
Timestamp: 201902111802
Total number of IP ranges: 444727
Number of Groups: 7
Group(0), Singularity(20), Number of IP ranges(142740)
Group(1), Singularity(19), Number of IP ranges(1210)
Group(2), Singularity(16), Number of IP ranges(241)
Group(3), Singularity(15), Number of IP ranges(38723)
```

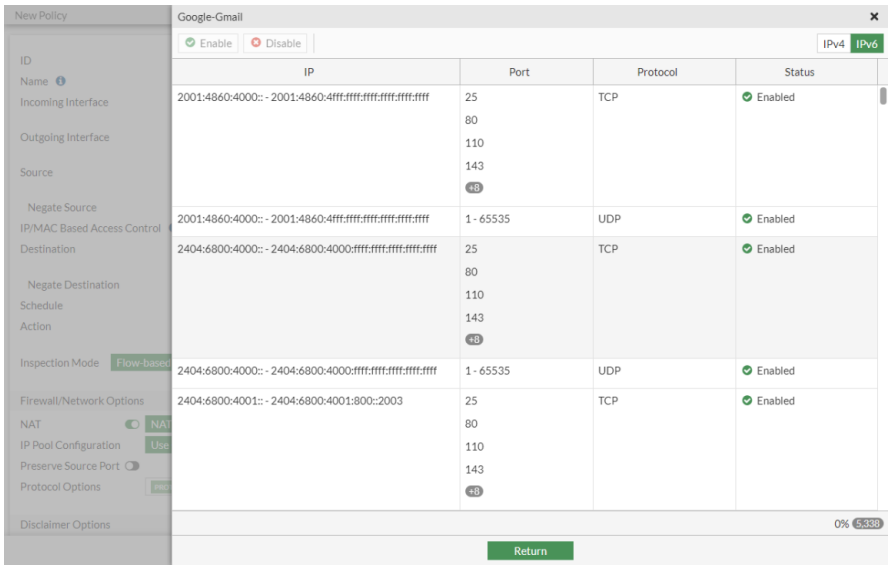
```
Group(4), Singularity(10), Number of IP ranges(142586)
Group(5), Singularity(8), Number of IP ranges(5336)
Group(6), Singularity(6), Number of IP ranges(113891)
Internet Service: 65646(Google.Gmail)
Number of IP range: 60
Number of IP numbers: 322845
Singularity: 15
Reputation: 5(Known and verified safe sites such as Gmail, Amazon, eBay, etc.)
Icon Id: 510
Second Level Domain: 53(gmail.com)
Direction: dst
Data source: isdb
```

Result



Because the IP and services related to Google Gmail on the Internet are included in this Internet Service (65646), all traffic to Google Gmail is forwarded by this policy.

Sample IPv6 configuration



In this example, the Google Gmail IPv6 ISDB address (ID 65646) is used as a destination in a firewall policy.

To apply a predefined IPv6 Internet Service entry to a policy using the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. In the *Destination* field, select *Internet Service* from the dropdown list.
3. In the *IPv6 Internet Service* section, select *Google-Gmail*.

4. Optionally, hover over the *Google Gmail* and click *View/Edit Entries*. A pane appears that displays the IPv6 address ranges for this Internet Service.

5. Click *Return* to close the pane.
6. Configure the other settings as needed.
7. Click *OK*.

To apply a predefined IPv6 Internet Service entry to a policy using the CLI:

```
config firewall policy
    edit 4
        set name "Internet Service6 policy"
        set srcintf "vlan100"
        set dstintf "wan1"
        set action accept
        set srcaddr6 "all"
        set internet-service6 enable
        set internet-service6-name "Google-Gmail"
        set schedule "always"
        set nat enable
    next
end
```

To diagnose an IPv6 Internet Service entry in the CLI:

```
# diagnose internet-service6 id-summary 65646

Version: 00007.02907
Timestamp: 202212161345
Total number of IP ranges: 36878
Number of Groups: 12
Group(0), Singularity(20), Number of IP ranges(60)
Group(1), Singularity(18), Number of IP ranges(12)
Group(2), Singularity(17), Number of IP ranges(2728)
Group(3), Singularity(16), Number of IP ranges(2812)
Group(4), Singularity(15), Number of IP ranges(4011)
Group(5), Singularity(10), Number of IP ranges(2345)
Group(6), Singularity(9), Number of IP ranges(14)
Group(7), Singularity(8), Number of IP ranges(1555)
```

```
Group(8), Singularity(7), Number of IP ranges(2704)
Group(9), Singularity(6), Number of IP ranges(7300)
Group(10), Singularity(5), Number of IP ranges(3154)
Group(11), Singularity(4), Number of IP ranges(10183)
Internet Service: 65646(Google-Gmail)
Number of IP ranges: 482
Singularity: 15
Icon Id: 510
Direction: both
Data source: isdb
Country: 32 36 56 76 124 152 158 203 208 246 250 276 344 348 356 372 376 380 392 404 458 484
        528 616 634 643 682 702 710 724 752 756 784 826 840
Region: 65535
City: 65535
```

Result

Because the IP and services related to Google Gmail on the Internet are included in this Internet Service (65646), all traffic to Google Gmail is forwarded by this policy.

Using custom Internet Service in policy

Custom Internet Services can be created and used in firewall policies.

When creating a custom Internet Service, you must set following elements:

- IP or IP ranges
- Protocol number
- Port or port ranges
- Reputation

You must use CLI to create a custom Internet Service, except for geographic based services (see Allow creation of ISDB objects with regional information on page 1547).

CLI syntax

```
config firewall internet-service-custom
    edit <name>
       set comment <comment>
       set reputation {1 | 2 | 3 | 4 | 5}
       config entry
           edit <ID>
               set protocol <protocol #>
               set dst <object_name>
               config port-range
                   edit <ID>
                       set start-port <port #>
                       set end-port <port #>
                   next
               end
           next
       end
```

```
    end
end
```

Sample configuration

To configure a custom Internet Service:

```
config firewall internet-service-custom
   edit "test-isdb-1"
       set comment "Test Custom Internet Service"
       set reputation 4
       config entry
          edit 1
              set protocol 6
              config port-range
                  edit 1
                      set start-port 80
                      set end-port 443
                  next
              end
              set dst "10-1-100-0"
          next
          edit 2
              set protocol 6
              config port-range
                  edit 1
                      set start-port 80
                      set end-port 80
                  next
              end
              set dst "172-16-200-0"
          next
       end
   next
end
```

To apply a custom Internet Service into a policy:

```
config firewall policy
    edit 1
        set name "Internet Service in Policy"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set internet-service enable
        set internet-service-id 65646
        set internet-service-custom "test-isdb-1"
        set action accept
        set schedule "always"
        set utm-status enable
        set av-profile "g-default"
        set ssl-ssh-profile "certificate-inspection"
        set nat enable
    next
end
```

Result

In addition to the IP address, IP address ranges, and services allowed by Google.Gmail, this policy also allows the traffic which access to 10.1.100.0/24 and TCP/80-443 and 172.16.200.0/24 and TCP/80.

Using extension Internet Service in policy

Extension Internet Service lets you add custom or remove existing IP address and port ranges to an existing predefined Internet Service entries. Using an extension type Internet Service is actually editing a predefined type Internet Service entry and adding IP address and port ranges to it.

When creating an extension Internet Service and adding custom ranges, you must set following elements:

- IP or IP ranges
- Protocol number
- Port or port ranges

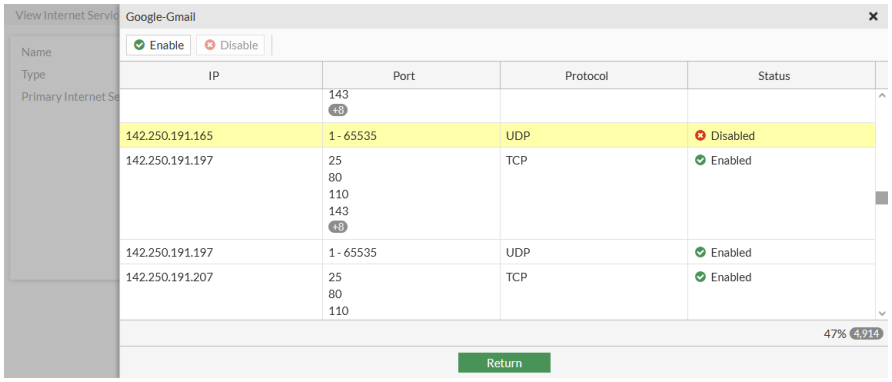
You must use CLI to add custom IP address and port entries into a predefined Internet Service.

You must use GUI to remove entries from a predefined Internet Service.

Custom extension Internet Service CLI syntax

```
config firewall internet-service-extension
    edit <ID #>
        set comment <comment>
        config entry
            edit <ID #>
                set protocol <number #>
                set dst <object_name>
                config port-range
                    edit <ID #>
                         set start-port <number #>
                         set end-port <number #>
                    next
                end
            next
        end
    end
end
```

Sample configuration



To configure an extension Internet Service in the CLI:

```
config firewall internet-service-extension
    edit 65646
        set comment "Test Extension Internet Service 65646"
        config entry
            edit 1
                set protocol 6
                config port-range
                    edit 1
```

```
                    set start-port 80
                    set end-port 443
                next
            end
            set dst "172-16-200-0"
        next
        edit 2
            set protocol 17
            config port-range
                edit 1
                    set start-port 53
                    set end-port 53
                next
            end
            set dst "10-1-100-0"
        next
    end
next
end
```

To remove IP address and port entries from an existing Internet Service in the GUI:

1. Go to *Policy & Objects* > *Internet Service Database*.
2. Search for *Google-Gmail*.
3. Select *Google-Gmail* and click *Edit*.
4. In the gutter, click *View/Edit Entries*.
5. Select the *IP* entry that you need to remove and click *Disable*.

6. Click *Return* twice.

To remove IP address and port entries from an existing Internet Service in the CLI:

```
config firewall internet-service-extension
    edit 65646
        config disable-entry
            edit 1
                set protocol 17
                config port-range
                    edit 1
                    next
                end
                config ip-range
```

```
                    edit 1
                        set start-ip 142.250.191.165
                        set end-ip 142.250.191.165
                    next
                end
            next
        end
    next
end
```

To apply an extension Internet Service into policy in the CLI:

```
config firewall policy
    edit 9
        set name "Internet Service in Policy"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set internet-service enable
        set internet-service-id 65646
        set action accept
        set schedule "always"
        set utm-status enable
        set av-profile "g-default"
        set ssl-ssh-profile "certificate-inspection"
        set nat enable
    next
end
```

Result

In addition to the IP addresses, IP address ranges, and services allowed by Google.Gmail, this policy also allows the traffic which accesses 10.1.100.0/24 and UDP/53 and 172.16.200.0/24 and TCP/80-443. At the same time, the traffic that accesses 2.20.183.160 is dropped because this IP address and port is disabled from Google.Gmail.

Global IP address information database

The Internet Service and IP Reputation databases download details about public IP address, including: ownership, known services, geographic location, blocklisting information, and more. The details are available in drilldown information, tooltips, and other mechanisms in the FortiView and other pages.

The global IP address database is an integrated database containing all public IP addresses, and is implemented in the Internet Service Database.

To view the owner of the IP address:

```
(global) # get firewall internet-service-owner ?
    id    Internet Service owner ID.
    1  Google
    2  Facebook
    3  Apple
    4  Yahoo
    5  Microsoft
```

```
    ......
    115  Cybozu
    116  VNC
```

To check for any known service running on an IP address:

```
(global) # diagnose internet-service info FG-traffic 6 80 8.8.8.8
    Internet Service: 65537(Google.Web)
```

To check GeoIP location and blocklist information:

```
(global) # diagnose internet-service id 65537 | grep 8.8.8.8
    8.8.8.8-8.8.8.8 geo_id(11337) block list(0x0) proto(6) port(80 443)
    8.8.8.8-8.8.8.8 geo_id(11337) block list(0x0) proto(17) port(443)
```

To check a known malicious server:

```
(global) # diagnose internet-service id-summary 3080383
    Version: 0000600096
    Timestamp: 201902111802
    Total number of IP ranges: 444727
    Number of Groups: 7
    Group(0), Singularity(20), Number of IP ranges(142740)
    Group(1), Singularity(19), Number of IP ranges(1210)
    Group(2), Singularity(16), Number of IP ranges(241)
    Group(3), Singularity(15), Number of IP ranges(38723)
    Group(4), Singularity(10), Number of IP ranges(142586)
    Group(5), Singularity(8), Number of IP ranges(5336)
    Group(6), Singularity(6), Number of IP ranges(113891)
    Internet Service: 3080383(Botnet.C&C.Server)
    Number of IP range: 111486
    Number of IP numbers: 111486
    Singularity: 20
    Reputation: 1(Known malicious sites related to botnet servers, phishing sites, etc.)
    Icon Id: 591
    Second Level Domain: 1(other)
    Direction: dst
    Data source: irdb
```

To check questionable usage:

```
(global) # diagnose internet-service id-summary 2818238
    Version: 0000600096
    Timestamp: 201902111802
    Total number of IP ranges: 444727
    Number of Groups: 7
    Group(0), Singularity(20), Number of IP ranges(142740)
    Group(1), Singularity(19), Number of IP ranges(1210)
    Group(2), Singularity(16), Number of IP ranges(241)
    Group(3), Singularity(15), Number of IP ranges(38723)
    Group(4), Singularity(10), Number of IP ranges(142586)
    Group(5), Singularity(8), Number of IP ranges(5336)
    Group(6), Singularity(6), Number of IP ranges(113891)
    Internet Service: 2818238(Tor.Relay.Node)
    Number of IP range: 13718
```

```
    Number of IP numbers: 13718
    Singularity: 20
    Reputation: 2(Sites providing high risk services such as TOR, proxy, P2P, etc.)
    Icon Id: 43
    Second Level Domain: 1(other)
    Direction: dst
    Data source: irdb

(global) # diagnose internet-service id-summary 2818243
    Version: 0000600096
    Timestamp: 201902111802
    Total number of IP ranges: 444727
    Number of Groups: 7
    Group(0), Singularity(20), Number of IP ranges(142740)
    Group(1), Singularity(19), Number of IP ranges(1210)

    Group(4), Singularity(10), Number of IP ranges(142586)
    Group(5), Singularity(8), Number of IP ranges(5336)
    Group(6), Singularity(6), Number of IP ranges(113891)
    Internet Service: 2818243(Tor.Exit.Node)
    Number of IP range: 1210
    Number of IP numbers: 1210
    Singularity: 19
    Reputation: 2(Sites providing high risk services such as TOR, proxy, P2P, etc.)
    Icon Id: 43
    Second Level Domain: 1(other)
    Direction: src
    Data source: irdb
```

IP reputation filtering

There are currently five reputation levels in the Internet Service Database (ISDB), and custom reputation levels can be defined in a custom internet service. You can configure firewall policies to filter traffic according to the desired reputation level. If the reputation level of either the source or destination IP address is equal to or greater than the level set in the policy, then the packet is forwarded, otherwise, the packet is dropped.

The five default reputation levels are:

1	Known malicious sites, such as phishing sites or sites related to botnet servers
2	High risk services sites, such as TOR, proxy, and P2P
3	Unverified sites
4	Reputable social media sites, such as Facebook and Twitter
5	Known and verified safe sites, such as Gmail, Amazon, and eBay

The default minimum reputation level in a policy is zero, meaning that the reputation filter is disabled.

For IP addresses that are not included in the ISDB, the default reputation level is three.

The default reputation direction is `destination`.

Example 1

Packets from the source IP address with reputation levels three, four, or five will be forwarded by this policy.

To set the reputation level and direction in a policy using the CLI:

```
config firewall policy
    edit 1
        set srcintf "wan2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set reputation-minimum 3
        set reputation-direction source
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

Packets from the source IP address with reputation levels three, four, or five will be forwarded by this policy.

Example 2

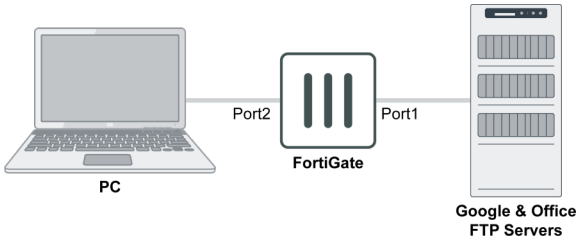
This policy allows only outbound FTP traffic, if the destination server has a minimum reputation of 4.

To set the reputation level and direction in a policy using the CLI:

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "wan2"
        set srcaddr "all"
        set dstaddr "all"
        set reputation-minimum 4
        set reputation-direction destination
        set action accept
        set schedule "always"
        set service "FTP"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

Internet service groups in policies

This feature provides support for Internet Service Groups in traffic shaping and firewall policies. Service groups can be used as the source and destination of the policy. Internet Service Groups are used as criteria to match traffic; the shaper will be applied when the traffic matches.



To use a group as a destination, `internet-service` must be enabled. To use a group as a source, `internet-service-src` must be enabled.

The following CLI variables are available in the `firewall policy` and `firewall shaping-policy` commands:

Variable	Description
`internet-service-group <string>`	Internet Service group name.
`internet-service-custom-group <string>`	Custom Internet Service group name.
`internet-service-src-group <string>`	Internet Service source group name.
`internet-service-src-custom-group <string>`	Custom Internet Service source group name.

Examples

The following examples use the below topology.

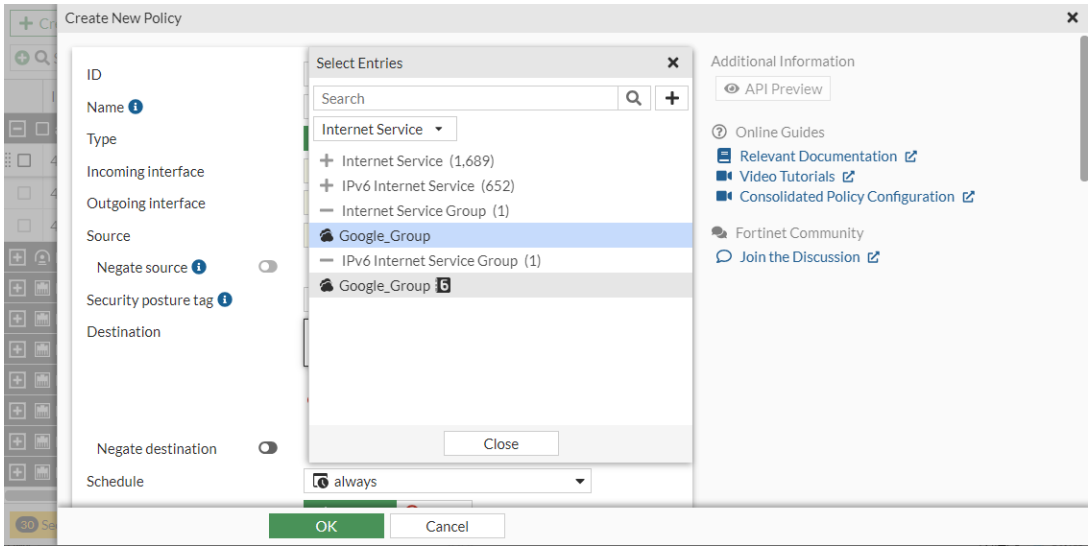
Example 1

In this example, the PC is allowed to access Google, so all Google services are put into an Internet Service Group.

To configure access to Google services using an Internet Service Group using the CLI:

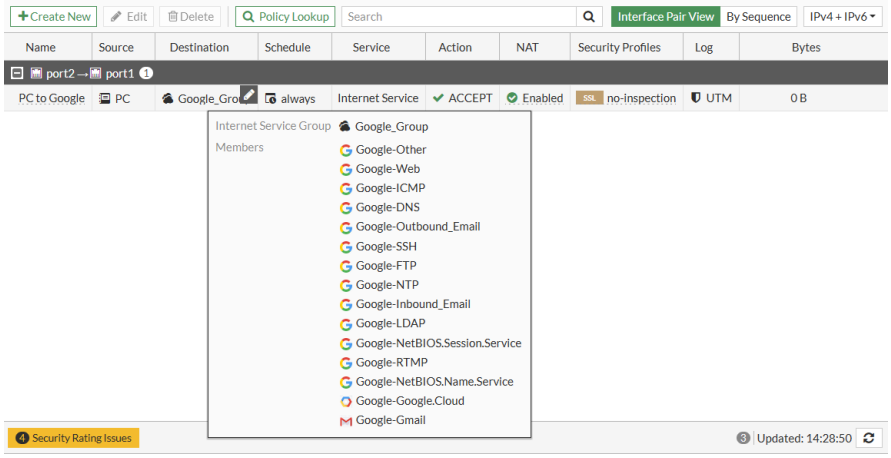
1. Create a Service Group:

```
config firewall internet-service-group
    edit "Google_Group"
        set direction destination
        set member Google-Other Google-Web Google-ICMP Google-DNS Google-Outbound_Email
Google-SSH Google-FTP Google-NTP Google-Inbound_Email Google-LDAP Google-
NetBIOS.Session.Service Google-RTMP Google-NetBIOS.Name.Service Google-Google.Cloud
Google-Gmail
    next
end
```



2. Create a firewall policy to allow access to all Google Services from the PC:

```
config firewall policy
    edit 1
```



```
        set name "PC to Google"
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set internet-service enable
        set internet-service-group "Google_Group"
        set action accept
        set schedule "always"
        set fsso disable
        set nat enable
    next
end
```

To configure access to Google services using an Internet Service Group in the GUI:

1. On the FortiGate, create a Service Group using the CLI.
2. Go to *Policy & Objects* > *Firewall Policy*, and create a new policy.
3. Set the *Destination* as the just created Internet Service Group.

4. Configure the remaining options, then click *OK*.
5. Go to *Policy & Objects* > *Firewall Policy* and hover over the group to view a list of its members.

Example 2

In this example, two office FTP servers are put into an Internet Custom Service Group, and the PC connection to the FTP servers is limited to 1Mbps.

To put two FTP servers into a custom service group and limit the PC connection speed to them in the CLI:

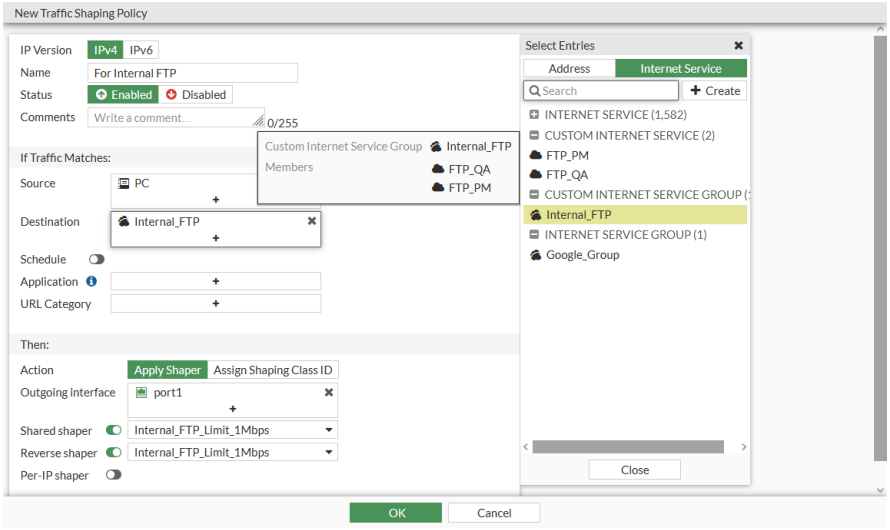
1. Create custom internet services for the internal FTP servers:

```
config firewall internet-service-custom
    edit "FTP_PM"
        config entry
            edit 1
                config port-range
                    edit 1
                        set start-port 21
                        set end-port 21
                    next
                end
                set dst "PM_Server"
            next
        end
    next
    edit "FTP_QA"
        config entry
            edit 1
                config port-range
                    edit 1
                        set start-port 21
                        set end-port 21
                    next
                end
                set dst "QA_Server"
            next
        end
    next
end
```

2. Create a custom internet server group and add the just created custom internet services to it:

```
config firewall internet-service-custom-group
    edit "Internal_FTP"
        set member "FTP_QA" "FTP_PM"
    next
end
```

3. Create a traffic shaper to limit the maximum bandwidth:



```
config firewall shaper traffic-shaper
    edit "Internal_FTP_Limit_1Mbps"
        set guaranteed-bandwidth 500
        set maximum-bandwidth 1000
        set priority medium
    next
end
```

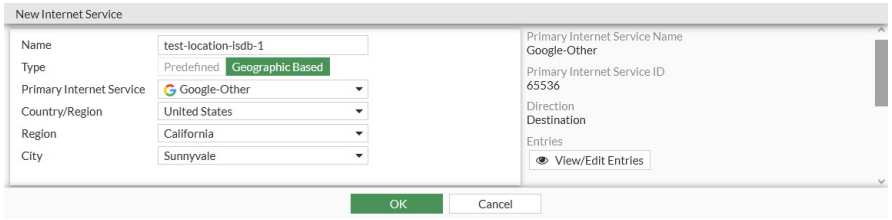
4. Create a firewall shaping policy to limit the speed from the PC to the internal FTP servers:

```
config firewall shaping-policy
    edit 1
        set name "For Internal FTP"
        set internet-service enable
        set internet-service-custom-group "Internal_FTP"
        set dstintf "port1"
        set traffic-shaper "Internal_FTP_Limit_1Mbps"
        set traffic-shaper-reverse "Internal_FTP_Limit_1Mbps"
        set srcaddr "PC"
    next
end
```

To put two FTP servers into a custom service group and limit the PC connection speed to the in the GUI:

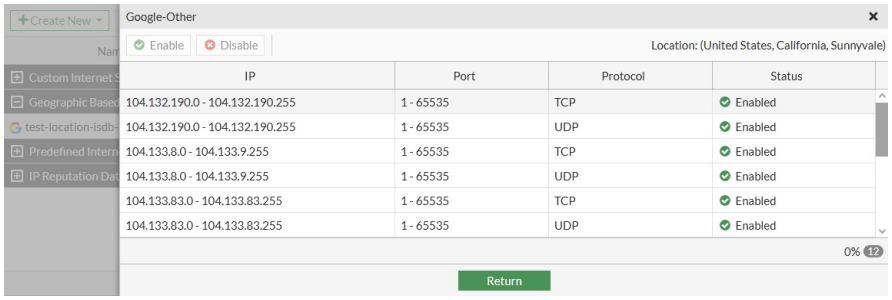
1. Create custom internet services for the internal FTP servers using the CLI.
2. Create a custom internet server group and add the just created custom internet services to it using the CLI.
3. Create a traffic shaper to limit the maximum bandwidth:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shapers* tab, and click *Create New*.
   b. Enter a *Name* for the shaper, such as *Internal_FTP_Limit_1Mbps*.
   c. Set the *Traffic Priority* to *Medium*.
   d. Enable *Max Bandwidth* and set it to *1000*.
   e. Enable *Guaranteed Bandwidth* and set it to *500*.
   f. Click *OK*.
4. Create a firewall shaping policy to limit the speed from the PC to the internal FTP servers:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policy* tab, and click *Create New*.
   b. Set the *Destination* to the just created custom internet service group, and apply the just create traffic shaper.

   c. Configure the remaining options as shown, then click *OK*.



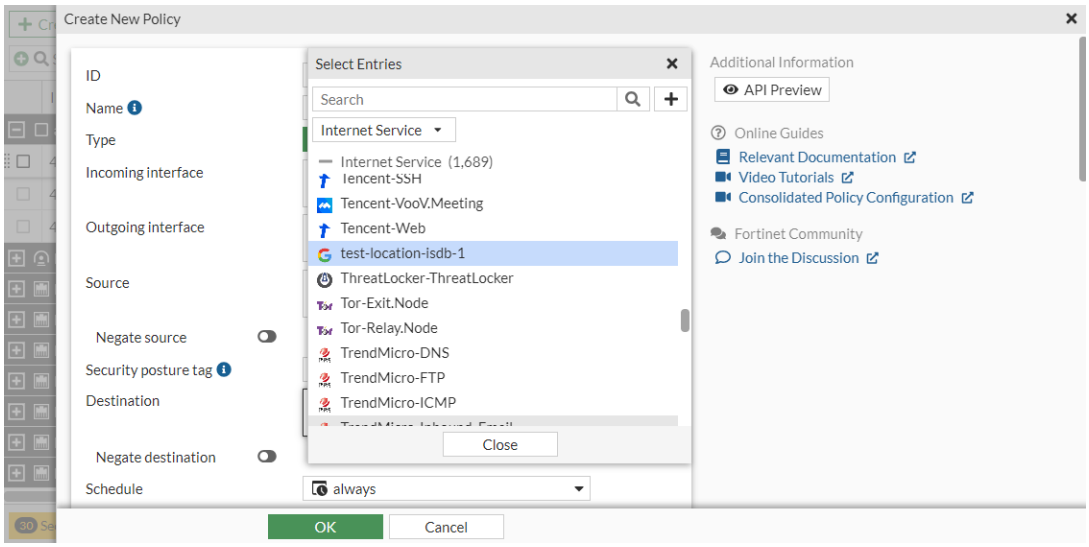
Allow creation of ISDB objects with regional information

Geographic-based Internet Service Database (ISDB) objects allow users to define a country, region, and city. These objects can be used in firewall policies for more granular control over the location of the parent ISDB object. ISDB



objects are now referenced in policies by name instead of ID.

To apply a location-based ISDB object to a policy in the GUI:



1. Create the ISDB object:
   a. Go to *Policy & Objects* > *Internet Service Database* and click *Create New* > *Geographic Based Internet Service*.
   b. Configure the settings as required.

   c. Click *OK*.
2. View the IP ranges in the location-based internet service:
   a. Go to *Policy & Objects* > *Internet Service Database* .
   b. In the table, hover over the object created in step 1 and click *View/Edit Entries*. The list of IPs is displayed:

   c. Click *Return*.
3. Add the ISDB object to a policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and create a new policy or edit an existing one.
   b. For *Destination*, select *Internet Service* from the dropdown list and select the ISDB object created in step 1.
   c. Configure the other settings as needed.

d. Click *OK*.

To apply a location-based ISDB object to a policy in the CLI:

1. Create the ISDB object:

```
config firewall internet-service-name
    edit "test-location-isdb-1"
        set type location
        set internet-service-id 65536
        set country-id 840
        set region-id 283
        set city-id 23352
    next
end
```

2. View the IP ranges in the location-based internet service:

```
# diagnose internet-service id 65536 | grep "country(840) region(283) city(23352)"
96.45.33.73-96.45.33.73 country(840) region(283) city(23352) blocklist(0x0) reputation
(4), domain(5) popularity(0) botnet(0) proto(6) port(1-65535)
96.45.33.73-96.45.33.73 country(840) region(283) city(23352) blocklist(0x0) reputation
(4), domain(5) popularity(0) botnet(0) proto(17) port(1-65535)
198.94.221.56-198.94.221.56 country(840) region(283) city(23352) blocklist(0x0)
reputation(4), domain(5) popularity(4) botnet(0) proto(6) port(1-65535)
198.94.221.56-198.94.221.56 country(840) region(283) city(23352) blocklist(0x0)
reputation(4), domain(5) popularity(4) botnet(0) proto(17) port(1-65535)
```

3. Add the ISDB object to a policy:

```
config firewall policy
    edit 3
        set name "PC to Google"
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "PC"
        set internet-service enable
        set internet-service-name "test-location-isdb-1"
        set action accept
```

```
            set schedule "always"
            set logtraffic all
            set logtraffic-start enable
            set auto-asic-offload disable
            set nat enable
        next
    end
```

Internet service customization

Internet Service Database (ISDB) entries can be tuned for their environments by adding custom ports and port ranges, as well as port mapping.

If you are in multi-VDOM mode, Internet service customization can only occur at the Global level and not in a VDOM. See VDOM overview on page 2733 for more information.

To add a custom port range:

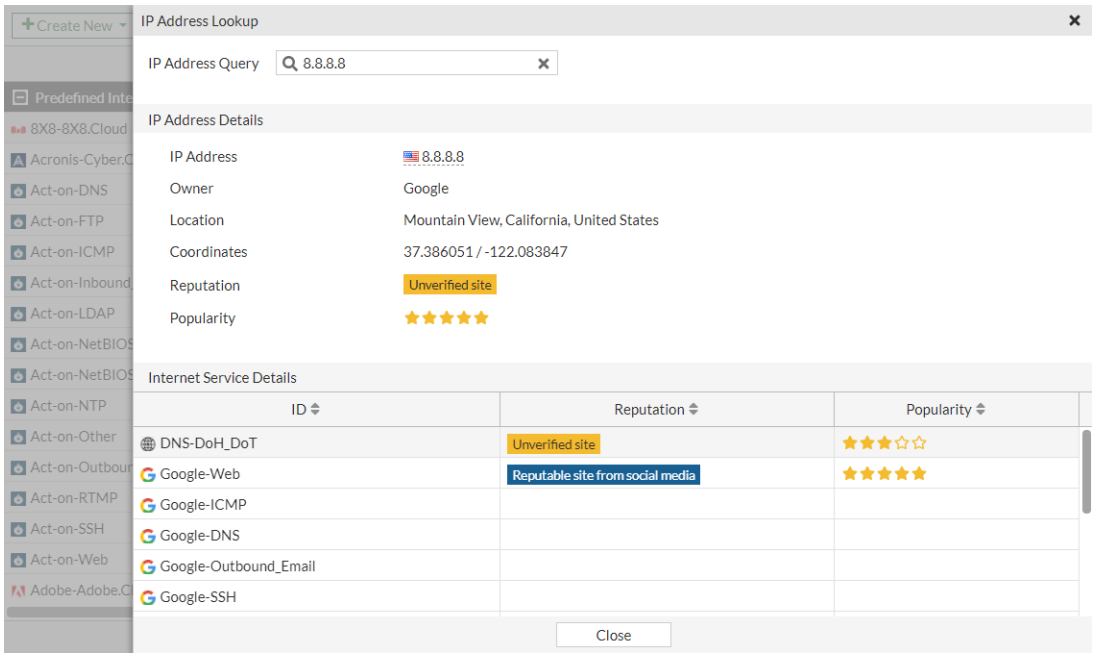
```
config firewall internet-service-addition
    edit 65646
        set comment "Add custom port-range:tcp/8080-8090 into 65646"
        config entry
            edit 1
                set protocol 6
                config port-range
                    edit 1
                        set start-port 8080
                        set end-port 8090
                    next
                end
            next
        end
    next
end
Warning: Configuration will only be applied after rebooting or using the 'execute internet-
service refresh' command.
```

To verify that the change was applied:

```
 # diagnose internet-service info FG-traffic 6 8080 2.20.183.160
 Internet Service: 65646(Google.Gmail)
```

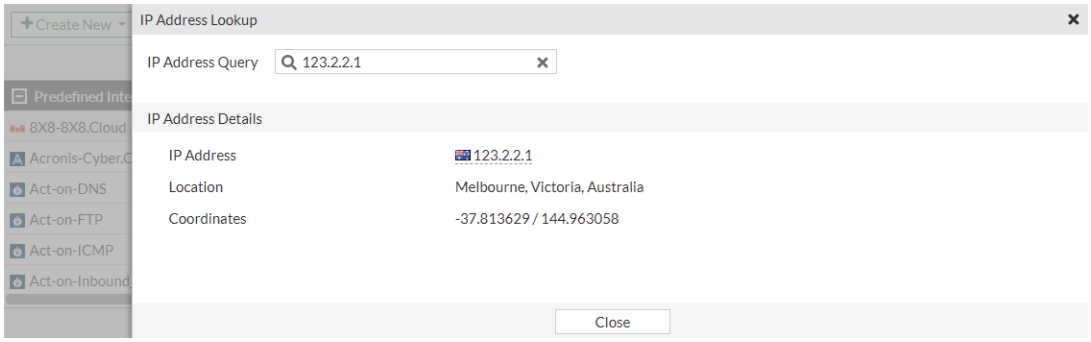
To configure additional port mapping:

```
config firewall internet-service-append
    set match-port 10
    set append-port 20
end
Warning: Configuration will only be applied after rebooting or using the 'execute internet-
service refresh' command.
```



Look up IP address information from the Internet Service Database page

The *IP Address Lookup* button allows users to look up IP address information from the Internet Service Database and GeoIP Database. Returned IP address information includes the reverse IP address/domain lookup, location, reputation, and other internet service information.



To look up IP address information:

1. Go to *Policy & Objects* > *Internet Service Database*.
2. Click *IP Address Lookup*. The *IP Address Lookup* pane opens.
3. In the *IP Address Query* field, enter the IP address and press `Enter`.

   Results of an IP address from the Internet Service Database:

   Results of an IP address from the GeoIP Database:

   Results of an IPv6 address from the GeoIP Database:

4. Click *Close*.

Internet Service Database on-demand mode

Internet Service Database (ISDB) on-demand mode replaces the full-sized ISDB file with a much smaller file that is downloaded onto the flash drive. This file contains only the essential entries for Internet Services. When a service is used in a firewall policy, the FortiGate queries FortiGuard to download the IP addresses and stores them on the flash drive. The FortiGate also queries the local MAC Database (MADB) for corresponding MAC information. The content of the ISDB entries used in firewall policies persists through reboots.

To enable ISDB (FFDB) on-demand mode:

1. Configure the global setting:

```
config system global
    set internet-service-database on-demand
end
```

   All FFDB files are erased.

2. Verify that there are no ISDB (FFDB) files:

```
# diagnose autoupdate versions | grep Internet -A 6
Internet-service On-Demand Database
---------
Version: 0.00000
Contract Expiry Date: n/a
Last Updated using manual update on Mon Jan  1 00:00:00 2001
Last Update Attempt: n/a
Result: Updates Installed
```

   Shortly after, the ISDB (FFDB) data structure is downloaded on the FortiGate. The following message appears in the debug messages:

```
do_ffsr_update[1567]-Starting  Update FFDB ondemand:(not final retry)
```

3. Run diagnostics again to verify that the ISDB (FFDB) files are saved on the FortiGate flash drive:

```
# diagnose autoupdate versions | grep Internet -A 6
Internet-service On-Demand Database
---------
Version: 7.02950
Contract Expiry Date: n/a
Last Updated using manual update on Fri Jan  6 06:45:00 2023
```

```
Last Update Attempt: n/a
Result: Updates Installed
```

4. Since no services have been applied to a policy, the IP range and IP address values are blank in the the summary details. For example, check the summary details for ID 1245187, Fortinet DNS:

```
# diagnose internet-service id-summary 1245187
Version: 00007.02950
Timestamp: 202301060645
Total number of IP ranges: 3085
Number of Groups: 1
Group(0), Singularity(90), Number of IP ranges(3085)
Internet Service: 1245187(Fortinet-DNS)
Number of IP ranges: 0
Number of IP addresses: 0
Singularity: 0
Icon Id: 19
Direction: dst
Data source: isdb
Country:
Region:
City:
```

5. Apply the Fortinet DNS service in a firewall policy:

```
config firewall policy
    edit 1
        set name "FDNS"
        set srcintf "port1"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set internet-service enable
        set internet-service-name "Fortinet-DNS"
        set schedule "always"
        set nat enable
    next
end
```

6. Verify the summary details again for ID 1245187 (Fortinet DNS). There is now data for the IP range and IP address values:

```
# diagnose internet-service id-summary 1245187
Version: 00007.02951
Timestamp: 202301061144
Total number of IP ranges: 3558
Number of Groups: 2
Group(0), Singularity(90), Number of IP ranges(3078)
Group(1), Singularity(10), Number of IP ranges(480)
Internet Service: 1245187(Fortinet-DNS)
Number of IP ranges: 480
Number of IP addresses: 55242
Singularity: 10
Icon Id: 19
Direction: dst
Data source: isdb
Country: 12 32 36 40 56 124 158 170 203 222 250 276 320 332 344 356 360 372 380 392 458
484
```

```

        15220 15507 15670 16347 16561 16564 16567 16631 17646 17746 17885 17975 17995
18071 18476 19066 19285 20784 21065 21092 21136
        21146 21266 21337 21779 21993 22292 22414 22912 23352 23367 23487 23574 23635
23871 23963 24076 24203 24298 24611 24955 25050
        25332 26854 27192 27350 28825 28866 65535
```

To verify MAC vendor information:

```
# diagnose vendor-mac id 1
Vendor MAC: 1(ASUS)
Version: 0000100146
Timestamp: 202301031100
Number of MAC ranges: 85
00:04:0f:00:00:00 - 00:04:0f:ff:ff:ff
00:0c:6e:00:00:00 - 00:0c:6e:ff:ff:ff
00:0e:a6:00:00:00 - 00:0e:a6:ff:ff:ff
...
```

Enabling the ISDB cache in the FortiOS kernel

A software ISDB cache can be enabled in the FortiOS kernel. This ISDB cache can be used to enhance lookup performance by circumventing the ISDB lookup penalty when revisiting the same resources.

The ISDB cache can be enabled using the following command:

```
config system settings
    set internet-service-database-cache {enable | disable}
end
```

Example

In the following example, after enabling the software ISDB cache, traffic will be generated twice to the same resource. Since the ISDB cache is enabled, no new query will occur in the ISDB. Instead, the ISDB lookup in performed in the cache table.

To enable the software ISDB cache:

1. Enable the ISDB cache:

```
config system settings
    set internet-service-database-cache enable
end
```

2. Create an ISDB firewall policy:

```
config firewall policy
    edit 1
        set internet-service enable
        set internet-service-name "Google-DNS" "Google-Other" "Google-Web"
        set internet-service6 enable
        set internet-service6-name "Google-DNS" "Google-Other" "Google-Web"
    next
end
```

3. Generate traffic to access the resource which matches the ISDB ID in the firewall policy.
4. Check the Internet Service cache lists:

```
# diagnose firewall internet-service-cache list
List Internet Service (IPV4) Cache in Kernel:
MAX_ISDB_CACHE_ENTRY_SIZE=1024 num_isdb_cache_entry=2 isdb_cache_hit_count=0 isdb_query_
count=2
proto=6 port=443 IP=10.151.118.105 id=1245185 country_id=840 region_id=283 city_id=21065
reputation=5 insert_timestamp=4302579542 cache_hit_count=0
proto=6 port=443 IP=10.8.8.8 id=65537 country_id=840 region_id=283 city_id=15905
reputation=5 insert_timestamp=4302579760 cache_hit_count=0

# diagnose firewall internet-service6-cache list
List Internet Service (IPV6) Cache in Kernel:
MAX_ISDB_CACHE_ENTRY_SIZE=1024 num_isdb_cache_entry=1 isdb_cache_hit_count=0 isdb_query_
count=1
proto=6 port=443 IP=2600:140a:1000:196::b33 id=7929993 country_id=124 region_id=65535
city_id=65535 reputation=4 insert_timestamp=4302580009 cache_hit_count=0
```

5. Generate traffic to access the same resource again.
6. Check the Internet Service cache lists:

```
# diagnose firewall internet-service-cache list
List Internet Service (IPV4) Cache in Kernel:
MAX_ISDB_CACHE_ENTRY_SIZE=1024 num_isdb_cache_entry=2 isdb_cache_hit_count=1 isdb_query_
count=2
proto=6 port=443 IP=10.151.118.105 id=1245185 country_id=840 region_id=283 city_id=21065
reputation=5 insert_timestamp=4302579542 cache_hit_count=0
proto=6 port=443 IP=10.8.8.8 id=65537 country_id=840 region_id=283 city_id=15905
reputation=5 insert_timestamp=4302579760 cache_hit_count=1

# diagnose firewall internet-service6-cache list
List Internet Service (IPV6) Cache in Kernel:
MAX_ISDB_CACHE_ENTRY_SIZE=1024 num_isdb_cache_entry=1 isdb_cache_hit_count=1 isdb_query_
count=1
proto=6 port=443 IP=2600:140a:1000:196::b33 id=7929993 country_id=124 region_id=65535
city_id=65535 reputation=4 insert_timestamp=4302580009 cache_hit_count=1
```

The ISDB lookup is performed in the cache table so there is no new query in the full ISDB.

Security Profiles

This section contains information about configuring FortiGate security features, including:

- Inspection modes on page 1556
- Antivirus on page 1562
- Web filter on page 1617
- Video filter on page 1661
- DNS filter on page 1675
- Application control on page 1708
- Inline CASB on page 1724
- Intrusion prevention on page 1740
- File filter on page 1770
- Email filter on page 1778
- VoIP solutions on page 1793
- ICAP on page 1825
- Web application firewall on page 1838
- Data loss prevention on page 1841
- Virtual patching on page 1882
- SSL & SSH Inspection on page 1895
- Custom signatures on page 1912
- Overrides on page 1923
- IP ban on page 1937
- Profile groups on page 1942

If you are unable to view a security profile feature, go to *System* > *Feature Visibility* to enable it.

Inspection modes

FortiOS supports flow-based and proxy-based inspection in firewall policies. You can select the inspection mode when configuring a policy.

Flow-based inspection takes a snapshot of content packets and uses pattern matching to identify security threats in the content.

Proxy-based inspection reconstructs content that passes through the FortiGate and inspects the content for security threats.

Certain security profiles allows users to display flow-based or proxy-based feature sets.

Certain unused WAD proxy processes are not started by default on FortiGate models with 2 GB of RAM or less to reduce memory usage. These process will only start when relevant proxy features are configured, such as explicit proxies, transparent proxies, or ZTNA.

This following topics provide information about inspection modes for various security profile features:

- Flow mode inspection (default mode) on page 1557
- Proxy mode inspection on page 1557
- Inspection mode feature comparison on page 1558

Flow mode inspection (default mode)

When a firewall policy's inspection mode is set to flow, traffic flowing through the policy will not be buffered by the FortiGate. Unlike proxy mode, the content payload passing through the policy will be inspected on a packet by packet basis with the very last packet held by the FortiGate until the scan returns a verdict. If a violation is detected in the traffic, a reset packet is issued to the receiver, which terminates the connection and prevents the payload from being sent successfully.

Flow-based inspection identifies and blocks security threats in real time as they are identified. All applicable flow-based security modules are applied simultaneously in one single pass, using Direct Filter Approach (DFA) pattern matching to identify possible attacks or threats. Pattern matching is offloaded and accelerated by CP8 or CP9 processors.

Flow-based inspection typically requires lower processing resources than proxy-based inspection and does not change packets, unless a threat is found and packets are blocked. Flow-based inspection is selected by default on new firewall policies. It is the recommended inspection mode, unless proxy-specific features are required. For more information, see Inspection mode feature comparison on page 1558.

Proxy mode inspection

When a firewall policy’s inspection mode is set to proxy, traffic flowing through the policy will be buffered by the FortiGate for inspection. This means that the packets for a file, email message, or web page will be held by the FortiGate until the entire payload is inspected for violations (virus, spam, or malicious web links). After FortiOS finishes the inspection, the payload is either released to the destination (if the traffic is clean) or dropped and replaced with a replacement message (if the traffic contains violations).

To optimize inspection, the policy can be configured to block or ignore files or messages that exceed a certain size. To prevent the receiving end user from timing out, you can apply client comforting. This allows small portions of the payload to be sent while it is undergoing inspection.

In proxy-based antivirus scanning, certain techniques are used to streamline scanning with either in-process or stream-based scanning. For more information, see Proxy mode stream-based scanning on page 1579.

Proxy mode provides some security profile capabilities that are not available to flow-based scanning:

- Video Filter
- Inline CASB
- Web Application Firewall (WAF)
- Content Disarm and Reconstruction (CDR)
- Web quota
- Sandbox Inline Scanning

For a complete list, see Inspection mode feature comparison on page 1558.

Some features are exclusively proxy-based:

- SSL Offloading
- Explicit Web Proxy
- ZTNA

Verify the capabilities that you need when deciding to use proxy-based or flow-based policy. Applying the same type of scan mode in all your policies also helps optimize your performance.

Inspection mode feature comparison

The following table shows which UTM profile can be configured on a flow mode or proxy mode inspection policy.

Some UTM profiles are hidden in the GUI and can only be configured using the CLI. To configure profiles in a firewall policy in CLI, enable the `utm-status` setting.

Some profiles might have feature differences between flow-based and proxy-based Inspection. From the GUI and CLI, you can set the *Feature set* option to be *Flow-based* or *Proxy-based* to display only the settings for that mode.

	Flow Mode Inspection Policy		Proxy Mode Inspection Policy		Feature set option
UTM Profile	**GUI**	**CLI**	**GUI**	**CLI**	
AntiVirus	Yes	Yes	Yes	Yes	GUI/CLI
Web Filter	Yes	Yes	Yes	Yes	GUI/CLI
Video Filter	No	No	Yes	Yes	N/A
DNS Filter	Yes	Yes	Yes	Yes	N/A
Application Control	Yes	Yes	Yes	Yes	N/A
Inline CASB	No	No	Yes	Yes	N/A
Intrusion Prevention System	Yes	Yes	Yes	Yes	N/A
File Filter	Yes	Yes	Yes	Yes	GUI/CLI
Email Filter	Yes	Yes	Yes	Yes	GUI/CLI
VoIP	Yes	Yes	Yes	Yes	N/A
ICAP	No	No	Yes	Yes	N/A
Web Application Firewall	No	No	Yes	Yes	N/A
Data Loss Prevention	No	Yes	Yes	Yes	CLI
Virtual Patching	Yes	Yes	Yes	Yes	N/A
SSL/SSH Inspection	Yes	Yes	Yes	Yes	N/A

The following sections outline differences between flow-based and proxy-based inspection for a security profile.

Feature comparison between Antivirus inspection modes

The following table indicates which Antivirus features are supported by their designated scan modes.

Part1	Replacement Message	Content Disarm	Mobile Malware	Virus Outbreak	Sandbox Post-Transfer Scanning	Sandbox Inline Scanning	NAC Quarantine
Proxy	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes*	No	Yes	Yes	Yes	No	Yes

*IPS Engine caches the URL and a replacement message is presented after the second attempt.

Part 2	Archive Blocking	Emulator	Client Comforting	Infection Quarantine	Heuristics	Treat EXE as Virus
Proxy	Yes	Yes	Yes	Yes (1)	Yes	Yes (2)
Flow	Yes	Yes	No	Yes	Yes	Yes (2)

1. Only available on FortiGate models with HDD or when FortiAnalyzer or FortiGate Cloud is connected and enabled.
2. Only applies to inspection on IMAP, POP3, SMTP, and MAPI protocols.

Part 3	External Blocklist	EMS Threat Feed	AI/ML Based Detection	FortiNDR Inline Detection
Proxy	Yes	Yes	Yes	Yes
Flow	Yes	Yes	Yes	No

Feature comparison between Web Filter inspection modes

The following table indicates which Web Filter features are supported by their designated inspection modes.

	FortiGuard Category-Based Filter	Category Usage Quota	Override Blocked Categories	Search Engines	Static URL Filter	Rating Option	Proxy Option	Web Profile Override
Proxy	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes (1)	No	Yes (2)	No	Yes	Yes	Limited (3)	No

1. Local Category and Remote Category filters do not support the warning and authenticate actions.
2. Local Category and Remote Category filters cannot be overridden.
3. Only HTTP POST Action is supported.

Feature comparison between Email Filter inspection modes

The following tables indicate which Email Filters are supported by the specified inspection modes for local filtering and FortiGuard-assisted filtering.

Local Filtering	Banned Word Check	Block/Allow List	HELO/ EHLO DNS Check	Return Address DNS Check	DNSBL/ ORBL Check	MIME Header Check
Proxy	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes	Yes	No	No	No	Yes

FortiGuard-Assisted Filtering	Phishing URL Check	Anti-Spam Block List Check	Submit Spam to FortiGuard	Spam Email Checksum Check	Spam URL Check
Proxy	Yes	Yes	Yes	Yes	Yes
Flow	No	No	No	No	No

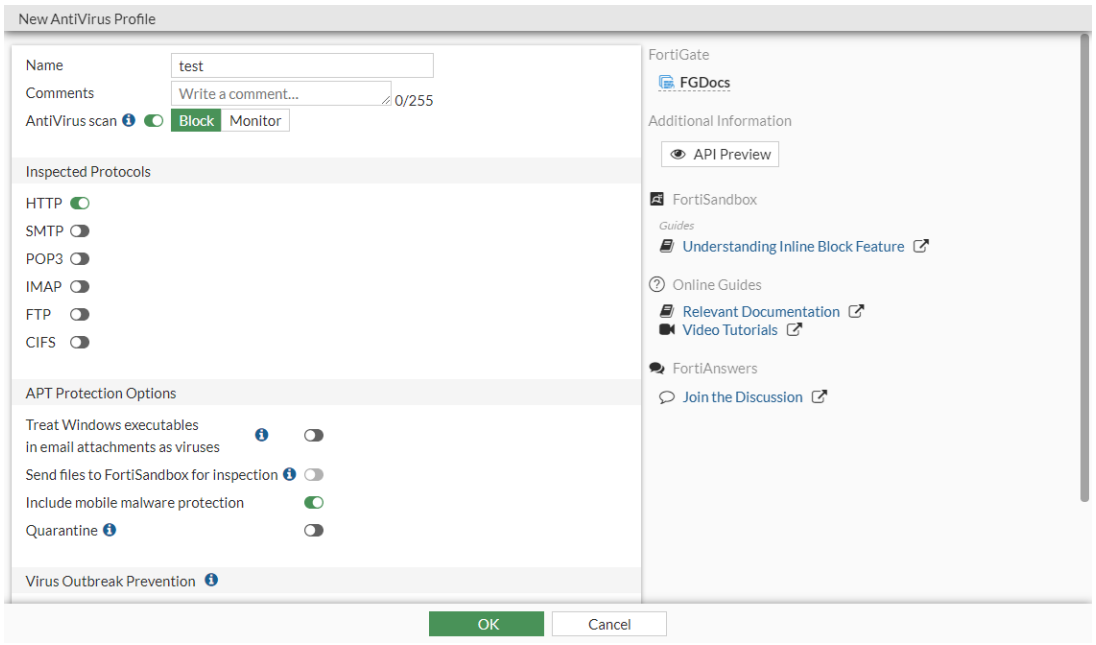
Feature comparison between DLP inspection modes

The following table indicates which DLP filters are supported by their designated inspection modes.

	Credit Card Filter	SSN Filter	Regex Filter	File-Type Filter	File-Pattern Filter	Fingerprint Filter	Watermark Filter	Encrypted Filter	File-Size Filter
Proxy	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes	Yes	Yes	Yes	Yes	No	No	Yes	Yes*

*File-size filtering only works if file size is present in the protocol exchange.

Proxy feature visibility in the GUI for entry-level models

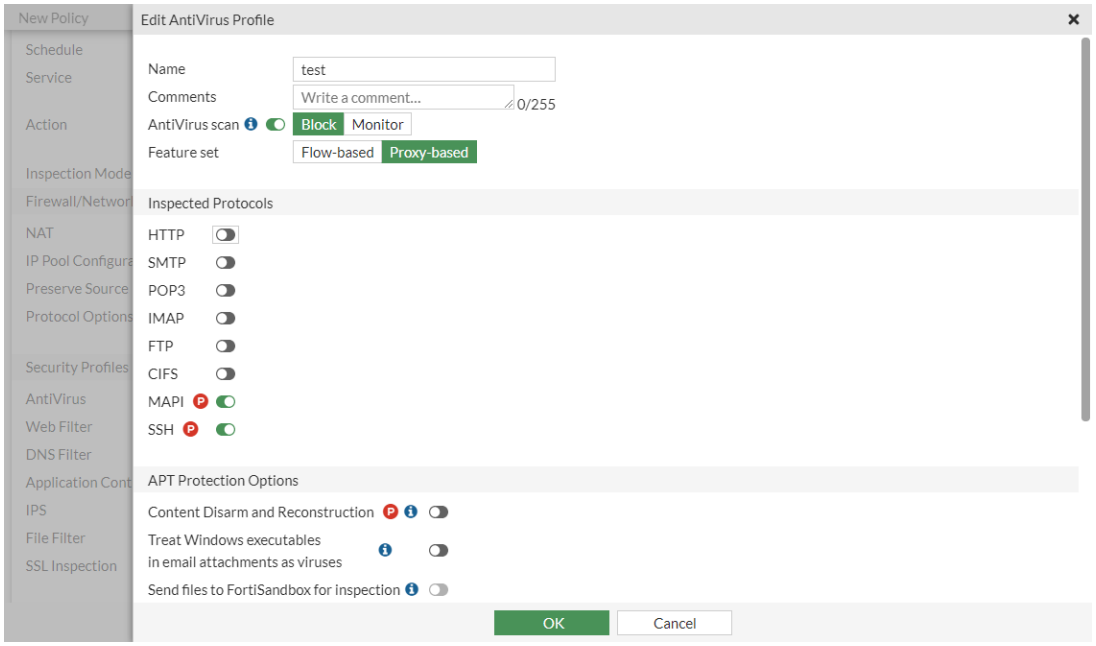


All entry-level models have ZTNA, proxy, explicit proxy, WANOpt, and web cache disabled by default. See To enable proxy features on entry-level platforms: on page 1562 for more information.

The `gui-proxy-inspection` setting under `config system settings` is enabled on most models except for entry-level platforms with 2 GB of RAM or less. When this setting is disabled:

- Proxy-based only profiles such as *ICAP*, *Web Application Firewall*, *Video Filter*, and *Zero Trust Network Access* are disabled (grayed out) on the *System* > *Feature Visibility* page.
- The *Feature set* field is disabled on UTM profiles. Only flow-based features are shown.

  Example AV profile:



- Firewall policy pages do not have option to select a *Flow-based* or *Proxy-based* inspection mode.
- Proxy-based UTM profiles cannot be selected within policy configurations or other areas.

Note the following exceptions:

- If the proxy feature set is enabled from the CLI or carried over from upgrading, it can be displayed in the GUI.
- If proxy-based inspection mode is enabled from the CLI or carried over from upgrading, it can be displayed in GUI firewall policy pages.

  Example AV profile being edited from the *New Policy* page after upgrading:

To enable proxy features on entry-level platforms:

```
config system global
    set proxy-and-explicit-proxy enable
end
config system settings
    set gui-proxy-inspection enable
end
```

Antivirus

This section includes information about antivirus techniques and configurations:

- Antivirus introduction on page 1562
- Advanced configurations on page 1585
- Configuration examples on page 1608

Antivirus introduction

FortiOS offers the unique ability to implement both flow-based and proxy-based antivirus concurrently, depending on the traffic type, users, and locations. Flow-based antivirus offers higher throughput performance.

FortiOS includes two preloaded antivirus profiles:

- *default*
- *wifi-default*

You can customize these profiles, or you can create your own to inspect certain protocols, remove viruses, analyze suspicious files with FortiSandbox, and apply botnet protection to network traffic. Once configured, you can add the antivirus profile to a firewall policy.

This functionality requires a subscription to FortiGuard Antivirus.

Protocol comparison between antivirus inspection modes

The following table indicates which protocols can be inspected by the designated antivirus scan modes.

	HTTP	FTP	IMAP	POP3	SMTP	NNTP	MAPI	CIFS	SSH
Proxy	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes*	Yes
Flow	Yes	Yes	Yes	Yes	Yes	Yes	No	Yes	No

* Proxy mode antivirus inspection on CIFS protocol has the following limitations:

- Cannot detect infections within some archive files.
- Cannot detect oversized files.

Other antivirus differences between inspection modes

Starting from 6.4.0, the scan mode option is no longer available for flow-based AV.

This means that AV no longer exclusively uses the default or legacy scan modes when handling traffic on flow-based firewall policies. Instead, AV in flow-based policies uses a hybrid of the two scan modes. Flow AV may use a pre-filtering database for malware detection in some circumstances as opposed to the full AV signature database in others. The scan method is determined by the IPS engine algorithm that is based on the type of file being scanned. When handling oversized files in flow-based AV, the action can either be pass (default) or block. When theaction is pass, IPS appends to-be-scan data into the AV scan buffer. If the appended file size exceeds the oversize-limit that is defined in the protocol option profile, then the AV session is cleared and the file is bypassed from AV scanning.

In contrast, proxy mode maintains the scan mode option, which can be toggled between default or legacy mode. In default mode, the WAD daemon receives the file and then decides if it can do an in-process scan of the file in simple AV configuration scenarios. If the file is in an oversized archive that is supported by the stream-based decompressor, then it is sent to stream-based scan for best effort inspection. Stream-based scan decompresses and scans the entire archive without archiving the file. If the file is not supported by stream-based scan, then it is buffered and then sent to the scanunit daemon for inspection on content that is under the oversize limit.

In legacy mode, stream-based scanning is disabled, so oversized archive files and files that cannot be handled by WAD in-process scan are buffered and sent to the scanunit daemon for processing.

Antivirus techniques

The security of digital systems is a top priority for organizations. A range of techniques and tools are employed to ensure the integrity and reliability of these systems.

The following table describes some of the industry standard techniques that are used for Antivirus protection, and if they can be configured in the GUI or CLI.

Technique	Description	GUI	CLI
Signature-based detection	Antivirus scan detects and compares malicious file against virus signatures database. The FortiGuard Antivirus Service uses content pattern recognition language (CPRL), which is more efficient and accurate than traditional signature-based detection methods.	✓	✓
Content Disarm and Reconstruction (CDR)	CDR sanitizes Office and PDF files by removing active content, preserving only the text. See Content disarm and reconstruction on page 1564 for more information.	✓	✓
Virus Outbreak Prevention (VOS)	VOS enhances FortiGate's antivirus database with third-party malware hashes. It checks file hashes against FortiGuard's database. See Virus outbreak prevention on page 1564 for more information.	✓	✓
External Malware Block List	Users can add their own malware signatures to an external list. See External malware block list on page 1565 for more information.	✓	✓
EMS Threat Feed	FortiGate receives malware feeds from FortiClient EMS, which itself gathers detected malware hashes from FortiClients. See EMS threat feed on page 1565 for more information.	✓	✓

Technique	Description	GUI	CLI
Behavior-based detection	Submit suspected malicious files to FortiSandbox for inspection. See Using FortiSandbox post-transfer scanning with antivirus on page 1585 and Using FortiSandbox inline scanning with antivirus on page 1587 for more information.	✓	✓
CIFS Scanning	File filtering and antivirus scanning on Common Internet File System (CIFS) traffic is supported. See CIFS support on page 1602 for more information.	✓	✓
Heuristic Analysis	Identify malicious files such as Windows Portable Executables (PEs) to combat zero-day attacks. See AI-based malware detection on page 1565 for more information.		✓
AI/ML, behavioral, and human analysis	Helps identify, classify, and respond to threats. See Using FortiNDR inline scanning with antivirus on page 1597 for more information.	✓	✓

See Configuring an antivirus profile on page 1566 and Testing an antivirus profile on page 1569 for more information.

Content disarm and reconstruction

Content disarm and reconstruction (CDR) allows the FortiGate to sanitize Microsoft Office documents and PDF files (including those that are in ZIP archives) by removing active content, such as hyperlinks, embedded media, JavaScript, macros, and so on from the files (disarm) without affecting the integrity of its textual content (reconstruction).

CDR is supported on HTTP, SMTP, POP3, and IMAP.

HTTP GET is supported, but not HTTP POST.
SMTP splice and client-comfort mode are not supported.
CDR does not support flow-based inspection modes.

It allows network administrators to protect their users from malicious document files. See Content disarm and reconstruction on page 1608 for a configuration example.

Virus outbreak prevention

FortiGuard VOS allows the FortiGate antivirus database to be supplemented with third-party malware hash signatures curated by FortiGuard. This allows VOS to manage zero-day threats effectively. The hash signatures are obtained from FortiGuard's Global Threat Intelligence database. Any signature that is added to FortiGuard becomes immediately active, eliminating the need to wait for AVDB (antivirus database) update. The AVDB queries FortiGuard with the hash of a scanned file. If FortiGuard returns a match, the scanned file is deemed to be malicious. Enabling the AV engine scan is not required to use this feature.

FortiGuard VOS can be used in both proxy-based and flow-based policy inspections across all supported protocols.

The FortiGate must be registered with a valid FortiGuard outbreak prevention license.

See FortiGuard outbreak prevention on page 1610 for a configuration example.

External malware block list

The external malware block list allows users to add their own malware signatures in the form of MD5, SHA1, and SHA256 hashes. The FortiGate's antivirus database retrieves an external malware hash list from a remote server and polls the hash list every n minutes for updates. Enabling the AV engine scan is not required to use this feature.

The external malware block list can be used in both proxy-based and flow-based policy inspections, but it is not supported in AV quick scan mode.

Note that using different types of hashes simultaneously may slow down the performance of malware scanning. It is recommended to use one type of hash.

See External malware block list on page 1612 and Malware hash threat feed on page 3409 for more details and configuration examples.

EMS threat feed

A FortiGate can pull malware threat feeds from FortiClient EMS, which in turn receives malware hashes detected by FortiClients. The malware hash can be used in an antivirus profile when AV scanning is enabled with block or monitor actions. This feature is supported in proxy and flow mode.

If an external malware blocklist and the FortiGuard outbreak prevention database are also enabled in the antivirus profile, the checking order is: AV local database, EMS threat feed, external malware blocklist, FortiGuard outbreak prevention database. If the EMS threat feed and external malware blocklist contain the same hash value, then the EMS infection will be reported if both of them are blocked.

See Malware threat feed from EMS on page 1600 for more details and configuration examples.

AI-based malware detection

The AV Engine AI malware detection model integrates into regular AV scanning to help detect potentially malicious Windows Portable Executables (PEs) in order to mitigate zero-day attacks. Previously, this type of detection was handled by heuristics that analyzed file behavior. With AV Engine AI, the module is trained by FortiGuard AV against many malware samples to identify file features that make up the malware. The AV Engine AI package can be downloaded by FortiOS via FortiGuard on devices with an active AV subscription. The machine-learning-detection setting is enabled by default at a per-VDOM level. Files detected by the AV Engine AI are identified with the W32/AI.Pallas.Suspicious virus signature.

To configure machine learning-based malware detection:

```
config antivirus settings
     set machine-learning-detection {enable| monitor | disable}
end
```

FortiGuard provides several sample files to test the AV configuration on the FortiGate, which are available to download from https://www.fortiguard.com/sample-files. Test the AI-based malware detection feature by downloading *AI Sample* file. See Example 2: AI sample file on page 1573.

Configuring an antivirus profile

In an antivirus profile, the FortiGate can be configured to apply antivirus protection to HTTP, FTP, IMAP, POP3, SMTP, CIFS, and NNTP sessions. Proxy-based profiles also support MAPI and SSH. Antivirus inspection prevents potentially unwanted and malicious files from entering the network. Antivirus profiles include multiple different functions, such as scanning files for virus signatures, scanning for advanced persistent threats, checking external malware hash lists and threat feeds, and others. Malicious files can be blocked or monitored, and can be quarantined. Some antivirus profile options require a license and/or other Fortinet products. Some antivirus profile options can only be configured in the CLI (refer to the FortiOS CLI Reference).

The feature set setting (proxy or flow) in the antivirus profile must match the inspection mode setting (proxy or flow) in the associated firewall policy. For example, a flow-based antivirus profile must be used with a flow-based firewall policy.

To configure an antivirus profile:

1. Go to *Security Profiles* > *AntiVirus* and click *Create New*.
2. Configure the following settings:

Name	Enter a unique name for the profile.
Comments	Enter a comment (optional).
AntiVirus scan	Enable one or more protocols for inspection, then enable *AntiVirus scan* for the selected protocols with a specified action. • *Block*: block the malicious traffic. • *Monitor*: log malicious traffic and allow it to pass inspection.

Feature set	Select the feature set for the profile. The feature set mode must match the inspection mode used in the associated firewall policy.
	• *Flow-based*
	• *Proxy-based*
	Additional options are available in proxy-based mode and are identified in the GUI with a *P* icon. See Inspection mode feature comparison on page 1558 for more details.
	If the *Feature set* option is not visible, enter the following in the CLI:
	`config system settings`
	`  set gui-proxy-inspection enable`
	`end`

Inspected Protocols	Enable to inspect the protocol for session inspection: HTTP, SMTP, POP3, IMAP, FTP, and CIFS. Disabled protocols are not inspected. MAPI and SSH can be inspected in proxy-based mode.
APT Protection Options	This section includes options available with FortiGuard to mitigate advanced persistent threats (APT) in file-based attacks.
Content Disarm and Reconstruction	This option is available in proxy-based mode when at least one protocol is enabled for inspection and *AntiVirus scan* is enabled.

	See Content disarm and reconstruction on page 1564 for more details.
Allow transmission when an error occurs	Enable to allow traffic to pass when an inspection error occurs. Disable to block traffic when an inspection error occurs.
Original File Destination	Specify how to quarantine files processed by content disarm and reconstruction. • *FortiSandbox*: quarantine files on FortiSandbox. The FortiSandbox must be enabled. See Using FortiSandbox post-transfer scanning with antivirus on page 1585 for more details. • *File Quarantine*: quarantine files on FortiGate models with a hard disk. • *Discard*: discard suspicious files.
Treat Windows executables in email attachments as viruses	Enable to deem all Windows executable files located in email traffic as viruses.
Send Files to FortiSandbox for Inspection	Enable to send files to FortiSandbox for inspection. The FortiSandbox must be enabled.
Scan strategy	FortiSandbox scans files inline for flow-based mode (*Inline*) and after the file transfer is complete for proxy-based mode (*Post Transfer*). See Using FortiSandbox inline scanning with antivirus on page 1587 and Using FortiSandbox post-transfer scanning with antivirus on page 1585 for more details.
File types	Specify which files to FortiSandbox for inspection. • *Suspicious Files Only*: only send suspicious files to FortiSandbox for inspection. • *All Supported Files*: send all supported files to FortiSandbox for inspection.
Do not submit files matching types	Click the + to exclude certain file types from being sent to FortiSandbox.
Do not submit files matching file name patterns	Click the + to enter a wildcard pattern to exclude files from being sent to FortiSandbox.
Use FortiSandbox database	Enable to use the signature database from FortiSandbox. The FortiSandbox must be enabled.
Send files to FortiNDR for inspection	This option is available in proxy-based mode when at least one protocol is enabled for inspection, *AntiVirus scan* is enabled, and FortiNDR is enabled. See Using FortiNDR inline scanning with antivirus on page 1597 for more details.
Include mobile malware protection	Enable to use the mobile malware protection database from FortiGuard for content scanning.
Quarantine	This option is available when at least one protocol is enabled for inspection and *AntiVirus scan* is enabled. Enable to quarantine infected files.

	See also Downloading quarantined files in archive format on page 1616.
Virus Outbreak Prevention	This section includes options available with the FortiGuard Virus Outbreak Protection Service (VOS). See Virus outbreak prevention on page 1564 and FortiGuard outbreak prevention on page 1610 for more details.
Use FortiGuard outbreak prevention database	Enable to use the outbreak prevention database that is available with Advanced Malware Protection on FortiGuard. A license is required. • *Block*: block the malicious traffic. • *Monitor*: log malicious traffic and allow it to pass inspection.
Use external malware block list	Enable to use one or more external blocklist file hashes. • *Block*: block the malicious traffic. • *Monitor*: log malicious traffic and allow it to pass inspection. • *All*: use all malware block lists. • *Specify*: select specific malware block lists. See External malware block list on page 1565 and Malware hash threat feed on page 3409 for more details.
Use EMS threat feed	This option is available when at least one protocol is enabled for inspection and *AntiVirus scan* is enabled. Enable to use malware threat feeds from FortiClient EMS. A FortiClient EMS Fabric connector with EMS threat feed enabled is required. See EMS threat feed on page 1565 for more details.

3. Click *OK*.

Protocol options

When applying an antivirus profile to a firewall policy, the protocol options profile defines parameters for handling protocol-specific traffic. These parameters affect functions such as the port mapping for inspecting each protocol, whether to log or block oversized files when performing AV scanning, enabling comfort client, and more. Protocol options profiles are configured by going to *Policy & Objects* > *Protocol Options*, or in the CLI under `config firewall profile-protocol-options`. See Protocol options on page 1464 for more information.

Scan mode

In proxy-based antivirus profiles, the scan mode can be set to either default or legacy. This setting can only be configured in the CLI. See Proxy mode stream-based scanning on page 1579 for more information.

To configure the scan mode:

```
config antivirus profile
    edit <name>
        set feature-set proxy
        set scan-mode {default | legacy}
    next
end
```

Testing an antivirus profile

Antivirus (AV) profiles can be tested using various file samples to confirm whether AV is correctly configured. In this topic, an AV profile is configured, applied to a firewall policy, and a user attempts to download sample virus test files hosted on eicar.org and fortiguard.com.

Different sample files are used to verify different features on the AV profile. The expectation is these files must be blocked by the AV profile, and the user should be presented with a block page.

File	Test case
EICAR test file	A plain text EICAR test file (hosted on eicar.org over a HTTPS connection) to test basic AV scanning on the FortiGate using deep inspection.
AI sample file	A machine learning sample file to test AI-based malware detection on the FortiGate.
Virus outbreak (VO) sample file	A zero-day sample virus file to test the outbreak prevention feature of the AV profile.
Behavioral-based samples	Files that are detected by a sandbox. This requires FortiSandbox integration with the FortiGate.

For the following AV test cases, the test PC has an IP of 192.168.1.110/24 and is connected to the internal1 interface. It accesses the internet through the wan1 interface.

Configuring the AV profile

The *default* AV profile is used, and the *Use FortiGuard outbreak prevention database* setting is enabled with the action set to block.

To configure the AV profile:

1. Go to *Security Profiles* > *AntiVirus* and edit the *default* profile.
2. In the *Virus Outbreak Prevention* section, enable *Use FortiGuard outbreak prevention database* and select *Block*. See FortiGuard outbreak prevention on page 1610 for more information about this setting.
3. Configure the other settings as needed (see Configuring an antivirus profile on page 1566).
4. Click *OK*.

By default, the FortiOS AV Engine has AI-based malware detection enabled (`set machine-learning-detection enable`) . The AV Engine AI malware detection model integrates into regular AV scanning to help detect potentially malicious Windows Portable Executables (PEs) in order to mitigate zero-day attacks. See AI-based malware detection on page 1565 for more information.

To verify the status of the AV Engine AI contract:

```
# diagnose autoupdate versions | grep AI -A6
AI/Machine Learning Malware Detection Model
```

```
---------
Version: 2.12588 signed
Contract Expiry Date: Tue Jul  9 2024
Last Updated using scheduled update on Tue Sep  5 08:23:15 2023
Last Update Attempt: Tue Sep  5 09:23:00 2023
Result: No Updates
```

Configuring the SSL SSH profile and firewall policy

The PC will be accessing and downloading the test files using HTTPS from the EICAR and the FortiGuard websites. Since HTTPS traffic is encrypted traffic, in order for the FortiGate to scan the encrypted traffic and inspect it for viruses and malware, it should act as the machine-in-the-middle to decrypt this communication and then re-encrypt it to send it to the website. Deep inspection must be enabled in the SSL SSH profile that will be applied to the firewall policy (see Deep inspection on page 1899). The *custom-deep-inspection* profile is modified to remove the *fortinet* FQDN address from the exemption list.

To configure the SSL SSH profile:

1. Go to *Security Profiles* > *SSL/SSH Inspection* and edit the *custom-deep-inspection* profile.
2. In the *Exempt from SSL Inspection* section, locate the *fortinet* FQDN entry in the *Addresses* field, and click the *X* to delete it.
3. Click *OK*.

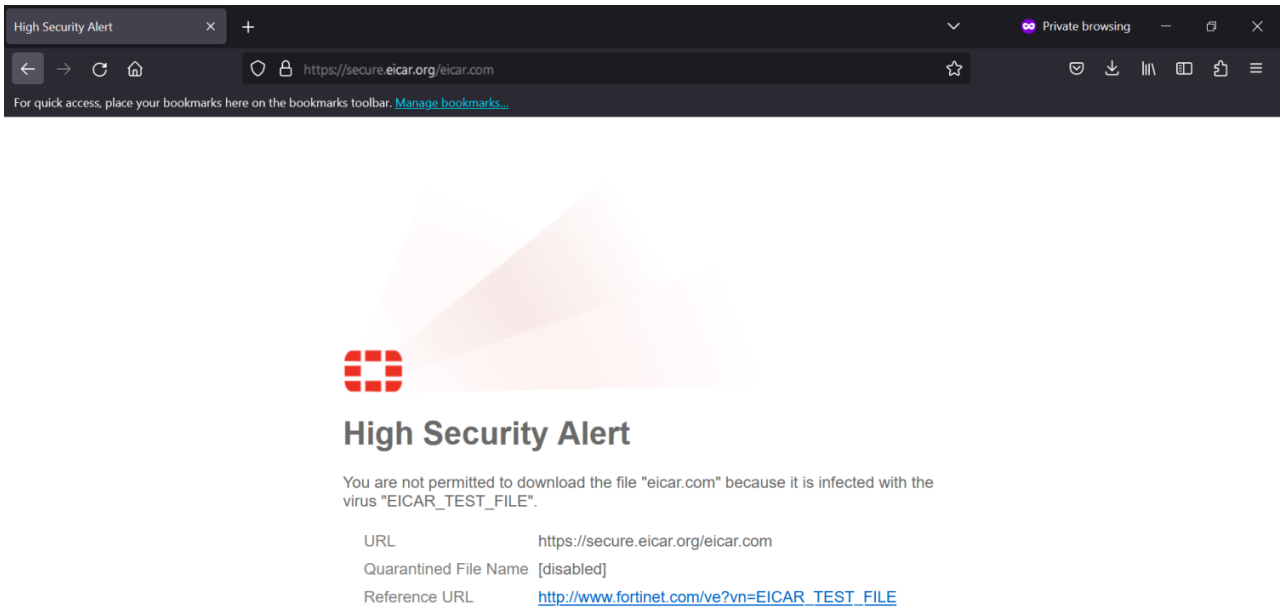
To configure the firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the following settings:

Name	*To Internet*
Incoming Interface	*internal1*
Outgoing Interface	*wan1*
AntiVirus	Enable and select *default*.
SSL Inspection	Select *custom-deep-inspection*.

3. Configure the other settings as needed (see Firewall policy on page 1296).

The feature set setting (proxy or flow) in the antivirus profile must match the inspection mode setting (proxy or flow) in the associated firewall policy. For example, a flow-based antivirus profile must be used with a flow-based firewall policy.



4. Click *OK*.

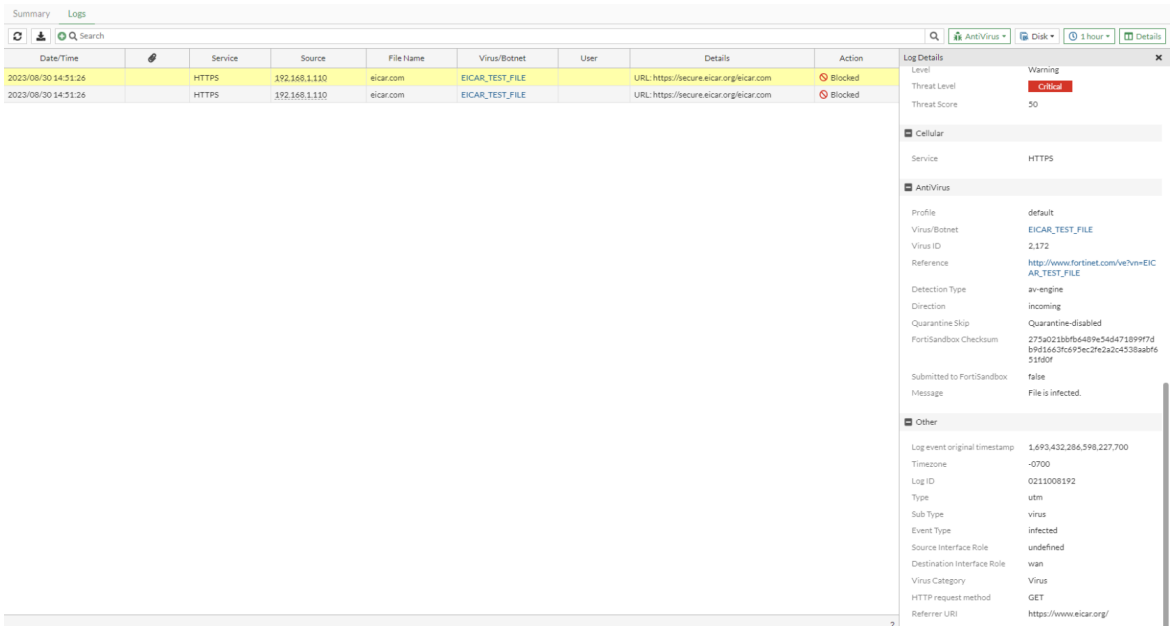
Example 1: EICAR test file

EICAR hosts anti-malware test files, which are available to download from https://www.eicar.org/download-anti-malware-testfile.

To test the AV profile with the EICAR test file:

1. On the PC, go to the EICAR website and download the *eicar.com* file.
2. The download attempt is blocked by the FortiGate's *default* AV profile, and a block page appears in the PC's browser.

3. Check the antivirus statistics on the FortiGate, `HTTP virus detected` increases by one:



```
# diagnose ips av stats show
 AV stats:
 HTTP virus detected: 1
 HTTP virus blocked: 0
 SMTP virus detected: 0
 SMTP virus blocked: 0
 POP3 virus detected: 0
 POP3 virus blocked: 0
 IMAP virus detected: 0
 IMAP virus blocked: 0
 NNTP virus detected: 0
 NNTP virus blocked: 0
 FTP virus detected: 0
 FTP virus blocked: 0
 SMB virus detected: 0
 SMB virus blocked: 0
```

4. Check the antivirus statistics using an SNMP walk:

```
root:~# snmpwalk -c public -v 1 10.1.100.6 1.3.6.1.4.1.12356.101.8.2.1.1
 iso.3.6.1.4.1.12356.101.8.2.1.1.1 = Counter32: 2  (fgAvVirusDetected)
 iso.3.6.1.4.1.12356.101.8.2.1.2.1 = Counter32: 1  (fgAvVirusBlocked)
 iso.3.6.1.4.1.12356.101.8.2.1.3.1 = Counter32: 1  (fgAvHTTPVirusDetected)
 iso.3.6.1.4.1.12356.101.8.2.1.4.1 = Counter32: 0
 iso.3.6.1.4.1.12356.101.8.2.1.5.1 = Counter32: 0
 iso.3.6.1.4.1.12356.101.8.2.1.6.1 = Counter32: 0
 iso.3.6.1.4.1.12356.101.8.2.1.7.1 = Counter32: 0
```

```
iso.3.6.1.4.1.12356.101.8.2.1.1.8.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.9.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.10.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.11.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.12.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.13.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.14.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.15.1 = Counter32: 0

```

5. Verify the AV log.
   a. In the GUI, go to *Log & Report* > *Security Events* and select the *AntiVirus* card. Select the log entry and click *Details*.

   b. In the CLI, enter the following:

```
# execute log filter category 2
# execute log display
date=2023-08-30 time=14:51:26 eventtime=1693432286598227820 tz="-0700"
logid="0211008192" type="utm" subtype="virus" eventtype="infected" level="warning"
vd="root" policyid=1 poluuid="c65fa590-4758-51ee-4d28-f2cc75f14979"
policytype="policy" msg="File is infected." action="blocked" service="HTTPS"
sessionid=15797 srcip=192.168.1.110 dstip=89.238.73.97 srcport=64641 dstport=443
srccountry="Reserved" dstcountry="Germany" srcintf="internal1"
srcintfrole="undefined" dstintf="wan1" dstintfrole="wan" srcuuid="ab8d1c24-30b1-51ee-

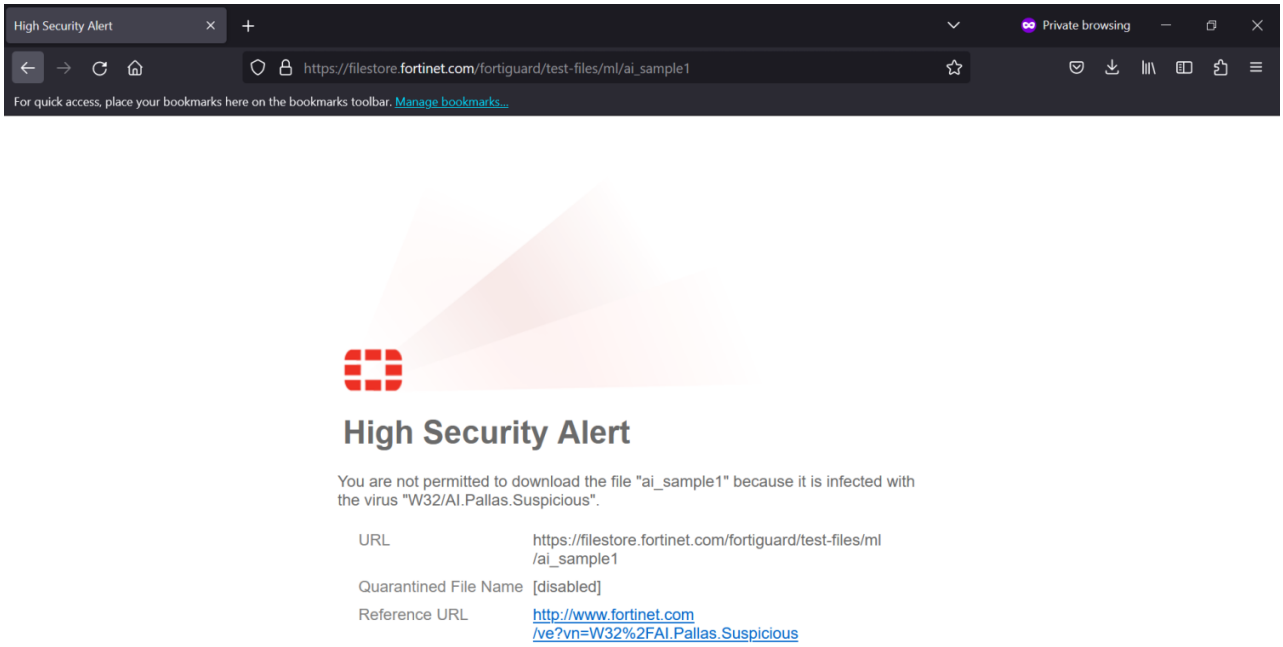
analyticssubmit="false" crscore=50 craction=2 crlevel="critical"
```

6. Optionally, reset the antivirus statistics to zero:

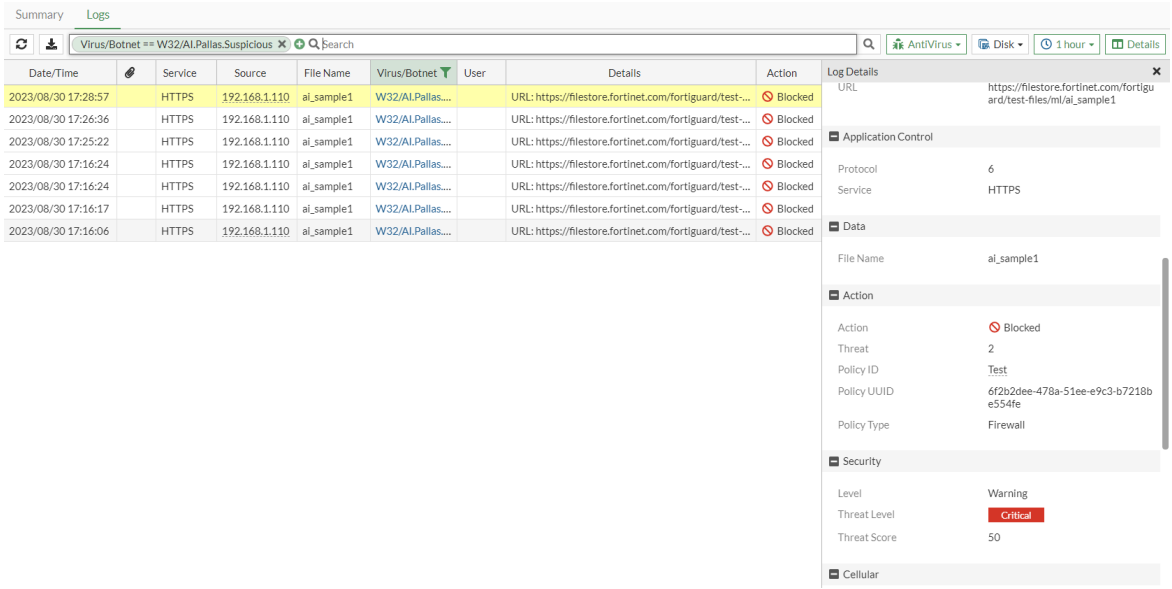
```
# diagnose ips av stats clear
```



See CLI troubleshooting cheat sheet for log gathering, analysis, and troubleshooting.

Example 2: AI sample file

FortiGuard provides several sample files to test the AV configuration on the FortiGate, which are available to download from https://www.fortiguard.com/sample-files.



To test the AV profile with the AI sample file:

1. On the PC, go to the FortiGuard website and download the *AI Sample* file.
2. The download attempt is blocked by the FortiGate's *default* AV profile, and a block page appears in the PC's browser.

   The file is blocked due to AI-based malware detection and will be logged. Files detected by the AV Engine AI are identified with the W32/AI.Pallas.Suspicious virus signature in the AV logs.

3. Verify the AV log.
   a. In the GUI, go to *Log & Report* > *Security Events* and select the *AntiVirus* card. Select the log entry and click *Details*.

b. In the CLI, enter the following:

```
# execute log filter category 2
# execute log display
date=2023-08-30 time=17:28:57 eventtime=1693441737721077640 tz="-0700"
logid="0211008192" type="utm" subtype="virus" eventtype="infected" level="warning"
vd="root" policyid=1 poluuid="c65fa590-4758-51ee-4d28-f2cc75f14979"
policytype="policy" msg="File is infected." action="blocked" service="HTTPS"
sessionid=1179 srcip=192.168.1.110 dstip=209.52.38.129 srcport=63117 dstport=443
srccountry="Reserved" dstcountry="Canada" srcintf="internal1" srcintfrole="undefined"
dstintf="wan1" dstintfrole="wan" srcuuid="6c43f8d6-478a-51ee-95d8-31177232e869"
dstuuid="6c43f8d6-478a-51ee-95d8-31177232e869" proto=6 direction="incoming"
filename="ai_sample1" quarskip="Quarantine-disabled" virus="W32/AI.Pallas.Suspicious"
viruscat="Virus" dtype="av-engine"
ref="http://www.fortinet.com/ve?vn=W32%2FAI.Pallas.Suspicious" virusid=8187637
url="https://filestore.fortinet.com/fortiguard/test-files/ml/ai_sample1"
profile="default" agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64; rv:109.0)

```

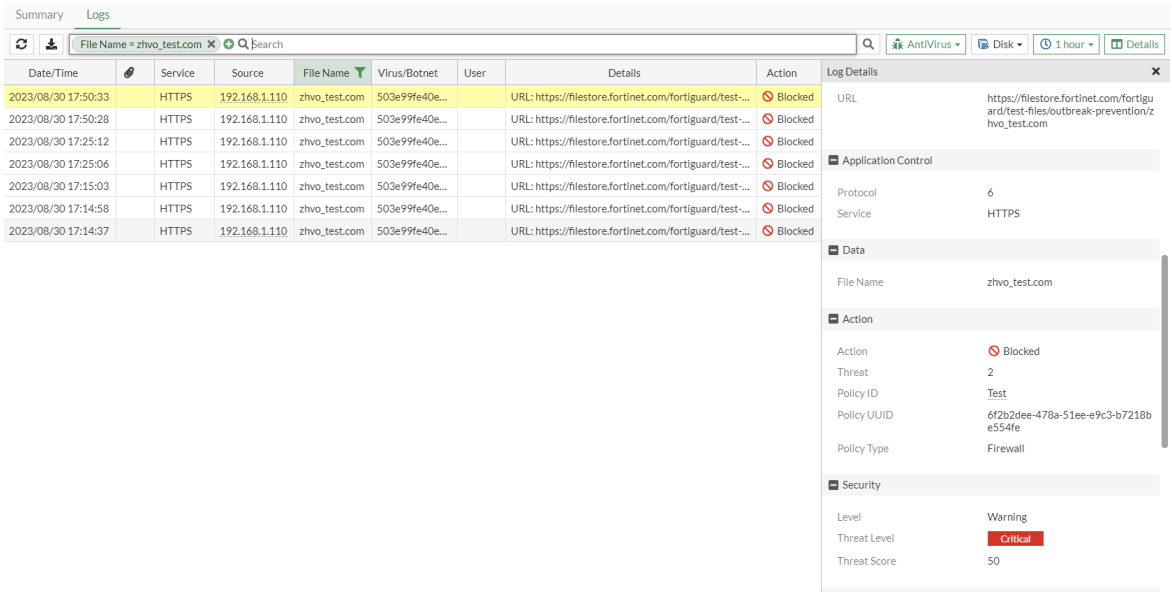
Example 3: VO sample file

To test the AV profile with the VO sample file:



1. On the PC, go to the FortiGuard website and download the *VO Sample* file.
2. The download attempt is blocked by the FortiGate's *default* AV profile, and a block page appears in the PC's browser.

The file is blocked due to the virus outbreak protection service and database that is enabled in the *default* AV profile.

3. Verify the AV log.
   a. In the GUI, go to *Log & Report* > *Security Events* and select the *AntiVirus* card. Select the log entry and click *Details*.

b. In the CLI, enter the following:

```
# execute log filter category 2
# execute log display
date=2023-08-30 time=17:50:33 eventtime=1693443033509250120 tz="-0700"

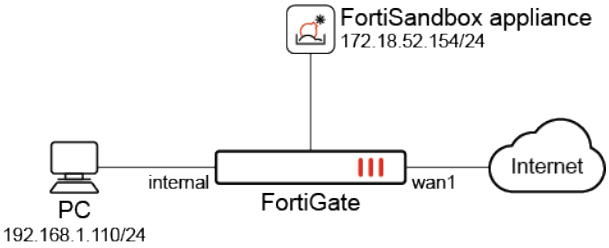
craction=2 crlevel="critical"
```

Example 4: behavioral-based samples detected by a sandbox



The FortiGate can be integrated with FortiSandbox appliance (used in this example), FortiSandbox Cloud, or FortiGate Cloud Sandbox. See Configuring sandboxing on page 3098 for more information about configuring the different FortiSandbox sandbox solutions.

There are two types of scan strategies that can be used in an AV profile.

- Inline: files are sent to the FortiSandbox, and the FortiGate waits for a verdict before completing the file transfer to the client (see Using FortiSandbox inline scanning with antivirus on page 1587).
- Post-transfer: files are sent to the FortiSandbox, but the FortiGate does not wait for a verdict and completes the file transfer to the client (see Using FortiSandbox post-transfer scanning with antivirus on page 1585).

- After the FortiSandbox scans and presents a verdict, it updates its malware signature database and the FortiGate retrieves the malware signature database from FortiSandbox if the FortiSandbox database on page 1584 is enabled.
- If a user attempts to download the file again, the FortiGate will either block or allow the download depending on the FortiSandbox verdict.

This example uses the inline AV scan strategy with a Windows executable sample file, and assumes that the scan profile has already been configured in FortiSandbox. See Verify the FortiSandbox Analysis in the FortiSandbox Administration Guide for more information.

To test the AV profile with a Windows executable sample file:

1. Integrate the FortiGate with the FortiSandbox appliance using the Security Fabric (see Configuring sandboxing on page 3098).
2. Update the AV profile to use inline scanning (see FortiSandbox appliance inline scanning).
3. On the PC, go to the FortiGuard website, hover over the *Windows Executable* link, right-click, and select the browser's option to copy the link.
4. Open another browser tab, paste the URL, and append the URL with `&s=<string>`, such as `https://filegen.fortinet.com/v1/sandbox-file?file_name=windows.exe&s=ftnt`.

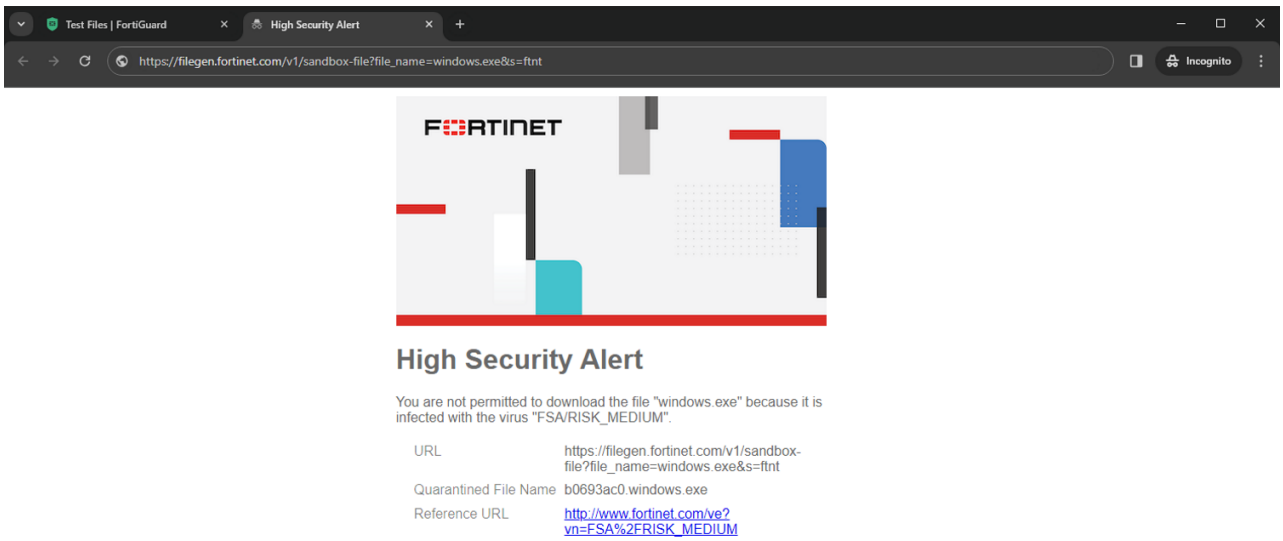
   Every file download attempt from the FortiGuard website downloads a new file. Downloading a file with same `<string>` ensures that the downloaded file is the same, and not a new file. A file named windows.exe starts to download.

   Since inline AV scanning is in use, the client's file is held while it is sent to FortiSandbox for inspection. During this time, the FortiGate may apply client comforting (see Protocol options on page 1464) by leaking a certain amount of bytes at a certain time interval to the client.

   Once a verdict is returned from FortiSandbox, the appropriate action (allow or block) is performed on the held file. If there is an error connecting to the FortiSandbox or a timeout on the FortiSandbox scanning the file within the default 50 seconds, the file can be passed, logged, or blocked based on FortiGate's configuration. In this example, the action is set to the default (`log-only`), which allows the file to be downloaded if FortiSandbox takes more than 50 seconds to present a verdict.

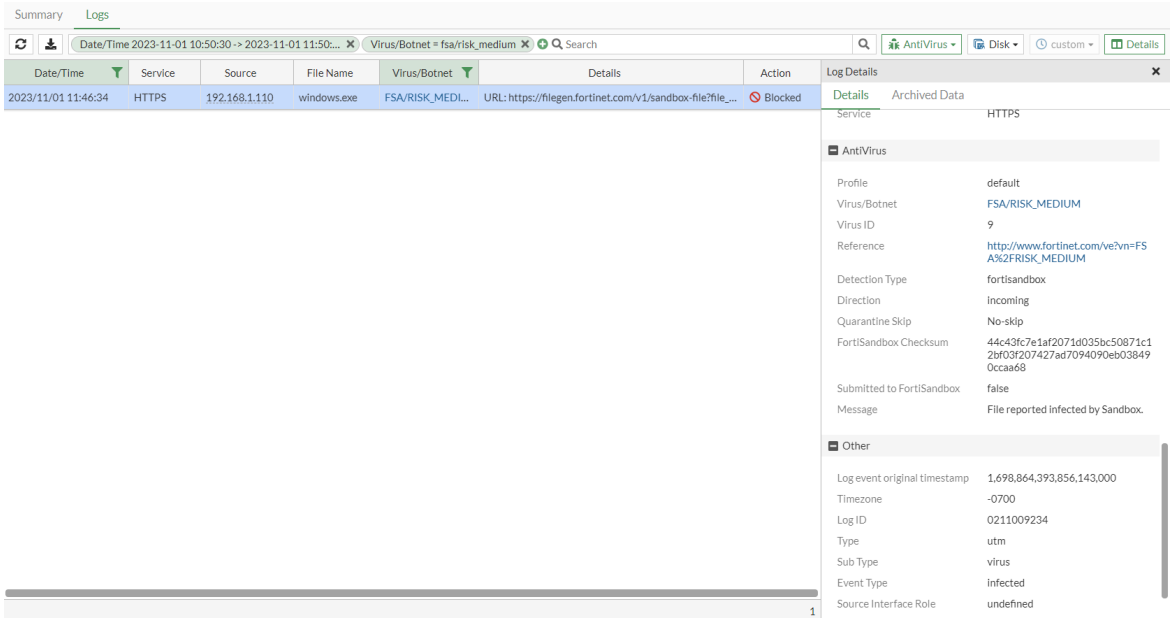
   In the first attempt, the windows.exe file is downloaded on the client's PC if FortiSandbox takes more than 50 seconds for scanning the file, after which the FortiGate encounters a scan timeout.

   a. To change the FortiSandbox error and timeout settings in the AV profile, enter the following in the CLI:



```
config antivirus profile
   edit <name>
       set fortisandbox-error-action {ignore | log-only | block}
       set fortisandbox-timeout-action {ignore | log-only | block}
   next
end
```

`fortisandbox-error-action {ignore | log-only | block}`	Set the action to take if FortiSandbox inline scanning encounters an error reaching the FortiSandbox: • `ignore`: take no action • `log-only`: log the FortiSandbox inline scan error, but allow the file (default) • `block`: block the file upon FortiSandbox inline scan error
`fortisandbox-timeout-action {ignore | log-only | block}`	Set the action to take if FortiSandbox inline scanning encounters a scan timeout: • `ignore`: take no action • `log-only`: log the FortiSandbox inline scan timeout, but allow the file (default) • `block`: block the file upon FortiSandbox inline scan timeout



5. Verify the AV log:

```
# execute log filter category 2
# execute log display
date=2023-11-01 time=11:30:45 eventtime=1698863444363194189 tz="-0700"
logid="0209008225" type="utm" subtype="virus" eventtype="inline-block" level="notice"
vd="root" policyid=1 poluuid="6f2b2dee-478a-51ee-e9c3-b7218be554fe" policytype="policy"
msg="Inline Block scan timeout." action="monitored" service="HTTPS" sessionid=946497
srcip=192.168.1.110 dstip=149.5.234.147 srcport=57497 dstport=443 srccountry="Reserved"
dstcountry="France" srcintf="internal1" srcintfrole="undefined" dstintf="wan1"
dstintfrole="wan" srcuuid="a051eeb2-5284-51ee-99d0-d8b19cb7439d" dstuuid="6c43f8d6-478a-
51ee-95d8-31177232e869" proto=6 direction="incoming" filename="windows.exe"
quarskip="No-quarantine-for-inline-block-error"
url="https://filegen.fortinet.com/v1/sandbox-file?file_name=windows.exe&s=ftnt
profile="default" agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36
(KHTML, like Gecko) Chrome/118.0.0.0 Safari/537.36" httpmethod="GET"
analyticssubmit="false" icbaction="timeout" crscore=50 craction=2 crlevel="critical"
```

6. After FortiSandbox finishes scanning the file (typically between one to three minutes), attempt to re-download the file using the same URL and separator (`https://filegen.fortinet.com/v1/sandbox-file?file_name=windows.exe&s=ftnt`).
7. The file is now blocked by the FortiGate, and a *High Security Alert* block page appears in the PC's browser.

8. Verify the AV log again.
   a. In the GUI, go to *Log & Report* > *Security Events* and select the *AntiVirus* card. Select the log entry and click *Details*.

   b. In the CLI, enter the following:

```
# execute log filter category 2
# execute log display
date=2023-11-01 time=11:46:34 eventtime=1698864393856143209 tz="-0700"

analyticssubmit="false" crscore=10 craction=2 crlevel="medium"
```

Proxy mode stream-based scanning

In proxy mode, AV scanning is processed as follows:

Can the file be scanned by in-process scan?

- This is determined by the WAD daemon.
- In-process scan can be used for simple AV configurations to quickly scan a file without handing it off to another process.
- The following, more complex feature sets cannot be processed by in-process scan:
  - AV engine AI scan
  - DLP
  - Quarantine
  - FortiGuard outbreak prevention, external block list, and EMS threat feed
  - Content disarm

Scan mode?

- To configure the scan mode:

```
config antivirus profile
    edit <name>
        set feature-set proxy
        set scan-mode {default | legacy}
    next
end
```

default	Enable stream-based scanning (default).
legacy	Disable stream-based scanning.

Is AV engine AI scan enabled?

- When enabled, supported files (such as EXE, PDF, and MS Office) are forwarded to the scanunit scan.
- AV engine AI scan is enabled by default. To disable it:

```
config antivirus settings
    set machine-learning-detection disable
end
```

Is the file supported by stream-based scan?

- Stream-based scan supports the following archive file types: ZIP, GZIP, BZIP2, TAR, and ISO (ISO 9660).
- In FortiOS 7.0, stream-based scan is supported in HTTP(S), FTP(S), and SCP/SFTP.
- In FortiOS 6.4 and 6.2, stream-based scan is only supported in HTTP(S).
- Stream-based scan does not support HTTP POST.
- Stream-based scan is not supported when the following features are enabled:
  - DLP
  - Quarantine
  - FortiGuard outbreak prevention, external block list, and EMS threat feed
  - Content Disarm
- If a file is not supported, it is buffered and sent to scanunit for scanning.

Is the file an oversized archive file?

- An oversized archive file is a compressed file that is oversized according to the following setting:

```
config firewall profile-protocol-options
    edit <profile>
        config <protocol>
            set oversize-limit <size>
        end
    next
end
```

- If the file is not oversized, it is buffered and sent to scanunit for scanning.

Notes

Stream-based scans:

- Are performed with no oversize limits on a best effort basis.
- Can inspect the contents of large archive files without buffering the entire file.
- Decompress and scan the entire archive.
- Can cache infected scan results and clean the scan results (this is enabled by default):

```
config antivirus settings
    set cache-infection-result enable
    set cache-clean-result enable
end
```

Legacy scan mode:

- Used to disable stream-based scanning for troubleshooting purposes.
- Limited by the oversize and uncompressed-oversize limits:

```
config firewall profile-protocol-options
    edit <profile>
        config <protocol>
            set oversize-limit <size>
            set uncompressed-oversize-limit <size>
        end
    next
end
```

TCP windows

Some file transfer applications can negotiate large TCP windows. For example, WinSCP can negotiate an initial TCP window size of about 2 GB.

The TCP window options can be used to prevent overly large initial TCP window sizes, helping avoid channel flow control issues. It allows stream-based scan's flow control to limit peers from sending data that exceeds a policy's configured oversize limit.

To configure TCP window size options:

```
config firewall profile-protocol-options
    edit <string>
        config {http | ftp | ssh | cifs}
            set stream-based-uncompressed-limit <integer>
            set tcp-window-type {auto-tuning | system | static | dynamic}
            set tcp-window-size <integer>
            set tcp-window-minimum <integer>
            set tcp-window-maximum <integer>
        end
    next
end
```

`{http | ftp | ssh | cifs}`	• `http`: Configure HTTP protocol options. • `ftp`: Configure FTP protocol options. • `ssh`: Configure SFTP and SCP protocol options.

	• `cifs`: Configure CIFS protocol options.
`stream-based-uncompressed-limit <integer>`	The maximum stream-based uncompressed data size that will be scanned, in MB (default = 0 (unlimited)). Stream-based uncompression used only under certain conditions.).
`tcp-window-type {auto-tuning | system | static | dynamic}`	The TCP window type to use for this protocol. • `auto-tuning`: Allow the system to auto-tune TCP window size (default). • `system`: Use the system default TCP window size for this protocol. • `static`: Manually specify the TCP window size. • `dynamic`: Vary the TCP window size based on available memory within the limits configured in `tcp-window-minimum` and `tcp-window-maximum`.
`tcp-window-size <integer>`	The TCP static window size (65536 - 33554432, default = 262144). This option is only available when `tcp-window-type` is `static`.
`tcp-window-minimum <integer>`	The minimum TCP dynamic window size (65536 - 1048576, default = 131072). This option is only available when `tcp-window-type` is `dynamic`.
`tcp-window-maximum <integer>`	The maximum TCP dynamic window size (1048576 - 33554432, default = 8388608). This option is only available when `tcp-window-type` is `dynamic`.

Databases

The antivirus scanning engine uses a virus signatures database to record the unique attributes of each infection. The antivirus scan searches for these signatures and when one is discovered, the FortiGate determines if the file is infected and takes action.

All FortiGates have the normal antivirus signature database. Some models have additional databases that you can use. The database you use depends on your network and security needs, and on your FortiGate model.

The extended virus definitions database is the default setting and provides comprehensive antivirus protection. Entry-level and some mid-range FortiGates cannot support the extreme database. The FortiGate 300D is the lowest model that supports the extreme database. All VMs support the extreme database. The `use-extreme-db` setting is only available on models that support the extreme database.

Extended	This is the default setting. This database includes currently spreading viruses, as determined by the FortiGuard Global Security Research Team, plus recent viruses that are no longer active. These viruses may have been spreading within the last year but have since nearly or completely disappeared.
Extreme	This includes the extended database, plus a large collection of zoo viruses. These are viruses that have not spread in a long time and are largely dormant. Some zoo viruses might rely on operating systems and hardware that are no longer widely used.

To change the antivirus database:

```
config antivirus settings
    set use-extreme-db {enable | disable}
```

```
end
```

FortiSandbox database

The *Use FortiSandbox database* setting in the Antivirus profile enables the FortiGate's antivirus engine to receive the latest malware signatures discovered by FortiSandbox that is stored inside FortiSandbox's malware database. By enabling *Use FortiSandbox database*, FortiGate uses these signatures from the malware database along with its existing antivirus signature database for scanning.The antivirus engine scan searches for the malware signature database and antivirus signature database in tandem to check for a match. Once a signature match is discovered, the FortiGate determines if the file is infected and takes action.

The malware signature database supplements the existing antivirus signature database on the FortiGate. This setting is useful if a FortiSandbox solution (either FortiGate Sandbox Cloud, FortiSandbox Cloud, or the FortiSandbox appliance) is deployed.

If you have multiple FortiGates deployed and FortiSandbox is in use, if *Use FortiSandbox database* is enabled in the Antivirus profile, it will enable all FortiGates to download the malware signature database from your FortiSandbox. This can prevent zero-day attacks discovered by the FortiSandbox. FortiSandbox can also be configured to submit its malware signature database with Fortinet Inc. Community by enabling the required *Contribute* settings under your scan profile. See Scan Profile Advanced Tab in the FortiSandbox Administration Guide for information on the scan profile.

FortiGuard labs later release the required submitted signatures in the form of Antivirus updates which can be downloaded by the FortiGates worldwide through FortiGuard updates. See Configuring FortiGuard updates on page 2953.

To enable using the FortiSandbox database in an antivirus profile in the GUI:

1. Go to *Security Profile* > *AntiVirus*.
2. Select the default profile and click *Edit*.
3. Under the *APT Protection Options*, enable *Use FortiSandbox database*.
4. Click *OK* to save the changes.
5. Apply this default profile to the respective firewall policy.

To enable using the FortiSandbox database in an antivirus profile in the CLI:

```
config antivirus profile
    edit "default"
        set analytics-db enable
    next
end
```

It is best practice to keep the `analytics-db` enabled.

To use the antivirus profile in a firewall policy:

```
config firewall policy
    edit 1
        set name "policyid-1"
        set srcintf "lan"
```

```
        set dstintf "wan"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set ssl-ssh-profile "certificate-inspection"
        set av-profile "default"
        set nat enable
    next
end
```

Once the Antivirus profile is configured to use the FortiSandbox database and submit files to FortiSandbox, and the antivirus profile is used in a firewall policy, the sharing of malware database from the FortiSandbox to the FortiGate needs to be configured. For information on submitting files to FortiSandbox, see Using FortiSandbox post-transfer scanning with antivirus on page 1585.

The configuration depends on the type of FortiSandbox in use. The table below shows key differences in configuration:

Type of FortiSandbox	Malware database sharing with the FortiGate
FortiSandbox Appliance/FortiSandbox VM (On-Premise)	Enabled using the Global network. See Global Network in the FortiSandbox Administration Guide.
FortiSandbox Cloud (PaaS)	Enabled by default.
FortiGate Cloud Sandbox (SaaS)	Enabled by default.

Advanced configurations

This section includes the following:

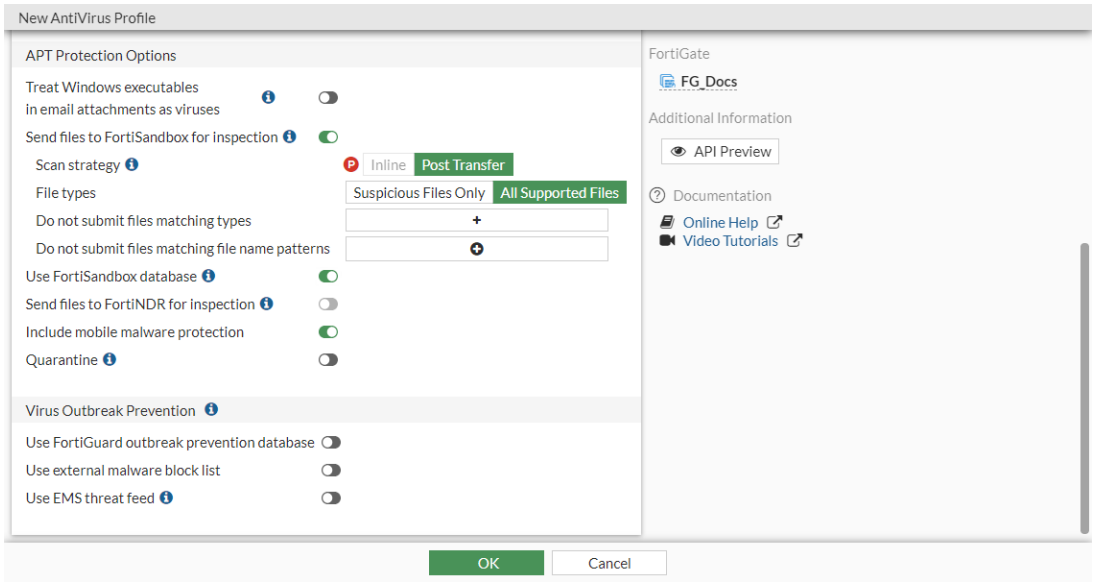
- Using FortiSandbox post-transfer scanning with antivirus on page 1585
- Using FortiSandbox inline scanning with antivirus on page 1587
- Using FortiNDR inline scanning with antivirus on page 1597
- Malware threat feed from EMS on page 1600
- CIFS support on page 1602

Using FortiSandbox post-transfer scanning with antivirus

Antivirus profiles can submit potential zero-day viruses to FortiSandbox for inspection. Based on FortiSandbox's analysis, the FortiGate can supplement its own antivirus database with FortiSandbox's threat intelligence to detect files determined as malicious or suspicious. This augments the FortiGate antivirus with zero-day detection.

FortiSandbox can be used with antivirus in both proxy-based and flow-based inspection modes. The FortiGate first examines the file for any known viruses. When a match is found, the file is tagged as known malware. If no match is found, the files are forwarded to FortiSandbox using the following options:

- *All Supported Files*: all files matching the file types defined in the scan profile of the FortiSandbox are forwarded.
- *Suspicious Files Only*: files classified by the antivirus as having any possibility of active content are forwarded to FortiSandbox. When using FortiGate Cloud Sandbox, we recommend selecting this option due to its submission



limits.

- *None*: files are not forwarded to FortiSandbox.

For more information, see Configuring sandboxing on page 3098.

To enable FortiSandbox inspection in an antivirus profile:

1. Go to *Security Profiles* > *AntiVirus*.
2. Create, edit, or clone an antivirus profile.
3. In the *APT Protection Options* section, set *Send Files to FortiSandbox for Inspection* to either *Suspicious Files Only* or *All Supported Files*.
4. Optionally, for *Do not submit files matching types*, click the + to exclude certain file types from being sent to FortiSandbox.
5. Optionally, for *Do not submit files matching file name patterns*, click the + to enter a wildcard pattern to exclude files from being sent to FortiSandbox.

6. Enable *Use FortiSandbox Database*.
7. Click *OK*.

FortiGate diagnostics

To view the detection count:

```
# diagnose test application quarantined 7
Total: 0

Statistics:
        vfid: 0, detected: 2, clean: 1252, risk_low: 6, risk_med: 2, risk_high: 1, limit_
reached:0
```

To verify the address is configured correctly:

```
# diagnose test application quarantined 1
…
```

```
fortisandbox-fsb1 is enabled: analytics, realtime=yes, taskfull=no
addr=172.18.52.154/514, source-ip=0.0.0.0, keep-alive=no. ssl_opt=3, hmac_alg=0
…
```

To run the diagnostics for real-time debugging:

```
# diagnose debug application quarantined -1
# diagnose debug enable
```

To check the FortiGate Cloud server status:

```
# diagnose test application forticldd 3
…
    Active APTServer status:  up
```

To view FortiGate Cloud Sandbox submission statistics for advanced debugging:

```
# diagnose test application quarantined 2
```

FortiSandbox diagnostics

To run the OFTP debug for advanced debugging:

```
# diagnose-debug device <client serial number>
```

Using FortiSandbox inline scanning with antivirus

FortiSandbox inline scanning can be used in proxy inspection mode. When inline scanning is enabled, the client's file is held while it is sent to FortiSandbox for inspection. During this time, the FortiGate may apply client comforting (see Protocol options on page 1464). For example, leaking a certain amount of bytes at a certain time interval to the client. Once a verdict is returned, the appropriate action (allow or block) is performed on the held file. If there is an error connecting to the FortiSandbox or a timeout on the FortiSandbox scanning the file within the default 50 seconds, the file can be passed, logged, or blocked based on FortiGate's configuration. For more information, see Configuring sandboxing on page 3098.

This topic describes how to configure the following:

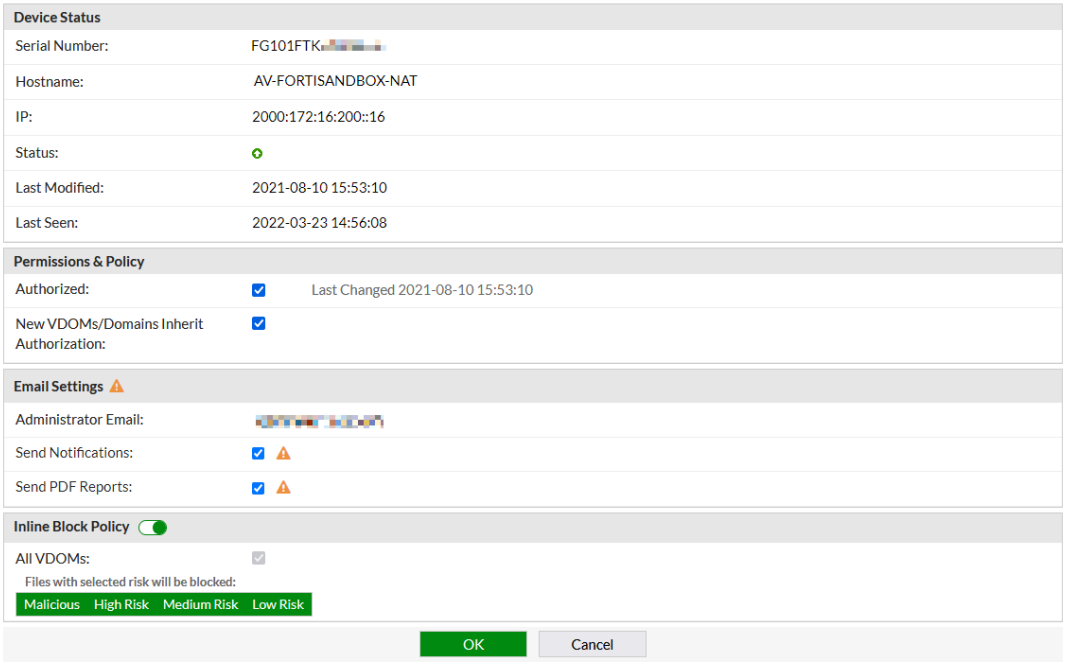
- FortiSandbox appliance inline scanning on page 1587
- FortiGuard AI-based Inline Malware Prevention Service on page 1592
- FortiSandbox scanning error and timeout actions on page 1596

FortiSandbox appliance inline scanning

Inline scanning requires a FortiSandbox appliance running version 4.2 or later, and the FortiSandbox must be reachable by port 4443. See Understanding Inline Block feature in the FortiSandbox Best Practices for more information.

FortiSandbox inline scanning is disabled by default. FortiSandbox inline scanning is best used in conjunction with AV engine scanning since there is a higher rate of detection by using both at the same time.

To enable FortiSandbox inline scanning:



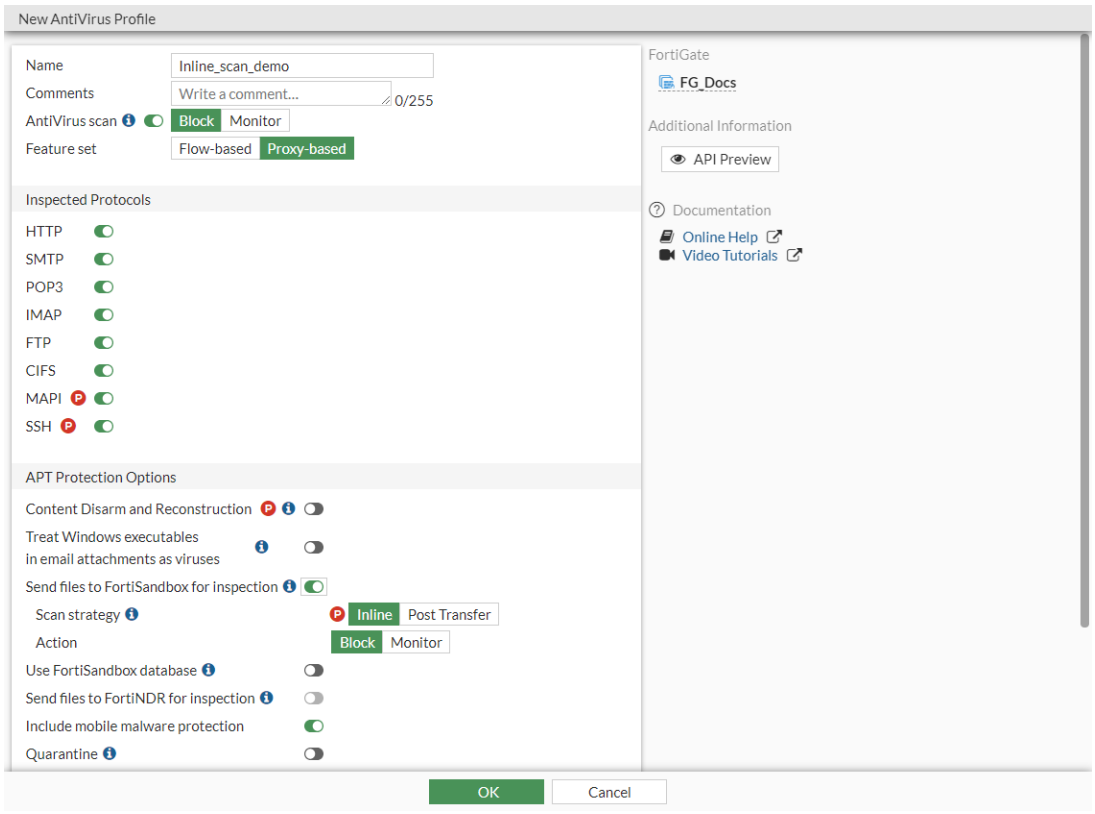
```
config system fortisandbox
    set status enable
    set inline-scan {enable | disable}
    set server <fortisandbox_server_ip>
end
```

To configure the FortiSandbox scanning options in an antivirus profile:

```
config antivirus profile
    edit <name>
        set fortisandbox-mode {inline | analytics-suspicious | analytics-everything}
        set fortisandbox-error-action {ignore | log-only | block}
        set fortisandbox-timeout-action {ignore | log-only | block}
        set fortisandbox-max-upload <integer>
        config {http | ftp | imap | pop3 | smtp | mapi | cifs | ssh}
            set av-scan {disable | block | monitor}
            set fortisandbox {disable | block | monitor}
        end
    next
end
```

`fortisandbox-mode {inline | analytics-suspicious | analytics-everything}`	Set the FortiSandbox scan mode: • `inline`: FortiSandbox inline scanning • `analytics-suspicious`: FortiSandbox post-transfer scanning; submit supported files if heuristics or other methods determine they are suspicious • `analytics-everything`: FortiSandbox post-transfer scanning; submit supported files and known infected files (default)
`fortisandbox-error-action {ignore | log-only | block}`	Set the action to take if FortiSandbox inline scanning encounters an error reaching the FortiSandbox: • `ignore`: take no action • `log-only`: log the FortiSandbox inline scan error, but allow the file (default) • `block`: block the file upon FortiSandbox inline scan error
`fortisandbox-timeout-action {ignore | log-only | block}`	Set the action to take if FortiSandbox inline scanning encounters a scan timeout: • `ignore`: take no action • `log-only`: log the FortiSandbox inline scan timeout, but allow the file (default) • `block`: block the file upon FortiSandbox inline scan timeout
`fortisandbox-max-upload <integer>`	Set the maximum size of files that can be uploaded to FortiSandbox (1 - 396, default = 10).
`av-scan {disable | block | monitor}`	Enable the antivirus scan service. Set to `block` or `monitor` to work with FortiSandbox (default = `disable`).
`fortisandbox {disable | block | monitor}`	Set the protocol level parameter for FortiSandbox file scanning: • `disable` (default), `block`, and `monitor` are available for inline scanning • `disable` (default) and `monitor` are available for post-transfer scanning

This example assumes that *Inline Block Policy* is already enabled in FortiSandbox for the FortiGate with selected risk levels (see FortiGate devices in the FortiSandbox Administration Guide for more information). The inline block policy in this example blocks all risk levels: malicious, high risk, medium risk, and low risk.



To configure FortiSandbox inline scanning in the GUI:

1. Enable FortiSandbox inline scanning globally:

```
config system fortisandbox
    set status enable
    set inline-scan enable
    set server "172.18.70.76"
end
```

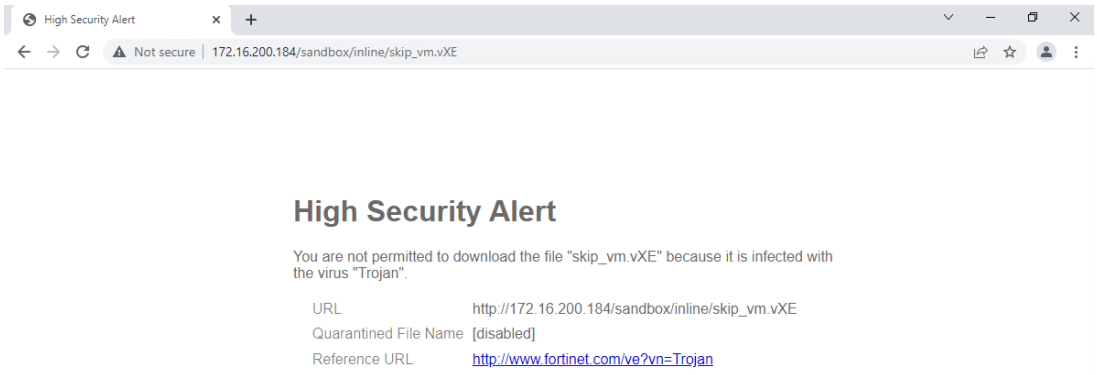
2. Configure the antivirus profile:
   a. Go *to Security Profiles* > *AntiVirus* and click *Create New*.
   b. Set the *Feature set* to *Proxy-based*.
   c. Enable the protocols to inspect.
   d. Enable *AntiVirus scan* and set it to *Block*.
   e. Enable *Send files to FortiSandbox* for inspection and set the *Action* to *Block*. The *Scan strategy* appears as *Inline* because it was configured in the CLI.

f. Click *OK*.

To configure FortiSandbox inline scanning in the CLI:

1. Enable FortiSandbox inline scanning globally:

```
config system fortisandbox
    set status enable
    set inline-scan enable
    set server "172.18.70.76"
end
```



2. Configure the antivirus profile:

```
config antivirus profile
    edit "Inline_scan_demo"
        set feature-set proxy
        set fortisandbox-mode inline
        config http
            set av-scan block
            set fortisandbox block
        end
        config ftp
            set av-scan block
            set fortisandbox block
        end
        config imap
            set av-scan block
            set fortisandbox block
```

```
            end
            config pop3
                set av-scan block
                set fortisandbox block
            end
            config smtp
                set av-scan block
                set fortisandbox block
            end
            config mapi
                set av-scan block
                set fortisandbox block
            end
            config cifs
                set av-scan block
                set fortisandbox block
            end
            config ssh
                set av-scan block
                set fortisandbox block
            end
        next
    end
```

To verify that infected files are blocked inline:

1. On a client, open a web browser and download an infected file.
2. The file is held while being scanned by FortiSandbox. Once FortiSandbox determines that file's risk level is not tolerated by the inline block policy, the FortiGate drops the connection and displays a replacement message that the file cannot be downloaded.

3. In FortiOS, view the antivirus log.
   - In the GUI, go to *Log & Report* > *Security Events* and click the *AntiVirus* card.
   - In the CLI:

```
# execute log filter category 2
# execute log display
1 logs found.
1 logs returned.

1: date=2022-03-23 time=16:19:37 eventtime=1648077577156255080 tz="-0700"
```

```

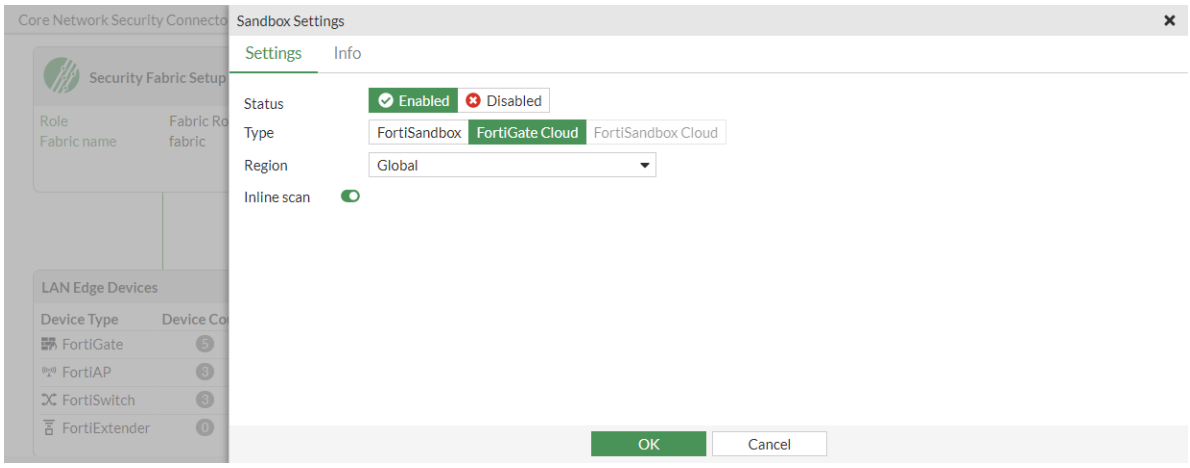
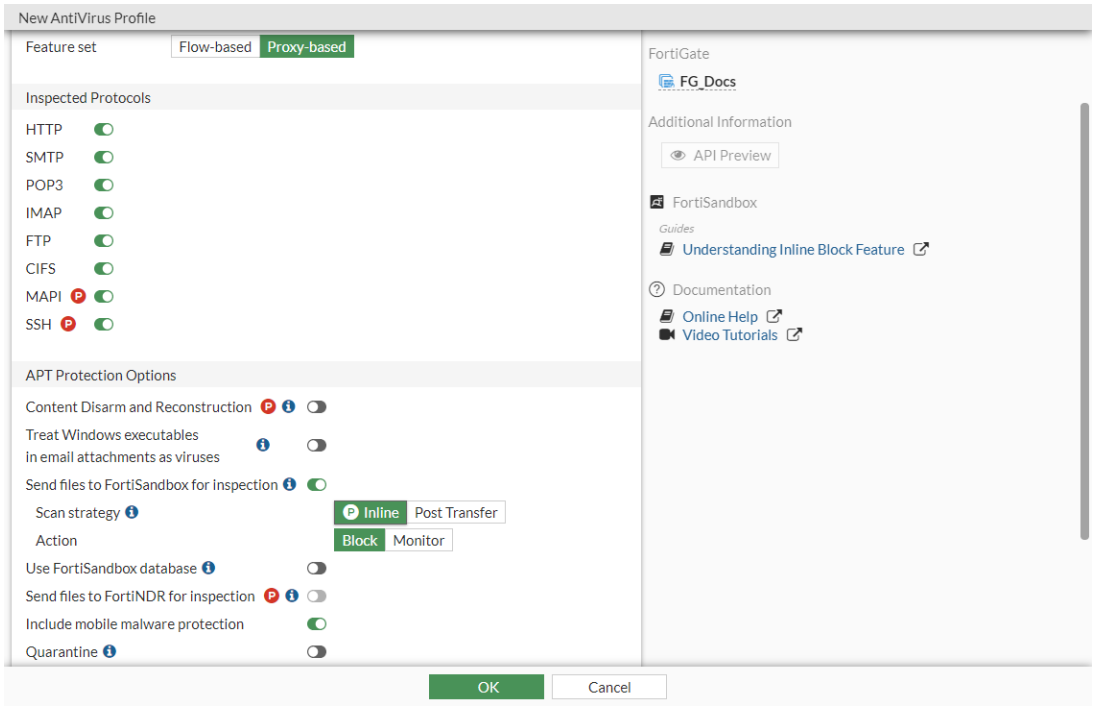
FortiGuard AI-based Inline Malware Prevention Service



Inline scanning is supported when the FortiGate is licensed with the FortiGuard AI-based Inline Malware Prevention Service (IL MPS). It works similar to inline scanning for the FortiSandbox appliance by holding a file up to 50 seconds for the verdict to be returned. Timed out scans can be set to block, log, or ignore. Inline scanning can be enabled from the GUI on the *Cloud Sandbox* configuration page.

Inline scanning is supported for FortiSandbox appliance, FortiNDR, and IL MPS. On a FortiGate, only a single inline scanning type can be configured at a time.



To configure IL MPS scanning in the GUI:

1. Enable the FortiGate Cloud feature visibility:
   a. Go to *System* > *Feature Visibility*.
   b. In the *Additional Features* section, enable *FortiGate Cloud Sandbox*.
   c. Click *Apply*.
2. Configure the *Sandbox* Fabric connector:
   a. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Sandbox* card.
   b. In the *Settings* tab, set the *Type* to *FortiGate Cloud*.
   c. Select a *Region*.
   d. Enable *Inline scan*.

e. Click *OK*.

3. Configure the antivirus profile:
   a. Go to *Security Profiles* > *AntiVirus* and click *Create New*.
   b. Set the *Feature set* to *Proxy-based*.
   c. Enable the protocols to inspect.
   d. Enable *Send files to FortiSandbox* for inspection.
   e. Set the *Scan strategy* to *Inline*, and set the *Action* to *Block*.

f. Click *OK*.

To configure IL MPS scanning in the CLI:

1. Disable FortiSandbox appliance and FortiSandbox Cloud:

```
config system fortisandbox
    set status disable
end
```

2. Configure FortiGate Cloud Sandbox:

```
# execute forticloud-sandbox region
0  Global
1  Europe
2  Japan
3  US
Please select cloud sandbox region[0-3]:0
Cloud sandbox region is selected: Global
```

3. Enable inline scanning for FortiGate Cloud:

```
config system fortiguard
    set sandbox-region "Global"
    set sandbox-inline-scan enable
end
```

4. Configure the antivirus profile:

```
config antivirus profile
    edit "av"
        set feature-set proxy
        set fortisandbox-mode inline
        config http
            set fortisandbox block
        end
        config ftp
            set fortisandbox block
        end
        config imap
            set fortisandbox block
        end
        config pop3
            set fortisandbox block
        end
        config smtp
            set fortisandbox block
        end
        config mapi
            set fortisandbox block
        end
        config cifs
            set fortisandbox block
        end
        config ssh
            set fortisandbox block
        end
        set scan-mode default
    next
end
```

To verify that infected files are blocked inline:

1. On a client, open a web browser and download an infected file using HTTP.
2. The file is held while being scanned by FortiGate Cloud Sandbox. Once FortiGate Cloud Sandbox determines that file's risk level is not tolerated, the FortiGate drops the connection and displays a replacement message that the file cannot be downloaded.
3. Verify the antivirus log:

```
# execute log display
1 logs found.
1 logs returned.

1: date=2022-07-12 time=16:31:26 eventtime=1657668686245018328 tz="-0700"
logid="0210008232" type="utm" subtype="virus" eventtype="fortisandbox" level="warning"
vd="vdom1" policyid=1 poluuid="54c06312-01fd-51ed-0db5-10c9586a0c2e" policytype="policy"
msg="Blocked by FortiSandbox." action="blocked" service="HTTP" sessionid=19934
srcip=10.1.100.191 dstip=172.16.200.194 srcport=51688 dstport=80 srccountry="Reserved"
dstcountry="Reserved" srcintf="port1" srcintfrole="undefined" dstintf="port9"
dstintfrole="undefined" srcuuid="1cb467b6-01fd-51ed-8abf-72abd959c0d0"
dstuuid="1cb467b6-01fd-51ed-8abf-72abd959c0d0" proto=6 direction="incoming"
filename="skip_vm.vXE" quarskip="Quarantine-disabled" virus="Unknown" viruscat="Trojan"

fsaseverity="high-risk" fsafileid=0 fsafiletype="exe" crscore=50 craction=2
crlevel="critical"
```

To verify that infected files are monitored:

1. Edit the antivirus profile to monitor files over HTTP:

```
config antivirus profile
    edit "av"
        set feature-set proxy
        set fortisandbox-mode inline
        config http
            set fortisandbox monitor
        end
    next
end
```

2. On a client, open a web browser and download an infected file using HTTP.
3. Verify the antivirus log:

```
# execute log display
1 logs found.
1 logs returned.

1: date=2022-07-12 time=16:34:25 eventtime=1657668865371976563 tz="-0700"
logid="0210008233" type="utm" subtype="virus" eventtype="fortisandbox" level="notice"
vd="vdom1" policyid=1 poluuid="54c06312-01fd-51ed-0db5-10c9586a0c2e" policytype="policy"
msg="Detected by FortiSandbox." action="monitored" service="HTTP" sessionid=20002
srcip=10.1.100.191 dstip=172.16.200.194 srcport=51724 dstport=80 srccountry="Reserved"
dstcountry="Reserved" srcintf="port1" srcintfrole="undefined" dstintf="port9"
dstintfrole="undefined" srcuuid="1cb467b6-01fd-51ed-8abf-72abd959c0d0"
dstuuid="1cb467b6-01fd-51ed-8abf-72abd959c0d0" proto=6 direction="incoming"
```

```
filename="skip_vm.vXE" quarskip="Quarantine-disabled" virus="Unknown" viruscat="Trojan"
dtype="fortisandbox" ref="http://www.fortinet.com/ve?vn=Unknown" virusid=0
url="http://172.16.200.194/sandbox/inline/skip_vm.vXE" profile="av" agent="curl/7.68.0"
httpmethod="GET" analyticssubmit="false" fsaaction="deny" fsaverdict="block"
fsaseverity="high-risk" fsafileid=0 fsafiletype="exe" crscore=50 craction=2
crlevel="critical"
```

To verify that infected files are blocked inline if a scan timeout occurs:

1. Edit the antivirus profile to block files over HTTP and when there is a scan timeout:

```
config antivirus profile
    edit "av"
        set feature-set proxy
        set fortisandbox-mode inline
        config http
            set fortisandbox block
        end
        set fortisandbox-timeout-action block
    next
end
```

2. On a client, open a web browser and download a large ZIP file (clean file).
3. When the scan timeout occurs, a replacement message appears that *The file "zipfile.zip" is still being scanned and will be released once complete. Please try the transfer again in a few minutes.*
4. Verify the antivirus log:

```
# execute log display
1 logs found.
1 logs returned.

1: date=2022-07-12 time=16:44:51 eventtime=1657669491697816069 tz="-0700"
logid="0210008236" type="utm" subtype="virus" eventtype="fortisandbox" level="warning"
vd="vdom1" policyid=1 poluuid="54c06312-01fd-51ed-0db5-10c9586a0c2e" policytype="policy"
msg="FortiSandbox scan timeout." action="blocked" service="HTTP" sessionid=20258
srcip=10.1.100.191 dstip=172.16.200.194 srcport=51830 dstport=80 srccountry="Reserved"
dstcountry="Reserved" srcintf="port1" srcintfrole="undefined" dstintf="port9"
dstintfrole="undefined" srcuuid="1cb467b6-01fd-51ed-8abf-72abd959c0d0"
dstuuid="1cb467b6-01fd-51ed-8abf-72abd959c0d0" proto=6 direction="incoming"
filename="zipfile.zip" quarskip="Quarantine-disabled"
url="http://172.16.200.194/sandbox/zipfile.zip" profile="av" agent="curl/7.68.0"
httpmethod="GET" analyticssubmit="false" fsaaction="timeout" fsafileid=0 crscore=50
craction=2 crlevel="critical"
```

5. After a few minutes, download the ZIP file again.
6. When the scan is complete on the FortiSandbox side, the file is downloaded and no log is generated because the scan deemed that the file is clean.

FortiSandbox scanning error and timeout actions

In this example, the HTTP protocol settings for `av-scan` and `fortisandbox` in the AV profile are both set to `block`. All files traversing HTTP in this configuration are scanned by the AV engine first, and then by FortiSandbox inline scanning for further file analysis. Based on the FortiSandbox results, FortiOS will take the appropriate action.

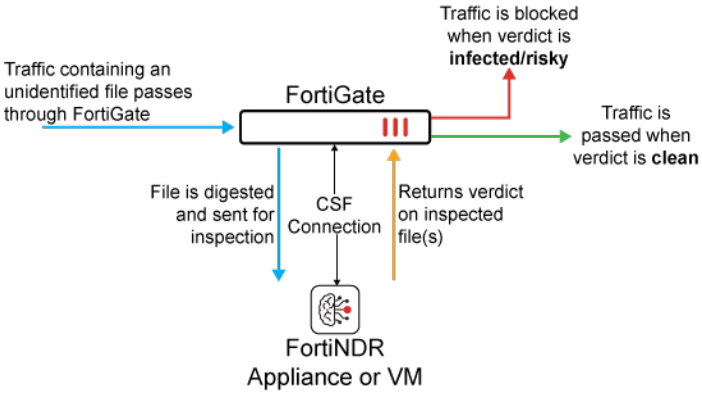
Files can be blocked if they contain a scan error or timeout. The scan timeout is configured in FortiSandbox and set to 50 seconds. If the file scan takes longer than 50 seconds, FortiSandbox returns a timeout to the FortiGate, and file is

dropped with the current configuration. If a user tries to download the same file again, the cached result is provided by FortiSandbox to the FortiGate based on the previous file scan.

This example assumes FortiSandbox inline scanning has been configured globally. The FortiGate will block the file if there is an inline scanning error or timeout.

To configure the antivirus profile to block files if there is an inline scanning error or timeout:

```
config antivirus profile
    edit "av"
        set feature-set proxy
        set fortisandbox-mode inline
        config http
            set av-scan block
            set fortisandbox block
        end
        set fortisandbox-error-action block
        set fortisandbox-timeout-action block
    next
end
```



If the administrator decides to take more risk and scan all files traversing HTTP, but log or ignore an inline scanning error or timeout, the profile is modified as follows:

```
config antivirus profile
    edit "av"
        set fortisandbox-error-action {log-only | ignore}
        set fortisandbox-timeout-action {log-only | ignore}
    next
end
```

The AV engine is still used first, followed by FortiSandbox inline scanning. The FortiGate will log or ignore the file if there is an inline scanning error or timeout, and the file is allowed to pass through.

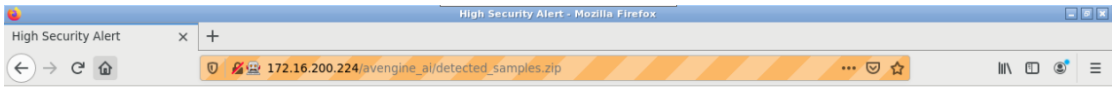
Using FortiNDR inline scanning with antivirus

FortiNDR (formerly FortiAI) can be used with antivirus profiles in proxy inspection mode (flow mode is currently not supported). FortiNDR inspects high-risk files and issues a verdict to the firewall based on how close the file features match those of malware. When enabled, FortiNDR can log, block, ignore, or monitor (allow) the file based on the verdict.

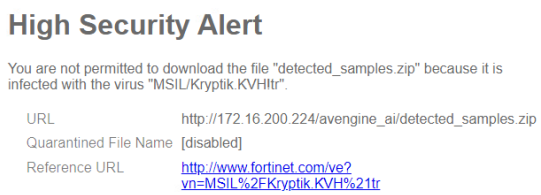
A licensed FortiNDR appliance with version 1.5.1 or later is required to use this feature.

To configure FortiNDR inline inspection with an AV profile:

1. Configure FortiNDR to join a Security Fabric in FortiOS (see Configuring FortiNDR on page 3118).
2. In the FortiNDR CLI, enable inline inspection:



```
config system fortindr
    set status enable
end
```



3. Configure an AV profile in FortiOS to use inline inspection and block detected infections:

```
config antivirus profile
    edit "av"
        set feature-set proxy
        config http
            set fortindr block
        end
        config ftp
            set fortindr block
        end
        config imap
            set fortindr block
        end
        config pop3
            set fortindr block
        end
        config smtp
            set fortindr block
        end
        config mapi
            set fortindr block
        end
        config nntp
            set fortindr block
        end
        config cifs
            set fortindr block
        end
        config ssh
            set fortindr block
        end
    next
end
```

4. Add the AV profile to a firewall policy. When potential infections are blocked by FortiNDR inline inspection, a replacement message appears (see Replacement messages on page 2941 for more information). An infection

blocked over HTTP looks similar to the following:

Sample log

```
date=2021-04-29 time=15:12:07 eventtime=1619734327633022960 tz="-0700" logid="0209008221"
type="utm" subtype="virus" eventtype="fortindr" level="notice" vd="vdom1" policyid=1
msg="Detected by FortiNDR." action="monitored" service="HTTP" sessionid=13312
srcip=10.1.100.221 dstip=172.16.200.224 srcport=50792 dstport=80 srcintf="wan2"
srcintfrole="wan" dstintf="wan1" dstintfrole="wan" proto=6 direction="incoming"
filename="detected_samples.zip" quarskip="File-was-not-quarantined"
virus="MSIL/Kryptik.KVH!tr" dtype="fortindr"
ref="http://www.fortinet.com/ve?vn=MSIL%2FKryptik.KVH%21tr" virusid=0
url="http://172.16.200.224/avengine_ai/detected_samples.zip" profile="av"
agent="curl/7.68.0" analyticssubmit="false" crscore=50 craction=2 crlevel="critical"
```

FortiNDR inline inspection with other AV inspection methods

The following inspection logic applies when FortiNDR inline inspection is enabled simultaneously with other AV inspection methods. The AV engine inspection and its verdict always takes precedence because of performance. The actual behavior depends on which inspected protocol is used.

HTTP, FTP, SSH, and CIFS protocols:

1. AV engine scan; AV database and FortiSandbox database (if applicable).
   a. FortiNDR inline inspection occurs simultaneously.
2. AV engine machine learning detection for WinPE PUPs (potentially unwanted programs).
   a. FortiNDR inline inspection occurs simultaneously.
3. Outbreak prevention and external hash list resources.
   a. FortiNDR inline inspection occurs simultaneously.

If any AV inspection method returns an infected verdict, the FortiNDR inspection is aborted.

POP3, IMAP, SMTP, NNTP, and MAPI protocols:

1. AV engine scan; AV database and FortiSandbox database (if applicable).
2. AV engine machine learning detection for WinPE PUPs (potentially unwanted programs).
   a. FortiNDR inline inspection occurs simultaneously.
3. Outbreak prevention and external hash list resources.
   a. FortiNDR inline inspection occurs simultaneously.

In an AV profile, use `set fortindr-error-action {log-only | block | ignore}` to configure the action to take if FortiNDR encounters an error.

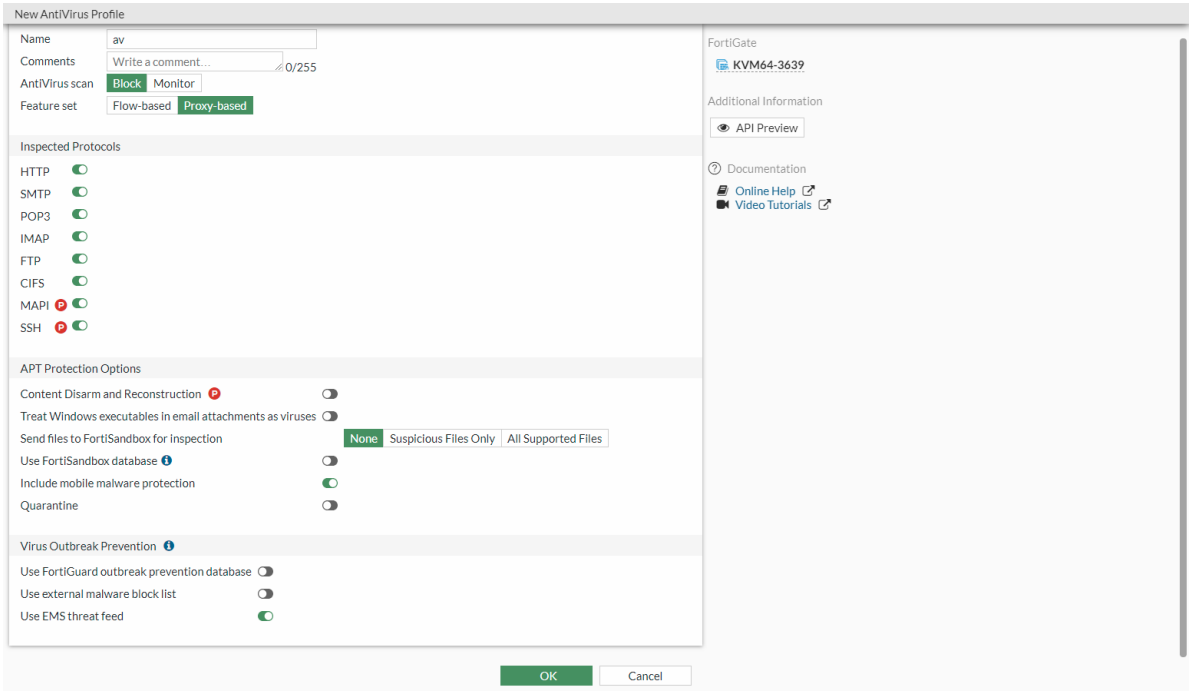
Accepted file types

The following file types are sent to FortiNDR for inline inspection:

7Z	HTML	RTF
ARJ	JS	TAR
BZIP	LZH	VBA
BZIP2	LZW	VBS
CAB	MS Office documents (XML and non-XML)	WinPE (EXE)
ELF	PDF	XZ
GZIP	RAR	ZIP

Malware threat feed from EMS

A FortiGate can pull malware threat feeds from FortiClient EMS, which in turn receives malware hashes detected by FortiClients. The malware hash can be used in an antivirus profile when AV scanning is enabled with block or monitor actions. This feature is supported in proxy and flow mode.



If an external malware blocklist and the FortiGuard outbreak prevention database are also enabled in the antivirus profile, the checking order is: AV local database, EMS threat feed, external malware blocklist, FortiGuard outbreak prevention database. If the EMS threat feed and external malware blocklist contain the same hash value, then the EMS infection will be reported if both of them are blocked.

To configure an EMS threat feed in an antivirus profile in the GUI:

1. Enable the EMS threat feed:
   a. Go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiClient EMS* card.
   b. Enable *EMS threat feed*.
   c. Configure the other settings if needed (see Configuring FortiClient EMS on page 3076 for more details).
   d. Click *OK*.

2. Create the antivirus profile:
   a. Go to *Security Profiles* > *AntiVirus* and click *Create New*.
   b. In the *Virus Outbreak Prevention* section, enable *Use EMS threat feed*.
   c. Configure the other settings as needed.

   d. Click *OK*.

To configure an EMS threat feed in an antivirus profile in the CLI:

1. Enable the EMS threat feed:

```
config endpoint-control fctems
    edit "WIN10-EMS"
        set fortinetone-cloud-authentication disable
        set server "192.168.20.10"
        set https-port 443
        set source-ip 0.0.0.0
        set pull-sysinfo enable
        set pull-vulnerabilities enable
        set pull-avatars enable
        set pull-tags enable
        set pull-malware-hash enable
        unset capabilities
        set call-timeout 30
        set websocket-override disable
    next
end
```

2. Create the antivirus profile:

```
config antivirus profile
    edit "av"
        config http
```

```
            set av-scan block
        end
        config ftp
            set av-scan block
        end
        config imap
            set av-scan block
        end
        config pop3
            set av-scan block
        end
        config smtp
            set av-scan block
        end
        config cifs
            set av-scan block
        end
        set external-blocklist-enable-all enable
        set ems-threat-feed enable
    next
end
```

Sample log

```
# execute log filter category utm-virus
# execute log display
```

```

```

CIFS support

Antivirus scanning on Common Internet File System (CIFS) traffic is supported in flow-based and proxy-based inspection. The file filter profile handles the configuration of file filtering on CIFS. The antivirus profile handles the antivirus configuration for CIFS scanning.

File filtering for CIFS is performed by inspecting the first 4 KB of the file to identify the file's magic number. If a match occurs, CIFS file filtering prevents the CIFS command that contains that file from running. The file filter functions differently for un-encrypted and encrypted CIFS traffic:

- For un-encrypted CIFS traffic, the standalone file filter works in flow and proxy mode.
- For encrypted CIFS traffic, the CIFS profile must be enabled in the firewall policy because the SMB server's credential settings are still be configured in CIFS profile. Using the standalone file filter only works in proxy mode.

For a CIFS profile to be available for assignment in a policy, the policy must use proxy inspection mode. See Proxy mode inspection on page 1557 for details. Note that in proxy inspection mode, special condition archive files (encrypted, corrupted, mailbomb, and so on) marked by the antivirus engine are blocked automatically.

Messages that are compressed with LZNT1, LZ77, and LZ77+Huffman algorithms can be scanned in proxy mode.

To configure file-type filtering and antivirus scanning on CIFS traffic:

1. Configure a CIFS domain controller on page 1603
2. Configure a CIFS profile on page 1603
3. Configure an antivirus profile on page 1605

Configure a CIFS domain controller

The domain controller must be configured when CIFS traffic is encrypted. The configuration tells the FortiGate the network location of the domain controller and the superuser credentials.

For FortiGate to retrieve the domain information, the user needs to grant Replicating Directory Changes permissions in the Domain Controller (DC). See How to grant the "Replicating Directory Changes" permission for the Microsoft Metadirectory Services ADMA service account for more information.

To configure the CIFS domain controller:

```
config user domain-controller
    edit "SERVER_NAME"
        set hostname "host"
        set domain-name "EXAMPLE.COM"
        set username "admin-super"
        set password *********
        set ip 172.16.201.40
    next
end
```

Configure a CIFS profile

To create a CIFS profile, configure the server credential type and create a file filter profile.

Set the CIFS server credential type

The CIFS server credential type can be `none`, `credential-replication`, or `credential-keytab`.

none

The CIFS profile assumes the CIFS traffic is unencrypted. This is the default value.

```
config firewall profile-protocol-options
    edit "cifs"
```

```
        config cifs
            set server-credential-type none
        end
    next
end
```

credential-replication

To decrypt CIFS traffic, FortiOS obtains the session key from the domain controller by logging in to the superuser account. The domain controller must be configured.

```
config firewall profile-protocol-options
    edit "cifs"
        config cifs
            set server-credential-type credential-replication
            set domain-controller "SERVER_NAME"
        end
    next
end
```

Variable	Description
domain-controller <string>	The previously configured domain to decrypt CIFS traffic for.

credential-keytab

To decrypt CIFS traffic, FortiOS uses a series of keytab values. This method is used when the SMB connection is authenticated by Kerberos. Keytab entries must be configured, and are stored in FortiOS in plaintext.

```
config firewall profile-protocol-options
    edit "cifs"
        config cifs
            set server-credential-type credential-keytab
            config server-keytab
                edit "keytab1"
                    set keytab
"BQIAAABFAAEAC0VYQU1QTEUuQ09NAAdleGFtcGxlAAAAAVUmAlwBABIAILdV5P6NXT8RrTvapcMJQxDYCjRQiD0Bzxh
wS9h0VgyM"
                next
            end
        end
    next
end
```

Variable	Description
keytab <keytab>	Base64 encoded keytab file containing the credentials of the server.

Configure CIFS file filtering

Multiple rules can be added to a file filter profile. See File filter on page 1770.

To configure a file filter for CIFS traffic:

```
config file-filter profile
    edit "cifs"
        set comment "block zip files on unencrypted cifs traffic"
        set feature-set flow
        set replacemsg-group ''
        set log enable
        config rules
            edit "rule1"
                set protocol cifs
                set action block
                set direction any
                set password-protected any
                set file-type zip
            next
        end
    next
end
```

Variable	Description
comment <string>	A brief comment describing the entry.
feature-set {flow | proxy}	Flow or proxy mode feature set (default = `flow`).
replacemsg-group <string>	Replacement message group.
log {enable | disable}	Enable/disable file filter logging (default = `enable`).
scan-archive-contents [enable | disable]	Enable/disable scanning of archive contents (default = `enable`).
protocol {http ftp smtp imap pop3 mapi cifs ssh}	Filter based on the specified protocol(s).
action {log-only | block}	The action to take for matched files: • `log-only`: Allow the content and write a log message (default). • `block`: Block the content and write a log message.
direction {incoming | outgoing | any}	Match files transmitted in the session's originating (`incoming`) and/or reply (`outgoing`) direction (default = `any`).
password-protected [yes | any]	Match only password-protected files (`yes`) or any file (default = `any`).
file-type <file_type>	The file types to be matched. See Supported file types on page 1776 for details.

Configure an antivirus profile

The antivirus profile handles the antivirus configuration for CIFS scanning.

To configure an antivirus profile:

```
config antivirus profile
    edit "av"
        ...
        config cifs
```

```
            set av-scan {disable | block | monitor}
            set outbreak-prevention {disable | block | monitor}
            set external-blocklist {disable | block | monitor}
            set quarantine {enable | disable}
            set archive-block {encrypted corrupted partiallycorrupted multipart nested
mailbomb fileslimit timeout unhandled}
            set archive-log {encrypted corrupted partiallycorrupted multipart nested
mailbomb fileslimit timeout unhandled}
            set emulator {enable | disable}
        end
    next
end
```

Variable	Description
av-scan	Enable antivirus scan service: • `disable`: Disable (default). • `block`: Block the virus infected files. • `monitor`: Log the virus infected files.
outbreak-prevention {disable | block | monitor}	Enable the virus outbreak prevention service: • `disable`: Disable (default). • `block`: Block the matched files. • `monitor`: Log the matched files.
external-blocklist {disable | block | monitor}	Enable the external blocklist: • `disable`: Disable (default). • `block`: Block the matched files. • `monitor`: Log the matched files.
quarantine {enable | disable}	Enable/disable quarantine for infected files (default = `disable`).
archive-block {encrypted corrupted partiallycorrupted multipart nested mailbomb fileslimit timeout unhandled}	Select the archive types to block: • `encrypted`: Block encrypted archives. • `corrupted`: Block corrupted archives. • `partiallycorrupted`: Block partially corrupted archives. • `multipart`: Block multipart archives. • `nested`: Block nested archives. • `mailbomb`: Block mail bomb archives. • `fileslimit`: Block exceeded archive files limit. • `timeout`: Block scan timeout. • `unhandled`: Block archives that FortiOS cannot open.
archive-log {encrypted corrupted partiallycorrupted multipart nested mailbomb fileslimit timeout unhandled}	Select the archive types to log: • `encrypted`: Log encrypted archives. • `corrupted`: Log corrupted archives. • `partiallycorrupted`: Log partially corrupted archives. • `multipart`: Log multipart archives. • `nested`: Log nested archives. • `mailbomb`: Log mail bomb archives.

Variable	Description
	• `fileslimit`: Log exceeded archive files limit. • `timeout`: Log scan timeout. • `unhandled`: Log archives that FortiOS cannot open.
emulator {enable | disable}	Enable/disable the virus emulator (default = `enable`).

Log samples

File-type detection events generated by CIFS profiles are logged in the `utm-file-filter` log category. Antivirus detection over the CIFS protocol generates logs in the `utm-virus` category. See the FortiOS Log Message Reference for more information.

Logs generated by CIFS profile file filter:

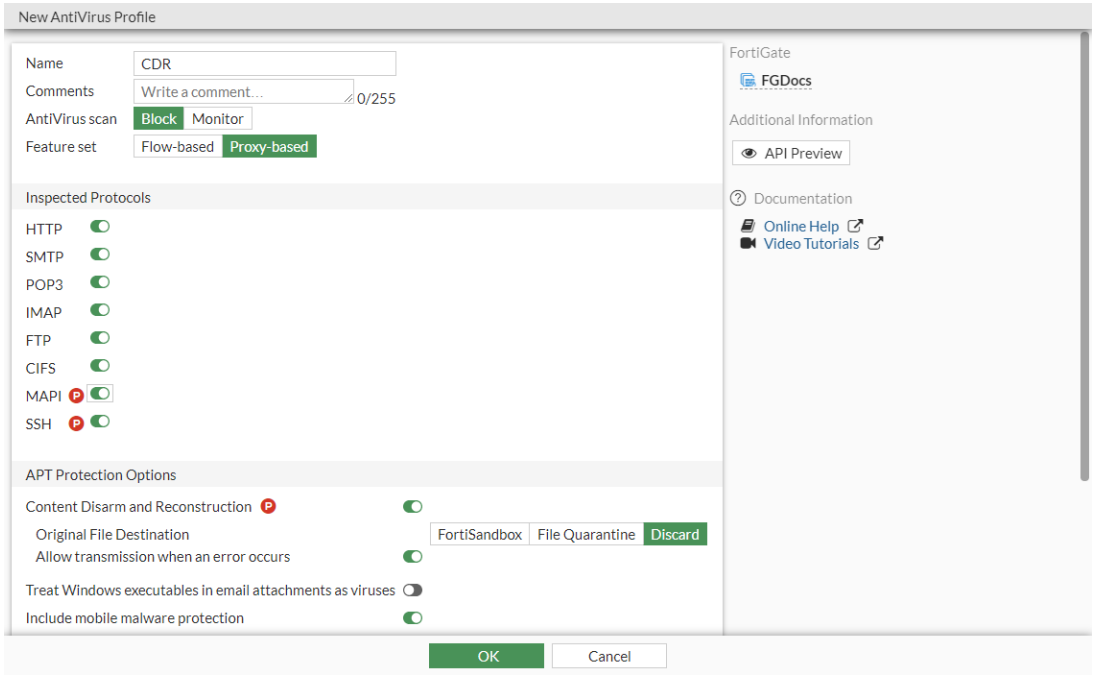
Configuration examples

This section includes the following examples:

- Content disarm and reconstruction on page 1608
- FortiGuard outbreak prevention on page 1610
- External malware block list on page 1612
- Exempt list for files based on individual hash on page 1615
- Downloading quarantined files in archive format on page 1616

Content disarm and reconstruction



In this example, the a Microsoft Office document with an embedded hyperlink (that redirects to an external website) is sent to the receiver. When the user receives the file, the hyperlink in the document is deactivated. See Content disarm and reconstruction on page 1564 for more information.

To configure CDR:

1. Go to *Security Profiles* > *AntiVirus*.
2. Edit an antivirus profile, or create a new one.

3. Under *APT Protection Options*, enable *Content Disarm and Reconstruction*.

4. Select a quarantine location from the available options:

FortiSandbox	Saves the original document file to a connected FortiSandbox.
File Quarantine	Saves the original document file to disk (if possible) or a connected FortiAnalyzer based on the FortiGate log settings (`config log fortianalyzer setting`).
Discard	The default setting, which discards the original document file.

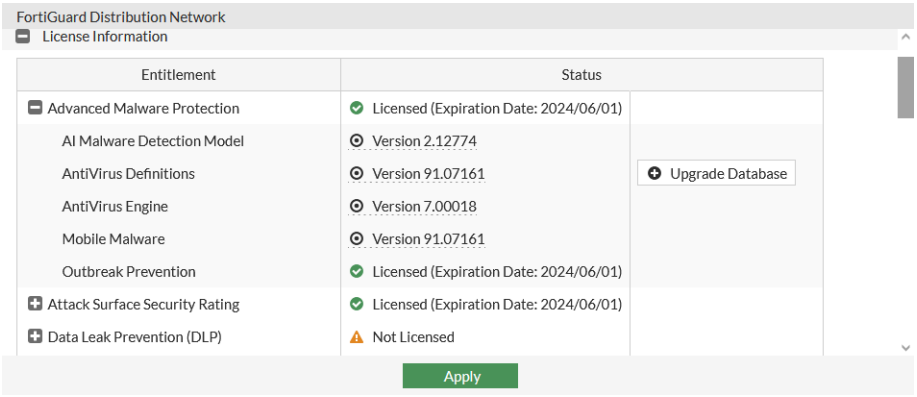
5. Click *OK*.

To edit the CDR detection parameters:

By default, stripping of all active Microsoft Office and PDF content types are enabled. In this example, stripping macros in Microsoft Office documents will be disabled.

```
config antivirus profile
    edit av
        config content-disarm
            set office-macro disable
            set detect-only {enable | disable}
            set cover-page {enable | disable}
        end
    next
end
```

Where:

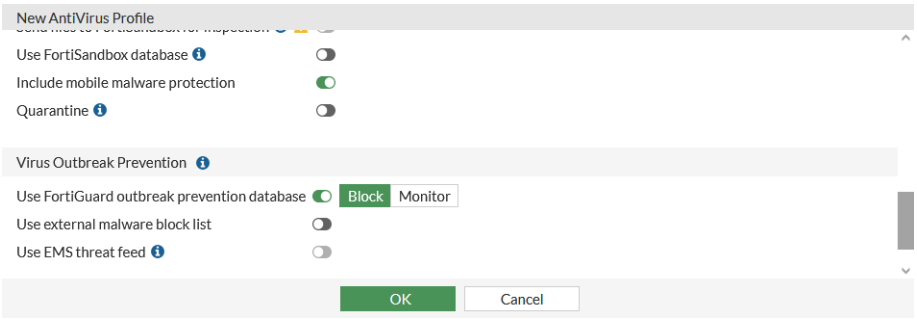


detect-only	Only detect disarmable files, do not alter content. Disabled by default.
cover-page	Attach a cover page to the file's content when the file has been processed by CDR. Enabled by default.

FortiGuard outbreak prevention

This example demonstrates how to enable FortiGuard Virus Outbreak Protection Service (VOS). See Virus outbreak prevention on page 1564 for more information.

To verify FortiGuard antivirus license information:



1. Go to *System* > *FortiGuard*.
2. In the *License Information* table, expand the *Advanced Malware Protection* entitlement section and locate the *Outbreak Prevention* entry.

3. See the instructions in the video How to Purchase or Renew FortiGuard Services, if required.

To enable FortiGuard outbreak prevention:

1. Go to *Security Profiles* > *AntiVirus*.
2. Edit an antivirus profile, or create a new one.
3. Under *Virus Outbreak Prevention*, enable *Use FortiGuard outbreak prevention database* and select *Block* or *Monitor*.

4. Click *OK*.

To verify FortiGuard antivirus license information:

```
# diagnose debug rating
Locale       : english

Service      : Web-filter
Status       : Enable
License      : Contract
```

```
    Service      : Antispam
    Status       : Disable

    Service      : Virus Outbreak Prevention
    Status       : Enable
    License      : Contract

    --=- Server List (Tue Feb 19 16:36:15 2019) -=-

    IP                    Weight    RTT Flags  TZ    Packets  Curr Lost Total Lost
       Updated Time
    192.168.100.185          -218      2 DI     -8        113          0          0 Tue Feb
    19 16:35:55 2019
```

To enable all scanunit debug categories:

```
# diagnose sys scanunit debug all

FortiGuard provides several sample files to test the AV configuration on the FortiGate, which are available to download from https://www.fortiguard.com/sample-files. Test the *Virus Outbreak Prevention* feature by downloading *VO Sample* file. See Example 3: VO sample file on page 1575.

External malware block list

This example demonstrates creating and implementing an external malware block list. See External malware block list on page 1565 for more information.

To create the external block list:

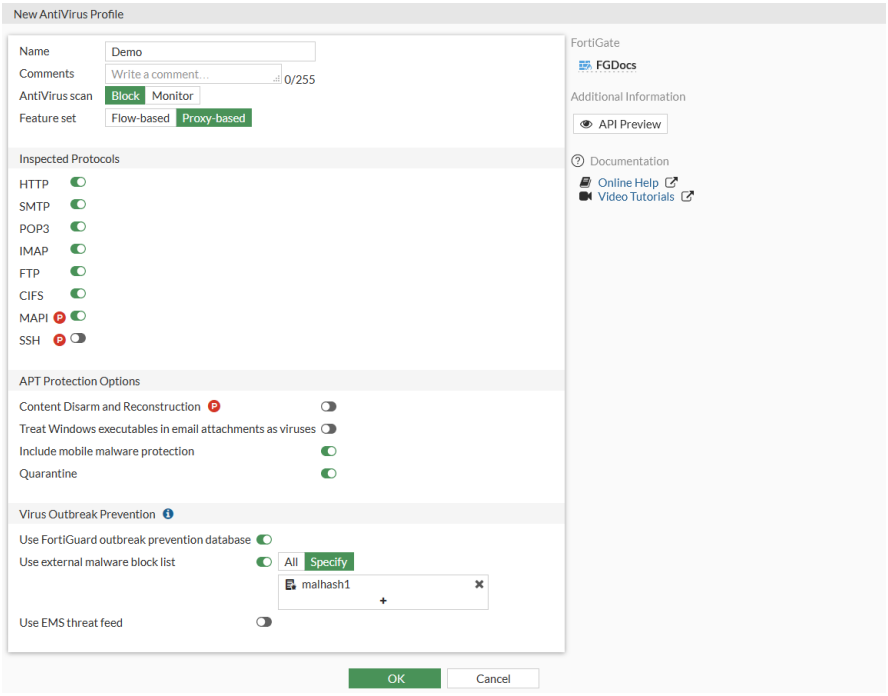
1. Create the malware hash list.
   The malware hash list follows a strict format in order for its contents to be valid. Malware hash signature entries must be separated into each line. A valid signature needs to follow this format:

```
# MD5 Entry with hash description
aa67243f746e5d76f68ec809355ec234  md5_sample1

# SHA1 Entry with hash description
a57983cb39e25ab80d7d3dc05695dd0ee0e49766  sha1_sample2

# SHA256 Entry with hash description
ae9bc0b4c5639d977d720e4271da06b50f7c60d1e2070e9c75cc59ab30e49379  sha256_sample1

# Entry without hash description
0289b0d967cb7b1fb1451339c7b9818a621903090e0020366ab415c549212521



# Invalid entries
7688499dc71b932feb126347289c0b8a_md5_sample2
7614e98badca10b5e2d08f8664c519b7a906fbd5180ea5d04a82fce9796a4b87sha256_sample3
```

2. Configure the external malware block list source:
   a. Go to *Security Fabric* > *External Connectors* and click *Create New*.
   b. Click *Malware Hash*.
   c. Configure the settings as needed. The URI must point to the malware hash list on the remote server.
   d. Click *OK*.
3. To view entries inside the malware block list on the *External Connectors* page, hover over the malware hash card and click *View Entries*.

To configure antivirus to use an external block list in the GUI:

1. Go to *Security Profiles* > *AntiVirus* and edit the antivirus profile.
2. In the *Virus Outbreak Prevention* section, enable *Use external malware block list* and click *Specify*.
3. Click the + in the field and select a threat feed.

4. Optionally, enable *Quarantine*.

5. Configure the other settings as needed.
6. Click *OK*.

To configure antivirus to use an external block list in the CLI:

```
config antivirus profile
    edit "Demo"
        set feature-set proxy
        set mobile-malware-db enable
        config http
            set av-scan disable
            set outbreak-prevention block
            set external-blocklist block
            set quarantine enable
            set emulator enable
            set content-disarm disable
        end
        config ftp
            set av-scan disable
            set outbreak-prevention block
            set external-blocklist block
            set quarantine enable
            set emulator enable
        end
        config imap
            set av-scan monitor
            set outbreak-prevention block
            set external-blocklist block
            set quarantine enable
            set emulator enable
            set executables default
```

```
        set content-disarm disable
    end
    config pop3
        set av-scan monitor
        set outbreak-prevention block
        set external-blocklist block
        set quarantine enable
        set emulator enable
        set executables default
        set content-disarm disable
    end
    config smtp
        set av-scan monitor
        set outbreak-prevention block
        set external-blocklist block
        set quarantine enable
        set emulator enable
        set executables default
        set content-disarm disable
    end
    config mapi
        set av-scan monitor
        set outbreak-prevention block
        set external-blocklist block
        set quarantine enable
        set emulator enable
        set executables default
    end
    config nntp
        set av-scan disable
        set outbreak-prevention disable
        set external-blocklist disable
        set quarantine disable
        set emulator enable
    end
    config cifs
        set av-scan monitor
        set outbreak-prevention block
        set external-blocklist block
        set quarantine enable
        set emulator enable
    end
    config ssh
        set av-scan disable
        set outbreak-prevention disable
        set external-blocklist disable
        set quarantine disable
        set emulator enable
    end
    set outbreak-prevention-archive-scan enable
    set external-blocklist-enable-all disable
    set external-blocklist "malhash1"
    set av-virus-log enable
    set av-block-log enable
    set extended-log disable
    set scan-mode default
```

```
    next
end
```

The quarantine setting is configured in each protocol (`set quarantine`). The malware threat feed is also specified (`set external-blocklist-enable-all disable`) to the threat connector, malhash1 (`set external-blocklist "malhash1"`).

To verify the scanunit daemon updated itself with the external hashes:

```
# diagnose sys scanunit malware-list list
md5 'aa67243f746e5d76f68ec809355ec234' profile 'malhash1' description 'md5_sample1'
sha1 'a57983cb39e25ab80d7d3dc05695dd0ee0e49766' profile 'malhash1' description 'sha1_
sample2'
sha256 '0289b0d967cb7b1fb1451339c7b9818a621903090e0020366ab415c549212521' profile 'malhash1'
description ''
sha256 'ae9bc0b4c5639d977d720e4271da06b50f7c60d1e2070e9c75cc59ab30e49379' profile 'malhash1'
description 'sha256_sample1'
```

Exempt list for files based on individual hash

The antivirus exempt list allows users to exempt known safe files that happen to be incorrectly classified as malicious by the AV signature and AV engine scan. Users can specify file hashes in MD5, SHA1, or SHA256 for matching, which are applied at a per-VDOM level. When matched, the FortiGate ignores the AV scan verdict so that the corresponding UTM behavior defined in the AV profile is not performed.

```
config antivirus exempt-list
    edit <name>
        set hash-type {md5 | sha1 | sha256}
        set hash <string>
        set status {enable | disable}
    next
end
```

The exempt list does not apply to results from outbreak prevention, machine learning, FortiNDR, or FortiSandbox inline scans.

In this example, an antivirus exempt list is configured for the EICAR anti-malware test file. Although the antivirus profile is configured to block HTTP, the client is able to download the file.

To configure an antivirus exempt list:

1. Configure the antivirus profile:

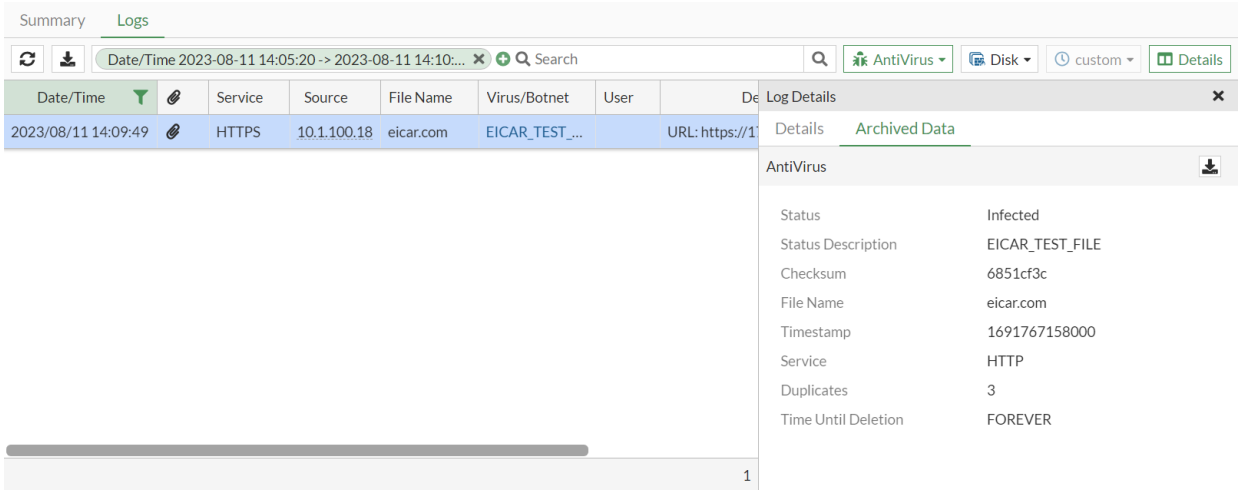
```
config antivirus profile
    edit "av"
        set feature-set proxy
        config http
            set av-scan block
        end
    next
end
```

2. Configure the antivirus exempt list:

```
config antivirus exempt-list
    edit "test-hash"
        set comment "eicar.com"
        set hash-type md5
        set hash "44d88612fea8a8f36de82e1278abb02f"
        set status enable
    next
end
```

3. Get a client to access https://www.eicar.com/ and download the anti-malware test file.

   The FortiGate exempts the AV scan verdict and bypasses the file. The client can download the file and no replacement message is displayed.



Downloading quarantined files in archive format

The FortiGate can download quarantined files in an archive format (.TGZ) instead of the original raw file. This allows for a more detailed analysis of the quarantined files and reduces the risk of malware infection.

The FortiGate must have a disk logging capacity or be connected to FortiAnalyzer for logging.

To download a quarantined archive file:

1. Ensure that quarantining files is enabled in the AV profile:
   a. Go to *Security Profiles* > *AntiVirus* and edit the AV profile.
   b. In the *APT Protection Options* section, verify that *Quarantine* is enabled. At least one protocol must be enabled in the AV profile for inspection, and *AntiVirus scan* must be enabled for the *Quarantine* option to work.
2. Go to *Log & Report* > *Security Events* and select the *AntiVirus* card.
3. Select a log entry and click *Details*. The *Log Details* pane opens.
4. Select the *Archived Data* tab and click the download icon (in the *AntiVirus* title bar).

Web filter

Web filtering restricts or controls user access to web resources and can be applied to firewall policies using either policy-based or profile-based NGFW mode.

In FortiOS, there are three main components of web filtering:

- Web content filter: blocks web pages containing words or patterns that you specify.
- URL filter: uses URLs and URL patterns to block or exempt web pages from specific sources, or block malicious URLs discovered by FortiSandbox.
- FortiGuard Web Filtering service: provides many additional categories you can use to filter web traffic.

These components interact with each other to provide maximum control over what users on your network can view and protect your network from many internet content threats.

Web filters are applied in the following order:

1. URL filter
2. FortiGuard Web Filtering
3. Web content filter
4. Web script filter
5. Antivirus scanning

FortiOS includes three preloaded web filter profiles:

- *default*
- *monitor-all* (monitors and logs all URLs visited, flow-based)
- *wifi-default* (default configuration for offloading WiFi traffic)

You can customize these profiles, or you can create your own to manage network user access.

Some features of this functionality require a subscription to FortiGuard Web Filtering.

The following topics provide information about web filters:

- URL filter on page 1618
- FortiGuard filter on page 1623
- Credential phishing prevention on page 1631
- Additional antiphishing settings on page 1633
- Usage quota on page 1636
- Web content filter on page 1639
- Advanced filters 1 on page 1642
- Advanced filters 2 on page 1645
- Web filter statistics on page 1649
- URL certificate blocklist on page 1650
- Websense Integrated Services Protocol on page 1650
- Inspecting HTTP3 traffic on page 1651

- Configuring web filter profiles with Hebrew domain names on page 1653
- Configuring web filter profiles to block AI and cryptocurrency on page 1658

URL filter

The URL filter uses specific URLs with patterns containing text and regular expressions so the FortiGate can process the traffic based on the filter action (exempt, block, allow, monitor) and web pages that match the criteria. Once a URL filter is configured, it can be applied to a firewall policy.

The following filter types are available:

URL filter type	Description
Simple	The FortiGate tries to strictly match the full context. For example, if you enter *www.facebook.com* in the *URL* field, it only matches traffic with *www.facebook.com*. It won't match *facebook.com* or *message.facebook.com*. When the FortiGate finds a match, it performs the selected URL action.
Regular expression/ wildcard	The FortiGate tries to match the pattern based on the rules of regular expressions or wildcards. For example, if you enter **fa** in the *URL* field, it matches all the content that has *fa* such as *www.facebook.com*, *message.facebook.com*, *fast.com*, and so on. When the FortiGate finds a match, it performs the selected URL action.

For more information, see the URL Filter expressions technical tip in the Knowledge Base.

The following actions are available:

URL filter action	Description
Exempt	The traffic is allowed to bypass the remaining FortiGuard web filters, web content filters, web script filters, antivirus scanning, and DLP proxy operations.
Block	The FortiGate denies or blocks attempts to access any URL that matches the URL pattern. A replacement message is displayed.
Allow	The traffic is passed to the remaining FortiGuard web filters, web content filters, web script filters, antivirus proxy operations, and DLP proxy operations. If the URL does not appear in the URL list, the traffic is permitted.
Monitor	The traffic is processed the same way as the *Allow* action. For the *Monitor* action, a log message is generated each time a matching traffic pattern is established.

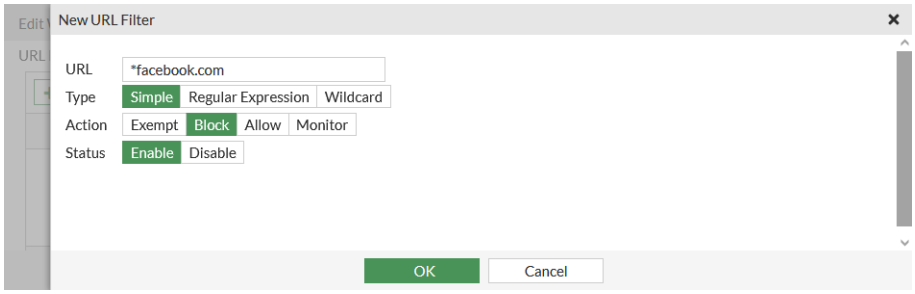
The exempt URL filter action can be configured to bypass all or certain security profile operations. This setting can only be configured in the CLI.

If the `action` is set to `exempt`, use `set exempt` to select the security profile operations that exempt URLs skip.

```
config webfilter urlfilter
    edit <id>
        config entries
            edit <id>
                set action exempt
                set exempt {av web-content activex-java-cookie dlp fortiguard range-block
pass antiphish all}
```

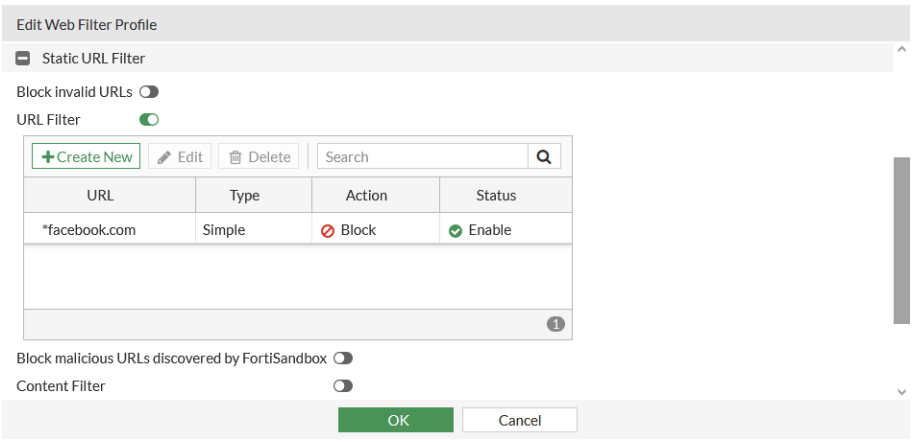
```
            next
        end
    next
end
```

Option	Description
av	Antivirus scanning
web-content	Web filter content matching
activex-java-cookie	ActiveX, Java, and cookie filtering
dlp	DLP scanning
fortiguard	FortiGuard web filtering
range-block	Range block feature
pass	Pass single connection from all
antiphish	Antiphish credential checking
all	Exempt from all security profiles



These exempt options are not visible in the GUI. Setting the URL filter *Action* to *Exempt* will exempt URLs from all security profiles.

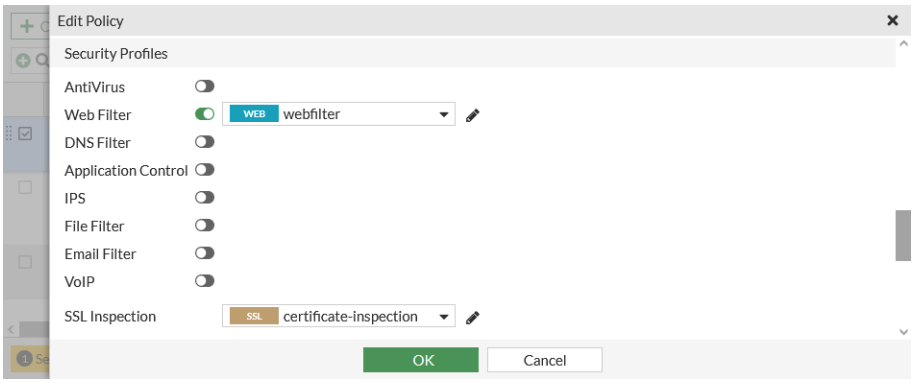
In the following example, a URL filter will be created to block the facebook.com URL using a wildcard.



Configuring a URL filter in the GUI

To create a URL filter for Facebook:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *URL Filter*.
3. Click *Create New*. The *New URL Filter* pane opens.
4. For URL, enter **facebook.com*, for *Type*, select *Wildcard*, and for *Action*, select *Block*.



5. Click *OK*. The entry appears in the table.

6. Configure the other settings as needed.
7. Click *OK*.

To apply the web filter profile to a firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Edit a policy, or create a new one.
3. In the *Security Profiles* section, enable *Web Filter* and select the profile that you created.
4. Set *SSL Inspection* to *certificate-inspection*.

The *no-inspection* profile does not perform SSL inspection, so it should not be selected with other UTM profiles.

5. Configure the other settings as needed.
6. Click *OK*.

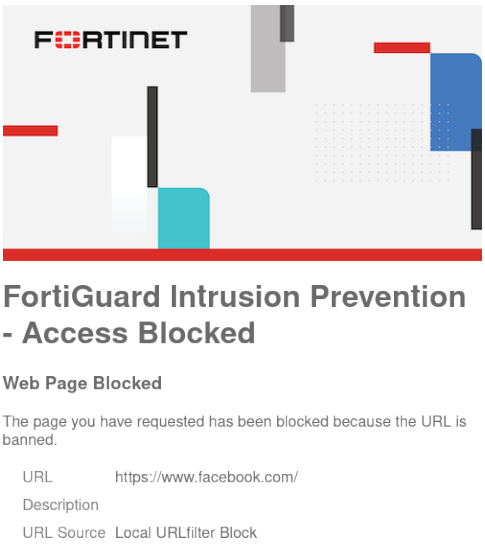
Configuring a URL filter in the CLI

To create a URL filter for Facebook:

```
config webfilter urlfilter
    edit 1
        set name "webfilter"
```

```
        config entries
            edit 1
                set url "*facebook.com"
                set type wildcard
                set action block
            next
        end
    next
end
```

To apply the URL filter to a web filter profile:



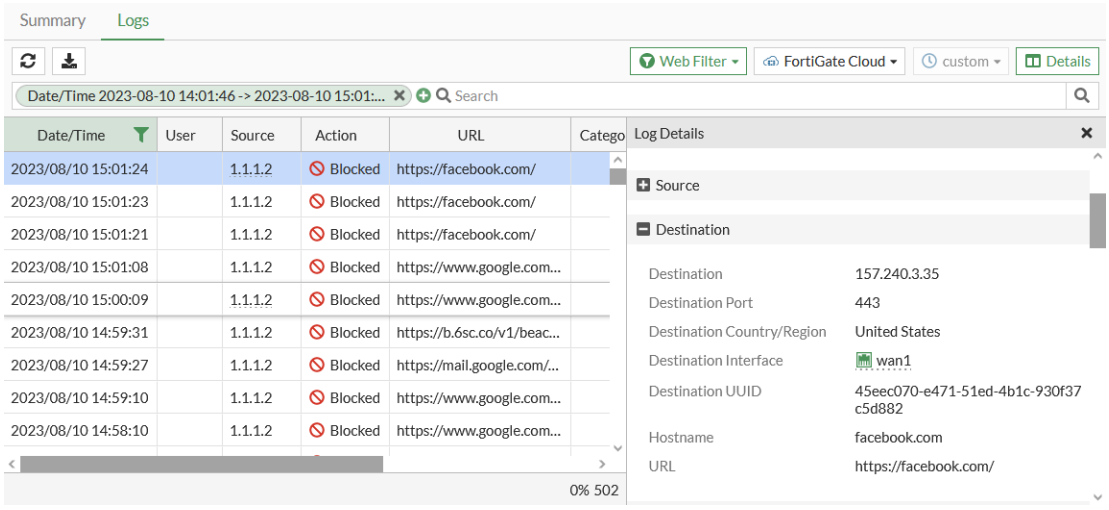
```
config webfilter profile
    edit "webfilter"
        config web
            set urlfilter-table 1
        end
        config ftgd-wf
            ...
        end
    next
end
```

To apply the web filter profile to a firewall policy:

```
config firewall policy
    edit 1
        set name "WF"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set logtraffic all
        set webfilter-profile "webfilter"
        set ssl-ssh-profile "certificate-inspection"
        set nat enable
    next
end
```

Verifying the URL filter results

Verify the URL filter results by going to a blocked website. For example, when you go to the Facebook website, the replacement message appears:



To customize the URL web page blocked message:

1. Go to *System* > *Replacement Messages*.
2. In the *HTTP* section, select *URL Block Page* and click *Edit*.
3. Edit the HTML to customize the message. See Replacement messages on page 2941 for more information.

To check web filter logs in the GUI:

1. Go to *Log & Report* > *Security Events*.
2. Click the *Web Filter* card name.
3. If there are a lot of log entries, click *Add Filter* and select *Event Type* > *urlfilter* to display logs generated by the URL filter.

To check web filter logs in the CLI:

```
# execute log filter category utm-webfilter
# execute log display

2: date=2023-08-10 time=15:02:25 eventtime=1691704944982929658 tz="-0700" logid="0315012544"
type="utm" subtype="webfilter" eventtype="urlfilter" level="warning" vd="root"

url="https://www.facebook.com/" sentbyte=812 rcvdbyte=0 direction="outgoing"
urlsource="Local URLfilter Block" msg="URL was blocked because it is in the URL filter list"
crscore=30 craction=8 crlevel="high"
```

FortiGuard filter

The FortiGuard filter enhances the web filter features by sorting billions of web pages into a wide range of categories that users can allow or block.

The FortiGuard Web Filtering service includes over 45 million individual website ratings that apply to more than two billion pages. When the FortiGuard filter is enabled in a web filter profile and applied to firewall policies, if a request for a web page appears in traffic controlled by one of the firewall policies, the URL is sent to the nearest FortiGuard server. The URL category or rating is returned. If the category is blocked, the FortiGate shows a replacement message in place of the requested page. If the category is not blocked, the page request is sent to the requested URL as normal.

To use this service, you must have a valid FortiGuard license.

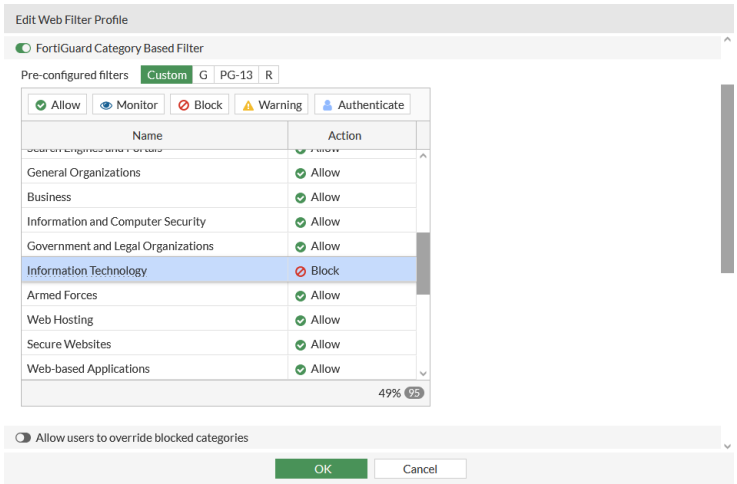
The following actions are available:

FortiGuard web filter action	Description
Allow	Permit access to the sites in the category.
Monitor	Permit and log access to sites in the category. User quotas can be enabled for this option (see Usage quota on page 1636).
Block	Prevent access to the sites in the category. Users trying to access a blocked site see a replacement message indicating the site is blocked.
Warning	Display a message to the user allowing them to continue if they choose.
Authenticate	Require the user to authenticate with the FortiGate before allowing access to the category or category group.
Disable	Remove the category from the from the web filter profile. This option is only available for local or remote categories from the right-click menu.

FortiGuard web filter categories

FortiGuard has many web filter categories, including two local categories and a special remote category. Refer to the following table for more information:

FortiGuard web filter category	Where to find more information
All URL categories	See Web Filter Categories.
Local categories	See Web rating override on page 1923.
Remote category	See Threat feeds on page 3388.



The priority of categories is local category > external category > FortiGuard built-in category. If a URL is configured as a local category, it only follows the behavior of the local category and not the external or FortiGuard built-in category.

Blocking a web category

The following example shows how to block a website based on its category. The Information Technology category (category 52) will be blocked.

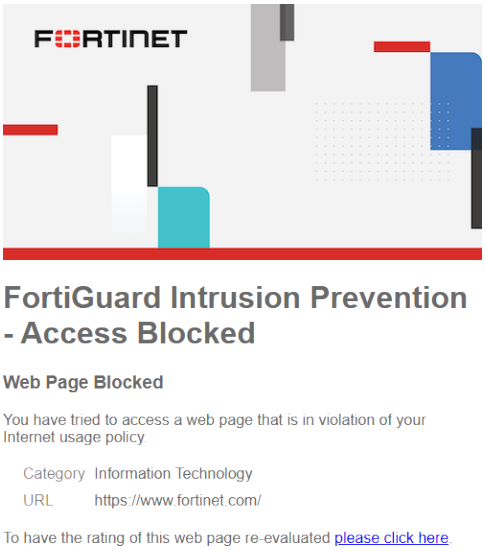
To block a category in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *FortiGuard category based filter* section, select *Information Technology*, then click *Block*.

3. Configure the remaining settings as needed.
4. Click *OK*.

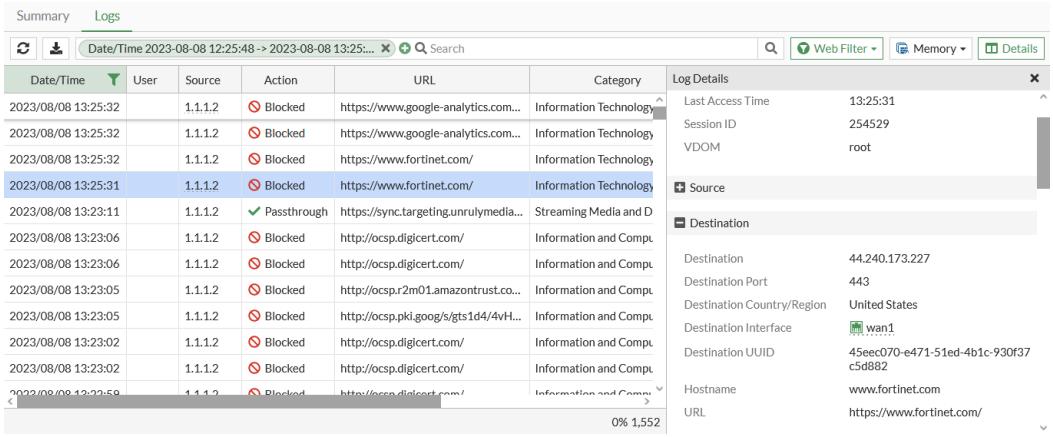
To block a category in the CLI:

```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
            unset options
            config filters
```



```
                edit 1
                    set category 52
                    set action block
                next
            end
        end
    next
end
```

You can use the `get webfilter categories` command to determine the web filtering category that corresponds to a given category ID.



To verify that the category is blocked:

1. Go to a website that belongs to the blocked category, such as www.fortinet.com.
   The page should be blocked and display a replacement message.

To view the log of a blocked website in the GUI:

1. Go to *Log & Report* > *Security Events*.
2. Click the *Web Filter* card name.

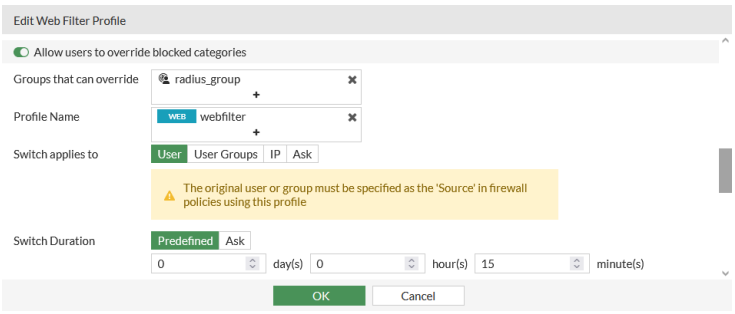
3. Select an entry with *blocked* in the *Action* column and click *Details*.
4. 

To view the log of a blocked website in the CLI:

```
# execute log filter category utm-webfilter
# execute log display

4: date=2023-08-08 time=13:25:31 eventtime=1691526331836645153 tz="-0700" logid="0316013056"
type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning" vd="root" policyid=1
poluuid="4a4b9d00-e471-51ed-71ec-c1a3bc8f773c" policytype="policy" sessionid=254529
srcip=1.1.1.2 srcport=60836 srccountry="Australia" srcintf="internal7" srcintfrole="lan"
srcuuid="45eec070-e471-51ed-4b1c-930f37c5d882" dstip=44.240.173.227 dstport=443
dstcountry="United States" dstintf="wan1" dstintfrole="wan" dstuuid="45eec070-e471-51ed-
4b1c-930f37c5d882" proto=6 service="HTTPS" hostname="www.fortinet.com" profile="default"
action="blocked" reqtype="direct" url="https://www.fortinet.com/" sentbyte=517 rcvdbyte=0
direction="outgoing" msg="URL belongs to a denied category in policy" ratemethod="domain"
cat=52 catdesc="Information Technology"
```

Allowing users to override blocked categories



There is an option to allow users with valid credentials to override blocked categories.

To allow users to override blocked categories in the GUI:

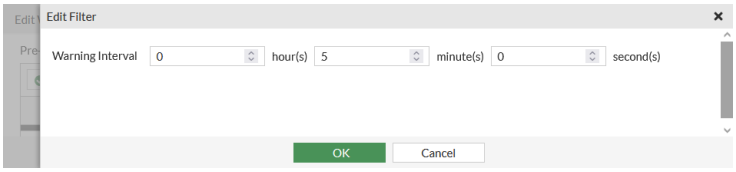
1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. Enable *Allow users to override blocked categories*.
3. Enter information in the following fields:

Groups that can override	Add the user group that will be allowed to override.
Profile Name	Add the web filter profile the overridden group will use. This cannot be the same profile as its own.
Switch applies to	Select *User*, *User Groups*, *IP*, or *Ask*.
Switch Duration	Select either *Predefined* to specify a duration, or *Ask* for user input.

4. Configure the other settings as needed.

5. Click *OK*.

To allow users to override blocked categories in the CLI:



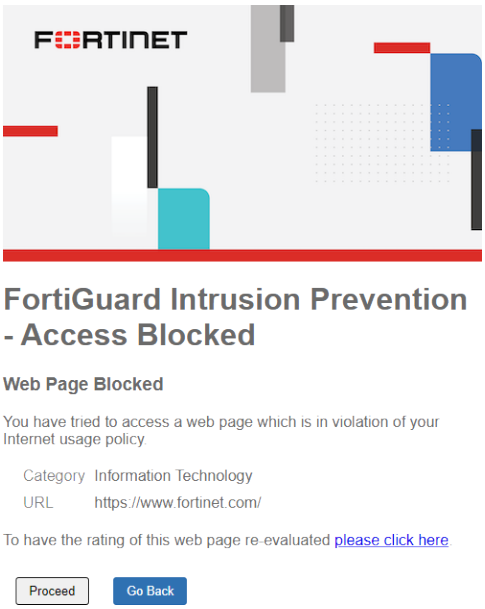
```
config webfilter profile
    edit "webfilter"
        set ovrd-perm bannedword-override urlfilter-override fortiguard-wf-override
contenttype-check-override
        config override
            set ovrd-user-group "radius_group"
            set profile "webfilter"
        end
        config ftgd-wf
            unset options
        end
    next
end
```

Issuing a warning on a web category

The following example shows how to issue a warning when a user visits a website in a specific category (Information Technology, category 52).

To configure a warning for a category in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *FortiGuard category based filter* section, select *Information Technology*, then click *Warning*.
3. Set the *Warning Interval*, then click *OK*.
   The warning interval is the amount of time until the warning appears again after the user proceeds past it.



4. Configure the remaining settings as needed.
5. Click *OK*.

To configure a warning for a category in the CLI:

```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
            unset options
            config filters
                edit 1
                    set category 52
                    set action warning
                next
            end
        end
    next
end
```

To verify that the warning works:

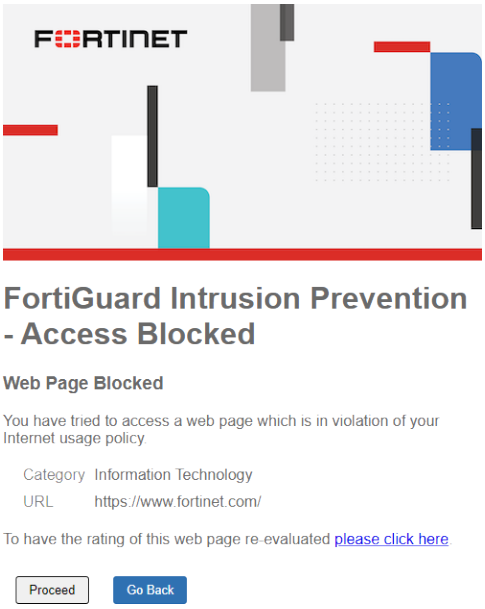
1. Go to a website that belongs to the category, such as www.fortinet.com.
2. On the warning page, click *Proceed* or *Go Back*.

Authenticating a web category

The following example shows how to authenticate a website based on its category (Information Technology, category 52).

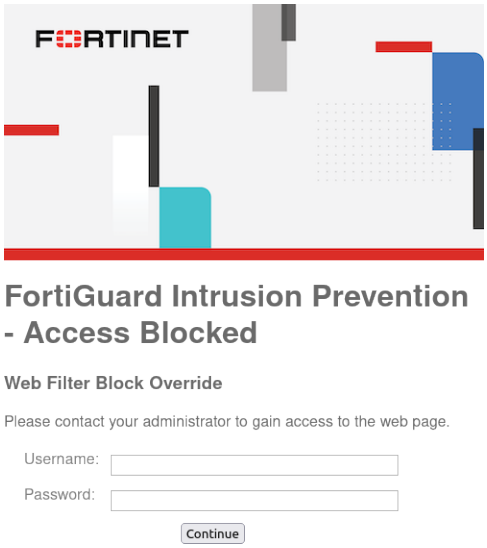
To authenticate a category in the GUI:

1. Go to *Security Profiles* > *Web Filter* and edit or create a new web filter profile.
2. In the *FortiGuard category based filter* section, select *Information Technology*, then click *Authenticate*.
3. Set the *Warning Interval* and select one or more user groups, then click *OK*.



4. Configure the remaining settings as needed.
5. Click *OK*.

To authenticate a category in the CLI:



```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
            unset options
            config filters
                edit 1
                    set category 52
                    set action authenticate
                    set auth-usr-grp "local_group"
                next
            end
        end
    next
end
```

To verify that you have configured authentication:

1. Go to a website that belongs to the category, such as www.fortinet.com.
2. On the warning page, click *Proceed*.

3. Enter the username and password for the configured user group, then click *Continue*.

Customizing the replacement message page

When the category action is *Block*, *Warning*, or *Authenticate*, you can customize the replacement message page that a user sees.

To customize the replacement message page:

1. Go to *Security Profiles* > *Web Filter* and edit or create a new web filter profile.
2. In the *FortiGuard category based filter* section, right-click on a category and select *Customize*.
3. Select a *Replacement Message Group*. See Replacement message groups on page 2945 for details.
4. Optionally, click *Edit FortiGuard Block Page* or *Edit FortiGuard Warning Page* to make modifications.
5. Click *Save*.
6. Configure the remaining settings as needed.
7. Click *OK*.

Customizing the CA certificate

When accessing a HTTPS webpage, in order to intercept the connection and perform an override, warning, or authentication, the connection must be proxied and the warning and/or authentication page must be signed with FortiGate's CA certificate. The client accessing the page must trust the CA in order to avoid certificate errors while browsing.

When applying the web filter profile to a firewall policy, an SSL inspection profile must also be selected.

To apply a custom certificate to the SSL inspection profile in the GUI:

1. Go to *Security Profiles* > *SSL/SSH Inspection* and click *Create New*, or edit an existing profile.
2. Under *SSL Inspection Options*, set *CA certificate* to the desired custom CA certificate.
3. Click *OK*.
4. On the client endpoints, ensure this custom CA is trusted.

To apply a custom certificate to the SSL inspection profile in the CLI:

```
config firewall ssl-ssh-profile
    edit <name>
        set caname <custom_CA_certificate>
    next
end
```

Credential phishing prevention

When credential phishing prevention is enabled, the FortiGate scans for corporate credentials submitted to external websites and compares them to sensitive credentials stored in the corporate domain controller. Based on the configured antiphishing rules in proxy mode web filter profiles, the FortiGate will block the URL or alert the user if the credentials match ones that are stored on the corporate domain controller.

- The corporate domain controller must be configured in the `domain controller`.
- For FortiGate to retrieve the domain information, the user needs to grant Replicating Directory Changes permissions in the Domain Controller (DC). See How to grant the "Replicating Directory Changes" permission for the Microsoft Metadirectory Services ADMA service account for more information.
- Credentials can be matched based on sAMAccountName, user principal name (UPN), or down-level logon name.
- The antiphishing profile defines the corporate domain controller, antiphishing check option, default action if no rules match, antiphishing status, and so on.
- Inspection entries in the profile define what action occurs when the submission request matches the specified FortiGuard categories.
- The profile scans for pre-defined and custom username and password fields in the HTTP request, such as `username`, `auth`, and `password`. You can evaluate custom fields by configuring custom patterns.
- The URL filter defines individual URLs that the antiphish action (block or log) is applied to when the URL submission request matches.

Web-based URL filter actions and FortiGuard category-based filtering have higher priority than antiphishing URL filter actions and FortiGuard filtering:

- If a request is blocked by the web-based URL filter or FortiGuard filter, there is no further antiphishing scanning. Antiphishing scanning only happens after the web-based URL filtes and FortiGuard filters allow the traffic.
- If a submission matches an entry in the URL filter table that has an antiphishing action, the defined action is taken. No further FortiGuard category-based rules are applied.
- Like firewall rules, the URL filter table and Fortiguard category-based antiphishing rules use a top-down priority. The rule that matches first is the one that is used.

In this example, URLs that match FortiGuard category 37 (social networking) will be blocked and other categories will be logged.

To configure credential phishing prevention:

1. Configure the corporate domain controller:

```
config user domain-controller
    edit "win2016"
        set hostname "win2016"
        set domain-name "corpserver.local"
        set username "Administrator"
        set password **********
        set ip <server_ip>
    next
end
```

The `hostname` and the `domain-name` are case sensitive.

2. Configure the antiphishing profile, which includes the FortiGuard category rule:

```
config webfilter profile
    edit <profile-name>
        set feature-set proxy
        ...
        config web
            ...
        end
        config antiphish
            set status enable
            set domain-controller "win2016"
            set default-action block
            set check-uri enable
            set check-basic-auth enable
            set max-body-len 65536
            config inspection-entries
                edit "inspect-37"
                    set fortiguard-category 37
                    set action block
                next
                edit "inspect-others"
                    set fortiguard-category all
                    set action log
                next
            end
            config custom-patterns
                edit "customer-name"
                    set category username
                next
                edit "customer-passwd"
                   set category password
                next
            end
        end
        ...
        set web-antiphishing-log enable
```

```
    next
end
```

- `check-uri` enables support for scanning HTTP GET URI parameters.
- `check-basic-auth` enables support for scanning the HTTP basic authentication field.

3. Configure the URL filter to scan specific URLs.

   The antiphish action is added to the URL filter table entry, and the URL filter is applied to the web filter profile:

```
config webfilter urlfilter
    edit 1
        set name "antiphish-table"
        config entries
            edit 1
                set url "www.example.com"
                set type simple
                set antiphish-action block
                set status enable
                set referrer-host ''
            next
        end
    next
end
config webfilter profile
    edit "<profile-name>"
        config web
            set urlfilter-table 1
        end
        ...
    next
end
```

4. Optionally, define custom patterns to scan fields other than the built-in username and password keywords:

```
config webfilter profile
    edit "<profile-name>"
        config custom-patterns
                edit "customer-name"
                    set category username
                next
                edit "customer-passwd"
                   set category password
                next
            end
        end
    next
end
```

Additional antiphishing settings

The following settings are available for antiphishing:

- Enable DNS service lookup in the domain controller so that the domain controller IP does not need to be configured. The DNS server will resolve the domain controller IP.
- Specify a source IP or port for the fetching domain controller.
- Use an LDAP server as a credential source (only the OpenLDAP server is supported).

- Block or log valid usernames regardless of password match.
- Use literal custom patterns type for username and password.
- Active Directory Lightweight Directory Services (AD LDS) support

Configuration examples

To enable DNS service lookup:

```
config user domain-controller
    edit "win2016"
        set ad-mode ds
        set dns-srv-lookup enable
        set hostname "win2016"
        set username "replicate"
        set password **********
        set domain-name "SMB2016.LAB"
    next
end
```

To specify the source IP and port for the fetching domain controller:

```
config user domain-controller
    edit "win2016"
        set ad-mode ds
        set hostname "win2016"
        set username "replicate"
        set password **********
        set ip-address 172.18.52.188
        set source-ip-address 172.16.100.1
        set source-port 2000
        set domain-name "SMB2016.LAB"

    next
end
```

To use an LDAP server as a credential store:

1. Configure the LDAP server:

```
config user ldap
    edit "openldap"
        set server "172.18.60.214"
        set cnid "cn"
        set dn "dc=qafsso,dc=com"
        set type regular
        set username "cn=Manager,dc=qafsso,dc=com"
        set password **********
        set antiphish enable
        set password-attr "userPassword"
    next
end
```

2. Configure the web filter profile:

```
    config webfilter profile
        edit "webfilter"
            set feature-set proxy
            config ftgd-wf
                unset options
                config filters
                    edit 1
                        set action block
                    next
                end
            end
            config antiphish
                set status enable
                config inspection-entries
                    edit "cat34"
                        set fortiguard-category 34
                        set action block
                    next
                end
                set authentication ldap
                set ldap "openldap"
            end
            set log-all-url enable
        next
    end
```

To configure username-only credential matching:

```
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
            unset options
            ...
        end
        config antiphish
            set status enable
            set check-username-only enable
            config inspection-entries
                edit "cat34"
                    set fortiguard-category 34
                    set action block
                next
            end
            set domain-controller "win2016"
        end
        set log-all-url enable
    next
end
```

To configure different custom pattern types for usernames and passwords:

```
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
```

```
            unset options
            ...
        end
        config antiphish
            set status enable
            config inspection-entries
                edit "cat34"
                    set fortiguard-category 34
                    set action block
                next
            end
            config custom-patterns
                edit "qwer"
                    set type literal
                next
                edit "[0-6]Dat*"
                next
                edit "dauw9"
                    set category password
                    set type literal
                next
                edit "[0-5]foo[1-4]"
                    set category password
                next
            end
            set domain-controller "win2016"
        end
        set log-all-url enable
    next
end
```

In this example, the `qwer` and `dauw9` entries use the literal type, while `[0-6]Dat*` and `[0-5]foo[1-4]` use the default regex type.

To configure Active Directory in LDS mode:

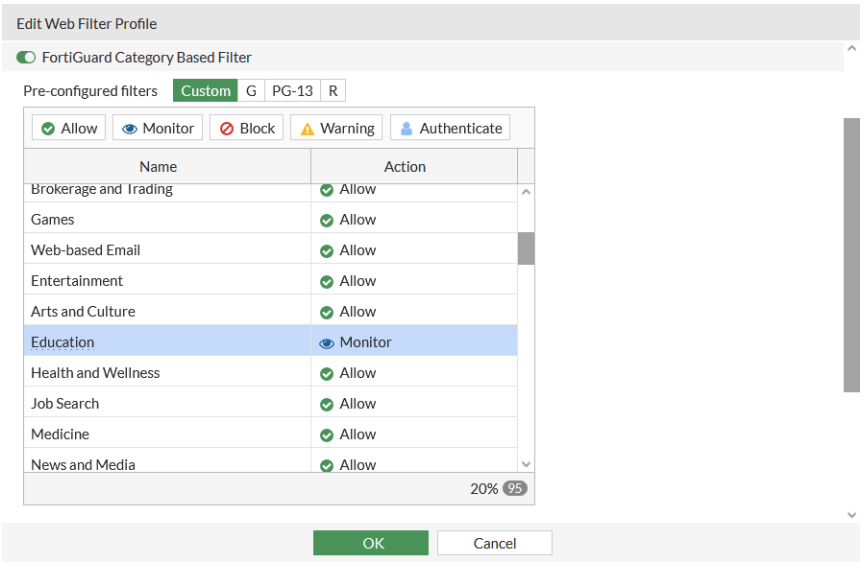
```
config user domain-controller
    edit "win2016adlds"
        set hostname "win2016adlds"
        set username "foo"
        set password **********
        set ip-address 192.168.10.9
        set domain-name "adlds.local"
        set ad-mode lds
        set adlds-dn "CN=adlds1part1,DC=ADLDS,DC=COM"
        set adlds-ip-address 192.168.10.9
        set adlds-port 3890
    next
end
```

Usage quota

In addition to using category and classification blocks and overrides to limit user access to URLs, you can set a daily quota by category, category group, or classification. Quotas allow access for a specified length of time or a specific

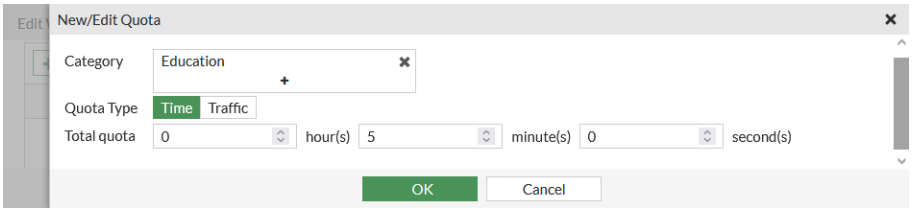
bandwidth, and are calculated separately for each user. Quotas are reset daily at midnight.

Quotas can be set for the *Monitor*, *Warning*, or *Authenticate* actions. Once the quota is reached, the traffic is blocked and the replacement message page displays.



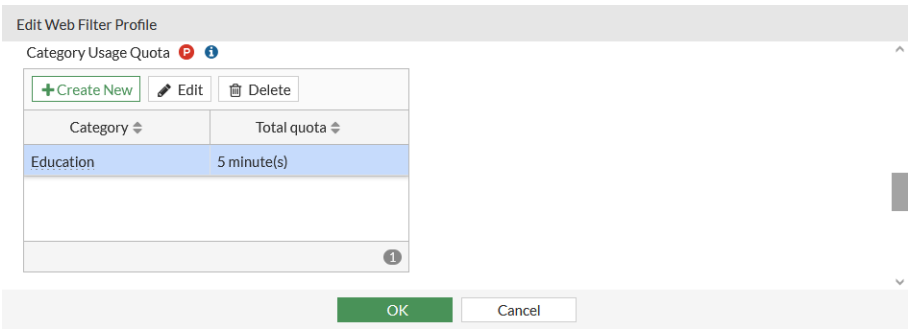
Quotas are only available in proxy-based inspection mode.

Configuring a quota



The following example shows how to set a time quota for the education category (category 30).

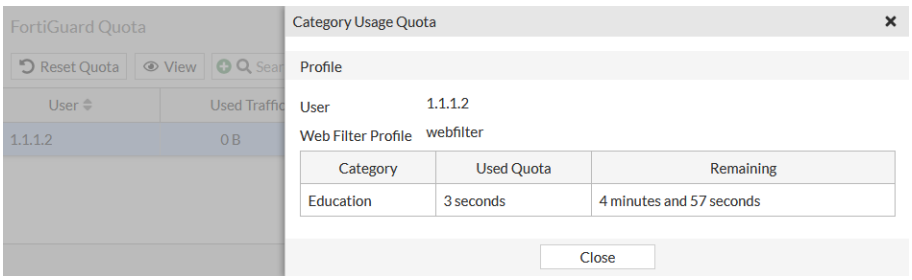
To configure a quota in the GUI:



1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. For *Feature set*, select *Proxy-based*.
3. In the *FortiGuard category based filter* section, scroll to the *General Interest - Personal* and click the + to expand the section.
4. Select *Education*, then click *Monitor*.

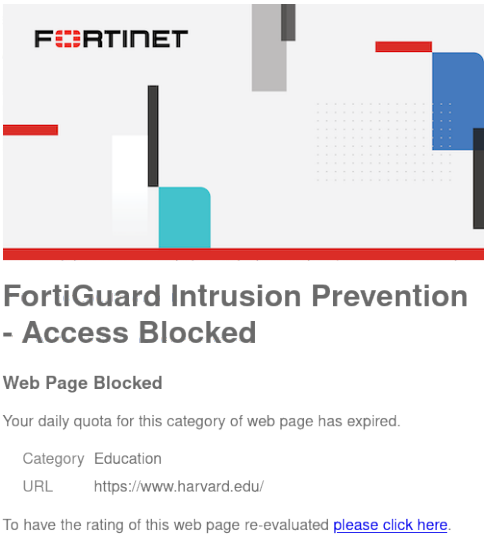
5. In the *Category Usage Quota* section, click *Create New*.
   The *New/Edit Quota* pane opens.
6. In the *Category* field, select *Education*.
7. For the *Quota Type*, select *Time* and set the *Total quota* to 5 minutes.

8. Click *OK*. The entry appears in the table.



9. Configure the other settings as needed.
10. Click *OK*.

To configure a quota in the CLI:



```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
           unset options
           config filters
              edit 1
                 set category 30
              next
           end
           config quota
              edit 1
                 set category 30
                 set type time
                 set duration 5m
              next
           end
        end
    next
end
```

To verify the quota usage:

1. Go to a website that belongs to the education category, such https://www.harvard.edu/. You can view websites in that category at the moment.
2. In FortiOS, go to *Dashboard* > *FortiGuard Quota Monitor* to check the used and remaining time.

3. When the quota reaches its limit, traffic is blocked and the replacement page displays.

Web content filter

You can control access to web content by blocking webpages containing specific words or patterns. This helps to prevent access to pages with questionable material. You can specify words, phrases, patterns, wildcards, and regular expressions to match content on webpages. You can use multiple web content filter lists and select the best one for each web filter profile.

The maximum number of web content patterns in a list depends on the model of the device. To find the maximum number of web content patterns allowed for a device, go to the Maximum Values Table (https://docs.fortinet.com/max-value-table). Select the software version and models, and click *Go*. Maximum values are displayed. In the *Search* box, enter *webfilter.content:entries* to find the maximum number.

When configuring a web content filter list, the following patterns are available:

Web content pattern type	Description
Wildcard	Use this setting to block or exempt one word or text strings of up to 80 characters. You can also use wildcard symbols such as *?* or * to represent one or more characters. For example, a wildcard expression *forti*.com* matches *fortinet.com* and *fortiguard.com*. The * represents any character appearing any number of times.
Regular expression	Use this setting to block or exempt patterns of regular expressions that use some of the same symbols as wildcard expressions, but for different purposes. In regular expressions, * represents the character before the symbol. For example, *forti*.com* matches *fortiii.com* but not *fortinet.com* or *fortiice.com*. In this case, the symbol * represents *i* appearing any number of times.

Content evaluation

The web content filter scans the content of every webpage that is accepted by a firewall policy. The system administrator can specify banned words and phrases and attach a numerical value (or score) to the importance of those words and

phrases. When the web content filter scan detects banned content, it adds the scores of banned words and phrases found on that page. If the sum is higher than a threshold set in the web filter profile, the FortiGate blocks the page.

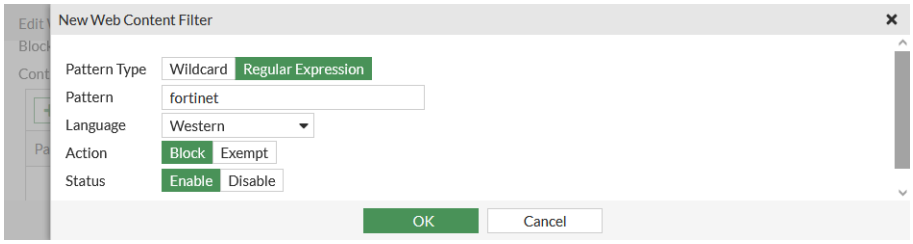
The default score for web content filter is 10 and the default threshold is 10. This means that by default, a webpage is blocked by a single match. These settings can only be configured in the CLI.

Banned words or phrases are evaluated according to the following rules:

- The score for each word or phrase is counted only once, even if that word or phrase appears many times in the webpage.
- The score for any word in a phrase without quotation marks is counted.
- The score for a phrase in quotation marks is counted only if it appears exactly as written.

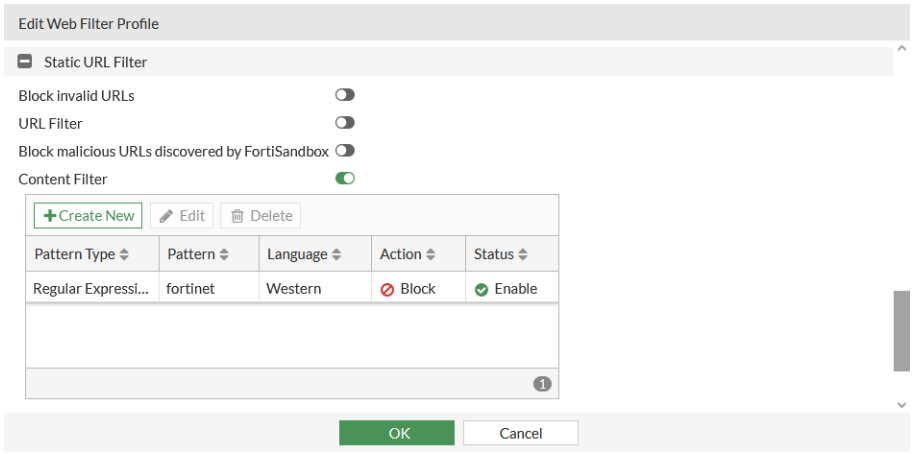
The following table is an example of how rules are applied to the webpage contents . For example, a webpage contains only this sentence:

The score for each word or phrase is counted only once, even if that word or phrase appears many times in the webpage.



Banned pattern	Assigned score	Score added to the sum for the entire page	Threshold score	Comment
word	20	20	20	Appears twice but is only counted once. The webpage is blocked.
word phrase	20	40	20	Each word appears twice but is only counted once, giving a total score of 40. The webpage is blocked.
word sentence	20	20	20	*word* appears twice and *sentence* does not appear, but since any word in a phrase without quotation marks is counted, the score for this pattern is 20. The webpage is blocked.
"word sentence"	20	0	20	This phrase does not appear exactly as written. The webpage is allowed.
"word or phrase"	20	20	20	This phrase appears twice but is only counted once. The webpage is blocked.

To configure a web content filter in the GUI:



1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *Content Filter*.
3. In the table, click *Create New*. The *New Web Content Filter* pane opens.
4. Configure the following settings:

Pattern Type	Regular Expression
Pattern	fortinet
Language	Western

Action	Block
Status	Enable

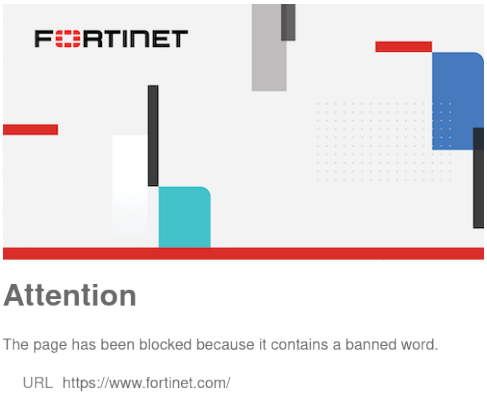
5. Click *OK*. The entry appears in the table.

6. Configure the other settings as needed.
7. Click *OK*.

To configure a web content filter in the CLI:

1. Create the content (banned word) table:

```
config webfilter content
   edit 1
      set name "webfilter"
      config entries
         edit "fortinet"
           set pattern-type regexp
           set status enable
           set lang western
           set score 10
           set action block
         next
      end
   next
end
```



2. Apply the content table to the web filter profile:

```
config webfilter profile
   edit "webfilter"
      config web
```

```
            set bword-threshold 10
            set bword-table 1
        end
        config ftgd-wf
            unset options
        end
    next
end
```

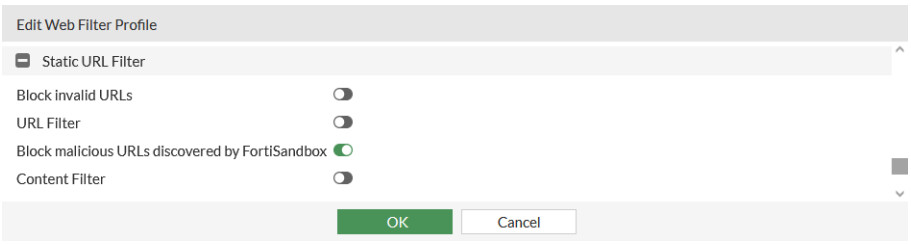
To verify the content filter:

1. Go to a website with the word *fortinet*, such as www.fortinet.com.
   The website is blocked and a replacement page displays:

Advanced filters 1

This topic gives examples of the following advanced filter features:

- Block malicious URLs discovered by FortiSandbox on page 1642
- Allow websites when a rating error occurs on page 1643
- Rate URLs by domain and IP address on page 1643
- Block invalid URLs on page 1644



Block malicious URLs discovered by FortiSandbox

This setting blocks malicious URLs that FortiSandbox finds. Your FortiGate must be connected to a registered FortiSandbox.

For information on configuring FortiSandbox, see Using FortiSandbox post-transfer scanning with antivirus on page 1585 and Using FortiSandbox inline scanning with antivirus on page 1587.

To block malicious URLs discovered by FortiSandbox in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *Block malicious URLs discovered by FortiSandbox*.

3. Click *OK*.

To block malicious URLs discovered by FortiSandbox in the CLI:

```
config webfilter profile
    edit "webfilter"
        config web
            set blocklist enable
        end
    next
end
```

Allow websites when a rating error occurs

If you do not have a FortiGuard license, but you have enabled services that need a FortiGuard license (such as FortiGuard filter), then you will get a rating error message.

Use this setting to allow access to websites that return a rating error from the FortiGuard Web Filter service.

To allow websites with rating errors in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Rating Options* section, enable *Allow websites when a rating error occurs*.
3. Click *OK*.

To allow websites with rating errors in the CLI:

```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
            set options error-allow
        end
    next
end
```

Rate URLs by domain and IP address

If you enable this setting, in addition to only sending domain information to FortiGuard for rating, the FortiGate always sends both the URL domain name and the TCP/IP packet's IP address (except for private IP addresses) to FortiGuard for the rating.

The FortiGuard server might return a different category of IP address and URL domain. If they are different, the FortiGate uses the rating weight of the IP address or domain name to determine the rating result and decision. This rating weight is hard-coded in FortiOS.

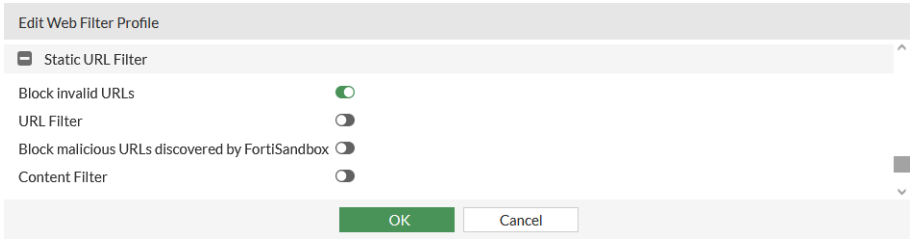
For example, if we use a spoof IP of Google as www.irs.gov, the FortiGate will send both the IP address and domain name to FortiGuard to get the rating. We get two different ratings: one is the search engine and portals that belong to the Google IP, the second is the government and legal organizations that belongs to www.irs.gov. Because the search engine and portals rating has a higher weight than government and legal organizations, the traffic is rated as search engine and portals.

To rate URLs by domain and IP address in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Rating Options* section, enable *Rate URLs by domain and IP address*.
3. Click *OK*.

To rate URLs by domain and IP address in the CLI:

```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
            set options rate-server-ip
        end
    next
end
```



Block invalid URLs

Use this setting to block websites when their SSL certificate CN field does not contain a valid domain name.

This option also blocks URLs that contains spaces. If there is a space in the URL, it must be written as *%20* in the URL path.

To block invalid URLs in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *Block invalid URLs* .

3. Click *OK*.

To block invalid URLs in the CLI:

```
config webfilter profile
    edit "webfilter"
        set options block-invalid-url
    next
end
```

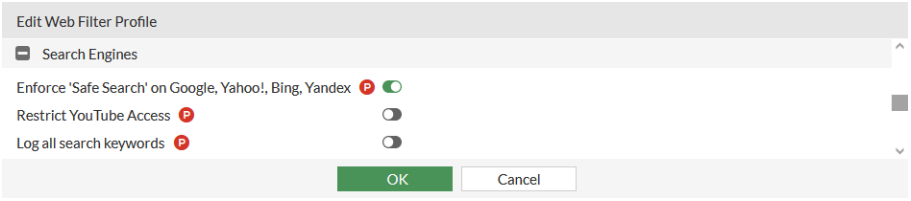
Advanced filters 2

This topic gives examples of the following advanced filter features:

- Safe search on page 1645
- Restrict YouTube access on page 1646
- Log all search keywords on page 1647
- Restrict Google account usage to specific domains on page 1647
- HTTP POST action on page 1648
- Remove Java applets, ActiveX, and cookies on page 1648

These advanced filters are only available in proxy-based inspection mode.

Safe search



This setting applies to popular search sites and prevents explicit websites and images from appearing in search results.

The supported search sites are:

- Google
- Yahoo
- Bing
- Yandex

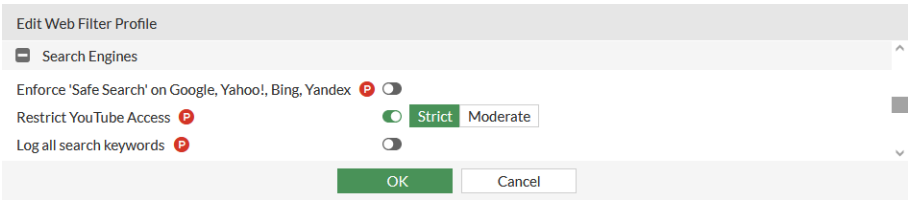
To enable safe search in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Search Engines* section, enable *Enforce 'Safe Search' on Google, Yahoo!, Bing, Yandex*.

3. Click *OK*.

To enable safe search in the CLI:

```
config webfilter profile
    edit "webfilter"
        config web
            set safe-search url header
        end
    next
end
```



Restrict YouTube access

The *Restrict YouTube access* setting in the video filter profile adds the HTTP header `YouTube-Restrict: Strict` or `YouTube-Restrict: Moderate` into the HTTP request when enabled. When YouTube reads this header, it applies the appropriate content restriction based on the selected mode. YouTube Restricted Mode is an optional setting that filters out potentially mature videos while leaving a large number of videos still available (see Restrict YouTube content available to users and Manage your organization's YouTube settings for more information). Google defines the restricted YouTube access modes as follows:

- Strict Restricted YouTube access: this setting is the most restrictive. Strict Restricted Mode does not block all videos, but works as a filter to screen out many videos based on an automated system, while leaving some videos still available for viewing.
- Moderate Restricted YouTube access: this setting is similar to Strict Restricted Mode but makes a much larger collection of videos available.

To restrict YouTube access in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Search Engines* section, enable *Restrict YouTube Access* and select either *Strict* or *Moderate*.

3. Click *OK*.

To restrict YouTube access in the CLI:

```
config webfilter profile
    edit <name>
        config web
            set set youtube-restrict {none | strict | moderate}
        end
    next
end
```

Vimeo access

The file filter profile includes a setting to restrict Vimeo access, which can only be configured in the CLI.

To restrict Vimeo access:

```
config webfilter profile
    edit <name>
        config web
            set vimeo-restrict {7 | 134}
        end
    next
end
```

`vimeo-restrict {7 | 134}`	Set the Vimeo restriction: • 7: do not show mature content • 134: do not show unrated and mature content

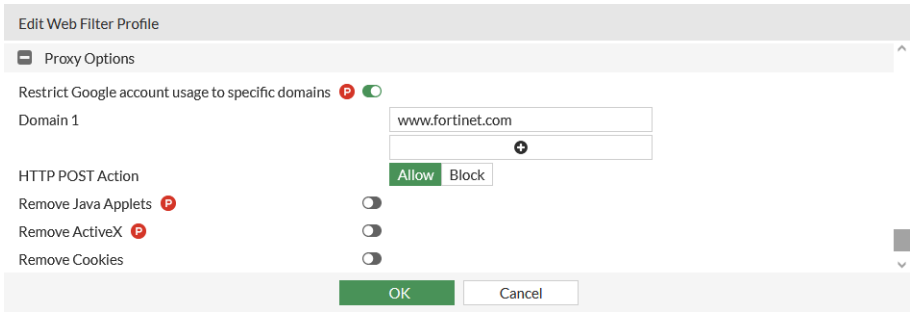
Log all search keywords

Use this setting to log all search phrases.

To enable logging search keywords in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Search Engines* section, enable *Log all search keywords*.
3. Click *OK*.

To enable logging search keywords in the CLI:



```
config webfilter profile
    edit "webfilter"
        config web
            set log-search enable
        end
    next
end
```

Restrict Google account usage to specific domains

Use this setting to block access to certain Google accounts and services, while allowing access to accounts with domains in the exception list.

To enable Google account restriction:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Proxy Options* section, enable *Restrict Google account usage to specific domains*.
3. Click the + and enter the domains that Google can access, such as www.fortinet.com.

4. Click *OK*.

When you try to use Google services like Gmail, only traffic from the domain of www.fortinet.com can go through. Traffic from other domains is blocked.

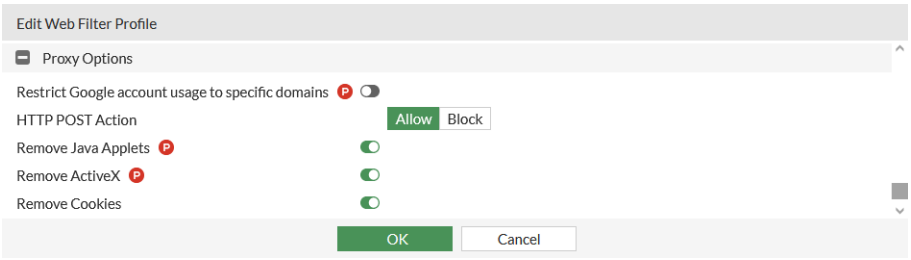
HTTP POST action

Use this setting to select the action to take with HTTP POST traffic. HTTP POST is the command used by the browser when you send information, such as a completed form or a file you are uploading to a web server. The action options are allow or block. The default is allow.

To configure HTTP POST in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Proxy Options* section, for *HTTP POST Action*, select *Allow* or *Block*.
3. Click *OK*.

To configure HTTP POST in the CLI:



```
config webfilter profile
    edit "webfilter"
        set post-action {normal | block}
        config ftgd-wf
            unset options
        end
    next
end
```

Remove Java applets, ActiveX, and cookies

Web filter profiles have settings to filter Java applets, ActiveX, and cookies from web traffic. Note that if these filters are enabled, websites using Java applets, ActiveX, and cookies might not function properly.

To enable these filters in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile. and go to the *Proxy Options* section.
2. In the *Proxy Options* section, enabled the filters you want to use: *Remove Java Applets*, *Remove ActiveX*, or *Remove Cookies*.

To enable these filters in the CLI:

```
config webfilter profile
   edit "webfilter"
      set options {activexfilter cookiefilter javafilter}
      config ftgd-wf
         unset options
```

```
      end
   next
end
```

Web filter statistics

FortiOS provides diagnostics commands to view web filter statistics reports, which are either proxy-based or flow-based. The commands are available in both VDOM and global command lines.

Proxy-based web filter statistics report

Use the `diagnose wad filter vd {<VDOM> | global}` command to filter for per-VDOM or global statistics reports.

In the following example, there are two VDOMs (root and vdom1) using proxy-based policies that have web filter profiles enabled.

To view per-VDOM statistics reports:

```
(global) # diagnose wad filter vd root
Drop_unknown_session is enabled.

(global) # diagnose wad stats filter list
filtering of vdom root
  dlp          = 0
  content-type = 0
  urls:
    examined = 6
    allowed = 3
    blocked = 0
    logged = 0
    overridden = 0

(global) # diagnose wad filter vd vdom1
(global) # diagnose wad stats filter list
filtering of vdom vdom1
  dlp          = 0
  content-type = 0
  urls:
    examined = 13
    allowed = 2
    blocked = 9
    logged = 8
    overridden = 0

(global) # diagnose wad filter vd ALL
(global) # diagnose wad stats filter list
filtering of all accessible vdoms
  dlp          = 0
  content-type = 0
  urls:
    examined = 19
    allowed = 5
    blocked = 9
```

```
        logged = 8
        overridden = 0
```

Flow-based web filter statistics report

Use the `diagnose webfilter stats list {<VDOM> | global}` command to check the flow-based web filter statistics.

In the following example, the VDOM is using flow-based policies that have web filter profiles enabled.

To view web filter statistics:

```
# diagnose webfilter stats list root
Proxy/flow URL filter stats:
request:   9474
blocked:   8606
allowed:   868
overridden:0
logged:    8606
pending:   0
```

URL certificate blocklist

As increasing numbers of malware have started to use SSL to attempt to bypass IPS, maintaining a fingerprint-based certificate blocklist is useful to block botnet communication that relies on SSL.

This feature adds a dynamic package that is distributed by FortiGuard and is part of the Web Filtering service. It is enabled by default for SSL/SSH profiles, and can be configured using the following CLI commands:

```
config vdom
    edit <vdom>
        config firewall ssl-ssh-profile
            edit "certificate-inspection"
                set block-blocklisted-certificates enable
            next
            edit "deep-inspection"
                set block-blocklisted-certificates enable
            next
        end
    next
end
```

Websense Integrated Services Protocol

Websense Integrated Services Protocol (WISP) servers can be used server, which allows the FortiGate to send traffic to the third-party web filtering service for rating and approval checking.

When WISP is enabled, the FortiGate maintains a pool of TCP connections to the WISP server. The TCP connections are used to forward HTTP request information and log information to the WISP server and receive policy decisions.

When a WISP server is used in a web filter profile, in flow or proxy mode, the following web filter scanning priority sequence is used:

1. Local URL filter
2. Websense web filtering service
3. FortiGuard web filtering service

The following example uses a WISP server configured in a flow mode web filter profile.

To use a WISP server in flow mode:

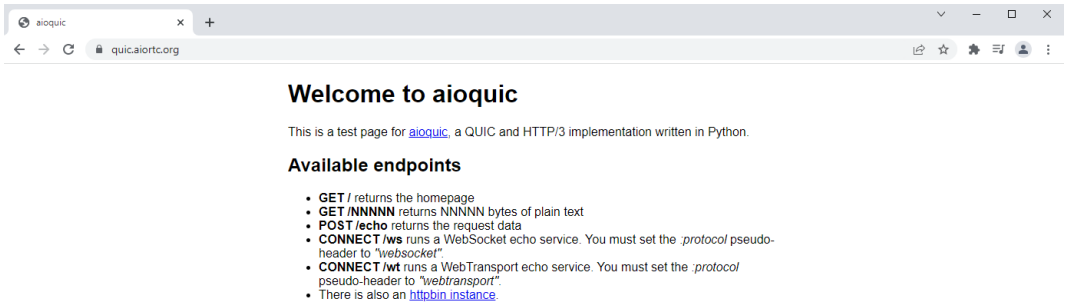
1. Configure the WISP servers:

```
config web-proxy wisp
    edit "wisp1"
        set server-ip 10.2.3.4
    next
    edit "wisp2"
        set server-ip 10.2.3.5
    next
    edit "wisp3"
        set server-ip 192.168.1.2
    next
    edit "wisp4"
        set server-ip 192.168.3.4
    next
end
```

2. Configure the web filter profile:

```
config webfilter profile
    edit "webfilter_flowbase"
        set feature-set flow
        config ftgd-wf
            unset options
            config filters
                edit 64
                    set category 64
                    set action block
                next
            end
        end
        set wisp enable
        set wisp-servers "wisp1" "wisp2"
        set wisp-algorithm {primary-secondary | round-robin | auto-learning}
        set log-all-url enable
    next
end
```

Inspecting HTTP3 traffic



HTTP/3 traffic can be inspected on the FortiGate in flow mode inspection.

When using Chrome, the browser may switch the HTTP/3 connection to HTTP/2 when deep inspection is applied, due to its sensitivity to delays caused by deep inspection.

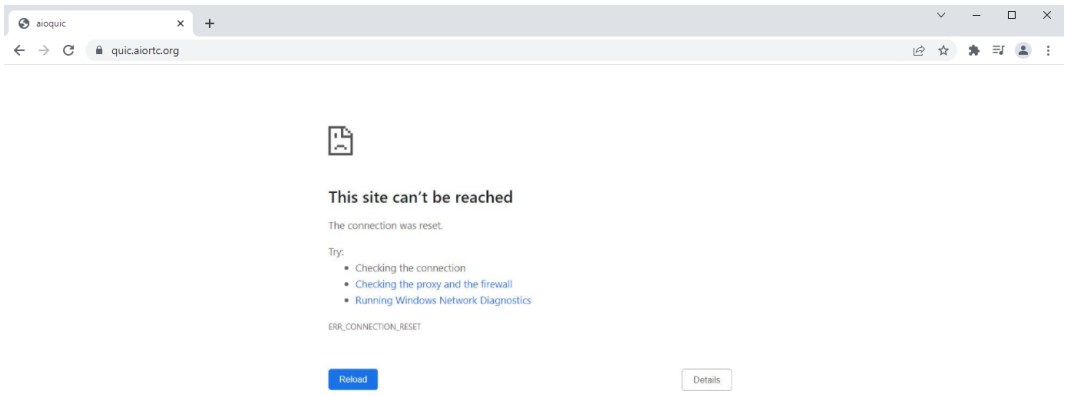
Example

In this example, a web filter profile is created to block the words *Welcome to aioquic*, which appear in a website that uses HTTP/3.

To block content in HTTP/3 traffic:

1. Configure the web filter banned word table:

```
config webfilter content
    edit 1
        set name "aioquic"
        config entries
            edit "Welcome to aioquic"
                set status enable
            next
        end
    next
end
```



2. Apply the banned word table in the web filter profile:

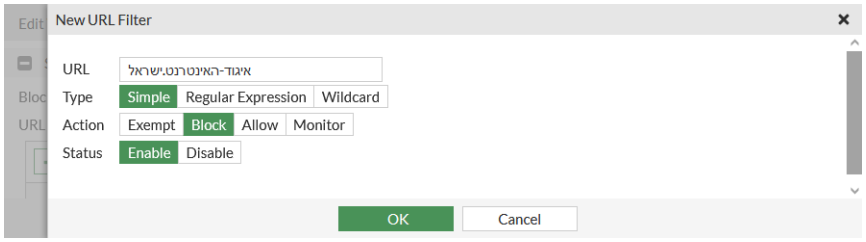
```
config webfilter profile
    edit "flow-webfilter"
        config web
            set bword-table 1
        end
        config ftgd-wf
            unset options
        end
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 1
        set utm-status enable
        set ssl-ssh-profile "deep-inspection"
        set webfilter-profile "flow-webfilter"
        set logtraffic all
        set nat enable
    next
end
```

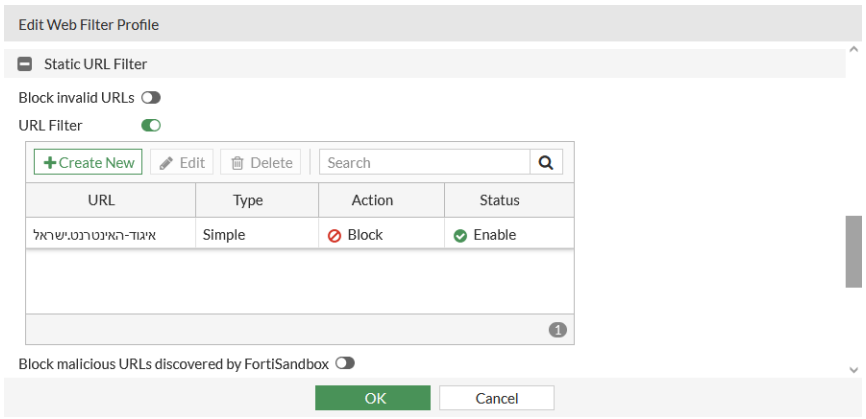
4. Access the website using a supported HTTP/3 client, such as Chrome or Firefox. The website is blocked by the FortiGate.

Configuring web filter profiles with Hebrew domain names



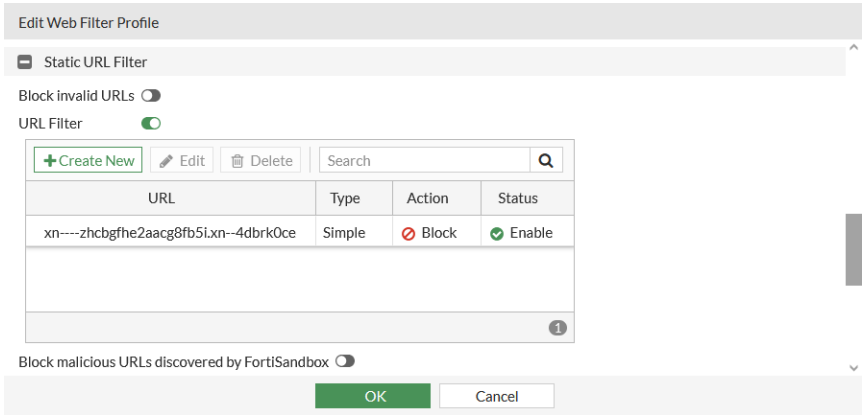
The domain name URLs in web filter profiles can be configured with non-ASCII characters, such as in Hebrew. Any configured domain name in non-ASCII characters is encoded into Punycode format, then the domain name in Punycode format is used to match the domain name in the HTTP request for URL filtering purposes.

In the following example, a Hebrew URL (`אינטרנט.ישראל`) is blocked in by a static URL filter. The URL translates to:



- `xn----zhcbgfhe2aacg8fb5i.xn--4dbrk0ce` in Punycode
- `en.isoc.org.il` in English

To configure the web filter profile in the GUI:

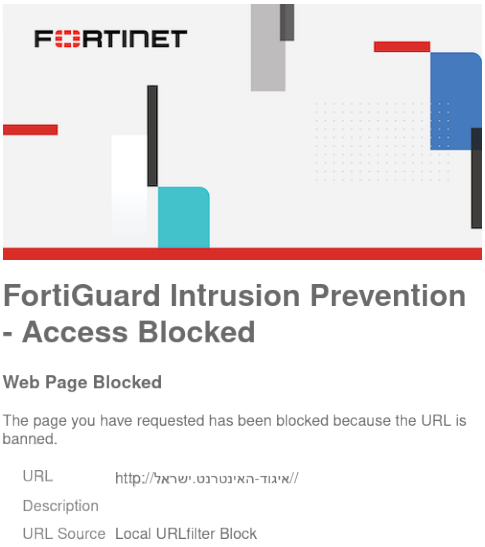


1. Go to *Security Profiles* > *Web Filter* and click *Create New*.
2. Enter a profile *Name*.
3. In the *Static URL Filter* section, enable *URL Filter* and click *Create New*.
4. Enter the Hebrew URL and set the *Action* to *Block*. The URL can be entered in Hebrew.

5. Click *OK* to save the filter. The URL appears in Hebrew in the URL filter table.

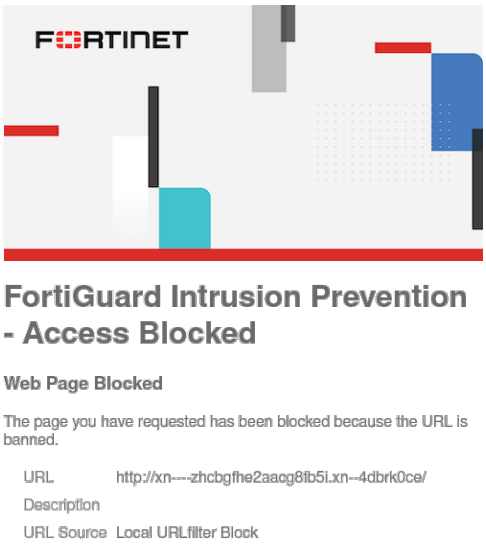
6. Click *OK* to save the web filter profile.
7. Edit the web filter profile. The URL in the table has been converted by the FortiGate into Punycode.

In the CLI, Punycode must be used to configure the Hebrew URL.



To configure the web filter profile in the CLI:

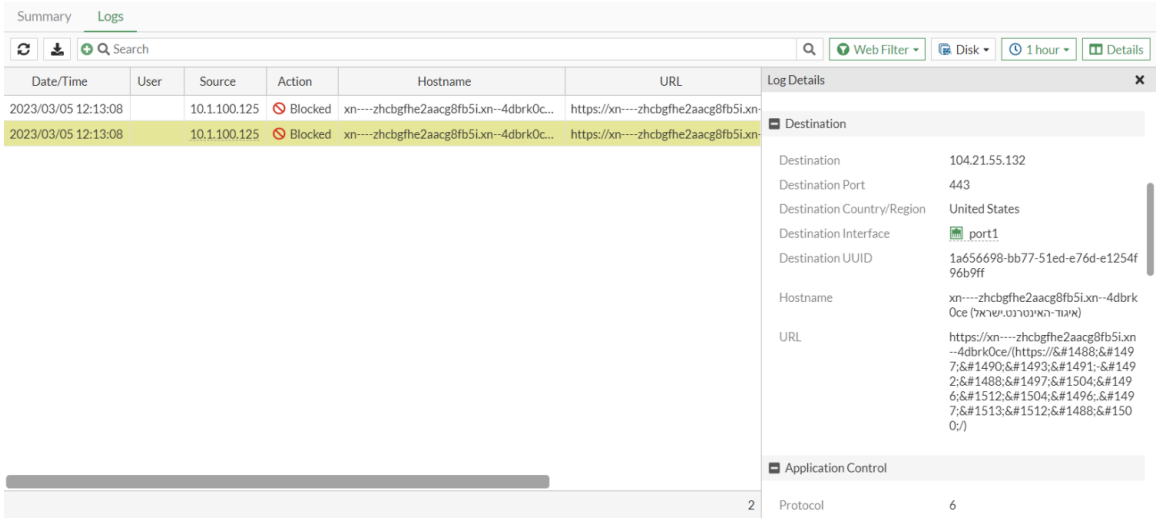
```
config webfilter urlfilter
    edit 1
        set name "Auto-webfilter-urlfilter_0wedo5f1c"
        config entries
            edit 1
                set url "xn----zhcbgfhe2aacg8fb5i.xn--4dbrk0ce"
                set action block
            next
        end
    next
end
```



To verify the configuration:

1. From a client, access the Hebrew URL over HTTPS. The website is blocked by the FortiGate.
2. The content of the replacement message displayed in the browser depends on the inspection mode.

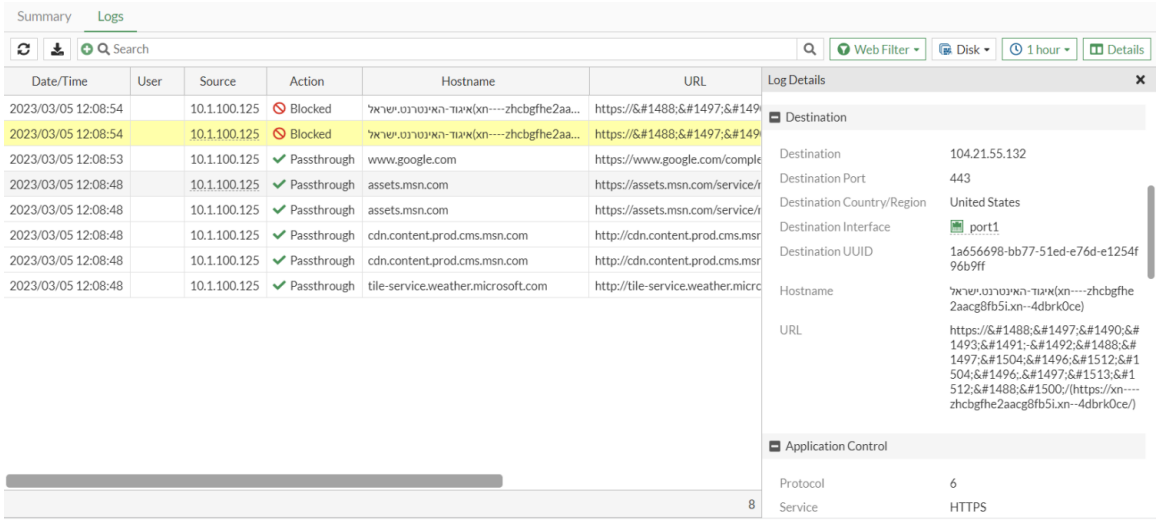
- In flow mode (current configuration), the URL is displayed in Hebrew.



- In proxy mode, the URL is displayed in Punycode.

To verify the logs:

1. Go to *Log & Report* > *Security Events* and select the *Web Filter* card.
2. Select a log and click *Details*. The format of the *Hostname* and *URL* fields depends on the inspection mode.
   - In flow mode, the *Hostname* is displayed in Punycode with Hebrew in parentheses. The *URL* is displayed Punycode.



When the log file is downloaded, the hostname in the raw file cannot be displayed. Paste the log into a text editor (such as Word or Notepad) to view the URL in Hebrew.

```
# execute log display
2 logs found.
2 logs returned.

```

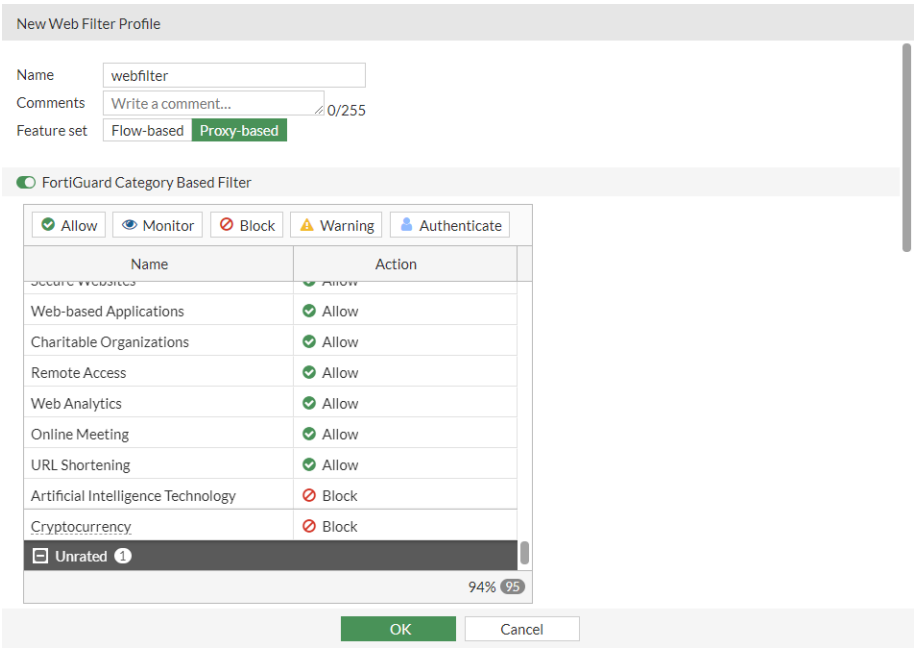
If a FortiGuard category-based filter is configured in a web filter profile, the same behavior for replacement messages and logs applies based on the inspection mode.



Configuring web filter profiles to block AI and cryptocurrency

The following FortiGuard web filter categories are available:

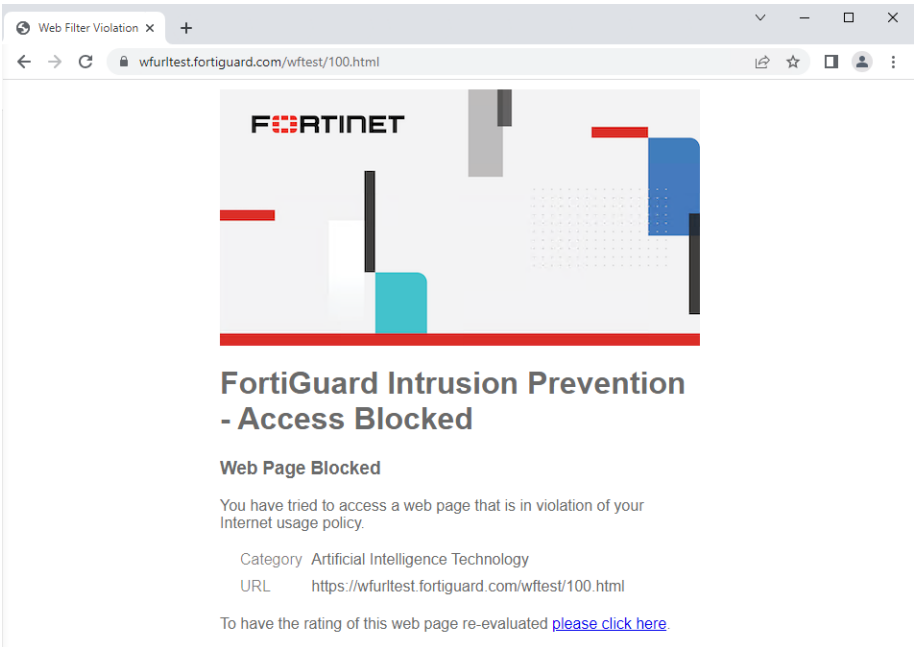
- Artificial intelligence technology (category 100): sites that offer solutions, insights, and resources related to artificial intelligence (AI).
- Cryptocurrency (category 101): sites that specialize in digital or virtual currencies that are secured by cryptography and operate on decentralized networks.

To configure a web filter profile to block the AI and cryptocurrency categories in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*.
2. Enter a name for the web filter profile.
3. In the category table, locate the *General Interest - Business* section. Select the *Artificial Intelligence Technology* and *Cryptocurrency* categories, and set the *Action* to *Block*.

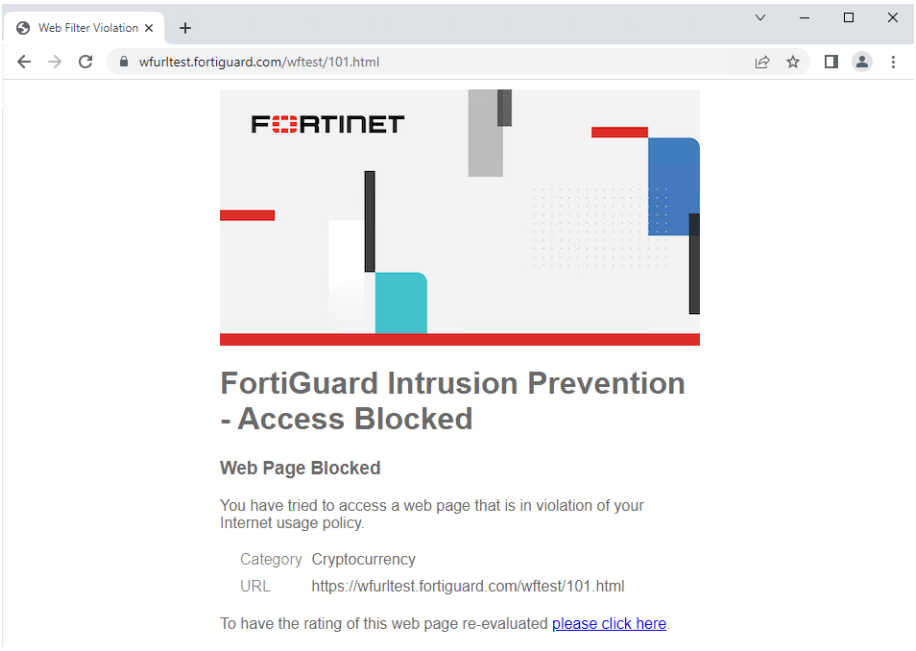
4. Configure the remaining settings as needed.
5. Click *OK*.

To configure a web filter profile to block the AI and cryptocurrency categories in the CLI:



```
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
```

```
            unset options
            config filters
                edit 100
                    set category 100
                    set action block
                next
                edit 101
                    set category 101
                    set action block
                next
                edit 52
                    set category 52
                next
            end
        end
        set log-all-url enable
    next
end
```



To verify that the categories are blocked:

1. Apply the web filter profile in a firewall policy.
2. On a device that is connected through the FortiGate and uses the policy, visit the test URLs for each category:
   a. `http://wfurltest.fortiguard.com/wftest/100.html`
   b. `http://wfurltest.fortiguard.com/wftest/101.html`

   The browser displays a replacement message that the URL is blocked based on the FortiGuard category.
   - Artificial intelligence technology:

- Cryptocurrency:

To verify the web filter logs:

1. In the GUI, go to *Log & Report* > *Security Events* and click *Web Filter*.
2. In the CLI, enter the following:

```
# execute log filter category utm-webfilter
# execute log display
1: date=2023-07-12 time=10:39:18 eventtime=1689183557968026063 tz="-0700"

Video filter

The video filter profile can be used to filter YouTube videos based on several criteria, including: FortiGuard categories, video titles, video descriptions, and channel IDs. These criteria provide a more granular override of a single channel, user, or video. The video filter profile is currently supported in proxy-based policies and requires SSL deep inspection. The FortiGuard Video filtering service is based on a valid FortiGuard web filter license.

It is recommended to block the QUIC protocol in application control profiles while applying video filter profiles (see Blocking QUIC manually on page 1722). By default, FortiOS can only inspect QUIC traffic in HTTP3 in flow mode, and video filtering only operates in proxy mode. By explicitly blocking QUIC in application control, video traffic utilizing the QUIC protocol on UDP/443 will revert to TCP/443 without QUIC, allowing the FortiGate to successfully inspect the traffic.

Configuring a video filter profile

In the GUI (*Security Profiles* > *Video Filter* > *Video Filter Profile*), four types of filters can be created on the *New Video Filter Profile* page: *Category*, *Title*, *Description*, and *Channel*.

When adding a *Category* type filter, the various FortiGuard categories, including *Any*, can be set to allow, monitor, or block videos in those categories. See Filtering based on FortiGuard categories on page 1662 for a detailed example and explanation of how the WAD daemon inspects videos.

The *Title* and *Description* type filters can be used to filter video based on keywords. See Configuring a video filter keyword list on page 1672 for more information. When a video's title or description matches a defined keyword, the video filter will take the corresponding action of allow, monitor, or block. See Filtering based on title on page 1669 and Filtering based on description on page 1670 for detailed examples.

The *Channel* type filter can be used to filter all or specific YouTube channels. When a video matches a YouTube channel, the video filter will take the corresponding action of allow, monitor, or block. See Filtering based on YouTube channel on page 1667 for a detailed example.

Users can prioritize configured filters within the video filter profiles based on their sequence order. To change the sequence order, drag the selected filter to the desired position. An implicit rule within the video filter profile is set to *Allow*. If a video does not match any of the other filters, it will be subject to this implicit rule and allowed to pass through.

To configure a video filter profile:

```
config videofilter profile
    edit <name>
        config filters
            edit <id>
                set type {category* | channel | title | description}
                set log {enable* | disable}
                set action {allow | block | monitor*}
            next
```

```
        end
    next
end
```

The default values are marked with an asterisk (*).

YouTube API key

The YouTube API key is required when filtering by a:

- YouTube video title
- YouTube video description
- YouTube channel in conjunction with filtering based on FortiGuard categories

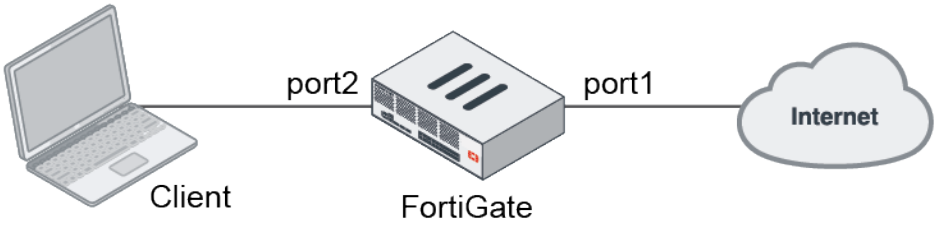
To configure the YouTube API key in the GUI:

1. Go to *Security Profiles* > *Video Filter* and select the *Video Filter Settings* tab.
2. Click the + to add an API key.
3. Click *OK*.

To configure the YouTube API key in the CLI:

```
config videofilter youtube-key
    edit <id>
        set key <string>
    next
end
```

Filtering based on FortiGuard categories



Video filtering is only proxy-based and uses the WAD daemon to inspect the video in four phases:

1. When the WAD receives a video query from a client, it extracts the video ID (`vid`) and tries to check the category and channel from the local cache.
2. If there is no match from the local cache, it connects to the FortiGuard video rating server to query the video category.
3. If the FortiGuard rating fails, it uses the `videofilter.youtube-key` to communicate with the Google API server to get its category and channel ID. This is the API query setting and it requires the user's own YouTube API key string. This configuration is optional.
4. If all steps fail to match the video, the WAD calls on the IPS engine to match the video ID and channel ID from the application signature database.

The FortiGuard anycast service must be enabled to use this feature.

In this example, a new video filter profile is created to block the Knowledge category.

It is recommended to block the QUIC protocol in application control profiles while applying video filter profiles (see Blocking QUIC manually on page 1722). By default, FortiOS can only inspect QUIC traffic in HTTP3 in flow mode, and video filtering only operates in proxy mode. By explicitly blocking QUIC in application control, video traffic utilizing the QUIC protocol on UDP/443 will revert to TCP/443 without QUIC, allowing the FortiGate to successfully inspect the traffic.

To configure a video filter based on FortiGuard categories in the GUI:

1. Create the video filter profile:
   a. Go to *Security Profiles* > *Video Filter*, select the *Video Filter Profile* tab, and click *Create new*.
   b. Enter a name (*category_filter*).
   c. Create the filter:
      i. In the *Filters* table, click *Create new*.
      ii. Set the *Type* to the *Category*.
      iii. Set the *Action* to *Block*.
      iv. Set the *Category* to *Knowledge*.
      v. Click *OK* to save the filter.
   d. Click *OK* to save the video filter profile.
2. Create the firewall policy:
   a. Enter the following:

Incoming Interface	port2
Outgoing Interface	port1
Source	All
Destination	All
Service	All
Inspection Mode	Proxy-based
NAT	Enable
Video Filter	Enable and select *category_filter*
Application Control	Enable and select *default*
SSL Inspection	deep-inspection
Log Allowed Traffic	All Sessions

   b. Configure the other settings as needed and click *OK*.

To configure a video filter based on FortiGuard categories in the CLI:

1. Create the video filter profile:

```
config videofilter profile
    edit "category_filter"
        config filters
            edit 1
                set type category
                set category "4"
                set action block
                set log enable
            next
        end
    next
end
```

2. Create the firewall policy:

```
config firewall policy
    edit 10
        set name "client_yt_v4"
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set application-list "default"
        set videofilter-profile "category_filter"
        set logtraffic all
        set nat enable
    next
end
```

Verifying that the video is blocked

When a user browses to YouTube and selects a video based in the Knowledge category, a replacement message will appear (see Example 3: blocking the video based on FortiGuard category on YouTube for an example replacement message). On the FortiGate, verify the forward traffic and web filter logs.

Sample forward traffic log:

```
2: date=2023-12-05 time=09:05:32 eventtime=1701796727673178582 tz="-0800" logid="0000000013"
type="traffic" subtype="forward" level="notice" vd="root" srcip=10.1.100.11 srcport=50568
srcintf="port2" srcintfrole="undefined" dstip=142.251.179.93 dstport=443 dstintf="port1"
dstintfrole="undefined" srccountry="United States" dstcountry="United States"
sessionid=480384 proto=6 action="client-rst" policyid=1 policytype="policy"

```

```
wanout=201892 lanin=126344 lanout=3493868 utmaction="block" countweb=2 countapp=3
sentdelta=0 rcvddelta=0 utmref=65514-4674
```

Sample web filter log:

```
1: date=2023-12-05 time=09:05:37 eventtime=1701795937361806440 tz="-0800" logid="0347013664"
type="utm" subtype="webfilter" eventtype="videofilter-category" level="warning" vd="root"
msg="Video category is blocked." policyid=1 poluuid="f4fe48a4-938c-51ee-8856-3e84e3b24af4"
sessionid=480384 srcip=10.1.100.11 dstip=142.251.179.93 srcport=50568 dstport=443
srcintf="port2" srcintfrole="undefined" dstintf="port1" dstintfrole="undefined" proto=6
httpmethod="POST" service="HTTPS" action="blocked" videoinfosource="FortiGuard"
profile="category_filter" videoid="hG-rVFM62J4" videocategoryid=4
videocategoryname="Knowledge" hostname="www.youtube.com" agent="Mozilla/5.0 (Windows NT
10.0; Win64; x64) AppleWebKit/537.36 (KH"
referralurl="https://www.youtube.com/results?search_query=udemy"
url="https://www.youtube.com/youtubei/v1/player?key=AIzaSyAO_FJ2SlqU8Q4STEHLGCilw_Y9_
11qcW8&prettyPrint=false"
```

Troubleshooting and debugging

To verify if the FortiGuard video filtering license is valid:

```
# get system fortiguard

fortiguard-anycast  : enable
fortiguard-anycast-source: fortinet
protocol            : https
port                : 443
...
webfilter-license   : Contract
webfilter-expiration: Mon Oct 28 2024
...
```

To verify the WAD worker is running:

```
# diagnose test app wad 1000
Process [0]: WAD manager type=manager(0) pid=232 diagnosis=yes.
Process [1]: type=worker(2) index=0 pid=294 state=running
              diagnosis=no debug=enable valgrind=supported/disabled
...
Process [6]: type=YouTube-filter-cache-service(9) index=0 pid=290 state=running
              diagnosis=no debug=enable valgrind=unsupported/disabled
...
```

To display and debug video filter cache:

```
# diagnose test app wad ?
....
        321:  Display Video Filter Cache stats.
        322:  Reset Video Filter Cache stats.
        323:  Flush Video Filter Cache entries.
        324:  Display Video Filter module stats.
        325:  Request category list from Youtube API.
        326:  Display FTGD agent module stats.
```

```
        327:  Reset FTGD agent module stats.
        328:  Toggle Video Filter Cache Check.
        329:  Toggle Video Filter FTGD Query.
        330:  Toggle Video Filter API Check.
```

To enable real-time WAD debugs:

```
# diagnose wad debug enable level verbose
# diagnose wad debug enable category video
# diagnose debug enable
```

Sample output

```

Filtering based on YouTube channel

Video filtering can be configured to filter any or specific YouTube channels. When a video matches a YouTube channel, the video will take the corresponding action of allow, monitor, or block. Video filtering is only supported in proxy-based inspection mode, and deep inspection must be enabled in the firewall policy.

The YouTube API key must be configured when using this feature in conjunction with filtering based on FortiGuard categories. See YouTube API key for more information.

Videos are filtered based on their sequence order, which could allow for specific categorization. A category can be blocked, but certain channels within that category can be allowed. If no match is found, then the video will be subjected to an implicit rule and allowed to pass through See Basic configuration for an example.

Identifying the YouTube channel ID

The following table lists how to identify the YouTube channel ID based on different YouTube video URLs formats:

Video URL	Channel ID
www.youtube.com/channel/<channel-id>	<channel-id> indicates the ID for the channel.
www.youtube.com/user/<user-id>	Open the page source and locate: `<meta itemprop="channelId" content="<channel-id>">` <channel-id> indicates the channel ID for the user page.
www.youtube.com/watch?v=<string>	Open the page source and locate: `<meta itemprop="channelId" content="<channel-id>">` <channel-id> indicates the channel ID for the video.

It is recommended to block the QUIC protocol in application control profiles while applying video filter profiles (see Blocking QUIC manually on page 1722). By default, FortiOS can only inspect QUIC traffic in HTTP3 in flow mode, and video filtering only operates in proxy mode. By explicitly blocking QUIC in application control, video traffic utilizing the QUIC protocol on UDP/443 will revert to TCP/443 without QUIC, allowing the FortiGate to successfully inspect the traffic.

Basic configuration

In this example, the Knowledge category in the video filter is configured to be blocked. The YouTube channel filter list is configured with the action set to monitor, which effectively creates an allowlist. The Fortinet YouTube channel ID UCJHo4AuVomwMRzgkA5DQEOA is allowed. This example uses the category_filter video filter profile and client_yt_v4 firewall policy configured in Filtering based on FortiGuard categories on page 1662.

To configure a video filter based on a YouTube channel in the GUI:

1. Go to *Security Profiles* > *Video Filter*, select the *Video Filter Profile* tab, and edit *channel_filter*.
2. In the *Filters* table, click *Create new*.
3. Set the *Type* to the *Channel*.
4. Set the *Action* to *Monitor*.
5. Set the *Channel* to *Specify* and enter the *Channel ID*, *UCJHo4AuVomwMRzgkA5DQEOA*.
6. Click *OK* to save the filter.
7. Click *OK* to save the video filter profile.

To configure a video filter based on a YouTube channel in the CLI:

```
config videofilter profile
    edit "category_filter"
        config filters
            edit 2
                set type channel
                set channel "UCJHo4AuVomwMRzgkA5DQEOA"
                set action monitor
                set log enable
            next
        end
    next
end
```

Verifying the configuration

Perform a search from a client for a video on YouTube that falls under the Knowledge category, such as any video from the Udemy channel. The result is a blocked video. However, searching for a video from the Fortinet YouTube channel results in an accessible video.

Sample logs:

```
1: date=2023-12-13 time=09:33:20 eventtime=1702488800873289004 tz="-0800" logid="0347013664"

11qcW8&prettyPrint=false"
```

Filtering based on title

Video filtering can be configured to filter using keyword-based filters for video titles. When a video's title matches the configured keyword, the video filter will take the corresponding action of allow, monitor, or block. Video filtering is only supported in proxy-based inspection mode, and deep inspection must be enabled in the firewall policy.

The YouTube API key must be configured to use this feature. Otherwise, the title filter will not retrieve the video information and bypass the traffic. See YouTube API key for more information.

It is recommended to block the QUIC protocol in application control profiles while applying video filter profiles (see Blocking QUIC manually on page 1722). By default, FortiOS can only inspect QUIC traffic in HTTP3 in flow mode, and video filtering only operates in proxy mode. By explicitly blocking QUIC in application control, video traffic utilizing the QUIC protocol on UDP/443 will revert to TCP/443 without QUIC, allowing the FortiGate to successfully inspect the traffic.

Basic configuration

In this example, videos are blocked that contain the keyword, game. For information about configuring video filter keyword lists, see Example configuration.

To configure the video filter profile in the GUI:

1. Configure the video filter profile:
   a. Go to *Security Profiles* > *Video Filter*, select the *Video Filter Profile* tab, and click *Create new*.
   b. Enter a name (*title-filter-profile*).
   c. In the *Filters* table, click *Create new*.
   d. Configure the filter with the following settings:
      i. Set the *Type* to *Title*.
      ii. Set the *Action* to *Block*.
      iii. Set the *Keyword* to *test-keyword-match-or*.
      iv. Click *OK*.
   e. Click *OK* to save the video filter profile.
2. Apply the video filter in a firewall policy.

To configure the video filter profile in the CLI:

1. Configure the video filter profile:

```
config videofilter profile
    edit "title-filter-profile"
        config filters
            edit 1
```

```
                set type title
                set keyword 1
                set action block
                set log enable
            next
        end
    next
end
```

2. Apply the video filter in a firewall policy.

Verifying the configuration

From a client, search for a video in YouTube named "How To Use Python Steam API || Steam game API python". The video is blocked.

Sample log:

```
6: date=2023-11-24 time=09:51:30 eventtime=1700848289598975941 tz="-0800" logid="0350013712"
type="utm" subtype="webfilter" eventtype="unknown" level="warning" vd="vdom1" msg="Video
title is blocked." policyid=1 poluuid="19841eb8-841c-51ee-7047-6a6860eb3522"
sessionid=384813810 srcip=10.1.100.141 dstip=142.251.33.110 srcport=21473 dstport=443
srcintf="port2" srcintfrole="undefined" dstintf="port1" dstintfrole="undefined" proto=6
httpmethod="GET" service="HTTPS" action="blocked" videoinfosource="API" profile="title-
filter-profile" videoid="LaRHkSVvDjI" videotitle="How To Use Python Steam API  || Steam game
API python" hostname="www.youtube.com" agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64)
AppleWebKit/537.36 (KH" url="https://www.youtube.com/watch?v=LaRHkSVvDjI"
```

Filtering based on description

Video filtering can be configured to filter using keyword-based filters for video descriptions. When a video's description matches the configured keyword, the video filter will take the corresponding action of allow, monitor, or block. The description filter supports the first 100 characters of the video description. Video filtering is only supported in proxy-based inspection mode, and deep inspection must be enabled in the firewall policy.

The YouTube API key must be configured to use this feature. Otherwise, the description filter will not retrieve the video information and bypass the traffic. See YouTube API key for more information.

It is recommended to block the QUIC protocol in application control profiles while applying video filter profiles (see Blocking QUIC manually on page 1722). By default, FortiOS can only inspect QUIC traffic in HTTP3 in flow mode, and video filtering only operates in proxy mode. By explicitly blocking QUIC in application control, video traffic utilizing the QUIC protocol on UDP/443 will revert to TCP/443 without QUIC, allowing the FortiGate to successfully inspect the traffic.

Basic configuration

In this example, videos are blocked where the description contains the keyword, API. For information about configuring video filter keyword lists, see Example configuration.

To configure the video filter profile in the GUI:

1. Configure the video filter profile:
   a. Go to *Security Profiles* > *Video Filter*, select the *Video Filter Profile* tab, and click *Create new*.
   b. Enter a name (*test-description-filter*).
   c. In the *Filters* table, click *Create new*.
   d. Configure the filter with the following settings:
      i. Set the *Type* to *Description*.
      ii. Set the *Action* to *Block*.
      iii. Set the *Keyword* to *test-keyword-match-all*.
      iv. Click *OK*.
   e. Click *OK* to save the video filter profile.
2. Apply the video filter in a firewall policy.

To configure the video filter profile in the CLI:

1. Configure the video filter profile:

```
config videofilter profile
    edit "test-description-filter"
        config filters
            edit 1
                set type description
                set keyword 2
                set action block
                set log enable
            next
        end
    next
end
```

2. Apply the video filter in a firewall policy.

Verifying the configuration

From a client, search for a video in YouTube named "Postman Tutorial #7 - HTTP Methods GET and POST in Postman". The description contains the text, "POSTMAN TUTORIAL - Complete API Testing and API Test Automation Course using Postman Tool...", so the video is blocked.

Sample log:

```
4: date=2023-11-24 time=16:08:51 eventtime=1700870931146681788 tz="-0800" logid="0351013728"
type="utm" subtype="webfilter" eventtype="unknown" level="warning" vd="vdom1" msg="Video
description is blocked." policyid=1 poluuid="090ca600-83e4-51ee-158a-a920fcf8f892"
sessionid=100211 srcip=10.1.100.141 dstip=142.250.69.206 srcport=24948 dstport=443
srcintf="port2" srcintfrole="undefined" dstintf="port1" dstintfrole="undefined" proto=6
httpmethod="GET" service="HTTPS" action="blocked" videoinfosource="API" profile="test-
description-filter" videoid="pUGmhtqVJRk" videodesc="Get all my courses for USD 5.99/Month -
https://bit.ly/all-c..." hostname="www.youtube.com" agent="Mozilla/5.0 (Windows NT 10.0;
Win64; x64) AppleWebKit/537.36 (KH" url="https://www.youtube.com/watch?v=pUGmhtqVJRk"
```

Configuring a video filter keyword list

Users have the ability to filter videos based on the video titles and descriptions by defining a video filter keyword. Multiple keywords can be defined using a wildcard or regular expression, and can be used with AND/OR logic options.

Unicode emoji character code is currently not supported.

Configure the video filter keyword list in the GUI:

1. Go to *Security Profiles* > *Video Filter*, select the *Video Filter Keyword* tab, and click *Create new*.
2. Configure the following:

Name	Enter a name.
Match operator	Select the match operator. • *Any*: match any keyword (OR logic) • *All*: match all keywords (AND logic)

3. Create the keywords:
   a. In the *Keywords* table, click *Create new*.
   b. Configure the following:

Pattern	Enter a regular expression or wildcard pattern string.
Pattern type	Select the pattern type. • *Wildcard*: suitable for basic search • *Regular Expression*: suitable for advanced search
Status	Set the status. • *Enable*: consider this keyword • *Disable*: ignore this keyword

   c. Click *OK*.
4. Click *OK* to save the keyword list.

Configure the video filter keyword list in the CLI:

```
config videofilter keyword
    edit <id>
        set name <string>
        set match {or | and}
        config word
           edit <name>
                set pattern-type {wildcard | regex}
                set status {enable | disable}
            next
        end
    next
end
```

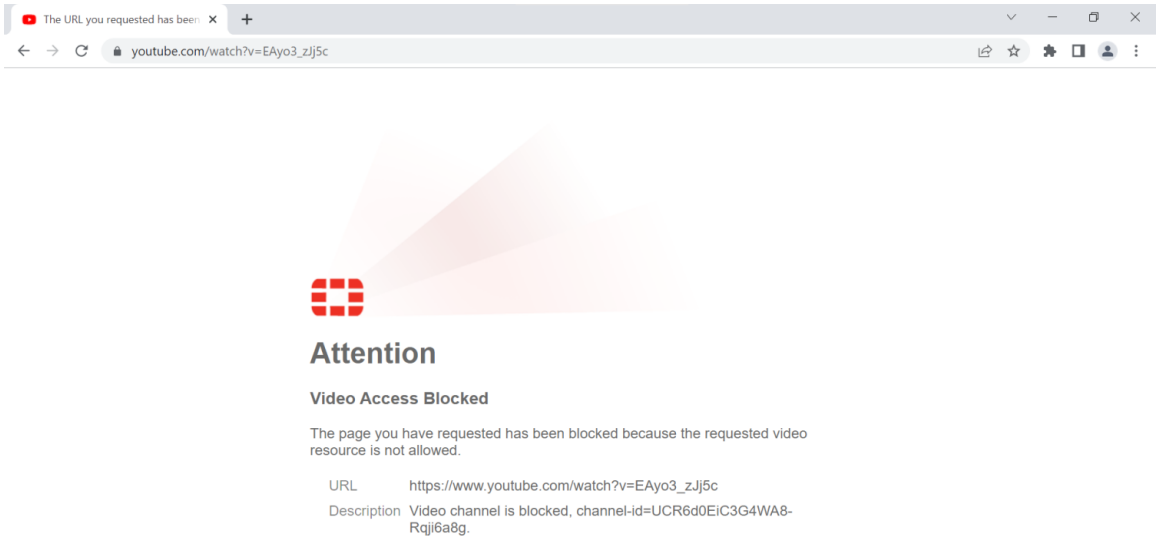
Example configuration

In this example, two keywords, API and game, are created with the wildcard and regular expression types, respectively. The match operator is set to *Any*.

Configure the video filter keyword list in the GUI:

1. Go to *Security Profiles* > *Video Filter*, select the *Video Filter Keyword* tab, and click *Create new*.
2. Enter a name (*test-keyword-match-or*) and set *Match operator* to *Any*.
3. In the *Keywords* table, click *Create new*.
4. Configure the API keyword with the following settings:
   a. In the *Pattern* field, enter *API*.
   b. Set the *Pattern type* to *Wildcard*.
   c. Click *OK*.
5. Click *Create new*.
6. Configure the game keyword with the following settings:
   a. In the *Pattern* field, enter *Game*.
   b. Set the *Pattern type* to *Regular Expression*.
   c. Click *OK*.
7. Click *OK* to save the keyword list.

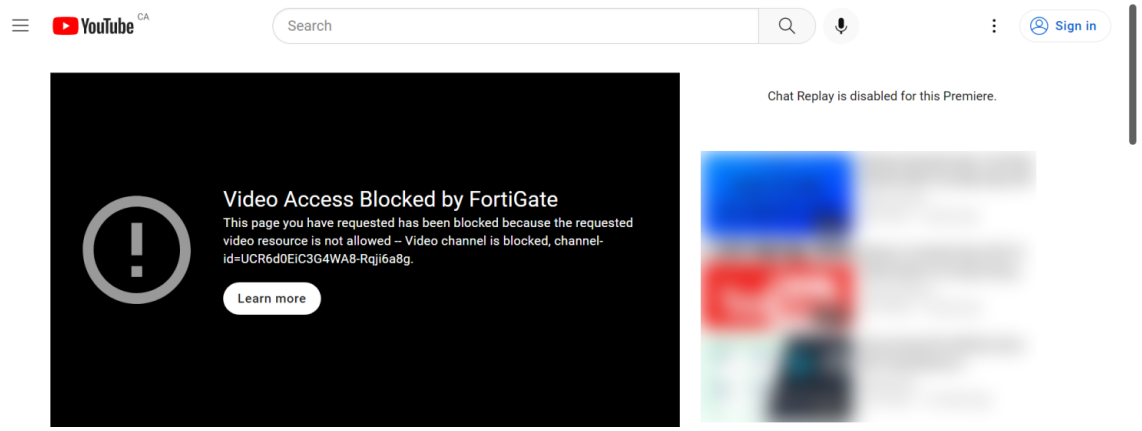
Configure the video filter keyword list in the CLI:



```
config videofilter keyword
    edit 1
        set name "test-keyword-match-or"
        set match or
        config word
           edit "API"
                set pattern-type wildcard
                set status enable
            next
            edit "Game"
                set pattern-type regex
                set status enable
            next
        end
    next
end
```

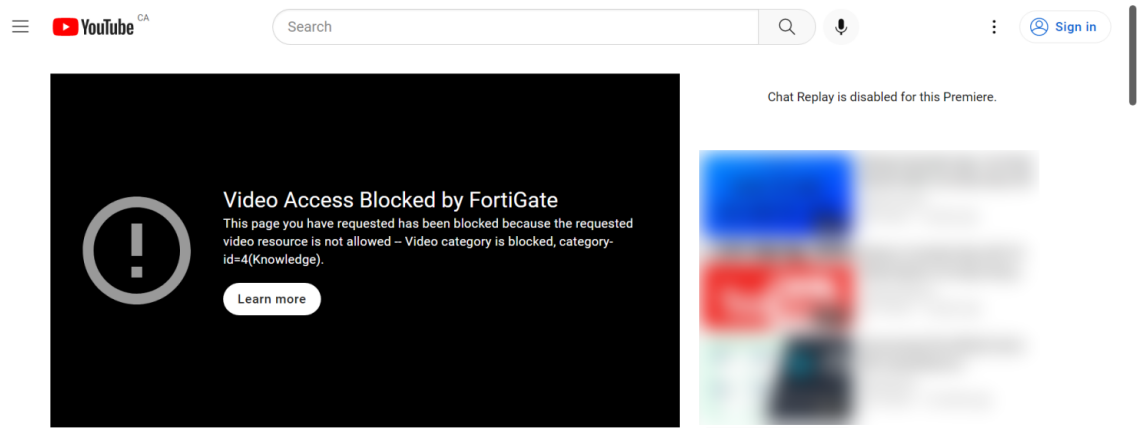
Replacement messages displayed in blocked videos

When a user visits a video directly by a URL, a full page replacement message is displayed. When a user loads a video from the YouTube website (homepage or recommended videos), the page loads and the replacement message is displayed in the video frame. For more information about configuring video filters, see Filtering based on FortiGuard categories on page 1662 and Filtering based on YouTube channel on page 1667.



Example 1: blocking the video based on the URL

In this example, the user entered the URL of a blocked channel ID in their browser. The replacement message is displayed in the browser (full page).



Example 2: blocking the video based on channel ID on YouTube

In this example, the user visited a blocked channel ID on the YouTube website. The replacement message is displayed in the video frame.

Example 3: blocking the video based on FortiGuard category on YouTube

In this example, the user visited a video on the YouTube website that belongs to a blocked FortiGuard category. The replacement message is displayed in the video frame.

DNS filter

You can apply DNS category filtering to control user access to web resources. You can customize the default profile, or create your own to manage network user access and apply it to a firewall policy, or you can add it to a DNS server on a FortiGate interface. For more information about configuring DNS, see DNS on page 271.

When both a DNS and a web filter are configured on a firewall policy, the DNS filter takes precedence. If certificate inspection is also used, the web filter replacement message might be shown instead of the SDNS block page. If both filters are set to block, SSL inspection is set to certificate inspection, and the destination web traffic is HTTPS, then the client receives a redirect to the SDNS server, which is then blocked by the web filter because the redirect URL cannot pass the certificate inspection.

DNS filtering has the following features:

- FortiGuard Filtering: filters the DNS request based on the FortiGuard domain rating.
- Botnet C&C domain blocking: blocks the DNS request for the known botnet C&C domains.
- External dynamic category domain filtering: allows you to define your own domain category.
- DNS safe search: enforces Google, Bing, and YouTube safe addresses for parental controls.
- Local domain filter: allows you to define your own domain list to block or allow.
- External IP block list: allows you to define an IP block list to block resolved IPs that match this list.
- DNS translation: maps the resolved result to another IP that you define.

Some DNS filter features require a subscription to FortiGuard Web Filtering.

DNS filtering connects to the FortiGuard secure DNS server over anycast by default. For more information about this configuration, see DNS over TLS and HTTPS on page 290.

The IPS engine handles the DNS filter in flow mode policies and queries the FortiGuard web filter server for FortiGuard categories. In proxy mode, the DNS proxy daemon handles the DNS filter and queries the FortiGuard SDNS server for FortiGuard categories. When a DNS filter profile is enabled in `config system dns-server`, the DNS proxy daemon handles the traffic.

DNS filter profiles cannot be used in firewall policies when the FortiGate is in NGFW policy-based mode; see NGFW policy on page 1313 for more information. They can be used in the DNS server; see FortiGate DNS server on page 277 for more information.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 1677), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 1697).

DNS filter behavior in proxy mode

In cases where the DNS proxy daemon handles the DNS filter (described in the preceding section) and if DNS caching is enabled (this is the default setting), then the FortiGate will respond to subsequent DNS queries using the result in the DNS cache and will not forward these queries to a real DNS server.

There are two options to disable this behavior:

- Disable DNS caching globally.
- Remove the DNS filter profile from the proxy mode firewall policy or from the DNS server configured on a FortiGate interface.

To disable DNS caching globally:

```
config system dns
    set dns-cache-limit 0
end
```

There will be a performance impact to DNS queries since each query will not be cached, and will be forwarded to a real DNS server.

FortiGuard DNS rating service

DNS over TLS connections to the FortiGuard secure DNS server is supported. The CLI options are only available when `fortiguard-anycast` is enabled. DNS filtering connects to the FortiGuard secure DNS server over anycast by default.

To configure DoT to the secure DNS server in the CLI:

```
config system fortiguard
    set fortiguard-anycast enable
    set fortiguard-anycast-source fortinet
    set anycast-sdns-server-ip 0.0.0.0
    set anycast-sdns-server-port 853
end
```

The following topics provide information about DNS filters:

- Configuring a DNS filter profile on page 1677
- FortiGuard category-based DNS domain filtering on page 1681
- Botnet C&C domain blocking on page 1684
- DNS safe search on page 1687
- Local domain filter on page 1689
- DNS translation on page 1694
- Applying DNS filter to FortiGate DNS server on page 1697
- DNS inspection with DoT and DoH on page 1698
- DNS over QUIC and DNS over HTTP3 for transparent and local-in DNS modes on page 1701
- Troubleshooting for DNS filter on page 1706

Configuring a DNS filter profile

A DNS filter profile contains settings that enable or disable various forms of DNS filtering, including:

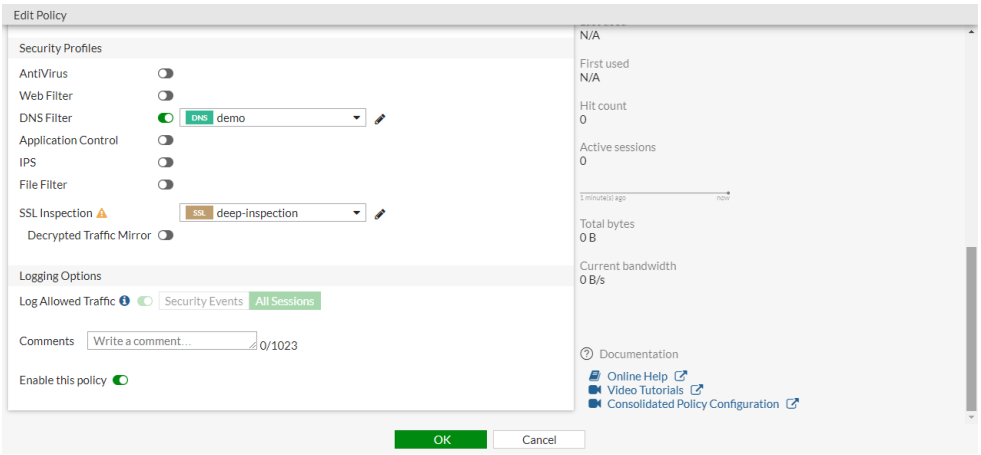
- FortiGuard filtering
- Botnet C&C domain blocking
- DNS safe search
- External dynamic category domain filtering
- Local domain filter
- External IP block list
- DNS translation

Once a DNS filter is configured, it can be applied to a firewall policy, or on a FortiGate DNS server if one is configured. In the following basic example, a DNS filter is created and applied to a firewall policy to scan DNS queries that pass through the FortiGate.

To configure a DNS filter profile in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*, or edit an existing profile.
2. Configure the settings as needed.

Name	Enter a unique name for the profile.
Comments	Enter a comment (optional).
Redirect botnet C&C requests to Block Portal	Enable to block botnet website access at the DNS name resolution stage. See Botnet C&C domain blocking on page 1684 for more details.
Enforce 'Safe Search' on Google, Bing, YouTube	Enable to avoid explicit and inappropriate results in the Google, Bing, and YouTube search engines. See DNS safe search on page 1687 for more details.
Restrict YouTube Access	When *Enforce 'Safe Search' on Google, Bing, YouTube* is enabled, select either *Strict* or *Moderate* to restrict YouTube access by responding to DNS resolutions with CNAME restrict.youtube.com and restrictmoderate.youtube.com respectively.



FortiGuard Category Based Filter		Enable to use the FortiGuard domain rating database to inspect DNS traffic. A FortiGuard Web Filter license is required to use this option. Expand the category groups in the table to view and edit the FortiGuard category settings to *Allow*, *Monitor*, or *Redirect to Block Portal*. See FortiGuard category-based DNS domain filtering on page 1681 for more details.
Static Domain Filter		This section includes options related to the static domain filter.
	Domain Filter	Enable to define local static domain filters to allow or block specific domains. The local domain filter has a higher priority than the FortiGuard category-based domain filter. Click *Create New* in the table to add a domain filter and configure the following settings. • *Domain*: enter a domain. • *Type*: select *Simple*, *Reg. Expression*, or *Wildcard*. • *Action*: select *Redirect to Block Portal*, *Allow*, or *Monitor*. • *Status*: select *Enable* or *Disable*. See Local domain filter on page 1689 for more details.
	External IP Block Lists	Enable to add one or more external IP block lists. See IP address threat feed on page 3402 for more details.
	DNS Translation	Enable to translate a DNS resolved IP address to another IP address specified on a per-policy basis. Click *Create New* in the table to add a DNS translation and configure the following settings. • *Type*: select *IPv4* or *IPv6*. • *Original Destination*: enter the address of a host or subnet that you want translated. When a resolved address in a DNS response matches this destination, the FortiGate will replace the address with the address in *Translated Destination*. • *Translated Destination*: enter the address of a host or subnet that you want the resolved address to be translated to. • *Network Mask*: enter the netmask for the original and translated destination. If a single host is used for the original and translated destination, set the netmask to *255.255.255.255*. • *Status*: select *Enable* or *Disable*. Enabling DNS translation will override matching DNS responses with translated IPs. See DNS translation on page 1694 for more details.
Options		This section includes other options related to the DNS filter.
	Redirect Portal IP	Set the IP address of the SDNS redirect portal. Select *Use FortiGuard Default*, or *Specify* and enter the IP address. When *FortiGuard Category Based Filter* categories are set to *Redirect to Block Portal*, the DNS response will use this IP address in its response to the client. If the client is accessing the domain on a web browser, they will be redirected to the block portal page on this address.

	Allow DNS requests when a rating error occurs	Enable to allow all domains when FortiGuard DNS servers fail, or they are unreachable from the FortiGate. When this happens, a log message is recorded in the DNS logs by default.
	Log all DNS queries and responses	Enable to log all domains visited (detailed DNS logging).

3. Click *OK*.

To apply a DNS filter profile to a policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*, or edit an existing policy.
2. In the *Security Profiles* section, enable *DNS Filter* and select the DNS filter.

3. Configure the other settings as needed.
4. Click *OK*.

CLI-only settings

The following DNS filter profile settings can only be configured in the CLI:

```
config dnsfilter profile
    edit <name>
        set block-action {block | redirect | block-servfail}
        set sdns-ftgd-err-log {enable | disable}
    next
end
```

`block-action {block | redirect | block-servfail}`	Set the action to take for blocked domains: • `block`: return NXDOMAIN for blocked domains. • `redirect`: redirect blocked domains to SDNS portal (default). • `block-servfail`: return SERVFAIL for blocked domains. When a FortiGuard or local domain filter category is set to *Redirect to Block Portal* in the GUI, the action is set to `block` in the CLI. By default, the `block-action` applied to a DNS profile is set to `redirect`.
`sdns-ftgd-err-log {enable | disable}`	Enable/disable FortiGuard SDNS rating error logging (default = enable).

To configure a DNS filter profile in the CLI:

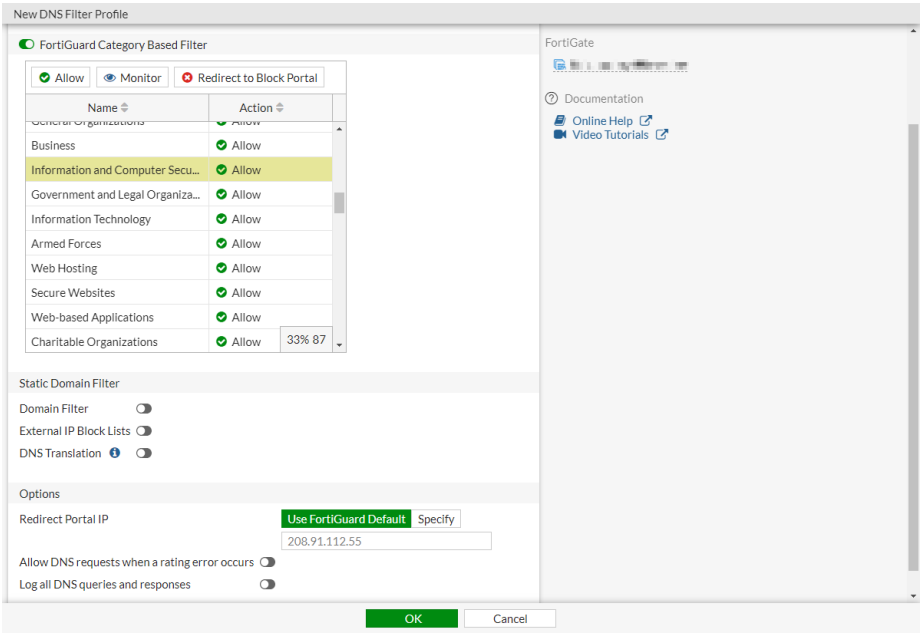
```
config dnsfilter profile
    edit "demo"
        set comment ''
        config domain-filter
            unset domain-filter-table
        end
        config ftgd-dns
            set options error-allow
            config filters
                edit 2
                    set category 2
                    set action monitor
                next
                edit 7
                    set category 7
                    set action block
                next
                ...
                edit 22
                    set category 0
                    set action monitor
                next
            end
        end
        set log-all-domain enable
        set sdns-ftgd-err-log enable
        set sdns-domain-log enable
        set block-action redirect
        set block-botnet enable
        set safe-search enable
        set redirect-portal 93.184.216.34
        set youtube-restrict strict
    next
end
```

To apply a DNS filter profile to a policy in the CLI:

```
config firewall policy
    edit 1
        set name "Demo"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set logtraffic all
        set fsso disable
        set dnsfilter-profile "demo"
        set profile-protocol-options "default"
        set ssl-ssh-profile "deep-inspection"
```

```
        set nat enable
    next
end
```

FortiGuard category-based DNS domain filtering



You can use the FortiGuard category-based DNS domain filter to inspect DNS traffic. This makes use of FortiGuard's continuously updated domain rating database for more reliable protection.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 1677), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 1697).

The FortiGate must have a FortiGuard Web Filter license to use the FortiGuard category-based filter.

To configure FortiGuard category-based DNS domain filtering in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*, or edit an existing profile.
2. Enable *FortiGuard Category Based Filter*.
3. Select the category and then select *Allow*, *Monitor*, or *Redirect to Block Portal* for that category.
4. In the *Options* section, select a setting for *Redirect Portal IP*. Select either *Use FortiGuard Default* (208.91.112.55) or click *Specify* and enter another portal IP. The FortiGate will use the portal IP to replace the resolved IP in the DNS response packet.

5. Click *OK*.

To configure FortiGuard category-based DNS domain filtering in the CLI:

```
config dnsfilter profile
   edit "demo"
      set comment ''
      config domain-filter
         unset domain-filter-table
      end
      config ftgd-dns
         set options error-allow
         config filters
             edit 2
                 set category 2
                 set action monitor
             next
             edit 7
                 set category 7
                 set action monitor
             next
            ...
             edit 22
                 set category 0
                 set action monitor
             next
         end
      end
      set log-all-domain enable
      set sdns-ftgd-err-log enable
      set sdns-domain-log enable
      set block-action {redirect | block}
      set block-botnet enable
      set safe-search enable
      set redirect-portal 93.184.216.34
      set youtube-restrict strict
   next
end
```

You can use the `get webfilter categories` command to determine the web filtering category that corresponds to a given category ID.

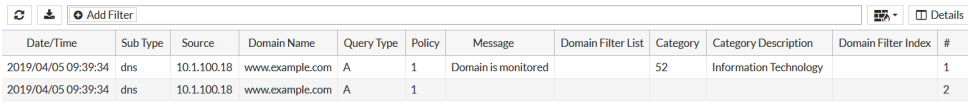
Verifying the logs

From your internal network PC, use a command line tool, such as dig or nslookup, to do a DNS query for some domains. For example:

```
#dig www.example.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 61252
;; Flags: qr rd ra; QUERY: 1; ANSWER: 1; AUTHORITY: 13; ADDITIONAL: 11

;; QUESTION SECTION:
;; www.example.com.             IN      A

;; ANSWER SECTION:
www.example.com.        17164   IN      A       93.184.216.34
```



```
;; AUTHORITY SECTION:
com.                    20027   IN      NS      h.gtld-servers.net.
com.                    20027   IN      NS      i.gtld-servers.net.
com.                    20027   IN      NS      f.gtld-servers.net.
com.                    20027   IN      NS      d.gtld-servers.net.
com.                    20027   IN      NS      j.gtld-servers.net.
com.                    20027   IN      NS      l.gtld-servers.net.
com.                    20027   IN      NS      e.gtld-servers.net.
com.                    20027   IN      NS      a.gtld-servers.net.
com.                    20027   IN      NS      k.gtld-servers.net.
com.                    20027   IN      NS      g.gtld-servers.net.

```

To check the DNS filter log in the GUI:

1. Go to *Log & Report* > *Security Events*.
2. Click the *DNS Query* card name. There are logs for the DNS traffic that just passed through the FortiGate with the FortiGuard rating for the domain name.

Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description	Domain Filter Index	#
2019/04/05 09:39:34	dns	10.1.100.18	www.example.com	A	1	Domain is monitored		52	Information Technology		1
2019/04/05 09:39:34	dns	10.1.100.18	www.example.com	A	1						2

To check the DNS filter log in the CLI:

```
# execute log filter category utm-dns

# execute log display
2 logs found.
2 logs returned.

```

Botnet C&C domain blocking

FortiGuard Service continually updates the botnet C&C domain list. The botnet C&C domain blocking feature can block the botnet website access at the DNS name resolving stage. This provides additional protection for your network.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 1677), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 1697).

To configure botnet C&C domain blocking in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*, or edit an existing profile.
2. Enable *Redirect botnet C&C requests to Block Portal*.
3. Optionally, click the *botnet package* link. The *Botnet C&C Domain Definitions* pane opens, which displays the latest list.

4. Configure the other settings as needed.
5. Click *OK*.

To configure botnet C&C domain blocking in the CLI:

```
config dnsfilter profile
   edit "demo"
```

```
      set comment ''
      config domain-filter
         unset domain-filter-table
      end
      config ftgd-dns
         set options error-allow
         config filters
            ...
         end
      end
      set log-all-domain enable
      set sdns-ftgd-err-log enable
      set sdns-domain-log enable
      set block-action block
      set block-botnet enable
      set safe-search enable
      set redirect-portal 208.91.112.55
      set youtube-restrict strict
   next
end
```

Verifying the logs

Select a botnet domain from that list. From your internal network PC, use a command line tool, such as dig or nslookup, to send a DNS query to traverse the FortiGate. For example:

```
#dig canind.co
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 997
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; canind.co.                   IN      A

;; ANSWER SECTION:
canind.co.              60      IN      A       208.91.112.55

;; Received 43 B
;; Time 2019-04-05 09:55:21 PDT
;; From 172.16.95.16@53(UDP) in 0.3 ms
```

The botnet domain query was blocked and redirected to the portal IP (208.91.112.55) .

To check the DNS filter log in the GUI:

1. Go to *Log & Report* > *Security Events*.
2. Click the *DNS Query* card name to view the DNS query blocked as a botnet domain.

Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description
2019/04/04 16:43:59	dns	10.1.100.18	canind.co	A	1	Domain was blocked by dns botnet C&C			
2019/04/04 16:43:59	dns	10.1.100.18	canind.co	A	1				

To check the DNS filter log in the CLI:

```
(vdom1) # execute log filter category utm-dns

(vdom1) # execute log display
```

```
2 logs found.
2 logs returned.

1: date=2019-04-04 time=16:43:59 logid="1501054601" type="utm" subtype="dns" eventtype="dns-
response" level="warning" vd="vdom1" eventtime=1554421439 policyid=1 sessionid=14135

qname="canind.co" qtype="A" qtypeval=1 qclass="IN"
```

Botnet C&C IPDB blocking

FortiOS also maintains a botnet C&C IP address database (IPDB). If a DNS query response IP address (resolved IP address) matches an entry inside the botnet IPDB, this DNS query is blocked by the DNS filter botnet C&C.

To view the botnet IPDB list in the CLI:

```
(global) # diagnose sys botnet list 9000 10
9000. proto=TCP ip=103.228.28.166, port=80, rule_id=7630075, name_id=3, hits=0
9001. proto=TCP ip=5.9.32.166, port=481, rule_id=4146631, name_id=7, hits=0
9002. proto=TCP ip=91.89.44.166, port=80, rule_id=48, name_id=96, hits=0
9003. proto=TCP ip=46.211.46.166, port=80, rule_id=48, name_id=96, hits=0
9004. proto=TCP ip=77.52.52.166, port=80, rule_id=48, name_id=96, hits=0
9005. proto=TCP ip=98.25.53.166, port=80, rule_id=48, name_id=96, hits=0
9006. proto=TCP ip=70.120.67.166, port=80, rule_id=48, name_id=96, hits=0
9007. proto=TCP ip=85.253.77.166, port=80, rule_id=48, name_id=96, hits=0
9008. proto=TCP ip=193.106.81.166, port=80, rule_id=48, name_id=96, hits=0
9009. proto=TCP ip=58.13.84.166, port=80, rule_id=48, name_id=96, hits=0
```

Select an IP address from the IPDB list and use a reverse lookup service to find its corresponding domain name. From your internal network PC, use a command line tool, such as dig or nslookup, to query this domain and verify that it is blocked by the DNS filter botnet C&C. For example:

```
# dig cpe-98-25-53-166.sc.res.rr.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 35135
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; cpe-98-25-53-166.sc.res.rr.com.              IN      A

;; ANSWER SECTION:
cpe-98-25-53-166.sc.res.rr.com. 60      IN      A       208.91.112.55

;; Received 64 B
;; Time 2019-04-05 11:06:47 PDT
;; From 172.16.95.16@53(UDP) in 0.6 ms
```

Since the resolved IP address matches the botnet IPDB, the query was blocked and redirected to the portal IP (208.91.112.55) .

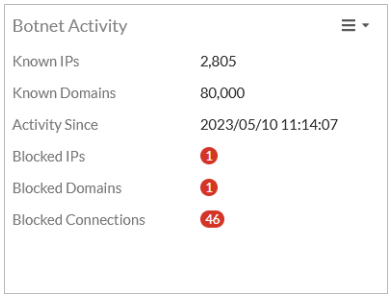
To check the DNS filter log in the GUI:

1. Go to *Log & Report* > *DNS Query* to view the DNS query blocked by botnet C&C IPDB.

Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description
2019/04/05 11:06:48	dns	10.1.100.18	cpe-98-25-53-166.sc.res.rr.com	A	1	Domain was blocked by dns botnet C&C			
2019/04/05 11:06:48	dns	10.1.100.18	cpe-98-25-53-166.sc.res.rr.com	A	1				

To check the DNS filter log in the CLI:

```
(global) # execute log filter category utm-dns



(global) # execute log display
2 logs found.
2 logs returned.

qname="cpe-98-25-53-166.sc.res.rr.com" qtype="A" qtypeval=1 qclass="IN"
```

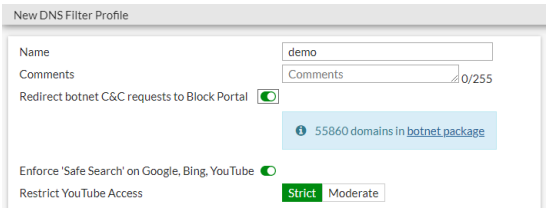
To check botnet activity:

1. Go to *Dashboard* > *Status* and locate the *Botnet Activity* widget.

2. If you do not see the widget, click *Add Widget*, and add the *Botnet Activity* widget.

DNS safe search

The DNS safe search option helps avoid explicit and inappropriate results in the Google, Bing, DuckDuckGo, Qwant, and YouTube search engines. The FortiGate responds with content filtered by the search engine.



For individual search engine safe search specifications, refer to the documentation for Google, Bing, DuckDuckGo, Qwant, and YouTube.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 1677), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 1697).

To configure safe search in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*, or edit an existing profile.
2. Enable *Enforce 'Safe search' on Google, Bing, YouTube* (this setting also applies safe search on DuckDuckGo and Qwant).
3. For *Restrict YouTube Access*, click *Strict* or *Moderate*.

4. Configure the other settings as needed.
5. Click *OK*.

To configure safe search in the CLI:

```
config dnsfilter profile
    edit "demo"
        config ftgd-dns
            set options error-allow
            config filters
                edit 2
                    set category 2
                next
               ...
            end
        end
        set log-all-domain enable
        set block-botnet enable
        set safe-search enable
        set youtube-restrict strict
    next
end
```

Verifying the logs

From your internal network PC, use a command line tool, such as dig or nslookup, and perform a DNS query on www.bing.com. For example:

```
# dig www.bing.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 46568
;; Flags: qr rd ra; QUERY: 1; ANSWER: 2; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.bing.com.                IN      A

;; ANSWER SECTION:
www.bing.com.           103     IN      CNAME   strict.bing.com
```

```
strict.bing.com.        103     IN      A       204.79.197.220

;; Received 67 B
;; Time 2019-04-05 14:34:52 PDT
;; From 172.16.95.16@53(UDP) in 196.0 ms
```

The DNS query for www.bing.com returns with a CNAME strict.bing.com, and an A record for the CNAME. The user's web browser then connects to this address with the same search engine UI, but any explicit content search is filtered out.

To check the DNS filter log in the GUI:

1. Go to *Log & Report* > *Security Events*.
2. Click the *DNS Query* card name.

Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description
2019/04/05 14:34:53	dns	10.1.100.18	www.bing.com	A	1	DNS Safe Search enforced		41	Search Engines and Portals
2019/04/05 14:34:53	dns	10.1.100.18	www.bing.com	A	1				

The DNS filter log in FortiOS shows a message of *DNS Safe Search enforced*.

To check the DNS filter log in the CLI:

```
# execute log filter category utm-dns
# execute log display
2 logs found.
2 logs returned.

1: date=2019-04-05 time=14:34:53 logid="1501054804" type="utm" subtype="dns" eventtype="dns-

Local domain filter

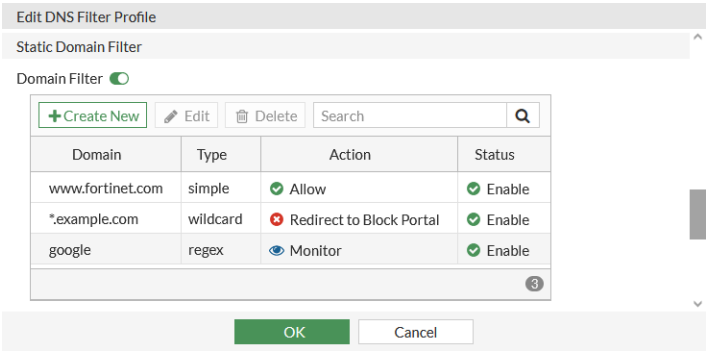
In addition to the FortiGuard category-based domain filter, you can define a local static domain filter to allow or block specific domains.

In a DNS filter profile, the local domain filter has a higher priority than FortiGuard category-based domain filter. DNS queries are scanned and matched first with the local domain filter.

- If the local domain filter list has no match, then the FortiGuard category-based domain filter is used. If a DNS query domain name rating belongs to the block category, the query is blocked and redirected. If the FortiGuard category-based filter has no match, then the original resolved IP address is returned to the client DNS resolver.
- If the local domain filter action is set to block and an entry matches, then that DNS query is blocked and redirected.
- If the local domain filter action is set to allow and an entry matches, it will skip the FortiGuard category-based domain filter and directly return to the client DNS resolver.

- If the local domain filter action is set to monitor and an entry matches, it will skip the FortiGuard category-based domain filter, directly return to the client DNS resolver, and log the resolution.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 1677), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 1697).



In this example, a DNS filter profile is configured and applied to a firewall policy running proxy-based inspection mode.

To configure the local domain filter in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*, or edit an existing profile.
2. Set *Name* to *demo*.
3. In the *Static Domain Filter* section, enable *Domain Filter*.
4. Click *Create New*. The *Create Domain Filter* pane opens.
5. Enter a domain, and select a *Type* and *Action*. This example has three filters:

Domain	Type	Action
www.fortinet.com	Simple	Allow
*.example.com	Wildcard	Redirect to Block Portal
google	Reg. Expression	Monitor

6. Click *OK*. The entry appears in the table.

7. In the *FortiGuard Category Based Filter* table, set *General Interest - Business* > *Search Engines and Portals* to *Redirect to Block Portal*.
8. Configure the remaining settings as required.
9. Click *OK*.

To apply the DNS filter to a policy-mode policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*, or edit an existing policy.
2. Configure the *Incoming Interface*, *Outgoing Interface*, *Source*, *Destination*, and *Service* as required.
3. Set *Inspection Mode* to *Proxy-based*.
4. Enable *DNS Filter* and select the *demo* filter.
5. Set *SSL Inspection* to *certificate-inspection*.
6. Configure the remaining settings as required.
7. Click *OK*.

To configure the local domain filter in the CLI:

```
config dnsfilter domain-filter
    edit 1
        set name "demo"
        set comment ''
        config entries
            edit 1
                set domain "www.fortinet.com"
                set type simple
                set action allow
                set status enable
            next
            edit 2
                set domain "*.example.com"
                set type wildcard
                set action block
                set status enable
            next
            edit 3
                set domain "google"
                set type regex
                set action monitor
                set status enable
            next
        end
        config domain-filter
            set domain-filter-table 1
        end
        config ftgd-dns
            config filters
                edit 23
                    set category 41
                    set action block
                next
            end
        end
    next
end
```

Wildcard entries are converted to regular expressions by FortiOS. As a result, wildcards will match any suffix, as long as there is a word boundary following the search term.

For example:

```
config entries
    edit 1
        set domain "*.host"
        set type wildcard
    next
end
```

will match `wp36.host` and `wp36.host.pressdns.com`, but not `wp36.host123.pressdnds.com`.

To avoid this, use an explicit regular expression search string:

```
config entries
    edit 1
        set domain "^.*\\.host$"
        set type regexp
    next
end
```

To apply the DNS filter to a proxy-mode policy in the CLI:

```
config firewall policy
    edit 1
        set name "port3-port1"
        set srcintf "port3"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "certificate-inspection"
        set dnsfilter-profile "demo"
        set logtraffic all
        set nat enable
    next
end
```

Testing and Verification

On a client computer, perform DNS lookup on the three domains:

Domain	DNS query result	Log
www.fortinet.com	Allowed. Resolved to correct IP.	None

Domain	DNS query result	Log
www.example.com	Blocked. Redirected to IP of block page.	Deny log
www.google.com	Allowed. Resolved to correct IP.	Allow log

To check the DNS filter log in the GUI:

1. Go to *Log & Report* > *Security Events*.
2. Click the *DNS Query* card name to show the logs.

To check the DNS filter log in the CLI:

```
# execute log display
71 logs found.
10 logs returned.

1: date=2022-08-17 time=18:16:50 eventtime=1660785410733825945 tz="-0700" logid="1501054401"

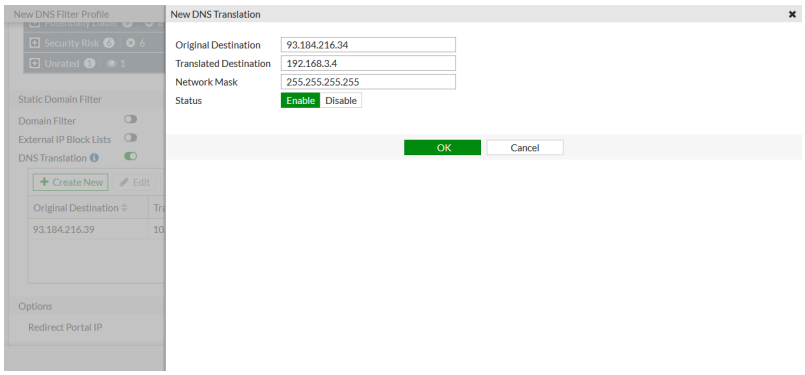
```

DNS translation

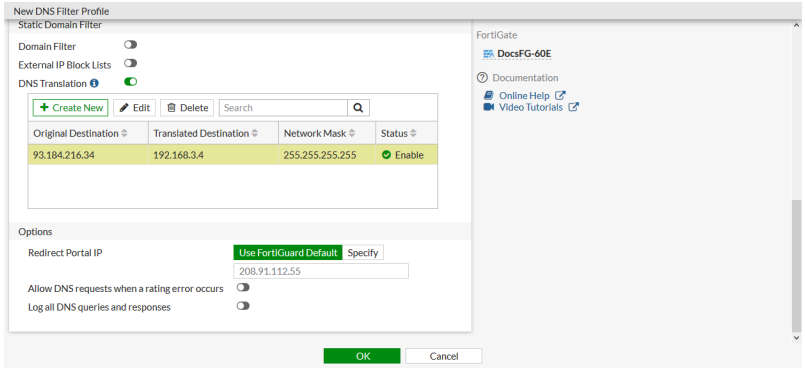
This setting allows you to translate a DNS resolved IP address to another IP address you specify on a per-policy basis.

For example, website A has a public address of 1.2.3.4. However, when your internal network users visit this website, you want them to connect to the internal host 192.168.3.4. You can use DNS translation to translate the DNS resolved address 1.2.3.4 to 192.168.3.4. Reverse use of DNS translation is also applicable. For example, if you want a public DNS query of your internal server to get a public IP address, then you can translate a DNS resolved private IP to a public IP address.



A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 1677), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 1697).

Sample configuration



This configuration forces the DNS filter profile to translate 93.184.216.34 (www.example.com) to 192.168.3.4. When internal network users perform a DNS query for www.example.com, they do not get the original www.example.com IP address of 93.184.216.34. Instead, it is replaced with 192.168.3.4.

To configure DNS translation in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*, or edit an existing profile.
2. In the *Static Domain Filter* section, enable *DNS Translation*.
3. Click *Create New*. The *New DNS Translation* pane opens.
4. Enter the *Original Destination* (the domain's original IP address), the *Translated Destination* IP address, and the *Network Mask*.

5. Click *OK*. The entry appears in the table.

6. Configure the other settings as needed.
7. Click *OK*.

To configure DNS translation in the CLI:

```
config dnsfilter profile
    edit "demo"
        set comment ''
        ...
        config dns-translation
            edit 1
                set src 93.184.216.34
                set dst 192.168.3.4
                set netmask 255.255.255.255
            next
        end
        set redirect-portal 0.0.0.0
        set redirect-portal6 ::
        set youtube-restrict strict
    next
end
```

To check DNS translation using a command line tool before DNS translation:

```
# dig www.example.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 27030
;; Flags: qr rd ra; QUERY: 1; ANSWER: 1; AUTHORITY: 2; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.example.com.             IN      A

;; ANSWER SECTION:

;; AUTHORITY SECTION:
example.com.            18578   IN      NS      b.iana-servers.net.
example.com.            18578   IN      NS      a.iana-servers.net.

;; Received 97 B
;; Time 2019-04-08 10:47:26 PDT
;; From 172.16.95.16@53(UDP) in 0.5 ms
```

To check DNS translation using a command line tool after DNS translation:

```
# dig www.example.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 62060
;; Flags: qr rd ra; QUERY: 1; ANSWER: 1; AUTHORITY: 2; ADDITIONAL: 0

;; QUESTION SECTION:

;; ANSWER SECTION:
www.example.com.        32491   IN      A       192.168.3.4

;; AUTHORITY SECTION:
```

```
example.com.            17123   IN      NS      b.iana-servers.net.
example.com.            17123   IN      NS      a.iana-servers.net.

;; Received 97 B
;; Time 2019-04-08 11:11:41 PDT
;; From 172.16.95.16@53(UDP) in 0.5 ms
```

DNS translation network mask

The following is an example of DNS translation that uses a network mask:

To configure DNS translation in the CLI:

```
config dns-translation
        edit 1
           set src 93.184.216.34
           set dst 1.2.3.4
           set netmask 255.255.224.0
        next
    end
```

To check DNS translation using a command line tool after DNS translation:

```
# dig www.example.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 6736
;; Flags: qr rd ra; QUERY: 1; ANSWER: 1; AUTHORITY: 2; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.example.com.             IN      A

;; ANSWER SECTION:
www.example.com.        29322   IN      A       1.2.24.34

;; AUTHORITY SECTION:
example.com.            13954   IN      NS      a.iana-servers.net.
example.com.            13954   IN      NS      b.iana-servers.net.

;; Received 97 B
;; Time 2019-04-08 12:04:30 PDT
;; From 172.16.95.16@53(UDP) in 2.0 ms
```

The binary arithmetic to convert 93.184.216.34 to 1.2.3.4 with the subnet mask is as follows:

1. AND src(Original IP) with negative netmask (93.184.216.34 & ~255.255.224.0):

   ```
   01011101.10111000.11011000.00100010 93.184.216.34
   00000000.00000000.00011111.11111111 ~255.255.224.0
   -------------------------------------------------------- &
   00000000.00000000.00011000.00100010 0.0.24.34
   ```

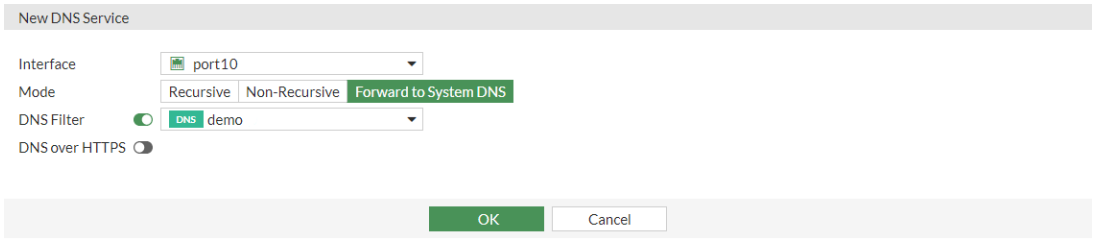
2. AND dst(Translated IP) with netmask:

   ```
   00000001.00000010.00000011.00000100 1.2.3.4
   11111111.11111111.11100000.00000000 255.255.224.0
   -------------------------------------------------------- &
   00000001.00000010.00000000.00000000 1.2.0.0
   ```

3. Final step 2 bitwise-OR 3:

```
00000000.00000000.00011000.00100010 0.0.24.34
00000001.00000010.00000000.00000000 1.2.0.0
-------------------------------------------------------- |
00000001.00000010.00011000.00100010 1.2.24.34
```

Applying DNS filter to FortiGate DNS server



You can configure a FortiGate as a DNS server in your network. When you enable DNS service on a specific interface, the FortiGate will listen for DNS service on that interface.

Depending on the configuration, DNS service works in three modes: *Recursive*, *Non-Recursive*, or *Forward to System DNS* (server). For details on how to configure the FortiGate as a DNS server and configure the DNS database, see FortiGate DNS server on page 277.

You can apply a DNS filter profile to *Recursive* and *Forward to System DNS* mode. This is the same as the FortiGate working as a transparent DNS proxy for DNS relay traffic.

To configure DNS service in the GUI:

1. Go to *Network* > *DNS Servers* (if this option is not available, go to *System* > *Feature Visibility* and enable *DNS Database*).
2. In the *DNS Service on Interface* section, click *Create New* and select an *Interface* from the dropdown.
3. For *Mode*, select *Forward to System DNS*.
4. Enable *DNS Filter* and select a profile from the dropdown.

5. Click *OK*.

To configure DNS service in the CLI:

```
config system dns-server
    edit "port10"
        set mode forward-only
        set dnsfilter-profile "demo"
    next
end
```

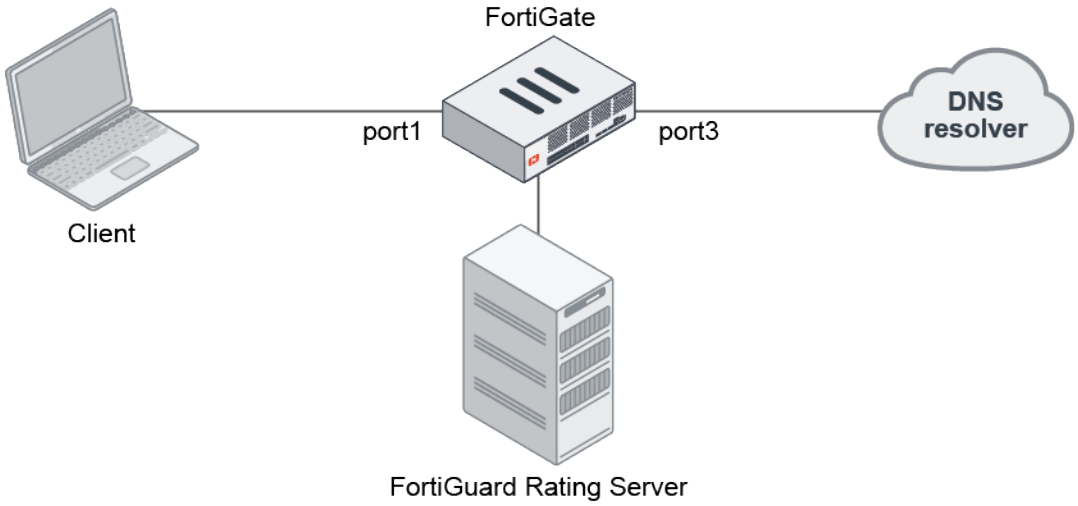
To check DNS service with a DNS filter profile using a command line tool:

In this example, port10 is enabled as a DNS service with the DNS filter profile demo. The IP address of port10 is 10.1.100.5 , and the DNS filter profile is configured to block category 52 (information technology). From your internal network PC, use a command line tool, such as dig or nslookup, to perform a DNS query. For example:

```
# dig @10.1.100.5 www.fortinet.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 52809
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0
```

```
;; QUESTION SECTION:
;; www.fortinet.com.            IN      A

;; ANSWER SECTION:
www.fortinet.com.       60      IN      A       208.91.112.55

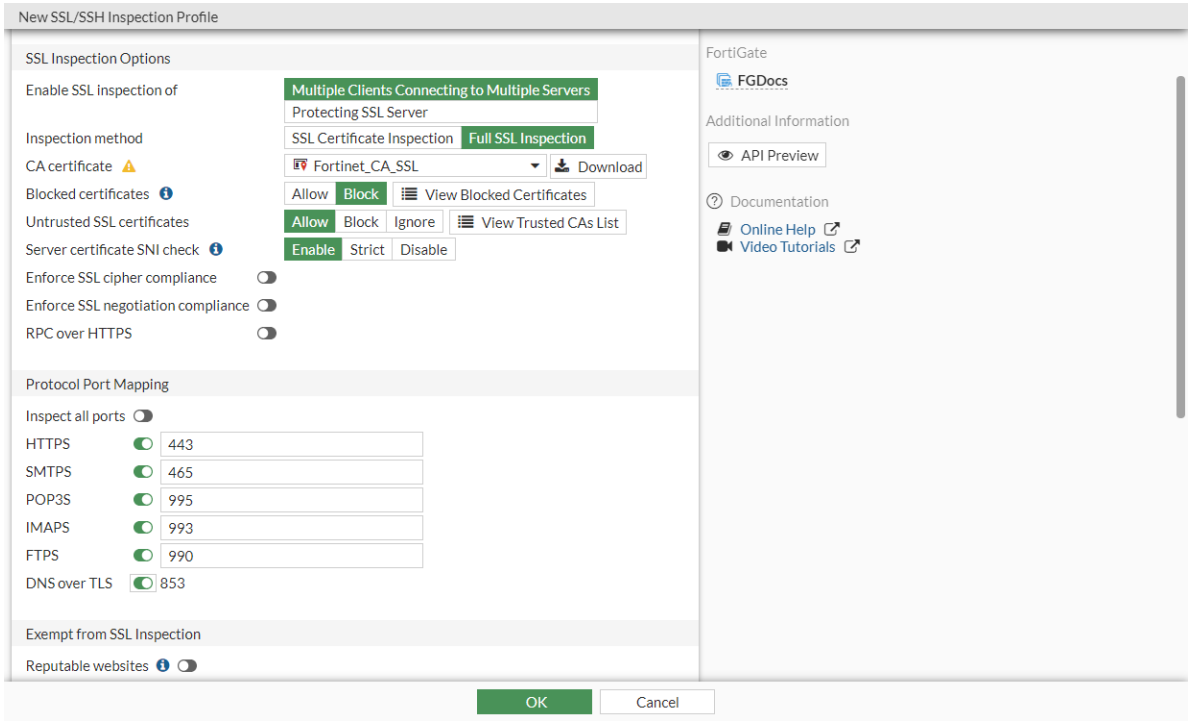


;; Received 50 B
;; Time 2019-04-08 14:36:34 PDT
;; From 10.1.100.5@53(UDP) in 13.6 ms
```

The relay DNS traffic was filtered based on the DNS filter profile configuration. It was blocked and redirected to the portal IP (208.91.112.55).

DNS inspection with DoT and DoH

DNS over TLS (DoT) and DNS over HTTPS (DoH) are supported in DNS inspection. Prior to 7.0, DoT and DoH traffic silently passes through the DNS proxy. In 7.0. the WAD is able to handle DoT and DoH, and redirect DNS queries to the DNS proxy for further inspection.



In the following examples, the FortiGate inspects DNS queries made over DoT and DoH to a Cloudflare DNS server. The DNS filter profile blocks the education category.

To configure DNS inspection of DoT and DoH queries in the GUI:

1. Configure the SSL-SSH profile:
   a. Go to *Security Profiles* > *SSL/SSH Inspection* and click *Create New*.
   b. Set *Inspection method* to *Full SSL Inspection*. DoT and DoH can only be inspected using doing deep inspection.

c. In the *Protocol Port Mapping* section, enable *DNS over TLS*.

d. Configure the other settings as needed.

e. Click *OK*.

2. Configure the DNS filter profile:

a. Go to *Security Profiles* > *DNS Filter* and click *Create New*.

b. Enable *Redirect botnet C&C requests to Block Portal*.

c. Enable *FortiGuard Category Based Filter* and set the *Action* for the *Education* category to *Redirect to Block Portal*.

d. Configure the other settings as needed.

e. Click *OK*.

3. Configure the firewall policy:

a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.

b. Enable *DNS Filter* and select the profile you created.

c. For *SSL Inspection*, select the profile you created.

d. Configure the other settings as needed.

e. Click *OK*.

To configure DNS inspection of DoT and DoH queries in the CLI:

1. Configure the SSL-SSH profile:

```
config firewall ssl-ssh-profile
    edit "ssl"
        config dot
            set status deep-inspection
            set client-certificate bypass
            set unsupported-ssl-cipher allow
            set unsupported-ssl-negotiation allow
```

```
            set expired-server-cert block
            set revoked-server-cert block
            set untrusted-server-cert allow
            set cert-validation-timeout allow
            set cert-validation-failure block
        end
    next
end
```

2. Configure the DNS filter profile:

```
config dnsfilter profile
    edit "dnsfilter"
        config ftgd-dns
            config filters
                edit 1
                    set category 30
                    set action block
                next
            end
        end
        set block-botnet enable
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port3"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "ssl"
        set webfilter-profile "webfilter"
        set dnsfilter-profile "dnsfilter"
        set nat enable
    next
end
```

Testing the connection

To query DNS over TLS:

1. Send a DNS query over TLS to the Cloudflare server 1.1.1.1 (this example uses kdig on an Ubuntu client). The www.ubc.ca domain belongs to the education category:

```
~$ kdig -d @1.1.1.1 +tls-ca +tls-host=cloudflare-dns.com www.ubc.ca
;; DEBUG: Querying for owner(www.ubc.ca.), class(1), type(1), server(1.1.1.1), port
(853), protocol(TCP)
;; DEBUG: TLS, imported 128 system certificates
```

```
;; DEBUG: TLS, received certificate hierarchy:
;; DEBUG:  #1, C=US,ST=California,L=San Francisco,O=Cloudflare\, Inc.,CN=cloudflare-
dns.com
;; DEBUG:      SHA-256 PIN: elpYCnCs9ZtkQBI4+cb2QtZcyOl5UI9jMkSvbTsTad0=
;; DEBUG:  #2, C=US,ST=California,L=Sunnyvale,O=Fortinet,OU=Certificate
Authority,CN=FG3H1E5818903681,EMAIL=support@fortinet.com
;; DEBUG:      SHA-256 PIN: s48VtdODlNZfAG2g/92hMLhitU51qsP9pkHAUtTJ+f4=
;; DEBUG: TLS, skipping certificate PIN check
;; DEBUG: TLS, The certificate is trusted.
;; TLS session (TLS1.3)-(ECDHE-SECP256R1)-(ECDSA-SECP256R1-SHA256)-(AES-256-GCM)
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 56850
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.ubc.ca.                  IN      A

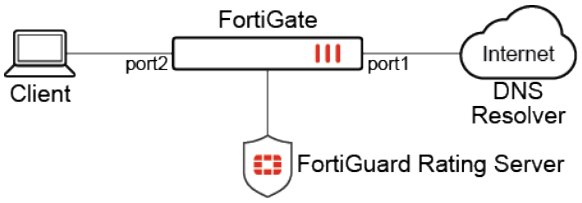
;; ANSWER SECTION:
www.ubc.ca.             60      IN      A       208.91.112.55

;; Received 44 B
;; Time 2021-03-12 06:53:37 UTC
;; From 1.1.1.1@853(TCP) in 6.0 ms
```

In this query, the FortiGate inspects the DNS query to the Cloudflare DNS server. It replaces the result with the IP of the FortiGuard block page, which successfully blocks the query.

To query DNS over HTTPS:

1. In your browser, enable DNS over HTTPS.
2. Go to www.ubc.ca. The website is redirected to the block page.



DNS over QUIC and DNS over HTTP3 for transparent and local-in DNS modes

DNS over QUIC (DoQ) and DNS over HTTP3 (DoH3) are supported in proxy mode inspection for transparent and local-in explicit modes. With DoQ and DoH3, connections can be established faster than with DNS over TLS (DoT) or DNS over HTTPS (DoH). The FortiGate can also handle the QUIC/TLS handshake and perform deep inspection for HTTP3 and QUIC traffic. This allows for faster and more secure DNS resolution, with improved privacy and reduced latency.

In transparent mode, the FortiGate is acting as a proxy, forwarding DNS queries, and not as a DNS server. In local-in DNS mode, the FortiGate acts as the DNS server and a DNS filter profile is applied in the system DNS server.

The firewall policy must be in proxy mode.

DoQ transparent and local-in query can be achieved using tools or applications in Linux, such as the q tiny command line DNS client from Natesales.

DoH3 transparent and local-in query can be achieved in Linux using q or Curl. In Windows, change the client network DNS server to the FortiGate and treat the FortiGate as a HTTP3 DNS server listening for DoH3 connections.

To configure DoQ in transparent mode:

1. Enable QUIC in the ssl-ssh-profile:

```
config firewall ssl-ssh-profile
    edit "protocols"
        config dot
            set status deep-inspection
            set quic enable
        end
    next
end
```

2. Configure a DNS filter profile:

```
config dnsfilter profile
    edit "dnsfilter_fgd"
        config ftgd-dns
            config filters
                edit 1
                    set category 30
                    set action block
                next
            end
        end
    next
end
```

3. Apply the profiles to a proxy firewall policy:

```
config firewall policy
    edit 1
        set name "dnsfilter"
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set dnsfilter-profile "dnsfilter_fgd"
        set logtraffic all
        set nat enable
    next
end
```

4. Test the configuration:

On the client, use q to query a FortiGuard category30 domain with the Adguard DNS server over QUIC. The default redirect block IP address should be returned:

```
pc03:~# q www.sfu.ca @quic://dns.adguard.com --tls-no-verify
2023/08/18 18:53:44 failed to sufficiently increase receive buffer size (was: 208 kiB,
wanted: 2048 kiB, got: 416 kiB). See https://github.com/quic-go/quic-go/wiki/UDP-
Receive-Buffer-Size for details.
www.sfu.ca. 1m0s A 208.91.112.55
www.sfu.ca. 1m0s AAAA 2620:101:9000:53::55
```

To configure DoQ in local-in mode:

1. In the FortiGate DNS server configuration, enable DoQ for a port with the previously configured DNS filter profile applied:

```
config system dns-server
    edit "port2"
        set dnsfilter-profile "dnsfilter_fgd"
        set doq enable
    next
end
```

2. Test the configuration:

   On the client, use q to query a FortiGuard category30 domain with the FortiGate interface over QUIC. The default redirect block IP address should be returned:

```
pc03:~# q www.mcgill.ca @quic://10.1.100.150 --tls-no-verify
2023/08/18 20:05:53 failed to sufficiently increase receive buffer size (was: 208 kiB,
wanted: 2048 kiB, got: 416 kiB). See https://github.com/quic-go/quic-go/wiki/UDP-
Receive-Buffer-Size for details.
www.mcgill.ca. 1m0s A 208.91.112.55
www.mcgill.ca. 1m0s AAAA 2620:101:9000:53::55
```

To configure DoH3 in transparent mode:

1. Enable QUIC in the ssl-ssh-profile:

```
config firewall ssl-ssh-profile
    edit "protocols"
        config https
            set ports 443 8443
            set status deep-inspection
            set quic enable
        end
    next
end
```

2. Configure a DNS filter profile:

```
config dnsfilter profile
    edit "dnsfilter_fgd"
        config ftgd-dns
            config filters
                edit 1
                    set category 30
                    set action block
                next
```

```
            end
        end
    next
end
```

3. Apply the profiles to a proxy firewall policy:

```
config firewall policy
    edit 1
        set name "dnsfilter"
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set dnsfilter-profile "dnsfilter_fgd"
        set logtraffic all
        set nat enable
    next
end
```

4. Test the configuration:

   On the client with HTTP3 support, use q or Curl to query a FortiGuard category30 domain with the Adguard DNS server or Cloudflare DNS server over QUIC. The default redirect block IP address should be returned:

```
pc03:~# q www.mcgill.ca --http3 @https://dns.adguard.com --tls-no-verify
2023/08/18 21:04:02 failed to sufficiently increase receive buffer size (was: 208 kiB,
wanted: 2048 kiB, got: 416 kiB). See https://github.com/quic-go/quic-go/wiki/UDP-
Receive-Buffer-Size for details.
www.mcgill.ca. 1m0s A 208.91.112.55
www.mcgill.ca. 1m0s AAAA 2620:101:9000:53::55
```

```
pc03:~# curl -H 'accept: application/dns-message' -v -k --http3 'https://1.1.1.1/dns-
query?dns=q80BAAABAAAAAAAAA3d3dwN1YmMCY2EAAAEAAQ' | hexdump
*   Trying 1.1.1.1:443...

* Sent QUIC client Initial, ALPN: h3,h3-29,h3-28,h3-27
  % Total    % Received % Xferd  Average Speed   Time    Time     Time  Current
                                 Dload  Upload   Total   Spent    Left  Speed
  0     0    0     0    0     0      0      0 --:--:-- --:--:-- --:--:--     0*
Connected to 1.1.1.1 (1.1.1.1) port 443 (#0)
* h3 [:method: GET]
* h3 [:path: /dns-query?dns=q80BAAABAAAAAAAAA3d3dwN1YmMCY2EAAAEAAQ]
* h3 [:scheme: https]
* h3 [:authority: 1.1.1.1]
* h3 [user-agent: curl/7.80.0-DEV]
* h3 [accept: application/dns-message]
* Using HTTP/3 Stream ID: 0 (easy handle 0x558fdd1c2220)
> GET /dns-query?dns=q80BAAABAAAAAAAAA3d3dwN1YmMCY2EAAAEAAQ HTTP/3
> Host: 1.1.1.1
> user-agent: curl/7.80.0-DEV
```

```
> accept: application/dns-message
>
< HTTP/3 200
< content-type: application/dns-message
< content-length: 44
<
{ [44 bytes data]
100    44  100    44    0     0   1305      0 --:--:-- --:--:-- --:--:--  1375
* Connection #0 to host 1.1.1.1 left intact
0000000 cdab 0081 0100 0100 0000 0000 7703 7777
0000010 7503 6362 6302 0061 0100 0100 0cc0 0100
0000020 0100 0000 3c00 0400 5bd0 3770
000002c
```

To configure DoH3 in local-in mode:

1. In the FortiGate DNS server configuration, enable DoH3 for a port with the previously configured DNS filter profile applied:

```
config system dns-server
    edit "port2"
        set dnsfilter-profile "dnsfilter_fgd"
        set doh3 enable
    next
end
```

2. Test the configuration:

   On the client with HTTP3 support, use q or Curl to query a FortiGuard category30 domain with the FortiGate interface over HTTP3. The default redirect block IP address should be returned:

```
pc03:~# q www.mcgill.ca --http3 @https://10.1.100.150 --tls-no-verify
2023/08/18 20:37:55 failed to sufficiently increase receive buffer size (was: 208 kiB,
wanted: 2048 kiB, got: 416 kiB). See https://github.com/quic-go/quic-go/wiki/UDP-
Receive-Buffer-Size for details.

```

Troubleshooting for DNS filter

If you have trouble with the DNS filter profile in your policy, start with the following troubleshooting steps:

- Check the connection between the FortiGate and FortiGuard DNS rating server (SDNS server).
- Check that the FortiGate has a valid FortiGuard web filter license.
- Check the FortiGate DNS filter configuration.

Checking the connection between the FortiGate and FortiGuard SDNS server

You need to ensure the FortiGate can connect to the FortiGuard SDNS server. By default, the FortiGate uses DNS over TLS (DoT, TCP port 853) to connect to the SDNS server. See DNS over TLS and HTTPS on page 290 for more information.

To check the connection between the FortiGate and SDNS server:

1. Verify the FortiGuard SDNS server information:

   ```
   # diagnose test application dnsproxy 3
   ...
   SDNS servers:
   173.243.140.53:853 vrf=0 tz=-480 encrypt=dot req=0 to=0 res=0 rt=34 ready=1 timer=0
   probe=0 failure=0 last_failed=0
   ```

   The SDNS server IP address might be different depending on location (in this example, it is 173.243.140.53:853).
2. In the management VDOM, check the communication between the FortiGate and the SDNS server:

   ```
   # execute ping 173.243.140.53
   ```

3. If FortiGuard is not reachable using anycast, configure the default FortiGuard SDNS (unicast) server (208.91.112.220):

   ```
   config system fortiguard
       set fortiguard-anycast disable
       set sdns-server-ip "208.91.112.220"
   end
   ```

4. Verify the list of SDNS servers again:

   ```
   # diagnose test application dnsproxy 3
   FGD_DNS_SERVICE_LICENSE:
   ```

```
server=208.91.112.220:53, expiry=2023-10-28, expired=0, type=2
server=83.231.212.53:53, expiry=2023-10-28, expired=0, type=2
```

The default FortiGuard SDNS server should work in most cases; however, you can switch to another server to see if it improves latency.

By default, DNS filtering connects to the FortiGuard secure DNS server over anycast and uses DoT (TCP port 853) when the default settings of `fortiguard-anycast enable` and `fortiguard-anycast-source fortinet` are configured. Disabling `fortiguard-anycast` will force the FortiGate to use cleartext (UDP port 53) instead of DoT (TCP port 853) in addition to disabling FortiGuard secure DNS over anycast.

Checking the FortiGuard DNS rating service license

The FortiGuard DNS rating service shares the license with the FortiGuard web filter, so you must have a valid web filter license for the DNS rating service to work. While the license is shared, the DNS rating service uses a separate connection mechanism from the web filter rating.

To check the DNS rating service license in the CLI:

1. View the DNS settings:

   ```
   # diagnose test application dnsproxy 3
   ```

2. Find the `FGD_DNS_SERVICE_LICENSE` line and check that the license has not expired:

   ```
   FGD_DNS_SERVICE_LICENSE:
   server=173.243.140.53:853, expiry=2023-10-28, expired=0, type=2
   ```

3. Find the `SDNS servers` line to view the functioning servers:

   ```
   SDNS servers:
   173.243.140.53:853 vrf=0 tz=-480 encrypt=dot req=0 to=0 res=0 rt=34 ready=1 timer=0
   probe=0 failure=0 last_failed=0
   ```

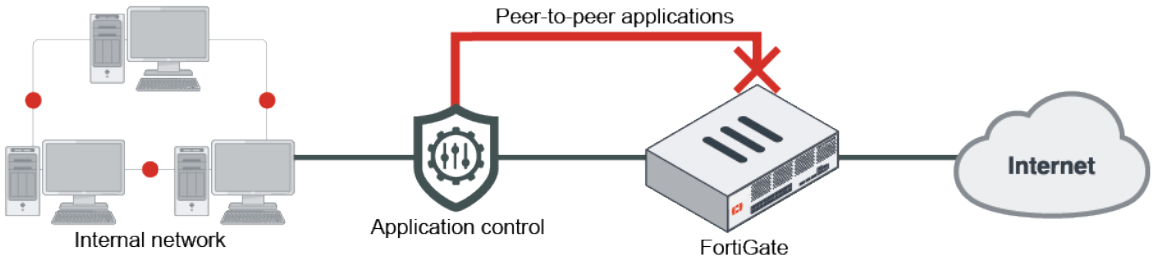
Checking the FortiGate DNS filter profile configuration

To check the DNS filter profile configuration:

1. In FortiOS, create a local domain filter and set the *Action* to *Redirect to Block Portal* (see Local domain filter on page 1689).
2. Apply this DNS filter profile to the policy.
3. From the client PC, perform a DNS query on this domain. If you get the profile's redirected portal address, this means that the DNS filter profile works as expected.

Additional troubleshooting

Use `diagnose test application dnsproxy <test level>` to troubleshoot further DNS proxy information, where:



Test level	Action
1	Clear DNS cache
2	Show statistics
3	Dump DNS setting
4	Reload FQDN
5	Requery FQDN
6	Dump FQDN
7	Dump DNS cache
8	Dump DNS database
9	Reload DNS database
10	Dump secure DNS policy/profile
11	Dump botnet domain
12	Reload secure DNS setting
13	Show hostname cache
14	Clear hostname cache
15	Show SDNS rating cache
16	Clear SDNS rating cache
17	Show DNS debug bit mask
18	Show DNS debug object members
99	Restart the dnsproxy worker

To debug DNS proxy details:

```
# diagnose debug application dnsproxy -1
# diagnose debug {enable | disable}
```

Application control

FortiGates can recognize network traffic generated by a large number of applications. Application control sensors specify what action to take with the application traffic. Application control uses IPS protocol decoders that can analyze network traffic to detect application traffic, even if the traffic uses non-standard ports or protocols. Application control supports traffic detection using the HTTP protocol (versions 1.0, 1.1, and 2.0).

FortiOS includes three preloaded application sensors:

- *default* (monitors all applications)
- *wifi-default* (default configuration for offloading WiFi traffic)
- *block-high-risk*

You can customize these sensors, or you can create your own to log and manage the applications on your network.

Once configured, you can add the application sensor to a firewall policy.

This functionality requires a subscription to FortiGuard Application Control.

The following topics provide information about application control:

- Configuring an application sensor on page 1709
- Basic category filters and overrides on page 1710
- Excluding signatures in application control profiles on page 1714
- Port enforcement check on page 1716
- Protocol enforcement on page 1716
- SSL-based application detection over decrypted traffic in a sandwich topology on page 1718
- Matching multiple parameters on application control signatures on page 1719
- Application signature dissector for DNP3 on page 1722
- Blocking QUIC manually on page 1722

Configuring an application sensor

FortiGates can recognize network traffic generated by a large number of applications using application control, which relies on IPS protocol decoders. Application sensors control what action is taken with application traffic.

To configure an application sensor:

1. Go to *Security Profiles* > *Application Control* and click *Create New*.
2. Configure the following settings:

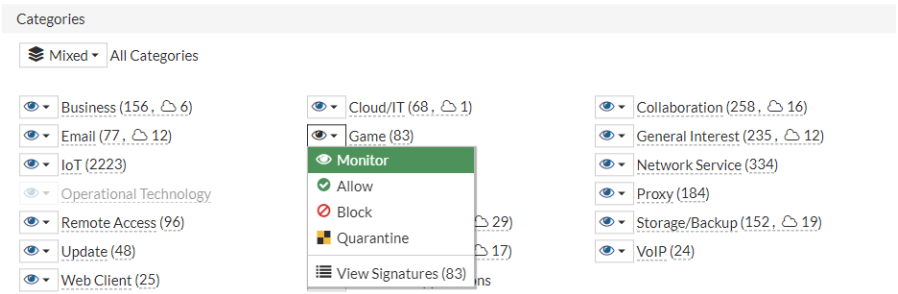
Name	Enter a unique name for the sensor.
Comments	Enter a comment (optional).

Categories	Configure the action to take on groups of signatures based on their category type. Applications belonging to the category trigger the configured action: monitor, allow, block, or quarantine. See Basic category filters and overrides on page 1710 for more information.
Network Protocol Enforcement	Enable/disable the enforcement of protocols over selected ports. See Protocol enforcement on page 1716 for more information.
Application and Filter Overrides	Configure multiple applications signatures with a dedicated action for a single sensor. Filters can be added based on the application category, behavior, popularity, protocol, risk, technology, or vendor subtype. For more information, see • Configuring application and filter overrides on page 1712 • Matching multiple parameters on application control signatures on page 1719 • Blocking applications with custom signatures on page 1914
Block applications detected on non-default ports	When enabled: • For monitor and allow actions, applications will be blocked if detected on non-default ports (as defined in FortiGuard application signatures). • Block actions still block traffic for the application regardless of the port. See Port enforcement check on page 1716 for more information.
Allow and Log DNS Traffic	The intended behavior is to allow and log DNS traffic. However, to fully enable logging, configure the following: 1. Within the application sensor profile, create a new *Application and Filter Overrides* entry. 2. Set the *Action* to *Monitor*. 3. Search for the DNS application, select it, and click *Add Selected*. 4. Click *OK* to save the override, then click *OK* to save the application sensor profile.
Replacement Messages for HTTP-based Applications	Enable/disable replacement messages for blocked applications. See Replacement messages on page 2941 for information about replacement messages.

3. Click *OK*.

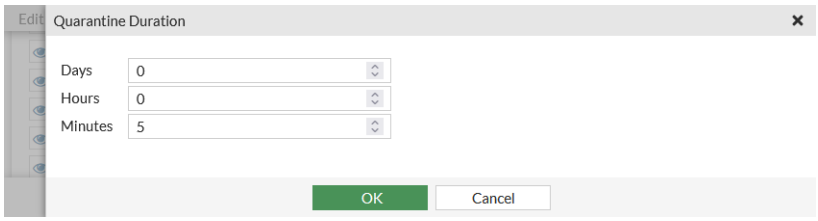
Basic category filters and overrides

When creating an application sensor, you can define the applications that you want to control. You can add applications and filters using categories, application overrides, and/or filter overrides with designated actions (monitor, allow, block, or quarantine).



Action	Description
Monitor	Passes the traffic and generates a log message.
Allow	Passes the traffic but does not generate a log message.

Action	Description
Block	Drops the detected traffic and generates a log message.
Quarantine	Blocks the traffic from an attacker IP address until the expiration time is reached and generates a log message.



For more information about application control logs, see Security Events log page on page 3447.

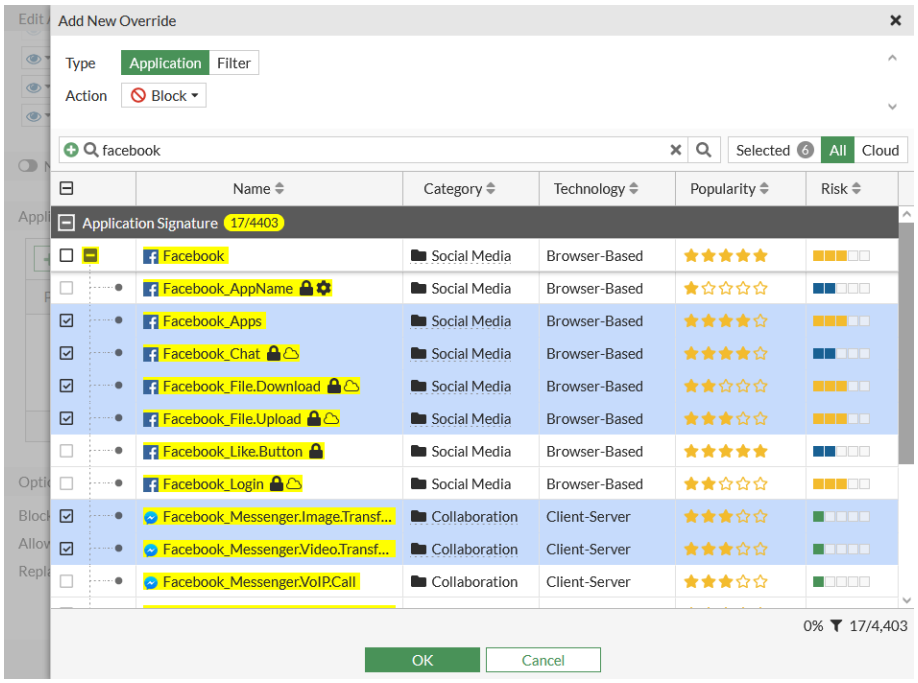
To configure category filters in the GUI:

1. Go to *Security Profiles* > *Application Control* and click *Create New*, or edit an existing sensor.
2. Under *Categories*, click the icon next to the category name to set the action or view the application signatures.

3. If you select the *Quarantine* action, the *Quarantine Duration* pane will open. Enter the duration values and click *OK*.

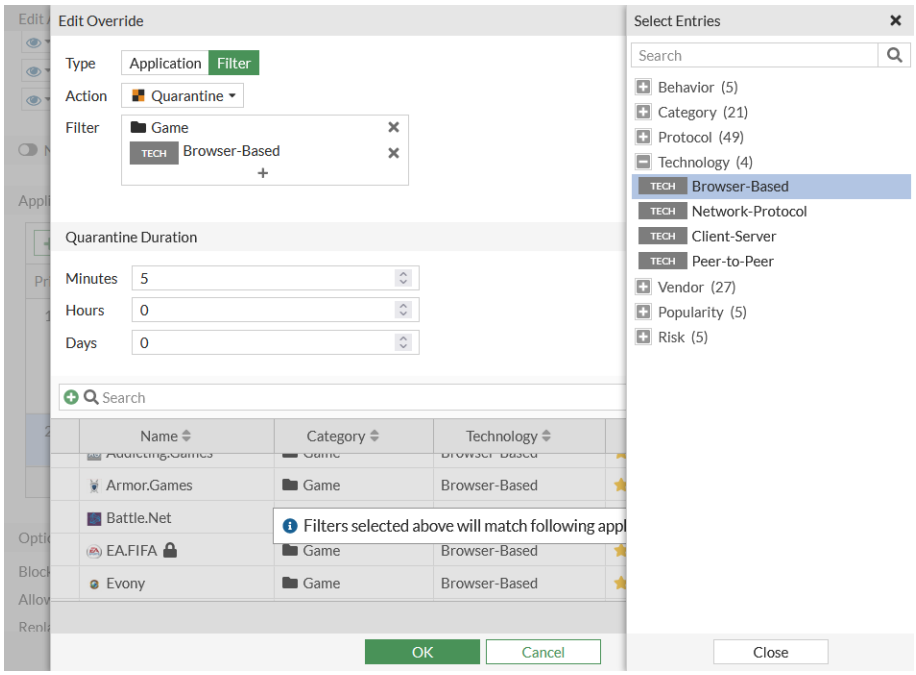
4. Click *OK*.

To configure category filters in the CLI:



```
config application list
    edit <name>
        config entries
            edit <id>
                set category <id>
                set action {pass | block | reset}
                set quarantine {none | attacker}
                set quarantine-expiry <###d##h##m>
                set log {enable | disable}
            next
        end
    next
end
```

Configuring application and filter overrides



Multiple application signatures can be added for one sensor with a designated action. Filters can be added based on behavior, application category, popularity, protocol, risk, technology, or vendor subtypes.

To configure overrides in the GUI:

1. Go to *Security Profiles* > *Application Control* and click *Create New*, or edit an existing sensor.
2. Add an application:
   a. In the *Application and Filter Overrides* table, click *Create New*.
   b. For *Type*, select *Application*.
   c. Select an *Action* from the dropdown.
   d. In the *Search* box, enter an application name and press `Enter`, or click the plus icon and configure a search filter.
   e. In the search results, select the required applications (you can select multiple applications).

   f. Click *OK*.
3. Add a filter:
   a. In the *Application and Filter Overrides* table, click *Create New*.
   b. For *Type*, select *Filter*.
   c. Select an *Action* from the dropdown.
   If the action is set to *Quarantine*, set the duration of the quarantine.
   d. In the *Filter* field, click the + . The *Select Entries* pane opens, and you can search based on filter subtypes. This example uses Browser-Based (under Technology) and Game (under Category).

e. Click *OK*.

4. Click *OK*.

To configure overrides in the CLI:

```
config application list
    edit <name>
        config entries
            edit <id>
                set protocols <integer>
                set risk <integer>
                set vendor <id>
                set technology <id>
                set behavior <id>
                set popularity <integer>
                set action {pass | block | reset}
                set quarantine {none | attacker}
                set log {enable | disable}
            next
        end
    next
end
```

`protocols <integer>`	Application protocol filter (0 - 47, or all).
`risk <integer>`	Risk or impact of allowing traffic from this application to occur (1 - 5; low (1), elevated (2), medium (3), high (4), and critical (5)).
`vendor <id>`	Application vendor filter (0 - 25, or all).
`technology <id>`	Application technology filter: • all

	• 0 (network-protocol) • 1 (browser-based) • 2 (client-server) • 4 (peer-to-peer)
`behavior <id>`	Application behavior filter: • all • 2 (botnet) • 3 (evasive) • 5 (excessive bandwidth) • 6 (tunneling) • 9 (cloud)
`popularity <integer>`	Application popularity filter (1 - 5, from least to most popular).
`action {pass | block | reset}`	Pass/block traffic or reset the connection for traffic from this application (default = block).
`quarantine {none | attacker}`	Set the quarantine method: • `none`: Quarantine is disabled. • `attacker`: Block all traffic sent from attacker's IP address. The attacker's IP address is also added to the banned user list. The target's address is not affected.
`log {enable | disable}`	Enable/disable logging for this application list (default = enable).

For more information, see the FortiOS CLI reference.

Excluding signatures in application control profiles

In an application control list, the exclusion option allows users to specify a list of applications they wish to exclude from an entry filtered by category, technology, or others. By excluding the signature, the application is no longer processed on the entry in which it is excluded, but may match subsequent entries that exist.

To configure signature exclusion:

```
config application list
    edit <name>
        config entries
            edit <id>
                set category <id>
                set exclusion <application id>
                set action {pass | block | reset}
            next
        end
    next
end
```

Sample configurations

In the following example, category 23 (social media) is blocked in the entries, and signature 34527 (Instagram) is excluded from this entry. Traffic to Instagram will pass because the signature is removed from entry 1 and the action of `other-application-action` is set to `pass`.

To configure signature exclusion:

```
config application list
    edit "test"
        set other-application-action pass
        set unknown-application-action pass
        set other-application-log enable
        set unknown-application-log enable
            config entries
                edit 1
                    set category 23
                    set exclusion 34527
                    set action block
                next
            end
    next
end
```

In the following example, entry 1 is configured so that category 23 (social media) is set to pass and signature 34527 (Instagram) is excluded. In entry 2, application 34527 (Instagram) is blocked, so the traffic to Instagram will be blocked, even though it is excluded in entry 1. Traffic to other signatures in category 23, such as Facebook, will still pass.

To configure signature exclusion:

```
config application list
    edit "test"
        set other-application-action pass
        set unknown-application-action pass
        set other-application-log enable
        set unknown-application-log enable
            config entries
                edit 1
                    set category 23
                    set exclusion 34527
                    set action pass
                next
                edit 2
                    set application 34527
                    set action block
                next
            end
    next
end
```

In the following example, an explicit proxy is behind the FortiGate with an excluded signature for 107347980 (Proxy.HTTP) and category 6 (proxy) is set to block. The client will allow normal proxy traffic to pass, but it will discard all proxy application traffic (such as KProxy, Tor, and so on).

To configure signature exclusion:

```
config application list
    edit "test"
        set other-application-action pass
        set unknown-application-action pass
        set other-application-log enable
        set unknown-application-log enable
            config entries
                edit 1
                    set category 6
                    set exclusion 107347980
                    set action block
                next
            end
    next
end
```

Port enforcement check

Most networking applications run on specific ports. For example, SSH runs on port 22, and Facebook runs on ports 80 and 443.

If the default network service is enabled in the application control profile, a port enforcement check is done at the application profile level, and any detected application signatures running on the non-standard TCP/IP port are blocked. This means that each allowed application runs on its default port.

To configure port enforcement check:

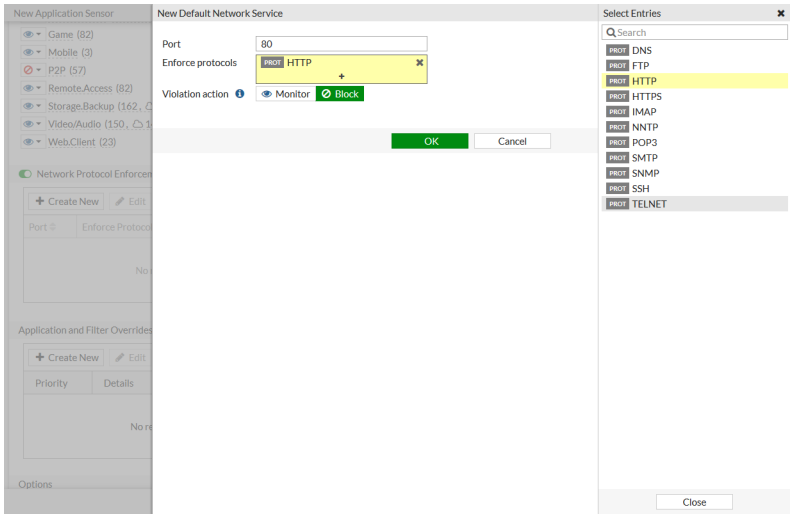
```
config application list
    edit <name>
        set enforce-default-app-port enable
        config entries
            edit 1
                set application 15896
                set action pass
            next
        end
    next
end
```

For example, when applying this application control sensor, FTP traffic (application 15896) with the standard port (port 21) is allowed, while the non-standard port (port 2121) is blocked.

Protocol enforcement

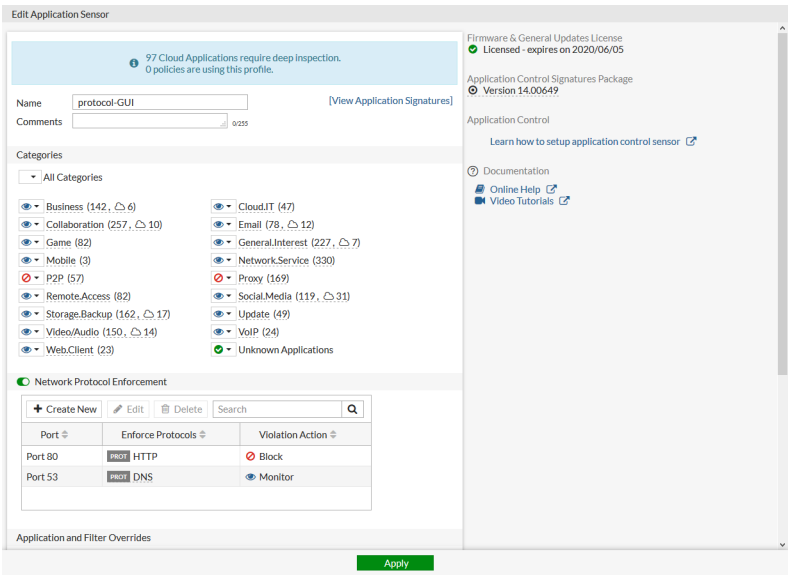
Protocol enforcement allows you to configure networking services (e.g. FTP, HTTP, HTTPS) on known ports (e.g. 21, 80, 443). For protocols that are not allowlisted under select ports, the IPS engine performs the violation action to block, allow, or monitor that traffic.

This feature can be used in the following scenarios:



- When one protocol dissector confirms the service of network traffic, protocol enforcement can check whether the confirmed service is allowlisted under the server port. If it is not allowlisted, the traffic is considered a violation and IPS can take the action specified in the configuration (block or monitor it).
- When there is no confirmed service for the network traffic, the traffic is considered a service violation if IPS dissectors rule out all of the services enforced under its server port.

In an applicable profile, a default network service list can be created to associate well known ports with accepted services.

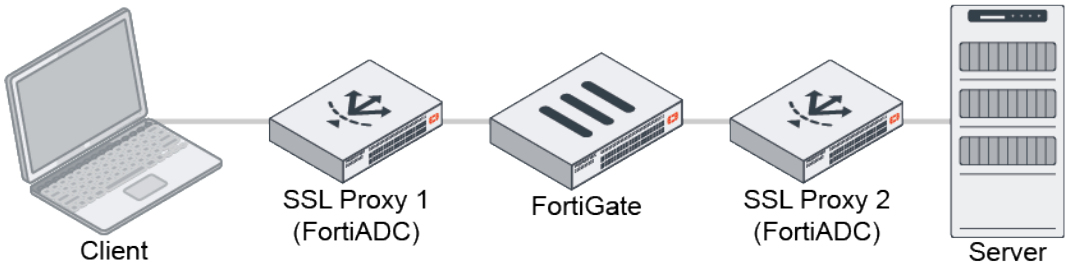


In the following example, an application sensor is configured to enforce HTTP on port 80 (block), and DNS on port 53 (monitor).

To configure protocol enforcement in the GUI:

1. Go to *Security Profiles* > *Application Control*.
2. Create a new application sensor or edit an existing one.
3. Enable *Network Protocol Enforcement*.
   Enforcement entries can be created, edited, or deleted to configure network services on certain ports and determine the violation action.
4. In the *Network Protocol Enforcement* table, click *Create New*.
5. Configure the entry for HTTP:
   a. For *Port*, enter 80.
   b. For *Enforced protocols*, select *HTTP*.
   c. For *Violation action*, select *Block*.
   d. Click *OK*.

6. Configure the entry for DNS:
   a. Click *Create New*, then for *Port*, enter 53.
   b. For *Enforced protocols*, select *DNS*.
   c. For *Violation action*, select *Monitor*.
   d. Click *OK*.
   The entries are displayed in the table.



7. Click *OK*.

To configure protocol enforcement in the CLI:

```
config application list
    edit "protocol-GUI"
        set other-application-log enable
        set control-default-network-services enable
        config default-network-services
            edit 1
                set port 80
                set services http
                set violation-action block
            next
            edit 2
                set port 53
                set services dns
                set violation-action monitor
            next
        end
    next
end
```

SSL-based application detection over decrypted traffic in a sandwich topology

When a FortiGate is sandwiched between SSL encryption and decryption devices, the FortiGate can process the decrypted traffic that passes between those devices. This feature adds support for decrypted traffic in application control. In some pre-defined signatures, the signature is pre-marked with the *require_ssl_di* tag. The `force-inclusion-ssl-di-sigs` option under `application list` allows users to control the inspection of dissected traffic. When this option is enabled, the IPS engine forces the pre-marked SSL-based signatures to be applied to the decrypted traffic of the respective applications. In the following topology, SSL Proxy 1 handles the client connection and SSL Proxy 2 handles the server connection, leaving the content unencrypted as traffic passes through the FortiGate.

To configure SSL-based application detection over decrypted traffic:

```
config application list
    edit "test"
        set force-inclusion-ssl-di-sigs {enable | disable}
    next
end
```

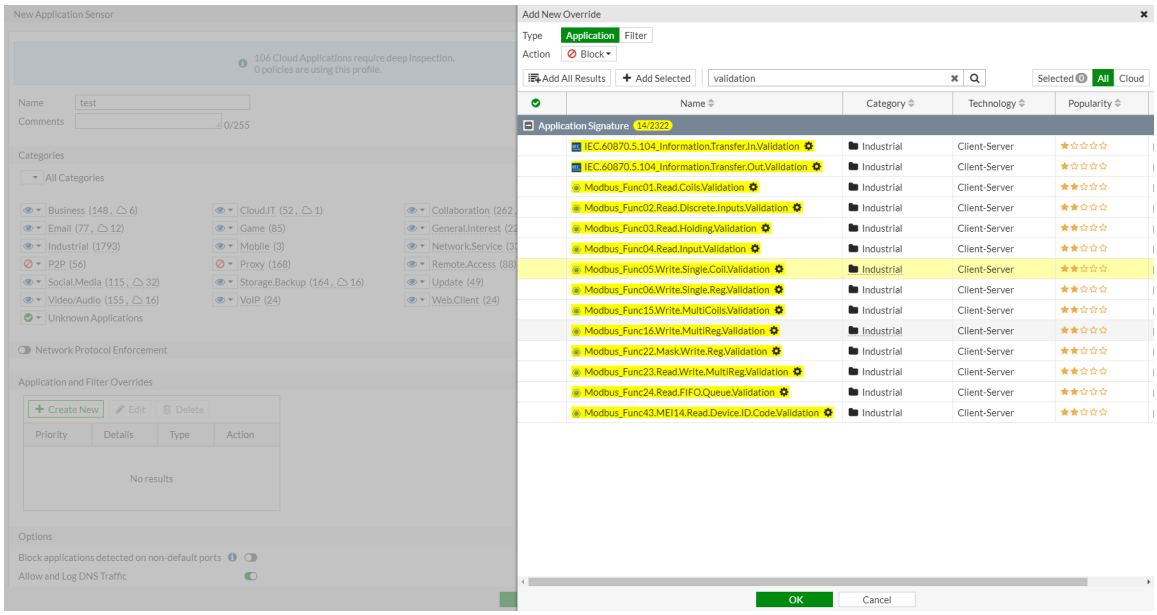
Example pre-marked SSL-based signature:

F-SBID(--vuln_id 15722; --attack_id 42985; --name "Facebook_Chat"; --group im; --protocol tcp; --default_action pass; --revision 4446; --app_cat 23; --vendor 3; --technology 1; --behavior 9; --pop 4; --risk 2; --language "Multiple"; --weight 20; --depend-on 15832; --depend-on 38468; ***--require_ssl_di "Yes"****; --casi 1; --casi 8; --parent 15832; --app_port "TCP/443"; --severity info; --status hidden; --service http; --flow from_client; --pattern "/pull?"; --context uri; --no_case; --pattern ".facebook.com"; --context host; --no_case; --tag set,Tag.Facebook.Pull; --tag quiet; --scan-range 10m,all; --date 20190301;)*

All signatures that include the *require_ssl_di* tag are pre-defined and cannot be customized.

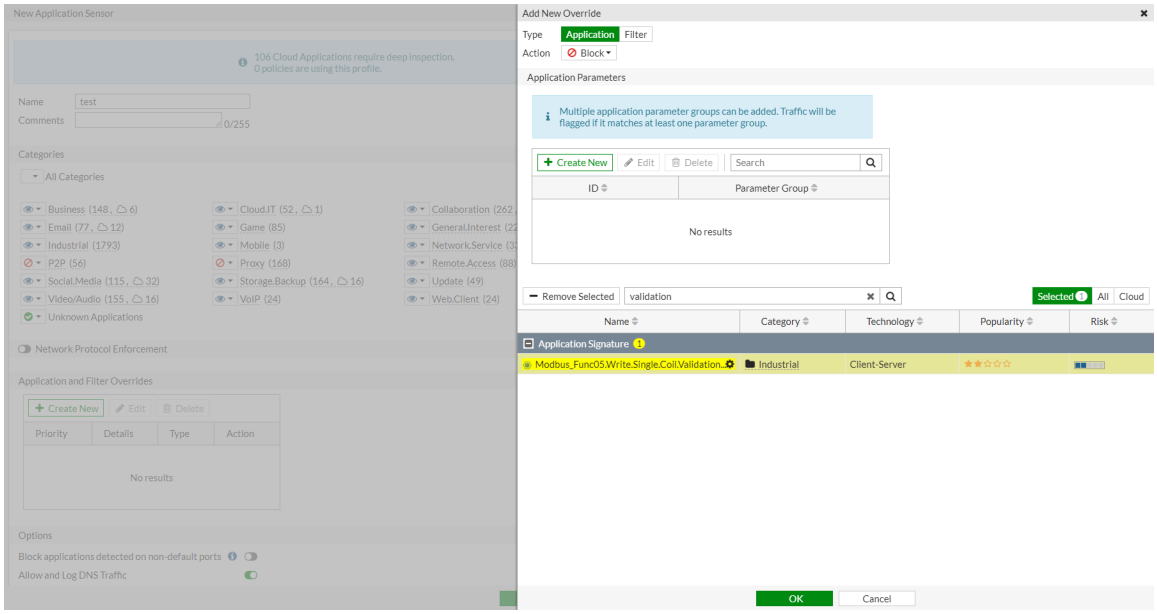
Matching multiple parameters on application control signatures

Application control signatures that support parameters (such as SCADA protocols) can have multiple parameters grouped together and matched at the same time. Multiple application parameter groups can be added to an override. Traffic will be flagged if it matches at least one parameter group.



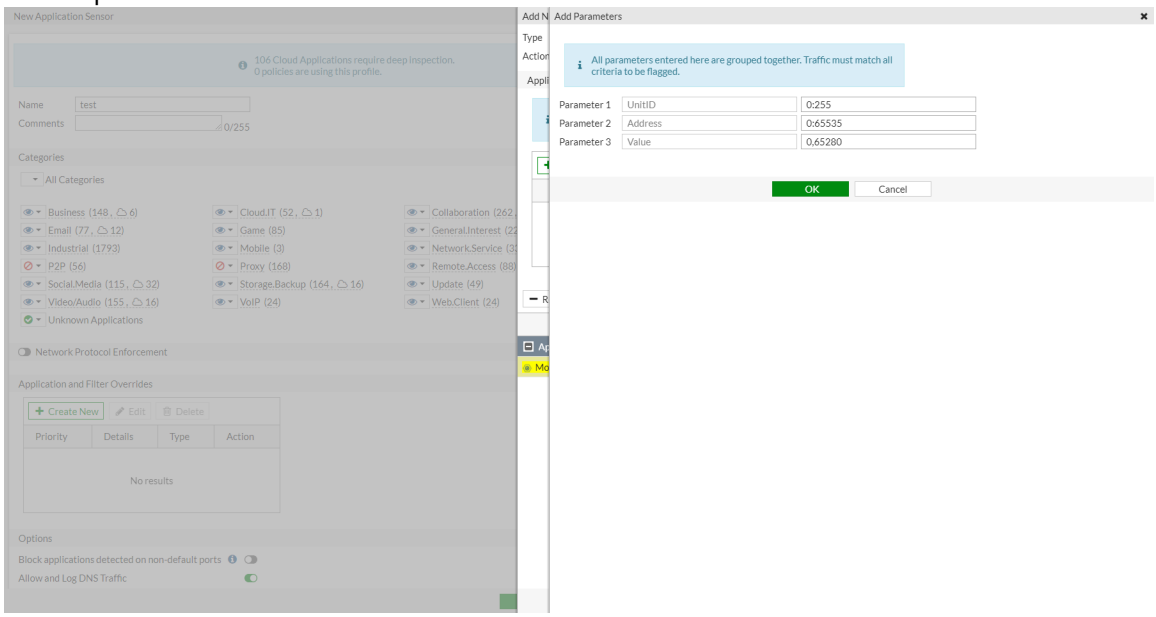
This example uses the Modbus_Func05.Write.Single.Coil.Validation signature. This is an OT signature, so ensure that no signatures are excluded:

```
config ips global
    set exclude-signatures none
end
```



To configure an application sensor with multiple parameters in the GUI:

1. Go to *Security Profiles* > *Application Control* and click *Create New*, or edit an existing sensor.
2. In the *Application and Filter Overrides* table, click *Create New*.
3. Search for *Modbus_Func05.Write.Single.Coil.Validation* and press `Enter`. A gear icon beside the signature name indicates it has configurable application parameters.



4. In the search results, select *Modbus_Func05.Write.Single.Coil.Validation* and click *Add Selected*.

5. Click the *Selected* tab. In the *Application Parameters* section, click *Create New*.

6. Edit the parameter values as needed.

7. Click *OK*.
8. Add more signatures if needed.
9. Click *OK*.

To configure an application sensor with multiple parameters in the CLI:

```
config application list
    edit "test"
        set other-application-log enable
        config entries
            edit 1

                set application 48885
                config parameters
                    edit 1
                        config members
                            edit 1
                                set name "UnitID"
                                set value "0:255"
                            next
                            edit 2
                                set name "Address"
                                set value "0:65535"
                            next
                            edit 3
                                set name "Value"
                                set value "0,65280"
                            next
                        end
                    next
                end
            next
            edit 2
                set category 2 6
```

```
            next
        end
    next
end
```

Application signature dissector for DNP3

The DNP3 application signature dissector supports detecting DNP3 traffic that is encapsulated by the RealPort protocol (Net.CX). DNP3 is used in industrial solutions over serial ports, USB ports, printers, and so on. RealPort encapsulation allows transportation of the underlying protocols over TCP/IP. The FortiGate OT signatures must be enabled to use RealPort.DNP3 signatures:

```
config ips global
    set exclude-signatures none
end
```

IPS engine version 7.0015 and later supports RealPort.DNP3 dissectors.

Sample logs

```

```

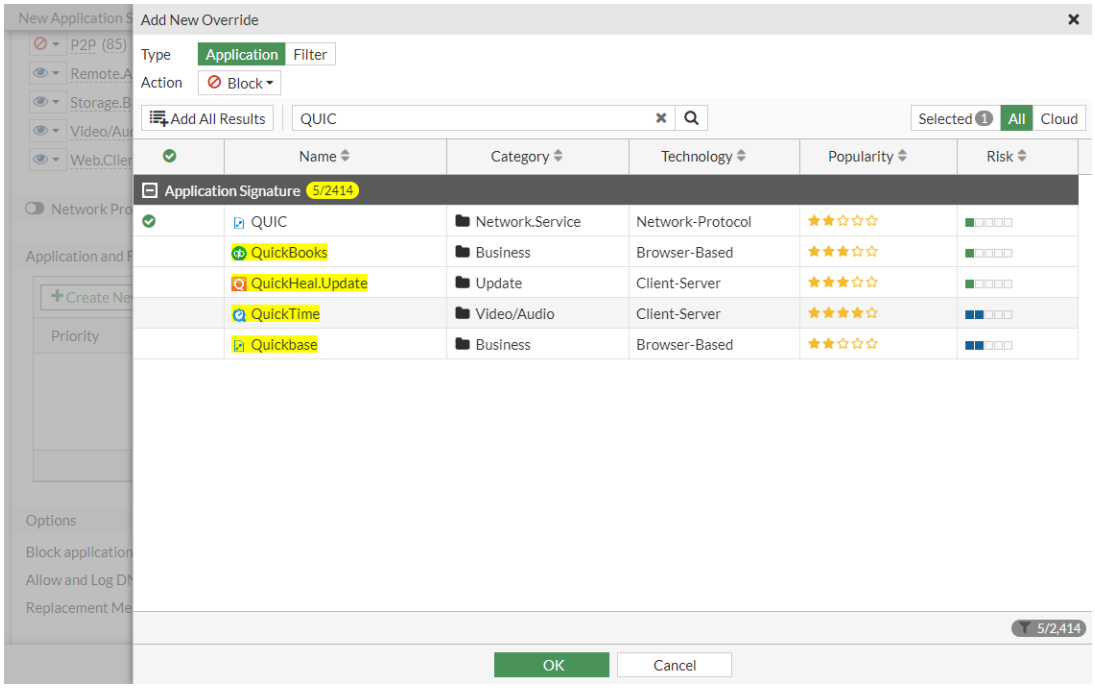
Blocking QUIC manually



With the full support of HTTP3 over QUIC in flow inspection mode, the application control profile no longer needs to block QUIC by default. However, if you're using proxy mode, you can manually block or monitor QUIC by selecting the QUIC application signature (40169).

To block the QUIC application signature in the GUI:

1. Go to *Security Profiles* > *Application Control* and click *Create New*.
2. Enter a name (*test*).
3. Add a filter override for the QUIC application signature:
   a. In the *Application and Filter Overrides* section, click *Create New*. The *Add New Override* pane appears.
   b. In the search box, enter *QUIC* and press `Enter`.
   c. Select the *QUIC* entry and click *Add Selected*.

d. Click *OK*.

4. Configure the other sensor settings as needed.
5. Click *OK*.

To block the QUIC application signature in the CLI:

```
config application list
    edit "test"
        set other-application-log enable
```

```
        config entries
            edit 1
                set application 40169
                set action block
                set log enable
            next
        end
    next
end
```

Sample traffic log

```

Inline CASB

The inline CASB security profile enables the FortiGate to perform granular control over SaaS applications directly on firewall policies. The supported controls include:

Control	Description
Privilege control	Specify the action to apply to user activities per application such as upload, download, share, delete, log in, and so on.
Safe search	On SaaS applications that support searching, enable and select the level of safe search.
Tenant control	Allow only users belonging to specific domains to access the SaaS application.
UTM bypass	For each user activity, bypass further UTM scanning any of the following security profiles: • Antivirus • DLP • File filter • Video filter • Web filter

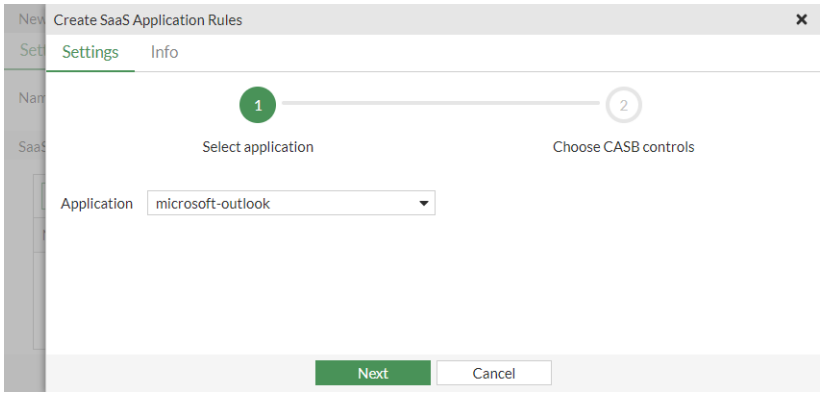
Administrators can customize their own SaaS applications, matching conditions, and custom controls and actions.

A firewall policy must use proxy-based inspection with a deep inspection SSL profile to apply the inline CASB profile and scan the traffic payload.

Inline CASB can be applied to a firewall policy or a proxy policy.

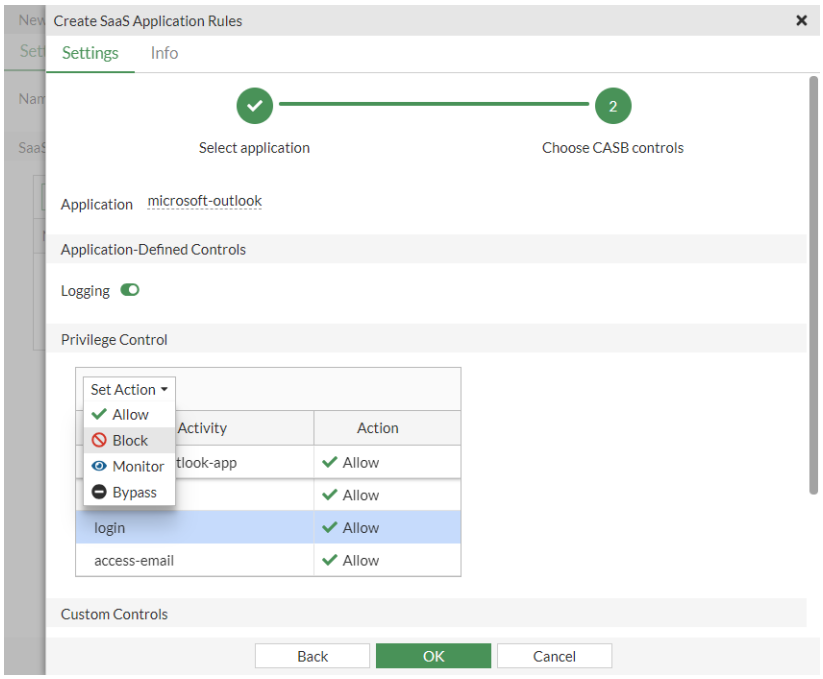
The Inline-CASB Application Definitions entitlement is licensed under the basic firmware and updates contract. To view the entitlement information, go to *System* > *FortiGuard* and expand the *Firmware & General Updates* section in the *License Information* table.

To enable inline CASB security profiles in the GUI:



1. Go to *System* > *Feature Visibility*.
2. Enable *Inline-CASB* in the *Security Features* section.
3. Click *Apply*.

Example 1: privilege control



In this example, logging in to Microsoft Outlook is blocked by the privilege control settings in the inline CASB profile.

To configure an inline CASB profile with privilege control in the GUI:

1. Configure the inline CASB profile:
   a. Go to *Security Profiles* > *Inline-CASB* and click *Create new*.
   b. Enter a *Name*, such as *outlook_test*.
   c. In the *SaaS Applications* table, click *Create new*. The *Create SaaS Application Rules* pane opens.
   d. Set the *Application* to *microsoft-outlook*, then click *Next*.

   e. Enable *Logging*.
   f. In the *Privilege Control* table, select *login* and from the *Set Action* dropdown, select *Block*.

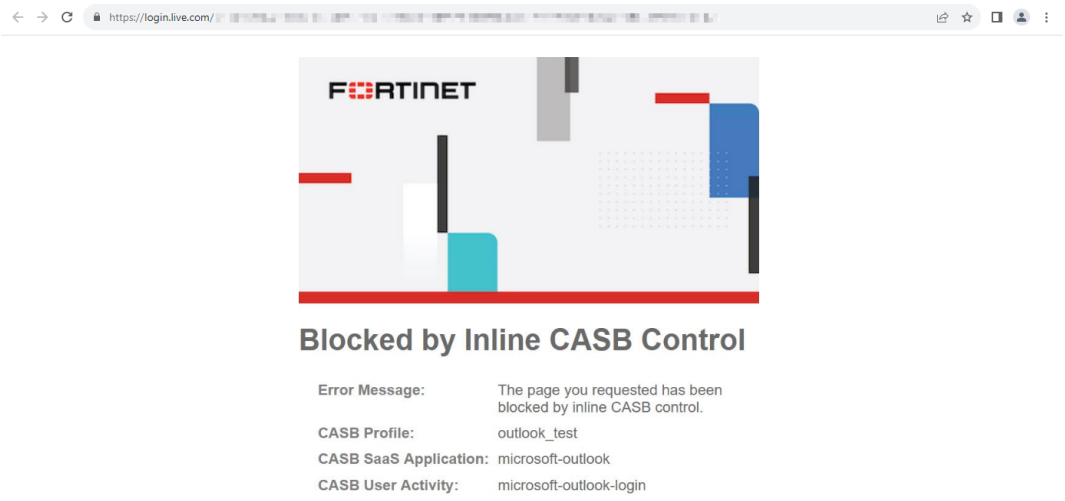
g. Click *OK*.

2. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*. Edit an existing policy, or create a new one.
   b. Set the *Inspection Mode* to *Proxy-based*.
   c. In the *Security Profiles* section, enable *Inline-CASB* and select the *outlook_test* profile.
   d. Set the *SSL Inspection* profile to one that uses deep inspection.
   e. Configure the other settings as needed.
   f. Click *OK*.

To configure an inline CASB profile with privilege control in the CLI:

1. Configure the inline CASB profile:

```
config casb profile
    edit "outlook_test"
        config saas-application
            edit "microsoft-outlook"
                config access-rule
                    edit "microsoft-outlook-login"
                        set action block
                    next
                end
            next
        end
    next
end
```



2. Configure the firewall policy:

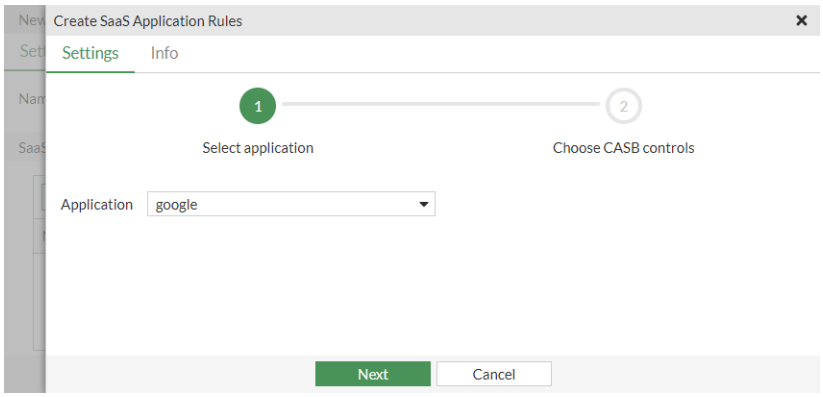
```
config firewall policy
    edit 6
```

```
        set name "casb_test"
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "ssl"
        set casb-profile "outlook_test"
        set nat enable
    next
end
```

To test the configuration:

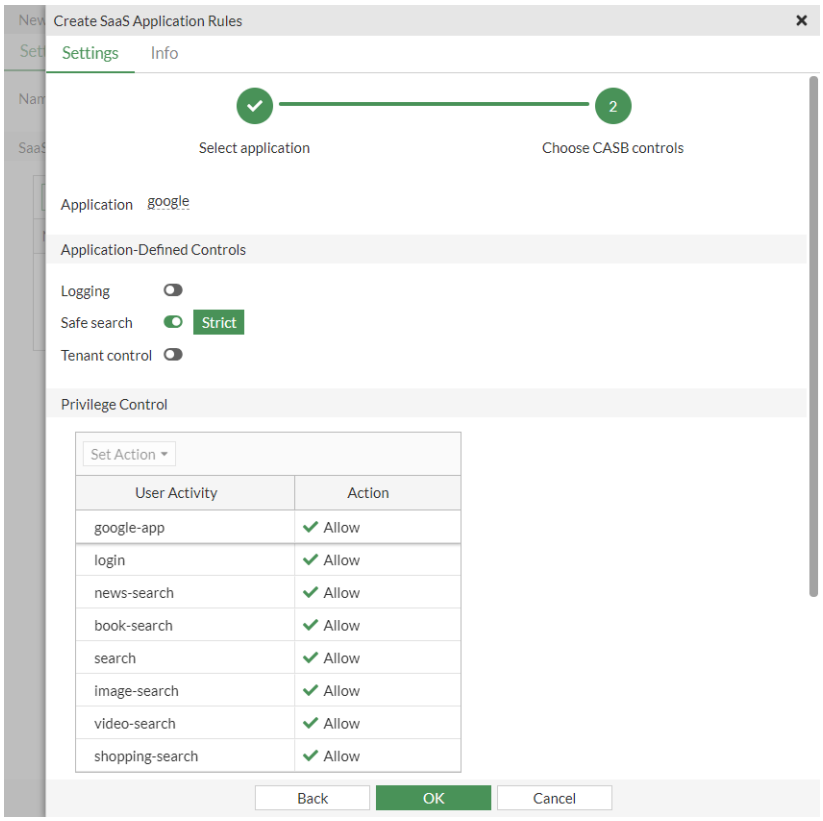
1. Open a browser and attempt to access the Outlook login page.
2. The traffic is blocked by the firewall policy. The browser displays a replacement message: *Blocked by Inline CASB Control*.

Sample log:



```
1: date=2023-08-18 time=16:59:32 eventtime=1692403171962221884 tz="-0700" logid="2500010000"
type="utm" subtype="casb" eventtype="casb" level="warning" vd="vdom1" msg="CASB access was
blocked because it contained banned activity." policyid=6 sessionid=63635 srcip=10.1.100.195
dstip=20.190.190.130 srcport=61013 dstport=443 srcintf="port1" srcintfrole="undefined"
dstintf="port3" dstintfrole="undefined" proto=6 action="block" profile="outlook_test"
saasapp="microsoft-outlook" useractivity="microsoft-outlook-login"
activitycategory="activity-control"
```

Example 2: safe search



In this example, safe search is configured for Google in the inline CASB profile.

To configure an inline CASB profile with safe search in the GUI:

1. Configure the inline CASB profile:
   a. Go to *Security Profiles* > *Inline-CASB* and click *Create new*.
   b. Enter a *Name*, such as *google_test*.
   c. In the *SaaS Applications* table, click *Create new*. The *Create SaaS Application Rules* pane opens.
   d. Set the *Application* to *google*, then click *Next*.

   e. Enable *Safe search*.

   f. Click *OK*.
2. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*. Edit an existing policy, or create a new one.
   b. Set the *Inspection Mode* to *Proxy-based*.

c. In the *Security Profiles* section, enable *Inline-CASB* and select the *google_test* profile.
d. Set the *SSL Inspection* profile to one that uses deep inspection.
e. Configure the other settings as needed.
f. Click *OK*.

To configure an inline CASB profile with safe search in the CLI:

1. Configure the inline CASB profile:

```
config casb profile
    edit "google_test"
        config saas-application
            edit "google"
                set safe-search enable
                set safe-search-control "strict"
            next
        end
    next
end
```

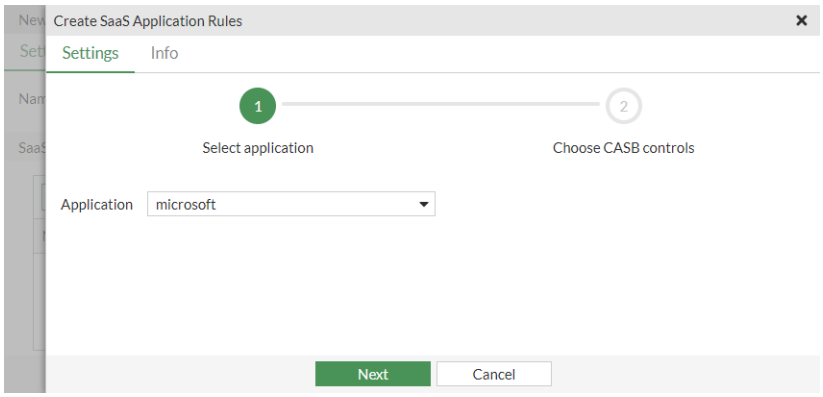
2. Configure the firewall policy:

```
config firewall policy
    edit 7
        set name "casb_test_google"
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "ssl"
        set casb-profile "google_test"
        set nat enable
    next
end
```

To test the configuration:

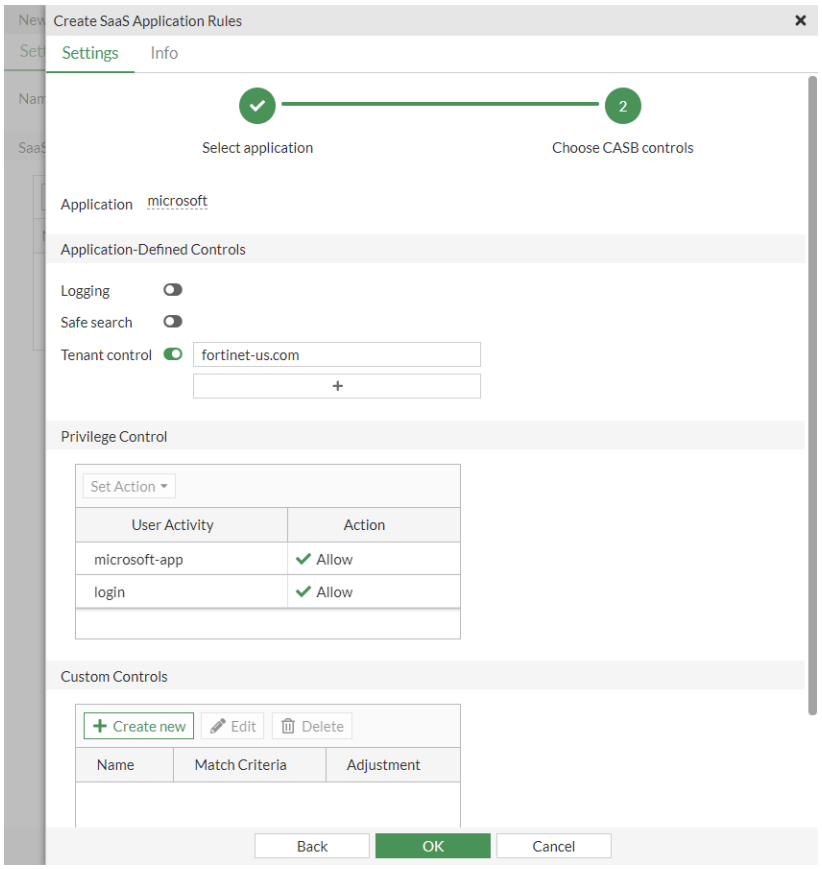
1. Open a browser and attempt to search in Google for content that is considered mature or explicit.
2. The sensitive content is filtered out in the search results.

Sample log:



```
1: date=2023-08-18 time=17:01:36 eventtime=1692403295962385271 tz="-0700" logid="2500010002"
type="utm" subtype="casb" eventtype="casb" level="information" vd="vdom1" msg="CASB access
was monitored because it contained activity." policyid=7 sessionid=63774 srcip=10.1.100.195
dstip=142.250.217.98 srcport=61065 dstport=443 srcintf="port1" srcintfrole="undefined"
dstintf="port3" dstintfrole="undefined" proto=6 action="monitor" profile="google_test"
saasapp="google" useractivity="google-safe-search" activitycategory="safe-search-control"
```

Example 3: tenant control



In this example, tenant control is configured for Microsoft in the inline CASB profile for the fortinet-us.com domain.

To configure an inline CASB profile with tenant control in the GUI:

1. Configure the inline CASB profile:
   a. Go to *Security Profiles* > *Inline-CASB* and click *Create new*.
   b. Enter a *Name*, such as *microsoft_test*.
   c. In the *SaaS Applications* table, click *Create new*. The *Create SaaS Application Rules* pane opens.
   d. Set the *Application* to *microsoft*, then click *Next*.

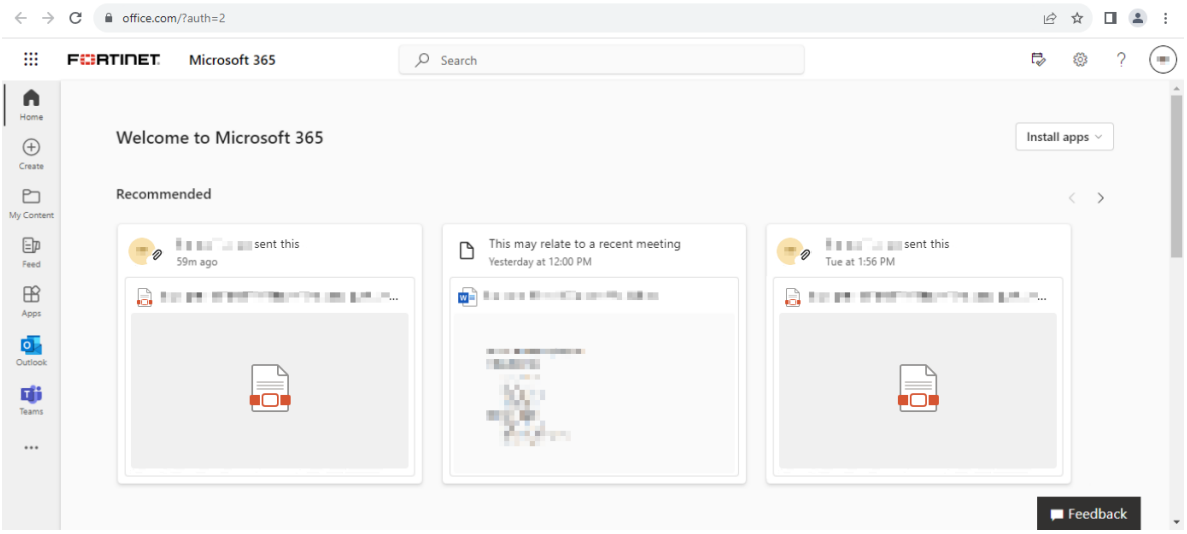
   e. Enable *Tenant control*. Click the + and enter *fortinet-us.com*.

f. Click *OK*.

2. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*. Edit an existing policy, or create a new one.
   b. Set the *Inspection Mode* to *Proxy-based*.
   c. In the *Security Profiles* section, enable *Inline-CASB* and select the *microsoft_test* profile.
   d. Set the *SSL Inspection* profile to one that uses deep inspection.
   e. Configure the other settings as needed.
   f. Click *OK*.

To configure an inline CASB profile with tenant control in the CLI:

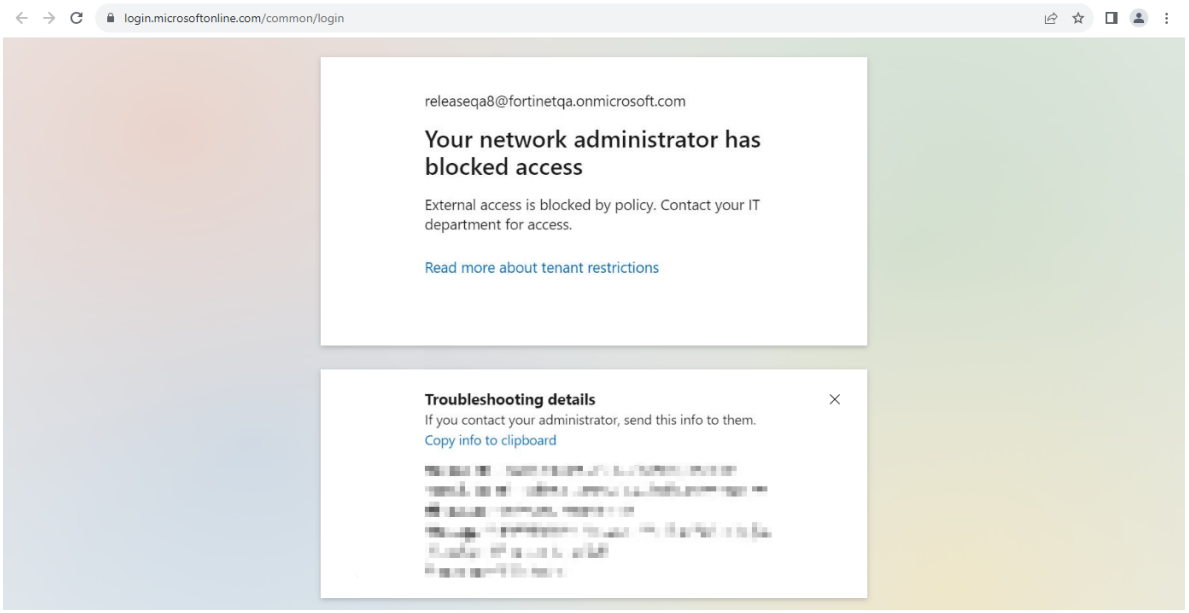
1. Configure the inline CASB profile:



```
config casb profile
    edit "microsoft_test"
        config saas-application
            edit "microsoft"
                set tenant-control enable
                set tenant-control-tenants "fortinet-us.com"
            next
        end
    next
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 8
        set name "casb_test_microsoft"
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "ssl"
        set casb-profile "microsoft_test"
        set nat enable
    next
end
```



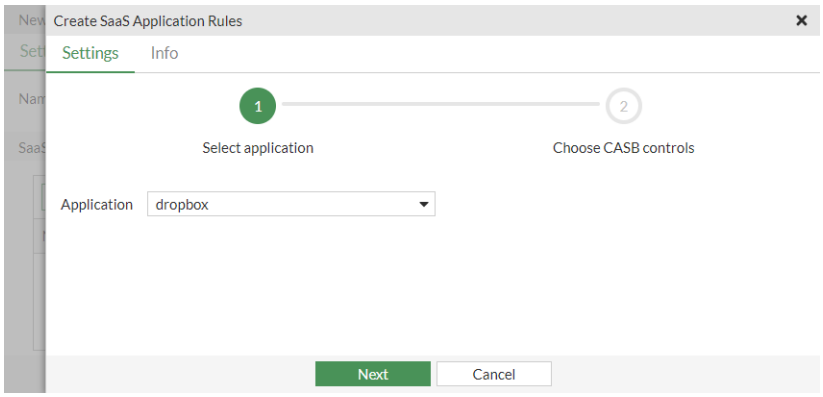
To test the configuration:

1. Open a browser and attempt to log in to Microsoft Office 365 with a fortinet-us.com account.
2. Since the domain is valid, the user can log in successfully.

3. Attempt to log in to Microsoft Office 365 with another account with a different domain.
4. The domain is invalid. The user is unable to log in, and an error message appears: *Your network administrator has*

blocked access.

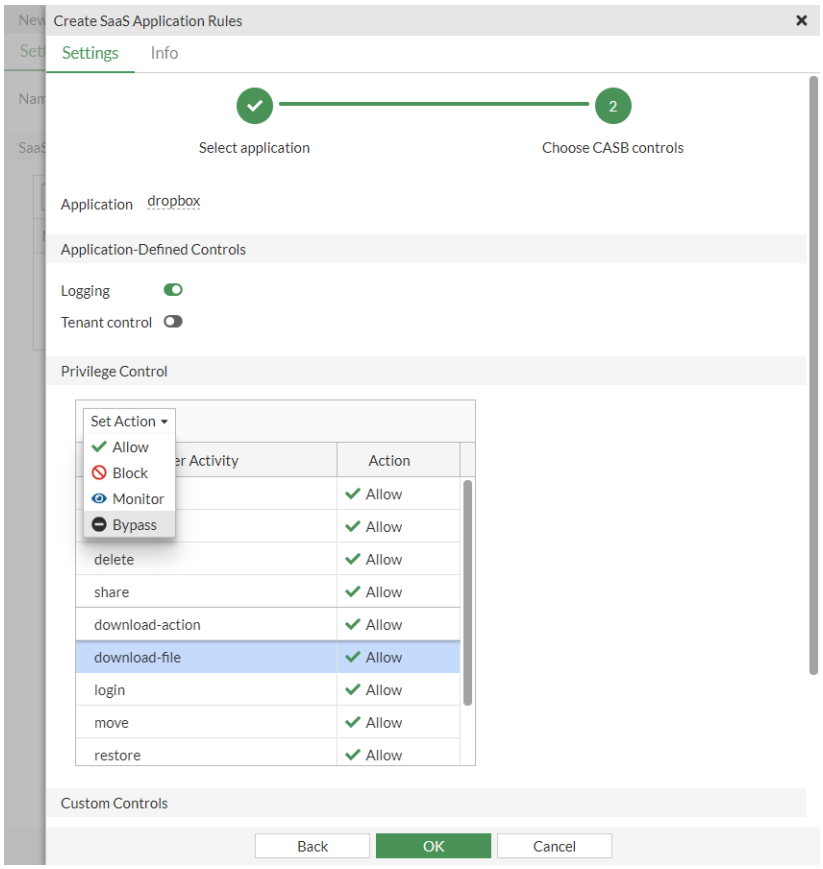
Sample log:



```
1: date=2023-08-18 time=17:09:25 eventtime=1692403765238967943 tz="-0700" logid="2500010002"
type="utm" subtype="casb" eventtype="casb" level="information" vd="vdom1" msg="CASB access
was monitored because it contained activity." policyid=8 sessionid=65108 srcip=10.1.100.195
dstip=20.189.173.15 srcport=61912 dstport=443 srcintf="port1" srcintfrole="undefined"
dstintf="port3" dstintfrole="undefined" proto=6 action="monitor" profile="microsoft_test"
saasapp="microsoft" useractivity="ms-tenant-control" activitycategory="tenant-control"
```

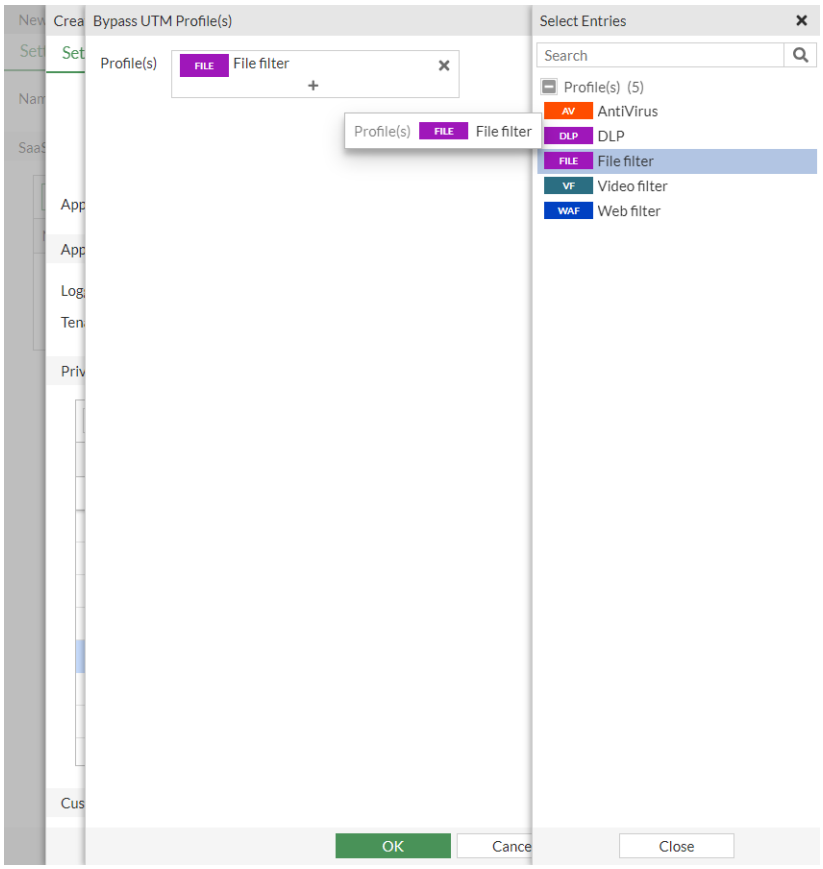
Example 4: UTM bypass

In this example, UTM bypass is configured for Dropbox file downloading in the inline CASB profile.



To configure an inline CASB profile with UTM bypass in the GUI:

1. Configure the inline CASB profile:
   a. Go to *Security Profiles* > *Inline-CASB* and click *Create new*.
   b. Enter a *Name*, such as *dropbox_test*.
   c. In the *SaaS Applications* table, click *Create new*. The *Create SaaS Application Rules* pane opens.
   d. Set the *Application* to *dropbox*, then click *Next*.



e. Enable *Logging*.

f. In the *Privilege Control* table, select *download-file* and from the *Set Action* dropdown, select *Bypass*.

The *Bypass UTM Profile(s)* pane opens.

g. Click the + and set *Profile(s)* to *File Filter*.

h. Click *OK* to save the bypass UTM profile.

i. Click *OK* to save the inline CASB profile

2. Configure the firewall policy:

a. Go to *Policy & Objects* > *Firewall Policy*. Edit an existing policy, or create a new one.

b. Set the *Inspection Mode* to *Proxy-based*.

c. In the *Security Profiles* section, enable *Inline-CASB* and select the *dropbox_test* profile.

d. Set the *SSL Inspection* profile to one that uses deep inspection.

e. Configure the other settings as needed.

f. Click *OK*.

To configure an inline CASB profile with UTM bypass in the CLI:

1. Configure the inline CASB profile:

```
config casb profile
    edit "dropbox_test"
        config saas-application
            edit "dropbox"
                config access-rule
                    edit "dropbox-download-file"
                        set bypass file-filter
                        set action bypass
                    next
                end
```

```
            next
        end
    next
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 9
        set name "casb_test_dropbox"
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "ssl"
        set casb-profile "dropbox_test"
        set nat enable
    next
end
```

To test the configuration:

1. Open a browser and log in to Dropbox.
2. Attempt to download a file, such as a PDF. The download is successful.

Sample log:

```
1: date=2023-08-18 time=17:15:29 eventtime=1692404129378193492 tz="-0700" logid="2500010001"

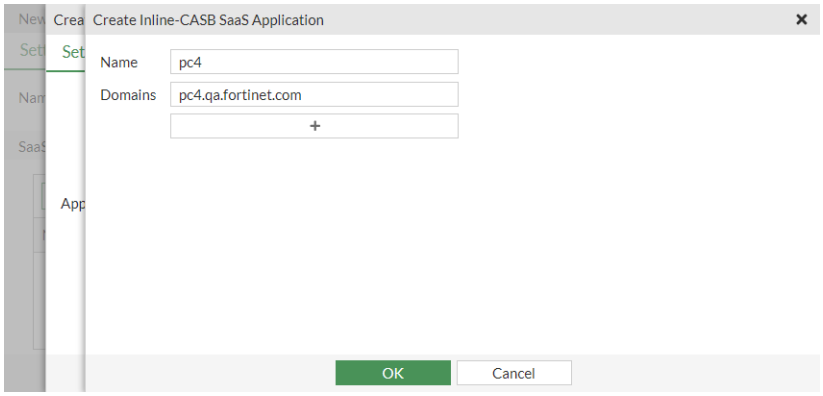
```



Example 5: customized SaaS application and user activity

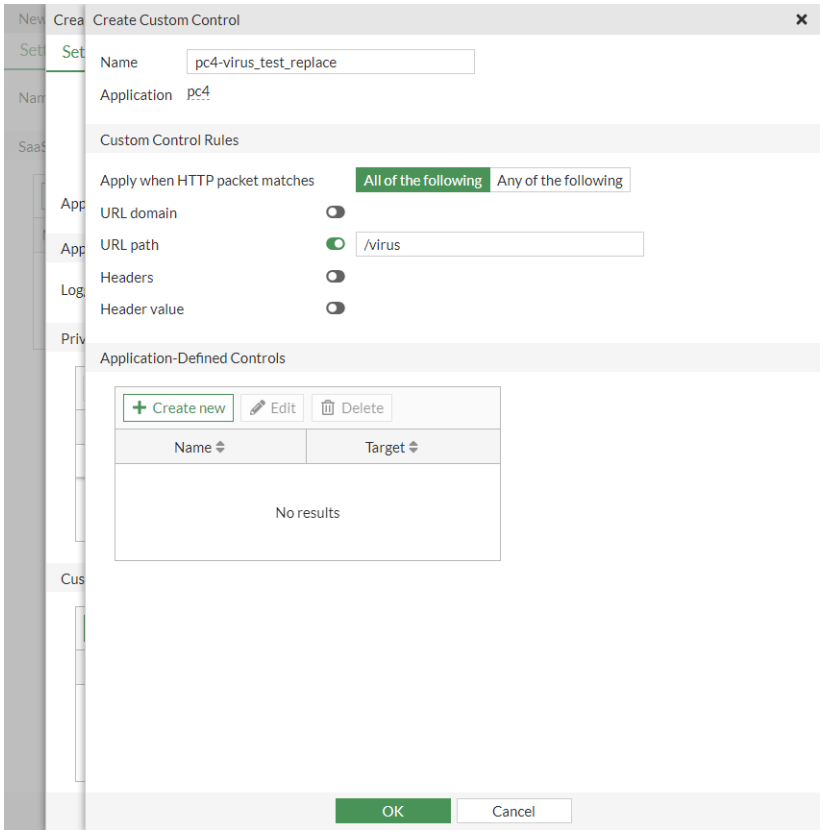
In this example, a custom SaaS application is created (pc4) with a custom user action. When a user accesses pc4.qa.fortinet.com/virus, they are redirected to pc4.qa.fortinet.com/testweb/testweb.htm.

To configure a customized inline CASB profile in the GUI:

1. Configure the inline CASB profile:
   a. Go to *Security Profiles* > *Inline-CASB* and click *Create new*.
   b. Enter a *Name*, such as *custom_test*.
   c. In the *SaaS Applications* table, click *Create new*. The *Create SaaS Application Rules* pane opens.
   d. In the *Application* dropdown, click the + to create a custom entry. The *Create Inline-CASB SaaS Application* pane opens.

e. Enter the *Name* (*pc4*) and *Domains* (*pc4.qa.fortinet.com*), then click *OK*.

f. Select *pc4* and click *Next*.



g. Configure the custom control and action:

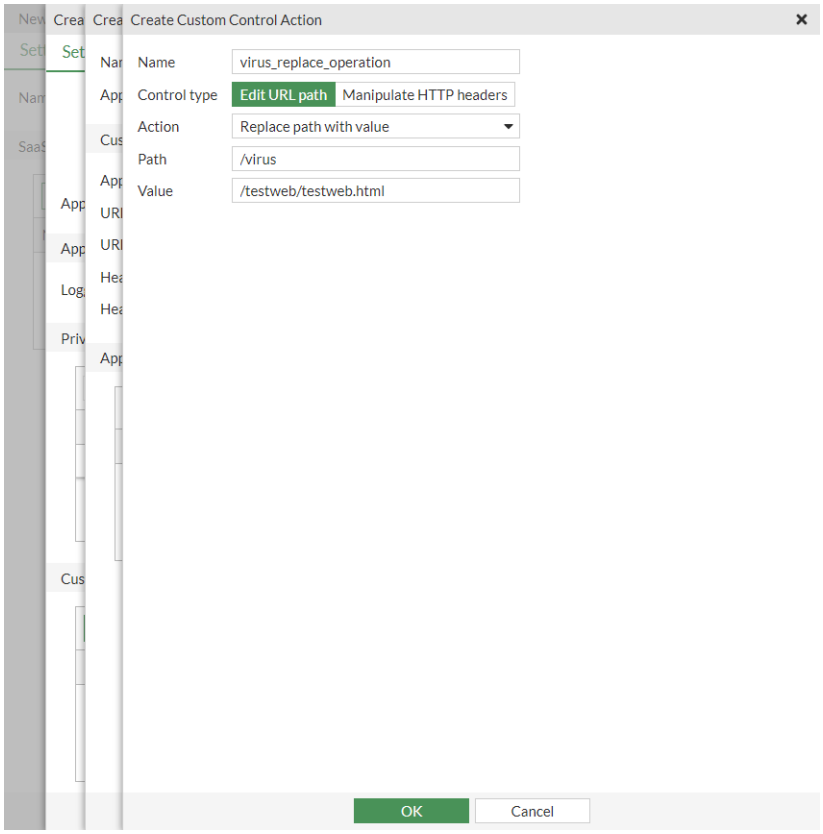
i. In the *Custom Controls* table, *Create new*. The *Create Custom Control* pane opens.

ii. Enter a *Name*, such as *pc4-virus_test_replace*.

iii. Set *Apply when HTTP packet matches* to *All of the following*.

iv. Enable *URL path* and enter */virus*.

v. In the *Application-Defined Controls* table, *Create new*. The *Create Custom Control Action* pane opens.



vi. Enter a *Name*, such as *virus_replace_operation*.

vii. Set the *Control Type* to *Edit URL path*.

viii. Set the *Action* to *Replace path with value*.

ix. Set the *Path* to */virus*.

x. Set the *Value* to */testweb/testweb.html*.

xi. Click *OK* to save the custom action.

xii. Click *OK* to save the custom control.

h. Click *OK* to save the application rule.

i. Click *OK* to save the inline CASB profile.

2. Configure the firewall policy:

a. Go to *Policy & Objects* > *Firewall Policy*. Edit an existing policy, or create a new one.

b. Set the *Inspection Mode* to *Proxy-based*.

c. In the *Security Profiles* section, enable *Inline-CASB* and select the *custom_test* profile.

d. Set the *SSL Inspection* profile to one that uses deep inspection.

e. Configure the other settings as needed.

f. Click *OK*.

To configure a customized inline CASB profile in the CLI:

1. Configure the CASB SaaS application:

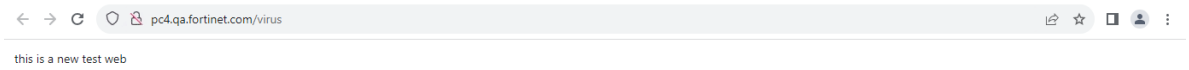
```
config casb saas-application
    edit "pc4"
        set domains "pc4.qa.fortinet.com"
    next
end
```

2. Configure the CASB user activity:

```
config casb user-activity
    edit "pc4-virus_test_replace"
        set application "pc4"
        set category other
        config match
            edit 1
                config rules
                    edit 1
                        set type path
                        set match-value "/virus"
                    next
                end
            next
        end
        config control-options
            edit "virus_replace_operation"
                config operations
                    edit "virus_replace_operation"
                        set target path
                        set action replace
                        set search-key "/virus"
                        set values "/testweb/testweb.html"
                    next
                end
            next
        end
    next
end
```

3. Configure the inline CASB profile:

```
config casb profile
    edit "custom_test"
        config saas-application
            edit "pc4"
                config custom-control
                    edit "pc4-virus_test_replace"
                        config option
                            edit "virus_replace_operation"
                            next
                        end
                    next
                end
            next
        end
    next
end
```



4. Configure the firewall policy:

```
config firewall policy
    edit 10
        set name "casb_test_custom"
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
```

```
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "ssl"
        set casb-profile "custom_test"
        set nat enable
    next
end
```

To test the configuration:

1. Open a browser and go to pc4.qa.fortinet.com/virus.
2. Access is redirected to pc4.qa.fortinet.com/testweb/testweb.htm.

Sample log:

```
1: date=2023-08-21 time=08:31:06 eventtime=1692631866382806917 tz="-0700" logid="2500010001"
type="utm" subtype="casb" eventtype="casb" level="information" vd="vdom1" msg="CASB access
was allowed although it contained activity." policyid=10 sessionid=3139 srcip=10.1.100.195
dstip=172.16.200.44 srcport=56774 dstport=80 srcintf="port1" srcintfrole="undefined"
dstintf="port3" dstintfrole="undefined" proto=6
url="http://pc4.qa.fortinet.com/testweb/testweb.html" action="bypass" profile="custom_test"
saasapp="pc4" useractivity="pc4-virus_test_replace" activitycategory="other"
```

Intrusion prevention

Intrusion Prevention System (IPS) detects network attacks and prevents threats from compromising the network, including protected devices. IPS can be in the form of a standalone appliance, or part of the feature set of a Next Generation Firewall (NGFW), such as FortiGate. IPS utilizes signatures, protocol decoders, heuristics (or behavioral monitoring), threat intelligence (such as FortiGuard Labs), and advanced threat detection in order to prevent exploitation of known and unknown zero-day threats. FortiGate IPS is even capable of performing deep packet inspection to scan encrypted payloads in order to detect and prevent threats from attackers.

When implementing IPS profiles, Fortinet recommends tuning the sensor to reflect the environment that it is protecting. This involves selecting only signatures that match the services and devices that it is meant to protect, and adjusting thresholds for selected anomalies to suit your environment.

Networks and devices are often exploited through vulnerabilities. Software vulnerabilities are one such example where a bug or inherent weakness in the code provides attackers an opportunity to gain access to the software. More severe vulnerabilities allow unauthorized access, data loss, and execution of malicious code. Exploitation of these vulnerabilities can cause damage to the machine and infect others. While the best solution is to patch vulnerabilities as soon as patches are available, IPS signatures offer a solution to detect and block exploitation of many vulnerabilities before they enter the network.

IPS signatures

Fortinet's solution combines industry-leading threat intelligence from FortiGuard Labs with the FortiGate NGFW to identify the latest threats and prevent them from entering your network. IPS signatures are one such method for delivering the latest protection. FortiGuard Labs uses AI and Machine Learning (ML) to analyze billions of events every day. The FortiGuard Labs research team also proactively performs threat research to discover new vulnerabilities and exploitation, and produces signatures to identify such threats. These IPS signatures are delivered to each FortiGate daily, so that the IPS engine is armed with the latest databases to match the latest threats.

IPS sensors

A FortiGate IPS sensor is a collection of IPS signatures and filters that define the scope of what the IPS engine will scan when the IPS sensor is applied. An IPS sensor can have multiple sets of signatures and/or filters. A set of IPS signatures consists of manually selected signatures, while a set of IPS filters consists of filters based on signature attributes like target, severity, protocol, OS, and application. Each signature has predefined attributes and an action, such as block, allow, monitor (pass), quarantine, and reset. It is also possible to create custom IPS signatures to apply to an IPS sensor.

From the *Security Profiles* > *Intrusion Prevention* pane, you can create new IPS sensors and view a list of predefined sensors.

FortiOS includes the following predefined IPS sensors with associated predefined signatures:

Predefined IPS sensors	Description
all_default	Filters all predefined signatures, and sets action to the signature's default action.
all_default_pass	Filters all predefined signatures, and sets action to pass/monitor.
default	Filters all predefined signatures with severity of Critical/High/Medium. Sets action to signature's default action.
high_security	Filters all predefined signatures with severity of Critical/High/Medium, and sets action to Block. For Low severity signatures, sets action to signature's default action.
protect_client	Protects against client-side vulnerabilities by filtering on `Target=Client`. Sets action to signature's default action.
protect_email_server	Protects against email server-side vulnerabilities by filtering on `Target=Server` and `Protocol=IMAP`, `POP3` or `SMTP`. Sets action to signature's default action.
protect_http_server	Protects against HTTP server-side vulnerabilities by filtering on `Target=Server` and `Protocol=HTTP`. Sets action to signature's default action.
wifi-default	Filters all predefined signatures with severity of Critical/High/Medium. Sets action to signature's default action. Used in profile for offloading WiFi traffic.

DDoS attacks

Besides protecting against threats and exploitation of vulnerabilities, the IPS engine is also responsible for mitigating Denial of Service (DoS) attacks where attackers attempt to bring a service down by flooding the target with traffic from distributed systems. Using anomaly-based defense, FortiGate can detect a variety of L3 and L4 anomalies and take action against these attacks. This can be configured under IPv4 and IPv6 DoS Policies, which is discussed in detail under DoS policy on page 1333.

This section contains the following topics:

- Signature-based defense on page 1742
- Configuring an IPS sensor on page 1745
- IPS configuration options on page 1748
- IPS signature filter options on page 1760
- SCTP filtering capabilities on page 1753
- Diameter protocol inspection on page 1756

This section also provides the following examples about IPS sensors:

- IPS with botnet C&C IP blocking on page 1764
- IPS signatures for the operational technology security service on page 1767
- IPS sensor for IEC 61850 MMS protocol on page 1769

Signature-based defense

Signature-based defense is used against known attacks or vulnerability exploits. These often involve an attacker attempting to gain access to your network. The attacker must communicate with the host in an attempt to gain access, and this communication includes commands or sequences of commands and variables. The IPS signatures include these command sequences, allowing the FortiGate unit to detect and stop the attack.

This section describes the following components used in signature-based defense:

- IPS signatures on page 1742
- Protocol decoders on page 1742
- IPS engine on page 1743
- IPS sensors on page 1743
- IPS filters on page 1744
- Custom and predefined signature entries on page 1744
- Policies on page 1745

IPS signatures

IPS signatures are the basis of signature-based intrusion prevention. Every attack can be reduced to a particular string of commands or a sequence of commands and variables. Signatures include this information, and FortiGate uses the information to detect and stop attacks.

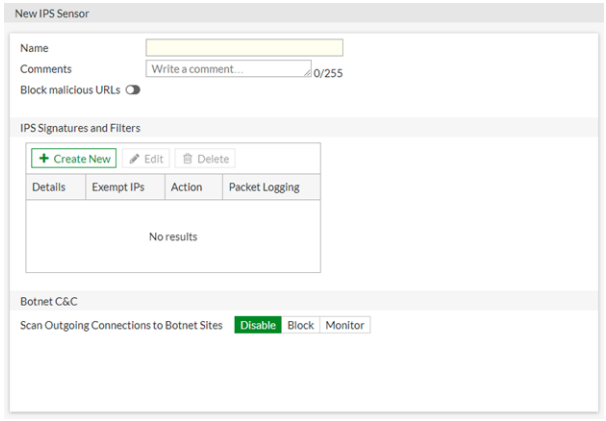
Signatures also include characteristics about the attack they describe. These characteristics include the network protocol associated with the attack, the vulnerable operating system, and the vulnerable application.

To view the complete list of signatures, go to *Security Profiles* > *IPS Signatures*. The list of signatures includes predefined and custom signatures. You can hover over the name of the IPS signature to display a pop-up window that includes an ID number. You can click the ID number to display the FortiGuard page.

Protocol decoders

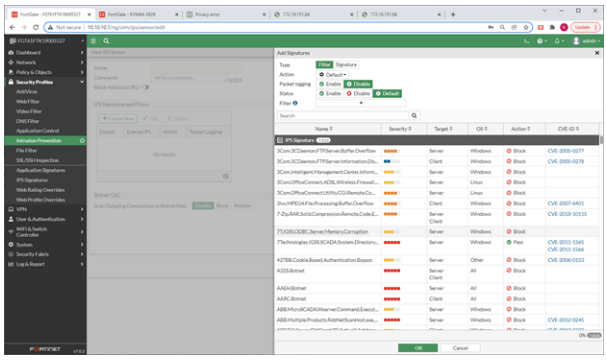
Before examining network traffic for attacks, the IPS engine uses protocol decoders to identify each protocol appearing in the traffic. Attacks are protocol-specific, so your FortiGate unit conserves resources by looking for attacks only in the

protocols used to transmit them. For example, the FortiGate unit will only examine HTTP traffic for the presence of a signature describing an HTTP attack.



IPS engine

Once the protocol decoders separate the network traffic by protocol, the IPS engine examines the network traffic for the attack signatures by using IPS sensors.



IPS sensors

The IPS engine does not examine network traffic for all signatures. The IPS engine examines network traffic for signatures specified in IPS sensors. You must first create an IPS sensor, and then you can specify what signatures the IPS sensor will use. You can add individual signatures to IPS sensors, or you can add filters to IPS sensors, and the filters automatically include the applicable signatures.

To view IPS sensors, go to *Security Profiles* > *Intrusion Prevention*. To create a new sensor, click *Create New*.

An IPS sensor is composed of IPS signatures and filters. Under *IPS Signatures and Filters*, click *Create New* to create a set of IPS signatures or a set of IPS filters.

You can create IPS sensors for specific types of traffic, and then select the IPS sensors in firewall policies designed to handle the same type of traffic. For example, you can specify all of the web-server related signatures in an IPS sensor, and select the IPS sensor in a firewall policy that controls all traffic to and from a web server that is protected by the FortiGate unit.

The FortiGuard Service periodically adds new predefined signatures to counter new threats. New predefined signatures are automatically included in IPS sensors that are configured to use filters when the new signatures match existing filter specifications. For example, if you have an IPS sensor with a filter that includes all signatures for the Windows operating system, your filter will automatically incorporate new Windows signatures that the FortiGuard Service adds to the database.

IPS signature and filter entries are checked from top down. When a signature is found in a set of signatures or filters, the action defined for the signature is taken.

IPS filters

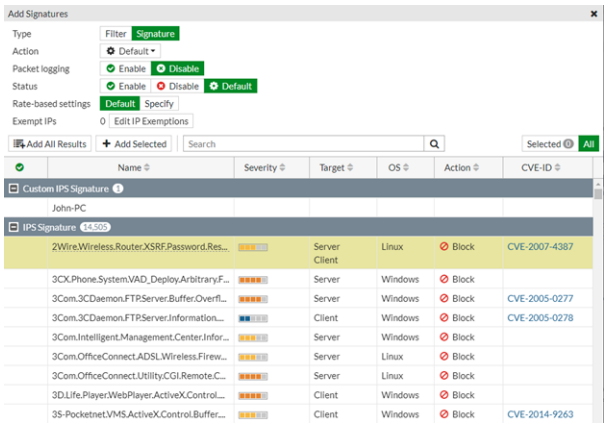
IPS sensors can contain one or more IPS filters. A filter is a collection of signature attributes that you specify. The signatures that have all of the attributes specified in a filter are included in the IPS filter.

Following are the attribute groups:

- Target
- Severity
- Protocol
- OS
- Application

Starting in FortiOS 6.4.2, you can also filter by CVE ID or CVE pattern by using the CLI. See FortiOS 6.4 New Features > IPS signature filter options.

When selecting multiple attributes within the same group, the selections are combined by using a logical `OR`. When selecting multiple attributes between attribute groups, each attribute group is combined by using a logical `AND`.



Once you select filters in the GUI, the filtered list of IPS signatures are displayed. Adjust your filters accordingly to construct a suitable list for your needs.

For example, if your FortiGate unit protects a Linux server running the Apache web server software, you could create a new filter to protect it. By setting *OS* filter attribute to *Linux*, and the filter attribute *Application* to *Apache*, the filter will include only the signatures that apply to both Linux and Apache. If you wanted to scan for all the Linux signatures and all the Apache signatures, you would create two filters, one for each.

To view the filters in an IPS sensor, go to *Security Profiles* > *Intrusion Prevention*, select the IPS sensor, and click *Edit*.

Custom and predefined signature entries

Signature entries allow you to add individual, custom or predefined IPS signatures to an IPS sensor. If you need only one signature, or you want to manually select multiple signatures that don't fall into the criteria for an IPS filter, adding a signature entry to an IPS sensor is the easiest way. Signature entries are also the only way to include custom signatures in an IPS sensor.

To select an individual signature, click a signature, and select *Add Selected*. The signature moves to the *Selected* list.

To select multiple signatures, use the *Search* bar to perform a keyword search, and then click *Add All Results* to move all entries to the *Selected* list.

Overriding the default action

Each IPS signature comes with a default action such as *Block* and *Pass*. In some scenarios, you may want to override this action. You can override a set of IPS filter or signatures. By default, a set of IPS filter or signatures has an action of *Default*, which applies a signature's default action when the signature is matched. By changing the action, you can override the setting for all signatures within the filter or signature set.

Policies

You must select an IPS sensor in a security policy or an interface policy to apply the IPS sensor to traffic. An IPS sensor that it not selected in a policy is not applied to network traffic.

Configuring an IPS sensor

You can configure IPS sensors to be used in policies in the GUI.

To configure an IPS sensor:

1. Go to *Security Profiles* > *Intrusion Prevention*.
2. Click *Create New*.

3. Configure the following settings:

Name		Enter a unique name for the sensor.
Comments		Enter a comment (optional).
Block malicious URLS		Enable to block malicious URLs based on a local malicious URL database on the FortiGate to assist in the detection of drive-by exploits. See Malicious URL database for drive-by exploits detection on page 1749.
IPS Signature and Filters		Select a signature or filter to assign to the sensor. See Configuring signatures and filters on page 1746.
Botnet C&C		
	Scan Outgoing Connections to Botnet Sites	Define the botnet scanning across traffic that matches the policy: • *Disable*: Do not scan connections to botnet servers. • *Block*: Block connections to botnet servers. • *Monitor*: Log connections to botnet servers. See IPS with botnet C&C IP blocking on page 1764.

4. Click *OK*.

For information on configuring IPS sensors in the CLI, see IPS configuration options on page 1748.

Configuring signatures and filters

Signatures and filters can be configured and added to IPS sensors. A filter is a collection of signature attributes. Any signatures that meet all of the attributes specified in a filter are automatically included in the IPS sensor. See IPS signature filter options on page 1760.

To configure a Signature entry of type Filter:

1. Go to *Security Profiles* > *Intrusion Prevention*.
2. Click *Create New*.
3. Configure the IPS sensor settings.
4. In *IPS Signatures and Filters*, click *Create New*. The *Add Signatures* pane is displayed.
5. Configure the settings as follows:

Type	Select *Filter*.
Action	Click the dropdown menu and select the action when a signature is triggered: • *Allow*: Allow traffic to continue to its destination. • *Monitor*: Allow traffic to continue to its destination and log the activity. • *Block*: Drop traffic that matches the signature. • *Reset*: Reset the session whenever the signature is triggered.

	• *Default*: Use the default action of the signature. Search for the signature in the *IPS Signature* pane to view the default *Action*. • *Quarantine*: Block the matching traffic. Enable packet logging. Quarantine the attacker.
Packet logging	Enable packet logging to save a copy of the packets when they match the signature. Packet copies can be analyzed later. Packet logging is not supported on all FortiGate devices. FortiAnalyzer logging or a hard disk are required to support this feature; see the Feature Platform Matrix.
Status	Define the signature status: • *Enable*: Enable the signature. • *Disable*: Disable the signature. • *Default*: Use the default status of the signature. Search for the signature in the *IPS Signature* pane to view the default *Status*.
Filter	Select the + to open the *Select Entries* field and select filter entries. There are different entry categories: • *Target*: Refers to the type of device targeted by the attack. • *Severity*: Refers to the level of the threat posed by the attack. • *Protocol*: Refers to the protocol that is the vector for the attack. • *OS*: Refers to the Operating System affected by the attack. • *Application*: Refers to the application affected by the attack.

6. Select one or more signatures from the *IPS Signatures* pane.
7. Click *OK*. The signature is added to the IPS sensor.
8. Click *OK*.

Individual signatures, custom or predefined IPS signatures can be selected for an IPS sensor. If you need only one signature, or you want to manually select multiple signatures that don't fall into the criteria for an IPS filter, adding a signature entry to an IPS sensor is the easiest way.

To configure a Signature entry of type Signature:

1. Go to *Security Profiles* > *Intrusion Prevention*.
2. Click *Create New*.
3. Configure the IPS sensor settings.
4. In *IPS Signatures and Filters*, click *Create New*. The *Add Signatures* pane is displayed.
5. Configure the settings as follows:

Type	Select *Signature*.
Action	Click the dropdown menu and select the action when a signature is triggered: • *Allow*: Allow traffic to continue to its destination. • *Monitor*: Allow traffic to continue to its destination and log the activity. • *Block*: Drop traffic that matches the signature. • *Reset*: Reset the session whenever the signature is triggered.

	• *Default*: Use the default action of the signature. Search for the signature in the *IPS Signature* pane to view the default *Action*. • *Quarantine*: Block the matching traffic. Enable packet logging. Quarantine the attacker.
Packet Logging	Enable packet logging to save a copy of the packets when they match the signature. Packet copies can be analyzed later. Packet logging is not supported on all FortiGate devices. FortiAnalyzer logging or a hard disk are required to support this feature; see the Feature Platform Matrix.
Status	Define the signature status: • *Enable*: Enable the signature. • *Disable*: Disable the signature. • *Default*: Use the default status of the signature. Search for the signature in the *IPS Signature* pane to view the default *Status*.
Rate-based settings	
Default	Use the default rate-based settings.
Specify	Specify the rate-based settings: • *Threshold*: Enter the threshold. See IPS signature rate count threshold on page 1749. • *Duration (seconds)*: Enter the duration in seconds. • *Track By*: Select the tracking method as *Any*, *Source IP*, or *Destination IP*.
Exempt IPs	Add IP addresses that are exempt from the signature rules. Click *Edit IP Exemptions* and click *Create New*. Edit the *Source IP/Netmask* and the *Destination IP/Netmask* to define the IP address for exemption. Click *OK* to add it to *Exempt IPs*.

6. Select one or more signatures from the *IPS Signatures* pane.
7. Click *OK*. The signature is added to the IPS sensor.
8. Click *OK*.

IPS configuration options

Besides configuring an IPS filter or selecting IPS signatures for an IPS sensor, you can configure additional IPS options for each sensor or globally for all sensors. This topic introduces the following available configuration options:

- Malicious URL database for drive-by exploits detection on page 1749
- IPS signature rate count threshold on page 1749
- Botnet C&C on page 1750
- Hardware acceleration for flow-based security profiles (NTurbo and IPSA) on page 1750
- Extended IPS database on page 1751
- IPS engine-count on page 1751
- OT threat definitions on page 1752
- Fail-open on page 1752

- IPS buffer size on page 1752
- Session count accuracy on page 1753
- Protocol decoders on page 1753

To configure IPS sensors, signatures, and filters in the GUI, see Configuring an IPS sensor on page 1745.

Malicious URL database for drive-by exploits detection

This feature uses a local malicious URL database on the FortiGate to assist in detection of drive-by exploits, such as adware that allows automatic downloading of a malicious file when a page loads without the user's detection. The database contains all malicious URLs active in the last one month, and all drive-by exploit URLs active in the last three months. The number of URLs controlled are in the one million range.

This feature can be enabled from an IPS sensor in the GUI by going to *Security Profiles* > *Intrusion Prevention* and editing or creating an IPS Sensor, then enabling *Block malicious URLs*. See Configuring an IPS sensor on page 1745.

To enable the blocking of malicious URLs in the CLI:

```
config ips sensor
    edit <profile>
        set block-malicious-url {enable | disable}
    next
end
```

Blocking malicious URLs is not supported on some FortiGate models, such as FortiGate 51E, 50E, or 30E.

IPS signature rate count threshold

You can use the IPS signature rate-based settings to specify a rate count threshold that must be met before the signature is triggered. A rate count threshold provides a more controlled recording of attack activity. For example, if multiple login attempts produce a failed result over a short period of time, then an alert would be sent and traffic might be blocked, which is a more manageable response than sending an alert every time a login fails.

This can be configured from the GUI by going to *Security Profiles* > *Intrusion Prevention*. Create or edit an IPS sensor. Within the sensor, edit the IPS signatures and filters. Only IPS signatures have the rate-based settings option. IPS filters do not. See Configuring an IPS sensor on page 1745.

Some settings are only available in the CLI.

To configure the IPS signature rate-based settings in the CLI:

```
config ips sensor
    edit <sensor>
        config entries
            edit <filter ID number>
```

```
                set rule <ids>
                set rate-count <integer>
                set rate-duration <integer>
                set rate-mode {continuous | periodical}
                set rate-track {none | src-ip | dest-ip | dhcp-client-mac  | dns-domain}
            next
        end
    next
end
```

`rule <ids>`	The predefined or custom IPS signatures to add to the sensor.
`rate-count <integer>`	The count of the rate (0 - 65535, default = 0). The rate-count must be configured before the other rate settings can be set.
`rate-duration <integer>`	Duration of the rate, in seconds (0 - 65535, default = 60)
`rate-mode {continuous | periodical}`	How the count threshold is met. • `continuous`: If the action is set to block, the action is engaged as soon as the rate-count is reached. For example, if the count is 10, the traffic would be blocked as soon as the signature is triggered 10 times. This is the default. • `periodical`: The FortiGate allows up to the value of the rate-count incidents where the signature is triggered during the rate-duration. For example, if the rate count is 100 and the duration is 60, the signature would need to be triggered 100 times in 60 seconds for the action to be engaged.
`rate-track {none | src-ip | dest-ip | dhcp-client-mac | dns-domain}`	Track one of the protocol fields within the packet (default = none).

Botnet C&C

See IPS with botnet C&C IP blocking on page 1764 for information on configuring settings in the CLI.

Hardware acceleration for flow-based security profiles (NTurbo and IPSA)

Some FortiGate models support a feature call NTurbo that can offload flow-based firewall sessions to network processors. See also NTurbo offloads flow-based processing in the Hardware Acceleration Guide. For IPSA enhanced pattern matching, see IPSA offloads flow-based advanced pattern matching in the Hardware Acceleration Guide.

Some FortiGate models also support offloading enhanced pattern matching for flow-based security profiles to CP8 or CP9 content processors.

To configure NTurbo and IPSA:

```
config ips global
    set np-accel-mode {none | basic}
    set cp-accel-mode {none | basic | advanced}
end
```

If the `np-accel-mode` option is available, your FortiGate supports NTurbo. The `none` option disables NTurbo, and `basic` (the default) enables NTurbo.

If the `cp-accel-mode` option is available, your FortiGate supports IPSA. The `none` option disables IPSA, and `basic` enables basic IPSA, and `advanced` enables enhanced IPSA, which can offload more types of pattern matching than basic IPSA. The `advanced` option is only available on FortiGate models with two or more CP8 processors, or one or more CP9 processors.

Extended IPS database

Some models have access to an extended IPS Database. Because the extended database may affect FortiGate performance, the extended database package may be disabled by default on some models, such as entry-level models.

You can only enable the extended IPS database by using the CLI.

To enable the extended IPS database:

```
config ips global
    set database extended
end
```

FortiGate models with the CP9 SPU receive the IPS full extended database, and the other physical FortiGate models receive a slim version of the extended database. The slim-extended DB is a smaller version of the full extended DB that contains top active IPS signatures. It is designed for customers who prefer performance.

Customers with non-CP9 SPU models need to upgrade to a CP9 SPU model (physical FortiGate) in order to get full IPS signature coverage. All FortiGate models 200 (E and F) and higher have a CP9 SPU.

See Determining the content processor in your FortiGate unit in the FortiOS Hardware Acceleration Guide to check if your device has a CP9 SPU.

FortiGate VMs with eight or more vCPUs can be configured to have a minimum of eight cores to be eligible to run the full extended database. Any FortiGate VM with less than eight cores will receive a slim version of the extended database.

IPS engine-count

FortiGate units with multiple processors can run one or more IPS engine concurrently. The `engine-count` CLI command allows you to specify how many IPS engines to use at the same time.

To specify the number of concurrent IPS engines running:

```
config ips global
    set engine-count <int>
end
```

The recommended and default setting is `0`, which allows the FortiGate unit to determine the optimum number of IPS engines.

OT threat definitions

Operational Technology (OT) threat definitions are defined to protect Industrial Control Systems (ICS), Operational Technology (OT) and SCADA systems, which are critical infrastructure used by manufacturing industries. An OT Security Service license is required to use this signature database. These signatures are excluded by default, but can be configured in the CLI.

Enabling the OT threat definitions may impact IPS performance, since this increases the number of signatures to scan. To optimize IPS performance, enable only IPS signature packages that are needed.

To configure OT signatures:

```
config ips global
    set exclude-signatures {none | ot}
end
```

Fail-open

A fail-open scenario is triggered when IPS raw socket buffer is full. Therefore IPS engine has no space in memory to create more sessions and needs to decide whether to drop the sessions or bypass the sessions without inspection.

To enable fail-open mode:

```
config ips global
    set fail-open {enable | disable}
end
```

The default setting is `disable`, so sessions are dropped by IPS engine when the system enters fail-open mode.

When enabled, the IPS engine fails open, and it affects all protocols inspected by FortiOS IPS protocol decoders, including but not limited to HTTP, HTTPS, FTP, SMTP, POP3, IMAP, and so on. When the IPS engine fails open, traffic continues to flow without IPS scanning.

Sessions offloaded to Nturbo do not support fail-open. When Nturbo data path is overloaded, traffic is dropped regardless of fail-open setting.

IPS buffer size

If system enters fail-open mode frequently, it is possible to increase the IPS socket buffer size to allow more data buffering, which reduces the chances of overloading the IPS engine. You can set the size of the IPS buffer.

To set the socket buffer size:

```
config ips global
    set socket-size <int>
end
```

The default socket size and maximum configurable value varies by model. In short, socket-size determines how much data the kernel passes to the IPS engine each time the engine samples packets.

Take caution when modifying the default value. If the socket-size is too large, the higher memory used by the IPS engine may cause the system to enter conserve mode more frequently. If set too low, the system may enter IPS fail-open mode too frequently.

Session count accuracy

The IPS engine can track the number of open session in two ways. An accurate count uses more resources than a less accurate heuristic count.

To configure the IPS open session count mode:

```
config ips global
    set session-limit-mode {accurate | heuristic}
end
```

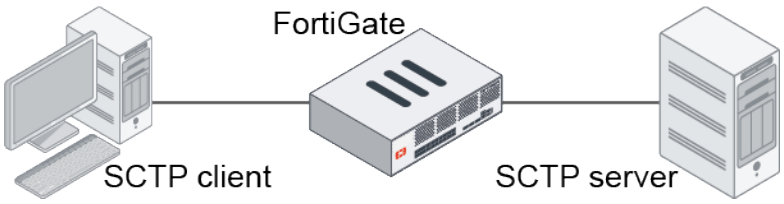
The default is `heuristic`.

Protocol decoders

The FortiGate Intrusion Prevention system uses protocol decoders to identify the abnormal traffic patterns that do not meet the protocol requirements and standards. For example, the HTTP decoder monitors traffic to identify any HTTP packets that do not meet the HTTP protocol standards.

To change the ports a decoder examines, you must use the CLI.

To configure protocol decoder ports:



```
config ips decoder dns_decoder
    config parameter "port_list"
        set value "100,200,300"
    end
end
```

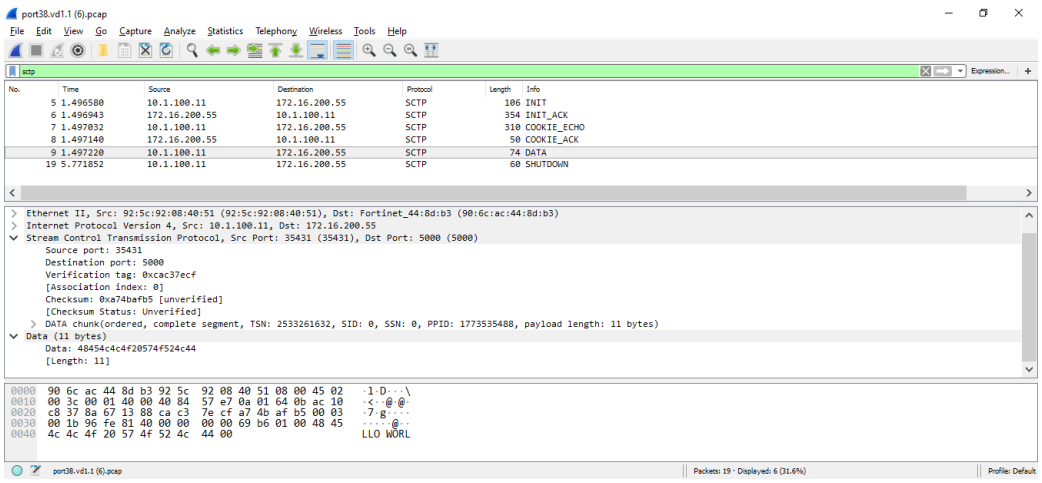
In this example, the ports examined by the DNS decoder were changed from the default 53 to 100, 200, and 300.

You cannot assign specific ports to decoders that are set to *auto* by default. These decoders can detect their traffic on any port. Specifying individual ports is not necessary.

SCTP filtering capabilities

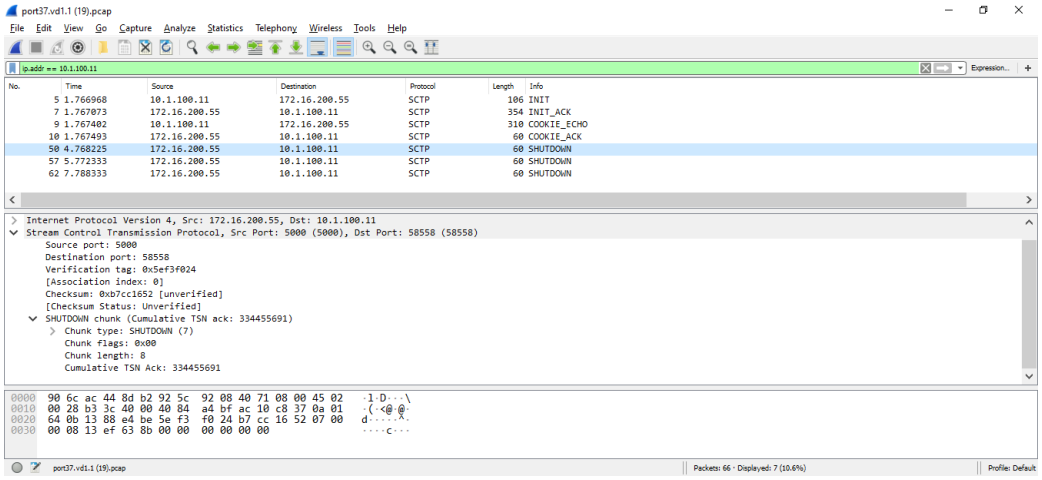
A Stream Control Transmission Protocol (SCTP) dissector and Payload Protocol Identifier (PPID) filter can be used to either terminate the SCTP session, or replace the offending data chunk with zeros to keep the client and server sequence numbers synchronized. The SCTP filter action can also pass the data chunk.

To configure and test an SCTP filter:



1. Configure an SCTP filter profile that uses the reset action:

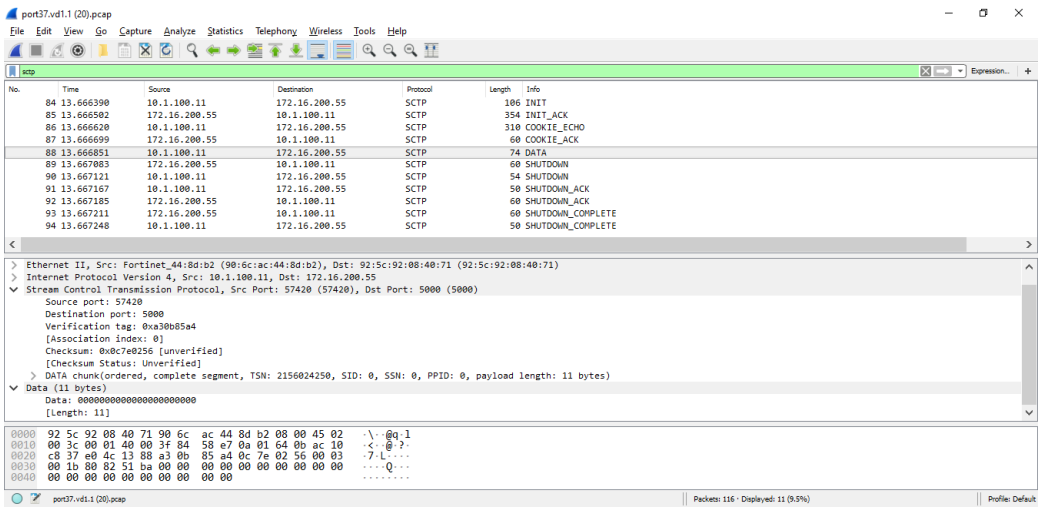
```
config sctp-filter profile
    edit "sctp"
        set comment "Demo profile"
        config ppid-filters
            edit 1
                set ppid 112233
                set action reset
                set comment "test chunk"
            next
        end
    next
end
```



2. Use the SCTP filter profile in a firewall policy:

```
config firewall policy
    edit 1
        set name "1"
        set srcintf "port38"
        set dstintf "port37"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "new-deep-inspection"
        set sctp-filter-profile "sctp"
        set logtraffic all
    next
end
```

3. On the SCTP client, confirm that the connection works and send a data chunk with PPID 112233.



4. The IPS engine detects the data chunk. The PPID matches the PPID filter, and the filter action is reset, so the data chunk is not received on the server, and the session is terminated.

5. Change the filter action to replace:

```
config sctp-filter profile
    edit "sctp"
        config ppid-filters
            edit 1
                set action replace
            next
        end
    next
end
```

6. Resend the data chunk.
7. The IPS engine detects the data chunk. The PPID matches the PPID filter, and the filter action is replace, so the data chunk is replaced with zeros.

Diameter protocol inspection

Diameter protocol inspection is supported on the FortiGate, which offers the following capabilities.

- Diameter-based packet forwarding and routing: the FortiGate can forward and route Diameter packets that match a firewall policy with an enabled and assigned `diameter-filter profile`. These diameter packets traverse over SCTP or TCP on the reserved port 3868.
- Packet sanity checking: this feature checks if the packet passing through the FortiGate conforms to the Diameter protocol standards as defined in RFC 3588.
  - This includes checking the release version field, error command flags, message length, reserved command flag bits, command code, and tracking the request and answer of the Diameter-based packets.
- Logging: for network auditing purposes, the traffic for both dropped and forwarded Diameter-based packets of the supported commands can be logged. By default, these are disabled.

Diameter protocol is particularly important on interfaces that are used to exchange information with roaming partners, through the Internetwork Packet Exchange (IPX) network.

This feature requires a valid IPS license.

```
config diameter-filter profile
    edit <name>
        set monitor-all-messages {enable | disable}
        set log-packet {enable | disable}
        set track-requests-answers {enable | disable}
        set missing-request-action {allow | block | reset | monitor}
        set protocol-version-invalid {allow | block | reset | monitor}
        set message-length-invalid {allow | block | reset | monitor}
        set request-error-flag-set {allow | block | reset | monitor}
        set cmd-flags-reserve-set {allow | block | reset | monitor}
        set command-code-invalid {allow | block | reset | monitor}
        set command-code-range <min-max>
```

```
    next
end
```

`monitor-all-messages {enable | disable}`	Enable/disable logging for all User-Name and Result-Code AVP messages.
`log-packet {enable | disable}`	Enable/disable packet log for triggered Diameter settings.
`track-requests-answers {enable | disable}`	Enable/disable validation that each answer has a corresponding request.
`missing-request-action {allow | block | reset | monitor}`	Set the action to be taken for answers without a corresponding request. • `allow`: allow or pass matching traffic. • `block`: block or drop matching traffic. • `reset`: reset sessions for matching traffic. • `monitor`: allow and log matching traffic.
`protocol-version-invalid {allow | block | reset | monitor}`	Set the action to be taken for an invalid protocol version. • `allow`: allow or pass matching traffic. • `block`: block or drop matching traffic. • `reset`: reset sessions for matching traffic. • `monitor`: allow and log matching traffic.
`message-length-invalid {allow | block | reset | monitor}`	Set the action to be taken for an invalid message length. • `allow`: allow or pass matching traffic. • `block`: block or drop matching traffic. • `reset`: reset sessions for matching traffic. • `monitor`: allow and log matching traffic.
`request-error-flag-set {allow | block | reset | monitor}`	Set the action to be taken for request messages with an error flag set. • `allow`: allow or pass matching traffic. • `block`: block or drop matching traffic. • `reset`: reset sessions for matching traffic. • `monitor`: allow and log matching traffic.
`cmd-flags-reserve-set {allow | block | reset | monitor}`	Set the action to be taken for messages with a command flag reserve bits set. • `allow`: allow or pass matching traffic. • `block`: block or drop matching traffic. • `reset`: reset sessions for matching traffic. • `monitor`: allow and log matching traffic.
`set command-code-invalid {allow | block | reset | monitor}`	Set the action to be taken for messages with an invalid command code. • `allow`: allow or pass matching traffic. • `block`: block or drop matching traffic. • `reset`: reset sessions for matching traffic. • `monitor`: allow and log matching traffic.
`set command-code-range <min-max>`	Set the valid range for command codes (min = 0, max = 16777215, default = 256-16777213).

To configure Diameter protocol inspection:

1. Configure the Diameter filter profile:

```
config diameter-filter profile
    edit "diameter_profile"
        set monitor-all-messages disable
        set log-packet enable
        set track-requests-answers enable
        set missing-request-action block
        set protocol-version-invalid block
        set message-length-invalid block
        set request-error-flag-set block
        set cmd-flags-reserve-set block
        set command-code-invalid block
        set command-code-range 256-1677213
    next
end
```

2. Apply the Diameter filter to a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "deep-inspection"
        set diameter-filter-profile "diameter_profile"
        set logtraffic all
        set auto-asic-offload disable
    next
end
```

NTurbo does not fully support SCTP, so if the configuration includes Diameter-over-SCTP, the `auto-asic-offload` setting should be disabled in the firewall policy. Otherwise, IPS does not get the full session packets.

```

IPS signature filter options

IPS signature filter options include hold time, CVE pattern, and IPS sensor attributes.

Hold time

The hold time option allows you to set the amount of time that signatures are held after a FortiGuard IPS signature update per VDOM. During the holding period, the signature's mode is monitor. The new signatures are enabled after the hold time to avoid false positives.

The hold time can be from 0 days and 0 hours (default) up to 7 days, in the format `##d##h`.

To configure the amount of time to hold and monitor IPS signatures:

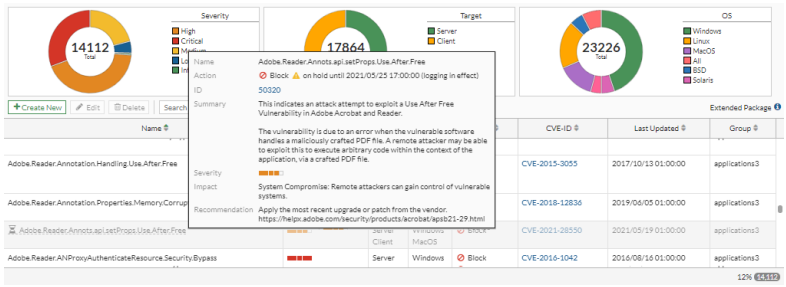
```
config system ips
    set signature-hold-time 3d12h
    set override-signature-hold-by-id enable
end
```

When a signature that is on hold is matched, the log will include the message `signature is on hold`:

```
date=2010-07-06 time=00:00:57 logid="0419016384" type="utm" subtype="ips"
eventtype="signature" level="alert" vd="vd1" eventtime=1278399657778481842 tz="-0700"
severity="info" srcip=10.1.100.22 srccountry="Reserved" dstip=172.16.200.55 srcintf="port13"
srcintfrole="undefined" dstintf="port14" dstintfrole="undefined" sessionid=3620
action="detected" proto=6 service="HTTP" policyid=1 attack="Eicar.Virus.Test.File"
srcport=52170 dstport=80 hostname="172.16.200.55" url="/virus/eicar" direction="incoming"
attackid=29844 profile="test" ref="http://www.fortinet.com/ids/VID29844"
incidentserialno=25165825 msg="file_transfer: Eicar.Virus.Test.File, (signature is on hold)"
```

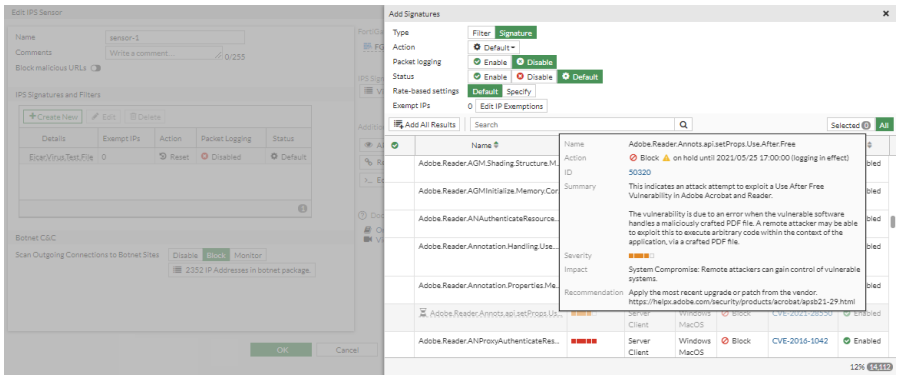
To view signatures being held by rule ID 29844 on the VDOM:

```
# diagnose ips signature on-hold vd1 29844
Rule: 29844, attack_id: 58886, last updated: 20170411
Rule: 29844, attack_id: 59517, last updated: 20170411
Rule: 29844, attack_id: 60105, last updated: 20170411
...
```



To view all help signatures on the VDOM:

```
# diagnose ips signature on-hold vd1
Rule: 17541, attack_id: 20899, last updated: 20140423
Rule: 17557, attack_id: 20934, last updated: 20140423
Rule: 17559, attack_id: 20932, last updated: 20140423
Rule: 17560, attack_id: 20933, last updated: 20140423
Rule: 17562, attack_id: 20928, last updated: 20170908
Rule: 17677, attack_id: 21187, last updated: 20171106
Rule: 17713, attack_id: 43756, last updated: 20140424
Rule: 17759, attack_id: 21298, last updated: 20140423
...
```



Viewing on hold information in the GUI

On hold signatures are grayed out in the GUI with an hourglass icon beside the signature name. A tooltip displays the on hold expiry time and other details.

On the *Security Profiles* > *IPS Signatures* page, for example, the *Adobe.Reader.Annots.api.setProps.Use.After.Free* signature is on hold. Hover over the grayed-out entry to view the tooltip, which includes the action and hold time expiry. On this page, all on hold signatures are displayed as on hold regardless of whether `override-signature-hold-by-id` is enabled.

The same tooltip is available on the *Edit IPS Sensor* (*Security Profiles* > *Intrusion Prevention*) page when creating or editing the IPS signatures. In the *Add Signatures* pane when the *Type* is *Signature*, signatures on hold are only displayed as on hold if `override-signature-hold-by-id` is enabled.

You can still use on hold signatures in an IPS sensor profile; however, the profile will not block matching traffic. It will monitor it instead (logging in effect) until the on hold time expires.

CVE pattern

The CVE pattern option allows you to filter IPS signatures based on CVE IDs or with a CVE wildcard, ensuring that any signatures tagged with that CVE are automatically included.

To configure CVE patterns for CVE-2010-0177 and all CVE-2017 CVEs:

```
config ips sensor
    edit "cve"
        set comment "cve"
        config entries
            edit 1
                set cve "cve-2010-0177"
                set status enable
                set log-packet enable
                set action block
            next
            edit 2
                set cve "cve-2017"
                set action reset
            next
        end
    next
end
```

For example, the CVE of the IPS signature *Mozilla.Firefox.PluginArray.NsMimeType.Code.Execution* is CVE-2010-0177. This matches the CVE filter in the IPS sensor, so traffic is blocked and logged:

```
date=2020-07-13 time=15:44:56 logid="0419016384" type="utm" subtype="ips"
eventtype="signature" level="alert" vd="vd1" eventtime=1594593896666145871 tz="-0700"
severity="critical" srcip=10.1.100.22 srccountry="Reserved" dstip=172.16.200.55
srcintf="port2" srcintfrole="undefined" dstintf="port1" dstintfrole="undefined"
sessionid=1638 action="dropped" proto=6 service="HTTPS" policyid=1
attack="Mozilla.Firefox.PluginArray.NsMimeType.Code.Execution" srcport=58298 dstport=443
hostname="172.16.200.55" url="/Mozilla" direction="incoming" attackid=20853 profile="sensor-
1" ref="http://www.fortinet.com/ids/VID20853" incidentserialno=124780667 msg="web_client:
Mozilla.Firefox.PluginArray.NsMimeType.Code.Execution," crscore=50 craction=4096
crlevel="critical"
```

IPS sensor attributes

When configuring IPS sensor profiles, IPS signatures can be filtered based on the attributes: default status, default action, vulnerability type, and the last update date. When monitoring the specific, filtered signatures, logs are not generated for other, irrelevant signatures.

This avoids generating a lot of false positives due to many signatures having the pass action, which is never logged.

To configure filters in an IPS sensor profile:

```
config ips sensor
    edit "test_default"
        config entries
            edit 1
                set default-action pass
```

```
                set default-status enable
                set vuln-type 12
                set last-modified before 2020/02/02
            next
        end
    next
end
```

`default-action {pass | block | all}`	Filter by signatures' default actions (default = all).
`default-status {enable | disable | all}`	Filter by signatures' default statuses (default = all).
`vuln-type <integer> ... <integer>`	Filter by signatures' vulnerability types.
`last-modified {before | after | between} <date> [end-date]`	Filter by signatures' last modified date (default = before 00/00/00). The date format is `yyyy/mm/dd`. The year range is 2001 - 2050.

When the IPS profile is used in a firewall profile and then the EICAR virus test file signature is triggered, the signature matches the values set in the filter and logs are generated:

IPS with botnet C&C IP blocking

The *Botnet C&C* section consolidates multiple botnet options in the IPS profile. This allows you to enable botnet blocking across all traffic that matches the policy by configuring one setting in the GUI, or by the `scan-botnet-connections` option in the CLI.

To configure botnet C&C IP blocking in the GUI:

1. Go to *Security Profiles* > *Intrusion Prevention*, and click *Create New* to create a new IPS sensor, or double-click an existing IPS sensor to open it for editing.
2. Navigate to the *Botnet C&C* section.
3. For *Scan Outgoing Connections to Botnet Sites*, select *Block* or *Monitor*.

4. Configure the other settings as needed.
5. Click *OK* to save the IPS sensor.
6. Add the IPS sensor to a firewall policy.

   The IPS engine will scan outgoing connections to botnet sites. If you access a botnet IP address, an IPS log is generated for this attack.
7. Go to *Log & Report* > *Security Events* and click the *Intrusion Prevention* card to view the log.

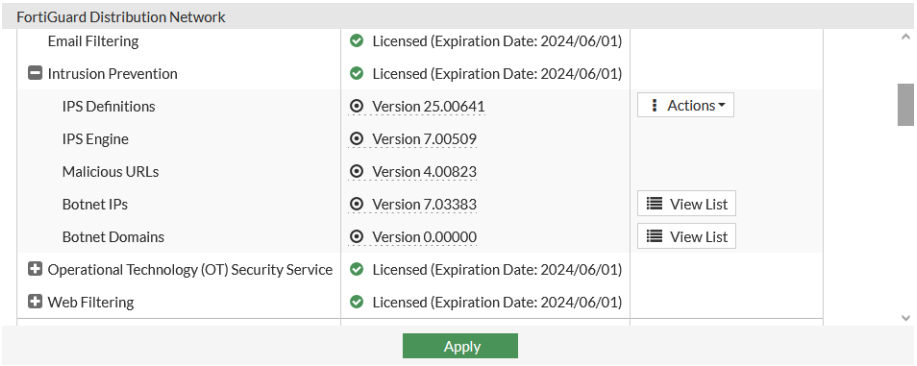
To configure botnet C&C IP blocking in the CLI:

```
config ips sensor
   edit "Demo"
      set scan-botnet-connections {disable | block | monitor}
   next
end
```

The `scan-botnet-connections` option is no longer available in the following CLI commands:

- `config firewall policy`
- `config firewall interface-policy`
- `config firewall proxy-policy`
- `config firewall sniffer`

Sample log



```
# execute log filter category 4
# execute log display
1 logs found.
1 logs returned.

1: date=2022-04-28 time=16:18:34 eventtime=1651187914585406621 tz="-0700" logid="0422016400"

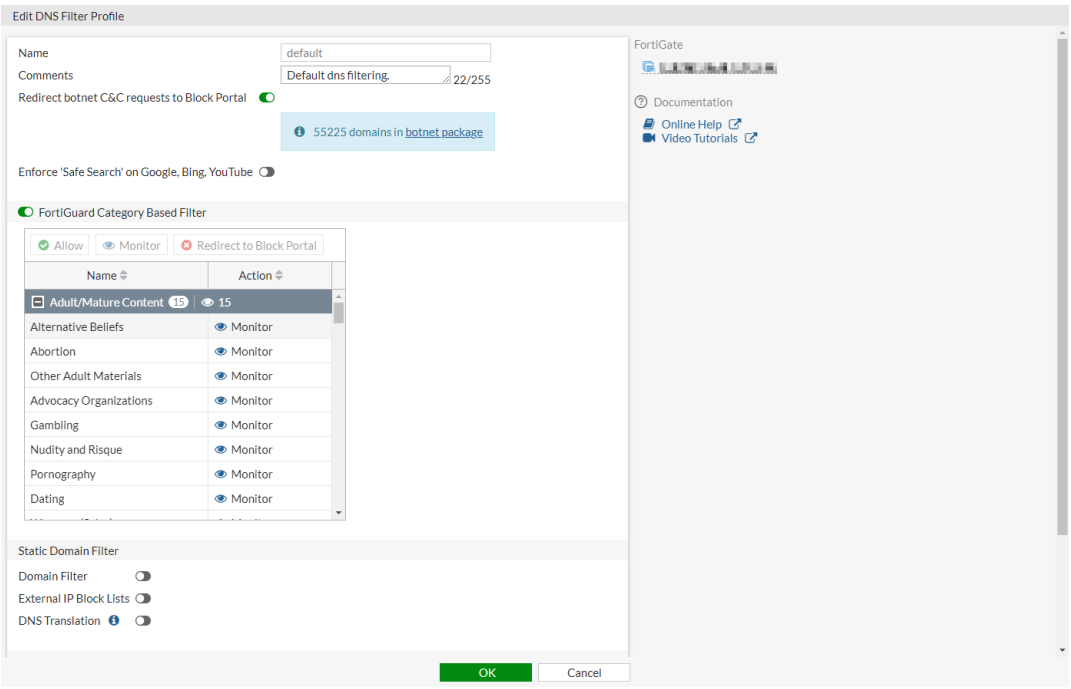
```

Botnet IPs and domains lists

To view botnet IPs and domains lists:

1. Go to *System* > *FortiGuard*.
2. Expand *License Information* > *Intrusion Prevention* to view *Botnet IPs* and *Botnet Domains* information.

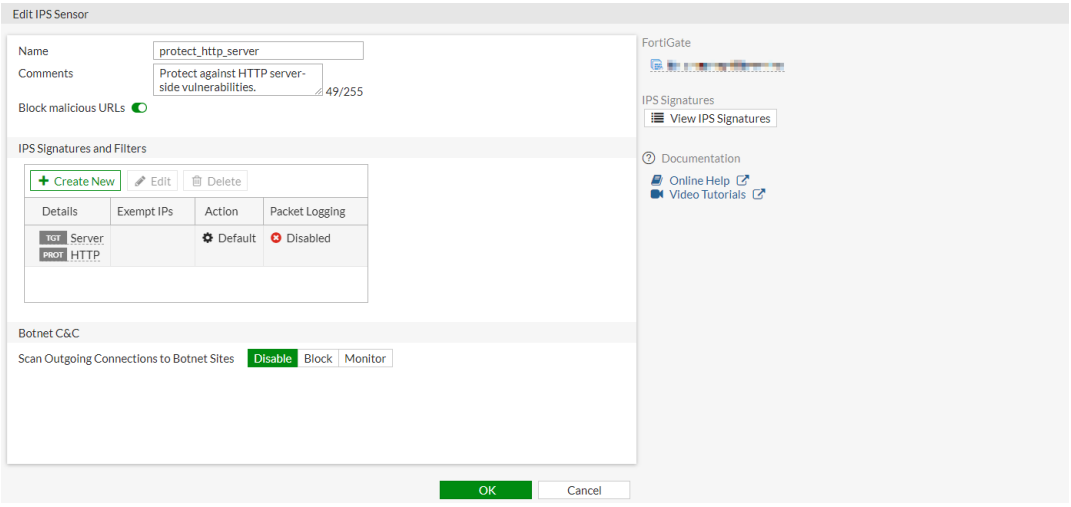


3. Click *View List* for more details.

Botnet C&C domain blocking

To block connections to botnet domains:

1. Go to *Security Profiles* > *DNS Filter*, and click *Create New*, or double-click an existing filter to open it for editing.
2. Enable *Redirect botnet C&C requests to Block Portal*.

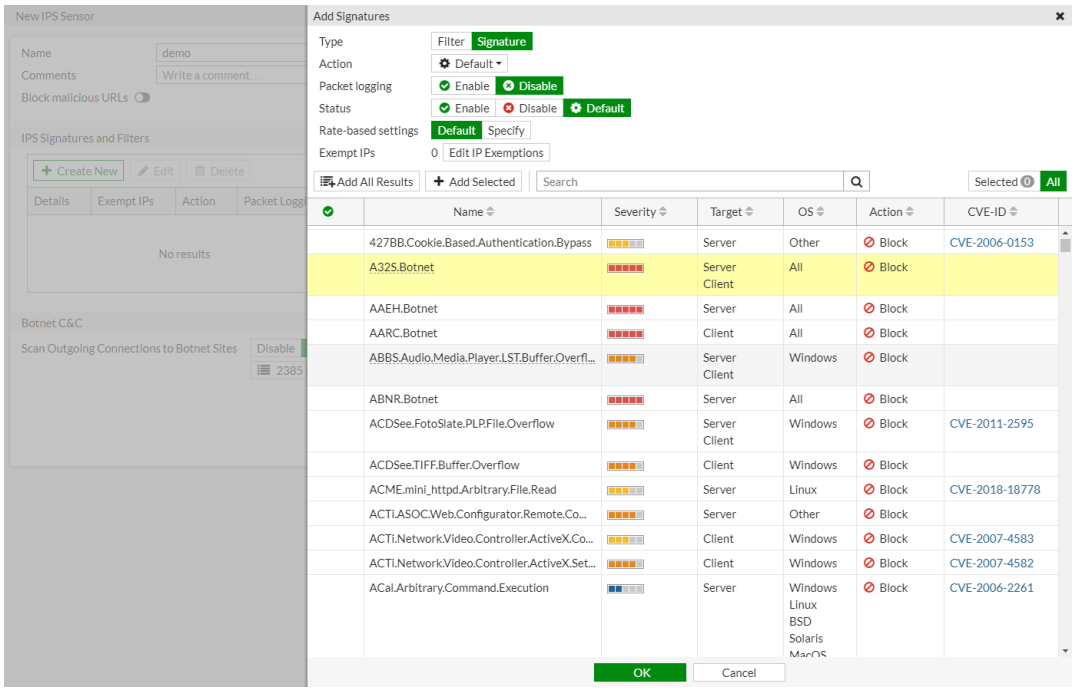


3. Configure the other settings as needed.
4. Click *OK*.
5. Add the filter profile to a firewall policy.

Botnet C&C URL blocking

To block malicious URLs:

1. Go to *Security Profiles* > *Intrusion Prevention*, and click *Create New*, or double-click an existing filter to open it for editing.
2. Enable *Block malicious URLs*.



3. Configure the other settings as needed.

4. Click *OK*.
5. Add the sensor to a firewall policy.

Botnet C&C signature blocking

To add IPS signatures to a sensor:

1. Go to *Security Profiles* > *Intrusion Prevention*, and click *Create New*, or double-click an existing sensor to open it for editing.
2. In the *IPS Signatures and Filters* section, click *Create New*. A list of available signatures appears.
3. For *Type*, select *Signature*. Select the signatures you want to include from the list.
4. Configure the other settings as needed.
5. Click *Add Selected*.

6. Click *OK* to add the IPS signatures to the IPS sensor.
7. Click *OK* to save the IPS sensor.
8. Add the sensor to a firewall policy to detect or block attacks that match the IPS signatures.

IPS signatures for the operational technology security service

The FortiGuard Operational Technology (OT) includes both application control and intrusion prevention signatures for industrial applications and protocols. The OT attack definitions are only updated if the FortiGate has a valid OT Security Services license and an IPS security profile is used in a policy.

By default, OT signatures are excluded from the signature lists in the GUI.

To verify that the FortiGate has a valid OT Security Service license:

1. Go to *System* > *FortiGuard*.
2. In the *License Information* table, check the license status of *Operational Technology (OT) Security Service*.
3. Expand the *Operational Technology (OT) Security Service* entry to see the current versions.

To force the industrial DB attack definitions to update:

1. Optionally, create an IPS profile:
   a. Go to *Security Profiles* > *Intrusion Prevention* and click *Create New*.
   b. Enter a name for the profile.
   c. In the *IPS Signatures and Filters* table click *Create New*.
   d. Click *OK*.
   e. Click *OK*.

   See Intrusion prevention on page 1740 for more information.
2. Use the IPS profile in a policy:
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Edit an existing policy, or click *Create New* to create a new policy.
   c. Under *Security Profiles*, enable *IPS* and select an IPS profile.
   d. Configure the remaining settings as needed, then click *OK*.
3. Go to *System* > *FortiGuard* and either click *Update Licenses & Definitions Now*, or wait for the next automatic update. The update could take a few minutes.
4. Refresh the page, then check the *Operational Technology (OT) Security Service* versions to confirm that they have been updated.

To make OT IPS and application control signatures available in the GUI:

```
config ips global
    set exclude-signatures none
end
```

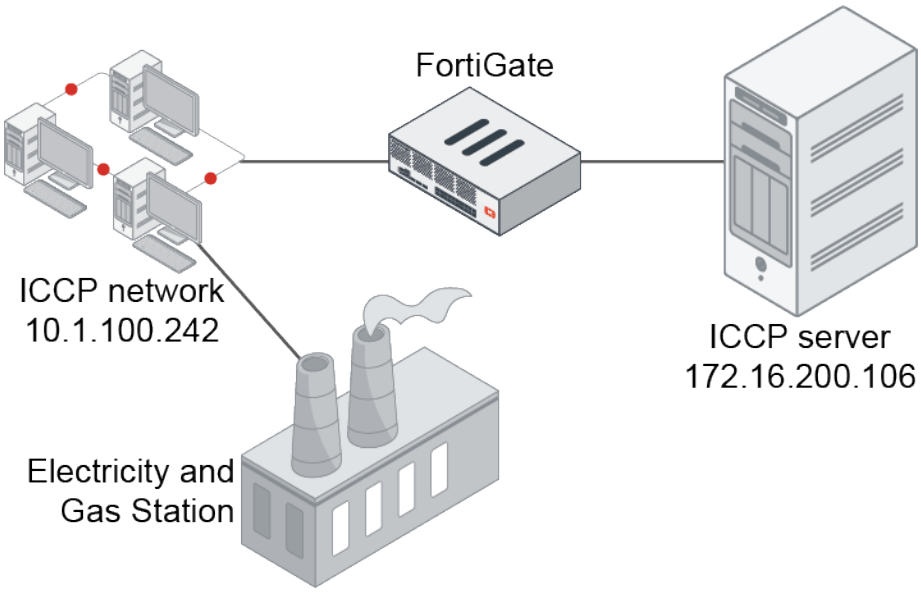
To view the signatures in the GUI:

1. Go to *Security Profiles* > *Application Signatures* and to find signatures that identify OT protocols.
2. Go to *Security Profiles* > *IPS Signatures* to find signatures that detect networks attacks that target OT assets.

To see the entire list of OT IPS Rules and OT Application Control rules, go to the following links:

- https://www.fortiguard.com/encyclopedia?type=otips
- https://www.fortiguard.com/encyclopedia?type=otapp

To see the list of Industrial Application Control signatures, go to the following link:



- https://www.fortiguard.com/appcontrol?category=Industrial

IPS sensor for IEC 61850 MMS protocol

IEC 61850 is a SCADA protocol whose services are mapped to a number of protocols, including MMS services. MMS/ICCP detection is supported in IPS. The purpose of the MMS dissectors is to identify every IEC 61850 service to distinguish different MMS/ICCP messages. IPS engine 6.0.12 and later support MMS dissectors.

The following scenarios are also supported:

- Multiple MMS PDUs are transferred in one TCP payload, and the IPS engine identifies individuals.
- An MMS message is split over multiple TCP segments, where MMS runs over COTP segments.
- ICCP/TASE.2 that also uses MMS transport (ISO transport over TCP for ICCP) is detected.

OT signatures must be enabled in the global IPS settings to receive MMS/ICCP signatures. By default, OT signatures are excluded.

```
config ips global
    set exclude-signatures {none | ot}
end
```

Below are some OT signatures for MMS/ICCP messages that can be detected by the IPS engine. This is not an exhaustive list.

- MMS_GetNameList.Request
- MMS_GetNamedVariableListAttributes.Request
- MMS_GetVariableAccessAttributes.Request
- MMS_Identify.Request
- MMS_Initiate.Request
- MMS_Read.Request
- MMS_Reset.Request
- ICCP_Transfer.Reporting
- ICCP_Create.Dataset
- ICCP_Abort
- ICCP_Start.Transfer.DSTransferSet
- ICCP_Get.Dataset.Element.Values

- ICCP_Get.Next.DSTransfer.Set.Value
- ICCP_Delete.Dataset
- ICCP_Start.Transfer.IMTransferSet

Diagnose command

The COTP dissector adds support for identifying every MMS PDU, and let the IPS engine separate them, like the Modbus and IEC-104 services for example.

```
# diagnose ips debug enable all
# diagnose debug enable
[284@78]ips_l7_dsct_processor: serial=8142 create: cotp
[284@78]ips_l7_dsct_processor: serial=8142 create: iec104
[284@78]ips_l7_dsct_processor: serial=8142 create: modbus
```

Log samples

MMS dissectors can be triggered, and MMS/ICCP signatures can be monitored and logged.

Log samples:

File filter

A file filter can be configured to control the flow of different types of files passing through FortiGate. This is done by setting up rules that specify which file types are allowed or blocked. The file filter can be applied directly to firewall policies and supports various traffic protocols in proxy or flow mode. The feature set setting (proxy or flow) in the file filter profile must match the inspection mode setting (proxy or flow) in the associated firewall policy. For example, a flow-based file filter profile must be used with a flow-based firewall policy.

Prior to FortiOS 6.4.1, file filter was embedded in the web filter, email filter, SSH inspection, and CIFS profiles.

Protocol	Proxy mode	Flow mode
CIFS	Yes	Yes
FTP	Yes	Yes
HTTP	Yes	Yes
IMAP	Yes	Yes
MAPI	Yes	No
POP3	Yes	Yes
SMTP	Yes	Yes
SSH	Yes	No

File filtering is based only on the file type (file meta data) and not on file size or content. A DLP dictionary, sensor, and profile would need to be configured to block files based on size or content, such as SSN numbers, credit card numbers, or regular expressions (see Basic DLP settings on page 1843 for more information).

The following options can be configured in a file filter profile:

GUI option	CLI option	Description
Basic profile settings		
Name	`name <string>`	Enter a unique name for the profile.
Comments	`comment <var-string>`	Enter a comment (optional).
Scan archive contents	`scan-archive-contents {enable | disable}`	Enable to scan archive contents.

Feature set	`feature-set {flow | proxy}`	Select the feature set for the profile. The feature set mode must match the inspection mode used in the associated firewall policy.
		• *Flow-based*
		• *Proxy-based*
		If the *Feature set* option is not visible in the GUI, enter the following in the CLI:
		`config system settings`
		`set gui-proxy-inspection enable`
		`end`

n/a	`log {enable | disable}`	Enable to use file filter logging. This setting is enabled by default.
n/a	`extended-log {enable | disable}`	Enable to use file filter extended logging. This setting is disabled by default.
n/a	`replacemsg-group <string>`	Set a replacement message group.
File filter rule settings		

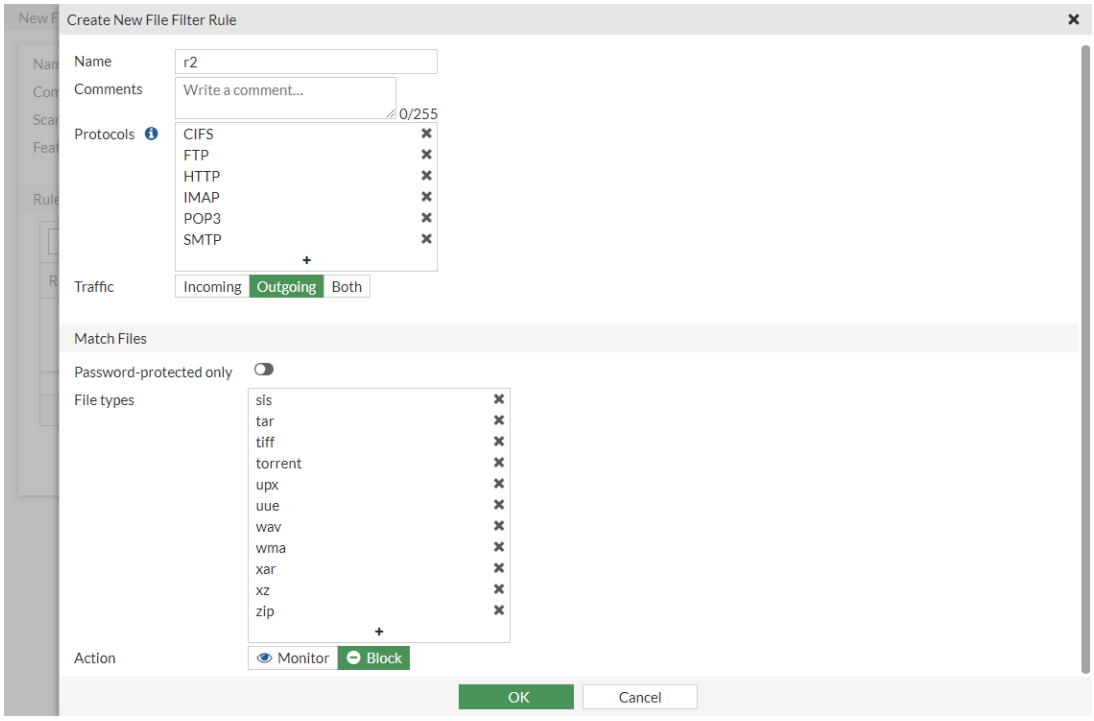
GUI option	CLI option	Description
Name	`name <string>`	Enter a unique name for the rule.
Comments	`comment <var-string>`	Enter a comment (optional).
Protocols	`protocol {option1}, {option2}, ...`	Set the protocols to apply to the rule. By default, all protocols are configured: CIFS, FTP, HTTP, IMAP, POP3, and SMTP in flow mode. Additionally, MAPI and SSH are configured by default in proxy mode.
Traffic	`direction {incoming | outgoing | any}`	Set the traffic direction: • *Incoming*/`incoming`: match files transmitted in the session's reply direction. • *Outgoing*/`outgoing`: match files transmitted in the session's originating direction. • *Both*/`any`: match files transmitted in the session's originating and reply directions.
Password-protected only	`password-protected {yes | any}`	Enable (`yes`) to match password-protected files. If the setting is not enabled, any file is matched.
File types	`file-type <name1>, <name2>, ...`	Select the file type. See Supported file types on page 1776 for the list of available options.
Action	`action {log-only | block}`	Set the action to take for a matched file: • *Monitor*/`log-only`: allow the content and write a log message. • *Block*/`block`: block the content and write a log message.

Configuring a file filter profile

In this example, a flow-based file filter is created that has two rules.

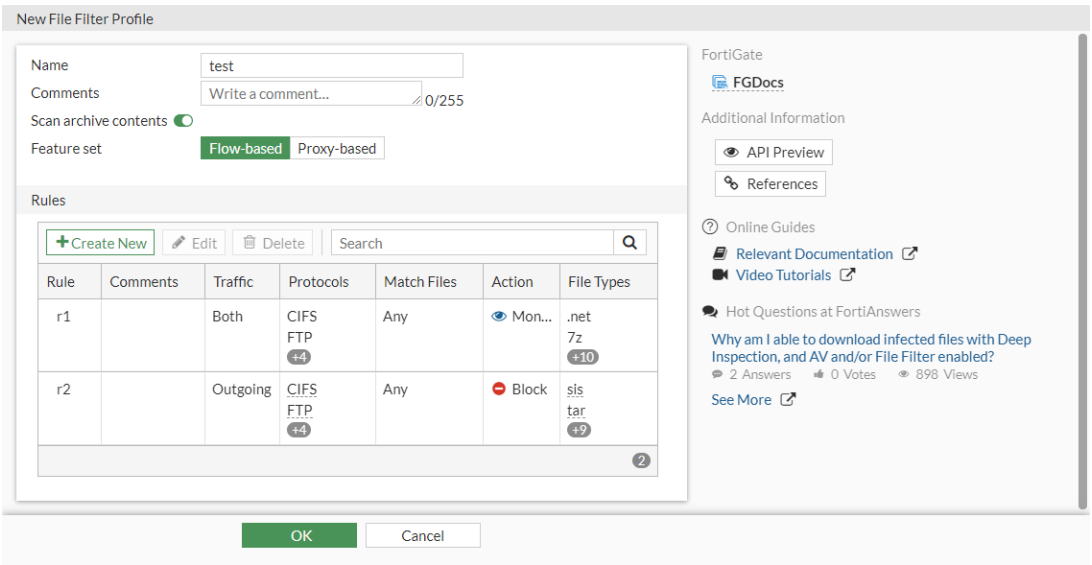
- Rule 1: applied to HTTP, FTP, SMTP, IMAP, POP3, and CIFS to monitor any matched .NET, 7-Zip, ActiveMime, ARJ, ASPack, AVI, Base64, Windows batch, BinHex, BMP, Bzip, and Bzip2 files transmitted in the session's originating and reply directions.
- Rule 2: applied to HTTP, FTP, SMTP, IMAP, POP3, and CIFS to block any matched SIS, TAR. TIFF, torrent, UPX, UUE, WAV, WMA. ZAR archive, XZ, and ZIP files transmitted in the session's originating direction.

To configure a file filter in the GUI:



1. Configure the filter profile:
   a. Go to *Security Profiles* > *File Filter* and click *Create New*.
   b. Enter a name.

c. Set the *Feature set* to *Flow-based*.
d. In the *Rules* table, click *Create New*.
e. Configure rule 1 as follows:



Name	r1
Protocols	HTTP, FTP, SMTP, IMAP, POP3, CIFS
Traffic	Both
Password-protected only	Deselect
File types	.net, 7z, activemime, arj, aspack, avi, base64, bat, binhex, bmp, bzip, bzip2
Action	Monitor

f. Click *OK* to save the rule.
g. In the *Rules* table, click *Create New* and configure rule 2 as follows:

Name	r2
Protocols	HTTP, FTP, SMTP, IMAP, POP3, CIFS
Traffic	Outgoing
Password-protected only	Deselect
File types	sis, tar, tiff, torrent, upx, uue, wav, wma, xar, xz, zip
Action	Block

h. Click *OK* to save the rule.
i. Click *OK* to save the filter profile.

2. Apply the filter to a policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and edit an existing policy or create a new one.
   b. In the *Security Profiles* section, enable *File Filter*.
   c. Select the filter from the dropdown box (*test*).
   d. Configure the other settings as needed.
   e. Click *OK*.

To configure a file filter in the CLI:

1. Configure the file filter profile:

```
config file-filter profile
    edit "test"
        set comment ''
        set feature-set flow
        set replacemsg-group ''
        set log enable
        set scan-archive-contents enable
        config rules
            edit "r1"
                set comment ''
                set protocol http ftp smtp imap pop3 cifs
                set action log-only
                set direction any
                set password-protected any
                set file-type ".net" "7z" "activemime" "arj" "aspack" "avi" "base64"
"bat" "binhex" "bmp" "bzip" "bzip2"
            next
            edit "r2"
                set comment ''
                set protocol http ftp smtp imap pop3 cifs
                set action block
                set direction outgoing
                set password-protected any
                set file-type "sis" "tar" "tiff" "torrent" "upx" "uue" "wav" "wma" "xar"
"xz" "zip"
```

```
            next
        end
    next
end
```

2. Apply the filter to a policy:

```
config firewall policy
    edit 1
        set name "filefilter-policy"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set file-filter-profile "test"
        set auto-asic-offload disable
        set np-acceleration disable
        set nat enable
    next
end
```

To view file filter logs in the GUI:

1. Go to *Log & Report > Security Events*.
2. Select the *File Filter* card.

To view file filter logs in the CLI:

```
# execute log filter category utm-file-filter
# execute log display
```

Supported file types

File filter allows the FortiGate to block files passing through based on file type based on the file's meta data only, and not on file size or file content. A DLP profile must be configured to block files based on size or content, such as SSN numbers, credit card numbers, or regexp.

The following file types are supported in file filter and DLP profiles:

Type	Description
.net	Match .NET files
7z	Match 7-Zip files
activemime	Match ActiveMime files
arj	Match ARJ compressed files

Type	Description
aspack	Match ASPack files
avi	Match AVI files
base64	Match Base64 files
bat	Match Windows batch files
binhex	Match BinHex files
bmp	Match BMP files
bzip	Match Bzip files
bzip2	Match Bzip2 files
cab	Match Windows CAB files
chm	Match Windows compiled HTML help files
class	Match CLASS files
cod	Match COD files
crx	Match Chrome extension files
dmg	Match Apple disk image files
elf	Match ELF files
exe	Match Windows executable files
flac	Match FLAC files
fsg	Match FSG files

wma	Match WMA files
xar	Match XAR archive files
xz	Match XZ files
zip	Match ZIP files

* This file type is only available in DLP profiles.

Email filter

Email filters can be configured to perform spam detection and filtering. You can customize the default profile, or create your own and apply it to a firewall policy.

Two kinds of filtering can be defined in a single profile, and they will act independent of one another.

Filter options can be organized according to the source of the decision:

- Local options: the FortiGate qualifies the email based on local conditions, such as block/allowlists, banned words, or DNS checks using FortiGuard Antispam.
- FortiGuard-based options: the FortiGate qualifies the email based on the score or verdict returned from FortiGuard Antispam.
- Third-party options: the FortiGate qualifies the email based on information from a third-party source (like an ORB list).

Local and FortiGuard block/allowlists can be enabled and combined in a single profile. When combined, the local block/allowlist has a higher priority than the FortiGuard block list during a decision making process. For example, if a client IP address is blocklisted in the FortiGuard server, but you want to override this decision and allow the IP to pass through the filter, you can define the IP address or subnet in a local block/allowlist with the clear action. Because the information coming from the local list has a higher priority than the FortiGuard service, the email will be considered clean.

Some features of this functionality require a subscription to FortiGuard Antispam.

Protocol comparison between email filter inspection modes

The following table indicates which email filters are supported by their designated inspection modes.

	SMTP	POP3	IMAP	MAPI
Proxy	Yes	Yes	Yes	Yes
Flow	Yes	Yes	Yes	No

The following topics provide information about email filter profiles:

- Configuring an email filter profile on page 1779
- Local-based filters on page 1780
- FortiGuard-based filters on page 1787
- Third-party-based filters on page 1789
- Filtering order on page 1790
- Protocols and actions on page 1791
- Configuring webmail filtering on page 1793

Configuring an email filter profile

Email filters can be configured to perform spam detection and filtering.

To configure an email filter profile:

1. Go to *Security Profiles* > *Email filter* and click *Create New*.
2. Configure the following settings:

Name		Enter a unique name for the profile.
Comments		Enter a comment (optional).
Enable spam detection and filtering		Enable/disable spam detection and filtering.
	Spam Detection by Protocol	Configure settings for SMTP, POP3, IMAP, and MAPI protocols. See Protocols and actions on page 1791 and Filtering order on page 1790 for more information.
	FortiGuard Spam Filtering	The FortiGate consults FortiGuard servers to help identify spammer IP address or emails, known phishing and spam URLs, known spam email checksums, and others. See FortiGuard-based filters on page 1787 for more information.
	Local Spam Filtering	Enable and configure local spam filters. See Local-based filters on page 1780 for more information.

3. Click *OK*.

Local-based filters

There are six types of local spam filters:

- HELO DNS lookup
- Return email DNS check
- Block/allow list
- Banned words*
- Trusted IP addresses*
- MIME header*

* These filters can only be configured in the CLI.

By default, HELO DNS and return email DNS checks are done before the block/allow list check. In some situations, such as when configuring a block/allow list to clear an email from performing further filtering, configure the following to give precedence to the block/allow list:

```
config emailfilter profile
    edit <name>
        config smtp
            set local-override enable
        next
    end
end
```

HELO DNS lookup and return email DNS checking are not supported while in flow-based inspection mode. See Inspection mode feature comparison on page 1558.

HELO DNS lookup

Whenever a client opens an SMTP session with a server, the client sends a HELO command with the client domain name. The FortiGate takes the domain name specified by the client in the HELO and performs a DNS lookup to determine if the domain exists. If the lookup fails, the FortiGate determines that any emails delivered during the SMTP session are spam. The HELO DNS lookup is only available for SMTP traffic.

Return email DNS check

The FortiGate performs a DNS lookup on the return field. If no such record exists, the email is treated as spam. When return email DNS checking is enabled, the FortiGate takes the domain in the reply-to email address and reply-to domain, and checks the DNS servers to see if there is an A or MX record for the domain. If the domain does not exist, the FortiGate treats the email as spam.

Block/allow list

Block/allow lists can be made from emails or IP subnets to forbid or allow them to send or receive emails. The following table summarizes the configurable options in a block/allow list.

Type	Description	Pattern	Action
IP/Netmask and *IPv6/Netmask*	The FortiGate compares the IP address of the client delivering the email to the addresses in the IP address block/allow list specified in the email filter profile. If a match is found, the FortiGate takes the action configured for the matching block/allow list entry against all delivered email. By default the `hdrip` setting under `config smtp` is disabled. If enabled, the FortiGate checks all the IP addresses in the header of SMTP email against the specified IP address block/allow list.	The filter is an IP address with a subnet mask.	• *Mark as Reject*: the email is dropped before reaching its destination. • *Mark as Spam*: the email is allowed through, but it will be tagged with an indicator marking the email as spam. • *Mark as Clear*: the email is allowed to go through to its destination on the assumption that it is not spam.

Type	Description	Pattern	Action
Recipient Address	The FortiGate compares the sender email address to the contents of the RCPT TO envelope header and To: mail header to the specified pattern. If a match is found, the FortiGate takes the action configured for the matching block/allow list entry.	• *Wildcard*: the filter is an email address with a wildcard symbol in place of the variable characters (such as **.example.com* or *fred@*.com*). • *Regular Expression*: the filter is a regular expression. For example, *^[_a-z0-9-]+(\.[_a-z0-9-]+)*@(example|xmple|examp).(com|org|net)* can be used to filter based on a number of email domain name combinations.	• *Mark as Spam*: the email is allowed through, but it will be tagged with an indicator marking the email as spam. • *Mark as Clear*: the email is allowed to go through to its destination on the assumption that it is not spam.
Sender Address	The FortiGate compares the sender email address to the contents of the MAIL FROM envelope header, From: mail header, and Sender: mail header to the specified pattern. If a match is found, the FortiGate takes the action configured for the matching block/allow list entry.		
Subject	The FortiGate compares the sender email address to the contents of the Subject: mail header to the specified pattern. If a match is found, the FortiGate takes the action configured for the matching block/allow list entry.		

Banned words

When banned word checking is enabled, the FortiGate examines emails for words that appear in the banned word list specified in the email filter profile.

The banned word pattern can be either wildcard or Perl regular expression, which could include part of a word, a whole word, a phrase, multiple words, or multiple phrases.

Each time the banned word filter detects a pattern in an email, it adds the pattern score to the sum of scores for the message. The score is set when creating a new pattern to block content (`set score`). Higher scores indicate more offensive content. If the total score of the discovered banned words in the email exceeds the threshold value set in the email filter profile, then the FortiGate treats the email as spam. The score for each pattern is counted only once, even if that pattern appears many times in the email. The default score for banned word patterns is 10, and the default threshold in the email filter is 10. This means that by default, an email message is blocked by a single match.

For example, if the FortiGate scans an email containing only this sentence: “The score for each word or phrase is counted only once, even if that word or phrase appears many times in the email message.” and the banned word list contains the following patterns:

Banned word pattern	Pattern type	Assigned score	Score added to sum for entire page	Comments
word	Wildcard	20	20	The pattern appears twice, but it is counted once.
word phrase	Wildcard	20	0	Both words appear in the email, but they do not appear together as specified in the pattern. There are no matches.
word*phrase	Wildcard	20	20	A match occurs as long as “word” appears before “phrase” regardless of what is in between them. The pattern appears twice, but it is counted once.
mail*age	Wildcard	20	20	This pattern is a match because “email message” appears in the email.

The email would be treated as spam if the banned word threshold is set to 60 or less.

To apply a banned word filter to an email filter profile:

1. Configure the banned words list:

```
config emailfilter bword
    edit 1
        set name "banned"
        config entries
            edit 23
                set pattern-type {wildcard | regexp}
                set pattern <string>
                set score <1 - 99999>
            next
        end
    next
end
```

2. Configure the email filter profile:

```
config emailfilter profile
    edit "myBannedWordsProfile"
        set spam-filtering enable
        set options bannedword
        set spam-bword-threshold <0 - 2147483647>
        set spam-bword-table 23
    next
end
```

Once a banned word list is configured in the CLI and applied to an email filter profile, some settings can be edited in the GUI for that particular email filter profile. A banned word profile can be selected, and its *Threshold* (`spam-bword-threshold`) can be edited.

Trusted IP addresses

When the FortiGate creates a list of trusted IP addresses, any incoming email traffic from these IP address is exempt from having IP-based checks, such as DNSBL, RBL, FortiGuard Antispam service, or locally-defined IP block lists.

If the FortiGate sits behind a company's mail transfer units, it may be unnecessary to check email IP addresses because they are internal and trusted. In this case, only external IP addresses would be checked. In some cases, external IP addresses may be added to the list if they are known to not be spam sources.

To configure a trusted IP address list:

1. Define the IP address list:

```
config emailfilter iptrust
    edit 1
        set name "trustedIP"
        config entries
            edit 33
                set addr-type {ipv4 | ipv6}
                set ipv4-subnet <IPv4_classnet>
                set ipv6-subnet <IPv6_network>
            next
        end
    next
end
```

2. Add the list to the email filter profile:

```
config emailfilter profile
    edit "email_filter_profile"
        set spam-iptrust-table 1
    next
end
```

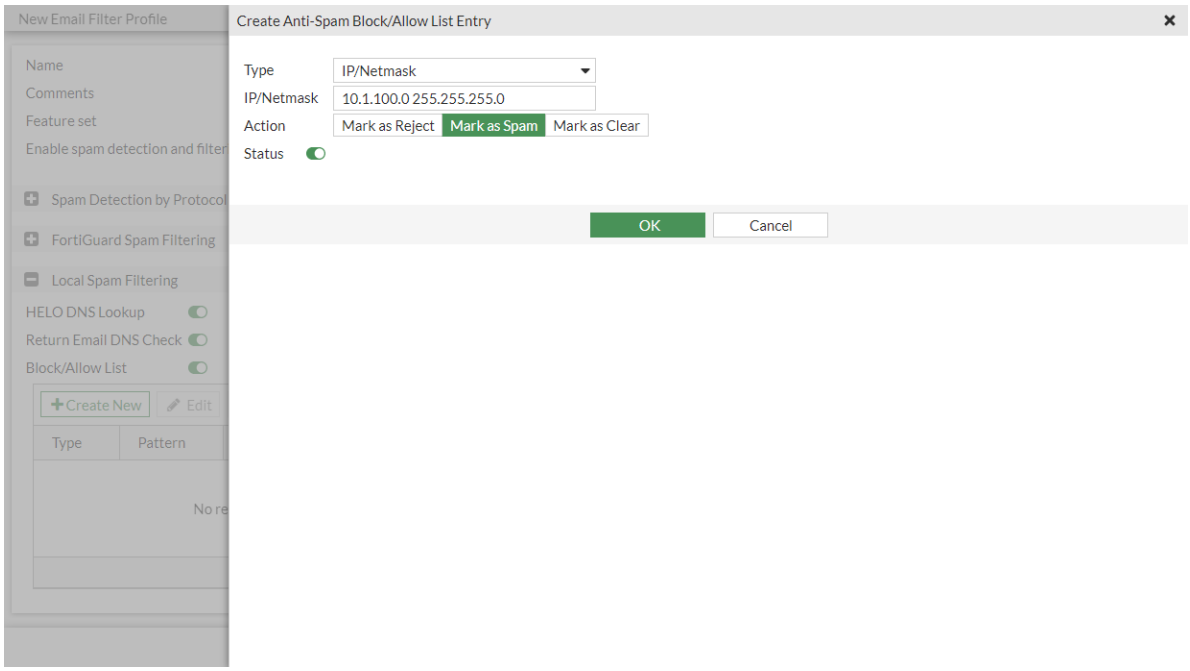
MIME header

This feature filters by the MIME header.

To configure a MIME header check:

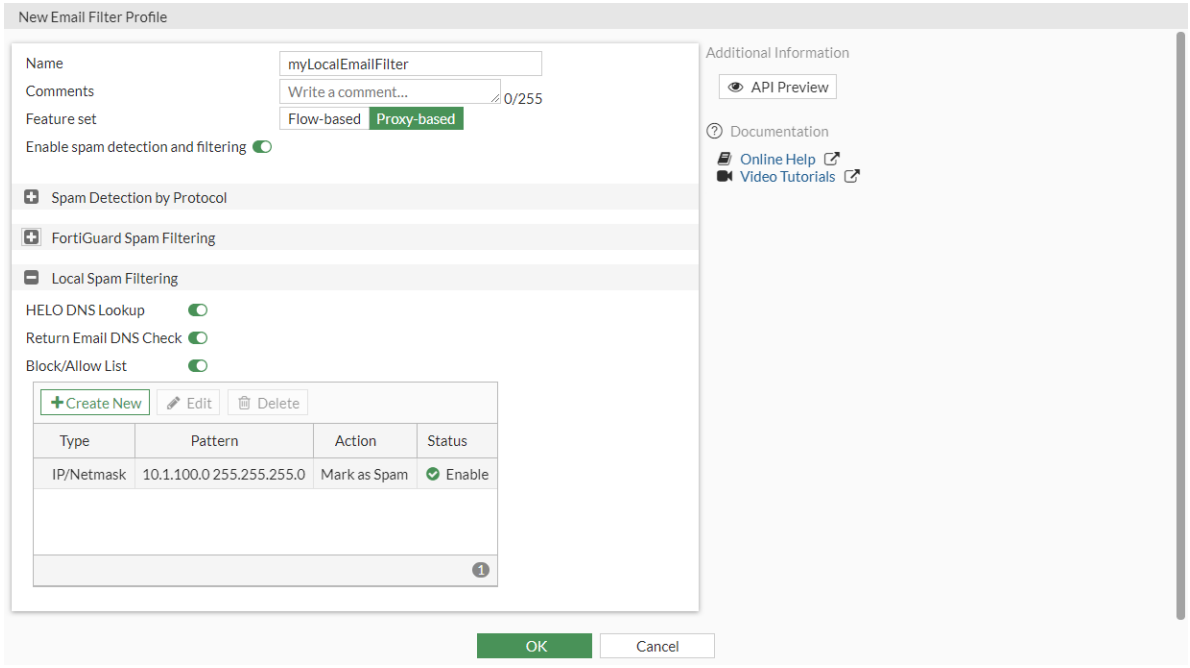
1. Define the header content:

```
config emailfilter mheader
    edit 100
        set name "mheader"
        config entries
            edit 1
                set fieldname <string>
                set fieldbody <string>
                set pattern-type {wildcard | regexp}
                set action {spam | clear}
            next
        end
    next
end
```



2. Add the header to the email filter profile:

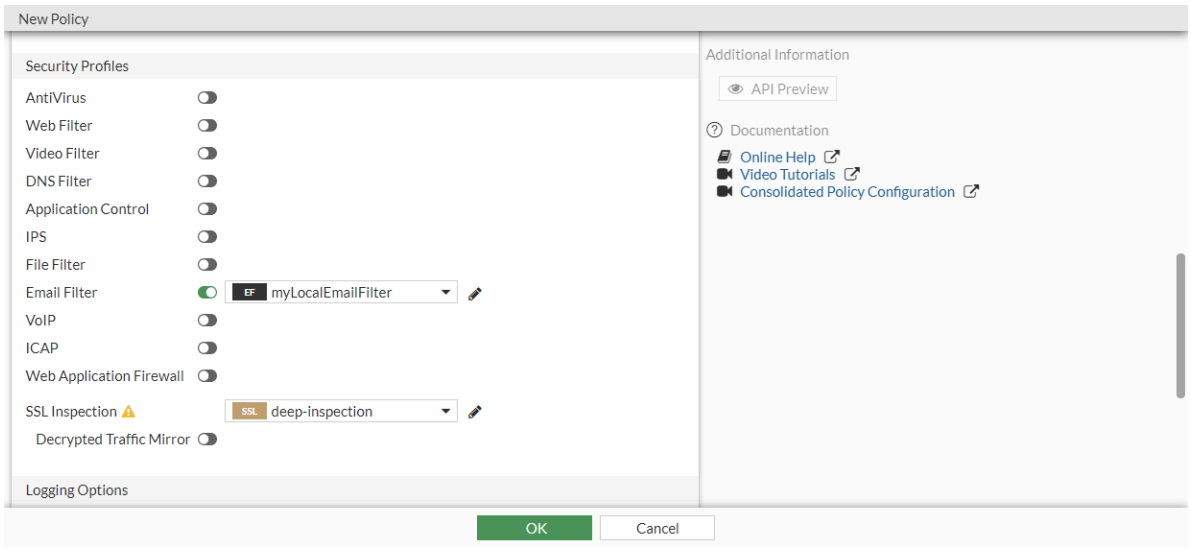
```
config emailfilter profile
    edit "email_filter_profile"
        set options spamhdrcheck
        set spam-mheader-table 100
    next
end
```



Configuring a local-based email filter

To configure a local-based email filter in the GUI:

1. Configure the email filter profile:
   a. Go to *Security Profiles* > *Email Filter* and click *Create New*, or edit an existing profile.
   b. Select a *Feature set* (*Proxy-based* is used in this example) and enable *Enable spam detection and filtering*.
   c. In the *Local Spam Filtering* section, enable the desired filters (*HELO DNS Lookup*, *Return Email DNS Check*, *Block/Allow List*).
   d. In the *Block/Allow List* table, click *Create New*. The *Create Anti-Spam Block/Allow List Entry* pane opens.
   e. Set the *Type* to *IP/Netmask* and enter an *IP/Netmask*.
   f. Select an *Action*.



g. Click *OK* to save the block/allow list.

h. Click *OK* save the email filter profile.

2. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*, or edit an existing policy.
   b. Set the inspection-mode to *Proxy-based*.
   c. Enable the *Email Filter* option and select the previously created profile.

   d. Set *SSL Inspection* to a profile that has deep SSL inspection enabled.
   Deep inspection is required to filter SMTP, POP3, IMAP, or any SSL/TLS encapsulated protocol.
   e. Configure the other settings as needed.
   f. Click *OK*.

To configure a local-based email filter in the CLI:

1. Configure a block/allow list:

```
config emailfilter block-allow-list
    edit 1
        set name "myBAL"
        config entries
            edit 1
                set status enable
                set type ip
                set action spam
                set addr-type ipv4
                set ip4-subnet 10.1.100.0 255.255.255.0
            next
        end
    next
end
```

2. Configure an email filter profile:

```
config emailfilter profile
    edit "myLocalEmailFilter"
        set spam-filtering enable
        set options spambal spamhelodns spamraddrdns
        config smtp
            set action tag
        end
        set spam-bal-table 1
    next
end
```

3. Use the profile in a firewall policy:

```
config firewall policy
    edit 1
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set emailfilter-profile "myLocalEmailFilter"
    next
end
```

FortiGuard-based filters

The FortiGate consults FortiGuard servers to help identify spammer IP address or emails, known phishing URLs, known spam URLs, known spam email checksums, and others. For more information, refer to the FortiGuard website.

There are five FortiGuard spam filtering options:

- IP address check
- URL check
- Detect phishing URLs in email (requires URL check to be enabled)
- Email checksum check
- Spam submission

FortiGuard-based filters are not supported while in flow-based inspection mode. See Inspection mode feature comparison on page 1558.

IP address check

The FortiGate queries the FortiGuard Antispam service to determine if the IP address of the client delivering the email is in the block list. If there is a match, the FortiGate treats delivered emails as spam.

URL check

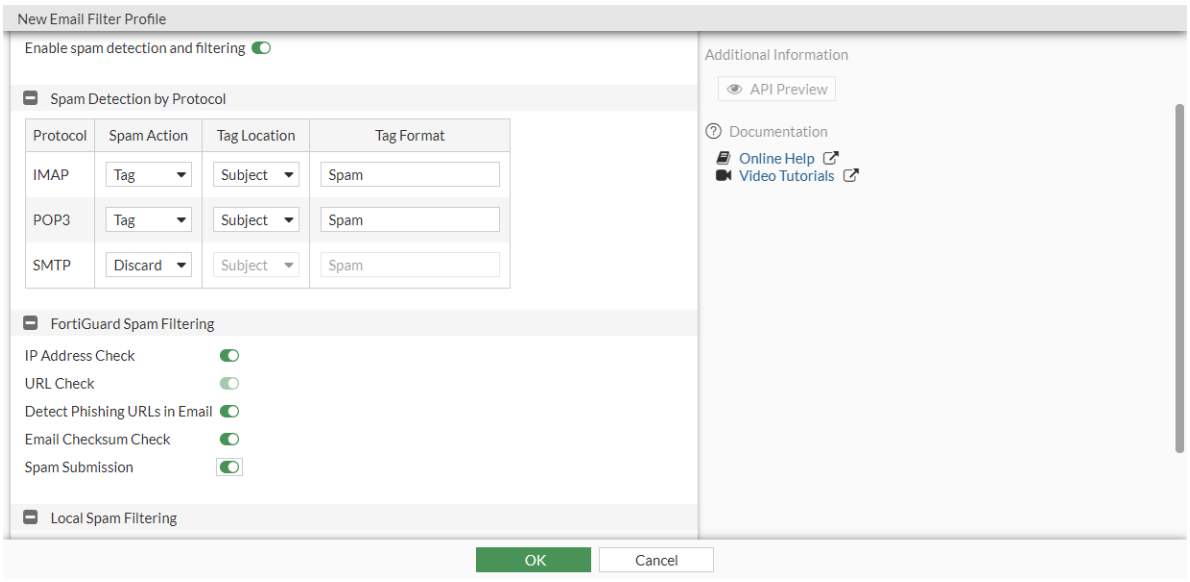
The FortiGate submits all URLs that appear in the email body to the FortiGuard service for checking. If a URL exists in the FortiGuard URL block list, the FortiGate treats the email as spam.

Detect phishing URLs in email

The FortiGate submits all URL hyperlinks that appear in the email body to the FortiGuard service for checking. If a URL exists in the FortiGuard URL phishing list, the FortiGate removes the hyperlink from the message. The URL remains in place, but it is no longer a clickable hyperlink.

Email checksum check

The FortiGate submits a checksum of each email to the FortiGuard service for checking. If a checksum exists in the FortiGuard checksum block list, the FortiGate treats the email as spam.



Spam submission

Spam submission is a way to inform the FortiGuard Antispam service of non-spam messages incorrectly marked as spam. When enabled, the FortiGate adds a link to the end of every email marked as spam. Click the link to notify the FortiGuard Antispam service if an email is marked incorrectly.

Configuring FortiGuard filters

To configure FortiGuard filters in the GUI:

1. Go to *Security Profiles* > *Email Filter* and click *Create New*.
2. Enable *Enable spam detection and filtering*.
3. In the *FortiGuard Spam Filtering* section, enable the following as needed:
   - *IP Address Check*
   - *URL Check*
   - *Detect Phishing URLs in Email*
   - *Email Checksum Check*
   - *Spam Submission*

4. Click *OK*.

To configure FortiGuard filters in the CLI:

```
config emailfilter profile
    edit <name>
        set spam-filtering enable
        set options spamfsip spamfsurl spamfsphish spamfschksum spamfssubmit
    next
end
```

Option	Description
`spamfsip`	Check email IP addresses
`spamfsurl`	Check email content URLs
`spamfsphish`	Check email content phishing URLs
`spamfschksum`	Check email checksums
`spamfssubmit`	Add FortiGuard Antispam spam submission text

Third-party-based filters

In addition to local and FortiGuard filters, FortiOS can leverage third-party sources, which are known as DNS-based blackhole lists (DNSBL) or Open Relay Behavior-modification Systems (ORBS). These are maintained lists of IP addresses that have been identified as associated with spamming.

The following example demonstrates how to configure a DNSBL. The `config emailfilter dnsbl` command is used to configure either DNSBL or ORBS.

To configure a DNSBL:

1. Define the server to get the DNSBL list from:

```
config emailfilter dnsbl
    edit 100
        set name "dnsbl"
        config entries
            edit 1
                set status enable
                set server <IP address or server name>
                set action {reject | spam}
            next
        end
    next
end
```

2. Add the DNSBL list to an email filter profile:

```
config emailfilter profile
    edit "email_filter_profile"
        set options spamrbl
        set spam-rbl-table 100
    next
end
```

Filtering order

The FortiGate checks for spam using various filtering techniques. The filtering order used by the FortiGate depends on which mail protocol is used.

Filters requiring a query to a server and a reply (FortiGuard Antispam service and DNSBL/ORDBL) are run simultaneously. To avoid delays, queries are sent while other filters are running. The first reply to trigger a spam action takes effect as soon as the reply is received.

Each spam filter passes the email to the next if no matches or problems are found. If the action in the filter is *Mark as Spam*, the FortiGate tags the email as spam according to the settings in the email filter profile. If the action in the filter is *Mark as Reject*, the email session is dropped. If the action in the filter is *Mark as Clear*, the email is exempt from any remaining filters. For SMTP and SMTPS, if the action is *Discard*, the email is discarded or dropped.

SMTP and SMTPS spam filtering order

The FortiGate scans SMTP and SMTPS email for spam in a specific order, which depends on whether or not the local override feature is enabled. This feature is disabled by default, but enabling it gives priority to local spam filters.

You can enable local override (`set local-override`) in an email filter profile to override SMTP or SMTPS remote checks, which includes checks for IP RBL, IP FortiGuard AntiSpam, and HELO DNS with the locally defined antispam block and/or allow lists.

SMTPS spam filtering is available on FortiGates that support SSL content scanning and inspection.

To configure local override of an antispam filter:

```
config emailfilter profile
    edit <name>
        set spam-filtering enable
        set options spambal spamfsip spamfsurl spamhelodns spamfsphish
        config smtp
            set local-override {enable | disable}
        end
        set spam-bal-table 1
    next
end
```

Local override disabled	Local override enabled
1. HELO DNS lookup, last hop IP check against ORDBL 2. Return email DNS check, FortiGuard email checksum check, FortiGuard URL check, FortiGuard IP address check, phishing URLs detection 3. Last hop IP checks local block/allow list 4. Envelope address checks local block/allow list 5. Headers IPs local block/allow list 6. Headers email address local block/allow list, MIME header checks based on local list of patterns (`mheader`) 7. Banned words (subject first, then body) based on local block/allow list (`bword`)	1. Last hop IP checks local block/allow list 2. Envelope address checks local block/allow list 3. Headers IPs local block/allow list, MIME header checks based on local list of patterns (`mheader`) 4. Headers email address local block/allow list 5. Banned words (subject first, then body) based on local list of patterns (`bword`) 6. HELO DNS lookup, last hop IP check against ORDBL 7. Return email DNS check, FortiGuard email checksum check, FortiGuard URL check, FortiGuard IP address check, phishing URLs detection

IMAP, IMAPS, POP3, and POP3S spam filtering order

The FortiGate scans IMAP, IMAPS, POP3, and POP3S email for spam in the following order:

1. MIME headers check, email address block/allow list check
2. Banned word check on email subject
3. IP block/allow list check
4. Banned word check on email body
5. Return email DNS check, FortiGuard email checksum check, FortiGuard URL check, DNSBL and ORDBL checks

IMAPS and POP3S spam filtering are available on FortiGates that support SSL content scanning and inspection.

Protocols and actions

In an email filter profile, there are options to configure settings for SMTP, POP3, IMAP, and MAPI protocols. For each protocol, you can set an action to either discard (block), tag, or pass the log for that protocol. The action options vary per protocol. For the tag action, the spam email can be tagged with configured text in the subject or header.

MAPI is only configurable in the CLI and with the proxy feature set.

To configure protocols in an email filer:

```
config emailfilter profile
    edit <name>
        set feature-set {flow | proxy}
        set spam-filtering enable
        set options {bannedword spambal spamfsip spamfssubmit spamfschksum spamfsurl
spamhelodns spamraddrdns spamrbl spamhdrcheck spamfsphish}
        config smtp
            set log-all {enable | disable}
            set action {pass | tag | discard}
            set tag-type {subject | header | spaminfo}
            set tag-msg <string>
            set hdrip {enable | disable}
            set local-override {enable | disable}
        end
        config imap
            set log-all {enable | disable}
            set action {pass | tag}
            set tag-type {subject | header | spaminfo}
            set tag-msg <string>
        end
        config pop3
            set log-all {enable | disable}
            set action {pass | tag}
            set tag-type {subject | header | spaminfo}
            set tag-msg <string>
        end
        config mapi
            set log-all {enable | disable}
            set action {pass | discard}
        end
    next
end
```

`options ...`	The following options are available: • bannedword: content block. • spambal: block/allow list. • spamfsip: email IP address FortiGuard antispam block list check. • spamfssubmit: add FortiGuard antispam spam submission text. • spamfschksum: email checksum FortiGuard antispam check. • spamfsurl: email content URL FortiGuard antispam check. • spamhelodns: email HELO/EHLO domain DNS check. • spamraddrdns: email return address DNS check. • spamrbl: email DNSBL and ORBL check. • spamhdrcheck: email MIME header check. • spamfsphish: email content phishing URL FortiGuard antispam check.

`tag-type {subject | header | spaminfo}`	Set the tag type: • subject: prepend text to the spam email subject. • header: append a user-defined MIME header to the spam email. • spaminfo: append spam information to the spam email header.
`tag-msg <string>`	Subject text or header added to the spam email.
`hdrip {enable | disable}`	Enable/disable SMTP email header IP checks for spamfsip, spamrbl, and spambal filters.
`local-override {enable | disable}`	Enable/disable local filter to override SMTP remote check result.

For more information, see config emailfilter profile in the FortiOS CLI Reference.

Configuring webmail filtering

You can configure an email filter to detect and log emails sent by Gmail and Hotmail. These interfaces do not use standard email protocols (SMTP, POP3, or IMAP) and use HTTPS instead. However, you can still configure the email filter to detect emails that pass through the FortiGate.

The FortiGate only detects and logs the emails, it does not discard or tag them.

To configure webmail filtering:

```
config emailfilter profile
    edit <name>
        set spam-filtering enable
        config msn-hotmail
            set log-all enable
        end
        config gmail
            set log-all enable
        end
    next
end
```

VoIP solutions

You can configure VoIP profiles to allow SIP and SCCP traffic and to protect your network from SIP- and SCCP-based attacks.

FortiOS includes two preloaded VoIP profiles:

- *default*
- *strict*

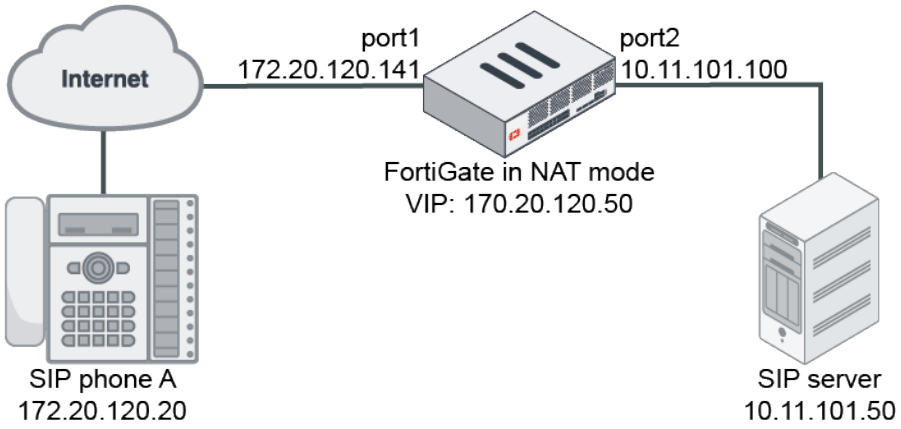
You can customize these profiles, or you can create your own and add them to firewall policies that allow VoIP.

VoIP profiles cannot be used NGFW policy-based mode. See NGFW policy on page 1313 for more information.

The following topics provide information about VoIP profiles:

- General use cases on page 1794
- NAT46 and NAT64 for SIP ALG on page 1798
- SIP message inspection and filtering on page 1806
- SIP ALG and SIP session helper on page 1811
- SIP pinholes on page 1816
- SIP over TLS on page 1818
- Voice VLAN auto-assignment on page 1820
- Scanning MSRP traffic on page 1821

General use cases



There are three scenarios in which the FortiOS session initiation protocol (SIP) solution is usually deployed:

1. The SIP server is in a private network that is protected from the internet by a FortiGate.
2. The SIP clients are in a private network that is protected from the internet by a FortiGate.
3. The SIP server is in a private network, such as a corporation's internal network or an ISP's network, that is protected from the internet by a FortiGate. The SIP clients are in a remote private network, such as a SOHO network, and behind a NAT device that is not aware of SIP applications.

The following VIP, NAT, and HNT examples show configurations for these common scenarios.

VIP

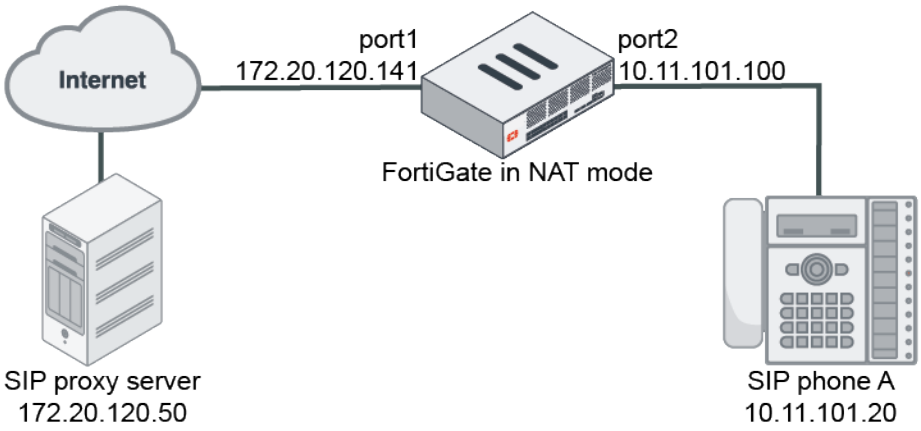
A FortiGate with SIP Application Layer Gateway (ALG) or SIP session helper protects the SIP server from the internet, while SIP phones from the internet need to register to the SIP server and establish calls through it.

A VIP needs to be configured for the SIP server, and the VIP must be applied in a firewall policy for the phones to send REGISTER messages through the FortiGate from port1 to port2.

Only one firewall policy needs to be configured for all SIP phones on both the internet and private network to register to the SIP server through port1 and set up SIP calls. This example assumes either SIP ALG or SIP session helper is enabled.

To configure the VIP for the SIP server:

```
config firewall vip
    edit "VIP_for_SIP_Server"
        set extip 172.20.120.50
        set extintf "port1"
        set mappedip "10.11.101.50"
    next
end
```



To configure the firewall policy:

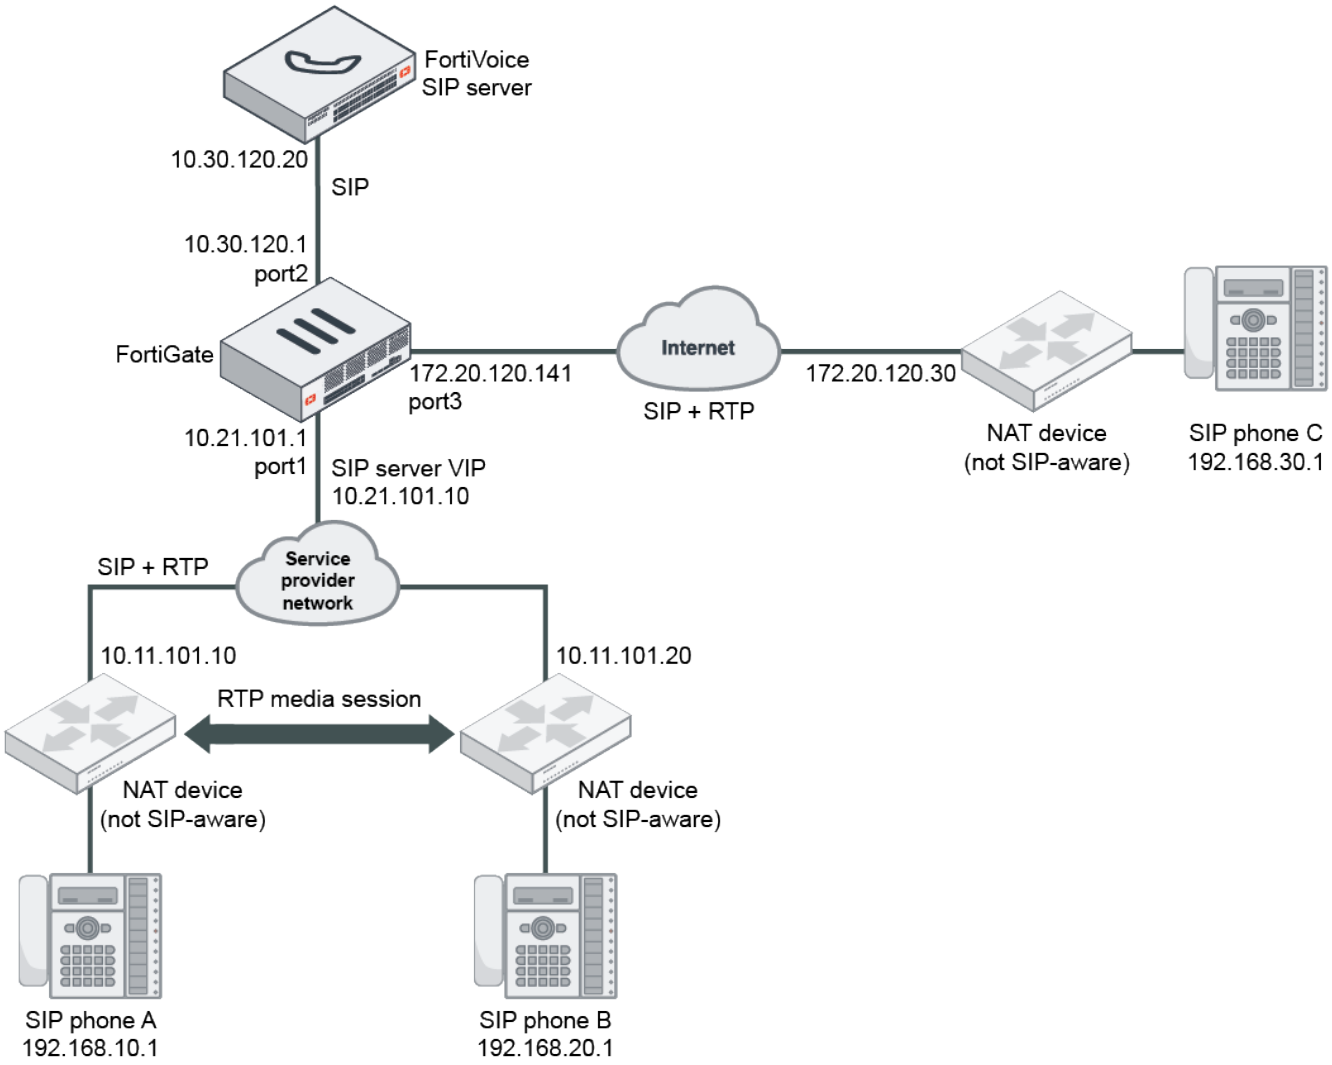
```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "VIP_for_SIP_Server"
        set action accept
        set schedule "always"
        set service "SIP"
    next
end
```

Setting `service` to `SIP` and not `all` in the firewall policy can improve protection by restricting the data traffic passing through the FortiGate to the SIP call traffic only.

NAT

A FortiGate with SIP ALG or SIP session helper protects the SIP phones and the internal network from the internet, while SIP phones in the internal network need to register to the SIP server installed on the internet and establish calls through it.

One firewall policy needs to be configured with NAT enabled for SIP phones to send REGISTER messages through the FortiGate from port2 to port1. This example assumes either SIP ALG or SIP session helper is enabled.



To configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "SIP"
        set nat enable
    next
end
```

HNT

A FortiGate with SIP ALG protects the SIP server from the internet, while SIP phones are in remote private networks behind NAT devices that are not aware of the SIP application. This is only supported in proxy mode.

In this example, the SIP server is located in an ISP's service cloud that is protected by the FortiGate SIP ALG, and the SIP phones are installed in the home networks of the ISP's customers.

The SIP messages traversing the remote NAT devices might have their IP addresses translated by the NAT device at the network layer, but untranslated at the SIP application layer because those NAT devices are not aware of the SIP applications. This causes problems in a SIP session initiated process. Special configurations for the hosted NAT traversal (HNT) are required to resolve this issue.

To configure the FortiGate with HNT support for SIP phones A and B to set up calls with each other:

1. Identify port1 as the external interface:

```
config system interface
    edit "port1"
        set external enable
    next
end
```

2. Configure the VIP for the SIP server:

```
config firewall vip
    edit "VIP_for_SIP_Server"
        set extip 10.21.101.10
```

```
        set extintf "port1"
        set mappedip "10.30.120.20"
    next
end
```

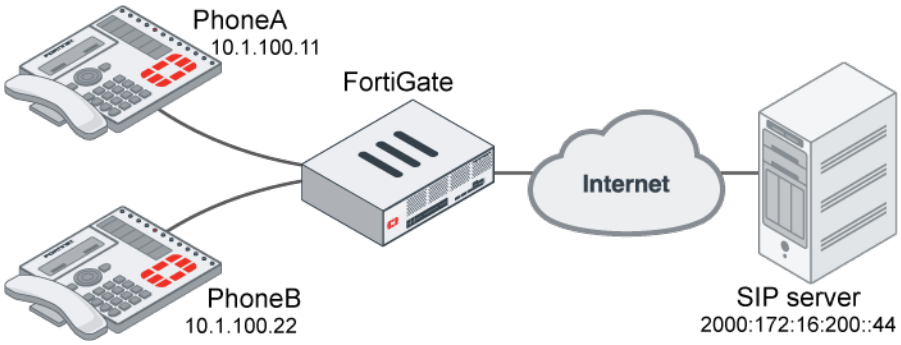
3. Configure a VoIP profile with HNT enabled:

```
config voip profile
    edit "hnt"
        config sip
            set hosted-nat-traversal enable
            set hnt-restrict-source-ip enable
        end
    next
end
```

`hosted-nat-traversal` must be enabled. `hnt-restrict-source-ip` does not have to be enabled, but can be enabled to restrict the RTP packets' source IP to be the same as the SIP packets' source IP.

4. Apply the VoIP profile and VIP in a firewall policy for phone A and B to register and set up SIP calls through the FortiGate and SIP server:

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "VIP_for_SIP_Server"
        set action accept
        set schedule "always"
        set service "SIP"
        set utm-status enable
        set voip-profile "hnt"
        set nat enable
    next
end
```



`nat` must be enabled in the firewall policy.

NAT46 and NAT64 for SIP ALG

NAT46 and NAT64 are supported for SIP ALG. A mix of IPv4 and IPv6 networks can use SIP ALG, allowing for proper call handling.

NAT46 example

In this example, SIP phones on the internal network use IPv4, and the SIP server on an external network uses IPv6. NAT46 is used with SIP ALG to allow for seamless communication. A VoIP profile, `sip`, has already been created.

To configure the FortiGate:

1. Configure a firewall VIP with NAT46 enabled:

```
config firewall vip
    edit "vip46_server_asterisk"
        set extip 10.1.100.100
        set nat44 disable
        set nat46 enable
        set extintf "port1"
        set ipv6-mappedip 2000:172:16:200::44
    next
end
```

2. Configure an IPv6 pool:

```
config firewall ippool6
    edit "client_server_nat46"
        set startip 2000:172:16:200::200
        set endip 2000:172:16:200::207
        set nat46 enable
    next
end
```

3. Configure a firewall policy:

```
config firewall policy
    edit 1
        set name "policy46-1"
        set srcintf "port1"
        set dstintf "port9"
        set action accept
        set nat46 enable
        set srcaddr "all"
        set dstaddr "vip46_server_asterisk"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set voip-profile "sip"
        set logtraffic all
        set auto-asic-offload disable
        set ippool enable
```

```
        set poolname6 "client_server_nat46"
    next
end
```

To check the SIP calls and session lists when the phones are registering to the SIP server:

1. View the SIP proxy SIP calls:

```
# diagnose sys sip-proxy calls
sip calls
  vdom 3 (vdom1) vrf 0 call 7f64bf044b00
    call-id: 1513782757
    txn 7f64bf048f00 (REGISTER)
      cseq 2 dir 0 state 5 status 200 expiry 868 HA 0
      i_session: 7f64bf045e00  r_session: 7f64bf045e00
      register: present
      from: sip:2002@10.1.100.100
      to: sip:2002@10.1.100.100
      src: 10.1.100.22:5060
      dst: [2000:172:16:200::44]:5060

  vdom 3 (vdom1) vrf 0 call 7f64bf076700
    call-id: 1490871789
    txn 7f64bf047a00 (REGISTER)
      cseq 2 dir 0 state 5 status 200 expiry 861 HA 0
      i_session: 7f64bf045000  r_session: 7f64bf045000
      register: present
      from: sip:2001@10.1.100.100
      to: sip:2001@10.1.100.100

```

NAT64 example

In this example, SIP phones on the internal network use IPv6, and the SIP server on an external network uses IPv4. NAT64 is used with SIP ALG to allow for seamless communication. A VoIP profile, `sip`, has already been created.

To configure the FortiGate:

1. Configure a firewall VIP with NAT64 enabled:

```
config firewall vip
    edit "vip64-1-asterisk"
        set extip 2000:10:1:100::100
        set nat66 disable
        set nat64 enable
        set ipv4-mappedip 172.16.200.44
    next
end
```

2. Configure an IP pool:

```
config firewall ippool
    edit "client_server_nat46"
        set startip 172.16.200.2
        set endip 172.16.200.3
        set nat64 enable
    next
end
```

3. Configure a firewall policy:

```
config firewall policy
    edit 1
        set name "policy64-1"
        set srcintf "port1"
        set dstintf "port9"
        set action accept
        set nat64 enable
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "vip64-1-asterisk"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
```

```
            set voip-profile "sip"
            set logtraffic all
            set auto-asic-offload disable
            set ippool enable
            set poolname "client_server_nat64"
        next
    end
```

SIP message inspection and filtering

There are two types of VoIP profiles that can be configured:

```
config voip profile
    edit <name>
        set feature-set {ips | voipd}
    next
end
```

`feature-set {ips | voipd}`	Set the inspection feature set. • `ips`: use the IPS Engine feature set for the `ips-voip-filter` firewall policy option. • `voipd`: use the SIP ALG feature set for `voip-profile` firewall policy option.

SIP ALG provides users with security features to inspect and control SIP messages that are transported through the FortiGate, including:

- Verifying the SIP message syntax.
- Blocking particular types of SIP requests.
- Restricting the rate of particular SIP requests.

Proxy-based SIP ALG (`feature-set voipd`) is also able to handle features such as pin hole creation and NAT that flow-based SIP inspection cannot. Flow-based SIP (`feature-set ips`) can handle features such as MSRP decoding and scanning that proxy-based SIP ALG cannot.

The two VoIP profile types can be configured separately or at the same time on a firewall policy:

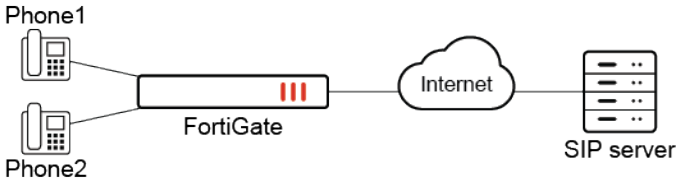
```
config firewall policy
    edit 1
        set voip-profile "voip_sip_alg"
        set ips-voip-filter "voip_sip_ips"
    next
end
```

Where:

- `voip-profile` can select a `voip-profile` with `feature-set voipd`.
- `ips-voip-filter` can select a `voip-profile` with `feature-set ips`.

The IPS-based VoIP profile (`ips-voip-filter`) allows flow-based SIP to complement SIP ALG while working together.

When both SIP ALG and SIP IPS are used and configured with same block rules, SIP IPS will take priority and do the blocking.



Unlike previous versions (7.0 and 7.2.0-7.2.4) where the firewall policy's inspection mode determines whether the SIP traffic is scanned by SIP ALG or flow-based SIP, the inspection mode does not matter in this version. A `voipd`-based VoIP profile will activate SIP ALG inspection, while an `ips`-based VoIP profile will activate IPS-based SIP inspection.

A `voip-profile` can be selected regardless of the `inspection-mode` used in the firewall policy.

For more information about the difference between SIP ALG and the SIP session helper, see SIP ALG and SIP session helper on page 1811.

Example

In this example, SIP ALG is required for pinhole creation, handling NAT, and controlling SIP messages that requires flow-based SIP. The administrator needs to configure two SIP profiles, one with each feature set (`voipd` and `ips`), and apply these SIP profiles in the same firewall policy.

To configure SIP ALG with SIP IPS:

1. Configure the VoIP profiles:

```
config voip profile
    edit "voip_sip_alg"
        set feature-set voipd
        set comment "sip_alg_simple"
        config sip
            set log-violations enable
            set log-call-summary enable
        end
    next
    edit "voip_sip_ips"
        set feature-set ips
        set comment "ips_voip_blocking"
        config sip
            set block-invite enable
            set log-violations enable
        end
    next
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port9"
        set action accept
```

```
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ips-sensor "g-default"
        set voip-profile "voip_sip_alg"
        set ips-voip-filter "voip_sip_ips"
        set logtraffic all
        set nat enable
    next
end
```

To verify the SIP proxy SIP calls:

1. Verify the register request:

```
# diagnose sys sip-proxy calls
sip calls
  vdom 1 (vdom1) vrf 0 call 7f2b99828300
    call-id: 619216389
    txn 7f2b998ad600 (REGISTER)
      cseq 2 dir 0 state 5 status 200 expiry 527 HA 0
      i_session: 7f2b998aac00  r_session: 7f2b998aac00
      register: present
      from: sip:2001@172.16.200.44
      to: sip:2001@172.16.200.44
      src: 10.1.100.11:5060
      dst: 172.16.200.44:5060
```

2. Verify the invite request:

```
# diagnose sys sip-proxy calls
sip calls
  vdom 1 (vdom1) vrf 0 call 7f2b99828300
    call-id: 619216389
    txn 7f2b998ad600 (REGISTER)
      cseq 2 dir 0 state 5 status 200 expiry 316 HA 0
      i_session: 7f2b998aac00  r_session: 7f2b998aac00
      register: present
      from: sip:2001@172.16.200.44
      to: sip:2001@172.16.200.44
      src: 10.1.100.11:5060
      dst: 172.16.200.44:5060
```

Sample logs

Register request:

```
date=2023-01-13 time=09:46:03 eventtime=1673631963477298677 tz="-0800" logid="0814044032"
type="utm" subtype="voip" eventtype="voip" level="information" vd="vdom1" session_id=17092
epoch=0 event_id=1 srcip=10.1.100.11 src_port=5060 dstip=172.16.200.44 dst_port=5060
proto=17 src_int="port1" dst_int="port9" policy_id=1 profile="voip_sip_alg" voip_proto="sip"
```

```
kind="register" action="permit" status="succeeded" duration=0 dir="session_origin" call_
id="619216389" from="sip:2001@172.16.200.44" to="sip:2001@172.16.200.44"
```

Invite request:

```
date=2023-01-13 time=09:54:43 eventtime=1673632484065549240 tz="-0800" logid="0814044033"
type="utm" subtype="voip" eventtype="voip" level="notice" vd="vdom1" session_id=17092
epoch=0 event_id=0 srcip=10.1.100.11 src_port=5060 dstip=172.16.200.44 dst_port=5060
proto=17 src_int="port1" dst_int="port9" policy_id=1 profile="voip_sip_ips" voip_proto="sip"
kind="call" action="block" status="N/A" reason="block-request" duration=0 dir="session_
reverse" message_type="request" request_name="INVITE" call_id="1967779864" count=0
from="<sip:2001@172.16.200.44>" to="<sip:2002@172.16.200.44>" attackid=50083
attack="SIP.Invite.Method"
```

SIP message syntax inspection

For syntax verification, the following attributes are available for configuration in the VoIP profile to determine what action is taken when a specific syntax error or attack based on invalid syntax is detected. For example, the action can be set to pass or discard it.

```
malformed-request-line
malformed-header-via
malformed-header-from
malformed-header-to
malformed-header-call-id
malformed-header-cseq
malformed-header-rack
malformed-header-rseq
malformed-header-contact
malformed-header-record-route
malformed-header-route
malformed-header-expires
malformed-header-content-type
malformed-header-content-length
malformed-header-max-forwards
malformed-header-allow
malformed-header-p-asserted-identity
malformed-header-sdp-v
malformed-header-sdp-o
malformed-header-sdp-s
malformed-header-sdp-i
malformed-header-sdp-c
malformed-header-sdp-b
malformed-header-sdp-z
malformed-header-sdp-k
malformed-header-sdp-a
malformed-header-sdp-t
malformed-header-sdp-r
malformed-header-sdp-m
malformed-header-no-require*
malformed-header-no-proxy-require*
```

* = only available in flow mode

SIP message blocking

The following options are available in the VoIP profile to block SIP messages:

```
block-long-lines
block-unknown
block-ack
block-bye
block-cancel
block-info
block-invite
block-message
block-notify
block-options
block-prack
block-publish
block-refer
block-register
block-subscribe
block-update
block-geo-red-options**
```

** = only available in proxy mode

SIP message rate limiting

The rate of certain types of SIP requests that are passing through the SIP ALG can be restricted:

```
register-rate
invite-rate
subscribe-rate
message-rate
notify-rate
refer-rate
update-rate
options-rate
ack-rate
prack-rate
info-rate
publish-rate
bye-rate
cancel-rate
```

Additionally, flow-based SIP supports the following rate tracking features:

```
register-rate-track none
invite-rate-track none
subscribe-rate-track none
message-rate-track none
notify-rate-track none
refer-rate-track none
update-rate-track none
options-rate-track none
ack-rate-track none
prack-rate-track none
info-rate-track none
```

```
    publish-rate-track none
    bye-rate-track none
    cancel-rate-track none
```

Call-Id and Content-Type regex

When the `ips` VoIP profile feature set is selected, options for Call-Id and Content-Type header values can be configured.

```
config voip profile
    edit <name>
        config sip
            set call-id-regex <string>
            set call-id-regex <string>
        end
    next
end
```

`call-id-regex <string>`	Enter a validation PCRE regular expression for the Call-Id header value.
`call-id-regex <string>`	Enter a validation PCRE regular expression for the Content-Type header value.

SIP ALG and SIP session helper

The SIP session helper is a high-performance solution that provides basic support for SIP calls passing through the FortiGate by opening SIP and RTP pinholes, and by performing NAT of the addresses in SIP messages.

SIP Application Layer Gateway (ALG) provides the same basic SIP support as the SIP session helper. In addition, SIP ALG provides a wide range of features that protect your network from SIP attacks, apply rate limiting to SIP sessions, check the syntax of SIP and SDP content of SIP messages, and provide detailed logging and reporting of SIP activity.

By default, all SIP traffic is processed by the SIP ALG. If the policy that accepts the SIP traffic includes a VoIP profile, the SIP traffic is processed by that profile. If the policy does not include a VoIP profile, the SIP traffic is processed by the SIP ALG using the default VoIP profile.

To change between SIP ALG mode and SIP session helper mode:

```
config system settings
    set default-voip-alg-mode {proxy-based | kernel-helper-based}
end
```

`default-voip-alg-mode {proxy-based | kernel-helper-based}`	Set how the FortiGate handles VoIP traffic when a policy that accepts the traffic does not include a VoIP profile. • `proxy-based`: use SIP ALG to process SIP traffic (default). • `kernel-helper-based`: use the SIP session helper to process SIP traffic.

The `default-voip-alg-mode` setting works together with the VoIP profile configured in a firewall policy to determine whether SIP ALG, SIP ALG with IPS SIP, or the SIP session helper are used to process the SIP traffic. The following firewall policy settings correspond to the VoIP profiles (see also SIP message inspection and filtering on page 1806).

```
config firewall policy
    edit <id>
```

```
        set voip-profile <voipd-based_profile>
        set ips-voip-filter <ips-based_profile>
    next
end
```

The following table explains the results of configuring different combinations of the preceding settings.

Firewall policy setting		Default VoIP ALG mode setting	
voip-profile	ips-voip-filter	kernel-helper-based	proxy-based
Yes	Yes	SIP ALG + IPS SIP	SIP ALG + IPS SIP
Yes	No	SIP ALG	SIP ALG
No	Yes	SIP ALG + IPS SIP	SIP ALG + IPS SIP
No	No	SIP session helper	SIP ALG

SIP ALG configurations

SIP ALG can be enabled in several ways. The following configuration examples demonstrate different settings.

Example 1

In this example, a `voipd`-based profile is configured and applied to a firewall policy. The `default-voip-alg-mode` remains as the default setting (`proxy-based`).

To configure SIP ALG:

1. Configure the default VoIP ALG mode:

```
config system settings
    set default-voip-alg-mode proxy-based
end
```

2. Configure the VoIP profile:

```
config voip profile
    edit "sip-alg-profile"
        set feature-set voipd
        config sip
            set status enable
        end
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 0
        set name "VoIP-Proxy"
        set utm-status enable
        set voip-profile "sip-alg-profile"
    next
end
```

Example 2

In this example, the `default-voip-alg-mode` is set to `kernel-helper-based`. A VoIP profile (VoIP-Proxy) has SIP enabled and is applied to a firewall policy.

To configure SIP ALG:

1. Configure the default VoIP ALG mode:

```
config system settings
    set default-voip-alg-mode kernel-helper-based
end
```

2. Configure the VoIP profile:

```
config voip profile
    edit "sip-alg-profile"
        set feature-set voipd
        config sip
            set status enable
        end
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 0
        set name "VoIP-Proxy"
        set utm-status enable
        set voip-profile "sip-alg-profile"
    next
end
```

Example 3

In this example, no VoIP profile is selected in the firewall policy. However, the `default-voip-alg-mode` is set to `proxy-based`. The default `voip-profile` is implicitly applied.

To configure SIP ALG to implicitly use the default VoIP profile:

1. Configure the default VoIP ALG mode:

```
config system settings
    set default-voip-alg-mode proxy-based
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 0
        set name "VoIP-Proxy"
        set utm-status enable
        set voip-profile ""
    next
end
```

SIP session helper configurations

In some instances, SIP providers may recommend that customers disable SIP ALG on their edge firewall. This is how you can disable SIP ALG and enable the SIP session helper.

Example 1

In this example, the `default-voip-alg-mode` is set to `kernel-helper-based`, and a VoIP profile is not applied in a firewall policy. Session helper 13 is enabled by default.

To configure the SIP session helper:

1. Configure the default VoIP ALG mode:

```
config system settings
    set default-voip-alg-mode kernel-helper-based
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 0
        set name "VoIP-session-helper"
        set utm-status enable
        set voip-profile ""
    next
end
```

3. Configure the session helper:

```
config system session-helper
    edit 13
        set name sip
        set protocol 17
        set port 5060
    next
end
```

Example 2

In this example, the `default-voip-alg-mode` is set to either `proxy-based` or `kernel-helper-based`. A VoIP profile that has SIP disabled is applied to the firewall policy.

To configure the SIP session helper:

1. Configure the default VoIP ALG mode:

```
config system settings
    set default-voip-alg-mode {proxy-based | kernel-helper-based}
end
```

2. Configure the VoIP profile:

```
config voip profile
    edit "sip-disabled-profile"
        set feature-set voipd
```

```
        config sip
            set status disable
        end
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 0
        set name "VoIP-session-helper"
        set utm-status enable
        set voip-profile "sip-disabled-profile"
    next
end
```

4. Configure the session helper:

```
config system session-helper
    edit 13
        set name sip
        set protocol 17
        set port 5060
    next
end
```

Example 3

In this example, the session helper is removed because the SIP provider suggests to disable SIP ALG and the session helper altogether.

To remove the SIP session helper:

1. Configure the default VoIP ALG mode:

```
config system settings
    set default-voip-alg-mode kernel-helper-based
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 0
        set name "VoIP-session-helper"
        set utm-status enable
        set voip-profile ""
    next
end
```

3. Remove the session helper:

```
config system session-helper
    delete 13
end
```

Modifying the SIP port

Most SIP configurations use TCP or UDP port 5060 for SIP sessions and port 5061 for SIP SSL sessions. If your SIP network uses different ports for SIP sessions, the SIP port can be changed. You can also listen to two TCP and UDP ports .

To change the SIP port:

```
config system settings
    set sip-tcp-port 5064
    set sip-udp-port 5065
    set sip-ssl-port 5066
end
```

To listen to two TCP and UDP ports:

```
config system settings
    set sip-tcp-port 5060 5064
    set sip-udp-port 5061 5065
end
```

To modify the SIP ports for the default SIP session helper:

```
config system session-helper
    edit 13
        set name sip
        set protocol 17
        set port 5065
    next
end
```

To add a new session helper to listen on UDP and TCP 5064:

```
config system session-helper
    edit 0
        set name sip
        set port 5064
    next
end
```

SIP pinholes

When SIP ALG processes a SIP call, it usually opens pinholes for SIP signaling and RTP/RTCP packets. NAT usually takes place during the process at both the network and SIP application layers. SIP ALG ensures that, with NAT happening, corresponding SIP and RTP/RTCP pinholes are created during the process when it is necessary for call sessions to be established through FortiOS devices.

By default, SIP ALG manages pinholes automatically, but some special configurations can be used to restrict the pinholes if required.

SIP pinhole restriction

The `strict-register` attribute is enabled by default. When enabled, after a SIP endpoint registers to the SIP server through a firewall policy on the FortiGate, only the SIP messages sent from the same IP address as the SIP server are allowed to pass through the SIP pinhole that is created in the FortiGate to reach the SIP endpoints. If the attribute is disabled, SIP messages from any IP addresses can pass through the pinhole created after the registration.

SIP pinhole restriction is only supported by SIP ALG and in proxy mode.

To configure registrar connection ability:

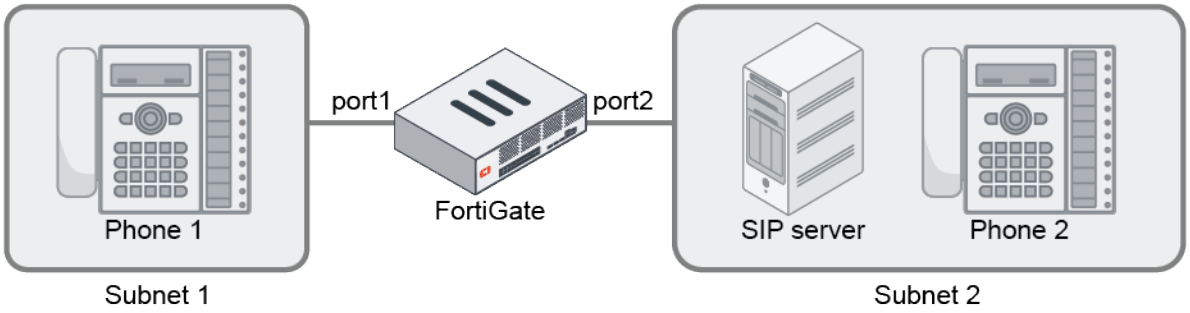
```
config voip profile
    edit <name>
        config sip
            set strict-register {enable | disable}
        end
    next
end
```

RTP/RTCP pinhole restriction

The `nat-port-range` setting is used to specify a port range in the VoIP profile to restrict the NAT port range for Real-time Transport Protocol/Real-time Transport Control Protocol (RTP/RTCP) packets in a Session Initiation Protocol (SIP) call session that is handled by the SIP application layer gateway (ALG) in a FortiGate.

When NAT is enabled, or VIP is used in a firewall policy for SIP ALG to handle a SIP call session established through a FortiGate, the SIP ALG can perform NAT to translate the ports used for the RTP/RTCP packets when they are flowing through the device between the external and internal networks.

To edit the translated port range for RTP/RTCP packets:



```
config voip profile
    edit <name>
        config sip
            set nat-port-range <start_port_number>-<end_port_number>
        end
    next
end
```

`nat-port-range <start_port_number>-<end_port_number>`	Enter the NAT port range (minimum port number = 5117, default = 5117-65535).

Example

In this example, Phone 1 is in Subnet 1, and the SIP server and Phone 2 are in Subnet 2. All SIP signaling messages and RTP/RTCP packets go through the SIP server. The RTP/RTCP ports on Phone 1 are configured as 17078/17079.

The FortiGate administrator wants to use NAT for the port 17078/17079 to 30000/30001. If Phone 1 and Phone 2 are registered to the SIP server, and they establish a call session between them through the FortiGate and the SIP server, then the RTP/RTCP ports 17078/17079 of Phone 1 will be translated to ports 30000/30001. All RTP/RTCP packets going out of port2 have source ports of 30000/30001, and all RTP/RTCP packets going into port2 also have destination ports of 30000/30001.

To configure the custom port range:

1. Edit the VoIP profile:

```
config voip profile
    edit "natPortRange"
        config sip
            set nat-port-range 30000-30001
        end
    next
end
```

It is best practice to configure the starting port as an even number and the ending port as an odd number.

2. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf port1
        set dstintf port2
        set srcaddr all
        set dstaddr all
        set service SIP
        set action accept
        set schedule always
        set voip-profile natPortRange
        set nat enable
    next
end
```

SIP over TLS

Some SIP phones and servers can communicate using TLS to encrypt the SIP signaling traffic. To allow SIP over TLS calls to pass through the FortiGate, the encrypted signaling traffic must be unencrypted and inspected. The FortiGate

SIP ALG intercepts, unencrypts, and inspects the SIP packets, which are then re-encrypted and forwarded to their destination.

The SIP ALG only supports full mode TLS. This means that the SIP traffic between SIP phones and the FortiGate, and between the FortiGate and the SIP server, is always encrypted. The highest TLS version supported by SIP ALG is TLS 1.3.

To enable SIP over TLS support, the SSL mode in the VoIP profile must be set to `full`. The SSL server and client certificates can be provisioned so that the FortiGate can use them to establish connections to SIP phones and servers, respectively.

This configuration is only supported in proxy mode.

To configure SIP over TLS:

1. Configure a VoIP profile with SSL enabled:

```
config voip profile
    edit "tls"
        config sip
            set ssl-mode full
            set ssl-client-certificate "ssl_client_cert"
            set ssl-server-certificate "ssl_server_cert"
        end
    next
end
```

   The `ssl_server_cert`, `ssl_client_cert`, and key files can be generated using a certification tool, such as OpenSSL, and imported to the local certificate store of the FortiGate from *System* > *Certificates* in the GUI. Existing local certificates in the certificate store can also be used. As always for TLS connections, the certificates used must be verified and trusted at the other end of the connection when required.

   For example, the CA certificate of the SIP server's certificate should be imported to the FortiGate as an external CA certification, so that the FortiGate can use it to verify the SIP server's certificate when setting up the TLS connection. The CA certificate configured as the `ssl_server_cert` should be installed as the trusted certificate on the SIP phones. The deployment of the certificates across the network depends on the SIP client and server devices that are used in the system.

2. Apply the profile to the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "vip_sip_server"
        set action accept
        set schedule "always"
        set service "SIP"
        set utm-status enable
        set voip-profile "tls"
    next
end
```

Voice VLAN auto-assignment

You can leverage LLDP-MED to assign voice traffic to the desired voice VLAN. After detection and setup, the IP phone on the network is segmented to its own VLAN for policy, prioritization, and reporting. The LLDP reception capabilities in FortiOS include LLDP-MED assignment for voice, voice signaling, guest, guest voice signaling, softphone, video conferencing, streaming video, and video signaling.

You can configureVLAN auto-assignment using the following steps:

1. Set up the VLAN for the voice device
2. Set up the DHCP server for the voice VLAN
3. Sett up the LLDP network policy
4. Enable LLDP on the physical interface that the VLAN belongs to
5. Apply the LLDP network policy on the physical interface
6. Confirm that the VLAN was assigned

To set up the VLAN for the voice device:

```
config system interface
    edit "vlan_100"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
        set alias "voice_vlan"
        set device-identification enable
        set role lan
        set snmp-index 25
        set interface "port10"
        set vlanid 100
    next
end
```

To set up the DHCP server for the voice VLAN:

```
config system dhcp server
    edit 1
        set dns-service default
        set default-gateway 192.168.1.99
        set netmask 255.255.255.0
        set interface "vlan_100"
        config ip-range
            edit 1
                set start-ip 192.168.1.110
                set end-ip 192.168.1.210
            next
        end
    next
end
```

To set up the LLDP network policy:

```
config system lldp network-policy
    edit "1"
        config voice
            set status enable
```

```
            set tag dot1q
            set vlan 100
        end
    next
end
```

To enable LLDP on the physical interface that the VLAN belongs to:

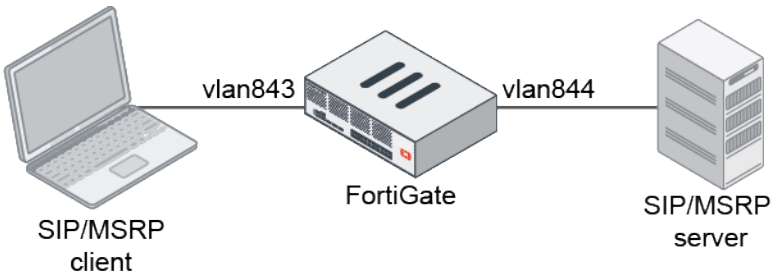
```
config system interface
    edit "port10"
        set vdom "root"
        set type physical
        set lldp-reception enable
        set lldp-transmission enable
        set snmp-index 14
    next
end
```

To apply the LLDP network policy on the physical interface:

```
config system interface
    edit "port10"
        set lldp-network-policy "1"
    next
end
```

To confirm that the VLAN was assigned as expected:

1. Connect an IP phone to the network.
2. Check the IP address on the phone.
   The IP address should belong to the voice VLAN.
3. Sniff on the FortiGate incoming interface to see if traffic from the IP phone has the desired VLAN tag.
   In this example, the voice traffic from the IP phone should be in VLAN 100.



Scanning MSRP traffic

An MSRP (Message Session Relay Protocol) decoder in the IPS engine scans for IPS signatures against the application data. Malicious payload in the text message can be blocked. A VoIP profile using flow inspection mode must be configured in the firewall policy. An IPS profile must be configured in the firewall policy to inspect the payload.

```
config voip profile
    edit <name>
        set feature-set flow
        config msrp
            set status {enable | disable}
            set log-violations {enable | disable}
            set max-msg-size <integer>
            set max-msg-size-action {pass | block | reset | monitor}
        end
    next
end
```

`status {enable | disable}`	Enable/disable MSRP.
`log-violations {enable | disable}`	Enable/disable logging of MSRP violations.
`max-msg-size <integer>`	Maximum allowable MSRP message size, in bytes (0 - 65535, default = 0).
`max-msg-size-action {pass | block | reset | monitor}`	Action for violating maximum MSRP message size: • pass: pass or allow matching traffic (default) • block: block or drop matching traffic • reset: reset sessions for matching traffic • monitor: pass and log matching traffic

Examples

In this first example, MSRP messages larger than 10 bytes will be blocked. The client sends an oversized MSRP message to the server. Message Automation & Protocol Simulation (MAPS™) is used, and a client-server model was configured to use the software to send MSRP traffic from vlan843 (client) to vlan844 (server) with plain text placed in the message field. The software uses the content of the MsrpInputMessage.txt file located in the default folder, where anything in that file will be sent by MSRP. The following text is used:

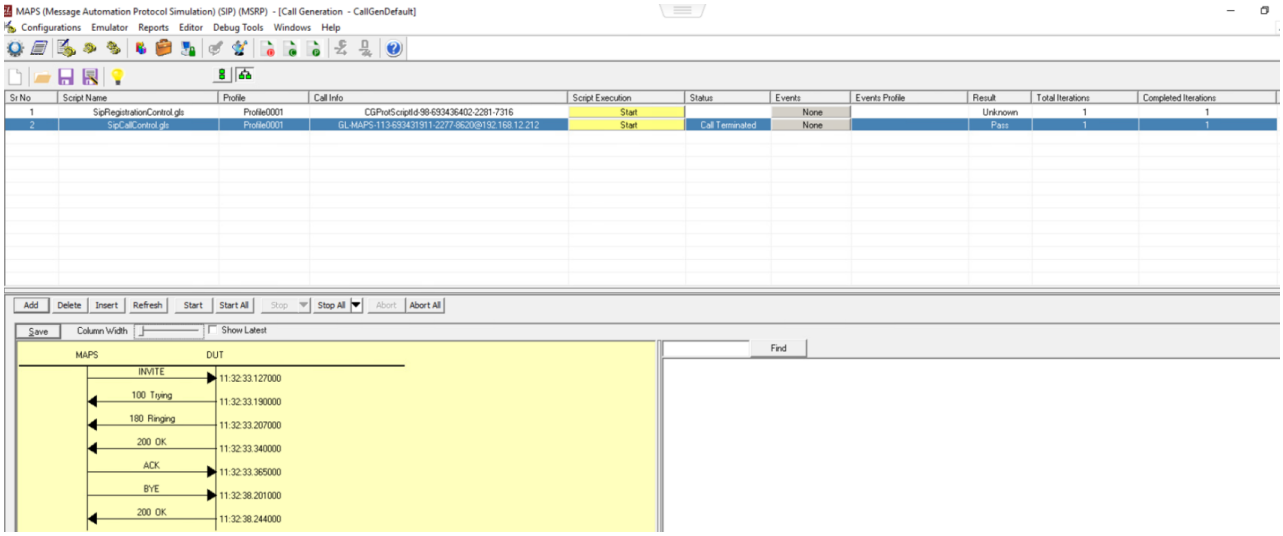
> GL's Message Automation & Protocol Simulation (MAPS™) is a protocol simulation and conformance test tool that supports a variety of protocols such as SIP, MEGACO, MGCP, SS7, ISDN, GSM, MAP, CAS, LTE, UMTS, SS7 SIGTRAN, ISDN SIGTRAN, SIP I, GSM AoIP, Diameter and others. This message automation tool covers solutions for both protocol simulation and protocol analysis. The application includes various test plans and test cases to support the testing of real-time entities. Along with automation capability, the application gives users the unlimited ability to edit messages and control scenarios (message sequences).

To configure MSRP traffic scanning:

1. Configure the VoIP profile:

```
config voip profile
    edit msrp_test
        set feature-set flow
        config msrp
            set status enable
            set log-violations enable
            set max-msg-size 10
            set max-msg-size-action block
        end
    next
end
```

2. Configure the firewall policy:



```
config firewall policy
    edit 1
        set name "vdom3"
        set srcintf "vlan843"
        set dstintf "vlan844"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
        set voip-profile "msrp_test"
        set logtraffic all
    next
end
```

3. Verify the log:

```
# execute log filter category 4
# execute log display
1 logs found.
1 logs returned.

1: date=2021-06-10 time=17:21:19 eventtime=1623370879840284165 tz="-0700"
logid="0419016384" type="utm" subtype="ips" eventtype="signature" level="alert"
vd="vdom3" severity="info" srcip=192.168.12.212 srccountry="Reserved"
dstip=192.168.12.213 srcintf="vlan843" srcintfrole="lan" dstintf="vlan844"
dstintfrole="lan" sessionid=27700 action="dropped" proto=6 service="MSRP" policyid=1
attack="MSRP.Max.Message.Size.Exceeded" srcport=20036 dstport=20036 direction="outgoing"
attackid=1000000 profile="g-default" ref="http://www.fortinet.com/ids/VID1000000"
incidentserialno=189792275 psrcport=0 pdstport=0 msg="msrp_decoder:
MSRP.Max.Message.Size.Exceeded, msg_size=270 exceeds config maximum=10"
```

4. In MAPS, verify that the call was terminated:

In this second example, malicious files will be blocked. The client sends an EICAR test sample to the server in an MSRP message. Message Automation & Protocol Simulation (MAPS™) is used, and a client-server model was configured to

use the software to send MSRP traffic from vlan843 (client) to vlan844 (server) with a plain text EICAR file containing a virus in the message field. The following text is used:

X5O!P%@AP[4\PZX54(P^)7CC)7}$EICAR-STANDARD-ANTIVIRUS-TEST-FILE!$H+H*

To configure MSRP traffic scanning:

1. Configure the VoIP profile:

```
config voip profile
    edit msrp_test
        set feature-set flow
        config msrp
            set status enable
            set log-violations enable
            set max-msg-size 0
            set max-msg-size-action pass
        end
    next
end
```

2. Configure the IPS profile:

```
config ips sensor
    edit "msrp"
        set extended-log enable
        config entries
            edit 1
                set rule 7470 29844
                set status enable
                set action block
            next
        end
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "vdom3"
        set srcintf "vlan843"
        set dstintf "vlan844"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
        set ips-sensor "msrp"
        set voip-profile "msrp_test"
        set logtraffic all
    next
end
```

4. Verify the log:

```
# execute log filter category 4
# execute log display
1 logs found.
1 logs returned.

1: date=2021-09-16 time=11:29:48 eventtime=1631816988947762597 tz="-0700"

ICAP

Internet Content Adaptation Protocol (ICAP) is an application layer protocol that is used to offload tasks from the firewall to separate, specialized servers. For more information see RFC 3507.

ICAP profiles can only be applied to policies that use proxy-based inspection. If you enable ICAP in a policy, HTTP and HTTPS (if HTTPS inspection is supported) traffic that is intercepted by the policy is transferred to the ICAP server specified by the selected ICAP profile. Responses from the ICAP server are returned to the FortiGate, and then forwarded to their destination.

By default, *ICAP* is not visible in the GUI. See Feature visibility on page 2974 for instructions on making it visible.

ICAP filter profiles cannot be used in NGFW policy-based mode. See NGFW policy on page 1313 for more information.

To configure ICAP:

1. Set up your ICAP server.
2. On the FortiGate, add an ICAP server.
3. Create an ICAP profile.
4. Use the ICAP profile in a firewall policy that covers the traffic that needs to be offloaded to the ICAP server.

The following topics provide information about ICAP:

- ICAP configuration example on page 1826
- ICAP response filtering on page 1828
- Secure ICAP clients on page 1830

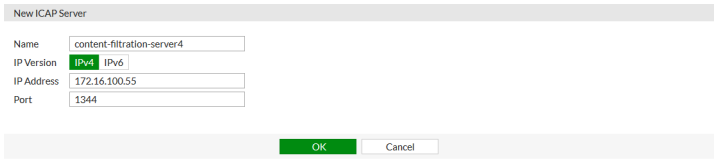
- ICAP scanning with SCP and FTP on page 1831
- Domain name in XFF with ICAP on page 1834

TCP connection pool for connections to ICAP server

A TCP connection pool can maintain local-out TCP connections to the external ICAP server due to a backend update in FortiOS. TCP connections will not be terminated once data has been exchanged with the ICAP server, but instead are reused in the next ICAP session to maximize efficiency.

For example, consider a scenario where an ICAP profile is used as a UTM profile in an explicit web proxy policy, and a client visits web servers through this proxy policy.

Once the WAD is initialized, when a HTTP request is sent from the client to the server through the FortiGate with an ICAP profile applied to the matched proxy policy, a TCP connection is established between the FortiGate and the ICAP server to exchange data.



When an ICAP session is finished, the TCP connection is kept in the WAD connection pool. When another ICAP session needs to be established, the WAD will check if there are any idle connections available in the connection pool. If an idle connection is available, then it will be reused; otherwise, a new TCP connection is established for the ICAP session. This process can be checked in the WAD debug log.

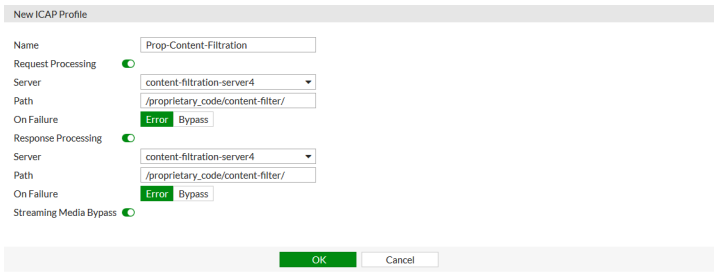
ICAP configuration example

In this example, the ICAP server performs proprietary content filtering on HTTP and HTTPS requests. If the content filter is unable to process a request, then the request is blocked. Streaming media is not considered by the filter, so it is allowed through and is not processed.

To configure the ICAP setup in the GUI:

1. Add the ICAP server:
   a. Go to *Security Profiles* > *ICAP Servers* and click *Create New*.
   b. In the *Name* field, enter a name for the ICAP server, such as *content-filtration-server4*.
   c. Select the *IP Version*.
   d. In the *IP Address* field, enter the IP address of the ICAP server.
   e. In the *Port* field, enter a new port number if required. The default value is *1344*.

   f. Click *OK*.



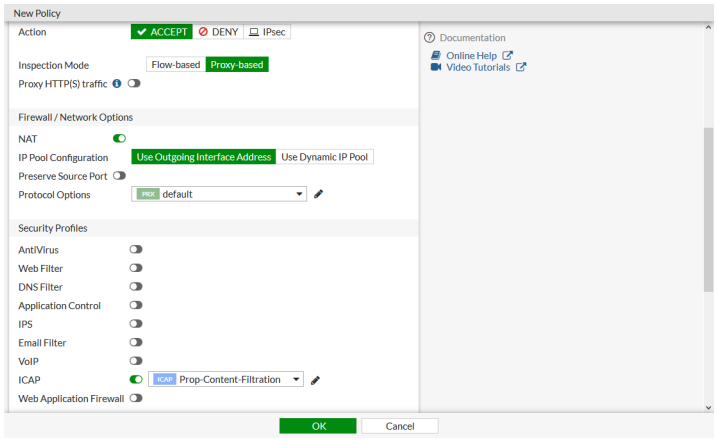
The maximum number of concurrent connections to ICAP server can be configured in the CLI (`set max-connections`). The default setting is 100 connections.

2. Create the ICAP profile:
   a. Go to *Security Profiles* > *ICAP* and click *Create New*.
   b. In the *Name* field, enter a name for the ICAP profile, such as *Prop-Content-Filtration*.

c. Enable *Request Processing* and set the following:
   - *Server*: select the ICAP server (*content-filtration-server4*).
   - *Path*: enter the path to the processing component on the server, such as */proprietary_code/content-filter/*.
   - *On Failure*: select *Error* to block the request. If the message cannot be processed, it will not be blocked.

d. Enable *Response Processing* and set the following:
   - *Server*: select the ICAP server (*content-filtration-server4*).
   - *Path*: enter the path to the processing component on the server, such as */proprietary_code/content-filter/*.
   - *On Failure*: select *Error* to block the request. If the message cannot be processed, it will not be blocked.

e. Enable *Streaming Media Bypass* to not offload streaming media to the ICAP server.



f. Click *OK*.

3. Add the ICAP profile to a policy:

a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.

b. Set *Inspection Mode* to *Proxy-based*.

c. Under *Security Profiles*, enable *ICAP* and select the ICAP server.

d. Configure the other settings as needed.

e. Click *OK*.

To configure the ICAP setup in the CLI:

1. Add the ICAP server:

```
config icap server
    edit "content-filtration-server4"
        set ip-version 4
        set ip-address 172.16.100.55
        set port 1344
        set max-connections 200
```

```
    next
end
```

2. Create the ICAP profile:

```
config icap profile
    edit "Prop-Content-Filtration"
        set request enable
        set response enable
        set streaming-content-bypass enable
        set request-server "content-filtration-server4"
        set response-server "content-filtration-server4"
        set request-failure error
        set response-failure error
        set request-path "/proprietary_code/content-filter/"
        set response-path "/proprietary_code/content-filter/"
        set methods delete get head options post put trace other
    next
end
```

3. Add the ICAP profile to a policy:

```
config firewall policy
    edit 5
        set name "icap_filter3"
        set srcintf "virtual-wan-link"
        set dstintf "virtual-wan-link"
        set srcaddr "FABRIC_DEVICE"
        set dstaddr "FABRIC_DEVICE"
        set dstaddr-negate enable
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "certificate-inspection"
        set icap-profile "Prop-Content-Filtration"
        set logtraffic disable
        set fsso disable
        set nat enable
    next
end
```

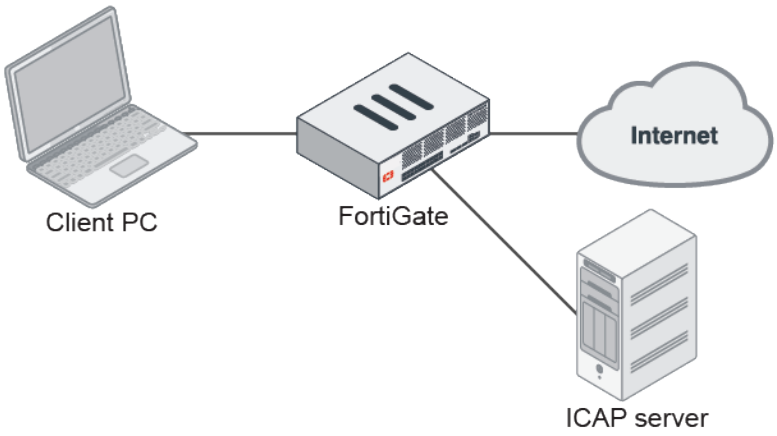
ICAP response filtering

ICAP HTTP responses can be forwarded or bypassed based on the HTTP header value and status code.

When configuring the ICAP profile, if `response` is enabled, the `respmod-default-action` option can be configured:

- If `respmod-default-action` is set to `forward`, FortiGate will treat every HTTP response and send ICAP requests to the ICAP server.
- If `respmod-default-action` is set to `bypass`, FortiGate will only send ICAP requests if the HTTP response matches the defined rules, and the rule's action is set to forward.

When configuring a response rule:



- The `http-resp-status-code` option is configured to specific HTTP response codes. If the HTTP response has any one of the configured values, then the rule takes effect.

- Multiple header value matching groups can be configured. If the header value matches one of the groups, then the rule takes effect.
- If both status codes and header values are specified in a rule, the response must match at least one of each.

The UTM ICAP log category is used for logging actions when FortiGate encounters errors with the ICAP server, such as no service, unreachable, error response code, or timeout. If an error occurs, a traffic log and an associated UTM ICAP log will be created.

Example

The FortiGate acts as a gateway for the client PC and connects to a reachable ICAP server. The ICAP server can be in NAT, transparent, or proxy mode.

In this example, client request HTTP responses will be forwarded to the ICAP server from all hosts if they have an HTTP status code of 200, 301, or 302, and have `content-type: image/jpeg` in the their header.

To configure an ICAP profile with HTTP response rules:

```
config icap profile
    edit "icap_profile2"
        set request disable
        set response enable
        set streaming-content-bypass disable
        set preview disable
        set response-server "icap_server1"
        set response-failure error
        set response-path ''
        set methods delete get head options post put trace other
        set response-req-hdr disable
        set respmod-default-action bypass
        config respmod-forward-rules
            edit "rule2"
                set host "all"
                set action forward
                set http-resp-status-code 200 301 302
                config header-group
                    edit 2
                        set header-name "content-type"
                        set header "image/jpeg"
```

```
                    next
                end
            next
        end
    next
end
```

To view the logs if an error occurs:

1. View the traffic log:

```
# execute log filter category 0
# execute log display
1 logs found.
1 logs returned.

 1: date=2019-10-25 time=17:43:47 logid="0000000013" type="traffic" subtype="forward"
level="notice" vd="vdom1" eventtime=1572050627037314464 tz="-0700" srcip=10.1.100.145
srcport=47968 srcintf="port1" srcintfrole="undefined" dstip=172.16.200.46 dstport=80
dstintf="port2" dstintfrole="undefined" poluuid="a4d5324e-f6c3-51e9-ce2d-f360994fb547"
sessionid=43549 proto=6 action="close" policyid=1 policytype="policy" service="HTTP"
dstcountry="Reserved" srccountry="Reserved" trandisp="snat" transip=172.16.200.1
transport=47968 duration=1 sentbyte=485 rcvdbyte=398 sentpkt=6 rcvdpkt=5
appcat="unscanned" wanin=478 wanout=165 lanin=165 lanout=165 utmaction="block"
counticap=1 crscore=5 craction=262144 crlevel="low" utmref=65532-0
```

2. View the UTM ICAP log:

```
# execute log filter category 20
# execute log display
1 logs found.
1 logs returned.

 1: date=2019-10-25 time=17:43:46 logid="2000060000" type="utm" subtype="icap"
eventtype="icap" level="warning" vd="vdom1" eventtime=1572050626010097145 tz="-0700"
msg="Request blocked due to ICAP server error" service="HTTP" srcip=10.1.100.145
dstip=172.16.200.46 srcport=47968 dstport=80 srcintf="port1" srcintfrole="undefined"
dstintf="port2" dstintfrole="undefined" policyid=1 sessionid=43549 proto=6
action="blocked" profile="icap_profile1" url="/icap_test/"
```

The logs show that the ICAP services stopped before the access. When the client tried to access HTTP and ICAP took effect, the FortiGate sent the ICAP request to the ICAP server and received an error. The client sees a *502 Bad Gateway* message, and FortiGate writes the two logs. In the GUI, the logged traffic is displayed as *Result: Deny: UTM Blocked*.

Secure ICAP clients

A secure SSL connection from the FortiGate to the ICAP server can be configured as follows:

```
config icap server
    edit <name>
        set secure {enable | disable}
        set ssl-cert <certificate>
    next
end
```

To configure a secure ICAP client:

1. Configure the ICAP server:

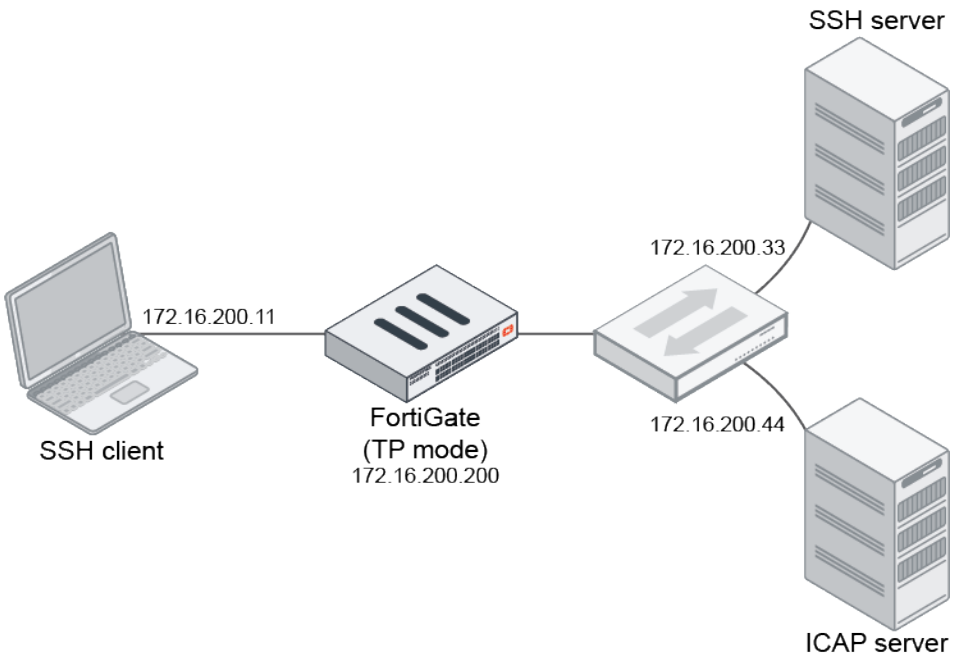
```
config icap server
    edit "icap_server1"
        set ip-version 4
        set ip-address 192.168.10.2
        set port 11344
        set max-connections 100
        set secure enable
        set ssl-cert "ACCVRAIZ1"
    next
end
```

Port 11344 is the standard port for secure ICAP. This must be configured manually if the secure connection is enabled.

2. Configure the ICAP profile:

```
config icap profile
    edit "icap_profile1"
        set request enable
        set response enable
        set streaming-content-bypass enable
        set request-server "icap_server1"
        set response-server "icap_server1"
    next
end
```

3. Configure the firewall policy:



```
config firewall policy
    edit 1
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "protocols"
        set icap-profile "icap_profile1"
    next
end
```

ICAP scanning with SCP and FTP

A FortiGate can forward files transferred by SCP and FTP to an ICAP server for further scanning. Previously, only HTTP and HTTPS were supported for ICAP forwarding.

Example

The FortiGate used in this example is operating in transparent mode. The SSH client, 172.16.200.11, sends a file named `today` to the SSH server at 172.16.200.33 using SCP. Since SCP transfers are encrypted inside an SSH tunnel, for the FortiGate to scan the traffic, deep inspection must be enabled in the SSL SSH profile.

To configure ICAP scanning with SCP:

1. Configure the ICAP server settings:

```
config icap server
    edit "icap_server1"
        set ip-address 172.16.200.44
    next
end
```

2. Configure the ICAP profile for SSH:

```
config icap profile
    edit "icap_profile1"
        set file-transfer ssh
        set file-transfer-server "icap_server1"
        set file-transfer-path "ssh_test"
    next
end
```

If the file transfer is over FTP, configure the profile as follows:

```
config icap profile
    edit "icap_profile1"
        set file-transfer ftp
        set streaming-content-bypass enable
        set file-transfer-server "icap_server1"
        set file-transfer-path "ftp_test"
    next
end
```

3. Configure the SSL SSH profile:

```
config firewall ssl-ssh-profile
    edit "protocols"
        config ssh
            set ports 22
            set status deep-inspection
        end
    next
end
```

4. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "ICAP"
        set srcintf "lan"
        set dstintf "mgmt"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set icap-profile "icap_profile1"
    next
end
```

To test the configuration:

1. On a Linux client, copy a filed named `today` to the SSH server using SCP:

```
scp today fosqa@172.16.200.33:/home/fosqa/ssh_depot/
```

2. Capture a sniffer trace between the FortiGate and ICAP server, then verify the output from the ICAP protocol session.
   a. The client request and the file to be inspected:

```
Icap_client REQMOD:
172.016.200.200.13185-172.016.200.044.01344: REQMOD icap://172.16.200.44:1344/ssh_
test ICAP/1.0
Host: 172.16.200.44:1344
X-Client-IP: 172.16.200.11
X-Server-IP: 172.16.200.33
X-Authenticated-User: TG9jYWw6Ly9hbm9ueW1vdXM=
X-Authenticated-Groups: TG9jYWw6Ly9sb2NhbGhvc3Qvbm8gYXV0aGVudGljYXRpb24=
User-Agent: FortiOS v7.2.0
Encapsulated: req-hdr=0, req-body=116

PUT /scp/today HTTP/1.1
Host: 172.16.200.11
Content-Type: application/octet-stream
Transfer-Encoding: chunked

1d
Tue Sep 20 04:01:50 UTC 2022
```

Where:

- `X-Client-IP` = the client sending the file
- `X-Server-IP` = the server receiving the file
- `Tue Sep 20 04:01:50 UTC 2022` = the content of the file, which is in clear text after the FortiGate performs deep inspection

b. The ICAP server response that the file is cleared and allowed to pass without modifications:

```
Icap-server reply:
172.016.200.044.01344-172.016.200.200.13185: ICAP/1.0 200 OK
ISTag: "GreasySpoon-1.0.7-b03"
Host: 0.0.0.0:1344
Encapsulated: req-hdr=0, req-body=136
Connection: keep-alive

PUT /scp/today HTTP/1.1
Host: 172.16.200.11
Content-Type: application/octet-stream
Transfer-Encoding: chunked
Content-Length: 29

1d
Tue Sep 20 04:01:50 UTC 2022
```

3. On a Linux client, copy the file from the server locally using SCP:

```
scp fosqa@172.16.200.33:/home/fosqa/ssh_depot/today2/
```

4. Similar outputs are observed. The ICAP client request indicates that the file is copied from the SSH server:

```
PUT /scp/today2 HTTP/1.1
Host: 172.16.200.33
```

Domain name in XFF with ICAP

The FortiGate can forward additional domain-related information to the ICAP server. Once domain information is gathered from an external authentication server (such as LDAP or an FSSO collector agent), FortiOS incorporates this domain information in `WinNT://DOMAIN/Username` format and forwards it to the ICAP server.

Basic ICAP configuration

The ICAP server and profile are configured on the FortiGate. The ICAP profile's header settings uses the `WinNT://$domain/$user` variable for the user information provided by the remote authentication server.

To configure the ICAP settings:

1. Configure the ICAP server:

```
config icap server
    edit "content-filtration-server4"
        set ip-address 10.1.100.41
        set max-connections 200
    next
end
```

2. Configure the ICAP profile:

```
config icap profile
    edit "Prop-Content-Filtration"
        set request enable
        set response enable
        set streaming-content-bypass enable
        set request-server "content-filtration-server4"
        set response-server "content-filtration-server4"
        set request-path "/proprietary_code/content-filter/"
        set response-path "/proprietary_code/content-filter/"
        set methods delete get head options post put trace other
        config icap-headers
            edit 1
                set name "X-Authenticated-User"
                set content "WinNT://$domain/$user"
            next
        end
    next
end
```

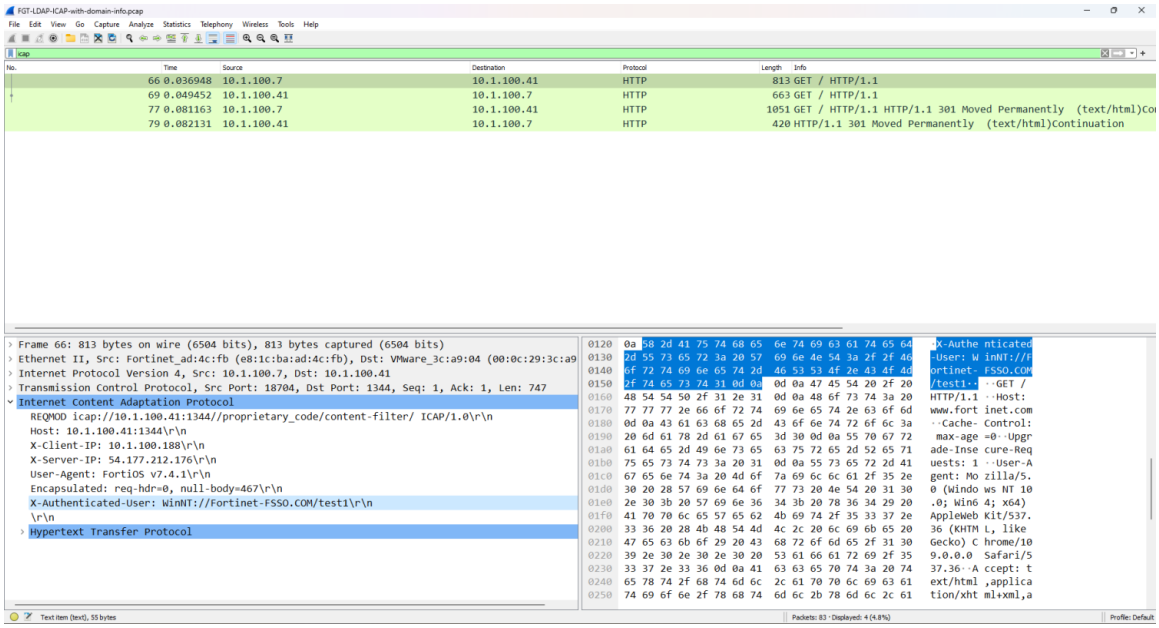
3. Configure the firewall policy:

```
config firewall policy
    edit 4
        set name "icap_filter3"
        set srcintf "port10"
        set dstintf "port9"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set icap-profile "Prop-Content-Filtration"
        set logtraffic all
        set nat enable
        set groups "ldap group" "AD-group"
    next
end
```

LDAP example

In this example, an AD LDAP server and remote user group are configured. When successful user authentication occurs, FortiOS retrieves all the user information (such as the domain name) from the UserPrincipalName attribute. A packet capture is used to compare the user and domain information before and after authentication in the ICAP REQMOD message.

To configure the LDAP authentication:



1. Configure the LDAP server:

```
config user ldap
    edit "AD-ldap"
        set server "10.1.100.131"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password **********
    next
end
```

2. Configure the LDAP user group:

```
config user group
    edit "ldap group"
        set member "AD-ldap"
        config match
            edit 1
                set server-name "AD-ldap"
                set group-name "CN=group1,OU=Testing,DC=Fortinet-FSSO,DC=COM"
            next
            edit 2
                set server-name "AD-ldap"
                set group-name "CN=group2,OU=Testing,DC=Fortinet-FSSO,DC=COM"
            next
        end
    next
end
```

3. Start local traffic dump between the FortiGate and ICAP server before a user authenticates and save it in a PCAP file.
4. Verify the PCAP file. The Fortinet-fsso.com domain appears in the ICAP REQMOD message.

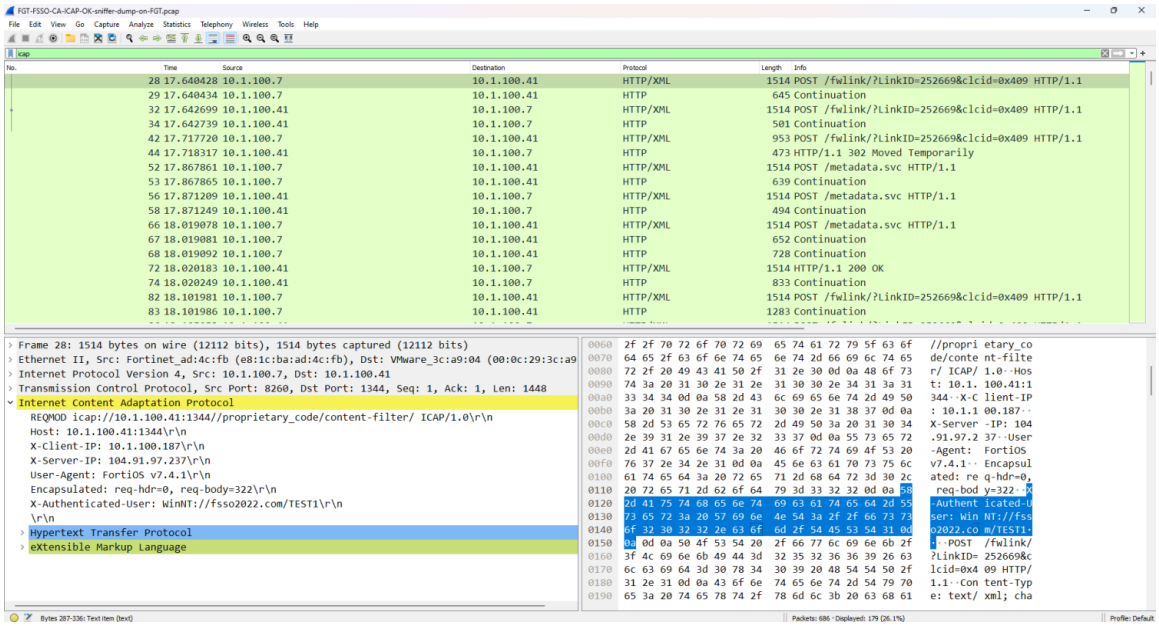
5. Optionally, run the following command to verify WAD debugs:

```
# diagnose wad debug enable category icap
```

FSSO example

In this example, a local FSSO agent and remote user group are configured. When successful user authentication occurs, FortiOS retrieves all the user information (such as the domain name). A packet capture is used to compare the user and domain information before and after authentication in the ICAP REQMOD message.

To configure the FSSO authentication:



1. Configure the FSSO agent:

```
config user fsso
    edit "AD-fsso"
        set server "10.1.100.199"
        set password **********
    next
end
```

2. Configure the FSSO user group:

```
config user group
    edit "AD-group"
        set group-type fsso-service
        set member "FORTINET-FSSO/GROUP1" "FORTINET-FSSO/GROUP2"
    next
end
```

3. Start local traffic dump between the FortiGate and ICAP server before a user authenticates and save it in a PCAP file.
4. Verify the PCAP file. The fsso2022.com domain appears in the ICAP REQMOD message.

5. Optionally, verify the FSSO log file and search for the `get_dns_domain` lines:

```
...
06/20/2023 14:58:58 [ 1484] FortiGate connection accepted, auth OK.
06/20/2023 14:58:58 [ 1484] FortiGate:FG4H1E5819900343-root connected on socket (2004).

```

Web application firewall

Web application firewall (WAF) profiles can detect and block known web application attacks. You can configure WAF profiles to use signatures and constraints to examine web traffic. You can also enforce an HTTP method policy, which controls the HTTP method that matches the specified pattern.

You can customize the default profile, or you can create your own profile to apply access rules and HTTP protocol constraints to traffic. You can apply WAF profiles to firewall policies when the inspection mode is set to proxy-based.

Web application firewall profiles cannot be used NGFW policy-based mode. See NGFW policy on page 1313 for more information.

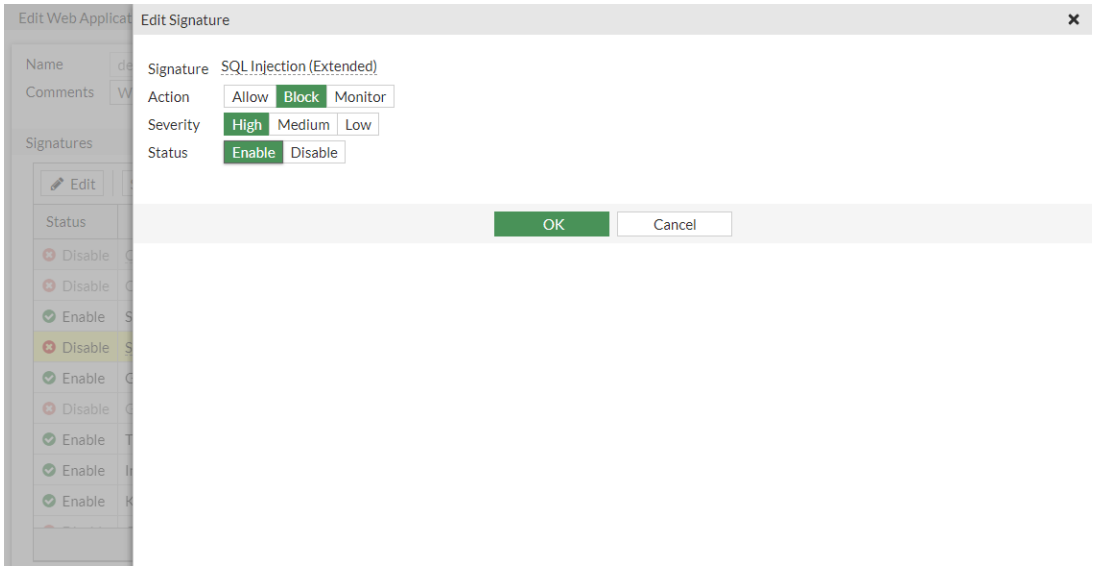
The following topic provides information about WAF profiles:

- Protecting a server running web applications on page 1838

Protecting a server running web applications

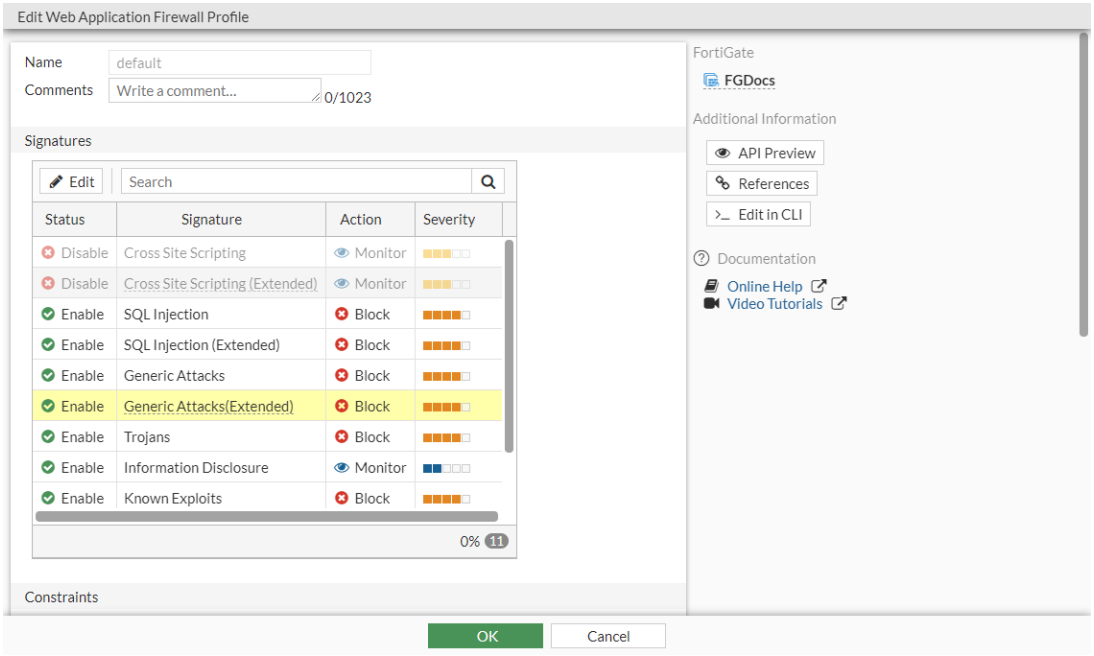
You can use a web application firewall profile to protect a server that is running a web application, such as webmail.

Web application firewall profiles are created with a variety of options called signatures and constraints. Once these options are enabled, the action can be set to allow, monitor, or block. The severity can be set to high, medium, or low.



In the following example, the default profile will be targeted to block SQL injection attempts and generic attacks.

The web application firewall feature is only available when the policy inspection mode is proxy-based.



To protect a server running web applications:

1. Enable the web application firewall:
   a. Go to *System* > *Feature Visibility*.
   b. Under *Security Features*, enable *Web Application Firewall*.
   c. Click *Apply*.
2. Edit the default web application firewall profile (*Trojans* and *Known Exploits* are blocked by default):
   a. Go to *Security Profiles* > *Web Application Firewall* and edit the *default* profile signature.
   b. Select *SQL Injection (Extended)* and edit it so that it is enabled, the *Action* is set to *Block*, and the *Severity* is set to *High*.
   c. Click *OK*.

   d. Enable *Generic Attacks (Extended)* and edit it so that it is enabled, the *Action* is set to *Block*, and the *Severity* is set to *High*.

e. Click *OK*.

f. Click *OK*.

3. Apply the profile to a security policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and edit the policy that allows access to the web server.
   b. For *Firewall / Network Options*, select the appropriate *Protocol Option*.
   c. For *Security Profiles*, enable *Web Application Firewall* and set it to use the *default* profile.
   d. Set the *SSL Inspection* to use the *deep-inspection* profile.
   e. Configure the other settings as needed.
   f. Click *OK*.
4. Verify that the web application firewall blocks traffic:
   a. Use the following URL to simulate an attack on your web server and substitute the IP address of your server:
   `http://<server IP>/index.php?username=1'%20or%20'1'%20=%20'1&password=1'%20or%20'1'%20=%20'1`
   An error message appears, stating that the web application firewall has blocked the traffic:

Using FortiWeb for protection

Another way of protecting web applications is to forward HTTP traffic to a FortiWeb for scanning and inspection. A typical use case is to use a one-arm topology with FortiWeb running in reverse proxy mode to scan traffic before accessing the webpage on the web servers. See Planning the network topology in the FortiWeb Administration Guide for more information.

Data loss prevention

The FortiGate data loss prevention (DLP) system prevents sensitive data from leaving or entering your network by scanning for various patterns while inspecting traffic passing through the FortiGate. Data matching defined sensitive data patterns is blocked, logged, allowed, or quarantined when it passes through the FortiGate.

The DLP system is configured based on the following components:

Component	Description
Data type	Define the type of pattern that DLP is trying to match. For example, this can be a pre-defined type such as keyword, regex, hex, credit card, US social security number (SSN), or other patterns. You can also create custom data types.
Dictionary	A collection of data type entries. When selecting a data type such as keyword, regex or hex, define the pattern that you are looking for.
Sensor	Define which dictionaries to check. You can match any dictionary, all dictionaries, or a special logical combination of the dictionaries. It can also count the number of dictionary matches to trigger the sensor.
File pattern	Define groups of file patterns based on pre-defined file types, or define your own pattern to match the file name.
DLP profile	Define rules for matching a sensor based on a file type or a message, and the type of protocol being used. It also allows you to choose the action to allow, log, block, or quarantine the address.

A DLP profile selects one or more sensors, and applies the sensor's pattern matching against the file type or message that is passing through selected protocols. The profile can be applied to a firewall policy where the traffic will be inspected.

In the backend, DLP uses Hyperscan to perform a one-parse algorithm for scanning multiple patterns. This allows DLP to scale up without any performance downgrade.

The FortiGuard Data Loss Prevention service enables the identification, monitoring, and protection of an organization's data through data breaches, insider threats, and data exfiltration. It uses a customizable database of more than 500 predefined data patterns and policies to simplify and expedite DLP deployment and integration into existing environments (see FortiGuard DLP service on page 1853 for more information).

Protocol comparison between DLP inspection modes

The following table indicates which protocols can be inspected by DLP based on the specified inspection modes.

	HTTP	FTP	IMAP	POP3	SMTP	NNTP	MAPI	CIFS	SFTP/SCP
Proxy	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes	Yes	Yes	Yes	Yes	No	No	Yes	No

DLP can be configured in both the CLI and the GUI irrespective or firewall policy inspection mode.

To use DLP profiles in a flow-based firewall policy, `set feature-set flow` must be set from the CLI. See Configuring DLP from the CLI on page 1845 for more information.

DLP profiles can only be added to a flow-based firewall policy from the CLI.

Archiving

DLP can archive some or all of the content that passes through the DLP system. There are two forms of DLP archiving.

- Summary only: a summary of all the activity detected by the profile is recorded. For example, when an email message is detected, the sender, recipient, message subject, and total size are recorded. When a user accesses a web browser, every URL that they visit is recorded.
- Full: detailed records of all the activity detected by the profile is recorded. For example, when an email message is detected, the message itself, including any attachments, is recorded. When a user accesses a web browser, every page that they visit is archived.

You can configure the type of archiving per protocol.

Logging and blocking files by file name

Sometimes, file names are not accurately recorded in DLP logs, even though the files are blocked correctly based on the DLP profile. This is particularly apparent on cloud-based services, such as Google Drive or SharePoint.

For HTTP file uploads, some cloud services use proprietary encodings and APIs to transfer files and exchange metadata, instead of standard HTTP mechanisms, requiring custom handling of the proprietary API. If a cloud service changes the API without notice, the custom handling becomes outdated and file names might not be logged properly. Due to this, special consideration must be taken when using DLP to block files by file pattern. To block a specific file type, it is better to block by file type, and not by file name pattern.

The following topics provide information about DLP:

- DLP techniques on page 1842
- Basic DLP settings on page 1843
- Advanced DLP configurations on page 1847
- DLP fingerprinting on page 1849
- FortiGuard DLP service on page 1853
- Sensitivity labels on page 1856
- DLP examples on page 1860

DLP techniques

The security of sensitive data is a top priority for organizations. A range of techniques and tools are used to maintain the confidentiality and accessibility of data.

The following table describes some of the industry standard techniques that are used for data loss protection, and if they can be configured in the GUI or CLI.

Technique	Description	GUI	CLI
Indexed Document Matching (IDM)	IDM creates unique fingerprints for your organization's crucial documents that hold sensitive information. This process involves analyzing the content of these documents and generating a checksum for each one. See DLP fingerprinting on page 1849 for more information.		✓
Exact Data Matching (EDM)	EDM identifies particular data values within an indexed data source that require safeguarding.		✓
Described Content Matching (DCM)	DCM scans through data to identify the presence of specific patterns using regular expressions (Regex). See Built-in DLP data type on page 1847 for more information.	✓	✓
Optical Character Recognition (OCR)	OCR scans and analyzes the content embedded within images for sensitive information, extending data protection to image-based content.		
Predefined data patterns	Default DLP patterns that classify private and confidential data that should be regulated in accordance with regulatory compliance requirements. See Built-in DLP data type on page 1847 for more information.	✓	✓
Custom data classification tags (data pattern)	FortiGate allows you to create patterns for your custom data type. See Custom DLP data type on page 1847 for more information.	✓	✓
True file type filtering	Identify a file by the data type in its meta data. See DLP file pattern on page 1848 for more information.	✓	✓
File size filtering	Identify a file based on its size. See Block HTTPS downloads of EXE files and log HTTPS downloads of files larger than 500 KB on page 1868 for an example.		✓
Microsoft Purview sensitivity labels	Sensitivity labels provide a mechanism to categorize and safeguard your data. They function as identifiers and highlight the significance of the data that they are attached to. See Sensitivity labels on page 1856 for more information.	✓	✓
FortiGuard DLP service	A database of predefined DLP patterns, such as data types, dictionaries, and sensors, that are dynamically managed by FortiGuard. A valid DLP license is required. See FortiGuard DLP service on page 1853 for more information.	✓	✓

Basic DLP settings

DLP settings can be configured for data types, dictionaries, sensors, file patterns, and profiles. This topic includes three examples that incorporate several DLP settings. DLP can be configured in both the CLI and the GUI irrespective of firewall policy inspection mode.

To use DLP profile in a flow-based firewall policy, `set feature-set flow` must be set from the CLI. See Configuring DLP from the CLI on page 1845 for more information.

DLP profiles can only be added to a flow-based firewall policy from the CLI.

On the *Security Profiles* > *Data Loss Prevention* page, there are *Profiles*, *Sensors*, and *Dictionaries* tabs to configure those DLP settings. DLP profiles can be added to proxy-based firewall policies and proxy policies from the GUI.

If *Data Loss Prevention* is not visible in the tree menu, go to *System* > *Feature Visibility* and enable it.

This section breaks down the DLP configuration into a sequence of steps:

1. Configure the DLP dictionary:
   - A DLP dictionary is a collection of data type entries. See Built-in DLP data type on page 1847 for more information.
2. Configure the DLP sensor:
   - A DLP sensor defines which dictionary to check. It counts the number of dictionary matches to trigger the sensor.
3. Configure the DLP profile:
   - A DLP profile allows for filtering by size and file type. See DLP file pattern on page 1848 for custom file type.
4. Add the DLP profile to a firewall policy.

All the steps mentioned above should be configured in the exact order given for ease of configuration.

Configuring DLP from the GUI

Use the following steps to configure DLP from the GUI.

To configure a DLP dictionary:

1. Go to *Security Profiles* > *Data Loss Prevention*.
2. Select the *Dictionaries* tab and click *Create New*.
3. Enter a name.
4. In the *Dictionary Entries* section, click *Create New*.
5. Set the *Type* and click *OK*.
6. Click *OK* to save the dictionary.

To configure a DLP sensor:

1. Go to *Security Profiles* > *Data Loss Prevention*.
2. Select the *Sensors* tab and click *Create New*.
3. Enter a name.
4. In the *Sensors Entries* section, click *Create New*.
5. Select the *Dictionary* from the dropdown menu and click *OK*.
6. Click *OK* to save the sensor.

To configure a DLP profile:

1. Go to *Security Profiles* > *Data Loss Prevention*.
2. Select the *Profiles* tab and click *Create New*.
3. Enter a name.
4. In the *Rules* section, click *Create New*.
5. Configure the following settings:

Name	Filter name.
Sensors	Select DLP sensors.
Severity	Select the severity or threat level that matches this filter.
Action	Action to take with content that this DLP profile matches.
Type	Select whether to check the content of messages (an email message) or files (downloaded files or email attachments).
File type	Select the number of a DLP file pattern table to match.
Protocol	Check messages or files over one or more of these protocols.

6. Click *OK*.
7. Click *OK* to save the profile.

To add the DLP profile to a firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Set the *Inspection Mode* to *Proxy-based*.
4. In the *Security Profiles* section, enable *DLP Profile* and select the desired profile.
5. Configure the other settings as needed.
6. Click *OK*.

Configuring DLP from the CLI

Use the following steps to configure DLP from the CLI.

To configure a DLP dictionary:

```
config dlp dictionary
    edit <name>
        config entries
            edit 1
                set type {credit-card | hex | keyword | mip-label | regex | ssn-us}
                set pattern <string>
                set repeat {enable | disable}
                set status {enable | disable}
            next
        end
```

```
    next
end
```

To configure a DLP sensor:

```
config dlp sensor
    edit <name>
        set match-type {match-all | match-any | match-eval}
        set eval <string>
        config entries
            edit <id>
                set dictionary <dlp_dictionary>
                set count <integer>
                set status {enable | disable}
            next
        end
    next
end
```

See Evaluation by Logical relationship on page 1848 for more information about `match-eval`.

To configure a DLP profile:

```
config dlp profile
    edit <name>
        set feature-set {flow | proxy}
        config rule
            edit <id>
                set proto <protocol> <protocol> ...
                set sensor <dlp_sensor>
                set action {allow | log-only | block | quarantine-ip}
            next
        end
    next
end
```

To add the DLP profile to a firewall policy:

```
config firewall policy
    edit <id>
        set srcintf <interface>
        set dstintf <interface>
        set action accept
        set srcaddr <address>
        set dstaddr <address>
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set dlp-profile <string>
    next
end
```

See DLP examples on page 1860 for sample configurations.

Advanced DLP configurations

The following topic provides information on advanced DLP configurations.

Built-in DLP data type

Built-in DLP data type includes pre-defined data types to match for keyword, regex, hex, mip label, credit card, and social security number (SSN). See Predefined data patterns on page 1843 for more information. The built-in DLP data type regex employs DCM to detect patterns. See Described Content Matching (DCM) on page 1843 for more information.

```
config dlp data-type
    edit "keyword"
        set pattern "built-in"
    next
    edit "regex"
        set pattern "built-in"
    next
    edit "hex"
        set pattern "built-in"
    next
    edit "mip-label"
        set pattern "^[[:xdigit:]]{8}-[[:xdigit:]]{4}-[[:xdigit:]]{4}-[[:xdigit:]]{4}-
[[:xdigit:]]{12}$"
        set transform "built-in"
    next
    edit "credit-card"
        set pattern "\\b([2-6]{1}\\d{3})[- ]?(\\d{4})[- ]?(\\d{2})[- ]?(\\d{2})[- ]?(\\d
{2,4})\\b"
        set verify "built-in"
        set look-back 20
        set transform "\\b\\1[- ]?\\2[- ]?\\3[- ]?\\4[- ]?\\5\\b"
    next
    edit "ssn-us"
        set pattern "\\b(\\d{3})-(\\d{2})-(\\d{4})\\b"
        set verify "(?<!-)\\b(?!666|000|9\\d{2})\\d{3}-(?!00)\\d{2}-(?!0{4})\\d{4}\\b(?!-)"
        set look-back 12
        set transform "\\b\\1-\\2-\\3\\b"
    next
end
```

Custom DLP data type

Custom data types can be added. See Custom data classification tags (data pattern) on page 1843 for more information.

To add a custom DLP data type:

```
config dlp data-type
    edit <name>
        set pattern <string>
        set verify <string>
        set transform <string>
    next
end
```

`pattern <string>`	Enter a regular expression pattern string without a look around.
`verify <string>`	Enter a regular expression pattern string used to verify the data type.
`transform <string>`	Enter the template to transform user input to a pattern using the capture group from `pattern`.

To use "?" in a regex pattern, see CLI basics on page 43. This method only supports direct console connection and SSH. It does not support the CLI console in the GUI.

DLP file pattern

A DLP file pattern can block, allow, log, or quarantine a file based on the specified file type in the file filter list (see Supported file types on page 1776). It employs True file type filtering to identify a file. See True file type filtering on page 1843 for more information.

To configure a DLP file pattern:

```
config dlp filepattern
    edit <id>
        set name <name>
        config entries
            edit <name>
                set filter-type {type | pattern}
                set file-type <file_type>
            next
        end
    next
end
```

Evaluation by Logical relationship

Evaluation by Logical relationship is a powerful tool used to combine multiple dictionary entries to define an accurate DLP sensor using logical expression.

Syntax example:

1. `set eval "dict(1) == 2"`

   Match DLP sensor only when dictionary one match count is two.
2. `set eval "(dict(1) + dict(2)) == 3"`

   Match DLP sensor only when dictionary one and dictionary two combined match count is three.
3. `set eval "(dict(1) == 2) && (dict(2) == 1)"`

   Match DLP sensor only when dictionary one match count is equal to two and dictionary two match count is equal to one.
4. `set eval "(dict(1) == 2) || (dict(2) == 1)"`

   Match DLP sensor only when dictionary one match count is equal to two or dictionary two match count is equal to one.

5. `set eval "dict(1) > dict(2)"`

   Match DLP sensor only when dictionary one match count is greater than dictionary two match count.

See Block HTTPS upload traffic that includes Visa or Mastercard information using evaluation through logical expression on page 1869.

DLP fingerprinting

DLP fingerprinting employs Indexed Document Matching (IDM) to detect sensitive data. See Indexed Document Matching (IDM) on page 1843 for more information. The file that the DLP profile filters is uploaded and the FortiGate generates and stores a checksum fingerprint. The FortiGate generates a fingerprint for all the files that are detected in network traffic, and compares all the checksums stored in its database. If a match is found, the configured action is taken. Any type of file can be detected by DLP fingerprinting, and fingerprints can be saved for each revision of a file as it is updated.

Using fingerprinting requires:

1. Creating a DLP fingerprint database by allowing the FortiGate to access a file server containing files from which to create fingerprints.
2. Adding fingerprinting filters to DLP profiles.
3. Adding the profiles to firewall policies that accept traffic that the fingerprinting will be applied on.

See Fingerprinting example on page 1850 for a sample configuration.

The document fingerprint feature requires a FortiGate that has internal storage.

To configure a DLP fingerprint document:

```
config dlp fp-doc-source
    edit <name>
        set server <string>
        set username <string>
        set password <password>
        set file-path <string>
        set sensitivity <Critical | Private | Warning>
    next
end
```

Command	Description
`server <string>`	Enter the IPv4 or IPv6 address of the file server.
`username <string>`	Enter the user name required to log into the file server.
`password <password>`	Enter the password required to log into the file server.
`file-path <string>`	Enter the path on the server to the fingerprint files.
`sensitivity <Critical | Private | Warning>`	Set the sensitivity or threat level for matches with this fingerprint database.

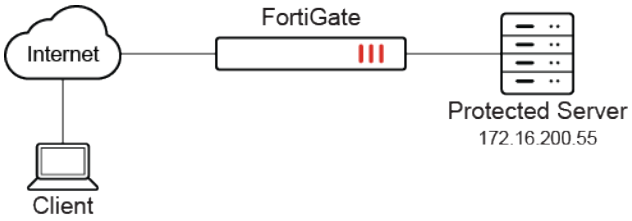
See config dlp fp-doc-source in the FortiOS CLI Reference for a comprehensive list of commands and supported FortiGate models.

A file server is required for the user to upload files. Each uploaded file will have a fingerprint generated by FortiGate, and will be stored locally as a checksum. Currently, only servers that are using the Samba (SMB) protocol are compatible.

To configure a DLP fingerprint profile:

```
config dlp profile
    edit <name>
        set feature-set proxy
        config rule
            edit <id>
                set proto {smtp | pop3 | imap | http-get | http-post | ftp | nntp | mapi |
ssh | cifs}
                set filter-by fingerprint
                set sensitivity {Critical | Private | Warning}
                set match-percentage <integer>
                set action {allow | log-only | block | ban | quarantine-ip}
            next
        end
    next
end
```

Command	Description
`proto {smtp | pop3 | imap | http-get | http-post | ftp | nntp | mapi | ssh | cifs}`	Set the protocol to inspect.
`filter-by fingerprint`	Set to match against a fingerprint sensitivity.
`sensitivity {Critical | Private | Warning}`	Set the DLP file pattern sensitivity to match.
`match-percentage <integer>`	Set the percentage of the checksum required to match before the profile is triggered.
`action {allow | log-only | block | ban | quarantine-ip}`	Set the action to take with content that matches the DLP profile.



Fingerprinting example

This configuration will block HTTPS download traffic that matches the checksums that are stored in the FortiGate fingerprint database.

When utilizing commonly-used SSL-encrypted protocols, such as HTTPS, SMTPS, POP3S, IMAPS, and FTPS, SSL inspection must be set to Deep Inspection. See Deep inspection on page 1899 for more information.

The client machine must also have the corresponding deep inspection Certificate Authority (CA) certificate installed.

In this example, a text document with sensitive data is being downloaded by the client using the HTTP GET method. The term *Protected Server* refers to the Samba file server that stores the fingerprint files. It is assumed that you already have a configured Samba file server.

The FortiGate intercepts the traffic using deep inspection and blocks the traffic as it matches the DLP profile configured on this FortiGate. See Sample log on page 1853 for a log sample.

To block network traffic that matches the checksums stored in the FortiGate fingerprint database:

1. Configure the DLP fingerprint database:

```
config dlp fp-doc-source
    edit "test"
        set server "172.16.200.55"
        set username "kiki"
        set password *****
        set file-path "/sambashare/upload/"
        set sensitivity "Critical"
    next
end
```

   This step can only be configured in the CLI.

2. Configure the DLP profile:

```
config dlp profile
    edit "fingerprint"
        set feature-set proxy
        config rule
            edit 1
                set proto http-get
                set filter-by fingerprint
                set sensitivity "Critical"
                set action block
            next
        end
    next
end
```

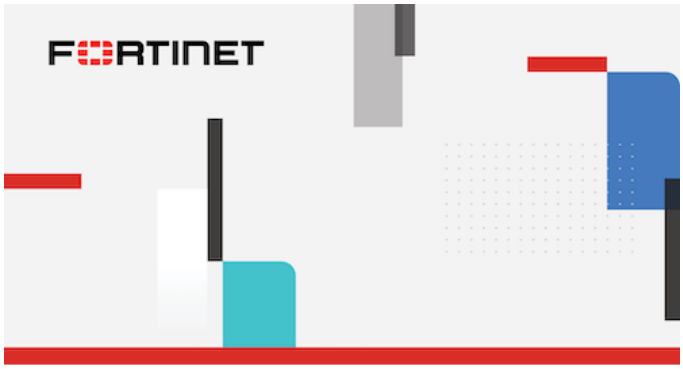
   DLP profiles that filter by fingerprint can only be configured in the CLI.

3. Add the DLP profile to a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
```

```
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set dlp-profile "fingerprint"
        set nat enable
    next
end
```

This can also be configured in the GUI. See To add the DLP profile to a firewall policy.



To verify the results:

1. Verify that the DLP fingerprint database is present on the FortiGate:

```
# diagnose test application dlpfingerprint 3
File DB:
---------------------------------------
id,     filename,       vdom,   archive,        deleted,        scanTime,
docSourceSrvr,  sensitivity,    chunkCnt,       reviseCnt,
1,      /sambashare/upload/testdlp,     root,   0,      0,      1706727347,     test,
2,      1,      0,
2,      /sambashare/upload/testdlp.txt, root,   0,      0,      1706728230,     test,
2,      1,      0,
```

2. Verify HTTP GET traffic that matches the checksums stored in the FortiGate fingerprint database is being blocked:

   A download attempt of a text file from a Windows device was made using Chrome browser. This text file is located on the protected server and its fingerprint is saved in the FortiGate fingerprint database.

Attention

The transfer attempt has been blocked because it appears to contain a data leak.

URL https://172.16.200.55/testdlp.txt

The download was unsuccessful, leading to the creation of a sample log. See Sample log on page 1853.

Sample log

To view the sample log:

1. Go to *Log & Report* > *Security Events* and select *AntiVirus*.
2. View the log details in the GUI, or download the log file:

```
1: date=2024-02-01 time=08:47:25 eventtime=1706734045777192462 tz="+1200"
logid="0954024576" type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root"
ruleid=1 dlpextra="Critical" filtertype="fingerprint" filtercat="file" severity="medium"
policyid=1 poluuid="f4fe48a4-938c-51ee-8856-3e84e3b24af4" policytype="policy"

(Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/121.0.0.0
Safari/537.36 Edg/121.0.0.0" httpmethod="GET" filename="testdlp.txt" filesize=20
profile="fingerprint"
```

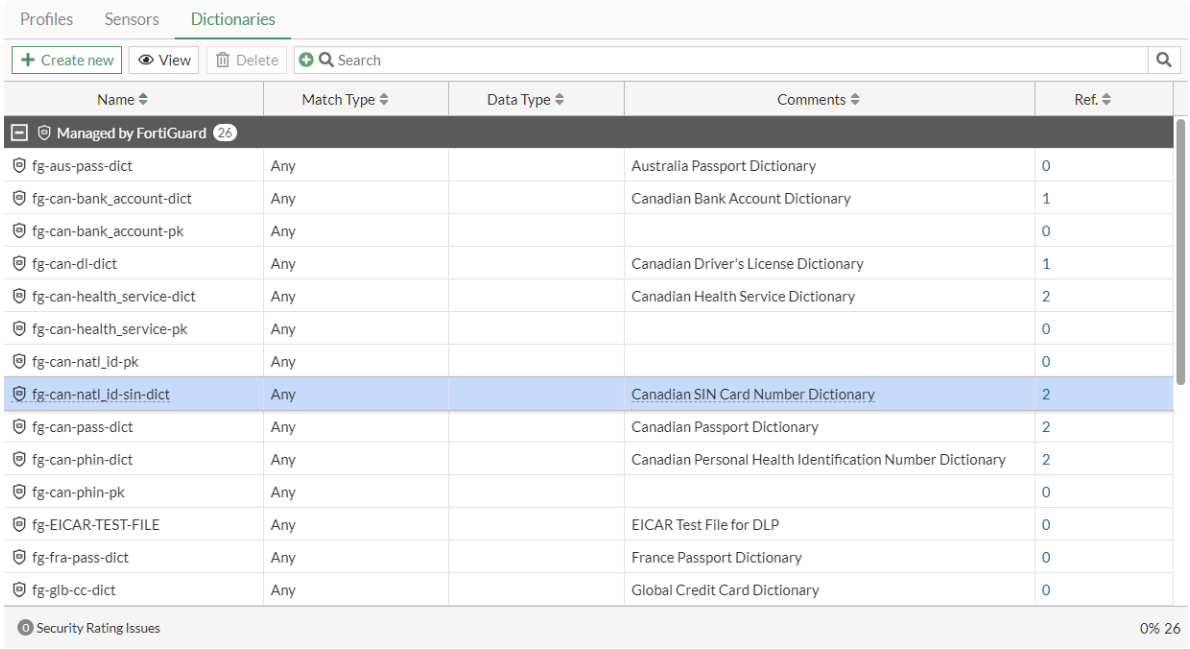
FortiGuard DLP service

The FortiGuard DLP service offers a database of predefined DLP patterns such as data types, dictionaries, and sensors. Example include:

- Drivers licenses for various countries, various states in the USA, and various provinces in Canada
- Tax numbers for various countries
- Credit card numbers
- Bank statements

When enabled, the DLP database (DLDB) is downloaded to the FortiGate and its predefined patterns can be configured in DLP profiles.

To configure DLP database updates:



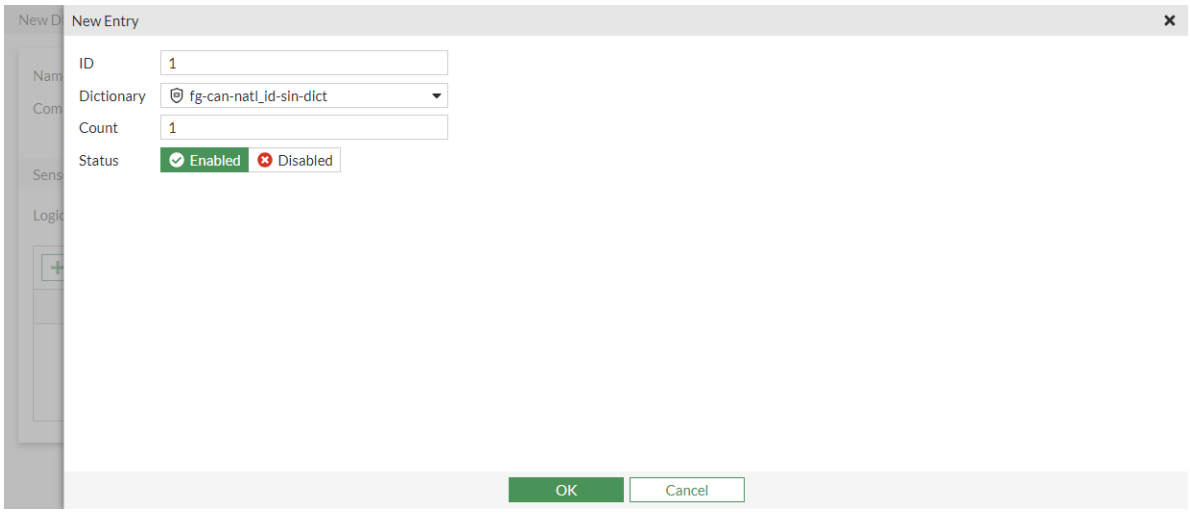
```
config system fortiguard
    set update-dldb {enable | disable}
end
```

To verify the database signature status:

```
# diagnose autoupdate versions
...
DLP Signature
---------
Version: 1.00010 signed
Contract Expiry Date: n/a
Last Updated using manual update on Fri Jan 27 15:25:00 2023
Last Update Attempt: Mon Jan 30 15:18:39 2023
Result: No Updates
```

Example

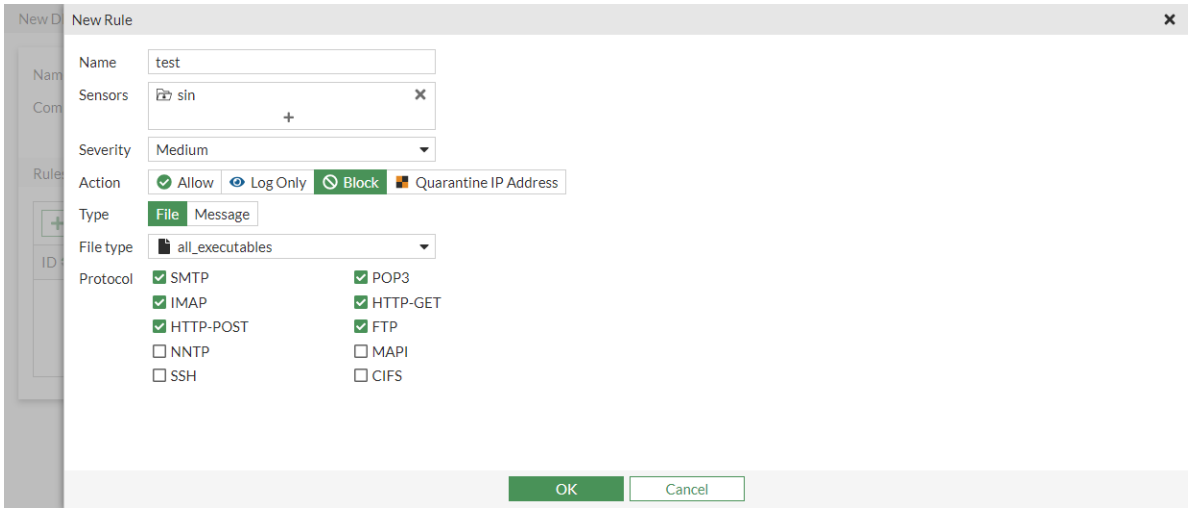
In this example, the administrator wants to look for data leakage of Canadian social insurance number (SIN) information and block this traffic. A DLP profile is created that uses the predefined dictionary, fg-can-natl_id-sin-dict, to check for Canadian Social Insurance Numbers (SINs).



To verify that the Canadian SIN data type is added to the list of predefined data types:

```
show dlp data-type
config dlp data-type
    ...
    edit "fg-can-natl_id-proximity"
        set pattern "fortiguard dlp signature"
    next
end
```

To configure the DLP profile in the GUI:



1. Configure the DLP sensor using the predefined dictionary from FortiGuard:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Sensors* tab, and click *Create New*.
   b. Enter a name (*sin*).
   c. In the *Sensor Entries* section, click *Create New*.
   d. Set the *Dictionary* to *fg-can-natl_id-sin-dict* and click *OK*.

e. Click *OK* to save the sensor.

2. Configure the DLP profile:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Profiles* tab, and click *Create New*.
   b. Enter a name (*test*).
   c. In the *Rules* section, click *Create New*.
   d. Configure the following settings:

Name	*test*
Sensors	*sin*
Severity	*Medium*
Action	*Block*
Type	*File*
File type	*all_executables*
Protocol	*SMTP*, *POP3*, *IMAP*, *HTTP-GET*, *HTTP-POST*, *FTP*

e. Click *OK*.
f. Click *OK* to save the profile.

To configure the DLP profile in the CLI:

1. Configure the DLP sensor using the predefined dictionary from FortiGuard:

```
config dlp sensor
    edit "sin"
        config entries
            edit 1
                set dictionary "fg-can-natl_id-sin-dict"
            next
        end
    next
end
```

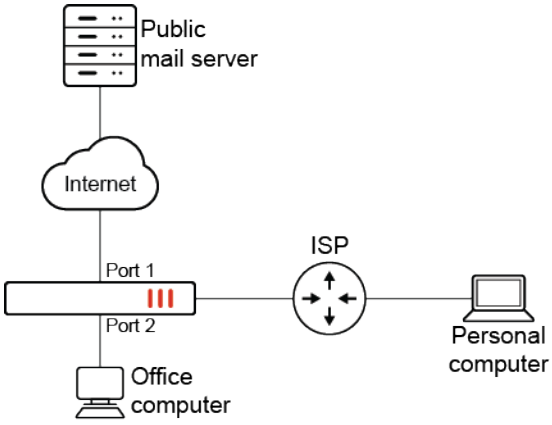
2. Configure the DLP profile:

```
config dlp profile
    edit "test"
        set feature-set proxy
        config rule
            edit 1
                set name "test"
                set proto smtp pop3 imap http-get http-post ftp
                set filter-by sensor
                set file-type 2
                set sensor "sin"
                set action block
            next
        end
    next
end
```

Sensitivity labels

In order to safeguard your organization's data, labels can be employed as markers for sensitive information. Microsoft provides sensitivity labels, which act as identifiers emphasizing the importance of the data they're associated with, thereby enhancing the security measures in place. See Protect your sensitive data with Microsoft Purview (formerly MIP) for more information.

Any data traffic that includes a sensitivity label can be effectively managed using FortiGate. This is made possible through the utilization of a pre-defined data type, *mip-label*, specifically designed for MIP in the Data Loss Prevention (DLP) dictionary. See Microsoft Purview sensitivity labels on page 1843 for more information.



Example

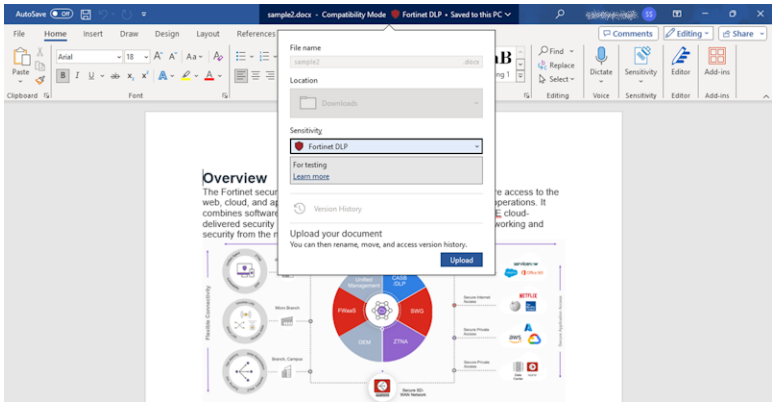
This configuration will block HTTPS upload traffic that matches the DLP profile.

When utilizing commonly-used SSL-encrypted protocols such as HTTPS, SMTPS, POP3S, IMAPS, and FTPS, SSL inspection must be set to Deep Inspection. See Deep inspection on page 1899 for more information.

Additionally, the client machine must have the corresponding deep inspection Certificate Authority (CA) certificate installed.

Sample topology

In this example, a Microsoft Office document that is marked with a sensitivity label is being attached to an email in the Chrome browser using Office Desktop. See Learn about sensitivity labels for more information. The FortiGate intercepts this traffic using deep inspection and blocks the attachment of the file because it matches the DLP profile that has been set up on this FortiGate.



When a sensitivity label is included in HTTPS upload traffic, the file is blocked and a DLP log is generated. See Sample log on page 1859 for a log sample.

Prerequisites

Before configuring FortiGate, complete the following steps:

1. Create and configure sensitivity labels and their policies. See Create sensitivity labels for more information.
2. Apply a sensitivity label to content. See Apply sensitivity labels to your files and email for more information.

   Once the sensitivity label is applied on a file, you'll see it displayed on the sensitivity bar.

3. Obtain Globally Unique Identifier (GUID) for your sensitivity labels. See Search for documents by sensitivity label for more information.

   Sample GUID:

```
PS C:\Windows\system32> Get-Label |Ft Name, Guid

Name                                Guid
----                                ----
Fortinet DLP                        ca51e4ff-0733-4744-bebb-d3e1eb6383f4
```

FortiGate uses the GUID for label matching. The *Pattern* for *mip-label* is configured to correspond to the label's GUID.

To block HTTPS upload traffic that includes MIP labels in the GUI:

1. Configure the DLP dictionary:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Dictionaries* tab, and click *Create New*.
   b. Set *Name* to *dic-case5*.
   c. In the *Dictionary Entries* table click *Create New*:
      i. Set *Type* to *mip-label*.
      ii. Set *Pattern* to *ca51e4ff-0733-4744-bebb-d3e1eb6383f4*.

      The pattern set here corresponds to the GUID of a specific sensitivity label. Please use your own GUID in this step. See step 3 of Prerequisites on page 1857 for how to obtain your label GUID.

      iii. Click *OK*.
   d. Click *OK*.
2. DLP profiles that filter by MIP can only be configured in the CLI. See Configure the DLP profile.
3. Add the DLP profile to a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Set the *Inspection Mode* to *Proxy-based*.
   c. In the *Security Profiles* section, enable *DLP Profile* and select *profile-case5*.
   d. Set *SSL Inspection* to *deep-inspection*.
   e. Configure the other settings as needed.
   f. Click *OK*.

To block HTTPS upload traffic that includes MIP labels in the CLI:

1. Configure the DLP dictionary:

```
config dlp dictionary
    edit "dic-case5"
        config entries
            edit 1
                set type "mip-label"
                set pattern "ca51e4ff-0733-4744-bebb-d3e1eb6383f4"
            next
```

```
        end
    next
end
```

The `set pattern` is set to the GUID of a specific sensitivity label. Please use your own GUID in this step. See step 3 of Prerequisites on page 1857 for how to obtain your label GUID.

2. Configure the DLP profile:

```
config dlp profile
    edit "profile-case5"
        set feature-set proxy
        config rule
            edit 1
                set name "mip-label"
                set severity critical
                set proto smtp pop3 imap http-get http-post ftp nntp mapi ssh cifs
                set filter-by mip
                set file-type 1
                set label "dic-case5"
                set action block
            next
        end
    next
end
```

3. Add the DLP profile to a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set dlp-profile "profile-case5"
        set nat enable
    next
end
```

Sample log

An attempt was made to send an email from a Windows device using Gmail's webmail service. The email was intended to include an attachment with a MIP label, but the attachment failed to upload, resulting in the generation of a sample log.

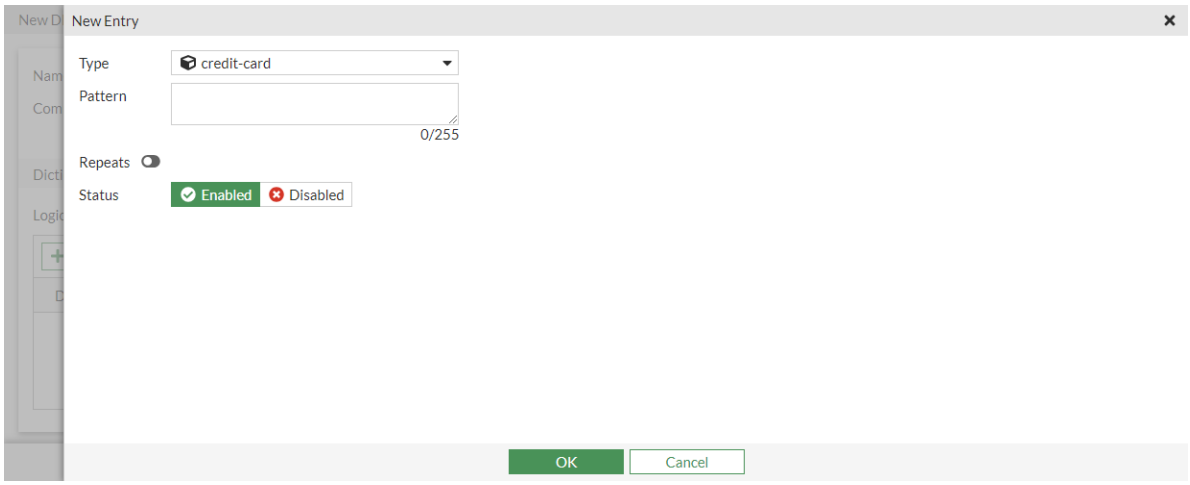
DLP examples

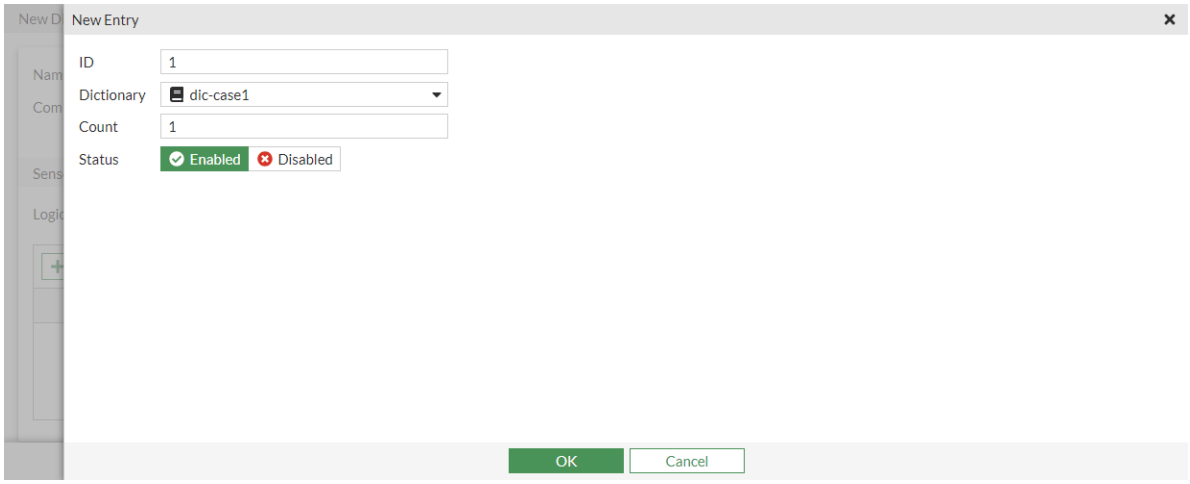
The following topics provide examples of DLP:



- Block HTTPS upload traffic that includes credit card information on page 1860
- Log FTP upload traffic with a specific pattern on page 1864
- Block HTTPS downloads of EXE files and log HTTPS downloads of files larger than 500 KB on page 1868
- Block HTTPS upload traffic that includes Visa or Mastercard information using evaluation through logical expression on page 1869
- Block access to LLM applications using keywords and FQDN on page 1874

Block HTTPS upload traffic that includes credit card information

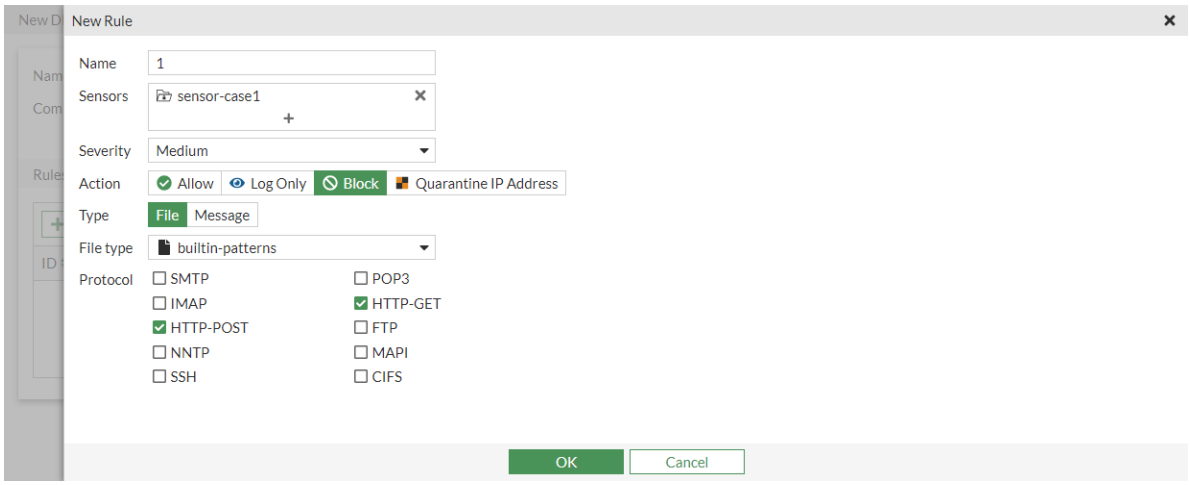
This configuration will block HTTPS upload traffic that includes credit card information. The pre-defined data type for credit card is used in the dictionary.



To block HTTPS upload traffic that includes credit card information in the GUI:

1. Configure the DLP dictionary:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Dictionaries* tab, and click *Create New*.
   b. Enter a name (*dic-case1*).
   c. In the *Dictionary Entries* section, click *Create New*.
   d. Set the *Type* to *credit-card* and click *OK*.

e. Click *OK* to save the dictionary.



2. Configure the DLP sensor:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Sensors* tab, and click *Create New*.
   b. Enter a name (*sensor-case1*).
   c. In the *Sensor Entries* section, click *Create New*.
   d. Set the *Dictionary* to *dic-case1* and click *OK*.

   e. Click *OK* to save the sensor.
3. Configure the DLP profile:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Profiles* tab, and click *Create New*.
   b. Enter a name (*profile-case1*).
   c. In the *Rules* section, click *Create New*.
   d. Configure the following settings:

Name	*1*
Sensors	*sensor-case1*
Severity	*Medium*

Action	*Block*
Type	*File*
File type	*builtin-patterns*
Protocol	*HTTP-POST*, *HTTP-GET*

e. Click *OK*.

f. Click *OK* to save the profile.

4. Add the DLP profile to a firewall policy:

a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.

b. Set the *Inspection Mode* to *Proxy-based*.

c. In the *Security Profiles* section, enable *DLP Profile* and select *profile-case1*.

d. Configure the other settings as needed.

e. Click *OK*.

When a credit card is included in HTTP POST traffic, the file is blocked and a DLP log is generated.

To block HTTPS upload traffic that includes credit card information in the CLI:

1. Configure the DLP dictionary:

```
config dlp dictionary
    edit "dic-case1"
        config entries
            edit 1
                set type "credit-card"
            next
        end
    next
end
```

2. Configure the DLP sensor:

```
config dlp sensor
    edit "sensor-case1"
        config entries
            edit 1
```

```
                set dictionary "dic-case1"
            next
        end
    next
end
```

3. Configure the DLP profile:

```
config dlp profile
    edit "profile-case1"
        set feature-set proxy
        config rule
            edit 1
                set name "1"
                set proto http-get http-post
                set filter-by sensor
                set file-type 1
                set sensor "sensor-case1"
                set action block
            next
        end
    next
end
```

4. Add the DLP profile to a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set dlp-profile "profile-case1"
        set nat enable
    next
end
```

When a credit card is included in HTTP POST traffic, a replacement message appears because it is blocked. A DLP log is generated.

Sample log

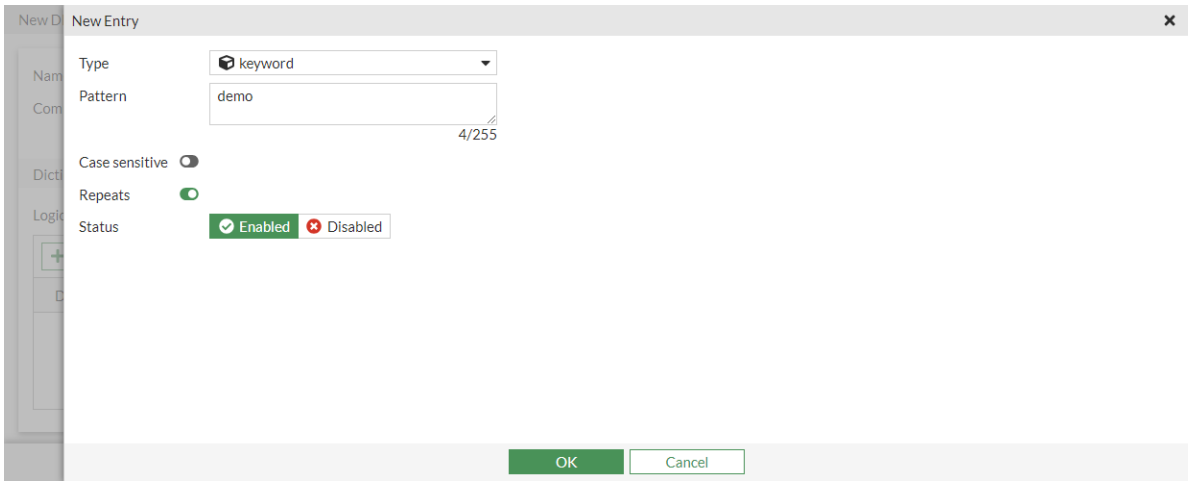
From Windows, the following command can be used to generate a sample log, using the cURL tool to post data, which contains a sample credit card number:

```
# curl -k -d 4024007149133315 https://172.16.200.55/card.doc -o?

1: date=2022-10-26 time=11:25:01 eventtime=1666808700281057923 tz="-0700" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root" ruleid=1 rulename="1"
```

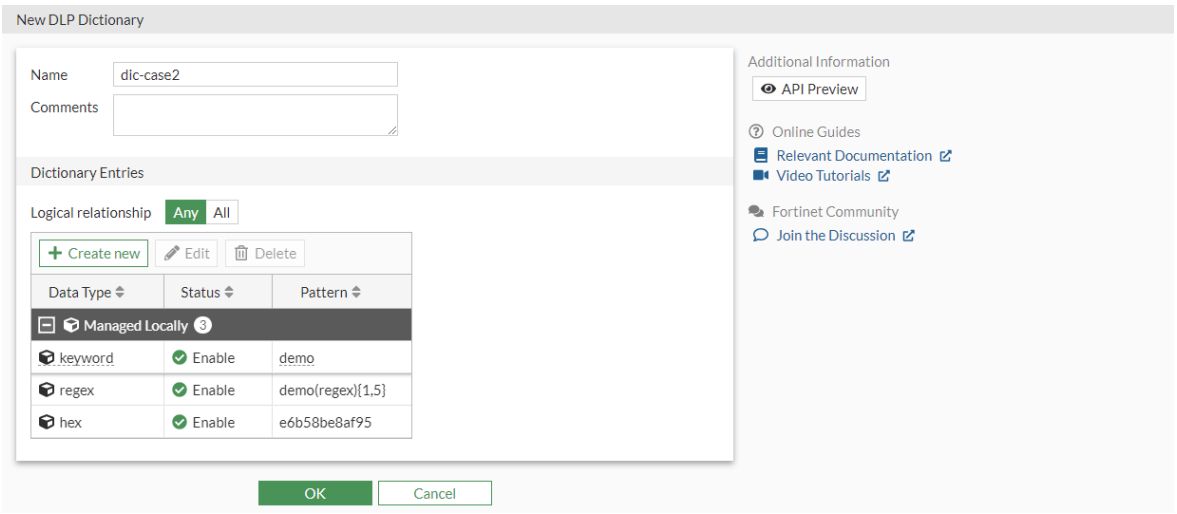
```
dlpextra="builtin-patterns;sensor-case1" filtertype="sensor" filtercat="file"
severity="medium" policyid=1 poluuid="891a526a-51cd-51ed-577a-6505bec88af9"
policytype="policy" sessionid=3905 epoch=2143297701 eventid=0 srcip=10.1.100.11
srcport=40370 srccountry="Reserved" srcintf="port2" srcintfrole="undefined"
srcuuid="502d2c8e-51cd-51ed-a24e-a091f4ff6fed" dstip=172.16.200.55 dstport=443
dstcountry="Reserved" dstintf="port1" dstintfrole="undefined" dstuuid="502d2c8e-51cd-51ed-
a24e-a091f4ff6fed" proto=6 service="HTTPS" filetype="msoffice" direction="outgoing"
action="block" hostname="172.16.200.55" url="https://172.16.200.55/card.doc"
agent="curl/7.83.1" httpmethod="POST" filename="card.doc" filesize=108 profile="profile-
case1"
```

Log FTP upload traffic with a specific pattern



This configuration will log FTP upload traffic with the following patterns:

- keyword = demo
- regex = demo(regex){1,5}
- hex = e6b58be8af95



The dictionary entries have repeat match enabled. The DLP sensor is set so this is repeated five times.

To log FTP upload traffic that has specific keyword, regex, and hex patterns repeated for five times in the GUI:

1. Configure the DLP dictionary with three entries:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Dictionaries* tab, and click *Create New*.
   b. Enter a name (*dic-case2*).
   c. In the *Dictionary Entries* section, click *Create New*.
   d. Set the *Type* to *keyword* and the *Pattern* to *demo*.
   e. Enable *Repeats* and click *OK*.

   f. Repeat these steps to add dictionary entries for the following (with *Repeats* enabled):
      i. Set the *Type* to *regex* and the *Pattern* to *demo(regex){1,5}*.
      ii. Set the *Type* to *hex* and the *Pattern* to *e6b58be8af95*.

g. Click *OK* to save the dictionary.

2. Configure the DLP sensor:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Sensors* tab, and click *Create New*.
   b. Enter a name (*sensor-case2*).
   c. In the *Sensor Entries* section, click *Create New*.
   d. Set the *Dictionary* to *dic-case2*, set the *Count* to *5*, and click *OK*.

   e. Click *OK* to save the sensor.

3. Configure the DLP profile:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Profiles* tab, and click *Create New*.
   b. Enter a name (*profile-case2*).
   c. In the *Rules* section, click *Create New*.
   d. Configure the following settings:

Name	*1*
Sensors	*sensor-case2*

Severity	*Medium*
Action	*Block*
Type	*File*
File type	*builtin-patterns*
Protocol	*FTP*

e. Click *OK*.

f. Click *OK* to save the profile.

4. Add the DLP profile to a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Set the *Inspection Mode* to *Proxy-based*.
   c. In the *Security Profiles* section, enable *DLP Profile* and select *profile-case2*.
   d. Configure the other settings as needed.
   e. Click *OK*.
5. Upload a Word document that contains "demo, demo, demo, demoregexregex," using FTP.
   A DLP log is generated after the FTP traffic passes.

To log FTP upload traffic that has specific keyword, regex, and hex patterns repeated for five times in the CLI:

1. Configure the DLP dictionary:

```
config dlp dictionary
    edit "dic-case2"
        config entries
            edit 1
                set type "keyword"
                set pattern "demo"
                set repeat enable
            next
            edit 2
                set type "regex"
                set pattern "demo(regex){1,5}"
```

```
                set repeat enable
            next
            edit 3
                set type "hex"
                set pattern "e6b58be8af95"
                set repeat enable
            next
        end
    next
end
```

2. Configure the DLP sensor:

```
config dlp sensor
    edit "sensor-case2"
        config entries
            edit 1
                set dictionary "dic-case2"
                set count 5
            next
        end
    next
end
```

3. Configure the DLP profile:

```
config dlp profile
    edit "profile-case2"
        set feature-set proxy
        config rule
            edit 1
                set proto ftp
                set filter-by sensor
                set file-type 1
                set sensor "sensor-case2"
                set action block
            next
        end
    next
end
```

4. Add the DLP profile to a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
```

```
            set dlp-profile "profile-case2"
            set nat enable
        next
    end
```

5. Upload a Word document that contains "demo, demo, demo, demoregexregex," using FTP.
   A DLP log is generated after the FTP traffic passes.

Sample log

```
1: date=2022-10-26 time=12:37:57 eventtime=1666813077679725858 tz="-0700" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root" ruleid=1 rulename="1"
dlpextra="builtin-patterns;sensor-case2" filtertype="sensor" filtercat="file"

filesize=26624 profile="profile-case2"
```

Block HTTPS downloads of EXE files and log HTTPS downloads of files larger than 500 KB

FortiGate can detect any file larger than the configured limit. See File size filtering on page 1843 for more information.

This configuration will block HTTPS downloads of EXE files and log HTTPS downloads of files larger than 500 KB.

To block HTTPS download of EXE files and log downloads larger than 500 KB:

1. Configure the DLP file pattern:

```
config dlp filepattern
    edit 3
        set name "case3-exe"
        config entries
            edit "exe"
                set filter-type type
                set file-type exe
            next
        end
    next
end
```

2. Configure the DLP profile:

```
config dlp profile
    edit "profile-case3-type-size"
        config rule
            edit 1
                set proto http-get
                set filter-by none
                set file-type 3
                set action block
            next
```

```
            edit 2
                set proto http-get
                set filter-by none
                set file-size 500
                set action log-only
            next
        end
    next
end
```

3. Add the DLP profile to a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "custom-deep-inspection"
        set dlp-profile "profile-case3-type-size"
        set logtraffic all
        set nat enable
    next
end
```

4. Download an EXE file using HTTPS. The download is blocked, a replacement message appears, and a DLP log is generated.

Sample log

```
1: date=2022-02-15 time=11:54:29 eventtime=1644954869682887856 tz="-0800" logid="0954024577"
type="utm" subtype="dlp" eventtype="dlp" level="notice" vd="root" ruleid=2 dlpextra="500 kB"
filtertype="none" filtercat="file" severity="medium" policyid=1 poluuid="905fb604-7ed4-51ec-
0853-79e498591bf8" policytype="policy" sessionid=12082 epoch=901683674 eventid=0

dstuuid="358d0f56-7ed4-51ec-50f7-a5e4525a641d" proto=6 service="HTTPS" direction="incoming"
action="log-only" hostname="2.na.dl.wireshark.org"
url="https://2.na.dl.wireshark.org/win64/Wireshark-win64-3.6.2.exe" agent="curl/7.61.1"
filename="Wireshark-win64-3.6.2.exe" filesize=10502090 profile="profile-case3-type-size"
```

Block HTTPS upload traffic that includes Visa or Mastercard information using evaluation through logical expression

This example will allow users to create a subset of the existing DLP data type, *credit-card*. It can be very beneficial for an organization that wants to prevent only certain types of credit cards and not all.

This configuration will block HTTPS traffic that includes Visa or Mastercard information. Two dictionary entries with DLP data-type regex are created with custom patterns to match Visa and Mastercard numbers respectively, and a third dictionary entry is created with pre-defined data type *credit-card*. All three entries are used in the sensor using evaluation via logical expression to further supplement the detection.

In the CLI, evaluation via logical expression can be defined using the command `match-eval`. It is a tool used to combine multiple entries to define an accurate DLP sensor.

Sample topology

In this example, a Microsoft Office document with Visa credit card information is sent securely to the receiver using the HTTP POST method. The FortiGate intercepts the traffic using deep inspection and blocks the traffic as it matches the DLP profile configured on this FortiGate.

To block HTTPS upload traffic that includes Visa or Mastercard credit card information in the GUI:

1. Configure the DLP dictionary:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Dictionaries* tab, and click *Create New*.
   b. Create an entry for Visa:
      i. Enter a name (*Finance_Credit_Card_Visa*).
      ii. In the *Dictionary Entries* section, click *Create New*.
      iii. Set the *Type* to *regex*.
      iv. Set *Pattern* to *4[0-9]{12}(?:[0-9]{3})* and click *OK*.
      v. Click *OK* to save the dictionary.
   c. Create an entry for Mastercard:
      i. Enter a name (*Finance_Credit_Card_Mastercard*).
      ii. In the *Dictionary Entries* section, click *Create New*.
      iii. Set the *Type* to *regex*.
      iv. Set *Pattern* to *(?:5[1-5][0-9]{2}|222[1-9]|22[3-9][0-9]|2[3-6][0-9]{2}|27[01][0-9]|2720)[0-9]{12}* and click *OK*.
      v. Click *OK* to save the dictionary.
   d. Create an entry for Credit Card:
      i. Enter a name (*CC_Number*).
      ii. In the *Dictionary Entries* section, click *Create New*.
      iii. Set the *Type* to *credit-card* and click *OK*.
      iv. Click *OK* to save the dictionary.
2. Configure the DLP sensor:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Sensors* tab, and click *Create New*.
   b. Enter a name (*Finance_Credit_Card_High*).
   c. In the *Sensor Entries* section, click *Create New*.
   d. Set the *Dictionary* to *Finance_Credit_Card_Visa* and click *OK*.
   e. Repeat the previous step twice to add *Finance_Credit_Card_Mastercard* and *CC_Number* in this order.
   f. Click *OK* to save the sensor.

g. Edit the newly created sensor.
h. Set the *Logical relationship* to *Evaluate*.
i. In the *Evaluated by* field, enter *(dict(1) > 0 && dict(3) > 0) || (dict(2) > 0 && dict(3) > 0)*.
j. Click *OK* to save the sensor.

For the DLP sensor with the *Logical relationship* set to *Evaluate*, *Count* and *Status* of any sensor entry will be ignored.

3. Configure the DLP profile:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Profiles* tab, and click *Create New*.
   b. Enter a name (*cc-block*).
   c. In the *Rules* section, click *Create New*.
   d. Configure the following settings:

Name	*1*
Sensors	*Finance Credit Card High*
Severity	*Critical*
Action	*Block*
Type	*File*
File type	*builtin-patterns*
Protocol	*HTTP-POST*, *HTTP-GET*

   e. Click *OK*.
   f. Click *OK* to save the profile.
4. Add the DLP profile to a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Set the *Inspection Mode* to *Proxy-based*.
   c. In the *Security Profiles* section, enable *DLP Profile* and select *cc-block*.
   d. Set *SSL Inspection* to *deep-inspection* to inspect HTTPS traffic.
   e. Configure the other settings as needed.
   f. Click *OK*.

When a Visa or Mastercard credit card is included in HTTP GET or POST traffic, the file is blocked and a DLP log is generated. See the Sample log on page 1873 for details on how to test this configuration.

To block HTTPS upload traffic that includes Visa or Mastercard credit card information in the CLI:

1. Configure the DLP dictionary:

```
config dlp dictionary
    edit "Finance_Credit_Card_Visa"
        config entries
            edit 1
                set type "regex"
                set pattern "4[0-9]{12}(?:[0-9]{3})"
```

```
                set repeat enable
                set comment "Visa"
            next
        end
    next
    edit "Finance_Credit_Card_Mastercard"
        config entries
            edit 1
                set type "regex"
                set pattern "(?:5[1-5][0-9]{2}|222[1-9]|22[3-9][0-9]|2[3-6][0-9]{2}|27
[01][0-9]|2720)[0-9]{12}"
                set repeat enable
                set comment "Mastercard"
            next
        end
    next
    edit "CC_Number"
        config entries
            edit 1
                set type "credit-card"
            next
        end
    next
end
```

To use "?" in a regex pattern, see CLI basics on page 43. This method only supports direct console connection and SSH. It does not support the CLI console in the GUI.

2. Configure the DLP sensor:

```
config dlp sensor
    edit "Finance_Credit_Card_High"
        config entries
            edit 1
                   set dictionary "Finance_Credit_Card_Visa"
            next
            edit 2
                set dictionary "Finance_Credit_Card_Mastercard"
            next
            edit 3
                set dictionary "CC_Number"
            next
        end
        set match-type match-eval
        set eval "(dict(1) > 0 && dict(3) > 0) || (dict(2) > 0 && dict(3) > 0)"
    next
end
```

3. Configure the DLP profile:

```
config dlp profile
    edit "cc_block"
        set feature-set proxy
        config rule
            edit 1
```

```
                set name "1"
                set severity critical
                set proto http-get http-post
                set filter-by sensor
                set file-type 1
                set sensor "Finance_Credit_Card_High"
                set action block
            next
        end
    next
end
```

4. Add the DLP profile to a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set dlp-profile "cc_block"
        set nat enable
    next
end
```

When a Visa or Mastercard credit card is included in HTTP GET or POST traffic, a replacement message appears because it is blocked. A DLP log is generated. See the Sample log on page 1873 for details on how to test this configuration.

Sample log

From Windows, the following command can be used to generate a sample log via HTTP POST traffic, using the cURL tool to post data, which contains a sample Visa credit card number:

```
# curl -k -d 4024007149133315 https://192.168.10.13/cc.doc -o?

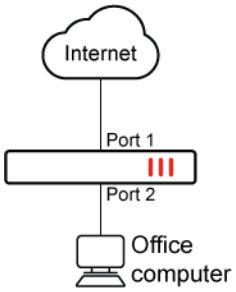
1: date=2023-03-17 time=15:37:41 eventtime=1679092660998869199 tz="-0700" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root" ruleid=1 rulename="1"
dlpextra="builtin-patterns;Finance_Credit_Card_High" filtertype="sensor" filtercat="file"
severity="critical" policyid=1 poluuid="26540ed0-ae54-51ed-80eb-89af8af4d53f"
policytype="policy" sessionid=14854 epoch=570215534 eventid=0 srcip=172.20.120.13
srcport=58012 srccountry="Reserved" srcintf="port2" srcintfrole="undefined"
srcuuid="3342cb44-9140-51ed-5dbe-8e0787bedeec" dstip=192.168.10.13 dstport=443
dstcountry="Reserved" dstintf="port3" dstintfrole="wan" dstuuid="3342cb44-9140-51ed-5dbe-
8e0787bedeec" proto=6 service="HTTPS" filetype="msoffice" direction="incoming"
action="block" hostname="192.168.10.13" url="https://192.168.10.13/cc.doc"
agent="curl/7.83.1" httpmethod="POST" filename="cc.doc" filesize=12288 profile="cc-block"
```

Block access to LLM applications using keywords and FQDN

Large language models (LLMs), such as GPT, are widely used in applications like chatbots. This configuration will block HTTPS upload traffic to LLM applications that include sensitive keywords. The pre-defined data type, keyword, is used in the Data Loss Prevention (DLP) dictionary.

To entirely prevent access to LLM applications, use a web filter profile with the FortiGuard *Artificial Intelligence Technology* category set to block. See Configuring web filter profiles to block AI and cryptocurrency on page 1658 for more information.

To confirm that the URL of the LLM application that you need to block is in the *Artificial Intelligence Technology* category. The URL category can be verified using the FortiGuard Web Filter Lookup.



When utilizing commonly-used SSL-encrypted protocols such as HTTPS, SMTPS, POP3S, IMAPS, and FTPS, SSL inspection must be set to Deep Inspection. See Deep inspection on page 1899 for more information.

Additionally, the client machine must have the corresponding deep inspection Certificate Authority (CA) certificate installed.

Example

In this example, a user is conducting a search on an LLM application in the Chrome browser on an office computer, using a sensitive keyword that has been configured in the DLP dictionary. The FortiGate intercepts this traffic using deep inspection and prevents the search that contains sensitive keywords because it matches the DLP profile that has been set up on this FortiGate.

When a sensitive keyword is included in HTTPS upload traffic, the request is blocked and a DLP log is generated.

To block HTTPS upload traffic that includes sensitive keywords in the GUI:

1. Configure the DLP dictionary:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Dictionaries* tab, then click *Create New*.
   b. Set *Name* to *llmapps*.
   c. In the *Dictionary Entries* table click *Create New*:
      i. Set *Type* to *keyword*.
      ii. Set *Pattern* to *fortinet*.
      iii. Enable *Case sensitive*.
      iv. Click *OK*.

   d. Repeat step c and set *Pattern* to *source code*.
   e. Click *OK*.
2. Configure the DLP sensor:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Sensors* tab, then click *Create New*.
   b. Set *Name* to *llmapps*.
   c. In the *Sensor Entries* section, click *Create New*:
      i. Set the *Dictionary* to *llmapps* then click *OK*.
   d. Click *OK*.
3. Configure the DLP profile:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Profiles* tab, then click *Create New*.
   b. Set *Name* to *llmapps*.
   c. In the *Rules* section, click *Create New*:
      i. Configure the following settings:

Name	llmapps1
Sensors	llmapps
Severity	Critical
Action	Block
Type	File
File type	builtin-patterns
Protocol	HTTP-POST

      ii. Click *OK*.
   d. In the *Rules* section, click *Create New* again:
      i. Configure the following settings:

Name	llmapps2
Sensors	llmapps
Severity	Critical
Action	Block
Type	Message
Protocol	HTTP-POST

      ii. Click *OK*.
   e. Click *OK* to save the profile.
   f. Unset the file type option to enable filtering of all file types, including unknown ones:

```
config dlp profile
    edit "llmapps"
        config rule
            edit 1
                unset file-type
            next
```

```
            end
        next
    end
```

4. Configure the firewall address for the LLM application:
   a. Go to *Policy & Objects* > *Addresses*, select the *Standard* tab, then click *Create New*.
   b. Set the following:

Name	<name>
Type	FQDN
FQDN	See FQDN on page 1878 for the FQDN on the specific LLM application.

   c. Click *OK*.
5. Add the firewall address to a group:
   a. Go to *Policy & Objects* > *Addresses*, select the *Address Group* tab, then click *Create New*.
   b. Set the following:

Group name	llmapps
Members	ChatGpt, AmazonQ, Gemini

6. Add the DLP profile and the address group to a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Set the *Inspection Mode* to *Proxy-based*.
   c. Set the *Destination* to *llmapps*.
   d. In the *Security Profiles* section:
      i. Enable *Application control* and select the profile that *QUIC* is blocked in. In this example, the *default* profile is selected.
      ii. Enable *DLP Profile* and select *llmapps*.
   e. Set *SSL Inspection* to *deep-inspection*.
   f. Configure the other settings as needed.
   g. Click *OK*.

When using a DLP profile in a proxy-based firewall policy, it is recommended to block the QUIC protocol in application control profiles (see Blocking QUIC manually on page 1722). By default, FortiOS can only inspect QUIC traffic in HTTP3 in flow mode. By explicitly blocking QUIC in application control, most traffic utilizing the QUIC protocol on UDP/443 reverts to TCP/443 without QUIC, allowing the FortiGate to successfully inspect the traffic.

To block HTTPS upload traffic that includes sensitive keywords in the CLI:

1. Configure the DLP dictionary:

```
config dlp dictionary
    edit "llmapps"
        config entries
            edit 1
                set type "keyword"
                set pattern "source code"
```

```
                set ignore-case enable
            next
            edit 2
                set type "keyword"
                set pattern "fortinet"
                set ignore-case enable
            next
        end
    next
end
```

2. Configure the DLP sensor:

```
config dlp sensor
    edit "amazonQ"
        config entries
            edit 1
                set dictionary "llmapps"
            next
        end
    next
end
```

3. Configure the DLP profile:

```
config dlp profile
    edit "llmapps"
        set feature-set proxy
        config rule
            edit 1
                set name "llmapps1"
                set severity critical
                set proto http-post
                set filter-by sensor
                set sensor "llmapps"
                set action block
            next
            edit 2
                set name "llmapps2"
                set type message
                set proto http-post
                set filter-by sensor
                set sensor "llmapps"
                set action block
            next
        end
    next
end
```

4. Configure the firewall address for the LLM application:

```
config firewall address
    edit <name>
        set type fqdn
        set fqdn <string>
    next
end
```

See FQDN on page 1878 for the FQDN on the specific LLM application.

5. Add the firewall addresses to a group:

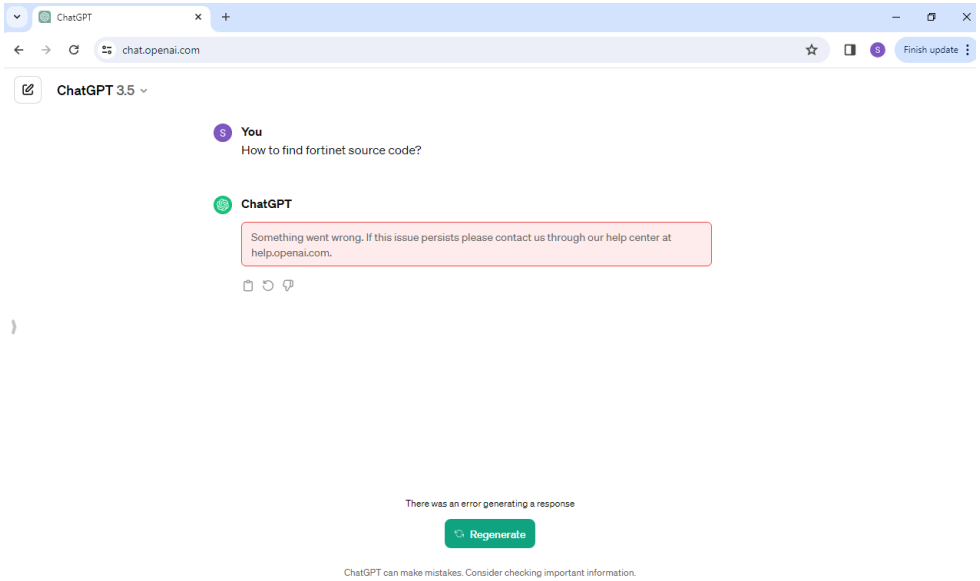
```
config firewall addrgrp
    edit "llmapps"
        set member "ChatGpt" "AmazonQ" "Gemini"
    next
end
```

6. Add the DLP profile and the FQDN address to a firewall policy:

```
config firewall policy
    edit 1
        set name "llmapps "
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "llmapps"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set dlp-profile "llmapps"
        set application-list "default"
        set nat enable
    next
end
```

When using a DLP profile in a proxy-based firewall policy, it is recommended to block the QUIC protocol in application control profiles (see Blocking QUIC manually on page 1722). By default, FortiOS can only inspect QUIC traffic in HTTP3 in flow mode. By explicitly blocking QUIC in application control, most traffic utilizing the QUIC protocol on UDP/443 reverts to TCP/443 without QUIC, allowing the FortiGate to successfully inspect the traffic.

FQDN



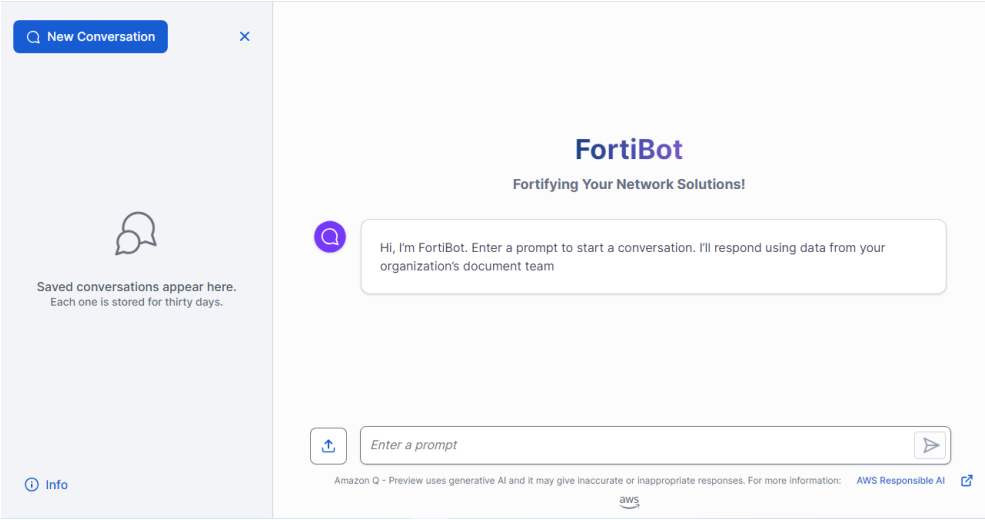
A firewall address should be created for each LLM application:

LLM application	FQDN
ChatGPT	*chat.openai.com*
Amazon Q	*qbusiness.us-west-2.api.aws* The FQDN for the Amazon Q application can vary depending on the region. In this example, the application is deployed in the *US West (Oregon)* region. See Service regions and endpoints.
Gemini	*gemini.google.com*

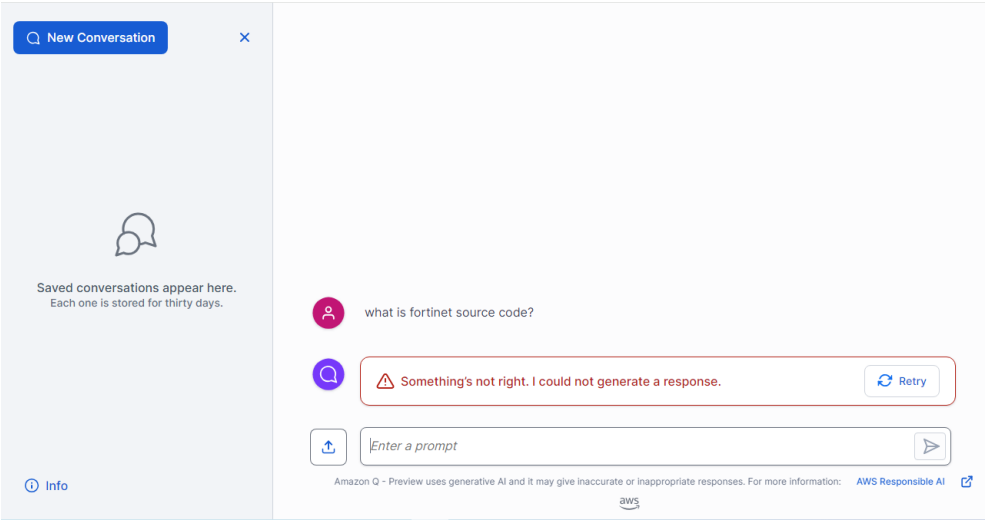
Verification

ChatGPT:

1. Visit https://chat.openai.com.
2. Search for any phrase that includes keywords set up in the DLP dictionary.



3. Verify that the request failed and an error was generated.
4. Review the log that was generated when the attempt was made to send an HTTP POST request containing sensitive keywords:

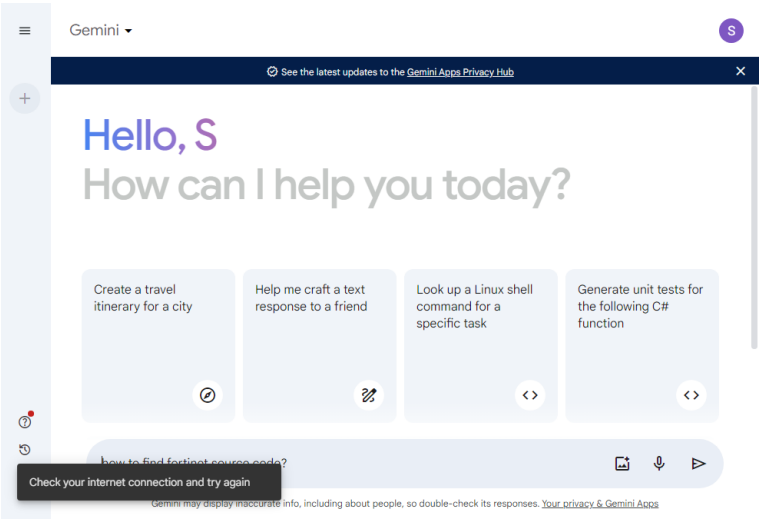


```
1: date=2024-03-15 time=09:59:35 eventtime=1710453575538415503 tz="+1200"
logid="0954024576" type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root"
ruleid=1 rulename="llmapps1" dlpextra="Sensor 'llmapps' matching any: ('llmapps'=1) >=
1; match." filtertype="sensor" filtercat="file" severity="critical" policyid=1
poluuid="eea32b46-db4e-51ee-92a9-b46e5580db33" policytype="policy" sessionid=69254
epoch=424445846 eventid=1 srcip=13.13.13.13 srcport=56747 srccountry="United States"
srcintf="port2" srcintfrole="undefined" srcuuid="d2f06fda-15e7-51ee-0d22-faaf5170dad2"
dstip=104.18.37.228 dstport=443 dstcountry="United States" dstintf="port1"
dstintfrole="undefined"
```

Amazon Q:

1. Visit your deployed Amazon Q application at the deployed URL link.

2. Search for any phrase that includes keywords set up in the DLP dictionary.



3. Verify that the request failed and an error was generated.
4. Review the log that was generated when the attempt was made to send an HTTP POST request containing sensitive keywords:

```
1: date=2024-03-15 time=09:50:29 eventtime=1710453029263609219 tz="+1200"
logid="0954024576" type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root"
ruleid=1 rulename="llmapps1" dlpextra="Sensor 'llmapps' matching any: ('llmapps'=1) >=
1; match." filtertype="sensor" filtercat="file" severity="critical" policyid=1
poluuid="eea32b46-db4e-51ee-92a9-b46e5580db33" policytype="policy" sessionid=68636

Gemini:

1. Visit https://gemini.google.com .
2. Search for any phrase that includes keywords set up in the DLP dictionary.

3. Verify that the request failed and an error was generated.
4. Review the log that was generated when the attempt was made to send an HTTP POST request containing sensitive keywords:

```
1: date=2024-03-15 time=12:46:08 eventtime=1710463568053453203 tz="+1200"

Virtual patching

Virtual patching is a method for mitigating vulnerability exploits against OT devices by applying patches virtually on the FortiGate. This is done in several steps:

1. A FortiGate uses the OT Detection signatures and service to collect device information from OT devices that are connected to an interface.
2. The device information is used to perform a vulnerability lookup by querying FortiGuard for device-specific vulnerabilities and mitigation rules.
3. The FortiGate caches the applicable signatures and mitigation rules that apply to each device, mapped to the MAC address of the device.
4. When a virtual patching profile is applied to a firewall policy, traffic that enters the firewall policy is subject to signature matching on a per-device basis.
   a. The IPS engine uses the MAC address of the device to match any mitigation rules that should apply.
   b. If the MAC address is in the exempted list, then patching is exempted or skipped.
   c. If the signature rule is in the exempted list, then patching is also exempted or skipped for that signature.
   d. Otherwise, all applicable rules for the device will be applied.

Virtual patching profiles

A virtual patching profile can be applied to firewall policies in any direction, protecting traffic from or to the vulnerable OT devices. Virtual patching profiles can also be combined with virtual patching on NAC policies, so that vulnerable OT devices are first assigned to a protected VLAN, and then firewall policies associated with the VLAN will apply the virtual patching profile. See OT and IoT virtual patching on NAC policies on page 1892 for more information.

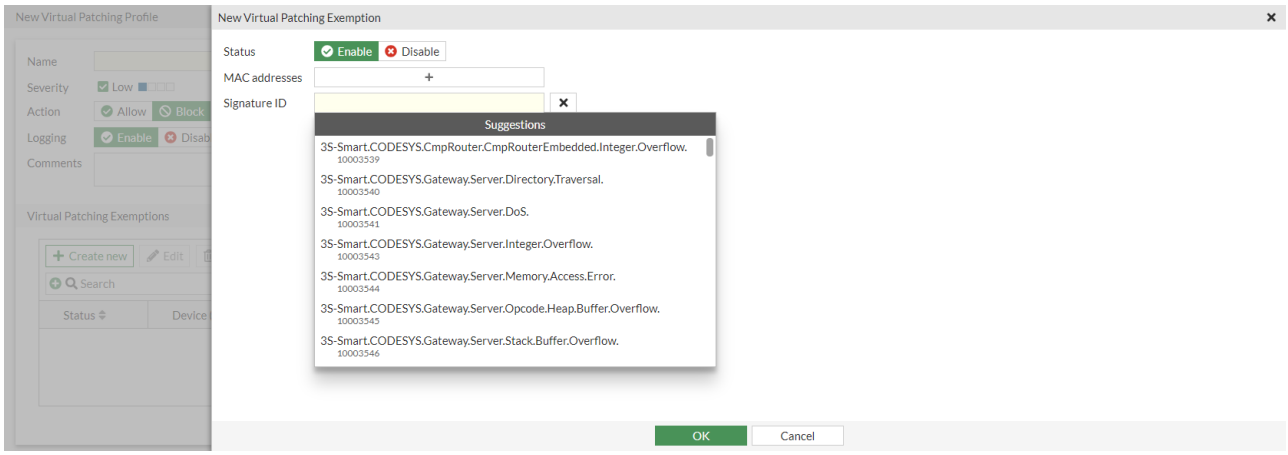
The following are requirements for the virtual patching feature:

- Purchase the appropriate OT-related license (virtual patching only applies to OT devices). See Operational Technology Security Service and License and entitlement information for more details.
- Enable device detection on the LAN interface.
  - In the GUI, go to *Network* > *Interfaces*, edit a LAN interface, enable *Device detection*, and click *OK*.
  - In the CLI, enter:

```
config system interface
    edit <name>
        set device-identification enable
    next
end
```

- Configure a firewall policy with an application control profile in order for device detection to occur. OT device detection collects device information by triggering application control signatures.

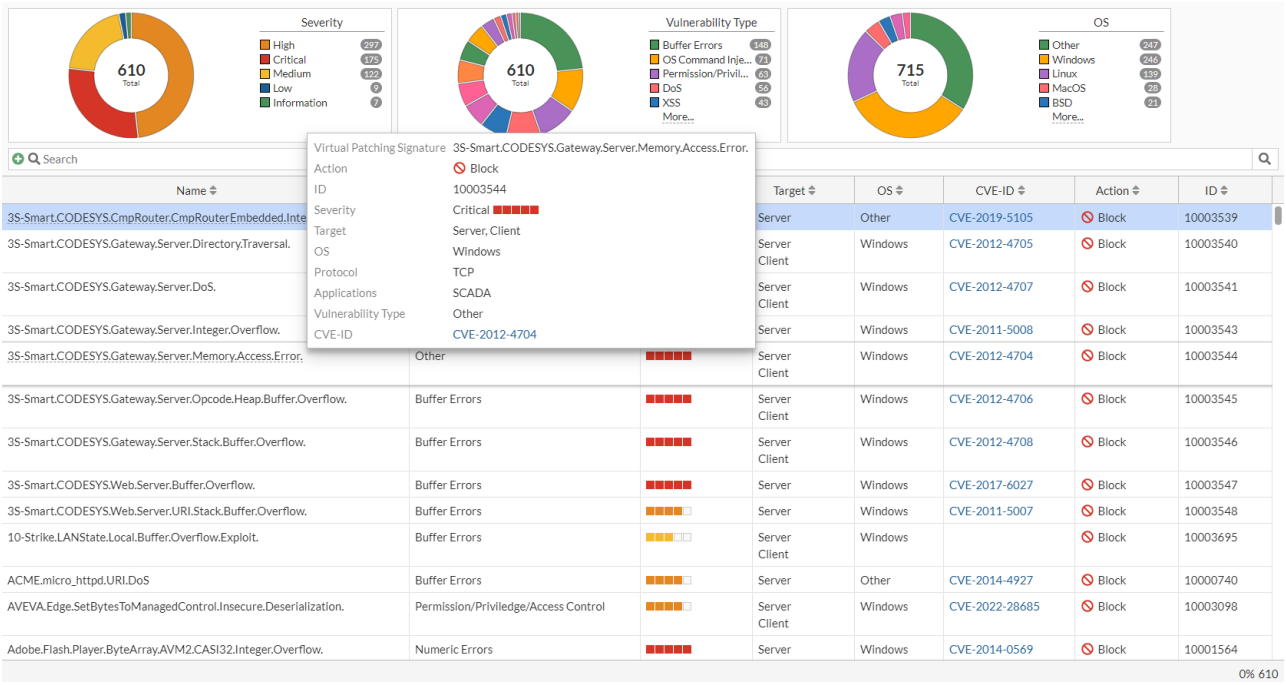
The following options can be configured in a virtual patching profile (see also OT virtual patching basic examples on page 1886):



GUI option	CLI option	Description
Basic profile settings		

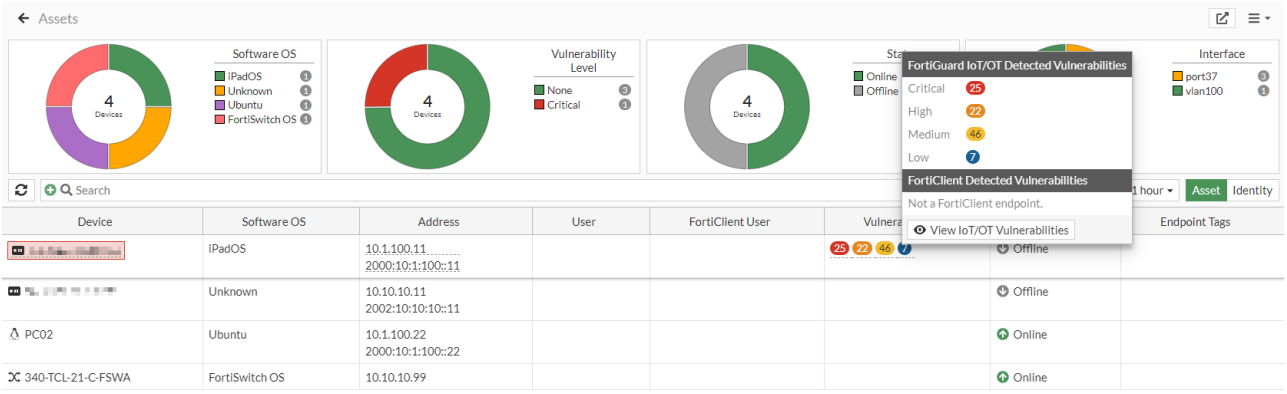
GUI option	CLI option	Description
Name	`name <string>`	Enter a unique name for the profile.
Severity	`severity {low medium high critical}`	Set the relative severity of the signature, from low to critical.
Action	`action {pass | block}`	Set the action to take for a matched device: • *Pass*/`pass`: allow sessions that match the profile. • *Block*/`block`: block sessions that match the profile (default).
Logging	`log {enable | disable}`	Enable/disable detection logging. This setting is enabled by default.
Comments	`comment <var-string>`	Enter a comment (optional).
Virtual patching exemptions settings		
Status	`status {enable | disable}`	Enable/disable exemption.
MAC addresses	`device <mac_address1>, <mac_address2>, ...`	Enter the device MAC addresses to exempt.
Signature ID	`rule <id1>, <id2>, ...`	Enter the pre-defined or custom signatures to exempt. See Virtual patching exemptions for more details.

To configure virtual patching in the GUI, ensure that *Virtual Patching* is enabled on the *System* > *Feature Visibility* page.

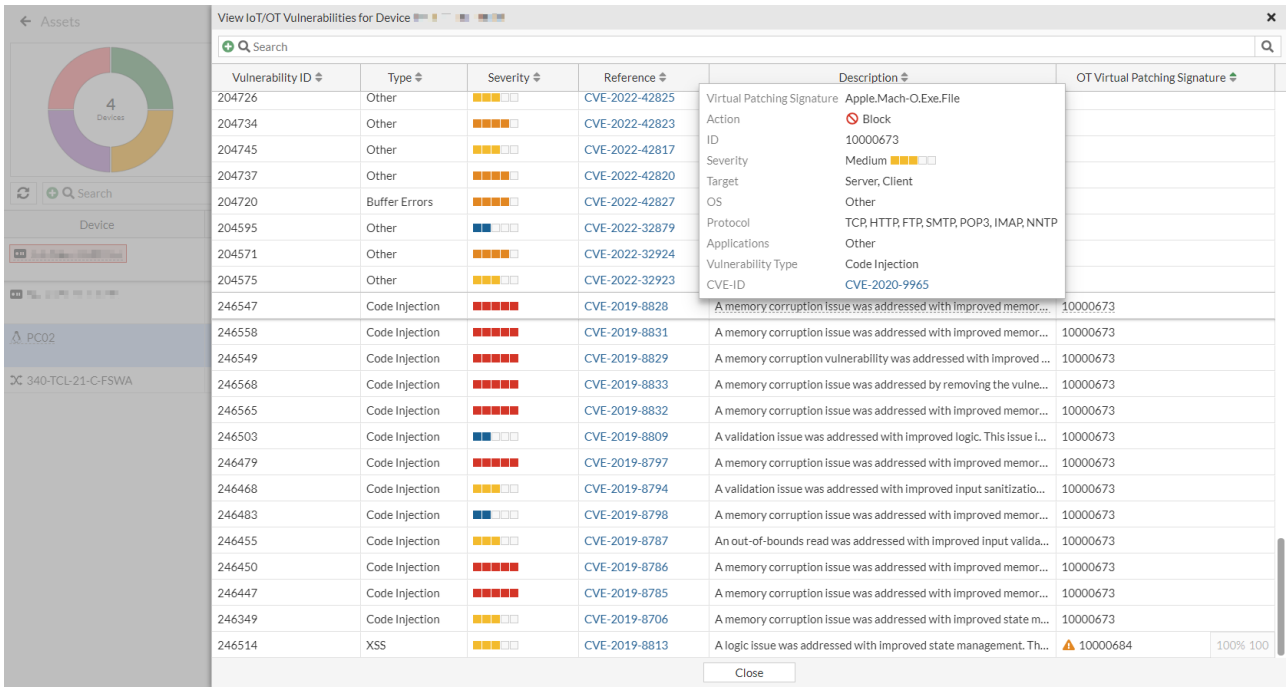


Virtual patching exemptions

The *Signature ID* field includes a dropdown below it with suggestions (signature name and ID). Users can select a signature from the *Suggestions* dropdown or type in the *Signature ID* field to find a specific signature.

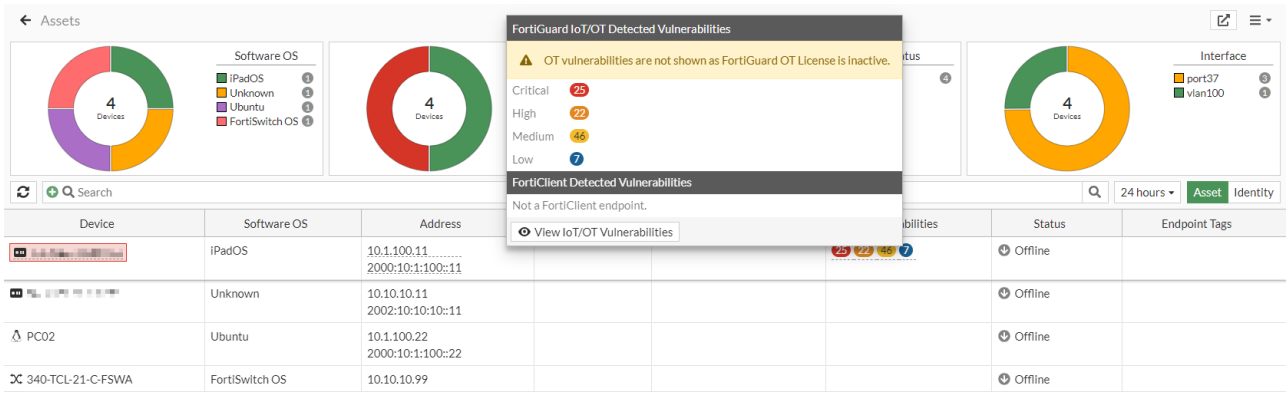


Virtual patching signatures

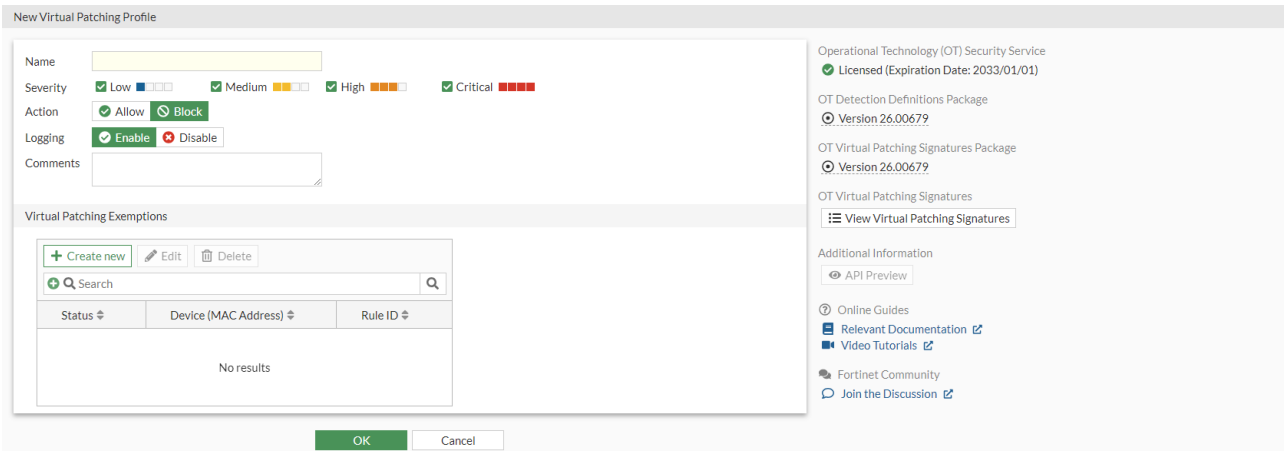


The *Security Profiles* > *Virtual Patching Signatures* page displays all OT virtual patching signatures. When using multi VDOM mode, the OT virtual patching signatures are displayed per VDOM.

The *Dashboard* > *Assets & Identities* > *Assets* widget displays a tooltip for detected IoT and OT vulnerabilities when hovering over the *Vulnerabilities* column.

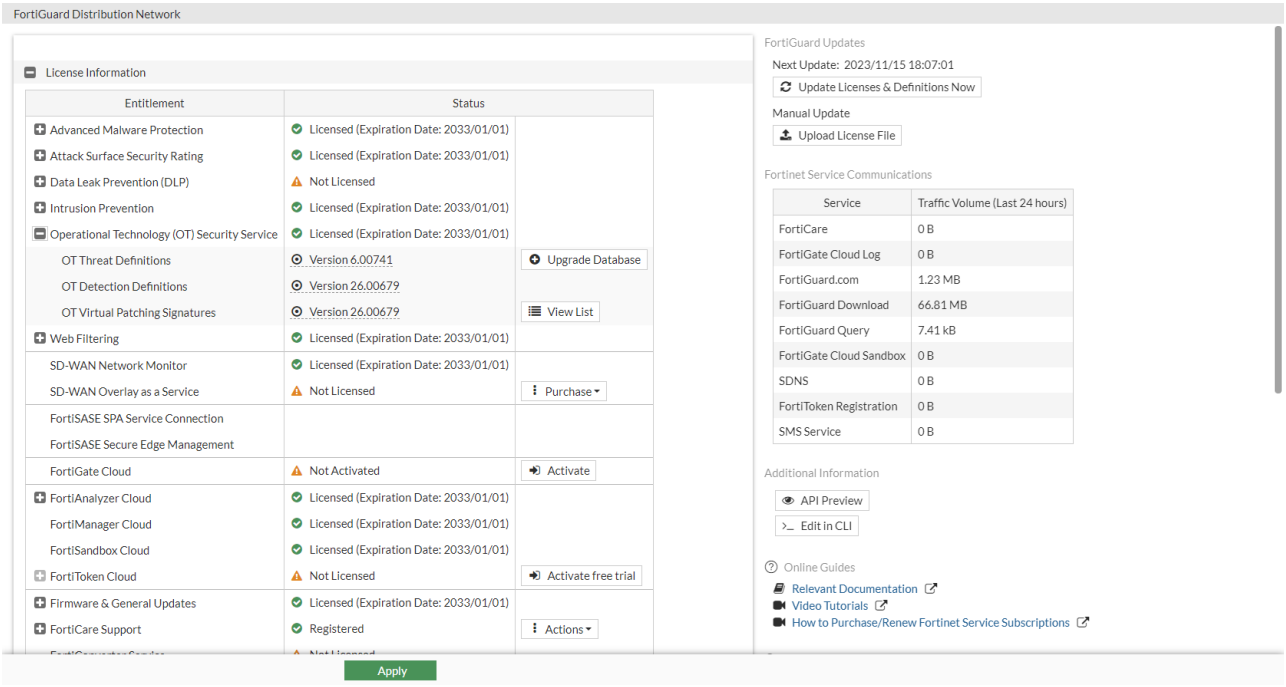


Clicking *View IoT/OT Vulnerabilities* in the tooltip displays a list of vulnerabilities retrieved from the FortiGuard API server for the device. The *OT Virtual Patching Signature* column includes the virtual patch signature ID that is mapped to the *Vulnerability ID*.



License and entitlement information

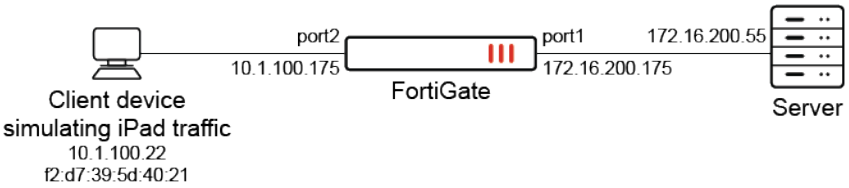
If a FortiGate does not have a valid OT license, a warning message is included in top of the IoT and OT vulnerabilities tooltip (*Assets* widget), indicating that OT vulnerabilities will not be detected.



The right-side gutter of virtual patching profile pages includes information about the following:

- *Operational Technology (OT) Security Service* entitlement status
- *OT Detection Definitions Package* version
- *OT Virtual Patching Signatures Package* version

The *System* > *FortiGuard* page also includes the list of signatures under the *Operational Technology (OT) Security Service* entitlement.



OT virtual patching basic examples

This topic contains two OT virtual patching examples: a basic configuration, and configuration that uses a NAC policy.

Example 1: basic configuration

This example demonstrates the flow for OT virtual patching from start to finish. First, a device (10.1.100.22) goes through device detection, which matches an OT detection signature downloaded on the FortiGate. Next, known vulnerabilities and OT patch signatures for this device are mapped to its MAC address. When traffic is generated by this

device, IPS scans the traffic to identify any traffic patterns that match known OT patch signatures for this device. If a match is found, traffic is blocked by the FortiGate.

For demonstrative purposes, the simulated vulnerable OT device is a PC simulating web traffic from an iPad. An OT detection signature is specially crafted to match this Apple iPad traffic to the OT device category. To simulate vulnerable traffic, a test OT patch signature is used to match a generic cross-site scripting (XSS) attack over HTTP.

To verify the status of the OT related definitions:

1. Verify the current contracts licensed to the FortiGate:

```
# diagnose test update info
…
OTDT,Mon Sep 24 17:00:00 2029
OTVP,Mon Sep 24 17:00:00 2029
…
```

2. Verify the versions and status of the OT definitions:

```
# diagnose autoupdate versions
…
OT Detect Definitions
---------
Version: 23.00545 signed
Contract Expiry Date: Sun Sep 23 2029
Last Updated using manual update on Thu Jul 20 09:40:03 2023
Last Update Attempt: n/a
Result: Updates Installed
--
OT Patch Definitions
---------
Version: 23.00505 signed
Contract Expiry Date: Sun Sep 23 2029
Last Updated using manual update on Thu Jul 20 09:39:50 2023
Last Update Attempt: n/a
Result: Updates Installed
…
```

3. View the OT detection rules downloaded on the FortiGate. In this example, the OT detection rule ID 1000870 is a specially crafted signature to match Apple iPad traffic to the OT category:

```
# get rule otdt status
app-name: "Apple.iPad"
id: 10000870
category: "OT"
cat-id: 34
popularity: 5.low
risk: 1.medium
weight: 10
shaping: 0
```

```
protocol: 1.TCP, 9.HTTP
vendor: 7.Apple
technology: 0.Network-Protocol
behavior:
dev_cat: Other
```

4. View the OT patch rules downloaded on the FortiGate. In this example, the OT patch rule is a specially crafted signature to match a generic XSS attack to a vulnerability:

```
# get rule otvp status
rule-name: "WAP.Generic.XSS"
rule-id: 10000684
rev: 20.321
date: 1653379200
action: pass
status: enable
log: disable
log-packet: disable
severity: 2.medium
service: TCP, HTTP
location: server
os: Other
application: Other
rate-count: 0
rate-duration: 0
rate-track: none
rate-mode: continuous
vuln_type: XSS
cve: 20198625
```

To configure virtual patching in the GUI:

1. Enable device detection on port2 :
   a. Go to *Network* > *Interfaces* and edit port2.
   b. In the *Network* section, enable *Device detection*.
   c. Click *OK*.
2. Configure the virtual patching profile:
   a. Go to *Security Profiles* > *Virtual Patching* and click *Create New*.
   b. Configure the following settings:

Name	*test*
Severity	Select *Low*, *Medium*, *High*, and *Critical*
Action	*Block*
Logging	*Enable*

   c. Click *OK*.
3. Apply the virtual patching profile to a firewall policy for traffic from port2 to port1:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. In the *Security Profiles* section, enable *Virtual Patching* and select the virtual patch profile (*test*).
   c. Enable *Application Control* and select an application control profile (*default*).
   d. Set *SSL Inspection* to a profile that uses deep inspection profile in order to scan SSL encrypted traffic.

e. Configure the other settings as needed.
f. Click *OK*.

To configure virtual patching in the CLI:

1. Enable device detection on port2:

```
config system interface
    edit "port2"
        set device-identification enable
    next
end
```

2. Configure the virtual patching profile:

```
config virtual-patch profile
    edit "test"
        set comment ''
        set severity low medium high critical
        set action block
        set log enable
    next
end
```

3. Apply the virtual patching profile to a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "custom-deep-inspection"
        set application-list "default"
        set virtual-patch-profile "default"
        set nat enable
    next
end
```

To test the virtual patching:

1. On the PC, generate traffic that simulates web traffic from an iPad. This traffic is generated in order for the FortiGate to perform device detection on port2. The OT detection signature 10000870 will be triggered, which considers this traffic from an OT device in this simulated scenario:

```
# curl 172.16.200.55 -H "User-Agent: Mozilla/5.0 (iPad; CPU OS 12_5_5 like Mac OS X)
AppleWebKit/605.1.15 (KHTML, like Gecko) Version/10.1.2 Mobile/15E148 Safari/604.1"
```

A log is generated, indicating the traffic that triggered the match:

```
3: date=2023-07-24 time=15:31:26 eventtime=1690237885960202460 tz="-0700"
logid="1059028704" type="utm" subtype="app-ctrl" eventtype="signature"
level="information" vd="root" appid=10000870 srcip=10.1.100.22 srccountry="Reserved"
```

```
dstip=172.16.200.55 dstcountry="Reserved" srcport=51548 dstport=80 srcintf="port2"
srcintfrole="undefined" dstintf="port1" dstintfrole="undefined" proto=6 service="HTTP"
direction="outgoing" policyid=1 poluuid="a3424268-1ffc-51ed-3ba9-f3a60e2271cf"
policytype="policy" sessionid=7284 applist="default" action="pass" appcat="OT"
app="Apple.iPad" hostname="172.16.200.55" incidentserialno=18882457 url="/"
agent="Mozilla/5.0 (iPad; CPU OS 12_5_5 like Mac OS X) AppleWebKit/605.1.15 (KHTML, like
Gecko) Version/10.1.2 Mobile/15E148 Safari/604.1" httpmethod="GET" msg="OT: Apple.iPad"
clouddevice="Vendor=Apple, Product=ipados, Version=12.5.5, Firmware=IOS" apprisk="low"
```

The FortiGate queries the FortiGuard OT query service with information about the OT device vendor and product. The service responds with the vulnerabilities and patch_sign_id applicable to this device. IPS caches this information in its device vulnerability database.

2. Verify the vulnerability by device MAC and IP address:

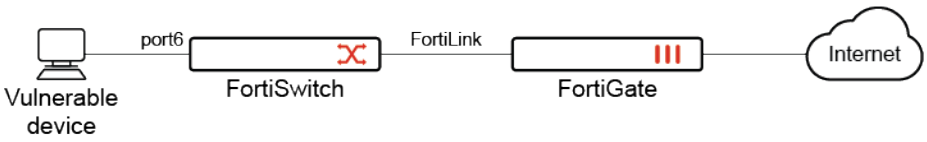
```
# diagnose user-device-store device memory vulnerability-query f2:d7:39:5d:40:21
10.1.100.22
Got 28 vulnerabilities, response size:1792
[Vulnerability-0]
        'vulnerability_id' = '110977'
        'severity' = '2'
        'signature' = '10000684'
```

3. Verify the virtual patch signatures stored and enabled on the FortiGate:

```
# diagnose ips share list otvp_cfgcache
f2:d7:39:5d:40:21 1 10000684
```

4. Using the vulnerable device 10.1.100.22, generate vulnerable traffic to the destination server 172.16.200.55. The traffic from this IP and MAC address triggers OT patch signature 1000684 to match and is subsequently blocked by the firewall policy:

```
# curl -X POST http://172.16.200.55/'index.html?<javascript>'
```



5. Verify the UTM virtual patch log that was recorded with information about the vulnerability that was virtually patched:

```
# execute log filter category 24
# execute log display
2 logs found.
2 logs returned.

1: date=2023-07-20 time=16:03:00 eventtime=1689894179977743851 tz="-0700"
logid="2400064600" type="utm" subtype="virtual-patch" eventtype="virtual-patch"
level="warning" vd="root" count=medium srcip=10.1.100.22 profiletype="Reserved"

service="HTTP" policyid=1 poluuid="a3424268-1ffc-51ed-3ba9-f3a60e2271cf"
policytype="policy" attack="WAP.Generic.XSS" srcport=47830 dstport=80
hostname="172.16.200.55" url="/index.html?<javascript>" agent="curl/7.61.1"
httpmethod="POST" direction="outgoing" attackid=10000684
```

Example 2: NAC policy

In this example, a NAC policy is pre-configured to detect devices with information or higher vulnerabilities, as demonstrated in OT and IoT virtual patching on NAC policies on page 1892. The NAC policy assigns the devices to vlan300.

A virtual patching profile is created to block any vulnerabilities with low, medium, high, or critical severity. The profile is applied to a firewall policy for outbound traffic.

To configure virtual patching in the GUI:

1. Enable device detection on vlan300:
   a. Go to *Network* > *Interfaces* and edit vlan300.
   b. In the *Network* section, enable *Device detection*.
   c. Click *OK*.
2. Configure the virtual patching profile:
   a. Go to *Security Profiles* > *Virtual Patching* and click *Create New*, or edit an existing profile.
   b. Configure the following settings:

Name	*OT_check*
Severity	Select *Low*, *Medium*, *High*, and *Critical*
Action	*Block*
Logging	*Enable*

   c. Click *OK*.
3. Apply the virtual patching profile to a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*, or edit an existing policy.
   b. In the *Security Profiles* section, enable *Virtual Patching* and select the virtual patch profile (*OT_check*).
   c. Enable *Application Control* and select an application control profile (*default*).
   d. Configure the other settings as needed.
   e. Click *OK*.

To configure virtual patching in the CLI:

1. Enable device detection on vlan300:

```
config system interface
    edit "vlan300"
        set device-identification enable
    next
end
```

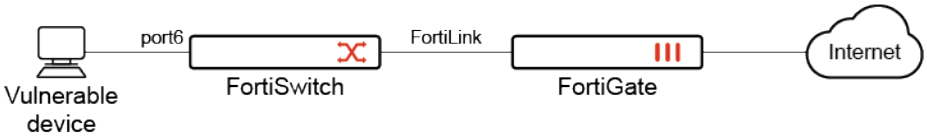
2. Configure the virtual patching profile:

```
config virtual-patch profile
    edit "OT_check"
        set severity low medium high critical
    next
end
```

3. Apply the virtual patching profile to a firewall policy:

```
config firewall policy
    edit 1
        set name "virtualpatch-policy"
        set srcintf "vlan300"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set application-list "default"
        set virtual-patch-profile "OT_check"
        set logtraffic all
    next
end
```

4. Verify the logs:



```
# execute log filter category utm-virtual-patch
# execute log display
...
1: date=2023-06-20 time=16:21:00 eventtime=1686180059982988434 tz="-0700"
logid="2400064600" type="utm" subtype="virtual-patch" eventtype="virtual-patch"
level="warning" vd="root" severity="medium" srcip=10.1.100.11 srccountry="Reserved"
dstip=172.16.200.55 dstcountry="Reserved" srcintf="vlan300" srcintfrole="undefined"
dstintf="port1" dstintfrole="undefined" sessionid=1445 action="dropped" proto=6
service="HTTP" policyid=1 poluuid="ce6b724c-0558-51ee-e9d3-f0b8ef1c115f"
policytype="policy" attack="WAP.Generic.XSS" srcport=37062 dstport=80
hostname="172.16.200.55" url="/index.html?<javascript>" agent="curl/7.61.1"
httpmethod="POST" direction="outgoing" attackid=10000684
ref="http://www.fortinet.com/ids/VID10000684" incidentserialno=214959182 msg="vPatch:
WAP.Generic.XSS" crscore=10 craction=16384 crlevel="medium"
```

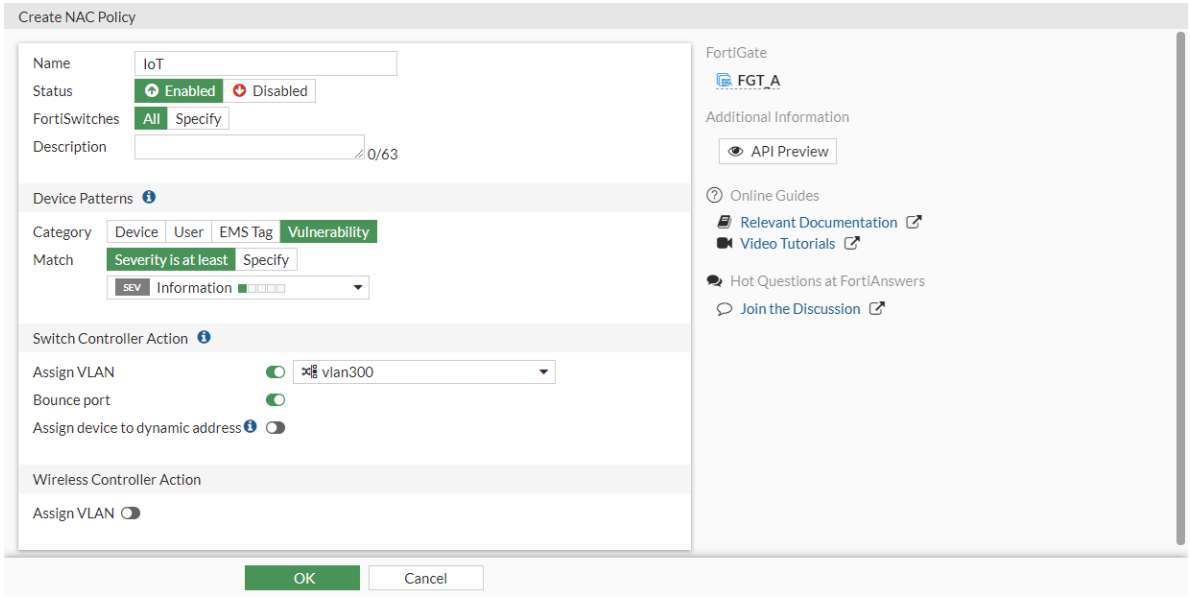
OT and IoT virtual patching on NAC policies

OT and IoT virtual patching can be applied to a NAC policy by setting the category to *Vulnerability* and configuring the *Match* criteria based on severity. Devices that match the criteria can be assigned and isolated to a NAC VLAN.

Example

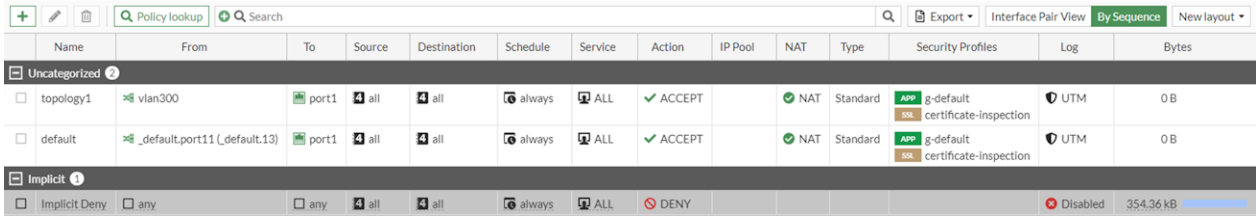
In this example, a device with a certain vulnerability severity is detected by the NAC policy on the FortiGate. Subsequently, the FortiSwitch port in which it is connected to is moved to vlan300 where traffic can be controlled for vulnerable devices. For more information about NAC policies, see Defining a FortiSwitch NAC policy in the FortiLink Administration Guide. This example assumes the vlan300 has already been configured.

The following settings are required for IoT device detection:



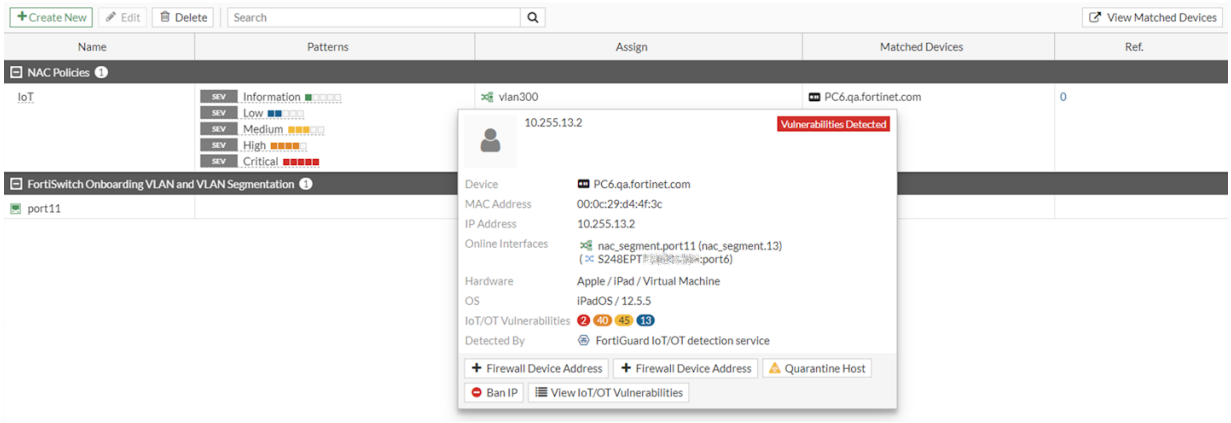
- A valid Attack Surface Security Rating service license to download the IoT signature package.
- Enable device detection on the LAN interface used by IoT devices.
  - In the GUI, go to *Network* > *Interfaces*, edit a LAN interface, enable *Device detection*, and click *OK*.
  - In the CLI, enter:

```
config system interface
    edit <name>
        set device-identification enable
    next
end
```



- Configure a firewall policy with an application control sensor.

To configure virtual patching on NAC policies



1. Configure the NAC policy:
   a. Go to *WiFi & Switch Controller* > *NAC Policies* and click *Create New*, or edit an existing policy.
   b. In the *Device Patterns* section, set *Category* to *Vulnerability*.
   c. Set *Match* to *Severity is at least* and select a severity level (*Information* is used in this example).
   d. In the *Switch Controller Action* section, enable *Assign VLAN* and select *vlan300*.

   e. Configure the other settings as needed.
   f. Click *OK*.
2. Enable NAC mode on the desired FortiSwitch ports (port6 in this example):
   a. Go to *WiFi & Switch Controller* > *FortiSwitch Ports*.
   b. Select *port6*, then right-click and set the *Mode* to *NAC*.
3. Enable application control on the firewall policy that is used to control outbound internet access for vulnerable devices (vlan300 to port1)

4. Generate traffic on the vulnerable client device.
5. Once the NAC policy is matched, go to *WiFi & Switch Controller* > *NAC Policies* to view the device matched to the policy.

The vulnerable device is also shown on *Dashboards* > *Assets & Identities* in the *Matched NAC Devices* widget.

To configure virtual patching on NAC policies in the CLI:

1. Configure the VLAN in the MAC policy:

```
config switch-controller mac-policy
    edit "IoT"
        set fortilink "fortilink"
        set vlan "vlan300"
    next
end
```

2. Configure the NAC policy:

```
config user nac-policy
    edit "IoT"
        set category vulnerability
        set severity 0 1 2 3 4
        set switch-fortilink "fortilink"
```

```
        set switch-mac-policy "IoT"
    next
end
```

3. Enable NAC mode on the desired FortiSwitch ports:

```
config switch-controller managed-switch
    edit "S248E***********"
        config ports
            edit "port6"
                set access-mode nac
            next
        end
    next
end
```

4. Configure a firewall policy to limit access for devices in this VLAN (vlan300).

SSL & SSH Inspection

Secure Sockets Layer (SSL) content scanning and inspection allows you to apply antivirus scanning, web filtering, and email filtering to encrypted traffic. You can apply SSL inspection profiles to firewall policies.

FortiOS includes four preloaded SSL/SSH inspection profiles, three of which are read-only and can be cloned:

- *certificate-inspection*
- *deep-inspection*
- *no-inspection*

The *custom-deep-inspection* profile can be edited, or you can create your own SSL/SSH inspection profiles.

Deep inspection (also known as SSL/SSH inspection) is typically applied to outbound policies where destinations are unknown. Depending on your policy requirements, you can configure the following:

- Which CA certificate will be used to decrypt the SSL encrypted traffic
- Which SSL protocols will be inspected
- Which ports will be associated with which SSL protocols for inspection
- Whether or not to allow invalid SSL certificates
- Whether or not SSH traffic will be inspected
- Which addresses or web category allowlists can bypass SSL inspection

The following topics provide information about SSL & SSH Inspection:

- Configuring an SSL/SSH inspection profile on page 1896
- Certificate inspection on page 1898
- Deep inspection on page 1899
- Protecting an SSL server on page 1902
- Handling SSL offloaded traffic from an external decryption device on page 1903
- SSH traffic file scanning on page 1905
- Redirect to WAD after handshake completion on page 1907
- HTTP/2 support in proxy mode SSL inspection on page 1908

- Define multiple certificates in an SSL profile in replace mode on page 1909
- Disabling the FortiGuard IP address rating on page 1911

Configuring an SSL/SSH inspection profile

The *custom-deep-inspection* profile can be edited or new SSL/SSH inspection profiles can be configured to be used in firewall policies.

To configure an SSL/SSH inspection profile in the GUI:

1. Go to *Security Profiles* > *SSL/SSH Inspection* and click *Create New*.
2. Configure the following settings:

Name	Enter a unique name for the profile.
Comments	Enter a comment (optional).
SSL Inspection Options	
Enable SSL Inspection of	Enable SSL inspection of: • *Multiple Clients Connecting to Multiple Servers*: Use this option for generic policies where the destination is unknown. This is normally used when inspecting outbound internet traffic. Other *SSL Inspection Options* become available to configure if this option is selected. • *Protecting SSL Server*: Use this option when setting up a profile customized for a specific SSL server with a specific certificate. Define the certificate using the *Server certificate* field. See Protecting an SSL server on page 1902 for more information.
Inspection method	Define the inspection method: • *SSL Certificate Inspection*: Only inspects the certificate, by way of the headers up to the SSL/TLS layer, and not the contents of the traffic. • *Full SSL Inspection*: Inspects the SSL/TLS encrypted traffic payload. See Deep inspection on page 1899.
CA certificate	Use the dropdown menu to select one of the installed certificates for the inspection of the packets. Click *Download* to save the certificate.
Blocked certificates	Block or allow potentially malicious certificates. Select *View Blocked Certificates* for a detailed list of blocked certificates, including the listing reason and date.
Untrusted SSL certificates	Configure the action to take when a server certificate is not issued by a trusted CA. • *Allow*: Allow the untrusted server certificate. This is the default value. • *Block*: Block the session. • *Ignore*: This option is for *Full SSL inspection* only. It re-signs the server certificate as trusted. When configured in the GUI for certificate inspection it has no effect and the setting is not saved.

		Click *View Trusted CAs List* to see a list of the factory bundled and user imported CAs that are trusted by the FortiGate.
	Server certificate SNI check	Check the SNI in the help message with the CN or SAN field in the returned server certificate: • *Enable*: If it is mismatched, use the CN in the server certificate for URL filtering. • *Strict*: If it is mismatched, close the connection. • *Disable*: Server certificate SNI check is disabled.
	Enforce SSL cipher compliance	Enable/disable SSL cipher compliance. This option is for *Full SSL inspection* only.
	Enforce SSL negotiation compliance	Enable/disable SSL negotiation compliance. This option is for *Full SSL inspection* only.
	RPC over HTTPS	Enable/disable inspection of Remote Procedure Calls (RPC) over HTTPS traffic. This option is for *Full SSL inspection* only.
Protocol Port Mapping		Inspect all ports with the IPS engine by enabling *Inspect all ports*. If *Inspect all ports* is disabled, specify the port through which traffic will be inspected in the field next to the listed protocols. Traffic of that protocol going through any other port will not be inspected.
Exempt from SSL Inspection		These options are for *Full SSL inspection* only. Use the menus in this section to specify any reputable websites, FortiGuard Web Categories, or addresses that will be exempt from SSL inspection: • *Reputable Websites*: Enable this option to exempt any websites identified by FortiGuard as reputable. • *Web Categories*: The categories of *Finance and Banking*, *Health and Wellness*, and *Personal Privacy* have been added by default. These categories are the most likely to have applications that will require a specific certificate. • *Addresses*: These can be any of the address objects that have an interface of *any*. • *Log SSL exemptions*: Enable this option to log all SSL exemptions. See Exempt web sites from deep inspection on page 1901 for more information.
SSH Inspection Options		
	SSH deep scan	Enable/disable SSH protocol packet deep scanning capabilities. *SSH port* will become available if *SSH deep scan* is enabled.
	SSH port	Define what ports will search for SSH protocol packets: • *Any*: Select this option to search all traffic regardless of service or TCP/IP port for packets that conform to the SSH protocol. • *Specify*: Select this option and enter the port number to restrict the search for SSH protocol packets to the TCP/IP port number specified. This is not as comprehensive but it is easier on the performance of the firewall.

Common Options	
Invalid SSL certificates	Allow or block the passing of traffic in invalid certificates. Additional common options that provide more granularity with actions for different types of invalid SSL certificates will become available if *Invalid SSL certificates* is set to *Custom*: • *Expired certificates*: Action to take when the server certificate is expired. The default action is block. • *Revoked certificates*: Action to take when the server certificate is revoked. The default action is block. • *Validation timed-out certificates*: Action to take when the server certificate validation times out. For certificate inspection, the default action is allow. For deep inspection, the default action is Keep Untrusted & Allow. • *Validation failed certificates*: Action to take when the server certificate validation fails. The default action is block. For deep inspection, the above options have the following actions: • *Keep Untrusted & Allow*: Allow the server certificate and keep it untrusted. • *Block*: Block the certificate. • *Trust & Allow*: Allow the server certificate and re-sign it as trusted.
Log SSL anomalies	Enable this feature to record and log traffic sessions containing invalid certificates. By default, SSL anomalies logging is enabled. Logs are generated in the UTM log type under the SSL subtype when invalid certificates are detected.

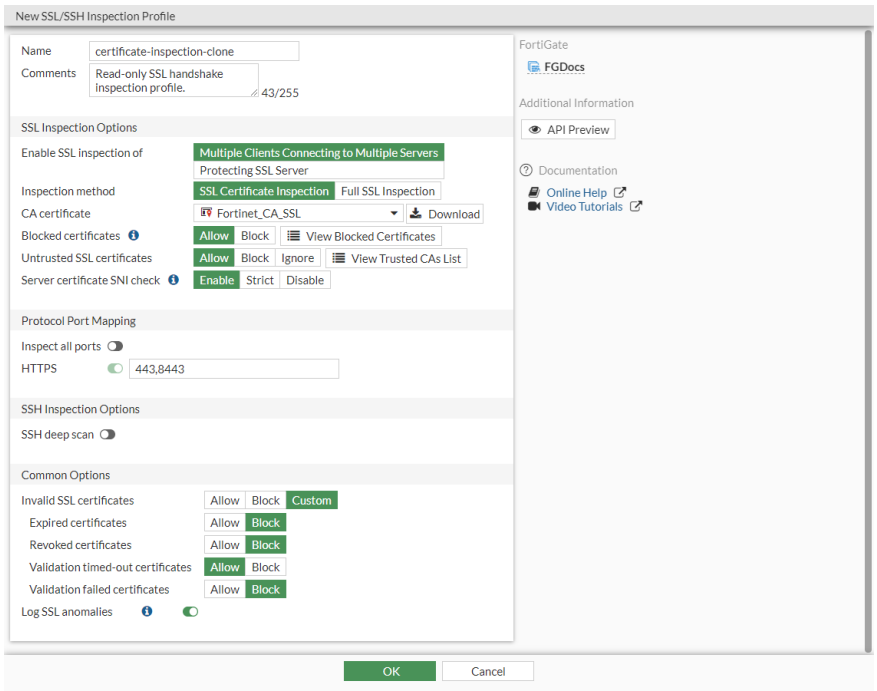
3. Click *OK*.

Certificate inspection

FortiGate supports certificate inspection. The default configuration has a built-in *certificate-inspection* profile which you can use directly. When you use certificate inspection, the FortiGate only inspects the headers up to the SSL/TLS layer.

If you do not want to deep scan for privacy reasons but you want to control web site access, you can use *certificate-inspection*.

When a firewall policy is in flow-based inspection mode, *SSL Certificate Inspection* does not validate the certificate. *Untrusted SSL certificates* and *Server Certificate SNI* checks are not performed. If these features are needed, use proxy-based inspection mode.



Inspect non-standard HTTPS ports

The built-in *certificate-inspection* profile is read-only and only listens on port 443. If you want to make changes, you must create a new certificate inspection profile.

If you know the non-standard port that the web server uses, such as port 8443, you can add this port to the *HTTPS* field.

To add a port to the inspection profile in the GUI:

1. Go to *Security Profiles* > *SSL/SSH Inspection*.
2. Create a new profile, or clone the default profile.
3. If you do no know what port is used in the HTTPS web server, under *Protocol Port Mapping*enable *Inspect All Ports*. If you know the port, such as port 8443, then set *HTTPS* to *443,8443*.

4. Configure the remaining setting as needed.
5. Click *OK*.

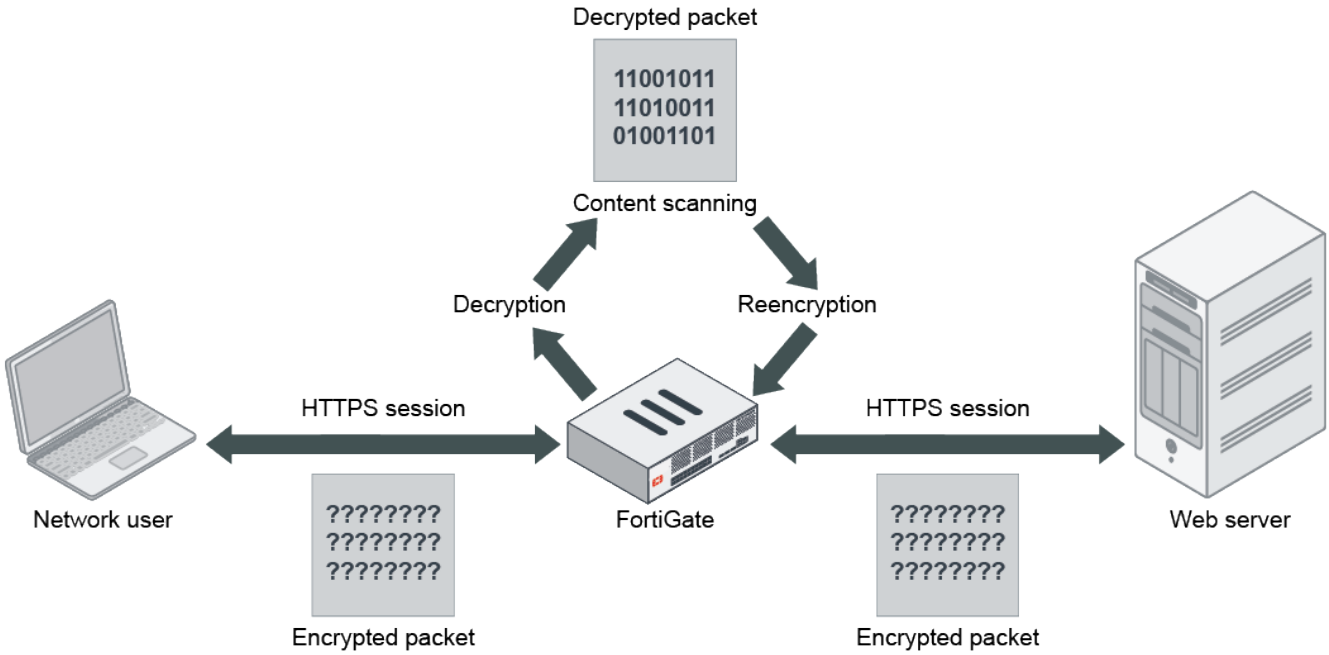
Common options

Invalid SSL certificates can be blocked, allowed, or a different actions can be configured for the different invalid certificates types. See Configuring an SSL/SSH inspection profile on page 1896.

When a firewall policy is in flow-based inspection mode, *SSL Certificate Inspection* does not validate the certificate. *Expired certificates* and *Revoked certificates* checks are not performed, and the *Validation timed-out certificates* and *Validation failed certificates* actions do not apply. If these features are needed, use proxy-based inspection mode.

Deep inspection

You can configure address and web category allowlists to bypass SSL deep inspection.



Reasons for using deep inspection

While Hypertext Transfer Protocol Secure (HTTPS) offers protection on the Internet by applying Secure Sockets Layer (SSL) encryption to web traffic, encrypted traffic can be used to get around your network's normal defenses.

For example, you might download a file containing a virus during an e-commerce session, or you might receive a phishing email containing a seemingly harmless download that, when launched, creates an encrypted session to a command and control (C&C) server and downloads malware onto your computer. Because the sessions in these attacks are encrypted, they might get past your network's security measures.

When you use deep inspection, the FortiGate impersonates the recipient of the originating SSL session, then decrypts and inspects the content to find threats and block them. It then re-encrypts the content and sends it to the real recipient.

Deep inspection not only protects you from attacks that use HTTPS, it also protects you from other commonly-used SSL-encrypted protocols such as SMTPS, POP3S, IMAPS, and FTPS.

Protocol port mapping

To optimize the FortiGate's resources, the mapping and inspection of the following protocols can be enabled or disabled:

- HTTPS
- SMTPS
- POP3S
- IMAPS
- FTPS
- DNS over TLS

Each protocol has a default TCP port. The ports can be modified to inspect any port with flowing traffic. The packet headers indicate which protocol generated the packet.

Protocol port mapping only works with proxy-based inspection. Flow-based inspection inspects all ports regardless of the protocol port mapping configuration.

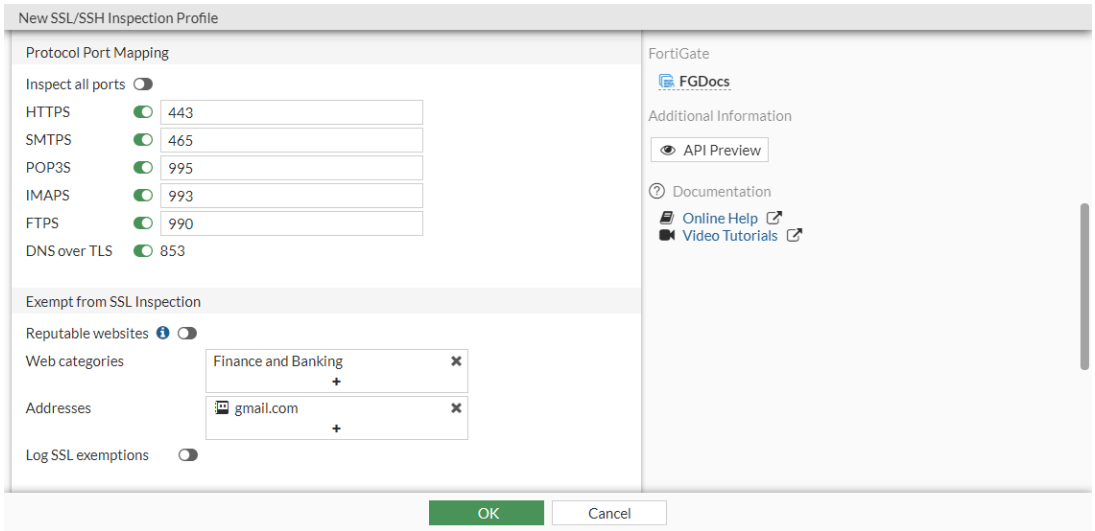
Browser messages when using deep inspection

When the FortiGate re-encrypts the content, it uses a stored certificate, such as *Fortinet_CA_SSL*, *Fortinet_CA_Untrusted*, or your own CA certificate that you uploaded.

Because there is no *Fortinet_CA_SSL* in the browser trusted CA list, the browser displays an untrusted certificate warning when it receives a FortiGate re-signed server certificate. To stop the warning messages, trust the FortiGate-trusted CA *Fortinet_CA_SSL* and import it into your browser.

If you still get messages about untrusted certificates after importing *Fortinet_CA_SSL* into your browser, it is due to *Fortinet_CA_Untrusted*. Never import the *Fortinet_CA_Untrusted* certificate into your browser.

To import *Fortinet_CA_SSL* into your browser:



1. On the FortiGate, go to *Security Profiles* > *SSL/SSH Inspection* and edit the *deep-inspection* profile. The default *CA Certificate* is *Fortinet_CA_SSL*.
2. Click *Download* and save the certificate to the management computer.
3. On the client PC, use the *Certificate Import Wizard* to install the certificate into the *Trusted Root Certificate Authorities* store.
   If a security warning appears, select *Yes* to install the certificate.

Exempt web sites from deep inspection

If you do not want to apply deep inspection for privacy or other reasons, you can exempt the session by address, category, or allowlist.

If you know the address of the server you want to exempt, you can exempt that address. You can exempt specific address type including IP address, IP address range, IP subnet, FQDN, wildcard-FQDN, and geography.

If you want to exempt all bank web sites, an easy way is to exempt the *Finance and Banking* category, which includes all finance and bank web sites identified in FortiGuard. For information about creating and using custom local and remote categories, see Web rating override on page 1923 and Threat feeds on page 3388.

If you want to exempt commonly trusted web sites, you can bypass the SSL allowlist in the SSL/SSH profile by enabling *Reputable websites*. The allowlist includes common web sites trusted by FortiGuard.

SSL version support

There are two ways to limit which SSL versions deep inspection is applied to.

- In the global attributes:

```
config system global
    set strong-crypto enable
end
```

- In the protocol configuration of a deep inspection profile:

```
config firewall ssl-ssh-profile
    edit <name>
        config {ssl | https | ftps}
            set min-allowed-ssl-version {ssl-3.0 | tls-1.0 | tls-1.1 | tls-1.2 | tls-
1.3}
        end
    next
end
```

Enabling `strong-crypto` in the global attributes sets the `min-allowed-ssl-version` to `tls-1.1` by default.

When a session is attempted using an SSL version below the minimum allowed version, the session can be blocked (default) or allowed.

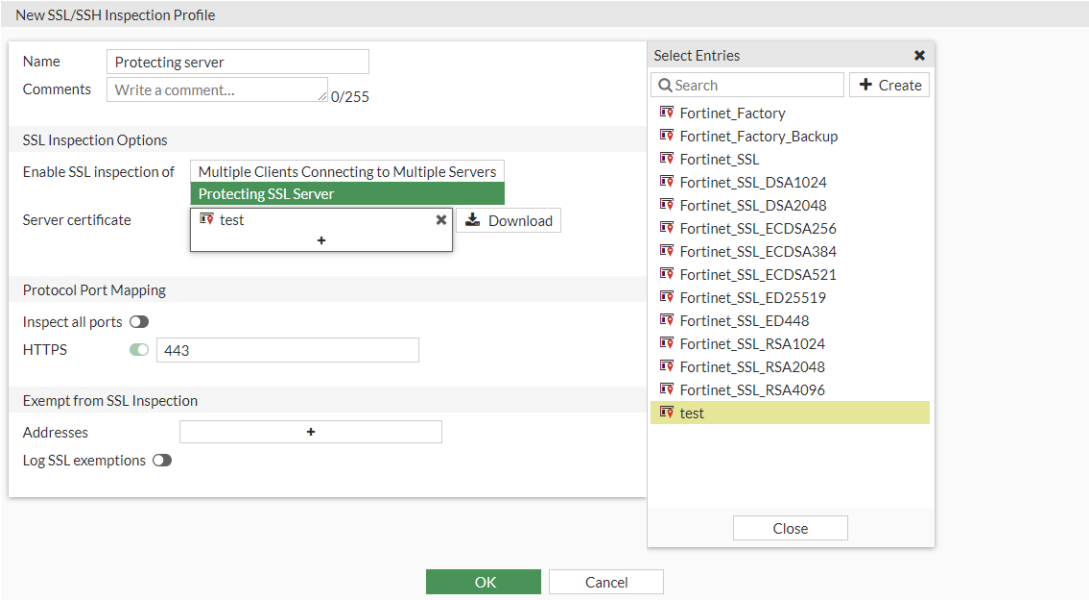
To configure the action based on the SSL version used being unsupported:

```
config firewall ssl-ssh-profile
    edit <name>
        config {ssl | https | ftps | imaps | pop3s | smtps | dot}
            set unsupported-ssl-version {allow | block}
        end
    next
end
```

Flow-based inspection does not support SSL version control.

HTTPS and DOT options can enable QUIC inspection using the `set quic enable` command. See DNS over QUIC and DNS over HTTP3 for transparent and local-in DNS modes on page 1701 for more information.

Protecting an SSL server



You typically use the FortiGate *Protecting SSL Server* profile as an inbound policy for clients on the internet that access the server through the internal side of the FortiGate.

Protecting SSL Server uses a server certificate to protect a single server.

You can use *Protecting SSL Server* if you do not want a client on the internet to directly access your internal server, and you want the FortiGate to simulate your real server.

To upload a server certificate into FortiGate and use that certificate in the SSL/SSH inspection profile:

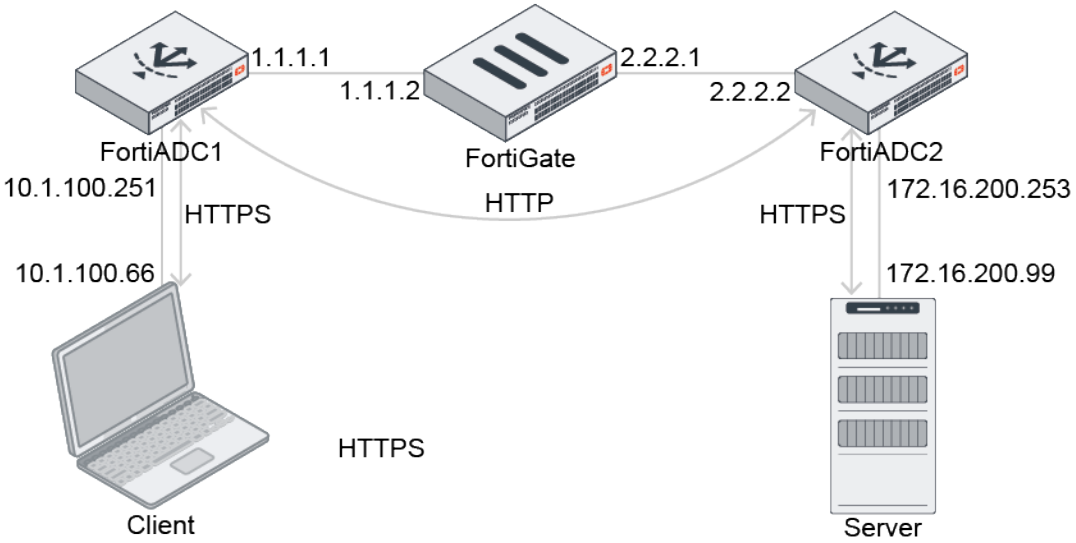
1. Go to *System* > *Certificates*.
2. Select *Import* > *Local Certificate* and upload the certificate.
3. Go to *Security Profiles* > *SSL/SSH Inspection* and edit or create a new profile.
4. For *Enable SSL Inspection of*, select *Protecting SSL Server*.
5. For *Server Certificate*, click the + and select the local certificate you imported.

6. Click *OK*.

When you apply the *Protecting SSL Server* profile in a policy, the FortiGate will send the server certificate to the client as your server does.

Handling SSL offloaded traffic from an external decryption device

In scenarios where the FortiGate is sandwiched between load-balancers and SSL processing is offloaded on the external load-balancers, the FortiGate can perform scanning on the unencrypted traffic by specifying the `ssl-offloaded` option in firewall `profile-protocol-options`. This option is supported in proxy and flow mode (previous versions only supported proxy mode).



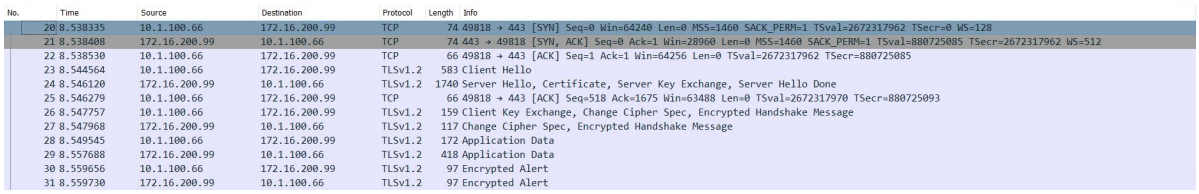
If the FortiGate receives an AUTH TLS, PBSZ, or PROT command before receiving plain text traffic from a decrypted device, by default, it will expect encrypted traffic, determine that the traffic belongs to an abnormal protocol, and bypass the traffic.

When the `ssl-offloaded` command is enabled, the AUTH TLS command is ignored, and the traffic is treated as plain text rather than encrypted data. SSL decryption and encryption are performed by the external device.

Sample topology

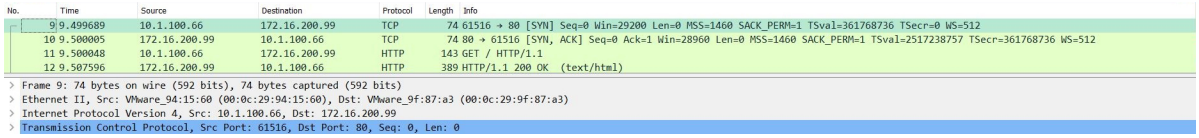
In this example, the FortiGate is between two FortiADCs and in SSL offload sandwich mode. The FortiGate receives plain text from ADC1 and forwards plain text to ADC2. There is no encrypted traffic passing through the FortiGate.

The client sends HTTPS traffic to ADC1, which then decrypts the traffic and sends HTTP to the FortiGate. The FortiGate forwards HTTP to ADC2, and the ADC2 re-encrypts the traffic to HTTPS.



To configure SSL offloading:

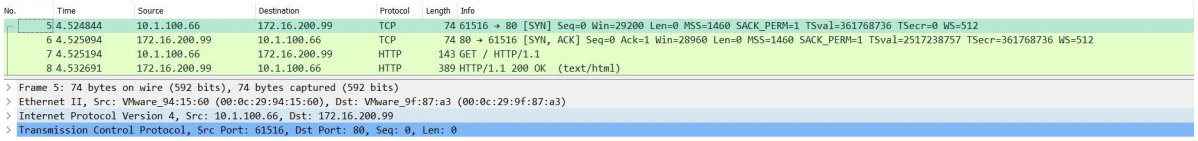
```
config firewall profile-protocol-options
    edit "default-clone"
        config http
            set ports 80
            unset options
            unset post-lang
            set ssl-offloaded yes
        end
        config ftp
            set ports 21
            set options splice
            set ssl-offloaded yes
        end
        config imap
            set ports 143
            set options fragmail
            set ssl-offloaded yes
        end
        config pop3
            set ports 110
            set options fragmail
            set ssl-offloaded yes
        end
        config smtp
            set ports 25
            set options fragmail splice
            set ssl-offloaded yes
        end
    next
end
```



Verifying the packet captures

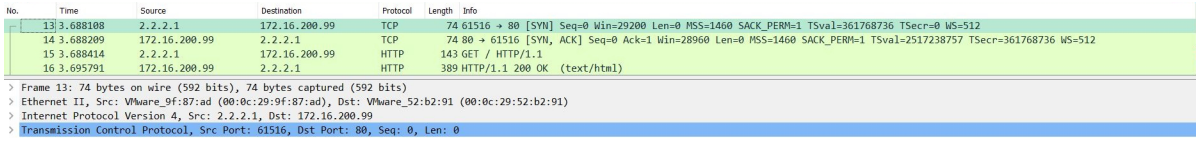
The ADC1 incoming port capture shows that ADC1 receives HTTPS traffic:

No.	Time	Source	Destination	Protocol	Length	Info
20	8.538335	10.1.100.66	172.16.200.99	TCP	74	49818 → 443 [SYN] Seq=0 Win=64240 Len=0 MSS=1460 SACK_PERM=1 TSval=2672317962 TSecr=0 WS=128
21	8.538408	172.16.200.99	10.1.100.66	TCP	74	443 → 49818 [SYN, ACK] Seq=0 Ack=1 Win=28960 Len=0 MSS=1460 SACK_PERM=1 TSval=880725085 TSecr=2672317962 WS=512
22	8.538530	10.1.100.66	172.16.200.99	TCP	66	49818 → 443 [ACK] Seq=1 Ack=1 Win=64256 Len=0 TSval=2672317962 TSecr=880725085
23	8.544564	10.1.100.66	172.16.200.99	TLSv1.2	583	Client Hello
24	8.546120	172.16.200.99	10.1.100.66	TLSv1.2	1740	Server Hello, Certificate, Server Key Exchange, Server Hello Done
25	8.546279	10.1.100.66	172.16.200.99	TCP	66	49818 → 443 [ACK] Seq=518 Ack=1675 Win=63488 Len=0 TSval=2672317970 TSecr=880725093
26	8.547757	10.1.100.66	172.16.200.99	TLSv1.2	159	Client Key Exchange, Change Cipher Spec, Encrypted Handshake Message
27	8.547968	172.16.200.99	10.1.100.66	TLSv1.2	117	Change Cipher Spec, Encrypted Handshake Message
28	8.549545	10.1.100.66	172.16.200.99	TLSv1.2	172	Application Data
29	8.557688	172.16.200.99	10.1.100.66	TLSv1.2	418	Application Data
30	8.559656	10.1.100.66	172.16.200.99	TLSv1.2	97	Encrypted Alert
31	8.559730	172.16.200.99	10.1.100.66	TLSv1.2	97	Encrypted Alert



The ADC1 outgoing port capture shows that ADC1 decrypts traffic and forwards HTTP traffic to the FortiGate:

No.	Time	Source	Destination	Protocol	Length	Info
9	9.499689	10.1.100.66	172.16.200.99	TCP	74	61516 → 80 [SYN] Seq=0 Win=29200 Len=0 MSS=1460 SACK_PERM=1 TSval=361768736 TSecr=0 WS=512
10	9.500005	172.16.200.99	10.1.100.66	TCP	74	80 → 61516 [SYN, ACK] Seq=0 Ack=1 Win=28960 Len=0 MSS=1460 SACK_PERM=1 TSval=2517238757 TSecr=361768736 WS=512
11	9.500048	10.1.100.66	172.16.200.99	HTTP	143	GET / HTTP/1.1
12	9.507596	172.16.200.99	10.1.100.66	HTTP	389	HTTP/1.1 200 OK (text/html)



```
> Frame 9: 74 bytes on wire (592 bits), 74 bytes captured (592 bits)
> Ethernet II, Src: VMware_94:15:60 (00:0c:29:94:15:60), Dst: VMware_9f:87:a3 (00:0c:29:9f:87:a3)

```

SSH traffic file scanning

FortiGates can buffer, scan, log, or block files sent over SSH traffic (SCP and SFTP) depending on the file size, type, or contents (such as viruses or sensitive content).

This feature is supported in proxy-based inspection mode. It is currently not supported in flow-based inspection mode.

You can configure the following SSH traffic settings in the CLI:

- Protocol options
- DLP profile
- Antivirus (profile and quarantine options)

To configure SSH protocol options:

```
config firewall profile-protocol-options
    edit <name>
        config ssh
           set options {oversize clientcomfort servercomfort}
           set comfort-interval <1 - 900>
           set comfort-amount <1 - 65535>
           set oversize-limit <1 - 798>
           set uncompressed-oversize-limit <0 - 798>
           set uncompressed-nest-limit <2 - 100>
           set scan-bzip2 {enable | disable}
        end
    next
end
```

To configure SCP block and log options:

```
config ssh-filter profile
    edit <name>
        set block scp
        set log scp
    next
end
```

To configure the DLP profile:

```
config dlp profile
    edit <name>
        set full-archive-proto ssh
        set summary-proto ssh
        config filter
            edit 1
                set proto ssh
            next
        end
    next
end
```

To configure the antivirus profile options:

```
config antivirus profile
    edit <name>
```

```
        config ssh
            set av-scan {disable | block | monitor}
            set outbreak-prevention {disable | block | monitor}
            set external-blocklist {disable | block | monitor}
            set fortindr {disable | block | monitor}
            set quarantine {enable | disable}
            set archive-block {encrypted corrupted partiallycorrupted multipart nested
mailbomb timeout unhandled}
            set archive-log {encrypted corrupted partiallycorrupted multipart nested
mailbomb timeout unhandled}
            set emulator {enable | disable}
        end
    next
end
```

To configure the antivirus quarantine options:

```
config antivirus quarantine
    set drop-infected ssh
    set store-infected ssh
    set drop-machine-learning ssh
    set store-machine-learning ssh
end
```

Redirect to WAD after handshake completion

In a proxy-based policy, the TCP connection is proxied by the FortiGate. A TCP three-way handshake can be established with the client even though the server did not complete the handshake.

This option uses IPS to handle the initial TCP three-way handshake. It rebuilds the sockets and redirects the session back to proxy only when the handshake with the server is established.

To enable proxy after a TCP handshake in an SSL/SSH profile:

```
config firewall ssl-ssh-profile
    edit "test"
        config https
            set ports 443
            set status certificate-inspection
            set proxy-after-tcp-handshake enable
        end
   next
end
```

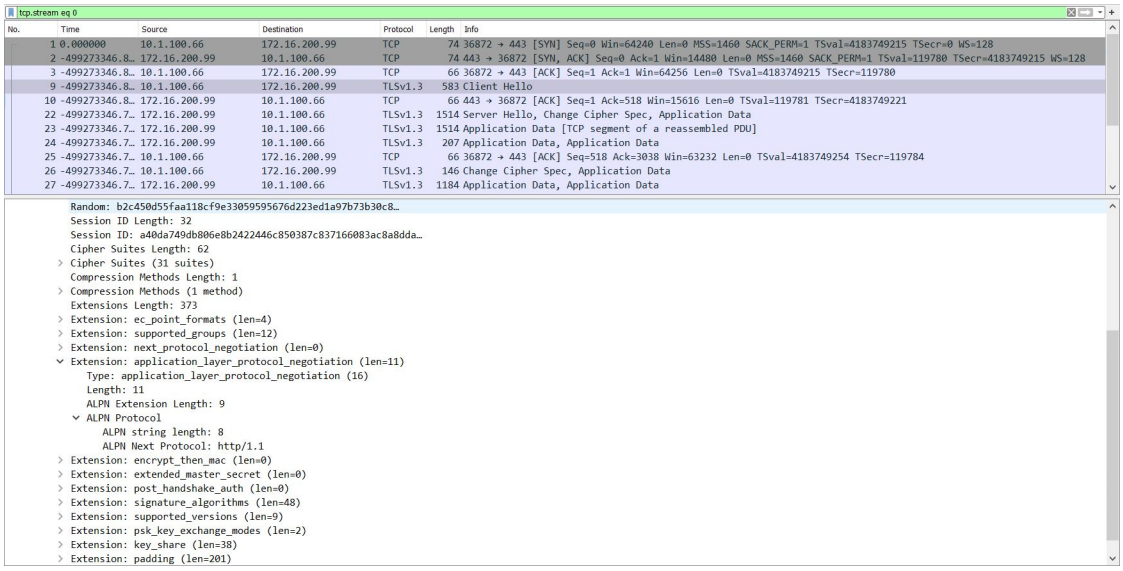
To enable proxy after a TCP handshake in protocol options:

```
config firewall profile-protocol-options
    edit "test"
        config http
            set ports 80
            set proxy-after-tcp-handshake enable
            unset options
            unset post-lang
        end
```

```
    next
end
```

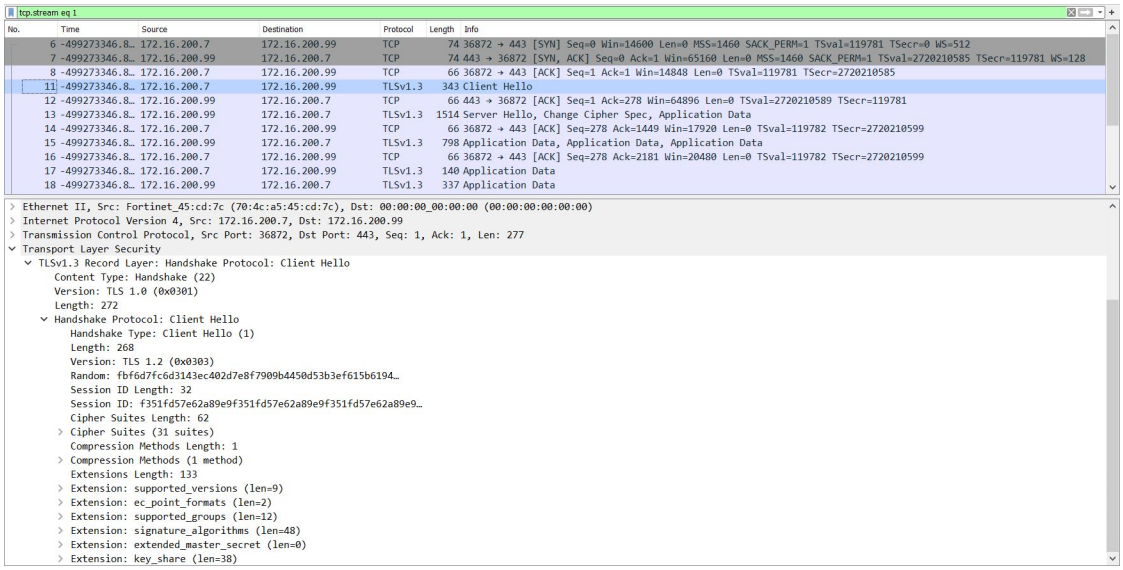
HTTP/2 support in proxy mode SSL inspection

Security profiles in proxy mode can perform SSL inspection on HTTP/2 traffic that is secured by TLS 1.2 or 1.3 using the Application-Layer Protocol Negotiation (ALPN) extension.



To set the ALPN support:

```
config firewall ssl-ssh-profile
    edit <profile>
        set supported-alpn {all | http1-1 | http2 | none}
    next
end
```

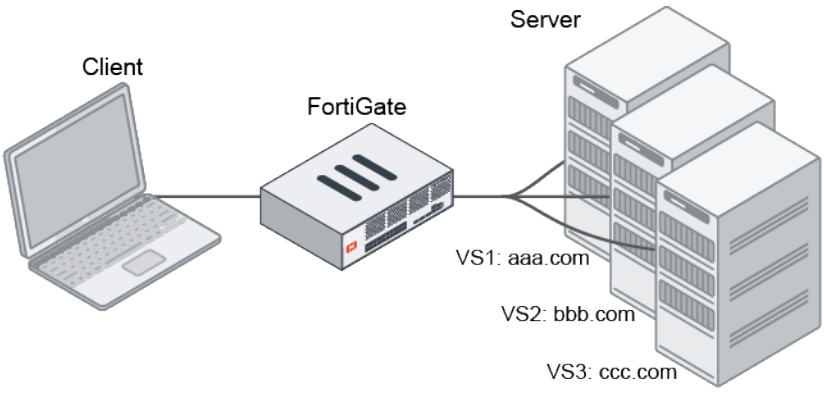


`all`	The FortiGate forwards all ALPN extensions, except SPDY. This is the default value.
`http1-1`	The FortiGate only forwards ALPN extensions that use HTTP/1.1. If the ALPN extension uses HTTP/2 or SPDY, then the FortiGate strips the ALPN header from the Client Hello.
`http2`	The FortiGate only forwards ALPN extensions that use HTTP/2. If the ALPN extension uses HTTP/1.1 or SPDY, then the FortiGate strips the ALPN header from the Client Hello.
`none`	The FortiGate always strips the ALPN header from the Client Hello when forwarding.

For example, if `supported-alpn` is set to `http2`, but the extension uses HTTP/1.1 or SPDY, the ALPN header is stripped from the Client Hello:

- Incoming packet capture:

- Outgoing packet capture:



Define multiple certificates in an SSL profile in replace mode

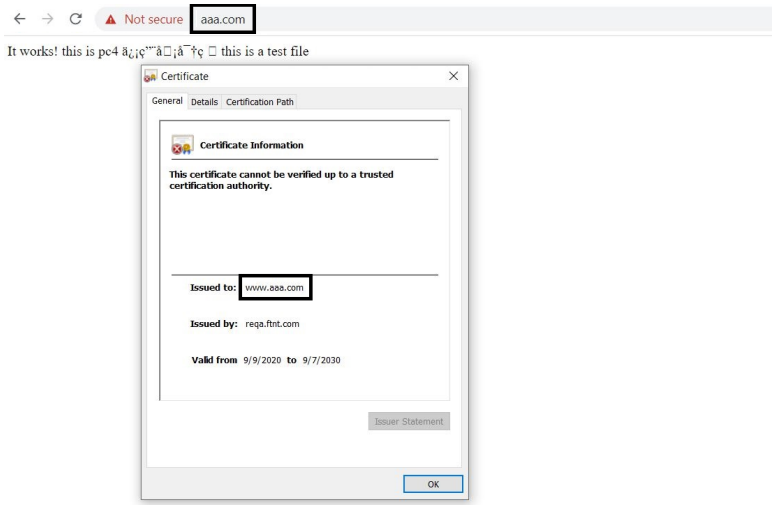
Multiple certificates can be defined in an SSL inspection profile in replace mode (*Protecting SSL Server*). This allows multiple sites to be deployed on the same protected server IP address, and inspection based on matching the SNI in the certificate.

When the FortiGate receives the client and server hello messages, it will compare the server name identification (SNI) and the common name (CN) with the certificate list in the SSL profile, and use the matched certificate as a replacement. If there is no matched server certificate in the list, then the first server certificate in the list is used as a replacement.

Example

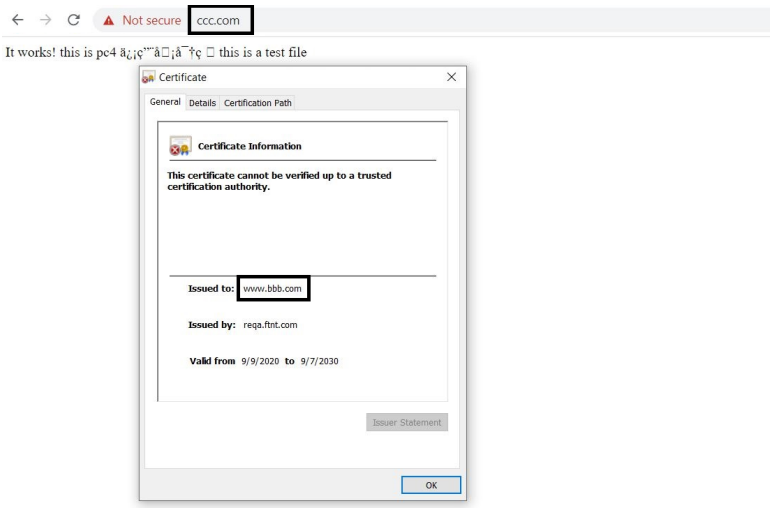
To configure an SSL profile in replace mode with multiple certificates:

```
config firewall ssl-ssh-profile
    edit "multi-cert"
        set server-cert-mode replace
```



```
        set server-cert "bbb" "aaa"
    next
end
```

To configure a policy that uses the SSL profile:



```
config firewall policy
    edit 1
        set name "multi-cert"
        set srcintf "port6"
        set dstintf "port11"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "multi-cert"
        set av-profile "default"
        set webfilter-profile "default"
        set logtraffic all
        set nat enable
    next
end
```

Results

If the SNI matches the CN in the certificate list in the SSL profile, then the FortiGate uses the matched server certificate. In this example, when the client accesses *www.aaa.com*, the FortiGate will use the *aaa* certificate as a replacement.

If the SNI does not match the CN in the certificate list in the SSL profile, then the FortiGate uses the first server certificate in the list. In this example, when the client accesses *www.ccc.com*, because there is no certificate for *www.ccc.com*, the FortiGate will use the *bbb* certificate as a replacement.

Disabling the FortiGuard IP address rating

The FortiGuard IP address rating for SSL exemptions and proxy addresses can be disabled using the `ssl-exemption-ip-rating` and `address-ip-rating` options.

To disable using the FortiGuard IP address rating for SSL exemptions:

```
config firewall ssl-ssh-profile
    edit <name>
        set ssl-exemption-ip-rating {enable | disable}
    next
end
```

To disable using the FortiGuard IP address rating for proxy addresses:

```
config firewall profile-protocol-options
    edit <name>
        config http
            set address-ip-rating {enable | disable}
        end
    next
end
```

The `ssl-exemption-ip-rating` and `address-ip-rating` options are enabled by default, so when both a website domain and its IP address return different categories after being rated by FortiGuard, the IP address category takes precedence when evaluating SSL exemptions associated with the SSL inspection profile and proxy addresses associated with the proxy protocol options profile. SSL exemptions and the `ssl-exemption-ip-rating` option work in both inspection modes (proxy and flow).

When the categories associated with the website domain and IP address are different, disabling the FortiGuard IP rating ensures that the FortiGuard domain category takes precedence when evaluating the preceding objects. For most websites, the domain category is valid when its IP address is unrated by FortiGuard. Since being unrated is considered as not having a category, the FortiGate uses the domain category as the website category.

A website might have an IP category that differs from its domain category. If they are different, the FortiGate uses the rating weight of the IP address or domain name to determine the rating result and decision. The rating weight is hard-coded in the FortiGate and depending on the relative category weights, the FortiGate may use the IP category instead of the website category. If the `ssl-exemption-ip-rating` option is disabled in the SSL inspection profile, then the FortiGate uses the domain category as the website category, which ensures SSL exemption operation as intended.

The `address-ip-rating` option in a proxy protocol options profile functions the same way as the `ssl-exemption-ip-rating` option. If the `address-ip-rating` option is disabled in a profile that is used in an explicit proxy policy that also uses a web filter profile, for HTTP or HTTPS traffic to a website that has different IP and domain categories and that matches the policy, the FortiGate will use the domain category when it evaluates categories for the web filter.

Custom signatures

You can create the following custom signatures and apply them to firewall policies:

- Application group
- Application signature
- IPS signature

The following topic provides information about custom signatures:

- Configuring custom signatures on page 1912
- Blocking applications with custom signatures on page 1914
- Filters for application control groups on page 1917
- Application groups in traffic shaping policies on page 1919

Configuring custom signatures

IPS signatures are the basis of signature-based intrusion prevention. Every attack can be reduced to a particular string of commands or a sequence of commands and variables. See Intrusion prevention on page 1740 for more information.

An IPS signature identifies characteristics of a packet that are unique to an attack, such as the protocol type, an option/value pair within the payload, other special aspects of the payload, or specific application options. Custom IPS signatures can be created to block, monitor, or quarantine specific traffic that is not covered by the IPS definitions list. To view the IPS definitions list:

- Go to *Security Profiles* > *IPS Signatures*.
- Go to *Security Profiles* > *Intrusion Prevention*, edit an existing IPS sensor, and click *View IPS Signatures* in the right-hand pane.
- Go to *System* > *FortiGuard*, in the *License Information* table expand *Intrusion Prevention*, and in the *IPS Definitions* row click *Actions* > *View List*.

An application signature identifies characteristics of a packet that is unique to an application. Custom application signatures can be used in application control profiles to block traffic from specific applications that are not covered by the application control signatures list. To view the application control signatures list:

- Go to *Security Profiles* > *Application Signatures* and select the *Signature* view.
- Go to *Security Profiles* > *Application Control*, edit an existing application sensor, and click *View Application Signatures* in the right-hand pane.

- Go to *System* > *FortiGuard*, in the *License Information* table expand *Firmware & General Updates* , and in the *Application Control Signatures* row click *Actions* > *View List*.

Application groups can be created by selecting individual application, or by filtering by application category. The groups can then be used in firewall policies.

For information about the syntax for building IPS and application control signatures, see the Custom IPS and Application Control Signature Syntax Guide.

To make the application signatures settings visible in the GUI:

1. Go to *System* > *Feature Visibility*
2. In the *Security Features* section, enable *Application Control*.
3. Click *Apply*.

To configure custom signatures:

1. Custom application and IPS signatures can be configured:
   - To configure custom application signatures, go to *Security Profiles* > *Application Signatures* and click *Create New* > *Custom Application Signature*. See Blocking applications with custom signatures on page 1914 for an example.
   - To configure custom IPS signatures, go to *Security Profiles* > *IPS Signatures* and click *Create New*.
2. Configure the following settings:

Name	Enter a unique name for the signature.
Comments	Enter a comment (optional).
Signature	Enter the signature.

3. Click *OK*.

To configure application groups:

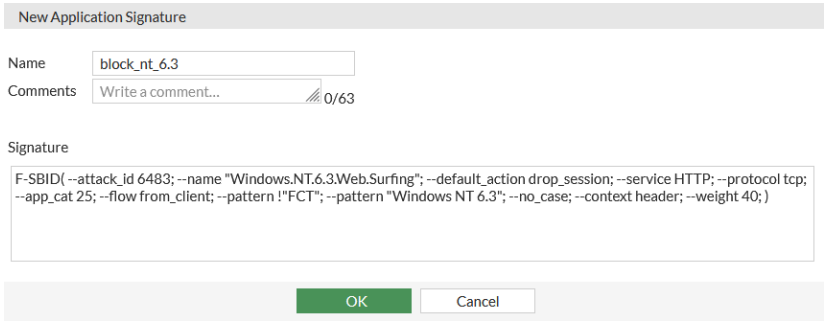
1. Go to *Security Profiles* > *Application Signatures* and click *Create New* > *Application Group*.
2. Configure the following settings:

Group Name	Enter a unique name for the signature group.
Type	Set the application group type, either application ID or application filter. See Filters for application control groups on page 1917 for information about the available filters.
Members	Select the applications or filter to include in the group.
Comments	Enter a comment (optional).

3. Click *OK*.
   See Application groups in traffic shaping policies on page 1919 for more information.

Blocking applications with custom signatures

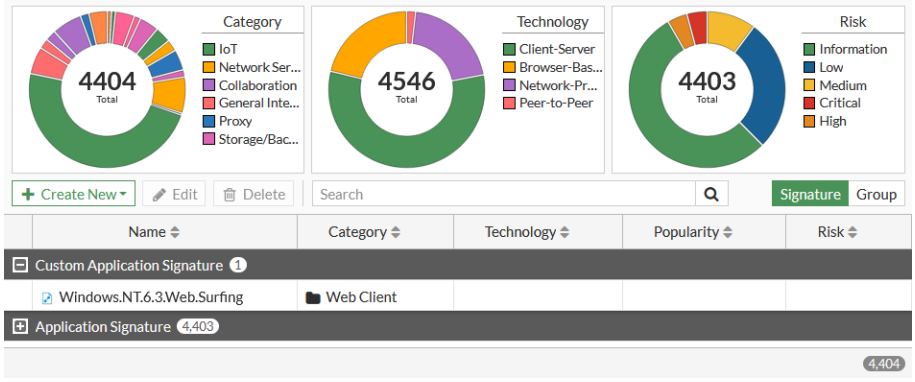
Custom signatures can be used in application control profiles to block web traffic from specific applications, such as out of support operating systems.



In this example, a custom signature is created to detect PCs running Windows NT 6.3 operating systems, including Windows 8.1. The signature is added to an application control profile and the action is set to block. The profile is then used in a firewall policy so that web traffic matching the signature is blocked. The logs generated by this example can be used to help identify other computers that need to be blocked.

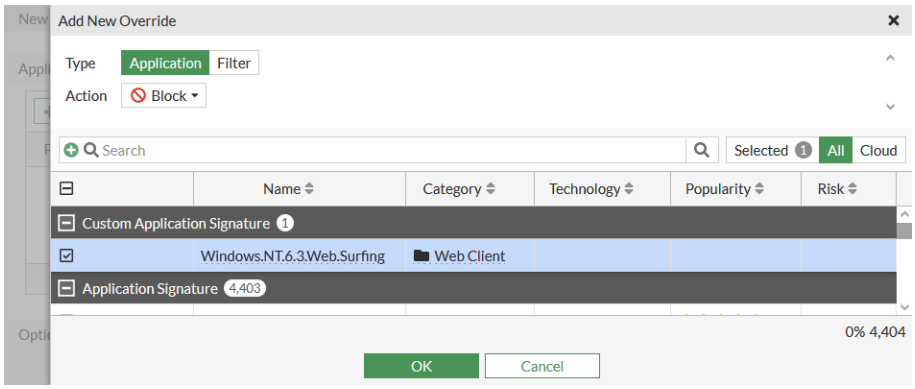
To create the custom application signature:

1. Go to *Security Profiles* > *Application Signatures* and click *Create New* > *Custom Application Signature*.
2. Enter a name for the custom signature, such as *block_nt_6.3*.
3. Enter the *Signature*. In this example:



```
F-SBID( --attack_id 6483; --name "Windows.NT.6.3.Web.Surfing"; --default_action drop_
session; --service HTTP; --protocol tcp; --app_cat 25; --flow from_client; --pattern
!"FCT"; --pattern "Windows NT 6.3"; --no_case; --context header; --weight 40; )
```

   This signature scans HTTP and HTTPS traffic that matches the pattern *Windows NT 6.3* in its header. For blocking older versions of Windows, such as Windows XP, you would use the pattern *Windows NT 5.1*. An attack ID is automatically generated when the signature is created.

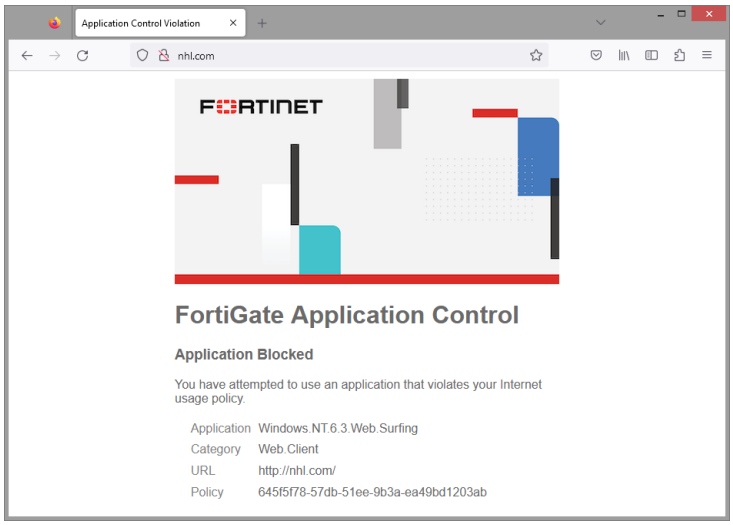


4. Click *OK*.

   The signature is included in the *Custom Application Signature* section of the signature list.

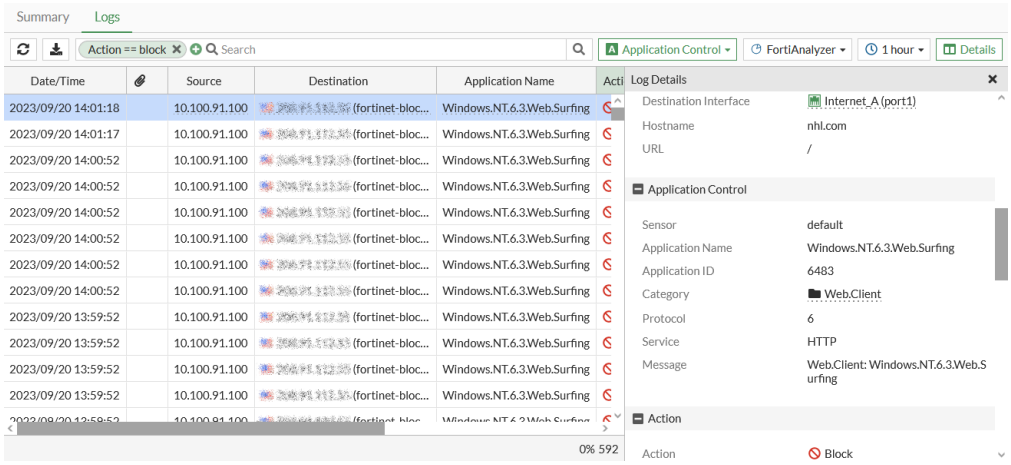
To use the signature in an application control profile:

1. Go to *Security Profiles* > *Application Control*.
2. Create a new profile, or edit an existing one.
3. In the *Application and Filter Overrides* table, click *Create New*.
4. Set *Type* to *Application* and *Action* to *Block*.
5. Select the custom signature from the list, using the search feature if required.



6. Click *OK*.
   The signature is added to the table.
7. Click *OK*.

To add the application control profile to a firewall policy:



1. Go to *Policy & Objects* > *Firewall Policy*.
2. Edit the policy that currently allows a connection from the internal network to the internet.
3. In the *Security Profiles* section, enable *Application Control* and select the profile.
   If deep inspection is not enabled, then only HTTP traffic will be scanned. To scan HTTPS traffic, set SSL Inspection to a profile that includes deep inspection. See SSL & SSH Inspection on page 1895 for more information.
4. Click *OK*.

Results

When a PC running one of the affected operating systems tries to connect to the internet using a web browser, a replacement message is shown. For information on customizing replacement messages, see Replacement messages on page 2941.

Go to *Log & Report* > *Security Events* to view the web traffic that is logged for the PC that is blocked by the application signature in the *Application Control* card.

The raw logs can also be downloaded:

```

Filters for application control groups

When defining application groups in NGFW policy or profile mode, the following group filters are available: protocols, risk, vendor, technology, behavior, popularity, and category.

```
config application group
    edit <name>
        set type filter
        set protocols <integer>
        set risk <integer>
        set vendor <id>
        set technology <id>
        set behavior <id>
        set popularity <integer>
        set category <id>
    next
end
```

`protocols <integer>`	Application protocol filter (0 - 47, or all).
`risk <integer>`	Risk or impact of allowing traffic from this application to occur (1 - 5; low (1), elevated (2), medium (3), high (4), and critical (5)).
`vendor <id>`	Application vendor filter (0 - 25, or all).
`technology <id>`	Application technology filter: • all • 0 (network-protocol) • 1 (browser-based) • 2 (client-server) • 4 (peer-to-peer)
`behavior <id>`	Application behavior filter: • all • 2 (botnet) • 3 (evasive) • 5 (excessive bandwidth) • 6 (tunneling) • 9 (cloud)
`popularity <integer>`	Application popularity filter (1 - 5, from least to most popular).
`category <id>`	Application category filter: • 2 (P2P) • 3 (VoIP) • 5 (video/audio) • 6 (proxy) • 7 (remote access) • 8 (game) • 12 (general interest) • 15 (network service) • 17 (update)

- 21 (email)
- 22 (storage backup)
- 23 (social media)
- 25 (web client)
- 26 (industrial)
- 28 (collaboration)
- 29 (business)
- 30 (cloud IT)
- 31 (mobile)
- 32 (unknown applications)

Sample configurations

In this example, a single filter (risk level 1) is configured in the application group in NGFW policy mode, so only signatures matching this filter will match the security policy.

To configure the application group:

```
config application group
    edit "risk_1"
        set type filter
        set risk 1
    next
end
```

To configure the security policy:

```
config firewall security-policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set status enable
        set schedule "always"
        set enforce-default-app-port disable
        set service "ALL"
        set app-group risk_1
        set logtraffic all
    next
end
```

In this example, the application group is configured so that only signatures matching both filters, category 5 (video/audio) and technology 1 (browser-based), will match the security policy. The application group can also be configured in a traffic shaping policy.

To configure the application group:

```
config application group
    edit "two"
```

```
        set type filter
        set category 5
        set technology 1
    next
 end
```

To configure the security policy:

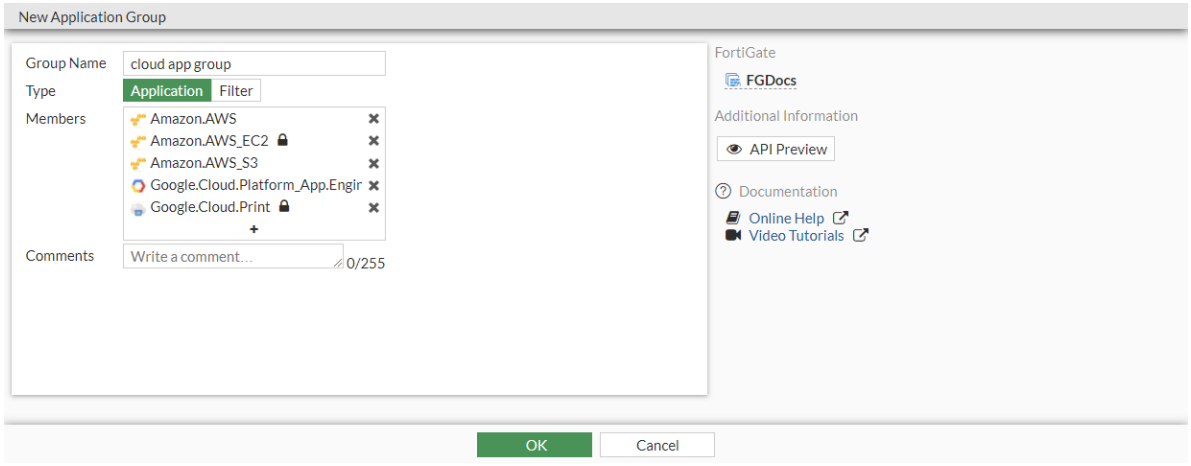
```
config firewall security-policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set status enable
        set schedule "always"
        set enforce-default-app-port disable
        set service "ALL"
        set app-group two
        set logtraffic all
    next
end
```

To configure the traffic shaping policy:

```
config firewall shaping-policy
    edit 1
        set ip-version 4
        set service "ALL"
        set app-group two
        set dstintf port1
        set traffic-shaper "max-100"
        set traffic-shaper-reverse "max-100"
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

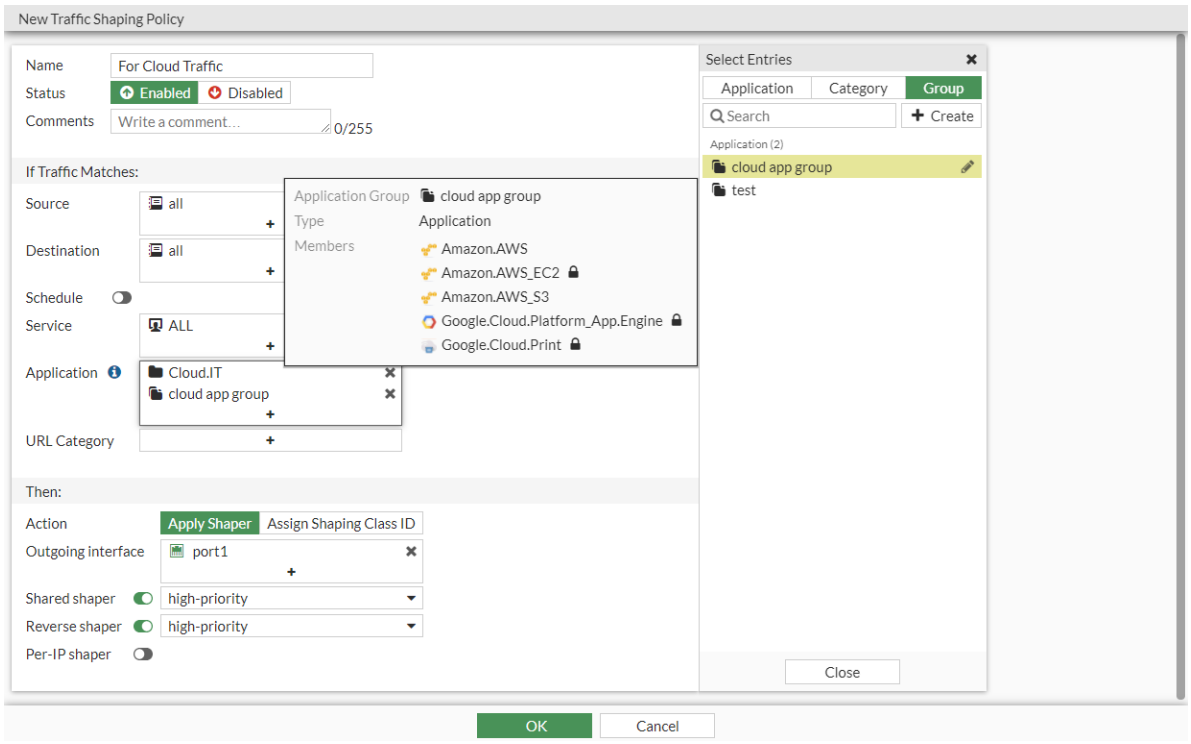
Application groups in traffic shaping policies

Application groups can be configured in traffic shaping policies. In this example, there are two traffic shaping policies:



- Policy 1 is for traffic related to cloud applications and has high priority.
- Policy 2 is for other traffic and has low priority.

At least one firewall policy must have application control enabled for the applications to match any policy traffic.

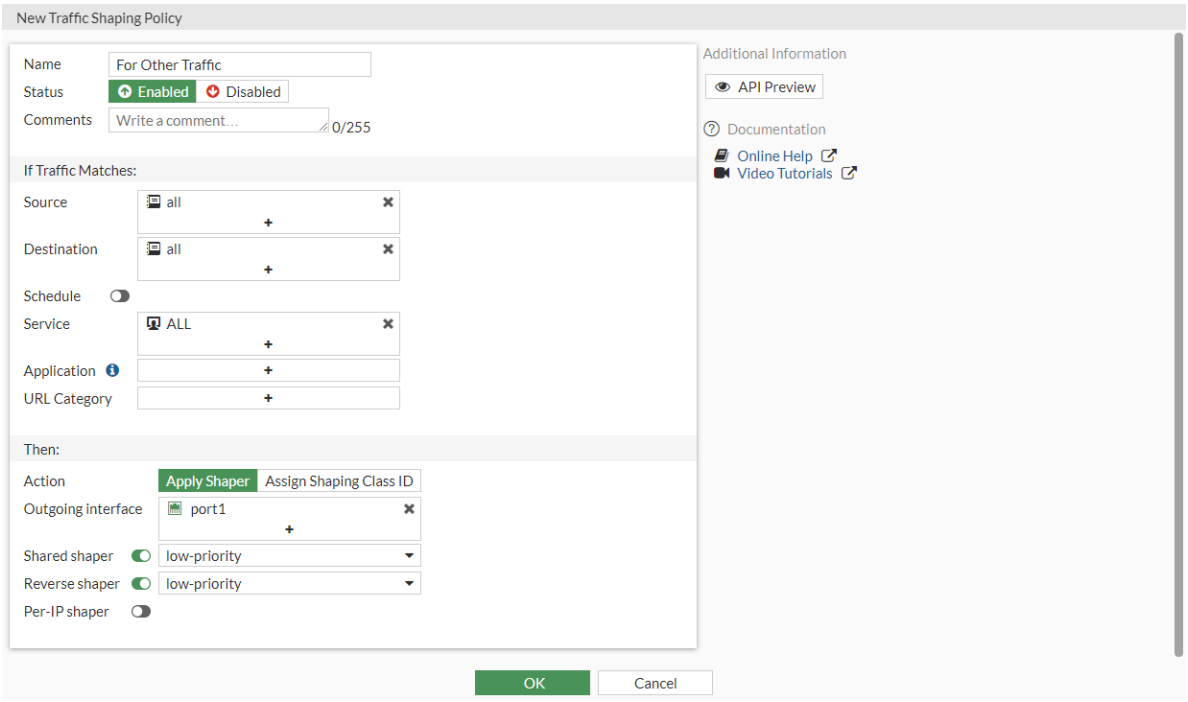


To configure a traffic shaping policy to use an application group in the GUI:

1. Configure an application group for cloud applications:
   a. Go to *Security Profiles* > *Application Signatures*.
   b. Click *Create New* > *Application Group*. The *New Application Group* page opens.
   c. Enter a name for the group, and for *Type*, select *Application*.
   d. Click the + to add the group the members.

   e. Click *OK*.
2. Create the shaping policy for the high priority cloud application traffic:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policies* tab, and click *Create New*.
   b. Enter the following:

Name	For Cloud Traffic
Source	All
Destination	All
Service	All
Application	Add the *Cloud.IT* category and the *cloud app group* application group.
Outgoing interface	port1
Shared shaper	high-priority
Reverse shaper	high-priority



c. Click *OK*.

3. Create the shaping policy for the low priority other traffic:

a. Click *Create New* and enter the following:

Name	For Other Traffic
Source	All
Destination	All
Service	All
Outgoing interface	port1
Shared shaper	low-priority
Reverse shaper	low-priority

b. Click *OK*.

To configure a traffic shaping policy to use an application group in the CLI:

1. Configure an application group for cloud applications:

```
config application group
    edit "cloud app group"
        set application 27210 36740 35944 43296 33048
    next
end
```

2. Create the shaping policies for the high priority cloud application traffic and low priority other traffic:

```
config firewall shaping-policy
    edit 1
        set name "For Cloud Traffic"
        set service "ALL"
        set app-category 30
```

```
            set app-group "cloud app group"
            set dstintf "port1"
            set traffic-shaper "high-priority"
            set traffic-shaper-reverse "high-priority"
            set srcaddr "all"
            set dstaddr "all"
        next
        edit 2
            set name "For Other Traffic"
            set service "ALL"
            set dstintf "port1"
            set traffic-shaper "low-priority"
            set traffic-shaper-reverse "low-priority"
            set srcaddr "all"
            set dstaddr "all"
        next
    end
```

Overrides

Web filter configuration can be separated into profile configuration and profile overrides.

You can also override web filter behavior based on the FortiGuard website categorization:

- Use alternate categories (web rating overrides): this method manually assigns a specific website to a different Fortinet category or a locally-created category.
- Use alternate profiles: configured users or IP addresses can use an alternative web filter profile when attempting to access blocked websites.

Some features of this functionality require a subscription to FortiGuard Web Filtering.

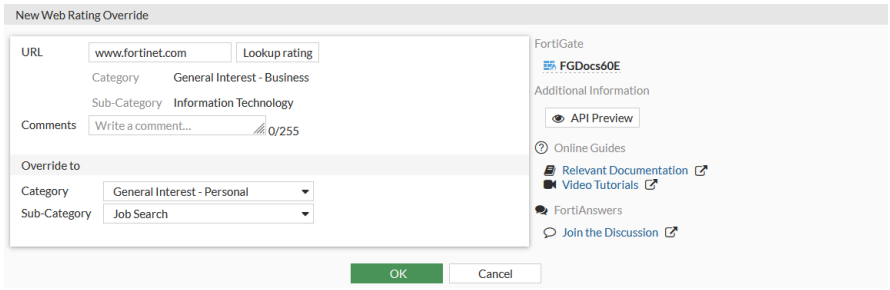
The following topics provide information about web overrides:

- Web rating override on page 1923
- Using local and remote categories on page 1931
- Web profile override on page 1933

Web rating override

Web rating overrides allow you to apply a category override to a URL. This overrides the original FortiGuard category for the URL with either a different FortiGuard category, a custom local category, or a threat feed remote category.

If a URL is in multiple active categories, the order of precedence is local categories, then remote categories, and then FortiGuard categories.



Web rating override requires a FortiGuard license.

To create a FortiGuard category override:

1. Go to *Security Profiles* > *Web Rating Overrides* and click *Create New*.
2. Configure the following settings:

URL		Enter the URL to override.
Lookup rating		Select to view any current *Category* and *Sub-Category* ratings.
Comments		Enter a comment (optional).
Override to		
	Category	Select a FortiGuard category, threat feed remote category, or a *Custom Category*.
	Sub-Category	Select a sub-category to further define the rating. If *Custom Category* was selected for the *Category*, you can select from a list of categories you created.

3. Click *OK*.

To create a custom local category override:

1. Create a custom category :
   a. Go to *Security Profiles* > *Web Rating Overrides*.
   b. Click *Custom Categories*, then click *Create New*.
   c. Configure the following settings:

Name	Enter a unique name for the category.
Status	Enable/disable the status of the category.

   d. Click *OK*.
2. Create a web rating override:
   a. Go to *Security Profiles* > *Web Rating Overrides* and click *Create New*.

b. Configure the following settings:

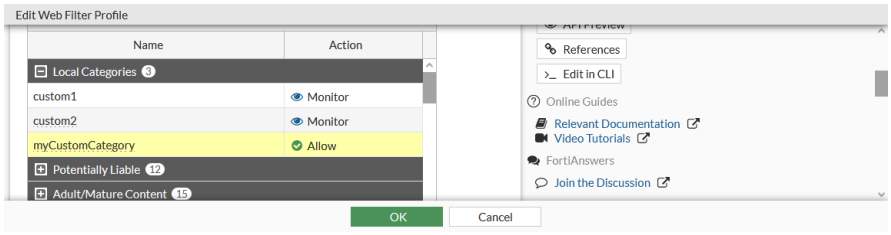
URL		Enter the URL to override.
Lookup rating		Select to view any current *Category* and *Sub-Category* ratings.
Comments		Enter a comment (optional).
Override to		
	Category	Select *Custom Category*.
	Sub-Category	Select the custom category that was just created.

c. Click *OK*.

To create a thread feed remote category override:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *FortiGuard Category*.
3. Enter a name for the threat feed. This will also be the name of the remote category.
4. Enter the *URL of external resource* that contains the list of URLs that will be overridden in this remote category.
5. Configure the remaining settings as needed, then click *OK*.

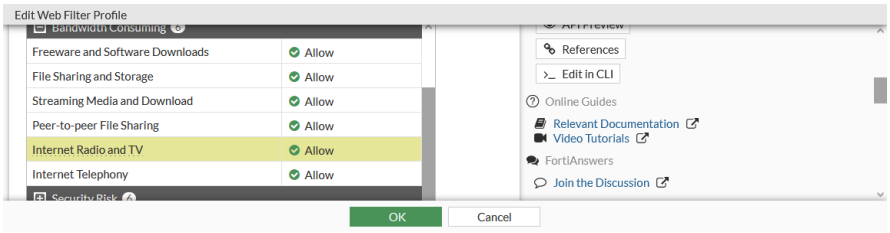
Sub-category actions



After configuring category override rules, an override category must be active in a web filter profile for it to take effect. Whether a category is active or not depends on the override method and action:

Override method	Active category actions	Inactive category actions
FortiGuard categories	Monitor, Block, Warning, or Authenticate	Allow
Local categories	Allow, Monitor, Block, Warning, or Authenticate	Disable*
Remote categories	Allow, Monitor, Block, Warning, or Authenticate	Disable*

*The *Disable* action is only available for local and remote categories by right clicking on the sub-category.



The *Allow* action in the GUI is different for FortiGuard categories compared to local and remote categories.

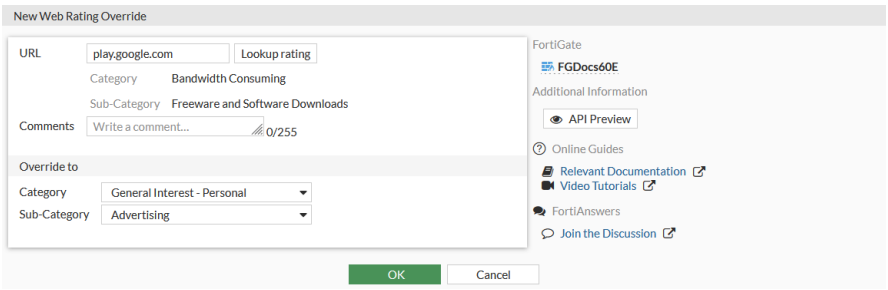
For local and remote categories, the *Allow* action in the GUI corresponds to the monitor action with logging disabled in the CLI:

```
config webfilter profile
    edit <profile>
        config ftgd-wf
            config filters
                edit 142
                    set category 142
                    set action monitor
                    set log disable
                next
            end
        end
    next
end
```

For FortiGuard categories, the *Allow* action in the GUI corresponds to no entry in the CLI:

The *Internet Radio and TV* sub-category has ID number 75.

```
config webfilter profile
    edit <profile>
        config ftgd-wf
            config filters
            end
        end
    next
end
```

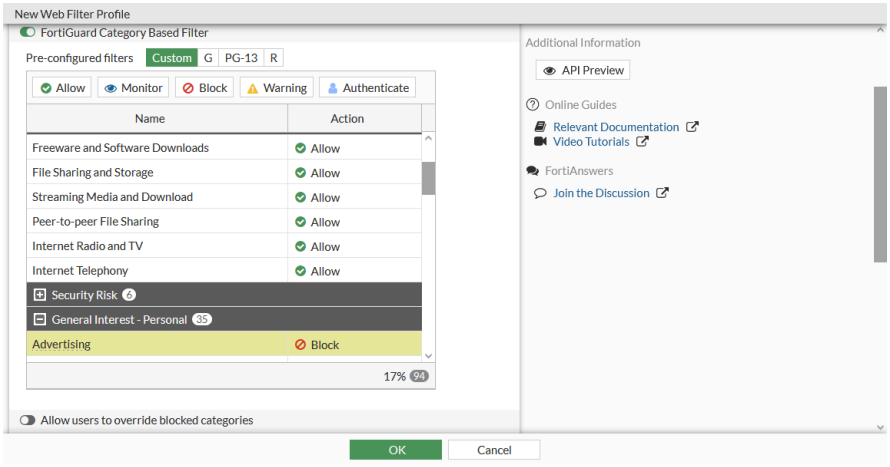


This means that a FortiGuard category with the *Allow* action applied is effectively inactive, as there is no actual action specified in the CLI.

Example 1: Override a FortiGuard category with another FortiGuard category

In this example, play.google.com is overridden from its original category, Freeware and Software Download (19), to the Advertising category (17). In the web filter profile, the Advertising category is set to *Block* and the Freeware and Software Download category is set to *Allow*.

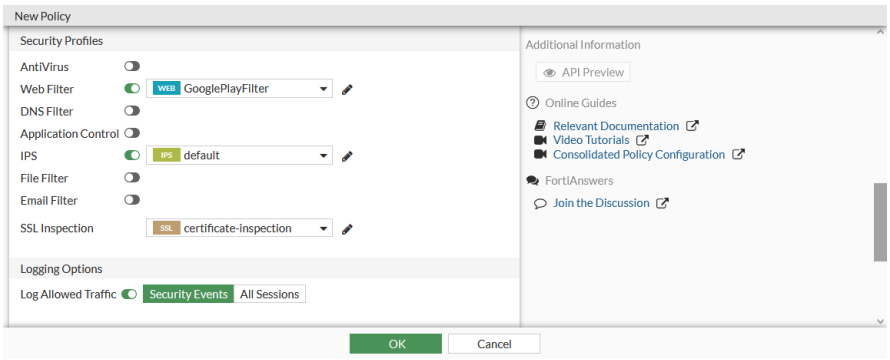
To configure a FortiGuard web rating override:



1. Go to *Security Profiles* > *Web Rating Overrides* and click *Create New*.
2. Enter the URL: play.google.com.
3. Optionally, click *Lookup rating* to see what its current rating is.
4. Set the *Category* and *Sub-Category* to an existing category that is different from the original category.

5. Click *OK*.

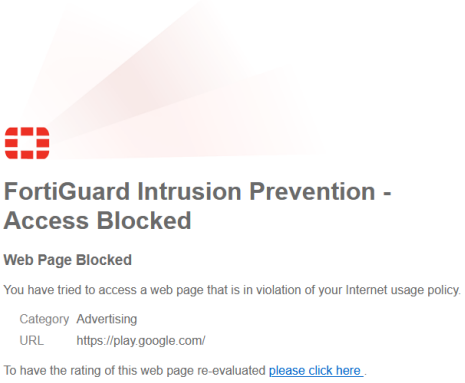
To apply the category in a web filter profile:



1. Go to *Security Profiles* > *Web Filter* and create or edit a web filter profile. See FortiGuard filter on page 1623 for more information.
2. Enable *FortiGuard category based filter*.
3. Set the action for the *Advertising* category in the *General Interest - Personal* group to *Block*.
4. Set the action for the *Freeware and Software Download* category in the *Bandwidth Consuming* group to *Allow*.

5. Configure the remaining settings required, then click *OK*.

To apply the category in firewall policy:



1. Go to *Policy & Objects* > *Firewall Policy* and create or edit a policy.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *Web Filter* and select the profile that you just created.
4. Set *SSL Inspection* to *certificate-inspection* or *deep-inspection*.

5. Enable *Log Allowed Traffic*.
6. Click *OK*.

To test the filter:

1. From a Workstation behind the firewall, open a browser and browse to play.google.com. The page will be blocked by the category override.

2. Go to *Log & Report* > *Security Events* and select *Web Filter*.
3. View the log details in the GUI, or download the log file:

```
date=2022-09-21 time=16:43:31 eventtime=1663803811966781540 tz="-0700"

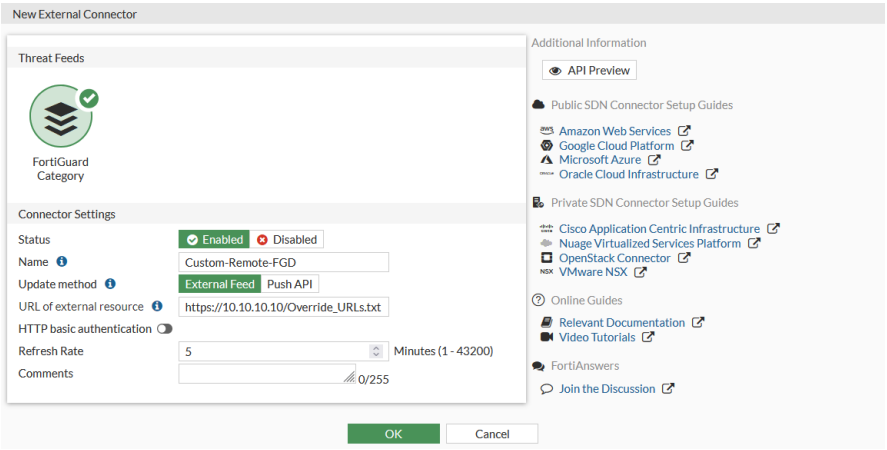
srcintfrole="undefined" dstip=142.251.211.238 dstport=443 dstintf="port1"
dstintfrole="undefined" proto=6 service="HTTPS" hostname="play.google.com" profile="FGD-
Override-FGD-Flow" action="blocked" reqtype="direct" url="https://play.google.com/"
sentbyte=517 rcvdbyte=0 direction="outgoing" msg="URL belongs to a denied category in
policy" method="domain" cat=17 catdesc="Advertising"
```



Example 2: Override a FortiGuard category with a remote category

In this example, play.google.com is added to an external URL category list and applied to a threat feed. In the web filter profile, the remote category is set to *Allow*, and the original FortiGuard category (Freeware and Software Download) is set to *Block*. Remote categories take precedence over FortiGuard categories, so the override action for the remote category will apply.

Delete the web rating override entry from example 1 for play.google.com before configuring this example.

To configure a FortiGuard threat feed for remote category override:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *FortiGuard Category*.
3. Enter a name for the threat feed, such as *Custom-Remote-FGD*. This will be the name of the remote category.
4. Enter the *URL of external resource* that contains the list of URLs that will be overridden to this remote category. This list will contain one entry for play.google.com.

5. Configure the remaining settings as needed, then click *OK*.

To apply the category in a web filter profile:

1. Go to *Security Profiles* > *Web Filter* and create or edit a web filter profile. See FortiGuard filter on page 1623 for more information.
2. Enable *FortiGuard category based filter*.
3. Set the action for the *Custom-Remote-FGD* category in the *Remote Categories* group to *Allow*.
4. Set the action for the *Freeware and Software Download* category in the *Bandwidth Consuming* group to *Block*.
5. Configure the remaining settings are required, then click *OK*.

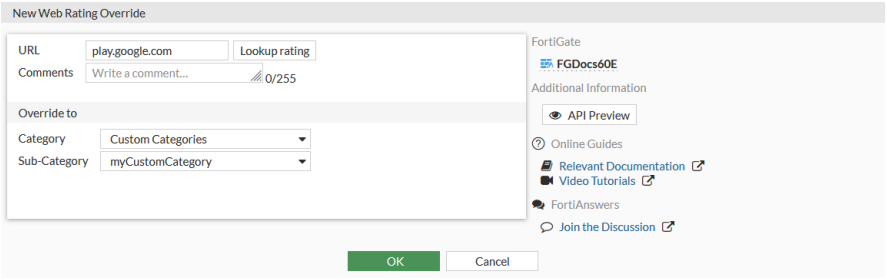
To apply the category in firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and create or edit a policy.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *Web Filter* and select the profile that you just created.
4. Set *SSL Inspection* to *certificate-inspection* or *deep-inspection*.
5. Enable *Log Allowed Traffic*.
6. Click *OK*.

To test the filter:

1. From a Workstation behind the firewall, open a browser and browse to play.google.com. The page will be allowed by the remote category override.
2. No logs are recorded because the *Allow* action is selected.

Example 3 - Override a FortiGuard category with a custom local category



In this example, play.google.com is added to a custom local category. that is set to Monitor in the web filter profile. Local custom categories take precedence over both remote and FortiGuard categories, so the override action for the local category will apply.

To create a custom local category override:

1. Go to *Security Profiles* > *Web Rating Overrides*.
2. Click *Custom Categories*, then click *Create New*.
3. Enter a name for the category, such as *myCustomCategory*, and ensure the *Status* is set to *Enable*.
4. Click *OK*.

To create a web rating override for the custom local category:

1. Go to *Security Profiles* > *Web Rating Overrides* and click *Create New*.
2. Enter the URL to override.
3. For *Category*, select *Custom Categories* and for *Sub-Category* select *myCustomCategory*.

4. Click *OK*.

To apply the category in a web filter profile:

1. Go to *Security Profiles* > *Web Filter* and create or edit a web filter profile. See FortiGuard filter on page 1623 for more information.
2. Enable *FortiGuard category based filter*.
3. Set the action for the *myCustomCategory* category in the *LocalCategories* group to *Monitor*.
4. The other actions can be left as they were at the end of example 2, *Custom-Remote-FGD* set to *Allow* and *Freeware and Software Download* set to *Block*.
5. Configure the remaining settings are required, then click *OK*.

To apply the category in firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and create or edit a policy.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *Web Filter* and select the profile that you just created.
4. Set *SSL Inspection* to *certificate-inspection* or *deep-inspection*.
5. Enable *Log Allowed Traffic*.
6. Click *OK*.

To test the filter:

1. From a Workstation behind the firewall, open a browser and browse to play.google.com. The page will be allowed by the local category override.
2. Go to *Log & Report* > *Security Events* and select *Web Filter*.
3. View the log details in the GUI, or download the log file:

```
date=2022-09-21 time=17:17:00 eventtime=1663805820486294353 tz="-0700"

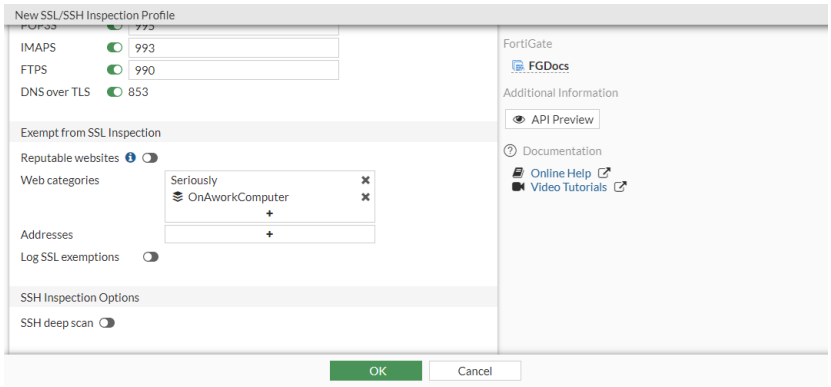
```



Using local and remote categories

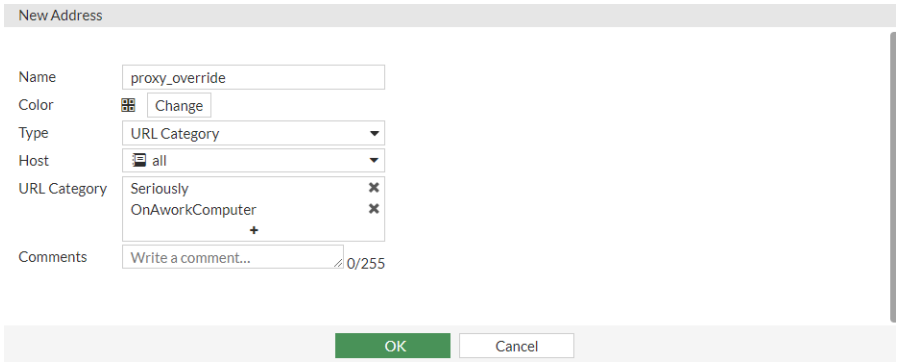
For some functions, local and remote FortiGuard categories must be explicitly selected to apply. In SSL/SSH inspection profiles, custom categories must be explicitly selected to be exempt from SSL inspection. In Proxy addresses, custom categories must be explicitly selected as URL categories for them to apply. In both settings, if a URL is in multiple selected categories, the order of precedence is local categories, then remote categories, and then FortiGuard categories.

SSL/SSH inspection profiles

To use local and remote categories in an SSL/SSH inspection profile to exempt them from SSL inspection in the GUI:

1. Go to *Security Profiles* > *SSL/SSH Inspection*.
2. Create a new profile or edit an existing one.
3. Ensure that *Inspection method* is *Full SSL Inspection*.
4. In the *Exempt from SSL Inspection* section, add the local and remote categories to the *Web categories* list .

5. Configure the remaining settings as required, then click *OK*.



To use local and remote categories in an SSL/SSH inspection profile to exempt them from SSL inspection in the CLI:

```
config vdom
    edit root
        config firewall ssl-ssh-profile
            edit "SSL_Inspection"
                config https
                    set ports 443
                    set status deep-inspection
                end
                ...
                config ssl-exempt
                    edit 1
                        set fortiguard-category 140
                    next
                    edit 2
                        set fortiguard-category 192
                    next
                end
            next
        end
    next
end
```

Proxy addresses

To use local and remote categories in a proxy address in the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Proxy* > *Address*.
2. Click *Create new* or edit an existing proxy address.
3. Set *Type* to *URL Category*.
4. In the *URL Category*, add the local and remote categories.

5. Configure the remaining settings as required, then click *OK*.

To use local and remote categories in a proxy address in the CLI:

```
config vdom
    edit root
        config firewall proxy-address
            edit "proxy_override"
```

```
                set type category
                set host "all"
                set category 140 192
                set color 23
            next
        end
    next
end
```

Web profile override

The following profile override methods are available:

- Administrative override
- Allow users to override blocked categories

Administrative override

Administrators can grant temporary access to sites that are otherwise blocked by a web filter profile. You can grant temporary access to a user, user group, or source IP address. You can set the time limit by selecting a date and time. The default is 15 minutes.

When the administrative web profile override is enabled, a blocked access page or replacement message does not appear, and authentication is not required.

Scope range

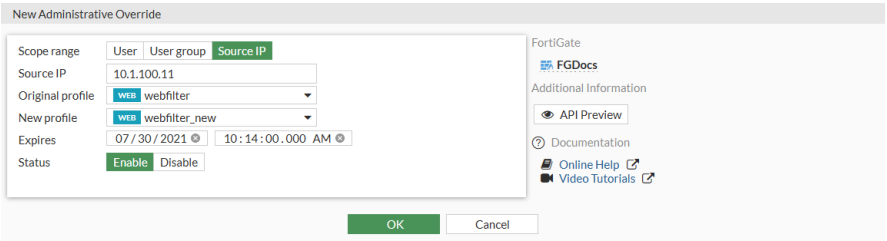
You can choose one of the following scope ranges:

- User: authentication for permission to override is based on whether or not the user is using a specific user account.
- User group: authentication for permission to override is based on whether or not the user account supplied as a credential is a member of the specified user group.
- Source IP: authentication for permission to override is based on the IP address of the computer that was used to authenticate. This would be used for computers that have multiple users. For example, if a user logs on to the computer, engages the override by using their credentials, and then logs off, anyone who logs on with an account on that computer would be using the alternate override web filter profile.

When you enter an IP address in the administrative override method, only individual IP addresses are allowed.

Differences between IP and identity-based scope

Using the IP scope does not require using an identity-based policy.



When using the administrative override method and IP scope, you might not see a warning message when you change from using the original web filter profile to using the alternate profile. There is no requirement for credentials from the user so, if allowed, the page will just appear in the browser.

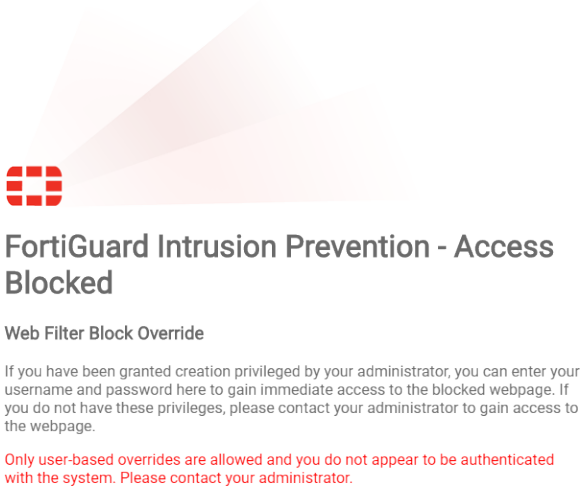
Configuring a web profile administrative override

This example describes how to override the *webfilter* profile with the *webfilter_new* profile.

To configure web profile administrative override using the GUI:

1. Go to *Security Profiles* > *Web Profile Overrides* and click *Create New*.
2. Configure the administrative override:
   a. For *Scope Range*, click *Source IP*.
   b. In the *Source IP* field, enter the IP address for the client computer (*10.1.100.11* in this example).
   c. In the *Original profile* dropdown, select *webfilter*.
   d. In the *New profile* dropdown, select *webfilter_new*.
   In the *Expires* field, the default 15 minutes appears, which is the desired duration for this example.

3. Click *OK*.



To configure web profile administrative override using the CLI:

```
config webfilter override
    edit 1
        set status enable
        set scope ip
        set old-profile "webfilter"
        set new-profile "webfilter_new"
        set expires 2021/07/30 10:14:00
        set initiator "admin"
        set ip 10.1.100.11
    next
end
```

Allow users to override blocked categories

For both override methods, the scope ranges (for specified users, user groups, or IP addresses) allow sites blocked by web filtering profiles to be overridden for a specified length of time.

But there is a difference between the override methods when the users or user group scope ranges are selected. In both cases, you would need to apply the user or user group as source in the firewall policy. With administrative override, if you do not apply the source in the firewall policy, the traffic will not match the override and will be blocked by the original profile. With the *Allow users to override blocked categories* setting, the traffic will also be blocked, but instead of displaying a blocking page, the following message appears:

When you choose the user group scope, once one user overrides, it will affect the other users in the group when they attempt to override. For example, user1 and user2 both belong to the local_user group. Once user1 successfully overrides, this will generate an override entry for the local_user group instead of one specific user. This means that if user2 logs in from another PC, they can override transparently.

Other features

Besides the scope, there are some other features in *Allow users to override blocked categories*.

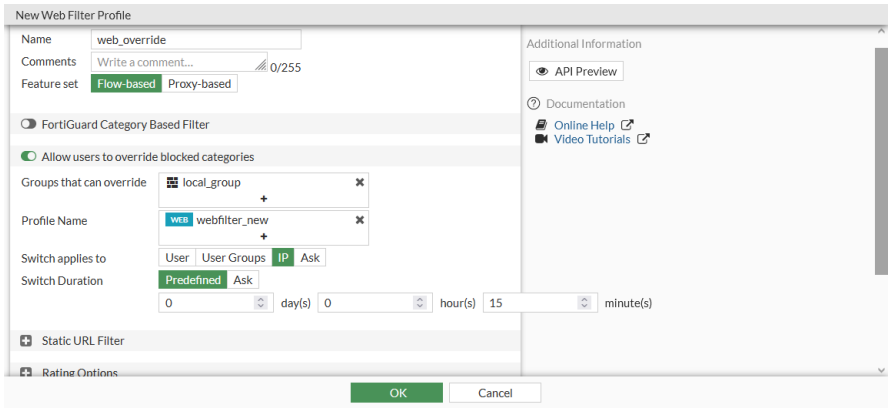
Apply to user groups

Individual users can not be selected. You can select one or more of the user groups recognized by the FortiGate. They can be local to the system or from a third party authentication device, such as an AD server through FSSO.

Switch duration

Administrative override sets a specified time frame that is always used for that override. The available options are:

- *Predefined*: the value entered is the set duration (length of time in days, hours, or minutes) that the override will be in effect. If the duration variable is set to 15 minutes, the length of the override will always be 15 minutes. The option will be visible in the override message page, but the setting will be grayed out.
- *Ask*: the user has the option to set the override duration once it is engaged. The user can set the duration in terms of days, hours, or minutes.

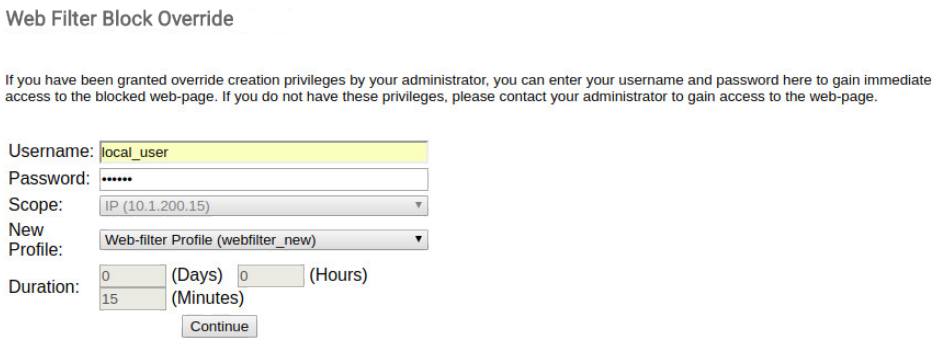


Creating a web profile users override

This example describes how to allow users in the *local_group* to override the *webfilter_new* profile.

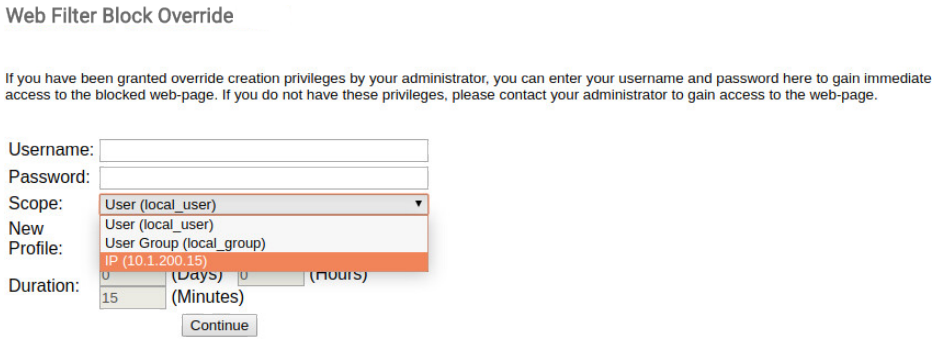
To allow users to override blocked categories using the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*.
2. Enter a name for the profile.
3. Enable *Allow users to override blocked categories*.
4. Configure the web filter profile:



a. Click the *Groups that can override* field, and select a group (*local_group* in this example).
b. Click the *Profile Name* field, and select the *webfilter_new* profile.
c. For the *Switch applies to* field, click *IP*.
d. For the *Switch Duration* field, click *Predefined*. The default *15* minutes appears, which is the desired duration for this example.
e. Configure the rest of the profile as needed.

5. Click *OK*.



Using the ask feature

This option is only available in *Allow users to override blocked categories* is enabled. It configures the message page to have the user choose which scope they want to use. Normally on the message page, the scope options are grayed out and not editable. In the following example, the *Scope* is predefined with *IP*.

When the ask option is enabled (through the *Switch applies to* field in the GUI), the *Scope* dropdown is editable. Users can choose one of the following:

- User
- User group
- IP

User and *User Group* are only available when there is a user group in the firewall policy. You must specify a user group as a source in the firewall policy so the scope includes *User* and *User Group*; otherwise, only the IP option will be available.

IP ban

The FortiGate IP ban feature is a powerful tool for network security. It allows the system to block traffic originating from specific IP addresses that are deemed potentially harmful by the system administrator.

When an IP address is banned, any active connections originating from the banned IP address are immediately terminated. Any subsequent connection attempts are rejected by the Kernel's packet filter, further fortifying the network's security.

Checks for IP bans are carried out only if there is a corresponding firewall policy with an ACCEPT action. If a match is found, the action is then altered to DENY. In scenarios where there is no matching policy, the connection is refused due to the implicit deny rule that is in effect.

Several methods can be used to ban IP addresses:

- FortiView Source: This method allows you to ban an IP address directly from the *FortiView Sources* monitor. See To ban an IP address for more information.
- IP ban: Administrators can configure an automation stitch with the *IP Ban* action, using a trigger such as a *Compromised Host* or an *Incoming Webhook*. When the automation is triggered, the client PC is quarantined. See Actions on page 3242 and Incoming Webhook Quarantine stitch on page 3217 for more information. The Automation Stitch feature can also be used to configure IP bans from other fabric devices.
- Command line interface (CLI): For those who prefer using command line, IP ban can be added with the CLI. See IP ban using the CLI on page 1938 for more information.
- Security profiles: Most security profiles include a mechanism to ban a source IP address. See IP ban using security profiles on page 1939 for more information.
- DoS policy: A Denial of Service (DoS) policy can be used to block any further traffic from a source IP address that is considered a malicious actor. See DoS policy on page 1333 for more information.

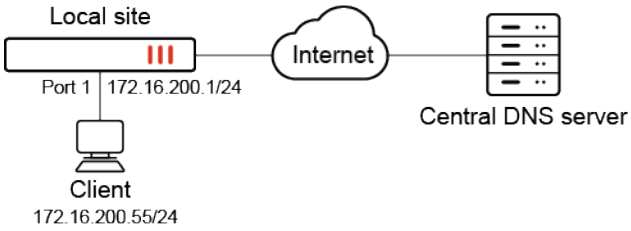
Additionally, administrators can control whether the banned IP list remains intact through a power cycle. See Configuring the persistency for a banned IP list on page 1941 for more information.

IP ban using the CLI

Administrators can use the following command to manage the banned IP address list:

```
# diagnose user banned-ip {list | add | delete | clear | stat}
```

Option	Description
list	List banned IPs.
add	Add banned IP address.
delete	Delete banned IP address.
clear	Clear all banned IP addresses.
stat	Statistics



To add an IP address to the ban list:

```
# diagnose user banned-ip add <src4 | src6> <src-ipv4 | src-ipv6> <expiry> <admin | dlp |
ips | av | dos | app>
```

Setting the expiry time to `0` results in an indefinite expiry time. If this is combined with the `banned-ip-persistency` (either `permanent-only` or `all`), the ban becomes permanent.

Example

In this example, a client PC is configured with the IP address 172.16.200.55, and an administrator adds the IP address to the IP ban list.

To add an IP address to the ban list:

```
# diagnose user banned-ip add src4 172.16.200.55 2 admin
```

To view the banned IP list:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
172.16.200.55       Tue Jan 16 14:46:00 2024 Tue Jan 16 14:56:00 2024 Administrative
```

To verify that the banned IP list is working:

1. From the client with the banned IP address of 172.16.200.55, send a DNS query for a domain that is configured on the Central DNS server.
2. Go to *Log & Report* > *Forward Traffic*, and search for IP address *172.16.200.55*.
3. View the log details in the GUI, or download the log file.

   In the following log file example, action is deny for source IP 172.16.200.55.

```
date=2024-01-16 time=14:48:43 eventtime=1705445143824107713 tz="+1200"
logid="0000000013" type="traffic" subtype="forward" level="notice" vd="root"

```

IP ban using security profiles

Configure one or all of the security profiles to quarantine all traffic originating from the infected host's IP address for a configurable duration. The IP address of the attacker is also incorporated into the list of banned users. The address of the target remains unaffected.

The following types of security profiles can be used to ban IP addresses:

- Antivirus on page 1939
- Application control on page 1940
- DLP on page 1940
- IPS on page 1941

Antivirus

To ban IP addresses using an antivirus profile:

1. Configure an antivirus profile:

```
config antivirus profile
    edit <name>
    config nac-quar
    set infected quar-src-ip
    set expiry <duration>
 end
```

2. View the banned IP address:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause

172.16.200.55       Wed Jan 17 13:06:05 2024 Wed Jan 17 13:08:05 2024 AV
```

Application control

Quarantine is available as one of the action types when the application matches this application control profile. See Basic category filters and overrides on page 1710 for more information.

To ban IP addresses using an application control profile:

1. Configure the application control profile:

```
config application list
    edit <name>
        config entries
            edit <id>
                set quarantine attacker
                set quarantine-expiry <duration>
            next
        end
    next
end
```

2. View the banned IP address:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
172.16.200.55       Thu Jan 18 07:17:13 2024 Thu Jan 18 07:22:13 2024 APP
```

DLP

Quarantine is available as one of the action types when the content matches this DLP profile. See Basic DLP settings on page 1843 for more information

To ban IP addresses using a DLP profile:

1. Configure the DLP profile:

```
config dlp profile
    edit <name>
        config rule
            edit <id>
                set proto <protocols>
                set action quarantine-ip
                set expiry <duration>
            next
        end
    next
end
```

2. View the banned IP address:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
172.16.200.55       Thu Jan 18 07:03:03 2024 Thu Jan 18 07:05:03 2024 DLP
```

IPS

Quarantine is available as one of the action types when the signature matches this IPS profile. A protocol must also be set. See Configuring an IPS sensor on page 1745 for more information.

To ban IP addresses using an IPS profile:

1. Configure the IPS profile:

```
config ips sensor
    edit <name>
        config entries
            edit <id>
                set quarantine attacker
                set quarantine-expiry <duration>
            next
        end
end
```

2. View the banned IP address:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
172.16.200.55      Thu Jan 18 06:42:06 2024 Thu Jan 18 06:44:06 2024 IPS
```

Configuring the persistency for a banned IP list

The `banned-ip-persistency` option configures whether the banned IP list persists through a power cycle.

```
config firewall global
    set banned-ip-persistency {disabled | permanent-only | all}
end
```

`banned-ip-persistency {disabled | permanent-only | all}`	Set the persistency of banned IPs across power cycling: • `disabled`: no entries are kept across power cycling (default). • `permanent-only`: only permanent IP bans are kept across power cycling. • `all`: all IP bans are kept across power cycling.

The banned IP list is created from quarantining. For example, when quarantining is enabled for IPS, application control, and DDoS. Permanent quarantining can be added manually using `diagnose user banned-ip add src4`.

The `diagnose user quarantine <parameter>` command has changed to `diagnose user banned-ip <parameter>`.

Example 1: keep all banned IPs across power cycling

When `banned-ip-persistency` is set to `all`, all the banned IPs are saved after a reboot. In this example, an application control security profile with quarantining is already configured. After traffic is generated that triggers the

quarantine rule, a quarantine list is generated.

To view the list of banned IPs:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
10.1.100.12       Tue Jul  5 18:01:05 2022 Tue Jul  5 18:21:05 2022 APP
```

After a reboot, the banned IP list is the same:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
10.1.100.12       Tue Jul  5 18:01:05 2022 Tue Jul  5 18:21:05 2022 APP
```

Example 2: keep only permanent banned IPs across power cycling

When `banned-ip-persistency` is set to `permanent-only`, only banned IPs with an indefinite expiry time are saved after a reboot. The permanent IP ban was already configured for 10.1.100.11 using `diagnose user banned-ip add src4 10.1.100.11 0 ips`.

To view the list of banned IPs:

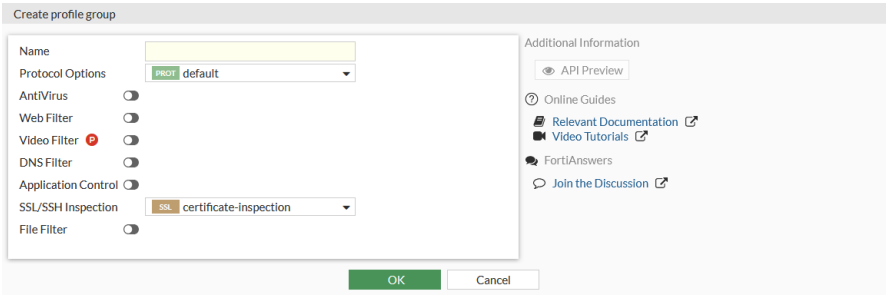
```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
10.1.100.12       Tue Jul  5 18:01:05 2022 Tue Jul  5 18:21:05 2022 APP
10.1.100.11       Tue Jul  5 18:06:35 2022 indefinite               IPS
```

After a reboot, only 10.1.100.11 remains in the banned IP list:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
10.1.100.11       Tue Jul  5 18:06:35 2022 indefinite               IPS
```

Profile groups

Security profiles can be organized into groups. They are useful when there are multiple policies that use the same security profiles, helping save time and preventing missing profiles when configuring policies. When changes need to be made, only the group has to be changed and not the individual policies.



By default, *Security Profiles* > *Profile Groups* is not visible in the GUI. It can only be enabled using the CLI.

To show profile groups in the GUI:

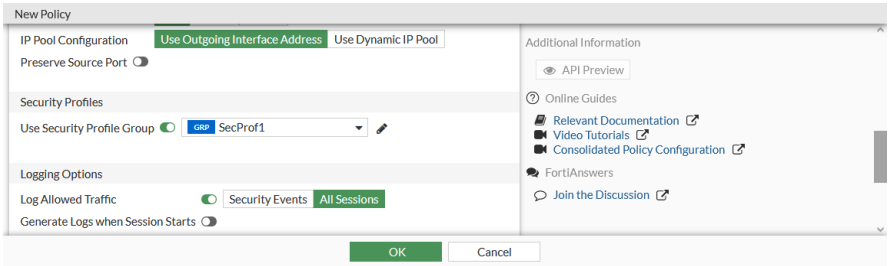
```
config system settings
    set gui-security-profile-group enable
end
```

To configure a profile group in the GUI:

1. Go to *Security Profiles* > *Profile Groups* and click *Create New*.

2. Enter a name for the group.
3. Enable the required profile types and select the profile that will be included in the group.
   A *Protocol Option* must be selected.
4. Click *OK*.

To configure a profile group in the CLI:



```
config firewall profile-group
    edit <name>
        set application-list <string>
        set av-profile <string>
        set cifs-profile <string>
        set dlp-profile <string>
        set dnsfilter-profile <string>
        set emailfilter-profile <string>
        set file-filter-profile <string>
        set icap-profile <string>
        set ips-sensor <string>
        set profile-protocol-options <string>
        set sctp-filter-profile <string>
        set ssh-filter-profile <string>
        set ssl-ssh-profile <string>
        set videofilter-profile <string>
        set voip-profile <string>
        set waf-profile <string>
        set webfilter-profile <string>
    next
end
```

`application-list <string>`	Name of an existing application list.
`av-profile <string>`	Name of an existing antivirus profile.
`cifs-profile <string>`	Name of an existing CIFS profile.
`dlp-profile <string>`	Name of an existing DLP profile.
`dnsfilter-profile <string>`	Name of an existing DNS filter profile.
`emailfilter-profile <string>`	Name of an existing email filter profile.

`file-filter-profile <string>`	Name of an existing file-filter profile.
`icap-profile <string>`	Name of an existing ICAP profile.
`ips-sensor <string>`	Name of an existing IPS sensor profile.
`profile-protocol-options <string>`	Name of an existing protocol options profile (default = `default`).
`sctp-filter-profile <string>`	Name of an existing SCTP filter profile.
`ssh-filter-profile <string>`	Name of an existing SSH filter profile.
`ssl-ssh-profile <string>`	Name of an existing SSL SSH profile (default = `certificate-inspection`).
`videofilter-profile <string>`	Name of an existing video filter profile.
`voip-profile <string>`	Name of an existing VOIP profile.
`waf-profile <string>`	Name of an existing WAF profile.
`webfilter-profile <string>`	Name of an existing web filter profile.

To use the profile group in a policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and edit an existing policy or create a new one.
2. In the *Security Profiles* section, enable *Use Security Profile Group* and select a group.
   No individual profiles can be selected if using a profile group.

3. Click *OK*.

To use the profile group in a policy in the CLI:

```
config firewall policy
    edit <policyid>
        set name <string>
        set srcintf <interface(s)>
        set dstintf <interface(s)>
        set action {accept | deny | ipsec}
        set srcaddr <address(es)>
        set dstaddr <address(es)>
        set schedule <schedule>
        set service <service(s)>
        set utm-status enable
        set profile-type group
```

```
            set profile-group <group>
        next
    end
```

VPN

Virtual Private Network (VPN) technology lets remote users connect to private computer networks to gain access to their resources in a secure way. For example, an employee traveling or working at home can use a VPN to securely access the office network through the Internet.

Instead of remotely logging into a private network using an unencrypted and unsecured Internet connection, using a VPN ensures that unauthorized parties cannot access the office network and cannot intercept information going between the employee and the office. Another common use of a VPN is to connect the private networks of multiple offices.

Fortinet offers VPN capabilities in the FortiGate Unified Threat Management (UTM) appliance and in the FortiClient Endpoint Security suite of applications. You can install a FortiGate unit on a private network and install FortiClient software on the user's computer. You can also use a FortiGate unit to connect to the private network instead of using FortiClient software.

The following sections provide information about VPN:

- IPsec VPNs on page 1946
- SSL VPN on page 2266

IPsec VPNs

The following sections provide instructions on configuring IPsec VPN connections in FortiOS 7.4.3.

- General IPsec VPN configuration on page 1946
- Site-to-site VPN on page 1978
- Remote access on page 2031
- Aggregate and redundant VPN on page 2093
- ADVPN on page 2136
- Fabric Overlay Orchestrator on page 2170
- Other VPN topics on page 2190
- VPN IPsec troubleshooting on page 2258

General IPsec VPN configuration

The following sections provide instructions on general IPsec VPN configurations:

- Network topologies on page 1947
- Phase 1 configuration on page 1947
- Phase 2 configuration on page 1961
- VPN security policies on page 1965
- Blocking unwanted IKE negotiations and ESP packets with a local-in policy on page 1968
- Configurable IKE port on page 1970

- IPsec VPN IP address assignments on page 1972
- Renaming IPsec tunnels on page 1975

Network topologies

The topology of your network will determine how remote peers and clients connect to the VPN and how VPN traffic is routed.

Topology	Description
Site-to-Site	Standard one-to-one VPN between two FortiGates. See Site-to-site VPN on page 1978.
Hub and spoke/ADVPN	One central FortiGate (hub) has multiple VPNs to other remote FortiGates (spokes). In ADVPN, shortcuts can be created between spokes for direct communication. See ADVPN on page 2136.
FortiClient dialup	Typically remote FortiClient dialup clients use dynamic IP addresses through NAT devices. The FortiGate acts as a dialup server allowing dialup VPN connections from multiple sources. See FortiClient as dialup client on page 2038.
FortiGate dialup	Similar to site-to-site except one end is a dialup server and the other end is a dialup client. This facilitates scenarios in which the remote dialup end has a dynamic address, or does not have a public IP, possibly because it is behind NAT. See FortiGate as dialup client on page 2032.
Aggregate VPN	Natively support aggregating multiple VPN tunnels to increase performance and provide redundancy over multiple links. See Packet distribution and redundancy for aggregate IPsec tunnels on page 2109.
Redundant VPN	Options for supporting redundant and partially redundant IPsec VPNs, using route-based approaches. See Redundant hub and spoke VPN on page 2131.
L2TP over IPsec	Configure VPN for Microsoft Windows dialup clients using the built in L2TP software. Users do not have to install any Fortinet software. See L2TP over IPsec on page 2056.
GRE over IPsec	Legacy support for routers requiring point-to-point GRE over IPsec for tunneling. See GRE over IPsec on page 1994.

Phase 1 configuration

Phase 1 configuration primarily defines the parameters used in IKE (Internet Key Exchange) negotiation between the ends of the IPsec tunnel. The local end is the FortiGate interface that initiates the IKE negotiations. The remote end is the remote gateway that responds and exchanges messages with the initiator. Hence, they are sometimes referred to as the initiator and responder. The purpose of phase 1 is to secure a tunnel with one bi-directional IKE SA (security association) for negotiating IKE phase 2 parameters.

The `auto-negotiate` and `negotiation-timeout` commands control how the IKE negotiation is processed when there is no traffic, and the length of time that the FortiGate waits for negotiations to occur.

IPsec tunnels can be configured in the GUI using the *VPN Creation Wizard*. Go to *VPN* > *IPsec Wizard*. The wizard includes several templates (site-to-site, hub and spoke, remote access), but a custom tunnel can be configured with the following settings.

The IPsec phase 1 interface type cannot be changed after it is configured. This is due to the tunnel ID parameter (`tun_id`), which is used to match routes to IPsec tunnels to forward traffic. If the IPsec phase 1 interface type needs to be changed, a new interface must be configured.

For FortiOS 7.4.0, SSL VPN web mode, explicit web proxy, and interface mode IPsec VPN features will not work with the following configuration:

1. An IP pool with ARP reply enabled is configured.
2. This IP pool is configured as the source IP address in a firewall policy for SSL VPN web mode, in a proxy policy for explicit web proxy, or as the local gateway in the Phase 1 settings for an interface mode IPsec VPN.
3. A matching blackhole route is configured for IP pool reply traffic.

Configuring an IP pool as the source NAT IP address in a regular firewall policy works as before.

For details, see Technical Tip: IP pool and virtual IP behaviour changes in FortiOS 6.4, 7.0, 7.2, and 7.4.

Name		Phase 1 definition name. The maximum length is 15 characters for an interface mode VPN and 35 characters for a policy-based VPN. For a policy-based VPN, the name normally reflects where the remote connection originates. For a route-based tunnel, the FortiGate also uses the name for the virtual IPsec interface that it creates automatically.
Network		
	IP Version	Protocol, either IPv4 or IPv6.
	Remote Gateway	Category of the remote connection: • *Static IP Address*: the remote peer has a static IP address. • *Dialup User*: one or more FortiClient or FortiGate dialup clients with dynamic IP addresses will connect to the FortiGate. • *Dynamic DNS*: a remote peer that has a domain name and subscribes to a dynamic DNS service will connect to the FortiGate.
	IP Address	The IP address of the remote peer. This option is only available when the *Remote Gateway* is *Static IP Address*.
	Dynamic DNS	The domain name of the remote peer. This option is only available when the *Remote Gateway* is *Dynamic DNS*.
	Interface	The interface through which remote peers or dialup clients connect to the FortiGate. This option is only available in NAT mode. By default, the local VPN gateway IP address is the IP address of the interface that was selected (*Primary IP* in the *Local Gateway* field).

Local Gateway	IP address for the local end of the VPN tunnel (*Primary IP* is used by default): • *Secondary IP*: secondary address of the interface selected in the *Interface* field. • *Specify*: manually enter an address. Interface mode cannot be configured in a transparent mode VDOM.
Mode Config	This option is only available when the *Remote Gateway* is *Dialup User*. Configure the client IP address range, subnet mask/prefix length, DNS server, and split tunnel capability to automate remote client addressing.
NAT Traversal	This option is only available when the *Remote Gateway* is *Static IP Address* or *Dynamic DNS*. ESP (encapsulating security payload), the protocol for encrypting data in the VPN session, uses IP protocol 50 by default. However, it does not use any port numbers so when traversing a NAT device, the packets cannot be demultiplexed. Enabling NAT traversal encapsulates the ESP packet inside a UDP packet, thereby adding a unique source port to the packet. This allows the NAT device to map the packets to the correct session. • *Enable*: a NAT device exists between the local FortiGate and the VPN peer or client. Outbound encrypted packets are wrapped inside a UDP IP header that contains a port number. The local FortiGate and the VPN peer or client must have the same NAT traversal setting (both selected or both cleared) to connect reliably. When in doubt, enable NAT traversal. • *Disable*: disable the NAT traversal setting. • *Forced*: the FortiGate will use a port value of zero when constructing the NAT discovery hash for the peer. This causes the peer to think it is behind a NAT device, and it will use UDP encapsulation for IPsec, even if no NAT is present. This approach maintains interoperability with any IPsec implementation that supports the NAT-T RFC.
Keepalive Frequency	Keepalive frequency setting. This option is only available when *NAT Traversal* is set to *Enable* or *Forced*. The NAT device between the VPN peers may remove the session when the VPN connection remains idle for too long. The value represents an interval in seconds where the connection will be maintained with periodic keepalive packets. The keepalive interval must be smaller than the session lifetime value used by the NAT device. The keepalive packet is a 138-byte ISAKMP exchange.
Dead Peer Detection	Reestablishes VPN tunnels on idle connections and cleans up dead IKE peers if required. This feature minimizes the traffic required to check if a VPN peer is available or unavailable (dead). The available options are: • *Disable*: disable dead peer detection (DPD). • *On Idle*: triggers DPD when IPsec is idle. • *On Demand*: Passively sends DPD to reduce load on the firewall. Only triggers DPD when IPsec outbound packets are sent, but no reply is received from the peer. When there is no traffic and the last DPD-ACK has been received, IKE will not send DPDs periodically.

		Notifications are received whenever a tunnel goes up or down, or to keep the tunnel connection open when no traffic is being generated inside the tunnel. For example, in scenarios where a dialup client or dynamic DNS peer connects from an IP address that changes periodically, traffic may be suspended while the IP address changes. When *Dead Peer Detection* is selected, optionally specify a retry count and a retry interval using `dpd-retrycount` and `dpd-retryinterval`. See Dead peer detection on page 1954.
	Forward Error Correction	Enable on both ends of the tunnel to correct errors in data transmission by sending redundant data across the VPN.
	Device creation	Advanced option. When enabled, a dynamic interface (network device) is created for each dialup tunnel.
	Aggregate member	Advanced option. When enabled, the tunnel can be used as an aggregate member candidate.
Authentication		
	Method	Either *Pre-shared Key* or *Signature*.
	Pre-shared Key	The pre-shared key that the FortiGate will use to authenticate itself to the remote peer or dialup client during phase 1 negotiations. The same key must be defined at the remote peer or client. See Pre-shared key.
	Certificate Name	The server certificate that the FortiGate will use to authenticate itself to the remote peer or dialup client during phase 1 negotiations. See Digital certificates.
	IKE Version	Either *1* or *2*. See Choosing IKE version 1 and 2 on page 1955.
	Mode	This option is only available when IKEv1 is selected. The two available options are: • *Aggressive*: the phase 1 parameters are exchanged in a single message with unencrypted authentication information. • *Main (ID protection)*: the phase 1 parameters are exchanged in multiple rounds with encrypted authentication information. When the remote VPN peer has a dynamic IP address and is authenticated by a pre-shared key, you must select *Aggressive* mode if there is more than one dialup phase 1 configuration for the interface IP address. When the remote VPN peer has a dynamic IP address and is authenticated by a certificate, you must select *Aggressive* mode if there is more than one phase 1 configuration for the interface IP address and these phase 1 configurations use different proposals.
	Peer Options	Options to authenticate VPN peers or clients depending on the *Remote Gateway* and *Authentication Method* settings.
	Any peer ID	Accepts the local ID of any remote VPN peer or client. The FortiGate does not check identifiers (local IDs). *Mode* can be set to *Aggressive* or *Main*. This option can be used with digital certificate authentication, but for higher security, use *Peer certificate*.

	Specific peer ID	This option is only available when *Aggressive Mode* is enabled. Enter the identifier that is used to authenticate the remote peer. The identifier must match the local ID configured by the remote peer's administrator. If the remote peer is a FortiGate, the identifier is specified in the *Local ID* field of the *Phase 1 Proposal* settings. If the remote peer is a FortiClient user, the identifier is specified in the *Local ID* field. In circumstances where multiple remote dialup VPN tunnels exist, each tunnel must have a peer ID set.
	Peer certificate	Define the CA certificate used to authenticate the remote peer when the authentication mode is *Signature*. If the FortiGate will act as a VPN client, and you are using security certificates for authentication, set the *Local ID* to the distinguished name (DN) of the local server certificate that the FortiGate unit will use for authentication purposes.
	Peer ID from dialup group	Authenticate multiple FortiGate or FortiClient dialup clients that use unique identifiers and unique pre-shared keys (or unique pre-shared keys only) through the same VPN tunnel. You must create a dialup user group for authentication purposes. Select the group from the list next to the *Peer ID from dialup group* option. You must set *Mode* to *Aggressive* when the dialup clients use unique identifiers and unique pre-shared keys. If the dialup clients use unique pre-shared keys only, you can set *Mode* to *Main* if there is only one dialup Phase 1 configuration for this interface IP address.
Phase 1 Proposal		The encryption and authentication algorithms used to generate keys for the IKE SA. There must be a minimum of one combination. The remote peer or client must be configured to use at least one of the proposals that you define.
	Encryption	The following symmetric-key encryption algorithms are available: • *DES*: Digital Encryption Standard, a 64-bit block algorithm that uses a 56-bit key. • *3DES*: triple-DES; plain text is encrypted three times by three keys. • *AES128*: Advanced Encryption Standard, a 128-bit block algorithm that uses a 128-bit key. • *AES128GCM*: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 128-bit key. Only available for IKEv2. • *AES192*: a 128-bit block algorithm that uses a 192-bit key. • *AES256*: a 128-bit block algorithm that uses a 256-bit key. • *AES256GCM*: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 256-bit key. Only available for IKEv2. • *CHACHA20POLY1305*: a 128-bit block algorithm that uses a 128-bit key and a symmetric cipher. Only available for IKEv2. See also HMAC settings.

	Authentication	The following message digests that check the message authenticity during an encrypted session are available: • *MD5*: message digest 5. • *SHA1*: secure hash algorithm 1; a 160-bit message digest. • *SHA256*: a 256-bit message digest. • *SHA384*: a 384-bit message digest. • *SHA512*: a 512-bit message digest. In IKEv2, encryption algorithms include authentication, but a PRF (pseudo random function) is still required (*PRFSHA1*, *PRFSHA256*, *PRFSHA384*, *PRFSHA512*). See also HMAC settings.
	Diffie-Hellman Groups	Asymmetric key algorithms used for public key cryptography. Select one or more from groups 1, 2, 5, and 14 through 32. At least one of the *Diffie-Hellman Groups* (DH) settings on the remote peer or client must match one the selections on the FortiGate. Failure to match one or more DH groups will result in failed negotiations.
	Key Lifetime	The time (in seconds) that must pass before the IKE encryption key expires. When the key expires, a new key is generated without interrupting service. The keylife can be from 120 to 172 800 seconds.
	Local ID	Optional setting. This value must match the peer ID value given for the remote VPN peer's *Peer Options*. • If the FortiGate will act as a VPN client and you are using peer IDs for authentication purposes, enter the identifier that the FortiGate will supply to the VPN server during the phase 1 exchange. • If the FortiGate will act as a VPN client and you are using security certificates for authentication, select the distinguished name (DN) of the local server certificate that the FortiGate will use for authentication purposes.
XAUTH		This option supports the authentication of dialup clients. It is only available for IKE version 1. • *Disable*: do not use XAuth. • *Client*: available only if the *Remote Gateway* is set to *Static IP Address* or *Dynamic DNS*. If the FortiGate is a dialup client, enter the user name and password for the FortiGate to authenticate itself to the remote XAuth server. • *PAP Server*, *CHAP Server*, *Auto Server*: available only if *Remote Gateway* is set to *Dialup User*. Dialup clients authenticate as members of a dialup user group. A user group must be created first for the dialup clients that need access to the network behind the FortiGate. The FortiGate must be configured to forward authentication requests to an external RADIUS or LDAP authentication server. Select the server type based on the encryption method used between the FortiGate, the XAuth client, and the external authentication server. Then select the user group (*Inherit from policy* or *Choose*). See Using XAuth authentication on page 1959.

Username	User name used for authentication.
Password	Password used for authentication.

Additional CLI configurations

The following phase 1 settings can be configured in the CLI:

VXLAN over IPsec	Packets with a VXLAN header are encapsulated within IPsec tunnel mode.
	
	To configure VXLAN over IPsec:
	
	`config vpn ipsec phase1-interface/phase1`
	`  edit ipsec`
	`  set interface <name>`
	`  set encapsulation vxlan/gre`
	`  set encapsulation-address ike/ipv4/ipv6`
	`  set encap-local-gw4 xxx.xxx.xxx.xxx`
	`  set encap-remote-gw xxx.xxx.xxx.xxx`
	`  next`
	`end`

IPsec tunnel idle timer	Define an idle timer for IPsec tunnels. When no traffic has passed through the tunnel for the configured `idle-timeout` value, the IPsec tunnel will be flushed.
	
	To configure IPsec tunnel idle timeout:
	
	`config vpn ipsec phase1-interface`
	`  edit p1`
	`  set idle-timeout [enable | disable]`
	`  set idle-timeoutinterval <integer>` *`IPsec tunnel idle timeout in minutes (10 - 43200).`*
	`  next`
	`end`

Monitor tunnel for failover	Monitor a site-to-site tunnel to guarantee operational continuity if the primary tunnel fails. Configure the secondary phase 1 interface to monitor the primary interface.
	
	To configure the monitor:
	
	`config vpn ipsec phase1-interface`
	`  edit <secondary phase1-interface>`
	`  set monitor <primary phase1-interface>`
	`  next`
	`end`

Passive mode	Passive mode turns one side of the tunnel to be a responder only. It does not initiate VPN tunnels either by auto-negotiation, rekey, or traffic initiated behind the FortiGate.

	To configure passive mode:
	`config vpn ipsec phase1-interface`
	`edit <example>`
	`set rekey {enable | disable}`
	`set passive-mode {enable | disable}`
	`set passive-tunnel-interface {enable | disable}`
	`next`
	`end`

Network ID	The network ID is a Fortinet-proprietary attribute that is used to select the correct phase 1 between IPsec peers, so that multiple IKEv2 tunnels can be established between the same local/remote gateway pairs.
	In a dial-up VPN, `network-id` is in the first initiator message of an IKEv2 phase 1 negotiation. The responder (Hub) uses the `network-id` to match a phase 1 configuration with a matching `network-id`. The Hub can then differentiate multiple dial-up phase 1s that are bound to the same underlay interface and IP address. Without a `network-id`, the Hub cannot have multiple phase 1 dialup tunnels on the same interface.
	In static phase 1 configurations, `network-id` is used with the pair of gateway IPs to negotiate the correct tunnel with a matching `network-id`. This allows IPsec peers to use the same pair of underlay IPs to establish multiple IPsec tunnels. Without it, only a single tunnel can be established over the same pair of underlay IPs.
	To configure the network ID:
	`config vpn ipsec phase1-interface`
	`edit <example>`
	`set ike-version 2`
	`set network-overlay enable`
	`set network-id <integer>`
	`next`
	`end`

Dead peer detection

By default, dead peer detection (DPD) sends probe messages every five seconds. If you are experiencing high network traffic, you can experiment with increasing the ping interval. However, longer intervals will require more traffic to detect dead peers, which will result in more traffic.

In a dynamic (dialup) connection, the *On Idle* option encourages dialup server configurations to more proactively delete tunnels if the peer is unavailable.

In the GUI, the dead peer detection option can be configured when defining phase 1 options. The following CLI commands support additional options for specifying a retry count and a retry interval.

For example, enter the following to configure DPD on the existing IPsec phase 1 configuration to use 15-second intervals and to wait for three missed attempts before declaring the peer dead and taking action.

To configure DPD:

```
config vpn ipsec phase1-interface
    edit <value>
        set dpd [disable | on-idle | on-demand]
        set dpd-retryinveral 15
        set dpd-retrycount 3
    next
end
```

DPD scalability

On a dialup server, if many VPN connections are idle, the increased DPD exchange could negatively impact the performance/load of the daemon. The `on-demand` option in the CLI triggers DPD when IPsec traffic is sent, but no reply is received from the peer.

When there is no traffic and the last DPD-ACK had been received, IKE will not send DPDs periodically. IKE will only send out DPDs if there are outgoing packets to send, but no inbound packets have since been received.

HMAC settings

The FortiGate uses the HMAC based on the authentication proposal that is chosen in phase 1 or phase 2 of the IPsec configuration. Each proposal consists of the encryption-hash pair (such as `3des-sha256`). The FortiGate matches the most secure proposal to negotiate with the peer.

To view the chosen proposal and the HMAC hash used:

```
# diagnose vpn ike gateway list

vd: root/0
name: MPLS
version: 1
interface: port1 3
addr: 192.168.2.5:500 -> 10.10.10.1:500
tun_id: 10.10.10.1
virtual-interface-addr: 172.31.0.2 -> 172.31.0.1
created: 1015820s ago
IKE SA: created 1/13 established 1/13 time 10/1626/21010 ms
IPsec SA: created 1/24 established 1/24 time 0/11/30 ms

  id/spi: 124 43b087dae99f7733/6a8473e58cd8990a
  direction: responder
  status: established 68693-68693s ago = 10ms
  proposal: 3des-sha256
  key: e0fa6ab8dc509b33-aa2cc549999b1823-c3cb9c337432646e
  lifetime/rekey: 86400/17436
  DPD sent/recv: 000001e1/00000000
```

Choosing IKE version 1 and 2

If you create a route-based VPN, you have the option of selecting IKE version 2. Otherwise, IKE version 1 is used.

IKEv2, defined in RFC 4306, simplifies the negotiation process that creates the security association (SA).

If you select IKEv2:

- There is no choice in phase 1 of aggressive or main mode.
- Extended authentication (XAUTH) is not available.
- You can utilize EAP and MOBIKE.

Repeated authentication in IKEv2

This feature provides the option to control whether a device requires its peer to re-authenticate or whether re-key is sufficient. It does not influence the re-authentication or re-key behavior of the device itself, which is controlled by the peer (the default being to re-key). This solution is in response to RFC 4478. As described by the IETF, "the purpose of this is to limit the time that security associations (SAs) can be used by a third party who has gained control of the IPsec peer".

To configure IKE SA re-authentication:

```
config vpn ipsec phase1-interface
    edit p1
        set reauth [enable | disable]
    next
end
```

IKEv2 quick crash detection

There is support for IKEv2 quick crash detection (QCD) as described in RFC 6290.

RFC 6290 describes a method in which an IKE peer can quickly detect that the gateway peer it has and established an IKE session with has rebooted, crashed, or otherwise lost IKE state. When the gateway receives IKE messages or ESP packets with unknown IKE or IPsec SPIs, the IKEv2 protocol allows the gateway to send the peer an unprotected IKE message containing INVALID_IKE_SPI or INVALID_SPI notification payloads.

RFC 6290 introduces the concept of a QCD token, which is generated from the IKE SPIs and a private QCD secret, and exchanged between peers during the protected IKE AUTH exchange.

To configure QCD:

```
config system settings
    set ike-quick-crash-detect [enable | disable]
end
```

IKEv1 quick crash detection

Based on the IKEv2 QCD feature previously described, IKEv1 QCD is implemented using a new IKE vendor ID (Fortinet Quick Crash Detection) so both endpoints must be FortiGates. The QCD token is sent in the phase 1 exchange and must be encrypted, so this is only implemented for IKEv1 in main mode (aggressive mode is not supported as there is no available AUTH message to include the token). Otherwise, the feature works the same as in IKEv2 (RFC 6290).

IKEv1 fragmentation

UDP fragmentation can cause issues in IPsec when either the ISP or perimeter firewall(s) cannot pass or fragment the oversized UDP packets that occur when using a very large public security key (PSK). The result is that IPsec tunnels do not come up. The solution is IKE fragmentation.

For most configurations, enabling IKE fragmentation allows connections to automatically establish when they otherwise might have failed due to intermediate nodes dropping IKE messages containing large certificates, which typically push the packet size over 1500 bytes.

FortiOS will fragment a packet on sending if only all the following are true:

- Phase 1 contains `set fragmentation enable`.
- The packet is larger than the minimum MTU (576 for IPv4, 1280 for IPv6).
- The packet is being re-transmitted.

By default, IKE fragmentation is enabled.

To configure IKEv1 fragmentation:

```
config vpn ipsec phase1-interface
    edit 1
        set fragmentation [enable | disable]
    next
end
```

IKEv2 fragmentation

RFC 7383 requires each fragment to be individually encrypted and authenticated. With IKEv2, a copy of the unencrypted payloads around for each outgoing packet would need to be kept in case the original single packet was never answered and would retry with fragments. With the following implementation, if the IKE payloads are greater than a configured threshold, the IKE packets are preemptively fragmented and encrypted.

To configure IKEv2 fragmentation:

```
config vpn ipsec phase1-interface
    edit ike
        set ike-version 2
        set fragmentation [enable|disable]
        set fragmentation-mtu <500-16000>
    next
end
```

IPsec global IKE embryonic limit

When trying to establish thousands of tunnels simultaneously, a situation can arise where new negotiations starve other SAs from progressing to an established state in IKEv2. The IKE daemon can prioritize established SAs, offload groups 20 and 21 to CP9, and optimize the default embryonic limits for mid- and high-end platforms. The IKE embryonic limit can be configured in the CLI.

```
config system ike
    set embryonic-limit <integer>
end
```

`embryonic-limit <integer>`	Set the maximum number of IPsec tunnels to negotiate simultaneously (50 - 20000, default = 1000).

To configure an IKE embryonic limit of 50:

```
config system ike
    set embryonic-limit 50
end
```

Pre-shared key vs digital certificates

A FortiGate can authenticate itself to remote peers or dialup clients using either a pre-shared key or a digital certificate.

Pre-shared key

Using a pre-shared key is less secure than using certificates, especially if it is used alone, without requiring peer IDs or extended authentication (XAuth). There also needs to be a secure way to distribute the pre-shared key to the peers.

If you use pre-shared key authentication alone, all remote peers and dialup clients must be configured with the same pre-shared key. Optionally, you can configure remote peers and dialup clients with unique pre-shared keys. On the FortiGate, these are configured in user accounts, not in the phase 1 settings.

The pre-shared key must contain at least six printable characters and should be known by network administrators. For optimum protection against currently known attacks, the key must consist of a minimum of 16 randomly chosen alphanumeric characters. The limit is 128 characters.

If you authenticate the FortiGate using a pre-shared key, you can require remote peers or dialup clients to authenticate using peer IDs, but not client certificates.

To authenticate the FortiGate using a pre-shared key:

1. Go to *VPN* > *IPsec Tunnels* and create a new tunnel, or edit an existing one.
2. Configure or edit the *Network* section as needed.
3. Configure or edit the *Authentication* settings as follows:

Method	*Pre-shared Key*
Pre-shared Key	<string>
IKE Version	*1* or *2*
Mode	*Aggressive* or *Main*
Peer Options	Select an *Accept Type* and the corresponding peer. Options vary based on the *Remote Gateway* and *Authentication Method* settings in the *Network* section. *Peer Options* are only available in *Aggressive* mode.

4. For the *Phase 1 Proposal* section, keep the default settings unless changes are needed to meet your requirements.
5. Optionally, for authentication parameters for a dialup user group, define *XAUTH* parameters.
6. Click *OK*.

Digital certificates

To authenticate the FortiGate using digital certificates, you must have the required certificates installed on the remote peer and on the FortiGate. The signed server certificate on one peer is validated by the presence of the root certificate installed on the other peer. If you use certificates to authenticate the FortiGate, you can also require the remote peers or dialup clients to authenticate using certificates. See Site-to-site VPN with digital certificate on page 1983 for a detailed example.

To authenticate the FortiGate using a digital certificate:

1. Go to *VPN* > *IPsec Tunnels* and create a new tunnel, or edit an existing one.
2. Configure or edit the *Network* section as needed.

3. Configure or edit the *Authentication* settings as follows:

Method	*Signature*
Certificate Name	Select the certificate used to identify this FortiGate. If there are no imported certificates, use *Fortinet_Factory*.
IKE Version	*1* or *2*
Mode	*Aggressive* is recommended.
Peer Options	For *Accept Type*, select *Peer certificate* and select the peer and the CA certificate used to authenticate the peer. If the other end is using the Fortinet_Factory certificate, then use the *Fortinet_CA* certificate here.

4. For the *Phase 1 Proposal* section, keep the default settings unless changes are needed to meet your requirements.
5. Optionally, for authentication parameters for a dialup user group, define *XAUTH* parameters.
6. Click *OK*.

Using XAuth authentication

Extended authentication (XAuth) increases security by requiring remote dialup client users to authenticate in a separate exchange at the end of phase 1. XAuth draws on existing FortiGate user group definitions and uses established authentication mechanisms such as PAP, CHAP, RADIUS, and LDAP to authenticate dialup clients. You can configure a FortiGate to function either as an XAuth server or client. If the server or client is attempting a connection using XAuth and the other end is not using XAuth, the failed connection attempts that are logged will not specify XAuth as the reason.

XAuth server

A FortiGate can act as an XAuth server for dialup clients. When the phase 1 negotiation completes, the FortiGate challenges the user for a user name and password. It then forwards the user's credentials to an external RADIUS or LDAP server for verification.

If the user records on the RADIUS server have suitably configured Framed-IP-Address fields, you can assign client virtual IP addresses by XAuth instead of from a DHCP address range.

The authentication protocol you use for XAuth depends on the capabilities of the authentication server and the XAuth client:

- Select *PAP Server* whenever possible.
- You must select *PAP Server* for all implementations of LDAP and some implementations of Microsoft RADIUS.
- Select *Auto Server* when the authentication server supports *CHAP Server* but the XAuth client does not. The FortiGate will use PAP to communicate with the XAuth client and CHAP to communicate with the authentication server. You can also use *Auto Server* to allow multiple source interfaces to be defined in an IPsec/IKE policy.

Before you begin, create user accounts and user groups to identify the dialup clients that need to access the network behind the FortiGate dialup server. If password protection will be provided through an external RADIUS or LDAP server, you must configure the FortiGate dialup server to forward authentication requests to the authentication server.

To configure XAuth to authenticate a dialup user group:

1. On the FortiGate dialup server, go to *VPN* > *IPsec Tunnels* and create a new tunnel, or edit an existing one.
2. Configure or edit the *Network*, *Authentication*, and *Phase 1 Proposal* sections as needed.

3. In the *XAUTH* section, select the encryption method *Type* to use between the XAuth client, the FortiGate, and the authentication server.
4. For *User Group*:
   a. Click *Inherit from policy* for multiple user groups defined in the IPsec/IKE policy, or
   b. Click *Choose* and in the dropdown, select the user group that needs to access the private network behind the FortiGate.

Only one user group may be defined for *Auto Server*.

5. Click *OK*.
6. Create as many policies as needed, specifying the source user(s) and destination address.

XAuth client

If the FortiGate acts as a dialup client, the remote peer, acting as an XAuth server, might require a username and password. You can configure the FortiGate as an XAuth client with its own username and password, which it provides when challenged.

To configure the FortiGate dialup client as an XAuth client:

1. On the FortiGate dialup client, go to *VPN* > *IPsec Tunnels* and create a new tunnel, or edit an existing one.
2. Configure or edit the *Network*, *Authentication*, and *Phase 1 Proposal* sections as needed.
3. In the *XAUTH* section, for *Type*, select *Client*.
4. For *Username*, enter the FortiGate PAP, CHAP, RADIUS, or LDAP user name that the FortiGate XAuth server will compare to its records when the FortiGate XAuth client attempts to connect.
5. Enter the *Password* for the user name.
6. Click *OK*.

Dynamic IPsec route control

You can add a route to a peer destination selector by using the `add-route` option, which is available for all dynamic IPsec phases 1 and 2, for both policy-based and route-based IPsec VPNs.

The `add-route` option adds a route to the FortiGate routing information base when the dynamic tunnel is negotiated. You can use the distance and priority options to set the distance and priority of this route. If this results in a route with the lowest distance, it is added to the FortiGate forwarding information base.

You can also enable `add-route` in any policy-based or route-based phase 2 configuration that is associated with a dynamic (dialup) phase 1. In phase 2, `add-route` can be enabled, disabled, or set to use the same route as phase 1.

The `add-route` option is enabled by default.

To configure add-route in phase 1:

```
config vpn ipsec
    edit <name>
        set type dynamic
        set add-route {enable | disable}
```

```
    next
end
```

To configure add-route in phase 2:

```
config vpn ipsec {phase2 | phase2-interface}
    edit <name>
        set add-route {phase1 | enable | disable}
    next
end
```

Blocking IPsec SA negotiation

For interface-based IPsec, IPsec SA negotiation blocking can only be removed if the peer offers a wildcard selector. If a wildcard selector is offered, then the wildcard route will be added to the routing table with the distance/priority value configured in phase 1. If that is the route with the lowest distance, it will be installed into the forwarding information base.

In this scenario, it is important to ensure that the distance value configured for phase 1 is set appropriately.

Phase 2 configuration

After phase 1 negotiations end successfully, phase 2 begins. In Phase 2, the VPN peer or client and the FortiGate exchange keys again to establish a secure communication channel. The phase 2 proposal parameters select the encryption and authentication algorithms needed to generate keys for protecting the implementation details of security associations (SAs). The keys are generated automatically using a Diffie-Hellman algorithm.

The basic phase 2 settings associate IPsec phase 2 parameters with the phase 1 configuration that specifies the remote end point of the VPN tunnel. In most cases, you need to configure only basic Phase 2 settings.

Some settings can be configured in the CLI. The following options are available in the *VPN Creation Wizard* after the tunnel is created:

New Phase 2		
	Name	Phase 2 definition name.
	Local Address	A value of `0.0.0.0/0` means all IP addresses behind the local VPN peer. Add a specific address or range to allow traffic from and to only this local address. See Quick mode selectors on page 1963.
	Remote Address	Enter the destination IP address that corresponds to the recipients or network behind the remote VPN peer. A value of `0.0.0.0/0` means all IP addresses behind the remote VPN peer. See Quick mode selectors on page 1963.
Advanced		Select the encryption and authentication algorithms that will be proposed to the remote VPN peer. To establish a VPN connection, at least one of the proposals specified must match the configuration on the remote peer.
	Encryption	The following symmetric-key encryption algorithms are available: • *NULL*: do not use an encryption algorithm. • *DES*: Digital Encryption Standard, a 64-bit block algorithm that uses a

		56-bit key. • *3DES*: triple-DES; plain text is encrypted three times by three keys. • *AES128*: Advanced Encryption Standard, a 128-bit block algorithm that uses a 128-bit key. • *AES128GCM*: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 128-bit key. Only available for IKEv2. • *AES192*: a 128-bit block algorithm that uses a 192-bit key. • *AES256*: a 128-bit block algorithm that uses a 256-bit key. • *AES256GCM*: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 256-bit key. Only available for IKEv2. • *CHACHA20POLY1305*: a 128-bit block algorithm that uses a 128-bit key and a symmetric cipher. Only available for IKEv2. See ChaCha20 and Poly1305 AEAD cipher on page 1965, AES-GCM for IKEv2 phase 1 on page 1965, and HMAC settings.
	Authentication	The following message digests that check the message authenticity during an encrypted session are available: • NULL: do not use a message digest. • *MD5*: message digest 5. • *SHA1*: secure hash algorithm 1; a 160-bit message digest. • *SHA256*: a 256-bit message digest. • *SHA384*: a 384-bit message digest. • *SHA512*: a 512-bit message digest. See also HMAC settings.
	Enable Replay Detection	Replay attacks occur when an unauthorized party intercepts a series of IPsec packets and replays them back into the tunnel. Replay detection allows the FortiGate to check all IPsec packets to see if they have been received before. If any encrypted packets arrive out of order, the FortiGate discards them. Note that 64-bit extended sequence numbers (as described in RFC 4303, RFC 4304 as an addition to IKEv1, and RFC 5996 for IKEv2) are supported for IPsec when replay detection is enabled.
	Enable Perfect Forward Secrecy (PFS)	Perfect forward secrecy (PFS) improves security by forcing a new Diffie-Hellman exchange whenever keylife expires.
	Diffie-Hellman Group	Asymmetric key algorithms used for public key cryptography. Select one or more from groups 1, 2, 5, and 14 through 32. At least one of the *Diffie-Hellman Groups* (DH) settings on the remote peer or client must match one the selections on the FortiGate. Failure to match one or more DH groups will result in failed negotiations.
	Local Port	Enter the port number that the local VPN peer uses to transport traffic related to the specified service (protocol number). The range is from 0 to 65535. To specify all ports, select *All*, or enter `0`.

Remote Port	Enter the port number that the remote VPN peer uses to transport traffic related to the specified service (protocol number). To specify all ports, select *All*, or enter `0`.
Protocol	Enter the IP protocol number of the service. To specify all services, select *All*, or enter `0`.
Auto-negotiate	Select this option for the tunnel to be automatically renegotiated when the it expires. See Auto-negotiate on page 1964.
Autokey Keep Alive	Select this option for the tunnel to remain active when no data is being processed.
Key Lifetime	Select the method for determining when the phase 2 key expires: • *Seconds* • *Kilobytes* • *Both* Enter a corresponding value for *Seconds* and/or *Kilobytes* in the text boxes. If *Both* is selected, the key expires when either the time has passed or the number of kilobytes have been processed.

Quick mode selectors

Quick mode selectors determine which IP addresses can perform IKE negotiations to establish a tunnel. By only allowing authorized IP addresses access to the VPN tunnel, the network is more secure.

The default settings are as broad as possible: any IP address or configured address object using any protocol on any port.

While the dropdown menus for specifying an address also show address groups, the use of address groups may not be supported on a remote endpoint device that is not a FortiGate.

When configuring a quick mode selector for *Local Address* and *Remote Address*, valid options include IPv4 and IPv6 single addresses, subnets, or ranges.

There are some configurations that require specific selectors:

- The VPN peer is a third-party device that uses specific phase2 selectors.
- The FortiGate connects as a dialup client to another FortiGate, in which case (usually) you must specify a local IP address, IP address range, or subnet. However, this is not required if you are using dynamic routing and `mode-cfg`.

With FortiOS VPNs, your network has multiple layers of security, with quick mode selectors being an important line of defense:

- Routes guide traffic from one IP address to another.
- Phase 1 and phase 2 connection settings ensure there is a valid remote end point for the VPN tunnel that agrees on the encryption and parameters.
- Quick mode selectors allow IKE negotiations only for allowed peers.
- Security policies control which IP addresses can connect to the VPN.
- Security policies also control what protocols are allowed over the VPN along with any bandwidth limiting.

If you are editing an existing phase 2 configuration, the local address and remote address fields are unavailable if the tunnel has been configured to use firewall addresses as selectors. This option exists only in the CLI.

Using the add-route option

Consider using the `add-route` option to add a route to a peer destination selector in phase 2 to automatically match the settings in phase 1.

To configure add-route:

```
config vpn ipsec {phase2 | phase2-interface}
    edit <name>
        set add-route {phase1 | enable | disable}
    next
end
```

Auto-negotiate

By default, the phase 2 security association (SA) is not negotiated until a peer attempts to send data. The triggering packet and some subsequent packets are dropped until the SA is established. Applications normally resend this data, so there is no loss, but there might be a noticeable delay in response to the user.

If the tunnel goes down, the auto-negotiate feature (when enabled) attempts to re-establish the tunnel. Auto-negotiate initiates the phase 2 SA negotiation automatically, repeating every five seconds until the SA is established.

Automatically establishing the SA can be important for a dialup peer. It ensures that the VPN tunnel is available for peers at the server end to initiate traffic to the dialup peer. Otherwise, the VPN tunnel does not exist until the dialup peer initiates traffic.

To configure auto-negotiate:

```
config vpn ipsec phase2
    edit <phase2_name>
        set auto-negotiate enable
    next
end
```

Installing dynamic selectors via auto-negotiate

The IPsec SA connect message generated is used to install dynamic selectors. These selectors can be installed via the auto-negotiate mechanism. When phase 2 has `auto-negotiate` enabled, and phase 1 has `mesh-selector-type` set to `subnet`, a new dynamic selector will be installed for each combination of source and destination subnets. Each dynamic selector will inherit the auto-negotiate option from the template selector and begin SA negotiation. Phase 2 selector sources from dialup clients will all establish SAs without traffic being initiated from the client subnets to the hub.

DHCP

The `dhcp-ipsec` option lets the FortiGate assign VIP addresses to FortiClient dialup clients through a DHCP server or relay. This option is only available if the remote gateway in the phase 1 configuration is set to dialup user, and it only works in policy-based VPNs.

With `dhcp-ipsec`, the FortiGate dialup server acts as a proxy for FortiClient dialup clients that have VIP addresses on the subnet of the private network behind the FortiGate. In this case, the FortiGate dialup server acts as a proxy on the

local private network for the FortiClient dialup client. A host on the network behind the dialup server issues an ARP request, corresponding to the device MAC address of the FortiClient host (when a remote server sends an ARP to the local FortiClient dialup client). The FortiGate then answers the ARP request on behalf of the FortiClient host, and then forwards the associated traffic to the FortiClient host through the tunnel.

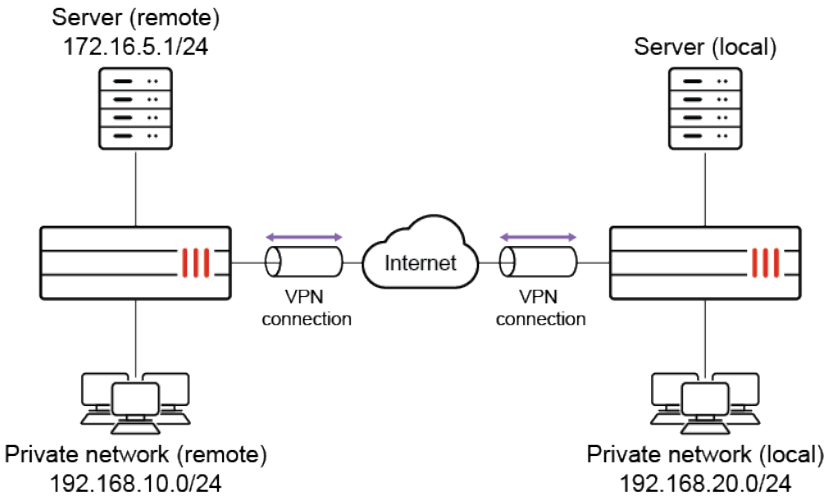
Acting as a proxy prevents the VIP address assigned to the FortiClient dialup client from causing possible ARP broadcast problems—the normal and VIP addresses can confuse some network switches when two addresses have the same MAC address.

ChaCha20 and Poly1305 AEAD cipher

In IKEv2 to support RFC 7634, the ChaCha20 and Poly1305 crypto algorithms can be used together as a combined mode AEAD cipher (like AES-GCM) in the `crypto_ftnt` cipher in `cipher_chacha20poly1305.c`:

```
config vpn ipsec phase2-interface
    edit <name>
        set phase1name <name>
        set proposal chacha20poly1305
    next
end
```

AES-GCM for IKEv2 phase 1



In IKEv2 to support RFC 5282, the AEAD algorithm AES-GCM supports 128- and 256-bit variants:

```
config vpn ipsec phase2-interface
    edit <name>
        set phase1name <name>
        set proposal [aes128gcm | aes256gcm]
    next
end
```

VPN security policies

This section explains how to specify the source and destination IP addresses of traffic transmitted through an IPsec VPN, and how to define appropriate security policies.

Topology

Defining policy addresses

In a gateway-to-gateway, hub-and-spoke, dynamic DNS, redundant tunnel, or transparent configuration, you need to define a policy address for the private IP address of the network behind the remote VPN peer (for example, `192.168.10.0/255.255.255.0` or `192.168.10.0/24`).

In a peer-to-peer configuration, you need to define a policy address for the private IP address of a server or host behind the remote VPN peer (for example, `172.16.5.1/255.255.255.255`, `172.16.5.1/32`, or `172.16.5.1`).

For a FortiGate dialup server in a dialup-client or internet-browsing configuration, the source IP should reflect the IP addresses of the dialup clients:

Defining security policies

Policy-based and route-based VPNs require different security policies.

- A policy-based VPN requires an IPsec policy. You specify the interface to the private network, the interface to the remote peer and the VPN tunnel. A single policy can enable traffic inbound, outbound, or in both directions.
- A route-based VPN requires an accept policy for each direction. For the source and destination interfaces, you specify the interface to the private network and the virtual IPsec interface (phase 1 configuration) of the VPN. The IPsec interface is the destination interface for the outbound policy and the source interface for the inbound policy. One security policy must be configured for each direction of each VPN interface.

If the policy that grants the VPN connection is limited to certain services, DHCP must be included, otherwise the client will not be able to retrieve a lease from the FortiGate's (IPsec) DHCP server because the DHCP request (coming out of the tunnel) will be blocked.

Policy-based VPN

An IPsec policy enables the transmission and reception of encrypted packets, specifies the permitted direction of VPN traffic, and selects the VPN tunnel. In most cases, a single policy is needed to control both inbound and outbound IP traffic through a VPN tunnel. For a detailed example, see Policy-based IPsec tunnel on page 1999. Be aware of the following before creating an IPsec policy.

Allow traffic to be initiated from the remote site

Policies specify which IP addresses can initiate a tunnel. By default, traffic from the local private network initiates the tunnel. When the *Allow traffic to be initiated form the remote site* option is selected, traffic from a dialup client, or a computer on a remote network, initiates the tunnel. Both can be enabled at the same time for bi-directional initiation of the tunnel.

Outbound and inbound NAT

When a FortiGate operates in NAT mode, you can enable inbound or outbound NAT. Outbound NAT may be performed on outbound encrypted packets or IP packets in order to change their source address before they are sent through the tunnel. Inbound NAT is performed to intercept and decrypt emerging IP packets from the tunnel.

By default, these options are not selected in security policies and can only be set through the CLI.

Defining multiple IPsec policies for the same tunnel

You must define at least one IPsec policy for each VPN tunnel. If the same remote server or client requires access to more than one network behind a local FortiGate, the FortiGate must be configured with an IPsec policy for each network. Multiple policies may be required to configure redundant connections to a remote destination or control access to different services at different times.

To ensure a secure connection, the FortiGate must evaluate policies with *Action* set to *IPsec* before *ACCEPT* and *DENY*. Because the FortiGate unit reads policies starting at the top of the list, you must move all IPsec policies to the top of the list, and be sure to reorder your multiple IPsec policies that apply to the tunnel so that specific constraints can be evaluated before general constraints. If you create two equivalent IPsec policies for two different tunnels, the system will select the correct policy based on the specified source and destination addresses.

Adding multiple IPsec policies for the same VPN tunnel can cause conflicts if the policies specify similar source and destination addresses, but have different settings for the same service. When policies overlap in this manner, the system may apply the wrong IPsec policy or the tunnel may fail.

Route-based VPN

When you define a route-based VPN, you create a virtual IPsec interface on the physical interface that connects to the remote peer. You create ordinary accept policies to enable traffic between the IPsec interface and the interface that connects to the private network. This makes configuration simpler than for policy-based VPNs.

To configure policies for a route-based VPN:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New* and define an *ACCEPT* policy to permit communication between the local private network and the private network behind the remote peer and enter these settings in particular:

Name	Enter a name for the security policy.
Incoming Interface	Select the interface that connects to the private network behind this FortiGate.

Outgoing Interface	Select the IPsec interface you configured.
Source	Select the address name you defined for the private network behind this FortiGate.
Destination	Select the address name you defined for the private network behind the remote peer.
Action	Select *ACCEPT*.
NAT	Disable *NAT*.

3. Click *OK*.
   To permit the remote client to initiate communication, you need to define a security policy for communication in that direction.
4. Click *Create New* and enter these settings in particular:

Name	Enter a name for the security policy.
Incoming Interface	Select the IPsec interface you configured.
Outgoing Interface	Select the interface that connects to the private network behind this FortiGate.
Source	Select the address name you defined for the private network behind the remote peer.
Destination	Select the address name you defined for the private network behind this FortiGate.
Action	Select *ACCEPT*.
NAT	Disable *NAT*.

5. Click *OK*.

Blocking unwanted IKE negotiations and ESP packets with a local-in policy

It is not unusual to receive IPsec connection attempts or malicious IKE packets from all over the internet. Malicious parties use these probes to try to establish an IPsec tunnel in order to gain access to your private network. A good way to prevent this is to use local-in policies to deny such traffic.

Sometimes there are malicious attempts using crafted invalid ESP packets. These invalid attempts are automatically blocked by the FOS IPsec local-in handler when it checks the SPI value against the SAs of existing tunnels. The IPsec local-in handler processes the packet instead of the firewall's local-in handler. So when these attempts are blocked, you will notice an `unknown SPI` message in your VPN logs instead of being silently blocked by your local-in policy. These log messages are rate limited.

Sample log and alert email

```
Message meets Alert condition

date=2020-08-11 time=09:28:40 devname=toSite1 devid=FGT60Fxxxxxxxxxx logid="0101037131"
type="event" subtype="vpn" level="error" vd="root" eventtime=1597163320747963100 tz="-0700"
logdesc="IPsec ESP" msg="IPsec ESP" action="error" remip=131.62.25.102 locip=192.157.116.88
remport=40601 locport=500 outintf="wan1" cookies="N/A" user="N/A" group="N/A"
```

```
xauthuser="N/A" xauthgroup="N/A" assignip=N/A vpntunnel="N/A" status="esp_error" error_
num="Received ESP packet with unknown SPI." spi="f6c9e2x1" seq="02000400"
```

The ESP packet handling process has the detection of unknown ESP packets enabled by default. You can disable the detection of unknown ESP packets using the `detect-unknown-esp` command.

To configure unknown ESP packet detection:

```
config system settings
    set detect-unknown-esp {enable | disable}
end
```

Note that invalid SPIs may not always indicate malicious activity. For example, the SPI may not match during rekey, or when one unit flushes its tunnel SAs. Administrators should collect as much information as possible before making a conclusion.

To block undesirable IPsec connection attempts and IKE packets using a local-in policy:

1. Configure an address group that excludes legitimate IPs:

```
config firewall addrgrp
    edit "All_exceptions"
        set member "all"
        set exclude enable
        set exclude-member "remote-vpn"
    next
end
```

2. Create a local-in policy that blocks IKE traffic from the address group:

```
config firewall local-in-policy
    edit 1
        set intf "wan1"
        set srcaddr "All_exceptions"
        set dstaddr "all"
        set service "IKE"
        set schedule "always"
    next
end
```

The default action is deny.

3. Verify the traffic blocked by the local-in policy:

```
# diagnose debug flow filter dport 500
# diagnose debug flow trace start 10
# diagnose debug enable

id=20085 trace_id=290 func=print_pkt_detail line=5588 msg="vd-root:0 received a packet
(proto=17, 10.10.10.13:500->10.10.10.1:500) from wan1. "
id=20085 trace_id=290 func=init_ip_session_common line=5760 msg="allocate a new session-
003442e7"
id=20085 trace_id=290 func=vf_ip_route_input_common line=2598 msg="find a route:
flag=84000000 gw-10.10.10.1 via root"
```

```
id=20085 trace_id=290 func=fw_local_in_handler line=430 msg="iprope_in_check() check
failed on policy 1, drop"
```

Configurable IKE port

Some ISPs block UDP port 500 or UDP port 4500, preventing an IPsec VPN from being negotiated and established. To accommodate this, the IKE port can be changed.

To set the IKE port:

```
config system settings
    set ike-port <integer>
end
```

ike-port	UDP port for IKE/IPsec traffic (1024 - 65535, default = 500).

Example 1: site-to-site VPN without NAT

In this example, the IKE port is set to 6000 on the two site-to-site VPN gateways. There is no NAT between the VPN gateways, but the ISP has blocked UDP port 500. A site-to-site VPN is established using the defined IKE port.

To set the IKE port:

```
config system settings
    set ike-port 6000
end
```

To configure and check the site-to-site VPN:

1. Configure the phase1 and phase2 interfaces:

```
config vpn ipsec phase1-interface
    edit "s2s"
        set interface "port27"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set wizard-type static-fortigate
        set remote-gw 11.101.1.1
        set psksecret **********
    next
end
config vpn ipsec phase2-interface
    edit "s2s"
        set phase1name "s2s"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set src-addr-type name
        set dst-addr-type name
        set src-name "s2s_local"
        set dst-name "s2s_remote"
```

```
    next
end
```

2. Check the IKE gateway list and confirm that the specified port is used:

```
# diagnose vpn ike gateway list

vd: root/0
name: s2s
version: 2
interface: port27 17
addr: 173.1.1.1:6000 -> 11.101.1.1:6000
tun_id: 11.101.1.1
remote_location: 0.0.0.0
created: 194s ago
PPK: no
IKE SA: created 1/2  established 1/2  time 0/4500/9000 ms
IPsec SA: created 1/2  established 1/2  time 0/4500/9000 ms
...
```

3. Check the VPN tunnel list:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=s2s ver=2 serial=1 173.1.1.1:6000->11.101.1.1:6000 tun_id=11.101.1.1 dst_mtu=1500
dpd-link=on remote_location=0.0.0.0 weight=1
bound_if=17 lgwy=static/1 tun=tunnel/15 mode=auto/1 encap=none/520 options[0208]=npu
frag-rfc  run_state=0 accept_traffic=1 overlay_id=0
...
```

Example 2: dialup VPN with NAT

In this example, the IKE port is set to 5000 on the VPN gateway and the dialup peer. The dialup peer is behind NAT, so NAT traversal (NAT-T) is used. The ISP blocks both UDP port 500 and UDP port 4500. The VPN connection is initiated on UDP port 5000 from the dialup VPN client and remains on port 5000 since NAT-T floating to 4500 is only required when the IKE port is 500.

To set the IKE port:

```
config system settings
    set ike-port 5000
end
```

To configure and check the dialup VPN with NAT:

1. Configure the phase1 and phase2 interfaces:

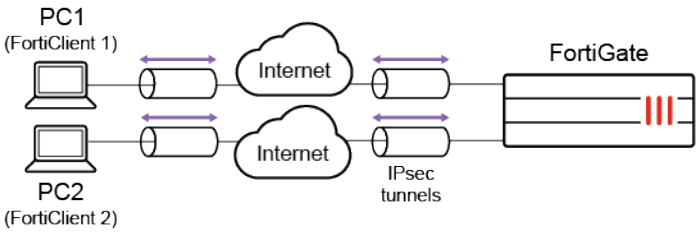
```
config vpn ipsec phase1-interface
    edit "server"
        set type dynamic
        set interface "port27"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
```

```
chacha20poly1305-prfsha256
        set dpd on-idle
        set wizard-type static-fortigate
        set psksecret **********
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "server"
        set phase1name "server"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set src-addr-type name
        set dst-addr-type name
        set src-name "server_local"
        set dst-name "server_remote"
    next
end
```

2. Check the IKE gateway list and confirm that the specified port is used:

```
# diagnose vpn ike gateway list

vd: root/0
name: server_0
version: 2
interface: port27 17
addr: 173.1.1.1:5000 -> 173.1.1.2:65416
tun_id: 173.1.1.2
remote_location: 0.0.0.0
created: 90s ago
nat: peer
PPK: no
IKE SA: created 1/1  established 1/1  time 0/0/0 ms
IPsec SA: created 1/1  established 1/1  time 0/0/0 ms
...
```



3. Check the VPN tunnel list:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=server_0 ver=2 serial=a 173.1.1.1:5000->173.1.1.2:65416 tun_id=173.1.1.2 dst_
mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
bound_if=17 lgwy=static/1 tun=tunnel/15 mode=dial_inst/3 encap=none/904 options
[0388]=npu rgwy-chg rport-chg frag-rfc  run_state=0 accept_traffic=1 overlay_id=0
...
```

IPsec VPN IP address assignments

When a user disconnects from a VPN tunnel, it is not always desirable for the released IP address to be used immediately. In IPsec VPN, IP addresses can held for the specified delay interval before being released back into the pool for assignment. The first-available address assignment method is still used.

Example

In this example, two PCs connect to the VPN. The IP address reuse delay interval is used to prevent a released address from being reused for at least four minutes. After the interval elapses, the IP address becomes available to clients again. Dual stack address assignment (both IPv4 and IPv6) is used.

To configure IPsec VPN with an IP address reuse delay interval:

1. Configure the IPsec phase1 interface, setting the IP address reuse delay interval to 240 seconds:

```
config vpn ipsec phase1-interface
    edit "FCT"
        set type dynamic
        set interface "port27"
        set mode aggressive
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set wizard-type dialup-forticlient
        set xauthtype auto
        set authusrgrp "local-group"
        set ipv4-start-ip 10.20.1.1
        set ipv4-end-ip 10.20.1.100
        set dns-mode auto
        set ipv4-split-include "FCT_split"
        set ipv6-start-ip 2001::1
        set ipv6-end-ip 2001::2
        set ip-delay-interval 240
        set save-password enable
        set psksecret **********
    next
end
```

2. Configure the IPsec phase2 interface:

```
config vpn ipsec phase2-interface
    edit "FCT"
        set phase1name "FCT"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
    edit "FCT6"
        set phase1name "FCT"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set src-addr-type subnet6
        set dst-addr-type subnet6
```

```
    next
end
```

To test the results:

1. Connect to the VPN with FortiClient 1 on PC1 then check the assigned IP address:

```
# diagnose vpn ike gateway list

vd: root/0
name: FCT_0
version: 1
interface: port27 17
addr: 173.1.1.1:4500 -> 173.1.1.2:60417
tun_id: 173.1.1.2
remote_location: 0.0.0.0
virtual-interface-addr: 169.254.1.1 -> 169.254.1.1
created: 14s ago
xauth-user: userc
2FA: no
FortiClient UID: 7C0897D80C8E4B6DAC775DD6B0F93BAA
assigned IPv4 address: 10.20.1.1/255.255.255.255
assigned IPv6 address: 2001::1/128
nat: peer
IKE SA: created 1/1  established 1/1  time 100/100/100 ms
IPsec SA: created 2/2  established 2/2  time 0/5/10 ms

  id/spi: 2 66140ba3e38b9b07/b64668f110ca4a48
  direction: responder
  status: established 14-14s ago = 100ms
  proposal: aes256-sha256
  key: 356637ee6e9a9cb5-fade432c09efb8aa-54be307fc1eeeab5-6e4b9ef19f98d5fa
  lifetime/rekey: 86400/86115
  DPD sent/recv: 00000000/00000394
```

2. Disconnect FortiClient 1 and connect with FortiClient 2. The IP address assigned to FortiClient 1 is not released to the pool, and a different IP address is assigned to FortiClient 2:

```
# diagnose vpn ike gateway list

vd: root/0
name: FCT_0
version: 1
interface: port27 17
addr: 173.1.1.1:4500 -> 173.1.1.2:64916
tun_id: 173.1.1.2
remote_location: 0.0.0.0
virtual-interface-addr: 169.254.1.1 -> 169.254.1.1
created: 6s ago
xauth-user: usera
2FA: no
FortiClient UID: EAF90E297393456AB546A041066C0720
assigned IPv4 address: 10.20.1.2/255.255.255.255
assigned IPv6 address: 2001::2/128
nat: peer
IKE SA: created 1/1  established 1/1  time 110/110/110 ms
IPsec SA: created 2/2  established 2/2  time 0/5/10 ms
```

```
  id/spi: 3 b25141d5a915e67e/b32decdb8cf98318
  direction: responder
  status: established 6-6s ago = 110ms
  proposal: aes256-sha256
  key: 374ab753f3207ea0-83496b5cb24b5a8d-c51da1fd505cf3a4-727884839897808a
  lifetime/rekey: 86400/86123
  DPD sent/recv: 00000000/00000453
```

3. Wait for 240 seconds, then disconnect and reconnect FortiClient 2. The IP address previously assigned to FortiClient 1 has been released back to the pool, and is assigned to FortiClient 2:

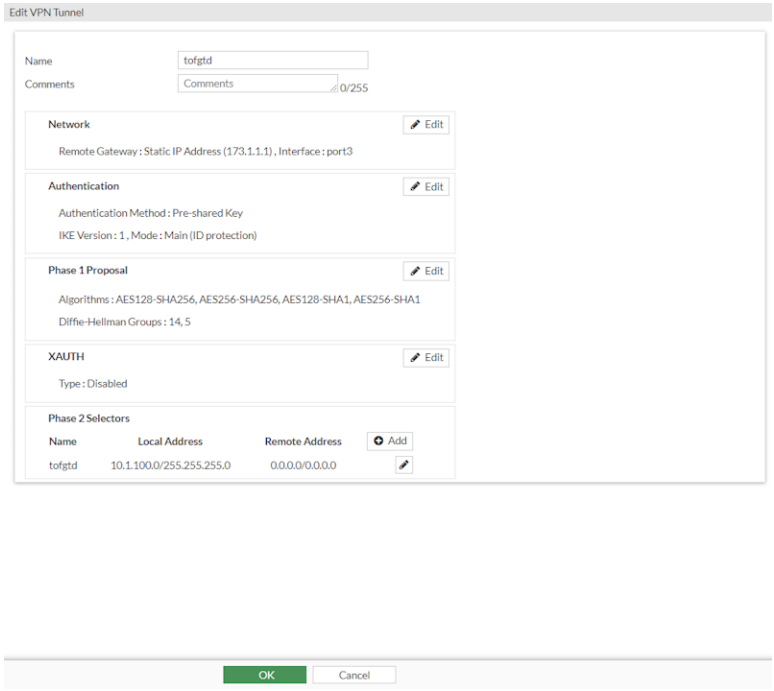
```
# diagnose vpn ike gateway list

vd: root/0
name: FCT_0
version: 1
interface: port27 17
addr: 173.1.1.1:4500 -> 173.1.1.2:64916
tun_id: 173.1.1.2
remote_location: 0.0.0.0
virtual-interface-addr: 169.254.1.1 -> 169.254.1.1
created: 20s ago
xauth-user: usera
2FA: no
FortiClient UID: EAF90E297393456AB546A041066C0720
assigned IPv4 address: 10.20.1.1/255.255.255.255
assigned IPv6 address: 2001::1/128
nat: peer
IKE SA: created 1/1  established 1/1  time 100/100/100 ms
IPsec SA: created 2/2  established 2/2  time 0/0/0 ms

  id/spi: 4 fb1fbad0c12f5476/aa06a2de76964f63
  direction: responder
  status: established 20-20s ago = 100ms
  proposal: aes256-sha256
  key: af43f1bb876dc79c-16448592fe608dc3-f251746d71b2c35d-c848e8c03bf738e9
  lifetime/rekey: 86400/86109
  DPD sent/recv: 00000000/000000a9
```

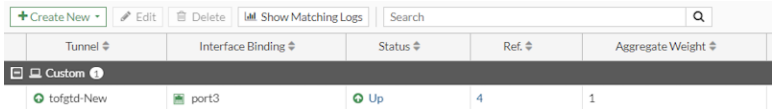
Instead of waiting for 240 seconds, you can instead use the `diagnose vpn ike gateway flush` command to release the previously used IP addresses back into the pool.

Renaming IPsec tunnels



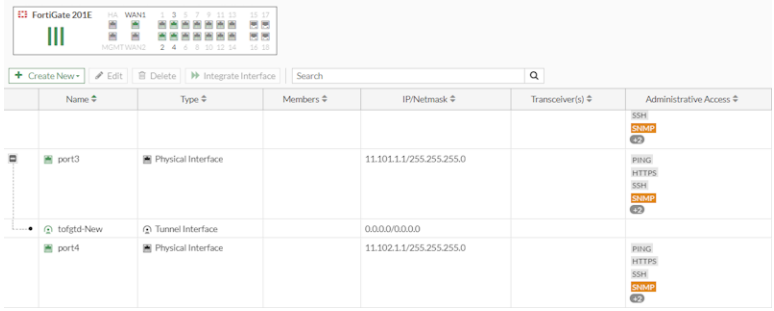
IPsec tunnels can be renamed. When you rename an IPsec tunnel, all references to the tunnel, such as routing and policies, are automatically updated to reflect the new name.

```
config vpn ipsec phase1-interface
    rename <string> to <string>
end
```



In this example, the IPsec tunnel named *tofgtd* is renamed to *tofgtd-New*, and all associated references are updated.

To rename an IPsec tunnel in the GUI:



1. Go to *VPN* > *IPsec Tunnels* and double-click an IPsec tunnel to open it for editing.
   In this example, the IPsec tunnel name is *tofgtd*.

2. In the *Name* box, type a new name, and click *OK*. The IPsec tunnel is renamed, and all associated references are updated.
   In this example, the IPsec tunnel is renamed to *tofgtd-New*.

3. Check the associated references:
   In this example, all associated references show the new IPsec tunnel name of *tofgtd-New*.
   - Go to *Network* > *Interfaces* to see that the interface references the new IPsec tunnel name.

   - Go to *Network* > *Static Routes* to see that the static route references the new IPsec tunnel name.

- Go to *Policy & Objects* > *Firewall Policy* to see that the policy references the new IPsec tunnel name

To rename an IPsec tunnel in the CLI:

1. Rename the IPsec tunnel.
   In this example, the IPsec tunnel named *tofgtd* is renamed to *tofgtd-New*:

```
config vpn ipsec phase1-interface
    rename tofgtd to tofgtd-New
end
```

2. Show the configuration to confirm that the IPsec tunnel was renamed.
   In this example, the IPsec tunnel was renamed to *tofgtd-New*:

```
show
config vpn ipsec phase1-interface
    edit "tofgtd-New"
        set interface "port3"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd disable
        set remote-gw 173.1.1.1
        ...
    next
end
```

3. Check the associated references.
   In this example, all associated references show the new IPsec tunnel name of *tofgtd-New*.
   - Confirm that the interfaces reference the new IPsec tunnel name:

```
config router static
show
config router static
    edit 3
        set dst 192.168.5.0 255.255.255.0
        set device "tofgtd-New"
    next
end
```

   - Confirm that the static route references the new IPsec tunnel name:

```
config system interface
show
    edit "tofgtd-New"
    ....
end
```

   - Confirm that the policies references the new IPsec tunnel name:

```
config firewall policy
show
config firewall policy
    edit 1
```

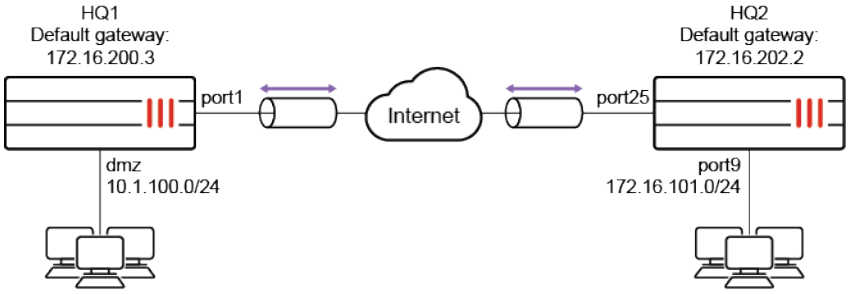
```
            set uuid 802c6c2e-8368-51ee-bf40-6c3c32da1024
            set srcintf "port2"
            set dstintf "tofgtd-New"
            set action accept
            ...
        next
        edit 2
            set uuid 80d136aa-8368-51ee-cc52-b0b06306fb80
            set srcintf "tofgtd-New"
            set dstintf "port2"
            set action accept
            ...
        next
    end
```

Site-to-site VPN

A site-to-site VPN connection lets branch offices use the Internet to access the main office's intranet. A site-to-site VPN allows offices in multiple, fixed locations to establish secure connections with each other over a public network such as the Internet.

The following sections provide instructions for configuring site-to-site VPNs:

- FortiGate-to-FortiGate on page 1978
- FortiGate-to-third-party on page 2006



FortiGate-to-FortiGate

This section contains the following topics about FortiGate-to-FortiGate VPN configurations:

- Basic site-to-site VPN with pre-shared key on page 1978
- Site-to-site VPN with digital certificate on page 1983
- Site-to-site VPN with overlapping subnets on page 1990
- GRE over IPsec on page 1994
- Policy-based IPsec tunnel on page 1999

Basic site-to-site VPN with pre-shared key

This is a sample configuration of IPsec VPN authenticating a remote FortiGate peer with a pre-shared key.

To configure IPsec VPN authenticating a remote FortiGate peer with a pre-shared key in the GUI:

1. Configure the HQ1 FortiGate.
   a. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, select *No NAT Between Sites*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *Remote Device*, select *IP Address*.
      ii. For the IP address, enter *172.16.202.1*.
      iii. For *Outgoing interface*, enter *port1*.
      iv. For *Authentication Method*, select *Pre-shared Key*.
      v. In the *Pre-shared Key* field, enter *sample* as the key.
      vi. Click *Next*.
   c. Configure the following settings for *Policy & Routing*:
      i. From the *Local Interface* dropdown menu, select the local interface.
      ii. Configure the *Local Subnets* as *10.1.100.0*.
      iii. Configure the *Remote Subnets* as *172.16.101.0*.
      iv. Click *Create*.
2. Configure the HQ2 FortiGate.
   a. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, select *No NAT Between Sites*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *Remote Device*, select *IP Address*.
      ii. For the IP address, enter *172.16.2001*.
      iii. For *Outgoing interface*, enter *port25*.
      iv. For *Authentication Method*, select *Pre-shared Key*.
      v. In the *Pre-shared Key* field, enter *sample* as the key.
      vi. Click *Next*.
   c. Configure the following settings for *Policy & Routing*:
      i. From the *Local Interface* dropdown menu, select the local interface.
      ii. Configure *Local Subnets* as *172.16.101.0*.
      iii. Configure the *Remote Subnets* as *10.1.100.0*.
      iv. Click *Create*.

To configure IPsec VPN authenticating a remote FortiGate peer with a pre-shared key using the CLI:

1. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. The IPsec tunnel is established over the WAN interface.

a. Configure HQ1.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 172.16.200.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.200.3
        set device "port1"
    next
end
```

b. Configure HQ2.

```
config system interface
    edit "port25"
        set vdom "root"
        set ip 172.16.202.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.202.2
        set device "port25"
    next
end
```

2. Configure the internal (protected subnet) interface. The internal interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel.

a. Configure HQ1.

```
config system interface
    edit "dmz"
        set vdom "root"
        set ip 10.1.100.1 255.255.255.0
    next
end
```

b. Configure HQ2.

```
config system interface
    edit "port9"
        set vdom "root"
        set ip 172.16.101.1 255.255.255.0
    next
end
```

3. Configure the IPsec phase1-interface.

a. Configure HQ1.

```
config vpn ipsec phase1-interface
    edit "to_HQ2"
        set interface "port1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
```

```
        set remote-gw 172.16.202.1
        set psksecret sample
    next
end
```

b. Configure HQ2.

```
config vpn ipsec phase1-interface
    edit "to_HQ1"
        set interface "port25"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.200.1
        set psksecret  sample
    next
end
```

4. Configure the IPsec phase2-interface.

a. Configure HQ1.

```
config vpn ipsec phase2-interface
    edit "to_HQ2"
        set phase1name "to_HQ2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

b. Configure HQ2.

```
config vpn ipsec phase2-interface
    edit "to_HQ2"
        set phase1name "to_HQ1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

5. Configure the static routes. Two static routes are added to reach the remote protected subnet. The blackhole route is important to ensure that IPsec traffic does not match the default route when the IPsec tunnel is down.

a. Configure HQ1.

```
config router static
    edit 2
        set dst 172.16.101.0 255.255.255.0
        set device "to_HQ2"
    next
    edit 3
        set dst 172.16.101.0 255.255.255.0
        set blackhole enable
        set distance 254
    next
end
```

b. Configure HQ2.

```
config router static
    edit 2
        set dst 10.1.100.0 255.255.255.0
        set device "to_HQ1"
    next
    edit 3
        set dst 10.1.100.0 255.255.255.0
        set blackhole enable
        set distance 254
     next
end
```

6. Configure two firewall policies to allow bidirectional IPsec traffic flow over the IPsec VPN tunnel.
   a. Configure HQ1.

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "to_HQ2"
        set dstintf "dmz"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "outbound"
        set srcintf "dmz"
        set dstintf "to_HQ2"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

   b. Configure HQ2.

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "to_HQ1"
        set dstintf "port9"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "outbound"
        set srcintf "port9"
        set dstintf "to_HQ1"
        set srcaddr "172.16.101.0"
```

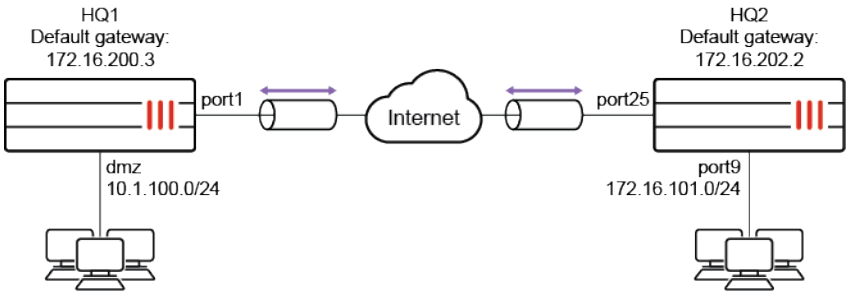
```
            set dstaddr "10.1.100.0"
            set action accept
            set schedule "always"
            set service "ALL"
        next
    end
```

7. Run `diagnose` commands. The `diagnose debug application ike -1` command is the key to troubleshoot why the IPsec tunnel failed to establish. If the PSK failed to match, the following error shows up in the debug output:

```
ike 0:to_HQ2:15037: parse error
ike 0:to_HQ2:15037: probable pre-shared secret mismatch'
```

The following commands are useful to check IPsec phase1/phase2 interface status.

a. Run the `diagnose vpn ike gateway list` command on HQ1. The system should return the following:



```
vd: root/0
name: to_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -> 172.16.202.1:500
created: 5s ago
IKE SA: created 1/1 established 1/1 time 0/0/0 ms
IPsec SA: created 2/2 established 2/2 time 0/0/0 ms
id/spi: 12 6e8d0532e7fe8d84/3694ac323138a024
direction: responder
status: established 5-5s ago = 0ms
proposal: aes128-sha256
key: b3efb46d0d385aff-7bb9ee241362ee8d
lifetime/rekey: 86400/86124
DPD sent/recv: 00000000/00000000
```

b. Run the `diagnose vpn tunnel list` command on HQ1. The system should return the following:

```
list all ipsec tunnel in vd 0
name=to_HQ2 ver=1 serial=1 172.16.200.1:0->172.16.202.1:0 tun_id=172.16.202.1

```

Site-to-site VPN with digital certificate

This is a sample configuration of IPsec VPN authenticating a remote FortiGate peer with a certificate. The certificate on one peer is validated by the presence of the CA certificate installed on the other peer.

To configure IPsec VPN authenticating a remote FortiGate peer with a digital certificate in the GUI:

1. Import the certificate.
2. Configure user peers.
3. Configure the HQ1 FortiGate.
   a. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, select *No NAT Between Sites*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *Remote Device*, select *IP Address*.
      ii. For the IP address, enter *172.16.202.1*.
      iii. For *Outgoing interface*, enter *port1*.
      iv. For *Authentication Method*, select *Signature*.
      v. In the *Certificate name* field, select the imported certificate.
      vi. From the *Peer Certificate CA* dropdown list, select the desired peer CA certificate.
      vii. Click *Next*.
   c. Configure the following settings for *Policy & Routing*:
      i. From the *Local Interface* dropdown menu, select the local interface.
      ii. Configure the *Local Subnets* as *10.1.100.0*.
      iii. Configure the *Remote Subnets* as *172.16.101.0*.
      iv. Click *Create*.
4. Configure the HQ2 FortiGate.
   a. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, select *No NAT Between Sites*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *Remote Device*, select *IP Address*.
      ii. For the IP address, enter *172.16.2001*.
      iii. For *Outgoing interface*, enter *port25*.
      iv. For *Authentication Method*, select *Signature*.

v. In the *Certificate name* field, select the imported certificate.
vi. From the *Peer Certificate CA* dropdown list, select the peer CA certificate.
vii. Click *Next*.

c. Configure the following settings for *Policy & Routing*:
i. From the *Local Interface* dropdown menu, select the local interface.
ii. Configure *Local Subnets* as *172.16.101.0*.
iii. Configure the *Remote Subnets* as *10.1.100.0*.
iv. Click *Create*.

To configure IPsec VPN authenticating a remote FortiGate peer with a digital certificate using the CLI:

1. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. The IPsec tunnel is established over the WAN interface.
   a. Configure HQ1.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 172.16.200.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.200.3
        set device "port1"
    next
end
```

   b. Configure HQ2.

```
config system interface
    edit "port25"
        set vdom "root"
        set ip 172.16.202.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.202.2
        set device "port25"
    next
end
```

2. Configure the internal (protected subnet) interface. The internal interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel.
   a. Configure HQ1.

```
config system interface
    edit "dmz"
        set vdom "root"
        set ip 10.1.100.1 255.255.255.0
    next
end
```

b. Configure HQ2.

```
config system interface
    edit "port9"
        set vdom "root"
        set ip 172.16.101.1 255.255.255.0
    next
end
```

3. Configure the import certificate and its CA certificate information. The certificate and its CA certificate must be imported on the remote peer FortiGate and on the primary FortiGate before configuring IPsec VPN tunnels. If the built-in Fortinet_Factory certificate and the Fortinet_CA CA certificate are used for authentication, you can skip this step.

   a. Configure HQ1.

```
config vpn certificate local
    edit "test1"
        ...
        set range global
    next
end
config vpn certificate ca
    edit "CA_Cert_1"
        ...
        set range global
    next
end
```

   b. Configure HQ2.

```
config vpn certificate local
    edit "test2"
        ...
        set range global
    next
end
config vpn certificate ca
    edit "CA_Cert_1"
        ...
        set range global
    next
end
```

4. Configure the peer user. The peer user is used in the IPsec VPN tunnel peer setting to authenticate the remote peer FortiGate.

   a. If not using the built-in Fortinet_Factory certificate and Fortinet_CA CA certificate, do the following:

      i. Configure HQ1.

```
config user peer
    edit "peer1"
        set ca "CA_Cert_1"
    next
end
```

      ii. Configure HQ2.

```
config user peer
    edit "peer2"
        set ca "CA_Cert_1"
```

```
        next
    end
```

b. If the built-in Fortinet_Factory certificate and Fortinet_CA CA certificate are used for authentication, the peer user must be configured based on Fortinet_CA.

i. Configure HQ1.

```
config user peer
    edit "peer1"
        set ca "Fortinet_CA"
    next
end
```

ii. Configure HQ2.

```
config user peer
    edit "peer2"
        set ca "Fortinet_CA"
    next
end
```

5. Configure the IPsec phase1-interface.

a. Configure HQ1.

```
config vpn ipsec phase1-interface
    edit "to_HQ2"
        set interface "port1"
        set authmethod signature
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set certificate "test1"
        set peer "peer1"
    next
end
```

b. Configure HQ2.

```
config vpn ipsec phase1-interface
    edit "to_HQ1"
        set interface "port25"
        set authmethod signature
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.200.1
        set certificate "test2"
        set peer "peer2"
    next
end
```

6. Configure the IPsec phase2-interface.

a. Configure HQ1.

```
config vpn ipsec phase2-interface
    edit "to_HQ2"
        set phase1name "to_HQ2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
```

```
    next
end
```

b. Configure HQ2.

```
config vpn ipsec phase2-interface
    edit "to_HQ2"
        set phase1name "to_HQ1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

7. Configure the static routes. Two static routes are added to reach the remote protected subnet. The blackhole route is important to ensure that IPsec traffic does not match the default route when the IPsec tunnel is down.

a. Configure HQ1.

```
config router static
    edit 2
        set dst 172.16.101.0 255.255.255.0
        set device "to_HQ2"
    next
    edit 3
        set dst 172.16.101.0 255.255.255.0
        set blackhole enable
        set distance 254
    next
end
```

b. Configure HQ2.

```
config router static
    edit 2
        set dst 10.1.100.0 255.255.255.0
        set device "to_HQ1"
    next
    edit 3
        set dst 10.1.100.0 255.255.255.0
        set blackhole enable
        set distance 254
     next
end
```

8. Configure two firewall policies to allow bidirectional IPsec traffic flow over the IPsec VPN tunnel.

a. Configure HQ1.

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "to_HQ2"
        set dstintf "dmz"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
```

```
    edit 2
        set name "outbound"
        set srcintf "dmz"
        set dstintf "to_HQ2"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

b. Configure HQ2.

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "to_HQ1"
        set dstintf "port9"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "outbound"
        set srcintf "port9"
        set dstintf "to_HQ1"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

9. Run `diagnose` commands. The `diagnose debug application ike -1` command is the key to troubleshoot why the IPsec tunnel failed to establish. If the remote FortiGate certificate cannot be validated, the following error shows up in the debug output:

```
ike 0: to_HQ2:15314: certificate validation failed
```

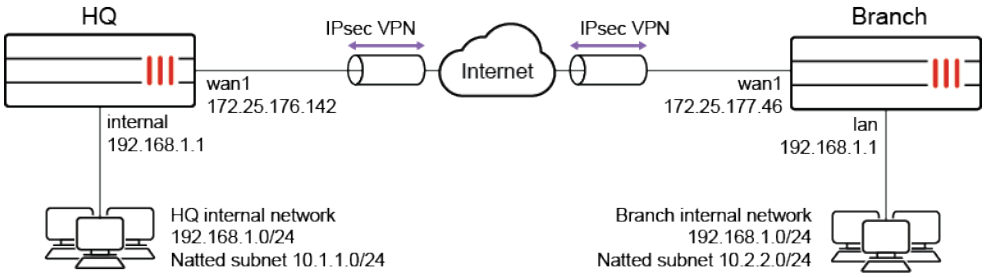
The following commands are useful to check IPsec phase1/phase2 interface status.

a. Run the `diagnose vpn ike gateway list` command on HQ1. The system should return the following:

```
vd: root/0
name: to_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -> 172.16.202.1:500
created: 7s ago
peer-id: C = CA, ST = BC, L = Burnaby, O = Fortinet, OU = QA, CN = test2
peer-id-auth: yes
IKE SA: created 1/1 established 1/1 time 70/70/70 ms
IPsec SA: created 1/1 established 1/1 time 80/80/80 ms
id/spi: 15326 295be407fbddfc13/7a5a52afa56adf14 direction: initiator status:
```

```
established 7-7s ago = 70ms proposal: aes128-sha256 key: 4aa06dbee359a4c7-
43570710864bcf7b lifetime/rekey: 86400/86092 DPD sent/recv: 00000000/00000000 peer-
id: C = CA, ST = BC, L = Burnaby, O = Fortinet, OU = QA, CN = test2
```

b. Run the `diagnose vpn tunnel list` command on HQ1. The system should return the following:



```
list all ipsec tunnel in vd 0

```

Site-to-site VPN with overlapping subnets

This is a sample configuration of IPsec VPN to allow transparent communication between two overlapping networks that are located behind different FortiGates using a route-based tunnel with source and destination NAT.

In the following topology, both FortiGates (HQ and Branch) use 192.168.1.0/24 as their internal network, but both networks need to be able to communicate to each other through the IPsec tunnel.

New virtual subnets of equal size must be configured and used for all communication between the two overlapping subnets. The devices on both local networks do not need to change their IP addresses. However, the devices and users must use the new subnet range of the remote network to communicate across the tunnel.

Configuring the HQ FortiGate

To configure IPsec VPN:

1. Go to *VPN* > *IPsec Wizard* and select the *Custom* template.
2. Enter the name *VPN-to-Branch* and click *Next*.
3. For the *IP Address*, enter the Branch public IP address (*172.25.177.46*), and for *Interface*, select the HQ WAN interface (*wan1*).

4. For *Pre-shared Key*, enter a secure key. You will use the same key when configuring IPsec VPN on the Branch FortiGate.
5. In the *Phase 2 Selectors* section, enter the subnets for the *Local Address* (*10.1.1.0/24*) and *Remote Address* (*10.2.2.0/24*).
6. Optionally, expand *Advanced* and enable *Auto-negotiate*.
7. Click *OK*.

To configure the static routes:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. In the *Destination* field, enter the remote address subnet (*10.2.2.0/24*).
3. For *Interface*, select the VPN tunnel you just created, *VPN-to-Branch*.
4. Click *OK*.
5. Create another route with the same *Destination*, but change the *Administrative Distance* to *200* and for *Interface*, select *Blackhole*. This is a best practice for route-based IPsec VPN tunnels because it ensures traffic for the remote FortiGate's subnet is not sent using the default route in the event that the IPsec tunnel goes down.

To configure the address objects:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. For *Name*, enter *HQ-original*.
4. For *IP/Netmask*, enter the original LAN subnet of HQ (*192.168.1.0/24*).
5. For *Interface*, select the LAN-side interface (*internal*).
6. Click *OK*
7. Create another address object named *Branch-new*, but for *IP/Netmask*, enter the new LAN subnet of Branch (*10.2.2.0/24*), and select the VPN interface (*VPN-to-Branch*).

To configure the IP pool:

1. Go to *Policy & Objects* > *IP Pools* and navigate to the *IP Pool* tab.
2. Click *Create new*.
3. For *Name*, enter *HQ-new*.
4. For *Type*, select *Fixed Port Range*.
5. Enter the *External IP address/range* (*10.1.1.1 – 10.1.1.254*, the new HQ subnet) and *Internal IP Range* (*192.168.1.1 – 192.168.1.254*, the original HQ subnet).
6. Click *OK*.

To configure the VIP:

1. Go to *Policy & Objects* > *Virtual IPs* and navigate to the *Virtual IP* tab.
2. Click *Create new*.
3. For *Name*, enter *HQ-new-to-original*.
4. For *Interface*, select the VPN interface (*VPN-to-Branch*).
5. Enter the *External IP address/range* (*10.1.1.1 – 10.1.1.254*, the new HQ subnet) and *Map to IPv4 address/range* (*192.168.1.1 – 192.168.1.254*, the original HQ subnet).
6. Click *OK*.

To configure the firewall policy for traffic from HQ to Branch:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. For *Name*, enter *From-HQ-to-Branch*.
3. For *Incoming Interface*, select the LAN-side interface (*internal*).
4. For *Outgoing Interface*, select the VPN tunnel interface (*VPN-to-Branch*).
5. For *Source*, select *HQ-original*.
6. For *Destination*, select *Branch-new*.
7. For *Service*, select *ALL*.
8. Enable *NAT*.
9. Select *Use Dynamic IP Pool* and select the *HQ-new* IP pool.
10. Click *OK*.

To configure the firewall policy for traffic from Branch to HQ:

1. Click *Create New* and for *Name*, enter *From-Branch-to HQ*.
2. For *Incoming Interface*, select the VPN tunnel interface (*VPN-to-Branch*).
3. For *Outgoing Interface*, select the LAN-side interface (*internal*).
4. For *Source*, select *Branch-new*.
5. For *Destination*, select the *HQ-new-to-original* VIP.
6. For *Service*, select *ALL*.
7. Disable *NAT*.
8. Click *OK*.

Configuring the Branch FortiGate

To configure IPsec VPN:

1. Go to *VPN* > *IPsec Wizard* and select the *Custom* template.
2. Enter the name *VPN-to-HQ* and click *Next*.
3. For the *IP Address*, enter the HQ public IP address (*172.25.176.142*), and for *Interface*, select the Branch WAN interface (*wan1*).
4. For *Pre-shared Key*, enter the matching secure key used in the *VPN-to-Branch* tunnel.
5. In the *Phase 2 Selectors* section, enter the subnets for the *Local Address* (*10.2.2.0/24*) and *Remote Address* (*10.1.1.0/24*).
6. Optionally, expand *Advanced* and enable *Auto-negotiate*.
7. Click *OK*.

To configure the static routes:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. In the *Destination* field, enter the remote address subnet (*10.1.1.0/24*).
3. For *Interface*, select the VPN tunnel you just created, *VPN-to-HQ*.
4. Click *OK*.
5. Create another route with the same *Destination*, but change the *Administrative Distance* to *200* and for *Interface*, select *Blackhole*.

To configure the address objects:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. For *Name*, enter *Branch-original*.
4. For *IP/Netmask*, enter the original LAN subnet of Branch (*192.168.1.0/24*).
5. For *Interface*, select the LAN-side interface (*lan*).
6. Click *OK*
7. Create another address object named *HQ-new*, but for *IP/Netmask*, enter the new LAN subnet of HQ (*10.1.1.0/24*), and select the VPN interface (*VPN-to-HQ*).

To configure the IP pool:

1. Go to *Policy & Objects* > *IP Pools* and navigate to the *IP Pool* tab.
2. Click *Create new*.
3. For *Name*, enter *Branch-new*.
4. For *Type*, select *Fixed Port Range*.
5. Enter the *External IP address/range* (*10.2.2.1 – 10.2.2.254*, the new Branch subnet) and *Internal IP Range* (*192.168.1.1 – 192.168.1.254*, the original Branch subnet).
6. Click *OK*.

To configure the VIP:

1. Go to *Policy & Objects* > *Virtual IPs* and navigate to the *Virtual IP* tab.
2. Click *Create new*.
3. For *Name*, enter *Branch-new-to-original*.
4. For *Interface*, select the VPN interface (*VPN-to-HQ*).
5. Enter the *External IP address/range* (*10.2.2.1 – 10.2.2.254*, the new Branch subnet) and *Map to IPv4 address/range* (*192.168.1.1 – 192.168.1.254*, the original Branch subnet).
6. Click *OK*.

To configure the firewall policy for traffic from Branch to HQ:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. For *Name*, enter *From-Branch-to-HQ*.
3. For *Incoming Interface*, select the LAN-side interface (*lan*).
4. For *Outgoing Interface*, select the VPN tunnel interface (*VPN-to-HQ*).
5. For *Source*, select *Branch-original*.
6. For *Destination*, select *HQ-new*.
7. For *Service*, select *ALL*.
8. Enable *NAT*.
9. Select *Use Dynamic IP Pool* and select the *Branch-new* IP pool.
10. Click *OK*.

To configure the firewall policy for traffic from HQ to Branch:

1. Click *Create New* and for *Name*, enter *From-HQ-to-Branch*.
2. For *Incoming Interface*, select the VPN tunnel interface (*VPN-to-HQ*).

3. For *Outgoing Interface*, select the LAN-side interface (*lan*).
4. For *Source*, select *HQ-new*.
5. For *Destination*, select the *Branch-new-to-original* VIP.
6. For *Service*, select *ALL*.
7. Disable *NAT*.
8. Click *OK*.

To verify the communication across the tunnel:

1. Go to *Dashboard* > *Network* and click the *IPsec* widget to expand to full screen view. The tunnels should be up on both FortiGates. If you did not enable *Auto-negotiate* in the IPsec VPN settings, you may have to select the tunnel and click *Bring Up*.
2. From a PC on the HQ network, ping a PC on the Branch network using the new IP for the Branch PC. The ping should be successful.

```
C:\Users\jheadley>ping 10.2.2.98

Pinging 10.2.2.98 with 32 bytes of data:
Reply from 10.2.2.98: bytes=32 time=7ms TTL=62
Reply from 10.2.2.98: bytes=32 time=1ms TTL=62
Reply from 10.2.2.98: bytes=32 time=1ms TTL=62
Reply from 10.2.2.98: bytes=32 time=1ms TTL=62

```

GRE over IPsec

This is an example of GRE over an IPsec tunnel using a static route over GRE tunnel and `tunnel-mode` in the `phase2-interface` settings.

To configure GRE over an IPsec tunnel:

1. Enable subnet overlapping at both HQ1 and HQ2.

```
config system settings
    set allow-subnet-overlap enable
end
```

2. Configure the WAN interface and static route.
   a. HQ1.

```
config system interface
    edit "port1"
        set ip 172.16.200.1 255.255.255.0
    next
    edit "dmz"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.200.3
        set device "port1"
    next
end
```

   b. HQ2.

```
config system interface
    edit "port25"
        set ip 172.16.202.1 255.255.255.0
    next
    edit "port9"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.202.2
        set device "port25"
    next
end
```

3. Configure IPsec phase1-interface and phase2-interface.
   a. HQ1.

```
config vpn ipsec phase1-interface
    edit "greipsec"
        set interface "port1"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set psksecret sample
        next
end
config vpn ipsec phase2-interface
    edit "greipsec"
        set phase1name "greipsec"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set protocol 47
    next
end
```

   b. HQ2.

```
config vpn ipsec phase1-interface
    edit "greipsec"
        set interface "port25"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.200.1
        set psksecret sample
        next
end
config vpn ipsec phase2-interface
    edit "greipsec"
        set phase1name "greipsec"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set protocol 47
    next
end
```

4. Configure IPsec tunnel interface IP address.
   a. HQ1.

```
config system interface
    edit "greipsec"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.2 255.255.255.255
    next
end
```

   b. HQ2.

```
config system interface
    edit "greipsec"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.1 255.255.255.255
```

```
    next
end
```

5. Configure the GRE tunnel.
   a. HQ1.

```
config system gre-tunnel
    edit "gre_to_HQ2"
        set interface "greipsec"
        set remote-gw 10.10.10.2
        set local-gw 10.10.10.1
    next
end
```

   b. HQ2.

```
config system gre-tunnel
    edit "gre_to_HQ1"
        set interface "greipsec"
        set remote-gw 10.10.10.1
        set local-gw 10.10.10.2
    next
end
```

6. Configure the firewall policy.
   a. HQ1.

```
config firewall policy
    edit 1
        set srcintf "dmz"
        set dstintf "gre_to_HQ2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set srcintf "gre_to_HQ2"
        set dstintf "dmz"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 3
        set srcintf "greipsec"
        set dstintf "greipsec"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

b. HQ2.

```
config firewall policy
    edit 1
        set srcintf "port9"
        set dstintf "gre_to_HQ1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set srcintf "gre_to_HQ1"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 3
        set srcintf "greipsec"
        set dstintf "greipsec"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

7. Configure the static route.

a. HQ1.

```
config router static
    edit 2
        set dst 172.16.101.0 255.255.255.0
        set device "gre_to_HQ2"
    next
end
```

b. HQ2.

```
config router static
    edit 2
        set dst 10.1.100.0 255.255.255.0
        set device "gre_to_HQ1"
    next
end
```

To view the VPN tunnel list on HQ1:

```
diagnose vpn tunnel list
list all ipsec tunnel in vd 0
----

To view the static routing table on HQ1:

```
get router info routing-table static
Routing table for VRF=0
S*      0.0.0.0/0 [10/0] via 172.16.200.3, port1
S       172.16.101.0/24 [10/0] is directly connected, gre_to_HQ2
```

Policy-based IPsec tunnel

This is an example of policy-based IPsec tunnel using site-to-site VPN between branch and HQ. HQ is the IPsec concentrator.

Sample topology

Sample configuration

To configure a policy-based IPsec tunnel using the GUI:

- Configure the IPsec VPN at HQ.
- Configure the IPsec concentrator at HQ.
- Configure the firewall policy at HQ.
- Configure IPsec VPN at branch 1.
- Configure the firewall policy at branch 1.
- Configure IPsec VPN at branch 2.
- Configure the firewall policy at branch 2.

To configure the IPsec VPN at HQ:

1. Go to *VPN* > *IPsec Wizard* to set up branch 1.
   a. Enter a VPN *Name*. In this example, *to_branch1*.
   b. For *Template Type*, click *Custom*. Click *Next*.
   c. Uncheck *Enable IPsec Interface Mode*.
   d. For *Remote Gateway*, select *Static IP Address*.
   e. Enter IP address, in this example, *15.1.1.2*.
   f. For *Interface*, select *port9*.
   g. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
   h. Click *OK*.
2. Go to *VPN* > *IPsec Wizard* to set up branch 2.
   a. Enter a VPN *Name*. In this example, *to_branch2*.
   b. For *Template Type*, click *Custom*. Click *Next*.
   c. Uncheck *Enable IPsec Interface Mode*.
   d. For *Remote Gateway*, select *Static IP Address*.
   e. Enter IP address, in this example, *13.1.1.2*.
   f. For *Interface*, select *port9*.
   g. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
   h. Click *OK*.

To configure the IPsec concentrator at HQ:

1. Go to *VPN* > *IPsec Concentrator* and click *Create New*.
2. Enter a name. In this example, *branch*.
3. Add the *Members to_branch1* and *to_branch2*.
4. Click *OK*.

To configure the firewall policy at HQ:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Enter a policy *Name*.
3. For *Incoming Interface*, select *port10*.
4. For *Outgoing Interface*, select *port9*.
5. Select the *Source*, *Destination*, *Schedule*, *Service*, and set *Action* to *IPsec*.
6. Select the *VPN Tunnel*, in this example, *Branch1/Branch2*.

7. In this example, enable *Allow traffic to be initiated from the remote site*.
8. Click *OK*.

To configure IPsec VPN at branch 1:

1. Go to *VPN* > *IPsec Wizard* to set up branch 1.
2. Enter a VPN name. In this example, *to_HQ*.
3. For *Template Type*, click *Custom*. Click *Next*.
4. Uncheck *Enable IPsec Interface Mode*.
5. For *Remote Gateway*, select *Static IP Address*.
6. Enter IP address, in this example, *22.1.1.1*.
7. For *Interface*, select *wan1*.
8. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
9. Click *OK*.

To configure the firewall policy at branch 1:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Enter a policy *Name*.
3. Choose the *Incoming Interface*, in this example, *internal*.
4. Choose the *Outgoing Interface*, in this example, *wan1*.
5. Select the *Source*, *Destination*, *Schedule*, *Service*, and set *Action* to *IPsec*.
6. Select the *VPN Tunnel*, in this example, *Branch1/Branch2*.
7. In this example, enable *Allow traffic to be initiated from the remote site*.
8. Click *OK*.

To configure IPsec VPN at branch 2:

1. Go to *VPN* > *IPsec Wizard* to set up branch 1.
2. Enter a VPN name. In this example, *to_HQ*.
3. For *Template Type*, click *Custom*. Click *Next*.
4. Uncheck *Enable IPsec Interface Mode*.
5. For *Remote Gateway*, select *Static IP Address*.
6. Enter IP address, in this example, *22.1.1.1*.
7. For *Interface*, select *wan1*.
8. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
9. Click *OK*.

To configure the firewall policy at branch 2:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Enter a policy *Name*.
3. Choose the *Incoming Interface*, in this example, *internal*.
4. Choose the *Outgoing Interface*, in this example, *wan1*.
5. Select the *Source*, *Destination*, *Schedule*, *Service*, and set *Action* to *IPsec*.
6. Select the *VPN Tunnel*, in this example, *to_HQ*.

7. In this example, enable *Allow traffic to be initiated from the remote site*.
8. Click *OK*.

To configure a policy-based IPsec tunnel using the CLI:

1. Configure the HQ WAN interface and static route.

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure the HQ IPsec phase1 and phase2.

```
config vpn ipsec phase1
    edit "to_branch1"
        set interface "port9"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 15.1.1.2
        set psksecret sample
        next
    edit "to_branch2"
        set interface "port9"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 13.1.1.2
        set psksecret sample
        next
end
config vpn ipsec phase2
    edit "to_branch1"
        set phase1name "to_branch1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
    edit "to_branch2"
        set phase1name "to_branch2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

3. Configure the firewall policy at HQ.

```
config firewall policy
    edit 1
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "10.1.100.0"
        set action ipsec
        set schedule "always"
        set service "ALL"
        set inbound enable
        set vpntunnel "to_branch1"
    next
    edit 2
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "192.168.4.0"
        set action ipsec
        set schedule "always"
        set service "ALL"
        set inbound enable
        set vpntunnel "to_branch2"
    next
end
```

4. Configure the IPsec concentrator at HQ.

```
config vpn ipsec concentrator
    edit "branch"
        set member "to_branch1" "to_branch2"
    next
end
```

5. Configure the branch WAN interface and static route.
   a. For branch 1.

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

   b. For branch 2.

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
```

```
        set ip 13.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 13.1.1.1
        set device "wan1"
    next
end
```

6. Configure the branch IPsec phase1 and phase2.
   a. For branch 1.

```
config vpn ipsec phase1
    edit "to_HQ"
        set interface "wan1"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 22.1.1.1
        set psksecret sample
        next
end
config vpn ipsec phase2
    edit "to_HQ"
        set phase1name "to_HQ"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

   b. For branch 2.

```
config vpn ipsec phase1
    edit "to_HQ"
        set interface "wan1"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 22.1.1.1
        set psksecret sample
        next
end
config vpn ipsec phase2
    edit "to_HQ"
        set phase1name "to_HQ"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

7. Configure the branch firewall policy.
   a. For branch 1.

```
config firewall policy
    edit 1
        set srcintf "internal"
```

```
            set dstintf "wan1"
            set srcaddr "10.1.100.0"
            set dstaddr "all"
            set action ipsec
            set schedule "always"
            set service "ALL"
            set inbound enable
            set vpntunnel "to_HQ"
        next
    end
```

b. For branch 2.

```
    config firewall policy
        edit 1
            set srcintf "internal"
            set dstintf "wan1"
            set srcaddr "192.168.4.0"
            set dstaddr "all"
            set action ipsec
            set schedule "always"
            set service "ALL"
            set inbound enable
            set vpntunnel "to_HQ"
        next
    end
```

FortiGate-to-third-party

This section contains the following topics about FortiGate-to-third-party VPN configurations:

- IKEv2 IPsec site-to-site VPN to an AWS VPN gateway on page 2006
- IPsec VPN to Azure with virtual network gateway on page 2012
- IPsec VPN to an Azure with virtual WAN on page 2021
- IPSec VPN between a FortiGate and a Cisco ASA with multiple subnets on page 2025
- Cisco GRE-over-IPsec VPN on page 2025

IKEv2 IPsec site-to-site VPN to an AWS VPN gateway

This is a sample configuration of an IPsec site-to-site VPN connection between an on-premise FortiGate and an AWS virtual private cloud (VPC).

AWS uses unique identifiers to manipulate a VPN connection's configuration. Each VPN connection is assigned an identifier and is associated with two other identifiers: the customer gateway ID for the FortiGate and virtual private gateway ID.

This example includes the following IDs:

- VPN connection ID: vpn-07e988ccc1d46f749
- Customer gateway ID: cgw-0440c1aebed2f418a
- Virtual private gateway ID

This example assumes that you have configured VPC-related settings in the AWS management portal as described in Create a Secure Connection using AWS VPC.

This example includes creating and configuring two tunnels. You must configure both tunnels on your FortiGate.

To configure IKEv2 IPsec site-to-site VPN to an AWS VPN gateway:

1. Configure the first VPN tunnel:
   a. Configure Internet Key Exchange (IKE).
   b. Configure IPsec.
   c. Configure the tunnel interface.
   d. Configure border gateway protocol (BGP).
   e. Configure firewall policies.
2. Configure the second VPN tunnel:
   a. Configure Internet Key Exchange (IKE).
   b. Configure IPsec.
   c. Configure the tunnel interface.
   d. Configure BGP.
   e. Configure firewall policies.

To configure IKE for the first VPN tunnel:

A policy is established for the supported ISAKMP encryption, authentication, Diffie-Hellman (DH), lifetime, and key parameters. These sample configurations fulfill the minimum requirements for AES128, SHA1, and DH Group 2. Category VPN connections in the GovCloud AWS region have a minimum requirement of AES128, SHA2, and DH Group 14. To take advantage of AES256, SHA256, or other DH groups such as 14-18, 22, 23, and 24, you must modify these sample configuration files. Higher parameters are only available for VPNs of category "VPN", not for "VPN-Classic".

Your FortiGate's external interface's address must be static. Your FortiGate may reside behind a device performing NAT. To ensure NAT traversal can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, it is recommended to disable NAT traversal.

Begin configuration in the root VDOM. The interface name must be shorter than 15 characters. It is best if the name is shorter than 12 characters. IPsec dead peer detection (DPD) causes periodic messages to be sent to ensure a security association remains operational.

```
config vpn ipsec phase1-interface
   edit vpn-07e988ccc1d46f749-0
      set interface "wan1"
      set dpd enable
      set local-gw 35.170.66.108
      set dhgrp 2
      set proposal aes128-sha1
      set keylife 28800
      set remote-gw 3.214.239.164
      set psksecret iCelks0UOob8z4SYMRM6zlx.rU2C3jth
      set dpd-retryinterval 10
   next
end
```

To configure IPsec for the first VPN tunnel:

The IPsec transform set defines the encryption, authentication, and IPsec mode parameters.

```
config vpn ipsec phase2-interface
   edit "vpn-07e988ccc1d46f749-0"
      set phase1name "vpn-07e988ccc1d46f749-0"
      set proposal aes128-sha1
```

```
      set dhgrp 2
      set pfs enable
      set keylifeseconds 3600
   next
end
```

To configure the tunnel interface for the first VPN tunnel:

You must configure a tunnel interface as the logical interface associated with the tunnel. All traffic routed to the tunnel interface must be encrypted and transmitted to the VPC. Similarly, traffic from the VPC will be logically received on this interface.

You must configure the interface's address with your FortiGate's address. If the address changes, you must recreate the FortiGate and VPN connection with Amazon VPC.

The `tcp-mss` option causes the router to reduce the TCP packets' maximum segment size to prevent packet fragmentation.

```
config system interface
   edit "vpn-07e988ccc1d46f749-0"
      set vdom "root"
      set ip 169.254.45.90 255.255.255.255
      set allowaccess ping
      set type tunnel
      set tcp-mss 1379
      set remote-ip 169.254.45.89
      set mtu 1427
      set interface "wan1"
   next
end
```

To configure BGP for the first VPN tunnel:

BGP is used within the tunnel to exchange prefixes between the virtual private gateway and your FortiGate. The virtual private gateway announces the prefix according to your VPC.

The local BGP autonomous system number (ASN) (65000) is configured as part of your FortiGate. If you must change the ASN, you must recreate the FortiGate and VPN connection with AWS.

Your FortiGate may announce a default route (0.0.0.0/0) to AWS. This is done using a prefix list and route map in FortiOS.

```
config router bgp
   set as 65000
   config neighbor
      edit 169.254.45.89
         set remote-as 64512
      end
   end
end
config router bgp
   config neighbor
      edit 169.254.45.89
         set capability-default-originate enable
      end
   end
end
config router prefix-list
```

```
   edit "default_route"
      config rule
         edit 1
            set prefix 0.0.0.0 0.0.0.0
         next
      end
   end
end
config router route-map
   edit "routemap1"
      config rule
         edit 1
            set match-ip-address "default_route"
         next
      end
   next
end
```

To advertise additional prefixes to the Amazon VPC, add these prefixes to the network statement and identify the prefix you want to advertise. Ensure that the prefix is present in the routing table of the device with a valid next-hop. If you want to advertise 192.168.0.0/16 to Amazon, you would do the following:

```
config router bgp
config network
   edit 1
      set prefix 192.168.0.0 255.255.0.0
   next
end
```

To configure firewall policies for the first VPN tunnel:

Create a firewall policy permitting traffic from your local subnet to the VPC subnet, and vice-versa.

This example policy permits all traffic from the local subnet to the VPC. First, view all existing policies using the `show firewall policy` command. Then, create a new firewall policy starting with the next available policy ID. In this example, running `show firewall policy` displayed policies 1, 2, 3, and 4, so you would proceed to create policy 5.

```
config firewall policy
   edit 5
      set srcintf "vpn-07e988ccc1d46f749-0"
      set dstintf internal
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service ANY
   next
end
config firewall policy
   edit 5
      set srcintf internal
      set dstintf "vpn-07e988ccc1d46f749-0"
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service ANY
   next
```

```
end
```

To configure IKE for the second VPN tunnel:

A policy is established for the supported ISAKMP encryption, authentication, DH, lifetime, and key parameters. These sample configurations fulfill the minimum requirements for AES128, SHA1, and DH Group 2. Category VPN connections in the GovCloud AWS region have a minimum requirement of AES128, SHA2, and DH Group 14. To take advantage of AES256, SHA256, or other DH groups such as 14-18, 22, 23, and 24, you must modify these sample configuration files. Higher parameters are only available for VPNs of category "VPN", not for "VPN-Classic".

Your FortiGate's external interface's address must be static. Your FortiGate may reside behind a device performing NAT. To ensure NAT traversal can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, it is recommended to disable NAT traversal.

Begin configuration in the root VDOM. The interface name must be shorter than 15 characters. It is best if the name is shorter than 12 characters. IPsec DPD causes periodic messages to be sent to ensure a security association remains operational.

```
config vpn ipsec phase1-interface
   edit vpn-07e988ccc1d46f749-1
      set interface "wan1"
      set dpd enable
      set local-gw 35.170.66.108
      set dhgrp 2
      set proposal aes128-sha1
      set keylife 28800
      set remote-gw 100.25.187.58
      set psksecret IjFzyDneUtDdAT4RNmQ85apUG3y4Akre
      set dpd-retryinterval 10
   next
end
```

To configure IPsec for the second VPN tunnel:

The IPsec transform set defines the encryption, authentication, and IPsec mode parameters.

```
config vpn ipsec phase2-interface
   edit "vpn-07e988ccc1d46f749-1"
      set phase1name "vpn-07e988ccc1d46f749-1"
      set proposal aes128-sha1
      set dhgrp 2
      set pfs enable
      set keylifeseconds 3600
   next
end
```

To configure the tunnel interface for the second VPN tunnel:

You must configure a tunnel interface as the logical interface associated with the tunnel. All traffic routed to the tunnel interface must be encrypted and transmitted to the VPC. Similarly, traffic from the VPC will be logically received on this interface.

You must configure the interface's address with your FortiGate's address. If the address changes, you must recreate the FortiGate and VPN connection with Amazon VPC.

The `tcp-mss` option causes the router to reduce the TCP packets' maximum segment size to prevent packet fragmentation.

```
config system interface
   edit "vpn-07e988ccc1d46f749-1"
      set vdom "root"
      set ip 169.254.44.162 255.255.255.255
      set allowaccess ping
      set type tunnel
      set tcp-mss 1379
      set remote-ip 169.254.44.161
      set mtu 1427
      set interface "wan1"
   next
end
```

To configure BGP for the second VPN tunnel:

BGP is used within the tunnel to exchange prefixes between the virtual private gateway and your FortiGate. The virtual private gateway announces the prefix according to your VPC.

The local BGP ASN (65000) is configured as part of your FortiGate. If you must change the ASN, you must recreate the FortiGate and VPN connection with AWS.

Your FortiGate may announce a default route (0.0.0.0/0) to AWS. This is done using a prefix list and route map in FortiOS.

```
config router bgp
   set as 65000
   config neighbor
      edit 169.254.44.161
         set remote-as 64512
      end
config router bgp
   config neighbor
      edit 169.254.44.161
         set capability-default-originate enable
      end
   end
config router prefix-list
   edit "default_route"
      config rule
         edit 1
            set prefix 0.0.0.0 0.0.0.0
         next
      end
   end
end
config router route-map
   edit "routemap1"
      config rule
         edit 1
            set match-ip-address "default_route"
         next
      end
   next
end
```

To advertise additional prefixes to the Amazon VPC, add these prefixes to the network statement and identify the prefix you want to advertise. Ensure that the prefix is present in the routing table of the device with a valid next-hop. If you want to advertise 192.168.0.0/16 to Amazon, you would do the following:

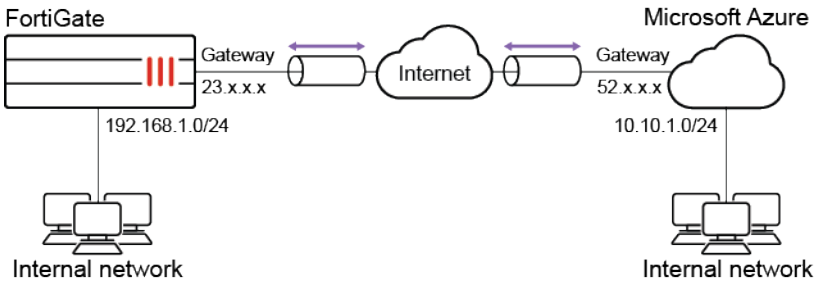
```
config router bgp
config network
   edit 1
      set prefix 192.168.0.0 255.255.0.0
   next
end
```

To configure firewall policies for the second VPN tunnel:

Create a firewall policy permitting traffic from your local subnet to the VPC subnet, and vice-versa.

This example policy permits all traffic from the local subnet to the VPC. First, view all existing policies using the `show firewall policy` command. Then, create a new firewall policy starting with the next available policy ID. In this example, running `show firewall policy` displayed policies 1, 2, 3, 4, and 5, so you would proceed to create policy 6.

```
config firewall policy
   edit 6
      set srcintf "vpn-07e988ccc1d46f749-1"
      set dstintf internal
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service ANY
   next
end
config firewall policy
   edit 6
         set srcintf internal
         set dstintf "vpn-07e988ccc1d46f749-1"
         set srcaddr all
         set dstaddr all
         set action accept
         set schedule always
         set service ANY
   next
end
```



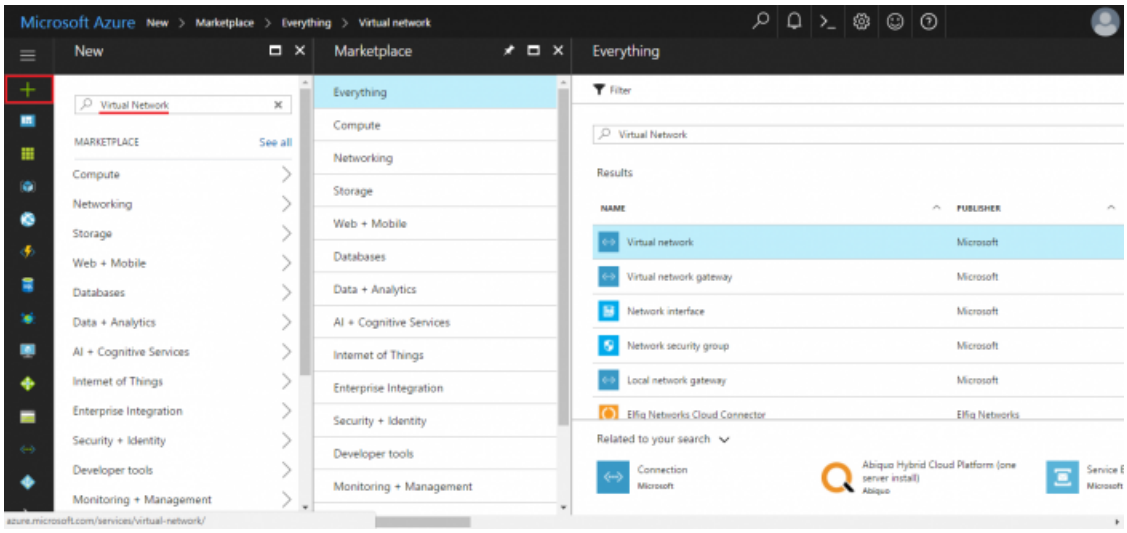
IPsec VPN to Azure with virtual network gateway

This example shows how to configure a site-to-site IPsec VPN tunnel to Microsoft Azure. It shows how to configure a tunnel between each site, avoiding overlapping subnets, so that a secure tunnel can be established.

Prerequisites

- A FortiGate with an Internet-facing IP address
- A valid Microsoft Azure account

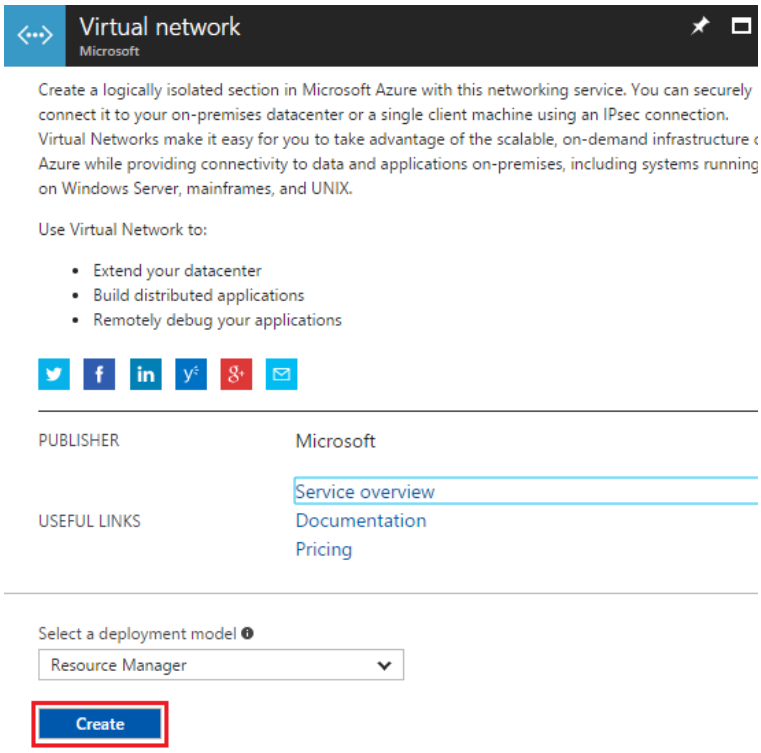
Sample topology



Sample configuration

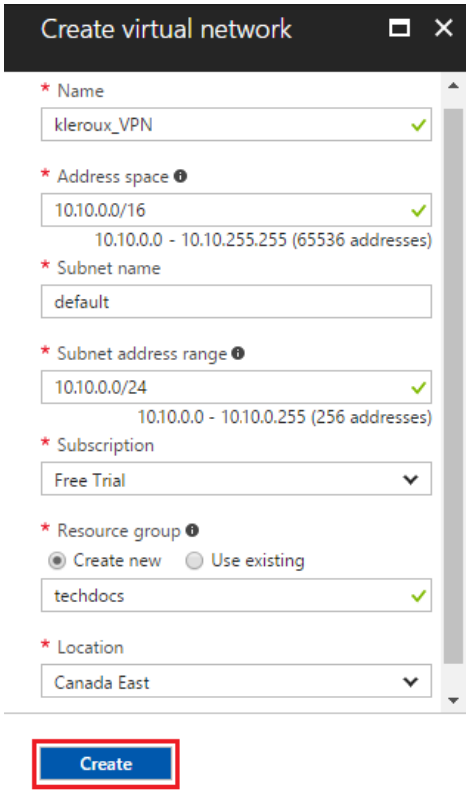
This sample configuration shows how to:

1. Configure an Azure virtual network
2. Specify the Azure DNS server
3. Configure the Azure virtual network gateway
4. Configure the Azure local network gateway
5. Configure the FortiGate tunnel
6. Create the Azure firewall object
7. Create the FortiGate firewall policies
8. Create the FortiGate static route
9. Create the Azure site-to-site VPN connection
10. Check the results



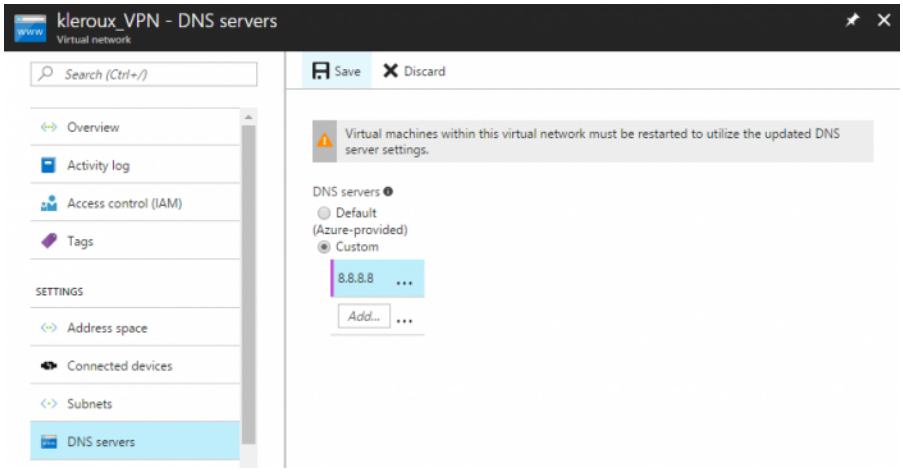
To configure an Azure virtual network:

1. Log in to Azure and click *New*.
2. In *Search the Marketplace*, type *Virtual network*.
3. Click *Virtual network* to open the *Virtual network* pane.

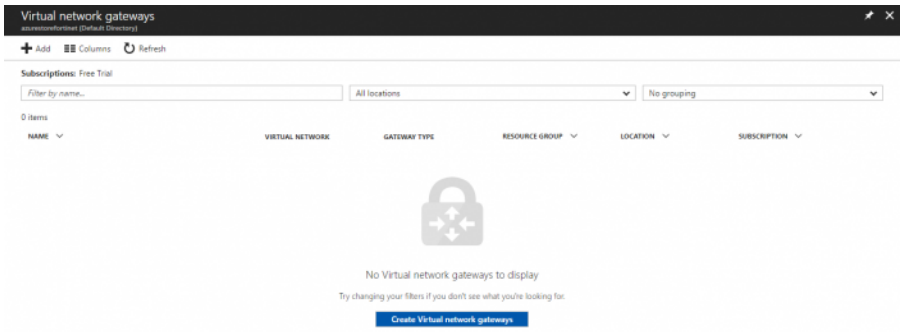


4. At the bottom of the *Virtual network* pane, click the *Select a deployment model* dropdown list and select *Resource Manager*.

5. Click *Create*.

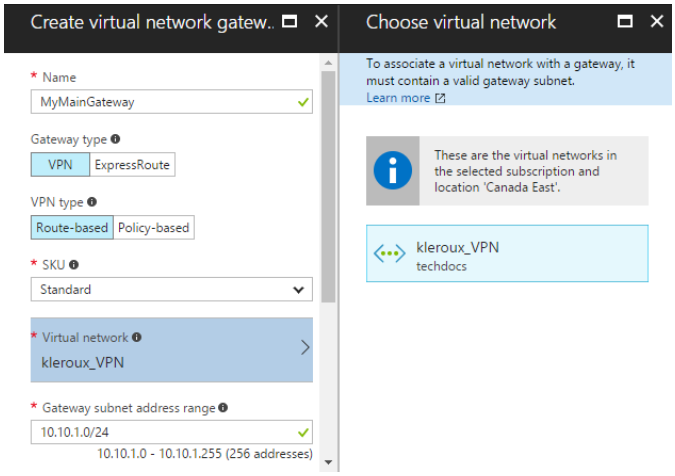


6. On the *Create virtual network* pane, enter you virtual network settings, and click *Create*.

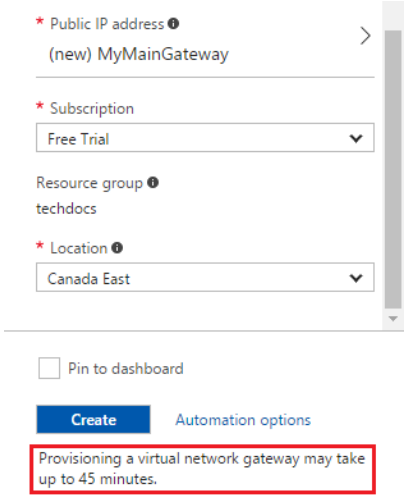


To specify the Azure DNS server:

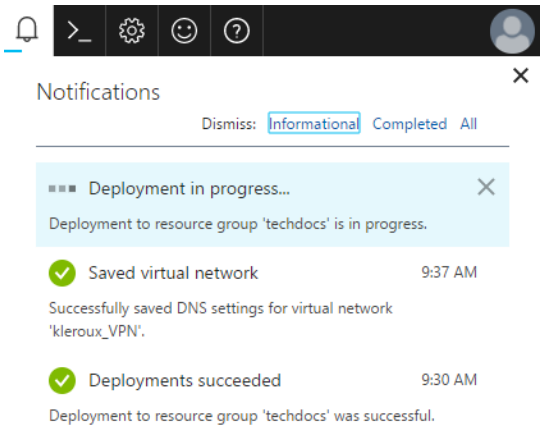
1. Open the virtual network you just created.
2. Click *DNS servers* to open the *DNS servers* pane.
3. Enter the IP address of the DNS server and click *Save*.



To configure the Azure virtual network gateway:

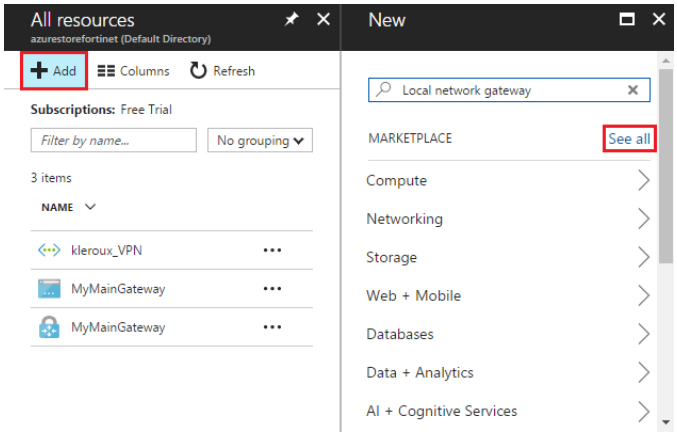


1. In the portal dashboard, go to *New*.
2. Search for *Virtual Network Gateway* and click it to open the *Virtual network gateway* pane.

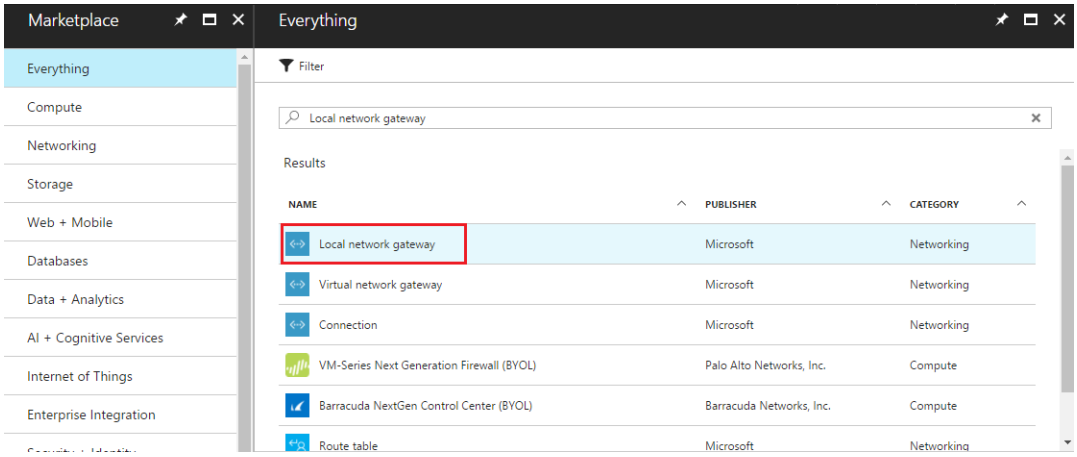


3. Click *Create Virtual network gateways* and enter the settings for your virtual network gateway.

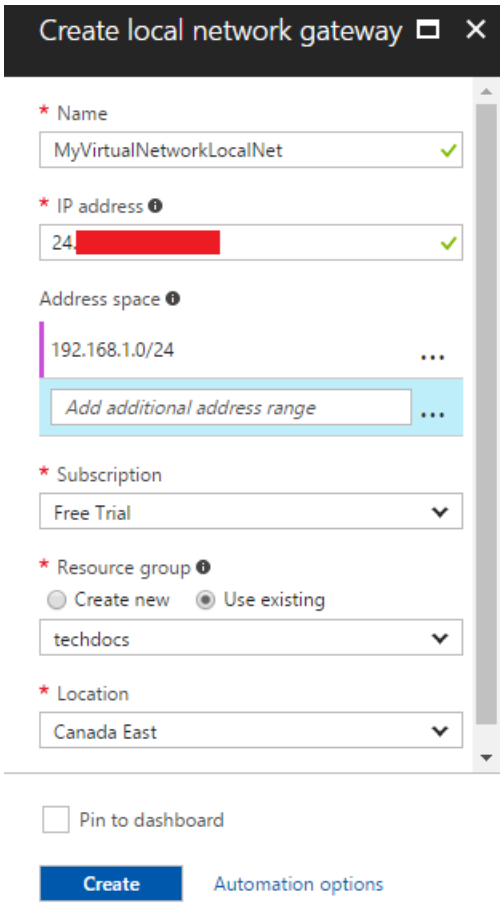
4. If needed, create a Public IP address.



5. Click *Create*.
Creating the virtual network gateway might take some time. When the provisioning is done, you'll receive a notification.



To configure the Azure local network gateway:



1. In the portal dashboard, click *All resources*.
2. Click *Add* and then click *See all*.

3. In the *Everything* pane, search for *Local network gateway* and then click *Create local network gateway*.

4. For the *IP address*, enter the local network gateway IP address, that is, the FortiGate's external IP address.

5. Set the remaining values for your local network gateway and click *Create*.

To configure the FortiGate tunnel:

1. In the FortiGate, go to *VPN* > *IP Wizard*.
2. Enter a *Name* for the tunnel, click *Custom*, and then click *Next*.
3. Configure the *Network* settings.
   a. For *Remote Gateway*, select *Static IP Address* and enter the IP address provided by Azure.
   b. For *Interface*, select *wan1*.
   c. For *NAT Traversal*, select *Disable*,
   d. For *Dead Peer Detection*, select *On Idle*.
   e. In the Authentication section, select
4. Configure the *Authentication* settings.
   a. For *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
   b. For *IKE*, select *2*.
5. Configure the *Phase 1 Proposal* settings.
   a. Set the Encryption and Authentication combination to the three supported encryption algorithm combinations accepted by Azure.
      - AES256 and SHA1
      - 3DES and SHA1

- AES256 and SHA256

b. For *Diffie-Hellman Groups*, select *2*.

c. Set *Key Lifetime (seconds)* to *28800*.

6. In *Phase 2 Selectors*, expand the *Advanced* section to configure the *Phase 2 Proposal* settings.
   a. Set the Encryption and Authentication combinations:
   - AES256 and SHA1
   - 3DES and SHA1
   - AES256 and SHA256

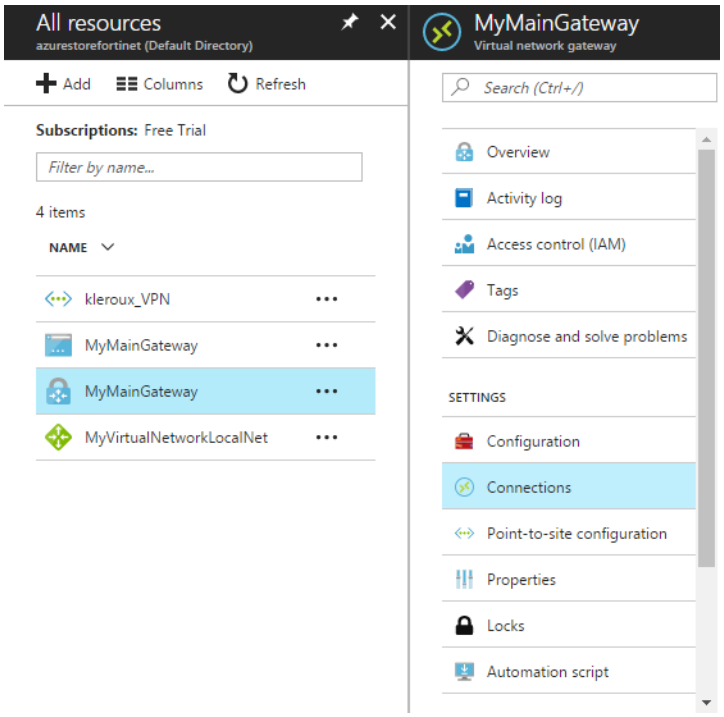
   b. Uncheck *Enable Perfect Forward Secrecy (PFS)*.
   c. Set *Key Lifetime (seconds)* to *27000*.
7. Click *OK*.

To create the Azure firewall object:

1. In the FortiGate, go to *Policy & Objects* > *Addresses*.
2. Create a firewall object for the Azure VPN tunnel.

To create the FortiGate firewall policies:

1. In the FortiGate, go to *Policy & Objects* > *Firewall Policy*.
2. Create a policy for the site-to-site connection that allows outgoing traffic.
   a. Set the *Source* address and *Destination* address using the firewall objects you just created.
   b. Disable *NAT*.
3. Create another policy that allows incoming traffic.
   a. For this policy, reverse the *Source* address and *Destination* address.
4. We recommend limiting the TCP maximum segment size (MSS) being sent and received so as to avoid packet drops and fragmentation.
   To do this, use the following CLI commands on both policies.



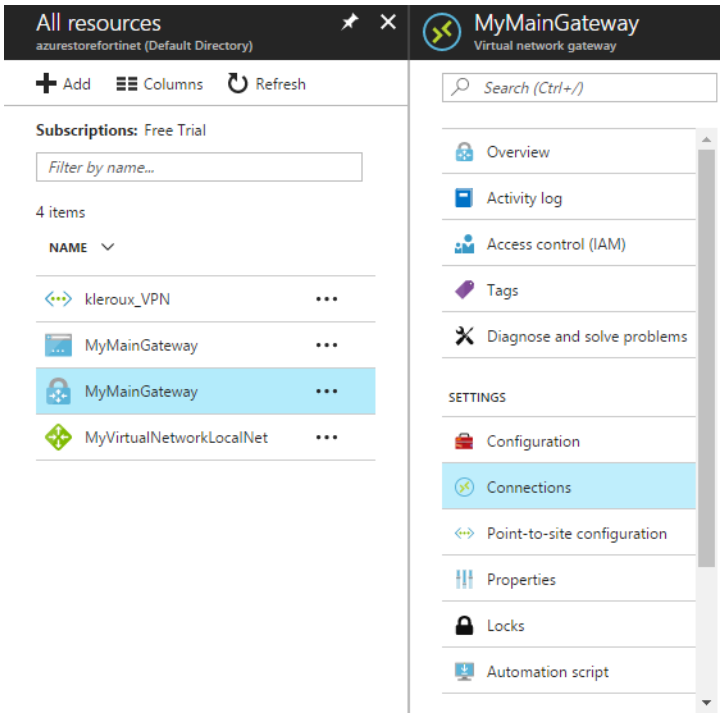
```
config firewall policy
   edit <policy-id>
      set tcp-mss-sender 1350
      set tcp-mss-receiver 1350
   next
end
```

To create the FortiGate static route:

1. In the FortiGate, go to *Network* > *Static Routes*.
2. Create an IPv4 Static Route that forces outgoing traffic going to Azure to go through the route-based tunnel.
3. Set the *Administrative Distance* to a value lower than the existing default route value.

To create the Azure site-to-site VPN connection:

1. In the Azure portal, locate and select your virtual network gateway.
2. In the *Settings* pane, click *Connections* and then click *Add*.



3. Enter the settings for your connection. Ensure the *Shared Key (PSK)* matches the *Pre-shared Key* for the FortiGate tunnel.

To check the results:

1. In the FortiGate, go to *Monitor* > *IPsec Monitor* and check that the tunnel is up. If the tunnel is down, right-click the tunnel and select *Bring Up*.
2. In the FortiGate, go to *Log & Report* > *System Events*.
   a. Select an event card to view more information and verify the connection.

3. In the Azure portal dashboard, click *All resources* and locate your virtual network gateway.
   a. In your virtual network gateway pane, click *Connections* to see the status of each connection.

   b. Click a connection to open the *Essentials* pane to view more information about that connection.
      - If the connection is successful, the *Status* shows *Connected*.
      - See the *ingress* and *egress* bytes to confirm traffic flowing through the tunnel.

IPsec VPN to an Azure with virtual WAN

This is a sample configuration of an IPsec site-to-site VPN connection between an on-premise FortiGate and an Azure virtual network (VNet). This example uses Azure virtual WAN (vWAN) to establish the VPN connection.

- Azure must use IPsec v2 for this configuration.
- Azure uses overlapped subnet IP addresses for the IPsec interfaces.

To configure IKEv2 IPsec site-to-site VPN to an Azure VPN gateway:

1. In the Azure management portal, configure vWAN-related settings as described in Tutorial: Create a Site-to-Site connection using Azure Virtual WAN.
   If a custom BGP IP address is configured on Azure's vWAN, such as 169.254.21.6 and 169.254.21.7, you must configure the FortiGate `remote-IP` to the corresponding *Custom BGP IP Address* value. If a custom BGP IP address is not configured, FortiGate `remote-IPs` should point to the *Default BGP IP Address* value.
2. Download the VPN configuration. The following shows an example VPN configuration:

```
[ {"configurationVersion":{"LastUpdatedTime":"2019-07-
    16T22:16:28.0409002Z","Version":"be5c5787-b903-43b1-a237-
    49eae1b373e4"},"vpnSiteConfiguration":
    {"Name":"toaws","IPAddress":"3.220.252.93","BgpSetting":
```

{"Asn":7225,"BgpPeeringAddress":"169.254.24.25","PeerWeight":32768},"LinkName":"toa
ws"},"vpnSiteConnections":[{"hubConfiguration":
{"AddressSpace":"10.1.0.0/16","Region":"West US","ConnectedSubnets":
["10.2.0.0/16"]},"gatewayConfiguration":{"IpAddresses":
{"Instance0":"52.180.90.47","Instance1":"52.180.89.94"},"BgpSetting":
{"Asn":65515,"BgpPeeringAddresses":
{"Instance0":"10.1.0.7","Instance1":"10.1.0.6"},"PeerWeight":0}},"connectionConfigu
ration":{"IsBgpEnabled":true,"PSK":"Fortinet123#","IPsecParameters":
{"SADataSizeInKilobytes":102400000,"SALifeTimeInSeconds":3600}}}]}]

3. Configure the following on the FortiGate. Note for `set proposal`, you can select from several proposals.

```
config vpn ipsec phase1-interface
   edit "toazure1"
      set interface "port1"
      set ike-version 2
      set keylife 28800
      set peertype any
      set proposal aes256-sha1
      set dhgrp 2
      set remote-gw 52.180.90.47
      set psksecret **********
   next
   edit "toazure2"
      set interface "port1"
      set ike-version 2
      set keylife 28800
      set peertype any
      set proposal aes256-sha1
      set dhgrp 2
      set remote-gw 52.180.89.94
      set psksecret **********
   next
end
config vpn ipsec phase2-interface
   edit "toazure1"
      set phase1name "toazure1"
      set proposal aes256-sha1
      set dhgrp 2
      set keylifeseconds 3600
   next
   edit "toazure2"
      set phase1name "toazure2"
      set proposal aes256-sha1
      set dhgrp 2
      set keylifeseconds 3600
   next
end
config system settings
   set allow-subnet-overlap enable
end
config system interface
   edit "toazure1"
      set vdom "root"
      set ip 169.254.24.25 255.255.255.255
      set type tunnel
      set remote-ip 10.1.0.7 255.255.255.255
      set snmp-index 4
      set interface "port1"
```

```
    next
    edit "toazure2"
      set vdom "root"
      set ip 169.254.24.25 255.255.255.255
      set type tunnel
      set remote-ip 10.1.0.6 255.255.255.255
      set snmp-index 5
      set interface "port1"
    next
  end
  config router bgp
    set as 7225
    set router-id 169.254.24.25
    config neighbor
      edit "10.1.0.7"
        set remote-as 65515
      next
      edit "10.1.0.6"
        set remote-as 65515
      next
    end
    config network
      edit 1
        set prefix 172.30.101.0 255.255.255.0
      next
    end
    config redistribute "connected"
      set status enable
    end
    config redistribute "rip"
    end
    config redistribute "ospf"
    end
    config redistribute "static"
    end
    config redistribute "isis"
    end
    config redistribute6 "connected"
    end
    config redistribute6 "rip"
    end
    config redistribute6 "ospf"
    end
    config redistribute6 "static"
    end
    config redistribute6 "isis"
    end
  end
```

4. Run `diagnose vpn tunnel list`. If the configuration was successful, the output should resemble the following:

```
name=toazure1 ver=2 serial=3 172.30.1.83:4500->52.180.90.47:4500 tun_id=52.180.90.47

```

IPSec VPN between a FortiGate and a Cisco ASA with multiple subnets

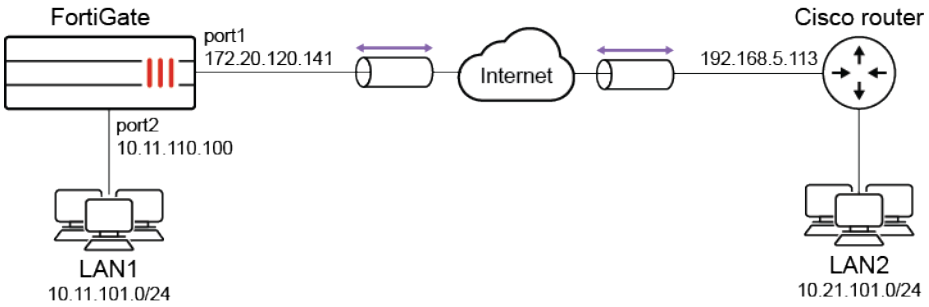
When a Cisco ASA unit has multiple subnets configured, multiple phase 2 tunnels must be created on the FortiGate to allocate to each subnet (rather than having multiple subnets on one phase 2 tunnel).

The FortiGate uses the same SPI value to bring up the phase 2 negotiation for all of the subnets, while the Cisco ASA expects different SPI values for each of its configured subnets. Using multiple phase 2 tunnels on the FortiGate creates different SPI values for each subnet.

To configure multiple phase 2 interfaces in route-based mode:

```
config vpn ipsec phase2-interface
    edit "First subnet"
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.142.0.0 255.255.254.0
    next
    edit "Second subnet"
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.143.0.0 255.255.254.0
    next
end
```

To configure multiple phase 2 interfaces in policy-based mode:



```
config vpn ipsec phase2
    edit "First subnet"
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.142.0.0 255.255.254.0
    next
    edit "Second subnet"
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.143.0.0 255.255.254.0
    next
end
```

Cisco GRE-over-IPsec VPN

This is a sample configuration of a FortiGate VPN that is compatible with Cisco-style VPNs that use GRE in an IPsec tunnel. Cisco products with VPN support often use the GRE protocol tunnel over IPsec encryption. Cisco VPNs can use either transport mode or tunnel mode IPsec.

Topology

In this example, LAN1 users are provided with access to LAN2.

Configuring the FortiGate

There are five steps to configure GRE-over-IPsec with a FortiGate and Cisco router:

1. Enable overlapping subnets.
2. Configure a route-based IPsec VPN on the external interface.
3. Configure a GRE tunnel on the virtual IPsec interface.
4. Configure security policies.
5. Configure the static route.

Enabling overlapping subnets

Overlapping subnets are required because the IPsec and GRE tunnels will use the same addresses. By default, each FortiGate network interface must be on a separate network. This configuration assigns an IPsec tunnel endpoint and the external interface to the same network.

To enable overlapping subnets:

```
config system settings
    set allow-subnet-overlap enable
    next
end
```

Configuring a route-based IPsec VPN

A route-based VPN that use encryption and authentication algorithms compatible with the Cisco router is required. Pre-shared key authentication is used in this configuration.

To configure route-based IPsec in the GUI:

1. Go to *VPN* > *IPsec Wizard* and select the *Custom* template.
2. Enter the tunnel name (*tocisco*) and click *Next*.
3. Enter the following:

Remote Gateway	Static IP Address
IP Address	Cisco router public interface (192.168.5.113)
Interface	FortiGate public interface (172.20.120.141)
Authentication Method	Pre-shared Key

Pre-shared Key	Entry must match the pre-shared key on the Cisco router
Mode	Main (ID Protection)
Phase 1 Proposal	3DES-SHA1, AES128-SHA1 (at least one proposal must match the settings on the Cisco router)
Local Address	GRE local tunnel endpoint IP address (172.20.120.141)
Remote Address	GRE remote tunnel endpoint IP address (192.168.5.113)
Phase 2 Proposal	3DES-MD5 (at least one proposal must match the settings on the Cisco router)
Local Port	0
Remote Port	0
Protocol	47

4. Click *OK*.
5. If the Cisco router is configured to use transport mode IPsec, configure transport mode on the FortiGate:

```
config vpn phase2-interface
    edit tocisco_p2
        set encapsulation transport-mode
    next
end
```

To configure route-based IPsec in the CLI:

```
config vpn ipsec phase1-interface
    edit tocisco
        set interface port1
        set proposal 3des-sha1 aes128-sha1
        set remote-gw 192.168.5.113
        set psksecret xxxxxxxxxxxxxxx
    next
end

config vpn ipsec phase2-interface
    edit tocisco_p2
        set phase1name tocisco
        set proposal 3des-md5
        set encapsulation [tunnel-mode | transport-mode]
        set protocol 47
        set src-addr-type ip
        set dst-start-ip 192.168.5.113
        set src-start-ip 172.20.120.141
    next
end
```

To add the IPsec tunnel end addresses:

```
config system interface
    edit tocisco
        set ip 172.20.120.141 255.255.255.255
        set remote-ip 192.168.5.113
```

```
    next
end
```

Configuring the GRE tunnel

The local gateway and remote gateway addresses must match the local and remote gateways of the IPsec tunnel. The GRE tunnel runs between the virtual IPsec public interface on the FortiGate unit and the Cisco router.

To configure the GRE tunnel:

```
config system gre-tunnel
    edit gre1
        set interface tocisco
        set local-gw 172.20.120.141
        set remote-gw 192.168.5.113
        set keepalive-interval <integer>
        set keepalive-failtimes <integer>
    next
end
```

The Cisco router configuration requires an address for its end of the GRE tunnel, so you need to add the tunnel end addresses.

To add the tunnel end addresses:

```
config system interface
    edit gre1
        set ip 10.0.1.1 255.255.255.255
        set remote-ip 10.0.1.2
    next
end
```

Configuring the security policies

Two sets of security policies are required:

- Policies to allow traffic to pass in both directions between the GRE virtual interface and the IPsec virtual interface.
- Policies to allow traffic to pass in both directions between the protected network interface and the GRE virtual interface.

To configure security policies in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Enter the following to allow traffic between the protected network and the GRE tunnel:

Name	LANtoGRE
Incoming Interface	Interface that connects to the private network behind the FortiGate (port2)
Outgoing Interface	GRE tunnel virtual interface (gre1)
Source	All
Destination	All

Action	ACCEPT
NAT	Disable

3. Click *OK*.
4. Create a new policy and enter the following to allow traffic between the GRE tunnel and the protected network:

Name	GREtoLAN
Incoming Interface	GRE tunnel virtual interface (gre1)
Outgoing Interface	Interface that connects to the private network behind the FortiGate (port2)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

5. Click *OK*.
6. Create a new policy and enter the following to allow traffic between the GRE virtual interface and the IPsec virtual interface:

Name	GREtoIPsec
Incoming Interface	GRE tunnel virtual interface (gre1)
Outgoing Interface	Virtual IPsec interface (tocisco)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

7. Click *OK*.
8. Create a new policy and enter the following to allow traffic between the IPsec virtual interface and the GRE virtual interface:

Name	IPsectoGRE
Incoming Interface	Virtual IPsec interface (tocisco)
Outgoing Interface	GRE tunnel virtual interface (gre1)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

9. Click *OK*.

To configure security policies in the CLI:

```
config firewall policy
    edit 1
        set name LANtoGRE
        set srcintf port2
        set dstintf gre1
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
    edit 2
        set name GREtoLAN
        set srcintf gre1
        set dstintf port2
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
    edit 3
        set name GREtoIPsec
        set srcintf gre1
        set dstintf tocisco
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
    edit 4
        set name IPsectoGRE
        set srcintf tocisco
        set dstintf gre1
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
end
```

Configuring routing

to direct traffic destined for the network behind the Cisco router into the GRE-over-IPsec tunnelTraffic destined for the network behind the Cisco router must be routed to the GRE tunnel. To do this, create a static route

To create the static route in the GUI:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. Enter the following:

Destination	IP and netmask for the network behind the Cisco router (10.21.101.0 255.255.255.0)
Interface	GRE tunnel virtual interface (gre1)
Administrative Distance	Leave the default setting

3. Click *OK*.

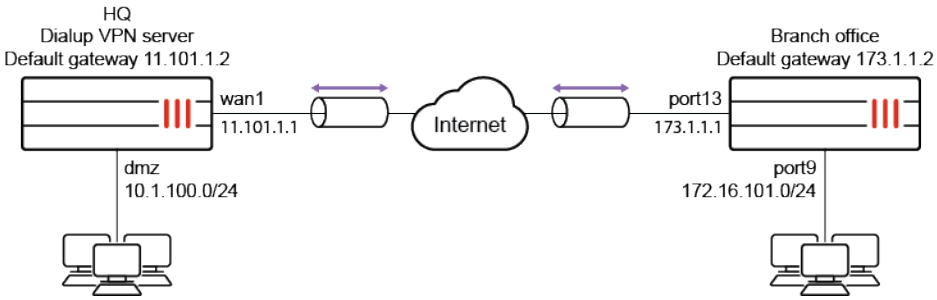
To create the static route in the CLI:

```
config router static
    edit 0
        set device gre1
        set dst 10.21.101.0 255.255.255.0
    next
end
```

Configuring the Cisco router

For more information, refer to Configuring and verifying a GRE over IPsec tunnel in the Fortinet Knowledge Base.

Remote access



Remote access lets users connect to the Internet using a dialup connection over traditional POTS or ISDN telephone lines. Virtual private network (VPN) protocols are used to secure these private connections.

The following topics provide instructions on configuring remote access:

- FortiGate as dialup client on page 2032
- FortiClient as dialup client on page 2038
- Add FortiToken multi-factor authentication on page 2042
- Add LDAP user authentication on page 2043
- iOS device as dialup client on page 2044

FortiGate as dialup client

This is a sample configuration of dialup IPsec VPN and the dialup client. In this example, a branch office FortiGate connects via dialup IPsec VPN to the HQ FortiGate.

You can configure dialup IPsec VPN with FortiGate as the dialup client using the GUI or CLI.

To configure IPsec VPN with FortiGate as the dialup client in the GUI:

1. Configure the dialup VPN server FortiGate:
   a. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, select *The remote site is behind NAT*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *Incoming Interface*, select the incoming interface.
      ii. For *Authentication Method*, select *Pre-shared Key*.
      iii. In the *Pre-shared Key* field, enter *your-psk* as the key.
      iv. Click *Next*.
   c. Configure the following settings for *Policy & Routing*:
      i. From the *Local Interface* dropdown menu, select the local interface.
      ii. Configure the *Local Subnets* as *10.1.100.0/24*.
      iii. Configure the *Remote Subnets* as *172.16.101.0/24*.
      iv. Click *Create*.
2. Configure the dialup VPN client FortiGate:
   a. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, select *This site is behind NAT*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *IP Address*, enter *11.101.1.1*.
      ii. For *Outgoing Interface*, select *port13*.
      iii. For *Authentication Method*, select *Pre-shared Key*.

iv. In the *Pre-shared Key* field, enter *your-psk* as the key.
v. Click *Next*.

c. Configure the following settings for *Policy & Routing*:
i. From the *Local Interface* dropdown menu, select the local interface. In this example, it is *port9*.
ii. Configure the *Local Subnets* as *172.16.101.0*.
iii. Configure the *Remote Subnets* as *10.1.100.0*.
iv. Click *Create*.

To configure IPsec VPN with FortiGate as the dialup client in the CLI:

1. In the CLI, configure the user, user group, and firewall address. Only the HQ dialup server FortiGate needs this configuration. The address is an IP pool to assign an IP address for the dialup client FortiGate.

```
config user local
    edit "vpnuser1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "vpngroup"
        set member "vpnuser1"
    next
end
config firewall address
    edit "client_range"
        set type iprange
        set start-ip 10.10.10.1
        set end-ip 10.10.10.200
    next
end
```

2. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.
   a. Configure the HQ FortiGate.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 11.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 11.101.1.2
        set device "wan1"
    next
end
```

   b. Configure the branch office FortiGate.

```
config system interface
    edit "port13"
        set vdom "root"
        set ip 173.1.1.1 255.255.255.0
```

```
    next
end
config router static
    edit 1
        set gateway 173.1.1.2
        set device "port13"
    next
end
```

3. Configure the internal interface and protected subnet. The internal interface connects to the internal network. Traffic from this interface will route out the IPsec VPN tunnel.
   a. Configure the HQ FortiGate.

```
config system interface
    edit "dmz"
        set vdom "root"
        set ip 10.1.100.1 255.255.255.0
    next
end
config firewall address
    edit "10.1.100.0"
        set subnet 10.1.100.0 255.255.255.0
    next
end
```

   b. Configure the branch office FortiGate.

```
config system interface
    edit "port9"
        set vdom "root"
        set ip 172.16.101.1 255.255.255.0
    next
end
config firewall address
    edit "172.16.101.0"
        set subnet 172.16.101.0 255.255.255.0
    next
end
```

4. Configure the IPsec phase1-interface. In this example, PSK is used as the authentication method. Signature authentication is also an option.
   a. Configure the HQ FortiGate.

```
config vpn ipsec phase1-interface
    edit "for_Branch"
        set type dynamic
        set interface "wan1"
        set mode aggressive
        set peertype any
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set xauthtype auto
        set authusrgrp "vpngroup"
        set net-device enable
        set assign-ip-from name
        set dns-mode auto
```

```
        set ipv4-split-include "10.1.100.0"
        set ipv4-name "client_range"
        set save-password enable
        set psksecret sample
        set dpd-retryinterval 60
    next
end
```

b. Configure the branch office FortiGate.

```
config vpn ipsec phase1-interface
    edit "to_HQ"
        set interface "port13"
        set mode aggressive
        set peertype any
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set xauthtype client
        set authusr "vpnuser1"
        set authpasswd vpnuser1-password
        set remote-gw 11.101.1.1
        set psksecret sample
    next
end
```

5. Configure the IPsec phase2-interface.

a. Configure the HQ FortiGate:

```
config vpn ipsec phase2-interface
    edit "for_Branch_p2"
        set phase1 name "for_Branch"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

b. Configure the branch office FortiGate.

```
config vpn ipsec phase2-interface
    edit "to_HQ_p2"
        set phase1name "to_HQ"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

6. Configure the static routes on the branch office FortiGate. The blackhole route is important to ensure that IPsec traffic does not match the default route when the IPsec tunnel is down.

```
config router static
    edit 2
        set dst 10.1.100.0 255.255.255.0
        set device "to_HQ"
    next
    edit 3
        set dst 10.1.100.0 255.255.255.0
        set blackhole enable
```

```
        set distance 254
    next
end
```

7. Configure the firewall policy to allow the branch office to HQ network flow over the IPsec tunnel. This configuration only supports traffic from the branch office FortiGate to the HQ FortiGate. Traffic is dropped from the HQ FortiGate to the branch office FortiGate.
   a. Configure the HQ FortiGate.

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "for_Branch"
        set dstintf "dmz"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

   b. Configure the branch office FortiGate.

```
config firewall policy
    edit 1
        set name "outbound"
        set srcintf "port9"
        set dstintf "to_HQ"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

8. Run `diagnose` commands to check the IPsec phase1/phase2 interface status. The `diagnose debug application ike -1` command is the key to troubleshoot why the IPsec tunnel failed to establish.
   a. Run the `diagnose vpn ike gateway list` command on the HQ FortiGate. The system should return the following:

```
vd: root/0
name: for_Branch_0
version: 1
interface: wan1 5
addr: 11.101.1.1:500 -> 173.1.1.1:500
created: 1972s ago
xauth-user: vpnuser1
assigned IPv4 address: 10.10.10.1/255.255.255.252
IKE SA: created 1/1 established 1/1 time 10/10/10 ms
IPsec SA: created 1/1 established 1/1 time 0/0/0 ms
id/spi: 184 5b1c59fab2029e43/bf517e686d3943d2
direction: responder
status: established 1972-1972s ago = 10ms
proposal: aes128-sha256
key: 8046488e92499247-fbbb4f6dfa4952d0
```

```
lifetime/rekey: 86400/84157
DPD sent/recv: 00000020/00000000
```

b. Run the `diagnose vpn tunnel list` command on the HQ FortiGate. The system should return the following:

```
list all ipsec tunnel in vd 0

FortiClient as dialup client

This is a sample configuration of dialup IPsec VPN with FortiClient as the dialup client.

You can configure dialup IPsec VPN with FortiClient as the dialup client using the GUI or CLI.

If multiple dialup IPsec VPNs are defined for the same dialup server interface, each phase1 configuration must define a unique peer ID to distinguish the tunnel that the remote client is connecting to. When a client connects, the first IKE message that is in aggressive mode contains the client's local ID. FortiGate matches the local ID to the dialup tunnel referencing the same Peer ID, and the connection continues with that tunnel.

To configure IPsec VPN with FortiClient as the dialup client on the GUI:

1. Configure a user and user group.
   a. Go to *User & Authentication* > *User Definition* to create a local user *vpnuser1*.
   b. Go to *User & Authentication* > *User Groups* to create a group *vpngroup* with the member *vpnuser1*.
2. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
   a. Enter a VPN name.
   b. For *Template Type*, select *Remote Access*.
   c. For *Remote Device Type*, select *Client-based* > *FortiClient*.
   d. Click *Next*.
3. Configure the following settings for *Authentication*:

   a. For *Incoming Interface*, select *wan1*.
   b. For *Authentication Method*, select *Pre-shared Key*.
   c. In the *Pre-shared Key* field, enter *your-psk* as the key.
   d. From the *User Group* dropdown list, select *vpngroup*.
   e. Click *Next*.
4. Configure the following settings for *Policy & Routing*:
   a. From the *Local Interface* dropdown menu, select *lan*.
   b. Configure the *Local Address* as *local_network*.
   c. Configure the *Client Address Range* as *10.10.2.1-10.10.2.200*.
   d. Keep the default values for the *Subnet Mask*, *DNS Server*, *Enable IPv4 Split tunnel*, and *Allow Endpoint Registration*.
   e. Click *Next*.
5. Adjust the *Client Options* as needed, then click *Create*.
6. Optionally, define a unique Peer ID in the phase1 configuration:
   a. Go to *VPN* > *IPsec Tunnels* and edit the just created tunnel.
   b. Click *Convert To Custom Tunnel*.
   c. In the *Authentication* section, click *Edit*.
   d. Under *Peer Options*, set *Accept Types* to *Specific peer ID*.
   e. In the *Peer ID* field, enter a unique ID, such as *dialup1*.
   f. Click *OK*.

To configure IPsec VPN with FortiClient as the dialup client using the CLI:

1. In the CLI, configure the user and group.

```
config user local
    edit "vpnuser1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "vpngroup"
        set member "vpnuser1"
    next
end
```

2. Configure the internal interface. The LAN interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel. Creating an address group for the protected network behind this FortiGate causes traffic to this network group to go through the IPsec tunnel.

```
config system interface
    edit "lan"
        set vdom "root"
        set ip 10.10.111.1 255.255.255.0
    next
end
config firewall address
    edit "local_subnet_1"
        set subnet 10.10.111.0 255.255.255.0
```

```
    next
    edit "local_subnet_2"
        set subnet 10.10.112.0 255.255.255.0
    next
end
config firewall addrgrp
    edit "local_network"
        set member "local_subnet_1" "local_subnet_2"
    next
end
```

3. Configure the WAN interface. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

4. Configure the client address pool. You must create a firewall address to assign an IP address to a client from the address pool.

```
config firewall address
    edit "client_range"
        set type iprange
        set comment "VPN client range"
        set start-ip 10.10.2.1
        set end-ip 10.10.2.200
    next
end
```

5. Configure the IPsec phase1-interface. In this example, PSK is used as the authentication method. Signature authentication is also an option.

```
config vpn ipsec phase1-interface
    edit "for_client"
        set type dynamic
        set interface "wan1"
        set mode aggressive
        set peertype one
        set peerid "dialup1"
        set net-device enable
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set xauthtype auto
        set authusrgrp "vpngroup"
        set assign-ip-from name
        set ipv4-name "client_range"
        set dns-mode auto
        set ipv4-split-include "local_network"
        set save-password enable
        set psksecret your-psk
        set dpd-retryinterval 60
```

```
    next
end
```

6. Configure the IPsec phase2-interface.

```
config vpn ipsec phase2-interface
    edit "for_client"
        set phase1name "for_client"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

7. Configure the firewall policy to allow client traffic flow over the IPsec VPN tunnel.

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "for_client"
        set dstintf "lan"
        set srcaddr "client_range"
        set dstaddr "local_network"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

To configure FortiClient:

1. In FortiClient, go to *Remote Access* and click *Add a new connection*.
2. Set the *VPN* to *IPsec VPN* and the *Remote Gateway* to the FortiGate IP address.
3. Set the *Authentication Method* to *Pre-Shared Key* and enter the key.
4. Expand *Advanced Settings* > *Phase 1* and in the *Local ID* field, enter *dialup1*.
5. Configure remaining settings as needed, then click *Save*.
6. Select the VPN, enter the username and password, then select *Connect*.

Diagnose the connection

Run `diagnose` commands to check the IPsec phase1/phase2 interface status. The `diagnose debug application ike -1` command is the key to troubleshoot why the IPsec tunnel failed to establish.

1. Run the `diagnose vpn ike gateway list` command. The system should return the following:

```
vd: root/0
name: for_client_0
version: 1
interface: port1 15
addr: 172.20.120.123:4500 ->172.20.120.254:64916
created: 37s ago
xauth-user: vpnuser1
assigned IPv4 address: 10.10.1.1/255.255.255.255
nat: me peer
IKE SA: created 1/1 established 1/1 time 10/10/10 ms
IPsec SA: created 1/1 established 1/1 time 0/0/0 ms
id/spi: 1 b40a32d878d5e262/8bba553563a498f4
```

```
direction: responder
status: established 37-37s ago = 10ms
proposal: aes256-sha256
key: f4ad7ec3a4fcfd09-787e2e9b7bceb9a7-0dfa183240d838ba-41539863e5378381
lifetime/rekey: 86400/86092
DPD sent/recv: 00000000/00000a0e
```

2. Run the `diagnose vpn tunnel list` command. The system should return the following:

```
list all ipsec tunnel in vd 0
=
=
name=for_client_0 ver=1 serial=3 172.20.120.123:4500->172.20.120.254:64916 tun_

Add FortiToken multi-factor authentication

This configuration adds multi-factor authentication (MFA) to the FortiClient dialup VPN configuration (FortiClient as dialup client on page 2038). It uses one of the two free mobile FortiTokens that is already installed on the FortiGate.

To configure MFA using the GUI:

1. Edit the user:
   a. Go to *User & Authentication* > *User Definition* and edit local user *vpnuser1*.
   b. Enable *Two-factor Authentication*.
   c. For *Authentication Type*, click *FortiToken* and select one mobile *Token* from the list.
   d. Enter the user's *Email Address*.

e. Enable *Send Activation Code* and select *Email*.
f. Click *Next* and click *Submit*.

2. Activate the mobile token.
   a. When a FortiToken is added to user *vpnuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

To configure MFA using the CLI:

1. Edit the user and user group:

```
config user local
    edit "vpnuser1"
        set type password
        set two-factor fortitoken
        set fortitoken <select mobile token for the option list>
        set email-to <user's email address>
        set passwd <user's password>
    next
end
```

2. Activate the mobile token.
   a. When a FortiToken is added to user *vpnuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

Add LDAP user authentication

This configuration adds LDAP user authentication to the FortiClient dialup VPN configuration (FortiClient as dialup client on page 2038). You must have already generated and exported a CA certificate from your AD server.

To configure LDAP user authentication using the GUI:

1. Import the CA certificate into FortiGate:
   a. Go to *System* > *Certificates*.
   If the *Certificates* option is not visible, enable it in *Feature Visibility*. See Feature visibility on page 2974 for details.
   b. Click *Import* > *CA Certificate*.
   c. Set *Type* to *File*.
   d. Click *Upload* then find and select the certificate file.
   e. Click *OK*.
   The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
   f. Optionally, rename the system generated *CA_Cert_1* to something more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

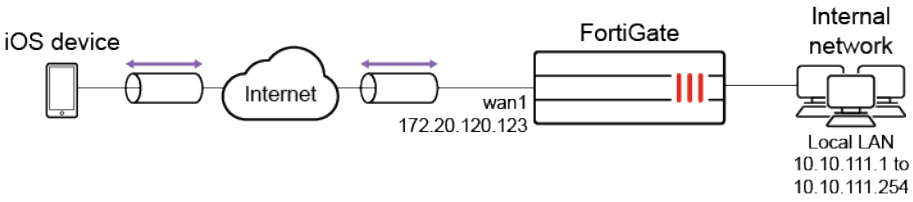
2. Configure the LDAP user:
   a. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
   b. Set *Name* to *ldaps-server* and specify *Server IP/Name*.
   c. Specify *Common Name Identifier* and *Distinguished Name*.
   d. Set *Bind Type* to *Regular*.

e. Specify *Username* and *Password*.
f. Enable *Secure Connection* and set *Protocol* to *LDAPS*.
g. For *Certificate*, select *LDAP server CA LDAPS-CA* from the list.
h. Click *OK*.

3. Add the LDAP user to the user group:
   a. Go to *User & Authentication* > *User Groups* and edit the *vpngroup* group.
   b. In *Remote Groups*, click *Add* to add the *ldaps-server* remote server.
   c. Click *OK*.

To configure LDAP user authentication using the CLI:

1. Import the CA certificate using the GUI.
2. Configure the LDAP user:



```
config user ldap
    edit "ldaps-server"
        set server "172.20.120.161"
        set cnid "cn"
        set dn "cn=Users,dc=qa,dc=fortinet,dc=com"
        set type regular
        set username "CN=Administrator,cn=users,DC=qa,DC=fortinet,DC=com"
        set password **********
        set group-member-check group-object
        set secure ldaps
        set ca-cert "LDAPS-CA"
        set port 636
    next
end
```

3. Add the LDAP user to the user group:

```
config user group
    edit "vpngroup"
        append member "ldaps-server"
    next
end
```

iOS device as dialup client

This is a sample configuration of dialup IPsec VPN with an iPhone or iPad as the dialup client.

You can configure dialup IPsec VPN with an iOS device as the dialup client using the GUI or CLI.

To configure IPsec VPN with an iOS device as the dialup client on the GUI:

1. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
   a. Enter a VPN name.
   b. For *Template Type*, select *Remote Access*.
   c. For *Remote Device Type*, select *Native* > *iOS Native*.
   d. For *NAT Configuration*, set *No NAT Between Sites*.
   e. Click *Next*.
2. Configure the following settings for *Authentication*:
   a. For *Incoming Interface*, select *wan1*.
   b. For *Authentication Method*, select *Pre-shared Key*.
   c. In the *Pre-shared Key* field, enter *your-psk* as the key.
   d. From the *User Group* dropdown list, select *vpngroup*.
   e. Deselect *Require 'Group Name' on VPN client*.
   f. Click *Next*.
3. Configure the following settings for *Policy & Routing*:
   a. From the *Local Interface* dropdown menu, select *lan*.
   b. Configure the *Local Address* as *local_network*.
   c. Configure the *Client Address Range* as *10.10.2.1-10.10.2.200*.
   d. Keep the default values for the *Subnet Mask*, *DNS Server*, and *Enable IPv4 Split tunnel*.
   e. Click *Create*.

To configure IPsec VPN with an iOS device as the dialup client using the CLI:

1. In the CLI, configure the user and group.

```
config user local
    edit "vpnuser1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "vpngroup"
        set member "vpnuser1"
    next
end
```

2. Configure the internal interface. The LAN interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel. Creating an address group for the protected network behind this FortiGate causes traffic to this network group to go through the IPsec tunnel.

```
config system interface
    edit "lan"
        set vdom "root"
        set ip 10.10.111.1 255.255.255.0
    next
end

config firewall address
    edit "local_subnet_1"
        set ip 10.10.111.0 255.255.255.0
```

```
    next
end

config firewall address
    edit "local_subnet_2"
        set ip 10.10.112.0 255.255.255.0
    next
end

config firewall addrgrp
    edit "local_network"
        set member "local_subnet_1" "local_subnet_2"
    next
end
```

3. Configure the WAN interface. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

4. Configure the client address pool. You must create a firewall address to assign an IP address to a client from the address pool.

```
config firewall address
    edit "client_range"
        set type iprange
        set comment "VPN client range"
        set start-ip 10.10.2.1
        set end-ip 10.10.2.200
    next
end
```

5. Configure the IPsec phase1-interface. In this example, PSK is used as the authentication method. Signature authentication is also an option.

```
config vpn ipsec phase1-interface
    edit "for_ios_p1"
        set type dynamic
        set interface "wan1"
        set peertype any
        set net-device enable
        set mode-cfg enable
        set proposal aes256-sha256 aes256-md5 aes256-sha1
        set dpd on-idle
        set dhgrp 14 5 2
        set xauthtype auto
        set authusrgrp "vpngroup"
        set assign-ip-from name
        set ipv4-name "client_range"
        set dns-mode auto
        set ipv4-split-include "local_network"
        set psksecret your-psk
        set dpd-retryinterval 60
```

```
    next
end
```

6. Configure the IPsec phase2-interface.

```
config vpn ipsec phase2-interface
    edit "for_ios_p2"
        set phase1name "for_ios_p1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set pfs disable
        set keepalive enable
    next
end
```

7. Configure the firewall policy to allow client traffic flow over the IPsec VPN tunnel.

```
config firewall policy
    edit 1
        set name "ios_vpn"
        set srcintf "for_ios_p1"
        set dstintf "lan"
        set srcaddr "ios_range"
        set dstaddr "local_network"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

8. Configure the iOS device.
   a. In the iOS device, go to *Settings* > *General* > *VPN* and select *Add VPN Configuration*.
   b. Set the *Type* to *IPsec* and enter a *Description*. Set the *Server* to the FortiGate's Internet-facing interface, and enter the username in *Account*. Enter the user password, the preshared IPsec VPN secret, then select *Done*.
   c. Ensure that the IPsec VPN configuration is highlighted (indicated by a checkmark), and select the *Not Connected* button. The IPsec VPN connects with the user's credentials and secret. The status changes to *Connected*, and a VPN icon appears at the top of the screen.
9. Run `diagnose` commands to check the IPsec phase1/phase2 interface status. The `diagnose debug application ike -1` command is the key to troubleshoot why the IPsec tunnel failed to establish.
   a. Run the `diagnose vpn ike gateway list` command. The system should return the following:

```
vd: root/0
name: for_ios_p1_0
version: 1
interface: port1 15
addr: 172.20.120.123:4500 -> 172.20.120.254:64916

IKE Mode Config clients

IKE Mode Config is an alternative to DHCP over IPsec. It allows dialup VPN clients to obtain virtual IP address, network, and DNS configurations amongst others from the VPN server. A FortiGate can be configured as either an IKE Mode Config server or client.

IKE Mode Config can configure the host IP address, domain, DNS addresses ,and WINS addresses. IPsec parameters such as gateway address, encryption, and authentication algorithms must be configured. Several network equipment vendors support IKE Mode Config.

An IKE Mode Config server or client is configured using `config vpn ipsec phase1-interface` and involves the following parameters:

Parameter	Description
ike-version {1 | 2}	IKE v1 is the default for FortiGate IPsec VPNs. IKE Mode Config is also compatible with IKE v2.
mode-cfg {enable | disable}	Enable/disable IKE Mode Config.
type {static | dynamic | ddns}	If you set `type` to `dynamic`, an IKE Mode Config server is created. The other settings create an IKE Mode Config client.
assign-ip {enable | disable}	Enable to request an IP address from the server. This configuration is for IKE Mode Config clients only.
interface <interface_name>	Specify the physical, aggregate, or VLAN interface to which the IPsec tunnel will be bound.

Parameter	Description
proposal <encryption_ combination>	The encryption and authentication settings that the client will accept.
ip-version {4 | 6}	By default, IPsec VPNs use IPv4 addressing.
ipv4-split-include <string> ipv6-split-include <string>	Mode Config server configuration. Applicable to IKEv1 and IKEv2. Specify the firewall address or address group that represents the subnets that the clients will have access to. This information is sent to the clients so that default traffic should not flow over the IPsec tunnel except for the specified subnets.
split-include-service <string>	Mode Config server configuration. Applicable to IKEv1 and IKEv2. Specify the service or service group that represents the services that the clients will have access to. This information is sent to the clients so that default traffic should not flow over the IPsec tunnel except for the specified services.
ipv4-split-exclude <string> ipv6-split-exclude <string>	Specify the subnets that should not be accessed over the IPsec tunnel. This information is sent to the clients so that all default traffic should flow over the IPsec tunnel except for the specified subnets. See Split-exclude in IKEv1.

Creating an IKE Mode Config client

In this example, the FortiGate connects to a VPN gateway with a static IP address that can be reached through port 1. Only the port, gateway, and proposal information needs to be configured. All other configuration information will come from the IKE Mode Config server.

To configure an IKE Mode Config client:

```
config vpn ipsec phase1-interface
    edit vpn1
        set ip-version 4
        set type static
        set remote-gw <gw_address>
        set interface port1
        set proposal 3des-sha1 aes128-sha1
        set mode-cfg enable
        set assign-ip enable
    next
end
```

Split-exclude in IKEv1

The `split-exclude` option specifies that default traffic flows over the IPsec tunnel except for specified subnets. This is the opposite of `split-include`, which specifies that default traffic should not flow over the IPsec tunnel except for specified subnets. The `split-include` and `split-exclude` options can be specified at the same time.

To configure split-exclude:

```
config vpn ipsec phase1-interface
    edit <name>
        set ike-version 1
```

```
        set type dynamic
        set mode-cfg enable
        set ipv4-split-exclude <string>
        set ipv6-split-exclude <string>
    next
end
```

Creating an IKE Mode Config server

To configure IKE Mode config settings, the following must be configured first :

```
config vpn ipsec phase1-interface
    edit "vpn-p1"
        set type dynamic
        set interface <interface_name>
        set ike-version < 1 | 2 >
        set mode-cfg enable
        set proposal <encryption_combination>
        set ip-version < 4 | 6 >
    next
end
```

In this example, the FortiGate assigns IKE Mode Config clients addresses in the range of 10.11.101.160 - 10.11.101.180. DNS and WINS server addresses are also provided. The public interface of the FortiGate unit is port1.

When IKE Mode-Configuration is enabled, multiple server IPs can be defined in IPsec phase 1.

The `ipv4-split-include` parameter specifies a firewall address (`OfficeLAN`), which represents the networks that the clients will have access to. This destination IP address information is sent to the clients.

To configure an IKE Mode Config server:

```
config vpn ipsec phase1-interface
    edit "vpn-p1"
        set type dynamic
        set interface "wan1"
        set xauthtype auto
        set mode aggressive
        set mode-cfg enable
        set proposal 3des-sha1 aes128-sha1
        set dpd disable
        set dhgrp 2
        set authusrgrp "FG-Group1"
        set ipv4-start-ip 10.10.10.10
        set ipv4-end-ip 10.10.10.20
        set ipv4-dns-server1 1.1.1.1
        set ipv4-dns-server2 2.2.2.2
        set ipv4-dns-server3 3.3.3.3
        set ipv4-wins-server1 4.4.4.4
        set ipv4-wins-server2 5.5.5.5
        set domain "fgt1c-domain"
        set banner "fgt111C-banner"
        set backup-gateway "100.100.100.1" "host1.com" "host2"
        set ipv4-split-include OfficeLAN
```

```
    next
end
```

Assigning IP addresses

Once the basic configuration is enabled, you can configure IP address assignment for clients, as well as DNS and WINS server assignments. Usually you will want to assign IP addresses to clients. The easiest way is to assign addresses from a specific range, similar to a DHCP server.

To assign an IP from an address range:

```
config vpn ipsec phase1-interface
    edit vpn1
        set ip-version 4
        set assign-ip enable
        set assign-ip-from range
        set ipv4-start-ip <range_start>
        set ipv4-end-ip <range_end>
        set ipv4-netmask <netmask>
    next
end
```

To assign an IP from a named firewall address or group:

```
config vpn ipsec phase1-interface
    edit vpn1
        set type dynamic
        set assign-ip-from name
        set ipv4-name <name>
        set ipv6-name <name>
    next
end
```

RADIUS server

If the client is authenticated by a RADIUS server, you can obtain the user's IP address assignment from the Framed-IP-Address attribute. The user must be authenticated using XAuth.

The users must be authenticated by a RADIUS server and assigned to the FortiGate user group `<grp_name>`. Since the IP address is not static, type is set to dynamic and `mode-cfg` is enabled. With IKE Mode Config, compatible clients can configure themselves with settings provided by the FortiGate.

To assign an IP from a RADIUS server:

```
config vpn ipsec phase1-interface
    edit vpn1
        set type dynamic
        set mode-cfg enable
        set assign-ip enable
        set assign-ip-from usrgrp
        set xauthtype auto
        set authusrgrp <grp_name>
    next
end
```

DHCP server

IKE Mode Config can use a remote DHCP server to assign the client IP addresses. Up to eight server addresses can be selected for either IPv4 or IPv6. The DHCP proxy must be enabled first.

To assign an IP from a DHCP server:

```
config system settings
    set dhcp-proxy enable
    set dhcp-server-ip <address>
    set dhcp6-server-ip <address>
end
config vpn ipsec phase1-interface
    edit vpn1
        set mode-cfg enable
        set assign-ip-from dhcp
    next
end
```

Certificate groups

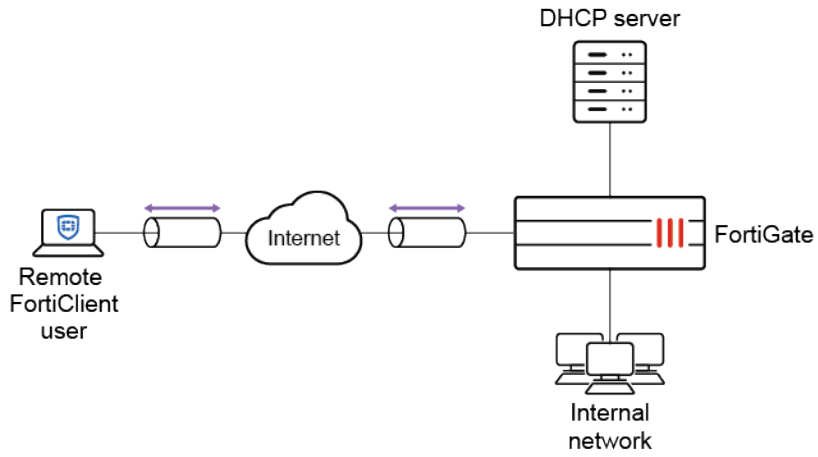
IKE certificate groups consisting of up to four RSA certificates can be used in IKE phase 1. Since CA and local certificates are global, the IKE daemon loads them once for all VDOMs and indexes them into trees based on subject and public key hash (for CA certificates), or certificate name (for local certificates). Certificates are linked together based on the issuer, and certificate chains are built by traversing these links. This reduces the need to keep multiple copies of certificates that could exist in multiple chains.

To configure the IKE local ID:

```
config vpn certificate local
    edit <name>
        set ike-localid <string>
        set ike-localid-type {asnldn | fqdn}
    next
end
```

Split-exclude in IKEv1

The `split-exclude` setting specifies that default traffic flows over the IPsec tunnel except for specified subnets. This is the opposite of `split-include`, which specifies that default traffic should not flow over the IPsec tunnel except for specified subnets. The `split-include` and `split-exclude` settings can be specified at the same time.



To configure split-exclude:

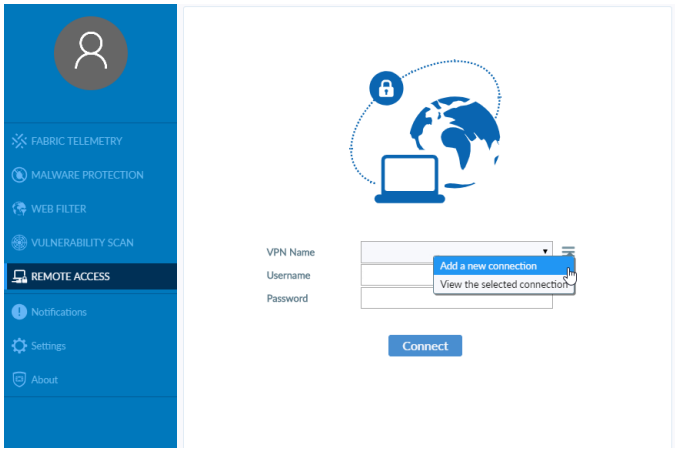
```
config vpn ipsec phase1-interface
    edit <name>
        set ike-version 1
        set type dynamic
        set mode-cfg enable
        set ipv4-split-exclude <string>
        set ipv6-split-exclude <string>
    next
end
```

IPsec VPN with external DHCP service

You can use an external DHCP server to assign IP addresses to your IPsec VPN clients. This is a common scenario found in enterprises where all DHCP leases need to be managed centrally.

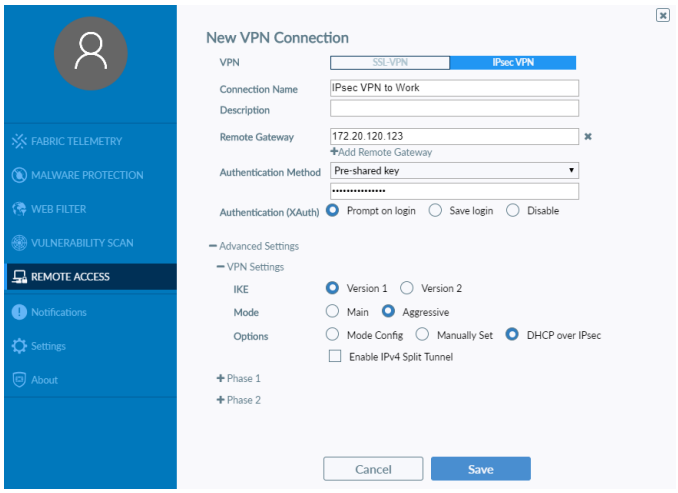
In this example, the DHCP server assigns IP addresses in the range of 172.16.6.100 to 172.16.6.120. The server is attached to internal2 on the FortiGate and has an IP address of 192.168.3.70.

To configure a DHCP server to assign IP addresses to IPsec VPN clients:



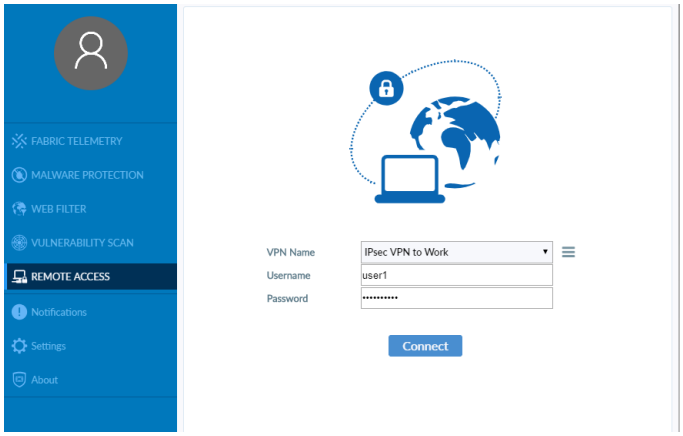
1. Create a user group for remote users:
   a. Go to *User & Authentication* > *User Definition* and click *Create New*.
   b. For *User Type*, select *Local User*.
   c. Complete the wizard, and click *Submit*.
   d. Go to *User & Authentication* > *User Groups* and click *Create New*..
   e. Create a *Firewall* user group for your remote users.
   f. For *Members*, add the user you just created.
   g. Click *OK*.
2. Add a firewall address for the local network and IPsec VPN client range:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Create a new *Subnet* address for the LAN, including the IP mask and local interface (*internal2*).
   c. Click *OK*.
   d. Create a new *IP Range* address for the IPsec VPN client range (`172.16.6.100-172.16.6.120`).
   e. Click *OK*.
3. Configure the IPsec VPN using a VPN tunnel in the CLI:

```
config vpn ipsec phase1-interface
    edit "dhcp_vpn"
        set type dynamic
        set interface "wan1"
        set mode aggressive
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set dhgrp 5
```



```
        set xauthtype auto
        set authusrgrp "ipsecvpn"
        set psksecret **********
        set dpd-retryinterval 60
    next
end

config vpn ipsec phase2-interface
    edit "toclient"
        set phase1name "dhcp_vpn"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set dhgrp 5
        set dhcp-ipsec enable
    next
end
```

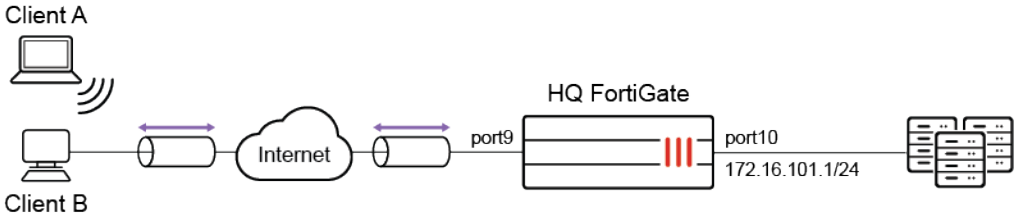


4. Configure the IPsec VPN interface:
   a. Go to *Network* > *Interfaces* and edit the newly created IPsec VPN interface.
   b. Enable the *DHCP Server*.
   c. Expand *Advanced* and change the *Mode* to *Relay*.
   d. Enter the external DHCP server IP address (`192.168.3.70`).
   e. Change the *Type* to *IPsec*.
   f. Click *OK*.
5. Create a security policy for access to the local network:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Configure the following parameters:
      i. Set the *Incoming Interface* to the tunnel interface created in step 3 (*dhcp_vpn*).
      ii. Set the *Outgoing Interface* (*internal2*).
      iii. Set the *Source* to the IPsec VPN client range defined in step 2 (*ipsecvpn_range*).
      iv. Set the *Destination* to the subnet address defined in step 2 (*Local LAN*).
      v. Set the *Service* to *ALL*.
   c. Click *OK*.
6. Configure FortiClient:
   a. In FortiClient, go to *REMOTE ACCESS* > *Add a new connection*.

b. Configure the following parameters:
   i. Set the *VPN* type to *IPsec VPN*.
   ii. Enter a connection name.
   iii. Set the *Remote Gateway* to the FortiGate external IP address.
   iv. Set the *Authentication Method* to *Pre-shared key* and enter the key below.
   v. Expand the *Advanced Settings* > *VPN Settings* and for *Options*, select *DHCP over IPsec*.
   vi. Click *Save*.

c. Select the new connection, and enter the user name and password.
d. Click *Connect*.

Once the connection is established, the external DHCP server assigns the user an IP address and FortiClient displays the connection status, including the IP address, connection duration, and bytes sent and received.



Verification

1. In FortiOS, go to *Monitor* > *IPsec Monitor* and verify that the tunnel *Status* is *Up*.
2. Go to *Log & Report* > *Forward Traffic* and verify the *Sent / Received* column displays the traffic flow through the tunnel.

L2TP over IPsec

This is an example of L2TP over IPsec.

This example uses a locally defined user for authentication, a Windows PC or Android tablet as the client, and `net-device` is set to `enable` in the `phase1-interface` settings. If `net-device` is set to `disable`, only one device can establish an L2TP over IPsec tunnel behind the same NAT device.

To configure L2TP over an IPsec tunnel using the GUI:

1. Go to *VPN* > *IPsec Wizard*.
2. Enter a VPN *Name*. In this example, *L2tpoIPsec*.
3. Configure the following settings for *VPN Setup*:
   a. For *Template Type*, select *Remote Access*.
   b. For *Remote Device Type*, select *Native* and *Windows Native*.
   c. Click *Next*.
4. Configure the following settings for *Authentication*:
   a. For *Incoming Interface*, select *port9*.
   b. For *Authentication Method*, select *Pre-shared Key*.
   c. In the *Pre-shared Key* field, enter *your-psk* as the key.
   d. For *User Group*, select *L2tpusergroup*
   e. Click *Next*.
5. Configure the following settings for *Policy & Routing*:
   a. From the *Local Interface* dropdown menu, select *port10*.
   b. Configure the *Local Address* as *172.16.101.0*.
   c. Configure the *Client Address Range* as *10.10.10.1-10.10.10.100*.
   d. Leave the *Subnet Mask* at its default value.
   e. Click *Create*.

To configure L2TP over an IPsec tunnel using the CLI:

1. Configure the WAN interface and static route on HQ.

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
```

```
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure IPsec phase1-interface and phase2-interface on HQ.

```
config vpn ipsec phase1-interface
    edit "L2tpoIPsec"
        set type dynamic
        set interface "port9"
        set peertype any
        set proposal aes256-md5 3des-sha1 aes192-sha1
        set dpd on-idle
        set dhgrp 2
        set net-device enable
        set psksecret sample
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "L2tpoIPsec"
        set phase1name "L2tpoIPsec"
        set proposal aes256-md5 3des-sha1 aes192-sha1
        set pfs disable
        set encapsulation transport-mode
        set l2tp enable
    next
end
```

3. Configure a user and user group on HQ.

```
config user local
    edit "usera"
        set type password
        set passwd usera
        next
end
config user group
    edit "L2tpusergroup"
        set member "usera"
    next
end
```

4. Configure L2TP on HQ.

```
config vpn l2tp
    set status enable
    set eip 10.10.10.100
    set sip 10.10.10.1
    set usrgrp "L2tpusergroup"
end
```

5. Configure a firewall address that is applied in L2TP settings to assign IP addresses to clients once the L2TP tunnel is established.

```
config firewall address
    edit "L2TPclients"
        set type iprange
        set start-ip 10.10.10.1
        set end-ip 10.10.10.100
    next
end
```

6. Configure a firewall policy.

```
config firewall policy
    edit 1
        set name "Bridge_IPsec_port9_for_l2tp negotiation"
        set srcintf "L2tpoIPsec"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "L2TP"
    next
    edit 2
        set srcintf "L2tpoIPsec"
        set dstintf "port10"
        set srcaddr "L2TPclients"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To view the VPN tunnel list on HQ:

```

Tunneled Internet browsing

This is a sample configuration of tunneled internet browsing using a dialup VPN. To centralize network management and control, all branch office traffic is tunneled to HQ, including Internet browsing.

To configure a dialup VPN to tunnel Internet browsing using the GUI:

1. Configure the dialup VPN server FortiGate at HQ:
   a. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name, in this example, *HQ*.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, select *The remote site is behind NAT*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *Incoming Interface*, select *port9*.
      ii. For *Authentication Method*, select *Pre-shared Key*.
      iii. In the *Pre-shared Key* field, enter *sample* as the key.
      iv. Click *Next*.
   c. Configure the following settings for *Policy & Routing*:
      i. From the *Local Interface* dropdown menu, select *port10*.
      ii. Configure the *Local Subnets* as *172.16.101.0*.
      iii. Configure the *Remote Subnets* as *0.0.0.0/0*.
      iv. For *Internet Access*, select *Share Local*.
      v. For *Shared WAN*, select *port9*.
      vi. Click *Create*.
2. Configure the dialup VPN client FortiGate at a branch:
   a. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name, in this example, *Branch1* or *Branch2*.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, select *The remote site is behind NAT*.
      v. Click *Next*.

b. Configure the following settings for *Authentication*:
   i. For *IP Address*, select *Remote Device* and enter *22.1.1.1*.
   ii. For *Outgoing Interface*, select *wan1*.
   iii. For *Authentication Method*, select *Pre-shared Key*.
   iv. In the *Pre-shared Key* field, enter *sample* as the key.
   v. Click *Next*.
c. Configure the following settings for *Policy & Routing*:
   i. From the *Local Interface* dropdown menu, select *internal*.
   ii. Configure the *Local Subnets* as *10.1.100.0/192.1684.0*.
   iii. Configure the *Remote Subnets* as *0.0.0.0/0*.
   iv. For *Internet Access*, select *Use Remote*.
   v. Configure the *Local Gateway* to *15.1.1.1/13.1.1.1*.
   vi. Click *Create*.

To configure a dialup VPN to tunnel Internet browsing using the CLI:

1. Configure the WAN interface and static route on the FortiGate at HQ.

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure IPsec phase1-interface and phase2-interface configuration at HQ.

```
config vpn ipsec phase1-interface
    edit "HQ"
        set type dynamic
        set interface "port9"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set psksecret sample
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "HQ"
        set phase1name "HQ"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
```

```
    next
end
```

3. Configure the firewall policy at HQ.

```
config firewall policy
    edit 1
        set srcintf "HQ"
        set dstintf "port9" "port10"
        set srcaddr "10.1.100.0" "192.168.4.0"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

4. Configure the WAN interface and static route on the FortiGate at the branches.
   a. Branch1.

```
config system interface
    edit "wan1"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

   b. Branch2.

```
config system interface
    edit "wan1"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 13.1.1.1
        set device "wan1"
    next
end
```

5. Configure IPsec phase1-interface and phase2-interface configuration at the branches.
   a. Branch1.

```
config vpn ipsec phase1-interface
    edit "branch1"
```

```
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "branch1"
        set phase1name "branch1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
        set src-subnet 10.1.100.0 255.255.255.0
    next
end
```

b. Branch2.

```
config vpn ipsec phase1-interface
    edit "branch2"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "branch2"
        set phase1name "branch2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm

        set auto-negotiate enable
        set src-subnet 192.168.4.0 255.255.255.0
    next
end
```

6. Configure the firewall policy at the branches.

a. Branch1.

```
config firewall policy
    edit 1
        set name "outbound"
        set srcintf "internal"
        set dstintf "branch1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
```

```
        next
        edit 2
            set name "inbound"
            set srcintf "branch1"
            set dstintf "internal"
            set srcaddr "all"
            set dstaddr "all"
            set action accept
            set schedule "always"
            set service "ALL"
        next
    end
```

b. Branch2.

```
    config firewall policy
        edit 1
            set name "outbound"
            set srcintf "internal"
            set dstintf "branch2"
            set srcaddr "all"
            set dstaddr "all"
            set action accept
            set schedule "always"
            set service "ALL"
        next
        edit 2
            set name "inbound"
            set srcintf "branch2"
            set dstintf "internal"
            set srcaddr "all"
            set dstaddr "all"
            set action accept
            set schedule "always"
            set service "ALL"
        next
    end
```

7. Configure the static routes at the branches.

a. Branch1.

```
    config router static
        edit 2
            set dst 22.1.1.1/32
            set gateway 15.1.1.1
            set device "wan1"
            set distance 1
        next
        edit 3
            set device "branch1"
            set distance 5
        next
    end
```

b. Branch2.

```
    config router static
        edit 2
```

```
            set dst 22.1.1.1/32
            set gateway 13.1.1.1
            set device "wan1"
            set distance 1
        next
        edit 3
            set device "branch2"
            set distance 5
        next
    end
```

8. Optionally, view the VPN tunnel list on a branch with the `diagnose vpn tunnel list` command:

```
list all ipsec tunnel in vd 0
----
name=branch1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1.1

```

9. Optionally, view static routing table on a branch with the `get router info routing-table static` command:

```
Routing table for VRF=0
S*      0.0.0.0/0 [5/0] is directly connected, branch1
S*      22.1.1.1/32 [1/0] via 15.1.1.1, wan1
```

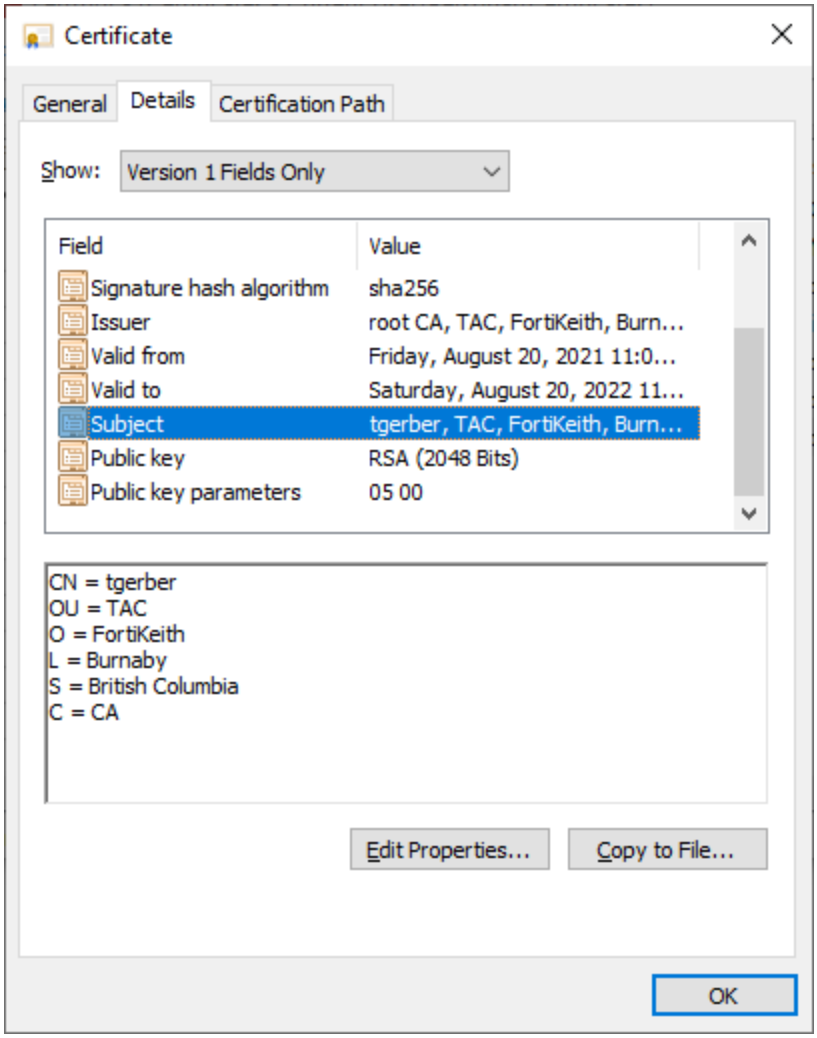
Dialup IPsec VPN with certificate authentication

In a dialup IPsec VPN setup, a company may choose to use X.509 certificates as their authentication solution for remote users. This method includes the option to verify the remote user using a user certificate, instead of a username and password. This method can be simpler for end users.

Administrators need to issue unique user certificates to each user for remote access management. The user certificate can be verified by the subject field, common name, or the subject identity in the Subject Alternative Name (SAN) field.

Subject field verification

This is the basic method that verifies the subject string defined in the PKI user setting matches a substring in the subject field of the user certificate. For example:



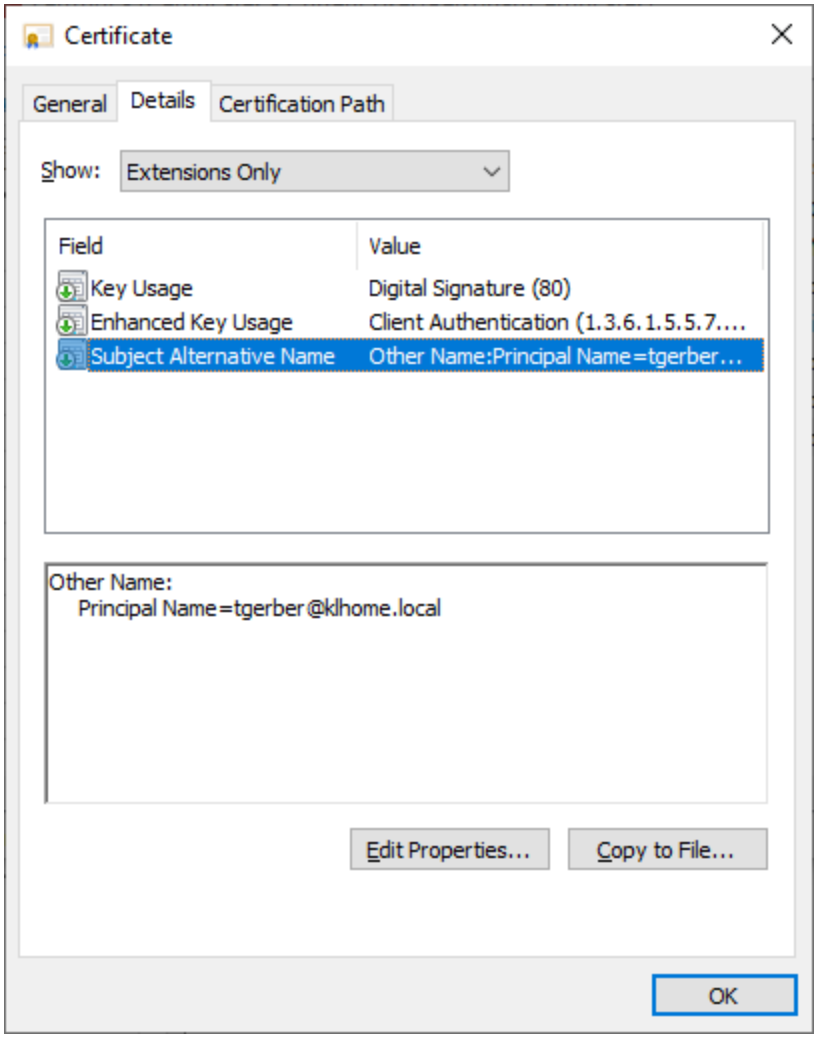
```
config user peer
    edit "tgerber"
        set ca "CA_Cert_2"
        set subject "CN=tgerber"
    next
end
```

Common name verification

In this method, administrators can define the CN string to match the common name (CN) in the subject field of the certificate. For example:

```
config user peer
    edit "tgerber"
        set ca "CA_Cert_2"
        set cn "tgerber"
    next
end
```

The matching certificate looks like the following:



A PKI user must be created on the FortiGate for each remote user that connects to the VPN with a unique user certificate.

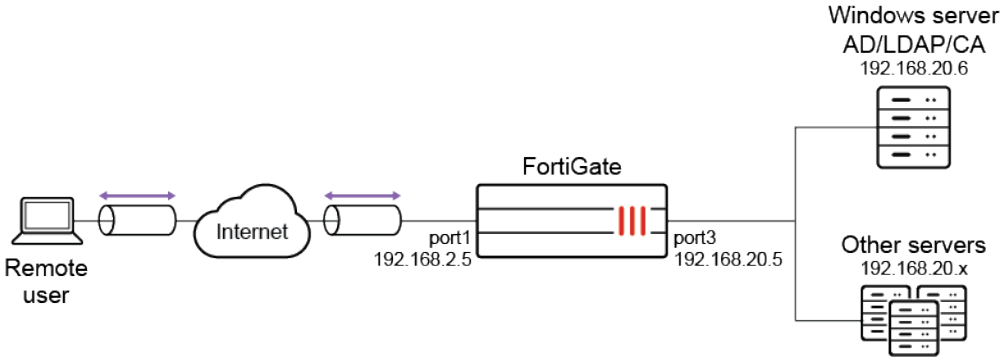
Principal name with LDAP integration

In this method, the PKI user setting references an LDAP server. When `mfa-mode` is set to `subject-identity`, the UPN in the user certificate's SAN field is used to look up the user in the LDAP directory. If a match is found, then authentication succeeds. For example:

```
config user peer
    edit "ldap-peer"
        set ca "CA_Cert_2"
        set mfa-server "WIN2K16-KLHOME-LDAPS"
        set mfa-mode subject-identity
    next
end
```

The matching certificate looks like the following:

This method is more scalable because only one PKI user needs to be created on the FortiGate. Remote users connect with their unique user certificate that are matched against users in the LDAP server.



Certificate management

Dialup IPsec VPN with certificate authentication requires careful certificate management planning. Assuming that a company's private certificate authority (CA) is used to generate and sign all the certificates, the following certificates are needed:

Certificate type	Description
Server certificate	The server certificate is used to identify the FortiGate IPsec dialup gateway. A CSR can be generated on the FortiGate and signed by the CA, or the CA can generate the private and public keys and export the certificate package to the FortiGate.
User certificate	The user certificate is generated and signed by the CA with unique CNs in the subject field and/or unique Principal Names in the SAN field. They are used to identify the user that is connecting to the VPN. User certificates must be installed on client machines.
CA certificate	The root CA certificate, and any subordinate CA that signed the actual user and server certificates, must be imported into the FortiGate and client machines. The CA certificate is used to verify the certificate chain of the server and user certificates.

Example

In this example, a dialup IPsec VPN tunnel is configured with certificate authentication using the subject field verification method and the LDAP integration method.

The company CA, named root CA, signs all the server and user certificates. The user, tgerber@klhome.local, has a user certificate signed by root CA installed on their endpoint. The corresponding user account is also present under the company's Active Directory.

There are five major steps to configure this example:

1. Importing the certificates
2. Configuring user authentication
3. Configuring the VPN
4. Configuring FortiClient and the endpoints
5. Testing and verifying the certificate authentication

Importing the certificates

The server certificate and CA certificate need to be imported into the FortiGate.

To import the server certificate:

1. Go to *System* > *Certificates* and select *Import* > *Local Certificate*.
2. For *Type*, select *PKCS #12 Certificate*.
3. Upload the key file exported from the CA and enter the password.
4. Click *OK*. The certificate now appears in the *Local Certificate* section.

To import the CA certificate:

1. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
2. For *Type*, select *File*.
3. Upload the CA certificate (usually a .CRT file). This certificate only contains the public key.
4. Click *OK*. The certificate now appears in the *Remote CA Certificate* section.

If any subordinate CA is involved in signing the certificates, you need to import its certificate.

Configuring user authentication

FortiGate PKI users do not appear in the GUI until at least one PKI user has been created in the CLI. The following instructions create the PKI users in the CLI.

To configure PKI users for subject field verification:

1. Create the PKI user and choose the CA certificate that was imported (if the certificate was signed by a subordinate CA, choose the subordinate CA's certificate):

```
config user peer
    edit "tgerber"
        set ca "CA_Cert_2"
        set subject "CN=tgerber"
    next
end
```

   For an example of CN field matching, see Common name verification.
2. Create additional users as needed.
3. Place the users into a peer group:

```
config user peergrp
    edit "pki-users"
        set member "tgerber" <user> ... <user>
    next
end
```

To configure PKI users for LDAP integration:

1. Configure the LDAP server that users connect to for authentication:

```
config user ldap
    edit "WIN2K16-KLHOME-LDAPS"
        set server "192.168.20.6"
        set cnid "sAMAccountName"
        set dn "dc=KLHOME,dc=local"
        set type regular
        set username "KLHOME\\Administrator"
        set password ************
        set secure ldaps
        set ca-cert "CA_Cert_1"
        set port 636
    next
end
```

2. Configure the PKI user to reference the LDAP server using the CA certificate that was imported:

```
config user peer
    edit "ldap-peer"
        set ca "CA_Cert_2"
        set mfa-server "WIN2K16-KLHOME-LDAPS"
        set mfa-mode subject-identity
    next
end
```

3. Place the user into a peer group:

```
config user peergrp
    edit "pki-ldap"
        set member "ldap-peer"
    next
end
```

Configuring the VPN

To configure the VPN, the address objects must be defined first so they can be used in the VPN and policy configurations. In this example, the VPN is configured in custom mode to define the authentication settings.

To configure the address objects:

1. Create the address range for the dialup clients:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.
   c. For *Name*, enter *remote-user-range*.
   d. For *Type*, select *IP Range* and enter *172.18.200.10-172.18.200.99* in the *IP Range* field.
   e. Click *OK*.
2. Create the address subnet for the destination 192.168.20.0/24:
   a. Click *Create new*.
   b. For *Name*, enter *192.168.20.0*.
   c. For *Type*, select *Subnet* and enter *192.168.20.0/24* in the *IP/Netmask* field.
   d. Click *OK*.

To configure the IPsec dialup tunnel:

1. Go to *VPN* > *IPsec Tunnels* and click *Create New* > *IPsec Tunnel*.
2. Enter a name for the tunnel, *Dialup-cert_0*.
3. For *Template type*, select *Custom* then click *Next*.
4. In the *Network* section, enter the following:

Remote Gateway	*Dialup User*
Interface	*port1*
Mode Config	Enable
Assign IP From	*Range*
IPv4 mode config > Client Address Range	*172.18.200.10-172.18.200.99*
Enable IPv4 Split Tunnel	Enable
Accessible Networks	*192.168.20.0*

5. In the *Authentication* section, enter the following:

Method	*Signature*
Certificate Name	Select the server certificate that was imported.
Mode	*Aggressive*
Peer Options > Accept Types	*Peer certificate group*
Peer Options > Peer certificate group	Select the group based on the preferred method: • For subject verification, select *pki-users*. • For LDAP integration, select *pki-ldap*.

When IKEv1 is used, aggressive mode should be selected so that the connecting endpoint will provide its peer ID in the first message of the IKE exchange. The peer identifier allows the FortiGate to match the correct tunnel when multiple dialup tunnels are defined.

6. For *Phase 2 Selectors*, leave the local and remote selectors as *0.0.0.0/0.0.0.0*.
7. Click *OK*.

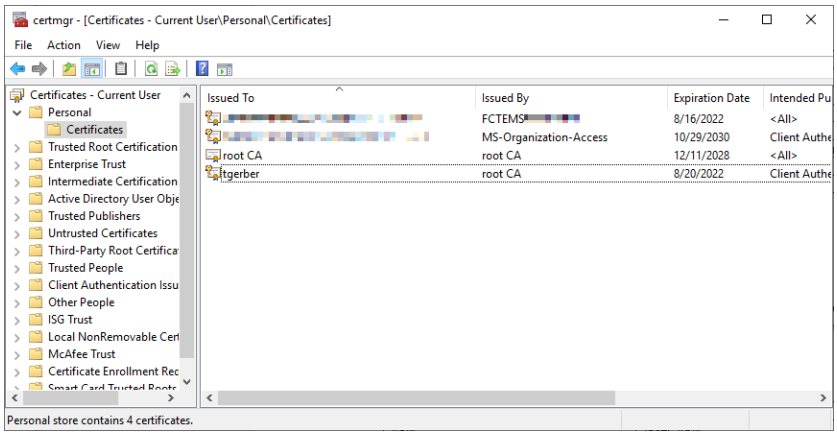
To configure the firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the following:

Name	Enter a policy name.
Incoming interface	*Dialup-cert_0*
Outgoing Interface	*port3*
Source	*remote-user-range*
Destination	*192.168.20.0*

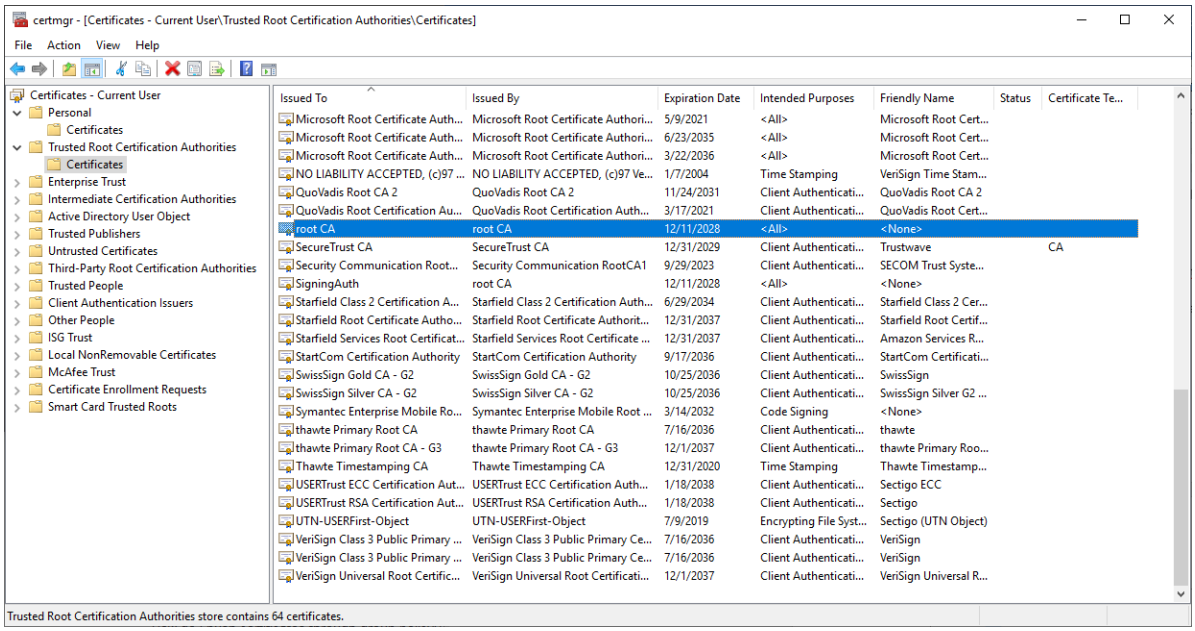
Schedule	*always*
Service	*ALL*
Action	*ACCEPT*

3. Configure the other settings as needed.
4. Click *OK*.



Configuring FortiClient and the endpoints

The following example is configured on a Windows PC with FortiClient 7.0.0. Other configurations may differ slightly.



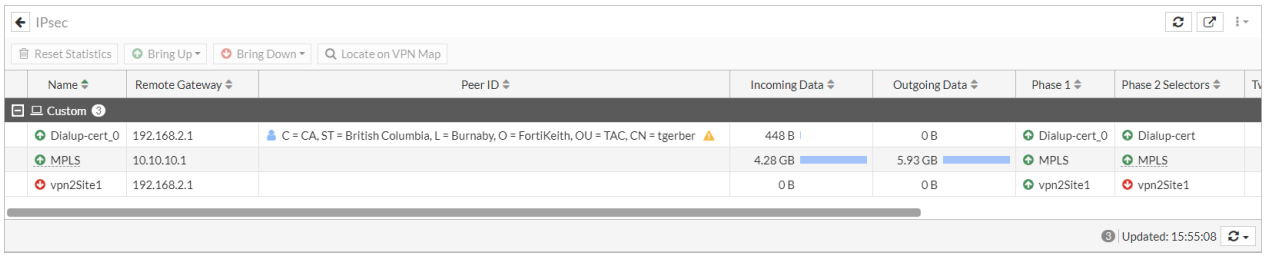
The user certificate and CA certificate must be installed on the endpoint device. They may be pushed by the administrator through group policies or another method. This example assumes that the user certificate and CA certificate are already installed on the endpoint.

To verify the user and CA certificates:

1. Open the Windows certificate manager (certmgr):
   a. In the Control Panel, type *Manage user certificate* in the search box.
   b. Click the result, *Manage user certificates*.
2. Go to *Personal* > *Certificate*. The user certificate should be listed.

3. Go to *Trusted Root Certification Authorities* > *Certificates*. The company CA certificate should be listed.

To configure the FortiClient endpoint settings:



1. In FortiClient, click the *Remote Access* tab and add a new connection:
   a. If there are no existing connections, click *Configure VPN*.
   b. If there are existing connections, click the menu icon and select *Add a new connection*.
2. Configure the following:

VPN	*IPsec VPN*
Connection Name	*Dialup-cert_0*
Remote Gateway	*192.168.2.5*
Authentication Method	*X.509 Certificate* Select the user certificate, *tgerber/root CA*, from the dropdown.
Authentication (XAuth)	*Disable*

3. Click *Save*.

Testing and verifying the certificate authentication

1. On the client PC, open FortiClient and click the *Remote Access* tab.
2. Select the VPN tunnel, *Dialup-cert_0*, and click *Connect*.
   If the connection is successful, a FortiClient pop-up will appear briefly indicating that the IKE negotiation succeeded. The *Remote Access* window now displays *VPN Connected* and the associated VPN tunnel details.
3. On the FortiGate, go to *Dashboard* > *Network* and locate the *IPsec* widget to view the VPN tunnel monitor. Click the widget to expand to full view.
   The widget displays tunnel information, including the *Peer ID* containing the subject field of the user certificate.

4. Go to *Log & Report* > *System Events* and select the *VPN Events* card. Several tunnel related logs are recorded.
5. The same logs can be viewed in the CLI:

```
# execute log filter category 1
# execute log filter field subtype vpn
# execute log display
7: date=2021-08-23 time=15:53:08 eventtime=1629759188862005740 tz="-0700"
logid="0101037138" type="event" subtype="vpn" level="notice" vd="root" logdesc="IPsec
connection status changed" msg="IPsec connection status change" action="tunnel-up"
remip=192.168.2.1 locip=192.168.2.5 remport=64916 locport=4500 outintf="port1"
cookies="19f05ebc8c2f7a0d/7716190005538db5" user="C = CA, ST = British Columbia, L =
Burnaby, O = FortiKeith, OU = TAC, CN = tgerber" group="pki-ldap" useralt="C = CA, ST =
British Columbia, L = Burnaby, O = FortiKeith, OU = TAC, CN = tgerber" xauthuser="N/A"
xauthgroup="N/A" assignip=172.18.200.10 vpntunnel="Dialup-cert_0" tunnelip=172.18.200.10
tunnelid=3418215253 tunneltype="ipsec" duration=0 sentbyte=0 rcvdbyte=0 nextstat=0
```

6. If any issues arise during the connection, run the following debug commands to troubleshoot the issue:

```
# diagnose debug application ike -1
# diagnose debug application fnbamd -1
# diagnose debug enable
```

SAML-based authentication for FortiClient remote access dialup IPsec VPN clients

SAML-based authentication for FortiClient remote access dialup IPsec VPN clients is now supported. This feature requires FortiClient 7.2.4 and FortiClient supports only using IKEv2. Two factor authentication using FortiToken push is also supported.

The FortiGate authd daemon has been enhanced to support SAML authentication and accepts local-in traffic from the FortiClient by the TCP port number configured in the `auth-ike-saml-port` setting (0 - 65535, default = 1001). Currently, this setting can only be configured in the CLI as follows:

```
config system global
    set auth-ike-saml-port <integer>
end
```

This allows the FortiGate to act as a SAML service provider (SP) for IKEv2 FortiClient remote access IPsec VPN clients by forwarding the FortiClient's SAML request to the configured SAML identity provider (IdP) for user authentication.

The `ike-saml-server` setting enables a configured SAML server to listen on a FortiGate interface for SAML authentication requests from FortiClient remote access IPsec VPN clients. Currently, this setting can only be configured in the CLI as follows:

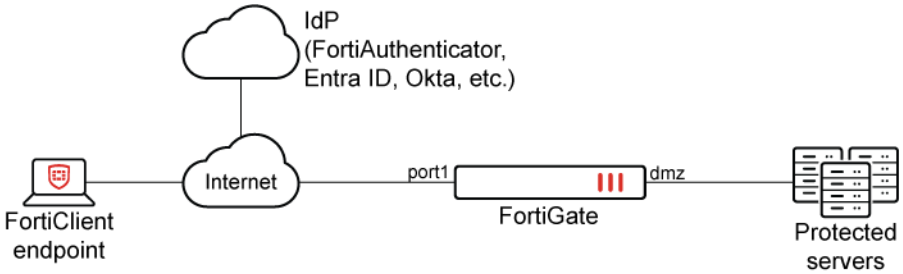
```
config system interface
    edit <name>
        set ike-saml-server <saml_server>
    next
end
```

FortiClient will validate the certificate presented to it by FortiGate during its initial SAML connection. This certificate can be configured on the FortiGate from the GUI under *User & Authentication* > *Authentication Settings* > *Certificate* under *User Authentication Options*. To import the certificate on the FortiGate, see Import a certificate.

This certificate can also be configured in the CLI as follows:

```
config user setting
     set auth-cert <certificate>
end
```

To prevent an invalid server certificate prompt on FortiClient, the certificate's common name (CN) should match the IPsec VPN remote gateway's FQDN. If the certificate is signed by a custom Certificate Authority or one that is not well-known, the Certificate Authority's (CA) certificate should be imported in FortiClient endpoint's Trusted Root Certificate Authority store. For details on installing a CA certificate on the endpoint, see Installing certificates on the client.



SAML authentication flow with IPsec

The SAML Authentication flow when using IPsec where FortiGate is the Service Provider (SP), FortiAuthenticator, Entra ID, Okta, or another SAML IdP is the Identity Provider (IdP) and FortiClient is the web-browser as follows:

1. When the FortiClient user clicks on Connect on FortiClient to connect to IPsec VPN Gateway (i.e. FortiGate), FortiClient first initiates a connection to FortiGate on the `auth-ike-saml-port` configured on FortiGate.
2. The FortiGate sends a SAML Authentication Requests inside a redirect to FortiClient. The redirect consists of URLs to reach the IdP.
3. FortiClient uses these redirects to send SAML Authentication Request to the IdP after which the login page on the IdP opens up.
4. The user authenticates to the IdP using their SAML credentials configured on the IdP.
5. The IdP sends a SAML Authentication Response that contains the user and group information in form of SAML Assertions to FortiClient.
6. FortiClient sends a SAML Authentication Response to FortiGate.
7. The FortiGate consumes the SAML Authentication Response and SAML Assertions after verifying the IdP using its IdP's certificate and provides FortiClient with a temporary token ID.
8. FortiClient initiates IPsec tunnel and presents the token ID for authentication. Upon successful verification of token ID, IPsec tunnel establishes.

SAML configuration example with different IdPs

We will now see how to configure IPsec with SAML authentication using different IdPs on FortiGate and FortiClient using the following example:

The configuration steps on the FortiGate, different IdPs and FortiClient are as follows:

1. Configure IKE-SAML authentication port number on FortiGate.
2. Configure IPsec VPN certificate on FortiGate.
3. Configure SAML IdP and SAML SP.
4. Configure IPsec IKEv2 on FortiGate.
5. Configure firewall policies on FortiGate.
6. Configure IPsec VPN profile on FortiClient.
7. Verify the IPsec connection.

Only Configuring SAML IdP and SAML SP on page 2076 is unique to individual IdPs. All other steps listed above are the same on FortiGate and FortiClient when using different IdPs.

Configuring IKE-SAML authentication port number on FortiGate

Configure a suitable TCP port number for SAML authentication (`auth-ike-saml-port`) used by FortiGate. This example uses port 9443 and the setting is configurable using CLI.

```
config system global
    set auth-ike-saml-port 9443
end
```

Configuring IPsec VPN certificate

In this step, using either the GUI or the CLI, configure the IPsec VPN certificate that is presented to FortiClient upon its initial connection.

To configure the IPsec VPN certificate in the GUI:

1. Go to *User & Authentication* > *Authentication Settings*.
2. Select the certificate from the *Certificate* dropdown menu. To import the certificate on FortiGate, see Import a certificate.

To configure the IPsec VPN certificate in the CLI:

If the certificate *VPN_Certificate* has already been imported on the FortiGate, then use the following CLI commands:

```
config user setting
    set auth-cert "VPN_Certificate"
end
```

Configuring SAML IdP and SAML SP

The SAML configuration on SP (FortiGate) will vary based on selected IdPs from the list below. Select the preferred combination of SP and IdP as per your requirement from the following list.

1. Configure FortiAuthenticator as SAML IdP and FortiGate as SAML SP
2. Configure Microsoft Entra ID as SAML IdP and FortiGate as SAML SP

SAML IdPs other than FortiAuthenticator or Microsoft Entra ID can be used. Please refer to the documentation of the respective SAML IdP for details.

Configuring IPsec IKEv2 on FortiGate

Configuring Remote access VPN on FortiGate enables FortiClient to connect to the IPsec VPN gateway configured on FortiGate. FortiClient 7.2.4 GA and above supports only IKEv2 for SAML authentication. The example discussed uses full-tunnel IPsec VPN. For split-tunnel configuration and other advanced configurations as per your requirement, see Remote access on page 2031.

To configure IPsec VPN on FortiGate with FortiClient as the dialup client:

1. Go to *VPN* > *IPsec Tunnels*.
2. Click *Create New* > *IPsec Tunnel*. The *VPN Creation Wizard* is displayed.
3. Enter the *Name* as *FCT_SAML*. This example does not use the VPN wizard for the IPsec tunnel configuration but rather configures a *Custom* IPsec tunnel.
4. Configure the *Template type* as *Custom*.
5. Click *Next*.
6. Configure the following options:

Name	*FCT_SAML*
Comments	(Optional)
Network	
IP Version	*IPv4*
Remote Gateway	*Dialup User*
Interface	*port1* Select the IPsec tunnel gateway interface.
Mode Config	*Enable*
Use system DNS in mode config	(Optional) Enable FortiClient to use the host's DNS server after it connects to VPN.
Assign IP From	*Enable* Select *Address/Address Group* from the dropdown list.
IPv4 mode config	
Client Address Range	*VPN_Client_IP_Range* *VPN_Client_IP_Range* is configured from *10.212.134.1* to *10.212.134.200*. If it is not already created, select *Create* > *Address* from the dropdown menu to create a new address object. See Subnet on page 1430 for more information.
Subnet Mask	*255.255.255.255*
DNS Server	*8.8.8.8*

Authentication	
Method	*Pre-shared key*
Pre-shared key	Enter the pre-shared key of at least six characters.
IKE	
Version	*2*
Peer Options	
Accept Types	*Any peer ID*
Phase 1 Proposal	
Encryption	*AES128*
Authentication	*SHA256* Select the desired Encryption and Authentication algorithms that should also match with Phase1 Proposals configured on FortiClient. See Configuring IPsec VPN profile on FortiClient on page 2079.

7. Keep other configurations as defaults.
8. Click *OK*. The newly created IPsec tunnel would be now visible under *VPN* > *IPsec Tunnels*.
9. As IKEv2 uses EAP for user authentication, enable EAP using the CLI inside the configured IPsec tunnel for user authentication, as follows:

```
config vpn ipsec phase1-interface
    edit "FCT_SAML"
        set eap enable
        set eap-identity send-request
    next
end
```

For other advanced custom configurations as per your requirement, see Remote access on page 2031.

The SAML group configured, `<group-name>`, must be either configured inside the IPsec Phase 1 setting, `set authusrgrp <group-name>`, or in the firewall policy, `set groups <group-name>`, to allow the traffic to flow through the IPsec tunnel. If the SAML group is configured in both IPsec Phase 1 and firewall policy, the traffic stops to flow through the IPsec tunnel. In the example discussed, it is configured it in the firewall policy.

Configuring firewall policies for IPsec tunnel

To configure firewall policies for IPsec tunnel:

1. Go to *Policy & Object* > *Firewall Policy*.
2. Click *Create New*.
3. Enter the following configuration:

Name	*IPsec to DMZ* Enter the desired name.

Incoming Interface	*FCT_SAML* Select the configured IPsec tunnel.
outgoing Interface	*DMZ* Select the interfaces that FortiClient needs access to when it connects to VPN.
Source	Under *Address*, select *VPN_Client_IP_Range*. Under *User*, select *SAML-FAC-Group* (or *SAML-ENTRA-ID-Group*).  The group under *User* is the SAML user group configured in the earlier steps.
Destination	*DMZ subnet* Click *Create* if it is not already created. See Subnet on page 1430 for more information.
Service	*ALL*

4. Click *OK*.
5. As IPsec tunnel configured as full-tunnel, create another policy to allow traffic from *IPsec to Internet*, to allow FortiClient to access Internet through IPsec tunnel.

For additional custom settings as per your requirement, see Firewall policy on page 1296.

Configuring IPsec VPN profile on FortiClient

To configure an IPsec VPN profile on FortiClient:

1. In FortiClient, go to *Remote Access* > *Configure VPN* or *Add a new connection*.
2. Set the following settings to configure an IPsec IKEv2 profile on FortiClient:

Connection Name	*VPN-Tunnel*
Remote Gateway	*<VPN Gateway FQDN>* or *<VPN Gateway IP>*
Authentication Method	*Pre-shared key* with *Enable Single Sign On (SSO) for VPN Tunnel* enabled.
Customize port	*9443*
Advanced Settings > VPN Settings	
IKE	*Version 2*
Options	*Mode Config*

To explore additional custom options to configure IPsec VPN profile, see Configuring an IPsec VPN connection.

Verifying IPsec connection

To verify the IPsec connection in the GUI:

1. On the client PC, open FortiClient and select the *Remote Access* tab.
2. Select the VPN tunnel, *VPN-Tunnel*, and click *Connect*.
3. If the connection is successful, a FortiClient pop-up will appear briefly indicating that the IKE negotiation succeeded. The *Remote Access* window now displays *VPN Connected* and the associated VPN tunnel details.
4. In FortiOS, go to *Dashboard* > *Network* and locate the *IPsec* widget. Click the widget to expand to full view and view more details.

To verify the IPsec connection in the CLI:

The following debugs are from FortiGate when used with FortiAuthenticator as the IdP. The debugs should be similar for other IdPs depending on the SAML attributes supported and sent by the IdP.

1. Verify the IKE gateway list:

```
# diagnose vpn ike gateway list
vd: root/0
name: FCT_SAML_0
version: 2
interface: port1 3
addr: 10.100.66.99:4500 -> 208.91.115.30:64917
tun_id: 10.212.134.1/::10.0.0.18
remote_location: 0.0.0.0
network-id: 0
transport: UDP
created: 33s ago
eap-user: testuser
2FA: no
groups:
  SAML-FAC-Group 5
peer-id: 172.19.50.196
peer-id-auth: no
FortiClient UID: 19E1FA565259468FB46EDAA9D595176F
assigned IPv4 address: 10.212.134.1/255.255.255.255
nat: me peer
PPK: no
IKE SA: created 1/1  established 1/1  time 1680/1680/1680 ms
IPsec SA: created 1/1  established 1/1  time 40/40/40 ms

  id/spi: 1049 f883b783547b0c64/f45745cd8b228850
  direction: responder
  status: established 33-31s ago = 1680ms
  proposal: aes256-sha256
  child: no

  DPD sent/recv: 00000000/00000000
  peer-id: 172.19.50.196
```

2. Verify the authd daemon debug output:

```
# diagnose debug application authd -1
...
[authd_http_on_method_post:5151]: src 10.1.100.253 flag 00008000
[authd_local_saml_auth:5602]: SAML login with UID '19E1FA565259468FB46EDAA9D595176F'.
[authd_http_prepare_javascript_redir:3852]: https://<VPN Gateway
FQDN>:9443/saml?0704048f9683e491
...
```

3. Verify the samld daemon debug output:

```
# diagnose debug application samld -1
...
</Session>
samld_send_common_reply [99]:     Attr: 17, 31, magic=040c07809dafc13e
samld_send_common_reply [99]:     Attr: 18, 29, 2024-03-19T21:42:21Z
samld_send_common_reply [95]:     Attr: 10, 26, 'username' 'testuser'
samld_send_common_reply [95]:     Attr: 10, 17, 'group' 'IT'
...
```

4. Verify the fnbamd daemon debug output:

```
# diagnose debug application fnbamd -1
...
[2426] handle_req-Rcvd auth cache message
[133] __saml_auth_cache_push-Auth cache created,
user='19E1FA565259468FB46EDAA9D595176F', SAML_server='saml-fac', vfid=0
[140] __saml_auth_cache_push-Hash bucket 227
[182] __saml_auth_cache_push-New auth cache entry is created,
user='19E1FA565259468FB46EDAA9D595176F', expires=1648598587, SAML_server='saml-fac',
vfid=0
[1918] handle_req-Rcvd auth req 994781475 for 19E1FA565259468FB46EDAA9D595176F in ipsec
opt=00000000 prot=5
[466] __compose_group_list_from_req-Group 'saml-fac', type 1

```

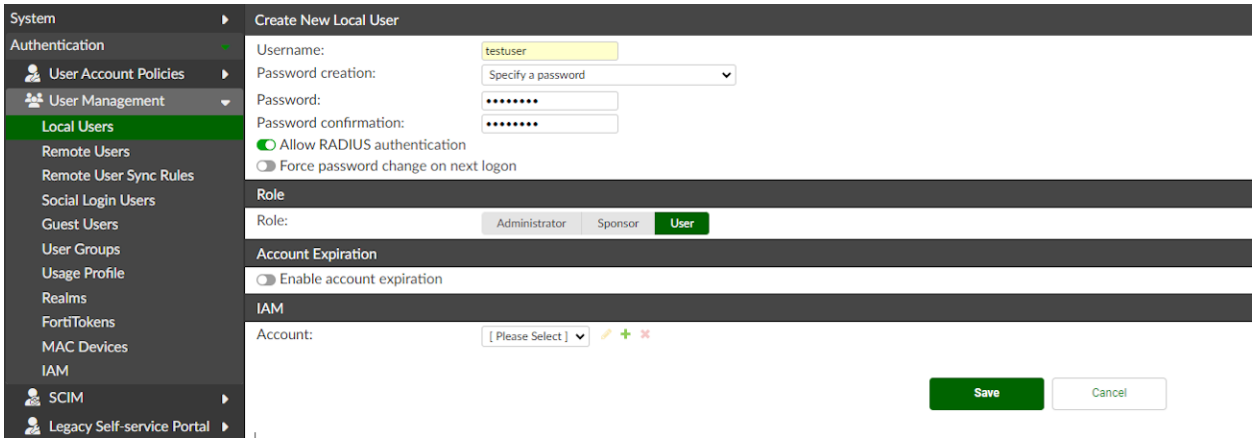
Configuring FortiAuthenticator as SAML IdP and FortiGate as SAML SP

This topic discusses the configuration steps required on FortiAuthenticator to act as the Identity Provider (IdP) and FortiGate to act as Service Provider (SP) during SAML Authentication for IPsec connection, as a part of the overall configuration in SAML-based authentication for FortiClient remote access dialup IPsec VPN clients on page 2074.

In the example discussed, the following assumptions and configuration steps are used:



1. FortiAuthenticator is configured with local user (*testuser*) inside a User group (*IT*).
2. This user belongs to a unique realm (*samlrealm*).
3. FortiAuthenticator also requires a server certificate (also called as IdP certificate) for itself signed by a well-known CA or trusted by FortiClient endpoint and FortiGate.
4. The IdP certificate must be imported into FortiGate after which FortiAuthenticator can use the certificate to sign the SAML messages.
5. FortiAuthenticator must then be configured as SAML IdP and FortiGate as SAML SP.

To configure a local user on FortiAuthenticator:

1. Go to *Authentication* > *User Management* > *Local Users* and select *Create New*.
2. Enter the following details shown below and leave other settings as the defaults.

Username	*testuser*
Password creation	*Specify a password*
Password	Enter a desired password
Password confirmation	Re-enter the password

3. Click *Save*.

For more advanced and custom configuration options, see Local users.

To configure a user group on FortiAuthenticator:

1. Go to *Authentication* > *User Management* > *User Groups* and select *Create New*.
2. To create a user group with a local user:
   a. In the *Name* field, enter the group name as *IT*.
   b. Set the *Type* as *Local*.

c. Under *Users*, from the *Available Users* table, select *testuser* and move it to the *Chosen Users* table.

3. Click *Save*.

For more advanced options, see User Groups.

To configure a user realm on FortiAuthenticator:

1. Go to *Authentication* > *User Management* > *Realms* and select *Create New*.
2. Name the realm as *samlrealm*.
3. In *User source*, from the dropdown, select *Local Users*.
4. Click *Save*.

For more advanced options, see Realms.

To import a server certificate on FortiAuthenticator:

1. Go to *Certificate Management* > *End Entities* > *Local Services* and select *Import*.
2. Depending on which file format your certificate is in, select the suitable *Type*.
3. Select *Upload a file* to locate the certificate file on your computer.
4. Click *Import*.

See End entities for more information on certificates on FortiAuthenticator.

To configure general SAML IdP settings on FortiAuthenticator for SAML:

1. Go to *Authentication* > *SAML IdP* > *General*, and select *Enable SAML Identity Provider portal*.
2. Configure the following settings:

Device FQDN	*<FortiAuthenticator FQDN>* To configure this setting, you must enter a *Device FQDN* in the *System Information* widget in the *Dashboard*.
Server address	*<FortiAuthenticator FQDN>* Enter the IP address or FQDN of the FortiAuthenticator device. This address must be accessible by the FortiClient endpoint.
Username input format	*username@realm*
Use default realm when user-provided realm is different from all configured realms	*Disabled*
Realms	*Realm*: *samlrealm* (Optional) *Groups* > *Filter*: *IT* Use *Groups* and *Filter* to add specific user groups. These user groups may be local users configured on the FortiAuthenticator itself or remote users populated from different remote authentication servers. See User Groups and Remote users for more information.
Legacy login sequence	*Disabled*
Default IdP certificate	*<IdP certificate>*

	This certificate is used by IdP to sign SAML messages before sending it to IdP. To import this certificate on FortiAuthenticator see Importing a server certificate. This certificate also needs to be imported on the SP (FortiGate) to be used in the SAML configuration, see Remote certificate on page 2986.

3. Select *Save* to apply any changes that you have made.

To configure service provider SAML settings on FortiAuthenticator for SAML:

1. Go to *SAML IdP* > *Service Providers*.
2. Click *Create New*.
3. Enter the following:

SP name	*FortiGate* Use any suitable SP name.
Server certificate	*<IdP certificate>* This certificate is used by IdP to sign SAML messages before sending it to IdP. To import this certificate on FortiAuthenticator, see Importing a server certificate. This certificate also needs to be imported on the SP (FortiGate) to be used in the SAML configuration. See Remote certificate on page 2986.
IdP Metadata	
Select an identifier to display IdP info	Click + to create a new IdP prefix. In the *IdP identifier* field, enter the prefix as *fac* and click *OK*. Fields such as *IdP entity id*, *IdP single sign-on URL*, and *IdP single logout URL* will populate automatically with this prefix information. These URLs must be accessible by FortiClient endpoints. Copy and paste this URL information in a separate notepad file as it will be used to configure IdP information on SP (FortiGate) later.
Authentication	
Authentication Method	*Password-only*
Assertion Attributes	Click + to expand it. Configure two SAML assertion attributes (*username* and *group*) as follows:
Assertion attribute	
SAML attribute	*username*
User attribute	*FortiAuthenticator* > *Username*
Assertion attribute	
SAML attribute	*group*
User attribute	*FortiAuthenticator* > *Group*

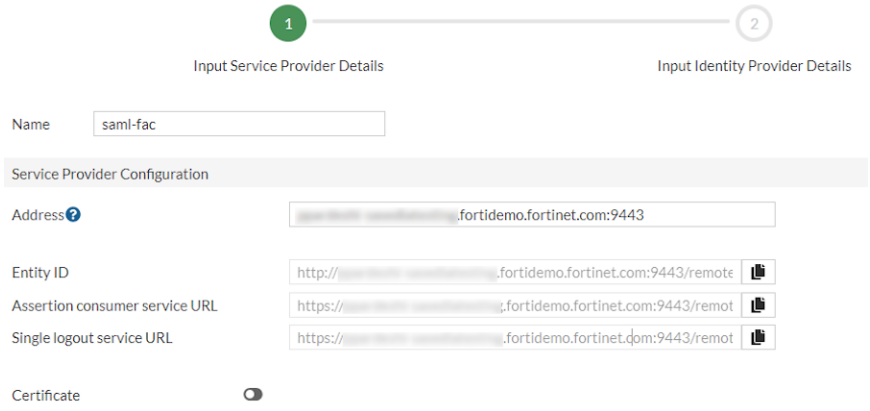
4. Click *Save*.

To export SAML IdP server certificate and import it on FortiGate:

1. On FortiAuthenticator, go to *Certificate Management* > *End Entities* > *Local Services*.
2. Select the certificate, *<IdP certificate>*, by selecting the left checkbox for the certificate entry in the table and clicking *Export Certificate*.
3. Go to the file location on your local computer and click *Save*.
4. On FortiGate, go to *System* > *Certificates*, and from the *Create/Import* dropdown, select *Remote Certificate*.
5. Select *Upload* to locate and upload the .cer remote certificate from your computer.
6. Click *OK*.

   The new certificate is now visible in the *System* > *Certificates* page under *Remote Certificate*.

To configure SAML server on FortiGate:



1. Go to *User & Authentication* > *Single Sign-On*.
2. Click *Create New*.
3. Enter the *Name* as *saml-fac*.
4. In the *Address* field, enter the FQDN/IP information in the following format:

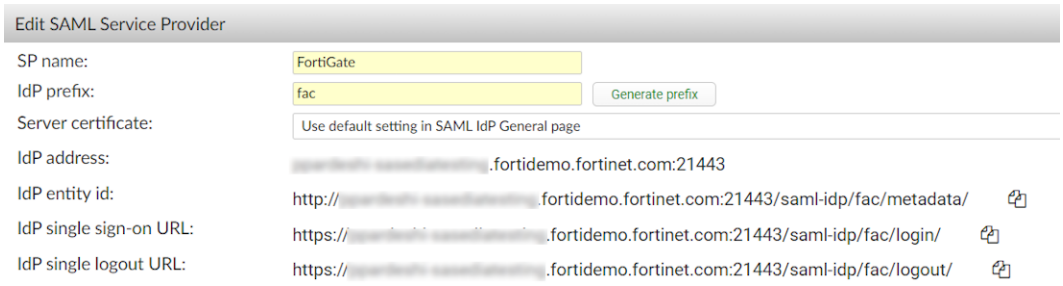
   <ipsec-vpn-gateway-fqdn/ip-address>:<saml-ike-authentication-port>

   The *Address* field is used by FortiClient to initiate IPsec connection to FortiGate.
5. On the FortiGate, from *Service Provider Configuration*, copy the following URLs (*Entity ID*, *Assertion consumer service URL*, *Single logout service URL*). In FortiAuthenticator, enter it in *Authentication* > *SAML IdP* > *Service Providers* > *FortiGate*, inside the *SP Metadata* fields according to following mapping:

FortiGate settings	FortiAuthenticator settings
Entity ID	SP entity ID
Assertion consumer service URL	SP ACS (login) URL
Single logout service URL	SP SLS (logout) URL

The following demonstrates on the FortiGate:

The following demonstrates on FortiAuthenticator:



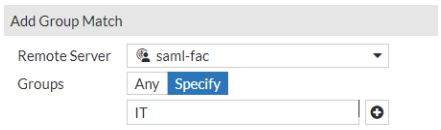
6. Click *Save* on FortiAuthenticator to save the SP URLs.
7. Return to FortiGate GUI, and click *Next*.

   Set the *Type* as *Custom*.The *Entity ID*, *Assertion consumer service URL*, and *Single logout service URL* fields required are available from FortiAuthenticator.
8. To copy the following URLs (*IdP entity id*, *IdP single sign-on URL*, *IdP single logout URL*) from FortiAuthenticator, go to *Authentication* > *SAML IdP* > *Service Providers* > *FortiGate* under *IdP Metadata*. Copy the URLs from FortiAuthenticator and paste it on FortiGate according to the following mapping:

FortiAuthenticator settings	FortiGate settings
IdP entity ID	Entity ID
IdP single sign-onURL	Assertion consumer service URL
IdP single logout URL	Single logout service URL

The following demonstrates on FortiAuthenticator:

The following demonstrates on the FortiGate:



9. In the *Certificate* dropdown, select the IdP certificate that was imported on FortiGate.
10. Enter the following details in *Additional SAML Attributes*.

Attribute used to identify users	*username*
Attribute used to identify groups	*group*

11. Click *Submit* to save the changes.

To create SAML user group on FortiGate:

1. Go to *User & Authentication* > *User Groups* .
2. Click *Create New*.
3. Enter *Name* as *SAML-FAC-Group*.
4. In *Remote Groups*, click *Add*.
5. From the *Remote Server* dropdown, select *saml-fac* SAML server.
6. In the *Groups* field, click *Specify* and enter *IT*.

7. Click *OK*.
8. Click *OK*.

To associate SAML server with IPsec gateway interface:

Use FortiGate CLI to bind and associate the SAML server with the VPN gateway interface (port1) as follows:

```
config system interface
    edit "port1"
        set ike-saml-server "saml-fac"
    next
end
```

Configuring SAML on IdP and SP is now complete. The next step is to use SAML configuration inside IPsec configuration. To configure IPsec, see Configuring IPsec IKEv2 on FortiGate on page 2077.

Configuring Microsoft Entra ID as SAML IdP and FortiGate as SAML SP

This topic discusses the configurations steps required if your users are managed through Microsoft Entra ID (formerly Azure Active Directory), as a part of the overall configuration in SAML-based authentication for FortiClient remote access dialup IPsec VPN clients on page 2074. Microsoft Entra ID will be configured as Identity Provider (IdP) and FortiGate as Service Provider (SP) during SAML Authentication for IPsec connection.

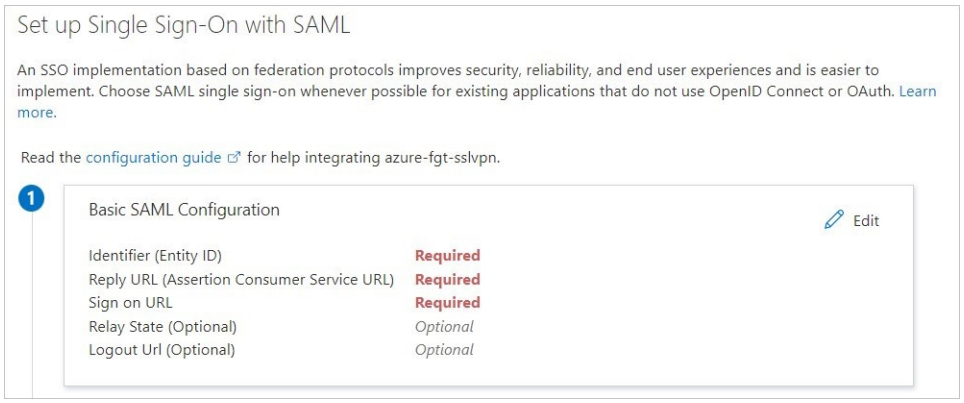
To configure a user on Microsoft Entra ID:

1. Login to the Azure portal (portal.azure.com).
2. Search for *Microsoft Entra ID service* in the search bar and click on it.
3. In the left side menu, go to *Users*.
4. Select *New user* > *Create new user*.
5. In the *Basic* properties:
   a. In the *Display name* field, enter *testuser*.
   b. In the *User principal name* field, enter the username@companydomain.extension. For example, *testuser@<mydomain>.onmicrosoft.com*.
   c. Select *Show password* and then write down the value that's displayed in the *Password* box.
   d. Select *Review + create*.
6. Select *Create*.

To configure a Security group and add user to it on Microsoft Entra ID:

In this section, we create a security group named *IT* in Microsoft Entra ID for the *testuser*. FortiGate will use this security group to grant the user network access through the VPN.

1. In the Azure portal, navigate to *Microsoft Entra ID* service.
2. In the left side menu, go to *Groups*.
   a. Select *New Group*.
   b. In the *Group type* list, select *Security*.
   c. In the *Group name* field, enter *IT*.
   d. (Optional) In the *Group description* field, enter *Group for granting FortiGate VPN access*.
   e. For the *Microsoft Entra roles can be assigned to the group (Preview) settings*, select *No*.
   f. In the *Membership type* field, select *Assigned*.
   g. Under *Members*, select *No members selected*.
   h. In the *Users and groups* dialog field, select *testuser* from the *Users* list, and then click *Select*.
   i. Select *Create*.
3. Back in the *Groups* section in Microsoft Entra ID, find the *IT* group and note the *Object Id*. This will be needed later.



To configure Enterprise application on Azure portal:

1. Configure user and groups:
   a. In the Azure portal, search for *Enterprise applications service* in the search bar.
   b. Click on *New application* and search for *FortiGate SSL VPN*.

   The application is named for “SSL VPN” but should still work with the IPsec VPN configuration.

   c. Once the application is found, select it, change the *Name* to *FortiGate IPsec VPN*, and click *Create*. It may take a few seconds to create the application.
   d. Once the application is created, go to *Enterprise application* > *All applications* > *FortiGate IPsec VPN*.
   e. On the application's overview page, in the *Manage* section, select *Users and groups*.
   f. Select *Add user/group*, then select *Users* in the *Add Assignment* dialog.
   g. In the *Users and groups* dialog, select *testuser* in the *Users* list, and then click *Select*.
   h. (Optional) If you are expecting any role value in the SAML assertion, in the *Select Role* dialog, select the appropriate role for the user from the list. Click *Select*.
   i. In the *Add Assignment* dialog, select *Assign*.
2. Configure single sign-on:
   a. Browse to *Enterprise application* > *All applications* > *FortiGate IPsec VPN application*.
   b. In the *Manage* section, select *Single sign-on*.
   c. In the *Select a single sign-on method* page, select *SAML*.
   d. In the *Set up Single Sign-On with SAML* page, select *Edit* for *Basic SAML Configuration* to edit the settings:

i. In *Identifier*, enter a URL in the pattern https://<FortiGate IP or FQDN address>:<Custom SAML-IKE port>/remote/saml/metadata.
ii. In *Reply URL*, enter a URL in the pattern https://<FortiGate IP or FQDN address>:<Custom SAML-IKE port>/remote/saml/login.
iii. In *Sign on URL*, enter a URL in the pattern https://<FortiGate IP or FQDN address>:< Custom SAML-IKE port >/remote/saml/login.
iv. In *Logout URL*, enter a URL in the pattern https://<FortiGate IP or FQDN address>:< Custom SAML-IKE port >/remote/saml/logout.

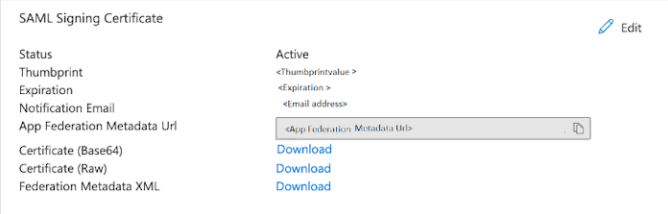
These URLs can be retrieved and copied directly from the FortiGate. Go to To configure SAML server on FortiGate: on page 2085 to get these URLs.

e. Click *Save*.

f. The FortiGate SSL VPN application expects SAML assertions in a specific format, which requires you to add custom attribute mappings to the configuration. The following screenshot shows the list of default attributes.

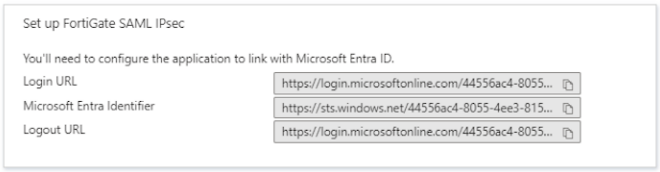
g. The claims required by FortiGate SSL VPN are shown in the following table. Names are case-sensitive.

Name	Source attribute
username	user.userprincipalname
group	user.groups



To create these additional claims:

i. Next to *User Attributes & Claims*, select *Edit*.
ii. Select *Add new claim*.
iii. For *Name*, enter *username*.
iv. For *Source attribute*, select *user.userprincipalname*.
v. Select *Save*.
vi. Select *Add a group claim*.
vii. Select *All groups*.
viii. Under *Advanced options*, select the *Customize the name of the group claim*.



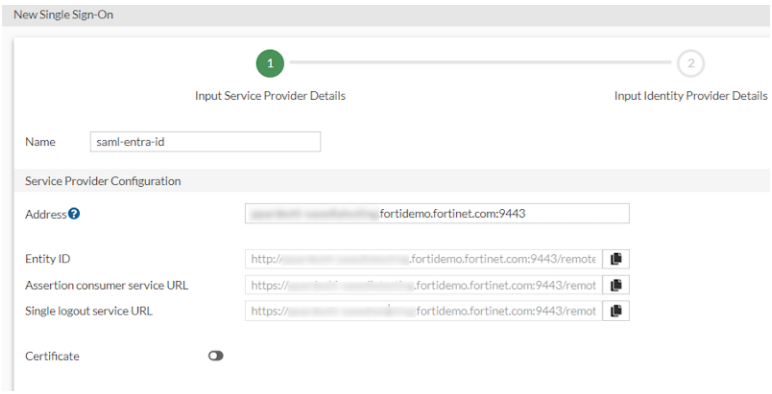
ix. For *Name*, enter *group*.

x. Select *Save*.

h. In the *Set up Single Sign-On with SAML* page, in the *SAML Signing Certificate* section, select *Download* next to *Certificate (Base64)* to download the certificate and save it on your computer. This will be needed in the step To export SAML IdP server certificate and import it on FortiGate: on page 2090

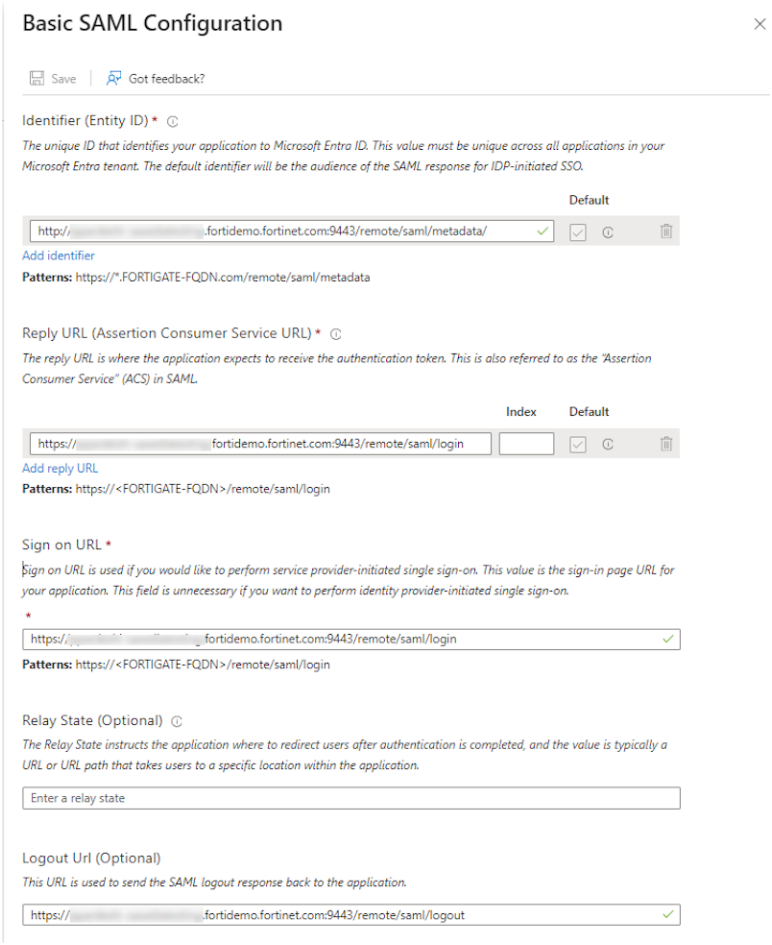
i. In the *Set up FortiGate SSL VPN* section, copy the URLs (*Login URL*, *Microsoft Entra Identifier*, *Logout URL*) and paste it inside FortiGate's SAML server configuration, discussed in To configure SAML server on FortiGate: on page 2090.

To export SAML IdP server certificate and import it on FortiGate:



1. On FortiGate, go to *System* > *Certificates*, and from the *Create/Import* dropdown, select *Remote Certificate*.
2. Select *Upload* to locate and upload the .cer remote certificate from your computer.
3. Click *OK*. The certificate will now be visible under *System* > *Certificates* > *Remote Certificate*.

To configure SAML server on FortiGate:



1. On the FortiGate, go to *User & Authentication* > *Single Sign-On* > *Create new*.
2. Enter the *Name* as *saml-entra-id*.
3. In the *Address* field, enter the FQDN/IP information in the following format:
   <ipsec-vpn-gateway-fqdn/ip-address>:<saml-ike-authentication-port>
   The *Address* field is used by FortiClient to initiate IPsec connection to FortiGate.
4. In *Service Provider Configuration*, copy the following URLs (*Entity ID*, *Assertion consumer service URL*, *Single logout service URL*) and use it in *Azure in Enterprise application* > *All applications* > *FortiGate IPsec VPN* > *Single sign-on page* > *Basic SAML Configuration*. Use the following mapping to copy the required values:

FortiGate settings	Microsoft Entra ID settings
Entity ID	Identifier (Entity ID)
Assertion consumer service URL	Reply URL (Assertion Consumer Service URL)
Assertion consumer service URL	Sign on URL
Single logout service URL	Logout URL (Optional)

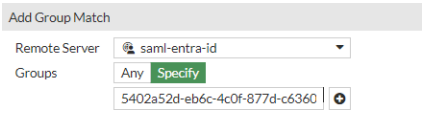
The following demonstrates on the FortiGate:

The following demonstrates on Microsoft Entra ID:

5. On the FortiGate GUI, click *Next*.
6. In *Identity Provider Details*, set the *Type* as *Custom*.
7. Paste the URLs copied from last step of section To configure Enterprise application on Azure portal: on page 2088 according to the following mapping:

Microsoft Entra IDsettings	FortiGate settings
Login URL	Assertion consumer service URL

Microsoft Entra IDsettings	FortiGate settings
Microsoft Entra Identifier	Entity ID
Logout URL	Single logout service URL



8. Select the *Certificate* from the dropdown. This certificate was imported into FortiGate in section To export SAML IdP server certificate and import it on FortiGate: on page 2090.
9. In the *Additional SAML Attributes* section, enter the following attributes:

Attribute used to identify users	*username*
Attribute used to identify groups	*group*

10. Click *Submit* to save the changes.

To configure SAML user group on FortiGate:

1. Go to *User & Authentication* > *User Groups* > *Create New*.
2. Enter *Name* as *SAML-ENTRA-ID-Group*.
3. In *Remote Groups*, click *Add*.
4. From the *Remote Server* dropdown, select *saml-entra-id SAML server*.
5. In *Groups*, click *Specify* and paste the Object ID copied in the section To configure a Security group and add user to it on Microsoft Entra ID: on page 2088.

6. Click *OK*.
7. Click *OK*.

To associate SAML server with IPsec gateway interface:

Use the FortiGate CLI to bind and associate the SAML server with the VPN gateway interface (port1) as follows:

```
config system interface
    edit "port1"
        set ike-saml-server "saml-entra-id"
    next
end
```

Configuring SAML on IdP and SP is now complete. The next step is to use SAML configuration inside IPsec configuration. To configure IPsec, see Configuring IPsec IKEv2 on FortiGate on page 2077.

Using EMS SN verification to enhance VPN security

The EMS serial number (SN) verification feature restricts establishing a VPN connection to the FortiGate to only licensed FortiClient endpoints. The EMS SN verification is performed by the FortiGate and the feature requires that the FortiGate

and FortiClient endpoints both must be connected to the same FortiClient EMS. See Enhancing VPN security using EMS SN verification on page 2307 for more information.

IPsec split DNS

This functionality empowers clients to determine whether DNS traffic should utilize the tunnel's DNS or the local DNS server for query resolution. This is achieved by letting users specify a list of FQDNs. Only FQDNs that match the specified list are directed to the tunnel for resolution, while all other queries are handled by the local DNS server.

The `internal-domain-list` option is available on IKEv2 phase1 dialup gateways if `mode-cfg` is enabled.

To enable IPsec Split DNS in the CLI:

```
config vpn ipsec phase1-interface
    edit <name>
        set type dynamic
        set ike-version 2
        set mode-cfg enable
        set dns-mode {manual | auto}
        set internal-domain-list <domain name>
    next
end
```

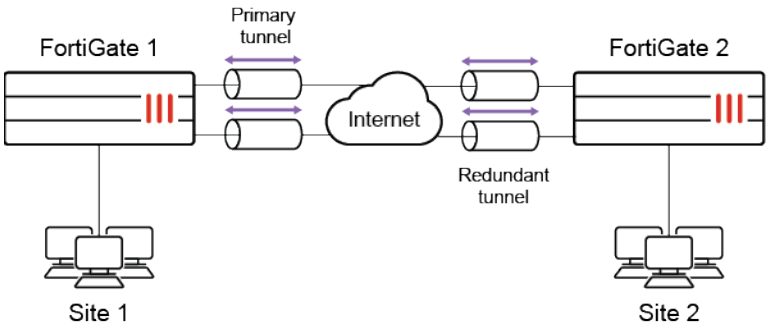
Command	Description
`set internal-domain-list`	One or more internal domain names in quotes separated by spaces.

Two scenarios need attention:

1. When there is no split tunnel, or the split tunnel is set to address *all*, the user must manually select the *Enable Local LAN* checkbox in the FortiClient by navigating to *Advanced Settings* > *Phase 1*. If not, only the FQDN matching the `internal-domain-list` will be resolved, discarding other DNS queries. However, once this setting is enabled on FortiClient, any non-matching DNS query will be resolved through the local DNS server.
2. If the `dns-mode` is set to `manual`, but the *ipv4-dns-server1* is not configured, the VPN tunnel's DNS will default to 0.0.0.0 and all DNS queries will be routed through the local DNS server.

Aggregate and redundant VPN

The following topics provide instructions on configuring aggregate and redundant VPNs:



- Manual redundant VPN configuration on page 2094
- OSPF with IPsec VPN for network redundancy on page 2097
- IPsec VPN in an HA environment on page 2104
- Packet distribution and redundancy for aggregate IPsec tunnels on page 2109
- Packet distribution for aggregate dial-up IPsec tunnels using location ID on page 2120
- Packet distribution for aggregate static IPsec tunnels in SD-WAN on page 2125

- Packet distribution for aggregate IPsec tunnels using weighted round robin on page 2129
- Redundant hub and spoke VPN on page 2131

Manual redundant VPN configuration

A FortiGate with two interfaces connected to the internet can be configured to support redundant VPNs to the same remote peer. Four distinct paths are possible for VPN traffic from end to end. If the primary connection fails, the FortiGate can establish a VPN using the other connection.

Topology

The redundant configuration in this example uses route-based VPNs. The FortiGates must operate in NAT mode and use auto-keying.

This example assumes the redundant VPNs are essentially equal in cost and capability. When the original VPN returns to service, traffic continues to use the replacement VPN until the replacement VPN fails. If the redundant VPN uses more expensive facilities, only use it as a backup while the main VPN is down.

A redundant configuration for each VPN peer includes:

- One phase 1 configuration for each path between the two peers with dead peer detection enabled
- One phase 2 definition for each phase 1 configuration
- One static route for each IPsec interface with different distance values to prioritize the routes
- Two firewall policies per IPsec interface, one for each direction of traffic

To configure the phase 1 and phase 2 VPN settings:

1. Go to *VPN* > *IPsec Wizard* and select the *Custom* template.
2. Enter the tunnel name and click *Next*.
3. Enter the following phase 1 settings for path 1:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the primary interface of the remote peer.
Interface	Select the primary public interface of this peer.
Dead Peer Detection	On-Demand

4. Configure the remaining phase 1 and phase 2 settings as needed.
5. Click *OK*.

6. Repeat these steps for the remaining paths.
   a. Path 2:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the secondary interface of the remote peer.
Interface	Select the primary public interface of this peer.
Dead Peer Detection	On-Demand

   b. Path 3:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the primary interface of the remote peer.
Interface	Select the secondary public interface of this peer.
Dead Peer Detection	On-Demand

   c. Path 4:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the secondary interface of the remote peer.
Interface	Select the secondary public interface of this peer.
Dead Peer Detection	On-Demand

To configure the static routes:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. In the *Destination* field, enter the subnet of the private network.
3. For *Interface*, select one of the IPsec interfaces on the local peer.
4. Enter a value for *Administrative Distance*.
5. Click *OK*.
6. Repeat these steps for the three remaining paths, and enter different values for *Administrative Distance* to prioritize the paths.

To configure the firewall policies:

1. Create the policies for the local primary interface:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Enter the following:

Name	Enter a name for the policy.
Incoming Interface	Select the local interface to the internal (private) network.
Outgoing Interface	Select one of the virtual IPsec interfaces.
Source	All
Destination	All

Schedule	Always
Service	All
Action	ACCEPT

c. Click *OK*.

d. Click *Create New* and configure the policy for the other direction of traffic:

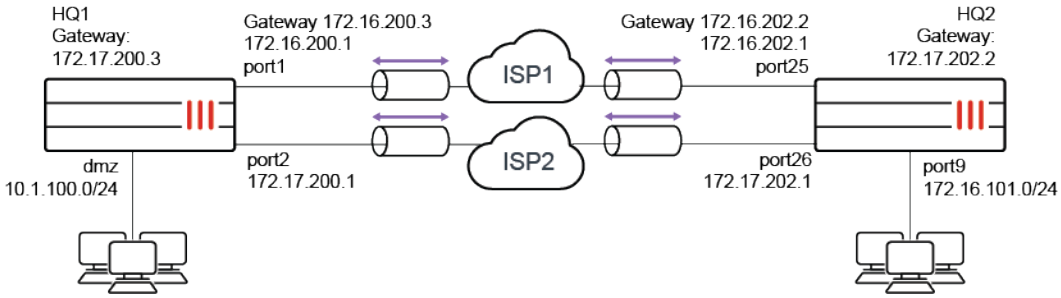
Name	Enter a name for the policy.
Incoming Interface	Select one of the virtual IPsec interfaces.
Outgoing Interface	Select the local interface to the internal (private) network.
Source	All
Destination	All
Schedule	Always
Service	All
Action	ACCEPT

e. In the policy list, drag the VPN policies above any other policies with similar source and destination addresses.

2. Repeat these steps to create the policies for the three remaining paths.

Creating a backup IPsec interface

A route-based VPN can be configured to act as a backup IPsec interface when the main VPN is out of service. This can only be configured in the CLI.



The backup feature works on interfaces with static addresses that have dead peer detection enabled. The `monitor` option creates a backup VPN for the specified phase 1 configuration.

To create a backup IPsec interface:

```
config vpn ipsec phase1-interface
    edit main_vpn
        set dpd on-demand
        set interface port1
        set nattraversal enable
        set psksecret ********
        set remote-gw 192.168.10.8
        set type static
    next
    edit backup_vpn
        set dpd on-demand
        set interface port2
        set monitor main_vpn
        set nattraversal enable
        set psksecret ********
        set remote-gw 192.168.10.8
        set type static
    next
end
```

OSPF with IPsec VPN for network redundancy

This is a sample configuration of using OSPF with IPsec VPN to set up network redundancy. Route selection is based on OSPF cost calculation. You can configure ECMP or primary/secondary routes by adjusting OSPF path cost.

Because the GUI can only complete part of the configuration, we recommend using the CLI.

To configure OSPF with IPsec VPN to achieve network redundancy using the CLI:

1. Configure the WAN interface and static route.
   Each FortiGate has two WAN interfaces connected to different ISPs. The ISP1 link is for the primary FortiGate and the IPS2 link is for the secondary FortiGate.
   a. Configure HQ1.
   ```
   config system interface
      edit "port1"
         set alias to_ISP1
         set ip 172.16.200.1 255.255.255.0
      next
      edit "port2"
         set alias to_ISP2
         set ip 172.17.200.1 255.255.255.0
      next
   end
   config router static
      edit 1
         set gateway 172.16.200.3
         set device "port1"
      next
      edit 2
         set gateway 172.17.200.3
         set device "port2"
         set priority 100
      next
   end
   ```
   b. Configure HQ2.
   ```
   config system interface
      edit "port25"
         set alias to_ISP1
         set ip 172.16.202.1 255.255.255.0
      next
      edit "port26"
         set alias to_ISP2
         set ip 172.17.202.1 255.255.255.0
      next
   ```

```
end
config router static
   edit 1
      set gateway 172.16.202.2
      set device "port25"
   next
   edit 2
      set gateway 172.17.202.2
      set device "port26"
      set priority 100
   next
end
```

2. Configure the internal (protected subnet) interface.
   a. Configure HQ1.
   ```
   config system interface
      edit "dmz"
         set ip 10.1.100.1 255.255.255.0
      next
   end
   ```
   b. Configure HQ2.
   ```
   config system interface
      edit "port9"
         set ip 172.16.101.1 255.255.255.0
      next
   end
   ```
3. Configure IPsec phase1-interface and phase-2 interface. On each FortiGate, configure two IPsec tunnels: a primary and a secondary.
   a. Configure HQ1.
   ```
   config vpn ipsec phase1-interface
      edit "pri_HQ2"
         set interface "port1"
         set peertype any
         set net-device enable
         set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
         set remote-gw 172.16.202.1
         set psksecret sample1
      next
      edit "sec_HQ2"
         set interface "port2"
         set peertype any
         set net-device enable
         set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
         set remote-gw 172.17.202.1
         set psksecret sample2
      next
      end
   config vpn ipsec phase2-interface
      edit "pri_HQ2"
         set phase1name "pri_HQ2"
         set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
              aes256gcm chacha20poly1305
         set auto-negotiate enable
      next
      edit "sec_HQ2"
         set phase1name "sec_HQ2"
   ```

```
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
           aes256gcm chacha20poly1305
      set auto-negotiate enable
   next
end
```

b. Configure HQ2.

```
config vpn ipsec phase1-interface
   edit "pri_HQ1"
      set interface "port25"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.200.1
      set psksecret sample1
   next
   edit "sec_HQ1"
      set interface "port26"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.17.200.1
      set psksecret sample2
   next
end
config vpn ipsec phase2-interface
   edit "pri_HQ1"
      set phase1name "pri_HQ1"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
           aes256gcm chacha20poly1305
      set auto-negotiate enable
   next
   edit "sec_HQ1"
      set phase1name "sec_HQ1"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
           aes256gcm chacha20poly1305
      set auto-negotiate enable
   next
end
```

4. Configure an inbound and outbound firewall policy for each IPsec tunnel.

a. Configure HQ1.

```
config firewall policy
   edit 1
      set name "pri_inbound"
      set srcintf "pri_HQ2"
      set dstintf "dmz"
      set srcaddr "172.16.101.0"
      set dstaddr "10.1.100.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
   edit 2
      set name "pri_outbound"
      set srcintf "dmz"
      set dstintf "pri_HQ2"
      set srcaddr "10.1.100.0"
```

```
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 3
        set name "sec_inbound"
        set srcintf "sec_HQ2"
        set dstintf "dmz"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 4
        set name "sec_outbound"
        set srcintf "dmz"
        set dstintf "sec_HQ2"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

b. Configure HQ2.

```
config firewall policy
    edit 1
        set name "pri_inbound"
        set srcintf "pri_HQ1"
        set dstintf "port9"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "pri_outbound"
        set srcintf "port9"
        set dstintf "pri_HQ1"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 3
        set name "sec_inbound"
        set srcintf "sec_HQ1"
        set dstintf "port9"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
```

```
    next
    edit 4
      set name "sec_outbound"
      set srcintf "port9"
      set dstintf "sec_HQ1"
      set srcaddr "172.16.101.0"
      set dstaddr "10.1.100.0"
      set action accept
      set schedule "always"
      set service "ALL"
    next
  end
```

5. Assign an IP address to the IPsec tunnel interface.
   a. Configure HQ1.

```
config system interface
  edit "pri_HQ2"
    set ip 10.10.10.1 255.255.255.255
    set remote-ip 10.10.10.2 255.255.255.255
  next
  edit "sec_HQ2"
    set ip 10.10.11.1 255.255.255.255
    set remote-ip 10.10.11.2 255.255.255.255
  next
end
```

   b. Configure HQ2.

```
config system interface
  edit "pri_HQ1"
    set ip 10.10.10.2 255.255.255.255
    set remote-ip 10.10.10.1 255.255.255.255
  next
  edit "sec_HQ1"
    set ip 10.10.11.2 255.255.255.255
    set remote-ip 10.10.11.1 255.255.255.255
  next
end
```

6. Configure OSPF.
   a. Configure HQ1.

```
config router ospf
  set router-id 1.1.1.1
  config area
    edit 0.0.0.0
    next
  end
  config ospf-interface
    edit "pri_HQ2"
      set interface "pri_HQ2"
      set cost 10
      set network-type point-to-point
    next
    edit "sec_HQ2"
      set interface "sec_HQ2"
      set cost 20
      set network-type point-to-point
    next
  end
  config network
```

```
      edit 1
         set prefix 10.10.10.0 255.255.255.0
      next
      edit 2
         set prefix 10.10.11.0 255.255.255.0
      next
      edit 3
         set prefix 10.1.100.0 255.255.255.0
      next
   end
end
```

b. Configure HQ2.

```
config router ospf
   set router-id 2.2.2.2
   config area
      edit 0.0.0.0
      next
   end
   config ospf-interface
      edit "pri_HQ1"
         set interface "pri_HQ1"
         set cost 10
         set network-type point-to-point
      next
      edit "sec_HQ1"
         set interface "sec_HQ1"
         set cost 20
         set network-type point-to-point
      next
   end
   config network
      edit 1
         set prefix 10.10.10.0 255.255.255.0
      next
      edit 2
         set prefix 10.10.11.0 255.255.255.0
      next
      edit 3
         set prefix 172.16.101.0 255.255.255.0
      next
   end
end
```

To check VPN and OSPF states using diagnose and get commands:

1. Run the `HQ1 # diagnose vpn ike gateway list` command. The system should return the following:

```
vd: root/0
name: pri_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -> 172.16.202.1:500

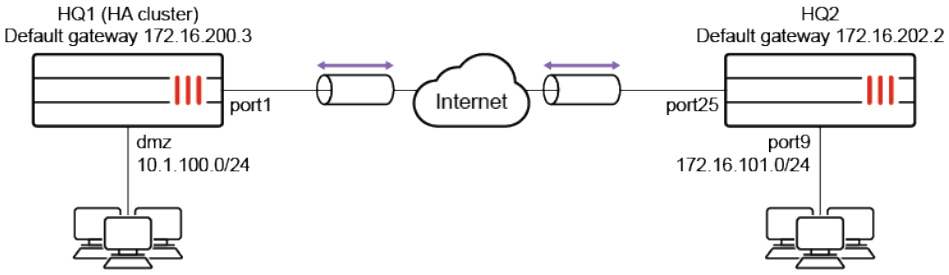
   dec:pkts/bytes=1/68, enc:pkts/bytes=1/136
```

3. Run the `HQ1 # get router info ospf neighbor` command. The system should return the following:

```
OSPF process 0, VRF 0:
Neighbor ID Pri State Dead Time Address Interface
2.2.2.2 1. Full/ - 00:00:37 10.10.10.2 pri_HQ2
2.2.2.2 1. Full/ - 00:00:32 10.10.11.2 sec_HQ2
```



4. Run the `HQ1 # get router info routing-table ospf` command. The system should return the following:
   ```
   Routing table for VRF=0
   O 172.16.101.0/24 [110/20] via 10.10.10.2, pri_HQ2 , 00:03:21
   ```
   In case the primary tunnel is down after route convergence.
5. Run the `HQ1 # get router info routing-table ospf` command. The system should return the following:
   ```
   Routing table for VRF=0
   O 172.16.101.0/24 [110/110] via 10.10.11.2, sec_HQ2 , 00:00:01
   ```

IPsec VPN in an HA environment

This is a sample configuration of site-to-site IPsec VPN in an HA environment.

For this example, set up HA as described in the HA topics. When setting up HA, enable the following options to ensure IPsec VPN traffic is not interrupted during an HA failover:

- `session-pickup` under HA settings.
- `ha-sync-esp-seqno` under IPsec phase1-interface settings.

You can configure IPsec VPN in an HA environment using the GUI or CLI.

In this example, the VPN name for HQ1 is "to_HQ2", and the VPN name for HQ2 is "to_HQ1".

To configure IPsec VPN in an HA environment in the GUI:

1. Set up IPsec VPN on HQ1 (the HA cluster):
   a. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, set *No NAT between sites*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *Remote Device*, select *IP Address*.
      ii. In the *IP address* field, enter *172.16.202.1*.
      iii. For *Outgoing Interface*, select port1.
      iv. For *Authentication Method*, select *Pre-shared Key*.
      v. In the *Pre-shared Key* field, enter an example key.
      vi. Click *Next*.
   c. Configure the following settings for *Policy & Routing*:
      i. From the *Local Interface* dropdown menu, select the local interface.
      ii. Configure the *Local Subnets* as *10.1.100.0/24*.

iii. Configure the *Remote Subnets* as *172.16.101.0/24*.
iv. Click *Create*.

2. Set up IPsec VPN on HQ2:
   a. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, set *No NAT between sites*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *Remote Device*, select *IP Address*.
      ii. In the *IP address* field, enter 172.16.200.1.
      iii. For *Outgoing Interface*, select port13.
      iv. For *Authentication Method*, select *Pre-shared Key*.
      v. In the *Pre-shared Key* field, enter an example key.
      vi. Click *Next*.
   c. Configure the following settings for *Policy & Routing*:
      i. From the *Local Interface* dropdown menu, select the desired local interface. In this example, it is port9.
      ii. Configure the *Local Subnets* as 172.16.101.0.
      iii. Configure the *Remote Subnets* as 10.1.100.0
      iv. Click *Create*.

To configure IPsec VPN in an HA environment using the CLI:

1. Configure HA. In this example, two FortiGates work in active-passive mode. The HA heartbeat interfaces are WAN1 and WAN2:

```
config system ha
   set group-name "FGT-HA"
   set mode a-p
   set password sample
   set hbdev "wan1" 50 "wan2" 50
   set session-pickup enable
   set priority 200
   set override-wait-time 10
end
```

2. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.
   a. Configure HQ1:

```
config system interface
   edit "port1"
      set vdom "root"
      set ip 172.16.200.1 255.255.255.0
   next
end
config router static
   edit 1
      set gateway 172.16.200.3
      set device "port1"
   next
```

```
end
```

b. Configure HQ2:

```
config system interface
   edit "port25"
      set vdom "root"
      set ip 172.16.202.1 255.255.255.0
   next
end
config router static
   edit 1
      set gateway 172.16.202.2
      set device "port25"
   next
end
```

3. Configure the internal (protected subnet) interface. The internal interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel.

   a. Configure HQ1:

```
config system interface
   edit "dmz"
      set vdom "root"
      set ip 10.1.100.1 255.255.255.0
   next
end
```

   b. Configure HQ2:

```
config system interface
   edit "port9"
      set vdom "root"
      set ip 172.16.101.1 255.255.255.0
   next
end
```

4. Configure the IPsec phase1-interface. This example uses PSK as the authentication method. You can also use signature authentication.

   a. Configure HQ1:

```
config vpn ipsec phase1-interface
   edit "to_HQ2"
      set interface "port1"
      set peertype any
      set net-device enable
      set ha-sync-esp-seqno enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.202.1
      set psksecret sample
   next
end
```

   b. Configure HQ2:

```
config vpn ipsec phase1-interface
   edit "to_HQ1"
      set interface "port25"
      set peertype any
      set net-device enable
      set ha-sync-esp-seqno enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.200.1
      set psksecret sample
   next
```

5. Configure the IPsec phase2-interface:
   a. Configure HQ1:
```
config vpn ipsec phase2-interface
   edit "to_HQ2"
      set phase1name "to_HQ2"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
           aes256gcm chacha20poly1305
      set auto-negotiate enable
   next
end
```
   b. Configure HQ2:
```
config vpn ipsec phase2-interface
   edit "to_HQ1"
      set phase1name "to_HQ1"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
           aes256gcm chacha20poly1305
      set auto-negotiate enable
   next
end
```
6. Configure static routes. Two static routes are added to reach the remote protected subnet. The blackhole route is important to ensure IPsec traffic does not match the default route when the IPsec tunnel is down.
   a. Configure HQ1:
```
config router static
   edit 2
      set dst 172.16.101.0 255.255.255.0
      set device "to_HQ2"
   next
   edit 3
      set dst 172.16.101.0 255.255.255.0
      set blackhole enable
      set distance 254
   next
end
```
   b. Configure HQ2:
```
config router static
   edit 2
      set dst 10.1.100.0 255.255.255.0
      set device "to_HQ1"
   next
   edit 3
      set dst 10.1.100.0 255.255.255.0
      set blackhole enable
      set distance 254
   next
end
```
7. Configure two firewall policies to allow bi-directional IPsec traffic flow over the IPsec tunnel:
   a. Configure HQ1:
```
config firewall policy
   edit 1
      set name "inbound"
      set srcintf "to_HQ2"
      set dstintf "dmz"
      set srcaddr "172.16.101.0"
      set dstaddr "10.1.100.0"
      set action accept
```

```
      set schedule "always"
      set service "ALL"
    next
    edit 2
      set name "outbound"
      set srcintf "dmz"
      set dstintf "to_HQ2"
      set srcaddr "10.1.100.0"
      set dstaddr "172.16.101.0"
      set action accept
      set schedule "always"
      set service "ALL"
    next
end
```

b. Configure HQ2:

```
config firewall policy
    edit 1
      set name "inbound"
      set srcintf "to_HQ1"
      set dstintf "port9"
      set srcaddr "10.1.100.0"
      set dstaddr "172.16.101.0"
      set action accept
      set schedule "always"
      set service "ALL"
    next
    edit 2
      set name "outbound"
      set srcintf "port9"
      set dstintf "to_HQ1"
      set srcaddr "172.16.101.0"
      set dstaddr "10.1.100.0"
      set action accept
      set schedule "always"
      set service "ALL"
    next
end
```

8. Use the following `diagnose` commands to check IPsec phase1/phase2 interface status including the sequence number on the secondary FortiGate. The `diagnose debug application ike -1` command is the key to troubleshoot why the IPsec tunnel failed to establish.

   a. Run the `HQ1 # diagnose vpn ike gateway list` command. The system should return the following:

```
vd: root/0
name: to_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -> 172.16.202.1:500
created: 5s ago
IKE SA: created 1/1 established 1/1 time 0/0/0 ms
IPsec SA: created 2/2 established 2/2 time 0/0/0 ms
  id/spi: 12 6e8d0532e7fe8d84/3694ac323138a024 direction: responder status:
       established 5-5s ago = 0ms proposal: aes128-sha256 key: b3efb46d0d385aff-
       7bb9ee241362ee8d lifetime/rekey: 86400/86124 DPD sent/recv: 00000000/00000000
```

   b. Run the `HQ1 # diagnose vpn tunnel list` command. The system should return the following:

```
list all ipsec tunnel in vd 0

name=to_HQ2 ver=1 serial=1 172.16.200.1:0->172.16.202.1:0 tun_id=172.16.202.1
```

```
bound_if=11 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/528 options[0210]=create_
     dev frag-rfc accept_traffic=1
proxyid_num=1 child_num=0 refcnt=11 ilast=7 olast=87 ad=/0
stat: rxp=0 txp=0 rxb=0 txb=0
dpd: mode=on-demand on=1 idle=20000ms retry=3 count=0 seqno=0

   dec:pkts/bytes=0/0, enc:pkts/bytes=0/0
```

Packet distribution and redundancy for aggregate IPsec tunnels

This is a sample configuration of a multiple site-to-site IPsec VPN that uses an IPsec aggregate interface to set up redundancy and traffic load-balancing. The VPN tunnel interfaces must have `net-device` disabled in order to be members of the IPsec aggregate.

Each FortiGate has two WAN interfaces connected to different ISPs. OSPF runs over the IPsec aggregate in this configuration.

The supported load balancing algorithms are: L3, L4, round-robin (default), weighted round-robin, and redundant. The first four options allow traffic to be load-balanced, while the last option (redundant) uses the first tunnel that is up for all traffic.

Dynamic routing can run on the aggregate interface, and it can be a member interface in SD-WAN (not shown in this configuration).

Configuring the HQ1 FortiGate in the GUI

There are five steps to configure the FortiGate:

1. Create the IPsec tunnels.
2. Create the IPsec aggregate.
3. Configure the firewall policies.
4. Configure the aggregate VPN interface IPs.
5. Configure OSPF.

To create the IPsec tunnels:

1. Go to *VPN* > *IPsec Wizard* and select the *Custom* template.
2. For *Name*, enter pri_HQ2 and click *Next*.
3. Enter the following:

Phase 1	
IP Address	172.16.202.1
Interface	port1
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

4. Configure the other settings as needed.
5. Click *OK*.
6. Create another tunnel named sec_HQ2 with the following settings:

Phase 1	
IP Address	172.17.202.1
Interface	port2
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

To create the IPsec aggregate:

1. Go to *VPN* > *IPsec Tunnels* and click *Create New* > *IPsec Aggregate*.
2. For *Name*, enter agg_HQ2.
3. Select a load balancing algorithm.
4. From the *Tunnel* dropdown, select the tunnels that you created previously (*pri_HQ2* and *sec_HQ2*). If required, enter weights for each tunnel.
5. Click *OK*.

To configure the firewall policies:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Create an inbound traffic policy with the following settings:

Name	inbound
Incoming Interface	agg_HQ2
Outgoing Interface	dmz
Source	172.16.101.0
Destination	10.1.100.0
Schedule	always
Action	ACCEPT
Service	ALL

3. Click *OK*.
4. Create an outbound traffic policy with the following settings:

Name	outbound

Incoming Interface	dmz
Outgoing Interface	agg_HQ2
Source	10.1.100.0
Destination	172.16.101.0
Schedule	always
Action	ACCEPT
Service	ALL

To configure the aggregate VPN interface IPs:

1. Go to *Network* > *Interfaces* and edit agg_HQ2.
2. For *IP*, enter 10.10.10.1.
3. For *Remote IP/Netmask*, enter 10.10.10.2 255.255.255.255.
4. Click *OK*.

To configure OSPF:

1. Go to *Network* > *OSPF*.
2. For *Router ID*, enter 1.1.1.1.
3. In the *Areas* table, click *Create New*.
   a. For *Area ID*, enter 0.0.0.0.
   b. Click *OK*.
4. In the *Networks* table, click *Create New*.
   a. Set the *Area* to *0.0.0.0*.
   b. For *IP/Netmask*, enter 10.1.100.0/24.
   c. Click *OK*.
   d. Click *Create New*.
   e. For *IP/Netmask*, enter 10.10.10.0/24.
   f. Click *OK*.
5. Click *Apply*.

Configuring the HQ2 FortiGate in the GUI

There are five steps to configure the FortiGate:

1. Create the IPsec tunnels.
2. Create the IPsec aggregate.
3. Configure the firewall policies.
4. Configure the aggregate VPN interface IPs.
5. Configure OSPF.

To create the IPsec tunnels:

1. Go to *VPN* > *IPsec Wizard* and select the *Custom* template.
2. For *Name*, enter pri_HQ1 and click *Next*.

3. Enter the following:

Phase 1	
IP Address	172.16.200.1
Interface	port25
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

4. Configure the other settings as needed.
5. Click *OK*.
6. Create another tunnel named sec_HQ1 with the following settings:

Phase 1	
IP Address	172.17.200.1
Interface	port26
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

To create the IPsec aggregate:

1. Go to *VPN* > *IPsec Tunnels* and click *Create New* > *IPsec Aggregate*.
2. For *Name*, enter agg_HQ1.
3. Select a load balancing algorithm.
4. From the *Tunnel* dropdown, select the tunnels that you created previously (*pri_HQ1* and *sec_HQ1*). If required, enter weights for each tunnel.
5. Click *OK*.

To configure the firewall policies:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Create an inbound traffic policy with the following settings:

Name	inbound
Incoming Interface	agg_HQ1
Outgoing Interface	port9
Source	10.1.100.0
Destination	172.16.101.0
Schedule	always
Action	ACCEPT
Service	ALL

3. Click *OK*.
4. Create an outbound traffic policy with the following settings:

Name	outbound
Incoming Interface	port9
Outgoing Interface	agg_HQ1
Source	172.16.101.0
Destination	10.1.100.0
Schedule	always
Action	ACCEPT
Service	ALL

To configure the aggregate VPN interface IPs:

1. Go to *Network* > *Interfaces* and edit agg_HQ1.
2. For *IP*, enter 10.10.10.2.
3. For *Remote IP/Netmask*, enter 10.10.10.1 255.255.255.255.
4. Click *OK*.

To configure OSPF:

1. Go to *Network* > *OSPF*.
2. For *Router ID*, enter 2.2.2.2.
3. In the *Areas* table, click *Create New*.
   a. For *Area ID*, enter 0.0.0.0.
   b. Click *OK*.

4. In the *Networks* table, click *Create New*.
   a. Set the *Area* to *0.0.0.0*.
   b. For *IP/Netmask*, enter 172.16.101.0/24.
   c. Click *OK*.
   d. Click *Create New*.
   e. For *IP/Netmask*, enter 10.10.10.0/24.
   f. Click *OK*.
5. Click *Apply*.

Monitoring the traffic in the GUI

To monitor the traffic:

1. Go to *Dashboard* > *Network* , hover over the *IPsec* widget, then click *Expand to Full Screen*.
2. Expand the aggregate tunnel in the table to view statistics for each aggregate member.

Configuring the HQ1 FortiGate in the CLI

There are six steps to configure the FortiGate:

1. Configure the interfaces.
2. Configure two IPsec phase 1 and phase 2 interfaces.
3. Configure the IPsec aggregate.
4. Configure the firewall policies.
5. Configure the aggregate VPN interface IPs.
6. Configure OSPF.

To configure the interfaces:

1. Configure port1, port2, and dmz as shown in the topology diagram.

To configure two IPsec phase 1 and phase 2 interfaces:

```
config vpn ipsec phase1-interface
   edit "pri_HQ2"
      set interface "port1"
      set peertype any
      set net-device disable
      set aggregate-member enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.202.1
      set psksecret sample1
   next
   edit "sec_HQ2"
      set interface "port2"
      set peertype any
      set net-device disable
      set aggregate-member enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.17.202.1
      set psksecret sample2
   next
```

```
   end
config vpn ipsec phase2-interface
   edit "pri_HQ2"
      set phase1name "pri_HQ2"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
           chacha20poly1305
      set auto-negotiate enable
   next
   edit "sec_HQ2"
      set phase1name "sec_HQ2"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
           chacha20poly1305
      set auto-negotiate enable
   next
end
```

To configure the IPsec aggregate:

```
config system ipsec-aggregate
   edit "agg_HQ2"
      set member "pri_HQ2" "sec_HQ2"
   next
end
```

To configure the firewall policies:

```
config firewall policy
   edit 1
      set name "inbound"
      set srcintf "agg_HQ2"
      set dstintf "dmz"
      set srcaddr "172.16.101.0"
      set dstaddr "10.1.100.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
   edit 2
      set name "outbound"
      set srcintf "dmz"
      set dstintf "agg_HQ2"
      set srcaddr "10.1.100.0"
      set dstaddr "172.16.101.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
end
```

To configure the aggregate VPN interface IPs:

```
config system interface
   edit "agg_HQ2"
      set ip 10.10.10.1 255.255.255.255
      set remote-ip 10.10.10.2 255.255.255.255
   next
end
```

To configure OSPF:

```
config router ospf
   set router-id 1.1.1.1
   config area
      edit 0.0.0.0
      next
   end
   config network
      edit 1
         set prefix 10.1.100.0 255.255.255.0
      next
      edit 2
         set prefix 10.10.10.0 255.255.255.0
      next
   end
end
```

Configuring the HQ2 FortiGate in the CLI

There are six steps to configure the FortiGate:

1. Configure the interfaces.
2. Configure two IPsec phase 1 and phase 2 interfaces.
3. Configure the IPsec aggregate.
4. Configure the firewall policies.
5. Configure the aggregate VPN interface IPs.
6. Configure OSPF.

To configure the interfaces:

1. Configure port25, port26, and port9 as shown in the topology diagram.

To configure two IPsec phase 1 and phase 2 interfaces:

```
config vpn ipsec phase1-interface
   edit "pri_HQ1"
      set interface "port25"
      set peertype any
      set net-device disable
      set aggregate-member enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.200.1
      set psksecret sample1
   next
   edit "sec_HQ1"
      set interface "port26"
      set peertype any
      set net-device disable
      set aggregate-member enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.17.200.1
      set psksecret sample2
   next
end
```

```
config vpn ipsec phase2-interface
   edit "pri_HQ1"
      set phase1name "pri_HQ1"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
           chacha20poly1305
      set auto-negotiate enable
   next
   edit "sec_HQ1"
      set phase1name "sec_HQ1"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
           chacha20poly1305
      set auto-negotiate enable
   next
end
```

To configure the IPsec aggregate:

```
config system ipsec-aggregate
   edit "agg_HQ1"
      set member "pri_HQ1" "sec_HQ1"
   next
end
```

To configure the firewall policies:

```
config firewall policy
   edit 1
      set name "inbound"
      set srcintf "agg_HQ1"
      set dstintf "port9"
      set srcaddr "10.1.100.0"
      set dstaddr "172.16.101.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
   edit 2
      set name "outbound"
      set srcintf "port9"
      set dstintf "agg_HQ1"
      set srcaddr "172.16.101.0"
      set dstaddr "10.1.100.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
end
```

To configure the aggregate VPN interface IPs:

```
config system interface
   edit "agg_HQ1"
      set ip 10.10.10.2 255.255.255.255
      set remote-ip 10.10.10.1 255.255.255.255
   next
end
```

To configure OSPF:

```
config router ospf
   set router-id 2.2.2.2
   config area
      edit 0.0.0.0
      next
   end
   config network
      edit 1
         set prefix 172.16.101.0 255.255.255.0
      next
      edit 2
         set prefix 10.10.10.0 255.255.255.0
      next
   end
end
```

Monitoring the traffic in the CLI

To view debugging information:

1. Verify the status of the phase 1 IKE SAs:

```
# diagnose vpn ike gateway list
vd: root/0
name: pri_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -> 172.16.202.1:500
tun_id: 172.16.202.1
created: 1520s ago
IKE SA: created 1/2 established 1/1 time 10/10/10 ms
IPsec SA: created 2/2 established 1/1 time 0/0/0 ms
   id/spi: 173 dcdede154681579b/e32f4c48c4349fc0 direction: responder status: established
        1498-1498s ago = 10ms proposal: aes128-sha256 key: d7230a68d7b83def-
        588b94495cfa9d38 lifetime/rekey: 86400/84631 DPD sent/recv: 0000000d/00000006
vd: root/0
name: sec_HQ2
version: 1
interface: port2 12
addr: 172.17.200.1:500 -> 172.17.202.1:500
created: 1520s ago
IKE SA: created 1/2 established 1/1 time 10/10/10 ms
IPsec SA: created 2/2 established 1/1 time 0/0/0 ms
   id/spi: 174 a567bd7bf02a04b5/4251b6254660aee2 direction: responder status: established
        1498-1498s ago = 10ms proposal: aes128-sha256 key: 9f44f500c28d8de6-
        febaae9d1e6a164c lifetime/rekey: 86400/84631 DPD sent/recv: 00000008/0000000c
```

2. Verify the phase 2 IPsec tunnel SAs:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
name=sec_HQ2 ver=1 serial=2 172.17.200.1:0->172.17.202.1:0 tun_id=172.17.202.1
bound_if=5 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/512 options[0200]=frag-rfc
     run_state=1 accept_traffic=1
proxyid_num=1 child_num=0 refcnt=7 ilast=5 olast=5 ad=/0
stat: rxp=39 txp=40 rxb=5448 txb=2732
dpd: mode=on-demand on=1 idle=20000ms retry=3 count=0 seqno=15
```

```

stat: rxp=38 txp=39 rxb=5152 txb=2768
dpd: mode=on-demand on=1 idle=20000ms retry=3 count=0 seqno=20
natt: mode=none draft=0 interval=0 remote_port=0
proxyid=pri_HQ2 proto=0 sa=1 ref=2 serial=2 auto-negotiate
   src: 0:0.0.0.0/0.0.0.0:0 dst: 0:0.0.0.0/0.0.0.0:0 SA: ref=3 options=18227 type=00
        soft=0 mtu=1438 expire=41231/0B replaywin=2048
      seqno=28 esn=0 replaywin_lastseq=00000027 itn=0
   life: type=01 bytes=0/0 timeout=42900/43200 dec: spi=1071b4f8 esp=aes key=16
        142cce377b3432ba41e64128ade6848c
      ah=sha1 key=20 20e64947e2397123f561584321adc0e7aa0c342d
   enc: spi=ec89b7ed esp=aes key=16 2ec13622fd60dacce3d28ebe5fe7ab14
      ah=sha1 key=20 c1787497508a87f40c73c0db0e835c70b3c3f42d
   dec:pkts/bytes=38/2568, enc:pkts/bytes=39/5432
```

3. Debug the IPsec aggregation list:

```
# diagnose sys ipsec-aggregate list
agg_HQ2 algo=RR member=2 run_tally=2
members:
   pri_HQ2
   sec_HQ2
```

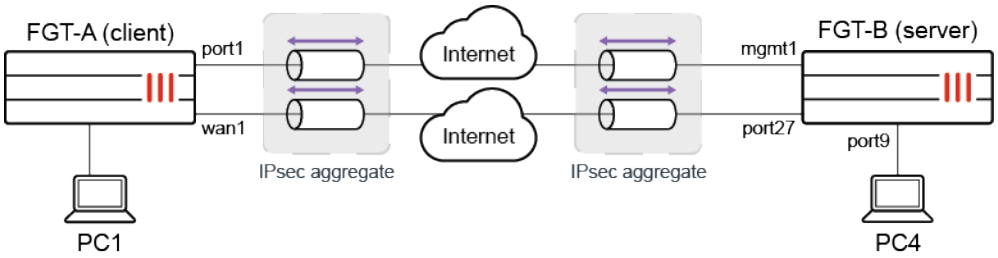
4. Verify the OSPF neighbor information:

```
# get router info ospf neighbor
OSPF process 0, VRF 0:
Neighbor ID Pri State Dead Time Address Interface
2.2.2.2 1. Full/ - 00:00:34 10.10.10.2 agg1_HQ2
```

5. Verify the OSPF routing table:

```
# get router info routing-table ospf
Routing table for VRF=0
O 172.16.101.0/24 [110/20] via 10.10.10.2, agg1_HQ2 , 00:18:43
```

Packet distribution for aggregate dial-up IPsec tunnels using location ID



To support per-packet load balancing on aggregate dial-up IPsec tunnels between sites, each spoke must be configured with a location ID. On the hub, per-packet load balancing is performed on the tunnels in the IPsec aggregate that have the same location ID.

Multiple dial-up VPN tunnels from the same location can be aggregated on the VPN hub and load balanced based on the configured load balance algorithm.

IPsec traffic cannot be offloaded to the NPU.

Example

In this example, an IPsec aggregate tunnel is formed between two dial-up IPsec tunnels in order to support per-packet load balancing.

To configure the client FortiGate (FGT-A):

1. Configure the IPsec tunnels:

```
config vpn ipsec phase1-interface
    edit "client1"
        set interface "port1"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.200.4
        set psksecret **********
    next
    edit "client2"
        set interface "wan1"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 173.1.1.1
        set psksecret **********
    next
end
```

2. Configure an aggregate of the IPsec tunnels:

```
config system ipsec-aggregate
    edit "agg1"
        set member "client1" "client2"
    next
end
```

3. Configure the location ID:

```
config system settings
    set location-id 1.1.1.1
end
```

To configure the server FortiGate (FGT-B):

1. Configure the IPsec tunnels:

```
config vpn ipsec phase1-interface
    edit "server1"
        set type dynamic
        set interface "mgmt1"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set psksecret ***********
        set dpd-retryinterval 60
    next
    edit "server2"
        set type dynamic
        set interface "port27"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set psksecret **********
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "server1"
        set phase1name "server1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
    edit "server2"
        set phase1name "server2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

2. Configure an aggregate of the IPsec tunnels:

```
config system ipsec-aggregate
    edit "server"
        set member "server1" "server2"
    next
end
```

3. Configure a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "server"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
```

```
        set schedule "always"
        set service "ALL"
    next
end
```

To check the IPsec tunnel and aggregate state:

1. List all of the VPN tunnels:

```
FGDocs # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=server1 ver=1 serial=1 172.16.200.4:500->0.0.0.0:500 tun_id=1.0.0.0 dst_mtu=0 dpd-

```

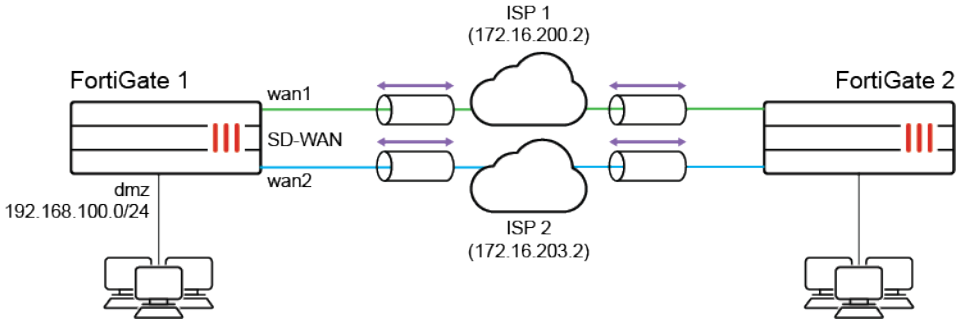
2. List the IPsec aggregate members:

```
# diagnose sys ipsec-aggregate list
server
members(3):
        server1_1
        server1_0
        server2_0
```



3. In the GUI, go to *Dashboard* > *Network* and expand the *IPsec* widget to review the traffic distributed over the aggregate members:

Packet distribution for aggregate static IPsec tunnels in SD-WAN

This is a sample configuration of aggregating IPsec tunnels by using per-packet load-balancing.

For example, a customer has two ISP connections, wan1 and wan2. On each FortiGate, two IPsec VPN interfaces are created. Next, an `ipsec-aggregate` interface is created and added as an SD-WAN member.

Configuring FortiGate 1

To create two IPsec VPN interfaces:

```
config vpn ipsec phase1-interface
    edit "vd1-p1"
        set interface "wan1"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.201.2
        set psksecret ftnt1234
    next
    edit "vd1-p2"
        set interface "wan2"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.202.2
        set psksecret ftnt1234
```

```
    next
end
```

```
config vpn ipsec phase2-interface
    edit "vd1-p1"
        set phase1name "vd1-p1"
    next
    edit "vd1-p2"
        set phase1name "vd1-p2"
    next
end
```

To create an IPsec aggregate interface:

```
config system ipsec-aggregate
    edit "agg1"
        set member "vd1-p1" "vd1-p2"
        set algorithm L3
    next
end
```

```
config system interface
    edit "agg1"
        set vdom "root"
        set ip 172.16.11.1 255.255.255.255
        set allowaccess ping
        set remote-ip 172.16.11.2 255.255.255.255
end
```

To configure the firewall policy:

```
config firewall policy
    edit 1
        set name "1"
        set srcintf "dmz"
        set dstintf ""virtual-wan-link""
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To configure SD-WAN:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "agg1"
            set gateway 172.16.11.2
        next
    end
end
```

Configuring FortiGate 2

To create two IPsec VPN interfaces:

```
config vpn ipsec phase1-interface
    edit "vd2-p1"
        set interface "wan1"
        set peertype any
        set net-device disable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.200.1
        set psksecret ftnt1234
    next
    edit "vd2-p2"
        set interface "wan2"
        set peertype any
        set net-device disable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.203.1
        set psksecret ftnt1234
    next
end

config vpn ipsec phase2-interface
    edit "vd2-p1"
        set phase1name "vd2-p1"
    next
    edit "vd2-p2"
        set phase1name "vd2-p2"
    next
end
```

To create an IPsec aggregate interface:

```
config system ipsec-aggregate
    edit "agg2"
        set member "vd2-p1" "vd2-p2"
        set algorithm L3
    next
end

config system interface
    edit "agg2"
        set vdom "root"
        set ip 172.16.11.2 255.255.255.255
        set allowaccess ping
        set remote-ip 172.16.11.1 255.255.255.255
    next
end
```

To configure the firewall policy:

```
config firewall policy
    edit 1
```

```
        set name "1"
        set srcintf "dmz"
        set dstintf ""virtual-wan-link""
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To configure SD-WAN:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "agg2"
            set gateway 172.16.11.1
        next
    end
end
```

Related diagnose commands

To display aggregate IPsec members:

```
# diagnose sys ipsec-aggregate list
agg1 algo=L3 member=2 run_tally=2
members:
        vd1-p1
        vd1-p2
```

To check the VPN status:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------

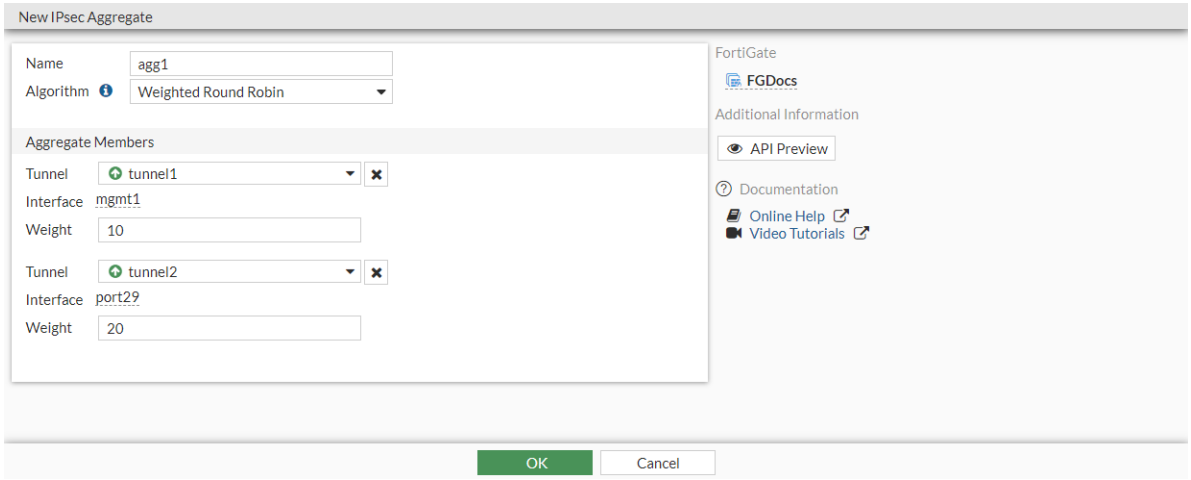
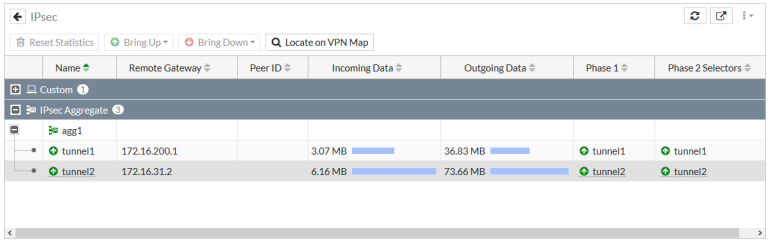
Packet distribution for aggregate IPsec tunnels using weighted round robin

A weighted round robin algorithm can be used for IPsec aggregate tunnels to distribute traffic by the weight of each member tunnel.



In this example, the FortiGate has two IPsec tunnels put into IPsec aggregate. Traffic is distributed among the members, with one third over *tunnel1*, and two thirds over *tunnel2*. To achieve this, the weighted round robin algorithm is selected, *tunnel1* is assigned a weight of 10, and *tunnel2* is assigned a weight of 20.



To create the IPsec aggregate in the GUI:

1. Go to *VPN* > *IPsec Tunnels* and click *Create New* > *IPsec Tunnel*.
2. Complete the wizard to create the *tunnel1* and *tunnel2* custom IPsec tunnels. Ensure that *Aggregate member* is *Enabled* for each tunnel under the *Network* > *Advanced* section.
3. Go to *VPN* > *IPsec Tunnels* and click *Create New* > *IPsec Aggregate*.
4. Enter a name for the aggregate, such as *agg1*, and ensure that *Algorithm* is *Weighted Round Robin*.
5. Add *tunnel1* as an aggregate members, and set *Weight* to *10*.

6. Add *tunnel2* as a second aggregate members, and set its *Weight* to *20*.

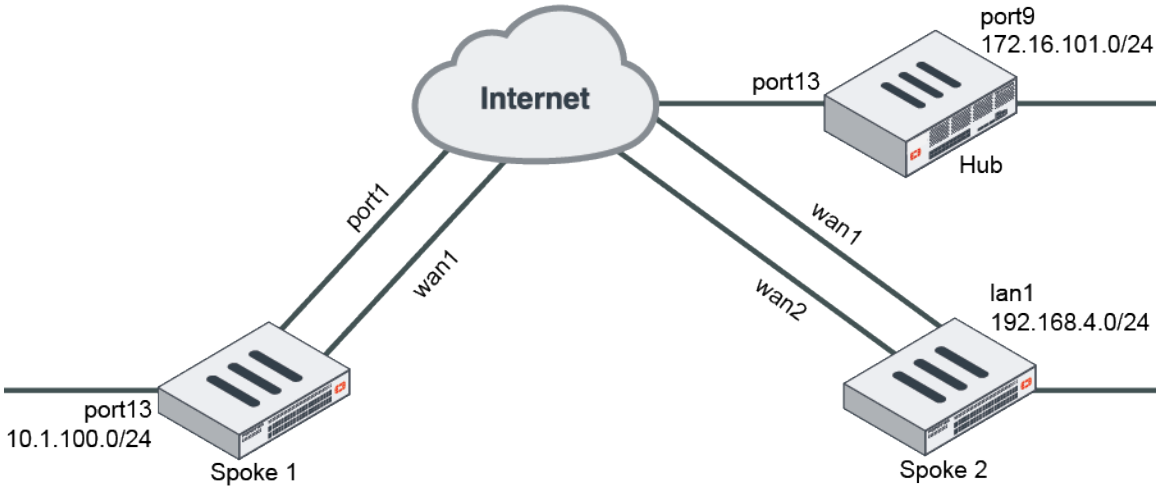
7. Click *OK*.
8. To view and monitor the aggregate tunnel statistics, go to the *IPsec* widget on the *Network* dashboard.

To create the IPsec aggregate in the CLI:

1. Create the *tunnel1* and *tunnel2* custom IPsec tunnels with aggregate-member enabled and aggregate-weight set for both tunnels:

```
config vpn ipsec phase1-interface
    edit "tunnel1"
        ...
        set aggregate-member enable
        set aggregate-weight 10
        ...
    next
    edit "tunnel2"
        ...
        set aggregate-member enable
        set aggregate-weight 20
        ...
    next
end
```

2. Create the IPsec aggregate:



```
config system ipsec-aggregate
    edit "agg1"
        set member "tunnel1" "tunnel2"
        set algorithm weighted-round-robin
    next
end
```

Redundant hub and spoke VPN

A redundant hub and spoke configuration allows VPN connections to radiate from a central FortiGate unit (the hub) to multiple remote peers (the spokes). Traffic can pass between private networks behind the hub and private networks behind the remote peers. Traffic can also pass between remote peer private networks through the hub.

This is a sample configuration of hub and spoke IPsec VPN. The following applies for this scenario:

- The spokes have two WAN interfaces and two IPsec VPN tunnels for redundancy.
- The secondary VPN tunnel is up only when the primary tunnel is down by dead peer detection.

Because the GUI can only complete part of the configuration, we recommend using the CLI.

To configure redundant hub and spoke VPN using the FortiOS CLI:

1. Configure the hub.
   a. Configure the WAN, internal interface, and static route.
   ```
   config system interface
      edit "port13"
         set alias "WAN"
         set ip 172.16.202.1 255.255.255.0
      next
      edit "port9"
         set alias "Internal"
         set ip 172.16.101.1 255.255.255.0
      next
   end
   config router static
      edit 1
         set gateway 172.16.202.2
         set device "port13"
      next
   end
   ```
   b. Configure the IPsec phase1-interface and phase2-interface.
   ```
   config vpn ipsec phase1-interface
      edit "hub"
         set type dynamic
         set interface "port13"
   ```

```
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set dpd on-idle
      set psksecret sample
      set dpd-retryinterval 60
   next
end
config vpn ipsec phase2-interface
   edit "hub"
      set phase1name "hub"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
           aes256gcm chacha20poly1305
   next
end
```

c. Configure the firewall policy.

```
config firewall policy
   edit 1
      set name "spoke-hub"
      set srcintf "hub"
      set dstintf "port9"
      set srcaddr "all"
      set dstaddr "172.16.101.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
   edit 2
      set name "spoke-spoke"
      set srcintf "hub"
      set dstintf "hub"
      set srcaddr "all"
      set dstaddr "all"
      set action accept
      set schedule "always"
      set service "ALL"
   next
end
```

2. Configure the spokes.

a. Configure the WAN, internal interface, and static route.

i. Configure Spoke1.

```
config system interface
   edit "port1"
      set ip 172.16.200.1 255.255.255.0
   next
   edit "wan1"
      set mode dhcp
      set distance 10
      set priority 100
   next
   edit "dmz"
      set ip 10.1.100.1 255.255.255.0
   next
end
config router static
   edit 1
```

```
      set gateway 172.16.200.2
      set device "port1"
   next
end
```

ii. Configure Spoke2.

```
config system interface
   edit "wan1"
      set ip 172.16.200.3 255.255.255.0
   next
   edit "wan2"
      set mode dhcp
      set distance 10
      set priority 100
   next
   edit "lan1"
      set ip 192.168.4.1 255.255.255.0
   next
end
config router static
   edit 1
      set gateway 172.16.200.2
      set device "wan1"
   next
end
```

b. Configure IPsec phase1-interface and phase2-interface.

i. Configure Spoke1.

```
config vpn ipsec phase1-interface
   edit "primary"
      set interface "port1"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.202.1
      set psksecret sample
      next
   edit "secondary"
      set interface "wan1"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.202.1
      set monitor "primary"
      set psksecret sample
      next
end
config vpn ipsec phase2-interface
   edit "primary"
      set phase1name "primary"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
           aes256gcm chacha20poly1305
      set auto-negotiate enable
      set src-subnet 10.1.100.0 255.255.255.0
   next
   edit "secondary"
      set phase1name "secondary"
```

```
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
           aes256gcm chacha20poly1305
      set auto-negotiate enable
      set src-subnet 10.1.100.0 255.255.255.0
   next
end
```

ii. Configure Spoke2.

```
config vpn ipsec phase1-interface
   edit "primary"
      set interface "wan1"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.202.1
      set psksecret sample
      next
   edit "secondary"
      set interface "wan2"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.202.1
      set monitor "primary"
      set psksecret sample
      next
end
config vpn ipsec phase2-interface
   edit "primary"
      set phase1name "primary"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
           aes256gcm chacha20poly1305
      set auto-negotiate enable
      set src-subnet 192.168.4.0 255.255.255.0
   next
   edit "secondary"
      set phase1name "secondary"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
           aes256gcm chacha20poly1305
      set auto-negotiate enable
      set src-subnet 192.168.4.0 255.255.255.0
   next
end
```

c. Configure the firewall policy.

i. Configure Spoke1.

```
config firewall policy
   edit 1
      set srcintf "dmz"
      set dstintf "primary" "secondary"
      set srcaddr "10.1.100.0"
      set dstaddr "172.16.101.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
end
```

ii. Configure Spoke2.

```
config firewall policy
   edit 1
      set srcintf "lan1"
      set dstintf "primary" "secondary"
      set srcaddr "192.168.4.0"
      set dstaddr "172.16.101.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
end
```

d. Configure the static route.

i. Configure Spoke1.

```
config router static
   edit 3
      set dst 172.16.101.0 255.255.255.0
      set distance 1
      set device "primary"
   next
   edit 4
      set dst 172.16.101.0 255.255.255.0
      set distance 3
      set device "secondary"
   next
end
```

ii. Configure Spoke2.

```
config router static
   edit 3
      set dst 172.16.101.0 255.255.255.0
      set distance 1
      set device "primary"
   next
   edit 4
      set dst 172.16.101.0 255.255.255.0
      set distance 3
      set device "secondary"
   next
end
```

3. Run `diagnose` and `get` commands.

a. Run the `Spoke1 # diagnose vpn tunnel list` command. The system should return the following:

```
name=primary ver=1 serial=1 172.16.200.1:0->172.16.202.1:0 tun_id=172.16.202.1

```

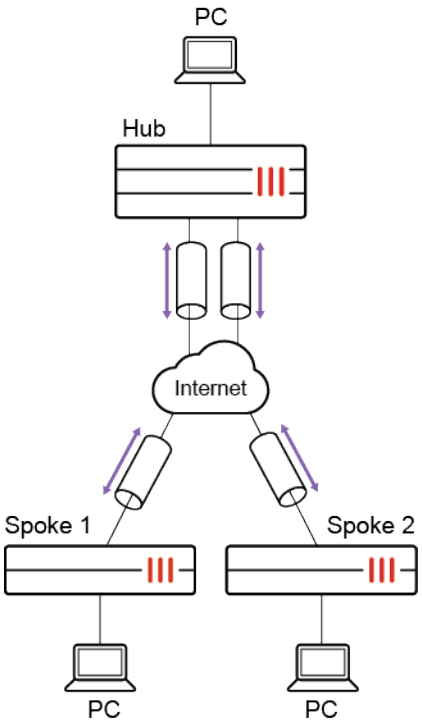
b. Run the `Spoke1 # get router info routing-table static` command. The system should return the following:

```
Routing table for VRF=0
..............
S 172.16.101.0/24 [1/0] is directly connected, primary
```

ADVPN

Auto-Discovery VPN (ADVPN) allows the central hub to dynamically inform spokes about a better path for traffic between two spokes.

The following topics provide instructions on configuring ADVPN:

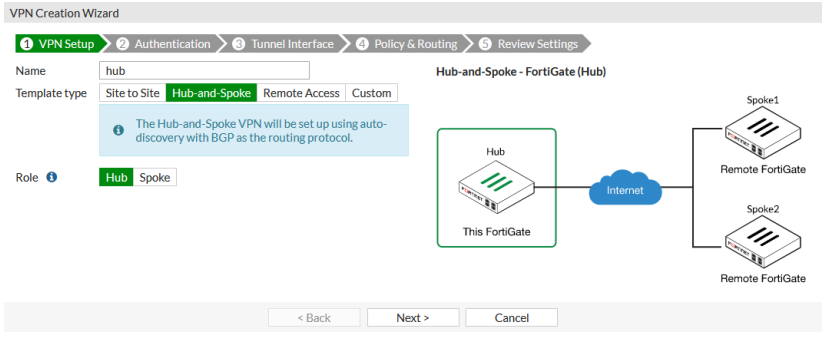


- IPsec VPN wizard hub-and-spoke ADVPN support on page 2136
- ADVPN with BGP as the routing protocol on page 2140
- ADVPN with OSPF as the routing protocol on page 2150
- ADVPN with RIP as the routing protocol on page 2159
- UDP hole punching for spokes behind NAT on page 2167

IPsec VPN wizard hub-and-spoke ADVPN support

When using the IPsec VPN wizard to create a hub and spoke VPN, multiple local interfaces can be selected. At the end of the wizard, changes can be reviewed, real-time updates can be made to the local address group and tunnel interface, and easy configuration keys can be copied for configuring the spokes.

When editing a VPN tunnel, the Hub & Spoke Topology section provides access to the easy configuration keys for the spokes, and allows you to add more spokes.



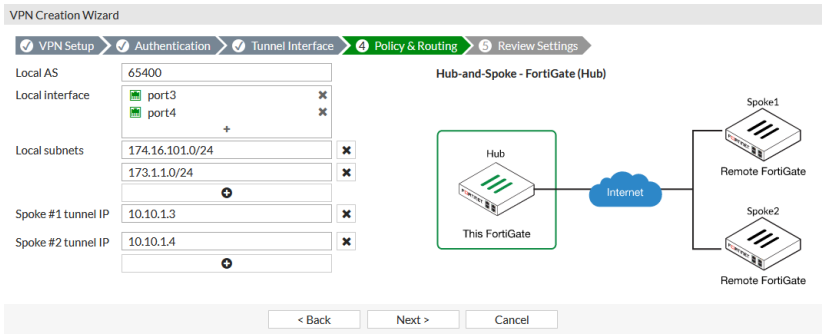
This example shows the configuration of a hub with two spokes.

To configure the hub:

1. Go to *VPN* > *IPsec Wizard*.
2. Go through the steps of the wizard:
   a. *VPN Setup*:

Name	hub
Template Type	Hub-and-Spoke
Role	Hub

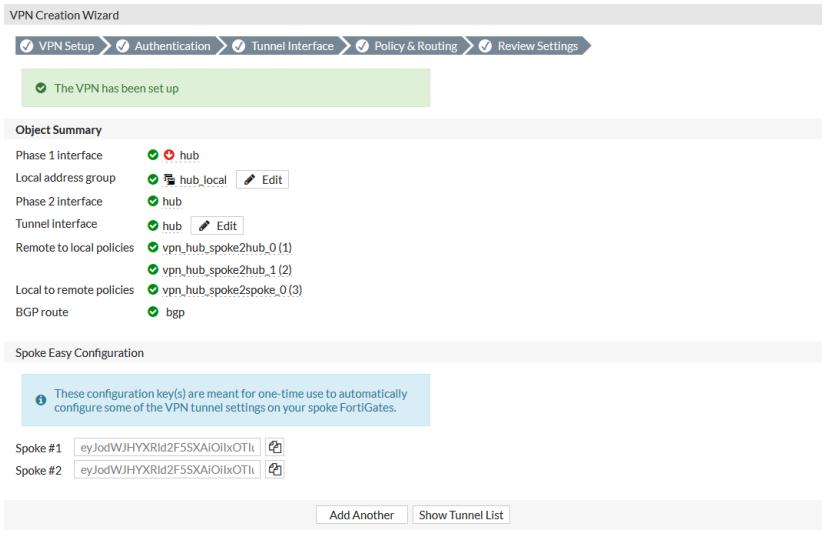
   b. *Authentication*:



Incoming Interface	port1
Authentication method	Pre-shared Key
Pre-shared key	<key>

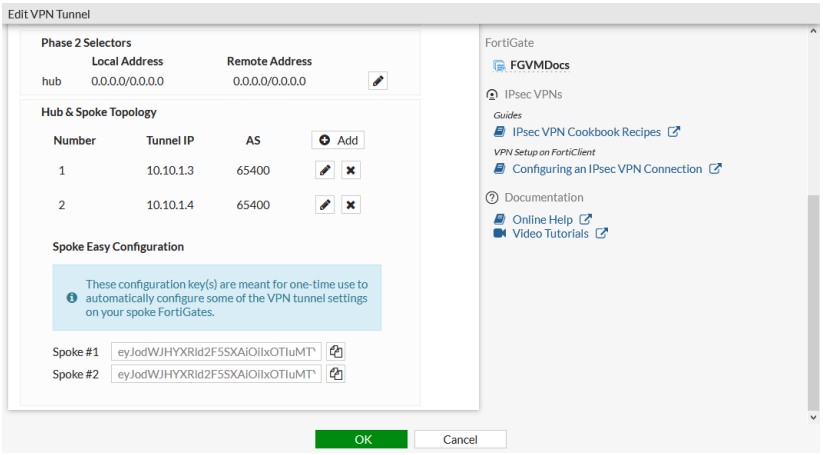
c. *Tunnel Interface*:

Tunnel IP	10.10.1.1
Remote IP/netmask	10.10.1.2/24



d. *Policy & Routing*:
Multiple local interfaces and subnets can be configured.

Local AS	65400
Local interface	port3 port4
Local subnets	174.16.101.0/24 173.1.1.0/24
Spoke #1 tunnel IP	10.10.1.3
Spoke #2 tunnel IP	10.10.1.4

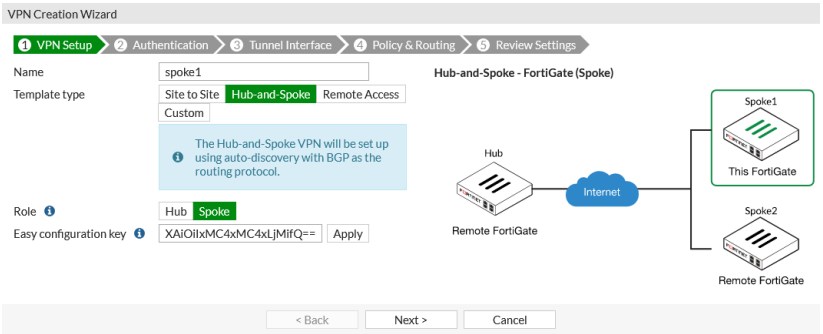


e. *Review Settings*:
Confirm that the settings look correct, then click *Create*.

3. The summary shows details about the set up hub:
   - The *Local address group* and *Tunnel interface* can be edited directly on this page.
   - Spoke easy configuration keys can be used to quickly configure the spokes.

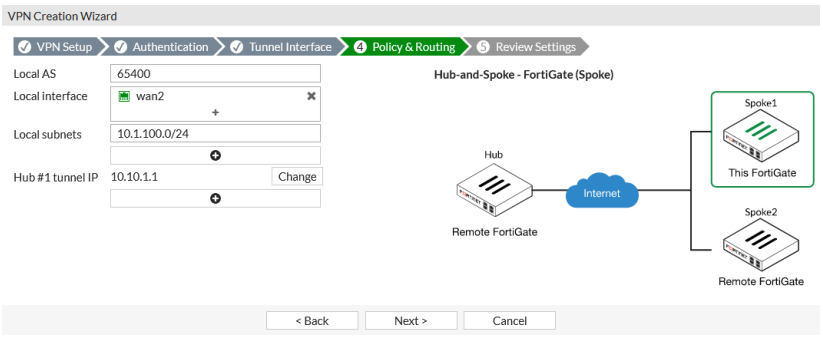
4. Click *Show Tunnel List* to go to *VPN* > *IPsec Tunnels*.

5. Edit the VPN tunnel to add more spokes and to copy the spokes' easy configuration keys.



To configure the spokes:

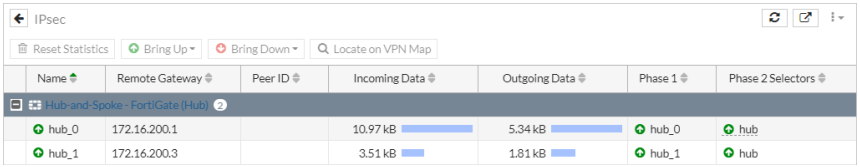
1. Go to *VPN* > *IPsec Wizard*.
2. On the *VPN Setup* page of the wizard, enter the following:



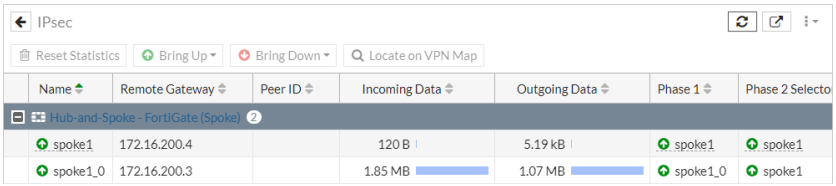
Name	spoke1
Template Type	Hub-and-Spoke
Role	Spoke

3. In the *Easy configuration key* field, paste the *Spoke #1* key from the hub FortiGate, click *Apply*, then click *Next*.

4. Adjust the *Authentication* settings as required, enter the *Pre-shared key*, then click *Next*.
5. Adjust the *Tunnel Interface* settings as required, then click *Next*.
6. Configure the *Policy & Routing* settings, then click *Next*:



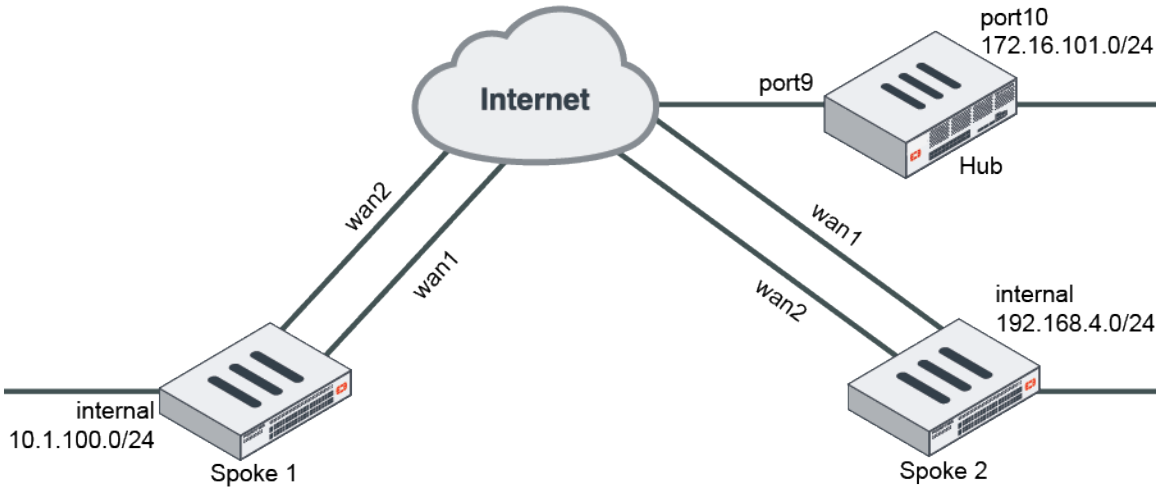
Local interface	wan2
Local subnets	10.1.100.0/24



7. Review the settings, then click *Create*.
8. The summary shows details about the set up spoke. The *Local address group* and *Tunnel interface* can be edited directly on this page.
9. Follow the same steps to configure the second spoke.

To check that the tunnels are created and working:

1. On the hub FortiGate, go to *Dashboard* > *Network* and expand the IPsec widget.
   The tunnels to the spokes are established.



2. On a spoke, go to *Dashboard* > *Network* and expand the IPsec widget.
   The tunnel to the hub and the spoke to spoke shortcut are established.

ADVPN with BGP as the routing protocol

This is a sample configuration of ADVPN with BGP as the routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface `net-device disable` must be run.
- IBGP must be used between the hub and spoke FortiGates.
- `bgp neighbor-group/neighbor-range` must be reused.

To configure ADVPN with BGP as the routing protocol using the CLI:

1. Configure hub FortiGate WAN interface, internal interface, and a static route:

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure the hub FortiGate:
   a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

```
config vpn ipsec phase1-interface
    edit "advpn-hub"
        set type dynamic
        set interface "port9"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1
3des-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set psksecret sample
        set dpd-retryinterval 5
    next
end
```

```
config vpn ipsec phase2-interface
    edit "advpn-hub"
        set phase1name "advpn-hub"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256
3des-sha256
    next
end
```

When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

b. Configure the hub FortiGate firewall policy:

```
config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "advpn-hub"
        set dstintf "port10"
        set srcaddr "all"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "advpn-hub"
        set dstintf "advpn-hub"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

c. Configure the hub FortiGate's IPsec tunnel interface IP address:

```
config system interface
    edit "advpn-hub1"
        set ip 10.10.10.254 255.255.255.255
        set remote-ip 10.10.10.253 255.255.255.0
    next
end
```

d. Configure the hub FortiGate's BGP:

```
config router bgp
    set as 65412
    config neighbor-group
        edit "advpn"
            set link-down-failover enable
            set remote-as 65412
            set route-reflector-client enable
        next
    end
```

```
        config neighbor-range
            edit 1
                set prefix 10.10.10.0 255.255.255.0
                set neighbor-group "advpn"
            next
        end
        config network
            edit 1
                set prefix 172.16.101.0 255.255.255.0
            next
        end
    end
```

3. Configure the spoke FortiGates:
   a. Configure the spoke FortiGates' WAN, internal interfaces, and static routes:
      i. Configure Spoke1:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 12.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 12.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

      ii. Configure the Spoke2:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 17.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
```

```
end
config router static
    edit 1
        set gateway 17.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 13.1.1.1
        set device "wan1"
    next
end
```

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

```
config vpn ipsec phase1-interface
    edit "spoke1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke1_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke1"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke1"
        set phase1name "spoke1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke1_backup"
        set phase1name "spoke1_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

ii. Configure Spoke2:

```
config vpn ipsec phase1-interface
    edit "spoke2"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke2_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke2"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke2"
        set phase1name "spoke2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke2_backup"
        set phase1name "spoke2_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

c. Configure the spoke FortiGates' firewall policies:

i. Configure Spoke1:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke1" "spoke1_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
```

```
        next
        edit 2
            set name "inbound_advpn"
            set srcintf "spoke1" "spoke1_backup"
            set dstintf "internal"
            set srcaddr "all"
            set dstaddr "all"
            set action accept
            set schedule "always"
            set service "ALL"
        next
    end
```

ii. Configure Spoke2:

```
    config firewall policy
        edit 1
            set name "outbound_advpn"
            set srcintf "internal"
            set dstintf "spoke2" "spoke2_backup"
            set srcaddr "all"
            set dstaddr "all"
            set action accept
            set schedule "always"
            set service "ALL"
        next
        edit 2
            set name "inbound_advpn"
            set srcintf "spoke2" "spoke2_backup"
            set dstintf "internal"
            set srcaddr "all"
            set dstaddr "all"
            set action accept
            set schedule "always"
            set service "ALL"
        next
    end
```

d. Configure the spoke FortiGates' tunnel interface IP addresses:

i. Configure Spoke1:

```
    config system interface
        edit "spoke1"
            set ip 10.10.10.1 255.255.255.255
            set remote-ip 10.10.10.254 255.255.255.0
        next
        edit "spoke1_backup"
            set ip 10.10.10.2 255.255.255.255
            set remote-ip 10.10.10.254 255.255.255.0
        next
    end
```

ii. Configure Spoke2:

```
    config system interface
        edit "spoke2"
            set ip 10.10.10.3 255.255.255.255
            set remote-ip 10.10.10.254 255.255.255.0
```

```
        next
        edit "spoke2_backup"
            set ip 10.10.10.4 255.255.255.255
            set remote-ip 10.10.10.254 255.255.255.0
        next
    end
```

e. Configure the spoke FortiGates' BGP:

i. Configure Spoke1:

```
config router bgp
    set as 65412
    config neighbor
        edit "10.10.10.254"
            set advertisement-interval 1
            set link-down-failover enable
            set remote-as 65412
        next
    end
    config network
        edit 1
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end
```

ii. Configure Spoke2:

```
config router bgp
    set as 65412
    config neighbor
        edit "10.10.10.254"
            set advertisement-interval 1
            set link-down-failover enable
            set remote-as 65412
        next
    end
    config network
        edit 1
            set prefix 192.168.4.0 255.255.255.0
        next
    end
end
```

4. Run `diagnose` and `get` commands on Spoke1 to check VPN and BGP states:

a. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1

  src: 0:0.0.0.0/0.0.0.0:0
  dst: 0:0.0.0.0/0.0.0.0:0
```

b. Run the `get router info bgp summary` command on Spoke1. The system should return the following:

```
BGP router identifier 7.7.7.7, local AS number 65412
BGP table version is 2
1 BGP AS-PATH entries
0 BGP community entries

Neighbor             V         AS [[QualityAssurance62/MsgRcvd]]
[[QualityAssurance62/MsgSent]]   [[QualityAssurance62/TblVer]]  InQ OutQ Up/Down
State/PfxRcd
10.10.10.254       1.          65412     143     142         1.     1.     1.
00:24:45                    2

Total number of neighbors 1
```

c. Run the `get router info routing-table bgp` command on Spoke1. The system should return the following:

```
Routing table for VRF=0
B       172.16.101.0/24 [200/0] via 10.10.10.254, spoke1, 00:23:57
B       192.168.4.0/24 [200/0] via 10.10.10.254, spoke1, 00:22:03
```

d. Generate traffic between the spokes and check the shortcut tunnel and routing table. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1

```

e. Run the `get router info routing-tale bgp` command. The system should return the following:

```
Routing table for VRF=0
B       172.16.101.0/24 [200/0] via 10.10.10.254, spoke1, 00:23:57
B       192.168.4.0/24 [200/0] via 10.10.10.3, spoke1_0 , 00:22:03
```

ADVPN with OSPF as the routing protocol

This is a sample configuration of ADVPN with OSPF as the routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface `net-device enable` must be run.
- OSPF must be used between the hub and spoke FortiGates.

To configure ADVPN with OSPF as the routing protocol using the CLI:

1. Configure hub FortiGate's WAN, internal interface, and static route:

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure the hub FortiGate:
   a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

```
config vpn ipsec phase1-interface
    edit "advpn-hub"
        set type dynamic
        set interface "port9"
        set peertype any
        set net-device enable
```

```
        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1
3des-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "advpn-hub"
        set phase1name "advpn-hub"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256
3des-sha256
    next
end
```

When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

b. Configure the hub FortiGate firewall policy:

```
config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "advpn-hub"
        set dstintf "port10"
        set srcaddr "all"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "advpn-hub"
        set dstintf "advpn-hub"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

c. Configure the hub FortiGate's IPsec tunnel interface IP address:

```
config system interface
    edit "advpn-hub1"
        set ip 10.10.10.254 255.255.255.255
        set remote-ip 10.10.10.253 255.255.255.0
    next
end
```

d. Configure the hub FortiGate's OSPF:

```
config router ospf
    set router-id 1.1.1.1
    config area
        edit 0.0.0.0
        next
    end
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 172.16.101.0 255.255.255.0
        next
    end
end
```

3. Configure the spoke FortiGates:
   a. Configure the spoke FortiGates' WAN, internal interfaces, and static routes:
      i. Configure Spoke1:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 12.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 12.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

      ii. Configure the Spoke2:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 17.1.1.2 255.255.255.0
    next
```

```
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 17.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 13.1.1.1
        set device "wan1"
    next
end
```

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

```
config vpn ipsec phase1-interface
    edit "spoke1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke1_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke1"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke1"
        set phase1name "spoke1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke1_backup"
        set phase1name "spoke1_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
```

```
        set auto-negotiate enable
    next
end
```

ii. Configure Spoke2:

```
config vpn ipsec phase1-interface
    edit "spoke2"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke2_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke2"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke2"
        set phase1name "spoke2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke2_backup"
        set phase1name "spoke2_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

c. Configure the spoke FortiGates' firewall policies:

i. Configure Spoke1:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke1" "spoke1_backup"
        set srcaddr "all"
```

```
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke1" "spoke1_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

ii. Configure Spoke2:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke2" "spoke2_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke2" "spoke2_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

d. Configure the spoke FortiGates' tunnel interface IP addresses:

i. Configure Spoke1:

```
config system interface
    edit "spoke1"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke1_backup"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

ii. Configure Spoke2:

```
config system interface
    edit "spoke2"
        set ip 10.10.10.3 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke2_backup"
        set ip 10.10.10.4 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

e. Configure the spoke FortiGates' OSPF:

i. Configure Spoke1:

```
config router ospf
    set router-id 7.7.7.7
    config area
        edit 0.0.0.0
        next
    end
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end
```

ii. Configure Spoke2:

```
config router ospf
    set router-id 8.8.8.8
    config area
        edit 0.0.0.0
        next
    end
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 192.168.4.0 255.255.255.0
        next
    end
end
```

4. Run `diagnose` and `get` commands on Spoke1 to check VPN and OSPF states:

a. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1
bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu
create_dev frag-rfc  accept_traffic=1
```

```
proxyid_num=1 child_num=1 refcnt=19 ilast=5 olast=2 ad=r/2
stat: rxp=1 txp=263 rxb=16452 txb=32854

proxyid=spoke1_backup proto=0 sa=0 ref=2 serial=1 auto-negotiate adr
  src: 0:0.0.0.0/0.0.0.0:0
  dst: 0:0.0.0.0/0.0.0.0:0
```

b. Run the `get router info ospf neighbor` command on Spoke1. The system should return the following:

```
OSPF process 0, VRF 0: Neighbor ID Pri State Dead Time Address Interface 8.8.8.8 1.
Full/ - 00:00:35 10.10.10.254 spoke1 1.1.1.1 1. Full/ - 00:00:35 10.10.10.254 spoke1
```

c. Run the `get router info routing-table ospf` command on Spoke1. The system should return the following:

```
Routing table for VRF=0
O       172.16.101.0/24 [110/110] via 10.10.10.254, spoke1, 00:23:23
O       192.168.4.0/24   [110/110] via 10.10.10.254, spoke1, 00:22:35
```

d. Generate traffic between the spokes, then check the shortcut tunnel and routing table. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1
bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu
create_dev frag-rfc  accept_traffic=1

proxyid_num=1 child_num=1 refcnt=19 ilast=2 olast=2 ad=r/2
stat: rxp=1 txp=313 rxb=16452 txb=35912
dpd: mode=on-idle on=1 idle=5000ms retry=3 count=0 seqno=2303
natt: mode=none draft=0 interval=0 remote_port=0
proxyid=spoke1 proto=0 sa=1 ref=3 serial=1 auto-negotiate adr
  src: 0:0.0.0.0/0.0.0.0:0
```

```
  dst: 0:0.0.0.0/0.0.0.0:0
  SA:  ref=6 options=1a227 type=00 soft=0 mtu=1438 expire=782/0B replaywin=1024
       seqno=13a esn=0 replaywin_lastseq=00000003 itn=0
  life: type=01 bytes=0/0 timeout=2371/2400
  dec: spi=c53a8f78 esp=aes key=16 7cc50c5c9df1751f6497a4ad764c5e9a

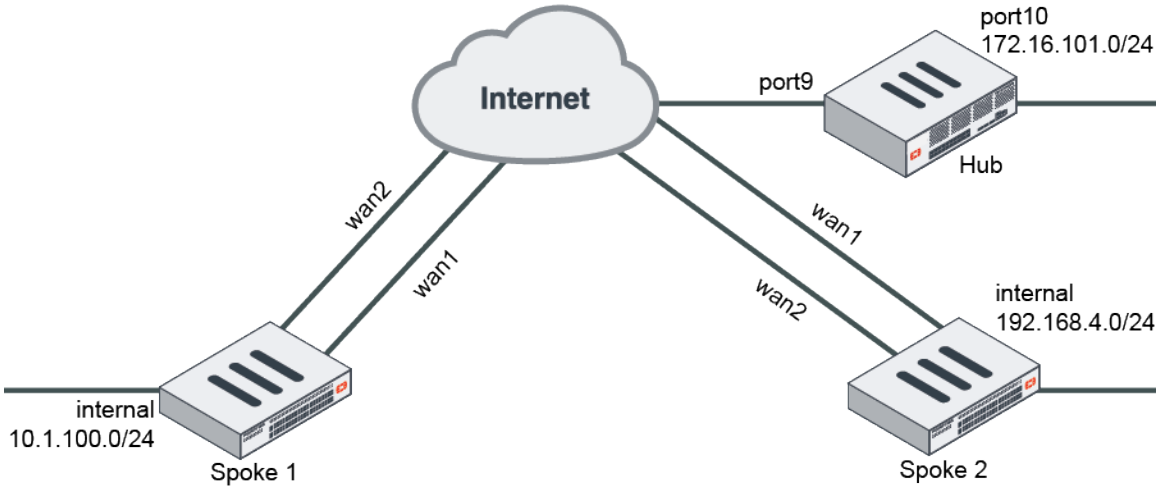
  npu_flag=03 npu_rgwy=13.1.1.2 npu_lgwy=15.1.1.2 npu_selid=a dec_npuid=1 enc_npuid=1
```



e. Run the `get router info routing-tale ospf` command. The system should return the following:

```
Routing table for VRF=0
O       172.16.101.0/24 [110/110] via 10.10.10.254, spoke1, 00:27:14
O       192.168.4.0/24  [110/110] via  10.10.10.3, spoke1_0, 00:26:26
```

ADVPN with RIP as the routing protocol

This is a sample configuration of ADVPN with RIP as routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface `net-device disable` must be run.
- RIP must be used between the hub and spoke FortiGates.
- `split-horizon-status enable` must be run on the hub FortiGate.

To configure ADVPN with RIP as the routing protocol using the CLI:

1. In the CLI, configure hub FortiGate's WAN, internal interface, and static route:

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure the hub FortiGate:
   a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

```
config vpn ipsec phase1-interface
    edit "advpn-hub"
        set type dynamic
        set interface "port9"
        set peertype any
```

```
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1
3des-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "advpn-hub"
        set phase1name "advpn-hub"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256
3des-sha256
    next
end
```

When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

b. Configure the hub FortiGate firewall policy:

```
config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "advpn-hub"
        set dstintf "port10"
        set srcaddr "all"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "advpn-hub"
        set dstintf "advpn-hub"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

c. Configure the hub FortiGate's IPsec tunnel interface IP address:

```
config system interface
    edit "advpn-hub1"
        set ip 10.10.10.254 255.255.255.255
        set remote-ip 10.10.10.253 255.255.255.0
    next
end
```

d. Configure the hub FortiGate's RIP:

```
config router rip
    set default-information-originate enable
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 172.16.101.0 255.255.255.0
        next
    end
    config interface
        edit "advpn-hub"
            set split-horizon-status disable
        next
    end
end
```

3. Configure the spoke FortiGates:
   a. Configure the spoke FortiGates' WAN, internal interfaces, and static routes:
      i. Configure Spoke1:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 12.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 12.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

      ii. Configure the Spoke2:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 17.1.1.2 255.255.255.0
```

```
        next
        edit "internal"
            set ip 192.168.4.1 255.255.255.0
        next
    end
    config router static
        edit 1
            set gateway 17.1.1.1
            set device "wan2"
            set distance 15
        next
        edit 2
            set gateway 13.1.1.1
            set device "wan1"
        next
    end
```

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

```
config vpn ipsec phase1-interface
    edit "spoke1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke1_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke1"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke1"
        set phase1name "spoke1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke1_backup"
        set phase1name "spoke1_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
```

```
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

ii. Configure Spoke2:

```
config vpn ipsec phase1-interface
    edit "spoke2"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke2_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke2"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke2"
        set phase1name "spoke2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke2_backup"
        set phase1name "spoke2_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

c. Configure the spoke FortiGates' firewall policies:

i. Configure Spoke1:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke1" "spoke1_backup"
```

```
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke1" "spoke1_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

ii. Configure Spoke2:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke2" "spoke2_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke2" "spoke2_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

d. Configure the spoke FortiGates' tunnel interface IP addresses:

i. Configure Spoke1:

```
config system interface
    edit "spoke1"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke1_backup"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

ii. Configure Spoke2:

```
config system interface
    edit "spoke2"
        set ip 10.10.10.3 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke2_backup"
        set ip 10.10.10.4 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

e. Configure the spoke FortiGates' RIP:

i. Configure Spoke1:

```
config router rip
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end
```

ii. Configure Spoke2:

```
config router rip
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 192.168.4.0 255.255.255.0
        next
    end
end
```

4. Run `diagnose` and `get` commands on Spoke1:

a. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1
bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu
create_dev frag-rfc  accept_traffic=1

  src: 0:0.0.0.0/0.0.0.0:0
  dst: 0:0.0.0.0/0.0.0.0:0
```

b. Run the `get router info rip database` command on Spoke1. The system should return the following:

```
Codes: R - RIP, Rc - RIP connected, Rs - RIP static, K - Kernel,
       C - Connected, S - Static, O - OSPF, I - IS-IS, B - BGP

   Network            Next Hop         Metric From            If     Time
Rc 10.1.100.0/24                             1.                 internal
Rc 10.10.10.2/32                               1.                 spoke1
R  172.16.101.0/24    10.10.10.254             1. 10.10.10.254      spoke1 02:28
R  192.168.4.0/24      10.10.10.254              1. 10.10.10.254       spoke1 02:44
```

c. Run the `get router info routing-table rip` command on Spoke1. The system should return the following:

```
Routing table for VRF=0
R       172.16.101.0/24 [120/2] via 10.10.10.254, spoke1, 00:08:38
R       192.168.4.0/24 [120/3] via 10.10.10.254, spoke1, 00:08:38
```

d. Generate traffic between the spokes, then check the shortcut tunnel and routing table. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1

```

e. Run the `get router info routing-tale rip` command. The system should return the following:

```
Routing table for VRF=0
R       172.16.101.0/24 [120/2] via 10.10.10.254, spoke1, 00:09:04
R       192.168.4.0/24 [120/2] via 10.10.10.3, spoke1_0, 00:00:02
```

UDP hole punching for spokes behind NAT

UDP hole punching allows ADVPN shortcuts to be established through a UDP hole on a NAT device. The NAT device must support RFC 4787 Endpoint-Independent Mapping.

In the following example, device 10.1.100.11 behind Spoke1 needs to reach device 192.168.4.33 behind Spoke2. Spoke1 and Spoke2 are behind NAT devices and have established IPsec tunnels to the Hub. The hole punching creates a shortcut between Spoke1 and Spoke2 that bypasses the Hub.

To verify the ADVPN shortcut is established between both spokes behind NAT:

```
# diagnose debug enable
# diagnose debug application ike -1

Fabric Overlay Orchestrator

The Fabric Overlay Orchestrator feature is an easy-to-use GUI wizard that simplifies the process of configuring a self-orchestrated SD-WAN overlay within a single Security Fabric. This feature is self-orchestrated since no additional tool or

device, aside from the FortiGates themselves, is required to orchestrate this configuration. An SD-WAN overlay configuration consists of IPsec and BGP configuration settings.

Currently, the Fabric Overlay Orchestrator supports a single hub architecture and builds upon an existing Security Fabric configuration. This feature configures the root FortiGate as the SD-WAN overlay hub and the downstream first-level FortiGates as the spokes.

After configuring the Fabric Overlay, you can complete the SD-WAN deployment by configuring SD-WAN rules.

If you cannot view the *VPN > Fabric Overlay Orchestrator* tree menu, configure the FortiGate as a root or a downstream device in the Security Fabric. See Configuring the root FortiGate and downstream FortiGates on page 3057 for more details.

The Fabric Overlay Orchestrator does not work when VDOM mode is enabled.

This section contains the following topics:

- Prerequisites on page 2171
- Network topology on page 2171
- Using the Fabric Overlay Orchestrator on page 2172

Prerequisites

Create a single Fortinet Security Fabric with the following components:

- A root FortiGate and one or more downstream FortiGates all running FortiOS 7.2.4 or later
- A FortiAnalyzer, or cloud logging using FortiAnalyzer Cloud or FortiGate Cloud
  - For FortiGate Cloud, all downstream devices must belong to the same FortiCloud account

  For more information about configuring these components, see Configuring the root FortiGate and downstream FortiGates on page 3057, Configuring FortiAnalyzer on page 3066, and Configuring cloud logging on page 3069 in the Security Fabric chapter.

The Fabric Overlay Orchestrator does not work when VDOM mode is enabled.

Network topology

The Fabric Overlay Orchestrator supports configuring an overlay for the following example hub and spoke topology using ADVPN and a single hub.

This topology corresponds to the single datacenter (active-passive gateway) design using the IPsec overlay design of one-to-one overlay mapping per underlay. For more details on these topics, see the SD-WAN Architectures for Enterprise guide.

In this topology, the datacenter FortiGate (Security Fabric root FortiGate) is the hub, and the branch FortiGates (Security Fabric downstream FortiGates) are the spokes. Each FortiGate has a distinctly defined LAN subnet and loopback interface (lb1) with an IP address within the 10.20.1.0/24 subnet.

The Fabric Overlay Orchestrator creates loopbacks to act as health check servers that are always up, and they can be accessed by adjacent Fabric devices. When configuring the policy creation option of either automatic or health check on the hub, the Fabric Overlay Orchestrator configures performance SLAs from the hub to the health check servers on 10.20.1.2 and 10.20.1.3 corresponding to the spoke 1 and spoke 2 FortiGates respectively. Likewise, when the Fabric Overlay Orchestrator runs on each spoke, it creates a performance SLA to the hub using its loopback address of 10.20.1.1.

Instead of using loopbacks, any business-critical applications and resources connected to the LAN of each device can be used as health check servers for performance SLAs.

Using the Fabric Overlay Orchestrator

If you cannot view the *VPN > Fabric Overlay Orchestrator* tree menu, configure the FortiGate as a root or a downstream device in the Security Fabric. See Configuring the root FortiGate and downstream FortiGates on page 3057 for more details.

The Fabric Overlay Orchestrator does not work when VDOM mode is enabled.

The following steps should be used to configure a self-orchestrated SD-WAN overlay within a single Security Fabric. These steps must be followed in order, and assume that the prerequisites and network topology are in place.

1. Configure the root FortiGate using the Fabric Overlay Orchestrator.
2. Configure one or more downstream FortiGates using the Fabric Overlay Orchestrator.
3. Configure an overlay on the spoke for an additional incoming interface on the hub (if applicable).
4. Verify the firewall policies on the hub FortiGate.
5. Verify the Fabric Overlay created by the Fabric Overlay Orchestrator:
   a. Verify the IPsec VPN tunnels on the hub FortiGate.
   b. Verify BGP routing on the hub FortiGate.
   c. Verify the performance SLAs on the hub FortiGate.
   d. Verify the firewall policies on a spoke FortiGate.
   e. Verify the IPsec VPN tunnels on a spoke FortiGate.
   f. Verify BGP routing on a spoke FortiGate.
   g. Verify the performance SLAs on a spoke FortiGate.
   h. Verify the spoke-to-spoke ADVPN communication.
6. Configure SD-WAN rules on the hub FortiGate.
7. Configure SD-WAN rules on the spoke FortiGates.

When configuring the root and downstream FortiGates, the Fabric Overlay Orchestrator configures the following settings in the background:

- IPsec overlay configuration (hub and spoke ADVPN tunnels)
- BGP configuration
- Policy routing
- SD-WAN zones
- SD-WAN performance SLAs

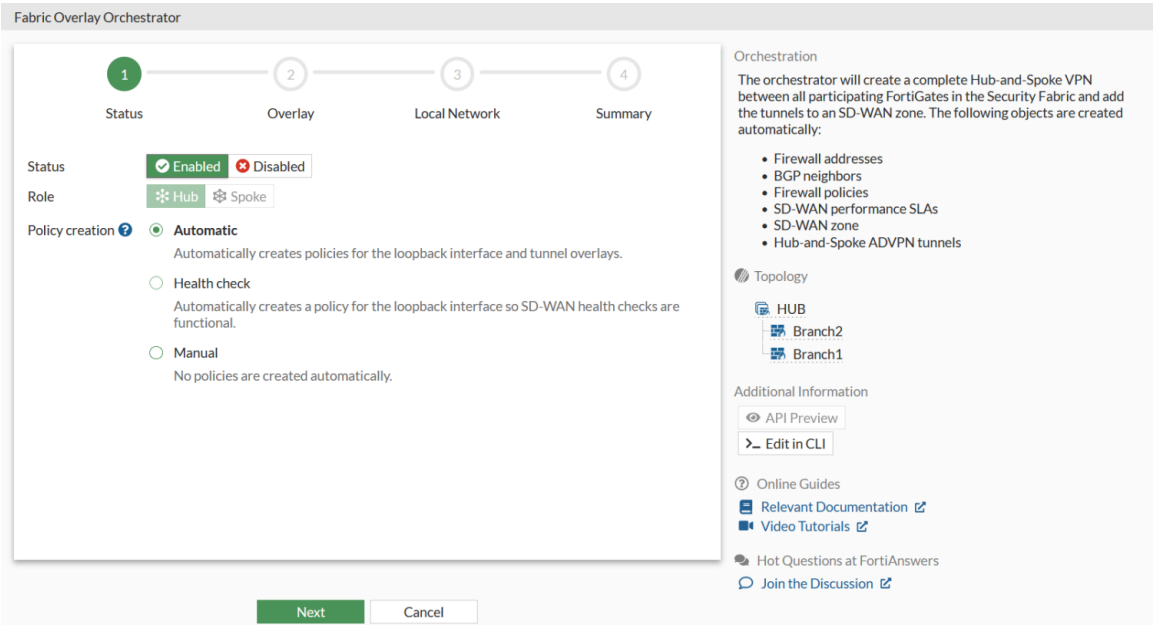
The FortiGate's role in the SD-WAN overlay is automatically determined by its role in the Security Fabric. The Fabric root will be the hub, and any first-level downstream devices from the Fabric root will be spokes.

After using the Fabric Overlay Orchestrator on all FortiGates and verifying the overlay settings, complete the SD-WAN deployment configuration using steps 3 (if applicable), and steps 6 and 7. See SD-WAN rules on page 829 for more information.

Creating firewall policies

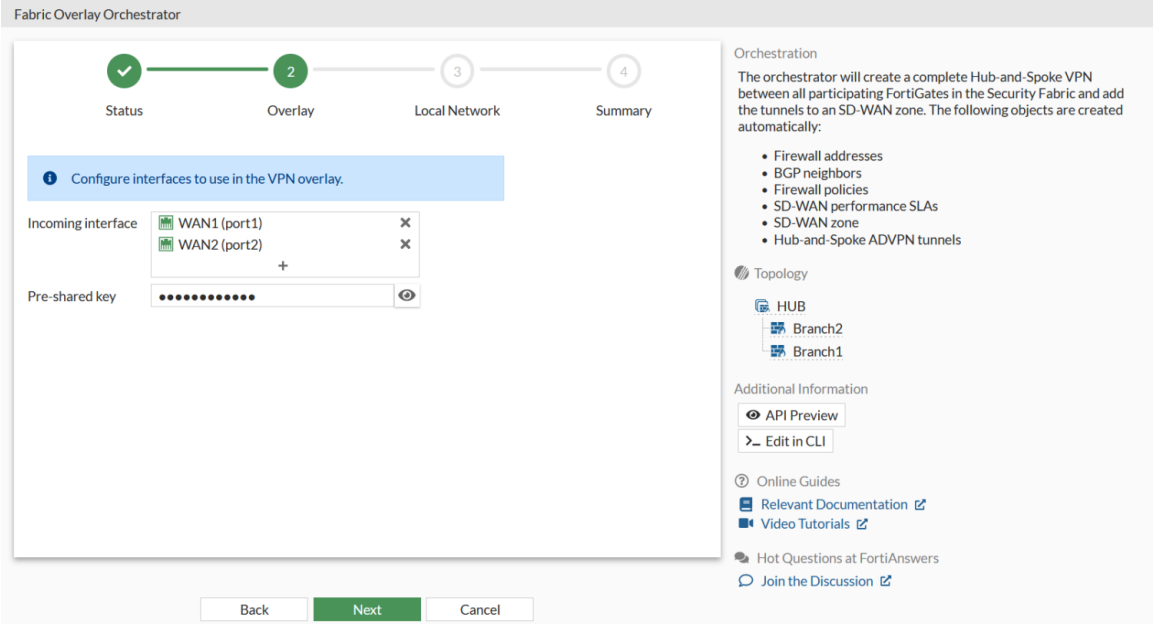
The Fabric Overlay Orchestrator can create firewall policies to allow all traffic through the SD-WAN overlay, or firewall policies to just allow health check traffic through it instead. When the Fabric Overlay Orchestrator is enabled on the root FortiGate, there are three *Policy creation* options:

- *Automatic*: automatically create policies for the loopback interface and tunnel overlays.
- *Health check*: automatically create a policy for the loopback interface so the SD-WAN health checks are functional.
- *Manual*: no policies are automatically created.



The *Automatic* policy creation option creates wildcard allow policies for the tunnel overlays. For some cases, these policies do not provide the necessary granularity to restrict overlay traffic to specific subnets or hosts.

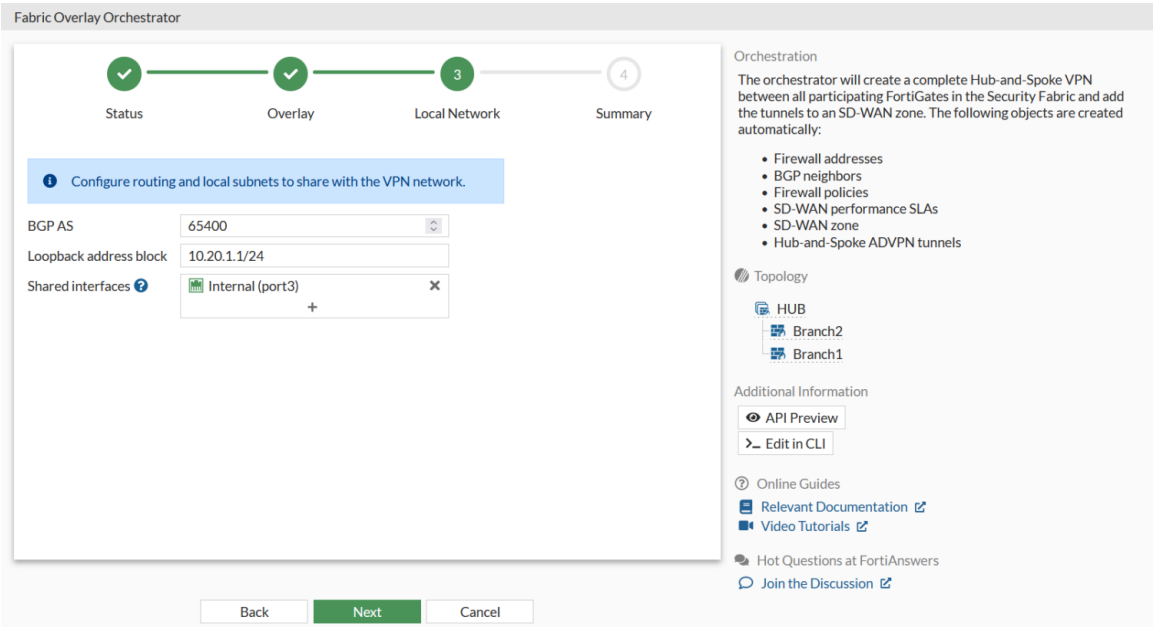
When the Fabric Overlay Orchestrator is configured on a device, changing the policy creation rule will create new policies based on the rule, but it will not delete existing policies. Deleting existing policies must be performed manually.



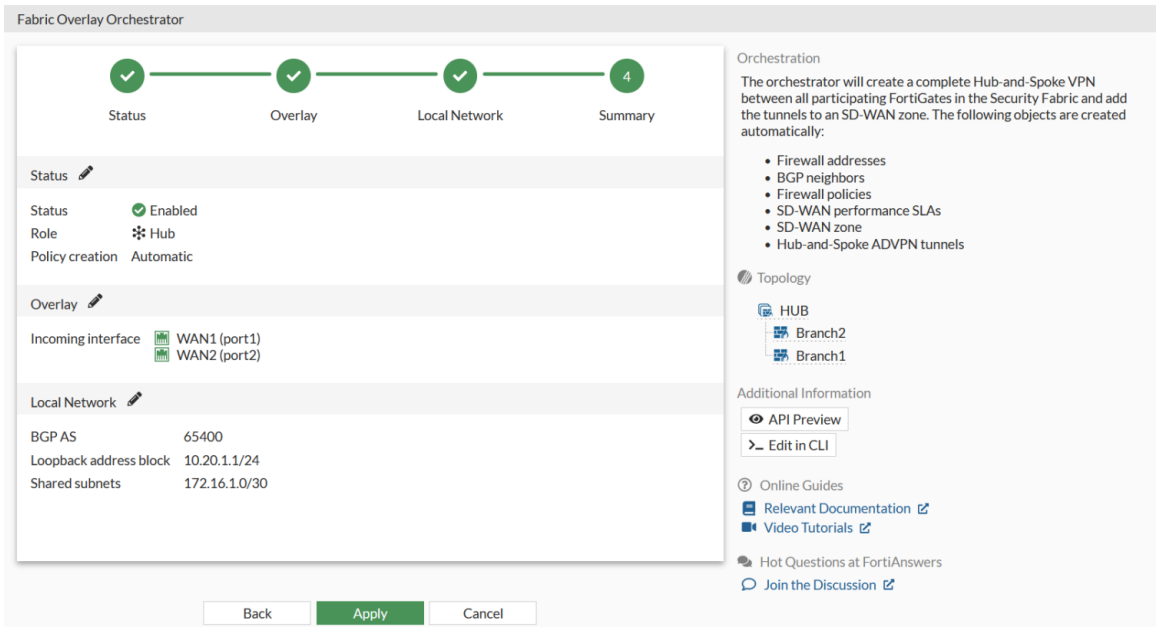
Configuring the root FortiGate using the Fabric Overlay Orchestrator

To configure the root FortiGate using the Fabric Overlay Orchestrator:

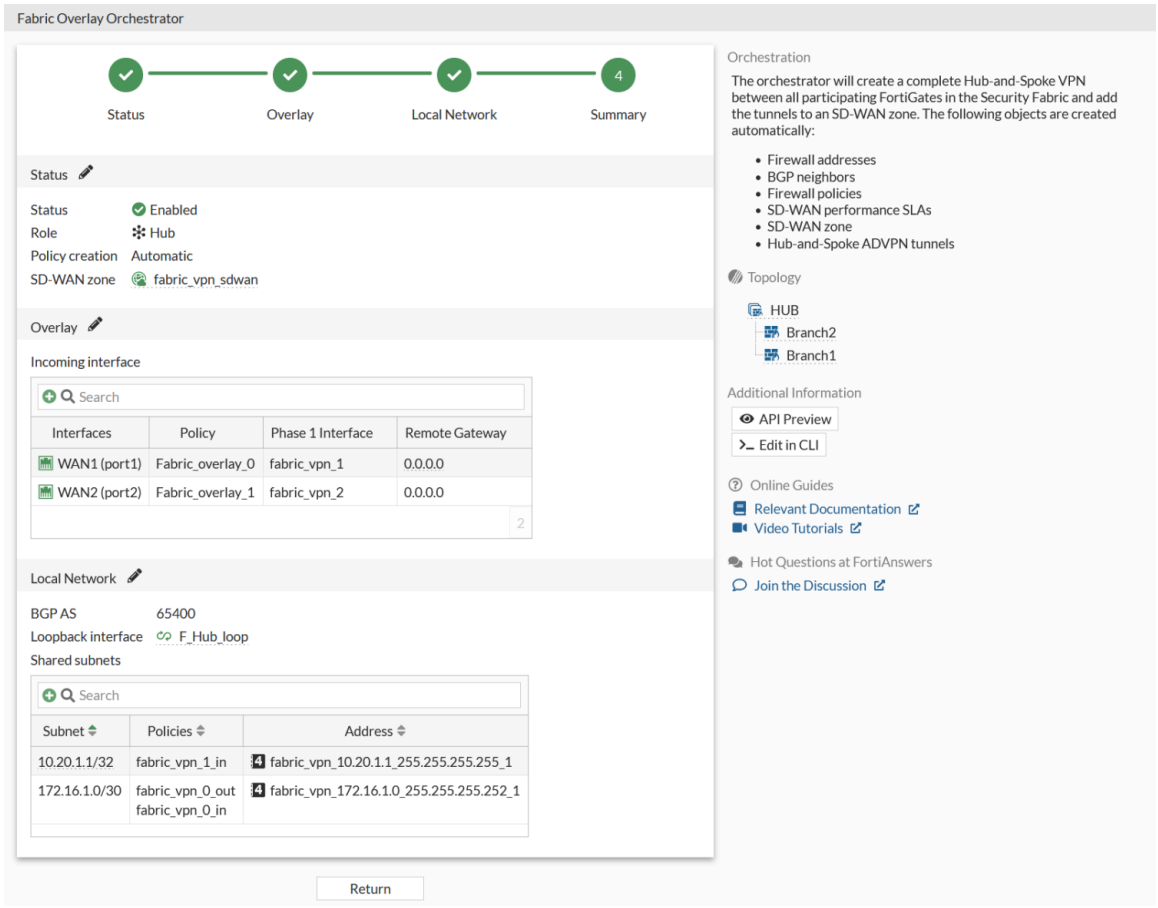
1. Go to *VPN* > *Fabric Overlay Orchestrator*.
2. Set the *Status* to *Enabled*. The *Role* is automatically selected based on the FortiGate's role in the Security Fabric. Ensure that *Hub* is selected. The Fabric root must always be the hub.
3. Set *Policy creation* to *Automatic*.



4. Click *Next*. The *Overlay* settings appear.
5. Select one or more interfaces as the *Incoming interface* or the underlay link over which the VPN overlay will be built (two incoming interfaces are selected in this example).
6. Enter the *Pre-shared key*.



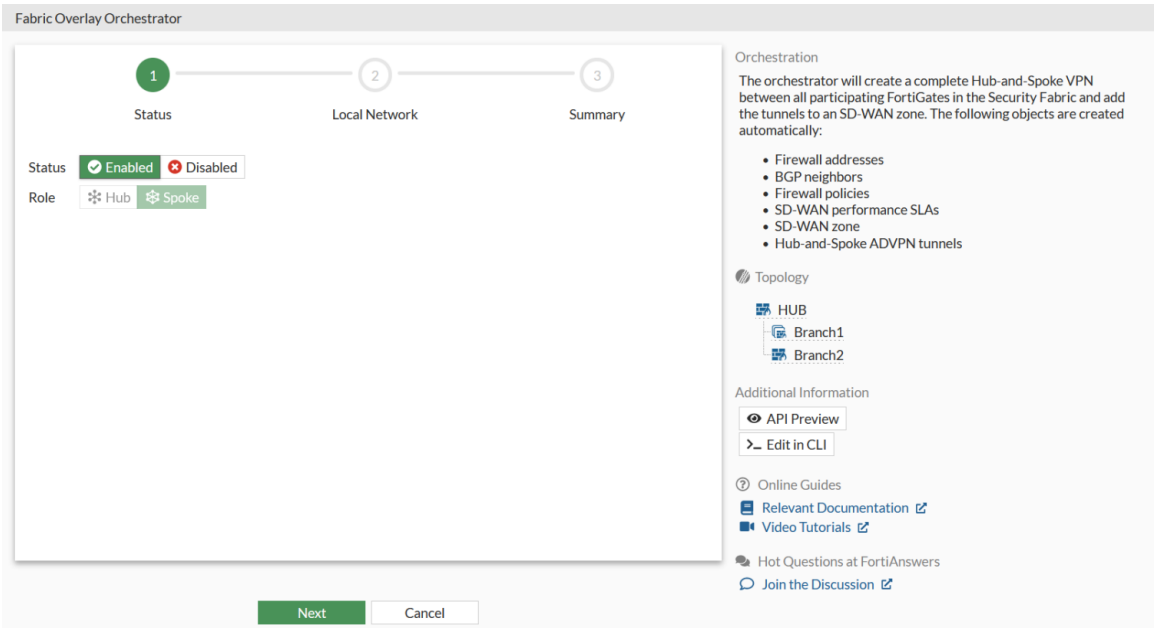
7. Click *Next*. The *Local Network* settings appear.
8. Configure routing and local subnets to share the following with the VPN network:



BGP AS	Optional setting to configure the BGP AS number. By default, this is set to *65400*.
Loopback address block	Optional setting to configure the loopback IP address. By default, this is set to *10.20.1.1/255.255.255.0*.
Shared interfaces	Select the interface of the local network to share with the VPN network.

9. Click *Next*. The *Summary* page appears.
10. Review the settings, then click *Apply*.

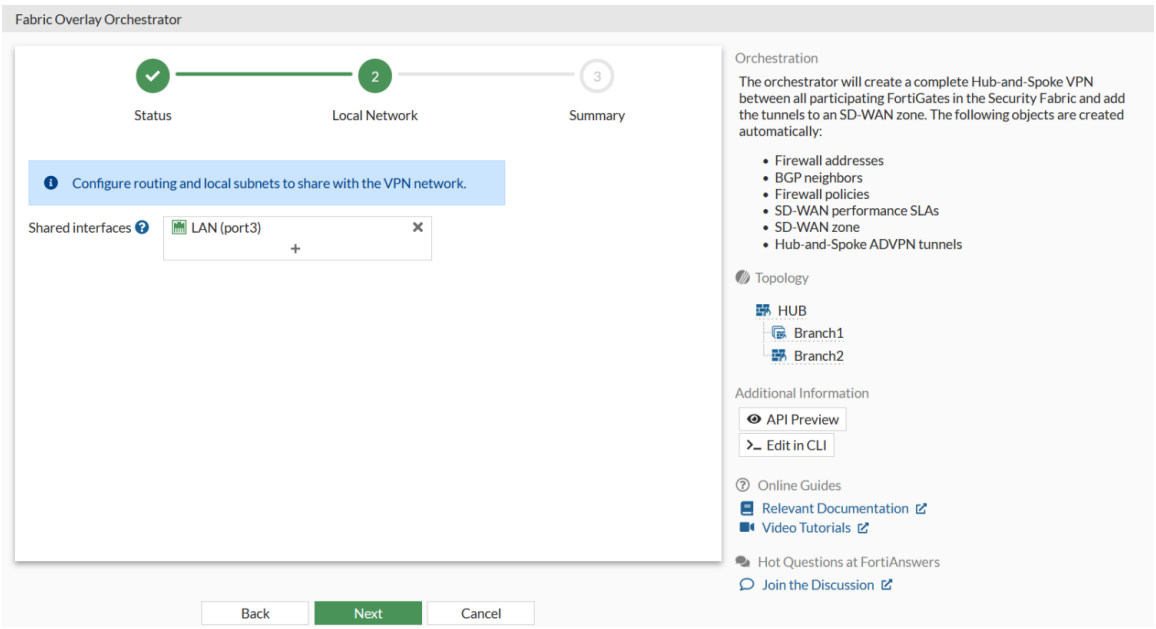
An updated *Summary* page appears with all the settings.



Note the following settings in this example:

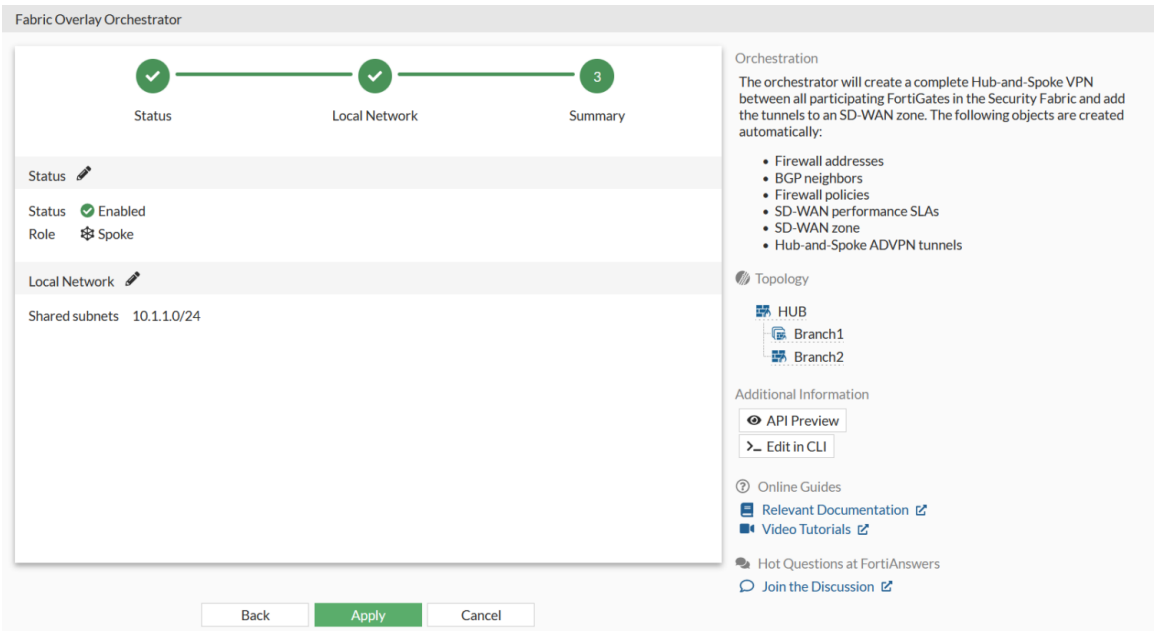
SD-WAN zone	Located in the *Status* section: *fabric_vpn_sdwan*.
VPN tunnels	Located in the *Overlay* section in the *Incoming interface* table under the *Phase 1 Interface* column: *fabric_vpn1* and *fabric_vpn2*.
BGP	Located in the *Local Network* section. The *BGP AS* is *65400*. The *Shared subnets* are *10.20.1.1/32* and *172.16.1.0/30*.
Loopback interface	Located in the *Local Network* section: *F_Hub_loop*.
Firewall policies	Located in two sections: • *Overlay* section in the *Incoming interface* table under the *Policy* column: *Fabric_overlay_0* and *Fabric_overlay_1* • *Local Network* section in the *Shared subnets* table under the *Policies* column: *fabric_vpn_1_in*, *fabric_vpn_0_out*, and *fabric_vpn_0_in*

Configuring a downstream FortiGate using the Fabric Overlay Orchestrator

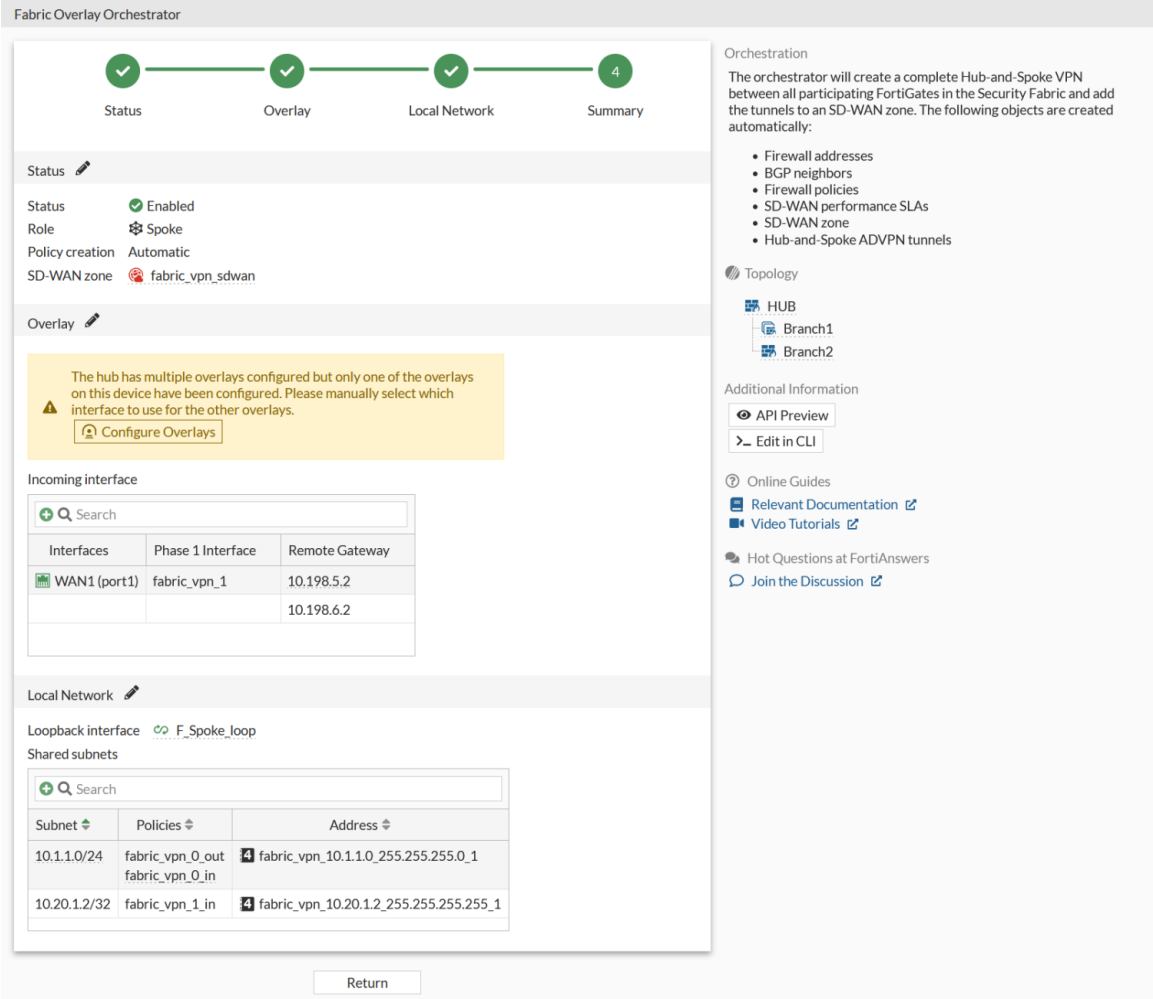


To configure a downstream FortiGate using the Fabric Overlay Orchestrator:

1. Go to *VPN* > *Fabric Overlay Orchestrator*.
2. Set the *Status* to *Enabled*. The *Role* is automatically selected based on the FortiGate's role in the Security Fabric. Ensure that *Spoke* is selected. Only downstream first-level FortiGates can be spokes.



3. Click *Next*. The *Local Network* settings appear.
4. Configure the routing and local subnets to share with the VPN network in the following fields:



Shared interfaces	Select the interface of the local network to share with the VPN network.

5. Click *Next*. As the downstream FortiGate updates, a *Configuring spoke Fabric VPN from root FortiGate* message appears The *Summary* page appears once the update is complete.

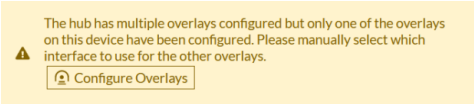
6. Review the settings, then click *Apply*.
   An updated *Summary* page appears with all the settings.

Note the following settings in this example:

SD-WAN zone	Located in the *Status* section: *fabric_vpn_sdwan*.
VPN tunnels	Located in the *Overlay* section in the *Incoming interface* table under the *Phase 1 Interface* column: *fabric_vpn1*.
BGP	Located in the *Local Network* section. The *BGP AS* is *65400*. The *Shared subnets* are *10.1.1.0/24* and *10.20.1.2/32*.
Loopback interface	Located in the *Local Network* section: *F_Hub_loop*.
Firewall policies	Located in the *Local Network* section in the *Shared subnets* table under the *Policies* column: *fabric_vpn_0_out*, *fabric_vpn_0_in*, and *fabric_vpn_1_in*.

The loopback IP addresses for the branches are generated based on the index number of the trusted device in the root FortiGate's Security Fabric (HUB) configuration.

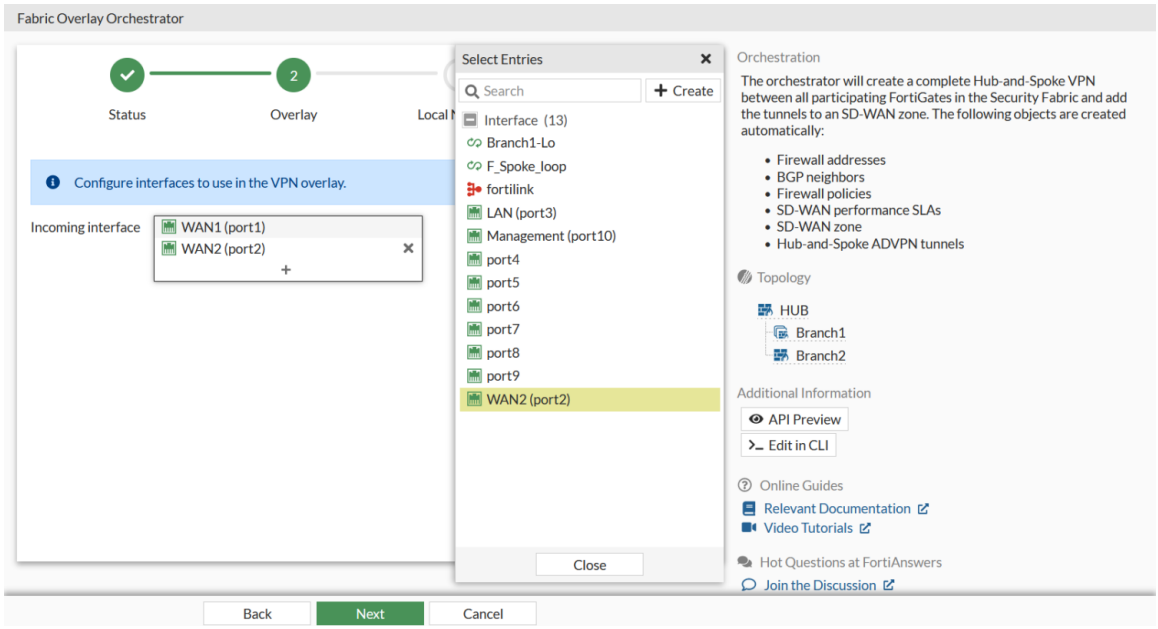
```
config system csf
    set status enable
    set group-name "fabric"
    config trusted-list
        edit "FGVM02TM22000001"
```



```
            set serial "FGVM02TM22000001"
            set index 1
        next
        edit "FGVM02TM22000002"
            set serial "FGVM02TM22000002"
            set index 2
        next
    end
end
```

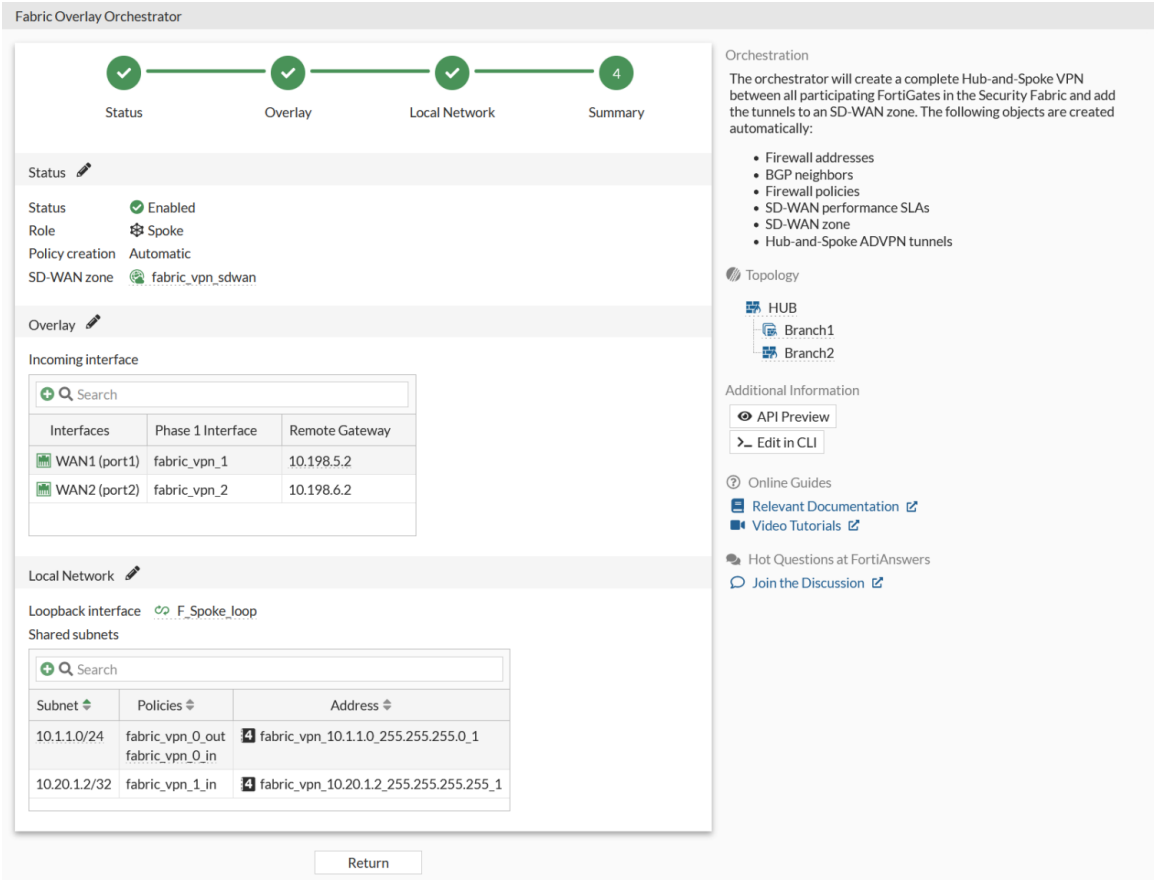
For example, if Branch1 (index 1) is the first FortiGate and Branch2 (index 2) is the second FortiGate authorized on the root FortiGate, the loopback addresses are generated as follows:

- Branch1 loopback IP: 10.20.1.2
- Branch2 loopback IP: 10.20.1.3



Configuring an overlay on the spoke for an additional incoming interface on the hub

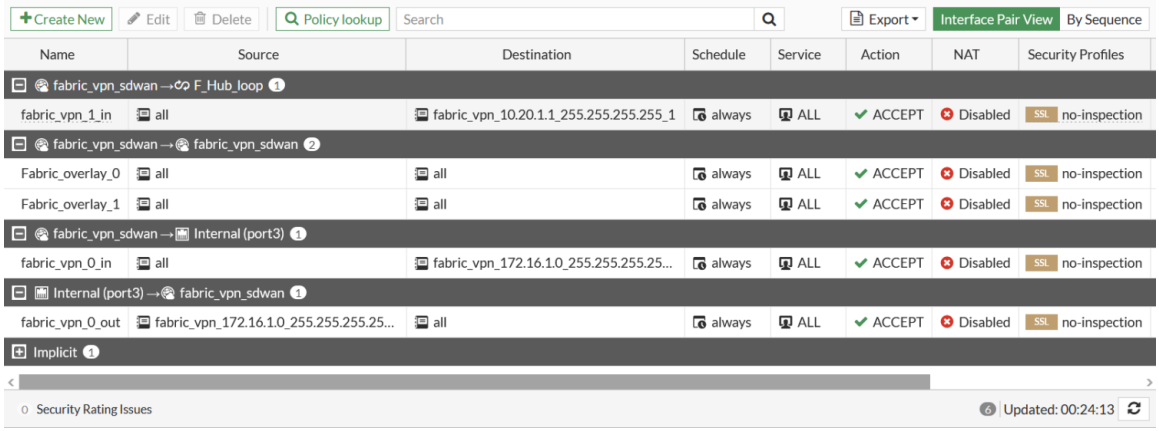
A hub typically includes two incoming interfaces, but additional interfaces can be configured if needed. On downstream devices, the following warning is displayed on the *Fabric Overlay Orchestrator* page that *The hub has multiple overlays configured but only one of the overlays on this device have been configured. Please manually select which interface to use for the other overlays.*



To configure an additional incoming interface on a spoke:

1. Go to *VPN* > *Fabric Overlay Orchestrator*.
2. Click *Configure Overlays* in the warning box.
3. Navigate to the *Overlay* section, click the + in the *Incoming interface* field, and select *WAN2 (port2)* to add it to the overlay.

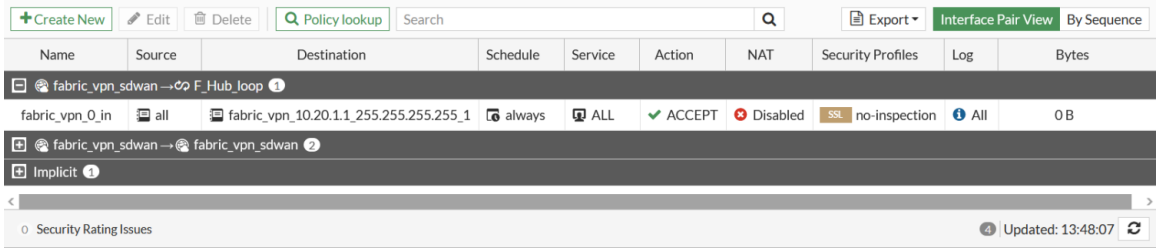
4. Click *Next*, then complete the remaining steps in the GUI wizard. On the *Summary* page, the additional interface *WAN2 (port2)* appears in the *Incoming interfaces* table.



Verifying the firewall policies on the hub FortiGate

Different policies are created on the hub FortiGate based on the *Policy creation* setting in the Fabric Overlay Orchestrator configuration (*Automatic*, *Health check*, or *Manual*).

Automatic

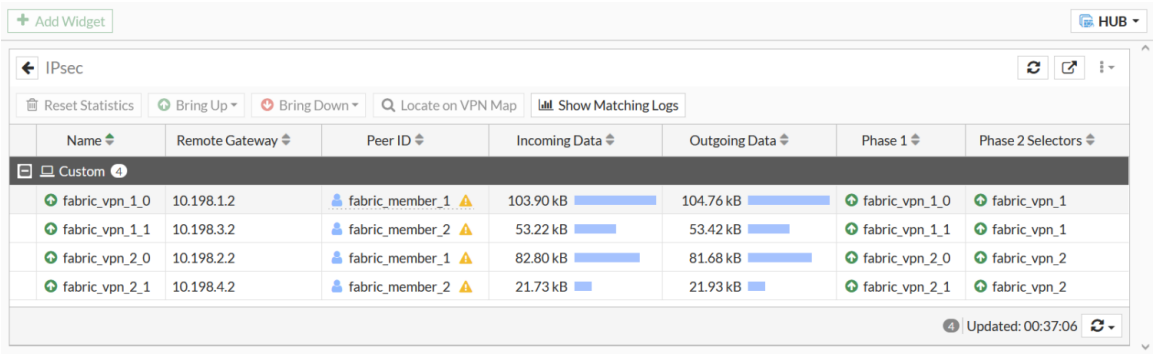


Go to *Policy & Objects* > *Firewall Policy* to verify that wildcard firewall policies have been configured on the hub FortiGate. This Fabric Overlay Orchestrator configuration example uses automatic policy creation, and the following firewall policies are configured:

The *Automatic* policy creation option creates wildcard allow policies for the tunnel overlays. For some cases, these policies do not provide the necessary granularity to restrict overlay traffic to specific subnets or hosts.

Health check

Go to *Policy & Objects* > *Firewall Policy* to verify that a single firewall policy allowing health check traffic to the hub's loopback has been configured on the hub FortiGate. For example:



Manual

Go to *Policy & Objects* > *Firewall Policy* to verify that no firewall policies have been created by the Fabric Overlay Orchestrator. If desired, firewall policies must be manually configured on the hub FortiGate to allow traffic to the loopback interface for health checks and the overlays.

Verifying the Fabric Overlay created by the Fabric Overlay Orchestrator

To verify the IPsec VPN tunnels on the hub:

1. Go to *Dashboard* > *Network* and click the *IPsec* widget to expand it.
2. Verify that there are two tunnels established for each phase 1 interface.

The naming convention <tunnel_name>_<number> indicates the relative order in which the tunnels were established:

fabric_vpn_1_0	VPN tunnel listening on the hub's WAN1 incoming interface; established with spoke 1 using its WAN1 interface
fabric_vpn_1_1	VPN tunnel listening on the hub's WAN1 incoming interface; established with spoke 2 using its WAN1 interface
fabric_vpn_2_0	VPN tunnel listening on the hub's WAN2 incoming interface; established with spoke 1 using its WAN2 interface
fabric_vpn_2_1	VPN tunnel listening on the hub's WAN2 incoming interface; established with spoke 2 using its WAN2 interface

Verify the BGP routing on the hub:

1. In the CLI, check the BGP peering status:

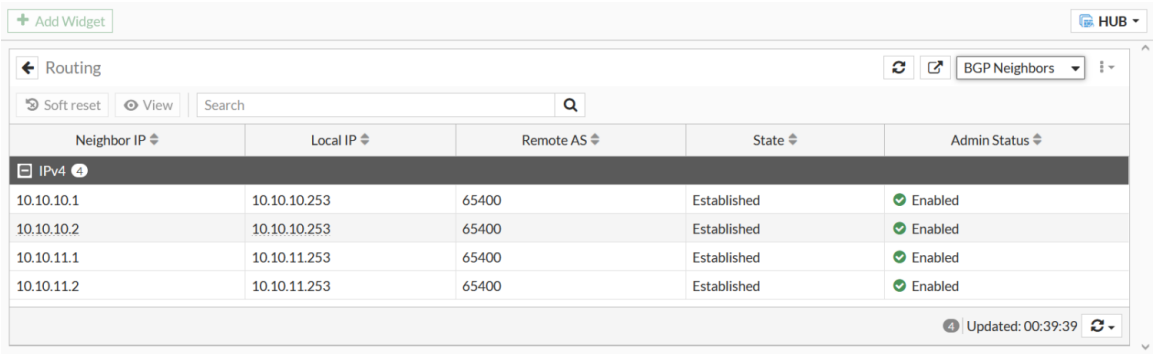
```
HUB # get router info bgp summary

VRF 0 BGP router identifier 10.20.1.1, local AS number 65400
BGP table version is 11
1 BGP AS-PATH entries
0 BGP community entries
Next peer check timer due in 43 seconds

Neighbor    V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
10.10.10.1  4      65400      23      27       11    0    0 00:09:28        2
10.10.10.2  4      65400      16      16       11    0    0 00:06:36        2
10.10.11.1  4      65400      14      20       11    0    0 00:09:22        2
10.10.11.2  4      65400       7      11       11    0    0 00:03:22        2

Total number of neighbors 4
```

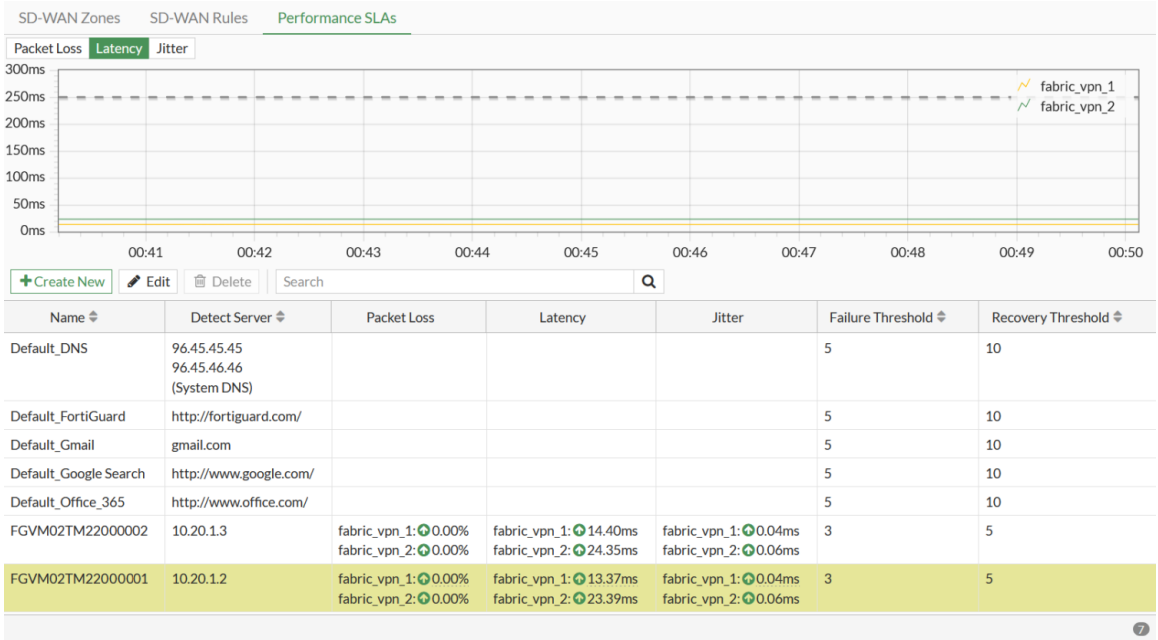
2. Check the BGP advertised routes:



```
HUB # get router info bgp neighbors 10.10.10.1 advertised-routes
VRF 0 BGP table version is 11, local router ID is 10.20.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network          Next Hop            Metric     LocPrf Weight RouteTag Path
*>i10.1.1.0/24      10.10.11.1                        100      0        0 i <-/2>
```

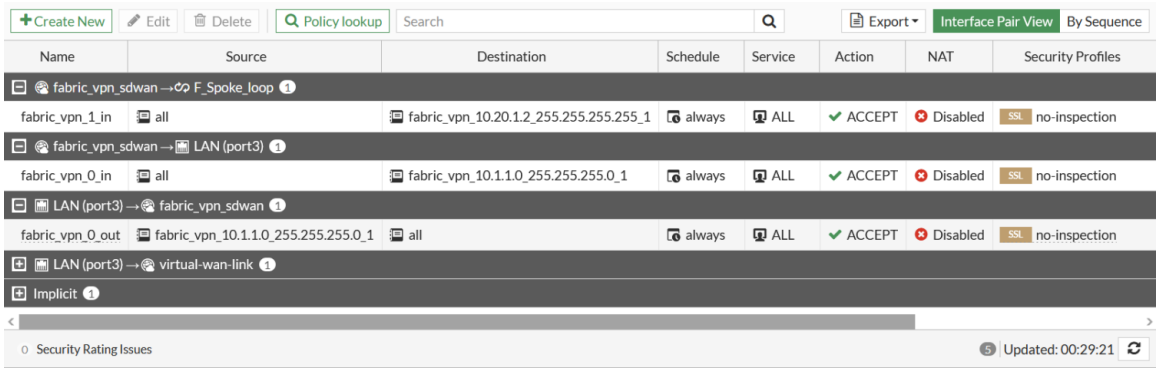
```
*>i10.1.2.0/24      10.10.11.2               100      0         0 i <-/2>
*>i10.1.2.0/24      10.10.10.2               100      0         0 i <-/1>
*>i10.10.10.0/24    10.10.10.253             100  32768         0 i <-/1>
*>i10.10.11.0/24    10.10.10.253             100  32768         0 i <-/1>
*>i10.20.1.1/32     10.10.10.253             100  32768         0 i <-/1>
*>i10.20.1.2/32     10.10.11.1               100      0         0 i <-/2>
*>i10.20.1.3/32     10.10.11.2               100      0         0 i <-/2>
*>i10.20.1.3/32     10.10.10.2               100      0         0 i <-/1>
*>i172.16.1.0/30    10.10.10.253             100  32768         0 i <-/1>



Total number of prefixes 10
```

3. In the GUI, go to *Dashboard* > *Network* and click the *Routing* widget to expand it.
4. In the dropdown, select *BGP Neighbors*.

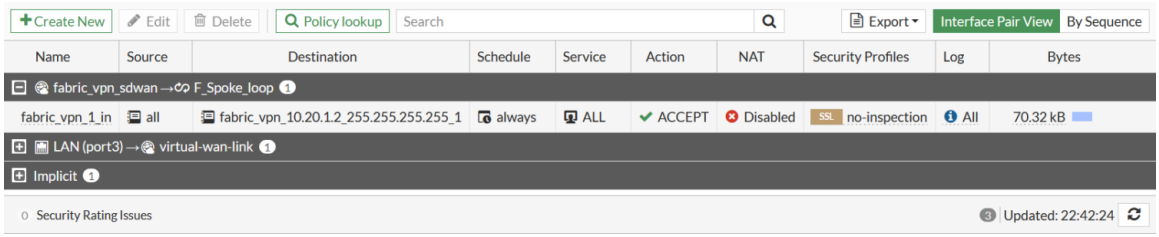
To verify the performance SLAs on the hub:



1. Go to *Network* > *SD-WAN* and select the *Performance SLAs* tab.
2. Verify that the performance SLAs are automatically created for each spoke. The performance SLA naming uses the serial number of the spoke FortiGate. There are two new entries.

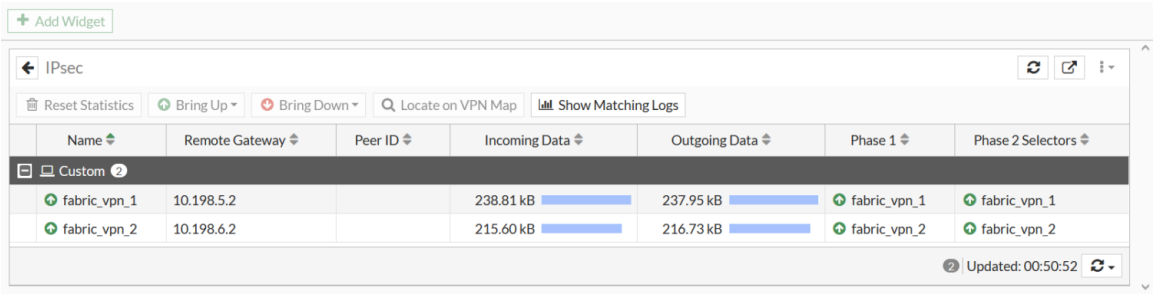
To verify the firewall policies on a spoke FortiGate:

Different policies are created on the spoke FortiGates based on the hub's *Policy creation* setting in the Fabric Overlay Orchestrator configuration (*Automatic*, *Health check*, or *Manual*). The *Automatic* setting is used in this example.



1. Go to *Policy & Objects* > *Firewall Policy*.
2. Verify that wildcard firewall policies have been configured.

The *Automatic* policy creation option creates wildcard allow policies for the tunnel overlays. For some cases, these policies do not provide the necessary granularity to restrict overlay traffic to specific subnets or hosts.



If the hub's *Policy creation*setting is *Health Check*, a single firewall policy that allows health check traffic to the spoke's loopback should be configured on the spoke FortiGates:

If the hub's *Policy creation*setting is *Manual*, there should be no new policies created by the Fabric Overlay Orchestrator. If desired, firewall policies must be manually configured on the spoke FortiGates to allow traffic to the loopback interface for health checks and the overlays.

To verify the IPsec VPN tunnels on a spoke:

1. Go to *Dashboard* > *Network* and click the *IPsec* widget to expand it.
2. Verify the IPsec tunnels that go back to the hub.

To verify BGP routing on a spoke:

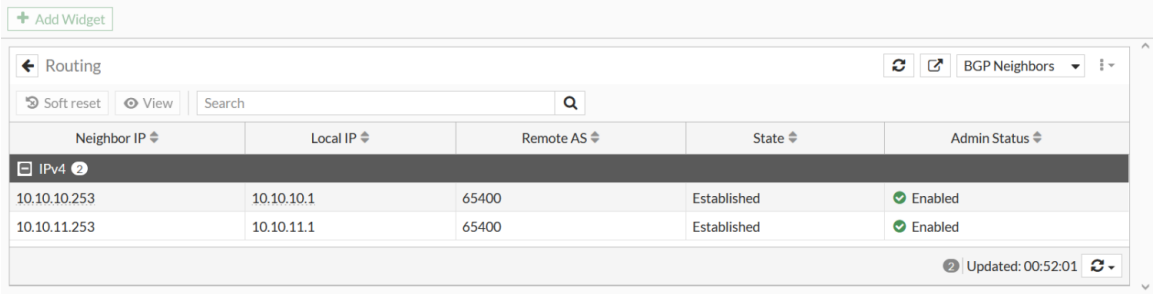
1. In the CLI, check the BGP peering status:

```
Branch1 # get router info bgp summary

VRF 0 BGP router identifier 10.20.1.2, local AS number 65400
BGP table version is 5
1 BGP AS-PATH entries
0 BGP community entries

Neighbor     V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
10.10.10.253 4      65400      41      37        4    0    0 00:23:39        8
10.10.11.253 4      65400      38      34        4    0    0 00:23:33        8

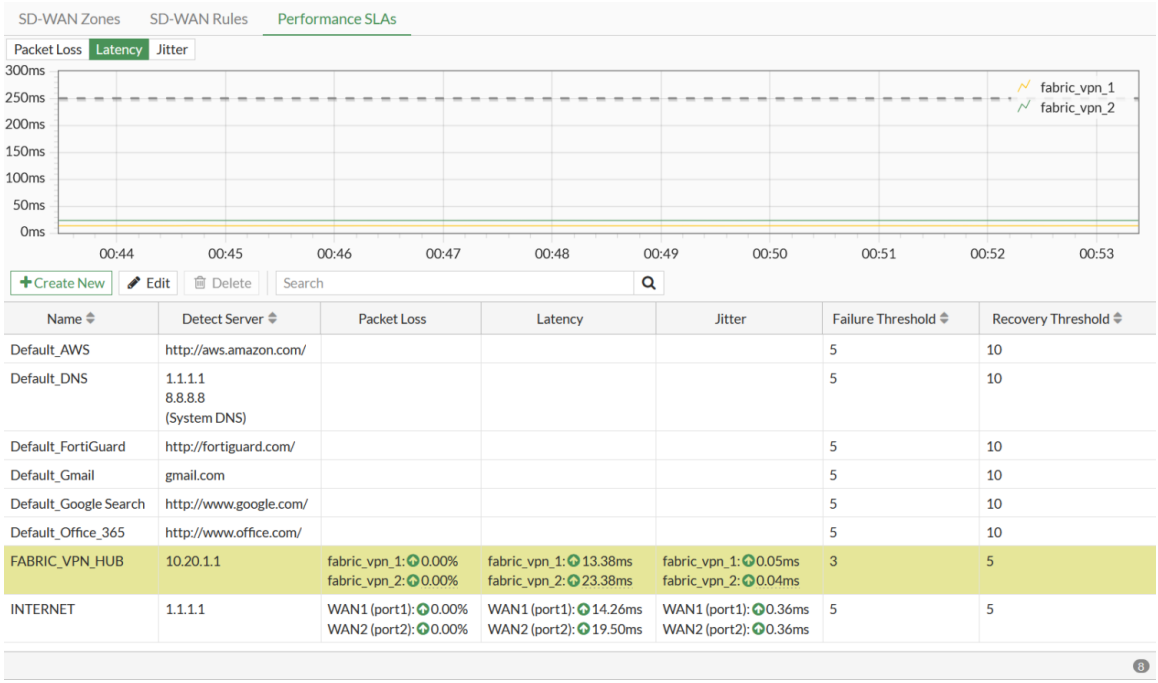
Total number of neighbors 2
```



2. Check the BGP advertised routes:

```
Branch1 # get router info bgp neighbors 10.10.10.253 advertised-routes
VRF 0 BGP table version is 5, local router ID is 10.20.1.2
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network          Next Hop            Metric     LocPrf Weight RouteTag Path
*>i10.1.1.0/24      10.10.10.1                        100  32768        0 i <0/->
*>i10.20.1.2/32     10.10.10.1                        100  32768        0 i <0/->



Total number of prefixes 2
```

3. In the GUI, go to *Dashboard* > *Network* and click the *Routing* widget to expand it.
4. In the dropdown, select *BGP Neighbors*.

To verify the performance SLAs on a spoke:

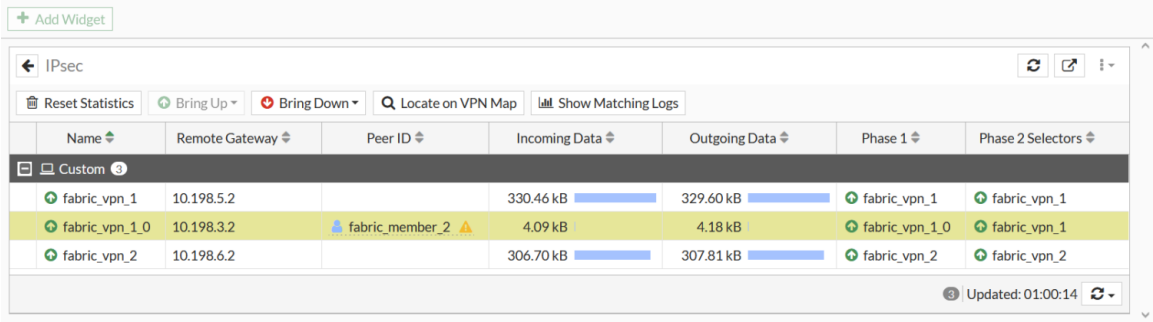
1. Go to *Network* > *SD-WAN* and select the *Performance SLAs* tab.
2. Verify that the performance SLA is automatically created for the hub FortiGate. There is a new entry (*FABRIC_VPN_HUB*).

Name	Detect Server	Packet Loss	Latency	Jitter	Failure Threshold	Recovery Threshold
Default_AWS	http://aws.amazon.com/				5	10
Default_DNS	1.1.1.1 8.8.8.8 (System DNS)				5	10
Default_FortiGuard	http://fortiguard.com/				5	10
Default_Gmail	gmail.com				5	10
Default_Google Search	http://www.google.com/				5	10
Default_Office_365	http://www.office.com/				5	10
FABRIC_VPN_HUB	10.20.1.1	fabric_vpn_1: 0.00% fabric_vpn_2: 0.00%	fabric_vpn_1: 13.38ms fabric_vpn_2: 23.38ms	fabric_vpn_1: 0.05ms fabric_vpn_2: 0.04ms	3	5
INTERNET	1.1.1.1	WAN1 (port1): 0.00% WAN2 (port2): 0.00%	WAN1 (port1): 14.26ms WAN2 (port2): 19.50ms	WAN1 (port1): 0.36ms WAN2 (port2): 0.36ms	5	5

To verify the spoke-to-spoke ADVPN communication:

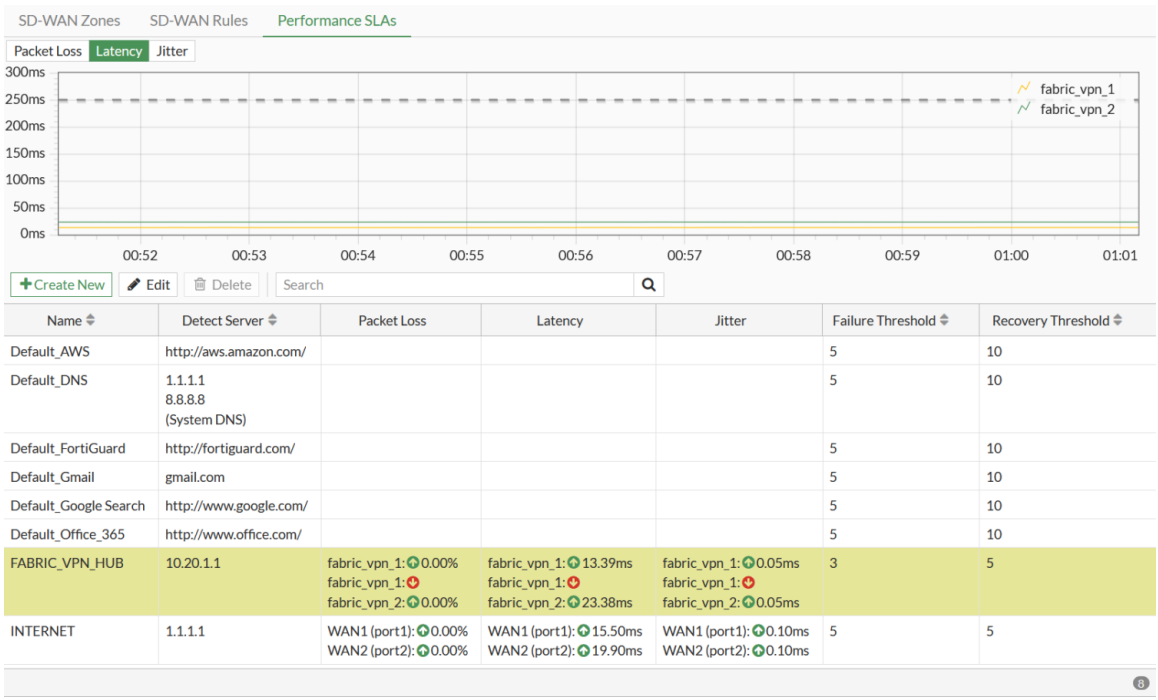
1. From Branch1, ping Branch2 (10.20.1.3):

```
Branch1 # exec ping-options source 10.20.1.2
Branch1 # exec ping 10.20.1.3
PING 10.20.1.3 (10.20.1.3): 56 data bytes
64 bytes from 10.20.1.3: icmp_seq=0 ttl=254 time=27.7 ms
64 bytes from 10.20.1.3: icmp_seq=2 ttl=255 time=17.4 ms
64 bytes from 10.20.1.3: icmp_seq=3 ttl=255 time=17.5 ms
64 bytes from 10.20.1.3: icmp_seq=4 ttl=255 time=17.4 ms



--- 10.20.1.3 ping statistics ---
5 packets transmitted, 4 packets received, 20% packet loss
round-trip min/avg/max = 17.4/20.0/27.7 ms
```

2. Verify the IPsec tunnel summary.
   - In the CLI, enter the following:



```
Branch1 # get vpn ipsec tunnel summary
'fabric_vpn_1_0' 10.198.3.2:0  selectors(total,up): 1/1  rx(pkt,err): 25/0  tx
(pkt,err): 26/2
'fabric_vpn_1' 10.198.5.2:0  selectors(total,up): 1/1  rx(pkt,err): 8032/0  tx
(pkt,err): 8022/2
'fabric_vpn_2' 10.198.6.2:0  selectors(total,up): 1/1  rx(pkt,err): 7462/0  tx
(pkt,err): 7478/1
```

   The `fabric_vpn_1_0` tunnel was created for spoke 1-to-spoke 2 communication.

- In the GUI, go to *Dashboard* > *Network* and click the *IPsec* widget to expand it.

3. Verify that the performance SLA was updated. Go to *Network* > *SD-WAN* and select the *Performance SLAs* tab.

The first performance SLA, *fabric_vpn_1*, that corresponds to the spoke-to-hub VPN tunnel is shown as up. The second one, *fabric_vpn_1* that corresponds to the spoke-to-spoke VPN tunnel (*fabric_vpn_1_0*) is shown as down since 10.20.1.1 is the IP address corresponding to the hub's loopback interface that is not present on another spoke.

Configuring SD-WAN rules on the hub FortiGate

On the hub, the Fabric Overlay Orchestrator automatically creates a performance SLA that corresponds to each spoke FortiGate using the serial number as the name of the performance SLA. SD-WAN rules must be configured on the hub FortiGate to direct traffic to each of the spokes using these performance SLAs.

To configure SD-WAN rules on the hub FortiGate:

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
2. Enter a name (such as *Hub-To-Br1*).
3. In the *Source* section, set the *Address* to the local subnet of the hub.
4. Configure the following in the *Destination* section:

   a. Set the *Address* to the local subnet of the spoke. If an address object does not exist yet, click *Create* in the slide-out pane and configure the address.
   b. Set the *Protocol number* as needed (default = *ANY*).
5. Configure the following in the *Outgoing Interfaces* section:
   a. Set the *Interface selection strategy* to *Lowest cost (SLA)*.
   b. Set the *Interface preference* to the SD-WAN members.
   c. Set *Required SLA target* to the corresponding performance SLA created by the Fabric Overlay Orchestrator for this the spoke. The name is based on the spoke FortiGate's serial number (*FGVM0XXX00000000 #1*).
6. Click *OK*.
7. Repeat these steps for the other spoke. Ensure the *Name* is unique, and that the *Destination* address corresponds to the local subnet behind the spoke.

If you need to disable the Fabric Overlay Orchestrator on the hub FortiGate by setting the *Status* to *Disabled*, you must first delete any SD-WAN rules on the hub FortiGate created using this procedure to ensure the added configuration does not block the clean-up process.

Configuring SD-WAN rules on the spoke FortiGates

On each spoke, the Fabric Overlay Orchestrator automatically creates a performance SLA that corresponds to the hub FortiGate. An SD-WAN rule must be configured on the spoke FortiGates to direct traffic to the hub FortiGate using this performance SLA.

To configure an SD-WAN rule on a spoke FortiGate:

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
2. Enter a name (such as *LAN-to-HUB*).
3. In the *Source* section, set the *Address* to the local subnet of the spoke.
4. Configure the following in the *Destination* section:
   a. Set the *Address* to the local subnet of the hub. If an address object does not exist yet, click *Create* in the slide-out pane and configure the address.
   b. Set the *Protocol number* as needed (default = *ANY*).
5. Configure the following in the *Outgoing Interfaces* section:
   a. Set the *Interface selection strategy* to *Lowest cost (SLA)*.
   b. Set the *Interface preference* to the SD-WAN members.
   c. Set *Required SLA target* to the corresponding performance SLA created by the Fabric Overlay Orchestrator, which is named *FABRIC_VPN_HUB#1* by default.
6. Click *OK*.

If you need to disable the Fabric Overlay Orchestrator on a spoke FortiGate by setting the *Status* to *Disabled*, you must first delete any SD-WAN rules on the spoke FortiGate created using this procedure to ensure the added configuration does not block the clean-up process.

Other VPN topics

The following topics provide instructions on configuring other VPN topics.

- VPN and ASIC offload on page 2190
- Encryption algorithms on page 2200

VPN and ASIC offload

This topic provides a brief introduction to VPN traffic offloading.

IPsec traffic processed by NPU

1. Check the device ASIC information. For example, a FortiGate 900D has an NP6 and a CP8.

```
# get hardware status
Model name: [[QualityAssurance62/FortiGate]]-900D
ASIC version: CP8
ASIC SRAM: 64M
CPU: Intel(R) Xeon(R) CPU E3-1225 v3 @ 3.20GHz
Number of CPUs: 4
RAM: 16065 MB
Compact Flash: 1925 MB /dev/sda
Hard disk: 244198 MB /dev/sdb
USB Flash: not available
Network Card chipset: [[QualityAssurance62/FortiASIC]] NP6 Adapter (rev.)
```

2. Check port to NPU mapping.

```
# diagnose npu np6 port-list
Chip   XAUI Ports            Max   Cross-chip
                             Speed offloading
----
np6_0  0
        1.    port17           1G    Yes
        1.    port18           1G    Yes
        1.    port19           1G    Yes
        1.    port20           1G    Yes

        1.    port14          1G    Yes
        1.    portA           10G   Yes
        1.
----
```

3. Configure the option in IPsec phase1 settings to control NPU encrypt/decrypt IPsec packets (enabled by default).

```
config vpn ipsec phase1/phase1-interface
    edit "vpn_name"
        set npu-offload enable/disable
    next
end
```

4. Check NPU offloading. The NPU encrypted/decrypted counter should tick. The `npu_flag 03` flag means that the traffic processed by the NPU is bi-directional.

```
# diagnose vpn tunnel list

```

2. Two options are used to control if the CP processes packets. If disabled, packets are processed by the CPU.

```
config system global
    set ipsec-asic-offload disable
```

```
        set ipsec-hmac-offload disable
    end
```

IPsec traffic processed by CPU

IPsec traffic might be processed by the CPU for the following reasons:

- Some entry-level models do not have NPUs.
- NPU offloading and CP IPsec traffic processing manually disabled.
- Some types of proposals - SEED, ARIA, chacha20poly1305 - are not supported by the NPU or CP.
- NPU flag set to 00 and software encrypt/decrypt counter ticked.
